## **EXECUTIVE SUMMARY**

In recent years, a number of non-native animal species have been observed in Alaska, some of which have proven to be invasive. Since animal introductions to the state are still limited in distribution, and because protecting land not yet infested by non-natives is an efficient technique for the management of invasive species, we have the opportunity to preserve Alaska's immense natural resources with careful management of invasive animal threats. However, before management efforts towards invasive species can be successful, information must be gathered to identify which non-native animal species are present in the state, where they occur, and which species pose the greatest risk to native ecosystems. In an effort to provide managers with the most up-to-date information regarding invasive animal species in Alaska, we compiled a comprehensive list of non-native animals that have been documented in the state, and also developed a list of potential future invaders based on their occurrence in neighboring states and/or provinces. We collected published and unpublished information on a number of non-native animal species that are known to pose a high risk to native ecosystems, and summarized information on their biology, modes of dispersal, documented impacts, control options, and current and historic distribution.

A total of 116 non-native animal species (including fishes, amphibians, reptiles, birds, mammals, invertebrates, parasites and pathogens) were documented as present (either historically or currently) in the state, of which 20 were designated as highly invasive species. Status reports describing biology and invasive potential were developed for 14 of the highly invasive species and are included as an appendix to this report, along with maps of their known current distribution in the state. An additional 41 species were identified as potential invaders based on their rapid spread in western North America and on their ability to disperse over large distances. Ten of the 41 potential invaders were identified as being highly invasive, and status reports were developed for 3 of those species.

The development of the first comprehensive list of non-native animals in Alaska summarizes necessary and preliminary information about the current status of these animals in the state. Information contained within the individual species status reports and associated distribution maps may be used to interpret a species' ability to spread into particular regions, and could be used in future mapping efforts to calculate rates of dispersal as well as enable prediction of future range expansions. As global climate change continues to warm the landscape, Alaska may become more susceptible to harmful invaders and the information compiled within this report could be useful in predicting and preventing animal invasions.

## **INTRODUCTION**

Invasive species are defined in federal law as species that are both non-native (alien) to a particular ecosystem and whose introduction causes or is likely to cause economic or environmental harm, or harm to human health (Executive Order 13112 1999). In recent years, a number of non-native animal species have been observed in Alaska, some of which have proven to be invasive. Invasive species threaten native ecosystem integrity and Alaska's valuable resources in fisheries, tourism, forestry, and agriculture by the alteration and loss of natural species biodiversity and ecosystem functions. Alaska's low population and relative geographic isolation have kept introductions of new invasive species comparatively low, but increased commercial traffic, development, and changes wrought by climate change all potentially increase the risk of new introductions to the state. Since many animal introductions to the state are still limited in distribution, and because protecting land not yet infested by non-natives is an efficient technique for the management of invasive species, we have the opportunity to preserve Alaska's valuable natural resources with careful management of invasive animal threats.

Before successful management efforts towards invasive species can be implemented, information must be gathered to identify which non-native animal species are present in the state, where they occur, and which species pose the greatest risk to native ecosystems. In an effort to provide managers with the most up-to-date information regarding invasive animal species in Alaska, we compiled a comprehensive list of non-native animals that have been documented in the state, and also developed a list of potential future invaders based on their occurrence in neighboring states and/or provinces. We collected published and unpublished information on a number of non-native animal species that pose a high risk to native ecosystems, and summarized information on their biology, modes of dispersal, documented impacts, control options, and current and historic distribution.

Specific project objectives were to:

- (1) Conduct a comprehensive literature review and consult with area biologists to compile a draft list of non-native animal species previously documented in Alaska. Compile a list of potential invaders to include species that have been documented in neighboring states and provinces.
- (2) Through literature review and expert consultation, identify which species are accidentals and unlikely invaders in Alaska and remove these species from the list, or identify them as such.
- (3) Research and synthesize information on the biology, modes of dispersal, documented impacts, and control options of listed species to identify those capable of causing the greatest impacts.

## **METHODOLOGY**

*Objective 1:* To develop a comprehensive list of non-native animal species in the state, we reviewed published and unpublished information available in peer-reviewed and gray literature, museum specimen collection databases, wildlife and invasive species program websites, news reports, and personal communications with Alaska biologists and invasive

species experts for fishes, amphibians, reptiles, birds, mammals, invertebrates, parasites and pathogens. Data were compiled into two lists: 1) a preliminary list of non-native animals documented in the state (either currently or historically) and 2) a list of invasive species that have been detected in adjacent states and provinces which have the potential to spread and establish in Alaska. For animals present in Alaska, we included information about the species' status (e.g., cryptogenic, reported but not yet confirmed in the state, documented but eradicated, native but translocated). Draft lists were reviewed by local biologists and invasive species experts, and updated throughout the process of literature review and information synthesis.

*Objective 2:* We refined the list of non-native animal species present in Alaska by identifying those species already recognized as invasive in existing literature, reports or by experts in the state. Based on evidence in the literature, we identified a number of non-native species known to pose a high risk to native biodiversity. These "high risk" species were selected for in-depth research into their biology, ecology and possible impacts to native systems. It would require a systematic ranking scheme in order to objectively identify the highest risk species. Unfortunately, a ranking exercise was beyond the scope of this project. Instead, we selected "high-risk" species based on their widespread recognition as invasive species in the literature.

*Objective 3:* For select "high-risk" animal species, we summarized available information relating to the taxonomy, reproduction, feeding, habitat needs, dispersal potential, current/historic distribution, documented impacts, and control options. Maps of species' Alaskan range and/or distribution were developed using ArcGIS software.

## RESULTS

The final list of non-native animal species in Alaska included 116 species documented (either historically or currently) in the state (including amphibians [3], birds [16], fishes [14], invertebrates [42], mammals [35], parasites [1], pathogens [4], and reptiles [1]; see Appendix I). An additional 41 species were identified as potential invaders based on their proximity in adjacent states and provinces and on their ability to disperse over large distances (amphibians [1], birds [1], invertebrates [37], and pathogens [2]; see Appendix II). Of those found in the state, 21 were highlighted as "high-risk" for invasiveness. Of those not yet found in the state, 10 were highlighted as "high-risk" for invasiveness. Status reports were developed for 17 species (2 amphibians, 10 invertebrates, 2 fishes and 3 mammals) and are included as Appendix III in this report.

## DISCUSSION AND FUTURE DIRECTION

The majority of species listed as non-native in Alaska are not considered invasive by the formal definition. An exploration of the factors contributing to a species' invasiveness, and a systematic effort to rank species according to objective criteria would be constructive and has yet to be conducted for animals in the state. The need to evaluate and rank non-native species is a prerequisite before expensive management is attempted, so that the most threatening species are addressed first. A ranking system can help set

priorities for research and control efforts for invading bird, mammal, fish, invertebrate, and pathogenic species. Since many of the species on the Alaska non-native animal list have been documented during the last 20 years (this may be due to increased number of invasions or increased reporting and research on invasive species), there is a consensus in the invasive species community that a prioritization scheme is an important first step. Biological and ecological data summarized during this project will provide a valuable reference for future ranking efforts. These data also provide basic geographic information that could form the groundwork for development of a GIS database of non-native animal species distribution.

The development of the first comprehensive list of non-native animals in Alaska, presented here, summarizes necessary and preliminary information about the current status of these animals in the state. By making this information available to researchers and the general public, we hope it will be used to identify data gaps in our understanding and help direct targeted research. We also hope that it will serve to increase public awareness of the negative impacts of invasive species, which in turn, could help prevent their future spread. Questions that need to be addressed in the future include: Which species or groups of animals have the most invasive potential, and which have already caused the most damage to native ecosystems in the state? How can we target entire groups or dispersal pathways for prevention of non-native animal introductions? Where would financial resources prove most effective in the fight against invasions, and are there invasive populations that are already beyond our control? Information contained within the individual species status reports and associated distribution maps may be used to interpret an invasive species' ability to spread into particular regions, and could be used in future mapping efforts to calculate rates of dispersal as well as enable prediction of future range expansions (Riccardi et al. 2000). As global climate change continues to warm the landscape, Alaska may become more susceptible to harmful invaders (Union of Concerned Scientists 2005) and the information contained within this report could be useful in predicting and preventing animal invasions.

## **ACKNOWLEDGEMENTS**

This project was generously funded by the Alaska Department of Fish and Game's Invasive Species Program. We would especially like to thank Tammy Davis, the Invasive Species Program Coordinator, for her guidance and enthusiasm throughout the duration of the project.

Many thanks to those who reviewed and contributed to the lists of non-native animal species of Alaska: Blythe Brown, Kodiak Soil and Water Conservation District; Paul Hennon, USDA Forest Service; Jeff Heys, National Park Service; James Kruse, USDA Forest Service; Denny Lassuy, US Fish and Wildlife Service; Whitney Rapp, National Park Service; Barbara Schrader, USDA Forest Service; and Rick Sinnott, Alaska Dept. of Fish and Game.

Invertebrates	<i>Teredo navalis</i>	European (naval) shipworm		Second et al 2005	
Invertebrates	<i>Hemicroca crocera</i>	European alder sawfly		Schrader and Hennion 2005	Low *
Invertebrates	<i>Ips typographus</i>	European spruce beetle		Schrader and Hennion 2005	High *
Invertebrates	<i>Malacosoma disstria</i>	Forest tent caterpillar	X	Schrader and Hennion 2005	High *
Invertebrates	<i>Carcinus maenas</i>	Green crab, European green crab		Fay 2002, UCS 2005, Aquatic Nuisance Species Project 2007	High ^
Invertebrates	<i>Adelges tsugae</i>	Hemlock woolly adelgid		Schrader and Hennion 2005	Moderate *
Invertebrates	<i>Diadumene lineata</i>	Japanese anemone		Second et al 2005	
Invertebrates	<i>Musculista senhousia</i>	Japanese mussel		Second et al 2005	
Invertebrates	<i>Ocenebrilus inornatus</i>	Japanese oyster drill		Second et al 2005	
Invertebrates	<i>Coleophora laricella</i>	Larch casebearer		Schrader and Hennion 2005	Moderate *
Invertebrates	<i>Ips cembrae</i>	Larch engraver		Schrader and Hennion 2005	Moderate *
Invertebrates	<i>Venerupis philippinarum</i>	Manila clam		Second et al 2005	
Invertebrates	<i>Mytilus galloprovincialis</i>	Mediterranean mussel		Second et al 2005	

**Appendix II, page 2.** List of non-native species that have been not been positively identified in Alaska, but have been documented in adjacent states and provinces, and have the potential to invade.

Taxon	Scientific Name	Common Name	Status Report	Reference	Reported Invasiveness Rank
Invertebrates	<i>Batrillaria atramentaria</i>	Mudsnail		Secord et al 2005	
Invertebrates	<i>Potamopyrgus antipodarum</i>	New Zealand Mudsnail	X	Fay 2002, UCS 2005	High*
Invertebrates	<i>Lymantria monacha</i>	Nun moth		Schrader and Hennion 2005	High*
Invertebrates	<i>Alitta succinea</i>	Pile worm		GISD 2007	
Invertebrates	<i>Dendrolimus pini</i>	Pine moth		Schrader and Hennion 2005	High*
Invertebrates	<i>Nuttallia obscurata</i>	Purple varnish clam		Secord et al 2005	
Invertebrates	<i>Clathria prolifera</i>	Red beard sponge		Secord et al 2005	
Invertebrates	<i>Lymantria mathura</i>	Rosy gypsy moth		USFS 2007	
Invertebrates	<i>Botrylloides violaceus</i>	Sheath tunicate		USGS 2007	
Invertebrates	<i>Ciona savignyi</i>	Solitary sea squirt		Secord et al 2005	
Invertebrates	<i>Styela clava</i>	Solitary sea squirt		Secord et al 2005	
Invertebrates	<i>Bythotrephes cederstroemi</i>	Spiny water flea		Fay 2002, GLIN 2007	
Invertebrates	<i>Adelges abietis</i>	Woolly spruce aphid		Schrader and Hennion 2005	Moderate*
Invertebrates	<i>Dreissena polymorpha</i>	Zebra mussel		Fay 2002, UCS 2005	High^
Pathogens	<i>Chrysomyxa abietis</i>	Foliar spruce rust		Schrader and Hennion 2005	
Pathogens	<i>Bursaphelenchus xylophilus</i>	Pine wilt nematode		Schrader and Hennion 2005	Low*

\* = Schrader and  
Hennion 2005  
^ = GISD 2007
