ANALYSIS: *(Attach a separate page if necessary)*

There is a great deal of uncertainty in calculating the cost differential between birth center and hospital births. There are potential savings and costs, but with the large number of variables involved, we cannot determine the net amount. Therefore, the fiscal note is for zero dollars. The number of Medicaid eligible women who might choose a birthing center instead of a hospital is unknown. In Alaska, about 2% of all births occur in a birthing center compared to less than 1% nationally. Medicaid babies are generally the most at-risk because of their circumstances. One birthing center delivery with serious complications could easily offset any cost savings. The rate of Medicaid deliveries in birthing centers would probably be lower than the statewide rate since birthing centers do not provide adequate care for high-risk pregnancies. An independent study found that the facility cost for a birthing center delivery is about 22% less than a hospital. The cost savings for 100 births is approximately \$40,000.00. There is a question whether birthing centers are an allowable federal Medicaid service. If birthing centers do not qualify for Medicaid reimbursement, the cost would be all GF. If they do qualify, the regular matching rate would apply.
