2. Dr. Mason Gaffney's ad valorem charge, or a "post" royalty system versus the "ante" systems in HB 854. In other words, the state determines its take before discovery, not after. Other governments, like the Canadian national, are going to the "post" systems, i.e. "progressive incremental royalty."

3. Incentives. There are no direct incentives to lessees contemplated in HB 854, except that "work commitment" would allow cash bonuses not to go to the government but instead used by industry for exploration.

4. Government equities in leases or state-owned and operated exploration companies are not envisioned in HB 854.

5. Oil Payment Bidding - shift royalty to rental.

6. Performance System which provides government with the authority to specify the exact rate and extent of resource development.

7. Share Bidding or Phillips Plan. Bonus bids are entered for the entire structure instead of for a specific tract. Based on their equity in the field, each company receives a percent of the profits or losses with a maximum percentage participation by any one company.

8. Alberta's so-called "checkerboard" leasing system wherein a reservation holder may apply for leases over not more than 50% of the area in the reservation in a checker-board pattern. These leases convey the right to produce and sell the Crown's oil and gas, and the government retains the right to alter unilaterally the terms and conditions of the arrangement.

SUMMARY OF FEDERAL OCS REGULATIONS

PERTAINING TO GEOLOGICAL AND GEOPHYSICAL INFORMATION

Title 30, Section 251.12 of the Code of Federal Regulations specifies that individuals and companies granted OCS exploration permits are required to allow the Department of the Interior (DOI) to inspect and select the forms of information listed below. The permittee must notify the DOI immediately of the acquisition or analysis of any geological data (part a of the section) or the acquisition, processing, or reprocessing of any geophysical data (in part b) collected under the permit. The DOI has at least one year after such notification to choose the material. A longer time period may be specified in the individual permits. The permittee is not required to submit interpreted geological or geophysical information for inspection and selection. If the permittee transfers geophysical data or processed geophysical information to a third party or a third party who has received geophysical data or processed geophysical information directly or indirectly from a permittee transfers said data or information to another third party, the transferor must notify the DOI of the action and bind the third party to the obligations of the permittee. The first set of regulations of this type were approved and put into effect in November, 1975.

The geological data from which the DOI may select includes: (This applies to COST-type and other stratigraphic test holes.)

1. Complete record of all geological and geochemical data and information resulting from each operation;

2. Paleontological reports identifying the microfossils by depth, unless washed samples are kept for inspection by the USGS;

3. Copies of well logs or charts (electrical, radioactive, sonic, etc.);

4. Core or bottom samples analyses or a representative cut of the samples;

5. Detailed descriptions of hydrocarbon shows or hazardous conditions; and

6. Other geological data and analyzed geological information obtained under the permit, as specified by DOI.

The geophysical data, processed geophysical information and reprocessed geophysical information which may be selected includes:

1. A complete record of each geophysical survey conducted, including the final location maps of all survey locations;

2. All common depth point and high resolution seismic data;

3. Processed geophysical information derived from the seismic data;

4. Geophysical data and processed information obtained from, but not limited to:

a. Shallow and deep subbottom profiles

b. Bathymetry

c. Side-scan sonar

d. Magnetometer systems

e. Bottom profiles

f. Gravity surveys

g. Magnetic surveys

h. Special studies such as refraction and velocity surveys, and

5. Reprocessed information such as true amplitude sections, migrated sections, and bright spot analyses.

The DOI may choose any or all of the above data or information at any stage of processing. Thus far the local USGS Conservation Division Office has been selecting final processed data and information. The geophysical data must be kept confidential for ten years after the issuance of the permit. Processed, reprocessed, and interpreted geophysical information is released to the public ten years after it has been submitted to the USGS. Geological data and analyzed and interpreted geological information obtained from deep stragigraphic tests are released five years after completion of the test well or 60 calendar days after the issuance of the first Federal lease within 50 geographic miles of the test site, whichever is earlier.

STATE'S RIGHT TO PURCHASE OIL & GAS IN HB 854

The State has the right in HB 854(v) to purchase not more than 16 2/3% of the oil and up to 100% of the gas at the regulated price or fair market value at the point of sale. The right to purchase is needed to protect the "in kind" taking of its royalty by Alaska, a sale of said royalty, and a subsequent reduction of the royalty in the later stages of production (d).

New Mexico, 1973, enacted a law which gives it the right to reserve an option to purchase at any time at the prevailing market price any or all minerals, including oil and gas, produced from State land. Thus, New Mexico may purchase 100% of the oil and gas found on State land.

Whereas the New Mexico Commissioner is authorized to waive the reservation option with respect to any specific mineral, he may not do so for oil or gas.

The Act, Chapter 26 of the Session Laws of 1973, has never been exercised by New Mexico; thus no opportunity has been given to test its constitutionality.

If Alaska were to reserve an option to purchase up to the amount of the royalty, fixed or bid, an equivalent net profit share would have to be determined.

TESTIMONY BEFORE ALASKA HOUSE RESOURCES COMMITTEE
ON HOUSE BILL 854
APRIL 8, 1978

(The following is written from notes which were referred to in the testimony before members of the committee who were holding a work session on the bill.)

My name is John Carson. I am Division Geologist in Alaska for Chevron U.S.A. Inc. I testified before your committee on March 17 on this same bill. My purpose today is threefold.

1. To re-emphasize the major points of my previous testimony;
2. To address "Suggested Revisions to HB 854" submitted by another major oil company; and
3. To answer any questions that the committee may have at this time.

In reviewing my previous testimony I would like to first restate that Chevron sees no need for HB 854. We do see a need for a stable, predictable, planned leasing program on State of Alaska lands.

In my earlier testimony I stated seven points of opposition to the bill. I would like to repeat those now.

First, we oppose the wide variety of bidding methods to be employed.
Second, we are opposed to the requirement of having to submit our proprietary data to the Commissioner.
Third, we oppose the State's right to have a call on production above their royalty share.
Fourth, we feel the five-year term is too short.
Fifth, we oppose the Commissioner having to submit his leasing program to the legislature and also to his having to defend the methods used.
Sixth, we oppose the ban on joint bidding between major oil companies.
Seventh, we feel the reduction of chargeability on upland acreage from 500,000 to

200,000 is arbitrary and unwarranted.

Chevron's reactions to the "Suggested Revisions of HB 654" can be categorized in three ways: First, we will emphasize where we disagree with the revisions, second we will support a revision and amplify by adding comment; and third, we will make no comment to those sections with which we agree. I would now like to proceed through the copy of the dually printed bill which displays the original text on the left-hand side of the page and displays "Suggested Revisions" on the right-hand side.

Page 5, (c). Chevron supports the deletion of this section. We feel that the Commissioner will lose control of the leasing procedure. We are also concerned that the requirement that no method be used more than 50% of the time without reason will encourage experimentation into untried methods.

Page 6, (c). Suggested revisions have added wording at the bottom of the page which apparently has the intent of forcing the Commissioner to use cash bonus bidding unless the Commissioner finds that another method will better serve the State's purpose. Chevron agrees with the intent, but feels that this clause has nothing in it which will satisfy that intent. The Commissioner can surely "find" that a method he chooses is better. He does not have to defend it or prove it. We feel that a far better way to treat this matter is to delete those bidding methods from the bill which are onerous. In our opinion, all are onerous except cash bonus bidding which we feel is the best method for determining the market value of oil and gas leases.

Page 9, (d). While we agree that, if royalty bidding is used, an ity to reduce the royalty will have to be employed, we think this clause points one of the problems with royalty bidding. The industry is encouraged to bid a high royalty to win a tract thereby entering into a contract which they may not be able to fulfill.

Page 10, (f) Original HB 654. We agree with this deletion. The Commissioner already

has this authority.

Page 10, (f) Suggested Revisions. Chevron feels that this drilling incentive credit system may have some merit. However, we feel it must be spelled out very clearly as to what portion of what costs will be applied. Footage drilled may be misleading. Also it seems that it must be made clear as to what areas the credit may be applied to.

Page 13, (j). Chevron feels that a ten year lease term is mandatory. Operating in Alaska's environment is particularly troublesome with a five-year term. A special problem is confronted when the original well drilled is unsuccessful but encourages the operator to explore farther. In such a case the unit which may have been formed to drill the first well will fall apart unless another well is drilled within a specified time. Time may be needed to record more seismic data. In fact, two seasons may be needed. If enough encouragement is displayed to drill another well, then further permitting, rig contracting, etc., will use up valuable time.

Chevron feels that a reasonable rental escalation for the last portion of a ten-year lease term may be acceptable. However, rental rates should be frozen and not subject to escalation once reserves are established and the operator must wait for gathering or transportation systems to be permitted and installed. These delays are often out of the operator's control and he should not be punished for them.

Page 13, (j). The suggested revisions have wisely deleted the sentence about two-thirds of the way down the page which grants authority to the Commissioner to grant limited production rights. This is an onerous, unworkable stipulation and ignores traditional oilfield practices as well as subsurface geometric principles.

Page 18,(o). The last sentence of this section should be deleted. Chevron is unclear as to what is intended but if the State is to become a working interest participant, we are opposed. In addition, we do not think the taxpayers should share in this type of risk capital expenditure.

Page 21, (u). For reasons stated previously we agree with the deletion of the section which could ban joint bidding by any companies, including majors.

Page 21, (v). Chevron does not feel that the State should have a call on any of an operator's production above the royalty share. An operator needs assurance that he will have a certain amount of production in order to enter into and fulfill his contracts. The suggested revisions are a step in the right direction but they do not go far enough.

Page 21, (w). Chevron is opposed to submitting our geophysical data to the State. We are concerned that confidentiality which will be threatened by oversights and State employees leaving to enter private industry. These data are the very heart of our program and we are not willing to see their confidentiality threatened.

Page 22, (c). Although we still do not see the need for the reduction of acreage chargeability limitation in the upland, we feel that 400,000 acres is more reasonable than 200,000.

OFFICE OF THE SECRETARY
WASHINGTON, D.C. 20240

JUN 29 1976

BAN ON JOINT BIDDING

Dear Mr. Chairman:

Section 105(e) of Public Law 94-163, the Energy Policy and Conservation Act, requires me to report to the Congress with respect to the feasibility and desirability of extending to onshore Federal energy leases the prohibition which now exists on joint bidding for Outer Continental Shelf oil and gas leases. I am happy to enclose the required report.

The recommendations of the report are that a joint-bidding ban be extended to oil and gas onshore, and to coal, but that no action be taken at this time as to oil shale, since no general leasing program for oil shale is now under way. It is our feeling that although little or no joint bidding has actually occurred in the past for onshore oil and gas or for coal, on balance the advantages of a limited ban seem to outweigh the disadvantages in these energy materials. We see no need to decide the issue for oil shale until general leasing is planned, at which time further experience with oil shale development may enable us to make a better-informed decision.

As you know, a ban on Outer Continental Shelf joint bidding was originated by the Department of the Interior and was in effect before the Energy Policy and Conservation Act was passed in December 1975. That Act legislated essentially the same ban as had previously been in our regulations. We have authority under the Mineral Leasing Act to promulgate onshore joint-bidding limitations as well, either by regulation or by announcement of qualifications for bidding. It is my view that legislation on this matter is unnecessary and undesirable, since a legislated ban is far too inflexible to suit the continually changing circumstances of the market for Federal energy leases. Rapid world energy price changes, differences in exploration risk among regions and even among individual leases in the same region, changing company structures and investment policies, and many other factors make it essential that joint-bidding limitations be easily and quickly adjusted, as they can be only if they are regulatory in character.

AMERICAN REVOLUTION BICENTENNIAL 1776-1976

Therefore, while it is my intention to limit joint bidding along the general lines suggested in this study, I do not recommend legislation on the matter. Further, I believe that more study is necessary of certain issues not yet adequately addressed. The exact size limits to be placed on eligibility for joint-bidding in coal are not well substantiated and need further work. No mention is made in this study of the criteria by which waivers to a ban should be granted when risks are unusually high because of large exploration costs, great exploration uncertainty, high technology, or any of a number of other possibilities for which allowance should be made. I am directing my staff to provide me with recommendations on these matters before I decide on the final promulgation of joint-bidding limitations.

Sincerely,

Secretary of the Interior

The Honorable Henry M. Jackson
Chairman
Senate Interior Committee
Washington, D.C. 20510

Enclosure

JOINT BIDDING FOR FEDERAL ONSHORE OIL AND GAS LANDS,

AND COAL AND OIL SHALE LANDS

(A study required by Section 105(e) of P.L. 94-163, the Energy Policy and Conservation Act of 1975)

Department of the Interior
Office of Policy Analysis
June 1976

In the Energy Policy and Conservation Act of 1975[1/], the Congress instructed the Secretary of the Interior to prescribe and make effective a rule which prohibits participation by more than one of the "major" oil companies in a joint bid for the oil and gas rights on any lands located on the Outer Continental Shelf (OCS), except where extremely high risk exists or where high exploration and development costs are involved. The Secretary was also instructed to study and report on the feasibility and desirability of extending this prohibition on joint bidding to the sales of oil and gas rights on Federal onshore lands, and to the sales of coal and oil shale rights on such lands.

The report that follows studies these questions In Section 2 the theory of joint bidding is outlined briefly. Here we examine the risk-sharing features of joint bidding in ventures whose outcomes are uncertain, and the consequent encouragement offered to smaller, more risk-averse firms to enter the bidding competition. But joint bidding has an opposite effect as well: a joint bid consolidates many offers into one, and converts what might have been active competition into legitimate collusion. We note some of the other features of joint bidding that bear on competition -- such as the opportunity that joint bidding negotiations may provide to exchange information about potential bids and geological data.

1/ 42 USC 6201; Public Law 94-163, 94th Congress, S. 622, Dec. 22, 1975. (See Appendix B where the relevant Sections 103(a-e) are reproduced).

We conclude that joint bidding is likely, on balance, to encourage competition if risks are large, and to discourage competition if risks are low.

In Section 3 we review the history of OCS bidding since its start in 1954, and we summarize some of the discussions and analyses of that history leading up to the 1975 restrictions on OCS joint bidding. This history is most useful as a benchmark against which to compare the situations in the current onshore oil and gas bidding, and the soon-to-be-active bidding for Federal coal and oil shale lands.

In Section 4 the characteristics of the bidding for competitively offered Federal onshore oil and gas lands are examined. Attention is focused on the levels of aggregate activity and on the investments, the costs, and the risks involved in onshore oil and gas ventures, especially as they compare to their counterparts in OCS ventures.

In Section 5 the prospects for competition in the sales of coal are examined. The structure of the industry -- which includes many firms not ordinarily considered coal mining firms -- is described, and the expected influence on that industry's behavior of the complicated patterns of western land ownership are analyzed.

We conclude that there is little justification for joint bidding for competitively leased Federal onshore oil and gas tracts. Although the probability is high that any such venture will not discover oil or gas, the magnitude of the typical operation in terms of the investment at

stake is so small that no pooling of risk is required to encourage competition. So long, then, as joint bidding is freely permitted there exists the potential that industry may use this device to obtain Federal leases at less than their true market value.

We recommend, then, that the restriction on joint bidding, exactly as stated in Section 105(a-d) of the Energy Policy and Conservation Act of 1975 (42 USC 6213), should be extended to cover the bidding for any right to develop crude oil, natural gas, and natural gas liquids on Federal lands other than those located on the Outer Continental Shelf.

We judge that the competition that can be expected in the bidding for western Federal coal lands is too fragile to allow the further dilution that unrestricted joint bidding would bring. We do not find the risks involved in undertaking the initial development of a coal tract to be of a large enough magnitude to justify unrestricted joint bidding. We conclude that a restriction on joint bidding, similar to that contained in Section 105 of the Energy Policy and Conservation Act of 1975 (42 USC 6213) should be extended to cover the bidding for any right to develop coal on Federal lands. We recommend, further, that the firms which are to be restricted from bidding with each other in joint coal ventures shall be those firms producing more than 25 million tons of coal annually.

In Section 6 the recent beginnings of a prototype shale oil industry on Federal lands are reviewed. Here technological uncertainties dominate

the picture. Experience is too limited to predict the future or, indeed, even the existence of this new industry with any assurance. One set of lease sales has taken place; more sales await the experiences gained in the early developmental stages of the four tracts already leased. The risk involved in a shale oil venture is high and might therefore appear to justify allowing joint bidding to make entry into competition more attractive. But the risk seems to be more at the development stage of the venture -- like some of the more advanced coal conversion proposals -- than at the discovery stage -- like OCS oil. There is the possibility, then, that means other than joint bidding can be found which will enable bidders to share these risks with other firms. Since new leasing in any quantity is, in any event, to be postponed until more developmental experience is gained on the four tracts already leased, it is appropriate to defer any action on a joint bidding restriction as well.

We recommend, then, that the decision on whether to restrict joint bidding for Federal oil shale lands be postponed to that time -- possibly three or four years hence -- when sufficient evidence on development and production experience shall have accumulated to warrant the resumption of leasing. At that time it will be more nearly feasible to assess the incidence of risk on the winner of an oil shale lease.

#3

SUGGESTED REVISION OF HOUSE BILL NO. 854

~~Deleted~~

(f) The commissioner may provide for the establishment of a drilling incentive credit system whereby a lessee drilling a well deemed to be an exploritory well on state lands may earn credits based on the footage drilled and the region in which the well is sited. Such credits are assignable, shall be effective for a limited period and may be used during that period toward a bid in a state lease sale, for royalty, lease rental or severance tax payments. In the same manner and under the same conditions the commissioner may provide for credits to be earned by persons doing geophysical work on state lands, provided that such work is performed during a period of two seasons prior to an announced lease sale on lands in the sale area. Such geophysical data shall become public after the sale has occurred.

b) (1) The commissioner shall annually prepare and submit to the legislature, between the first and the fourteenth day of each regular legislative session, a proposed oil and gas leasing program specifying as precisely as practicable the location of tracts proposed to be offered for oil and gas leasing during the third and fourth calendar years following the calendar year in which the proposed program is submitted to the legislature. Within 60 days after receiving the proposed oil and gas leasing program the legislature may by concurrent resolution disapprove all or any part of the proposed leasing program.

(2) Except as provided in (3) of this subsection, no oil and gas lease issued by the commissioner shall be valid unless it was included in a proposed leasing program submitted to the legislature during the third and fourth calendar years preceeding the year in which the lease is issued and was in a part of the program not disapproved by the legislature, except that an area proposed for leasing in the fourth calendar year after the year in which the program is submitted to the legislature may be leased if the commissioner reproposes the area to the following regular legislative session, and the area is not subsequently disapproved in accordance with (1) of this subsection.

(3) The commissioner may issue oil gas leases that have not been submitted to the legislature in accordance with (1) of this subsection if:

(A) the land to be leased was previously subject to a valid state of federal oil and gas lease;

(B) the land to be leased is contiguous to land already under state, federal or private lease, is no more than 5760 acres in area, and the commissioner finds, after hearing, that leasing of the land would result in a substantial probability of exploratory drilling activity on or adjacent to the land to be leased; or

(C) the land to be leased is adjacent to land owned or controlled by another party on which a discovery of commercial quantities of oil or gas has been made, and where the commissioner finds, after hearing, that a reasonable probability that the land to be leased contains oil or gas in communication with the oil or gas discovered on the land of the other party.

* Sec. 5. Transitional Provision. By the 14th day of the first session of the Eleventh Legislature the Commissioner of Natural Resources shall submit a proposed oil and gas leasing program to the legislature in accordance with AS 38.05.180(b), except that the proposed program shall cover all areas to be leased in 1979 through 1983. No lease, except as authorized under AS 38.05.180(b)(3), shall be issued during 1979, 1980, or 1981 unless it was included in this proposed leasing program, and was not disapproved by the legislature by concurrent resolution within 60 days of the date it received the proposed program.

Re: House Bill 854

Dear "Chat":

I believe I've already mentioned to you that, in my opinion, the best interests of the State, the major oil companies, and independents alike will continue being served best by current oil and gas leasing laws. Not only is HB 854 not needed, it would in fact be counter productive in that it would thwart, rather than encourage, new exploration for oil and gas in Alaska. It also sets the stage for a burgeoning bureaucracy which the taxpayer needs like a hole in the head, and it begs for State encroachment into sectors of the oil business which would best be left in the hands of private enterprise.

In the event that HB 854 is enacted, it should at least contain a provision to retain our present system of non-competitive oil and gas leasing, for legal and moral as well as practical reasons.

For two years, now (since April 19, 1976), the State has been legally obligated under AS 38.05.145(b) to issue non-competitive leases on at least 100,000 acres that I know of in the Becharof Lake area on the Alaska Peninsula. These leases will have to be issued even if AS 38.05.145(b) is repealed with enactment of HB 854, that is, unless the repeal is made retroactive to a date preceding the State's original leasing obligation date. To make the repeal retroactive, however, would call for an immoral, if not illegal, breach of trust on the part of the Administration (who authored the bill). I would of course also view a retroactive repeal as a reprehensible abuse of legislative power.

From a practical standpoint, non-competitive leasing as we know it today is also needed in order to encourage exploration in Alaska's little explored, remote, and/or geologically questionable oil and gas provinces. Some specific practical as well as moral and legal reasons why non-competitive leasing must be retained for Susitna Basin (and similar low-priority areas) are set forth in my letter of March 31, 1978, to Natural Resources Commissioner Robert E. LeResche.

Rep. C. V. Chatterton April 4, 1978

After you have had an opportunity to read the enclosed copy of my letter to Mr. LeResche, I hope you will see your way clear to do what you can to kill HB 854 altogether. Barring that, any pressure which you or your colleagues can bring to bear to retain our present non-competitive leasing law through appropriate amendments to HB 854 will be greatly appreciated.

Very truly yours,

LUM LOVELY

Encl.

Re: Issuance of non-competitive oil and gas leases in Susitna Basin

Dear Dr. LeResche:

It has just come to my attention that you or Governor Hammond will be announcing within the next few days that a relatively small area near Flaxman Island on the North Slope will soon be opened for competitive oil and gas leasing, and that many non-competitive oil and gas (and coal?) leases will finally be issued by the State pursuant to applications filed by numerous individuals as long as 2½ years ago. It is also my understanding that you will be announcing your intention to reject all currently pending non-competitive lease applications filed by oil and gas companies in Susitna Basin (many were filed nearly 2 years ago), in order that the land now covered by those applications might be reclassified for competitive oil and gas leasing only.

Your proposed North Slope competitive lease sale will surely generate spirited bidding because of Exxon's recent nearby oil discovery. And, you are certainly to be commended for acting affirmatively at long last on those non-competitive oil and gas lease applications which so many individuals filed in good faith so many years ago. If you have been adivsed that competitive interest will be high in those areas which are now covered by oil company applications for non-competitive leases in Susitna Basin, however, then your advisors are sadly out of touch with reality.

As an independent geologist who makes his living principally from oil and gas leasing activities, and as the one person who has more leasing experience in Susitna Basin than any other individual, I can assure you on the basis of real world experience that interest in Susitna Basin is extremely low at this time despite Union Oil Company's current reconnaissance seismic activities in the southwestern corner of the basin.

Rejection of oil company applications in Susitna Basin at this time will serve only to dampen what little interest there is in Susitna Basin already. Even if competitive interest were eventually to develop in the basin, however, required cumbersome and time consuming pre-leasing and leasing procedures would necessarily result in undue delays in exploration and development activities. If it is your intention to encourage early exploration for natural gas and/or oil in Susitna Basin, therefore, you will approve, rather than reject, all oil company non-competitive oil and gas

lease applications in the Basin, forthwith, just as you contemplate doing for those non-competitive lease applications which were filed by individuals in the area.

Please bear in mind that Susitna Basin is an extremely low-priority geologic province where oil possibilities are believed to be nil and possibilities for natural gas are marginal at best. The sedimentary section is thin in Susitna Basin, and structural information there is extremely scarse.

Moreover, hundreds of thousands of acres remain unleased (or even applied for) in the basin, despite the fact that this land has been available for non-competitive oil and gas leasing for many years now. I also wish to stress that Texaco dropped its oil and gas leases on over 150,000 acres in Susitna Basin after first conducting an extensive seismic program there some eight years ago. Furthermore, to my knowledge Texaco has no plans to drill its remaining 70,000 acres of leases in the basin before they expire next December.

I also think you should know that oil companies haven't exactly been stumbling all over themselves trying to buy my leases in Susitna Basin, either. It took me 7½ years to sell my 40,000-acre Yentna River lease block (to Union Oil Company and Pacific Lighting) in the southwest part of the basin, for example, and, after nearly eight years, I still haven't found any takers for my 47,000-acre Highway Bridge lease block in the east-central part of the basin despite the fact that Union Oil Company is now conducting seismic operations only 25 miles away. As a matter of fact, I still own leases in the immediate vicinity of Union's current shooting area which I haven't yet been able to sell or farm out!

I caution you not to interpret as an indication of high general interest the over-the-counter non-competitive oil and gas lease applications which Amarex Inc. and Gas Supply Corporation of Alaska (GASCOA, a subsidiary of Anchorage Natural Gas) filed jointly on 40,000 acres in the southeastern part of the basin, and on 36,000 acres in the north-central part of the basin nearly two years ago. These companies are so cautious about Susitna Basin, in fact, that, prior to filing the aforementioned applications, they were unwilling to purchase either my Yentna River lease block (which Union Oil and Pacific Lighting now own) or my Highway Bridge lease block, even for as little as $3.00 per acre (my rental investment at that time). In their view, there were (and still are) simply too many geological unknowns in Susitna Basin to justify spending more than a state filing fee of $20.00 per application plus the required annual rental of 50¢ per acre for leases there. Inasmuch as Amarex and GASCOA filed their applications with my help, I can also attest to the fact that their applications cover prospects which are inferred, only, on the basis of best-guess extrapolations from old, incomplete, and now publicly available seismic data which Pure Oil Company filed with the U.S.G.S. over 14 years ago.

Neither should you misconstrue Union Oil Company's recent over-the-counter filings for oil and gas leases in Susitna Basin as an indication that an abundance of favorable geological data is available in that area.

As a matter of fact, in filing its recent applications for non-competitive oil and gas leases on approximately 100,000 acres west of Mt. Yenlo, Union Oil Company had even less geological information to go on than Amarex and GASCOA had when they filed their aforementioned applications elsewhere in Susitna Basin. No outcrops are present where Union filed, for example, and neither has any seismic exploration ever been conducted in the area. Moreover, it should be obvious from the simple rectangular pattern of Union's filings west of Mt. Yenlo that the company hasn't the foggiest notion of what to expect geologically in the area. It would therefore be unrealistic, indeed, to expect Union (or anyone else, for that matter) to pay any more for leases in the area than the small filing fees and rentals which are presently required for state non-competitive leases.

Amarex, GASCOA (now McAlester Fuel Company), and Union Oil Company obviously filed their respective non-competitive oil and gas lease applications in Susitna Basin with the intention of eventually exploring large areas where geologic information is currently sparse or non-esistent. In data deficient areas such as these, however, history shows that 90% or more of the land will be condemned geologically by future exploration. These companies are therefore faced with the unpleasant task of condemning most is not all of their respective areas of interest as cheaply as possible!

In these circumstances, of course, it would be totally unrealistic to expect that any of the aforementioned companies (or any others) would suddenly become spirited bidders for competitive leases in any of the geologically questionable areas mentioned above. In fact, it is safe to say that no exploration whatsoever will be initiated in the aforementioned areas by either Amerex, McAlester, or Union Oil unless inexpensive non-competitive leases are first issued to them by the State pursuant to their currently pending applications

The facts make it clear that reclassification of the aforementioned areas for competitive leasing, only, would result in postponement, if not total abandonment, of new exploration and development efforts in Susitna Basin. The question is, however, "Can the State afford to block exploration in Susitna Basin at this time in hopes that competitive interest in the area may pick up at some indefinite time in the future?" I don't believe it can. Here's why.

As you know, Mr. Pat Dobey of the Division of Minerals and Energy Management here in Anchorage has warned the Administration and the public that the Anchorage Bowl area will be faced with a critical shortage of natural gas by 1985 (just seven years from now), unless more discoveries are made in south-central Alaska soon, or, in the alternative, unless a state-built-or-subsidized gas pipeline is laid from Prudhoe Bay to Anchorage.

It would of course be unwise for the State to spend taxpayers' money on a gas pipeline from Prudhoe Bay to Anchorage, when oil companies such as those who have filed for non-competitive leases in Susitna Basin appear ready, willing, and able to spend money from the private sector to explore for and develop natural gas reserves right here in Anchorage's own back yard.

It therefore behooves the State to approve the aforementioned oil companies' non-competitive oil and gas lease applications, forthwith, in order to clear the way for new exploration in Susitna Basin as soon as possible. Remember, Anchorage is rapidly running out of gas, and new discoveries of oil and gas generally require lead times ranging from five to ten years. The State simply cannot afford to hold up development in Susitna Basin any longer. To do so would be totally irresponsible.

While new exploration in Susitna Basin could be highly beneficial to the State of Alaska in general, and to Anchorage natural gas consumers in particular, it could also result in a significantly broadened tax base for the Matanuska-Susitna Borough in which Susitna Basin is situated. Obviously, any further impediments to early leasing, exploration, and development in the aforementioned areas will definitely not be in the best interests of the Matanuska-Susitna Borough. It is therefore to be expected that your proposal to reclassify lands for competitive leasing in Susitna Basin will be denounced by the Matanuska-Susitna Borough Assembly and Planning Department when your competitive reclassification proposal comes up for notice and review pursuant to Section 38.05.305 of the Alaska Statutes. Undue delay in broadening the borough's tax base could be avoided, of course, if you would simply approve all currently pending oil-company (and individually-filed) applications for non-competitive oil and gas leases in Susitna Basin forthwith.

While I believe you can justify immediate approval of all pending non-competitive oil and gas lease applications in Susitna Basin on the basis of the foregoing reasons alone, you must of course also consider the moral and legal aspects of your forthcoming proposal to reject all lease applications filed by oil companies while approving similar applications filed by individuals.

First of all, it must be remembered that all of the now-pending applications were filed in good faith pursuant to laws and regulations which were in effect when the applications were filed (and still are in effect). Moreover, it clear that most of these applications would have been approved already, were it not for the current land freeze.

The land freeze, of course, was originally designed to protect certain aggrieved parties until such time that their grievances could be reconciled by the courts and/or the Legislature (these grievances have since been reconciled). It was not intended to be used as a means of cheating oil companies out of non-competitive oil and gas leases when it was first instituted, and it should not be used as a weapon to be turned against oil companies now.

The oil companies which are involved here (and individuals, too, for that matter) have filed their lease applications pursuant to laws and regulations which are supposed to protect their first-priority rights to the lands in which they have revealed their interest to the world in good faith (their areas of interest are described in their applications, of course, and their applications are on public file for all to see). Accordingly, use of the land freeze as a means of selectively blocking the issuance of leases to

oil companies, while allowing the issuance of such leases to individuals, not only would constitute a reprehensible breach of trust on the part of the admininstation but also would serve double duty as an arbitrary and capricious abuse of administrative power which probably could be challenged successfully in court.

While oil and gas possibilities in Susitna Basin are generally considered to be marginal (even by those oil companies now holding oil and gas leases and lease applications in the area), the element of surprise in oil and gas exploration is such tnat significant reserves of oil and gas could nevertheless be discovered there. For a low-priority area such as Susitna Basin, however, economic incentives for exploration must be unusually attractive. You can provide this needed incentive, of course, simply by making it easy for everyone (including oil companies) to assemble large blocks of inexpensive non-competitive oil and gas leases in the area.

An early increase in the rate of exploration and development in Susitna Basin will clearly bring economic benefits not only to the State but to the Matanuska-Susitna Borough as well. It will also provide new jobs for oil workers, and it will stimulate new business for the service companies. Moreover, by making it known that you are clearing the way for possible early discoveries which could prevent the occurrence of an impending natural gas crisis in the Anchorage area, you could make considerable political hay in this important election year.

The foregoing observations make it obvious that competitive leasing will not stimulate urgently needed new exploration for oil and gas in Susitna Basin, whereas non-competitive oil and gas leasing will. I therefore urge you to reconsider your present plans to reclassify lands in Susitna Basin for competitive leasing only, and, instead, to approve all presently pending applications which oil companies and individuals alike have filed for non-competitive oil and gas leases in the area to date. I also urge you to lift the current land freeze in order to clear the way for future non-competitive oil and gas leasing in Susitna Basin. The sooner you take these important steps, of course, the sooner exploration can get under way, and the better it will be for all parties concerned.

Very truly yours,

L. C. LOVELY

SUMMARY OF ACREAGE LIMITATION
CHANGE IN HB 854

The acreage any one State lessee may hold is 500,000 acres upland and 500,000 acres offshore. HB 854 reduces the uplands to 200,000 acres. This is to help increase the number of upland lessees by limiting the holdings of the larger major oil companies. Offshore holdings will be unaffected.

No other state that we are aware of has an acreage limitation. But no other state is Alaska's size nor has any state tens of millions of acres available to lease.

The Federal government has an acreage maximum for its uplands within each state. During Alaska's territorial days the Federal oil and gas acreage limitation in Alaska was 100,000 acres. In other states it was 46,080 acres.

After 1961 the Federal maximum for Alaska rose to 300,000 acres in the Northern district (approximately north of the Yukon River) and 300,000 in the Southern district. These apply today. There is no Federal acreage limitation on the Outer Continental Shelf. Presently, the acreage limitation is 246,080 uplands acres of Federal leases per state, other than Alaska.

HB 854 grants companies five years from the effective date of the act to comply with the 200,000 upland acre maximum.

A list of major leaseholdings as of February, 1978, (showing uplands and offshore holdings of those companies which now exceed 200,000 acres) follows:

ALASKA OIL AND GAS ACREAGE HOLDINGS
(as of March 13, 1978)

COMPANY	ACRES		
ARCO	408,151.21	356,882.86	acres of uplands
		51,268.35	offshore
		408,151.21	total
UNION	287,032.83	233,138.75	uplands
		53,894.08	offshore
		287,032.83	total
PHILLIPS PETROLEUM	243,227.94	80,332.74	uplands
		162,895.20	offshore

IN THE HOUSE

BY THE RULES COMMITTEE BY REQUEST OF THE GOVERNOR

HOUSE BILL NO. 854

IN THE LEGISLATURE OF THE STATE OF ALASKA

TENTH LEGISLATURE - SECOND SESSION

A BILL

For an Act entitled: "An Act relating to the leasing and exploration of state land for oil and gas development."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

Section 1. AS 38.05.180 is repealed and re-enacted to read:

Sec. 38.05.180. OIL AND GAS LEASING. (a) The legislature finds that

(1) the people of Alaska have an interest in the development of the state's oil and gas resources to

(A) maximize the economic recovery of the resources;

~~(B) minimize the exploitation of these natural resources in protection of the public interest;~~

B (C) maximize competition among parties seeking to explore and develop the resources;

C (D) maximize use of Alaska's human resources in the development of the resources;

(2) it is in the best interests of the state to encourage an assessment of its oil and gas resources and to allow the maximum flexibility in the methods of issuing leases to

(A) recognize the many varied geographical regions of the state and the different costs of exploring for oil and gas in these regions;

~~(B) recognize the need for stimulating development in particular regions of the state;~~

B (C) minimize the adverse impact of exploration, develop-

ment, production, and transportation activity, ~~on the environment of the state;~~

(B) maximize state revenue from profitable oil and gas production, while minimizing revenue from unsuccessful exploration and from marginal economic oil and gas production.

b) (1) The commissioner shall annually prepare and submit to the legislature, between the first and the fifteenth day of each regular legislative session, a proposed oil and gas leasing program specifying as precisely as practicable the location of tracts proposed to be offered for oil and gas leasing during the third and fourth calendar years following the calendar year in which the proposed program is submitted to the legislature. Within 60 days after receiving the proposed oil and gas leasing program the legislature may by concurrent resolution disapprove all or any part of the proposed leasing program.

(2) Except as provided in (3) of this subsection, no oil and gas lease issued by the commissioner shall be valid unless it was included in a proposed leasing program submitted to the legislature during the third and fourth calendar years preceeding the year in which the lease is issued and was in a part of the program not disapproved by the legislature, except that an area proposed for leasing in the fourth calendar year after the year in which the program is submitted to the legislature may be leased if the commissioner reproposes the area to the following regular legislative session, and the area is not subsequently disapproved in accordance with (1) of this subsection.

(3) The commissioner may issue oil gas leases that have not been submitted to the legislature in accordance with (1) of this subsection if:

(A) the land to be leased was previously subject to a valid state of federal oil and gas lease;

(B) the land to be leased is contiguous to land already under state, federal or private lease, is no more than 5760 acres in area, and the commissioner finds, after hearing, that leasing of the land would result in a substantial probability of exploratory drilling activity on or adjacent to the land to be leased; or

(C) the land to be leased is adjacent to land owned or controlled by another party on which a discovery of commercial quantities of oil or gas has been made, and where the commissioner finds, after hearing, that a reasonable probability that the land to be leased contains oil or gas in communication with the oil or gas discovered on the land of the other party.

(4) Simultaneously with submission of the leasing program required under (1) of this subsection, the commissioner shall submit to the legislature a report containing the following:

(A) the schedule of all lease sales held during the preceding calendar year, the bidding method or methods utilized and an analysis of the results of the bidding;

(B) a description of all lease sales to be held during the current and next two succeeding calendar years and, if determined, the bidding methods to be used;

(C) the reasons a particular bidding method has been selected.

(c) The commissioner may issue oil and gas leases on state land to the highest responsible qualified bidder determined by competitive bidding under regulations adopted by the commissioner. Bidding may be by sealed bid or according to any other bidding procedure the commissioner determines is in the best interests of the state. Whenever, under any of the leasing methods listed in this subsection, a royalty share is reserved to the state, it is free of all lease or unit expenses, including but not limited to separation, cleaning, dehydration, gathering, salt water disposal, and preparation for transportation off the lease or unit area. Following a pre-sale analysis, the commissioner may choose at least one of the following leasing methods:

(1) bonus bidding

(A) a cash bonus bid with a fixed royalty share reserved to the state of not less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease;

(B) a cash bonus bid with a fixed royalty share reserved to the state based on a sliding scale according to volume of production but in no event less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease;

(2) royalty bidding

(A) a fixed cash bonus with a royalty share reserved to the state as the bid variable but not less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease;

(B) a fixed cash bonus with a royalty share reserved to the state based on a sliding scale according to the volume of production as the bid variable but not less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease;

(3) net profit bidding

(A) a cash bonus bid with a fixed royalty share reserved to the state of not less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease and a fixed share of the net profit derived from the lease of not less than 30 per cent reserved to the state;

(B) a fixed cash bonus with the share of the net profit derived from the lease reserved to the state as the bid variable;

(C) a fixed cash bonus with a fixed royalty share reserved to the state of not less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease with the share of the net profit derived from the lease reserved to the state as the bid variable;

(D) the share of the net profit derived from a lease reserved to the state under this subsection is royalty sale proceeds for the purpose of the Alaska Permanent Fund under AS 37.10.065;

(4) a work commitment bid with a fixed cash bonus, or a fixed royalty or a fixed sliding scale royalty or a fixed net profits share reserved to the state, or any combination of these methods, at the discretion of the commissioner, with a work commitment stated in a dollar amount as the bid variable; however, in no event may a royalty

share reserved to the state be less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease.

(d) To prolong the economical life of an oil and gas field, the commissioner shall adopt regulations for all bidding methods to allow reduction of royalty to compensate for increasing costs in the later stages of production decline. The commissioner may grant such a reduction of royalty so long as the reduced royalty begins no sooner than two years after initial production from the lease.

(e) The commissioner may, in his discretion, defer any part of the payment of a cash bonus, under (c) of this section, according to a schedule announced at the time of the announcement of the lease sale, but such payment shall be made in total no later than five years from the date of the lease sale.

~~(f) The commissioner may withhold acreage from leasing in a particular lease sale.~~

(g) The commissioner shall adopt regulations governing the calculation of net profits for lease sales under (c)(3) of this section. In the event of any dispute between the state and a lessee concerning the calculation of the net profits under the regulation adopted under this subsection, the burden of proof is on the lessee.

(h) The commissioner shall adopt regulations governing the exploration work commitment leasing method under (c)(4) of this section. The commissioner shall require either (i) a cash deposit for 20 per cent of the work commitment or, (ii) a performance bond, in form and substance and with a surety satisfactory to the commissioner, in the principal amount of 20 per cent of the exploration work commitment assuring the commissioner that the commitment will be faithfully discharged in accordance with this section, the regulations, and the lease.

A lessee who fails to discharge a work commitment in its entirety is liable to the state for the undischarged portion of the commitment. At his discretion, the commissioner may terminate the work commitment if he finds that the work would be unnecessary or cumulative.

h (f) At his discretion, the commissioner may enter into an agreement whereby, with the consent of the lessee, the state's royalty share of oil and gas production may be stored or retained in storage by the lessee, or the commissioner may enter into an agreement with one or more of the affected field lease holders to trade current royalty production from a field for a like amount, kind, and quality of future production, on the condition that the state receives back its stored or traded royalty share during the first half of the estimated field life or no later than 15 years after start of production, whichever is sooner.

i (f) An oil and gas lease must cover a reasonably compact area not exceeding 5,760 acres, and must be for a period of five years. The commissioner may grant a lease for a term greater than five years but not to exceed 10 years, where he finds that the longer period is necessary to encourage exploration and development in areas where environmental conditions severely restrict operations. An oil and gas lease shall be automatically renewed if and for so long thereafter as oil or gas is produced in paying quantities from the lease or, if the lease is committed to a unit approved by the commissioner. A lease issued under this section covering land on which there is a well capable of producing oil or gas in paying quantities does not expire because the lessee fails to produce oil or gas unless the lessee is allowed reasonable time to place the well on a producing status. Upon renewal, the commissioner may increase lease rentals so long as the increased rental rate does not exceed 150 per cent of the rate for the

preceding year. The commissioner may provide by regulation and in the lease that the lessee may earn production rights only to the depth drilled at the beginning of production from the lease. If drilling has commenced on the expiration date of the primary term of the lease and is continued with reasonable diligence, including such operations as redrilling, sidetracking, or other means necessary to reach the originally proposed bottom hole location, the lease continues in effect until 90 days after drilling has ceased and for so long thereafter as oil or gas is produced in paying quantities.

j(k) The commissioner may establish by regulation that after a well has been plugged and abandoned, the rental rate which was in effect during the year of abandonment is maintained for the remainder of the term. Rental is payable in advance and continues until income to the state from royalty, net profit, or exploration work commitment exceeds rental income to the state for that year; after the rental income schedule has been exceeded for three consecutive years, the rental terminates. Oil and gas leases shall provide for payment to the state of rental on the following basis:

(1) for the first year, $1.00 per acre;

(2) for the second year, $1.50 per acre;

(3) for the third year, $2.00 per acre;

(4) for the fourth year, $2.50 per acre;

(5) for the fifth year, $3.00 per acre.

k(l) Upon timely application as provided by regulation, the state may issue to the holder of a federal or private lease, a state shorelands lease covering land within the exterior boundaries of the federal or private lease which has been excluded on the basis of navigability or which is later administratively or judicially determined to be shoreland. The term of such a state shoreland lease shall be the same

as the term of the federal or private lease, but may not exceed five years.

(l) To conserve the natural resources of all or a part of an oil or gas pool, field, or like area, whether or not the part is then subject to a cooperative or unit plan of development or operation, lessees and their representatives may unite with each other, or jointly or separately with others, in collectively adopting or operating under a cooperative or a unit plan of development or operation of the pool, field, or like area, or a part of it, when determined and certified by the commissioner to be necessary or advisable in the public interest. The commissioner may, with the consent of the holders of leases involved, establish, change, or revoke drilling, producing, rental minimum royalty, and royalty requirements of the leases and adopt regulations with reference to the leases, with like consent on the part of the lessees, in connection with the institution and operation of a cooperative or unit plan as he determines necessary or proper to secure the proper protection of the public interest. The commissioner may require oil and gas leases issued under this section to contain a provision requiring the lessee to operate under a reasonable cooperative or unit plan, and he may prescribe a plan under which the lessee must operate. The plan must adequately protect all parties in interest, including the state.

(m) A plan authorized by (l) of this section, which includes land owned by the state, may contain a provision vesting the commissioner, or a person, committee, or state agency with authority to modify from time to time the rate of prospecting and development and the quantity and rate of production under the plan. All leases operated under a plan approved or prescribed by the commissioner are excepted in determining holdings or control under sec. 140 of this

chapter. The provisions of this section concerning cooperative or unit plans are in addition to, and do not affect AS 31.05.

(n) Producing acreage on a known geologic structure of a producing oil or gas field is excluded from chargeability as against the acreage limitation provisions of sec. 140 of this chapter.

(o) When separate tracts cannot be individually developed and operated in conformity with an established well-spacing or development program, a lease, or a portion of a lease, may be pooled with other land, whether or not owned by the state, under a communitization or drilling agreement providing for an apportionment of production or royalties among the separate tracts of land comprising the drilling or spacing unit when determined by the commissioner to be in the public interest. Operations or production under the agreement are considered as operations or production as to each lease committed to the agreement.

(p) The commissioner may, on conditions which he prescribes, approve drilling, or development contracts made by one or more lessees of oil or gas leases, with one or more persons, when, in his discretion, the conservation of natural resources or the public convenience or necessity requires it or the interests of the state are best served. All leases operated under approved drilling or development contracts, and interests under them, are excepted in determining holding or control under sec. 140 of this chapter. Drilling or development contracts may include, at the discretion of the commissioner, provisions authorizing the state to share in the costs of exploration.

(q) To avoid waste or to promote conservation of natural resources, the commissioner may authorize the subsurface storage of oil or gas whether or not produced from state land, in land leased or subject to lease under this section. This authorization may provide for the payment of a storage fee or rental on the stored oil or gas, or,

instead of the fee or rental, for a royalty other than that prescribed in the lease when the stored oil or gas is produced in conjunction with oil or gas not previously produced in paying quantities.

(i) Each oil or gas lease issued by the state must contain a provision requiring the lessee to furnish the Department of Labor a quarterly report regarding the employment of state residents on the leased property. The commissioner of labor shall adopt regulations necessary to implement thi subsection. No lease issued under this chapter is valid unless it contains provisions requiring the employment of qualified Alaska residents in accordance with AS 38.40.030, and complies in all respects with the requirements of ch. this title.

(j) Notwithstanding any other provision of this section, land which has been offered for lease within the previous five years but which received no bids at competitive sale may be, at the discretion of the commissioner, immediately offered for lease, under regulations adopted by him, upon terms appearing most advantageous to the state, including leasing noncompetitively. The commissioner shall use a sliding scale royalty based upon such formulae as he determines to be in the public interest but not less than 12 1/2 per cent at the beginning of production from the lease in amount or value of the production removed or sold from the lease or unit area encompassing the lease. A lease must provide for payment to the state of rental but need not adhere to the rental schedule in (k) of this section nor to the 5,760-acres-per-lease limitation in (j) of this section. The lease term may not exceed five years except as provided in (j) and (k).

(t) In accordance with regulations adopted in advance the commissioner, with respect to any individual oil and gas lease sale, may, for the purpose of promoting competition, restrict joint bidding among major oil and gas companies.

(u) Each oil and gas lease shall give to the state has the right to purchase not more than 16 2/3 per cent of the volume of oil and up to 49 per cent of the volume of gas produced from a lease issued in accordance with this section, at the regulated price, or, if no regulated price applies, at the fair market value at the point of sale, except that any oil or gas obtained by the state as royalty or net profits shall be credited against the amount that may be purchased under this subsection. Oil and gas purchases under this subsection shall be subject to the provisions of AS 38.06.

(v) A lessee or permittee conducting any exploration for, or development or production of, oil or gas on state land shall provide the commissioner access to all noninterpretive data obtained from that activity and shall provide copies of that data, as the commissioner may request. The confidentiality provisions of AS 38.05.035 shall apply to the information obtained under this subsection.

(w) The commissioner shall promulgate regulations as may be necessary to carry out the purposes of this chapter.

4/10/78

* Sec. 2. AS 38.05.135(b) is repealed and re-enacted to read:

(b) When minerals are to be leased, in addition to any other notice given, notice must also be given as provided in secs. 305 and 345 of this chapter.

* Sec. 3. AS 38.05.140(c) is amended to read:

(c) No person may take or hold at one time phosphate leases on state lands exceeding in the aggregate 10,240 acres. No person may take or hold sodium leases or permits during the life of sodium leases on state lands, exceeding in the aggregate acreage 5,120 acres, except that the commissioner may, where it is necessary in order to secure the economic mining of sodium compounds, permit a person to take or hold sodium leases or permits for up to 15,360 acres. No person may take or hold at any one time oil or gas leases exceeding in the aggregate 500,000 acres granted on tide and submerged lands, and 200,000 [500,000] acres on all land [LANDS] other than tide and submerged land [LANDS], including leases held both as lessee and under option or operating agreement from others. A person has five years from the effective date of this Act to conform to the 200,000-acre upland limitation. Where more than a single person holds an interest in an oil or gas lease, each person shall be charged only with that percentage of the total acreage which corresponds to its percentage share of the total beneficial interest in the lease.

* Sec. 4. AS 38.05.145(b) is repealed.

* Sec. 5. Transitional Provision. By the fifteenth day of the first session of the Eleventh Legislature the Commissioner of Natural Resources shall submit a proposed oil and gas leasing program to the legislature in accordance with AS 38.05.180(b), except that the proposed program shall cover all areas to be leased in 1979 through 1983. No lease, except as authorized under AS 38.05.180(b)(3), shall be issued during 1979, 1980, or 1981 unless it was included in this proposed leasing program, and was not disapproved by the legislature by concurrent resolution within 60 days of the date it received the proposed program.

April 6, 1978

The Honorable Alvin Osterback
Chairman, Resource Committee
Alaska House of Representatives
Pouch V
Juneau, Alaska 99811

Dear Chairman Osterback:

Recently, Mr. Mark Singletary provided the Resources Committee with verbal testimony reflecting Atlantic Richfield Company's reaction to proposals contained in HB 854.

Attached is written commentary on HB 854 which I would respectfully request that the Committee consider and include in the official record of these proceedings.

Sincerely,

Dave Harbour

Alaska State and Local
Government Relations

ATLANTIC RICHFIELD COMPANY COMMENTS ON
HOUSE BILL 854

"An Act relating to the leasing and exploration of state land for oil and gas development."

April 6, 1978

Comments on Section 1:

Sec. 38.05.180(a)(1)(B)

In the description of the legislative purposes of this bill, there is a negative connotation given the word "exploitation" in Sec. 38.05.180(a)(1)(B). This section in general suggests sinister motives to the oil and gas industry which need to be "minimized." A possible modification should read, "regulate the development of these natural resources in protection of the public interest."

Sec. 38.05.180(a)(2)

Underlying this section is the notion that it is in the State's best interest to maximize the leasing methods available to the State. However, it is our view that the new leasing methods proposed are largely untested and may result in reduced revenues to the State. Further, it is not at all clear how a unit agreement could ever be formulated for a group of lessees who had obtained their leases under a combination of the proposed bidding methods.

Sec. 38.05.180(b)

This section deals with the Commissioner's obligations to prepare a leasing program for the following 5 year period and his obligation to keep the legislature informed. We are in favor of such a long-range leasing program and support the State's acknowledged

goal of "stability and predictability" in a petroleum leasing program. However, the long-range benefits intended and the State's goal are frustrated by the ability, and, indeed requirement, that the Commissioner review and possibly revise the leasing program at least annually. Perhaps the possibility of revision could be limited to the last two years of the ongoing five year programs so that industry could expend exploration dollars with some certainty that a sale will be held. Alternatively, Sec. 38.05.180(b)(3) should be deleted.

The annual submission to the legislature of the leasing program, although for "its information," would seem to presuppose further modification of the leasing program. Again, opportunity for yearly modification of the leasing program abrogates the State's goal of a stable and predictable petroleum leasing system. As an alternative to reporting to the legislature, the Commissioner could be required to make an annual public report of the leasing program.

Additionally, in Sec. 38.05.180(b)(5)(E), the Commissioner is required to justify in his report to the legislature why more than 50 percent of an area is leased under any one method of leasing. This requirement of justification seems to be an incentive, if not explicit direction, to utilize the full array of leasing alternatives for any one sale and to, in effect, "experiment".

The language in Sec. 38.05.180(b)(2) is extremely confusing and should be clarified. Further, it is not clear whether or not this section is directed to or will have any effect, intended or otherwise, on the Beaufort Sea sale.

Sec. 38.05.180(c)

This section authorizes four generic categories or methods of leasing: (1) "Bonus bidding," (2) "Royalty bidding," (3) "Net profit bidding," and (4) a "Work commitment bid." Several combinations or variations of methods are authorized under each of the generic headings.

The first method of conventional bonus bidding has the best overall record from the lessor's standpoint. A study of federal OCS sales through 1975 showed that industry had invested $35 billion in bonuses, exploration and development on OCS leases while receiving $22 billion in revenue.

Net profit bidding opens up a multitude of problems as to the definition of "net profit." This method would allow many companies to get into a land position for speculative purposes. It is a

fierce deterrent to early drilling as it is far easier and cheaper to wait out the competition. It is extremely cumbersome to administer and audit, and is even more costly to operate than royalty bidding methods.

The last method of bidding, a work commitment for a lease which cannot, by definition, exceed 5,760 acres, seems completely unworkable as such an area is much too small. This method is usually used in European and mid-east concessions or Canadian permits or reservations which share a common characteristic of being very large geographic areas.

In each of the four leasing methods, the language describing the State's royalty is troublesome. Each description of the State's royalty provides, "... royalty share reserved to the state of not less than 12 1/2 cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease ...." (emphasis added) This language would preclude anything but 100 percent state units. Unitization of lands involving federal or native lands and state lands would be impossible because of the inability of the participants to give the state at least 12-1/2 percent of the production from the "unit area encompassing the [state] lease."

Further, it should be noted that all of the methods and components of the alternate leasing methods will necessitate substantial increases in the budgets and personnel of the agencies involved.

Finally, if some minimum flexibility in leasing methods is desired, the same could be accomplished with minor changes in the existing law.

Sec. 38.05.180(d)

This section allows the Commissioner to reduce royalty when production becomes uneconomical, but only after two years of production. The most recent federal leases require only one year of production, which would be more in line with the stated goal of the bill to minimize revenue from marginal production. Given the explicit description of the royalty in Sec. 38.05.180(c) as "not less than 12 1/2 percent ...," it is not clear whether the Commissioner could ever reduce royalty to any figure below 12 1/2 percent.

Sec. 38.05.180(e)

This section purportedly authorizes the Commissioner to defer payment of any part of a cash bonus bid, provided the bonus is paid within five years. This authority is in direct conflict with AS 38.05.335(c), neither referenced nor repealed by the bill, which requires a deposit of 20 percent, in cash, of the bid.

Sec. 38.05.180(f)

This section authorizes the Commissioner to withhold acreage from leasing in a particular sale. It is assumed that the motive of

this provision is a desire to increase the state's income from leasing by leasing, for example, only part of a structure, and then, once proven productive, leasing the remainder for higher amounts. However, this authority to withhold acreage can just as easily decrease the state's income, in the event the first acreage leased is found non-productive -- which is usually the case. In essence, this section is authorization for the Commissioner to "gamble" on the productivity of state lands.

This section also seems unfair to the first lessees, who, if the first tracts leased prove productive, are faced with the prospect of having to buy themselves back into the fruits of their own risk at a higher rate.

Sec.'s 38.05.180(g) and (h)

These sections relate net profits and work commitment leasing which, as previously discussed, are ill-advised.

Sec. 38.05.180(i)

There are no objections to this section so long as the trading or storage of royalty oil remains and is clearly the subject of mutual agreement.

Sec. 38.05.180(j)

This section concerns several of the provisions to be included in state oil and gas leases:

First, this section reduces the primary term of state leases from 10 to 5 years. It should be understood that in most areas of Alaska the ability to carry out exploration work is limited to a four month period per year, consequently a five year lease allows only 1-2/3 years of exploratory work. This is clearly insufficient in such a high cost, high risk area.

Second, this section provides that a state lease will be "renewed", if and for so long thereafter as oil and gas is produced in paying quantities or if the lease is committed to a unit. The term "renewed" should be replaced with the term "extended" as this is the long-understood and recognized effect of production or commitment to a unit.

Third, the section's provision concerning shut-in wells should be clarified, since, in its present form, it appears as though the shut-in well must be located on the land prior to the issuance of a lease

Fourth, this section authorizes the Commissioner to increase rentals up to 150 percent of the preceding year's rate and to provide that a lessee earns production rights only to the depth drilled at the beginning of production. Both of these provisions should be deleted as unnecessary and unworkable.

As to rental increases, as noted, Alaska is already a high cost, high risk area. The prospect of substantial rental increases

during the primary term of a lease will serve only to curb exploration not encourage it.

The provision concerning production rights only as to the depth drilled is unnecessary and unfair. Aside from an obvious example of the lessee drilling into the top of a reservoir and being mechanically unable to go deeper and thereby losing the main body of the reservoir, it also could result in split owne·ship of a lease with one party having to drill through another's rights to reach his own with possible damage to the upper reservoir resulting.

Finally, the means of extending a lease by drilling are set forth in this section. Given the seasonal nature of drilling in Alaska, the 90 day grace period after drilling has ceased should be expanded if further drilling is prevented by environmental considerations or other circumstances imposed by the State.

Sec. 38.05.180(k)

The increased rentals proposed in this section will discourage exploration and will not increase income to the State because the extra expense will be compensated by lower bid totals. The present $1.00 per acre per year rental should be retained.

Further, this section alters substantially the nature of the ordinary rental provisions in oil and gas leases. The rental to be paid under these provisions is no longer a delay rental. This

section provides, "Rental is payable in advance and continues until income to the state from royalty, net profit, or exploration work commitment exceeds rental income to the state ... for three consecutive years ...." There is no provision for credit or set-off of rental paid during those three years against the state's income from production. Consequently, for the first three years of production, the state would receive both rental income and production income.

Sec. 38.05.180(l)

This section should be modified to provide that the state shall issue a State shorelands lease, as AS 38.05.180 presently reads. Also, the Commissioner should be given the discretion to grant a shorelands lease in excess of five years.

Sec.'s 38.05.180(m) and (n)

These two sections concern the unitization of state leases and are re-enactments of present law. However, given the alternate leasing methods of the bill, and the previously discussed, implicit direction to the Commissioner to "experiment" with these methods, unitization of state leases will be extremely difficult, if not impossible.

It is entirely reasonable to assume that under this bill, a proposed unit will be composed of leases involving highly disparate royalty percentages and one net profits or other kind

of lease. The extreme difficulty of applying these completely different lease burdens to the production allocated to each lease under a proposed unit are obvious. These difficulties constitute a disincentive to unitization and therefore nullify the conservation benefits of unitization.

Sec. 38.05.180(o)

This section concerns the acreage chargeability of KGS leases and is unobjectionable.

Sec. 38.05.180(p)

This section is a re-enactment of the present authorization for the pooling of state leases. Like the provisions concerning unitization, the problems inherent in alternate leasing methods will make pooling more difficult, to the detriment of the conservation objectives of pooling.

Sec. 38.05.180(q)

This section authorizes the State to share in the costs of exploration under a drilling or development contract. Oil and gas exploration is extremely risky and historically the province of private enterprise. Financial participation by the state in an exploration venture raises fundamental questions as to the appropriate role of state government. Given the fact that most wells drilled are unsuccessful, and the substantial sums involved in drilling in Alaska, additional challenges may be anticipated as to the authority or wisdom of the State to participate in a particular drilling project.

Sec. 38.05.180(r)

This section is a re-enactment of present law concerning the subsurface storage of oil or gas on state leases. However, the present law's provision concerning the extension of the lease used for storage for the period of storage and so long thereafter as oil and gas are produced was deleted. This extension provision should be retained.

Sec. 38.05.180(s)

This section concerns the employment of state residents on state leases is substantially the same as the existing law.

Sec. 38.05.180(t)

This section is an attempt by the state to encourage exploration on lands on which no bids have been tendered. This philosophy is laudable. However, the Commissioner should not be restricted by the leasing details of this section.

Sec. 38.05.180(u)

This section would restrict joint bidding and should be deleted. Joint bidding can very well be to the advantage of the state as it tends to increase the size of the bids submitted and facilitates the exploration process. See, for example, the paper in the November 1976 issue of "Journal of Petroleum Technology" in which the authors conclude that "joint bidders tend to bid on more sought-after (and apparently more valuable) leases and that they tend to bid higher, on the average, than solo-bidding

competitors". Industry testimony before the U.S. Senate has indicated that since the first OCS sale in 1954, 172 companies have purchased OCS leases. 42% of these leases were not purchased by the major companies, and in recent years the smaller companies have increased their share of OCS production at the expense of the major oil companies.)

Depending on the content of the regulations adopted, this section may violate Article 8, §17 of the Alaska Constitution. This Constitutional provision requires that laws and regulations governing the use or disposal of natural resources must apply equally to all persons "similarly situated".

Sec. 38.05.180(v)

This section grants the state an unfettered option to purchase 16-2/3 percent of oil and up to 100 percent of gas produced from a state lease. This section will in effect eliminate the lessee's ability to use the gas sales contract as a method of financing. Consequently, gas exploration in Alaska will be discouraged if not precluded. Similarly, if the state should wait several years before deciding to take up to 100 percent of the gas, the discoveror of a gas field would be deprived of all income from his legally obtained gas, because he could not enter into a contract with any other user. This section would also eliminate or impair the ability of lessees to utilize the production payment as a method of financing, likewise discouraging exploration.

Sec. 38.05.180(w) This section requires state access to all of a permittee or lessee's exploration data and should be eliminated from the bill. This section is, in essence, a confiscation of valuable proprietary data, for the sole purpose of deciding whether the explorer has found anything or not. If the state decides he has, the area could then be thrown open to all other competitors, thereby removing any incentive for an aggressive company to be a leader or employ innovative ideas to discover new resources. This section completely removes that incentive, and thereby will cause significant state natural resources to remain unsought.

In addition, grave problems as to the preservation of the confidential nature of the data are inherent in this section. It is common knowledge that such information is extremely confidential and closely guarded by the individual members of the industry.

The existing law upon which the oil and gas industry has relied for the confidentiality of information is contained in AS 38.05.035(a)(9)(C). This existing provision requires the director to keep geological, geophysical and engineering data confidential "upon request of the persons supplying the information." As the Bill's provision requires disclosure of information to the Commissioner, not the director, and since it requires also access, as distinct from supplying copies, are the confidentiality provisions incumbent upon the director not

applicable to the information required to be disclosed to the Commissioner?

If this section is to be applicable to existing exploration data, then the Commissioner's access and utilization of such existing data is almost certainly an unconstitutional taking of this valuable and expensive property. If the Commissioner is to be allowed access at all to such data, such access should be limited to future data only. Further, there should be a requirement of the adoption of regulations prescribing the confidentiality of this data and the addition of statutory criminal penalties for intentional disclosure of such data.

Section 2

There are no objections to this section concerning notice of mineral leasing.

Section 3

This section would amend AS 38.05.140(c) to reduce the upland acreage limitation from 500,000 acres to 200,000 acres. In Alaska, where there are large areas of state lands which are potentially eligible for bid, a 500,000 acre limitation, which the present statute contemplates, is not unreasonable. The effect of a 200,000 acre limitation would clearly be to limit the participation of those individuals who are most active in exploration business in Alaska, i.e., those individuals who have

historically submitted the highest bids to the state. It is not at all clear why the state would seek to discourage, rather than to encourage, the continued involvement of those individuals in Alaska. Further, this section's applicability to the holding of existing lessee's -- requiring them to reduce their holdings within 5 years -- is an unconstitutional taking of leasehold estates.

MEMORANDUM

SUBJECT: Leasing of State Land for Oil and Gas Development - HB 854 (W.O. #11/R)

TO: The Honorable Alvin Osterback

FROM: Gregg K. Erickson
Director of Research

You requested that we provide an analysis of this bill. We have done this below in a cursory manner, and have attached additional material provided by the Department of Natural Resources (DNR). We have also noted some areas where we see potential problems. You will undoubtedly be taking a great deal of testimony on this bill from DNR, the legislature's consultants (Milton Lipton and Mason Gaffney), and the industry. After you have heard the testimony we would be pleased to address any points that you may at that time wish to have analyzed in depth.

Under current law the state is restricted to leasing oil and gas lands under the bonus bid system, or by the non-competitive system, which is essentially a lottery. However, the use of the non-competitive system has been of little importance during the past fifteen years, since all lands of medium or high potential have been classified so as to make them only eligible for bonus bidding.

In recent years other jurisdictions, most notably the federal government, have been moving towards expanding the number of bidding systems that could be used in leasing oil and gas lands. The U.S. Senate and House of Representatives have passed different versions of a bill that would accomplish this, and are about to enter conference on this legislation.

The legislation before your committee, HB 854, resembles this federal legislation in a number of important ways. The major thrusts of both the Alaska bill and the federal legislation are directed at expanding a number of leasing systems that may be used by the government in disposing of its land, increasing the opportunities for smaller firms to participate in development of oil and gas resources, and at insuring that the government achieves an appropriate return for the leasing of its oil and gas lands. In addition, the federal legislation establishes

procedures for coordination and review of federal leasing plans by adjacent states, and establishes institutional arrargements for protection of the environment.

The attached material headed "Description of Leasing Methods in HB 854" sets out in summary form the systems that would be allowable under the Alaska legislation as it now stands. Also attached is a memorandum from Mr. Jack Roderick to Commissioner LeResche which describes the rationale which went into choosing these systems. This particular memorandum has been released by the Department with the request that its circulation be restricted to legislators and legislative staff. All the other attached material may be released to the public, if you so choose.

Some points which you may particularly wish to look into in your consideration of HB 854 are noted below:

1. Legislative Review. The legislation calls for submission by the commissioner to the legislature of an annual "leasing program". The administration apparently intends that no lease would be issued unless "it is for an area included in" the program (page 2, line 19). If this is indeed the intent, it perhaps could be clarified by amending language at this point. In any case, the you should note that the bill has been carefully drafted to avoid any active involvement in leasing policy by the legislature. This, of course, is no change from the current policy, but under HB 854 the latitude of the commissioner, in choosing leasing systems and in other matters, has been substantially increased, and the legislature may wish to be more involved.

2. Expenses Charged Against Royalty Oil. The bill contains language (subsection (c), on page 4) which would insure that future leases are not subject to the same sort of dispute over the cleaning and dehydration costs as the state is now litigating with the Prudhoe Bay producers.

3. Choice of Leasing Systems by the Commissioner. Nowhere in the bill does the legislature give the Commissioner of Natural Resources any guidance as to when he should or should not use a particular leasing system. The commissioner is required, in his annual "leasing program" submission, to explain to the legislature why he believes a particular system should be used in a particular area. However, the choice and the adequacy of the justification remain beyond legislative review. In the attached material DNR has provided some explanation as to the conditions that would call for the use of one system or another. The legislature may wish to consider these explanations, and - if it agrees with them - may wish to include language within the law to give the commissioner (and future commissioners) guidance along these lines.

4. Work Commitment Bidding. Paragraph (4) (on page 5) would establish work commitment bidding as a leasing alternative. Under this system the bid variable would be the amount of effort the lessee agrees to expend in exploring the land. Use of this alternative will, on the average, result in less revenue to the state, with the revenue that is foregone by the state being expended in developing resources that would otherwise be uneconomic. This is a clear instance of economic subsidy. The legislature may wish to consider whether this subsidy is desirable, and if so, whether this is the most efficient way to provide it.

5. Commissioner's Discretionary Authority to Reduce Royalty. The commissioner now has authority to reduce the royalty rate on tracts having marginal production. So far as we know this authority has never been utilized. Subsection (d) of the proposed law (page 6) retains this authority to lower royalties. It becomes much more significant in the context of this bill, however, because of its use of royalty bid and sliding scale royalty leasing systems. Particularly in the case of the royalty bid arrangement, a lessee may, with a very high royalty bid, acquire a tract on the assumption that the commissioner will reduce that royalty if and when production is developed. The legislature may wish to consider the possibly of limiting this authority to only to royalties paid ~~the~~ WHEN production level is within the lowest block of the royalty schedule, i.e., at the bottom of the "sliding scale".

6. Non-competitive Bidding. HB 854 would allow the commissioner, at his discretion, to offer acreage on a lottery system if the acreage had not received a bid in an earlier competitive sale. The legislature should be aware that this system, in combination with initial offerings at unrealistically high minimum bids, could be used to give away the state's oil and gas resources to private individuals or firms.

We will be pleased to examine these or other questions in more detail. We are confident that Mr. Lipton, Professor Gaffney, and the industry will raise additional questions that the legislature may also wish to examine.

My name is Morris Lowman and I represent Marathon Oil Company in Anchorage, Alaska, as its Senior Petroleum Landman. I have had 32 years experience in the oil industry of which 27 has been land related work. This experience has been in the states of California, Oregon, Washington and Alaska. My first exposure to Alaska work came in the late 1940's when I reduced surface geological work done by our geologist on triangular air photos to a plain map. In the 1950's, I was involved in the preparation of offers to lease for Federal lands when interest developed on the Kenai Peninsula. I was one of many petroleum landmen on the scene when it was announced that oil had been discovered at Swanson River. I had continued working acquaintances with Alaska land problems off and on until my permanent assignment to Anchorage in 1966.

We wish to thank you for the opportunity to express our views regarding HB 854, the proposed legislation entitled "An Act relating to the leasing and exploration of State land for oil and gas development".

I am submitting in writing a detailed statement of comments regarding this proposed piece of legislation and in my brief oral testimony I will dwell on the more onerous provisions and highlight or summarize our objections.

There are probably some provisions of the existing leasing act that need to be looked at, however, the existing law has been workable and the State has profited from its operation. We feel the whole-sale modifications as proposed in HB 854 are unnecessary and will create a considerable burden on the management of a leasing program with little or no net increase compensation to the State. It will be a burden to adjudicate and because of the many alternative discretionary decisions permitted, the commissioner may find himself open to challenges.

We have long encouraged the State to establish a leasing program as proposed in 38.05.180(b). We feel such a program

schedule, manpower needs and their financial needs. We do fear the provision contained therein that the commissioner must review and revise every year. This requirement takes away all stability a five year program is trying to provide.

Under Section 38.05.180(c), several alternative leasing methods are proposed. Other than the Cash Bonus bidding, we believe the systems proposed would not be to the best interest of the State of Alaska. When you use the royalty bidding or net profits bidding, you are assuming some of the risk and a governmental body should not be in the risk business. The costs and manpower required to manage and audit a net profits operation could become a bureaucratic nightmare and the net results to the State could be increased operational costs and less net returns for the benefit of its citizens. It is our belief that a work commitment type bidding would not be feasible or workable when a lease size is limited to 5,760 acres. This type of lease contract can best be utilized when large concessions can be granted. The agreements made by the Native Corporations are a good example.

Royalty bidding may be attractive to some operators, however, it is not the type of contract that encourages early evaluation of a tract. Also, there could be a danger of a party over bidding and rather than lose money on operations he would withhold development or would be requesting a modification of the terms of contract pursuant to Section 180(d) of this proposed legislation. How would a fair and equitable adjustment be made when you have the unsuccessful competitive bidders looking over your shoulder?

The report to the legislature on the various leasing methods, if used, as required Section 180(b)(5) would not be pertinent as it would probably be 10 to 15 years before a true evaluation is known. With competitive cash bonus bidding, you can generally determine its then present value when you have a willing seller and a willing buyer or buyers. Under

competitive royalty bidding,

may be open to question or challenge. For this reason, it would be smart to eliminate the royalty bidding method.

Section 180(g) provides for the commissioner to adopt regulations governing calculation of net profits. There are many interpretations of how to determine net profits and any rules established must be mutually acceptable and understood or it could be challenged. As stated above, such an auditing operation would be required and would cost the State more to audit such a method than by a straight royalty lease.

Section 180(h) gives the commissioner the discretion to terminate a portion of a work commitment if he finds that the work would be unnecessary or cumulative. This discretionary authority is dangerous as it would require the use of interpretative data. When dealing with geological information, it is highly interpretative and two identically educated persons can have legitimate differences of opinion which could be cause for challenge of any action taken.

Section 180(j) gives the commissioner the authority to provide a regulation and lease term that a lessee may earn production rights only to the depth drilled at the beginning of production from a lease. This in industry parlance is called horizontal segregation. This is a dangerous procedure and a poor business practice. When a party decides to test a structure, he usually drills to the best or the known productive horizon and if a discovery is made he will complete said well and continue development operations. It may be several years following initial drilling when enough data is available or the risk of drilling deeper is further minimized to merit such deeper drilling. By creating horizontal segregation, you increase the demand or call on surface usage and increase potential damage to the surface. Also, there would be danger of damage to shallow producing horizons from third party operations. We strongly oppose this provision and feel it is a detriment to the State.

Under Section 180(k), a rental in an oil and gas lease

for the rental period which is usually a year. When an operator drills a well and commences production operations, he then starts paying royalties or in some cases minimum royalties. Section 180(k) states that a lessee will continue paying rental until royalties have exceeded the rental rate for three (3) consecutive years. This sounds like the State wants its cake and to eat it also. This is an inflationary and a highly unethical proposal and we object to it. Also, we recommend the State establish a fixed rental rate and maintain it for the primary term of the lease or until the lease is placed on a production classification.

Section 180(v) says that the State has rights to purchase up to 100 percent of the volume of gas produced from a lease. If this type provision is included, it will do considerable harm to a viable petroleum industry. It would be difficult for a wildcatter to get financing and those companies that have already developed gas processing facilities would be in jeopardy of not having supplies for its plant. This section will in effect eliminate or impair the ability of lessees to use gas sales contracts or production payments as a method of financing, likewise discouraging exploration. No one should have this type of monoply on gas - not even a governmental body.

Section 180(w) provides for state access to all of a lessee's or permittee's exploration data and is objectionable to Marathon. A company's private proprietary data is its stock in trade and guarded closely. Any taking without due compensation is a grave injustice. This provision should be deleted.

There are several areas that need to be looked at closely for meaning or definition, however, those points herein above spoken to are the most objectionable and need to be eliminated.

Thank you for your attention and patience and if there are any questions, I will attempt to answer them.

RE: H.B. 854

Dear Mr Chairman:

It is my understanding your committee will be holding hearings on H.B. 854 on March 16th and 17th, 1978. Unfortunately, we will have no representative at the hearings to testify and therefore, we respectfully request this letter be included in the official record of the hearings.

First of all, we object to most sections of this Bill as it is very complex, creates a multiple choice system that is unworkable, discourages exploration on State lands, and above all would have a serious impact on the development of our lands. We strongly urge that no action be taken on H.B. 854 this year.

Previous State selections and proposed selections in our region total several million acres with oil and gas potential in the Nushagak Basin (Bristol Bay Basin). BBNC lands in the onshore portion of this sedimentary basin would total about 1,750,000 acres surrounding 17 villages, several of which the Native lands are not contiguous. In other words, most of our lands with the new proposed State selections would be adjacent to or surrounded by State lands. In many instances, a drilling unit would involve both State and Native lands and in some instances, Federal lands. Therefore, any changes in leasing of State lands will have a direct effect on BBNC lands. Most of the provisions of H.B 854 would change the economics of State and Native lands in a producing unit. The net result will be that the portion of the unit under State leases would become uneconomical and abandoned first and the Native portion of the unit would then become less economical followed by early abandonment and thusly leaving large amounts of oil or gas in the ground. This could hardly be called conservation.

BBNC has had a joint agreement with a major oil company whereby, with commercial production, we will become a producing oil company. We do not lease our lands! Knowing some of our selected lands might not be adequate to cover undefined seismic structures, we anticipated leasing State or Federal lands in order to form drilling units for early development of our lands. About three years ago, we filed the necessary qualifying documents to hold both State and Federal oil and gas leases and have filed offers to lease on several thousand acres of Federal lands.

We have no problem with the present leasing system as it has been tried, tested, proven and above all, is understandable. Such a mixed bag of radical, czarist possibilities as proposed in H.B. 854 is uncomprehensible, unjustified and will no doubt have the opposite effect of the original intent, unless the intent was to retard development of State lands indefinately and in effect retard development of much of our lands.

Again, we strongly urge the postponement of any action on this Bill.

Sincerely,

W. C. Bishop

March 10, 1978

The Honorable Alvin Osterback
Alaska House of Representatives
Pouch V
Juneau, Alaska 99811

Dear Al:

Due to previously scheduled meetings, we will be unable to have anyone at the hearings on H.B. 854, rescheduled for March 16th and 17th, 1978. Enclosed are sufficient copies of our testimony for each of the committee members.

Al, this Bill, if passed, would be disasterous for BBNC or any other region that has large areas of State selected lands with oil and gas potential. We would be especially hard hit as the State proposes to select several million more acres in our region which we had earlier supported.

This Bill would be a disservice to the entire State and a disaster to the Natives. It is so complex that few, even with an oil industry leasing background, would or could understand it. Certainly it would take months of research in order to salvage much that would be logical. Since there is a somewhat limited time this session, I would strongly urge you, as Chairman, to hold this Bill in committee without any further action.

With best regards.

Sincerely,

Bill

W. C. Bishop
Manager, Subsurface Resources

SUMMARY OF FEDERAL OCS REGULATIONS

PERTAINING TO GEOLOGICAL AND GEOPHYSICAL INFORMATION

Title 30, Section 251.12 of the Code of Federal Regulations specifies that individuals and companies granted OCS exploration permits are required to allow the Department of the Interior (DOI) to inspect and select the forms of information listed below. The permittee must notify the DOI immediately of the acquisition or analysis of any geological data (part a of the section) or the acquisition, processing, or reprocessing of any geophysical data (in part b) collected under the permit. The DOI has at least one year after such notification to choose the material. A longer time period may be specified in the individual permits. The permittee is not required to submit interpreted geological or geophysical information for inspection and selection. If the permittee transfers geophysical data or processed geophysical information to a third party or a third party who has received geophysical data or processed geophysical information directly or indirectly from a permittee transfers said data or information to another third party, the transferor must notify the DOI of the action and bind the third party to the obligations of the permittee. The first set of regulations of this type were approved and put into effect in November, 1975.

The geological data from which the DOI may select includes: (This applies to COST-type and other stratigraphic test holes.)

1. Complete record of all geological and geochemical data and information resulting from each operation;

2. Paleontological reports identifying the microfossils by depth, unless washed samples are kept for inspection by the USGS;

3. Copies of well logs or charts (electrical, radioactive, sonic, etc.);

4. Core or bottom samples analyses or a representative cut of the samples;

5. Detailed descriptions of hydrocarbon shows or hazardous conditions; and

6. Other geological data and analyzed geological information obtained under the permit, as specified by DOI.

The geophysical data, processed geophysical information and reprocessed geophysical information which may be selected includes:

1. A complete record of each geophysical survey conducted, including the final location maps of all survey locations;

2. All common depth point and high resolution seismic data;

3. Processed geophysical information derived from the seismic data;

4. Geophysical data and processed information obtained from, but not limited to:

a. Shallow and deep subbottom profiles

b. Bathymetry

c. Side-scan sonar

d. Magnetometer systems

e. Bottom profiles

f. Gravity surveys

g. Magnetic surveys

h. Special studies such as refraction and velocity surveys, and

5. Reprocessed information such as true amplitude sections, migrated sections, and bright spot analyses.

The DOI may choose any or all of the above data or information at any stage of processing. Thus far the local USGS Conservation Division Office has been selecting final processed data and information. The geophysical data must be kept confidential for ten years after the issuance of the permit. Processed, reprocessed, and interpreted geophysical information is released to the public ten years after it has been submitted to the USGS. Geological data and analyzed and interpreted geological information obtained from deep stragigraphic tests are released five years after completion of the test well or 60 calendar days after the issuance of the first Federal lease within 50 geographic miles of the test site, whichever is earlier.

STATE'S RIGHT TO PURCHASE OIL & GAS IN HB 854

The State has the right in HB 854(v) to purchase not more than 16 2/3% of the oil and up to 100% of the gas at the regulated price or fair market value at the point of sale. The right to purchase is needed to protect the "in kind" taking of its royalty by Alaska, a sale of said royalty, and a subsequent reduction of the royalty in the later stages of production (d).

New Mexico, 1973, enacted a law which gives it the right to reserve an option to purchase at any time at the prevailing market price any or all minerals, including oil and gas, produced from State land. Thus, New Mexico may purchase 100% of the oil and gas found on State land.

Whereas the New Mexico Commissioner is authorized to waive the reservation option with respect to any specific mineral, he may not do so for oil or gas.

The Act, Chapter 26 of the Session Laws of 1973, has never been exercised by New Mexico; thus no opportunity has been given to test its constitutionality.

If Alaska were to reserve an option to purchase up to the amount of the royalty, fixed or bid, an equivalent net profit share would have to be determined.

TESTIMONY ON

ALASKA LEASING POLICY BILL

(H.B. 854)

By
Rod L. Boane
Alaska District Manager
Exxon Company, U.S.A.

Before The
State of Alaska
House Resources Committee

Juneau, Alaska

March 17, 1978

Mr. Chairman and Members of the Committee --

I am Rod L. Boane, District Manager for the Alaska Exploration District of Exxon Company, U.S.A. I appreciate the opportunity to be here today and present the views of my Company concerning the proposed Leasing Policy Bill.

First, let me say that Exxon believes the existing provisions of Section 38.05.180 of the Alaska Statutes are quite satisfactory in administering adequate control over exploratory and development activities on State leases. Therefore, we do not believe these new amendments to the Statutes are needed to protect the public interest. On the contrary, we think the proposed amendments would create unnecessarily involved and cumbersome procedures that will neither foster needed exploration nor benefit the State of Alaska. Although we take exception to almost all features of the proposed amendments, in the interest of time, I intend to discuss only the more troublesome provisions, with particular emphasis on the proposed bidding methods.

Exxon believes that the best method for awarding leases is on a cash bonus basis. This system has several advantages which I would like to review.

- First, the successful bidder sees very strong incentives to explore and develop rapidly and to recover the maximum economic volume of hydrocarbons at the lowest possible cost. This is necessary in order for him to maximize the return on the cash bonus invested.

- o Second, under the cash bonus system, the State bears none of the risk that commercial reserves will not be found. This risk is placed directly on industry where it belongs. This is a particularly critical concept in Alaska which is still essentially a frontier province where very little exploratory drilling has occurred and thus very little is known about the oil and gas potential of most of the State. When one further takes into account the fact that Alaska is a very high cost area due to its remoteness and harsh operating environment, it should be easy to see that the exploration risks and costs are indeed great. The Gulf of Alaska history should prove this point as, thus far, no commercial discovery has been made.

- o Third, under the cash bonus system there is no possible way that the awards will be made in an arbitrary manner since the highest bid is obvious.

- o Finally, the system is simple and inexpensive to administer, and its integrity is unaffected by future events. The State would not have to expand its staff to implement this system.

Now I would like to compare the alternate bidding methods proposed in this legislation to conventional cash bonus bidding with fixed royalty. Basically, the proposed alternative bidding methods fall into one of three categories. The first category involves some form of royalty bidding. The second category uses

some form of net-profit bidding. The third category uses some form of work commitment. All three categories require a cash bonus, either as a bid variable or a fixed amount. Let's first examine the royalty bidding systems.

(1) It is not uncommon for operators to discover reserves of lesser magnitude than anticipated. With high fixed royalty, some of these discoveries could not be developed profitably unless the State agreed to accept a lower royalty than originally bid. Downward adjustment in royalty rate prior to any development would be difficult to administer and could undermine the integrity of this bidding system.

(2) With royalty bidding, the successful bidder does not have a strong incentive for rapid exploration and development since front-end cash investment is small. Speculators could therefore see incentives to acquire leasehold interest, and then wait in hopes that they will be able to cash in on the discoveries made by others. This situation would obviously result in delayed exploration and development activities.

(3) With exclusive royalty bidding, the public bears the major portion of the exploration risk because if the tract doesn't contain commercial hydrocarbon reserves, as the majority will not, the public receives no compensation whatever. As an example, the State received $900 million in bonus for acreage on the North Slope in the September 1969 sale. Under a royalty bidding system the State would have received little income to date. We strongly believe that risk-taking and its associated rewards or losses are more properly the province of private enterprise.

The second royalty bidding system involves a sliding scale royalty system which would be difficult to monitor and, practically speaking, would make it impossible to compare bids unless you know the total reserves, the price at which production would be sold, and the rate of production. Sliding royalty could result in widely differing positions on prudent development. Also, unitization of tracts would be a very complex and difficult job.

With these comments in mind, let's review recent experience with royalty bidding in the Federal sector. A program of experimentation began with the recent sale in the Lower Cook Inlet. Thirty-four percent of the tracts were put up for royalty bidding. Selection of these tracts was in such a manner that they were scattered over the entire sale area. When this type of tract distribution is coupled with a forced unitization lease stipulation, it is not difficult to conclude that the owners of the royalty tracts have no incentive for rapid evaluation. They can just sit back and wait for the owners of cash bonus tracts to do the initial drilling. They can then join the units covering any reservoirs that extend under their tract.

After the Cook Inlet sale, this problem apparently became obvious to the Department of Interior. For the North Atlantic Sale (Sale #42), they attempted to "fix" this problem by grouping the royalty tracts together and having them removed from the cash bonus tracts. They further expanded the experiment by having a group of cash bonus tracts that had a fixed royalty of 40 percent.

Industry comments relating to royalty bidding have apparently begun to create some concerns about this system. In the upcoming South Atlantic Sale (Sale #43), we see another attempt to "fix" difficulties in the previous system. Tracts are being offered by cash bonus bidding with a sliding scale royalty. They have attempted to "fix" the unitization problem by again grouping the sliding scale royalty tracts together. However, they did not address how a group of sliding scale royalty tracts or sliding scale royalty and cash bonus tracts would be unitized.

Now that this experimentation process has begun, we see the continuing creation of new difficulties and complexities as attempts are made to correct previous difficulties and problems. It appears that this process is going to have a "snow-balling" effect and may eventually reduce competition. In this situation, only the companies that can afford to dedicate a large professional staff to the long unitization negotiations and wait long periods for initial production will servive. This certainly does not promote increased competition.

Now let's look at the second bidding category a profit-sharing system, which has most of the same adverse characteristics as royalty bidding, but with four added complications and disadvantages.

(1) Using net profits will be much like selecting a contractor to perform a job. The operating efficiency of the bidder could become an important consideration in determining which of

several bidders had submitted the high bid inasmuch as the gross proceeds to be received by the public would be a direct function of the efficiency of the operator. Thus, the successful bidder would no longer be obvious. Since the relative operating efficiency of companies cannot be determined quantitatively, the Commissioner would be vulnerable to charges that bid awards were being made in an arbitrary or discriminatory manner.

(2) A profit-sharing system would be difficult and costly to administer. A large administrative organization would likely be established to audit and monitor the continuing activities of lessees. Discretionary judgments would be required by the State with regard to what costs were to be included or rejected in the profit base. This system could lead to State control of expenditures.

(3) A profit-sharing system would significantly reduce the incentive for a successful bidder to operate at maximum efficiency. Any prudent operator utilizes a priority system when restraints of either manpower or materials create limitations. When these restraints exist, net-profit tracts will have low priority. The result - reduction of efficiency. It would also reduce the timing and incentive for development of advanced technology currently in progress by industry.

(4) Most important, sharing in net profits would signal the State's entry into the production phase of the oil business. It might be politically and economically difficult for the State not

to be deeply involved in decisions about day-to-day operations and thereby become an operating partner. This step would not be consistent with the maintenance of a strong private enterprise system either within the oil industry or within the State itself.

The third category of biddi system is work commitment which can be combined with any of the other methods. A work commitment bid becomes a form of cash bonus bidding. If an operator has a high interest in a tract, he will bid a work commitment which is equivalent to what he would bid in a cash bonus system. In many instances, this committment would be much larger than required for evaluation. If early exploration results are negative, the operator remains committed to drill more wells than would normally be prudent or necessary.

The provision that the Commissioner can terminate a work commitment further complicates the issue. Termination of a work commitment for one operator would undoubtedly result in inequities because he has received an unfair competitive advantage. Continuation of this practice could result in extremely high work commitments in anticipation of cancellation after performing only a portion of the work.

A work commitment bid will be nothing more than a form of cash bonus. The same result can be ac omplished more easily and efficiently with a cash bonus bid.

Now I would like to discuss a few other provisions which give us concern.

(1) AS38.05.180(v) Right to Purchase - The provision gives the State the right to purchase not more than 16 2/3 percent of the oil and 100 percent of the gas. The most onerous portion of this provision is the right of the State to purchase 100 percent of the gas.

The present and potential supplies of gas within Alaska far exceed reasonably anticipated demands by the State residents. Therefore, to find a market, this gas will have to move into interstate commerce. This requirement, that the State could remove the gas from the market, could severely hamper a producer's ability to market the reserves. Without a reasonable expectation that the developed gas can be marketed, there is greatly reduced incentive to explore.

It would also retard development of natural gas for State residents. The risk that the gas could be diverted would have significant impact on ventures to install gas transportation systems.

In addition to these concerns, it raises other questions such as:

1. Determination of fair market value
2. Use of gas for lease fuel
3. Timing and rate of production - could the State control these to satisfy their own requirements or desires?

(2) AS380.05.180(w) - Exxon is strongly opposed to this proposed section which requires any lessee or permittee conducting exploration for, or development or production of, oil or gas on State land, to provide the Commissioner access to all data obtained from such activity and to provide copies of such specified data, as the Commissioner may request. Access to all data could potentially permit endless intrusions into private business. Much of this data is very costly. In a competitive industry such as ours, a considerable amount of data is proprietary. Disclosure of this type of data could result in the loss of a competitive edge. In none of the other producing states are operators required to provide access to all data. In addition, we feel that any such requirement would, in effect, constitute a "taking" for which compensation by the State would be required. We believe this proposed amendment is unnecessary and should be deleted because the existing regulations provide the State with adequate control over exploration and development activities.

(3) AS38.05.100(1) - We are strongly opposed to the concept of earning production rights only to the depth drilled at the beginning of production from a lease. We are not aware of this language in lease forms for any other producing state.

This language is somewhat similar to that commonly used by a lessee in "farming out" acreage for the purpose of evaluating specific geologic objectives by a third party. In a frontier

province like Alaska it doesn't make any sense to place such restrictions in the lease form. The idea should be to give the lessee maximum flexibility in evaluating his acreage - not to curtail or to require unreasonable and costly actions on his part. We, therefore, strongly suggest that this language be deleted.

We also recommend that reworking be added to the list of actions which will hold a lease in force. In fact, a grace period of 60 days should be allowed between cessation of production and initiation of drilling or reworking operations. This useful and desirable feature is in the present law.

(4) AS38.05.180(j) Lease Term - A five-year primary lease term is very restrictive in Alaska. The remote location of most prospects, rugged terrain, short construction season, and reduced drilling season, either necessary or imposed, make completion of the exploration cycle a difficult and time-consuming process. Once a discovery is made, additional drilling is required before an estimate of the field size can be made. All of the previously mentioned factors affect this drilling too. Once the lengthy process of discovering a field and establishing its commerciality is complete, the long development phase must begin. We strongly recommend that the 10-year lease term be retained.

(5) AS38.05.180(c) Uplands Acreage Limitation - The proposed 200,000-acre limitation on all lands other than tide and submerged lands is very restrictive compared with the current 500,000-acre limitation in a State like Alaska which has so many frontier

interior basins to explore. In a hostile high cost environment such as Alaska, a large block of acreage may be necessary in order to justify exploration. We believe the proposed 200,000-acre limitation would be a strong disincentive of an operator to explore these frontier interior basins and strongly recommend maintenance of the current 500,000-acre limitation.

(6) AS38.05.180(u) Joint Bidding - The provision allowing the Commissioner to restrict joint bidding, if he so desires, could prohibit the involvement of some companies most capable of operating in the Alaskan environment.

A study was performed by the University of Southern California and the USGS to determine the effects of restricting majors from bidding jointly in the OCS. They concluded that on the average, this restriction resulted in more bids per lease by the major oil companies.

(7) Legislative Review - We object to the requirement for submission of the leasing program for annual review by the Legislature because we believe it will result in unnecessary delays in implementing leasing programs.

(8) AS38.05.180(q) Drilling and Development Contracts - The proposed amendment which would allow the State to share in exploration costs is inconsistent with the provisions of the lease agreement, as the State's royalty interest is free of all exploration

and development costs. If this is intended to allow the State to share in working interest, we a - opposed since it would signal entrance of State Government into the oil and gas business.

In closing, I would like to reiterate that Exxon believes the current leasing statutes and the implementing and regulations have served the State and industry well and do not need to be changed.

Passage of this bill will require the State to embark into an experimental program. Because these systems are unknown, many mistakes will be made. New "wrinkles" will be tried in order to correct these mistakes. In fact, the State of Alaska will find itself taking a course which is identical to the course presently being followed by the Federal Government. The end result will be an extremely complex system which may allow only a few companies to survive.

This concludes my prepared testimony, and I will be happy to answer any questions which yo" may have.

* * * * *

STATE'S RIGHT TO PURCHASE OIL & GAS IN HB 854

The State has the right in HB 854(v) to purchase not more than 16 2/3% of the oil and up to 100% of the gas at the regulated price or fair market value at the point of sale. The right to purchase is needed to protect the "in kind" taking of its royalty by Alaska, a sale of said royalty, and a subsequent reduction of the royalty in the later stages of production (d).

New Mexico, 1973, enacted a law which gives it the right to reserve an option to purchase at any time at the prevailing market price any or all minerals, including oil and gas, produced from State land. Thus, New Mexico may purchase 100% of the oil and gas found on State land.

Whereas the New Mexico Commissioner is authorized to waive the reservation option with respect to any specific mineral, he may not do so for oil or gas.

The Act, Chapter 26 of the Session Laws of 1973, has never been exercised by New Mexico; thus no opportunity has been given to test its constitutionality.

If Alaska were to reserve an option to purchase up to the amount of the royalty, fixed or bid, an equivalent net profit share would have to be determined.

TESTIMONY ON H.B. 854

Mr. Chairman, members of the committee, my name is John Carson, and I appreciate the opportunity to comment on House Bill 854.

I've been a petroleum geologist for 22 years, and I'm presently Division Geologist in Alaska for Chevron U.S.A., the principal domestic oil and gas subsidiary of the Standard Oil Company of California. I've lived and worked in this state, and since 1965, I've been actively involved in all state lease sales and the two OCS sales in the Gulf of Alaska and the Lower Cook Inlet.

Chevron is aware of the amount of preliminary work done by the state administration and the Department of Natural Resources in researching and drafting this legislation.

We commend efforts in drafting legislation that proposes a five-year leasing program for Alaska. We believe the state should be encouraged in its effort to establish and maintain such a long-term program, with appropriate industry participation.

Members of the committee, the petroleum industry--as indicated by its response to your solicitations--clearly desires a realistic plan that can serve as the basis for an effective working relationship between the industry and the state.

Frankly, we believe the proposed legislation will inhibit or prevent orderly development of oil and gas resources in Alaska--to the detriment of the state government, its taxpayers and my own industry.

I will say candidly that this legislation is untenable from our point of view. If enacted into law, H.B. 854 would have a serious and far-reaching impact on my own company, and would give us serious cause to reconsider our exploration activities in the high-cost, high-risk frontier state lands of Alaska.

The situation we face today reminds me of a quote I heard the other day attributed to an executive of Walt Disney Productions, which recently announced that it was abondoning its latest recreation complex because of excessive and oppressive regulation.

The Walt Disney executive blamed the end of the project on, and I quote: "An irresponsible proliferation of delays, the never-ending requests for more irrelevant information and studies, and bureaucratic sidetracking and meanderings into unreasonable alternatives."

I realize this is the first of many hearings on this legislation, but H.B. 854, as now written, would be counter-productive. It actually would be a step backward at the very time our nation desperately needs an effective oil and gas exploration program.

Generally stated, we object to provisions covering: 1) the wide variety of bidding methods to be employed; 2) the Commissioner's access to all the lessee's data, including proprietary data; 3) the state's call on production; 4) short and restrictive lease term and conditions; 5) the need for the Commissioner to submit and defend his lease plan before the legislature; 6) the Commissioner's right to ban joint bidding by major companies; and 7) reduced acreage chargeability on state uplands.

Time does not permit me to discuss in detail each of the provisions, but I will attempt to outline our most significant objections:

First, the wide variety of bidding methods:

In advocating numerous bidding schemes--actually a shift from only cash bonus bidding, a system that has worked well--the administration hopes to maximize its financial return from state lands.

But Chevron believes a move away from the cash bonus method means the perilous abandonment of a proven concept that has brought stability to the state's leasing program. The bonus system would be replaced by an array of untested leasing methods, particularly in the frontier areas.

We believe this provision, if enacted, will transform Alaska into a trial-and-error laboratory in oil and gas leasing. It means replacing orderly development with uncertainty and the unknown. It's not a gamble Chevron feels is worth taking.

Before discussing each bidding system, all concerned parties should be aware that a move away from cash bonus bidding will result in three key developments:

First, it will shift a substantial part of the burden of risk from industry to the taxpayer.

Second, it will serve as a substantial deterrent to exploration and development, and

Third, it will cause the rapid and constant growth of state agencies to administer, evaluate and audit the leases and subsequent production. This places increasing demands on taxpayers to support this bureaucracy.

Chevron believes these are unacceptable consequences which would be intolerable to the taxpayers and leaders of this state.

As you know, cash bonus bidding provides that leases be awarded to the highest cash bonus bidder. This bonus is paid before the lessee can proceed with exploratory drilling on the lease.

The other bid methods provide for bid variables such as royalty, net profit, or work commitment. In these cases, the state receives nothing other than perhaps a small fixed bonus at the time of leasing. Other revenue is not forthcoming under the royalty and net profit schemes unless there is production. Simply stated: No production, no revenue.

In our opinion, cash bonus bidding is the only method that will strongly encourage the petroleum industry to lease and explore the state land.

We further believe that this method will result in the production of the most oil and gas and consequently will provide the most revenue, both to the state and the petroleum industry.

The other methods, employing biddable royalties and net profits, reduce the incentive to explore and produce. These alternatives, particularly in the case of biddable royalties, serve to shorten the economic life of the fields--resulting in less production and, therefore, less revenue.

Cash bonus bidding is particularly advantageous to the lessor in frontier areas of high risk. Most of Alaska's lands are in this category.

Now let's compare other proposed bidding methods with traditional cash bonus bidding. Because of time limitations, I can only touch briefly on these, but I am prepared to go into more detail if questions arise.

The royalty bidding method, although it allows oil and gas companies to acquire land with little cash, is a strong deterrent to early drilling. Very simply, it is easier and cheaper to wait on others to bear the risk and expense of exploratory drilling.

Having spent little capital to acquire the lease, an operator is tempted not to spend a dime to evaluate the lease, hoping an adjacent leaseholder may do it for him. Carried to the extreme, the effect of this would be that no wells would be drilled to evaluate the leases. This same problem is inherent in the net profits system, which I'll talk about shortly. On the other hand, when cash bonus is involved, the winning bidder has a strong incentive for early drilling because his bonus investment is earning him nothing.

In cash bonus bidding the state assumes none of the risk but still receives revenue from leases, whether or not they are productive.

The advantages of this system were clearly demonstrated a few years ago in the sale of federal leases off the coasts to Mississippi, Florida and Louisiana. Successful bidders paid $743 million for several tracts on one structure, the Destin Anticline, and spent over 10 million dollars drilling seven dry holes on the structure--all at no cost to the taxpayer. Under royalty or net profit bidding, the government would have received nothing.

What would government have received if it had sold the Gulf of Alaska on a royalty bid basis? As in the Gulf of Mexico case I previously cited, nothing. Should the taxpayer and the government be forced to suffer the loss of more than one-half billion dollars--when to date, no royalty appears forthcoming?

The NPRA comes to mind as another example of an area adjudged to possess high potential, but which so far is a disappointment. Again, if sold on a royalty bidding method, the lessors would have received nothing to date.

Let me emphasize that in all these cases, the areas were considered extremely attractive to both the industry and government. These are precisely the types of areas in which the state might be enticed to use a royalty or net profit bidding method. Yet none of these has led to any discovery or government revenue.

Proponents of royalty bidding believe it encourages competition among bidders and allows the small company and the independent improved entry into oil and gas lease bidding. Cash bonus bidding usually is blamed for tending to discourage small companies from bidding.

This is not supported by the facts. Small companies gain entry into the sale by joining with a larger company or with several other smaller companies. In the recent Lower Cook Inlet sale, independents and smaller companies bid on royalty and cash bonus tracts with about the same frequency as the majors. Of the 34 companies which bid in the sale, 18 were smaller companies. These 18 made successful cash bonus bids on 26 tracts, of which 13 were sold for more than one million dollars. Moreover, the small companies are represented in half of the top tracts of the sale.

The second proposed bidding method we are concerned about is net profit bidding. This system has most of the disadvantages of royalty bidding plus two more: It requires a huge staff to administer and audit.

For example, each property would require a battery of accountants to audit the companies' production and costs. Just as in the case of royalty bidding, the risks are passed on to the government. Furthermore, net profit bidding discourages cost-effective, efficient development practices.

Work commitment bidding is the least onerous alternative to cash bonus bidding methods and would be beneficial, provided that it is enforceable. We view this method with some caution because of the uncertainty of the conditions under which it might be imposed.

At this point, I would like to summarize why we believe a majority of the industry prefers cash bonus as the best method for both the state and the energy explorers.

First, we believe it is the foundation for all free enterprise contract arrangements;

Second, it is the simplest and easiest to determine and administer by all parties;

Third, it is fair and equitable; by this I mean that all parties travel at their own risk, and finally,

The right to explore is paid for in advance.

In 1977 the Department of Natural Resources completed a report entitled, "A Study of Petroleum Leasing Methods and Possible Alternatives." H.B. 854 apparently is based on this study and its conclusions.

In this study, a great deal of attention is given to the "percentage of acreage option." We assume this is the reason for granting the Commissioner authority to withhold acreage from any sale areas under Section 180 (c) (4) (f). Under this scheme, certain amounts of acreage would be withheld from a sale so that following a discovery the state could collect a windfall on drainage acreage sales. This is a workable approach only if you know which acreage to withhold and on which structures. This is rarely the case, as we saw in the MAFLA, Gulf of Alaska and NPRA. Furthermore, industry cannot bid or drill on only portions of prospects in high risk or high cost areas which predominate in Alaska.

I would like to make a few more comments about the Department of Natural Resources' report. The one overriding conclusion of that study was that a variety of bidding methods, widely employed, would increase the state's return from its commitment of oil and gas properties.

Chevron believes this conclusion is biased against cash bonus bidding, and we feel that the odds are against anyone knowing all they need to know to use the right method at the right time. The state, even if armed with a skilled staff and large amounts of data, can hope to do no better than an individual company in evaluating potential and risks, and these companies are more often wrong than right in their appraisals.

We believe the state's report, and particularly its main bias against cash bonus bidding, is based on a few but major faulty economic assumptions.

First, the authors of the report assume that the industry will make an 18 percent rate of return. Although this is very desirable, and would not be out of line considering the high risk involved, past experience shows that the industry has averaged no more than seven to eight percent from OCS ventures which approximates Alaska lands, according to several exhaustive studies. For example, in May 1977 Prof. Walter J. Mead of U.C. Santa Barbara testified before a U.S. House of Representatives Committee that weighted average rate of return from 184 leases issued in the Gulf of Mexico in 1954-55 amounted to only 7½ percent before taxes. This sale period was selected because these leases have a 20-year production history which provides a comprehensive data base.

Second, no reduction of state income was assumed in royalty cases, but it almost certainly will occur. The economic limit of a field is going to be greatly influenced by the amount of royalty. The higher the royalty, the earlier the economic limit is reached. When an operator can no longer produce oil or gas profitably the result will be oil and gas left in the ground and neither industry, nor the state, will make any money on it.

* * *

Next, I would like to turn to the provision of the bill that would require the lessee or permittee to make available to the Commissioner all data obtained from exploration and production activities on the lease or permit. We believe this provision raises fundamental questions about the appropriateness of the state's entry into the exploration business, and secondly, points to grave problems--from our point of view--about the preservation of confidentiality.

should but
The language in the proposed legislation does not distinguish between, "raw", "processed" and "interpretative" data. We are unalterably opposed to providing the state with the results of the efforts of our interpretative staff. Industry cannot operate under this law. We urge the committee to delete this section.

We are also opposed to giving the state our basic geophysical data. We are not convinced that the state can hold this data confidential because of its large staff and turnover rate. Any leak of this sensitive information to our competitors definitely will have an immediate and adverse impact on our exploration program in this state.

The third provision we object to (Sec. 38.05.180(v)) gives the state the right to purchase up to 16 and two-thirds percent of the lessee's share of the oil and up to 100 percent of the lessee's gas.

We are not opposed to the state's right to take its royalty share of oil or gas in kind, but we oppose any provisions which empowers the state to take any portion of the lessee's share.

In order to justify the risk and expense of exploration and development, and be able to satisfy its contractual commitments, the lessee must retain the right to dispose of all of its share of production. Without this right, the state of Alaska lands become less desirable to explore and develop. We believe this is another step toward the state's entry into the oil and gas business, which should stay with private industry.

It seems inconceivable to Chevron that the state would take a portion of the lessee's share when that is the very incentive for industry to explore in the state initially.

Another provision we oppose is Paragraph Q. Paragraph Q refers to drilling and development contracts and to the authority of the state to share in the cost of exploration.

We're not clear on the meaning and intent of this paragraph. If it means the state intends to become a working interest participant in leases, then we strongly object.

Our next objection concerns the terms and conditions of the lease itself. Because of the remoteness of most of Alaska's land and the seasonal restriction on operations, Chevron prefers a ten-year primary lease term. We feel this length of time is necessary to adequately evaluate a lease under Alaskan conditions.

There is one provision which would allow the Commissioner to grant rights on leases only to the depth drilled at the time p duction begins. Chevron is at a total loss to see how this provision can benefit the state in any way. It will certainly cause waste in time and money for the industry because wells will be drilled far beyond primary objectives--just to ensure earning the rights of a normal lease. In effect, this will delay production and thereby delay revenue to the state.

Considering the geological, legal and practical ramifications of this provision, one must conclude that it is totally unacceptable to the industry and can do the state no good. It should be stricken from the bill.

Our next objection is to any effort to restrict joint bidding between majors or multinational companies. In Alaska, particularly, with its accompanying expensive costs of exploration and production, it is essential for large and small companies to be able to join together to share the risk.

A ban on joint bidding by majors does not necessarily increase state income. In fact, a recent study by the Department of Interior showed that joint bidders tend to bid higher, on the average, than solo bidding competitors. (November 1976 issue of the Journal of Petroleum Technology.)

The next provision we wish to discuss deals with the need for the Commissioner to submit and defend his leasing program to the legislature. We prefer that the various reporting methods set out in this section not be prescribed in law. We believe this review is an administrative function and that public hearings are an adequate and effective vehicle for gathering comments and reactions to the proposed action. Neither the timber leases nor any other types of state lease are submitted to the legislature, and to require this approach in law for the petroleum industry will lead to further delays in development of the state's natural resources. Particularly objectionable to us is the requirement that the Commissioner must defend his previous year's program and explain why he used certain methods. This is certain to toss the entire leasing program into an interminable bureaucratic morass.

And finally we oppose the provision which deals with acreage chargeability. We believe the reduction to 200,000 acre limitation on uplands is arbitrary and unjustified. The 500,000 acre limitation in this state, where there are large areas of state lands potentially available for bid, is not unreasonable. A large acreage position is necessary as an incentive for an operator to explore frontier areas.

In closing, Mr. Chairman, Chevron believes H.B. 854 is an unreasonable, unwise and unworkable piece of legislation that simply is not in the best interest of the citizens of Alaska.

As I said at the outset of my remarks, my own company would be faced with the prospect of seriously reassessing its current and future exploration activities on Alaska state lands if this bill is enacted.

It is our opinion that this legislation will only serve to inhibit or prevent the orderly exploration and development of Alaska's oil and gas properties.

We oppose a shift away from the successful cash bonus bidding system because we believe that the cash bonus ensures a fair and equitable return to the state, as well as ensuring the fair share of any revenue resulting from production.

It is conceivable that Prudhoe Bay may not have been found if royalty or net profits bidding or percentage acreage option had been employed.

Mr. Chairman, members of the committee, we have serious concern that if this legislation becomes law, the ultimate losers will be the citizens of this state, as well as the consumers of oil and gas.

Thank you for giving Chevron this opportunity to comment on this proposed legislation.

* * *

DESCRIPTION OF LEASING METHODS IN HB854

Currently, the State of Alaska's leasing system is a cash bonus bid with a minimum fixed royalty of 12.5 percent. The methods outlined below include the present system with different fixed royalties, sliding scale royalty with bonus bid, sliding scale royalty bid with fixed bonus, net profit share bid with fixed bonus, royalty bid with fixed bonus and exploration work commitment. The basic elements of these methods are summarized below.

(1) Bonus Bid With Fixed Royalty

Bonus bid with fixed royalty is the system currently used by the State of Alaska. In a lease sale, the winning bid for a tract is the one which makes the highest sealed or auctioned cash bonus bid. There is also a minimum royalty of 12.5 percent. An advantage of this system is that government receives revenue regardless if there are economical quantities of oil or gas found and/or produced. To avoid early termination of production, royalties need to be flexible during a field's declining years.

(2) Sliding Scale Royalty With Bonus Bid (or Sliding Scale Bid with Fixed Bonus)

Under this system, the government receives a cash bonus bid and a sliding scale royalty. We used 12.5 percent as a minimum figure and 62.5 percent as a ceiling wherein the rate in any period is dependent upon the production of that period.

The royalty rate is graduated in much the same manner as the federal personal income tax. Table I gives two examples of a sliding scale royalty schedule. The royalty is progressive, that is, the royalty on additional production increases. For example, in the South Central Area, the initial 500 barrels pay a royalty of 12.5 percent, the next 500 barrels pay 25 percent. The royalty rate increases by 12.5 percentage points per 500 barrels until 2000 barrels of output are achieved. All production beyond 2001 barrels pays a royalty of 62.5 percent. Thus, if production reaches 5000 barrels, the average royalty rate is 50 percent. In the limit, the average rate would converge towards 62.5 percent as daily production continues to increase.

As field productivity declines and well production falls, the producer backs down the schedule and royalties decline. In order to optimally exploit the field, the royalties should decline to zero near the end of field life. Actually, final rates of five or six percent would result in minimal early shut down.

TABLE I
TYPICAL SLIDING SCALE ROYALTY SCHEDULES

SOUTH CENTRAL AREA

Daily Average Prod. Rate (Bbls./day)	Incremental Royalty Rate (%)	Royalty For Specific Producing Rates: Producing Rate (Bbls./day)	Royalty Production (Bbls./day)	Average Royalty Rate (%)
-500	12.5	500	62.5	12.50
501-1000	25.0	1000	187.5	18.75
1001-1500	37.5	1500	375.0	25.00
1501-2000	50.0	2000	625.0	31.25
2001-2500	62.5	2500	937.5	37.50
		3500	1562.5	44.64
		4500	2187.5	48.61
		5000	2500.0	50.00

NORTH SLOPE AREA

Daily Average Prod. Rate (Bbls./day)	Incremental Royalty Rate (%)	Royalty For Specific Producing Rates: Producing Rate (Bbls./day)	Royalty Production (Bbls./day)	Average Royalty Rate (%)
-1000	12.5	1000	125	12.50
1001-2000	25.0	2000	375	18.75
2001-3000	37.5	3000	750	25.00
3001-4000	50.0	4000	1250	31.25
4001 and above	62.5	5000	1875	37.50
		7000	3125	44.64
		9000	4375	48.61
		10000	5000	50.00

Note: The Sliding Scale Royalty Schedule for the North Slope area is signifi cantly higher than for the South Central area because the higher North Slope operating costs result in a much higher economic limit.

Hopefully, this illustration clarifies the relationship between production rates and royalty rates.

Greater flexibility in setting the initial rate is the major advantage of this system while not running the risk of an uneconomically (for Industry) high royalty rate. On the other hand, to achieve an overall lower royalty payment, a company might spread out production over a longer period of time. Usually, however, because of the time value of money and increased operating costs, oil companies generally try to accelerate production.

(3) Net Profit Share Bid With Fixed Bonus

A small fixed bonus is required as earnest money. The bonus is low enough to encourage producers to bid a high net profit share while permitting profitable development.

(4) Royalty Bid With Fixed Bonus

This system utilizes the same method to calculate fixed bonus as described for Net Profit Share. The bid parameter is a function of production instead of net profits. Since the bonus is fixed, interested parties bid on the royalty rate that the government is to receive. The advantage of royalty bidding is that little front end money is needed by Industry. However, this could encourage speculation causing an overbid. Royalty bidding should encourage more competition among bidders and may allow the smaller companies a better chance of winning the tract.

(5) Work Commitment With Fixed Bonus, Royalty or Net Profit Share

The government itemizes the performance criteria such as the rate and amount of work to be performed on each tract. The total bid specified in dollar terms and a portion of the bid used for exploration and development activities. This system gives the government some control over the rate and extent of resource development.

SUMMARY OF ACREAGE LIMITATION
CHANGE IN HB 854

The acreage any one State lessee may hold is 500,000 acres upland and 500,000 acres offshore. HB 854 reduces the uplands to 200,000 acres. This is to help increase the number of upland lessees by limiting the holdings of the larger major oil companies. Offshore holdings will be unaffected.

No other state that we are aware of has an acreage limitation. But no other state is Alaska's size nor has any state tens of millions of acres available to lease.

The Federal government has an acreage maximum for its uplands within each state. During Alaska's territorial days the Federal oil and gas acreage limitation in Alaska was 100,000 acres. In other states it was 46,080 acres.

After 1961 the Federal maximum for Alaska rose to 300,000 acres in the Northern district (approximately north of the Yukon River) and 300,000 in the Southern district. These apply today. There is no Federal acreage limitation on the Outer Continental Shelf. Presently, the acreage limitation is 246,080 uplands acres of Federal leases per state, other than Alaska.

HB 854 grants companies five years from the effective date of the act to comply with the 200,000 upland acre maximum.

A list of major leaseholdings as of February, 1978, (showing uplands and offshore holdings of those companies which now exceed 200,000 acres) follows:

ALASKA OIL AND GAS ACREAGE HOLDINGS
(as of March 13, 1978)

COMPANY	ACRES		
ARCO	408,151.21	356,882.86	acres of uplands
		51,268.35	offshore
		408,151.21	total
UNION	287,032.83	233,138.75	uplands
		53,894.08	offshore
		287,032.83	total
PHILLIPS PETROLEUM	243,227.94	80,332.74	uplands
		162,895.20	offshore
		243,227.94	total
EXXON	158,627.73		
TEXACO	156,027.03		
SOHIO PETROLEUM	135,588.28		
BP ALASKA	103,218.99		
CITIES SERVICE	140,071.58		
CHEVRON	126,493.55		
AMOCO	126,134.64		
MOBIL	120,375.19		
MARATHON OIL	71,538.36		
BEARD OIL	71,260.49		
SHELL OIL	40,603.10		
GETTY	29,857.30		
SUN OIL	27,453.87

Legislative Auditor
Division of Legislative Audit

SUBJECT: Release of Audits

In accordance with AS 24.20.311, the following audit report was approved for release to the Legislature and the public on April 3, 1978:

A Review of Alaska Coastal Management Program, Grant No. 04-6-158-50029, Office of the Governor, Division of Policy Development and Planning

A Special Review of The Division of Marine Transportation, Department of Transportation and Public Facilities

Enclosed is a short digest covering the audit for your convenience. Should you desire a copy of the completed report, it is available at the following libraries or through our office (465-3830):

Alaska State Library
Alaska Historical Library
University of Alaska Library, College
University of Alaska Library, Anchorage
Z. J. Loussac Public Library, Anchorage

March 3, 1978

SUMMARY OF: A Special Review of the Division of Marine Transportation, Department of Transportation and Public Facilities

PURPOSE OF THE REVIEW

In accordance with your request and Title 24 of the Alaska Statutes, this special report has been prepared on all passenger service aspects of the Division of Marine Transportation, Southeast System. The Steward's Department is responsible for passenger services. The report encompasses:

1. Purchasing and warehousing of supplies used by the Steward's Department.

2. Operating procedures of the Steward's Department on board vessels.

3. Accounting and management control of all passenger services activities.

FINDINGS AND RECOMMENDATIONS

Most of the problem areas noted in our review have been addressed in prior audits, not only by the Division of Legislative Audit (November, 1973 and April, 1976) but also by the Governor's Management and Efficiency Review (May, 1976), the Department of Transportation and Public Facilities' Internal Review (November, 1977), and the Department of Administration's Division of Internal Audit (April, 1966). Each of the previously mentioned reviews emphasized the inadequacy of the Division's accounting and management information system. Yet, management still lacks any effective means of evaluating the Passenger Services Operation.

In addition, all reports noted deficiencies in procedures for purchasing and/or controlling inventory. Our current review again addresses the supply function. Unresolved problems exist in purchasing, receiving, record-keeping,

controlling merchandise transfers, and reconciling physical inventories with accounting records.

The dates of the above audits show that a sufficient period of time for effective action has elapsed since problem areas were initially addressed.

1. DOT-PF should review the total system of providing passenger services for the Marine Transportation Division--including supply, operating, and accounting functions--in order to coordinate efforts and clearly define responsibilities. When the analysis has been completed, procedures should be documented in an operating manual, distributed to appropriate personnel, and regularly updated.

2. The current system of reporting operating results to management is totally inadequate. Management must develop and utilize informational tools to effectively monitor current operations and to make sound long range policy decisions.

3. Material usage should be determined for all retailing operations of the Steward's Department. The usage should be regularly compared to developed usage standards and to sales.

4. Purchases should be planned in advance and based upon realistic usage expectations.

5. The Department should regularly dispose of inventory which exceeds reasonable need. The variety of inventory items should be reduced.

6. The Department's supply section should periodically conduct a complete inventory at all warehousing locations. The accounting section should develop and maintain inventory control accounts for all warehouse locations. These accounts should be reconciled by accounting to its project ledger data as well as to the results of supply's physical counts.

7. The Department's supply section should strengthen warehouse controls in two areas: 1) Receiving goods and 2) accuracy of warehouse records.

8. Accounting for merchandise transfers would be improved by controlling documents.

9. Control over goods and the accuracy of information generated by vessel personnel would be improved by instituting written procedures (see Recommendation

No. 1), training personnel, and improving communications between shore and vessels.

10. Petty cash accounts on vessels should be reduced to minimum amounts necessary for making change and small expenditures.

11. Coin-operated vending machines on vessels should be either owned by the State or covered by a valid contract.

12. Payments to foreign vendors should be made directly to the vendor. When a voucher is prepared the exchange rate should be determined from a local bank and the adjustment in U.S. funds should be recorded on the vendor's invoice.

February 3, 1978

SUMMARY OF: A Review of the Alaska Coastal Management Program

PURPOSE OF THE REVIEW

To perform a review of the Alaska Coastal Management Program second year grant (Grant No. 04-6-158-50029). The review included audit determinations in the areas of:

1. Financial Compliance
2. Economy and Efficiency
3. Program Results

FINANCIAL ACTIVITIES

$1,788,169.52 was expended by the Alaska Coastal Management Program during the second grant year. As a result of this audit, we have questioned $548,480.34 of the expenditures.

FINDINGS AND RECOMMENDATIONS

1. Property records maintained by the five departments purchasing equipment with Coastal Zone Management (CZM) funds should identify the source of funds used to acquire the property.

   Twenty-five equipment items purchased with CZM funds were examined. Seven of 25 items were not on the property list. Twelve of the remaining 18 items did not indicate funding source.

2. The Alaska Coastal Management Program should not conduct primary research for purposes of completing an Alaska Coastal Management Plan in accordance with the Coastal Zone Management Act of 1972. (PL 92-583, PL 94-37)

   The Department of Environmental Conservation (DEC) purchased equipment in the amount of $6,376 for use in gathering primary data. These expenditures were not authorized by ACMP.

3. Approved time reports should be submitted for all employees charging time to the grant.

Four departments, Office of the Governor, DEC, Natural Resources and Community and Regional Affairs do not require approved time sheets from their CZM employees. Consequently we were unable to determine if payroll charges were properly charged to CZM.

4. The methods of accounting for CZM Federal and match funds by the grantee and subgrantees need to be improved.

We found several exceptions in auditing the CZM funds which individually are insignificant, but when looked at together indicate weaknesses in the accounting for CZM funds.

5. The Alaska Coastal Management Program should establish policies and procedures for the accounting and reporting of in-kind match contributions.

Two departments, Fish and Game and Natural Resources have commingled CZM State match funds with regular operating funds. Consequently, we were unable to separately identify CZM expenditures.

EFFICIENCY AND ECONOMY OF OPERATIONS AND PROGRAM RESULTS

6. The Office of Coastal Zone Management should establish a work schedule that identifies and assigns priority to work program elements which must be completed and included as part of the federally approved Alaska Coastal Management Plan.

The Policy Base Document, which is the heart of the Coastal Management Program, is several months behind schedule.

7. The Office of Coastal Zone Management should review all work program elements to be sure all sections of the Alaska Coastal Management Act and the Federal Coastal Management Act are complied with.

We noted several program compliance contingencies which may prevent Federal and State approval of the Alaska Coastal Management Plan.

8. The Office of Coastal Zone Management should establish policies and procedures to assure effective use is made of available management and financial aids.

A. ACMP did not timely file required quarterly financial and progress reports.

B. ACMP did not timely process reimbursement requests. This cost the State approximately $100,000 in lost interest income.

9. State departments participating in the Alaska Coastal Management Program should obtain a federally approved indirect cost rate and apply it to eligible Federal reimbursable expenditures.

State departments did not claim indirect costs for reimbursements. This amounted to approximately $50,000.

HB 857

February 17, 1978

The Honorable Hugh Malone
Speaker of the House
Alaska State Legislature
Juneau, Alaska 99811

Dear Mr. Speaker:

Under authority of art. III, sec. 18 of the Alaska Constitution, and in accordance with AS 24.30.060(b) and the Uniform Rules of the Alaska State Legislature, I am transmitting a bill extensively amending and updating AS 38.05.180, Oil and Gas Leasing.

I am pleased to present for your consideration this major piece of legislation dealing with Alaska's energy future. Not since statehood has the legislature addressed itself to determining how best to lease our petroleum land. Conditions have changed dramatically since then, both for the petroleum industry and the state, and it is time to make such a reappraisal.

The proposed changes will update the leasing law to provid increased public control over exploration, development, and production from state land, obtain a fair return from our non-renewable resources, and, at the same time, provide land from which explorers may find new energy supplies.

How Alaska leases its oil and gas lands will in large part determine our continuing relationship with the oil industry. Many of the problems we now confront in determining the state's fair share of the Prudhoe field could certainly best have been resolved at the time the initial leases were offered by the state. This legislation would make that more likely in the future.

As you are aware, Congress is presently debating a new law covering federal oil and gas leasing on the

Outer Continental Shelf. As you are also aware, much of the attractive OCS land is directly adjacent to Alaska's three-mile offshore land. For this reason, my proposed legislation attempts to be as inclusive as the federal OCS legislation, but more workable, and thus, hopefully, more acceptable to the oil and gas industry.

This legislation is designed to accomplish a number of important state objectives. First, it requires state land to be offered competitively under any of several new leasing methods, including bidding by royalty, sliding royalty net profits and work commitment or a combination of any of these methods. Under certain circumstances, land may be offered on a noncompetitive basis.

Second, it reduces the length of the term of a lease from ten years to five years, to assure that exploration begins promptly once state land is leased. Under certain severe environmental conditions a lease may be for a longer period, but not to exceed ten years.

Third, the legislation increases rentals, including those on shut-in fields, to increase incentives to explore and produce oil and gas fields.

Fourth, the bill grants to the state the right to purchase up to 16 2/3 per cent of the oil and 100 per cent of the natural gas or gas products from the lease, thereby protecting sale commitment of royalty oil and gas in the event the state's royalty is reduced on marginal fields.

Fifth, it reduces the acreage limitation on state uplands so that more companies will have an opportunity to participate in exploring in Alaska and, for the same reason, it allows the state to restrict joint bidding by major or international oil companies.

Finally, the legislation provides that the executive branch will file two reports with the legislature each year. One will outline the state's leasing program for the forthcoming five years. The other will explain the leasing methods used or to be used. I have chosen this method of informing the legislature and the public because I believe there is a need to create as much certainty in leasing policies and procedures as possible. Requiring a five-year state

leasing program to be made public will, I believe, lend stability and predictability to the petroleum exploration business in Alaska and will also raise the level of consciousness of the citizens of Alaska about the workings of the oil business. I can think of no better way to the inform the legislature and the public than to report on a regular basis what land will be made available for oil and gas leasing and by which of several leasing methods the state proposes to offer that land.

The second report will note which leasing methods were used during the preceding year and which methods are proposed to be used in the coming year. Hopefully, enough explanation as to why one method was chosen over another will help educate us all. Although this places an increased burden on those chosen to make these day-to-day decisions, I think it appropriate to use this public accounting procedure for all subsequent state oil and gas lease sales.

Through your leadership, the legislature and my Department of Natural Resources have worked together in an effort to find a solution to Alaska's future leasing policy.

The legislature's action in commissioning Dr. Mason Gaffney's study last year and the subsequent work by the department has paid dividends in developing our understanding of the options available to the state. I wish to thank you for your foresight and cooperation in this most important matter.

Sincerely,

Jay S. Hammond
Governor

MEMORANDUM

HB 854

DEPARTMENT OF NATURAL RESOURCES
DIVISION OF MINERALS AND ENERGY MANAGEMENT

TO: Robert LeResche
Commissioner, DNR

DATE: April 24, 1978

FROM: Jack Roderick JR
Special Projects, DMEM

HB 854 - Alberta's Oil and Gas Incentive Credit regulations.

Having reviewed Alberta's drilling and geophysical incentive credit programs, I think we should familiarize ourselves before Michael Day, or some Alberta official, briefs us as to how the programs are actually administered. (see my 4/18 memo to Boness)

From reading the attached incentive regulations, it appears that the Board of Energy Resources Conservation (5 appointed persons regulating all energy matters in Alberta) decides which wells qualify for incentive credits. The Minister of Energy and Natural Resources (formerly mines and minerals) decides which seismic surveys qualify. In both cases, a certificate is issued to the qualifier when the permit is issued, prior to the actual drilling or shooting.

Credits may be taken against bonuses, rentals, royalties, and taxes for a fixed period of time (until December 31, 1978 under existing law). Please note that neither drilling nor geophysical credits are transferable. However, in the case of geophysical credits, if a licensee can show that he is not a holder of a "mineral right" under Alberta law the Minister may pay him an amount of money equivalent to the amount of credit he has earned. Gas credits are treated differently from oil credits.

For drilling credit purposes, Alberta is divided into 3 drilling and 4 geophysical regions. The intent, obviously, is to make certain areas of the Province more attractive for exploration by increasing (or decreasing) incentive credits in those areas.

The noninterpretive geophysical data collected by the licensee is made available by the licensee to the public for a period of not less than five years after acquisition at a designated percentage cost of the credit allowance. The government, therefore, enforces the law and regulations but the actual transfer of information takes place within the petroleum industry, not the government.

I have attached copies of Alberta's basic incentive credit regulations. I caution that they have been amended several times since their adoption, but in no structural way that I am aware of.

Michael Day, or whomever, can give us the details when and if he comes to Juneau. Milton Lipton, being a consultant to Alberta, will be able to contribute some comments, also.

GOVERNMENT OF THE PROVINCE OF ALBERTA

ALBERTA REGULATION 18/74

(Filed January 31, 1974)

THE MINES AND MINERALS ACT

(O.C. 210/74)

Approved and Ordered,

GRANT MacEWAN,

Lieutenant Governor. Edmonton, January 30, 1974.

Upon the recommendation of the Honourable the Minister of Mines and Minerals, the Lieutenant Governor in Council, pursuant to section 14, clause (h) and sections 31 and 142 of The Mines and Minerals Act, makes the regulations in the Appendix attached hereto, being the "Exploratory Drilling Incentive Regulations, 1974".

PETER LOUGHEED (Chairman)

EXPLORATORY DRILLING INCENTIVE REGULATIONS, 1974

1. In these regulations,

(a) "Board" means the Energy Resources Conservation Board;

(b) "class A footage" and "class B footage" mean the respective intervals of depth that are deemed by the Board to qualify for credit of an incentive exploratory well in accordance with section 6 of these regulations;

(c) "crude oil" means crude oil as defined under The Oil and Gas Conservation Act;

(d) "Department" means the Department of Mines and Minerals;

(e) "gas" means gas as defined under The Oil and Gas Conservation Act;

(f) "incentive exploratory well" means a well certified by the Board on or after January 1, 1974 as an incentive exploratory well;

(g) "licensee" means the person to whom a licence is granted under The Oil and Gas Conservation Act for a well certified as an incentive exploratory well;

(h) "Minister" means the Minister of Mines and Minerals;

(i) "plains area", "northern area" and "foothills area" mean the respective areas of Alberta defined in SCHEDULE C to these regulations.

2. (1) Where a licence is granted on or after January 1, 1974 for the drilling of a well for oil or gas, the Board, on the advice of its Geology Department, shall determine whether or not the well qualifies as an incentive exploratory well.

(2) Where a well qualifies as an incentive exploratory well under subsection (1), the Board shall so certify and attach a copy of the certification to each copy of the well licence.

(3) Within 30 days after the granting of a licence for a well that did not qualify as an incentive exploratory well, the applicant for the licence may request the Board to review the eligibility of the well for certification.

(4) Upon conclusion of the review under subsection (3) the Board shall notify the applicant of its decision and if the well qualifies as an incentive exploratory well the Board shall send two copies of the certification to the licensee.

3. (1) A certification lapses 30 days after the date thereof unless the drilling of the well has been commenced.

(2) Where the drilling of an incentive exploratory well is not being conducted to the satisfaction of the Board until completion or abandonment of the well, the Board shall so notify the licensee and thereupon the certification lapses.

(3) When a certification lapses the Board shall inform the Department.

4. (1) When a certification for an incentive exploratory well lapses the holder of the well licence may, within 30 days after the date on which certification lapsed, apply to the Board for a new certification and if the well qualifies as an incentive exploratory well the Board shall so certify subject to subsections (2) and (3).

(2) If any other well has been licensed and certified in the area influenced by the well for which an application for new certification is made under subsection (1), the Board will determine the amount of qualifying footage for the well as though the existing incentive exploratory well had not been certified, and in the event of more than one well having been licensed and certified, priority for credit will be determined by the date of certification.

(3) For the purpose of determining priority for credit between a well under subsection (1) and a well under subsection (2), the application for new certification under subsection (1) shall be treated by the Board as though it were an initial application for well licence and certification.

(4) Where the well referred to in subsection (1) or (2) is certified as an incentive exploratory well, the Board shall send two copies of the certification to the licensee.

5. The Board shall send a copy of each certification to the Department.

6. (1) After the drilling of an incentive exploratory well is completed and upon receipt by the Board of all relevant information relating to the well the Board shall determine what intervals of depth, if any, of the well qualify as class A footage and class B footage.

(2) Upon conclusion of the determination under subsection (1) the Board shall notify the licensee of its decision.

(3) The licensee may forthwith advise the Board that he accepts the determination indicated under subsection (2).

(4) Within 30 days of the notification made under subsection (2) the licensee may apply to the Board to review the determination and the application shall be accompanied by particulars to substantiate any alternative determination of class A footage or class B footage made by the licensee.

(5) Upon conclusion of the review under subsection (4) the Board shall notify the licensee of its decision.

7. When an incentive exploratory well is completed or abandoned to the satisfaction of the Board, it shall inform the Department

(a) the date that the well was completed or abandoned,

(b) the depth of the well in feet, and

(c) the intervals of depth that qualify as class A footage or class B footage.

8. (1) When an incentive exploratory well has been completed or abandoned to the satisfaction of the Board, a credit shall be determined by the Department in accordance with SCHEDULE A or SCHEDULE B and the licensee shall be notified of the credit as determined.

(2) The licensee, within 30 days after the notification made under subsection (1) shall inform the Department in writing as to the manner of allocation of the credit among the participants including those referred to in subsection (5), and the credit shall be allocated and established accordingly.

(3) If the licensee fails to inform the Department within 30 days of the manner of allocation of credit, the credit as determined in subsection (1) shall be established in the records of the Department in the name of the licensee

(4) If an amendment to a well licence is obtained to deepen an incentive exploratory well beyond the formation originally authorized by the well licence, the credit with respect to the deepened portion of the well shall be established according to subsection (2) or (3) unless within 30 days after being notified under subsection (1) the licensee informs the Department in writing as to the manner of allocation of the credit relating to the deepened portion of the well, and thereupon the credit shall be allocated and established accordingly.

(5) The licensee in allocating credit under subsection (2) or (4) shall not allocate more than 20 per cent of the credit to those participants who do not contribute to the actual cost of drilling the well.

(6) Credit established for an incentive exploratory well may, after its allocation, be revised at the discretion of the Minister if the revision is warranted based on information not previously regarded or correctly processed by the Board or the Department.

(7) Credit established under this section is not transferable

9. A credit shall not be established for any incentive exploratory well the drilling of which is commenced after December 31, 1977.

10. Credit established pursuant to section 8, upon the written request of the holder thereof, and subject to procedures established by the Department, may be applied in satisfaction of

(a) moneys payable by him with respect to any applications and dispositions made under Part 5 of The Mines and Minerals Act,

(b) moneys payable by him pursuant to section 40 of The Mines and Minerals Act, or

(c) taxes levied under The Freehold Mineral Taxation Act,

and becoming due and payable between January 1, 1974 and December 31, 1979.

11. Crude oil production

(a) obtained from the class A or class B footage interval of an incentive exploratory well that was certified after January 1, 1974 and that commenced drilling before December 31, 1977,

(b) obtained from a pool in which no other well within three miles has been exempted from payment of royalty to the Crown either under these regulations or under Alberta Regulation 378/72, and

(c) attributable to the drilling spacing unit of the incentive exploratory well referred to under (a),

shall be exempt from payment of royalty to the Crown for a period terminating five years after the date on which production of the well commences.

12. (1) Gas production

(a) obtained from the class A or class B footage interval of an incentive exploratory well that was certified after January 1, 1974 and that commenced drilling before December 31, 1977,

(b) obtained from a pool in which no other well within three miles has been exempted from payment of royalty to the Crown under these regulations, and

(c) attributable to the drilling spacing unit of the incentive exploratory well referred to under (a),

shall be exempt from payment of royalty to the Crown for a period terminating two years after the date on which production of the well commences.

(2) The exemption in subsection (1) is void at the end of seven years from the original finished drilling date of the incentive exploratory well but may be extended at the discretion of the Minister.

13. Where a drilling spacing unit contains a well that is completed for crude oil production in accordance with clauses (a) and (b) of section 11, it shall be exempt from the payment of tax under The Freehold Mineral Taxation Act with respect to petroleum for a period of five calendar years immediately following the year in which the well was completed.

14. Where a drilling spacing unit contains a well that is completed for gas production in accordance with clauses (a) and (b) of section 12, it shall be exempt from the payment of tax under The Freehold Mineral Taxation Act with respect to natural gas for a period of two calendar years immediately following the year in which the well was completed.

15. A decision of the Board under these regulations is final.

SCHEDULE A

Applicable to Class A Footage

Class A footage shall be determined as being the depth interval of a well that has not been duplicated either by

(i) a drilled and abandoned well within approximately one and one-half miles, or

(ii) a completed well or a well that in the opinion of the Board warrants completion, within approximately three miles

SCHEDULE C

FOOTHILLS AREA

The Foothills Area consists of the lands in Alberta listed below and those lands within Alberta located south and west of the listed lands:

Township 1, Range 24; Township 2, Range 25; Township 3, Range 26; Township 4, Range 27; Township 5, Range 28; and Townships 6 to 11 inclusive, Range 29, all west of the 4th Meridian;

and

Townships 12 and 13, Range 1; Townships 14 to 20 inclusive, Range 2; Townships 21 and 22, Range 3; Townships 23 to 28 inclusive, Range 4; Townships 29 and 30, Range 5; Townships 31 to 34 inclusive, Range 6; Townships 35 and 36, Range 7; Township 37, Range 8; Township 38, Range 9; Townships 39 and 40, Range 10; Township 41, Ranges 11, 12 and 13 inclusive; Township 42, Range 14; Township 43, Ranges 15 and 16; Township 44, Range 17; Townships 45 and 46, Range 18; Townships 47 and 48, Range 19; Township 48, Range 20; Township 49, Ranges 21 and 22; Township 50, Range 23; Townships 51 and 52, Range 24; Townships 53 and 54, Range 25; Township 54, Range 26; Townships 55 and 56, Range 27, all west of the 5th Meridian;

and

Township 56, Range 1; Townships 57 and 58, Range 2; Township 58, Range 3; Townships 59 and 60, Range 4; Township 60, Ranges 5 and 6; Township 61, Ranges 7 and 8; Township 62, Ranges 9, 10 and 11; Townships 63 and 64, Range 12; and Township 65, Ranges 13 and 14, all west of the 6th Meridian.

PLAINS AREA

The Plains Area consists of the lands in Alberta contained within the outer perimeter of the lands listed below:

On the east by Townships 1 to 52 inclusive, Range 1; on the north by Township 52, Ranges 1 to 12 inclusive; on the east by Townships 53 to 58 inclusive, Range 13; and on the north by Township 58, Ranges 13 to 26 inclusive; all west of the 4th Meridian;

and

On the north by Township 58, Ranges 1 to 4 inclusive; on the west by Townships 35 to 58 inclusive, Range 4; all west of the 5th Meridian;

and

On the west from Townships 1 to 34 inclusive, the lands immediately adjacent to the FOOTHILLS AREA.

and

On the south by Township 1, Ranges 1 to 23 inclusive, all west of the 4th Meridian.

NORTHERN AREA

The Northern Area consists of the remaining lands in Alberta not included in the FOOTHILLS AREA or the PLAINS AREA.

GOVERNMENT OF THE PROVINCE OF ALBERTA

ALBERTA REGULATION 35/75

(Filed February 11, 1975)

THE MINES AND MINERALS ACT

(O.C. 219/75)

Approved and Ordered,

RALPH G. STEINHAUER,

Lieutenant Governor. Edmonton, February 10, 1975.

Upon the recommendation of the Honourable the Minister of Mines and Minerals, the Lieutenant Governor in Council, pursuant to section 14, clause (h) of The Mines and Minerals Act, makes regulations in accordance with the Appendix attached hereto, being the Geophysical Incentives Program Regulations.

PETER LOUGHEED (Chairman)

GEOPHYSICAL INCENTIVE PROGRAM REGULATIONS

1. In these regulations,

(a) "Department" means the Department of Mines and Minerals;

(b) "foothills area", "green area", "yellow area" and "plains area" mean the respective areas of Alberta described in Schedule C to these regulations;

(c) "geophysical incentive program" means a seismic survey conducted for the purpose of exploring for petroleum or natural gas or both and certified by the Minister as a geophysical incentive program;

(d) "geophysical information and data" means all field data, field reports and the standard processed sections that are stacked after filtering and correction for statics and normal moveout;

(e) "licence" means a licence issued pursuant to Part 9 of The Mines and Minerals Act;

(f) "licensee" means the holder of a licence;

(g) "minimum subsurface coverage" means the coverage obtained when seismic pulses generated from not less than four different source positions are reflected from a subsurface point;

(h) "Minister" means the Minister of Mines and Minerals;

(i) "seismic survey" means a survey conducted by the use of the geophysical prospecting technique known as the seismic reflection method.

2. These regulations do not apply to a seismic survey the recording of which commenced before January 1, 1975.

3 (1) A licensee may, in accordance with these regulations, apply to the Minister to have a seismic survey certified as a geophysical incentive program.

(2) An application under subsection (1) shall be made

(a) prior to commencing the recording of the seismic survey, or

(b) in a case where the recording of the seismic survey commenced on or after January 1, 1975 and before the coming into force of these regulations, not later than February 28, 1975.

(3) The application shall be in Form 1 of Schedule A to these regulations.

(4) Where a seismic survey initially qualifies as a geophysical incentive program, the Minister shall issue an Interim Certificate in Form 2 of Schedule A to these regulations which shall be attached to the copy of the licence in the records of the Department.

(5) A copy of the Interim Certificate shall be sent to the licensee.

4. (1) An Interim Certificate lapses one year after the date thereof unless the seismic survey to be conducted under the Interim Certificate has been commenced.

(2) An Interim Certificate may be granted for one or more seismic surveys to be conducted thereunder.

5. Where a seismic survey is being conducted under an Interim Certificate, the Minister or any person authorized by him may at any time for the purposes of investigation and inspection have access to all the field data and field reports obtained by the licensee during the course of conducting the seismic survey, and the licensee or his representative shall render to the Minister or the person authorized by him such assistance as may be necessary.

6. (1) Within 90 days of completing a seismic survey or surveys under an Interim Certificate, the licensee shall submit to the Minister a final report in Form 3 of Schedule A to these regulations for each seismic survey so completed.

(2) The final report in subsection (1) shall be executed on behalf of the licensee by a registered member of The Association of Professional Engineers, Geologists and Geophysicists of Alberta under seal.

(3) Upon submitting the final report or reports, the licensee may in writing request the Minister to approve a reduction in the size or extent of a seismic survey, and where the Minister approves the reduction the Interim Certificate shall be amended accordingly and a copy shall be sent to the licensee.

(4) Upon receipt of the final report or reports, the licensee shall, at the request of the Minister, make available to the Department for purposes of investigation and inspection all geophysical information and data obtained from each seismic survey completed under the Interim Certificate.

7. (1) When the seismic survey or surveys under an Interim Certificate are completed to the satisfaction of the Minister, the Minister shall certify the seismic survey or surveys as a geophysical incentive program and a credit shall be determined by the Minister in accordance with Schedule B to these regulations, and the licensee shall be notified of the credit as determined.

(2) The Minister shall not give a certification under subsection (1) where he is satisfied that

(a) the seismic survey fails to meet the minimum subsurface coverage, or

(b) the seismic survey is not conducted in accordance with the standards of good geophysical practices.

(3) The licensee, prior to the recording of a seismic survey that is the subject of an application under section 3, shall inform the Minister

in writing as to the manner of allocation of the credit among the participants who have contributed to the actual cost of conducting the seismic survey.

(4) If the licensee fails to inform the Minister of the manner of allocation of the credit, the credit as determined in subsection (1) shall be established in the records of the Department in the name of the licensee.

(5) A credit established pursuant to this section is not transferable.

8. (1) Subject to subsection (2), a credit established pursuant to section 7 may, upon the written request of the licensee, be applied in satisfaction of

(a) moneys payable by him pursuant to dispositions under Part 5 of The Mines and Minerals Act; or

(b) taxes levied under The Freehold Mineral Taxation Act.

(2) Where a licensee provides the Minister with satisfactory evidence indicating that the licensee is not the registered owner of a mineral right within the meaning of The Freehold Mineral Taxation Act or the holder of an agreement under Part 5 of The Mines and Minerals Act, the Minister may pay to the licensee an amount in money equivalent to the amount of credit established in his name in the records of the Department.

9. (1) Any geophysical information and data obtained pursuant to a certified geophysical incentive program shall be made available by the licensee to any person for a period of not less than five years,

(a) three years after the date upon which the geophysical incentive program was certified under section 7, and

(b) at a cost to that person of not more than 60 per cent of the credit established under section 7 for each mile of minimum subsurface coverage.

(2) If a licensee, within the three-year period referred to in subsection (1),

(a) withdraws from Alberta and ceases carrying on business in Alberta, or

(b) being a corporation, is dissolved or is struck off the register pursuant to The Companies Act

he shall place in trust with a person approved by the Minister all the geophysical information and data obtained pursuant to a certified geophysical incentive program until the three-year period has expired and for an additional period of five years, and any credit held in the name of the licensee in the records of the Department shall be cancelled.

10. (1) Where a seismic survey or surveys conducted under an Interim Certificate are not completed to the satisfaction of the Minister and certification as a geophysical incentive program is not granted, all geophysical information and data obtained from the seismic survey or surveys shall be made available in accordance with section 9.

(2) Where a licensee fails to make available geophysical information and data in accordance with section 9, his licence and any credit established under section 7 shall be cancelled.

11. Any of the powers of the Minister under these regulations may be exercised by any employee of the Department authorized in writing by the Minister for that purpose.

SCHEDULE B

DETERMINATION OF CREDIT

The credit in dollars for a certified geophysical incentive program shall be calculated in accordance with the following equation:

Credit (in dollars) = 500 KM

where K is the incentive factor for the area of Alberta described in Schedule C in which the geophysical incentive program was conducted,

and

M is the number of miles of minimum subsurface coverage in that area.

Incentive Factors

For the purposes of section 7 and this Schedule, the incentive factors established for the areas of Alberta described in Schedule C are:

(a) 1 for the yellow area and the plains area;

(b) 2 for the green area; and

(c) 3 for the foothills area.

SCHEDULE C

Foothills Area

The foothills area consists of the lands in Alberta listed below and those lands within Alberta located south and west of the listed lands:

Township 1, Range 24; Township 2, Range 25; Township 3, Range 26; Township 4, Range 27; Township 5, Range 28; and Townships 6 to 11 inclusive, Range 29, all west of the 4th Meridian;

and

Townships 12 and 13, Range 1; Townships 14 to 20 inclusive, Range 2; Townships 21 and 22, Range 3; Townships 23 to 28 inclusive, Range 4; Townships 29 and 30, Range 5; Townships 31 to 34 inclusive, Range 6; Townships 35 and 36, Range 7; Township 37, Range 8; Township 38, Range 9; Townships 39 and 40, Range 10; Township 41, Ranges 11, 12 and 13 inclusive; Township 42, Range 14; Township 42, Ranges 15 and 16; Township 41, Range 17; Townships 45 and 46, Range 18; Townships 47 and 48, Range 19; Township 48, Range 20; Township 49, Ranges 21 and 22; Township 50, Range 23; Townships 51 and 52, Range 24; Townships 53 and 54, Range 25; Township 54, Range 26; Townships 55 and 56, Range 27, all west of the 5th Meridian;

and

Township 56, Range 1; Townships 57 and 58, Range 2; Township 58, Range 3; Townships 59 and 60, Range 4; Township 60, Ranges 5 and 6; Township 61, Ranges 7 and 8; Township 62, Ranges 9, 10 and 11; Townships 63 and 64, Range 12; and Township 65, Ranges 13 and 14, all west of the 6th Meridian.

Green Area

The green area consists of that part of Alberta in which public lands are classified a forest land not available for agricultural develop-

ment other than grazing by an order of the Minister of Lands and Forests pursuant to section 12 of The Public Lands Act, but does not include those lands described in this Schedule as the foothills area.

Yellow Area

The yellow area consists of that part of Alberta in which public lands are classified as being adaptable to any kind of disposition by an order of the Minister of Lands and Forests pursuant to section 12 of The Public Lands Act.

Plains Area

The plains area consists of the remaining lands in Alberta not described in the foothills area, the green area or the yellow area.

STATE OF ALASKA

DEPARTMENT OF NATURAL RESOURCES

A STUDY OF STATE

PETROLEUM LEASING METHODS

AND POSSIBLE ALTERNATIVES

A REPORT TO THE STATE OF ALASKA, JAY S. HAMMOND, GOVERNOR,
DEPARTMENT OF NATURAL RESOURCES, GUY MARTIN, COMMISSIONER,
AND TO THE
ALASKA STATE LEGISLATURE, INTERIM COMMITTEE ON OIL AND
GAS TAXATION AND LEASING POLICY, CHANCY CROFT, CHAIRMAN

FEBRUARY 1977

JAY S. HAMMOND, GOVERNOR

DEPARTMENT OF NATURAL RESOURCES

OFFICE OF THE COMMISSIONER, 11TH FLOOR, STATE OFFICE BLDG.
POUCH M – JUNEAU 99811

February 17, 1977

The Honorable Jay S. Hammond
Governor of Alaska
Pouch A
Juneau, Alaska 99811

Dear Governor Hammond:

The following report regarding State oil and gas leasing has been prepared by the Department of Natural Resources as a part of a joint Administration-Legislature effort to evaluate the present leasing system and to explore alternatives for the future. The overall study effort, for which I served as Project Director, also includes other Department documents, the reports of independent consultants and miscellaneous other information.

The information in this report, and the entire study, is intended to serve as basic background material to illuminate alternative State objectives and leasing methods which may be desirable for the future. Although some conclusions are reached in parts of the various studies, no final comprehensive conclusions or positions have been reached, pending further analysis of the results of the study project and discussion thereof.

The complexity and importance of the oil and gas leasing issue for the future of the State has thus far sustained an ideal level of constructive cooperation between the Administration and Legislature, and I am hopeful that this report will contribute to an informed outcome on this matter.

Very truly yours,

Guy R Martin

Guy R. Martin

FOREWORD

This report has been prepared in response to Departmental and Legislative interest in the methods and policies of competitive leasing of state lands for oil and gas purposes. A fairly complete history has been compiled showing pertinent information on past practices of the State. Summaries of all lease sales, bonuses, rentals, receipts and results of drilling and royalty awards are discussed. As a result of this report, it can be concluded that some types of bidding will theoretically yield greater income to the State under specific circumstances than other types will. From strictly a monetary point of view, this study reveals that four major factors will determine which method of bidding would be most advisable for the State to follow. The amount of income to be derived by the State will be determined by the level of risk, the size of the reservoir, the cost of exploration and development, and the value of the oil at the wellhead.

This report has revealed some areas that require further study and this will be done in the coming months. For example, the study reveals that with current economic, royalty, and tax conditions, the minimum size field that an oil and gas operator can afford to look for in Alaska must exceed 55 million barrels in close in areas such as Cook Inlet and could be 100 million barrels or more in remote areas. Also since special cases arise from marginal fields, more detail analysis should be made of effects of reducing royalties to encourage production in sub-economic fields.

Since the purpose of this report is to show variations that can result from various types of bidding most of the emphasis is on types of bidding

other than the cash bonus system. It should not be construed however, as condemning cash bonus bidding nor recommending any alternate type of bidding. The analyses are presented merely to show relative income under specific sets of assumed conditions. A change in some of the input factors can give substantial changes in results.

Risk is the most significant of the variables which would affect income to the State. In unknown, undrilled, untested areas, where the information level is low the risk will be extremely high and these analyses indicate that the cash bonus bidding method would yield greater income to the State. As more information becomes available and as the risk decreases, the method which yields the greatest monetary return revolves around some type of royalty bidding. After a discovery is made, any open acreage on the structure in essence becomes drainage acreage, risk will be low and royalty or some other type of bidding may yield a far greater income to the State than the cash bonus type of bidding. Somewhere then between the extremes of no information and maximum information the method yielding the greatest income probably will switch from cash bonus bidding to some other type of bidding. A significant result of this study indicates that state income can be increased for all leasing methods studied by using a percentage acreage option which is withholding a portion of the structure for later leasing. Other types of bidding are discussed to accomplish other purposes.

There are increasing pressures on government to secure more information about state lands and to know more about the possibilities of petroleum occurrences before the lands are leased. These analyses have been made on the assumption that more information will be available to the State

and if those conditions exist we feel that the values shown give reliable indications of benefits to be derived from one method as compared to another method of bidding.

Risk is dependent on the amount of information available to industry and income to the State is dependent on the knowledge industry has in an area. This study assumes that geological and geophysical information is available to the State at a level above that which it now has. Obtaining this additional information will require expenditure of larger sums of money than in the past. The reader is cautioned not to use the values shown as indicative of all conditions, because as mentioned above, significantly different results are obtained as input factors change. The uncertainty of crude oil prices in remote areas could cause input parameters to change significantly with corresponding changes in analysis results. Therefore, the information presented is to compare one method of bidding versus another method of bidding for a specific set of circumstances.

Administrative costs and number of personnel can vary greatly depending on the leasing method used. An ad valorem type of leasing could cost up to $240,000 more per year to administer where a net profits system might add $500,000 with the same number of operators and leases as we now have. In Alberta it is pointed out that 100 people administer 50,000 lease agreements and 60 people are involved with auditing in a cost sharing leasing system.

From an administrative cost standpoint, the present method of operation results in the lowest total operating cost at about $1.1 million per year. Depending on the level of data acquisition and analysis, costs will increase

from the present quarter million dollars per year. To obtain adequate seismic data for managing an area of 100 miles by 15 miles will cost from $70,000 to over $1,500,000. The present budget contains $110,000 for the purpose in FY 78.

SECTION I - GENERAL

STATUTORY PROVISIONS

Leasing of public lands for oil and gas is carried out under provisions of AS 38. Section 38.05.180(a) states as follows:

> "All tide and submerged lands, mental health lands, school lands, and university lands shall be leased by competitive bidding, and whenever oil or gas is discovered in commercial quantities the Commissioner shall determine the extent of the area of lands in addition to the tide, submerged, mental health lands, school, or university lands in the same general area of the discovery well which, by reason of the discovery, the Commissioner reasonably believes to be capable of producing oil or gas, and the additional lands shall be leased to the highest responsible qualified bidder, by competitive bidding under general regulations, in units not exceeding 2,560 acres (except that tide and submerged lands shall be leased in units of not exceeding 5,760 acres), which shall be as nearly compact in form as possible, upon the payment by the lessee of such bonus as may be accepted by the Commissioner and of such royalty as may be fixed in the lease which shall not be less than 12.5% in amount or value of the production removed or sold from the lease. All lands other than those above provided to be leased by competitive bidding may be leased competitively or non-competitively as determined by the Commissioner to be

in the best interest of the State. Non-competitive leases shall be issued in units not exceeding 2,650 acres in any one lease. Non-competitive leases shall be conditioned upon the payment by the lessee of a royalty of 12.5% in amount or value of the production removed or sold from the lease." (Our emphasis added).

Section 38.05.335(c) states, "The Commissioner shall require each bidder for the competitive leasing of oil and gas lands to submit with his bid a deposit of money equal to 20% of the amount bid."

It is therefore apparent that the present statute provides that when oil and gas leases are to be sold competitively they must be sold by cash bonus bidding and a deposit of money is required to accompany the bid. Because 38.05.335(c) provides that a deposit of money equal to 20% of the amount bid, it is not possible to bid by other methods without determining the total monetary value of the bid at the time of bidding. Accordingly, it is not possible to make bids based on any other basis than cash bonus. There is no other provision which will permit disposal or leasing of the lands for oil and gas in any other fashion at this time. In the event it is felt necessary to change the statute to permit leeway for the Commissioner to accept other types of bidding.

ADMINISTRATIVE

At this time all of the responsibility for the management of the leasing program in the State has been delegated to the Division of Minerals and

Energy Management. This division works under the provisions of AS 38 and makes recommendations on mineral leasing policies and procedures. Within the division there is a leasing section and a petroleum section. In the leasing section there is a Minerals Leasing Manager, who supervises the section and seven other employees. The budget for this section approximates $212,000 per year. It should be pointed out, however, that during past times when the State was active in leasing lands, this section had 13 employees. The decline in leasing activity has necessitated the transfer of five employees to other segments of the Division of Lands, leaving current personnel at eight. With anticipated increases in leasing activity in the future, it will be necessary to replace some of the personnel and enlarge the staff. The current staff is involved in servicing and maintenance of existing oil and gas, coal and mining claims and leases.

In the petroleum section there is a Petroleum Manager, who supervises the section which includes eight other permanent positions. At present we have not been able to fill all professional positions and two temporary employees are assisting in the petroleum work. This section is responsible for analysis and evaluation of oil and gas problems and making recommendations on future policies regarding lease sales. The current budget of this section approximates $316,000 per year including approximately $40,000 for acquisition of subsurface data. Request for next fiscal year includes funding of present positions and $223,000 for acquisition of subsurface data.

PROCEDURES

In the past decision to lease has been based upon interest of the industry and needs of the State. In at least one instance, Governor William Egan

interrupted a lease sale to announce to the audience that the State had received enough money from the bids up to that point to run the State government on through that fiscal year and that there would be no need to have additional lease sales until sometime next year. This is indicative of the interest and need which the State had in leasing its land. To follow through on the lease sale, after it had been decided that one would be held, the Department of Natural Resources solicited nominations from the industry on prospective areas that they would like to see put up in a lease sale. The interest was gaged, based on the nominations of the various companies, and the area to be included in a lease sale was pared down to a manageable area, approximating 200,000 to 300,000 acres.

Various members of the Department concerned with oil and gas matters were advised that consideration was being given to a lease sale and appropriate representatives of Departments of Fish and Game and Environmental Conservation were contacted. After many meetings, basic leasing criteria and stipulations were agreed upon and approximately 60 days before the lease sale, this information was published and made available to the industry along with the area to be included in the lease sale. All lease sales have been held for bonus type bidding. Prior to 1969, a statutory provision included an award for the first discovery on a structure of 7½ percent of all royalties paid for the first ten years of production.

Actual holding of the lease sale has been the responsibility of the Division of Lands and upon receipt of the bids, the Commissioner of Natural Resources with the aid of his staff, has determined if the bids were responsive to the advertisement and if an adequate price was received for the bids considering the information available at that time. The

Commissioner has had available all geological and engineering information on wells drilled in the State up to that time, however he has had very little geophysical information. In most of the lease sales, some bids have been rejected as being too low or non-responsive. Upon acceptance by the Commissioner money has been paid by the successful bidders into the General Fund and the leases executed by the State.

Upon issuance of the lease, the minerals leasing section, has established records and procedures to ensure that rentals are received in a timely fashion and that development occurs according to the terms of the lease. Close liaison is required with the Attorney General's office in interpreting the terms of the lease and in pursuing administrative actions to cancel leases in the event that rentals are not timely paid.

With the formation of the Division of Minerals and Energy Management we anticipate closer scrutiny of the performance of the operators and performance of the properties themselves, if production is obtained. By doing this, we hope to ensure that timely development is carried out and operations will provide the greatest recovery for the benefit of the State.

SEC. 2

SECTION II

OIL AND GAS LEASING HISTORY - ALASKA STATE LANDS

Introduction and Background

Purpose

The primary purpose of this report is to trace the history of oil and gas leasing in Alaska with primary emphasis on state lands and the legal, regulatory and practical framework under which it has developed. Special emphasis will be given to the background under which this system has been operated, so that its effect can be better understood.

Background

The history of oil in Alaska goes back to at least 1867 when the first oil claims were staked at Katalla and Yakataga. The first wildcat well was drilled in 1898 near Iniskian on the Alaska Peninsula, closely followed by the first test in the Katalla area, at Controller Bay in 1901. However, it was not until the second Controller Bay well was drilled in 1902, that the first successful oil producer in Alaska was found, a one foot sand at 250 feet. During the next 50 years, activity was sporadic with very little success. Oil wells were drilled in the Katalla-Yakataga area on the Alaska Peninsula and the Upper Cook Inlet Basin, and the North Slope. The North Slope drilling was to explore the Petroleum Reserve which was set aside by Congress in 1923. Only minor finds of oil and gas were discovered in this effort.[1]

In the early 1950's, industry interest in Alaska was revived and with the discovery of the Swanson River Field by Richfield Oil Company in 1957, the oil industry in Alaska was established. In 1956, the year before the discovery at Swanson River, there was a little over 2.8

1. Edmondson, Cameron A., A History of Alaskan Oil, Alaska Petroleum and Industrial Directory 1970-71, Pgs. 11-13

million acres under oil and gas lease in Alaska. At the time of Statehood at the end of 1958, the total had grown to 19.5 million acres, and in 1960 almost 35 million acres were under lease.

The Swanson River discovery was just one of the many dramatic events that greatly affected the future of the oil and gas industry in Alaska. With Statehood, the State of Alaska acquired large blocks of land with oil potential and immediately began leasing them. This led to major important discoveries in Upper Cook Inlet, and there was no longer any question that Alaska had a viable oil industry. The State also acquired a large block of land on the Arctic Slope in the mid 60's which it immediately leased. After several years of drilling with very discouraging results, the Prudhoe Bay discovery was made in 1968, an event which attracted attention to Alaska as no other single event since Statehood had done. Closely paralleling in time the State's North Slope activity, was the Alaska Native Land Claims issue and the land withdrawals that the Secretary of the Interior imposed as a result. These withdrawals ultimately and completely shut down federal oil and gas leasing in Alaska. There has been no significant federal uplands leasing since 1966.

Federal Leasing System It is apparent that the origin of the State of Alaska's leasing system is closely tied to federal mineral leasing laws in effect at the time Alaska became a state. There was a deliberate attempt to conform Alaska's laws to federal laws as much as possible. This is apparent in the following quote from a memo from William E. Dyer, of the Division of Lands, to Phil Holdsworth, Commissioner, Department of Natural Resources on May, 5, 1959, regarding early drafts of the oil

and gas regulations:

> "In as much as the State's statute is similar to the Federal procedures, we wonder whether or not it is too risky to introduce a program which is different from the Federal. First, state lands and federal lands will lie side by side. Two different systems might result in confusion to the public. Second, the personnel which the State will undoubtedly hire to administer the regulations will be from BLM. Such persons are already familiar with the Federal system. They would not have to be retrained in new methods. Third, the Federal regulations are long and laborious. They are long and laborious because, for one thing, they have over a period of years been developed to block as many loopholes as possible. The State might wish to take advantage of the Federal experience in that regard by using much of the phraseology contained in the Federal regulations. Fourth, there are considerable number of judicial and administrative decisions concerning the Federal regulations. These decisions would be helpful for those charged with the administration of the State regulations provided that the State regulations follow the Federal."

Mr. Dyer further noted, that Senate Bill #77, which is the basic origin of the 1959 Land Act, "might best be termed a little brother to the Federal system". In a paper prepared by Mr. Holdsworth, then the Commissioner of the Department of Natural Resources, and presented at the Fifth Annual Mining, Minerals, and Petroleum Conference, in College, Alaska in 1960, it is equally apparent that the basic State system is similar to the Federal system. The concern for making this system com-

patible with the Federal system can be easily understood when one realizes that many of the areas the State would eventually select under the Statehood Act would be under federal oil and gas leases and the leases, (under the terms of the Statehood Act), would be transferred to the State for administration. Even today, state noncompetitive lease areas are often interspersed with federally issued leases which must be administered under their terms under Federal law.

The comparison of federal and state oil and gas leasing provisions contained in the previously cited paper by Commissioner Holdsworth, Table 1, gives some of the basic provisions of the Federal leasing system in effect in 1960. For practical purposes, it is generally acknowledged that the Federal system, as it was applied in Alaska, was essentially a noncompetitive leasing system. Only two competitive sales have been held, both in the Arctic area with a total revenue of less than $430,000 dollars. The reason for the lack of competitive activity is that the Mineral Leasing Act only provides for competitive leasing when the lands are in a known geologic structure. Since essentially all the lands in the State were open for leasing at the time of the revival of interest in Alaska in the early 50's, and because terminated leases were immediately released noncompetitively on the structures that have been proven were under lease at the time the known geologic structure was established.

Thus, at the time of statehood, most Alaska lands were available for federal noncompetitive oil and gas leasing, on a first come, first served basis, for a $10 filing fee and the filing of the first year's rental.

Rental was $.50 an acre for each lease year. A lease was issued for a five year primary term with the right to one five year extension. Royalty on production was set at 12.5% by law. The basic lease statistics on federal leasing are included in Table 3, and the statistics on revenue are shown in Table 4.

It is easy to understand how leasing flourished in the late 50's and early 60's on federal lands in Alaska as a result of the success of Swanson River and the attention being given Alaska by the major U.S. oil companies. The peak in leasing of 16, 547 leases, totalling nearly 35 million acres was reached in 1960. The 1960 total included leases in the North Slope, Bethel, Yukon Koyukuk, Bristol, Middle Tanana, Copper River, Yukon Kandik, Gulf of Alaska and Cook Inlet Basins. Most of the wells drilled during that year were in the Cook Inlet Basin, primarily on the Kenai Peninsula. However, wells were also spudded in the Katalla - Yakataga area and the Bethel Basin. The previous year, wells had been also drilled in the Nenana area and on the Alaska Peninsula.2

As can be seen from Table 3, federal leasing activity peaked in 1960 and began to drop off at a rate of several million acres per year. This can be explained in part by the widespread activity throughout the State in 1959 and the success of activity on the Kenai Peninsula. This activity had generated an excessive amount of leasing which, coupled with the fact that the initial wildcats in the other basins were unsuccessful, probably account for the major drop in leasing activity. However, a contributing factor may have also been a shift in emphasis to state lands. With Statehood, the State immediately set out with an agressive

2. History of Drilling in Alaska Between 1953 and 1966, Alaska Petroleum Directory, 1966-67 Edition, Pgs. 97-119.

leasing program, primarily in Upper Cook Inlet Basin, which attracted considerable industry interest at the time.

State Leasing System

Even though the State leasing system is very similar to the Federal system, they have operated in essentially the same environment with drastically different results. As with the Federal system, the State laws have always provided for both a competitive and non competitive system.

The most significant difference in the systems, and the one that has had the most effect on revenue, is the ability of the State to classify lands as competitive. The initial Land Act, Chapter 169, SLA, 1959, provided, "all tide and submerged lands shall be leased by competitive bidding and whenever oil or gas is di covered in any well on Alaska land in commercial quantities the Commissioner shall determine the extent of the area of any lands in addition to tide and submerged lands in the same general area of the discovery which by reason of such discovery, the Commissioner reasonably believes to be capable of producing oil or gas and such additional lands shall be leased by competitive bidding." The Act was amended, Chapter 61, SLA, 1960, to include mental health lands, school lands, and university lands, in the category to be leased by competitive bidding. However, it still limited other uplands to competitive bidding only where the lands were in the vicinity of a commercial discovery, a concept very similar to the known geologic structure concept under the Federal rules. As is evidenced by the following quote, in a letter dated January 3, 1972, from Roscoe E. Bell, Director, Division of Lands, to Jalmar Kerttula, of the Alaska House of

Representatives, the State early recognized the limitations of the Federal system:

> If the wording, "whenever oil or gas is discovered in commercial quantities, "were amended to add," or where sufficient geological or geophysical data were available to provide evidence of a favorable geological structure," there would be an opportunity for the State to encourage oil and gas exploration, to shorten the lapsed time between leasing and exploration, and to materially advance the financial well being of the State by leasing competitively areas that now must be leased noncompetitively.

This letter is also a good indicator of the Department thinking on noncompetitive vs. competitive leasing at the time and a copy is included with this report under Table 2. The law was amended in 1964 to the present language which provides that the Commissioner may lease [illegible] lands competitively when he determines it to be, "in the best interest of the State."

The State was faced with a unique problem. Most people agreed that oil revenue was one of the best hopes of meeting the rising state needs. Even though the State would receive 90% of the Federal revenue from oil and gas leasing, much of the Federal revenue would be delayed because it would come in the form of future royalties. There was no significant bonus or rental monies associated with Federal leasing. With many well known potential petroleum areas throughout the State open to lease on a first come, first served basis, unique measures were necessary to attract

interest from the Federal lands to State lands. The geologic potential of the harsh offshore waters of Cook Inlet offered the most obvious potential to attract immediate development on state lands. Most of the other lands that the State had or could select immediately were under lease and would be tied up for several years in title transfer. The other offshore areas had not yet attracted much attention.

Therefore, they immediately proceeded with the leasing of Upper Cook Inlet under terms to encourage development as soon as possible and at the same time, earn revenue from the leasing. Major factors in accomplishing these objectives were the discovery royalty incentive on large lease tracts, a short lease term (5 years) and a favorable government attitude towards the industry. The first large sale in Cook Inlet, (#7 in 1961) earned nearly 15 million dollars in bonuses, and the second large sale, (#9 in 1962) earned over 15 million dollars in bonuses. As can be seen from the statistics attached to this report, these two sales alone grossed more than federal payments to the State for all of their leasing activity up to that time.

Of more significance than the lease revenue to the State's future economic wellbeing however, was that the industry immediately proceeded to explore and develop the leased areas. This activity resulted in discovery of the Cook Inlet oil and gas fields, which are the source of the present oil and gas royalty income from state lands. Four of the five oil fields in the Cook Inlet Basin, Middle Ground Shoal, Granite Point, Trading Bay, and McArthur River fields were discovered on leases issued at these sales. It was the discovery and development of these fields

along with the Swanson River field that firmly established Alaska as one of the important oil producing areas in the world.

Thus, the State system operating in essentially the same environment was able to produce considerably more royalty and lease revenue in a much shorter time and with less acreage than the Federal system. The statistics included with this report show the results of the two systems. State revenue from leasing alone through 1975, i.e., bonuses and rental, amounts to $1,066,079,564. Through 1975 nearly $210,000,000 have been paid in production royalties. This compares to federal receipts from 1959 through 1975 of nearly $5[illegible],000,000 in oil and gas rentals and nearly $66,000,000 in oil and gas royalty payments.

Description of Present System

Statutory provisions for Alaska oil and gas leasing are contained in AS 38.05 primarily in sections 38.05.130 through 38.05.180. The regulations are contained in Title 11 of the Alaska Administrative Code, under Chapters 82, 83, and 88. Under these provisions a lease may be issued either competitively or noncompetitively.

The regulations, 11 ACC 82.105, provide that all lands not required by law to be leased competitively or not classified competitive by order of the Commissioner are noncompetitive for mineral leasing purposes. Before lands are available for noncompetitive leasing they must be opened by publishing a notice declaring the lands open for lease. A notice of opening must provide a 30 day filing period. During this time any applications that are filed are considered filed simultaneously and the

top priority for the noncompetitive lease is determined by public drawing. Similarly, after lands are leased and the lease terminates the lands are again made available, unless classified competitive, through a 30 day simultaneous filing period with the winner again being determined by public drawing. Any lands that are not leased through both of these procedures become available, after the end of the 30 day filing period.

The statutes (AS 38.05.180) provide that noncompetitive leases will be for a primary term of five years and can be extended for two years if the lands are in a competitive classification at the time of expiration of the primary term or five years if noncompetitive. The statute further provides that the royalty rate shall be 12.5% in amount or value of the production and that the maximum size of the lease shall not exceed 2,560 acres. The lease shall continue until the end of its primary term or its extension and so long thereafter as oil or gas is produced in paying quantities. The annual rental rate is set at $.50 an acre and is payable in advance or the lease automatically terminates under its terms and conditions.

Noncompetitive lease terms and regulations have remained essentially unchanged since statehood, except for the classification provisions which are discussed later in this report.

The statute requires that all tide and submerged lands, mental health lands, school lands, and university lands be leased competitively. It also provides that any lands which the Commissioner determines are capable of producing oil or gas as the result of a discovery in an area

must be leased competitively. In addition, the Commissioner may classify any lands competitive where he believes it is in the best interest of the State. Competitive leases are issued under the procedures of 11 AAC 82.400. The regulations provide that the method of bidding shall be either by public auction or by sealed bids. It is generally agreed that the provisions of the regulations and AS 38.05.335 require that the high bidder be determined on the basis of the highest cash bonus submitted at the sale.

Competitive leases are issued for a primary term of ten years except in the Cook Inlet sedimentary basin where the law provides that the leases shall be for a primary term of not more than ten years and not less than five years at the discretion of the Commissioner, and continue so long thereafter as oil or gas is produced in paying quantities. The royalty rate may not be less than 12.5% in amount or value of production. The maximum lease size is 2,560 acres for uplands and 5,760 for tide and submerged lands. The statute provides a rental rate of $1 an acre, which by the terms of the lease and the regulations must be payable in advance. Some of the basic provisions under the competitive system have changed since statehood. These are discussed in detail later in this report.

Both noncompetitive and competitive leases provide that leases will be extended if drilling has commenced on or before the expiration date until the well has been completed and so long thereafter as oil or gas is produced in paying quantities. They both provide that leases proven capable of production may be extended by shutin production. Provisions for unitization and extension of leases included within a unit are also

standard to both procedures. Acreage that may be held at any one time may not exceed 500,000 acres on tide and submerged lands and 500,000 on all other lands. Producing lands in an approved unit agreement and lands operated under an approved drilling or development contract are excluded for acreage limitation purposes.

Land Availability

With the advent of the modern oil and gas industry in Alaska in the early 1950's, almost all lands in Alaska were open to oil and gas leasing except on the North Slope.

The lands on the North Slope had been closed by executive order to mineral leasing for many years. They were not restored until April 18, 1958, when all of the lands except Petroleum Reserve #4 were opened for mineral leasing. The Secretary of Interiors' opening order provided for leasing through a noncompetitive lease offering in a simultaneous filing period. This was done in a series of six offerings by the Federal Bureau of Land Management beginning in 1958 and ending in 1966. A total of 22,300,000 acres were offered with a little over 5,000,000 acres being issued as leases. See Table 12 included with this report.[3]

The next significant effect on availability of lands for oil and gas leasing was the creation of the Arctic Wildlife Range, totalling about 8.9 million acres and the Clarence Rhodes Wildlife Range, totalling about 3.1 million acres in 1960. Following this was the so called "land freeze". As a result of protests from the Alaska Natives, the Secretary

3. Jones, Daniel A., Oil and Gas Leasing On The North Slope Alaska; Paper presented at Seventh Annual Mining, Mineral and Petroleum Conference, College, Alaska, March 20, 1964. Pg. 6

of the Interior suspended issuance of oil and gas leases in 1966. Applications would be accepted but leases would not be issued. The Secretary continued accepting applications until January 17, 1969, when Public Land Order 4582 was issued withdrawing all Alaska lands from oil and gas lease applications. During the period from 1966 until the "super land freeze" in 1969, oil and gas lease applications were filed on approximately 21 million acres.[4]

The Federal land freeze did not affect state lands except that new lands could not be transferred to the State which might be made available for leasing. In addition to the tide and submerged lands that were acquired with statehood, the State acquired the right to select approximately 103 million acres. It proceeded to select petroleum lands immediately, primarily in the Cook Inlet Basin and along the fringes of the Gulf of Alaska. The North Slope lands were selected in 1964 and 1969. The 1964 block totalled approximately 1.75 million acres and the 1969 block totalled nearly 3 million acres. Most of the lands selected in 1964 were tentatively approved by the Federal government in 1964 and were thus available for leasing. Petroleum lands along the Alaska Peninsula on the Bristol Bay side were also selected in 1969, however, approval of these lands was not received until recently.

The State immediately proceeded with making newly acquired lands available for oil and gas lease, as can be seen from the sale statistics included with this report. Sales were held frequently throughout the State. The apparent policy was to lease acreage wherever significant industry

4. Simasko, Donald L., Native Land Claims and Their Effect on Leasing in Alaska, Paper Presented at 1971 National Institute For Petroleum Landmen, Pgs. 153-191

interest occured. Most observers agree that this policy continued pretty much until the large Prudhoe Bay sale in 1969. This attracted considerable attention to the importance of leasing as a revenue earner for the State and leasing decisions became increasingly more involved. Since the Prudhoe Bay sale, the only leasing activity has been in the Cook Inlet Basin primarily in areas of previous leasing.

Noncompetitive lands were immediately opened for leasing upon receipt of title to the lands from the federal government. The early opening orders made all lands available for leasing to which the State had received title up to the date of the opening order. Except for procedural changes, this practice continued up until the State noncompetitive activity was discontinued late in 1975.

Competitive Classifications

As previously noted, the statute presently provides that the Commissioner may classify any lands competitive for purposes of oil and gas leasing, when he determines that it is the best interest of the State to do so. Prior to the amendment in 1964, the statute provided only for competitive leasing of certain types of lands and lands in the vicinity of a discovery. The letter from Roscoe E. Bell, then Director of the Division of Lands, to Representative Kertulla, previously cited in this report and included herewith, is a good indicator of the thinking on this point at that time. The first classification order effective January 8, 1963, was for lands primarily in the Beluga area in the Cook Inlet Basin, as a

result of the discovery of the Beluga Gas field. Since that date, there has been a total of 23 classifications. Most of them are in the Cook Inlet Basin. All of the lands selected by the State on the North Slope have been classified as competitive and most of the lands in the Cook Inlet Basin were classified competitive as company interest developed in the areas. The classification problem was somewhat simplified in the Cook Inlet Basin because many of the areas were interspersed with lands which were competitive by law and the classifications were based largely on the desire to provide only one leasing system in the area.

Comparison Between Competitive and Noncompetitive Leasing

As a consequence of the state's policy of classifying lands competitive where significant interest was indicated (see Roscoe Bell's letter to Jalmar Kertulla), comparisons of the activity and revenue generated by the two systems probably have little meaning, except from a historical viewpoint. From a total of 183 exploratory wells drilled on state issued leases, only 12 were drilled on noncompetitive leases. None of the 12 resulted in oil and gas in paying quantities. For a complete breakdown of wells drilled, see Table 10.

Revenue statistics are equally overbalanced. Approximately $10,392,730 of the total $37,826,590 rentals through 1975 were received from noncompetitive leasing. In addition, approximately $2,647,760 have been received in filing fees from applications in simultaneous filing periods. All the bonus and royalty income has been from competitive leases with exception of minor royalty income from transferred federal leases.

In 1972, an area on the Kenai Peninsula which had previously been under

competitive classification was reclassified to noncompetitive. Competitive interest had been low in the area for several years, and even when areas were leased, bonus was not high. One of the highest interest areas when they were opened to application after the reclassification was Township I North, Range 12 West, Seward Meridian. Nine tracts in this township earned from $1.13 per acre to $11.00 per acre in filing fees. In comparison, the most recent competitive sales in that township drew bids of high bonus from $2.00 to $3.34 per acre.

A similar comparison can be made for areas on the lower Kenai Peninsula, which have always been noncompetitive except for interspersed lands which are competitive by law, i.e., school, university and mental health. Results on Township 3 South, Range 14 West, Seward Meridian, one of the more active filing areas, noncompetitive leasing earned from $.75 to $20.00 per acre in filing fees with most recent competitive sales in the township earning from $3.15 to $7.67 per acre in bonus.

It is also interesting to note that lands had been available for competitive leasing in both of these townships in previous sales but had not been nominated for lease, or had not been leased after being offered. The failure to lease through the competitive system would be higher in areas of less interest. This offers support to one of the common arguments for noncompetitive leasing that considerable revenue can be earned from lands that would not otherwise be leased.

Discovery Royalty

The original state land act provided for reduction of the royalty rate

to 5 per cent for the entire lease for ten years following the date of the discovery, for the first discovery of oil or gas in commercial quantities in any geologic structure. This provision was deleted from the law in 1969. To date, only 8 leases have been certified for discovery royalty; however, there may eventually be additional certifications since there are still active leases which were issued before the 1969 law change. See Table 9 for a listing of the certifications.

At the time of statehood, the federal law provided a 5% discovery royalty incentive for federal leases in Alaska issued prior to May 3, 1958. Many federal leases, especially in the Cook Inlet basin, were subject to the discovery royalty provision at the time of statehood. Thus, it was necessary for the state leases to carry a similar provision to be comparable. Most observers agree that the discovery royalty incentive in Cook Inlet on large lease tracts was a very significant factor in the early drilling and development of that area. The 10 year period for all of the leases certified in Cook Inlet has now expired. The total difference between actual payments on discovery leases and the 12½% rate amounts to $8,754,000 for the 5 offshore leases involved. The total would have been much greater except that the first discovery on the Trading Bay structure was on one of the low quantity producing leases on that structure.

The reduced royalty rate for the discovery lease in the Prudhoe Bay field expires on December 31, 1977. Since production is not scheduled to commence until mid 1977, it is apparent that very little discovery benefits will accrue to this lease.

Bidding Methods

All state sales have been by sealed bid with the bidding variable being the highest cash bonus offered for the lease.

The original land act provided that competitive bidding would be "under general regulations" adopted by the commissioner. A statutory provision was adopted in 1966 to specifically "require each bidder for the competitive leasing of oil and gas lands to submit with his bid a deposit of money equal to 20 per cent of the amount bid", AS 38.05.335(c) (emphasis added). Thus, prior to the 1966 statutory change, the regulations controlled the bidding procedure, but after the law change it was apparent that a system very similar to the cash bonus bidding system was dictated.

The original oil and gas leasing regulations provided that the method of bidding be by sealed bids or at public auction by cash bonus, that the lease shall be awarded to the responsible qualified bidder offering the highest cash bonus, and that the bids must be accompanied by cashier's or certified checks, money orders or cash of at least 20% of the amount bid. These regulations were interpreted to only allow a bidding system where the only bidding variable was cash bonus. The regulations remained essentially unchanged in this regard until the 1974 revision, the last revision. The present regulations are much more general in bidding procedures, but the statutory limitations still apply.

The only alternative bidding method the record indicates has been considered is alternate or slide bidding. At a hearing held in Anchorage on June

30, 1969, the department asked for public input on the possibility of using a system similar to the "alternate" or "slide" bid system used in Canada for the 1969 Prudhoe Bay sale. Under the proposal, bidders who were unsuccessful on a tract would have been allowed to "slide" their bid to another tract. This method was explored as a possilbe method of allowing each bidder to use all his available money for the sale to his best advantage. The theory being that significant bidders might not have enough money to bid as high as they would like on all tracts. With the ability of "sliding" bids to alternate tracts, the possibility of pyramiding money on a few tracts was a possible benefit of the Canadian system. The availability of money did not prove to be as big a factor as originally anticipated. It was felt that the major bidders would be able to secure enough money to make their best bid on the major tracts in which they were interested and that the system would therefore not result in higher bonus revenue. The system was not adopted for this and other problems with the system, such as complicated mechanics of bidding and sale administration, the difficulty of public understanding and the possiblity of charges of collusion between the bidders and the state. The oil industry was also almost unaminously opposed to it.

Royalty

Royalty on noncompetitive leases has always been set by law at 12½%. Competitive leases may be issued with higher royalty rates since the statute has always only provided the minimum royalty rate of 12½ %. The first sale that utilized a higher rate was sale #28 in the Cook Inlet

basin. The rate used in this sale and in the last sale in this area was 16 2/3%.

Tract Sizes

The original land act provided a maximum tract size of 5760 acres for tide and submerged lands and 640 acres for all other lands. The law was revised in 1964 to increase the maximum size of upland tracts to 2560 acres.

The trend in the early offshore sales was to large tracts. Tract size in sale numbers 7 and 9, the first large Cook Inlet offshore sales, averaged 3760 and 3546 acres, respectively. There were many tracts over 5000 acres in size in these sales. The standard changed soon after this, however, to a four section block concept (about 2560 acres) when existing land patterns would allow.

Minimum Bid

Minimum bids have not been prescribed for any of the lease sales, except that most sales have provided that a bid of less than one dollar per acre will not be considered, primarily for the purpose of preventing nuisance bids. This provision was dropped in the 23rd sale (the 1969 Prudhoe Bay sale) and several insignificant nuisance type bids were received which caused considerable administrative expense, primarily legal, to resolve.

The regulations have always provided that the state may reject all bids on a tract when determined to be in the best interest of the state. Bids have been rejected in five of the sales under this provision. One high bid was rejected in the 8th sale, 8 rejected in the 9th sale, 3 rejected in the 14th sale, 33 rejected in the 21st sale and 15 bids rejected in the 23rd sale.

Conditional Leases

To avoid a long delay in development, the Statehood Act provided that upon receipt of tentative approval from the Federal government, the State could issue conditional leases on the land. There is often a long period between the determination of availability of the lands for state acquisition and the actual issuance of patent, primarily because of the survey problems.

A law was passed in 1960 to provide for extension of a conditional lease for a period equal to the period during which the lease was conditional. Almost all the Prudhoe Bay development was during the conditional period of the leases. The first leases were issued effective early 1965, but the first patents were not received until 1974. Thus, many of the leases in this area were extended for nearly ten years. Because of this development it was apparent that a conditional lease was not a deterrent to exploration and development and the extension provision was deleted from the law in 1969.

Lease Forms

The basic provisions of both of the lease forms have remained essentially the same. There have been several updates to conform to statutory changes and to correct errors. The original competitive lease form, DL1, was adopted late in 1959 and was revised April 1961, October 1963, April 1971, May 1973 and September 1974. The 1961 and 1963 revisions were apparently to correct typographical errors in the original form. The 1971 revision deleted the reference to water use in the granting clause to be consistent with the Water Use Act, AS 46.15; deleted the clause granting a conditional lease extension to be consistent with deletion of the provision from the statute; deleted the discovery royalty clause for the same reason and added a directional drilling clause and an employment clause regarding hire of Alaska residents.

The noncompetitive lease form, DL2, was first used in 1960 and was revised April 1961, May 1962, and May 1966. The changes in the non-competitive form were comparable to the changes in the competitive form.

Environmental Controls

When Alaska started its oil and gas leasing program, there were essentially no controls on oil and gas lease operators, except for controls on actual well drilling practices by the U.S. Geological Survey and under the Alaska Oil and Gas Conservation Commission. An operator could explore and develop on federal and early state leases without any approvals from other state or federal regulatory agencies. Operation on federal wildlife ranges such as the Kenai Moose Range were an exception. Very stringent surface use requirements were applied in these areas. When the state

started leasing offshore, however, as a result of concern by fishermen in Cook Inlet, they realized the need for more controls for tide and submerged land locations. A standard wildlife stipulation was adopted in August 1962 for inclusion in all offshore oil and gas leases. This stipulation required the written approval of the Department of Natural Resources "for the location and type of each structure before it is erected on tide and submerged lands". The stipulation was similar to the one that is presently used in all leases. Since 1968, a similar stipulation has been included in all leases issued, including both competitive and noncompetitive. In 1970, all lessees were ordered to obtain approval in accordance with the standard stipulation, even if the stipulation had not been included at the time the lease was issued. All operators have complied with this order.

There was also no control over seismic operations at the time of statehood. Neither the state or federal governments required permits or provided operating guidelines. except in wildlife ranges and park lands There was considerable public concern expressed in the late 1960's over damage done by seismic and other geophysical operations, and in 1968, the State Senate adopted a joint resolution requesting the department to adopt regulations. The primary concern was over excessive clearing of trails, damage done during trail construction, debris, damage from repeated use of the same trails, particularly in Arctic areas during the summer months, and disturbance and damage to fish and game resources.

Regulations requiring permits for all seismic operations were adopted

late in 1969. Since then, the major concerns have been taken care of by requiring operators to operate only during periods which will prevent or minimize disturbance, utilize existing trails when possible, remove all debris, utilize equipment which will do the least damage in cross country travel, avoid critical fish and game areas and rehabilitate any disturbed areas. In addition, the operators have gone back and cleaned up some of the debris left over from the past operations.

The state regulations are primarily for environmental control and operators are not required to file survey results. They are required, however, to file the location of trails, camps and seismic lines to facilitate field inspection.

Administration

The Minerals Section in the Division of Lands was the agency primarily responsible for the administration of the state's oil and gas leasing program until October 1976. The program received technical support and direction from the Division of Oil and Gas, and, to a lesser extent, the Division of Geological and Geophysical Surveys. Field surveillance support was also provided by the Division of Lands' District offices. The activity was consolidated with all the land owner mineral functions in a new division the Division of Minerals and Energy Management in October 1976.

The original Minerals Section had responsibility for all coal and locatable mineral activities on state lands, in addition to oil and gas.

They reached a peak of 13 employees in 1962, which gradually decreased to the total of 9 authorized positions at the time of consolidation into the Division of Minerals and Energy Management. There are no exact figures on the number of positions involved with the state leasing program in the other divisions, but it probably has not exceeded four, based on the number of positions transferred in the consolidation. In addition, less than two positions have been directly involved in the two mineral active district offices.

The administration of the present system is simple because of a well understood, highly predictable, and to a large extent, self executing legal and policy framework. The past administration of the present system placed considerable dependence on the "market place" to insure a fair return to the state for its oil and gas resources, thereby requiring a minimum of administrative expense and discretion.

TABLE NO. 1

COMPARISON OF FEDERAL AND STATE OIL AND GAS LEASING PROVISIONS*

Provision	Existing Law (Federal Lands)	HR 10455 (Federal lands)	State Law (State Lands)
(1) Maximum allowable acreage under oil and gas leases and options held by any one person or corporation (excluding leased acreage committed to cooperative or unit plan of development).	100,000 acres under lease and 200,000 acres under option	300,000 acres under lease & option, but not more than 200,000 acres under option, in each of 2 leasing districts.	500,000 acres on tide & submerged lands, plus 500,000 acres on uplds., without regard to lease or option status.
(2) Term of noncompetitive oil and gas leases.	5-year primary term with right to one 5-year extension	10-year primary term-no extension	5-year primary term with right to 1 5-year ext.
(3) Extension of lease term if actual drilling is underway at expiration date.	None provided	2-year extension	Extension until 90 days after such drilling has ceased
(4) Annual rental noncompetitive leases	50 cents per acre first year; 2nd and 3rd years waived; 25 cents per acre for 4th and 5th years; 50 cents per acre for 6th thru 10th years	50 cents per acre per year	50 cents per acre per yr.
(5) Royalties - (Minimum royalty of $1/per acre in lieu of rental after discovery of oil or gas).	Noncompetitive 12½% Competitive Not less than 12½%	Noncompetitive 12½% Competitive Not less than 12½%	Noncompetitive 12½% except that royalty shall be 5% on production from lease containing discovery well on new geologic structure for 10 years following discovery date. Competitive Not less than 12½%, except that royalty shall be 5% on production from lease containing discovery well on new geologic structure for 10 years following discovery date.

*Taken from a paper presented at the Fifth Annual Mining, Minerals and Petroleum Conference by Phil R. Holdsworth, Commissioner, Dept. of Natural Resources, April, 1960

TABLE NO. 2*

January 3, 1962

Mr. Jalmar Kerttula
Alaska House of Representatives
Star Route
Palmer, Alaska

Dear Mr. Kerttula:

This is in response to the question raised by you in my office as to what changes in law would be required to give the Commissioner of Natural Resources more authority to declare lands competitive for oil and gas leasing. The law now provides, Section I, Article 8, Chapter 169, SLA 1959, "As hereinafter provided, lands may be withheld from lease application on a first-come, first-served basis, and offered only on a competitive bid basis when determined by the Commissioner to be in the best interests of Alaska." Thus, the Commissioner now has the authority to open the land for competitive bidding, but as provided in Section I, Article 8, (7)a, "All tide and submerged lands, mental health lands, school lands, and university lands shall be leased by competitive bidding---------- and whenever oil or gas is discovered in any well in commercial quantities, the Commissioner shall determine the extent of the area of any lands in addition to tide, submerged, mental health lands, school or university lands in the same general area of the discovery well, which by reason of such discovery the Commissioner reasonably believes to be capable of producing oil or gas, and such additional lands shall be leased by competitive bidding."

If the wording, "whenever oil or gas is discovered in commercial quantities," were amended to add, "or where sufficient geological or geophysical data are available to provide evidence of a favorable geological structure," there would be an opportunity for the State to encourage oil and gas exploration, to shorten the lapsed time between leasing and exploration, and to materially advance the financial well being of the State by leasing competitively areas that now must be leased noncompetitively. At the same time it would not eliminate noncompetitive leasing in wildcat areas where geological or geophysical exploration has not been conducted.

Perhaps it would be worthwhile to review what has recently happened in the last noncompetitive area in the Tyonek. Because there were no producing wells in the area, and because the land was acquired under the general grant provision of the law, we could not offer to lease competitively even though intense interest was expressed by oil companies and suggestions were made by some company representatives that they would consider providing the State with geological and geophysical data if the land could be leased competitively.

We offered 82 tracts of approximately 2560 acres each during a 30 day simultaneous filing period. Following are the results of the opening, as compared with what might have been expected under the above legislative language:

	As Held Under Present Law and Regulations	Probable - If Legislation Were Amended
Total number of leasing tracts,	82 of 2560 acres each	Approximately 320 of 640 acres each
Number of applications or bids per tract	15 - 703	0 - 10
Number of applications or bids from oil companies	1 - 30	0 - 10
Number of tracts leased noncompetitively to date	80	Probably 220
Number of tracts leased competitively	None	Probably 100
Application fees Received	$267,640	$100,000
Cost of Processing	$ 50,000	$ 20,000
Rentals, noncompetitive @ 50¢/acre	$ 96,087	$ 64,087
Rentals, competitive @ $1.00/acre	None	$ 64,000
Bonus Bids	None	$7,990,000
Total State Revenue	$313,727	$8,198,087

The bonus bids were estimated at the same average per acre rate as those received from the nearby Tyonek mental health sale, or $124.85 per acre. It is believed the past experience in the mental health area might be somewhat comparable, although this cannot be verified. At least for discussion purposes it may be assumed that the mental health sale is a fair indication of the value of the land in the nearby noncompetitive area, providing you applied these values to lands considered to be sufficiently valuable by operating companies that they would nominate

them for competitive bidding and back up the nomination with sufficient geological or geophysical data to convince the Commissioner of their oil and gas potential.

It is a known fact that leases actually have been assigned at three to seven dollars per acre with a three to seven per cent overriding royalty. As long as only three of the 82 leases were drawn by and issued to operating oil companies, it may be assumed that most of the leases will be assigned, in fact, 25 leases totaling 63,026 acres have already been assigned.

It can hardly be said that this so-called "noncompetitive lease openint" was in any sense actually noncompetitive. The tabulation below demonstrates that it was highly competitive since one to thirty (or an average of twelve) oil companies filed on each tract along with the hundreds of other persons who filed:

Tract #	Oil Com. App.	App. Filed	Tract #	Oil Com. App.	App. Filed
S-13-4-1	7	67	S-13-5-1	19	309

43	23	586
44	26	632
45	29	703

From suggestions made by industry representatives, and from the number of applications filed by oil companies, it may be fairly assumed that sufficient geophysical or geological information was available to have justified substantial competitive bidding on at least one third of the tracts, if it had been possible for the State to offer selected lands competitively.

It should be noted also that competitive bidding, especially where bids are high, results in immediate action in exploration; witness the road building and drilling which has occurred in the Tyonek during the seven months immediately following the sale. On the other hand, the period immediately following noncompetitive leasing is occupied with negotiation of assignments to put together a large enough "package" (twenty to thirty thousand acres), to justify geological or geophysical exploration prior to drilling. If there were the possibility of self protection by competitive bidding, exploratory work would be carried out prior to leasing so that the company could properly evaluate bidding levels.

Any proposal for extension of competitive leasing will be objected to by some companies and many independents because it represents a change and because the "small man" cannot compete with the large companies in seismic exploration, or in dollars paid at the sale, thus, he must depend upon chance and skillful negotiation to block up acreage.

In strictly noncompetitive wildcat areas noncompetitive leasing and independent activity to "package" acreage may serve to promote exploration and ultimate development, thus, there is much to be said for preserving the noncompetitive system. The limited authority provided to the Commissioner by the above suggested legislative language would result in much land being left open to noncompetitive bidding, and probably would adequately protect the "small man". At the same time, the "undue enrichment" of a few individuals who contribute little or nothing to development could be replaced by substantial additional revenues for the State, without necessarily increasing the cost to the oil companies because, as I have pointed out above, the companies compete to buy individual assignments after a noncompetitive opening. The prices may be substantial on individual tracts - in the last sale amounting to more than $20,000 per tract. In addition, the landman for the company may have to expend a great amount of time and travel to different parts of the United States to complete the negotiations for a block of land.

I trust these thoughts will be of value to you. All that I have said above supports your expressed belief that it would be in the State's interest to increase the authority of the Commissioner to classify lands as competitive.

I shall be glad to discuss the subject further when you are in Anchorage. So that Commissioner Holdsworth will know of your interest, I am sending him a copy of this letter.

Very sincerely yours,

Roscoe E. Bell
Director

REB:dfo
cc: Phil R. Holdsworth, Commissioner

TABLE NO. 12

NORTH SLOPE

FEDERAL LEASING HISTORY*1

PLO 1621 restored PLO 82 to mineral leasing on April 18, 1958. This order provided for leasing through noncompetitive lease offering in a simultaneous filing period. This was done in the following order:

Drawing Date	Acreage Offered	Tracts Offered	Tracts Rec'd Offers	Offers Received	Acres Leased*2
1958	3,400,000	1364	608	-	1,520,000
6/11/64	3,600,000	1440	1000	14,725	2,500,000
5/13/65	4,000,000	1558	268	31,431	670,000
11/19/65	"	1960	148	1397	370,000
1966	3,000,000	1247	7	8	17,500
12/30/66	4,300,000	1817	215	500	537,500*3
Total	22,300,000				5,615,000

*1 Adapted from August 21, 1968 Alaska Scouting Service Report

*2 Estimated on basis of 2500 acres per parcel

*3 Leases not issued because of "land freeze"

THE SENSITIVITY OF STATE PETROLEUM INCO
TO VARIOUS LEASING METHODS

SECTION III

SUMMARY

Four leasing methods and one option were analyzed in detail. Economic analyses were run on a computer for each of the studied leasing methods. Model field sizes used, ranged from 100 million to 5 billion barrels of recoverable oil. An analytical comparison shows that state income (immediate, long range, and discounted) varied considerably depending on the leasing method. However, different leasing methods have other advantages and disadvantages to the State such as to encourage or discourage investment capital, exploration, field development, production rates, economic field life, and competition at leasing auctions. The results of this study clearly indicate there is no "one-best-method" of leasing. The data does show that knowledge of the potential petroleum structure is essential and that leasing methods need to be tailored to the structures being leased and to the State's needs.

Bonus bidding maximizes immediate income to the State and is discussed on page II - 20. Sliding scale royalty with cash bonus bidding provides lesser immediate income to the State than does bonus bidding, but provides greater total income to the State as can be seen on Figure II - 10, page II - 22. Royalty bidding and Net Profits Bidding (both with fixed cash bonus) are similar as far as the income stream provided to the State; they generally provide the least immediate income but greatest amount of total income to the State of Alaska - this is shown on Figure II - 12, page II - 25. (Royalty Bid and Net Profits Bid provide increased state income by reducing Federal income tax and by reducing the amount of Oil Company Investment on which a rate of return is to be made.)

A significant result of this study is that State income can be increased for all leasing methods studied by using a percent of acreage option. This option consists of acquiring sufficient knowledge to intelligently withhold some of a structure when leasing.

As is shown in Tables II - 1 and II - 2 pages II - 27C and 27B, bonus income to the State was increased from 48.1 to 174.9 million dollars for our field model with 600 million barrels recoverable oil. This is an increase of 131.1 million dollars.

INTRODUCTION TO THE SENSITIVITY ANALYSIS

Petroleum Development and Past Leasing Policy. In the 74 years that have elapsed since the first commercial oil was found in Alaska at Katalla, the State has seen wave after wave of explosive development crash upon its shores, followed by the inevitable receding wave of bust and recession. After petroleum was found at Swanson River in 1957 (a major oil field of 218 million barrels of recoverable reserves), Alaska was catapulted into the petroleum era and the resulting series of petroleum lease sales have changed Alaska's economic emphasis from hard minerals to oil.

As Alaska moved into the petroleum scene, it found itself in the unique position of being the late comer to the party and winning the door prize. Alaska found that it possessed a great wealth of petroleum at a time when the other states and the Federal government were closing the curtain on the final act of their petroleum resources. The nation has managed to use the majority of its oil and gas resources in seventy years and now finds production falling with demand increasing - a grim situation, to say the least.

Alaska is therefore in a crucial position concerning the national and world energy crisis. The State has over 50% of the nation's remaining potential reserves, and the majority of these reserves lie on Alaska's Continental Shelves and uplands of the State. The nation is now moving to the OCS to develop the last oil resources, and Alaska with 560,000 square miles of shelf has more oil potential area (70%) than all of the other OCS areas

combined. This means that world and Federal actions, native development and state needs will be key factors in the State's future petroleum policies.

Political, economic, environmental and social requirements are now being considered as part of the State's needs, a much more complicated situation than earlier years and certainly more controversial. This report will concentrate on various methods of leasing petroleum lands. The decision of whether to lease or not, and when to lease, are basic policy decisions beyond this report. HOW to lease in light of the changes of recent years is a difficult and complex problem. This study will attempt to analyze some options and insight into this aspect of our natural resource management.

The present state leasing system was initiated in an earlier era when the major leasing consideration was in maximizing the current revenues to the State. Petroleum was leased upon a single variable - the initial cash bonus. In general, this system was effective and workable. It provided the State with the necessary revenue to move from dependence upon the Federal government to true statehood and provided impetus to establish an oil industry in Alaska.

With the 1969 Prudhoe Bay lease sale, the construction of the Alyeska Pipeline, and other changing economic and social circumstances, the public is becoming more interested in future leasing methods.

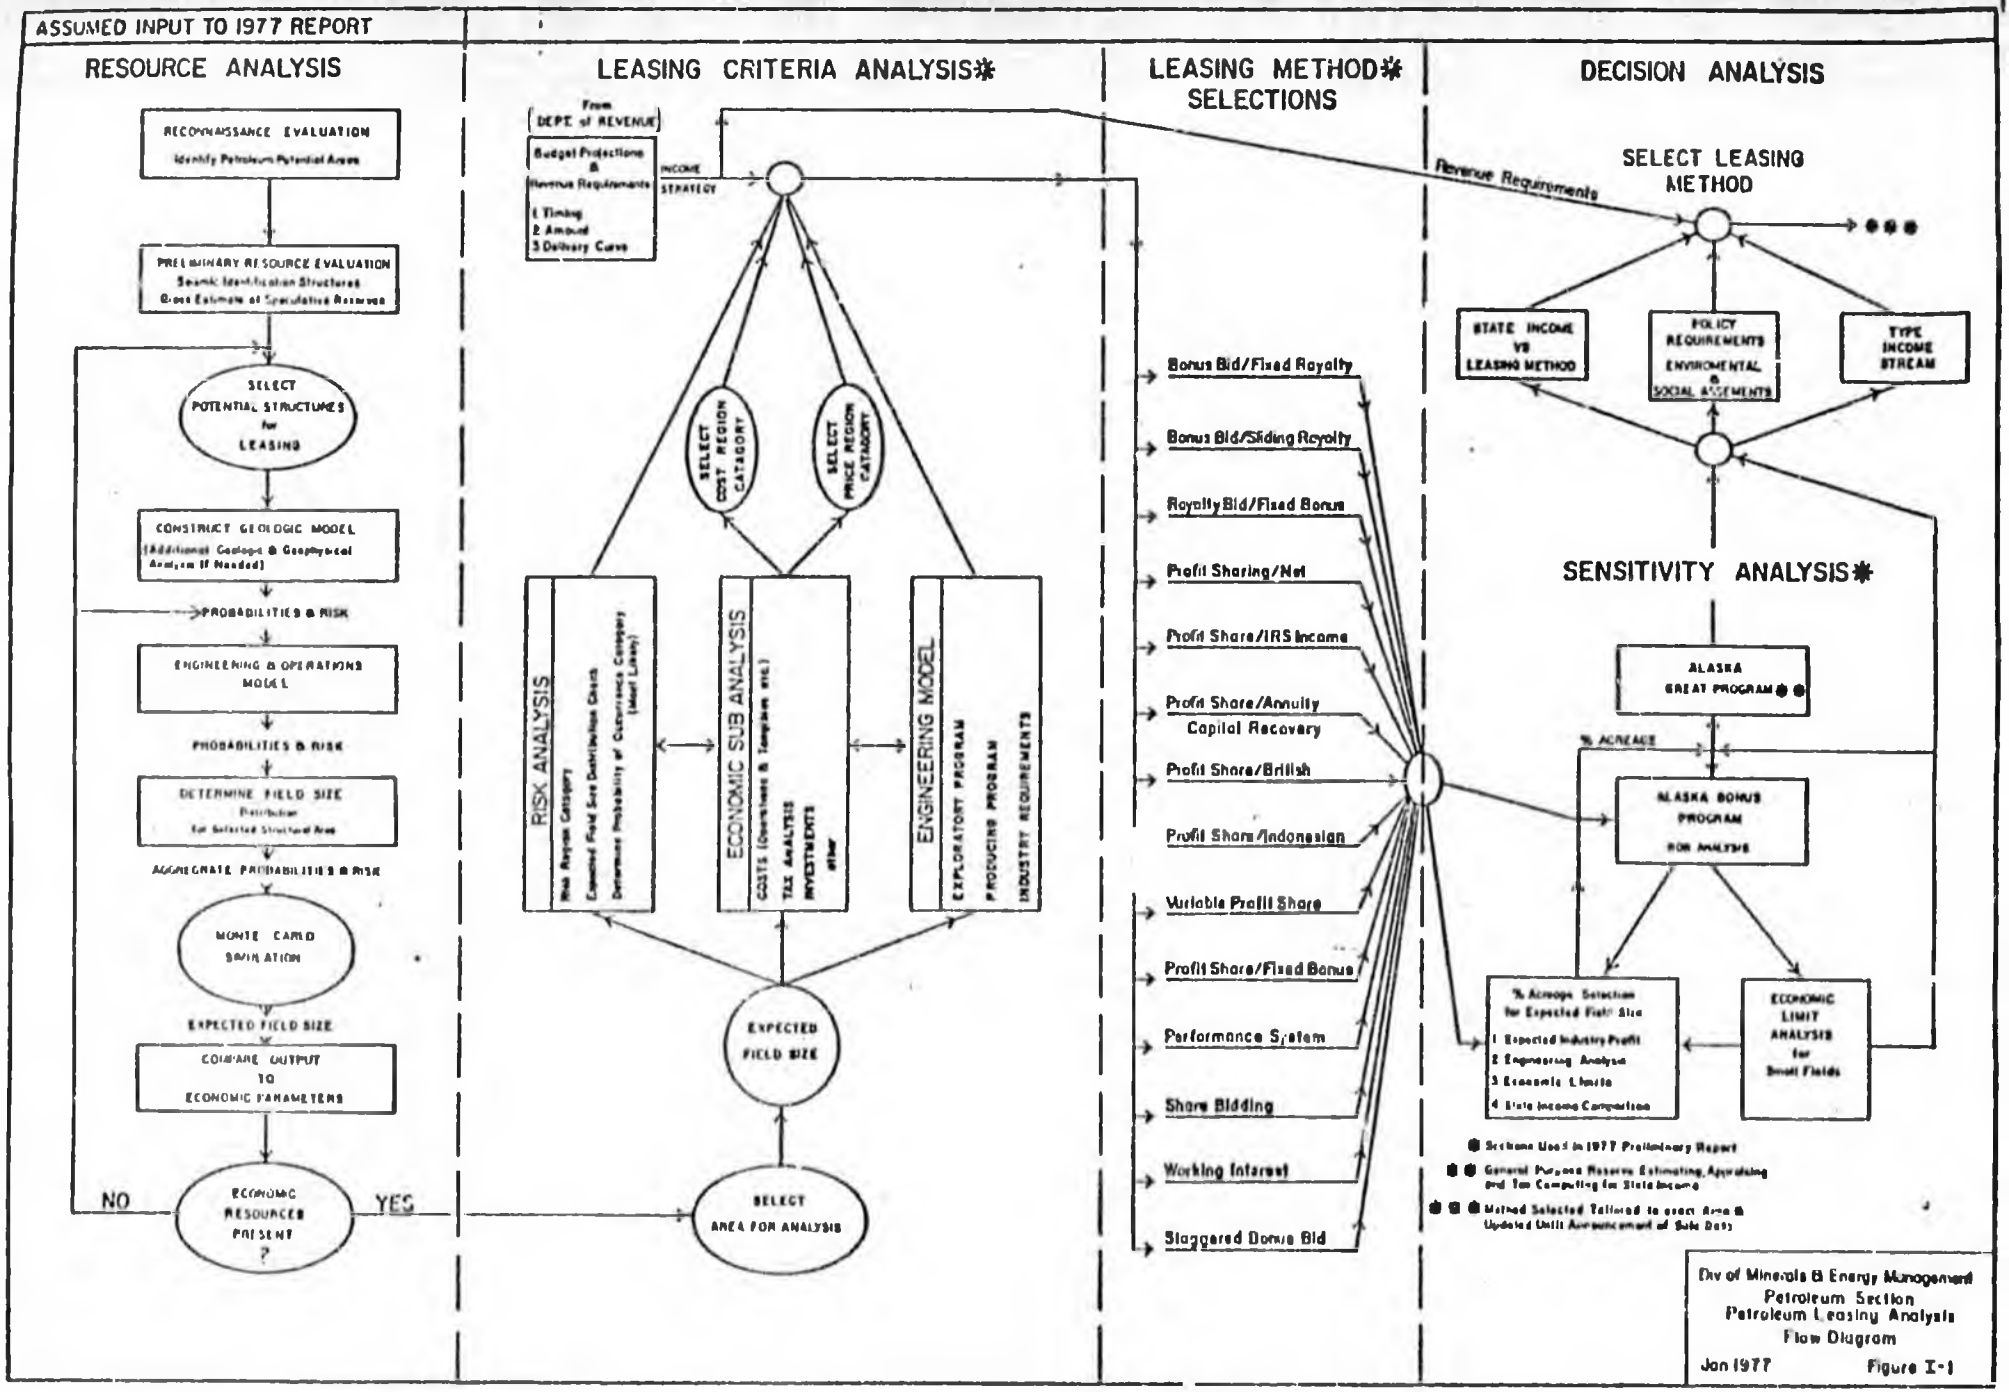
Management implies benefits, but it requires knowledge, and it assumes risks. This leasing study indicates that the State may achieve greater economic benefits and the ability to take these benefits when the State needs them if we undertake a managed leasing system. But what is a managed leasing system? If we ACQUIRE KNOWLEDGE of the key factors needed for leasing, ESTIMATE THE RISK in making a decision based on this knowledge, then MAKE THE DECISION THAT WILL GIVE US THE BEST CHANCE OF ULTIMATE GAIN we are "managing".

In our specific case of leasing petroleum we have found that we will need, (1) knowledge of the resource (gained from geologic, engineering and economic research), (2) Understanding of the risk of finding oil and of finding a certain amount of oil, and (3) the ability to choose the best method for capitalizing on knowledge and risk (right time, area and method to lease; in other words a flexible leasing method).

Our Leasing Analysis has shown that income to the State is extremely dependent upon risk and the type of risk we're dealing with is partially a function of knowledge. We have found that if we can quantify the risk, we will be able to lease to our advantage and a leasing program can be tailored to accomplish this.

Leasing Policy Problem. We have approached the leasing problem in the following manner. KNOWING where the potential petroleum may be located and estimating the amount of petroleum is fundamental to the determination of risk. This information is also essential for long range planning, economic projections, budgeting, and many other natural resource development issues. The Resource Analysis section of Figure I-1 indicates the steps involved in obtaining the resource knowledge needed for a State Resource Management analysis.

THE ALASKA RESOURCE EVALUATION & LEASING SYSTEM



The resource analysis steps shown, comprise a broad based statistical - analytical approach. The amount of exploration information used would be kept to a minimum. Only enough data would be gathered to determine the distribution of the large potential oil and gas fields, the gross expected value reserves of the fields and to ascertain the probabilities of finding petroleum.

The Division of Minerals and Energy Management is tasked with the "Resource Analysis" and would provide the "Expected Field Size" needed for a Resource Management Analysis. This study begins with an expected field size and assumes that adequate knowledge is available for the basic pre-leasing management decisions.

Since we cannot manage without knowledge, our only other option is to lease by an open bidding system that permits anyone to bid at competitive auction and establish a true value between the parties on that day. In retrospect this may prove to be either beneficial or detrimental to the best interests of the State.

Determination of Risk. The need to recognize the effects of uncertainty associated with oil and gas leasing, exploration, and production, especially in frontier areas, lead to the use of expected value as the method of accounting for risk and uncertainty. The probabilities of finding a certain amount of petroleum are determined using modern computer technology. This "Risk" oil field is then fed into a RISK determination analysis that accounts for the uncertainties that affect income such as costs and prices. Finally Risk is again considered in the economic computer program, so that the final output is the EXPECTED dollar income to the State from a chosen leasing procedure.

Decision Analysis. The final step in a resource management analysis would be to compare the economic results of the resource analysis with budgetary requirements, environmental and service needs, and policy guidelines. A decision on when, how, where, and how much of the resource to lease would then be made.

With the formation of the Division of Minerals and Energy Management, the State now has the technical ability to undertake a resource management analysis.

The Leasing Sensitivity Study. The questions naturally arise, should we manage? Is it worth it? To find the answers we have used models to determine the sensitivity of state income to various leasing factors. Since the leasing method is the factor over which the state government can have the greatest possible control, we have compared various leasing methods against the key income variables of RISK, FIELD SIZE, COST, AMOUNT OF ACREAGE and PRICE OF OIL.

Five potential oil field sizes, small, medium, large, subgiant, and giant, were selected as being representative of the range of potential hydrocarbon fields remaining in Alaska. Cost regions and price regions were selected as were various probabilities of success. (Details of these key factors are given in Appendix A, C & D).

Each combination of oil field size, cost region, and probability of success was analyzed using an appropriate computer model. Likely bid variables (bonus, royalty or profit share) were estimated by performing a discounted cash flow analysis of the exploration, development, and production of a field

from an oil company's point of view. Sensitivity analysis procedures were used to determine a profile of bid variable versus expected rate-of-return. Using the value for the bid variable which yields the target rate-of-return, the cash flow to the State was projected via computer simulation for various size fields, cost regions, risk conditions and State income. All of these variables fluctuate with each bidding method. Bidding methods are described in Section VI. Special versions of GREAT, a widely used petroleum economics system developed and supported by Garrett Computing Systems, Inc. of Dallas, Texas, were prepared to fit the specific needs of the State.

Natural Gas Fields. The exploration and discovery of natural gas fields has been considered and our decision was to evaluate the sensitivity of natural gas fields to leasing at a later date. The uncertainties at this time of prices, markets, transportation systems and many other factors would have called for a risk analysis -- sensitivity study even greater than the one we have used for oil.

If we are to have flexibility in leasing, the oil sensitivity analysis has plainly demonstrated a need. The evidence being what it is for chance, we prefer to undertake the gas study as a direct consequence of our lease planning system and will begin work on this project in the near future.

The results of the oil field sensitivity study are very conclusive. Proper management in leasing will lead to higher income for the State at the risk we assumed. If the probability of occurrence is higher than we have assumed the resulting income to the State in all cases will be higher. If it turns out to be lower than we have assumed, the income will be lower in all cases.

Since evaluation of the produced gas depends on several variables the effects of solution gas are not handled separate from oil in this analysis. The effects on the study are in the order of less than 1%.

SENSITIVITY ANALYSIS OF SELECTED LEASING METHODS

Various specific parameters are important to an analytical study of income from various leasing methods. These parameters are discussed in the following sections and are briefly identified here.

A sensitivity analysis of leasing methods must include all income to the State from the leasing and production of petroleum properties. These include bonuses, royalties, various production and property taxes and state income tax. These income sources are explained more completely in the section titled "State Petroleur Income Sources".

A discussion of leasing methods must include an analysis of the oil field models used in the study. As was done in this study, the models used should be based on existing Alaska oil fields. Parameters of field size (reserves), investments, operating costs and production rates were based on actual Alaska fields. The models used in this study are described in the section "Expected Petroleum Field Models".

The Chance of Finding The Expected Field Size (a following section) is important to the validity of any study which is based on analytical comparisons. National field discovery statistics, modified by Alaska data, is used to develop field sizes and probability of finding the expected size field.

Income from any venture is dependent on the risks involved. State petroleum income varies directly with the risks involved. The concepts of risk and how it affects income is discussed in the following sections titled "The Risk Factor" and "Importance of the Risk Factor".

STATE PETROLEUM INCOME SOURCES

Since statehood, at the present, and for the forseeable future, petroleum revenues have constituted a major portion of the State's income. These revenues accrue from leasing bonuses, royalty interest, severance tax, conservation tax, advalorem tax rentals, and from State income tax.

The State has been leasing potential petroleum lands at 12.5% royalty by soliciting sealed cash bonus bids (the State's last lease sale was at 16 2/3% royalty but that sale in "Katchemak Bay" sale has been environmentally questioned, and the State is now negotiating a buy-back of the leases. The royalty represents the State's retained interest in the oil and gas. The bonus constitutes the amount of money a bidder is willing to pay for the privilege of exploring for petroleum and for the privilege of developing and producing the oil and gas which may be found.

The State commonly collects four different types of taxes from the oil companies which are actively engaged in the production of oil and gas in Alaska. The severance tax is based on gross value of production, the conservation tax is based on the amount of oil and gas produced, the advalorem tax is based on the value of oil and gas property, and the state income tax is based on taxable income.

Tax rates are set by the legislature, therefore, State income from the severance tax, conservation tax and the advalorem tax is essentially fixed, dependent on the amount and value of production and the valuation of the producing properties. The State income tax is based on taxable income

of the particular company. The company is able to manipulate taxable income and therefore the amount of State income tax actually paid. As will be discussed later in this report, the State also has the capability of influencing the taxable income of companies producing oil and gas from State lands. The royalty represents the State's ownership of the oil and gas. Therefore, the State has the perogative of specifying the ownership percent, or utilizing it as a bid parameter. That is, the amount of ownership the State would have in its resources could be a bid item.

Of course, the size of the bonuses bid are determined by the oil companies. From an engineering and geologic model, they determine the probable size of the oil field and the probability of occurrence. The cost of development, cost of production, expected value of the production and required return on investment are input into a computer program which calculates the return of investment at different discount rates. From these data, the oil company determines the maximum bonus it would be willing to pay to acquire the right to explore and to develop and produce the oil and gas property. The final selection of the bonus is based on what the company believes it will have to bid to acquire the property. That is, if only one company is interested in a lease, their actual bonus bid would be less than the maximum they would be willing to pay. On the other hand in a highly competitive bidding case, one of the bidders will overbid.

EXPECTED PETROLEUM FIELD MODELS

As shown on the Resource Evaluation and Leasing System flow sheet (Figure I-1), the input to our leasing criteria and Sensitivity Analysis is the EXPECTED PETROLEUM FIELD SIZE. In order to show the sensitivity of various leasing methods to State income, we have modeled five expected field sizes. A detailed discussion of the field models is given in Appendix A. The models range from a small field with an expected value of 50 million barrels of oil recoverable (Mercury) to a super giant field with an expected value of 5 billion barrels of oil recoverable (Jupiter). These models are assumed in each case to be the expected recoverable quantities resulting from an analysis of the field size distribution considered. The expected value concept will only briefly be covered since this approach has been discussed in other papers and is used in our study as a routine application of the probability theory.

Figure II-2 taken from the Cornell University study shows the field size distribution of all the oil fields discovered in the United States between 1943 and 1968. It is important to note the rapid decrease in field size as the number of fields discovered increases. The field size distribution for each petroleum province, although log normal in nature, would differ from this aggregated United States field size distribution, but some important observations can be used for concentrating our attention on optimum leasing strategies. Because field sizes within a province follow a log normal distribution, it is important to know the approximate location on this curve of the state owned fields. Since it

*Since larger fields are statistically found first, the size of new fields found will generally decrease with time.

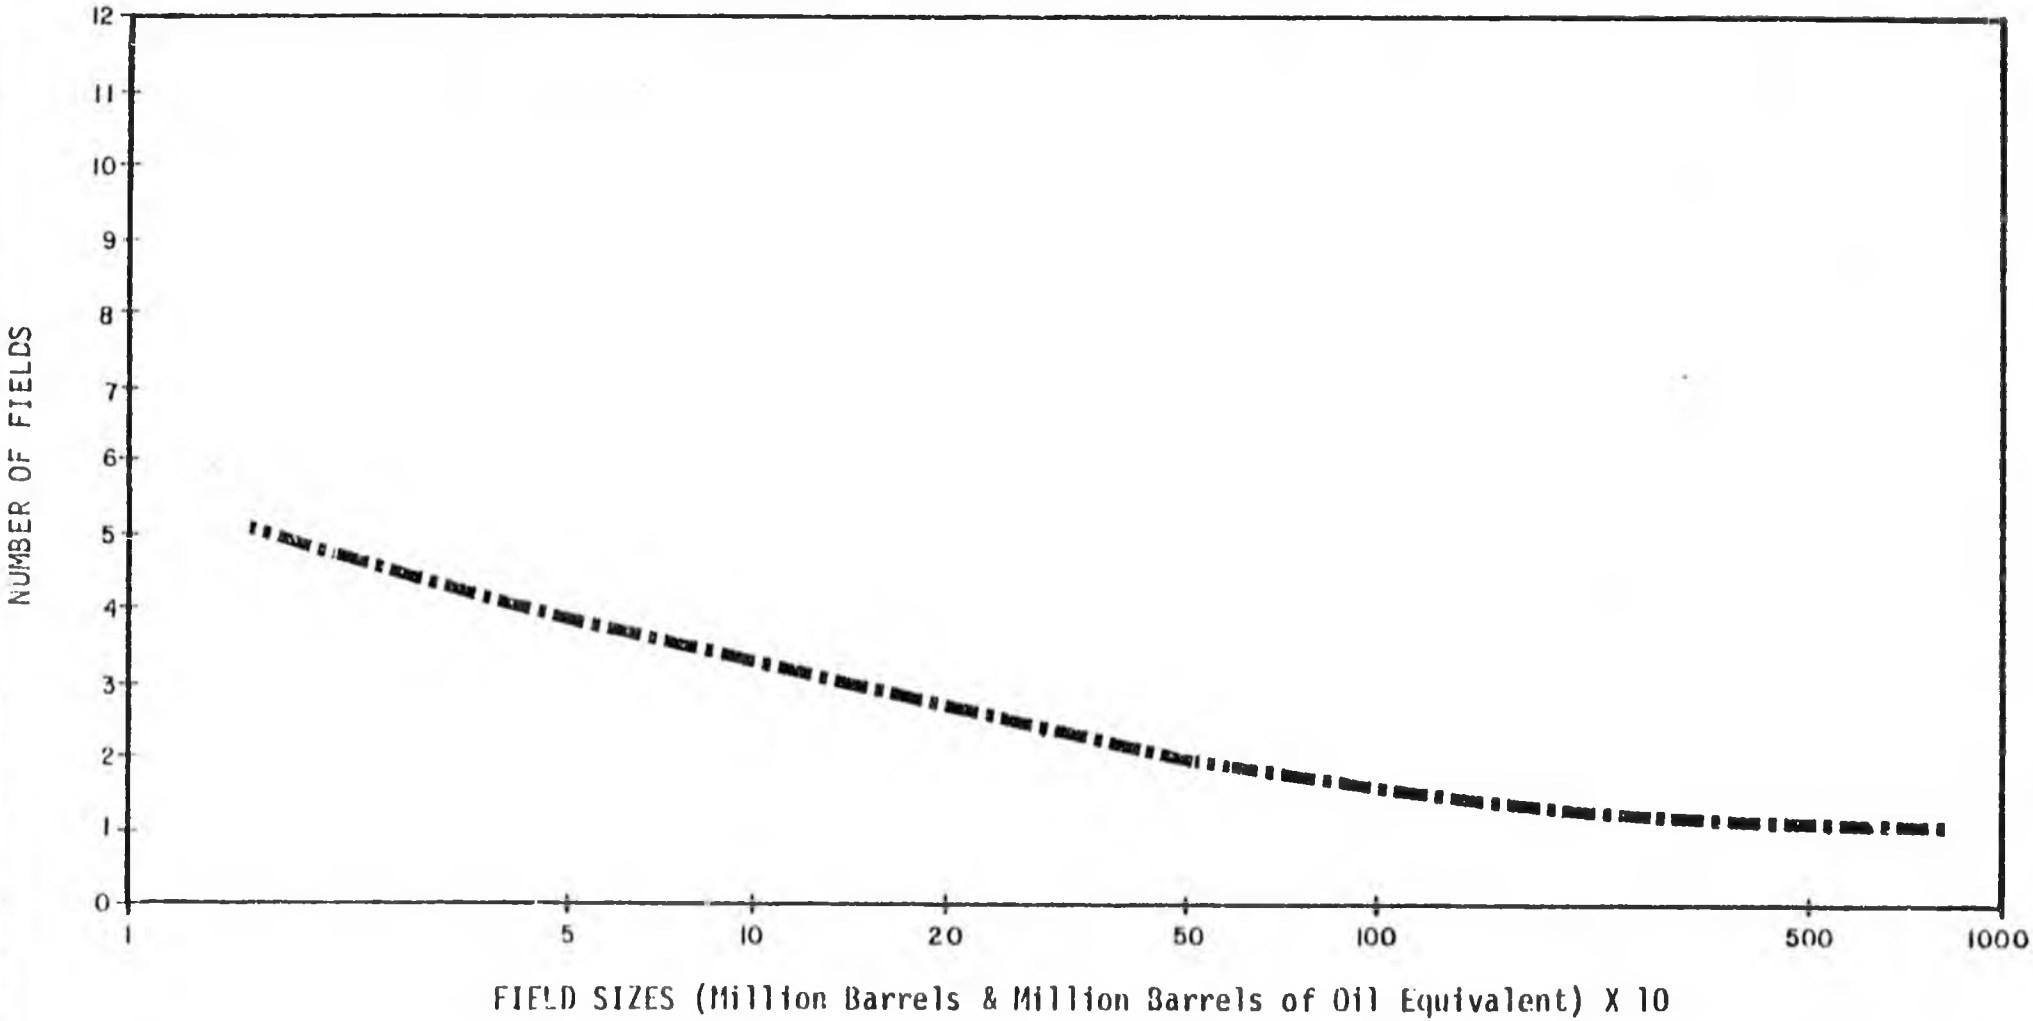
Figure II-2

is expected that large fields generally will be discovered early in the exploration time horizon (Cornell Study). Figure II-2 can also be used as a rough time versus discovery plot.

As expected, when Alaskan fields are plotted on a semilog graph (Figure II-3) the field distribution is on the flat far right portion of the United States (province) log normal distribution curve. This is illustrated on Figure II-4 which shows that Alaska's petroleum development stage is in the early time distribution zone and the expected value field distribution is on the flat or larger field portion of the curve.

What is the significance of this to the State? It means that with fairly inexpensive geologic/geophysical analysis and the use of probability theory we should be able to determine the expected risk field sizes to be found before a sale. It will be important for us to understand that as provinces in the State change in maturity, we will see the expected field sizes decrease with time and move along the distribution curve. A flexible leasing system will be necessary to take advantage of this knowledge.

*APPROXIMATE ALASKA FIELD SIZE DISTRIBUTION TO 1977



*Because of the immaturity of Alaskan development, field discoveries are larger and, as expected, the distribution curve resembles the flat portion or early time zone of the national curve.

FIGURE II-3

Figure II-4

CHANCES OF FINDING THE EXPECTED FIELD

A discussion of the risk factor follows this section but before defining risk with relation to income, we must understand the relationship of expected field size to possible discovery.

Once we have determined through analysis what the expected field size will be, the chances of finding that amount of oil or gas in the structure will follow the normal rules of probability for the structure. In other words, the chances of finding more or less petroleum than expected are a function of the accuracy of information available and the assumptions made for THE SIZE STRUCTURE WE ARE CONSIDERING FOR LEASE. For this study we have assumed a normal distribution for the expected reserves in the structure. Based on this distribution, the odds are equal that we will have more oil in the structures rather than less oil. Therefore, whether we find any petroleum or not will be the significant variable and that will be a function of the risk parameters of discovery.

THE RISK FACTOR

The risk factor used in our sensitivity analysis for petroleum leasing is the percent chance of discovering the expected field in question. This percent chance can range from around 90% (a drainage situation) to 10%, the rough average used for wildcat ventures.

In general, to lease acreage when the risk would be below 10% would be unwise for government and in some cases uneconomical for Industry. This follows from the general rule that risk is a function of knowledge. For example, to lease acreage with a 1,000 to one chance of finding the expected field size would probably result in uneconomic overbids by Industry on small fields and very low bids for the State on large fields.

We have shown in our sensitivity analysis that income to the State increases as the uncertainty of finding petroleum decreases. It is better therefore for the State to ensure that as much knowledge as possible is available to the public and Industry before leasing.

What are some examples of chance of finding, or risk? In 1976 the success rate of new field wildcats finding oil or gas in the United States was 18% (Petroleum Information Corporation, reported in January 1977 Alaska Report). In Alaska on the North Slope after the initial discoveries, the expected chance of finding oil on the remaining Prudhoe Bay structure tracts was reflected by the high price bid in the 1969 lease sale.

IMPORTANCE OF THE RISK FACTOR

Income from oil and gas fields on State land is distributed as follows: for repayment of investment, for operating costs; to the State for royalty and various taxes, to the Federal government for income tax, and to the oil company as profit, (a distribution is shown on Figure II-8).

Income to the State is shown on Figure II-6 for a typical, medium size Alaskan oil field with an expected recovery of 600 million barrels. Income is for a bonus bid at 12.5% royalty case and is based on the expected field size, and the estimated parameters of cost, price, and recovery (the computer input parameters are explained in Appendix B). As shown on Figure II-6, at a risk factor of 10% (10% chance of finding the expected field) expected income to the State would be 0.34 billion dollars; at a risk factor of 90% (90% probability of occurrence) the State would expect to receive 3.0 billion dollars.

As the confidence level increase from 10% to 90%, income to the State increases. Most of the income at 10% risk results from non-bid sources of royalty and taxes. However, the cash bonus bid, at a risk factor of 10%, is 48.2 million dollars while at a risk factor of 90%, the cash bonus bid would be 377.5 million dollars. This is nearly an 8-fold increase.

It becomes immediately obvious that the State can increase it's income from petroleum properties by influencing the acquisition of data so that probability of success is increased. This is also concluded by Richard Norgaard on page 2 of his report titled "Uncertainty, Competition and Leasing Policy" prepared for the Department of Natural Resources.

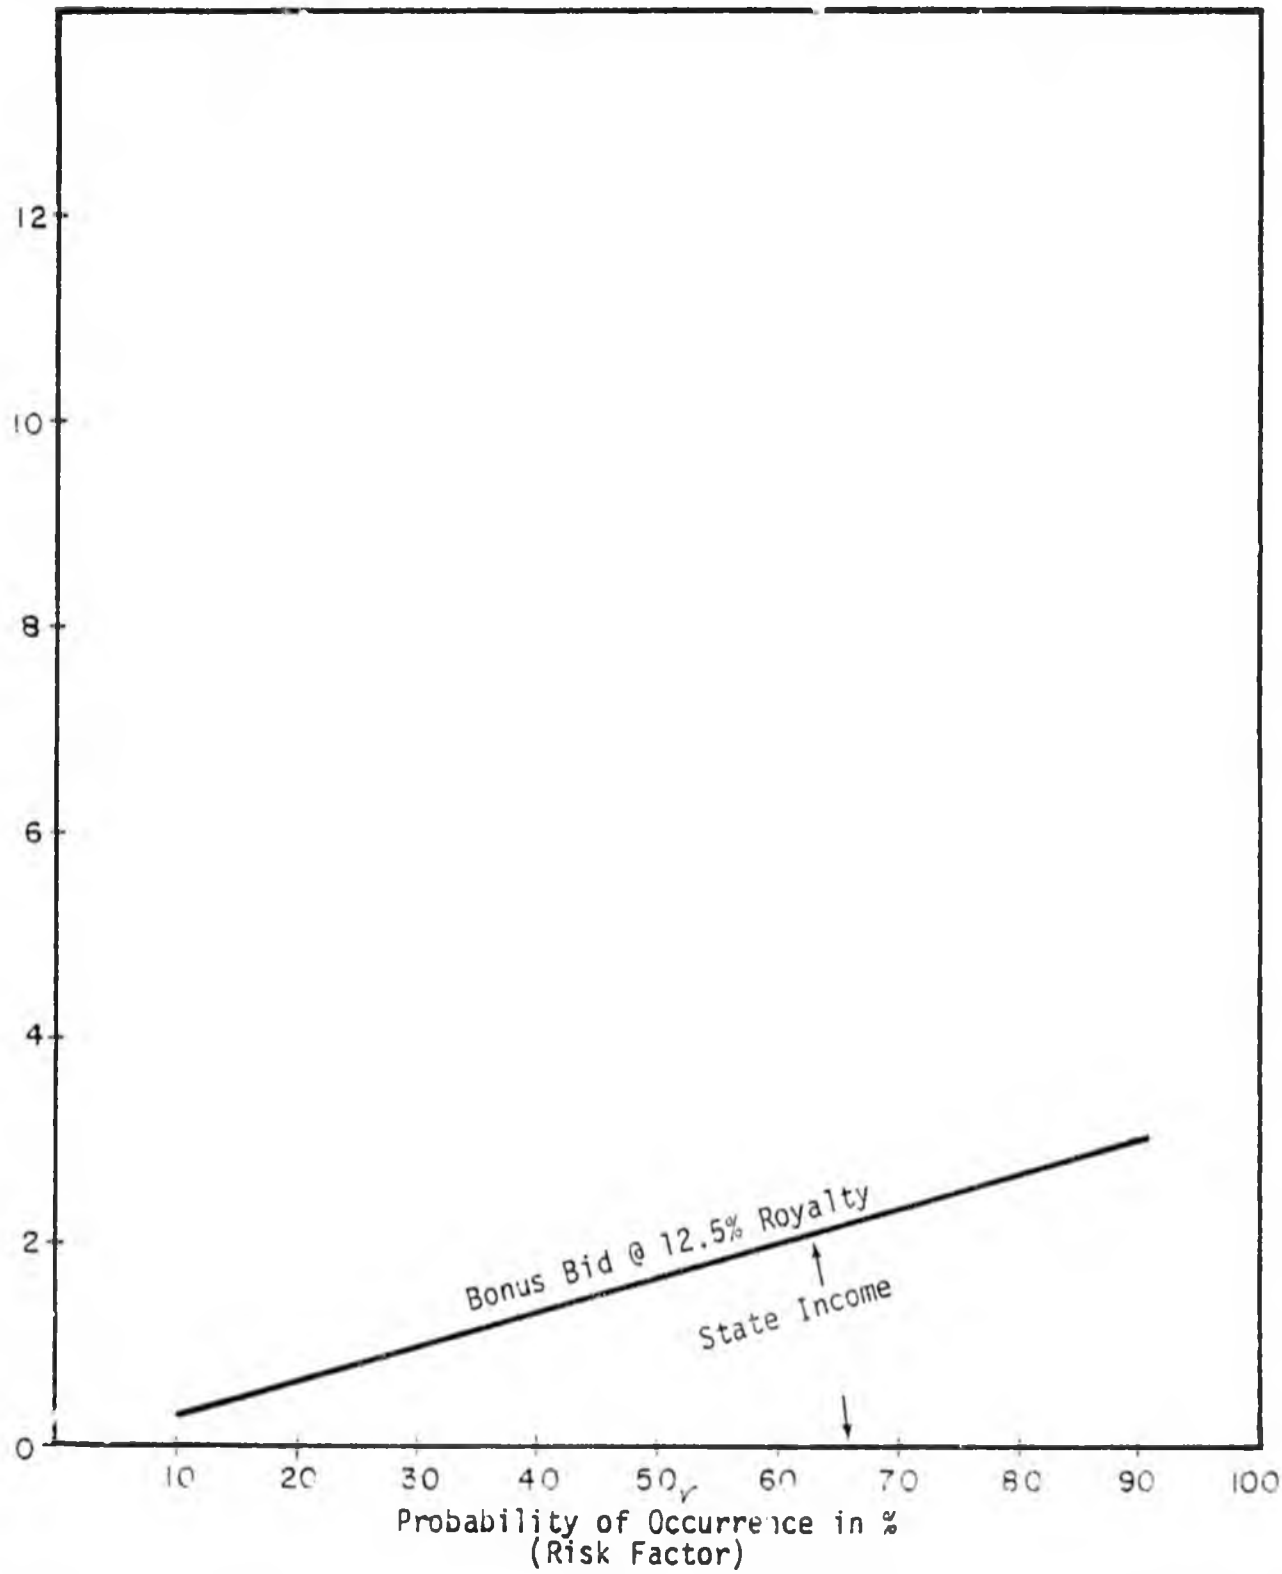

FIGURE II- 6

EXPECTED VALUE CONCEPT

Direct (and total) state income from leasing will increase as the probability of occurrence increases because the expected value of the leased structure also increases. It is the "expected value" amount of oil or gas in a structure upon which oil companies calculate their bids. The expected value is a direct function of probability of occurrence.

The expected value is the mean (or average) value of the dry structures plus the producing structures. For example, if 9 dry structures are drilled per each discovery, then the probability of a discovery for any specific structure is 1 in 10, or 10%. This means that the average oil recovery for each of the 10 structures drilled is 10% of the productive structure. If the field size is 600 million barrels of recoverable oil, the average amount per structure expected is 60 million barrels.

As additional information is obtained, it's possible that only 4 structures will be drilled for each discovery (some structures will not be drilled because of the extremely low probability of an economical field). With 4 dry structures drilled for each discovery drilled, the expected value (average amount) of recoverable oil for each structure will increase to 120 million barrels. Therefore, for each field leased, the income to the State should be increased. This increase should be in direct proportion to the increased probability of the expected event occurring, in this case a discovery.

The expected value of gross income from production also increases as the probability of occurrence (a discovery) increases. For the medium size expected oil field (600 million barrels of recoverable oil), as the probability of occurrence increases from 10% to 90%, the expected value of gross income increases from 1.1 billion dollars to 9.9 billion dollars--this is shown graphically on Figure 11-7.

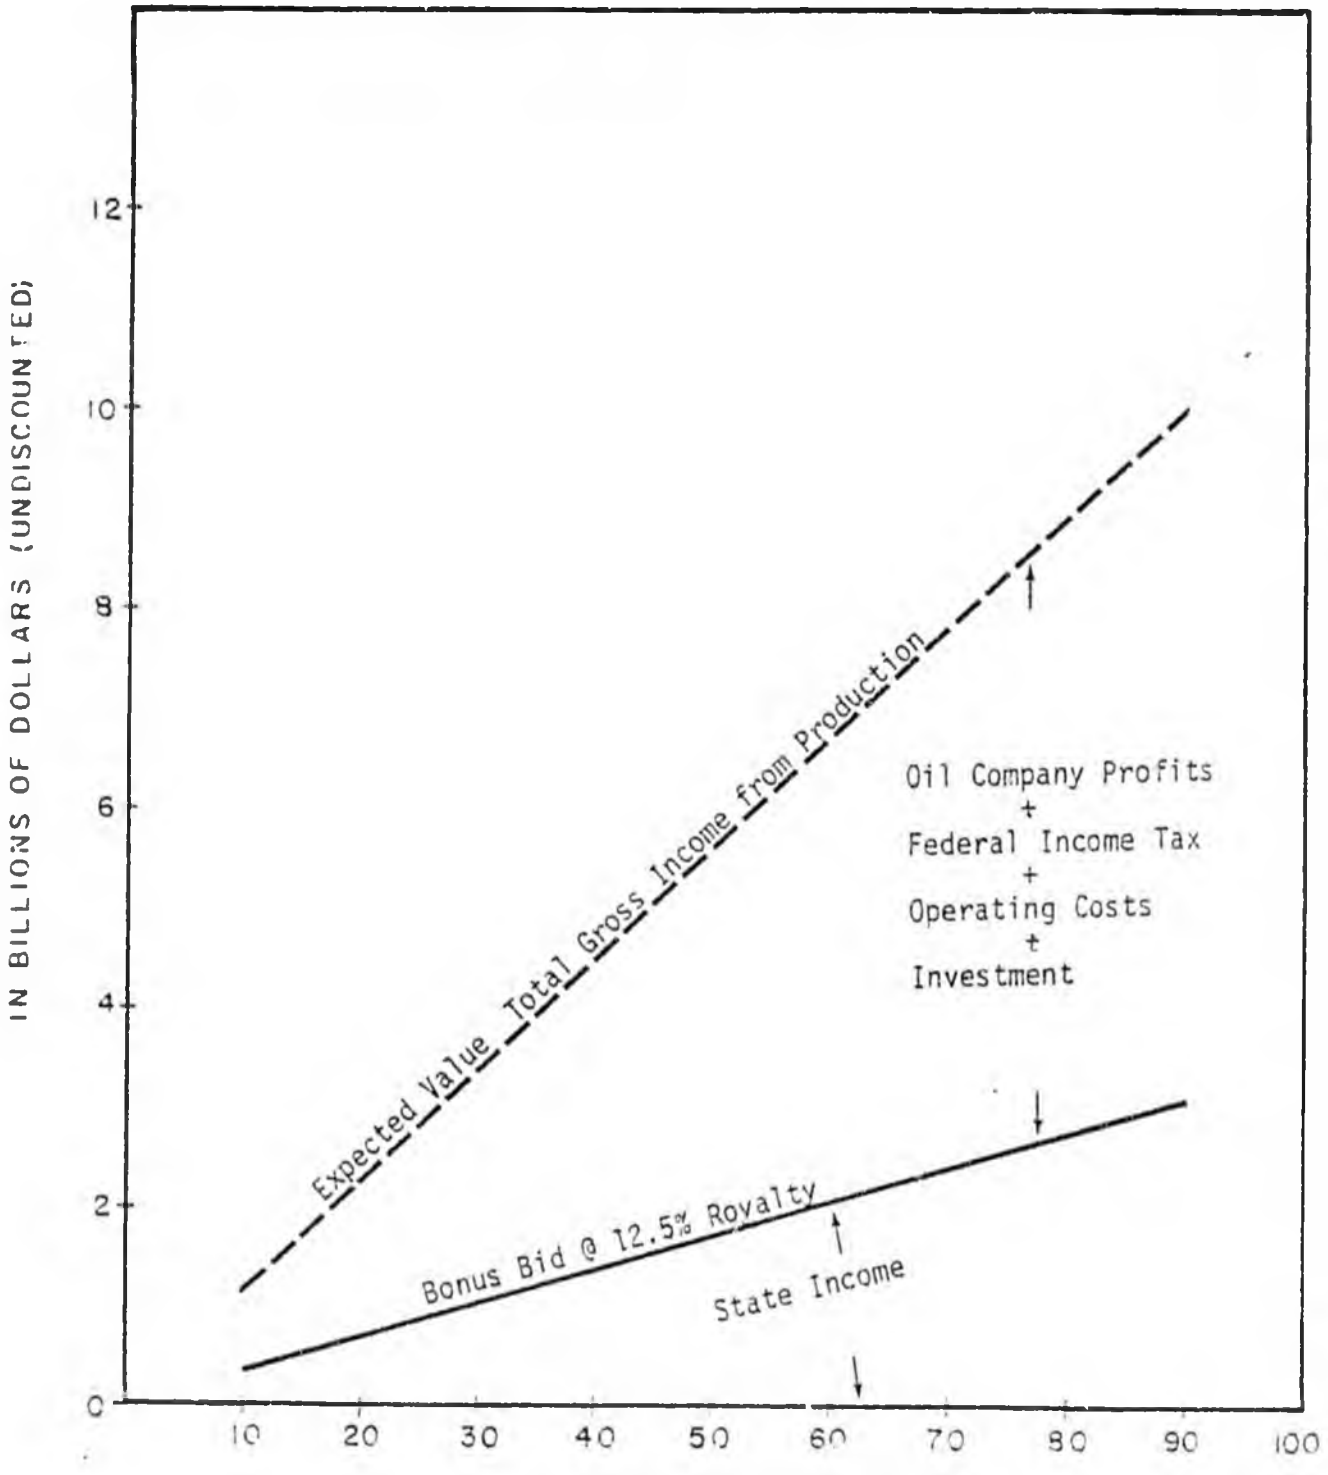

FIGURE II-7

THE SENSITIVITY OF STATE PETROLEUM INCOME TO VARIOUS LEASING METHODS

ANALYTICAL COMPARISON OF ALTERNATE LEASING METHODS

ANALYTICAL COMPARISON OF LEASING METHODS

There are a large number of possible leasing criteria. Some involve how much of the structure is leased at different times. Others involve which parameter of royalty or cash bonus are fixed by the owners and which ones are bid items. Five leasing methods based on different bidding parameters versus probability of occurrence at 1%, 10%, 50% and 90% are analyzed in this study. The method currently used by the State, cash bonus bid at 12.5% fixed royalty, is compared to 4 alternate methods: 1) cash bonus bid at 25% royalty; 2) cash bonus bid at sliding scale royalty; and 3) royalty bid at fixed cash bonus; 4) net profits bid at fixed bonus; and 5) percent of acreage.

State income from various leasing methods was determined by an economic analysis utilizing a special adaptation of a Garrett computer program. This program is explained in Appendix B. Input data included bonus payment, dry hole costs, investment schedules, production schedules, operating costs and crude oil prices. Output data combine the following sources for total state income: bonus, severance tax, royalty, conservation and advalorem tax, and state income tax. The output also includes operating costs and schedules for depreciation of investment and for amortization of the bonus. Total State income is given at various discount factors. The oil company income is discounted at 10%.

Gross income from production is distributed as follows: for repayment of investment; operating costs, State income such as cash bonus, royalty, income tax, and other state taxes, Federal income tax, and as oil company profit. For the cash bonus bid at 12.5% royalty leasing method, the percent distribution of the gross income is approximately the same at a risk factor of 10% as it is at a risk factor of 90%

DISTRIBUTION OF GROSS INCOME

Based on Current Method of Leasing
(Bonus Bid @ 12.5% Royalty)

Medium Expected Oil Field
(600 Million Barrels Recoverable)

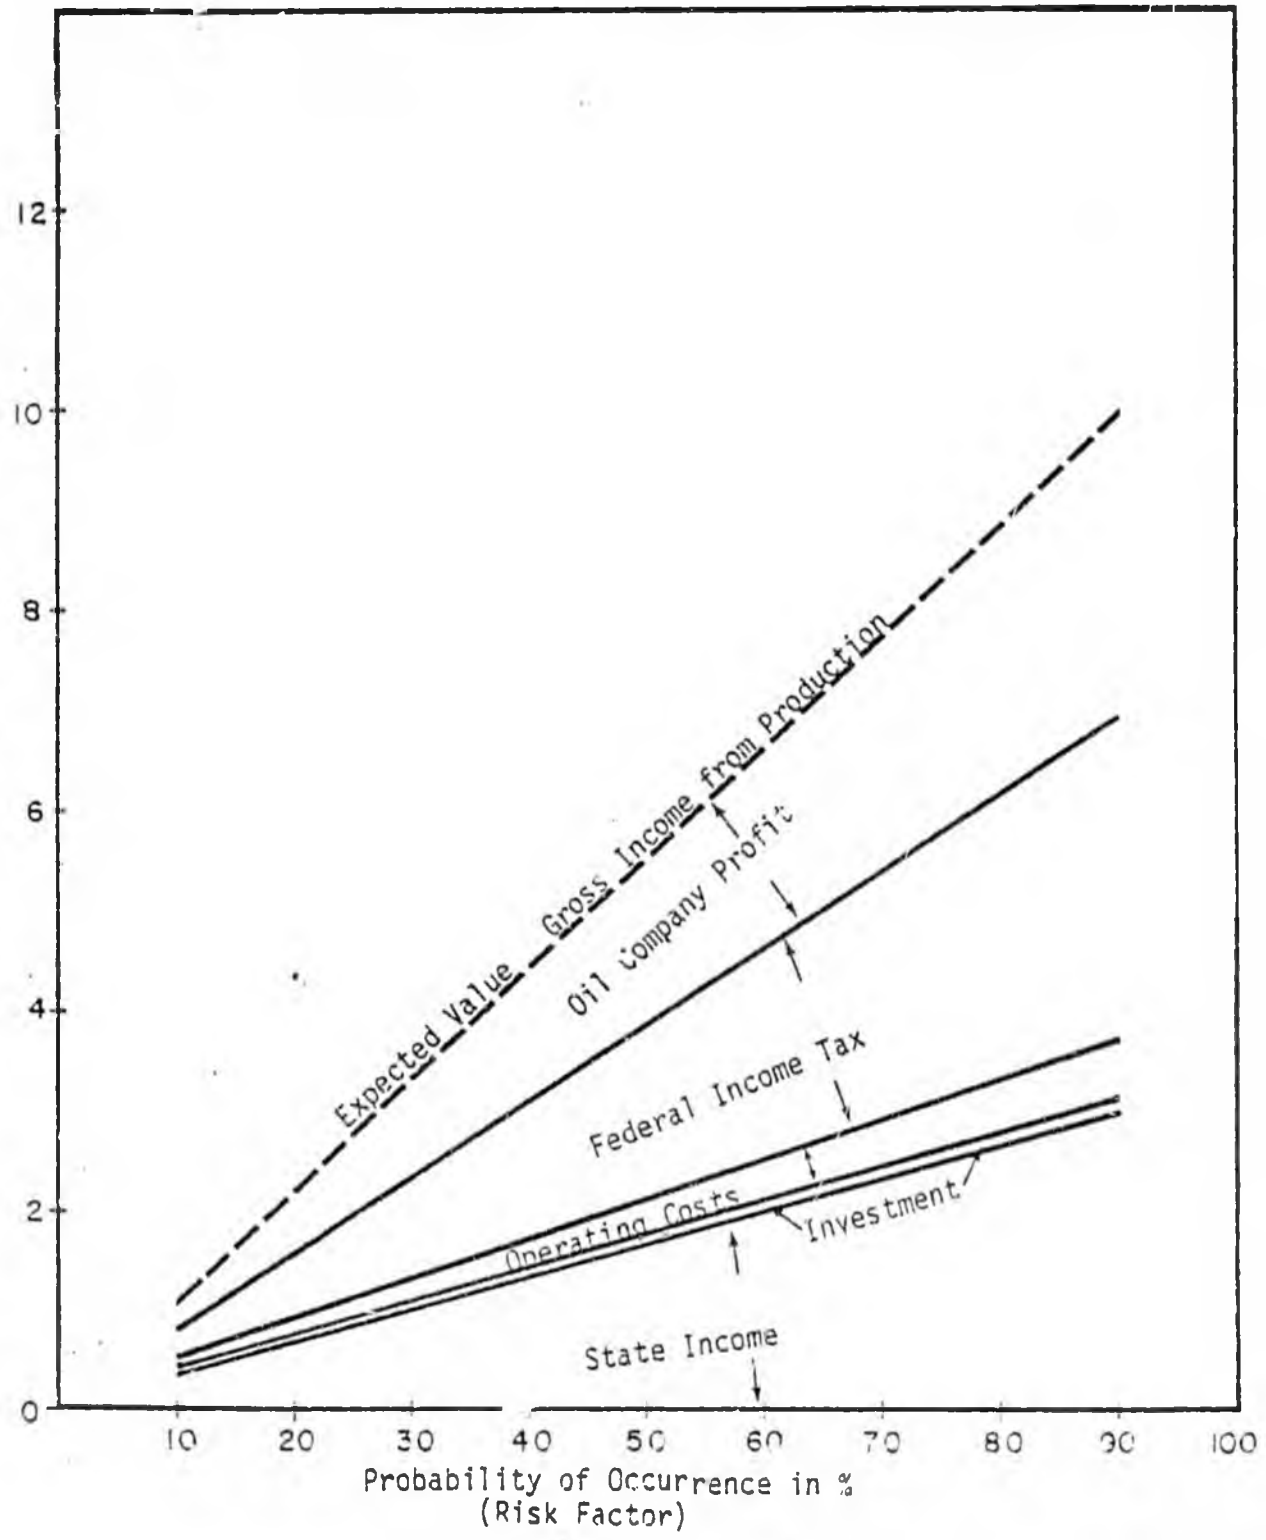

FIGURE II-8

(Figure II-8). Averages are as follows:

Operating cost and investment - 6%

State income - 31%

Federal income tax - 32%

Oil company profit - 31%

Note that State income, Federal income and oil company profits are about evenly divided. While the income distribution percentages remain approximately constant at probability of occurrence of 10% and 90%, the total income for distribution increases from 1.1 billion at 10% probability to 9.9 billion dollars at 90% probability.

Bonus Bid at 12.5% Royalty. This is the method currently used by the State. (All recent competitive leases have been issued with a 16-2/3% royalty requirement.) If there is little available knowledge about a structure, assumed probability of occurrence is low. At a low probability of occurrence, there is little difference between the various leasing or bidding methods. This can be seen in Figure II-9 at the 10% probability of occurrence where the plotted curves tend to converge.

In the past, not much has been known about the structures in Alaska prior to bidding, therefore cash bonus bids at 12.5% or 16.67% royalty were not too bad a method. For small field size (100 million barrels recoverable) with a 10% probability of success, income to the State is not significantly affected by the bidding methods. However, as can be seen from an inspection of Figure II-10, as the probability of occurrence increases there are methods of leasing which provide much higher income to the State. The percent probability of occurrence can be improved (some of the risk removed) by obtaining and analyzing specific structures.

Operating Costs
Investment
Federal Income Tax
Oil Company Profit

FIGURE II-10

Bonus Bid @ 25% Royalty. This bid method does provide greater income to the State than does a bonus bid at 12.5% royalty. The bonus is approximately 25% less than at 12.5% royalty, but total income is approximately 25% to 30% greater, depending on the specific cases being compared - this is shown on Figure II-9 and II-10. At discount rates of 6% and 10% (Figures II-19 and II-20 bonus bid at 25% royalty provides more present worth income to the State than does the current leasing method (bonus bid at 12.5% royalty).

Sliding scale royalty with bonus bid. The royalty scale is set by the State prior to advertising leases for bid. When leasing small fields with low production rates, this method provides the same income to the State as does the cash bonus bid at 12.5% royalty. As field size increases, production rates increase and State income from a bonus bid with sliding scale royalty increases considerably over the income provided by a cash bonus bid with a fixed 12.5% royalty. Figure II-11 gives the income distribution in the sliding royalty case for a medium sized oil field. This leasing method allows the State to participate in the operators good fortune, if the operator finds a large field, the State's royalty increases. If the operator finds a field of lesser size than he expected, he is not burdened with a high royalty such as he would be with a royalty bid.

Another important aspect is that as a good field declines, the royalty percent will also decline, thus extending the economic life of the field. Of course, as the economic life of the field is extended, the ultimate recovery increases and the amount of oil left in the reservoir decreases. The aspect of encouraging more ultimate recovery so the oil or gas left in the reservoir is decreased is good for the conservation of a depletable natural resource.

DISTRIBUTION OF GROSS INCOME
FOR AN ALTERNATE LEASING METHOD

Sliding Scale Royalty With Bonus Bid

Medium Expected Oil Field
(600 Million Barrels Recoverable)

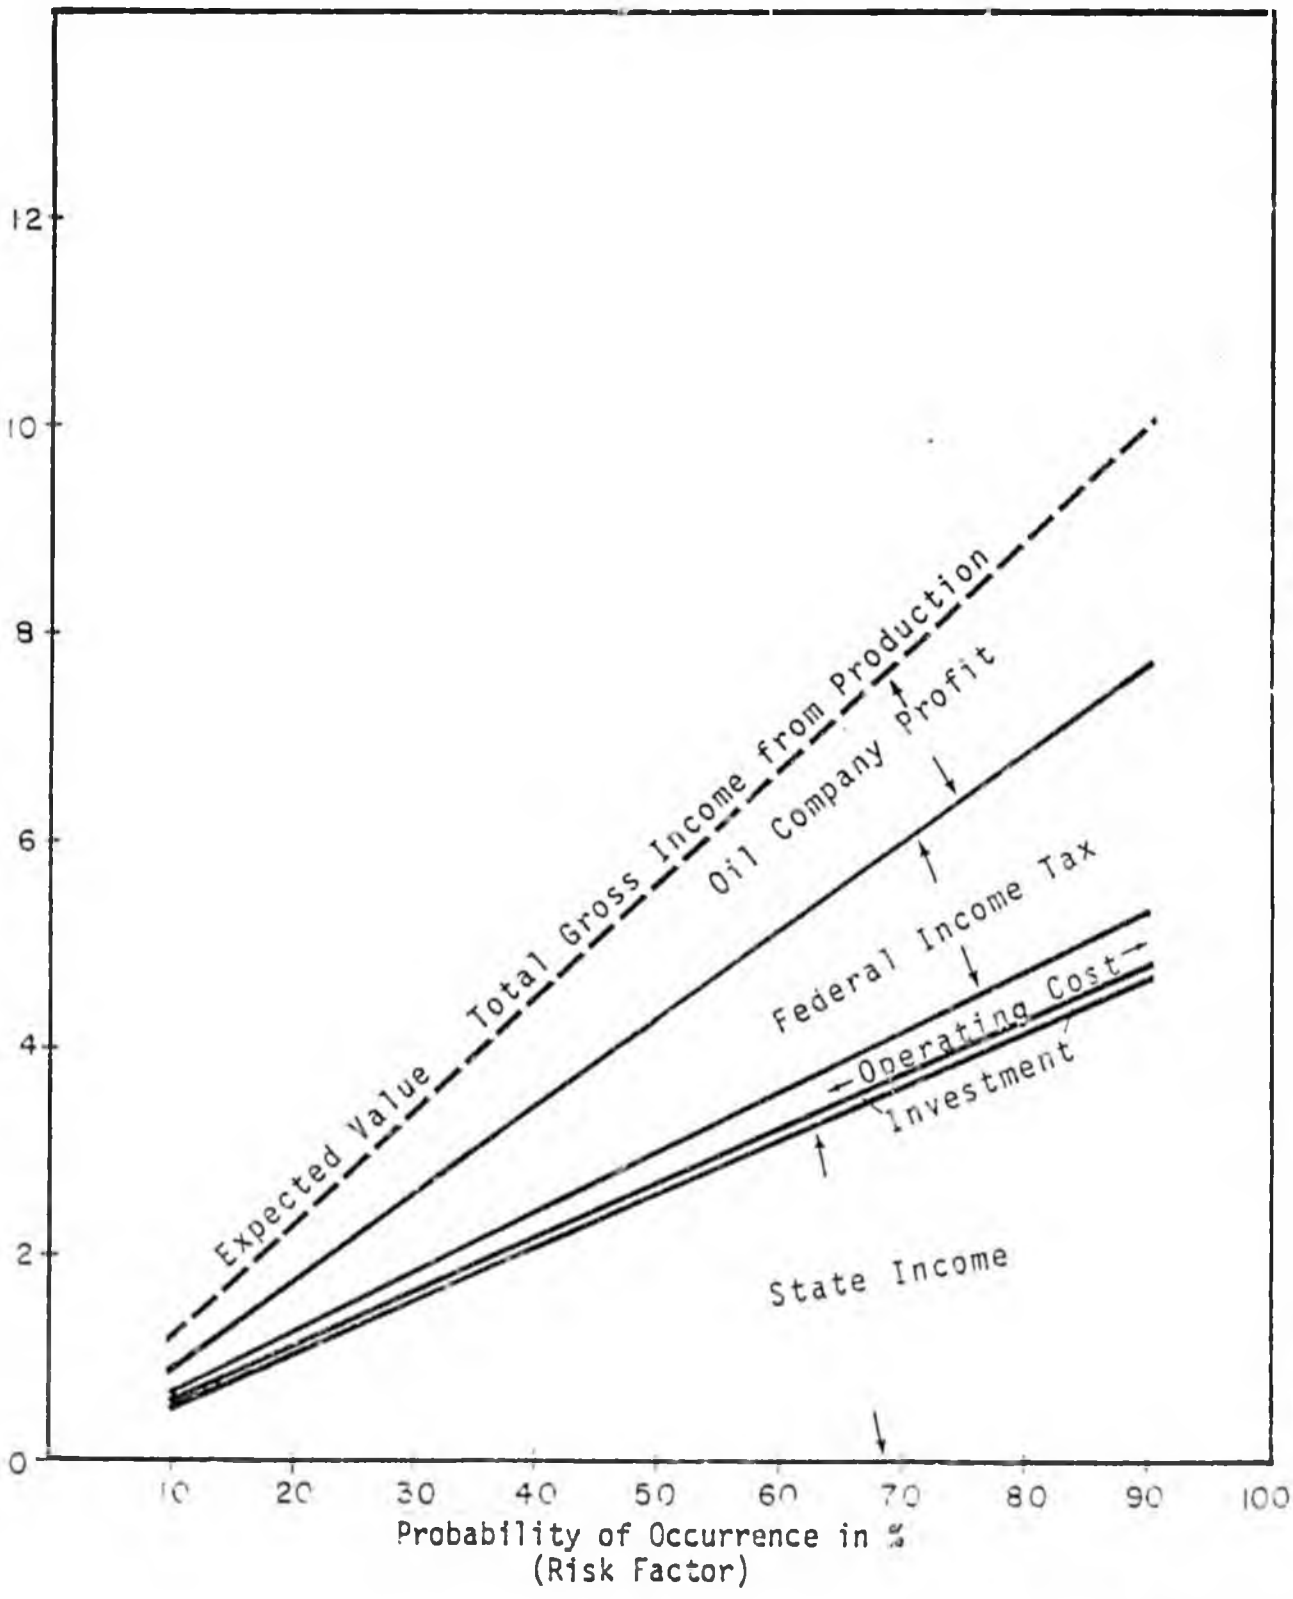

FIGURE II-11

Royalty Bid at a Fixed Cash Bonus. The fixed cash bonus is utilized to encourage only earnest bidders and is calculated at 2.5 cents per expected volume of recoverable oil. As with all of the leasing methods, the main data was based on the operator (oil company) earning an 18% rate-of-return. As is shown on Figure II-9, the royalty bid (and net profits bid) provide more income to the State than do any of the other analyzed methods except at small field sizes. At an oil field size of 100 million barrels recoverable oil, (Figure II-10), income to the State from the royalty bid (65.8 million) was essentially the same as for the cash bonus bid at 12.5% royalty (61.2 million) at 10% risk.

In our models the major economic advantage to the State from royalty bidding over the bonus bid case is from a reallocation of Federal income taxes. Figure II-12 showing the income distribution for an expected field size of 600 MM/bbls in the royalty bidding case should be compared with Figure II-8 in the bonus bid case (an overlay of the Federal income tax revenues from Figure II-8 has been provided for easy reference). As can be seen by the comparison, the State takes a much larger income in the royalty case at the expense of the Federal government. The absence of a large front end investment, the bonus, allows a company to have a smaller profit profile in the royalty case but still make the same rate-of-return on investment as the bonus bid case, 18%. The "Tax Break" illustrated here is an incentive for seeking higher royalties whenever, or however possible.

DISTRIBUTION OF GROSS INCOME

Based on an Alternate Leasing Method
(Royalty Bid at Fixed Bonus)

Medium Expected Oil Field
(600 Million Barrels Recoverable)

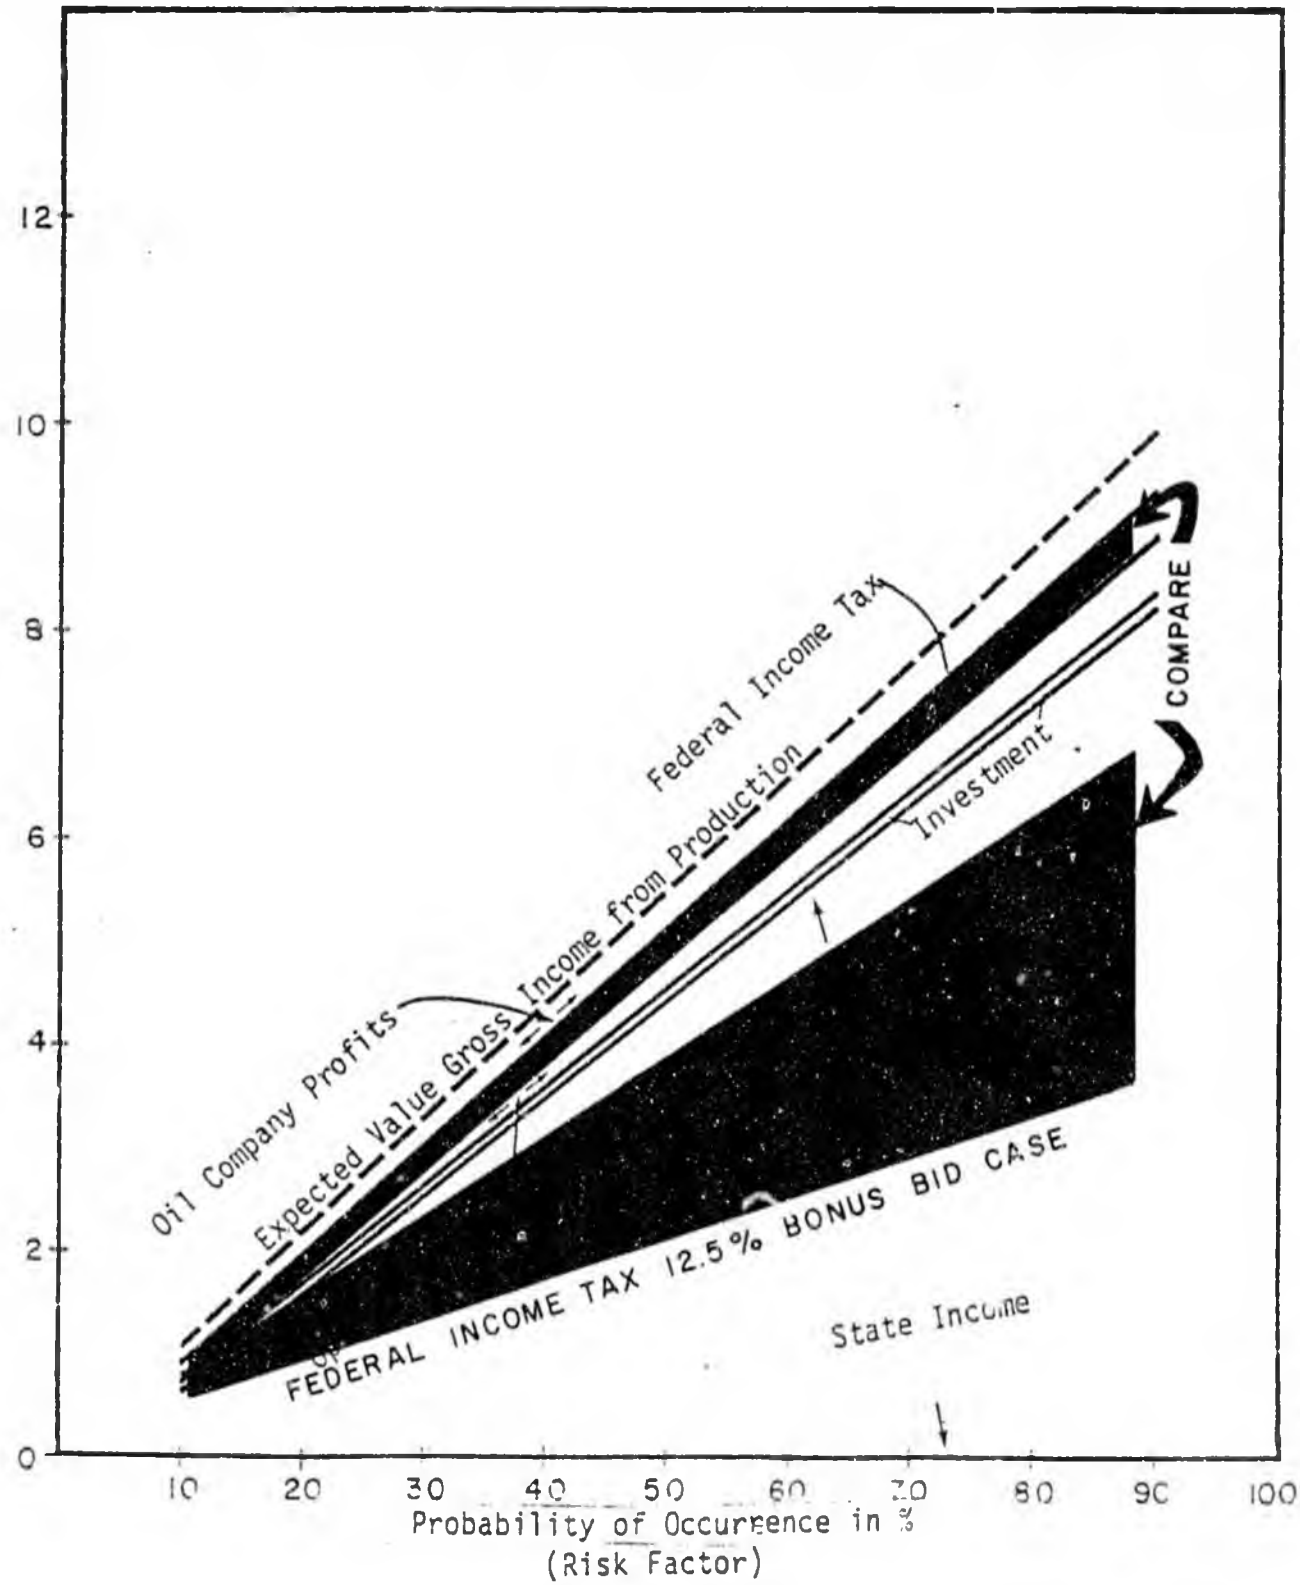

FIGURE II-12

Net Profits at a Fixed Cash Bonus. For this leasing method, a small fixed bonus is required as earnest money. The companies then bid on the percent of net profits they will return to the State after they have recovered their investment. Income to the State for the net profit cases is essentially similar to the income from royalty bidding, (Figures II-9 and II-10). For those examples where the two cases diverged, the net profit data is shown separately.

Listing of Leasing Model Results. The data listed in Tables II-1 and II-2 (pages 27b and 27c) constitute the major portion of the results of this leasing study. This data is the computer calculated results of the economic models for the leasing methods consedered. Most of the graphs in Section II of this report were plotted from data contained in these tables.

Data on Tables II-1 and II-2 show that at risk factors of 10% and 90% (% probability of finding the expected field size), the bonus bid at 12.5% royalty method provides the least expected value income to the State of all the methods analyzed in this report. The net profits bid method provides the largest expected value income to the State, being only slightly higher than the royalty bid method. The sliding scale royalty with bonus bid method provides an income stream which is between the net profits bid method and the bonus bid method. Section III of this report contains additional factors which must be considered when selecting a leasing method.

RESULTS OF LEASING MODEL SIMULATIONS @ 10% RISK AND LOW COST REGION

1E PERCENT OF ACREAGE OPTION

This option has the capability of significantly increasing State income from petroleum leases. The main elements of this option are that only a part of the structure is leased initially; the remaining acreage is leased after a discovery has been made. The remaining acreage leased will be "probable reserves," and will therefore bring a much higher price than will wildcat acreage. Leasing of the Prudhoe Bay structure is a good example of the percent of acreage option. The initial leases were auctioned off for about 12 million dollars. After oil was discovered the remaining acreage (generally marginal tracts near the oil water contract) were leased in 1969 for 900 million dollars.

For comparison purposes, the income to the State from leasing a whole structure at the initial auction was compared to leasing only 60% of the structure at the initial auction (See Figure II-13). Bidding method for both cases is the "Cash Bonus Bid at 12.5% Royalty" method. Comparisons were made for a medium size field; calculations for both cases were at 10% and at 90% probability of success.

For the base case at 10% probability, each of the ten structures (9 dry and 1 productive) were leased in total at the auction, but all of the structures were not necessarily leased at the same auction. For the percent of acreage option, only 60% of each tract was leased initially; out of 10 structures leased in this manner, statistically, 9 would be barren and the remaining 40% of the structure acreage could not be leased. However, after discovering oil in the one good structure, the remaining 40% of the acreage in that

structure could be leased with an expected confidence level of 90% probability of success. The remaining 40% of the acreage in the discovery structure was leased as before - 12.5% royalty, cash bonus bid. Since the expected probability is now 90%, the cash bonus bid would be increased, resulting in increased income to the State.

At a risk factor of 10%; expected value income from the base method was 0.34 billion dollars versus 1.4 billion dollars from the percent of acreage option. (Some of the increased expected value is due to taxes which would also be received by the base method; however, there is an actual increase due to the difference in the bonuses). The bonus for the base method was 48.2 million dollars as compared to 179.9 million dollars for the percent of acreage option, this represents an actual value increase of 131.7 million dollars.

If at the time of initial leasing, enough data is available so that the bidders consider the probability of occurrence to be 90%, then there is no gain in state income by withholding acreage, this is shown on Figure II-13. However, it would be very rare for any group to consider any undrilled structure as having a 90% probability of occurrence (90% chance the expected amount of oil is present).

While for this example, the calculations and discussions were based on an oil field having an expected recovery value of 600 million barrels, income to the State can also be increased for other field sizes. Figure II-14 shows a similar comparison for a giant field where 60% of the acreage was held back. However, as the field size decreases, there becomes a size whereby it's not feasible to have the oil companies bid on only a part of the field. Since this is a somewhat subjective factor, calculations

FIGURE II-13

and analysis as used on larger structures will not necessarily delineate the minimum size structure on which acreage can be withheld at the time of initial leasing. However, it will be possible for the DMEM to determine, depending on location and other conditions, the minimum field size on which acreage can be advantageously withheld.

For this comparison, the data for both the base case and the percent of acreage option were obtained from a bonus bid at 12.5% royalty method. If other methods considered in this report were used with the percent of acreage option, (royalty bid, net profits, or sliding scale royalty) equivalent or even greater income gains would be realized.

Of course, there are other possibilities under the percent of acreage option. For example, after oil has been discovered in the portion initially leased, the remaining acreage need not be leased but could be held by the resource owner (State of Alaska) for direct participation in the unit. The value of this alternative or any alternate depends on the State's income needs and their willingness to share risks.

This model study indicates that State income can be greatly increased over the long run by mapping structures, analyzing the potential petroleum reserves and then on the basis of resource econometric calculations, finding the optimum percent of acreage to lease.

FIGURE II-14

MARGINAL FIELDS REQUIRE FLEXIBILITY IN LEASING

Minimum economical field size in Alaska is much larger than in the lower 48 states. Considering the Cook Inlet area where development and production costs are high, the minimum field size is very dependent on the price of crude oil. As shown by Figures II-15 and II-16, for 12.5% royalty and 18% rate-of-return, at a crude oil price of $10.50/Bbl, the minimum field size is about 54.8 million barrels recoverable. However, at an average crude price of $17.40/Bbl the minimum field size (reserves) is only about 13 million barrels recoverable.

Small fields which are uneconomic at specific values of crude oil price, royalty, and rate-of-return can be made economical if any one or a combination of these three factors are appropriately changed. The preceding paragraph explained that as crude oil prices increase, the minimum field size decreases. The same Figures (II-15 and II-16), also show that for a given oil price and a fixed rate-of-return, as the royalty is decreased, minimum economical field size is also decreased. This means that small fields which would not be economical to produce at a 12.5% royalty, could be economical if the royalty percent was decreased.

Minimum economical field size can also be decreased if industry is willing to accept rate-of-returns lower than the 18% used in this report. This is unlikely however, because the anticipated rate-of-return from a high risk venture must be much higher than for a low risk venture. Where one would be willing to buy secure bonds at a 10% rate-of-return, he would not be willing to invest in a risk venture if the best possible rate-of-return was only 10%. In business, as the amount of risk increases, the anticipated rate-of-return from a successful

venture must also increase to compensate for the losses from the unsuccessful ventures. Because of the high risks involved with finding and developing an oil field, it is entirely probable that the 18% rate-of-return used in this repor[illegible] low, depending on the specific structures being leased and on the bid[illegible]hods being used to auction off the leases.

The State [illegible]he capability, and perhaps the obligation to influence the timely develo[illegible]nt and production of small fields. Of the three parameters which most influence the minimum economical field size, the State has the capability of adjusting only one of the parameters - the royalty percent. Even if the royalty were reduced to zero, the State would realize income from severance tax, conservation tax, advalorem tax and from income tax. These tax revenues would not be realized unless the field were produced. The oil company makes some profit and derives benefits from supplying refineries with feed stock. The nation benefits from an increased supply of crude oil.

Marginal fields must be developed and produced on a timely basis. For a specific set of conditions of field size, oil price, royalty, and rate-of-return, the location and development timing are related and are critical. For example, any oil field which is near already producing fields is more economical to develop and to produce than if it is remotely located. This is because the facilities, equipment and personnel required for the operating field can be utilized in the operation of a small, nearby field. While some additional direct labor may be required, the repair crews and supervisors could cover both fields; in other words, the fixed operating costs would not significantly increase. Thus, it is critical that the marginal fields be developed and produced while there are large producing fields in the area.

The State has the capability of encouraging the development of marginal fields. The State benefits [illegible] development as does industry and the nation. Therefore, if the [illegible] to encourage this development, a flexible leasing program will be necessary so the leasing system can be tailored to existing conditions.

SENSITIVITY OF THIS ANALYSIS TO CHANGES IN VARIOUS PARAMETERS

Extremely High Risk Cases. Two leasing methods were analyzed at a 1% probability of success to determine if the results obtained from this study would be valid for extremely high risk situations. The bonus bid @ 12.5% royalty case and the royalty bid at fixed bonus case were run at extremely high risk.

The major elements of these extremely high risk cases were that 100 bonuses would be received and 100 structures would be drilled. The bonuses were appropriately factored to reflect the 1% probability assigned to this venture. Since our study assumes 3 wells are drilled per structure, there were a total of 297 dry holes drilled - 300 exploratory wells total. The cost of drilling these wells was included in both cases as dry hole exploratory costs. For a dry structure, the bonus and the well cost were expensed at significant tax loss to the State; as a matter of fact, the tax loss constitutes 42.3% of the bonus received.

The rate-of-return from high risk ventures must be adequate to compensate for the statistical losses. The bonus bid method requires relatively larger bonuses than does the royalty bid methods. The bonus is a leasehold investment item while royalty operates like a cost of production. Therefore, the investment risked on a bonus bid case is significantly higher than the investment risked on a royalty bid case.

In recognition of the relative risks, the bonus bid case was run at a higher rate-of-return than was the royalty bid case. A rate-of-return of 22.5% was deemed reasonable for the bonus bid case. From the oil company's viewpoint, the royalty bid case is much more secure; therefore, we assumed a 10.5% rate-of-return for this case. The results of the economic calculations are shown graphically on Figure II-17. For these conditions at all discount rates from 0% to 10%, the royalty bid method provides significantly more income to the State than does the bonus bid method.

Next, the cases were compared at equal rates-of-return (16%). At this rate-of-return, undiscounted income from the royalty bid case is higher than for the bonus bid case. But at a discount rate of 2%, the present worth income from both cases is equal - at discount rates above 2%, the bonus bid case provides more income to the State than does the royalty bid case.

Changes in Crude Oil Prices. Crude oil prices used in this report are the Tier II prices for Cook Inlet. These prices are then escalated at a rate of 5% per year to a maximum value of $18.00 per barrel. The maximum value of $18.00 per barrel is reached in the twelfth year after the lease sale, 7 years after production starts. The average price per barrel for the cases studied is $17.40 per barrel. The initial price is $10.86/Bbl.

The possibility exists that the Federal government will set crude oil prices for newly discovered fields. Therefore, we reran the computer programs, changing only the crude oil prices. The comparative effects on the selected leasing methods is shown in Figure II-18. This figure shows state

All Cases At Risk Factor = 10%

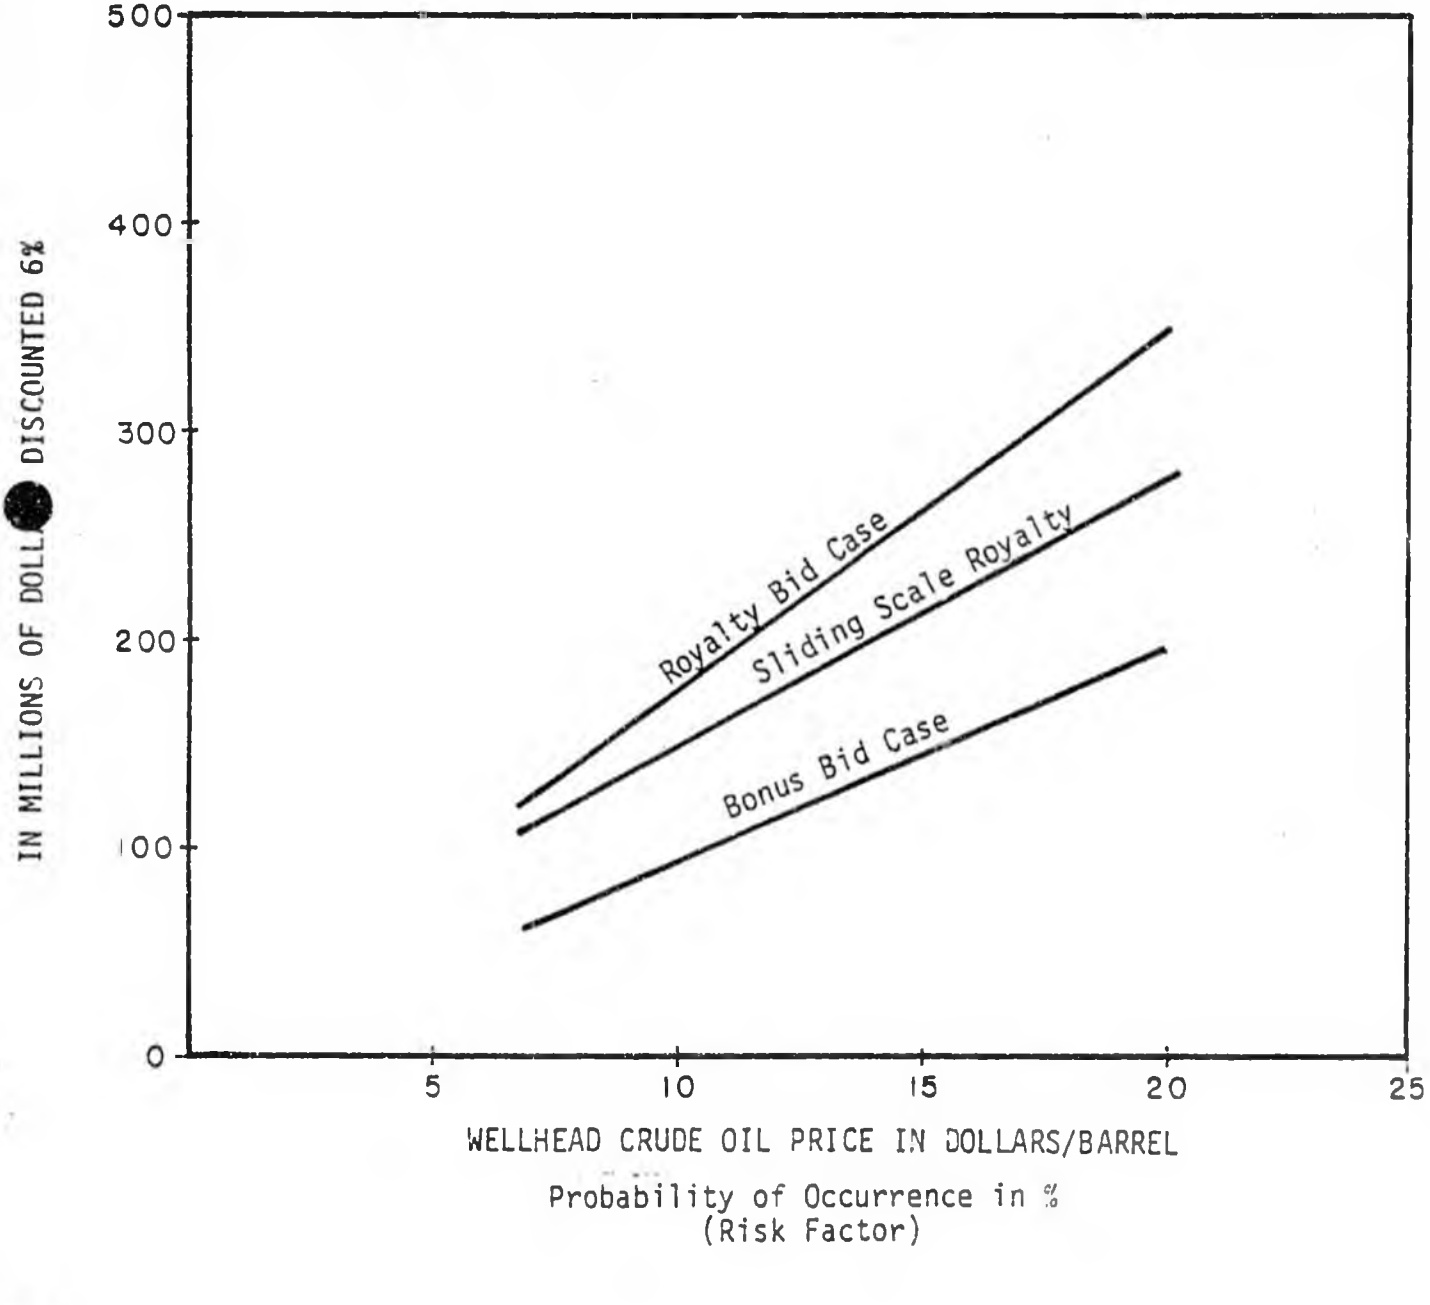

FIGURE II-19

income (discounted 6%) versus wellhead crude oil price.

For the range in crude oil values studied, the comparative relationship of the selected bidding methods did not significantly change. The range of crude oil prices considered was $7.00 to $20.00 per barrel. Over this range, the discounted income curves for the bonus bid case was always lowest, the royalty bid case the highest, and the sliding scale royalty case was in between; a net profit bid case would be similar to the royalty bid case. Thus a change of crude oil prices from a low of $7.00 per barrel to a high of $20.00 per barrel does not change the comparative results of this study.

Effects of Produced Gas. Wellhead gas production was considered in this study. There are many unknowns which effect the value of gas removed from oil. Some of these unknowns are:

1. First, how much gas is produced - what is the producing gas/oil ratio?

2. Next, how much of this gas will be required for lease fuel - fuel usage depends on the field location, availability of commercial electricity, gravity of the oil, water content, emulsion condition, temperature of the production, and distances from the gathering centers to the cleaning facilities and sale point.

3. Third, marketability of the gas - some Cook Inlet gas is handled at a loss, some is sold at various values from about 16¢/MCF to 64¢/MCF.

4. Lastly, what is the present worth of profits (PWP) resulting from reinjection of the produced gas?

Since evaluation of the produced gas depends on several variables the effects of solution gas are not handled separate from oil in this analysis. The effects on the study are in the order of less than 1%.

Government and Discount Rates. What discount rate should governments use? Discount rates are used by businesses to compare alternative investments. The Net Present Value (NPV) of future cash flows that would result from alternate investments is a uniform comparison base; it's about the only one available to business (governments use a "cost to benefit ratio").

Goals of businesses differ from those of governments. A business's only goal is to make money for their stockholders. A government's goal is to provide those services for the populace which they cannot provide for themselves. A business wants to continue making profit to pay monetary dividends in perpetuity while a government needs money to supply services in perpetuity. A business uses Present Worth of Profits (PWP) to compare investments; to be consistent, a government should use Present Worth of Services (PWS) to compare various options. PWP is not compable to PWS. Since a Discounted Cash Flow (DCF) is used to determine PWP, it cannot also be used to determine PWS, therefore, it may be wrong for governments to utilize a (DCF) as does business.

A government has a requirement for a sustained income in perpetuity. Money in a bank provides no services to the populace - at best, the interest earned is useful for future services. Since the value of oil and gas is increasing with time (a recent USGS prediction indicates crude oil prices of $80.00 per barrel by the year 2,000, if that's accurate or even 50% accurate), more State income may be gained by leaving it in the ground to mature than by "banking it" or spending it frivolously. Indeed, if the price escalation of crude oil is greater than the bank interest, a loss will result from early removal of crude oil. At this point in time, this is a real possibility. Perhaps current income over and above current requirements should be discounted to appropriately reflect the price loss resulting from early removal of crude oil.

While it is uncertain that governments should utilize discount rates to evaluate future cash flows, data is presented for discount rates of 6% and 10%. Shown on Figure II-19 and II-20 is discounted income to the State for the leasing methods analyzed. At these discount rates, (6% and 10%), the relative positions of the income curves for the various leasing methods do not change, they only shift downward.

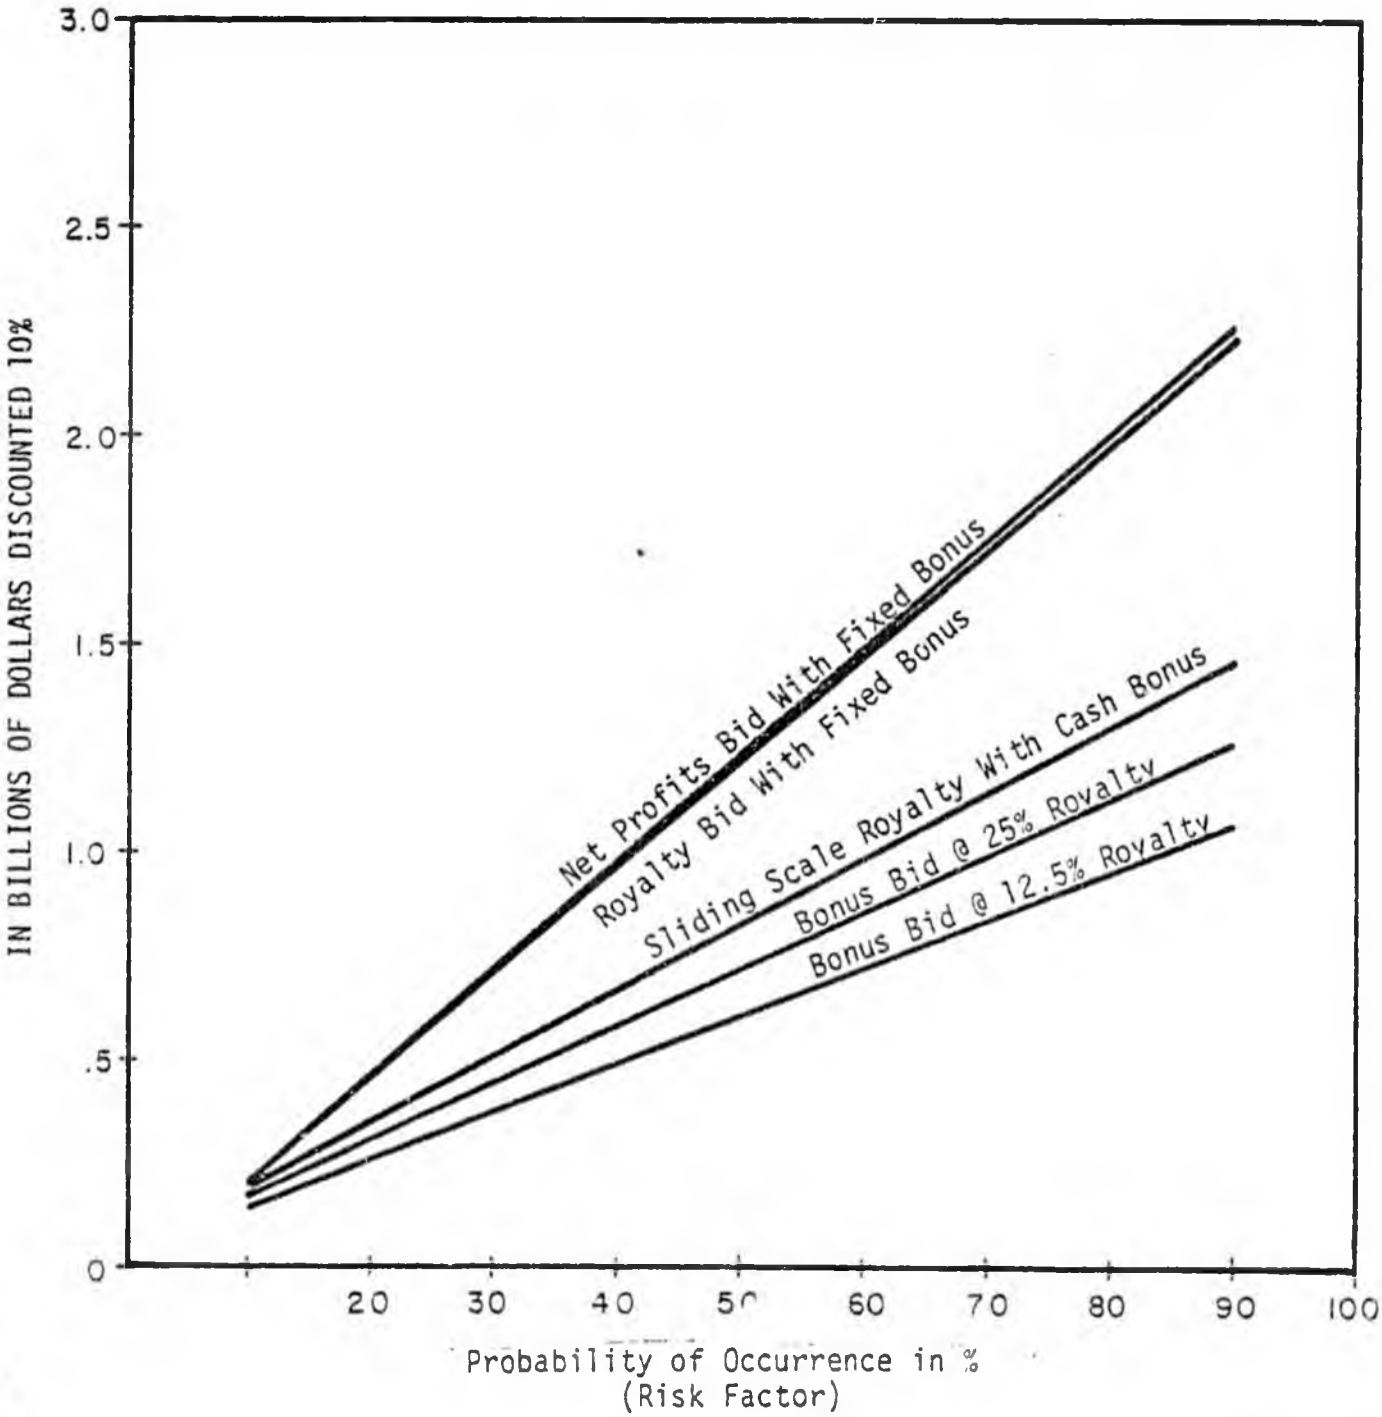

FIGURE II-21

EFFECTS OF VARIOUS LEASING METHODS

To obtain the amount of bonus to be bid under a cash bonus bid system, the interested companies make geological and engineering models of the field. This data is put into a computer program along with the rate-of-return the company requires. The computer output lists the present worth of profits at various rates-of-return and the bonus which can be paid for each complement of discount rate and rate-of-return. Company management then selects the bonus based on the historical success of the company in obtaining the reserves calculated by the engineers and geologists.

To determine the amount to be bid under the Royalty Bid system, the Net Profit system or the Bonus Bid for Sliding Scale Royalty system, input variables are changed to reflect the required output data. In all cases, the bid parameter is listed in the output for various rates-of-return at the company's discount rate of money. This data is frequently displayed on a normal distribution curve so management can readily perceive the bid value versus risk.

The geological and engineering risks are incorporated into the respective models. However, the final risk applied to the bid quote is done by top management based on the statistical success of the company in obtaining the reserves calculated by the geologists and the engineers.

Bonus Bid Method. This is the method currently used by the State of Alaska, the Federal government and various other state governments. The advantage to the State is that immediate income is maximized. The cash bonus can be utilized by the resource owner before any production is obtained. In the likely event of a dry structure, the resource owner still has obtained the bonus; the

implications of a resource owner obtaining large revenues for nothing is beyond the scope of this report. However, it does seem wasteful of capital resources. It should also be noted that tax deductions taken by industry in the unsuccessful ventures result in a reduction of the net bonus to the State of Alaska.

The State of Alaska's income needs have been great while the sources of income have been few. Generally, the cash bonus has been spent before the field is developed, and in many instances, the bonus has been spent even before a discovery has actually been made.

Compared to cash bonus bidding there is no other leasing method which maximizes the immediate income to the State of Alaska.

The disadvantages of the bonus bid, from the State's position, is that considerable future income may be sacrificed to obtain immediate cash income. The best example of this is that for all the State's petroleum leases on the North Slope bonus bids totaled 912 million dollars. Estimated reserves of the Prudhoe Bay Field are 9.6 billion barrels. Total State bonuses collected from all North Slope leases to date amount to only 9.5 cents per barrel of oil for the Prudhoe Bay Field. As additional reserves are developed on the already-leased North Slope acreage, the bonus value will drop below this 9.5 cents per barrel figure. Bonus wise, the State of Alaska virtually gave away the Prudhoe Bay oil.

In addition to the above considerations, the amount available for the bonus bid is based on the cost/price assumptions made at the time of bidding. If the costs or prices change after a lease has been awarded, the comparative value of the bonus changes. If costs decrease, the bonus was too low; if costs

increase, the bonus was too high. Similarly, if crude oil prices decrease, the bonus was comparatively high; however, in the more probable event that crude oil prices increase, the bonus would then be too low. The 1969 Prudhoe Bay lease sale occurred when Cook Inlet prices averaged 2.63 $/bbl.

From the producing companies consideration, they are making a considerable investment several years before they can possibly get any return for that investment. The cash bonus is wasted if the structures are dry. It has not purchased anything of value and does not assist in the exploration or development of resources. For small companies, this cash bonus or "Front End Money" imposes a large problem. For even large companies bidding on large structures, an equitable bid may be a significant part of the very high costs needed to bring the field to production. Here again the Prudhoe Bay Field is a good example. When the $0.9 billion bonus is added to the $8-10 billion for pipeline cost plus the field development costs of $5-6 billion, the aggregate cost strains the financial markets of even a group of large companies such as ARCO, BP, EXXON, and SOHIO.

In anticipation of the ability to finance a venture (bonus + development + transportation), a company would reduce their bonus bid based on the availability of capital and especially on the basis of their ability to obtain the needed capital.

Royalty Bid Method. On the other end of the bidding spectrum is the royalty bid. This is the bidding method most frequently compared to bonus bidding. Generally, a small fixed cash bonus is required to reduce speculation by those who have no intentions of exploring the leases. The winning bidder is the company which bids the highest fractional royalty to the resource owner.

The royalty bid is a means by which the resource owner can share in the benefits of a large field such as the Prudhoe Bay Field. However, the resource owner

must also share the risks in the dry structures, from which he would get nothing except the small fixed bonus.

Based on the same geologic, engineering and economic models, an operator would be more willing to promise large future payments contingent on the success of the exploration and development than he would be willing to pay an equivilent amount as a lump sum cash bonus at the lease sale when the first income from production is 4-6 or more years away; and when income from the investment may never be realized.

From the resource owner's consideration, a disadvantage of royalty bidding is that the owner shares the risk with the operator. For a dry structure, the owner would realize only the small fixed bonus whereas under the bonus bid, the owner would normally have received a larger bonus.

Royalty income to the State can be influenced by the crude oil prices set by the Federal government. The income gain to the State from royalty bidding as opposed to bonus bidding results in part from a reduction in Federal income tax (Figure III-1&2). This occurs because the royalty oil is not income to the operating company, therefore, it is not subject to Federal income tax. Since the Federal government through the FEA sets crude oil prices, they have the capacity to affect the royalty income to the State of Alaska. Decreased crude oil prices would not necessarily decrease income to the Federal government because they can make up the lost taxes downstream of the refinery. Any consideration of royalty bidding should include the possibility of the FEA setting crude oil prices which would affect income to the State.

Another disadvantage from the owner's viewpoint is that the royalty is a cost of

production and, economically speaking, acts like a production expense. As the cost of production increases, the minimum economic production rate is increased. This means that the economic limit is reached sooner in terms of cumulative production as well as in years of field life. When the economic limit is reached at a lesser cumulative production, the amount of the resource left in the ground is increased, thus wasting a valuable resource. Reaching the economic limit sooner in years also reduces the number of Alaska jobs available. This problem could be resolved by having the royalty decrease as production declines in the field's old age period.

Royalty bidding should entice more competition in the leasing auctions. During OCS lease sale No. 36 in the Gulf of Mexico, some tracts were put up for royalty bid plus fixed cash bonus while other tracts were offered at a cash bonus bid plus 16.67% royalty. The tracts leased on the royalty basis averaged 7.1 bids per tract as compared to only 2.2 bids per tract for those leased by bonus bid.

From industry's viewpont, royalty bidding takes much of the uncertainty out of bidding. The majority of their committment is based on the contingency of production. If they develop production, they pay. If no production is developed, they don't pay. This aspect increases competition for the leases and allows the allocation of more capital for exploration; however, it also makes it much easier to walk away from poor prospects. By keeping the front end investment low, industry's capital financing is much easier to obtain. Indeed, if the capital market is weak, they may have a difficult time financing the entire project, e.g. the TransAlaska Pipeline.

Since royalty is based on production, it has the effect of increasing the minimum production costs and therefore, the minimum production rate for an economic

operation. Theoretically, as the minimum economic rate is increased, the economic life of the field is shortened; therefore, the company may discontinue production of a field at a lesser percent recoverable under royalty bid than would occur under bonus bidding. This is speculative reasoning because an integrated oil company may operate a field at a loss because refinery feed stock is needed and because operating losses can be made up downstream. In actual practice, very few fields have been abandoned. They may be shut in or production suspended awaiting recompletion, stimulation, or secondary recovery, but they are seldom abandoned to the extent of recovering the equipment, plugging the well bore and cutting off the casing below ground level.

Net Profit Bid Method. Under this system, industry bids on the percent of net profits (after capital recovery but before taxes) which will be returned to the resource owner. Profits which are to be split are those obtained after the lessee has recovered all of this invested capital plus a nominal interest value. Also, at the time of leasing, a small fixed cash bonus is required as earnest money. In this study, the fixed bonus was based on expected reserves within the leased acreage.

Economically, this system is very similar to the royalty bid system. That is, the front end money required is low. The majority of return to the resource owner is predicated on the profitable production of the resource. Similar to royalty bidding, the resource owner shares the risk of not obtaining profitable production. If profits are not made, the resource owner's only income is the small fixed bonus paid at the time of leasing.

Some of the financial advantages of this system are very similar to those of royalty bidding. Since the front end money is low, financing exploration and

development costs is much easier for the company than under the current bonus bid system. The lessee should be willing to bid more money contingent on future profits then he would be willing to bid for a lump sum cash bonus bid.

Similar to the royalty bid system, the net profit system operates as an increased cost of production. That is, it raises the minimum economic value of production. As this minimum economic value of production is increased, the economic life of the field is reached at a lesser cumulative production and at a shorter time in years. However, as was discussed under royalty bidding, the economic limit is not necessarily the cut-off point as far as the company's willingness to produce a field. This is because the company may need the feed stocks to operate their refinery; and because profits lost from operation can be made up downstream of the refinery. Also, marginal on-shore fields are generally kept in operation pending some remedial work, stimulation, secondary recovery plans or pending significant crude oil price increases.

A disadvantage of the net profit system is that since the resource owner's income is based on the net profits of the company, the resource owner will want to know what the actual profits are. To ensure that only applicable costs are deducted from income, it would be necessary that the resource owner do extensive auditing of the books of all of the companies which were producing from leases obtained under the net profits system of bidding. Also, there could be a good deal of controversy regarding the need for and the chargeable costs of some investment items.

Another disadvantage could be that the companies would attempt to consolidate

profitable ventures with losing ventures (this is sometimes called cross subsidy). This is possible within the same lease or field as when a profitable option is coordinated with an unprofitable one - for example; field extensions, pool extensions, secondary recovery projects, production acceleration projects, facilities expansion and others.

Sliding Scale Royalty Method. For this leasing method, royalty rates which increase with production rates are set by the resource owner; bids are awarded to the bidder who offers the highest cash bonus.

This method of leasing combines the good points of the cash bonus bid at fixed royalty system with the good points of the royalty bid system. In effect, it's a compromise between the two systems.

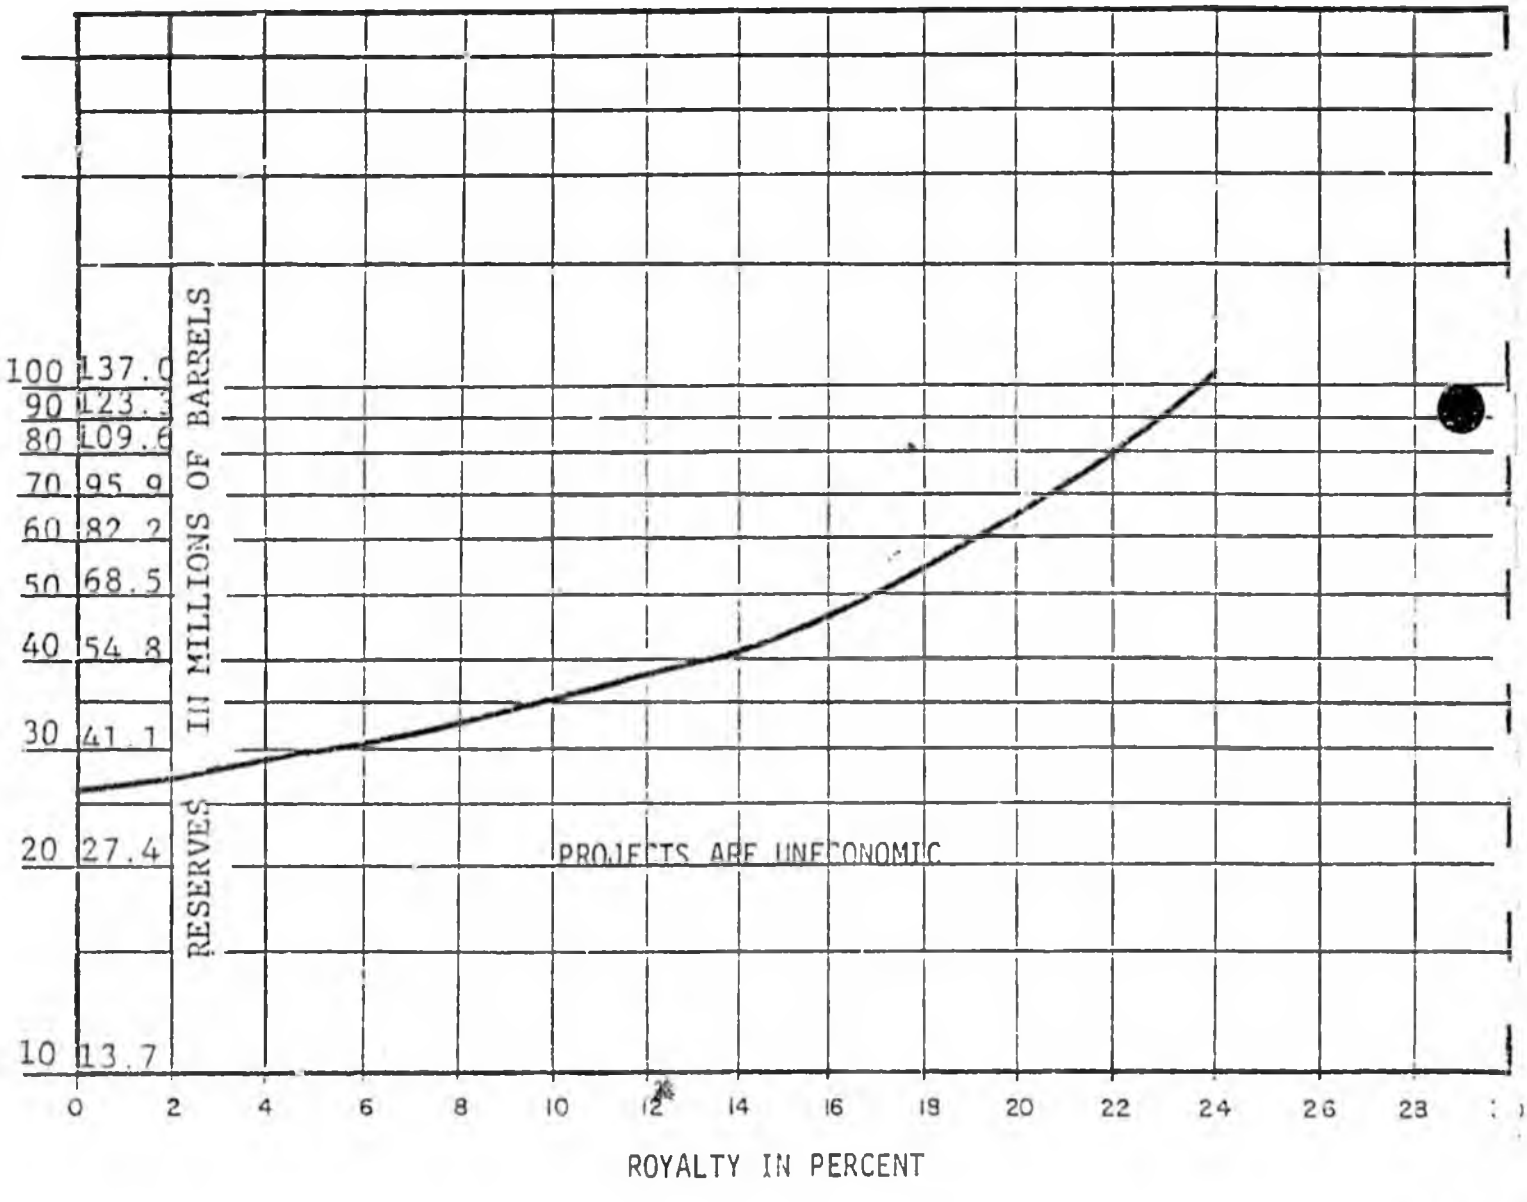
The sliding scale royalty system has the advantage of allowing the resource owner to realize some immediate income from lease sales and still allows some participation in the profits should a large field be discovered - for example, Prudhoe Bay. The cash bonus received would be less than under bonus bidding at fixed royalty, but would be more than the bonus required for either the royalty bid or the net profit systems. The royalty received would be greater than for bonus bidding and less than under the royalty bid or the net profit bid systems.

Under this method of leasing, prior to the sales, the State sets a predetermined sliding scale royalty rate which can be based on a variety of parameters. A very common one is production rate of the wells, individually or based on the average well production rate for the month. The interested bidders then bid on the

ECONOMIC LIMIT DEFINED BY

ROYALTY VERSUS RISK
FOR OIL WITH AVERAGE VALUE OF 10.5 DOLLARS/BARREL

Also Shows Royalty Versus Reserves
At The Economic Limit



amount of a fixed cash bonus which they will give to the resource owner for the privilege of exploring, developing, and hopefully producing from the leased tract.

The sliding scale royalty method is a very convenient tool which the State can utilize to prolong field life and increase ultimate recovery. As normally used, sliding scale royalty increases the percent royalty above a base percent (usually 12.5% or 16.67%) depending on production rate. However, for very small fields (and as large fields decline), the royalty percent could be decreased. Figure III-3 shows that for a crude oil price of $10.50/Bbl, and a rate-of-return of 18%, a field of 30 million barrels recoverable is only economic if the State is willing to accept about 6% royalty. It could also be economic if industry was willing to accept lower rates-of-return; however, for high risk ventures, a reasonable rate-of-return would probably be nearer to 25% than the 18% used in this report.

Percent of Acreage Option. Withholding a percent of the acreage is a leasing option which has resulted in increased income to resource owners. The elements of this option are that only 40 to 60 percent of the acreage is leased at the initial auction; the balance of the acreage is leased after a discovery is made. If only dry structures are found, the remaining acreage would not be leased.

At the initial leasing, all bids will be discounted for the risks involved. After exploratory wells have been drilled, either reserves will be found or the structure will be dry. If dry structures are found, the remaining acreage will not be leased. If reserves are found, the remaining acreage can be leased as proven reserves and will thus bring in premium bids.

This of course is what happened with the Prudhoe Bay oil field. Prior to discovering oil in 1969, Arctic Slope competitive bid bonuses totaled only 12 million dollars. After oil was discovered, competitive bonuses for the remaining acreage totaled 900 million dollars - most of this acreage straddled the oil/water contact and was definitely inferior to previously leased tracts.

Withholding acreage can increase income to the resource owner because irrespective of the risks initially applied, after a discovery is made the remaining acreage may be considered as probable reserves by the bidders. Thus, the increased income is due to a decrease in risk, not because of the bidding method utilized. In fact, any bidding method could be used in conjunction with the percent of acreage option.

There are some dangers in withholding acreage. In areas where a great deal of uncertainty exists, if too little of the structure or basin is offered at the initial auction, there may be few bidders. If too much of the basin is offered at the initial auction, it may turn out that the productive acreage is entirely within the leased tracts. Therefore, the bidding methods should be as carefully tailored to the particular structure or basin being leased as if the whole would be leased at the first auction.

The percent of acreage leasing option is a technique of withholding a part or a block of the leaseable acreage; it should not be confused with "checker boarding". Checker boarding is a leasing option whereby only alternate sections are leased initially. In the lower 48 states where fields are small, cost are relatively low, and well spacing may be as close as one to each 5 or 10 acres, checker boarding may be equitable to the operator. However, in

Alaska where well spacing is 1 well for each 160 acres and cost are high, fields must be large to encourage economic development. Checker boarding alternate sections in Alaska would be uneconomic to leasees and would probably result in the tracts not being leased. In the percent of acreage option, we are considering that only 40-60% of the structure is leased initially - that is, a few large blocks would be withheld.

OTHER CONSIDERATIONS

The purpose of an auction is to allow the bidders to set the fair market value of the commodity being sold. The fair market value can only be obtained when there is a sufficient number of bidders to insure actual competition. Anything that increases the number of bidders increases the competition and therefore increases the probability of the seller obtaining the true market value for his goods. On the other hand, anything that decreases the competition decreases the probability that the sale price will be the fair market value.

For a variety of reasons, the large oil companies tend to combine in partnership groups and make joint bids. This practice tends to spread their risks, but it also tends to reduce competition in bidding. In an attempt to encourage competition, the Federal government has prohibited the 9 largest oil companies from bidding together - the companies are listed in the Federal Register Announcement dated September 27, 1976. This is an option that Alaska ought to consider emulating in all future lease sales.

Also, the State should consider allowing industry to pay their cash bonus bids on an installment basis. This would spread out the income to the State and would ease financing problems for the companies. In Alaska where bonus bids, and exploration and development costs tend to be high, small companies are virtually excluded from competing. If they could pay their cash bonus bids on an installment basis, they could possibly compete in the bidding, (a bond should be required to insure payment of the balance). As discussed earlier, the winning bid at an auction is more apt to approach the fair market value when there are a large number of participants.

This report has presented analytical comparisons and discussions of four bidding methods and of one leasing option. Model fields were constructed based on existing Alaska fields. Income to the State was computer calculated for each of the analyzed bidding methods. The advantages and disadvantages of each of the four bidding methods was discussed, one method at a time. The major advantages and disadvantages which should be considered are summarized in the following paragraphs.

Proper selection of a bidding method can optimize benefits to the State in various ways:

1. Increase immediate income
2. Sustained yearly income
3. Increased total income
4. Encourage exploration activity
5. Prolong field life
6. Encourage development of marginal fields.
7. Increase the number of bidders.

There is no "one" best method which can maximize all of the above possible advantages to the State. To select a bidding method for a particular lease sale, the selector must know the relative importance of the above criteria at that point in time.

For each of the analyzed leasing methods, there are relative disadvantages as well as the advantages. The methods which have the most distinct advantage in one criteria will have a distinct disadvantage in another criteria. Some

of the more obvious disadvantages of the various leasing systems analyzed are:

1. Reduction in total state income
2. Reduction in immediate income
3. Decreased exploration activities
4. Shortened economic field life
5. Discourage development of marginal fields
6. Require strict State surveillance of oil industry accounting
7. Decrease the number of bidders.
8. Varying degrees of risk assumed by the State

These disadvantages are a compilation of the disadvantages of the various leasing systems analyzed. They are not all attributable to any one system.

Selection of the leasing method to be used for selling resources in a specific structure must include consideration of the disadvantages to be minimized as well as the advantages to be maximized or at least optimized. A flexible leasing system based on analytical research will allow not only the selection of the "best" method but the combination of various methods to produce a product that will maximize the benefits listed and minimize the disadvantages.

There is no single leasing method which is the best in all situations. The selection of a leasing method for a particular lease is dependent on the structures being leased and on the State's income requirements at the time of leasing. Analytical data has been presented which show some methods maximize immediate income while others maximize total income. All of the methods discussed in this report have advantages and disadvantages relative to the other methods. Only by understanding the atmosphere in the State and requirements of the State at the time of leasing can the "best method" be selected: e.g. the one which has advantages we want to maximize along with disadvantages we can tolerate.

PETROLEUM FIELD MODELS

This study concerns the effect of different leasing methods on the income received by the State of Alaska from the development of its petroleum resources. Therefore, the study team chose known Alaskan fields as the foundation on which to build five oil field models. Each of the leasing methods was tested on the models, and the income to the State and to industry was measured, thereby enabling evaluation of the leasing methods. The discussion of the Engineering/Geologic models follows:

Proven Alaskan oil fields range in size from less than 80 million to about 8 billion barrels of recoverable oil. Five model fields which range from 50 million to 5 billion barrels of recoverable oil were chosen as representative of the sizes of oil fields which may be found in Alaska in the future. The smallest of the model fields, Mercury, contains approximately 50 million barrels. Mars 110 million, Venus 600 million, Neptune 1 billion and Jupiter 5 billion barrels. These fields are ranked as marginal, small, medium large and giant (as compared with Alaskan oil fields).

The 50 million barrel field is smaller than the smallest currently producing Alaskan field, but using this size of field reflects the future of development in a pioneer area such as Alaska. In the normal course of petroleum development in an area, the largest fields are discovered and produced first. As time passes, better technology and economics allow the discovery and development of smaller fields which were previously unknown and would have been uneconomic. Alaska may be entering this second stage of development in areas such as the Upper Cook Inlet.

There is no such thing as a "typical" oil field, but certain physical characteristics and development activities are common to all fields in a geographic region such as Alaska. The model oil fields used in this study are based on Trading Bay, Granite Point and McArthur River Oil Fields in Cook Inlet and Prudhoe Bay on the North Slope. Table K-1 lists all of the physical characteristics of the model fields. Note that reserves are listed as recoverable reserves. In actuality, the oil in place (i.e. in the ground) can be as much as three times greater than the recoverable oil. This study assumes an average recovery rate of 30% using secondary recovery techniques. Thus, Mercury Oil Field with recoverable reserves of 50 million barrels actually may have 166.67 million barrels of oil in the ground. The largest model field, Jupiter, has recoverable reserves of five billion barrels and may have oil-in-place of 16.67 billion barrels.

The physical parameters, such as the feet of pay, acres occupied, porosites and permeabilities, for each model field are all adapted from the corresponding real field as are the gas-oil ratios, oil gravities, and sulfur contents. In some cases, the acres occupied by a model field are scaled down from the real fields to reflect the differences in amounts of reserves.

Although most of the real Alaskan fields are producing oil from several pools, the leasing study fields are modeled using one producing pool. Consultation with petroleum engineers of the Division of Oil and Gas Conservation committee indicated that this assumption will not appreciably affect the computer results, or the validity of the conclusions.

PHYSICAL PARAMETERS OF THE MODEL FIELDS
The Sensitivity of State Petroleum Income to Various Leasing Methods
January 1977 Table K-1

Figure K-2 illustrates the development history of Northern Cook Inlet oil fields upon which the model fields development histories are based. For the purpose of this study, time zero is the lease sale date. All development takes place in relation to that date. It can be seen on Table K-2 that the average length of time from lease sale to production in the Cook Inlet has been approximately five years; therefore, the study uses that time span, also.

Table K-3 is a compilation of the production histories of the model fields. Based on the accepted historical average, each model field requires three exploratory wells. Mercury, Mars and Venus are located offshore and Neptune and Jupiter are situated onshore. Mercury uses two offshore production platforms while Mars and Venus require three. The number of production wells ranges from 32 to 240 with the average initial production rates ranging from 12,500 to 9,120,000 barrels per month. Eight to eleven years elapse between the lease sale date and the date when the fields reach peak production. Peak production rates range from 400,000 to 29,000,000 barrels per month and lasts from five to seven years, depending on the particular model field.

Based on the history of Alaskan oil development, it is also assumed that all of the model fields require water injection for secondary recovery pressure maintenance, which begins from eight to twelve years after the lease sale. The number of injection wells range from 13 to 30.

Production of the various fields begins to decline from 12 to 16 years after the lease sale. Decline rates vary from 10 to 20 percent, and the production rate at the end of the economic life of the fields range from 25,000 to 330,000

barrels per month.

Figures K-3 through K-7 illustrate the production histories of their model fields. Mercury oil fields' economic life (years of production) is estimated to be 27 years. All of the other larger fields may produce for 30 years. These are based on accepted historic averages. The length of any fields' economic life is very difficult to predict because of the uncertainties involved in changing technology and economics. It is possible that improved secondary recovery techniques and higher oil prices may extend production years far beyond the above mentioned estimations. Economic life also varies with the type of leasing method employed. Some of the computer analyses did run the economic lives beyond 30 years, but the amount of oil produced during that time is very insignificant when compared to the total production.

In the actual analysis for a future lease sale, engineering/geologic models of the potential risk oil fields to be leased will be modeled in the same manner as presented here. The expertise and knowledge gained through this modelling program will be invaluable for assessing the cost benefits of developing Alaska's energy and mineral resources.

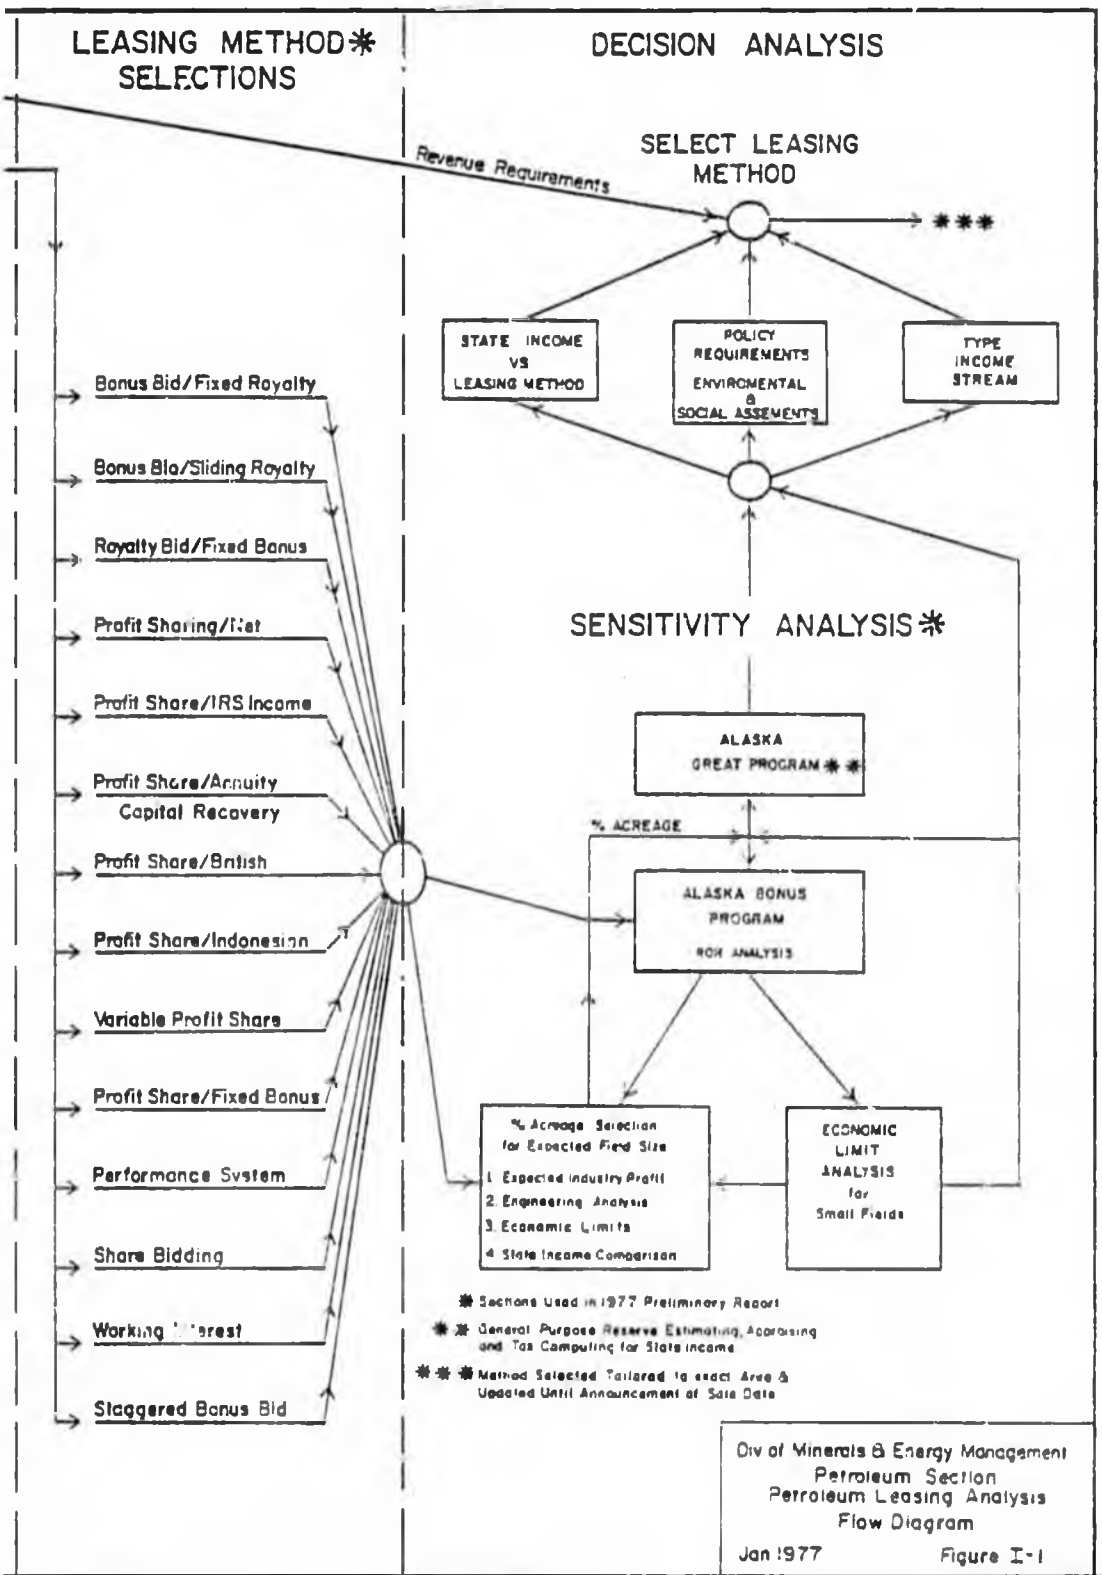
Figure K-7

The section of the Alaska Resource Evaluation and Leasing System that covers the sensitivity of the State's income to the leasing method utilized is described in this appendix. The following chart displays that portion of the general flow diagram that will be covered.



The computer model system employed uses a modern econometric approach designed for an industrial cash flow analysis for a potential venture. Since it is assumed that the State already owns the entire potential field it can approach the problem from a combined average position. In other words, the State will receive income from all the various bidders and can therefore model the entire oil field dealing with only one composite oil company cash flow. The econometric model uses this composite oil company as the test case to determine what incomes and rates of return will result from winning the leases in the sale, then exploring and developing the field.

Because of the unique circumstances surrounding the oil and gas leasing situation in the State of Alaska, it was necessary to have a computer model system developed to fit its needs. Garrett Computing Systems, Inc. of Dallas, Texas refurbished its GREAT system (Generalized Reserve Estimating, Appraising and Tax Computing) to suit these necessary variations and to provide the kind of output the State needed for use in its study of the sensitivity of oil and gas leasing methods.

Two program variations were developed. These programs, the ALASKA BONUS program and the ALASKA GREAT program, are combined into a system which provides an Income to the State of Alaska report as a final product. Figure V-1 shows how the various inputs are incorporated into the ALASKA BONUS program, with the resulting outputs to be used in the ALASKA GREAT program to produce the final report.

Following through this flow diagram in detail, the first decision to be

SENSITIVITY ANALYSIS
COMPUTER MODEL SYSTEM

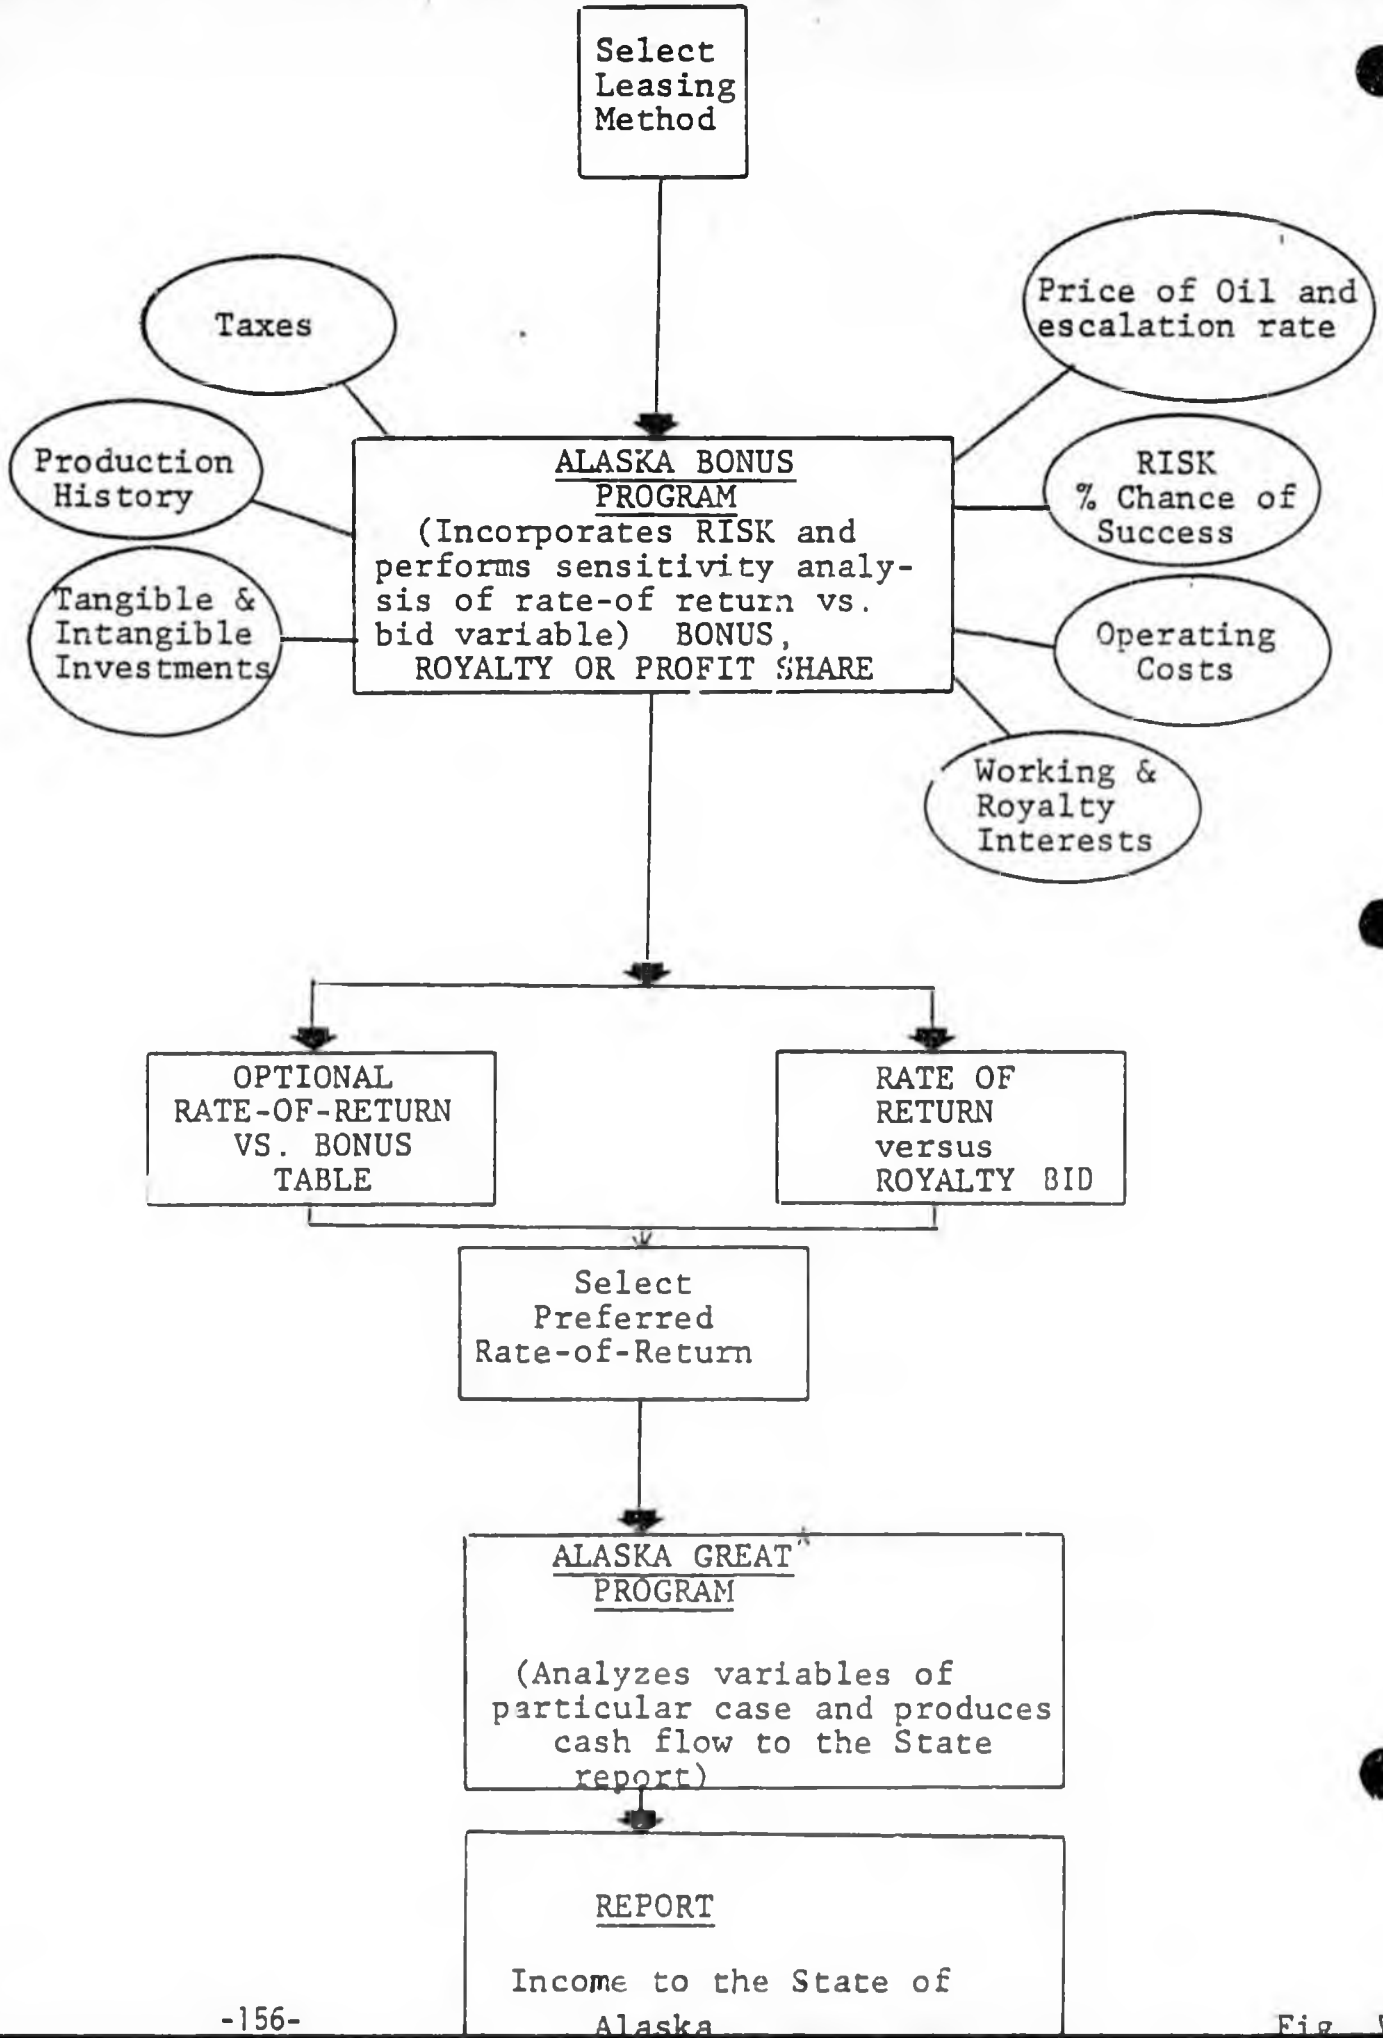


Fig. V-1

made is the choice of a leasing method. The resultant bonuses and/or royalties are used as inputs to the BONUS program along with the other input parameters specified, including taxes, production history, operating costs, price of oil, etc. The ALASKA BONUS program incorporates RISK and performs a sensitivity analysis producing a table of rates of return versus the bonus bid variables. The predetermined rate of return is taken from the table along with its corresponding bonus bid. This bonus bid is used as input to the ALASKA GREAT program which analyzes all of the inputs and produces the finalized report of the Income to the State of Alaska.

ALASKA BONUS PROGRAM

The ALASKA BONUS program is a special computer model used to analyze the cash flow from a lease to the company winning the bid and developing the field. It incorporates risk, entered as the percent chance of success, and performs sensitivity analyses of rate of return versus the bid variable (bonus, royalty, or profit share).

The basic input data to the computer is composed of the investments, expenses, production, prices, etc. of a lease. The investments are designated by type - for example, bonus payment, intangible, exploratory cost, tangible well cost, etc., and by the timing of the investment. Production, expenses and product prices are scheduled for the life of the field. The prices and expenses may be escalated if so desired.

A risk factor is entered into the BONUS program as a percent chance of

success. These adjustments for risk are handled as follows:

1) The dry hole/success ratio is calculated as the probability of a success. For a 10 percent chance of success this ratio is 9 (.9/.1), for a 50/50 chance the ratio is 1, etc.

2) Investments such as BONUS and EXPLORATORY are made whether or not the project is a success, and so are equal to the dry hole cost.

3) BONUS type investments are used for the lease bonus. For tax purposes, a bonus is capitalized when made and amortized over the life of production on a units of production basis. If the lease is determined to be non-commercial, the bonus may be written off as a lump sum at that time.

4) EXPL type investments are used for both tangible and intangible exploratory investments. Intangibles are written off when they are made and tangibles are capitalized and depreciated if a success or written off as a lump sum if non-commercial.

5) All other investment types are for those investments made only if the lease is productive.

6) The BONUS version multiplies each BONUS and EXPL type investment by the dry hole/success ratio to arrive at the dry hole cost associated with each success. These costs are then handled as described in 3-4 above.

7) A discounted cash flow analysis is then performed on the composite of the dry hole case with its associated tax treatment and the successful case with its associated tax treatment.

8) If so desired, this model will automatically perform a sensitivity analysis by varying the BONUS and producing a BONUS versus rate of return profile. A plot of a typical BONUS versus rate of return profile is included at the end of this report.

9) Other sensitivity analysis features are available to produce royalty or profit share versus rate of return tables.

THE ALASKA GREAT PROGRAM

The ALASKA version of GREAT is the computer model written by Garrett for the State to analyze the income to be received by the State of Alaska in the form of taxes, royalties, bonuses, profit shares, etc., from the various leasing alternatives. After the BONUS version has been used to determine a likely bid variable (bonus, royalty, or profit share), the case is analyzed by the ALASKA version to produce the cash flow to the State.

The options available allow the analyst to see the cash flow to the State under a variety of corditions such as assuming a success, assuming a dry hole, expected value combining success and failure, etc.

The reports show income to the State by year for each of the following

categories:

-Bonus

-Royalties and/or Profit Shares

-Severance Taxes

-Conservation and Ad Valorem Taxes

-State Income Taxes

-Total Income to State

In addition, it shows total gross production, life of production, and the present worth of the cash flow discounted at eight rates from 2 percent to 20 percent. Figure V-2 is an example of the Alaska Great output for an expected value oil field of 600 Million Barrels at 10 percent risk.

INPUTS FOR VARIOUS LEASING METHODS

Several leasing alternatives were explored in this sensitivity analysis, but fewer than had been anticipated due to time constraints. Those methods explored were:

1) Bonus Bid with Fixed Royalty

2) Fixed Bonus with a Royalty Bid

3) Fixed Bonus with Net Profit Share

4) Bonus Bid with Sliding Scale Royalty

5) Percentage of Acreage Withheld Option

Each method had to be dealt with differently within the constraints of the system of programs. In the bonus bid with fixed royalty method, the royalty rate (either 12.5 or 25 percent) is input into the ALASKA BONUS program, which produces the rate of return versus bonus bid table.

WHEN BONUS IS   706681. M$, ROR =    0.  PCT.
```

The bonus bid which corresponds to the desired pre-determined rate of return can then be selected. This bonus bid is input to the ALASKA GREAT program producing the Income to the State of Alaska report.

In the second leasing method, The Fixed Bonus with a Royalty Bid, the fixed bonus is determined as follows.

Fixed Bonus = 2.5 cents per barrel of expected recoverable oil

The royalty bid is then determined by running a TRACE ROR (rate-of-return) on the BONUS program, which contains a first guess at the royalty percentage. By trial and error, and by using the TRACE ROR, two points can be obtained above and below the desired 18 percent rate-of-return. By interpolation the exact royalty percentage can be found.

The Fixed Bonus with a Net Profit Share method produces the most problems with the computer input. It was first determined that the company must be allowed to recapture the amount of its tangible investment plus 4 percent interest, to give the company some return on its investment. After this amount has been calculated, a TRACE ROR is run to compute the Net Profit Interest at an 18 percent rate of return to the oil company. (This trace is done within the BONUS program).

Next, a TRACE A is run on the ALASKA GREAT program to trace line 44 or the "Net Profit Stream." A list is provided of thirty-two values which tell at what time the investment plus 4 percent interest will be recaptured and when the state will begin to get its percentage of profit share. It is necessary to put a "0" in the royalty slot on line 210.

The net profit stream from the TRACE A is input on lines 305 through 309 into the ALASKA GREAT program, producing the income to the state of Alaska. Of course, the fixed bonus in this method is determined in the same way as it is paired with the Royalty Bid.

The fourth leasing alternative, the Bonus Bid with a sliding scale royalty is handled in a slightly different manner. It was determined that approximately five percent increments gave an adequate representation of a sliding scale royalty. These royalty increments are input on line 183. Lines 181 and 182 denote barrels of available oil, and barrels to be added to each step of the royalty up the scale. For example, a 20 percent royalty of production over 1,000,000 barrels added to a base figure of 200,000 Bbls would be the royalty in this case. Therefore the royalty is a function of the production of the oil field.

The final leasing method dealt with is the Percentage of Acreage Withheld Option. In this method, the entire area under consideration is divided into tracts with 40 percent withheld for sale at a later date. Sixty percent of the tracts are sold at a 10 percent risk, and are input to the computer as such. The remaining tracts are sold two years later, so all of the time limits of production and investments must be increased by two years. Also a 90 percent risk factor is used at this later date. The resultant incomes from these two runs are added together to give the total income to the State of Alaska.

The major economic factors are calculated by the ALASKA BONUS program and the ALASKA GREAT program in this fashion:

Production*= Field Size x Risk Factor

$$\text{Total Bonus Amount} = \frac{\text{Bonus per Structure}}{\text{Risk Factor}}$$

$$\text{Total Dry Hole Cost} = \frac{\text{Dry hole costs per Structure}}{\text{Risk Factor}}$$

Gross Revenue = Expected Production x Crude Oil Price

Severance Tax = Gross Revenue x .079

Royalty Value = (Gross Revenue - Severance Tax) x Royalty Fraction

Revenue to Oil Company = Gross Revenue - Severance Tax

Conservation and Advalorem Tax = Gross Production x .1175¢/Barrel

Operating Cost = Wells per year x Fixed value depending on Field Size

State Income Tax = (Oil Co. Revenue - Operating Cost - Depreciated Tangible Investment - Amortized Bonus - C & A Tax) x .094

Fed Income Tax less Investment Tax Credit = (Oil Co. Rev - Operating Cost - Depreciate tangible Investment - Amortized Bonus - C & A Tax - State Income Tax x .48

Profit = Oil Co. Revenue - Bonus - Investment - Operating Cost - C& A Tax - State Income Tax - FIT

State Income = Bonus + Severance Tax + Royalty + C & A Tax + State Income Tax

*In this study production is called "Expected Value Production."

APPENDIX C

COST, PRICE AND EXPECTED VALUE

The approach used in this report is to approximate actual conditions expected wherever possible. To accomplish this a considerable effort was used to determine what the possible future prices of oil could be and what operating costs might occur on State lands. We have selected only one price method for our sensitivity study although we realize that there may be considerable uncertainty in future Alaskan prices and costs. In an actual resource management analysis we will be using a probabilistic input for costs and prices and a Monte Carlo sampling technique for the economic calculations to account for this uncertainty. The price and cost approach we have used appears to be quite adequate for showing the sensitivity of income to leasing methods.

PRICE

A great deal of uncertainty surrounds FEA pricing of new oil. Therefore, for purposes of this study, the price used in the low price case has been either the current upper tier price in Cook Inlet, or the expected price to be received at Prudhoe Bay as published in the Oil and Gas Journal. In the high price case the world price of OPEC oil adjusted for transportation costs was used. These prices were escalated by 5% per year to a maximum of $18.00 per barrel with the expectation that the OPEC countries will raise the real price of oil each year by at least this percentage and that the FEA will allow the real price of oil to rise at this rate. This price approach is probably conservative since real price increases in the value of petroleum in the next thirty years may be spectacular.

COST

Because very little has been published on costs of petroleum production or investment costs in the State of Alaska, the costs used in this study were predicted on the best estimate available. To assist in this estimate, cost parameters from the Cornell University study (Alternative Energy Leasing Strategies and Schedules for the Outer Continental Shelf), and from special studies published by the American Petroleum Institute were used, among others.

In addition to the costs of operating a field and its associated investment costs for platforms, production facilities, exploratory and development wells; a rate for Federal and state income tax, Alaska severance tax, ad valorem tax, and conservation tax was included.

Due to the inconsistency of income received from Alaska corporation income tax due to the provision for apportionment, the scenarios are based on the operations of a domestic oil company. By using this approach all companies are placed on the same tax basis.

Ad valorem tax and conservation tax is computed on a per barrel basis. The study "Analysis of the Profitability of Operations in the Cook Inlet Basin by the Oil and Gas Industry, Taken as a Whole" prepared by the Department of Revenue, was used to estimate ad valorem tax on a per barrel basis.

Operating costs were based on a cost per well since operating costs follow closely increased development, and decline with well shut ins. Operating costs include lifting costs and remedial well work.

The most commonly used method of computing depreciation of equipment on producing oil properties is the "unit-of-production" method, and this method was used in this study. The distinguishing feature of this method is that depreciation per unit is obtained by dividing the estimated units of hydrocarbon reserve into the investment in equipment. The number of barrels produced in a given period is multiplied by the depreciation per unit to obtain the amount of depreciation for the period.

So far as this study is concerned, the situation in which the operator has the full working interest and there are no other outstanding interests except the basic royalty or net profit interest was the only one considered.

For purposes of computing Federal income tax, the oil company was allowed a 10% investment tax credit, which is in line with current tax procedure.

All costs, such as geological and geophysical costs, are considered "sunk" at the time of lease sale, and are given no consideration in investment costs of the project. Sunk costs and the costs of borrowing money are considered, though, when choosing a rate-of-return equitable to the oil company. The Cornell study also considered prior costs to be "sunk" at the time of lease sale. Price and cost regions (Figure C1) are discussed in Section IV of the report.

Expected Value

The expected value concept was used throughout this study as a method of uniting uncertainty and economic factors into a meaningful decision criterion. For any course of action there are at least one and often many possible outcomes.

COST REGIONS

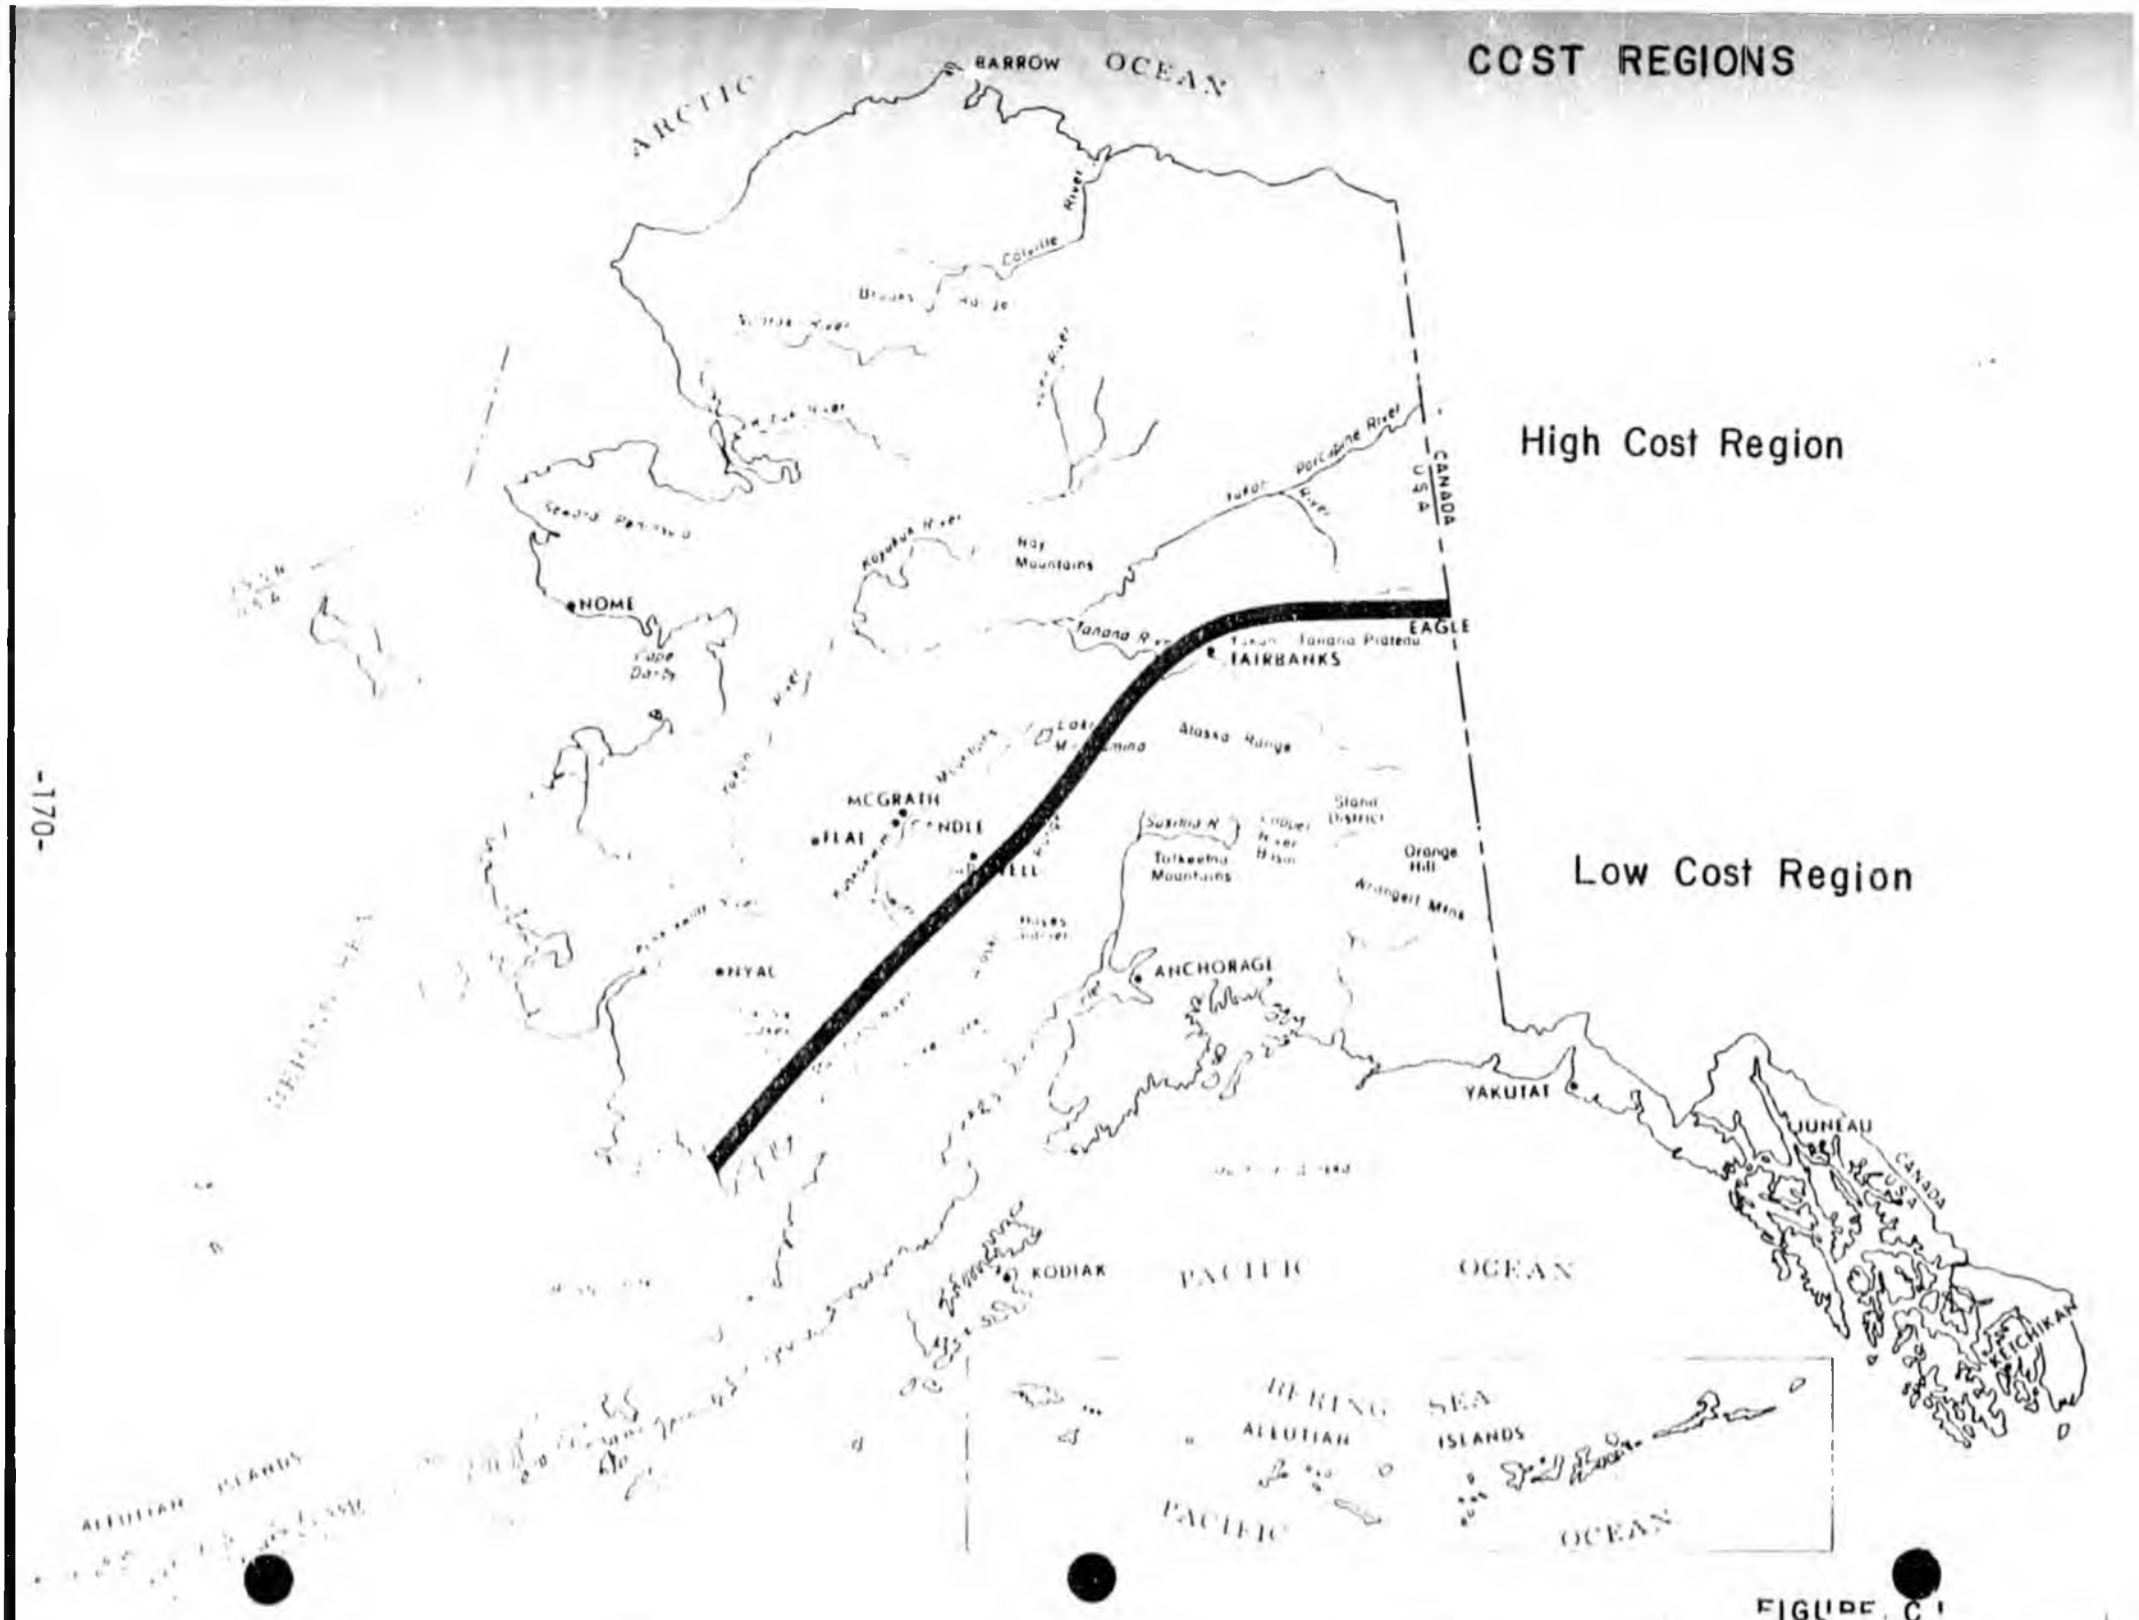

FIGURE C1

The probabilities of each of these possible outcomes, each expressed as a fraction from 0 to 1.0, must sum to 1.0. If an event has a certain outcome then that outcome has a probability of 1.0 If an event has multiple possible outcomes, such as the flip of a fair coin, the sum of the probabilities of occurrence must equal 1.0, e.g. probability of heads (0.5) plus probability of tails (0.5) equals 1.0.

The expected value of an outcome is defined as the value received if that outcome occurs times the likelihood of its occurrence. The expected value of a course of action is the sum of the expected values of its possible outcome. For example, if nine dry structures are drilled for each discovery drilled, the probability of a discovery for any specific structure is one in ten or 10%. This then means that the average oil recovery for each of the ten structures drilled is 10 percent of the productive structure. Suppose additional information on the field was obtained, causing some structures not to be drilled because of low probability of an economical size field. It would then be likely that the probability of occurrence would increase (due to better information) as would the expected value. Let's say that with the new information, only four dry structures are drilled for each discovery drilled. This results in the expected value of recoverable oil to increase from 10 percent to 20 percent. Therefore, based on this information, for each field leased, the cash bonus bid to the State should be increased in direct proportion to the increase in the probability of the expected event occurring.

In business and economic decision making, a major decision criterion is often expected monetary value or EMV. For instance, assume that the president of the company has two alternative courses of action for a proposed investment. The first alternative has a 50/50 chance of either losing $100,000 or making

$1,000,000 thus its EMV = (.5)(-100,000)+(.5)(1,000,000)= -50,000 + 500,000 = $450,000. Alternative two has a 30 percent chance of losing $100,000 and a 70 percent chance of making $700,000, with an EMV of (.3)(-100,000) + (.7)(700,000) = -30,000 + 490,000 = $460,000. Therefore, if the company president based his decision on EMV, he would select alternative number two. Of course, there may be other overriding considerations but strictly from the standpoint of maximizing EMV, alternative two is superior.

In this analysis, the monetary value was most often represented by cash flows and their discounted values rather than simple lump sum values.

APPENDIX D

Currently, the State of Alaska's leasing system is a cash bonus bid with a minimum fixed royalty of 12.5 percent. The methods analyzed in this report include the present system with different fixed royalties, sliding scale royalty with bonus bid, net profit share bid with fixed bonus, royalty bid with fixed bonus and percentage of acreage withheld. This limited number of methods were chosen for analysis from a great number of possible methods due to time limitation factors. In the future The Division of Minerals and Energy Management plans to analyze a number of other methods possibly including fixed bonus with oil payment bidding, performance system, share bidding, working interest system, staggered bonus bidding, profit share with an IRS income base, annuity capital recovery profit share, British-type profit share, Indonesian production sharing, variable profit share, fixed bonus with profit share bidding. The basic elements of these methods are summarized below after a discussion of the methods utilized in this study. If a more detailed description of these methods is desired, please refer to Federal Leasing of Petroleum on the Outer Continental Shelf or Alternative Energy Leasing Strategies and Schedules for the Outer Continental Shelf (see bibliography).

EXAMINATION OF METHODS USED IN THIS STUDY

(1) Bonus Bid With Fixed Royalty

Bonus bid with fixed royalty is the system currently used by the State of Alaska. In a lease sale, the winning bid for a tract is the one which makes the highest sealed cash bonus bid. There is also a minimum royalty of 12.5 percent. An advantage of this system is that government receives revenue regardless if there are economical quantities of oil or gas found and/or produced. However, bonus bids are depressed to account for risk. An inherent difficulty is that royalty affects income but not cost. For evaluation purposes, we have used two

different fixed royalty rates: our current rate of 12.5% and an increased rate of 25%. To avoid early termination of production, royalties need to be flexible during a field's declining years.

(2) Sliding Scale Royalty With Bonus Bid

Under this system, the government receives a cash bonus bid and a sliding scale royalty. We used 12.5% as a minimum figure and 60% as a ceiling wherein the rate in any period is dependent upon the production of that period. If the production rate is high, then a higher royalty rate is applied. This encourages production to continue in order to extend the field's economic limit. The royalty rate falls as production declines. Greater flexibility in setting the initial rate is the major advantage of this system while not running the risk of an uneconomically (for Industry) high royalty rate. On the other hand, to achieve an overall lower royalty payment, a company might spread out production over a longer period of time. Usually, however, because of the time value of money and increased operating costs, oil companies generally try to accelerate production.

(3) Net Profit Share Bid With Fixed Bonus

The fixed bonus in this report was calculated by multiplying 2.5 cents per barrel times estimated recoverable reserves. This small fixed bonus is required as earnest money. The bonus is low enough to encourage producers to bid a high net profit share while permitting profitable development. In this system, the operator recovers all of the capital investment plus 4% nominal interest per year before the government takes its share of the profit.

(4) Royalty Bid With Fixed Bonus

This system utilizes the same method to calculate fixed bonus as described for Net Profit Share. The bid parameter is a function of production instead of net

profits. Since the bonus is fixed, interested parties bid on the royalty rate that the government is to receive. The advantage of royalty bidding is that little front end money is needed by Industry. However, this would encourage speculation causing an overbid. Royalty bidding should encourage more conpetition among bidders and may allow the smaller companies a better chance of winning the tract.

(5) Percentage of Acreage Withheld Option

This option should be considered for use in any high risk bidding situation, except for small fields. As its title implies, a percentage of the acreage is withheld from the initial lease sale situation. Analysis has shown that the lessor can derive significantly higher incomes by withholding a percentage of a petroleum structure for a deferred sale. The percentage to be withheld would be determined from geologic/geophysical data and economic analysis on the prospective structure.

Refer to the analysis section for further discussion of these methods.

POSSIBLE METHODS FOR FUTURE ANALYSIS

(1) Fixed Bonus With Oil Payment Bidding

A fixed bonus is specified in dollars whereas the oil payment can be designated as a percent of production or as a set number or barrels to be paid for each year of the lease. The primary advantage is that both government and private industry share the market price risk of petroleum. However, if the oil payment percentage of production, then this method is actually royalty bidding. Moreover, if the payment is in terms of barrels paid per year, then the system is actually a rental system. Both royalty and rental systems have their advantages and disadvantages so there is not a unique advantage to having an oil payment bidding system.

(2) Performance System

This system, which has been used by Canada and Great Britain, replaces the competitive market place with administrative evaluations. The government, as the authorized leasing agent, itemizes the performance criteria such as the rate and amount of work to be performed on each tract, and the amount of capital expenditures. The performance system provides government with the authority to specify the exact rate and extent of resource development. This allows for stringent control over the use of the resources. Another advantage of this system is that it may give small operators greater access to the resources.

(3) Share Bidding or Phillips Plan

The entire structure is leased in this system. Bonus bids are entered for the entire field instead of for a specific tract. Based on their equity in the field, each company receives a percent of the profits or losses with a maximum of 20 percent participation by any one company. The companies form a corporation with each company having the same percentage of control as they have equity. One operator is responsible for exploration and development. Bonus bids held in escrow may be used for field development costs. The advantage of this system is that the bonus bids are used as working capital to explore and develop the field. However, the administrative complexity of such a plan necessitates close government monitoring of the corporations' activities. This monitoring increases administrative costs to the government, but in return the government acquires detailed knowledge of operation economics.

(4) Working Interest

In this system, the companies bid for working interest shares of the structure rather than for a specific tract. The winning bidders are those whose bids

sum to the largest total bid for the entire area. The lessor selects an operator to undertake exploration and development of the area after the lease sale. The economics of this system are similar to the profit share or royalty systems. The difference is that this system allows for more than one owner of the structure since it is likely that there will be several winning bidders.

(5) Staggered Bonus Bidding

The bonus is not paid in one lump sum, but in several stages. For instance, paying at the time of sale, when petroleum is found and when production begins. The primary advantage of this system is that there is less capital expended at the front end, thereby allowing more funds for exploration and development.

(6) Profit Share Systems

Profit share systems consist of a variable cash bonus bid plus profit sharing taken on net income. Since there are a number of ways to define net income, there are also a number of profit sharing systems. In these profit sharing systems there is no allowance for loss sharing if no development occurs. The remainder of the leasing methods will be some variation of profit sharing.

(A) Profit Share System With an IRS Income Base

The IRS income base is defined as gross revenue minus operating costs and depreciation. This definition is essentially net operating revenue in each year allowing for the depreciation of capital investment. One advantage of this system is that since costs are deducted before the profit share is taken, it reduces the possibility of early termination of production.

(B) Annuity Capital Recovery Profit Share System

The annuity, with a pre-specified interest rate and length of capital recovery period, is derived from all of the capital investment plus interest to the time production begins. To obtain the profit share base, the amount of the annuity is subtracted from net operating profits. After the investment capital has been recovered, the government profit share is taken from the net operating profit. The profit share rate can generally be set high since the profit share base approximates a true economic share. The problem of no development occurring because the profit share rate was set too high has been alleviated by this system.

(C) British Type Profit Share System

In this system, the government does not take its profit share until after some factor times the total capital investment is recovered from net profits. Otherwise, the economics are the same as the annuity capital recovery system except that the investment capital is recovered sooner and over a shorter time interval.

(D) Indonesian Production Sharing System

All capital equipment becomes government property in this system. However, a rental rate of up to 10% per year is allowed to be added to operating costs. Each year operating cost can be deducted from forty percent of production. If operating costs exceed forty percent, they can be carried forward to the following year. The profit share is then taken from the remaining sixty percent. This system is more appropriately called a constrained profit system, since total recoverable costs cannot exceed forty percent of the value of production. There is no provision in this system for return on initial investment capital in the profit share basis.

(E) Variable Profit Share System

Variable profit share is similar to the sliding scale royalty system with the exception that the variation in profit share rate is expressed in terms of annual net profits rather than annual production. This system could be used with any of the profit share systems described thus far. There is the advantage in this system of more flexibility in setting the rate before reserves and costs are known than in fixed rate system. Production may be spread over a longer time period to achieve a lower profit sharing rate.

(F) Fixed Bonus With Profit Share Bidding System

The bonus is fixed in this system and interested parties bid on the profit share that the government is to receive. This system encourages speculation, however, and to what degree, can only be evaluated in conjunction with the type of profit share base being used.

COMBINATIONS

Of the leasing methods just discussed, it is apparent that some of the methods can be combined to give a large possible number of leasing alternatives. Combinations will not be examined individually because inferences can be drawn from the basic alternatives previously described.

SECTION IV

THE VARIATION OF PETROLEUM LEASING CRITERIA WITH GEOGRAPHIC LOCATION

SUMMARY

Limited data was available for this study and many subjective decisions were used during the analysis. Even within the limited scope of this work it is apparent that areas of the state can be divided into different leasing classifications for oil and gas. An on-going resource/economic analysis of resource areas by the Division of Minerals and Energy Management will insure refinement of this classification system and an optimum cost/benefit leasing program.

The lessons learned here and the technical abilities developed can be used for determining the cost/benefit of leasing other Energy and Minerals. Coal and Uranium would both fall easily into this type of analysis. Uranium is leased everywhere in the United States but Alaska on a royalty per pound basis. Up to now no economic/cost benefit attempt has been made to establish what the optimum price would be for leasing coal and uranium. Some coal leases have been let for 10¢ a ton on twenty year contracts. The application of an analysis similar to the one used for petroleum to other resources would be the first step to ENERGY Resource Management.

SECTION IV

The State of Alaska is unique in its position as a potential national source of petroleum and its derivatives. The vast area to be developed along with the explorative immaturity of the state provides many variables which can change with time. In this report, these variables will be examined and some conclusions will be drawn as to the potentials of oil and gas resources on state lands in Alaska, and the possibility of state leasing sales to be held in the future.

The analysis "Sensitivity of State Income to Various Leasing Methods" revealed four key variables with respect to oil and gas leasing. (1) The amount of the expected petroleum resources, (2) the risk of finding these reserves, (3) cost of operations and (4) the price of petroleum. This study indicates that all four of these variables are dependent upon their geographic locations in Alaska. Since income to the State from oil and gas development is therefore dependent upon a knowledge of the resource and regional characteristics, flexible leasing methods will be necessary if income to the state is to be maximized.

We have found that the state can be divided into regions based on the key leasing criteria. These Resource/Risk/Cost/Price provinces can be used when considering leasing methods and would establish the type of input variables for economic resource analysis before leasing.

Potential Oil & Gas Regions on State Lands

The potential of the state oil and gas lands has been calculated from the Division of Geological and Geophysical Survey's Open File Report 50 (Figure G-1) which outlines basin by basin estimates of recoverable oil and gas resources in Alaska. As this report states, these state land calculations are subject to a high degree of error, given the lack of information and exploration data in some of these areas. The information available to the state at this time for evaluation of petroleum resource 's limited but the Division of Minerals and Energy Management in its long range analysis of petroleum potential for leasing will acquire seismic and other data in the future to adequately evaluate each state province. There is a possibility of large oil fields in some of the more promising sedimentary basins which might make these estimates too low, but there is also the possibility of no fields or very small fields in some of the state held areas which could make the estimates too high.

As previously stated, Alaska's sedimentary basins are relatively unexplored. The variability in the amount of explorative data is great, ranging from the exhaustively explored areas of the Upper Cook Inlet and Prudhoe Bay to the Western Chukchi and Norton Sound Provinces which have never been drilled. The amount of hydrocarbons in these areas is a highly speculative question, and future information will surely modify the resource picture of the State of Alaska.

Both patented and tentatively approved state lands lie within the onshore oil basins in Alaska (Figure G-2). The onshore lands are generally not too

high in petroleum potential, with the exception of those on the North Slope and in Bristol Basin. Generally, interior areas have a greater potential for gas than oil.

The State owns or has tentative approval on a large amount of promising land in the Bristol Bay - Alaska Peninsula region, the North Slope, and on the Kenai peninsula in Lower Cook Inlet. At this time, these lands appear to have potential for both oil and gas and would be relatively low in cost of production, owing to existing transportation systems.

In addition to its onshore lands, the State owns coastal waters to a limit of three miles from state shorelines (Figure G-2) The three mile limit submerged lands provide the state with some good petroleum potential areas notably in the Gulf of Alaska, Cook Inlet, Bristol Bay and Beaufort Sea regions. As Federal OCS leasing progresses and offshore discoveries are made, the three mile limit submerged lands will need to be seriously considered for leasing.

In this section we have outlined the potential recoverable oil and gas reserves on state lands including those within Alaska's three mile limit. Their potential will be discussed in the light that future exploration data will change these estimates.

Because of this degree of variability, it is necessary to look at the State in different sections, or leasing provinces. Each leasing province contains different risk and cost parameters, as well as more or less potential for oil reserves. Figure G-1 has shown the location of these provinces,

*Not enough explorative information is available in this region to make an estimate of potential resource quantities.
**Large reserves possible, but not enough explorative information available.

LEASING CRITERIA

Price

Well head price difference within the State for new Alaskan petroleum is primarily a function of the cost of transporting the crude to market. In this initial study we have simply chosen price regions based on the availability and cost of transportation. These regions were chosen subjectively and will be refined when our studies on transportation and development costs are completed. Figure G-3 show a rough Price-Cost region breakdown for the State. Three pricing criteria that can be used are:

1. Low Well Head Price: High pipeline cost, difficult tanker movement, long distances.
2. Medium Well Head Price: Less than number 1.
3. High Well Head Price: Ice free areas, near Coast, cheaper pipelines, shorter distances.

Cost

In this report, the State of Alaska has been divided into three cost regions (Figure G-3). These cost determinations have been based on location, existing transportation, (pipelines, etc.), navigability of adjacent waters (ice free ports all year or not), cost and availability of labor, materials, and location near population centers. What all of these factors have in common is location. The more remote the petroleum potential area, the higher the cost. These cost parameters are outlined below:

1. Low Cost: Near to existing transportation system, close to population center, lower labor and material cost, southern location.
2. Medium Cost: Middle-Alaska location, possible extensions to existing pipeline systems, feasibility of roadways, etc.

FIGURE G.3

3. High Cost: Remote, northern location. Difficult transportation (no ice-free ports or existing pipeline systems), high labor and material costs, no existing social infrastructure.

Risk

For our purposes, risk is a function of the exploration maturity of a petroleum potential area, and the degree of confidence that oil or gas will be discovered. In general, the less exploratory information available in a petroleum region, the higher the risk factor. To outline the leasing criteria in this study, we have estimated the level of public knowledge, as well as the overall potential for oil and gas resources within an area. When selecting a leasing method for a particular sale, the degree of confidence factor would be a major consideration.

1. Low Risk: Good potential for either oil or gas, previous discoveries within the region under discussion, a high level of exploration maturity.
2. Medium Risk: Medium to good potential for oil or gas, no previous discoveries in the area, and/or moderate knowledge level of the region through explorative methods. (Seismic work, etc.)
3. High Risk: Poor oil or gas potential, exploration maturity level is low, and no previous oil or gas discoveries in area or closely located regions.

Table G-3 groups the geographic petroleum provinces by exploration maturity (Risk) and cost region. The largest number of provinces lie in the high risk category and this is indicative of the lack of exploratory information available in the central and northern provinces of the state. Only the Upper Cook Inlet and Prudhoe Bay areas can be classified as mature enough to assign a Low Risk type leasing method analysis. Ideally, areas should not be selected for leasing in a high risk category. Since this will not always be possible because of

outside influences such as OCS development, lack of drilling date, etc., analysis for leasing procedure will have to be done using arbitrary decisions and tables such as these.

The important factor to recognize is that the various petroleum potential areas of the state are each different with respect to the key leasing parameters. Each province must be approached on an individual basis and leased with a method that fits its unique status. Once the decision has been reached to consider leasing, a detailed risk analysis of the expected value petroleum features would need to be undertaken. As shown in the economic analysis of leasing methods, it is to the advantage of the state to always attempt to decrease the risk before actual leasing, and a decrease in risk can be achieved by insuring that there is as much public knowledge of the petroleum potential area as possible. Flexibility, public knowledge, and analysis are absolute prerequisites for optimum cost benefit resource development.

PETROLEUM POTENTIAL AREAS AND CORRESPONDING LEASING CRITERIA

The various leasing criteria can be combined to give the leasing character of each resource province. These approximate classifications can then be used for planning future leasing and in the economic analysis for selection of an optimum leasing method. Referring to Figure G-2 which shows the various leasing provinces, Table G-2 lists each of these provinces along with its corresponding leasing characteristics.

Table G-2 can be utilized for the establishment of priorties on exploratory data acquisition and as a preliminary tool for long range lease planning. As the table is refined, it will be used as a classifications input for a leasing method analysis.

STATE LAND WITH PETROLEUM POTENTIAL

BY

PROVINCE

Following is a description of each potential area, both onshore and offshore, including estimates of their petroleum potential.

GULF OF ALASKA

Figure G-4

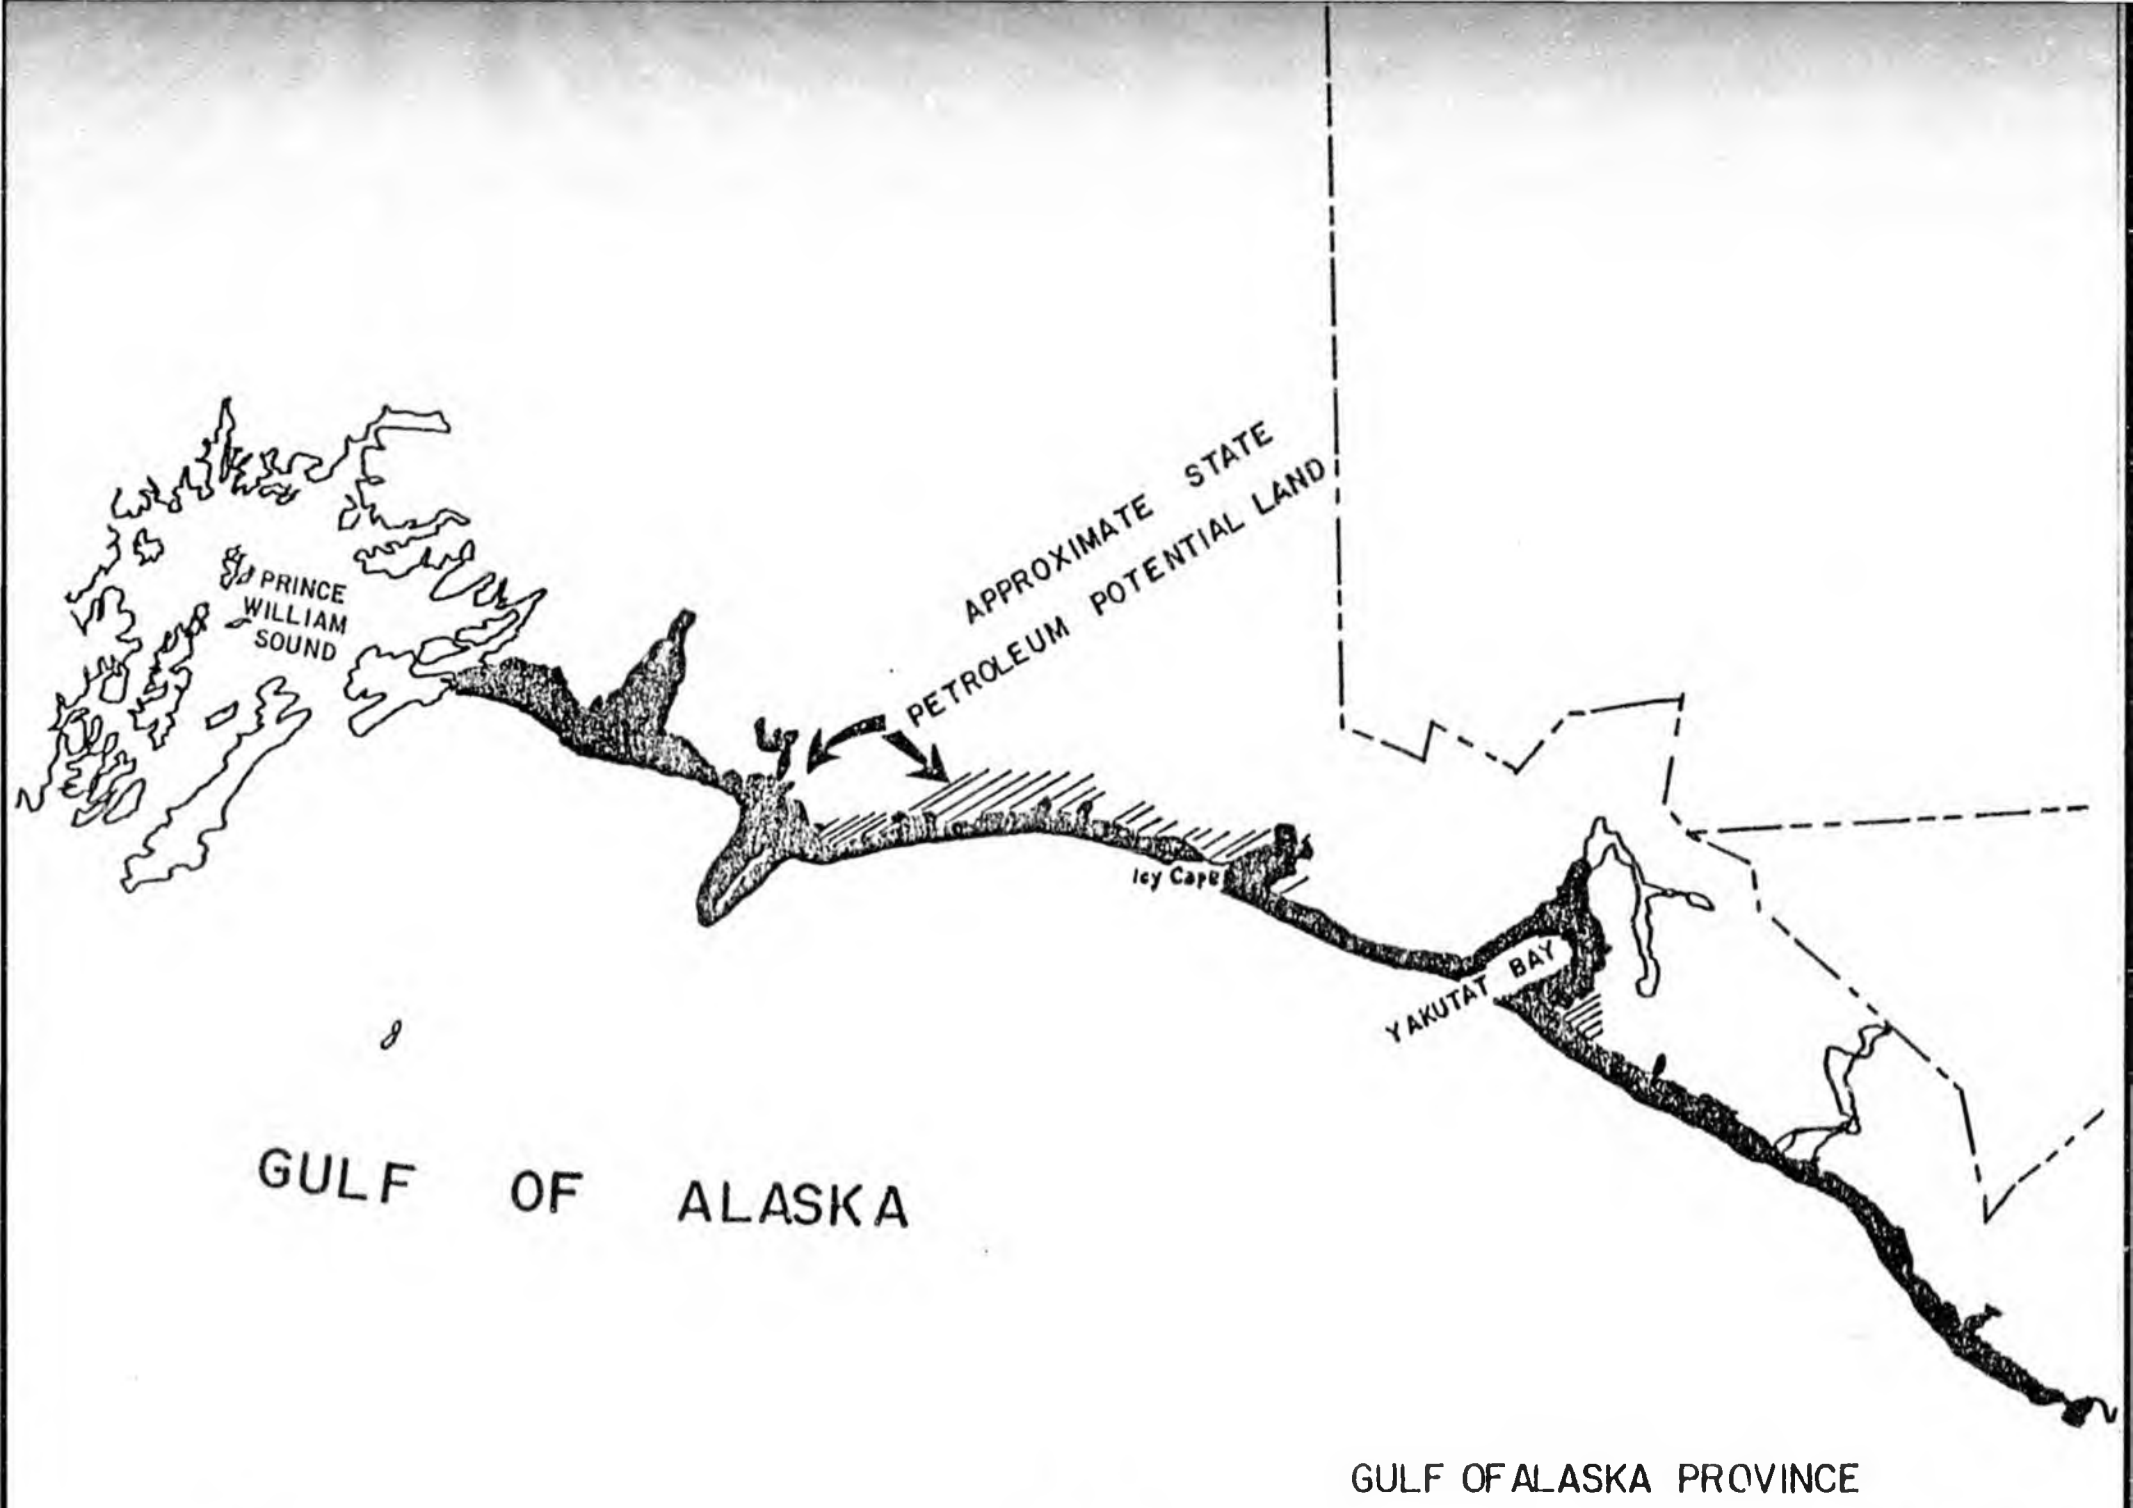
The State submerged lands in the Gulf of Alaska could contain a few small petroleum fields or one large field, or perhaps, God forbid, nothing but salt water. Both onshore and offshore statelands which lie in the Gulf of Alaska total approximately 3,940 square miles. The average thickness of the sedimentary deposits in this area is about 1.8 miles, making the available amount of sediments about 7,088 cubic miles. A low to high estimate of petroleum reserves ranges from zero to 354 million barrels. Gas reserves could range from zero to 2,000 TCF.

COOK INLET BASIN (LOWER & UPPER COOK INLET)

Figure G-5

It is becoming increasingly apparent that the Upper Cook Inlet Basin has been developed near the economic limit of its resources and capacity, and that future oil and gas discoveries will lie further south.

The estimate of recoverable oil and gas in offshore areas has been lowered as more exhaustive exploration has yielded fewer discoveries than previously expected. Also, the remaining state owned areas to be explored lie on the fringes of the Cook Inlet basin, where oil and gas potential may not be as high as in the middle portion of the basin Because of this, the estimate of 115,000 bbls/cubic mile in Alaska Open File 50 has been dropped to 50,000 bbls/cubic mile, to serve as a more realistic bottom line figure for



GULF OF ALASKA PROVINCE

FIGURE G-4

recoverable oil and gas resources on remaining state submerged lands.

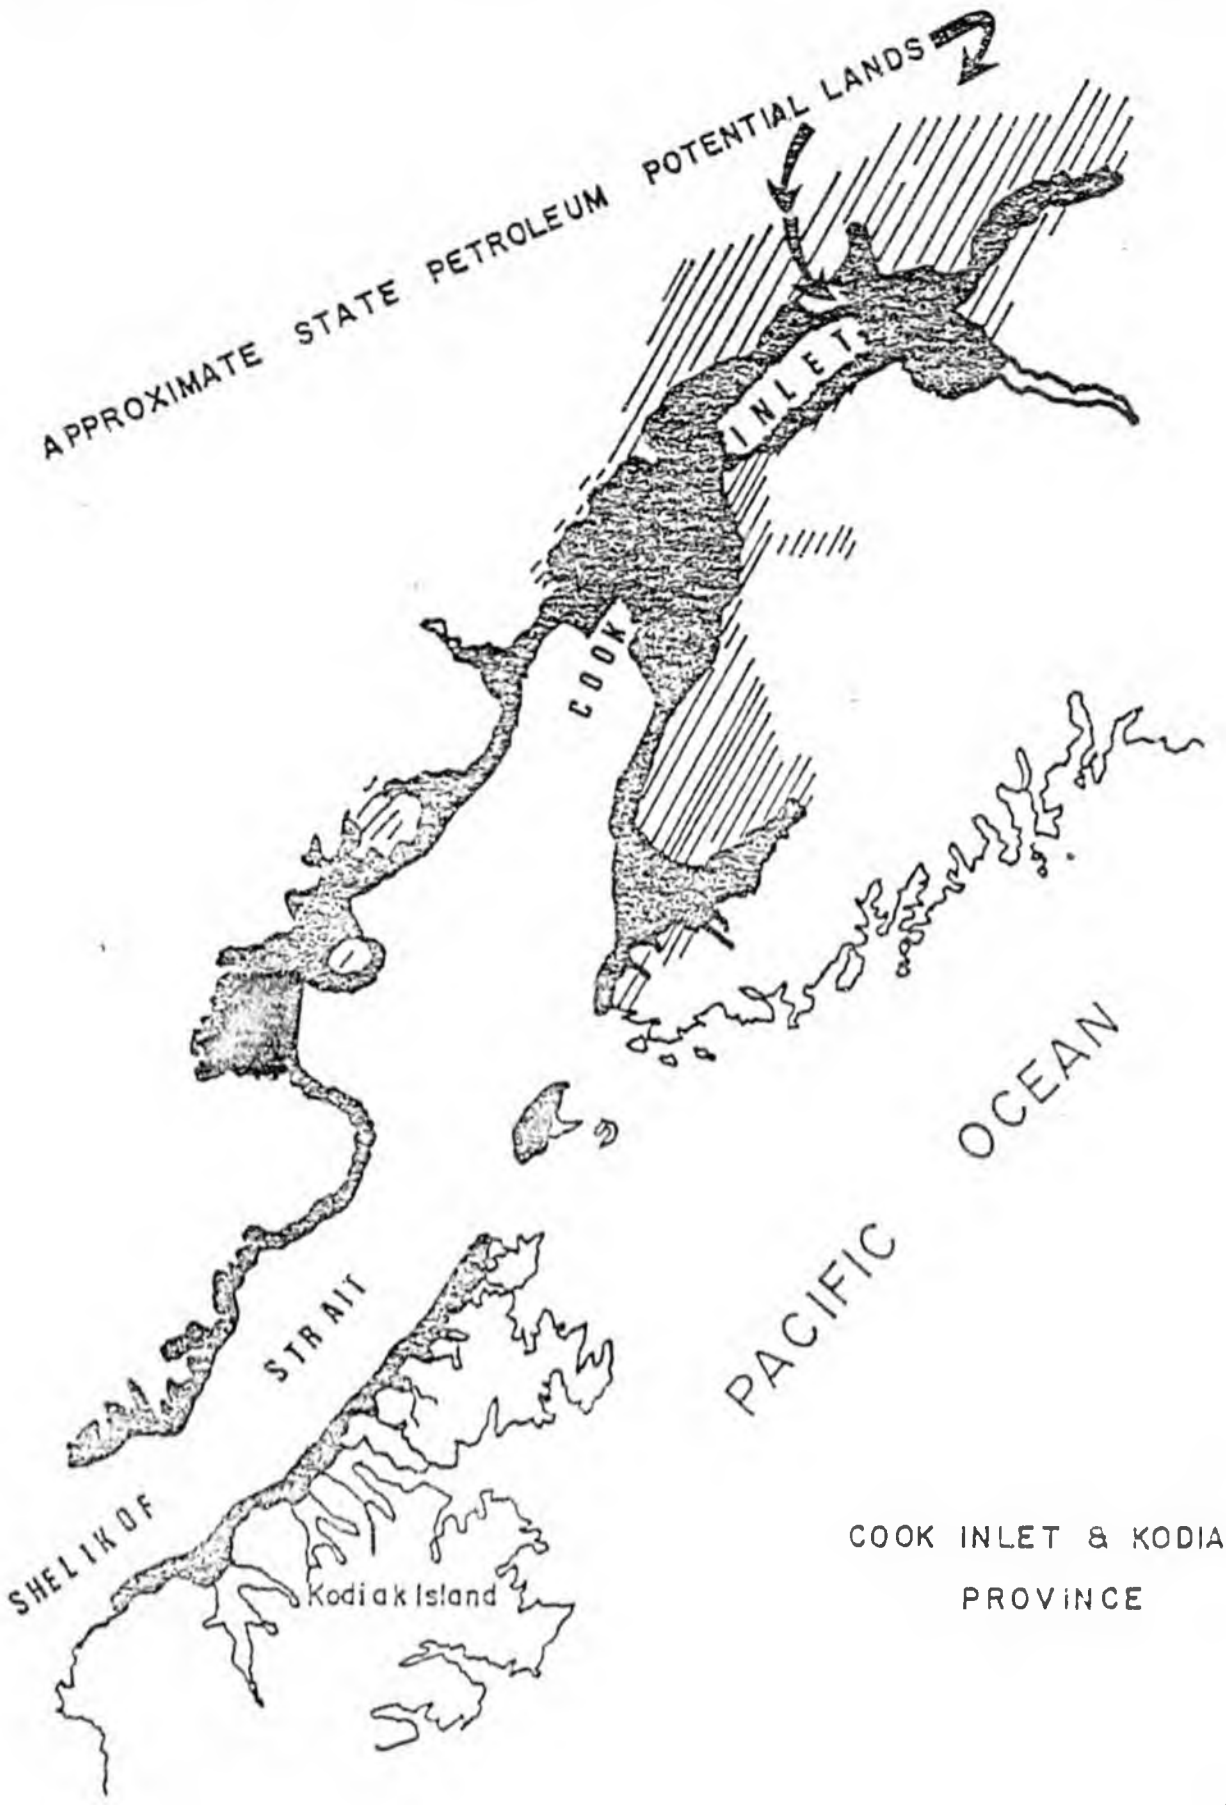
Onshore areas of the Upper Cook Inlet contain a large amount of both patented and tentatively approved state lands. These lands were believed to be of high petroleum potential, but exploration in the northern onshore areas has not been as successful as anticipated. Therefore, the estimation in this area also has been scaled down to 25,000 bbls/cubic mile.

KODIAK ISLAND

Figure G-5

The State owns very little petroleum potential land in the Kodiak Island province. The three mile limit area around Kodiak Island is at the edge of the petroleum province and the speculative estimated petroleum resources are low.

Approximately 4,000 square miles of petroleum potential lands are in this province. Because of the poor petroleum potential of this area, and its location at the edge of the petroleum basin, we estimate the quantity of available hydrocarbons in this region to be from zero to marginal. Our outlook for possible economic recovery of resources is pessimistic.



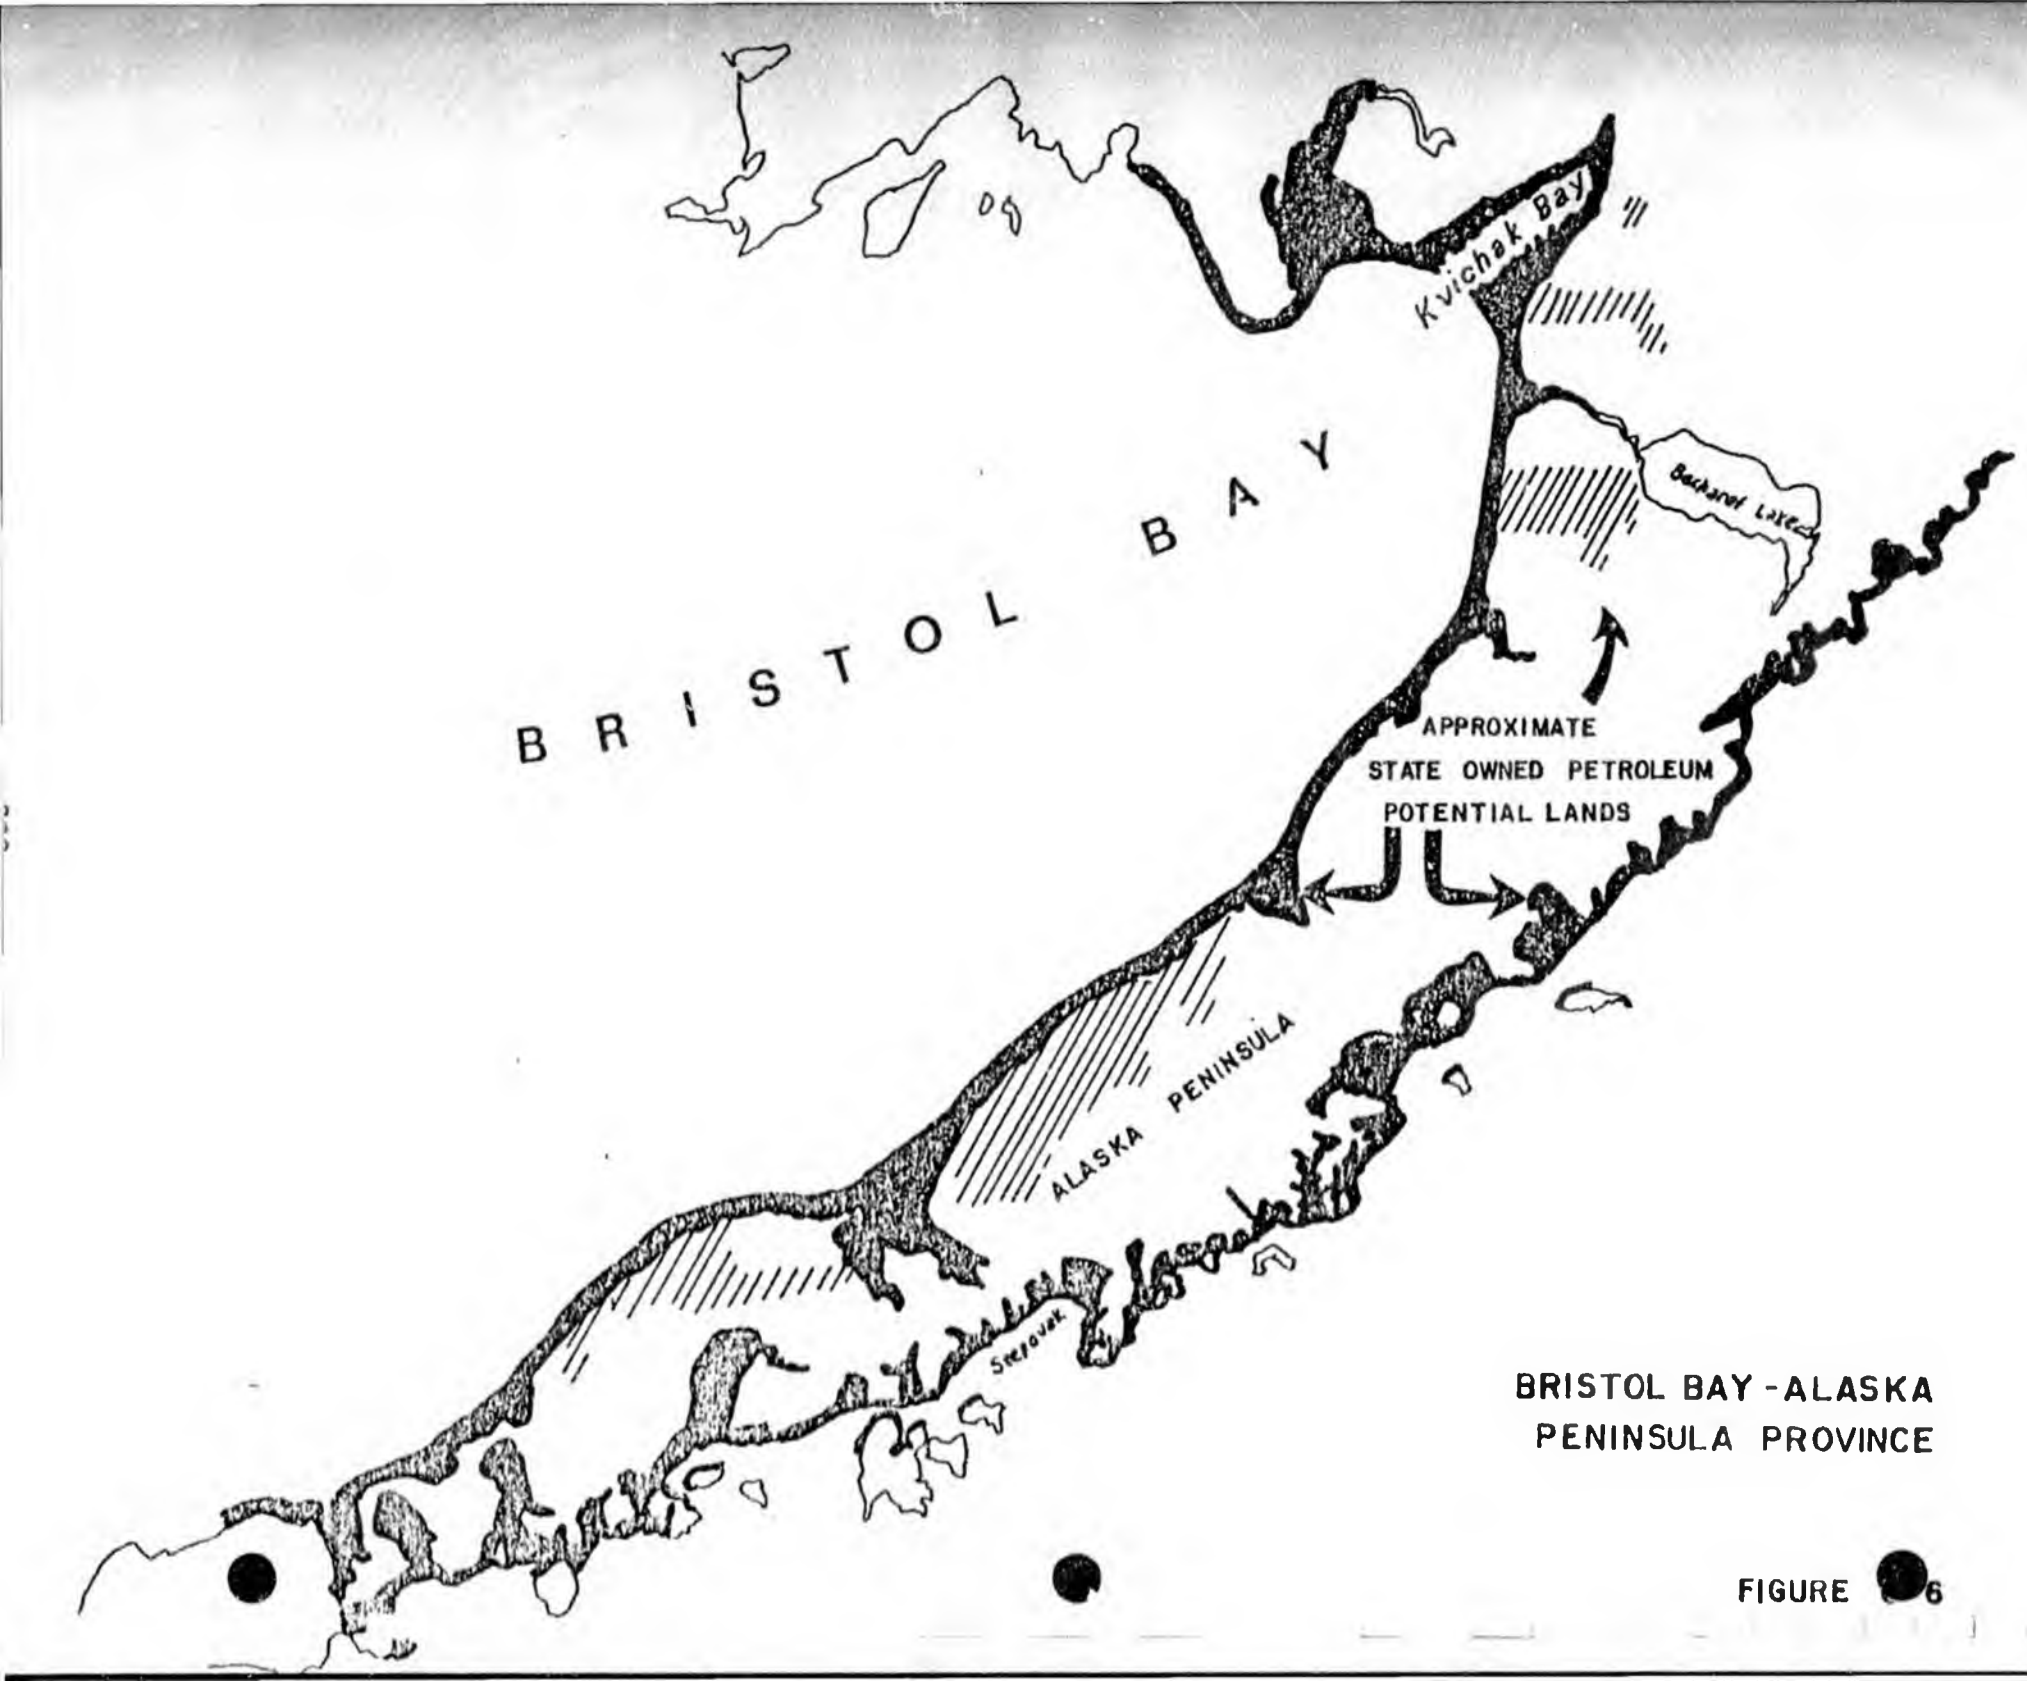
COOK INLET & KODIAK ISLAND PROVINCE

FIGURE G-5

BRISTOL BASIN & THE ALASKA PENINSULA

Figure G-6

Presently the Bristol Bay Basin and the Alaska Peninsula are two of the more promising areas in Alaska for future reserves of petroleum. Although exploration efforts have revealed no commercial quantities of petroleum to date, drilling operations continue. In time we should know more about this area and its potential for hydrocarbon deposits, but for now the amount of estimated speculative recoverable petroleum ranges from 300 MMB to 650 MMB. Of course, this could lie in small deposits or in one large petroleum reserve. Speculative potential natural gas on state owned land averages 29.65 TCF.



BRISTOL BAY - ALASKA
PENINSULA PROVINCE

FIGURE 6

BERING SEA (Bethel Offshore)
(Yukon-Koyukuk Offshore)
(Norton Basin)

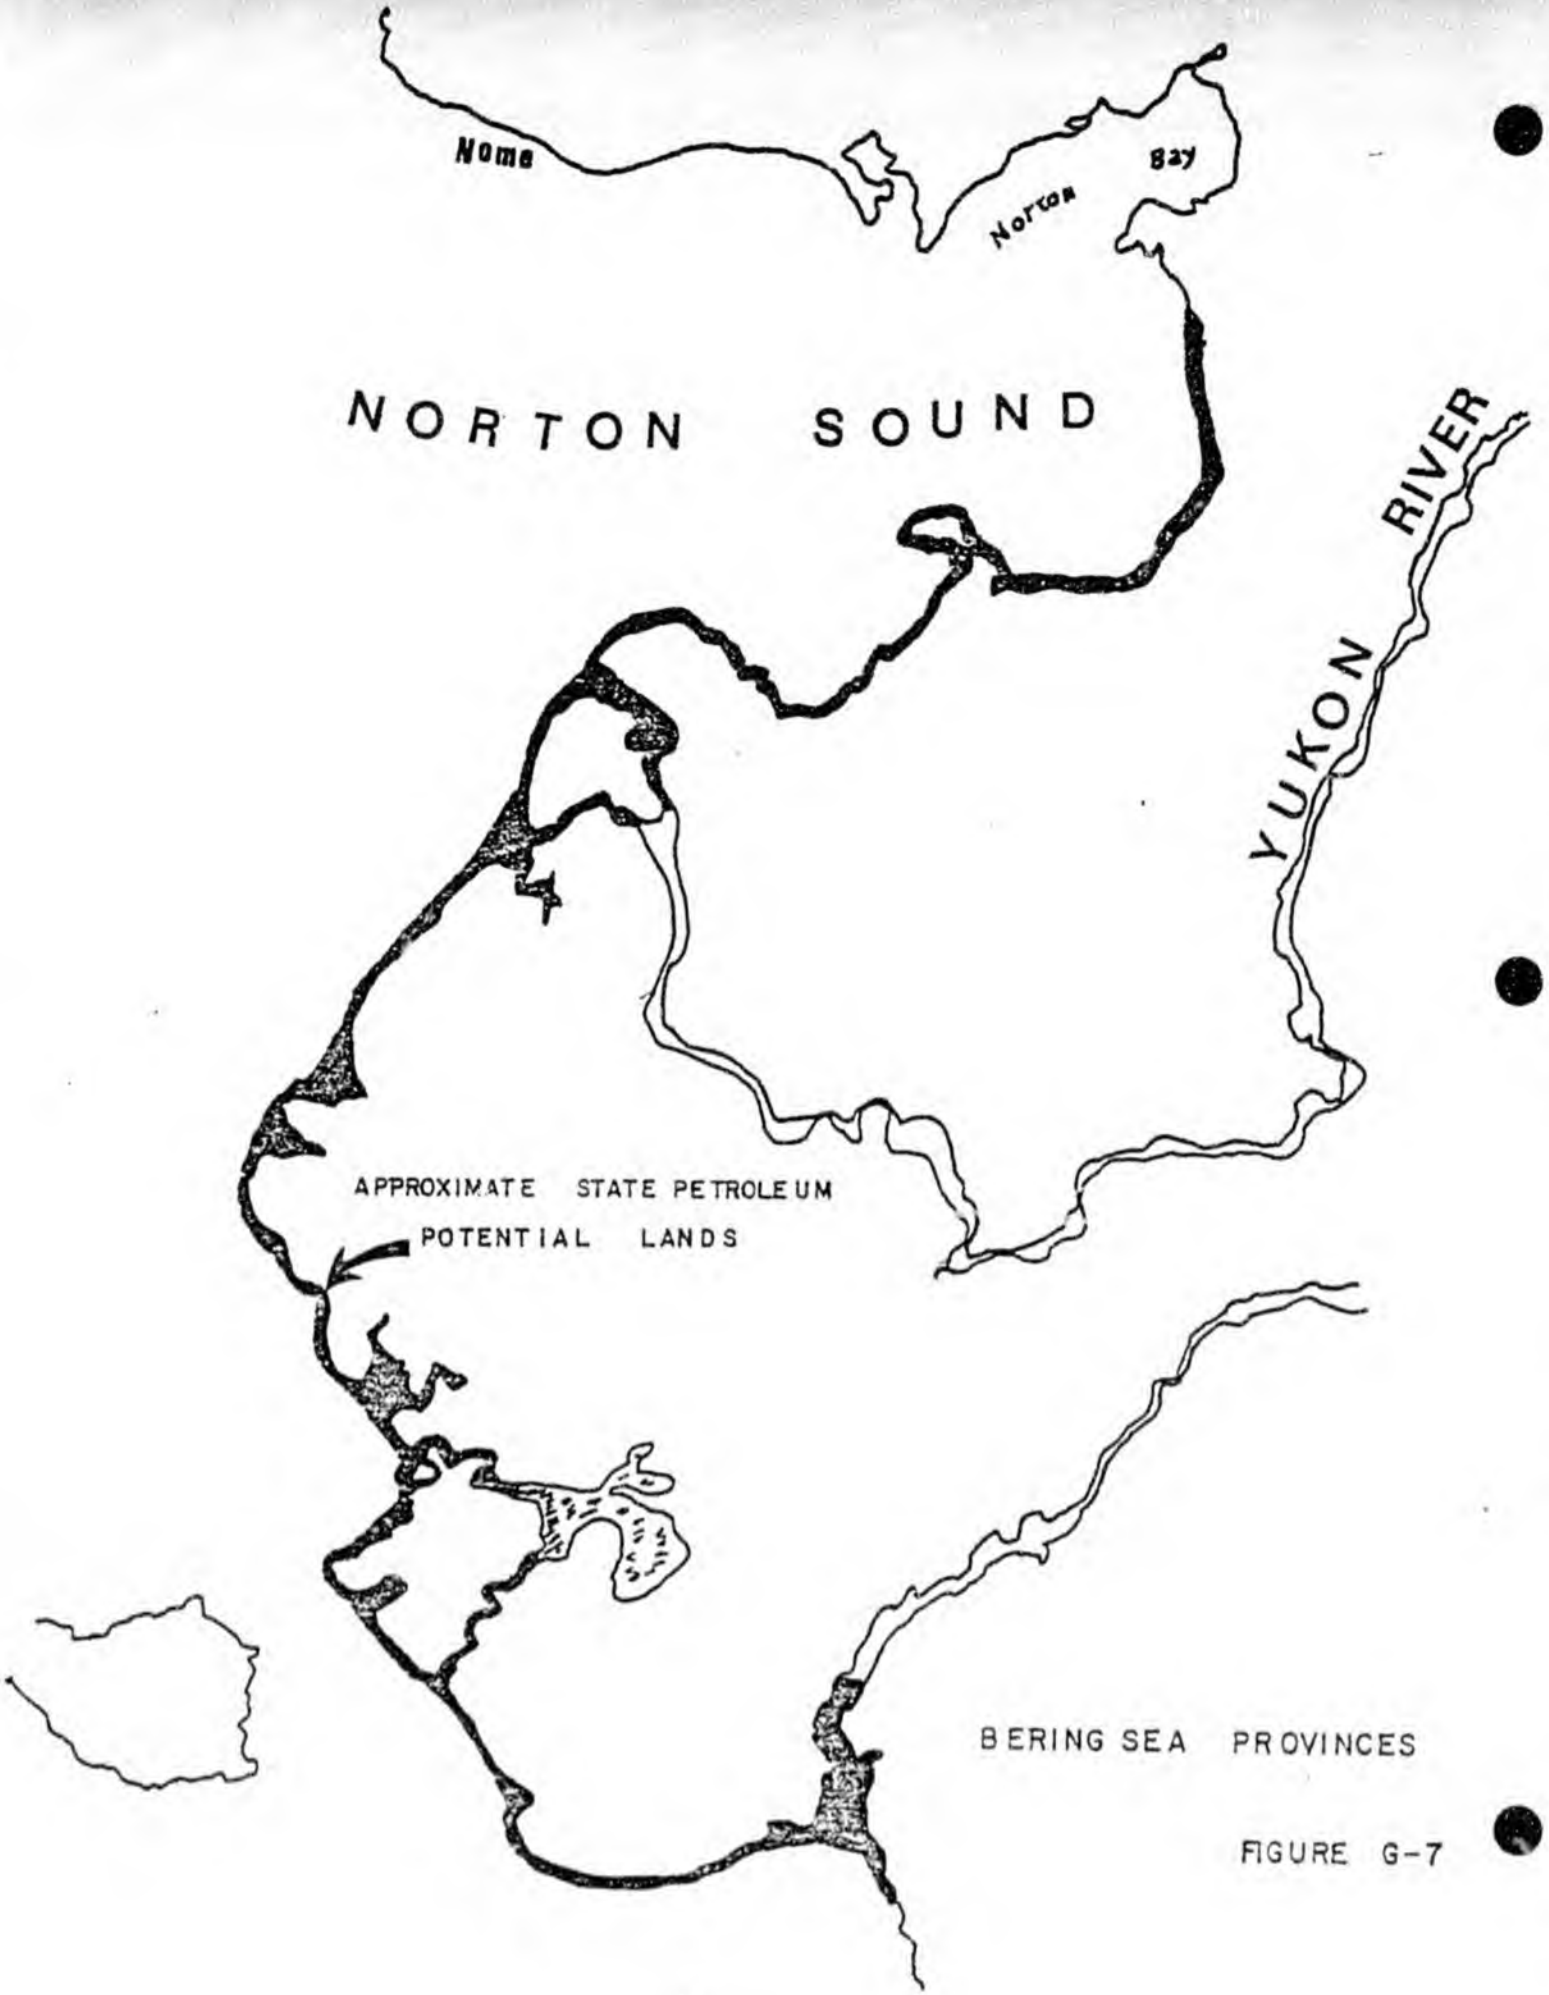
Figure G-7

State owned lands of the Bering Sea petroleum potential basins are geologically complex, and the chance of finding giant oil and gas fields is small. The fields are more likely to be small and scattered; however, the cumulative reserves in these fields could be potentially economic. Future OCS development may lead to discoveries in the state submerged lands.

There are no onshore state lands adjacent to the Bering Sea provinces under discussion. The petroleum potential of coastal submerged lands of the Yukon-Koyukuk Basin (612 Sq. miles), the Bethel Basin (506 sq. miles), and the Norton Sound (972 sq. miles) is relatively unknown. The development of OCS acreages and onshore native activity will provide information in the future. Seismic data will also be needed for evaluation of these state lands.

MINCHUMINA, HOLLITNA, LOWER TANANA, COPPER RIVER, AND THE YUKON-KOYUKUK GEOSYNCLINE

There has been very little state land selected in the interior petroleum basins. As indicated in Open File 50, the majority of state land selections to date in interior Alaska have been in the hard mineral highland areas. Only a few miles of state selections appear on the fringes of the lowland petroleum basins (See Figure G-2). An estimate of the petroleum potential in these scattered lands is not possible with the limited data available to the state at this time. Hopefully, the state will be able to select



Nome
Norton Bay
NORTON SOUND
YUKON RIVER
APPROXIMATE STATE PETROLEUM
POTENTIAL LANDS
BERING SEA PROVINCES

FIGURE G-7

additional lowlands in the future. The Division of Minerals and Energy Management will need to evaluate the interior lands as conditions permit.

KOTZEBUE PROVINCE

Figure G-8

Onshore and offshore areas of the Kotzebue Province are in a potential petroleum area, and future exploration could lead to discoveries. State petroleum potential lands total approximately 864 square miles in this area, all lying offshore or located in Selawick Lake. Very little drilling has occurred in this region, with only two dry holes drilled on land to date, but generally these state submerged lands lie in the thicker sedimentary portions of the petroleum basin than the areas where the unsuccessful tests were made.

As in the case of the Bering Sea petroleum areas, future OCS and native development may give us more information on this area. Seismic data will also give a clearer picture of petroleum potential.

HOPE PROVINCE

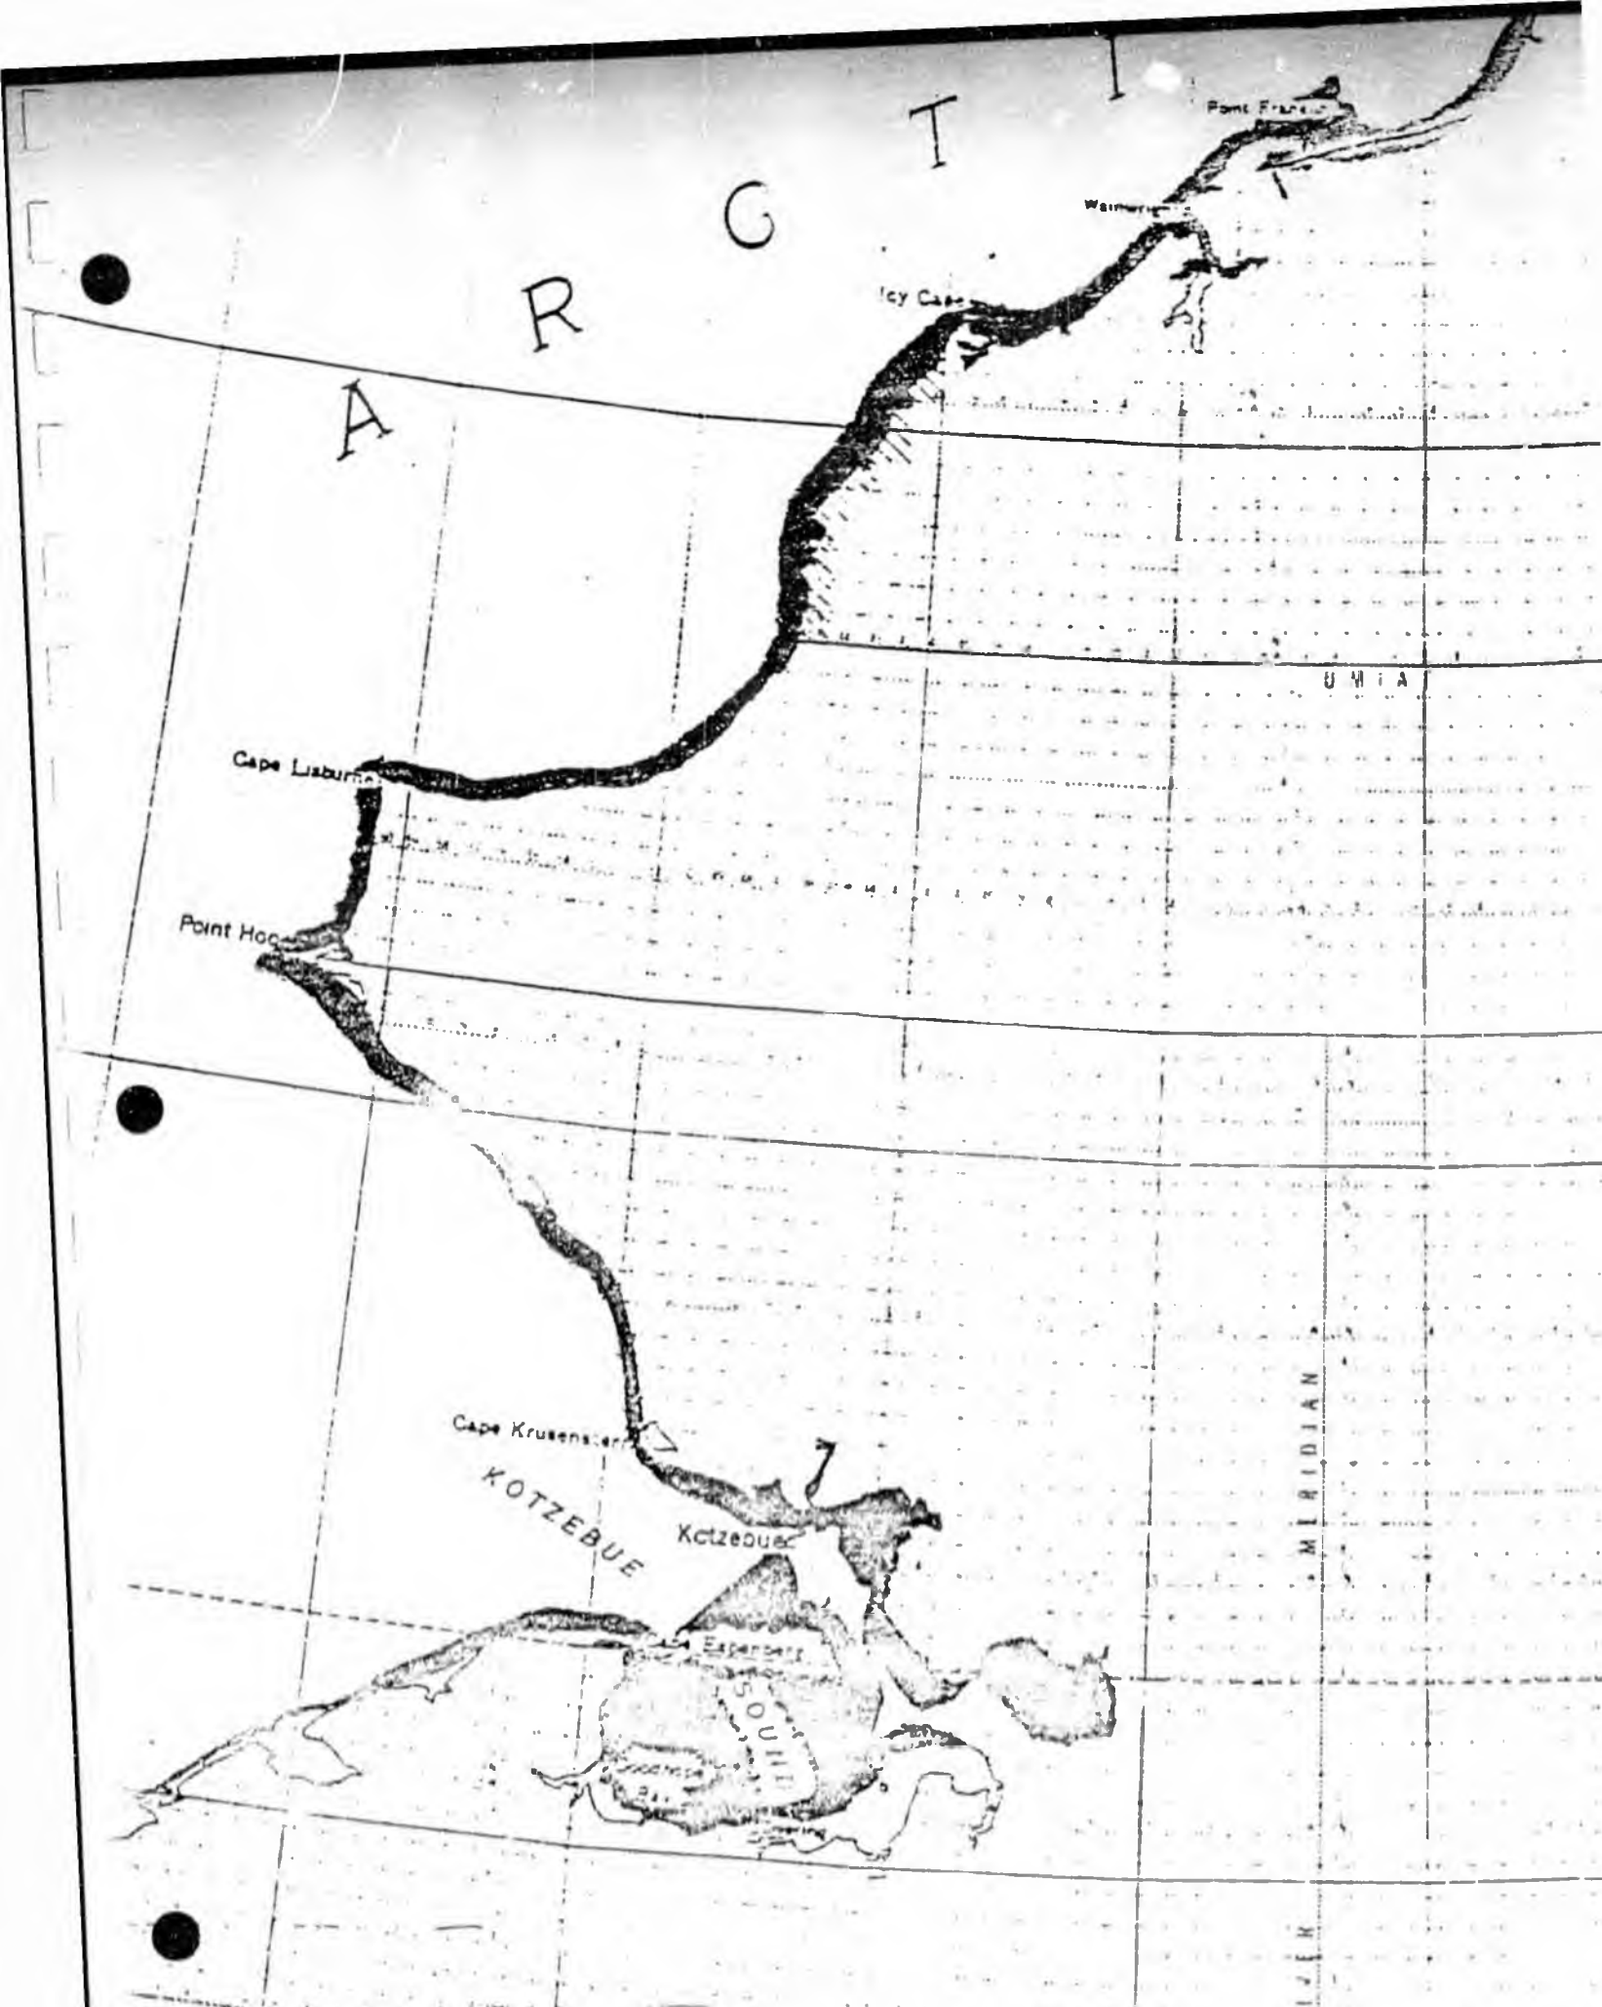
Figure G-8

State lands contained within the Hope Province consist of about 450 square miles along the coastline of the lower Chukchi Sea. It is difficult to speculate on amounts of recoverable oil and gas in the Hope Province because of the small amount of public exploratory work which has been done to date, but on the basis of available information, the state owned lands do not appear to be very promising. Estimates of potential reserves will have to be made in the future after sufficient data becomes available.

CHUKCHI PROVINCE

Figure G-8

The oil and gas potential of the Chukchi Province is highly speculative



Kotzebue Province
Hope Province
Chukchi Province

Figure G-8

due to the lack of seismic and explorative data in this area. The state-owned lands contained within the Chukchi Province are all submerged, three mile limit lands. When more information is available we should have a better picture of the hydrocarbon potential of the entire Chukchi region.

State owned submerged lands in the Chukchi total about 1,440 square miles.

NORTH SLOPE REGION

Figure G-9

State owned uplands of the North Slope are shown on Figure G-10. These lands have been under active industry exploration for a number of years and contain the Prudhoe Bay giant petroleum field. The potential for additional oil is high here and a rough estimate of remaining reserves would be as follows:

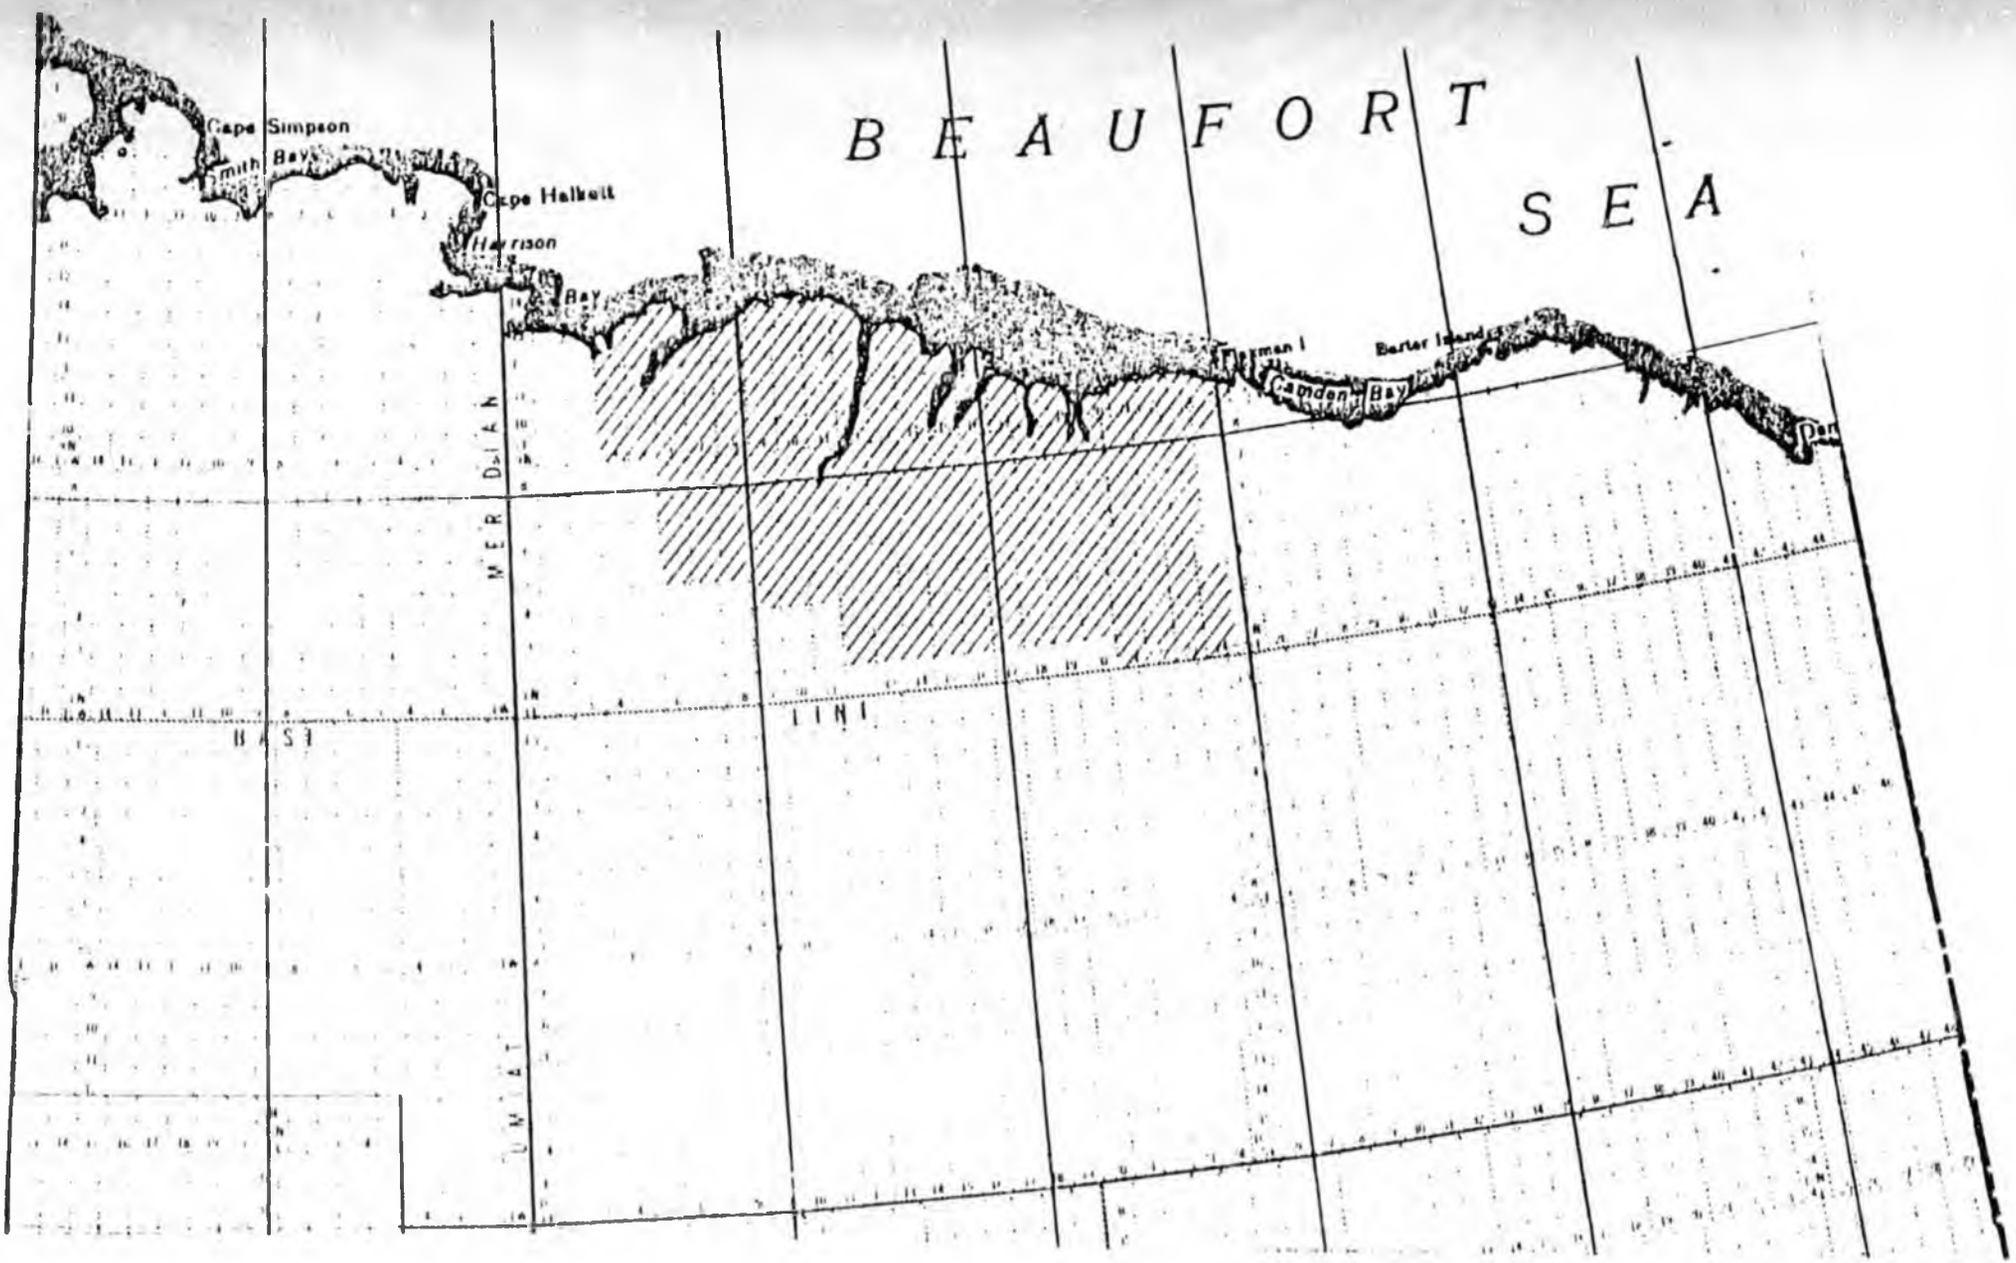
There are approximately 6,624 square miles of state lands contained within the North Slope uplands. This total is about ten percent of the entire number I potential lands on the Slope. Taking ten percent of the potential recoverable reserve figure in Open File 50, there are about 1,200 MMB of recoverable oil reserves, and 3,400 TCF of natural gas. These are middle estimates, and real recovery could be more or less than these reserve figures. Seismic data is needed to map the structures in these state uplands.

BEAUFORT PROVINCE

Because of the proximity of the Beaufort Sea area to the Prudhoe Bay discovery, and its geological similarities to Prudhoe Bay, the Beaufort Sea

region is high on the list of state areas available to oil and gas leasing. There are about 2,160 square miles of state offshore lands available for leasing in the Beaufort Sea area, including the coastal areas of the NPR4 and the Wildlife Refuge.

Department of Natural Resources Open File Report 50 gives the entire Beaufort Sea a figure of 15.5 billion barrels of recoverable oil and 41.8 trillion cubic feet of gas. The lease area is only a small part of this province, so it is difficult to estimate the amount of recoverable oil and gas. Using volumetric methods of analysis, a low estimate of petroleum resources would be 306 MMB. A low natural gas estimate would equal 129.8 TCF. There is a good possibility for these resources to lie in large deposits, and because of the proximity to Prudhoe Bay, chances of economical recovery would be good. These estimates are bottom line since there is a good chance of much larger reserves lying in the unleased vicinity of Prudhoe Bay.



North Slope (Eastern)
Beaufort Sea Province

Figure G-3

SECTION V

STAFF AND BUDGETING NEEDS OF SOME LEASING METHODS CONSIDERED

By

Jack Roderick, Deputy Commissioner

Department of Natural Resources

STAFF AND BUDGETING NEEDS

Historically, the State has operated its leasing system, both competitive and non-competitive, with a staff of fewer than 20 people. This includes management and all administrative help. Competitive bonus bid, royalty bid, cost or profit sharing (auditing) and ad valorem charge (appraising) systems of leasing, or any combination, take different levels of staffing. The type and quality of information required by the State, before and/or after leasing, controls the level.

The competitive cash bonus-fixed royalty leasing system used to date by the State causes the least administrative burden. Compared to any of the alternative systems being considered it requires the least "value judgements" by administrators and the least amount of information from companies.

Moving away from this standard system, thereby increasing the State's need for information, increases the administrative costs of the State. How much will depend upon the mix of various systems and the volume of information required by state personnel and/or consultants and contractors.

One basic assumption is made: that a system or systems of leasing can be devised that will keep the number of state personnel required to a minimum. However, the quality of the people in any system must be very high, and much of the data collection and interpretation, be it accounting or geophysical, can be contracted out.

One other assumption is that once having accepted part of the "risk" (unlike the bonus bid system) the State will not spend great amounts of money for statisticians, computer analysts and economists to only second-guess the results of lease sales. A postmortem review procedure will be necessary, but we have assumed that it will not be overly involved.

The staffing needs for the various leasing alternatives will be presented as follows:

1. Bonus bid (with delay rental);
2. Royalty bid - sliding or otherwise;
3. Cost (profit) sharing; and
4. Ad valorem (reserves) charge.

Generally, existing administrative staff in the State are capable of handling bonus bid or delay rental and royalty bid systems. Depending on the number of lease sales, the number of operators and the complexities of the ante and post sale information analysis, the "team" is presently in place. Any change in the present bonus bid system will, based on a cursory examination of other jurisdictions, cost the State more money.

At the present time, like the Federal Government, the State must do some estimating of anticipated reserves before a sale in order to evaluate the bids when received. In a royalty bid situation, more emphasis would have to be placed on monitoring production rates and establishing wellhead values after production begins. Before discovery, no significant increase

in staff would appear necessary. (Australia is presently in a fight over what offshore wellhead values should be.)

A competitive royalty leasing system would inevitably require some work commitments from the (operator). The simplest commitment would be to do so much exploration work up to and including a well or wells. Some jurisdictions simply permit affidavits attesting to the work accomplished; others require certified audits. In any event, the State would have to require some auditing staff to satisfy itself that the work required to offset the smaller bonus was being done. No estimate of additional staff required under a royalty bid leasing system has been made here because the work commitments would be part of the lease terms and they are almost infinite, ie. they would be "negotiated" between the operator and the State.

The present budget of the Department of Natural Resources Division handling oil and gas leasing is approximately $1.1 million. This includes the Director of the Division of Minerals and Energy Management, a leasing manager and staff, a petroleum manager, one petroleum reservoir engineer, one petroleum economist, one petroleum geophysicist, one petroleum geologist, one petroleum engineer, and one petroleum revenue audit supervisor.

This "team" appears equipped to manage oil and gas leases in either a bonus bid or royalty bid situation. If bonuses are paid with a delay rental method several more land management officers and clerks would likely be necessary. If royalty were bid, skilled lease negotiators would be needed.

The cost (profit) sharing, or net profits, system would be the most costly to administer, again depending on the specific requirements. This, for the reason that the State would need to obtain and evaluate the operators' cost figures. A few major oil companies, it can be argued, would be easier to monitor than a large number of smaller oil operators, but one of the State's goals may be to increase the number of operators, thereby increasing the administrative costs.

Cost padding, sometimes known as "gold plating," useful life of the asset, depreciation paths, etc., in short all the necessities of auditing a business are called for in a net profits type leasing system.

Like administering on income tax (IRS), this "cost" leasing system requires that costs be allocated to tax or deduction impacts. Other governments, notably the Canadian Federal Government and several provinces are into variations on the "net profits" arrangements. Production offshore Long Beach, California involves these type of cost sharing leases.

As cost sharing leasing system would necessitate auditors experienced or trained in the petroleum exploration business. These auditors would most likely be located in a division of the government concerned with monitoring state revenue. In Alberta, approximately 100 people administer approximately 50,000 agreements (leases), where as some 60 persons are involved with "auditing" certain costs involved with petroleum production.

Knowing actual costs of operating a business will involve the State more

substantially. Estimates of administrative costs to the State must be very general depending on whether State law requires financial disclosure, the general relationship between the State and the operators, and how many operators and fields are being monitored.

Based on experiences in other states and foreign countries, most administrators of leasing systems feel that a "net profits" system of leasing will cost "substantially more" to administer. Assuming the same number of operators and equal number of leases as are now being administered under the bonus bid or prospective royalty bid systems, staffing needs could double again the needs under the ad valorem charge system.

Thus, whereas an additional $240,000.00 might be expected to administer an ad valorem system, (see following), $500,000.00 could be necessary to administer a "net profits" system.

The ad valorem (reserve) charge type leasing system would place the emphasis on appraising the value of the reserves in the ground once a discovery had been made. This would necessitate determining the size of the field, the potential productivity and the estimated rate of flow. This is basically now being done by the staff of the Department of Revenue in establishing the reserves tax. Again, depending on the number of oil and gas fields involved and the level of sophistication needed (with the sums of money involved the level would need to be very high), the administrative costs could be significant.

Again, assuming several fields discovered in the Arctic and assuming an ad valorem (reserves) charge based on a percentage of assessed value of the discovered reserves, the following minimum staffing and budgeting could be anticipated to set a workable ad valorem charge:

1 petroleum assessor	$ 25,000
2 petroleum appraisors	40,000
1 petroleum economist	30,000
3 research analysts	45,000
4 contract petroleum engineers	100,000
Total salaries	$240,000

The subject of what kind of information the State should acquire prior to offering its land under any leasing system, may be as important as the system itself. How much information is necessary to make wise decisions involving public resources is a matter of continued heated debate. The debate falls between the true laissez-faire proponents on the one hand to the government owned exploration firm on the other, with the "resource manager" somewhere in between.

Also, almost as important as the amount and type of information required, is the decision of what to do with the information once acquired. Recognizing the need for confidentiality of "proprietory" information, should the subsurface information acquired by public funds be made public? What will be the result of such publication?

Each government involved with petroleum exploration has to deal with the

information question. Alberta has recently begun a scheme in which it will expend some $20 million a year to acquire geophysical information. Rather than using the information to predetermine the potential of the lands to be leased or to enter into the business in competition with operators, Alberta requires that the information be made public at a nominal cost, usually after the lease sale. Alberta decided that this method would encourage competition in bonus bid sales and further activity in the later phases of exploration.

In Alaska, costs of acquiring seismic data and of modeling the results must be examined by the Legislature if it decides to direct the administration to devote more energy to "managing" the State's oil and gas resources. Attached hereto is an estimate of approximate costs of acquiring seismic data necessary to evaluate an area 100 by 15 miles in Alaska. (Appendix A). Depending on a number of variables, the costs can range from $70,000 to as high as 2 1/2 million dollars.

Caution should be used in examining these figures because they are only estimates. However, it is significant to note that joining others obviously brings the costs down and, in any event, the costs are high.

Compared to the cost of acquiring the raw data, interpreting it would be comparatively cheap. We have estimated $10,000 for a consultant to interpret 500 miles of seismic records. This latter cost becomes important particularly if reconnaissance data becomes available from the U.S.G.S or more data is acquired from operators by the State. Depending on the volume acquired more state personnel might be required. The Division

of Energy and Management's 1977 fiscal budget calls for $40,000 for acquisition of geophysical information, and $110,000 for Fiscal '78.

In summary, the present bonus bid leasing system used by Alaska takes the fewest state personnel to administer. It is the easiest to administer because most all evaluative decisions are left to the operators. As one moves away from this system, administrative costs will likely rise.

They will rise significantly as the need for additional petroleum appraisers and reservoir engineers grows, and will go even higher if the State asks to participate in the knowledge of costs and profits of the oil and gas operators. (The ultimate would appear to be the need for information to protect an equity interest.)

Auditors, similar but, perhaps, even more expert than income tax inspectors, would be necessary in a true "net profits" system. The incentives for the operator are all toward increasing the costs allowable. The level of monitoring depends to some extent on the level of confidence the State and operators have in each other.

Lastly, the amount of physical information required by the State before and after a discovery of petroleum needs to be addressed. It is costly and it is available. How it is used and for what purpose is critical to the health of the State's role in exploration.

And finally, no system will work well unless there are qualified people making the decisions. The administrator, located between the elected official and the public, traditionally has tended to lay back. Judgments made in the oil and gas exploration business inevitably results in being proved "right" or "wrong". There's either oil and/or gas there in paying quantities, or there is not.

This is not the traditional role of government administrators, but they have been and can be attracted to government service.

SEISMIC DATA ACQUISITION AND COST MODELING

for a

PETROLEUM RESOURCE ANALYSIS

By

Ted R. Fons

Division of Minerals and Energy Management

SEISMIC DATA ACQUISITION AND COST MODELING FOR A PETROLEUM RESOURCE ANALYSIS

INTRODUCTION

In order to have controlled development of its petroleum reserves, the State of Alaska must be able to determine the location and the potential quantity of this valuable resource. Exploration seismology is the primary method available to achieve this objective. The following text discusses the various methods by which the State can acquire seismic exploration data and, through a model study, the approximate cost of data acquisition.

CONCLUSIONS

The procuring and interpretation of geophysical data in order to determine Alaska's petroleum reserves is an integral part of having an intelligently managed energy evaluation and development plan. The cost of acquiring the data could vary from negligible, if picked up by regulation, to considerable, if the State must contract proprietary data. Currently, the least cost route to obtain reconnaissance data would be through obtaining USGS Open File Reports, purchasing old data and being an original participant in group industry seismic programs. Structural detail information could possibly come from group shoots but would probably have to be gathered as contract proprietary work.

In order to determine some approximate costs for geophysical data that would be needed to evaluate an area considered for leasing 100 by 15 miles containing at least one major structure, an exploration model was developed. Results

indicate that costs can range from around 70 thousand dollars to 2.5 million dollars depending on a variety of factors.

METHODS OF ACQUIRING SEISMIC DATA

There are several routes the State can take to acquire geophysical and specifically seismic data. Given an area of interest the State can (1) obtain United States Geological Survey open file data, (2) participate as a partner in a group industry seismic program, or (3) contract original work. A fourth method would be to require copies of seismic data as a stipulation of exploration permits on state lands. This fourth method would be following the precedent set by the Federal government and its implementation would probably be similar to the Federal method. For each of these data acquisition methods the cost of acquisition, location, grid spacing, data quality and time of acquisition must be considered. Each method now will be discussed in detail.

Federal and Public Data. The primary concerns of the USGS in obtaining seismic data in Federal waters are to evaluate the energy potential of the area, to determine the potential environmental hazards, and to perform basic geological research. Many of its older surveys extend into state waters and this data can be obtained for the cost of reproduction of its Open File Reports. Through the State's personnel participation and sharing of expenses with the USGS, there is the possibility of the USGS extending its Federal Water Surveys into Alaskan State waters. Such a cooperative effort in the acquisition and interpretation of the USGS Exploration data would be to the advantage of both parties. The data's location grid spacing, and time of acquisition would not be completely controllable, but it would provide a low cost addition to the State's data base. Data is also available

from public sources such as universities and other Federal agencies.

Industry Group and Speculative Seismic Surveys. The least costly method of obtaining technologically up-to-date seismic data in current areas of exploration interest is through the State's participation in the petroleum industries group seismic survey. An original participant in a group seismic survey has the advantage of influencing the decision on line location and grid spacing. To buy into a group after the original participant closing date, generally costs up to twice the original amount thereby making it advisable to be an original participant. Also, the late participant cannot influence the group's decisions. Old group survey and contractor speculative survey data is available to the State at varying costs depending upon location and age. This old data would give the State an original data base to expand upon. Group surveys are the least expensive way to obtain good quality reconnaissance data in a current area of interest.

Original Contract Data. The greatest control over all but the cost factor is obtained by the contracting of original seismic programs. The line location, grid spacing, and acquisition time would all be dictated by the State. This kind of control is necessary when one desires to perform a detailed structural investigation. Although original contract work is very expensive, relative to the other methods, the cost can be held down by sufficient planning and foresight. By keeping informed of crew location and contracting for small amounts of structural detail data the major expense of crew mobilization can be avoided. The amount of detail data contracted would depend upon whether the State had acquired copies of industry data, permit stipulations and other factors.

Regulative Requirements. By requiring that a copy of all geophysical data taken in the State be turned over to the State as part of leasing State land or obtaining a geophysical operations permit, Alaska would be guaranteed obtaining both reconnaissance and structural detail data. This data, of course, would be in current areas of interest and may not be timely with respect to long range planning. But it would allow detailed structural analyses after a lease sale. The cost of acquisition would be, at most, the cost of reproduction. For structures that lie wholly in State waters a complete structural evaluation would be possible. For structures which lie partially in Federal waters, a total evaluation would not be possible if the State only receives the data covering the position of the structure in state waters. Planning for future lease sales should include a seismic analysis to identify structural areas that lie both on State and other lands. Cooperative leasing ventures can then avoid drainage of State resources.

EXPLORATION COST PREDICTION

The actual cost of obtaining seismic data varies considerably and depends not only on the source of the data, as discussed previously, but also on the area of the State being evaluated. For the purpose of this cost analysis, the State has been divided into three cost of exploration areas. The areas are the Arctic Submerged Lands, the other submerged lands, and the State uplands. Assuming good data quality, the probability of finding a particular size field in the above mentioned areas is strictly dependent upon the seismic line grid spacing. (See Appendix A-A.)

Probabilities of Finding a Structure. Table 1 shows the probabilities of finding a structure of a specific size given a particular size seismic line

grid spacing. Four oil fields were chosen to represent a range of structures over the State's current structure size range of interest. The MacArthur River field was chosen as the target size field for this cost study. It is a 500,000 BBL field with an approximate structural area of 28 square miles, which gives a structural equivalent diameter of 5.9 miles. Table 1 presents the various probabilities of finding a structure of this size given a seismic grid spacing of twenty, ten, eight, and five miles. They are respectively 0.35, 0.63, 0.74 and 0.96. Also, if the grid spacing is 8 miles, the probability of finding a Prudhoe Bay size field is 1.0 (100%), of finding a MacArthur size field is 0.74, a Granite Point size field 0.52 and a Trading Bay size field 0.41.

Model Lease Area and Costs. Figure 1 displays a portion of a fifteen by one hundred mile area chosen as the model reconnaissance area. An eight mile reconnaissance seismic grid and a two mile structural detail seismic grid are displayed in the figure. These grid spacings were used in the cost determinations. Three hundred and ninety-five (395) miles of reconnaissance data and one hundred and three (103) miles of detail data were needed to find and adequately describe the MacArthur River field size structure.

The actual costs to explore the size area defined by the model in each of the cost regions is given in Table 2. The cost per mile of the seismic data, the cost to acquire 395 miles of reconnaissance data, and the cost to acquire 103 miles of detail seismic work are arranged by cost region and data source. The total cost is the sum of the original group shoot reconnaissance costs and the original contract detail data costs. The cost figures for the original contract work are only close approximations from a telephone survey and are not actual bid figures. The cost figures can be considered accurate within 15%.

If more than one structure is found in the model area then the cost of the reconnaissance data is distributed to each structure and thereby reduces the structure finding cost.

For the model, the lease area is considered to be the 154 square miles that were detailed by the contracted proprietary data.

Late Participant Group Shoot	$800/Mile Recon. $316,000.00 Detail $82,400.00	$60.00/Mile Recon. $23,700.00 Detail $6,180.00	$50.00/Mile Recon. (Old data) $19,750.00 Detail No Data
Total Cost Group Recon Contract Detail	$384,600.00*	$70,750.00	$534,750.00

Data: 8 mile reconnaissance seismic grid, 2 mile detail seismic grid, recon. line mile = 395, detail line mile = 103, model field size = 500 MM.BBLs, (McArthur River Field), resultant lease area 154 square miles.

*If crew is not in area there is a mobilization cost of, from $100,000. to $250,000.00, from Kenai to North Slope.

Interior Alaska seismic costs could be very high, but the State owns very little oil potential land in the interior at this time. The shallow Holitna Basin could possible be evaluated using a combination of cheaper methods, such as gravity and shallow refraction seismic.

TABLE OF SEISMIC EXPLORATION COSTS, BY COST REGION

TABLE 2

Seismic Data Grid Size Determination

When performing a seismic reconnaissance survey, the grid spacing of the seismic lines is a major factor in determining the cost of the survey. The two factors which control the grid spacing are the size of the structures being sought and the probability of finding a structure of a particular size. In a specific geologic province knowledge of structural character and orientation will influence the type and orientation of the grid size used.

The development that follows is a generalized probabilistic approach to the problem of what size grid spacing to use when a structure of a particular size is being sought. The basic geometric assumptions are that the structure is circular with a diameter of "D" and the grid is equilateral with a side length of L. The structure is considered found if one of the sides of the square grid passes through the structure a distance less than or equal to "S" from the center of the structure, as displayed in Figure 1a. For the purposes of this discussion "S" is chosen to be one third of "D."

$$S = 1/3\ D$$

Figure 1b displays a portion of a seismic grid. The center of a structure of diameter "D" has an equal probability of being at any point withi. the representative grid. The crosshatched region of width "S" within the grid is the region where the center of the structure must lie in order to be considered found. If the center of the structure lies in the central non-crosshatched region it is considered missed. The ratio of the Find Area to the Total Area enclosed by the grid represents the probability

of finding the structure "P_f." So that:

$$P_f = \frac{\text{Find Area}}{\text{Total Area}}$$

$$P_f = L^2 - (L - 2S)^2$$

$$P_f = 1 - (1 - 2\frac{S}{L})^2$$

Now, since $S = \frac{1}{3} D$,

then $P_f = 1 - (1 - \frac{2}{3}\frac{D}{L})^2$.

The ratio D:L is the ratio of the structural diameter to the seismic grid spacing. The above final equation is plotted as Figure 2. Displayed on Figure 2 is the following example. Given a grid spacing of 5 miles when looking for a structure of 3 miles in diameter, the ratio would be 3/5 or 0.6. The probability of finding a structure of that size with the given grid spacing would be about 0.64. In a similar manner, given the grid is 5 miles and the structural diameter is 5 miles the probability of recognizing that a structure has been found is 0.89.

Figure 2 can therefore be used to determine the probabilities of finding structures of various sizes given a particular size seismic grid spacing. Conversely, it can also provide the answer for the size grid spacing to use to find a particular size structure within a particular probability.

GLOSSARY

ADVALOREM TAX - the tax derived from the value of oil and gas property.

ALASKA GREAT COMPUTER PROGRAM - projects the cash flow to the State of Alaska resulting from leasing of natural resources, includes bonus, royalty, severance tax, conservation tax, advalorem tax and income tax used to compare various leasing strategies. A commercial program of GARRETT Computer Corporation adapted for the Division of Minerals and Energy Management.

ANALYSIS - an examination in detail, so as to determine the nature or tendencies for the purpose of understanding and/or comparison of parallel systems.

BONUS BID - the amount of money a bidder is willing to pay for the privilege of exploring for petroleum and for the privilege of developing and producing the oil and gas which may be found.

BONUS COMPUTER PROGRAM - determines the expected rate of return to be obtained from a lease as a function of the probability of finding commercial quantities of hydrocarbons, bonus paid, royalty percentage, and/or profit share percentage.

CONSERVATION TAX - tax based on the amount of oil produced.

DISCOUNT RATE - the time value rate of money which is used to evaluate future income and expenditures at present value -- generally equatable to a company interest rate at which the company borrows or lends money, or the average rate of return.

DMEM - Division of Minerals and Energy Management within the Department of Natural Resources, State of Alaska.

ECONOMIC LIMIT - The production rate at which the cost to produce a field is equal to the revenue received.

EXPECTED VALUE - the average value obtained from a number of attempts which include the successes and the failures.

EXPECTED PETROLEUM FIELD SIZE - the average field size obtained from a number of attempts which include the successes and the failures.

FEA - Federal Energy Administration

FIXED BONUS - a predetermined sum of money required by the resource owner to ensure that only earnest bidders participate in the auction. Syn: earnest money.

FRONT END MONEY - cash bonus paid at the time of leasing.

GREAT - Generalized Reserve Estimating, Appraising Tax Computing System, developed and operated by Garrett Computing Services, Inc.

INCOME - the money or other gain received for labor, services, property or investments.

MODEL - a set of estimated parmeters which are assumed to reflect reasonable values as compared to actual fields.

NORMAL DISTRIBUTION - a symmetrical bell-shaped curve, where the relative frequency with which a variable will take on values between two points is the area under the curve between the two points on the horizontal axis.

OIL, LOWER TIER - FEA regulated oil price applicable to all old oil produced on old discoveries.

OIL, UPPER TIER - FEA regulated oil price applicable to a new oil discovery or oil produced above a base level.

PARAMETER - any measurable characteristic of the defined universe.

PRESENT WORTH - the present value of future income or expenditures which is determined by discounting future income and expenditures at an acceptable discount rate.

PROBABILITY - relative frequency of particular events in a very long sequence of trials.

PROBABILITY OF SUCCESS - the chance of finding the expected value resource (field size).

RATE OF RETURN - discount rate which results in the discounted present worth of future net income becoming equal to the discounted investment.

RECOVERABLE RESERVES - the amount of production that can profitably be removed with present technology.

REVENUE - the income, royalties, rentals and fees, collected by government.

RISK - percent chance of success.

SEVERANCE TAX - tax derived from the gross value of production.

STATE INCOME TAX - tax based on taxable income.

TAXABLE INCOME - all company income less operating cost, less depreciation on investment, less amortized pre-leasehold costs (bonus), less conservation and advalorem tax.

SEC. 4

MILTON LIPTON:

The comments that I would like to offer and then open up to your questions are based upon the draft for a bill that amends the leasing policy of the state. To begin with, I call your attention to a rather unique and I think a very progressive statement of the preamble which says that among the purposes of this is to maximize the state's share from profitable oil and gas production while minimizing revenue from unsuccessful exploration wells and from marginal economic oil and gas production. It is a most unusual approach for a state or a government that is leasing property to take....that is...what you are saying in effect is that you are not trying to maximize your revenues come oil or high water, but that you'll take your revenues from successful oil and gas exploration and you are prepared to forego under certain circumstances optimum revenues that you might have gotten from bonuses paid to the state where the venture was unsuccessful. I would think that the industry would look with great favor upon this as a principle of leasing, and as I said before, it's a most unusual thing to see a government proposing this itself.

A major change which is now being proposed in your leasing policy has to do with bidding methods and on page 4 of the proposed draft bill there are actually eight (8) different bidding methods itemized which would be available to the commissioner and from which he could select in any particular lease sale. The eight different bidding methods break down really into four different bid variables. The first is the very familiar front end bonus bid, and there are three (3) different ways this can be done.

The second is royalty bidding and there are two different ways the commissioner can do that. The third is bidding for a net profit interest to the state out of the proceeds of successful oil and gas exploration development and production. The fourth is bidding on the basis of work obligations, how much a company will commit itself to work obligations. As I said, the bonus bidding is the familiar one which as been used most commonly, I think, almost exclusively here in Alaska in which the blocks which are up for competitive bidding will go to that company that offers to the state the highest bonus, and then the terms of the lease specify certain fixed commitments on the part of the leasing company, in the past, it has been almost universally 12 1/2% royalty. Under this proposed legislation, if the commissioner can solicit competitive bidding on the basis of a front-end bonus but with one of three alternative sets of fixed commitments written into the lease. One is a straight royalty which shall not be less than 12 1/2%. Second is a sliding scale royalty, that is beginning initial production at one level and then moving upward. And the third is a combination of a fixed royalty and a net profit interest to the state where the fixed royalty shall not be less than 12 1/2% of the fixed profit, interest shall not be set by the commissioner at less than 30%. So in effect this deviates from your present practice only insofar as it gives the commissioner a choice of three different elements which he can write into the leases when he opens them up for competitive bidding on the basis of the bonus. The royalty bidding is quite different. Here the two alternatives are that the companies would bid competitively; offering, competing on the basis of a sliding scale royalty which cannot begin at less than 12 1/2% and which carries thereafter a fixed bonus. The bonus is fixed by the commissioner, the companies bid on what kind of a sliding scale royalty they are prepared to offer the state or alternatively there's a fixed bonus and they offer a

fixed royalty. They bid competitively on royalty not a sliding scale royalty, but one says I'll offer 12 1/2%, another one says I'll offer 15%, yet another one says I'll offer 18%..... A few words about royalty, competitive royalty bidding, in previous discussions with committees of this legislature we have argued that royalty bidding is not a preferred form of bidding, except under very exceptional circumstances. If, for example, you have semi-proven acreage where the volume of the oil to be found is reasonably calculable, and the risks are not that great, location of the oil in terms of distance from ports or whatever else is pretty well known because other production is close by, under those circumstances you might have royalty bidding. But under most circumstances we would feel that royalty bidding is not a preferred form of bidding. You remember from our discussion of severance tax that the nature of the royalty or of the severance tax is that it becomes a percentage of gross value. Taken off the top of the gross value without regard to what the profitability of the venture is and when companies don't have to pay a very large bonus, the bonus is fixed at a modest rate, everybody pays the same bonus bids, but competitively on the basis of the royalty there may be a tendency for companies in their exuberance to obtain the lease to push the royalty which they offer the state progressively higher, they don't know what their competitors are going to offer, so they stretch their bid in order to win the lease. And then subsequently it may turn out that this royalty to which they commit themselves and which must be paid on every barrel of production over the entire duration of the lease becomes a very burdensome one; it could lead to earlier abandonment. But this is particularly relevant, what I'm saying now in the context of paragraph "D" at the bottom of page 4, which says regulation shall be established for all bidding methods to allow reduction of royalty to compensate for these increasing costs in the later stages of production decline, to prolong the

economic life of the field. And then it goes on, it says that the commissioner cannot really abate the royalty before at least two years of production have transpired. But, I put it to you, that although discretion on the part of the commissioner to abate royalties is something which you had in your lease a long, long time ago in your leasing bill; although this may be good legislative practive and good administrative practice when fields are beginning to reach the end of their natural life and you would like to encourage the maintenance of production even if it means taking a lesser royalty; to have this in the statute at the time when companies are bidding competitively on the royalty and then there is a temptation to say, well, if we bid too high a royalty, we come running back to the commissioner and we ask for abatement of the royalty So, you put the state, you put the commissioner in a very bad hole and and you have perhaps without intending to, you encouraged the companies to bid not the highest royalty that they think they can afford to pay in light of their exploration expectations, but to over bid because when worse comes to worse they will go running back for abatement of royalty. So I would think that if you are going to maintain this feature in the leasing law which says that in order to encourage the continuation of marginal production there will be the possibility of abating royalty then you certainly, I think, want to consider very, very carefully whether you want to have among the options, under which the commissioner can lease, bidding competitively on royalty. The third alternative or the third form of competitive bidding is bidding a percentage of net profit to the state. What this means in effect is that the companies who are bidding competitively to obtain a lease will say to the state, well, your lease requires us to pay a fixed bonus so we all have to do that and in another version your lease requires us to pay a fixed bonus, plus no less than 12 1/2% royalty whatever the commissioner specifies. Now, each company

bids competitively by saying to the state that after we have paid the bonus and after we pay a royalty of 12 1/2% of gross well head value on every dollar of production, thereafter, each year we convey to the state a percentage of our net profits and the companies bid competitively; the company that commits itself to turning back to the state the largest percentage of net profits is the company that wins the lease. Net profits can be defined, they are not defined in the statute, and I think correctly not so. The commissioner before any lease sale where the bidding component or the bidding variable is net profit, tells all companies who are entering the bidding precisely how net profit will be computed. It does not have to be and, hopefully, will not be the same way net profit is computed for income tax purposes. It is a notional concept of net profit which says you start with this gross value or whatever it is and you subtract certain specified costs everyone knows precisely without too great argument or debate how the accounting will be done in the course of the year and relatively simple accounting can be mandated by the commissioner before the lease sale. We have felt for a long time that the net profit bidding variable is a particularly attractive one, both in the standpoint of industry and for the standpoint of whatever government it is that's putting up acreage for lease. Not necessarily to the exclusion to other possibilities, but under certain circumstances a very attractive approach. What it does is, it removes a great deal of the capital available for exploration from the front-end bonuses so that the money thats available goes to productive work instead of just to front-end bonus. Where there is highly successful exploration the lessor, State of Alaska in this case, can expect to have very, very substantial revenues from the lease quite apart from taxation or anything else. Revenue from the

lease as the percentage of net profits. You might even think of net profit as a royalty based upon net value instead of a royalty based upon gross value. Sometime it's referred to as a net royalty or a net profit carried interest. What it means in effect is that the State of Alaska takes on a very considerable proportion of the risks in the exploration game. It does get a bonus but the bonus is a small bonus fixed by the commissioner as being appropriate to this bidding variable. And it may get, say, a fixed royalty but after that the larger proportion of the income which the state might expect to receieve it would receive only if the lease proves to be a productive lease and how much the state gets depends upon how much oil or gas is found, what the value the oil or gas is, and how profitable the operation. So the state in a sense becomes a partner with the explorer in both the failures and the successes of the venture. But the state does not become a working partner, the state does not become an active partner, the state is not in the oil and gas business. The decision as to whether or not the exploration should take place, the competitive bidding on what the net profit conveyed to the state is... all of these are private decisions by private industry in a competitive environment. Then the final variable, and it is the eighth item among the alternatives available to the commissioner, is bidding on the basis of work commitments. And there in a sense, the commissioner says when the sale is being advertised, that there is going to be a fixed bonus, and there is going to be a stipulated royalty. Now the winner of this lease who is entitled to do the exploration is the company who commits the largest amount of money to exploration process. This kind of bidding, perhaps, would be utilized in very, very difficult environment areas where the state wants to be sure that all potentials of the acreage are really explored, where the costs of exploration may be very, very high and where in the absence of work commitments the companies may be inclined to back out too quickly in terms of the results of one

unsuccessful well or whatever the case might be and the state would like to get the best possible exploration of the prospects within the area put up for lease and therefore says to the companies, we will reduce your bonus commitments, we won't have a bidding on the basis of royalty, but we will allow you to bid on how much you are prepared to commit to the exploration of this acreage which the state is putting up for lease. Well, just a few comments, I've already indicated that I think, that we think, that gross royalty bidding except in rare circumstances, is not the most attractive form of competitive bidding, and particularly not if you are going to allow abatement of royalty under certain circumstances. Bonus bidding, net profit bidding, work bidding, each one a reasonable approach to competitve bidding depending upon the nature of the area which is up for lease; how the state, the commissioner, and his technical staff regard the potentials. So I think that by providing these alternatives, the state is in effect creating a reasonable basis for a leasing policy within Alaska. I wonder, however, whether it is necessary in legislation to itemize all eight possibilities, that is to say, a bonus bid with not less than a 12 1/2% royalty, or a bonus bid with a sliding scale royalty, or a bonus bid with not less than 12 1/2% royalty and not less than 30% net profit. There are many variations which are itemized here, and for example, a bonus bid with not less than 12 1/2% royalty, and not less than 30% net profit is hardly, I would suspect in most areas, is hardly going to get much competition in terms of the bonus. Why not less than 30% net profit? It seems to me that if you lay out in gross terms what the permissable bid variables are, bonus under certain circumstances royalty, perhaps net profit, work commitments, and then leave it to the commissioner as to the combination of variables and the minima for the fixed items he wants to put in there, how far can one anticipate in legislation itself, what combination of fixed commitments

should underlie the selection of a bid variable, like a bonus variable and I would think that perhaps it might be advisable for the legislature to consider presenting to the commissioner a greater option of more bidding variables and perhaps set certain minima, but not itemize them in the details which appear here. Now there is one other aspect of the bidding that I would like to refer to and it is an item that appears on page 9. It says lands which have been offered for lease within the previous five years, but which received no bids at public auction may at the discretion of the commissioner be immediately offered for lease under regulations promulgated in advance upon terms most advantageous to the state including leasing non-competitively. The commissioner shall utilize a sliding scale of royalty based upon such formuli as he determines to be equitable, but need not adhere to the rental schedule in subsection (k) of this act nor to the 57 (indesc.) acres per lease and so on. What I am calling your attention to is the option here avaiable to the commissioner where a lease that is offered for bidding has not been taken up very quickly, to put it back for lease including under noncompetitive circumstances. I think that this could open up some dangerous precedents. Particularly if it's offered too quickly. I mean that the fact that a lease is not taken up in competitive bidding does not mean that there is no oil and gas there, it does not mean that the prospects are not good for oil or gas, it means that given the state of the knowledge at that moment of time, given the way the industry perceives the attractiveness at the moment of time they have'nt been interested in bidding on it.. They had other things that were more attractive, whatever the case might be. But let some time go by before opening this up for leasing again and particularly under competitive conditions again, what may have been learned about the geology of the state in the interim period. The way in which

company perspectives may have changed for a lot different reasons, I don't know what the case may be, I think may lead to the ability to lease under more favorable terms rather than for the state to conclude that nobody wanted our lease, well, we would like to have it explored anyway, let's get it on the market as quickly as possible, even if under noncompetitive circumstances. I would strongly suggest that you hear from the department, as well as from me, and others about why there is a sense of urgency about leasing noncompetitively just because the lease has not been taken up. I pass to other aspects than the terms of bidding and leasing. On page 5, there is a very pregnant one line clause which says the commissioner is authorized to withhold acreage from leasing in a particular lease sale. Now again, for those of you who remember one of the first reports we made for the legislature on leasing policy many, many years ago, one of the things that was discussed was the advisability, under appropriate circumstances, of the state leasing less than the full acreage in which there might be industry interest. Now enough acreage has to be put up for lease so that the companies that win the leases have a reasonable aggregation of acreage to provide for viable production of oil or gas or whatever is discovered. It doesn't necessarily mean that everything within a particular area of prospective interest has to be put up for lease simultaneously, there is good reason particularly if the purpose is to maximize the states share from profitable oil and gas production and minimize revenue from unsuccessful exploration wells and from marginal production for the state to withhold a certain amount of acreage. Now the acreage which was withheld may be condemned as absolutely sterile if the exploration around it finds nothing, (indesc.) the state may have withheld may turn out to be condemned by the industry you will never be able to lease it in which case you will not have gotten any bonus revenue

or whatever the case may be. But on the other hand, if it is successful you may come up with a subsequent lease sale with a net profit bidding for example, which makes it very attractive to the state in terms of the income that they will receive. So I would think that this thing is that the commissioner is not only authorized, but subject only to circumstances which make it undesireable which in case the commissioner has to exercise his judgement, that he should in fact withhold acreage it should be a more positive thing. I wouldn't want to make it binding under all circumstances. discretion must lie (indesc.) some areas where it may not be feasible where whatever acreage is put up really has to encompass the most of the structure which is in interest. If it can be done, I think it would be advisable to do so. The next feature that I would like to touch on briefly has to do with the period of exploration and on page 6 the appropriate paragraph says that an oil and gas lease shall cover a reasonably compact area and be for a period of five years. And there is no provision here for extension of the exploration period except under specific circumstances if production is eminent or a well has to be completed or the property goes into unitization. What under normal circumstances is a 5 year exploration period. I would suggest that there should be provision for at least some reasonable extension of the exploration period particularly in a country as difficult to operate in as the State of Alaska, where the geology, the environment, the climate, the circumstances all make it impossible to conclude an ongoing exploration period precisely within the five years. A whole exploration season may be lost because of a combination of circumstances; because drilling equipment couldn't get out there, or at the end of one season the

seismic work never got completed and one has to wait for the proper time of the year to go back and finish it and one loses a year of exploration. I would think it would be advisable to allow an extension of the exploration period. If in the view of the commissioner, good faith has been exercised by the leasing company in the previous 5 years. I think it does no violence to the interest of the state. But there is another very interest feature thats introduced here at the bottom of page 9, paragraph v, the state shall have the right to purchase not to exceed 16 2/3% by volume of the oil and gas produced pursuant to a lease, and it goes on. That is to say, the state is assuring itself that if it chooses, it can have as much as 1/6th of the oil or gas produced on the lease. Now included within that would be the states royalty oil and gas and the volume metric equivalent of whatever the state may get on a net profit share. But if those fall short of 2/3rds of the oil and gas the state has the right to buy at the market value at the field price enough to make up 2/3rds. There is no obligation on the state to do it, the state has the right to do it. I see a tremendous advantage of the state in this, I seen no great diadvantage to the industry in this if exercised judiciously. It could be unattractive to the industry if it is arbitrarily applied and particularly out of small production where the lease holder really needs a substantial volume of oil to provide the economics for his export out of the state for example, and taking away 1/6th of the volume of oil starts cutting things too narrow for him, then I would say that this could be a burden to any company who is undertaking the exploration and who successfully is doing the development. So I would think there ought to be at least some proviso where by the lease holder is protected against simply a determination to take 16 2/3rd

no matter what, and in particularly small areas where the increment of the state gets may matter very little to the state but may matter very much to the producing company. I think some kind of clause should be put in to provide the protection.

That's the sum of the remarks that I think I could make about the special features of this proposed bill and if there are any aspects of it that I touched on or things that I have not chosen to talk to that you would like to address yourself to, I'm at your mercy.

SENATOR POLAND I will ask you one question Mr. Lipton, and that is, have you felt for sometime that our leasing policy needed to be updated or overhauled?

MILTON LIPTON Well, I think that if only to broaden increase, the number of options available for leasing, yes, I think so. I think the traditional front end bonus bidding and there is a lot to be said for it under the proper circumstances, and, but for this to be the sole basis of competitive bidding, I think it places a burden in rank wildcat areas upon the industry which is unnecessary, that you have to put so much money that ought to be used constructively, pay out as a bonus and it puts the state in a position where in many rank wildcat areas what the state gets is miniscule in terms of bonuses compared to what may be the profitability. If you add up the sum total of bonuses received by the state from the producing areas of Prudhoe Bay, it is miniscule bonus income because the companies were bidding on rank wildcat areas at a time when even if they were

successful no one ever knew if it could be developed, tremendous volumes of oil had to be found and if prices had ever stayed at $3.00 per barrel it never woud have been produced you see, under those circumstances obviously the bonuses are very very little. Now, I think there is no great virtue in the state having competition on the basis of front end bonuses when the total amount of bonus income you may get, particularly in the less attractive areas of the state. What seemed to be the less atractive areas of the state will be very very little and may prove to be the most attractive producing areas after they are developed. So that if you minimize the front end bonus under certain circumstances and go to a net profit interest then you have a chance of sharing much more considerably in the profitability of successful ventures and without doing great violence to the incentives of the industry. Because no company is going to bid away such a large share of the net profits that it leaves them without the incentive of very very profitable operations on the remaining shares. Now it is something which I think can be equitable both to the state and to the company. So yes, I do think that the leasing warranted amendment if for no other reason than to introduce a greater variety of bidding variables without going mad with you know giving the commissioner so many options that the poor man will never no on what basis he can make a selection. But I think to introduce several other options is a major step forward.

Q: Senator Huber - Milt, can you tell me from industries viewpoint if we would do any harm to this bill, in particular, or good or otherwise, your comments in regards to us putting an Alaska hire clause into the leasing requiring Alaska hire based not upon our regulatory rights but upon our proprietary contract rights?

Lipton: Senator Huber, you know, you ask me from the standpoint of the industry you really should ask that of the industry, not of me, but I would give you a very quick impression and if you put an Alaska hire clause, in, what it

means to the industry depends really on what you intend by Alaska hire. I mean there, if the industry doesn't have sufficient flexibility to obtain competent people, whatever their origin, then I think it does harm to the industry. But if the way in which it is applied is sufficiently flexible then I suspect not only wouldn't the industry object, but the industry would be delighted. You know, I think the industry would like to make the maximum possible contribution to Alaska hire. But it must be a very difficult thing to administer, I suppose.

Q: Senator Huber - I apologize for asking the industry viewpoint. I was asking basically for the economics of the industries viewpoint.

Lipton - Well, as I said the economics are affected depending upon how this either contributes to, or intereferes with the efficiency of the industries exploration and producing operations.

Q: Senator Huber - I was referring to a particulary in the difference between our regulatory powers as a government and our proprietary rights as a contract maker in this particular case.

Lipton - Well Senator Huber, this suggests to me that if you are doing this as part of a contract rather than by regulation, does that mean it's going to be less flexible, because it is in the contract?

Q: Senator Huber - Madame Chairman, Mr. Lipton, the intention is to make it less flexible because we are presently finding that our leases do not contain this and that hiring is not being done from the North Slope from Alaska where it could be done when there is qualified people sitting on the benches. And we want something to get a handle on this, so that it is not going to be struck down by the Supreme Court saying that you cannot make

such a law we want to work on our proprietary rights being that is our oil that we are selling.

Lipton - Senator Huber, I find it very difficult to give you a responsive answer because if you say that there are qualified people sitting up there who are not being hired, now obviously that is bad and if you had it in the lease they would be hired. On the other hand, if the industry may interpret qualified people differently. I don't know it's very very, it's difficult to say. But if the whole idea is to make it a firmer obligation through the lease that is one thing. But if you make it a firmer obligation and there is no flexiblity then I think it could be very difficult.

Q: Senator Huber - Well Madame Chairman, I won't dwell on it but just one more short thing, so that you understand what I am talking about. When the industry on the North Slope makes a deal, with forinstance, a Hawaiian corporation to supply them with the personnel and to do the hiring for them and then the hiring is done in Houston Texas we become concerned when there is qualified Alaskans sittin on the bench. But if we have a handle, a way that we can get a handle on this, using our proprietary rights we should be doing it, or trying to find a way to do it when we know that we can't do it with our regulatory rights and that is why I wanted to get your expertise on this.

Senator Meland - Madame Chairman, I, has Mr. Lipton spoken to any type of questions about all the legislature or are we just talking about (inaudible). Because I did have some questions that were left over from Wednesday, but we can certainly wait on that and talk about this legislation before us.

Senator Poland - Well what we had though we would do is talk about this and when there are no more questions on this we will go to the royalty oil proposals and then throw it open for all types of questions.

Q: Senator Radar - There are many question Madame Chairman. I had two items that I would like to have Dr. Lipton comment on. One of them is the concept of limiting from 500,000 acres to 200,000 acres the amount that any one entity can hold in leased lands and that concept actually appears in several faces in the bill. I assume it is to prevent or to insure a competitive market here so that we don't end up with one company dominating the field. Comment on this and give us your observations on that and what problems and benefits might flow from that.

Lipton - I think there is great virute in limiting acerage holding by an individual company. On the other hand, I have no feel really, for whether 200,000 acres as an amendment to the 500,000 alternative is too little or not. I would strongly urge that in order to acheive the same purpose, that is, I think that two things are of value. Acerage limitation I think could go in there. I don't think it does violence, providing that it is not so narrow that in a sense very soon you start reducing the number of competitors and a company that is successful in a couple of lease sales and then suddenly finds itself barred from further competitive bidding for acerage. You defeat your own purpose if you do that. But I sense that the purpose of the legislature and certainly the interest of the state is that acerage shall not be held. The purpose of winning acerage under a lease is to get on with the business of exploration. And therefore I would suggest that whether there is competive bidding on work obligations is one of the options or not. I think there should be work obligations in every lease. The commissioner should in every lease stipulate minimum, not maximum work obligations. We are not trying to tell the companies how to conduct their exploration activities. But there should be certain minimum work commitments which the companies have to perform in order to hold that lease. Let them get on with the business of exploration. It does no violence to the purpose of the companies, unless they want to get in that bidding and then sit back and wait for

somebody else to do some work or they wanted to be sure they were represented in the area but they had other fish to fry elsewhere in the state or somewhere else. I think you have a five year duration of the lease and I have already suggested that you might be willing to extend it, if the companies really need it and they have been going about their business. On the other hand, there should be minimum work obligations in every lease there. I think also there is a certain virtue in putting a ceiling on the amount of acerage which a given corporate or individual can hold as a result of leasing from the State of Alaska. I certainly would not want you to cut that down so small that you lose the competitive bidding and the third, fourth and the fifth lease sale because one company has already not exhausted it's interest, not even exhausted it's dollars but has exhausted it's ability to hold acerage in the state.

Q: Senator Radar - Would you comment on the provision as to the lessee or permittee conducting any exploration for development or production of oil and gas, the state shall provide the commissioner access to all data obtained from such activities and shall provide copies of such specific data as the commissioner may request. I don't know whether that is intended to change the public disclosure of that information or whether there is still proprietary interests or not but what is your understanding of that provision and your comment? It is on the top of page ten. It starts on the second line.

Lipton - I assume that your statutes prevent public disclosure of this for some minimum period. What is it two years in Alaska. Two years, I think I believe. Two years by statute.

Q: Senator Radar - Cause I take it that the proposal here does not suggest that we alter that proprietary -

Lipton - I would hope not. I would hope not. I think the right to proprietary information for at least two years. For any company operating here considering the amount of money which goes into

exploration. I think that should be protected.

Q: Senator Radar - Well let me ask you this. Would that be true. I assume the reason for your statement is that a company therefore gets the value of it's own work product. But what if the state, for example, should for reasons unknown, at the time of exploration, should withhold in the leasing for a period of three years. Then under those circumstances we would have deprived the company of the value of it's own work product. I don't know how to avoid that but I can see a problem here and perhaps discretion should be available here. Although I am not certain as to the purpose of this particular section or what the discretion or the thrust of the discretion should be. Whether the purpose here basically is to give the state the right to deprive them of the work product, within two years or what?

Lipton - Well I don't know how you can set the period of confidentiality so that it conforms with the amount of, the lapse of time between one lease sale and another lease sale. I mean that is a pretty difficult thing to do. I don't think, see the point is the state has access to this information. It is just that the competitors don't have access to this information. And in that respect there is a certain value in extending the period of confidentiality to a reasonable period of time because the value of the information is not just for another lease sale in exactly the same area. There is an awful lot of information. It becomes valuable because one correlates it with what one knows from other wells elsewhere. One builds up ones geologic and geophyical knowledge as this stuff becomes public. So there is virtue in keeping it confidential for a reasonable length of time. But I don't know, one can't do it for too long a time or you deprive the industry as a whole of what is really basic knowledge necessary for it to advance. So there is some kind of a compromise has to be struck between the virtue of the confidentiality to the company doing the work and how important it is for the whole industry to know more and more about the State of Alaska.

Q: Senator Radar - Well let me ask you. You have suggested in a number of instances descretion in the commissioner. Do you think that in this particular instance that we should provide administrative descretion in perhaps, write in a minimum or maximum or something of that nature. Or do you think the two year -

Lipton - Senator Radar I don't think this is an area where the commissioner ought to have descretion. This is protection which the legislature is going to give to an exploring company as they are taking the risks in putting it's money in. It depends upon the legislature to know exactly what it's protection is.

Q: Senator Radar - Well what if you wrote in a minimum of two years, an extension of that period of time before it was made public?

Lipton - Senator Radar, I don't know of any place where that exists. That of course doesn't mean that it's a bad idea. I don't know that it exists anywhere else. I am not familiar with it. I think normally two years is pretty ample time. Again I would certainly defer to the judgement of people in the administration you know they have alot more experience with what the circumstances up here in Alaska have been.

Q: Senator Huber - Madame Chairman, I would like to just ask Milton just one thing, one question that was raised here by Senator Radar and I would hope he would concur with me. Milton will you take a look into the matter that Senator Radar brought out to determine in your opinion how our laws stack up on this at this time and give us some kind of a report on it. I think I know and the question I would like to ask you would be if you thought that two years was the best period of time and compare this with our current law and give us another report.

Lipton - Yes. I would be pleased to.

Q: Senator Radar - Madame Chairman, perhaps if I might ask Dr. Lipton, he said he had no particular feel to the 200,000 acre limitation for single holdings. I might ask him if it is possible for you to develop a feel for that. At least give us your best judgementas to whether or not -

Lipton - Yes.

Bristol Bay Native Corporation 445 E. 5TH AVENUE / P.O. BOX 220 / ANCHORAGE, ALASKA 99510 / PH (907) 278-3602

March 10, 1978

The Honorable Alvin Osterback
Chairman
House Resource Committee
Pouch V
Juneau, Alaska 99811

RE: H.B. 854

Dear Mr Chairman:

It is my understanding your committee will be holding hearings on H.B. 854 on March 16th and 17th, 1978. Unfortunately, we will have no representative at the hearings to testify and therefore, we respectfully request this letter be included in the official record of the hearings.

First of all, we object to most sections of this Bill as it is very complex, creates a multiple choice system that is unworkable, discourages exploration on State lands, and above all would have a serious impact on the development of our lands. We strongly urge that no action be taken on H.B. 854 this year.

Previous State selections and proposed selections in our region total several million acres with oil and gas potential in the Nushagak Basin (Bristol Bay Basin). BBNC lands in the onshore portion of this sedimentary basin would total about 1,750,000 acres surrounding 17 villages, several of which the Native lands are not contiguous. In other words, most of our lands with the new proposed State selections would be adjacent to or surrounded by State lands. In many instances, a drilling unit would involve both State and Native lands and in some instances, Federal lands. Therefore, any changes in leasing of State lands will have a direct effect on BBNC lands. Most of the provisions of H.B 854 would change the economics of State and Native lands in a producing unit. The net result will be that the portion of the unit under State leases would become uneconomical and abandoned first and the Native portion of the unit would then become less economical followed by early abandonment and thusly leaving large amounts of oil or gas in the ground. This could hardly be called conservation.

BBNC has had a joint agreement with a major oil company whereby, with commercial production, we will become a producing oil company. We do not lease our lands! Knowing some of our selected lands might not be adequate to cover undefined seismic structures, we anticipated leasing State or Federal lands in order to form drilling units for early development of our lands. About three years ago, we filed the necessary qualifying documents to hold both State and Federal oil and gas leases and have filed offers to lease on several thousand acres of Federal lands.

We have no problem with the present leasing system as it has been tried, tested, proven and above all, is understandable. Such a mixed bag of radical, czarist possibilities as proposed in H.B. 854 is uncomprehensible, unjustified and will no doubt have the opposite effect of the original intent, unless the intent was to retard development of State lands indefinately and in effect retard development of much of our lands.

Again, we strongly urge the postponement of any action on this Bill.

Sincerely,

W. C. Bishop

OIL AND GAS LEASING POLICY:

ALTERNATIVES FOR ALASKA IN 1977

A Report to the State of Alaska, Jay S. Hammond, Governor

Department of Natural Resources, Guy R. Martin, Commissioner,

and to the

Alaska State Legislature, Interim Committee on Oil and

Gas Taxation and Leasing Policy, Chancy Croft, Chairman

February 1, 1977

OIL AND GAS LEASING POLICY: ALTERNATIVES FOR ALASKA IN 1977

TABLE OF CONTENTS

Part I, Text

-- Summary

A. Reasons for this study and Report

B. Objectives of the State

1. Businesslike management of State property
2. Equity
3. Practicality
4. Avoiding economic waste
   a. Slow use of proven reserves
   b. Premature investment
5. External impacts
6. Coordination with leasing on federal and native lands

C. Elements of Leasing

1. Prior claim: the noncompetitive system
2. The bonus
3. The delay rental
4. The royalty
5. Specific terms
6. Profit-sharing
7. Rent-sharing
   a. Capital recovery with fixed interest
   b. Front-end recovery
   c. Ad valorem charge (AVC)
8. Regulating field operations
   a. Rate of flow
   b. Unitization
   c. Well spacing
9. Acreage reservation (checkerboarding)
10. Sale of undivided interests
11. Handling information: generation, control and disclosure
12. Sale of fixed volume
13. State intervention

The Choice of a bid variable

D. Lease sales: when, where, how much, what, and why

1. Selecting the lease procedure
2. Ranking by maturity
3. Calculating the growth rate
4. The State's interest rate
5. The time for exploration
6. A reservation price
7. Stability of sales
8. Special factors

E. Administrative load and staff needs

Summary

The purpose of this report is to be of service to the Alaska State Legi ture and the Department of Natural Resources in their review of oi gas leasing policy. It is written from the State's viewpoint. It t. he State's interests as being frequently adverse to those of the Sta lessees, without being hostile to them. Where the State's interest verse to the federal interest, we take the State's position. Otherwise, the purpose is to be as objective as possible. The Report lists the pros and cons of alternative policies and indicates what the Legislature needs to do to make each policy work. Recommendations are made in a tentative way.

This is a survey rather than an intensive study of any one alternative. The purpose is to display the full range of alternatives and the full range of issues to be considered regarding each one, so as to keep individual matters in the larger perspective so that no one issue is overweighted. The purpose is to compare, and to show how different leasing elements complement or substitute for each other. The purpose is to serve as a springboard for legislative review and a guide to additional, more selective investigations.

As a unifying theme, the list of alternatives proceeds sequentially, showing how each more complex alternative emerges as an answer to faults perceived in prior ones.

As a set of criteria for judgment the Report seeks to lay on the table assumed goals of the State. These are the following:

-- Business-like ma[illegible]his is taken to mean in practice the maximization of discounte[illegible]

-- Equity. This is take[illegible]n avoiding giveaways; reducing the lottery element in leasing; hewing to the productivity basis of distribution of income; collecting for the State the rent of its lands; basing industry incentives on productivity rather than acquisition of State assets; and reducing the differential advantage accorded to accumulated wealth.

-- Workability. This means a minimum of arbitrary regulation, achieved by binding the lessor and the lessee in a community of interests when writing the lease.

-- Avoiding economic waste. In addition to physical waste, there are the wastes of producing at excessive cost and doing things at the wrong time. The Report suggests abandoning the criterion of maximizing ultimate recovery in favor of maximizing discounted cash flow; avoiding the dissipation of rent by overspending, particularly on capital. It warns against the twin dangers of using proven resources too slowly and searching out new ones too early.

-- External impacts. These are seen as negative by environmentalists and as positive by developmentalists. The reconciliation lies in a wider distribution of benefits.

-- Coordination with federal and native landowners.

The Report now surveys leasing alternatives in sequence:

-- Noncompetitive leasing is faulted for giving away too much and encouraging premature leasing and production.

-- A high bonus partially cures these problems but creates a serious front-end filter problem. Professor Norgaard's postmortem analysis of bonus bidding i Alaska indicates that too little has been received for leases.

-- A high annual rental cures the problem of the front-end filter by replacing it. It may overaccelerate production, however, unless made to dwindle over time. A rental whose level is set before discovery reduces the buyer's risk since he may drop the lease at will, but does not alleviate the State's risk of selling for too little. A rental based on assessed value avoids this problem and also dwindles over time.

-- High royalty rates solve much of the risk problem. They eliminate the front-end filter and they collect revenue. However, they allow too much speculation. They also put a drag on production, especially marginal production. Premature shutdown turns out to be a minor problem. Others are greater: slow production and future shift; leakage of rent into private hands from better deposits; excessive deferral of State revenues; and lower success ratios for exploration. These problems can be alleviated by imposing specific work terms, by using sliding scales, and by limiting the term of the lease.

-- Specific terms. These must be used with high royalties to compensate for the disincentive effects. Mandatory liability for environmental damage is also suggested.

-- Profit sharing. This means letting lessees write off costs against royalties and also raising the rate to compensate. This lets the State receive more per barrel from the richer deposits, and avoids

sterilizing the marginal ones. It gets us into the same problems as administering an income tax: the rate is high, padding costs is likely, depreciation paths and lives must be determined according to complex and sometimes arbitrary formulas. There remains a loophole for unrealized capital gains.

-- Rent-sharing. In addition to costs the lessee deducts interest on the value of his improvements by one of three methods: by allowing deduction of capital over time with interest at a specified rate; by allowing front-end recovery of capital and by applying an ad valorem charge to the assessed value of the leasehold interest. The first two alternatives engage us in severe auditing problems, and both are biased against exploration on long-shot ventures. The third alternative removes the auditing problem and replaces it with an assessing problem. It also puts a bite on unrealized capital gains. It avoids many faults seen in prior systems: it raises money; it defers payments but not excessively; it puts no drag on production; it requires little direct regulation; it imposes no shift towards the future; there is little opportunity to pad expenses; and there is only a limited bias against long-shot exploration (because what is hard to find is often hard to produce and therefore low-valued). Its problem is discouraging postleasing exploration. Some remedies are suggested.

-- Regulating field operations. Some form of unitization is required. It is suggested that this will work much better if the State accepts the criterion of maximizing discounted cash flow, eliminating a conflict between the State and the operators. A two-tier system is suggested as an alternative to 100 percent unitization.

-- Three alternatives are passed over lightly, although without prejudice. These are: checkerboarding; the sale of undivided interests; and the sale of a fixed volume of oil and gas.

-- Handling information. The Report considers the pros and cons of the State's buying more information on contract as an alternative to relying on industry nomination. The weight of argumentation is in favor of the State's taking a more active role.

-- Direct State intervention in the market is considered, primarily to aid in monitoring prices used as bases of evaluation for royalty and assessment purposes, and to guarantee to all lessees equal access to transportation.

Next a criterion and procedure is developed for timing lease sales. State lands are to be ranked according to maturity or "ripeness." Ripeness is defined as a condition where the percentage growth rate of the DCF of the State's interest slows down. The State's wealth is maximized by selling leases when this anticipated growth rate slows down below the rate of interest. The appropriate rate of interest should be the State's borrowing rate. The question is raised whether the State should set a reservation price when auctioning leases. The Report addresses the question of whether the proposed procedure will cause leases to be sold at a sufficiently even rate.

The Report considers the administrative load and personnel requirements associated with alternative leasing systems. The use of royalties entails ancillary regulation to compensate for the disincentive effects of the royalty on production. The profit share system entails an

auditing staff to avoid the deduction of unjustified expenses. So, also, do the first two rent-sharing systems where capital costs with interest are deductible. The ad valorem charge system entails a staff of valuation engineers or appraisers, whose services are also required to operate a system of timing lease sales optimally.

Leasing is seen as supplementary to taxation, and taxation is not seen as an adequate substitute for leasing policy because taxation is addressed to persons or corporations while leasing policy is addressed to parcels of real estate. The exceptions to this are a net proceeds tax and a property tax, either of which might be used as a substitute for leasing policy.

Recommendations are submitted tentatively in light of the complexity of the subject and the several imponderables involved. I recommend screening out systems based on ex ante forecasts of resource values like the bonus bidding system, because of the front-end filtering out of leaner firms and because so much has to be gambled on so little information. We consider the lease elements whose value depends on actual disclosure of resource values and rank them in the following order: the ad valorem charge, the profit share, the sliding scale royalty, and the front-end recovery. We recommend a vigorous program of State-financed contract exploration with publicity of findings. We recommend scheduling lease sales according to the ripeness criterion described above. We prefer that unitization be administered by an organization of local leaseholders.

Our most immediate and unambiguous recommendation is for a greatly expanded program of information-collecting and valuation, to serve as a necessary base for all other decisions.

A. Reasons for this study and Report

This study was commissioned by Guy R. Martin, Commissioner of Natural Resources, State of Alaska, in cooperation with the Legislative Interim Committee on Oil and Gas Taxation and Leasing Policy, chaired by Senator Chancy Croft. The present Report is part of a larger study being conducted by the Department of Natural Resources, a study described in Commissioner Martin's statement of July 10, 1976, entitled "Alaska Oil and Gas Leasing Study," copies of which have been submitted to the Legislature. The primary focus of the present study is Section 4 of the July 10th memo which reads as follows: "A description and analysis (legal, economic, other as necessary) of all alternative systems which are practically applicable to State use in Alaska, with emphasis on broadening the State capability to employ alternatives rather than making final decisions on which systems to use. This task should consider the practical experience of other states and nations as well as leasing theory and research.

a. Special attention in the analysis should be given the risk element in alternative systems as it relates to public administration of oil and gas resources.

b. The analysis should include, in some form, an overview of this entire leasing issue of use to State officials and legislators."

This Report also responds to Section 5: "An economic/legal analysis of the interrelationship of leasing (ownership interests) alternatives with taxation alternatives. Ongoing coordination with the taxation

segment of the administration/legislative study."

This Report also responds to Section 7: "Design of a system (a criterion) for decision-making by public administrators regarding various leasing alternatives. What information must be available; what factors should be considered; what process should be followed to decide between new alternatives."

In keeping with the spirit of the assignment, the tenor of this Report is expository and not advocatory. The main purpose is to lay out major alternatives in a systematic way to serve as a basis for legislative review, debate and decision. The report does offer its own recommendations at the end and the consultant offers his own judgments from time to time where it seems appropriate, and where they may be identified as such. The overall spirit of the Report, however, is to define and articulate alternatives, to spell them out in a logical sequence, stating the advantages of each, the faults of each, and what the Legislature would have to do to make each one work. Most of them will "work" --sort of-- and are in operation in various jurisdictions around the globe. It is a question of what might work better in light of your own objectives, circumstances, and visions of the future.

In developing alternatives, the Report proceeds from the simple and basic to the more complex and sophisticated, showing how each complexity develops as a logical effort to overcome some fault in the simpler system. Before breaking down in complexities, however, the effort is made to apply Adam Smith's dictum that the evolution of successful inventions is not, in the end, into greater complexity but

greater simplicity -- an observation dramatized by Igor Sikorsky when he exhorted his engineers, "Simplicate, simplicate -- and then add more lightness!"

A purpose is to cut down the seeming number of alternatives without reducing the real number by boiling proposals down to their essentials and showing how few of them there really are. The number of possible combinations is still extremely high because there are so many elements in a lease but the number of reasonable combinations is much smaller because they need to be combined so as to balance each other and countervail each other's faults.

A correlative purpose is to develop commensuration, that is conversion factors among the apples and the oranges. By doing so we develop a common tongue for communication, a common currency for trade-offs, and a unitary standard for decision-making.

Alaska's interest in this topic is timely and in step with a worldwide trend to study and improve leasing systems. This is a natural result of increased valuation of oil and gas resources in the ground. As the retail price rises there is enormous leverage on field prices. The farther the field is from the gas pump the greater the leverage, so that the percentage increase in the field value of Alaska's resources is at a rate so high that few would have credited it a few years ago. Field prices everywhere are rising out of all proportion to other costs. This is reflected in extremely high bonus bids offered for tracts which were previously considered marginal or submarginal. A recent survey indicated that costs of land acquisition

by oil and gas companies increased by nearly 700 percent from 1970 to 1974 (Joint Association Survey, 1976) in comparison with all other costs which increased by considerably less than 100 percent. Clearly, the world is recognizing the high value of remaining oil and gas lands and it behooves any prudent landowner to protect his interests and to economize on the resource with much greater care than ever before.

Most analysts now foresee continued upward pressure on energy prices and this consultant, although forecasting is not his forte, is inclined to agree. This is the more reason to guard our future interests by using care in drawing leases now. The lease contract is binding and irrevocable, unlike tax policies. No legislature can bind or limit the tax power of a future legislature; but neither can a legislature in the United States, with its strong tradition of judicial review, rewrite a lease contract executed by its predecessors. Other nations may force renegotiation of contracts considered unfair in the light of changed circumstances. This is not unknown even in the United States but much rarer and harder than in countries of different traditions.

The result is a growing interest in public landowners' participating in future profits from oil and gas. For generations past, many governments virtually gave away land simply to get it used; while private landowners sold their future rights for a little money up front. Now these attitudes are changing drastically and there is ferment everywhere. The U.S. Congress has entertained several bills in both branches calculated to increase government participation in future profits in spite of

the government's having secured large revenues from bonus bids following the OCS Act of 1953. There has been some support ofor a federal oil and gas corporation to explore in advance of leasing. Equity participation in corporations has been a strong trend, exemplified for example in Norway, in Canada, in Saudi Arabia and elsewhere. Indonesia has pioneered its own interesting leasing system, characterized by rapid capital recovery to the lessee followed by very high royalties. Papua-New Guinea has recently adopted the same principle in more sophisticated form, basing its law on the careful advice of economists Ross Garnaut and Anthony Clunies-Ross. The academic world which ignored this topic for many years past is beginning to spawn several research projects and will soon be awash with reports and articles and proposals and econometric studies and models and new philosophies. The world is moving. Alaska is in step, although perhaps a step behind. The present assignment indicates an intent to catch up or pull ahead.

B. Objectives of the State

Only individuals, it is said, can have objectives. By "objectives of the State" this Report means the objectives of the effective majority of Alaska's voters as expressed through their political representatives and other leaders. No one thinks that representative government can completely succeed in representing everyone or, perhaps, anyone. But it is what we have, and this report addresses these leaders as though they were the State.

The Report does not presume to say what the State's objectives should be. It, rather, purports to distill what the consultant observes them to be; and to articulate and organize ambient ideas which are often heard but want greater system and organization. This entails the consultant in some interpretation. Those with more data and better interpretation may improve on this statement. The present report only begins the job of laying out our goals on the table.

A further purpose is to begin to define and expand on their specific implications. This inevitably entails even more interpretation and perhaps even some presumption by the consultant. Seeing these implications as he interprets them, one may sometimes recoil and say "no! -- That's not what I really want." So be it -- then we may go back and spell out more realistic objectives we can live with and we are well down the road to our present goal which is to be prepared for decision-making.

The following are what I take to be the State's objectives in framing a leasing policy:

1. Businesslike management of State property

The State holds property in trust for the people of the State and has a duty to manage it prudently for their maximum benefit. This means several things but one is certainly money. The State is a landlord. It wants to secure maximum income. It does not do this by fostering maximal use of resources but optimal use -- that is, it encourages lessees to maximize the bottom line, recognizing that income is net of costs. "Maximum income" is still ambiguous, however, because rival schedules of land use and income differ in their time-distribution: a fast start means a slow finish and vice versa. To resolve this ambiguity we deduct interest on capital between the dates capital is committed and later recovered.

This goes far towards resolving ambiguities but still leaves a large one, the treatment of the investment in withholding unproduced reserves from year to year. The final resolution is achieved by maximizing the Net Present Value of future cash flows. This procedure is also called maximizing wealth; and also called maximizing Discounted Cash Flow (DCF).[1] This report uses the last, which seems to be in common

---

[1] There are references in Alaska reports to maximizing the "DCF rate of return." This usage seems ambiguous since the rate of return is held fixed at a rate determined by outside markets when one discounts the cash flow. It is the present value of the cash flow that one maximizes. It is mathematically quite possible and simple to hold the present value fixed and maximize the rate of return instead, using the same mathematical formulae, but treating the interest rate as the unknown to be maximized rather than as a "given." Sometimes this is done when one is out of contact with outside capital markets but there is no need for it here; and it would not affect the findings anyway because, as a rule, maximizing the internal rate of return as it is called will not lead to strikingly different results from maximizing the Discounted Cash Flow, so long as one makes no mistakes in mathematics.

use in Alaska. Businesslike management means adopting the criterion of maximizing DCF.

Maximum DCF is not to be applied rigidly or dogmatically or narrowly as a standard. It does not always comprehend all relevant values and factors. It does, however, comprehend a great many more than critics of the "almighty buck" might realize because it is the net balance arrived at after a long process of adding and balancing all manner of pluses and minuses. In addition, it provides a logical analytical framework within which newly recognized goods and bads may be added to the analysis in carefully measured perspective. One of these, on the minus side, is environmental damage. Some environmental damages are measurable in reduced cash flow. Damage to commercial fisheries is an example. Others are indirectly measurable in the marketplace. For example, the loss of residential and recreational amenities on privately owned land which reduces their service flow is measured in reduced selling prices of titles to the real estate.

Damage to sports fishing reduces an amenity service-flow which is harder to measure than cash flow but no less important on that account. Economists are developing techniques for measuring such service-flows. These techniques are still imperfect, like the rest of this world, but they at least let us set an upper and lower bound on the values and so let us begin to measure them in the same balance with other things.

On the plus side, increased payrolls and commercial sales deriving from oil and gas income will increase residential and

commercial values in some areas. Part of this increase is a "secondary benefit" from oil and gas development and should also be entered into the balance. This obviously gets complicated and extended. It is beyond the scope of this Report to resolve all such issues. The present point is that the use of the crassly materialistic and narrow concept of Discounted Cash Flow does not in any way box us in and preclude us from broadening the scope of the analysis when we have the will and resources to do so. It provides a framework of analysis which is almost indefinitely extensible to comprehend as many variables as we have the ambition to try to consider.

The concept of "discounting the future" disturbs many people but it is only the choice of words which is unfortunate. Discounting does not imply neglecting, abusing or short-changing the future but, rather, charting the most advantageous path into the future. The mechanism discounts poorer paths to the future because there are better ones -- "better" meaning a higher rate of increase of wealth. It is not prodigal to decline a 3 percent path in preference to a 10 percent path.

It is often suspected that discounting the future leads us always in the direction of faster resource use. Not so. We will see that this criterion may well lead the State to retard lease sales and production, so long as the anticipated proceeds to the State are growing faster than money in the bank. On marginal and submarginal lands these net proceeds begin growing from a base near zero. From such a low base they need not grow much in order to grow faster than money in the bank.

Discounting the future requires a discount rate. The State's rate need be no higher than its borrowing rate but it can be a good deal lower when Alaska has surplus funds to invest. There is no suggestion here that the "social" rate of discount is lower than the market, a concept wanting in both precision and rationale. It is, rather, a practical question. If the State cannot invest its surplus for high returns then an investment in the growing value of oil and gas in the ground may be a superior alternative.

Maximizing DCF as a criterion solves two problems for us, problems of timing. One is the optimal rate of production from proven reserves. These timing decisions are largely in the hands of lessees except to the extent that the State interferes with their natural desire to maximize DCF by controlling the rate of production. An equally or more important timing decision is when to begin production. Here the State is in the saddle with its decision of when to sell leases. The DCF criterion says that we should sell leases at that time when we expect that their future value will be growing more slowly than money in the bank. This rationale has been developed in the consultant's previous work, "Extractive Resources and Taxation." The relevant pages are attached as Appendix A.

The State's concern with money is not narrowly centered on lease-hold income but includes tax revenues of course. On the minus side, there will be associated public costs with increased economic activity. An exclusive or unbalanced attention to either the revenues or the costs without the other will always be misleading. It is the

net balance of advantage that we seek to maximize. This should provide a reasonable basis for compromise between the advocates of growth on the one hand and restraint on the other.

While leasing policy should help to protect State revenues, the State has minimal interests in protecting federal revenues from oil and gas. Since the federal rate is much higher than the State rate, especially after the Multistate Tax Compact (MTC) sharing formula is applied, leasing policy may often achieve a net increase of State revenues by being bent to consider the foibles of federal tax law applied to oil and gas, a law which the State follows. Much as we may deplore the peculiar federal tax treatment of income from oil and gas, there seems little reason for the State in its capacity as a landlord to conduct its affairs so as to maximize federal taxation of lessees where that would cut into State revenues from its property.

2. Equity

There is a strong feeling that the distribution of benefits from oil and gas production in Alaska should be equitable. Equitable does not mean equal although there is some suggestion of that in it and it might be more equal than now. There is support for the productivity theory of distribution, however. This means that rewards should be shared in relation to productive contributions rather than other factors like luck of the draw and the weight of superior wealth accumulated in the past.

Tolerance of gambling and the lottery principle has not altogether died. There are residuals of it in the lottery system for allocating noncompetitive leases which are filed on "simultaneously," that is, within one 30-day period, and of course there are lottery elements in the bonus-bidding system. There is a growing interest, however, in shifting from Lady Luck to productivity as a basis for distributing wealth. This is a corollary of a desire for greater equality since productivity is usually more equally distributed than luck, and certainly moreso than accumulated wealth. The Alaska attitude is Jeffersonian: "...there is a natural aristocracy among men. The grounds of this are virtue and talent....There is also an artificial aristocracy, founded on wealth and birth, without either virtue or talent....The natural aristocracy I consider the most precious gift of nature, for the instruction, the trust, and the government of society."

The implication of this is that we should seek to identify and measure that value which belongs to the State, that is the rent of

land, and then collect it. At the same time we leave to lessees all the other values, the ones which they create. Jefferson continued, "What is needed is a wise and frugal government, which shall restrain men from injuring one another, which shall leave them otherwise free to regulate their own pursuits of industry and improvement, and shall not take from the mouth of labor the bread it has earned."

As a happy corollary, if we succeed in this we will protect necessary incentives to the industry and other lessees. A skillful system of discriminating rent collection will leave more incentive to lessees than a blunt instrument such as a royalty accomplishes. A rent-collecting device will take more from the flush deposits in their flush years and less or none from the marginal deposits, leaving incentives unimpaired.

Collecting rent will, to be sure, reduce certain kinds of incentives but these are ones that should be reduced in the interests of efficiency. Resource economists have repeatedly observed that the failure of landlords to collect rent results in overstimulation of resource use by interlopers, resulting in the dissipation of rent, as on the open sea fishery, or an open range. In such a case, reducing incentives is a good thing. It is not enough for incentives to be large; they should motivate people to allocate resources productively.

The prevailing concept of equity also implies that rewards should be related to ability and application more than to the weight of accumulated wealth. In practice this amounts to a suspicion that the present bonus-bidding system with its high requirements for money up

front is filtering out large numbers of potential lessees whose productivity might be high but whose accumulated wealth is low.

A corollary concept here is that reducing the bonus money screen would increase the number of competitive bidders. This, if properly handled, should allow the State to increase its revenues.

3. Practicality

Alaska has traditionally operated with a minimal bureaucracy. While it is increasingly recognized that some additional staff may be very productive, beginning from this low base, there is a presumption against any proposed system that presupposes a large and elaborate and expensive bureaucracy. It is also desirable that there be a low burden of compliance in the form of paper work imposed on lessees and that minimum policing be entailed.

Alaskans have traditionally left considerable latitude of judgment to their higher public officials as well as to technical specialists like reservoir engineers. There is a growing interest in stating objective criteria for these persons to follow, minimizing the burden of judgment and making it easier to evaluate the performance of individuals.

A practical system will be as automatic as possible, minimizing direct regulations and controls which are required when people have to be forced to go against what they perceive to be their economic interests. This is accomplished by drawing leases so as to bind the contracting parties in an identity of interests. The lease should make

the interests of the lessee as nearly as possible identical with those of the State, so he is moved to act in the State's interest by economic incentives rather than orders controlling his rate of production, work commitments, spacing, diligence, and so on.

A very simple system like a royalty system without other features might seem to avoid many problems, but in fact has the shortcoming of involving the lessor in extensive direct regulation in order to offset the disincentive effects of the high royalty rate. A profit share system, allowing for extensive deduction of costs by the lessee, precludes such direct regulations but on the other hand requires extensive audit of expenditures. A rental which is proportional to the appraised value of reserves like the Alaska Reserves Tax avoids the foregoing sets of problems but requires personnel with the ability to place a value on reserves. It is hardly possible to avoid demands for additional personnel under any system designed to protect the interests of the State. It will be a question of determining which system is least costly and most effective to administer.

4. Avoiding economic waste

There is a new and explicit concern with avoiding "economic waste." This is quite a change from and quite an improvement over the prevailing concepts which are limited to preventing "physical waste." The State presently legislates against various kinds of physical waste, for example against flaring and venting gas; against producing from "rate sensitive" reservoirs too fast to maximize "ultimate recovery." In this legislation waste is perceived only in concrete, materialistic terms.

Any subsidy to the industry tends to prevent the "physical waste" of not producing submarginal oil and gas. The State has extended a few such subsidies such as a tax holiday to a pipeline in Cook Inlet. Nonuniformity in taxation is a sort of subsidy to those taxed less, and the term "tax subsidy" is commonly applied to it nowadays. Federal income tax law traditionally extends enormous tax subsidies to the oil and gas industry through preferential treatment. The State has followed along by adopting the federal tax law and in addition has joined the Multistate Tax Compact (MTC) whose allocation formulas minimize State tax revenues from oil and gas. The attitude might perhaps by summed up as "as much as possible, as early as possible."

Producing subeconomic reserves entails not only the economic waste of the excess of costs over revenues, there is also the waste of selling the reserves when they are cheap, instead of later when they probably will have become dear. Our initial criterion of maximizing Discounted Cash Flow (DCF) would tell us to hang on to reserves as long as their value was growing faster than money in the bank.

Past policy in administration has been disposed to take an "infant industry" posture towards oil and gas. Raising money or maximizing State wealth has been secondary to attracting activity and capital. Lease sales have occurred at the initiative of industry nominations more than the State's, with the State not much disposed to hold back for the best price. Encouraging and establishing the industry was ipso facto a good thing.

A policy of leasing on demand will undoubtedly stimulate early exploration which will result in locating deposits that might otherwise not be produced, at least for a while. This might be construed as minimizing physical waste -- the waste of not finding something. There has been little concern about the economic waste inherent in premature and duplicative preleasing exploratory investments. In an earlier phase this was carried to even greater extremes when noncompetitive leases were issued. But leasing on demand at the rather low prices that have been received is only a halfway step between noncompetitive leasing of the free entry, first-come first-served, variety and an economical system which would maximize the discounted cash flow of the State.

As to duplication of effort, this is generally rationalized on the grounds that a second explorer might use a different concept from the first and therefore find something overlooked by the first. That is beautiful so long as cost is no object, but it is really no substitute for a benefit cost analysis that would at least purport to tell us how the cost of a second pass at the shot lines relates to its probability of success.

In regulating field production the concept of maximum efficient rate (MER) has been accepted rather uncritically with the thought that itmust be good to maximize ultimate recovery. MER has been accepted not for what might be the legitimate reason that prices are rising or the partly legitimate reason that it requires fewer wells and that saves capital, but rather almost entirely on the grounds that faster flow might cause physical waste. In this case the goal "as early as possible" clashes with the goal "as much as possible" and the latter wins.

The net result of overstimulating preleasing investigation, and decelerating production, is to attract lots of capital into the industry and slow down the rate of recovery. Capital requires to be paid for every year that it is tied up without being recovered. This payment necessarily detracts from the surplus that remains to be captured by the State. This is a kind of economic waste which I believe the State would like to learn to avoid. It dissipates rent.

The traditional conservationist feeling in favor of wide spacing developed at a time when the land surface was subdivided into small private properties, smaller than most oil-bearing structures, so that some offset was needed. The result today is rather one-sided preaching for the benefits of wide spacing without due note of its costs. Such preaching, which is widespread in the literature of this business, also suggests more solicitude for lessees than lessors because the interest of lessors is generally to have lessees apply more capital rather than less, where royalty is being charged. This bias is understandable in an industry where lessees have traditionally dominated lessors by virtue of being larger and fewer; and lessees' agents have written the books.

Where there is a high royalty rate the lessor's interest is to see prompt in-filling at high density. The lessee, on the other hand, might prefer to invest capital by stepping out to someone else's land while dawdling on this.

There is a growing awareness in the State that exclusive preoccupation with physical waste is a one-track goal which lacks adequate

balancing of benefits against the costs of achieving them. There should be an equal awareness that the problem of one-track goals is not peculiar to oil and gas. Specialists in any resource or activity become interested parties and tend to overvalue it and undervalue the costs of promoting it -- since costs represent a sacrifice of the interests of specialists in other resources and activities. This is a universal problem in an over-specialized world.

Legislators are called on to be generalists, arbitrating among the claims of competing specialists. There is no suggestion here that oil and gas interests are better at this game than other specialists, that their technical inside language is more obscure or intimidating than that used in other professions, or that their high "standards" are more unreasonable than those imposed by other groups of whom we could all supply examples. Focusing on "physical waste" is an overpleading technique not peculiar to the oil and gas industry. We bear down on oil and gas here because it is our subject matter and not because it is outstandingly bad. No industry or profession has any monopoly on self-serving, special pleading, and careerism.

Economic waste occurs whenever we prevent physical waste at a cost higher than the value of the oil saved. This would be simple enough to see and correct if all costs were present costs and all production flows occurred right away. The problem is more subtle because it usually involves the factor of time and therefore questions of capital and compound interest. Some major economic wastes of timing are described in what follows. Please note that I speak not only of what has been and

what is but also of what might be if we adopt certain alternative leasing policies that have been proposed.

a. Slow use of proven reserves

Slow production occurs if the State requires it through MER regulation or if it simply fails to build a fire under lessees whose cost of waiting is virtually nil when there is no substantial delay rental, and who might be "stepping out" with other leases which preoccupy them from attending to this one. Not maximizing DCF means ignoring the cost of interest -- first, the cost of drilling wells and equipping the lease and, second, the holding cost of the unproduced reserves. To schedule production this way is the same as assuming that no profit is required on investments, an assumption inconsistent with the idea usually accepted that some very high rate of return is required in order to interest lessees in taking a lease. This paradox is too often resolved by sloughing the cost onto the State in the form of lower bids for leases, from which lower base the lessee can still earn a good rate of return. This clearly is a bad resolution for the State.

The MER standard developed historically as a reaction to the rule of capture and has had at times a useful history therefore, leanding some aura of engineering "authority" to restrictions on production. But it became abused and harnessed to the purpose of helping rationalize price maintenance restrictions; and then it became habitual and traditional, applied in a rote way. It is not appropriate to Alaska today. It can easily become another case of a fixed professional "standard" applied without regard to circumstance or cost, forgetting

that "cost" means more than money. It means an invasion of the standards of other professions and other people who have to make the economic sacrifice.

b. Premature investment

We noted above how a noncompetitive claim-staking system based on priority of claim leads to premature and duplicative investment; and that a system of leasing upon industry demand or nomination halfway resembles a simple claim-staking system. The result is to sink too much capital too soon in the initial phases of exploration, proving up, social infrastructure, equipping leases, mobilizing support facilities, and so on. Money at 10 percent doubles every seven years. Money at 20 percent doubles every four years. To advance investment by a few years, therefore, is the same as doubling the costs.

But as well as neglecting cost-- and often more serious -- premature investment neglects price, the price of the product reflected in the price of the lease. The lessees who buy early aren't neglecting it for they can ride up the escalator, having obtained a lease and being under little pressure to produce quickly. It is the State that is neglecting price when it sells leases too soon at too low a figure. It then plays the lessees' game if it permits or, worse, requires them to produce slowly and at the same time encourages them to go out and acquire more leases.

There should be no implication that the State should hold onto its unsold leases indefinitely, waiting for the top dollar. To everything there is a season and a time for every purpose. The criterion

of maximizing DCF is in keeping with the wisdom of Ecclesiastes for it tells us exactly the best time to sell, namely when the anticipated selling proceeds stop growing faster than money in the bank. Early sale may waste the resource by releasing it for a low price. Later sale may conserve the resource but waste the capital tied up in it. Optimal timing balances the two considerations.

Some things are happening too soon and others are happening too late. Is this just random confusion with no pattern? No, there is a pattern which may be summarized as slow recovery of capital. Capital is put in too soon and taken out too late. The cost of all those extra dollar years of capital time is borne by the State.

A waste imposed by slow turnover is loss of flexibility and adaptability. Each time capital is recovered and replaced it may be brought up to date with new technological developments. The advantage of flexibility is perhaps most obvious in respect to contractual commitments. "Old" gas may be subject to Federal Power Commission (FPC) regulation and tied to a particular pipeline, or it may in any event be under a long-term contract. In an inflationary period there is always an advantage of bringing new supplies on the market at new prices.

There are also more fundamental reasons not dependent on inflation. I have analyzed these in the work already cited and append the relevant pages as Appendix B.

Another route to understating costs is to accept the plea of those with an interest in supplying oil fields that one man's cost is another man's income and therefore to cancel these out. The result of

heeding these arguments is to conceive of benefits in gross rather than net terms. This almost always results in premature development inasmuch as the gross value of a resource is not only greater than the net value but it is positive during that early period when the net value is negative. This kind of argument can be carried even farther by some "economic base" analysts who compute "multipliers" of still more extended benefits proliferating downstream and upstream and sidestream from the resource development, all being dependent on it. If there is much unemployed labor and idle industrial capacity such a case might sometimes be made. In Alaska, which imports labor and oil field materials and steel, there seems little basis for it.

Unfortunately, economic development which is sought after by some and shunned by others is defined by none. This leaves the door open to considerable uncertainty. The extreme prodevelopment posture is that resource discovery creates value and then provides an economic base for mutiple benefits all around. Current thinking seems to be moving away from this. Discovery does not create value all alone. It is a cash-register payoff from the larger development of infrastructure, community support facilities, and so on. All activities are mutually supportive, discovery no more so than others, and the other contributors need support, too. The new emphasis on the problems of community impact is some acknowledgement of this.

It is not surprising that people who see mainly the costs of development and disregard the benefits are disposed to wait a longer time before permitting it to take place. They, too, may get carried

away and overstate their position, becoming like Oscar Wilde's crabbed economist who "knew the cost of everything and the value of nothing." In this Report we will not try to resolve these complex and extended issues, but treat the question of multipliers and extended benefits and costs as something of a standoff, except where very specific external costs or benefits may be identified and measured.

Another economic waste to guard against is "cross-subsidy." This is a generic term for what occurs whenever accounts are consolidated and costs are deductible so that high-cost and losing ventures may be rolled in with low-cost and winning ventures. Cross-subsidy is a hazard in every profit-sharing scheme such as the corporate income tax, and it would be a hazard in any profit-sharing lease resembling the corporate income tax. It is a hazard in any lease that resembles utility rate regulation where a lessee is guaranteed a rate of return. The resulting overinvestment of capital is known in the trade as "goldplating," or more formally as the "Averch-Johnson effect."

Goldplating today might often take the seductive form of an excessive lack of resistence to the claims of some worthy cause like environmentalism. The caribou lobby specialists may overvalue that, the energy specialists may overvalue energy but they can join forces in undervaluing the costs of having both, the costs being shifted to others.

Perhaps the commonest manifestation of cross-subsidy is the overextension of subeconomic feeder lines. This is nearly universal elsewhere and will undoubtedly happen here without vigorous efforts to prevent it.

When we combine this pattern of waste with the pattern of improper timing described earlier, they tend to reinforce each other in a general pattern of overdecentralization. Too much capital is applied too early to expand exploration and allied transportation lines. Too little is applied and too late to more intensive development in and around proven reserves. The overall pattern has much in common with imperialism. All of this can be avoided by hewing faithfully to the concept of businesslike management with maximum DCF. That will be our lodestar.

5. External impacts

To allow for the externalities of oil and gas production both positive and negative the State seems evenly divided between those who perceive more pluses than those who perceive more minuses.[7] This is appropriate since there are both kinds. The issue between the polarized parties is sharper, however, than can be resolved by such devices as measuring the value of the sports fishery, for example, and trading off these values for equivalent energy values because some of the very things seen as positive by some like added payrolls, added spending, and increased property values seem negative to others. Change viewed as progress by some is seen as retrogression by others. To measure and then reconcile these attitudes would be far beyond our scope.

We need not, however, leave the matter completely unresolved. A key to reconciliation is in the distribution of gains and losses. There are probably more gains than losses from general economic development since the actors reinforce one another, but the gains are not equally distributed. One man's windfall is another man's wipeout. Many gains are

unearned and received by absentee investors. As the problem is distributive so is the probable solution. Wide distribution of the benefits of oil and gas development will make it much more acceptable. Leasing policy can contribute to this solution, although it is by no means the whole story.

Another external cost imposed on society by extractive industries is frequently instability, and many people fear the boom and bust characteristics of oil and gas and other mining industries. This consideration argues for leases that yield steady revenues and encourage steady activity and it also may argue for a steady flow of lease sales. Neither of these is an absolute, obviously, and must be balanced against the question of getting top dollar by turning production and sales on and off.

6. Coordination with leasing on federal and native lands

Federal and native lands will share common transportation lines and support bases with State lands. They may be on the same structures. State and federal lands especially have extraordinarily long common boundaries in oil-prone areas. The State evinces strong desires not to be led by federal policy and to have some input into federal policy. At the same time, there is no drainage treaty or compact between the different landowners even though England and Norway have managed to work this out on an international basis. Until this is done, clearly a strike near the boundary will force a drainage sale on the other side. If the Feds and the natives get and keep ahead of the State, the State

might do very well by specializing in drainage sales, a policy favored by many. But there is an uncomfortable feeling that this loss of initiative might also impose high costs by letting others determine the location of activity as well as the timing. There is also some fear that division among the three kinds of landlords might divide them for easier conquest by the industry. The State's objective therefore is clearly to achieve a higher degree of cooperation.

C. Elements of Leasing

There are several elements in a lease, most of which are optional and variable along a wide spectrum. Kinds of leases are frequently distinguished by identifying the bid variable; but the constant elements may be more important than the bid variable where they are set at very high rates. Thus we discuss the pros and cons of each element in leasing first, and only at the end discuss the choice of a bid variable.

1. Prior claim: the noncompetitive system

A substantial acreage in Alaska remains under noncompetitive lease. Figures forwarded by Mr. Denton of the DNR for noncompetitive acreage of "oil companies" totaled to 625,000 acres. In addition there is acreage held by individuals. Ranking the companies in order of their net acreage held, we find that the top 10 percent hold 58.9 percent of the noncompetitive net acreage. This compares with 64 percent when we do the same thing for competitive net acreage. Major holders of noncompetitive acreage are Texaco, Union, Cities' Service, Amoco, and Atlantic Richfield. (Major holders of competitive acreage are the same firms plus Sohio, Phillips, BP Alaska, Exxon, Standard of California, and Mobil.) (See Appendix C.)

Noncompetitive systems are widespread outside the United States. Major faults appear to be that they give away State property without payment, and so encourage premature claims and, where there is a work requirement, premature use. The claim-staker rather than the State gets in on the ground floor of the elevator and holds the resource while it appreciates from a zero value up to whatever value its natural richness

warrants. Any rate of return beginning from a base equal to 0 is mathematically infinitely high and therefore not to be lightly given away.

We append an analysis by Professor Michael Crommelin, Faculty of Law, University of Melbourne, Australia (Appendix D).

2. The bonus

There are several advantages to using a high bonus in allocating leases and it has many staunch advocates, including Walter Mead and Milton Lipton. Advantages of a high bonus include:

a. Large commitment by the lessee -- he will not walk away.

b. There is no marginal disincentive imposed on the lessee.

c. The State receives its money up front.

d. Major corporations have access to market funds at rock bottom interest rates, about 7.5 percent on bonds today, and therefore presumably will discount future expectations at correspondingly low rates. Some of them have access to internal funds whose opportunity cost or alternative use may be even lower in the event the management is embarrassed with more assets than it can manage effectively. Some utilities, in seeking to support their rate bases, have advanced money to invest in leases. This last kind of investment is being cross-subsidized by the profit-making parts of the firm and may yield extremely low marginal rates to the company. Historical evidence presented by Mead from the Gulf of Mexico indicates rates of return of about 7.5 percent.

e. If the State should be exploited inadvertently it can use the tax mechanism later on to compensate.

f. The transfer is complete and there is no need for policing prices later on, auditing costs and so on.

On the con side, major problems with high bonus payments are the following:

a. High capital barrier to entry, reducing the number of bidders. This is undesirable both because of the concentration of wealth and power which it implies but also because reduced competition might prevent the State's receiving fair value. Data supplied by Mr. Denton when ranked by net acreage indicate that the top 10 percent of the holders of competitive net acreage have 64 percent of the acreage. These top 10 percent consist of Arco, Phillips, Union, SoCal, Exxon, Sohio, Mobil, and Cities' Service. While this degree of concentrated control is not unusual in other places and other industries it is still higher than many would consider socially desirable.

b. As low as the industry's internal cost of capital may be, the State's effective rate is probably lower. This is a considerable change from the past and calls for a change in policy. The State is no longer desperate for front money but on the contrary is looking for outlets for its permanent fund. The industry, on the other hand, may be entering an era of higher internal interest rates. It is freely alleged that figures like 20 percent are used in determining bonus bids although this is difficult to nail down. It is certain, however, that monumental capital requirements are projected for oil and gas related investment requirements in the next decade, presaging increasing tightness of capital and therefore lower bonus bids relative to resource values.

c. The bonus aggravates the cash crunch since it is synchronized with the need to find capital for drilling and equipping. This may result in underallocation of money to the latter, especially for small firms.

d. The time preference and therefore the production scheduling of different firms is ruled by their internal interest rates which vary from one firm to another. The allocation of credit among companies is based not on marginal productivity but on collateral security. The result is too much time pressure on some lessees and too little on others. The one may depend on extremely rapid use while the other may depend on speculation and delay above and beyond the social interests.

e. The payment is determined and made before enough is known about actual reserves. There is a large lottery element in the outcome and the outcome is not closely correlated with the price paid. The State might sell $10 billion worth of oil for $6 million as it apparently did at the 1965 auction at Prudhoe Bay. At the same time it sells some barren land for a high price. The rule of caveat emptor is applied, frequently intentionally by the seller. This constitutes a fraud with malice aforethought, which would not be tolerated in private business dealings and it is questionable if the State should observe a lower level of elementary morality than is expected of private sellers.

f. The distribution of petroleum reserves in nature is extremely unequal as among different deposits and tracts. The result is extreme inequality in the distribution of gains to wealth when all the payments are made up front and the results of successful and unsuccessful gambles fall entirely on the lessee.

g. If, as is generally believed, most investors are risk-averse, then the lottery element in having a high bonus acts as an additional filter screening out possible entrants. This leads to higher concentration and less active competition in the bidding for State property. Also, to the extent that accumulated wealth and a positive attitude towards gambling are factors determining the high bidder, productivity and cost control are less determinant.

h. Use of bonus bidding lends itself to preemptive, preclusive buying by wealthier firms concerned with controlling the market and discouraging competitors.

i. Once a bonus is paid and then a discovery made it is hard and costly to deny production if the environmental damage turns out to be high relative to the value of production. We have just lucked out of one such trap; we might do worse another time.

j. Transfer or sale of lease for a high bonus is a de facto sale of land but without much property tax liability imposed on capital or land (notably excepting the special Alaskan reserves tax). The capital invested in drilling and equipping is partly exempt and the intangible capital developed from exploratory drilling is not taxed. The leasehold interest itself is not always taxed. While such tax relief should result in higher bonus bids, this exacerbates the problem of the front-end filter.

k. The front-end filter becomes even tighter when lease sales are large and there is no slide bidding and the usual 20 percent advance bonus is required.

1. If oil and gas prices are regulated, and of course they are vulnerable to this risk, a bonus paid in the past is not treated as a current cost and not rolled in, resulting in lower prices received, whereas certain kinds of subsequent participation demands by the State might be treated in the regulatory mechanism as costs. In distinguishing between old oil and new oil, regulation may also distinguish between old costs and new costs.

Our worst suspicions of bonus bidding are confirmed by the brilliant, succinct and damning analysis of Alaska's past experience researched and written by my associate, Professor Richard Norgaard of the School of Resource Economics, University of California, Berkeley (Appendix E). Bonuses captured only from 9 percent to 16 percent of the surplus DCF value above costs and royalties in Cook Inlet. There were too few bidders to assure effective competition. Outcomes were wildly unrelated to bonuses bid and paid. Bidders have successfully used advanced gaming strategies and statistical analyses to take advantage of a State without expert staff in these fields. The State has not set adequate reservation prices or screened out fishing bids and overnominations: only 2 percent of the offshore Cook Inlet tracts leased through 1968 have produced. Dr. Norgaard recommends drastic changes.

3. The delay rental

Delay rentals are the smallest of the three major payments in the usual bid, the other two being bonus and royalty. They have been by no means negligible, however, and in Alberta, for example, have run at 50 percent as much as royalties and bonuses at various times. In addition,

as compared with royalties they come earlier, and when we figure compound interest are blown up into an even larger figure.

Delay rentals are usually an annual yearly payment that ceases when production and royalties begin but there is room for many variations. They might continue until production ends, for one. For another, they need not be at a fixed level but might increase in proportion to some index such as cost of living or they might be made proportional to the assessed value of reserves, giving them the character of a property tax on reserves. Another possibility is to pay the bonus on the installment plan over several years. Yet another possibility is the production bonus, a contingent payment which is due only when and if commercial pay-rock is struck. This has some of the character of a bonus and some of the character of a rental and will be treated here.

The advantages of delay rentals and other rentals are the following:

a. Payment is deferred. This has the same effect as extending credit to payers of bonuses and letting them pay on the installment plan. This is of greater advantage to the leaner interloping firms and tends to increase competition.

b. The payment is fixed with respect to production and places no drag on it therefore. Thus it achieves two goals at once that the State is seeking. It shifts payments into the future and it does so without disincentive effect. If anything, it applies positive leverage to accelerate production.

c. At present when the firms need more time they simply request that leases be extended and the request is frequently granted. This involves arbitrary exercise of judgment by officials. It would be better for lessees to pay so much a year and make their own decisions. The pressure would be on them, of course, to accelerate production once the lease was signed. Firms would be less anxious to nominate acreage and insist on lease sales many years in advance of the availability of transportation.

d. Alaska has millions of acres out under lease. It could all be returning more money each year or else be relinquished for future sale at a more propitious time. Alaska is getting $1.00 per acre year for these lands. OCS lands are yielding $3.00 per acre year in practice and go higher on drainage and development tracts. Norwegian rentals go up to $21 per acre year.

e. Most capital is subject to property taxation and must therefore yield a return high enough to cover both interest and property taxes. The investment in withholding oil reserves from production, however, need only yield a competitive interest rate. A delay rental serves to compensate for the lack of property taxation so that the same discount rate is applied in both cases.

f. A rental is terminable in practice when a lease is dropped due to lack of interest. This reduces the risk imposed on the lessee considerably and should result in higher bids on the bid variable, whatever that might be.

c. At present when the firms need more time they simply request that leases be extended and the request is frequently granted. This involves arbitrary exercise of judgment by officials. It would be better for lessees to pay so much a year and make their own decisions. The pressure would be on them, of course, to accelerate production once the lease was signed. Firms would be less anxious to nominate acreage and insist on lease sales many years in advance of the availability of transportation.

d. Alaska has millions of acres out under lease. It could all be returning more money each year or else be relinquished for future sale at a more propitious time. Alaska is getting $1.00 per acre year for these lands. OCS lands are yielding $3.00 per acre year in practice and go higher on drainage and development tracts. Norwegian rentals go up to $21 per acre year.

e. Most capital is subject to property taxation and must therefore yield a return high enough to cover both interest and property taxes. The investment in withholding oil reserves from production, however, need only yield a competitive interest rate. A delay rental serves to compensate for the lack of property taxation so that the same discount rate is applied in both cases.

f. A rental is terminable in practice when a lease is dropped due to lack of interest. This reduces the risk imposed on the lessee considerably and should result in higher bids on the bid variable, whatever that might be.

g. A delay rental is smoothly convertible to an ad valorem base at such time as enough is known about the reservoir and its contents to allow reasonably accurate assessment. Thus, instead of being a fixed amount per year it would be a fixed percentage of the assessed value of the reserves, still retaining its key qualities of shifting payments into the future and not varying as a function of production.

On the negative side are the following considerations:

a. Early shutdown. This traditional argument against fixed charges would apply only to one of the several alternative forms of rental, the nonterminable level payment. It can be prevented by adopting one of the declining forms. Professor Rooney's studies (Appendix F) indicate that the problem of early shutdown is not a serious one in general unless there is a substantial bias against investments in pressure maintenance. A constant rental contains no such bias. An ad valorem rental based on the value of as yet unproduced minerals would exempt the value of capital in place and therefore leave the lessee with a substantial investment even at such time as the rental charge approached zero.

b. Rentals are traditionally lowest of the three kinds of lease payments. This suggests that the industry doesn't like them and would not accept them readily. While this point is often made, this consultant discounts it because of other evidence, presented later (Section 7c).

c. Some federal tax provisions favor delayed production, advantages which might be lost by any lease provision which promotes early production.

d. A lessee might promise to pay a high rental and then walk away from the lease in a short number of years if it proves to be unproductive. Some would consider this to be a disadvantage of the system although it is included among the positive aspects as well.

e. The rental is normally fixed ex ante. It therefore has the same lottery qualities as a bonus.

The pros and cons discussed above indicate there are alternative forms of rental, which are listed here:

a. One might pay the bonus on the installment plan over a specified number of years at a specified rate of interest.

b. The traditional "delay rental" terminates when production begins and royalties are paid. It is usually at some fixed level per acre independent of value, although BLM policy permits figures of $3.00, $5.00 and $10.00 per acre, depending on the class of acreage.

c. A rental might increase yearly at a fixed or an accelerating rate during the preproduction period in order to emphasize the landlord's intent to force action.

d. A rent might be level for the term of lease. This is the pattern that must be faulted for forcing early shutdown.

e. A rental might be a specified percentage of the bonus bid, for a fixed number of years. If the percentage were rather high, say 20 or 30 percent, the effect would be nearly the same as option (a.), that is paying the bonus on the installment plan, but with a substantial down payment. If the rate were 100 percent you would have exactly the same effect as an installment plan payment.

f. The rental might be a specified percentage of the appraised value of the unproduced minerals in the ground. This is an ad valorem charge (AVC). It closely resembles the ad valorem property tax in its impact and administration. Administrative aspects of this form of levy, mainly the technique of assessing minerals in the ground, have been ably discussed before this body by Robert Paschall. Basic principles of the application of such a charge are laid out in Appendix H with a numerical example showing how one would use the data in the Van Poollen report on the Sadlerochit Formation to levy the charge, and how it would diminish over time.

The ad valorem charge differs sharply from those discussed previously in that it is based on progressive disclosures of the value of minerals actually present while the others are based, like bonus bids, on ex ante surmising about what might be there. The ad valorem charge (AVC) is ex post discovery, while the other forms of rental are ex ante.

Thus AVC has some of the good and some of the bad qualities of a royalty. Like a royalty, it is based on what is actually in the ground rather than an uninformed guess as to what might be there, and is a function of actual outcomes. It therefore prevents many of the distributive inequities which flaw the system of high bonuses.

On the negative side, again like a royalty, it has some disincentive effect on discovery since discovery and proving of reserves result in higher assessments. The effect is much weaker here than with a royalty, however, because the ad valorem charge is based only on the value of the resource in situ whereas the royalty is also, in effect, a

charge on all the costs of extracting the deposit as well. In the extreme, on a marginal deposit the ad valorem charge will be zero whereas a royalty, could it be collected, would be substantial. Similarly, at the end of life the ad valorem charge falls to zero while royalties continue with a fixed rate.

The two more substantial weaknesses of the ad valorem charge appear to be, first, there is some question about whether assessments can be tolerably accurate in practice, and second, there is some disincentive effect on exploratory drilling. These weaknesses may be substantially overcome by a combined system which would work as follows: There would be two stages in the life of a lease, before and after the discovery of commercial petroleum. Before discovery, the rental would be a specified percentage of the bonus bid (as in paragraph (e.) above). Following discovery, the same percentage would be applied to the assessed value of the discovered reserves. It would progressively rise as more reserves were proven and decline as they were exhausted (see Appendix H).

The presence of several lessees on any one structure would probably prevent substantial concealment of reserves. However, if experience suggested such concealment to be a problem, it might be offset by programs of compulsory disclosure, State participation in drilling, penalties for concealment, and so on. Professor Norgaard (Appendix E) and Professor Rooney (Appendix F) both suggest schemes for State exploration.

g. Lease terms might be quite short, say five years, with rents "renegotiable" at that time. Such "renegotiation" would be rather

unilateral with the State holding the upper hand and would seem to impose unreasonable risks on lessees. Unilateral renegotiation of terms is actually practiced in many countries around the world in the wake of multiplying petroleum prices which made the original lease terms seem egregiously favorable to the lessees. Even American law occasionally permits change of contracts in the face of gross unforeseeable, external change of conditions. In general, however, this seems an unsystematic and arbitrary approach and less desirable than AVC which, although it might be criticized for some arbitrariness in the assessment process, is subject to objective administration and evaluation of performance.

4. The royalty

Production-based royalties are traditionally a large element in mineral leases. The most frequently heard proposal for reducing high front-end bonuses today is to increase royalty rates either directly or through making them the bid variable. The advantages of high royalties would be the following:

a. Payment is deferred. This eases entry for leaner firms and conserves front money for actual drilling and equipping leases. It increases competition and aids small business.

b. Major payments are contingent on the lessee's finding commercial petroleum and are in proportion to the volume, although not the value of what he finds. This reduces the risk element in lease bidding. It also reduces the premium now placed on prior knowledge of what is there and reduces the advantage of firms that can afford extensive early investment in preleasing surveys.

c. It removes the possibility of the lessee's paying a high price for something that is not present and removes the probability of windfalls when more is present than the market expected.

d. The State now has a lower discount rate than many potential bidders and can better afford to participate in future income at the expense of immediate cash. This must be tempered with the thought that the median voter is poorer than the median corporate shareholder and has a higher time preference. On the other hand, the State is free from federal income tax so that a given percentage return on investment is more attractive to the State than it is to a taxable private body. If it were just a matter of avoiding State taxes this advantage would be spurious, but if the State can successfully avoid federal taxes where private lessees cannot there appears to be a net advantage from the State's own viewpoint. Countering this is the observation that some large energy corporations have succeeded in lowering their effective federal income tax rates to a low percentage of profit, but the answer to that is that it is not an objective of the State to encourage a small number of large firms but to maximize the number of potential entrants into the field, including those too small to take full advantage of tax loopholes.

e. A royalty is the exact opposite of the depletion allowance. Oil and gas firms, in their eagerness to secure depletion allowances, will be willing to pay higher royalties than otherwise, a relationship which might be exploited to benefit the State. However, this again runs counter to the desire to benefit smaller firms inasmuch as the depletion

allowance is now limited to smaller wells and is programmed to shrink progressively over the next few years.

f. A properly attuned royalty might substitute for unitization of a common pool. It may also substitute for direct controls on well-spacing and rates of flow.

In spite of its attractive features, the royalty has a long list of problems.

a. There is no commitment by the lessee. He may tie up land at little cost by merely promising to pay high future royalties and wait for a free ride on his neighbor. A successful bidder who overbids may abandon the lease, but there is no symmetry. The bidder who successfully underbids cashes in at the expense of the lessor, who cannot back out.

b. Marginal deposits are made submarginal and marginal effort on rich deposits is made submarginal. This applies to entire tracts, to the high-cost fringes of low-cost deposits, to the extra wells and capacity needed to give better control of timing, to equipping the lease, to work-overs, to the date of beginning production, to the stretch-out of the entire period of production, to the date of terminating production, to pressure maintenance and secondary recovery, to exploration for smaller and marginal deposits, and to production during high-cost seasons. Vastly more is involved here than the problem of early shutdown usually emphasized.

Royalties are not automatically passed on to consumers. Prices are determined by supply and demand in world markets. The burdens of the royalty system are borne primarily by the landowner in the form of lower net income.

c. A good deal of leakage of surplus cash flow is suffered by the landlord on the low-cost flush deposits, especially during their flush years when the surpluses are yielded. To be sure the prospect of winning these surpluses tends to raise bids all round but as noted, high royalties on low-value deposits are uncollectible whereas low royalties on low-cost deposits are irretrievable.

d. The lessee's incentive to defer production is exaggerated. There is a strong future shift. The mathematics of this are developed in Appendix J. The basic idea may be simply expressed: It costs more to produce faster, and royalties discourage incurring costs (because the resulting output is shared with the landlord but the costs are borne entirely by the lessee). In addition, there is an exaggerated motive to wait for higher prices. A royalty makes a marginal field or unit of production submarginal, but by waiting for higher prices the lessee can wait until it becomes somewhat better than marginal even after paying the royalty.

By the same token, if fluctuating prices are expected or experienced the lessee's motivation to turn production on and off at his convenience is exaggerated. The lessor's royalties are therefore afflicted by instability beyond what would be an optimal adjustment to changing markets. Instability also has negative external effects on impacted communities, of course.

It may be shown mathematically (see Appendix J) that the disincentive of a royalty operates with greatest force on investments that are incurred immediately before their effects are felt in increased

production. That is, it strikes hardest at workovers, at pressure maintenance, secondary recovery, and so on. Its effects are relatively less in relation to investments that occur well in advance of production such as exploration. The overall result of this pattern is a stretch-out of the commitment of unrecovered capital between first outlay and ultimate recovery. This pattern increases overall capital requirements which in turn works to the advantage of wealthier firms and helps to screen out the leaner firms. Thus the royalty system works to the disadvantage of the very firms that it is designed to help.

e. The deferral of revenues hurts the State, of course. The additional deferral caused by the future shift of production hurts even more. Deferral of State revenues is acceptable if it serves the function of encouraging more competitive firms; but deferral of revenues after discovery serves little or no such function. The lessee who discovers commercial pay-rock may cash out immediately in several ways. Companies regularly borrow or issue stock on the basis of discoveries. Not only does this take cash out of them, it does so without incurring any federal tax liability and is thus substantially subsidized by the workings of income tax law. Economists regard the nontaxation of unrealized capital gains to be a major source of bias in tax law. Unrealized gains are an unpreempted potential tax source. It is a good principle of State policy to go after unpreempted revenue sources, as noted earlier, and a royalty fails to do this. On the contrary, it widens the loophole.

f. The lessee may shortchange the lessor by understating the price of produced oil and gas. This has to be policed carefully at some expense.

g. Environmental damage from oil and gas production is more a function of the fact that some production is taking place than it is a variable function of the flow of volume in any year. The royalty-induced stretch-out therefore increases the total environmental damage.

h. There are many more little finds to be discovered than big ones, more poor ones than rich ones. The effect of royalties is to screen out the little ones. This greatly reduces the success ratio where success is defined as simply finding a commercial find that is producible. It screens out the little ones without succeeding in capturing all the rent on the big ones. It tends, therefore, to reduce sharply the number of viable firms since the expected success ratio is an important consideration, especially for the leaner firms which cannot afford a large number of failures. Once again it fails in one of its primary objectives, which is creating an economic environment more favorable to the leaner firms.

The discussion of pros and cons of royalties has centered on the simple concept of a high royalty rate. Some of the disadvantages may be overcome by the use of step royalties, sliding scale royalties, and using royalty as the bid variable which results in different rates on different deposits. Professor Rooney has outlined a workable step-royalty system (Appendix F). In our recommendations we include this among the workable alternatives.

There are many drawbacks, however. The problem with sliding scales is that they slide only with volume, and volume is only one of several factors that need to be considered. In addition, a scale which

is progressive with respect to volume worsens the tendency of royalties to shift production into the future, since the high rate brackets may be avoided by reducing production now and stretching it out. If the rate is progressive per well it may be avoided by drilling more wells.

If it is progressive per tract it also depends arbitrarily on the size of the tract. It causes future shift. And it has a built-in bias against the marginal fringes of superior tracts which may exist where the tract is fractured and complicated.

It takes no account of cost differences which are independent of the volume factor. Thus, a high-volume well in a difficult, remote location gets a high rate while a low-volume well in a convenient location without much depth gets a low rate. It is a blunt instrument.

It makes no distinction between high volume which is the result of natural pressure achieved at no cost, and high volume which is the result of costly pressure maintenance such as that now experienced in several Cook Inlet fields whose volume has been maintained over the years at some cost.

It might be possible to adjust for all these and other variable factors by an extensive and complex system of variable rates based on extended observation of particular circumstances. All this would accomplish is the same thing that might be accomplished generally and accurately by letting costs be deducted. Deducting costs, however, has its own problems, and this lets us avoid them.

One problem with royalties may be solved by the use of a State marketing board. That is the problem of price determination if it

appears that the lessees are fiddling the transfer prices which are used to determine the State's share. This is the approach taken by British Columbia in marketing its natural gas through a provincial marketing board. The royalty is taken as an excess profit of the marketing board. Unfortunately, this only solves one of the several problems of the royalty system. The British Columbia experience has been one of having progressively to raise the field price and reduce its profits in order to stimulate more exploration and production. The basic fault is that it fails to distinguish between the low-cost and the high-cost deposits.

A very useful adjustment in a royalty system is to let the rate increase as a function of an index of petroleum prices. This offsets part of the future shift problem since it removes the incentive to hold back waiting for higher prices. It fails to account for cost changes, however.

Another device similar to a royalty would be taxation levied on a major pipeline. There is a case against any taxation of pipelines, especially underutilized ones, because of their economies of scale.[1] The "six-tenths rule" implies that optimal rates would cover only 60 percent of costs. This implies the need for a subsidy, rather than a tax. I.C.C. regulation is not geared to accommodate this kind of thinking, so we can forget about the subsidy idea. There is also a special case for taxing, TAPS, to recoup the windfalls at Prudhoe. In general, however, taxing

---

[1] There is an engineering rule of thumb, the "six-tenths rule," that the cost of incremental capacity is 60 percent as high as the unit cost of the capacity before the increment. The rule is inaccurate and not universal but gives a rough notion of what is normal.

pipelines has the same faults as a royalty. (Inflating pipeline rates for reasons other than taxation, as I.C.C. regulation seems to do, has all the bad effects of a royalty without the benefit of raising revenue.)

Another feature of a royalty which may be an advantage or disadvantage is that it may be taken in kind and marketed by the State. This has aroused great enthusiasm in Alaska recently but the kind of enthusiasm suggests the kind of problems that would be encountered, namely domestic use at low productivity in preference to export at higher prices. This is a subsidy. The recipient has to take his subsidy in the one form of underpriced petroleum products and will use them wastefully. Industries which use lots of cheap energy do not constitute an unusually seminal economic base. Energy-intensive industries tend to be capital-intensive, and frequently polluting. Located in remote areas, they generate a minimum of associated activity. As an example there is Kitimat, British Columbia, with its hot house aluminum industry dependent on underpriced power. What would be the effects of reallocating this power to a more diversified community in a more attractive area where it would attract more labor-intensive industry?

5. Specific terms

Here we treat specific terms that are not generally specified in money; but we do not treat field regulations, which are in Section 8. The use of specific terms generally runs counter to the goals of administrative simplicity and objectivity, since terms tend to be arbitrary or discretionary and are usually discrete with sharp black and white boundaries as opposed to incremental pressures which run along a spectrum.

The present treatment is abbreviated in order to reserve more time and space for matters of higher current priority.

a. The term in years

i. The term before beginning production. Five years is usually allowed subject to discretionary extension. It might be better to substitute a delay rental increasing at an increasing rate. Lessees naturally will argue in favor of longer terms. That is their interest. Ours is to sit on the landlord's side of the table. From this position there is much to be said for holding feet to the fire.

ii. The term after beginning production. The practice, of course, is to let the term continue as long as production continues. An alternative is to terminate the lease after the lessee has recovered a volume of reserves previously agreed upon. This is discussed in a later section.

b. Size limits

i. Size per parcel. Professor Stephen Cheung, an authority on leasing systems, has emphasized the landlord's advantage in keeping parcels small. This helps to assure that each lessee, in making a viable operation, will apply a certain minimum of labor and capital to the landlord's land. Lessees argue in favor of larger parcels. Again that is clearly their interest, but it is adverse to the landlord's.

ii. Cumulative total acreage by state and by substate region. There is an argument for limiting the holdings of one firm in any area, in order to increase the operating base of as many potential competitors

as possible. This also assures closer attention to each individual parcel. There are nine firms who currently hold more than 200,000 acres each of competitive leases in Alaska. It is not clear that one firm can effectively explore and operate that many acres at once. However, acreage maxima are difficult to enforce, so that in general we prefer the use of general economic incentives rather than acreage limitations.

iii. A "market-structure impact statement." The State might reasonably mount a substantial antitrust operation, presumably in the Attorney-General's department. Winning bids might be rejected if the Attorney-General's office determined that accepting the bid might tend to reduce competition.

c. Joint bidding

There is a good case for prohibiting joint bidding, which reduces the number of competitors. Professor Norgaard's statement (Appendix E) speaks to this point. Like Professor Mead in an earlier study, Professor Norgaard found that the number of independent bidders is a most important variable determining the size of bids. The counter-argument that joint bidding permits bids to occur which would not otherwise be made, owing to high capital requirements, is unpersuasive where the bidders are large multinational firms, which are simultaneously bidding elsewhere in Alaska and the world.

d. Liability for environmental damage

It would make sense for environmental damages anywhere in Alaska to be made a first lien on the lease from which the offending oil

originated. We might further introduce a progressive element in this by making the liability a first lien on all leases held by the offending company.

For damages beyond the amount thus recoverable, it probably is desirable to make participation in environmental damage insurance a mandatory feature of all State leases.

None of these terms should be imposed in a punitive or negative spirit. The objective is never to damage the industry, but to help the State. The objective is never to penalize larger firms for being large, but to open the door to help smaller firms. We should carefully avoid referring to "the industry" as a block, and praising or blaming it as a whole. Lease terms which favor small business over big business are not hostile to "the industry." They are, rather, designed to help most firms in the industry by offsetting unfair advantages enjoyed by the large and wealthy firms. Whenever the State can help itself by helping the industry it should do so. Whenever the State can help itself by weakening oligopolistic elements in the industry in order to strengthen competitive elements in the industry, it should do so. None of this is "hostile to industry" in general.

In addition, the State's interest as landlord is generally adverse to that of the industry as tenant. In asserting its legitimate property interests, the State is adverse to industry without being hostile to industry. These are all important distinctions which should be held firmly in mind to avoid confusion. The American Petroleum Institute, in one of its publications, argues in favor of larger parcels,

bigger sales at one time, longer terms, and the absence of any reservation price. In opposing the Institute's position, the State is not being "hostile." Rather, it is asserting its own legitimate interests and at the same time being friendly to smaller firms whose interests seem neglected in the API positions.

6. Profit sharing

To overcome the weaknesses of the royalty system the lessor may allow the lessee to deduct from royalty payments an allowance for costs. In return he raises the basic rate charged per barrel. Thus the royalty, which resembles a sales tax, is converted into a profit share resembling an income tax.

The concept is simple enough in regard to regular expenses of operation and routine maintenance which are deducted from production payments in the year in which the are incurred. The allocation of deductions becomes more complicated with respect to capital outlays, and since these are normally quite high relative to ongoing expenses the matter cannot be overlooked.

Capital outlays must be deductible over a considerable period of years, presumably the useful life of the capital. This immediately engages us in a number of complexities and tricky questions which we will discuss under the negative aspects of the proposal.

Since we are dealing with a lease and not a tax on the total income of the multinational corporation, only those costs can be deductible which are expended on site, or in such close conjunction with it that we have no difficulty identifying them. This means that overhead

expenses are not deductible. Neither are federal taxes. The proposal thus resembles what is called a "net proceeds" tax rather than a pure income tax. The distinction is important and fundamental. The income tax is in personam; that is, it is levied on a person or corporation as such. The net proceeds tax, on the other hand, is in rem: it is levied on the income and expenses attributable to a particular "thing," in this case the leasehold.

This also means that interest payments are not deductible. The deduction is based on the value of the capital applied to the site regardless of whether it is debt financed or equity financed. It might seem preferable to allow some deduction for the cost of capital whether it be equity capital or debt capital, but this proposal is considered in the following section, #7.

The lessee might recover his capital on a per year basis or, alternatively, on a per barrel basis. If the latter, it must be subject to some yearly maximum to avoid his recovering his capital all in one or two years as would happen with a flush producer. Such accelerated recovery would mean in effect that the lessee's capital would not be tied up for any appreciable number of years and that there was no base remaining on which he could legitimately be said to be contributing to the profit. This in turn would convert the arrangement from profit sharing to simple rent collecting, which is discussed in Section 7. The present proposal is that the State share in the lessee's profits, which presupposes that the lessee still have some unrecovered capital outstanding which contributes to the joint profit.

The per barrel recovery basis resembles the depletion allowance of the income tax and may be thought of in similar terms with this difference: the present proposal limits the depletion allowance to recovery of costs actually incurred. On the surface the per barrel basis might seem much superior to the per year basis of cost recovery, because the per barrel cost credit comes in the form of a depletion allowance and would offset the disincentive effects of the royalty element. Actually this is a minimal advantage for two reasons. One is that there must be an upper limit per year in any event to keep this a profit share system, and the other is that the deduction of current expenses eliminates the disincentive effects of the royalty in the short run in any event. In fact, adding to this a per barrel depletion allowance would have a slight tendency to accelerate production.

Therefore, we do not sharply distinguish between the per barrel basis and the per year basis in discussing the pros and cons.

The advantages of the net proceeds or profit sharing approach are the following:

a. Allowing costs to be deducted overcomes the problems that plague the royalty system without incurring the problems that plague the bonus system. It succeeds in binding the lessor and the lessee in much more of a common interest -- they share the profits and they also share the costs.

This means that we succeed in preserving incentives at the margins, both intensive and extensive, and reduce (without eliminating) the "deadweight loss" that is caused by the disincentive effects of a

royalty. Second, we can and indeed we must charge a basically higher rate which rifles in on the flush producers who have little cost to deduct per barrel and succeeds in extracting a large amount of rent which leaks away when we depend on royalties.

b. Because costs themselves are deducted, this approach obviates the complex schemes of sliding scales and so on which one might use to modify the royalty system to make it approximate a cost sharing system.

c. This approach sustains over a long period of time the union of interests between lessor and lessee.

d. The nonacknowledgement of overhead costs creates minimal bias since this merely results in lower bids for the bid variable. Overhead costs will be roughly proportionate to on-site costs for many firms. For some others, overhead costs will be large relative to on-site costs and they will be discriminated against, but it may be desirable to discourage such firms since their overhead costs will be incurred outside the State and since they tend to be the larger firms. The intent is not to discourage larger firms but to encourage smaller ones relatively.

e. The income received by the State from different leases will be now made progressive with respect to profitability. That is, the State's share per barrel on marginal oil will be zero while its share per barrel on profitable oil will be quite high.

On the negative side, we now create some new problems and are left with some old ones:

a. The basic problem of the royalty system is only partially solved because a large share of the economic costs remains undeductible,

that is, the interest on the lessee's investment. This is normally a high figure compared with current operating costs because in this industry capital costs are very high relative to operating costs. As a result, there will still be some deadweight loss because some marginal opportunities will be made subeconomic and there will also be some leakage of rents because the basic rate cannot be set high enough to extract all the rent from the best deposits.

b. The problem of future shift, which is so exaggerated in the royalty system, is compensated for by cost deduction but not 100 percent compensated for. This point requires mathematical exposition and is treated in Appendix J.

c. There are new and formidable administrative problems in allowing cost deductions, several of which have been suggested above. Substantial staff will be required to frame the system properly in all its details initially and then to administer it. Administrative problems will resemble and approximate those involved in the corporate income tax. They might be considerably ameliorated by legislation requiring disclosure of corporate income tax returns to DNR personnel. This is not altogether on the negative side. Information about the costs of the industry would be of great aid to DNR personnel and administrators in performing their functions effectively. On the negative side, the industry would avoid such exposure and this might reduce bids.

d. The slow recovery of capital allowed, which is an inherent feature of this system, will be harder on the leaner firms which we want to encourage. Of course, the fact that some capital is recoverable is

attractive to all. The fact that it is recoverable only slowly is more acceptable to the richer firms than it is to the leaner ones.

e. The ability to deduct exploratory costs is not worth much where the probability of success is low. Thus, if the success ratio is one in ten, only 10 percent of the preproduction exploratory costs will ever be eligible for deduction. On the other hand, the costs of working over a producing field would all be deductible. This constitutes a large bias in the treatment of different kinds of costs and different parcels, which would need to be compensated for although there may be no simple and administrable way of doing so. It constitutes a serious drawback to a parcel-by-parcel system.

f. There will be some padding of costs and some gold plating which will leak through our best efforts to prevent them. These problems will be greatest on drainage tracts where production is a sure thing. Professor Rooney indicates that padding of costs is a very serious problem in the profit share leases in Long Beach, California.

g. If there is no inflationary adjustment made, the actual capital recovery allowance will be less in constant dollars than the amount of capital invested.

h. The allowance of fixed capital recovery has a negative leverage effect on incentives. It is the opposite from a regular fixed charge which has a positive leverage effect. After the lessee has recovered his allowable capital quota for the year, his incentives will be less. And after he has recovered it for the life of the deposit, his incentives will be permanently less. This pattern is bound to create some distortions.

Another and very different approach to profit sharing is through the State's taking an equity participation in one or more private corporations, as Canada has done with Panarctic Oils and Great Canadian Oil Sands, Limited. This does not directly solve the problem of land disposal, however, unless the State secures its equity by trading land for shares in the corporation. This, however, then makes the State a partner in all the affairs and ventures of the corporation around the world and gets far beyond the basic question of leasing policy which this study addresses.

A distantly related proposal is that offered by Phillips Petroleum that the bonus bid should be recoverable by the lessee as a deduction from royalties. This would either constitute a net cost to the State or else result in higher initial bonus bids in anticipation of later recovery. The latter has no particular advantages and would raise the bonus higher than otherwise and worsen the problem of the front-end filter.

7. Rent-sharing

We have seen how the landlord may share the lessee's costs in effect by letting him write them off against royalties. We've discussed profit sharing where the lessee may write off his operating costs and also his capital costs. The next and last logical step is to let him write off interest on his capital costs as well. What remains, then, for the landlord is the net contribution of the land; that is, the contribution to output which may be attributable to the resources which the landlord contributed. In theory this divides the product exactly as it

should be. The lessee gets a return in proportion to his investment and the landlord gets a return based on the value of his contribution. The question is whether this theoretical ideal can be approached in practice.

There are three basic approaches which are sufficiently different that we will discuss them separately:

a. Guaranteed rate of interest

In this scheme the lessee may deduct from his royalty base the operating costs, the capital costs, plus interest on unrecovered capital. The interest rate would be set at some market-derived figure like 8 or 9 percent. The capital could not be written off immediately. It would have to be depreciated over several years. There are many alternative rates of depreciation and many alternative ways of selecting the life over which capital may be depreciated. Were we to opt for this alternative, we would have to give detailed consideration to the complex choice of depreciation paths and life. An extended discussion of this is premature at this point, however. We would also have to decide whether to allow carry-forward of unused depreciation in years of no production.

b. Front-end recovery of capital

We can let the lessee have the first cut at production, letting him keep the entire proceeds until such time as he shall have recovered all of his deductible capital expenses. In a flush producer this will occur so rapidly that the question of interest rate is not critical. His capital is tied up for such a short period that interest on it is not a large amount. Following this, the State takes the lion's

share of the operating profit, leaving 15 or 20 percent to the operator as an incentive. There will be a bid variable, probably a bonus, to soak up any residual net advantage which operators anticipate.

(An unnecessary variation on this scheme would be to let the bonus also be deductible. As discussed in Section 6, this merely adds to the capital which the lessee has to put in and take out without achieving any particular purpose. Another elegant variation would be to let operators write off their capital outlays against the bonus. This, too, would result in inflating bonus bids and simply constitute lost motion with little net effect. We do not, therefore, discuss these bonus recovery options any further.)

c. Ad valorem charge based on reserves in place

This method has been alluded to earlier in Section 3, dealing with rentals. Like a rental it is based on time rather than production, but unlike the traditional concept of a delay rental it is not determined simply ex ante or per acre, but is based on a continuing assessment of the capacity of a reservoir to produce. It is determined ex post the disclosure of reservoir contents rather than ex ante. Therefore we continue and complete the discussion of it in this section.

There are pros and cons of rent sharing by whichever of the three methods, and then they have their individual pros and cons. First we consider all three collectively. On the positive side, they all have the following benefits:

1. There is a theoretically attainable degree of perfection where there is no deadweight loss. This theoretical perfection is not

attainable in practice but is worthy of note because other systems would impose deadweight losses on the State, even if they could be perfectly administered at zero cost, because of fundamental conceptual defects. In the rent-share schemes every cost of developing any resource is deductible. On marginal resources where the costs just equal the gains the rent share equals zero, so there is no charge levied to have a disincentive effect on the producer.

2. The counterpart of zero deadweight loss is zero leakage of State income into private hands. This again presupposes perfect administration and administrability. Rent is exactly the income properly attributable to the State's share in the joint effort, that is, the share contributed by land which the State owns.

3. The rent share is progressive with respect to profitability, like the profit share, only more so. Oil produced from strictly marginal deposits where costs equal gains yields the State no share whatsoever. But oil produced after the lessee has recovered his capital from rich tracts goes nearly 100 percent to the State. The State gets a higher share from the more "profitable" -- only now we should say "rentable" -- deposits because the basic rate can be so much higher. By virtue of allowing the deductibility of all costs, including interest on investment, we can now increase the basic rate nearly to 100 percent (subject to administrative feasibility).

Ideally, the State's share will be progressive only with respect to that profitability that derives from the land input. Extra profits that come from more efficient management, cutting costs and so on

should accrue to the operator. Whether this can be accomplished depends on how effectively we can audit the deduction of costs. Under alternatives (1.) and (2.) especially, this poses serious problems which we discuss later.

4. Rent sharing is based on ex post disclosures of the outcomes of exploration rather than ex ante guessing.

On the negative side, there are these problems:

1. Rates must be much higher than under other systems. This accentuates incentives to evade, and it makes all valuation questions more critical.

2. By virtue of its efficacy in collecting rents, the system reduces incentives for preleasing exploration. This forces us either to provide substitutes or to come to a decision that the present level is economically excessive and costly. Even if we do so conclude, this will leave a number of firms with a substantial investment in preleasing information subject to some capital loss, which they will resist.

a. Capital recovery with fixed interest

The proposal is to let the lessee write off capital investments against royalties at so much per year. He may write off capital together with interest on unrecovered capital at a fixed rate of interest like 8 or 9 percent. The advantages of this arrangement are the following:

1. The State starts recovering money right away. The lessee's capital continues to work for the State and the lessee remains entangled for a considerable period of time.

2. There is an upper limit on what the lessee can get. He is guaranteed a reasonable rate of return on his investment and little more. He is not relieved of all risks because the guarantee depends on production.

3. In case the State's share is left too low, there is a safety valve in the fact that there is still a bid variable, like the bonus, to soak up any excess of expectations.

4. The guarantee of interest reduces risk, and so reduces any risk premium needed or alleged to attract capital.

5. Full cost recovery with interest eliminates the tendency to slow down production which the royalty imposes (Appendix J).

6. There is no intertemporal bias against early costs incurred long before there is income from the lease. Exploratory drilling is recoverable. Compound interest accrues and may finally be recovered. (This does pose severe auditing problems, however.)

7. There is no temptation to pad capital costs in the declining years, because they can only be taken at so much per year.

Disadvantages are the following:

1. Padding expenses and gold plating. With a high basic royalty rate and generous deductions allowed with interest, the temptation towards boondoggling is at a maximum. The landlord may expect severe problems of monitoring, surveillance and evaluation. This system makes a lessee think and act like a regulated utility. This probably gives some practical notion of its impact. We have learned to survive with regulated utilities even though utilities pad their rate bases. We might similarly learn to survive with this system, in spite of its problems.

There are special aggravated problems in remote areas where "base maintenance," rather than drilling per se, is the largest cost. "Base maintenance" comprises a wide range of the necessities, amenities, follies and recreations of life, a bottomless sink of unauditable expenses.

Just as with profit sharing schemes, there is underrecovery of capital on long-shot, wildcat acreage. The British and Canadians have tried to compensate for this by extending somewhat beyond the individual parcel the area in which accounts may be consolidated, so that the costs of losers may be written off against the gains of winners over some considerable area. They call the boundary of this area the "ring fence." They are vague about how this fence line is drawn. Their system delegates more arbitrary power to civil "servants" than ours does, and may not be tolerable here (or there).

To be sure, federal income taxation contains a bias in favor of risky ventures; leasing upon industry demand, as Alaska has done, has a similar bias. It is difficult to evaluate countervailing biases and this has not been undertaken. If this idea is one that the Legislature wishes to pursue such an investigation would be desirable.

3. The guaranteed interest rate is the same for all firms regardless of their own cost of capital. This is a relative advantage to the wealthier firms whose cost of capital is lower. It is not as great an advantage, however, as that in the bonus element, because the discounted present value of the bonus is derived by discounting all future revenues, not simply those imputable to the lessee's capital.

The lower cost of capital to larger, wealthier firms may be inferred from data in Appendix K. Larger firms make less use of their credit ratings than smaller firms do, even though the credit ratings are better. This is to say that the larger firms could, if they wished, borrow a good deal more at 7.5 or 8 percent but are choosing not to. This displays the presence of internal funds such that the internal cost of capital is no greater than 7.5 percent.

b. Front-end recovery

The proposal is to let the lessee recover his capital at the front end before the State gets anything. The lessee recovers his capital with maximum feasible speed. His stake is in and out s rapidly that it need earn little interest.

The advantages are the following:

1. The incentive is towards haste. The lessee will not dawdle just to have interest pile up. He avoids interest costs by minimizing the period of capital commitment rather than writing off interest at a given rate.

2. There is reduced temptation to pad the early, preproduction outlays, because no interest is allowed. Exploratory drilling is already largely expensible for federal tax, and further temptation by the State might be redundant.

3. There is minimum feasible risk imposed on the lessee except as before where there is wildcat acreage.

4. This system favors the leaner firms. It shifts payments into the future more than any other system. The lessee owes the State

nothing until he has recovered almost everything -- everything that is his.

5. Lessees' capital is kept working in the industry, going in and out in a rapid reciprocating movement. A maximum of work is performed with a minimum of capital tied up. Small firms, particularly, depend on high capital turnover.

6. There is no need to determine depreciable lives and depreciation paths.

7. There is no inflationary leakage because so little time passes between investment and recovery.

The negative points are the following:

1. The premium on early inception may be excessive and in some cases cause wasteful haste. Presumably this could be controlled.

2. There is no explicit provision for the lessee's receiving interest on his capital. He would, however, adjust for this by reducing his bid (for the bid variable, whatever that might be). The best arrangement probably is for the State not to try to capture 100 percent of the cash flow after capital is recovered but to set the rate at 80 percent or so, leaving the bid variable to soak up the remainder.

3. The nominal royalty rate will be extremely high. This will lend itself to exaggeration and misinterpretation by critics who might succeed in having the system changed after the lessees had already recovered their capital, resulting in severe losses to the State. There is no protection against this other than widespread understanding.

4. The problem remains of a bias against wildcat acreage and other long-shot acreage. If the system is attractive enough on other grounds, some means could probably be devised to compensate for this. It would have to be something other than simply letting large firms pool their entire accounts within the State, because this contains a built-in bias in favor of the larger firms just as the corporate income tax does.

5. The temptation to expense dubious capital outlays against any flush producer is overwhelming, posing a severe auditing problem. To be sure, the auditor must be shown that the capital is to be productive on the same parcel, with its diminishing returns from a limited resource. So the possibilities of fraud are finite. In addition, this encourages intensive infilling and development as opposed to overdecentralization, probably a needed antidote to other biases. But this remains a drawback.

c. The ad valorem charge (AVC)

We touched on this method earlier in Section 3, the discussion of rentals, because it has some of the character of a rental, being an annual charge independent of production. We continue the discussion here because it also is a device for sharing rent. The ad valorem charge or AVC resembles a property tax. It consists of a base which is the current appraised value of the resource; and a percentage rate. The charge is the product of the base times the rate. The rate is high and common to all. The base varies from zero up to very high values for superior deposits.

The advantages of this leasing element are the following:

1. It cures the major fault of a high bonus by shifting payments into the future.

2. It cures the major fault of delay rentals by depending on ex post disclosures of what the ground contains rather than ex ante estimates made in the dark.

3. It cures the faults of a high royalty by not varying with production and by allowing for cost differences automatically in the evaluation procedure. That is, high-cost production carries a low AVC base. (In the extreme a marginal deposit has no value at all and hence there is no ad valorem charge.) As a counterpart, AVC minimizes the leakage of rents from low-cost resources out of the State treasury. They carry a high AVC base; and the common rate is high.

4. It cures the fault of profit sharing by allowing interest on the lessee's capital, again automatically in the valuation process. The "automaticity" depends on the appraiser's having proper legislation to work with and upon the legislation's having competent appraisers to implement it, so it is only automatic on the assumption of careful preparation and continued vigilance. The present point is that an appraisal of the resource in situ is always made net of the full costs of developing it and one of these costs is interest on the capital required for the purpose.

5. This lease element cures the fault of other rent-sharing techniques by having no place for padding costs or gold plating. A lessee cannot reduce the assessed value of his property by overdeveloping it. The major risk indeed is the reverse. He might inadvertently get it

increased that way, although this would constitute an error in administration rather than the intent of the system.

The intent is that the appraiser would calculate that schedule of production which maximizes discounted cash flow (DCF). He would value the deposit based on the assumption that that schedule was followed and that only those costs were incurred which were necessary to follow that schedule. Incurring additional costs would not lower the valuation, nor increase it either.

There should be no difficulty about recognizing this concept and procedure because it is what any buyer in the market place goes through when determining what to pay for bare land; and it is what any appraiser goes through when estimating what a market price would be, based on highest and best use.

6. AVC cures the fault of noncompetitive leasing, which is to overstimulate investment in exploration (which occurs whenever landlords fail to collect rent). A concern is that it might overcure the problem, leaving us with inadequate exploration. This is considered further on the negative side, and also in Section II on how to motivate exploration.

Overinvestment in exploration is just as much padding and gold plating as any other kind of overinvestment. It is insidious and seductive because it is invisible and hard to evaluate, and because there is in the "cultural subconscious" a proexploratory bias. There is also a federal tax bias for exploration to which the State need not add.

Nevertheless, one could go too far, and we must be careful to preserve enough motive to explore. There are several possible ways of

doing this. One would be to let the lessee recover his postleasing costs of exploratory drilling before the ad valorem charge is imposed. Other options are discussed in Section II.

7. Like options a. and b., this method of rent collection is progressive with respect to rentability -- the State gets a high share per barrel from rich deposits and little or nothing from marginal deposits. This option scores better on this count than the first two because of the absence of padding and gold plating (which would dissipate rent from richer deposits).

8. Because of advantage #7, this method permits the State to schedule the timing of lease sales in an optimal way, and to get more money from bid-variable-bonuses. Compare it with a high royalty rate. A high royalty rate means that at the time a deposit has risen to marginal status (owing to increased prices or any other cause) it is still worth less than nothing to a lessee after paying the royalty: yet it has a large positive value to the State, or would have if the State could induce a lessee to produce it. This gives the State an interest in selling leases at a time when lessees have little interest in buying them.

This in turn puts the State at a bargaining disadvantage at the time a lease is sold. When, on the other hand, the State's share is based merely on the net value of the resource, the State has an accurate criterion to follow in timing leases. Maximizing the DCF of the State is now socially optimal. This point is discussed in more detail in Section D below.

9. Where the AVC element is large, and appraisals are kept current (as they must be), the State assumes almost all the "passive" risks. Those are the risks imposed by price changes, cost changes, and changes of market interest rates. When prices rise, valuations rise and vice versa. This is appropriate since price basically affects the value of land which is the State's contribution. This also removes a good deal of risk from the lessee. It accomplishes for the lessee just what a perfect hedging market would accomplish.

As to interest rates, when market interest rates rise the capitalization or "cap rate" used in valuation should rise, too. This lowers the valuation and reduces the tax. Mathematically, it reduces the valuation exactly by that amount required to let the lessee continue to earn a market rate of interest at the new market rate. The mathematics is shown in Appendix H.

This is quite an important feature whose importance might not be as immediately obvious as the price hedging feature. It makes the investment less risky than investment in a government bond with a fixed coupon. When market interest rates rise, the value of fixed coupon bonds falls below par. Under the AVC system a rise in market interest rates does not reduce the valuation of mineral deposits by nearly the same amount -- the State's claim falls, protecting the holder from the same degree of price risk that he would experience with a government bond.

Both these features would be attractive to risk-averse investors. This probably would increase the number of bidders for State lands.

10. The valuations of reserves required to operate this system would constitute an inventory of proven reserves, an inventory much more accurate than what is available today and much more objective. This inventory information would be useful in planning community facilities, transportation, and allied infrastructure. The sum total of information known might be little greater than now, but it would all be of public record and centralized in one location and accessible to all State planning agencies as well as to private individuals, local governments, native corporations, and firms interested in exploration on comparable or adjacent lands. The benefits of better planning extend outside the State into consuming states and federal regulatory agencies which are concerned about supply adequacy when pipelines are authorized. This national interest in improved inventory would justify Alaska's requesting financial support for its program.

11. AVC is free from the fault of a royalty, that there is no early commitment. There is an immediate and growing commitment from the lessee to the lessor. This is accomplished without imposing such a heavy front-end load as the bonus does, but without deferring state revenues as much as front-end capital recovery would do. In this respect it is comparable to the Alaska tax on mineral reserves.

This time pattern may approach optimality in terms of the credit needs of all the parties involved, beginning from the assumption that it is desirable to encourage smaller firms as well as to prevent speculation and to protect State revenues. When we look at borrowing rates and credit ratings we note that small firms can borrow for short

periods of time at a small disadvantage compared with large firms. The greater disadvantage of small firms in capital markets is long-term borrowing. The present proposal calls for some short-term advance of capital by the lessee, but not very much in comparison with a high bonus payment.

A pure bonus bid would be derived by discounting future expectations over the next 30 or 40 years, including future gas production which may be way down the line. This means that the same 30 or 40 years will in general be required to recoup the investment. The unrecovered investment must be financed over that whole period. Access to long-term money is what gives larger multinational conglomerated firms their special edge in financial matters. The present proposal cuts deeply into the prospects of future gain from leases and thereby minimizes the need for long-term financing to purchase leases initially.

12. A minor and uncertain potential advantage is that under price regulation by FEA and FPC, with their "cost plus" philosophy, an AVC might be construed as a current operating cost and rolled into the price, in contrast to historical bonuses which might be ignored.

13. AVC moves into one of the largest loopholes in federal tax law, the exemption of unrealized capital gains. After discovery, and before production, there is a large increase in the wealth of the lessee. The increase is bankable and bondable and therefore realizable in cash, but not taxable. AVC, like the Alaska reserves tax, taps this unpreempted source of revenue.

By taking early cash from lessees this might seem to hurt the leaner firms, but not so: they are not asked for cash until they have a bankable asset to raise cash on. At this point they are on the way from lean to fat.

On the negative side are the following drawbacks:

1. AVC is not in common use. We would start near the bottom of a learning curve when introducing a new system. In addition, there must be a lingering suspicion that there could be some reason why it is not in common use.

Tempering this, however, the components of the system are in common use and are acceptable business practices. In 1973 five of eight majors operating in Alberta voluntarily chose an AVC in preference to increased royalties. (Alberta did not follow through.) The concept of a variable payment based on an index determined by fallible human beings is not uncommon. The variable rate mortgage has been successfully introduced. Another acceptable practice is setting farm rents in midwestern counties by "county average yields." This allows for the effect of weather fluctuations. Property taxation everywhere, of course, depends on assessed variations. Almost every investment everywhere in real estate is made subject to this hazard. While valuations vary in quality and complaining is constant, the system has lasted for 2,000 or 3,000 years and undoubtedly will continue. Mr. Paschall has explained how the system works in California and has emphasized that successful appraisal does not presuppose a 100 percent accurate estimate of ultimate reserves. Professor Adelman says "The development of known oil pools can

be calculated with tolerable accuracy even on the basis of incomplete data" (Adelman, 1969:26), and in his research has demonstrated how one can draw inferences from limited data.

Oil companies buy and sell their reserves, and also each other, based on appraisal. A frequent practice is to hire two recognized appraisers and agree in advance to accept the average of their two appraisals. In a recent case this resulted in a price increment of $6 million.[2] Loans and credit ratings are based on appraisals of property value and many outstanding contracts involve payments which are indexed or tied to the consumer price index or other price index.

The question is whether firms would have confidence that an objective assessment would be made by a State employee, and not whether such an objective assessment is possible or acceptable. It is up to the State, therefore, to set up procedures assuring objectivity. Judicial review is one of these and it might be desirable to create a court specializing in this kind of case, to be sure the judge understood the issues. This is the practice in Australian property taxation and is reported to work better than the use of general courts.

2. AVC is a tax on successful exploration to the extent that exploration identifies the reserve whose value is the tax base. Large private landholders in the lower 48 have sometimes deferred exploration in order to avoid property taxation, at least by their own account. This fault is not peculiar to AVC: any system of tapping revenues from proven

[2] The purchase of McAlester Fuel Co. by Alaska Interstate Co. for $45.8 million instead of $39.4 million originally announced (Wall Street Journal, January 6, 1977).

reserves is also a tax on exploration. The problem is worse with AVC, however, by virtue of its greater efficiency in identifying and capturing the rent of proven reserves. Other systems, by their very inefficiency and inaccuracy, allow a considerable leakage of mineral rent out of the State treasury, which in turn serves as an incentive for more exploration.

Preleasing exploration is not the problem, so long as there is a lease sale with a bid variable. The lease sale would provide the same opportunity as it does now for firms to limit the size of their bids in light of the need to earn a rate of return high enough to recoup investment in preleasing exploration. The problem centers about post leasing exploratory drilling.

To keep this problem in perspective, this problem concerns one-tenth of all costs. The Joint Association Survey reported the following breakdown of expenditures from its respondents in 1974. These respondents were estimated to comprise about 76 percent of the revenues of the industry in the United States (Joint Association Survey, 1976).

	Billion $	%
Exploratory wells	1.6	11
Acquiring undeveloped acreage	5.7	38
Geological and geophysical	.6	4
Development wells	2.7	18
Lease equipment	.8	5
Production expenditures and overhead	3.5	23
Total	14.9	99[3]

[3]Differences due to rounding

Ad valorem taxes, that is property taxes resembling in their impact our AVC, were included among production expenses and overhead and were equal to $.4 billion or almost two-thirds as much as was spent on preleasing exploration. Spending on exploratory wells is a substantial but not an overwhelming part of the total, being substantially less than the costs of development and production. While there is a problem to be solved yet, it is not as great a problem as it would be if exploratory drilling were a larger share of total costs.

A partial solution to the problem of motivating exploration adequately is simply to adopt a lower percentage rate for the charge.

Another mitigating factor is that deposits which are expensive to produce, and which therefore carry a low ad valorem base for the AVC, are on the whole the same ones that are expensive to find by virtue of being small, deep, remote and so on. AVC therefore does not take a large bite out of the value of deposits that are expensive to discover but mainly out of those that are cheap to discover. In this respect it is less discouraging to exploration than would be a royalty which raised the same total revenue.

This problem is further explored in Section 11. In general there is a choice to be made between leaving some rent as bait for explorers or paying for exploration by direct contract before leases are signed.

3. As with other rent-collecting devices, the AVC rate is going to be high; so all judgments and decisions are more critical. In order to work properly the system must be more fine-tuned than a royalty

for example. It is something like licensing surgeons to operate instead of giving aspirin. More careful training and control are called for, and personnel capable of more discriminating judgments. I would not overstate this point, because the judgments called for are primarily of one kind -- valuation -- and are subject to review according to preannounced objective criteria. Nor are they regulatory kinds of judgments which involve ordering lessees to do or not to do specific acts. They are nonetheless judgments and the consequences of error may be severe, and this must be reckoned as a fault of this lease element.

Another disadvantage of high rates is the ease with which they may be misinterpreted. A high rate on a small base raises no more money than a low rate on a large base, but more easily evokes images of confiscation. This problem may be ameliorated by using a capitalization rate rather lower than the 18 percent currently in use in the Alaska reserves tax. Eight percent, a market rate of interest, seems more reasonable today. Inflated capitalization rates are the same as underassessment of the base. As indicated, the State is assuming a large share of the risk under this system so that a low, riskless capitalization rate is appropriate.

4. The first few annual payments are preproduction. As compared with some other systems, therefore, this one has a larger front-end load. This issue is discussed under advantage #13.

8. Regulating field operations

In issuing a lease, the State reserves the right to regulate field operations in the interest of preventing waste. This primarily involves control over rate of flow, unitization and spacing.

a. Rate of flow

Where many independently owned tracts overlie a common communicating pool, everyone recognizes that some regulation of flow is needed. This is true even where production is not rate-sensitive, in order to obviate the excess costs of hyperaccelerated withdrawals. Even where physical waste is caused by rapid recovery, it may be the lesser economic waste: capital sunk in excess capacity may be the greater one. The most frequently heard rationale, however, is to prevent physical waste, because of the traditional overemphasis on physical waste. Whichever we emphasize, all hands can agree that some control is needed over rate of flow. This may be accomplished through total unitization, or through prorating allowable flows to individual wells and parcels based on an overall reservoir plan.

It would be most desirable to stipulate that the objective of such a plan, by whatever means administered, be to maximize discounted cash flow (DCF) rather than ultimate recovery. The latter is no criterion at all for reservoirs which are not "rate sensitive," and it is the wrong criterion for those that are.

In Appendix I we present discounted cash flow values derived from different production schedules for the reservoir at Prudhoe Bay as presented in the Van Poollen report. It is clear that the fastest option

which they presented is the one that maximizes the gross DCF without deducting costs. Information on costs is not given in the report. In Appendix I, however, we show what to do with such cost information when it is available. Shifting from the 1.2 MBD schedule to the 1.8 MBD schedule increases gross DCF by $5.6 billion when a 10 percent discount rate is used. All we need to do now is match this gain against the cost of additional wells required to achieve it. The number of wells and the cost per well are figures that knowledgeable people could supply readily. It is quite likely that they would be less than the gain in DCF, and therefore be justified (in the absence of major considerations not listed here). Even as we complete this Report, the operators are announcing their intent to increase capacity in daily flow towards the upper figure.

Appendix I indicates that optimal flow is not very sensitive to the rate of interest. The gain in gross DCF from speeding up flow is calculated over a wide range of interest rates and is not much affected. To the extent it is affected, the effect is the opposite from what one normally expects in other kinds of investments: at a higher rate of interest more investment in drilling wells is justified rather than less. Most long-term investments, of course, look worse at higher rates of interest. Investment in recovering minerals looks better, because we shift cash flow towards the present.

It might be thought that anticipated rising prices of petroleum products would reduce the optimal rate of flow. So they do but not by very much. The effect of well-head prices rising at 5 percent per year is the same as the effect of lowering the discount rate from 15

percent to 10 percent and Appendix I shows that this effect is not very great.

We must distinguish sharply, however, between anticipated rising prices and absolute high prices at a fixed level. While anticipated future increases tend slightly to reduce optimal flow, high prices today and continuing into the future (but not rising) increase the payoff from investment in additional wells and argue strongly in favor of speedier production. The existence of today's elevated price level, therefore, calls most urgently for review of traditional flow regulation based on MER or maximizing ultimate recovery. In the DCF analysis a slight loss of ultimate recovery is a minimal consideration. Even a substantial loss of ultimate recovery may be small relative to the interest costs of holding unproduced reserves longer than necessary. Tradition has elevated the minimal factor to a maximal and almost the sole criterion of rate determination.

Interest on assets which one owns is an "invisible" cost and all too easily relegated to the limbo of irrelevant, abstruse, philosophical speculation by those who don't actually have to pay it. Proper economy of valuable natural resources would be achieved if we regarded the managers as being saddled with a mortgage equal to the value of the resource, on which interest is due regularly, thus converting the invisible cost into a tangible, painful cash outflow.

A lessee, left to his own devices, will in his own interest act so as to maximize DCF. If the State prohibits this in advance of lease sale, it makes the lease that much less attractive. The cost of

this kind of regulation is thus borne by the State in lower bids. If the State imposes an uneconomical concept of regulating flow it has little gain to show for its cost. By the same reasoning, future leases can be sold at considerably advanced values if they are free from flow regulation based on the concept of MER.

Should the State decide to abandon MER, this also opens the possibility of renegotiating old leases. The State can calculate the present value to the lessee of being allowed to produce faster and offer to sell him that right for that price.

b. Unitization

Unitization may be partial or complete and it may be under the control of the operators exclusively or it may involve extensive State participation and surveillance.

There are advantages in keeping unitization partial. It is always tempting to view the potential gains from total rationalization of a large works project, consisting of many parts, but there is also the danger of losing individual initiative, enterprise and familiarity with the local scene; and there is the danger of doing too much at once. Not all producers are ready to move simultaneously, as we see today at Prudhoe Bay.

A two-tier approach is recommended, analogous to that used in irrigation areas for administration of aquifers overlain by many competing landowners, each with his own water pump. Landowners join in forming a water conservation district which is given the task of aquifer management, and certain powers over withdrawals by individuals. Water

conservation districts generally have inadequate powers, but an analogous petroleum conservation district in Alaska, beginning de novo, need not suffer such limitations. The State might initiate such a district for each communicating pool and make membership compulsory among its lessees.

The argument for this two-tier approach is weaker with petroleum management than it is with aquifer management inasmuch as we cannot visualize a water agency taking over the minutiae of operating every farm, where the water input is relatively much less important than petroleum to an oil firm. Even so, the Joint Association Survey data cited earlier indicate that development and production costs in field management outweigh exploratory well drilling costs by a substantial amount, and it might be letting the tail wag the dog to let unitization become total. Partial unitization could involve trade-offs and adjustments among separate lessees. Where wells need to be divided unevenly among tracts, cash payments could be made to compensate the losers from the gains of the winners. The same can be done when one producer is ready to go and another wants to wait. Whether this is a feasible and superior arrangement in the circumstances would call for extended study, so in this Report we advance the suggestion without endorsing it.

It is desirable as a general principle to minimize the intervention of State officials in decisions which might be left to operators in the field who have a proprietary economic interest in the outcome. The arguments for this are numerous and traditional and need not be repeated here. A great advantage of abandoning the MER criterion and substituting the DCF criterion is that it eliminates the conflict of

goals between the State and the lessees concerning flow regulation, thus making it possible to delegate fuller authority to the lessee operators themselves and minimize State intervention. The presumption today is that the State needs to prevent the operators doing something which is advantageous to them but somehow disadvantageous to the State. Things go better when we can presume that the operators are serving the public interest by attending to their private interests.

The State cannot impose unitization unilaterally where oil-bearing structures straddle the border with federal lands, to say nothing of subjecting federal structures to regulation by State officials. On the other hand, if communicating pools were subject to regulation by an organization of the operators, using a two-tier system like that suggested, it should make it easier to achieve successful unified management in the field. The delegation of operating control and planning to local organizations should obviate the question of which central agency is in charge.

Much of the above presupposes that the State accept DCF in preference to MER as the criterion for regulating flow. Let us therefore recap how we justify spending more money to speed up flow even when that will result in physical waste. Can we accept real physical waste merely for the purpose of saving something as vulgar as money, in a form as profane as interest, and as imaginary as interest foregone on investments which we might have made?

Say it costs $100 to discover $50 worth of oil in the ground. The world is telling us something by the way it prices petroleum, as well

as the resources required to develop it. It is telling us that the resources which we sacrifice to gain the petroleum are worth more than the petroleum. This is clear enough when the resource cost is materialistic in the form of steel and when it is personal in the form of labor. It is harder for some people to accept when the cost is entirely financial in the form of interest payments on a mortgage, but interest too is a real social cost.

Interest is the cost of getting your hands on wealth today which you do not own, in order to build something today which will yield you a much greater return in the future. Thus, if you put $100,000 into a building to be rented, you will get your $100,000 back in less than ten years, normally, in voluntary payments made by renters. After that everything is a surplus above the cost of production. Over a life of 50 years the unit will probably yield five or six times its initial cost in net cash flow to the owner. Thus, having wealth at your disposal today instead of years down the line is very productive, which is why interest is paid. The rate of interest is the rate of exchange between wealth this year and wealth next year. It is determined in the same kinds of markets that determine conversion factors between apples and oranges.

Economists and businessmen are saying we are in greater danger of running out of capital to develop resources, than we are out of resources in the ground themselves. There is nothing vulgar or profane, therefore, about economizing on capital in a resource-short world. Nor is there anything sacred about economizing on physical resources when the cost is wasting capital.

Let us consider the feeling sometimes expressed that there would be something prodigal about producing rapidly from proven reserves at Prudhoe Bay. A purpose of faster production at Prudhoe Bay would be to fill the pipeline and thus delay the need for new lease sales. The pressure will be on, obviously, to increase production from some source until the pipeline is full. By producing slower at Prudhoe, we would not reduce the withdrawal of petroleum from Alaska; we would rather cause some to be withdrawn from other areas instead. Speeding the flow from Prudhoe means getting the same flow from fewer acres and from a lesser investment in exploration, drilling and equipping wells, and equipping leases.

This is not to argue against advance planning to keep the pipeline full. It is, rather, a matter of planning to do so at the least cost. Doing anything at the least cost involves a small risk of not accomplishing the goal, but that is acceptable. Keeping the pipeline full is not an absolute. It is a desirable thing, if at a reasonable cost. What is required is a careful cost-benefit analysis of the whole picture. It would be a mistake to let leasing policy be dominated by any absolute commitment to keep the pipeline full regardless of cost. When we look at the chaos at the marketing end of the pipeline it would be ludicrous to demand absolute certainty at the production end at the expense of the people of Alaska.

c. Well spacing

This is largely the same issue as rate of flow. Higher flow rates require more wells, more closely spaced. It is not very fitting that the State of Alaska should impose wide spacing requirements on its lessees. This may be a throwback to another situation in another state where surface subdivision caused excessive well density, which had to be countered by public regulation. In Alaska the State is the landlord collecting royalties. The interest of such a landlord is to maximize the capital invested by the lessee. The royalty reduces the operator's incentive to apply capital, and this needs to be countervailed.

Closer spacing in addition to increasing rates of flow may also have some effect in increasing ultimate recovery. In fractured reservoirs with noncommunicating pools, this is obviously true. In other reservoirs it may be true. Little is published on this. It may be desirable for the State to commission a study on this subject: what is the optimal well spacing, well diameter, and rate of flow to be adopted, assuming that the goal is to maximize discounted cash flow net of costs? Most past analysis is not on target because it is premised on the goals of minimizing physical waste, and prorating excess capacity to market demand. Alaska, 1977, is no time and place to be invoking "standards" and going by the book when the standards and the books were developed for other conditions in other places and times.

It sometimes happens that regulators, operating under what appear on the surface to be counterproductive criteria, modify them in practice and make regulation work out better. We have not reviewed

actual procedures, and limit these comments to the criteria which appear to be followed as guidelines, whether by legislative mandate or professional tradition. No criticism is intended or implied of any individual or group.

9. Acreage reservation (checkerboarding)

The Alberta system of crown reservations has attracted considerable attention. Professor Andrew R. Thompson of the University of British Columbia Faculty of Law has been an exponent, although his enthusiasm is reported to be waning. Alberta, too, is modifying and backing away from the system. The concept as explained by Professor Thompson is for ". . . free entry on unproven lands under an exploratory reservation or permit which carries the right to lease, but requires that at least half the acreage, or some other fraction, be relinquished to the State on a checkerboard or corridor pattern after the lapse of a sufficient period of time for completing exploratory work and evaluation. Thus, it is the oil company that . . . must decide when and what to lease . . ." (Thompson 1969:86-87). An attractive feature of this system is, as Thompson points out, that it relieves State officers of a "tremendous burden of decision."

On the negative side, this may also relieve the State of a large quantity of oil since the State (or the Alberta crown) gets the leftovers after the lessee has picked the eyes out of the land.

It does seem advantageous for the Commissioner of Natural Resources, in his discretion, to lease out some areas for exploratory drilling while holding back adjacent and interstitial tracts for later

drainage sales to benefit from the spillover of exploration on the leased tracts. This is discussed further in Section D on the timing of lease sales.

It does not seem advantageous to let the lessee have the choice of lands to select. This is another "blunt instrument" whose results may be capricious and arbitrary. Since finer instruments are available, we do not pursue this further at this time. Authorities who have studied this subject in some depth are Professor Michael Crommelin, Faculty of Law, University of Melbourne, Australia; Professor Andrew R. Thompson; Dr. Campbell Watkins, Petroleum Consultant in Calgary; and Professor Anthony Scott, Faculty of Economics, University of British Columbia. For a fuller description of the Alberta system we are submitting along with this Report a copy of Crommelin, Scott, and Peter Pearse, "Management of Oil and Gas Resources in Alberta: An Economic Evaluation of Public Policy."

10. Sale of undivided interests

It has been proposed that communicating pools or even larger units should be sold as such, rather than as volumes of the earth's crust underneath tracts of land measured on the flat. There are certain advantages:

a. The "transactions costs" of negotiating among the several surface owners would be obviated. Unitization is inherent and automatic.

b. Small firms could take a small interest. The scheme allows for ownership to be divided into many units, let's say 100. Each bidder would indicate a price and also the number of units he wished to acquire

at that price. These would then be ranked in order of price until they added up to 100 percent. The winning bidders would then automatically become an operating consortium.

c. There is a dramatic reduction in risk, since offsetting risks are pooled. There is much less need for preleasing survey, therefore. The structure itself can be confirmed before there is great concern about just where upon it to take a position.

On the negative side, here are some considerations:

a. Entire structures or geologic features would have to be marketed at one stroke. The possibility of the State's withholding acreage for later drainage sale at high price is precluded.

b. The degree of centralized administration may be unnecessary, and the loss of autonomous action by the smaller individual firms undesirable. The controlling operator presumably would be the largest owner of shares and production would be presumably regulated more for his benefit than that of others. Smaller firms would tend to lose some freedom of action. There are alternative unitization methods available which do not impinge on freedom of action to the same degree (see Section 8 above).

c. Professor Rooney's analysis of the Long Beach case sheds some light on problems inherent in undivided interests. The dominant interest there evidently gains considerably by integrating the Long Beach production into its vertically integrated operation. If the smaller interests represented other firms their interests would tend to be neglected.

On the whole this represents an interesting possibility for solving one of the many problems of petroleum leasing, but it is neither broad enough nor promising enough to warrant further discussion in this Report of limited scope.

11. Handling information: generation, control and disclosure

Preleasing investment in geological and geophysical investigation accounted for 4 percent of the expenditures recorded by the firms in the Joint Association Survey (JAS Survey, 1976). For a fairer picture of the importance of these expenses we should multiply by three or so, to account for the time difference. These expenditures take place many years before the others do and before their results show up on the positive side of the income statement. Remember that money doubles every seven years at 10 percent. Then we should multiply by another factor because preleasing work is bigger in Alaska than the lower 48.

The industry pays these costs on the first round but the State inevitably bears them in the form of lower bids. Alternative methods of financing preleasing exploration have therefore been suggested. We will consider the existing system and a couple of alternatives.

a. The present system: open access to State unleased lands; timing of leasing dependent on industry initiative through the nomination system

Some advantages are the following:

1. It is hard for the State to play the sleeping landlord. Enterprising private businessmen are free to call the attention of State officials to economic opportunities.

2. Judgmental decisions are in the hands of highly motivated private firms. Several of them are in competition so that many concepts are applied to the same land by people who are rewarded by being creative.

3. The State does not have to bear the cost of conducting its own survey.

4. The system is time-honored and familiar and acceptable to the industry.

On the minus side:

1. Preleasing investment is another front-end filter like a high bonus. It is a tighter screen as well for the leaner firms, at least per dollar involved, because of the long waiting period between investment and recovery and the uncertainty of recovery. A firm possessing no real estate but only intangible wealth in the form of information is not very creditworthy, especially for long-term loans, so that this activity is nearly unfinanceable and requires equity capital. The advantage then is to firms with accumulated wealth.

2. Preleasing exploration adds no value to any real asset owned by the firm and therefore has to find its reward in the firms' acquiring State lands at a low value. An extreme case, of course, is the 1965 sale of 90 percent of the oil in the Prudhoe Bay field for $6 million. Application by the State of a low "discovery royalty" rate to early finds aggravates this situation. The State gets a lot of wildcat acreage surveyed in this manner, but there is no guarantee that the cost to the State is less than the benefit. It is more likely to be the other

way around. And the State does not get the information. (Nomination does not convey much information, because overnomination is the standard operating procedure.)

3. A counterpart to point #2 is that the firm with a large investment in preleasing exploration may neglect intensive infilling and development of acquired leases, and instead buy more leases. This is implied by the common allegation that many firms do not look at investments that yield less than 20 percent, even though they can borrow at 7.5 or 8 percent. The excess of 20 percent over 8 percent presumably reflects, among other things, some allowance to cover the overhead of preleasing exploration. But if a firm spurns investment opportunities on leases which yield less than 20 percent, it will not apply adequate capital to develop them. This would lead to a pattern of decentralization of development in the State.

4. Duplication and prematurity. Since access is open, the competitive edge in exploration comes only in part from doing the job better. In large part it comes from doing it sooner. The result is "soonerism," somewhat akin to behavior in the Oklahoma land rush when the race went to the swift. In addition, there is a certain amount of costly duplication, some of which may be justified and some of which has been prevented by cooperative line-shooting, but not all of which has been or could be eliminated.

Even where the lines are shot jointly, costly interpretations are duplicated many times without there being any occasion to ask if the first exploratory well might not be a cheaper alternative. By the

time many firms are interested in duplicating the same interpretation it is most likely that the existence of a structure is well known and the purpose of incurring this expense is primarily acquisitive and redistributive rather than productive: that is, it is a matter of jockeying for competitive advantage over other firms wishing to acquire the same resource rather than a matter of increasing the resource.

5. Each firm's information is held tightly secret. Secrecy is almost always counterproductive and expensive to maintain. Secrecy prevents any positive spillover value from information in advance of disclosure. State planning agencies cannot use it and environmentalists cannot use it. Peg Tileston, spokesperson for Alaska Center for the Environment, advises me that industry secrecy about future plans for activities with large environmental impacts ranks at the top of environmentalists' concerns and that full disclosure would go far towards abating many of these concerns. Tina Stonorov, Executive Secretary, Alaska Conservation Society, writes "Thorough public discussion of lease proposals . . . should precede every such decision. . . . If an area is so poorly known that . . . guidelines can't be written, lease sales are obviously premature" (Stonorov, 1976). These concerns are much aggravated by the fact that overnomination is routine on the part of many firms seeking to hide their real intentions.

6. The system is vertically integrated. The firms that explore and nominate a tract early have every advantage in bidding for it at the time, more or less of their choosing, when they nominate it and push for it to be auctioned. There are, to be sure, some firms which

specialize in preleasing exploration and acquisition and then try to sell their acquisitions to production and marketing firms. Such sales are, however, subject to taxation at that time, which the vertically integrated firm is spared.

7. Larger deposits are generally easier to find than smaller ones. This system draws most exploratory effort into the search for big ones where it is least needed and away from the smaller ones. An elephant in the bush looks much better than several birds in the hand. This reinforces the propensity towards decentralization.

8. Preleasing exploration does not necessarily or even generally increase the value of State lands. It may reduce the value if the absence of petroleum is confirmed. This information is of value to potential buyers but not to the State and the State need not feel obligated to pay for it.

9. State officials, to recoup losses, may turn around and knowingly sell bad acreage for h'gh prices as in 1969. It should, I believe, be considered beneath the dignity of a sovereign state, equipped with the powers and immunities of sovereignty, to withhold information that would prevent a businessman from damaging himself by bidding high for defective real estate. The sovereign should be above this game, not part of it.

10. Independent exploratory firms which acquire leases for sale to majors may be exploited by the latter's superior bargaining power.

Because of these several criticisms, alternatives have been suggested which we now consider:

b. Exploration by contract

The State may employ firms specializing in exploration to perform geological and geophysical investigations on the understanding that the results would be made public. Contracts might be drawn in a variety of ways with or without substantial bonus incentives, based on results of investigations. Professor Rooney suggests one method (Appendix G). The State would also do its best to secure greater cooperation from the U.S. Geological Survey, NOAA, and the Department of Interior in order to use information derived from federal lands to learn more about adjacent State lands. Cooperation with native corporations would also be desirable. The advantages would be the following:

1. Preleasing investigations would be unitized, obviating the cost of duplication. The State would recoup its investment in the form of higher bids and it shold recoup more than its investment because the bidding firms need not cover the overhead of their duplicative preleasing investments. Entry would be open to many more bidders, resulting in keener competition as well.

Once information has been gathered it costs little to disseminate it. It is a "public good" (a good which, once created, may be provided to any number of people at little extra cost). It probably costs less to publish data than to keep it secret. Some analogous cases where government publicizes valuable information are: weather reporting, earthquake fault-mapping and prediction; navigation aids; road maps; public land survey; the Torrens system of land title registration used in Canada and Australia; farm market reports; farm extension services; public health information; and public education.

2. The State may control timing of lease sales better, reducing industry initiatives with demands for premature nomination. In order to time lease sales in an economic way, State officials need have some basis for predicting expected sale proceeds and this procedure supplies them some of that information. The State at the time of sale can set its own reservation price as well.

3. Contracting explorers would come from the same geo-data industry that presently exists in firms now doing contract work for the industry.

4. The State's exploratory function would not be preclusive. Any firm that can do the job better still has the option of doing so. Thus, while it may be true that the Postal Service is unenterprising, this criticism should be directed against the Post Office and not against the present proposal, which does not contain any prohibition on competition.

5. There is no built-in propensity towards underpricing or overpricing leases, as with the present system. All parties on the buying and selling sides have available all the information that there is.

6. A substantial barrier to entry would be eliminated. Many more firms could bid on any given lease. The State itself would also become an effective "bidder" in the sense that it could set an affective reservation price. Leaner firms have a greater need for foreknowledge and a lesser ability to finance it.

7. The State would assume the riskiest element in the petroleum business, a risk it is able to bear because of its diversification, and a risk which it should bear because the risk is inherent in the land which the State owns.

8. Contracting exploratory firms will be motivated by a desire to enhance their reputations and get future contracts. In addition, various bonus and incentive systems may be adopted which reward them with percentages of what they find.

9. The problem of secrecy is dispelled. Planners and environmentalists can know as much as anyone about what is planned and what is going on.

On the minus side, here are some weak points:

1. Firms in the geo-data industry are not used to allowing disclosure.

2. Incentives are less acute than when the firm is gambling its own money. In the extreme, we might visualize a group of long-haired geology professors out practicing art for art's sake, mindless of any payoff.

We might alleviate this problem by spelling out objectives clearly, keeping contracts short, and shifting away from poor performers. We could give performance bonuses based on findings, even though we know this is a function of what there is to find as well as the skill of the finder. At least we would not be giving it all away in order to get it found.

We could allow two or more contracting firms to explore the same ground, provided we had some rational reason based on evidence to think that might be worth the extra cost (as opposed to the present system of letting all comers in regardless of any evidence of productivity) and the door is always open to others if the government is botching the work. Experience would soon show if officials were capable of being productive. Competition and exposure would stir them up, too -- pride of performance is an important element in competition, regardless of remuneration. Most workers in competitive industry also work on fixed salaries.

A variation of the contract system is the Alberta practice. The province contracts with private firms to put up 30 percent of their costs in return for which it gets their information after a lapse of one year. The Province can, but normally does not, publish the information before a sale of the land in question. Canadians are great compromisers and this system appears to compromise between two or three different principles. The results, we may surmise, will be equally mixed.

Another variation is the incentive-bonus contract. Instead of paying the exploring firm a fixed fee or a cost-plus fee, we may reward it with a percentage (or other function) of the value of its findings. This is similar to the contract system except with greater performance bonuses built into the contract, and lesser cost-plus payments.

Either method has the advantage that the State breaks into a joint in the vertically integrated industry and creates a market at that joint. In this case it is a market for the "products" of exploration

firms. It gets the job done cheaper and without giving away its right to dispose of the resource once its outlines have been discovered.

Incentive-bonus has the advantage of keying motivation more to results. It has the disadvantage that the value added by exploration depends on luck. No matter how skillfully you search and how hard you work you cannot find what isn't there; while a fool may stumble on an elephant in the dark. A good job of exploring barren land will reduce its value by confirming its barrenness. It is hard to find a system for rewarding the effort of exploration on small tracts on an incentive basis.

There is a federal tax problem, too. Cash rewards paid out become ordinary taxable income in contrast to capital gains, only 50 percent of which would be taxable, and in even greater contrast to unrealized capital gains enjoyed by vertically integrated corporations which are not taxable at all. The weight of bias in the federal tax system would work against this proposal. Simple contract exploration doesn't share this fault in the same degree, since the capital gains would be realized by the State which is not taxable. While we should in general be chary of exploiting the State's nontaxability, in this case it seems justified in order to offset the special tax privilege accorded to private firms which are vertically integrated.

Another approach which becomes feasible in the event that we announce our intention to recapture the lion's share of any findings (by any of the various methods described in earlier sections) is to abandon the distinction between preleasing and postleasing exploration. We could

divide State lands into large tracts and lease them as wildcat acreage. In order to be sure that lessees were highly motivated we would subject them to a delay rental which rose annually at an increasing rate or a constant percentage rate of about 10 percent per year. This would assure that no one took out any such lease without exploring diligently.

Instead of the delay rental we might use the shrinking concession as Iran does. Iran progressively takes back a percentage of concession acreage after five, ten, and finally, twelve years, charging $3.00 per acre year in the meantime.

Another variation on this plan would be modeled on the proposal frequently made and sometimes implemented to base property tax assessments on self-assessment by the landowner. In this case the leaseholder would set his own delay rental, which would be considered an Ad Valorem Charge at a specified percentage of a base value. To prevent his setting a low base value, the lease would contain a reservation stipulating that the State might repossess it for the base value declared by the lessee. Another reservation would open the area to exploration by others who might acquire the lease from the sitting leaseholder by paying him his declared value plus 15 percent. The idea is to allow a reasonable security to the leaseholder but to keep everyone on his toes and avoid exploiting the State by underpayment.

There is little doubt that such a system could be made to work, even though it is novel and would require much explanation and discussion. Among its prominent advocates are Professor Arnold Harberger, University of Chicago, and Professor Daniel Holland, editor of

the National Tax Journal. At this point we merely pose this as a beguiling alternative without lengthy discussion.

d. Postleasing incentives

All systems that take a bite of mineral rents based on ex post disclosures have some tendency to discourage postleasing exploration, primarily exploratory drilling. This is no problem with the bonus system or with delay rentals. A high royalty rate still leaves an incentive to explore for large, rich deposits which still will yield a surplus but biases exploration away from possums in favor of elephants. Profit-sharing and rent-sharing schemes allow the deduction of exploratory outlays, solving the problem but creating another problem of padding.

The Ad Valorem Charge, in most ways ideal, may leave inadequate incentive for exploratory drilling. We can now see several solutions to this problem. One is to allow a deduction for drilling costs, guarding as best we can against padding of costs. Second is the use of high and rising delay rentals. The level of such rentals might be the bid variable. This has the advantage over the first method of raising money instead of giving it away. Third is a time limit on leases. Fourth might be a reservation by the State, in its capacity as assessor, of the right to enter the leasehold to investigate sections not being actively produced. It could also reserve a right to repossess them for the purpose of resale to others.

12. Sale of fixed volume

The State might contract with lessees to sell them a specified volume of oil, subject to the lessee's finding it at the lessee's expense. After the lessee had withdrawn the specified quantity, the lease would terminate and possession revert to the State for future resale, along with capital invested by the lessee. All information generated by the lessee would belong to the State.

The purpose is to get the State's land explored at a reasonable cost without having to give away or sell below value those few extraordinarily valuable deposits.

The effect of the proposal would be similar to paying explorers a fixed finder's fee for any commercial deposit, regardless of its size. It has the advantage that there need be no dispute over whether a deposit is "commercial" or not. The lessee would search until he found one that he himself considered commercial.

The proposal seems potentially workable. It is, however, novel and untried and, insofar as we are aware, undiscussed. It contains several possible pitfalls to guard against, all of which would require further analysis. We omit further discussion here, leaving this for future study if there is interest.

13. State intervention

The State cannot achieve its goal of business-like management without knowing a great deal about the nuts and bolts of the industry with which it is dealing.

On the price side, almost all leasing schemes presuppose accurate knowledge about price. Internal transfer prices of vertically integrated corporations can rarely be taken at face value. In addition to the obvious kinds of fiddling which are possible and frequently discussed, there is the question of volume discounts. There may be a spot market for petroleum at a considerably higher level than the price for firm wholesale supplies. There may be independent refineries that would pay a higher price than the major firms' internal transfer price. What, then, shall we consider the prevailing price?

In a perfectly competitive industry we would find a central market somewhere in which we could have some confidence. In an industry dominated by vertically integrated firms, where oil is frequently swapped for oil rather than for money, where certain markets are dominated by a small number of refineries and marketing networks, these questions assume great importance. The question of marketing is beyond our scope, but it seems obvious that the State would benefit by moving aggressively and definitively in this area to preclude its being exploited by under-pricing. A very productive use of royalty oil might be to supply a state marketing agency to "test the waters" and find out what price might be fetched by independent oil offered outside of regular marketing channels.

The possibility should not be overlooked, particularly with natural gas, of dealing directly with governments of the consuming states. These governments, after all, regulate the distribution of gas within their boundaries. California has taken some halting steps in the direction of looking into securing its own supplies of gas reserves.

Here, however, arises another hazard. Consuming states would like nothing better than to capture oil and gas reserves in Alaska, subject to mandatory delivery at regulated low prices. A paramount consideration in leasing policy should always be to blunt the impact of regulation by the FPC and the FEA, agencies whose policies seem calculated to effect a large transfer of wealth from producers to consumers. There need be no sense of guilt about this. California has no more claim on the resources of Alaska than Alaska has on the resources of California; and if California did have such a claim, underpricing gas and oil would be a most inefficient way to assert it. We are not suggesting that Alaska exploit consumers in a monopolistic way; we are, rather, suggesting that Alaska avoid being exploited by consumers in a monopsonistic way by consumers with the club of federal power at their command.

Dealing with vertically integrated concerns (with dedicated reserves designated for specific plants and consuming regions) lends itself to this kind of exploitation. Long-term leases dedicated to costly pipelines financed by consumers make the State vulnerable. The shorter the term of the lease, the later it is written, and the more the State depends on the free market, the stronger is its position. All these are complex and ramifying questions beyond our present scope. The present point is that they urgently require attention when a leasing policy is being formed.

Closer to home, access to any common carrier pipeline needs to be aggressively assured by exercise of the good offices of the State. Attorney John Lamont has indicated that equal access to common carrier

pipelines is far from automatic (Lamont, 1974). In order to sell additional North slope leases the State clearly must guarantee potential buyers full and equal access to the pipeline. In the event that producing capacity may exceed transporting capacity, the formula for allocating capacity needs to be specified in advance. Second-class treatment for nonowners of the line will result in second-class bids for State leases.

The choice of a bid variable

There should be a bid variable. There should be an auction at some point in the leasing process. Otherwise we are back at a noncompetitive system with its propensity towards prematurity or "soonerism." We now ask which of the leasing elements makes the best bid variable.

An argument for choosing the royalty as the variable is that a sliding scale is needed to make high royalty rates tolerably workable, and one way of making the scale slide is to let the bidders decide what the rate is to be.

The trouble is, variable royalties will slide on ex ante expectations rather than ex post disclosures. If we do opt for sliding royalties, it would be more feasible in my opinion to base them on objective ex post conditions such as depth, location, size, pressure, bearing strength of surface, length of working season, and so on.

The same considerations, pro and con, apply to profit share bidding in somewhat lesser degree.

When we get to the rent share element there is no need for any sliding scale. Sliding scales are simply means to make royalty and

profit share systems more nearly approximate rent share systems. The idea is to capture as close to 100 percent of the rent as the State can. There is no need to settle for less because rent is a surplus above necessary payments for costs and incentives. It is exactly the value imputable to the natural resource which the State contributes to the production process.

The bonus makes a logical bid variable because it is hard to set in any other way. It is not a percentage of anything fixed or known. To be sure, it could be set equal to the State's appraisal, but this is based on imperfect knowledge ex ante. An additional advantage of the bonus as the bid variable is familiarity and custom.

The problem with the bonus bid variable is that whatever is variable may tend to increase over time in relative importance and we are trying to get away from heavy reliance on bonuses. We may solve this problem easily by tying the bonus and the rental together at a fixed percentage, with the rental being a high percentage of the bonus. If the percentage were 50 percent the bonus bid would be converted to a rental bid with a double rental paid in year 1.

An annual rent has most of the good qualities of a bonus with few of its failings. We would recommend, therefore, that the rent-to-bonus ratio be set quite high. Indeed, the main reason for retaining the bonus element at all is its familiarity.

If we choose to let the ad valorem charge (AVC) be a large element in subsequent lease income, there is attractiveness in using the same rate for both the charge and the rent-to-bonus ratio, let's say 25

percent. Then there may be a smooth transition from the bonus bid as the basis of valuation to an assessment of reserves as the basis, maintaining the same 25 percent rate on each.[4]

If we choose a high delay rental and a system of production-based payments, we can probably improve on the present concept of letting the delay rental lapse when production is shown to be commercially feasible. This contains an arbitrary element, permitting token production or token shows of producibility to terminate the rental. It might be better to let the rental continue and be creditable against production payments. This will pose another arbitrary decision later on when pressure is dropping and production falling, but later arbitrary decisions are less harmful than earlier arbitrary decisions and in this case probably less consequential.

---

[4] Looking farther ahead, the State may wish to consider actually transferring land title, and go out of the leasing business. The Legislature could create a special class of property, to wit, oil and gas rights transferred to private hands after the date of legislation, subject to a 25 percent ad valorem property tax. The proposed system would lend itself to a smooth transition from public to private property, without there being any giveaway element.

D. Timing Lease Sales

Our position on this question has now been foreshadowed at several points. We will only summarize and recapitulate here.

Decisions about timing lease sales entail the following sequence:

1. The State must determine which leasing procedure and method of repayment it will use before it is possible to determine rationally the optimal timing of lease sales.

2. Potentially leasable lands should be ranked according to "ripeness" or maturity for lease sale. This ranking will be roughly in the order of value. Economists generally agree that it makes sense to use the best resources first, but value is not the only criterion nor is it unambiguous since it could mean value per acre, value per barrel, value per well or value per parcel. The correct criterion does not involve these ambiguities, because it is a percentage.

We are discussing the value of the State's share of the income from the lease and not the value of the leasehold interest. We mean the present value or discounted cash flow of the State's share. This reduces it to a unitary figure. It will be a substantial job to make these estimates and to attach appropriate degrees of certainty to them. This job is indeed impossible so long as preleasing exploration is a monopoly of the potential lessees and the information is not shared with the State. The State must buy or otherwise acquire more information. Professors Rooney and Norgaard both address this vital point (Appendixes G and E).

The next step is to arrive at a forecast of how rapidly we anticipate the present value of the State's share will be rising. This is not a mysterious concept. If we had a simple bonus bidding system it would mean how fast we expected that bonus bids would be rising. If we have a State participation system it means that we calculate the present value or DCF of anticipated State revenues, first on the assumption that we begin the process this year, second on the assumption that we begin next year, third on the assumption that we begin the year after that, and so on.

This all might be done by hunch, but it would be much better to lay the whole process out explicitly on paper in a very systematic way with all the assumptions being stated. This will involve a substantial amount of work the first few times, but specialized personnel may quickly become familiar with the routines involved and devote most of their time to the few questions of judgment which have to be factored in.

3. The basic criterion for ripeness is now assessable. We calculate each year the anticipated percentage growth in the present value of the State's interest in the lease. So long as this figure is higher than the relevant interest rate the time is still unripe for selling.

This is a very difference criterion from a "high display of interest" by the industry. It is likely that the "sooner" interest will be high at a time when sooners anticipate future values to be rising at a very high percentage rate. They would like to get in on the fast

part of the growth curve, but there is no advantage in this for the State.

In calculating the State's share, we must be sure to deduct all associated costs and figure only the net value of the State's share. The gross share will always be growing at a slower percentage rate than the net share, so if we focus on the gross we will sell too soon.

We should add State tax collections to the gross, but be sure to subtract associated public costs from the total to arrive at the net. Adding taxes without subtracting public costs will cause us to sell too soon.

We should resist the blandishments of those whose incomes are our costs. Their interest will be to urge us to sell before the time that is optimal for the State.

We should not accept the argument to speed up selling so that development can occur before costs of development rise further. No cost of development is rising anywhere like as fast as the value of oil in the ground, a fact documented earlier. The wellhead price of Swanson River Oil in 1961 was $1.50 a barrel. If we produced that oil beginning today, fifteen years later, and had it classified as new oil and sold it for $12.00 a barrel, that is an eightfold increase in fifteen years, which works out to 15 percent per annum compounded. The State can borrow money at a much lower rate than that.

We should not give in to the pressure applied by "socners" who see the value of their map files depreciating with each passing year. The State owes them nothing.

We should not think that selling for top dollar will tend to screen out leaner firms. Lean, efficient firms can pay well for something they can sell quickly. It is long waiting periods that screen out lean firms: they work with impatient money. We can also reduce the price of entry by shrinking the size of the units we well, as the price per barrel goes up. The later we sell the more profit is to be made on each barrel and the fewer barrels it requires to make a viable operation.

We should remain constantly aware that the owners of the pipeline have much less interest than the State does in waiting for higher prices. Since they own the pipeline and the costs are mostly fixed, their value for oil is at Valdez while ours is at Prudhoe. The percentage increase in value at Prudhoe will always be greater than the percentage increase at Valdez because of the leverage effect.

In forecasting needs for production from new leases, the State should bear in mind the finding from other areas that the major increment to new reserves each year does not come from new discoveries but from the revaluation of proven reserves on extant leases (Lovejoy and Homan, 1967).

4. The appropriate interest rate for the State to use should be no higher than its borrowing rate and might be lower if the State has surplus funds which it is being forced to invest in ventures of questionable marginal productivity merely in order to do something with the Permanent Fund. The State should add a "shadow cost" to its interest rate to account for its freedom from its own State and local taxes. It does not make sense for the State to invest capital or withhold assets

earning 4 percent from its own citizens who might be earning 5 percent, where the extra 1 percent goes to pay State and local taxes. But as to the extra 3 or 4 percent required to pay federal taxes, that is another question. This is 99 percent leakage from the State and so, as a matter of State policy, should not be considered. Federal policy is something else, but that is not our present concern.

5. Just as there is an optimal time to sell leases, so there is an optimal time to begin preleasing exploration. Where the State is contracting this out, the time to begin should be calculated essentially in the same way as the time of selling leases. This will necessarily be done on a much lesser base of information.

6. At the time of lease auctions the State should set a reservation price. The Public Land Law Review Commission found that where all bids were rejected, they were substantially higher at the next auction. Professor Norgaard's analysis (Appendix E) pinpoints this as one of the most needed reforms.

7. The State should give some concern to maintaining a steady flow of lease sales, but should not let that dominate policy. For one thing, it tends to follow automatically from the criteria suggested. That is, a bulge in lease sales will overload the industry and reduce present bids and create, therefore, an expectation of higher future bids.

An artificially contrived steady flow in the face of roller coaster world prices is not advisable. It is extremely costly in lost revenues and one of its major effects is to help the largest firms overcome their diseconomies of scale, that is, their large commitment of

fixed capital. Smaller, more flexible firms are better able to move in and out and take advantage of unstable conditions.

Something along the line of the procedure sketched above has been attempted by Kalter, Tyner and Hughes in their "Alternative Energy Leasing Strategies and Schedules for the Outer Continental Shelf" (Kalter, et al., 1975). I do not vouch for everything in the Kalter report and I believe it leaves out some of the steps specified, yet I recommend it as a first step towards demonstrating how to apply these procedures.

A particular problem in the context of current federal price controls is the need to watch federal regulators carefully with their tendency to discriminate against what they call "old oil." In many natural resource tenure questions there is a grandfatherhood principle of favoritism applied. This indeed is the basis of "soonerism." Federal price control of oil and gas has taken exactly the opposite tack, a reverse grandfatherhood principle, with new producers being allowed better prices than old producers. So long as we may expect this regulatory philosophy to continue, the interest of the State obviously is to defer leasing commitments longer than otherwise. This consideration reinforces other arguments for deferral of leasing and argues strongly for withholding lands from lease. This would not be an antisocial gesture towards the lower 48, but a defensive posture forced on the State by a counterproductive, uneconomical, and irrational Federal policy to which the State has no choice but adapt as best it can.

The State should guard against losing control of its own priorities by being forced into drainage sales along the boundaries of federal and native lands. Some are born decisive, some achieve decisiveness, and some have decisions thrust upon them, often by others with other axes to grind. The State should push for early resolution of uncertain tenures: native over-claims and State selections. It should push for a drainage agreement with federal and native landowners. The more oil- and gas-prone lands it selects, the greater its decision-making role in the energy industry. Whether the recreation industry, one alternative, will be equally consequential in a future of higher energy and transportation costs is a question to which State officials should give much thought.

Another argument for deferring lease sales is the State's desire to extract more tax revenue from the windfalls at Prudhoe Bay. Heavy taxes on petroleum income received by private firms would be borne by the State in lower bids for new leases. If there is to be a period of high taxation of corporate income from petroleum, it would be well not to sell many new leases until this phase shall have ended.

E. Procedural Implications: Administrative Load and Staff Needs

We may now summarize and recapitulate our observations about staff needs.

Past policy has been dominated and limited by a traditional emphasis on economy of staff. Sales policy over a considerable period was dominated by the short-run cash needs of the State, a passive posture of nonmanagement. These traditions are inappropriate now that the State's oil and gas assets have become so large and are ripening into even higher values.

Yet the Legislature is appropriately cautious about plunging ahead blindly, building a costly administrative empire without making careful, discriminating judgments as to what is most required. One need not look far for examples of valuable public resources whose administrations eat up much of the rents that might be returned to the Treasury.

Economists are aware of a serious perceptual bias, however, which makes most people more aware of padded payrolls than padded capital budgets, the latter being in general a worse problem. The capital-intensive and land-intensive bias of bureaucracies is easily explained: once capital is acquired and captured, its annual cost no longer appears in the budget. Payrolls, on the other hand, are a regular cash outflow, highly visible and much easier to jump on, fairly or not.

A recommendation, therefore, is to make a conscious effort to compensate for this bias. An excellent way is to maintain a constant appraisal of the value of the assets disposed over by the bureaucracy and impose a

"shadow mortgage" on the agency equal to the appraised value of its resources. If we discover that the annual value of the nonlabor input, measured in this way, is much greater than the cost of the personnel we are using to administer it, it will give us a better perspective on the potential productivity of additional personnel.

Having said that we still want to economize on personnel. This does not mean underpaying them, which is one of the more expensive "economies" known to public administration. It does mean adopting those leasing methods which involve the least lost motion. Lost motion results when the basic leasing concept fails to bind the lessee and the lessor in a community of interest. The cheapest leasing method to administer is the one which sets up the least conflict.

High royalties rate poorly on this score. The State shares in the gross income but not in the costs. The State is a landlord administering a share-cropping system. Historical experience with sharecropping shows that successful landlords always oversee many details of their tenants' operation. They have to require the tenant to apply minimum amounts of labor and capital per acre. Thus, a royalty system leads inevitably towards work commitments, with extensive State intervention into operating decisions, which in turn presupposes large staff requirements. Thus, the royalty system, which at first seems so simple, is not simple to administer successfully.

The next step beyond royalty is profit sharing. This in turn requires constant auditing of expenditures. Staff requirements here may be compared with Internal Revenue Service requirements in the kind and

quantity of personnel. Some staff requirements could be obviated by borrowing information from the federal agency. However, the kind of information required for the net proceeds approach, presupposed with individual leases, might be difficult to obtain. In addition, federal tax returns are limited by the peculiar institutions of federal taxation of oil and gas, which we do not wish to emulate.

If we use a profit share system or a rent share system where the interest rate is guaranteed, we must solve complex problems about the useful lives and depreciation paths of capital assets. Many of these are treated as current expenses for federal purposes so that we cannot simply borrow the federal rules, even if we regard them as well conceived in the first place.

An advantage of the front-end recovery system is that we do not have to decide about depreciation lives and paths.

All cost sharing schemes, however, pose us a choice between two evils. We may submit to exploitation through cost padding or we may build up a large audit staff whose job is to trace down the endless and mind-bending maze of avoidance devices which may be and have been utilized to transfer profits to controlled companies elsewhere.

If we opt for the ad valorem charge approach, we need to staff up a large appraisal section. We need a staff of professional appraisers supported by additional reservoir engineers. On the other hand, we can dispense with the auditors and we need not be involved in imposing work commitments on lessees. Appraisal itself is a species of audit, and the ad valorem charge imposes its own kind of work commitment on the

person who has to pay it. Where the administration of cost sharing may be compared with the Internal Revenue Service, the administration of the ad valorem charge may be compared with property tax assessment.

Whether we choose royalties or cost sharing or ad valorem charge, we cut into private motivation to explore the underground and will need to allocate some cash to acquire the information in other ways, either in-house, or by contracting out exploration, or by Rooney's Exploration Expenditure Bidding (Appendix G). Either way, the appropriations committee will see the cash outflow and have to use inference and analysis to be persuaded that the bids received for State property are higher as a result. We should guard against the resulting perceptual bias leading us to overestimate the costs relative to the gains.

The next step in eliminating administrative costs is to move back to an ex ante system with emphasis on the bid bonus and/or a corresponding delay rental. These systems appear to relieve us of some administrative burden.

Note well, however, that in order to time sales properly we need the services of an appraisal staff, even if we use a simple bonus system. We need to be able to set a reservation price in case the bids are all too low, and above all we need to know the rate at which probable sales prices are increasing, in order to know the optimal time to sell. We would obviate the simpler appraisal task of valuing resources ex post discovery and description, but make more critical the more difficult task of appraisal before disclosure of outcomes.

An appraisal staff is also needed to assess environmental impacts which may be measured as the difference in the value of property before and after the impact.

Our most unambiguous staffing recommendation is, therefore, the creation and staffing of an appraisal section. Appraisal gets right to the heart of the rent-collecting business which is to distinguish high-cost deposits from low-cost deposits. It gets right to the heart of timing leasing sales which is putting a value on the State's share and its rate of growth. It gets to the matter of environmental impacts as just mentioned. It supplies an inventory to be used in planning. It is a means of collecting and organizing information in the most generally useful way.

Whatever leasing method is selected, staff resources should be set aside for constant review and evaluation. There should be a postmortem on every sale. How did we do? What mistakes did we make? How can we avoid them next time? Few of us would welcome intensive scrutiny of all our past decisions and understand the reluctance of others to be similarly scrutinized. Yet we all recognize the potential value in such review when applied to others, like the surgeon who just took out our kid's tonsils. It would be desirable, therefore, to institutionalize the postmortem review procedure.

While these are all important matters an excessive concern with them would be premature at this time. The first priority is to legislate basic businesslike guidelines for managing the State's extremely valuable resources. No administration can perform any better than its legislative

mandate allows and an excessive concern with administrative questions at this time would interfere with putting full priority on the larger question of specifying the basic conceptual guidelines and criteria for businesslike management.

F. Leasing and Taxation

Comparisons of leasing alternatives and taxation alternatives have been made throughout this Report. We will not repeat, but bring out points not made elsewhere.

Various lease elements have their counterparts in various taxation elements, but a lease is a binding contract which cannot be unilaterally changed by future legislatures, unlike a tax. A lease can discriminate against interstate commerce unlike a tax (for example, by allowing deduction of in-State costs but not out-of-State costs). A lease is an interest in real estate from which the State can reserve all manner of powers to itself, which it can hardly do when imposing a tax.

A lease differs from most familiar taxes in that it is in rem, that is it is attached to a piece of real estate rather than being in personam, that is an obligation of individuals as such. While this differentiates it from most taxes, it makes it similar to the property tax which is also in rem.

Any attempt to use the corporate income tax in lieu of an adequate leasing policy meets with only limited success because the tax is in personam, and requires an audit of all the affairs of the corporation, and requires interstate sharing, and is subject to the interstate commerce clause. The alternative, "net proceeds" tax, has been criticized by Ziefman and Ainsworth. (Ziefman and Ainsworth, 1977).

The tax instrument that we see as most capable of substituting for leasing policy would be a special, classified property tax to be imposed

either on leasehold interests in oil and gas, or on title to oil and gas after that had been passed from the State to a private buyer. This would closely resemble the proposed ad valorem charge, but would be subject to future changes of rates since the present legislature cannot biud future legislatures in tax matters.

G. Tentative Recommendations

Recommendations are offered tentatively by listing alternative leasing elements in what the consultant now believes to be their order of preference. This listing is not designed to persuade. On the contrary, it may serve to put readers on notice of the consultant's personal judgments which may have unconsciously affected his marshaling of the arguments. Nor is our position ready to be chiseled in stone. This is a complex new field; we have a lot to learn and the consultant reserves the right to change his mind subject to new information and new insights.

I would screen out the systems based on ex ante forecasts, and go with one of the ex post systems. This means primarily that I would not continue depending on a high front-end bonus. This is not because of any universal antipathy to bonuses. In the analogous matter of timber sales from federal forests, I prefer the bonus system as practiced by the BLM in preference to a stumpage rate based on scaled volume as practiced by the Forest Service. Standing timber may be cruised with tolerable accuracy before bids are made and accepted, and the period of time involved is or can be short.

Here on the other hand, we are dealing with resources much less well known in advance and whose extraction extends over two or three decades following the investment in the bonus. Even a five-year contract, as used in some forest sales, screens out many worthy operators without accumulated wealth and would much better be payable on the installment

plan to avoid this problem. To require bidders to pay in advance for an unknown possibility of acquiring a 20- or 30-year supply is virtually to substitute wealth for productivity as the effective basis of allocation. The possession of great wealth suggests there may have been past productivity, although predation and privilege are also sources of wealth. It is no guarantee of present or future productivity.

Whatever system is chosen it needs to be accompanied by vigorous inquiry into the transfer prices being used as the basis of valuation. If costs are to be made deductible the same holds true in spades.

I would place greatest emphasis on that lease element I have called the ad valorem charge (AVC). As indicated earlier, use of this element detracts from the motivation for exploratory drilling and this needs to be compensated for. A high and rising delay rental is recommended.

If we wish to retain the form and terminology of the bonus system, we could describe this as a low signature bonus paid on the installment plan followed by a high production bonus or discovery bonus whose size depends on the flow of production.

To strengthen the State's hand in appraisal and minimize concealment of reserves it would be desirable to accompany this system with a program of State-financed contract exploration with publicity of findings. (Appendix E and Appendix G) This is not, however, absolutely necessary. We could have AVC postleasing, while continuing to rely on the present system of privately financed preleasing exploration.

An ad valorem charge (AVC) at a high rate obviates reservations of acreage for the purpose of getting top dollar at drainage sales. AVC

assures that the State will collect these surpluses anyway.

My second choice would be profit sharing, without front-end recovery or recovery of interest at a guaranteed rate. This is a compromise among the pros and cons of different systems. Royalties, on the one hand, impose too much deadweight loss as the landlord shares revenues without sharing the costs. Sharing costs, on the other hand, in a high degree at a high rate is not administrable. There will be excessive padding.

Profit sharing is somewhat less paddable and hence, with severe policing, would be workable. Since costs may be written off against royalties, but without interest, its bias is mostly against costs which are incurred long before they result in increased production. We have noted that there is too much of that anyway, that several factors conspire to stretch out the period between investment and recovery of capital.

There is a substantial policing benefit to compensate for the social cost of not letting interest costs be deductible against production payments. Interest costs are invisible to most people, and somewhat mysterious, and not so easily perceived as padding. Most people perceive padding in terms of putting relatives on the payroll, featherbedding, girlfriends, and other labor-related offenses. These are highly visible and easily understood, hence likely to be overstressed relative to padding of interest payments. But capital can be lazy, too, and undoubtedly will be if interest payments are guaranteed. Profit sharing avoids this problem.

My third choice is a variable royalty with rates varying according to a variety of objective criteria which could be combined in a point system. Rates would be high where costs are low and vice versa. It would

not do simply to assume that volume of flow is the only important factor affecting costs and to have a sliding or step scale increasing with flow. Several other cost factors, probably including several not even alluded to in our previous discussion, need to be entered into the formula. We could remove the future shift effect by limiting the term of the lease to about 25 years or less.

The advantage of this system over actual deduction of cash expenses is the absence of opportunities for padding. Royalty rates would be low where the characteristics of deposits indicated that a prudent operator of average capability would incur high costs. Individuals who performed better than this standard would reap the rewards of their own efficiency.

The system could be progressively amended and improved over the years as experience indicated that the cost of overcoming certain handicaps had been overestimated or underestimated.

In some ways this system resembles the AVC, being based on an outside objective appraisal of the differential value of different deposits. It is something like having the Legislature play the role of assessor when it sets up the point system. Whether this is practicable is partly a question of how many variables there are which affect costs of production. If there are only a few whose effects on costs can be accurately specified then this system might be workable.

My fourth choice would be front-end recovery. This is preferable to guaranteeing a rate of interest because fast recovery is so much more important to lean firms than to rich ones. This system is to be compared with the privilege of expensing capital investments for income tax purposes.

The problem is that any capital expenditure could be written off immediately against a flush producer, opening the door to extensive goldplating and dissipation of rent. Auditing problems are not insurmountable: there is a limit to the credulity of any auditor as to what may legitimately be justified in expending to develop a specific mineral deposit, and auditors would be highly specialized in the oil and gas business.

If either the profit-share, variable royalty, or front-end recovery system is adopted it needs to be preceded by a substantial delay rental to commit the lessee to performance.

We would not recommend returning to the non-competitive or other claim-staking system. We would not recommend high front-end bonuses. We would not recommend exclusive reliance on annual rentals determined ex ante. We are mildly enthusiastic about unitization, b t prefer a two-tier system coupling individual operation of tracts with overall reservoir management subject to control by lessees themselves, and encouraged by the State to maximize discounted cash flow for the group. An effective two-tier system might permit parcels to be smaller than now, a subject we have not explored.

We would not object to putting an upper limit on the acreage controlled by any one lessee, but regard this as difficult to enforce, somewhat arbitrary, and probably unnecessary if other suggested changes are made. We would not object to leases' being subject to an antitrust impact evaluation by the Attorney-General, although we view this as legalistic, potentially arbitrary, and less desirable than generalized incentives designed to encourage competition.

We believe that liability for environmental damages downstream from a lease should be a lien on the leasehold interest (not on the State's interest) up to the full value of the leasehold interest, provided the damages occur in Alaska. It would be desirable for this lien to extend to all the leasehold interests held by the company committing the damages, introducing a progressive element into risk liability.

Leases should be transferable. All information generated on State-owned lands should be reserved to the State and made public immediately. The State should extend its good offices in the form of a guarantee to all leaseholders that they may have equal access to common carrier transportation. Differences among different leaseholders on the same structure as to desired rates of production are to be resolved by transfers from those preferring slower rates to those who prefer faster rates at a field price to be set by State authority, based on an appraisal of true market value.

Various lesser recommendations on a variety of points have been made from time to time as we proceeded.

We believe the measures recommended would constitute an effective response to the challenge of oil and gas leasing policy in Alaska.

Acknowledgments

I wisn to thank many people who have given of their time and ideas to help make this Report a more useful product. The initiative of the Commissioner of Natural Resources, Guy Martin, his organizational input, and his continuing interest and support are particularly appreciated. In addition, there has been excellent support from the Assistant Commissioner, Jack Roderick, and the DNR staff: O. K. Gilbreth, Pedro Denton, Pat Dobey, and Hoyle Hamilton, particularly.

Gregg Erickson and Fred Boness of the Legislative Affairs Agency have been most helpful. I feel especially supported by the several years of prior research conducted by Gregg Erickson, all of which has been most helpful.

Time has been freely given by James Rhode, David Knudson, Thomas Williams, Barbara Sorenson, and Vincent Wright. I also benefited from an early meeting with the Legislative Interim Committee on Oil and Gas Leasing and Taxation, attended by Senators Croft, Huber, and Poland, and Representatives Anderson, Davis, and Malone.

Alaska citizens outside of government who have given helpful counsel are Robert Atwood, Jamie Love, Tina Stonorov, Peg Tileston, and Arlon Tussing.

Outside of Alaska, I have benefited from the advice of large numbers of informed people of whom I would particularly mention Eugene Corrigan, Executive Director of the Multistate Tax Compact; Professor Robert Kalter, Cornell University; Professor Duncan Harkin, University of Wisconsin; Professor William Lord, University of Colorado; Professor

Stephen Smith, University of Wisconsin; Dr. John Wilson of John Wilson Associates, Washington, D.C.; Dr. William Pendleton of the Ford Foundation; Professor Walter Mead, University of California, Santa Barbara; Robert Paschall, California State Board of Equalization; Ronald Welch, California State Board of Equalization (retired); Professor Albert Church, University of New Mexico; Professor Delworth Gardner, Giannini Foundation, Berkeley, California; Professor Anthony Clunies-Ross, University of Papua, New Guinea; Professor Don Kash, University of Oklahoma; Professor Stephen Cheung, University of Washington; Loren Sivertson, Department of Economic Development, Government of British Columbia; Professor Fred Peterson, Council of Economic Advisors; and Dr. Jack Stockfisch, American Petroleum Institute.

I have benefited from an enormous volume of written words, only part of which are acknowledged in the text. Some particularly helpful works have been several articles by Gregg Erickson; Stephen McDonald's book on "Oil and Gas Conservation"; Lovejoy and Homan on "Estimating Mineral Reserves"; the Public Land Law Review Commission Report, quarterbacked by Duncan Harkin at the University of Wisconsin, dealing with Alaska; Stephen Cheung's book on "The Theory of Share Tenancy"; Gale Johnson's earlier seminal article on the same subject; the report of Professors Kalter, Tyner, and Hughes to the Department of the Interior on OCS leasing policy and scheduling; the California State Assessor's handbook, "Guide to Mineral Valuation"; the recent Library of Congress summary of alternative leasing methods by Useem and Lindahl; the report of the Jackson Committee; the Van Poollen report on the effect of different

rates of extraction from the Sadlerochit Reservoir; the Tanzer report to the State Legislature; the Lipton statement; the work of Campbell Watkins on the economics of oil reservoir development; and Martin Stern's paper, "A Policy Impact Model for the Supply of Depletable Resources." All of these have proved to be fertile sources of information and ideas along with many other works too numerous to list, some of which no doubt should be listed on the same level with those already mentioned if memory only served and time were long enough.

Special mention is due to Professor Guy Phillips, University of California, Riverside, who researched recent changes and prospective changes in federal tax policy related to oil and gas.

Finally, I must thank my associates, Professor Michael Crommelin, Professor Richard Norgaard, and Professor Robert Rooney, whose work is in the Appendixes to this Report. In addition to this independent research, they improved my mind by frequent consultation. They added many ideas to the final Report and subtracted several bad ones. Final responsibility for the Report, however, rests with the author.

SEC. A

Introduced: 2/17/78
Referred: Resources and Finance

IN THE HOUSE

BY THE RULES COMMITTEE BY REQUEST OF THE GOVERNOR

HOUSE BILL NO. 854

IN THE LEGISLATURE OF THE STATE OF ALASKA

TENTH LEGISLATURE - SECOND SESSION

A BILL

For an Act entitled: "An Act relating to the leasing and exploration of state land for oil and gas development."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

Section 1. AS 38.05.180 is repealed and re-enacted to read:

Sec. 38.05.180. OIL AND GAS LEASING. (a) The legislature finds that

(1) the people of Alaska have an interest in the development of the state's oil and gas resources to

(A) maximize the economic recovery of the resources;

(B) minimize the exploitation of these natural resources in protection of the public interest;

(C) maximize competition among parties seeking to explore and develop the resources;

(D) maximize use of Alaska's human resources in the development of the resources;

(2) it is in the best interests of the state to encourage an assessment of its oil and gas resources and to allow the maximum flexibility in the methods of issuing leases to

(A) recognize the many varied geographical regions of the state and the different costs of exploring for oil and gas in these regions;

(B) recognize the need for stimulating development in particular regions of the state;

(C) minimize the adverse impact of exploration, develop-

ment, production, and transportation activity on the environment of the state;

(D) maximize state revenue from profitable oil and gas production, while minimizing revenue from unsuccessful exploration and from marginal economic oil and gas production.

(b) The commissioner shall prepare, review, revise, and maintain an oil and gas leasing program as follows:

(1) The leasing program shall be submitted to the legislature for its information within 10 days after the convening of each regular session of the legislature. The leasi program must indicate as precisely as practicable the size, timing, and location of leasing activity which the commissioner determines will best meet state needs for the following five-year period. The commissioner shall establish the timing and location of leasing, to the maximum extent practicable, so as to obtain a balance between the potential for environmental damage, the potential for the discovery of oil and gas and the potential for adverse impact on the local communities in the state.

(2) After the leasing program has been prepared by the commissioner, a lease shall be issued if it is for an area included in the leasing program; however, leasing may continue until January 1, 1980 or until a program is prepared, whichever is sooner, and leasing under (t) of this section may be excepted from the leasing program if the commissioner finds it to be in the best interests of the state.

(3) The commissioner shall review the leasing program at least once each year, at which time he may revise and reapprove the program.

(4) The commissioner shall, by regulation, establish procedures for

(A) receipt and consideration of nominations for any

A lessee who fails to discharge a work commitment in its entirety is liable to the state for the undischarged portion of the commitment. At his discretion, the commissioner may terminate the work commitment if he finds that the work would be unnecessary or cumulative.

(i) At his discretion, the commissioner may enter into an agreement whereby, with the consent of the lessee, the state's royalty share of oil and gas production may be stored or retained in storage by the lessee, or the commissioner may enter into an agreement with one or more of the affected field lease holders to trade current royalty production from a field for a like amount, kind, and quality of future production, on the condition that the state receives back its stored or traded royalty share during the first half of the estimated field life or no later than 15 years after start of production, whichever is sooner.

(j) An oil and gas lease must cover a reasonably compact area not exceeding 5,760 acres, and must be for a period of five years. The commissioner may grant a lease for a term greater than five years but not to exceed 10 years, where he finds that the longer period is necessary to encourage exploration and development in areas where environmental conditions severely restrict operations. An oil and gas lease shall be automatically renewed if and for so long thereafter as oil or gas is produced in paying quantities from the lease or, if the lease is committed to a unit approved by the commissioner. A lease issued under this section covering land on which there is a well capable of producing oil or gas in paying quantities does not expire because the lessee fails to produce oil or gas unless the lessee is allowed reasonable time to place the well on a producing status. Upon renewal, the commissioner may increase lease rentals so long as the increased rental rate does not exceed 150 per cent of the rate for the

preceding year. The commissioner may provide by regulation and in the lease that the lessee may earn production rights only to the depth drilled at the beginning of production from the lease. If drilling has commenced on the expiration date of the primary term of the lease and is continued with reasonable diligence, including such operations as redrilling, sidetracking, or other means necessary to reach the originally proposed bottom hole location, the lease continues in effect until 90 days after drilling has ceased and for so long thereafter as oil or gas is produced in paying quantities.

(k) The commissioner may establish by regulation that after a well has been plugged and abandoned, the rental rate which was in effect during the year of abandonment is maintained for the remainder of the term. Rental is payable in advance and continues until income to the state from royalty, net profit, or exploration work commitment exceeds rental income to the state for that year; after the rental income schedule has been exceeded for three consecutive years, the rental terminates. Oil and gas leases shall provide for payment to the state of rental on the following basis:

(1) for the first year, $1.00 per acre;

(2) for the second year, $1.50 per acre;

(3) for the third year, $2.00 per acre;

(4) for the fourth year, $2.50 per acre;

(5) for the fifth year, $3.00 per acre.

(l) Upon timely application as provided by regulation, the state may issue to the holder of a federal or private lease, a state shorelands lease covering land within the exterior boundaries of the federal or private lease which has been excluded on the basis of navigability or which is later administratively or judicially determined to be shoreland. The term of such a state shoreland lease shall be the same

as the term of the federal or private lease, but may not exceed five years.

(m) To conserve the natural resources of all or a part of an oil or gas pool, field, or like area, whether or not the part is then subject to a cooperative or unit plan of development or operation, lessees and their representatives may unite with each other, or jointly or separately with others, in collectively adopting or operating under a cooperative or a unit plan of development or operation of the pool, field, or like area, or a part of it, when determined and certified by the commissioner to be necessary or advisable in the public interest. The commissioner may, with the consent of the holders of leases involved, establish, change, or revoke drilling, producing, rental minimum royalty, and royalty requirements of the leases and adopt regulations with reference to the leases, with like consent on the part of the lessees, in connection with the institution and operation of a cooperative or unit plan as he determines necessary or proper to secure the proper protection of the public interest. The commissioner may require oil and gas leases issued under this section to contain a provision requiring the lessee to operate under a reasonable cooperative or unit plan, and he may prescribe a plan under which the lessee must operate. The plan must adequately protect all parties in interest, including the state.

(n) A plan authorized by (m) of this section, which includes land owned by the state, may contain a provision vesting the commissioner, or a person, committee, or state agency with authority to modify from time to time the rate of prospecting and development and the quantity and rate of production under the plan. All leases operated under a plan approved or prescribed by the commissioner are excepted in determining holdings or control under sec. 140 of this

chapter. The provisions of this section concerning cooperative or unit plans are in addition to, and do not affect AS 31.05.

(o) Producing acreage on a known geologic structure of a producing oil or gas field is excluded from chargeability as against the acreage limitation provisions of sec. 140 of this chapter.

(p) When separate tracts cannot be individually developed and operated in conformity with an established well-spacing or development program, a lease, or a portion of a lease, may be pooled with other land, whether or not owned by the state, under a communitization or drilling agreement providing for an apportionment of production or royalties among the separate tracts of land comprising the drilling or spacing unit when determined by the commissioner to be in the public interest. Operations or production under the agreement are considered as operations or production as to each lease committed to the agreement.

(q) The commissioner may, on conditions which he prescribes, approve drilling, or development contracts made by one or more lessees of oil or gas leases, with one or more persons, when, in his discretion, the conservation of natural resources or the public convenience or necessity requires it or the interests of the state are best served. All leases operated under approved drilling or development contracts, and interests under them, are excepted in determining holding or control under sec. 140 of this chapter. Drilling or development contracts may include, at the discretion of the commissioner, provisions authorizing the state to share in the costs of exploration.

(r) To avoid waste or to promote conservation of natural resources, the commissioner may authorize the subsurface storage of oil or gas whether or not produced from state land, in land leased or subject to lease under this section. This authorization may provide for the payment of a storage fee or rental on the stored oil or gas, or,

instead of the fee or rental, for a royalty other than that prescribed in the lease when the stored oil or gas is produced in conjunction with oil or gas not previously produced in paying quantities.

(s) Each oil or gas lease issued by the state must contain a provision requiring the lessee to furnish the Department of Labor a quarterly report regarding the employment of state residents on the leased property. The commissioner of labor shall adopt regulations necessary to implement this subsection. No lease issued under this chapter is valid unless it contains provisions requiring the employment of qualified Alaska residents in accordance with AS 38.40.030, and complies in all respects with the requirements of ch. 40 of this title.

(t) Notwithstanding any other provision of this section, land which has been offered for lease within the previous five years but which received no bids at competitive sale may be, ~~at the discretion of the commissioner~~, ~~immediately~~ offered for lease, under regulations adopted by him, upon terms appearing most advantageous to the state, including leasing noncompetitively. The commissioner shall use a sliding scale royalty based upon such formulae as he determines to be in the public interest but not less than 12 1/2 per cent at the beginning of production from the lease in amount or value of the production removed or sold from the lease or unit area encompassing the lease. A lease must provide for payment to the state of rental but need not adhere to the rental schedule in (k) of this section nor to the 5,760-acres-per-lease limitation in (j) of this section. The lease term may not exceed five years except as provided in (j) and (k).

(u) The commissioner may, by regulation, restrict joint bidding ~~by~~ major or multi-national oil and gas companies to encourage competition.

(v) The state has the right to purchase not more than 16 2/3 per cent of the volume of oil and up to 100 per cent of the volume of gas produced from a lease issued in accordance with this section, at the regulated price, or, if no regulated price applies, at the fair market value at the point of sale, except that any oil or gas obtained by the state as royalty or net profits shall be credited against the amount that may be purchased under this subsection. Oil and gas purchased under this section may be used by the state in the same manner as it uses its royalty oil and gas.

(w) A lessee or permittee conducting any exploration for, or development or production of, oil or gas on state land shall provide the commissioner access to all data obtained from that activity and shall provide copies of specific data, as the commissioner may request.

* Sec. 2. AS 38.05.135(b) is repealed and re-enacted to read:

(b) When minerals are to be leased, in addition to any other notice given, notice must also be given as provided in secs. 305 and 345 of this chapter.

* Sec. 3. AS 38.05.140(c) is amended to read:

(c) No person may take or hold at one time phosphate leases on state lands exceeding in the aggregate 10,240 acres. No person may take or hold sodium leases or permits during the life of sodium leases on state lands, exceeding in the aggregate acreage 5,120 acres, except that the commissioner may, where it is necessary in order to secure the economic mining of sodium compounds, permit a person to take or hold sodium leases or permits for up to 15,360 acres. No person may take or hold at any one time oil or gas leases exceeding in the aggregate 500,000 acres granted on tide and submerged lands, and 200,000 [500,000] acres on all land [LANDS] other than tide and submerged land [LANDS], including leases held both as lessee and under option or

operating agreement from others. A person has five years from the effective date of this Act to conform to the 200,000-acre upland limitation. Where more than a single person holds an interest in an oil or gas lease, each person shall be charged only with that percentage of the total acreage which corresponds to its percentage share of the total beneficial interest in the lease.

* Sec. 4. AS 38.05.145(b) is repealed.

DEPARTMENT OF NATURAL RESOURCES

A STUDY OF STATE

PETROLEUM LEASING METHODS

AND POSSIBLE ALTERNATIVES

A REPORT TO THE STATE OF ALASKA, JAY S. HAMMOND, GOVERNOR, DEPARTMENT OF NATURAL RESOURCES, GUY MARTIN, COMMISSIONER, AND TO THE ALASKA STATE LEGISLATURE, INTERIM COMMITTEE ON OIL AND GAS TAXATION AND LEASING POLICY, CHANCY CROFT, CHAIRMAN

FEBRUARY 1977

STATE OF ALASKA
DEPARTMENT OF NATURAL RESOURCES
OFFICE OF THE COMMISSIONER

JAY S. HAMMOND, GOVERNOR

11TH FLOOR, STATE OFFICE BLDG.
POUCH M — JUNEAU 99811

February 17, 1977

The Honorable Jay S. Hammond
Governor of Alaska
Pouch A
Juneau, Alaska 99811

Dear Governor Hammond:

The following report regarding State oil and gas leasing has been prepared by the Department of Natural Resources as a part of a joint Administration-Legislature effort to evaluate the present leasing system and to explore alternatives for the future. The overall study effort, for which I served as Project Director, also includes other Department documents, the reports of independent consultants and miscellaneous other information.

The information in this report, and the entire study, is intended to serve as basic background material to illuminate alternative State objectives and leasing methods which may be desirable for the future. Although some conclusions are reached in parts of the various studies, no final comprehensive conclusions or positions have been reached, pending further analysis of the results of the study project and discussion thereof.

The complexity and importance of the oil and gas leasing issue for the future of the State has thus far sustained an ideal level of constructive cooperation between the Administration and Legislature, and I am hopeful that this report will contribute to an informed outcome on this matter.

Very truly yours,

Guy R Martin

Guy R. Martin
Commissioner

FOREWORD

This report has been prepared in response to Departmental and Legislative interest in the methods and policies of competitive leasing of state lands for oil and gas purposes. A fairly complete history has been compiled showing pertinent information on past practices of the State. Summaries of all lease sales, bonuses, rentals, receipts and results of drilling and royalty awards are discussed. As a result of this report, it can be concluded that some types of bidding will theoretically yield greater income to the State under specific circumstances than other types will. From strictly a monetary point of view, this study reveals that four major factors will determine which method of bidding would be most advisable for the State to follow. The amount of income to be derived by the State will be determined by the level of risk, the size of the reservoir, the cost of exploration and development, and the value of the oil at the wellhead.

This report has revealed some areas that require further study and this will be done in the coming months. For example, the study reveals that with current economic, royalty, and tax conditions, the minimum size field that an oil and gas operator can afford to look for in Alaska must exceed 55 million barrels in close in areas such as Cook Inlet and could be 100 million barrels or more in remote areas. Also since special cases arise from marginal fields, more detail analysis should be made of effects of reducing royalties to encourage production in sub-economic fields.

Since the purpose of this report is to show variations that can result from various types of bidding most of the emphasis is on types of bidding

other than the cash bonus system. It should not be construed however, as condemning cash bonus bidding nor recommending any alternate type of bidding. The analyses are presented merely to show relative income under specific sets of assumed conditions. A change in some of the input factors can give substantial changes in results.

Risk is the most significant of the variables which would affect income to the State. In unknown, undrilled, untested areas, where the information level is low the risk will be extremely high and these analyses indicate that the cash bonus bidding method would yield greater income to the State. As more information becomes available and as the risk decreases, the method which yields the greatest monetary return revolves around some type of royalty bidding. After a discovery is made, any open acreage on the structure in essence becomes drainage acreage, risk will be low and royalty or some other type of bidding may yield a far greater income to the State than the cash bonus type of bidding. Somewhere then between the extremes of no information and maximum information the method yielding the greatest income probably will switch from cash bonus bidding to some other type of bidding. A significant result of this study indicates that state income can be increased for all leasing methods studied by using a percentage acreage option which is withholding a portion of the structure for later leasing. Other types of bidding are discussed to accomplish other purposes.

There are increasing pressures on government to secure more information about state lands and to know more about the possibilities of petroleum occurrences before the lands are leased. These analyses have been made on the assumption that more information will be available to the State

and if those conditions exist we feel that the values shown give reliable indications of benefits to be derived from one method as compared to another method of bidding.

Risk is dependent on the amount of information available to industry and income to the State is dependent on the knowledge industry has in an area. This study assumes that geological and geophysical information is available to the State at a level above that which it now has. Obtaining this additional information will require expenditure of larger sums of money than in the past. The reader is cautioned not to use the values shown as indicative of all conditions, because as mentioned above, significantly different results are obtained as input factors change. The uncertainty of crude oil prices in remote areas could cause input parameters to change significantly with corresponding changes in analysis results. Therefore, the information presented is to compare one method of bidding versus another method of bidding for a specific set of circumstarces.

Administrative costs and number of personnel can vary greatly depending on the leasing method used. An ad valorem type of leasing could cost up to $240,000 more per year to administer where a net profits system might add $500,000 with the same number of operators and leases as we now have. In Alberta it is pointed out that 100 people administer 50,000 lease agreements and 60 people are involved with auditing in a cost sharing leasing system.

From an administrative cost standpoint, the present method of operation results in the lowest total operating cost at about $1.1 million per year. Depending on the level of data acquisition and analysis, costs will increase

from the present quarter million dollars per year. To obtain adequate seismic data for managing an area of 100 miles by 15 miles will cost from $70,000 to over $1,500,000. The present budget contains $110,000 for the purpose in FY 78.

DESCRIPTION OF LEASING METHODS IN HB854

Currently, the State of Alaska's leasing system is a cash bonus bid with a minimum fixed royalty of 12.5 percent. The methods outlined below include the present system with different fixed royalties, sliding scale royalty with bonus bid, sliding scale royalty bid with fixed bonus, net profit share bid with fixed bonus, royalty bid with fixed bonus and exploration work commitment. The basic elements of these methods are summarized below.

(1) Bonus Bid With Fixed Royalty

Bonus bid with fixed royalty is the system currently used by the State of Alaska. In a lease sale, the winning bid for a tract is the one which makes the highest sealed or auctioned cash bonus bid. There is also a minimum royalty of 12.5 percent. An advantage of this system is that government receives revenue regardless if there are economical quantities of oil or gas found and/or produced. To avoid early termination of production, royalties need to be flexible during a field's declining years.

(2) Sliding Scale Royalty With Bonus Bid (or Sliding Scale Bid with Fixed Bonus)

Under this system, the government receives a cash bonus bid and a sliding scale royalty. We used 12.5 percent as a minimum figure and 62.5 percent as a ceiling wherein the rate in any period is dependent upon the production of that period.

The royalty rate is graduated in much the same manner as the federal personal income tax. Table I gives two examples of a sliding scale royalty schedule. The royalty is progressive, that is, the royalty on additional production increases. For example, in the South Central Area, the initial 500 barrels pay a royalty of 12.5 percent, the next 500 barrels pay 25 percent. The royalty rate increases by 12.5 percentage points per 500 barrels until 2000 barrels of output are achieved. All production beyond 2001 barrels pays a royalty of 62.5 percent. Thus, if production reaches 5000 barrels, the average royalty rate is 50 percent. In the limit, the average rate would converge towards 62.5 percent as daily production continues to increase.

As field productivity declines and well production falls, the producer backs down the schedule and royalties decline. In order to optimally exploit the field, the royalties should decline to zero near the end of field life. Actually, final rates of five or six percent would result in minimal early shut down.

TABLE I
TYPICAL SLIDING SCALE ROYALTY SCHEDULES

SOUTH CENTRAL AREA

Daily Average Prod. Rate (Bbls./day)	Incremental Royalty Rate (%)	Royalty For Specific Producing Rates: Producing Rate (Bbls./day)	Royalty Production (Bbls./day)	Average Royalty Rate (%)
-500	12.5	500	62.5	12.50
501-1000	25.0	1000	187.5	18.75
1001-1500	37.5	1500	375.0	25.00
1501-2000	50.0	2000	625.0	31.25
2001-2500	62.5	2500	937.5	37.50
		3500	1562.5	44.64
		4500	2187.5	48.61
		5000	2500.0	50.00

NORTH SLOPE AREA

Daily Average Prod. Rate (Bbls./day)	Incremental Royalty Rate (%)	Royalty For Specific Producing Rates: Producing Rate (Bbls./day)	Royalty Production (Bbls./day)	Average Royalty Rate (%)
-1000	12.5	1000	125	12.50
1001-2000	25.0	2000	375	18.75
2001-3000	37.5	3000	750	25.00
3001-4000	50.0	4000	1250	31.25
4001 and above	62.5	5000	1875	37.50
		7000	3125	44.64
		9000	4375	48.61
		10000	5000	50.00

Note: The Sliding Scale Royalty Schedule for the North Slope area is significantly higher than for the South Central area because the higher North Slope operating costs result in a much higher economic limit.

Hopefully, this illustration clarifies the relationship between production rates and royalty rates.

Greater flexibility in setting the initial rate is the major advantage of this system while not running the risk of an uneconomically (for Industry) high royalty rate. On the other hand, to achieve an overall lower royalty payment, a company might spread out production over a longer period of time. Usually, however, because of the time value of money and increased operating costs, oil companies generally try to accelerate production.

(3) Net Profit Share Bid With Fixed Bonus

A small fixed bonus is required as earnest money. The bonus is low enough to encourage producers to bid a high net profit share while permitting profitable development.

(4) Royalty Bid With Fixed Bonus

This system utilizes the same method to calculate fixed bonus as described for Net Profit Share. The bid parameter is a function of production instead of net profits. Since the bonus is fixed, interested parties bid on the royalty rate that the government is to receive. The advantage of royalty bidding is that little front end money is needed by Industry. However, this could encourage speculation causing an overbid. Royalty bidding should encourage more competition among bidders and may allow the smaller companies a better chance of winning the tract.

(5) Work Commitment With Fixed Bonus, Royalty or Net Profit Share

The government itemizes the performance criteria such as the rate and amount of work to be performed on each tract. The total bid specified in dollar terms and a portion of the bid used for exploration and development activities. This system gives the government some control over the rate and extent of resource development.

of ALASKA

MEMORANDUM

DEPARTMENT OF NATURAL RESOURCES
DIVISION OF MINERALS AND ENERGY MANAGEMENT

DATE: February 28, 1978

Robert E. LeResche
Commissioner Natural Resources

FILE NO:

TELEPHONE NO:

FROM: [redacted]

SUBJECT: Rationale and Apparent Objections to HB 854- Oil and Gas leasing Bill.

Predictability, certainty and an acceptable political climate. These are the three things the petroleum industry looks for in an area attractive for exploration.

I contend it is the availability of land, not the method by which land is offered, that is the critical consideration. In other words, Alaska will become more attractive, less subject to severe criticism by the industry, once land is made available for leasing. The methods of leasing will quickly become secondary.

This contention, of course, will be disputed by the industry. They will argue that because the law allows administrators to choose from a wide variety of leasing methods the industry will remain uncertain about what to expect. I contend that the industry will be given plenty of advance notice of what method will be used in a sale and will therefore have enough time to plan financial strategy.

Industry's contention that Alaska must compete with other areas in the world within company budgets is, of course, correct. This does not mean, however, that Alaska has to settle on one, or perhaps two, leasing methods so as to make the Alaska budget dollar compete within a particular company. The company can estimate how much Alaska's prospective oil is worth to them and can calculate how much will be spent on a particular sale based on the method of lease offering, along with a multitude of other considerations. My basic assumption, of course, is that the oil is here and, eventually, the companies will come looking for it.

Which brings me back to my first point. Certainty and predictability will be established once the industry is convinced that a regular, stable procedure for offering oil and gas lands has been established by Alaska. Once lands are available and administrators are directed to offer leases to the public, most of the pressure will relax.

Industry's objection to the two reports to the legislature by the executive, I think, dramatizes my point. I think the industry will eventually accept the 5-year leasing program as a giant step toward predictability and, even though given wide public accountability, will come to believe that the report will not result in more governmental interference. Industry looks,

however, I think on the annual leasing method report as a way for the legislature to probably work its way into the day-to-day leasing decisions best left to the governor. They fear "politics" in leasing, and I am less sure of this one that I am the leasing program report.

The underlying criticism of HB 854 you will hear, I believe, is that Alaska is "experimenting" with leasing methods. We are said to be trying to adapt all the good features used in other states and jurisdictions and are trying to make them work where they were not designed to work. Alaska is frontier; Alaska is different, goes the argument.

I believe I was to take the first cut at a comprehensive review of Alaska's oil and gas leasing law following Dr. Gaffney's study. I do not claim infallibility but I do claim to have weighed the many considerations which make Alaska like and unlike other jurisdictions. As I have told you, I have tried to confront, head-on, the question of the question of the number of participants in exploration in Alaska. You have mentioned the concept of "incentives", at least as it applies to information, and I have indicated that whereas incentives are not directly dealt with in the legislation I think we may get there in the future.

So, with that background let me set forth the rationale for and some of the anticipated objections to HB 854.

Several concepts were examined and rejected. Found to be not applicable, at least at this time, are the so-called dual-leasing system (Ted Stevens' amendment to S-9). Congress may yet include something like it in OCS legislation. Also, the concept which involves distinguishing between exploration leases and those development and production activities which would be allowed after oil or gas is discovered. We have not included this concept because we believe that Alaska can know before it offers its land for drilling what development and production activities it expects to take place.(Incidentally, the conference committee on S-9 and HR 1614 is scheduled shortly.)

We examined the "ante" versus "post" royalty impact. The post (after) charge is the economic recommendation Dr. Mason Gaffney drew in his study of February, 1977 for the legislature. Dr. Gaffney concluded that the ideal way for a government (any lessor) to determine its economic rent was to determine such rent after a discovery at the price then existing and based upon the size of the field discovered. Determining the value of the field after the discovery is much like the present

calculations of the reserves tax. Its newness, being untried and the unsettling effect its introduction and application would have had on exploration activities in Alaska we felt would be primarily negative. Also, we felt that the legislature could follow-up on Dr. Gaffney's recommendations if they wished. Canada, in its new law for leasing of the North and offshore, has proposed a "progressive incremental royalty" similar in concept to Dr. Gaffney's ad valorem charge. Perhaps, it will be in Alaska's future.

We examined the incentive programs existing in the Province of Alberta, and other jurisdictions, and determined that although some incentives may be needed in the future, they should not be dealt with in this bill. Giving direct tax and other incentives to exploration operators may be necessary, particularly to stimulate the much needed geological and geophysical information data, but we felt future legislatures could deal with this basic policy charge. Rather than incentives, we believe the pace of exploration can best be determined at the time and by the terms of the original lease. And, as I note later, the work commitment lease method can be used to offer incentives.

We examined the trends all over the world toward governments retaining ownership interests (equity) in leases, and toward government-owned and operated exploration companies. We rejected both of these ideas for Alaska. Equity interests in leases makes no sense so long as the state has the flexibility to deal with the many and varied leasing situations which will confront it. Government sponsored exploration, if at all, can be achieved by contract with industry rather than by bureaucrats.

Again, the petroleum industry, not unlike any business, needs certainty and predictability in order to be comfortable doing business. A "stable and predictable leasing policy" - Tom Kelly. "The industry will initially tend to go where it's wanted and an orderly contract and dependable lease sale schedule would undoubtedly provide an impetus to further exploration in the state" - Pennzoil.

The state's need for a flexible, comprehensive, all-inclusive means of leasing appears to conflict with the industry's desire for predictability. One company (Chevron) in an informal paper went so far as to say that giving these many alternatives to the state (HB 854, before a significant change) amounts to "overkill" and makes Alaska an "experimental laboratory in oil and gas leasing." They conclude by saying: "We consider this to be capricious".

In the name of predictability and certainty, oil operators of size almost without exception opt for the cash bonus bid with a fixed royalty as the preferred leasing method. They want the simplest and most predictable method possible

I believe Alaska needs a flexible leasing law so that it may adjust to changes as they occur. The world, national and Alaska energy and oil and gas future is in a state of flux and will remain so for the two decades for which this bill is designed to accomodate. No one can be sure what future developments in energy will be and particularly in Alaska where exploration condition are so diverse.

Alaska is now one of the largest oil owning entities in the world. It will be dealing with petroleum matters, directly, for at least the next two decades, probably much longer. It's immediate future depends in large part on how it deals with petroleum matters. As such, it should become familiar with most of the alternative methods it can use to control petroleum exploration. HB 854, we believe, once it is enacted and in operation will provide the industry the certainty it requires. Admittedly, it calls for State land to be offered by methods including but also other than bonus bid where feasible. The bill introduces more alternatives than now exist, but once these methods are in place and have been used, we believe, most uncertainty will disappear.

One last word on flexibility. In addition to the State, the Federal government and Native Regional Corporations will be leasing land for oil and gas exploration for the next several decades. Terms and conditions under which leases are issued by these entities will include all the variables addressed in HB 854, and, undoubtedly, more. To protect its interest and to operate effectively in this constantly changing exploration picture, the State needs a flexible leasing law by which to respond.

Following, are an itemized list of the objections which I anticipate will be made to HB 854.

1. Term of 5 years. All operators want a lease term as long as possible. In HB 854, Commissioner can go up to 10 years if "extreme conditions, etc." exist. The majors usually know what they intend doing when they bid and lease. The smaller companies will argue that they need more time to put drilling blocks together. The State's interest is to have leases explored and it is not in having leased acreage on the books paying rentals only. Deals can be made in five years. Drilling should proceed as soon as possible, or the land should be offered again to a more agressive operator.

   The time between Cook Inlet lease sales in 1962 and 1965 until first production was begun from Middle Ground,

McArthur, Trading Bay and Granite Point averages under 4 years. Note this is production, not beginning drilling date. Average time from sale to drilling in New Mexico is 6 years.

As I have indicated before, I believe this is the most important term in the lease. The ideal would be for the commissioner to have discretion to set the length of the lease, but I do not believe the legislature or the industry would accept such discretionary authority.

2. Methods of leasing

a. Royalty bidding creates no incentive to develope leases (Chevron). This is particularly true if "surrounding leasehold were such that early evaluation was likely" -(Champlin Petroleum). Same lack of incentive argument is said to apply to high net profits and/or work commitment.

Loss of revenue to state, too risky and premature shutdown problem - (SE Alaska Empire editorial; a reprint of Fairbanks News-Miner editorial, 1977-no date) Rumor has it the USGS in Anchorage (Jones, et al) don't like royalty bidding and DOI forced it on So. Cook Inlet sale. But ARCO's first location appears to be on a royalty tract.

b. Work commitment is faulted for several reasons. Economists, including Gregg Erickson, see it as stimulating activity which the marketplace would not otherwise require. In fact, it can be used to stimulate exploration and, specifically, to acquire exploration information in areas which otherwise might not be explored. There can be an element of incentive in this method.

Tom Kelly sees the use of work commitments as pre-empting small companies. (It is interesting to note that Chevron favored the work commitment so long as the bonus or royalty was fixed and the work commitment was the sole biddable factor). Kelly sees it discouraging the promoting of participations (partners?) in drilling deals because the amount of dollars bid has been fixed. Frankly, I don't quite understand his argument, and contrary to hurting the small companies, I believe it could be used to encourage them to explore. Kelly believes a work commitment works best when it is negotiated and I agree with

him, but we agree that it is unlikely that the Alaskan legislature and public would condone negotiated lease terms by public officials. (unlike royalty sales.)

c. No mention is made of sliding scale royalty by any of the AOGA participants or companies who replied to your letter. All in the department, including Easy Gilbreth and Pedro Denton (from past memorandum in file), feel this is a most satisfactory answer. We are preparing several sliding scale examples for the Cook Inlet and the North Slope so as to focus on the factors which must be taken into consideration in setting the appropriate scale for an area.

d. Net profit will be objected to because it gets the government into the oil company's books and it will will be more costly to administer. Economists Lipton, Erickson, et al will argue it returns the most to the state.

Most economists will agree, I believe, it is the best way if "gold plating " can be controlled, but there seems to be disagreement as to whether it is best used where risks are high or low. Government encroachment will underlie the opponent's arguments.

3. The acreage limitation of 200,000 acres on state uplands (rather than present 500,000) has been objected to thus far only by a few majors. The reduction in the maximum is obviously aimed at the larger companies, and we should so state directly. (A list of state leaseholdings as of 2/10/78 is attached).

Some background may be helpful. No other state that I am aware of, has an acreage limitation. But no other state is Alaska's size nor has any state tens of millions of acres available to lease.

The Federal government has an acreage maximum for its land within each state. During Alaska's territorial days the Federal oil and gas acreage limitation in Alaska was 100,000 acres. In other states it was 46,080.

After 1961, Alaska's rose to 300,000 in the Northern district (approximately north of the Yukon River) and 300,000 in the Southern district. These apply today. Presently the acreage limitation is 246,080 acres of Federal leases per state, other than Alaska.

Finally, note that in HB 854 companies are given five years from the effective date of the act to comply with the 200,000 acre maximum.

Hopefully, a lesser upland acreage maximum in Alaska will act as, albeit a small, incentive for companies other than the majors now here to explore in Alaska.

4. The state's right to purchase up to 16 2/3% of the oil and 100% of the gas will be opposed on the grounds that it is a negative incentive for integrated companies who wish to find and use the oil and gas. We should be careful of this one, but suffice to say that in 1972 New Mexico passed a similar law (N. Mexico can purchase 100% of gas and oil), which though never exercised or tested in court, remains on the books. (a copy attached).

5. Rentals may be opposed as being too high. The authority of the commissioner to up the rental at least 150% each year on shut-in leases may begin to bind the operator without a market, but there is no easy answer to the shut-in field unless we investigate something like the reserves tax concept, which I don't believe will solve the problem.

6. Leases offered noncompetitively after receiving no bids appear to be favored by the industry. Tom Kelly comments that such leases should be offered immediately (automatically?) after the competitive sale.

Please note that HB 854(t), as written, allows the commissioner three options. He can offer tracts immediately, at any time up to 5 years after receiving no bids, or not at all. If he intended to offer tracts noncompetitively immediately after a competitive sale he would so announce in the notice of the competitive sale.

The problem inherent in giving the administrator this many options, it will be argued, is that unpredictability will occur. Unless the operator knows before hand that he can fill out his block of acreage, he is at a distinct disadvantage. The administrator should take these matters into consideration before he notices a sale.

Milton Lipton, Gregg Erickson and others may oppose this open-ended authority to lease noncompetitively following an unsuccessful competitive sale on the grounds that an administrator might rig a competitive sale so that it will not elicit bids so that an immediate noncompetitive lease can be awarded. I don't think such a hit-and-run transaction can exist these days, particularly with HB 854's public disclosure procedures, but, perhaps, I'm too naive.

7. Sealed bids or oral auction or sliding sealed bids (like Alberta). HB 854 permits the commissioner to use any or all of these. Sealed bids will be most commonly used. They are easy to administer. Oral bidding is used in New Mexico and Colorado. Champlin recommends oral bidding on "low potential" land so as to avoid preparing bid forms and "leaving money on the table." New Mexico, on the contrary, uses oral bidding about 50% of the time when it perceives that there will be alot of competition in a sale. About 50% of the time New Mexico offers tracts by sealed bid.

   Alberta allows bidders to slide bids from one tract to another in a sale. Thus, if bidder A's sealed bid fails to win on tract 1, he can direct his bonus be slid to tract 2, and so on.

   Tom Kelly, when commissioner, had his staff investigate this sliding bid method in Alberta in hopes that it might be used for the 1969 Prudhoe Bay $900 million sale. The idea was rejected because the industry objected on the grounds that it would cause too much uncertainty so close to the time of sale. Score one for certainty. Obviously, the advantage to the state would be that more money would be paid at the sale if bids were allowed to slide. Before actually using this system, Alberta's procedures should be studied again.

8. By regulation, the lessee may earn only to the depth drilled(j). I envision that the state would not invoke this right until it felt deeper horizons contained oil, and then would give the lessee a reasonable time to explore deeper. If the lessee failed to drill deeper, the deeper horizons would be offered at a competitive lease sale. Alberta woke up to this problem late and solved it by changing terms of existing lease contracts with all that political controversy.

   I will ask Peter Froehlich to research whether this issue of drilling deeper might not be solved by tightening-up terms of the lease form to require due diligence by the operator at the request of the state.

CHAPTER 26

AN ACT

RELATING TO STATE LANDS; REQUIRING THE COMMISSIONER OF PUBLIC LANDS TO RESERVE CERTAIN RIGHTS TO THE STATE IN LEASES OR OTHER CONVEYANCES OF STATE LANDS GRANTING ANY INTEREST IN OR RIGHTS TO MINERALS OF WHATSOEVER KIND, INCLUDING OIL AND GAS; PROVIDING FOR A WAIVER OF THE REQUIRED RESERVATION; PROVIDING FOR DISPOSAL OF RESERVED MINERALS.

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF NEW MEXICO:

Section 1. COMMISSIONER OF PUBLIC LANDS TO RESERVE CERTAIN RIGHTS TO THE STATE IN LEASES OR OTHER CONVEYANCES OF ANY MINERAL INTERESTS OR RIGHTS TO MINERALS IN STATE LANDS.--In any lease or other conveyance of state lands granting any interest in or rights to minerals of whatsoever kind, including oil and gas, in those lands executed by the commissioner of public lands after the effective date of this section, the following reservation of rights to the state shall be made: "The state has a continuing option to purchase at any time and from time to time, at the market price prevailing in the area on the date of purchase, all or part of any minerals (specify the minerals) that may be produced from the lands covered by this lease (or other conveyance).".

Section 2. WAIVER OF REQUIREMENTS FOR RESERVATION OF RIGHTS IN LEASES OR CONVEYANCE FOR SPECIFIC MINERALS--PROCEDURES FOR WAIVER.--

A. The commissioner of public lands may waive by written order the reservation of rights required under Section 1 of this act in respect to any specific mineral, other than fossil fuels, for which

SCRCS/HB 441
Approved March 9, 1973

there is no significant consumptive use within the state, but such order may be made only:

(1) after written notice is mailed by certified mail at least twenty days before the hearing required by Paragraph (3) of this subsection to the governor;

(2) after notice of the hearing required by Paragraph (3) of this subsection is posted in the same manner as notice of public sale of mineral leases is required to be posted under Section 7-9-34 NMSA 1953;

(3) after a public hearing on the issue of waiver under this subsection has been held by the commissioner of public lands or his designated representative in accordance with procedure adopted by the commissioner of public lands; and

(4) if the commissioner of public lands finds after considering the evidence produced at the hearing that a waiver of the provision would be in the best interests of the trust beneficiaries considering long-range and short-range benefits.

B. A waiver granted under Subsection A of this section shall be limited to a definite period of time not to exceed five years. Waivers may be renewed by the commissioner but only after following the procedure required under Subsection A of this section.

Section 3. DISPOSAL OF MINERALS BY COMMISSIONER OF PUBLIC LANDS --The commissioner of public lands shall dispose of any minerals reserved under this act at the best price available in order to gain the maximum benefit for the trust beneficiaries.

STATE'S RIGHT TO PURCHASE OIL & GAS IN HB 854

The State has the right in HB 854(v) to purchase not more than 16 2/3% of the oil and up to 100% of the gas at the regulated price or fair market value at the point of sale. The right to purchase is needed to protect the "in kind" taking of its royalty by Alaska, a sale of said royalty, and a subsequent reduction of the royalty in the later stages of production (d).

New Mexico, 1973, enacted a law which gives it the right to reserve an option to purchase at any time at the prevailing market price any or all minerals, including oil and gas, produced from State land. Thus, New Mexico may purchase 100% of the oil and gas found on State land.

Whereas the New Mexico Commissioner is authorized to waive the reservation option with respect to any specific mineral, he may not do so for oil or gas.

The Act, Chapter 26 of the Session Laws of 1973, has never been exercised by New Mexico; thus no opportunity has been given to test its constitutionality.

If Alaska were to reserve an option to purchase up to the amount of the royalty, fixed or bid, an equivalent net profit share would have to be determined.

LEASING METHODS EXAMINED

BUT NOT INCLUDED IN HB 854

1. The so-called "dual leasing" system which would authorize the State to issue separate exploration and production leases. Senator Ted Steven's amendment to S-9 would permit the exploratory lessee to share with the government (Federal) the costs of the exploratory drilling program, which would be managed by the lessee, in exchange for a share of the revenues received by the government from a subsequently issued production lease.

   The Administration believes that the State can know before it offers its land for drilling what development and production activities it expects to take place.

2. Dr. Mason Gaffney's ad valorem charge, or a "post" royalty system versus the "ante" systems in HB 854. In other words, the state determines its take before discovery, not after. Other governments, like the Canadian national, are going to the "post" systems, i.e. "progressive incremental royalty."

3. Incentives. There are no direct incentives to lessees contemplated in HB 854, except that "work commitment" would allow cash bonuses not to go to the government but instead used by industry for exploration.

4. Government equities in leases or state-owned and operated exploration companies are not envisioned in HB 854.

5. Oil Payment Bidding - shift royalty to rental.

6. Performance System which provides government with the authority to specify the exact rate and extent of resource development.

7. Share Bidding or Phillips Plan. Bonus bids are entered for the entire structure instead of for a specific tract. Based on their equity in the field, each company receives a percent of the profits or losses with a maximum percentage participation by any one company.

8. Alberta's so-called "checkerboard" leasing system wherein a reservation holder may apply for leases over not more than 50% of the area in the reservation in a checker-board pattern. These leases convey the right to produce and sell the Crown's oil and gas, and the government retains the right to alter unilaterally the terms and conditions of the arrangement.

SUMMARY OF ACREAGE LIMITATION
CHANGE IN HB 854

The acreage any one State lessee may hold is 500,000 acres upland and 500,000 acres offshore. HB 854 reduces the uplands to 200,000 acres. This is to help increase the number of upland lessees by limiting the holdings of the larger major oil companies. Offshore holdings will be unaffected.

No other state that we are aware of has an acreage limitation. But no other state is Alaska's size nor has any state tens of millions of acres available to lease.

The Federal government has an acreage maximum for its uplands within each state. During Alaska's territorial days the Federal oil and gas acreage limitation in Alaska was 100,000 acres. In other states it was 46,080 acres.

After 1961 the Federal maximum for Alaska rose to 300,000 acres in the Northern district (approximately north of the Yukon River) and 300,000 in the Southern district. These apply today. There is no Federal acreage limitation on the Outer Continental Shelf. Presently, the acreage limitation is 246,080 uplands acres of Federal leases per state, other than Alaska.

HB 854 grants companies five years from the effective date of the act to comply with the 200,000 upland acre maximum.

A list of major leaseholdings as of February, 1978, (showing uplands and offshore holdings of those companies which now exceed 200,000 acres) follows:

ALASKA OIL AND GAS ACREAGE HOLDINGS
(as of March 13, 1978)

COMPANY	ACRES		
ARCO	408,151.21	356,882.86	acres of uplands
		51,268.35	offshore
		408,151.21	total
UNION	287,032.83	233,138.75	uplands
		53,894.08	offshore
		287,032.83	total

DESCRIPTION OF LEASING METHODS IN HB854

Currently, the State of Alaska's leasing system is a cash bonus bid with a minimum fixed royalty of 12.5 percent. The methods outlined below include the present system with different fixed royalties, sliding scale royalty with bonus bid, sliding scale royalty bid with fixed bonus, net profit share bid with fixed bonus, royalty bid with fixed bonus and exploration work commitment. The basic elements of these methods are summarized below.

(1) Bonus Bid With Fixed Royalty

Bonus bid with fixed royalty is the system currently used by the State of Alaska. In a lease sale, the winning bid for a tract is the one which makes the highest sealed or auctioned cash bonus bid. There is also a minimum royalty of 12.5 percent. An advantage of this system is that government receives revenue regardless if there are economical quantities of oil or gas found and/or produced. To avoid early termination of production, royalties need to be flexible during a field's declining years.

(2) Sliding Scale Royalty With Bonus Bid (or Sliding Scale Bid with Fixed Bonus)

Under this system, the government receives a cash bonus bid and a sliding scale royalty. We used 12.5 percent as a minimum figure and 62.5 percent as a ceiling wherein the rate in any period is dependent upon the production of that period.

The royalty rate is graduated in much the same manner as the federal personal income tax. Table I gives two examples of a sliding scale royalty schedule. The royalty is progressive, that is, the royalty on additional production increases. For example, in the South Central Area, the initial 500 barrels pay a royalty of 12.5 percent, the next 500 barrels pay 25 percent. The royalty rate increases by 12.5 percentage points per 500 barrels until 2000 barrels of output are achieved. All production beyond 2001 barrels pays a royalty of 62.5 percent. Thus, if production reaches 5000 barrels, the average royalty rate is 50 percent. In the limit, the average rate would converge towards 62.5 percent as daily production continues to increase.

As field productivity declines and well production falls, the producer backs down the schedule and royalties decline. In order to optimally exploit the field, the royalties should decline to zero near the end of field life. Actually, final rates of five or six percent would result in minimal early shut down.

TABLE I
TYPICAL SLIDING SCALE ROYALTY SCHEDULES

SOUTH CENTRAL AREA

Daily Average Prod. Rate (Bbls./day)	Incremental Royalty Rate (%)	Royalty For Specific Producing Rates: Producing Rate (Bbls./day)	Royalty Production (Bbls./day)	Average Royalty Rate (%)
-500	12.5	500	62.5	12.50
501-1000	25.0	1000	187.5	18.75
1001-1500	37.5	1500	375.0	25.00
1501-2000	50.0	2000	625.0	31.25
2001-2500	62.5	2500	937.5	37.50
		3500	1562.5	44.64
		4500	2187.5	48.61
		5000	2500.0	50.00

NORTH SLOPE AREA

Daily Average Prod. Rate (Bbls./day)	Incremental Royalty Rate (%)	Royalty For Specific Producing Rates: Producing Rate (Bbls./day)	Royalty Production (Bbls./day)	Average Royalty Rate (%)
-1000	12.5	1000	125	12.50
1001-2000	25.0	2000	375	18.75
2001-3000	37.5	3000	750	25.00
3001-4000	50.0	4000	1250	31.25
4001 and above	62.5	5000	1875	37.50
		7000	3125	44.64
		9000	4375	48.61
		10000	5000	50.00

Note: The Sliding Scale Royalty Schedule for the North Slope area is significantly higher than for the South Central area because the higher North Slope operating costs result in a much higher economic limit.

Hopefully, this illustration clarifies the relationship between production rates and royalty rates.

Greater flexibility in setting the initial rate is the major advantage of this system while not running the risk of an uneconomically (for Industry) high royalty rate. On the other hand, to achieve an overall lower royalty payment, a company might spread out production over a longer period of time. Usually, however, because of the time value of money and increased operating costs, oil companies generally try to accelerate production.

(3) Net Profit Share Bid With Fixed Bonus

A small fixed bonus is required as earnest money. The bonus is low enough to encourage producers to bid a high net profit share while permitting profitable development.

(4) Royalty Bid With Fixed Bonus

This system utilizes the same method to calculate fixed bonus as described for Net Profit Share. The bid parameter is a function of production instead of net profits. Since the bonus is fixed, interested parties bid on the royalty rate that the government is to receive. The advantage of royalty bidding is that little front end money is needed by Industry. However, this could encourage speculation causing an overbid. Royalty bidding should encourage more competition among bidders and may allow the smaller companies a better chance of winning the tract.

(5) Work Commitment With Fixed Bonus, Royalty or Net Profit Share

The government itemizes the performance criteria such as the rate and amount of work to be performed on each tract. The total bid specified in dollar terms and a portion of the bid used for exploration and development activities. This system gives the government some control over the rate and extent of resource development.

TWO VIEWS ON BIDDING STRATEGIES

WEALTH MAXIMIZING STRATEGIES FROM THE STATE'S VIEWPOINT

The choice of bidding method cannot be made on the basis of any single criteria but is the result of evaluating a number of factors including but not limited to the potential economic payoff and physical characteristics of the lease area. HB854 offers essentially four leasing schemes: (1) Bonus Bid - Fixed Royalty, (2) Royalty Bid - Fixed Bonus, (3) Net Profit Bidding with Fixed Bonus, (4) Work Commitment with Bonus Bidding. These options will be briefly evaluated.

Bonus Bid - Fixed Royalty

If the royalty is fixed at 12-½%, there is no reason to use this option. It is of historical value only. At higher fixed royalties, it has some merit, but the higher fixed royalty means a lower bonus bid which is supposedly the advantage of the system. Private discount rates are too high for bonus bidding to be advantageous to the State. For example, a brief examination of an annuity table suggests that increases in the discount rate rapidly diminish the present value of a future income stream. This income stream can be interpreted as the discounted net revenues resulting from the potential discovery and development of an oil field. Table II illustrates the discount rate effect.

Table II
Present Value of an Annuity of $1 Million
(Values in 10^0)

Number of Years	Discount Rates					
	6%	10%	14%	16%	18%	20%
20	$11.470	$ 8.514	$6.623	$5.929	$5.353	$4.870
30	13.765	9.427	7.003	6.177	5.517	4.979
N	16.67	10.00	7.14	6.25	5.56	5.00

From the State's viewpoint, a 6% discount rate may properly reflect the present value of the income generated by the potential oil discovery. The industry, on the other hand, is likely to discount the future net income stream at much higher rates, say 20%. Thus, the maximum bid under ideal circumstances would be $5 million for an income stream that would yield net revenues of on million per year in perpetuity. Perpetuity is longer than the life of Prudhoe Bay.

Royalty Bid - Fixed Bonus

Relatively easy to administer - reduces risk and front end filter to the private sector. With sliding scale, most early shut down problems are avoided. The fact

that the State receives a revenue stream over a 20^{+} year time horizon also is an attractive feature. The Beaufort Sale is an ideal candidate for a royalty bidding scheme.

Net Profit Bidding

This is very attractive from a risk sharing point of view. All risks (geologic, exploration, development, and production costs as well as product price) are shared with the industry. Would increase exploration and development in remote high risk areas. May be useful where there is low probability of bid find. Under ideal circumstances (political) is the best of all possible options but does have serious administrative problems.

Work Commitment

Cases where State wants information and is willing to specify type of information desired. Good for high risk areas in remote locations. May also be used where the State wants more information before putting structures up for competitive bidding scheme.

On balance, the royalty bidding schemes represent a substantial improvement over bonus bidding and are administratively tractable. Given the time to build the expertise, it may be advisable to shift to profit sharing or ad valorem schemes.

MULTIPURPOSE STRATEGIES

Bonus Bids

Bonus bidding should be applied in cases where the State has either:

(a) A very great amount of knowledge about the resource, or
(b) The prospect is of extremely high risk, the lessor has little knowledge of the resource and expected value revenues would be marginal.

The first case (a) where tracts might be offered for Bonus Bidding could be that of a drainage or near drainage situation where the State wished to maximize its near term discounted revenues. It would be advisable to not offer all of the tracts for bonus bidding, but to withhold a percent of acreage to be sold at a later date, (Report 2-77). Also, since royalty and other bidding methods have shown to offer higher expected value revenues for lower risk cases it could be advisable to mix royalty bidding with the bonus bidding, a practice followed by the Federal Government in the recent Cook Inlet OCS sale.

In the second case (b), that of extreme high risk, bonus bidding can be used as a filter to determine the value of marginal tracts. This is discussed under the section on (t) low potential, high risk and previously leased.

Report 2-77 indicates that for very high risk cases all bidding methods approach the same level of expected value income for the State. In cases of small and marginal potential reservoirs the bonus bid method with its ease of administration might afford optimum State revenues. Report 2-77 also indicates that in probability of success percents of 1 percent or less bonus bids could afford higher revenues, but the State should ensure that leasing under such high risk cases only occurs when sufficient knowledge is gained to indicate that the land to be leased is of such a low potential. For example, a geologic structure as large as the Prudhoe Bay anticline may have had a high degree of risk before it was drilled but its potential to hold enormous reserves was there. Bonus bidding should not have been used in that instance.

In summary, bonus bidding can be used when:

(1) Very small potential reservoirs are expected;

(2) Extreme risk is expected and the gaining of sufficient knowledge to determine the presence of reservoirs is unwarrented because of marginal to low potential indications.

(3) A sliding royalty should be considered in all bonus bid cases;

(4) This method could be used in a mixture with other methods such as royalty bidding;

(5) Also, in general, this method should only be considered when leasing in the less desirable state areas, i.e. those below the top 10 rank.

Royalty Bidding - Fixed Bonus

Report 2-77 indicates that royalty bidding and profit sharing deliver the highest expected value revenues to the State of all bidding methods. It is particularly effective where the probability of occurrence is high (i.e. low risk) and especially when the expected reservoirs are large. A sliding scale should be added in the declining production years to eliminate the problem of premature shut down. Cases for royalty bidding would be when:

(1) The State has enough knowledge to assess the size of potential traps.

(2) Potential reservoirs are not extremely small or of extreme risk.

The Beaufort Sea sale is a good example of a case for using Royalty bidding on tracts. In general, this method should be considered when leasing in the top 10 leasing areas on the desirability scale.

Net Profit Bidding

Net profit bidding would be most advantageous when costs and oil prices are in a state of extreme fluctuations making economic predictions unreliable. In remote high risk areas, this method might attract stronger bids than the royalty

or the bonus bid method.

Of the 35 potential State leasing areas, this method might be used to advantage on those areas below the top 10 in desirability.

Work Commitment

(See section (t)).

This bidding method can be best used where the State has a large (i.e. 100,000+ acres) area of probable low potential where industry has shown a general lack of interest in exploration and leasing. By offering a large area for lease to one lease owner, the State provides an extra incentive to undertake exploration and the State ensures the exploration by making the bid variable.

This method would be used in remote low potential high risk areas. Some of the State's 3 mile limit lands such as Area IX might be applicable to this method.

Low Potential & High Risk and Previously Leased Section (t)

On the basis of exploration knowledge, lack of interest by industry and reasonable analysis, the department may determine that lands have very low potential for oil and gas.

As a means of encouraging the evaluation and possible development of these low potential lands, the department could:

(1) Offer the lands for competitive lease using a bonus bid with sliding royalty. A minimum bid equal to the first year's rentals could be used to filter the bids. This should give a check on the potential of the lands. The sliding royalty would act as a safeguard for very low value bonus bid tracts if a discovery is made later on the lands.

(2) On tracts that receive no acceptable bids, the commissioner could hold a non-competitive similtaneous drawing after proper notice (30 days). Tracts not receiving applications for the drawing could then be opened for over the counter applications. Tracts could be offered at fixed 50¢/year rentals, 5 year terms. A sliding scale royalty would be used in all cases to provide a revenue safeguard against future potential discoveries.

(3) In some cases, all tracts not receiving acceptable bids could be aggregated into large blocks (100,000 acres or more) and offered for work commitment bidding or development contracts.

construct, maintain, and use all such buildings, machinery, roads, pipelines, powerlines, and railroads, sink such shafts, drill such wells, remove such soil, and to remain on said lands or any part thereof for the foregoing purposes and to occupy as much of said lands as may be necessary or convenient for such purposes hereby expressly reserving to itself, its lesses, successors, and assigns, as aforesaid, generally all rights and power in, to, and over said land, whether herein expressed or not, reasonably necessary or convenient to render beneficial and efficient the complete enjoyment of the property and rights hereby expressly reserved." (§ 1 art VII ch 169 SLA 1959; am § 14 ch 61 SLA 1960; am § 1 ch 42 SLA 1966; am § 3 ch 240 SLA 1976)

Effect of amendment. — The 1976 amendment substituted "§§ 315 — 325 of this chapter, §§ 45 — 120 of this chapter, or ch. 50 of this title except as provided in AS 38.50.050 is" for "§§ 315 — 325 of this chapter or §§ 45 — 120 of this chapter, except for those lands originally acquired by purchase, exchange, condemnation, gift, escheat or foreclosure are" near the beginning of the section.

Legislative committee report. — For report on ch. 42, SLA 1966 (HB 387 am), see 1966 House Journal, p. 492.

Chapter 19, SLA 1977 held not invalid. — Chapter 19, SLA 1976, authorizing a three-way exchange of land between the state of Alaska, the United States government and a regional corporation of Alaska Natives, was not invalid on the ground that it waived the provisions of this section restricting the state's right to alienate minerals and former AS 38.95.060 authorizing exchanges of land with native corporations on the basis of equal value. State v. Lewis, Sup. Ct. Op. No. 1364 (File No. 3039), 559 P.2d 630 (1977).

Sec. 38.05.127. Access to navigable or public waters. (a) Before the sale, lease, grant, or other disposal of any interest in state land adjacent to a body of water or waterway, the Department of Natural Resources shall,

(1) under regulations, determine if the body of water or waterway is navigable water, public water, or neither;

(2) upon finding that the body of water or waterway is navigable or public water, provide for the specific easements or rights-of-way, or both, reasonably necessary to insure free access to and along the body of water, unless the department finds that regulating or limiting access is necessary for other beneficial uses or public purposes.

(b) The Department of Natural Resources shall adopt regulations implementing this section.

(c) Nothing in this section affects valid existing rights. (§ 2 ch 117 SLA 1976)

Editor's note. — Section 1, ch. 117, SLA 1976, provides: "Intent. It is the intent of this Act to implement the provisions of art. VIII, sec. 14, Alaska State Constitution, relating to access to the navigable or public waters of the state."

Legislative committee report. — For report on ch. 117, SLA 1976 (HCS 2d CSSB 215), see 1975 Senate Journal, p. 452; 1975 House Journal, p. 1296.

Sec. 38.05.130. Damages and posting of bond. No rights shall be exercised by the state, its lessees, successors or assigns under the

reservation as set out in § 125 of this chapter or until the state, its lessee, successors, or assigns make provisons to pay the owner of the land full payment for all damages sustained by the owner, by reason of entering upon the land. If the owner for any cause refuses or neglects to settle the damages, the state, its lessees, successors, assigns, or an applicant for a lease or contract from the state for the purpose of prospecting for valuable minerals, or option contract or lease for mining coal or lease for extracting petroleum or natural gas, may enter upon the land in the exercise of the reserved rights after posting a surety bond determined by the director, after notice and an opportunity to be heard, to be sufficient as to form, amount, and security to secure to the owner payment for damages, and may institute legal proceedings in a court where the land is located, as may be necessary to determine the damages which the owner may suffer. (§ 2 art VII ch 169 SLA 1959; am § 15 ch 61 SLA 1960)

Article 6. Leasing of Mineral Lands.

Section		Section	
135.	Generally	175.	Potassium
137.	Leasing agreements	180.	Oil and gas
140.	Limitations	181.	Geothermal resources
145.	Leasing procedure	182.	Royalty on natural resources
150.	Coal	183.	Sale of royalty
155.	Phosphates	184.	Limitation on oil and gas leases in certain areas, and reacquisition of leases
160.	Oil shale		
165.	Sodium		
170.	Sulphur		

Sec. 38.05.135. Generally. (a) Except as otherwise provided, valuable minerals deposits in lands belonging to the state shall be open to exploration, development, and the extraction of minerals. All lands, together with tide, submerged, or shorelands, to which the state holds title to or to which the state may become entitled, may be obtained by permit or lease for the purpose of exploration, development, and the extraction of minerals. Except as specifically limited by §§ 135 — 181 of this chapter, lands may be withheld from lease application on a first-come, first-served basis, and offered only on a competitive bid basis when determined by the commissioner to be in the best interests of the state. In unproven areas the commissioner may offer additional incentives, including a reduction of royalty to a minimum of five per cent in the case of oil and gas, and other terms in and granting permit or lease for exploration and development whenever it appears to be in the best interests of the state to do so.

(b) When minerals are to be leased on a competitive basis, in addition to any other notice given, notice shall also be given as provided in §§ 305 and 345 of this chapter. If land is to be made available for noncompetitive mineral leasing, notice of the proposed action shall also be given as provided in §§ 305 and 345 of this chapter. After the notice of

noncompetitive leasing has been made as required in this subsection, notice of the subsequent issuance of a noncompetitive lease for the land involved shall be made by mail not less than 30 days before the issuance of the lease only to those who have requested the notice. (§ 1 art VIII ch 169 SLA 1959; am § 1 ch 30 SLA 1964; am § 1 ch 91 SLA 1967; am § 2 ch 71 SLA 1971; am § 10 ch 257 SLA 1976)

Effect of amendment. — The 1976 amendment added present subsection (b).

Validity of prohibition or regulations of removal or exploitation of oil, minerals, soil, sand, gravel, stone or natural products within municipal limits, 168 ALR 1188.

73 C.J.S. Public Lands § 259.

Sec. 38.05.137. Leasing agreements. The commissioner is authorized to enter into cooperative mineral leasing agreements with the United States regarding lands which are the subject of a title dispute between federal and state authorities. Any such lease need not conform to the provisions of state law applicable to state leases issued under the authority of this chapter. (§ 2 ch 30 SLA 1964)

Sec. 38.05.140. Limitations. (a) No person may take or hold coal leases or permits during the life of coal leases on state lands exceeding an aggregate of 46,080 acres, except that a person may apply for coal leases or permits for acreage in addition to 46,080 acres, not exceeding a total of 5,120 additional acres of state land. The additional area applied for shall be in multiples of 40 acres and the application shall contain a statement that the granting of a lease for additional lands is necessary for the person to carry on business economically and is in the public interest. On the filing of the application, the coal deposits in the lands covered by the application shall be temporarily set aside and withdrawn from all other forms of disposal provided under §§ 135 — 181 of this chapter.

(b) The commissioner shall, after posting notice of the pending application in the local land office, conduct public hearings on the application for additional acreage. After public hearings, to the extent he finds to be in the public interest and necessary for the applicant in order to carry on business economically, the commissioner may, under regulations he prescribes, permit the person to take or hold coal leases or permits for an additional aggregate acreage of not more than 5,120 acres.

(c) No person may take or hold at one time phospate leases on state lands exceeding in the aggregate 10,240 acres. No person may take or hold sodium leases or permits during the life of sodium leases on state lands, exceeding in the aggregate acreage 5,120 acres except that the

commissioner may, where it is necessary in order to secure the econom. mining of soduim compounds, permit a person to take or hold sodium leases or permits for up to 15,360 acres. No person may take or hold at any one time oil or gas leases exceeding in the aggregate 500,000 acres granted on tide and submerged lands, and 500,000 acres on all lands other than tide and submerged lands, including leases held both as lessee and under option or operating agreement from others. Where more than a single person holds an interest in an oil or gas lease, each person shall be charged only with that percentage of the total acreage which corresponds to its percentage share of the total beneficial interest in the lease.

(d) The commissioner, for the purpose of encouraging the greatest ultimate recovery of coal, oil, gas, oil shale, phosphate, sodium, potassium, sulphur, and geothermal resources and in the interest of conservation of natural resources, after public hearing, or, when the state's title to land beneath navigable waters has been legally challenged by the United States and litigation initiated, may waive, suspend, refund, or reduce the rental, or minimum royalty, or reduce the royalty on an entire leasehold, or on any tract or portion of a leasehold segregated for royalty purposes, whenever in his judgment it is necessary to do so in order to promote development, or whenever in his judgment the lease cannot be successfully operated under its terms. If the commissioner, in the interest of conservation, directs or assents to the suspension of operations and production under a lease granted, the payment of acreage rental or of minimum royalty prescribed by the lease may be suspended during the period of suspension of operations and production. The term of the lease shall be extended by adding the period of suspension to the lease.

(e) The provisions of (d) of this section that apply to waiver, suspension, refund or reduction of rental of minimum royalty apply to rental or minimum royalty paid before or after June 19, 1970 on any lease covering land beneath navigable waters which, according to the records of the division of lands, is in effect on June 19, 1970.

(f) The submerged and shorelands lying north of 57°, 30 minutes north latitude and east of 159°, 49 minutes west longitude within the Bristol Bay drainage are designated as the Bristol Bay Fisheries Reserve. Within the Bristol Bay Fisheries Reserve no surface entry permit to develop an oil or gas lease may be issued on state owned or controlled land until the legislature by appropriate resolution specifically finds that the entry will not constitute danger to the fishery. (§ 2 art VIII ch 169 SLA 1959; am § 1 ch 68 SLA 1969; am §§ 1, 2 ch 208 SLA 1970; am §§ 3, 4 ch 71 SLA 1971; am § 1 ch 102 SLA 1972)

Legislative committee report. — For report on ch. 68, SLA 1969 (HB 3030), see 1969 House Journal, p. 572.

Sec. 38.05.145. Leasing procedure. (a) Deposits of coal, phosphates, oil shale, sodium, potassium, oil, gas, geothermal resources and state lands containing these deposits are subject to disposition under rules and regulations, recommended by the director and adopted by the commissioner, and the provision of §§ 145 — 181 of this chapter. In applying the acreage limitations the commissioner may apply the rule of approximation. The uses of the rule of approximation made before March 31, 1960, by the commissioner are ratified.

(b) If the state selects or otherwise acquires land other than shorelands, title to which was in the federal government and which, at the effective date of the selection or acquisition, is subject to a valid existing offer for a noncompetitive United States oil and gas lease, or application for a prospecting permit or noncompetitive mining lease, for coal, phosphates, sulphur, oil shale, sodium, or potassium under the federal Act of February 25, 1920 (41 Stat. 437 as amended), or for a noncompetitive United States geothermal lease, or applications for a prospecting permit or noncompetitive lease under the federal Act of December 24, 1970 (84 Stat. 1566), the offeror or applicant for the federal permit or lease, if a qualified applicant hereunder, shall be considered the first qualified applicant for a state noncompetitive oil and gas lease, noncompetitive geothermal lease, prospecting permit, or noncompetitive mining lease and is entitled to a state noncompetitive lease or permit upon compliance with the provisions of the regulations covering applications within 60 days after receipt of written notice from the commissioner of selection or acquisition. These priorities are not effective if the land covered by the federal offers or applications is classified by the commissioner as competitive land within 90 days after the selection of the land is finally approved by the Secretary of the Interior or the land is otherwise acquired. (§ 3 art VIII ch 169 SLA 1959; am § 16 ch 61 SLA 1960; am § 3 ch 30 SLA 1964; am §§ 5, 6 ch 71 SLA 1971; am § 33 ch 71 SLA 1972)

Revisor's note (1971). — In § 6, ch. 71, SLA 1971, the first sentence of AS 38.05.145(b) was split into two sentences. Since that would leave the first sentence incomplete and meaningless, and appears to have been a manifest clerical error, the two have been rejoined. Also, the missing "or" has been inserted before "for a noncompetitive United States geothermal lease" in that sentence. The federal Act of February 25, 1920, referred to is PL 66-146; the federal Act of December 24, 1970, referred to is PL 91-581 (the Geothermal Steam Act of 1970).

Legislative committee report. — For report on ch. 71, SLA 1972 (HCSSB 383 am H), see 1972 House Journal, p. 898.

Applied in Moore v. State, Sup. Ct. Op. No. 1284 (File Nos. 2551, 2587), 553 P.2d 8 (1976).

Sec. 38.05.150. Coal. (a) The commissioner may, and upon the petition of a qualified applicant, shall divide coal lands or the deposits of coal owned by the state into leasing tracts of 40 acres each, or multiples of 40 acres, and in the form which will permit the economical mining of the coal in the tract.

(b) Thereafter the commissioner may, upon the request of a qualified applicant or on his own motion, from time to time, offer the lands or

deposits of coal for leasing. Each lease shall be awarded to a qualified applicant by competitive bidding or by the method which the commissioner adopts by general regulation.

(c) Where prospecting or exploration work is necessary to determine the existence or workability of coal deposits in an unclaimed and undeveloped area, the commissioner may issue to qualified applicants prospecting permits for a term of two years, not exceeding 5,120 acres. If within the period of two years the permittee shows to the commissioner that the land contains coal in commercial quantities and submits a satisfactory mining plan for the coal's recovery, the permittee shall be entitled to a lease for all or part of the land in his permit. A coal prospecting permit may be extended by the commissioner for a period of two years, if he finds that the permittee has been unable, with the exercise of reasonable diligence, to determine the existence or workability of coal deposits in the area covered by the permit and desires to prosecute further prospecting or exploration, or for other reasons in the opinion of the commissioner warranting extension.

(d) For the privilege of mining or extracting the coal in the lands covered by the lease, the lessee shall pay to the state the royalties specified in the lease. The royalties shall be fixed before offering the lease, and shall be effective for a period of not more than 20 years. The royalties shall be not less than five cents a ton of 2,000 pounds. The lessee shall also pay an annual rental payable at the date of the lease and annually thereafter, on the land or coal deposits covered by the lease, at a rate fixed by the commissioner before offering the lease. The annual rental shall be effective for a period of not more than 20 years. The annual rental shall be not less than 25 cents an acre for the first year of the lease, not less than 50 cents an acre for the second year, third year, fourth year and fifth year, and not less than $1 an acre for each year thereafter during the continuance of the lease. The rental for each year shall be credited against the royalties as they accrue for that year. Each lease shall provide that the annual rental payment is subject to adjustment at intervals of no more than 20 years and adjustments shall be based on the current rates for properties similarly situated.

(e) Each lease shall be for an indeterminate period upon condition of diligent development and continued operation of the mine, except when operation is interrupted by strikes, the elements, or casualties not attributed to the lessee. (§ 3(1) art VIII ch 169 SLA 1959; am § 17 ch 61 SLA 1960; am § 1 ch 71 SLA 1966; am §§ 2, 3 ch 68 SLA 1969)

Legislative committee reports. — For report on ch. 71, SLA 1966, see 1966 House Journal, p. 491. For report on ch. 68, SLA 1969 (HB 303), see 1969 House Journal, p. 572.

Sec. 38.05.155. Phosphates. (a) The commissioner may lease to qualified applicants lands belonging to the state which contain deposits of phosphates and associated and related minerals, when in his judgment it is in the public interest to do so. The commissioner may lease land

included in a permit may not exceed 2,560 acres of land in reasonably compact form. Upon showing to the satisfaction of the commissioner that valuable deposits of potassium compounds have been discovered by the permittee within the area covered by his permit, and that the land is chiefly valuable for these deposits, the permittee is entitled to a lease for all or a part of the land embraced in the prospecting permit, at a royalty of not less than two per cent of the quantity or gross value of the output of potassium compounds and other related products, except sodium, at the point of shipment to market. The commissioner may lease lands known to contain valuable deposits of potassium compounds which are not covered by permits or leases through advertisement, competitive bidding, or other methods as he adopts by general regulation. The area covered by the lease may not exceed 2,560 acres.

(b) Each lease shall be conditioned upon payment by the lessee of a royalty of not less than two per cent of the quantity or gross value of the output of potassium compounds and other related products, except sodium, at the point of shipment to market, and the payment in advance of a rental of 25 cents an acre for the first calendar year or fraction of it, 50 cents an acre for the second calendar year, third calendar year, fourth calendar year, and fifth calendar year, and $1 an acre a year thereafter during the continuance of the lease. The rental for any one year shall be credited against royalties accruing for that year.

(c) Each lease shall be for a term of 20 years and so long thereafter as the lessee complies with the terms and conditions of the lease. (§ 3(6) art VIII ch 169 SLA 1959)

Sec. 38.05.180. Oil and gas. (a) All tide and submerged lands, mental health lands, school lands, and university lands shall be leased by competitive bidding, and whenever oil or gas in discovered in commercial quantities, the commissioner shall determine the extent of the area of lands in addition to tide, submerged, mental health lands, school, or university lands in the same general area of the discovery well which, by reason of the discovery, the commissioner reasonably believes to be capable of producing oil or gas, and the additional lands shall be leased to the highest responsible qualified bidder by competitive bidding under general regulations, in units of not exceeding 2,560 acres (except that tide and submerged lands shall be leased in units of not exceeding 5,760 acres), which shall be as nearly compact in form as possible, upon the payment by the lessee of such bonus as may be accepted by the commissioner and of such royalty as may be fixed in the lease which shall not be less than 12½ per cent in amount or value of the production removed or sold from the lease. All lands other than those above provided to be leased by competitive bidding may be leased competitively or noncompetitively as determined by the commissioner to be in the best interests of the state. Noncompetitive leases shall be issued in units of not exceeding 2,560 acres in any one lease. Noncompetitive leases shall be conditioned upon the payment by the lessee of a royalty of 12½ per

cent in amount or value of the production removed or sold from the lease. Competitive leases issued under this subsection shall be for 10 years except that in the Cook Inlet sedimentary basin, leases shall be for a primary term of not more than 10 years and not less than five years at the discretion of the commissioner, and shall continue so long thereafter as oil or gas is produced in paying quantities. Noncompetitive leases issued under this subsection shall be for a primary term of five years and shall continue so long thereafter as oil or gas is produced in paying quantities. If drilling has commenced on the expiration date of the primary term of the lease and is continued with reasonable diligence, such operations to include redrilling, sidetracking or other means necessary to reach the originally proposed bottom hole location, the lease shall continue in effect until 90 days after drilling has ceased and for so long thereafter as oil or gas is produced in paying quantities. If all or part of the lands covered by the lease are lands that have been selected by the state under laws of the United States granting lands to the state and a patent has not been issued on them, a conditional lease may be issued. However, no term extension may be granted for the period during which the lease was conditional.

(b) An oil or gas lease issued under this section which is subject to termination by reason of cessation of production does not terminate if, within 60 days after production ceases, reworking or drilling operations are commenced on the land under lease and are thereafter conducted with reasonable diligence during the period of nonproduction. No lease issued under this section expires because operation or production is suspended under an order, or with the consent of the commissioner. No lease issued under this section covering lands on which there is a well capable of producing oil or gas in paying quantities expires because the lessee fails to produce oil or gas, unless the licensee is allowed a reasonable time within which to place the well on a producing status. After producing status is established, production shall continue on the leased premises until suspension of production is allowed by the commissioner.

(c) Upon the expiration of the initial five-year term of a noncompetitive lease maintained in accordance with applicable requirements and regulations, the record title holder is entitled to a single extension of the lease, unless otherwise provided by law. A noncompetitive lease on lands not determined to be competitive lands shall be extended for a period of five years and so long thereafter as oil or gas is produced in paying quantities. A noncompetitive lease on lands determined to be competitive lands shall be extended for a period of two years and so long thereafter as oil or gas is produced in paying quantities. A noncompetitive lease extended under this paragraph is subject to the rules and regulations in force at the expiration of the initial five-year term of the lease. No extension may be granted, however, unless within a period of 90 days before the expiration date

an application for extension is filed by the record title holder or an assignee whose assignment has been filed for approval, or an operator whose operating agreement has been filed for approval.

(d) The commissioner may provide for extension of the term of a lease whether competitive or noncompetitive, if all or part of the lease is included in an approved unit plan or program of secondary recovery operation to bring about or restore production.

(e) All noncompetitive oil or gas leases issued under this section shall be conditioned upon the payment by the lessee in advance of an annual rental of 50 cents an acre or fraction of an acre. All competitive oil and gas leases issued under this section shall be conditioned upon the payment of an annual rental, before discovery on the leased lands, of $1 an acre or fraction of an acre. A minimum royalty of $1 an acre instead of rental is payable at the expiration of each lease year beginning on or after a discovery of oil or gas in paying quantities on the lands leased.

(f) Repealed by § 7 ch 30 SLA 1964.

(g) An offeror for a federal oil and gas lease whose lease was issued after January 2, 1959, or a qualified applicant for a preference right under the Act of July 3, 1958, (72 Stat. 322) whose application for a preference right was filed before January 3, 1959, has a preference right to a state lease on the shorelands included within the exterior boundaries of the federal lease.

(h) If lands described in the offer for a federal lease are covered by nontidal water and are excluded from the federal lease on the basis of navigability, the state shall, upon application within 60 days after notice of the exclusion, if not previously filed, grant a preference lease for the areas excluded, carrying the same provisions as an ordinary state lease on the same lands, except that the term of the state lease shall conform in all respects to that of the adjoining federal lease including extended terms. The state shall issue a shorelands preference lease where a federal lease has been issued before March 31, 1960, and application is made to the state before July 1, 1960. Where a federal lessee or offeror failed before January 3, 1959, to file a proper application for a preference right under the Act of July 3, 1958, he may apply for a state preference lease under this section, subject to the rights of intervening applicants.

(i) Where the lands are classified as competitive, they shall be leased by competitive bidding. The holder of the preference right has 10 days after receipt of notice in which to submit an amount equal to the highest bid plus the rental for the first year.

(j) Upon timely application as provided by regulation, the state shall issue to the holder of a federal lease a state shorelands lease covering land within the exterior boundaries of the federal lease which has been excluded on the basis of navigability or which are later administratively or judicially determined to be "shorelands." The term of every shoreland lease shall conform to that of the adjacent federal lease including

extended terms. The authority of the state to classify the lands as competitive or noncompetitive shall not be impaired.

(k) Instead of the foregoing procedure, the federal lessee or his assignee may, at his option, exercise his preference right for a state lease on the shorelands included within the exterior boundaries of his federal lease by applying to the division of lands, Department of Natural Resources. If, at the time of applying, the lands are classified as noncompetitive, the state shall, upon application, issue a lease covering whatever shorelands are included within the exterior boundaries of the federal lease. If, at the time of applying, the shorelands included in the federal lease are classified as competitive lands, the lands shall be leased by competitive bidding. The competitive lease shall be issued to the federal lessee or his assignee upon payment to the state of an amount equal to the highest bid for the lease, plus the rental for the first year, payment to be made within 10 days after the lessee's or assignee's receipt of written notice from the director of the division of lands of the amount of the highest bid. These leases, whether competitive or noncompetitive, shall carry the same conditions as an ordinary state lease on the same lands, except that the term of the state lease shall conform to that of the adjoining federal lease, including extended terms, and shall terminate if the federal lease is terminated for any reason. The lease shall provide for annual rental at the rate of $100 a unit of 640 acres or part thereof of the lands included within the federal lease until agreement is reached between the state and the Secretary of the Interior of the United States, or his authorized representative, as to the actual area of the shorelands included in the federal lease, and as to the apportionment between the state and federal government of the rental theretofore paid under the federal lease.

(l) The lease of a record lessee of a federal oil and gas lease who filed, or whose predecessor in interest filed, between July 3, 1958, and January 3, 1959, a proper preference right application under the Act of July 3, 1958, (72 Stat. 322) to have included in the lease the shorelands within the exterior boundaries of the lease and which lease or any part of it has terminated or failed as to the shorelands due to mispayment of or failure to pay the required rental as to the shorelands in advance of the anniversary date of the federal lease, shall be revived and reinstated as to the shorelands upon payment to the Bureau of Land Management of the United States Department of the Interior or to the state of all rental payable as to the shorelands under the lease since January 3, 1959. The rights under this section terminate 60 days after receipt of notice from the director, but not later than March 31, 1961. Nothing herein operates to extend a lease beyond its stated term.

(m) To conserve the natural resources of all or a part of an oil or gas pool, field, or like area, (whether or not the part is then subject to a cooperative or unit plan of development or operation), lessees and their representatives may unite with each other, or jointly or separately with

others, in collectively adopting or operating under a cooperative or a u[illegible] plan of development or operation of the pool, field, or like area, or a part of it, whenever determined and certified by the commissioner to be necessary or advisable in the public interest. The commissioner may, with the consent of the holders of leases involved, establish, alter, change, or revoke drilling, producing, rental minimum royalty, and royalty requirements of the leases and make regulations with reference to the leases, with like consent on the part of the lessees, in connection with the institution and operation of a cooperative or unit plan as he determines necessary or proper to secure the proper protection of the public interest. The commissioner may provide that oil and gas leases issued under this section shall contain a provision requiring the lessee to operate under a reasonable cooperative or unit plan, and he may prescribe a plan under which the lessee shall operate. The plan shall adequately protect all parties in interest, including the state.

(n) A plan authorized by (m) of this section, which includes lands owned by the state, may contain a provision vesting the commissioner, or a person, committee, or state agency with authority to alter or modify from time to time the rate of prospecting and development and the quantity and rate of production under the plan. All leases operated under a plan approved or prescribed by the commissioner are excepted in determining holdings or control under § 140 of this chapter. The provisions of this section concerning cooperative or unit plans are in addition to, and do not affect AS 31.05.

(o) Producing acreage on a known geologic structure of a producing oil or gas field is excluded from chargeability as against the acreage limitation provisions of § 140 of this chapter.

(p) When separate tracts cannot be individually developed and operated in conformity with an established well-spacing or development program, a lease, or a portion of a lease, may be pooled with other lands, whether or not owned by the state, under a communitization or drilling agreement providing for an apportionment of production or royalties among the separate tracts of land comprising the drilling or spacing unit when determined by the commissioner to be in the public interest. Operations or production under the agreement shall be considered as operations or production as to each lease committed to the agreement.

(q) The commissioner may, on conditions which he prescribes, approve drilling, or development contracts made by one or more lessees of oil or gas leases, with one or more persons, whenever, in his discretion, the conservation of natural products or the public convenience or necessity requires it or the interests of the state are best served. All leases operated under approved drilling, or development contracts, and interests under them are excepted in determining holding or control under § 140 of this chapter.

(r) To avoid waste or to promote conservation of natural resources, the commissioner may authorize the subsurface storage of oil or gas

whether or not produced from state lands, in lands leased or subject to lease under this section. This authorization may provide for the payment of a storage fee or rental on the stored oil or gas, or, instead of the fee or rental, for a royalty other than that prescribed in the lease when the stored oil or gas is produced in conjunction with oil or gas not previously produced. A lease on which storage is so authorized shall be extended at least for the period of storage and so long thereafter as oil or gas not previously produced is produced in paying quantities.

(s) Each oil or gas lease issued by the state shall contain a provision requiring the lessee to furnish the Department of Labor a quarterly report regarding the employment on the leased property of state residents. The commissioner of labor shall promulgate regulations necessary to carry out the provisions of this subsection. (§ 3(7) art VIII ch 169 SLA 1959; am § 18 ch 61 SLA 1960; am § 1 ch 124 SLA 1962; am §§ 4—7 ch 30 SLA 1964; am § 20 ch 70 SLA 1964; am § 2 ch 91 SLA 1967; am § 1 ch 65 SLA 1969; am § 1 ch 86 SLA 1970)

Revisor's note (1970). — In ch. 86, SLA 1970, subsection (s) of AS 38.05.180 was incorrectly designated (t).

Cross references. — See note to AS 38.05.020. As to establishment of drilling units for pools, see AS 31.05.100. As to gross production tax, see AS 43.55.010.

Purpose of subsection (a). — The provisions of subsection (a) of this section were intended to insure that leases on valuable oil and gas producing state lands will be made available to the public on a fair and equitable basis, that the state will be adequately compensated for its natural resources, and that the state's resources are developed in an orderly fashion. For the commissioner to decide that these purposes are furthered by providing for bidding by cash bonus cannot be said to be unreasonable. Kelly v. Zamarello, Sup. Ct. Op. No. 705 (File Nos. 1255, 1256), 486 P.2d 906 (1971).

And construction thereof. — The only reasonable construction that can be placed on subsection (a) of this section is that the legislature intended to give the commissioner broad authority to determine the kind of bonus he will accept. The legislature at the time it passed subsection (a) was undoubtedly aware that under competitive bidding procedures different forms of bonuses might be offered. It did not itself prescribe a particular form, but instead provided that competitive bidding shall be "under general regulations," and that lands shall be leased upon the payment of "such bonus as may be accepted by the commissioner." The plain language of the statute shows that royalties were to be fixed independently of the acceptance of the highest bonus. Kelly v. Zamarello, Sup. Ct. Op. No. 705 (File Nos. 1255, 1256), 486 P.2d 906 (1971).

Power to change law respecting lease extensions is vested in state. — The governmental power to change the law respecting the granting of lease extensions, vested in Congress prior to statehood and preserved by § 6(k) of the Alaska Statehood Act, became vested in the state when the lands subject to the lease were granted to the state as its property. Kirkpatrick v. Commissioner, Dep't of Natural Resources, Sup. Ct. Op. No. 201 (File No. 388), 391 P.2d 7 (1964).

And has been exercised by the Alaska Land Act. — The state has exercised its power to change the law respecting lease extensions by the Alaska Land Act and by regulations adopted under its authority. Kirkpatrick v. Commissioner, Dep't of Natural Resources, Sup. Ct. Op. No. 201 (File No. 388), 391 P.2d 7 (1964).

Subsection (c) has no application to pre-statehood federal leases. — Read in the context of article 6 of this chapter, it becomes apparent that subsection (c) of this section, as to extensions, relates only to leases issued by the state under the authority of the Alaska Land Act, and is not pertinent with respect to pre-statehood federal leases. Kirkpatrick v. Commissioner, Dep't of Natural Resources, Sup. Ct. Op. No. 201 (File No. 388), 391 P.2d 7 (1964).

Subsection (c) of this section, relating to extensions of state oil and gas leases, has no application to federal leases of lands

granted to the state by the Alaska Statehood Act. Hence, appellant had no right to an extension of its federal lease, but only a right, which it was granted under the commissioner's regulations, to a state lease for a period of two years following expiration of the original five-year term of its federal lease. Kirkpatrick v. Commissioner, Dep't of Natural Resources, Sup. Ct. Op. No. 201 (File No. 388), 391 P.2d 7 (1964).

Nor to lands classified by Statehood Act as competitive. — The language of this section is not directed to a situation where lands have been classified as competitive by the Alaska Land Act itself, and where there is no room for the exercise of the commissioner's authority to make classifications. Kirkpatrick v. Commissioner, Dep't of Natural Resources, Sup. Ct. Op. No. 201 (File No. 388), 391 P.2d 7 (1964).

Effect of Alaska Statehood Act and statutes on pre-statehood federal leases. — For effect of the Alaska Statehood Act and statutes enacted by the Alaska State Legislature on oil and gas leases of Alaska lands issued by the United States Department of the Interior while Alaska was a territory of the United States, see Kirkpatrick v. Commissioner, Dep't of Natural Resources, Sup. Ct. Op. No. 201 (File No. 388), 391 P.2d 7 (1964).

Land classification orders of the commissioner are not within the meaning of "regulation" under the Administrative Procedure Act (AS 44.62.180 — 44.62.250) and are thus not subject to it. Bradley v. State, 2 Alas. L.J. No. 6, p. 88 (June-July, 1964).

State's reclassification of lands in the Cook Inlet Basin for competitive oil and gas leasing under subsection (a) of this section upheld in Bradley v. State, 2 Alas. L.J. No. 6, p. 88 (June-July, 1964).

For full treatment and explanation of oil and gas leasing procedures under Alaska law, see Bradley v. State, 2 Alas. L.J. No. 6, p. 88 (June-July, 1964).

"Commercial quantities" construed. — See Pan American Petroleum Corp. v. Shell Oil Co., Sup. Ct. Op. No. 553 (File No. 918), 455 P.2d 12 (1969).

The words "bonus" and "royalty" in their broadest concepts and meanings are conflicting and overlapping. On the other hand, when it is necessary that they be distinguished, there is a narrower concept of the two terms as they are ordinarily and commonly used and understood in the oil and gas industry in which they do not conflict but are harmonious. In this narrower sense, a reservation or a payment of a part or percentage of production under a lease which is to continue throughout the life of the lease is regarded as "royalty," and a sum certain to be paid in cash or out of production is regarded as "bonus." Kelly v. Zamarello, Sup. Ct. Op. No. 705 (File Nos. 1255, 1256), 486 P.2d 906 (1971).

In its broadest sense, "bonus" is any consideration given for a lease over and beyond the usual ⅛th royalty, whether the additional consideration be paid or payable and whether paid in cash or payable out of production. Kelly v. Zamarello, Sup. Ct. Op. No. 705 (File Nos. 1255, 1256), 486 P.2d 906 (1971).

In its broadest aspect, "royalty" is a share of the product or profit reserved by the owner for permitting another to use the property. In this broad sense, a sum certain to be paid out of production, although "bonus" in that it is consideration in addition to the usual ⅛th royalty, would also be "royalty." Kelly v. Zamarello, Sup. Ct. Op. No. 705 (File Nos. 1255, 1256), 486 P.2d 906 (1971).

Choosing concept of "bonus" most commonly encountered. — In choosing the concept of "bonus" most commonly encountered in the oil and gas industry, defendants acted neither unreasonably nor arbitrarily. Kelly v. Zamarello, Sup. Ct. Op. No. 705 (File Nos. 1255, 1256), 486 P.2d 906 (1971).

Requiring compensation for lease immediately upon award of lease. — It is not unreasonable for the commissioner to determine that it is in the state's best interest to receive compensation for the leases immediately upon the award of the lease, rather than to wait for uncertain sums to arrive in the form of premium royalties. Kelly v. Zamarello, Sup. Ct. Op. No. 705 (File Nos. 1255, 1256), 486 P.2d 906 (1971).

Considering only cash portions of bids. — In considering only the cash portion of plaintiffs' 33 bids, defendants acted pursuant to valid regulations which provided that a lease would be awarded to the bidder offering the highest cash bonus. Since other bids on the 33 tracts contained higher cash offerings than plaintiffs' bids, the defendants acted properly in determining that the high cash bids on those 33 tracts were the apparent high bids, not plaintiffs' bids. Kelly v. Zamarello, Sup. Ct. Op. No. 705 (File Nos. 1255, 1256), 486 P.2d 906 (1971).

Royalty legislation on state oil and gas leases is a matter within the paramount jurisdiction of the state. The conservation

of oil and gas is a matter within the authority of the states. 1969 Op. Att'y Gen., No. 6.

The royalty provisions of a mineral leasing act are related to conservation of natural resources. 1969 Op. Att'y Gen., No. 6.

The United States, under the 10th amendment to the Constitution of the United States, has no authority to legislate on state royalty provisions and state oil and gas leases. 1969 Op. Att'y Gen., No. 6.

An overriding gross royalty of 2% of all proceeds from any state and federal lands conflicts with the Statehood Act and the province of the Alaska state legislature. 1969 Op. Att'y Gen., No. 6.

A 2% overriding gross royalty cannot apply to a federal lease on public lands within the State of Alaska. 1969 Op. Att'y Gen., No. 6.

A 2% overriding gross royalty cannot apply to a State of Alaska oil and gas lease issued pursuant to this section. 1969 Op. Att'y Gen., No. 6.

Commissioner empowered to grant royalty reduction. — This section empowers the commissioner of the Department of Natural Resources, not the director, division of lands, to grant the specified royalty reduction. Union Oil Co. v. State Dep't of Natural Resources, Sup. Ct. Op. No. 1087 (File No. 2025), 526 P.2d 1357 (1974).

Cited in Shell Oil Co. v. Pan American Petroleum Corp., 5 Alas. L.J. No. 11, p. 230 (Nov., 1967).

ALR reference. — Validity of compulsory pooling or unitization statute or ordinance requiring owners or lessees of oil and gas lands to develop their holdings as a single drilling unit and the like, 37 ALR2d 434.

Sec. 38.05.181. Geothermal resources. (a) *Purpose.* The legislature finds and declares that

(1) the people of Alaska have an interest in the development of the state's geothermal resources potential for

(A) use in the generation of electrical power that may reduce the state's dependence on fossil fuel power plants that seriously pollute the atmosphere in a number of areas;

(B) the production of geothermal steam that may provide central heat for urban areas close to geothermal areas;

(C) the production of valuable minerals and other byproducts associated with geothermal steam and accompanying brines; and

(D) the distillation of fresh water;

(2) the state, through the Department of Natural Resources and its division of lands, should exercise its authority to encourage the exploration for, discovery and production of, geothermal resources in the public interest to

(A) encourage maximum economic recovery of this potentially important natural resource and prevent its waste;

(B) ensure that the exploration for, and production of, geothermal resources, and the disposal of wastes from them, are carried on in a way that will safeguard life, health, property, public welfare and the environment; and

(C) preserve the state's natural, scenic values especially in those areas where geothermal resources are or may be found; although the need to develop new sources of energy rapidly is becoming urgent, every effort also must be made to protect those hot springs and geysers that are among nature's scenic wonders.

A Note on

PROPOSED CHANGES IN ALASKA'S OIL PRODUCTION TAX

W. J. Levy Consultants Corp.
New York, N.Y.
March, 1978

AGO 547695

A Note on

PROPOSED CHANGES IN ALASKA'S OIL PRODUCTION TAX

1. In this Report for the Alaskan Legislature, we review changes in Alaska's oil production tax recommended by the Department of Revenue and incorporated in Senate Bill No. 532 and House Bill No. 878.

2. In 1977, Alaska's production tax was amended to eliminate automatic escalation in cents-per-barrel tax rates.* At the same time, the amended law provided for annual review of cents-per-barrel and cents-per-MCF tax rates by the Department of Revenue, with a written report and recommendations for changes to be submitted to the Governor. The Governor, then, submits the proposed changes to the Legislature.

3. The Department of Revenue's Report for 1978 recommended (and SB532/HB878 incorporate) the following changes --

> An increase in the cents-per-barrel tax rate for other-than-old crude oil from 80 to 96.8 cents, which corresponds to raising the floor price (i.e., the price below which the cents-per-barrel rather than the percent-of-value tax applies) from $6.53 to $7.90 per barrel;
>
> An increase in the cents-per-barrel tax rate on old crude oil from 60 to 63.4 cents per barrel, raising the floor price from $4.90 to $5.18 per barrel; and

* Prior to this change, cents-per-barrel tax rates had increased or decreased with percentage changes in the Wholesale Price Index for crude petroleum published by the Bureau of Labor Statistics of the U.S. Department of Labor.

AGO 547696

Re-introduction of automatic escalation in cents-per-barrel tax rates, tying rates to percentage changes in the Gross National Product Deflator published by the Bureau of Economic Analysis of the U. S. Department of Commerce. *

4. In reviewing these proposed changes in the oil production tax rates, the Legislature will want to consider carefully two things. First, the reasoning behind the Department of Revenue's recommendations, as set out in the Department's report to the Governor. ** Second, that any changes in production taxes be reviewed in conjunction with proposed changes in other taxes that the State assesses on the oil and gas industry, notably the corporate income tax.

The Floor Price
for Prudhoe Bay Crude

5. The Department of Revenue report finds that the current floor price (and thus also the cents-per-barrel tax rate) is "inadequate." The Department calculates that the "market value" of Prudhoe Bay oil on the North Slope is significantly above the prices being reported by the companies for severance tax (or royalty) purposes. Furthermore, the floor price, which is designed to protect the State's severance tax revenues in the event that prices reported by companies are artifically depressed, is also below the computed market value. The conclusion: the floor price is too low to do its intended job of protecting revenues. The recommendation: raise the floor price for other-than-old oil to the level calculated by the Department as the market value ($7.90) of Prudhoe Bay crude on the North Slope.

---

* Changes in tax rates would be based on changes in the Deflator from the First Quarter of 1978.

** Recommended Changes in Alaska's Oil and Gas Production Tax Rates for 1978, a Report to Governor Jay S. Hammond by the Alaskan Department of Revenue.

6. Our firm has always regarded increasing the severance tax as the ultimate recourse for the State in the event that wellhead values are artifically depressed by the actions of tax-paying companies. The question the Legislature must consider now is whether the current circumstances of wellhead pricing warrant taking such a major step at the present time in the light of available evidence. This can best be judged by looking, as the Department has, at the various elements that enter into Prudhoe Bay oil prices -- i.e., pipeline tariff rates, tanker charges, and prices in markets to which the oil moves.

TAPS Tariff

7. The major factor serving to lower wellhead values below earlier expectations is the high level of TAPS pipeline tariffs filed by the companies with the ICC (now FERC) and used by the companies in their netback calculations. These tariff rates average out to some $6.20 per barrel.* In contrast, the interim tariffs allowed by the ICC average some $4.83 per barrel, or $1.37 per barrel less. The State of Alaska, in its protest to the ICC, set out tariff rates that averaged around $3.96. FERC is now in the process of conducting an investigation (with Alaska Pipeline Commission participating) into TAPS rates in order to establish lawful permanent tariffs. Pending the final outcome, the Courts have allowed the companies to continue to charge their initial filed tariffs.

8. Thus, the question of what are reasonable interstate tariff rates for TAPS is being reviewed and will eventually be resolved by the appropriate regulatory body. Whatever rates are eventually approved by the FERC will be those actually charged for transportation of the bulk of oil moved via TAPS and will thus bear on the value of oil on the North Slope. These rates would be appropriate to the calculation of oil values for severance tax and royalty purposes.

* A weighted average calculated by the Department of Revenue based upon pipeline ownership.

9. If finally approved TAPS rates are below the initially filed company rates -- and lower ICC interim rates would certainly point in this direction -- the effect would be to raise North Slope values and severance taxes to which the State was entitled. The State would obviously want to take whatever steps are necessary to ensure that it is in a position to collect back taxes in the event that this were to happen. Assuming that the State does have this protection, it would seem inappropriate for the State now to raise the floor price for production tax purposes to reflect what the State judges will be the (lower) tariff finally approved. This puts the State in the position of prejudging a complicated issue which is being subject to extensive hearings, later careful regulatory consideration, and probably also eventually review in the Courts.*

Tanker Charges

10. The Department of Revenue's report also takes issue with the tanker charges being submitted by the companies. The Department points out that the reported charges (e.g., $.81-$1.08 to the West Coast) are substantially above what had been estimated by many third-party observers and by company spokesmen themselves earlier on. In contrast to pipeline tariff rates, tanker charges are not regulated. Thus, the State will not have regulated rates to provide guidelines.

11. In the circumstances, we certainly feel that Legislative inquiry into the question of tanker charges is warranted, in course of hearings on the proposed changes in Alaska's production (severance) tax. Many factors affect tanker costs -- e.g., tanker size, timing of charters, bunker costs,

* Note that the proposed increase in floor price from $6.53 to $7.90 (+$1.37) is the same as the difference between average ICC interim ($4.83) and company posted tariffs ($6.20). Thus, although other aspects of wellhead valuation are at issue, the pipeline tariff is pivotal.

AGO 547699

safety and environmental standards, etc. Thus, ocean transportation costs may have increased substantially since earlier estimates were made. However, the companies transporting North Slope crude via tanker should explain how they arrive at the charges they are reporting to the State. With a better understanding of the factors underlying those charges, the State should be in a better position to judge their reasonableness for purposes of valuation.

12. The State might also want to consider the possibility of establishing some norm for transportation rates at which North Slope crude could be moved in substantial and continuous volume to major markets -- rather than continuously monitoring charges for each and every company's transportation. This rate would presumably be one which a company could match on the basis of prudent transportation commitments. Companies who are particularly astute in their tanker operations could hope to do better -- and would benefit therefrom by not having North Slope oil values and thus production taxes raised by their lower-than-average tanker costs. Other companies who make less astute business decisions on tanker coverage would have to bear the consequence without the State picking up part of higher-than-average costs through lower severance taxes.

13. In this connection, we note that the average transportation cost of oil moving in international trade in foreign flag tankers has been calculated since 1954 by an independent London Tanker Brokers' Panel. Their estimates, Average Freight Rate Assessment (AFRA), are widely used as proxy for companies' actual transportation costs both in commercial contracts where delivered prices require a freight component and in c.i.f. values for Government administration and tax purposes. Some such approach might be considered for tanker movements of North Slope crude. This could avoid potential conflicts over tanker charges. In the event, companies would be completely free to make their own decisions as to how they cover their tonnage requirements, but tanker charges for purposes of wellhead valuation would reflect objective criteria as to ocean transportation costs.

Market Prices

14. The Department has also questioned the companies' data on market prices received for oil, particularly on the West Coast. The Department calculates a value for North Slope oil at a refinery destination in Los Angeles. This estimate of $13.44 is based on the Official Government Selling Price for Saudi Arabian Medium (31°) crude f.o.b. plus LR2 (80,000-159,999 dwt.) AFRA tanker transportation. It finds this estimate to be at the upper end of the range of West Coast market prices reported by the companies ($13.16-$13.44).

15. The problem, here, is that there are many factors that bear on market prices and it is difficult to come up with a precise objective estimate. First, there are questions of crude quality. The Department's estimate of refinery value, for example, is based on a 31° Saudi crude, when North Slope crude is in fact around 27°. If Saudi Heavy crude (27°) were used, the Department's estimate would have been $13.14 -- or below the low end of the companies' range. On the other hand, Saudi Heavy crude (as also Saudi Medium crude) contains substantially more sulphur than North Slope crude, which enhances the value of North Slope relative to these crudes.* Furthermore, the relative value of various crude qualities varies from refiner to refiner, depending on his processing facilities, market requirements, etc. At least as important, there are other aspects to crude sales than selling price that also affect the value to the buyer and seller -- e.g., credit terms, obligations for the seller to offtake crude from the buyer,** etc.

---

* As against 1-percent sulphur for North Slope, Saudi Heavy is 2.8 percent and Medium 2.4 percent.

** The major third-party purchaser of North Slope crude is Socal for its Los Angeles and San Francisco refineries. Press reports indicate that at least some of Socal's contractual purchases of North Slope crude involve commitments by sellers to lift Middle East crude that Socal would have otherwise processed on the West Coast. Sellers of North Slope crudes are reportedly moving this Middle East crude to East-of-Rockies refineries.

AGO 547701

16. The State will obviously want to continue to monitor whatever relevant information it can obtain on sales prices for North Slope oil. However, given the range of difficulties in assessing an appropriate market price, the selling prices reported by the companies, in our judgment, do not look to be obviously out of line.

17. Finally, we note that companies have calculated severance tax values by netting back from the markets to which North Slope oil actually moves. Owing to much higher transport costs, netbacks from Gulf Coast shipments are obviously significantly lower than from the West Coast. The Department of Revenue, in its assessment of a market price netback for a severance tax floor price, has used only the West Coast as a reference point. On this basis, companies forced to ship North Slope crude to the Gulf Coast would have to pay a severance tax based on a higher netback calculated by the Department for the West Coast rather than actual netback from the market to which their crude moves.

18. In a report we prepared for the Legislature in 1970 on valuation of Alaskan crude oil,* we took the position that limited volume shipments of Alaskan crude to distant markets, which may reflect individual company economics, would not normally bear on the valuation of Alaskan crude. Valuation should be based on market prices in refining centers "where there is a substantial and continuous movement of Alaskan oil by the industry in general." At present, substantial volumes of North Slope crude move to the Gulf Coast; when production reaches 1.2 million barrels daily, approximately two fifths (500,000 barrels daily) is likely to be moving to the Gulf Coast. In these circumstances, it is not inappropriate that the value of Alaskan crude on the North Slope takes into account the fact that a substantial portion of production cannot realize the higher netback values obtainable on the West Coast, owing to limitations on the absorptive capacity of West Coast refineries for North Slope crude.

* Economic Considerations Bearing on Valuation of Alaskan Crude Oil and State Policy on Pipelines, December, 1970.

AGO 547702

Cents-per-Barrel Escalation

19. In addition to raising floor prices, the Department has also recommended re-introduction of automatic escalation in floor prices with an index of inflation. Escalation with the GNP deflator would almost inevitably result in progressive increases in severance taxes where cents-per-barrel and not percent-of-value is the operative tax.

20. Last year's severance tax revision was presumably designed to establish schedules of severance taxation appropriate to the producing circumstances of Alaska and with regard also to rates of severance taxation in other producing states. No doubt wellhead values and hence severance tax revenues have worked out below expectations; and we discussed above whether an increase in floor prices ought now to be considered as offset to protect Alaska's interests.

21. Escalation of floor prices with inflation, however, could have the effect of increasing producing companies' effective severance tax rates without regard to wellhead values. We have noted in the past that previous escalation with the Wholesale Price Index for crude petroleum imposed a progressively increasing severance tax burden on Cook Inlet producers whose old oil prices were held down by Federal price ceilings whilst average crude prices and hence their cents-per-barrel tax moved upward. The adverse effect (i.e., rising cents-per-barrel severance taxes relative to wellhead values) could be even more incongruous when escalation is triggered by a GNP deflator that reflects price behavior for the U.S. economy as a whole.

22. To the extent that crude oil prices advance in the future -- notably foreign oil prices into Alaska's Lower 48 markets, but also domestic oil prices that directly or indirectly affect the competitive evaluation of North Slope crude -- that would tend to raise wellhead values and severance tax revenues. Similarly, changes in transportation charges would be reflected in wellhead values and severance tax revenues. And to the extent that percent-of-wellhead value is the operative severance tax, there is a meaningful relationship between severance tax liability and production values.

23. Cents-per-barrel may be a necessary floor for protection of Alaska's interests in appropriate circumstances. Escalation of cents-per-barrel would not seem to be an appropriate device to raise severance taxes or severance tax income. If that is at issue, the Legislature could more cogently address the question whether established percents-of-value ought to be raised.

The Honorable Alvin Osterback
Chairman
House Resources Committee
Alaska State Legislature
Pouch V - State Capitol
Juneau, AK 99811

Dear Alvin:

Enclosed please find our Notes on Proposed Changes in Alaska's Oil Production Tax. Again, I am sorry that we were unable to testify before your House Resources Committee on this matter last week, but I expect that you may want to have actual testimony and an opportunity for your Committee members to ask questions on the occasion of our next visit.

I am taking this opportunity to make our Notes available to other interested persons as indicated below.

Cordially,

Milton Lipton
Executive Vice President

AGO 547705

TO: CHAIRMAN, HOUSE RESOURCES COMMITTEE
AND ALL COMMITTEE MEMBERS

FROM: SUB-COMMITTEE ON OIL & GAS

During the week of march 21 - 26 the Joint Senate and House Resources Committees met to hear testimony relating to the various oil and gas taxation bills currently before us. Some of the bills under discussion, have not been refered to this committee.

Of the ones that have been, the Sub-committee on Oil and Gas recommends that H.B. 321, H.B. 322, C.S.H.B. 323, H.B. 328, and S.B. 274 be brought to the full committee's attention for consideration and that they be acted upon and passed out of committee no later than April 7.

Each of these bills have a further referal tc House Finance and the Finance Committee has scheduled hearings and work sessions on these bills beginning early next week. Representatives from the oil companies and several nationally recognized economists will be present. We urge all members, who are able, to attend.

RECOMMENDED BILLS

H.B. 321 - SEVERENCE TAX

This tax, in our opinion, rates highest in priorities. It's timeliness is dependant upon the actions undertaken by the Federal Energy Administration in setting a recommended "well head" price by April 15, 1977, and further by actions later taken by the I.C.C. in recommending the transportation cost of North Slope crude. For other features of the bill, we refer the committee's attention to the Governor's transmittal letter for H.B. 321, included with this report.

H.B. 322 - ALASKA NET INCOME TAX OR FRANCHISE TAX

This tax bill, in our opinion, has several advantages over our present income tax collection system. It is easy to administer, is based upon the amount earned within the state, including OCS development, and would provide the State and the industry with a stable taxation policy for years to come. For other features, we refer you to the Governor's transmittal letter for H.B. 322, included in this report.

AGO 547706

H.B. 323 - PROPERTIES AD VALOREM TAX

This tax bill, our opinion, is premature. It would increase the scope of taxable property to include refining, liquefaction, and marine transportation. We believe that it would act as a "disincentive", at this time, for future development within our state, and of all the tax bills before us, meet with the most resistence. Accordingly, we have asked the Department of Revenue to place before this committee, a committee substitute for H.B. 323 which would reduce the bill to a "house-keeping" measure. This has been done and is before the committee for consideration.

H.B. 328 - RESERVE TAX

This tax bill amends the reserves tax bill to allow a credit reduction of tax levied 12 [20] if the oil flow through the Trans-Alaska Pipeline by October 1, 1977 has reached at least 600,000 barrels of oil on a daily average. Otherwise, the bill extends the reserve tax beyond the December 31, 1977 effective date of the original act. We urge its passage.

S.B. 274 - THE TAKING OF OIL AND GAS ROYALITY IN KIND

This bill requires that royality oil and gas be taken "in kind" rather than in money unless deemed otherwise by the commissioner, the Alaska Royality Oil and Gas Development Advisory Board, and the the Legislature. As an encouragement for future development within our state, we urge the passage of this bill.

AGO 547707

CONCLUSION:

The Sub-committee bleieves that the passage of these tax proposals, taken in conjunction with the desire to have the Alaskan Permanent Fund replace the eventual and inevitable passage of our nonrenewable resources, will produce a desired benefit for the State of Alaska. We further believe that they <u>will not</u> act as a disincentive for the oil industry and that their passage will ensure Alaska's "fair share" in the wealth of our state. Regarding this aspect, we urge committee members to read the Tanzer Report, "IMPACT OF INCREASED TAXATION ON OIL EXPLORATION AND DEVELOPMENT IN ALASKA", submitted to all members of the Alaskan State Legislature on March 25, 1977.

We have asked that Mr. John Messenger from the Department of Revenue be present to assist committee members in answering their questions and would, as this time, like to highly commend the staff of Senate and House Resources for providing the back-up material needed for the committee's deliberations.

Rep. Merle G. Snider
Rep. Hugh Malone
Rep. William Akers.

AGO 547708

HOUSE BILL NO. 321 by the Rules Committee by request of the Governor, entitled: HB 321

"An Act relating to the oil and gas properties production tax; and providing for an effective date."

was introduced, read the first time and referred to the Committees on Resources and Finance.

The Governor's transmittal letters appear following the bill to which it pertains: fiscal notes appear in House Supplemant No. 31 to today's journal.

"March 8, 1977

HB 321

The Honorable Hugh Malone
Speaker of the House
Alaska State Legislature
Juneau, Alaska 99811

Dear Mr. Speaker:

Under the authority of art. III, sec. 18 of the Alaska Constitution, and in accordance with AS 24.30.060(b) and the Uniform Rules of the Alaska State Legislature, I am transmitting a bill relating to the oil and gas properties production tax.

As a result of a recent study of Alaska's oil and gas tax structure, the Department of Revenue has recommended several changes in the state's production or "severance" tax. This bill incorporates those specific recommendations.

Currently the state's oil production tax is calculated according to "stair stepped" rates depending upon the level of production for the lease or property. As currently structured the tax may have an adverse impact upon a particular property as it reaches its economic limit. The "stair step" approach may not alleviate this adverse effect since the economic limit may vary substantially from one part of the state to another. This is because it may be more costly to produce and transport the oil in the more remote areas of the state. Accordingly, the bill contains an economic limit mechanism which automatically scales the tax rate down as the production nears its economic limit. This will insure that the tax will not unduly inhibit oil production as it reaches its economic limit.

One of the immediate dangers which face the state's revenue picture is the potential for artificially depressed pricing of the state's North Slope oil. This could result from federal pricing decisions or excessive tariff costs from the wellhead to the refinery. To insulate the state's petroleum revenues from these forces, the bill provides for a mechanism which would raise the cents-per-barrel floor to correspond to a mid-range market value for North Slope oil and tie that floor to an index which will let the floor keep pace with inflation.

One of the Department of Revenue's recommendations -- the oil and gas surtax -- which was designed to offset revenue losses due to depressed pricing of North Slope oil and which was to be imposed only on holders of state-owned leaseholds was deleted on the advice of this department because of the substantial legal problems involved.

The bill places the tax on gas at a parity with the tax on oil. Currently gas is taxed at only 4 percent while oil is taxed from 5 to 8 percent. The bill would tax both oil and gas at 10 percent. In addition, the bill sets a cents-per-Mcf floor for the gas tax similar to the cents-per-barrel floor for oil. This new floor for gas corresponds to the highest market price in the state, and it too is tied to an index to keep pace with inflation.

Sincerely,

Jay S. Hammond
Governor "

AGO 547709

HOUSE BILL NO. 322 by the Rules Committee by request of the Governor, entitled: H3 322

"An Act establishing an oil and gas corporate franchise tax; and providing for an effective date."

was introduced, read the first time and referred to the Committees on Resources and Finance.

"March 8, 1977

The Honorable Hugh Malone
Speaker of the House
Alaska State Legislature
Juneau, Alaska 99811

Dear Mr. Speaker:

Under the authority of art. III, sec. 18 of the Alaska Constitution, and in accordance with AS 24.50.060(b) and the Uniform Rules of the Alaska State Legislature, I am transmitting a bill establishing an oil and gas corporate franchise tax.

The Department of Revenue, in its oil and gas tax study, found two basic deficiencies with the corporate income tax as it relates to oil and gas corporations. This bill would correct those deficiencies.

HB 322

The first problem is the eroded federal tax base. The department found that the federal corporate tax base which Alaska has adopted has been substantially eroded by special exemptions, deductions, credits and other accounting devices. The result has been that oil and gas corporations pay an effective tax rate much smaller than the statutory 48 percent. Accordingly, the bill would enact a separate franchise tax on a corporation's "book income." "Book income" is the net income which the corporation reports to its stockholders. This would eliminate all the special Congressional tax provisions.

In addition, the department found that the present apportionment formula does not fully represent the oil and gas corporate activity in the state. The present formula of property, payroll, and sales generally measures corporate business activity in the state. For natural resource companies, however, it does not. No reflection in the present formula is made for the scarcity value of the oil and gas produced. Accordingly, the bill will substitute for the present sales factor an extraction factor which will give weight specifically to oil and gas production activity.

One of the advantages of this franchise tax is that it will take into account elements of property, payroll, and extraction located on the Outer Continental Shelf which causes a resulting impact on the adjoining state. Thus property, payroll, and extraction not located in any state but which are located off the shores of an adjoining state which is impacted by the oil and gas production activity will be allocated to that state suffering the impact. Although this latter provision may raise some constitutional law questions, we believe that the proposal comes within the limits of the state's taxing powers given the impact on the coastal communities of our state of these OCS activities.

Sincerely,

Jay S. Hammond
Governor"

AGO 547710

HOUSE BILL NO. 328 by the Rules Committee by request of the Governor, entitled: HB 328

"An Act amending the oil and gas reserves ad valorem tax; and providing for an effective date."

was introduced, read the first time and referred to the Committees on Resources and Finance.

" March 9, 1977

The Honorable Hugh Malone
Speaker of the House
Alaska State Legislature
Juneau, Alaska 99811

Dear Mr. Speaker:

Under the authority of art. III, sec. 18 of the Alaska Constitution, and in accordance with AS 24.50.060(b) and the Uniform Rules of the Alaska State Legislature, I am transmitting a bill amending the oil and gas reserves ad valorem tax.

Section 1 of this bill proposes that the reserve tax levy be reduced from 20 mills to 12 mills this year with the condition that an additional levy will be made if there is a delay in the start-up of the Trans-Alaska Pipeline.

This amendment is proposed because the state has a budget surplus for FY 1977. This surplus is somewhat illusory, however, since the reserve tax payments may be recouped by oil and gas producers by credits against future severance tax. Accordingly, the adoption of this measure would reduce the surplus for 1977 and also reduce the amount "borrowed" from future revenues.

Section 2 provides for a contingent 1979 assessment at a rate to be determined by that year's legislature.

Sincerely,

Jay S. Hammond
Governor"

AGO 547711

HOUSE BILL NO. 323 by the Rules Committee by request of the Governor, entitled:

"An Act relating to the oil and gas exploration, production, and pipeline and marine transportation property tax; and providing for an effective date"

introduced, read the first time and referred to the Committees on Resources and Finance.

"March 8, 1977

HB 323

The Honorable Hugh Malone
Speaker of the House
Alaska State Legislature
Juneau, Alaska 99811

Dear Mr. Speaker:

Under the authority of art. III, sec. 18 of the Alaska Constitution, and in accordance with AS 24.30.050(b) and the Uniform Rules of the Alaska State Legislature, I am transmitting a bill relating to the oil and gas exploration, production, and pipeline and marine transportation property tax.

The Department of Revenue has recently completed its study of Alaska's oil and gas tax structure and has made several recommendations. One set of recommendations dealt with the state's 20-mill property tax imposed by AS 43.56. This bill would implement that set of recommendations.

The bill corrects four problem areas in the current property tax: the omission of certain important kinds of oil-and-gas-related properties from the definition of taxable property; present uncertainty about how pipelines should be valued; the static nature of the $1500 per-capita limitation on municipal taxation, and the extent to which municipal property tax payments should be allowed as credits against the state tax. The bill's features are described below:

Section 1 of the bill makes clear that taxes paid to municipalities which exceed the statutory limitations in AS 29.53.045 and 29.53.050 are not creditable against the state tax.

Section 3 of the bill removes the current uncertainty on pipeline valuation by ensuring that pipelines will be valued on the basis of their full and true value with due regard to their economic value. This will eliminate the possibility of pipelines being valued under the depressed valuation method of actual cost depreciated.

Section 4 of the bill defines full and true value of property used in refining or liquefying of gas or oil as replacement cost less depreciation. It also defines the value of taxable marine transportation property.

Section 7 adds new categories of taxable property including oil refineries, gas processing plants and liquefied natural gas facilities. This will mean greater revenues to the state from these important oil and gas properties.

Section 8 and 9 of the bill tie the $1500 per capita municipal limitation to the Anchorage cost-of-living index in order that the limitation would increase over time as inflation raises the cost to municipalities of providing services to its residents.

HB 323

In addition, Sections 2, 4, 5, 6, and 7 are aimed at amending the relevant provisions of AS 43.56 to provide for the taxation of marine transportation property (i.e. tankers) on an apportioned basis determined by the number of days spent on ports loading and unloading gas and unrefined oil divided by the total number of days-spent-in-ports everywhere. Although these provisions raise close and difficult questions of constitutional law regarding the ability of the state and municipalities to impose an ad valorem property tax on such vessels in light of the traditional application of the "home port" doctrine, it is the view of the Department of Law that these vessels have sufficent nexus with the state to bring them within the constitutional parameters of the state's taxing power.

Sincerely,

Jay S. Hammond
Governor"

MEMORANDUM

SUBJECT: Revenue Effects of HB 878

TO: The Honorable Al Osterback, Chairman
House Resources Committee

The Honorable Hugh Malone

FROM: Richard G. Haggart
Research Analyst

This memorandum is in response to your request that we prepare an analysis of the longer-term revenue impacts associated with HB 878. Tables I and II attached detail the revenue impacts of this legislation at varying inflation rates through 1990 for both Prudhoe Bay and Cook Inlet.

As can be seen from the tables, the major effect of the legislation would be felt in terms of Prudhoe Bay oil. The increase in the floor price alone (without accounting for inflation increases in the floor price as specified in the bill) would increase state revenues by approximately $750 million through 1990. Since the floor price would escalate at the same rate as the Gross National Product Deflator (a general measure of inflation within the U.S. economy), actual revenue increases over present law would be substantially greater. Based on an assumed annual inflation rate of between 4% and 6%, HB 878 would generate between $1.5 billion and $2.2 billion more in additional severance tax revenues through 1990 than would the current law (after deducting approximately $386 million in remaining Early Development Incentive Credits held by Prudhoe Bay oil producers). Under the same assumptions, revenues from Cook Inlet production would increase between $19.9 and $29.7 million over the same period.

If you have any further questions regarding this legislation or its associated effects we will be happy to answer them.

AGO 5477 18

Mr. Chairman and members of the House Resources Committee:

I want to thank you for the opportunity to testify today on HB 878. HG 878 represents in bill form the Department of Revenue's recommendations for changes in the state's cents-per-barrel tax rates under the production tax statute. These recommendations and our reasons are contained in a recent repor to Governor Hammond.

The bottom line of our recommendation is that the cents-per-barrel floor needs to be adjusted upwards to prevent further erosion of the state's production tax revenues which have resulted from spiralling transportation charges.

As you know our production tax is an alternative tax. A producer of new oil like that produced at Prudhoe Bay pays either 12.25 percent of the wellhead value or .80 per barrel of the oil produced, whichever is greater. The cents-per-barrel tax acts as a floor since if the wellhead value falls below a certain level the cents-per-barrel becomes applicable and the producer pays the certain enumerated cents-per-barrel regardless how far the well head value declines.

As I mentioned the present cents-per-barrel rate for all oil other than old oil is set at .80 per barrel and establishes an effective production tax floor of $6.53. That is, 12.25 percent of $6.53 is 80 cents. At wellhead values above

$6.53, 12.25 percent of that value equals a greater tax per barrel than .80 and at well head values below $6.53, 12.25 percent of the well head value gives a tax amount less than .80.

It is our position that a floor of $6.53 is not sufficient to protect the revenues of the state since the true value of our oil is much higher than that assuming fair and reasonable transportation charges.

Last year we recommended a cents-per-barrel floor of $7.50. We considered this a conservative mid-range estimate of a Prudhoe Bay wellhead value assuming no puffed tariffs or other corporate manipulations.

The oil industry did not dispute this figure of $7.50. In fact their public statements showed likely wellhead values ranging from $7.00 to $8.00. For example, the public statements of the industry last year are summarized in our report.

Third party estimates of likely wellhead values also fell in the $7.00 to $8.00 range and are summarized in our report.

Unfortunately for Alaska, when the oil industry filed its production tax and royalty returns a few months later when Prudhoe Bay production began in June, they reported wellhead values $1.00 to $3.00 below their public statements.

This reduction in the wellhead values - below what the industry stated - below what third parties stated - and below what the department stated - can be directly traced to the claimed transportation costs of the companies. These transportation costs we believe are both inflated and unreasonable.

For example, during the month of June the TAPS owners filed unprecedented tariffs in the range of $6.04 to $6.44, in some cases over a dollar more than the companies stated only three to four months earlier. These tariffs were subsequently protested as unreasonable by the United States Justice Department, the State of Alaska, the Arctic Slope Native Corporation and the Interstate Commerce Commission staff. The matter is now pending in court litigation and administrative adjudication.

Another example is the claimed tanker transportation costs. These costs have ranged from 81 cents to a $1.08 to the West Coast and $3.61 to the Gulf Coast. These reported charges are also substantially above what the companies stated earlier in the year. Unlike pipeline tariffs, however, which are now regulated by the Federal Energy Regulatory Commission, these tanker charges are not regulated by any public regulatory agency. Instead the transportation costs are set by negotiation between the shipper and the tanker company which in some cases may actually be between affiliated companies.

These inflated pipeline tariffs and tanker charges have reduced Alaska's wellhead values substantially and resulted in Alaska royalty and production tax revenues to plummet.

Again we are not talking about a difference of a few cents in the wellhead value and a loss of a few million dollars, but a difference of dollars in the wellhead value resulting in a loss of hundreds of millions of dollars.

Just to show how bad the situation has gotten, Shoio has managed to reduce the wellhead value for the oil which it is transporting to the Gulf Coast, to $2.87. This is from $2.00 to $3.00 below what it publically stated would be the case only three months prior to production.

For example in February of last year the Department estimated gross royalty revenues in FY 79 of $520 million. In January of this year after the companies had reported their first few months of wellhead values, our estimates of gross royalty revenues for FY 79 had dropped to $358 million. And in a continual spiral downward this month we are now projecting gross royalty revenues in FY 79 of $300 million. It also should be noted that it is not only the state's general fund that is affected by these reduced wellhead values, but the permanent fund and the payments into the Alaska Native Fund have been reduced substantially as well

since 16 percent of the state's royalty revenues are paid to the Native Fund and 25 percent are paid into the permanent fund.

Although the legislature cannot now correct the royalty reduction since they are set by prior statute and leases, the legislature does have the power to prevent further erosion of the state's production tax revenues by adjusting the cents-per-barrel floor.

We recommend putting a stop to the further decline of our production tax revenues by setting the cents-per-barrel floor at its true market value of $7.90 and escalating that amount over time based upon inflation.

We have arrived at that figure in two different ways. First of all, we have taken comparable market refinery prices on the West Coast and subtracted reasonable transportation costs (determined from third party sources) to arrive at an objective market wellhead value of $7.91.

A second way of looking at it is to take last year's estimate of wellhead value which was consistent with the public statements of the oil companies and numerous consulting firms and add to that figure the changes in inflation or oil prices since that time. As such $7.50 plus 5.7 percent inflation as measured by the G.N.P. deflator would yield a value of $7.93.

This action would bring our severance tax revenues back into line with what they should be absent inflated transportation charges. For example in FY 79 it would protect an additional $32 million in net production tax revenues over what we are now projecting under present law.

I ask for your favorable consideration of this important piece of legislation.

Introduced: 3/9/78
Referred: Resources and Finance

IN THE HOUSE

BY THE RULES COMMITTEE BY REQUEST OF THE GOVERNOR

HOUSE BILL NO. 878

IN THE LEGISLATURE OF THE STATE OF ALASKA

TENTH LEGISLATURE - SECOND SESSION

A BILL

For an Act entitled: "An Act relating to oil and gas taxes; and providing for an effective date."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

* Section 1. AS 43.55.011(c) is amended to read:

(c) The cents-per-barrel amount equals $0.634 [$0.60] per barrel of taxable old crude oil produced from the lease or property, and $0.968 [$0.80] per barrel for all other taxable oil produced from the lease or property, both as adjusted by sec. 12 of this chapter.

* Sec. 2. AS 43.55.012(a) is repealed and re-enacted to read:

(a) The amounts set out in sec. 11(c) and sec. 16(c) of this chapter shall be increased or decreased by a percentage equal to the percentage of change in the Gross National Product Deflator published by the Bureau of Economic Analysis of the United States Department of Commerce, using 1972 as the base period for the deflator (1972 = 100). Changes in tax rates will be computed based on changes in the Gross National Product Deflator from the First Quarter 1978 Gross National Product Deflator. The department shall post the changes in the tax rates periodically and shall send notice of the changes to every person producing oil within the state.

* Sec. 3. AS 43.55.016(c) is amended to read:

(c) The cents-per-Mcf amount equals $0.068 [$0.064] per thousand cubic feet of taxable gas produced from the lease or property as adjusted by sec. 12 of this chapter.

* Sec. 4. This Act is retroactive to include production occurring

AGO 547725

at any time after December 31, 1977.

* Sec. 5. This Act takes effect immediately in accordance with AS 01.10.070(c).

#6878

ALASKAN TESTIMONY - JOE T. McMILLAN

MARINE TRANSPORTATION COSTS FOR NORTH SLOPE CRUDE

My name is Joe T. McMillan. I am General Manager of the Supply Department for Exxon USA. We appreciate the opportunity to appear today and discuss the marine transportation costs associated with moving North Slope crude to the West Coast. The basis Exxon is using in determining these costs is market-oriented and is consistent with the requirements of the severance tax statutes.

The payment of severance taxes requires the determination of a value for Prudhoe Bay crude at the inlet to the Trans Alaska Pipeline (TAPS). Since the crude must compete with other alternative crudes that can be delivered to a refiner, our prices for North Slope crude on the West Coast are based on market factors, primarily the landed cost of foreign crude imports adjusted for quality. The various increments of cost for moving the Prudhoe Bay crude from the North Slope to the refiner are deducted from the West Coast price of the crude to determine the TAPS inlet value.

In the attachment, I have shown how we determined the value for the crude that was produced in December 1977 and moved to the West Coast. The marine costs reported to the State include the Federal Oil Spill Fund payment, an allowance for marine losses, casualty insurance and tanker repositioning costs, as well as ocean freight costs from Valdez to the West Coast market. Let me discuss each of these components.

The Federal Oil Spill charge amounts to $0.05/B on North Slope crude shipped from Valdez. This is paid to the U.S. Government to build up the $100MM fund provided for in the TAPS Authorization Act. The fund will be available, if necessary, to pay for spill cleanup and administrative costs. The costs currently exclude the State of Alaska risk avoidance assessment which is presently being litigated. This could add another 2-3¢/B to the transportation costs.

The marine losses are to cover evaporation and other handling of the crude while in transit and were initially based on our experience in moving significant volumes of crude on a worldwide basis. It is not uncommon in the marine industry for a loss factor of .5% to be employed for this purpose. However, our operating experience in this service has been lower. In January we adjusted the loss factor to .25% to reflect our actual experience in shipping the North Slope crude during the August-December 1977 period.

The charge for casualty insurance is based on actual quotes from outside insurance companies. The insurance cost is for the complete move from the North Slope to the West Coast and would cover casualty losses from the pipeline and the terminal at Valdez, as well as any marine casualty losses.

The freight costs and the tanker repositioning costs are also governed by market conditions. In the foreign marine trade a panel of London brokers publish a monthly market rate for various sized tankers. The rate is representative of the actual mix of long and short-term charters and spot voyages currently in use in the foreign market. The Average Freight Rate Assessment, or AFRA, rates are widely used by industry and are accepted by a number of governments in assessing foreign marine costs. However, there is no such outside information available for U.S. Flag or Jones Act ships in West Coast trade. For this reason,

we have used our actual charter rates for ships in North Slope service to develop the marine freight from Valdez for both the chartered and our own ships. These charter rates are set by arm's-length negotiations between a third party ship owner and the company chartering the vessel. The repositioning costs are required to reflect the expense of moving the ships from their original service to the West Coast trade. These costs are not included on the charter costs and are a one-time expense that is being amortized over an 18-month period.

In addition, a 2.5% management fee is added to cover the cost of market solicitations, charter negotiations and administration, schedule coordination, and other services provided by Exxon Marine Department. The fee is composed of (1) the normal brokerage fee (1-1/4%) associated with market solicitation and charter negotiations and (2) an estimate of the costs for the remaining items.

The charter costs negotiated by Exxon represent a true measure of the value of term coverage of North Slope crude movements. However, West Coast transportation rates will vary due to different charter costs, discharge ports, and size of ship. For example, at San Francisco, the terminals are not capable of accepting ships with greater than a 34-foot draft. As a result, a charge must be added to partially unload, or lighter, a portion of the cargo into barges or smaller ships for movement to the refineries in that area. The alternative would be the use of much smaller ships and increased costs. However, most ships calling at Los Angeles can be accepted fully laden, thereby saving lightering costs. These and other variations explain why marine costs reported for an individual month or for different companies are not the same.

In conclusion, the marine transportation charges used by Exxon to determine the value of Alaska North Slope crude reflect third-party commercial market conditions. We believe this to be a proper and fair basis for determining the severance tax value for North Slope crude oil.

BASIS FOR EXXON'S NORTH SLOPE CRUDE PRICE NETBACK FOR SEVERANCE TAX

	December 1977 $/B	Basis/Comments
West Coast Market Price	13.16	Negotiated West Coast sales price. Represents parity price with imported crude adjusted for quality/other factors.
Federal Oil Spill Fund	(0.05)	5¢/B levied on each barrel loaded at Valdez until a $100 MM fund is established.
Marine Losses	(0.03)	0.2% losses based on previous Exxon experience. Actual North Slope experience indicates a higher loss of 0.25%.
Casualty Insurance	(0.01)	Crude casualty loss insurance for pipeline and Marine moves. Rate based on quotes from outside insurance companies.
Marine Freight from Valdez	(0.90)	Tanker rates for both owned and period chartered tonnage are based on third party charter rates plus a 2-1/2% management fee.
Tanker Repositioning	(0.09)	18-month amortization of positioning ships from Gulf Coast to West Coast (via Cape Horn) based on third party market charter cost.
Marine Subtotal	(1.08)	
TAPS Tarriff/Losses	(6.27)	Exxon Pipeline Company's ICC interim tariff
TAPS Inlet	5.81	

AGO 5477729

TESTIMONY BEFORE THE HOUSE RESOURCES COMMITTEE
OF THE ALASKA STATE LEGISLATURE
BY K. E. SHOWALTER
DIRECTOR, ALASKA GOVERNMENT AFFAIRS
SOHIO PETROLEUM COMPANY
MARCH 24, 1978
3

Chairman Osterback and members of the Committee:

I am K. E. Showalter, Director of Alaskan Government Affairs for Sohio Petroleum. My remarks are directed to House Bill 878, a proposed amendment to the oil and gas production tax laws. This bill would do two things; it would increase the production tax floor from $.80 to $.968, a 21% increase on top of an approximate 50% increase just last year, and it would escalate the floor tax by means of the Gross National Product Deflator index.

The recommendation for the increase in the floor is justified on the basis that the Prudhoe Bay Producers are somehow "manipulating" or "managing" transportation costs in such a way as to reduce well head values to the detriment of the State of Alaska and to the benefit of the producers.

The current well head values are no doubt somewhat below the expectations of the state and I can also tell you they are disappointing to Sohio and its stockholders.

It has been charged that Sohio and others deliberately gave misleading estimates of transportation costs last year that resulted in the production tax floor being set too low. I can categorically state that we were trying to make the best good faith, estimates we could with the information available at the time and I also believe that the other companies were doing the same.

In the short time that the Department of Revenue recommendation has been available we have not yet been able to do all the research necessary to give a comprehensive reply to their charges. However, we have done some preliminary work and would like to examine more closely some of the evidence presented in the recommendation.

First let's take a look at TAPS tariffs. The Department of Revenue cites a Sohio estimate by Mr. R. M. Donaldson on March 21, 1977 of $5.00 to $6.00 as one of the "misleading" estimates. Some three months later we filed a tariff of $6.16 -- less than 3% above the estimated range. Hardly a gross deception when the range given was 20%.

The recommendation also cites estimated tariffs from a Wainwright Securities report dated April 1, 1977. On page 42 of that report is a table showing three tariff levels using different assumptions as to how the ICC might rule on final tariffs for the TAPS pipeline. The tariffs listed were:

$3.32 per barrel (ICC 8% return)
$4.23 " " (ICC 10% return)
$6.25 " " (Elkins Act 7% return)

An additional 5¢ per barrel has to be added for the TAPS spill fund.

On page 47, the Wainwright report goes on to say:

> "As matters now stand, the TAPS owners are apparently moving forward to post initial tariffs on an Elkins Act basis, in the belief that past practice affords good justification for continuing to use this tariff setting approach."

The Elkins Act 7% rate of return basis was listed by Wainwright at $6.25, remarkably close to the middle of the range of tariffs filed of $6.04 to $6.44.

On page 49 of the Wainwright report points out the ifficulties of estimating final TAPS tariffs:

> "It should be fairly obvious from the preceding discussion that any attempt to accurately forecast pipeline tariffs and earnings is frought with major imponderables. While an endless number of permutations and combinations can be constructed as a means of defining sensitivities, in the end a useful earnings estimate must rest on a limited number of possibilities. Thus, in developing our 1977-1980 North Slope earnings estimates, we used only two alternatives for deriving TAPS tariffs and pipeline earnings: (1) the traditional Elkins Act consent Decree method, the basis on which the companies (with the possible exception of Ameranda Hess) apparently intend to file, at lease initially; and (2) the return on equity approach outlined by the ICC in the WBPL proceeding. These two cases can also be viewed as bracketing the eventual outcome."

Thus, this report estimated that the final tariffs will be somewhere between $4.23 and $6.25. We fail to see how this report could "mislead" anyone.

But the real issue on tariffs is that the extensive hearings required before the Federal Energy Regulatory Commission and the Alaska Pipeline Commission are now far from complete and it will be several months until final tariffs are determined. Should the State of Alaska and the other protestants prevail, with the tariffs finally set at a rate lower than we are now charging, our filed tariffs require that the pipeline companies refund the difference to the shippers. In that eventuality Sohio, as a producer, would then be required to pay the State of Alaska any difference in taxes and royalties attributed to such lower tariff on every barrel of oil shipped at the higher rate, regardless of when it was shipped.

The industry is also accused of shifting profits to tanker affiliates and away from the well head. Sohio has no affiliate in the tanker business since the Jones Act precludes us from owning or operating intercoastal vessels in the U.S. because B.P., Ltd., owns over 25% of our stock. All the tankers transporting our oil are owned by others and are on time charters of various lengths. The large newly built tankers are backed financially by Sohio long term charters. There would be no advantage for Sohio to shift profits away from the well head, where the profits are ours, to tanker transportation, where someone else gets the dollars.

Our estimate of $2.75 for shipments to the Gulf Coast was lower than the actual cost turned out to be. This $2.75 estimate was made in March, 1977. Since we do not own the tankers we can not set rates, we must negotiate the best deal possible and we believe we have done so.

The use of the $3.61 from our December reports is, in itself, misleading. As the Department of Revenue must know, we have agreed with the State of Alaska that since actual tanker costs cannot be determined on a monthly basis in time to make our tax payments we estimate tanker costs on a quarterly basis and pay taxes based on the estimate. Sixty days after the end of the quarter a determination of actual costs is made and tax adjustments made accordingly.

During December our tax payments were based on an estimate of $3.61. However, we have since determined that the actual costs were $3.31 for December and the extra tax due has been paid to the Department of Revenue.

Our people have estimated and have used for January, a tanker cost of $.99 to the West Coast and $3.05 to the Gulf Coast. These estimates may be high or low and will be adjusted on the first of June to the actual costs. So right now it looks as though our estimate was off about $.30 (11%) rather than the reported $.86, not really a bad estimate.

AGO 547732

In addition, we note that FCCS CSHB 118 has an appropriation of $35,000 for a study of tanker costs by Legislative Affairs. We are confident that an objective study will show that the tanker rates we are charging are proper.

I would also like to point out that Sohio has been working for about 4 years and has spent over $35,000,000 to date in an attempt to secure permits and do engineering work on the PAC-TEX pipeline project from Long Beach California to Midland, Texas. We do not have all the permits but we are getting closer. This line will, if built, reduce the cost of shipments to the Gulf Coast substantially, to the benefit of both the producers and the State. I believe this massive effort indicates that we are working hard to get the most reasonable transportation costs possible for Prudhoe Bay crude oil, even while we are accused of "manipulating" in the other direction.

I'm not quite sure why royalty oil was brought up in the Department's recommendations and in their testimony but since it was I would like to comment briefly on that subject. On page 16, of the Department's recommendations they point out:

> "The purpose of mentioning all these prices is not to set the ground for any possible legislative resolution of these royalty matters, since the royalty questions are already being litigated."

This is a fact. When we read our leases they say that we are to pay royalty "at the well" and that certain cleaning and dehydrating costs are deductible from the royalty value. The state believes that royalty value should be determined at the LACT meter with no deductions. These and other matters are the subject of the current litigation and their resolution should properly be left with the courts.

To sum up these three issues:

(1) The pipeline tariffs will be set at a level that the FERC and APC determine is proper. If they are lower than we have charged we will have to pay adjusted taxes and royalties.

(2) Tanker costs are above estimates but not nearly as much as indicated earlier and it appears you are about to make a study to determine whether or not these charges are reasonable.

(3) Royalty disputes (which have no bearing on this bill) are properly being decided in the courts.

I wish this committee could have also had the benefit of testimony on this bill from legislative consultant Milton Lipton. He did review the Senate companion bill with the Senate Resources Committee and you might want to get a transcript of that hearing. Since his testimony has not been transcribed I hesitate to quote him, but the essence of his testimony could be summarized, I believe accurately, as follows:

(1) Crude oil has no inherent value on the North Slope, therefore it is not proper to set any value such as $7.93 at the well head for tax purpose.

(2) Tariffs are being set by FERC and APC and Alaska should be prepared to accept whatever level they set. Lipton expects that the final tariffs will be significantly lower than those filed.

(3) The state should examine tanker charges and CONSIDER ~~corridor~~ setting up an independent board of ship brokers that would meet periodically and determine reasonable tanker charges for the future, based on recent past history.

The bill also would change the floor annually using the GNP Deflator Index. We believe, as we stated last year, that this is a totally inappropriate index and that it is wrong to use any index to automatically change the tax. Recent experience in Cook Inlet with indexing certainly should show the inequities created by this mechanism when the Federal Government is controlling the price of crude oil. The GNP Deflator Index is a very broad index with no relationship to the price of crude oil and is inappropriate for this purpose.

If my notes are correct, the Department of Revenue estimates that this tax increase will produce about $32 million in FY 79. Our calculations show that at 1.1 million barrels per day the additional tax will be about $54 million. Perhaps the difference is that the Department subtracted out the reserves tax credit. In any case it is an additional $54 million burden since we would get the credits under current law at a later date. PRUDHOE BAY OIL ONLY

I want to end my remarks by pointing out that the State of Alaska and the oil producers operating here do have many interests in common. I believe that efficient transportation of oil to market is one of those common interests, as I have explained about on the PAC-TEX line. There are many other examples that can be made. The point is, we would like to someday arrive at a milestone where the State and the producers could spend some time and effort working together on constructive things that will benefit both, rather than seemingly always being at odds on one subject or another. May be it isn't possible but we would certainly like to try.

Thank you.

TESTIMONY OF HARLAM MARTENS OF EXXON COMPANY, U.S.A.
BEFORE HOUSE RESOURCES COMMITTEE
H.B. 878
March 23, 1978
Juneau, Alaska

JKC

I am Harlan Martens, an attorney in the Anchorage office of Exxon Company, U.S.A. My comments today will be in three general areas -- on the overall implications of H.B. 878 as we see them, the Department of Revenue's report to Governor Hammond, upon which H.B. 878 is based, and the inequity of the cents-per-barrel minimum severance tax, in general.

The Department of Revenue report alleges that oil prices, pipeline tariff and tanker transportation costs are being manipulated so as to artificially lower oil values for severance tax purposes. When critically examined, the allegations made are based entirely on unwarranted assumptions and unjustified conclusions. The report fails to substantiate any of the charges. Further, the report fails to emphasize that the matters of transportation costs and TAPs tarrifs being questioned are currently all subjects of either appropriate administration hearings or pending litigation. These proceedings shall shed light upon the reasonableness of all transportation costs from the North Slope.

Exxon categorically denies the allegations in the Department of Revenue's report and dismisses the report out of hand because of its baseless charges.

The remainder of my comments will be addressed to House Bill 878.

House Bill 878

House Bill 878 would increase the cents-per-barrel minimum tax classified as "old oil" from 60 cents to 63.4 cents and other oil

from 80 cents to 96.8 cents. The minimum cents per MCS tax for gas would be increased from 6.4 cents to 6.8 cents. H.B. 878 also provides for a periodic adjustment to these amounts according to the percentage change in the Gross National Product Deflator. It would be retroactive to the first of 1978. Exxon believes this proposed legislation is unnecessary, untimely and inappropriate:

1) because it is being proposed not on the basis of any demonstrated need for more tax revenues, but on the bases of a report with unsubstantiated allegations which makes the proposed Bill look like a punitive measure;

2) because it deals with matters which are currently the subjects of regulatory agency hearings or litigation; and

3) because the Bill seeks to have the State participate in increases in oil values but have the oil producers bear all the impact when values drop below the established floor level.

With respect to this third point, on January 25, 1978, Dr. Milton Lipton, Consultant to the Legislature, addressed this committee and said:

"The establishment of the floor...says...that the State abstracts itself from the realities of the environment in which the oil companies are operating, that come hell or high water, whether the industry... is able to get the wellhead value on which the State's per cent-of-value tax is calculated, the State would get at least (the floor amount)...."

In essence House Bill 878 is nothing more than an additional and retroactive 21 percent severance tax increase in Prudhoe Bay oil production, effective a mere 6 months after the effective date of the 50 percent severance tax increase enacted last session.

In the last legislative session, the severance tax rate for oil was set by statute at 12.25 percent of realization, or a minimun of 80 cents per barrel. Of course, when the minimum floor takes effect, the actual severance tax rate exceeds the normal statutory tax rate. For instance, in December 1977, the average severance tax rate actually paid by Prudhoe Bay producers was 13.8 percent.

House Bill 878 would compound this inequity by taxing about half of the Prudhoe Bay production, which must be marketed on the Gulf Coast, at a rate more than double the existing severance tax rate! Any company which must transport its North Slope oil to the Gulf Coast would be hit hard by this proposed legislation because of the reduction of field realization due to the high transportation costs. Regardless of the intent of H.B. 878 the effect of the double tax rate for oil delivered to the Gulf Coast or beyond is to create discrimination against those parties that cannot market their Alaska oil on the West Coast.

The future of Alaska is dependent on development of its resources which, according to the USGS, includes vast undiscovered oil and gas reserves. Any new oil production which must be moved beyond the West Coast could be taxed at rates for above the statutory rate, as is the case for oil moving through the Panama Canal to the U.S. Gulf Coast. It seems obvious that the necessary inclusion of such a severance tax burden in producer's economic analyses will have severe negative impact on future development decisions.

Summary

In summary, Exxon believes this proposed legislation is both inappropriate and inequitable. It is premature in view of the orderly regulatory and legal proceedings now underway and would place unnecessary burdens on industry. Its enactment would be a further disincentive to future development in Alaska and counter-productive to the best interests of Alaskans.

March 30, 1978

The Honorable Alvin Osterback
Chairman, House Resources Committee
Alaska State House of Representatives
Pouch V State Capitol Building
Juneau AK 99811

Dear Representative Osterback:

On behalf of Marathon Oil Company, I would like to present our views on House Bill 878: "An Act relating to oil and gas taxes; and providing for an effective date".

Prior to the OPEC embargo in 1973, it might have been logical to set floor prices on hydrocarbons to protect State revenues derived from production (severance) taxes. However, today with the market price stability created by a strong demand for a scarce commodity, it certainly appears to be unwarranted.

The severance tax statute enacted last session established floor prices on "old oil" (lower-tier), "other oil" and natural gas. The basis for these floor prices is somewhat obscure, but certainly they exceed the actual controlled prices for lower-tier oil and natural gas in the Cook Inlet Basin. Now, HB 878 proposes to inflate these artifically high floor prices by the Gross National Product Deflator (GNPD) which reportedly increased 5.7% during 1977. In the first place, the current law which established the floor prices did not become effective until July 1, 1977; thus, the reason for applying an annual inflation rate to amend these prices cannot be (logically) explained. Secondly, this inflation factor is being applied to hydrocarbon prices which are regulated by the Federal Government. For example, the lower-tier oil price that Marathon receives in the Cook Inlet was permitted by the Federal Energy Administration (Department of Energy) to increase only seven cents or 1.5% during all of 1977. I believe this conclusively exhibits the impracticality of applying the GNPD to an artifically priced commodity which is not permitted by law to reflect its true market value.

AGO 547739

In conclusion, Marathon respectfully recommends that your Committee reject completely HB 878. Conversely, if you believe that the current severance tax statute is in need of improvement, we recommend the deletion of the floor price concept. If this was eliminated, the questionable practice of manipulating floor prices by the introduction of unrelated inflators would become unnecessary. The tax computation would then revert back to a simple percent-of-value calculation based strictly on actual prices received for the hydrocarbons. This concept is used by many other oil and gas producing states.

I thank you for your time and consideration.

Respectfully yours,

R. E. Grove

copy to Members of House Resources Committee

ATLANTIC RICHFIELD COMPANY STATEMENT
STATE OF ALASKA
HB 878

Atlantic Richfield Company, as a major producer of crude oil in the State of Alaska, objects to the proposal made in HB 878 which would increase the taxes paid on oil and gas production. Our objections are based on a view that the proposed increase is unreasonable and inequitable. It is unreasonable to change the tax almost immediately after establishing the present tax rate. It is inequitable to base the tax on values which are substantially above the market value. We further believe it is not in the long term interest of the State of Alaska to continue increasing oil and gas taxes -- already the highest of any state in the Union -- since it will signal a worsening of the tax climate to investors and potential developers of Alaska resources.

Support for the tax proposal contained in HB 878 seems to be based not on need for revenue but on the argument that the actual market price of North Slope crude is less than had been anticipated. In respect to the marketing of North Slope crude, Atlantic Richfield Company and the State of Alaska have a common interest -- both would like to sell their crude oil in the market at the highest competitive value. In fact, we each worked hard to avoid having an entitlement burden added under federal regulations which threatened to drastically reduce wellhead price less than a year

AGO 547741

ago. We felt an entitlement burden would have been completely inappropriate. Similarly, Atlantic Richfield Company considers it grossly unfair to tax on the basis of a price which is significantly above the present value of the item being taxed. In reality the minimum tax proposed under HB 878 means the effective tax rate on Prudhoe Bay oil would be not 12 1/4% but nearly 15% for Atlantic Richfield Company at today's crude prices.

The Department of Revenue supports this tax proposal by suggesting that the true market value of North Slope crude is $7.91 per barrel at the wellhead. Atlantic Richfield Company bases its sales of North Slope crude on a substantially lower estimate of its market value. Although we do not know in detail how the Department of Revenue estimate was derived, it should be possible to identify differences by comparison with the following itemization for reporting production taxes.

		$/BBL
Los Angeles Market for North Slope Crude		13.44
Less: Vessel Transportation	0.88	
Pipeline Transportation	6.05	
State and Federal Spill Funds	0.11	
North Slope Gathering	0.25	
Sub Total Expenses		7.29
Net Value for Tax Base		6.15

The tanker rate above is the one actually used by Atlantic Richfield Company in establishing its wellhead price. At times actual cost to the Company could vary both above and below the 88¢ per barrel figure depending on the tanker market, the vessel used and the many other expenses which can fluctuate on a short term basis. In fact, we have paid more than 88¢ for our movements involving chartered vessels, but the wellhead price was not correspondingly lowered for tax and royalty purposes.

The pipeline tariff is currently being reviewed and is in litigation. Obviously, any change here would affect the wellhead price.

In additional argument, the Department of Revenue offers support for the tax proposal by stating the earlier oil company estimates of anticipated wellhead price were higher than are now actually being realized. However, it would be inappropriate to ascribe the difference solely to transportation costs. For instance, one important additional factor in the wellhead price of North Slope crude is the competing price of imported crude oil. A year ago it seemed quite reasonable to expect that OPEC would carry out its announced intention of raising crude oil price substantially. There was also hope then that Alaskan crude would be allowed better access to markets through alternatives proposed by the oil companies to reduce transportation costs. These anticipated

changes did not take place. However, significant efforts were made and some options are still open.

In summary, we believe it is most unreasonable to establish a floor price for tax purposes which is substantially above market price. If the present floor price is to be amended, we suggest it be pegged to the market price of oil and not to the GNP deflator. Use of the Gross National Product deflator could eventually lead to additional distortion since oil price and GNP deflator do not necessarily have any relationship to each other. It seems more reasonable either to leave the floor price at a set figure as it is today, or to provide a market mechanism such as the one suggested.

House Resources Committee
Alaska State Legislature
Pouch V - State Capitol
Juneau, AK 99811

Dear Alvin:

Enclosed please find our Notes on Proposed Changes in Alaska's Oil Production Tax. Again, I am sorry that we were unable to testify before your House Resources Committee on this matter last week, but I expect that you may want to have actual testimony and an opportunity for your Committee members to ask questions on the occasion of our next visit.

I am taking this opportunity to make our Notes available to other interested persons as indicated below.

Cordially,

Milton Lipton
Executive Vice President

A Note on

PROPOSED CHANGES IN ALASKA'S OIL PRODUCTION TAX

W. J. Levy Consultants Corp.
New York, N. Y.
March, 1978

AGO 547746

A Note on

PROPOSED CHANGES IN ALASKA'S OIL PRODUCTION TAX

1. In this Report for the Alaskan Legislature, we review changes in Alaska's oil production tax recommended by the Department of Revenue and incorporated in Senate Bill No. 532 and House Bill No. 878.

2. In 1977, Alaska's production tax was amended to eliminate automatic escalation in cents-per-barrel tax rates.* At the same time, the amended law provided for annual review of cents-per-barrel and cents-per-MCF tax rates by the Department of Revenue, with a written report and recommendations for changes to be submitted to the Governor. The Governor, then, submits the proposed changes to the Legislature.

3. The Department of Revenue's Report for 1978 recommended (and SB532/HB878 incorporate) the following changes --

> An increase in the cents-per-barrel tax rate for other-than-old crude oil from 80 to 96.8 cents, which corresponds to raising the floor price (i.e., the price below which the cents-per-barrel rather than the percent-of-value tax applies) from $6.53 to $7.90 per barrel;
>
> An increase in the cents-per-barrel tax rate on old crude oil from 60 to 63.4 cents per barrel, raising the floor price from $4.90 to $5.18 per barrel; and

* Prior to this change, cents-per-barrel tax rates had increased or decreased with percentage changes in the Wholesale Price Index for crude petroleum published by the Bureau of Labor Statistics of the U.S. Department of Labor.

Re-introduction of automatic escalation in cents-per-barrel tax rates, tying rates to percentage changes in the Gross National Product Deflator published by the Bureau of Economic Analysis of the U. S. Department of Commerce.*

4. In reviewing these proposed changes in the oil production tax rates, the Legislature will want to consider carefully two things. First, the reasoning behind the Department of Revenue's recommendations, as set out in the Department's report to the Governor.** Second, that any changes in production taxes be reviewed in conjunction with proposed changes in other taxes that the State assesses on the oil and gas industry, notably the corporate income tax.

The Floor Price
for Prudhoe Bay Crude

5. The Department of Revenue report finds that the current floor price (and thus also the cents-per-barrel tax rate) is "inadequate." The Department calculates that the "market value" of Prudhoe Bay oil on the North Slope is significantly above the prices being reported by the companies for severance tax (or royalty) purposes. Furthermore, the floor price, which is designed to protect the State's severance tax revenues in the event that prices reported by companies are artifically depressed, is also below the computed market value. The conclusion: the floor price is too low to do its intended job of protecting revenues. The recommendation: raise the floor price for other-than-old oil to the level calculated by the Department as the market value ($7.90) of Prudhoe Bay crude on the North Slope.

* Changes in tax rates would be based on changes in the Deflator from the First Quarter of 1978.

** Recommended Changes in Alaska's Oil and Gas Production Tax Rates for 1978, a Report to Governor Jay S. Hammond by the Alaskan Department of Revenue.

6. Our firm has always regarded increasing the severance tax as the ultimate recourse for the State in the event that wellhead values are artifically depressed by the actions of tax-paying companies. The question the Legislature must consider now is whether the current circumstances of wellhead pricing warrant taking such a major step at the present time in the light of available evidence. This can best be judged by looking, as the Department has, at the various elements that enter into Prudhoe Bay oil prices -- i.e., pipeline tariff rates, tanker charges, and prices in markets to which the oil moves.

TAPS Tariff

7. The major factor serving to lower wellhead values below earlier expectations is the high level of TAPS pipeline tariffs filed by the companies with the ICC (now FERC) and used by the companies in their netback calculations. These tariff rates average out to some $6.20 per barrel.* In contrast, the interim tariffs allowed by the ICC average some $4.83 per barrel, or $1.37 per barrel less. The State of Alaska, in its protest to the ICC, set out tariff rates that averaged around $3.96. FERC is now in the process of conducting an investigation (with Alaska Pipeline Commission participating) into TAPS rates in order to establish lawful permanent tariffs. Pending the final outcome, the Courts have allowed the companies to continue to charge their initial filed tariffs.

8. Thus, the question of what are reasonable interstate tariff rates for TAPS is being reviewed and will eventually be resolved by the appropriate regulatory body. Whatever rates are eventually approved by the FERC will be those actually charged for transportation of the bulk of oil moved via TAPS and will thus bear on the value of oil on the North Slope. These rates would be appropriate to the calculation of oil values for severance tax and royalty purposes.

* A weighted average calculated by the Department of Revenue based upon pipeline ownership.

9. If finally approved TAPS rates are below the initially filed company rates -- and lower ICC interim rates would certainly point in this direction -- the effect would be to raise North Slope values and severance taxes to which the State was entitled. The State would obviously want to take whatever steps are necessary to ensure that it is in a position to collect back taxes in the event that this were to happen. Assuming that the State does have this protection, it would seem inappropriate for the State now to raise the floor price for production tax purposes to reflect what the State judges will be the (lower) tariff finally approved. This puts the State in the position of prejudging a complicated issue which is being subject to extensive hearings, later careful regulatory consideration, and probably also eventually review in the Courts.*

Tanker Charges

10. The Department of Revenue's report also takes issue with the tanker charges being submitted by the companies. The Department points out that the reported charges (e.g., $.81-$1.08 to the West Coast) are substantially above what had been estimated by many third-party observers and by company spokesmen themselves earlier on. In contrast to pipeline tariff rates, tanker charges are not regulated. Thus, the State will not have regulated rates to provide guidelines.

11. In the circumstances, we certainly feel that Legislative inquiry into the question of tanker charges is warranted, in course of hearings on the proposed changes in Alaska's production (severance) tax. Many factors affect tanker costs -- e.g., tanker size, timing of charters, bunker costs,

* Note that the proposed increase in floor price from $6.53 to $7.90 (+$1.37) is the same as the difference between average ICC interim ($4.83) and company posted tariffs ($6.20). Thus, although other aspects of wellhead valuation are at issue, the pipeline tariff is pivotal.

safety and environmental standards, etc. Thus, ocean transportation costs may have increased substantially since earlier estimates were made. However, the companies transporting North Slope crude via tanker should explain how they arrive at the charges they are reporting to the State. With a better understanding of the factors underlying those charges, the State should be in a better position to judge their reasonableness for purposes of valuation.

12. The State might also want to consider the possibility of establishing some norm for transportation rates at which North Slope crude could be moved in substantial and continuous volume to major markets -- rather than continuously monitoring charges for each and every company's transportation. This rate would presumably be one which a company could match on the basis of prudent transportation commitments. Companies who are particularly astute in their tanker operations could hope to do better -- and would benefit therefrom by not having North Slope oil values and thus production taxes raised by their lower-than-average tanker costs. Other companies who make less astute business decisions on tanker coverage would have to bear the consequence without the State picking up part of higher-than-average costs through lower severance taxes.

13. In this connection, we note that the average transportation cost of oil moving in international trade in foreign flag tankers has been calculated since 1954 by an independent London Tanker Brokers' Panel. Their estimates, Average Freight Rate Assessment (AFRA), are widely used as proxy for companies' actual transportation costs both in commercial contracts where delivered prices require a freight component and in c.i.f. values for Government administration and tax purposes. Some such approach might be considered for tanker movements of North Slope crude. This could avoid potential conflicts over tanker charges. In the event, companies would be completely free to make their own decisions as to how they cover their tonnage requirements, but tanker charges for purposes of wellhead valuation would reflect objective criteria as to ocean transportation costs.

Market Prices

14. The Department has also questioned the companies' data on market prices received for oil, particularly on the West Coast. The Department calculates a value for North Slope oil at a refinery destination in Los Angeles. This estimate of $13.44 is based on the Official Government Selling Price for Saudi Arabian Medium (31°) crude f.o.b. plus LR2 (80,000-159,999 dwt.) AFRA tanker transportation. It finds this estimate to be at the upper end of the range of West Coast market prices reported by the companies ($13.16-$13.44).

15. The problem, here, is that there are many factors that bear on market prices and it is difficult to come up with a precise objective estimate. First, there are questions of crude quality. The Department's estimate of refinery value, for example, is based on a 31° Saudi crude, when North Slope crude is in fact around 27°. If Saudi Heavy crude (27°) were used, the Department's estimate would have been $13.14 -- or below the low end of the companies' range. On the other hand, Saudi Heavy crude (as also Saudi Medium crude) contains substantially more sulphur than North Slope crude, which enhances the value of North Slope relative to these crudes.* Furthermore, the relative value of various crude qualities varies from refiner to refiner, depending on his processing facilities, market requirements, etc. At least as important, there are other aspects to crude sales than selling price that also affect the value to the buyer and seller -- e g., credit terms, obligations for the seller to offtake crude from the buyer,** etc.

---

* As against 1-percent sulphur for North Slope, Saudi Heavy is 2.8 percent and Medium 2.4 percent.

** The major third-party purchaser of North Slope crude is Socal for its Los Angeles and San Francisco refineries. Press reports indicate that at least some of Socal's contractual purchases of North Slope crude involve commitments by sellers to lift Middle East crude that Socal would have otherwise processed on the West Coast. Sellers of North Slope crudes are reportedly moving this Middle East crude to East-of-Rockies refineries.

16. The State will obviously want to continue to monitor whatever relevant information it can obtain on sales prices for North Slope oil. However, given the range of difficulties in assessing an appropriate market price, the selling prices reported by the companies, in our judgment, do not look to be obviously out of line.

17. Finally, we note that companies have calculated severance tax values by netting back from the markets to which North Slope oil actually moves. Owing to much higher transport costs, netbacks from Gulf Coast shipments are obviously significantly lower than from the West Coast. The Department of Revenue, in its assessment of a market price netback for a severance tax floor price, has used only the West Coast as a reference point. On this basis, companies forced to ship North Slope crude to the Gulf Coast would have to pay a severance tax based on a higher netback calculated by the Department for the West Coast rather than actual netback from the market to which their crude moves.

18. In a report we prepared for the Legislature in 1970 on valuation of Alaskan crude oil,* we took the position that limited volume shipments of Alaskan crude to distant markets, which may reflect individual company economics, would not normally bear on the valuation of Alaskan crude. Valuation should be based on market prices in refining centers "where there is a substantial and continuous movement of Alaskan oil by the industry in general." At present, substantial volumes of North Slope crude move to the Gulf Coast; when production reaches 1.2 million barrels daily, approximately two fifths (500,000 barrels daily) is likely to be moving to the Gulf Coast. In these circumstances, it is not inappropriate that the value of Alaskan crude on the North Slope takes into account the fact that a substantial portion of production cannot realize the higher netback values obtainable on the West Coast, owing to limitations on the absorptive capacity of West Coast refineries for North Slope crude.

* Economic Considerations Bearing on Valuation of Alaskan Crude Oil and State Policy on Pipelines, December, 1970.

AGO 547753

Cents-per-Barrel Escalation

19. In addition to raising floor prices, the Department has also recommended re-introduction of automatic escalation in floor prices with an index of inflation. Escalation with the GNP deflator would almost inevitably result in progressive increases in severance taxes where cents-per-barrel and not percent-of-value is the operative tax.

20. Last year's severance tax revision was presumably designed to establish schedules of severance taxation appropriate to the producing circumstances of Alaska and with regard also to rates of severance taxation in other producing states. No doubt wellhead values and hence severance tax revenues have worked out below expectations; and we discussed above whether an increase in floor prices ought now to be considered as offset to protect Alaska's interests.

21. Escalation of floor prices with inflation, however, could have the effect of increasing producing companies' effective severance tax rates without regard to wellhead values. We have noted in the past that previous escalation with the Wholesale Price Index for crude petroleum imposed a progressively increasing severance tax burden on Cook Inlet producers whose old oil prices were held down by Federal price ceilings whilst average crude prices and hence their cents-per-barrel tax moved upward. The adverse effect (i.e., rising cents-per-barrel severance taxes relative to wellhead values) could be even more incongruous when escalation is triggered by a GNP deflator that reflects price behavior for the U.S. economy as a whole.

22. To the extent that crude oil prices advance in the future -- notably foreign oil prices into Alaska's Lower 48 markets, but also domestic oil prices that directly or indirectly affect the competitive evaluation of North Slope crude -- that would tend to raise wellhead values and severance tax revenues. Similarly, changes in transportation charges would be reflected in wellhead values and severance tax revenues. And to the extent that percent-of-wellhead value is the operative severance tax, there is a meaningful relationship between severance tax liability and production values.

23. Cents-per-barrel may be a necessary floor for protection of Alaska's interests in appropriate circumstances. Escalation of cents-per-barrel would not seem to be an appropriate device to raise severance taxes or severance tax income. If that is at issue, the Legislature could more cogently address the question whether established percents-of-value ought to be raised.

RECOMMENDED CHANGES

IN

ALASKA'S OIL AND GAS PRODUCTION TAX RATES

FOR 1978

A Report to Governor Jay S. Hammond
by the Alaska Department of Revenue

AGO 547756

"At the present level of cents-per-barrel rates, the State's production tax income would have to suffer considerable reduction as the result of oil prices artificially lowered below the free-market price before the cents-per-barrel tax would begin working . . . ."

--State of Alaska, Department of Revenue, Alaska's Oil and Gas Tax Structure (February 1977), p. VI-21

AGO 547758

INTRODUCTION AND BACKGROUND

Concern over very low wellhead prices for Alaska's nonrenewable oil and gas resources is not a recent development. In 1972, faced with spiralling costs for the Trans Alaska Pipeline and correspondingly, rapidly sinking wellhead values for the oil wealth at Prudhoe Bay, Alaska turned to a cents-per-barrel production tax as a means to protect its revenues from that field, as well as others. By allowing a credit against the cents-per-barrel tax for royalty payments, the net effect of that legislation was to set a floor on the State's combined royalty and tax revenues, regardless how low the wellhead price might have gone. This floor corresponded to the combined revenues that would have been received with a wellhead price of $2.65 a barrel. The specific cents-per-barrel rates were: 45.8 cents-per-barrel, 51.1 cents-per-barrel, 53.8 cents-per-barrel and 59.1 cents-per-barrel and applied to oil production at specified incremental amounts.

During the First Special Session of 1973, the cents-per-barrel rates were changed, raising the effective floor for production tax income to a level corresponding to a wellhead price of $3.375 for Prudhoe-type oil (27° API gravity). This floor increased and decreased, depending on whether the API gravity was above or below 27°. In addition the entire cents-per-barrel mechanism was tied to an escalator -- the

AGO 547759

Wholesale Price Index for crude oil published by the Bureau of Labor Statistics of the U. S. Department of Labor.

In that 1973 session the cents-per-barrel rates were set at: 16.875 cents-per-barrel for the first 300 barrels of oil production, 20.25 cents-per-barrel for the next 700 barrels, and 27 cents-per-barrel for oil production over 1,000 barrels. These rates corresponded to percentage rates of 5 percent, 6 percent and 8 percent. The continuing concerns over low wellhead prices during 1973 were so strong that the House Finance Committee during the special session went so far as to propose a production tax based solely upon a cents-per-barrel basis with an escalation feature (CS HB4). The major proponent of this approach was the then Speaker of the House of Representatives, Tom Fink. He and others were concerned about the continued reduction of projected Prudhoe Bay wellhead values and the then current price discrepancies in reported royalty and production tax values in Cook Inlet. These price discrepancies were the multiple wellhead values assigned to the oil of the same quality produced in the Cook Inlet area.

After the 1973 change in the production tax statute, several changes occured in Wholesale Price Index for crude petroleum so that at the beginning of 1977 the basic cents-per-barrel tax rates set out in the statute had escalated to become: 30.51 cents, 36.62 cents and 48.83 cents. At percentage

rates of 5 percent, 6 percent and 8 percent the cents-per-barrel tax set an equivalent cents-per-barrel floor of $6.10 for 27° crude oil.

In a voluminous review and critique of Alaska's tax laws as applied to the oil and gas industry, the Department of Revenue last year pointed out the following danger in the then-existing production tax:

> ". . . the focus here is on the effectiveness of the tax as a reliable source of revenue for the State and on its safeguards against possible actions that would jeopardize that revenue. The greatest of those dangers is the manipulation of oil price, especially in regard to North Slope oil. There are basically two parties that might want to manipulate the price of Prudhoe oil. One is the oil companies themselves, by inflating transportation costs and similar charges in order to lower the field price of the oil on which the tax is based. The other is the federal government, through price controls.
>
> * * * * * * *
>
> "The Department of Revenue recommends raising the 'floor' from its present level, which corresponds to $6.10 a barrel for Prudhoe Bay oil, to a level more

AGO 547761

closely reflecting the full market value of that oil. At the present level of cents-per-barrel rates, the State's production tax income would have to suffer considerable reduction as the result of oil prices artificially lowered below the free-market price before cents-per-barrel tax would begin working to prevent any further reduction.

State of Alaska Department of Revenue, Alaska's Oil and Gas Tax Structure (February 1977) pp. V-31 and VI-21 (emphasis added).

Acting on the Department's recommendations, Governor Hammond submitted bills (SB 238 and HB 321) to both Houses that would have raised the cents-per-barrel floor to correspond to a $7.50 wellhead price, escalating on the basis of the gauge of national inflation (the deflator for the Gross National Product). While many of the production tax proposals in the Governor's bills were eventually enacted, those relating to rates and the cents-per-barrel floor for oil were not. Instead, the version finally passed and presently in effect specifies a 12.25% rate or $0.80 a barrel for all oil except "old oil", both to be scaled down by the Economic Limit Factor. This sets a cents-per-barrel floor corresponding to a wellhead price of $6.53 -- higher than the old $6.10 floor but still almost a dollar below the $7.50 "full market value" of Prudhoe Bay oil. This floor does not escalate under the new law.

For "old oil" (like the majority of production from Cook Inlet), the cents-per-barrel floor is at a $5.18 price level (for 34° API gravity).

AGO 547763

Federal Pricing Actions.

In its study, Alaska's Oil and Gas Tax Structure (February 1977), the Department of Revenue expressed in some length (at pp. V-37 to V-48) grave concerns about federal intentions and actions and their potential adverse effects on Alaska's price-related revenues from oil and gas, particularly with respect to Prudhoe Bay. By law (15 U.S.C. Sec. 757(g)) North Slope production was (and is) singled out for separate pricing consideration from that of the rest of the country. For reasons set out in that study, the chance that federal price controls could be used to depress the price of Prudhoe Bay crude oil below market levels was a real and ominous possibility.

At hearings before the Federal Energy Administration (FEA) in Washington, D.C. and Anchorage, in March and again in May, the State testified strongly to the need for the marketplace, not price controls, to determine the wellhead price of North Slope oil. In meetings with the Administrator of FEA John O'Leary, and in the White House with James Schlesinger, Governor Hammond brought the State's message home to the federal decision-makers on a personal level.

Fortunately these vigorous efforts were successful.

AGO 547764

On August 17, 1977 FEA adopted a rule-making which sets a price ceiling significantly above the anticipated wellhead price level for North Slope oil. At the same time FEA chose to treat North Slope oil the same as high-cost imported oil for purposes of the special "entitlements" program, which is intended to equalize costs between refiners buying less expensive, price-controlled oil and those buying expensive uncontrolled or imported oil. As FEA said at the time,

> ". . . by providing [North Slope] crude oil with wellhead prices that are as high as possible (consistent with . . . the cost of the imported oil it is replacing), the maximum monetary and psychological incentives are provided for these and other producers to explore aggressively elsewhere in the Arctic and in other frontier regions." [Emphasis added]

42 Federal Register 41567 (August 17, 1977).

Actions by the Oil Companies.

Last year the Department of Revenue also expressed concern about actions by the oil companies themselves that would understate the wellhead value of Prudhoe Bay production. As the Department wrote then,

"A [major] vertically integrated company can, in a very real sense, choose which of its integrated operations -- producing, transportation, refining, or marketing -- will be carried on the books as break-even or losing operations and which will be the sources of the profits of the overall enterprise.

". . . Another influence [on where the company books its profits] can be royalty and production tax payments. If the field price of an integrated producer's production can be lowered as the result of shifting booked profits from production to some downstream phase of operations, the overall enterprise would lose nothing by doing so since it is merely moving money from one pocket to another. In fact it would actually have a net gain since the lowered field price means that less royalty and production tax have to be paid . . . .

"There seem to be three possible opportunities for some . . . companies owning interests in the Prudhoe Bay field to realize most or all of the benefits from the prevailing prices in the world oil market so dominated by OPEC while holding the line, so to speak, on production tax and royalty for that oil. These are in setting the TAPS tariff (or tariffs), in marine transportation costs and in marketing the oil to refiners outside the West Coast area."

Alaska's Oil and Gas Tax Structure, pp. V-32 and V-33.

The bills submitted by Governor Hammond contained a cents-per-barrel floor corresponding to a wellhead price of $7.50, which was in accord with the statements of the oil companies themselves and of other experts. The $6.53 floor in the bill that passed represented an open invitation to the companies to shift profits at least to the extent of the difference between $7.50 and $6.53. As we now see from the record, the companies more than accepted that invitation and, in doing so, belied their own statements. It is worth comparing their actions and their words here to reveal the magnitude by which the companies have altered the expectations they led Alaska and others to believe.

In January 1977 -- the month before the Department of Revenue recommended a cents-per-barrel floor of $7.50 -- Atlantic Richfield Company (ARCO) projected a wellhead price of $7.58, using a TAPS tariff of $5.24 and tanker costs from Valdez to the West Coast of $0.70. ARCO, Crude Oil Postings District V, 1977 Prices, Entitlements Variations (January 3, 1977) cited in University of Alaska Institute of Social and Economic Research, Federal Policies Affecting the Wellhead Value of Prudhoe Bay Crude Oil (March 22, 1977), p. 33.

In a statement presented February 7, 1977 to James R. Schlesinger (then the President's chief energy advisor and now Secretary of Energy), the chairman of the board of The Standard Oil Company (Ohio) Charles E. Spahr said,

AGO 547767

"Assuming for a moment that Prudhoe Bay oil sold at the well for the upper tier average price of $11.63, its delivered price in California would be about $17.50, including about $5.00 for the Alaska pipeline tariff and $.75 for tanker costs from Alaska to California. Obviously, no one would buy Alaskan oil at that price when foreign oil can be purchased at the same place for a little over $13.00. To be competitive, the wellhead price at Prudhoe Bay would have to go down to something on the order or $7.25."

On March 9, 1977 FEA issued a "Notice of Inquiry" about the pricing of North Slope oil and announced hearings in Washington, D.C., San Francisco and Anchorage on March 21, 22, and 23, respectively. At those hearings the following testimony was given:

If North Slope crude does not have an entitlement burden and thus is treated . . . like exempt stripper, or Naval Petroleum Reserves oil, we would expect the wellhead price to be about $7.20 per barrel."

--Herbert H. Zachow, Manager of Crude and Product Supply, ARCO (March 21, 1977)

AGO 547768

"We currently estimate that the TAPS tariff will be approximately $5.60. This tariff is calculated using traditional ICC methodology."

--Atlantic Richfield Company Responses To Questions 1 - 14, Alaska North Slope Crude Oil Pricing and Entitlements Treatment (March 21, 1977, p.2

"Assuming a $5.60 tariff and $.70 vessel cost from Valdez to Los Angeles the following prices would be expected:

TABLE II
ANTICIPATED PRICES

Location	Dec 77	
Wellhead	7.20	. . .
Valdez	12.80	. . .
Puget Sound	13.70	. . .
San Francisco	13.50	. . .
Los Angeles	13.50	. . . "

--Atlantic Richfield Company Responses to Questions 1 - 14, Alaska North Slope Crude Oil Pricing and Entitlements Treatment (March 21, 1977), p. 4

"Until pipelines are in place, the cost to move oil by tanker from Los Angeles to the Gulf Coast through the Panama Canal will be in the range of $2.00 per barrel."

--Richard M. Donaldson, Vice President SOHIO (March 23, 1977); also Frank E. Mosier, Senior Vice President, SOHIO (March 21, 1977)

"Our expectation is that the TAPS tariff will be in the range of $5.00 to $6.00 per barrel from the Prudhoe Bay field to Valdez . . . . The costs of tanker movement of the oil from Valdez to Puget Sound, San Francisco, Los Angeles, and the Gulf Coast are expected to average as follows:

Valdez to Puget Sound	$0.50 per barrel
Valdez to San Francisco	$0.75 per barrel
Valdez to Long Beach	$0.75 per barrel
Valdez to Gulf Coast	$2.75 per barrel"

--SOHIO, Responses to Fourteen Questions Raised by the Federal Energy Administration Notice of Inquiry Dated March 7, 1977 (March 21, 1977), p. 2

"If the present price of oil imported on the West Coast and Gulf Coast is $13.75 per barrel for quality similar to Alaskan North Slope, then the equivalent prices for North Slope crude are as follows:

	Dollars per Barrel			
	Puget Sound	San Francisco	Los Angeles	Gulf Coast
Delivered	$13.75	$13.75	$13.75	$13.75
Valdez	$13.25	$13.00	$13.00	$11.00
Wellhead	$7.25-$8.25	$7.00-$8.00	$7.00-$8.00	$5.00-$6.00"

--Sohio, Responses to Fourteen Questions Raised by the Federal Energy Administration Notice of Inquiry Dated March 7, 1977 (March 21, 1977), pp. 6-7

Later, in hearings at Washington, D.C., San Francisco and Anchorage on May 25, 26 and 27, respectively, the oil companies basically repeated these messages to FEA:

> "under this rulemaking, a North Slope crude producer will receive about $7/bbl. at the wellhead for his production."
>
> --Herbert H. Zachow, Vice President, Crude and Product Supply, ARCO (May 25, 1977)

> "It is anticipated that when production starts this year, North Slope prices will be entering the market at a wellhead price of around $7/bbl."
>
> --William E. Wade, Manager of Resources Planning, Corporate Planning Division, ARCO (May 26, 1977)

> "With such pricing and entitlement treatment [as ARCO had proposed to FEA in March 1977], we expected North Slope wellhead prices initially to be only about $7 per barrel. [Actually, ARCO had said $7.20.] While we continue to favor our recommended pricing and entitlement treatment for North Slope crude, we support the FEA's proposals in the rulemaking under consideration today. These proposals . . . should permit the same initial wellhead price as our earlier recommendations."
>
> --Howard A. Slack, Vice President and Resident Manager, Alaska Division, ARCO (May 27, 1977)

During the question and answer period at the San Francisco hearing, Mr. Wade (quoted above) told Mr. John Muller of FEA that the TAPS tariff was expected to be $5.50 to $6.00, and he told Mr. Boldt of FEA that tankers from Valdez to West Coast ports would be $0.75 to $0.90. Mr. Steve Donaldson, Manager of Regulatory Reports & Analysis for Powerine Oil Company, disagreed with Mr. Wade's tanker figure, suggesting $0.45 instead.

This disagreement is nothing compared to the one between the figures quoted above that were given in the first half of last year and the ones the oil companies were reporting for royalty purposes during the second half. The following table summarizes this abrupt change and speaks for itself.

CONTRADICTIONS BETWEEN THE OIL COMPANIES' PUBLIC STATEMENTS AND THE FIGURES THEY REPORTED FOR ROYALTY PURPOSES TO THE STATE

(Based on December 1977 reports)

	As Stated	As Reported	Difference
1/3/77, ARCO			
Wellhead Price	$7.58	$6.41	(1.71)
TAPS Tariff	5.24	6.15	.91
Tanker to West Coast	.70	.88	.18
2/7/77, SOHIO			
Wellhead Price	7.25	6.14	(1.11)
TAPS Tariff	5.00	6.27	1.27
Tanker to West Coast	.75	.89	.14
3/21/77, ARCO			
Wellhead Price	7.20	6.41	(.79)
TAPS Tariff	5.60	6.15	.55
Tanker to West Coast	.70	.88	.18
3/21 and 23/77, SOHIO			
TAPS Tariff	5.00-6.00	6.25-6.28	0.25-1.28
Tanker to San Francisco or L.A.	.75	.89	.14
Wellhead (net back from San Fran. or L.A.)	7.00-8.00	6.14	(1.86)-(.86)
Tanker to Gulf Coast	2.75	3.61	.86
Wellhead (netback from Gulf Coast)	5.00-6.00	3.53	(2.47)-(1.47)
5/26/77, ARCO			
Wellhead Price	"about 7.00"	6.41	(.59)
TAPS Tariff	5.50-6.00	6.15	.15-.65
Tanker to West Coast	.75-.90	.88	(.02)-.13

AGO 547773

For all Prudhoe Bay owners, the weighted average TAPS tariff (based on volume) reported in December was $6.24 (as opposed to a weighted average tariff based on pipeline ownership percentages, of $6.20), the weighted average tanker cost reported (based on volume) was $1.12, and the weighted average wellhead price was only $5.44. However, the companies did not pay royalties on the basis of that $5.44; instead, they are claiming further deductions for "field costs," which the State believes are unauthorized. These deductions average 61.4 cents a barrel, reducing the average price actually paid for royalty purposes to $4.79.

The purpose of mentioning all these prices and deductions is not to set the ground for any possible legislative resolution of these royalty matters, since the royalty questions are already being litigated. Rather, the point to be made is that the industry's interests and those of the State of Alaska do not always coincide; where they do not coincide, the industry has shown that it will readily part company to advance its own purposes. In royalty and in production tax, the industry's interests are served by low wellhead prices and so it has parted company on this matter, not only from the State, but also from its spokesman who scant months before were unabashedly predicting prices from one to two dollars a barrel higher.

AGO 547774

ELEMENTS AFFECTING FIELD VALUE

Earlier in this report it was mentioned generally how the wellhead value of our oil for production tax and royalty is affected by market prices and transportation charges. This section will describe in greater detail how the projected wellhead value of Prudhoe Bay oil has been affected by pricing decisions and transportation charges.

In general, the value of oil for purposes of computing production tax and royalty is determined by taking the market sales price or value for the oil and netting back any transportation charges from the point of sale to the field. Thus the market prices and transportation costs have an important and direct bearing on wellhead values.

Price Ceilings

In the department's oil and gas tax study, possible effects of federal ceilings for North Slope oil were discussed. Alaska's Oil and Gas Tax Structure (February 1977), pp. V-37 to V-48. At that time the President had not yet recommended to Congress what price ceilings would be applicable to North Slope oil. The danger existed at that time that the federal government could establish a wellhead price ceiling substantially below that of imported crude or even other categories of new oil. That in itself apart from corporate price manipulation

AGO 547775

could have substantially reduced severance tax and royalty revenues over time.

Subsequently, however, as stated earlier in this report, the FEA adopted regulations which placed North Slope oil under upper tier price ceilings and gave it exempt entitlement's treatment. 42 Federal Register 41567 (August 17, 1977). This essentially gave favorable pricing and entitlement treatment to North Slope production since the beginning price ceilings would be substantially above what was projected to be a wellhead value for North Slope oil and no entitlement penalties would be assessed against North Slope oil.

Market Prices

The starting point in any determination of wellhead value is market price received for the oil, which is then reduced by the transportation charges between the place of sale and the field where the oil is produced.

In the case of North Slope oil, some oil has been sold right at the mouth of the Trans Alaska Pipeline system (LACT meter) so that no net back of transportation charges is necessary. The market price of that oil in the field, in fact, becomes a value for computation of severance tax purposes assuming that the prices are truly arms-length

AGO 547776

sales. Those sales taking place at the wellhead as reported in December Royalty reports are as follows:

Company	Sales Price
Getty	$6.38
Mobil	6.23

Other companies have made sales at Valdez which include tariff charges on the transportation of the oil from the North Slope to Valdez. These sales are as follows:

Company	Sales Price
Amerada Hess	$12.60
Exxon	12.30
Hunt Group	12.62
Sohio	12.53

The majority of the oil, however, has been transported by the producing companies and marketed in various locations outside the state. These sales prices and their destinations are:

Company	Sales Price	Destination
ARCO	$13.44	West Coast
Exxon	13.16	West Coast
Phillips	13.38	West Coast
Sohio	13.30	West Coast
Sohio	13.42	Gulf Coast

Pipeline Tariffs

The largest element of transportation cost, and therefore the one having the biggest effect on wellhead value is the tariff charge of the Trans Alaska Pipeline System (TAPS)

AGO 547777

which transports the oil from Prudhoe Bay, where it is produced, to Valdez, where it is loaded onto tankers and transported out of state.

During the months of May and June of 1977 the eight owner companies of the Trans Alaska Pipeline System filed with the Interstate Commerce Commission (ICC) initial tariffs for the transportation of oil from Prudhoe Bay to Valdez. Those initial tariffs ranged from $6.04 to $6.44 per barrel and taken together computed a weighted average tariff per barrel of $6.20 based upon pipeline ownership.

Those initial filed tariffs were:

Pipeline Carrier	Filed Tariff
Amerada Hess	$6.44
ARCO	6.04
BP	6.35
Exxon	6.27
Mobil	6.31
Phillips	6.22
Sohio	6.16
Union	6.09

Subsequent to the initial filing of pipeline tariffs, the ICC's Bureau of Investigations and Enforcement, the U.S. Department of Justice, the State of Alaska and Arctic Slope Regional Corporation all filed protests against the initial tariffs [Protest and Petitions For Suspension by the United States Department of Justice, June 15, 1977; Protest/Complaint of the State of Alaska Seeking the Suspension and Investigaiton

AGO 547778

of Initial Rates and Tariff Provisions, June 15, 1977; Protest and Petition of The Bureau of Investigation and Enforcement for Suspension and Investigation, June 15, 1977; Protest and Petition for Suspension of Initial Rates and Tariffs by the Arctic Slope Regional Corporation, June 13, 1977].

The protests sought suspension and institution of a formal investigation of the rates published by the TAPS carriers. In its protest the State of Alaska set forth what it considered reasonable interim tariffs for TAPS as follows:

Pipeline Carrier	Rate
Amerada Hess	(Insufficient information)
ARCO	$3.74
BP	4.42
Exxon	3.80
Mobil	3.59
Phillips	(Tariff had not been filed)
Sohio	4.04
Union	3.85

Protest/Complaint of the State of Alaska Seeking the Suspension and Investigation of Initial Rates and Tariff Provision, June 15, 1977 (p. 4).

On June 28, 1977, the Interstate Commerce Commission (ICC) suspended the initial filed rates for a seven-month statutory period and ordered an immediate investigation of the rates. At the same time that the ICC suspended the filed rates it stated that it would accept for filing a lower schedule of interim rates pending the outcome of the investigation.

AGO 547779

That schedule was as follows:

Pipeline Carrier	Interim Rate
Amerada Hess	$4.85
ARCO	4.91
BP	4.68
Exxon	5.10
Mobil	4.84
Phillips	4.83
Sohio	4.70
Union	4.84

Order of the Interstate Commerce Commission in Investigation and Suspension Docket No. 9164, Trans Alaska Pipeline System (Rate Filings) and No. 36611, Trans Alaska Pipeline System (Rules and Regulations), June 28, 1977.

Thus the initial tariffs, the proposed tariffs by the State of Alaska and the Interim Tariffs allowed by the ICC looked as follows:

Pipeline Carrier	Filed Tariff	Alaska's Proposed Tariff	Interim Tariff
Amerada Hess	$6.44	--	$4.85
ARCO	6.04	$3.74	4.91
BP	6.35	4.42	4.68
Exxon	6.27	3.80	5.10
Mobil	6.31	3.59	4.84
Phillips	6.22	--	4.83
Sohio	6.16	4.04	4.70
Union	6.09	3.83	4.84

Several of the pipeline companies petitioned the Fifth Circuit Court of Appeals contending that the ICC was without authority to suspend the initial tariffs or to suggest maximum interim tariffs. Mobil Alaska Pipeline Company v United States,

AGO 547780

No. 77-2392, (July 6, 1977); BP Pipeline Inc. v United States, No. 77-2412 (July 8, 1977); Exxon Pipeline Co. v United States, No. 77-2421 (July 11, 1977); ARCO Pipe Line Co. v United States, No. 77-2437 (July 14, 1977).

The Fifth Circuit Court, however, dismissed the pipeline carriers petitions concluding that the ICC had acted lawfully. Mobil Alaskan Pipeline Company v United States, 557 P2d 775 (1977).

Some of the companies then filed motions in the U.S. Supreme Court for a stay of the Fifth Circuit decision. Four of the carriers also filed petitions for certiorori. The Supreme Court granted a stay of the Fifth Circuit decision and the certiorori petitions, and at the present time a decision on the seven month suspension and interim rates is pending before the Supreme Court. Order of November 28, 1977 Granting Certiorori in Mobil Alaska Pipeline Co. v United States, No. 77-452; Exxon Pipeline Co. v United States, No. 77-457; BP Pipeline, Inc. v United States, No. 77-551; ARCO Pipe Line Co. v United States, No. 602.

Concurrently with the litigation over interim rates the ICC and now its successor the Federal Energy Regulatory Commission (FERC) has been conducting its investigation of TAPS rates in order to set lawful permanent tariffs.

AGO 547781

The investigation proceedings have separated into two phases. The first phase of the proceedings deals with such issues as the allowable rate base and the appropriate rate of return while the second phase of the investigation will deal with the amount of costs which may be claimed by the carriers as a part of the rate base.

All of the protestants, including the State of Alaska, argue that the TAPS tariffs filed by the pipeline companies are too high for several reasons. Joint Pre Hearing Brief of the United States Department of Justice, The State of Alaska and The Arctic Slope Regional Corporation, (December 30, 1977).

First, for example, it is being argued that the pipeline companies should earn a rate of return on the actual investment in the pipeline system rather than upon an inflated valuation of replacement cost. This approach would be consistent with rate bases used for most public utilities and would insure that pipeline owners would not receive a return on their investment more than once.

It is also being argued that the rate of return allowed to the pipeline companies on TAPS for the debt and equity portions of the pipeline should be no higher than that needed to reflect the relative risks involved and to compensate for the costs of servicing the debt.

In addition, the protestants have argued that the pipeline owners should be allowed only a return on prudent investments and not be allowed to include any costs due to mismanagement or inefficiency.

All of the arguments are aimed at the extremely excessive nature of the tariffs. One illustration of how the tariffs were "pumped-up" as high as they were is shown by the double counting of a rate of return on the pipeline owners debt. In the initial filing, the pipeline carriers computed their proposed tariffs high enough to cover their operating costs (including interest) plus a rate of return on the total valuation of the pipeline. In essence, the pipeline companies were claiming a double rate of return on that portion of the pipeline financed through debt. They were first recovering their interest expense on their debt in addition to a rate of return on the borrowed money itself. The ICC, however, in its order suspending the rates, eliminated the double counting for purposes of setting interim rates by specifying that it would accept, on an interim basis, tariffs based upon a 10 percent rate of return on valuation with interest cost to be paid out of company's rate of return.

The effect of the excessive tariffs for the pipeline companies was extremely high rates of return and substantial profits for the pipeline companies. For example the degree of profit that would be yielded by the pipeline companies using

their originally filed tariffs was illustrated by the Commission as follows:

Pipeline Carrier	on Equity	on Total Investment	on Valuation
Amerada Hess	31.5%	13.8%	13.3%
ARCO	86.2%	13.1%	12.4%
BP	42.5%	14.2%	13.5%
Exxon	31.4%	13.2%	12.5%
Mobil	(no equity)	13.8%	13.1%
Phillips	38.2%	14.0%	13.1%
Sohio	40.6%	13.6%	13.1%
Union	71.1%	13.8%	12.7%
Average	46.0%	13.6%	12.9%

These inflated tariffs substantially reduced severance tax and royalty values and resulted in considerably reduced revenues. For example, shortly after the initial tariffs were filed the Department of Revenue estimated the loss of revenues would be as shown in the following table:

Duration of High Tariffs	Reduced Royalty and Prod. Tax Revenue
6 months	15.6
12 months	41.7
18 months	70.5

These initial tariffs were way beyond what others expected the pipeline companies would claim. Those third party estimates are shown on the following table.

AGO 547784

Date	Source	Amount

Even the Department of Revenue's extremely conservative estimate of $5.54 (worst case scenario) of what the companies might claim fell substantially below what was actually filed. As shown earlier in this report the filed tariffs also exceeded substantially the public pronouncements of the companies themselves.

AGO 547785

Tanker Tariffs

Another item having a direct impact on the wellhead value for calculation of the severance tax is the cost of marine transportation from Valdez to various points on the West Coast and Gulf Coast of the United States.

Unlike pipeline tariffs, the oil tanker transportation costs are not regulated by any government regulatory body since the tankers are not operating as common carriers. Instead the transportation charges are set by negotiation between the tanker company and the shipper, which in some cases may be between affiliated companies.

Since production began in June of 1977 tankers have been loading oil at Valdez and transporting it to various locations in the states of California, Washington and on the Gulf of Mexico. The charges claimed for this transportation have varied considerably between shippers and far exceed the expectation of third parties who estimated the amount of the charge.

Those tanker charges that have been claimed during the month of December are as follows:

AGO 547786

Company	Charge	Destination
ARCO	$ .88	West Coast
Exxon	1.08	West Coast
Phillips	.81	West Coast
Sohio	.89	West Coast
Sohio	3.61	Gulf Coast

These tanker charges that have ranged from $.88 to $3.61 are substantially greater than what other third parties thought the charges would be. These estimates were as follows:

AGO 547787

Date	Source	Tanker Cost
11/76	Mortada International, The Determination of Equitable Pricing Levels for North Slope Alaskan Crude, pp. II-18, III-10, III-12, IV-24, VII-6 and VII-7	
	Delivered to Los Angeles	.671*
	Delivered to Puget Sound	.459*
	*Figures in 1976 dollars	
4/76	Drexel Burnham & Co., The North Slope: Paradise Lost?, pp. IV-11	.50
1/7/77	Washington Analysis Corp., Entitlements Program Impact on North Slope Profits	
	Delivered to West Coast	.60
2/28/77	Merrill, Lynch, Pierce, Fenner & Smith, Inc., Institutional Report, "Petroleum Notes, Prudhoe Bay Crude Oil, Entitlements Program," p. 4.	.55
4/1/77	Wainwright Securities Inc., Industry Review, "Petroleum Industry, North Slope Oil and Gas," pp. 25 (Table 7), 43 (Table 10)	
	Delivered to Puget Sound	.50
	Delivered to San Francisco	.80
	Delivered to Long Beach	.70
	Delivered to Houston	2.45
4/15/77	The President of the United States, Report to Congress on the Pricing of Alaska North Slope (ANS) Crude Oil pp. 63-64 (Table IX-3)	
	Delivered to Puget Sound (120 MB/D)	.74
	Delivered to San Francisco (250 MB/D)	.96
	Delivered to Los Angeles (340 MB/D)	1.01
	Delivered to Gulf Coast (490 MB/D)	2.98

The Department of Revenue predicted a weighted average tanker charge of $.59 to the West Coast and it too was much below the tanker charges claimed.

Transportation to more Distant Markets

Another factor complicating the determination of wellhead value is the West Coast surplus. When the new production from Prudhoe Bay combined wi imports and California production, the amount of crude oil exceeded the physical capacity of the refineries on the West Coast to process it. As a result the surplus oil had to be, and still must be transported to other areas of the United States in order to be sold.

Currently, the North Slope surplus oil is being transported by Sohio through the Panama Canal by tanker to market destinations o the Gulf Coast. As production from Prudhoe Bay increases to 1.2 million barrels a day in March of this year, the surplus situation will worsen.

Several possible pipelines to transport surplus oil from the West Coast to eastern markets are on the drawing board, including: The Sohio Pipeline, Atlantic Richfield's proposed "Yoyo" of the Trans-Mountain line, the Kitimat line and the Northern Tier Pipeline. For the short term, however, no relief from the problem is in sight except the costly transshipment through the Panama Canal.

The extra transportation charge claimed by Sohio for shipment through the Panama Canal has been $2.72 per barrel. This in

itself has greatly reduced the wellhead value on a major portion of the North Slope production.

FIELD VALUE

In taking the market prices received for Prudhoe Bay oil and netting back actual claimed transportation charges from the point of sale to the point of production, the producers are reporting wellhead values ranging from $3.53 to $7.70.

The lowest value is reported by Sohio for the oil which it is marketing on the Gulf Coast. Sohio begins with a market price on the Gulf Coast of $13.42. From that amount it is deducting $3.61 for tanker transportation from Valdez to the Gulf Coast and a $6.28 TAPS pipeline charge from Prudhoe Bay to Valdez.

A schedule showing the various reported values for each of the producers follows. These reported values are taken from the December royalty reports as filed by the North Slope producers, and as stated earlier these values taken together produce a weighted average wellhead value for severance tax purposes of $5.44.

AGO 547791

Producer	Quantity	Sale	Market Price	Tanker Cost	TAPS Tariff	Reported Value*
Amerada Hess	119,585	Valdez	$12.60	--	$6.44	$6.16
ARCO	4,507,962	West Coast	13.44	.88	6.16	6.40
Chevron	187,488	--	--	--	--	7.70
EXXON	3,913,000	West Coast	13.16	1.08	6.27	5.81
EXXON	514,699	Valdez	12.30	.15	6.27	5.88

Getty	121,920	Prudhoe Bay	6.38	--	--	6.38
Hunt Group	21,191	Valdez	12.62	--	6.14	6.48
Louisiana Land & Expl.	8,839	Valdez	11.89	--	6.04	5.85
Marathon	11,094	--	--	--	--	6.35
Mobil	465,495	Prudhoe Bay	6.23	--	--	6.23
Phillips	454,632	West Coast	13.38	.81	6.22	6.35
Placid	9,415	Valdez	12.62	--	6.14	6.48
Sohio	4,550,000	West Coast	13.30	.89	6.27	6.14
Sohio	6,097,000	Gulf Coast	13.42	3.61	6.28	3.53
Sohio	1,170,000	Valdez	12.53	--	6.25	6.28

*Not including field cost deductions

AGD 547792

Although clearly not deductible under AS 43.55.140 for severance tax purposes in determining wellhead value, the producers have deducted so called "field costs" in determining wellhead value for royalty payments. These costs or deductions represent the costs of gathering, cleaning and dehydrating the oil from the point where the oil comes out of the ground to the point where it is metered into the Trans Alaska Pipeline. The state has taken issue with these deductions as well as all other producer calculations of wellhead value for royalty purposes in a lawsuit entitled State v Amerada Hess et. al., Superior Ct., No. 77-847, First Judicial District.

The amount of field costs deducted for royalty purposes have varied in amount among the producers and for December those deductions ranged as follows:

Producer	Field Cost Deductions
Amerada Hess	.68
ARCO	.64
Exxon	.53
Getty	.78
Mobil	1.11
Phillips	1.03
Placid	.77
Sohio	.60

Thus for royalty purposes the producers during the month of December repor[illegible] values as follows:

Producer	Royalty Value
Amerada Hess	$5.48
ARCO	5.77
Chevron	7.70
Exxon (West Coast)	5.28
Exxon (Valdez)	5.35
Exxon (Fairbanks)	5.50
Getty	5.60
Hunt Group	6.48
Louisiana Land & Exploration	5.85
Marathon	6.35
Mobil	5.12
Phillips	5.32
Placid	5.71
Sohio (West Coast)	5.48
Sohio (Gulf Coast)	2.87
Sohio (Valdez)	5.62

Thus with claimed field costs, Sohio for example, is claiming a wellhead value of $2.87 for the oil which it is shipping to the Gulf Coast. The weighted average wellhead value of Prudhoe Bay oil for royalty purposes for all producers during the month of December is $4.79 per barrel.

In contrast to the values being reported to the State of Alaska for severance tax and royalty purposes, an objective comparison of the value of North Slope oil using comparable market refining prices on the West Coast and reasonable transportation charges from the market to the North Slope oil field yields a value substantially above the reported values.

First of all, in computing a comparative market wellhead value, we begin with a free market price of oil of like quality to that of North Slope oil. That market price of oil, most comparable to North Slope oil is the price of oil imported to the West Coast and is computed as follows.

VALUE OF 27° ALASKA NORTH SLOPE (ANS) OIL
AT REFINERY DESTINATION

	Los Angeles
Saudi sales price FOB Ras Tanura	$12.32
Class 2 tanker tariff (AFRA)	1.12
Import fee	-0-
Price for Saudi FOB refinery	13.44
Entitlement for Saudi	-2.37
Refiner's acquisition cost for Saudi	11.07
Entitlement given for ANS oil	2.37
VALUE (Max. price refiners would pay for ANS oil)	13.44

Thus the free market value at the refinery of Prudhoe Bay oil is $13.44.

Secondly, reasonable transportation charges need to be computed and subtracted from the market price at the refinery. Again we have used third party bench marks in computing a comparison of wellhead value.

All the TAPS protestants including the State of Alaska, the U.S. Justice Department, the Arctic Slope Native Corporation, and the ICC staff have recommended TAPS tariffs substantially below what the companies originally filed. All of the TAPS

protestants except the ICC staff recommended TAPS tariffs below even the ICC interim tariffs. For purposes of this report, however, we have chosen the ICC interim rates as a bench mark for reasonable pipeline transportation costs even though these tariffs may in fact still be too high as permanent tariffs.

Those interim tariffs were:

Pipeline Carrier	Interim Rate
Amerada Hess	4.85
ARCO	4.91
BP	4.68
Exxon	5.10
Mobil	4.84
Phillips	4.83
Sohio	4.70
Union	4.84

Using the weighted average of these tariffs results in a pipeline transportation cost of $4.85 per barrel.

For tanker transportation to the West Coast we have chosen a conservative estimate of .70 based upon third party calculations of average tanker costs to the West Coast.

Using these third party bench mark figures of refinery prices and transportation costs results in a market price net back to the field of $7.91.

Also in contrast to the reported wellhead values are the projections of values by third parties as shown in the following table. Interestingly enough, however, these third party estimates coincide closely with our construction of an objective determination of a Prudhoe Bay wellhead value.

INFLATION AND CHANGES IN WORLD OIL PRICES

In Alaska's Oil and Gas Tax Structure (p. VI-22), the Department of Revenue recommended last year that

> "[t]o prevent the 'floor' from losing value through time it should escalate"

Suggested escalators then were the Gross National Product (GNP) deflator, which is the primary index of U.S. inflation, and the world market price of similar foreign oil. The GNP deflator during the last year has changed as follows:

GNP Deflator
(1972 = 100)

Index Period	Index Amount	Change from 3rd Quarter 1976
3rd Quarter 1976	134.56	--
4th Quarter 1976	136.35	+1.3%
1st Quarter 1977	138.13	+2.7%
2nd Quarter 1977	140.52	+4.4%
3rd Quarter 1977	142.25	+5.7%

With respect to world oil market prices, 1977 saw a period of two-tier pricing within OPEC come to an end. The split in OPEC developed when Saudi Arabia and the United Arab Emirates (UAE) refused to go along with the rest of OPEC in December 1976 in raising their State Sales Prices by 10 percent. Instead, Saudi Arabia and the UAE raised prices by only about 5 percent. In midyear this breach was closed, when the two nations raised their prices while the rest of OPEC forewent its previously announced increase scheduled

AGO 547799

for that time. Since Saudi Arabian crudes are of all imports, most like Prudhoe Bay crude in refining characteristics, the midyear increase in price for those crudes is relevant to the appropriate cents-per-barrel floor for Alaskan oil production. Accordingly, the exact prices and percentages of change follow:

Changes in State Sales Prices (FOB)
by Saudi Arabia and the U.A.E.
During 1977

Crude Type	1-1-77 $/B	1-9-78 $/B	% Change	
Saudi Arabia				
Berri (39°)	12.48	13.22	+5.9]	
Light (34°)	12.09	12.70	+5.0]	+5.5%
Medium (31°)	11.69	12.32	+5.4]	average
Heavy (27°)	11.37	12.02	+5.7]	
U.A.E. (39°)	12.514	13.26	+6.0

*base year different than 1967

AGO 547802

The present $6.53 floor for "other oil" is inadequate.

As shown earlier (p. 38) an objective computation of the market value of Prudhoe Bay oil using comparable refinery market prices and reasonable transportation costs (determined from third party sources) yields a wellhead value of $7.91.

Additionally, at the same time as the Department recommended a $7.50 floor, the oil companies were speaking publicly of wellhead prices near and above that level. Numerous informed consulting firms were forecasting prices in this range, too (see p. 40). Aside from inflation and the price increases of Saudi Arabia and the UAE, nothing else has changed during 1977 that would alter the appropriateness of that figure. As such, $7.50 plus 5.7 inflation as measured by he G.N.P. deflator yeilds a value of $7.93.

Accordingly, the Department of Revenue recommends a floor of $7.90. The cents-per-barrel amount that corresponds to this floor at a 12.25 percent rate is .96775 which, when rounded, is $.968. AS 43.55.011(c) should be amended so that $.968 replaces the $.80 figure that is there now.

The Department also believes it is appropriate at this time to adjust the cents-per-barrel rate for "old oil" and the cents-per-Mcf rate only to the extent necessary to offset

AGO 547803

the 5.7 percent inflation. Thus the $0.60 figure in AS 43.55.011(c) should be changed to $0.634, and the $0.064 figure in AS 43.55.016(c) should be changed to $0.068.

While AS 43.55.012(a) requires only that Department of Revenue make the recommendations above, the Department will further recommend a change in AS 43.55.012(a) itself so that a greater degree of stability may be incorporated into the production tax. As that statute reads now, the cents-per-barrel tax rates must come under review each and every year. This needlessly creates an uncertainty from one year to the next, which can eventually harm the investment climate for further oil and gas development. The Department therefore recommends tying the cents-per-barrel and cents-per-Mcf rates to an index to offset the adverse effects of inflation on the meaningfulness of these floors. This would be done by repealing AS 43.55.012(a) in its entirety and enacting the following provision to replace it:

> (a) The amounts set out in sec. 11(c) and sec. 16(c) of this chapter shall be increased or decreased by a percentage equal to the percentage of change in the Gross National Product Deflator published by the Bureau of Economic Analysis of the United States Department of Commerce, using 1972 as the base period for the deflator (1972 = 100). Changes in tax rates will be computed based on changes in the Gross National

Product Deflator from the First Quarter 1978 Gross National Product Deflator. The department shall post the changes in the tax rates periodically and shall notify every person producing oil within the state of the changes.

III. ANALYSIS (See Fiscal Note Preparation Instructions, Section III)

It is assumed that the bill will only result in acquisition of the 13.89 acres of private land. Actual opening and operation of the area for public recreation would be dependent upon a future allocation for development of the area. This development would include a boat ramp, parking, toilet facilities, trails, water well, picnic sites, and several tent camping sites. The cost of this development is estimated to be 225.0 dollars and presumably would occur in 1979 or 1980.

It is expected that 50-50 matching funds would be available in 1979 from the federal Land and Water Conservation Fund.

Assuming that development funds will be appropriated by the legislature in 1979, maintenance costs will be reasonably low thereafter due to the provision of low maintenance facilities. Maintenance and operation cost projections also assume that the area will not be open to the public until it is developed. To open the area in an undeveloped condition would lead to high maintenance costs due to random use patterns which would develop.

IV. DATE 4/5/78 PREPARED BY Terry A. McWilliams, Director
AGENCY Division of Parks, Dept. of Natural Resources
Original: Legislative Finance PHONE 465-2421 (Anchorage: 274-4676)

STATE OF ALASKA

MEMORANDUM

DEPARTMENT OF NATURAL RESOURCES
DIVISION OF LAND & WATER MANAGEMENT

TO: NEIL C. JOHANNSEN
Chief of Planning
Division of Parks

DATE: December 23, 1977

FILE NO:

TELEPHONE NO:

FROM: DENNIS L. LATTERY C.R.A.
Appraiser

SUBJECT: Letter of opinion of value

As requested this is to provide you with an estimate of the market value of a parcel of land located at the confluence of the Funny River and Kenai Rivers described to me as:

Tract Six, Addition No. Two, Heistand Subdivision NE¼, SE¼ Goverment Lots 12 & 13, Section 28, T5N, R9W, S.M. (Total 13.89 acres)

You will understand that I have not had the benefit of a field inspection of this property nor the comparable sales used to support this estimate. Because of this I am obliged to provide you with a probable range of values rather than a simple "ball park" figure. I will note that I have appraised a number of parcels in this area in the past, including both backlands and river fronting properties,and that I am reasonably familiar with market thinking in the vicinity.

On a basis of five reasonably current sales in this area, including a 47 acre river fronting tract very near the subject, a range in value of $7,500.00 to $8,300.00 per acre is indicated to this property.

I hope this is sufficient for your needs.

MEMORANDUM

State of Alaska
DEPARTMENT OF FISH AND GAME

TO:
Russ Redick
Regional Supervisor
SF - Anchorage

DATE : November 8, 1977

FROM:
Sid Logan
Area Management Biologist
SF - Soldotna

SUBJECT: Kenai-Funny River
Confluence Land Purchase

This memo is in reference to your request of November 2 concerning the desirability of the state acquiring the McFarland property located at the Funny-Kenai River confluence. We believe the purchase of this parcel would be beneficial to recreational angling public for the following reasons:

1. This site is located 10 miles east of Soldotna adjacent to the Funny River Road. This is a good gravel all weather road which provides for easy access from the Soldotna-Kenai areas. Also, it would be more readily accessible to the Anchorage population center when a bridge is eventually constructed across the Kenai River near Naptowne connecting it with the Sterling Highway.

2. This 14 acre parcel has approximately 1,000 feet of frontage on the Kenai River which would be available as shoreline access to the angling public. Most of the land above and below this site is either private or generally not accessible from the road system. The site also has excellent potential for the construction of a boat ramp or harbor in the sheltered Funny River.

3. This will be the only developed public access site on the south bank of the Kenai River except for the Soldotna City Campground. It will also be located approximately in the center of a 16 mile section of the Kenai River which is only lightly utilized due to the lack of readily accessible developed public access. During the 1977 king salmon fishery this area received only 9.1 percent of the total effort although it comprises 47.1 percent of the stream area open to fishing.

4. The Kenai River is the most popular salmon fishery in the state of Alaska so the demand for improved public access is very high. Total angler effort on king salmon during June and July has increased by 252 percent over a four year period from 23,600 man-days in 1974 to 83,000 man-days in 1977. Effort on silver salmon during August and September was 36,000 man-days in 1976.

Proposed Funny River State Wayside

size of parcel: 13.89 acres

Appraised value:$110,000 (based on Alaska Division of Lands estimate of value)

Development potential: (prepared by Alaska Division of Parks)

While the site is capable of supporting a wide variety of recreational uses and development, the following appear most appropriate for the expected user groups and character of the site:

- parking area for 40 vehicles
- toilets (fiberglass vault type)
- single lane boat launch
- water well
- fishing trails along rivers
- 8 picnic sites
- 10 tent camping sites
- interpretive display (salmon)
- signs, road work, misc.

Development costs: 1978 dollars 195,600
1980 dollars 285,700

(note:these figures are based on the above facilities. 1980 dollars are used as this is the Division of Parks estimate as to when the construction of facilities could be undertaken)

Dear Hugh;

The south side of the upper Kenai needs an access point and House Bill 887 should provide this. I hope that the House and Senate will expedite this bill to provide funds to acquire this land.

I hope you will accept my letter to Senator Tillion for your use in the House.

Sincerely,

Bill

Alaska Fisheries Development Corporation (Informational)

BOX 969
CORDOVA, ALASKA 99574
(907) 424-3116

March 13, 1978

The Honorable Terry Gardiner
House of Representatives
State Capitol Building
Juneau, Alaska 99811

Dear Representative Gardiner,

The Alaska Fisheries Development Corporation (Corporation) is a not-for-profit Alaska corporation recently formed by members of the Alaska fishing industry. The organization has been carefully structured so that its voting membership will equitably reflect both the harvesting and the processing sectors of the industry. Since December 3, 1977, a representative group of fishermen and processors has worked cooperatively to both form the Corporation and to draft a comprehensive bottomfish proposal which would win industry's support. Both goals have been realized.

Though many factors have encouraged this promising effort on th part of historically opposed segments of the industry, the most persuasive has been the promise of 2.7 million dollars in federal funding which the industry was led to believe would be available from Saltonstall-Kennedy Fund monies for the development of the Alaska bottomfish industry. Because it was necessary to have a viable legal entity which could receive and manage such monies and programs, the industry was compelled to coordinate its efforts and form the corporation. The current bottomfish proposal is the first of the research and development projects which the Corporation anticipates it will undertake.

Though early indications from NMFS and NOAA are encouraging the Corporation has been informally advised that contrary to earlier agency assurances the full 2.7 million dollars is not available for Alaska. Concurrently a hard look is being taken at this somewhat surprising cooperative effort on the part of industry. Skeptics lurk at every corner despite the demonstrated ability of this organization to perform well and to be flexible as well as resourceful.*

*Though timely filed with NMFS the proposal was modified by by industry at the urging of both NMFS staff and high-level NOAA personnel. The revised proposal includes the independently submitted proposal of the Aleutian-Pribloff Fisheries Cooperative additional supporting marketing and economic data and a change from a one to a two year time frame.

To date members of the industry have volunteered their time with the understanding that incurred travel, telephone and printing expenses will be reimbursed. Similar organizations in other areas of the United States have and are obtaining funding for such initial activities through federal channels. Alaska's request to NMFS for such seed money was denied, though the Alaska Sea Grant program donated $2000 for travel expenses to insure that working sessions were attended by fishermen as well as processors.

The Corporation is aggressively seeking funding with a membership drive and from donations of supportive components of the industry. Though the response has been excellent the process is a slow one. In order to maintain interest in and committment to the Corporation and the proposal and to attract future funding, it is imperative that the proposed projects are implemented as soon as the money is available. A qualified staff, a solid budget and a base of operations are all prerequisites to the successful management of the projects.

Thus the Corporation seeks a grant of $100,000 from the State of Alaska. It is essential that such funding be appropriated immedeately for two reasons: 1) to indicate to both federal agencies and the industry itself that the State endorses this activity and has confidence in the industry's ability to look after its own needs and 2) to insure that there is a management team in place as soon as possible.

It is crucial that the viability of the Corporation be insured; that it is poised to swing into action as soon as the allocation of S-K funding for Alaska is confirmed so that no momentum is lost. Delay could well result in denial of funding for 1979 and beyond, not to mention the impact that such failure would have on the development of this most important fishery.

Thank you in advance for considering this request for a grant for $100,000. Your concern and support of the fishing industry in Alaska does not go unnoticed. It is the industry of the future for Alaska.

Respectfully,

The Board of Directors
Alaska Fisheries Development
Corporation

HB
904

Introduced: 3/22/78
Referred: Resources and Finance

IN THE HOUSE

BY THE RULES COMMITTEE BY REQUEST OF THE GOVERNOR

HOUSE BILL NO. 904

IN THE LEGISLATURE OF THE STATE OF ALASKA

TENTH LEGISLATURE - SECOND SESSION

A BILL

For an Act entitled: "An Act relating to Alaska land policy; and providing for an effective date."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

* Section 1. PURPOSE. Alaska's Constitution directs that the state "encourage the settlement of its land and the development of its resources by making them available for maximum use consistent with the public interest" (art. VIII, sec. 1), and to "provide for the utilization, development, and conservation of all natural resources belonging to the State, including land and waters, for the maximum benefit of its people" (art. VIII, sec. 2). The constitution also directs that "Fish, forests, wildlife, grasslands, and all other replenishable resources belonging to the State shall be utilized, developed, and maintained on the sustained yield principle, subject to preferences among beneficial uses" (art. VIII, sec. 4). The purpose of this Act is to implement these broad constitutional goals through establishment of policies for use of state land surface and to express these policies in sufficient detail to guide the administrative decisions which govern the use and management of state-owned land.

* Sec. 2. AS 38 is amended by adding a new chapter to read:

CHAPTER 4. POLICY FOR USE AND CLASSIFICATION OF STATE LAND SURFACE.

ARTICLE 1. PUBLIC AND PRIVATE LAND USE.

Sec. 38.04.005. POLICY. (a) In order to provide for maximum use of state land consistent with the public interest, it is the policy of the State of Alaska to plan and manage state-owned land to

establish a balanced combination of land available for both public and private purposes. The choice of land best suited for public and private use shall be determined through the inventory, planning, and classification processes set out in secs. 60 and 70 of this chapter.

(b) In classifying state land for private use and settlement purposes, the director shall make adequate provision for public open space which is accessible to communities so that natural areas are easily reached from all communities and settled areas. The amount of such land must be sufficient to meet existing and projected needs for accessible public recreation land. Special care shall be taken to preserve public access to public water and to retain state ownership of sufficient land which combine high value for recreation and other public purposes with accessibility to settled areas. This classification for public purposes does not constitute dedication to open space, but the division's management of land so classified shall be in a manner to preserve the identified values.

(c) In allocating land for private use and public retention, the requirements of future generations must be considered. To this end, a supply of state land of a variety of types and locations must be reserved to provide an opportunity for future decisions.

(d) Private land use rights are integral to the material well-being of the people of Alaska and our society.

(e) Involvement of municipalities and local residents is essential in the decision making process which leads to making state land available for private use.

Sec. 38.04.010. PUBLIC INTEREST IN MAKING LAND AVAILABLE FOR PRIVATE USE. (a) The primary public interest in conveying rights to state land surface to private parties is to make them available to individuals and other persons for direct use in areas classified as

suitable for these purposes. In making state land available for private use, the director shall seek to guide year-round settlement to areas where public services already exist, or can be extended with reasonable economy, or where development of a viable economic base is probable.

(b) State land which is located beyond the range of existing schools and other necessary public services, or which is located where development of sources of employment is improbable, may be made available for seasonal recreational purposes or for low density settlement, with sufficient separation between residences so that public services will not be necessary or expected.

Sec. 38.04.015. PUBLIC INTEREST IN RETAINING STATE LAND IN PUBLIC OWNERSHIP. The primary public interests in retaining areas of state land surface in public ownership are:

(1) to make them available on a sustained yield basis for a variety of beneficial uses including subsistence, forestry, grazing, sport hunting and fishing, hiking, snowmobiling, skiing, and other activities of a type which can generally be made available to more people and conducted more successfully if the land is in public rather than private ownership;

(2) to facilitate mining and mineral leasing by managing appropriate public land for surface uses which are compatible with subsurface uses;

(3) to protect critical wildlife habitat and areas of special scenic, recreational, scientific, or other environmental concern;

(4) to restrict development in floodplains, avalanche zones, and other hazardous locations; and

(5) to guide the location of settlement and development to

minimize public costs and maximize social and economic benefits.

ARTICLE 2. LAND AVAILABILITY FOR PRIVATE USE.

Sec. 38.04.020. TIMING AND AMOUNT. On a continuing or annual basis, the director shall make available for private use an array of state land suitable for a variety of uses. During fiscal year 1979, the director shall make available a minimum of 50,000 acres, not more than 10 per cent of which may be made available for leasing. Annually thereafter, the following three options for the state land availability program must be submitted to the legislature along with the administration's budget: an increased-level program, a current-level program, and a reduced-level program. At least one option must include at least 50,000 acres.

Sec. 38.04.025. VARIETY OF USES. In making state land available for private use, the director shall endeavor to accommodate persons with a current need and anticipated use for the land. To this end, the director shall assess the nature of the supply and demand for state land in different regions and locations of the state, taking into account the supply of available land under other ownership, and shall make land available in locations and other programs suited to the differing needs of prospective users throughout the state.

Sec. 38.04.030. LAND AVAILABILITY PROGRAMS. Programs which may be used by the director to make the state's land surface available for private use under this section include sale of whole or partial rights to the fee simple estate, including conveyance of agricultural use rights; leasing; open-to-entry; homesiting; homesteading; permitting for construction and occupation of cabins in isolated locations on land retained in state ownership; and other methods as provided by law.

Sec. 38.04.035. CRITERIA FOR PROGRAM SELECTION. In determining

which land availability program is appropriate for state lands in different locations, the director shall be guided by the following criteria:

(1) To cover public costs associated with private land use and to provide the public with a fair return for publicly owned property, conveyance of state land to private parties should be at fair market value except where otherwise authorized by statute or by administrative regulation.

(2) Sale or lease programs should be employed where land is readily accessible to a major community center or where, because of a prime location on waterfront or a transportation route or some other location characteristic, land has relatively high real estate value.

(3) Lease programs should be employed

(A) where special land use controls are required and there is a high public interest in having certain types of land used for particular purposes;

(B) when the intended use is a temporary one;

(C) in commercial or industrial situations when a leasehold can provide cash flow advantages to the lessee;

(D) when a unique location with special public values is involved, as in a deep water port; and

(E) where current demand for private use is high, but projections suggest that, in the future, the land may be more valuable for public use, as in accessible waterfront recreation areas.

(4) For enabling isolated cabin development in remote locations where survey and conveyance is impractical, a system for cabin permits on public land should be used.

(5) Limited or conditional title may be granted when the

state's best interest so dictates. Among other things, title limitations may include grants of agricultural interest only, retention of development rights, and retention of scenic or other easements. A conditional title may be tied to a development schedule or other standards of performance.

Sec. 38.04.040. AVAILABILITY OF MENTAL HEALTH LAND, SCHOOL LAND, AND UNIVERSITY LAND. Mental health land, school land, and university land may be made available at fair market value for private use under the purposes of this chapter; however, any such action must be in accordance with statutes pertaining to these lands and the authority of the mental health land board, the Board of Education, and the Board of Regents of the University of Alaska.

Sec. 38.04.045. SURVEY AND SUBDIVISION. (a) State land to be conveyed in fee simple or less than fee simple estate must be subdivided so that lots and tracts are of a size which fits the requirements of individual users and reflects the physical characteristics of the land, except that in locations where there is an inadequate margin between the demand for and the supply of vacant land, the state may make land available for private acquisition in parcels that are larger than required for individual use.

(b) Before the conveyance of surface rights to state land, an official cadastral survey must be accomplished, unless a comparable, acceptable survey exists that has been conducted by the Federal Bureau of Land Management. The rectangular survey section corner positions must be monumented and shown on a cadastral survey plat approved by the state. However, for those areas where the state may wish to convey surface estate outside of an Official Cadastral Survey grid, the director may waive monumentation of all individual section corner positions and substitute an official control survey with control

points being monumented at approximately two-mile intervals and shown on control survey plats approved by the state. No portion of land to be conveyed may be located more than two ~~suitable~~ Malone miles from such a survey control monument. The lots and tracts in state subdivisions must be monumented and the cadastral survey and plats for the subdivision must be approved by the state. Where land is located within a municipality with planning, platting, and zoning powers, plats for state subdivisions must comply with local ordinances and regulations in the same manner and to the same extent as plats for subdivisions by other landowners. State subdivisions must be filed in the district recorder's office. The requirements of this section do not apply to land made available through material sales or a cabin permit system, or under short-term leases.

Sec. 38.04.050. ACCESS TO PRIVATE USE AREAS. Wherever state land is surveyed for purposes of private use, adequate rights-of-way and easements must be reserved as necessary for access and, where appropriate, for power and telephone service to each parcel of land. Where necessary and appropriate for the use intended, the director shall arrange for the development of surface access as part of the land availability program. The direct cost of local access development must be borne by the recipient of the land unless otherwise provided by state statutes or regulations.

Sec. 38.04.055. ACCESS THROUGH PRIVATE USE AREAS. The director shall reserve easements and rights-of-way on and across land which is made available for private use as necessary to reach or use public water and public and private land.

ARTICLE 3. INVENTORY, PLANNING, AND CLASSIFICATION.

Sec. 38.04.060. INVENTORY. (a) The commissioner shall prepare and maintain on a continuing basis an inventory of all state land and

water and their resource and other values, giving priority to areas of potential settlement and of critical environmental concern. This inventory must be kept current so as to reflect changes in conditions and to identify new and emerging resource and other values.

(b) The commissioner's inventory must include land and water under interagency assignment of land management authority and land and water proposed for such an assignment. That land and water must be reviewed at regular intervals to analyze current and proposed uses as these uses relate to alternative uses for all or part of the land and to determine the uses which best provide for the public interest.

(c) As funds and manpower are made available, the commissioner shall provide local and federal governments and major private landowners with data from the inventory for the purpose of planning and managing the uses of land in proximity to state land.

Sec. 38.04.065. LAND USE PLANNING AND CLASSIFICATION. (a) The commissioner shall, with local governmental and public involvement, develop, maintain and, when appropriate, revise land use plans which provide, by regions or areas, for the use of the state-owned land.

(b) In the development and revision of land use plans, the commissioner shall:

(1) use and observe the principles of multiple use and sustained yield;

(2) use a systematic interdisciplinary approach to achieve integrated consideration of physical, economic, and social factors affecting the region or area;

(3) give priority to planning and classification in areas of potential settlement and critical environmental concern;

(4) rely, to the extent that it is available, on the inventory of the state land, its resources, and other values;

(5) consider present and potential uses of state land;

(6) consider the supply, resources, and present and potential use of land under other ownership within the area or region of concern;

(7) weigh long-term benefits to the public against short-term benefits;

(8) plan for compatible surface and mineral land use classifications; and

(9) provide for meaningful participation in the planning process by affected local governments, state and federal agencies, adjacent landowners, and the general public.

(c) As a basis for more detailed land use planning and classification, the commissioner shall develop regional land use plans for the use of all state land. These regional plans must identify and delineate (1) areas of settlement and settlement impact, where land must be classified for various private uses and for public recreation, open space, and other public uses desirable in and around settlement; and (2) areas which must be retained in state ownership and planned and classified for various uses and purposes in accordance with sec. 15 of this chapter.

(d) Official regional or area plans and subsequent amendments adopted by the commissioner after public and local governmental participation must be signed and dated by the commissioner. Land classifications must be made in accordance with these official plans.

(e) Land must be classified before being made available for private use or included in the management systems described in sec. 70 of this chapter.

(f) Decisions about the location of easements and rights-of-way, other than for minor access, must be integrated with land use planning

and classification for the appropriate area or region.

(g) Land use plans adopted by the commissioner under this section must be consistent with local governmental land use plans to the maximum extent he determines to be consistent with the state interests and the purposes of this chapter. Where a local zoning ordinance or other land use regulation is in effect, the provisions of AS 35.30.020

Sec. 38.04.070. MANAGEMENT SYSTEMS. (a) State land classified for uses and purposes involving retention in public ownership may be included in the following management systems:

(1) State Public Reserve System: areas of public land to be managed for a wide variety of compatible uses and purposes in accordance with the principles of multiple use and sustained yield; land designated to this system may include, but need not be limited to, state forest reserves and state wildlife reserves as well as land classified for public purposes within settlement impact areas;

(2) State Park System: areas with special recreational, scenic, cultural, historical, wilderness, or similar values, to be managed primarily for the public use and enjoyment of these values;

(3) State Trail System: a system of public historic or recreational trails;

(4) Wild and Scenic River Systems: a system of rivers with special natural, scenic, and recreational values designated by the state to be managed as part of the national system of wild and scenic rivers in accordance with the federal Wild and Scenic Rivers Act (82 Stat. 906; 16 U.S.C. 1271 et seq.);

(5) State Public Domain: land within areas designated on regional plans as settlement and settlement impact which are not part of the management systems listed in (1) -- (4) of this subsection; through classification, this land may be made available for private use, settlement, and development as well as for public uses associated

with settlement and development.

(b) State land classified in accordance with sec. 65 of this chapter may be included in the State Public Reserve System by proclamation of the governor.

(c) State land classified in accordance with sec. 65 of this chapter may be included in the State Park System, State Trail System or the Wild and Scenic River System by proclamation of the governor. However, no state land, water, or combination of land and water may, except by Act of the state legislature, be closed to multiple purpose use, if the area involved contains more than 640 acres.

ARTICLE 4. GENERAL PROVISIONS.

Sec. 38.04.900. REGULATIONS. The commissioner may adopt under the Administrative Procedure Act (AS 44.62) regulations he believes are necessary to carry out the purposes of this chapter. Within 120 days after the effective date of this Act, the director shall submit to the commissioner draft regulations implementing this chapter and revising regulations in effect on the effective date of this Act pertaining to planning, classification, management, and disposal of the state's surface estate in land. New and revised regulations must be integrated in a single comprehensive draft compatible with the structure of the Alaska Administrative Code. In preparing this draft, the director shall seek to simplify and clarify regulations governing land planning, classification, management, and disposal.

Sec. 38.04.910. DEFINITIONS. In this chapter, unless the context otherwise requires,

(1) "commissioner" means the commissioner of the Department of Natural Resources;

(2) "director" means the director of the division of lands of the Department of Natural Resources;

(3) "fair market value" means the price at which a willing seller and a willing buyer will trade;

(4) "multiple use" means the management of state land and its various resource values so that it is used in the combination that will best meet the present and future needs of the people of Alaska, making the most judicious use of the land for some or all of these resources or related services over areas large enough to provide sufficient latitude for periodic adjustments in use to conform to changing needs and conditions; it includes (A) the use of some land for less than all of the resources, and (B) a combination of balanced and diverse resource uses that takes into account the short-term and long-term needs of present and future generations for renewable and nonrenewable resources, including, but not limited to, recreation, range, timber, minerals, watershed, wildlife and fish, and natural scenic, scientific, and historic values;

(5) "official cadastral survey" means a United States public land survey or a survey executed under survey instructions issued by the division for the purpose of preparing a cadastral survey plat, and approved and accepted by the division for the state's official records;

(6) "official control survey" means a position marked on the ground by triangulation or traverse stations established in conformity with standards adopted by United States Coastal and Geodetic Survey for first, second and third order work, whose geodetic positions have been rigidly adjusted on the North American datum of 1927 and approved by the division;

(7) "short-term lease" means a lease for a term of five years or less;

(8) "state park" means an area of state land designated by

proclamation of the governor or by statute to be managed for public use and enjoyment of recreational, scenic, cultural, historical, wilderness, and similar values, including but not limited to areas designated under (A) AS 41.20.050 - 41.20.060, roadside rests and recreational beaches; (B) AS 41.20.130 - 41.20.160, 41.20.330 - 41.20.365, ch. 61 SLA 1966, and ch. 26 SLA 1967, state recreation areas, (C) AS 41.20.170 - 41.20.320, state parks; and (D) AS 41.35.030, state monuments and historic sites;

(9) "state trail" means an area designated by proclamation of the governor or by statute to be managed as a public historic or recreational trail including but not limited to (A) trails designated under AS 41.20.070 - 41.20.120, wilderness trails and campsites; and (B) trails and footpaths designated under AS 41.20.355 - 41.20.375;

(10) "state wild and scenic river" means any free-flowing river or stream so designated by the state in accordance with the criteria set forth in the Federal Wild and Scenic Rivers Act (82 Stat. 906; 16 U.S.C, 1271-1287);

(11) "sustained yield" means the achievement and maintenance in perpetuity of a high level annual or regular periodic output of the various renewable resources of the state lands consistent with multiple use.

* Sec. 3. AS 38.05.300 is repealed.

* Sec. 4. This Act takes effect immediately in accordance with AS 01.-10.070(c).

TESTIMONY

REGARDING LAND POLICY BILL

PRESENTED BY

JOINT FEDERAL-STATE LAND USE PLANNING COMMISSION FOR ALASKA

APRIL, 1978

The Commission wants to speak in support of Senate Bill 562 establishing an Alaskan land policy. We have been studying State land policy for several years and participated with the Administration in preparing this bill. As we reviewed the existing statutes governing the State's public domain and studied the State's land programs as they have operated over the past 15 years, we found that Alaska has very little statutory guidance to govern the Administration's decisions about disposal or retention of State lands. The existing constitutional and statutory requirement that State lands be managed for "maximum use and benefit consistent with the public interest" gives us an excellent basic goal, but is not specific enough to guide the administrator who is deciding where and how much State lands to make available for private use. As evidence of this statutory lack, we have seen the State's land program shift from large tract disposal practices in the late 1960's and early 1970's to the minimal disposal of recent years.

Members of the Legislature have recognized this problem, and, last year, Senator Poland requested the Commission to study the subject and prepare recommendations to this Legislature. We presented initial recommendations to members of the Senate and House Resources Committees this

January. The land policy bill represents a refinement of those sections of the Commission's recommendations dealing with policy matters.

The land policy bill before you accomplishes these purposes through three articles:

(1) Article 1 covers policy for public and private use. Essentially, this section makes it clear that the State's overall land policy is to provide lands for both private and public use purposes and to allocate suitable lands for each purpose. Special emphasis is placed on maintaining a balance of public and private lands near communities so that natural areas are easily reached by all people, and not just those who can afford to travel long distances. Two parallel subsections set forth the public purpose in making lands available for private use and the public purpose in retaining State lands in public ownership for recreation, mining, resource development, and other purposes. The policy statement recognizes the essential role of local governments in the process of arriving at decisions about State lands.

(2) Article 2 provides guidelines to the Administration for making land available for private use. The first section on timing and amount is identical to the first section of the land credit bill which Governor Hammond introduced. This section mandates that the Administration make a quantity of State

lands available on an annual basis for private use purposes. A minimum of 50,000 acres is set for the first year, no more than 10% of which may be leased land. Thereafter, the amount is set annually by the Legislature. The basic orientation of this section is towards making land available for direct, individual use in locations and in parcel sizes that best meet differing needs in different areas as determined through an inventory process.

The bill sets forth a State policy for making land available at fair market value, particularly in close-in locations with high real estate values; but the criteria provide room for use of homesiting and open-to-entry in appropriate locations. To prevent misuse of leasing, as has occurred in past years, the bill lists the types of special circumstances where leasing would be an appropriate method of making land available. Provision is also made for recreation cabin permitting in isolated locations on State lands. A section on availability of trust lands is included, and standards for surveying and subdivision as well as for adequate access are set forth. On page 7 there is a strong provision requiring State subdivisions to conform with local platting authority.

(3) Article 3 covers inventory planning and classification. This section draws from existing scattered and partial statutory direction for land inventory, planning and classification to

establish in one statute a clear, simple and unified program for analyzing the value and use potential of State lands. All lands must be inventoried and their appropriate use designated. As part of this process, the advise of local governments must be obtained.

The section establishes a new State management system for multiple use lands, called the "State Public Reserve System." There is also a new section on wild and scenic rivers giving the State the option of designated selected rivers in State ownership as part of the National Wild and Scenic Rivers System to be managed by the State in accordance with national guidelines. The Legislature retains its existing authority to approve any designation of more than 640 acres which would close the land to multiple use.

In summary, much of what is included in the land policy bill are generally accepted principles of good land management. The bill acknowledges the public desire to acquire State land for private use and mandates an active program in this direction. However, it does so in a responsible manner without sacrificing the many other valid uses of State land. We feel that adoption of this bill will clarify the State's position as a land manager, and will help in establishing this fact at a national level.

REGARDING LAND POLICY BILL

PRESENTED BY

JOINT FEDERAL-STATE LAND USE PLANNING COMMISSION FOR ALASKA

APRIL, 1978

The Commission wants to speak in support of Senate Bill 562 establishing an Alaskan land policy. We have been studying State land policy for several years and participated with the Administration in preparing this bill. As we reviewed the existing statutes governing the State's public domain and studied the State's land programs as they have operated over the past 15 years, we found that Alaska has very little statutory guidance to govern the Administration's decisions about disposal or retention of State lands. The existing constitutional and statutory requirement that State lands be managed for "maximum use and benefit consistent with the public interest" gives us an excellent basic goal, but is not specific enough to guide the administrator who is deciding where and how much State lands to make available for private use. As evidence of this statutory lack, we have seen the State's land program shift from large tract disposal practices in the late 1960's and early 1970's to the minimal disposal of recent years.

Members of the Legislature have recognized this problem, and, last year, Senator Poland requested the Commission to study the subject and prepare recommendations to this Legislature. We presented initial recommendations to members of the Senate and House Resources Committees this

January. The land policy bill represents a refinement of those sections of the Commission's recommendations dealing with policy matters.

The land policy bill before you accomplishes these purposes through three articles:

(1) Article 1 covers policy for public and private use. Essentially, this section makes it clear that the State's overall land policy is to provide lands for both private and public use purposes and to allocate suitable lands for each purpose. Special emphasis is placed on maintaining a balance of public and private lands near communities so that natural areas are easily reached by all people, and not just those who can afford to travel long distances. Two parallel subsections set forth the public purpose in making lands available for private use and the public purpose in retaining State lands in public ownership for recreation, mining, resource development, and other purposes. The policy statement recognizes the essential role of local governments in the process of arriving at decisions about State lands.

(2) Article 2 provides guidelines to the Administration for making land available for private use. The first section on timing and amount is identical to the first section of the land credit bill which Governor Hammond introduced. This section mandates that the Administration make a quantity of State

lands available on an annual basis for private use purposes. A minimum of 50,000 acres is set for the first year, no more than 10% of which may be leased land. Thereafter, the amount is set annually by the Legislature. The basic orientation of this section is towards making land available for direct, individual use in locations and in parcel sizes that best meet differin needs in different areas as determined through an inventory process.

The bill sets forth a State policy for making land available at fair market value, particularly in close-in locations with high real estate values; but the criteria provide room for use of homesiting and open-to-entry in appropriate locations. To prevent misuse of leasing, as has occurred in past years, the bill lists the types of special circumstances where leasing would be an appropriate method of making land available. Provision is also made for recreation cabin permitting in isolated locations on State lands. A section on availability of trust lands is included, and standards for surveying and subdivision as well as for adequate access are set forth. On page 7 there is a strong provision requiring State subdivisions to conform with local platting authority.

(3) Article 3 covers inventory planning and classification. This section draws from existing scattered and partial statutory direction for land inventory, planning and classification to

establish in one statute a clear, simple and unified program for analyzing the value and use potential of State lands. All lands must be inventoried and their appropriate use designated. As part of this process, the advise of local governments must be obtained.

The section establishes a new State management system for multiple use lands, called the "State Public Reserve System." There is also a new section on wild and scenic rivers giving the State the option of designated selected rivers in State ownership as part of the National Wild and Scenic Rivers System to be managed by the State in accordance with national guidelines. The Legislature retains its existing authority to approve any designation of more than 640 acres which would close the land to multiple use.

In summary, much of what is included in the land policy bill are generally accepted principles of good land management. The bill acknowledges the public desire to acquire State land for private use and mandates an active program in this direction. However, it does so in a responsible manner without sacrificing the many other valid uses of State land. We feel that adoption of this bill will clarify the State's position as a land manager, and will help in establishing this fact at a national level.

SECTION BY SECTION ANALYSIS
LAND POLICY BILL
HOUSE BILL NO. 904/SENATE BILL NO. 562

Sec. .005. This section sets forth basic intent and purpose regarding state-owned lands. Paragraphs (a) through (e) are purposely worded in the form of general policy directives rather than in the form of specific binding legal requirements. The last sentence in (b), lines 13-16, page 2, needs some explanation. Such a statement is necessary if lands classified for open space purposes are to qualify as the matching share for federal funds under the Land and Water Conservation Program.

Sec. .010. Under this statement, the basic orientation of State land disposal is towards the needs of individuals and other parties who will actually use the land. The Commission recommended this policy after finding that state land sales in the late 1960's and 1970's had primarily benefited land companies and wealthy individuals who could afford large tract purchases, rather than individuals who were looking for cabin or house sites. To change this orientation, land should be made available in individually sized parcels.

This section also includes a directive that state land availability programs concentrate in areas where public services already exist or can be extended, or where a viable economic base could be developed. This policy would not prohibit remote land disposal but, rather, direct that in such areas disposal would be mainly for recreation cabin sites with seasonal road or water access. Another method of fulfilling this directive might be through a rural cabin permit system, meeting the needs of people who want real isolation with several miles of separation between sites.

Sec. .015. This section lists the various reasons for retaining some state lands in public ownership, and is generally self-explanatory.

Sec. .020. This paragraph is identical to the first paragraph of the Governor's land credit proposal. An annual determination of acreage to be available for private use gives the legislature the flexibility to respond to changes in circumstances over the years. An annual determination is consistent with the basic thrust of the policy bill which is to make lands available where they are most needed and with consideration of local supply and demand factors. We would note that, in terms of meeting people's needs, it is not the gross acreage of land that is important but, rather, location, access, and tract size.

Sec. .025. This section is simply additional direction to base the land availability programs on an assessment of the differing needs for land of different types in various parts of the state, and to tailor state land programs accordingly.

Sec. .030. This section summarizes the variety of land availability programs within existing statutes and regulations and adds, in lines 25, 26, and 27, authority for a cabin permit system to be used in isolated locations on state-owned lands. To enable private use of remote isolated lands, the state must have a program which does not require land survey. In isolated locations a survey can cost as much as $4,000, often exceeding the market value of the land. A permit system which, unlike a conveyance program, would not entail land survey.

Sec. .035. The fair market value criterion set forth in (1) is self-explanatory. Besides the reasons included in the paragraph, the Commission recommends this approach because grant programs tend to invite public abuse, and are very difficult to administer in a fair and evenhanded manner. It should be noted that most of the participants at the Alaska Public Forum favored a market value approach to state land disposal. However, item (1) allows the use of less than fair market value programs as authorized by statute or administrative regulation and thus would enable the continuation of the homesite, homestead, and open-to-entry programs.

Paragraph (2) is self-explanatory.

Paragraph (3) spells out specific and detailed criteria for the choice of areas where lease programs would be used. This is an important addition to the state's body of land law. In the past lease programs have often been used where sale programs would have been more suitable.

Paragraph (4) gives direction for the use of cabin permitting in isolated, remote areas.

Paragraph (5) refers to the director's existing statutory authority to grant conditional title in special situations such as agricultural areas where the state wishes to ensure agricultural development, or in areas where the state may wish to preserve scenic easements, while making the land available for private uses compatible with this purpose.

Sec. .040. This section is self-explanatory. As a result of our discussion with the Community and Regional Affairs Committee, we are proposing a substitute paragraph (A in the list of suggested amendments) that would establish a more aggressive program for trust land availability.

Sec. .045. Under this section, the state would set survey control markers so that individual private surveys, tied to these markers, would mesh and not overlap. In the western states where areas were surveyed separately by private citizens, without an overlying set of control points, there were serious problems with overlapping and contradictory surveys. As a result, citizens were saddled with title problems, unusable property, etc. Through this section, we hope to avoid or minimize such problems in Alaska.

Sec. .050. This section requires the state to provide adequate access to private use areas. Lines 18 through 20 gives direction for the integration of state road development programs with land availability programs in appropriate locations. If state land is actually to be made available for individual use, it is important to strengthen the state's role in development of local access roads associated with state land use programs.

Sec. .055. Self-explanatory.

Sec. .060. A regular, updated inventory of the land suitability should be the foundation of the state's land management program. The state already has a good start in this direction through the land selection inventory.

Paragraph (b) of this section directs the division to reassess holdings of other state agencies, such as the Division of Aviation, to see if the land amount is excessive or inadequate in relation to current needs and alternative uses of the property. Such a program is especially important in small communities where excessive agency holdings occasionally preempt lands that are vitally needed for other community uses.

Sec. .065. Paragraphs (a) and (b) provide guidelines and standards for the development of land use plans for state lands.

Paragraph (c) directs the commissioner to prepare regional land use plans for all of the state-owned land. These would be of simple "first-cut" plans separating areas of settlement and settlement impact from areas of public use and ownership.

Paragraph (d) provides a formal method of identifying the official plan so that the public and the admi istration knows which document to rely on, and makes the important requirement that land classification be based on the official plan.

Paragraph (e) is self-explanatory.

Paragraph (f) establishes a needed tie between transportation planning and general land planning.

Paragraph (g) requires state planning to be consistent with local governmental planning.

Sec. .070. This section adds a state multiple use management system to the existing state park and trail systems. Lands may be designated to this new system, the "State Public Reserve System" by proclamation of the governor. The legislature retains its existing power to approve any designation of land to a system closed to multiple purpose use for an area of over 640 acres.

Paragraph (4) gives the state the option of designating rivers or portions of rivers to be managed by the state under the guidelines of the National Wild and Scenic Rivers System. Such authority may be desirable in some areas where segments of a river are owned by the federal and state governments. If a whole river-trip area can be managed under one set of guidelines, overall recreation benefits may be increased.

Sec. 900. This section includes a requirement that the director adopt, within 120 days, a comprehensive revision of the regulations affecting planning, classification, management, and disposal of state land surface. The administration has long recognized the need for this overall rewrite, and work on a revision is in process.

*Sec. 3. The repealed section 38.05.300 deals with classification and with the authority of the legislature to approve single-use designation for more than 640 acres. This bill spells out the classification and planning process more completely, and section 38.05.300 should be deleted to avoid confusion. The legislature's control over single-use designation of more than 640 acres is included in section .070(c) of this bill (page 8, lines 8-10).

Municipality of Anchorage

POUCH 6-650
ANCHORAGE, ALASKA 99502
(907) 274-2525

GEORGE M. SULLIVAN,
MAYOR

OFFICE OF THE MAYOR

April 17, 1978

The Honorable Kay Polland
Alaska State Senator
Pouch V
Juneau, Alaska 99811

Dear Senator Polland:

Senate Bill No. 562 will come before the Natural Resource Committee on Monday, April 17, 1978. There are three sections of this Bill which may adversely affect the Municipality of Anchorage. We would like to share our concerns with you regarding these sections before the Bill is heard by your committee.

Proposed section 38.04.045 (b) deals with the survey and subdivision of State land to be conveyed to private ownership. This section mandates compliance with local planning and platting ordinances. However, this section exempts from these ordinances land made available through mineral sales or a cabin permit system.

We object to the exemption provision for two reasons. First, it would be detrimental to the Municipality's planning program because under it large segments of land within the Municipality would not be subject to our planning and platting ordinances. If certain segments of land are not subject to the Municipality's planning and platting ordinances, then the ordinances become ineffective because they are designed to regulate all the land within the Municipality.

Second, the exemption provision conflicts with the policy contained in A.S. 09.55.275 which requires that any agency of the State must comply with local platting regulations in the same manner as private land owners when the State seeks to acquire property. This policy logically applies to the converse, i.e. when the State seeks to dispose of property. Providing for a partial exemption when the State seeks to dispose of property appears to serve no purpose. For the foregoing reasons, we suggest that the exemption provision be deleted.

Proposed section 38.04.065 deals with State Land Use Planning and Classification. Subsection (g) requires that State land use plans be consistent with local plans only to the extent that the Commissioner determines the local plan to be consistent with State interests.

We object to this subsection because it seems to conflict with A.S. 35.10.020 entitled "Consultation with Municipal Planning and Zoning Commissions". This section requires the State to comply with all local planning and zoning ordinances in the same manner as private land owners unless a State agency can "clearly demonstrate an overriding State interest". When a State agency makes such a showing, a specific waiver must be granted by the Governor.

We suggest that subsection (g) be made consistent with the language in A.S. 35.10.020 by amending the latter to require State land use plans to be consistent with Municipal plans unless a gubernatorial waiver is granted upon a "clear showing of an overriding State interest".

Proposed Section 38.04.065 would involve the State in regional land use planning in areas which now have local planning. The Municipality of Anchorage has actively engaged in a land use planning program and intends to maintain this effort. Until the degree of State involvement in local land use management is clarified, we cannot support this proposed section.

Sincerely,

George M. Sullivan
Mayor

Michael J. Meehan
Director of Planning

LAND POLICY BILL

Suggested Amendments

A. Page 6, line 6, suggested substitution for section .040.

AVAILABILITY OF MENTAL HEALTH LAND, SCHOOL LAND, AND UNIVERSITY LAND. Under the purposes of this chapter, mental health land, school land, and university land may be made available for private use in accordance with statutes governing such lands. In their capacity as trustee for such lands, the Mental Health Board, the Board of Education, and the Board of Regants of the University of Alaska shall, within 120 days from the date of this act, define goals and objectives for the management and disposition of lands under their trusteeship. In accordance with these goals and objectives and in consultation with the municipalities in which such lands are located, the director shall prepare an annual program for sale or lease offerings of selected mental health lands, school lands, and university lands. This program shall accompany the annual land availability programs submitted to the Legislature in accordance with section .020 of this chapter.

B. Page 7, line 11, substitute for last sentence.

The requirements of this section do not apply to land made available through a cabin permit system, material sales, or short-term leases; provided, however, that for short-term leases a municipality may require compliance with local subdivision ordinances.

C. Page 9, line 27, added sentence to paragraph (e).

The classification process must include notice and review requirements of existing statutes.

D. Page 10, line 5, added sentence to paragraph (g).

Where a local zoning ordinance or other land use regulation is in effect, the provisions of AS 35.30.020 and AS 35.30.030 shall apply.

To: Bush members of the
House Resources Committee

From: Kathy Brown, A.A. for
The Bush Caucus

Re: House Bills 904 and 905 which are before the Resources Committee this afternoon

Date: April 19, 1978

House Bill 904 by the Governor relating to an Alaska Land Policy is identical to Senate Bill 562 by the Resources Committee which is currently in Senate Resources and, like HB 904, it has an additional referral to the Finance Committee. I am attaching a brief summary of the bill which I took from the Governor's transmittal letter.

House Bill 905 by the Governor relating to land disposal is identical to Senate Bill 568, also by the Governor. The Senate bill too is in Senate Resources with an additional referral to Finance. I am attaching copies of the Governor's letter of transmittal which gives a "quick and dirty" summary of the bill.

The drafter of the bill is Pete Fraelich of the Dept. of Law. Should anyone have any detailed questions.

was introduced, read the first time and referred to the Committees on Commerce and Finance.

HB 904 BY REQUEST BILL NO. 904 by the Rules Committee by request of the Governor, entitled:

"An Act relating to Alaska land policy; and providing for an effective date."

was introduced, read the first time and referred to the Committees on Resources and Finance.

The Governor's transmittal letter on HB 904 & 905 appears following:

"March 22, 1973

The Honorable Hugh Malone
Speaker of the House
Alaska State Legislature
Juneau, Alaska 99811

Dear Mr. Speaker:

Under the authority of Article III, Section 18 of the Alaska Constitution, and in accordance with AS 24.30.050(b) and the Uniform Rules of the Alaska State Legislature, I am transmitting two bills related to the disposal of land. This legislation, in conjunction with existing law, will constitute a comprehensive long-term state land management policy and will mandate a rational process to make state land available for private ownership and use.

The first bill, called the Alaska Land Credit Act, will establish a new program by which state land would be made available at minimal cost. The second measure, the Alaska Land Policy Act, clarifies and supplements the broad multiple land use mandates set out in Article VIII of the Alaska Constitution.

We who live in this state should be able to secure land for private use. Twenty-two thousand people have underscored that desire for land by signing the Beirne initiative. But that initiative has real problems. It would require that up to thirty million acres be made available on a first-come, first-served basis. Each three-year resident would be entitled to stake 40 acres of public land wherever vacant state land exists. Land would be issued, free, to the first claimant without regard to their needs or public needs. No improvement or residence on the land would be required to gain title.

This is no plan to give people needed sites for cabins or other use. It is, plainly and simply, a vast land give-away which could create an Oklahoma land rush in Alaska.

Although many Alaskans recognize the problems of this approach, they support it because there is no permanent policy established in the law to get even needed public lands into private ownership. An alternative method must be provided which creates a land policy that is reasonable, consistent, useable and stable.

I am introducing two bills into the Legislature today to provide that alternative. The bills accomplish the following:

Land Credit Bill

1. Make a minimum 50,000 acres of land available to the public in the first year, in addition to that already being conveyed. Thereafter the amount made available each year is determined by the Legislature, but more land might be opened each year.

2. Establish a Land Credit of $1,000 for each year of residency. These credits may be used for up to 90% of the purchase or rental price of public land.

3. Land credits may be applied to all means of land disposal: Open to Entry, direct sales, lease sale of agricultural rights, and homesite programs.

HB 905

LETTER OF TRANSMITTAL OF HOUSE BILLS 904 & 905 FROM MARCH 22 7[illegible] HOUSE JOURNAL

HB 903 HOUSE BILL NO. 903 by the Finance Committee, entitled:

"An Act establishing an invention awards program."

was introduced, read the first time and referred to the Committees on Commerce and Finance.

HB 904 HOUSE BILL NO. 904 by the Rules Committee by request of the Governor, entitled:

"An Act relating to Alaska land policy; and providing for an effective date."

was introduced, read the first time and referred to the Committees on Resources and Finance.

The Governor's transmittal letter on HB 904 & 905 appears following:

"March 22, 1973

The Honorable Hugh Malone
Speaker of the House
Alaska State Legislature
Juneau, Alaska 99811

Dear Mr. Speaker:

Under the authority of Article III, Section 18 of the Alaska Constitution, and in accordance with AS 24.30.030(b) and the Uniform Rules of the Alaska State Legislature, I am transmitting two bills related to the disposal of land. This legislation, in conjunction with existing law, will constitute a comprehensive long-term state land management policy and will mandate a rational process to make state land available for private ownership and use.

The first bill, called the Alaska Land Credit Act, will establish a new program by which state land would be made available at a minimal cost. The second measure, the Alaska Land Policy Act, clarifies and supplements the broad multiple land use mandates set out in Article VIII of the Alaska Constitution.

We who live in this state should be able to secure land for private use. Twenty-two thousand people have underscored that desire for land by signing the Beirne initiative. But that initiative has real problems. It would require that up to thirty million acres be made available on a first-come, first-served basis. Each three-year resident would be entitled to stake 40 acres of public land wherever vacant state land exists. Land would be issued, free, to the first claimant without regard to their needs or public needs. No improvement or residence on the land would be required to gain title.

This is no plan to give people needed sites for cabins or other use. It is, plainly and simply, a vast land give-away which could create an Oklahoma land rush in Alaska.

Although many Alaskans recognize the problems of this approach, they support it because there is no permanent policy established in the law to get even needed public lands into private ownership. An alternative method must be provided which creates a land policy that is reasonable, consistent, useable and stable.

I am introducing two bills into the Legislature today to provide that alternative. The bills accomplish the following:

Land Credit Bill

1. Make a minimum 50,000 acres of land available to the public in the first year, in addition to that already being conveyed. Thereafter the amount made available each year is determined by the Legislature, but more land might be opened each year.

2. Establish a Land Credit of $1,000 for each year of residency. These credits may be used for up to 90% of the purchase or rental price of public land.

3. Land credits may be applied to all means of land disposal: Open to Entry, direct sales, lease sale of agricultural rights, and homesite programs.

HB 905

COPIES OF LETTER OF TRANSMITTAL FOR HOUSE BILLS 904 & 905 FROM March 22 76 HOUSE JOURNAL

HB 904

Land Policy Bill

1. Establish a land and resource inventory program for analyzing the value and use potential of state land.

2. Establish a clear legislative statement of land disposal policy.

3. Establish a means for balancing private and public land uses and allocating lands for each purpose.

4. Establish a logical system to ensure useable and safe land is conveyed to the public.

These bills, I believe, meet the legitimate needs of the people of Alaska for land, but do so in a responsible manner. The bills accept the basic concept of the land disposal from the Beirne initiative but take it several logical steps further. I feel these bills are wider in application and more far-sighted in that they

provide for a continuation of desirable public uses on public lands while making land available to the citizens of Alaska for their needs.

Sincerely,

[signature]

Jay S. Hammond
Governor"

HB 905 HOUSE BILL NO. 905 by the Rules Committee by request of the Governor, entitled:

"An Act relating to disposal of state land; and providing for an effective date."

was introduced, read the first time and referred to the Committees on Resources and Finance.

HB 906 HOUSE BILL NO. 906 by the Finance Committee, entitled:

"An Act making a special appropriation to the power project revolving fund; and providing for an effective date."

was introduced, read the first time and referred to the Finance Committee.

(IDENTICAL TO HB 904)

Senate Bill 562

"An Act relating to Alaska Land Policy

This bill, based on the recommendations of the Federal-State Land Use Policy Commission, seeks to provide a comprehensive land use policy for state land which will implement broad constitutional goals for both public and private purposes. These policies are to be sufficiently detailed to guide administration decision making. The legislature must approve annually, the Administration's state land disposal program.

The bill contains three major elements:

1) Policy for Use and Classification of State land and Surface. Article VIII of the Alaska Constitution mandates that the state provide for a balanced combination of public and private land use and to allocate suitable land for such use.

   Local involvement in land classification prior to disposal is provided for in order to balance public use against private which may be especially important in lands adjacent to communities.

2) Land Availability for Private Use. This section mandates that state land be made available to individuals on an annual basis in locations and parcel sizes that best meet differing needs in different parts of the state. A minimum of 50,000 acres shall be made available during the first year after enactment, no more than 10% of which shall be for leases. Thereafter, the Administration shall present to the legislature annually for its approval, three options for land disposal programs. These options will be a) an increased level program, b) a current level program, and c) a reduced level program. At least one option must include at least 50,000 acres.

3) Inventory, Planning and Classification. The bill requires the timely completion of an inventory of the resource values of all state lands. Through use of the inventory, land needs may be met with the best possible lands designated for the purpose intended. The designation of land use shall be accomplished in cooperation with local governments and the public.

In addition to existing state land management systems (State parks, trail systems, wild and scenic river systems, etc) a new classification called the State Public Reserve System is established for lands to be designated for multiple uses. The legislature would retain its existing authority to approve any designation of more than 640 acres which would close land to multiple use.

Further provisions establish guidelines for surven and subdivision, public access and easements.

III. ANALYSIS (See Fiscal Note Preparation Instructions, Section III)

Detailed analysis and breakdown not yet completed. Will be completed and submitted on April 3, 1978. (See attached sheet for general breakdown)

N.B.

This fiscal note must be read in conjunction with the fiscal note for HB 905 (Land Disposal Act) since $4,579,631 in costs are identical in both bills (i.e. each bill mandates disposal of the same 50,000 acres). The additional cost of this bill, if HB 905 passes, is only $428,233.

Present municipal subdivision laws generally require actual construction of road access before sale of parcels under 40 acres in size. Unless the State is released from such requirements, the additional fiscal impact could be quite severe.

Preliminary

Estimated State Implementation Costs

Alaska Land Policy Act -- HB904, SB562

This preliminary statement analyzes the costs of implementing (1) the 50,000 acre minimum per year disposal directive and (2) the administration of the land inventory, assessment, coordination, etc. efforts. This is basically a first year cost analysis because Section 38.04.020 of the bill provides for an annual program as part of the administration's budget (at the 50,000 acre minimum level an estimated 5 percent inflationary factor could be added for each succeeding year).

1. 50,000 acre disposal TOTAL COST = $4.579,631/TOTAL PERSONNEL = 59 full time

The following acreages from the state's three principal disposal programs are assumed to comprise the first year's offerings (costs do not include provision of roads or services at sites):

Program	No. Sites	Acres/Site	Total Acres
Homesite	1,000	5	5,000
Open-to-entry	1,000	5	5,000
Agriculture and	500	20	10,000
general sales	250	40	10,000
	50	160	8,000
	25	320	8,000
	7	640	4,480
TOTALS	2,830 sites		50,480 acres

The following activities are assumed for any disposal program: (1) site identification and evaluation, (2) public information and community coordination, (3) subdivision and layout, (4) survey and records, (5) appraisal, (6) disposal and accounting, (7) administration, and (8) follow-up monitoring.

A. Estimated costs for (1) site identification and evaluation, (2) public information and community coordination, and (3) subdivision layout: $361,618/ 9 full time.

March 28, 1978

Preliminary

Estimated State Implementation Costs

Alaska Land Credit Act -- HB905 ← SB565

This preliminary statement analyzes the costs of implementing (1) the 50,000 acre minimum per year disposal directive and (2) the administration of the land credit program. This is basically a first year cost analysis because Section 38.05.041 of the bill provides for an annual program as part of the administration's budget (at the 50,000 acre minimum level an estimated 5 percent inflationary factor could be added for each succeeding year). Section 38.05.042(f) provides that the director determine reimbursable costs (i.e. roads, survey, utilities, etc.), which are not taken into account here, and which revenues from would most likely not be "earmarked" for program expenses. This analysis also does not attempt to forecast any income from the 10 percent total cash and 5 percent down payment provisions of Section 38.05.042(f).

1. 50,000 acre disposal TOTAL COST = $4,579,631/TOTAL PERSONNEL = 59 full time

The following acreages from the state's three principal disposal programs are assumed to comprise the first year's offerings (costs do not include provision of roads or services at sites):

Program	No. Sites	Acres/Site	Total Acres
Homesite	1,000	5	5,000
Open-to-entry	1,000	5	5,000
Agriculture and	500	20	10,000
general sales	250	40	10,000
	50	160	8,000
	25	320	8,000
	7	640	4,480
TOTALS	2,830 sites		50,480 acres

The following activities are assumed for any disposal program: (1) site identification and evaluation, (2) public information and community coordination, (3) subdivision and layout, (4) survey and records, (5) appraisal, (6) disposal and accounting, (7) administration, and (8) follow-up monitoring.

A. Estimated costs for (1) site identification and evaluation, (2) public information and community coordination, and (3) subdivision layout: $361,618/ 9 full time.

STATE LAND REPORT

29:

733 W. FOURTH AVE.
ANCHORAGE, ALASKA

FEDERAL-STATE LAND USE PLANNING COMMISSION FOR ALASKA

STATE LAND POLICY RECOMMENDATIONS

AND

BACKGROUND PAPERS

DECEMBER, 1977

Federal-State
Land Use Planning Commission
For Alaska

December, 1977

On May 17, 1977, Senator Kay Poland, Chairman of the Senate Resources Committee, asked the Commission to analyze the location, availability, and demand for private land in Alaska as it would be after the implementation of the Alaska Native Claims Settlement Act. The specific types of demand for private property and their relation to appropriate land disposal procedures was considered to be of particular interest to the Resources Committees of the House and Senate. The purpose of the inquiry was to solicit information that could aid these Committees in their formulation of State land disposal policy.

Part I of this report presents the findings and recommendations of the Federal-State Land Use Planning Commission regarding retention and disposal policy and procedure for State public lands. The findings were based on staff research; work with the Alaska Department of Natural Resources Planning and Research Section and Division of Lands and Waters; contact with municipalities and Native corporations; and a public workshop featuring people with land use and development experience and expertise. Part II of this report contains the abbreviated proceedings of this workshop and a representative sample of the information analyzed in the process of making these recommendations.

We hope that this background document will benefit the continuing legislative dialogue concerning the disposition and management of State lands.

In addition to these efforts, the Federal-State Land Use Planning Commission continues to explore State policy and practice concerning park and recreation areas. As requested by Senator Poland, the Commission will prepare specific recommendations regarding criteria and policy for establishing State parks later this year.

Sincerely yours,

Esther C. Wunnicke
Federal Co-Chairman

Sincerely yours,

Walter B. Parker
State Co-Chairman

STATUTORY GUIDELINES FOR RETENTION AND DISPOSAL OF STATE LANDS

Recommended by the
Joint Federal-State Land Use Planning Commission
December, 1977

1. Public interest in State lands. State owned public lands belong to all citizens of the State. Thus, any action affecting the disposition of State owned lands must be consistent with the general public interest and must recognize the property rights to these lands which are owned by all citizens.

2. Interests of future generations. In planning the allocation and disposition of State lands, the requirements of future generations must be considered. To this end, a supply of State lands of the various available types and locations shall be reserved to provide an opportunity for future decisions.

3. Need for a balanced combination of public and private land use. Some types of land use, such as hunting, fishing, skiing, snowmobiling, enjoyment of natural lands and wilderness, trapping, and many forms of resource development, can be made available to more people and conducted more successfully if the land is publically owned rather than divided among private owners. For other forms of land use, particularly land uses associated with community development and settlement, private property rights are necessary either through ownership or less than fee simple conveyance. Thus, making State lands available for maximum use and development, in accordance with Alaska's constitution, will require a balanced combination of lands under both public and private land use rights.

4. Inventory, planning, and classification of State lands and resources. The public interest in State lands will be best realized if State owned lands and resources are periodically and systematically inventoried and their future uses projected through a land use planning process which includes consideration of characteristics of the land and natural enviornment, as well as social and economic factors, and provides for meaningful participation by local governments, adjacent land owners and the general public. Classification of State lands shall be based on such a comprehensive planning process.

5. Inventory of private and municipal lands and local wishes. To gain adequate perspective on needs for State land disposal or retention, the director shall also conduct a periodic and systematic inventory of the supply and quality of private and municipal lands available in all regions where the State owns land. As part of this inventory, he shall ascertain local wishes concerning the retention and disposal of State lands. Planning and classification of State lands for

disposal purposes shall reflect the adequacy or inadequacy of the supply of suitable land from private and municipal sources as well as local wishes about State land management.

6. Retention of State lands for public use near communities. In classifying State lands for settlement purposes, the director shall seek to retain nearby accessible lands in State, municipal, or other public ownership so that natural areas are easily reached from all communities and settled areas. The amount of such lands shall be sufficient to existing and projected needs for accessible public recreation lands. Special care shall be taken to preserve public access to public waters and to retain State ownership of lands which combine high recreational value with accessibility to settled areas.

7. Primary public interest in retaining State lands in public ownership. The primary public interests in retaining State lands in public ownership are:
   a. to make them available for hunting, fishing, natural area recreation, governmental installations, and other types of land use and resource development which generally require public rather than private land ownership;
   b. to protect areas of critical wildlife habitat and of special scenic, recreational, or other environmental concern;
   c. to restrict development in hazardous locations; and
   d. to guide the location of settlement and development to minimize public costs and maximize social and economic benifits.

8. Primary public interest in conveying rights to State lands to private parties. The primary public interest in conveying rights to State lands to private parties is to make them available to individuals and corporations for direct use and construction in locations suitable for the land use intended. Conveying State lands in a manner which primarily accommodates parties whose purpose is to hold and resell vacant lands for financial gain is contrary to the public interest, except in areas where there is a real scarcity of vacant land on the private market.

9. Avoiding new settlement in areas where a viable economic base is improbable. Settlement in rural areas where there is little or no source of employment and income can burden the general public with extreme costs for schools, roads, police protection, and other public services. If a dispersed population pattern is to be encouraged, it should be based on development of a local economy creating employment or jobs.

10. Designing lot sizes and disposal methods to further needs of different land users. In planning land disposal actions, the director shall seek to accommodate parties with a current need and use for the

land. Different users of State lands, for example, people seeking a weekend cabin site, people looking for a wilderness homesite, agricultural and industrial developers, have very different requirements in terms of location, tract size, and methods of tenure. To accommodate these different needs, the director shall assess the special requirments of prospective users and shall design a comprehensive set of methods of conveying rights to State lands, tailored to fit various needs. Lots and tracts in disposal areas shall be sized to fit the requirements of individual users and to reflect the physical limitations of the land. Within these constraints, disposal areas shall be divided to maximize the number of individual recipients.

11. Provisions of access. Adequate access is essential to both public and private use of State lands. State lands which are made available for settlement purposes shall have access from water or, where appropriate, the State shall arrange for the development of surface access. The direct costs of access development shall be born by the recipient of the land. In planning conveyance of State lands to private parties, necessary easements and rights-of-way for public travel shall be reserved to provide access to public waters and to public and private lands beyond the disposal area.

12. Disposal to be at market value. Except where justified by a clear public interest, State land disposals shall make land available at market value. In cases where the State conveys limited rights to lands, the price of the land shall be adjusted to reflect reduced market value. In any case, the costs of survey and other direct costs of disposal shall be born by the recipient of the land.

13. Avoiding preference rights. Granting preferance rights to any special group or class of citizens shall be avoided.

14. Regulations providing for municipal and State agency participation. Regulations shall be adopted to establish the participation of affected municipalities and State agencies in making determinations regarding the suitability of various State lands for retention in public ownership or conveyance to private users.

15. Regulations establishing a system for registering private interests. Regulations shall also establish a method whereby private citizens can register their interest in retention or conveyance of a given area of State land.

16. Minimizing administrative costs and establishing public trust. As far as possible, methods of conveying State land rights to private parties shall be designed to minimize future administrative requirements and to establish public trust in the responsiveness, fairness, and consistency of State land management.

LEASING OF STATE LANDS

Findings and Recommendations of the
Joint Federal-State Land Use Planning Commission
December, 1977

Alaska's constitution calls for the maximum use and development of its lands consistent with the public interest. As a land management tool, leasing is designed to accommodate both objectives, to enable development and land use while protecting the public interest. The panelists at the recent State Land Disposal Policy workshop agreed that State land managers could use a leasing program to further the interests of both the land owners and the users. The panelists also recognized that along with providing benefits for both private and public interests, there is a growing public recognition that leasing is a land management technique that can be useful in Alaska. Financial institutions have become more accustomed to financing development on leasehod interests as well. But, before this tool can be fully utilized by State government, certain requirements must be met.

Under past administrations, leasing has not always been used appropriately and effectively and has failed to realize its potential. In addition, the current statute has brought leasing of State lands to a standstill. The deliberations of the panelists, coupled with the investigation of leasing policy in other States and an analysis of lease administration in Alaska, prompts the following findings and recommendations:

Findings:

1. Leasing is an effective technique under certain conditions and in particular situations:
   a. When special land use controls are required and there is a high public interest in seeing certain classes of land used for particular purposes;
   b. When the intended use is a temporary one, as in non-renewable resource extraction;
   c. In commercial-industrial situations when a leasehold can provide cash flow and tax advantages to the lessee;
   d. When a unique location with special public values is involved, as in a deep water port;
   e. When demand for private use is high, but projections suggest that, in the future, the land may be more valuable for public use; and
   f. When property values are high and market demand intense, the State can earn significant revenue through leasing, but proper timing of leasing activity is crucial to success.

2. A major problem with the State leasing program in the past has been lack of sophisticated administration. In order to be effective as lessors, State land managers must:

   a. Recognize that prompt, accurate appraisal and rental adjustment insures that State lessees pay rates similar to adjacent private property owners. This provides revenue to the State, encourages effective land use, prevents the State from competing unfairly with the private sector, and builds trust and predictability in State land management practices;
   b. Employ knowledgeable personnel who are familiar with leasing policy and experienced with and sensitive to the requirements of private financial institutions;
   c. Employ leasing techniques in appropriate situations such as locations where demand to use the land is high;
   d. Insure that tract sizes are consistent with the requirements of the user; and
   e. Establish rental adjustment ceilings that allow lessees to foresee rental rates for at least 10 years in advance.

3. The current State leasing statute is unworkable for the following reasons:

   a. The current statute does not permit the State to keep its annual rental at market rates;
   b. The current statute is being tested in court by the trust board because trust land transactions must be at fair market value. This is not possible under current law.
   c. The current statute encourages speculation in State leaseholds because the 25 year reappraisal period and 50% limit on rental adjustment after 25 years ensure that State lease rates will be considerably below market value for comparable properties. At normal inflation rates the current reappraisal and rental adjustment process will not even keep pace with the declining value of the dollar.
   d. The State cannot adjust leasehold rentals to recover investments it makes in infrastructure development such as road and sewer construction.
   e. By granting existing leaseholders a windfall, the new lease law conveys a special privilege to a few citizens at a financial cost to the general public.
   f. The multiple appraisals called for in the statute are too expensive to be practicable except in limited instances when tract values are extremely high.

g. The present statute does not clarify the award of damages in those cases where leased State lands are condemned for public purposes.
h. At the termination of a lease under current statute, the lessee will have gained a substantial leasehold interest so valuable that conversion to a proper rate schedule would be tantamount to confiscation. Such a conversion would be politically and economically difficult to implement. In effect, this would diminish, if not abolish, State control of the land.

Recommendations:

1. The Legislature should amend the leasing statute to see that:

   a. Leaseholds are reappraised and rentals adjusted on a 5 year basis;
   b. Rental adjustments are limited to an increase of 100% over a 5 year period;
   c. Appraisal requirements reflect a reasonable relationship between the cost of appraisal services and the value of the parcel involved; and
   d. Aggrieved lessees have access to an administrative appeal mechanism.
   e. Condemnation awards to lessees of State land should exclude compensation for leasehold interest based on submarket rental rates.
   f. Trust land development and management costs should be charged against trust land revenues.

2. Care should be taken by State administrative personnel to utilize leasing as a management tool only where it is well suited to the purposes intended.

3. The budgets approved for land administration must provide for both the quality and quantity of staffing necessary to guarantee prompt and competent appraisal and administration of State leaseholds.

4. State leasing policy must be sufficiently consistent to provide a reliable basis for lending.

STATE TRUST LANDS

Findings and Recommendations of the
Joint Federal-State Land Use Planning Commission
December, 1977

Findings:

1. Before Statehood, the Federal government granted certain lands to the Territory of Alaska for the benefit of the University of Alaska (100,000 acres), the public school system (109,000 acres), and the mental health program (1,000,000 acres). Original Federal legislation making these reservations included precise terms governing the management of land and the revenues received therefrom.

2. The Statehood Act conveyed these preestablished trust responsibilites to the State of Alaska. Because of repealer clauses in the sections of the Statehood Act pertaining to University and school lands, the State is not bound by the precise terms of previous Federal legislation relating to these lands, however, a trust responsibility remains.

3. The statutes require separate funds for revenues gained from school and University lands, but there is no special fund for the mental health program. Instead, these revenues have been placed in the general fund.

4. By statute, the director must manage mental health lands for the support of the mental health program. Revenues derived from management of these lands must be used first for support of this program, and any excess deposited in the general fund.

5. Since the school, University, and mental health lands are held in trust for the financial support of these programs, it is normally incumbent upon the State to handle transactions of trust lands on the basis of fair market value. Revenues derived from school and University lands must be invested and the interest allocated to the support of the respective programs.

6. School lands were granted under the historic "in-place" system of conveying sections 16 and 36 in each township. The State only received those school lands which had been surveyed as of the date of statehood. However, since surveying was concentrated near communities, several of the State's school land sections are stategically located in urban growth areas.

7. Most of the university lands and all of the mental health lands have been selected "at large" from vacant, unreserved

public lands. University lands could only be selected from non-mineral, surveyed lands, requirements which placed them directly in the already settled areas. Since selections were for the purpose of maximizing real estate value, and were accomplished prior to the State's general grant selections, lands in the University and mental health trusts comprise prime real estate around communities and in valuable waterfront locations.

8. Because of the strategic location of trust lands in relation to community development and settlement, management decisions affecting trust lands have had, and will have, a major impact on community growth patterns.

9. The effect of vacant trust lands on community growth patterns has been random and varied. Some communities have grown around trust lands, leaving trust lands as windows of open space in heavily settled areas. In Anchorage, State trust lands are zoned "Public Lands and Institutions", a designation which prohibits private development. In Southeastern communities, where trust lands are numerous, the effect has been to either compress and consolidate community growth or to force a "leapfrog" pattern that is costly in terms of public utilities and services.

10. There are probable conflicts between the State's general welfare objective of achieving a desirable land use pattern and the State's obligation to the trust to obtain fair market value from trust lands. In some cases, the trust lands are well suited as parks, but this use may conflict with the State's long-term responsibility as trustee to manage the lands for revenue.

11. In acting as the land management agent for all three trusts, the Division of Lands may have a built-in conflict of interest where it manages lands for more than one trust in the same location.

12. The trust boards have never developed land management guidelines, and, in turn, the State has failed to actively manage trust lands to obtain market value for the trusts. The State has not charged the trust boards for management services, but few services have been rendered.

13. Alaska municipalities would like to select trust lands because of their desireable location and value for community development or public use purposes.

14. Under current State statutes, trust lands are subject to legislation granting preference rights to certain groups that make them available for less than market value.

15. Under current State statutes some trust lands are available for mineral staking and, therefore, for acquisition of private property rights at less than market value.

16. Under the new lease law, passed in 1977, the State undermined the administration's ability to manage leaseholds on trust lands at market value.

17. The permanent fund requirements, which make no distinction between mineral revenues from trust lands and general grant lands, are inconsistent with the State's trust responsibilities.

Recommendations:

1. The trust boards should clearly define their objectives regarding the lands which the State holds in trust for the public schools, the University, and the mental health program. In the absence of a specific statute defining trust responsiblities in Alaska, these objectives must conform to general trust standards. The Division of Lands shall manage trust lands as the agent of the trusts, in accordance with these objectives.

2. If the primary objective of the trust boards is to use lands for revenue, then this objective may conflict with the State and municipal objective of achieving a sound land use pattern. This conflict could be resolved, without compromise by either party, through an exchange of existing trust lands for an equally valuable interest in State surface or subsurface elsewhere. Such exchanges must comply with the "prudent person" standard of trust investment.

3. The definition of State land, as used in statutes pertaining to the permanent fund, preference rights, lease holders rights, and other topics, should distinguish between State general grant lands and trust lands. State statutes which abridge the trust responsibilities should be amended.

4. A separate statutory fund should be created for the proceeds from the mental health lands.

BUDGETING FOR STATE LAND MANAGEMENT

Findings and Recommendations of the
Joint Federal-State Land Use Planning Commission
December, 1977

Findings:

1. Achieving effective, responsive administration of programs conveying State land rights to private parties will require that the administrative capacity of the Division of Lands be expanded. Additional professional expertise in leasing, appraisal, permitting, easements, sales, and other aspects of land management must be acquired.

2. Topographic mapping, site planning, land survey, and access development are essential elements of any land disposal program. To convey State land rights to private owners in a manner which accommodates the variety of their different needs and makes good use of available land, the Division of Lands must have the staff and budget to satisfy these requirements.

3. Resource inventory, land use planning, consultation with local people, and classification of State lands must proceed apace with any disposal of State land rights to private parties. Current funding for these efforts is inadequate in relation to the amount and complexity of State land ownership.

Recommendation:

That the Legislature work closely with the Department of Natural Resources to develop and fund a budget that is sufficient to support the State's responsibilities for planning and managing State lands for both retention and disposal purposes.

WORKSHOP

Introduction

On Tuesday, November 29, 1977, the State Lands Subcommittee of the Federal-State Land Use Planning Commission (FSLUPC) held a workshop to discuss State land disposal policy. Legislators were invited to attend the session, as well as a variety of opinion leaders and experts in the fields of land management and real estate economics. People familiar with the costs and impacts of land development were represented also.

Formal Workshop Participants:

Virgina dal Piaz, Land Planner and Environmentalist
Bob Arwezon, Anchorage Real Estate Developer
John Norman, Managing Partner, Cole, Rhodes, Hartig, Norman, and Mahoney
Wes Howe, Matanuska-Susitna Borough Manager
Ted Smith, Director, Division of Lands and Water
Herb Lang, President, Anchorage Sand and Gravel
Don Karabelnikoff, Real Estate Consultant, City and Borough Development
Earl Miller, Vice President, Alaska Mutual Savings
David McCabe, General Partner. Alaska Mortgage Group
Andy Hoge, Attorney - Hoge, Lekisch, Cardwell, and Lawrence
James Hurley, FSLUPC, Commissioner
Hugh Gellert, President, Bear-Fritz, Inc.
Phil Holdsworth, FSLUPC, Commissioner
Steve Reeve, Chief - Classifications, Alaska Division of Lands
Dale Tubbs, Land Management Consultant, Moening-Grey & Associates
Norman Gorsuch, FSLUPC, Commissioner
Esther C. Wunnicke, FSLUPC, Federal Co-Chairman
Walter B. Parker, FSLUPC, State Co-Chairman
Janet McCabe, FSLUPC, Land Management Planner

AGENDA

8:30 Introduction

Briefing on Supply, Location and Accessibility of State Land

9:00 Statutory Guidelines for State Land Disposal

1. Do the existing statutes provide adequate guidance to the administration in terms of purpose, amount, location, and timing of State land disposal?
2. In deciding about disposal actions and programs, what should be the role of the legislature and what should be the role of the administration?
3. If you were to write a guidelines for State land disposal--purposes, amounts, and timing--what would you include?

10:30 Disposal Methods

1. Considering the various forms of demand for State lands, what is the public interest in disposing of public lands for various purposes? Which types of demand for State land should be accommodated?
2. How would you identify the different types of demand for which State land should be made available and which methods of disposal are best suited to each type? What is your advise on tract size and pricing as well as the method of conveying rights to land?

1:30 Leasing

1. In what locations and situations is leasing an appropriate method of land disposal?
2. What were the problems with the State's prior leasing program and what were the reasons for these problems?
3. In the past, leasing has been a barrier to financing. Is this situation changing?
4. What will be the affects of the new leasing law? Would you recommend that it be amended? If so, how?

2:30 Trust Lands

1. How have the trust lands influenced land planning and management?
2. What advantages and disadvantages have prior management of trust lands had for the State as a whole and for the trusts?
3. Are there changes in legislation, regulations, or management of trust lands that you would advise?

3:30 Budgetary Implications

1. What is a typical pattern of public cost and revenue for new settlement on State lands in a remote area?
2. What budetary adjustments will be necessary if the State embarks on a program of disposing of individually sized lots provided with access?
3. What are the administrative and budgetary implications of disposing of lands in a manner which retains some rights in State ownership?

Workshop Proceedings On
State Land Disposal Policy

Statutory Guidelines for State Land Disposal

The workshop opened with a discussion of statutory guidelines for State land utilization. Virginia dal Piaz, Alaska Center for the Environment, joined Bob Arwezon, Anchorage real estate developer, and John Norman, past State assistant attorney general and local attorney, in this discussion.

Following the introductory remarks, Virgina dal Piaz, representing an environmental perspective, preceded the discussion of statutory guidelines for State land disposal by noting Alaska's role as the last frontier. For years we have been the most prodigal of people with land and we have wasted it, along with other finite resources, with impunity. Peoples' right to land is one of the most basic principles of our national heritage. There was always so much of it and no matter how we fouled it, there was always more over the next hill--or so it seemed.

We are now at the "last frontier" as development in the United States has spread over the continent from East to West and now North. Alaska is probably one of the last places on Earth where we know enough about mistakes made elsewhere that land use and development can take place compatably with the environment and character of the Northland. America needs a new land ethic--and attitude that considers the needs and requirements of the land first and which then attempts to foster human relationships with the land to the greatest extent possible. The farther removed people are from the land and responsibility for it, the more careless and destructive they are of it.

She felt that the existing statutory guidelines were inadequate because we do not fully know the amount and location of all State lands. The role of the legislature should consist of gathering input from the administration, public, and possibly consultants; and then setting a comprehensive policy with broadly stated goals for State land disposal. The administration should conduct research and planning, as well as manage and enforce the policy set forth by the legislature.

Dal Piaz recommended the following guidelines: The State should rely on leasing for specified uses and should avoid land sales. Before disposing of additional land, the State should complete an inventory of lands that consider location and physical suitability for development. It appears that there is very little State land suitable for development, and the bulk of State land should be left for future generations. The State should move slowly and only lease a few tracts per year, with a future

maximum of 10% of the State lands under lease. Land disposal should take place after careful thought and consideration and only after a comprehensive policy has been set. Agencies involved in land disposal should be adequately staffed and funded in order to carry out the disposal programs expediciously. Actual land disposal should occur on a regular basis, for example, each spring and fall, depending on the rate at which land is disposed.

Dal Piaz aknowledged that there is a strong public interest and a great sense of frustration by people who for one reason or another do not own land but would like to. Witness the homestead initiative which demands the State "give away" its land to residents "free". This type of legislation is to be avoided at all costs, and is not in the best interests of intelligent, reasoned and planned State land disposal. It would be in the State's best interest to have firm land disposal guidelines in the statutes to avoid this type of knee jerk reaction legislation. She noted the possibility of setting up a land use board to oversee the entire disposal process. Such a board could be made up of representatives from the legislature, administration, and the public.

Bob Arwezon, a realtor, differed with Virgina dal Piaz on the merits of private land ownership, feeling that it is desireable. He maintained that, "In looking at the problem, I probably have got to set out some basic guidelines that I think I, and other people, the citizens of Alaska, consider or look at. One is that the ownership, private ownership of land isn't a bad thing. Fee simple ownership is what this country's built on, and it is desirable. I know, in Vancouver, B.C., and I know in the United Nations, that this is a concept that is being attacked, but I don't think the citizens of Anchorage or citizens of Alaska feel that the right to own private property is wrong."

"The other concept that I operate from is that land is perhaps one of the only things that man does not and cannot destroy. Land is always there. We can use it, we can grow things on it, we can mine, we can alter it, we can build on it, but that piece of land is always there. It is not something that is disposable. Land always remains. I would prefer to think of it as a State land utilization policy or program, and not disposal."

Arwezon also felt that the existing land disposal statutes were inadequate. He blamed this, in part, on the Legislature which has failed to set out an explicit State land policy. This leaves too much discretion with the administrator and results in programs that lose touch with what people want. Arwezon thought that, "the government bureaucrats may not agree with the way the private sector operates, and the way the people feel, but if they don't operate and make available, in a good orderly process, the lands, then we are going to see legislation which is not going to be based on good planning concepts." As he saw it, "one of the reasons that you have -- I shouldn't say 'knee-jerk' but it might be suitable -- legislation or referendums or initiatives passed that perhaps are not

well thought out, is that people feel that State land policy is not responsive to their needs." In addition, Arwezon felt that the formulation of realistic legislative policy required private sector involvement.

According to Arwezon, utilization of land is the key to a good land disposal policy. Speculation is not necessarily bad and happens when the State disposes of land too quickly. He said that the timing of land disposal is important in order to best serve the needs of the people as well as providing appropriate financial returns to the State. Planning and land use controls should be the responsibility of local governments. In the unorganized borough, the legislature should take an active role in planning.

John Norman, an Anchorage attorney, then spoke about land as a finite resource which requires a shift in public land policy toward a realization that development is not the only goal for land use. At the same time, the human demand for fee simple land ownership must be recognized to avoid a reaction resulting in an unmanagable land situation.

Regarding current statutory guidelines, the State constitution expounds maximum utilization and settlement on a sustained yield basis, but guidelines for interpreting what this really means are inadequate. According to Norman, "This gets into very basic questions, questions of philosophy, questions of how people feel. But I think that an administrator is owed some direction here, because as evidenced right now by the actions of various administrations, there really aren't those guidelines, and the administrations sort of react the way they think they ought to." Statues do exist, but with the exception of preference rights, there is still a basic lack of policy. Policy should be broad enough to allow administrative management flexibility without sacrificing a clear policy direction. Classification by itself is not an adequate land use management tool because it is too ambiguous. "But the point I'm making is," said Norman, "if I was a new guy on the job at ADL, looking at what I was supposed to do, I'd find some specific tasks that I had laid out for me, but my end goal wouldn't be that clear in my mind, still. I would still wonder, am I to manage these things and husband them and put as many restrictions as possible on them, or is my job to get them out and let the private sector take over. And that's an area that I think needs to be addressed, it can be debated one way or the other, but I think it does need to be addressed."

Norman felt that the legislature should limit itself to gathering input and advice, and setting policy for administrative implementation. He recommended the following disposal guidelines:

1. complete a comprehensive State land inventory including navigable water bottoms;
2. manage and dispose of lands with a minimum of restrictions because the State should not be in a landlord role;

3. make lands available for maximum public use as well as maximum private ownership; and
4. strive for long range consistency of State land management and disposal policy to increase public confidence.

Ted Smith generally agreed with the points made by Norman and added that the Constitution does not define "public interest" as it relates to land disposal. He doesn't think that the Administration has too much power, but rather that there has been inadequate direction from the Legislature. The Legislature is not qualified to do planning, and they should leave that up to the administration. Smith also added that given the present leasing law, future State land leasing was not very likely.

Wes Howe, Matanuska-Susitna Borough Manager, suggested that land disposal be carried out on a per capita basis. Once a policy is set, then available land could be increased according to corresponding population increases. Currently in the Mat-Su Borough there are approximately 30,000 parcels of land in private ownership and only 5,000 households. He made the point that the number of households in the borough theoretically could increase several-fold without further subdivision.

Norman then pointed out that Federal land disposal programs were wasteful and no longer met legitimate public needs. Homesteading and the 1872 Mining Law, which encourage random rural settlement, are no longer appropriate. Land disposal programs should not be a tool of social policy and should be carried out at fair market value. As he put it, "if the land is put out to private ownership, which I think it ought to be, it ought to be done in a sensible way, making sure that there is access and so forth, and with a fair return to the State, fair market value."

Herb Lang felt that the State has been holding back land supply which has created the current speculative climate. The State should also keep a careful eye on the market to avoid dumping too much land for too low a price. Timing of land disposal is critical if it is to be done properly.

Bob Arwezon pointed out that, "... being in the real estate business, I know everybody wants two and a half to five acres, with a stream, and a moose that walks through the back yard during hunting season, and with a view of the mountains or the inlet. But they also -- they also want it with a sidewalk and streetlights, sewer and water, curbs, gutters, paving." Dale Tubbs and Smith joined Arwezon to voice the "no such thing as free land" point of view. Land disposal is expensive because it requires surveying, planning, access, and other administrative costs. The true costs of land disposal should be born by the private land owner. Smith estimated that current costs to the State for the disposal of 5-acre homesite parcels will amount to approximately $1,000 to $1,200 each, not counting roads.

Phil Holdsworth suggested that land planning in the unorganized borough be carried out by the legislature with the advise of the Department of Natural Resources. He also felt that the State should sell land with no strings attached.

David McCabe, an appraiser, advised that the State should avoid wholesale disposal by providing lands in small, discreet areas where the needs are particularly striking. Relating to Howe's earlier comments about the per capita land situation, McCabe noted that a significant portion of private land parcels in the State are patented mining claims, cannery sites, or eroding coastal areas where public development is unlikely to take place. So per capita measurements can be misleading.

Disposal Methods and Techniques

Herb Lang, from Anchorage Sand and Gravel, began his discussion of land disposal methods by stating that the demand for fee simple land was strong. If this demand is not provided for, there can be serious political backlash. Lang stated, "So whatever idea there may develop on the disposal of land, it has to take into consideration what the people really want. We cannot always play "good for you" type of commander. The troops don't allow it. We have this homestead referendum, which anybody working the land would find really not a very good idea, very inefficient, and a very expensive disposal of resources. But I think it comes about because of the State land policies employed in the last two years." The current lease law came about in this fashion too, because lessees in Alaska were frustrated. People who want to build homes desire and need fee simple ownership in order to get financing. Leasing for residential use is not always appropriate. Business property leases are better.

Leasing programs, especially difficult ones, will not survive and the public will demand a reversal of leasing policy if it is not responsive. Unlike the present leasing law, leasing should be carried out carefully and in a sophisticated manner or it should not be attempted. The State should acknowledge that leasing agricultural rights amounts to a social policy. Farmers are generally more interested in fee simple ownership. So in order to make an agricultural rights leasing program work, the State is going to have to give up a certain amount of income by offering these lands at less than their usual value. Lang also noted that any State land disposal should be accompanied by road development.

Ted Smith, Director of the Division of Land and Water, began his presentation by stating that mechanisms already exist for most land disposal needs. Having just heard from 600 people at a series of eight hearings on land disposal regulations, he could see that the public was eagerly awaiting the availablity of State land. From these hearings, he perceives five types of demand for land.

1. Commercial/industrial: which could be provided by trust land leases.
2. Residential: which could be provided by public auction or by the homesite program (although there is a general shortage of land suitable for this purpose). Leasing is inappropriate here.
3. Agricultural: which could best be provided by fee simple ownership and zoning, but this is not currently politically feasible. Leasing of agricultural rights will probably be the most common method of supply.
4. Recreational second homes: This demand is somewhat nebulous but strong. Could be met by the open-to-entry and homesite programs. There are State lands that are appropriate for this use. Leasing is not appropriate.
5. "Remote" or "Lifesyle" residences: the present land disposal techniques do not meet this demand, with the exception of a few open-to-entry sites. Generally, however, open-to-entry sites are too clustered. This demand might be met by some sort of use permit system.

Smith felt that, "-- one of the goals that I think we need to keep in mind in building these disposal programs, is that we need to minimize the State's downstream involvement in administering these lands. There's very little that I can do sitting behind a desk that a farmer in the field, for instance, can't do better. And I think there must be some kind of a law, if there isn't, I think I'll invent it, that says that the farther from the site where a decision is applied that that decision is made, the worse the decision is likely to be." On the other hand, there is a legitimate need for a certain amount of ongoing management, for example, zoning in the unorganized borough. At the homesite hearings Smith expressed amazement that bush residents didn't seem to be offended by State zoning.

Wes Howe from the Matanuska-Sustina Borough then talked about the merits of clustered vs. scattered settlement patterns. As Howe sees it, "So as far as the public interest is concerned, I think we've got to look at the public interest of -- not necessarily minimizing, but at least keeping to some sensible level the cost of government with respect to providing a widely scattered population." He noted that providing services to rural populations is expensive. High transportation costs in Mat-Su Borough for school children on Oil Well Road and from Skwentna has spawned experiments to try out alternative transportation means. Another costly service, fire protection, must generally be available within five miles of a dwelling in order to receive fire insurance. It is in the public interest to keep government costs down, which can best be achieved by limiting scattered settlement. Land disposal policies that are designed to meet a "psychic demand" alone are expensive. Howe felt that two-thirds of Alaskans don't really even care about public land policy.

Don Karabelnikoff, a real estate consultant, spoke next about supply and demand of State land. He stated that land should be disposed of when needed for community expansion and when such disposal would not hurt other State interests. The demand for land is closely related to economic activity. The State should carry out a sophisticated analysis of land economics in the local market in order to avoid flooding the market or causing an unnecessary scarcity of usable land.

Leasing is an appropriate method of land disposal for commercial/industrial and agricultural uses, although it requires careful management. In the course of leasing State lands which will be the site of substantial improvements, consideration must be given to the requirements of the lending institutions if the State basing program is to be successful. Lands for residential purposes should be sold in fee simple through auction, negotiated sale, or over-the-counter sale with all sales at market value unless overiding State interests dictate otherwise.

The State should avoid getting into intensive real estate development as this is best done by private developers. According to Karabelnikof, "... where there's demand for smaller parcels, that is, residential homesites, or for smaller lots, something around an acre, a half acre or two or three acres, I suggest that very large parcels be made available to people who are involved in the development business, in other words, if you're talking about residential neighborhoods, sell 160 acres." Large parcels could be sold to developers who would submit a development plan and then contract the development on a bid basis. This method of land disposal would permit greater efficiency and would combine the best of State and private abilities. "Because real estate developers are manufactures in the true sense of the word. They take a raw product, piece of land, and they put a lot of capital into it, and they hire a lot of people to do things, like build roads, and make whatever other improvements are necessary, and lot of engineering consultants and planners, and they come up with a product that people apparently want. The government, either local or State, to me is far less efficient, and I don't think that the State ought to put itself in the role of being a real estate developer when it comes to projects. I think the State has -- has got enough problems of its own without trying to become a subdivider." Rural residential land demand could be met by leasing or life-estate permits.

Karabelnikoff defined the speculator as someone who holds land as inventory until it is developed. If land will not be immediately used, because of site conditions or lack of demand for the property, it will remain vacant until it is needed in the community development process. In this case, only a speculator would have an interest in owning the land. He noted that the State is the largest speculator. "The role of the speculator, as I understand it, is that he provides liquidity for owners who no longer want to own their property, and nobody else can do anything with it right now." Speculation is a logical function of the market place when supply exceeds demand. In summary, State lands should

be conveyed to the private sector only when there is a demonstrated need to use the land for some purpose. Preferably, these disposals should be at market value unless other benefits accrue to the State.

Ted Smith then commented that the State is not quite like a business because it is publically accountable for its actions. This drives up costs which makes the above mentioned development plan idea look good. On the other hand, Dale Tubbs expressed the notion that develpment plans would place too many restrictions on the honest bidder and could actually stifle development. He was concerned that the program could become a meaningless blue print show-and-tell. He felt that the currently required agricultural development plans were overly restrictive and inflexible. Wes Howe followed by expressing his dissatisfaction with the downstream problems with development plans, citing inflexibility and difficult administrative follow-through. Walt Parker attributed part of this problem to inadequate financing of administrative efforts which might be changed by the State in the future.

Toward the end of the discussion about land disposal methods, Lang mentioned that fee simple land auctions allowed people to choose what they wanted. Norman agreed with this and went on to say that whenever the State imposes restrictions on land, there will always be those who will scheme to get around them. He added, "there are as many wants and desires as there are people. And there's no way the State is ever going to please all the people, and if you try, you'll wind up with kind of a mess with nobody really happy. So I think the goal is to achieve a balance, set aside enough in the public sector, those lands that really should be protected, and for the remainder, get it out and don't be afraid to get it out in fairly large chunks." Armezon liked the idea of granting permits for those who wanted to live in the remote wilderness (Smith's "fifth" demand) because it allowed people to live there for a finite time period without conveying any land or rights, thus reducing administrative requirements.

Leasing

The first topic discussed after the lunch break was State leasing policy. The panelists were Earl Miller, Vice-President of Alaska Mutual Savings; David McCabe, Appraiser and General Partner of Alaska Mortgage Group; Andrew Hoge, Attorney for numerous lending institutions and developers; and Hugh Gellert, President of Bear-Fritz, Inc., a land development firm. Generally, the panelists agreed that leasing was one useful disposal method for the management of State lands. Past problems with the leasing program stem largely from inappropriate use of this management tool. Administrative inflexibility and inefficiency have contributed to the problems as well. But these technical difficulties can be remedied, and the need for State land managers to be able to utilize leasing as a management technique was advocated by all of the panelists.

Earl Miller believes that leasing can be a useful tool in any land disposal situation as long as it is administered in an effective manner. Good administration, timely, flexible, and tailored to the situation and character of the leasehold is essential to an effective program. A special burden is placed on public land managers because their leasing negotiations must be carried out in the public eye. This arrangement does not always lend itself to good business management. But the fish bowl of public scrutiny is a fact of life in State land policy, so an effective program demands personnel of high caliber operating under guidelines that spell out the management philosophy and policy of the State in a clear and concise fashion. Miller sees the lack of policy guidelines as one key shortcoming in past State leasing practice. A second problem area he identified is the limited quantity and quality of State lease management personnel.

Miller agreed that financing has been difficult on some State leaseholds in the past. One reason for this difficulty was the fact that State land management personnel were unfamiliar with the requirements of lending institutions. A second problem, which has been generally remedied now, was the need for clarification of the right of assignment. The right to assign a lease to a lender is a fundamental requirement of most lending institutions. The final point made by Miller regarding the financing aspects of State lease management was repeated throughout the day. If the State wants to run an effective leasing program it must adopt stable consistent operating procedures. Uncertainty is unacceptable. Said Miller, "-- my feelings are that the biggest thing from a financing standpoint is trusting the State in their actions. What's going to follow after that lease is signed, are they going to come back in a couple years and say 'whoops, we made a mistake, and we're going to renege and back up and cause problems'. We've lost a lot of trust in what the State's actions will be after the lease is signed." Lenders demand to know what to expect from the State and continual change in statute, regulation, or administration does not inspire trust.

In conclusion, Miller briefly analyzed the statutory changes in the leasing law that were made by the 1977 legislature. He felt that the perspective develcped by Alaska Advocate reporter Bill Lazarus in the November 2, 1977 edition of that paper was a fairly accurate one. The absence of an escalator clause for the first two and one-half decades of the lease term coupled with a 50 percent adjustment limit after this period limits the ability of the State to keep pace with the rising of cost of living. Such a program will have a devastating effect on trust land management. Miller did not think that the trust board officers could possibly operate under the provisions of the new statute and still maintain their statutory fiduciary responsibility. Miller also thought the concept of rental adjustment limits was a good one because it allowed lenders to determine with some certainty what to expect over the long run. But the length of the reappraisal period and the extent of the adjustment limitations in the recently adopted statute are essentially a giveaway of State resources.

Anchorage appraiser David McCabe was the second panelist to speak. He focused on the locations and situations when leasing can be an effective method of land management policy. A prime reason for the State to lease a particular parcel of ground results from the need for the State to maintain physical control of the parcel. For instance, land situated in areas with unique geographic values fits this category. Parcels with access to deep water, transportation corridors, or other location values fit here too. Another possibility might be certain soil types potentially valuable for agriculture, over which the State would want to exercise use control beyond that possible through sale covenants or local land use controls. The important factor here is that land ownership is probably the single most effective means of land use management. In cases where the State recognizes unique values that require public retention to insure productive use, but wishes to encourage use and development for specific purposes the lease is an appropriate land management tool.

A second situation where the lease can prove effective occurs where the intended use will be temporary. McCabe offered the example of Livengood. Once a viable gold rush and mining community, this town virtually vanished as interior mining activity dwindled in the early 20th century. After a sleep of some 30 years, Livengood boomed again as a key intersection on the North Slope haul road. The Lost River bornite development is another situation where the term of activity is likely to be fixed on the longevity of the mining operation. For situations of this nature and other similar uses where the tenure will be limited or temporary, the lease is a very effective land mangement tool.

A third type of situation which McCabe thought would fit well into a leasing mode were those locations where land values are high and the properties are complex. This possibility arises repeatedly with regards to the trust lands, whether they be selected for school, university, or mental health purposes. The trust lands were selected in many cases because of their good location and high or potential value. The leasing of these lands could be a real money-maker for the State, particularly for the trust programs. In an active market, the lease manager finds it a good deal easier to keep abreast of value appreciation. In addition, complex properties with prime location are attractive to lessees.

McCabe proposed an interesting approach to property taxation as the fourth appropriate use of the leasing tool. He argued that in the unorganized borough the lease rental could serve in lieu of property taxes. The revenues could pay for occasional services as needed. This would save the State from the immense burden of assessing all of the properties in an unorganized borough which would result from a disposal program of fee estates. McCabe thought, "as a real estate appraiser, that just curdles my blood, to think of the State trying to get into that." Another value of leasing was that it provided an opportunity for a lessee who was short on capital to get established. Whether the use was industrial or agricultural, it was demonstrated how in the first 15

or 20 years of a lease term development is encouraged by offering a virtual loan of the property's value, then charging annual rental considerably lower than payments for land purchased for the same term. By giving a lessee an advantage on the front end, the State could use leasing to promote economic growth.

Past problems with the leasing program stem mainly from uneven and sometimes inequitable management. The crux of the problem has been the absence of timely reappraisal and adjustment of annual rentals. As this task was brought up to date in 1976 and current market values calculated, the resulting rental adjustments were astronomical. Many lessees had made development decisions based on land values near $.25 per foot, and their development choices were no longer economically feasible when values were more accurately established at $4. The lessees found themselves locked into subleases which were based on inappropriate land values. The lessees also found the administration inflexible and insensitive to their problems. Trust in State land managers was scuttled and the lessees saw no recourse but a legislative reprieve.

The new statute relieves problems for many current lessees by granting them a windfall profit for their political efforts. Unfortunately, it might also eliminate the future use of the leasing tool. Certainly, the revenue raising goals of the trust boards will be frustrated by the statute. In addition, McCabe demonstrated how the purchasing power of a dollar earned from a State lease would dwindle to $.21 after 25 years and $.17 after 35 years at minimum inflation rates if the rental adjustment limits in the current statute were maintained. A more reasonable limit would be 100 percent on a 5-year reappraisal basis, in McCabe's eyes. This approach would offer the certainty required by the lenders, but would enable the State to capture some share of the value appreciation. As it stands, the current statute makes the State able to compete unfairly with the private sector in the land management business and provides a subsidy to a special class of Alaskans at the same time. Private landowners, particularly Native corporations who expect to derive considerable income from land rents, cannot compete with the uneconomic terms offered by the State.

McCabe also criticized the use of the complicated reappraisal system. He felt that merely the cost of two MIA appraisals would discourage many reappraisal efforts. He stated, "It's a provision that makes sense if you're dealing with properties that are worth $100,000 or more. Because the nut is big enough to stand the expense of the valuation. If you are talking about a half-acre that some guy wants to lease to put a diesel plant on, or a State lot at Aniak, where the value of the land is three or four hundred dollars, it is totally unworkable. It's going to make it that much more difficult to do business in many, many parts of the State." This alone would frustrate attempts to keep the program current. McCabe concluded with the observation that, "... for the State to get into a leasing business, which is so far removed from typical market terms, in many places is going to ruin the market for Native corporations

to lease their lands, and for private owners to develop and lease land that they may own. And, you know, I am of the opinion that the -- the lease of surface rights is, for many of the -- many of the Native corporations, the best chance that they are going to have to survive as viable entities. I think this is a very, very serious problem for them."

Andrew Hoge was the next panelist to enter the fray. As an attorney for various lending institutions, Hoge provided a valuable perspective on the leasing program from the point of view of both the financial institution and the developer. He esd familiar with numerous leaseholders who had found past difficulty with the State leasing program, and actively monitored attempts to enhance the program's effectiveness by legislative action. Hoge believed that leasing was an appropriate tool whenever the use of the property planned by the lessee was known or could be determined. Thus, land along an airport, well suited for air related commercial and industrial development, should be leased for those purposes. Recreation parcels, on a particular lake, stream, or viewpoint, also lend themselves well to leasing. Even residential land can be leased. Leasing is less effective, however, when the use cannot be identified. Leasing land in large tracts for purposes well served by small tracts is an example of inappropriate use of leasing techniques which causes problems down the road. Understanding the importance of timing is also key to the appropriate use of the leasing tool. When land for use is scarce, people are willing to lease land. When land gluts the market, leases will be less attractive. The good manager must read the market and utilize his management techniques at the proper time.

According to Hoge, "I suspect a couple of things were wrong with the State's prior leasing program, and this -- this is not a charge against the present administration, it really is a historical problem." When the State first began to lease lands, the parcels were small and value of improvements placed on them was not too significant. However, as loan amounts began to rise and the extent of development broadened, lender scrutiny increased as well. Lenders usually consult a checklist of 15 or 20 items before they will loan funds for some undertaking. As financing requirements increase, the lenders turn to ADL to establish the certainty of the situation they are evaluating. In the past, lenders have found a lack of qualified people at ADL who understood their business and also an absence of the administrative flexibility needed to adapt to changing conditions.

Hoge argued that there are legitimate commercial requirements and it takes experienced administrators to be responsive to these demands. As Hoge put it, "I use the words 'certainty and stability'. There is absolutely no reason for a lender to -- to rely on the State of Alaska. I mean, if every deal can be challenged, why make the loan. And if you're going to make the loan, you're going to cut it down one way or the other. You're going to cut down the amount of money you're going to

lend, or you're going to increase the interest rate." In order to operate, lenders must be able to trust the State. In the past, this has not always been that easy to do. The State has been responsive in some cases, for instance, the basic changes that permitted assignments have certainly made financing easier. Hoge pointed out that escalator clauses were common in some private sector leasing. But, usually lenders require that the ascertainable rental provisions be fixed at least 10 years (or a decade) in addition to the term of their loan. In the case of savings and loan institutions, this is required by law and generally, my experience with lending institutions in Alaska, require it as a matter of practice. In a few instances with insurance companies, these provisions requiring ascertainable rental may be somewhat less, in the range of 7 or 8 years on a 25 or 30 year term loan. "The purpose of this provision is," I think, "a reasonable one; in other words, if a borrower was in financial trouble, the additional period gives the lender an opportunity to work out the loan and stretch out the amortization so as to reduce the principal and interest payment."

Hoge offered the absence of limits and administrative inflexibility as the two main reasons that lessees wanted to see that the statute was amended. Realistic application of the regulations is mandatory for successful administration. In order to be effective, valuations must be current and should reflect what is happening in the market. But when the State fell behind and then caught up in a hurry, it put many lessees at a disadvantage. Hoge was the only panelist that believed the new lease law was really workable. He recognized that current leasholders would enjoy a windfall when they converted to the new leasing system. But, he believed that the economic advantage granted to lessees of State land would be reflected in increased bid prices at State land auctions in the future. Hoge felt that a well run bidding procedure would capture this added incentive to lease State lands.

Hugh Gellert, President of Bear-Fritz, Inc., was the final panelist to take the floor. Many points had been covered by this time, and he acknowledged that he could support the majority of the comments offered by his colleagues. He approached the new leasing statute as a case study of why the State has had, and will probably continue to have, problems in the leasing business. The willingness of the legislature to change the statute in response to hot, but essentially limited pressure encourages anyone with an administrative problem to go directly to the legislature. This approach was encouraged by the current administration who refused to flex in response to demonstrated hardship and pointed the complaining lessees towards Juneau. The few who were injured went, and the resulting changes will reward them and essentially punish the public interest. As an example of stability, the way the issue was resolved is unfortunate. By way of encouragement to special interest pressure, the example could only lead to further activity along these same lines.

Gellert made a special point of the fact that land leasing and associated contract administration is a very sophisticated enterprise. "I think

under the previous State system, the lessee probably never really understood the implications of what was written on the paper. Possibly because it was written in such small obscure language that very few people did understand it. It says, for the State's defense, if you read it a few times, that yes, the State can really grab you anywhere along the line. And many of these people who were the original lessees testified, you know, they never knew that's what it said. And they struck me as honest people. They probably never did know what it said. For years and years the State let these appraisals lapse, underappraised, and things were fine. And then all of a sudden here comes the -- somewhere close to the market appraisal and everbody falls down in a dead faint." For that matter, real property appraisal requires highly skilled and motivated people as well. For leasing to be effective and appropriate, it takes a degree of sophistication on both sides. In the instant situation, neither side was particularly well prepared. Gellert served on the Governor's ad hoc land management practices committee. In testimony before the ad hoc board, lessee after lessee testified that they did not know what their leases said. Although they received a copy of the document they hadn't read it because they believed they could trust the State. Gellert was surprised by this testimony. But he was equally surprised by the inexperienced appraisers, tardy valuations, and generally inefficient administration of the leasing program which became apparent through the Ad Hoc Committee's investigation.

Gellert felt that the sophistication necessary for successful leasing was noticeably absent from both lessor and lessee. If the State wanted to actively lease lands, they should certainly upgrade the quality of their appraisal and contract administration programs. He also thought that the windfall gained by current lessees would not be diminished by the open bidding procedure for future lessees of State land. Gellert disagreed with Hoge's observation that a well run auction would produce bids which reflected the advantages of leasing State land under present law. The way the State has administered their land programs in the past prompted Gellert to foresee continuing problems. The necessary expertise and command of the market situation was just not available at ADL.

In the ensuing discussion, Ted Smith, Director of the State's Division of Land and Water, took issue with the oft stated observation that you could not trust the State of Alaska. He argued that trust and stability is a two-way street, and the lessee had certain obligations to keep the program operating as well. Another item that came up during the comment period was an exchange between Senator Croft and McCabe. McCabe offered an example of two tracts, side by side, each worth $10,000, with one leased and one sold. Assuming a land value increase of 10 percent per year, an effective tax rate of 52 percent, with the land sale on a 10 percent down and 8 percent interest basis and a 20 mill property tax, the land buyer would pay $27,470 over the first 9 years. The leaseholder, on the other hand, would have paid $8,882 over the same 9 years.

McCabe was demonstrating the front-end advantages to the lessee over the purchaser in the first decade. Senator Croft wanted to know at what point the two sets of figures were equal. The model had not been developed to this point. But the point where leasing becomes equal to purchase for the developer is a good ways down the road. A number of factors including opportunity cost, asset value, and other tax assumptions would be required to make the model wholly workable.

Land and Water Director Smith said that under the current statutes the State administration did not expect to apply the leasing tool to any State lands. He also stated that he understood that the trust boards were quite uncomfortable with the new policy as well. Very recently, the Board of Education, charged with trust responsibility for the common school lands, filed a suit testing the new statute. Virginia dal Piaz pointed out that the discussion had been very technical and the real truth and beauty inherent in retention of public lands and leasing for use purposes had not received enough attention. John Norman thought it would be useful to calculate the costs of not having enough land in fee simple ownership. He felt sale was more appropriate than leasing and built stronger communities as well. David McCabe spoke, agreeing with dal Piaz but acknowledging the fact that if leasing was going to be a good tool in the land managers kit it required a well honed, sophisticated approach. It was time to recognize that leasing wasn't universally appropriate and that a good program demands competent administration. Ted Smith concluded the section with the observation that, "I think that we do have a problem in the leasing program, in that we only have one program. Whatever we have on the books, that's the only method that's available. With trust lands in particular. I think we need a wider array of tools. Some of the tools that the private market uses, like leasing for a percentage of the gross, and other techniques should be available to the State."

Trusts

The second topic of the afternoon session was the trust lands and how they are managed. The basic questions around which the discussion was framed was:

1. How have the trust lands influenced land planning and management?
2. What advantages and disadvantages have prior management of trust lands had for the State as a whole and for the trusts?
3. Are there changes in legislation, regulations, or management of trust lands that you would advise?

The trust land panelists were Steve Reeve, newly appointed Chief of Classifications for ADL who formerly served as the Planning Director of the Ketchikan Borough; FSLUP Commissioner Phil Holdsworth, past Commissioner of the State's Natural Resources Department; and Dale P. Tubbs, former Deputy Director of ADL now a private land management consultant for Moening-Gray and Associates.

Steve Reeve led off and presented particularly valuable insights based on his experience working in SE Alaska. Many trust lands were selected during territorial days and high value lands were chosen when possible. A number of communities in SE are heavily impacted by trust land holdings. Producing revenue is the operating goal of the trust land managers and their land utilization practices are not always consonant with local growth plans. Reeve used the Juneau trust land map developed by FSLUPC staff to demonstrate how the trust lands occupied virtually all of the useable land within the City. In Ketchikan the problem is even worse as the U.S. Forest Service has not permitted residential development in the surrounding Forest to the extent allowed in Juneau. For Ketchikan the experience has been that only intense local pressure results in disposal for use purposes near the City.

The location of the trust lands has also had a deleterious effect on certain land development patterns in SE. Besides escalating the value of land by withholding so much of it from the market, the nondevelopment of the trust lands has forced community growth to leap frog the underutilized trust property. Local input into the sale and management of trust lands has been negligible. The absence of a community voice in trust land management decisions is particularly galling to Reeve who says, "-- it is crucial that communities that are surrounded by these lands have a significant role in identifying which lands are to be disposed of, are to be sold, and which lands are to be retained and when that's going to occur." If the lands were general selection State lands, they could be conveyed to the municipality and the local government would be able to utilize the property in accordance with the Borough's comprehensive development plan. Unfortunately, this possibility seems remote as the Borough cannot afford to satisfy the revenue requirements of the trust setup as it is currently aligned.

The overall effect of these land holdings has not been entirely negative. For one thing the absence of available land has forced many towns to develop a compact land use pattern. Since the fringe lands are unavailable for development the opportunity for sprawl is substantially reduced. In addition, public ownership of the lands has tended to inhibit growth in many SE communities. This has some benefits as well. Reeve would like to see active local control of trust lands, particularly where they inhibit community development. But he recognizes that the statutory obligations of the trust boards must be dealt with by statute or regulatory adjustments before new management arrangements are really practicable. In addition, Reeve questioned the idea presented throughout the day that land use control should be a local affair when he pointed out that, "-- that isn't possible without some kind of assistance from the State. I think that's an issue that the State has not dealt with adequately. In terms of general planning programs throughout all of the smaller communities, I would say everwhere except Anchorage, land use planning programs are poor, and they are understaffed. They are expected to do certain things, like, for example, put together a meaningful nomination to the State for selections from national forest, or develop coastal

management programs, or other matters of State interest as well as local interest. But they simply do not have the ability to do that. And I think that any time you expect them to do certain things, I think you should help them out. And whatever form that takes, whether it's financial assistance, manpower, a stronger and more active Department of Community and Regional Affairs, or whatever it may be, you cannot shift responsibility for land use control to local government in any meaningful fashion until you have taken measures to improve their ability to do the job."

The second speaker was FSLUPC Commissioner Phil Holdsworth who outlined the history of the trust lands and the manner and authority by which they were selected. An outline of his historical summary is attached to these proceedings.

Commissioner Holdsworth outlined the legislation that created the first trust lands. School and university grants date back to 1915 but, because they depended on survey, the State did not receive considerable acreage. Yet, the acreage they did receive was usually good because the survey process was most likely to be initiated in and around developed areas. Federal legislation was specific about the restrictions on the management of these lands. School and university land managers were restricted to leasing, and only the income earned was available for the school programs. At the time of Statehood, these land grants were confirmed by the Federal government and transferred to the State for management in accordance with the purposes for which they were originally reserved.

In 1956, the Territory was encouraged to select not more than 1,000,000 acres to provide an economic base for the mental health program. The management restrictions for these lands were not as strict as those outlined for school and university lands. However, the Territory was to administer them as a "public trust", and the mental health programs were to be primary recipients of the income. The Statehood Act confirmed this grant as well. With mental health land selections there was no requirement that the land be surveyed. Therefore, considerable selection flexibility was allowed and many parcels with high value were selected.

State statutes have delegated management authority for these lands to the Division of Lands, Department of Natural Resources. ADL conducts this management program subject to the approval of the Board of Regents (university lands), Board of Education (school lands) and Mental Health Land Trust Board.

After sketching the legislative foundation of the trust lands, Holdsworth raised a number of issues that currently cause concern for trust land managers. Many board members are dissatisfied with ADL management services. ADL, who is not compensated for managing the trust lands, seeks a more equitable arrangement in exchange for their efforts. In addition, the legislature has made the trust lands subject to many Alaska statutes that conflict with the revenue producing goals of the

trust land legislation. Under these conditions, there seems to be agreement that changes must be made in the manner by which State trust lands are managed.

Commissioner Holdsworth discussed this matter with a number of administration personnel. While he found a consensus that management practices should be evaluated and enhanced, there were a variety of opinions as to exactly what changes would be the most productive. One approach suggested that the trust boards should get a fixed percentage of total State land revenues. Mangement decisions on trust lands would be made on the same basis as the decisions made for other State lands. Another way of looking at this situation called for trust land management to be separated from ADL and authority delegated to private managers who could be more responsive to the Trust Board's revenue goals. Other options between these two poles were presented as well. But the agreement that change is needed underlines the importance of carefully considering the range of choices available.

Commissioner Holdsworth outlined present trust land disposal practices and pointed out that accounting procedures were such that revenues were not directed to the funds who owned the lands earning the revenues. He also alerted the panel to certain State statutes that may be in conflict with federally imposed trust responsibilities. Examples of conflict arise in both the permanent fund legislation and the newly enacted leasing statute. Finally, Mr. Holdsworth explained how most of the trust lands were selected well before the general selections permitted by the Statehood Act. For this reason many Mental Health land parcels are centrally located. Land management problems can cause community problems because of the strategic location.

Mr. Dale Tubbs was the final trust land panelist. He spoke from prepared remarks and they are attached to this paper. It should be mentioned that Tubbs recently completed an exhaustive Study of the trust land situation for the University of Alaska Board of Regents. His recommendations take on a certain added dimension as they were adopted by the regents at their recent Kenai meeting and now represent management policy for the university lands. Tubb's written comments also have application for the remaining trust lands.

Early on, Tubbs made the distinction that trust lands should not be considered part of the State public domain lands. Too often in the past, management decisions have not always treated the trust lands as though they were private lands to be managed for a distinct purpose. Part of the blame for this management policy must fall on the trust boards which have not spelled out management guidelines for the ADL. But the managers themselves are to blame as well. It has been more expeditious in many situations to treat the trust lands as though they were part of the State's general land endowment. However, until they are managed like corporate private lands, their value as an endowment is going to be diminished by policy and legislation which ignore the trust distinction.

Trust land management has been spotty. The mental health lands have received the most attention because of their location and the fact that no mental health trust land board was available to evaluate ADL practices. University and school lands have suffered in the market place as well. As Tubbs put it, "In management, the trust land boards must require more aggressive management from the Division of Lands if the Division of Lands is going to continue as the manager. The trust boards must require the Division of Lands to show funds being requested in their budget and earmark them for management of that particular fund, and keep it identifiable in the final outcome of the budget. Too often what happens is the Division of Lands has said, 'Okay, university and school, we're watching out, we're budgeting monies'. And then the budget gets first cut by the Commissioner, then it gets cut by the Governor, then it gets cut by the Legislature, and what's left goes back, the program is revised, priorities are rearranged, and your trust land management funds are lost." Few funds have been available to ADL to survey, build roads, and, in other ways, satisfy local subdivision requirements. Tracts of inappropriate size have been forced on the market to avoid these requirements. This has not benefited the trust concept either. Of course, there are examples of success in trust land development. Alaska Industrial Subdivision is one example. Residential subdivisions like Windemere have been well developed as well.

Dale Tubbs saw a need for changes in the legislation that effects trust lands. Primarily, his emphasis was aimed at guaranteeing that trust lands were not treated as State public domain but were recognized as lands separate from general land legislation. He also called on the legislature to observe their trust responsibilities when these lands were placed into the State's amenity land system such as parks and refuges. Tubbs also called for the adoption of legislation that would improve the capabilities of the trust land managers.

Regulations for trust land management do not reflect Trust Board policy. This is primarily true because the trust boards have failed to articulate management objectives in the past. However, the regents have taken a new look at this situation and are now working on developing such a management program for their lands. But the blame cannot all be place on the boards. If ADL designs trust land management regulations, they should reflect trust board contributions. A need to broaden the communication between the managers and the boards is evident.

Tubbs also offered a series of suggestions for improving the management and administration of State trust lands. Basically the thrust of his comments outlined the conflicts inherent in being the manager of both public and trust lands. As Tubbs sees it, "the Division of Lands has a conflict of interest in managing the three trust funds when like lands occur in the same area. How can the Division get the most for any one when each are competing for the same market. And this has shown up repeatedly. You try to get the School Board to lay down and play dead while the university can do something, or the other way around." In

addition, day to day management suggetions such as making lease terms more specific to the parcel being leased were mentioned. State policy on log exports may make social sense but when applied to trust land timber, the effect is to limit revenue. Sand and gravel disposal is another revenue producing opportunity that is essentially foregone on most trust lands. All in all, if the goal is revenue, then adminstration of trust and public lands in the State must be on different terms administratively.

Tubbs also made the telling point that since local governments control zoning assignments they also have authority over the VALUE of trust lands. For instance a vast majority of the Mental Health Lands in Anchorage are zoned PLI. Mr. John Norman argued that this was an excellent opportunity for some basic policy decisions. He suggested that trust lands should be exchanged for Slope reservoir lands or other lands with a known current value. The the trust boards can just clip coupons while the State can have a more flexible management program. Commissioner Hurley wondered wondered how three separate district boards with little land management experience could be effective managing the trust lands. He opted for a more unified approach to trust land management.

Budget

The meeting closed with a brief discussion of the costs of land management and State land disposal programs. Ted Smith stated that for ADL, "at the moment, our annual budget's about five million dollars. So that gives you a ballpark figure." He went on to describe in detail the costs that had resulted from the homesite program in the first year. Speaking of preimplementation estimates he said, "... like any estimate, we found holes in it when we actually started to do it. First of all, you note that it makes some assumptions on economies of scale. We talk about 100 units, and 1,000 units, and like, 300 homesites, 3,000 homesites. And the way the bill was actually implemented, you don't get those economies of scale, because you can't find sufficient blocks of land that meet all those requirements that you can get the surveying savings and platting savings and all like that. So far, I've just checked, and we've spent $103,000 -- on contract costs for the surveying of these 183 sites so far. And that amounts to about $562 per parcel. And unfortunately, it does not include platting, administration expenses, and soil tests which will bring costs to $1,000 per parcel or more." Smith seemed sensitive to the land management budget questions and explained that his staff is evaluating the prospect of using contract appraisers. This possibility could become operational if the price is right. David Simpson, Matanuska-Susitna Planner, echoed Wes Howe and talked about the costs of providing services to scattered residential dwellers. This theme was picked up and followed by many of the panelists.

Commissioner Gorsuch summed up the day well when he said that it all seemed pretty simple until he heard the facts. He found that the panelists had contributed extensively to his understanding of certain issues. He

thought there was a need to clarify basic State land disposal policy and to create a process that would encourage certainty, stability, and trust in the system. Statute should state policy and the legislature could be more effective if it were less involved in stating day to day management operating procedure and put more emphasis on stating basic policy guidelines for future State land disposal. Commissioners Hurley and Holdsworth also described the value of the discussion and extended appreciation to the contributors.

Walt Parker, State Co-Chairman, captured the mood of the day in his closing comments, "I wish to thank you all for coming today, it was certainly one of the more provacative sessions we've had in the five years of the Commission's existence. I would echo my colleague, Mr. Hurley, that the great question of whether it is better to retain control of the public lands through leasing, or to dispose of them through private ownership is solvable within our State system. In a state with 103 million acres both interests should be able to be accommodated with some equity on each side. And that doesn't mean in the sense of compromise with anybody's basic philosophy. I think it's just a simple recognition that possibly some lands are better handled through conveyance as rapidly as possible into the private system, and some lands are better handled through retaining a substantial hold on the public equity in those lands."

"Some of the things that came through to me today were the need to simplify our declaration of State land policy. Policy making should not try to get too subtle in trying to control the public wealth through statutes. I think the review of past land legislation, where that attempt has been done, reveals to all of us the problems we get into there, trying to overcontrol the public. We need to have a trust in the certainty and stability of the system, certainly an important point that was brought up here today. I think this idea extends to many areas in our beleaguered State. Until we get certain major land issues behind us and do get the system settled down a little bit, we're all going to live with uncertainty that creates what appear to be policy dichotomies that really may not be."

Land Availability

Introduction

There are approximately 365 million acres of land in Alaska. The Statehood Act gave Alaska 25 years to complete the selection of its full entitlement of more than 103 million acres of this land. The status of this selection process is approximately as follows:

Land Selection Status
January 1, 1978

Grant Type	Entitlement Acreage	Selected Acreage*
General	102,550,000	71,162,999.22
Community	400,000	83,792.44
Community National Forest	400,000	47,292.27
Mental Health Trust	1,000,000	1,017,215.59
University Trust	100,000	99,414.48
School Trust	---	109,073.43

*Selected Acreage also includes lands tentatively approved and patented.

Recent State land selection activity has identified considerable additional acreage for selection under the general grant and National Forest community grant authority. These selections will probably be completed in 1978. The State now has management authority, resulting from tentative approval or patent of its selections, for more than 36 million acres of land.

More than 1 million acres were in private ownership prior to the Alaska Native Claims Settlement Act (ANSCA). In addition, ANCSA will convey about 44 million more acres into private ownership by Native Corporations. Altogether, after ANCSA is implemented, there will be more than 45 million acres in private hands. With Alaska's small population, this results in a per capita private land ownership in the State of 112 acres. The nation wide average stands at 7.5 acres.

Less than 150,000 acres of Alaska's private land is intensively used for residential, industrial, commercial, agricultural, or recreational purposes. The Soil Conservation Service reports that only 7 million acres of the lands selected by the State are "good" for intensive use. Even in those railbelt boroughs where economic activity is high, the intensity of land use is not. The Matinuska-Susitna Borough reports an 85 percent private land parcel vacancy rate. Unimproved parcels on the Kenai Peninsula make up 76 percent of the available private land. In Anchorage, the land parcel vacancy rate is almost 50 percent.

Private land is available in significant quantities in the railbelt region. Land is less abundant in southeastern communities, but the upcoming National Forest selections could relieve the scarcity. In western Alaska, some communities have witnessed the price of land raising rapidly due to a scarcity of parcels in private ownership. Implementation of ANCSA could relieve this problem.

Other than trust lands, the State does not own considerable acreage that is in a location suitable for residential use. Most of the State-owned lands are beyond reasonable commuting distance. But State lands are suited for other uses, such as agriculture, rural-remote living experiences, recreation, small scale timber operations, and other uses less dependent on easy daily access. Also, the State has an opportunity to make better use of its trust lands, which are, for the most part, well located. More intensive use of the trust lands could satisfy land scarcity problems in some areas, and, at the same time, produce needed revenues for State operations.

Land ownership near population centers, primary access routes, and waterfronts will be influenced by the resolution of the borough and municipal land selection issue. The State's largest boroughs have already filed extensive selections. The North Slope Borough is in court attempting to establish the extent of their selection rights. The community lands situation will also be affected by the 1,280-acre ANCSA 14(c)3 lands which will be conveyed to municipalities for public use by the village corporations that receive their entitlements. In southeast, the municipalities are looking to the State selections from National Forests to solve their community expansion needs.

Sales and leases of land surface have not been a very important source of revenue for the State. About $2 million per year, or less than $35 million, have been generated since statehood. This is an insignificant portion of the State's current budget. More intensive management of well located trust lands could increase these revenues. But, for the most part, State lands are not located where surface use demand is high, and surface management will not be very productive in terms of revenue.

The State has recently renewed its interest in land disposal programs. In the past, these efforts have been primarily limited to public land sale auctions, lease sale auctions, and the Open-To-Entry (OTE) program. The OTE program has been suspended since 1973, but recently new regulations have been drafted that could put the process in motion once again. Also, the State will unveil the new Homesite program in 1978 with the offering of nearly 200 parcels near Fairbanks in the 4th Judicial District. Agricultural land rights will be leased in the Tanana and Delta Junction areas as well.

To date, the State has transferred nearly 140,000 acres into private fee simple ownership through competitive bidding. More than 325,000 acres of State land are leased for agricultural, grazing, and recreational uses.

Almost 15,000 acres will be transferred to private ownership through the original OTE program. All of these activities will continue in 1978. The State will emphasize making lands available for homesite and agricultural purposes. There is talk of a remote cabinsite permit program, too.

The land facts presented here may appear confusing. In terms of raw numbers, we are confronting a wide range of acreage statistics. But when the lands are viewed in a use context, or seen in terms of location and relation to access or other supply networks, the acreage figures are more refined. This concept is explored further in the article by Sally Gibert entitled, "State Owned Land: Where Is It? - How Could It Be Used?"

ANCHORAGE, ALASKA

FEDERAL-STATE LAND USE PLANNING COMMISSION, FOR ALASKA

STATE-OWNED LAND
WHERE IS IT LOCATED? HOW COULD IT BE USED?

By Sally Gibert

In recent months, there has been a growing public interest in State land disposal programs which would place more land in private ownership. Recent hearings on the State's open-to-entry and homesite programs, and the current Alaska homestead initiative have generated considerable debate. The following article offers important information about the location and supply of State land, as well as a discussion of some of the factors, both positive and negative, that go along with making public land available for private ownership.

Sally Gibert is a Natural Resources Specialist on the staff of the Federal-State Land Use Planning Commission. The Commission has been studying the location and accessibility of State, Federal, municipal, and private lands around Alaska's main growth centers and analyzing various methods of making public land available for private use. Commission recommendations on policy guidelines for the retention and disposal of State lands will be presented to the Legislature this month.

State-owned Land
Where is it located? How could it be used?

For most people, land is symbolic of many things of important personal significance like security, wealth, power, and happiness. Thus, Alaskan dreams about land range from thoughts of building a cabin in the woods, to the hope of acquiring financial security by selling land on a rising market.

Images like these and the hard realities of private land costs have created an increasing public clamor for converting more public land to private use. This demand is closely tied to the lure of the "Alaskan Life-style." Genuine attempts to accommodate these needs through the disposal of State lands should be carried out. But in order to be effective, we must have full awareness of the availability of appropriate lands and the subsequent results of their disposal.

The existing private land ownership patterns in Alaska stem primarily from Federal land disposal programs which began before Statehood. These Federal programs have provided about 877,000 acres of Alaska's private land, mostly from the Homestead and other settlement programs which were effectively closed in 1974.

Subsequent State land disposal programs have been primarily public land sale auctions (138,000 acres), land lease auctions (323,000 acres), and the open-to-entry program (14,000 acres leased, 1,900 acres patented to date). The results of these combined programs have placed over a million acres of land in private hands.

It should also be remembered that the 44 million acres of land granted to the Natives under the Alaska Native Claims Settlement Act (ANCSA) will be private lands that may be sold at any time after conveyance. At this time, however, it is difficult to predict the amount of land that may be sold or leased by the Native corporations because their management programs are so new. Only a few million acres have actually been conveyed so far, though recent efforts to speed up the pace of conveyance are starting to yield results.

Most of the people who feel that more private land is desirable in Alaska are demanding that it come from the seemingly vast supply of State lands. But, despite the fact that the State has selected some 70 million acres of land and will be selecting another 35 million acres, there is a relative scarcity of the kind of land that is useable for community growth. Most is far too remote from centers of employment and commerce.

It is natural to ask why the State has a shortage of lands that are really useable for development. The answer lies in the timing of Statehood rather than in the quality of land selection. Statehood and State selections came after lands had been homesteaded and private landowners

had acquired properties near communities and along the existing transportation systems. State selections also came after prime lands had been set aside for the congressionally mandated trust programs. The best of the remaining State lands were chosen by the boroughs and some were sold to private parties.

To see who owned the accessible and buildable lands in the vicinity of the new capital site, the Federal-State Land Use Planning Commission studied in detail the land ownership and soil characteristics of lands within one mile of road or rail access from Talkeetna to Palmer. To someone driving along the Parks Highway north of Palmer, the relatively vacant land pattern is deceptive. Many would assume that much of it is State land. However, the Commission found that less than 9,000 acres (10%) of the lands suitable for residential development are general State selections. On the other hand, 82% are already privately owned. The remaining 8% are trust lands or borough lands. A similar pattern exists for the lands around Fairbanks. In the Anchorage bowl, where State lands are particularly scarce, there are less than 240 acres of uncommitted State lands.

Around Alaska's smaller communities, a different, yet parallel, land pattern has emerged. Over 200 Native corporations have selected a sizeable portion of the lands suitable for intensive land uses along the coast and river systems and around lakes. Native villages, like communities in general, have traditionally been established in the most habitable areas, so it follows that a large percentage of Alaska's buildable lands are Native selected, about one-third according to U.S. Soil Conservation Service data. State lands, which frequently border these first priority Native selections, contain only about one-fifth of the buildable lands in Alaska. A sample study in the Dillingham vicinity showed that only % of the accessible, buildable lands were State selected while 67% w : selected by the Natives of that region.

The fact is that much of the State's lands are inaccessible or difficult to develop because of steep or difficult topography, swamps, or severe permafrost. This situation should be kept in mind when designing land disposal programs that will maximize the use of both private and public lands at the least cost.

Most of those who contemplate owning 40 to 160 acres "somewhere out there" think of a cabin in the woods on gentle terrain, hopefully on a lake, stream, or near a road. This trend can be illustrated by looking at the locations where people staked open-to-entry leases. Almost 80% were clustered around lakes and streams which provided easy access and potable water. There are, of course, available State lands that fit this description. But they are limited and should be disposed of judiciously.

A wholesale giveaway of State lands will allow the lucky few who jump in first to acquire large blocks of the most desirable or close-in lands--

far in excess of their ability to use them. Then, as the best land rapidly dwindles, the remaining people would be forced to select from a pool of increasingly remote or unuseable land. Consequently, smaller scale land disposal, like the State's new 5-acre homesite and updated open-to-entry programs, will allow more people an opportunity to acquire useable State land.

In addition to those who want accessible land near existing communities, there is a sizeable segment of the population who would prefer a more rural setting. This group, typically young people, still need access, schools, and possibly other services like fire protection. Rural State lands with existing services are in extremely short supply. In fact, because so few State lands have road access, the State Division of Lands actually had difficulty locating appropriate lands to be made available this spring under the 5-acre homesite program.

While the supply of accessible land is small, there is a significantly larger quantity of State land suitable for residential or recreational use in remote areas. The limiting factor for remote land disposal programs is cost. The high public costs of remote and rural land disposal are not necessarily prohibitive, but they do demand public recognition of the choices involved.

Recent laws and court interpretations are forcing the State government to provide expensive services to resident landowners, even to those in remote areas. In Skwentna, for example, the State must pay the costs of flying bush children to school. Although this example is extreme--it indicates a trend toward increased State and local responsibility to rural residents involving great costs to taxpayers.

To minimize these high costs, remote land disposal programs should be carefully planned to consolidate transportation, survey, administrative, and educational requirements. The Division of Lands has estimated that the costs of land surveys, soil analysis, and other purely administrative costs (roads, schools, etc., not included) for the 5-acre homesite program will be about $1,000-1,200 for each lot in the subdivision. Scattered sites would be more expensive. Lack of planning prior to any major land disposal will permit randomly dispersed subdivisions which would be extremely costly. For example, at the present price tag of $125,000 per mile for construction of modest rural roads, and $1,500 per mile per year for maintenance, the State cannot afford a proliferation of rural routes.

There are some Alaskans, however, who do not want roads, schools, and other amenities associated with an urban or rural residential life-style. These people would prefer to live in the relative isolation of wilderness or semi-wilderness. To satisfy their needs at minimal expense, the State could retain the land in public ownership and simply give the individual a permit to build and occupy a cabin for a number of years. When the permittee vacated the cabin, it would become public property to be used by the next permittee.

This approach is in keeping with traditional Alaska back country views of land and cabin rights. Sites would be sufficiently isolated so public schools would not be required or expected. By granting "use permits" for remote State lands, the government could reduce the necessity of providing costly and unwanted services, while still allowing scattered residential use of the land that would otherwise remain vacant.

While attempting to meet the demand for additional private land in Alaska, we should not lose sight of the importance of retaining adequate accessible recreational land in public ownership. Alaskans still have the opportunity to avoid the frustration of mile after mile of "No Trespassing" signs. This is critical for those who want to hunt, fish, hike, ski, or snowmobile on public lands.

If public lands important for present and future recreational use are not identified and retained prior to land disposal, Alaska will experience a private land ownership pattern will diminish Alaska's unique life-style. A diversified and discreet land disposal program could promote additional private land opportunities without sacrificing these public values.

Policy For Land Retention and Disposal

Introduction

The State's primary policy statement about land disposal is in the Constitution.

> "It is the policy of the State to encourage the settlement of its land and the development of its resources by making them available for maximum use and development consistent with the public interest." (Constitution of the State of Alaska, Article VIII, Section 1.)

The statutes modify this mandate slightly by saying

> "Disposal and use of State lands shall conform to the constitution of the State of Alaska and the principles of multiple purpose use consistent with the public interest." (Alaska Statutes, Section 38.05.285.)

Both of these statements are so general as to be of little use when it comes to making day-to-day decisions about the extent, timing, and location of State land disposal. In the absence of legislative guidance, the administration has been left to make the major decisions. Administrative policy has varied widely over the years. During the late 1960s and early 1970s, the State sold 138,000 acres, an area 9 times the extent of the development of the Anchorage bowl. This land went to approximately 4,000 buyers. In recent years, disposals have been held to a minimum.

Instead of setting policy guidelines, the Legislature has responded by legislating programs, such as the 1977 Homesite Law and the new leasing law. So the State remains without a clear policy to guide land disposal or retention. In recognition of this lack, Senator Kay Poland, Chairman of the Senate Resources Committee, requested the Commission to develop recommendations about State land disposal policy. During its December meeting, the Commission debated this policy.

The following documents provide a glimpse of land disposal policies which have been developed by other major public land holders. First, we included the statement of land management policy adopted by the Greater Anchorage Area Borough several years ago; then a summary of the land policy and practices of other major land holding states; and finally, an excerpt from the Federal Land Policy and Management Act of 1976 which governs Federal Bureau of Land Management lands.

STATEMENT OF POLICY ON THE USE OF BOROUGH-OWNED LANDS

Anchorage Municipality, 1975

The policy of the Greater Anchorage Area Borough concerning use of Borough-owned lands by persons or organizations other than the Borough itself is set by Article 20.20 of the Borough Code of Ordinances. Borough lands which are subject to uses of this nature under Article 20.20 are lands which are in the Borough Land Trust Fund. Other Borough lands which are not in the Land Trust Fund are managed by specific Borough departments. Any use which is contemplated for non-Trust Fund lands must be requested through the department managing these lands, such as the Department of Public Works or the Department of Parks and Recreation.

It has been the general policy of the Greater Anchorage Area Borough to permit the use of Land Trust Fund lands by persons or organizations other than the Borough itself only when such use is demonstrated to be in the public interest. In the past, the only private uses permitted have been for park and recreation developments which are open to the general public without restriction. Section 20.20.070 specifies that the preferred management policy for Land Trust Fund lands requires that the lands be leased and not sold. Section 20.20.070(c) permits the lease of these lands to "duly-qualified non-profit corporations", for a period not to exceed 55 years, with a yearly lease payment of not less than 2 1/2 % of the appraised fair market value, and with required re-appraisals at five-year intervals. Land Trust Fund lands leased to private parties who do not qualify under the "non-profit corporation" requirement may be leased for a period not to exceed 55 years, at normal fair market value rates, with required five-year reappraisals. All leases or other disposals of Land Trust Fund property which have been negotiated by the Land Trust Fund Council must be reviewed by the Borough Assembly prior to becoming final.

As previously, stated private uses of Borough-owned lands have been restricted to park and recreation purposes open to the public at large. The Borough has not looked with favor upon private developments on public lands which would be restricted in scope or in actual use to any one group or organization, or to any class of persons smaller than the general body of borough citizens. Uses may not be limited to members of an association or club, or to activities sponsored by an association or club, even though membership in that club may easily be obtained. Since these public lands belong to all of the citizens of the Borough, and to

both present and future generations, any private use of Borough lands must sufficiently protect the property rights in these lands which are owned by all citizens.

If these basic criteria for private use of Borough lands are met, then additional considerations should be taken into account. The drastic alteration of existing topography or vegetation is not generally permitted. Site development should be no more than necessary for the use permitted, and should be of such nature that the land will re-vegetate or otherwise restore itself if use of the site for the permitted purpose ceases in the future. Requirements may be imposed for sanitary facilities, trash removal, supervision of activities by qualified personnel, and any other aspect which may be needed to assure the clean, safe and orderly use of the site. Depending upon the activity, insurance may also be required to protect the Borough against claims for damage to persons or property as a result of use of the site under lease from the Borough. It is apparent that the person or organization seeking such a lease should be a recognized legal entity, qualified to obtain insurance and to accomplish the requirements necessary to protect the public interest.

Land Disposal Policy In Other States

In June of 1976, David Hanson, Chief of the Alaska Department of Natural Resources Planning and Research Section, wrote letters to the land departments of many states with situations similar to those of Alaska. The focus of the questions asked by Hanson was on the land disposal policy employed by the various State land departments. The responses from the different states varied, but many interesting issues were raised. Some of the states' only responded as to the policies utilized with regard to their school lands. But the responses shed a little light on a number of topics important to a discussion of State land disposal policy.

The nature of the questions asked by Hanson is characterized by these examples.

1. What methods of programs would insure that land disposal would be restricted to conform with appropriate land uses as determined by statewide policy or local plan?

2. What methods of disposal would prevent or discourage land speculation yet recognize real needs for land?

3. What is your state's experience or policy in the application of restrictive covenants or use easements?

4. Has your state disposed of land by means of perpetual, non-possessory interests in land that are tied to a specific use, while retaining other development rights?

5. Has your state disposed of land with stipulations that the land be developed within a certain time period, and if so have stipulations been effective in meeting the particular objective?

6. What general classifications of land does your state sell or lease and what is your criteria for disposal or public retention?

7. What degree of administrative or land management responsibilities might be associated with the implementation of the above questions?

8. How much land does your state own and how much has been sold?

The responses, summarized and state-by-state follow:

California

William F. Northrup, Executive Officer of the State Lands Commission, responded by pointing out that the Commission administers school grant land, swamp and overflow lands, and tidelands in the state. Including tidelands, the Commission today controls more than 5 million acres of But 5 million acres of school lands have been sold along with 2.2 million acres of swamp land. There have been no land sales since 1970 except those needed by certain public agencies. Northrup characterized California as moving towards the long-term lease in the application of covenants and retained state rights in the land because perpetual covenants and sale deed restrictions had proved unworkable. Not only was it difficult to enforce deed covenants, but it was also near impossible to foresee the needs of the future. Leasing allows a vehicle for change to meet these changing needs. In California use restrictions have been used in leases which stipulate development within a certain time. Such restrictions have not been attempted in deeds of sale. Above all, reminds Northrup, that effectiveness of time constraints, or any other restriction, is only as good as the agency's management and police efforts.

Idaho

Natural Resource planner, Lynn Thaldorf, answered for this State's Department of Lands. Idaho received approximately 3.6 million acres at statehood and has sold a little over 1 million acres to date. State land sales are conducted with full notice to the appropriate county land use agency. Idaho retains lands valuable for timber, recreation, or watershed purposes. Lands useful for agriculture and grazing or which are isolated or surrounded by private property holdings are usually made available for sale. The state also carries on an active exchange program with the Federal government to compensate for the shotgun ownership pattern of some state lands. Idaho has had little experience with use restrictions, timed development, or scenic easements on state land disposals. Land sales are all on an oral auction basis. Patented sale tracts are nominated by the community at large. Land office agents then analyze the nominated parcel and determine whether a sale action is appropriate. Idaho has no regulations to restrict the use of lands once they are sold. Land use control is a function of local (county) governments.

Nevada

The Division of State Lands in Nevada now owns 2,796 acres. Deputy State Land Registrar, Kigoshi Nishikawa, writes that approximately 2.7 million acres of State lands have been sold. Nevada used to reserve mineral rights to land sold by the state, but an attorney-general's opinion ruled those reservations invalid. Nevada retains no authority to control land uses after the land has been sold. Land use controls

are a local perogative except in certain areas legislatively recognized for their critical environmental values. Nevada quit selling state lands in 1965 and has no experience with timed development, use restrictions, or any other land use controls. Nevada appears to have little interest in land use controls at the state level. Nishikawa suggests that management responsibilities are particularly onerous when the state attempts to tell people how to use lands in private ownership. Nevada could well serve as a model of the western land ethic.

Louisiana

C. J. Bonnecarrere, Secretary of the State Mineral Board, wrote an exceedingly friendly letter. In it he advised that Lousiana had made all of the mistakes that could be imagined in the disposal and management of their state's land. He reported that it was 1930 before the state began to take their management responsibility seriously and started the resource assessment work necessary for making good constructive planning decisions. Bonnecarrere pointed out that what was significant to Alaska as a state was also important to the nation as a whole. He urged the State to go slow and purposefully and not be afraid of developing innovative procedures. Bonnecarrere felt that the cost of multiple "gold rushes" would be prohibitive for the State and the nation. He warned that resource evaluation was very important so that use decisions take all values into account. He found single use management is destructive from either side of the coin. It must be remembered that the passage of time significantly affects the value of certain resources. Bonnecarrere spoke from 36 years of experience in the Louisiana land department and urged Alaska to recognize that retention of certain lands is in the best interests of the State and its people.

New Mexico

Assistant Attorney General, Ernest L. Padilla, of the State Land office wrote for the Commissioner of Public Lands in New Mexico. New Mexico was originally granted approximately 13 million acres of land. About 4 million of these were sold, although a current moratorium has suspended sales of state lands. The remaining 9 million acres are considered trust lands and are managed for revenue purposes. Padilla points out that the best interests of the trust do not always coincide with those of the general welfare of the state. The state moratorium on land sales is based on the view that, over the long run, land will continue being a much better asset. The state does make land available to municipalities. Leases, easements, water rights, timber and gravel sales are all administered by the Commissioner of Lands. The purpose of all land transaction is to get the best deal for the trusts. New Mexico depends on local government for land use controls.

Wyoming

Commissioner of Public Lands and Farm Loans, A. E. King, responded for Wyoming stating that his office adminstered 3.6 million surface acres

and 4.4 million acres of granted mineral land. King advises that the principle tool in restricting land use is to retain ownership. The only title reservation for state land sales is the mineral estate, and Wyoming does not utilize restrictive covenants because it is felt that they unfairly restrict the flexibility of the purchaser. In order to curb speculation, Wyoming often leases valuable lands and even if lands are sold, easements for public access for fishing, hunting, and other purposes are regularly reserved. The state retains development rights when they grant easements but use requirements, development timing, or length of tenure are not a subject of sales. Wyoming utilizes a homesite lease with development requirements for the planned development of recreation areas. State land disposals are only made when it is in the best interest of the taxpayers of the state. Wyoming also recognizes that land ownership requires land management and has a complete and professional staff of appraisers, foresters, and mineral landmen. Wyoming has sold a bit more than one half million acres of land of an original surface entitlement of 4.2 million acres. They have current leases on 3.6 million acres. The tone and competence of the letter was of high quality which may speak for Wyoming's land management program.

Montana

Acting Commissioner, Leo Berry, Jr., of the Department of State Lands wrote from Montana, and his response concerned school lands in the state. Montana sold 1.1 million acres of their original entitlement and currently manages the remaining 5.1 million acres. Policy since 1970 has been to not sell school lands because land ownership has been a better hedge against inflation. Agricultural lands have not been sold for more than 15 years because lease revenues have been more lucrative than returns from investment of land sale principal. Localities are responsible for land use control, but Montana believes that lease restrictions are more effective land use controls than deed covenants. For land sales, acreage limitations and use restrictions are the best way Montana has found to curb speculation, but Berry agrees that it is difficult to totally prevent it. Grazing land and "4th class land" is the only type of land sold in the past few years. Orderly development of subdivisions is the responsibility of the Community Affairs Department who watch over water and sewer requirements. 4th class land is only offered and sold in alternate lots of 5 acres and less. Revenue production is the chief purpose of trust land management. Timber and water shed lands are not sold under any circumstances. Montana sold school lands rapidly to establish a general fund in the 1890's. Since that time, Montana has restricted sales to lands of limitied resource value where management costs exceed returns.

Colorado

Raymond H. Simpson, President of the State's Board of Land Commissioners, responded to the Hanson questionaire. Simpson said that Colorado's land

use laws were the responsibility of the counties. The board cooperated with these local governments and state land was zoned according to local zoning restrictions. Simpson said large BLM ownership in their state reduced the land available for commercial purposes. Simpson thought strong zoning efforts could be successful in Alaska too. He felt that public lands should be subject to the same restrictions imposed on those lands privately owned. Colorado sold 1.7 million acres of their original entitlement of 4.7 million acres. Simpson stressed that leases must be managed and that covenants in patents have the same drawback. He suggested that future land use be controlled through the local zoning apparatus instead. Speculation can only be discouraged according to Simpson, when sufficient acreage is available. State land agencies must be careful to prevent a government created shortage. Retention of land is based on long term worth to the State. Agriculture and grazing leases are the dominant type employed in Colorado.

Utah

Utah has sold 5.5 million acres of an original grant of 9.5 million according to Donald G. Prince, Assistant Director of the Division of State Lands. Utah has no statewide land use policy, but any land owner is subject to local zoning requirements established by the respective county government. Utah sells lands on a competitive bid basis and reports that they have formed no method which would prevent or discourage land speculation. Utah does not employ restrictive covenants except for the reservation of mineral values. Sales of state land are only possible when the State Land Board determines that the action is in the best interest of the state. Sales are primarily for industrial development according to Prince although residential sales are being considered for the energy impact towns.

North Dakota

Owen L. Anderson of the State Land Department's legal staff replied for North Dakota. As it happens, North Dakota has neither statewide or local land use plans. Anderson could envision cooperation between the trust boards and the local land use regulations, if they are adopted, but reminded that the trust boards had a fiduciany duty above all else. Some use restrictions have been discussed for state lands but none have been implemented. Anderson expressed the opinion that speculation was the mechanism by which land evolved to its highest and best use. While speculation has had some harmful effects on the environment and economy of certain areas, it also serves to better manage the lands in others. For instance, a speculator is closer to the land and has a better feel for the value of a particular parcel. This is especially true when the state land agency doesn't have the luxury of a large number of field men. Anderson believes land use control comes through local comprehensive planning, enforced zoning and building codes, and reform of Federal tax laws that reward speculation. The best investment a state can make in good land use control is through local government.

North Dakota does not utilize restrictive easements and covenants in its land sales. But recently the Land Department has looked at the "scenic" easement favorably. The state has also considered selling only grazing rights to some lands so as to preclude the cultivation of native grasslands. The deeds to these lands would contain a reversionary clause which returned the land to the State if the owner ceased to use the lands for pasture and meadow purposes. This is only being discussed, and the state has no actual experience with the sale of limited rights in land. North Dakota has not considered requirements for timed development. Agricultural lands are sold while pasture and meadow lands are usually leased. Agricultural lands are sold because North Dakota legislature and trust boards feel that farmers are the best stewards of the land. Natural acres best suited for wildlife habitat, waterfowl production, or parks are not sold at public auction but are sold to other state agencies at private sales. Anderson feels that the fact that many state agencies manage their own lands is a deficiency in the system. But he also believes that a more rational centralized management would be politically impossible.

North Dakota, like all the states except Nevada, retains all minerals in the lands that are sold. The state originally owned 3.1 million acres of land and acquired an additional 1.5 million acres through farm foreclosures during the Depression. All but 40,000 acres of the farm lands have been sold and approximatley 750,000 surface acres are still managed by the State Land Department. Also the state controls more than 3 million acres of mineral lands, 800,000 of which are classified as coal lands. Anderson said that in order to utilize all of the techniques described in ADL's questionaire it would require a large highly professional permanent staff. He did not see this occurring in frugal North Dakota.

Oregon

William S. Cox, Director of the Division of State Lands complained that Oregon disposed of their grant lands rapidly and the methods could be characterized as a broad giveaway. Cox argues that by 1976 standards, the grant lands could have been the key to maintaining state policies on hunting, fishery, and other land use needs not recoginized by the Federal government. Cox asks Alaska if we are really clear about the purpose of state land ownership, wonders if disposal is really necessary, and urges consideration of the long term lease as a means for permitting use but maintaining ownership. Oregon no longer sells land and stopped sales back in 1969. During their active sales program they used no restrictive covenants except mineral reservations. Cox points out that the state can make such deed restrictions as it might choose, but they are often impossible to enforce after the first buyer in the chain.

Cox believes speculation can only be curbed when the government owns the land and permits its use through leasing. Long term ground leases will permit development and amortization of lessee's costs. Then at time of

renewal the situation can be reevaluated. Periodic rental adjustments reflect the increase in land value. The restrictions used in leases are considerably more effective than the same terms in a sale deed. Oregon leases grazing lands but most of the more productive properties have already been sold, many before 1910. But even for the 770,000 remaining state acres, Cox has a complete professional staff of timber, range, recreation, and wildlife managers. Cox calls for the utilization of professional expertise to translate the state's needs into specific management criteria. The level of staffing depends on the level of control desired and the intensity of use in Oregon creates different demands than that experienced in Alaska. But Cox stresses that ownership requires management. Oregon's original school grant was 3.5 million acres and the rapid sale of these lands has been chronicled as a sad day in Oregon history. Cox urges study of the Oregon experience in order to really understand the importance of land ownership.

Arizona

John M. Little, Administrator of the Land Use and Planning Section of the State Land Department answered briefly for Arizona. Although not responding to the eight specific questions, Little enclosed a copy of the State Land Department's Land Use Plan. The planning power was delegated to the State Land Commissioner in 1972 by a legislature that wanted the Land Department to "Make long range plans for the future use of state lands in cooperation with other agencies and local political subdivisions". Rather than halt business and create a PLAN for activities that had been going on for 75 years, the Land Department designed an Operating Program for Environment and Resource Advantages. The Land Department used program rather than plan so that people would realize that the scheme was already in action.

Little blames the failure of most State Land Use Plans on the fact that no one realizes that the point of beginning is not the plan but the need to state the objectives (or policy). Planners have a penchant for trying to overlay the natural tensions of society with a universal "plan". But it is difficult to formulate a system that would cover any and all needs for food, fiber, minerals, aesthetics, recreation, etc. Another planning shortcoming is the absence of compatible terminology between the different levels of practicing planners. This is true too in Alaska when we compare State and Federal land classification programs. In order to make a plan at all useful, we must be clear about the tangible purpose of our efforts.

Arizona follows this policy in its land use operating program:

> "It is the policy of the State of Arizona to manage its land and resources for perpetual production of food, fiber and timely recovery of minerals, and
>
> (a) establish workable criteria to modify the stated objectives of the policy, and

(b) within the standards of the policy, to allow the people of Arizona the highest degree of freedom to chose their life-style and the industries to accomodate these life-sytles."

In addition, Arizona considers all public property as a trust resource. Leases and sales are at fair market value. Water use law is also carefully proscribed. Arizona maintains as complete a resource inventory as they can afford. Land use decisions are designed by professional resource managers. Public input is sought and decisions reflect both local and statewide interests. Appeals are accommodated in the process as well. Once a program is adopted, the Land Department is responsible for implementation and enforcement. The management criteria established by the Commissioner for the professional managers is instructive.

Values: Every acceptable and available tool and theory is used to arrive at monetary market values and weigh these against values that may be lost by the activity proposed.

Leases: Grazing - the ability to use. Agriculture - availability of water.

Sales: Sell only when sale can be justified on some basis other than that there is a buyer.

Trades: Improve land ownership patterns for trust management and as a preference over sales.

Selections: The highest forseeable value and management patterns.

Water: Beneficial use on a priority basis as provided by law.

Arizona believes that its policy is based in law and its process is designed to achieve the challenges of real life, land management, and administration. The emphasis on clear statements of policy and the attitude that day-to-day operations cannot be suspended while a plan is being formulated could serve as good examples for Alaska.

TITLE I—SHORT TITLE, DECLARATION OF POLICY, AND DEFINITIONS

SHORT TITLE

43 USC 1701 note.

SEC. 101. This Act may be cited as the "Federal Land Policy and Management Act of 1976".

DECLARATION OF POLICY

43 USC 1701.

SEC. 102. (a) The Congress declares that it is the policy of the United States that—

(1) the public lands be retained in Federal ownership, unless as a result of the land use planning procedure provided for in this Act, it is determined that disposal of a particular parcel will serve the national interest;

(2) the national interest will be best realized if the public lands and their resources are periodically and systematically inventoried and their present and future use is projected through a land use planning process coordinated with other Federal and State planning efforts;

(3) public lands not previously designated for any specific use and all existing classifications of public lands that were effected by executive action or statute before the date of enactment of this Act be reviewed in accordance with the provisions of this Act;

(4) the Congress exercise its constitutional authority to withdraw or otherwise designate or dedicate Federal lands for specified purposes and that Congress delineate the extent to which the Executive may withdraw lands without legislative action;

(5) in administering public land statutes and exercising discretionary authority granted by them, the Secretary be required to establish comprehensive rules and regulations after considering the views of the general public; and to structure adjudication procedures to assure adequate third party participation, objective administrative review of initial decisions, and expeditious decisionmaking;

(6) judicial review of public land adjudication decisions be provided by law;

(7) goals and objectives be established by law as guidelines for public land use planning, and that management be on the basis of multiple use and sustained yield unless otherwise specified by law;

(8) the public lands be managed in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values; that, where appropriate, will preserve and protect certain public lands in their natural condition; that will provide food and habitat for fish and wildlife and domestic animals; and that will provide for outdoor recreation and human occupancy and use;

(9) the United States receive fair market value of the use of the public lands and their resources unless otherwise provided for by statute;

(10) uniform procedures for any disposal of public land, acquisition of non-Federal land for public purposes, and the exchange of such lands be established by statute, requiring each disposal, acquisition, and exchange to be consistent with the prescribed mission of the department or agency involved, and reserving to the Congress review of disposals in excess of a specified acreage;

(11) regulations and plans for the protection of public land areas of critical environmental concern be promptly developed;

(12) the public lands be managed in a manner which recognizes the Nation's need for domestic sources of minerals, food, timber, and fiber from the public lands including implementation of the Mining and Minerals Policy Act of 1970 (84 Stat. 1876, 30 U.S.C. 21a) as it pertains to the public lands; and

(13) the Federal Government should, on a basis equitable to both the Federal and local taxpayer, provide for payments to compensate States and local governments for burdens created as a result of the immunity of Federal lands from State and local taxation.

(b) The policies of this Act shall become effective only as specific statutory authority for their implementation is enacted by this Act or by subsequent legislation and shall then be construed as supplemental to and not in derogation of the purposes for which public lands are administered under other provisions of law.

Making State Land Available For Private Use

Introduction

Alaskans want land for recreation headquarter sites. Some people fly to their sites, others prefer to use boats to travel rivers and lakes or bays and oceans for access. Other people prefer to ride the railroad or drive their car in order to reach a recreation cabin or campsite. Hiking, skiing, snowmachine, and ATV can also be used for access to recreation sites. The Alaska lifestyle makes demand for sites of this nature high.

Agricultural use of State lands is often the basis of demand for land. Potential agricultural uses range from 5,000-acre commercial grain farms to 10-acre subsistence farming efforts. Interest in grazing livestock on State lands exists as well. The variety of demands for agricultural lands requires a range of programs to satisfy the range of potential uses.

People want State lands for residential homesites. A portion of this demand is focused around urban centers while some of it is more rural in character. There are also those hardy souls looking for an isolated homesite. State lands are available to satisfy the latter demands while those who require their homesites close-in will have to look to other land owners. The same rule applies to business locations, although some commercial opportunities may be realized on State trust lands.

The papers in this section deal with disposal methodology. The first paper is a fact sheet on the homesite program. The second describes some changes in the Open To Entry program that were suggested by folks who entered land under its authority in the Talkeetna area. The third paper in this section looks at some varieties of demand for land in Alaska and illustrates, for discussion purposes, appropriate responses available to the land owner. The final paper is a listing of the pro's and con's of certain disposal methods that were analyzed by the Department of Natural Resources.

FACT SHEET ON HOMESITES

The homesite entry bill was approved by the last session of the State Legislature. The Division has received numerous inquiries about homesites. The following list of facts should help answer most of the questions raised:

1. There are no homesites available now. It's anticipated there will be by next spring.

2. The homesite entry lands still need to be classified and surveyed.

3. Regulations needed to implement the law also have to be developed. They are being written now and should be ready for public hearing around the end of August or the first of September.

4. The regulations will then go to public hearing. They will be held statewide. Times and places will be announced when the regulations are ready. The hearing process should take about 90 days.

5. The law specifies that land be made available in each of the four judicial districts on a rotating basis. The rotation will start in the Fourth Judicial District (Fairbanks), then to the Third (Anchorage) and then to the First (Southeast). The Second Judicial District (Arctic Slope) does not have any land that meets the criteria of the new law.

6. When homesite land becomes available it will be advertised for three consecutive weeks in newspapers and on radio and television.

7. An applicant must be 18 years old and a resident of Alaska for six years to qualify.

8. If there are more applications than land available, preference will be based on length of residency.

9. Before the homesite will be conveyed the applicant must build a habitable, permanent, single-family dwelling and occupy the land for a cumulative total of 21 months within a three-year period. Twenty-year residents only have to live on the land for five months.

10. The fee for filing an application will not exceed $10. The only other cost is for reimbursing the State for survey and platting work.

OPEN-TO-ENTRY, THE TALKEETNA EXPERIENCE

Excerpt from
Land: Bridge to Community in the OTE Area North of Talkeetna
by Dr. Robert A. Durr, August 1974

The dilemma the Entry lands people face is this: they recognize the right and des[illegible]y of the public's having access to the land just as they had, a[illegible] do not want to exclude anyone who wishes to share in the real va[illegible]f living on the land as they have (speculators and developers excepte[illegible]At the same time, they are clearly aware that, if the present O[illegible] Entry laws are maintained, allowing the occupancy of adjacent 5 [illegible]racts blanketing the land, the very values that brought the people to t[illegible] land and are bringing others would be destroyed.

In wrestling with this dilemma, the people have shaped the following recommendation for changes in the Open to Entry land laws. (insofar as the Open to Entry lands are microcosmic of the land situation in Alaska generally, these recommendations might apply to the overall question of land use.)

A) Perhaps the simplest solution deemed desirable by all the entrymen would be to close the present Open to Entry lands to further occupancy and open new areas to entry. As Don Sheldon put it, "If this particular area is saturated, (and) it looks to me that it is, and they intend to hold the line on the Open to Entry sites, I say close the local areas that are saturated and open some of the areas that are not saturated." He suggested, as possibilities the Kuskokwim, Colville, Yukon, Koyukuk areas, the Brooks Range, and the north side of the Alaska Range. Jim Barbeau agrees with the principle of widely dispersed Open to Entry areas: "These places shouldn't all be in one area----a large congregation in one area which would deplete the resources. They probably should be spread out all over the State."

Several people advised that a closure at this time, before things had gone too far altogether, would permit everyone, including the State, to assess over the next year, or five or ten years, what the Open to Entry Program has achieved and whatever and how its intitial policies should be changed or modified.

Mike Fisher of Talkeetna has been an interested and knowledgeable observer of the Program and its entrymen and believes it has been successful in the humanistic terms of this study:

> In general, I can say that I'm pretty pleased with what I've seen in the Open to Entry area of the survey. I've seen a lot of good old-fashioned nice neighborly things happeing out there. And I've met a lot of nice people who are helping themselves and their

neighbors, and they're living pretty well along the lines of what we'd call the good old days.....We do have a sense of community and a spirit out ther_, and we do h' hat I think has the potential for very nice things happening ıi that some of the kids that are raised out there will be ontributors to the society and the development of Alaska to come.

He therefore concludes that:

> If we have a human resource and a l. ouce in Talkeetna and around Talkeetna, and the results of this study indicate that people are bettering themselves, or attempting to better themselves, and the society is being served, and enlightened, and enhanced, then I say let's not run this thing into the ground; let's just say that with the present population density in this area of 20 persons per each 640 square acres, let's just see what develops out there.

Gene Roguszka concurs with the general principle and suggests that "when the filings reach the one third stage of land within a section, a moratorium be placed on further filings. The moratorim should last for a period of 36 months, the idea being this: give the opportunity for things in that particular area to stabilize." He adds that a provision would be necessary to prevent the unstaked areas from being used in the interim so that they would still be desirable if and when the Program were reopened in those areas.

B) The second most prevalent type of proposal was along the lines of an increase of acreage to each entryman. The specific numbers suggested ranged from 10 acres per person (a man and wife could than claim 20 acres between them) to 40 acres per family unit. (Surprisingly, perhaps, no one seriously urged the adoption of the homestead-scale of 160 acres, because they did not feel that much land to be necessary to subsistence and the best interests of the ecology and because they are aware of the abuses and specualtion that have plagued the Homestead Act.) The greater acreage allotment would be retroactive in that entrymen who have already filed on 5 acres could expand their present site to the maximum acreage allowed. In cases where 5 acre plots have been leased or bought adjacent to one another, as is frequently the case around lakes, the entrymen would have perforce to expand to the rear of his original 5 acres in "railroad car" fashion. This would at least be preferable to being restricted within the original allotment. It would have to be specified that the additional acreage be contiguous with the present site, in order to help obviate the temptation to speculate.

Most of the entrymen actually living on the land would agree with Joe Wilson's statement:

> I think where we need different land laws for different kinds of people is different laws for recreation-type people than you have

> for, you might say, homestead or live-on type people.....Five acres are fine for recreation..... to go out to a park for a weekend or so.....some people want to go out for, say a few years.....We've had all kinds of programs for national parks, national forests, and so forth, that are aimed at city people going out there for a short time. But I think that--- even though the people who want to live out in the bush aren't a great number of people and don't have a lot of voting power (as compared with the multitudes in the cities), I think there should be some provisions for people who want to go out into the bush and <u>live</u> there.

Jim and Gloria Barbeau of Talkeetna felt strongly that if a man or family can "prove up" by making a go of it on the land, the State should survey and give them the land. There is in fact widespread disgruntlement over the State "being in the real estate business": in effect managing the people's inheritance in order to sell it to them, as old-time bushman "Whitey" Rudder put it. It is argued that the revenue the State gets from the taxation of the land consequent to a person's receiving title is all that should be required.

C) Two other closely related proposals were:

1. To withdraw "green-belt" areas from occupancy around those localities which, because of desirability, have become densely populated, such as around most lakes and streams. This proposal would leave the "green-belt" acreage in the State's hands and open to the public for hiking, camping, and so forth, but it would permit the entrymen within its enclosure to utilize the resource, such as timber and firewood. The optimum extent of the "green-belt" that would afford a sustained yield of wood, berries, wildlife, and so forth, as well as guarantee an expanse of unoccupied land adequate to the psychological and spiritual needs of the people, can probably be best determined in consultation with forestry experts. But the people's initial estimate is that the "green-belt" would have to be no less than 60 acres deep on the score of the latter consideration alone.

2. A proposal to "checkerboard" the 5 acre plots was made by a couple from Anchorage who use their 5 acre site for recreational purposes. The idea is to prevent the possibility of the 5 acre sites being located immediately adjacent to one another, and thereby insuring a greater degree of privacy, quiet, and unspoiled landscape. This plan is obviously most feasible for the recreational use of the land and would be inadequate to the needs of the year-round homesteader. A combination of a "checkerboard" and "green-belt" patterning of certain areas might be better than either alone.

D) A large portion of the people living on the land expressed concern, anger, and resentment at the prevalence of speculation. With land for human use so much at a premium, they vigorously object to those who would "tie it up" just to make money from it. As one individual put it:

> Open Entry I think is being abused as much as the Homestead Act was. You know, people were supposed to homestead and farm and build communities. In Alaska they homesteaded, tore down the trees, and then they left, because that's how you get your land. So that program was badly abused. So now they come up with Open Entry, and it's supposed to be another deal where everybody gets land they want to use-----you know, it's actually written in there that you have to want to use the land yourself-----but it's being abused the same way. Everybody goes out and stakes, but they're not using it. They want it so they can sell it.

In everyone's opinion, it should not be possible for anyone to spend a few hours on the land, pay fees, and eventually obtain title. Mike Fisher sums it up:

> I'd like to see some aspect of the law that tended to preclude speculation with Open to Entry lands.....The law should have some provision in it that favors an individual who will go out and sustain himself on the land. And by sustain himself.....I mean actually go out there and live on the land, and learn some things and make some observations.....I think that a requirement to obtaining eventual title to this land should be at least a token amount of living on it. I don't believe it should be possible to just go out and set foot on the land once.....and wind up with that land. It's that sort of thing that encourages useless and blind and deleterious speculation.....

The people are not adamant about these recommendations as constituting the only solutions to their dilemma. They mainly wish to make their problem clear to those who represent them and are empowered to take whatever action would effect a solution in the best interests of the land and the people, preserving those essential life-values that the humanistic use of the land cultivates.

FSLUPC Staff Paper
November, 1977

Disposal Methods

This paper defines various typical forms of demand for private acquisition of State land; outlines the different expectations and requirements of both the user and the State in each case; and suggests disposal methods which meet private and public interests as far as possible.

We have assumed several common public objectives that apply to any form of land disposal. These are:

1. To enable the various types of users to acquire land in locations and forms they need and, conversely, to prevent the land offering from being usurped by speculative interests.

2. To accommodate the interests of both the user and the public as far as possible.

3. To assure that land is used in accordance with State and local land use plans.

4. To minimize administrative costs.

We are asking Advisory Committee and workshop members to analyze and criticize this draft so Commissioners can have the benefit of your thinking at the next meeting. In writing this piece, the author has assumed the role of both the private interest and the State somewhat facetiously, but with the hope that doing so will spark your interest, critique, and comment.

Case 1

The individual who wants a site for a permanent residence within daily commuting distance of a community. Generally, this individual needs to be able to drive daily to the central community where he earns his living, shops, and educates his children. He probably needs financing for his house, so the method of conveyance should not pose a barrier to lending. Though he expects to build soon, life is uncertain; he may run into financial or other difficulties, so he doesn't want to be obligated to build by a set time. Public sewer and water are desirable, but if unavailable, the lot size should be large enough for on-site water and sewer. In most areas, two acres is adequate for this purpose. He is willing and able to pay a reasonable price at residential property rates, but he can be outbid by buyers who may want the land for commercial, industrial, or speculative purposes.

State interests. The State has very little land of this type to offer. Where it does own land of this type, the State's primary objective is that the land be well developed in residential use.

The State realizes that gaps in the growth pattern, caused by failure to dispose of public lands or by speculative landholdings, can add to the costs of public utilities and services and increase commuting distances. Sometimes the public values of close-in public recreation space outweigh these costs, but our case deals with close-in lands that are better suited for private residential than for public recreational use.

Disposal methods. Since the land in question is within the immediate range of community growth, the local municipality will be the recipient of both the public costs and public revenues of development. By State law, the municipality has local planning authority for the total community. For these reasons, it is decided that disposal is most appropriately handled by the municipality.

To protect the basic State interest that the lands be well used, the State decides to require local zoning and subdivision regulations as a condition of conveyance of State lands to the municipality. The State believes that the municipality will have far more success establishing land use controls before rather than after lands are conveyed to private parties, and should be encouraged to do so.

Where the State does own land of this type outside the jurisdiction of a municipality, prospective disposal areas are carefully evaluated to determine whether the location is part of a desirable pattern of community growth and whether public services can be extended to the area with reasonable efficiency. In making this determination, the State works closely with nearby communities and with the Department of Community and Regional Planning. When, as a result of these considerations, the State decides to dispose of the land, the method chosen is sale by public auction followed by over-the-counter offerings of remaining tracts. The details of the sale are tailored to favor the individual home builder. Before sale lots are (1) subdivided into a size that is adequate but not excessive for on-site water and sewer; (2) provided with developed access and power (though arrangements with the company serving the area); and (3) zoned for single family or duplex residential purposes. The size of the lot, together with the residential zoning, discourages speculative purchasers and help keep bid prices within reach of the home builder.

Case 2

The commercial or industrial developer who needs a site for an immediate construction project. This case is exemplified by the Collier Chemical Company in Kenai or the Teamsters' Buildings in Anchorage, both of which are built on State leaseholds. Generally, the commercial or industrial company has a particular site in mind and very exacting locational requirements, such as accessibility to deep water or a central location in a community. Because cash flow is a primary consideration, the company would like to minimize its initial investment and is strongly interested in gaining tax benefits through its method of tenure.

State interests. The State has only a few sites that meet the exacting requirements of a commercial or industrial developer. Since the State sees development as being beneficial to the economy and to the welfare of the citizens of Alaska, it is important to State interests that the few prime sites available be well used, and not be conveyed to a party who might hold the lands for speculative profit.

The land is highly valuable, and the developer is well able to pay a fair price for the land. The State also has an obligation not to undercut private owners of competitive sites. For these reasons, the State sees a public interest in asking market value for the use of the land.

The State is also interested in environmental quality and wants sufficient control over the design of a project to establish environmental protection measures. The high public interest and considerable potential public revenue associated with these key sites, justifies the expenditure that may be necessary for adequate administration.

Disposal methods. As in the previous case, commercial and industrial development is generally located in a community expansion area. It is appropriate that the responsibility and revenue for disposal of such lands belong to the municipality, since the municipality will have to bear much of the cost of providing public services for the development as well as for the population growth that the added employment will generate. Thus, the State classifies most of this land for selection by the municipality. The State interest in the quality of use of these key parcels is protected by requiring adequate municipal planning, zoning, and subdivision regulation as a condition to conveyance.

In the few cases where the State retains this type of land, and handles disposal directly, the disposal method chosen is a lease under a development plan contract. This approach has been used successfully in similar situations in the past, for example, Collier Chemical Company. Under a development plan contract, bidders submit development plans and schedules which become part of the terms of the lease for successful bidders.

The lease has a major advantage for the developer by minimizing capital investment in land. Since lease payments are a deductable business expense and since improvements on leased land can be depreciated over the term of the lease, the company gets a tax break. Leasing enables the State to establish desired land use controls and to receive fair value for the use of the property. In approving the development plan and schedule, and other terms of the lease, the State has an opportunity to negotiate with the company to secure environmental protection measures which may be necessary.

The company's obligation to meet annual lease payments together with the development schedule included in the terms of the lease help ensure that the State's prime land will be used productively.

Case 3

The individual who wants a recreation cabin site on waterfront land within a half day's travel from a major community. This person wants to build a summer cabin in a good recreation location, somewhere within a half day's drive or flight from the community where he lives. He wants his site to have some special recreational amenity, preferably water frontage, but a good view or a streamside site are also attractive. He needs to be able to reach his site easily, at least in the summer. If road building is necessary, he would prefer to share the costs of a public road construction project, rather than go through the hassle of lining up his neighbors and arranging for the construction himself. At any rate, the latter approach would not be feasible for more than a mile or so.

Generally, his cabin involves a significant cash investment. Since he works during the week, he has little time for a do-it-yourself project. Perhaps he will handle part of the construction himself, but he will purchase his building materials. He is definitely looking for a marketable title and, therefore, for a surveyed lot.

He is worried about vandalism and would prefer a few neighbors, but wants them far enough away from his cabin so he cannot see them. A site of two to three acres is adequate to his needs, assuming the surrounding area is laid out to include public open space available for general recreational purposes.

State interests. Most of the State lands of this type have been selected for the mental health trust, and must be managed to maximize revenues for this purpose. However, the State does have a limited supply of general grant lands of this type.

The State wants to plan these prime recreation locations carefully, especially the waterfront areas, to preserve public access to fishing lakes and key recreation sites. But, through detailed small area planning, the State identifies some areas that could be used by private parties. In fact, some argue that the mixture of public and private recreation lands enhances both forms of land use.

These lands have significant real estate value for the general public, and planning, surveying, and access development is costly. Furthermore, the prospective buyers are not hardship cases. Therefore, the State decides that it is in the public interest to charge fair market value.

Because these are scarce and desirable tracts, the State fears they may be acquired by speculators rather than users. The State has a constitutional mandate to choose a mode of conveyance that will favor the users as far as possible.

The State also wants to discourage the conversion of recreation cabins to year-round dwellings, since it does not want the public

State interests. The State has only a few sites that meet the exacting requirements of a commercial or industrial developer. Since the State sees development as being beneficial to the economy and to the welfare of the citizens of Alaska, it is important to State interests that the few prime sites available be well used, and not be conveyed to a party who might hold the lands for speculative profit.

The land is highly valuable, and the developer is well able to pay a fair price for the land. The State also has an obligation not to undercut private owners of competitive sites. For these reasons, the State sees a public interest in asking market value for the use of the land.

The State is also interested in environmental quality and wants sufficient control over the design of a project to establish environmental protection measures. The high public interest and considerable potential public revenue associated with these key sites, justifies the expenditure that may be necessary for adequate administration.

Disposal methods. As in the previous case, commercial and industrial development is generally located in a community expansion area. It is appropriate that the responsibility and revenue for disposal of such lands belong to the municipality, since the municipality will have to bear much of the cost of providing public services for the development as well as for the population growth that the added employment will generate. Thus, the State classifies most of this land for selection by the municipality. The State interest in the quality of use of these key parcels is protected by requiring adequate municipal planning, zoning, and subdivision regulation as a condition to conveyance.

In the few cases where the State retains this type of land, and handles disposal directly, the disposal method chosen is a lease under a development plan contract. This approach has been used successfully in similar situations in the past, for example, Collier Chemical Company. Under a development plan contract, bidders submit development plans and schedules which become part of the terms of the lease for successful bidders.

The lease has a major advantage for the developer by minimizing capital investment in land. Since lease payments are a deductable business expense and since improvements on leased land can be depreciated over the term of the lease, the company gets a tax break. Leasing enables the State to establish desired land use controls and to receive fair value for the use of the property. In approving the development plan and schedule, and other terms of the lease, the State has an opportunity to negotiate with the company to secure environmental protection measures which may be necessary.

The company's obligation to meet annual lease payments together with the development schedule included in the terms of the lease help ensure that the State's prime land will be used productively.

to have to shoulder the costs of elementary schools serving small isolated populations.

Disposal method. The State obtains topographic maps and other basic information about the land and prepares a detailed land use plan. In developing the plan, sites for lots are selected so that each will have some special recreation amenity, be it a good view or accessibility to a lake or stream. Areas for public recreation use are interwoven with areas for private acquisition, and particular care is taken to reserve campsites at lake outlets and intakes and public easements along the waterfront. Where the property is near the main road system, a summer road providing access to both public and private property is planned and developed. The lots are surveyed, roads are constructed, and arrangements are made with the Department of Highways for summer, but not winter, road maintenance.

There is a debate within the State administration about how to dispose of the land. It is generally agreed that the State should charge fair market value, that the offering should be limited to one lot per family unit and that the State should zone the property for recreational cabin use before the lots are offered to the public. Some think that a lease is the most effective method of putting the land into the hands of the users, but others point out that lease offerings are often left untaken at public auctions. Genuine users are few and far between and crop up gradually over time, rather than in a bunch at an auction.

It is finally decided that the most effective and flexible method of meeting both public and private objectives is to offer long-term leasehold interests, first at an auction and then to make remaining parcels available through an over-the-counter lease offering. Over time, the State expects that it will find enough parties who really want an attractive cabin site to pay off the costs of subdivision and access road development and, eventually, to compensate the State for the value of the use of the property. An additional reason for this approach is that the lease gives the State some future option of converting key recreation areas to public use as needed in the unforeseeable future.

Case 4

The farmer or agri-business wanting agricultural land for commercial agricultural purposes. This individual ranges from the small farmer who wants to make his living by farming to agri-businesses that may use a small quantity of land in combination with substantial capital improvements, to the barley farmer who must cultivate several thousand acres for an economically successful venture. Their common denominator is that they want to use land to produce food products and to do so at a profit. Essentially, they are businessmen for whom land is one of the factors of production.

Some of these farmers, though they are sincere in their wish to farm at present, see one of the long-term benefits of farming as being able to

subdivide and sell their property and reap the benefits of land value increases.

Their land requirements in terms of acreage vary widely, depending on the nature of their venture. A successful potato farm may use 40 acres, whereas a barley farm may require 2,000. Locational requirements also vary, since some regions are better for some types of agriculture than others. Access to the regional transportation system is vital for all.

All seek to minimize their investment in land, though some forms of farming with high productivity per acre are better able to tolerate high land prices and taxes than others. Barley farming, for example, probably could not survive under the high land prices in the Matanuska-Susitna Valley.

State interests. The State has made a policy decision to use part of its land base to encourage viable agriculture. There is a widespread belief that agriculture is a valuable, though minor sector of the economy, and a feeling generally that the citizens of Alaska would be poorer without local farming.

With this identified public interest in preserving and developing agriculture, the State is willing to dispose of agricultural land at below market values if this is necessary to encourage successful farming. But the State is very concerned that, in doing so, they put the land into the hands of true farmers. The State has had some bad experience with people who have used the "foot-in-the-door" technique to acquire rights to land under one set of conditions and then exerted pressure to change the conditions. In particular, previous State agricultural leasing programs have been abused in this manner.

Disposal methods. The State decides that it has a responsibility to the public to make sure that people who receive prime agricultural land have the necessary qualifications for successful farming. To this end, the State developes criteria and standards for screening applicants for agricultural land, including prior training and/or experience, and possession of necessary working capital. Applicants for agricultural land are selected on the basis of their qualifications as farmers, rather than by lottery or competitive bid. A blue ribbon commission of agricultural experts from the University, experienced farmers, and Soil Conservation Service personnel is established to make the selection.

To elicit applications, the State announces that it will sell agricultural development rights only at appraised market value to qualified applicants. Sale of limited rights means that market value and, hence, sale price is very low compared to value for full development rights.

Applicants must qualify by the standards of the screening commission and submit an acceptable farm development plan and schedule. Tract sizes are then tailored to fit the requirements of individual

applicants. The sale contract incorporates the farm development plan and schedule as part of the terms of the sale. The contract also specifies that the land reverts to the State should it be used for other than agricultural purposes.

Case 5

The individual who wants agricultural land primarily for residential or recreational purposes, rather than for commercial agriculture. This form of land demand is not easily represented by any one individual. Instead, there are several different types of people in this group. Some are retired persons who can afford to live away from a center of employment and who would like to have acreage to cultivate, more as an avocation than as a source of subsistence or income. Others are families whose wage earner works seasonally or intermittently at a remote site. He may be a construction worker, a military employee stationed at a remote site, or he may work on an oil rig. Since his commuting from home to job is infrequent, he is less troubled by a long commute than the person who commutes daily. Others are people whose version of recreation is more agricultural than water-related. They would like their weekend or summer home to be a place where they can keep horses, grow vegetables or mow a meadow. Still, others are people who want a "subsistence farm". They want to obtain part of what they eat through their own efforts, and have the cash to be able to afford to do so.

Most of these people find that 5 to 10 acres are actually enough for their purposes, though many of them think in terms of larger acreages, more for the satisfaction of ownership than for actual use. Most do not need to be within daily committing distance of employment centers but they do need access, often in both the winter and summer. Here again, if road construction is necessary for access, these people would find it less costly and more convenient to participate in the cost of a public project, than to try to gain an agreement of property owners along the right-of-way to develop their own road.

Most want agricultural land, but large units of level agricultural land are not essential. In fact, for some, a rolling or hillside location makes their site more attractive.

Members of this group are likely to have somewhat erratic sources of income. Their lives are generally less stable and predictable than regular commuters, and many would run into trouble if they were required to put up a structure by a given date as a condition of ownership.

Title to land is important to this group. They identify with the homesteading ethic, and ownership is a major part of their satisfaction with their property.

State interests. The State identifies several serious problems in accommodating the wishes of this type of individual. First, since many of these people will be building year-round residences in remote areas, the State is concerned that the public will be saddled with the extreme cost of providing schools wherever more than eight

children are located. If recipients of State lands subdivide their property, then the public costs of schools and other services to the remote area will be greater.

Secondly, there is a legislative policy that agricultural lands be devoted to agricultural purposes. Though many of these people seek agricultural land, it is dubious that their purpose is agricultural in the sense of developing that sector of the State's economy.

On the other hand, the State sees the land needs of these part-time or subsistence farmers as being a legitimate prospective use of State lands, and decides to accommodate their interests wherever it can be done without undue harm to the public interest.

Disposal methods. The State decides to dispose of some lands for this purpose along or near existing roads in areas that are already served by a rural school bus system. Outside of existing school bus routes, the State decides to limit disposal for this purpose to summer recreational use. They feel that it is possible to enforce the summer recreational restriction by locating in areas that are served by summer roads only and developing an agreement with the local government and the Department of Highways to maintain this policy. Zoning before disposal by either the State or the local municipality will reenforce the distinction between areas for summer recreational use and year-round residential use. It is doubtful, however, that zoning will be very effective in this regard unless it is coordinated with the highway maintenance program.

A further criterion in selecting lands for this form of disposal is to avoid large blocks of prime agricultural land, but, instead, to chose lands with lesser or scattered agricultural values. This approach will reserve the State's prime agricultural lands for commercial agriculture.

Once the location is identified, topographic maps are prepared and lots are carefully planned and subdivided to provide access, some agricultural acreage and, if possible, a view from each property.

In selecting the method of conveyance, the State considers home-siting, but decides against this method because it is felt that the prospective purchasers need more flexibility in the timing of their development than is allowable under the Homesite Law. Retirees, for example, may want to acquire their land sometime before they actually retire and build and live on it. Further, the lottery system in the Homesite Law makes it impossible for an individual who has a strong preference for a particular site to assert his preference by out-bidding others.

Instead, the State decides to sell lots of five acres at auction and to offer remaining unsold property-over-the-counter. Speculative acquisition for subdivision purposes will be discouraged by establishing residential zoning before the sale and by including a

covenant in the sales contract prohibiting subdivision and limiting use to accord with the regulations of zoning.

Case 6

The individual who wants an opportunity to live in a remote area. This person's primary objective is the experience of living in isolation in the Alaska wilderness. He is typified by some of the people who filed for land north of Talkeetna under the open-to-entry program, but who expressed dissatisfaction with the program because other people filed next to them. Typically, this person's wilderness experience is not a lifetime project, but a matter of "dropping out" for a year or more. Since he is removing himself from the economic mainstream, the cash resources which he can invest in land and structure are limited.

He respects the integrity of the land and appreciates the historic Eskimo concept that land is for all to use and cannot be divided up into special ownerships. Still, he wants to keep his neighbors at a considerable distance and he needs enough surrounding woodland to supply himself with firewood.

State interests. The State recognizes that, though this individual represents a very small segment of its citizens, he is a legitimate potential user of State lands. Unlike the other types of land users, this individual's needs are not as well met by private lands as by State lands. Private lands are more accessible, costly, and give our individual little guarantee of isolation. Therefore, perhaps the State has a special obligation to accommodate him. Further, the State sees this wilderness buff as a potential user of lands that are so isolated and inaccessible that they will have little use to most citizens. Thus, allowing this individual to use State lands is a way of extending the accessibility and usability of State lands. Cabins and trails in remote areas add to the safety and therefore the accessibility of wilderness areas.

On the other hand, the State does not want to commit land to a few individuals in a way that will be costly to the taxpayer. The State sees little public interest in assuming the considerable expense of surveying remote isolated tracts or of providing schools for small settlements in remote locations. Land appraisal in such areas is costly and uncertain because of the absence of an active market.

Disposal method. The State decides that the best approach to meet the public and private interests in this case would be to retain the land in public ownership and simply give the individual a permit to build and occupy a cabin for a number of years. He would acquire no ownership rights; his permit would not be assignable; and his cabin would be public property to be used by the next permittee. This approach is in keeping with traditional Alaska backcountry views of land and cabin rights.

The cabin location would not be staked or surveyed. Instead, the permit would be tied to a cabin location identified by a dot on an aerial photo. The State would identify a large remote area within which widely separated cabin site locations could be nominated by the prospective permittee. Through regulations, the State would establish certain ground rules for granting a permit, for example:

1. No cabin within a quarter mile of another.

2. Trails, but no roads to the cabin site.

3. Minimal standards for fire safety in cabin construction.

4. Renewable permit granted for a period of 10 years, with a requirement that the State must give the permittee 3 years' notice if it does not intend to renew the permit at the end of its term.

5. Permit is not assignable. If permit is terminated, cabin reverts to State and goes with the land. However, if the State decides to reissue the permit, the prior permittee has the right to nominate his successor and his nominee has a preference right to the permit, assuming he meets all other requirements.

6. Minimal annual permit fee, set in relation to administrative costs, not on the basis of land values.

7. Prospective permittee must attend a day's course at the Division of Lands, covering the concept of public ownership, fire safety, timber cutting to improve rather than harm the forest, etc.

Pros and Cons of Titles and Methods
of Disposal of Surface Interests in State Land
by
Gary Johnson
Alaska Department of Natural Resources, 1976

The first part of the following list will identify general pros and cons of various titles and rights to State land. The second part of this list will identify various pros and cons concerning methods of disposal. Although each of these subjects are very closely related, they are separated here for purposes of analysis. Any method of disposal might conceivably be used for conveying each land title or right listed below. The pros and cons have been determined in view of general public and State interests.

Part I

Titles and Rights

A. Fee Title

PROS	CONS
1. Few if any title questions or future complications	1. Opportunity for control over the use of land is lost (subject to local control such as zoning)
2. Allows highest and best economic use	2. Does not insure immediate use of the land
3. Simplifies land appraisal	3. Excludes public use of the surface
4. Puts land on the local tax roles	4. All surface development rights may be sold at a time and location that does not have optimum development of all rights
5. Gives private managers control over land for economic purposes	
6. Eliminates the responsibility of the State to pay local lien assessments	

7. Reduces the State's management responsibility (fire control)

8. Provides a land base and collateral for economic activity

9. An owner may take better care of the land because his misuse (erosion, dumping and vegetation removal) will subtract from the value when sold

B. Fee Title with real covenants

PROS

1. Controls the use of land without using police powers such as zoning

2.

CONS

1. The burden of proof is placed on the State rather than the land owner in questions of land use when hardship is shown

2. A real covenant will tend to evaporate over the years and no longer be enforceable

3. Very often a court will not enforce a real covenant on equitable grounds

4. Difficulty and cost involved in in administration and enforcement

5. May affect resale financing of the land and its value as collateral

6. Different State administration may interpret covenants differently

C. Defeasible Fee Simple

PROS

1. Strongly controls the use of land without using police powers such as zoning because the title reverts to the State if the condition is breached

CONS

1. Difficulty and cost involved in administration and enforcement

2. Will affect resale, financing and the value of the land as collateral

2. It is possible to clearly prove that breach has occured

3. It will tend to be permanent

4. Equitable conditions will rarely be used to annul conditions creating a defeasible fee

3. Breach of conditions need to be acted on immediately

4. Jurors tend to be reluctant to return adverse judgements to their fellow land owners

5. Conditions which are applicable at the time of conveyance may not be applicable at a future date

D. Title to an interest in land for a specific limited use (easement)

PROS

1. State retains ownership of the land while conveying the use interest

2. Retains other development rights in State ownership

3. Land is taxed only on the development rights transferred

4. Provides for lower priced land sales

5. Additional development rights may still be used

6. The interest may be sold, leased or mortgaged

7. Use of the land is controlled by virtue of trespass rather than zoning or covenant

CONS

1. A use interest title may not be well understood because many uses are not ordinarily conveyed in this way

2. Not as much collateral would associated with the land

3. Some administration and inspection is involved

4. Complicates land appraisal

E. Leasehold

PROS

1. Helps insure use of the land

2. Retains the land in State ownership

3. Provides a continuous State income

CONS

1. Requires substantial administration and management

2. Requires reappraisal every five years

4. Provides for the use of land at lower cost

5. Controls the use of the land through classification or covenant

3. Management costs may outweigh income to State

4. May tend to encourage misuse of the land (erosion, dumping, vegetation removal) because has no right to sell the land

5. Use may conflict with local zoning

6. Title to the land seems to be more desirable to most people

F. Non real property surface interests (leases, permits or resource sales that do not apply to fixed, permanent, or immovable things such as buildings and land)

PROS

1. Allows use of the land for grazing, shore fishery use, timber, material or water

2. Allows use of land or resources without conveying title to the land

3. Other uses cannot be excluded

CONS

1. People cannot be kept off the land if that is necessary to the user

Part II

Methods of Disposal

A. Auction

PROS

1. Fewer administrative procedures

2. Returns highest market revenue for the land

3. Promotes economic efficiency

4. Apportions the land fairly in economic terms

CONS

1. The auction method may bid land beyond its real value

2. Promotes speculative risk

3. State revenue from land is minor compared with other revenue sources

4. Tends to exclude low income people

5. Higher cost of land tends to encourage a more productive use of the land

5. Administrative costs can be fairly high

B. Negotiated

PROS

1. Reduces administrative costs associated with auction
2. Can make land available at a lower price
3. Depending on the objectives of the public administrators, tends to promote economic growth and reduce speculative risk

CONS

1. May place too much discretionary power in the hands of public administrators
2. Can create inconsistency in administrative decisions
3. Lower cost of land tends to increase the likelihood that the land will not be used for its most productive purpose
4. May favor certain classes of people
5. Returns lower revenue for the land

C. Lottery

PROS

1. Provides an opportunity for people of all levels of income or qualifications to obtain land
2. Distributes wealth

CONS

1. Does not promote economic efficiency
2. Places power in the hands of public administrators who may qualify applicants according to certain classes of people

D. Claim (Selected and filed on by individuals)

PROS

1. Reduces State costs of survey
2. Provides an opportunity for people of all levels of income or qualifications to obtain land

CONS

1. Creates ownership boundary problems
2. This is the poorest system in terms of orderly development and proper land management

3. Creates administrative problems

4. Tends to reduce revenue from land

Preference right

PROS	CONS
Protects the interests of an owner while providing opportunity for other buyers and higher land revenue if the preference right holder is limited to meeting high bid	1. Increases administration cost
	2. Increases discretionary power of public administrators
Protects the interests of someone who qualifies under the law if the preference right is negotiated	

Land Exchange

PROS	CONS
Allows the exchange of land that is more appropriate for public ownership for land that is more appropriate for private ownership.	1. Administrative time involved in negotiation
	2. Determination of value
Administrative tool to obtain land that the State couldn't otherwise obtain	3. Complexities involved in a two-way transaction
	4. Agreeing on a piece of ground

Municipal Land Selections

PROS	CONS
Assists local units of government with revenue	1. The land selection program is inequitable among the boroughs
Transfers land for local purposes in some case	2. Opportunity for control over use of land by the State is lost
Incentive to form a borough	3. Has not always been effective in getting borough formed
	4. Legal selection problems

5. Costs the State to maintain land management agreements

6. Many complex legal problems

H. Development Plan Required

PROS

1. Helps insure use of the land

2. Controls use of land while under contract or lease

3. Qualifies people and helps insure use the land according to State objectives

CONS

1. Requires substantial administration and inspection for compliance

2. May be inflexible in terms of changing conditions

3. May conflict with local plans or controls

4. Limits number of people who can qualify and buy

5. Discretionary power to Director may be abused

trust lands

Trust Lands

Introduction

Before Statehood, the Federal government granted certain lands to the Territory of Alaska for benefit of the University of Alaska (100,000 acres), the public school system (109,000 acres), and the mental health program (1,000,000 acres). The legislation which granted this acreage established its management in a constructive trust program with certain restrictions. At Statehood, these established trust responsibilities were conveyed to the State of Alaska. Currently, the Alaska Division of Lands (ADL) manages the trust lands for the respective trust boards.

Recently there has been considerable debate over trust land management. One group believes that trust lands should be considered the same for management purposes as any other State lands, and the trust boards should get a fixed percentage of State land revenues. Another course calls for turst land management to be separated from the ADL so the trust boards would be free to contract for land management services with private firms who may be more responsive to their revenue orientation. It is generally agreed that some changes are needed, and this underlines the importance of carefully considering the range of choices available.

The two papers in this section provide excellent background material for the trust land discussion. The first was written by Tom Meacham of the Attorney General's office for the Governor's Ad Hoc Advisory Committee on State Land Practices and Procedures. The second was prepared by land management consultant, Dale Tubbs, who was retained by the Board of Regents to study the University trust land ownership situation. The recommendations made by Tubbs are applicable, for the most part, to all of the trust lands, although his work was performed specifically for the University.

MEMORANDUM State of Alaska

TO: Members, Ad Hoc Land Advisory Panel

DATE: February 8, 1977

FILE NO:

TELEPHONE NO:

FROM: Thomas E. Meacham
Assistant Attorney General
Anchorage - AGO

SUBJECT: Brief Synopsis of School, University and Mental Health Trust Land Statutes

I have been requested by members of the panel to prepare an outline of the legal constraints presently placed upon lands conveyed from the federal government to the former Territory of Alaska, and later the State, for specific support of school, university and mental health programs. This outline will discuss each of the three land grant programs separately, though several of their aspects are similar. An extensive discussion of the legal precedents applicable to administration of these programs will not be attempted, though some significant legal point will be mentioned. Some of the material in this outline was abstracted from Alaska's School, University and Mental Health Lands, by Ronald L. McCowan, a 1975 legal intern with the Division of Lands.

I

UNIVERSITY LANDS

A. Federal Law. University lands were first granted to the Territory of Alaska by the Act of March 4, 1915, 48 U.S.C. Sec. 353, which states at Sec. 353:

> Reservation of lands for educational purposes; proceeds or income set aside; lands excluded. When the public lands of the Territory of Alaska are surveyed, under direction of the Government of the United States, sections numbered 16 and 36 in each township in said Territory shall be reserved for the sale or settlement for the support of common schools in the Territory of Alaska; in section 33 of each township in the Tanana Valley between parallel 64, 65 north latitude, and between the 145th and 152nd degrees west longitude (meridian of Greenwich) shall be reserved from sale or settlement for the support of a Territorial agricultural college and school of mines established by the legislature of Alaska

> upon the tracts granted in Section 354 of this title; provided, however, that if settlement with a view toward homestead entry has been made upon any part of the section reserved by . . . other lands may be designated and reserved thereof in the manner and reserved thereof in the manner and reserved in lieu thereof in the manner provided in sections 851 and 852 of Title 3; provided further, that the Territory may, by general law, provide for leasing said land in area not to exceed one section to any one person, association or corporation for not longer than ten years at any one time; and provided further, that the entire proceeds or income derived from said reserved lands are appropriated and set apart as separate and permanent funds in the Territorial treasury, to be invested and the income from which shall be expended only for exclusive use and benefit of the public schools of Alaska or of the agricultural college and school of mines, respectively, in such a manner as the Legislature of Alaska may by law direct. . . ."

Section 354 of the same act granted Section 6, T 1 South, R. 1 West, Section 31, T. 1 North, R. 1 West, Section 1, T. 1 South, R. 2 West, and Section 36, T. 1 North, R. Two West, Fairbanks Meridian, to the Territory of Alaska, under the express conditions that they ". . . shall be forever reserved and dedicated to use as a site for an agricultural college and school of mines; . . ."

It is clear from the quoted statute that the university lands granted by the federal government to the Territory were to be subject to lease only, and that the "entire proceeds or income derived" were to be appropriated as a permanent fund for the university under the direction of the territorial legislature; and as to the enumerated sections of land transferred by Section 354, they were to be used exclusively as the physical location of the university.

On January 21, 1929, another federal act was adopted which granted additional lands to the Territory of Alaska for university purposes. 48 U.S.C. Sec. 354(a) states:

Agricultural college and school of mines; additional grant of public lands; conditions and limitations. In addition to the provision made by Sections 353 and 354 of this title, for the use and benefit of the agricultural college and school of mines, there is granted to the Territory of Alaska for the exclusive use and benefit of the agricultural college and school of mines, one hundred thousand acres of vacant non-mineral surveyed unreserved public lands in the Territory of Alaska, to be selected, under the direction and subject to the approval of the Secretary of the Interior, by the Territory, and subject to the following conditions and limitations:

(a) the college and school provided for in this section shall forever remain under the exclusive control of the said Territory, and no part of the proceeds arising from the sale or disposal of any lands granted herein shall be used for the support of any denominational or sectarian college or school.

(b) It is declared that all lands granted to said Territory and especially transferred and confirmed to the said Territory and shall be by the said Territory held in trust, to be disposed of, in whole or in part, only in the manner herein provided, and for the objects specified in the granting provisions, and that the natural products and money proceeds of any of said lands shall be subject to the same trusts as the lands producing the same. Disposition of any of said lands or of any money or thing of value directly or indirectly derived therefrom or any object other than that for which such particular lands or the lands from which such money or thing of value shall be derived or granted or in any manner contrary to the provisions of this section shall be deemed a breach of trust.

(c) No mortgage or other encumbrance of said lands shall be valid in favor of any persons for any purpose or any circumstances whatsoever. Said lands shall not be sold or leased, in whole or in part, except to the highest bidder at public auction, notice of which public auction shall first have been duly given by advertisement, which shall set forth the nature, time, and place of the transaction to be had, with full description of the lands to be offered, published once each week for not less than ten successive weeks in a newspaper of general circulation, published regularly at the capital and in a newspaper of like circulation which shall then be regularly published nearest to the location of the land so offered; nor shall any sale or contract for the sale of any timber or natural product of such lands be made, save at the place, in the manner and after the notice is thus provided for sales and leases of the lands themselves; provided however, that nothing herein contained shall prevent said territory from leasing any of said lands referred to in this section for a term of five years or less without such advertisement herein required.

(d) All lands, leasehold, timber and other products of the land before being offered shall be appraised at their true value, and no sale or other disposal thereof shall be made for a consideration of less than a value so ascertained, nor, in the case of the sale of the land, less than a minimum price of $5 per acre . . .

(e) A fund shall be established in the Territorial treasury to carry out the purposes of this section, . . . the Territorial treasurer shall keep all such money invested in sale interest bearing securities . . . the income from said fund may and shall be used exclusively for the purposes of such agricultural and school of mines, providing that no portion of said income shall be applied, directly or indirectly, under any pretense whatever, to the purchase, erection, preservation, or repair or any building or buildings.

> (f) Every sale, lease, conveyance, or contract of or concerning any of the lands granted or confirmed or the use thereof of the natural products thereof, not made in substantial conformity with the provisions of this section, shall be null and void. It shall be the duty of the Attorney General of the United States to prosecute in the name of the United States and in its courts such proceedings at law or in equity as may from time to time be necessary to enforce the provisions thereof relative to the application and disposition of the said lands and the products thereof, and the funds derived therefrom.

This act, unlike the Act of 1915, permitted the sale of university lands received under it, provided that proper notice, appraisal and sale procedures were first used. Like the 1915 act, the 1929 act required the holding of all income derived from university lands or from products of university lands to be placed in trust for the support of the university, with only the income earned by that trust account available for expenditures to support the university.

According to figures compiled in 1975, university lands applied for by the Territory under the 1915 act, (which granted Sections 33 only) totalled 11,000.43 acres with 8,666.8 acres of that total patented to the Territory. Under the 1920 additional university land grant, application had been made for 99,303.3 acres and patent had been received for 99,414.5 acres, the difference in acreage being accounted for by correction of surveys after patent was received.

On July 7, 1958, the Alaska Statehood Act was passed, which stated in Section 6(k):

> Grants previously made to the Territory of Alaska are hereby confirmed and transferred to the State of Alaska upon its admission. Effective upon the admission of the State of Alaska into the Union, Section 1 of the Act of March 4, 1915 [the school and university lands act], as amended, . . . [is] repealed and all lands therein reserved under the provisions of Section 1 as of the date of this Act, shall, upon the admission of said

> state into the Union, shall be granted to such state for the purposes for which they were reserved; but such repeal shall not affect any outstanding lease, permit, license or contract issued under said section 1, as amended, where any rights or powers with respect to such lease, permit, license, or contract, shall not effect the disposition of the proceeds or income derive prior to such repeal from any lands reserved under said section 1, as amended, or derived thereafter, from any disposition of reserved lands or interest therein made prior to such repeal.

This grant to the State of the university lands "for the purposes for which they were reserved" is the grant under which the State of Alaska presently administers the university lands. It is important to note that the "purposes" for which the lands were first reserved were preserved by the Statehood Act, but the explicit conditions under which the Territory was required to manage the lands were not expressly continued into statehood, and were arguably repealed by repeal of the underlying act.

On September 19, 1966 Public Law 89-588, 80 Stat. 811, an act which repealed sections 3 through 7 of the 1929 University Land Grant Act (which include paragraphs (b) through (f) quoted previously). The purpose of this repeal was to give the State and the university more freedom in administering and disposing of lands granted by the 1929 act, without being constrained by the restrictive conditions imposed by the original act, a purpose which was previously achieved by Section 6(k) of the Statehood Act with regard to the 1915 university and school land grant act.

B. State Constitution and Statutes

Article VIII, Section 6 of the Alaska Constitution states:

> State public domain. Lands and interest therein, including submerged and tide lands, possessed or acquired by the state and not used or intended exclusively for governmental purposes, constitute the state public domain. The legislature shall provide for the selection of lands granted to the state by the United States and for the administration of the state public domain.

Article VII, Section 8 of the Alaska Constitution states:

> Leases. The legislature may provide for the leasing of, and the issuance of permits for exploration of, any part of the public domain or interest therein, subject to reasonable concurrent uses . . .

Article VIII, Section 9 of the Alaska Constitution states:

> Sales and Grants. Subject to the provisions of this section, the legislature may provide for the sale or grant of state lands, or interests therein, and establish sale procedures. All sales or grants shall contain such reservations to the State of all resources as shall be required by Congress or the State and shall provide for access to these resources . . .

Article VIII, Section 10 of the Alaska Constitution states:

> Public Notice. No disposal of leases of state lands, or interests therein, shall be made without prior public notice and other safeguards of the public interest as may be prescribed by law.

Thus, subject to any reservations prescribed by Congress, university lands are subject to lease and sale under procedures adopted in conformity with the Constitution.

Article VII, Section 2 of the Alaska Constitution states:

> The University of Alaska is hereby established as the state university and constituted a body corporate. It shall have title to all real and personal property now or hereafter set aside for or conveyed to it. Its property shall be administered and disposed of according to law.

AS 38.05.365(16) defines "state lands" as follows:

> 'State lands' or 'lands' means all lands including shore, tide and submerged lands, or resources belonging to or acquired by the state.

AS 38.05.370(20) defines "university lands" as:

> 'University lands' means all Sections 33 reserved to the university under 38 Stat. 1214, as amended, 48 U.S.C. 353 and all lands granted to or reserved for the benefit of the university.

UNIVERSITY OF ALASKA

AS 38.05.020, concerning the authority and duties of the Commissioner of the Department of Natural Resources, contains the following provision:

> (a) The commissioner shall supervise the administration of the land division.

AS 38.35.035 concerning the powers and duties of the Director of the Division of Lands, contains the following provisions:

> (a) The director shall . . . (2) manage, inspect or control state lands and improvements on them belonging to the state and under the jurisdiction of the division . . .
>
> (4) prescribe application procedures and practices for the sale, lease or other disposition of available lands, resources, property, or interest in them; . . .
>
> (6) Under the conditions and limitations imposed by law and the commissioner, issue deeds, leases or other conveyances disposing of available lands, resources, property or any interests in them;
>
> (7) Have jurisdiction over state lands, except for those lands acquired by the Alaska World War II Veterans' Board and the Agricultural Loan Board . . .

Section 38.05.030, which is an exception to the general statutory provisions regarding the sale or lease of state lands, states as follows:

> (a) The sale, lease or other disposal of university lands shall be made by the commissioner in accordance with the provisions of this chapter. University lands may be exchanged for (1) state lands; (2) privately owned lands; (3) vacant, unappropriated and unreserved public lands; and (4) lands owned by a city, borough or other public entity. However, all lands exchanged for other university lands must have the same fair market value as the other university lands. No sale, lease, or other disposal of university lands may be made without the approval of the Board of Regents of the University of Alaska.

AS 14.40.350, regarding the authority of the University Board of Regents, states:

> Sec. 14.40.350. Board of Regents authorized to lease lands. The Board of Regents may execute leases for mining, agriculture, or other purposes to the lands granted for the benefit of an agricultural college and school of mines for Alaska by the Act of Congress approved March 4, 1915, for such time and at such rent or royalty as may seem just and as provided by law.

AS 14.40.360 states:

> Sec. 14.40.360. Board of Regents authorized to select and to sell or lease lands granted by Act of Congress. The Board of Regents may select the lands granted to Alaska by the Act of Congress approved January 21, 1929, and may sell or lease them and deposit the proceeds in the state treasury in conformity with that Act.

Pursuant to the statutes, regulations have been adopted providing for the sale or lease of state land, with appropriate provisions where university lands may be involved. It is evident that the state statutes have been interpreted to require management of the university lands, together with other state lands, by the Department of Natural Resources and the Division of Lands.

II

School Lands

A. Federal Statutes. The federal statute granting surveyed sections 16 and 36 to the Territory of Alaska (48 U.S.C. Sec. 353) has been previously quote with regard to university lands granted by the same act. That statute, as originally enacted in 1915, provided only for the lease of such lands, and did not specifically allow the Territory to sell school lands. Further, the income derived from the lease of school lands was to be appropriated for the permanent fund, and only the income earned by that fund was to be used for school purposes.

Pursuant to the school grant, by 1975 Alaska had applied for 110,905.2 acres of federal lands, and had received patent to 100,202.3 acres.

In 1958, the Alaska Statehood Act was adopted, and provided in Section 6(k), as previously quoted, that grants previously made to the Territory were to be confirmed and transferred to the State of Alaska upon its admission, to the Union, repealing the Act of March 4, 1915 and granting them to the State "for the purposes for which they were reserved".

B. State Constitution and Statutes. The State constitutional provisions regarding the State public domain and the sale and lease of State lands, quoted previously in the context of university lands, are equally applicable to school lands received by the State.

The state statutes at Title 38, pertaining to the duties of the Commissioner of Natural Resources and the Director of the Division of Lands, quoted in the context of the university lands, apply equally to the administration of school lands. In addition, other state statutes specifically concern school lands. AS 38.05.365(14) states:

> 'School lands' means those rectangular sections 16 and 36 within each township surveyed on or before January 3, 1959, and confirmed and transferred to the State of Alaska upon its admission under Section 6(k), Alaska Statehood Act, 72 Stat. 339, and any other lands designated solely for school revenues.

AS 35.05.030(e), pertaining to exceptions to the general sale and lease policy of the State, states:

> The sale, lease or other disposal of school land under the jurisdiction of the Department shall be made by the commissioner in accordance with the provisions of this chapter. However, disposal of school lands, under this subsection, other than disposal by lease for a term of years, shall be made only for sites for school facilities or for public park and public recreation purposes. School lands may be exchanged for (1) state lands; (2) vacant, unappropriated and unreserved public lands, and (3) lands owned by a city, borough or other public entity. In the case of unequal value, cash may be used to equalize land values. If the Department determines that it is in the best interest of the State to dispose of the school lands located in Sections 16 and 36 in an organized borough or city of any class,

the borough or city is authorized, and has preference for six months after notice, to acquire the land at the appraised value by purchase or exchange of land acceptable to the Department. No sale, lease, exchange or other disposal of school lands may be made without the approval of the State Board of Education. The State Board of Education shall act as a trustee of school lands. The Board may obtain private counsel or other professional assistance when necessary, to carry out its duties as a trustee.

AS 38.05.032 states:

SCHOOL LAND DISPOSITION PROCEDURES. (a) Before the sale, lease or other disposal of school land, the director shall

(1) cause the preparation of a development plan which adequately describes the manner in which the land will be developed or utilized; however, no development plan is required for an exchange of school land to a public entity;

(2) make notice under sec. 345 of this chapter of the proposed development plan, stating that a disposal of the land for such use is under consideration, and that interested persons may make comments and submit alternative proposals for development and use within 30 days of the last publication of notice; and

(3) notify municipalities as provided in sec. 305 of this chapter at the same time notice is published or posted under (2) of this subsection; no further notice to municipalities need be given at the time of disposal.

(b) In the case of school land to be disposed of within municipalities, no disposal may be made until the municipal planning authority has held a public hearing on development plans and applications relating to the land

> to be disposed of. The director shall make development plans and applications available to municipal planning authorities for this purpose. No disposition of land may be made sooner than three weeks after a hearing held under this subsection. No disposition of land may be made unless the development plan is approved by the municipal planning authority.
>
> AS 38.05.070(c) states:
>
> A lease may be issued for a period up to 55 years . . . However, a nonrenewable lease for school lands may be issued for a period not to exceed 99 years.

School lands have been subject to lease for a term longer than the ten-year term originally set by the federal law in 48 U.S.C. Sec. 353, and such lands have also been subject to disposal by sale. It is thus clear that the interpretation given Section 6(a) of the Alaska Statehood Act is that upon confirmation of the grants previously received by the Territory for school and university purposes, the federal statute (48 U.S.C. Section 353-354 was repealed in its entirety, and only the purposes of the original grants, and not the conditions limiting the disposal of the original grants remained to govern State administration of these lands after statehood.

III

MENTAL HEALTH LANDS

A. Federal Law. On July 28, 1956, Public Law 830 (70 Stat. 709, 48 U.S.C. Sec. 46-3), entitled "Authority of the Territory of Alaska in the Field of Mental Health", was enacted. Title 2 of that Act made certain special grants to the Territory of Alaska for support of the mental health program, including certain land grants contained in Section 202 of the Act, in the following language:

> (a) The Territory of Alaska is hereby granted and shall be entitled to select, within ten years from the effective date of this Act, not to exceed one million acres from the public lands of the United States and Alaska which are vacant, unappropriated, and unreserved at the time of their selection . . .

(b) The lands authorized to be selected by the Territory of Alaska by Subsection (a) of this section shall be selected in such manner as the laws of the Territory may provide, and in conformity with such regulations as the Secretary of the Interior may prescribe. The authority to make selections shall never be alienated or bargained away, in whole or in part, by the Territory. . . .

(c) All grants made or confirmed under this section shall include mineral deposits; providing, however, that mineral deposits in lands which on January 1, 1956 were subject to Public Land Order No. 82 of January 22, 1942, shall not be included.

(d) Following the selection of lands by the Territory pursuant to Subsection (b), but prior to the issuance of final patents, the Territory shall be authorized to lease and make conditional sales of selected lands.

(e) All lands granted to the Territory of Alaska under this section, together with the income therefrom and the proceeds from any dispositions thereof, shall be administered by the Territory of Alaska as a public trust and such proceeds and income shall be first applied to meet the necessary expenses of the mental health program of Alaska. Such lands, income and proceeds shall be managed and utilized in such a manner as the legislature of Alaska may provide. Such lands, together with any property acquired in exchange therefor or acquired out of the income or proceeds therefrom may be sold, leased, mortgaged, exchanged, or otherwise disposed of in such a manner as the legislature of Alaska may provide, in order to obtain funds or other property to be invested, expended or used by the Territory of Alaska. The authority of the Legislature of Alaska under this subsection shall be exercised in a manner compatible with the conditions and requirements imposed by other provisions of this act.

The Alaska Statehood Act at Section 6(k), quoted previously, confirmed this grant of lands to the State of Alaska. However, the 1956 Mental Health Act was not repealed by the Statehood Act, since at that time Alaska had approximately eight years remaining within which it was permitted to select lands under the Act. As of 1975, Alaska had selected 1,026,147.9 acres of land under its mental health grant, and had obtained patent to 787,532.8 acres. In addition, it had obtained tentative approval to 187,294.1 acres of mental health selections.

Lands selected and tentatively approved to the State under the Mental Health Act have also been selected by various Native Village corporations under the Alaska Native Claims Settlement Act. The Alaska Native Claims Appeal Board has ruled that those Native selections are not valid, since mental health lands did not "pass to" the State of Alaska pursuant to ANCSA, but were a previous grant prior to Statehood, and thus not subject to selection under ANCSA. It is expected that further Court proceedings may be anticipated to resolve this issue.

B. State Constitution and Statutes. The State constitutional provisions applicable to mental health lands, as part as the State public domain, have been previously quoted in the section discussing university lands. State statutory provisions concerning the authority of the Commissioner of Natural Resources and the Director of the Division of Lands, quoted previously, apply with equal force to the management of mental health lands, with some additions. AS 38.05.365(8) states:

> 'Mental Health Lands' means lands granted under Title II, Section 202, of Public Law 830, 84th Congress, 2nd Session, as heretofore or hereafter amended.

AS 38.05.035, regarding the powers and duties of the Director of the Division of Lands, states in subsection (a)(13) that the Director shall:

> select, administer and dispose of mental health lands for the support of the mental health program, except that no mental health lands may be disposed of without the approval of a board composed of the director of the Division of Mental Health, Chairman of the Mental Health Advisory Council, and the Commissioner of Revenue.

IV

COURT DECISIONS

There have been no Supreme Court decisions in Alaska regarding an interpretation of the trust status of school, university or mental health lands. A 1975 Alaska Supreme Court case had the opportunity to examine the specific deed restrictions imposed on university lands granted for the site of the University. U. of Alaska v. National Aircraft Leasing, Ltd., 536 P.2d 121 (1975). A 1964 opinion of the Attorney General, which has some persuasive effect but which does not have the force of law, determined that trust lands, after they are transferred to the State of Alaska, under the Alaska Statehood Act, were subject to the express proviso that they be used for the purpose for which they were originally reserved. A copy of this Opinion of the Attorney General is attached hereto.

State courts in other states have discussed the trust responsibilities of states regarding lands granted to them under the terms of a particular federal act, and have generally held that the administration of the lands must conform to the grant, and to the acceptance of that grant by the State. Magnolia Petroleum Co. v. Price, 206 P. 1033 (Okla. 1922); State Highway Commission v. State, 297 N.W. 194 (N.D. 1941); Application of Dasburg , 1133 P.2d 569 (N.M. 1941). This subject has also been discussed by the Supreme Court of the United States in Lassen v. Arizona, 385 U.S. 458, 17 L.Ed. 2d 515 (1967).

This brief discussion of applicable case law is not intended to be exhaustive or analytical, but merely to indicate that there is general case-law support for the position that the administration of school, university and mental health trust lands is a trust responsibility, and is governed to a degree by the language and conditions of the original statutory grant of lands. The extent to which such original grant still controls details of the methods and terms under which such lands may be leased or sold, however, is not discussed here, as it is a subject upon which there are no clear guidelines in Alaska at the present time.

OF ALASKA

UNIVERSITY OF ALASKA TRUST LAND MANAGEMENT

by Dale Tubbs, Moening Grey and Associates
December, 1977

Recommended Proposal for Improved Management of University Trust Lands

Management of the University Trust Lands has been a role of the Alaska Division of Lands with little input from University of Alaska Board of Regents. The land management policies developed have been those derived for other state lands with little or no specific direction from the Board. The purpose of this proposal is to formulate policies and directives, define the Board's objectives for university land management, relieve itself of housekeeping tasks by delegating certain responsibilities to the University's administrative officers, and provide the Alaska Division of Lands with specific direction for university land management.

Implementation of the improved land management objectives will require some legislative action to maintain the trust and provide uniformity. The major emphasis will be placed on Board policy from which the Division of Lands will operate.

The proposals being considered are with the assumption the Division of Lands will continue to act as the Board's land management agent.

Recommended Board of Regent Procedural Changes

All transactions involving university land do not warrant full Board involvement. It is recommended the Board delegate to the President of the University of Alaska those transactions similarly delegated to the director of lands and

the Board retain for its action all transactions parallel to those of the Commissioner of Natural Resources. An exception to this delegated authority could be the approval of land classification orders.

The purpose of this change is to relieve the Board from having to consider land transactions with little or no adverse impact on the university lands. It will also speed the process for making lands and resources available to the public. A further modification is to have a committee within the Board provide the approvals comparable to those of the Commissioner. If the disposal request fits within the Board's policy and guidelines, little or no further Board involvement should be necessary.

In regard to the agency relationship with the Division of Lands, the Board is recommened to cancel or revise the existing Management Agreement[1/] entered into on October 12, 1960. The agreement was signed by Wm. R. Wood, then President of the University of Alaska, and Phil R. Holdsworth, then Commissioner of Natural Resources. This agreement has become out dated and the Board's new approach to land management needs to be discussed with the Division of Lands.

The implementation of a revised land management policy is suggested on several fronts. These include: legal research to basic questions involving the trust lands and their use; recommended legislative changes to benefit the trust lands; Board of Regent land management policy directives; and directives to the Division of Lands for land management action. Each are elaborated below.

Legal Research

Obtain legal opinion to determine:

1. If university lands are included in the term state lands as used throughout the text of AS 38. with special emphasis on As 38.05. 365(16).[2/]

2. If the University of Alaska is required to deposit the fair market rental value into the trust fund when it uses its own lands for university purposes.

3. If university lands can be staked under the mineral location laws (AS 38.05.185-.280)[3/] without providing a return to the trust fund.

4. If a lease that is being assigned can be reappraised to establish a new rental fee.

5. If gift, endowment and purchased lands are exempt from disposal procedures as established in AS 38. Also, determine the impact of AS 38.05.030(d)[4/] in regard to endowment lands.

6. If land management costs can be recovered from the trust fund and the applicability of making the funds available to the Division of Land by using a reimburseable services agreement.

7. If Chapter 138 1977 SLA[5] that repealed and re-enacted AS 38.05.085 and .105, violates the fair market return required for trust grant lands.

8. The extent to which the Board of Regents may delegate authority to the President of the University and/or staff members and meet the intent of AS 38.05.030(a)[6] Can a parallel be struck similarly to the Commissioner of Natural Resources and the Division of Lands Director.

Legislative Changes

Existing statutes were identified in the land management study having an effect on reducing the income that can be derived from university trust lands. The following revisions are recommended to benefit the income potential:

1. Revise AS 14.40.350 to conform with AS 14.40.360[7] to allow for disposal other than by lease only.

2. Revise AS 38.05.067, .069, and .321[8] to remove preference rights that limit competition when university lands are offered. This will offer the university land to a larger market.

3. Revise AS 38.05.315(a)[9] to exclude university lands from being included in state lands to be made available at less than market value to governmental entities.

4. Revise AS 38.05.315(b-d)[10/] to exclude university land from being made available to non-profit organizations at less than market value.

5. Revise AS 38.05.185[3/] to exclude university land from being available to mineral location by claim staking but make them available by lease for mineral development. Further, provide for land rental and a royalty for minerals removed.

6. Revise AS 38.05.365(16)[2/] definition of state land to exclude university land unless specifically included by name as used throughout AS 38.

New legislation passed in the 1977 session has brought about a major change in determining land rentals and limitations on the adjustment of rents. (AS 38.05.105)[5/] It is recommended the Board appoint a committee of two or three Regents to meet with representatives of the State Board of Education and the Mental Health Board to determine remedial action to the legislation. Advisors to such a meeting should include an investment counselor and an appraiser in addition to the attorney giving the opinion regarding the law.

Board of Regent Land Management Policies

Written Board of Regent land management policies will assist the land manager and the public. An established policy will also provide uniform treatment to like situations.

The following policies are recommended for adoption:

1. Revise the present policy on leasing land to provide for the sale of university land when it is offered for residential purposes. This policy can also apply to large parcels being offered under a residential development plan concept. The development sale concept would only become final if the land is in fact subdivided and provided with streets, sewer, water and other utilities.

   Included in a policy to sell could be lands dedicated to public use when the topography renders the site undevelopable by reasonable standards. Examples of such areas are swamp land included in state game refuges, rock out crop areas in state parks, and lands within watershed areas prohibiting development or marketable use. Sales in these instances would be an alternative to land exchanges. These sales should also have a reverter clause to return the land to the university if the public use is discontinued or abandon.

2. Provide rights-of-way without cost for development roads and utilities that enhance use and occupancy of university land. Such rights-of-way are limited to underground utilities, above ground utilities and roadways directly servicing the tract. In no instance is the easement to exceed 20 feet in width for utilities or 60 feet in width for roads. Variances to this policy must be submitted to the Board for their action.

3. Provide rights-of-way for other utilities and roads by lease or purchase agreement. Any such purchase agreement is to include a reverter clause to reconvey the right-of-way back to the university without cost

unless the adjacent lands have been sold.

4. Companion easements are required from adjacent property owners for those easements following common property boundaries. Easements granted for roads shall be for public use and have physical access to existing public ways or dedicated public access.

5. Gift, endowment and purchased lands are not subject to AS 38.05.030(a).

6. Provide materials disposed of under AS 38.05.110-.120 to governmental agencies at market value. The market value shall be supported by an appraisal.

7. Provide materials disposed of under AS 38.05.110-.120 to the private sector by competitive bidding only. No negotiated disposals are encouraged because of the limited monetary return vs the administrative cost to monitor the take and regroom the site. No free use permits will be authorized.

8. Negotiated timber sales are not encouraged and will not receive favorable consideration unless the sale results in cleaning up the area, salvaging damaged, dead, or logging waste timber.

9. Land appraisals shall take into account the commercial timber and material value included in the tract evaluation.

10. Land exchanges proposed to remove university land from the readily available market place will not receive favorable consideration from the Board.

11. Mineral development is encouraged on university land where minerals may occur. Mining is to be by lease only with compensation to the university based on an acreage rental and royalty return.

12. Agricultural development is encouraged for Class II and Class III soils when the Board determines it is in the best interest of the university.

13. Greater utilization of existing leases is encouraged by allowing subdividing for subleasing or assignment when the best interest of the university are served. Prior approval of the University is required before subdividing and the development must meet platting standards required by local government.

14. Requests to change the land use as allowed in a lease will require Board approval. Any changes, if granted, shall require a relinquishment of the lease and a re-offering by public auction. No preference right inures to the former lessee.

Division of Lands Directives

It is recommended the following directives be considered for instructing the

Division of Lands in the management of university land.

1. Submit all regulations affecting university land and resources proposed for public hearing to Board of Regent members and the President of the University for review and comment. The same applies to the final form of the proposed regulation prior to being submitted to the lieutenant governor for filing.

2. Policy directives affecting the availability or non-availability of university land or resources be reviewed and approved by the university prior to implementation.

3. The division devise a program of making recreation sites available by lease or permit within the Haines forest management area. A first draft proposal to be available for discussion within 120 days of this request.

4. The division provide the university land staff with a list of delinquent lease contracts to allow prospective assignees to acquire the lease and keep it active.

5. Complete the pending university land exchanges by December 31, 1978.

6. Discontinue the policy of offering university lands classified as agriculture for 10¢ per acre per year as authorized by the University

of Alaska letter dated June 25, 1963 and directed in your Division Order #69 dated October 7, 1963.

7. Provide the University Land Management office with appeal notices, hearing dates, and hearing officer decisions relating to University leases. Prior to making a final decision consultation is to be made with President of the University or his designee.

8. Complete the 100,000 acre land grant selections provided by the Act of 1929, P.L. 679. Submit the proposed selections to the President of the University for concurrance prior to finalizing the selection.

9. Provide the University Land Management office with all actions involving university land as spelled out in AS 38.05.305.[11/]

10. Discontinue offering or making available university lands to non-profit organization or governmental entities at less than market value.

11. Identify and propose land to be considered for exchange for the university lands located within the State Parks and Game Refuge Systems.

12. Provide for a 30 day concellation clause in all special land use permits issued under AS 38.05.330. Such permits shall be for

temporary use, and not have a damaging effect on the land.

13. Provide the University with proposed mineral closing orders and justification for taking the action. President approval will be required for such actions.

14. Budget for manpower, services and contractual money in an identifiable manner to earmark funds that will be spent for university land management.

15. Prepare a land disposal package for university land in the City of Valdez for a 1978 or 1979 offering.

16. Begin preparation of a land use plan for university land within the Willow capital site and present a progress report to University staff in October, 1978.

17. Prepare a report outlining the effect of Chapter 138, 1977 Session Laws of Alaska on existing leases with comments and suggested recommendations.

18. Prepare a report outlining management problems encountered by the Division of Lands in the management of University Trust Lands and discuss same with University staff and Board of Regent land committee.

Homesite Statute, 1977	120

State Homesites - Associated Public Costs

Introduction

In 1977, the Alaska Legislature amended Title 38 of the Alaska Statutes by adding Chapter 8 which directed that 25,000 acres of State land be made available for homesites. The maximum size of the parcels to be granted to voting age Alaskans with at least 6 years residency was set at 5 acres. Title to the land can only be acquired after an applicant occupies the land for at least 21 months, constructs a habitable, permanent, single-family residence, and reimburses the State for survey and platting costs. Applicants for the limited number of parcels available each year in rotating judicial districts of the State will be chosen by lottery.

The bill requires that public services be available, that the area be zoned residential, that soils have sufficient drainage and be suited for on-site sewage disposal, and that choice of homesite lands avoid agricultural and mineralized lands and fish regeneration areas. Availability of services and the existence of land use guidance regulations implies that the homesite disposals should be near settled areas and within the boundaries of existing political subdivisions. Uncertainty concerning the ultimate conveyance of municipal land entitlements has caused many boroughs to resist State land disposals within their boundaries. In addition, the Legislature did not fund the program sufficiently to allow the provision of access. Where road construction is a municipal subdivision requirement, and State road funds are lacking, disposal of State homesites would require a waiver of existing local requirements.

The combination of these factors has directed homesite activity outside existing municipal boundaries. In the 4th judicial district where activity is centered for the first year of the program, the homesite offerings are scheduled in Delta, Tok, Rex, and Circle. In each case, the lands which have been surveyed for implementation of the program lie outside of the organized governmental boundaries. Therefore, the zoning required by the bill is the responsibility of the Alaska Division of Lands, for they are charged with land use regulation in the unorganized borough. Regulations have been drafted and public hearings produced a generally favorable response to these early State zoning efforts. Final publication and adoption of these regulations will be forthcoming.

Cost figures for disposing parcels of land in the unorganized but accessible and partially serviced portions of the State are not complete. Basic service estimates combined with early actual experience in the first four activity areas offer a glimpse of what these costs might be. An analysis of these figures, administrative costs, and required technical services must accompany the implementation of this bill in order to keep in perspective the financial requirements of State land disposal programs.

Administrative cost scenarios have been developed by the Department of Natural Resources. The manpower and publication costs were estimated for the provision of 300 to 3,000 homesites per year. Acreage limitations in the bill suggest that a total of 5,000 to 10,000 parcels could be conveyed. But in the first year only 188 parcels will be offered. So the high range costs in terms of the scope of the program are probably over-ambitious. But it is clear that in order to achieve an orderly homesite disposal program that can be responsible to rural area land requirements, additional staffing will be necessary. Appendix I outlines DNR's estimates of State administrative costs. It also indicates the approximate value of the lands that the State would dispose in such a program.

Technical services must also be considered in a land disposal program of this nature. The Division of Lands survey costs will average about $600 per lot if the sites are grouped in 20-50 parcel clusters, existing section corners are nearby and monumentation requirements are minimal. This is a bare bones estimate that will limit cadastral engineering efforts to a basic gridiron approach with little sensitivity for existing topography and natural features. An additional $200-400 per lot will be required to contract for soil analysis required by DEC in rural areas to insure on-site water and sewer compatibility.

The costs described so far are those required to make land available for development consonant with program requirements. Early entrymen will face immediate access problems. Rights-of-way will be surveyed and ownership retained by the State, but actual road development will be the responsibility of the new residents. State programs exist to aid these efforts. The primary source of funding will probably be the Local Service Roads and Trails Program which is administered by the Department of Transportation. Currently, these funds are available to communities within established transportation network development plans. The time period between application by a recognized entity and actual construction usually runs about three years. Bob Hainline who directs this program for DOT estimates that per mile costs using State equipment are approximately $75,000 and in those areas where local contractors are available the costs run as high as $125,000 per mile. These figures are for local collector road construction with a completed width of 16 feet. The costs of secondary road access from the primary road net to the subdivisions themselves are pegged much higher at $750,000 per mile. Yearly maintenance of local roads and trails is set at $1,500 per year. Secondary road maintenance is correspondingly more expensive.

There are other costs that must be recognized as well. School transportation costs vary from area to area. In Willow, these costs average $1.65 per mile while near Fairbanks these costs can run as high as $2.18 per mile. Average family size in Alaska exceeds 3 persons so the settlement of 188 parcels could mean an increase in the number of students traveling to school. The peripheral location of these homesite developments will probably require bussing of students. Other services that

are supported by State funding and revenue sharing are police enforcement, fire protection, and parks and recreation expenditures. The exact effect of the homesite disposals on these State programs will not be evident until experience demonstrates whether the availability of land encourages in-migration or a redistribution of local populations.

For purposes of study, an examination of the costs associated with the disposal of 68 tracts in the Tok area was undertaken. These estimates are approximate but should serve to provide a yardstick of those costs that can be expected as the program developes.

Technical services, which are eventually reimbursed by the entryman, ran around $600 per parcel in Tok. Survey costs were low because of existing work that had already been done in the area. Soil analysis costs were kept low too because DEC allowed ADL to utilize core samples and drill logs available from nearby private development. These opportunities and resulting economies will not always be present.

The Tok homesite parcels are bounded on three sides by existing roads. But, in order to develop the interior parcels in the tract, approximately 2.75 miles of collecter roads will be required. At a minimum cost of $75,000 per mile these roads would cost roughly $206,250. With local contractor's equipment being used rather than the State's, these costs will run closer to $343,750. We must remember that these are minimum roadways at best and further widening and surfacing would cost considerably more. So, in order to build the least expensive road at the low cost scenario, an expenditure of around $3,000 per parcel can be expected.

The Alaska Gateway REAA claims that sufficient space is available for the 68 assumed additional students. The cost to transport these students to the school at current rates runs about $15 a day because the Tok homesites are only a little under 3 miles from existing facilities. For a 180-day school year, school transportation costs would increase about $2,750.

State revenue sharing for fire protection is based on population. If we assume an average family size of three and substantial in-migration, the State would pay an increased allotment at $7.50 per capita which at the maximum would mean an additional $1,500 per year. A public water and/or sewer system requires too many assumptions to permit accurate price predictions. At first, such improvements would be unnecessary because lot size permits on site development. However, as development proceeds, these expenditures may be mandatory and should be recognized. Without hydrants, fire insurance costs are exorbitant, even with modern volunteer fire departments.

This summary of costs for the Tok disposal is, of course, sketchy. But it is easy to see that even when homesite disposal is close to developed areas, as required by the bill, and much of the existing service infrastructure has been established, the real costs to the State of Alaska

are high. Where settlement results in a new community with seven or more elementary school aged children and no school is within bussing distance, the State is obligated to provide a school. A minimal 2 classroom structure costs at least $500,000.

Appendix II gives development costs for a range of areas in Alaska. The costs may be reduced to three elements. First, there are the costs associated with making the land legally available for settlement. A second layer of expenditures result from building the roads and other necessary service facilities. Finally, we must recognize the recurring costs associated with providing services and annual maintenance.

These costs will vary from site to site. There are only 20 lots in the Rex disposal area but one way to the school house in Anderson is almost 7 miles. There are 42 parcels near Circle and they will require at least 2 miles of service road. Appendix II contains information about these disposal areas. Accurate record keeping and a joint information effort between State agencies will be required in order to keep track of the financial facts of land diposal programs. As these parcel offerings occur throughout the State, we can develop a meaningful picture of the costs of free land.

3. Appendix III - Copy of bill authorizing state land to be made available as homesites.

I. Cost Estimates - Homesite Program

Administrative Costs

The estimated costs of the program are based on the following scenarios: The program, which would be set up on a statewide basis, must furnish homesite lands from existing patented or tentatively approved state lands. These lands would need to be field inspected for their homesite suitability and land planning reports prepared. After being approved by the Planning Section and/or the Land Use Planning Commission, the land would be classified. During this time, systems must be set up to qualify the applicants by checking the application background material against court recordings, title recordings, voter registrations, etc. Once this was accomplished, provisio for choosing recipients would be established. Following this prepara tion, actual management of the program would begin. This would inclu enforcement capability during the three-year residency period.

The following estimates of personnel and travel expenses are based upon the assumptions and the knowledge of time and costs involved in the initiation and management of the past Open-to-Entry Program.

Selections: This phase would require the services of a full time Land Management Officer IV (L.M.O.IV) and a Land Management Officer (L.M.O. II) and a Land Management Assistant I (L. M. A. I) to adequately supervise and coordinate the program on a state-wide basis. The services of a Cartographer II and two Planners would be required. District offices would need additional personnel for initial field examination in the category of an L.M.O. I plus budgetary monies for remote as well as close-in travel and per diem. Land planning reports instigated by thedistricts would need processi thereby necessitating additional classification workload and thus personnel.

Qualifying of Applicants: An adequate, though not necessarily stringent check of the applicant's legal qualification would be necessary requiring adding personnel to existing district's rosters, as well as personnel to set up and oversee the auctions and/or lotteries.

Enforcement of Management: Enforcement for compliance would require that field inspection be a continuing and time consuming item requiring coordination and administration work by people out of the District as well as headquarter offices.

District Office Expenses: The District offices would require two new positions and a substantial increase in travel funding. The estimates set forth below assume a minimum program of 100 and a maximum program of 1,000 homesites per District per year.

District Office Expenses

in Dollars/year

District	Personnel Salaries (a)	Regional Travel Costs			
		100 Units/District		1,000 Units Distric	
		Remote Areas(b)	Close-in Areas (c)	Remote Areas	Close-in Areas
Southeastern					
L.M.O. II	27,224	18,000	3,600	180,000	36,000
L.M.A. I	17,742				
Southcentral					
L.M.O. II	27,224	18,000	3,600	180,000	36,000
L.M.A. I	17,742				
Northcentral					
L.M.O. II	31,516	18,000	3,600	180,000	36,000
L.M.A. I	20,271				
TOTALS	141,719	54,000	10,800	540,000	108,000

(a) Employees' salaries include base salary plus State provided benefit costs.

(b) Remote area refers to any area which cannot readily be inspected, but requires a charter (boat or plane) to inspect. Known costs are transposed with emphasis on flying as the fastest means of verification of compliance. 10/25 inspections per day within a 100-mile radius of the district offices. If areas greater than 100 miles are opened, then inspection time/costs will increase in proportion.

(c) Close-in refers to areas available to highway, railbelt and nearby water access which can be reached with relative ease. After the fact costs are predicated on a monthly check basis, with between 25/50 inspections per day.

Headquarters Expenses: A staff of seven full-time employees to oversee selections, classifications, contracts, lotteries and servicing of the program would be needed in the Anchorage headquarters office.

Headquarters Expenses

in Dollars/year

Position Title	Salary	Travel Costs (a)	
		Remote	Close-in
1 L.M.O. IV	32,058	1,500	300
2 L.M.O. II	54,448	3,000	600
1 Carographer II	21,800	1,200	1,200
1 L.M.A. II	20,271		
2 Planners - 16	23,490		
- 18	27,224		
TOTAL EXPENSES	179,291	5,700	2,100

(a) Travel costs are limited to one trip for three headquarters personnel to District Offices to observe field work. The Cartographer would be expected to make several trips for record coordination purposes.

Advertising Costs: Three days public notice in a major paper would costs $250.00. Such a notice would have to be printed at least twice a year in a paper in each District with a total cots of $1,500.00.

Total Administrative Costs

in Dollars/year

	300 Homesites		3,000 Homesites	
	Remote	Close-In	Remote	Close-In
3 District Offices				
Salaries	141,719	141,719	141,719	141,719
Travel	54,000	10,800	540,000	108,000
Headquarters				
Salaries	179,291	179,291	179,291	179,291
Travel	5,700	2,100	5,700	2,100
Newspaper Costs	1,500	1,500	1,500	1,500
TOTAL COSTS	382,210	335,410	868,210	432,659

Value of State Public Land Given in the Program

Sales in the various districts indicate approximate values which can be used in estimate value lost if the State provides homesite land free rather than at the fair market value. Though great disparity exists between individual values for both remote and close-in properties, the median values have been used for this analysis. Land in remote areas has been valued at $400 to $500 an acre and land close in to settled areas valued at $2,000 to $2,500 an acre. All homesites are assumed to be of the 2-acre lot size.

Values of Homesite Lands

in Dollars/Year

District	100 Sites/District		1,000 Units/District	
	Remote	Close-in	Remote	Close-In
Southeastern	100,000	500,000	1,000,000	5,000,000
Southcentral	80,000	400,000	800,000	4,000,000
Northcentral	80,000	400,000	800,000	4,000,000
TOTAL COSTS	260,000	1,300,000	2,600,000	13,000,000

Summary

Summary of State Homesite Program Costs
(Land Value and Administration Expenses)a

In Dollars/Year

Site Processed Per Year	Remote Areas			Close to Settlement Areas		
	Land Value[d]	Admin	Total	Land Value[e]	Admin.	Tot
300[b]	260,000	382,210	642,210	1,300,000	335,410	1,635,
	2,600,000					
3,000[c]	2,600,000	868,210	3,468,210	13,000,000	432,659	13,432,

a. Does not include ancillary costs to the State for required service such as new schools, etc.

b. 100 sites per District for 3 districts.

c. Maximum number of sites - 1,000 per district for 3 districts.

d. Assumes a cost of $400 to $500 an acre for remote areas.

e. Assumes a cost of $2,000 to $2,500 an acre for close to settlement areas.

State Costs per Homesite Unit

in Dollars/Unit

Location	Per Year	Total Costs	Per Site[a]	Per Acre
Remote	300	642,210	2,140.70	1,070.35
Remote	3,000	3,468,210	1,156.07	578.04
Close-in	300	1,635,410	5,451.37	2,725.68
Close-in	3,000	13,432,659	4,475.55	2,237.77

a. A site is assumed to be 2 acres.

II PUBLIC COSTS - STATE LAND DISPOSALS

SOUTHCENTRAL

ITEM	COST
1. Roads

$/Population	$7.50/capita, Revenue Sharing
5. State Troopers	
	$60,000/man, Budgeted - Includes Equipment
6. Parks & Recreation	
	$5/capita, Revenue Sharing

7. Sewer

Construction $/ft.	$50-$60/ft Laterals, $100+/ft. collectors (Engineering and Construction) - Anchorage
Treatment Plant	$4 mill/plant, $800,000/68,000' Interceptor ... mill/57,000' Collector, 5,000-11,000 pop.
Average $/mo.	$100,000/yr., Maintenance

8. Water

Construction $/ft.	$50-65/ft. 12" Main + Service Lines + Hydrant (Engineering and Construction) - Anchorage
Treatment Plant	$180,000/16" Diameter Well + Treatment + Generator; 70,000 - 80,000 population served

9. Electricity

Construction $/ft.	$2500-3500/pole, 1st 165' to House free $1500-2500/lot Underground

10. Telephone

Lines #/ft.

TOK HOMESITES

68 lots

Roads

80' ROW: 22" @660'/" = 14520' secondary roads (2.75 mi.)

LSR&T: $110,000/mi. x $\frac{14,520}{5,280}$ = $302,500; Main $4125/yr.

State: $700,000/mi. x $\frac{14,520}{5,280}$ = $1,925,000; Main $6050/yr.

Sewer Lines

22" @660'/" = 14520' laterals

Laterals: $60/ft x 14,520' = $871,200

Service: $20/ft x 200' x 68 lots = $272,000

Assume collectors present, houses 200' from road

Water

Same as sewer + $1100/hydrant

Assume 6 hydrants: $1,149,800

Telephone

Electricity

No charges levied if under 325' from existing line.

School Transportation

2.8875 mi. one way = 11.55 mi/day = $14.90/day

For a school year of 180 days = $2681.91

Alaska Gateway REAA claims sufficient space available for additional students - no new construction would be needed.

Fire - State Revenue Sharing

Assume average family size of 3; 204 people - 7.50/capita = $1530/yr

PUBLIC COSTS - STATE LAND DISPOSALS

LAWS OF ALASKA

1977

Source | Chapter No.

SCS CSHB 2 (Resources) am S | 142

AN ACT

Authorizing state land to be made available as homesites.

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

* Section 1. PURPOSE OF ACT. The longstanding policy of the state, declared in the Constitution of the State of Alaska (art. VIII, sec. 1) and the Alaska Land Act (AS 38.05.350), has been to encourage the settlement of the state's land and the development of its resources by making them available for maximum use consistent with the public interest. In authorizing the classification of land for settlement as homesites, this Act is intended to further that policy explicitly, by recognizing that the immediate production of revenues to the state through the auction of land to the highest bidder, virtually the only method by which state land has been made available to the public for residential use, is secondary in importance to the primary, and ultimately more beneficial and productive, goal of providing land for Alaskans to settle at a cost reasonably within their means, and that the highest and best use of some land may clearly be for habitation.

* Sec. 2. AS 38 is amended by adding a new chapter to read:

CHAPTER 8. HOMESITES.

Sec. 38.08.010. CLASSIFICATION OF LAND FOR HOMESITE ENTRY. (a) The director shall classify, survey, and plat for homesite entry 25,000 acres of state land which is otherwise vacant, unappropriated and unreserved and is suitable for erection of residential dwellings to use as a permanent abode.

(b) Land classified as homesite entry land shall be divided into parcels not exceeding five acres in reasonably compact form, with boundaries conforming as nearly as practicable to natural geologic and topographic features.

(c) No land may be classified for homesite entry which

(1) lacks drainage sufficient for construction of residential dwellings;

(2) has soil which has been classified and interpreted as appropriate for agriculture in soil surveys conducted by the Soil Conservation Service of the United States Department of Agriculture;

(3) is known to be mineralized with commercially valuable minerals;

(4) is located where homesites would threaten fish regeneration;

(5) is located where existing services provided by the state and political subdivisions of the state would be inaccessible;

(6) lacks sufficient water for a residential dwelling used as a permanent abode; or

(7) is unsuitable for on-site sewage disposal, if other methods of sewage disposal are not feasible.

Sec. 38.08.020. OFFERING OF LAND FOR HOMESITE ENTRY. Following classification of land for homesite entry, offerings of homesite entry land shall be made on a rotating basis from among the four judicial districts of the state. The director shall publish notice of the availability of the land for at least three consecutive weeks through the electronic media and in at least three newspapers of general circulation in the state, at least one of which, if possible, shall be a newspaper of general circulation in the vicinity of the available land.

Sec. 38.08.030. APPLICATIONS FOR HOMESITE ENTRY; FEES. (a) To qualify for a homesite entry permit, an applicant shall

(1) at the time of application have attained the age of 18;

(2) submit proof acceptable to the commissioner that he is a resident of the state at the time of application, and that he has been a resident of the state for not less than six years immediately preceding the date his application was submitted, or that he has been a resident for 20 years cumulatively;

(3) agree to comply with the requirements for obtaining a patent to land set out under sec. 60 of this chapter.

(b) Fees for filing an application may not exceed $10.

Sec. 38.08.040. ISSUANCE OF ENTRY PERMIT. (a) An applicant meeting the qualifications for homesite entry under sec. 30 of this chapter shall be issued a revocable

permit to occupy and improve the homesite in order to qualify for issuance of patent as provided in this chapter. The application fee is the sole rent chargeable on the permit for its duration.

(b) If the number of applicants qualified for homesite entry exceeds the number of available homesites offered, or if several applicants apply and qualify for the same homesite, priority in award of an entry permit shall be accorded to that applicant showing proof of the longest residency in the state.

(c) The permit may not be assigned, conveyed or otherwise transferred, but rights under the permit may devolve by testate or intestate succession. An attempt to assign, convey, or to otherwise transfer the permit, is void and constitutes a substantial breach.

(d) An applicant may apply for more than one available homesite. No person holding a homesite patent may apply for a homesite entry permit, no person may simultaneously hold more than one homesite entry permit, and no person who is a member of the homesite entry permit holder's household may be issued a homesite entry permit while a member of the homesite entry permit holder's household.

Sec. 38.08.050. REVOCATION OF ENTRY PERMIT. (a) The entry permit may only be revoked for failure to erect a dwelling as required under sec. 60 of this chapter, or for other substantial breach of the terms and conditions of the homesite entry permit.

(b) Upon revocation and termination of a permit, improvements or chattels upon the homesite shall be managed, and subsequent issuance of a permit for entry on the homesite shall be conditioned, in the same manner as provided in AS 38.05.090 for removal or reversion of improvements upon termination of leases of state land.

Sec. 38.08.060. ISSUANCE OF PATENT. (a) A person who enters upon homesite entry land under a permit issued by the director shall be issued a patent to the land conveying an unencumbered title if that person

(1) occupies the land for a cumulative total of 21 months within the three-year period following issuance of the homesite entry permit, or five months with 20 years Alaskan cumulative residence;

(2) erects a habitable, permanent, single-family dwelling on the homesite, which meets all applicable state and local regulations, within three years of the date of issuance of the homesite entry permit; for the purposes of this paragraph, mobile homes are not considered to be permanent dwellings unless they are placed on a permanent foundation;

(3) reimburses the state for the survey and platting undertaken in accordance with this chapter; the director shall provide by regulation for installment payments of this reimbursement.

(b) Nothing in this chapter shall be construed to prohibit a person issued a homesite entry permit from residing in a temporary habitable dwelling on the homesite until revocation of the homesite entry permit.

(c) No person may be issued more than one patent during his lifetime, nor may any person who is a member of a patent holder's household be issued a patent while a member of the patent holder's household.

(d) If a dwelling is found to have been substantially completed under sec. 100 of this chapter, patent shall be issued upon completion of the dwelling, notwithstanding (a)(2) of this section.

Sec. 38.08.070. LAND LOCATED WITHIN MUNICIPALITIES. No state land which is located within the boundaries of an organized borough or city may be classified for homesite entry under this chapter until the proposed use of the land has been studied and approved jointly by the director and the local planning authority. Nothing in this section or AS 29.18.190 prevents the director from selecting and classifying for homesite entry land which would otherwise be available for borough or city selection under AS 29.18.-190. If classified for homesite entry, the land shall not be available for city or borough selection.

Sec. 38.08.080. REQUIRED ZONING. No state land which is located within the boundaries of a municipality which exercises planning and zoning authority under AS 29 may be offered by the director for homesite entry under this chapter until the land has been zoned by the governing body of the municipality for residential use only. No state land which is located within a municipality which does not exercise planning and zoning authority, or which is located in the unorganized borough, may be offered by the director for homesite entry under this chapter unless the division of lands has adopted zoning regulations to restrict the use of the land to residential purposes.

Sec. 38.08.090. DISCLAIMER OF INTENT TO PROVIDE SERVICES. Nothing in this chapter obligates the state to provide services to land which is the subject of homesite entry and patent.

Sec. 38.08.100. SUBSTANTIAL COMPLETION OF DWELLING. An entry permit may not be revoked for failure to erect a dwelling in the time required under sec. 60(a)(2) of this chapter if the director finds that erection of the dwelling has been substantially completed and progress toward completion is being made at the expiration of the time required.

Sec. 38.08.110. REGULATIONS. The commissioner shall adopt regulations in accordance with AS 44.62.180 - 44.62.-290 to carry out the purposes of this chapter.

Sec. 38.08.120. DEFINITIONS. In this chapter

(1) "commissioner" means the commissioner of natural resources;

(2) "habitable dwelling" means a dwelling of a permanent nature, together with fixtures and facilities, including sanitary facilities, required or customary in the vicinity of the land made available for homesite entry;

(3) "resident" means a person who is not claiming residence in another state and shows by all attending circumstances that his intent is to make this state his permanent residence.

* Sec. 3. AS 29.33.090 is amended by adding a new subsection to read:

(c) The assembly shall regulate and restrict the use of state land within the borough which is vacant, unappropriated and unreserved and which is found suitable for classification and disposal for homesite entry under AS 38.08.010. Compliance with the provisions of this subsection is a prerequisite to issuance of homesite entry permits for land within the borough.

* Sec. 4. AS 29.13.100 is amended by adding a new paragraph to read:

(37) AS 29.33.090(c) (zoning of state land for homesite entry)

* Sec. 5. No land may be classified and made available for homesite entry under AS 38.08.010 - 38.08.120 within any portion of the new capital site established under AS 44.06 before July 1, 1982.

Approved by the Governor: June 18, 1977
Actual Effective Date: September 16, 1977

leasing

Leasing: A Gap In Disposal Methodology

Introduction

Leasing was selected as an area for special focus of staff study. News stories and interviews with opinion leaders indicated that the new leasing statute for State land passed in the 1977 session deserved a closer examiniation. It was a featured topic of the Workshop, and the proceedings indicate the variety of comments received on the topic of leasing.

On one hand, an increasing number of people believe that the State should make more extensive use of leases to satisfy the demands for use of State land while retaining underlying ownership for the benefit of the general public. On the other hand, there is considerable recognition that leasing requires sophisticated techniques and knowledgeable management personnel in order to be successfully implemented.

This section of the report contains some of the background information that the Commission consulted in forming their recommendations. The first paper is a copy of the current statute. It is followed by an excerpt from the final report of the Governor's Ad Hoc Advisory Committee on State Land Practices and Procedures. The third paper was prepared by the Commission staff and was circulated among the participants in the Workshop for background and discussion purposes. The final item is a news paper clipping describing the filing of a lawsuit to test the validity of the new leasing statute as it pertains to some of the trust lands and the response of some current leaseholders.

Sec. 38.05.085. TERM OF LEASE. (a) The lease shall provide that

(1) for the initial 25-year period of the lease, the lessee shall pay the state a fixed base annual rent to be agreed upon by the parties in compliance with the provisions of this chapter;

(2) the fixed base annual rent to be paid by the lessee shall be readjusted when the initial 25-year period of the lease has expired and, thereafter, every 10 years; and

(3) the readjusted annual rent may not exceed 10 per cent of the value of the property as determined in (b) of this section or 50 per cent more than the amount paid each year during the initial period or the preceding 10-year period, whichever is lower.

(b) When it becomes necessary to determine the fair market value of property as required by (a) of this section, the lessee shall appoint an M.A.I. appraiser and the state shall appoint an M.A.I. appraiser. The two appraisers so appointed shall, within a specified period of time agreed upon by the parties, make their appraisals of the property in question. If the two appraisers agree upon the fair market value, the determination is absolutely binding on the parties. In the event the two appraisers are unable to agree, they shall together appoint a third M.A.I. appraiser who shall then make his appraisal of the property in question. When the third appraisal is completed, the two of the three appraisals which are nearest each other in their determination of the fair market value shall be averaged and the resultant sum shall be the fair market value of the matter in question and absolutely binding on the parties. All costs incurred in making the appraisals provided for in this subsection shall be borne by the state and the lessee equally.

(c) The lessee shall make advance payments of the annual rent or portion of it as the director, with the approval of the commissioner, may require.

(d) A preference right lessee of grazing or forest land may follow the payment schedule established in his cancelled federal lease or grazing permit if he so desires.

(e) Notice of all actions by the department affecting the rights of a lease or lessee shall be given to the lessee.

(f) A violation of a provision of this chapter or of a term or provision of a lease subjects the lessee to appropriate legal action, including, but not limited to, a forfeiture of the lease.

(g) In this section,

(1) "annual rent" means the amount of rent paid annually determined by multiplying the fair market value by the rental rate computed at the time of the initial 25-year

period of the lease or of each subsequent 10-year period of the lease;

(2) "rental rate" means the rate, expressed as a percentage of fair market value, which a comparable class of privately owned property would bring in the open market with the same conditions of lease as offered by the state.

* Sec. 10. AS 38.05 is amended by adding a new section to read:

Sec. 38.05.103. RIGHTS OF HOLDER OF SECURITY INTEREST. (a) If there is a breach or default of a term of a lease or of the provisions of this chapter relating to a lease, the division shall provide written notice of the breach or default by personal service or by registered or certified mail to the lessee and to any holder of record having a security interest in the leased property. The notice shall also make demand upon the lessee to cure or remedy the breach or default within 60 days from the date of receipt of the notice and demand. If a lessee fails to cure or remedy the breach or default within 60 days, or within the additional time which the division may allow for good cause, the state may, subject to (b) of this section, exercise any right which it may have at law or as set out in the lease.

(b) If a lessee fails to cure or remedy a breach or default within the time allowed in (a) of this section, a holder of a security interest who has received notice under (a) of this section may cure or remedy the breach or default if the breach or default can be cured by the payment of money or, if this cannot be done, by performing or undertaking in writing to perform the terms, covenants, restrictions and conditions of the lease capable of performance by the holder. The holder shall act within 60 days from the date of receipt of notice under (a) of this section, or within an additional period as the director may allow for good cause.

* Sec. 11. AS 38.05.105 is repealed and re-enacted to read:

Sec. 38.05.105. PERIODIC RENT ADJUSTMENTS. (a) Each lease shall stipulate that at the conclusion of the initial 25-year period of the lease and at intervals of 10 years thereafter the annual rent payment is subject to adjustment. Charges or adjustments shall be based primarily on an adjusted fair market value. However, if the director of the division of lands determines that single-family residential development is the best use of the land, the reappraisal period may be lengthened or the readjustment waived in accordance with regulations adopted by the department. Before a waiver of rent adjustment is issued, the land shall have a current reappraisal. A waiver is valid only if single-family residential development actually occurs. The regulations adopted under this section shall ensure that the state receives a fair return from the land.

(b) The provisions of sec. 85(b) of this chapter are applicable to reappraisals of leases required by this section, except that, in determining an adjusted market value,

(1) changes in property value due to governmental actions, including zoning reclassifications, shall be included; and

(2) changes in property value due to private improvements made to the property or other privately owned or leased property since originally entering into the lease shall be excluded.

* Sec. 12. CONVERSION OF LEASES. The provisions of secs. 9 - 11 of this Act are applicable to state leases which are in existence on or before the effective date of this Act if a lessee under a lease elects, in writing, to be bound by this Act. When a lessee elects to be bound by the provisions of this Act, the state shall enter into a new lease with the lessee for a term equal to the remaining period of the original lease which is being terminated that is consistent with the provisions of this Act. However, for purposes of determining the annual rent by the state, the fair market value of the property which is used to establish the fixed base annual rent for the initial period of the lease may not exceed the fair market value as it was last appraised on or before January 1, 1975, brought forward to January 1, 1976, at the rate of 10 per cent a year, or, if the lease was entered into after January 1, 1975, on the basis of the fair market value at the time the lease was entered into.

* Sec. 13. The provisions of sec. 12 of this Act expire on January 1, 1979.

IV. FINDINGS AND RECOMMENDATIONS OF THE COMMITTEE

The findings of the committee were numerous but can be grouped into major categories:

1) State lessees are dissatisfied with the state interpretation of lease contract terms, especially those relating to appraisal. Many lessees testified before the committee as to their grievances.

2) The Division's regulations covering sales and leases are often outdated and conflicting with statutes in some cases.

3) The State's lease contract form is not in line with commercial contracts and has many ambiguities in it.

4) Some state statutes in Title 38.05 are vague and unclear.

5) Payment methods for state sales contracts do not match those used in the private sector and may contribute to ballooning land values.

These findings outline the basis for the committee's recommendations which follow.

The recommendations of the committee concern statute, policy, and regulation changes, and can be grouped by topic.

The following five items are of <u>general concern</u>:

1. The committee wishes to note that in the course of public testimony it was apparent that Division of Aviation lessees had significant problems with their current leases. This subject was not within the scope of the committee's deliberations and, therefore, not addressed.

2. To comply with new statutes the committee recommends a major overhaul of Division of Lands regulations. The committee has found many of the regulations now in effect to be outdated and superseded by statutes.

3. The committee recommends that the Legislature apply the provisions found in Title 38 to those in Title 3, Title 19, and Title 35. The rationale would be to make land laws uniform among the Division of Aviation, Department of Highways, and Division of Lands.

4. Looking to the future, when the Division appraisal workload gets even heavier, the committee recommends that all (or all significant) appraisals be done by contract appraisers, with the Division appraisers functioning as review appraisers.

5. The committee stands opposed to Senate Bill 234, since the needs as outlined in this bill are covered by present legislation; the committee finds SB 234 not in the best interests of the State or the land management of the State.

In order to provide predictability in appraisals and reappraisals, for the benefit of the State and the public, the committee recommends the following:

1. At present many lessees are suffering hardship due to rent increases of several hundred percent. To provide for this relief and as a curative for such future increases the statutory provisions found in section nine of the attached bill are recommended. Provision for optional conversion of present leases to ones that will place a ceiling of 100% on rental increases every five years will largely prevent future hardship cases and resolve satisfactorily the present cases. With a rent ceiling, lease rental increases will be more predictable resulting in more financial stability for the lessee. (The Alaska Industrial Subdivision hearing panel recommends insuring predictability by placing some control over the size of the rental increase through utilization of a ceiling on the size of the increase in rental every five years.)

   Sections 8 and 9 of the attached bill will accomplish the above recommendations.

2. The committee recommends that land offered over the counter be reviewed at 90 to 120 day intervals to determine if an increase in value has occurred. This review is desired so that parcels are not undervalued by progressive changes in the market.

   Section 10 of the attached bill would accomplish this.

3. Since public notice is covered in AS 38.05.345 the change to "appraisal" for AS 38.05.310 is warranted by its present content. The committee recommends that land may be appraised 120 days in advance of a sale or lease. The change from 90 to 120 days would be desirable in that minimum bid information could be given to the public well in advance of the actual sale or lease auction. In addition 11 AAC 54.140 should be repealed.

   Section 10 of the attached bill will accomplish this.

4. In order to provide a workable solution to the problems of confidentiality of appraisal data, the committee recommends that the Director of the Division of Lands refrain from including confidential information in any appraisal prepared for the Division of Lands use.

5. The committee believes that the word "primarily" may imply special consideration to some lessees. In order to treat all lessees fairly and equitably the committee recommends that the word "primarily" be stricken. Deleting "primarily" would clarify the basis for reappraisal. (This was also recommended by the Alaska Industrial Subdivision hearing panel.)

   Section 8 of the attached bill will accomplish this.

To improve <u>accounting policies</u> and <u>administrative procedures</u>, and to protect the State, the purchaser and the lessee, the following are recommended:

1. The committee recommends that the Division of Lands have the option of requiring all sales contracts over $400.00 per year to be paid in quarterly installments instead of annual installments. It is the committee's belief that this would ease the financial strain on the buyer and yet not add significantly to the State's administrative costs. To provide quarterly payments would require a change in AS 38.05.065 with the present annual payments deleted and the quarterly payment provision adopted in its place.

   Section 3 of the attached bill would accomplish this.

2. The committee recommends that a $10.00 fee charge to cover administrative costs be given to those who make sale or lease payments with checks that are returned. It is a standard business practice to provide for such charges and is recommended to protect the State's interests.

3. The committee recommends instituting default charges for late sale or lease payments. At present, there exists no penalty and many payments are late. The form of penalty recommended is notification charges to all delinquent payments and penalty charges to payments delinquent more than 30 s. The notification charge would be $5.00 for the t tice, $20.00 for the second notice and a pc rge of 6 percent of the payment.

It is suggested that the rges be adopted as a regulation under authori 38.05.035(4)(5) as follows:

11 AAC 54.365. Delinquent Payments.

In the event of a delinquent payment, the following charges will apply:

1. A $10.00 penalty for payment with a check that is returned.

2. A $5.00 penalty for notification of payments over thirty-five days late.

3. A $20.00 penalty for a second notification of payments more than fifty days late.

4. A penalty of 6 percent of the rental or sale payment for payments delinquent by more than thirty days.

4. The committee recommends adding the following to the end of 11 AAC 54.190: Upon execution of the contract of sale the director shall cause the original copy of the contract to be recorded in the recording district wherein the property is located.

5. The committee recommends that 11 AAC 58.490 have a section .495 added: Upon execution of the lease the director shall cause the original copy of the lease to be recorded in the recording district wherein the property is located.

6. The committee recommends adding in 11 AAC 58.830 Recordation of Assignments, Modifications, Changes in Rental or Cancellations: Upon any assignment, modification, change in rental or cancellation, the director shall cause to be recorded an original document which recites the changes made in the recording district in which the property is located.

7. The committee recommends that somewhere in 11 AAC 58 a section be added: Fees for Recordation. The Division of Lands shall absorb any expense of recording all existing contracts of sale, leases, assignments, modifications, changes in rent; hereafter the director shall collect the necessary fee for recording any contract of sale, lease, or change of application from the contract purchaser or lessee at the time of execution.

8. The committee recommends that the Attorney General draft for introduction to the next session of the Legislature a statute which will require all state agencies dealing in lands to record any such transaction (including any transaction dealing with plats and subdivisions) and further stating that failure to so record does not impose any liability on the State.

In order to achieve more flexibility and simplicity in handling land disposal transactions, the following are recommended:

1. The committee recommends that the State charge a market rate of interest in its sales contracts. The interest rate, at present 6%, is below market levels and may have contributed to inflated prices at state land sales. By setting interest rates at market levels, the State would help prevent inflated land prices and at the same time return more income to the State. To provide for a market rate of interest in sales contracts, no change in AS 38.05.065 would be required. The addition of a statement of market rate in this statute would be desirable, however.

   Section 3 of the attached bill would accomplish this.

2. The committee recommends that the State adopt a system of level payments in place of declining payments in its sale contracts. The system of level payments is in common use in the business world, and the payment figures are easily set forth in a contract. The disadvantage of the present method is that interest must be recalculated every year and the payments decrease each year. From both the State's and the buyers' viewpoints, the level payment method would be preferred. The State would receive slightly more in interest payments over the contract terms and the buyer would not have to make as high initial payments. To provide level payments would require a change in AS 38.05.065 with the present system deleted and the level payment system adopted in its place.

Sections 2 and 3 of the attached bill would accomplish this.

3. The committee recommends that in Title 38.05 the term "fair market value" be used in place of "fair appraised market value" and "market value." The meaning is felt to be the same in all cases. The committee would like to see one standard term used to avoid confusion and misunderstanding.

   Sections 4, 5, 7, and 13 of the attached bill would accomplish this.

4. The current procedures for informing the public of state lands transactions are covered in AS 38.05.305 and AS 38.05.345. The two procedures do not mesh in a clear manner. The committee recommends that the procedures be clarified in a manner that will be flexible enough to inform the public fully and yet not require multiple advertising for minor negotiated transactions.

   Section 11 of the attached bill will accomplish this.

5. The committee recommends that the Director be given the authority to set the payment period from one to twenty years. This type of flexibility would allow the State and buyers greater market possibilities. To provide for this would require that the installment clause in AS 38.05.065 be deleted and replaced by the one to twenty year provision.

   Section 3 of the attached bill would accomplish this.

6. The committee recommends that the State be given more flexibility to resolve contract of sale violations. This is necessary to prevent foreclosures as the only remedy for minor contract violations.

   Section 3 of the attached bill would accomplish this.

To institute improvements in the <u>leasing system</u>, the following are recommended:

1. To implement the new lease provisions recommended by this committee new lease forms for various types of leases will be required. It is the committee's recommendation that the Division draft new lease forms to comply with the statutes adopted, and that the new forms be reviewed by this committee.

The recommended lease form and attachments in Appendix C accomplish this.

2. The committee recommends that all state leases to other public agencies be at the normal fair market value rate of payment.

   This reflects a regulation change.

3. The committee recommends that state government agencies get out of residential leasing.

   This reflects a policy change.

4. To provide the lessee insurance against a land boom or unexpected increase the committee recommends that rental increases at the five year reappraisal periods not exceed 100 percent of the prior existing annual rental rate. This action would increase the predictability of the lessee's payments. The stability thus created would add significant borrowing power for the lessee to finance improvements on the leased ground.

   Section 8 of the attached bill would accomplish this.

5. The duration of a lease and the economic life of substantial improvements, such as stores or factories, may not coincide. In order to see that state leased land is used in a rational, economically productive manner the committee recommends that lessees of long-term leases be given a renewal option for up to fifteen years. This type of option would grant the lessee more flexibility in maximizing his investment returns, especially during the final years of his lease. It would also increase the lessee's planning possibilities for use of the leased ground. This action would also soften the impact of termination of the lease. Specifically, this would permit a lessee to make substantial repairs to a building when the remaining term of the lease would not otherwise justify it.

   Section 6 of the attached bill would accomplish this.

6. The committee agrees that a lease should be converted at its present classification, and the leaseholder should then have the option to change classification subject to Division of Lands approval.

This is made possible under the attached lease document so that a conversion (assuming passage of HB 383) to a new lease form would permit the leaseholder to change classification at his option.

7. The committee recommends that a level term for recreational leases not be provided.

8. The Alaska Industrial Subdivision hearing panel recommends that in accord with the provisions of the lease, lessees should be encouraged to record expenses incurred in site preparation so that the "original condition" can be more adequately ascertained.

   The Ad Hoc committee concurs. This recommendation is handled in the attached lease document.

9. The Alaska Industrial Subdivision hearing panel recommends that lease language should be clarified to remove any possible inconsistencies with 11 AAC 58.520 (Adjustment of Rental).

   The Ad Hoc committee concurs.

10. The Alaska Industrial Subdivision hearing panel recommends eliminating the floating easement. The State could exercise the right of eminent domain to condemn. The condemnation would probably result in greater compensation for damages to the lessee, especially in view of the Supreme Court decision in State v. Hammer, 550 P.2d 830, thus the lease would be more attractive to the leasing market. Additionally, the language in the current lease is ambiguous as to damages compensable. This ambiguity only encourages litigation.

    The Ad Hoc committee concurs. This has been accomplished in the attached lease form.

11. The Alaska Industrial Subdivision hearing panel states that, if its recommendations are adopted, the State would be assured a competitive position in the lease market. The recommendations would encourage development of the leaseholds consistent with the intent of the leasing regulations and would be equitable to the lessee. The hearing panel also believes the State should be able to obtain a good return on its land. Accordingly, the rental rate should be changed to reflect the removal of the undesirable aspects of the state lease.

The Ad Hoc committee concurs. Continuing to include rate as an appraisal element will accomplish this objective.

This change is found in the attached lease form.

12. In order to set a fixed rental rate on a lease, the committee recommends an addition to A.S.38.05.085:

> amend to add the following sentence after ". . . to protect the interests of the state. The lease rental rate shall remain fixed for the term of the lease and any permitted extensions thereof, unless the leased premises or a portion thereof is reclassified pursuant to provisions of this chapter. A violation of any provision of this chapter . . . ."

To provide a vehicle for arbitrating protests and appeals involving land transactions, the following is recommended:

1. The Division of Lands has had many protests from private parties over the past few years leading the committee to believe that a board of appeals is highly desirable and needed at this time. At present there exists no arbitration board or board of appeals to handle appeals allowed by Division of Lands regulations. The creation of a board of appeals would effect a responsive mechanism for solving most problem cases arising from Division of Lands transactions that affect private parties. The board of appeals would be faster and less costly to private parties than legal recourse, which would still be available. The board is structured to maintain adequate expertise while attempting to eliminate bias in favor of the Division of Lands. This binding appeals board would substitute for the Commissioner in the present appeal process. (The Alaska Industrial Subdivision hearing panel also recommends such an appeal process.)

   Section 14 of the attached bill would accomplish this.

The committee recommends the following to improve trust land management:

1. The committee believes that state trust lands (school, mental health, and university) are now and have been managed at low intensity. These lands may be returning only a fraction of their potential value that could be

realized by a small, full-time management staff. The Division manages these lands at no charge to the various trust funds and receives no reimbursement for its services. Therefore, it has traditionally placed low priority on management of these lands. This committee recommends that the State Legislature authorize each trust board the authority to freely contract with any agency or private firm for the management of its lands for revenue production in accordance with the State's land act.

Section 1 of the attached bill would accomplish this.

2. In order to provide a uniform 55-year limit for all long-term leases the committee recommends deletion of the 99-year provision found in A.S.38.05.070(c) for school lands.

Section 6 of the attached bill would accomplish this.

FSLUPC Staff Paper
November, 1977

Leasing

The objective of this staff report is to make available information about State surface leasing policy, to analyze that policy as it has operated in the past, and to make suggestions which might promote thinking that will lead to more effective use of this land management tool in the future.

Unencumbered owner-operatorship seems to be the foremost goal in American land-tenure policy. This premise was the theme of western development. But an examination of the present tenure situation in the United States shows that at least 63 percent of the residential units are tenant occupied. Even in agriculture we find that tenants operate one out of every eight farms. If the analysis includes the fact that a high proportion of the pepole who do own property hold their rights subject to a real estate mortgage, it appears that unencumbered owner-operatorship is more a goal than a reality.

Is this an unhealthy situation? Not if we see property ownership as the end goal in a dynamic process or recognize that for many the end isn't even ownership but profitable use of the land. Millions of families find it both expedient and wise to use leasing or credit financing as a means to the attainment of their ownership goals. The tenant relationship can also be healthy when we consider that some tenants prefer long term leases to the alternative of actually buying their sites. Many valuable locations in large metropolitan centers have been developed by tenants operating under long-term leases. In these cases, the leases represent a method of real estate financing in which the tenant enjoys a 100 percent loan of the value of the landlord's property. So leasing arrangements can provide a valuable and serviceable function in enhancing the interests of both landlords and tenants. Landlords can lease surplus lands to others and receive a monetary return from properties they do not wish to occupy or operate. Tenants can acquire use and possession rights to the properties held by others.

The policy purpose behind State direction of the land settlement and disposal process is basically a desire to achieve rational, productive management of Alaska's lands. Land disposal regulations are lengthy and complex. But an emphasis is placed on classification and land use planning. The mineral estate can only be leased and never sold, and this disposal program is handled separate of the surface leasing and sales program. The Director of ADL decides which lands will be made available for sale or lease and the limitations, conditions, and terms are set by this officer. Generally land is sold or leased to the highest bidder at public auction, and the appraised value is the basement of acceptable prices. The framework is a rational one, and adequate authority has been placed in the hands of the administrator. Leasing policy is outlined in statute. Maximum term of leases is set at 55 years and they may be renewed for a like term. Until the last Legislature, the annual

rental payment on State leases was subject to adjustment at 5-year intervals based on a current appraisal of rental value. The Director can negotiate small size leases, under $250 annual rental, without the bother of a public sale or auction. Leases may be assigned and/or subleased with the Director's approval, but subleases are limited to improved properties. Finally, lands that are valuable for surface values of a Statewide interest are available only through leasing from the ADL. Tidelands, timber and grazing lands fall into the category of surface classifications which may never be permanently alienated from State ownership.

A review of State leasing activity shows that this tool has been actively used in the 15 years since Statehood.

Classification of Land	1961-71	1972	1973	1974	1975	Leases As Of Dec. 31, 1975
Commercial-Industrial	171	1	0	1	1	152
Residential	65	15	0	2	0	47
Agricultural	25	2	0	1	0	14
Grazing	84	3	8	14	0	66
Private Recreation	638	40	52	39	12	509
Reserved Use	69	2	0	4	0	37
Utility	66	12	12	51	11	127
Commercial	33	5	2	1	2	32
Industrial	41	9	4	22	21	69
Unclassified	35	8	3	9	6	42
Open To Entry	1,469	851	899	574	16	3,161
Resource Management	0	0	8	9	1	17
Total Leases	2,696	948	994	727	70	4,273

The figures terminate as of 1975 because recent data was not immediately available from ADL or published in its annual report. However, 26 new leases were issued in 1976 while 350 were closed, most by OTE. The value of the leases to the State of Alaska has shown a steady growth as well. The face value of State land leases is derived by capitalizing annual rental at 6 percent.

Effective On December 31	Leases Acreage	Value
1971	238,423	$10,589,083.00
1972	256,232	11,470,066.00
1973	182,854	14,868,867.00
1974	214,155	21,361,641.00

Figures for 1975 and 1976 were not available from ADL. The above values came from the 1974 ADL annual report.

The amount of acreage under lease can be compared to that under State land sales contract to put these figures in perspective. Since 1960, only 138,000 acres have been sold by the State while almost twice as many acres are under lease. This is not the perception of the average Alaskan citizen. For instance at the recent Anchorage meeting of the Statewide Public Forum there was wide support for leasing of State lands. But the supporters of leasing favored it as a "new deal", a method not currently used that could be useful in combatting certain abuses. The primary problem that drew attention at the Forum was land speculation. Forum attendees advocated leasing because it could curb speculation and return unearned value increments through the State to the people.

There are a number of reasons that leasing is a valuable tool for land use management. We have discussed some benefits to both the owner and the users of certain property. A primary appeal of leasing to State land management officers is that the State continues to own the land. This means that the State collects a steady stream of revenue from the use of its land, but most important of all, the State maintains some say over how the land is to be used. In comparison to all known methods of land use control, whether through suitability classification, local zoning powers, sale contract covenants, or reversionary clauses, there is no method more effective than ownership. The authority to direct land use is of considerable value to the State.

As Division records indicate, people are willing to lease land for a variety of uses in Alaska. Most of the school, mental health, and university lands in the State are leased rather than sold because the goal is a continuing source of revenue for the trustee. Under the old statute of 5-year reappraisal of lease rental, speculation in leased State land was frustrated because the State eliminated lease interest equity when they regularly readjusted the rental to current market value. To further discourage speculation, unimproved lands cannot be subleased according to the regulations.

These factors should add up to a sucessful program. There are benefits for both parties and a good deal of public acceptance of leasing as a disposal technique for public lands. Financial institutions who were slow to advance financing on land leased from the State have broadened their outlook and even residential development of considerable magnitude has been constructed on leased State lands in Anchorage. Certain adjustments to State land lease contracts would make bankers even more comfortable, but general acceptance of leasing as a land management tool in Alaska appears to be good.

Or so it appeared until the 1977 session of the Legislature. In this session a new land lease law was proposed. It came primarily as a response to ADL's efforts to perform its 5-year reappraisal task in the Alaska Industrial Subdivision near downtown Anchorage. ADL attempted to bring lease rates up to their current market value, and in some cases,

these increases amounted to more than 4,000 percent. This caused considerable consternation among the lease holders. When similar raises shocked lessees in other parts of the State, the political interest was strong enough to focus attention on ADL's leasing program and bring about sweeping changes in the manner in which leaseholds were revalued for rental purposes.

The statutory changes have sparked interest in State leasing policy. The Alaska Advocate quoted real estate consultant Ken Gain as calling the new legislation, "a speculators dream". If this is the effect of the new law, it clearly opposes public sentiment against land speculation in the State, and it certainly doesn't represent the purposes of legislators who responded to the demand for changes in the State leasing program. The amended statute has worried the governing boards of Alaska's trust lands who went so far as to postpone action on a planned disposal in the Fairbanks area. The trust boards are analyzing the effect of the new law on their responsibilities at this time. With this level of interest and concern on the part of the administration, and a leasing program that promotes speculation rather than dampening it as was intended, the issue will provoke additional attention in future Legislative sessions.

What went wrong with the State leasing program? The key issues appear to be day-to-day management of the program and inappropriate application of the leasing technique. Earlier we reviewed the positive reasons for leasing State lands. They included increased public control of land use, a steady income stream, public capture of land value appreciation, and benefits to the lessee in reduced front-end costs and relatively low yearly rentals. But when the State retains ownership in land, it also retains an administrative obligation to manage the property in a competent fashion. This is particularly important with regard to lease management. Uncertainty is the bane of the business world. It has been suggested that State efforts to reappraise property were often executed in a casual manner. This resulted in land valuations that did not reflect current market situations. While lessees are often pleased when reappraisals are late and reflect little increase in value, they are also led into decision making patterns that are economically unrealistic. At first the lease lands are unfair competitors in the midst of property subject to the market system. But when they are finally evaluated in real current market terms, the results are chaotic. A leaseholder who develops property as though it were worth $.25 per foot is placed at a considerable disadvantage when a reappraisal jumps the value per foot to $4.

Property managers who had entered a series of subleases on developed properties based on below market land values were left holding the bag. Squeezed from the top and the bottom they went to Juneau. The rapid inflation of prices in Alaska, chronicled by writers in both of Anchorage's Daily newspapers, produced a situation of extremely volatile land values. In an active market of this kind, lease administrators are severely tested. ADL's response fell short. One reported example is the lease

of State school trust lands for the refinery at North Pole. The reappraisal was completed more than 18 months late. Further, it was arbitrarily halved at the suggestion that the soil conditions on the site were poor. However, soil conditions were never actually evaluated by the appraisal officer. A good leasing program requires good management in order to be effective. Reappraisals must be accurate reflections of current market conditions and they must be timely. Financial centers are understandably wary when a volatile market and ineffecient administration combine to promote uncertainty. When the State retains ownership, they assume an obligation to keep the leaseholder apprised of current conditions and value of the lands he will develop. The public deserves as much, too.

One frequently raised objection to State lease policy is that a lessee spends his money to improve the land, and then the State adds these improvements to the value and charges the lease holder even more at annual rental time. But, in fact, statute requires the State to appraise lands as though they were in their original condition. Often the increase in value will come from public expenditures for roadways, drainage, or sewer projects. Such improvements at public expense should be reflected in property value increases. But, actual site improvements cannot be counted against the developer. Yet memories are often short, and the exact "original conditions" are recollected differently by each side. Another probability is that a market for particular soil conditions will develop because their location is so valuable. As development techiques are mastered, comparable sales on well located bog lands become available and more accurate appraisals are possible. Each of these conditions require competent administration.

The number and caliber of ADL appraisal employees has not kept pace with this increasing responsibility. The appraisal section appears to be understaffed and underpaid if compared to similarly charged sections at the Department of Transportation and appraisers in private industry. This situation has been pointed out before, and thin staffing cannot assume the complete responsibility. It could be more appropriate for policy to spell out that the State will assume the value of site improvements over a 15 or 20 year period. This would provide sufficient time to amortize fill and drainage projects and other site improvements of this nature. It would also relieve ADL of the obligation to "remember" original condition long after the character of a locality might change.

The North Pole refinery lease program points up the arrangement between the trust boards and the Alaska Division of Lands. ADL serves as the management agent for the trust boards. Many have argued that the free services the trust boards receive are a bad deal for both sides. The trust boards believe they have an effecient setup because appraisal, survey, and other management tasks are provided to them at little or no cost. The ADL enjoys the role of servicing the trust lands because it provides a margin of control over lands that would otherwise be a wild card in the State's land ownership pattern. Mental health and university lands which represent most of the 1.2 million acres of trust lands was

to provide revenue for the mental health program, the common school trust fund, and the University of Alaska. The quality of management services available from ADL do not satisfy a revenue maximizing goal. In addition, ADL bears a broader administrative burden from which they earn no revenue, leading to the manpower problems we have already discussed. It appears that either ADL should be paid for their services to the trust boards, or that the trust board should obtain their management services from the private sector.

Another common feeling about leases is that by the end of the lease period, the lessee will have paid more for the land by installment than it would have cost him to buy it outright. This argument has certain red herring aspects. In the first place, few people actually buy land outright, instead they rely on credit arrangements to make purchase feasible. The fact is that, in land sales, interest payments can often exceed the actual price of parcel by the time a payoff period is completed. So this comparison can be misleading. If not interest costs, then opportunity costs must be considered. It is often a benefit to the lessee to be able to avoid large front-end committments of capital. If the lessee does not have to tie up his money in land, then he has the opportunity to put it to more productive use. A farmer might buy equipment or a developer might add another floor to his building. Leasing provides certain tax advantages as well. A lease can be depreciated over its term while fee simple land used for business purposes cannot.

Land ownership is repeatedly mentioned as the land use planners strongest hole card. Unfortunately, this strength has led the ADL to exercise the leasing option in areas unsuited for this technique. Leasing is a excellent means for land management in an active, lively market where land will be intensively used. Areas best suited for leasing are those classified for commercial and industrial purposes. Established residential neighborhoods and high demand recreational areas can also be good opportunities for leasing activity, but the strongest requirement is for good demand, and an active market. Leasing large parcels of rural lands where market activity and economic demand is limited will be less worthwhile. About the only action available to a leaseholder when the rent increases in this situation is minimum development followed by subdivision in order to make payments. (Then the State is forced with a large number of subleases and further administrative woes.) Large tracts are often leased in rural locations when a small tract lease would probably serve the needs of the lease holder. The situations caused by leasing improperly sized tracts for "utility" purposes are unnecessary. Leasing is good policy in the right place, (i.e. where there is an active market for use of the property.)

Another opportunity for leasing is in the area of agricultural land. There is a limited amount of land which is actually suitable for agricultural activity in Alaska. Historically, agriculture has faced stiff competition from sources outside the State. It is often difficult to develop a market for agricultural production sufficiently lucrative to justify the use of the land for that purpose. But while current market

conditions are not particularly receptive to Alaskan agricultural efforts, it would be unwise to allow this fact to lead to the conversion of all of the soils which are suited for farming to other uses. If the State were to lease only the agricultural rights to land, it could accomplish two desired goals. First, by limiting the amount of development latitude available to the leaseholder, the market value of the property is reduced and the State can make suitable lands available for agriculture at a reduced or subsidized annual rental. This could foster agricultural activity at the present time while preserving the lands for agricultural use in the future as well. By leasing the State forecloses the conversion option and retains such a decision for public appraisal at some time in the future. The marketing of limited rights is a relatively new technique. Appraisal of only one of the bundle of rights presents new challenges to the administrators of State lands. The management requirements take on considerable importance in light of the problems caused by poor administration in the past.

Under the requirements of the new lease law, managers of State lands have evidenced reluctance to utilize the leasing tool. In the new leasing statute reappraisal comes after the first 25 years. While this may reduce the appraisal load by reducing the frequency of reappraisal, it also creates a situation in which the State will be unable to adjust lease rental to even keep pace with the rate of inflation. In the current case, the readjusted annual rental shall not exceed 50 percent more than the amount paid yearly during the highest of the initial or preceeding period. People familiar with the rate of inflation in Alaska can see that a 50 percent limitation after 25 years will effectively curb rental adjustments to even less than the rate of inflation. An example of this situation can be demonstrated if we look at what happens to a parcel of land leased by the State in 1977. Appraisal sets the present value at $10,000, and with a lease rate of 6 percent, the annual rental would be $600. The first reappraisal and annual rental adjustment would occur in 2002. If we assume a moderate rate of inflation of 4 percent, the inflated value of the parcel in 2002 would be $26,658. Now this is the value increase caused by inflation alone and does not take into account social overhead expenditures or any other factor which might have also enhanced the value. The annual rental at 6 percent of $26,658 would be approximately $1,600. But the 50 percent increase limitation would prevent the readjusted rate from exceeding $900. Thus, under current statute, the rental adjustment could not even keep pace with a moderate rate of inflation. This does not take into account the other factors which lead to the appreciation of land values. The new State lease law will not only hinder the expansion of the use of the leasing technique, but it will render current leases even less useful for avowed State purposes.

There are many reasons we can expect renewed interest in the leasing statute in upcoming legislatures. As a land management tool, leasing of surface lands demands our attention. The benefits of an active leasing program are many and when properly administered, such a program can

promote economic development that is compatible with the public interest. The thought of leasing public property does not have the same rhetorical zing as that associated with owning private property. But tenancy is common in the United States for a variety of healthy reasons. Additional support for the use of this technique can be heard when assembled Alaskans debate State land disposal policy and discuss means for curing certain abuses. Agriculturists, fighting an uphill battle against climate, market, and reality, want leases of limited land rights for both subsidy and conservation reasons.

However, inappropriate use of the leasing technique has limited its effectiveness in some cases. Oversize parcels leased in areas of limited market activity have led to leasehold abuses. Casual reappraisal and limited staffing have led to inappropriate development on certain lease parcels, and left businessmen uncertain and finally outraged. Over reliance on the lease rather than emphasis on strengthening local land use control institutions has misled administrators as well. Leasing is only one tool of many available to the manager of public lands. Let us take it out, dust it off, and develop policy that will ensure that it is properly used.

The comments, opinions, and facts represented in this report are drawn from a variety of sources. Conversations with a number of ADL officers and review of the Divisions annual report were useful. David McCabe, Don Karibullnikof, and Dr. G. Hayden-Green presented the leasing picture from the private sector. State statutes concerning land and the respective regulations were reviewed as was Commission publication, "Agenda For State Lands".

ANCHORAGE DAILY NEWS December 29, 1977

Education board sues over land lease law

By ROSEMARY SHINOHARA
Daily News Staff Writer

The state Board of Education went to court Wednesday to challenge a land lease law which the board believes threatens a trust fund for schools in Alaska.

The law, passed by the 1977 legislature at the urging of state leaseholders, limited the amount of money the state can charge for state land leases, particularly the amount the base rent can be increased.

The Board of Education lawsuit in state Superior Court said the law is unconstitutional because it would now allow the school trust to receive full market value and compensation for the leases.

CERTAIN state lands are set aside to benefit schools, others benefit mental health programs and universities, and others are "general grant" lands which benefit the state treasury.

The state Division of Lands has not yet converted any leases to comply with the new law. Ted Smith, director of the state Division of Land and Water Management, said he had expected to begin signing the long-awaited lease conversion forms by today.

An assistant state attorney general promised in court Wednesday that the Division of Lands will not process any applications from leaseholders to convert their leases until a decision is made in the Board of Education case.

THE COURT ACTION leaves a group of leaseholders in an industrial subdivision in Mountain View in the middle of a battle between two state entities.

The Mountain View leaseholders spearheaded the drive to change the law in the 1977 legislature, after they were hit with rent increases of as much as 800 percent in 1976.

In November, the leaseholders complained the state was too slow at implementing the law, and held a meeting to discuss what to do about it.

AT THE TIME, Smith said he was waiting for the Attorney General's Office to approve forms for converting the leases. Smith said Wednesday the forms were now at the printer's, and he was prepared to begin processing them until the court action occurred.

To further complicate the issue, the state Attorney General's Office has a conflict in the case, and it has hired a private attorney to argue it on behalf of the state Division of Lands.

When the new law was passed by the legislature, the state attorney general issued an opinion that it was unconstitutional, and recommended the governor veto it. The legislation became law without the governor's signature.

TOM MEACHAM, an assistant attorney general who represented the state Division of Lands in court Wednesday, said the state agreed to withhold converting any leases on school trust lands, including the Mountain View leases, to assure that the private attorney who will handle it would have adequate time to prepare for the case.

A hearing on a move by the Board of Education for a preliminary injunction to prevent the state from implementing the law has been scheduled for Jan. 30 in Anchorage.

Smith said there are about 100 applications from leaseholders seeking to convert their leases, and the bulk of them are on school trust lands in the Anchorage area.

Lowell MacNutt, spokesman for the Mountain View leaseholders, said he's certain the group will move to protect its members' interests, but the leaseholders haven't had time to decide what to do yet.

ANCHORAGE DAILY TIMES, December 29, 1977

State Lease Changes Await Court

By PATTI EPLER
Times Staff Writer

The state division of lands yesterday agreed to hold off issuing or converting leases on school trust land for about a month until a challenge of land lease laws is brought to court.

The state Board of Education yesterday filed suit in Anchorage Superior Court challenging the constitutionality of a land lease law passed by the legislature this year.

That law limits the amount of money the state can charge for lessees and limits the amount of appraised increase. It gives lessees the option of converting their current lease to a new one with more favorable terms including 25 years between appraisals and a maximum lease increase of 50 percent.

The suit, filed shortly before lease conversions by the division were to begin, asks that the law be declared unconstitutional and alleges that the law does not allow the school trust to receive full compensation and fair market value for any sale or lease of school land.

Lease conversions were expected to be approved by the state before Jan. 1, said a division of lands letter on file in court records.

Judge Justin Ripley yesterday heard arguments on a motion by the board to temporarily halt the conversion process. But attorneys for the state agreed to stop the proceedings until preliminary hearings can take place. Those hearings are scheduled for the week of Jan. 30.

Tom Meacham, assistant attorney general who represented the state, said the state has hired private attorney to handle the case because of an apparent conflict. The state agreed to stop the conversions so the attorney would have time to familiarize himself with the case, he said.

Attorney General Avrum Gross said earlier this year that the land lease law might be unconstitutional and recommended that Gov. Jay Hammond veto the bill. However, the bill passed into law without the governor's signature.

The board, a state agency usually represented by the attorney general's office, also was forced to hire a private attorney to argue its case since the lawsuit was directed at the state itself.

(See Page 2, Col. 2)

Board Challenges Lease Law For Creating 'Unfair' Effects

(Continued From Page 1)

B. Richard Edwards, who is representing the board, said yesterday it is the schools themselves, not the board, that will lose money under the new law. But the board, as land trustee, is responsible for the schools financial welfare regarding leases.

An affidavit filed on behalf of the board indicates that large amounts of potential revenue will be lost if leases are converted. Paul Dirksen, a real estate appraiser, said the fixed base annual rent established by the new law "will result in far less than fair market value being received by the state.

"Under prior lease provisions of school land leases, the lease rental was based on appraised fair market value and it was required that the land be reappraised every five years. This process is much more in tune with determining a reasonable return and fair market value for school lands," he said.

Dirksen cited examples of lost revenue in his affidavit. Under the new law, one section of land that would rent for $28,000 per year in the market place, is leased by the state for $6,305 per year. That amount would remain the same for 25 years —until the year 2001 — at which time the lease could increase up to 50 percent or about $9,400. However, in the market place, rental would be about $120,000 in that year, Dirksen said.

ANCHORAGE DAILY NEWS January, 6, 1978

Leaseholders plan suit to implement law

People who hold state land leases in an industrial subdivision in Mountain View plan to file a lawsuit to attempt to require the state to implement a law passed by the 1977 legislature which will result in lower rental rates for them, a spokesman for the leaseholders said Thursday.

At the same time, the leaseholders plan to intervene in a lawsuit between the state Board of Education and the State Division of Land and Water Management, according to Lowell MacNutt of John Bagoy and Associates, spokesman for the leaseholders.

THE LEASES in Mountain View are on school trust lands, and the proceeds from them are earmarked for state educational purposes.

The Board of Education went to court in late December, just as the State Division of Land and Water Management was preparing to convert the leases to conform to the 1977 law.

The education board lawsuit in state Superior Court said the new lease law threatens the school trust fund, and is unconstitutional.

MacNUTT said leaseholders met Wednesday, and decided to intervene in that courtsuit to protect their interests.

The leaseholders believe that Ted Smith, director of the Division of Land and Water Management, tried to get the education board to file suit against him, MacNutt said.

"We feel Smith is arbitrarily dragging his feet."

SMITH WAS attending meetings in Juneau Thursday night and could not be reached for comment.

MacNutt said the leaseholders' hands are tied until the rental situation is resolved. Many of them protested increases assessed by the state before the legislature changed the law, and continued paying their pre-increase rates.

The question of whether they must pay the increased amount for any period of time is unresolved.

The question of how much the leaseholders must pay for the period after which the increase is still unresolved.

As a result, businesses that want to expand, or go out of business, can't do it, MacNutt said.

The Joint Federal-State Land Use Planning Commission for Alaska was created by Congress and the Alaska Legislature to provide a statewide land use planning process that will insure the economic development of the State in a manner that is compatible with the social and economic well-being of the public, their interests, and the environment.

The Commission also is to improve coordination and resolve conflicts between the State, Federal government, and private landowners in the State, and recommend laws, policies and programs to the President, Congress and the Governor of Alaska for a coordinated comprehensive statewide land use planning process.

The Commission, created by the Alaska Native Claims Settlement Act of 1971, is headed by the Governor of Alaska or his full-time Co-Chairman, and by a Federal Co-Chairman appointed by the President of the United States. Four Commissioners are appointed by the Secretary of the Interior, and four by the Governor of Alaska.

HB
907

STATE
of ALASKA

MEMORANDUM

DEPARTMENT OF NATURAL RESOURCES

TO: House Resources Committee

DATE: 4/27/78

FILE NO:

TELEPHONE NO:

FROM: Alice L. Iliff ALI
Research Analyst

SUBJECT: HB 907: Repeal of AS 34.10 (Land Registration Act)

This vestige of territorial law requires that for any land situated outside a borough or city where local land ownership records are kept, its owner must file a "statement of real property ownership". The statute may have had a legitimate purpose as a temporary transitional device accompanying the installation of a recording system in territorial days, as it encouraged the introduction of land ownership information into the public record. Today, its reason for being is much more speculative.

To induce compliance with the filing requirement of the statute, it provides for modest financial penalties in the event of a failure to file. Once assessed, a penalty becomes a lien against the property. The lien is subject to foreclosure under the statute, but if (as is usually the case) the landowner fails to respond to the lien foreclusure action by answering the petition, the land owner may "redeem" the property during the first year following its "foreclosure". After the expiration of this one-year redemption period, the procedure departs from the usual foreclosure model. Instead of selling the property to satisfy the lien and turning the overage in proceeds back to the owner, the State simply keeps the property. The land may be "repurchased" by its owner, but that right of repurchase is extinguished if the land is disposed of into private ownership by the State or is held by the State for and devoted to a "public purpose" and improvements are constructed upon it. Since the existence of these rights of repurchase makes management of the land as public domain difficult and expensive (administrative costs exceeding $30,000 per year for approximately 140 parcels with negligible return), the State can only derive a benefit from this forfeited land by disposing of it into private ownership by sale. The parcels usually have changed hands since foreclosure, resulting in time consuming administrative problems for both the State and the innocent victims.

There is no longer any public purpose served by this statute. From the beginning, the only legitimate purpose of the law was to compel landowners to identify their land holdings and place them on the record. But where recordable transactions (conveyances, mortgages, and the like) take place, the advantages of recording alone induce the new owner or mortgagee to record. Another purpose commonly attributed to the law, that of providing a record of land ownership in the unorganized borough to satisfy various public and private information needs, is illusory. The recording system itself satisfies this purpose - incompletely, albeit, but just as effectively as the superfluous statement file requirement does.

Assume that there were some legitimate public policy served by a law requiring land owners to file statements of real property ownership. It is clear that the penalty and lien foreclosure devices in the statute have not been effective in securing compliance with that filing requirement.

Filing a statement (or, more to the underlying objective, getting private land holdings on the record) can be encouraged by a "carrot", by a "stick", or by a combination of the two. The "carrot" in this case is the recording law itself - the landowner whose interest is recorded enjoys an important priority over he who does not record. This legal protection is a "carrot" sufficient to induce all who are aware of the recording law to use it, irrespective of the existence of any penalties for nonuse of the system.

The "stick" to induce filing is a penalty fee backed up by the lien foreclosure mechanism. This has apparently not been effective. People file because they want the benefits of the recording system; people fail to file because they are unaware of the existence of the system and the benefits which would inure to them from using it. A penalty mechanism will only encourage compliance by those who are already aware of the system but would not otherwise use it - a negligible class of persons.

A principal problem with the foreclosure action as a compliance mechanism is that it is only inflicted upon those landowners whose land holdings have been discovered due to the recordation of a conveyance. The recording of the conveyance itself, with or without an accompanying ownership statement, fulfills the legislative goal of getting land onto the public records. In these cases, the need for a statement is superfluous and the idea of penalizing the person for failing to file one borders on the absurd. In other words, when scrutinized against the actual operation of the statute, the reasoning underlying the foreclosure mechanism is seen to be circular: (1) the objective of the law is to get land holdings on the record; (2) the foreclosure process exists to encourage compliance with the law in order to satisfy that objective; (3) the only lands which are subjected to foreclosure are those whse existence comes to the attention of the Division of Lands when they are recoreded; (4) at that point, the lands have entered into the recording system and the legislative objective has been met.

In summary,

1. There is no valid public purpose served by the land registration statute. To the extent that there is any need to have a public record of land holdings in the unorganized borough, that need is fully met by the existing recording system, supplemented by the land status records of State and Federal governments.

2. The filing requirement of the land registration law imposes an undesirable paperwork burden and expense upon private landowners. This burden should not exist without some countervailing public policy.

3. Administration of the law costs the State $30,000 to $50,000 every year in employee time that could be better utilized for other efforts. Trying to administer AS 34.10 in light of Native lands conveyances, homesites, and any other upcoming programs of land disposal will be impossible due to lack of staff and monies, as well as inequities of this law that have been perpetrated for years to the disadvantage of the public. There is consensus among all agencies involved that the statute is unnecessary.

4. Because of the existence in perpetuity of rights of repurchase on foreclosed lands, the State cannot effectively manage these properties as public land. It can only derive benefit from them by disposing of them back into private ownership at the expense of innocent holders of repurchase rights.

5. Taking a person's land away for failure to file a superfluous piece of paper is bad public policy. It is even worse when the person failed to file simply because the person was ignorant of the filing requirement.

For all of these reasons, the statute should be repealed.

HB 907

March 24, 1978

The Honorable Hugh Malone
Speaker of the House
Alaska State Legislature
Juneau, Alaska 99811

Dear Mr. Speaker:

Under the authority of art. III, sec. 18 of the Alaska tution, and in accordance with AS 23.30.060(b) and the Uniform Rules of the Alaska State Legislature, I am transmitting a bill repealing the Land Registration Law, AS 34.10.

The Land Registration Law is a vestige of territorial days which requires that private owners of land outside cities and boroughs file statements of real property ownership. Modest penalties are imposed for failure to file. These penalties become liens against property which may be foreclosed, resulting in forfeiture of the land to the state. After foreclosure, the land may be redeemed for a period of one year, but it is also subject to a continuous "right of repurchase" by the former owner and his assigns. This right to repurchase is extinguished only by disposal of the land or construction of a public building upon it. These repurchase rights inhibit effective management of land gained by foreclosure and have been the subject of abuse by industrious opportunists who, although they have never had any relationship with either the foreclosed land or its owners, obtain some colorable interest in the land and attempt to reap a windfall by repurchasing it.

The requirement of filing statements of real property ownership is somewhat obscure and often ignored by landowners. It does not enhance the existing recording system and government records which, according to the Division of Lands, fully meet any need for public record of land holding outside of municipalities. Penalizing an individual for failure to file a superfluous document is, in my view, bad public policy, especially when the individual probably does not know of the requirement to file.

Administration of the Land Registration Law costs the state $30,000 - $50,000 per year with negligible return. Costs could easily triple with the huge amounts of land soon to be placed in private ownership, including native selections and state and municipal land disposals. It seems senseless to continue the burden of this law on taxpayers, land owners, and state agencies.

State agencies and staff involved concur in the desirability of repealing this law and incurring the substantial time and money savings which would result.

This bill would repeal the entire Land Registration Law (AS 34.10), except for one provision (AS 34.10.170) which states that land obtained by foreclosure under the chapter may be administered and disposed of in the same manner as other state land. The bill also includes a provision which continues, for three years after enactment, current rights to repurchase land lost by foreclosure; then, after published notice, those rights of formerly indefinite duration are terminated, thus clearing the state's title to that land.

The Land Registration Law is outdated, nearly universally unpopular, costly and burdensome to administer, often unfair, and yields little, if any, benefit to the state. Therefore, I urge its repeal by passage of this bill.

Sincerely,

JSH

Jay S. Hammond
Governor

TENTH LEGISLATURE

FISCAL NOTE

I. REQUEST

Bill/Resolution No. HOUSE BILL NO. 907

Title Repeal of Land Registration Act

Requested by Governor Date 3/23/78

III. ANALYSIS (See Fiscal Note Preparation Instructions, Section III)

Repeal of this law will not incur additional funds. It is estimated that approximately $30,000 to 50,000 will be saved by the various agencies which administer this statute, including the Dept. of Natural Resources, the Depatment of Law, the District Recrder's Office, and the Court System. These savings will be reallocated to existing programs.

Jur., Mortgages, § 1 et seq.; 42 Am. Jur., Property, § 1 et seq.; 45 Am. Jur., Records and Recording Laws, § 1 et seq. 91 C.J.S. Vendor and Purchaser § 1.

Sec. 34.10.020. Collection of penalties. (a) The Department of Natural Resources shall collect all penalties due under this chapter and transmit them to the Department of Revenue for deposit into the general fund.

(b) The department may appoint the recorder of each recording district as its agent for purposes of collecting penalties from the persons

who are subject to the penalty payment and who personally file a statement in the office of the department. When the appointments are made, the recorder shall collect the penalty, if possible, issue receipts for the payment in duplicate, attach the duplicate receipt to the original filing statement, and, transmit to the department at the time of transmitting the monthly ownership statements 90 per cent of the penalty collected. The recorder shall retain 10 per cent of the penalty collected as his commission.

(c) For the purpose of this chapter an error in the description, area or acreage of property does not invalidate the assessment of the penalty against the property if the description is sufficiently accurate to identify the property. (§ 6 ch 134 SLA 1953; am § 4 ch 135 SLA 1955)

Sec. 34.10.030. Funds for administration. Funds for administration of this chapter are those provided in the appropriation for the department. (§ 10 ch 135 SLA 1955)

Article 2. Registration.

Section
40. Filing statement
50. Penalty and lien for failure to file statement
60. Duties of recorder

Sec. 34.10.040. Filing statement. (a) The owner of real property in the state but outside an incorporated city, public utility district, school district or other political subdivision where record of ownership of real property is kept shall file in the office of the recorder of the recording district in which the property is located, before January 1, 1956, a sworn statement in duplicate giving his name, his post office address, an accurate legal description of the tract of land, its area or acreage, the date acquired, and other information necessary for the purposes of this chapter.

(b) The provisions of (a) of this section do not apply to

(1) an owner who acquired title to his property before July 1, 1949, and has complied with the registration provisions of § 22-2-1, ACLA 1949;

(2) an owner who has complied with this chapter before March 28, 1955; or

(3) property to which the United States or the state holds title.

(c) Upon transfer of title to real property after December 31 1955, within the localities described in (a) of this section where filing is required, a similar statement must be filed by the owner of the newly acquired tract before January 1 of the year after the transfer occurs.

(d) An owner of real property who has filed the statement required by this section need not file another statement under this chapter. (§ 4 ch 134 SLA 1953; am § 2 ch 135 SLA 1955)

Revisor's note. — Section 22-2-1 ACLA 1949 was repealed by § 2 ch 134 SLA 1953 but was referred to in (b) (1) of the above section which was § 4 ch 134 SLA 1953.

Am. Jur. and C.J.S. references. — 45 Am. Jur., Records and Recording Laws, § 1 et seq.

91 C.J.S. Vendor and Purchaser § 1 et seq.

Sec. 34.10.050. Penalty and lien for failure to file statement. (a) Upon failure to file the statement required in § 40 of this chapter, the owner is subject to a penalty of $5. For property acquired after December 31, 1955, the owner is subject to a penalty of $10 for failure to file each required statement. A penalty for failure to file a statement becomes a lien upon the property on January 1 of the year after the failure to file. The lien is subject to collection as provided in §§ 70 — 170 of this chapter.

(b) If a penalty is not paid before the date the delinquent list is published in accordance with § 70 of this chapter, a penalty of $5 attaches to each tract listed in the delinquent list of September 1, 1956, and a penalty of $10 attaches to each tract listed in the delinquent list compiled after September 1, 1956. (§ 4 ch 134 SLA 1953; am § 2 ch 135 SLA 1955)

Sec. 34.10.060. Duties of recorder. (a) When a statement is filed, the recorder shall file a duplicate copy or prepare and enter a copy in a special registration law book to be provided by him for that purpose. The recorder shall enter the name of the owner in an alphabetical index together with the date and hour of filing the statement. The recorder shall number the original filing statements in consecutive order, and enter on the statements the date received and customary filing information, and shall, before the eleventh day of each month, transmit to the department all original statements filed with him for the preceding calendar month together with 90 per cent of the receipts collected for penalty payments as provided for in § 20 of this chapter.

(b) When a recorder receives a document for recording evidencing a transaction of real property for which a filing statement is required by § 40 of this chapter, he shall notify the new owner of the filing requirements, and if not so filed, he shall notify the department on a special form provided for the purpose. (§ 5 ch 134 SLA 1953; am § 3 ch 135 SLA 1955)

Article 3. Enforcement.

Section		Section	
70.	Procedure for foreclosing lien	120.	Procedure for foreclosure sale
75.	Release of prior liens	130.	Deed directed by judgment
80.	Redemption	140.	Right to possession
90.	Affidavits in foreclosure action	150.	Conveyance in lieu of foreclosure
100.	Burden of proof	160.	Answer.
110.	Powers and duties of the court	170.	State administration of lands

Sec. 34.10.070. Procedure for foreclosing lien. (a) The department shall file in the office of the clerk of the superior court in the judicial district in which the property subject to the lien is located a list of all parcels of property subject to the lien, and upon which penalties are

unpaid for a period of at least one year after they are due and payable.

(b) The lien on the parcels contained in the list shall be foreclosed by appropriate proceedings by the department in the name of the state in the manner provided in §§ 70 — 170 of this chapter. The parcels affected by the lien shall be numbered serially. The department shall (1) post a certified copy of the list in its office; (2) mail to the last known owner at his last known address a registered letter advising him of the lien; (3) either post a notice of the lien upon the real property involved, or post notice of the lien in the nearest post office, whichever the department determines is best calculated to provide actual notice to the owner of the land; and (4) publish the list once each week for four consecutive weeks in a newspaper of general circulation in the judicial district in which the property is situated. The action shall be entitled "In the matter of foreclosure of liens under the Land Registration Law of 1953, as amended."

(c) The filing of the list, the mailing of notice to the lienee, and the posting of the notice on the land involved or in the nearest post office constitute and have the same effect as the filing of a separate complaint and service of summons to foreclose a lien. (§ 7 ch 134 SLA 1953; am § 5 ch 135 SLA 1955; am § 3 ch 179 SLA 1959)

Sec. 34.10.075. Release of prior liens. A lien or lien right on property which accrued under this chapter before March 28, 1955, is released, and no action to enforce the lien may be sustained. (§ 8 ch 135 SLA 1955)

Sec. 34.10.080. Redemption. (a) A person who has a right, title or interest in or lien upon a parcel described in the list of delinquent penalties may redeem the parcel by paying to the Department of Revenue the amount shown in the list of delinquent penalties within 60 days from the date of the filing of the list in the office of the clerk of the court, or may serve a verified answer upon the attorney general, setting out in detail the nature, character and amount of his interest and a defense or objection to the foreclosure of the lien.

(b) The caption of the answer shall contain a reference to the serial number of each parcel concerned. The answer must be served on the attorney general or filed in the office of the clerk of the judicial district within 20 days after the last day for redemption.

(c) If a person fails to redeem or answer, the person is in default and is barred from all his right, title and interest in the parcel described in the list of delinquent penalties, and a judgment of foreclosure may be taken as provided in this chapter. Upon redemption the person redeeming is entitled to a certificate from the Department of Revenue describing the property in the same manner as it is described in the list of delinquent penalties. Upon the filing of the certificate with the clerk of the court, the clerk shall note the word "redeemed" and the date of filing opposite the description of the parcel on the list. The notice operates to cancel the notice of pendency of action with respect to the

parcel. (§ 22-2

parcel. (§ 22-2-9 ACLA 1949; am § 1 ch 106 SLA 1949; am § 9 ch 134 SLA 1953)

Sec. 34.10.090. Affidavits in foreclosure action. Affidavits of filing, publication, posting, mailing or other acts required by this chapter in connection with an action to foreclose liens shall be filed in the office of the clerk of the superior court in the judicial district in which the property subject to the lien is situated and shall, together with all other documents required by this chapter to be filed in the office of the clerk, constitute a part of the judgment roll in a foreclosure action. (§ 22-2-10 ACLA 1949; am § 1 ch 106 SLA 1949; am § 9 ch 134 SLA 1953)

Sec. 34.10.100. Burden of proof. (a) It is not necessary for the plaintiff to plead or prove the various steps, procedures and notices for the assessment of the penalties or other lawful charges against the lands set out in the list of delinquent penalties. The penalties or other lawful charges and the lien for them are presumed valid. A defendant alleging an irregularity in the lien must particularly specify in his answer the irregularity and must affirmatively establish the defense.

(b) This chapter applies to all defendants even though one or more of them are infants, incompetents, absentees or nonresidents of the state. (§ 22-2-12 ACLA 1949; am § 1 ch 106 SLA 1949; am § 9 ch 134 SLA 1953)

Sec. 34.10.110. Powers and duties of the court. (a) The court may determine and enforce the priorities, rights, claims and demands of the parties to the action as they exist according to law, including those of the defendants as between themselves.

(b) In a proper case the court may direct a sale of the lands and the distribution or other disposition of the proceeds of the sale.

(c) The court shall make a final judgment, in relation to a parcel included in the list of delinquent penalties,

(1) directing the sale of the parcel when an answer is filed by a party, and the court determines that the party has a right, title, interest, claim, lien or equity of redemption in the parcel;

(2) awarding to the state the possession of a parcel when no answer is filed and the parcel is not redeemed. (§§ 22-2-13, 22-2-14 ACLA 1949; am § 1 ch 106 SLA 1949; am § 9 ch 134 SLA 1953)

Sec. 34.10.120. Procedure for foreclosure sale. (a) A sale directed by the court shall be a public auction by the Department of Revenue.

(b) Public notice of the auction shall be given once a week for at least three successive weeks in a newspaper published in the judicial district. The notice shall be posted in a conspicuous place at the United States post office nearest the land to be sold.

(c) The description in the notice of the parcel offered for sale shall be the description contained in the list of delinquent penalties, with the other descriptions the court directs. (§ 22-2-13 ACLA 1949; am § 1 ch 106 SLA 1949; am § 9 ch 134 SLA 1953)

Sec. 34.10.130. Deed directed by judgment. (a) A judgment directing a conveyance under this chapter shall contain a direction to the Department of Revenue to prepare, execute and have recorded a deed conveying full and complete title to the parcel

(1) to the grantee in a foreclosure sale;

(2) to the state when the state is awarded possession of an unredeemed parcel.

(b) Upon the execution of the deed the grantee or state is seized of an estate in fee in the land, and all persons (including infants, incompetents, absentees and nonresidents) who may have had a right, title, interest, claim, lien or equity of redemption in the land are barred from the right, title, interest, claim, lien or equity of redemption. (§§ 22-2-13, 22-2-14 ACLA 1949; am § 1 ch 106 SLA 1949; am § 9 ch 134 SLA 1953)

Sec. 34.10.140. Right to possession. A party who acquires title to premises under this chapter is entitled to possession as if the person had obtained a judgment in an action for forcible entry and detainer of the property. (§ 22-2-15 ACLA 1949; am § 1 ch 106 SLA 1949; am § 9 ch 134 SLA 1953)

Sec. 34.10.150. Conveyance in lieu of foreclosure. Instead of prosecuting an action to foreclose a lien on a parcel, the state may accept a conveyance of the interest of a person having a right, title, interest, claim, lien or equity of redemption in the parcel. (§ 22-2-17 ACLA 1949; am § 1 ch 106 SLA 1949; am § 9 ch 134 SLA 1953)

Sec. 34.10.160. Answer. (a) If a verified answer is served upon the attorney general within the period specified in § 80 of this chapter, the court shall immediately hear and determine the issues raised by the complaint and answer in the same manner and under the same rules as it hears and determines other actions, except as provided otherwise in this chapter.

(b) Upon trial, proof that the statement required by § 40 of this chapter was filed when due or that the penalty was paid, together with interest due, constitutes a complete defense.

(c) When an answer is filed as provided in this section, the defendant has an absolute right to the severance of the action as to a parcel of land in which he has an interest, upon written demand filed with or made a part of his answer. (§ 8 ch 134 SLA 1953)

Sec. 34.10.170. State administration of lands. The Department of Natural Resources may sell, lease or administer all real property to which the state obtains title under this chapter in the same manner as it is authorized to sell, lease or administer other state land. Proceeds derived from the sales, leases or administration shall be remitted to the Department of Revenue and deposited into the general fund of the state. Article 4. Redemption.

Section		Section	
180.	Right of redemption	220.	Repurchase by record owner or assigns
190.	Procedure for redemption	230.	Definitions
200.	Redemption before judgment	240.	Short title
210.	Redemption after order of court		

Sec. 34.10.180. Right of redemption. It is the intent of the legislature to enact into the "Land Registration Law of 1953" a true right of redemption in the owner and in a lienholder or other person having an interest in property affected by that law. (§ 1 ch 17 SLA 1957)

Sec. 34.10.190. Procedure for redemption. Property subject to §§ 80 and 110 — 130 of this chapter may be redeemed before or after foreclosure by the owner of the property, or by a person having an interest in it by paying to the department all penalties, interest and costs due on the property

(1) before the entry of an order by the court awarding possession of the property to the state and directing the deeding of the property to the state, or

(2) within one year after the entry by the court of the order (§ 2 ch 17 SLA 1957; am § 1 ch 179 SLA 1959)

Sec. 34.10.200. Redemption before judgment. Upon redemption of property before the entry of an order by the court, the department shall execute a certificate of redemption to the owner of the property. The certificate shall identify the property redeemed and shall state that all penalties, interest and costs are paid. (§ 3 ch 17 SLA 1957)

Sec. 34.10.210. Redemption after order of court. Upon redemption of property after the entry of an order by the court but before the expiration of the one-year redemption period, the Department of Natural Resources shall, on behalf of the state, execute and deliver a quitclaim deed to the former owner of the property. (§ 4 ch 17 SLA 1957; am § 2 ch 179 SLA 1959)

Sec. 34.10.220. Repurchase by record owner or assigns. (a) The record owner at the time of the entry of the order of foreclosure or his assigns may, at any time before sale of the foreclosed property by the state, repurchase the property and the property shall be resold by the state to the former record owner, or his assigns, for the full amount applicable to the property under the judgment and decree, with interest at the rate of eight per cent a year from the date of entry of the judgment and decree of foreclosure to the date of repurchase, together with other charges imposed on the property.

(b) No right of repurchase attaches to property, after the termination of the redemption period, which has been sold by the state or which is held by the state for and devoted to a public purpose authorized by law

with the public purpose. (§ 5 ch 17 SLA 1957; added by § 4 ch 179 SLA 1959)

Sec. 34.10.230. Definitions. In this chapter (1) "department" means the Department of Natural Resources;

(2) "real property" includes patented land and other land in which the owner has a fee simple title. (§ 7 ch 135 SLA 1955)

Sec. 34.10.240. Short title. This chapter may be cited as the Land Registration Law. (§ 1 ch 134 SLA 1953)

Chapter 15. Conveyances.

Article
1. Form and Effect (§§ 34.15.010 — 34.15.140)
2. Acknowledgment and Proof (§§ 34.15.150 - 34.15.250)
3. Recording (§§ 34.15.260 — 34.15.350)

Article 1. Form and Effect.

Section
10. Manner of executing conveyances
20. Conveyance by nonresident married woman
30. Form of warranty deed
40. Form of quitclaim deed
50. Effect of quitclaim
60. Passage of fee
70. Passage of grantor's entire estate
80. Covenants not implied
90. Covenant not implied in mortgage
100. Conveyance of lands held adversely
110. Conveyances construed as creating tenancy in common
120. Remedy of tenant in common
130. Joint tenancy abolished
140. Tenancy by the entirety

Sec. 34.15.010. Manner of executing conveyances. (a) A conveyance of land, or of an estate or interest in land, may be made by deed, signed and sealed by the person from whom the estate or interest is intended to pass, who is of lawful age, or by his lawful agent or attorney, and acknowledged or proved, and recorded as directed in this chapter, without any other act or ceremony whatever.

(b) In a deed or conveyance of the family home or homestead by a married man or a married woman, the husband and wife shall join in the deed or conveyance.

(c) The requirement that a spouse of a married person join in a deed or conveyance of the family home or homestead does not create a proprietary right, title or interest in the spouse not otherwise vested in the spouse.

(d) Failure of the spouse to join in the deed or conveyance does not affect the validity of the deed or conveyance, unless the spouse appears on the title. The deed or conveyance is sufficient in law to convey the legal title to the premises described in it from the grantor to the grantee when the deed or conveyance is otherwise sufficient, and (1) no suit is filed in a court of record in the judicial district in which the land is located within one year from the date of recording of the deed or conveyance by the spouse who failed to join in the deed or conveyance to have the deed or conveyance set aside, altered, changed, or reformed, or (2) the spouse whose interest in the property is affected does not file,

Referred: The Special Committee on Subsistence, Resources and Finance

BY THE RULES COMMITTEE BY REQUEST (for the Special Committee on Subsistence)

IN THE HOUSE

HOUSE BILL NO. 960

IN THE LEGISLATURE OF THE STATE OF ALASKA

TENTH LEGISLATURE - SECOND SESSION

A BILL

For an Act entitled: "An Act relating to fish and game management."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

* Section 1. INTENT. The legislature finds that there is a need to develop a statewide policy on the utilization, development and conservation of fish and game resources, and to recognize that those resources are not inexhaustible and that preferences must be established among beneficial users of the resources. The legislature further determines that it is in the public interest to clearly establish subsistence use as the priority beneficial use of Alaska's fish and game resources and to recognize the needs, customs and traditions of Alaskan residents. The legislature further finds that beneficial use of those resources by all state residents should be carefully monitored and regulated, with as much input as possible from the affected users, so that the viability of fish and game resources is not threatened and so that resources are conserved in a manner consistent with the sustained-yield principle.

* Sec. 2. AS 16.05.020(1) is amended to read:

(1) supervise and control the department, and, except as provided under sec. 93 of this chapter, he may appoint and employ division heads, enforcement agents, and the technical, clerical, and other assistants necessary for the general administration of the department;

* Sec. 3. AS 16.05.090 is amended by adding a new subsection to read:

(c) There is established in the Department of Fish and Game a division of subsistence hunting and fishing.

* Sec. 4. AS 16.05 is amended by adding new sections to read:

Sec. 16.05.093. DIRECTOR OF THE DIVISION OF SUBSISTENCE HUNTING AND FISHING. The division of subsistence hunting and fishing shall be administered by a director appointed by the governor.

Sec. 16.05.094. DUTIES OF DIVISION OF SUBSISTENCE HUNTING AND FISHING. The division of subsistence hunting and fishing shall

(1) compile existing data and conduct studies to gather information on all aspects of the role of subsistence hunting and fishing in the lives of the residents of the state;

(2) ~~quantify~~ the amount, value, and extent of dependence on food acquired through subsistence hunting and fishing;

(3) make information gathered available to the legislature in a form suitable for use in developing legislation relating to land ~~and~~ water ~~management~~;

(4) assist the legislature to determine what uses of fish and game, as well as which users and what methods, should be termed subsistence uses, users, and methods;

(5) evaluate the impact of state and federal laws and regulations on subsistence hunting and fishing and, when corrective action is indicated, make recommendations to the governor and the legislature;

(6) make recommendations to the Board of Game and the Board of Fisheries regarding adoption, amendment and repeal of regulations relating to subsistence hunting and fishing.

* Sec. 5. AS 16.05.221 is amended to read:

Sec. 16.05.221. BOARDS OF FISHERIES AND GAME. (a) For purposes of the conservation and development of the fishery resources of the state, there is created the Board of Fisheries composed of nine [SEVEN] members appointed by the governor, subject to confirmation by a majority of the members of the legislature in joint session. The [APPOINTED] members shall be residents of the state and shall be appointed without

regard to political affiliation [OR GEOGRAPHICAL LOCATION OF RESIDENCE]. Membership of the board shall include one user of fish for subsistence from each of the four judicial districts of the state, two holders of sport fishing licenses who are not users of fish for subsistence, two holders of commercial fishing licenses, and one member at large. The commissioner is not a member of the Board of Fisheries, but shall be ex officio secretary.

(b) For purposes of the conservation and development of the game resources of the state, there is created a Board of Game composed of nine [SEVEN] members appointed by the governor, subject to confirmation by a majority of the members of the legislature in joint session. The [APPOINTED] members shall be residents of the state, and shall be appointed without regard to political affiliation [OR GEOGRAPHICAL LOCATION OF RESIDENCE]. Membership of the board shall include one user of game for subsistence from each of the four judicial districts of the state, two holders of hunting licenses who are not users of game for subsistence, two master guides, and one member at large. The commissioner is not a member of the Board of Game, but shall be ex officio secretary.

* Sec. 6. AS 16.05.251 is amended by adding a new subsection to read:

(b) The Board of Fisheries shall adopt regulations in accordance with the Administrative Procedure Act (AS 44.62) permitting the taking of fish for subsistence uses unless the board determines, in accordance with the Administrative Procedure Act, that adoption of such regulations will jeopardize or interfere with the maintenance of fish stocks on a sustained-yield basis. Whenever it is necessary to restrict the taking ~~or other consumptive uses~~ of fish in order to assure the maintenance of fish stocks on a sustained-yield basis, or to assure the continuation of subsistence uses of such resources, subsistence use shall be the priority use.

If further restriction is necessary, the board shall establish restrictions and limitations on and priorities for these consumptive uses on the basis of the following criteria:

(1) customary and direct dependence upon the resource as the mainstay of one's livelihood;

(2) local residency; and

(3) availability of alternative resources.

* Sec. 7. AS 16.05.255 is amended by adding new subsections to read:

(b) The Board of Game shall adopt regulations in accordance with the Administrative Procedure Act (AS 44.62) permitting the taking of game for subsistence uses unless the board determines, in accordance with the Administrative Procedure Act, that adoption of such regulations will jeopardize or interfere with the maintenance of game resources on a sustained-yield basis. Whenever it is necessary to restrict the taking or other consumptive uses of game in order to assure the maintenance of game resources on a sustained-yield basis, or the continuation of subsistence uses of such resources, subsistence use shall be the priority use. If further restriction is necessary, the board shall establish restrictions and limitations on and priorities for these consumptive uses on the basis of the following criteria:

(1) customary and direct dependence upon the resource as the mainstay of one's livelihood;

(2) local residency; and

(3) availability of alternative resources.

(c) No regulations permitting the taking of game may be adopted unless the game is edible at the time of year when the taking is to be permitted.

* Sec. 8. AS 16.05.257(a) is amended to read:

(a) The Board of Game, at its regularly scheduled annual meeting,

shall consider and may adopt regulations providing for subsistence hunting in a game management unit or subunit or a portion of a unit or subunit upon

(1) recommendation of the department, based on biological evidence;

(2) the recommendation [MAJORITY VOTE] of the active local advisory committees for that game management unit or subunit or a portion of a unit or subunit;

(3) the written petition of not less than 100 interested residents of that game management unit or subunit or a portion of a unit or subunit; or

(4) the written petition of not less than 25 interested residents of an area which is requested for establishment as a subsistence area within a game management unit or subunit or a portion of a unit or subunit.

* Sec. 9. AS 16.05.257(c) is repealed and re-enacted to read:

(c) No regulations may be adopted by the Board of Game under (a), (b) or (f) of this section unless, in addition to the requirements of AS 44.62.180 - 44.62.290, the department

(1) holds public hearings, after reasonable notice, at least 30 days before the meeting at which the regulation is to be adopted, with at least one of the hearings being held in close proximity to the area potentially affected;

(2) presents at the hearings the information provided for in (e) of this section;

(3) makes the information provided for in (e) of this section available to the appropriate advisory committees and to petitioners if consideration of adoption of regulations was prompted by petitions under (a)(3) or (4) of this section; comments shall be received by the board

until 10 days before any adoption of regulations.

* Sec. 10. AS 16.05.257(d) is amended to read:

(d) A petition submitted under (a)(3) - (4) of this section shall contain a complete description of the area requested as a subsistence area and a specification of the species within the area considered necessary for subsistence use. A petition or request made under (a)(2), (3) or (4) of this section must be filed with the department at least 75 days before the next scheduled meeting of the board.

* Sec. 11. AS 16.05.257(e) is repealed and re-enacted to read:

(e) The department shall investigate every petition or request made under (a)(2), (3) or (4) of this section and provide the following information: (1) the concentration and carrying capacity of the species to be affected; (2) the concentration of other species; (3) the extent of competition of other species with the affected species in the area; (4) the current hunting practices in the area, including numbers of animals taken and by what methods and means, whether the take is subsistence or recreational, and characteristics of the hunters; (5) the past and present dependence of persons in the area for subsistence use of a species; (6) the biomass of the species to be affected; (7) the population trends in the area; and (8) whether the population is able to support a nonsubsistence harvest. No decision denying, creating or changing a subsistence hunting area may be made unless based on specific written findings of fact regarding all the information provided in accordance with this section. No subsistence hunting area may be created if the board determines that creation of such an area will jeopardize or interfere with the maintenance of game populations on a sustained-yield basis.

* Sec. 12. AS 16.05.257(h)(1) is amended to read:

(1) "subsistence hunting" means the taking of game animals by

a state resident for subsistence uses by means defined by the Board of Game [FOOD OR CLOTHING FOR PERSONAL OR IMMEDIATE FAMILY USE];

* Sec. 13. AS 16.05.257(h)(2) is repealed and re-enacted to read:

(2) "subsistence hunting area" means an area in which only subsistence hunting of the affected species is permitted and which is managed for maximum food potential.

* Sec. 14. AS 16.05.257 is amended by adding a new subsection to read:

(i) The Board of Game may make no decision denying, creating or changing a subsistence hunting area unless based on specific written findings of fact regarding all the information provided in accordance with (e) of this section. No subsistence hunting area may be created if the board determines that creation of such an area will jeopardize or interfere with the maintenance of game populations on a sustained-yield basis.

* Sec. 15. AS 16.05.290 is amended to read:

Sec. 16.05.290. COMPENSATION OF BOARD MEMBERS. Each member of a board is entitled to travel expenses, [AND $100] per diem, and $100 in compensation for each day going to and from and for each day in actual attendance at board meetings and other meetings or conferences authorized by a board.

* Sec. 16. AS 16.05.345 is amended to read:

Sec. 16.05.345. MUSK OXEN. The department shall issue big game tags for the taking of musk oxen if an open season is declared. The cost of these tags is $500 for residents and $1,000 for nonresidents unless the musk ox is to be taken for subsistence by a person residing in the vicinity of the habitat of the musk ox, in which case the tag shall be issued at no charge. Public notice to the general public, drawings for subsistence musk oxen permits shall be held in villages in the vicinity of the musk oxen habitat. The department shall conduct a drawing for permits to take musk oxen.

No person is eligible for more than one permit a year. Each application for a permit shall be accompanied by a $10 fee.

* Sec. 17. AS 16.05.930(b) is amended to read:

(b) This chapter does not prohibit a person from taking fish or game during the closed season for religious purposes or in a case [, IN CASE] of dire emergency, as defined by regulation promulgated by the appropriate board.

* Sec. 18. AS 16.05.930 is amended by adding a new subsection to read:

(e) This chapter does not prevent the traditional barter of fish and game taken by subsistence hunting or fishing, except that the commissioner may prohibit the barter of subsistence-taken fish and game by regulation, emergency or otherwise, if a determination on the record is made that the barter is resulting in a waste of the resource, damage to fish stocks or game populations, or circumvention of fish or game management programs.

* Sec. 19. AS 16.05.940 is amended by adding new paragraphs to read:

(26) "subsistence uses" means the customary and traditional uses in Alaska of wild, renewable resources for direct personal or family consumption as food, shelter, fuel, clothing, tools, or transportation, for the making and selling of handicraft articles out of nonedible by-products of fish and wildlife resources taken for personal or family consumption, and for the customary trade, barter or sharing for personal or family consumption; for the purposes of this paragraph, "family" means all persons related by blood, marriage, or adoption, and any person living within the household on a permanent basis;

(27) "barter" means the exchange or trade of fish or game taken for subsistence uses for valuable consideration other than money.

* Sec. 20. AS 24.20 is amended by adding new sections to read:

Sec. 24.20.600. SUBSISTENCE COMMITTEE ESTABLISHED. The Subsis-

lature when attending sessions, except that members of the committ receive no per diem during the legislative sessions other than th er diem allowance paid to other members of the legislature.

Sec. 24.20.650. STAFF. The Legislative Affairs Agency shall provide the Subsistence Committee with professional and clerical assistance under the auspices of the Legislative Council.

Sec. 24.20.660. DUTIES. The Subsistence Committee shall

(1) gather information on all aspects of subsistence hunting and fishing and the role of subsistence in the lives of the residents of the state;

(2) monitor the activities of state officers and agencies which affect the use of subsistence resources;

(3) evaluate the impact of federal laws, regulations, and policies which affect subsistence;

(4) receive public comment on governmental action affecting subsistence;

(5) review regulations adopted by the Board of Fish and the Board of Game which affect subsistence.

Sec. 24.20.670. POWERS. (a) The Subsistence Committee has the following powers:

(1) to organize and adopt rules for the conduct of its business;

(2) to hold public hearings;

(3) to call upon all state officials, agencies, and institutions to give full cooperation to the committee and its staff by collecting and furnishing information, conducting studies and writing recommendations;

(4) to sponsor legislation in accordance with AS 24.30.-060(b), including resolutions annulling regulations.

tence Committee is established as a permanent interim committee of the legislature. The establishment of the committee is a recognition that continuous and intensive legislative study and involvement in the subsistence lifestyle is necessary to insure that the subsistence lifestyle remains a viable way of life for those who live it through choice or necessity.

Sec. 24.20.610. MEMBERSHIP. The Subsistence Committee is composed of three members of the house appointed by the speaker of the house, and three members of the senate appointed by the president of the senate; however, two of the three members from each house shall be the chairman of the standing resources committee or his designee and one other member of the committee. The membership from each house shall include at least one member from each of the two major political parties. The committee elects a chairman from among its members.

Sec. 24.20.620. TERM OF MEMBERSHIP. The Subsistence Committee shall be organized within 15 days after the organization of each legislature. Members serve for the duration of the legislature during which they are appointed. If they are reelected or their term of office extends into the next succeeding legislature, they continue to serve until reappointed or the appointment of their successor.

Sec. 24.20.630. VACANCIES. When a vacancy occurs in the membership of the Subsistence Committee, the presiding officer of the house incurring the vacancy shall choose a successor.

Sec. 24.20.640. MEETINGS. The Subsistence Committee may meet during sessions of the legislature and during the interim between sessions at such times and places in the state as the chairman may determine. Members may receive, for the minimum time required to get to and from meetings and for the period while attending meetings, the same travel and per diem allowances provided by law for members of the legis-

(b) Nothing in secs. 600 - 680 of this chapter authorizes the referral by the presiding officer of either house of legislation to the committee at regular or special sessions of the legislature.

Sec. 24.20.680. REPORTS. The Subsistence Committee shall submit a summary report of its findings and recommendations to each legislature.

* Sec. 21. AS 24.30.060(b) is amended to read:

(b) Bills introduced by the Legislative Council shall be delivered with a letter of explanation to the rules committee of either house and bear the inscription "Rules Committee by Request of the Legislative Council"; <u>bills introduced by the Subsistence Committee shall be delivered with a letter of explanation to the rules committee of either house and bear the inscription "Rules Committee by request of the Subsistence Committee";</u> bills introduced by the Administrative Regulation Review Committee shall be delivered with a letter of explanation to the rules committee of either house and bear the inscription "Rules Committee by Request of the Administrative Regulation Review Committee"; bills introduced by the Legislative Budget and Audit Committee shall be delivered with a letter of explanation to the rules committee of either house and bear the inscription "Rules Committee by Request of the Legislative Budget and Audit Committee." Bills presented by the governor shall be delivered with a letter to the rules committee of either house and bear the inscription "Rules Committee by Request of the Governor"; bills so presented and inscribed shall be received as bills carrying the approval of the governor as to policy and budget impact. The governor may submit a statement of purpose and effect with each bill and appear personally or through a representative before any committee considering legislation.

* Sec. 22. The permanent interim Subsistence Committee established in AS 24.20.600, enacted in sec. 20 of this Act expires December 31, 1984.

Delete

* Sec. 23. Notwithstanding any other provisions of law, the terms of all persons appointed to the Board of Fisheries and the Board of Game under AS 16.05.221 and serving on the boards on the effective date of this Act expire on that date. The governor shall appoint persons to seats on the boards as reconstituted under AS 16.05.221, as amended in sec. 5 of this Act, within 30 days of the effective date of this Act.

IV. DATE May 2, 1978 PREPARED BY Bill Morrison
AGENCY Fish and Game
PHONE 465-4120

Original: Legislative Finance
cc: Budget and Management
Prime Sponsor (First Legislator Named)

33-001 (Rev. 12/77)

I. Sections 2-4 establish a Division of Subsistance.

In addition to a Headquarters staff of director, deputy director, secretary, and administrative assistant, work would be accomplished by regional positions with clerical support at range 18 in Juneau, Anchorage, Kodiak, Fairbanks, Barrow, Bethel, Dillingham, Galena, Kotzebue, and Nome. Range 18 is the same level as Fisheries or Game Biologist III. This is the project manager level and would be expected to have a broad range of professional experience as well as the ability to interact well with the public. Travel is provided at $3,000 for regional positions, and $4,000 for the director and deputy. Contractual funds are for phones, printing, advertising, and space rental. (Figures assume 600/mo. for regional space and phones; 1,000/yr. for regional printing; 700/mo for HQ space and phones; 3,000/yr for HQ printing and miscellaneous). New equipment is needed for all positions.

Line item costs for the Division of Subsistance are as follows:

100 - 699.9	400 - 4.5
200 - 38.0	500 - 35.3
300 - 93.4	

Line item 500 is reduced to 3.0 for FY '80 and beyond.

II. Section 5 adds two members each to the Boards of Fisheries and Game.

The cost of each additional Fisheries Board member would be $1,500 in travel and $4,500 in per diem. The cost of each additional Game Board member would be $1,000 in travel and $2,200 in per diem. These figures do <u>not</u> include the additional compensation addressed in section 15 of the bill. Total cost of section 5 is $18,400, all in line 200.

III. Section 15 provides additional compensation for Board members.

Board members currently receive $100 per diem per day. The effect of section 15 would be to reduce the per diem to the same as that paid other state employees (this fiscal note assumes an average of $60), and to add compensation of $100 per day for Board members. Actual per diem paid would be reduced from $49,800 in FY '79 (both boards) to $29,900 in line item 200. Compensation of $100 per day would add $49,800 in line item 100

IV. Section 20 creates a permanent Interim Subsistance Committee of the Legislature. There is no fiscal impact of this action in the Department of Fish and Game. However, the Division of Legislative Affairs would be fiscally impacted by this section.

DESCRIPTION:

TUNDRA TIMES, JANUARY 1978

SUBSISTENCE: TRADITION AND A WAY OF LIFE

HB 960 Sectional Analysis

§1 Statement of legislative intent.

§§2-4 Creates a Division of Subsistence Hunting and Fishing in the Department of Fish and Game, with a director appointed by the Governor. The division shall collect information and conduct studies on subsistence hunting and fishing and is to provide information and recommendations to the Governor, Legislature and Boards of Fisheries and Game.

§5 The Boards of Fisheries and Game are increased from seven to nine members. Four members are to be subsistence users; two sports users; two commercial users and one at-large member.

§6 The Board of Fisheries is required to adopt regulations allowing subsistence fishing unless allowing subsistence fishing will make it impossible to maintain fish stocks on a sustained-yield basis. When any restriction on the taking of fish is necessary, subsistence use shall be the preferred use. If restriction of recreational and commercial fishing is not adequate to assure maintenance of fish stocks on a sustained yield basis, subsistence use can be restricted or prioritized by use of the criteria set forth in the bill.

§7 Same as Section 6 but applicable to the Board of Game. In addition, subsection (c) prohibits regulations allowing the taking of game during seasons when the game is inedible.

§8 The Board of Game is required to consider every request to create a subsistence hunting area. The appropriate advisory committee in the area may recommend that such an area be created.

§9 Before on a request for a subsistence hunting area the Board must hold public hearings and provide biological information to the appropriate people.

§10 The request for creation of a subsistence hunting area must be filed with the Department at least 25 days before the next board meeting.

§11 The Department shall investigate the request for creation of a subsistence hunting area and compile specific biological data about the species to be affected and the area. The specific information required is set forth in the bill.

§12 "Subsistence hunting" is defined.

§13 "Subsistence hunting area" is defined.

§14 The Board of Game must make specific written findings of fact whenever it creates or changes a subsistence hunting area or denies a request for such an area. No such area may be created if game populations could not be maintained on a sustained-yield basis.

§15 The compensation of members of the Boards of Fisheries and Game is increased by $100 per day.

§16 A musk oxen tag is to be issued free to subsistence users living near the musk oxen. Drawings for subsistence permits must be held in the local villages, with advance publicity.

§17 Taking of fish and game during closed seasons for religious purposes is authorized.

§18 Barter of subsistence-taken fish and game is authorized unless the commissioner finds that barter is resulting in waste, damage to fish stocks or game populations, or circumvention of fish and game management programs.

§19 "Subsistence uses" is defined. "Barter" is defined.

§20 A permanent interim committee of the Legislature on subsistence is created. The section sets forth the membership, terms of membership and powers and duties.

§21 The Subsistence Committee may introduce bills through the Rules Committee.

§22 The Subsistence Committee created in section 20 terminates in 1984.

§23 Upon adoption of this bill, the terms of all members of the Boards of Fisheries and Game terminate and new members are to be appointed by the Governor.

BASIC ELEMENTS OF

"AN ACT RELATING TO FISH AND GAME MANAGEMENT"

FAIRBANKS, ALASKA APRIL 19, 1978

Editorial

State abandons front of subsistence support

For the better part of a year now, Alaska Native leaders have become at home in America's airspace, jetting between Barrow, Kotzebue, Bethel, Dillingham and other regional centers, and points south and east: Anchorage, Juneau and Washington, D.C.

Thousands of miles have been logged in pursuit of a pathetically simple notion: that Alaska Natives who still rely directly upon the land for their livelihood and cultural identity should be able to continue doing so. They have accepted that never again will they be totally free to pursue game without limits and restrictions. They have gone out of their way to explore with other parties ideas for dividing Alaska's fish and wildlife resources among all users, urban and rural. For their sincere efforts to cooperate with competing user groups in Alaska in developing responsible management plans, they have been repaid with condescension, suspicion

PLEASE TURN TO PAGE TWO

State abandons subsistence

CONTINUED FROM PAGE ONE

and betrayal of the trust they placed in their adversaries to also be reasonable and sincere.

Natives Stung

Natives have been particularly stung by the complete abandonment by the Hammond Administration of even a pretense of what the subsistence needs of Alaska Natives are and how they should be met by state management policies. In a press conference last week, Hammond backed up comments made by Fish and Game Commissioner Ronald Skoog in Washington, D.C. to the effect that the State of Alaska would no longer support federal oversight of state subsistence management as set forth in the draft Alaska lands bill approved by the House Interior Committee earlier this year. Hammond's statement, coupled with similar statements made by the Board of Game and the Alaska Legislature recently have only increased, not diminished, the need for federal recognition and protection of the subsistence lifestyle.

Gruesome Detail

But let us tell the story in a little more gruesome detail.

Three state administrations–Egan's, Hickel's and Hammond's–have stated publicly their willingness to preserve the option of Native people to live basically as they have for years. This commitment strongly implied active state efforts to protect fish and wildlife resources from over-exploitation by urban users and to protect the land base so critical to the survival of wild species.

Hickel and Egan never lifted a finger to fulfill their commitments. This is borne out by the angry testimony of rural Alaskans who told U.S. Congressmen last summer they needed federal assistance not only to protect them from pressures exerted by the dominant urban population and its regular shooting sprees in the Alaska bush, but from the very state government which had pledged itself to perform that protective duty. At the very least, rural Alaskans demanded, the federal government should keep an eye on the state because historically the state had proven unwilling or unable to implement management schemes necessary to divide wildlife resources equitably among competing users.

The reluctance of the state to permit subsistence to enter the realm of everyday management of the resources is clearly demonstrated by the unwillingness of regulatory authorities to designate seasons and bag limits compatible with Native game use patterns, the lack of technical and financial support for the local advisory committees, failure to commit money from the General Fund to fish and game management and the open refusal of the Board of Game to honor the intent of a 1975 bill to restrict urban traffic to critical subsistence areas. State Fish and Game officials, from top to bottom have consistently portrayed the state's local and regional subsistence economies to this writer in the most derogatory terms, characterizing Native cultural aspirations as shallow and insincere, and forecasting the ultimate demise of subsistence cultures as progress marches on, as if there was no need to make an effort to bolster the rural lifestyle against those forces. Earlier this month, State Fisheries Biologist Ray Baxter, of Bethel, was quoted in the Los Angeles Times as saying subsistence culture has become "so twisted and distorted in the past 100 years that you can't really recognize it as a culture.

"There's no word or concept for conservation in the Eskimo language. They exterminate any resources they can get their hands on."

Enter Hammond

So much for explaining why ruralites are hostile to state management. Enter now Jay S. Hammond, a man whose heart even now we do not wish to doubt. Hammond decided last year to put some teeth in his own administration's pledge to balance fish and game management to accomodate subsistence and sport users.

Hammond told us he was going to undertake a reorganization of the Dept. of Fish and Game in an effort to make it more responsive to the needs of subsistence users; he wanted to correct some of the more chronic proolems, such as lack of rural input in policy-making. He planned to carry out this effort administratively, knowing that most state legislators like the department just the way it is–catering to the whims of trigger-happy sportsmen.

Hammond's proposed reorganization was also advanced for another reason. Rural Alaskans convinced Congressman John Seiberling and his Subcommittee on General Oversight and Alaska Lands last summer that nothing more than the barest minimum of lip service had been paid by the state to subsistence needs, even falling short of state promises, and that they could only expect a fair shake from the federal government. The Congressmen made it clear that they saw the debate over Alaska's federal land as an excellent opportunity to honor the Congressional commitment to subsistence protection made at the time the land claims act was passed in 1971. Although Congress maintained Alaska Natives would no longer enjoy an untouchable right to pursue game, it did assert that the Alaska Native subsistence lifestyle would not be allowed to die an unnatural death as a result of hostile neglect or a one-sided battle with detractors of Native culture.

Land Bill

When the Congressmen returned to Washington, they wrote a land bill for Alaska that said, among other things, that the federal government shall have the authority to oversee state management of subsistence resources. The idea is that the state should submit a plan explaining how it intends to meet federal subsistence guidelines. Hammond's departmental reorganization IS that plan, one that is being field-tested throughout the state. The fact that the plan has not been particularly well-received by

State abandons subsistence

CONTINUED FROM PAGE TWO

Agriculture, with delegated authority to the state upon compliance with requirements of the Act and the appropriate secretary. Unfortunately, the state's position on this title has been misrepresented by some implying that we endorse this concept. We do not! Governor Hammond has made that position quite clear, as indicated earlier in this testimony. I might add as well that most if not all state wildlife management agencies do not support this concept either, and are strongly in favor of maintaining states' authorities and responsibilities for resident fish and wildlife."

In a phone call from Skoog to a joint meeting of the Boards of Fish and Game, Skoog elaborated on the state's reversal:

"We feel we should not deal with subsistence in this bill–but our previous recognition of it makes it difficult to back off now."

Incomprehensible

Director of the Rural Alaska Community Action Program, Phil Smith telegrammed Hammond after the governor called a press conference to confirm that he endorsed the thrust of Skoog's jagged d-2 blades, incredulous at the executive's action:

"What is incomprehensible, at best, at this point in the development of the d-2 legislation that the state would unilaterally, and without prior consultation with either AFN or RurAL CAP, so completely turn the tables on this issue.

"2. Secondly, I believe the state has generally ignored the benefits to its management regime that Title VII presently offers. At the very least, we see (and have strongly encouraged) the following: . .

"A. State management on all federal lands, under a state plan, and with assurance of cooperative management where indicated.

"B. Federal statutory guarantees, subject only to limited federal oversight, of the state's right to manage fish and wildlife on those federal lands.

"C. Federal financial participation (beyond Pittman-Robertson and Dingle-Johnson funding) of up to 50 percent of the costs of implementing the management regime adopted by the state.

"D. Federal statutory support to the state's oft-stated priority of subsistence being the number one priority consumptive use of fish and game resources.

"By assuming the posture that Title VII abrogates the tenets of the Statehood Act and violates the principle of "state's rights," we are afraid the state is risking the loss of all the above gains. In my opinion, any alternative to Title VII as presently written would further polarize the people of Alaska on the d-2 issue."

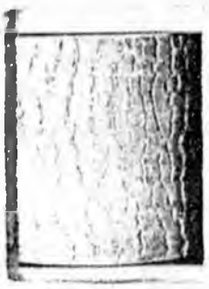
Ted Stevens

Amen. We would only add that contrary to misinformation recently issued by states rights advocate Senator Ted Stevens, in no instance does Title VII mandate actual federal day-to-day management of Alaska's fish and game resources on federal land, UNLESS the state refuses to comply with federal guidelines. We are at a loss to understand why the guidelines are so offensive, considering that most are consistent with the frequent promises by the state to accomodate subsistence use of wildlife resources in management plans.

Frustration

What makes this whole question of federal oversight so frustrating is that Native detractors insist that in demanding oversight of state game management, Natives are asking for the sun and moon. In fact, they are asking the feds for what the state has so long denied them: protection of a fair share of game and fish resources, consistent with their proveable need for those resources, against poorly managed access by other user groups to those same resources.

Those who are most eager to steal away the land and life that Alaska Natives have fought so hard to retain control of argue that Native acculturation into the mainstream of Western Civilization is inevitable. They cannot be blind to the fact that if they can successfully strangle Native efforts to gain a greater voice in the disposition of land and subsistence resources, they will have destroyed one tool that Native people can use to protect their life. Federal



urban or rural resource users, in our view, strengthens the need for federal oversight until state management competence is demonstrated.

But there is more.

In an unpublished interview with the Tundra Times on February 9, Hammond actually endorsed the federal oversight concept. Referring to Title VII, the subsistence section of the Alaska Federal land bill ultimately adopted by the full House Interior Committee, Hammond said his reaction to the subsistence language was:

"Generally favorable. I'm a little concerned with one portion of it, which would be Section 705(b) which might create a rather difficult administrative problem area in that it sets forth a prescribed procedure whereby a single regional council might compel the Secretary to go through a very lengthy process of hearings.

"I think that's perhaps overly complex. I think section (a) accomodates concerns of the regional councils that might feel boards of fish and game are not complying with the mandate of the Act, without going into that type of organized, formalized structure.

"I am not stating that the State's regional council proposal is the best answer to the question, but it does provide a means where we could implement administratively something that apprently now Congress has deemed adequate, and the Natives, to meet their concerns. I am pleased to that extent."

When we asked if his administration would continue to support the language of the committee's Title VII, Hammond replied:

"Well yes. I was back in Washington and conveyed to Congressman Seiberling and all the other parties there what our views were in that regard and they pretty well accomodated this. So I would have no reason not to support something that we pretty well initiated.

"My only concern is that what appears to be an administrative complexity that doesn't appear necessary. I have a little concern about that particular section, but aside from that, fine."

The section of Title VII he referred to was not related to the concept of federal oversight and in fact, the committee accepted a Hammond sponsored amendment to alter Sec. 705(b).

Another Committee

This month, yet another Congressional committee took up the Alaska land issue. Fish and Game Commissioner Ronald Skoog flew to Washington, D.C. to tell the Subcommittee on Fisheries and Wildlife Conservation and the Environment that the Hammond Administration has had a change of heart:

"Within Title VII of the House Interior and Insular Affairs Committee has selected to adopt language which would revamp considerably the fish and wildlife management system for federal lands in Alaska. Under this "Subsistence Title" in H.R. 39 the authority to manage all fish and wildlife on all federal lands is vested in the Secretary of the Interior and/or the Secretary of

evens took second place in the men's division Old Time Fiddlers Championship Contest, on March 25-25. Bill won a beautiful trophy

oversight of subsistence management by the state gives Alaska Natives a fighting chance to preserve their way of living, a way of living with far more cultural integrity than many critics are able to perceive.

We know that if Native people have anything to say about it, their rural lifestyle, based squarely upon the taking of fish and game, with its various regional and ethnic variations in tradition, social structure and technology, will be preserved. Not as a stopping place on the way to cultural extinction, but as a way to live freely chosen by the people, as other Americans expect to choose their paths through life; a lifestyle cherished for its simplicity, its closeness to the essential sources of all living things, its vitality in nourishing a strong sense of identity and closeness of spirit among people.

The point is, federal oversight of state subsistence management gives Alaska Natives a chance to preserve that which is rightfully theirs to keep or surrender. Unrestricted state management, considering past and present experience, virtually guarantees that Alaska Natives will lose what is rightfully theirs whether they wish to give it up or not.

[illegible] really be better? "I sure hope so," said one 48-[illegible]ear resident of Nome, who asked to remain anonymous. "We have to improve. We can't go on the way we [illegible] of [illegible]

IN THE HOUSE BY SCHAEFFER

HOUSE CONCURRENT RESOLUTION NO. 23

IN THE LEGISLATURE OF THE STATE OF ALASKA

TENTH LEGISLATURE - FIRST SESSION

Requesting an earlier opening of the caribou season in the arctic game management units.

BE IT RESOLVED BY THE LEGISLATURE OF THE STATE OF ALASKA:

WHEREAS many villages in the state's arctic game management units have always utilized the meat of the caribou as their primary wild meat food source; and

WHEREAS, due to a serious depletion of the Western-Arctic herd in recent years, state regulations have reduced the allowable take of caribou in Units 23, 24, 26A and 26B from fifteen a year to one bull by permit only, with a change of the opening of the season from July 15 to October 1; and

WHEREAS the October 1 opening date fails to recognize that in most cases bull caribou have started rutting by that date and their meat is unfit for human consumption; and

WHEREAS, with so few animals available for human use, wastage of this nature is intolerable;

BE IT RESOLVED by the Alaska State Legislature that the Board of Game is respectfully requested to change the opening date for the caribou season in Units 23, 24, 26A, and 26B from October 1 to September 1. August 1.

STATE OF ALASKA
DEPARTMENT OF FISH AND GAME
OFFICE OF THE COMMISSIONER
JAY S. HAMMOND, GOVERNOR
SUBPORT BUILDING – JUNEAU 99801

April 8, 1977

The Honorable Alvin Osterback
Chairman, House Resources Committee
Alaska State Legislature
Pouch V, State Capitol
Juneau, Alaska 99811

Dear Mr. Osterback:

This is in reply to your letter of March 21, 1977 requesting information on the proposed Arctic National Wildlife Range resolutions.

The Department supports the passage of HCR 41 Arctic National Wildlife Range Protection and HJR 34 Environmental Defense of the Arctic National Wildlife Range. The resolutions are consistent with the intent of the withdrawal which established the Range to preserve the "unique wildlife, wilderness and recreational values" of the area.

During the Gas Line Public Hearings, the Department opposed development within the Arctic National Wildlife Range. The Range is unique in that it is the United States' last example of virtually undisturbed arctic ecosystems-- coastal plain, foothills, mountains and the plant and animal species that exist there.

The Arctic National Wildlife Range provides habitat for caribou, bears, wolves, musk oxen and other mammals. It is a nesting, molting and staging area for waterfowl, gulls, terns and other birds.

Caribou are probably most dependent upon the Range not being disturbed by development. The Porcupine caribou herd has an estimated population of 100,000 - 120,000 animals which makes it the largest caribou herd in the state. The Porcupine herd's calving grounds are within the boundaries of the Range. Although the herd uses different ranges and migration patterns from time to time, the calving areas tend to remain constant and are critical to the caribou's existence. Development in the calving areas would be extremely detrimental to the herd.

The Range is also a scientific laboratory and asset and a recreational resource. Development within the Arctic National Wildlife Range would diminish the value of these activities and would destroy some of the Range's most important values. The Arctic National Wildlife Range's primary value is as an essentially pristine area that contains the entire sweep of natural ecological communities from the Brooks Range to the Arctic Ocean. This value can be protected only by maintaining the integrity of the Range.

The Department believes the term "commercial development" needs clarification. Although the Department opposes industrial types of development, we have no objection to guiding and related activities. It should be made clear that the guide industry will not be adversely affected by the resolutions.

The Department is not submitting a fiscal note at this time. Although it is not anticipated that additional funds will be necessary, the actions taken by the Governor and the President of the United States will be the determining factor in this regard.

If additional information is needed please let me know.

Sincerely,

for James W. Brooks
Commissioner

April 6, 1977

FROM: George C. Silides, P. E. GCS

Notes on SCR 37 and HCR 43 - approving the extension of the Tesoro agreement to purchase royalty crude oil taken in kind.

1. Article XII of the contract between the State and Alaska Oil and Refining Company, to which Tesoro is the legal successor, indicates that the construction and operation of a refinery in Alaska is a pertinent part of the contract. Had the refinery not been built, State reserved the right to cancel the contract to deliver oil.

2. Notwithstanding any FEA mandatory allocation regulations, it can be argued that, in view of the foregoing requirement to construct a refinery as a condition to purchase oil, the State has an obligation to supply an in-state refinery built to process royalty oil - availability of royalty being sufficient and price equal to that of other in-state purchasers.

3. The original contract granted Tesoro the right to extend the contract for two successive three year periods, subject to any new terms and conditions mutually agreed upon by Tesoro and the State.

4. While Tesoro is not willing to give up its allocation rights, it is willing to enter into a temporary, one year, extension until the State gets its act together.

5. The price continues to be the highest average price currently allowed and paid for like oil throughout the field plus 2 cents a barrel for quantities over 15,000 barrels/day. In addition, the State secured an adjustment of 3 cents a barrel instead of 5 cents for each degree API gravity below 40; a net gain of 2 cents/bbl for each degree.

In the event of price deregulation, the price paid to the State under this contract will rise to meet the deregulated price.

6. There is no competing proposal to refine the royalty oil requested.

7. Considering all of the information available and different factors involved, it appears that approving a one year extension of the Tesoro contract is in the best interests of the State.

8. With direct reference to the original contract and manner in which it was entered into, I have found upon examination that, while former Commissioner Tom Kelly might have created

a favored status purchaser, he also drove a hard bargain in favor of the State. The State is well protected in the matter of price, default, and in the matter of the purchaser being required to take, at the option of the State, all royalty taken in kind and surplus to the internal needs of the State, regardless of the available amount.

March 22, 1977

The Honorable Hugh Malone
Speaker of the House
Alaska State Legislature
Juneau, Alaska 99811

Dear Mr. Speaker:

Under the authority of art. III, sec. 18 of the Alaska Constitution, I am transmitting a resolution giving legislative approval to a one-year extension of the agreement between Tesoro-Alaskan Petroleum Company for the purchase of royalty crude oil from the Cook Inlet area. AS 38.06.055(a) provides that no sale of state-owned royalty oil may be made unless approved by concurrent resolution of the legislature.

The Alaska Royalty Oil and Gas Development and Advisory Board has reviewed the extension and granted its appoval on March 8, 1977. The Board's declarations and findings are included in the material submitted to each legislator today. We would be pleased to assist you with any additional information which you request.

The present agreement between the state and Tesoro-Alaskan will expire on December 31, 1977. Tesoro-Alaskan has expressed its desire to continue purchasing state royalty oil from Cook Inlet, and I believe it is in the best interests of the state to continue to sell that oil to Tesoro-Alaskan. Tesoro-Alaskan is the largest refiner in the state and supplies a large portion of the Alaskan petroleum market. It supplies a larger quantity of petroleum products to Alaskan consumers than royalty oil purchased.

As you know, the Federal Energy Administration currently controls the ceiling price of all domestic crude oil, including that produced in the Cook Inlet. This Extension Agreement provides for the state to receive the maximum known price for the oil which can be obtained under these regulations.

Summary and Background for Sale and
Purchase of State Royalty Gas to Alaska
Pipeline Company and for related
Agreement with Phillips Petroleum Company

This contract entitled "Gas Purchase Contract", dated April 11, 1977, between Alaska Pipeline Company (Buyer) and the State of Alaska (Seller) is regarding the sale and purchase of State royalty gas. To accomodate delivery of gas under the above contract it was necessary to enter into an agreement dated April 11, 1977 between Phillips Petroleum Company (Lessee) and the State of Alaska. The above contracts will supercede the contract entitled "Gas Purchase Contract", dated June 4, 1976 between Alaska Pipeline Company and the State of Alaska and was approved by the legislature. The new agreements are necessary because certain of the provisions of the old agreement have proven unworkable.

The following exhibits are submitted in support of these agreements:

1. Gas Purchase Contract dated June 4, 1976 between APC and the State.
2. North Cook Inlet Field Royalty Gas, Commissioner's Proposal in Concept.
3. House Concurrent Resolution No. 142, introduced May 4, 1976.
4. Letter dated April 30, 1976 to the Speaker of the House from the Governor.
5. Findings and Conclusions for Non-Competive Sale.

The reasons that the Contract entered into last year could not become operational are as follows:

1. Article 2.1 of that agreement required that Buyer was to purchase all royalty gas available at the point of delivery (wellhead). Buyer does not have adequate demand to take all of the gas all of the time. Buyer agreed that all gas purchased under the contract will be used to meet the requirements of its customers within the State of Alaska. One solution to Buyer's inability to use all of the royalty gas might have been for Buyer to sell its surplus gas back to Phillips Petroleum. Had Buyer done that it may have been in breach of last years contract because Buyer agreed to use the gas for its customers and the sale was for in-state use. Phillips, however, sells the gas out-of-state.

2. The point of delivery of the gas was at the wellhead on the Lessee's offshore platform in the North Cook Inlet Field. Buyer was required, at its own expense, to arrange to accept the gas at the point of delivery. However, Buyer has been unable to do so because it is not economically feasible to construct a pipeline to the point of delivery and because Buyer has been unable to reach agreement with the Lessee to use Lessee's existing pipeline to deliver the gas to a point on the North Kenai Road where Buyer could receive the gas. Lessee has been unwilling to transport the gas for Buyer

because to do so would place Lessee under the jurisdiction of the Alaska Public Utilities Commission and Lessee does not wish to become a public utility.

Current agreements provide for several provisions which deserve special consideration. They are as follows:

Quantity

The Buyer presently does not have markets for all royalty gas produced nor does the Lessee have the production capacity to produce enough gas to maintain required production at his LNG plant, in addition to producing all royalty gas. The Buyer and Lessee have therefore agreed that they will both use their "best reasonable efforts" to accomodate the other and that Lessee will produce and Buyer will sell that gas which is available.

If this agreement is not completed, the Buyer's market will have to be satisfied from reserves in the Kenai gas field which would be unnecessarily depleted, and royalty gas produced from Lessee's field would be delivered to his market outside the State of Alaska.

The Lessee will be installing compressors to maintain current production rates and to accomodate production of royalty gas. However, as the field well pressure continues to decline, the ability to produce the total required gas will correspondingly decline. Since the Lessee is required to maintain [illegible]duction for the LNG plant, the Buyer has agreed to allow an[illegible]duction shortfall to be taken from that quantity of gas dedi[illegible]d to Buyer.

However, it is also reasonable to expect that productivity in the field will be sufficient to accomodate the needs of the Buyer for most of the life of these agreements.

Delivery - Compression

The Lessee has agreed to deliver the gas purchased by Buyer, by utlitzing Lessee's pipeline facilities, to a point near the North Kenai road. The compression facilities necessary to increase field production will be installed by Lessee to accomodate this increased demand.

The Buyer previously agreed with Lessee that the cost of delivery shall be 10¢ per MCF and that the cost of compression shall be an additional 10¢ per MCF. These costs are paid directly from Buyer to Lessee for the account of the State. Should additional compressors be required during the life of these agreements the new charges must be agreed to or the contracts will terminate. It is further understood that Buyer's alternative source of gas would cost the same as royalty gas delivered to the same point.

Price

The State will at all times during the life of the agreements receive at least as much and perhaps more for its royalty gas as it would have received if it had taken its royalty in-value.

Public Utilities Commission/Alaska Pipeline Commission

A major reason the previous agreement failed was because Lessee would be subject to the jurisdiction of the above

mentioned regulatory agencies. The current agreements have been designed to avoid this problem as the only way that the producer would agree to transport the gas. The legal opinions relating to this matter were requested from the Attorney General and are enclosed to support these agreements.

The regulatory agencies would normally audit such costs as the delivery and compression charges to be paid by the Buyer to Lessee. However, in this case the Buyer and Lessee had agreed to these charges prior to the development of the current agreements. It is evident that had the previous agreement become operational, these same charges would have been applied to this gas.

Gas Purchase Contract

dated June 4, 1976 between

Alaska Pipeline Company

and

State of Alaska

Gas Purchase Contract

This Contract, made and entered into this 4th day of June 1976, by and between the Alaska Pipeline Company ("APC") herein referred to as "Buyer" and the State of Alaska, hereinafter referred to as "Seller" :

WITNESSED

WHEREAS, Buyer owns and operates a natural gas pipeline system in areas of Alaska for the delivery of natural gas for ultimate consumption within the State of Alaska, and

WHEREAS, Seller has the right under each of the leases identified at Exhibit "A" attached hereto to be paid by the lessee thereunder a royalty of twelve and one-half percent in kind or in value of the natural gas produced and saved and used off of the lands covered by each such lease, and

WHEREAS, Seller is authorized by AS 38.05.183 to sell royalty gas; and

WHEREAS, Buyer represents to Seller that all gas purchased under this contract will be used to meet the requirements of its customers within the State of Alaska;

NOW, THEREFORE, in consideration of the representations, covenants, and conditions herein contained, Buyer and Seller hereby agree as follows:

ARTICLE 1

Seller's Royalty Gas

1.1 Seller hereby agrees that within 30 days after the execution and approval of this agreement as required by the laws of the State of Alaska, Seller shall notify the lessee under the leases set forth at Exhibit "A" of this agreement of Seller's election to take its royalty gas in kind. Said notice will provide that the lessee shall commence the delivery of said royalty gas to Seller (or to Seller's designee) upon a receipt of notice from Seller that all facilities necessary to enable Buyer to receive and market said gas are ready; provided, however, in no event shall lessee be required to commence the delivery of royalty gas to Seller (or its designee) prior to six (6) months following lessee's receipt of notice of Seller's election to take its royalty gas in kind.

1.2 In order that Seller can give its lessee as much advance notice as possible of the date it will start receiving its royalty gas in kind, Buyer shall notify Seller, and Seller shall notify its lessee, at least 60 days prior to the date Buyer will receive gas from Seller pursuant to this contract.

ARTICLE II

Quantity

2.1 It is understood and agreed by the parties that the volume of gas available to Seller from the leases covered by this contract depends upon the production from the leases over which Seller has no control. Buyer hereby agrees to purchase on each day commencing with the date of first delivery

AGO 935908

hereunder and continuing during the term of this contract all of Seller's royalty gas available at the point of delivery described in Article III hereof.

ARTICLE III

Delivery Point and Delivery Pressure

3.1 The point of delivery of all gas delivered hereunder shall be at the same point of delivery that Seller receives delivery of its royalty gas from its lessee in the North Cook Inlet Field.

3.2 Buyer, at its own expense, shall arrange to accept Seller's gas at the point of delivery.

3.3 Seller will deliver gas received by Seller from lessee at the pressure at which the gas is received by Seller from its lessee.

ARTICLE IV

Quality

4.1 The gas to be delivered by Seller to Buyer at the delivery point shall be gas of the same quality as is delivered to Seller by the lessee at the point of delivery.

ARTICLE V

Price and Billing

5.1 The price to be paid by Buyer to Seller for gas delivered shall be as follows:

a. Commencing on the date of first deliveries hereunder, assuming that this date occurs prior to July 1, 1977 and continuing until the first day of July 1977, the price shall be 55.5 cents per MCF.

b. Commencing on the first day of July 1977 and continuing until the first day of July 1978 the price shall be the higher of (i) 60.36 cents per MCF, (ii) the price Seller would have received from Phillips Petroleum Company had it not elected to receive its royalty gas in kind, (iii) the highest price paid by any purchaser in the upper Cook Inlet area for gas of similar quality and similar conditions of delivery; with due regard to appropriate factors including, but not limited to, difference of BTU content, delivery pressure, term of the contract and connection charges.

c. For each succeeding 12 month period commencing July 1, 1978 the price shall be increased to the higher of (i) the previous year's price plus 2 cents per MCF, (ii) the price Seller would have received had it not elected to take its

royalty in kind, (iii) the highest price paid by any purchaser in the upper Cook Inlet area for gas of similar quality and conditions of delivery; with due regard to appropriate factors including, but not limited to, difference of BTU content, delivery pressure, term of the contract and connection charges.

5.2 Thirty days prior to the date of each annual price change, Seller, at its option, may determine the price which it would have received from its lessee had it not elected to take its royalty gas in kind and the highest price being paid for gas of similar quality and similar conditions of delivery; with due regard to appropriate factors including, but not limited to, difference of BTU content, delivery pressure, term of the contract and connection charges in the upper Cook Inlet area and submit the same to Buyer along with suitable supporting evidence as to such prices. Buyer shall have the right to submit other evidence within the 30 day period.

5.3 After the delivery of gas has commenced Buyer shall, on or before the 20th day following the end of each month, render to Seller a statement showing the quantity of gas delivered during that month and shall therewith pay Seller the amount due for all such gas.

5.4 Each party hereto shall have, at its expense, the right to examine the books and records of the other party to the extent necessary to verify the accuracy of any statement, charge, computation, or demand made under or pursuant to this

contract. Any statement shall be final as to both parties unless questioned in writing within two (2) years after payment thereof has been made.

5.5 The terms "upper Cook Inlet area" as used here in shall mean the area encompassed in a radius of 100 kilometers from the Phillips Petroleum North Cook Inlet platform.

ARTICLE VI

Term

6.1 This contract shall become effective upon the execution hereof and the approval of the Alaska Royalty Oil and Gas Development Advisory Board and the State Legislature and shall continue and remain in effect until July 1, 1984, unless terminated prior to such date by mutual agreement of the parties, or pursuant to Article VII.

ARTICLE VII

Conditions Precedent

7.1 Buyer shall have the right to terminate this contract upon 30 days written notice to Seller if Buyer is unable to make satisfactory arrangements to take delivery of the gas. Buyer shall exercise this right to terminate on or before January 31, 1978, thereafter Buyer may not exercise this right to terminate.

ARTICLE VIII

Notices

8.1 Notices required to be given under this contract shall be deemed sufficiently given and served when and if

deposited in the United States mail postage prepaid and certified or registered addressed to Seller at:

Commissioner

Department of Natural Resources

Pouch M, Juneau, Alaska 99811

or to Buyer at:

Alaska Pipeline Company

P. O. Box 6288

Anchorage, Alaska 99502

IN WITNESS WHEREOF, the parties hereto have caused this Agreement to be executed in four (4) original counterparts on this day and year first above written.

AGO 935914

North Cook Inlet Field Royalty Gas
Commissioner's Proposal in Concept

The Commissioner of Natural Resources has recognized that the increasing growth of the Cook Inlet area of Alaska with its resultant increase in the use of natural gas requires that additional natural gas reserves be allocated for that purpose from State of Alaska royalty gas. From the standpoint of size of uncommitted gas reserves, geographical location and possible pipeline access, the North Cook Inlet field royalty gas appears the best available supply at this time. Pursuant to AS 38.05. 182 the Commissioner proposes that it is in the best interest of the State to take in kind the State's royalty share of the gas production from the North Cook Inlet gas field and requests the consent of the Alaska Royalty Oil and Gas Development Advisory Board for this change.

The Commissioner further proposes to dispose of the North Cook Inlet field royalty gas to Alaska Pipeline Company and its subsidiaries through a negotiated contract. The proposed contract will contain the following provisions:

1. Purchaser agrees to take 1/8 of daily production from the North Cook Inlet gas field on an if and as deliverable basis for the contract period. The State will report to the Purchaser each month the amount of royalty gas produced by Phillips during the prior months.

The approximate average daily royalty gas share of the production from Phillips' North Cook Inlet field platform is 17,000 MCF. Gas production from the platform varies as LNG plant needs dictate therefore no daily amount can be specified.

2. Point of delivery will be the wellhead.

3. Purchaser is responsible for measurement costs, and any compression or dehydration costs if or when necessary.

4. The contract expires on June 1, 1984, unless extended by mutual agreement for a period not to exceed one year.

5. The price of the gas will be equal to the price the State otherwise would have received from Phillips for its royalty gas for export as LNG to Japan; but not less than the highest price paid by any purchaser in the Cook Inlet area for a similar sale of gas of similar quality. The price will be adjusted yearly on the anniversary date of the contract.

6. The contract shall not be effective until

-all necessary permits and authorizations by governing bodies are obtained

-all transportation or exchange arrangements have been completed to the satisfaction of the parties involved.

-six month's notice required under lease

The Commissioner request approval of the above proposed conceptual plan by the Alaska Royalty Oil and Gas Development Advisory Board.

IN THE HOUSE

BY THE RULES COMMITTEE BY REQUEST OF THE GOVERNOR

HOUSE CONCURRENT RESOLUTION NO. 142

IN THE LEGISLATURE OF THE STATE OF ALASKA

NINTH LEGISLATURE - SECOND SESSION

Relating to the taking of state-owned royalty oil or gas in-kind and its disposal by sale.

BE IT RESOLVED BY THE LEGISLATURE OF THE STATE OF ALASKA:

WHEREAS the legislature by enactment of the Alaska Royalty Oil and Gas Development Board statute, AS 38.06. et seq., has established a clear policy of favoring the taking of state-owned royalty oil or gas in-kind and making that royalty available for in-state uses; and

WHEREAS the State of Alaska presently receives a one-eighth royalty on gas produced from the North Cook Inlet Gas Field in value, but has the right to receive this royalty in-kind; and

WHEREAS the commissioner of natural resources has entered into a contract for the sale and purchase of state-owned royalty gas from the North Cook Inlet Gas Field with Alaska Pipeline Company, an Alaskan corporation which sells natural gas in the Anchorage and North Kenai Road areas; and

WHEREAS the contract between the State of Alaska and Alaska Pipeline Company requires as a condition precedent to its becoming effective approval by a majority of each house of the Legislature;

BE IT RESOLVED by the Alaska State Legislature that approval of Alaska Royalty Gas Sale No. 76-1, the contract for the sale of state royalty gas from the North Cook Inlet Gas Field to Alaska Pipeline Company, is hereby approved.

AGO 935919

E X H I B I T

4.

April 30, 1976

The Honorable Mike Bradner
Speaker of the House
Alaska State Legislature
Pouch V
Juneau, Alaska 99811

Transmittal of Proposed
Alaska Royalty Gas Sale No. 76-1

Dear Mr. Speaker:

Attached is Alaska Royalty Gas Sale Contract No. 76-1 providing for a sale of State royalty gas from the North Cook Inlet Gas Field to Alaska Pipeline Company pursuant to AS 38.06 et seq., AS 38.05.182-183, and 11AAC26.005-.900. Also attached are all necessary waivers or consents related to this action and required under the law. The contract and all necessary related actions have been approved by the Alaska Royalty Oil and Gas Development Advisory Board pursuant to the above statutes and regulations. Other information pertinent to the proposed sale is also attached, with the intention of supplying you with an adequate record on this matter.

Alaska Pipeline Company, and its subsidiary Alaska Gas and Service Company, supply natural gas to the Anchorage area and a portion of the North Kenai peninsula known as the North Kenai road area. Increased use of natural gas due to growth in both areas is diminishing the gas reserves dedicated to Alaska Pipeline Company faster than anticipated. The company estimates that the contract amount for the North Kenai road area will be exhausted by May of this year and has executed a one year contract with their present supplier to extend their service.

Natural gas from the North Cook Inlet Gas Field, operated by Phillips Petroleum Company, is transported from the offshore platform to the LNG plant in the Nikiski area served by the North Kenai road and liquified for export to Japan.

The proposed contract provides that the State of Alaska will take its royalty share of the North Cook Inlet Gas Field production in kind rather than in value, and sell this gas to Alaska Pipeline Company at the same price that the State would otherwise receive from Phillips Petroleum Company. The amount of gas sold would average 15 to 16 million cubic feet per day and total about 41 billion cubic feet over the term of the royalty sales contract, which would expire June 1, 1984, coincidentally with the expiration of the present Phillips contract for export to Japan. Transportation or exchange provisions will be arranged by Alaska Pipeline Company, as will all necessary regulatory clearances.

The present peak gas demands along the North Kenai road can be as high as 10 million cubic feet per day. Gas excess to these needs can be used to augment the gas supply to Anchorage and extend the life of those reserves.

The total contract amount represents about one and one-half year's supply of gas at Anchorage's present rate of use, and about one year's production of the North Cook Inlet Gas Field.

The Commissioner of Natural Resources and the Alaska Royalty Oil and Gas Development Advisory Board recognize that the proposed sale of royalty gas will somewhat shorten the productive life of the North Cook Inlet Gas Field by approximately one year. Since the LNG contract requires delivery of a specified amount each year it will be necessary to increase the daily production of the field by the amount of the royalty gas withdrawn from the LNG plant. On balance, however, the sale of this royalty gas to supply the North Kenai road area and Anchorage is deemed to be in the best interest of the State, as it returns State royalty gas from foreign export to Alaska consumers at a price which assures all Alaskans a fair return for their resources.

I have, at various times, expressed the belief that section 55 of the Royalty Board Statute (which requires legislative approval by concurrent resolution of any sale of surplus royalty gas) is unconstitutional. The Administration believes that this requirement raises a substantial constitutional question and has concluded that in the future appropriate action will be necessary either by the Legislature to amend the Royalty Board Statute or by the courts to decide the constitutionality of

section 55. Notwithstanding such doubts concerning the constitutionality of this provision, the contract is being submitted to the Legislature for approval. Two reasons support this submission. First, early in this session, the Commissioner of Natural Resources advised the Legislature of his intent as a policy matter to carry out all the requirements of the Royalty Board Statute. I believe it would be less than forthright to pursue any other course for a sale during the closing days of the legislative session. Second, although this sale involves a relatively small quantity of gas, I am anxious to see it consummated at the earliest possible time as it will directly and immediately benefit gas consumers in the Anchorage and North Kenai areas. For that reason, it is undesirable that this contract become entangled in litigation which might extend over a lengthy period of time.

To avoid the choice of either appearing to acquiesce in the requirement of legislative approval or undertaking a perhaps unnecessary confrontation, a term has been included within the contract which provides that the contract will not become effective until approved by concurrent resolution passed by a majority of each house of the Legislature. The Administration always has the right to seek the advice and counsel of the Legislature and I have in this contract sought to make legislative approval a condition precedent to the contract becoming effective. I am submitting this contract to you for your approval pursuant to that term. However, in doing so, I wish to make clear beyond preadventure that my action should not be construed as either approval of or acquiescence in section 55 of the Royalty Board Statute and that I do not feel personally or legally obligated to submit future contracts for the sale of royalty oil or gas to the Legislature for approval by concurrent resolution.

You are aware that this is the first royalty sale contract prepared under the existing Statute, and of the first of its kind in the Nation. The Commissioner of Natural Resources, who is the official responsible for the agreement, is prepared to supply all necessary additional information to assist you in your consideration of this sale contract. Thank you for your consideration.

Sincerely,

Jay S. Hammond
Governor

JAY S. HAMMOND
GOVERNOR

STATE OF ALASKA
OFFICE OF THE GOVERNOR
JUNEAU

April 22, 1977

ACR 58

The Honorable Hugh Malone
Speaker of the House
Alaska State Legislature
Juneau, Alaska 99811

Dear Mr. Speaker:

Under authority of art. III, sec. 18 of the Alaska Constitution, and in accordance with AS 24.30.060(b) and the Uniform Rules of the Alaska State Legislature, I am transmitting a resolution giving legislative approval to a sale of royalty natural gas from the North Cook Inlet Field to Alaska Pipeline Company. AS 38.06.055(a) provides that no sale of state-owned royalty oil may be made unless approved by concurrent resolution of the legislature.

The Alaska Royalty Oil and Gas Development Advisory Board reviewed the contract and granted its approval on April 6, 1977. The Board's declarations and findings are included in the material submitted to each legislator today. I would be pleased to assist you with any additional information which you request.

Last year the State of Alaska and the Alaska Pipeline Company entered into a contract for the sale of the same royalty gas to Alaska Pipeline Company. That contract was approved by the legislature last session. However, certain difficulties with volume flexibility and arranging for the transportation of the gas from the offshore platform to shore prevented Alaska Pipeline Company from receiving the gas under that contract. The current agreement has been executed to solve these problems and allow royalty gas to be delivered to Alaska Pipeline Company.

The problems with the previous agreement were:

1. Alaska Pipeline Company was unable to use all of the royalty gas at all times (as required in the contract) due to lack of an adequate market; and yet, because of limitations also included in the contract, is unable to sell the excess gas back to Phillips Petroleum Company for export from the State.

AGO 935925

2. Alaska Pipeline Company was unable to enter into an agreement with Phillips Petroleum Company for transporting of the gas to shore from the production platform due to understandable reluctance of Phillips to expose themselves to the jurisdiction of the Public Utilities Commission or the Pipeline Commission. The new agreement I am submitting to the legislature today remedies these problems.

This new agreement with Alaska Pipeline necessitated that the State itself also enter into an agreement with Phillips Petroleum Company for delivery of the royalty gas from the platform to shore. This agreement requires that the State pay the cost of gathering and compressing the royalty gas to the point of delivery; however, Alaska Pipeline Company in turn agrees to pay these costs to Phillips for the account of the State. The Royalty Board has neither responsibility nor authority to judge the appropriateness of the level of these charges, and has not done so.

Phillips Petroleum Company has operational problems affecting their ability to deliver guaranteed volumes of royalty gas to shore, as does Alaska Pipeline Company affecting their ability to market the gas available. These companies, together with the State, have agreed to use their "best reasonable efforts" to accommodate the needs of one another to produce and market royalty gas.

The contract between the State and Phillips does not strictly require legislative approval since it does not involve a sale of royalty gas. Nevertheless, I have included it in the materials submitted to the legislature because it is an integral part of the sale of royalty gas to Alaska Pipeline Company.

I believe your careful review of the enclosed materials will reveal many questions regarding this approach to resolving the many problmes associated with the acquiring and delivery of this royalty gas. However, I also believe that these agreements are the best possible solution at this time, are in the best interest of the State, and are important to the long-term interest of Anchorage utility customers.

Thank you for your consideration.

Sincerely,

Jay S. Hammond
Governor

Materials for Legislature

GAS PURCHASE CONTRACT

This Contract, made and entered into this 12th day of April 1977, by and between the Alaska Pipeline Company ("APC") herein referred to as "Buyer" and the State of Alaska, hereinafter referred to as "Seller":

WITNESSETH

WHEREAS, Buyer owns and operates a natural gas pipeline system in areas of Alaska for the delivery of natural gas for ultimate consumption within the State of Alaska, and

WHEREAS, Seller has the right under each of the leases, identified in Exhibit "A" to this Contract, to be paid by Lessee thereunder a royalty of twelve and one-half percent in-kind or in-value of the natural gas produced and saved or used off of the lands covered by each lease, and

WHEREAS, Seller is authorized by AS 38.05.183 to sell royalty gas; and

WHEREAS, Buyer represents to Seller that the gas received by Buyer under this contract will be used to meet the requirements of its customers within the State of Alaska; and

WHEREAS, this Gas Purchase Contract when executed will supersede and extinguish that certain Gas Purchase Contract executed June 4, 1976 by the parties hereto;

NOW, THEREFORE, in consideration of the representations, covenants, and conditions herein contained, Buyer and Seller hereby agree as follows:

AGO 935929

The "Gas Purchase Contract" dated April 11, 1977, between Alaska Pipeline Company and the State of Alaska is hereby amended by adding this page 1(a) between pages 1 and 2.

ARTICLE I

DEFINITIONS

The following terms when used in this contract shall have the following meanings:

1.1 The term "day" shall mean a period of twenty-four (24) consecutive hours beginning and ending at 7:00 o'clock A.M. The reference date for any day shall be the date of the beginning of such day.

1.2 The term "month" shall mean a period beginning at 7:00 o'clock A.M. on the first day of a calendar month and ending at 7:00 o'clock A.M. on the first day of the next succeeding calendar month.

1.3 The term "Mcf" shall mean one thousand (1,000) cubic feet of natural gas measured as hereinafter provided.

Alaska Pipeline Company

Date: 4-20-77

State of Alaska

Date: 4-19-77

ARTICLE II 4-19-77 RL Dead Line 4-20-77

~~DEFINITIONS~~

Seller's Royalty Gas

2.1 Seller hereby agrees that within 30 days after the execution and approval of this agreement as required by the laws of the State of Alaska, Seller shall notify the Lessee under the leases set forth at Exhibit "A" of Seller's election to take its royalty gas in-kind. Said notice will provide that the Lessee shall commence the delivery of said royalty gas to Seller or to Seller's designee upon a receipt of notice from Seller that all facilities necessary to enable Buyer to receive and market said gas are ready; provided, however, in no event shall Lessee be required to commence the delivery of royalty gas to Seller or its designee prior to six (6) months following Lessee's receipt of notice of Seller's election to take its royalty gas in-kind.

2.2 In order that Seller can give its Lessee as much advance notice as possible of the date it will start receiving its royalty gas in-kind, Buyer shall notify Seller, and Seller shall notify its Lessee, that all facilities necessary to receive and market said gas are ready, at least 60 days prior to the date Buyer will receive gas from Seller pursuant to this Contract.

2.3 Buyer agrees that Seller's royalty gas which is purchased and received by Buyer will be used or resold for use

AGO 935931

within the State of Alaska.

ARTICLE III

Quantity

3.1 It is understood and agreed by the parties that the volume of gas available to Seller from the leases covered by this Contract depends upon the production from the leases over which Seller has no control, and further depends upon the Lessee's gathering capacity installed and available, over which Seller likewise has no control. Buyer hereby agrees to purchase on each day commencing with the date of first delivery hereunder and continuing during the term of this contract up to all of Seller's royalty gas available at the point of delivery described in Section 5.1 hereof, it being understood that Buyer's requirements for its markets may not allow Buyer to purchase the entire amount of Seller's royalty gas on each day it is available; and it being further understood that Buyer will take not less than the amount for which Buyer has demand and delivery facilities available. Buyer shall use its best reasonable efforts to take not less than three (3) billion cubic feet per year of royalty gas at the point of delivery.

3.2 It is recognized that it is impossible to deliver to Buyer each day the exact amount of royalty gas produced from the leases listed in Exhibit "A". Seller agrees that Seller or Lessee will carry an over and short account with respect to the receipts of royalty gas and the delivery of same to Buyer; provided,

however, that the account shall never be required to carry more than a total of 60,000 Mcf over or underdelivery. In the event the takes by Buyer on a cumulative basis shall ever be more than 60,000 Mcf less than the amount of royalty gas available to Buyer at the point of delivery, Buyer shall not be allowed to make up for any such underdelivery and Seller may sell the undelivered quantity of royalty gas to Lessee.

ARTICLE IV

Quality, Pressure, and Odorization

4.1 The gas to be delivered by Seller to Buyer at the delivery point shall be gas of the same quality and pressure as delivered to Seller by the Lessee at the point of delivery. Seller shall have no obligation to improve the quality or pressure of gas beyond that quality and pressure at which Lessee delivers the gas to seller.

4.2 Gas delivered hereunder will not be odorized and if Buyer so utilizes the gas delivered hereunder for purposes which require odorization of such gas, the full responsibility for such use is Buyer's and Buyer agrees to comply with all laws and regulations respecting the odorization of such gas and hereby indemnifies and holds Seller harmless from any and all claims, injuries, expenses, penalties and damages arising out of or connected with Buyer's failure to observe strictly and comply with all laws, rules and regulations with respect hereto.

ARTICLE V

Point of Delivery, Point of Measurement, Ownership, and Measurement

5.1 Buyer shall install, maintain, and operate a connection into the Lessee's pipeline system at or near Lessee's pipeline tap presently being used to deliver gas from Lessee's pipeline to the Tesoro refinery located in the general vicinity of the Kenai LNG plant on the North Kenai Road, (hereinafter called "the point of delivery"). The point of delivery of all gas delivered hereunder shall be at the same point of delivery that Seller receives its royalty gas from the Lessee.

5.2 Buyer agrees to install, maintain, and operate all pipeline, pressure regulators, and related facilities necessary to receive gas hereunder at and from the point of delivery above specified, to Buyer's metering station(s) also located in the general vicinity of the Kenai LNG plant on the North Kenai Road (hereinafter called "the point of measurement").

5.3 Buyer shall be deemed to be in control and possession of the gas delivered hereunder at and from the point of delivery and responsible for any damage or injury caused thereby. Buyer shall be responsible for any gas lost between the point of delivery and the point of measurement. Buyer shall indemnify and hold Seller harmless as to any injury or damage arising out of the delivery of gas to Buyer and its measurement hereunder.

5.4 Standards of Measurements and Tests

5.4.1 Except for the determination and computation of total heating value, the unit of volume of gas delivered hereunder shall be one (1) cubic foot at an absolute pressure of fourteen and sixty-five hundredths (14.65) pounds per square inch and at a base temperature of sixty (60) degrees Fahrenheit.

5.4.2 The volumes of gas delivered hereunder shall be measured and computed by Buyer in accordance with the methods prescribed in Gas Measurement Committee Report No. 3, Natural Gas Department, American Gas Association, including the Appendix thereto, dated April, 1955, except that the atmospheric pressure shall be assumed to be fourteen and seven-tenths (14.7) pounds per square inch. The method used for correcting such volumes for deviation from the Ideal Gas Laws shall be the procedure recommended in the most current Report of the American Gas Association or by any other method mutually agreeable to the parties hereto.

5.4.3 The specific gravity of the gas delivered hereunder shall be determined by Lessee utilizing the method prescribed in American Petroleum Institute Code No. 50-A at the beginning of delivery hereunder and once during each month thereafter. The results of each such determination shall be used in computing the volume of gas delivered hereunder until the effective date of the next succeeding test.

5.4.4 The flowing temperature of the gas delivered hereunder shall be determined by means of a continuous recording thermometer installed by Buyer so that it will properly record

the temperature of the gas flowing through the meter. The arithmetical average of the hourly temperatures recorded each day shall be used in computing the volumes of gas delivered during such day.

5.4.5 If the gas delivered hereunder is solely from the 16-inch pipeline serving the North Cook Inlet Field, the total heating value of the gas shall be the average of that recorded on the recording calorimeter for Lessee's gas at the inlet to Kenai LNG Plant during the billing period corrected to thirty (30) inches of Mercury and sixty (60) degrees Fahrenheit dry.

5.5 Measurement

5.5.1 Seller or Lessee may at their option and expense, install check meters upstream or downstream of Buyer's meter station provided that such check meters will be installed so as not to interfere with the operation of Buyer's facilities. The calibrating and adjusting of meters and the changing of charts and the reading of charts on meters shall be done by the party who installed the meters.

5.5.2 Buyer, Lessee, and Seller shall have access at all times to Buyer's metering equipment including all other instruments used by Buyer in determining the measurement and quality of the gas delivered hereunder, but the reading, calibrating and adjusting thereof, and the changing of charts shall be done only by the employees, agents, or representatives of Buyer. Upon

request of Lessee or Seller, Buyer shall submit to Lessee or Seller records and charts from such equipment subject to return by Lessee or Seller within thirty (30) days after receipt thereof Buyer hereby agrees to assure Seller and Lessee ingress and egress at the point of measurement and between the point of delivery and the point of measurement without charge for all purposes necessary hereto.

5.5.3 At least once a month Buyer shall test its above mentioned metering equipment or cause the same to be tested and shall give Lessee or its representative reasonable prior notice of the time all such tests are to be made so that Lessee may, if desired, have its representative present to observe such tests and any adjustments made upon such metering equipment. Following any test, any of Buyer's metering equipment found to be inaccurate to any degree shall be adjusted immediately to measure accurately. If upon any test such metering equipment is found to be inaccurate by two percent (2%) or more, registration from said metering equipment and any payments based upon such registrations shall be corrected at the rate of such inaccuracy for any period of inaccuracy which is definitely known or agreed upon, but in case the period is not definitely known or agreed upon, then for a period extending back one-half of the time elapsed since the last previous test, not exceeding however, fifteen (15) days.

Filed 4-20-77
RL 4-19-77

5.5.4 If for any reason Buyer's meter is out of service or is found registering inaccurately and the error is not determinable by ordinary test such that the volume of gas delivered

AGO 935937

through such meter cannot be ascertained or computed from the readings thereof, the volume of gas so delivered during the period the meter is out of service or registering inaccurately shall be estimated and agreed upon by the parties hereto upon the basis of the best available data, using the first of the following methods which is feasible:

(a) By correcting the error if the percentage of error is ascertainable by calibration, special test, or mathematical calculation;

(b) By using the registration of any check measuring equipment of Lessee if installed and registering accurately;

(c) By estimating the volume by comparing it with deliveries during preceding periods under similar conditions when the meter was registering accurately.

ARTICLE VI

Price and Billing

6.1 The price to be paid by Buyer to Seller for gas deliveries shall be as follows:

(a) Commencing on the date of first deliveries hereunder assuming that this date occurs prior to July 1, 1978 and continuing until the first day of July, 1978, the price shall be 64.65 cents per MCF.

(b) Commencing on the first day of July, 1978 and continuing until the first day of July, 1979 the price shall be the higher of (i) 66.65 cents per

MCF, (ii) the price Seller would have received from Lessee had it not elected to receive its royalty gas in kind, (iii) the highest price paid by any purchaser in the upper Cook Inlet area for gas of similar quality and similar conditions of delivery; with due regard to appropriate factors including, but not limited to, difference of BTU content, delivery pressure, term of the contract and connection charges.

(c) For each succeeding 12 month period commencing July 1, 1979 the price shall be increased to the higher of (i) the previous year's price plus 2 cents per Mcf, (ii) the price Seller would have received had it not elected to take its royalty in-kind, (iii) the highest price paid by any purchaser in the upper Cook Inlet area for gas of similar quality and conditions of delivery; with due regard to appropriate factors including, but not limited to, difference of BTU content, delivery pressure, term of contract and connection charges.

(d) In addition to the price otherwise payable hereinabove, for gas delivered to Buyer at the delivery point Buyer shall pay to Lessee, for the account of Seller, a gathering charge of ten cents (10.0¢) per Mcf from the date of first delivery hereunder. The above stated charge shall increase six percent (6%) compounded annually on each anniversary of the date of this contract.

(e) It is recognized by the parties hereto that it will be necessary for Lessee to install compression facilities

during the term of this Agreement. At the time the first compressor unit is installed and first used, Buyer shall pay to Lessee, for the account of Seller, in addition to the price and gathering charge otherwise payable hereinabove, a compression charge of ten cents (10.0¢) per Mcf for all gas delivered to Buyer at the delivery point. Such charge shall increase by six percent (6%) per year compounded annually, commencing on the first anniversary of the date such compression facilities are installed and ready for operation. Nothing herein shall be construed by either party as an obligation on Lessee to install any compression facilities whatever or to operate any compression facilities already installed.

(f) In addition to the price provisions stated herein, Buyer hereby agrees to pay Seller as part of the total purchase price of the royalty gas any costs not otherwise stated herein incurred by Seller in transporting that gas to the point of delivery specified in section 5.1 of this agreement including but not limited to any amount which Seller is obligated to reimburse Lessee for a proportion of new or increased fees, imposts, duties, charges, excises or taxes. RL 4-19-77 Acc 4-20-77

RL 4-19-77 Acc 4-20-77

6.2 Thirty days prior to the date of each annual price change, Seller, at its option, may determine the price which it would have received from its Lessee had it not elected to take its royalty

AGO 935940

gas in-kind and the highest price being paid for gas of similar quality and similar conditions of delivery; with due regard to appropriate factors including, but not limited to, difference of BTU content, delivery pressure, term of the contract and connection charges in the upper Cook Inlet area and submit the same to Buyer along with suitable supporting evidence as to such prices. Buyer shall have the right to submit other evidence within the 30 day period.

6.3 On or before the 15th day of each month after the delivery of gas hereunder has commenced Buyer shall furnish Seller and Lessee with a full and complete statement reflecting the quantity of gas delivered at the delivery point during the preceding month and the total amounts due hereunder. Payment under sections 6.1(d), 6.1(e) and 6.1(f) of this Contract shall be made to Lessee on account of Seller at Lessee's office in Bartlesville, Oklahoma within ten (10) days after delivery of each such statement. Payment under sections 6.1(a), 6.1(b) and 6.1(c) of this Contract shall be made to Seller on the day of delivery of each such statement by direct wire transfer of federal reserve funds through the Federal Reserve Bank wire transfer system to the following address:

BANK OF AMERICA, NA + SA
San Francisco, California
Securities Department 3255
Credit to: State of Alaska Investment Account

or to such other address as the Commissioner of Revenue may designate.

6.4 Each party hereto shall have, at its expense, the right to examine the books and records of the other party to the extent

AGO 935941

necessary to verify the accuracy of any statement, charge, computation, or demand made under or pursuant to this contract. Any statement shall be final as to both parties unless questioned in writing within two (2) years after payment thereof has been made.

6.5 The terms "upper Cook Inlet area" as used herein shall mean the area encompassed in a radius of 100 kilometers from the Lessee's North Cook Inlet platform.

ARTICLE VII

Termination

7.1 This contract shall become effective upon the execution hereof and the approval of the Alaska Royalty Oil and Gas Development Advisory Board and the State Legislature and shall continue and remain in effect until June 1, 1984 unless terminated or extended prior to such date by mutual agreement of the parties, or pursuant to this Article or Article VIII.

7.2 Seller's obligations hereunder are contingent upon Seller arranging with Lessee for satisfactory transportation of royalty gas sold hereunder to the point of delivery specified in section 5.1 of this agreement. If, after exercising Seller's best efforts, Seller is unable to arrange such transportation on terms satisfactory to Seller, Seller shall give notice to Buyer and this agreement shall terminate 30 days after said notice.

7.3 The parties hereby agree that in the event that any govenmental agency declares that Lessee's activities hereunder subject Lessee to regulation as a utility, then either party shall have the option to give notice to the other and this agreement shall terminate 30 days after said notice.

AGO 935942

7.4 In the event of default by Buyer in making the payments required by this Contract, Seller shall give notice to Buyer and if the default continues for a period of 30 days after such notice, Seller shall have the option of terminating this Contract.

7.5 In the event that Lessee installs or causes to be installed compression facilities in addition to the first compressor unit mentioned in section 6.1(e) of this contract, Seller shall give Buyer written notice at least six (6) months prior to the time Lessee anticipates placing such additional facilities in operation to maintain capacity in its gathering system. Such notice shall also terminate this agreement at the end of the six (6) month period unless within ninety (90) days of the date of such notice a new compression charge is agreed upon by the two parties to be applicable when the additional facilities go into operation. If a new compression charge is agreed upon, this agreement shall not terminate but shall continue in full force and effect as amended to include the new compression charge.

7.6 If the agreement between Seller and Lessee attached hereto as Exhibit "B" is terminated for any reason, this agreement may be terminated by either party upon thirty (30) days notice.

7.7 If deliveries to Buyer hereunder have not commenced on or before June 30, 1978, then this Contract shall immediately terminate.

ARTICLE VIII

Representation, Condition Precedent and Force Majeure

8.1 It is expressly recognized and agreed that the gas gathering system utilized for deliveries hereunder is operated and maintained by Lessee for its own purpose and that Lessee will not dedicate any facilities or otherwise undertake to render any service to or for the public. This Agreement is being undertaken solely to effectuate the delivery of royalty gas which Buyer is purchasing from the State of Alaska, and the parties hereto make the material representation that neither this Agreement nor Buyer's use or disposition of the gas delivered hereunder will subject Lessee to regulation by the Federal Power Commission or the Alaska Public Utilities Commission or the Alaska Pipeline Commission.

8.2 Force Majeure

8.2.1 No liability shall result to either party from delay in performance or non-performance of any obligation hereunder (except Buyer's obligation to make payment hereunder) caused by circumstances reasonably beyond the control of the party affected, including, but not limited to, acts of God, fire, flood, storm, war (declared or undeclared), repair of facilities, breakage or accident to machinery or lines of pipe, repair, redrilling or reworking of wells, governmental regulation, requisition or direction, labor strikes or lockouts or breach of contract by Lessee.

8.2.2 The party claiming relief under this Article VIII shall advise the other party with reasonable promptness in writing

AGO 935944

giving full particulars of the cause or causes relied upon and shall also give prompt notice in writing of the cessation of any such cause or causes. The party claiming force majeure shall exercise due diligence in undertaking to remedy and overcome the cause of delay hereunder, but neither party shall be required to agree to any demand of labor to settle any strike or labor dispute except in the sole discretion of the party subject to such strik or labor dispute.

ARTICLE IX

Miscellaneous

9.1 The terms and provisions of this Agreement shall extend to and be binding upon the parties hereto, their assigns and successors in interest. It is understood, however, that Buyer may not assign its rights and interest in this Agreement without the written consent of Seller, except as may be necessary to Buyer to conform with its various financing documents or as may be desirable to Buyer as to its commonly owned affiliate or subsidiary. No assignment shall relieve any assignor of this Agreement of its obligations hereunder without the written consent of Seller.

9.2 In the event Buyer does not receive or purchase all of said royalty gas which is available to Buyer, then Seller may receive and dispose of that portion not taken by Buyer provided Seller does not burden Buyer with any cost therefor including Lessee's charges for gathering and compression on the gas not taken by Buyer.

ARTICLE X

Notices

10.1 Except as herein otherwise provided, any notice, request, demand, statement or bill provided for in this Contract, or any notice which either party may desire to give to the other, shall be in writing and shall be considered as duly delivered when mailed by registered mail to either of the parties hereto as the case may be at the following address:

Commissioner of Natural Resources
State of Alaska
Pouch M
Juneau, Alaska 99811

Alaska Pipeline Company
P. O. Box 6288
Anchorage, Alaska 99502

or at such other address as either party shall designate from time to time by formal written notice. Routine communications, including monthly statements and payments, shall be considered as duly delivered when mailed by either registered or ordinary mail except payments for royalty gas from Buyer to Seller which must be made by wire transfer under section 6.3 of this Contract.

IN WITNESS WHEREOF, the parties hereto have caused this Contract to be executed in two (2) original counterparts on this day and year first above written.

AGREEMENT

This Contract, made and entered into this 11th day of April, 1977, by and between the State of Alaska, herein referred to as "State", and Phillips Petroleum Company, herein referred to as "Lessee",

W I T N E S S E T H

WHEREAS, Lessee is the holder of certain mineral leases from the State in the North Cook Inlet area of Alaska, said leases identified in Exhibit "A" to this Agreement; and

WHEREAS, the State has the right under the terms of said leases to receive in value or in kind a 1/8 (one-eighth) royalty share of natural gas produced from said leases; and

WHEREAS, the State desires to receive its in kind royalty share of natural gas at a point other than at Lessee's production platform; and

WHEREAS, Lessee operates a gas pipeline to gather natural gas from the said leases to the LNG facility at Kenai, Alaska (hereinafter referred to as Kenai LNG Plant), which Lessee operates; and

WHEREAS, Lessee is willing to deliver to the State its in kind royalty share of the natural gas from said leases at a point near the Kenai LNG Plant; and

WHEREAS, the State desires to receive its royalty share of the natural gas from said leases at such a point

and has agreed with Alaska Pipeline Company to sell such gas to Alaska Pipeline Company (herein referred to as "APC") for resale and use within the State of Alaska according to the terms of that certain Gas Purchase Contract attached hereto as Exhibit "B".

NOW, THEREFORE, premises considered, the State and Lessee hereby mutually agree as follows:

ARTICLE I

DEFINITIONS

The following terms when used in this Agreement shall have the following meanings:

1.1 The term "day" shall mean a period of twenty-four (24) consecutive hours beginning and ending at 7:00 o'clock A.M. The reference date for any day shall be the date of the beginning of such day.

1.2 The term "month" shall mean a period beginning at 7:00 o'clock A.M. on the first day of a calendar month and ending at 7:00 o'clock A.M. on the first day of the next succeeding calendar month.

1.3 The term "Mcf" shall mean one thousand (1,000) cubic feet of natural gas measured as hereinafter provided.

ARTICLE II

The State's Royalty Gas

2.1 Within 30 days after the execution and approval of this Agreement as required by the laws of the State of Alaska, the State shall notify the Lessee under the leases

set forth at Exhibit A, the State's election to take its royalty gas in kind. Said notice will provide that the Lessee shall commence the delivery of said royalty gas to the State (or to the State's designee) upon a receipt of notice from the State that all facilities necessary to receive and market said gas are ready; provided, however, in no event shall Lessee be required to commence the delivery of royalty gas to the State (or its designee) prior to six (6) months following Lessee's receipt of notice of the State's election to take its royalty gas in kind.

2.2 In order that the State give Lessee as much advance notice as possible of the date it will start receiving its royalty gas in kind, the State shall notify Lessee that all facilities necessary to receive and market said gas are ready, at least sixty (60) days prior to the date on which Lessee shall be required to commence delivery pursuant to this Agreement.

ARTICLE III

FACILITIES

3.1 Lessee is presently operating and maintaining a natural gas gathering system between the North Cook Inlet Field and the Kenai LNG Plant.

3.2 The State or its designee shall install, maintain and operate all pipeline, pressure regulators, and related facilities necessary to receive gas hereunder at the point of delivery hereinafter specified. Said point of delivery shall be at or near the existing pipeline tap being presently used to deliver gas from Lessee's pipeline to the

Tesoro refinery located in the general vicinity of the Kenai LNG Plant on the North Kenai Road.

3.3 The State or its designee shall install, operate and maintain all necessary equipment at the point of delivery and at the State's or its designee's measuring station(s) (hereinafter called the "point of measurement") to properly control, odorize, and measure the volumes of gas delivered hereunder.

3.4 Lessee hereby grants the State or its designee ingress and egress at the point of delivery without charge for all purposes necessary hereto, and the State and its designee hereby agree to assure Lessee ingress and egress at the point of measurement and between the point of delivery and the point of measurement without charge for all purposes necessary hereto.

ARTICLE IV

QUANTITY OF GAS

4.1 Subject to the availability of capacity in its facilities to handle volumes in excess of its own needs and to the extent of such availability, and upon proper written notice from the State under Article II hereof, Lessee shall gather the royalty gas in the North Cook Inlet Field and deliver same to the State at the point of delivery specified herein. The State is entitled to receive at the wellhead 1/8 (one-eighth) of the natural gas produced from the leases listed in Exhibit "A", and to the extent that Lessee gathers and delivers more or less than the amount of royalty gas to which the State is entitled,

that difference shall be carried in the over and short account described below or Lessee shall purchase same on the basis provided in Section 4.3 below.

It is recognized that it is impossible to deliver to the State or for the State or its designee to receive the exact amount of royalty gas produced from the leases listed in Exhibit "A". Lessee agrees that it will carry an over and short account with respect to the receipts of royalty gas and the delivery of same to the State, provided, however, that Lessee shall never be required to carry more than a total of 60,000 Mcf over or under delivery. In the event the takes by the State on a cumulative basis shall ever be more than 60,000 Mcf less than the amount of royalty gas available at the point of delivery, the State shall not be allowed to make up for any such underdelivery, and Lessee shall purchase the excess undelivered quantities of royalty gas over 60,000 Mcf from the State at the wellhead on the basis provided in section 4.3 below.

4.2 Subject to (i) the availability of royalty gas at the platform and (ii) to the State's or its designee's requirements, and (iii) the State's or its designee's ability to take such requirement, Lessee shall use its best reasonable efforts to deliver to the State or its designee at the delivery point specified herein on an annual basis not less than three (3) billion cubic feet of royalty gas; provided, however, that in using such best reasonable efforts, Lessee shall not be required to install or operate any pipeline, compression or other facilities which, when operating as a reasonably prudent operator, it would not otherwise install

and/or operate.

4.3 The parties recognize that the State contemplates selling such royalty gas to Alaska Pipeline Company and that such purchaser may be unable from time to time to take and deliver to its customers the full volumes of gas attributable to the State's royalty interest although it is committed to purchase that volume from the State. In such event, Lessee agrees to purchase from the State from time to time those volumes which APC is unable to take. For such volumes which it purchases from the State, Lessee will pay the State a price equal to that amount which Lessee would have otherwise paid to the State as royalty if the State had not elected to receive its royalty gas in kind, and Lessee will not charge the State for gathering or compressing such volumes of gas or for other charges under this Agreement.

ARTICLE V

POINT OF DELIVERY AND OWNERSHIP

5.1 The point of delivery to the State for all gas gathered and delivered hereunder by Lessee shall be at the juncture of APC's facilities and Lessee's facilities located near the pipeline tap serving the Tesoro refinery as mentioned in Section 3.2 of this Agreement.

5.2 Lessee shall be deemed to be in control and possession of the gas deliverable hereunder and responsible for any damage or injury caused thereby until said gas shall have been delivered to the State or its designee at the point of delivery, after which delivery State or its designee shall be deemed to be in exclusive control and possession of

the gas and responsible for any injury or damage caused thereby.

5.3 Measurement of royalty gas shall be the responsibility of the State or its designee subject to Lessee's right to verify such measurement or to install and operate check metering equipment, and shall be done at a metering station(s) on the North Kenai Road, called the "point of measurement". The State or its designee shall be responsible for any gas lost between the point of delivery and the point of measurement.

ARTICLE VI

QUALITY, PRESSURE, AND ODORIZATION

6.1 Lessee shall deliver gas hereunder at the pressure existing from time to time in its facilities at the point of delivery.

6.2 Lessee agrees that the quality of gas, when delivered at the point of delivery hereunder, shall be the quality of gas existing in its gathering system from time to time and the State agrees to accept such gas.

6.3 It is understood that the gas delivered hereunder will not be odorized by Lessee, and if the State or its purchaser so utilizes the gas delivered hereunder for purposes which require odorization of such gas, the full responsibility for such use is the State's. Lessee shall have no responsibility for odorizing such gas irrespective of the State's disposition of same.

ARTICLE VII

STANDARDS OF MEASUREMENT AND TESTS

7.1 Except for the determination and computation

of total heating value, the unit of volume of gas delivered hereunder shall be one (1) cubic foot at an absolute pressure of fourteen and sixty-five hundredths (14.65) pounds per square inch and at a base temperature of sixty (60) degrees Fahrenheit.

7.2 The volumes of gas delivered hereunder shall be measured and computed by the State or its designee in accordance with the methods prescribed in Gas Measurement Committee Report No. 3, Natural Gas Department, American Gas Association, including the Appendix thereto, dated April, 1965, except that the atmospheric pressure shall be assumed to fourteen and seven-tenths (14.7) pounds per square inch. The method used for correcting such volumes for deviation from the Ideal Gas Laws shall be the procedure recommended in the most current Report of the American Gas Association or by any other method mutually agreeable to the parties hereto.

7.3 The specific gravity of the gas delivered hereunder shall be determined by Lessee's utilizing the method prescribed in American Petroleum Institute Code No. 50-A at the beginning of delivery hereunder and once during each month thereafter. The results of each such determination shall be used in computing the volume of gas delivered hereunder until the effective date of the next succeeding test.

7.4 The flowing temperature of the gas delivered hereunder shall be determined by means of a continuous recording thermometer installed by the State or its designee so that it will properly record the temperature of the gas flowing through the meter. The arithmetical average of the

hourly temperatures recorded each day shall be used in computing the volumes of gas delivered during such day.

7.5 If the gas delivered hereunder is solely from the 16-inch pipeline serving the North Cook Inlet Field, the total heating value of the gas shall be the average of that recorded on the recording calorimeter for Lessee's gas at the inlet to Kenai LNG Plant during the billing period corrected to thirty (30) inches of Mercury and sixty (60) degrees Fahrenheit dry.

ARTICLE VIII

MEASUREMENT

8.1 As agreed in Section 5.3 hereof, the State or its designee shall be obligated to and be responsible for all metering of gas hereunder.

8.2 The State or Lessee may, at their option and expense, install check meters upstream or downstream of the State's or its designee's meter station provided that such check meters will be installed so as not to interfere with the operation of the State's or its designee's facilities. The calibrating and adjusting of meters and the changing of charts and the reading of charts on meters shall be done by the party who installed the meters.

8.3 The State and Lessee shall have access at all times to the State's or its designee's metering equipment including all other instruments used by the State or its designee in determining the measurement and quality of the gas delivered hereunder, but the reading, calibrating and adjusting thereof, and the changing of charts shall be done

AGO 935957

only by the employees, agents, or representatives of the State or its designee. Upon request of Lessee, the State or its designee shall submit to Lessee records and charts from such equipment subject to return by Lessee within thirty (30) days after receipt thereof.

8.4 At least once a month the State or its designee shall test its above-mentioned metering equipment or cause the same to be tested and shall give Lessee or its representative reasonable prior notice of the time all such tests are to be made so that Lessee may, if desired, have its representative present to observe such tests and any adjustments made upon such metering equipment. Following any test, any of the State's or its designee's metering equipment found to be inaccurate to any degree shall be adjusted immediately to measure accurately. If upon any test such metering equipment is found to be inaccurate by two percent (2%) or more, registration from said metering equipment and any payments based upon such registrations shall be corrected at the rate of such inaccuracy for any period of inaccuracy which is definitely known or agreed upon, but in case the period is not definitely known or agreed upon, then for a period extending back one-half (1/2) of the time elapsed since the last previous test, not exceeding, however, fifteen (15) days.

8.5 If for any reason the State's or its designee's meter is out of service or is found registering inaccurately and the error is not determinable by ordinary test such that the volume of gas delivered through such meter cannot be ascertained or computed from the readings thereof, the

volume of gas so delivered during the period the meter is out of service or registering inaccurately shall be estimated and agreed upon by the parties hereto upon the basis of the best available data, using the first of the following methods which is feasible:

(a) by correcting the error if the percentage of error is ascertainable by calibration, special test, or mathematical calculation;

(b) By using the registration of any check measuring equipment of Lessee if installed and registering accurately;

(c) By estimating the volume by comparing it with deliveries during preceding periods under similar conditions when the meter was registering accurately.

ARTICLE IX

GATHERING AND COMPRESSION CHARGES AND TAXES

9.1 For all gas delivered by Lessee to the State at the delivery point, the State or its designee shall pay to Lessee a gathering charge of ten cents (10.0¢) per Mcf from the date of first delivery hereunder. The above-stated charge shall increase by six percent (6%) compounded annually, on each anniversary date of the date this Agreement.

9.2 It is recognized by the parties hereto that it may be necessary for Lessee to install compression facilities during the term of this Agreement. At the time the first compressor unit is installed and first used, the State

AGO 935959

or its designee shall pay Lessee in addition to the gathering charge set forth in Section 9.1, a compression charge of ten cents (10.0¢) per Mcf for all gas delivered by Lessee to the State at the delivery point. Such charge shall increase by six percent (6%) per year, compounded annually, commencing on the first anniversary of the date such compression facilities are installed and first used.

9.3 In the event that Lessee installs or causes to be installed from time to time compression facilities in addition to the first compressor unit mentioned in Section 2, above, Lessee shall give the State and its designee written notice at least six (6) months prior to the time Lessee anticipates placing any additional unit or units in operation in order to maintain capacity in its gathering system. Such notice shall also terminate this Agreement at the end of such six (6) months period. If, within ninety (90) days of the date of such notice the parties shall agree upon a new compression charge to be applicable when such additional compression facilities go into operation, then this Agreement shall not terminate but shall continue in full force and effect as amended to include the new compression charge.

9.4 Lessee shall pay all ad valorem taxes on its pipelines and facilities employed in delivering gas hereunder. In addition to the price and payments hereinabove provided, the State shall reimburse Lessee in the proportion of deliveries made to the State by Lessee, an amount equal to the aggregate total of any new or increased fee, impost, duty, charge, excise or tax levied or imposed in addition to the rates at which those, if any, are levied, assessed, or

fixed as of the date hereof, with respect to the gathering of the royalty gas delivered hereunder (including compression) prior to its delivery to the State that Lessee may be required to pay for directly or indirectly.

ARTICLE X

BILLING AND PAYMENTS

10.1 On or before the 15th day of each month during the term hereof the State or its designee shall furnish Lessee with a full and complete statement reflecting all gas delivered by Lessee during the preceding month and the total amount due hereunder pursuant to Article IX hereof. Payment hereunder shall be made to Lessee at its office in Bartlesville, Oklahoma within ten (10) days after delivery of each such statement.

10.2 On or before the 30th day of each month during the term hereof Lessee shall furnish to the State or its designee a full and complete statement reflecting the total amount of royalty gas produced by Lessee during the preceding month. Deducting the quantity taken by the State for such month, Lessee shall determine the amount of royalty gas not taken by the State for such month and shall make payment therefor to the State together with said statement.

10.3 Each party hereto shall have, at its expense, the right to examine the books and records of the other party to the extent necessary to verify the accuracy of any statement or invoice made under or pursuant to this contract. Any statement shall be final as to both parties unless questioned in writing within two (2) years after payment

AGO 935961

thereof has been made.

ARTICLE XI

REPRESENTATION AND CONDITION PRECEDENT

11.1 It is expressly recognized and agreed that the gas gathering system utilized for deliveries hereunder is operated and maintained by Lessee for its own purpose and Lessee does not, by entering into this Agreement, dedicate any facilities or otherwise undertake to render any service to or for the public. This Agreement is being undertaken solely to effectuate the delivery of royalty gas to the State, and the State makes the material representation that neither this Agreement nor the State's use or disposition of the gas delivered hereunder will subject Lessee to regulation by the Federal Power Commission, the Alaska Public Utilities Commission, or the Alaska Pipeline Commission.

11.2 In the event that any governmental agency shall declare that Lessee's activities hereunder subject Lessee to regulation as a utility, then either party shall have the option to terminate this Agreement upon thirty (30) days' notice in writing.

ARTICLE XII

ALASKA PIPELINE COMPANY

12.1 The State has entered into a Gas Purchase Agreement with Alaska Pipeline Company, under the terms of which APC will purchase the State's royalty gas after same has been delivered by Lessee to the State. Under such contract, APC has agreed to make for the State's account all

AGO 935962

payments required by Articles IX and X hereof. Lessee agrees to accept such payments by APC as satisfaction of the State's obligations under Articles IX and X hereof. In the event of default by APC in making such payments, Lessee shall promptly notify the State and if such default continues for a period of thirty (30) days after such notice, Lessee shall have the option of terminating this Agreement in its entirety.

12.2 Lessee agrees to accept the State's designation of APC as the State's designee hereunder for the performance of any other obligations which the provisions hereof place on the State.

12.3 By its execution hereof APC ratifies all of the terms, covenants, conditions, and representations hereof.

ARTICLE XIII

FORCE MAJEURE

13.1 No liability shall result to either party from delay in performance or non-performance of any obligation hereunder (except the State's obligation to make payment hereunder) caused by circumstances reasonably beyond the control of the party affected, including, but not limited to, acts of God, fire, flood, storm, war (declared or undeclared), repair of facilities, breakage or accident to machinery or lines of pipe, repair, redrilling or reworking of wells, governmental regulation, requisition or direction, or labor strikes or lockouts.

13.2 The party claiming relief under this Article XIII shall advise the other party with reasonable promptness

in writing giving full particulars of the cause or causes relied upon and shall also give prompt notice in writing of the cessation of any such cause or causes. The party claiming force majeure shall exercise due diligence in undertaking to remedy and overcome the cause of delay hereunder, but neither party shall be required to agree to any demand of labor to settle any strike or labor dispute except in the sole discretion of the party subject to such strike or labor dispute.

ARTICLE XIV

TERM

14.1 This Agreement shall become effective upon the execution hereof and the execution and approval of the Alaska Royalty Oil and Gas Development Advisory Board and the State Legislature of the Contract attached as Exhibit "B" hereto and shall remain in effect until June 1, 1984, unless terminated or extended prior to such date by mutual agreement of the parties, or pursuant to this Article or Article XI or XIII.

14.2 In the event that the Agreement attached hereto as Exhibit "B" is terminated, this Agreement may be terminated by either party upon thirty (30) days notice.

14.3 If deliveries to the State or its designee hereunder have not commenced on or before June 30, 1978, then this Agreement shall terminate immediately.

14.4 In the event of termination of this Agreement or of deliveries of royalty gas hereunder, the parties agree that such termination shall have the effect of revoking the State's election to receive its royalty gas in-kind

AGO 935964

as of the date of termination and Lessee shall immediately commence such royalty payment under the terms of the leases listed in Exhibit "A" to assure the state of its full royalty share on all gas produced from the leases.

ARTICLE XV

MISCELLANEOUS

15.1 Except as herein otherwise provided, any notice, request, demand, statement or bill provided for in this Agreement, or any notice which either party may desire to give to the other, shall be in writing and shall be considered as duly delivered when mailed by registered mail to either of the parties hereto as the case may be at the following address:

Commissioner of Natural Resources
State of Alaska
Pouch M
Juneau, Alaska 99811

Phillips Petroleum Company
Attn: Gas and Gas Liquids Division
Bartlesville, Oklahoma 74004

Alaska Pipeline Company
P. O. Box 6288
Anchorage, Alaska 99502

or at such other address as either party shall designate from time to time by formal written notice. Routine communications, including monthly statements and payments, shall be considered as duly delivered when mailed by either registered or ordinary mail.

IN WITNESS WHEREOF, this Agreement is executed as of the day and year first above written.

ALASKA PIPELINE COMPANY

Contract to Purchase State Royalty Gas

Findings and Conclusions of the Commissioner
Pursuant to Alaska Statute 38.05.183(c)

Alaska Statute, AS 38.05.183(c), requires that the Commissioner of Natural Resources make public, in writing, the specific findings and conclusions upon which a determination not to use competitive bid procedures is based for a sale of Alaska royalty oil or gas. Publication is to follow approval of the determination by the Alaska Royalty Oil and Gas Development Advisory Board. On April 6, 1977, the Royalty Board did approve the Commissioner's determination to waive the competitive bidding requirement for sale of royalty gas to the Alaska Pipeline Company by approving the contract entitled "Gas Purchase Contract" for gas, dated April 11, 1977, between the State of Alaska and Alaska Pipeline Company. Accordingly, these written findings and conclusions are submitted in fulfillment of the requirements of AS 38.05.183(c).

The Contract entitled "Gas Purchase Contract" dated April 11, 1977, between the Alaska Pipeline Company and the State of Alaska, as well as the agreement between the Phillips Petroleum Company and the State of Alaska, have been entered into because the Contract entitled "Gas Purchase Contract" dated June 4, 1976 could not become implemented.

The Findings and Conclusions for Non-Competive Sale for the previous Contract is appended to support the current Findings and Conclusions of the Commissioner not to use competive bid procedures for these contracts.

The current agreements have been executed solely to solve these problems and allow royalty gas to be delivered to the Buyer.

The reasons for this determination not to use competitive bid are the same as the previous determination.

Findings and Conclusions for Non-Competitive Sale

Pursuant to AS.38.05.183 and AS.38.06 the findings and conclusions which form the basis for the decision that the sale of North Cook Inlet Gas Field royalty gas to Alaska Pipeline Company should be non-competitive sale are summarized.

1. Alaska Pipeline Company formerly Anchorage Natural Gas Company, is in need of additional natural gas supply. The present contract of 10 billion cubic feet to supply the North Kenai road area will be exhausted during the first half of 1976. Alaska Pipeline has executed an agreement recently with their supplier which enables them to use gas from the Anchorage contract reserves to supply the North Kenai area for one additional year. Projections of the present growth rate of Anchorage and use of natural gas indicate that the Anchorage contract dedicated gas supply could be exhausted several years before the contract termination at the end of 1992.

2. The proposed sale amount of royalty gas is sufficient to meet the needs of the North Kenai area for the term of the agreement. Present use of the North Kenai area is 10 million cubic feet per day. About 90% of this gas is used by the Bernice Lake electric generating plant of Chugach Electric Association. The difference between winter and summer loads is small. The North Cook Inlet Gas Field royalty gas share averages 15 to 16 million cubic feet per day. Gas in excess to the North Kenai area demand can be used to augment the Anchorage contract gas supply. The total volume of gas which would be sold under the proposed agreement is approximately 40 to 41 billion cubic feet.

3. North Cook Inlet Gas Field gas furnishes 70% of the gas supply of the Nikiski LNG plant, the remaining 30% is supplied by Marathon from the Kenai Gas Field. The LNG is shipped to Japan in cryogenic tankers and revaporized for use by Tokyo Gas and Tokyo Electric. At this time, the State is taking its royalty share in value and this gas brings the greatest return to the State of any royalty gas.

4. Proposed sale of this royalty gas will not diminish State revenue. Alaska Pipeline has agreed to pay the State the same price that the State otherwise would have received

from Phillips. Price terms in the proposed agreement are based on Phillips prices plus an agreement to pay a price equal to the highest price paid in Upper Cook Inlet for gas of similar quality and similar conditions of delivery.

5. The proposed action may reduce the productive life of the field equivalent to one year at the present rate of production. The total amount of gas sold under the agreement will be about 40 to 41 billion cubic feet per year. The present LNG contract dedicated reserves are 647,543 million cubic feet. Estimated original recoverable reserves were 1,500,000 million cubic feet. The estimated remaining gas reserves not committed to contract are about 834 billion cubic feet.
The proposed sale involves about 5% of the remaining uncommitted reserves. Because the LNG sale contract requires delivery of 50,750 million cubic feet of gas per year to Tokyo, it will be necessary for Phillips to increase the field production by the amount withdrawn for royalty sale. While this increased production will shorten the producing life of the field, the amount of decrease is small and amounts to less than one year's production.

6. During the period of review of Alaska Pipeline Company's application for purchase of royalty gas applications were also made by Homer Electric Association, Pacific Alaska LNG and Phillips Petroleum.

Homer Electric wished to buy the Bernice Lake generating facility from Chugach Electric and wanted to use the North Cook Inlet Gas Field royalty gas to supply the generator. This would be the same use proposed by Alaska Pipeline. Homer Electric subsequently advised the Alaska Royalty Oil and Gas Development Board that HEA had made satisfactory arrangements with the City of Kenai for a gas supply in the event it would be needed.

Pacific Alaska LNG made a statement that they would be interested in bidding for the North Cook Inlet royalty gas if it were offered in a competitive bid sale.

Later, Pacific Alaska advised the Board both by mail and in person that they were not making application for the North Cook Inlet royalty gas but rather a general statement applicable to possible future sales of other royalty gas.

Phillips Petorleum made a firm offer to purchase the royalty gas with an increase in price of five cents per thousand cubic feet (MCF) the first year, a similar increase the second year, and an annual escalation of two cents per MCF thereafter for the life of the present contract.

The withdrawals of Homer Electric and Pacific Alaska LNG left Phillips Petroleum as the only viable alternate to Alaska Pipeline's application.

CONCLUSION:

The decision to hold a negotiated sale rather than a competitive sale was based on several factors: end use, price to consumers, and future gas supply for Alaska.

The export of LNG to Japan has created a substantial market for Alaska's natural gas converting a non-revenue producing resource into a valuable asset with substantial revenues to the State.

The exported LNG produces about 75% of the State revenue from natural gas. While there was a reluctance to alter the use of the royalty gas and possibly necessitate additional costs to the LNG project, the use of the gas by the Kenai and Anchorage consumers was deemed to be a higher and better use.

Alaska Pipeline agreed to pay the State the same price the State otherwise would have received for the gas thereby maintaining the same revenue from the gas. While a competitive sale might have resulted in more revenue for the State it would also result in the gas being exported from the State and not available for Alaskan use. Alternately, if an Alaskan comapny was the successful high bidder it likely would set a new high price to the Alaskan consumer.

The present sale represents a balance of public values regarding this series of issues. The proposed non-competitive sale of North Cook Inlet Gas Field royalty gas appears to be in the best interest of the State as a whole and of the Kenai and Anchorage area gas consumers more directly. There is no loss of revenue to the State; the gas sale will be the gas supply for the North Kenai road area and add to the Anchorage area gas reserves; the slight lo s of productive life of the North Cook Inlet Gas Field is offset by the continued service to the Alaskan gas consumers.

APPROVAL OF THE AGREEMENT FOR THE PURCHASE AND SALE OF STATE ROYALTY GAS FROM THE NORTH COOK INLET FIELD BETWEEN THE STATE AND ALASKA PIPELINE COMPANY

WHEREAS, Alaska Statutes 38.06.050(a) and 38.05.183 require that the Alaska Royalty Oil and Gas Development Advisory Board ("Board") grant to the Commissioner of Natural Resources ("Commissioner") written approval for the sale, exchange or other disposition of royalty oil or gas, and

WHEREAS, Alaska Statute 38.05.182 requires that the Board grant its consent to the taking of royalty oil or gas in-kind, and

WHEREAS, the Board has been advised by the Commissioner of the progress of negotiations and has heard testimony, both in public sessions and working sessions, from the purchaser, and

WHEREAS, the Commissioner has now concluded his negotiations with the purchaser and has presented to this Board for its approval an agreement for the sale of royalty gas from the North Cook Inlet field (which gas is identified more specifically in the Contract), and

WHEREAS, This Board has carefully reviewed the proposed agreement and has received public comment on the agreement, and

WHEREAS, This Board finds that the taking of royalty gas in-kind to meet the obligations under the agreement will serve an important public purpose and be of general benefit to the public interest,

NOW THEREFORE, the Alaska Royalty Oil and Gas Development Advisory Board hereby grants its approval of the "Gas Purchase Contract" between the State of Alaska and Alaska Pipeline Company and further approves the taking in-kind of the royalty gas dedicated to this agreement.

This approval relates to that certain agreement entitled "Gas Purchase Contract" between the Alaska Pipeline Company and the State of Alaska dated this day of April 11, 1977.

APPROVAL OF REQUEST OF COMMISSIONER OF NATURAL RESOURCES
TO WAIVE REQUIREMENT OF COMPETITIVE BIDDING

WHEREAS, Alaska Statutes 38.06.050(c) and 38.05.183 (a) and (c) require the Alaska Royalty Oil and Gas Development Advisory Board ("Board") grant written approval to the Commissioner of Natural Resources ("Commissioner") to waive the requirement that royalty oil or gas be sold by competitive bid, and

WHEREAS, the Commissioner has submitted to this Board a request to waive the requirement of public bidding with respect to royalty gas from the North Cook Inlet Field, and

WHEREAS, the Board has considered the request of the Commissioner and finds the Commissioner's reasons sufficient to justify a waiver of the requirement for public bidding in the public interest;

NOW THEREFORE, the Alaska Royalty Oil and Gas Development Advisory Board hereby grants to the Commissioner of Natural Resources its approval of his request to waive public bidding.

This waiver relates to that certain agreement entitled "Gas Purchase Contract" between Alaska Pipeline Company and the State of Alaska dated this day of April 11 _____ 1977.

APPROVAL OF REQUEST OF COMMISSIONER
OF NATURAL RESOURCES
TO REJECT APPLICATIONS

WHEREAS, Alaska Statute 38.06.050(b) prohibits the rejection of applications for the purchase of royalty oil or gas by the Commissioner of Natural Resources ("Commissioner") without the approval of the Alaska Royalty Oil and Gas Development Advisory Board ("Board"), and

WHEREAS, the Commissioner in conjunction with his request for the sale of royalty gas to Alaska Pipeline Company requests that he be allowed to reject applications in conflict with the proposed sale, and

WHEREAS, this Board has reviewed all other applications for the purchase of royalty gas and heard public comment thereon,

NOW THEREFORE, this Board hereby grants its approval to reject applications to the extent such applications are rendered infeasible or impossible by the contracts for the sale of royalty gas approved by this Board on this date.

This approval relates to that certain agreement entitled "Gas Purchase Contract" between Alaska Pipeline Company and the State of Alaska dated this day of April 11, 1977.

APPROVAL OF THE AGREEMENT FOR THE TAKING AND GATHERING OF STATE ROYALTY GAS BETWEEN THE STATE OF ALASKA AND PHILLIPS PETROLEUM COMPANY

WHEREAS, Alaska Statutes 38.06.050(a) and 38.05.183 require that the Alaska Royalty Oil and Gas Development Advisory Board ("Board") grant to the Commissioner of Natural Resources ("Commissioner") written approval for the sale, exchange or other disposition of royalty oil or gas, and

WHEREAS, Alaska Statute 38.05.182 requires that the Board grant its consent to the taking of royalty oil or gas in-kind, and

WHEREAS, the Board has been advised by the Commissioner of the progress of negotiations and has heard testimony, both in public sessions and working sessions, from the Lessee, and

WHEREAS, the Commissioner has now concluded his negotiations with the Lessee and has presented to this Board for its approval an Agreement for the sale of royalty gas from the North Cook Inlet (which gas is identified more specifically in the Agreement), and

WHEREAS, This Board has carefully reviewed the proposed agreement and has received public comment on the agreement, and

WHEREAS, This Board finds that the taking of royalty gas in-kind to meet the obligations under the agreement will serve an important public purpose and be of general benefit to the public interest,

NOW THEREFORE, the Alaska Royalty Oil and Gas Development Advisory Board hereby grants its approval of the Agreement between the State of Alaska and Phillips Petroleum Company and further approves the taking in-kind of the royalty gas dedicated to this agreement.

This approval relates to that certain "Agreement" to take in-kind royalty gas from the North Cook Inlet between the State of Alaska and Phillips Petroleum Company. Dated April 11, 1977.

MEMORANDUM

Jur: APUC
Phillips
Ak Pipe Co.

TO: Guy Martin, Commissioner
Dept. of Natural Resources

DATE: March 7, 1977

FILE NO:

TELEPHONE NO:

FROM: Wilson Condon
Deputy Attorney General

SUBJECT: Jurisdiction of the APUC over Phillips Petroleum Pipeline

This is in response to your memorandum of February 24, 1977, in which you ask if the Alaska Public Utilities Commission would have jurisdiction over a pipeline operated by Phillips Petroleum if State-owned royalty gas is transported over that pipeline to North Kenai Road, where it would be sold by the State to Alaska Pipeline Company, a wholly owned subsidiary of Alaska Gas and Service. My conclusion is that the APUC would not have jurisdiction over the Phillips Petroleum Company pipeline.

The Alaska Public Utilities Commission has jurisdiction over "public utilities" which are defined by AS 42.05.70(2) as follows:

> "public utility" or "utility" includes every corporation (whether public, cooperative, or otherwise), company, individual, or association of individuals, their lessees, trustees, or receivers appointed by a court, that owns operates, manages or controls any plant, pipeline or system for
>
> * * *
>
> (D) furnishing by transmission or distribution of natural or manufactured gas to the Alaska public for compensation;
>
> * * *

"Public" is defined by AS 42.05.701(5) as follows:

> "public" or "general public" means
>
> (A) any group of 10 or more customers that purchase the service or commodity furnished by a public utility as defined in (2) of this section; and
>
> (B) any utility purchasing the product or service or paying for the transmission of electric energy, natural or manufactured gas, or petroleum products which are resold to a group included in (A) of this paragraph or which are used to produce the service or commodity sold to the public by the utility.

If Phillips delivers royalty natural gas to the State at the wellhead, and the State contracts with Phillips for transportation of that gas to North Kenai Road, Phillips will be rendering a utility-type service because it will be engaged in the transmission of natural gas. Phillips, however, will be neither a "utility" nor "public utility" within the meaning of the Public Utilities statute because it will not be furnishing transmission service to the "public" or the "Alaska public." Phillips would be furnishing transmission service to the State. This would make it a public utility if 1) the State is the 10th customer to purchase transmission service (our assumption is there are less than 10 purchasers of transmission service), or 2)if the State is a "utility. . . paying for the transmission of. . . natural. . . gas. . . which is resold to [any group of 10 or more customers that purchase the service or commodity furnished by a public utility. . .]." The State would not be a utility (because it does not fit within the definition of AS 42.05.701(2)), thus Phillips could not be a public utility subject to the jurisdiction of the APUC when it furnishes transmission service to the State.

MEMORANDUM

TO: Don Wold
Executive Director
Alaska Royalty Oil and Gas
Development Advisory Board

DATE: March 29, 1977

FILE NO:

TELEPHONE NO:

FROM: Wilson Condon
Deputy Attorney General

SUBJECT: Jurisdiction of the Alaska Pipeline Commission Over Phillips East Cook Inlet Gas Line

This is in response to your memorandum of March 11, 1977 in which you ask if the Alaska Pipeline Commission (APC) would have jurisdiction over a pipeline operated by Phillips Petroleum if State-owned royalty gas is transported over that pipeline to North Kenai Road, where it would be sold by the State to Alaska Pipeline Company, a wholly owned subsidiary of Alaska Gas and Service. My conclusion is that the APC would not have jurisdiction over the Phillips Petroleum Company pipeline.

The Alaska Pipeline Commission has jurisdiction over "pipelines", "pipeline facilities" and "pipeline carriers". AS 42.06.630(10) defines "pipeline carrier" as:

> . . . the owner, including corporations . . ., of any pipeline, as the term is defined in this section, or any interest in it;

AS 42.06.630(9) defines "pipeline" or "pipeline facility" as:

> . . . all the facilities of a total system of pipe . . . in this state used by a pipeline carrier for transportation, for hire and as a common carrier, of oil or gas for delivery, storage, or further transportation, and including all pipe, pump and compressor stations, station equipment, and all other facilities used or necessary for an integral line of pipe to effectuate the transportation from point to point, excluding, however, gas processing plant, heaters and separators;

The salient portion of the above definition is written in the conjunctive, i.e., to be a "pipeline" or "pipeline facility" under the Alaska Pipeline Commission Act, AS 42.06 et seq., a pipeline facility must be used ". . . for transportation, for hire and as a common carrier . . ." (emphasis added).

Of course Phillips, in the arrangement described at the outset of this memorandum, will be using its pipeline for "transportation" of gas. However, since the subject pipeline is neither operated by Phillips "as a common carrier" nor is it subject to the "common carrier" covenant requirement of AS 38.35.120 due to the fact that the lease of state lands for the subject pipeline pre-dates the enactment of that statute, the subject pipeline would not fall within the jurisdiction of the APC were the proposed arrangement to be entered into by Phillips.

Mr. Don Wold, Executive Director
Alaska Oil and Gas Development Advisory Board
Department of Natural Resources
State Office Building
Juneau, AK 99811

Dear Don:

In response to your requests this week, we are writing to summarize and describe the essence and the effect of the contract(s) executed by the State and Phillips and Alaska Pipeline Company (APC) regarding the taking in kind of the State's royalty gas (1/8th) from the North Cook Inlet Gas Field.

By way of background, APC's supply until now has come entirely from the Kenai gas field, which is owned by Union and Marathon. We have had two supply contracts: one for Anchorage, in which delivery to us is at the Kenai gas field; and one for the North Kenai Road ("Nikiski") area, in which delivery to us is at or near the Kenai LNG plant.

The "Anchorage" contract is for a total of 550 BCF (billions of cubic feet) to be taken (take or pay for) at 26 BCF/year (which is 72,000 MCFD--72,000 thousand cubic feet per day) by December 31, 1992, but with deliverability of 160,000 MCFD on any day through December 31, 1985. The basic price for this gas is 24¢ per MCF until January 1, 1981, then 27¢ until January 1, 1986, and then the defined "area price" for the remainder of the contract term. In addition to this basic price we pay 19.5¢ per MCF for the extra deliverability described above, and the

ALASKA PIPELINE COMPANY

General Offices Located at 3000 Spenard Road
P.O. Box 6288 / Anchorage, Alaska 99502

19.5¢ is adjusted each January 1 by the ratio of the published Wholesale Price Index (WPI) of the preceding November to the WPI of November, 1974. At present, the total cost for gas under this "Anchorage" contract is 45.1¢ per MCF.

The "Nikiski" contract was for 10 BCF to be delivered from May 1, 1967 to April 30, 1977, with deliverability of 10,000 MCFD, no take or pay, and priced at 1.5¢ higher than the basic price for "Anchorage" reserves as described above. We used the last of the 10 BCF under this contract in August of 1976, and thereafter we began taking "Anchorage" reserves at Nikiski, priced at the total price of "Anchorage" reserves plus 1.5¢ per MCF, temporarily (one year was agreed) pending resolution of a longer term supply. We had expected to be using North Cook Inlet royalty gas as the replacement for "Anchorage" reserves at Nikiski, and still expect to be doing so upon the implementation of the royalty gas contracts as revised this year.

We selected North Cook Inlet royalty gas because we believed, and still believe, this gas will be available to us and our customers at a lower price than any other "new" reserves. This gas is under contract (as LNG) to June 1, 1984 for export to Tokyo and its cost to us is approximately 75¢ per Mcf immediately, rising to 85¢ when compressors are installed, with certain escalation as described in the revised contracts. In comparison, Pacific Alaska LNG is offering $1.45 for similar gas from Cook Inlet (without the same deliverability of our "Anchorage" reserves), with escalations. We do not have proof of the $1.45 pricing, but it can be verified by the State. Thus, we see the royalty gas to be available

to us at less than half the going price of "new" gas in the Cook Inlet area, delivered on the North Kenai Road.

Our alternative to competing at the $1.45 price level is to continue to utilize "Anchorage" reserves at Nikiski, as we are now doing, but to pay the same price we would have paid for royalty gas. We have verbal assurance that we can operate on this basis at Nikiski while we install the facilities necessary to shift to royalty gas, and we are proceeding with preparations to do so at the earliest possible date following legislative approval of the royalty contracts as revised. We hope to begin taking royalty gas as early as June, 1977.

Several questions arose over the two years it has taken to reach agreement of the several parties as to our use of royalty gas, and I will try to comment as information for those who review the actions taken. First, the royalty gas contract signed last year, and approved by the legislature, was contingent on APC working out an arrangement with Phillips to obtain delivery of the royalty gas through their pipeline from the platform to the Kenai LNG plant, and it required "take or pay" of 100% of the royalty gas. These elements led to problems which had to be resolved as has been done in the revised contracts which were executed last week. The differences are (1) that the delivery to shore will be made by Phillips for the State, with APC paying Phillips for the account of the State, at prices negotiated by APC with Phillips, and (2) that there will be no "take or pay": Phillips will make a best effort to deliver at least 3 BCF per year (roughly 55% of the total royalty), and APC will make a best effort to take all of the royalty which Phillips

can deliver, but neither party will be obligated to make extra investment or incur unreasonable extra operating cost.

Without obligation, APC expects Phillips to deliver essentially all the royalty and expects to take all the royalty, but only experience will tell the outcome of this expectation. Phillips may install one or more units of compression, and APC may install a pipeline to connect the royalty gas into its pipeline to Anchorage. Various factors outside the respective control of Phillips and APC have made it necessary to develop a best-efforts arrangement rather than the original "take or pay" of 100% of the royalty.

APC's royalty pipeline, if built, would provide several advantages:

1. It would essentially assure APC's ability to take all of the available royalty, all of the time, and gain the maximum benefit from royalty gas.
2. It would provide "back-up" for APC's North Road customers while royalty gas may not be available due to downtime of the LNG plant, the platform, or the Phillips pipeline or compressors.
3. It would provide APC with access to other than royalty gas in the vicinity of the Kenai LNG plant, which is at the center of several streams of natural gas--supplies to Swanson River for repressurizing, ammonia/urea manufacture, Pacific Alaska LNG, etc. Thus, the pipeline could give APC additional options on "new" gas from various sources.

4. It would provide an independent supply of gas to APC for emergency in the event of catastrophic failure of the Kenai gas field--well operations, dehydration, or compression--or of APC's pipeline from the field to Mile 16 of APC's pipeline to Anchorage.

Feasibility of the royalty pipeline depends on the possibility of exchanging royalty gas with Union-Marathon, final rate decisions of the Alaska Public Utilities Commission (APUC), final quantification of the amount of royalty gas to be delivered, flow through of the extra cost of royalty gas, and other factors including availability and cost of right of way. At present it appears that there is sufficient benefit from the royalty line to justify the investment by APC.

APC's experience with the APUC is such that royalty gas is particularly attractive: the flow through of its extra cost to end users has been authorized by the APUC, whereas no other purchase by APC can be made with flow through except by further hearings. This fact, plus the fact that it appears royalty gas will always be available (for the contract term) at less cost than any other likely "new" gas, make the royalty most advantageous to APC and its customers. Further, the precedent of this purchase of this royalty gas by APC should be helpful at a future date when other royalty gas may become available and feasible for purchase by APC.

It is clear that APC's action to purchase royalty gas is in the public interest. The price is the lowest available to APC and its

ALASKA PIPELINE COMPANY

General Offices Located at 3000 Spenard Road
P.O. Box 6288 / Anchorage, Alaska 99502

customers; the price is qualified to be not less than the State would have received by its continued export to Japan or by any comparable sale during the contract term within 100 kilometers of the Phillips platform; and a relatively modest investment is required by APC even including the royalty pipeline. Other "new" gas could involve meeting the currently competitive price of Cook Inlet gas ($1.45) and could involve pipeline costs or take or pay costs many times that for royalty gas. The quantity of this royalty gas is rather ideal for APC's present requirements. In 1976, APC's total purchases were 28.6 BCF compared to the required take or pay quantity of 26 BCF per year at the Kenai gas field. As structured, the royalty gas contracts would allow APC (and Phillips) to match their investment to market developments and thus provide the optimum conditions for such investment.

Clearly, Phillips has been a reluctant party in these contracts but has acted responsibly and reasonably and consistent with the public interest. Phillips preference has always been to retain the royalty gas and increase its value by liquefaction for export to Japan. That contract was originally 52¢ FOB Tokyo, but now is $1.95. Clearly the increase ($1.43) contains a substantial increase of profit (which is shared by the State through its royalty price). Clearly the 20¢ revenue which Phillips will realize by bringing the royalty gas on shore does not compare with the revenue and income Phillips would realize by its export.

The 20¢ delivery/compression charge is obviously the most Phillips could charge, because it is the most APC would pay. The State is realizing the most it can from the royalty gas, because APC will not pay more for this gas. To suggestions, if any, that APC should not have accepted the delivery charge as contracted, APC would respond that it would be no more logical to require Phillips to accept less than their required price than for the State to accept less than it deems to be necessary for this gas.

APC will not increase its income by purchasing this royalty gas--it will simply recover most (not all) of its costs, by flow through. APC's objective in making this purchase is to prolong the life of its gas reserves and thus the availability of its "old" gas at "old gas pricing" for its customers.

APC firmly believes that the merit of its purchase of royalty gas has been established already in various arenas.

1. The APUC considered the subject in extensive hearings in 1975 and its order clearly contemplates the purchase and in fact, deemed the matter to be of urgent importance.
2. The Royalty Board and the Commissioner of Natural Resources have reviewed this matter at great length and have approved and authorized its present form.
3. The Attorney General has reviewed jursidictional aspects and agreed it is not contrary to the public interest or the laws of Alaska.

ALASKA PIPELINE COMPANY

General Offices Located at 3000 Spenard Road
P.O. Box 6288 / Anchorage, Alaska 99502

4. The legislature, in its prior approval, has endorsed the concept and pricing of this purchase by APC.

Previously, support for this purchase by APC was given by the City of Anchorage, Chugach Electric Association, and Homer Electric Association. APC is not aware of any opposition to its purchase of this royalty gas (opposition by Pacific Alaska LNG was withdrawn in 1976, at the insistence of APC). When these various governmental and business approvals are considered, and when the alternative can only be that this gas would continue to be exported to Japan, APC believes that ample justification for the contracts has been made.

At present, APC has about 415 BCF of gas remaining under contract at the Kenai gas field. At 30 BCF per year, there would be 14 years of reserves now remaining. The royalty gas potentially available to June, 1984 is about 40 BCF, which is less than a 10% increase. APC is and has been attempting to reduce the growth rate of its gas sales through conservation measures such as waste heat recovery by power plants and by opposing and reducing the use of gas-generated electric heat. However, it is very likely that unavoidable growth will shorten APC's reserve life to 10 years or less. APC must look to the long term aspects of its gas supply in order to avoid future shortages and problems with the long-term (20 year) financing APC requires. Purchase of the royalty gas is a step, but only a step, in this direction. Royalty gas at 75¢ or 85¢ will be helpful to APC in its negotiations for additional "new" gas reserves, viewed in the context of competitive offerings at $1.45 or possibly a price equivalent to oil in future years.

ALASKA PIPELINE COMPANY

General Offices Located at 3000 Spenard Road
P.O. Box 6288 / Anchorage, Alaska 99502

Delays in obtaining royalty gas can only diminish its benefit to APC and its customers because of the quantity available as well as the timing and impact of the purchase.

Very truly yours,

Dale Teel
President

DT/pm

Phillips

February 25, 1977

Mr. John Horn
Phillips Petroleum Company
Gas and Gas Liquids Division
Bartlesville, Oklahoma 74004

Dear Mr. Horn:

As you know, the State of Alaska entered into an agreement with the Alaska Pipeline Company on June 4, 1976 for the sale of the State's royalty gas produced from your company's North Cook Inlet Gas Field. The Alaska Pipeline Company and Phillips have been unable to work out a mutually satisfactory arrangement for delivery of the gas. The State of Alaska, through the Department of Natural Resources, is continuing to explore various ways this can be accomplished in the interest of all parties.

The Alaska Pipeline Company has proposed that the State enter into an agreement with your company to take delivery of royalty gas from your pipeline at a mutually agreeable point near the North Kenai Road. The State is presently exploring this possibility and your cooperation has been greatly appreciated. Several questions have been raised regarding this procedure. They are:

1. Will the Alaska Public Utilities Commission have jurisdiction over the Phillips pipeline if the State takes delivery at this point? The State's Attorney General has been asked for an opinion.

2. What charges would be made by Phillips for delivery of the gas to this point? What is the detailed justification of these charges?

3. We understand that as the field pressure declines, compressors will be installed to maintain production rate. What costs will be incurred by the State and what is the detailed justification of these costs?

4. What is your best forecast of the dates of installation of the first and future compressors and how will the cost to the State change with installation of additional compressors?

5. What is your best forecast of future production from this field? Will you share with the State your future production plans so that the State may plan accordingly to utilize its royalty gas?

6. The State understands your need to maintain production of your LNG plant and that your ability to deliver royalty gas to the State will change as the field pressure changes. Would you please explain this procedure and give us your best forecast of your ability to make delivery in the future?

Your response to the above would be greatly appreciated together with any further information that you may feel to be pertinent to the solution of this problem.

Would you please review the draft agreement prepared by Alaska Pipeline Company between Phillips and the State and recommend changes that may be of interest to your company?

Thank you for your cooperation. Your early response to the above will be greatly appreciated.

Very truly yours,

Donald G. Wold
Executive Director

DGW/jl

Royalty Gas
North Cook Inlet Field

File: 1-Ho-115-77-C&GL

Mr. Donald G. Wold, Executive Director
Royalty Oil & Gas Development Advisory Board
Department of Natural Resources
Pouch M
Juneau, Alaska 99811

Dear Sir:

In your letter of February 25, 1977, you have requested certain information regarding whether Phillips could make the royalty gas from the North Cook Inlet Field available at an onshore location on the North Kenai Road, rather than in the field as provided in our lease with the State of Alaska. Information is listed by the numbers used in your letter:

2. Q. What charges would be made by Phillips for delivery of the gas to this point? What is the detailed justification of these charges?

   A. Since we had previously negotiated a place differential of 10¢ per Mcf starting with the calendar year of 1977 and increasing 6% per year thereafter with Alaska Pipeline Co., Phillips would be willing to utilize this approach with the State. Although this is a negotiated figure, the data supporting same is shown on Table I.

3. Q. We understand that as the field pressure declines, compressors will be installed to maintain production rate. What cost will be incurred by the State and what is the detailed justification of these costs?

   A. For the first compressor unit (approximately 3800hp) installed, compression charge would be 10¢ per Mcf increasing 6% per year from the year of installation. As later units are added, the compression charge will be agreed upon at that time. The above charge is the result of negotiations with Alaska Pipeline Company and is on the condition that Royalty gas would be handled only when there is surplus capacity in our gathering system and compressors. The above charge would be substantially higher if based on adding sufficient additional compressor capacity to assure the availability of capacity and would also entail a substantial minimum annual payment to cover these additional costs. Our calculations are attached as Table II.

4. Q. What is your best forecast of the dates of installation of the first and future compressors and how will the cost to the State change with installation of additional compressors?

4. Continued.

A. This is dependent on the amount of royalty gas taken by the State and also on other factors, such as, whether LNG in addition to current deliveries to Japan is sold to the south 48 states. Based on present information, we estimate that the first unit would be installed in 1978 or 1979.

5. Q. What is your best forecast of future production from this field? Will you share with the State your future production plans so that the State may plan accordingly to utilize its royalty gas?

A. Production has averaged 43 to 45 Bcf annually over the last several years. We visualize that production could increase to 55 Bcf or more per year including royalty gas taken in kind.

6. Q. The State understands your need to maintain production of your LNG plant and that your ability to deliver royalty gas to the State will change as the field pressure changes. Would you please explain this procedure and give us your best forecast of your ability to make delivery in the future?

A. Without compression, the volume available from North Cook Inlet Field will decline rather rapidly commencing in 1979. Producing at the 43 to 45 Bcf per year rate and with the installation of compressors, these rates are estimated to continue until 1983, after which the volume declines approximately 10% per year. If the higher rate of 55 Bcf per year is maintained, the volume will commence declining in 1984 at the rate of approximately 10% per year.

You will appreciate that, due to the number of unknown factors, the information provided above is based on our best estimates of the situation as it now exists. New developments could change these estimates.

John Horn

Cost/Mcf @ 43 Bcf/Year = 16.4¢

Cost/Mcf @ 55 Bcf/Year = 12.9¢

TABLE II

COMPRESSORS
(FIRST UNIT)

To maintain capacity in the gathering system and compressors to handle the full 12.5% royalty gas volume, it will be necessary to install compressors at an earlier date. Also, it is estimated that to maintain this capacity it will be necessary to install an additional compressor unit over and above that required for maintaining deliveries without the State taking its royalty gas in kind. Estimated differential in compressor investment is $5,000,000.

Cost of Compression

	$/Year
Depreciation (10 Years)	$ 500,000
Rate of Return 15% on Average Investment	375,000
Income Taxes @ 52.9% (State & Federal)	420,000
Operating Expense	715,000
TOTAL	$2,010,000

Minimum Annual Payment	= $2,010,000
Royalty Gas Volume @ 43 Bcf/Year	= 5.4 Bcf
Royalty Gas Volume @ 55 Bcf/Year	= 6.9 Bcf
Cost/Mcf @ 5.4 Bcf	= 37.2¢
Cost/Mcf @ 6.9 Bcf	= 29.1¢

Phillips agreed with Alaska Pipeline Company's request to a compressor charge of 10¢/Mcf on a space-available basis and no minimum annual charge.

General Offices Located at 3000 Spenard Road
P O Box 6288 / Anchorage, Alaska 99502

March 10, 1977

Memo to: File

Subject: Rationale for Accepting Gathering and Compression Charges Proposed on North Cook Inlet Royalty Gas

By telephone March 10, 1977 Mr. Don Wold asked us to rationalize the acceptance of a 10¢/MCF charge for "gathering" and a 10¢/MCF charge for compressing royalty gas we have negotiated to purchase from the State of Alaska.

The State will escalate the price we pay for royalty gas to the highest price paid by other purchasers within 100 kilometers for similar quality and similar delivery conditions. We had offered to pay no more than the price the State would otherwise have received through the continued export of the royalty gas to Japan as LNG.

It thus is clear that the State places the State's interest above the interests of our ratepayers to the extent we have to pay more than would result from export of this gas. It does not follow that the Lessee who has made the investment required for production, gathering, and compression of royalty gas can be or should be held responsible to deliver the royalty gas at less cost than the Lessee determines to be necessary, fair, and reasonable. In fact, efforts by the State to do so will simply result in there being no agreement and no delivery of royalty gas by the Lessee.

The Lessee cannot be treated as a regulated operator under Alaska law, and the Lessee has the right to determine whether or not, and at what price, it is willing to share its facilities and install new facilities for the benefit of our ratepayers rather than for its shareholders. Clearly, the Lessee prefers not to share these facilities and will not do so if effort is made to assert that delivery of royalty gas onshore could have equal or greater priority than its contractual duty to delivery LNG to Tokyo, regardless of the revenue (price) received by Lessee.

The Lessee has provided (letter of 3-3-77) some cost estimates, reluctantly, to show the reasonableness of the prices accepted by us:

Table I: Pipeline (Gathering)

Annual cost is reported to be $7,070,000. Assuming all this cost is carried by 43 BCF or 55 BCF, the average cost is 16.4¢ or 12.9¢. The selection of 10¢ as being appropriate for gathering

General Offices Located at 3000 Spenard Road
P.O. Box 6228 / Anchorage, Alaska 99502

royalty gas is less than these average costs, but clearly more than the incremental cost, as it must be. There is no way for a third party to impose a different price on the Lessee, and the price of 10¢ is far below any alternative available to us. In fact, there is no such alternative except not to take royalty gas, and we are not obliged to do so. We bear all the risk that the cost of this gas will remain competitive and will be recoverable through our revenues.

Table II: Compressors (first unit)

Annual cost is reported to be $2,010,000. Assuming all this cost is carried by 43 BCF or 55 BCF, the average cost is 4.67¢ or 3.65¢. While the compression is not required except to deliver royalty gas (but all the gas must be compressed), the incremental cost here would be 37.2¢ or 29.1¢. However, the Lessee recognizes that during the contract term compression will be required even if royalty gas is not being delivered to us. The selection of 10¢ as being appropriate for the compression is less than the short term incremental cost but well more than the average cost. Again, there is no way for a third party to impose a different price on the Lessee, and we bear all risk that the cost of this gas will remain competitive and will be recoverable through our revenues.

If the two components are combined, the results are:

$9,080,000 annual cost @ 43 bcfy

21.12¢ average cost

versus 20.00¢ price requested

The price requested is below the reported average cost. Assuming no incremental cost for gathering (pipeline) however, the price requested is well above the incremental cost. In fact, there is an incremental cost for gathering (as to dehydration), and other down-hole expenses which are a function of production rate. We are not equipped to quantify these costs and there is no reason to do so. The essence of this matter is that the Lessee has offered us a price below average cost and above incremental cost which is acceptable to us and that we are the only party at risk.

General Offices Located at 3000 Spenard Road
P.O. Box 6233 / Anchorage, Alaska 99502

There are only two beneficiaries of this contract. We do not benefit, since we will simply recover our added costs from our rate payers. We believe Phillips will not benefit since they are reluctant and clearly prefer to process and ship the gas to Japan. We believe their profits in processing and selling the royalty gas to Japan would be much greater than the amount of income from the proposed compression and transmission charges net of incremental expenses. The State takes no risks and may benefit from a higher wellhead price. Our ratepayers benefit from the increased life of our committed reserves. If the transaction is not consummated then, the losers are the State and our ratepayers, which (through power distribution) include more than half of the State's population, from Homer and Seward to Talkeetna.

There is no way to require the Lessee to deliver royalty gas (at any price) and no way to disagree with the price(s) now offered. Clearly the end objective -- obtaining of royalty gas -- is in the public interest, and the State should place that interest foremost.

To: The House Resources Committee

From: Jim Keeline, Registered Guide

RE: HCR 95

Since I have had the opportunity to do some research on HCR 95, there have been a few things brought to my attention.

1) The guides that have an area already expect some type of monetary exchange, for another guide to use that area, even though they are not using it at that time. I have run across this situation several times.

2) It appears to me that the guides that have one area will not be willing to let a new guide use it and those that do have areas are the lucky ones. It will be difficult for those who want to get into the business as they will not be able to do so without a great deal of expense.

Due to the above reasons, I urge you to reconsider either HCR 95 or some other form of relief for this inequitable situation.

Thank you,

Jim Keeline

STATE OF ALASKA

JAY S. HAMMOND, Governor

DIVISION OF OCCUPATIONAL LICENSING

POUCH D
JUNEAU, ALASKA 99811

March 31, 1978

Honorable Alvin Osterback
Chairman
House Resources Committee
Pouch V
Juneau, Alaska 99811

Dear Chairman Osterback:

I am taking the liberty of replying to your letter of this date to Commissioner H. Phillip Hubbard concerning the minutes of the meeting of the Guide Licensing and Control Board, because Commissioner Hubbard is in Anchorage.

The information which you received from Pam Knode concerning the availability of these minutes was relayed from me.

The board convened in Fairbanks on Monday, March 27 at 1:30 p.m. and adjourned in the evening on March 30. The days of March 28-30, were convened at 8:00 a.m. each day and board business was considered and recorded on tape.

Due to airline scheduling, the board's recording secretary will return to Juneau on an evening flight today, carrying with her the tape recordings and notes of the meeting. She will begin preparing the pencil draft of the minutes on Monday, however, with some thirty hours of tape recordings to review, it is my opinion that a draft of the minutes will not be available by Tuesday afternoon.

We will, of course, provide you with the tapes and do our best to extract relevant parts by Tuesday, if possible. Since I have not had an opportunity to discuss the proceedings with anyone attending the meeting, however, I have no way of knowing how much of the meeting was devoted to the subject of exclusive guiding areas.

I hope this more fully explains our situation. We do our best to comply with legislative requests for information, but in this instance, I don't believe we can do so within the time constraints imposed.

Very truly yours,

Sharon Andrew

IT HAS COME TO OUR ATTENTION THAT THE ALASKA BOARD OF GAMES IS CONTEMPLATING THE OPENING OF THE PIPELINE CORRIDOR TO THE TAKING OF BIG GAME. WE FEEL THAT THIS ACTION WOULD PUT THE OIL PIPELINE IN GRAVE DANGER OF BEING UNINTENTIONALLY DAMAGED BY WEAPONRY USED BY SUCH TAKING. YOUR IMMEDIATE ATTENTION TO THIS MATTER THROUGH A TELEGRAM TO THE ALASKA BOARD OF GAME FAIRBANKS INN, FAIRBANKS, ALASKA, APPRAISING THEM OF YOUR CONCERN TO NOT ALLOW THIS TO HAPPEN WOULD BE GREATLY APPRECIATED.

WILLIAM S (BUD) WILLIAMS, PRESIDENT TANANA CHIEFS CONFERENCE,

GORDON JACKSON, PRESIDENT OF RURAL CAP,

21-23 = strike = CS 2/22/78

Introduced: 2/1/78
Referred: Resources

IN THE HOUSE BY SCHAEFFER AND ANDERSON

HOUSE CONCURRENT RESOLUTION NO. 95

IN THE LEGISLATURE OF THE STATE OF ALASKA

TENTH LEGISLATURE - SECOND SESSION

Annulling an administrative regulation adopted by the Guide Licensing and Control Board providing for the registration of camps.

BE IT RESOLVED BY THE LEGISLATURE OF THE STATE OF ALASKA:

WHEREAS under AS 44.62.320 the legislature by concurrent resolution adopted by a vote of both houses may annul a regulation of an agency or department; and

WHEREAS using AS 08.54.040(a)(6) and AS 08.54.050 as authority, the Guide Licensing and Control Board established a camp registration regulation for the purpose of effectuating exclusive big game guiding areas surrounding registered camps; and

WHEREAS clear legislative direction and authority exists for establishing quotas of guides within designated geographical games units or subunits of the state, but no apparent authority exists for creating exclusive areas for particular individuals within those units or subunits; and

Strike

WHEREAS the creation of such exclusive areas tends to reduce healthy competition and works to insulate and perpetuate abuses by unscrupulous and unsportsmanlike guides;

BE IT RESOLVED by the Alaska State Legislature that administrative regulation 12 AAC 38.050 is annulled.

MARK JENSEN:

We have an extra on our agenda, just kind of an open discussion for public input on the question of whether or not these areas that become ah nonusable areas because of a guide passing away or deceased guide, whether the guide board should look at those areas as being closed until they are reassigned or should be used as just a open area for anybody, and ah--ah, I think, ah the question was asked of the board to make a decision as to how we wanted to handle it, but ah for a short period of time here, why, ah the board would receive public input on that one question. Bill?

BILL WAUGAMAN:

Yeah I have something to say on that, ah

CHARLES KEIM:

Mr. Chairman, could we have their names to appear on the minutes?

MARK JENSEN:

Yes, Mr. Waugaman?

BILL WAUGAMAN:

My name's Waugaman, Bill Waugaman, Fairbanks. I have been trying to get this sort of thing going in Alaska for many many years, I'm talking about now assigned guide areas. It's finally come to pass and basically the reason that I wanted to get these assigned guide areas is because ah in prior years, there were no incentive for a outfitter or a guide to build up his area with camps, strips, trails, corrals, whatever. With assigned guide areas, you've got this incentive, and a lot of people have done alot work and a lot of money, have facilities out there and many instances, this is during the asset, or one of their main assets, and if anything should happen to them, that should--that asset isn't worth a heck of a lot without that guide area, going along with it. So, in you deliberations, I think that ah it would be a good idea if you bear this in mind, because it might be that heirs, son, nephew, or it may be that the heirs may want to sell the area to somebody that

is qualified, that, first and foremost, you got to think of the man that is spent his money and his time out there developing his areas.

MARK JENSEN:

Any questions to the board?

MARK JENSEN:

Thanks Bill. Next, just make your statement with your name.

JOE WANT:

My name is Joe Want, Fairbanks. I would like to see these areas left closed when a guide vacates them or dies, it unfortunately happens, until it--until the board has a chance to assign that area to someone else. They either--whatever criteria you decide to establish as far as how you are going to select what applicant can go in there. If you don't, in some areas like Kodiak or even the Brooks Range now your--your creating a situation where there are some guides who are not assigned areas and some guides that were assinged areas could still go in there--you're going to end up as a good possibility ending up with a congestion in that area of guides. And one area that I'm thinking in particular, the game may well not stand it. This one area I'm thinking about probably has a population of roughly 150 sheep, one guide moved in there and apparently took seven or eight and the residents were in there taking seven and eight, like that. If you had two operating in there, its--its disaster, just think what would happen to that population.

CHARLES KEIM:

Who's th s, Mr. Want?

JOE WANT:

This happens to be on the East Fork of Chandler. But this very same situation could arise in other areas where a guide goes in the areas, is not necessarily is not familiar with the amount of game in the area and over harvests. And if--if you have a vacant quide area there, it obviously was lucrative or theorically lucerative to run an operation in there at one time. If you have an influx of of guides, plus the

resident pressure, those resident species in that area are going to suffer. I think that those areas should be closed, and those people interested in hunting in those areas should petition the board, then the board, by whatever criteria you decide, would say, okay, Mr. Jones, you can go in there and hunt for two years or three years or whatever until we see what type of operation you are going to run.

BUD WIESE:

In other words, you say the board should just allow a guide on a temporary deal to use that until which time the board ah does set up some regulations.

JOE WANT:

Well, whatever criteria you finally decide. The thing that I'm concerned about is three different guiding operations going into that area in one year.

MARK JENSEN:

When we leave it open.

JOE WANT:

When it's left open. That's why I would suggest that they be closed and at the next guide board meeting, petitions could be received for allowing someone else to ge in to that area, but not to leave the thing open. Let the board make that decision at the next meeting.

BUD WIESE:

We have been working two years now trying to get some regulations through the bureaucrats above us to transfer areas, and so far we have been shot down.

FRANK CHAPADOS:

We have been making progess though.

BUD WIESE:

Yeah, we are making progress, we getting ah

CLARK ENGLE:

...getting closer.

BUD WIESE:

We only got three pages of corrections to go through now.

FRANK CHAPADOS:

What's your reactions to ah the heirs, for example ah

JOE WANT:

Pardon?

FRANK CHAPADOS:

Take that action in the place of the deceased and--and ah, you know, allowing another guide to in and hunt in the area.

JOE WANT:

I think that you have to look at each individual situation. If you have a situation of, we'll say, that I'm 60 years old now, and by that time, my boys will be, I don't know, ah, you know, they will be 30, and they have been guiding in that area for 12 or 13 years, that certainly should--there should be, you know, that should be taken into consideration.

FRANK CHAPADOS:

Well...

JOE WANT:

Because he--if you--excuse me, but whatever criteria you set up if--if one of my boys happens to become a guide, he's going to have 12 years or 14 years in it, assuming that I live that long.

FRANK CHAPADOS:

Well, I think our regulations are going to deal with that--that situation. My--my question is, during the time that the area is closed, and before it is reassinged, what ah what rights do the heirs have? I mean ah, you know, for example, if they are...after a family ah retains ah whatever property you have, and your assets, and that sort of thing ah you think that they could ah--ah allow hunting in there just as if you were--were alive and ah and granted permission to another guide to come and hunt in the area?

JOE WANT:

Since the guide board meets every ah, roughly, twice a year, I believe...

MARK JENSEN:

Up to four times a year times a year.

JOE WANT:

Well, I'm just saying as a minimum, I can't see where more than one hunting season would go by where the guides and that--where the guide board would not be in a position to react to one of these situations, they may very well be this--some sort of sti--stipulation can be put in there that if his heirs or, you know, providing his heir is a guide, I--I mean, I don't think that if--if my--if I die, my boys are soon be (indisc.)...What this means is if those heirs have been active in that guiding business, well then, yes, they (indisc.) and then the guide board could review it and make their decision from that point.

FRANK CHAPADOS:

Well, in other words, ah...

JOE WANT:

Because...excuse

JOE WANT:

One situation is goint to come up as if the--if the father, whatever, is happens to be dying, and he is going to have some hunts booked, already, and theoretically his son is going to go--he should be able to go ahead and take those hunts out into the forest.

If they had the guides licensed...

FRANK CHAPADOS:

I think the questions in my mind are then are these heirs retain the right to ah--ah--in your mind, do you think the heirs retain the right to ah allow other guides to come in and hunt in the area?

JOE WANT:

I don't think so. I think the only right that you pass on is the right of the heir to guide in there if he is a qualified guide for

that season or whatever until the guide board acts on it. Now, it can be theory if--if he had no heirs other than his wife, I would not like to see the situation arise where the wife could ah say, okay, Johnny Jones, you can go in there. I think that should be--that right should be left to the board.

CLARK ENGLE:

Joe, let me ask this, ah, say that ah--ah a professional had 10 hunts booked for a fall season, he died just before the fall season, ah, what would your ideas be and what should happen to those particular hunters? Should the widow be allowed to go get Joe Blow the guide to come in and run the hunts for her until there--those hunts are taken care of? I think it is consideration that the board should look at it.

JOE WANT:

I don't know.

MARK JENSEN:

I would like to interrupt here a little bit because of time, more than anything else, but, to bring you up to date on what's happening, for a couples of years now, we held public hearings on regulations and had public input and ah brought them back to you for changes, one thing or another, ah, the position that the regulations are in now are in the Attorney General's office, and they have been looked at, the ones that we passed at our last meeting, and some suggestions for word changes for clarification have been made. They have asked us now ah to pass on these ah verbally at this meeting and as quick as we can to get them back down ah so that they can keep being certified and start on their route. Our--I think ask our attorney Liza Fussner here, to ah just kind of go over them and we have..

CLARK ENGLE:

I have a question, Mr. Chairman, while we are talking about this ah we--are we jumping from this one to...

MARK JENSEN:

Yes

CLARK ENGLE:

to these?

MARK JENSEN:

We're going to take this up as an emergency for the simple reason that I have--I have really forgotten to tell the board that the Commerce Department asked me to do this immediately ah on our agenda...

STATE
of ALASKA

MEMORANDUM

TO: Ms. Susan Hunter
House Resource Committee
Pouch V
Juneau, Alaska 99811

DATE: March 3, 1978

FILE NO:

TELEPHONE NO:

FROM: Investigator William N. Bellingar
BY: Katherine Goodell, Admin. Assistant
Guide Investigations
Fish and Wildlife Protection
Anchorage

SUBJECT: REQUEST-EXCLUSIVE/JOINT USAGE GUIDE AREAS

Per your request we are enclosing all available copies of exclusive/joint usage guiding area maps throughout the State; a listing of these areas by the guide's name; and a listing by unit with the criteria used.

We have not yet completed Unit 13 and 14 maps but anticipate finishing them Monday morning and forwarding them to you at that time.

If you require further assistance please do not hesitate to contact this office.

WNB:KEG:LJ

cc: Col. Fred M. Woldstad

Units 1-5: At the February 18-19, 1977 Guide Licensing and Control Board meeting Units 4 and 5 applicants that met the criteria of three years within the last five years of Statements of Financial Remuneration on file with this office as of November 1, 1976 were granted permanent areas. Temporary areas in Units 4 and 5 were granted to those applicants that had at least one year of Statements on file as of that date. Unit 4 was designated for "joint usage" by those guides who had applied and qualified, and Unit 5 was divided into individual areas with joint usage for areas of boundary overlap.

In a poled telephone vote taken by Marcus Jensen, Guide Board Chairman, on February 25, 1977 it was decided that those guides that were granted exclusive guiding privileges in Unit 4 would also be granted exclusive guiding privileges in Units 1-3 on a joint usage basis with those guides who had applied and qualified for Units 1-3.

At the February meeting the Board decided, for purposes of assigning exclusive guiding areas in Southeastern Alaska, Unit 1 would be considered one guiding area, Unit 2 and/or 3 would be one guiding area, and Unit 4 would be one guiding area.

Units 1-4 were advertised in early March as open for any late filings, adjustments of areas, etc. for a period of ninety (90) days from the date of the notice. The Board granted to the additional qualifying guides joint usage privileges in those units at the July 14-18, 1977 Board meeting.

Those applying for areas in Units 1-4 are as follows:

William Bernhardt
Layton A. Bennett (Unit 1 only)
~~Roy Biffle~~ (withdrew)
Chalres Boyd (Unit 4 only)
Les Elkins
John Erickson
Ben Forbes
Duncan Gilchrist (Units 1 & 4 only)
F. W. Ingledue
Marcus Jensen
Tom D. Katzeek
Karl Lane
Vic Lane
Jack O'Donnell
Jimmie Rosenbruch
Kenneth Schoonover
Frank See
Eugene Smith
Tarleton Smith
William W. Peterson

All those that applied were granted joint usage priveleges in Units 1-4. Those guides with notations after their names applied for and received those units only as joint usage (they were offered joint usage of the entirety of Units 1-4 but this was their preference).

Those applying for areas in Unit 5 are as follows:

Mike Branham
Charles R. (Dick) Cox
Robert Eckman
Ken Fanning
A. J. Israelson
John Latham
Jerry H. Nelson

Those receiving areas in Unit 5 are as follows:

Dick Cox	permanent
Mike Branham	temporary
Robert Eckman	permanent
Ken Fanning	temporary
A.J. Israelson	permanent

Unit 6: At the July 14-18, 1977 Guide Licensing and Control Board meeting Unit 6 applicants that met the criteria of three years within the last five years of Statements of Financial Remuneration on file with this office as of November 1, 1976 were granted permanent areas. Temporary areas were granted to those applicants that had two years within the last five years of Statements on file.

For purposes of assignment Unit 6 was divided into three areas: A. East of the Copper River to Icy Bay (boundary between Units 5 & 6). B. West of the Copper River to Mt. Dennison, Hadak Point, Brown Basin, Goose Isl., and Hinchenbrook Isl. C. The rest of Unit 6.

These three areas were designated for "joint usage" by those guides who had applied and qualified.

Unit 6 Applicants:

Roy L. Biffle
Karl Braendel
Eberhard Brunner
Gene Cecil
Don DeHart
Robert V. Dettinger
Bill Ellis
Ralph Ertz
Herbert F. Fassler
Allen W. Faust
Raymond J. Foldager
Jeff Graham
Dick Gunlogson
Richard W. Halford
Bill Holliday
John Kinda
Howard Knutsen
Clarence LaBounty
John Latham
Jack Lee
Dennis O. Lary
Ray McNutt
Austin Meekins
James R. Metheny
Wm. G. Morrow
Gene Needles
George Palmer
Donald G. Sisson
Edward Stevenson
Roland Stickney
Tom Walker
Mark J. Warren
Jess M. Wassom
Gordon Windell
Edward Zimmerman

Those that qualified and received joint usership of Unit 6, Subunit A:

Gene Needles
James Metheny
Roland Stickney
Dick Gunlogson
Bill Ellis
Gordon Windell
Ray McNutt
John Kinda
Ray Foldager

Those that qualified and received joint usership of Unit 6, Subunit B:

Dennis O. Lary
George Palmer
Edward Stevenson
Tom Walker.
Bob Dettinger

Those that qualified and received joint usership of Unit 6, Subunit C:

Herbert F. Fassler
Ralph Ertz (considered by petition & granted special exception)
Jack Lee
Clarence LaBounty (qualified because of grandfather rights)

Unit 7: Areas in this unit were also granted at the July 14-18, 1977 Guide Board meeting to those guides who had at least three years within the past five years of Statements of Financial Remuneration on file with this office for a permanent assignment and two years within the past five years for a temporary assignment.

UNIT 7 APPLICANTS:

Roy L. Biffle
Lee Browning
Gene Cecil
Walter E. Cox
Don Fell
John Kinda
Clarence LaBounty
Charles S. Martin
William L. Miller
Wyman Owens
A.W. Smith
Sherman "Red" Smith
Earl Stevens
Dale R. Wood
Leonard F. Yuknis
Edward Zimmerman

Those that qualified and received areas requested in Unit 7 with joint usage for areas of overlap:

Walter Cox
William Miller
Mike McBride
Wyman Owens
~~Lee Browning~~
Ed Zimmerman

NOTE: As Units 6, 7, 13, 14, & 15 were recently assigned at the July 1977 Board meeting and the minutes have not been received by this office yet the above information may not be totally accurate. Also, those that could not meet the minimum criteria were given the opportunity to have their petitions heard before the Board - these petitions were handled the same way as those for Unit 13 (see Unit 13 information for further details).

UNIT 8: Exclusive guiding areas were granted in this unit at the July 22-25, 1975 Guide Board meeting using the following criteria set by the Board at that meeting: To obtain a permanent guiding area, a registered or master guide must have used the area for 4 consecutive years (except for justified cause(s) approved by the Board) such as a guide with Statements of Financial Remuneration.

UNIT 8 APPLICANTS:

William Bivins
Karl Braendel
Danny L. Brose
Alfred Burnett
Lynn Castle
R.O. Coleman
Don DeHart
Darrel Farmen
Allen Faust
Leon Francisco
Ward Gay
Rick Halford
Lee Hancock
Wayne Hans

Joe Want

UNIT 9: At the March 25-27, 1977 Guide Board meeting the Board granted permanent exclusive guiding areas in Unit 9 to those guides who had at least three years within the last five years of Statements of Financial Remuneration on file with this office as of November 1, 1975 and/or three years within the last five years of Bear Camp Registrations. Temporary areas were granted to those applicants who had at least two years of Statements of Financial Remuneration on file as of that date, and/or a signed statement from three registered guides testifying that they have known the applicant to have been guiding in Unit 9 for at least 2 years within the last five years.

UNIT 9 APPLICANTS:

Roy L. Biffle
Stephen Black
Eldon Brandt
Bud Branham
Dennis Branham
James R. Branham

UNIT 10: There was no criteria set for Unit 10 as all three guides who had applied agreed to share this area as joint usage. They were as follows:

James Branham
Don Johnson
Jack Myers

UNIT 11: At the March 25-27, 1977 Guide Board meeting the Board granted permanent excluisve guiding areas in Unit 11 to those guides who had at least three years within the last five years of Statements of Financial Remuneration on file with this office as of November 1, 1976. Temporary areas were granted to those applicants who had at least two years of Statements of Financial Remuneration on file as of that date or if there were other guides who would verify that that guide had hunted at least 2 years within the last five years in that area.

UNIT 11 APPLICANTS:

Roy L. Biffle (has 3 areas)
Charles A. Boyd
Glenn O. Brewster
Kenneth H. Bunch
Gene Cecil
John Claus
Walter E. Cox
Don DeHart
Robert V. Dettinger
Charles Edmonds
Ralph Ertz
Dennis Harms
Jim Harrower

UNIT 12: At the March Board meeting the Board granted permanent exclusive guiding areas in Unit 12 to those guides who had at least three years within the last five years of Statements of Financial Remuneration on file with this office as of November 1, 1976. Temporary areas were granted to those applicants who had at least two years of Statements of Financial Remuneration on file as of that date or those who could have at least three registered guides verify that they had guided at least 2 years within the last 5 years in that area.

UNIT 12 APPLICANTS:

Roy L. Biffle
C. M. (Bud) Conkle
Don DeHart
Bill Ellis
Marlin Crasser
Dick Gunlogson
Lee Hancock
Ed Hendricks
John E. Hepler
Elizabeth Hickethier
Bill Holliday
Cleo B. McMahan
Ray McNutt
Charles Moe
Gene Needles
Ken Oldham
Terry Overly
Urban E. Rahoi
Andy Runyan
Kenny Sailors
Jonathan Summar
Donald W. Taylor
Ivan Thorall
Doug Vaden
Thomas Vaden
Lavell Wilson
Gordon Windell
Charles Wirschem
Fred W. Young
June Moore
John E. Erickson

Those that qualified and received areas in Unit 12 with joint usage for areas of boundary overlap:

Bud Conkle
Don DeHart
Bill Ellis
Dick Gunlogson
Lee Hancock
Elizabeth Hickethier
Cleo B. McMahan
Ray McNutt
Charles Moe
Ken Oldham
Terry Overly
Urban E. Rahoi
Andy Runyan
Kenny Sailors
Jonathan Summar
Donald Taylor

Ivan Thorall
Doug Vaden
Thomas H. Vaden
Lavell Wilson
Fred Young
June Moore
John Erickson

UNIT 13: At the July 14-18, 1977 Guide Board meeting the Board granted permanent areas to those guides who had at least three years within the past five years of Statements of Financial Remuneration on file with this office before November 1, 1976. Temporary areas were granted to those guides with at least two years of Statements on file as of that deadline. Those that could not meet the criteria were given the opportunity to file petitions with the Board and were heard before the Board after assignments were made to those guides who met the minimum criteria. Many of the petitions were accepted on the basis that the guide provide within 6 months proof of utilization by any of the following methods. These areas were granted on a temporary basis until such time as they could show at least three years of past usage. If they could not come up with the requisite proof of utilization within the next 6 months the temporary usage permits would be revoked.

Methods of Proving Utilization. Submit the following:

1. Copies of Statements of Financial Remunration
2. Copies of personal contracts
3. Letters from other guides attesting to the fact that the guide in question was guiding in the area that year or those years.
4. Letters from his clients attesting to the fact that they were on guided hunts in the area at that time.
5. Correspondence between guide and client concerning their guided hunt in the area at that time.

RE: HCR 95

Dear Commissioner:

I was surprised to learn that your legislative liaison Pam Knode informed my staff that the minutes from the recent meeting of the Guide Licensing and Control Board might not be available for the Committee to review on Tuesday, April 4 when we will be taking up HCR 95.

Both the Speaker of the House and the Majority Leader have requested to review those minutes where they apply to the Board's action on the exclusive guiding areas.

I hereby request that those portions of the minutes that reflect the Board's intentions on the exclusive guiding areas be submitted to the Committee, Room 118, Capitol Building by 1:30 p.m., Tuesday, April 4.

Sincerely,

Alvin Osterback, Chairman
House Resources Committee
House Bush Caucus

AO/sh

Juneau, Alaska

Feb 29, 1978

Dear Mr. Osterback,

I have been guiding in the state for over 8 years. For the last two years I have guided on my own in unit 19 and have been very successful in my young business as a guide which is over 2/3 of my total income, I am now out of business from the guide boards new decision. What they (the board) has done cannot be constitutional and by all means not fair. Please support the house resolution No 95. My livelihood as well as many new guides depend on it.

Sincerely
Mark E Miller

March 10, 1978

Senator George Hohman
Alaska State Senate
Juneau, Alaska

Dear Senator Hohman;

As discussed at your office in Juneau recently, the entire village of Mekoryuk is backing something you can push through the senate for "exclusive" guiding right on Nunivak (Game Unit 18 A.)

With this self-diterminaton act (B.I.A.) in effect, I think this would be a great step in course of this nature.

There are several of us who will be taking tests for our registered license shortly. It does not hamper or question whether we will be legal or not in the future.

There simply is no reason for someone elee to be coming in from the "outside" and collect capital and leaving very little to our humble community after utilizing what is on the Island which is by virture, ours.

Since you are aware of our problem I think that you may be able to help.

With regards,

Larson King

Larson King
Mayor, City of Mekoryuk

March 6, 1978

Rep. Hugh Malone

I am wrighting in regards to a game guide regulation which I object to. THE EXCLUSIVE TERRITORY LAW.

I think it is unconstitutional. Some guides have as much as three areas with no limit to size. While others have none.

I am in favor of deleting EXCLUSIVE GUIDE TERRITORY from the guide regulations.

A Guide For 30 Years

Rudy Voigt

House Resource Committee
Chairman Al Osterback
Juneau, Alaska

Dear Al:

It has been a long time since we have talked and even longer since we spent some time together on a bear hunt at Volcano Bay. That was in 1963 I believe.

I have been making my living totally from big game hunting and fishing since 1954. I am opposed to the recent action of the Guide Licensing and Control Board in assigning exclusive guide areas. I believe this action is unfair, unconstitutional and was handled very poorly. I urge you to support House Concurrent Resolution No. 95.

Thank you.

Sincerely,

Bob Curtis
Registered Guide

cc: Kay Poland

2/24/78

To Mr. Al. Osterbeck
House Resources Comm.
Juneau Alaska.

I am a registered guide and have been in the guiding profession for 15 years. I support the House Res # 95 to annul the exclusive guide areas as currently assigned by the Guide board. I feel that the Guide boards actions were unethical and unfair and that the Guide Lists were not carried out for the best interests for all the guides. It is my wish that this matter could be resolved by the legislature because the Guide board has shown me no more than negligence, incompetence and insensitivity.

Sincerely

William D. Morrow
William D. Morrow

EXCLUSIVE GUIDE AREAS SHOULD REMAIN IN EFFECT. NOT FAIR TO GUIDED HUNTERS TO HAVE SEVERAL PARTIES HUNTING SAME AREA AT SAME TIME, ALSO NOT GOOD GAME MANAGEMENT TO OVERHUNT ANY AREA. BEAR IN MIND THAT FISHING GROUNDS ARE DIVIDED INTO AREAS TO PREVENT OVERHARVEST OF CHOICE GROUNDS. POSSIBLY LIMIT EXCLUSIVE GUIDE AREAS TO NOT OVER TWO OR THREE HUNDRED SQUARE MILES. SOME GUIDES HAVE MUCH MORE THAN I THINK THEY ARE ABLE TO HUNT.

Alaska State Legislature
Juneau, Alaska

Copy all files

Dear Mr. Osterback:

I would like to thank you and your Committee for the long hours of testimony you listened to on H.C. & R. 95, concerning guide areas. Little does the public realize the long hours many legislators put in. I would also like to add that our Guide Licensing and Control Board has been in somewhat the same position, putting in long hours and working hard to accomplish a good program.

As the meeting concluded I understood you or one of the members to say that unless some inequities were remedied you planned to take the bill up again, after our next meeting. I am sure you are aware that any regulation change first must be identified and then advertised for public hearing. After the public hearing it is formalized by the Board and then goes through the lengthy process of the Attorney General's Office and the Review Board. Some of our regulations have taken over a year, after public hearings, to be formalized.

It might be informative for your Committee to know some of the processes that our Board is now using. Speaking for myself I think the Committee should be cognizant of the fact that our Board has handled over 450 guide area cases and with only four guides objecting at the hearing yesterday, to area assignments, should certainly add some weight to the fact that our regulations have been workable.

If I am going to take a message to my next Board meeting it would be helpful if your Resources Committee could be specific in your recommendations. I am listing below a brief outline of the process our Board is now using:

1. The Board has legal guidance from the Attorney General's Office on all rules and regulations;

2. All regulations are advertised for public hearings;

3. Any guide can petition the Board if he feels he has a special case, and the Board will grant him a hearing;

4. All guides who are involved in the case, or in a boundary dispute, are notified by registered mail before the hearing;

08-HBLH

STATE OF ALASKA

JAY S. HAMMOND, GOVERNOR

DEPARTMENT OF COMMERCE & ECONOMIC DEVELOPMENT

DIVISION OF OCCUPATIONAL LICENSING / POUCH D – JUNEAU 99811

5. Board meetings are held in Anchorage,Fairbanks and Juneau, with public participation;

6. No guide areas have been transferred;
(This will not occur until regulations are finalized)

7. The Board has worked closely with the Dept. of Game and Dept. of Public Safety in formulating policy;

8. A personal file for every guide has been established in our Anchorage office where his guide-client contracts are kept, and show his activity in the field;

9. No guide can hold an area if he does not show contracts over the current two year period;

10. A professional investigator is assigned immediately to check any violation;

11. At nearly every Board meeting we sit as a jury and hear violation cases that are presented by the Attorney General's Office; disciplinary action is then taken.

As added information I would like to note that the size of the guide area does not relate to the number of animals in that area. Most of the time a small area, with good feed habitat, produces more game.

Our Board would appreciate it very much if you would send us the names of the 21 guides that Mr. Sparks from Bethel spoke of as operating in his area.

Our Board feels that from reports across the nation the State of Alaska has a much better image in the guide field than ever before, and we would still like to improve this, and know that we can, with your help. If I can be of any more assistance please let me know. Hoping to hear from you, I am,

Sincerely yours,

Marcus F. Jensen

Department of Fish and Game would have to reinstate their Bear Camp Registration Program in Unit 9. They discontinued this program with the advent of exclusive guiding area assignments in that unit.

4) Fiscal impact: none X Fiscal analysis attached _____

5) Amendments proposed:

None

6) Comments:

(See attached)

1. First of all, I think that to "annul" the regulation 12AAC 38.050 is a bit premature since the Guide Licensing and Control Board just now concluded the exclusive/joint usage guiding area assignments statewide and are in the process of developing new regulations to replace 12AAC 38.050. A copy of the proposed regulations is attached.

2. This Resolution claims that "no apparent authority exists for creating exclusive areas for particular individuals within those units or subunits;" According to the proposed 12AAC 38.051 GUIDING AREA PERMITS (a) the purpose is "...in order to limit the number of guides allowed to guide for big game animals in that area."

   This, in effect, establishes a "quota" of guides within designated geographical game units or subunits of the state in accordance with Section 08.54.040(8) and Section 08.54.050 of the Alaska Statutes.

3. The Resolution also claims that "creation of such exclusive areas tends to reduce healthy competition and works to insulate and perpetuate abuses by unscrupulous and unsportsmanlike guides;"

   a. First, I'll address myself to "...reduce healthy competition..." There is much competition for these areas since to qualify for one in the first place you must be currently licensed and meet the requirements of 12AAC 38.053.

      Also, in order to retain an area once granted, a guide must comply with 12AAC 38.057 MINIMUM USAGE OF GUIDING AREA.

   b. "...works to insulate and perpetuate abuses by unscrupulous and unsportsmanlike guides;" Although I do not have a revised copy of the proposed regulations (being prepared by Department of Commerce now) the Board, in all likelihood, will adopt 12AAC 38.058 GROUNDS FOR REVOCATION OF GUIDING AREA PERMIT. (See draft copy attached.)

      This proposed regulation is self-explanatory and only serves to point out that "abuses" will not be tolerated and are grounds for revocation of an exclusive/joint usage guiding area permit.

      This also tends to promote "healthy competition".

4. I don't know if it is necessary to point out that exclusive guiding area assignments are beneficial in many ways, however, I will bring out a few points the Senate should be aware of:

   a. This regulation is beneficial to the general public. A specific area assignment promotes sound game conservation practices because, when a guide is assigned an area, this is the only place he can go and, if he wipes out his game, he is out of business. In the past there was nothing to prevent a guide from hunting out an area and then moving on to someplace else.

      With the number of guides currently licensed, the number of additional guides being licensed each year, and growing public concern over game conservation some action must be taken to save the guiding profession while taking into account the need for conservation.

The only alternative to exclusive guiding area assignments as a means of establishing a "quota" of licensed operating guides in a given geographical game unit or subunit is to limit the number of guides who may hold licenses at any one time. This method does not even begin to compare with exclusive guiding areas as a means of promoting sound game conservation.

b. This regulation is beneficial to guides and their clients. [redacted] assignments are also designed to reduce conflicts and friction between guides over hunting areas. A guide cannot use another's area without his written permission according to proposed regulation 12AAC 38.052.

When a guide takes a client into the field it is very disturbing to both the guide and the client to discover that another guide with clients has also chosen that location in which to conduct their hunt. If they choose to stay in the same area, the other hunting party may interfer with the quality of their hunt and, if they have to go elsewhere, it may reduce the actual hunting time available to that client.

By establishing exclusive guiding areas this problem is reduced, if not eliminated, and a client has more of a chance for a pleasant and successful hunt.

c. Exclusive guiding area assignments are also beneficial to State agencies in the performance of their duties. Knowing where a registered or master guide is operating makes it easier for Fish and Wildlife Protection Officers to enforce the law. Also, being assigned an area would tend to make a guide more inclined to report violations in his area.

The Department of Fish and Game is apparently using exclusive guiding area information in lieu of Bear Camp Registrations in Unit 9. I believe this information is used for bear population studies to determine necessary opening and closure dates of hunting seasons.

Re: Amended Guide Board Regulations

Dear Representative McKinnon:

This memorandum is in response to your request dated March 25, 1977. You have requested advice on whether the February 25, 1977 amendment to the Guide Board regulations [12 AAC 38.020, 12 AAC 38.040, and 12 AAC 38.050] were actions taken in excess of the statutory authority of the Guide Licensing and Control Board. Specifically, you asked four questions:

"(1) Did the Board exceed the scope of its authority in granting the exclusive guiding areas outside of Units 8, 16, and 20?;

(2) Are any of the exclusive guiding areas that the Board granted valid outside of Units 8, 16, and 20?;

(3) Do any or all of the amended regulation exceed the scope of their statutory authority?;

(4) Did the Board, itself, exceed the scope of its authority by its substantive amendments of the regulations?"

In light of the present provisions of AS 08.54.-040, particularly the recent addition implemented by sec. 1, ch. 133 SLA 1976, the general answer to your inquiry is that the amended regulations of February 25, 1977 are proper with

STATE OF ALASKA
THE LEGISLATURE
LEGISLATIVE AFFAIRS AGENCY

POUCH Y - STATE CAPITOL
JUNEAU, ALASKA 99811
907-465-3800

MEMORANDUM February 22, 1978

SUBJECT: Changes to Legislation in Final Form

TO: Committee Assistants and Secretaries

FROM: Sally McIntire, Legal Editor

The Legislative Employees' Handbook, page 9, paragraph 8, notes that all bills and resolutions prepared by the Legislative Affairs Agency are recorded on mag cards and that to facilitate revisions it is important to use an LAA copy of these measures, when possible, to indicate changes.

In conjunction with this, it is also very important that any changes, no matter how minor, on measures in final form (in blue or orange jackets) be made by the agency to ensure that the mag cards are kept completely accurate. The mag cards are used by the engrossing clerks in the offices of the Chief Clerk and the Senate Secretary and by our editing and enrolling staffs. Any changes (whiteouts, additions, or deletions) made outside those offices will not appear on the mag cards. The result -- confusion and delay for the piece of legislation involved.

Bills and resolutions that require changes before being submitted to the Chief Clerk or Senate Secretary should be brought to the Legal Services office, Room 502, Capitol, and every effort will be made to expedite these changes.

It would also be very helpful if the original and all copies (three carbons which are attached to the original) are returned at the time changes are requested in case it is possible to reuse some of the pages.

Your assistance and cooperation will be appreciated.

Re: Amended Guide Board Regulations

Dear Representative McKinnon:

This memorandum is in response to your request dated March 25, 1977. You have requested advice on whether the February 25, 1977 amendment to the Guide Board regulations [12 AAC 33.020, 12 AAC 38.040, and 12 AAC 38.050] were actions taken in excess of the statutory authority of the Guide Licensing and Control Board. Specifically, you asked four questions:

"(1) Did the Board exceed the scope of its authority in granting the exclusive guiding areas outside of Units 8, 16, and 20?;

(2) Are any of the exclusive guiding areas that the Board granted valid outside of Units 8, 16, and 20?;

(3) Do any or all of the amended regulation exceed the scope of their statutory authority?;

(4) Did the Board, itself, exceed the scope of its authority by its substantive amendments of the regulations?"

In light of the present provisions of AS 08.54.-040, particularly the recent addition implemented by sec. 1, ch. 133 SLA 1976, the general answer to your inquiry is that the amended regulations of February 25, 1977 are proper with

regard to the questions you have raised. Section 1, ch. 133 SLA 1976, effective January 1, 1977, added paragraph (8) to subsection (a) of AS 08.54.040, so that the relevant provisions of that section now read:

> . [T]he board shall . . . (8) establish
> f licensed operating guides who may operate
> gnated geographical game units or sub-
> state and provide for an equitable
> e procedure for limiting the number
> or g[illegible] to that quota; preference shall be given to qualified, available and willing licensed guides who reside within the designated game unit or subunit.

AS 08.54.050 provides that:

> The board shall adopt procedural and substantive regulations, under the Administrative Procedure Act (AS 44.62), required by this chapter as reasonably necessary for its administration.

Therefore, in order to implement AS 08.54.040(a)(8) [& 1, ch. 133 SLA 1976], the board was mandated by statute to:

(1) designate geographical game units or subunits in the state;

(2) establish a quota of licensed operating guides who may operate within those designated geographical game units;

(3) provide for an equitable and reasonable procedure for limiting the number of guides to that quota; and

(4) establish a means of preferring guides who reside within the designated game unit or subunit.

Section 1 of the amended regulations establishes a method by which the board may ascertain who resides within certain game units so that the board could implement the preference mandated by statute. Section 2 of the amended regulations designates geographical game units or subunits. Sections 3 and 4 of the amended regulations is intended to establish a reasonable and equitable procedure for limiting the number of guides in a particular game unit.

Therefore, not only are the board's activities and regulations within the boundaries of AS 08.54, but also the board's actions and regulations were mandated by the addition of AS 08.54.040(a)(8) through § 1, ch. 133 SLA 1976.

Sincerely,

AVRUM M. GROSS
ATTORNEY GENERAL

(2) a. ORGANIZATIONAL SUPPORT FOR BILL		(2) b. ORGANIZATIONAL OPPOSITION TO BILL
		Alaska Professional Hunters Assoc. Guide Board

(3) PROGRAM EFFECTS OF BILL

The enactment of this bill would seriously complicate management of some species of big game. For example, the present management program for brown bear on Kodiak Island would collapse, necessitating promulgation of new regulations to protect the resource.

(4) FISCAL IMPACT: kk NONE ☐ FISCAL ANALYSIS ATTACHED

(5) AMENDMENTS PROPOSED:

(6) COMMENTS:

See attached.

6. COMMENTS:

Although the Department of Fish and Game, and the Board of Game, no longer have responsibility for guiding matters, the actions of the Guide Board and activities of guides still directly impact game resources and game management programs. Therefore, the Department of Fish and Game has an interest in the subject matter of House Concurrent Resolution No. 95.

Mr. Chairman, the Department has experienced many regulatory cycles with the Game Board and its precursor, the Board of Fish and Game. Year after year we received proposals for regulatory changes and listened to public complaints on the subject of guides. Complaints on guiding rather frequently have their basis in the mobility of guides--their ability to operate in the Arctic one week, Alaska Peninsula the next, and so on. To try to control abuses by some guides, various regulations were adopted (which then impacted all hunters). Care had to be taken to insure that seasons opened simultaneously in widely separated units (regardless of different optimum times in those areas) to preclude shifting of guiding pressure.

The assignment of specific guides to geographic areas is another example of the Guide Board's efforts to regulate the industry. When fully implemented, the system will restrict the mobility of guides and facilitate the management of most species of big game. The system already has produced direct benefits to the brown bear management program on Kodiak Island. If the regulation is annulled, less desireable alternative systems will have to be devised.

Nome

COMMUNITY INVOLVEMENT

Since mid-December we have been holding meetings to obtain input from the public in order to develop regulations for the forthcoming spring walrus season. Our purpose was to find a course of action that would be the least objectionable to all concerned. Since time was a limiting factor we concentrated our efforts at those villages which have traditionally taken a large number of walrus, and are the places where we can expect the most problems if and when restrictive regulations are imposed. We held two meetings in Nome-King Island and Savoonga, and one meeting at each of the villages of Gambell and Diomede.

Because comments ranged over a broad spectrum, we are summarizing the material we presented to the public which should help you to understand the synthesis of our ultimate recommendations. At all meetings we covered three basic topics, guiding, ivory permits, and status of walrus in Alaska. The latter subject was further subdivided into two general categories, past and present hunting trends in Alaska, and proposed solution to "our" problems. The following are the major points we discussed under each topic:

Ivory Permits

1. We gave a history of why the permits were established, and how they were being used.

   A. Theoretically the permits help maintain the carver industry by retaining the bulk of the ivory in the hands of the established carvers.

   B. Most permit holders were not complying with the conditions of the permit: they were not recording transactions in ivory, nor were they returning the permit as specified.

2. We pointed out there was significant black market traffic in raw ivory and these acts were illegal by regulation since one or more of the recipients did not possess an ivory permit.

3. In order for the ivory permit to be effective, that is maintain the ivory in the hands of the carvers, it would be necessary to actively enforce the present regulations.

4. If the regulations were not enforced, then it would be possible for anyone to deal in raw ivory. If that's the case, why have the permit in the first place?

We concluded by asking what were the desires of the community. Did they feel it was necessary to regulate raw ivory through a permit, or did they prefer to dispense with the permit and let the market regulate itself?

Guiding

1. Criteria for becoming a registered guide.

2. An explanation of the Guide Board's action to establish registered guides now living in this area. (At St. Lawrence Island we discussed the establishment of Winnie James, Gambell; and Alex Akeya, Savoonga; as registered guides; and how they could assist boat captains in taking out sport hunters).

3. Basic guide regulations and what is expected of a registered guide.

4. Advantages to the community from guiding.

   A. A guide would obtain a significant amount of revenue for a relatively short hunt.

   B. Since no more than one or two walrus would be taken on any one trip, all meat could be easily salvaged, and this would reduce the problems of wastage.

   C. With money coming in from guiding, less walrus would be needed for ivory; and this should result in a decrease of the annual harvest or at least stabilize it.

   D. One could expect other monetary spin offs from guiding such as an expanded tourist industry during the summer.

We concluded the subject of guiding by saying we strongly supported the concept, and would like to see an expansion of this industry principally by local residents. We offered our assistance to meet this goal.

Walrus

Due to the controversial nature of the subject, we frequently went off on diverse tangents discussing a variety of issues. Therefore, it was often difficult to stick to a presentation with some assemblence of order. The following are the salient points usually brought-up sometime during the course of a meeting.

1. A discussion of the Marine Mammal Protection Act passed in 1972, and the subsequent return of walrus management to the State in April, 1976.

2. One stipulation of return of management to the State of Alaska was the annual harvest should not exceed 3000 animals.

3. For the past 15 years the Department of Fish & Game has compiled annual harvest data statewide. During the spring biologists are usually stationed at the communities who traditionally have taken 70% or more of the annual kill.

4. Department records indicate the annual harvest averaged about 1700 animals from 1962 through 1974.

5. The kill in 1976 was nearly 3000, of which a good portion were taken principally for the ivory.

6. The department recognizes the fact that the country is experiencing an inflationary period, and it costs more to purchase food, fuel and the variety of items needed to maintain our present standard of living. Therefore some increase in the annual harvest is expected. However, there is a point where the population cannot withstand an ever increasing harvest. Based on the Federal Guidelines, and the present utilization of walrus, we feel that point is close at hand, if not already here.

7. The large harvest of walrus last year focused attention from all over the world. The Soviet Union sent letters complaining about headless walrus on their beaches. Many concerned citizens throughout Alaska and the lower 48 are asking questions about the method of walrus hunting in Northwest Alaska. Their inquiries are embarrassing.

8. Since it is entirely possible that a few villages could take a harvest of 3000 animals which would then require an emergency closure, we are looking at ways to distribute the kill fairly among all villages.

9. We think one solution is to allocate the harvest based on traditional use. For example if for the last 5 years a village has been killing an average of 200 walrus, perhaps this is an equitable fair share.

10. What we would like to know is how many walrus the community feels it needs; based not necessarily on what happened in 1976, but what is legitimately required in terms of meat and ivory.

11. When the community decides on a figure, we would like it to be kept in perspective with what other villages are doing statewide. In other words if you say you need 400 walrus can you justify that take to another village of equal population who has only been killing 50 animals a year.

12. Finally if a realistic figure is derived, give us some ideas how we can insure each village takes no more than their fair share.

In summary we asked all participants to view the problem on a statewide level and arrive at a recommendation that could be applied not only to their area but to all villages taking walrus.

COMMUNITY INPUT

Reaction from the participants at these meetings ranged from calm acceptance of the problem to outright militancy to any restrictive change whatsoever. There seemed to be a pattern to this attitude. The larger the community and their resultant involvement in "governmental organization" the more outspoken and anti-control were the individuals. Conversely, a small isolated community showed a real willingness to work out a solution that was mutually acceptable. In our opinion many of the comments were not relevent to the subject or to our responsibilities. For instance we were frequently accused of failing to bring in other governmental agencies to assist with the problem. Some went so far as to say that our presentation was an attempt to publicly ridicule the native community, and use it as an excuse to extinguish subsistence hunting rights. Further, the regulation proposals were another example of anglo-saxon government exerting their will over the Alaskan native. It was also stated that the Department of Fish & Game was not morally correct in proposing any restrictions on subsistence hunting until all facets of the subject have been thoroughly studied. This included but was not limited to biological considerations, cultural attrition, economic impact, and alternatives through governmental assistance.

Wading through the rhetoric, several common concerns surfaced at the meetings.

1. Each community was concerned it was they who would suffer the most through restrictive regulation. They felt it would be better if some other area was regulated first. For example King Island representatives complained that the Diomedes killed many more walrus than they could possibly use. Some of these animals should go to areas such as Nome, where more people would benefit. On the other hand the Diomedes said the cost of living was going up, and they required more money to maintain their present standard of living. It seemed fair to the Diomedes that they should be allowed to increase their harvest and larger communities should cut back because there were greater employment opportunities for their residents.

2. All communities expressed fear that a quota system of any sort would prevent them from securing a living from the land and would result in greater dependency on welfare and/or substantial suffering in the family.

3. Most recognized that waste was a problem, but they felt the present situation left no alternatives. Ivory is needed for economic support, concurrently however, meat is acquired far in excess of immediate needs. With inadequate storage facilities to preserve meat through the summer, they see no reason why meat should be returned to the community. Most said they would make a more concerted effort to retrieve meat if and when storage was available.

4. A majority readily admitted that once three or four walrus had been taken their prime concern was no longer for meat but obtaining ivory for their livelihood. Since the spring walrus season is short they say there is relatively little time to stockpile ivory. With this premise some expressed concern that they may not have time to retrieve meat, even if there were storage facilities.

5. Almost to the man, every hunter and/or carver felt that any restriction in the walrus harvest would limit their economic opportunity; and would result in greater dependence on governmental assistance programs. When questioned about the large quantities of ivory both new and old leaving the outlying communitites for Nome and other cities both in Alaska and the lower states, no adequate reasons were given other than the fact that they need ready cash. The village of Diomede thought an ivory"bank" in the village would alleviate the problem of raw ivory being lost to the area. Their inquiry into the feasibility of the project was rejected by the regional corporation as not being economically sound.

5. All communities with schools have programs to instruct ivory carving. The Northwest Community College is even offering such a course. In all cases those individuals that take such courses feel they should be allowed their fair share of ivory. Translating their wishes does not mean dividing up the allotted harvest, but increasing the harvest so that everyone can have a share equal to quantities obtained in the past.

The comments listed above represent views common to one or more communities, but do not necessarily represent the views of every village. The response at Diomede was of significance in that there was no hostility displayed at the meeting. Several of the village elders commented on the recent trends in walrus hunting, and the mayor expressed concern that other villages may look with disfavor at Diomede if current actions continue. A general awareness of the problem is present within this village.

Several individuals commented in private that assistance from the state and federal agencies has alleviated the need for large amounts of marine mammal meat. Declining interest in seal hunting throughout the region has indicated that this trend may be wide spread. A shift in emphasis has also taken place in several of the native stores. In past years ivory, both raw and carved, was accepted "currency" for all commodities. Carvers have found that they can sell their ivory at retail prices even in the village, and consequently ask these prices when trading for food at the stores.

The stores are finding it difficult to resell ivory purchased at retail prices, and are developing a considerable backlog on their shelves. Recently some native stores have cut back or eliminated the amount of ivory acceptable as cash payment. Therefore, the trend is toward an all cash economy. To meet their immediate needs, hunters are selling raw ivory for cash rather than searching for more lucrative markets to peddle their carved products. This problem in itself is not significant, but it is a contributing factor to a complex situation.

Due to the variety of comments, it is difficult to formulate a clear expression of the public's desire on each issue. The following is our best assessment of the majority opinion.

Ivory Permits

All communities were in favor of the idea of retaining as much raw ivory as possible in the hands of local carvers. With that goal in mind, they favored the retention of the ivory permits. However, we detected a reluctancy to abide by the paperwork requirements. When we pointed out that failure to comply with the regulations (such as selling ivory to the bar owners without a permit) would result in citation and possible fine to both parties, ivory permits were less appealing. Citing similar examples further dampened their enthusiasm for the permit system. Hunters who did not carve but had raw ivory for sale, opposed ivory permit regulations. Overall the majority

of constituents wanted to prevent raw ivory from leaving the "area". What method used was subject to debate, but retaining the ivory permit in some form seem to be the least objectionable.

Guiding

Although not entirely unanimous an overwhelming majority favored the guiding concept if they could be involved in some of the financial rewards. Their biggest objection was the lengthy requirements for a registered guides license. The following argument was common: "We have been hunting walrus all our lives. Why must we have an outside guide help us when he doesn't know anything about walrus hunting?" There is some justification to their stand. Villages like Diomede and Wales are relatively isolated, and to date have not attracted the interest of a registered guide. Some hunters in these villages have the expertise to guide walrus hunters, yet they cannot legally do so without a registered guide at their location. To alleviate this catch-22, villages wanted to see a system invoked similar to the permits in lieu of guide licenses issued by the Department of Fish & Game a few years back. Interpreting their wishes in light of our present system, they wanted a special test to obtain a Class A license. This might include but would not be limited to an oral test of the applicant and an examination of this equipment. If he met the minimum qualifications of a registered guide, then he would spend the next few years meeting all the qualifications of a registered guide without the direct assistance of a registered guide. Obtaining this plateau, he would be examined by the Guide Board like everyone else.

If such a "Class A" system was implemented, it would be approved on a species by species basis such as walrus or polar bear; a concept they supported.

We talked about guiding in term, of a quota, and it was agreed that any walrus taken by sport hunters would come out of their allotted village quota. Most wanted to see a close working relationship between the village, and the Department of Fish & Game (and other agencies) to enhance guiding in their area.

Walrus

In most cases it took awhile for the participants at the meetings to admit that a problem existed with the present annual harvest and utilization of walrus. Initially they reacted by saying the walrus population consisted of thousands of animals, and they saw no reason why they should not continue to harvest at a level commensurate with their demands. In essence if their action was biologically sound, it was morally right.

Hunters tended to view their situation from an isolated perspective. Their philosophy seemed to be if the community needs it, take it and all this was done with little thought of the consequences of their action outside their own sphere of influence. Eventually after discussing many ramifications of the issue, particularly from a statewide standpoint, most agreed that they could improve present hunting methods, and could "survive" with an annual harvest something less than 1976. However, they made it perfectly clear that they could not cut-back very far, especially in the immediate future. Their economy and culture are geared to taking a specific number of animals. The following example was cited: If a village has traditionally depended on walrus, and during the last five years has taken an average of say, 400 animals a year, then this figure represents their level of dependency. Any regulation which curtails this dependency would impose a severe hardship on the community. This was perhaps the strongest point argued throughout all the discussions.

When asked how many walrus were required to meet their needs, most villages were able to arrive at a figure which represented the will of the majority. Savoonga and Gambell agree on 450 at each village. Diomede requested 530; the King Island-Nome community had a tough time wrestling with this problem, but settled on a figure of 300.

MANAGEMENT RECOMMENDATIONS

Ivory Permits

During the spring of 1976 meetings were held in most of the important communities (utilizing marine mammals) in Game Management Unit 22 to outline walrus and ivory permit regulations. As a result a total of 336 raw ivory permits were issued from the Nome office, but in spite of our emphasis to comply with the regulations only 96 have been returned as of 25 February 1977. Three radio announcements as well as a discussion of the subject at recent village meetings has not been effective in gaining compliance. There is an apparent lack of interest in using the permit. After a meeting in Nome last spring 44 people signed a list indicating a desire to buy or sell ivory, but less than half the permits were claimed at our office. Several individuals who have tried to conscientiously abide by the regulations have told us they have seen people openly sell ivory without a permit. They know because they asked to see the sellers permit at the time of the transaction.

Currently the issuance of 1977 permits is contingent upon the return of the 1976 permit, however, to circumvent this situation many individuals report the permit as "lost". Even of the 96 permits returned to our office, 30% were blank other than the signature of the permit holder. Compliance in reporting transactions in ivory was greater from residents living outside GMU's 22-26, than areas where walrus are normally taken. Conclusions should not be drawn from this sample size, but it suggests a trend. In areas where raw ivory is scarce, the permit holder is more likely to comply with the regulations; possibly, because he has more to lose if the permit is revoked.

A cursory inspection of the permits returned indicated confusion about how the permit was to be completed. Some individuals addressed and signed their own permit when they purchased ivory, but failed to do likewise on the permit of the person from which the ivory was purchased. Other confusion was evident making it nearly impossible to follow the flow of ivory through the various transactions.

It is obvious to us that the permit has done little to stem the flow of raw ivory from those villages that claim they need this commodity to make a living. Because the permit is not accomplishing the job it was designed to do, we recommend that the permit system be dropped entirely. The many hours expended issuing permits and explaining the reason for the regulations can hardly be justified by the results obtained. We believe non-compliance will continue to plague the present system, and it will tax our budget with precious little results from our efforts.

If we are required to continue issuing raw ivory permits, we suggest an overhaul as outlined in the rewrite of the ivory permit guideline policy which we sent you a couple of weeks ago. The "new" permit system, if adopted, needs to be clearcut, self explanatory, and enforceable!

Guiding

We realize that the guiding profession is a "union-shop" organization, whose membership is limited solely to individuals who meet the specified qualifications. A closed shop may meet the needs of the urban Alaskan who is readily familiar with bureaucratic protocol; however, we do not feel this system can be fairly imposed on a rural community such as Diomede. Several members of this village (and others) have the education and the expertise to conduct a guided walrus hunt; yet, they do not easily fit into the regulatory framework that allows them to do so. Based on their comments at our meetings, we think there are justifiable complaints with the present guiding regulations.

We suggest that the Department of Fish & Game again bring this problem to the attention of the Guide Board, asking them to consider a fair solution.

We proposed they assign a registered guide to villages who wish to promote "local" guiding, and/or they allow interested hunters to take an oral test for a Class A Guide License. Certified annually, that such a Class A guide has the equipment and facilities to conduct a hunt; he would be authorized to function without the direct assistance of a registered guide. Such annual certification would be limited to a maximum of two species of game a year, and applicants would be required to take an oral Class A examination for each category of game.

Once a Class A guide met the minimum time qualification and had a sufficient number of recommendations from past clients, he could apply to take the registered guide test.

Further we recommend that a representative is appointed to assist the rural areas with guiding problems. If it is not feasible to assign a member from the guide board or a registered guide living in the area, we proposed the guide board delegate "organization authority" to the Department of Fish & Game. This would not be a mandate for regulatory authority, rather it would be to act as spokesman for the Guide Board. We envisage principal duties would include advising residents of guid regulations, verification of compliance for Class A guides, and assisting with guiding problems in the villages. Unless the present guiding regulations are substantially improved, we believe the system will promote further confrontations in rural villages.

Walrus

In formulating our walrus recommendations we relied heavily on the premise that our first responsibility as game managers was to provide for the welfare of the resource, and second to do so in a manner that was best for the good of the people. A lot of time and money went into our effort to obtain input from that segment of the public commonly identified with the problem, and we have tried to incorporate their ideas into our proposal.

Our management mandate from the Department of Interior stipulated that no more than 3000 walrus a year should be taken annually in Alaska. All our data, including the Soviet kill, suggests an annual harvest of this magnitude is within the biological carrying capacity of the walrus population. Assuming that our data are accurate our next area of concern is to design regulations that meet the needs of the people. We have weighted our recommendations in favor of those who are most dependent on the resource rather than those who are removed from this level of dependency and may have other motivations.

At our Regional meeting, we discussed and decided to propose a statewide quota system for all villages located in GMU 22, 23, and 26. This type of regulation is a new concept to the affected villages, and their initial reaction, as demonstrated in our recent meetings, is one of outright opposition. Only after a long discourse into the reasons for these regulations and the long term benefits has there been some reluctant acceptance of the idea. In order

to sell the quota concept; and gain some appreciable level of understanding, we believe is it necessary to hold meetings at all the villages. If we do not, there is a good likelihood we would have a regulation which would command a low level of compliance, and which we would be unable to "effectively" enforce due to manpower constraints.

In those 4 communities where we have presented the problem and discussed it in great depth, we received a commitment as to the number of walrus required for their annual needs. These figures were reasonably close to our proposed quota. These villages take nearly 50 of the annual harvest, and if we can reach an effective comprise with them, seemingly we have made a gigantic step towards solving confrontation on the rural level.

Our past field experience indicates the annual harvest at other villages will be limited more by weather and availability of animals, than by actual desire from hunters. From a practical standpoint it is unlikely the harvest at any of these villages will exceed 300 animals, and in most cases it will be less than 50. If "natural" conditions restrict their abiiity to harvest, then it may not be desirable to impose regulations that seem unnecessarily restrictive. It is desirable to formulate regulations that will cause the least number of problems with the using public, yet will meet our immediate management requirements to the resource.

With this objective in mind we make the following recommendations for the 1977 walrus hunting season.

Unit 18: No closed season and no limits.

Justification: The harvest in this area has averaged about 40 animals a year and has never exceeded 100. We need not impose harvest restrictions until this situation changes.

Unit 22: No closed season, a bag limit of 5 females and 10 males per man Maximum annual quota of 1900 animals distributed as follows:

Savoonga	Maximum annual quota	450	
Gambell	Maximum annual quota	450	
Rome-King Island	Maximum annual quota	300	
Diomede	Maximum annual quota	500	
All other areas	Maximum annual quota	200	of which no more than 150 can be taken by any one community.

All hunters would be required to report their kill under some sort of mandatory system, such as a harvest ticket, permit or punch card.

Justification: The quotas assigned to Savoonga, Gambell, Diomede, and Nome were based largely on recommendations from the community as to actual needs. These are a maximum quotas, and would not necessarily be attained every year. Other villages are less dependent on walrus, and could probably meet their subsistence requirements with 200 animals.

Mandatory reporting is necessary to insure that villages take no more than their authorized quota, and that the Unit Quota is not exceeded. It will also provide definitive information as to what classes of people are taking the walrus.

Unit 23 & 26: No closed season. Maximum quota of 600 animals of which no more than 150 can be taken at any one community.
Bag limit: maximum of 5 females and 5 bulls per hunter.

Justification: Alaska Department of Fish & Game harvest data for the last ten years indicates the average annual harvest for this area has been less than 300 walrus. The 1976 harvest which was abnormally high was less than 450 walrus. To meet inflationary costs, the using public indicates they require a number of walrus above recent harvest; 600 animals should more than meet this need.

Final Summary

Under the foregoing regulations the statewide harvest of walrus should not exceed 2600 animals. The combined Unit quota for 22, 23 and 26 is 2500 walrus, and Unit 18 is not likely to take over 100 animals. It is felt GMU 22 should receive a larger quota because communities from this unit have traditionally depended on walrus for a substantial portion of their existence. Communities located in other GMU's do not have the same level of dependency, because walrus are not available and/or there are other wildlife resources which are favored. A mandatory reporting procedure was not proposed for Unit 23 and 26

because the harvest at most locations has been below 150 animals annually. Until these communities are advised of the varied harvest problems, it would be difficult to enforce such a system on a statewide basis.

It is anticipated that the proposals presented here will be adopted only as interm regulations. They are designed to solve the immediate problem of excessive harvest. As hunters become aware of the national and international inplications of their actions, we can work to implement regulations that will meet other objectives; objectives that are perhaps equally important now, but that will take time to solve because of the problems of community castration.

As a final recommendation we suggest the Director or Commissioner of Fish & Game contact other state agencies such as the Department of Community and Regional Affairs, and inform them of problems where they might be able to provide assistance. Aid in the construction of freezer facilities to help alleviate the reoccurring problem of waste might be one example.

AGENDA

HCR 95 Annulling an administrative regulation adopted by the Guide Licensing and Control Board on the registration of camps.

The House Resources Committee here in Juneau will take testimony using the teleconferencing network from the remote areas first in the following order:

Ketchikan
Anchorage
Bethel
Fairbanks
Nome

Bob Maynard
Asst. Atty. General

*Testimony will then be taken from Juneau in the following order:

Rick Halford . . .	Guide
Marcus Jensen . .	Chairman, Guide Licensing & Control Board
William Bellingar	Investigator, Division of Fish & Wildlife Protection, Dept. of Public Safety
James Nutgrass . .	Investigator, Division of Fish & Wildlife Protection, Dept. of Public Safety
Sharon Andrews . .	Director of Licensing, Dep. of Commerce
Urban "Pete" Nelson	Member, Alaska Board of Game
Robert A. Rausch .	Director, Division of Game
Ray McNutt	President, Alaska Professional Hunters Association
Phil Driver. . . .	Guide, outfitter from the Arctic
Dr. Charles Keim .	Guide, member of Guide Licensing & Control Bd.
Clark Engle. . . .	Master Guide, member of Guide Licensing Bd.
H. "Glen" Glenzer.	Member, Guide Licensing & Control Board

*Due the high level of participation in the remote areas, as well as in Juneau, it is requested that witnesses keep their comments brief and to the point. This will allow everyone an opportunity to air his opinion.

If necessary, this hearing will re-convene at 7:00 p.m. this evening to finish any work necessary on the bill.

February 15, 1977

Senator Frank Ferguson
Pouch V.
Alaska State Legislature
Juneau, Alaska

Dear Senator Ferguson:

With regard to our conversation yesterday I have notified our Anchorage office in respect to having them bring the necessary records to Juneau, dealing with game units 23 through 26.

I have also asked them to bring a suitable map where guide areas could be pinpointed, showing at least what area the guides were in. The minutes for our December meeting are just being conpleted and we expect to have them ready for our meeting here in Juneau by the end of this week.

I have set aside a time of 10 AM, Saturday, February 19, 1977, in the Conference Room, Subport, Fish and Game Department, and would be happy to have you and any other interested legislators meet with us and discuss questions of mutual interest concerning the Board's activities.

Sincerely yours,

Marcus F. Jensen, Chairman
Guide Licensing & Control Board

cc: Wm. Bellingar

July 29, 1977

Senator Frank Ferguson
Box 131
Kotzebue, Alaska 99752

Dear Frank:

I was talking to the Director of Game, Bob Rausch a few days ago and he mentioned that it was practically certain that the state would be given management of the polar bear and hair seal in the very near future. The habitat of both of these animals is along the Arctic where many of the Eskimo villages are.

In talking to Mr. Rausch I am sure that there will be no more airplane hunting for polar bear. It will probably develop into dog teams and snow-mobiles. No doubt there will be a permit schedule set up where a certain number of animals will be identified for subsistence and a certain number for recreation purposes.

Our Guide Licensing and Control Board has encouraged the Natives on Nunivak and St. Lawrence Island to become interested in the guiding profession. It seems to me that some of the Eskimos at Point Hope and Wainwright and Barrow and also Kotzebue might be interested in the guiding profession for polar bear non-resident hunters. The revenue that they would receive for one hunt would far exceed anything they could get from shooting a polar bear for their own use.

The reason for this letter is to ask you if you have any suggestions on the best way to coordinate interested people in the villages, the guide board members, and the state Game personnel, where all interested parties could get together and have the Department of Game explain what they have in mind on the new program; and also have members of the guide board explain what is needed to qualify as a registered guide and how this could be implemented.

One thought - and that is that I just found out the Alaska Professional Hunters Association have a convention scheduled in Anchorage for the 3rd and 4th of December. It might be possible to get the interested parties to get together for a meeting at that time.

I would appreciate hearing from you, and any suggestions you might have. I will be away until the latter part of September, and will look forward to your reply then.

Sincerely yours,

MEMORANDUM

February 16, 1978

SUBJECT: HCR 95 (Work Order No. 4539)

TO: House Resources Committee

FROM: Joel F. Bennett JFB
Legislative Counsel

You have asked for my position on whether AS 08.54.040(a)(8) authorizes the Guide Licensing and Control Board to adopt 12 AAC 38.050 which in effect gives individual guides an exclusive big game guiding area, closed to other guides.

Briefly, I would state that AS 08.54.040(a)(8) is at the very least ambiguous on whether the exclusive area referred to is an established game management unit or subunit (of which there are 26, clearly delineated by map), or a smaller area within a game management unit or subunit, to be designated as necessary by board action. On its face, it is subject to both interpretations. In Senate Resources Committee discussions, this scheme was clearly intended to be a "limited entry system for guides" based on a quota, and providing for reasonable and equitable procedures for limiting the number of guides to that quota. Whether limiting a small area to a quota of one, based on use, occupancy, financial value, and "other considerations" is reasonable, is subject to differing opinion. It very possibly may not be.

Additionally, assuming the sort of system that is presently implementing AS 08.54.040(a)(8) was the sort contemplated by the legislature, it still may be subject to challenge on constitutional grounds as violative of equal protection and due process of the law. In effect, it sets up two classes of guides, and discriminates in favor of one class, presumably on the basis of conservation of the resource. A court would examine the basis for this to determine if it was reasonable and whether a less discriminatory method to effectuate the purpose is possible. Is there a better way to manage game than this, i.e., by adjusting seasons, or bag limits, etc.

A court may very well find that the granting of such a monopoly in an area obstructs competition impermissibly, fails to be a reasonable exercise of resource management, and denies persons similarly situated equal protection of the law.

The issues referred to in this letter will be more extensively treated in a further analysis by Ken Vassar of our office, who has most recently been researching the same problem. Our recent discussions would indicate that we share the opinion that further clarification of AS 08.54.040(a)(8) may be necessary.

LEGISLATIVE AFFAIRS AGENCY

M E M O R A N D U M April 4, 1977

SUBJECT: Guide Board Questions

TO: Representative Joseph McKinnon

FROM: Joel Bennett, Legislative Counsel

This is in answer to your questions concerning the validity of the Guide Licensing and Control Board's actions to establish "exclusive guiding areas". As background, I should state that the validity of an administrative regulation depends upon a board or agency's authority to adopt it. Regulations "implement, interpret, or make specific" statutes.

The legislature passed ch. 133 in 1976, which took effect January 1, 1977. It reads as follows:

> "...The board shall
>
> ...(8) establish a quota of licensed operating guides who may operate within designated geographical game units or subunits of the state and provide for an equitable and reasonable procedure for limiting the number of guides to that quota; preference shall be given to qualified, available and willing licensed guides who reside within the designated game unit or subunit." (AS 08.54.040(8))

Prior to this statute, under a regulation adopted in June of 1974, the board began to restrict guides to a total of three guide districts, out of the 26 districts established. I find no authority for that regulation until January 1, 1977, when the legislature authorized the above quota to be established. The quota law clearly was the first statute that contemplated a so-called "limited entry" system for guides.

I do not see that AS 08.54.040(8), authorizes exclusive areas within districts, as the guide board apparently does. In my opinion, 12 AAC 38.050, insofar as it awards exclusive areas to guides (prohibiting use by others) has no statutory

authority. The board cites AS 08.54.050 as its authority, but this is a general statutory authority and I think does not contemplate the scheme adopted in 12 AAC 38.050. As evidence of this, the legislature felt it necessary to pass ch. 133 SLA 1976, giving the board authority to adopt a quota restriction, apparently concluding then, that no authority existed under the board's general statutory authority.

You refer to the latest regulatory amendments (Register 50; am 2/25/77) and question their authority as authorizing exclusive areas outside of Units 8, 16, and 20. I question the validity of 12 AAC 38.050 in the first place --- and can find no statutory authority for it creating the initial exclusive areas --- such action goes far beyond the board's general authority to "regulate guiding activity". Even assuming that 12 AAC 38.050 is valid, granting exclusive areas outside of Units 8, 16 and 20 before the date of the recent amendment (2/25/77) would not have been valid. I understand that this is what you feel has happened.

I would summarize by saying that the implementation of "exclusive guiding areas" has no defensible statutory authority, and that an exclusionary application of 12 AAC-38.050 could be successfully challenged.

Incidentally, my initial memorandum of March 18, 1977, dealt with the relationship between AS 08.54.040(8) and 12 AAC 38.040, not with the question of exclusive areas within districts.

I hope this will be of some assistance to you.

Current Issues	8
Agency Responses:	
Guide Licensing and Control Board	9(c)
Consolidated Agency Response (Department of Commerce and Economic Development, Guide Licensing and Control Board, and Department of Law).	10(a)
Legislative Audit's Additional Comments.	11(a)

PURPOSE OF THE REVIEW

In accordance with a Budget and Audit Committee request and the provisions of Title 24 of the Alaska Statutes, a performance review of the Guide Licensing and Control Board was conducted to determine if:

1. The Board's organization and operation are in compliance with applicable statutes.

2. Statutory obligations are being met.

3. The Board is effectively aiding the Alaska citizenry.

ORGANIZATION AND FUNCTION

The Guide Licensing and Control Board (GLCB) was established by the 1973 Session Laws of Alaska and succeeds the Board of Fish and Game, Department of Fish and Game, which previously regulated the guiding industry. The seven member GLCB is appointed by the Governor with confirmation by the Legislature and is restricted to having no more than three members as licensed guides.

The GLCB is organized under the Department of Commerce, Division of Occupational Licensing. Two budgeted positions, a Guide Investigator and Administrative Assistant, in the Department of Public Safety, Division of Wildlife Protection, have been provided to assist in the licensure and investigations of guides.

The function of the Board is primarily regulatory, mandated by AS 08.54.040. Accordingly, the Board has the capacity to administer examinations; determine qualifications of guides; establish performance standards and regulate activities; maintain guide registers; prohibit harmful guiding activities; conduct hearings regarding licensure; and establish quotas of guides for specified geographical areas.

FINDINGS AND RECOMMENDATIONS

Recommendation No. 1

In the assignment of Exclusive Guiding Areas (EGA's), the Guide Licensing and Control Board (the Board) should uniformly apply the criteria established for the Game Management Unit under consideration.

AS 08.54.040(8) requires that an equitable and reasonable procedure be followed in assigning Exclusive Guiding Areas. In the March 25-27, 1977 Board meeting, the following criteria was established for the assignment of EGA's in Unit 9:

1. Permanent Area. At least three years of Statements of Financial Remuneration (contracts) and/or three Bear Camp Registrations on file within five (5) years as of November 1, 1976.

2. Temporary Area. Same as above except only two years of contracts and/or Bear Camp Registrations are required.

We found three applicants who were denied temporary EGA's in Unit 9 on the basis of an insufficient number of contracts on file. From the records on file at the Guide Investigator's Office we determined that these individuals had the required number of Bear Camp Registrations to qualify for a temporary EGA. There are several similar cases where other applicants did not have contracts on file, but did receive a temporary EGA solely on the basis of having the required number of Bear Camp Registrations.

The lack of uniform applications of the established criteria creates the following problems:

1. Affected individuals may initiate legal action against the State of Alaska.

2. The Board's credibility and fairness in the exercise of its authority may be questioned.

Recommendation No. 2

The Guide Licensing and Control Board (the Board) should obtain adequate documentation of previous experience to insure that only qualified applicants are being issued Class-A Assistant Guide Licenses.

We found no record to document that several individuals licensed by the Board in 1976 were qualified to serve as Class-A Assistant Guides.

AS 08.54.120 states in part that to qualify for a Class-A Assistant Guide License, the applicant must have served at least one season as a Licensed Assistant Guide. An applicant may alsc qualify if previously issued a permit in lieu of a Registered Guide License by the Department of Fish and Game.

A Class-A Assistant Guide may essentially perform the same service that a Registered Guide performs, except he is unable to contract for hunts. Therefore, it is essential for the protection of the public that a Class-A Assistant Guide possess the required experience to conduct a hunt in a competent and safe manner. The Board did not obtain the adequate documentation necessary to determine that the aforementioned applicants meet the experience requirement.

Recommendation No. 3

The Department of Law should take prompt action against Guides who violate Guide Board Statutes and Regulations.

The Department of Law has not timely processed accusations against Guides who have been accused of violating Guide Board Statutes or Regulations; or taken action against Guides who have not filed Statements of Financial Remuneration (contracts), as required by Regulation 12 AAC 38.060. This has resulted in the following problems:

1. Several of these accusations are quite old and recently a Hearing Officer recommended dismissal of an accusation because of its age.

2. A large number of Guides are not filing their contracts.

The enforcement of Guide Board Statutes and Regulations are necessary to ensure that:

1. Guide Board Statutes and Regulations are consistently applied.

2. The Guiding Industry is adequately regulated.

3. The public is adequately protected.

Recommendation No. 4

The Guide Licensing and Control Board (the Board) should develop program objectives that state specifically what is to be accomplished in quantitative terms.

Program objectives describe what a Board is seeking to accomplish during a specific fiscal year. Well formulated

objectives are capable of measurement and should include numeric targets so that actual accomplishments can be compared with stated targets.

The State Statutes identify what the goals of the Board are, but the Board has not formulated the objectives necessary to meet these goals or stated them in quantitative terms.

Effective program management and control is best achieved when comparisons can be made between predetermined objectives and actual performance. Variations that result can be analyzed and the necessary corrective action can be taken so that desired program objectives can be obtained.

CURRENT ISSUES

Legality of Exclusive Guiding Areas

The question has been asked, does the Guide Licensing and Control Board (the Board) have the authority to establish exclusive guiding areas?

The Attorney General issued an opinion in April, 1977 stating that the Board has the authority to establish exclusive guiding areas.

In order to clarify this matter, we requested a legal opinion from Legislative Affairs. Legislative Affairs issued an opinion which stated that section one of 133 SLA 1976 - AS 08.54.040(a)(8) - gives the Board the authority to establish exclusive guiding areas.

Game Violations by Guides

We were informed by Investigators for the Department of Public Safety (DPS) and Guides that game violations by certain Guides is a significant problem. They allege that a common practice among certain Guides is the hunting of brown bears the same day airborne, which is prohibited by Regulation 5 AAC 81.070.(a)(6).

We recommend the Guide Licensing and Control Board study the problem of game violations by Guides and take appropriate action to solve the problem.

Equal Opportunity for Alaskan Natives

We found that the Guide Licensing and Control Board has made an effort to increase participation of Alaskan Natives in the Guiding Industry. For example, the Board has:

1. Created two sub-districts in the Arctic (Nunvikak Island and St. Lawrence, King and Little Diomede Island). Before this action, Guides had to qualify for all the Arctic.

2. Visited Native Villages and explained what the Guiding Industry was about.

3. Gave special oral examinations to Alaskan Natives.

However, the Board should increase its effort to ensure that qualified Alaskan Natives are given an opportunity to participate in the Guiding Industry.

JAY S. HAMMOND, GOVERNOR

DEPARTMENT OF COMMERCE & ECONOMIC DEVELOPMENT

DIVISION OF OCCUPATIONAL LICENSING POUCH D – JUNEAU 99811

November 29, 1977

RECEIVED
DEC 1 1977
LEGISLATIVE AUDIT

Mr. Gerald L. Wilkerson, CPA
Legislative Auditor
Division of Legislative Audit
Pouch W, Alaska Office Building
Juneau, Alaska 99811

Dear Mr. Wilkerson:

I have received your preliminary report on the Guide Licensing & Control Board. I appreciate this opportunity to make a few comments on the review. My comments will refer to the recommendations that you have made, and I will start by commenting on Recommendation No. 1:

Your concern in this recommendation is that three individuals who had the required number of bear camp registrations did not receive a temporary permit. The reason they did not receive their temporary permit at our first hearing on Unit 9 was because they had over-filed on areas being used by older guides. In examining some of these individual cases the Board's concern was a possible building up of too much hunting impact in a small given area. We told these applicants to continue to examine the map on Unit 9 and see if they could find some areas that would be open and usable in that Unit. At a later meeting, areas for these individuals were being developed. The problem was not a lack of uniform application. I think the problem was the Board's concern of being realistic in trying to protect the resource from over-harvest. In most cases the guides themselves recognize this, although it seems that each man does everything possible to try and improve his own situation, which is probably to his credit.

Recommendation No. 2: In the matter of issuing several Class A guide licenses in 1976 I wish to report that this is certainly a special case that needs clarifying. The normal procedure for an applicant to receive a Class A license is to have it handled by our investigator, William Bellingar, who checks out the necessary requirements for the license. Normally, this takes anywhere from three to six months.

The case you are referring to relates to St. Lawrence Island. Back two years ago the Guide Licensing and Control Board was studying the impact of establishing individual guide areas. It was decided at that time not to include the Arctic Coast under individual cases but leave it open. The Board had a three-point approach:

08-H8LH

1. leave Arctic Coast open;
2. meet with the Natives on the village level and explain the guide program;
3. give oral tests to some Native guides to the extent they could come under the class of registered guide.

All three of these points have been accomplished. We now have Native registered guides, Ed Shavings, Sr., at Nunivak, Winfred James at Gambell and Hakie at Savoonga.

I authorized one of our Board members, Charles Keim, to travel to St. Lawrence Island, with a Fish and Game Protection Officer, to meet with the Natives in regard to giving them a license for guiding walrus hunts, which had just been approved by the State Department of Fish and Game. Our Act permits our Board to give oral exams for licenses under certain circumstances. We felt that the situation at St. Lawrence Island was unique, in that all those given a Class A license were Native residents, had lived and hunted there all their lives. Mr. Keim is very much of a perfectionist in giving exams and he personally checked each one of these men out before issuing him a license. Because this was the first year of guiding activity for walrus the Board felt it did not want to be put in the position of making it difficult for resident Natives to share in this vocation. We, therefore, extended ourselves in expediting this type of license. It should in NO way reflect in an adverse way against the thoroughness that is normally practiced by our Fish and Game Protection Division in issuing these licenses. I think this is another example of the Board extending its right hand to help the Native population under emergency timing.

Recommendation No. 3: With reference to the Department of Law and the time it takes to process accusations, I think that in this area the Office of the Attorney General and the Board should have some open dialog. I believe that in many cases the Board itself could help expedite some of the minor violations and help relieve the load that continually builds up in the Attorney General's Office. I think it would be helpful if we could write up some procedural steps that can be followed both by our Board and by the Attorney, in processing the violations.

Recommendation No. 4: The recommendation is that our Board should develop program objectives. I would agree with this recommendation as I personally, and I know the other Board members do too, like to have our future programs well established. We have tried to do this in the past, and I think very successfully. If you were to examine the minutes for the past two years you would find that our program has been aimed toward strengthening our guide standards. This has been accomplished by passing our 16-point Code of Ethics, in addition to our main program of giving exclusive guide areas in the 26 game units. We have proceeded with this program as expeditiously as possible, holding long hearings and working many hours each day. At our upcoming December meeting in Anchorage, we have listed for allocation the last five game units and when these are completed, we will have finished allocating all the game units in Alaska.

Our Board, at this next meeting, will set up a new program for the coming year. There is much yet to be done in smoothing out the rough spots and we will attempt to do this. We have had excellent cooperation from the Department of Commerce and Economic Development's Occupational Licensing Division under Mrs. Sharon Andrew. Also, I am proud to say that our staff in Anchorage has turned in an excellent record of dedication and efficiency. When one considers that a filing system had to be set up for 450 registered guides and 500 assistant guides, plus keeping track of all the mail and questions that come in, one can see that the staff certainly has been very busy.

In closing, there are a few observations that I can make that might be interesting. In assigning individual guide areas, it has brought to a minimum violations by aircraft. For example, no more is it necessary for a guide to cover the lower peninsula looking for brown bear when he knows the only area he can hunt in is his own assigned area. I have been surprised at how protective and jealous the individual guides have become, after assigning them their own area. The guides themselves have shown great cooperation in making this new program work. The one area that is still somewhat "tender", and we are working at it constantly, is the action of the few new guides who over-file in trying to establish areas for themselves. We will be working constantly with these people to satisfy their needs to the best of our ability.

I think it has been very helpful to have had a review by the Audit Department and I certainly appreciate the high caliber of men in the Department and the open manner in which they go about their business.

Respectfully yours,

Marcus F. Jensen

SECTION I

COMMENTS OF DEPARTMENT OF COMMERCE
AND ECONOMIC DEVELOPMENT

A. ORGANIZATION AND FUNCTION

Presented on page 4 of A Performance Review of Guide Licensing and Control Board Department of Commerce and Economic Development (Report), is a brief analysis of the organization and function of the Guide Licensing and Control Board (Board). The analysis is accurate, however, no reference is made to the overall purpose of regulation of this industry.

While no stated Legislative objective is found in AS 08.54, it is the department's understanding that regulation of the game guide industry is primarily for the enhancement of the State's game management, as well as the protection of the consumer. The continued utilization of this important renewable resource is contingent upon controlled harvesting, in order to avoid depletion of the resource.

B. FINDINGS AND RECOMMENDATIONS

Recommendation No. 1

In making this recommendation, it appears, the auditors relied solely upon the minimum usage requirements established by the Board in order for an applicant to be eligible for either a temporary or permanent Exclusive Guiding Area (EGA), to determine that the criteria established were not being applied uniformly.

It is the Department's understanding that the Board has always considered additional factors such as the number of minimally qualified applicants for a specific EGA in relation to the harvestable resource available. This is consistent with the overall purpose of the regulatory effort in this industry. Since the review of the Board's records did not reveal this information, the Department will recommend that the Board take action to more clearly delineate its criteria.

Recommendation No. 2

The circumstances surrounding the issuance of certain Class A Assistant Guide Licenses in 1976 were unusual. The management of some marine mammals was returned to the State after a number of years under federal jurisdiction. As a result, a limited number of walruses were to be harvested within a short time frame, the Board determined it to be in the public interest to assure that Alaska Natives, familiar with the local terrain and hunting of walrus be licensed.

The Department concurs with Recommendation No. 2, but recognizes the legitimacy of the Board's concerns in this instance and will work with the Board to develop an appropriate procedure for fulfilling this recommendation when unique circumstances are present.

Re mmendation No. 3

The Board's relationship with this Department is different from that of the other occupational boards which are organized under it. The Legislature has funded two positions in the Department of Public Safety, Division of Wildlife Protection to assist the Board in its investigative enforcement capacity. Therefore, the Division of Occupational Licensing has only been involved in this aspect to a very limited degree and the Department has insufficient information upon which to base a response.

It should be noted, however, that in recent months, th s Department of Law has developed written procedures for uniform managmenet of administrative proceedings by its staff and written guidelines for agency use which will result in more efficient handling of these proceedings.

Recommendation No. 4

The Department concurs with this recommendation and will within existing constraints work with the Board in an effort to identify quantifiable objectives.

CURRENT ISSUES

This section of the Report (see page 8) identifies correctly some major current concerns for effective regulation of the Guiding Industry.

Dear Mr. Wilkerson:

I have received your preliminary report on the Guide Licensing & Control Board. I appreciate this opportunity to make a few comments on the review. My comments will refer to the recommendations that you have made, and I will start by commenting on Recommendation No. 1:

Your concern in this recommendation is that three individuals who had the required number of bear camp registrations did not receive a temporary permit. The reason they did not receive their temporary permit at our first hearing on Unit 9 was because they had over-filed on areas being used by older guides. In examining some of these individual cases the Board's concern was a possible building up of too much hunting impact in a small given area. We told these applicants to continue to examine the map on Unit 9 and see if they could find some areas that would be open and usable in that Unit. At a later meeting, areas for these individuals were being developed. The problem was not a lack of uniform application. I think the problem was the Board's concern of being realistic in trying to protect the resource from over-harvest. In most cases the guides themselves recognize this, although it seems that each man does everything possible to try and improve his own situation, which is probably to his credit.

Recommendation No. 2: In the matter of issuing several Class A guide licenses in 1976 I wish to report that this is certainly a special case that needs clarifying. The normal procedure for an applicant to receive a Class A license is to have it handled by our investigator, William Bellingar, who checks out the necessary requirements for the license. Normally, this takes anywhere from three to six months.

The case you are referring to relates to St. Lawrence Island. Back two years ago the Guide Licensing and Control Board was studying the impact of establishing individual guide areas. It was decided at that time not to include the Arctic Coast under individual cases but leave it open. The Board had a three-point approach:

1. leave Arctic Coast open;
2. meet with the Natives on the village level and explain the guide program;
3. give oral tests to some Native guides to the extent they could come under the class of registered guide.

All three of these points have been accomplished. We now have Native registered guides at Nunivak, Gambell, and Savoonga.

I authorized one of our Board members, Charles Keim, to travel to St. Lawrence Island, with a Fish and Game Protection Officer to meet with the Natives in regard to giving them a license for guiding walrus hunts, which had just been approved by the State Department of Fish and Game. Our Act permits our Board to give oral exams for licenses under certain circumstances. We felt that the situation at St. Lawrence Island was unique, in that all those given a Class A license were Native residents, had lived and hunted there all their lives. Mr. Keim is very much of a perfectionist in giving exams and he personally checked each one of these men out before issuing him a license. Because this was the first year of guiding activity for walrus, the Board felt it did not want to be put in the position of making it difficult for resident Natives to share in this vocation. We, therefore, extended ourselves in expediting this type of license. It should in NO way reflect in an adverse way against the thoroughness that is normally practiced by our Fish and Game Protection Division in issuing these licenses. I think this is another example of the Board extending its right hand to help the Native population under emergency timing.

Recommendation No. 3: With reference to the Department of Law and the time it takes to process accusations, I think that in this area the Office of the Attorney General and the Board should have some open dialog. I believe that in many cases the Board itself could help expedite some of the minor violations and help relieve the load that continually builds up in the Attorney General's Office. I think it would be helpful if we could write up some procedural steps that can be followed both by our Board and by the Attorney in processing the violations.

Recommendation No. 4: The recommendation is that our Board should develop program objectives. I would agree with this recommendation as I personally, and I know the other Board members do too, like to have our future programs well established. We have tried to do this in the past, and I think very successfully. If you were to examine the minutes for the past two years you would find that our program has been aimed toward strengthening our guide standards. This has been accomplished by passing our 16-point Code of Ethics in addition to our main program of giving exclusive guide areas in the 26 game units. We have proceeded with this program as expeditiously as possible, holding long hearings and working many hours each day. At our upcoming December meeting in Anchorage, we have listed for allocation the last five game units and when these are completed, we will have finished allocating all the game units in Alaska.

Our Board, at this next meeting, will set up a new program for the coming year. There is much yet to be done in smoothing out the rough spots and we will attempt to do this. We have had excellent cooperation from the Department of Commerce and Economic Development's Occupational Licensing Division under Mrs. Sharon Andrew. COMMENTS OF DEPARTMENT OF LAW

STATE OF ALASKA

JAY S. HAMMOND, GOVERNOR

DEPARTMENT OF LAW

OFFICE OF THE ATTORNEY GENERAL

POUCH K - STATE CAPITOL
JUNEAU 99811

December 2, 1977

Mr. Gerald L. Wilkerson, CPA
Legislative Auditor
Division of Legislative Audit
Pouch W - Alaska Office Building
Juneau, Alaska 99811

Dear Mr. Wilkerson:

This letter is in response to your preliminary audit entitled "A Performance Review of Guide Licensing and Control Board, Department of Commerce and Economic Development, October 14, 1977.

This audit finds shortcomings with the Department of Law in two respects: (1) failure to timely process accusations against guides for violation of the licensing statutes; (2) failure to take action against guides who have not filed Statements of Financial Remuneration required by 12 AAC 38.060. Let me briefly respond to each in turn.

Failure to Timely Process Accusations Against Guides for Violation of the Licensing Statute

The audit is correct in stating that several accusations are quite old and that, in one case, a hearing officer recommended dismissal because of the remoteness of the events which were the subject of the accusation. The audit, I believe, errs in attributing these facts to deficiencies in the Department of Law.

A review of the guide board docket and our own files discloses that, with respect to the oldest case, there is no record that the department received investigatory reports for which accusations might have been filed. Had they been received, it is fair to presume that action would have been taken immediately, since particularly in the occupational licensing field our department has acted swiftly to initiate disciplinary proceedings. Other cases have been active for varying lengths of time. Any delays have been the result of attempting to serve papers on the respondents, scheduling by the hearing officers, and final action on proposed decisions.

With respect to the specific allegation regarding dismissal of one case by a hearing officer for staleness, I would simply refer you to my response of October 10, 1977, a copy of which is attached. I believe the explanation contained in it adequately characterizes the events.

Contrary to the implications of the audit, I believe the department has been expeditious in its handling of these licensing matters. When the evidence is there, we move with all deliberate speed.

Failure to Take Action Against Guides Who Have Not Filed Statements of Financial Remuneration

The Department of Law has never refused to initiate administrative proceedings against licensed guides for violation of 12 AAC 38.060. In fact, department personnel have encouraged the Guide Board Investigator to prepare cases based on violations of this regulation.

The department has declined to criminally prosecute guides for violation of 12 AAC 38.060. There are several reasons why prosecutions are not initiated, but they boil down to this: it is nearly impossible to convict a guide under that regulation. Let me elaborate. When a district attorney evaluates a case, he or she views it against the standard of proof required in criminal cases: proof beyond a reasonable doubt. To be successful in prosecuting a guide will require that either the client (hunter) or an employee of the guide testify, against the guide, that a hunt was conducted. Since over 80 percent of guided hunters are nonresidents, it is extremely expensive to procure their testimony. Their appearance cannot be required in our courts. The testimony of a guide's employees is difficult to procure. But even if the State can overcome those hurdles and can prove the hunt occurred, the guide can always say that he mailed the Statement of Financial Remuneration to the appropriate office, but that it was "lost in the mail". The jury returns a verdict of not-guilty; the prosecutor has wasted valuable and limited resources; and a smug and no less unscrupulous guide goes about his business-as-usual.

In this light I believe that the department's decision to deal with these violations through disciplinary proceedings is a wise one. The department has dealt with these cases diligently. Accordingly, I urge you to review and revise your audit in that regard.

Sincerely,

Avrum M. Gross
Attorney General

Re: Interim Letter No. 2
Guide Licensing & Control
Board Audit

Dear Mr. LaVine:

I am in receipt of your letter dated October 6, 1977, regarding your audit of the Guide Licensing and Control Board, and expressing your concern with the Department of Law's processing of accusations for that board. Before reviewing this matter on a case by case basis, I feel that some initial observations are in order.

The history of some of the cases does reflect the fact we were extremely short staffed in 1976 with regard to Guide Board matters, because the attorney position assigned to these matters was not filled for most of the year. In addition, there have been a few cases which have not moved as quickly as they might have. But, in many instances, this has not been the fault of this office. Moreover, review of those cases filed with our office in 1977 will reveal, I believe, that in recent months any problems which existed with respect to the processing of accusations has been resolved.

It has been alleged that the Department of Law has not taken action against guides who have not filed Statements of Financial Remuneration (contracts), as required by 12 AAC 38.060. First of all, criminal prosecution of a guide for failure to file a Statement of Financial Remuneration should be differentiated from administrative action, initiated by accusation, against the guide's guiding privileges, i.e.

proceedings to suspend or revoke the guide's license, taken for this type of violation.

With regard to criminal prosecution of a guide for violation of 12 AAC 38.060, it appears that certain attorneys in various district attorneys' offices have declined to prosecute guides under this regulation. For the reasons outlined below, their decision seems to be reasonable. The evidentiary problems associated with criminal prosecution of a guide under this regulation are substantial, especially when considered in light of the standard of proof applied in criminal proceedings, i.e. proof beyond a reasonable doubt. In most cases, successful prosecution of a guide under this regulation will require that either the client (hunter) or an employee of the guide testify, against the guide, that a hunt was conducted. Since 80 percent of guided hunters are nonresidents, it is extremely expensive to procure their testimony. Furthermore, we have no way of requiring their appearance in our courts. The testimony of a guide's employees is difficult to procure for obvious reasons. In addition, even if we can prove the hunt occurred, the guide can always say that he mailed the Statement of Financial Remuneration to the appropriate office, but that it was "lost in the mail", thereby defending himself. While 12 AAC 38.060 is a valuable enforcement tool, of the many guiding regulations, it is one of the least significant in terms of furthering the Guide Board's statutory purpose to "prohibit guiding activities which are unsportsmanlike, unethical, unsafe, against principles of conservation, degrading to the guiding profession, or which adversely effect the natural resources," as set forth in AS 08.54.040(6). In light of the evidentiary problems, the expense, and the relative significance of 12 AAC 38.060, it would seem that violations of this nature would be more properly pursued in administrative proceedings.

This was discussed with the Guide Board Investigator early this year. It was agreed at that time that the Department of Law would deal with violations of 12 AAC 38.060 administratively through license revocation or suspension proceedings. The Department of Law has never refused to prosecute guides under this regulation by the latter means. To the contrary, the Guide Investigator has been encouraged to prepare cases based on violations of this regulation for administrative treatment via accusation. The Department of Law has just recently prepared an accusation based on the charge of failure to file a Statement of Financial Remuneration.

It has also been alleged that the Department of Law has not processed accusations in a timely fashion against guides who have been accused of violating guiding statutes

or regulations. By telephone conversation of October 7, 1977, you have specifically requested information on the status of the following cases. They are referred to by case number to protect the identity of the accused guides. The dates following the case number indicate the date on which the Guide Board Investigator believes an accusation request was filed with the Department of Law:

1. C 77-5084 (04-29-76) A hearing was held on this case four or five months ago. It was to be held earlier, but the guide, who resides in the State of Washington in the winter, requested that it be held later, so that it would be convenient for him to attend. The Hearing Officer requested supplemental briefing, following the hearing. The Hearing Officer has issued his proposed decision, however the Department of Law intends to request reconsideration of it. Therefore, the matter is still "open". In any event, the Board will not meet until December of this year, and their final approval is necessary for proposed disciplinary action to become effective.

2. C 75-1424/C 75-01107 (1975) The hearing in this case is set for October 18, 1977. We have encountered a number of problems attempting to locate the respondent in this matter, and once we were able to do so the hearing was set on immediately for the first time available at which both the Hearing Officer and the respondent could be present. The Department of Law has gone to great lengths in many of these cases to allow the respondent to be present. This is often difficult because the guides spend a great deal of time in the field or are otherwise unavailable. (In this case, the respondent is a commercial fisherman.)

3. C 77-5089 (04-20-74) The Guide Investigator indicates that this matter was filed with the Attorney General's Office in April of 1974. When the Attorney General's Office was requested to take action on this case in the spring of this year, a complete search was made of the office, and no record of such a case was found. The office informed the Guide Investigator that there was no record of any file having been opened on this matter or of any documents pertaining to it in the office. Subsequently, the Investigator supplied the office with a new accusation request and supporting documents. These have been reviewed, and it has been determined that the case is too old for prosecution. It involves incidents which occurred approximately five years ago. Moreover, the Investigator requested that accusations be filed against two guides. One of them is simply not liable under the laws of our state for the activities complained of. Proceedings against the other guide

would entail out-of-state depositions which would be difficult and expensive to obtain. Budget limitations simply do not permit us to proceed in this manner except in the "best" of cases.

4. E 2054 (03-20-75) This office has no record of having received an accusation request against this individual. Informal discussions were held with regard to the possibility of proceeding against him, however supporting documentation was never supplied.

5. C 77-11423 (10-15-76) This is the case referred to in your letter, at the bottom of page one, in which a Hearing Officer recommended dismissal of an accusation because of its age. It should be noted that he also recommended dismissal because he did not believe the guide was guilty of the violations as charged. The incidents giving rise to the accusation occurred in November, 1975. The Department of Law received an accusation request in October, 1976. An accusation was filed shortly thereafter, and a Hearing Officer was assigned to hear the case early in 1977. He was unavailable for a hearing date until May, 1977, when he heard the case. At the hearing, he acknowledged the intervening five-month delay as being his fault. In addition, criminal proceedings were brought against this guide based on the same incidents. It is the practice of the Department of Law, to wait until the criminal proceedings are resolved before proceeding administratively, to avoid duplicative effort on the part of our attorneys, since licenses are often revoked in the course of criminal proceedings.

6. C 77-5092 (04-14-76) This case number references two cases, based on the same incident. Under the Guide Statutes, a registered guide is vicariously liable for the acts of his assistant guide. A hearing was held last March with respect to the assistant guide, and the Hearing Officer recommended a three-year suspension of his license. At the Guide Board meeting in July, the Board affirmed this decision, and the guide's license was officially suspended. At that time, the Board instructed the Assistant Attorney General present to proceed against the registered guide's license also. An accusation is currently being prepared against the registered guide.

7. C 76-18396 (12-08-76) This case is currently being reviewed to see if there is sufficient evidence to proceed with an accusation against the guide.

8. C 76-14769 (12-08-76) A preliminary hearing was held on this case last December based on complaints

filed by various clients of the guide. At that time, the Board instructed the Department of Law to proceed with an investigation of the case and to file an accusation against the guide based on alleged unethical conduct, specifically, taking out clients too early in the season to give them a good hunt, poor food, and double booking aboard the guide's boat. Since that time, the Department of Law has determined that while there may be merit in the complaints, there is not sufficient evidence present to support legal action against the guide, as there are as many letters from clients on file which praise the guide, as criticize him. However, investigation has uncovered one possible violation of a game regulation, which may have occurred on board the guide's boat, to-wit: shooting a deer from the boat. The Division of Fish & Wildlife Protection is currently investigating this charge. When their report is received, the Department of Law will determine whether there is sufficient evidence to proceed against the guide at this time.

9. C 77-11983 (09-23-76) An accusation has been filed against this guide, but he has not returned a Notice of Defense indicating that he intends to defend against it. A Hearing Officer has been requested. The hearing should be held in the near future, and the matter should be ready for final disposition by the Board at their December meeting.

As you know, the Guide Board Investigator has filed a number of accusation requests with the Department of Law this year, all of which have been filed since April. In our telephone conversation of October 7, 1977, you indicated that you would like review of these case to be treated in group form. Eleven such cases have been filed with our office. Accusations have been prepared, and in most cases served, in seven of those cases. Additional information has been requested in two of the remaining cases, and must be received prior to the filing of accusations. An accusation will be drawn up shortly in the tenth case, as it is based simply on the vicarious liability of a registered guide for his assistant guide, against whom an accusation has already been filed. With regard to the eleventh case, the office is reviewing it to see whether an accusation is warranted.

Perhaps it will be helpful to explain the general procedure followed by the Department of Law in processing these accusations. First, an accusation request is received from the Guide Board Investigator, along with supplemental material detailing the nature of the violation and the evidence currently available. The Department of Law reviews the request and the material, and determines if additional investigation and evidence is necessary for the state to

proceed. If this is so, the Department requests the Guide Board Investigator to make such investigations as are required. When we feel that sufficient evidence has been compiled, an accusation is drawn up. The original is sent to the Department of Commerce & Economic Development, and copies are served upon the guide. Oftentimes it may take four to eight weeks to effect service, as the guides are often difficult to reach. Upon service, the guide has 15 days to return a Notice of Defense indicating that he wishes to defend against the action. Personal service on the guide is attempted, as opposed to service by registered mail, because the guides are often absent from their mailing addresses for periods in excess of two weeks, because of their work. Service by registered mail would therefore often result in a guide losing the option of defending the action. After a Notice of Defense is received, the Department requests a Hearing Officer through the Governor's Office. When a Hearing Officer is assigned, the Hearing Officer, the Department's attorney, and the guide and/or his attorney arrange a mutually-convenient date for the hearing. The Hearing Officer may or may not request supplemental briefing following the hearing. Subsequent to the hearing, the Hearing Officer reviews the facts elicited at the hearing, and issues findings of fact and conclusions of law, along with a proposed decision. At the next Board meeting (which occur about three times a year), the Hearing Officer's findings and proposed decision are read to the Board, at which time the Board either affirms and adopts the proposed decision, or rejects it and orders a new hearing. These proceedings are conducted under the Administrative Procedure Act (AS 44.62).

Sincerely,

Avrum M. Gross
Attorney General

THE LEGISLATURE

BUDGET AND AUDIT COMMITTEE

AUDIT DIVISION
POUCH W—ALASKA OFFICE BUILDING

FINANCE DIVISION
POUCH WF—STATE CAPITOL

JUNEAU 99801

December 13, 1977

Members of the
Legislative Budget and Audit Committee:

We have reviewed the consolidated responses of the Department of Commerce and Economic Development, Guide Licensing and Control Board, and Department of Law and the auditor's comments are listed below:

Recommendation No. 1

In the assignment of Exclusive Guiding Areas (EGA's), the Guide Licensing and Control Board (the Board) should uniformly apply the criteria established for the Game Management Unit under consideration.

Guide Licensing and Control Board Response to Recommendation No. 1:

> "Your concern in this recommendation is that three individuals who had the required number of bear camp registrations did not receive a temporary permit. The reason they did not receive their temporary permit at our first hearing on Unit 9 was because they had over-filed on areas being used by older guides. In examining some of these individual cases the Board's concern was a possible building up of too much hunting impact in a small given area. We told these applicants to continue to examine the map on Unit 9 and see if they could find some areas that would be open and usable in that Unit. At a later meeting, areas for these individuals were being developed. The problem was not a lack of uniform application. I think the problem was the Board's concern of being realistic in trying to protect the resource from over-harvest. In most cases the guides themselves recognize this, although it seems that each man does everything possible to try and improve his own situation, which is probably to his credit."

Auditor's Comment:

> In a letter dated December 12, 1977, to the Division of Legislative Audit, the Chairman of the Guide Board

stated that in a recent meeting the Guide Board did not uniformly apply the criteria established for assigning Exclusive Guiding Areas (EGA's) in Game Management Unit 4.

We maintain our position that the Guide Board, in the assignment of EGA's, should uniformly apply the criteria established for the Game Management Unit under consideration.

Department of Commerce and Economic Development Response to Recommendation No. 1:

"In making this recommendation, it appears, the auditors relied solely upon the minimum usage requirements established by the Board in order for an applicant to be eligible for either a temporary or permanent Exclusive Guiding Area (EGA), to determine that the criteria established were not being applied uniformly.

It is the Department's understanding that the Board has always considered additional factors such as the number of minimally qualified applicants for a specific EGA in relation to the harvestable resource available. This is consistent with the overall purpose of the regulatory effort in this industry. Since the review of the Board's records did not reveal this information, the Department will recommend that the Board take action to more clearly delineate its criteria."

Auditor's Comment:

It is the position of Legislative Audit that all factors should be considered before the criteria is established for assigning Exclusive Guiding Areas. Otherwise, the Board will not be able to follow AS 08.54.040(8) which requires that an equitable and reasonable procedure be followed in assigning exclusive Guiding Areas.

Recommendation No. 3

The Department of Law should take prompt action against Guides who violate Guide Board Statutes and Regulations.

Department of Law Response in Part:

"This audit finds shortcomings with the Department of Law in two respects: (1) failure to timely process accusations against guides for violation of the licensing statutes; (2) failure to take action against guides who have not filed Statements of Financial Remuneration required by 12 AAC 38.060. Let me briefly respond to each in turn.

Failure to Timely Process Accusations
Against Guides for Violation of the Licensing Statute

The audit is correct in stating that several accusations are quite old and that, in one case, a hearing officer recommended dismissal because of the remoteness of the events which were the subject of the accusation. The audit, I believe, errs in attributing these facts to deficiencies in the Department of Law.

A review of the guide board docket and our own files discloses that, with respect to the oldest case, there is no record that the department received investigatory reports for which accusations might have been filed. Had they been received, it is fair to presume that action would have been taken immediately, since particularly in in the accupational licensing field our department has acted swiftly to initiate disciplinary proceedings. Other cases have been active for varying lengths of time. Any delays have been the result of attempting to serve papers on the respondents, scheduling by the hearing officers, and final action on proposed decisions."

Auditor's Comments:

The Department of Law in an attachment to their response states that they have no record of receiving investigatory reports for two cases (CC77-5089 and E2054) for which accusations might have been filed. According to the information supplied to us by the Department of Public Safety, Division of Fish and Wildlife Protection, these cases were filed with their office.

In another part of the Department's response they state:

> "...The history of some of the cases does reflect the fact we were extremely short staffed in 1976 with regard to Guide Board matters, because the attorney position assigned to these matters was not filled for most of the year. In addition, there have been a few cases which have not moved as quickly as they might have..."

Recently, the Department has made progress in processing accusations in a timely manner.

We affirm our recommendation as written.

Department of Law Response in Part:

"Failure to Take Action Against Guides
Who Have Note Filed Statements of Financial Remuneration

The Department of Law has never refused to initiate administrative proceedings against licensed guides for

violation of 12 AAC 38.060. In fact, department personnel have encouraged the Guide Board Investigator to prepare cases based on violations of this regulation.

The department has declined to criminally prosecute guides for violation of 12 AAC 38.060. There are several reasons why prosecutions are not initiated, but they boil down to this: it is nearly impossible to convict a guide under that regulation. Let me elaborate. When a district attorney evaluates a case, he or she views it against the standard of proof required in criminal cases: proof beyond a reasonable doubt. To be successful in prosecuting a guide will require that either the client (hunter) or an employee of the guide testify, against the guide, that a hunt was conducted. Since over 80 percent of guided hunters are nonresidents, it is extremely expensive to procure their testimony. Their appearance cannot be required in our courts. The testimony of a guide's employees is difficult to procure. But even if the State can overcome those hurdles and can prove the hunt occurred, the guide can always say that he mailed the Statement of Financial Remuneration to the appropriate office, but that it was "lost in the mail". The jury returns a verdict of not-guilty; the prosecutor has wasted valuable and limited resources; and a smug and no less unscrupulous guide goes about his business-as-usual."

Auditor's Comment:

We agree that it is difficult and expensive to prosecute a guide. However, the enforcement of all Guide Board Statutes and Regulations are necessary to ensure that the public and game resources are adequately protected and the guiding industry is properly regulated. By enforcing only certain Board laws and regulations, the attitude of non-compliance would be fostered among guides and the public which would be detrimental to the welfare of the State.

We affirm our recommendation as written.

SUBJECT: Exclusive Guiding Areas

TO: Roger Levine
Legislative Audit Division

FROM: Kenneth E. Vassar
Staff Attorney

On June 28, 1974, the Guide Licensing and Control Board adopted regulations (12 AAC 38.040 and 050) which limited guides applying for new certification to a total of three districts and authorized exclusive guiding areas in units 8, 16, and 20 (guiding districts established by the board correspond to game management units established by the Board of Fish and Game in 5 AAC 90.10 as of January 1, 1974). On January 1, 1977, section one of 133 SLA 1976 took effect. This section added a paragraph to AS 08.54.040 and reads as follows:

> (a) Except as provided in sec. 45 of this chapter, the board shall....
>
> (8) establish a quota of licensed operating guides who may operate within designated geographical game units or subunits of the state and provide for an equitable and reasonable procedure for limiting the number of guides to that quota; preference shall be given to qualified available and willing licensed guides who reside within the designated game unit or subunit.

On February 25, 1977, the board amended 12 AAC 38.040 and 050. The amendment authorizes camp registration in all units - not just in units 8, 16, and 20 - based on occupancy, use, financial value, and other considerations. Camp registration is for the purpose of effectuating exclusive guiding areas surrounding the camps for distances to be determined by the board. The previous limitation of three districts per guide remained in effect.

The following questions have arisen as a result of this activity, and they are as follows:

(1) Did the board have the authority, before January 1, 1977 (the effective date for section one of 133 SLA 1976), to authorize exclusive guiding areas?

(2) Assuming it had such authority, did it exceed its authority in granting exclusive guiding areas outside units 8, 16, and 20?

(3) What effect has section one of 133 SLA 1977 had on the authority, if any, of the board to establish exclusive guiding areas?

(4) May guides who have been granted an exclusive guiding area transfer the right to guide exclusively in that area, and may the board authorize such practice?

(5) Did the board have authority, before January 1, 1977, to limit guides to three districts each?

(6) What effect has section one of 133 SLA 1976 had on that authority?

The following paragraphs will address these questions.

1. Exclusive guiding areas before January 1, 1977. The regulation in effect before January 1, 1977, which authorized the establishment of exclusive guiding areas in units 8, 16, and 20 was 12 AAC 38.050(a) and (b). These subsections stated:

(a) Registration of one main camp by guides in units 8, 16, and 20 will be allowed based on occupancy, use, and financial value that must be substantiated to the board's satisfaction.

(b) Camp registration is to effectuate an exclusive big game guiding area surrounding the registered camp, for a distance to be determined by the board.

The authority cited for this section was AS 08.54.050, which has not been amended since then. It provides:

The board shall adopt procedural and substantive regulations, under the Administrative Procedure Act (AS 44.62), required by this chapter or reasonably necessary for its administration.

Considering the language of AS 08.54.050, it is apparent that 12 AAC 38.050(a) and (b) could have been justified only if it were "reasonably necessary" for the administration of some provision of the chapter. It is arguable that the establishment of exclusive guiding areas was "reasonably necessary" for administering the following paragraphs of AS 08.54.050(a):

> (a) Except as provided in sec. 45 of this chapter, the board shall....
>
> (3) establish guide performance standards and regulate activity...
>
> (6) prohibit guiding activities which are unsportsmanlike, unethical, unsafe, against principles of conservation, degrading to the guiding profession, or which adversely affect the natural resources....

Generally speaking, state officers, boards, commissions, and departments have such powers as may have been delegated to them by express constitutional and statutory provisions, or as may properly be implied from the nature of the particular duties imposed on them. It will be noted that AS 08.54.040(a)(3) grants broad powers to the board. The board shall regulate the activities of guides. Courts have recognized the wide range of discretion vested in state boards under such broad statutes and have refused to interfere with the exercise of that discretion unless the person challenging it demonstrated that the board's action was prohibited by a specific statutory provision or by clear legislative intent. The following synopsis is a small sampling of those cases reaching this result:

> Courts should not substitute their judgment for that of the commission with respect to what is wise and fair in the economy of the state. Sun Oil Co. v. Burford, 130 F.2d 10. (1942 C.A. 5th Cir)
>
> A state officer's decision is not arbitrary and capricious, even though not the wisest and best that could be made, if action was exercised honestly and on due consideration, and there was room for two opinions. Whatcom County v. Langlie, 246 P.2d 836. (1952 Wash)

> A board or commission on which the legislature confers broad general powers is invested with discretion in choosing the means and methods of accomplishing the result expected, and, in the absence of fraud or manifest abuse of that discretion, its determination is conclusive. Elliott v. Superior Court, 180 C.A.2d 894.
>
> An administrative agency which has authority to enact regulations is vested with a large measure of discretion and the burden of showing that the agency has acted improperly in enacting regulations rests upon the one who asserts it. Page v. Welfare Commissioner, 365 A.2d 1118 (1976 Conn)

The powers granted in AS 08.54.040(a)(3), as noted before, are broad. If the cases cited apply, which it seems they should, then the board's actions have a rebuttable presumption of validity based upon the board's wide discretion in choosing the means of accomplishing the results expected. The presumption of validity cannot be rebutted merely by asserting that the board's decision is not "the wisest and the best that could be made." The burden is on the party challenging the board's actions to show that they are arbitrary, capricious, or fraudulent, or that they constitute manifest abuse of the discretion granted the board. To the best of my knowledge, no such showing has been made.

Beyond the wide discretion vested in the board under AS 08.54.040(a)(3), there is the further discretion inherent in administering the powers granted the board under AS 08.54.040(a)(6). That paragraph gives the board the power to prohibit guiding activities which are "against principles of conservation...or which adversely affect the natural resources." This, too, is a broad power since the legislature did not restrict the means for accomplishing the results expected, and it carries with it wide discretion in choosing the means to be used. A look at the situation which existed before adoption of the regulation in issue illustrates the reasonableness of the board's decision to authorize exclusive guiding areas. Senator Poland, in floor debate over CS SB 661 (a precursor of 133 SLA 1976) on March 25, 1976, stated:

> Kodiak Island was one of the toughest ones of all, because they had had, believe it or not, 198 guides that had been guiding on Kodiak at one time or another.

> By the use of the, by using past records of guiding there, they were able to reach an amicable agreement where 19 are now guiding there. The others had to go to other districts.

It is important to recognize that Kodiak Island is within unit 8, one of the designated units within which exclusive guiding areas were authorized.

In a situation where a large number of guides are concentrating on limited areas of hunting, thus causing potentially irreversible damage to the resources in those limited areas, and where it is the duty of the board to prohibit guiding activities which adversely affect the natural resources, it seems that there is "room for two opinions" as to the reasonable necessity of establishing exclusive guiding areas in those regions. Hence, the board's decision to use such areas was within its range of discretion.

In short, I believe that the broad powers and wide discretion granted the board under AS 08.54.040(a)(3) and (6) encompass and authorize the establishment of exclusive guiding areas.

2. Exclusive guiding areas outside units 8, 16, and 20 before February 25, 1977. Assuming that 12 AAC 38.050, as it read before the recent amendment (2/25/77), was valid, granting exclusive areas outside units 8, 16, and 20 would not have been valid. The establishment of such areas would have been beyond the authority of the board's own regulations, since authorizing exclusive areas in certain units implies a lack of authorization for exclusive guiding areas in other units.

3. The effect of 133 SLA 1976 on exclusive guiding areas. After the effective date of section one of 133 SLA 1976, the board amended 12 AAC 38.050(a) to read:

> Registration of camps by guides will be allowed based on occupancy, use, financial value and other considerations that must be substantiated to the board's satisfaction.

The listing of authority under the regulation was also amended to add AS 08.54.040(a)(6), as well as AS 08.54.050. It is interesting to note that section 40(a)(6) was listed and not section 40(a)(8), the new paragraph dealing specifically with quotas.

There are at least two considerations which support the argument that passage of 133 SLA 1976 (hereinafter referred to as sec. 40(a)(8)) ratified or at least did not refute the board's power to authorize exclusive guiding areas.

The first consideration relates to the language of sec. 40(a)(8). The section is quoted on the first page of this memorandum. It requires the board to establish quotas within "designated geographical game units or subunits of the state." Since an exclusive guiding area simply amounts to a quota of one within a designated subunit of the state, the establishment of such areas is expressly authorized under this language.

The section also requires the board to provide for an equitable and reasonable procedure for limiting the number of guides to the quota. In furtherance of this requirement, the board has utilized advice from biologists in the Department of Fish and Game to determine where exclusive guiding areas are needed. Furthermore, the regulations provide guidelines for the granting of exclusive areas; under these guidelines, the board must take into consideration occupancy, use, financial value, and other considerations.

It is true that the guiding districts used by the board correspond to districts established by regulation of the Board of Fish and Game and that there are also established subunits under those regulations which do not correspond to the exclusive guiding areas. Nevertheless, the legislation does not specify the subunits to which the board must adhere. Thus, the board is free to designate its own subunits and is not bound by regulations adopted by the Board of Fish and Game.

The second consideration supporting exclusive guiding areas subsequent to the enactment of sec. 40(a)(8) relates to the legislative history of sec. 40(a)(8). It was introduced in the senate in 1976 as SB 661, section one of which provided for quotas "within designated geographical areas." This bill was replaced with CS SB 661, section one of which provided for quotas "within designated geographical game units or subunits." The new language was provided by the Senate Resources Committee and represents a conscious effort by the chairman of that committee to assure the authority of the board to establish exclusive guiding areas. In her statement on the Senate floor on March 25, 1976, Senator Poland, the chairman of the committee, specifically referred

to the method in use by the board at that time on Kodiak Island (this statement is quoted supra), and in describing CS SB 661., she stated:

> It's a policy of setting a quota and assigning guides to definite units. It has been practiced on Kodiak Island and has worked out extremely well there....

I think there can be no question but that the author of the language which was enacted and became sec. 40(a)(8) intended it to authorize the continued practice of granting exclusive guiding areas and that the legislature, at least by implication, intended the same result in passing the bill.

4. Transferral of guiding rights in exclusive guiding areas. The grant of an exclusive guiding area is a privilege and not a vested right of the grantee. Under sec. 40(a)(8), the privilege may only be granted by the board subject to "equitable and reasonalbe" procedures established by the board. It may not be granted, then, by any other person or group, including the holder of a grant. Furthermore, the authorization by the board of such practice would constitute the abrogation of its statutory duty to establish "equitable and reasonable" procedures for limiting guides to the quota established. Part of the procedure established by the board includes consideration of the use and occupancy of the area by the guide seeking the privilege. To allow the sale or transfer in any manner of the privilege by its holder would destroy the equitable and reasonable nature of the grant since it would eliminate the use and occupancy considerations. Therefore, such practice is beyond the authority of any grantee of an exclusive guiding area and may not be authorized by the board.

5. Three districts per guide before sec. 40(a)(8).

6. Three districts per guide after sec. 40(a)(8).

Sec. 40(a)(8) provides for the establishment of quotas within districts; it does not address itself to the establishment of a three district per guide quota. Therefore, since sec. 40(a)(8) has no effect on such a quota, the board's authority to limit guides to three districts must be based upon some other section in the chpater, and questions 5 and 6 may thus be answered together.

The regulation limiting new certifications to a limit of three districts per guide is 12 AAC 38.040. Before the amendments of February 25, 1977, the authority listed for this regulation was AS 08.54.050, but after the amendment, this was expanded to include AS 08.54.040(a)(3) and (6). These sections have been quoted previously in this memorandum and will not be reproduced here.

The establishment of a three district per guide limitation is within the authority of the board under the broad powers established in sec. 40(a)(3) and (6), for it can be justified as reasonably necessary to the regulation of guiding activity under sec. 40(a)(3) and to the prohibition of guiding activities which are unsafe under sec. 40(a)(6). By limiting a guide to three districts, the board is better able to assure the competence of the guide in the areas where he is guiding. The guide is more likely to become well aware of the individual nature of his guiding area and of the animals and potential dangers therein. Thus, the regulation promotes competency, safety, and conservation in guiding and is within the authority of the board to adopt.

I hope this has satisfactorily answered your questions. If there is anything more I can do for you, please let me know.

Copies to file

Representative Al Osterback, Chairman
House Resources Committee
Alaska State Legislature
Juneau Alaska

Dear Al:

The Commerce Department notified me today that you had scheduled House Joint Resolution 95 for a hearing on Friday afternoon.

The Guide Licensing & Control Board has had to readjust its proposed hearing in Fairbanks and now have it scheduled starting March 27, to run through that week. For some of the members to spend a week away from their jobs has been difficult and they have had to reschedule many of their activities to be prepared to attend the Board meeting. In talking to some of the Board members it seems under the circumstances they would be unable to come to Juneau for Fridays meeting.

Our own staff in Anchorage is loaded with work, tryingto get ready for the meeting, and the Attorney General's office in Anchorage, where we have Liza Fussner as our special attorney, is also swamped. She is in the process of finalizing a full day of court cases for the Board to hear. I would very much like to have her at a hearing in case legal questions come up that the Board members could not answer.

At our last hearing on H.J.R. 95 the time ran on so long that your committee did not hear from the Department of Game or the Attorney General's office. Both of these departments have been somewhat involved in our activities, and where I do not know what their testimony would be it might be that your committee would want to hear from them.

Respectfully yours,

Mark

Marcus F.Jensen, Chairman
Guide Licensing and Control Board

BOARD OF FISHERIES
C/O DEPARTMENT OF FISH AND GAME
SUBPORT BUILDING, JUNEAU 99801

Box 1633
Kodiak, Alaska 99615
May 22, 1978

The Honorable Alvin Osterback
Chairman, Committee on Resources
Alaska House of Representatives
Pouch V
Juneau, Alaska 99811

Dear Representative Osterback:

This is in reply to your April 21 request for comments on CSHB 807 and HCR 105.

CSHB 807. I have no objection to appropriating additional money to the Sport Fish Division for managing Cook Inlet salmon. I assume this is an appropriation that is an addition to the budget and does not replace another program. Better management of the Cook Inlet fishery would ease some of the uncertainty that the Board faces when it makes its allocation decisions. It has become increasingly apparent during my time on the Board that fishing activity and the demands of Alaska's population on the resource are expanding at a faster rate than the appropriations necessary to meet these demands.

HCR 105. The Legislature has given the responsibility of regulating and protecting the fishery resources of Alaska to the Board of Fisheries. I've enclosed a copy of the upper Cook Inlet management policy that the Board adopted last December. Basically the policy designates the subsistence fishermen and the sport fishermen as the primary harvesters of king and silver salmon before June 30 and after August 15. Cook Inlet is one of the most complicated areas to manage in the state. There is a significant overlap of salmon species that are not of prime recreational interest but are of high commercial value during part of this time period. It is the Board's intent to attempt to utilize as fully as possible the commercial species while protecting the recreational species

as much as possible. HCR 105 does not have the flexibility to accomplish this goal. It is for this reason that I am opposed to it. It would result in significant amounts of those salmon which are of no interes+ to sport fishermen being left unharvested.

If I can be of any further assistance, please let me know.

Sincerely,

Nick Szabo
Chairman

Enclosure

cc: Commissioner Skoog
Board Members

Correct Copy

Policy #77-27-FB

COMPREHENSIVE MANAGEMENT POLICY FOR THE UPPER COOK INLET

The dramatically increasing population of the Cook Inlet area has resulted in increasing competition between recreational and commercial fishermen for the Cook Inlet salmon stocks. Concurrently, urbanization and associated road construction has increased recreational angler effort and may adversely affect fisheries habitat. As a result the Board of Fisheries has determined that a policy must now be determined for the long-term management of the Cook Inlet salmon stocks. This policy should rest upon the following considerations:

1. The ultimate management goal for the Cook Inlet stocks must be their protection and, where feasible, rehabilitation and enhancement. To achieve this biological goal, priorities must be set among beneficial uses of the resource.

2. The commercial fishing industry in Cook Inlet is a valuable long-term asset of this state and must be protected, while recognizing the legitimate claims of the non-commercial user.

3. Of the salmon stocks in Cook Inlet, the king and silver salmon are the target species for recreational anglers while the chum, pink, and red salmon are the predominant commercial fishery.

4. User groups should know what the management plan for salmon stocks will be in order that they can plan their use consistent with that plan. Thus, commercial fishermen must know if they are harvesting stocks which in the long-term will be managed primarily for recreational consumption so that they may plan appropriately. Conversely, as recreational demands increase the recreational user must be aware of what stocks will be managed primarily for commercial harvest in order that he not become overly dependent on these fish for recreational purposes.

5. Various agencies should be aware of the long-term management plan so that salmon management needs will be considered when making decisions in areas such as land use planning and highway construction.

6. It is imperative that the Department of Fish and Game receive long-range direction in management of these stocks rather than being called upon to respond to annually changing Board directives. Within the Department, divisions such as F.R.E.D., must receive such long-term direction.

EXHIBIT NO. "13"

page 1 of 2

Therefore, the Board establishes priorities on the following Cook Inlet stocks north of Anchor Point. In so doing it is not the Board's intent to establish exclusive uses of salmon stocks; rather its purpose is to define the primary beneficial use of the stock while permitting secondary uses of the stock to the extent it is consistent with the requirements of the primary user group.

1. Stocks which normally move in Cook Inlet to spawning areas prior to June 30, shall be managed primarily as a non-commercial resource.

2. Stocks which normally move in Cook Inlet after June 30, shall be managed primarily as a non-recreational resource until August 15; however existing recreational target fish shall only be harvested incidental to the non-recreational use; thereafter stocks moving to spawning areas on the Kenai Peninsula shall be managed primarily as a non-commercial resource. Other stocks shall continue to be managed primarily as a non-recreational resource.

3. The Susitna coho, the Kenai king, and the Kenai coho runs cannot be separated from other stocks which are being managed primarily as non-recreational resources; however, efforts shall be made, consistent with the primary management goal, to minimize the non-recreational catch of these stocks.

Nicholas G. Szabo, Chairman
Alaska Board of Fisheries

ADOPTED: December 13, 1977

VOTED: 5-0

EXHIBIT NO. 13

page 2 of 2

(3) Section 6(g) of the Alaska Statehood Act is amended by adding at the end thereof the following new sentence: "As to all selections made by the State after January 1, 1979, pursuant to section 6(b) of this Act, the Secretary of the Interior, in his discretion, may waive the minimum tract selection size where he determines that such a reduced selection size would be in the national interest and would result in a better land ownership pattern.

(h) In furtherance of its entitlement to lands under section 6(b) of the Alaska Statehood Act, the United States hereby conveys to the State of Alaska all right, title, and interest of the United States in and to all vacant, unappropriated, and unreserved lands, including lands subject to subsection (m) of this section, which lie within those townships outside the boundaries of conservation system units established, designated, or expanded by this Act, which are specified in the list of State Selection Interest Lands submitted by the State of Alaska and on file in the office of the Secretary of the Interior, and as depicted on the map entitled "_____", dated March 1978.

(i) (1) Lands identified in subsection (h) are conveyed to the State subject to valid existing rights and Native selection rights under the Alaska Native Claims Settlement Act. All right, title and interest of the United States in and to such lands shall vest in the State of Alaska

Considerations For Alaska State Land Selections

Alaska Department of Natural Resources

February 1, 1978

Planning and Research Section
Department of Natural Resources
323 East 4th Avenue
Anchorage, Alaska 99501

I. Why is the State of Alaska selecting land now?

The Alaska Statehood Act

The Alaska Statehood Act grants the State of Alaska the right to choose and gain title to 104 million acres of federal land in Alaska. The majority of this entitlement, 102.5 million acres, is to provide for present and future settlement including residential, industrial, commercial and recreational land needs. To date the state has selected nearly 75 million acres of this general grant lands entitlement, leaving 25-30 million acres remaining to be selected.

Section 17 (d)(2) of The Alaska Native Claims Settlement Act

Section 17(d)(2) of the Alaska Native Claims Settlement Act directed the Secretary of the Interior to classify up to 80 million acres of Federal land in Alaska for inclusion in the National Park, Wildlife Refuge, Forest and Wild and Scenic River Systems. Congress gave itself until December 31, 1978 to act on the Secretary's recommendations, and over the past six years a number of (d)(2) bills have been introduced. Congress is now considering final (d)(2) legislation.

The State of Alaska is urging Congress to address state land selection rights within the context of (d)(2) legislation. The ultimate goal is to gain Congressional assurrance for land conveyance to the State of Alaska of the majority of our remaining land entitlement as part of any final (d)(2) bill.

II. Why are General Grant Lands so important to Alaskans?

Most of Alaska's 367 million acres of land will continue to be owned and managed by the federal government even after completion of land selections. The federal government will retain ownership of approximately 218 million acres. As a result of the Alaska Native Claims Settlement Act, a large portion of additional lands (44 million acres) will be owned by private native corporations. After all selections are completed, the state will own approximately 29% of the land area, the natives 12% and the federal government 59%. Although it is certain that both the native and federal lands will play a major role in fulfilling many of Alaska's land related needs, it is the state's land that can best be managed through our state and local governments in a way to assure that Alaskans' land needs are met.

III. How does the state decide which lands to choose?

Land and Resource Inventory and Evaluation

To insure the wisest selection of Alaska's remaining land entitlement Governor Hammond initiated a process to identify federal and native over-selected lands within Alaska suitable for state ownership. The Department of Natural Resources is responsible for this process. During the past two years the department has studied and evaluated Alaska's land and natural resources. Agricultural, mineral, forestry, fisheries, wildlife, recreation, land settlement potential, and other values were assessed based on the best information available to state government, including citizen and industry

input, Federal-State Land Use Planning Commission data, and the collective expertise of state land managers and resource experts.

Based on this assessment, the Department of Natural Resources chose 71 separate "state interest" areas to create a selection pool of 45 million acres including federal and native overselected lands. From this pool the state will choose much of its remaining general grant land entitlement.

Public Review

The 45 million acre land pool does not represent state land selections. Rather it is a first step which will alert Congress to our basic desires and provide the basis for public discussion. In an announcement last November, Governor Jay Hammond said, "It is our intention to press aggressively for conveyance of 25 to 30 million acres from this pool and other lands through the (d)(2) legislation. Our decision of which lands should ultimately be selected will only take place after an extensive process of public meetings, and review. Identification of these tentative state interest lands initiates this process of public review and input to our eventual selection action."

The Department of Natural Resources is now in the process of scheduling public meetings in some 19 communities throughout the state. The Department is interested in gathering more local knowledge about lands within the selection pool, as well as hearing people's thoughts concerning the types of lands and the location of lands which the state is considering. Since the tentative pool must be refined, public input gained from these meetings can play a significant role in shaping the eventual selection package.

IV. How can individual Alaskan citizens participate?

A large map of the State of Alaska should be on display in your city hall or community center. This map will show lands which the state has previously selected and the new interest areas which comprise the 45 million acre pool. Consider both the statewide picture as well as the lands in your specific area. Come and discuss your opinions of the state interest areas at the public meeting in your community. Your participation in this program is an important part of the state land selection process.

The following list briefly highlights the basic guidelines which the state is currently following in the consideration of additional lands for selection. (Please note that the listing does not reflect a priority ranking of the guidelines).

1. SETTLEMENT LANDS: The state should select land around regional centers such as Kotzebue, Nome, Bethel and Dillingham as well as additional potential settlement areas for the future in regions such as the Yukon and Kuskokwim River valleys, the uplands of the Yukon Flats and the Bristol Bay drainage.

2. ROADS: The state should continue to emphasize selections in the vicinity of existing transportation routes and potential transportation crossroads or key areas.

3. AGRICULTURE: The state should attempt to select all lands made available rated in the top half of Alaska's agricultural land. Any remaining agricultural lands should be selected if other valuable resource capabilities are specifically identified.

4. FORESTRY: Future selections should attempt to acquire forest lands from the best half of Alaska's forest potential areas.

5. COMMERCIAL FISHERIES: Selections should consist of key parcels of limited acreage and prime locations for purposes of fishery enhancement, hatchery sites, research facilities, and access sites.

6. TOURISM: Recreation lands identified in the White Mountain area, Tangle Lakes area, and near the Alaska Yukon border should be selected, if possible, as well as additions to the highway campground system and noted recreation sites along major waterways.

7. HARD ROCK MINERAL LANDS: The state should balance out existing mineral holdings with very selective acquisitions in mineral areas of known potential, and areas which may become mining activity centers, such as on the Seward Peninsula and the southwest portion of the Brooks Range, to facilitate provision of state services.

8. COAL LANDS: The state should acquire appropriate coal lands which rank in the best third of coal potential lands in the state.

9. OIL AND GAS LANDS: The state's goal should be to refine and augment existing oil and gas holdings or select new areas of extremely high resource potential including consideration of heretofore unavailable areas such as the National Petroleum Reserve - Alaska on the North Slope.

10. WILDLIFE HABITAT AND USE AREAS: The state should select strategic small parcels which will provide access for various wildlife user groups and also key areas to insure continuation of the state's resource management options for wildlife.

11. HIGH USE RECREATION AREAS AND PARKS: The state should select 750,000 acres of potential park lands which are needed to fulfill the state's recreational development plan as well as prime areas for recreation facilities along major roads and waterways.

12. LAND QUALITY: The state should select stable and useable lands of high quality and multiple use value throughout the state.

13. RIVERS AND COASTS: The state should select land for settlement, recreation use, and access values along the Yukon and Kuskokwim Rivers as well as appropriate locations along the coastline of Alaska.

14. PYK LINE: The state should continue past policies of generally not encouraging large residential establishments away from main regional centers north of the Porcupine-Yukon-Kuskokwim River line.

15. OWNERSHIP PATTERN: Selections should attempt to ensure adequate access to existing and future state land areas with particular emphasis on accessibility between state lands and major transportation corridors, rivers and coastlines.

IN THE HOUSE

HOUSE CONCURRENT RESOLUTION NO. 105

IN THE LEGISLATURE OF THE STATE OF ALASKA

TENTH LEGISLATURE - SECOND SESSION

Relating to fishing in Cook Inlet.

BE IT RESOLVED BY THE LEGISLATURE OF THE STATE OF ALASKA:

WHEREAS certain extant and proposed regulations of the Department of Fish and Game concerning the Cook Inlet salmon fishery appear not to be in the best interests of all parties concerned; and

WHEREAS equitable treatment of commercial, subsistence and sport fishermen is of necessity a prime consideration of the law; and

WHEREAS the rapidly expanding population of the Anchorage area is in serious need of enhanced recreational opportunities; and

WHEREAS the fishery resource of Cook Inlet must be judiciously managed to preserve and expand its production levels; and

WHEREAS the contribution of the Cook Inlet fishery to the tourism industry, Alaska's fourth largest industry, is substantial and increasing;

BE IT RESOLVED by the Alaska State Legislature that the Governor is respectfully requested to direct the Department of Fish and Game to promulgate regulations opening the commercial fishery in ~~all~~ North & Central Lethin districts of Cook Inlet from July 1 to August 15 of each year, subject to individual openings and closings within those dates by the Department of Fish and Game, and reserving the remainder of the season, before and after that period, for subsistence and sport fishing. This shall not preclude subsistence and sport fishing during the designated period for commercial fishing.

Representative Alvin Osterback
Chairman, Resources Committee
Alaska State Legislature
Pouch V, Juneau, Ak. 99801

Dear Representative Osterback:

The purpose of this letter is to express support for the Resolution under consideration by your committee which declares the hornless musk ox to be a domestic animal. It is also to offer additional information which might be considered useful, especially with regard to the present domestic musk ox industry which provides a growing number of tundra/coastal village people with a significant portion of their annual income.

It has been customary for agriculturalists to consider an animal as domestic if it met the following standards: 1) its breeding were under the control of man, and through selection certain characteristics were emphasized which differed from their occurence in the wild ancestors; 2) it were maintained under a program of complete husbandry management; 3) it, and its products, were utilized in an active economy.

The musk oxen maintained by this Cooperative meet these standards in the following manners:

I. The present domestic musk ox herd has been selectively bred through several generations. Selection was based upon rapid growth, early maturity, and, particularly, the annual yield of qiviut, the underwool upon which the textile industry is based. An additional factor was selection for small body size in comparison to qiviut yield. In achieving these results, the selective breedin has produced an animal which differs markedly from its wild ancestors, grows faster, matures earlier, and yields more qiviut.

II. The domestic musk ox has been maintained on farms since 1954, is tame, and follows a regular daily agricultural routine which extends from the breeding season in September through the calving and qiviut-collecting season in May-June. It is treated and used as a normal domestic animal.

III. The principal product of the domestic musk ox is its qiviut, or underwool, which is knitted into delicate garments and provides employment and cash incomes for over a hundred persons in the tundra/coastal villages of Alaska. These include Mekoryuk, Tununuk, Nightmute, Bethel, Goodnews Bay, St. Michels, St. Marys, Unalakleet, Fortuna Lodge, Marshall, Elim, Nome, Tooksook Bay, Shishmaref, Kotzebue, Wainwright, Pt. Barrow, Kodiak, and others. At present, plans are in progress to locate herds and to train textile knitters in Unalaska, Akutan, Atka, Teller, St. Lawrence, Kivalina, Point Hope, etc.

IV. Specifically, a domestic musk ox can always be distinguished, even from a distance, because it has no horns - in contrast to its wild ancestors. (The horns have either been removed when calves or, when occuring, the hornless characteristic will be extended through selective breeding

In addition to meeting the above standards for domestic status, these musk oxen have been widely accepted by the general public as domestic, especially with reference to their economic use and farm management. They have also been referred to as domestic animals in the scientific journals, and have been treated as domestic animals in the compilation of agricultural statistics. This followed normal expectations, since domestication has been one of the principal stated goals regarding musk oxen since their importation in 1930.

By means of the Resolution declaring these musk oxen to be domestic, those tundra/coastal people who rely upon them for their livelihood will become eligible for a variety of technical assistance and grants. They also then will enjoy the normal rights and privileges common to the ownership of domestic animals in other areas.

It seems, therefore, that many advantages and benefits will accrue to the participating residents of tundra/coastal Alaska by a declaration that their animal is domestic.

With many thanks for your consideration -

Sincerely yours,

John Teal

STATE OF ALASKA
THE LEGISLATURE

LEGISLATIVE AFFAIRS AGENCY

POUCH Y - STATE CAPITOL
JUNEAU, ALASKA 99811
907 465-3800

MEMORANDUM

April 11, 1978

SUBJECT: Technical Assistance Provided by State Agencies to Domestic Livestock Producers

TO: The Honorable Lisa Rudd

FROM: George Utermohle
Research Analyst G.U.

You have requested us to determine what technical assistance state agencies may provide to domestic livestock producers.

The only state agency which provides services to the producers of domestic livestock is the Division of Agriculture within the Department of Natural Resources. The Division of Agriculture provides veterinary services to livestock producers on a regular basis. The state veterinarian is authorized to "study problems incidental to the raising of livestock and other domestic animals, and advise those engaged therein upon matters pertaining to breeding, care and the prevention and cure of diseases of livestock and other domestic animals" (AS 03.25.020 (6)). Other services which the Division provides to livestock producers include: the assistance of a marketing specialist, particularly for meat and dairy products; meat inspection services; and a slaughter house for reindeer in Nome.

The Alaska statutes do not include a generally applicable definition of "domestic animal" or "domestic livestock". The only definition in the statutes is a definition of "domestic animal" which is meant to include goats, sheep, cattle, horses and swine, however this definition is applicable only to state grazing districts. It would seem that, even in its limited context, this definition is not an exclusive definition of domestic animals. Other livestock or animals would not be excluded from use of state grazing districts by this definition. Thus, in the absence of legislative guidance in the form of statute or resolution, the division of agriculture may exercise its discretion in determining which animals constitute domestic animals or livestock in order to determine eligibility for its services.

Ms. Ginger Baim
c/o Representative Lisa Rudd
Alaska State Legislature
Juneau, Alaska 99801

Dear Ginger:

It was great to receive your splendid letter, and to be brought up-to-date on your whereabouts and activities. Your job with Representative Rudd sounds both interesting and exciting, (have you ever not lived excitingly?), and your reasons are plain decent.

Our producers' cooperative and the farm at Unalakleet are going on, completely independent and on their own feet, thanks to the often valiant work of Sigrun and Bart. There are about 170 village people trained as knitters, more than half very active. I hope to answer village requests for more textile workshops so that we can bring this number up to over 200 by the end of this year. As you know, for many years I have thought that there was no occupation so exploited as the cottage industry, and have insisted upon a village woman having the dignity of her labor and her place of work (her home) through decent pay - even for beginners, at least the national minimum wage, and then, their owning the whole works in addition. Now we hope to start training, six at a time, the men and women who have applied for the whole year training program needed to become herders and herd managers. Starting this summer, if possible, in Unalakleet. We still have our original sex mix in occupations, culturally perhaps too early: some female herders; some male knitters.

The Unalakleet herd is to be a distribution center, and the village most eager to have a station is Unalaska, where the social-economic conditions are poor. There are no hoofed native animals on the island, but we still will use the perimeter fencing, etc., for husbandry purposes. The people there really can use the employment.

You kindly asked if there were something you might do to help the project. There is, and it is of great immediate importance. For ten years, since 1968, I have realized that our project must be free to develope in terms of its proper agricultural directions. It cannot do that if we are associated, even in a remote way, with the Department of Fish & Game. Ours are not wild animals, nor animals to be used as targets for trophy hunters. (In fact, they are a relatively recent importation from Greenland.) They are domestic animals selectively bred through some generations, the basis of an agricultural industry providing employment, and hope for more employment, through a product which doesn't require killing them. They belong under the aegis, if anything, of Alaska's equivalent of a department of agriculture; not Fish and Game and wildlife.

Some years ago I corrsponded with U.S. Senator George Aiken, who had been chairman of the Senate Agriculture Committee, to have them declared what they are, a domestic animal. He told me that the logical first step was to have the state legislature declare them, by either resolution or act, a domestic animal, and to define them as "Domestic Musk Oxen", ovibos domesticus. Such a resolution would automatically shift them from Fish & Game to agriculture - and make the project eligible for technical assistance from the USDA.

I did not bring the matter up in the late Sixties or early Seventies because, frankly, I was warned that my opposition to the trophy-hunting of Nunivak's wild musk oxen had created such a popular animosity that almost anything I proposed would be defeated.

But now, as we are well into the final stage, the spread of this form of agriculture through the tundra/coastal villages, it is appropriate that no time be lost in getting them declared domestic animals - and out to the aegis of agriculture.

It occurs to me that Representative Rudd might be willing to give it a try? It is vital to us, to a large and growing number of remote village people employed by and members of the Cooperative - and the need is immediate.

Would you be interested in approaching Representative Rudd and asking for her help?

Meanwhile, with many thanks for your letter and good news -

Sincerely,

John

Re: HCR 124

Representative Alvin Osterback
Chairman, Resources Committee
Alaska State Legislature
Pouch V, Juneau, Ak. 99801

Dear Representative Osterback:

The purpose of this letter is to express support for the Resolution under consideration by your committee which declares the hornless musk ox to be a domestic animal. It is also to offer additional information which might be considered useful, especially with regard to the present domestic musk ox industry which provides a growing number of tundra/coastal village people with a significant portion of their annual income.

It has been customary for agriculturalists to consider an animal as domestic if it met the following standards: 1) its breeding were under the control of man, and through selection certain characteristics were emphasized which differed from their occurence in the wild ancestors; 2) it were maintained under a program of complete husbandry management; 3) it, and its products, were utilized in an active economy.

The musk oxen maintained by this Cooperative meet these standards in the following manners:

I. The present domestic musk ox herd has been selectively bred through several generations. Selection was based upon rapid growth, early maturity, and, particularly, the annual yield of qiviut, the underwool upon which the textile industry is based. An additional factor was selection for small body size in comparison to qiviut yield. In achieving these results, the selective breeding has produced an animal which differs markedly from its wild ancestors, grows faster, matures earlier, and yields more qiviut.

II. The domestic musk ox has been maintained on farms since 1954, is tame, and follows a regular daily agricultural routine which extends from the breeding season in September through the calving and qiviut-collecting season in May-June. It is treated and used as a normal domestic animal.

III. The principal product of the domestic musk ox is its qiviut, or underwool, which is knitted into delicate garments and provides employment and cash incomes for over a hundred persons in the tundra/coastal villages of Alaska. These include Mekoryuk, Tanunuk, Nightmute, Bethel, Goodnews Bay, St. Michels, St. Marys, Unalakleet, Fortuna Lodge, Marshall, Elim, Nome, Tooksook Bay, Shishmaref, Kotzebue, Wainwright, Pt. Barrow, Kodiak, and others. At present, plans are in progress to locate herds and to train textile knitters in Unalaska, Akutan, Atka, Teller, St. Lawrence, Kivalina, Point Hope, etc.

IV. Specifically, a domestic musk ox can always be distinguished, even from a distance, because it has no horns - in contrast to its wild ancestors. (The horns have either been removed when calves or, when occuring, the hornless characteristic will be extended through selective breeding.)

In addition to meeting the above standards for domestic status, these musk oxen have been widely accepted by the general public as domestic, especially with reference to their economic use and farm management. They have also been referred to as domestic animals in the scientific journals, and have been treated as domestic animals in the compilation of agricultural statistics. This followed normal expectations, since domestication has been one of the principal stated goals regarding musk oxen since their importation in 1930.

By means of the Resolution declaring these musk oxen to be domestic, those tundra/coastal people who rely upon them for their livelihood will become eligible for a variety of technical assistance and grants. They also then will enjoy the normal rights and privileges common to the ownership of domestic animals in other areas.

It seems, therefore, that many advantages and benefits will accrue to the participating residents of tundra/coastal Alaska by a declaration that their animal is domestic.

With many thanks for your consideration -

Sincerely yours,

John Teal

GOVERNOR HAMMOND SEEKS POSITION ON FISHERIES CONVENTION
March 14, 1977
#47

Governor Jay Hammond has directed the Alaska State Fisheries Council to propose an Alaska position on the future of the International North Pacific Fisheries Convention (INPFC).

The Commission regulates aspects of high seas fishing involving the U. S., Canada, and Japan. Hammond said the U. S. State Department about a month ago gave the required one-year notice of its intention to terminate the INPFC. Hammond said, "The real purpose of that notice is to create a strong sense of urgency that prompts Japan and Canada into renegotiating the treaty within one year."

The annual INPFC meeting is set for Anchorage in October. Hammond said, "During the 23 year life of the INPFC, built-in procedural roadblocks have prevented us from strengthening our long-standing position of terminating the Japanese high seas salmon fishery on stocks of Bristol Bay and Western Alaska origin. One of the benefits for Alaska from adoption of the extended jurisdiction law was the strengthening of that position. Renegotiation of the treaty should bring it into conformity with the extended jurisdiction law. We must take advantage of this opportunity to achieve the best treaty terms for Alaskans and that is why I have asked the Alaska

State Fisheries Council to study and then recommend an Alaska position."

Hammond said the State Fisheries Council will ask for the assistance of others knowledgeable in the activities of the INPFC and of fisheries management in Alaska.

He said the Council will first prepare a draft position paper on renegotiation objectives which will be the basis for public hearings at appropriate locations, after which the Alaska State Fisheries Council will formulate a solid, effective Alaska position.

Hammond added, "A unified Alaskan position will give us the maximum influence in formulating the United States position at meetings later this year, as well as working most effectively at subsequent international negotiating sessions."

REPORT FROM OIL & GAS SUB-COMMITTEE
ON H.J.R. #11

Mr. Chairman & Members:

The sub-committee on Oil and Gas has unanimously decided to return H.J.R. 11 to the full resources committee with a "do pass" recomendation, following their meeting at 1:00 p.m. January 24.

It has been requested that the full committee hear brief testimony from Ms. Sam dal Piaz, lobbyist for the Alaska Conservation Society. It is my understanding that she will be speaking in favor of the resolution and will be present in the committee room at 1:00 p.m..

It has also been suggested that I contact the office of The Honorable Warren G. Magnuson, Chairman of the Senate Committee on Commerce, requesting a possible "Time-Table" and "Feasibility" reaction. This I will do, the morning of January 25, and report any information I receive to the full committee.

Dear Commissioner,

The House Resources Committee will be reviewing HJR 29 Federal Oil Spill Liability Legislation on Thursday March 17, 1977, at 1:15 p.m. in Room 118 of the Capitol Building.

Please supply us with a position paper or material you have on this bill by the time of the meeting. If you have any information pertinent to these topics, the committee would appreciate receiving that, too. If you know of other interested groups, please contact them.

If you have suggested amendments, please supply the staff with copies of that prior to the meeting.

If there is a fiscal implication and a note is necessary, please prepare it and submit it to the committee -- preferably prior to the meeting.

Thank you for your cooperation.

IN THE HOUSE BY SPECKING AND MALONE

HOUSE JOINT RESOLUTION NO. 29

IN THE LEGISLATURE OF THE STATE OF ALASKA

TENTH LEGISLATURE - FIRST SESSION

Relating to federal oil spill liability legislation.

BE IT RESOLVED BY THE LEGISLATURE OF THE STATE OF ALASKA:

WHEREAS the United States House of Representatives is presently considering comprehensive oil spill liability legislation which includes a provision for preempting state oil spill liability laws; and

WHEREAS Alaska recognizes the great need for comprehensive federal legislation in this critical area to replace the presently inadequate and incomplete liability provisions of present federal law; and

WHEREAS oil spill liability law is an essential means for states to encourage safe oil tanker operation, especially considering the great preponderance of oil spills which are caused by human error; and

WHEREAS Alaska's oil spill liability law provides unique incentives for safe tanker operation; and

WHEREAS a limitation on oil spill removal liability as proposed in H.R. 776 and similar legislation is an arbitrary limit which may not cover the cleanup costs of accidents resulting from present petroleum operations in Alaska nor the probable future petroleum operations in offshore, ice-covered regions; and

WHEREAS Alaska's greatest resource wealth is her renewable resources; and

WHEREAS these renewable resources should be protected to the greatest degree possible from potential damage from nonrenewable resource development;

BE IT RESOLVED that the Alaska State Legislature respectfully requests that the Congress of the United States not preempt the several states from maintaining oil spill liability law which encourages safe petroleum

operations; and be it

FURTHER RESOLVED that the Alaska State Legislature encourages the U. S. Congress to allow the test of time to determine whether state liability legislation is indeed a complementary component to federal comprehensive oil spill liability law.

COPIES of this resolution shall be sent to the Honorable John M. Murphy, Chairman of the House Committee on Merchant Marine and Fisheries; and to the Honorable Ted Stevens and the Honorable Mike Gravel, U. S. Senators, and the Honorable Don Young, U. S. Representative, members of the Alaska delegation in Congress.

To Chief Clerk 3/14/77

Irene,

Sorry, but I just got the CS from upstairs —

Deanie Nelson

OUTGOING TELEGRAM

February 23, 1977
8:20 p.m. PST
Reno, Nevada
Operator 278

The Honorable Don Young
U. S. House of Representatives
Washington, D. C.

I understand that the Subcommittee on the Coast Guard of the House Merchant Marine and Fisheries Committee is again considering legislation on comprehensive oil pollution liability and compensation, and that hearings will be held this week. Last year HR 14862 was passed out of committee, and has been reintroduced as HR 776. While we support the concept of this bill, we strongly object to the provision in Sec. 110(a) preempting State jurisdiction over the field of liability, or State development of funds to provide for cleanup and third party damages. Further, we are of the opinion that any such legislation must serve, not only as a source of readily available funds for recovery of damages, but must also provide an economic incentive to improve vessel construction and operation. HR 776 does not accomplish the latter.

In the last few years, a number of states, including our own, have developed schemes to either provide for state-operated cleanup programs or third party damage claims, or both. Most such programs are funded through per barrel taxes, civil penalties, license fees, premiums, or a combination thereof.

Alaska's program is unique in that it is designed to provide incentives for safer operations and funds only oil spill cleanup costs, rather than including third party damages. We feel that this scheme is compatible with the development of a national program.

As well, we are concerned that the Federal program, through preemption of jurisdiction of State courts, would be unsympathetic to the peculiar needs of Alaskans, particularly those dependent upon ocean resources for their livelihood. State courts, which have traditionally handled liability, are much more acquainted with both the field and local perspective and need.

We will provide you and the Subcommittee with more detailed information soon.

Ernst W. Mueller
Commissioner
Alaska Department of Environmental Conservation

STATE OF ALASKA

JAY S. HAMMOND, GOVERNOR

DEPARTMENT OF FISH AND GAME

OFFICE OF THE COMMISSIONER

SUBPORT BUILDING – JUNEAU 99801

April 8, 1977

The Honorable Alvin Osterback
Chairman, House Resources Committee
Alaska State Legislature
Pouch V, State Capitol
Juneau, Alaska 99811

Dear Mr. Osterback:

This is in reply to your letter of March 21, 1977 requesting information on the proposed Arctic National Wildlife Range resolutions.

The Department supports the passage of HCR 41 Arctic National Wildlife Range Protection and HJR 34 Environmental Defense of the Arctic National Wildlife Range. The resolutions are consistent with the intent of the withdrawal which established the Range to preserve the "unique wildlife, wilderness and recreational values" of the area.

During the Gas Line Public Hearings, the Department opposed development within the Arctic National Wildlife Range. The Range is unique in that it is the United States' last example of virtually undisturbed arctic ecosystems-- coastal plain, foothills, mountains and the plant and animal species that exist there.

The Arctic National Wildlife Range provides habitat for caribou, bears, wolves, musk oxen and other mammals. It is a nesting, molting and staging area for waterfowl, gulls, terns and other birds.

Caribou are probably most dependent upon the Range not being disturbed by development. The Porcupine caribou herd has an estimated population of 100,000 - 120,000 animals which makes it the largest caribou herd in the state. The Porcupine herd's calving grounds are within the boundaries of the Range. Although the herd uses different ranges and migration patterns from time to time, the calving areas tend to remain constant and are critical to the caribou's existence. Development in the calving areas would be extremely detrimental to the herd.

The Range is also a scientific laboratory and asset and a recreational resource. Development within the Arctic National Wildlife Range would diminish the value of these activities and would destroy some of the Range's most important values. The Arctic National Wildlife Range's primary value is as an essentially pristine area that contains the entire sweep of natural ecological communities from the Brooks Range to the Arctic Ocean. This value can be protected only by maintaining the integrity of the Range.

The Department believes the term "commercial development" needs clarification. Although the Department opposes industrial types of development, we have no objection to guiding and related activities. It should be made clear that the guide industry will not be adversely affected by the resolutions.

The Department is not submitting a fiscal note at this time. Although it is not anticipated that additional funds will be necessary, the actions taken by the Governor and the President of the United States will be the determining factor in this regard.

If additional information is needed please let me know.

Sincerely,

for James W. Brooks
Commissioner

file

February 7, 1978

Honorable Kay Poland
Alaska State Legislature
Juneau, AK 99801

Dear Senator Poland:

In response to the request by the Senate Resources Committee in their final day of hearings on Senate Bills 439 and 440, and Senate Joint Resolution 37, the following information is submitted:

The average yearly take of bowhead whales by all Alaskan Eskimo villages for the past ten years is 24.4 whales. The take in 1976 was 48 whales.

The average yearly take of bowhead whales in Barrow for the past ten years is 13 whales. The take in 1976 was 23 whales.

The average yearly take of bowhead whales by Soviet natives for the past five years is 2 whales. They took no bowhead whales in 1976.

A call this morning to Dr. George Harry, Director of the Marine Mammal Division of National Marine Fisheries Service in Seattle, confirms that there has been no take of bowhead whales by Canadian Eskimos in recent years.

Bowhead whale catch statistic tables have been attached for your information. Please do not hesitate to call on us if we can be of any further assistance.

Sincerely,

Harry L. Rietze

HJR 60

STATE OF ALASKA

DEPT. OF ENVIRONMENTAL CONSERVATION

JAY S. HAMMOND, GOVERNOR

POUCH O – JUNEAU 99811

February 22, 1978

The Honorable Alvin Osterback
Chairman
Resources Committee
House of Representatives
Pouch V
Juneau, Alaska 99811

Dear Mr. Chairman:

I understand that your Committee is planning to receive testimony on House Joint Resolution No. 60 (requesting the federal government to remove solid waste on land in Alaska in accordance with the Resource Conservation and Recovery Act). This department played an active role in shaping several provisions of the Federal Resource Conservation and Recovery Act (RCRA). To provide you with some background information on the issue addressed by HJR 60, I thought that it might be useful to include some history of our involvement with the Act and our basic rationale for the provisions which we persuaded Congress to include in the law.

Two years ago Deputy Commissioner Reinwand and I worked closely with the National Governors' Association and Senator Gravel, who is a ranking member of the Senate Environment and Public Works Committee, to win congressional approval of several provisions to the 1976 Resource Conservation and Recovery Act. The key provision waived the federal government's sovereign immunity, thereby requiring federal facilities to obtain state permits for solid waste disposal sites. The definition of a disposal site was purposefully written to be sweeping in its scope so that abandoned junk on federal lands could be regulated under a state's solid waste management program.

Another important provision which we were successful in placing in the Act mandates the federal government to complete a study of the federal lands solid waste problem in Alaska. The results of the study are to be submitted to Congress, together with any recommendations for action to correct the problem. A second report will be completed in mid-April and submitted to Congress. This department is coordinating the study--at EPA's request--and we will be using the data gathered to design a comprehensive program to require the federal government to clean up the problems.

During the course of the study, we pinpointed several extremely serious problems which warrant immediate attention. One problem is the environmental messes that exist at certain active DEWLine sites. Through our permit programs we are requiring the Air Force to take action to correct them. I have enclosed a copy of the draft permit which we are proposing to issue to the Air Force for its Barter Island site. The draft permit is being circulated to the Air Force and interested members of the public for review and comment. When we have received comments from the Air Force and public, we will sift through them to determine if changes should be made in finalizing the permit.

We plan to take similar action where problems exist on federal lands throughout the State. The message we are sending to the federal government is that we want compliance with State solid waste laws and regulations, and we want compliance to be accomplished in an expeditious manner.

Therefore, we support the thrust of HJR 60 and deeply appreciate the Legislature's interest in this matter. However, there are a few technical changes which we would like to recommend that the Committee consider. They are:

1. On page 2, line 1, we recommend that the words "the Environmental Protection Agency to implement" be stricken, and replaced with: "all federal agencies administering public lands in Alaska to take swift action to remove or dispose of solid wastes identified in."

   The rationale for this change is that the appropriate land management agencies, not EPA, should be responsible for cleaning up the existing solid waste problems.

2. On page 2, line 7, we recommend the inclusion of the following paragraph:

   "BE IT FURTHER RESOLVED that the Alaska Legislature strongly supports the Department of Environmental Conservation in its regulatory programs to require federal agencies to take action to solve the long-standing environmental problems created by the solid waste which the federal government has left throughout the State."

   This paragraph would buttress the Department's current and planned efforts to require the federal government to solve the solid waste problem in an expeditious manner.

Support from the Legislature would strengthen the Department's efforts in dealing with the federal agencies.

3. On page 2, line 11, between the words "Congress" and "and" insert: "the Honorable Jennings Randolph, Chairman of the Senate Environment and Public Works Committee, the Honorable Harley O. Staggers, Chairman of the House Committee on Interstate and Foreign Commerce."

We recommend inclusion of these two members of Congress as they chair the committees which have jurisdiction over solid waste legislation.

If you have any questions on this matter, please do not hesitate to contact me or my Deputy Commissioner Jerry Reinwand.

Sincerely,

Ernst W. Mueller
Commissioner

Enclosure

STATE OF ALASKA

WASTE DISPOSAL PERMIT
(SOLID WASTE MANAGEMENT PERMIT)

Permit No. NR-1-78 Date of Issuance:

This Waste Disposal Permit is issued to Department of the Air Force, Detachment 3, 46th Aerospace Defense Wing (ADCOM), Petersen Air Force Base, Colorado 80914, for the operation and maintenance of a solid waste facility located in SE 1/4, Sec. 13, T9N, R34E Umiat Meridian, at Barter Island DEW Line Station, Alaska

and is subject to the conditions and stipulations in sections A.1 through D.9, of this permit and the applicable State laws and regulations.

This permit is issued under provisions of Alaska Statutes, AS 46.03.100-110, Water, Air, and Environmental Conservation, Alaska Administrative Code as amended or revised, and other applicable State laws and regulations.

This permit is effective upon issuance and expires July 31, 1980; it may be terminated or modified in accordance with AS 46.03.120.

This permit is not valid until signed by the Deputy Commissioner of the Department of Environmental Conservation.

Deputy Commissioner
Department of Environmental Conservation

A. SITE PREPARATION--The permittee shall

1. Submit to this department for approval, on or before ~~April~~ May 15, 1978. A disposal site development and operation plan for the permitted facility. The plan shall include:

   a. a profile of the permitted site's soils.

   ~~a.~~ b detailed facility maps or plan sheets showing existing contours, proposed developments, type of landfill method (trench or area), locations, diminsions and order of refuse cell construction and proposed finished site contours.

   ~~b. description of the existing site soil profile.~~

   c. detailed narrative of the proposed developments including step by step descriptions of the proposed operating procedures for trench excavation, cell construction, scrap metal recovery and other activities associated with operation of the disposal facility.

~~Upon receiving departmental approval, this permit will be amended to incorporate the approved plan activities as an integral part of the permit.~~ This permit shall be amended to incorporate the development and operation plan as soon as it has received departmental approval.

2. Maintain a working copy of the department approved development and operational plan from A.1. at Bar-M for use in constructing and operating the facility.

3. Submit a proposed schedule of operating hours and days to this department for review and approval within thirty days of the date of issuance of this permit.

4. Erect and maintain signs informing users of the site operating hours and rules, and signs directing users to the active dumping point.

B. CLEAN UP OF EXISTING SOLID WASTE--The permittee shall:

1. Remove all solid wastes from the existing open dump and transfer it to the proposed facility. Salvageable metal shall be separated and stockpiled in the proposed reclaimable metal holding area. The remaining solid waste shall be landfilled in accordance with the department approved site development plan specified in A.1. All solid wastes shall be transferred and processed, and the existing dump closed and restored not later than September 15, 1978.

2. Collect all solid wastes from the shallow waters, inter-tidal areas and beaches near the Bar-M station and the affected portions of the Arctic Wildlife Range. Collected wastes shall be transported to the proposed landfill for processing and disposal as specified in B.1.

3. Transport the abandoned metal tower located about one and one-half miles from the existing open dump to the proposed reclaimable metal holding area, on or before September 15, 1978.

4. Cleanup and restore the Manning Point site by September 15, 1979. Cleanup activities shall be coordinated with the North Slope Borough and the Kaktovik Inupiat Corporation. A plan for the cleanup will be submitted to the North Slope Borough, the Kaktovik Inuipiat Corporation and this department's Northern Region Office at least 90 days before the initiation of any cleanup action. The cleanup shall include at a minimum:

   a. Collection and removal from Alaska of all P.O.L. barrels by September 15, 1979.

   b. Removal of all collapsed buildings, and collection of all miscellaneous solid waste. Scrap lumber and wood may be open burned under terms of an Open Burning Permit to be obtained from the department's Northern Regional Office. All other materials shall be transported to the proposed landfill for salvage or disposal.

   c. Surface rehabilitation, including reseeding of disturbed areas, shall be accomplished no later than September 15, 1979.

5. Remove from Alaska, no later than September 15, 1979, all salvageable and reclaimable materials collected during the cleanup operations.

C. OPERATION--The permittee shall:

1. Consolidate and compact the deposited wastes into cells in accordance with the approved submittal required in A.1., above.

2. Cover the compacted refuse with at least six inches of compacted soil at the end of each operating day.

3. Separate salvageable metals and stockpile them in the reclaimable metals holding area indicated on the permit application. The accumulated wastes shall be transported South to a processing center and the holding area cleaned out at least once each year.

4. Collect all littered and windblown wastes in and adjacent to the disposal facility at least once each month and return them to the active dumping point for burial.

5. Prohibit open burning on the landfill and immediately extinguish any fires that may occur.

6. Prohibit the deposition of waste oil and petroleum products and chemical and hazardous wastes.

7. Incinerate all combustible and putrescible waste generated at the Bar-M station prior to disposal.

8. Comply with all portions of the permit application not otherwise addressed herein.

D. GENERAL

1. The permittee shall allow the Commissioner of Environmental Conservation or his authorized representative, upon presentation of credentials,

a. to enter upon the permittee's premises where waste collection or disposal works are located at such times and upon such terms as the Department may reasonably require, and
b. at reasonable times, to have access to and to be allowed to copy any records required to be kept under the terms and conditions of this permit and to inspect any monitoring equipment or monitoring method required in this permit.

2. Availability of Records

Except for information relating to secret processes or methods of manufacture, all records and reports prepared in accordance with the terms of this permit shall be available for public inspection at the offices of the Alaska Department of Environmental Conservation.

3. Civil and Criminal Liability

Nothing in this permit shall be construed to relieve the permittee from civil or criminal penalties for noncompliance, whether or not such noncompliance is due to factors beyond his control, including but not limited to accidents, equipment breakdowns, or labor disputes.

4. Property Rights

The issuance of this permit does not convey any property rights in either real or personal property, or any other privileges; nor does it authorize any injury to private property or any invasion or personal rights, nor any infringements of federal, State or local laws and regulations.

5. Severability

The provisions of this permit are severable and, if any provision of this permit or the application of any provision of this permit to any circumstances is held invalid, the application of such provision to other circumstances and the remainder of this permit shall not be affected thereby. Notwithstanding the above, in the event that such invalidation materially alters the scope or conditions of this permit, the Department shall have the right, at its sole option, to terminate the permit.

6. State Laws

Nothing in this permit shall be construed to preclude the institution of any legal action or relieve permittee from any responsibilities, liabilities, or penalties established pursuant to any applicable State law or regulation.

7. Posting of Permit

The permittee shall post conspicuously and maintain a copy of this permit at the disposal facility.

8. Transfers

This permit is not transferable and is the property of the State of Alaska, Department of Environmental Conservation. Should operation

of the facility be contracted or a change in contractors be made, the new contractor shall be notified in writing of the existence of the permit and its conditions. A copy of the written notification shall be forwarded to the Commissioner of the Department of Environmental Conservation.

9. This permit shall be amended to provide for the upgrading or closure of the site, if the facility is classified as an "open dump" in accordance with the inventory and definitions being developed by the Environmental Protection Agency under the Resource Conservation and Recovery Act of 1976, P.L. 94-580.

updating of standards for recovered materials and for the use of recovered materials in various industrial, commercial, and governmental uses.

"DEVELOPMENT OF MARKETS FOR RECOVERED MATERIALS

"SEC. 5003. The Secretary of Commerce shall within two years after the enactment of this Act take such actions as may be necessary to— 42 USC 6953.

"(1) identify the geographical location of existing or potential markets for recovered materials;

"(2) identify the economic and technical barriers to the use of recovered materials; and

"(3) encourage the development of new uses for recovered materials.

"SEC. 5004. The Secretary of Commerce is authorized to evaluate the commercial feasibility of resource recovery facilities and to publish the results of such evaluation, and to develop a data base for purposes of assisting persons in choosing such a system. 42 USC 6954.

"Subtitle F—Federal Responsibilities

"APPLICATION OF FEDERAL, STATE, AND LOCAL LAW TO FEDERAL FACILITIES

"SEC. 6001. Each department, agency, and instrumentality of the executive, legislative, and judicial branches of the Federal Government (1) having jurisdiction over any solid waste management facility or disposal site, or (2) engaged in any activity resulting, or which may result, in the disposal of solid waste or hazardous waste shall be subject to, and comply with, all Federal, State, interstate, and local requirements, both substantive and procedural (including any requirement for permits or reporting or any provisions for injunctive relief and such sanctions as may be imposed by a court to enforce such relief), respecting control and abatement of solid waste or hazardous waste disposal in the same manner, and to the same extent, as any person is subject to such requirements, including the payment of reasonable service charges. Neither the United States, nor any agent, employee, or officer thereof, shall be immune or exempt from any process or sanction of any State or Federal Court with respect to the enforcement of any such injunctive relief. The President may exempt any solid waste management facility of any department, agency, or instrumentality in the executive branch from compliance with such a requirement if he determines it to be in the paramount interest of the United States to do so. No such exemption shall be granted due to lack of appropriation unless the President shall have specifically requested such appropriation as a part of the budgetary process and the Congress shall have failed to make available such requested appropriation. Any exemption shall be for a period not in excess of one year, but additional exemptions may be granted for periods not to exceed one year upon the President's making a new determination. The President shall report each January to the Congress all exemptions from the requirements of this section granted during the preceding calendar year, together with his reason for granting each such exemption. 42 USC 6961. Exemptions. Presidential report to Congress.

SOLID WASTE CLEANUP ON FEDERAL LANDS IN ALASKA

Study.
42 USC 6981 note.

SEC. 3. (a) The President shall direct such executive departments or agencies as he may deem appropriate to conduct a study, in consultation with representatives of the State of Alaska and the appropriate Native organizations, to determine the best overall procedures for removing existing solid waste on Federal lands in Alaska. Such study shall include, but shall not be limited to, a consideration of—

(1) alternative procedures for removing the solid waste in an environmentally safe manner, and

(2) the estimated costs of removing the solid waste.

Report to congressional committees.

(b) The President shall submit a report of the results together with appropriate supporting data and such recommendations as he deems desirable to the Committee on Public Works of the Senate and to the Committee on Interstate and Foreign Commerce of the House of Representatives not later than one year after the enactment of the Solid Waste Utilization Act of 1976. The President shall also submit, within six months after the study has been submitted to the committees, recommended administrative actions, procedures, and needed legislation to implement such procedures and the recommendations of the study.

Llangollen Landfill, Del., leachate control research program.
42 USC 6981 note.

SEC. 4. (a) In order to demonstrate effective means of dealing with contamination of public water supplies by leachate from abandoned or other landfills, the Administrator of the Environmental Protection Agency is authorized to provide technical and financial assistance for a research program to control leachate from the Llangollen Landfill in New Castle County, Delaware.

Cooperation with EPA.

(b) The research program authorized by this section shall be designed by the New Castle County areawide waste treatment management program, in cooperation with the Environmental Protection Agency, to develop methods for controlling leachate contamination from abandoned and other landfills that may be applied at the Llangollen Landfill and at other landfills throughout the Nation. Such research program shall investigate all alternative solutions or corrective actions, including—

(1) hydrogeologic isolation of the landfill combined with the collection and treatment of leachate;

(2) excavation of the refuse, followed by some type of incineration;

(3) excavation and transportation of the refuse to another landfill; and

(4) collection and treatment of contaminated leachate or ground water.

Such research program shall consider the economic, social, and environmental consequences of each such alternative.

(c) The Administrator of the Environmental Protection Agency shall make available personnel of the Agency, including those of the Solid and Hazardous Waste Research Laboratory (Cincinnati, Ohio), and shall arrange for other Federal personnel to be made available, to provide technical assistance and aid in such research. The Administrator may provide up to $250,000, of the sums appropriated under the Solid Waste Disposal Act, to the New Castle County areawide waste treatment management program to conduct such research, including obtaining consultant services.

42 USC 6901 note.

STATE OF ALASKA
DEPARTMENT OF ENVIRONMENTAL CONSERVATION
POUCH O
JUNEAU, ALASKA 99811

WASTE DISPOSAL PERMIT
(SOLID WASTE MANAGEMENT PERMIT)

Permit No. NR-1-78 Date of Issuance:

This Waste Disposal Permit is issued to Department of the Air Force, Detachment 3, 46th Aerospace Defense Wing (ADCOM), Petersen Air Force Base, Colorado 80914, for the operation and maintenance of a solid waste facility located in SE 1/4, Sec. 13, T9N, R34E Umiat Meridian, at Barter Island DEW Line Station, Alaska

and is subject to the conditions and stipulations in sections A.1 through D.9, of this permit and the applicable State laws and regulations.

This permit is issued under provisions of Alaska Statutes, AS 46.03.100-110, Water, Air, and Environmental Conservation, Alaska Administrative Code as amended or revised, and other applicable State laws and regulations.

This permit is effective upon issuance and expires July 31, 1980; it may be terminated or modified in accordance with AS 46.03.120.

This permit is not valid until signed by the Deputy Commissioner of the Department of Environmental Conservation.

Deputy Commissioner
Department of Environmental Conservation

A. SITE PREPARATION--The permittee shall

1. Submit to this department for approval, on or before ~~April~~ May 15, 1978. A disposal site development and operation plan for the permitted facility. The plan shall include:

a. a profile of the permitted site's soils.

~~a.~~ b. detailed facility maps or plan sheets showing existing contours, proposed developments, type of landfill method (trench or area), locations, diminsions and order of refuse cell construction and proposed finished site contours.

~~b.~~ ~~description of the existing site soil profile.~~

c. detailed narrative of the proposed developments including step by step descriptions of the proposed operating procedures for trench excavation, cell construction, scrap metal recovery and other activities associated with operation of the disposal facility.

This permit shall be amended to incorporate the development ~~Upon receiving departmental approval, this permit will be amended to incorporate the approved plan activities as an integral part of the permit.~~ and operation plan as soon as it has received departmental approval.

2. Maintain a working copy of the department approved development and operational plan from A.1. at Bar-M for use in constructing and operating the facility.

3. Submit a proposed schedule of operating hours and days to this department for review and approval within thirty days of the date of issuance of this permit.

4. Erect and maintain signs informing users of the site operating hours and rules, and signs directing users to the active dumping point.

B. CLEAN UP OF EXISTING SOLID WASTE--The permittee shall:

1. Remove all solid wastes from the existing open dump and transfer it to the proposed facility. Salvageable metal shall be separated and stockpiled in the proposed reclaimable metal holding area. The remaining solid waste shall be landfilled in accordance with the department approved site development plan specified in A.1. All solid wastes shall be transferred and processed, and the existing dump closed and restored not later than September 15, 1978.

2. Collect all solid wastes from the shallow waters, inter-tidal areas and beaches near the Bar-M station and the affected portions of the Arctic Wildlife Range. Collected wastes shall be transported to the proposed landfill for processing and disposal as specified in B.1.

3. Transport the abandoned metal tower located about one and one-half miles from the existing open dump to the proposed reclaimable metal holding area, on or before September 15, 1978.

4. Cleanup and restore the Manning Point site by September 15, 1979. Cleanup activities shall be coordinated with the North Slope Borough and the Kaktovik Inupiat Corporation. A plan for the cleanup will be submitted to the North Slope Borough, the Kaktovik Inuipiat Corporation and this department's Northern Region Office at least 90 days before the initiation of any cleanup action. The cleanup shall include at a minimum:

   a. Collection and removal from Alaska of all P.O.L. barrels by September 15, 1979.

   b. Removal of all collapsed buildings, and collection of all miscellaneous solid waste. Scrap lumber and wood may be open burned under terms of an Open Burning Permit to be obtained from the department's Northern Regional Office. All other materials shall be transported to the proposed landfill for salvage or disposal.

   c. Surface rehabilitation, including reseeding of disturbed areas, shall be accomplished no later than September 15, 1979.

5. Remove from Alaska, no later than September 15, 1979, all salvageable and reclaimable materials collected during the cleanup operations.

C. OPERATION--The permittee shall:

1. Consolidate and compact the deposited wastes into cells in accordance with the approved submittal required in A.1., above.

2. Cover the compacted refuse with at least six inches of compacted soil at the end of each operating day.

3. Separate salvageable metals and stockpile them in the reclaimable metals holding area indicated on the permit application. The accumulated wastes shall be transported South to a processing center and the holding area cleaned out at least once each year.

4. Collect all littered and windblown wastes in and adjacent to the disposal facility at least once each month and return them to the active dumping point for burial.

5. Prohibit open burning on the landfill and immediately extinguish any fires that may occur.

6. Prohibit the deposition of waste oil and petroleum products and chemical and hazardous wastes.

7. Incinerate all combustible and putrescible waste generated at the Bar-M station prior to disposal.

8. Comply with all portions of the permit application not otherwise addressed herein.

D. GENERAL

1. The permittee shall allow the Commissioner of Environmental Conservation or his authorized representative, upon presentation of credentials,

a. to enter upon the permittee's premises where waste collection or disposal works are located at such times and upon such terms as the Department may reasonably require, and
b. at reasonable times, to have access to and to be allowed to copy any records required to be kept under the terms and conditions of this permit and to inspect any monitoring equipment or monitoring method required in this permit.

2. Availability of Records

Except for information relating to secret processes or methods of manufacture, all records and reports prepared in accordance with the terms of this permit shall be available for public inspection at the offices of the Alaska Department of Environmental Conservation.

3. Civil and Criminal Liability

Nothing in this permit shall be construed to relieve the permittee from civil or criminal penalties for noncompliance, whether or not such noncompliance is due to factors beyond his control, including but not limited to accidents, equipment breakdowns, or labor disputes.

4. Property Rights

The issuance of this permit does not convey any property rights in either real or personal property, or any other privileges; nor does it authorize any injury to private property or any invasion or personal rights, nor any infringements of federal, State or local laws and regulations.

5. Severability

The provisions of this permit are severable and, if any provision of this permit or the application of any provision of this permit to any circumstances is held invalid, the application of such provision to other circumstances and the remainder of this permit shall not be affected thereby. Notwithstanding the above, in the event that such invalidation materially alters the scope or conditions of this permit, the Department shall have the right, at its sole option, to terminate the permit.

6. State Laws

Nothing in this permit shall be construed to preclude the institution of any legal action or relieve permittee from any responsibilities, liabilities, or penalties established pursuant to any applicable State law or regulation.

7. Posting of Permit

The permittee shall post conspicuously and maintain a copy of this permit at the disposal facility.

8. Transfers

This permit is not transferable and is the property of the State of Alaska, Department of Environmental Conservation. Should operation

of the facility be contracted or a change in contractors be made, the new contractor shall be notified in writing of the existence of the permit and its conditions. A copy of the written notification shall be forwarded to the Commissioner of the Department of Environmental Conservation.

9. This permit shall be amended to provide for the upgrading or closure of the site, if the facility is classified as an "open dump" in accordance with the inventory and definitions being developed by the Environmental Protection Agency under the Resource Conservation and Recovery Act of 1976, P.L. 94-580.

To Rep. Alvin Osterback and members of the House Resources Committee:

Bill Ellis

REGISTERED GUIDE & OUTFITTER

DEVIL'S MOUNTAIN LODGE - MILE 42 NABESNA ROAD - GAKONA, ALASKA 99586 - (907) 822-3318

HCR 95

When are the legislators and other businesses going to recognize guiding as an industry, providing a large amount of revenue to this State. Guiding should be given the same consideration as any other industry in the State.

We have accepted restrictions on the number of employees we may have, double jeopardy, exclusive guiding areas and the guide board. If this House Bill 95 is passed, more than three years of hard, steady work will go down the drain. I believe the guide board should be given an opportunity to weed the bugs out of the guiding area system. If you annul the guiding areas, you might as well abolish the guide law itself. I believe you should be lending strength to the guiding area concept in order to strengthen the guiding profession.

I have been in the guiding business full time for over 20 years. This State has never recognized our profession on the ground of revenue we bring into the State. I took exception to lines 21-23. There are industrious and unscrupulous people in every industry, not just the guiding industry. You should be looking at the industry, not the individuals.

I ask that you oppose this House bill and give the Guide Board a chance to make the guiding areas work.

Bill Ellis, Master Guide

JUNEAU, ALASKA 99801

May 31, 1978

The Honorable Ted Stevens
United States Senate
411 Russell Senate Office Building
Washington, D.C. 20510

Dear Ted:

Enclosed is a copy of my comments on the BLM's draft Wilderness Review Procedures. Am sure you are familiar with Sec. 1307 of H.R. 39 as it moved between House Committees. I believe every effort should be made to see that a similar provision remains in the final bill as it passes the Congress.

As you may know, WGM has been denied a permit to construct an airstrip to serve two very promising deposits north of Kotzebue; one held by General Crude and Houston Oil & Minerals, and the other by Cominco. These deposits are near enough to each other to be served by a common airstrip. They are on 17(d)(1) lands. This action is, in effect, denying the right of reasonable access to develop valid existing mining claims which is guaranteed under the mining laws.

In another case, a supply train with tracked vehicles and sleds moving fuel and other supplies over the snow early this spring, and on an existing mine road along the upper Tok River southeast of Fairbanks, was stopped by BLM in the field. The destination was valid claims staked on state selected lands. In both cases the movement of needed materials by helicopter would be economically prohibitive, considering the advanced stage of development and the distances involved.

It is because of these incidents, and the policies of BLM as applied in the field, even before finalization of their Wilderness Review Procedures and the application of Sec. 603 of FLMPA, that serious consideration should be given to amending FLMPA. The provisions of Sec. 603 should not apply to the remainder of Alaska public lands following the final identification of the National Interest Lands.

Your comments on the above suggestion, and critique of the enclosed statement, would be appreciated.

Sincerely,

Phil R. Holdsworth

Phil R. Holdsworth, P.E.

326 FOURTH STREET No. 1009
JUNEAU, ALASKA 99801

May 31, 1978

Director (370)
Bureau of Land Management
Department of the Interior
Washington, D.C. 20240

Dear Sir:

Reference is made to my letter of May 16, 1978 relative to your draft "Wilderness Review Procedures" of February 27, 1978. Specific comments follow.

Exemptions from wilderness review identified on Page 6 include Native lands under ANCSA, 17(d)(2) withdrawals, and TA'd State selections. Why are not other long-standing State selections, filed prior to October 21, 1976, also exempted from the wilderness review?

On Page 11, under paragraph III - Wilderness Review Policy, again only TA'd State selections are exempted from the review. Under paragraph 4, at the top of Page 17, the statement is made "- - - (Alaska inventory will be postponed until native claims land tenure has been finalized);". What about State land tenure, at least for those lands selected prior to October 21, 1976?

Earlier drafts of the proposed review procedures tended to give greater recognition to State selections as valid existing rights. After all, these rights under the Statehood Act preceded those granted to Alaska Natives under ANCSA.

Most of the problems presently posed in Alaska under this program are the result of regional or district applications of the provisions of Sec. 603 of FLPMA. There is a tendency on the part of BLM district managers to apply the provisions of this section now, even though native claims land tenure has not been finalized, and there is even some question as to the permanent status of some of the State TA'd selections. The status of continuing exploration on valid mining claims located on State selected and 17(d)(1) lands prior to October 21, 1976 is also in question.

Attention should be called to what appears to be the intent of Congress, or at least that of the House Interior & Insular Affairs Committee, in Sec. 1307 of H.R. 39 as it moved to the House Merchant Marine & Fisheries Committee. The first sentence of this section reads - "Notwithstanding any other provision of law, section 603 of the Federal Land Policy and Manage-

ment Act of 1976, shall not apply to any lands in Alaska." The accompanying committee report explained this provision on Page 222 as follows - "Even though there have been no completed BLM studies of Alaskan public lands under this provision of law or under the relevant provisions of the Wilderness Act, the Committee is of the opinion that its review activities and subsequent decisions regarding the areas which have been recommended to the Congress by the present Administration and preceding Administrations have achieved the essential objectives of the review requirements of section 603, and that it is appropriate to relieve the Secretary of the requirement of section 603 of Public Law 94-579 in connection with the remainder of Alaska public lands." It is recognized that this has not been enacted into law, but to the best of my knowledge the House Merchant Marine & Fisheries Committee left this language in their version of the legislation.

Currently, continued mineral exploration and its attendant reasonable access to valid mining claims, located prior to October 21, 1976, have been denied both on 17(d)(1) and State selected lands. It would appear that it may be necessary to push for a specific amandment to FLPMA to exempt Alaska from the provisions of section 603, at least until the land entitlements of the State and Alaska Natives are satisfied.

Respectfully submitted,

Phil R. Holdsworth

PMS CLARK GRUENING

ALASKA HOUSE OF REPRESENTATIVES

POUCH V KMAIL STOP 3100

JUNEAU ALASKA 99811

TO THE STATE LEGISLATURE AND ALL LEVELS OF LOCAL GOVERNMENT IN THE STATE OF ALASKA.

IMPLEMENTATION OF SECTION 603 OF THE BLM ORGANIC ACT OF 1976 MEANS THAT ALL ROADLESS AREAS OF 5000 ACRES OR GREATER ON FEDERAL LAND ARE SUBJECT TO MANAGEMENT AS WILDERNESS UNDER THE WILDERNESS ACT OF 1964. THIS MEANS NO MECHANIZED EQUIPMENT OF ANY KIND IS ALLOWED THEREON. THIS MEANS THAT ALL ECONOMIC OR PRODUCTIVE ACTIVITY EXCEPT BY HAND METHODS IS PROHIBITED ON THESE LANDS, INCLUDING PROHIBITION OF RECREATIONAL EQUIPMENT SUCH AS SNOW MACHINES, BOATS, AIRCRAFT.

SECTION 603 IS CURRENTLY BEING ENFORCED IN ALASKA AS CAN BE SUBSTANTIATED BY AT LEAST THREE MINERS WHOSE OPERATIONS HAVE BEEN DIRECTLY AFFECTED THEREBY. CALL ME AT 479-6231 FOR DOCUMENTATION.

I URGE YOU TO CONSIDER ADOPTION OF THE FOLLOWINXLPROPOSED RESOLUTION AT THE EARLIEST POSSIBLE TIME.

BEAR IN MIND THAT CURRENT BLM POLICY APPARENTLY DEFINES RBADS AS ONLY THOSE THAT ARE PUBLICLY MAINTAINED YEAR-ROUND. THISMMEANS SEASONAL ROADS IN ALASKA FAIL TO EXEMPT AN AREA FROM WILDERNESS MANAGEMENT.

7##. PROPOSED RESOLUTION

WHEREAS, THIS RESOLUTION IS BASED ON THE STATE OF ALASKA'S LONG STANDING UNDERSTANDING AND APPRECIATION OF THE IMPORTANT PART MINING, OIL, AGRICULTURE, TIMBERING, HUNTING, FISHING, AND GUIDING HAVE CONTRIBUTED TO THE BASIC ECONOMY OF THE STATE OF ALASKA AND THE NATION AND TO THE STANDARD OF LIVING OF ALL THE CITIZENS OF THE U.S.

WHEREAS, IT IS THE APPARENT INTENTION OF THE DEPARTMENT OF INTERIOR TO CONDUCT A WILDERNESS REVIEW PROGRAM UNDER SECTION 603 OF BLM ORGANIC ACT THAT WILL EFFECTIVELY PROHIBIT MINING AND OIL EXPLORATION OR DEVELOPMENT AND WILL FURTHER INTERFERE WITH OR PROHIBIT TIMBERING, AGRICULTURE, AND RECREATIONAL OPERATIONS

WHEREAS, THIS PROPOSED WILDERNESS POLICY AS OUTLINED DEPENDS TO A GREAT MEASURE ON THE DEFINITION OF WHAT CONSTITUTES A "ROAD" OR "ROADWAY" AND BECAUSE ROADS AND ROADWAYS INSIDE THE STATE OF ALASKA ARE VITAL TO THE CONDUCT OF COMMERCE, HEALTH, WELFARE, SECURITY AND THE PURSUIT OF HAPPINESS OF ITS CITIZENS

WHEREAS, THE PROPOSED WILDERNESS POLICY AND REVIEW BY THE DEPARTMENT OF INTERIOR WOULD CHANGE THE ADVALOREM TAX STRUCTURE OF FUTURE POSSIBLE PATENTED LANDS THUS REDUCING FUTURE PROPERTY TAX REVENUES FOR THE STATE, THUS INCREASING THE EXISTING INDIVIDUAL TAX BURDEN AND INCREASING THE LOSS OF PERSONAL INCOME TO THE CITIZENS OF THE STATE OF ALASKA BY REMOVING VAST AREAS FROM ANY PRODUCTIVE USE

WHEREAS, THE IMPLEMENTATION OF THIS POLICY WOULD TEND TO ENCROACH ON STATES RIGHTS, REDUCE OR SERIOUSLY LIMIT DOMESTIC EXPLORATION FOR AND PRODUCTION OF VITALLY NEEDED MINERALS, OIL, FOOD AND FIBRE AND OTHER RAW MATERIALS, THUS FORCING INCREASED DEPENDENCE ON UNRELIABLE AND EXPENSIVE FOREIGN SOURCES WITH THE ATTENDANT PROBLEMS OF INSECURITY OF SUPPLIES AND ADDED DEFICITS IN THE BALANCE OF PAYMENTS THUS REDUCING THE TRUE VALUE OF U. S. CURRENCY AND BY SO DOING SERIOUSLY HARM ALL U. S. CITIZENS

WHEREAS, IMPLEMENTATION OF SECTION 603 MAY BE USED AS A THREAT TO FORCE ALASKANS TO QUIT THEIR RESISTANCE AGAINST HR-39 WHICH IS CLEARLY NOT IN THE BEST INTEREST OF MOST ALASKANS AS EXPRESSED IN CITIZEN POLLS

WHEREAS, THROUGH A MOUNTAINOUS MAZE OF BUREAUCRACY AND REGULATION, THE FEDERAL GOVERNMENT ALREADY MAINTAINS EFFECTIVE CONTROL OVER THE MEANS OF PRODUCTION OF U.S. INDUSTRY, AND EXTRACTIVE INDUSTRIES IN PARTICULAR

WHEREAS, THE IMPLEMENTATION OF SECTION 603 TOGETHER WITH RARE II AND HR-39 EFFECTIVELY REMOVES ALL FEDERAL LANDS IN ALASKA FROM ANY PRODUCTIVE USE TO SUPPORT THE LIVELIHOODS OF ITS CITIZENS

WHEREAS, THE JOBS OF ALASKANS INVOLVED IN MINERAL EXPLORATION, TIMBERING AND CONSTRUCTION ARE IN IMMEDIATE JEOPARDY BECAUSE OF PROCEDURES ALREADY COMMENCED BY BLM TO DENY PERMITS

NOW THEREFORE, BE IT RESOLVED, WE MEMBERS OF THE ALASKA STATE LEGISLATURE HEREBY WISH TO GO ON RECORD AS OBJECTING TO THE PROPOSED WILDERNESS POLICY PROGRAM AND REVIEW AND FURTHER WISH TO URGE THE ADMINISTRATION, INCLUDING THE DEPARTMENTS OF INTERIOR AND AGRICULTURE TO CONSIDER THE DESIRES OF THE CITIZENS OF THIS STATE AND TO SOLICIT THE ALASKA STATE LEGISLATURE TO PASS ON THE NEED OF FUTURE DESIGNATED WILDERNESS AREAS ON THE PUBLIC LANDS WITHIN THE STATE OF ALASKA

AND BE IT FURTHER RESOLVED THAT WE URGE THE U. S. CONGRESS TO GRANT IMMEDIATE LEGISLATIVE RELIEF TO ALASKA FROM THE IMPLEMENTATION OF SECTION 603 OF THE BLM ORGANIC ACT.

RESPECTFULLY SUBMITTED,

JEFF KNAEBEL

TLX 09035402

2243 EST

IPMAFUB AHG

13

Representative Steve Cowper
State of Alaska
Pouch V
Juneau, Alaska 99811

Dear Steve:

Mr. Bruce Boyd relayed your request for items significant in justifying SSSB 13 to operate a research facility for the study of surplus heat utilization at Fort Wainwright. The following points represent specific justifications for this appropriation:

1. At the present time, waste heat in the form of hot water from the steam operated electrical power plant at Fort Wainwright is dissipated in a cooling pond. This procedure adds water vapor to the atmosphere and generates substantial ice fog in the Fairbanks area during the cold winter months.

2. Consequently, the U.S. Army Cold Regions Research and Engineering Laboratory is currently constructing a system to dissipate the waste heat through pipes buried in the soil and for space heating in a greenhouse.

3. The U.S. Army is accomplishing the necessary engineering design and construction for this project, but does not intend to undertake the technological development necessary to utilize this system in the production of horticultural crops. Nevertheless, the system is ideally suited for this purpose.

4. The facilities would provide an excellent opportunity for the Alaska Agricultural Experiment Station to work cooperatively with this project in developing the necessary horticultural technology and application. SSSB 13 would provide an appropriation to the University of Alaska for the necessary personnel and materials to develop this technology and to provide a significant demonstration for the utilization of waste heat in other areas of Alaska. Without this appropriation the Agricultural Experiment Station will not have sufficient funds to accomplish the cooperative effort.

5. The horticultural industry in Alaska is particularly well adapted to utilize low grade waste heat in the +70°F to 80°F range that is available from power plants such as the plant at Fort Wainwright. Successful development of this technology would permit Alaska to produce high value, intensively cultured crops at world market prices and, more importantly, would provide these products for Alaskans.

6. If waste heat can be utilized in soil and greenhouse warming, Alaska will have a plant growth environment that is technically superior to areas at more southerly latitudes. The advantage is due to improved photosynthetic activity of leaves in sunlight and cool air conditions and the longer period of this advantage. The long day lengths from March 20 to September 20 and the better internal plant conditions for photosynthesis are advantages when low soil temperatures do not limit plant growth. Improved soil temperatures allow crops to take full advantage of long sunlight days, and and often higher yields are produced than in the best commercial production areas of the nation.

7. The U.S. Army has leveled the land adjacent to the power plant at Fort Wainwright, has added peat soil amendment to specifications supplied by the Agricultural Experiment Station, and is in the final stages of installing buried pipes to dissipate waste heat in experimental plots. In addition, plans are underway to construct greenhouse facilities heated by waste heat adjacent to the test plots according to technology transferred from greenhouse research at the Agricultural Experiment Station.

8. Specific tasks to be accomplished cooperatively by the Agricultural Experiment Station at these facilities if an appropriation is provided are as follows:

vegetables under a system of near optimum soil temperature.

b. To determine the extension of growing season that can be achieved both in the greenhouse and out-of-doors using heated soil.

c. To determine the proper fertility and irrigation practices necessary for these systems.

d. To examine the possibility of growing commercial cut flowers such as roses, carnations and chrysanthemums using soil warming in a greenhouse environment.

e. To detect and correct any disease or insect problems that may develop under these growing systems.

9. Successful development of this technology will demonstrate an effective system for dissipating waste heat from power plants in a manner that will substantially reduce ice fog pollution, and will provide the technology necessary to expand the horticultural industry in Alaska through a system of energy conservation. This work is an essential step in developing energy conservation in Alaska.

Additional details of this research are available in a proposal provided to the House Resources Committee.

Sincerely,

James V. Drew
Director, Agricultural Experiment Station
Fairbanks, Alaska

$4,505.46	Position Total

Horticulture Trainee (11A) $6,402.56
(Temporary Help)

This position would be necessary to perform maintenance and gardening functions and other tasks. This person would weed, care for harvest, weigh garden products and perform other labor functions.

$5,248.00	Salary ($1,312 per month x 4 months)
1,154.56	Staff Benefits (22%)
$6,402.56	Position Total

400 Commodities $2,500.00

Supplies necessary to continue waste heat research:

a) Fertilizers and Growth Media	$ 550.00
b) Pots	225.00
c) Plants and Seed	1,725.00
	$2,500.00

TOTAL FY 79 COSTS $46,350.92

(DRAFT)

Research Proposal

The Development of technology necessary to use "waste" heat for the enhancement of horticulture in Alaska and to reduce thermal pollution problems

University of Alaska
Agricultural Experiment Station
Fairbanks, Alaska 99701

D.H. Dinkel
Principal Investigator

Abstract

The purpose of this project is to develop the horticultural technology necessary to use the enormous quantities of excess heat that will be rejected in Alaska from power plants, refineries, pipeline pumping stations and geothermal sources. The use of waste heat for the production of horticultural crops in greenhouses and heated areas of soil outdoors is common to all wise proposals to completely utilize reject heat. The horticulture production part is necessary because the heat can be utilized during summer months and when less is required for space heating or other uses.

It is estimated that the quantity of excess heat that would be available from industry in Alaska could meet the heat energy requirements for hundreds of acres of high value vegetable and flower production.

In this project, both soil heating and "space" heating for greenhouses will be employed in conjunction with proven Northern Agricultural practice, with the dual purpose of improving agricultural production and reducing final output temperature and consequently thermal pollution from power plant cooling water.

The agricultural industry, and particularly the horticultural industry, is probably in the best position of many of the energy consuming activities to use low-grade heat from cooling waters discharged by industry. The Agricultural industry is also in the best position to utilize the high temperature excess heat from the pumping stations of the oil and gas pipelines.

Considering the magnitude and basic importance of agricultural production and the extent of its' energy use, a significant increase in efficiency of production would be obtained through the substitution of waste energy for nonrenewable resource-consuming energy. In addition, the increase in solar energy conversion to food and ornamental plants would be an important Alaskan and national gain.

The principle reason for agriculture's favorable position in Alaska is that growth rates are increased dramatically when soil temperatures are increased slightly or conventional greenhouses and temporary plastic canopies are used to improve air temperatures. These practices make possible in Alaska the use of solar energy that otherwise is not useable for food and other beneficial production. In some instances, lengthened growing seasons may permit additions of another crop, possibly doubling and tripling production of the land. Increasing Alaska's critically low soil temperature and using canopies and greenhouses creates a significantly better plant growth environment than found in most other areas of the U.S. because of the long sunlight days. This advantage should allow us to produce high value intensively cultured crops at world market prices, and more important provide these products to Alaskans.

Much of the basic information needed for the establishment of a horticultural industry using waste heat in Alaska is available in literature and from preliminary research in the state. What is most needed now is applications research, and the engineering and economic design required to demonstrate and incorporate what is known into development plans.

The proposed research will be done by the Agriculture Experiment Station, University of Alaska in cooperation with (CRREL) Cold Regions Research and Engineering Laboratory) and the U.S. Army.

The work will be done using existing greenhouse and crop facilities at the Fairbanks Agricultural Experiment Station and in facilities that are fortuitously being developed by the U.S. Army at Fort Wainwright to reduce thermal pollution and ice fog problems associated with the power generating facility.

The engineering and construction for much of this project is being done by the U.S. Army and Cold Regions Research and Engineering Laboratory (CRREL) at the Fort Wainwright South Power Plant. Heated "waste" water with temperatures of +70°F to +85°F in large quantities is available. Evaporation from the present large cooling ponds associated with this waste creates a severe ice fog problem in winter months. Efforts to reduce this thermal pollution problem are underway by dissipating the heat in soil by circulating the warm water through a buried grid of pipes. There would be a significant advantage to Alaska and the immediate community if these efforts could be used to conduct the developmental research necessary to demonstrate the use for the tremendous quantities of unused heat in the state.

Introduction

The primary energy source for modern agricultural food, fiber and ornamental production remains the sun; however, man has learned that he can increase productivity of his crops by modifying the plants' environment for maximum capture of sunlight. This environment modification is largely dependent upon the use of fossil fuels to supply the required technological materials such as machinery, plastics, pesticides and petroleum for heating, farming, drying, processing and transportation.

Much of the energy required to produce intensively cultured crops in Alaska is in the form of heat requirements. This energy is needed to heat greenhouses and warm soils. If these heat requirements are supplied in Alaska we then have a plant growth environment that is technically superior which should create an economic advantage even in regards to competing on world markets for commodities that can be shipped. The advantage is due to the improved photosynthetic activity of leaves in sunlight and cool air conditions (10), and the longer period of this advantage. An analysis of Alaska's climate shows that during a similar calendar period corresponding to May through mid-September, there are 430 to 550 more hours of sunshine in Alaska than there are at latitudes similar to Minneapolis, Minnesota and Chicago, Illinois. The advantage

of this extra sunshine for rapid growth of adapted crops has been amply demonstrated by the production of the well-known 70-lb Alaskan cabbage and by numerous research studies in Alaska (7). Thus, the longer period of sunlight from March 20 to September 20 and the better internal plant condition for photosynthesis are advantages to growth if soil temperature or other factor does not limit the activity.

It has been demonstrated that one of the most critical environmental factors that limits the growth of many crops in Alaska is the soil temperature (4,5,6,7). Soil temperatures that seldom rise above 13-18°C. at the 10 cm. soil depth during the growing season impede seed germination and severely limit the growth of certain economic plants. The optimum soil temperatures for most cultivated crops ranges from between 21 and 30°C. Increased soil temperatures resulting from the use of clear polyethylene on the soil, electric heating cables and buried styrofoam give greatly increased growth of crops and earlier maturation (7). Clear polyethylene mulches cause soil heating by solar radiation because of the entrapped layer of still air, reduced moisture evaporation and the lower transmission by polyethylene of the heat radiation from soil as compared to the high transmission of incoming solar radiation. The improved soil temperatures allow the crops to take full advantage of the long sunlight days, and often higher yields are measured than those produced in the best commercial production areas of the nation.

Research in climates such as Minnesota show that soil warming by waste heat does provide some improved growth rate and some extension of the growing season (1,2). Due to normally warm soils during mid-summer in Minnesota that are near optimum for plant growth, waste energy can only be used during the spring and again in the fall. Alaska, with the much colder soils throughout the year and the greater sunlight during the growing season, offers greater advantages for waste heat utilization for the production of high value crops.

The feasibility for the use of low temperature waste heat for heating of greenhouses has been reported (3, 10, 11). A large greenhouse industry has developed in Iceland using warm water from geothermally heated springs for heating. A viable seasonal greenhouse industry has developed in Alaska using fossil fuels for a heat source. There is a significant need to expand this industry utilizing waste heat from industrial and geothermal sources. The rising cost and scarcity of fossil fuels to heat greenhouse units is a major threat to the stability and continuance of the nation's greenhouse vegetable and ornamental units. These factors appear to be blocking expansion and may actually terminate the greenhouse industry in areas where alternative methods of heating cannot be found.

Energy from industrial sources, usually in the form of hot water at temperatures from 21 to 70°C, is normally wasted by discharging it into the air or into bodies of water. These point sources of unused heat represent a poor stewardship of our resources and cause an environmental impact of considerable concern. A systematic approach to the utilization of unused heat suggest its' use in district heating of

houses, businesses and greenhouses, and in warming field soils for crop production.

Extent of unused heat: The efficiency of modern fossil fueled electrical generator plants is approximately 40%, while that of nuclear plants ranges between 30 and 33%. Thus, of the total energy available from the original fuel source slightly over one-third is presently used. The remaining two-thirds is rejected by being discharged into the environment. About 85 percent of the rejected heat is discharged into water bodies and 15 percent is discharged into the environment through the stack. Enormous quantities of very high temperature steam will be exhausted from the Energy Resources of Alaska refinery at North Pole, Alaska. Each pumping station along the trans-Alaska oil pipeline will exhaust large quantities of heat. It has been estimated that the 12 pumping station and liquefaction plant for a trans-Alaska gas line may exhaust approximately 36 million BTUs per second.

Facilities:

The Agricultural Experiment Station 40' x 90' existing greenhouse with attached head house will be used to produce test plants and for initiating the greenhouse work. One 30' x 40' section of the greenhouse will be slightly modified to simulate conditions that will be associated with a source of hot water.

The major plot work will be done at Fort Wainwright near the Power plant cooling pond. The U.S. Army and CRREL are concerned about the vapor pollution problems associated with the cooling pond and about the thermal waste. They have agreed to support a joint effort to the extent that they will provide engineering and most of the construction for the study site. The Agricultural Experiment Station wishes to cooperate by supplying the horticultural research effort.

CRREL has leveled the land adjacent to the site, added peat soil amendment to our specifications and are presently in the final stages of installing the distribution system and the piping to heat some test plots. There presently are 3 test plots 50' x 150' that will be heated with adjacent control plots. CRREL presently has plans to construct greenhouse facilities adjacent to these test plots to transfer the technology from the Agricultural Experiment Station greenhouse to an operational system.

Tasks:

To determine proper crop varieties and productive capacity of vegetables under the proposed system of near optimum soil temperature.

To determine the amount of season extension that can be achieved both in the greenhouse and out of doors using soil heating with and without plastic canopies.

To determine the proper fertility and irrigation practices necessary for this type of system.

To examine the possibility of growing commercial cut flowers such as roses, carnations and chrysanthemums by using a system that has heat provided in the soil and that would grow for 9 months and during the dark months of November, December and January would be held at a storage temperature of approximately 35°F. During the dark period the greenhouse would be modified with heat saving shields similar to those used in Europe so that heat loss could be reduced.

To determine if unusual disease and insect problems may develop as a result of the warmer environment.

Additional Project Objectives:

Concurrent with the horticultural objectives, data will be produced that will be useful for improving the collection and distribution system for waste energy in northern conditions.

Information will be gathered on thermal and vapor pollution abatement.

Personnel:

The Principle Investigator and leader for the Agricultural Experiment Station effort will be Dr. Donald H. Dinkel, Professor of Plant Physiology. The legislation is largely to provide research assistance to Dr. Dinkel.

The Principle Investigator and leader of the CRREL effort will be Dr. Terry McFadden.

Pertinent Questions and Answers on Subject - Waste Heat

By
D. M. Dinkel

Q. What is waste heat?

A. Waste heat is the term commonly used for energy that is rejected from various industrial sources. It usually results from the burning or other consumption of fossil fuels; however, it may also result from nuclear power plants or represent the unused heat from geothermal sources. The waste heat rejected from a process using fossil fuel usually exceeds the amount of the energy that is put to useful work such as the production of electricity. For example, most electrical power generation facilities that operate with fossil fuels have only a 30 per cent efficiency and the remainder is rejected as hot water or hot air.

Q. What is the extent of unused heat in Alaska?

A. The quantity is enormous at the present time and it will increase greatly as the pipelines, refinery and other power plants are placed into operation. It is estimated that each pumping station along the Trans-Alaska Pipeline could heat 2000 homes. The estimate for the North Pole Petroleum refinery is that 10,000 homes could be heated. Canadian sources estimate that each pumping station associated with their Mackenzie Valley Pipeline will produce enough clean waste heat to meet the requirements for 15 to 20 acres of greenhouse vegetable production. However, there has not been an inventory made of the present and future status of the waste heat that will be rejected and that could be used in the state.

Q. What are some proposed uses?

A. Agriculture, fisheries and aquaculture, forestry, processing and district heating in commercial and domestic areas. High temperature waste heat also may be useful in some cases for the generation of electricity where uses can be found for the remaining lower temperature heat so that vapor and thermal pollution is not a problem. For example, it would be technically possible to generate electricity from the high temperature waste from the North Pole Petroleum refinery. However, if this is done the reject energy would be in a form that could not be injected into the upper atmosphere and would create a vapor or ice fog problem during winter months. Agriculture and district heating could provide a use for this remaining low temperature reject energy.

Agriculture

The high temperature reject heat could be useful for forage and grain drying and may provide the necessary component that would make potato processing feasible in the state and therefore, expand potato production.

Heat energy consisting of hot air, hot water or steam and at temperatures ranging from 80°F to 800°F would be useful for greenhouse

production and vegetable and plant production in areas that would support horticulture crop production resulting from soil warming. The use of the heat in greenhouses and then during the summer months in the soil for crop production is necessary to all wise proposals that suggest a near total use for the energy. This crop use is probably necessary because it can utilize the low temperature energy and would utilize the heat as less is needed for other uses. It appears to be an important part of every systems approach to utilizing this resource because the near total use of the resource will make the collection and distribution more economical for each use.

Aquaculture, Forestry Processing and District Heating

The use of heat to improve production of fisheries through hatchery rearing and in fish production ponds is suggested. The heat requirement for forestry, processing industries and in district heating of homes and businesses is obvious if the heat can be collected and distributed. The more complete use that would result by greenhouse and soil heat use would provide a better economic picture for the above uses.

Q. Is our environment suitable for the types of intensive crop production that is suggested?

A. During the four summer months it is superior to most other areas of the nation. The northern latitudes are recognized to have the highest photosynthetic production rate in the world during these four summer months. If the season can be lengthened and/or the soil warmed, the productive capacity can be further increased, and this photosynthetic advantage further exploited.

Q. Why hasn't the greenhouse industry developed without the waste heat use?

A. It is one of Alaska's major agricultural industries at the present time, but it has been developed through the use of fossil fuels which are even higher in cost than they are in the rest of the nation.

Q. There are indications that hundreds of acres of greenhouse and soil heated vegetable production is possible. Could all of these products be marketed in Alaska?

A. No. Besides providing Alaskans with vegetables and ornamental plants, it would be necessary to market cut flowers such as roses, carnations, chrysanthemums and etc. on national and world markets. It is proposed that this could be done competively during 5-6 months of the year because of Alaska's superior environment for greenhouse production and through the use of waste energy.

Q. Why do you feel that it is important to examine national and world markets for cutflowers?

A. Because it appears to be necessary at the present time in order to make more complete use of our unused resource. It also would add to the stability of our economy to have a renewable resource such as this contributing to the state's economy. It would also decrease the nation's consumption of fossil fuels now used for this purpose in the present greenhouse growing areas.

Q. What will be the temperature of the Waste Heat?

A. The temperature of the reject heat energy will vary with the type of industry and will range from about 80°F to above 800°F. It will be exhausted as hot air, hot water or steam.

It is expected that not all reject energy could be utilized at this time because of accessibility problems, the lack of adjacent growing areas and the lack of technology. A systems approach with agriculture as a major user appears to give the best potential.

Q. What is the urgency in the legislation now in process?

A. We must promote the use or it will not happen. The potential for use must be designed into the system in the beginning in order to develop the most economical recovery system. For example the oil pipeline pumping stations were not designed with reject heat use in mind, and, therefore, it will cost more to recover the heat.

Although the technology appears to be available at the present time to make economical use of the energy, it is necessary to demonstrate this and to improve this technology.

15 April 1977

Bob LeResche, Commissioner
Department of Natural Resources
Pouch M
Juneau, Alaska 99811

ATTENTION: Pat Conheady

Dear Commissioner,

The House Resources Committee will be reviewing CSSB 58 am on Wednesday April 20, 1977 at 1:15 p.m. in room 118 of the Capitol Building.

We have received the material from Senate Resources which was submitted to the committee. If you have any other information pertinent to this bill the House Resources Committee would appreciate receiving that, too. If you know of other interested groups, please contact them.

Thank you for your cooperation.

Sincerely,

al Osterback

FEDERAL FUNDS						
OTHER (Specify)						

POSITIONS

FULL TIME		2	4	4		
PART TIME						
TEMPORARY						

III. ANALYSIS (See Fiscal Note Preparation Instructions, Section III)

The main fiscal impacts of the proposed legislation stem from personnel costs associated with developing the program, collecting data from well drillers and preparing data for storage in a computerized system. Utilization of Federal data storage systems will minimize costs associated with the State developing its own storage system. New personnel (one geological assistant and one geologist I) will collect data, prepare it for storage and interpret the data for utilization in the development of an overall water planning program. These positions plus current personnel will allow the Department of Natural Resources to process data from an estimated 6,000 wells per year.

Prime Sponsor (First Legislator Named)

Guy R. Martin

33-001 (Rev. 10/76)

January 18, 1977

The Honorable John L. Rader
President of the Senate
Alaska State Legislature
Juneau, Alaska 99811

Dear Mr. President:

Under the authority of art. III, sec. 18 of the Alaska Constitution, and in accordance with AS 24.30.060(b) and the Uniform Rules of the Alaska State Legislature, I am transmitting a bill amending the powers and duties of the Division of Geological and Geophysical Surveys of the Department of Natural Resources by transferring with only a minor change some overlapping and long dormant powers and duties of the Department of Health and Social Services.

Presently AS 41.08 requires the state geologist to conduct geological and geophysical surveys to determine the locations and supplies of ground waters and to print and publish special and topical reports, and authorizes him to enter into cooperative agreements to perform surveys, studies, and investigations. On the other hand, AS 41.05.010 - 41.05.030 declares hydrologic data to be of public interest and grants to the Department of Health and Social Services the powers and duties of collection, recording, evaluation, distribution, and publication of data on water of the state and authorizes the adoption of regulations to achieve those objectives. The disassociation of the duties affected and of surface and ground water studies, investigations, data, and surveys is neither logical nor desirable. The Division of Geological and Geophysical Surveys is the most logical agency to accomplish the objectives and to render these beneficial services to the public in the most capable manner.

The only proposed change made in the transferred powers is the addition of the power to require all water well drillers to file basic water and aquifer data to the existing power to require the filing of water survey results. The reason for this change is that much water well drilling takes place which is not part of water surveys and in areas which have never been the subject of water surveys. Basic data from such drilling is necessary to construct a true and complete picture of the state's water resources.

The transfer and minor expansion of these powers and duties is therefore requested at this time by repealing AS 41.05.010 - 41.05.030 and amending AS 41.08.

Sincerely,

Jay S. Hammond
Governor

OF ALASKA

DATE : September 17, 1976

FROM: Ronald B. Lind, Director
Division of Budget and Management
Office of the Governor

SUBJECT: Department of Environmental Conservation
Request to Receive and Expend $52,000
Additional Federal Funds

The Department of Environmental Conservation requests authority to receive $52,000 additional federal funds from the Environmental Protection Agency.

The Federal Safe Drinking Water Act establishes a major new program to assure that public water suppliers provide safe water to their customers. In Alaska a number of water supplies have been found to be either biologically or chemically unsafe. The recent discovery of arsenic in the water supplies of the Fairbanks and Kenai area together with the finding of biologically impure water in Cordova's emergency water supply and in those of various trailer parks, subdivisions etc. around the state attest to the need to inventory and monitor public water supplies. These funds will be utilized to establish the necessary field, laboratory and central office staff to implement this program. These funds are in addition to $290,400 already received from the EPA for this program, which is included in the FY 77 budget.

Your approval is recommended in accordance with the provisions of SLA 1976, Chapter 279, Section 12.

RP 77-156 (G)

DATE October 5, 1976

FROM: Ronald B. Lind, Director
Division of Budget and Management
Office of the Governor

SUBJECT: Department of Environmental Conservation, Request to Establish Three Permanent Full Time Positions and One Permanent Part Time Position

The Department of Environmental Conservation request authority to establish the following permanent full time positions: Environmental Research Analyst II, Environmental Research Engineer III, Clerk Typist III, and Public Participation Specialist (Permanent Part Time).

The funding source for these positions are the Safe Drinking Water Supply Grant (RP 77-156), The positions will be deleted September 30, 1977 unless additional funding is received.

The Environmental Research Analyst II (RP 77-154 and 77-156) will manage information resulting from sanitary survey inspections, water system inventories, and village sanitation facility inventories. Also, this position will act as the interface between water supply managers and village safe water managers, and computer data handling storage facilities.

The Environmental Engineer III will coordinate implementation of HB 407, the Water and Wastewater Operator Certification and Training Program.

The Clerk Typist III will insure water quality management planning and implementation conducted by local units of government are coordinated and consistent with the statewide plan.

The Public Participation Specialist (Permanent Part Time) will conduct public participation programs. Current State policy and federal government regulations require emphasis on increasing public participation in program management.

Your approval is recommended in accordance with Executive Order 20 and AS 44.17.040.

February 4, 1977

Guy Martin, Commissioner
Department of Natural Resources
State of Alaska
Pouch M
Juneau, Alaska 99811

Dear Commissioner Martin:

We have received a copy of Senate Bill 58, which gives the state geologist new powers and duties relating to water resources in the state of Alaska. The bill adds to the responsibilities of the Geological and Geophysical Surveys by making it the principal agency in the state responsible for water resources data.

Centralizing the acquisition and filing of water data in a single state agency that is dedicated to basic, unbiased scientific information will be of great benefit to the state. The section of the Bill which requires the filing of basic water and aquifer data is an important and significant addition to existing requirements.

As you are aware, the U.S. Geological Survey collects and analyzes hydrologic data in the state of Alaska under both a federal program and a state cooperative program on a cost sharing basis. We have, at the present time, a very substantial program with the Geological and Geophysical Surveys of the Alaska Department of Natural Resources. Our federal responsibilities include not only the collection and analysis of hydrologic data but also the coordination of hydrologic data collection programs among all federal agencies.

1977
Department of
Natural Resources

The provisions of the Senate Bill 58 would be of benefit not only to the state but also to the U.S. Geological Survey in its dual role as a cooperator with state agencies and as a federal agency having federal responsibilities for the collection and analysis of water data. The designation of a single state agency as the principal water agency in the state will be advantageous, both from the standpoint of cooperative programs and as a single point source for filing and retrieving water related data.

We have recently had discussions with the Water Resources Policy Committee Work Group of the Governor's Office and with members of the water planning group of the Section of Planning in the Alaska Department of Natural Resources. Through these discussions, we have described to the state the nature of the water resources program that we currently are conducting and the inadequacies of parts of the program. We have particularly emphasized the importance of a long-term data collection base as a part of the state's total water resources program. We believe that the passage of this bill would be in direct support of this concept and would result in significant long-term benefits to the state.

Sincerely yours,

Harry Hulsing
District Chief

Article 1. Hydrological Data.

Section
10. Hydrological data declared to be of public interest
20. Collection, recording, distribution and use of hydrological data
30. Regulations by Department of Health and Social Services

Sec. 41.05.010. Hydrological data declared to be of public interest. Systematic collection, recording, evaluation, and distribution of data on the quantity, location and quality of waters of the state in the ground, on the surface of the ground, or along the coasts, are in the public interest and necessary to the orderly domestic and industrial development of the state. (§ 1 ch 155 SLA 1957)

Sec. 41.05.020. Collection, recording, distribution and use of hydrological data. The Department of Health and Social Services has the following powers and duties:

(1) collect, record, evaluate, and distribute data on the quantity, quality and location of underground, surface and coastal waters of the state;

(2) publish or have published data on the waters of the state;

(3) require the filing with it of the results and findings of surveys of water quality, quantity and location, including water well drilling logs, pumping tests, flow measurements, type of aquifer, tidal currents and physical characteristics, and volume determinations;

(4) accept and expend funds for the purposes of §§ 10—[illegible] this chapter and enter into agreements with individuals, public [illegible]ate agencies, communities, private industry, state agencies and agencies of the federal government. (§ 2 ch 155 SLA 1957; am § 6 ch 104 SLA 1971)

Effect of amendment. — The 1971 amendment substituted "Department of Health and Social Services" for "Department of Health and Welfare" near the beginning of this section.

Sec. 41.05.030. Regulations by Department of Health and Social Services. The Department of Health and Social Services may adopt regulations relating to and providing for the systematic collection, recording and distribution of data on the waters of the state. (§ 3 ch 155 SLA 1957; am § 6 ch 104 SLA 1971)

Effect of amendment. — The 1971 amendment substituted "Department of Health and Social Services" for "Department of Health and Welfare."

February 4, 1977

Guy Martin, Commissioner
Department of Natural Resources
State of Alaska
Pouch M
Juneau, Alaska 99811

Dear Commissioner Martin:

We have received a copy of Senate Bill 58, which gives the state geologist new powers and duties relating to water resources in the state of Alaska. The bill adds to the responsibilities of the Geological and Geophysical Surveys by making it the principal agency in the state responsible for water resources data.

Centralizing the acquisition and filing of water data in a single state agency that is dedicated to basic, unbiased scientific information will be of great benefit to the state. The section of the Bill which requires the filing of basic water and aquifer data is an important and significant addition to existing requirements.

As you are aware, the U.S. Geological Survey collects and analyzes hydrologic data in the state of Alaska under both a federal program and a state cooperative program on a cost sharing basis. We have, at the present time, a very substantial program with the Geological and Geophysical Surveys of the Alaska Department of Natural Resources. Our federal responsibilities include not only the collection and analysis of hydrologic data but also the coordination of hydrologic data collection programs among all federal agencies.

7 1977
Department of
Natural Resources

The provisions of the Senate Bill 58 would be of benefit not only to the state but also to the U.S. Geological Survey in its dual role as a cooperator with state agencies and as a federal agency having federal responsibilities for the collection and analysis of water data. The designation of a single state agency as the principal water agency in the state will be advantageous, both from the standpoint of cooperative programs and as a single point source for filing and retrieving water related data.

We have recently had discussions with the Water Resources Policy Committee Work Group of the Governor's Office and with members of the water planning group of the Section of Planning in the Alaska Department of Natural Resources. Through these discussions, we have described to the state the nature of the water resources program that we currently are conducting and the inadequacies of parts of the program. We have particularly emphasized the importance of a long-term data collection base as a part of the state's total water resources program. We believe that the passage of this bill would be in direct support of this concept and would result in significant long-term benefits to the state.

SHEE ATIKA, INCORPORATED

P.O. Box 578
Mt. Edgecumbe, Alaska 99835
Phone - (907) 747-3534

March 23, 1978

Senator Kay Poland
Chairman, Senate Resources Committee
Alaska State Senate
Pouch V
Juneau, Alaska 99801

Dear Senator Poland

The Board of Directors of Shee Atika, Inc. have directed me to convey their concerns to the Senate Resource Committee relating to the administration's proposed forest practices act.

We would very much like to see a forest practices act adopted this year. We are equally interested; however, in seeing that a practical and fair forest practices act is adopted. Several points were noted by our Directors during their attendance at the Senate Resource Committee work session, held March 8th, at which Mr. Jeff Haynes present the administration's draft bill. Shee Atika, Inc. would like to express the following concerns relating to those points:

1. We need a forest practices act this year.

   A. It appears that operations and activities on privately owned forest lands will be regulated through other authority, with less concern or emphasis on private forest management, if an act is not adopted this year.

   B. Section 208 of the Federal Water Polution Control Act essentially mandates the State to adopt an act; BUT we can adopt a practical act to satisfy the Section 208 requirements. Sec. 208 does not require us to adopt a "California" type act which is both difficult expensive to administer and unfair to the private land owner.

2. We feel that the administration's draft bill is generally acceptable with the following critical exceptions:

   A. Forestry on private and state or municipal land should be administered from a level comparable to atleast the Division status within state government. Forest resources deserve attention and status equal to Commercial Fisheries, Sport Fisheries etc. if not equivilant to Fish and Game and Environmental Conservation.

   B. The Forestry branch should be led by a professional forester. This is necessary to insure that administration of a forest practices act have continuity without being subject to a possible political reward system, to insure appreciation for forest management problems by the administrator, to insure communication between the forest land owner and the administrato and to insure that in inter division or inter department relationships modern technical forestry is represented and understood.

C. Alaska's forest practices act should incorporate a notification system for activities on private lands, not a permit system as in the administrati draft. We have no objection to the "prior approval permit" system on public lands. At the Resources committee meeting Mr. Haynes did not adequately discuss the differences between these two systems. The basic difference is that a permit system (as proposed in the administration's dra requires the state's permission before a land owner can conduct activities on private lands; while, a notification system requires that a land owner inform the state prior to any activity on private land and that the land owner obey state law and regulation. Mr. Haynes reported that a notificati system was nothing mc ' than requiring a land owner to "mail a postcard" to the state when he ' she was planning to conduct a forestry operation cn his or her land. This is absolutely untrue. The administration probabl has proposed a prior approval "permit" system because it wants the state to have a reasonable amount of influence on forest practices on private lands. That objective is reasonable and very acceptable for us as a land owner. That same objective can be accomplished; however, by tailoring a notificati system in the proposed forest practices act. The notification system works very well in Oregon and it will work well in Alaska. We don't need to burden the private land owners and the state with the inherent problems of a California type prior approval "permit" system to accomplish the objecti of insuring that privately owned forest resources are properly managed. We would suggest that the "permit" system in the administration's draft be replaced by a"notification" system which required 30 days prior notification b an operator or owner including filing of operation plans which identify wh activity (s) is/are planned, what equipment will be used, where roads will be located, where streams are located, how the area be refo sted etc. The plans should include location of the affected area on a USGS 1" mile topographic map with road & bridge locations, activity boundaries, streams, campsites, land fills, log storage areas, fuel storage areas, rock pits, water source, sewage disposal system, and landings identified and located. This is the same information that would be required by the administration's draft. We suggest that in lieu of a "permit" system the act should authori the state to require a pre-orperation meeting wi h the operator or land own This would give the state an opportunity to exp'ain any concerns and advise the land owner/operator of the probable consequence of an activity. The need for a pre-operation meeting shuld be left to the discretion of the reviewing officer. We would advocate and endorse very stiff penalties(as i the administration's bill) to insure compliance with state law and regulati under a true "notification" system. We would not be adverse to posting a reasonable bond prior to any operation on our lands. If the state consider adopting the preformance bond concept; however, it would be desirable to include some means of exempting small landowners and operators and guarantee ing that the bond amount would be no larger than that required to both encourage compliance and cover the expense of correcting a possible adverse situation created by an illegal activity.

March 23, 1978

Senator Kay Poland
Chairman, Senate Resources Committee

Page 3

A true notification system (as used in Oregon) is far less expensive to administer than a permit system which requires state consent as suggested by the administration. Considering volume harvested California's permit system is 6.5 times as expensive for that state's taxpayers when compared to Oregon's notification system. Considering the number of operation notices filed California's permit system is 27.3 times as expensive as a notification act. It is logical to conclude that these costs would increase by a blanket 25% cost of business factor and 25% allowance for increased transportation expense in Alaska. Transportaion represents only 7% of Oregon and California's forest practices connected budget while it would probably approach 33% of the forest practices budget in Alaska. The transportation allowance would tend to be much higher under a "permit" system as a "permit" system has an inherent characteristic which encourages state enforcement personnel to make several visits to each operation prior, during and following the activity. Fixed administrative expenses will also be much higher in Alaska due to the relatively fewer number of operations here and smaller annual yield when compared with Oregon and California.

D. We agree with Senator Meland's concern regarding the administration's provision 41,17.040 b (6) that "allowance be made for scenic and asthetic quality in or adjacent to areas of substantial importance to the tourism industry." This provision will undoubtedly foster many law suits as people disagree on such items as:

1. What constitutes "allowance"?

2. What is "scenic and asthetic quality"?

3. What constitutes "substantial importance"?

Mr. Haynes indicated that this section intended to authorize the state to use an incentive program to compensate land owners for the economic impact of state restrictions under this section. If this is the intent, we suggest that the act should mention the state's authority to compensate a land owner for volutarily curtailing any activity related to "scenic quality" which the state finds objectionable. We further suggest that the implication that a land owner can be prevented from managing his resources (if the state feels the activity would conflict with "scenic value") be stricken.

We would like to express the following views on other points discussed in the committee session March 8.

1. We endorse that portion of the administrations bill which sets mandatory standards for reforestation and conversion to non-forest uses. These are reasonable standards which we plan to meet and surpass.

March 23, 1978

Senator Kay Poland
Chairman, Senate Resources Committee

Page 4

2. We concur with Senator Sumner's concern about who has the burden (landowner or state ?) under Section 41.17.040 b(1) of the administration's bill which states "timber harvesting is limited to areas where data and information indicate an absence of reforestation problems which would preclude that area from producing a sustained yield of merchantable timber". This problem could easily be corrected, and the objective retained, by modifing the passage to read "timber harvesting may be limited in areas where data and information indicate that it would produce unsolvable reforestation problems which would preclude that area from producing a sustained yield of merchantable timber."

Thank you for your consideration. We were pleased to note the committee's expression of concern for the rights of the private landowner at the March 8 meeting.

Sincerely

Warren R. Weathers
Executive Director Shee Atika, Inc.

WRW/nmw

An Alaska Forest Resources and Practices Act has been in the works for four years.

This legislation is urgently needed to provide policy and program direction with respect to development and conservation of forest resources on state and certain private land.

Other states have waited too long to pass forest practices legislation, acting only after controversy became intolerable and attitudes were irreconcilable. By enacting CSSB 59 now, before logging in Alaska reaches its greatest intensity, we can avoid that mistake, develop forest management measures through the combined expertise of all interested parties, and permit Alaska to enjoy a national reputation for leadership in the administration of forest resources.

The process by which this bill was developed demonstates that consensus among forest users is possible if the proper mechanism is employed. Originally introduced by the Administration, the legislation was the subject of hearings in two previous legislative sessions. After last year's hearing in Senate Resources, there was still substantial disagreement; consequently, a working group composed of members of the Administration and all affected user groups was established by the Resources Committee and requested to come up with a consensus bill. The response was a Sponsor Subsistute, further revised by Senate Resources and subsequently Senate Finance as Committee Substitutes.

(1)

Undoubtedly, no one is ecstatic with the final product. It is the result of hundreds of hours of negotiation involving the Legislature, the Administration, native corporations, the forest products industry, the Forest Service, conservation groups, commercial fishermen's representatives, and professional foresters associations. However, it is a compromise which all have indicated they can live with, and which is probably the best result possible given the very controversial nature of this subject. Such legislation is inevitable in the long run, and to delay it to future sessions would only result in massive duplication of the work already done with no significant guarantee of a better bill. Moreover, in the interim, there would be no adequate vehicle to resolve the user conflicts which are certain to occur.

CSSSSB 59 would establish a Division of Forest, Land and Water Management in the Department of Natural Resources, with specified responsibilities over forest affairs. It would be headed by a State Forester selected by the commissioner from nominees submitted by a Board of Forestry; the Board would also advise and comment on proposed regulations and related matters. The State Forester would have a wide range of authorities and duties, including management of state forests, public education and assistance, and development of regulations embodying desirable forest practices on state and designated private land.

(2)

Special provision is made to incorporate the State Forester into the process of developing nonpoint source water pollution control measures so that an acceptable state program is formulated and we are not ultimately pre-empted by the Environmental Protection Agency in this very sensitive area.

Incidental and small scale commercial operations and harvesting primarily for noncommercial or personal use are exempted from the bill to protect homesteaders and other small landowners from unwarranted government regulation.

The State Forester would be directed by a set of policy standards, with one set for public land and another for private land to reflect the difference in state interest in such lands and to protect the prerogatives of private landowners.

Promulgated regulations governing forest practices would be applied to public and private land, supervised through a notification process, and enforced through an administrative penalties provision with special allowances to insure that the government's enforcement discretion is not abused.

The State Forester would be required to develop a plan to implement the policies and provisions of the bill and to report to the Legislature at two year intervals on the operations of the Division and to show that the policies and provisions are being carried out.

In summary, this bill would accomplish a state purpose of the first magnitude without unjustified government interference or duplication of existing government entities, and I urge that the Senate take favorable action.

(3)

Major Changes in Finance Committee Substitute:

1. Division:

   -required to be established;
   -retitled Forest, Land and Water Management (responsibilities from Resources Committee Substitute retained)
   -Director selected from list submitted by Board of Forestry

2. Exemption for small landowners modified to focus more on the manner in which the timber is being used rather than the type of land from which it is harvested. In practice, this is really a form change as it was not intended to alter the coverage of the exemption.

3. Standards Applicable to Private Land; reinsertion of standard for reforestation, substantially modified from original Sponsor Subsitute version.

4. Review of Operations: changed from limited prior approval to modification system.

Rules Committee Substitute contained three corrections of clerical errors made in typing Finance Committee Substitute.

April 6, 1978

The Honorable John L. Rader
President of the Senate
Alaska State Legislature
Juneau, Alaska 99811

Dear Mr. President:

Under authority of art. III, sec. 18 of the Alaska Constitution, and in accordance with AS 24.30.060(b) and the Uniform Rules of the Alaska State Legislature, I am transmitting a substitute bill for SB 59 (forest resources and practices), introduced by me during the 1977 legislative session. This sponsor substitute is the result of a considerable amount of further study and numerous meetings involving persons and organizations concerned with forest resources and practices. The following statement of the reasons for this legislation and the section-by-section analysis go into some detail in order to provide evidence of legislative intent.

I. REASONS FOR THE LEGISLATION

The purpose of the legislation is to establish a program for the administration of forest resources in Alaska so that the state may realize, over the long term, the wide variety of products, benefits, and services obtainable from forestland.

It is especially important that this legislation be enacted before use of forest resources in Alaska reaches its greatest intensity. States which have delayed passage of appropriate forest practices Acts until an absolute necessity arose have often experienced a climate of conflict which complicated legislative deliberations and reduced the quality of the legislative product. In addition, some options for approaches to administration and for realization of objectives were already foreclosed. Enactment of an Alaska Forest Resources and Practices Act at this time would permit consideration of potential measures and programs in an atmosphere conducive to

solutions mutually agreeable to all parties. Most important, it will allow conflicts to be resolved in advance, precluding potential disruption of operations in the field.

While a state forest resources program is necessary and desirable, it is not the intention of this legislation to create a massive new bureaucracy which would only result in waste of government funds and manpower. Rather, the approach used is to fill existing gaps in the statutes through enabling legislation which would provide for a thorough forest management program without duplicating or overlapping existing government programs of the Department of Natural Resources or other state agencies. Emphasis is placed on cooperation between these agencies to achieve generally desired objectives.

Development of this transmittal letter reflects my wish to limit the language of the Act to essential matters while providing the intent behind its provisions. I offer the Act and the letter as a package, with the statements of intent in the letter to govern application and interpretation of the Act. The appropriate committees of the legislature are strongly urged to adopt this transmittal letter as the committee report on the bill.

II. SECTION-BY-SECTION ANALYSIS

Section 10. Declaration of Intent.

Section 10 contains a brief statement of the findings of the legislature and the purpose of the legislation. Paragraph (1) recognizes the range and variety of forest resources; that forest products include not only timber but other products obtained from the land and water (including marine areas) influenced by forest ecosystems; that multiple products, benefits, and services are obtained from forest resources; and that forest resources and values often escape quantification.

Paragraph (2) reflects my desire that the various businesses and other activities (whether or not commercial) which are dependent upon forest resources receive the support of the state for their continuation in the government's forest resources program. The term "economic enterprises" is intended to be comprehensive, including not only existing businesses but those industries which may be developed as new forest resources become accessible or economically viable, and recognizing that forest resources present opportunities for small businesses as well as large corporations.

"Activities and pursuits" includes those which are not necessarily revenue-generating, and would encompass subsistence use.

Paragraph (3) declares that the programs and measures provided for in the Act are not only desirable but a basic duty of the state and implement the directives contained in several of the sections of Article VIII, Alaska Constitution. It is especially critical that timber supplies and other renewable resources be maintained and available in perpetuity to protect the longevity and insure the stability of the forest products industry, to insure that enterprises dependent on forest resources continue to make a substantial contribution to the Alaskan economy, to prevent impairment of the capability of the land and water to produce renewable resources, and to make certain that forest land generates the services and benefits, whether commercial or not, which Alaskans have come to expect from it.

Paragraph (4) contains two important concepts. First, much contemporary legislation has relied excessively on regulatory measures to achieve desired goals when this approach may in fact be both onerous and inefficient. Therefore, this Act would direct that regulations, services, and incentives be employed in the combination which is most likely to accomplish the purposes of the Act.

Second, the state has not to date developed a high-profile forestry program emphasizing the expertise of professional foresters, which is inherently necessary if forest resource administration in Alaska is to be successful. As a result, paragraph (4) stresses the importance of forest resource professionals as an essential element to complete the state's multidisciplinary capacity.

Paragraph (5) addresses the need for the state to carry out its responsibilities for control of nonpoint source pollution under the Federal Water Pollution Control Act under the leadership of the Department of Environmental Conservation, which is the lead agency under law for this program. The Environmental Protection Agency has left it to the states to devise their own approaches in this area, but has indicated that the federal government will assume control if a state does not develop an approved program. The Department of Environmental Conservation may legally delegate its authority with respect to this program to the Department of Natural Resources or otherwise use the forestry expertise of DNR with respect to development of the nonpoint source program, and the regulations developed under this chapter could be used in conjunction with this program.

Paragraph (6) recognizes that regulations adopted under the Alaska Coastal Management Act must address forestry matters; to avoid conflicting regulations, it is necessary that those adopted under this Act be used under the Coastal Management Act, superseding any forestry regulations previously adopted under the CZM Act. However, any prior efforts under CZM should be considered in adopting regulations under this Act.

Section 20. Administration.

This section designates the officials responsible for administration of the Act and establishes authority for carrying out desirable forest resources programs.

Subsection (a) reflects the request of numerous interest groups that a division responsible for forestry be created within state government in order to (1) provide recognition for forestry and forest products, as has already been done for many other natural resources, (2) bring the expertise of professional foresters to bear on forest management issues, and (3) establish a contact and focus point in the government for the forest products industry and other users of forest resources. This subsection expresses the governor's power to create a Division of Forest, Land and Water Management with the director to be known as the state forester. It is emphasized that the state forester must be a trained professional with the requisite education and fully experienced with the many issues and subjects inevitable in the administration of the Act.

Subsection (b) provides that the ultimate responsibility for implementing the Act is vested in the commissioner. However, the expertise of forest resource managers cannot be employed unless the forestry expertise housed in the division is fully used. Consequently, it is expected that the commissioner will delegate authority for daily administration of the Act to the state forester, reserving to himself only those matters requiring the attention of a cabinet officer. Moreover, the commissioner and the state government in general should make use of the state forester on other forestry matters even though they may technically be beyond the purview of the Act.

I recognize that it will take some time to develop completely the program envisioned by the legislation. However, by creating the division, naming a state forester, and listing the functions assigned to him, I expect that the program ultimately formulated will exceed the accepted minimums for administration of forest resources. Specifically, I intend

that the commissioner and the state forester employ foresight and innovation rather than being constrained by conventional attitudes so that Alaska's forest management effort enjoys a national reputation for leadership and competence.

Forest managers are expected to calculate timber harvests and rotation ages in a way which insures sustained yield and a steady supply; this has been difficult in the past on state land because the acreage available for timber use has not remained constant. Subsection (c) provides for the opportunity to establish a minimum fixed timber supply base from which to make sustained yield calculations. In addition, the state will ultimately determine that land which it wishes to retain in state ownership for multiple use purposes, some of which will be forested land. While subsection (c) does not mean that all of the state's retained land will be designated as state forests (as opposed to some other category), it does allow for the designation of that land with substantial timber and other resources for retention. Failure to designate state forest land as a state forest does not, of course, remove it from the provisions of this chapter.

The ultimate success of the state's forest management program will depend on the knowledge available to decisionmakers. Numerous subjects and issues invite research and experimentation, and subsection (d) sanctions the designation of special forest units for this purpose. I would anticipate the use of such forests for analysis of exotic stocks; development of genetically superior stocks; evaluation of the effects of land use activities and of methods to reduce adverse impacts; experimentation with advanced harvesting, extraction and transportation techniques and equipment; examination of programs for control of disease, fire, and insect infestation; cooperative projects with other agencies respecting compatible management of multiple resources; and any other activities enhancing or refining forest management efforts. Such forests must be limited to the minimal size necessary for conducting the research or experiment so that ill-considered major projects may not be continued under the guise of scientific investigation.

Reforestation and afforestation must be the highest priority among silvicultural programs, being most directly related to maintenance of perpetual supplies of timber. Within funding capacity, the commissioner is expected to make available planting stock to assist operators in meeting reforestation requirements of the Act, although this does not relieve their duty to observe those requirements. The term "nurseries and

greenhouses" is not intended to be restrictive; all facilities providing planting stock (including containerized greenhouses and other advanced versions) are consistent with this section. "Forest vegetation" was used instead of forest trees since there may be instances where ground cover or other plants will be beneficial in forest management. Subsection (e) also provides that the commissioner may charge for providing planting stock, with any proceeds to go to the general fund.

Subsection (f) authorizes a full range of professional management services and participation in federal assistance programs such as those conducted by the Forest Service under their state and private forestry division. Since there will be many new timber operators and owners in the state in the near future, education and management assistance efforts may provide expertise which would be otherwise unavailable, leading to more efficient operations and better forest practices. Such services must be closely coordinated with regulatory and review requirements, as is discussed later in this analysis.

As discussed earlier, the Department of Environmental Conservation may legally delegate authority to the Department of Natural Resources for development of regulations necessary to implement the forestry portion of the state program for control of nonpoint source pollution under the Federal Water Pollution Control Act, as amended, or to use any other arrangement to take advantage of the forestry expertise of DNR. Subsection (g) formalizes this authorization and directs DNR to seek a cooperative agreement on this subject. However, it also reemphasizes that DEC is the lead agency and that any regulations or cooperative agreements must be approved by the commissioner of environmental conservation before they become effective.

Since maximum contact with forest resource constituencies is critical if the government and the private sector are to understand each other's positions and interests, subsection (h) places a duty on the commissioner to consult with all appropriate parties in the administration of the Act. The commissioner is expected to consult continuously with other state agencies possessing natural resource management responsibilities and to draw fully upon their expertise; this is expecially true where DNR has no expertise of its own in a particular subject area. The term "landowners" should be construed to include adjacent landowners with respect to operations which may affect them. Moreover, the commissioner is not limited to entities within the state; federal

agencies, and agencies and institutions of other states and of foreign countries should be contacted to provide the state forester with maximum access to information on new management techniques and other matters. The provision on cooperative agreements and contracts is intended to permit formalization of consultation, management, and other activities where desirable.

With respect to subsection (i), there were a number of requests for creation of an advisory committee or board to assist the state forester. However, establishment of a specific committee or board by statute automatically initiates a useless controversy over the makeup of the entity. Moreover, while a general advisory committee may be important, creation of special committees on particular issues of special importance may also be warranted from time to time. While the bill endorses the advisory committee approach where appropriate, it provides flexibility which is the key to a successful advisory committee system, and thus leaves it to the department to determine the particulars. The commissioner is, nevertheless, directed to establish at least one advisory committee, and it is expected that the commissioner will use the advisory committee system (1) to develop specific approaches to implementing the standards in sec. 40 through the advice of professionals and other interested persons, (2) to formulate the particulars of the exemptions under sec. 30(c), and (3) to carry out consultative duties under subsection (h).

Moreover, advisory committees created must be representative of the various constituencies dependent on or affected by management of forest resources so that a full range of public opinion is received. Advisory committees should meet regularly, and members should be appointed to specified terms long enough to permit them to become familiar with the issues and to make meaningful recommendations. The commissioner should appoint an advisory committee as soon as possible after the effective date of the Act to assist in the development of regulations. The provision on travel and expenses is intended to be used only where advisory committee activities are clearly necessary and of benefit to the state.

While there were several suggestions for a provision mandating the location of the state forester, I believe that access to trained forestry personnel by the public is more directly responsible for the success of a government forestry program. Therefore, subsection (j) speaks to distribution of the department's foresters rather than the location of the state forester.

The introduction to this analysis stressed the importance of avoiding duplication of existing authority in the enactment of forest practices legislation. Subsection (k) fulfills this objective by insuring that the statutory prerogatives of other agencies are retained and that this Act is not viewed as other than supplemental to the overall state regulatory framework for forest resources. The only exceptions are that (1) forestry regulations developed under this chapter shall be used as the forestry segment of the Coastal Management Act program and (2) if authorized by the commissioner of environmental conservation, regulations adopted under this chapter may serve as the forestry portion of the state program for control of nonpoint source pollution.

Subsection (l) is self-explanatory.

Section 30. Applicability.

This section specifies the applicability of the Act to particular land and activities.

Subsection (a) is self-explanatory. The limitation in SB 59 to commercial forest land was removed as it was considered to be illogical and extremely difficult to administer. Municipalities are not prevented from adopting ordinances which embody stricter standards and practices than those promulgated under this Act.

Subsection (b) reflects the fact that state standards adopted under the Federal Water Pollution Control Act may be made applicable to federal lands.

Subsection (c) covers exemptions. The intent of this provision is to limit the applicability of this Act to major commercial operations which genuinely affect the objectives of this chapter relating to the maintenance of a stable and healthy forest products industry and the perpetuation of supplies of renewable resources. Consequently, the commissioner is required to make exemptions by regulation to insure that small landowners who expect to be able to sell or otherwise use their timber will be permitted to do so. Since it is impossible to determine in all cases what is a "small landowner", the commissioner may determine the particulars through exemption regulations. However, any owner of the tracts described is entitled to an exemption unless his tract is being used as a part of a major commercial operation, as where a logging company purchases the timber rights to numerous contiguous tracts in order to conduct a large scale logging program. With respect to tracts larger than 160

acres which are not part of a homestead, farm, or residential or recreational property, the commissioner may exempt them if they are not capable of being managed as a sustained yield forest unit.

Section 40. Regulatory and Administrative Standards.

The best approach to forest practices legislation is to avoid placing specific practices measures in the statute; instead, practices should be developed through the regulatory process, with such regulations and other administrative actions governed by guiding standards contained in the Act. Section 40 contains such standards.

Subsection (a) contains standards applicable to all forest land, regardless of whether in public or private ownership.

Paragraph (1) recognizes the importance of determining the reforestation capacity of land before timber harvesting. The determination is to be made by the government. This standard is not intended to mandate a non-declining yield type of management, but it does reflect the paramount state interest in having all forest land (unless legitimately converted to another use) continue to produce merchantable timber over the long term.

Paragraph (2) dictates that important information relative to any decision should be collected and used, and that it should be current. In some cases, land managers have become lax in keeping abreast of recent developments in their field, and make decisions based more on their status as professionals rather than through true analysis of a situation. This standard is not intended to be an unwarranted obstacle to management activities or to focus the burden of developing data on the operator. It does, however, place a duty on the manager to account for his actions in a convincing way.

Paragraph (3) mandates recognition of the concepts of environmentally sensitive areas and best management practices in conjunction with nonpoint source measures if adopted under this chapter. A number of approaches could be utilized, depending on the objective to be achieved, including standards, quantitative limitations, and zones or management units.

Paragraph (4) identifies two important elements often missing in forest resource management; first, that forest practices requirements often impose real costs on the operator, and should be weighed in terms of the public benefits realized;

and second, that a format for the harvest of trees convenient for government managers may be unrealistic for operators in view of marketing conditions.

Paragraph (5) recognizes the fundamental public trust obligation of the state to insure that the capability of the land to produce renewable resources is not impaired. While a particular species of tree or wildlife may have little relative value now, the future may find it suddenly in great demand. If the land is incapable of producing it to the demand level, an important land management option is lost, to the detriment of the public welfare.

Paragraph (6) reflects that loss of scenic quality may have an impact beyond the boundaries of the land where the activity is taking place. While this standard permits consideration of scenic factors where economically feasible, it is not intended as a prohibition on land-use activities, especially on private land where private landowners are justified in using resources subject to their ownership. It is directed primarily at public land where scenic quality is one of the multiple uses and values deserving recognition in a public land management program. In situations where an area is an important source of tourism and recreation, for example, a landscape architect might be employed in the design of the layout.

Subsection (c) contains those additional standards appropriate for public land.

Paragraph (1) follows similar federal legislation by applying the principles of multiple use and sustained yield to public land. These concepts are so well accepted as desirable objectives that further explanation is unnecessary. Once again, the approach which allows satisfaction of present needs without foreclosing future options is the most desirable.

Paragraph (2) injects another common principle in forest management. Specifically, while multiple use necessarily involves combining compatible uses within a large land area, forest practices and allocations result in assigning priority uses to particular areas. This standard provides that any allocation system should be implemented through analysis of the capability of the land and the resources and values present.

Paragraph (3) does not require that all uses be given equal distribution in the implementation of a multiple-use system.

It does, however, require that the process begin without any preconceptions or prejudices on the part of land managers.

Paragraph (4) recognizes the need to accommodate the concerns and requirements of the many forest resource constituencies.

Section 50. Administrative Plan and Report.

Subsection (a) requires that a plan be developed by the department demonstrating compliance with the Act. Without such a planning process, it would be difficult for the department to direct all of its activities and programs toward meeting uniform goals. Moreover, there would be no guarantee that a long range blueprint (based on a rotation age or similar concept) for forest management would be formulated; this is necessary if undesirable consequences are to be addressed before they become impossible to deal with. It is expected that the plan will concern itself specifically with management issues of interest to the public, such as harvesting methodology, timber management philosophy, and a system for perpetuation of supplies of renewable resources. While the plan will necessarily be revised and augmented over time to reflect new information and management techniques, the first draft should accompany the first report to the legislature required by subsection (b).

Subsection (b) requires a report to the legislature demonstrating accountability with respect to subsection (a).

Subsection (c) directs the preparation of recommendations for financial incentives as part of the threefold approach to achieving the objectives of the Act (regulations, services, and incentives).

Section 60. Regulations.

This section vests authority for regulations governing forest practices. Regulations may be adopted, of course, to implement other portions of the Act as well.

Subsection (a) lists the subject areas for regulations. They are intended to cover appropriate silvicultural and related activities necessary for forest management without encroaching on functions traditionally performed by other agencies. It is expected that a set of at least interim regulations would be developed by early 1979.

There has been a number of requests for a one-stop permit process. The department should not be vested with authority

to actually approve permit applications on behalf of other agencies since that is a matter for their discretion. However, an operator should not have to visit each agency and division which requires a permit. Therefore, this section allows the operator to make all of his permit applications through one place and to be informed of the outcome by the department. Where applicable, the provisions of AS 46.3[illegible] should be used to coordinate multiple permit determinations.

Subsections (c) and (d) are self-explanatory.

Section 70. Review and Approval of Operations.

This section is intended to institute a review process which combines the best elements of the notification system and the prior-approval system without incorporating their disadvantages as well.

Subsection (a) is, of course, subject to any exemptions granted under sec. 30(c).

Subsection (b) stresses the importance of the professional management services approach. If there is early and consistent contact between operators and the department with respect to pending operations, the operator will gain maximum benefit from assistance programs, understand applicable regulations so as to avoid inadvertent violations, provide state officials with a full understanding of his interests and needs, and in general facilitate administration of the Act. With full cooperation between operators and the state, review under this section could be rendered largely a formality. Moreover, while the statutory requirements must be met, I recognize that operations may range from a one-time harvest occupying one season to an ongoing harvest program taking place continuously for years. The commissioner is expected to tailor this process to various proposed projects so that unnecessary bureaucratic obstacles are not erected.

The review process in subsections (c) through (i) imposes an ironclad time frame on the length of the government review. There are no exceptions. The notification description should consist of a logging and access plan so that the location of land-use activities is easily discerned. The extended period in subsection (d) is to be authorized only where the complexity of the subject matter makes it physically impossible for a 20-day review, such as for a proposed operation involving many thousands of acres to take place over a number of years. If state agencies possess the manpower to review the operation within 20 days, an extension

should not be authorized. Moreover, an extension should only be for the period necessary to complete the review, and not necessarily for the full additional 20 days. Above all, the commissioner must insure that extensions are not used as an excuse for bureaucratic delay. This extension is not to be employed as an excuse for bureaucratic delay.

Subsection (e)(4) recognizes that there may be instances where a particular phase of an operation requires closer examination; it is emphasized that additional materials required of the operator under this language must be carefully limited to only those matters requiring additional review, and not used as an excuse for the forest managers to force the operator to do their work for them. Once again, if the professional management services approach is fully used, the review process in this section should not become an issue.

With respect to public notice under subsection (h), notice should be given locally as well where there is no newspaper published in the area.

Subsection (i) stresses that site examinations may be used where such would benefit the review process.

Subsection (j) prohibits substantial deviation from approved plans. "Substantial deviation" means a departure significant enough to jeopardize attainment of the objectives of the Act. Close contact between the operator and the department should permit any problems to be resolved in advance of a crisis.

Subsection (k) reflects that there will be some instances where immediate action is necessary, as in the case of salvage of trees, fire hazards, or other situations where a genuine emergency is involved.

The authority for posting of security under subsection (m) is to be used only where necessary. Obtaining bonds and other security devices is often difficult, especially for small operators, and may prevent them from doing business at all. Where security is required, the amount should be geared to the actual danger being protected against, possibly through some type of sliding scale arrangement.

Subsection (n) is self-explanatory. This was not intended to apply to operations which have already been completed.

Section 80. Deployment of Broadcast Chemicals.

Regulation of forest practices must necessarily reflect the state of the art. All consequences cannot be known in advance of operating; with an appropriate margin of error built in, such operations can be conducted successfully even though there are many unknowns regarding particular impacts.

Broadcast chemicals are a special case, however, as they involve the introduction of a foreign substance into the ecosystem. The state, for example, very strictly controls the introduction of exotic wildlife into Alaska because biologists often have little idea as to how a new species will interreact with the existing species composition. Foreign substances pose similar dangers to the forest ecosystem. I believe that forest managers should have a reasonable idea of the effects of using a foreign substance before it is applied on a large scale. While this section leaves to the discretion of the commissioner of environmental conservation the methodology to be used in regulating broadcast chemicals, it may well be advisable to undertake testing of some substances under controlled conditions before permitting commercial application of the substance.

Section 90. Conversion of Forest Land to Other Uses.

The provision in this section is a requirement of due process. However, it is my intent that proposed conversions be closely monitored so that subterfuge is not employed to escape responsibilities for reforestation. Moreover, while continued use as productive forest land cannot be required, it may be permissible to specify minimum revegetation of land for water quality purposes.

Section 100. Inspections, Investigations, and Enforcement.

This section authorizes each agency with statutory responsibilities over forest land to enforce those responsibilities. However, it also directs affected agencies to coordinate their enforcement activities so that operators are not subjected to differing interpretations of the same law or other undesirable or unnecessary procedures; interagency enforcement teams could be used to avoid this problem. Enforcement agents should avoid entering upon private land unless there is good reason to be there.

Section 110. Prohibitions, Penalties, and Enforcement Procedures.

The enforcement procedures in this section are straightforward and need no detailed explanation. Several features of this section should be stressed, however.

First, there are no criminal penalties. An administrative (civil) penalty system is used instead. Fines and penalties imposed are judicially reviewable under sec. 120.

Second, the burden of proof is, of course, on the state. An order resulting from a proceeding may be tailored to the exact nature of the violation so that the punishment is not disproportionate to the violation. A number of factors must be considered in determining a fine so that it reflects the gravity of the violation; it is expected that some type of fine schedule will be developed by the department so that penalties for the same offense are uniform.

Third, any emergency orders are limited to actual emergencies and have a duration of 21 days; therefore, they cannot be used as an excuse for not holding a hearing except in the context of an emergency.

Fourth, the bill establishes a hearing system designed to insure that operators are given a fair opportunity to present their case, and it recognizes that any proceeding instituted against a respondent may visit considerable expense and inconvenience on him. Special provisions are inserted to provide assistance to a respondent and to permit him to select an informal, nonadversary hearing process.

Fifth, the bill provides for a hearing officer who is not a state employee and who is not in any way connected with the preparation of the state's case.

Section 120. Appeals and Judicial Review.

This section is self-explanatory.

Section 130. Civil Action.

This section is self-explanatory. However, in order to discourage frivolous or obstructionist suits, I would hope that judges adjudicating cases brought under this section having no serious merit would impose costs and fees on the plaintiff under Civil Rule 82.

Section 950. Definitions.

While the definitions are self-explanatory, special mention must be made of the definition in paragraph (13). The intent of this definition, as the term is used in the Act, is to insure that consequences recognizable on the basis of the present state of the art of forest resource management are

reflected in management decisions, and that decisions include the establishment of a margin of error where it is understood that the consequences of an action are unknown. It is expected that studies undertaken by the state forester (using experimental forests and/or commercial logging operations) will be used to continually increase the bank of knowledge relating to the impacts of logging and other land use activities, and that the results would be described in the report submitted under § 50.

Partially exempt service.

Section 2 of the bill amends the section of the State Personnel Act listing the positions in the exempt service. It adds the state forester, consistent with the new chapter in sec. 1 of the bill.

Effective Date.

The effective date of the Act is January 1, 1979. However, it is expected that the department will engage in preparatory activities immediately so that full implementation may begin on the effective date.

Sincerely,

Jay S. Hammond
Governor

GOLDBELT, INCORPORATED
130 SEWARD STREET, SUITE 302 • JUNEAU, ALASKA 99801 • (907) 586-6244

TESTIMONY OF JOSEPH G. WILSON
ON BEHALF OF GOLDBELT, INCORPORATED ON
PROPOSED SPONSOR SUBSTITUTE
SENATE BILL NO. 59
IN THE LEGISLATURE OF THE STATE OF ALASKA
TENTH LEGISLATURE - SECOND SESSION
A BILL RELATING TO FOREST RESOURCES AND PRACTICES

Madame Chairman, Members of the Committee, My name is Joseph G. Wilson. I am the President and Chairman of the Board of Directors of Goldbelt, Incorporated, the Alaska Native Claims Corporation organized by the Juneau Natives for the purpose of selecting land pursuant to Section 14 H (3) of the Alaska Native Claims Settlement Act of 1971. Goldbelt has 2,700 shareholders, each of whom is a duly enrolled Alaska Native. Goldbelt will own the surface estate of 23,040 acres of land in Northern Southeast Alaska that will have substantial timber value.

Goldbelts concern with Proposed Sponsor Substitute Senate Bill No. 59 lies in its impact on our right as private land owners to manage our forest lands.

Goldbelt has reviewed Sealaska's amendments to the Proposed Sponsor Substitute Senate Bill 59, Alaska Forest Practices Act and consider these to be the minimum requirements for the protection of private property interests.

The amendments focus on 1.) a Board of Forestry is established with broad representation from industry, property owners, and other interest groups. An important consideration of the Board is that their responsibility will be to directly participate in the formulation of draft regulations pertaining to the

MANAGEMENT AND USE OF FOREST RESOURCES. 2.) THE ORGANIZATION FOR A DIVISION OF FORESTRY LED BY A STATE FORESTER WITH SUFFICIENT FORESTRY EDUCATIONAL BACKGROUND. 3.) THE AMENDMENTS ADDRESS THE STANDARDS OF REGULATIONS WITH EMPHASIS ON THE ECONOMIC ENVIRONMENT OF THE INDUSTRY AND RECOGNITION THAT MAN IS AN ESSENTIAL FEATURE IN MANAGING THE FOREST AND RELATED RESOURCES.

GOLDBELT CONSIDERS THESE TO BE THE BASIC MINIMUM REQUIREMENTS FOR THE PROTECTION OF PRIVATE LAND OWNERSHIP INTERESTS. WITHOUT THESE AMENDMENTS, GOLDBELT, INCORPORATED WOULD BE OPPOSED TO THE PASSAGE OF THIS LEGISLATION DURING THIS SESSION.

MADAME CHAIRMAN, WE THANK YOU FOR THE OPPORTUNITY TO TESTIFY.

Testimony of Robert E. LePesche, Commissioner
Department of Natural Resources
on the
Sponsor Substitute for Senate Bill 59

Senate Resources Committee
April 10, 1973

Thank you for the opportunity to testify before the Committee on the Sponsor Substitute for Senate Bill 59, an Act relating to forest resources and practices.

As you know, a forest practices act has been in the works for more than three years. We consider it an extremely high priority. Only if we enact such legislation before logging reaches its greatest intensity are we in a position to (1) head off user groups conflicts before they occur, (2) establish forest practices and other ground rules before equipment is moved into the field, (3) provide the highest level of professional assistance to logging operators, and (4) fully realize the benefits of a healthy forest products industry while insuring perpetual supplies of renewable forest resources. Accomodating the many constituencies which depend upon forest resources will be difficult and complex, and we must start now. Most states have waited too long to adopt forest practices legislation, and have suffered for it. We should not repeat that mistake. By acting now, the establishment of a high profile professional forestry program will permit Alaska to occupy a position of national leadership in forest management.

During the hearings held by this Committee last year, it was evident that there was opposition to a number of provisions of the Administration Bill. Consequently, you asked that we work with affected interest groups in an attempt to come up with legislation which would respond to and reconcile the many points of view in

this controversial area.

In the interim period, we have tried to negotiate solutions to the problems with the bill with the Forest Service, state government entities, professional foresters, the forest products industry, native corporations, conservation groups, fishermen, and others. Of course, virtually everyone in Alaska has some stake in the management of Alaska's forests, and it was impossible to talk with all of them. Nevertheless, we did work continuously with those who evidenced a desire to participate in the revision of S.B. 59. Indeed, I cannot think of many pieces of legislation which have undergone the scrutiny, discussion, and reworking which has taken place on S.B. 59. At this point, the bill belongs as much to those participants as it does to us, and we believe the Sponsor Substitute is about as close as we can come to consensus legislation. It is certainly superior to the original S.B. 59, and we are indebted to those who have worked with us for the numerous improvements made and to this Committee for providing the forum to do so. We expect that the bill will receive considerable support from a number of different interest groups.

The Committee will note that we have submitted a rather lengthy transmittal letter along with the Sponsor Substitute. This letter contains the many statements of intent requested by persons and organizations who worked on the bill. The bill and the letter should be considered a package representing our efforts over the past year. As a result, we urge in the strongest terms that, if the bill is passed out favorably by this Committee, the transmittal letter be adopted as the Committee Report on the legislation.

The specifics of the legislation were reviewed with you at the working session of the Committee several weeks ago. Consequently, I will reserve going into that level of detail until responding to your questions when the testimony is completed. I would like to underscore, however, that the bill-

(1) establishes a visible professional forestry program in the Department of Natural Resources;

(2) adopts a threefold approach to forest management to include assistance by professional foresters and economic incentives as well as regulations;

(3) mandates thorough consultation with public and private entities through advisory committees and other mechanisms;

(4) exempts from regulation small landowners who may wish to sell their timber but are not really in the forest products business;

(5) allows for coordination of forestry regulations under this Act, the Coastal Management Act, and the Federal Water Pollution Control Act to avoid duplication and insure that appropriate disciplines are involved;

(6) establishes general policies for forest management, separated into those appropriate for public and for private land, and covering such matters as reforestation, providing for the needs of all constituencies, avoiding unwarranted economic burdens on operators, and insuring retention of the productive capacity of forest land with respect to renewable resources;

(7) authorizes regulations but precludes duplication of the programs of other agencies;

(8) limits government oversight of operations to a restricted and closely controlled review process;

(9) requires a report to the legislature showing that DNR has complied with and carried out the legislation;

(10) leaves development of specific standards to a regulatory process involving

all interest groups;

(11) permits genuine conversion of forest land to other uses; and

(12) employs an administrative penalty system rather than criminal sanctions, with special safeguards to avoid undue burdens on an operator charged with a violation.

In addition, two matters warrant special mention. First, there has been an obvious desire on the part of industry to obtain a high level forestry program, and therefore considerable discussion on the locus of a forestry division and the state forester. After a meeting in my office with representatives of various interest groups, we have redrafted certain parts of the bill to incorporate what we believe should be an acceptable compromise. Section 020 no longer requires that the Division of Forest, Land, and Water Management be in the Division of Lands, and Section 050(c) requires us to report to the Legislature in two years on the operations of the Division and, in consultation with interested parties, to develop recommendations regarding the qualifications of the state forester and the location of the Division as well as the legal authorities of the Department relating to forestry.

Second, several suggestions for changes were made by Committee members at the working session. As a result, we have (1) clarified and made more express the exemption for small landowners in §030, (2) added a definition of "silviculture" in §950, (3) deleted the provision in §110(a) that each day of a violation constitutes a separate offense, (4) added to the definition of "sustained yield" in §950 to clarify reforestation requirements, and (5) and added language to the transmittal letter to deter unwarranted intrusions on private land by state officials.

In concluding, I would stress again the importance of gaining passage of the Sponsor Substitute this year before many new operations get under way. If the bill is enacted, it is our intention to create the Division of Forest, Land, and Water Management immediately and to name an advisory committee with representation of all forest resources constituencies to work with us in the implementation of our forestry program.

At this point, I would ask that you hear from the persons who have indicated a desire to testify, since they will be able to speak to many of the issues which you are undoubtedly concerned about. Along with other members of the Administration, I will be available during the course of the hearings to answer questions on the bill and to provide any other assistance. Again, I appreciate the opportunity to testify, and I thank the Committee for the interest it has already shown in this bill.

UNITED STATES DEPARTMENT OF AGRICULTURE
FOREST SERVICE

P. O. Box 1628, Juneau, Alaska 99811

1510

April 24, 1978

Honorable Kay Poland
Alaska State Senate
Pouch Y
Juneau, Alaska 99811

Dear Senator Poland:

I have been following with a great deal of both personal and professional interest, the development of State forest practices legislation. I have been impressed with your concern to assure that the legislation provides the environmental protection necessary, and at the same time protects the rights of private landowners. The issues involved in forest practices on private land are indeed more complex than on public land.

Section 41.17.060 on regulatory and administrative standards, is of particular interest to us. This section authorizes the implementation of specific regulatory forest practices on the ground, and through membership on the Board of Forestry, we look forward to participating in the development of those regulations.

The policy of the Forest Service nationally, has been to encourage and support sound State forest practices legislation. Our previous testimony before your Committee attests to this.

An additional consideration in Alaska is the requirement in the Alaska Native Claims Settlement Act that lands selected by the Native corporations be managed under certain specified practices. Sub-section K, Section 22, states that:

> "Any patents to lands under this Act which are located within the boundaries of a National Forest shall contain such conditions as the Secretary deems necessary to assure that such lands are managed under the principle of sustained yield and under management practices for protection and enhancement of environmental quality no less stringent than such management practices on adjacent National Forest lands for a period of twelve years."

The job that now faces us is to develop standards and guidelines to meet the intent stated by Congress. We expect the State Forest Practices

Act now under development by your Committee will significantly aid in meeting Congressional requirements.

The work you and your Committee have done in bringing the various interests together on Statewide forest practices issues is of great value. I might suggest a meeting with ourselves, you and some of the other interests, as a way toward developing a practical approach in complying with the forest practices provision of ANCSA. I would welcome your counsel on this.

Sincerely,

Robert H Tracy

for JOHN A. SANDOR

UNITED STATES DEPARTMENT OF AGRICULTURE
FOREST SERVICE
P. O. Box 1628, Juneau, Alaska

April 10, 1978

TESTIMONY FOR THE SENATE RESOURCE COMMITTEE
SENATE BILL NO. 59, SPONSOR SUBSTITUTE

MADAM CHAIRMAN AND MEMBERS OF THE COMMITTEE:

MY NAME IS MARVIN C. MEIER, U. S. FOREST SERVICE, AND I AM TESTIFYING TODAY FOR REGIONAL FORESTER, JOHN. A. SANDOR.

WE ARE PLEASED TO HAVE THIS OPPORTUNITY TO SHARE OUR THOUGHTS ON THE PROPOSED FOREST PRACTICES ACT, SPONSOR SUBSTITUTE FOR SENATE BILL No. 59. WE HAVE A KEEN INTEREST IN THE DEVELOPMENT OF A STRONG STATE FORESTRY PROGRAM BECAUSE WE FIRMLY BELIEVE THAT ALASKANS WILL PROFIT IN MANY WAYS FROM THE DEVELOPMENT OF SUCH A PROGRAM. THE BILL UNDER CONSIDERATION WILL BE HELPFUL IN ACHIEVING THIS OBJECTIVE. IT IS THE RESULT OF A COOPERATIVE EFFORT OF LEGISLATIVE, EXECUTIVE, AND PROFESSTIONAL FORESTRY EXPERTISE.

MADAM CHAIRMAN, YOUR PERSONAL LEADERSHIP AND THE EFFORTS OF THIS COMMITTEE HAVE BEEN EFFECTIVE IN IMPROVING THE PROPOSED FOREST PRACTICES ACT THAT HAS EVOLVED THESE PAST THREE YEARS. IT HAS BEEN A PLEASURE FOR THE FOREST SERVICE TO WORK WITH THE STATE, YOUR COMMITTEE, AND OTHERS IN THIS EFFORT.

ALTHOUGH WE WILL NOT DISCUSS THE BILL IN GREAT DETAIL, THERE ARE SOME POINTS ON WHICH WE DO WISH TO COMMENT. FIRST, THE BILL WILL STRENGTHEN THE STATE FORESTRY AGENCY AND THE ROLE OF THE

STATE FORESTER. IN THIS GREAT STATE WITH THE VAST ACREAGE OF FORESTS AND RELATED RENEWABLE RESOURCES, THE APPLICATION OF SOUND FOREST PRACTICES MUST BE ASSURED. THE MANAGEMENT OF THE STATE'S FOREST RESOURCES IS EXTREMELY IMPORTANT FOR TIMBER, FISHERIES AND WILDLIFE, RECREATION, WATER, AND OTHER USES. THE FULL VALUE OF FOREST RESOURCE MANAGEMENT WILL BE REALIZED ONLY IF THE STATE CONTINUES TO HAVE COMPETENT, PROFESSIONAL PERSONNEL IN THE POLICY MAKING POSITIONS DIRECTING THE PROTECTION AND MANAGEMENT OF THESE RESOURCES. THE EXPERIENCE IN MOST WESTERN STATES CLEARLY ILLUSTRATES THIS.

THE BILL PROVIDES FOR THE DEVELOPMENT OF INCENTIVES AS A WAY OF ACHIEVING GOOD FOREST MANAGEMENT. SEVERAL OF THE LOWER 48 STATES HAVE ESTABLISHED, OR ARE WORKING TOWARD THE ESTABLISHMENT OF, INCENTIVE PROGRAMS. THEIR EXPERIENCE WILL BE HELPFUL TO ALASKA. THE INCENTIVES NEED TO BE THOUGHT OF IN BROAD TERMS AS INCENTIVES TO ALL FOREST RESOURCES AND OVERALL FOREST LAND MANAGEMENT, NOT JUST TIMBER MANAGEMENT. THE SECTION ON INCENTIVES AND COOPERATIVE FOREST MANAGEMENT WILL ENCOURAGE AND ASSIST PRIVATE FOREST LANDOWNERS TO USE THEIR LAND AND RESOURCES TO THEIR OWN BENEFIT, AND IN WAYS IN WHICH SOCIETY AS A WHOLE DOES NOT SUFFER.

THE BILL'S SECTION ON REGULATORY PROCEDURES WILL ALSO HELP PROTECT ALASKA'S RESOURCES. THIS PART OF THE PROGRAM IS IMPORTANT TO ASSURE THAT FOREST-RELATED RESOURCES ARE WISELY MANAGED FOR COMMODITY AS WELL AS ENVIRONMENTAL GOALS.

THE BILL PROVIDES FOR THE STATE'S CONTINUED PARTICIPATION AND INVOLVEMENT IN THE FEDERAL COOPERATIVE FORESTRY PROGRAMS. THESE PROGRAMS HAVE PROVEN THEMSELVES VALUABLE TO MOST OTHER STATES. THIS WILL WILL HELP ASSURE THE CONTINUATION AND EXPANSION OF ALASKA'S PARTICIPATION IN THESE PROGRAMS. IN FISCAL YEAR 1978, THE FOREST SERVICE WILL PROVIDE OVER $700,000 FOR COOPERATIVE PROGRAM FUNDING, WHICH IS A 40 PERCENT INCREASE OVER FISCAL YEAR 1977. WE CANNOT PROMISE THIS KIND OF INCREASE EACH YEAR, HOWEVER, THE U. S. DEPARTMENT OF AGRICULTURE DOES RECOGNIZE THE IMPORTANCE OF A STRONG COOPERATIVE FORESTRY PROGRAM HERE AND NOW. THE FOREST SERVICE IS COMMITTED TO SUPPORTING AND AND CONTINUING SUCH A PROGRAM.

THE BILL AUTHORIZES DESIGNATION OF STATE FORESTS FOR RETENTION AS MULTIPLE-USE LANDS AND AUTHORIZES THE ESTABLISHMENT OF STATE TREE NURSERIES. SUCH AUTHORITIES ARE SOUND, AND AGAIN ARE PROVEN IN THE EXPERIENCE OF OTHER STATES. THERE ARE FOREST REGENERATION NEEDS NOW, AND THESE NEEDS ARE LIKELY TO INCREASE AS MORE TIMBER IS HARVESTED. TO THE EXTENT THAT PRIVATE NURSERIES ARE NOT ABLE TO PROVIDE THE STOCK THAT IS NEEDED AT AN AFFORDABLE PRICE, WE ADVOCATE STATE SUPPORTED NURSERIES. THEY WOULD RESULT IN BETTER LAND UTILIZATION, THEREBY REDUCING THE AMOUNT OF LAND IMPACTED BY A GIVEN TIMBER HARVEST LEVEL. ALSO, A STATE SUPPORTED NURSERY COULD LEAD TO DEVELOPMENT OF IMPROVED PLANTING STOCK.

AGAIN, IT HAS BEEN A PLEAURE WORKING WITH VARIOUS STATE PERSONNEL AND WITH YOUR COMMITTEE IN THE DEVELOPMENT OF THIS PROPOSED LEGISLATION. THE ENACTMENT AND IMPLEMENTATION OF THE PROPOSED BILL SHOULD HELP ASSURE THE SOUND MANAGEMENT OF ALASKA'S FORESTS AND RELATED RENEWABLE RESOURCES.

SOCIETY OF AMERICAN FORESTERS

Alaska Section

April 10, 1978

TESTIMONY FOR THE SENATE RESOURCES COMMITTEE
SENATE BILL NO. 59, SPONSOR SUBSTITUTE

MADAM CHAIRMAN AND MEMBERS OF THE COMMITTEE;

MY NAME IS BOB JANES AND I AM APPEARING TODAY FOR THE ALASKA SECTION OF THE SOCIETY OF AMERICAN FORESTERS.

WE WELCOME THIS OPPORTUNITY TO GIVE TESTIMONY IN FAVOR OF THE CURRENT SPONSOR SUBSTITUTE FOR SENATE BILL NO. 59. THE ALASKA SECTION REPRESENTS OVER 200 PROFESSIONAL FORESTERS THROUGHOUT THE STATE OF ALASKA, AND IS PART OF A NATIONAL ORGANIZATION OF MORE THAN 20,000 SUCH MEMBERS. DURING THE PAST THREE YEARS, WE HAVE BEEN ACTIVE IN HELPING TO FORMULATE LEGISLATION FOR A SOUND STATE FOREST PRACTICES ACT IN ALASKA. A YEAR AGO, WE MADE AN IN-DEPTH ANALYSIS OF SENATE BILL NO. 59, BY TESTING IT AGAINST OUR SOCIETY OF AMERICAN FORESTERS RECOMMENDED NATIONAL CRITERIA FOR A COMPETENT STATE FOREST PRACTICES ACT. WE ARE HAPPY TO SEE THAT SUGGESTIONS AS A RESULT OF THAT EFFORT HAVE BEEN INCORPORATED INTO THE SPONSOR SUBSTITUTE BEFORE YOU TODAY.

ONE OF OUR PRIMARY CONCERNS A YEAR AGO, WAS THE NEED FOR THE STATE FORESTER TO PLAY A MORE PROMINENT AND AUTHORITATIVE ROLE IN ADMINISTERING THE ACT IN A SOUND AND PROFESSIONAL MANNER. SINCE THE DIRECTOR OF THE DIVISION OF FOREST, LAND, AND WATER

MANAGEMENT WILL BE THE STATE FORESTER, AND SINCE THIS PERSON MUST HAVE PROFESSIONAL NATURAL RESOURCES LAND MANAGEMENT CREDENTIALS, IT APPEARS THE ORGANIZATIONAL STRUCTURE NOW PROVIDES FOR OVERCOMING THAT PARTICULAR PROBLEM. WITH PROPER DELEGATED AUTHORITY EXTENDED BY THE COMMISSIONER, THE STATE FORESTER SHOULD BE ABLE TO OPERATE IN A LEADERSHIP ROLE IN THE MANNER WE ENVISION IS NECESSARY. WE MUST EMPHASIZE, HOWEVER, THE IMPORTANCE OF DELEGATING SIGNIFICANT AUTHORITIES TO THE STATE FORESTER. OTHERWISE, A PROGRESSIVE STATE FORESTRY AWARENESS IN ALASKA COULD AGAIN BACKSLIDE, AND OBSTRUCT SOUND PROTECTION, MANAGEMENT AND UTILIZATION OF THE ABUNDANCE OF NATURAL RESOURCES THIS GREAT STATE HAS.

ANOTHER OF OUR MAJOR CONCERNS IN THE PAST WAS THE EFFECT THIS LEGISLATION WOULD HAVE ON PRIVATE LANDOWNERS. CRITERIA #7 OF OUR NATIONAL GUIDELINES STATES "A FOREST PRACTICES ACT SHOULD ALLOW A FOREST LANDOWNER LATITUDE IN APPLYING PROFESSIONAL FORESTRY EXPERTISE AND FOREST MANAGEMENT PRINCIPLES. ADMINISTRATIVE REQUIREMENTS FOR FOREST LANDOWNERS AND OPERATORS SHOULD NOT BE UNDULY BURDENED." IN PREVIOUS INPUT, WE EXPRESSED THOUGHTS ABOUT THE APPARENT INAPPROPRIATE INVASION OF RIGHTS AGAINST PRIVATE LANDOWNERS BECAUSE OF UNDULY RESTRICTIVE REGULATORY PRACTICES. FOR EXAMPLE, THERE WAS A PROVISION IN PREVIOUS PROPOSED LEGISLATION THAT READ "TIMBER HARVESTING IS NOT PERMITTED IN AN AREA UNLESS RELEVANT DATA AND INFORMATION INDICATE THAT THERE WILL BE NO REFORESTATION PROBLEMS LEADING TO THE INABILITY OF THAT AREA TO PRODUCE A SUSTAINED YIELD OF MERCHANTABLE TIMBER." WE COMMENTED THAT WHILE THIS MAY BE APPROPRIATE FOR STATE OR MUNICIPAL FOREST LANDS, IT

WAS NOT APPROPRIATE AS A BASIS FOR DEPRIVING A PRIVATE LANDOWNER OF ECONOMIC VALUES THAT EXISTED ON HIS OWN LAND. THE CORRESPONDING REGULATORY STANDARD IN THE CURRENT SPONSOR SUBSTITUTE, SEC. 41.17.040 (B) (1), NOW READS "TIMBER HARVESTING IS LIMITED TO AREAS WHERE DATA AND INFORMATION DEMONSTRATE THAT NATURAL OR ARTIFICIAL REFORESTATION TECHNIQUES WILL RESULT IN THE PRODUCTION OF A SUSTAINED YIELD OF MERCHANTABLE TIMBER FROM THAT AREA." DURING THE OPERATOR NOTIFICATION PROCESS WITH THE COMMISSIONER, THIS REQUIRED DETERMINATION SHOULD BE EASILY RESOLVED. ANOTHER OVERLY RESTRICTIVE PROVISION IN THE SAME SECTION OF THE PREVIOUSLY PROPOSED LEGISLATION READ, "SCENIC AND AESTHETIC QUALITY SHALL BE MAINTAINED IN OR ADJACENT TO AREAS OF SIGNIFICANT IMPORTANCE TO THE TOURISM AND RECREATION INDUSTRY." THE CORRESPONDING REGULATORY STANDARD NOW READS "WHERE ECONOMICALLY PRACTICABLE, ALLOWANCE MAY BE MADE FOR SCENIC AND AESTHETIC QUALITY IN OR ADJACENT TO AREAS OF SUBSTANTIAL IMPORTANCE TO THE TOURISM AND RECREATION INDUSTRY." IN ESSENCE, THESE TYPES OF UNDULY RESTRICTIVE MEASURES HAVE BEEN ELIMINATED AND WE BELIEVE PRIVATE LANDOWNERS ARE NOW GIVEN FAIR CONSIDERATION IN THE SPONSOR SUBSTITUTE BILL. IN ADDITION, SECTION 41.17.070 HAS BEEN SUBSTANTIALLY IMPROVED REGARDING REVIEW AND APPROVAL OF OPERATIONS EVERY EFFORT WILL BE MADE TO LIMIT THE REVIEW AND APPROVAL PERIOD TO A MAXIMUM OF 20 DAYS. WITH THESE EXAMPLES, IT IS DEMONSTRATED THAT UNDULY BURDENSOME REQUIREMENTS HAVE BEEN STREAMLINED OVER THE PREVIOUS BILL.

PROPOSED LEGISLATION FOR AN ALASKA FOREST PRACTICES ACT STARTED IN THE SECOND SESSION OF THE NINTH LEGISLATURE. IT CONTINUED IN THE FIRST SESSION OF THE TENTH LEGISLATURE, AND IS NOW IN ITS THIRD YEAR. TO HELP ASSURE SOUND PROFESSIONAL MANAGEMENT OF ALASKA'S

FOREST LAND RESOURCES AT THE EARLIEST POSSIBLE TIME, WE URGE YOUR COMMITTEE TO AGGRESSIVELY STRIVE FOR ADOPTION OF THIS SPONSOR SUBSTITUTE FOR SENATE BILL No. 59, DURING THIS SECOND SESSION OF THE TENTH LEGISLATURE.

THANK YOU FOR LISTENING TO US TODAY.

SB

128

April 28, 1977

The following is a list of the changes from SB 128 to CSSB 128 by John Farleigh, Administrative Assistant.

1. Page 2, line 24, changes 10 to 15. This is to conform with SB 1 which is now law. (Ch. 8, SLA 1977)

2. Page 3, line 4, Add a new section 6 and re-number accordingly. This section comes from SB 147 (the Fish and Game Omnibus Act that has passed the Resources Committee) and is designed to define "registered under the laws of the State" so that the Department of Fish and Game can begin regulating fishing vessels within the 200 mile limit.

3. Page 6, line 16, changes $500 to $750. This raise in the ceiling allows all non-resident fees to be 3 times that of residents.

4. Page 6, line 29. This technical amendment came from the Attorney General's office to correct a "proof reading oversight".

Chairman
Senate Finance Committee

From: John Farleigh
Administrative Assistant
Senate Resources Committee

Re: Amendment to CS SB 128

Pursuant to the 200 mile limit legislation enacted last year by Congress, the Alaska Department of Fish and Game is allowed to regulate fishing vessels "registered under the laws of the state." Section 6 was added by the Resources Committee to define "registered under the laws of the state" so that the Department of Fish and Game can begin regulating fishing vessels beyond the three-mile limit. However, due to an oversight, the committee substitute did not include an immediate effective date for this section. Therefore, I have drafted an amendment and attached it for your consideration which would allow the department to regulate fishing beyond the three-mile limit beginning this year.

AMENDMENT

OFFERED IN THE SENATE: BY: Finance Committee

To: CS for SENATE BILL No. 128

HOUSE BILL No. _____

February 4, 1977

The Honorable John L. Rader
President of the Senate
Alaska State Legislature
Juneau, Alaska 99811

Dear Mr. President:

Under the authority of art. III, sec. 18 of the Alaska Constitution, and in accordance with AS 24.30.060(b) and the Uniform Rules of the Alaska State Legislature, I am transmitting a bill related to commercial fishing licensing. The bill would (A) eliminate the currently required gear license and commercial fishing license for holders of entry permits and thus simplify the paper-work of license applications for all concerned, especially the fishermen. The number of pieces of paper necessary to fish would be decreased from 4 to 2. One of these two, the vessel license, would be freely transferable between fishermen using the same vessel as it would be issued "anonymously" to a vessel, not to a person. The function (B) of issuing vessel licenses would be transferred from the Department of Revenue to the Commercial Fisheries Entry Commission.

The bill would authorize (C) the Entry Commission to establish permit fees to reflect the inclusion of fees formerly required for gear and commercial license. Finally, (D) the bill amends statutes relating to the Commercial Fishing Loan Program and the Fisherman's Fund to reflect all these licensing changes.

I urge special consideration of this bill as it implements a part of recommendation number 3(revised) of the Management and Efficiency Review Study.

Sincerely,

Jay S. Hammond
Governor

A REPORT ON

SENATE BILL NO. 128

by The Commercial Fisheries Entry Commission

with the concurrence of:
The Department of Fish and Game
The Department of Revenue
The Department of Public Safety

February 22, 1977

SENATE BILL NO. 128

"An Act relating to commercial fishing licensing and providing for an effective date."

Introduction

The Governor's bill entitled "An Act relating to commercial fishing licensing and providing for an effective date" presents the legislature with a new program of commercial fisheries licensing. The departments of Fish and Game and Revenue and the Commercial Fisheries Entry Commission designed this program to ease the paperwork for the fisherman, to save time and money for the State and to increase the accuracy and availability of the licensing data base.

Program Description

The new licensing program eliminates the gear and commercial licenses, separates the vessel license from an assigned operator and creates a crewmember license similar to the commercial license. A renewed entry permit will be the only requirement for a gear operator in order to participate in a fishery. A vessel used in commercial fishing must be licensed and no indication of who will operate the boat will be needed. People who participate in the fishery as crewmembers will have to obtain a crewmember license.

A resident, non-resident fee system for permits will be initiated in the proposed licensing program. This will compensate for revenue previously received for gear and commercial licenses based on residency. The 3 to 1 non-resident fee ratio used for gear licenses will be adopted for the permit fee schedule.

In the present system, vessel licenses are issued to operators. This has caused considerable inconvenience to the fishermen since Revenue and/or Fish and Game forms must be completed each time a fisherman changes vessels or takes on additional operators. The Department of Fish and Game also finds this paperwork time consuming and unnecessary. Without the operator connected to the vessel, there will no longer be a residency distinction and the proposed license program will charge one fee for the vessel license.

The Commercial Fisheries Entry Commission will continue to issue entry permits and will incorporate vessel licensing in its renewal system making licensing for gear operators one simple function. Each year forms will be sent to every permit holder with his renewal information pre-printed by computer. The recipient simply makes any necessary corrections, signs the form and returns it to the Commission with the appropriate fees. The permit holder and the vessel will then be licensed for the coming year. This new procedure for licensing requires far less time and effort for the fisherman than the present licensing system in which he has to obtain three Fish and Game licenses from the Department of Revenue and an entry permit from the Commercial Fisheries Entry Commission.

The Department of Revenue licensing division will issue licenses to crewmembers using its license vendor outlets. The holder of a renewed entry permit may participate in any fishery as a crewmember without purchasing a crewmember license.

The Alaska Fishermen's Fund will be maintained at its current level. This Fund provides for the treatment and care of Alaska commercial fishermen who are injured or become ill in commercial fishing activities. The Commercial Fisheries Entry Commission will assume responsibility for the transfer of money to cover each permit holder. The Department of Revenue will also transfer money to the fund for each crewmember license sold.

Revenue Analysis

The gear and commercial fishing licenses are being discontinued and will no longer contribute to the State's commercial license revenue. The anonymous vessel license and the new crewmember license will only partly make up for this loss. The rest must come from increased permit fees.

As seen in Table I, State revenues derived from the four types of license and permits now available approximated $1.5 million for each of the last four years. The new system is expected to produce $2.6 from the new vessel and crewmember

licenses and entry permits. The increase in revenue will come mainly from the three to one non-resident to resident permit fee differentiation.

Vessel license revenue will be based on a new fee. An anonymous $20 fee will replace the previous $10 fee for a resident vessel operator and $30 fee for the non-resident. When the $20 fee is applied to the number of vessel licenses sold in the past, vessel revenue totals $254,380, approximately $100,000 more than previous years. (Table II)

To project crewmember license revenue, the number of commercial license sold to persons who did not also have a gear license is used to estimate the number of people who were crewmembers. The percentages of resident and non-resident commercial licenses sold in the past are applied to the estimated number of crewmembers so total anticipated revenue can be derived. As seen in Table III projected 1978 crewmember revenue is $113,550.

These two amounts of new fee revenues, $254,380 for vessel licenses and $113,550 for crewmember licenses make up only a quarter of total revenues collected in the past. Under the new program the additional revenue must come exclusively from permit fees.

The Limited Entry Law requires permit fees to "reasonably reflect the different rates of economic return for different fisheries". It also calls for the fees to be set by regulation, although a ceiling is mandated. SB 128 raises the ceiling from $100 to $500. The new permit fees will remain in about the same proportions as they presently exist. Some adjustments will be made to more closely reflect the rates of economic return for the various fisheries.

When deriving total permit revenues, adjustments must be made to account for poverty permit fees. If a fisherman falls within Federal poverty guidelines he may purchase a permit for a reduced fee. This fee will be increased from $5 to $15 to reflect the cost of issuing the permit. The $15 fee will be less than the total cost of his licenses and permit under the present system.

A doubling of present permit fees closely reflects what the resident fisherman now pays in annual licenses and permits. However, with the 3 to 1 non-resident to resident ratio, the doubled fees will bring the State an extra million dollars in revenue. This extra revenue would bring the total money collected from commercial fishing licensing to $2.6 million. Table IV compares portions of the new fee schedule with the old schedule.

The cost of managing, rehabilitating and enforcing the fisheries have increased at a rapid rate over the last few years and now totals $17.6 million. Over the past 5 years the State has operated at an average inflation rate of 7% yet the price of commercial gear and vessel licenses have not increased since 1959. A bill which was passed in last year's Legislature doubled the cost of sports fishing licenses for residents from $5 to $10. SB 128 would allow a greater recognition of the State's costs in relation to commercial fisheries while at the same streamlining and improving its licensing program.

Table I

1974-1976 Licensing Revenue

	1974	1975	1976	Projected 1978
Gear	$ 425,287	$ 397,777	$ 413,805	- - -
Vessel	$ 152,486	$ 158,704	$ 160,737	$ 254,380
Commercial	$ 325,020	$ 334,510	$ 385,280	$ 113,550
Permits	$ 604,924	$ 646,191	$ 625,894	$2,202,395
TOTAL	$1,507,717	$1,537,182	$1,585,716	$2,570,325

Total figures include money transferred to the Fishermen's Fund, approximately $200,000 per year. The 1976 revenues for gear, vessel and commercial licenses are preliminary figures. The 1978 Commercial License entry represents revenue to be collected from Crewmember Licenses.

Table II

Vessel License Revenue

1975 Resident Licenses	10,369	@ $10 =	$103,690
1975 Nonresident Licenses	2,350	@ $30 =	$ 70,500
	12,719		$174,190

Projected 1978 Vessel License Revenue:

Total Licenses	12,719	@ $20 =	$254,380

Table III

Crewmember License Revenue

1975 Commercial licenses less gear licenses: 7,373

73% resident or 5,382 licenses @ $10/license = $53,820

27% nonresident or 1,991 licenses @ $30/license = $59,730

Projected 1978 Crewmember License Revenue: $113,550

Table IV

A COMPARISION OF OLD AND NEW RESIDENT LICENSE AND PERMIT FEES

SB

159

Leasing residential land was conceived as a method of making land available to those people who could not afford to purchase land at state sales. Leasing at a low fee would encourage development and construction of homes and increase local tax bases. This noble idea has been misconceived and totally revised over the years until the program now resembles a great loan shark scheme which entices you with a low fee and after you are hooked raises the fee by 1000% or more. Enclosed are the leases re-appraised in 1975 and 1976. Please note that all of the lower percentage increases are on non-profit or other state agency leases, i.e., Highways, Fish and Game, etc. At these rates, it would be cheaper to buy land than to rent. Over a period of 15 to 20 years you will have paid for the land plus interest, twice; after that your costs would multiply.

At present, all state leased land is of no value because of the uncertainty of the future rent, and the unavailability of mortgage financing. It is imperative that something be done immediately to correct this situation. The Governor's bill does not even address the problem.

The present Administration has over-reacted to the publicity about the Teamster's and Penney leases and have a paranoia that the state should make millions from leaseholders, 95% of whom receive no income at all from leased land.

The real facts are that leased land has always been over or underpriced by a foolish desire to establish a percentage of the fee simple value as the rental figure. This only works when demand is greater than supply, which is not the case in land in Alaska. Most of the lease sales were failures as the land was not leased at the time of sale. Some was leased later over the counter when the market value caught up to the price, and some was withdrawn. Today there are less than 25,000 acres of state land leased to private owners, of some 5 to 6 million acres set aside for leasing.

Instead of trying to increase the rental of acreage leased to impossible rates, the state should embark on a reasonable program to get the rest of its land paying something.

Income from rental from leased land in 1975 for University and Mental Health Lands was $184,218. In spite of the fact that together the University and the Mental Health lands total over 2 million acres, less than 1/10 of 1% is leased after 17 years of statehood.

R a Williams

Former employees of the Division have stated that since leases seldom sold at the sales they concluded that there was no market. Apparently no one took the view that maybe 6% of fee simple was too high a rate for residential land.

I will close with a comment of the Governor's Ad Hoc Committee. This committee was designed by the former Commissioner to review the leasing program and act as an arbitrator between the leaseholders and the Division of Lands. Unhappily, the Commissioner was engrossed in the D2 Lands, the Cook Inlet sway, the Outer Coast Oil Lease Sale and a dozen other vitally-important items in Washington, D. C., and the members of the committee were selected by the Director, M. Smith. Most were either employees of the state, or former state employees, and a few are potential employees or contractors with the state.

The Arbitrators soon became the Advocates of the Division and their Bill - HB 387 - duly describes their thinking. It does not address the main problem. It provides no solution for financing, and it assumes the state should or can lease thousands of acres of land at ten times the lifetime price of a purchase.

P.O. BOX 4-N
ANCHORAGE, ALASKA 99509

April 15, 1977

The Honorable Jay S. Hammond
Governor, State of Alaska
Pouch "A"
Juneau, Alaska 99811

Dear Governor:

As a member of the Ad Hoc Advisory Committee on State Land Practices and Procedures, I wish to make the following comment on our final report of April 1977.

I do agree with the committee's report and stand behind it with one reservation. I do not pretend to have an answer but only concern. I feel that the lease rental increases being left open with a possible increase every five years to 100 percent is too much of a hardship on an individual leasing lands. I would think by having an open ended increase it would put an extraordinary heavy burden on the lessor for the purpose of financing any one project for the simple reason the banks would never know what the lessor would ultimately have to pay for the lease. Again, I state to you that I have no answer for the best possible solution, but only a great concern that I hope is given much more consideration before a final bill is passed through the legislator.

I appreciate the opportunity you have given me in serving with this committee.

Sincerely,

Carl H. Marrs
Land Manager

Introduced: 3/4/77
Referred: Rules

IN THE SENATE BY SACKETT

SENATE RESOLUTION NO. 4

IN THE LEGISLATURE OF THE STATE OF ALASKA

TENTH LEGISLATURE - FIRST SESSION

Congratulating Jean Elizabeth Dementi on her ordination into the Episcopal priesthood.

BE IT RESOLVED BY THE SENATE:

WHEREAS Jean Elizabeth Dementi was recently ordained into the Episcopal priesthood, and she is the first woman in Alaska to be so ordained; and

WHEREAS since 1951 Jean Dementi has been serving the Alaska bush as a missionary nurse in Nenana, as a hospital superintendent and nurse in Fort Yukon, and as a nurse-evangelist in Shageluk and Anvik; and

WHEREAS she has served the spiritual needs of the Alaska bush communities of Shageluk, Grayling and Anvik for 22 years, first as a lay minister, then since 1972 as a deacon of the Episcopal Church, again the first woman in Alaska to be so ordained; and

WHEREAS Jean Dementi has the utmost respect as an educator and a "bedrock" theologian from the Bishop and the diocesan staff in Alaska;

BE IT RESOLVED that the Alaska State Senate extends its warmest congratulations to Jean Elizabeth Dementi on the occasion of her historic ordination into the Episcopal priesthood, culminating 26 years of service to the Alaskan bush and to the church.

A COPY of this resolution shall be sent to Jean Elizabeth Dementi of Shageluk.

24 May 1977

Darwin Smith
Cheri Lake Star Route Road
Wasilla, Alaska 99687

Dear Mr. Smith,

I received your telegram some time ago on the state land leasing issue. As you know, the House Resources Committee was considering HB 383, HB 387, and SB 159 all at the same time. SB 159 and HB 387, were at that time almost identical. The House Resources Committee chose CSSB 159 (Finance) am as the best of the three bills and sent it out of Committee in late April. Upon receipt of your telegram, and a number of others of the same nature, I gave serious thought to holding a hearing in the Anchorage - Wasilla - Palmer area. Due to the session nearing a close, however, public hearings in your area would have delayed action on this issue until next year. In most cases I would honor a request such as yours and I regret not being able to do so in this case. I felt then, and do feel now, that action on this issue was of immediate importance because if something was not passed this session, some people faced the danger of losing businesses.

After the bill left House Resources, it was further revised in the Rules Committee (House). Please find a copy of that version attached. The bill has still not passed the legislature. The Senate would not accept the present version from the House, so a Free Conference Committee was appointed to iron out the differences. Legislators appointed to the Free Conference Committee are:

Senator Sumner	Representative Freeman
Senator Croft	Representative Urion
Senator Huber	Representative Smith

This Free Conference Committee has not, to date, come up with a compromise bill. I have urged them to do so this session and I am confident that they will.

AGO 936003

If you still have problems with the Alaska Division of Lands' land leasing program after passage of this legislation, please let me know and perhaps we can arrange for your personal input during the 1978 session.

You will find enclosed: 1) a copy of CSSB 159 (Finance) am - the form of the bill when it was reported out of the House Resources Committee; 2) a copy of HCS CSSB 159 - the present form of the bill; and 3) a list of people who testified before the House Resources Committee on the issue.

Sincerely,

Alvin Osterback

Gregory Black
Big Lake Route, Box 86
Wasilla, Alaska 99687

Dear Mr. Black,

I received your telegram some time ago on the state land leasing issue. As you know, the House Resources Committee was considering HB 383, HB 387, and SB 159 all at the same time. SB 159 and HB 387, were at that time almost identical. The House Resources Committee chose CSSB 159 (Finance) am as the best of the three bills and sent it out of Committee in late April. Upon receipt of your telegram, and a number of others of the same nature, I gave serious thought to holding a hearing in the Anchorage - Wasilla - Palmer area. Due to the session nearing a close, however, public hearings in your area would have delayed action on this issue until next year. In most cases I would honor a request such as yours and I regret not being able to do so in this case. I felt then, and do feel now, that action on this issue was of immediate importance because if something was not passed this session, some people faced the danger of losing businesses.

After the bill left House Resources, it was further revised in the Rules Committee (House). Please find a copy of that version attached. The bill has still not passed the legislature. The Senate would not accept the present version from the House, so a Free Conference Committee was appointe to iron out the differences. Legislators appointed to the Free Conference Committee are:

Senator Sumner	Representative Freeman
Senator Croft	Representative Urion
Senator Huber	Representative Smith

This Free Conference Committee has not, to date, come up with a compromise bill. I have urged them to do so this session and I am confident that they will.

AGO 936013

If you still have problems with the Alaska Division of Lands' land leasing program after passage of this legislation, please let me know and perhaps we can arrange for your personal input during the 1978 session.

You will find enclosed: 1) a copy of CSSB 159 (Finance) am - the form of the bill when it was reported out of the House Resources Committee; 2) a copy of HCS CSSB 159 - the present form of the bill; and 3) a list of people who testified before the House Resources Committee on the issue.

Sincerely,

Alvin Osterback

Persons who testified before the House Resources Committee on "the leasing of state land other than for the extraction of natural resources."

28 March 1977

Representative Miles, sponsor of HB 387

George Silides, Resource Consultant for the Senate and House Resources Committees

Ted Smith, Director of the Alaska Division of Land & Water Management

Lowell McNutt, lessee in the Alaska Industrial Subdivision

Joe Wilhour, lessee in the Alaska Industrial Subdivision

David McCabe, private appraiser & member of the ad-hoc committee

Jamie Love, member of the ad-hoc committee

Ken Davis, lessee in the Alaska Industrial Subdivision

Robert Ford, lessee in the Alaska Industrial Subdivision

Hugh Galleck, co-chairman of the ad-hoc committee

Joe Norman, a member of the ad-hoc committee

Bill Mack, Chairman of the Alaska Land & Lease Holders Assoc.

Herb Lang, member of the ad-hoc committee

13 April 1977

Ken Davis

Bill Mack

Senator Kay Poland, original sponsor of SB 159

18 April 1977

Ted Smith

Darwin Heiny, speaking for the state Board of Education

Ken Davis

Robert Ford

Leon T. Brown, lessee in the Mountain Home Subdivision.

FINAL REPORT AND RECOMMENDATIONS

April, 1977

THE GOVERNOR'S AD HOC ADVISORY COMMITTEE ON STATE LAND PRACTICES AND PROCEDURES

TABLE OF CONTENTS

)

AGO 936049

I. SUMMARY OF THE COMMITTEE'S FORMATION, MISSION, AND ACCOMPLISHMENTS

On October 8, 1976 the Governor's Ad Hoc Advisory Committee on State Land Practices and Procedures met for the first time. The mission of the committee was outlined by Guy Martin, Commissioner of the Department of Natural Resources. He said that the Governor desired a small, precise, and efficient panel to find new ways to improve state land practices and procedures, not to set policy but to address the legal and technical aspects of disposal and other contractual relationships. Judgments, criticisms, and new recommendations were to be effected. Michael C. T. Smith, Director of the Division of Lands, clarified the mission further by adding that the committee should:

1) consider primarily revenue production, as opposed to social benefits, in its analysis;

2) make no assumptions as to state policy regarding the number, size, and location of land sales or other disposals; and

3) recommend changes that will be applicable to any likely state land policy.

The committee made a dedicated attempt to accomplish its mission. The tasks of studying existing statutes, regulations, and practices, and examining them in light of current land disposal and contractual relationships was formidable, but many members worked successfully to this end. Uncovering and identifying disposal and contractual problems involved considerable time and effort. Correct identification of a particular problem of this nature is a major step toward solving it. Perhaps the greatest success of the committee was discerning from Division of Lands personnel and state lessees the exact nature of their problems and concisely defining them. This action will have a lasting effect on Division of Lands personnel who are charged with formulating policy and procedures for land disposals and contractual relationships. The committee did make significant recommendations to effect changes in statutes, regulations, and Division procedures and policy. The lease form used by the State was revised to include terms and conditions that would offer benefits to both the State and the lessee. The recommendations of the committee in general give the State more flexibility to respond to client needs. Both client and State will benefit greatly if the committee's recommendations are carried out. The mission of the committee has been accomplished with admirable success in this regard.

AGO 936050

Selected areas were covered, specifically those of sales and leasing. The committee states that this report is not meant, by any means, to be all-inclusive.

AGD 936051

II. THE INDIVIDUALS ON THE COMMITTEE

The individuals who served on the committee volunteered considerable time and effort. Each member was selected on the basis of having specialized knowledge and expertise. The following list of members and their qualifications shows considerable diversity.

Mike Colletta - State Senator.

Hugh Gellert - President of Bear Fritz, Inc., a land development company with interests in Anchorage and the Kenai Peninsula.

Grant Giesler - Vice President of Alaska Mutual Savings Bank (resigned 1/5/77).

Herb Lang - President of Anchorage Sand and Gravel (joined the committee 1/6/77).

Jamie Love - Director of the Alaska Public Interest Research Group (AkPIRG).

David McCabe - Private Appraisor.

William Mack - Chairman of the Alaska Land and Lease Holders Association.

Carl Marrs - Land Manager for Cook Inlet Region, Inc.

John Norman - Attorney specializing in the area of corporate and natural resources law.

Lidia Selkregg - Anchorage Assemblywoman; Professor of Regional Planning at the Arctic Environmental Information and Data Center in Anchorage.

Theodore C. Smith - Former State Representative; present Director of the State Division of Land and Water Management.

AGO 936052

III. COMMITTEE WORK PROCESS

The committee worked in a series of sessions, all of which were open to the public. Meetings were held weekly from October 8, 1976 to March 30, 1977 with the exception of 12/17/76 -1/5/77, when the committee recessed for the holidays. Two additional evening work sessions were held, and two evening meetings to hear public comments took place on 12/1/76 and 3/3/77. The meetings were loosely structured to accommodate those attending and to provide time for public comment.

The committee addressed the area of sales in its first sessions and proceeded to the area of leases in the later sessions. There was considerable public input from concerned individuals, and organizations, and many persons with specialized knowledge were invited. A great deal of support was provided by many state agencies, particularly by the State Division of Lands and the Department of Law. Considerable time was spent in information gathering. The Division often was requested to provide information on current procedures. Considerable information on Division activities was compiled. The changes recommended were made cautiously and are well supported by the information gathered. The committee's recommendations were made in the form of motions which were voted on by majority vote at the meetings. Recommendations were made freely as each subject area was explored.

Many meetings, including the two evening public comment sessions, were advertised in two newspapers. Press releases and newspaper articles appeared locally. Mass mailouts provided general information and announced upcoming meetings; lists of meeting dates were avilable at all sessions. The interested public was encouraged to contact the Division of Lands with any verbal or written questions and comments. Copies of materials used by the committee were available to the public and public comment was specifically taken on the committee's interim recommendations and draft bill to the Governor.

Almost all sessions were tape recorded in their entirety. Written minutes of meetings were time-keyed to the tapes to allow verification. The public is welcome to listen to or make copies of these tapes by contacting the Division of Lands.

AGO 936053

IV. FINDINGS AND RECOMMENDATIONS OF THE COMMITTEE

The findings of the committee were numerous but can be grouped into major categories:

1) State lessees are dissatisfied with the state interpretation of lease contract terms, especially those relating to appraisal. Many lessees testified before the committee as to their grievances.

2) The Division's regulations covering sales and leases are often outdated and conflicting with statutes in some cases.

3) The State's lease contract form is not in line with commercial contracts and has many ambiguities in it.

4) Some state statutes in Title 38.05 are vague and unclear.

5) Payment methods for state sales contracts do not match those used in the private sector and may contribute to ballooning land values.

These findings outline the basis for the committee's recommendations which follow.

The recommendations of the committee concern statute, policy, and regulation changes, and can be grouped by topic.

The following five items are of <u>general concern</u>:

1. The committee wishes to note that in the course of public testimony it was apparent that Division of Aviation lessees had significant problems with their current leases. This subject was not within the scope of the committee's deliberations and, therefore, not addressed.

2. To comply with new statutes the committee recommends a major overhaul of Division of Lands regulations. The committee has found many of the regulations now in effect to be outdated and superseded by statutes.

AGO 936054

3. The committee recommends that the Legislature apply the provisions found in Title 38 to those in Title 3, Title 19, and Title 35. The rationale would be to make land laws uniform among the Division of Aviation, Department of Highways, and Division of Lands.

4. Looking to the future, when the Division appraisal workload gets even heavier, the committee recommends that all (or all significant) appraisals be done by contract appraisers, with the Division appraisers functioning as review appraisers.

5. The committee stands opposed to Senate Bill 234, since the needs as outlined in this bill are covered by present legislation; the committee finds SB 234 not in the best interests of the State or the land management of the State.

In order to provide predictability in appraisals and reappraisals, for the benefit of the State and the public, the committee recommends the following:

1. At present many lessees are suffering hardship due to rent increases of several hundred percent. To provide for this relief and as a curative for such future increases the statutory provisions found in section nine of the attached bill are recommended. Provision for optional conversion of present leases to ones that will place a ceiling of 100% on rental increases every five years will largely prevent future hardship cases and resolve satisfactorily the present cases. With a rent ceiling, lease rental increases will be more predictable resulting in more financial stability for the lessee. (The Alaska Industrial Subdivision hearing panel recommends insuring predictability by placing some control over the size of the rental increase through utilization of a ceiling on the size of the increase in rental every five years.)

   Sections 8 and 9 of the attached bill will accomplish the above recommendations.

2. The committee recommends that land offered over the counter be reviewed at 90 to 120 day intervals to determine if an increase in value has occurred. This review is desired so that parcels are not undervalued by progressive changes in the market.

   Section 10 of the attached bill would accomplish this.

3. Since public notice is covered in AS 38.05.345 the change to "appraisal" for AS 38.05.330 is warranted by its present content. The committee recommends that land may be appraised 120 days in advance of a sale or lease. The change from 90 to 120 days would be desirable in that minimum bid information could be given to the public well in advance of the actual sale or lease auction. In addition 11 AAC 54.140 should be repealed.

   Section 10 of the attached bill will accomplish this.

4. In order to provide a workable solution to the problems of confidentiality of appraisal data, the committee recommends that the Director of the Division of Lands refrain from including confidential information in any appraisal prepared for the Division of Lands use.

5. The committee believes that the word "primarily" may imply special consideration to some lessees. In order to treat all lessees fairly and equitably the committee recommends that the word "primarily" be stricken. Deleting "primarily" would clarify the basis for reappraisal. (This was also recommended by the Alaska Industrial Subdivision hearing panel.)

   Section 8 of the attached bill will accomplish this.

To improve accounting policies and administrative procedures, and to protect the State, the purchaser and the lessee, the following are recommended:

1. The committee recommends that the Division of Lands have the option of requiring all sales contracts over $400.00 per year to be paid in quarterly installments instead of annual installments. It is the committee's belief that this would ease the financial strain on the buyer and yet not add significantly to the State's administrative costs. To provide quarterly payments would require a change in AS 38.05.065 with the present annual payments deleted and the quarterly payment provision adopted in its place.

   Section 3 of the attached bill would accomplish this.

2. The committee recommends that a $10.00 fee charge to cover administrative costs be given to those who make sale or lease payments with checks that are returned. It is a standard business practice to provide for such charges and is recommended to protect the State's interests.

AGO 936056

3. The committee recommends instituting default charges for late sale or lease payments. At present, there exists no penalty and many payments are late. The form of penalty recommended is notification charges to all delinquent payments and penalty charges to payments delinquent more than 30 days. The notification charge would be $5.00 for the first notice, $20.00 for the second notice and a penalty charge of 6 percent of the payment.

It is suggested that the fee charges be adopted as a regulation under authority of AS 38.05.035(4)(5) as follows:

11 AAC 54.365. Delinquent Payments.

In the event of a delinquent payment, the following charges will apply:

1. A $10.00 penalty for payment with a check that is returned.

2. A $5.00 penalty for notification of payments over thirty-five days late.

3. A $20.00 penalty for a second notification of payments more than fifty days late.

4. A penalty of 6 percent of the rental or sale payment for payments delinquent by more than thirty days.

4. The committee recommends adding the following to the end of 11 AAC 54.190: Upon execution of the contract of sale the director shall cause the original copy of the contract to be recorded in the recording district wherein the property is located.

5. The committee recommends that 11 AAC 58.490 have a section .495 added: Upon execution of the lease the director shall cause the original copy of the lease to be recorded in the recording district wherein the property is located.

6. The committee recommends adding in 11 AAC 58.830 Recordation of Assignments, Modifications, Changes in Rental or Cancellations: Upon any assignment, modification, change in rental or cancellation, the director shall cause to be recorded an original document which recites the changes made in the recording district in which the property is located.

7. The committee recommends that somewhere in 11 AAC 58 a section be added: Fees for Recordation. The Division of Lands shall absorb any expense of recording all existing contracts of sale, leases, assignments, modifications, changes in rent; the director shall collect the necessary fee for recording any contract of sale, lease, or change of application hereunto from the contract·purchaser or lessee at the time of execution.

8. The committee recommends that the Attorney General draft for introduction to the next session of the Legislature a statute which will require all state agencies dealing in lands to record any such transaction (including any transaction dealing with plats and subdivisions) and further stating that failure to so record does not impose any liability on the State.

In order to achieve more flexibility and simplicity in handling land disposal transactions, the following are recommended:

1. The committee recommends that the State charge a market rate of interest in its sales contracts. The interest rate, at present 6%, is below market levels and may have contributed to inflated prices at state land sales. By setting interest rates at market levels, the State would help prevent inflated land prices and at the same time return more income to the State. To provide for a market rate of interest in sales contracts, no change in AS 38.05.065 would be required. The addition of a statement of market rate in this statute would be desirable, however.

   Section 3 of the attached bill would accomplish this.

2. The committee recommends that the State adopt a system of level payments in place of declining payments in its sale contracts. The system of level payments is in common use in the business world, and the payment figures are easily set forth in a contract. The disadvantage of the present method is that interest must be recalculated every year and the payments decrease each year. From both the State's and the buyers' viewpoints, the level payment method would be preferred. The State would receive slightly more in interest payments over the contract terms and the buyer would not have to make as high initial payments. To provide level payments would require a change in AS 38.05.065 with the present system deleted and the level payment system adopted in its place.

AGO 936058

Sections 2 and 3 of the attached bill would accomplish this.

3. The committee recommends that in Title 38.05 the term "fair market value" be used in place of "fair appraised market value" and "market value." The meaning is felt to be the same in all cases. The committee would like to see one standard term used to avoid confusion and misunderstanding.

   Sections 4, 5, 7, and 13 of the attached bill would accomplish this.

4. The current procedures for informing the public of state lands transactions are covered in AS 38.05.305 and AS 38.05.345. The two procedures do not mesh in a clear manner. The committee recommends that the procedures be clarified in a manner that will be flexible enough to inform the public fully and yet not require multiple advertising for minor negotiated transactions.

   Section 11 of the attached bill will accomplish this.

5. The committee recommends that the Director be given the authority to set the payment period from one to twenty years. This type of flexibility would allow the State and buyers greater market possibilities. To provide for this would require that the installment clause in AS 38.05.065 be deleted and replaced by the one to twenty year provision.

   Section 3 of the attached bill would accomplish this.

6. The committee recommends that the State be given more flexibility to resolve contract of sale violations. This is necessary to prevent foreclosures as the only remedy for minor contract violations.

   Section 3 of the attached bill would accomplish this.

To institute improvements in the <u>leasing system</u>, the following are recommended:

1. To implement the new lease provisions recommended by this committee new lease forms for various types of leases will be required. It is the committee's recommendation that the Division draft new lease forms to comply with the statutes adopted, and that the new forms be reviewed by this committee.

AGO 936059

The recommended lease form and attachments in Appendix C accomplish this.

2. The committee recommends that all state leases to other public agencies be at the normal fair market value rate of payment.

   This reflects a regulation change.

3. The committee recommends that state government agencies get out of residential leasing.

   This reflects a policy change.

4. To provide the lessee insurance against a land boom or unexpected increase the committee recommends that rental increases at the five year reappraisal periods not exceed 100 percent of the prior existing annual rental rate. This action would increase the predictability of the lessee's payments. The stability thus created would add significant borrowing power for the lessee to finance improvements on the leased ground.

   Section 8 of the attached bill would accomplish this.

5. The duration of a lease and the economic life of substantial improvements, such as stores or factories, may not coincide. In order to see that state leased land is used in a rational, economically productive manner the committee recommends that lessees of long-term leases be given a renewal option for up to fifteen years. This type of option would grant the lessee more flexibility in maximizing his investment returns, especially during the final years of his lease. It would also increase the lessee's planning possibilities for use of the leased ground. This action would also soften the impact of termination of the lease. Specifically, this would permit a lessee to make substantial repairs to a building when the remaining term of the lease would not otherwise justify it.

   Section 6 of the attached bill would accomplish this.

6. The committee agrees that a lease should be converted at its present classification, and the leaseholder should then have the option to change classification subject to Division of Lands approval.

This is made possible under the attached lease document so that a conversion (assuming passage of HB 383) to a new lease form would permit the leaseholder to change classification at his option.

7. The committee recommends that a level term for recreational leases not be provided.

8. The Alaska Industrial Subdivision hearing panel recommends that in accord with the provisions of the lease, lessees should be encouraged to record expenses incurred in site preparation so that the "original condition" can be more adequately ascertained.

   The Ad Hoc committee concurs. This recommendation is handled in the attached lease document.

9. The Alaska Industrial Subdivision hearing panel recommends that lease language should be clarified to remove any possible inconsistencies with 11 AAC 58.520 (Adjustment of Rental).

   The Ad Hoc committee concurs.

10. The Alaska Industrial Subdivision hearing panel recommends eliminating the floating easement. The State could exercise the right of eminent domain to condemn. The condemnation would probably result in greater compensation for damages to the lessee, especially in view of the Supreme Court decision in State v. Hammer, 550 P.2d 830, thus the lease would be more attractive to the leasing market. Additionally, the language in the current lease is ambiguous as to damages compensable. This ambiguity only encourages litigation.

    The Ad Hoc committee concurs. This has been accomplished in the attached lease form.

11. The Alaska Industrial Subdivision hearing panel states that, if its recommendations are adopted, the State would be assured a competitive position in the lease market. The recommendations would encourage development of the leaseholds consistent with the intent of the leasing regulations and would be equitable to the lessee. The hearing panel also believes the State should be able to obtain a good return on its land. Accordingly, the rental rate should be changed to reflect the removal of the undesirable aspects of the state lease.

The Ad Hoc committee concurs. Continuing to include rate as an appraisal element will accomplish this objective.

This change is found in the attached lease form.

12. In order to set a fixed rental rate on a lease, the committee recommends an addition to A.S.38.05.085:

> amend to add the following sentence after ". . . to protect the interests of the state. The lease rental rate shall remain fixed for the term of the lease and any permitted extensions thereof, unless the leased premises or a portion thereof is reclassified pursuant to provisions of this chapter. A violation of any provision of this chapter . . . ."

To provide a vehicle for arbitrating protests and appeals involving land transactions, the following is recommended:

1. The Division of Lands has had many protests from private parties over the past few years leading the committee to believe that a board of appeals is highly desirable and needed at this time. At present there exists no arbitration board or board of appeals to handle appeals allowed by Division of Lands regulations. The creation of a board of appeals would effect a responsive mechanism for solving most problem cases arising from Division of Lands transactions that affect private parties. The board of appeals would be faster and less costly to private parties than legal recourse, which would still be available. The board is structured to maintain adequate expertise while attempting to eliminate bias in favor of the Division of Lands. This binding appeals board would substitute for the Commissioner in the present appeal process. (The Alaska Industrial Subdivision hearing panel also recommends such an appeal process.)

   Section 14 of the attached bill would accomplish this.

The committee recommends the following to improve trust land management:

1. The committee believes that state trust lands (school, mental health, and university) are now and have been managed at low intensity. These lands may be returning only a fraction of their potential value that could be

realized by a small, full-time management staff. The Division manages these lands at no charge to the various trust funds and receives no reimbursement for its services. Therefore, it has traditionally placed low priority on management of these lands. This committee recommends that the State Legislature authorize each trust board the authority to freely contract with any agency or private firm for the management of its lands for revenue production in accordance with the State's land act.

Section 1 of the attached bill would accomplish this.

2. In order to provide a uniform 55-year limit for all long-term leases the committee recommends deletion of the 99-year provision found in A.S.38.05.070(c) for school lands.

Section 6 of the attached bill would accomplish this.

IN THE

BY RULES COMMITTEE BY REQUEST OF THE GOVERNOR

BILL NO.

IN THE LEGISLATURE OF THE STATE OF ALASKA

TENTH LEGISLATURE - FIRST SESSION

A BILL

For an Act entitled: "An Act relating to state lands and providing for an effective date."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

* Section 1. AS 38.05.030 is amended by adding a new subsection to read:

Section 38.05.030 (F). Notwithstanding the provisions of (a) and (e) above and 38.05.035 (a)(13), the trustees of state trust lands may manage or contract with any agency, public or private, for the management of trust lands pursuant to the provisions of this chapter. Costs of such management shall be borne by the respective trusts.

* Section 2. AS 38.05.055 is amended to read:

Section 38.05.055. SALE PROCEDURES. Except as provided in Section 315(d) of this chapter, the sale shall be made at public auction to the highest qualified bidder as determined by the director. An aggrieved bidder may appeal to the commissioner within five days after the sale for a review of the director's determination. The sale shall be conducted by the director or his representative, and at the time of sale the successful bidder shall deposit an amount determined by the director but not less than 5% (EQUAL TO ONE-TENTH) of the purchase price. The director or his representative shall immediatley issue a receipt containing a description of the land or property purchased, the price bid, and the terms of sale, which receipt shall be acknowledged in writing by the bidder. A contract of sale on a form approved by the attorney general shall be signed by the purchaser and, after approval of the commissioner, the contract shall also be signed by the director on behalf of the state.

* Section 3. AS 38.05.065 is amended to read:

Section 38.05.065. TERMS OF CONTRACT OF SALE. The contract of sale shall require the remainder of the purchase price to be paid over a period

of not more than 20 years, which shall be set for each sale by the director. Installment payments plus interest will be set on the level payment basis over the payment period. The interest rate charged on installment payments shall be the prevailing rate on similar land transactions at the time the contract is signed, as determined by the director, but in no case shall it be below 5% per year or above the current usury rate as set by AS 45.45.010(b) and (d). (IN ANNUAL INSTALLMENTS OF NOT LESS THAN 10 PER CENT OF THE PURCHASE PRICE, WITH INTEREST AT THE RATE OF NOT LESS THAN FIVE PER CENT A YEAR.) The director, with the consent of the commissioner, may also impose conditions, limitations, and terms which he considers necessary and proper to protect the interest of the state. Violations of any provision of this chapter or the terms of the contract of sale subject the purchaser to appropriate administrative and legal action, including but not limited to specific performance, foreclosure, ejectment, or other legal remedies in accordance with applicable state law. (LEGAL ACTION, INCLUDING A FORECLOSURE ACTION IN ACCORDANCE WITH APPLICABLE STATE LAW.)

* Section 4. AS 38.05.067(b) is amended to read:

Section 38.05.067(b). The director shall not sell the lands under this section at less than their fair (APPRAISED) market value. The director shall make regulations necessary to ensure that lands sold under this section are for bona fide residential use and not for speculation.

* Section 5. AS 38.05.068(a) is amended to read:

Section 38.05.068(a). FOREST SERVICE PERMITTEES' SALES PREFERENCE. Before offering to the public any land which is subject to a valid existing United States Forest Service permit in effect in a state-selected area at the time the area was patented to the state, or which is subject to a lease issued under Section 87 of this chapter, the director shall offer the land for sale to the permittee or his successor in title, if he can be found, at not less than its fair (APPRAISED) market value before offering to the general public.

* Section 6. AS 38.05.070(c) is amended to read:

Section 38.05.070(c). A lease may be issued for a period of up to 55 years, if it appears to be in the best interest of the state and if the commissioner approves. A lease for a period in excess of 25 years shall grant the lessee an option entitling him to extend the term of the lease for up to 3 consecutive five year periods in addition to the original term. If the Commissioner determines that the land or a part of it which is the subject of a grazing

lease is not being used for the purpose issued, the lease may be declared void. (HOWEVER, A NONRENEWABLE LEASE FOR SCHOOL LANDS MAY BE ISSUED FOR A PERIOD NOT TO EXCEED 99 YEARS.)

* Section 7. AS 38.05.087(a) is amended to read:

Section 38.05.087(a). FOREST SERVICE PERMITTEES' LEASING PREFERENCE. Before offering to the public any land for lease which is subject to a valid existing United States Forest Service permit in effect in a state-selected area at the time the area was patented to the state, the director shall offer the land for leasing to the permittee at not less than its fair (APPRAISED) market value before offering it to the general public.

* Section 8. AS 38.05.105 is amended to read:

Section 38.05.105. Each lease shall stipulate that the annual rental payment is subject to adjustment at five year intervals and shall be based (PRIMARILY) on a reappraised annual rental value. Any increase due to reappraisal may not exceed 100% of the annual rental for the preceding 5 year period. However, if the director of the division of lands determines that residential development is the best use for the land, the reappraisal period may be lengthened or the readjustment waived in accordance with regulations adopted by the commissioner. Before a waiver of rental readjustment is issued, the land shall have a current reappraisal. A waiver is valid only if residential development actually occurs, and only if it is necessary for obtaining primary long-term financing. The regulations adopted under this section shall ensure that the state receives a fair return from the land.

* Section 9. AS 38.05 is amended by adding a new paragraph to read:

Section 38.05.106. CONVERSION OF LEASES. (a) Any person holding a valid lease as lessee of lands from the State under provisions of AS 38.05.070 - .105, or as an approved assignee of such lessee under the terms of such lease, may, at his option, convert his lease so as to obtain certain benefits, enumerated in subparagraph (b) below, which were not available to him at the date his lease was originally entered, if the lessee at the time of conversion makes all payments due under the conversion rate and is not in violation of any other lease provision.

(b) Those lease benefits which shall be made available to a lessee qualifying under subsection (a) of this section shall be all of those lease provisions authorized or made applicable by this act to new leases entered into by the State after the effective date of such statutes.

(c) The effective annual rental value at conversion shall be based on the most recent reappraisal provided that such reappraisal was within 2 years of the effective date of this act. In all other cases, the conversion shall be based on the next reappraisal.

(d) Any conversion as to trust lands shall be effective only if approved by the appropriate board of trustees.

(e) Applications for conversion must be made within 3 years of the effective date of this act.

* Section 10. AS 38.05.310 is amended to read:

Section 38.05.310 (NOTICE AND) APPRAISAL. (a) No land may be sold or leased, or a renewal lease issued (WITHOUT PUBLIC NOTICE) except in the case of an oil or gas or mineral lease, unless it has been appraised within 120 (90) days before the date of (FIXED FOR THE) sale or lease. (WHEN LAND IS OFFERED AT PUBLIC SALE BUT IS NOT SOLD AND IS AVAILABLE)For over the counter sale (AT THE PRIVATE SALE, NO) an (RE)appraisal is required unless the director finds (CONSIDERS) that a change in value of the lands has not (MAY HAVE) occurred. A grazing lease may be granted to a lessee of federal grazing lands without prior appraisal, if his federal lease was cancelled to allow the state to select the lands under lease. No land may be sold or leased for less than fair (THE APPROVED, APPRAISED) market value, except as provided in .315 and .320 of this chapter and .75 - .85 of this chapter. No land or interest in land may be sold, leased, or otherwise disposed of without public notice.

(b) When land is offered at public sale but is not sold, it may be available for sale over the counter. The director shall review the list

of lands available on a quarterly basis and shall certify that there has been no change in value since the last reappraisal. If an increase in value occurs in any parcel, the director shall withdraw that parcel from sale over the counter.

* Section 11. AS 38.05.345(a) is amended to read:

Section 38.05.345(a). Public notice of an auction sale (LEASE OR OTHER DISPOSAL) of [illegible] or interest in it shall be substantially as follows.

* Section 12. AS 38.05.345(e) is amended by adding a new subparagraph to read:

Section 38.05.345(e) Public notice of an action other than as specified in paragraph (a) above shall conform to the requirements of AS 38.05.305 and this paragraph. Such notice shall, when given pursuant to AS 38.05.305(c), be published at least once in a newspaper of general circulation in the vicinity in which the land affected by the proposed activities is located.

* Section 13. AS 38.05.365 is amended by adding a new subparagraph to read:

Section 38.05.365. "Market Value" or "Fair Market Value" means the highest prices, estimated in terms of money, which the property would bring if exposed for a sale for a reasonable time in the open market, with a seller, willing but not forced to sell, and a buyer, willing but not forced to buy, both being fully informed of all the purposes for which the property is best adapted or could be used.

* Section 14. AS 38.05 is amended by adding a new paragraph to read:

Section 38.05.380. STATE BOARD OF LAND APPEALS. (a) The State Board of Land Appeals shall consist of five members, one of whom shall be the Commissioner of Natural Resources or his designated representative. The other members of the board shall be appointed by the governor from the general public, with due regard for the desirability of prior legal, natural resource or real estate training and experience as criteria for selection of public members. All board members are subject to confirmation by a majority of the members of the legislature in joint session.

(b) The director of the division of lands shall provide administrative support for the board.

(c) The governor shall appoint the public members of the board for terms of three years each, except that the initial terms of one of the members first appointed under this chapter shall be for one year and one member for two years. The public members are entitled to compensation

in the amount of $50.00 per day for each day or portion of a day spent in actual meeting or on authorized official business incident to their duties, and to all other transportation and per diem expenses as provided by law.

(d) Jurisdiction of the board shall extend to all matters arising under the Alaska Land Act (AS 38.05) and the Water Act (AS 46.15) from which an appeal may be taken under statute or regulation to the commissioner from a decision of the director, division of lands. The board in all appeals filed after the effective date of this chapter, shall have the appellate authority formally vested in the commissioner by provisions of the Alaska Land Act. An appeal from a decision of the board, if taken, shall be to the Superior Court.

(e) Three members of the board shall constitute a quorum. A majority of a quorum shall be able to render a decision. The board shall adopt regulations governing its procedures, and may adopt other regulations which may be necessary or convenient in carrying out the purposes of this chapter.

DEPARTMENT OF NATURAL RESOURCES
DIVISION OF LANDS
323 East Fourth Avenue
Anchorage, Alaska 99501

ADL NO. _____

LEASE AGREEMENT

THIS Lease agreement made and entered into this _____ day of _____, 19___, by and between the State of Alaska, through the Director of the Division of Lands, with the consent and approval of the Commissioner of the Department of Natural Resources, acting for and on its behalf under and pursuant to AS 38.05, as amended, and the regulations promulgated thereunder, as amended or hereafter amended, hereinafter referred to as the LESSOR; and _____ of _____ hereinafter referred to as the LESSEE:

WHEREAS, the Lessor has caused the lands herein demised to be appraised and such appraisal was made and approved on or after _____, 19_____; and

WHEREAS, the Lessor has caused a notice of intent to lease the lands herein demised to be published as required by law or caused notices of intent to lease to be posted as required by law; and

WHEREAS, an auction of the herein demised property was held at the time and place designated by notice and said sale was approved by the Director of the Division of Lands, Department of Natural Resources, State of Alaska:

NOW THEREFOR, the Lessor has agreed to let and does hereby let and demise to the Lessee, and the Lessee has agreed to take and does hereby take from the Lessor the surface estate of all that lot, piece, or parcel of land more particularly bounded and described, as follows:

_____

_____

_____

_____

_____

located in the _____ Recording District, State of Alaska.

TO HAVE AND TO HOLD the said demised premises for a term of _____ ( ) years commencing on the ___ day of _____, 19_____, and ending at 12 o'clock midnight on the _____ day of _____, _____, a period of fifty-five years unless sooner terminated as hereinafter provided.

The Lessee shall be granted the option to extend the term of his lease for no more than three consecutive five-year periods beyond the original term of the lease, provided that Lessee notifies Lessor of his intention to exercise one or more such options no later than 6 months prior to expiration of the original lease term or the first or second extension terms, as applicable.

The Lessee shall pay to the Lessor rental as follows: Equal _____ payments, in advance, on or before the _____ day of _____ of every year during

AGO 936074

said term at the rate of _____ Dollars ($_____) per _____; such payments to be subject to adjustment as hereinafter required from the effective date hereof, as provided herein.

The annual rental as hereinafter provided for shall not during any rental period increase more than one hundred percent of the immediately preceeding annual rental.

It is agreed that each of the covenants, terms and agreements herein contained shall be binding upon the parties and upon their respective successors and assigns.

1. Appurtenances, and Encumbrances-- Lessor leases and grants to Lessee all easements, parking and loading rights, rights of ingress and egress, fixtures and appurtenances now or hereafter belonging or pertaining to said premises. The described premises are leased, subject to patent restrictions, easements, rights-of-way, if any, zoning and building restrictions and statutes and governmental regulations now in effect or hereafter adopted by any governmental authority.

2. Payment of Taxes and Assessments-- Lessee agrees to pay to the public authorities charged with collection thereof, promptly as the same may become due and payable, all taxes, permit, inspection and license fees and other public charges, whether of a like or different nature, except for general and special assessments lawfully levied upon the leasehold estate and any buildings, structures, fixtures, improvements or leasehold interest now or hereafter located thereon, or arising in respect of the occupancy, use or possession of the leased Premises, and which are charged against and are, or may become, a lien during the term of this lease; and Lessee agrees to exhibit to Lessor, on demand receipts evidencing payment of all taxes, fees and other similar public charges so payable by Lessee. Lessee shall also pay all charges of water, sewer, gas, electricity, power or other public utility services rendered on or to the Premises during the term of this lease as such charges become due.

3. Documentation of Improvements-- Lessee must within 90 days of completion of any site improvements, including but not limited to clearing, leveling, excavation, and backfill, and exclusive of any structures, file with the lessor adequate and reasonable documentation of such improvements including any applicable costs and quantities. Such documentation is intended to aid in future determinations of the original condition of the Premises.

4. Notification and Late Payment Charge-- In the event lessee becomes 30 days delinquent in payments due, a late payment charge of 6% of such amount due shall be levied against the lease. Additionally, a charge for notification for payments 30 days late shall be made at the rate of $5.00 for the first notice and $20.00 for the second notice.

5. Permitted Uses-- (a) The Lessee shall use the leased Premises for uses and purposes consistent with those cited in Attachment 1, and in conformance with applicable local zoning ordinances. At any time Lessee may request a change in permitted uses, provided that Lessee's existing or proposed use of the Premises is consistent with existing zoning. If the Lessor concurs with such change of permitted use, then this lease shall terminate, and a new lease, upon a form and containing terms, appraisal and rental rate applicable to the changed classification; shall be executed for the balance of the unexpired lease term, or renewal term if applicable, then remaining.

b. Lessee may request that part of the leased Premises be severed

from the Premises for purposes of changing of that part for a use or uses not permitted under the then existing permitted uses of the Premises. If the Lessor concurs, then this lease shall terminate as to the part so severed, and a new lease, upon a form and containing terms, appraisal and rental rate applicable to the changed permitted uses; shall be executed for the balance of the unexpired lease term, or renewal term if applicable, then remaining. The annual rentals applicable to the original leased Premises shall be adjusted to reflect the effect of severance of the part permitted by this paragraph for the balance of the original lease term or the renewal term, if applicable. If severance of a portion of the Premises is permitted, Lessee shall comply with all state and local laws and ordinances regarding the subdivision of real property, and shall bear the expenses and costs attributable to survey, recording and other compliance with said laws and ordinances.

6. Compliance with Laws' Ordinance and Regulations-- Lessee shall comply with all applicable laws, ordinances and regulations of duly constituted public authorities now or hereafter in existence which in any manner affect the leased Premises or the sidewalks, alleys, streets, and ways adjacent thereto, or any buildings, structures, fixtures or improvements or the use thereof. Lessee further agrees that it will not permit any unlawful occupation, business or trade to be conducted on the Premises, or any use to be made thereof contrary to any law, ordinance or regulation applicable thereto.

The lessee, at its own cost and expense, shall keep the leased Premises and all improvements which at any time during the term of this lease may be situated thereon, in good maintenance, condition and repair during he entire term of this lease, and hereby expressly waives any right to make repairs to the Premises at the expense of Lessor which may be allowed by any statute or law in effect at the time of the execution of this lease or any amendment thereof, or by any other statute or law which may be hereafter passed during the term of this lease. The Lessee's rights under this Lease may be terminated by the Director, in whole or in part, if the leased Premises are used for a purpose unlawful under Federal or State law or regulation, or local Government ordinance as applicable.

7. Lessee's Rights of Occupancy and Use-- Lessee, when not in default of performance of any of its obligations hereunder, shall have the following rights, during the term of this Lease, from time to time and in such manner, and to such extent, as Lessee may in its sole judgment deem advisable, except where any of said rights is conditioned upon prior approval of Lessor: (a) The right to demolish, remove or otherwise dispose of any improvements presently or subsequently situated upon the leased Premises; (b) The right to erect, place, or install upon the leased Premises buildings, structures, and improvements as from time to time it shall deem advisable; (c) The right to make such alterations, additions and repairs to the leased Premises as it may desire.

8. Disposition of Improvements Upon Termination-- (a) All buildings, structures and permanent improvements, including any signs which are installed, placed or attached in or about the leased Premises by Lessee, shall remain the property of Lessee at the expiration or termination of this lease, or of any renewal term thereof. The lessee shall within 60 days after termination or expiration of the lease remove all improvements located on the leased Premises, provided that such removal will not cause injury or damage to the leased Premises; and further provided that the Lessor may extend the time for removing such improvements in a case where hardship is demonstrated. Following removal Lessee shall leave Premises in a safe and natural condition. The retiring Lessee may, with the consent of the Lessor,

sell his improvements to the succeeding lessee.

(b) If any improvements and/or chattels having an appraised value in excess of $10,000.00, as determined by the Lessor, are not removed within the time allowed, such improvements and/or chattels shall, upon due notice to the Lessee, be sold at public sale under the direction of the Lessor. The proceeds of sale shall inure to the Lessee who placed such improvements and/or chattels on the lands after payment to the Lessor of all rents due and owing and expenses incurred in holding such sale. In case there are no other bidders at any such sale, the Lessor is authorized to bid on such improvements and/or chattels. The Lessor shall acquire all rights, both legal and equitable, that any other purchaser could acquire by reason of said sale and purchase.

(c) If any improvements and/or chattels having an appraised value of $10,000.00 or less, as determined by the Lessor, are not removed within the time allowed, such improvements and/or chattels shall revert to, and absolute title shall vest in, the Lessor.

9. Freedom From Liens-- Lessee will not permit any mechanics', laborers', or materialmens' liens to stand against the leased Premises or improvements for any labor or materials furnished to Lessee, or claimed to have been furnished to Lessee or to Lessee's agents, contractors, or sublessees, in connection with work of any character performed on said Premises or improvements by or at the direction or sufferance of Lessee; provided, however, that Lessee shall have the right to contest the validity or amount of any such lien or claimed lien. In the event of such contest, Lessee shall give to Lessor such reasonable security as may be demanded by Lessor to insure payment thereof and to prevent any purported sale, foreclosure or forfeiture of the premises or improvements by reason of such non-payment. Such security need not exceed one and one-half times the amount of such lien or such claim of lien. Lessee shall record such bond as contemplated by Section 34.35.072, Alaska Statutes upon Lessor's demand. Lessee shall immediately pay any judgment rendered on any proven claim of lien, together with all proper costs and charges, and shall have such lien released or judgment satisfied at Lessee's own expense. The State may file such notices of non-responsibility as it may deem necessary, pursuant to A.S. 34.35.065.

10. Lawful Use of Premises-- The Lessee may use and occupy the leased Premises for any lawful purpose provided such purpose is allowed under Attachment 1 of this Lease.

11. Indemnity to Lessor-- Lessee will indemnify and hold Lessor harmless from and against all claims and demands for loss or damage, including property damage, personal injury or wrongful death, arising out of or in connection with the use or occupancy of the Premises by Lessee or any other person under Lessee, and from any accident or fire on the Premises and from any nuisance made or suffered thereon, and from any failure by Lessee to keep the Premises in a safe condition, and Lessee will reimburse Lessor for all its costs and expenses, including reasonable attorneys' fees, incurred in the defense of any such claims; and Lessee will hold all goods, materials, furniture, fixtures equipment, machinery and other property whatsoever on the Premises at the sole risk of Lessee, and will save Lessor harmless from any claim of loss or damage thereto by any cause whatsoever. If all or part of the improvements placed by Lessee on the demised premises are destroyed by fire, earthquake or other cause, Lessee shall remove the debris and clean up the affected area within 60 days of the occurrence of such destruction, and may surrender to Lessor this lease, together with any interest of Lessee and of any mortgagee in

the remaining insurance proceeds and Lessee may thereby be relieved of any further obligation hereunder.

12. Default-- If Lessee at any time during the term or renewal term of this lease (and regardless of the pendency of any bankruptcy, reorganization, receivership, insolvency or other proceedings, in law, in equity or before any administrative tribunal, which has or might have the effect of preventing Lessee from complying with the terms of this lease) (a) shall fail to make payment of any installment of rent or of any other sum herein specified to be paid by Lessee, or (b) shall fail to observe or perform any of Lessee's other covenants, agreements or obligations hereunder, and if any such default shall not be cured as to (a) within ten days after Lessor shall have given Lessee written notice of such failure to make payment, or as to (b) within thirty (30) days after Lessor shall have given to Lessee written notice specifying such default or defaults, Lessee shall not have commenced diligently to cure such default; or if Lessee has filed a voluntary petition or has become subject to an involuntary petition under any provision of the Bankruptcy Act, 11 U.S.C. 701 et. seg; or if Lessee finally and without further possibility of appeal or review is adjudicated a bankrupt or insolvent; or if Lessee has a receiver or a Trustee appointed for all or substantially all of its business or assets on the ground of Lessee's insolvency; or if Lessee has itself appointed as debtor-in-possession in a proceeding for a reorganization or an arrangement; or if Lessee shall make an assignment for the benefit of its creditors, then in any such event Lessor shall have the right, at its election, then or at any time thereafter, and while such default, defaults or events shall continue, to give Lessee written notice of Lessor's intention to terminate this lease and all of Lessee's rights hereunder, on the date specified in such notice, which date shall not be less than thirty (30) days after the date of giving of such notice; and on the date specified in such notice this lease and all rights granted Lessee hereunder shall terminate as fully as if the lease had then expired by its own terms; and Lessee hereby covenants to peaceably and quietly surrender to Lessor said leased Premises and all structures, buildings improvements and equipment located thereon, subject to paragraph 7 (a) above and to execute and deliver to Lessor such instrument or instruments which may be required by Lessor to properly evidence termination of Lessee's rights and interest hereunder.

In the event of termination of this lease as provided in this paragraph 12, Lessor shall have the right to repossess the leased Premises and such structures, buildings, improvements and equipment, thereon and subject to paragraph 5 above either with process of law or through any form of suit or proceeding, as well as the right to sue for and recover all rents and other sums accrued up to the time of such termination, and damages arising out of any breach on the part of Lessee, including damages for rent for the balance of the lease term not then accrued. Lessor shall also have the right, without taking possession of the premises or terminating this lease, to sue for and recover all rents and other sums, including damages, at any time and from time to time which may accrue hereunder as a result of any default of Lessee.

13. Condemnation-- If the whole or any part of the demised premises shall be taken for any public or quasi-public use, under any statute or by right of eminent domain or private purchase in lieu thereof, by any public or quasi-public body vested with the power of eminent domain, then when possession shall be taken thereunder of the leased Premises, or any part thereof, the following provisions shall control:

a. Taking of All Premises-- If all of the Premises are taken by condemnation; the term of this lease and all rights of the Lessee hereunder shall immediately terminate, and the rent shall be adjusted as of the time of such termination so that Lessee shall have paid rent only up to the time of such taking. Lessor shall

be entitled to the full condemnation proceeds, except that portion thereof attributable to the value of the buildings or improvements placed on the Premises by Lessee.

b. Taking of Substantial Part of Premises-- If the taking by condemnation reduces the ground area of the leased Premises by at least thirty percent (30%), or materially affects the use being made by the Lessee of the demised premises, Lessee shall have the right, by written notice to Lessor made not later than one hundred eighty (180) days after possession shall be taken, to elect to terminate or to not terminate this lease under the provisions set forth herein. If the election to terminate is made the provisions of (a) of this paragraph relating to the taking of the whole Premises shall govern. If the election not to terminate is made the lease shall continue and Lessor shall be entitled to the full condemnation proceeds except the portion thereof attributable to the value of the buildings or structural improvements placed on the Premises by Lessee; and rent at the existing rate and amount shall be adjusted as of the date of the taking of possession, and the rent for the balance of the term, except as modified from time to time under paragraph 1 of attachment 1 hereof, shall be reduced so that the new rent shall be that part of the former rent (before condemnation) which the unimproved value of the untaken Premises (appraised after the taking) bears to the unimproved value of the entire Premises immediately before the taking. Any dispute, controversy or claim arising out of or relating to the fixing of the new rent shall be settled by arbitration as provided herein.

c. Taking of Insubstantial Part of Premises-- If the taking is of such an insubstantial portion of the ground area that the use being made by Lessee of the leased premises is not materially affected, the provisions of this paragraph regarding Lessee's election not to terminate shall govern.

14. Quiet Enjoyment-- Provided Lessee is not in default hereunder, Lessor covenants that Lessee shall have peaceful and quiet enjoyment of the leased Premises without let or hindrance on the part of Lessor, and Lessor will warrant and defend Lessee in the peaceful and quiet enjoyment of the leased Premises.

15. Notices-- All notices required or permitted under this agreement shall be made by certified or registered mail, postage prepaid, to the parties at the following addresses.

To The Lessor: _____

To The Lessee: _____

16. Rights or Remedies-- Except as may be inconsistent with or contrary to any provision of this lease, no right or remedy herein conferred upon or reserved to Lessor shall be exclusive of any other right or remedy, and each and every right or remedy shall be cumulative and in addition to any other right or remedy given hereunder, or now or hereafter existing at law or in equity or by statute.

17. Waiver or Forebearance-- The receipt of rent by the Lessor, with or without knowledge of any breach of the lease by the Lessee, or of any default on the part of the Lessee in the observance or performance of any of the conditions or covenants of this lease, shall not be deemed to be a waiver of any provision of this lease. No failure on the part of the Lessor to enforce any covenant or provision herein contained, nor any waiver of any right hereunder by the Lessor, unless in writing, shall discharge or invalidate such term or covenant; nor shall any forebearance or

written waiver affect the right of the Lessor to enforce any term or covenant in the event of any subsequent breach or default. The receipt by Lessor of rent or any other sum of money or the termination, in any manner, of the lease term or the giving by Lessor of any notice hereunder to effect such termination, shall not reinstate, continue, or extend any term herein leased, or destroy, or in any manner impair the validity of any such notice of termination as may have been given hereunder by the Lessor to the Lessee prior to the receipt of any such sum of money or other consideration, unless the contrary effect shall be expressed in writing and signed by the Lessor.

18. Inspection-- Lessor shall, at all reasonable times have access to the Premises for the purpose of inspection.

19. Successors in Interest-- This Lease shall be binding upon and inure to the benefit of the respective heirs, successors in interest and assigns of the parties hereto.

20. Assignment or Subletting— Lessee shall not sublet or assign the leased premises or any part thereof, without the prior written consent of Lessor to such subletting or assignment, which consent shall not be unreasonably withheld, subject to use provisions of this lease. However, Lessee, without prior authorization may assign this Lease, or any part thereof, to a duly licensed and authorized lending institution for loan security purposes, provided that this right to assign shall not operate as a subordination of Lessor's rights hereunder, nor a subordination of its fee. Lessor agrees that upon receipt of application for assignment by Lessee, it will consent to or deny a proposed subletting or assignment by Lessee. No assignment or subletting of the Premises or any portion thereof by Lessee shall void Lessee's obligation to pay the rent herein reserved for the full term of this sublease or any extensions thereof. Anything contrary in the foregoing notwithstanding, Lessee shall have the right to sublease all or any portion of the enclosed space in any building which Lessee may construct upon the leased Premises without prior written approval of Lessor.

21. Soil Conditions and Water Drainage-- Lessor makes no warranty and assumes no liability regarding the soil conditions or water drainage upon the leased premises.

22. Mineral Reservation-- The Lessor hereby expressly saves, excepts and reserves out of the grant hereby made, unto itself, its lessees, successors, and assigns forever, all oils, gases, coal, ores, minerals, fissionable materials, and fossils of every name, kind or description, and which may be in or upon said lands above-described, or any part thereof, and the right to explore the same for such oils, gases, coal, ores, minerals, fissionable materials and fossils. All coal, oil, gas and other minerals and all deposits of stone or gravel valuable for extraction or utilization, are excepted from the operation of a surface lease. Specifically, the lessee of the surface rights shall not sell or remove for use elsewhere any timber, stone, gravel, topsoil, or any other material valuable for building or commercial purposes; provided, however, that material required for the development of the leasehold may be used. It also hereby expressly saves and reserves out of the grant hereby made, unto itself, its lessee, successors, and assigns forever, the right to enter by itself, its or their agents, attorneys, and servants upon said lands, or any part or parts thereof, at any and all times, for the purpose of opening, developing, drilling and working mines or wells on these or other lands and taking out and removing

therefrom all such oils, gases, coal, ores, minerals, fissionable materials and fossils; and to that end it further expressly reserves out of the grant hereby made, unto itself, its lessees, successors, and assigns forever, the right by its or their agents, servants and attorneys at any and all times to erect, construct, maintain, and use all such buildings, machinery, roads, pipelines, powerlines, and railroads, sink such shafts, drill such wells, remove such soil, and to remain on said lands or any part thereof for the foregoing purposes and to occupy as much of said lands as may be necessary or convenient for such purposes, hereby expressly reserving to itself, its lessees, successors, and assigns, as aforesaid, generally all rights and power in, to and over said land, whether herein expressed or not, reasonably necessary or convenient to render beneficial and efficient the complete enjoyment of the property and rights hereby expressly reserved.

Provided, however, no rights shall be exercised by the Lessor or its mineral lessees, until provision has been made by the Lessor or its mineral lessees to pay to the Lessee of the land, upon which the rights herein reserved to the Lessor or its mineral lessees, are sought to be exercised, full payment for all damages sustained by said Lessee, by reason of entering upon said land; and provided that if said Lessee for any cause whatever refuses or neglects to settle said damages, the Lessor or its mineral lessees, or any applicant for a mineral lease or contract from the Lessor or its lessees for the purpose of prospecting for valuable minerals, or option contract or lease for mining coal or lease for extracting petroleum or natural gas, shall have the right, after posting a surety bond with the Director issued by a corporation qualified to do business in Alaska and licensed to sell insurance in Alaska, or a bond executed by one or more individual sureties approved by the Director, after due notice and opportunity to be heard, to be sufficient in amount and security to secure the said Lessee full payment for all such damages, to enter upon the land in the exercise of said reserved rights, and shall have the right to institute such legal proceedings in a court of competent jurisdiction wherein the land is situated, as may be necessary to determine the damages which the surface lessee of such lands may suffer.

23. Mortgage of Leasehold Interest of Tenant-- A leasehold mortgagee, a beneficiary of a deed of trust, or a security assignee shall have and be subrogated to any and all rights of Lessee with respect to the curing of any default hereunder by Lessee. If the holder of any such mortgage, the beneficiary of any such deed of trust, or the security assignee shall give Lessor, before any default shall have occurred in the Lease, a written notice containing the name and post office address of such holder, Lessor shall thereafter give to such holder a copy of each notice of default by Lessee at the same time as any notice of default shall be given by Lessor to Lessee; and Lessor will not thereafter enter into any modification of this Lease without the prior written consent of such mortgagee, beneficiary or security assignee. If by reason of any default of Lessee, either this Lease or any renewal thereof shall be terminated at the election of Lessor prior to the stated expiration thereof, Lessor shall enter into a new Lease with the leasehold mortgagee, the beneficiary of a deed of trust, or the security assignee, for the unexpired portion of the lease term, effective as of the date of such termination, at the rent and on the terms herein contained, subject to the following conditions.

Mortgagees, beneficiary or security assignee shall do the following:

a. make written request to Lessor for a new lease within forty (40) days after the date of such termination; and such written request shall

be accompanied by payment to Lessor of all sums then due Lessor under this lease as if termination had not occurred but with such costs as are permitted under this Lease.

b. pay to Lessor, at the time of the execution and delivery of such new Lease, any and all sums due thereunder, in addition to those which would at the time of the execution and delivery thereof be due under this Lease but for such termination, and in addition thereto, any reasonable expenses, including legal and attorneys' fees to which Lessor shall have been subjected by reason of such default.

c. on or before the execution and delivery of such new Lease, perform all other conditions required to be performed by Lessee, to the extent that Lessee shall have failed to perform such conditions.

24. Arbitration— Any dispute between the parties arising under this lease or through the performance or non-performance of any term of this lease shall be first subject to resolution by arbitration, under the authority and procedures contained in Alaska Statutes 09.43. Appointment of an arbitrator shall be made by agreement between the parties. If no agreement can be reached, each party shall appoint an arbitrator, who shall by agreement between themselves appoint a third arbitrator. If any State Board of Land Appeals is later created which shall have jurisdiction over disputes which may arise under this lease, such Board shall assume jurisdiction and no requirement for arbitration shall thereafter be imposed during the pendency of such jurisdiction.

25. Integration and Modification— This document including attachments which by reference are made a part hereof, contains the entire agreement of the parties hereto. All negotiations, statements, representations, warranties, and assurances, whether oral or written, which are in any way related to the subject matter of this lease, and the performance by either party hereto, are merged and integrated into the terms of this document.

This Lease may not be modified nor amended except by a writing signed by both parties hereto, and any purported amendment or modification is without effect until reduced to a writing signed by both parties hereto.

IN WITNESS WHEREOF the State of Alaska, Lessor, acting through the Director of the Division of Lands of the Department of Natural Resources, lawfully authorized thereunto, has caused these presents to be executed at Anchorage, Alaska, in duplicate, and the said Lessee has hereunto set his hand, agreeing to keep, observe and perform the rules and regulations promulgated under AS 38.05, as amended, the terms conditions and provisions herein contained, on the Lessee's part to be kept, observed and performed.

Attachment No. 1 Commercial-Industrial Lease

ADL NO. _____

The following clauses are hereby included in and by reference made a part of the attached lease document.

1. Modified Rentals

(a) Beginning with the lease year and continuing at five-year intervals thereafter, the annual rental shall be modified so as to equal _____ percent of the fair market value of the premises at such appraisal dates, as determined by appraisal as hereinafter specified; provided, however that the premises shall be valued and appraised at the date of the rental modification, as unimproved land as defined herein. For purposes of rental modification, unimproved land shall mean the leased land in its original condition at the commencement date of the Lease, disregarding all building or structural improvements above or below grade, excavation or backfill, and disregarding all landscaping, paving, leases or encumbrances placed on the property by the Lessee. The foregoing notwithstanding, any improvements above or below grade placed on or made available to the property by the Lessor or at the expense of the

Lessor shall not be disregarded. The unimproved land, as above defined, shall be appraised at its highest and best use regardless of its actual use, but subject to existing use restrictions and zoning.

2. Special Assessments--In the event any general or special assessment is levied on the Premises for a part of the cost of any public work or improvement assessed according to benefit found by levying authority to accrue therefrom to the demised Premises, Lessor shall pay for the same.

3. Permitted Uses--The lands described herein are intended to permit uses common to industrial development areas. Such uses may include but are not limited to light manufacturing, processing, storage, wholesaling, and distribution operations as well as limited commercial uses.

4. Liability Insurance--Lessee will at its own expense obtain and maintain during the term of this Lease and any renewal term thereof comprehensive general liability insurance with respect to the leased Premises, naming Lessor as additional assured, from an insurance company authorized to do business in Alaska, with minimum

limits of not less than $200,000 for injury to one person and not less than $1,000,000 for injury to more than one person in any one accident or occurrence, and insurance in a sum not less than $200,000 against claims for property damage, or such higher limits as Lessor may from time to time determine, with due regard to then prevailing prudent business practice in the State of Alaska, as reasonably adequate for it's protection, and Lessee will from time to time upon receipt thereof deposit promptly with Lessor upon demand current certificates of such insurance.

Attachment No. 1 Residential Lease

ADL No. _____

The following clauses are hereby included in and by reference made a part of the attached lease document.

1. The annual rent in the sum of _____ payable by Lessee each year beginning with the lease year and modified at five-year intervals thereafter as provided for under paragraph 2(a) excepting waivers of rental as provided for in paragraph 2(b). This lease shall continue until the _____ day of _____, _____ a period of fifty-five years, and shall be payable in _____ installments.

2. (a) The annual rental shall be modified so as to equal _____ percent of the fair market value of the premises, at such appraisal dates as determined by appraisal in a manner as hereinafter specified; provided, however, that the premises shall be valued and appraised at the date of the rental modification as unimproved land as defined herein. For the purposes of rental modification, unimproved land shall mean the leased land in its original condition at the commencement date of the lease, disregarding all building or structural improvements above or below grade, excavating or backfill, and disregarding all landscaping, paving, leases

AGO 936088

or encumbrances placed on the property by the Lessee. The foregoing notwithstanding, any improvements above or below grade placed on or made available to the property by the Lessor or at the expense of the Lessor shall not be disregarded. The unimproved land, as above defined, shall be appraised at its highest and best use regardless of its actual use, but subject to existing classification, zoning, and lease use restrictions.

(b) If a waiver of rent adjustments is necessary for obtaining long-term financing of residential development which has occurred or in actuality will occur on the leased premises, then upon approval of Lessee's application for waiver of rent adjustments, the annual rent for the thirty years next succeeding, or for the remainder of the lease term, whichever is less, shall from the date of approval of such waiver be determined by appraisal as hereinbefore provided, upon approval of such appraisal by the Lessor. Lessee shall pay all expenses of such appraisal. Approval or rejection of such appraisal shall be given by the Lessor within two weeks after its submission to the Lessor, which approval shall not be unreasonably withheld. Such appraisal, upon approval, shall be

used to determine the rental under the waiver of rent adjustments if the effective date of the appraisal is not earlier than one year prior to the date of application for the waiver. Upon termination of such waiver, rental shall be adjusted upon the anniversary date of the next ensuing five-year interval from the lease commencement date.

(c) If an appraisal as provided for in paragraph (a) has been performed, and is applicable to the portion for which the waiver is granted such appraisal may be used to determine the rental under said waiver as long as the effective date of the appraisal is not earlier than one year prior to the date of the application for waiver.

(d) Anything to the contrary notwithstanding, upon approval of sublease, the Lessor shall have the right to readjust the rental of all parcels subleased at that time. Such parcels so adjusted and subject to waiver shall be leased at the new rental for the duration of such waiver. Any portion of those lands legally described herein which are not subject to sublease shall be reduced

in rental in proportion to the amount of land subleased at that time. Upon such adjustment the annual rental shall be the cumulative amount of annual rental for each portion and shall be based on the methods and rate stated in paragraph (a) of this clause.

3. Special Assessments--In the event any general or special assessment is levied on the premises for a part of the cost of any public work or improvement assessed according to the benefit found by levying authority to accrue therefrom to the demised premises, Lessee shall pay for the same.

4. Permitted Uses--The lands described herein are intended for residential use.

Attachment No. 1 Utility Lease

ADL No. _____

The following clauses are hereby included in and by reference made a part of the attached lease document:

1. Modified Rentals--(a) Beginning with the lease year and continuing at five-year intervals thereafter, the annual rental shall be modified so as to equal _____ percent of the fair market value of the premises at such appraisal dates, as determined by appraisal as hereinafter specified; provided, however that the premises shall be valued and appraised at the date of the rental modification as unimproved land as defined herein. For purposes of rental modification, unimproved land shall mean the leased land in its original condition at the commencement date of the Lease, disregarding all building or structural improvements above or below grade, excavation or backfill, and disregarding all landscaping, paving, or encumbrances placed on the property by the Lessee. The foregoing notwithstanding, any improvements above or below grade placed on or made available to the property by the Lessor or at the expense of the Lessor shall not be disregarded. The unimproved land, as above defined, shall be appraised at its highest and best use regardless of its actual use, but subject to existing classification and zoning.

AGO 936092

2. Special Assessments--In the event any general or special assessment is levied on the Premises for a part of the cost of any public work or improvement assessed according to benefit found by levying authority to accrue therefrom to the demised Premises, Lessee shall pay for the same.

3. Permitted Uses--The lands described herein are intended to permit any use which is consistent with zoning and building restrictions and statutes and governmental regulations now in effect or hereafter adopted by any governmental authority.

4. Liability Insurance--In the event of uses other than residential or agricultural, Lessor may require that Lessee will at his own expense obtain and maintain during the term of this Lease and any renewal term thereof comprehensive general liability insurance with respect to the leased Premises, naming Lessor as additional assured, from an insurance company authorized to do business in Alaska, with minimum limits of not less than $200,000 for injury to one person and not less than $1,000,000 for injury to more than one person in any one accident or occurrence, and insurance in a sum not less than $200,000 against claims for property damage, or such higher limits as Lessor may from time

to time determine, with due regard to then prevailing prudent business practice in the State of Alaska, as reasonably adequate for its protection, and Lessee will from time to time upon receipt thereof deposit promptly with Lessor upon demand current certificates of such insurance.

Attachment No. 1 Recreational Lease

ADL No. _____

The following clauses are hereby included in and by reference made a part of the attached lease document:

1. Modified Rentals--(a) Beginning with the lease year and continuing at five-year intervals thereafter, the annual rental shall be modified so as to equal _____ percent of the fair market value of the premises at such appraisal dates, as determined by appraisal as hereinafter specified; provided, however, that the premises shall be valued at the date of the rental modification as unimproved land as defined herein. For purposes of rental modification, unimproved land shall mean the leased land in its original condition at the commencement date of the Lease, disregarding all building or structural improvements above or below grade, excavation or backfill, and disregarding all landscaping, paving, leases or encumbrances placed on the property by the Lessee. The foregoing not withstanding, any improvements above or below grade placed on or made available to the property by the Lessor or at the expense of the Lessor shall not be disregarded. The unimproved land, as defined above, shall be appraised at its highest and best use regardless of its actual use, but subject to existing use restrictions and zoning.

AGO 936095

2. Special Assessments--In the event any general or special assessment is levied on the premises for a part of the cost of any public work or improvement assessed according to benefit found by levying authority to accrue therefrom to the demised premises, Lessee shall pay for the same.

3. Permitted Uses--Whereas the lands described herein are intended for recreational use they shall under the terms of this lease have a maximum use density of one recreational dwelling or structure and accessory building or structure which are reasonably necessary for the use and enjoyment of and are in keeping with the nature of the recreational lease.

Attachment No. 1 Agricultural Lease

ADL No. _____

The following clauses are hereby included in and by reference made a part of the attached lease document:

1. Modified Rentals--(a) Beginning with the lease year and continuing at five-year intervals thereafter, the annual rental shall be modified so as to equal _____ percent of the fair market value of the premises at such appraisal dates, as determined by appraisal as hereinafter specified; provided however that the premises shall be valued at the date of the rental modification as unimproved land as defined herein. For purposes of rental modification, unimproved land shall mean the leased land in its original condition at the commencement date of the Lease, disregarding all building or structural improvements above or below grade, excavation or backfill, and disregarding all landscaping, paving, leases or encumbrances placed on the property by the Lessee. The foregoing notwithstanding, any improvements above or below grade placed on or made available to the property by the Lessor or at the expense of the Lessor shall not be disregarded. The unimproved land, as above defined, shall be appraised at its highest and best use regardless of its actual use, but subject to existing use restrictions and zoning.

2. Special Assessments--In the event any general or special assessment is levied on the premises for a part of the cost of any public work or improvement assessed according to benefit found by levying authority to accrue therefrom to the demised premises, Lessee shall pay for the same.

3. Permitted Uses--Whereas the lands described herein are permitted agricultural uses, they shall, under the terms of this lease, shall be limited to the following rights of use:

(a) The right to develop one single family dwelling and accessory buildings or structures for the family's use.

(b) The right to develop and utilize the property for agricultural purposes that include grazing of livestock, cultivation of crops or forage, and storage of crops, feed, animals, and agricultural equipment and supplies.

(c) The right to construct fences, structures, and buildings reasonably required for agricultural production on the property.

(d) The right to harvest timber only as needed to clear fields, pastures, and roadways.

AGO 936099

SENATE FINANCE COMMITTEE
March 9, 1977
9:03 a.m.

All members of the Committee were in attendance except Croft and Tillion. Also in attendance: Judy Crohdahl; Attorney General Avrum Gross and Bob Maynard, Assis' nt Attorney General, Department of Law. PRESENT

Chairman Sackett called the meeting to order. The following bill assignments were made:

BILL ASSIGNMENT

SB 95	-	Butrovich
SB 209	-	Butrovich
SCR 15	-	Meland
CSSB 159	-	Orsini
SB 191	-	Butrovich
HB 152	-	Tillion
HB 154	-	Sackett
HB 189	-	Butrovich
HJR 10	-	Tillion
SJR 16	-	Hohman
SB 27	-	Sackett
SB 78	-	Orsini
SB 175	-	Sackett
SB 204	-	Hohman

Chairman Sackett moved that House Bill 122 (An act making a supplemental appropriation to the Alaska Pipeline Commission and providing for an effective date) be brought up for discussion. There being no objection, it was so ordered. HB 122

Mr. Gross stated that $656,000 of this request is for a contractual arrangement with Terry Lenzher to have him investigate the Alyeska construction for the State to aid their case before the Interstate Commerce Commission regarding tarrifs. Mr. Gross stated there are two parts to this contract: One is the Department of Law contracting for the actual trial; and the other is the investigation of the case which is with the Pipeline Commission.

Mr. Gross stated the Department of Law and the Pipeline Commission have met and concur that the overall control of this should belong to the Department of Law.

Mr. Gross stated there are two other areas which this appropriation is concerned with. One is $156,000 for the Pipeline Commission to establish methodology to see how they are going to set rates. And the other is $21,000 to hire a CPA Auditor and Engineer.

Senator Orsini asked if the CPA Auditor and Engineer was one position or two. Mr. Gross stated it is two positions and the funding requested is for three months in FY 77. These positions have been requested in the FY 78 budget. AGO 936022

MOTION
SB 159

Senator Orsini moved that Senate Bill 159 (An act relating to leasing of State land other than for extraction of natural resources) be brought up for discussion. Senator Orsini stated that the bill dealt with complicated issues relating to state lands and the leasing of those lands. He advised that he understood some people who are leasing state lands are experiencing a great deal of difficulty due to reappraisal, and some are not. He further advised that in dealing with this matter, the committee might solve some of the problems and hurt the state, or it may maintain the state function and hurt some leaseholders. He added that his approach to the bill was to try to be as fair as possible to all concerned. He stated that he had spoken with appraisers, private lessors, and others involved in this type of transaction, and received a variety of different opinions. He advised that his intention was to make leasing of state land competitive with leasing of private land; that the provisions of leasing state land are not as beneficial to the lessor as are private provisions.

Senator Orsini advised that the Senate Resources Committee had drafted and passed a Committee Substitute for the original bill, and using Resources' Committee Substitute, he had drafted one of his own. He added that neither his bill nor Resources attempted to solve all of the problems, but did resolve some of the problem areas.

Senator Orsini presented committee members with copies of his graph outlining the relationship between inflation (cost of living) and land. Explaining his graph (copy attached to these minutes), Senator Orsini advised that in the 1960's inflation figured at approximately 3%. During this same time frame, the value of land increased 10%. In the early to mid 70's, the situation is somewhat different due mostly to the pipeline which produced a rapid increase in the cost of living in Alaska of about 7%. At the same time, values of land in Alaska increased 15%. Senator Orsini advised that from the above figures, he attempted to come up with figures for use in dealing with the leasing of state land.

Chairman Sackett requested that Senator Orsini explain the differences between his committee substitute and the one prepared by Resources.

Senator Orsini advised that the Resource Substitute proposed a lease for a total of 55 years. The initial lease period would be 25 years, and thereafter reappraisal and changes in

AGO 936023

rent occur every 10 years. The current provision is for these reappraisals to occur every 5 years. My Committee Substitute would provide for 3 initial 10 year periods, and thereafter 5 years. The above provisions are based upon the need for a ceiling for loan purposes from commercial banking institutions. He further added that his proposed Committee Substitute puts a ceiling on the three 10 year periods, and this ceiling is a key point in the ability of the lease to support financing.

Senator Butrovich advised that he felt the length of time would be important in determining whether or not a lease met the criteria established by a banking institution for loan purposes, and asked Senator Orsini if he had checked the terms of his proposed Substitute with the requirements of financial institutions. Senator Orsini advised that the banks were looking for stability. They need the ceiling so they can evaluate the risk involved, and the proposed Committee Substitute has a 30-year ceiling.

Senator Butrovich stated that the Resource Substitute appeared to offer a 25 year initial leasing period while Senator Orsini's changed that time period to 10 years. Senator Orsini replied that it should be viewed as a change from 25 years to 30 years. There is a difference in the amount we can charge at the end of each of the three 10-year periods, but there is a ceiling on the whole 30 years.

Senator Butrovich questioned Senator Orsini concerning how he had arrived at the 170% included in the ceiling. Senator Orsini advised that the percentage figure was derived from the percentage of inflation the state has experienced over the past 10 years. My thinking on that was that cost of living is not only an increase in costs, it is also an increase in income. The economic value from the property would increase as well as the cost of other things. If the state is not in a period of high inflation, the percentage would be the lower fair market value. As an example, Senator Orsini advised that if a leaseholder had a $1,000 annual lease, and assuming that the percentage actually goes to 170%, the breakdown would be:

$1,000 for the first ten years
$2,700 for the second ten years
$2,900 for the last ten years.

Senator Butrovich asked if Senator Orsini had conferred with people testifying before Resources regarding the content of his Committee Substitute. Senator Orsini advised that he

AGO 936024

had only completed work on the proposed substitute last evening, adding that he wasn't sure it would get by the Governor, but further adding that there was no question in his mind but that the Governor would veto the Resource Committee Substitute because the time period contained therein is too long.

Senator Orsini advised that another area that should be discussed pertains to the two items that should be taken into consideration when calculating rent. The first item is valuation; and the second is rental rate. Senator Orsini stated that discussions with private lessors had convinced him that the current 8% rental rate charged by the state is too high. The opinion appears to be that 6% is a fair rate given the restrictions on state leases. He further advised that part of the problem is the fact that conditions vary, and what the Committee Substitute attempts to do is build a fair but flexible rental rate based on comparable private rental.

Chairman Sackett asked what the Resource Committee Substitute proposed in the way of rental rates, and Senator Orsini replied that Resources has a maximum of 10%. Senator Orsini stated that his Committee Substitute floats the rental rate; that 8% is the going private rate, but the state has additional conditions (such as lack of an option to purchase) that make it less attractive for an individual to lease state land at 8%.

Senator Orsini further advised that he did not address the question of whether or not the state should be in the leasing business. If we are going to be in the business, it should be conducted as fairly as possible and made attractive enough so people will lease. On the other hand, the state shouldn't give the land away because it does belong to the people.

At this time Chairman Sackett advised that the committee would hear testimony pertaining to the two Committee Substitutes from those present. Mr. George Hollett, Deputy Director of the Division of Land and Water Management addressed the committee advising that he had not before had an opportunity to review Senator Orsini's substitute. Mr. Hollett advised that the state has lease agreements under existing statutes that are not compatible with the going market. Private leases are effected on a case by case basis which the state is unable to do. The state has to set stipulations that apply to all, and added that the Resource hearings pretty well brought out current problems with state leasing.

GEORGE HOLLETT
DIV. LAND &
WATER MANAGEMENT

AGO 936025

Mr. Hollett further advised that he was aware that if the state was to give 25 year rental terms, the banking facilities would look favorably upon this provision. He further stated that he would hope something would develop which would lend stability if the state is going to be in the leasing business. We find that in residential pieces of property, there has to be a stable period of time in order for institutions to lend. On commercial property the time doesn't have to be as long or there must be a ceiling so the banker can come up with some figures as to payback.

Senator Butrovich advised that he was concerned about what the state is doing to individuals who have entered into leases and improved the property. These people have existing leases and suddenly the state is escalating the rental price on property upon which they have substantial investments. Mr. Hollett advised that everyone agreed that a problem exists. There has to be something in the statutes that lets us get to this situation. The present day situation calls for the state to look at land and get the value.

Senator Orsini advised that his Committee Substitute addressed the question of how to take care of leases entered into over the past 5 years, and referred the committee's attention to Section 4. He advised that this section was very close to the provisions of the Resource Substitute in that it allows a person with an ongoing lease to enter into the new leasing system for the remainder of his lease. The Resource version would allow this person to enter into a total new lease. The ability to change over to the new system would expire on January 1, 1979. If the lessee should choose not to become bound under the new system, his lease would continue as before.

JOE WILHOUR
ALASKA INDUSTRIAL PARK

Mr. Joe Wilhour advised that he is currently a leaseholder in the Alaska Industrial Park Subdivision. He advised that he was unable to testify regarding Senator Orsini's proposed Committee Substitute due to the fact he had received a copy upon entering the committee room and was unable to listen to the previous testimony and read the proposed substitute at the same time. He advised that the Resource committee had come up with an acceptable bill which did not cover everything, but would at least keep the leaseholders in his area from losing their land. He stated that if a leaseholder is run off his land, he not only loses the

AGO 936026

lease, he loses his improvements and is still left with a mortgage to repay at the bank. He added that there was a definite need for a ceiling, but added that it was no good if the ceiling is too high.

Senator Orsini asked Mr. Wilhour what had happened to his land since the lease commenced. Has there been any rezoning, road improvements, etc. Mr. Wilhour replied that there had been no rezoning, and not much in the way of road improvements either. There had been a recent sewer and water project effected in the area though. Senator Orsini referred to page 2, line 17 of his proposed Substitute dealing with state reappraisals. He advised that under this section, improvements made to leased property by the individual would not be included within the reappraisal. The reappraisals would consider only state-implemented improvements.

Senator Hohman asked Mr. Wilhour how many people maintained leases within the above Industrial Park Subdivision. Mr. Wilhour replied that there are approximately 64 leases. Mr. Hollett advised that of the total 980 outstanding leases between the state and various individuals, not all of them would be affected as adversely as Mr. Wilhour whose lease is in an area where prices have been rising rapidly. Senator Hohman advised that it was his understanding that some leaseholders are being threatened to the point where they will have to walk away from the land, leaving their improvements and investments behind. Mr. Hollett advised that the 63 members of the Industrial Subdivision had hired Doug Baily to represent them in this matter. Mr. Wilhour advised that he believed more leaseholders than those within the Industrial Subdivision were involved in this problem, and cited the Matanuska Valley as another area where the raise in lease price has been just like an eviction notice. The leaseholders just cannot pay the price.

Senator Tillion referred to page 4, line 21 of Senator Orsini's Committee Substitute, dealing with long term financing. He stated that this section encouraged a person to go to a banker rather than trying to fund the lease himself. He further stated that he believed that a person who could fund the lease out of his own finances should have the same consideration as someone who has borrowed the money.

AGO 936027

Senator Orsini again referred to the reappraisal and the fact that he didn't feel improvements made by the individual should increase the value--only state improvements should have this effect. Mr. Davis advised that he didn't think there would be any serious contention regarding this provision, but added that in effect the provision would only make it more difficult to conduct the appraisal. He stated that he didn't feel this type of assessment would be a practical approach to the situation, adding that it would put the appraiser in the position of having to consider school facilities, rezoning, water, sewer, and road systems relating to the property, and yet close his eyes to the buildings and other improvements located on the property when making his evaluation.

REAPPRAISAL PROBLEMS

Chairman Sackett advised committee members and those present that the committee would bring the bill up for further discussion at the bill session scheduled for 8:00 a.m., April 4, 1977.

Chairman Sackett moved that Senate Bill 228 (Supplemental appropriation to the Office of the Governor, Alaska Plan Committee) be brought on for discussion. Mr. Milo Griffin, Executive Director of the Alaska Plan appeared to testify. He advised committee members that last year the Plan had requested $320,000 for yearly operation. The Governor's office cut that figure to $100,000, and we ran out of funds as of the 15th of this month. The audit recommended that we be refunded, and the Governor's office said they would submit a supplemental to give us enough funds to operate at the existing level.

MOTION
SB 228
ALASKA PLAN

TESTIMONY
MILO GRIFFIN

Senator Croft asked Mr. Griffin where the Plan currently is operation-wise. Mr. Griffin replied that they had cut their staff from 14 to 5, and they currently don't have enough funds for payroll this month. He added that Judy Greene from the Governor's office was to have initiated the supplemental but had apparently not followed through. The Plan needs $50,000 to carry it until June.

Senator Hohman asked if the internal audit report resulted from a routine audit, and Mr. Griffin replied no, the Plan was asking for funds and the Governor's office was not sure whether we should be a state agency or remain in our current status. The audit determined that it would cost too much for us to become a state agency, so the Governor's Office has requested the supplemental.

The meeting adjourned at approximately 10:00 a.m.

ADJOURN

SENATE FINANCE COMMITTEE
April 4, 1977
8:15 a.m.

All members of the Committee were present, with Senators Croft and Butrovich arriving late. Also in attendance: Milt Barker, Fiscal Analyst; Judy Cronlin, Administrative Assistant. Mr. Ken Davis and Joe Wilhour, Lease holders of State land; and the following persons from the Department of Health and Social Services: Marsha Hubbard; Dr. Jerry Schrader, Director, Division of Mental Health; and Bob Kemp, Acting Director, Division of Public Assistance. PRESENT

Chairman Sackett called the meeting to order and made the following bill assignments:

BILL ASSIGNMENTS

SB 19	- Sackett
SB 44	- Meland
SB 117	- Sackett
SB 152	- Meland
SB 184	- Meland
SB 200	- Butrovich
SB 228	- Hohman
SB 240	- Croft
SB 275	- Hohman
SB 276	- Hohman
SB 279	- Tillion
SB 280	- Tillion
SB 281	- Tillion
SB 284	- Butrovich
CSHB 84	- Orsini
HB 186	- Sackett
HB 349	- Sackett
SCR 38	- Butrovich

SB 159

Senator Orsini moved that Senate Bill 159 (Act relating to leasing of State land other than for extraction of natural resources) be brought up for discussion. There being no objection, it was so ordered. Senator Orsini presented information to the committee concerning growth in value of vacant real estate. He also stated that he has received a three page letter from the Legislative Affairs Agency on his proposed Finance Committee Substitute for SB 159 concerning the legal ramifications. He stated he has not yet had the opportunity to go through this in its entirety.

Senator Orsini advised he has talked with Ted Smith concerning the House version of this bill (HB 383) and that it is the same as the recommended Resource Committee Substitute with one minor change in Section 2.

Senator Orsini stated that most lands that are leased are lands held in trust for municipalities or the University and that additional lands will be coming to the State from the village corporations under the land claims act.

AGO 936029

Mr. Ken Davis presented testimony to the Committee concerning SB 159. He stated they are in favor of the Resources Committee Substitute for SB 159. He believes the Committee Substitute addresses the needs of both the lease law and the lease holders. He stated that paragraphs one and two on page one are particularly necessary to meet the needs of financial institutions as they have been quoted to him in the last twelve months. He stated that financial institutions requirements are normally for a ten year period exceeding the end of the mortgage. He stated that financial institution will not look at the normal 25% down credit approach. The applicant must have sufficient assets in order to build on State leased land.

RESOURCE COMMITTEE SUBSTITUTE SB 159

Senator Orsini asked if most private leases had an escalator clause and Mr. Davis said they did. Senator Tillion stated that most private leases have an escalator clause but it is designed to give the leasor the same buying power. It is not based on the land becoming more valuable.

Senator Orsini stated that the point is that lending institutions will not loan money on a lease that may increase in value over a period of years. Senator Croft asked if anyone knew of a private lease that was based on the value of land. Mr. Davis stated he knew of none. Senator Tillion stated this was the point he was trying to make.

Mr. Davis stated that page 2, line 23, and page 3, paragraph B of the Resource Committee Substitute, do give financial institutions the right to collect if there is a default. He stated that under present law that right does not exist.

Mr. Davis stated that under line 7 on page 4, the land will be coming back to the State at a faster time frame than you might normally expect.

Chairman Sackett asked for Mr. Davis's comments concerning Orsini's proposed Committee Substitute. Mr. Davis stated that with page 1, line 12 no one would be able to obtain a loan except by using his personal assets. He stated he believes paragraph two takes the incentative for developing a property away. He stated the first ten year appraisal could remove the initiative for anyone to take the initial step in developing a property. He stated he does think the five year terms from that point on are realistic.

FINANCE COMMITTEE SUBSTITUTE SB 159

Mr. Davis stated the State has chosen not to develop the property they are leasing. They have chosen to maintain the property to insure they get an income. He stated the income over a period of years can be less since they have chosen not to develop. Mr. Davis stated that Senator Orsini's proposed bill goes just a little further than HB 383 (Governor's bill by request).

AGO 936030

Discussion on the escalation clause being based on improved value of land and on inflationary value. Mr. Wilhour stated that in addition to having the land improved, the state receives additional benefits from its development in income tax, gross tax, benefits of employment and taxes from them. Mr. Davis stated that on page 2, line 11 of the Resource Committee Substitute there is an additional inflationary edge, in that the State can ask and receive prepayment of the annual rental rate.

Senator Croft stated there are several portions of Orsini's proposed Finance Committee Substitute that are desirable. Senator Croft moved that a Finance Committee substitute be drafted to include page 2, subsection (e) of Orsini's proposed committee substitute and that the first two lines be changed to "Changes in property value due to governmental actions, off property improvements, . . ." and that "single family" be added before "residential development" on page three, line 26 of the Resolution Committee substitute. Discussion on the changes. There being no objection, it was so ordered. SB 159 MOTION

Senator Meland asked Mr. Davis if he agreed with the changes. Mr. Davis stated he could see no problem with the changes.

Chairman Sackett stated the Finance Committee Substitute for SB 159 would be drafted and presented to the Committee at the April 5, 1977 meeting.

Senator Meland moved that Senate Bill 122 (Supplemental appropriation to the Department of Health and Social Services) be brought up for discussion. There being no objection, it was so ordered. Senator Meland stated persons from the Department of Health and Social Services were here to answer questions on this supplemental appropriation. Ms. Hubbard stated the Malpractice portion is being changed from 144.6 to 138.2 and that the general fund portion is 105.8. She advised there were originally eight BRU's involved with malpractice and that there are now four. Discussion on malpractice. SB 122

Ms. Hubbard advised that Medicaid has been reduced to zero. She stated that General Relief Medical has been increased from 125,000 to 243,200. Ms. Hubbard stated they have found that one-third of the expenditures for a given fiscal year are submitted and paid after that fiscal year. She stated their current authorized amount is $2.5 million and their expenditures are $2.7 million. Discussion on reason for delay in submission of bills. Mr. Bob Kemp stated that services are often rendered before a person is found eligible for General Relief Medical. Ms. Hubbard stated they have conducted a poll concerning date of services and date of payment. She will provide this information to Milt Barker.

AGO 936031

SENATE FINANCE COMMITTEE
April 5, 1977
9:10 a.m.

All members of the Committee were present. Also in attendance: Mr. Ken Davis and Mr. Joe Wilhour, Lease Holders of State Land; Ross Schaff, State Geologist, Division of Geological and Geographysical Surveys, Department of Natural Resources; Milt Barker, Fiscal Analyst, and Judy Crondahl, Administrative Assistant; and Elaine Mitchell of the Press. PRESENT

Chairman Sackett called the meeting to order and stated the proposed Finance Committee Substitute for SB 159 (act relating to leasing of state land other than for extraction of natural resources) had been redrafted. SB 159 FINANCE COMMITTEE SUBSTITUTE

Senator Croft stated that several of the Committee's changes, as stated at the April 4 meeting, were not included in the Committee Substitute. The following changes in the proposed Finance Committee Substitute were made:

Page 4, line 1 - "single family" was added before "residential"
Page 4, line 5 - "single family" was added before "residential"
Page 4, lines 6 & 7 - a period was inserted after "occurs" and "and only if necessary for obtaining primary long-term financing." was deleted

There was discussion on whether or not the word "primary" on page 3, line 28 should be deleted. Mr. Davis stated that the Ad Hoc Committee had recommended that "primary" be deleted; however it was not a unanimous decision. Mr. Davis stated that those that wanted to leave the word in felt that it did give some latitude. He stated that if it was not left in, and there was no comparable market, then they would have no place to go.

Senator Tillion moved that lines 14 and 15 on page 4 be amended to read: (2) changes in property value due to private improvements made to the property or other privately owned or leased property since originally entering into the lease shall be excluded. He stated the purpose of this was to insure that the value of the land was not increased due to improvements made by the developer on the leased or privately owned land surrounding it.

Senator Orsini stated his understanding was that this was taken care of by adding "governmental" to Section 1 on line 12, page 4. Senator Tillion stated this only exempted the particular property the individual has a lease on; it does not exempt him from increased land values because of improvements on property surrounding his lease.

Senator Croft stated he did not agree with the motion. He stated he was not convinced that all actions on other areas should be excluded. AGO 936032

Question on Tillion's motion. Croft opposed. Motion carried.

Ms. Crondahl advised that at the April 4 meeting, the Committee has concurred that Section B of Orsini's proposed Committee Substitute was to be included. She stated that when the bill was redrafted, Mr. Jack Chenowith advised her that if Section B was to be included, then Section D must also be included. The Committee had no objections to the addition of Section D (line 26, page 2 of the current Finance Committee Substitute draft).

Senator Croft moved that Finance Committee Substitute for SB 159 be passed from the Committee with individual recommendations. There being no objection, it was so ordered. SB 159 MOTION

Chairman Sackett moved that Senate Bill 58 (relating to hydrological data) be brought up for discussion. There being no objection, it was so ordered. He introduced Mr. Ross Schaff who stated that the Constitution in Article 8, Section 13, provides that the State is the owner of the water in the State and allocates that water. He stated that in terms of allocation, NR is charged with appropriation of the water, DEC controls polution, and Fish and Game controls the wildlife. SB 58

Chairman Sackett asked if the private owner drilling his own well would be required to fill out the paperwork and Mr. Schaff said he would.

Senator Tillion asked if the non-professional well driller would have to hire a professional. Mr. Schaff stated that is not the intent, but the non-professional would have to file with them and log what had been drilled that day.

Chairman Sackett stated he would come back to the Committee with a Committee Substitute or amendment on SB 58.

Chairman Sackett advised that close-outs would begin on Monday, April 11 at 1:30 p.m. with the Education Committee of the Whole.

The meeting adjourned at 10:02 a.m. ADJOURN

ATTENTION: Pat Conheady

Dear Commissioner,

The House Resources Committee will be reviewing HB 445 Leasing of State Land. HB 445 has not been scheduled yet. We will notify you later in regards to the date, time and location.

Please supply us with a position paper or material you have on this bill by the time of the meeting. If you have information pertinent to this topic, the Committee would appreciate receiving that, too. If you know of other interested groups, please contact them.

If you have suggested amendments, please supply the staff with copies of that prior to the meeting.

If there is a fiscal implication and a note is necessary, please prepare it and submit it to the Committee -- preferably prior to the meeting.

Thank you for your cooperation.

Sincerely,

Al Osterback, Chairman
House Resources Committee

Senator Joseph Orsini
Alaska State Senate
Pouch V
Juneau, Alaska 99811

RE: Committee Substitute for Senate Bill #159

Dear Senator Orsini:

I have reviewed a copy of the above-referenced bill which you sent to me. Basically, I consider it an improvement over the present leasing policy. It would appear that it will be easier to finance improvements on leases due to the fact that rents will be fixed with 10-year periods and that there will be less likelihood for small businessmen and homeowners leasing State land to be forced to abandon or sell their leases because of the ravages of inflation. Likewise, during periods in which cumulative inflation is less than 70% during any 10-year period, the State will be able to adjust the rents to Fair Market Values at the end of each lease period.

However, because of the longer periods between rental adjustments and the fact that maximum rental adjustments are provided for, in periods in which there is rapid inflation or rapid increases in land value, a Lessee could accumulate a sizeable leasehold interest which could be sold at a substantial profit. Since I am certain that it is your desire to make State land readily available to the citizens of the State of Alaska, but not allow them to speculate at the expense of other taxpayers, I would suggest that the following change be made to the bill: ["In the event that a leaseholder sells or assigns his lease to another party, a re-determination of the annual rental shall be made pursuant to Paragraph 4E and the purchaser or assignee shall be obligated to pay that rental until the next rental adjustment period."] I feel this amendment will allow the Lessee to have the advantages and protection provided for in this bill without allowing him to receive a windfall profit at the expense of the State and its other taxpayers.

In sub-paragraph J, where the term MAI Appraiser is used, a more proper definition would be "an appraiser who is a member of the American Institute of Real Estate Appraisers holding the MAI designation". Since there are now a number of Alaskan appraisers who have the MAI designation, it might be advisable to require that, in addition to holding the MAI designation, the appraiser also be a resident of and doing business in the State of Alaska.

AGO 936037

It is my opinion that resident appraisers will be able to do a better appraisal at less cost. If this provision is not included in the bill, in some cases, Lessees may bring in non-resident appraisers (I am assuming that the State will uphold it's philosophy of local hire) who, because of their lack of familiarity with Alaskan conditions, will require a greater time to complete an accurate appraisal. Since the State will be paying half of the cost of such appraisals, I see no justification for the taxpayers of Alaska to pay the cost of travel and lodging for non-residents, plus the additional fee that will be required for a non-resident to familiarize himself with Alaskan conditions.

While I am sure that no bill can be written that will be 100% satisfactory to everyone, I feel that with the above-referenced changes, this bill will be a marked improvement over the present law. If I can provide you with any additional information, please feel free to call on me.

SB

181

Wednesday, May 25, 1977, statement by Alaska Department of Fish and Game concerning:

Orca Inlet-Controller Bay
Critical Habitat Nomination
(Senate Bill No. 181)

The Alaska Department of Fish and Game strongly supports this bill. This area is probably the major shore bird/waterfowl migration/staging area in Alaska and possibly in North America. It encompasses tidelands and adjacent lowlands south and east of Cordova and of Hawkins Island, and also in the Copper River Delta and Controller Bay areas east and west of Katala.

Importance: During the spring migration period in excess of 20-million shore-birds (plove andpipers, snipe, etc.) and an additional one-million waterfow (ducks plus geese) utilize the food and water resources on these tidelands while waiting for the northern breeding grounds to open. This tremendous number of birds includes over 180 individual species. This resting period is extremely important to the migrating birds in permitting them to regain some of the fat reserves expended during the northward flight.

During the fall migration, depending on environmental factors, 10-20 million shore-birds, about one-million ducks and geese, and thousands of Sandhill cranes stop again at these tidelands, resting and feeding while preparing for the migration to their wintering grounds. These are located principally within the Pacific flyway, but also extend

throughout the United States, Mexico, South America, Australia, New Zealand, and the Hawaiian Islands.

In addition to this extensive use by migrating birds, some 50-100,000 shore-birds and waterfowl, hundreds of thousands of sea-birds, hundreds of bald eagles, and many other birds utilize the area throughout this spring-fall period. In total, 219 species have been recorded in the region: 72 occur in the tens of thousands, 10 in the millions.

National Significance: This habitat is one of the most important shore-bird migration/staging areas in North America. It also provides the nesting, molting, and feeding habitat for the largest known concentration of Trumpeter Swans in North America, nearly the entire world's population of Dusky Canada Geese, and large numbers of bald eagles.

Rationale for this Critical Habitat Designation: The preceding discussion outlines well the extensive use of this region as a breeding, resting, and staging area by countless numbers of various species of waterbirds and shorebirds. Many of these (e.g. the ducks and geese, et al.) provide exceptional recreational opportunity for both consumptive (hunters) and non-consumptive (bird watchers) users. More importantly, however, it is a key area for the migration of a major portion of Alaska's waterbird populations by providing a valuable rest stop for the "energy refueling" necessary to sustain long migrational flights. The major responsibility of the Alaska Department of Fish and Game is to manage and sustain Alaska's fish and wildlife resources for the enjoyment and use of all Alaskans, and in fact of all Americans. A "critical habitat" designation for this area will demonstrate the State's concern for such resources and will help control unrestrictive use that could be detrimental to these vast bird populations. The designation is not prohibitive of other uses, but does direct attention and consideration to all resources and does help provide for rational "development" planning by the State.

Public Support: The designation of this area as a "critical habitat" has received strong support from the Alaska Waterfowl Association, the Alaska Conservation Society, conservationists generally, and numerous members of the public at large, especially waterfowl hunters and bird watchers. A public hearing was held by the Alaska Department of Fish and Game in Cordova on February 26, 1976, and there was general strong support. Recommendations from that meeting resulted in the deletion of certain areas proposed and the addition of others.

Possible Problems: The Department of Natural Resources has indicated that there is low hydrocarbon potential in the Orca Inlet portion of the area, but better potential elsewhere in the area for both oil and gas. That kind of development could be detrimental, but need not if properly planned. There is nothing in the current statutes that prohibits mining or oil and gas development or other development from occurring within designated "critical habitats".

Permitting Requirements: As indicated on the following page, Alaska Statute 16.20.260 requires that any person or organization contemplating "use" or "construction work" on a "critical habitat" obtain the written approval of the Commissioner of the Alaska Department of Fish and Game.

Statute Authority: Pertinent language of the Alaska Statutes, Title 16, Article 5, are restated here for your information.

Article 5. Fish and Game Critical Habitat Areas

Sec. 16.20.220. Purpose. The purpose of §§ 220-270 of this chapter is to protect and preserve habitat areas especially crucial to the perpetuation of fish and wildlife, and to restrict all other uses not compatible with that primary purpose.

Sec. 16.20.240. Regulations. The board shall promulgate regulations it considers advisable for conservation and protection purposes governing the taking of fish and game in state fish and game critical habitat areas.

Sec. 16.20.250. Multiple land use. Before the use, lease or other disposal of land under private ownership or state jurisdiction and control, within state fish and game critical habitat areas created under this chapter, the period or responsible state department or agency shall notify the commissioner of fish and game. The commissioner shall acknowledge receipt of notice by return mail.

Sec. 16.20.260. Submission of plans and specifications. When the board so determines, it shall instruct the commissioner, in the letter of acknowledgement, to require the person or governmental agency to submit full plans for the anticipated use, full plans and specifications of proposed construction work, complete plans and specifications for the proper protection of fish and game, and the approximate date when the construction or work is to commence, and shall require the person or governmental agency to obtain the written approval of the commissioner as to the sufficiency of the plans or specifications before construction is commenced.

Sec. 16.20.270. Additional critical habitat areas. The commissioner shall submit a list of additional critical habitat areas to the legislature annually.

Dear Representative Osterback,

It has come to our attention that Senate Bill 181, "An Act creating the Orca Inlet and Controller Bay critical habitat area" is, and has been, hung up since last May in your committee.

We have achieved deletion of this area as a Wilderness Study Area from HR 39. However, we still want to see in place the degree of environmental protection from the State level this bill will achieve.

It is our request that you move this bill as soon as possible to gain passage this session.

Your prompt action on this matter will be appreciated.

Sincerely,

Bob Blake

The Honorable Representative Alvin Osterback
Chairman, House Resources Committee
Alaska House of Representatives
Pouch V, Juneau Alaska 99801

Dear Representative Osterback,

I am writing to request your committee to take action on SB-181 (Orca Inlet-Controller Bay Critical Habitat Area). SB-181 has recieved full support of the community of Cordova at a public hearing followed by supporting resolutions from the Cordova Chamber of Commerce, Cordova District Fisheries Union, and the Copper River-Prince William Sound Fish & Game Advisory Committee.

Please notify this office when the bill comes up for hearing so we can alert the parties who wish to testify on its behalf before your committee.

Respectfully

February 23, 1977

The Honorable John L. Rader
President of the Senate
Alaska State Legislature
Juneau, Alaska 99811

Dear Mr. President:

Under the authority of art. III, sec. 18 of the Alaska Constitution, and in accordance with AS 24.30.060(b) and the Uniform Rules of the Alaska State Legislature, I am transmitting a bill creating the Orca Inlet and Controller Bay critical habitat area.

This area is probably the major shore bird/waterfowl migration/staging area in Alaska and possibly in North America. It is located adjacent to and east of Cordova, south and east of Hawkins Island and the Copper River Delta.

During the spring migration period, 20 million shore birds as well as an additional one million waterfowl (ducks and geese) use the food and water resources on these tidelands while waiting for the northern breeding grounds to open. This tremendous amount of birds includes over 180 individual species.

During the fall migration, depending on environmental factors, 10-20 million shore birds as well as an additional one million ducks and geese stop at these tidelands, resting and feeding while preparing for the migration to their wintering grounds, principally located within the Pacific flyway, but extending throughout the United States, Mexico, South America, Australia, New Zealand, and the Hawaiian Islands. In addition to this immense migrational use, there are 50-100,000 shore birds and waterfowl using this area throughout the summer.

This habitat is one of the most important shore bird migration/ staging areas in North America. It also provides the nesting, molting and feeding habitat for the largest known concentration of Trumpeter Swans in North America as well as nearly the entire world's population of Dusky Canada Geese.

Sincerely,

Jay S. Hammond
Governor

Alaska State Legislature

ANALYSIS OF MAJOR CHANGES BETWEEN SB 196 AND CSSB 196
BY JOHN FARLEIGH, ADMINISTRATIVE ASSISTANT, SENATE RESOURCES

2:00 Thursday

SB 196	CSSB 196
(a) Requires tags for all shellfish pots.	(a) Requires tags only for king crab pots in areas with pot limits.
(b) Tags are issued by Dept. of Revenue with each shellfish pot license.	(b) Tags are issued by Dept. of Fish & Game at the time the fisherman notifies the Dept. of his intent to fish in an area with a pot limit. (He must notify the Dept. by August 1)
(c) Requires the tags to be attached directly to the pot (the pot would have to be pulled to be checked for the proper tag).	(c) Requires the tags to be attached to the pot and/or buoy at the Board of Fisheries' discretion.
(d) Allows the Dept. of Revenue to set the fees in an appropriate manner.	(d) Requires the Dept. of Fish & Game to charge the fisherman for the cost of the tags including reasonable administrative costs.
(e) Requires all shellfish pots to be connected to a "sea lion" buoy.	(e) Requires only king crab pots to be connected to a "sea lion" buoy (license revocation clause does not apply to this requirement).

In addition to these changes CSSB 196 also includes:

(f) A provision to make tags nontransferable unless the gear license is transferred under emergency provisions. (A.S. 16.05.670)

(g) A prohibition against unauthorized sale, reproduction, exchange, or use of tags.

(h) A definition of "registration tags" that allows the Board of Fisheries to require any device or method determined to be appropriate.

(i) A requirement that the court, in addition to any other penalty imposed by law, revoke the shellfish pot license of a person convicted of fraud or misuse of registration tags for a period of one to five years.

ANALYSIS: CS for SB 196, Regulation of Shellfish pots

Passage of CS for SB 196 will require positive identification of shellfish pots and buoys used in taking King Crab by means of individually numbered registration tags designating year of issuance which are to be issued with each license and permanently affixed to each pot.

A reliable manufacturer estimates that a tag suitable for this use can be produced for approximately $.20 each. Approximately 280 vessels will be affected by the requirement to identify shell fish pots (Sec 16.05.632). The pot limit is 75 pots that can be fished per vessel in regulated areas. Lost gear and replacement pots average approximately 25% of the total shellfish pots. Therefore, approximately 26,250 tags will be needed at a cost of approximately $5,250.00. Shipping, postage, and other handling charges would amount to approximately $2,000.00.

Personal services to administer tag issuance and maintain records will be necessary for six months per year at Homer, Kodiak, Juneau, and Petersburg. This requirement will be satisfied by four temporary Clerk III's, totaling 12 man-months per year at a total cost of $12,721.00.

Registration tags could be issued for a fee of $.75 per tag to offset General Funds.

DATE : March 9, 1977

FROM: R. H. Pilcher, Manager
Juneau Field Office
Department of Revenue

SUBJECT: SB 196 Regulation of Shellfish Pots

Passage of SB 196 will require positive identification of shellfish pots (and buoys) by means of individually numbered registration tags designating year of issuance which are to be issued with each license and permanently affixed to each pot.

It is believed the tag would have to be of a compostion that would withstand rough handling and exposure to the elements, including long periods of submersion in salt water. The information required or the tag, Indiviually numbered designating year of issuance, will necessitate a tag at least 3/4 inch by 2 1/2 inches in size, if not larger. A reliable manufacturer estimates that such a tag could be produced in .032 gauge stainless steel with stamped in eight digit numbers and with drilled holes at each end, for approximately $.20 ecnts each.

In 1976, 989 shellfish pot licenses were sold. Pot limits run from 40 to 900 pots that can be legally fished, but the average in 1976 was approximately 200 pots per license. Therefore, approximately 200,000 tags would have to be produced at a cost of approximately $40,000.00. Shipping, postage and other handling charges would amount to approximately $20,000.00. Therefore, it is believed that registration tags could be issued for a fee of $1.00 per tag.

SB 196 requires registration tags and buoys to conform to regulations, other specifications and requirements considered appropriate by the Board of Fisheries, and be issued under procedures considered appropriate by the Department of Revenue. If these regulations, specifications, requirements and procedures result in a tag different from that proposed above, the fee per tag may have to be adjusted.

There is no effective date on the bill. An effective date of January 1, 1978 is required to allow time to design, order, manufacture and ship the tags.

DRAFT RESOLUTION

The Board recognizes the socio-economic advantages of pot limits in certain areas and urges the Protection Division to enforce it to the best of its abilities.

Furthermore, Mr. Harder's proposal may be applicable on some king crab fisheries of the state while in other major production areas new refinements may be necessary to implement it on a reasonable cost-benefit ~~ratio.~~ basis. The Alaska Board of Fisheries urges the legislature to explore the possibilities of funding a comprehensive program that would incorporate a realistic and enforceable approach to this pot limit problem.

My name is Ole Harder, I'm a crab fisherman from Kodiak. I started fishing in Kodiak in 1948, and except for a few years I've fished there ever since. I'd like to express myself on the King Crab pot limit to the Resources Committee and the House and Senate. I'd like to start out with a little background on the pot limit. We started with 30 pots in Kodiak, then went to 60 pots, and then to 75. Kodiak fishermen signed a petition to bring it back to 60 a number of years ago, and everyone signed it with the exception of a few boats. Somehow the petition was lost at the Board meeting in Seward. Since that time we have had a 75 pot limit, and up until three or four years ago we hadn't had major problems. Somewhere, and somehow the chiseling has gotten worse. I would say that guys are fishing as high as 250 pots in Kodiak now, while fishermen who abide by the limit and fish 75 pots could be penalized for $100,000 or better in gross stock because he is living within the law. Now we have to find an answer to this problem. One of the things we can do is throw the pot limit out. If we do that let's see how that might affect Kodiak. We have a population of around ten or eleven thousand people that are totally dependent on fishing. Without fishing there would be nothing, except a little logging. I can predict what might happen without the pot limit. I understand we have a quota of around 12 or 13 million pounds of 7 inch crab this season. If a hundred boats fished with 200 pots, 50 with 150, and 50 with 75 pots. If my arithmetic is right, it would come to around 31,250 pots. If in three days we came up with a thousand pounds per pot (which, by the way, is a very reasonable catch at around 120 crab per pot in three days) we would then be talking around 31,000,000 pounds. While these figures are high, believe

you me, in not too many years you might see to throw the pot limit out. What this will do to the local economy I'm sure I don't have to tell you. Even if I cut my figures in half, or even in thirds, it would be disastrous. For instance if the Bering Sea and Dutch Harbor opens on September 15, and we open on September 1, we might be seeing the beginning of the end to the local fishermen and particularly the smaller boats. We also have to consider the resource. If fishing is better than the Department of Fish and Game anticipated, we could very well catch more than the allowable harvest which would, of course, be disastrous for the future. The pot limit is not any different in my opinion than the size of the seine or gill net in this state. If we get away with the size of the seines and gill nets and so forth, we will also see a drastic change in the gearing of the boats. Most everybody who wants to stay in business will have to buy a bigger boat in order to compete with the bigger seines and bigger gill nets and so on. Now I've heard the argument quite frequently as a matter of fact, that the National Marine Fisheries Service wants to do away with it. Well, I talked to Mr. Chingham who is on the Council and he reassured me that if the Council would implement whatever the State does and it will stick. And furthermore, I think that the new administration in Washington, D.C. is committed to put people to work, not take work away from them, which would be the case if the pot limit were thrown out. The Department of Fish and Game or the enforcement people so far have not been able to come up with a workable solution to the pot limit. My suggestion is that the State has a tape made up and put on every pot the fishermen fish. It can be a four

inch tape by the Fish and Game Department and they can be numbered from 1 to 75. They can even have reflector tape stuck on the tape that will work for radar. The reflector could also work for lights, and the tape could even be infra-red. All we have to do is apply it around the center of the buoy (I think a 60 inch buoy is the biggest size to my knowledge anyone uses) and every year we can change the color code. In other words, once you use the color one year that color is out - the next year you use a different color. I also suggest that you have ten extra tags. If a fisher-man loses a pot, for instance pot number 16, you then put pot number 76 on after notifying the Department of Fish and Game. A total of ten extra pots should be sufficient to cover what might be lost in one year. There might be various questions about the enforcement of this policy. The fishermen I have talked to so far all seem to think that there is a workable solution, and they will in turn testify. I feel that if I am on the grounds and I see a pot without the State tag on the pot bouys, I will consider it a lost pot and treat it as such. I also suggest that we put a permanent plastic tag with the Fish and Game number on it fastened below the pivot buoy. Thank you very much.

My name is Kenneth Moore from Homer, Alaska. I have fished lower Cook Inlet area. I've fished for 11 years, the past 7 I've fished in the king crab area. In lower Cook Inlet and Kachemak Bay, we have a problem with people fishing too many pots. It's an unenforceable problem, as near as we can see there is very little attempt has been made to enforce it, however, it is a very difficult thing to enforce. The tape that Ole just brought up is probably the only possible means that I have heard that might work to enforce it. I feel very strongly that it would work, and I think it should be considered along with considering in

however, there is also enforcement would have to take place, and I think that if enforcement would look into it, they will probably find that it could be enforced in this manner. Thank you very much.

My name is Hank Gain, I am a commercial fishermen from Seldovia. I have been fishing Kachemak Bay since 1953. We feel that removing the pot limit at this time would be disaster to the communities boardering on Kachemak Bay. As it is, we have a law on the books , and to my knowledge has never bee : even attempted to be enforced. We have asked the department previously while the protection agency was with the department to enforce this law and they said it was unenforceable. Since the State Police have taken over the protection, we hear the same thing. We think we do have a workable plan now that can be enforced, and with the enforcement of this law, it will stop a lot of the influx of the gear coming into the Bay, which is over the pot limit. Some of the boats fishing as high as 150 pots are causing an economic hardship on the fishermen and the residents of Seldovia. Therefore, we recommend that they adopt the proposal that was submitted previously on this tape to put, in effect, taping of the bouys which we highly endorse. This tape can be made or bought in its form now that cannot be peeled off the bouy that you will destruct, whereas other tapes can possibly be removed. But this tape can be applied to these bouys and cannot be used over again. We firmly and highly endorse this method of identifying pots and with this, we feel certain that the pot limit can be enforced and preserve the fishers of the small areas and preserve the economy of the towns surrounding Kachemak and Kamishak Bay.

Members of the House and Senate Committees, I'm Bill Bledso, a fishermen from Homer, and I fish king and tanner crab in the lower Cook Inlet. I think it's a real good idea to get some kind of enforcement going on this pot limit thing. The law has been on the books for quite a long time and the many comments we get when we bring it up to people who are supposed to be enforcing it, is that they don't have any way to do it, because at the present time they have to go out and pull every pot that a fisherman has to be sure that the pot itself is fishing king crab before they can even start to make a case. In addition, there are quite a number of pots in Cook Inlet that are fishing , and people are using them are completely unmarked with even Fish and Game numbers of the boats , there are a couple of bouys tied on. If we could set up some system where the pots could be accounted for, and this tape idea that Ole presented earlier might be a real good idea. Might make the whole system a lot more enforceable and help us out a lot and help out the resource as far as conserving the crab and making the season last a little bit longer and spreading it out so the processors could handle the crab. I think it would also be necessary to enact some kind of a rule or regulation or a law that stated that any pot that any pot that had this particular tape on it was a king crab pot, and that would not make it necessary for the enforcement people to have to pull the pot and determine that it was a king crab pot. There are going to have enough trouble locating all 75 pots or more of person's string anyway to be sure that they have more than 75 pots there. So I think it would be a real good idea, all in all, to somehow enforce this provision. I talked to a fisherman the other day and he said that he didn't know of anybody fishing in Cook Inlet who had only 75 pots. So that might give you some idea of the magnitude of this problem. So I would urge you to adopt this proposal and how to get us some help there on enforcing this regulation.

Thank you.

Ruel Homberg from Sand Point. I've fished here since 1954. My organization has a proposal to the Fish and Game to abolish the pot limit for our area. However, we've considered this a long time before we finally did put the proposal in. I wasn't one of the original members, that submitted that proposal this year, however, after talking to various people about the , someway to enforce the pot limit, I would feel that may be we should consider or take another look that the pot limit before we go to far. However, I don't know what the Board's action is going to be, but I would say if the Board did abolish the pot limit for our area now, possibly when they did come up with some way of enforceing the pot limit, I could see where this could really be a great help to us because as we are looking at some other things with the tanner crab, for instance, wanting a area registration or a an exclusive area registration were we could work a pot limit into that to be in effect and would probably eliminate need for area registration then. I have been trying to get ahold of some of the people from other organizations to find out what their feeling was on what we have talked about here but I haven't been able to , so what I'm saying here, I just have to speak for myself right now. I don't have much more to say other than that after talking with Ole here, I think maybe what he has is probably about the only way that there may be some way to enforce this. Thank you.

16 May 1977

FROM: Rep. Al Osterback, Chairman
House Resources Committee

alvin osterback

I am a crab fisherman myself; and as I see it, passage of SB 196 will only result in a gear fight. Through the years I have witnessed several gear fights. I have seen one crab boat shoot at another crab boat to chase it out of an area. There have been several cases of one boat shooting another boat's buoys amd sinking the pots.

If we pass this bill, all a guy would have to do to get rid of another guy is take up his tagged buoys and replace them with untagged buoys when no one is around. Then Fish & Game comes along and sticks the second guy in jail because he can't prove someone else switched his buoys.

Now let's look at enforcement costs. To enforce something like this, you would need night and day coverage. Four areas of the state have pot limits and would be affected by this bill. They are:

1. Southeast Alaska - 5 mo. season for Red King Crab and 12 month season for Brown King Crab.
2. Cook Inlet - 6 mo. season.
3. Prince William Sound - 6 mo. season.
4. Kodiak Area - 2 mo. season.

One enforcement boat could cover Southeastern and would operate year around. Two boats would be necessary to cover Cook Inlet, Prince William Sound, and the Kodiak Area. Seasons in these 3 areas all fall within the same 6 month period. That means three new boats at $1 million each, an initial cost of $3 million.

Annual operating costs would run about $1 million.

See attachment for breakdown of annual costs.

ANNUAL COST BREAKDOWN

Crew of 9 men per boat:			
Skipper	$25,000	$25,000	
Mate	25,000	25,000	
Cook	25,000	25,000	
2 Engineers	25,000	50,000	
4 Deck Hands	20,000	80,000	
		$205,000	$ 410,000
Annual upkeep		$ 20,000/boat	60,000

Operating costs:

Fuel
~~Gasoline~~ $528/day/boat
($.50/gal. X 40 gal./hr.
X 24 hr./day)

Groceries $180/day/boat
($20/day/man X 9 men)

Operating cost of $700/day/boat

[$700/day X 730 crew days/year] = 511,000

TOTAL ANNUAL COST FROM SB 196 $ 981,000

THE UNITED FISHERMEN MARKETING ASSOC. REPRESENTING FISHERMEN IN KODIAK AND THE BERING SEA IS OPPOSED TO COMMITTEE SUBSTITUTE FOR SB196 CONCERNING BIODEGRADEABLE SHELL FISH POT MECHANIZATION AND ENFORCEMENT OF THE KING CRAB POT LIMIT. WHILE IT MAY DE DESIREABLE TO ENFORCE THE PRESENT POT LIMIT, CONSIDERING THE LIMITED CAPABILITY OF THE PROTECTION DIVISION, WE FEEL IT SHOULD BE A HIGHER PRIORITY TO PROTECT THE RESOURCE ITSELF. NAMELY PROTECTING CLOSED AREA TO PREVENT OVER FISHING AND ENDANGERING THE RESOURCE.

THE POT LIMIT IS NOT A BIOLOGICAL MEASURE BUT IS A SOCIAL DEVICE DESIGNED TO ACHIEVE SOME PARITY AMONG VESSELS OF VARIOUS SIZES. THERE IS ALSO SOME QUESTION AS TO WHETHER POT LIMITS ARE CONSISTENT WITH THE NATIONAL STANDARD OF THE F.C.M.A. OF 1976 THAT REQUIRES THE MANAGEMENT MEASURES PROMOTE EFFICIENCY.

IN REGARD TO BIODEGRADEABLE MECHANISM, WHILE IT MAY BE NECESSARY IN A FEW FISHERIES IN SOME SPECIFIC AREAS, WE FEEL THAT IS SHOULD BE LEFT TO THE DISCRETION OF THE BOARD OF FISHERIES AS TO WHEN AND WHERE THIS SHOULD BE IMPERMENTED. IT HAS BEEN SCIENTIFICALLY DEMONSTRATED THAT THERE IS NOT A PROBLEM FOR KING CRAB AND TANNER CRAB POTS. THE BOARD OF FISHERIES IS CURRENTLY CONDUCTING STUDIES OF FISH POTS AND DUNGENESS CRAB POTS AND THE APPROPRIATE MECHANISM THAT COULD BE USED. BOTH ON THE SCENE OBSERVATION BY FISHERMAN AND SCIENTIFICALLY CONDUCTED DERELICT POT STUDIES SHOW THAT CRAB READILY ESCAPE FROM UNBAITED POTS. VERY THOUGHFUL CONSIDERATION SHOULD BE GIVEN TO IMPOSEING INPEDIMENTS ON THE DEVELOPMENT OF THE FISHING INDUSTRIES AT A CRUCIAL TIME WHEN IT IS HAVING TO COMPETE WITH FOREIGN FLEETS, ESPECIALLY WHEN THESE RESTRICTIONS CANNOT BE BIOLOGICALLY JUSTIFIED.

May 3, 1977

SUBJECT: HCS for CS for SB 227

TO: Representative Alvin Osterback, Chairman
House Resources Committee

FROM: Richard A. Bradley
Legislative Counsel

The House Committee Substitute requested is enclosed with this memorandum.

Changes proposed in secs. 10 and 20 of the bill introduce the suggestion Federal agencies will participate in the simplified application procedure [Sec. 20(1)] as well as in the review process.

The bill formerly only referred to Federal agencies in Sec. 20(5), a section allowing for the dissemination of information on Federal law.

It seems clear that the State cannot require Federal agencies such as the Corps of Engineers or the Coast Guard to use the Department of Environmental Conservation as the agency accepting filings for their permits. To this extent, addition of the word "federal" at lines 24 and 26, page 1, is beyond the authority of the State and perhaps misleading to applicants.

It also seems inappropriate to suggest that State procedures are involved in the review of Federal applications. Line 3, page 2.

The amendments at line 7 and line 8, page 2 present no such problem.

The remaining sections of the bill (except for §60(d)) contain no references to Federal agencies. No problems are presented by this approach.

Although I have reservations about the Committee's proposal, the bill is delivered as requested.

FISCAL ANALYSIS SB 227

The difficulty in preparing a fiscal analysis for this bill stems from it's optional nature. We are not sure how often this procedure will be utilized by the public. Washington State established a similar optional system in 1973. By 1976 of the 119 applications received, 10 were active, 25 permits had been issued and 84 were withdrawn. Basically their system is used in determining the various agency positions on a permit prior to withdrawal. Assuming similar usage in Alaska, say for the purposes of this analysis, 30 permits per year for major projects; the tasks required by this bill and their associated costs are:

1. Develop master application format, print and distribute.

Object Code	Item	Cost
300	development, printing and distribution	$2,000.00

2. Local government certification of project proposals

   Fiscal impact on local governments only

3. Receive screen and process master applications

   Costs can be absorbed in Field Office and Permit Information Centers.

4. Establish a tracking mechanism. Once established, log and process master applications to other agencies.

Object Code	Item	Cost
100	Clerk IV	$15,270

5. Process agency responses to master applications

   Costs included in #4 above.

6. Mail necessary applications to applicant. Send complete applications to other agencies.

   Costs included in #4 above.

7. Verify land and water ownership

   Costs may increase for applicant but can probably be absorbed by the Department. The applicant would be required to submit the proof of ownership.

8. The Department must cause an advertisement to be placed at the applicants expense in the local papers, once a week for three weeks.

   To avoid costs here the applicant would be required to show proof of publication. Therefore State costs can be absorbed into the position established under item #4 above.

9. Public hearings must be held on controversial permits. Assuming half of the 30 permits per year require hearings at a cost of $1,500.00 per hearing costs become $22,500.00

Object Code	Item	Cost
200	travel	$15,000.00
300	hearing and transcription	$7,500.00

10. Hearing information must be summarized and distributed.

Because this activityis already done to some extent, the cost to summarize the additional hearings can probably be absorbed by existing and new positions and associated costs discussed above.

11. Final decisions by other agencies must be received and processed through to the applicant as a final permit.

Costs included in #4, above.

12. Information Centers are required at each regional office and in the Commissioners Office in Juneau. Assuming a contractual arrangement with a municipality where Regional Offices exist to be just as expensive as establishing these centers "inhouse", the costs become.

Object Code	Item	Cost
100	Ad. Assistant I - Anchorage	$18,465.00
100	Ad. Assistant I - Valdez	$21,885.00
100	Ad. Assistant I - Fairbanks	$21,105.00
100	*Ad Assistant I - Juneau	-0-
	Total	$41,455.00

* Costs for Juneau position can be absorbed in #4 above.

13. Contracts for Local Permit Information Centers may be initiated with outlying communities. Assuming no additional personnel would be hired, the costs should be minimal. Estimate 1,000/year support costs for perhaps a dozen centers

Object Code	Item	Cost
300	12 Local Information Centers	$12,000.00

14. Miscellaneous support costs for each center and new position

Object Code	Item	Cost
400	Commodities	$1,200.00
500	Equipment for new positions	$4,000.00

April 20, 1977

To: Representative Alvin Osterback

From: Senator Kay Poland

Re: CSSB 227 "Permitting"

CSSB 227 relative to securing state permits for various projects involving use of state land, air, or water has been referred to your committee.

Passage of this Bill would be a distinct public service in providing a certainty of time, procedure, and definitive policy where none now exists.

Attached is an analysis of the Bill prepared by the staff of the DEC and of the Resources Committee, as well as a summary of that analysis. In addition, I am prepared to give any personal testimony your Committee may wish.

SUMMARY OF ANALYSIS, CSSB 227

The Bill is designed to facilitate communications between the public and state agencies having jurisdiction over various permits. The Bill establishes a single procedure of application, hearings, and processing. The procedure is optional with the applicant who remains free to follow existing procedures if his/her purpose is better served thereby. The Bill provides;

1. Regularly accessible local offices for information and assistance.

2. A single master application and time certain for the initial reply of all agencies. Agencies not responding lose their right to subsequently require a permit.

3. Provides an expedited process. The Department of Environmental Conservation coordinates the processes of all other agencies. The decision making authority of any other agency is not altered or diminished.

4. A single hearing is coordinated for all agencies and public.

5. A firm time sequence is established, ending guesswork and undue delays.

6. Compliance with local government ordinances and planning is mandatory.

7. Existing fee schedules are retained. Amending of fee schedules is not prohibited.

ANALYSIS OF CSSB 227, "PERMITTING"

CSSB 227, the proposed "Environmental Coordination Procedures Act" (ECPA) is designed largely around a bill passed by the Washington State Legislature in 1973. The bill is designed to facilitate communications between the public, including applicants for permits, and state agencies which have jurisdiction over various permits. The bill establishes a procedure, optional with the applicant, by which all permits necessary for a particular project may be applied for, and processed, as a single unit. A single, joint public hearing on all permits is provided for, as well as a single public notice procedure.

As envisioned, the bill has the following objectives:

1. To provide a regularly, accessible local office where information on the requirements for federal, state, and local permits may be acquired. These, the so-called "Permit Requirements Information Centers", are to be established in the Office of the Commissioner of Environmental Conservation, and each regional office of the Department of Environmental Conservation.

2. To provide a single master application form, which is submitted to the Department, and circulated by it directly to other state agencies. The other agencies must declare, within 15 days, whether they require permits of the applicant and, if so, which permits. Agencies which do not so declare may not subsequently require a permit of the applicant for that project.

3. To provide for an expedited process by which all permit applications, as identified by state agencies, are transmitted by the Department, which subsequently coordinates the permit processes of other agencies. Thus, the contacts between an individual and a potentially large number of state agencies can be limited to a single contact with one agency. In the event of problems with a particular project, communications between all agencies and the applicant are facilitated, but if no such problems arise, the applicant contacts only the Department of Environmental Conservation.

4. ECPA would help coordinate the decision-making process for all state agencies, through a mandated information flow, but it would not remove or alter an individual agency's decision-making authority.

5. If a public hearing is found to be required after polling all affected agencies, ECPA would require a single public hearing at which all the various views of the agencies, the applicant, and the public can be heard.

6. The ECPA process would eliminate guesswork and undue delays in permit processing; a firm time sequence is established by law, this sequence can be extended only for over-riding considerations.

7. The Department of Environmental Conservation would be the administrator of the program, coordinating the efforts of the various state agencies. ECPA would not give DEC any new jurisdiction or new power over the other state agencies. ECPA specifically retains the existing authorities of state agencies.

8. ECPA would provide for proof of conformance with local government requirements before state permits are issued. In a real sense, local governments would then have a "veto" or certification power over a project through denial of certification.

9. The bill allows for the withholding of the final permit until ownership of the land is established, but requires the application process to continue concurrently with acquisition. As a practical matter, any state land involved is usually a part of the application process.

It should be understood that the ECPA process does not, necessarily, expedite the permit process. An applicant can choose to handle each required permit on an individual basis, although this could potentially be more time consuming. Most permits for small projects are handled routinely by state agencies, many simple ones in a matter of days or hours. The ECPA process, in that it has a minimum time requirement of 150 or so days between master application filing and permit issuance, would not be chosen by a project sponsor which had only a few, simple permits needed.

More complex projects, such as oil refineries, power plants, etc., would be required to have a much larger number of permits, some of which, because of legal requirements or built-in delay factors, may take 180 days or more for processing. For example, the discharge permit issued by the Environmental Protection Agency under the National Pollutant Discharge Elimination System requires that permits be applied for 180 days prior to discharge. State requirements vary; many have mandatory 30 or 60-day waiting periods, although extensions for cause are allowed. Many state permit processes do not mandate time schedules, and potentially the applicant could suffer undue delays without recourse. By mandating a maximum time schedule by which all permits must be processed and issued, ECPA would assure the applicant of an answer within a time certain.

The ECPA permit process is not without some cost to the public. Costs previously borne by the applicant, and his consultants, if any, would be partly borne by the state in copying permit applications, distribution, and coordination costs. Many state permit and approval programs are conducted at no cost to the applicant, and those that do not always relate actual costs of permit processing to the fee. In addition, the establishment of the Permit Requirements Information Center would entail costs, both in manpower and material.

Existing fee schedules are retained, and nothing in the Act prohibits amending the fee schedules, if necessary, to meet any added costs.

STATE OF ALASKA

JAY S. HAMMOND, GOVERNOR

DEPARTMENT OF NATURAL RESOURCES

DIVISION OF LANDS

323 E. 4TH AVENUE – ANCHORAGE 99501

April 28, 1977

Honorable Alvin Osterback, Chairman
House Resources Committee
Pouch V
Juneau, Alaska 99811

Dear Mr. Chairman:

Please add my following statement to the record on CSSB 227.

I sympathize wholly with the aim of CSSB 227, that is, the applications in the permitting process for state agencies should be coordinated and simplified. It is certainly undesirable for a timber operator, for instance, to have to contact over 30 different federal and state agencies in order to obtain requisite operating permits.

It is my opinion, however, that the subject bill does not meet this objective in any significant way. I think it is necessary to separate the type of permits which the state issues into two separate categories. These are regulatory permits, i.e., the permits the State issues through its police power and proprietary permits, i.e., the permits issued by the State because it is the owner of the resources to be used. A permit issued under the police power of the State is one in which the aim is to protect the general public health and welfare. A proprietary permit, on the other hand, is issued to insure that use of state owned resources is in the best interest of the owners of those resources - all the people of the State.

Title 38 deals extensively with the authority of the Department of Natural Resources as the steward of the state's natural resources. AS 38.05 in particular details statutory requirements which the Department must meet in granting any permit to utilize state resources.

CSSB 227 does not (nor should it) relieve the Department from complying with any of these requirements. Thus, for those actions for which the permitting authority falls under Title 38, the procedure outlined under CSSB 227 would have the opposite effect of that which is intended. Instead of shortening and simplifying the process for the applicant, it would merely add another layer of bureaucracy to the already substantial

statutory requirements. The time span which currently has a roughly six month minimum would be substantially increased and a separate hearing process added.

I urge that in your deliberations on this bill that you consider exclusion of those permits which the State issues in its role as landlord as opposed to permits which it issues in its role as sovereign. We will be happy to work with you in drafting necessary amendments to Title 38 which could make the "one-stop" process of CSSB 227 more workable.

Please contact me if I may be of assistance to you.

Yours truly,

Ted

Theodore G. Smith, Director
Division of Land and Water Management

STATE of ALASKA

MEMORANDUM

TO: The Honorable Alvin Osterback
Chairman, House Resource Comm.

DATE: May 19, 1977

SUBJECT: Soil Survey Report (Requested during the hearing on SB 230)

FROM: F.S. Hensinger, DVM
Dept. of Nat. Res. (Agric.)

Attached is some material referencing the soil survey work that was done this past year under a cooperative effort indicated in the report.

There was a 25.0 contribution by the State for their share. A final report by the Soil Conservation Service will be available in July, and a copy will be furnished your committee.

Please see that Rep. Malone receives the second copy, as he was the member of your Resource Committee that specifically requested the information.

UNITED STATES DEPARTMENT OF AGRICULTURE
SOIL CONSERVATION SERVICE
2221 East Northern Lights Blvd., Suite 129, Anchorage, Alaska 99504

May 13, 1977

Mr. Allan Linn, Director
Division of Agriculture
P.O. Box 1088
Palmer, Alaska 99645

As the result of a request from the NANA Regional Native Corporation to the Alaska Soil Conservation District, Range and Soil Surveys were conducted by the USDA Soil Conservation Service on the reindeer grazing lands within the NANA Corporation boundaries last summer. A cooperative agreement between the SCS, Alaska SCD, NANA Corporation and the BLM was executed calling for cooperation among each of these agencies to accomplish the work. In addition, a cooperative agreement was signed between SCS, the Alaska SCD and the Bureau of Indian Affairs which provided for BIA funding up to $50,000 to be used in part for the Kotzebue area Range and Soil Survey. A breakdown of funding that went into the field work is as follows:

SCS	55,000
NANA Corp.	25,000
BIA	25,000
State of Alaska	25,000

Funds were used for a variety of purposes including a $45,000 contract with the University of Alaska, Geophysical Institute for assistance in using LANDSAT imagery and for collaborating in developing new technology for making surveys in the tundra areas of the State. Other sizable expenditures were for helicopter service, helicopter fuel, salaries for plant scientists and soil scientists, aides, per diem costs and airplane transportation.

A great deal more SCS time has gone into the development of the Range and Soil Survey Report after the close of the field season. It is estimated that an additional $25,000 of SCS funds will be expended to complete the Kotzebue area Range and Soil Survey Report which is due to be published in July 1977. This includes time spent in developing range site descriptions, soil descriptions, LANDSAT imagery map work, plant and soil laboratory analysis and printing costs.

During the past winter SCS initiated a study of snow conditions and its relation to reindeer range management in the area. This will be an ongoing study but during the past year SCS spent $5,000 in this endeavor.

The total area covered in the survey in approximately 4.5 million acres including the grazing permit areas of NANA Corporation, Karmun, Hadley and Grey. Development of new survey methods using LANDSAT imagery, computer technology and ground truth data collection by a team of field scientists using a helicopter for transportation permitted us to survey this large area in a short time. It was also done at a very low cost when compared to costs using conventional methods. BLM estimated that it would cost $104,000 to make range surveys on only 500,000 acres in the area.

The purpose of making the Range and Soil Survey is to provide inventory data necessary for range management planning. Through good range management by the reindeer herders, red meat production should be increased and the winter and summer grazing areas will be properly utilized. The Survey will present a scientific documentation of the potential value of the various range sites in the region.

Upon completion of the Range Survey the SCS will work with the reindeer herders and the BLM in developing individual range management plans.

The reindeer herders association at Nome have asked that range and soil surveys and the range planning work of the SCS and Alaska Soil Conservation District continue until all of the grazing lands on the Seward Peninsula are covered. That is an additional 12 to 15 million acres.

We feel that this project has been very successful in developing new methodology that will have far reaching benefits to the State of Alaska. I am attaching other documents that may provide additional information.

T. G. Freeman, acting

Weymeth E. Long
State Conservationist.

TO : Ted Freeman, State Resource Conservationist, Anchorage

DATE: September 10, 1976

FROM : Jim Preston, Range Conservationist, Homer

SUBJECT: CONS - NANA Range/Soil Survey including the following four reindeer grazing leases: Karmun, NANA (old Clark), Hadley, and Gray.

Objective of Survey:
To provide the soil/range resource inventory data necessary for range management planning interpretations.

1. Increasing reindeer red meat production within the scope of range conservation planning.
2. Depicting in scientific documentation the potential value of surveyed area as its best use being for reindeer range.
3. To prepare a range plan for each of the four grazing leases.

Work Done:
Starting on 7-28-76 and finishing up one month later (about 8-26-76) SCS surveyed 4,500,000 acres. (refer to forthcoming memo from Preston to Freeman on use of Landsat in range/soil survey on Seward Peninsula-1976. This memo by Preston was also inputted by T. George, B. Fibich, and P. Scorup. Therefore, its tardiness is explained.)

Twelve to fifteen range site descriptions will be extracted from the 75 SCS-RANGE - 417's, "Plant Yield Records," executed on this 4,500,000 acre survey. Landsat color products dictate perimeters of study. If a range site could be called a sample area, 75 ÷ 15 = 5 SCS-417's. Each SCS- 417 reflects ten sample plots, thus 5 x 10 = 50 sample plots per sample area. This, of course, is guesstimation only as we are a long way from actually knowing how many range site descriptions we will end up with in this 4,500,000 acre NANA survey.

Work Remaining:
Refer to Umnak/Unalaska Survey Report dated 9-10-76 for step by step procedures in progressing from raw "plant yield record" data to planning stage, including follow-up.

Recommendations:
That a comprehensive range plan be prepared for the four grazing leases. In these plans will exist the basic and necessary maps, interpertations and narratives (Refer again to Umnak/Unalaska Report) plus an interpretive map showing accumulated snow depth, hard pack areas, prevailing wind direction and blown bare areas. Year by year follow-up will refine this data.

THE USE OF SATELLITE IMAGERY IN THE RANGE AND SOIL SURVEY OF NANA CORPORATION LANDS OF THE SEWARD AND BALDWIN PENINSULAS

by

William R. Fibich, Soil Conservation Service
April 1977

A range survey is an inventory of the vegetation present on the land. The vegetation occurs in definite patterns, or native plant communities which can be identified and located on a map. A native plant community usually consists of a variety of different species of plants which are well adapted to living together on a particular part of the landscape.

The purpose of a range survey is to identify and describe the native plant communities in an area, to determine their food potential, and to indicate on a map their size and location. This vegetative inventory can then be used in planning the overall management of particular kinds of animals which will be living in harmony with these native plant communities. Plants are selective in regard to the kind of soil on which they live. There are different kinds of soil. Some soils are too wet, some are too dry, and some are just right for certain kinds of plants. Just as there are different soils there are different kinds of plant communities which inhabit these various soils. We, therefore, have a definite correlation between a particular soil and the plants which live on that soil. An inventory of the soils is an important part of the range survey.

In the process of making this range survey for the NANA Corporation the use of satellite imagery contributes mostly by showing the locations, patterns, and size of the various plant communities and their associated

soils. Satellite images are very similar to colored aerial photographs in appearance and are the result of variously reflected light from the earth's surface. These different light intensities are assigned individual colors. Each unique native plant community and its associated soil exhibits a particular ability to reflect light. The reflected light is collected by the satellite and a color-patterned image is the result. Since the color blue is usually assigned to the reflectance of water, the oceans, lakes, and streams are clearly defined. The land and water surface of the earth is easily identified, and a comparative linear scale can be established for the image.

The next step in this range survey was to investigate the various colors of the image. This investigation includes the complete inventory and classification of the principal plants and soils within the individual colors. This data supplies information such as pounds of feed available per acre, time of the year and location on the range the feed is available, and soil conditions which may affect the movement and health of the reindeer.

There are a few considerations one must understand when using these images to assist in the inventory of the range and soils. Within any one color there usually are two or more native plant communities and their associated soils. Also, in less than 10 percent of this study area of four million acres, there were instances where two different plant communities were represented by the same color, and where two different colors represented the same plant community.

~~DRAFT~~
1975

NANA CORPORATION AREA RANGE AND SOIL SURVEY

It is recognized by the NANA Regional Native Corporation that a good range inventory is the first step toward a successful reindeer herding operation. During the summer of 1975 the NANA Corporation requested the assistance of the Alaska Soil Conservation District and the USDA Soil Conservation Service in conducting Range and Soil Surveys on the designated Reindeer Grazing Permit Areas within the region.

In a range survey plant communities are identified and correlated with soil types. The extent and location of plant communities are mapped to be used in management plans. Yield data is then obtained to allow computation of the volume of plant material available for grazing. With this information, recommended stocking rates can be developed and management practices planned to allow for optimum production of the herd and proper protection of the range. The range and soil surveys will be the basis for comprehensive range management plans.

PRELIMINARY WORK

The total area involved is approximately five million acres in size and includes the current reindeer allotments held by Lawrence Grey (1,190,400 acres), Paul Hadley (2,232,320 acres), Charlie Clark (814,080 acres), and Alfred Karmun (689,250 acres). The NANA Reindeer Enterprizes, Inc. expects to soon be granted the permit for the Grey allotment by BLM. Because this area was too large to permit the SCS to complete the requested surveys within a reasonable time using conventional methods, it was necessary to devise a new and modern system to do the job. With the aid of the University of Alaska Geophysical Institute, a system using Satellite Imagery and computer

analysis of Landsat data was developed. A field test of the process was conducted on a small portion of the reindeer range of the Baldwin Peninsula during the late summer of 1975. It was found that with adequate ground truth field work by competent soil and range technologists that it was feasible to produce the range and soil inventory using Landsat data.

1976 WORK PLAN

This project is to refine the new technique, developed in 1975 and to test applicability over the whole area. During the 1976 field season, SCS will work with the University of Alaska Geophysical Institute in developing the use of Satellite Imagery and Landsat data in conducting soil and range surveys in the NANA region. Extensive field work will be conducted throughout the four permit areas by a technical team consisting of an SCS range specialist, a soil scientist, and a technologist from the University of Alaska Geophysical Institute. Field information will be correlated with Landsat data during the field season. It is estimated that four weeks of field time, using a helicopter for transportation, will be required to complete the investigation on the four to five million acres. Field studies are scheduled to be carried out during the month of August.

Estimated budget for the project is as follows:

SCS		
SCS technical assistance (field and office)		$30,000
SCS per diem and misc. expense		7,000
Helicopter	72 hours @ $400	28,000
Landsat technology cost		45,000
Total		$110,000

TO : Ted Freeman, State Resource Conservationist
Anchorage

DATE: September 10, 1976

FROM : Jim Preston, Range Conservationist, Homer

Jim

SUBJECT: CONS - NANA Range/Soil Survey including the following four reindeer grazing leases: Karmun, NANA (old Clark), Hadley, and Gray.

Objective of Survey:
To provide the soil/range resource inventory data necessary for range management planning interpretations.

1. Increasing reindeer red meat production within the scope of range conservation planning.
2. Depicting in scientific documentation the potential value of surveyed area as its best use being for reindeer range.
3. To prepare a range plan for each of the four grazing leases.

Work Done:
Starting on 7-28-76 and finishing up one month later (about 8-26-76) SCS surveyed 4,500,000 acres. (refer to forthcoming memo from Preston to Freeman on use of Landsat in range/soil survey on Seward Peninsula-1976. This memo by Preston was also inputted by T. George, B. Fibich, and P. Scorup. Therefore, its tardiness is explained.)

Twelve to fifteen range site descriptions will be extracted from the 75 SCS - RANGE - 417's, "Plant Yield Records," executed on this 4,500,000 acre survey. Landsat color products dictate perimeters of study. If a range site could be called a sample area, 75 ÷ 15 = 5 SCS-417's. Each SCS- 417 reflects ten sample plots, thus 5 x 10 = 50 sample plots per sample area. This, of course, is guesstimation only as we are a long way from actually knowing how many range site descriptions we will end up with in this 4,500,000 acre NANA survey.

Work Remaining:
Refer to Umnak/Unalaska Survey Report dated 9-10-76 for step by step procedures in progressing from raw "plant yield record" data to planning stage, including follow-up.

Recommendations:
That a comprehensive range plan be prepared for the four grazing leases. In these plans will exist the basic and necessary maps, interpertations and narratives (Refer again to Umnak/Unalaska Report) plus an interpretive map showing accumulated snow depth, hard pack areas, prevailing wind direction and blown bare areas. Year by year follow-up will refine this data.

THE USE OF SATELLITE IMAGERY IN THE RANGE AND SOIL SURVEY OF NANA CORPORATION LANDS OF THE SEWARD AND BALDWIN PENINSULAS

by

William R. Fibich, Soil Conservation Service
April 1977

A range survey is an inventory of the vegetation present on the land. The vegetation occurs in definite patterns, or native plant communities which can be identified and located on a map. A native plant community usually consists of a variety of different species of plants which are well adapted to living together on a particular part of the landscape.

The purpose of a range survey is to identify and describe the native plant communities in an area, to determine their food potential, and to indicate on a map their size and location. This vegetative inventory can then be used in planning the overall management of particular kinds of animals which will be living in harmony with these native plant communities. Plants are selective in regard to the kind of soil on which they live. There are different kinds of soil. Some soils are too wet, some are too dry, and some are just right for certain kinds of plants. Just as there are different soils there are different kinds of plant communities which inhabit these various soils. We, therefore, have a definite correlation between a particular soil and the plants which live on that soil. An inventory of the soils is an important part of the range survey.

In the process of making this range survey for the NANA Corporation the use of satellite imagery contributes mostly by showing the locations, patterns, and size of the various plant communities and their associated

soils. Satellite images are very similar to colored aerial photographs in appearance and are the result of variously reflected light from the earth's surface. These different light intensities are assigned individual colors. Each unique native plant community and its associated soil exhibits a particular ability to reflect light. The reflected light is collected by the satellite and a color-patterned image is the result. Since the color blue is usually assigned to the reflectance of water, the oceans, lakes, and streams are clearly defined. The land and water surface of the earth is easily identified, and a comparative linear scale can be established for the image.

The next step in this range survey was to investigate the various colors of the image. This investigation includes the complete inventory and classification of the principal plants and soils within the individual colors. This data supplies information such as pounds of feed available per acre, time of the year and location on the range the feed is available, and soil conditions which may affect the movement and health of the reindeer.

There are a few considerations one must understand when using these images to assist in the inventory of the range and soils. Within any one color there usually are two or more native plant communities and their associated soils. Also, in less than 10 percent of this study area of four million acres, there were instances where two different plant communities were represented by the same color, and where two different colors represented the same plant community.

analysis of Landsat data was developed. A field test of the process was conducted on a small portion of the reindeer range of the Baldwin Peninsula during the late summer of 1975. It was found that with adequate ground truth field work by competent soil and range technologists that it was feasible to produce the range and soil inventory using Landsat data.

1976 WORK PLAN

This project is to refine the new technique, developed in 1975 and to test applicability over the whole area. During the 1976 field season, SCS will work with the University of Alaska Geophysical Institute in developing the use of Satellite Imagery and Landsat data in conducting soil and range surveys in the NANA region. Extensive field work will be conducted throughout the four permit areas by a technical team consisting of an SCS range specialist, a soil scientist, and a technologist from the University of Alaska Geophysical Institute. Field information will be correlated with Landsat data during the field season. It is estimated that four weeks of field time, using a helicopter for transportation, will be required to complete the investigation on the four to five million acres. Field studies are scheduled to be carried out during the month of August.

Estimated budget for the project is as follows:

SCS	
SCS technical assistance (field and office)	$30,000
SCS per diem and misc. expense	7,000
Helicopter 72 hours @ $400	28,000
Landsat technology cost	45,000
Total	$110,000

POUCH Y, STATE CAPITOL
JUNEAU, ALASKA 99811

April 25, 1977

TO: Senator John Sackett

FROM: Senator Jalmar Kerttula

SUBJECT: Department of Natural Resources, Div. of Agri.

The proposed appropriation provides State funding for contractual services with U.S. Department of Agriculture, Soil Conservation Service. Services provided will be soil and/or range surveys on the soils of Alaska to increase the resources data for the benefit of State Department of Natural Resources, other State agencies and the using public. Service will be arranged to allow the State a higher voice in establishing priorities to S.C.S. work activities in Alaska by having Soil Conservation Board of Alaska participate in survey area priority decisions.

At a current cost near 75¢ per acre, this amount will provide survey services to up to 67,000 acres of Alaska land. Exact locations are not finalized. Reconnaissance studies by S.C.S. indicate Alaska contains about 20,000,000 acres of tillable lands. Soil surveys facilitate land-use planning and implementation programs.

Senator Jalmar Kerttula
State of Alaska
Pouch Y, State Capitol
Juneau, Alaska 99811

Dear Senator Kerttula:

I would like to provide additional justification for Senate Bill No. 280, an Act making a special appropriation to the Department of Natural Resources, Division of Agriculture, to fund state participation in the National Cooperative Soil Survey.

1. The needs for resource inventories in Alaska are enormous. Decisions involving the use of Alaska's lands now and in the future will have substantial impact on the well being of future generations of Alaskans.

2. Soil inventories produced through the National Cooperative Soil Survey provide resource data of considerable value for all types of land planning and use. No maps of large areas of land are made in such detail and involve so many significant factors as do soil maps.

3. The soil survey program includes: (1) determining the important characteristics of soils, (2) classifying soils into defined classificational units, (3) establishing and plotting on maps the boundaries among kinds of soil, and (4) correlating and predicting the behavior of soils under defined sets of management practices including agriculture, forestry, civil engineering and wildlife management.

4. The ultimate usefulness of soil surveys depends upon accurate soil correlation. This process involves (1) comparing local classificational units with those already defined and named in the general system of classification, (2) recognizing, establishing and naming new units consistent with the system, (3) grouping geographic units into named and defined soil associations, and (4) arranging the units into keys or groups to bring out principles and relationships.

5. In spite of the need for soil surveys in Alaska, detailed soil surveys are available for a smaller acreage of land in Alaska than in any other state, except the very smallest states. Nevertheless, Alaska's needs for detailed soil surveys are greater than any other state.

6. At the present time, soil surveys in Alaska are accomplished entirely by soil scientists of the Soil Conservation Service, USDA, ostensibly in cooperation with the Agricultural Experiment Station, University of Alaska, under a cooperative agreement. In actuality, the State of Alaska employs no soil scientists to cooperate with the Soil Conservation Service in the National Cooperative Soil Survey.

7. Thus, the State of Alaska has no direct contact with the soil survey program in the state, and no voice in decisions regarding soil classification or correlation within the state. Yet Alaska relies heavily on soil surveys published by the USDA in developing legislation regarding land use and in making long term decisions regarding land use.

8. Senate Bill No. 280 would provide funds to permit the State of Alaska to be directly involved operationally and in a decision-making capacity regarding the classification, correlation and survey of soils in Alaska.

Sincerely,

James V. Drew
Director, Agricultural Experiment Station

TESTIMONY OF RUSSELL W. CAHILL, DIRECTOR

ALASKA STATE PARKS

ON SENATE BILL 305

"CABINS IN STATE PARKS"

Murkowski
Sen. Poland
needs copies
Put in log

Mr. Chairman, Members of the Committee, the Department of Natural Resources believes this legislation is superfluous. Division of Parks has full authority to construct cabins in State Parks at this time. The master plans for Denali Park and Kachemak Park call for public use cabins. However, during the public process of producing a bond bill and bond issue for the ballot in 1976, we heard nothing from either the public or the Legislature which would have indicated that public use cabins were in the high priorities for State Park development.

Those of you who were here in the last session may recall that the request for capital funds for State Parks was cut in half by this Committee before it ever reached the Finance Committee of the House. The development needs passed on to us in legislative and public meetings were for campgrounds, auto access, sanitary facilities, and trail access to the back country: not cabins. Our proposed projects reflected those needs and are now law.

There is a letter of intent which was passed by the Senate with this bill and which not only instructs the Division to build the cabins, but tells us where to put them. It seems to me that the Senate Resources Committee, which has been reluctant even to hold hearings on any new park proposals, now wants to manage the existing Park System.

Considering the issues here, I believe this bill doesn't have any substance and is unnecessary. The Senate cut our district operations budget by more than $100,000 this year. The Free Conference Committee version of that budget still includes a $79,000 cut in district operations. The majority of that money was for garbage pickup in the State Park System and yet, funds to implement this cabin legislation (approximately $135,000 of general fund expenditures the first year), are nowhere to be found in the '78 fiscal budget.

Finally, this legislation calls for the Division of Parks to consult with local organizations to minimize the costs associated with this construction. In my experience, these groups then receive a preference right for the use of the cabins. Indeed, in many cases, such as the Sierra Club's former lodge in Yosemite National Park and many others, the cabins become a bone of contention between the general public and the organizations. In addition, this bill suggests that primary consideration be given to potential use of trails, rivers, lakes, and seashore by residents of Alaska. If you look at status plats around most of the lakes in southcentral Alaska and around the coast of Kachemak Bay State Park and several other coastal areas of Southcentral, you will find that the State, under the "open to entry" program, turned over much of the lakeshores and rivershores of the State to private ownership for recreation purposes. We have no quarrel with that use, however, we have found that the public has been effectively cut-off from many of these lakeshore areas by this allocation of land. We in the Division of Parks and I in particular feel that some of these lakes and rivers should be left open to continued public use without cabins or other structures. I believe

you would be surprised to find the number of people who wish to canoe and kayak along the few lakeshores that are in the State Park System and To camp in a place where there are no cabins.

I suggest that if this legislature wishes to have public cabins in State Parks, it should pass a small bond issue in 1978 and go to the voters with it. Unless the funds are provided to do this work, passage of this bill is tantamount to handing a hungry person a photograph of a meal and asking that person to eat the picture.

Second Session - Ninth Legislature

I. REQUEST

Bill No. S.B. 306

Title: Cabins Within State Parks and State Game Refuges

Requested by: Senator Croft Date: 5/4/77

Return Date Requested: 5/4/77

SUMMARY

(1) RELATED BILLS (SIMILAR OR CONFLICTING) None

(2) a. ORGANIZATIONAL SUPPORT FOR BILL

Unknown

(2) b. ORGANIZATIONAL OPPOSITION TO BILL

Unknown

(3) PROGRAM EFFECTS OF BILL

If cabins are constructed in very remote areas, the costs in manpower and materials for maintenance are normal. If close to roads, they are inordinately high. Cabins attract high vandalism levels and are places for very high visitor conflict levels. Cost of operations are much higher than equal camping site costs. Reservation system will be costly to operate.

(4) FISCAL IMPACT: ☐ NONE ☒ FISCAL ANALYSIS ATTACHED

(5) AMENDMENTS PROPOSED:

Page 1 - line 10, delete (each State Park) and replace with State parks. Page 1 - lines 12 & 13, delete (each state game refuge) and add State Game refuges. Page 2 - line 10, after "reservation" add and fee

(6) COMMENTS:

Director of Parks is cautious on this. Hundreds of private cabins exist on state leased lands. Often the only undeveloped shore accessible to the public is in state parks. Initial development would require 9 cabins in Parks and Refuges. Fees should be charged. Director considers letter of intent an attempt by legislature to run program. No funds available to do this job in FY78 budget. Would require new appropriation or 1978 bond issue.

Alaska State Legislature

House

HOUSE RESOURCES COMMITTEE

Alvin Osterback, Chairman

Pouch V, State Capitol
Juneau, Alaska 99811
(907) 465-3715

18 May 1977

The Honorable Hugh Malone
Speaker
Alaska State House of Representatives

Dear Representative Malone:

The following is the intent of the House Resources Committee with the passage of HCS for SB 306.

During Fiscal Year 1978 this Act shall be administered as a pilot program, with nine cabins to be constructed in the following state parks and game refuges.

(1) One cabin in Chugach State Park;

(2) one cabin in Kachemak Bay State Park;

(3) one cabin in Denali State Park;

(4) one cabin in Susitna Flats State Game Refuge; and

(5) five cabins in other state parks and state game refuges, to be chosen by the Commissioner of Natural Resources with the concurrance of the Commissioner of Fish and Game.

Sincerely,

Alvin Osterback

STATE of ALASKA

MEMORANDUM

DEPARTMENT OF NATURAL RESOURCES
OFFICE OF THE COMMISSIONER

TO: Bob Palmer, Special Projects
Phil Hubbard, Commissioner of Commerce
Mike Smith, Assistant Commissioner
Ted Smith, Director of Lands
Allan Linn, Director of Agriculture

DATE : April 15, 1977

FROM: Bob LeResche
Commissioner

SUBJECT: Delta Agricultural Action Plan

The feasibility report by the Ad Hoc Delta Barley Group, has been completed and reviewed by the Division of Policy Development and Planning. In addition, the Delta Land Management Planning Study is essentially completed. All three of these studies have been very well done, and fit together very well as a guide to future action. The purpose of this memorandum is to establish an action plan for aggressive accomplishment of the recommendations in these three studies.

I am requesting those indicated below to move with all practical speed to accomplish the tasks outlined:

TANANA LOOP AREA: In accordance with the Delta Land Management Planning Study, the Division of Lands should proceed to lay out, plat, and make available for sale around 5,000 acres of land for small farmsteads. This land should be in approximately half-section parcels, and should be an agricultural rights sale. The Division of Lands should work closely with the Division of Agriculture and the University of Alaska, to lay out this land disposal, and to derive the procedure by which it shall occur. Hopefully, disposal can begin by January, 1978.

GENERAL ADMINISTRATIVE TASKS:

1. Definition of "agricultural rights." The Division of Lands should immediately get together with the Department of Law and draw up an acceptable definition of agricultural rights to be included in any sale or lease of these rights. The Division of Agriculture should be consulted during this process. This definition might well contain identification of permitted uses, and the covenants/easements to sale, as well as provisions for recreational access and liability against crop depredation. The Department of Fish and Game should be consulted concerning the latter.

The Director of Lands should report progress to me on this item on June 1.

045.3

2. Appraisal policy for "agricultural rights." The Division of Lands, the Department of Law, and Division of Agriculture should get together once a working definition of agricultural rights is established, to consider principles whereby these rights will be appraised precedent to sale or lease. These agencies should consider whether potential economic viability of a specifically stated farming venture on the land should be an overriding factor in appraisal. The Director of Lands should report to me on this on July 1.

3. Resolution of potential statutory conflicts regarding how much land can be transferred to an individual. The Department of Law and the Division of Lands should work together to resolve these conflicts as they affect conveyance of agricultural rights. The Director of Lands should recommend action to me by July 1.

4. Determination of appropriate method of disposal of agricultural rights. The Division of Lands and Division of Agriculture should derive a set of principles from which decisions can be made in individual cases whether to offer agricultural rights for purchase, lease, or lease-purchase. In addition, they should establish the principles under which future decisions should be made regarding whether leases or purchases should be by bidding, lottery, or negotiation. The Director of Agriculture should make recommendations to me in this regard by July 1.

5. Classification of agricultural lands in the Delta Land Management and Planning Study area. The Division of Lands should complete classification of lands designated as agricultural by the Delta Land Management Plan.

"DELTA BARLEY PROJECT" :

1. Lay out of project. The Division of Lands and the Division of Agriculture shoudl prepare a final project lay-out plan, using the recommendations of the Ad Hoc barley project group, the Delta Land Management planning Study, and the Division of Policy evelopment and Planning report. This final layout should be reviewed by all concerned parties, including especially those who had active involvement with the three above studies. I hope that the project layout can be finalized and accepted by all parties by July 1. The Director of Lands should report progress in this regard to me on July 1.

2. Platting the Division of Lands should proceed rapidly with platting the area pursuant to the approved layout plan. On July 1, the Director of Lands should give me a schedule under which platting will occur.

3. The Division of Parks should initiate an archaeological and historical survey, pursuant to AS 41.35.070, as soon as the final development plan for both the barley project area

and the Tanana Loop area is available. The Director of Parks should let me know as soon as possible a reasonable time schedule for completing this survey.

4. Test plot clearing. The Division of Agriculture, with cooperation from the Division of Lands should arrange for clearing a half-section or full section test plot. The purpose of this clearing will be to test clearing methods, to test moisture retention and blowoff tendancies, and to test barley production. The Division of Agriculture should ensure that representatives of the Department of Fish and Game, Department of Environmental Conservation, the Ad Hoc Group and the University all have ample opportunity to help design the test procedures, and to be present and participate in the actual clearing and manipulation of the test plot as well as any subsequent measurements they may wish to undertake. The Director of Agriculture should give me an action plan and schedule for this test clearing, as well as for all test procedures to be undertaken during fiscal year 1978, by June 1.

5. Design of environmental studies. The Division of Lands should immediately contact the Departments of Fish and Game and Natural Resources, as well as interested members of the Ad Hoc Committee, and request that they design by May 15 specific environmental studies that will be necessary in order to evaluate clearing methods, prepare the final project layout plan, and assist in development of the conservation plan. These studies should be designed in detail and costed out so that we may proceed to implement them without delaying the project unnecessarily.

6. Soil conservation plan. The Division of Agriculture, Division of Lands, Department of Environmental Conservation and the Soil Conservation Service, should begin preparation of a soil conservation plan for the entire Delta Clearwater area. This plan should at least cover soil conservation and erosion control, pesticide use, herbicide and fertilizer use, and water quality. In addition, the plan may consider such things as energy conservation, suggestions for clearing and farm management practices. The Director of Agriculture should give me by June 1, a schedule for completion of this soil conservation plan.

7. Funding alternatives. The Division of Agriculture and the Department of Commerce and Economic Development should assist Mr. Palmer as much as possible in his quest for non-State funds that may be available to finance the Delta Barley project. Hopefully, some specific avenues of approach should be available to us by July.

In addition, Bob Palmer and I are presently preparing a supplemental budget for accomplishing the other directives

included in this memorandum. All interested parties should telephone me by May 1 with specifics regarding any additional funding they will need to accomplish these directives during fiscal year 1978.

8. Timber sales. The Division of Lands should make announcements as soon as possible offering timber within areas planned for clearing to local residents at a minimal fee, to cover at least the cost of administration of timber removal. These announcements should be in compliance with the final project layout to be derived above, and should be offered if possible by August 1.

9. Local government and farmers cooperative. The Division of Agriculture, Department of Community and Regional Affairs and Department of Commerce and Economic Development should develop an active program of contact with the City of Delta Junction and local farmers, designed to clarify the long-term role of local government and any potential farmers cooperative organizations in future agricultural development in the Delta area. I would suggest it would be very beneficial for the State to provide a similar level of aid to Delta farmers, including both those involved in the Tanana Loop "small" acreage farms and in the Delta Barley project, as we are currently providing to fishermen interested in nonprivate, nonprofit aquaculture projects. I would suggest that the Department of Commerce and Economic Development review the contract that the Division of Policy Development and Planning has with the Southeast aquaculture Organization and consider creating a similar relationship between the State and Delta farmers.

10. The Division of Agriculture, Division of Lands, Department of Commerce and Economic Development should together prepare a draft of qualifications for those who will qualify to purchase or lease large tracts of agricultural rights in the Delta barley area. These criteria should follow those discussed by the Ad Hoc Group and the Division of Policy Development and Planning, and should include experience factors, financial qualifications, and other factors. I would suggest that these criteria be derived solely on the basis of maximizing the probability of success of the Delta farming venture, and not on the basis of insuring that enough qualified farmers will be immediately available. The Director of Agriculture should give me a draft list of criteria by July 1.

I feel if we can accomplish all of the above on approximately the time scale outlined, we will have made a very positive step toward achieving a new and viable renewable resource industry in Alaska, planned and endorsed by local residents, financially responsible, and environmentally sound. Upon our accomplishment of all of the above, and upon qualification of the requisite number of potential private participants (i.e., upon sufficient showing of private demand by qualified

individuals) I would intend to make approximately 50,000 acres of land available for barley production in the Delta area as outlined by previous plans.

I sincerely hope we all can work together compatibly in pursuing this exciting prospect.

cc: Governor Jay S. Hammond

BL:lb

The primary purpose of this land clearing operation is to test an alternative method of clearing land when the vegetative cover consists primarily of heavy moss cover and black spruce timber.

Technicians of the U.S. Soil Conservation Service have devised this system and believe that it has a number of significant advantages over the conventional method of bulldozing all material--including the top soil that adheres to the roots of the vegetation--into large "berm piles". Those berm piles are then burned or allowed to decompose over the next 20 years or so.

The clearing process proposed is explained in some detail in the accompanying correspondence from Mr. Burt Clifford, U.S. Soil Conservation Service.

Recent estimates for clearing and breaking costs received from Mr. Dennis Green, heavy equipment contractor in Delta Junction and generally recognized in that area as one of the most qualified and reasonable land clearing contractors, yield the following cost data regarding the clearing method to be tested:

Clearing	$100/acre
Clean-up of burn residue	$20/acre
"Breaking	$30/acre
TOTAL	$150/acre

Mr. Green recently completed clearing 2,000 acres of somewhat similar timber for a private individual, using the conventional "berm pile" method. His charges were $338,000.

It is hoped that the alternative method of land clearing that will be used on the test plot will result in a number of advantages:

1. No loss of top soil since the vegetation and any soil adhering to the roots will only be moved the width of a bulldozer blade;

2. No berm piles to inhibit farming operations, reduce acreage available for production and provide an eyesore;

3. Lower costs--since the vegetation will be moved to a much shorter distance than with the conventional methods of clearing land.

Contractors in the Fairbanks-Delta Junction area who are expected to bid on the large clearing project (60,000 to 70,000 acres), if the legislature ultimately approves such a project, recently stated to Dr. C. E. Lewis, Agricultural Economist, University of Alaska, that at least 2,000 acres should be included in the test plot. They stated that anything less would not yield significant data on which they could base contract bids.

Enclosure

LAND CLEARING
SHEAR AND BURN METHOD

Burton L. Clifford - Resource Conservationist
USDA - Soil Conservationist

The method of shearing stands of woodland and removal of the woody materials by fire is not a new method. It has several distinct advantages for clearing large blocks of agricultural lands which include speed, low cost, and nutrient retention.

STANDARD CLEARING METHOD

Land clearing is done with large crawler tractors equipped with angle blades, bulldozing the vegetation after the ground is frozen. The vegetation (woods and moss) is dozed into long berm rows, normally running lengthwise of the field. The berms, depending on vegetation and snow conditions will be 150 to 200 feet apart. Width ranges from 30 to 45 feet, height approximately 20 feet. If a good job of dozing is completed, the newly cleared area between the large berms can be broken (plowed). If not, hand labor is needed to remove remaining sticks and small logs before breaking. Approximately 20-25 percent of the field will be under berms.

The berms are allowed to dry through the summer. After the fire season they are set ablaze. The residue is generally rebunched and reburned. Any soil residue in the berm piles is scattered or disbursed in the field. The process of berm removal is slow, usually requiring 2 - 3 years to dispose of the debris. It is expensive costing three to four times per acre over the original clearing method.

A disadvantage of this clearing method is that the berms hinder farm operations. The area between the berms is generally irregular. The area under the berms cannot be farmed. By the time the berms are removed, and the soils under them planned, five to six years have been spent developing this 25 percent of the field. This method is slow and expensive. Total costs including berm removal is running approximately $150+ per acre for the complete clearing job.

Another disadvantage is that the operator must be skilled in clearing methods. An unskilled operator generally includes a high volume of top soil in the berm rows, adding to both cost and time for removal. Land clearing by this method is a specialized art.

This has become the "standard" method in Alaska. This is largely due to restrictions about burning during the dry season. Fire has an important role in development. Homesteading started in the late fifties in the Clearwater because of old wildfire burns. These burns removed the moss ground cover, stripped the boughs from the spruce trees, and allowed the remaining standing residue to dry. With only dry tree stems left, clearing was easy. The bulldozed residue burned clean in the berms. Clearing cost ran about 50% below unburned areas. These areas have now been developed and all future agricultural lands will be developed from mature woodland stands.

In summary, the main disadvantages of this present method are:

1. Slow and costly - In unburned areas, approximately 1/2 to 3/4 of an acre can be cleared per tractor hour. At $60 per hour, costs would be $80 to $120 per acre for the initial bulldozing. With berm removal included, costs will run $150 to $200 per acre.
2. Berms are created. They have a considerable amount of moss and green plant materials in their composition. Any snow included is slow to thaw, and berms remain wet for long periods of time. Assuming that berms only have vegetation materials, it takes an average of three years for final removal. Berms and berm removal also seriously affects the establishment of windbreaks.
3. Snow conditions - Heavy snow conditions not uncommon to the Clearwater, rapidly increase cost, place berms closer together, increase size, and decrease their removal rate.
4. Operators - Operators inexperienced in agricultural clearing tend to place too much soil in the berms. Operators are generally experienced in construction clearing where cost and soil removal are not major factors.

SHEAR AND BURN CLEARING METHOD

This method was used in the Fairbanks area in the late 1950's with considerable success. An old Army surplus D-8 caterpillar tractor with an angle cable dozer was used for the shearing operation. Used grader blades were welded flat at the base of the dozer to form a knifelike blade that would float over the frozen soil, shearing the vegetation. The blade was angled and the tractor operated around a field, much the same way as cutting hay. The blade sheared the vegetation and rolled it into small compact dirt free windrows.

The field was allowed to dry part of the summer then a fire was set around the entire perimeter. The resulting fire thoroughly burned the dryed vegetation, leaving the field almost completely cleared and ready for the breaking process with little additional dozer work. This work was done on permafrost soils with black spruce and deep moss ground cover. The dry moss was necessary to provide fuel to burn the large trees. The method was fast and cheap, but was discontinued with the inability of farm operators to obtain fire permits for burning during summer months.

Modern tractors equipped with hydraulically controlled angle blades can shear better than the above described blade. They have the advantage of "down" pressure, where the older cabled blades had to "float". The hydraulic blade provides positive control that allows an operator to shear vegetation with ease. He can easily control the blade for depth of cut.

The shear and burn method of land clearing is briefly:

1. To shear the vegetation at the soil surface from its root or ground support, and roll into small (4' to 6' diameter) windrows.
2. Dry the vegetation to a low enough moisture content that the materials would be totally consumed in place by fire.
3. Burn in predesigned fuel cells based on vegetation type and compartment size at a time that total consumption of the materials will occur.

It is proposed that the shear and burn method be used in all large scale clearing operations. On a project level adequate fire control can be provided to burn residues during the dry summer months.

The vegetation would be sheared on frozen soil conditions with angled blade to form the vegetation into windrows. In the black spruce areas, this, because of the frost conditions, could extend well into the summer months.

The windrows, small and close together, would range from approximately 10' to 20' apart. Width depends on clearing method (figure 1.). The merits of each method needs to be examined, for both ease and speed of clearing, drying capabilities, and burning capabilities.

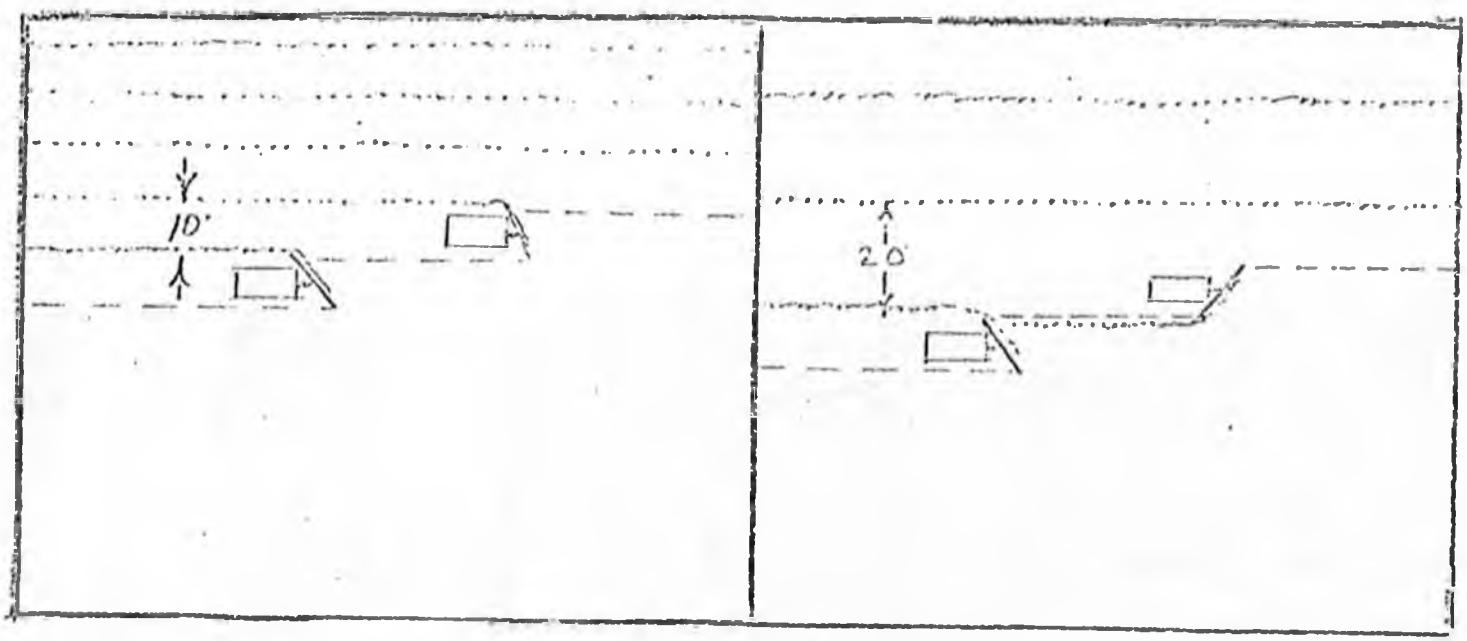

Figure 1: Two tractors are working together - on the left, they are working around a field making single windrows. On the right the tractors are combining two into a single windrow. The advantages and disadvantages of each need evaluation.

All woodland can be cleared by this method. The main difference would be burning dates. Total cosumption of the materials should occur in black spruce and heavy moss ground cover the first summer following clearing. Hardwoods would require a second season for drying. In both cases, the date of the burn should be determined by the dryness (moisture content) of the largest tree stems in the proposed burn. Fuel cells will be formed in compartments for (1.) the type of vegetation to be burned and (2.) the size of the desired burn. It is most important to restrict all burning before and after clearing until the cell has dried to provide the maximum burn efficiency. The more vegetation present, the hotter and cleaner the burn. The large tree stems must be consumed completely during the burn for maximum efficiency of time and money. In case some stems were not completely consumed by the burn, clean up would be relatively fast and economical. Burning can be conducted when favorable atmospheric conditions prevail causing little likelihood of local smoke problems. Dry materials create less smoke.

In summary, the shear and burn clearing method has the following advantages:

1. Low cost - The ground is covered much faster. One operator noted he thought he could maintain three miles per hour. At this rate, 3.6 acres per hour would be covered 3 $60/hour = $17.00 per acre. At two miles per hour, 2.42 Ac/Hr = $25.00 per acre; at one mile per hour, 1.2 Ac/Hr = $50.00 per acre. In all of the above, the cost is far below standard methods, and no berms are created. Without the necessity of berm removal land clearing costs are reduced far below the "standard" clearing method. Allowing cost for burning and some clean up, it is suggested with good operators that the cost may be well below $100.00 per acre.
2. Less soil disturbance - Soil would not be pushed into large berms. Any soil that is disturbed would not be piled. Breaking and farming methods would level any disturbed situations.
3. Operators without clearing experience can be used. Again any soil disturbance created by such an operator can easily be remedied. The ground fire would do an excellent cleanup of small sticks and broken stems normally left on the ground.
4. Heavy snow conditions presents no major problems. The material is only to be sheared and rolled. The snow would not be a load factor under these conditions. It would melt rapidly and thoroughly during break up.
5. Excellent fire control - With the clearing residue rolled and fuel cells delinated, excellent control can be maintained during burning.
6. The land can be cropped earlier. Dr. Wooding, Agronomist, Alaska Experiment Station, suggests that this method would save a full year during the development stage by eliminating the need for decomposition of organic material on the soil surface, normally a problem when "standard" clearing methods are used.

7. Scarification for new forestation - Windbreaks could be developed from natural regeneration of the woodland. Fire acts as a scarifier for this new start. Areas formally burned in the Clearwater have excellent stands of hardwoods with a spruce understory.

Questions and Concerns:

1. The materials must be burned during the warm dry summer months which is the peak fire season. Will agencies with fire management responsibilities cooperate so the burn can be carried out with reasonable safety and still attain maximum effectiveness?
2. Methods to determine ideal time to burn for naximum benefits are needed. This involves the moisture content of the vegetation, and design and construction of the fuel cells.
3. Actual costs - It would be well to demonstrate this method on the conditions found in the Clearwater to determine the true results. At present, contractors do not fully understand this concept, and do not have a feel for costs.
4. The advantage (if any) of a single versus double blade windrow relating to speed of clearing, burning efficiencies, and fire control is needed.

It is suggested that a trial be started immediately on the two predominant vegetation types found in the Clearwater area, black spruce and hardwoods. Two 160 acre tracts are proposed as a minimum, one in each vegetation pattern.

The layout should be such that each tract is a mile long. On 160 acre tracts, this would amount to four 40 acre tracts end to end - 1320' x 5280'. The mile run is needed to test travel time rates. In the actual clearing process, it is envisioned that the runs would be very long between turns. The 40 acre tracts might be ideal for fuel cells for trial burning this summer.

One technique that has surfaced is chaining the vegetation before clearing. This process mainly orientates the vegetation. The question is if it is necessary, or could a heavy roll bar frame be attached to the top of the tractor blade achieve the same purpose. A roll bar would eliminate one operation (chaining) saving time and money. This is necessary information on both vegetation types.

Such a trial would place the Delta barley proposal on a much firmer footing relative to clearing costs. This is a major aspect of the proposal, and should be verified. It would create a demonstration for contractors to observe, putting them on a more competitive bid basis. If this is a viable method, it would serve as a pattern to plan all future agricultural development in interior Alaska.

, Nevada, New Mexico, and Utah) is underway to mine the cost of producing and marketing crops and tock on irrigated lands in the Southwestern States. This mation will afford a sound basis for planning and ilishing agri-businesses in these areas with special lits for American Indians, Mexican-Americans, and r low-income people.

erative work with a national consulting firm and try has determined factors which motivate industries stablish plants in nonmetropolitan areas, the role of munities in plant establishment, and the reaction of tudied communities to new plants. This work is im- ng communities' opportunities to attract branch plants.

operative project (Economic Development Adminis- n, Montana State University and Agricultural Ex- iment Station, and Economic Development Association astern Montana) has determined the feasibility and of producing, processing, and marketing livestock from n Montana. This will, hopefully, upgrade returns to tana stockmen, who are currently producing livestock d at over $600 million annually, and may provide tional employment to as many as 200 people, including rican Indians.

DELTA AGRICULTURE PROJECT

An Approach to Baseline Surveys and Research

A well designed and coordinated series of studies would contribute to the success of the proposed farming project and related resource uses in the Delta Project area and would permit improved planning for later agricultural developments elsewhere. Delta baseline studies would assess hydrologic, meteorologic, soil, vegetation, and wildlife resources in the project area and in nearby, similar, undisturbed areas, both before and during project implementation.

Many state and federal agencies and units of the University of Alaska have the talents, equipment, and other resources to accomplish the varied elements of these ecosystem studies. None of these agencies presently has the funds to put these resources to work. Moreover, no means has been identified to assure that individual agency studies are part of a systematic program designed to meet objectives efficiently.

The following approach is proposed:

1) The Legislature should be asked to appropriate $150,000 for baseline studies critically needed in May-June 1977 (see attached list A).

2) The FY 78 budget should contain $90,000 for state share of baseline studies and project coordination in FY 78 (see attached list B and C)

3) The supplemental and FY 78 monies should be appropriated to the Department of Natural Resources for redistribution to state agencies as per lists A, B, and C.

4) The School of Agriculture and Land Resources Management should be designated as coordinator of research design, research activities, and reporting.

additional research participation and additional funding from appropriate federal agencies such as ARS, SCS, USGS, FS, and others (List C).

List A. Critical projects for May-June 1977.

1) Meteorologic data collection, especially wind force and direction, evaporation rates, ground temperatures (DNR) $4,000

2) Hydrologic studies: spring runoff patterns, water quality in Delta-Clearwater (DNR) $3,000

3) Spring mammal and bird population and distribution; fish distribution (ADFG) $3,000

TOTAL FY 77 $10,000

List B. FY 78 Baseline research

*1) Hydrologic studies (DNR) $20,000

*2) Soil characteristics, chemical residue levels (DEC) $15,000

3) Water quality Delta-Clearwater (DEC) $ 5,000

*4) Meteorologic studies (DNR) $20,000

*5) Vegetation mapping (DNR) $ 5,000

*6) Fish and wildlife populations (ADFG) $15,000

List C. FY 78 Coordination

1) Salary, travel, services $10,000

TOTAL FY 78 $90,000

*Studies to be done on Delta project area and control area.

JAY S. HAMMOND, GOVERNOR

DEPARTMENT OF LAW

OFFICE OF THE ATTORNEY GENERAL / POUCH K – STATE CAPITOL
JUNEAU 99811

March 7, 1978

The Honorable Alvin Osterback
Chairman, House Resources Committee
Alaska State House of Representatives
Capitol Building, Room 118
Juneau, Alaska 99801

Re: Comments on Senate floor amendment to SB 428 am (Page 3, lines 14-16)

Dear Representative Osterback:

The Commercial Fisheries Entry Commission has asked me to attend the House Resources Committee hearing this afternoon to offer testimony on a provision added to SB 428 am on the floor of the Senate. Unfortunately, an unexpected conflict in my schedule will prevent my attendance at the hearing today, so I am writing to briefly summarize my comments on the floor amendment. These comments were, for the most part, offered to the Senate Resc s Committee at a hearing on this bill on February 6, 1978 d discussed at some length before the committee declined to amend the bill along the lines of the floor amendment which narrowly passed.

The floor amendment at issue is Part II of Amendment 3 offered by Senator Huber, which substituted new language for AS 16.43.355(h) as follows:

> (h) The permit holder may appeal to the superior court for, and is entitled to, trial de novo of the board's action. Either party to the appeal may demand a jury trial. SB 428 am, Page 3, Lines 14-16; Senate Journal on page 241. (Emphasis added).

There are three problems with this amendment, in my view, and they are underlined above. First, it states that a permit holder, aggrieved by the administrative revocation of his permit because he supplied false information to the commission, is entitled to trial de novo on appeal. In many

appeals to court of administrative decisions, trial de novo is unnecessary, redundant, and wasteful of the time and resources of the court and both parties. A record containing all the evidence considered by the agency is before the court and, therefore, there is usually no reason to develop the evidence over again. AS 44.62.570(d) governs all appeals from administrative decisions not specifically the subject of a particular statute to the contrary. It gives the court discretion to augment the administrative record or hold a hearing (not "trial") de novo, if appropriate; i.e., if there is new relevant evidence that could not have been offered to the agency, or if relevant evidence was improperly excluded by the agency. This approach is much more efficient and flexible than that embodied in the above quoted floor amendment, which would allow permit holders to drag out appeals to the detriment and expense of all involved.

The second problem with the amendment is that it refers to "the board's action" (Page 3, Line 15) when the decision involved is that of the commission; i.e., the Commercial Fisheries Entry Commission.

The third problem is that the amendment states that either party to an appeal "may demand a jury trial" (Page 3, Line 16). This is a novel and inappropriate approach to appeals of administrative decisions. The only questions involved in such an appeal are legal issues (See AS 44.62.570(a) and (b)), whereas juries are only capable of considering factual issues. Nonetheless, the implication of the objectionable language of the floor amendment is that, if a party demands a jury trial, the court has no discretion and must grant one. This incongruity would render such appeals unworkable, if not impossible to conduct in practice.

In conclusion, I strongly suggest that the original language of AS 16.43.355(h) be reinstated in place of the Senate floor amendment at Page 3, Lines 14-16 of the bill. This would insure that appeals of permit revocation decisions would be conducted in the same time-tested manner as nearly all other appeals from administrative decisions, and in accord with AS 44.62.560 and .570 of the Administrative Procedure Act. It would be the most equitable and efficient means to provide for judicial review.

Alternatively, the following language would give an aggrieved permit holder a right to request a hearing de novo before a judge, even if there is no new or improperly excluded evidence, while foreclosing the totally inappropriate possibility of "jury trial."

I.

(h) A permit holder may appeal the commission's decision to a superior court. At the request of either party to an appeal, the court, in its discretion, may hold a hearing de novo.

I hope these comments are of some assistance in your consideration of this bill.

Sincerely,

AVRUM M. GROSS

STATE OF ALASKA

JAY S. HAMMOND, GOVERNOR

COMMERCIAL FISHERIES ENTRY COMMISSION

POUCH KB
JUNEAU, ALASKA 99811

March 6, 1978

The Honorable Alvin Osterback
Chairman, House Resources Committee
Alaska State House of Representatives
Capitol Bldg. - Room 118
Juneau, Alaska 99801

Dear Representative Osterback:

You have requested the comments of the Commercial Fisheries Entry Commission SB 428 am, which is currently before the House Resources Committee.

Upon second reading in the Senate, SB 428 was amended by several floor motions, about which we would submit the following for your committee's consideration:

The first amendment offered appears at page 2, line 5, beginning with the words "The hearing place..." (Senate Journal page 241). The purpose of this amendment is to provide that the revocation hearing take place at or near the place of residence of the permit holder. The Commission anticipates few revocation hearings and therefore it does not feel that these provisions are unduly oppressive. However, it may well be that the permit holder would desire to have a hearing at a place other than the Judicial District in which he resides. Inasmuch as the referenced section of SB 428 mandates a hearing within the permit holder's Judicial District, the Commission would suggest that the language of that section be amended to allow the permit holder to waive the mandatory requirements appearing on page 2, line 5-7. In this regard, the following language is offered:

> "Unless waived in writing, the hearing place shall be held within the Judicial District in which the permit holder resides for those residing in the State of Alaska. The hearing place shall be at the discretion of the Commission for those permit holders residing outside the State of Alaska;"

While this amendment will undoubtedly have some impact on the Commission's budget because of the added requirement for Commission and staff travel, possible transportation of records, etc., the exact magnitude cannot be determined at this time. The Commission would expect revocation hearings to be rare, and if that is the case attendant costs could probably be absorbed without a specific budgetary increase. Consequently, we recommend no change in the fiscal note accompanying this bill.

The second amendment offered is of two parts (Senate Journal pp. 241-2). Part I appears at page 1, line 21 of SB 428. That amendment added the word "materially" after the word "correct" appearing at line 21. The Senate Resource Committee version of SB 428 did not contain the word "materially." Inasmuch as the word "knowingly" appears in the language of section 16.43.355(a), it is felt by the Commission, that if a person intentionally submitted false information knowing of the falsehood, the use of the modifier "materially" served a superfluous purpose. In effect, what Part I of the amendment accomplishes is to attach culpability to big lies while protecting those lies which are small. A problem also exists in defining the term "materially" as it is necessarily vague. The Commission feels that where proscribed action can result in the revocation of a person's entry permit, the statute should be drawn without words of vagueness. In light of the gravity of permit revocation, it is only fair that a person be specifically apprised of the prohibited conduct.

The second portion of this floor amendment appears at page 3, line 14-16 of SB 428. SB 428 as passed by the Senate Resources Committee provided for an appeal of a Commission permit revocation decision pursuant to the Administrative Procedure Act. A discussion of the scope of that appeal process appears in the House Resource Committee file on SB 428. The floor amendment offered provides that all appeals of a Commission decision to revoke a permit shall be in the scope of a trial de novo. In reference to section (h) appearing at page 3, lines 14-16, Peter Froehlich of the Department of Law will attend the Tuesday committee meeting and offer testimony on those provisions.

While this amendment does not directly affect the Commission's function, it does place what may be excessive burdens upon the permit holder. A full trial over matters previously presented at an administrative hearing will result in added and repetitive costs to the permit holder due to the formal and extended nature of court trials. A

full trial, as opposed to oral arguments, would be more difficult to accommodate on the court calendar due to the amount of time a trial requires. This could result in delays of the resolution of the permit holder's case. It should also be noted that the appeal is from the "Commission's" decision rather than the "board's" decision.

In light of the foregoing, it is respectfully submitted that the interest of the fisherman would be furthered by reinstatement of the language originally appearing in the bill as passed out by the Senate Resource Committee:

h. "Judicial review of a commission determination under this section may be had in accordance with AS 44.62.560-44.62.570." (SB 428 as passed by the Senate Resources Committee page 3, lines 10-12.)

This would provide the fisherman with the option of an appeal to the courts at a lower cost and consuming less time than a full scale trial de novo, with or without a jury.

A third floor amendment was offered as section 5 of SB 428 and relates to the transfer of a permit after court ordered suspension of use privileges thereunder (Senate Journal pp. 242-3). The Commission supports this amendment.

The Commission concurs with the remainder of SB 428 am in the form in which it is now before you.

Thank you for the opportunity to comment on this bill. A member of the Commercial Fisheries Commission will be present when SB 428 am comes before the House Resources Committee, Tuesday March 7, 1978 at 1:30 p.m. to answer any questions.

Sincerely,

Allan Adasiak
Chairman

JAY S. HAMMOND, GOVERNOR

COMMERCIAL FISHERIES ENTRY COMMISSION

POUCH KB – JUNEAU 99811

February 3, 1978

The Honorable Kay Poland
Chairman, Senate Resources Committee
Alaska State Senate Pouch V
Juneau, Alaska 99811

Dear Senator Poland:

Re: SB 428

Regarding Senator Tillion's question regarding the term "willfully" as it appears in Sec. 3 of SB 428 at page 3 line 13 and page 4 line 2, we have contacted Dan Hickey at the Department of Law. Mr. Hickey indicated that the term "willfully" appearing at page 3 line 13 should be omitted. The term "willfully" as used at page 4 lines 2 and 6 should be deleted and the word "knowingly" substituted in its place. A letter from Ann Carpinetti of Mr. Hickey's office confirming the above-mentioned amendments should be received by your committee shortly, if it has not been received already.

The propriety of the term "other unavoidable hardship" appearing at page 1 line 12 has been addressed by Pete Froehlich, the Commission's Assistant Attorney General. His statements regarding this wording should have been received by you by now. If not, his letter will be forthcoming shortly.

The Commission will be happy to send a representative to the Monday, February 6, Committee meeting to answer any questions. The Commission has also requested that Pete Froehlich attend the meeting to answer any legal questions the Committee may wish to advance.

If there are any further questions or other service you may require, please feel free to contact me at the Commission. Your assistance in this matter is greatly appreciated. The Commissioners are presently out of town holding previously scheduled public hearings or I'm sure one of them would have

responded personally to the Committee's inquiries.

Respectfully,

David V. George
Legal Advisor

Re: SB 428, relating to commercial fishing permits

Dear Senator Poland:

It has come to my attention that a question arose at the January 31, 1978 hearing on this bill before your committee concerning the words "other unavoidable hardship" as used on page 1, line 12 of the bill. I am writing to share with you and the committee my thoughts on this language.

In my opinion, it is possible for the Commercial Fisheries Entry Commission to administer this criteria for temporary emergency transfer of permits both fairly and restrictively. The entire sentence containing the language at issue reads:

> The commission shall adopt regulations providing for the temporary emergency transfer of entry permits and interim use permits when illness, disability, death, or other unavoidable hardship prevents the permit holder from participating in the fisher." (Emphasis added).

In accordance with the well-established principle of statutory construction of ejusdem generis, where general words follow a listing of specific words, the general words are construed to embrace only circumstances similar in nature to those emumerated by the previous specific words. (See 2A Sands, Sutherland Statutory Construction, § 47.17, 4th Ed. 1973). Thus, "other unavoidable hardship" includes only circumstances similar in nature and gravity to illness, disability and death.

The phrase "unavoidable circumstances" is used in the Commission's regulations at 20 AAC 05.630(a)(5). In that context, the Commission has interpreted the phrase to mean circumstances (1) beyond one's control which prevent his participation in a fishery, (2) in frustration of his specific definite intent to do so, (3) despite all reasonably possible efforts. Applying the same meaning to "unavoidable hardship," along with the principle of ejusdem generis, results in the interpretation that only serious hardship beyond one's control which frustrates his specific and definite intent to participate in a fishery despite all reasonably possible efforts would be included within the scope of those words.

This seems to be a sufficiently narrow criteria for emergency transfers, while at the same time allowing for the myriad of possible types of unavoidable hardship which may properly justify such a transfer

I hope this letter is of some help in your further consideration of this bill. Please contact me if any questions on this matter remain.

Sincerely,

AVRUM M. GROSS

SB428 am

STATE OF ALASKA

JAY S. HAMMOND, GOVERNOR

DEPARTMENT OF LAW

CRIMINAL DIVISION

POUCH KC – STATE CAPITOL
JUNEAU, ALASKA 99811

February 6, 1978

The Honorable Kay Poland
Senator
State of Alaska
Pouch V
Juneau, Alaska 99811

Re: SB 428

Dear Senator Poland:

It is my understanding, after discussing Senate Bill 428 with a representative from the Commercial Entries Fisheries Commission, that your committee desired some comment from the Criminal Division of the Department of Law regarding the level of culpability under proposed amendments which would be required to be proven for conviction of certain prohibited acts under AS 16.43, which regulates entry into Alaska commercial fisheries.

Section 3 of Senate Bill 428 amends AS 16.43.360(a) in part by adding the requirement that a person be proved to have acted wilfully before he may be convicted of a statutory or regulatory violation of the chapter. (p.3, line 13). Presently no proof of the violator's state of mind is necessary under the language of the statute to establish a violation under AS 16.43.360(a). I would recommend deleting this portion of the amendment from the bill. It is difficult to establish a wilfull state of mind in prosecuting violations of regulatory provisions, and generally no conscious state of mind is constitutionally required for regulatory violations. Unless there is some other purpose for the amendment, I see no reason to make enforcement of AS 16.43 more difficult for the state.

Section 4 of the bill amends AS 16.43.360(b), which prohibits making a false statement of fact in an application

03-C7LH

for renewal of an interim use or entry permit. The proposed amendment in part adds the requirement that a person be proved to have acted wilfully (p. 4, lines 2 and 6) before he may be convicted of violating the subsection. Apparently the purpose of this amendment is to avoid the prosecution under the sub-section of persons who mistakenly mistate facts on an application or renewal form. I would recommend substituting "knowingly" for "wilfully" on page 11, lines 2 and 6. While both terms are similar and indicate a state of mind where the offender is aware that he or she is making a false statement, the use of "knowingly" is suggested because it is more precise and additionally, complies with the efforts by the Criminal Code Revision Subcommission to clarify and limit the terms used to define culpable mental states for criminal offenses. The proposed criminal code employs four mental states: intentional, knowing, reckless, and criminal negligence. If criminal prohibitions in other titles of the Alaska Statutes also use these states of mind, our statutes will be easier for people to understand and for the courts to interpret.

Thank you for the opportunity to comment on Senate Bill 428.

Very truly yours,

STATE of ALASKA

MEMORANDUM

TO: The Honorable Kay Poland
Chairman, Senate Resources Committee
Alaska State Senate

DATE : February 3, 1978

FROM: David V. George
Commission Legal Advisor
Commercial Fisheries Entry Commission

SUBJECT: Letter of Explanation of SB 428 re cost of proceeding under proposed section relating to administrative revocation of permit

Senator Huber has raised the question of whether judicial review under the Administrative Procedure Act (APA) as provided in Section 2 of SB 428, would act as a defacto financial prohibition to the permit holder's judicial review of the administrative agency's action. The sections of the APA brought into issue are AS 44.62.560 and 570. Copies of these sections are appended to this reply.

SB 428 Section 2 of the Administrative Level:

Due process requires that the proposed revocation of a permit be preceded by notice of the proposed action, and that the permit holder be afforded an opportunity to be heard prior to a resolution of the issues.

SB 428 Section 2 proposes a mechanism for administrative revocation of a permit by the Commercial Fisheries Entry Commission. This power does not presently exist. SB 428 could have stopped there and left the Commission with the obligation to adopt regulations regarding the procedure to be employed which were consistent with due process. However, because of the gravity of the potential consequences of permit revocation, the Commission felt it was appropriate for the Legislature to provide for an administrative revocation procedure which ensured the respect of the permit holder's due process rights. This legislative statement in effect says: "If you cheat you'll be punished, but we are going to make sure that the State plays by the rules so that it doesn't cheat you."

Before any administrative hearing then, the State must give notice of the proposed action. The permit holder is given the opportunity to appear at the hearing, with or without counsel, and give his side of the story. The responsibility of the permit holder at the hearing is no greater than that required at any administrative hearing--he may, if he wishes, show up and contest the proposed action.

Section 2(b)(2) imposes a greater burden on the State, however. Section 2(b)(2) requires that before the Commission acts it must have received an affidavit setting forth facts warranting permit revocation. The notice requirements of Section 2(b)(2-6) were drafted requiring specificity on everything reasonably necessary to apprise the permit holder of the potential loss involved and the basis of the proposed action. This specificity will help guarantee a meaningful hearing.

Under SB 428, the State is also required, when holding the hearing, to provide a hearing officer who will act as the presiding officer of the hearing. The hearing officer is at the expense of the State, but will employ his legal background to aid both the permit holder and the Commission in the presentation of necessary facts. It is believed that use of a hearing officer will help insure greater impartiality as well as a more concise record.

In review, the formal hearing procedures required by SB 428 at the administrative level impose additional burdens only upon the State and not upon the party against whom the action is proposed.

SB 428 Section 2 and the Judicial Level:

Senator Huber has expressed concern that affording judicial review of the Commission's decision pursuant to AS 44.62.560-570 might be financially unfeasible for the permit holder to pursue. It was apparently Senator Huber's concern that a "de novo" judicial review might lower the cost of this review were a less formal administrative hearing held at the outset.

Due process requires the right of judicial review of the Commission's decision, whether the administrative hearing is formal or informal. The nature of the review would ultimately dictate the amount of expense to the permit holder. The proper forum for review is the Superior Court. [AS 22.10.020, 22.15.050, 44.62.560]

Were the Superior Court to hold a "trial de novo", cost to the litigant would be greatly increased. Evidence submitted at the administrative hearing, whether it was formal or informal, would have to be reintroduced at a "trial de novo" subject to all appropriate objections and cross-examination rights of the State. Witnesses would have to appear, perhaps for the second time, and the litigant himself would be making a second appearance thus increasing travel expenses.

Pre-trial discovery may be in order requiring additional costs. Since a trial of three or four days is much more difficult to schedule on the court calendar than a half-day argument (as would be the case were there not a "trial de novo"), greater delay could be anticipated than if the case were one of simple appellate review. All told, an informal administrative hearing followed by a trial "de novo" at the judicial level would substantially increase, rather than decrease, the direct cost to the permit holder.

Review under AS 44.62.560 generally amounts to a review of the record of the administrative hearing to determine the propriety of the administrative action taken. An appellant is required to transmit the record of the administrative agency hearing to the Superior Court at his own cost and provide a cost bond on appeal. In the Commission's experience, for cases involving permit decisions, this is usually no more than $350.00. The Superior Court may, in its discretion, order additional evidence or require a hearing "de novo." [570(d)] Therefore, Sections 560 and 570 of AS 44.62 do provide for the possibility of a "de novo" hearing where justice requires.

Conclusion

Section 2 of SB 428 as proposed will increase the responsiveness of State government at the administrative level, while imposing no greater burden upon the permit holder than would a less formal administrative hearing procedure.

Judicial review of an administrative determination under AS 44.62.560 and 570 provides a much less costly avenue of review than would a mandatory trial "de novo." Notwithstanding, Sections 560 and 570 do allow sufficient discretion whereby the Superior Court may order a trial "de novo" where justice dictates.

It would therefore appear that SB 428 provides a fair method of civil revocation of an entry permit, which is also the least costly alternative available.

DVG:eb

requires the agency to make findings of fact regarding conditions which have changed since the imposition of the penalty at least one year previous. 1963 Ops. Att'y Gen., No. 10.

Sec. 44.62.560. Judicial review. (a) Judicial review by the superior court of a final administrative order may be had by filing a notice of appeal in accordance with the applicable rules of court governing appeals in civil matters. Except as otherwise provided in this section, the notice of appeal shall be filed within 30 days after the last day on which reconsideration can be ordered, and served on each party to the proceeding. The right to appeal is not affected by the failure to seek reconsideration before the agency.

(b) The complete record of the proceedings, or the parts of it which the appellant designates, shall be prepared by the agency. A copy shall be delivered to all parties participating in the appeal. The original shall be filed in the superior court within 30 days after the appellant pays the estimated cost of preparing the complete or designated record or files a corporate surety bond equal to the estimated cost.

(c) The complete record includes (1) the pleadings, (2) all notices and orders issued by the agency, (3) the proposed decision by a hearing officer, (4) the final decision, (5) a transcript of all testimony and proceedings, (6) the exhibits admitted or rejected, (7) the written evidence, and (8) all other documents in the case.

(d) Upon order of the superior court, appeals may be taken on the original record or parts of it. The record may be typewritten or duplicated by any standard process. Analogous rules of court governing appeals in civil matters shall be followed where this chapter is silent, and when not in conflict with this chapter.

(e) The superior court may enjoin agency action in excess of constitutional or statutory authority at any stage of an agency proceeding. If agency action is unlawfully withheld or unreasonably withheld, the superior court may compel the agency to initiate action. (§ 24 (ch 2) ch 143 SLA 1959)

Cross reference. — See note to AS 44.62.570.

This section and AS 44.62.570 prescribe the manner and scope of judicial review. Mobil Oil Corp. v. Local Boundary Comm'n, Sup. Ct. Op. No. 989 (File No. 1947), 518 P.2d 92 (1974).

But they do not address the form of an agency's determinations. Mobil Oil Corp. v. Local Boundary Comm'n, Sup. Ct. Op. No. 989 (File No. 1947), 518 P.2d 92 (1974).

When review is proper. — Review is proper where postponement of appellate review until a final judgment is entered by the superior court may result in injustice because of impairment of a legal right and where the order sought to be reviewed is of such substance and importance as to justify deviation from the normal appellate procedure by way of appeal and to require the immediate attention of this court. Mukluk Freight Lines v. Nabors Alas. Drilling, Inc., Sup. Ct. Op. No. 967 (File No. 1870), 516 P.2d 408 (1973).

When order is final. — An order by the trial court as a general rule is said to be final if it completely and finally disposes of the contested claims on their merits. Mukluk Freight Lines v. Nabors Alas. Drilling, Inc., Sup. Ct. Op. No. 967 (File No. 1870), 516 P.2d 408 (1973).

The term "finality" is subject to several definitions. Mukluk Freight Lines v. Nabors Alas. Drilling, Inc., Sup. Ct. Op. No. 967 (File No. 1870), 516 P.2d 408 (1973).

the superior court to assert jurisdiction and grant preliminary relief in a case where an agency has established a permanent rate. A.J. Industries, Inc. v. Alaska Pub. Serv. Comm'n, Sup. Ct. Op. No. 622 (File No. 1173), 470 P.2d 537 (1970), rev'd on other grounds on rehearing, 483 P.2d 198 (1971).

Appeal to court to obtain review and return to court to continue litigation are separate processes. — Appealing to a court for the purpose of obtaining review of an inferior tribunal's order and returning to a court with retained jurisdiction for the purpose of continuing litigation are separate and distinct legal processes. Greater Anchorage Area Borough v. City of Anchorage, Sup. Ct. Op. No. 856 (File No. 1569), 504 P.2d 1027 (1972).

Court apprising parties of right to seek review did not retain jurisdiction. — A lower court which merely apprised the parties of their rights to seek judicial review of an administrative adjudication under this chapter did not retain jurisdiction. Greater Anchorage Area Borough v. City of Anchorage, Sup. Ct. Op. No. 856 (File No. 1569), 504 P.2d 1027 (1972).

Applied in Wilson v. Employment Security Comm'n, 6 Alaska L.J. No. 3, p. 93 (March, 1968); Jager v. State, Sup. Ct. Op. No. 1161 (File No. 2057), 537 P.2d 1100 (1975); Moore v. State, Sup. Ct. Op. No. 1284 (File Nos. 2551, 2587), 553 P.2d 8 (1976).

Op. No. 917 (File No. 1613), 512 P.2d 887 (1973); Alaska Pub. Util. Comm'n v. Greater Anchorage Area Borough, Sup. Ct. Op. No. 1139 (File No. 2314), 534 P.2d 349 (1975).

Am. Jur. reference. — 42 Am. Jur., Public Administrative Law, § 185.

Sec. 44.62.570. Scope of review. (a) An appeal shall be heard by the superior court sitting without a jury.

(b) Inquiry in an appeal extends to the following questions: (1) whether the agency has proceeded without, or in excess of jurisdiction; (2) whether there was a fair hearing; and (3) whether there was a prejudicial abuse of discretion. Abuse of discretion is established if the agency has not proceeded in the manner required by law, the order or decision is not supported by the findings, or the findings are not supported by the evidence.

(c) The court may exercise its independent judgment on the evidence. If it is claimed that the findings are not supported by the evidence, abuse of discretion is established if the court determines that the findings are not supported by (1) the weight of the evidence, or (2) substantial evidence in the light of the whole record.

(d) The court may augment the agency record in whole or in part, or hold a hearing de novo. If the court finds that there is relevant evidence which, in the exercise of reasonable diligence, could not have been produced or which was improperly excluded at the hearing, the court may (1) enter judgment as provided in (e) of this section and remand the case to be reconsidered in the light of that evidence; or (2) admit the evidence at the appellate hearing without remanding the case.

(e) The court shall enter judgment setting aside, modifying, remanding, or affirming the order or decision, without limiting or controlling in any way the discretion legally vested in the agency.

(f) The court in which proceedings under this section are started may stay the operation of the administrative order or decision until (1) the

court enters judgment, (2) a notice of further appeal from the judgment is filed, or (3) the time for filing the notice of appeal expires.

(g) No stay may be imposed or continued if the court is satisfied that it is against the public interest.

(h) If further appeal is taken, the supreme court may, in its discretion, stay the superior court judgment or agency order.

(i) If a final administrative order or decision is the subject of a proceeding under this section, and the appeal is filed while the penalty imposed is in effect, finishing or complying with the penalty imposed by the administrative agency during the pendency of the proceeding does not make the determination moot. (§ 25 (ch 2) ch 143 SLA 1959)

This section and AS 44.62.560 prescribe the manner and scope of judicial review. Mobil Oil Corp. v. Local Boundary Comm'n, Sup. Ct. Op. No. 989 (File No. 1947), 518 P.2d 92 (1974).

But they do not address the form of an agency's determinations. Mobil Oil Corp. v. Local Boundary Comm'n, Sup. Ct. Op. No. 989 (File No. 1947), 518 P.2d 92 (1974).

Questions for review. — One type of administrative decision on questions of law involves questions in which the particularized experience and knowledge of the administrative personnel goes into the determination. When this type of question is presented to the court for review, deference should be given to the administrative interpretation, since the expertise of the agency would be of material assistance to the court. The other kind of case presents questions of law in which knowledge and experience in the industry affords little guidance toward a proper consideration of the legal issues. These cases usually concern statutory interpretation or other analysis of legal relationships about which courts have specialized knowledge and experience. Consequently, courts are at least as capable of deciding this kind of question as an administrative agency. Swindel v. Kelly, Sup. Ct. Op. No. 812 (File Nos. 1416, 1418), 499 P.2d 291 (1972).

Leasing decisions of the division of lands and Department of Natural Resources are subject to judicial review. Such judicial review would be governed by the relevant provisions of the Administrative Procedure Act (AS 44.62). Swindel v. Kelly, Sup. Ct. Op. No. 812 (File Nos. 1416, 1418), 499 P.2d 291 (1972).

Four principal standards of review. — In interpreting this section the supreme court has recognized at least four principal standards of review of administrative decisions. These are the "substantial evidence test" for questions of fact; the "reasonable basis test" for questions of law involving agency expertise; the "substitution of judgment test" for questions of law where no expertise is involved; and the "reasonable and not arbitrary test" for review of administrative regulations. Jager v. State, Sup. Ct. Op. No. 1161 (File No. 2057), 537 P.2d 1100 (1975).

The reasonable basis approach should be used for the most part in cases concerning administrative expertise as to either complex subject matter or fundamental policy formulations. Swindel v. Kelly, Sup. Ct. Op. No. 812 (File Nos. 1416, 1418), 499 P.2d 291 (1972).

Application of the reasonable basis test is extremely useful where the administrative action under review resembles executive as opposed to legislative or judicial activity, where the decision under review clearly has nothing to do with the agency's rule making function. Swindel v. Kelly, Sup. Ct. Op. No. 812 (File Nos. 1416, 1418), 499 P.2d 291 (1972).

This section is made applicable to review of final orders of the Public Utilities Commission by AS 42.05.551. Jager v. State, Sup. Ct. Op. No. 1161 (File No. 2057), 537 P.2d 1100 (1975).

Whether proposed utility rates were designed to and could meet competition, shift sales of gas from winter to summer, and achieve interruptibility, are all questions of fact of the type traditionally reviewed under a substantial evidence standard. Jager v. State, Sup. Ct. Op. No. 1161 (File No. 2057), 537 P.2d 1100 (1975).

Public Utilities Commission's decision whether to conduct a rate investigation is similar to the type of decision involving agency expertise in a mixed law and fact setting subject to the "reasonable basis" standard of review. Jager v. State, Sup. Ct. Op. No. 1161 (File No. 2057), 537 P.2d 1100 (1975).

OTHER RECOMMENDATIONS:

Chairman

H 60 (rev. 6/77)

POSITION PAPER ON

CS FOR SENATE BILL NO. 477

An Act entitled: "An Act relating to licensing of sport fishing, hunting and trapping."

This bill would provide privileged access to Alaska's fish and game resources through 25¢ hunting, fishing, and trapping licenses to persons whose need for same included both financial hardship, and substantial use of these resources for personal use as food.

This department would be required to provide to the Department of Revenue a sum equal to the difference in revenues received for the special licenses, and the normal cost of $25, for each year this provision was in effect.

The department supports the concepts contained in this legislation, as it would appear to benefit persons with legitimate needs, while restricting widespread and indiscriminate participation.

There would be no administrative impact on this department. The amount of general funds required to reimburse the Department of Revenue for the cost of subsidizing the purchase price of the licenses themselves however, is not budgeted and would be needed if the subsidy is to be made available without jeopardizing current programs.

At current rates of participation, 6,000 such licenses could reasonably be expected to be sold by Department of Revenue agents, if no restrictive policies were implemented in FY79.

Therefore, the Department estimates a maximum subsidy amount of $148,500. As the impact of future regulations for this program cannot readily be predicted from our information, a lesser amount may suffice, however we would not wish to speculate in this area and would therefore request funds for the current projection of 6,000 license subsidies.

Dear Representative Osterback:

We were pleased to learn that the Alaska Legislature is considering a resolution which would permit your state to become a member of the Western States Legislative Forestry Task Force.

I thought perhaps the enclosed information might be of help to you in considering membership. Enclosed is a copy of a letter to Representative Mike Miller, as well as our 1976 Annual Report, a recent report prepared by Chairman Steen, and a presentation made by the Task Force on the RARE II issue to the Governors of our member states and Ted Smith of your state's Department of Natural Resources.

The Task Force would welcome Alaska as a member, and if we can be of any assistance to you, please do not hesitate to let us know.

Sincerely,

Richard A. Robyn

Honorable Robert Ziegler
Alaska State Senator
Box 7500
Ketchikan, Ak. 99901

Dear Senator Ziegler:

During the Directors' meeting in Fairbanks on July 22, 1977, the most important item of statewide interest was Alaska Loggers Association unanimous endorsement of proposed State of Alaska participation in the Western State Legislative Task Force. The enclosures supply the purposes of the Task Force.

It follows that Alaska Loggers Association desires that legislative support be given this program, hence you and the other members of the Southeastern delegation are being urged to introduce and support enabling legislation.

Sincerely,

Donald A. Bell

Manager

June 6, 1977

Mr. Donald A. Bell, Secretary Manager
Alaska Loggers Association
111 Stedman Street
Ketchikan, Alaska 99901

Dear Don:

It was good to visit with you briefly by phone regarding the Western States Legislative Forestry Task Force and to learn of your interest in possibly supporting participation by Alaska.

The WSLFTF consists of two Senators and two Representatives respectively, from California, Oregon, Washington, Idaho and Montana. These twenty members are appointed by the Senate and House Leadership of each state.

Each legislative session, which in Oregon is every two years, the legislature must pass a measure which authorizes continued participation in the T.F. The other four states have adopted resolutions similar to Oregon's.

In addition to the Joint Resolution each state adopts an appropriation bill to finance expenses of the T.F. The dollar amount depends on a formula based on the state budget plus the volume of available standing timber. Current assessment allocations are California $37,000, Oregon $16,000, Washington $14,000, Idaho $5000 and Montana $4000; these are round figures. A new Executive Secretary was hired at the meeting in Burlingame on June 4. He is Dick Robyn and he maintains the T.F. office at 1107 9th Street, Sacramento, California 95814, phone (916) 322-4395.

The T.F. has concerned itself with a wide range of Western Forestry issues including major legislation affecting forestry, USFS management budgets, impacts of NEP Act, Endangered Species, Wilderness and land withdrawals, SETA Funding to the states, reforestation, Monongahela and the Zieske case, Sections 208, 303 and 404 and their impacts on the states, in-lieu payments, Resources Planning Act, BLM Organic Act, the National Forest Management Act including a T.F. trip to Congress which was helpful to the cause, Clarke-McNary appropriations, Western insect problems, the drought, Grizzly Bear range set-asides, roadless areas, sealed bidding, etc.

The T.F. has developed numerous resolutions and followed through with many contacts to Congress and the Administrations. The T.F. has worked hard at representing the Western viewpoint on many issues.

On several occasions T.F. members have expressed an interest in Alaskan participation and it came up again last week at the California meeting. The consensus was that Alaska should be invited to participate. My contact with you is intended to provide background information so your associations can make a judgement about supporting enabling legislation in your state.

One other item, twenty-three western forestry oriented associations comprise the Western Forest Resource Council. The Council meets on call of the chairman to consider forestry matters affecting the west. The Council considers liaison with the WSLFTF to be a matter of high priority. For several years my Board of Trustees has authorized me to serve as the liaison man with the T.F. as requested by the Council and it has been a rewarding experience. I believe the T.F. has been very helpful on many western forestry problems of mutual interest to Council members and can be even more effective in the future.

Enclosed are a number of documents which may be helpful as you review this matter.

Sincerely,

Jim Corlett

House Joint Resolution 2

Sponsored by Representative BYERS, Senators HALLOCK, THORNE

SUMMARY

The following summary is not prepared by the sponsors of the measure and is not a part of the body thereof subject to consideration by the Legislative Assembly. It is an editor's brief statement of the essential features of the measure as introduced.

Directs President of Senate and Speaker of House to appoint two Senators and two Representatives to serve on Western States Forestry Task Force.

NOTE: Matter in bold face in an amended section is new matter [*italic and bracketed*] is existing law to be omitted. complete new sections begin with SECTION

HOUSE JOINT RESOLUTION 2

Whereas the forest industries of the Western States play a vital role in the economic development of these states; and

Whereas there is an obvious need for developing means for protecting and fostering these forest industries so as to maximize yield while protecting the resource for future generations; and

Whereas the subjects that require interstate cooperation include but are not limited to insect infestations, conservation, production and marketing, all of which know no state boundaries; now, therefore,

Be It Resolved by the Legislative Assembly of the State of Oregon:

(1) The President of the Senate and the Speaker of the House of Representatives join with the presiding officers of the legislatures of Washington, Idaho, Montana and California, each in appointing two Senators and two Representatives to represent Oregon on the Western States Forestry Task Force, which shall operate as a clearinghouse for opinion from all the various interests involved in the Western States forest industries, and which shall include among its duties the duty to report to the legislatures of the participating states and to the state delegations in the United States Congress concerning means of protecting and fostering the forest industries of the participating states.

(2) Copies of this resolution shall be sent to the presiding officers of the legislatures of Washington, Idaho, Montana and California.

WILDERNESS OVERKILL

A supplement to the APA Management Report spotlighting preservationist efforts to set aside more wilderness than the nation can afford.

No. 6

July 21, 1977

National Support Needed For S. 1787...

The Only Alaska Land Management Bill That Fairly Reconciles Environmental & Economic Interests!

When Alaska was ceded to the United States by Russia 110 years ago, in exchange for the then staggering sum of $7.2 million, many citizens called the acquisition "Seward's Folly," after the Secretary of State who negotiated the purchase.

In recent years, particularly since the attainment of statehood in 1959, most Americans have become aware that in addition to its strategic significance, the immense Alaskan land and water mass, 586,000 square miles in area, is a priceless treasury of scenic grandeur and diverse natural resources of a magnitude that has not even begun to be adequately inventoried.

Alaska is a virtual sub-Continent – a state one-fifth the size of the rest of the nation. In the national interest, it's essential that narrow preservationist-backed legislative proposals affecting the state's natural resources should be set aside and more balanced solutions found, such as S. 1787. The most devastating of the environmentalist-inspired proposals, H.R. 39, would lock up as much as one-third of Alaska – or more than Illinois, Indiana, Wisconsin and Michigan combined. (Map drawn by the Cooperative Extension Service, University of Alaska)

If the far-sighted William Henry Seward were alive today, we think he would approve of this statement by Alaska's Senator Ted Stevens, to the U.S. Senate on June 30, 1977:

"Alaska is at the same time the nation's final storehouse of wilderness and resource values. Natural wonders abound and scores of species of wildlife flourish in unparalleled numbers throughout the state. Natural resources also are found in quantities not available elsewhere in the nation. Thus, Alaska is called upon to be America's principal source of supply for natural resources and also its primary showcase for wilderness and wildlife values. These demands cannot be met to everyone's satisfaction, but this does not mean that a reasonable balance between both goals cannot be struck. That balance can be found, and it is up to Congress to find it."

During recent months, in response to this challenge, Congress has been overwhelmed by legislative proposals that could deeply affect Alaska's future, as well as the national interest, for generations to come.

It is vital for Americans to realize that the great majority of these proposals—in particular H.R. 39, the Alaska National Interest Lands Conservation Act drafted by Congressman Morris Udall (D-Ariz.) with the fervent support of environmental groups—are one-sided efforts to achieve wilderness designation for vast areas of Alaska, well knowing that this designation denies consideration of numerous other values.

H.R. 39 and its counterparts will not achieve the true balance sought by Senator Stevens for the disposition of what has been called the d-2 lands issue.*

THE ONE MEASURE THAT MAKES A SERIOUS EFFORT TO REACH THIS BALANCE IS S. 1787, THE ALASKA NATIONAL INTEREST LANDS ACT DEVELOPED BY SENATOR STEVENS, ALASKA GOVERNOR JAY HAMMOND AND THE STATE'S ONE CONGRESSMAN, DON YOUNG.

Unlike H.R. 39—which would lock up about 150 million of the best of Alaska's 350 million acres as a "no development" zone and playground for wilderness enthusiasts—S. 1787 responsibly addresses the need for flexible management of Alaskan lands, fairly acknowledging the aspirations of native groups, business and tourist interests, resource development interests, and preservation groups.

*Section 17 (d) (2) of the Alaska Native Claims Settlement Act authorized the Secretary of the Interior to withdraw up to 80 million acres of vacant, unreserved and unappropriated federal public lands for study as potential additions to the national parks, wildlife refuges, forests, and wild and scenic rivers systems. Congress authorized these withdrawals to continue through 1978, at which time they will terminate by operation of law. Thus, unless this time frame is extended, Congress has approximately 18 months to make a "final" decision on the d-2 lands issue—an issue aggressively seized by preservatonist organizations and their supporters in the "lower 48" states as an opportunity to rush through Congress more legislation meeting narrow single purpose wilderness goals.

S. 1787 Offers Imaginative Plan For Cooperative Land Management

The key to S. 1787, introduced on the Senate floor June 30 by Senator Stevens, is a working partnership between federal, state and private land management that will enable Alaska to avoid the virtual downgrading to a "poor relation" territorial status that would accompany the enactment of the Udall and other extreme preservationist proposals.

It provides a realistic framework for safeguarding Alaska's unique natural heritage while encouraging a carefully considered approach to the continued development of resources for the benefit of both the regional and national economies.

The Stevens proposal suggests the addition of 25 million acres of new national parks, wildlife refuges, national forests and wild and scenic rivers. Included in these additions would be two new park units, the Gates of the Arctic and Wrangell-St. Elias National Parks, located in the central Brooks Range and South Central Alaska respectively.

TIMBER POTENTIAL RECOGNIZED

The proposal would also establish two major national forests in Alaska's interior. The areas comprising the Porcupine and Yukon Flats National Forests have been identified as containing high potential for agricultural development and timber harvest, and the establishment of these areas as national forests would allow this potential to be developed.

An imaginative aspect of S. 1787 would be the designation of 56 million acres of other lands, withdrawn under Section 17 (d) (2) as Federal Cooperative Lands to be managed by existing federal agencies, including the National Park Service, the U.S. Fish and Wildlife Service, and the U.S. Forest Service.

These lands would be managed in conjunction with the lands designated for cooperative management by the State of Alaska and private landowners under the classification authority of an Alaska Land Classification Commission that would be established by the legislation. In effect, the Commission would

function as a planning and zoning body for lands under its jurisdiction. This would allow for cooperative management and protection of entire ecosystems, avoiding piecemeal and conflicting management of land as often experienced in the "lower 48" states.

Sponsors of the legislation point out that there is considerable incentive for the State of Alaska and private landowners to dedicate lands to cooperative management. The summary of S. 1787 notes that without the dedication of a substantial amount of state lands, the cooperative management program will not be created and lands would continue to be managed by the federal government without any Alaskan participation in management and classification decisions.

It has been proposed that the eight-member Commission should consist of four Commissioners appointed by the President of the United States and four by the Governor of the State of Alaska.

S. 1787 is proof that Alaskans' plea to be heard in the Congress deserves the immediate attention and support of legislators—and citizens everywhere. *This is responsible legislation*—generously framed to allow the rest of America a full partnership role with local citizens, rather than a dictatorial role—in the management of a state that is one-fifth the size of the rest of the nation.

SPECIAL TRUST FUND PROPOSED

The measure includes the innovative and meritorious suggestion that funds derived from the cooperative management of federal lands in Alaska be placed in a special trust fund to be used exclusively for the purchase of private lands in the other 49 states which have been or will be designated as part of the national park, wildlife refuge or wild and scenic rivers system. There is a backlog of such lands, and sufficient funds for their purchase are not anticipated to be appropriated by Congress in the near future.

Alaska

LAND AND WATER

- Alaska has 375,303,000 acres of land and inland waters

OIL AND GAS

- Alaska contains 29.4 percent of *all* U.S. domestic *proven* reserves of oil
- The Trans Alaskan pipeline will provide 1.2 million barrels of oil a day or *8.9 percent of our total U.S. daily consumption*
- Alaska has 11.8 percent of *all* U.S. *domestic* proven gas reserves
- Alaska has 170 million acres of sedimentary basin (potential oil and gas deposits)

HYDRO-ELECTRIC POTENTIAL

- Alaska has 76 sites with potential for 171,839 million Kwy/year

MINERALS

- Immense deposits throughout the State. According to the Bureau of Mines, 28 out of 37 mineral commodities *now imported* into the U.S. are found in Alaska.

AGRICULTURE

- Alaska has 20 million acres with potential for agricultural crops

FOREST PRODUCTS

- Alaska has approximately 106 million acres of forest lands, including about 28 million acres of commercial grade timber

. . .AND MUCH MORE THAT HASN'T EVEN BEEN FOUND YET!

H.R. 39 Hits At S.E. Alaska's No.1 Industry

Land withdrawals proposed in H.R. 39 would do grievous harm to timber harvesting in Southeast Alaska, where the state's wood products industry is concentrated.

Industry spokesmen strongly refute nonsensical but widely publicized preservationist claims that the Tongass National Forest is being destroyed by logging. In the 16-million acre forest, Forest Service plans call for timber harvest on 4 million acres. In addition, just 280,000 acres have been harvested since 1903. This is 4.6 percent of the commercial forest land or 1.8 percent of the total national forest. Moreover, the harvested areas contain some of the most vigorously growing new stands of timber to be found anywhere in the United States.

The point is that in the Tongass National Forest there is an appropriate balance between economy and environment.

Need To Correct Hearings Imbalance

Hearings on the Udall bill, H.R. 39, were held at several locations in the "lower 48" states earlier this spring and summer. The vociferous and superbly drilled preservationist minority was quite successful in dominating testimony at several of the hearings. As the hearings process continues in Alaska through July and August, the need becomes more urgent for correction of this misleading imbalance, and for total rejection of H.R. 39 and other patently inequitable approaches!

As Senator Stevens has stated, "only now are we realizing the immensity of the decision which we created for ourselves in the passage of Section 17 (d)(2). As we approach consideration of this decision in earnest, members of Congress on both sides of the Hill are beginning to realize the tremendous burden that has been placed on us by an artificial deadline. *While there may be a need to provide some immediate protection for some d-2 lands, it is becoming obvious that it is neither necessary nor wise to make a final decision for all time on all d-2 lands in Alaska.*"

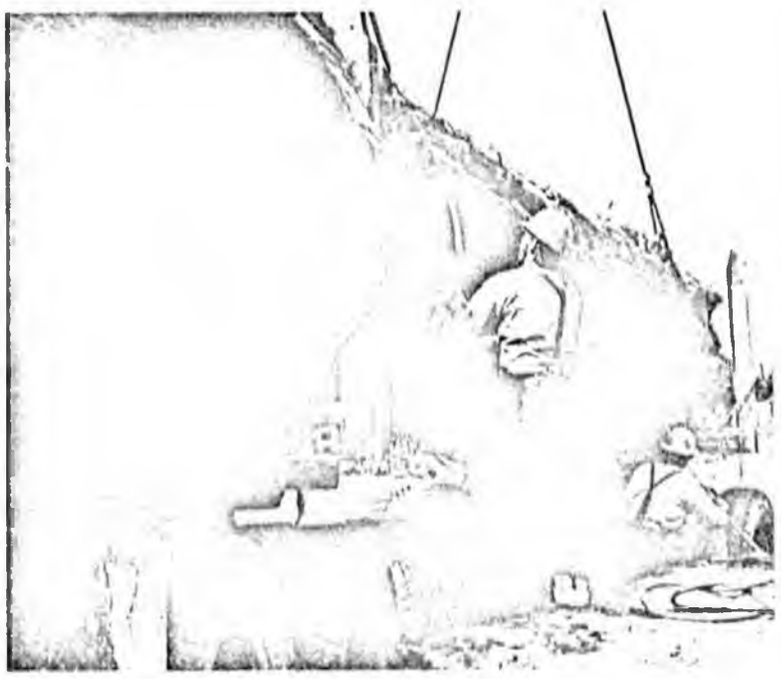
The heart of the d-2 question, Senator Stevens reminds us, is that Congress is called upon to pass final judgment on an area exceeding the combined size of the states of California and Washington, and over five times the size of the acreage presently under the administration of the National Park System created by Congress over the past 100 years.

HASTY ACTION UNDESIRABLE

The issue is of such importance not only to Alaska but to the entire nation that it demands careful, measured action rather than hasty overkill—action that will assure flexible management responsive to many needs.

The American Plywood Association wholeheartedly endorses Senator Stevens' view that S. 1787 strikes the right balance between the dual goals of environmental protection and providing for appropriate and necessary development of Alaska's resources. We strongly urge all our readers to join in the efforts to assure passage of Alaska land management legislation embodying these wise and eminently fair principles, in preference to the self-centered and economically devastating prescriptions of environmental special interest groups.

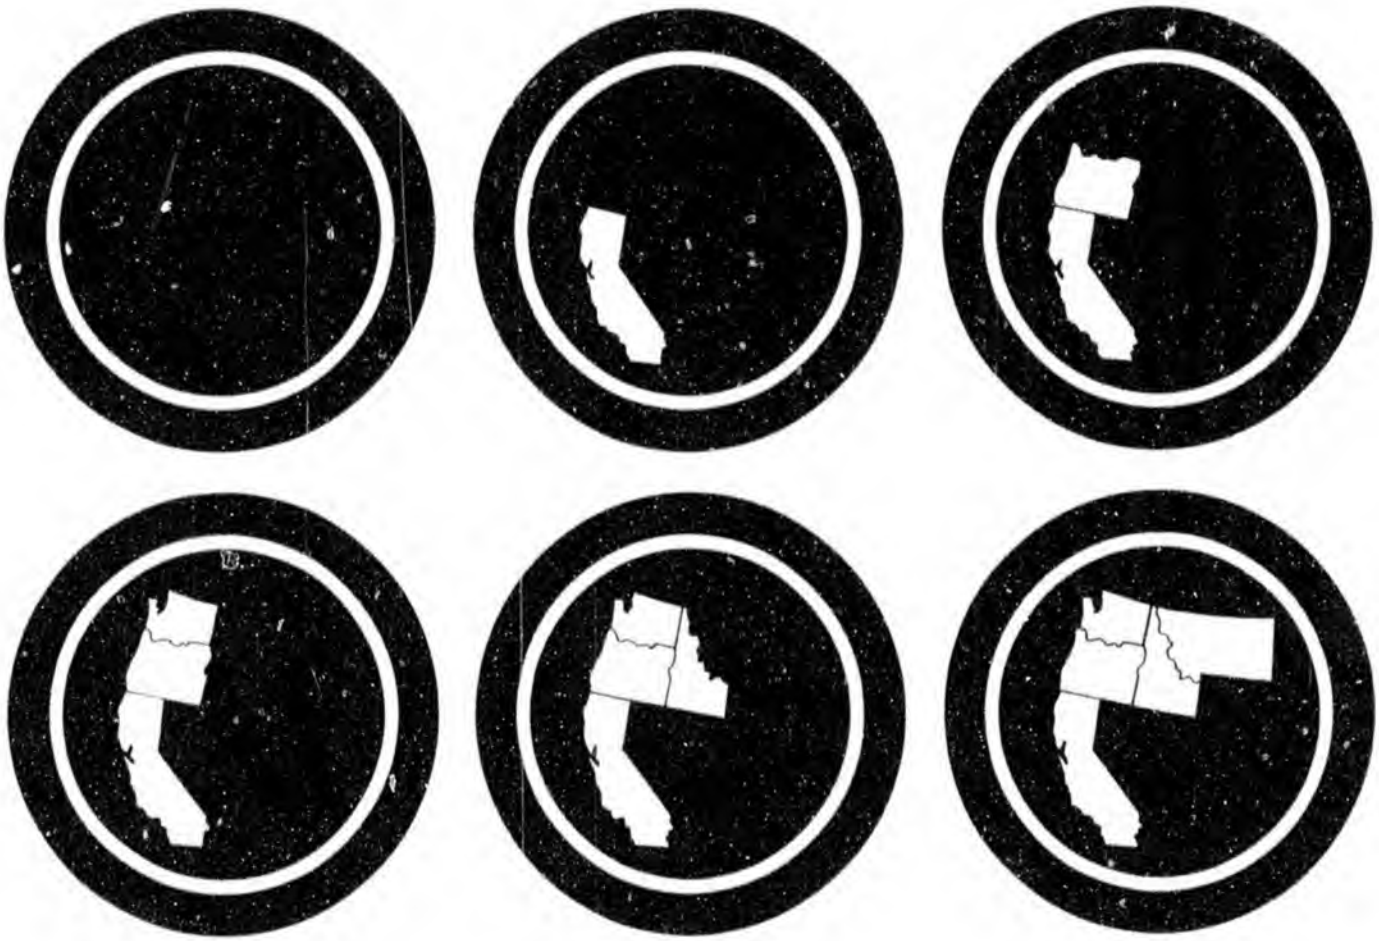
PLEASE WRITE YOUR CONGRESSMAN TODAY IN SUPPORT OF S. 1787—AND IN NO UNCERTAIN TERMS TELL THE HOUSE SUBCOMMITTEE ON GENERAL OVERSIGHT AND ALASKA LANDS (LISTED ON PAGE 5) THAT H.R. 39, H.R. 3454, AND OTHER ONE-SIDED PROPOSALS DESERVE DECENT BUT IMMEDIATE BURIAL!



Harvesting the over-mature, dead and dying coastal forests of Southeast Alaska allows for the growth of healthier trees, as well as providing jobs in the timber industry and badly needed wood products for the public. (Pictures courtesy Alaska Loggers Association)

WESTERN STATES LEGISLATIVE
FORESTRY TASK FORCE
1st ANNUAL REPORT

DECEMBER 15, 1976



MEMBERS - WESTERN STATES LEGISLATIVE FORESTRY TASK FORCE

CHAIRMAN, Senator Randolph Collier
VICE-CHAIRMAN, Senator Ted Hallock

CALIFORNIA

Senator Randolph Collier *
Senator Lou Cusanovich
Assemblyman Barry Keene
Assemblywoman Pauline Davis *

IDAHO

Senator J. Wilson Steen
Senator Kermit Kiebert
Representative Israel Merrill *
Representative Gary Ingram

MONTANA

Senator Joe Roberts
Senator Bob Brown
Representative William Gwynn *
Representative Joe Magone *

OREGON

Senator Ted Hallock
Senator Mike Thorne
Representative Dick Bonebrake *
Representative Bud Byers

WASHINGTON

Senator Lowell Peterson
Senator Harry Lewis *
Representative John Martinis
Representative Art Moreau

EXECUTIVE SECTRETARY

Dean Cromwell

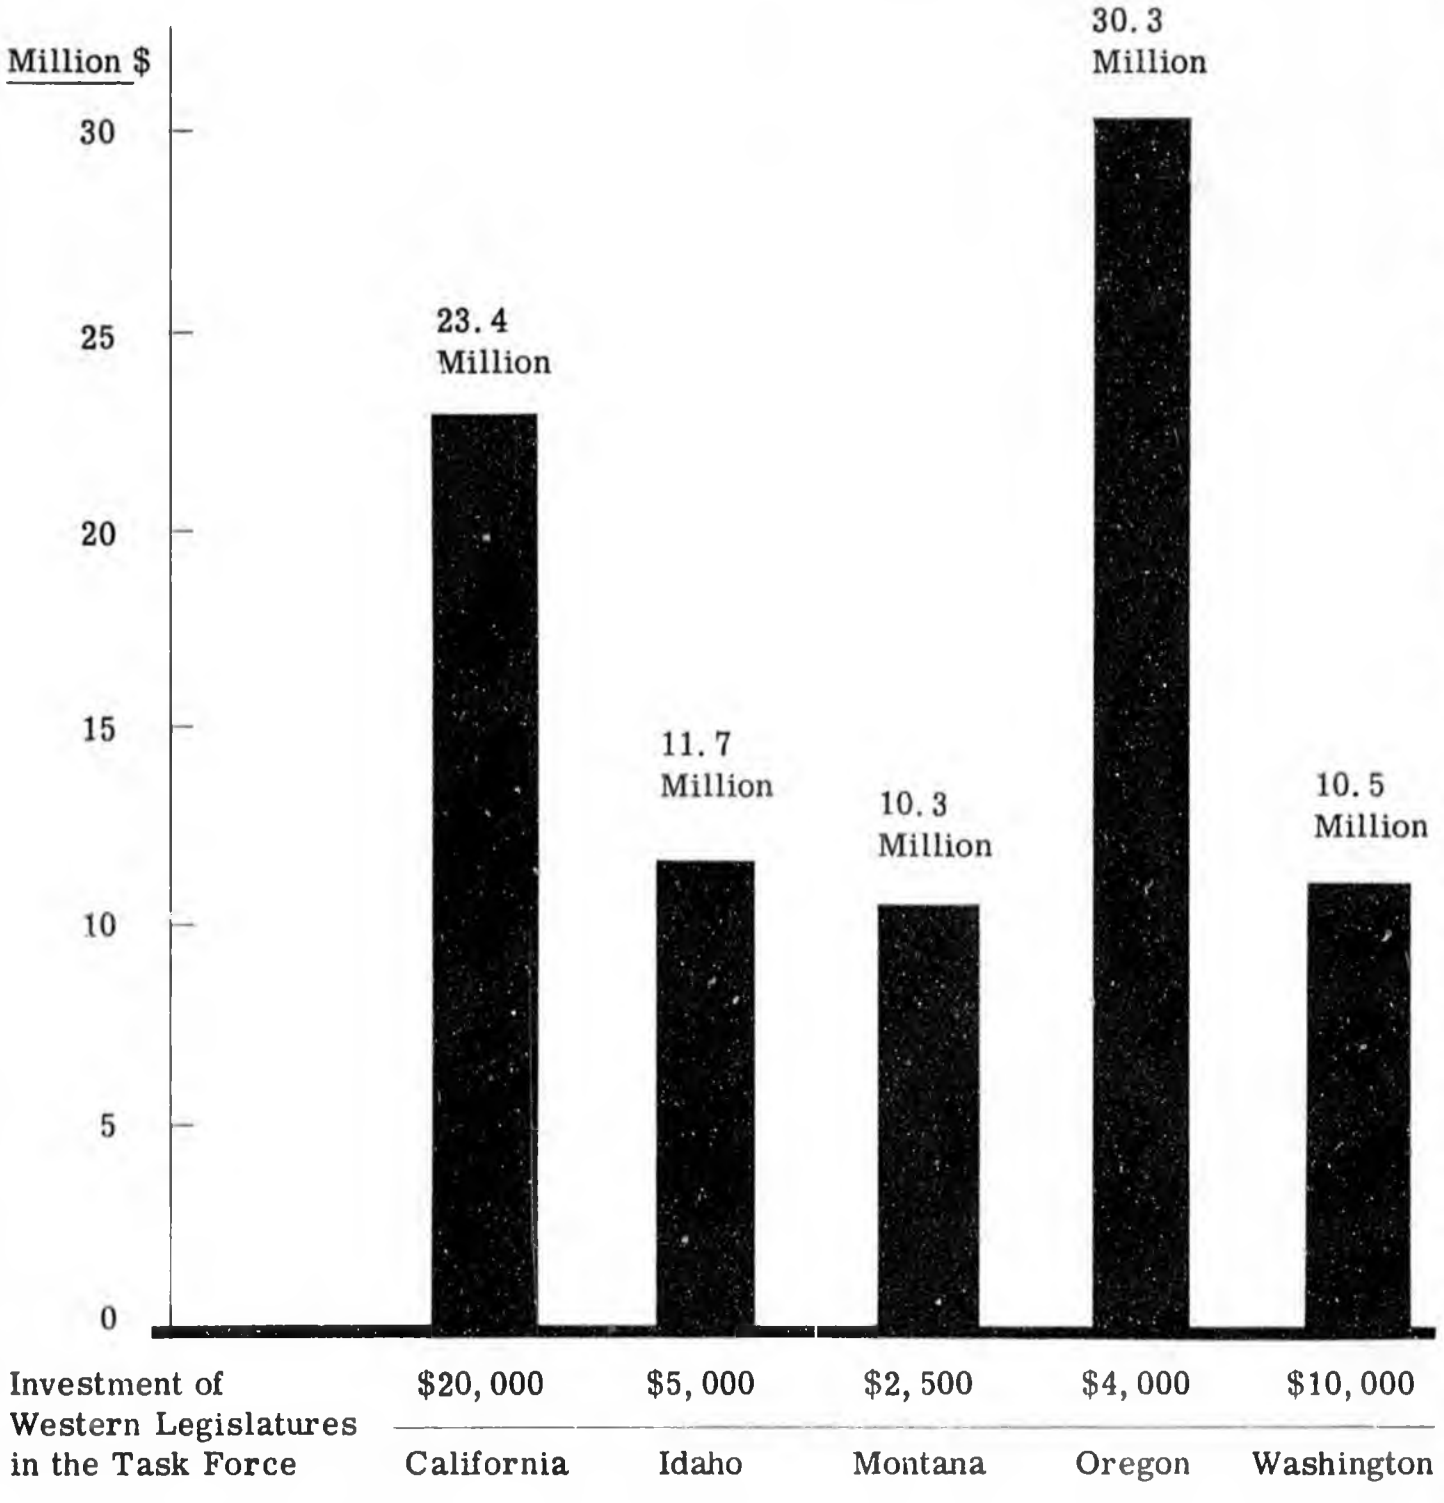
TASK FORCE OFFICE

Suite 614, Forum Building
1107 Ninth Street
Sacramento, CA. 95814

* These members worked on the Task Force until January 1977, but for various reasons will be replaced for the next biennium.

TASK FORCE IN ACTION *

Small legislative investment helped influence increases in federal dollars paid to local governments in the Western States:



* Increase in federal dollars.

OVERVIEW

Mandate

- Monitor policy of federal agencies and Congress with respect to public resource lands of the West.
- Develop coordinated actions to assure maximum public benefit from management of Western forest resources.
- Develop and coordinate new forestry programs of mutual benefits to the Western States.

Current Programs

- Review proposed congressional forestry legislation.
- Review federal agency actions affecting Western public resource land.
- Review federal agency program and budget needs affecting forestry in the West.
- Review new state forestry programs which could be of mutual benefit.
- Review forestry program proposals of various interest groups and adapt such proposals to the benefit of the Western States.

Action in 1976

Via resolution or testimony in person in Washington, D. C., the Task Force called on Congress to:

- Firmly set into law the authorization to sell timber in national forests and to give the Forest Service flexibility to manage timber subject to environmentally sound guidelines.
- Increased payments to local governments to offset tax losses and larger service requirements caused by federal land ownership.
- Give states maximum control in developing water quality standards on forest lands.
- Provide direction to on-going land use planning in the national forests by establishing national priorities and use goals.

At a specific program level, the Task Force urged Congress to:

- Maintain present levels of federal funds allocated to federal-state cooperative fire protection programs.
- Accelerate access roading in selected areas of the national forests.
- Promote programs for greater wood fiber availability via utilization and reforestation.
- Focus attention on programs to diminish damage caused by forest insects and to increase salvage of

the damaged trees.

Congressional Response

Congressional actions in which the Task Force played a role:

- National Forest Management Act passed to permit sale of timber from national forests and to give U.S. Forest Service management flexibility.

- Payments in Lieu of Taxes Act passed, authorizing about $37.2 million which could be paid to local governments in the member states with qualifying federal lands; legislation passed authorizing an increase approximately $49 million in member states' share of National Forest timber sales receipts.

- Legislation clarifying role of states in setting water quality standards passed both houses, died in conference committee.

- Legislation passed requiring additional information upon which Congress can establish priorities for the national forests; however, no hearings were held to discuss programs that have been recommended for the national forests.

At a program level:

- Cooperative fire fighting funding largely maintained, preserving approximately $3 million for the member states.

- Congress increased federal share of road construction allowing for possibly more access roading.

- Legislation passed calling for greater wood fiber utilization and authorizing up to $200 million for reforestation.

- Congress ordered completion of a Forest Service study on forest insect problems in the West to provide direction and expected funding levels of programs to reduce the impact of forest insects.

CREATION OF THE TASK FORCE

The clash of concerns over jobs and the environment is seldom more clear or vocal than in the debates over the use of the forest resources in the West. This is not surprising. Harvesting and processing of timber, from both public and private land, comprises a mainstay of the economic well-being of thousands of people. At the same time timberland, especially that in the public domain, is subject to intense multiple use pressure. Many of these uses conflict with harvesting timber or serve to point out environmental damage that occurs through such operations.

Since it can pass laws affecting land use and because it owns a substantial amount of the forest resource in the West, the federal government strongly influences the region's welfare. Seemingly minor changes in federal policies can set off major controversies between regional and even national interests and, in turn, become major policy issues.

There seems to be little likelihood that these issues will diminish. By 2020, according to an assessment made under the Resource Planning Act:

- All major recreation activities will increase 50-400%.
- Demand for range forage will increase by 60%.
- Consumptive use of water will rise by 50%.
- Use of wildlife and fish resources will grow greatly.
- Timber demand will double.

The national forests and private timberlands will be under heavy pressure to meet these demands.

Yet, it is critical that we recognize the need to preserve for future generations the freedom of choice to meet new and developing needs. Under the pressure to meet today's growing demands, there is the danger of destroying future options by committing forest lands to uses with irrevocable impacts on the land.

As the forest resource is vitally important to the West and as federal policies directly affect this resource, it is essential that the Western States play a stronger role in the development of federal policies affecting public and private resource lands. This need compelled the state legislatures of California, Idaho, Montana, Oregon and Washington to form, from within their memberships, the Western States Legislative Forestry Task Force in 1974. The Task Force was charged with developing coordinated actions to assure the maximum benefit from the management of all of the region's forest resources.

The Task Force consists of two representatives and two senators from each of the legislatures of the member states. It meets approximately every two months to review national legislative proposals and to analyze actions and budgets of federal agencies having jurisdiction on public resource

lands. Testimony is taken from experts in various forestry-related fields, viewpoints are exchange with various interest groups, and action is taken on common problems.

THE 1976 YEAR - POLICY AREAS

Major Forestry Legislation Passes Congress

The major forestry issue in Congress this year was legislation proposed to rewrite the enabling laws and management directives of the Forest Service. The need for this legislation came from a court decision regarding the Monongahela National Forest in West Virginia which severely limited the ability of the Forest Service to market timber. In response to this decision, timber sales were halted in four Southern States.

Task Force action was sparked when the Monongahela precedent was applied in a decision affecting timber sales on the Tongass National Forest in Alaska, and was thought to jeopardize sale of national forest timber in the five Western States. Because of the gravity of this issue, the Task Force journeyed to Washington, D. C. in March to meet with congressmen and various interest groups. After discussing the issue personally with many of the Western senators and representatives, the Task Force adopted a position calling for support of management flexibility for the Forest Service. This position was made known to Western congressmen in person and through testimony to the Forest Subcommittee of the House Agriculture Committee. It was also vigorously pushed throughout the ensuing congressional debates over proposed forestry legislation.

After considerable debate, each house passed a different bill. In October, the conference committee agreed on major forestry legislation, S. 3091. In October, President Ford signed S. 3091 into law as the National Forest Management Act of 1976.

This Act is favorable to Western forestry and contains a number of items advocated by the Task Force. The Forest Service is given authority to sell timber and flexibility, subject to environmental guidelines, to manage the forest resource in appropriate ways.

Task Force members regard passage of this law as an indication that the Task Force can help provide Congress with input necessary for developing pragmatic forestry legislation. The Act provides the foundation for a strong timber economy in the West. Of equal importance, major steps are taken towards preserving and maintaining the forest resource base.

Payments to Local Governments Increased

One of the major concerns of the Task Force is the impact on the local tax base of the high proportion of land owned by the federal government in the Western States. On many of these lands, national parks and wilderness areas, for example, no federal payments are made. In addition, where payments are made, they are sometimes not sufficient to reimburse local government for providing services to people

using the areas.

As a result of this concern, the Task Force strongly supported legislation before the 94th Congress that provided for greater payments to local governments. Specifically, the Task Force actively pushed the National Forest Management Act of 1976, which adds about $49 million to local payments, and the Payments in Lieu of Taxes Act, which increases local payments by about $37 million. In passing both of these acts, Congress potentially has added over $86 million to the financial base of local governments. This is indicated on page ii of the Report.

The National Forest Management Act was signed into law in October, 1976. The Act contains a provision supported by the Task Force which will increase the payments to counties for roads and schools. Presently 25% of all monies received from each national forest must be paid to the state for distribution in the county of origin for roads and schools. These payments are based on the stumpage value of the timber sold. The National Forest Managment Act of 1976 adds to this value the worth of reforestation expenditures and timber purchaser credit road allotments.

The increased base means more dollars to local government. For the five Western States, the increased payments each year will be approximately:

California	$12.6 million
Idaho	2.4
Montana	1.4
Oregon	25.7
Washington	6.9
	$49.0 million

Also in October, 1976, the President signed into Law H.R. 9719, the Payment in Lieu of Taxes Act. This Act sponsored by the National Association of Counties and advocated by the Task Force staff in a special trip to Washington, D.C. to discuss the issue with Western congressmen, provides for payments to local governments for the first time on a large federal acreage.

This Act provides for maximum payment of 75¢ per acre to counties within whose boundaries are located certain federal lands. Lands include National Park lands, wilderness areas under jurisdiction of the U.S. Forest Service, National Forest lands, lands administered by the Bureau of Reclamation, and lands utilized as reservoirs as part of water development projects under the Army Corps of Engineers or Bureau of Reclamation.

Current federal payments to these counties are not reduced. There is, however, a payment ceiling based on population and total current payments. If existing payments exceed 75¢ an acre, then an additional 10¢ per acre, limited by population, is provided for general expenditure by the counties.

Upon appropriation by Congress, the Payments in Lieu of Taxes Act would bring over $37 million each year to member states of the Western States Legislative Forestry Task Force. By state, these values are:

California	$10.8 million
Idaho	9.3
Montana	8.9
Oregon	4.6
Washington	3.6
	$37.2 million

The Task Force members see the $37 million from the Payments in Lieu of Taxes Act and the $43 million from the National Forest Management Act of 1976 as major gains for local governments in the Western States. These firmly establish a federal commitment to reimburse local governments for services rendered to users of federal lands. Of equal importance, they indicate the size of the federal commitment in Western public lands and reaffirm the need for a group such as the Western States Legislative Forestry Task Force to speak for the interest of the Western States.

Progress Made on Water Quality Role of States

For a number of months the Task Force has been concerned about the impact of the Amendments to the Federal Water Pollution Control Act of 1972. This concern has been centered on two portions of the Act, Section 404 and Sections 208 and 303.

Section 404 provides the Secretary of the Army and the Administrator of the Environmental Protection Agency with authority to regulate "the discharge of dredged or fill material into the navigable waters at specific disposal sites". A U.S. District Court decision in 1975 defined navigable waters as all waters of the United States and required the Army Corps of Engineers to develop revised regulations which expanded its dredge and fill authority to include normal forestry and agriculture activities.

The Task Force strongly objected to the extension of Corps permit authority to normal forestry operations. Traditionally, states, not the Corps, have had responsibility for controlling the effects of timber harvesting and have, in recent years, strongly exercised this authority in the West. In addition, under another section of the Amendments to the Water Pollution Control Act, the Environmental Protection Agency is monitoring state laws regulating water quality from forestry operations.

In an effort to reverse the court decision, the Task Force actively supported attempts in Congress to remove the permit authority of the Corps from forestry operations. The House and the Senate passed different bills (H.R. 9760 and S. 2710) which would have allowed state control. However, a major difference over regulation of wetlands could not be resolved and the bills died in conference committee.

During the congressional debate, the Task Force staff again journeyed to Washington to explain the views of the Task Force to the Western congressional delegations. These meetings with congressmen played a major role in obtaining an exemption of forestry operations from Corps permit authority. More importantly, the principle was clearly set forth that Western States possess the right and responsibility to regulate their forest resources.

Although no legislation was passed, the Task Force feels that considerable progress was made in clarifying with Congress the role of states in regulating private forestry. The Task Force plans to reiterate this position in the next Congress and to once again support

legislation to limit Corps permit authority.

Within the Western States, the Task Force is concerned over the impact of Sections 208 and 303 of the Water Pollution Control Act Amendments of 1972. Section 303 requires that each state have a continuing statewide planning process dealing with water quality standards and implementation that is approved by the Environmental Protection Agency. Section 208 requires that areawide waste treatment management plans be prepared for areas with potential water quality problems, including regulatory programs to control all point and non-point sources of pollution.

In a court suit over these sections, it was ruled that Section 208 planning must be done for all areas of the state rather than just those areas facing water quality problems. Although the decision has been appealed, the EPA has promulgated its final planning regulations. Under these regulations, states are responsible for developing and implementing a program of control non-point sources of water pollution. A state may prescribe "best management practices" which are the required non-point source control programs.

Forestry operations are termed non-point source operations as they do not cause pollution from a single outlet and consequently, are subject to regulations calling for best management practice regulations.

As regulations can prescribe specific harvesting techniques which must be followed, Sections 208 and 303 have a potentially major impact on state forest practice laws. At the very least, the impact of these sections will be to force a review of the effectiveness of present laws. At the other extreme, the Environmental Protection Agency could probably dictate a forest practice act to the state.

The Western States Legislative Forestry Task Force, recognizing both the urgency to protect water quality and the need that the states, not a federal agency undertake this function, have instructed the staff on monitor developments. As the Task Force views water quality control as a critical aspect of forestry problems in the West, it plans to seek pragmatic, effective regulations.

Need for Congressional Priorities and Targets for Forestland Use

A major concern to the Task Force is the fact that Congress has not yet established clear priorities and targets for all uses on the national forests. Until such priorities are set, the Forest Service has no clear guidelines for its planning procedures and must use its own judgement about the optimum combination of uses. Under such circumstances, it is subject to severe pressure from special interest groups. As the planning process is completed in this atmosphere and the land base is allocated to various uses, the nation may find its forestland options restricted by action of a federal agency without specific congressional direction.

A vehicle for examining priorities was developed when Congress passed the Forest and Rangeland Renewable Resources Planning Act of 1974. Under

this legislation, the Forest Service was to assess the forest resource, prepare a series of possible development options, and make a recommendation for a program to be approved and funded by Congress.

In 1976 the Forest Service submitted a program for congressional approval. Congress, so far, has not critically examined the program and has not committed the level of funding needed to sustain the recommended program.

Congress, however, has taken steps to obtain information necessary to a critical examination of any programs recommended for the national forests. Under the National Forest Management Act of 1976, the Secretary of Agriculture is required to report on the potential for increasing wood fiber utilization and wood products recycling. In addition, an increased inventory was directed of the non-timber aspects of the national forests. Requirements for data to evaluate the long term cost and benefits of the program are also strengthened.

The Task Force believes that these steps indicate that Congress intends to examine the recommended program for the national forests. While members of the Task Force are pleased with the National Forest Management Act of 1976, the Task Force feels that too much uncertainty still surrounds the programs recommended under the Resources Planning Act. As decisions made about these programs will have far-reaching effects in the West, steps must be taken to clarify congressional priorities and funding commitments. For this reason the Western States Legislative Forestry Task Force has urged Congress to undertake hearings on the recommended program, to set clear priorities for all forest uses, and to reaffirm the commitment made to a strong multiple use forestry program by augmenting the budget of the Forest Service.

PROGRAM AREAS

Congress Maintains Cooperative Fire Funding

The Task Force, joining with the National Association of State Foresters, asked Congress to maintain a cooperative fire program that provides over $3 million a year in federal funds to the member states for fire control.

Under Section 2 of the Clarke-McNary Act (CM-2) the Forest Service is authorized to help states develop and fund cooperative fire protection programs with the states. Over the years, CM-2 programs have been among the most effective and justifiable cooperative programs. National expenditures have grown to over $23 million with the share of the five Western States being over $3 million. These funds have become an integral part of the member states' firefighting budgets, representing, for example, 21% of Idaho's fire prevention funds.

The Administration in the 1976 Budget had proposed to halve the funding and then to terminate the program in 1978. On the recommendation of the Task Force, the National Association of State Foresters, and others, Congress rejected the Administration's proposal and provided $20 million nationally. About $ million will flow to the Western States.

Greater Federal Role Assumed in Road Building

The Western States Legislative Forestry Task Force believes that one of the major factors slowing management of the national forests, particularly in the West, is that roads have not been constructed to provide access. Many miles of roads still need to be constructed to permit timber management, recreational activity, and other forest uses demanded by a large segment of the population. Roading is also a key element in increasing salvage and management in diseased and dying stands of trees.

The Task Force has taken an active role in trying to identify roading needs and in urging that Congress focus on roading questions. The Task Force has felt that such a focus could lead to greater federal appropriations designated for national forest road development which would facilitate resource protection and management capabilities.

Discussion of roading questions on the national forests took place in the 94th Congress, both in the budget hearings and in the debates over the National Forest Management Act of 1976. In the budget hearings, Congress agreed that the federal government should assume a larger role in road building on the national forests and raised the general appropriation for roads by about $38 million. However, because of an offsetting decrease by Congress in money available to permit timber purchasers to build roads, the $38 million does not significantly increase the

number of miles of access roads that will be constructed.

In the National Forest Managment Act of 1976, Congress has also indicated a greater reliance on general appropriations for road building. In an effort to increase the competitive posture of small timber purchasers, a provision was added that would allow these purchasers the option to request that the Forest Service construct roads. Also, in an action supported by the Task Force, Congress reaffirmed a current policy that requires that the Forest Service must use appropriated funds to construct roads of a quality superior to those strictly required for seasonal transportation of forest products. This policy is necessary to insure that the costs of roads designed for public use should be borne by the public and not by the timber purchasers.

These actions of the 94th Congress are generally consistent with Task Force thinking. However, the Task Force believes that more money will be necessary to support an accelerated program of access roading. The Task Force recognizes that complex questions and trade-offs are raised by speeding the access road program. Access roads, for exampie, can severely conflict with desires that some areas be classified or studied as wilderness. In addition, there is a great need to coordinate an accelerated access roading program with a final determination of lands that are to be withdrawn from timber production.

Still, consistent with this recognition, the Task Force supports a greater level of funding for access roading in selected areas of the Western national forests. In the coming year the Task Force will work to help select areas needing access roads and will attempt to obtain the level of funding necessary to construct these roads.

Greater Wood Utilization and Reforestation Planned

A recurring theme at the 1976 Task Force meetings was that valuable timber assets are being lost by failing to reforest understocked lands and by wasting usable material at harvest sites. The loss of these assets is particularly acute in the Western States. About one million acres of national forest land needs to be restocked. In addition, a large amount of wood fiber is left on the ground at harvest locations.

Since the pressure is constantly increasing to provide more wood fiber from the national forests, the Task Force strongly feels top priority must be given to thriftier utilization and accelerated reforestation. As early as 1974 and continuing through 1976, the Task Force has requested that the Forest Service and Congress focus attention on problems of reforestation and underutilization.

The 94th Congress was particularly receptive to requests for greater wood fiber utilization. The National Forest Managment Act of 1976 requires that the Secretary of Agriculture assess the potential for greater wood fiber production and utilization and for more wood product recycling. In addition, the Secretary of Agriculture is required to develop utilization standards

and harvesting practices to promote more effective wood use.

Congress also took strong action to reforest understocked national forest lands. Under the National Forest Management Act of 1976, Congress has authorized $200 million annually for reforestation and has instructed that the backlog of understocked acres be reforested within eight years.

The Task Force believes that these actions positively address the needs for more efficient and thorough use of the national forest resources. As it is a large task to reforest and to increase the utilization from national forests in the West, the Task Force plans to monitor these programs and to work for their effective implementation.

Congressional Action Needed on Insect Problems

Estimated annual timber mortality in the four western regions of the U.S. Forest Service totals 1.95 billion board feet lost to insects and 1.85 billion board feet lost to disease as compared to only 140 million consumed by fire. An example of the impact of insect and disease mortality is that a billion board feet of timber is enough to build 900,000 housing units, each with 11,000 board feet of lumber.

Of the amount of timber lost to insects and disease, only a small part is harvested each year. Prompted by the staggering losses and meager salvage, the Task Force has petitioned Congress to take steps to reduce losses and to raise harvest levels of diseased and dead material. These steps include completion of a major survey of insect problems, expanded insect research and control programs, improved pesticide registration procedures, more funding for intensive management programs, and better cooperative prevention programs.

The Task Force, in particular, is pressing for highly accelerated access roading in carefully selected areas and for rapid completion of land use planning in insect prone areas. These steps are prerequisites to effective management and salvage programs.

With the input of the Task Force and others, Congress has recognized the existence of insect and disease problem and possible solutions. Thus Congress has, in budget language, directed completion of a forest insect study by the Forest Service. This analysis, entitled the Western Forest Insect Issues Study, should be available by early in 1977. It is intended to provide needed cost and benefit data on various program proposal.

The Task Force firmly believes that Congress must take action to reduce the amount of timber lost to insects and disease. Consequently, it is the intent of the Task Force to aggressively support congressional funding for programs necessary to meet the insect and disease problems of the Western forests.

THE FUTURE

Aggressive Task Force Action Planned Next Two Years

Based on success to date, the Western States Legislative Forestry Task Force plans an aggressive program for the next biennial period. The Task Force will continue to monitor proposed congressional legislation and to actively advocate the common interest of the Western States in forestry legislation.

The Task Force staff has travelled to each state in an effort to become familiar with regional and local problems and to lay the groundwork for a series of meetings in 1977. These meetings will deal with six areas of critical importance to Western forestry. They are:

1/ Review of the impact of the increasing number of federal laws affecting forestry on private and public lands.

Federal laws affecting use of forest lands in the West have proliferated greatly. No analysis has yet been completed that clearly spells out limitations and extra costs imposed by this growth of legal requirements. The Task Force considers an inventory of the laws and their impact to be an essential element to policy coordination and improvement.

2/ Selective analysis of the budget needs of the Forest Service in each of the Western regions.

The budget process of the U.S. Forest Service, especially as a result of the current implementation of the Resources Planning Act, is extremely complex. As the major management agency on Western public forestland, program needs and performance of the Forest Service are crucial to the interests of the Western States. Consequently, the Task Force believes that it should carefully analyze and, where necessary, work to improve selected programs of the Forest Service. This analysis will also provide information necessary to advocate programs of special Western interest before Congress.

3/ Definition and promotion of areas needing congressional action on the Resources Planning Act.

In 1974, Congress passed the Forest and Rangeland Renewable Resources Planning Act. Commonly called the "Resources Planning Act", this law is the basic planning and budgeting document for the U.S. Forest Service. Under the Act the Forest Service is required to present a recommended program with funding requests to Congress. Congress, then, will review the program and funding needs.

Congress has not yet reviewed the recommendations made by the Forest Service. Because of the

potentially great impact that the recommended program will have in the West, the Task Force will attempt to have Congress review the program next year and to set priorities to guide planning on the national forests.

4/ Analysis of state efforts under federal guidance to control water quality impacts from forestry operations.

A major Task Force concern is the impact of the regulations of federal agencies on water quality control laws in the Western States. An analysis of the entire water quality area is therefore planned.

5/ Development of strong programs for forest insect and disease control.

The Task Force is greatly concerned over the nearly 4 billion board feet of timber lost each year to insects and disease. Strong action is planned to develop and fund appropriate management and control programs.

6/ Review programs for state and federal incentives for forestry on private lands.

One area which has had little attention is the use of federal funds to encourage private timber owners, particularly small owners, to plant trees and manage forestlands. A number of slightly funded federal programs currently exist but, in total, have little impact in the West. The Task Force believes incentives programs should be reviewed critically. It is particularly important to establish the effectiveness and the level of funding that would be required to fully implement a meaningful program.

Expansion Planned

The Task Force, in an effort to significantly expand the amount of national forestland represented by the Task Force, is extending an invitation to the state of Alaska to join the membership. With addition of Alaska, the Task Force would represent about 70% of the volume of softwood growing stock and about one quarter of all the commercial timberland in the United States.

As such it can speak effectively for the forestry interests of the Western States. More importantly, it can speak as the pragmatic voice of practitioners of public policy and can present a unique and vital addition to the development of the nation's forest policy.

TASK FORCE INCOME AND BUDGET

The Western States Legislative Forestry Task Force is funded entirely from appropriations by the state legislatures of the member states. For the biennium 1975 thru 1977, the Task Force income originates as follows:

State	Appropriation	Billed and Recieved	To Bill (Assuming Reappropriation)
California	$20,000 (annual)	$20,000	$10,000
Idaho	5,000 (annual)	5,000	2,500
Montana	2,500 (biennial)	2,500	-
Oregon	4,000 (biennial)	4,000	-
Washington	10,000 (biennial)	10,000	-
		$41,500	$12,500

The Task Force commenced staff operations in February, 1976. The biennial budget has therefore been prorated over 17 months. This is a monthly expenditure of approximately $3,200.00. It should be noted that for a full biennium the monthly budget would be about $2,800.00.

For the 1976-1977 fiscal year the Task Force adopted the following monthly budget guide:

1/	Staff payments	
	a. Executive Secretary	$1,500
	b. Stenographer	400
2/	Office rental and utilities	125
3/	Office supplies	40
4/	Phone	250
5/	Publications and mailings	65
6/	Travel	400
7/	Miscellaneous costs	120
8/	Operating reserve	275
		$3,175

At a business meeting in December in Spokane, the Task Force adopted a staff support budget for the next biennium of $76,500. A new formula for sharing the staff support budget was also adopted.

The formula, based on ability to pay and benefits received, is indicated on the next page:

As a measure of benefit it is possible to use the net volume of softwood sawtimber on commercial timberland in the United States as of 1970, (The Outlook for Timber in the United States, Appendix I, p. 245).

	Volume (Million BF)	% Total in West
California	271,671	21.7
Idaho	130,986	10.4
Montana	100,925	8.1
Oregon	434,671	34.9
Washington	309,802	24.9
	1,248,055	100.0

As a measure of ability to pay, it is possible to use the general revenues for each state in 1975, (State Government Finances in 1975, Table 3, Financial Aggregates: 1975, p. 9).

	Revenue	% Total in West
California	$ 15,628 million	75.0
Idaho	527	2.6
Montana	505	2.5
Oregon	1,534	7.3
Washington	2,631	12.6
	$ 20,825	100.0

Weighting each of these factors equally gives the following combined share of any proposed budget:

	Factor		
State	Ability	Benefit	State Share
California	75.0%	21.7%	48.35%
Idaho	2.6	10.4	6.45
Montana	2.5	8.1	5.30
Oregon	7.3	34.9	21.15
Washington	12.6	24.9	18.75
	100.0	100.0	100.00

Using these percentages the $76,500 budget is allocated as follows:

	Formula Percentage	Share of Total $76,500 Budget
California	48.35	$36,987.75
Idaho	6.45	4,934.25
Montana	5.30	4,054.50
Oregon	21.15	16,179.75
Washington	18.75	14,343.75
	100.00	$76,500.00

TASK FORCE MEETINGS AND WITNESSES

Portland, Oregon
January 23, 24 and 25, 1976

Mr. John Crowell, Chairman, National Forest Products Association Monongehela Task Force

Mr. Bill Clothier, Environmental Protection Agency Region 10, Seattle

Mr. Donald E. Lawyer, United States Corps of Engineers, Portland

Dr. Barney Dowdle, College of Forest Resources, University of Washington

Dr. John L. Walker, Director of Resources Services, Simpson Timber Company, Seattle

Washington, D. C.
March 22, 1976

Dr. Dennis LeMasters, Society of American Foresters, Washington, D. C.

Mr. Joseph McGraff, General Counsel, National Forest Products Association, Washington, D. C.

Dr. John Muench, Chief Economist, National Forest Products Association, Washington, D. C.

Mr. Brock Evans, Chief Legislative Advocate, Sierra Club, Washington, D. C.

Mr. John Davenport, Western Forest Industries Association, Portland

Sacramento, California
May 7 and 8, 1976

Mr. George Craig, Western Timber Association, San Francisco

Mr. Joe McCracken, Western Forest Industries Association, Portland

Mr. Bob Robertson, National Association of Independent Lumbermen, Washington, D. C.

Mr. Mike Harter, Consultant to the Advisory Commission on Intergovernmental Relations, Washington, D. C.

Mr. George Cook, County Supervisors Association of California, Sacramento

Mr. Doug Leisz, Regional Forester for Region 5, U.S. Forest Service, San Francisco

Mr. Bob Ground, United States Forest Service Region 5, San Francisco

Mr. Bob Tyrrel, U.S. Forest Service, Region 6, Portland

Mr. Keith Thompson, U.S. Forest Service, Region 1, Missoula

Mr. John Thompson, Georgia Pacific Corporation, Portland

Mr. John Birch, California Office Bureau of Land Management, Sacramento

Mr. Bob McCarthy, California Office Bureau of Land Management, Sacramento

Mr. Larry Morandi, Council on Inter-governmental Relations, San Francisco

Boise, Idaho
August 7 and 8, 1976

Ms. Louise Shadduck, Idaho Forest Industry Council, Coeur d'Alene

Mr. Dave Graham, U.S. Forest Service, Region 6, Portland

Mr. Bill Carter, U.S. Forest Service, Umitilla National Forest, Oregon

Mr. R. J. Bruning, Special Assistant to Governor Andrus, Boise

Mr. Jay Gruenfeld, Potlatch Corporation, President, Western Forest Resource Council

Mr. Glenn Parsons, Boise Cascade Corporation, Le Grande, Oregon

Mr. John McGhehey, Boise Cascade Corporation, Le Grande, Oregon

Mr. George Kline, Staff Member of Senator Frank Church, Idaho

Mr. Harold Geren, Environmental Protection Agency, Boise

RESOLUTIONS: 1974 TO PRESENT

As this document is the First Annual Report of the Task Force, a chronological record is presented of the resolutions adopted by the Task Force since its inception in 1974.

At the first meeting in mid-1974, a number of issue areas were assigned to Task Force members for special study. After three more meetings involving testimony from a wide range of experts, the investigations of Task Force members led to a series of findings and recommendations adopted in December, 1974.

New issues appeared in 1975 and after considerable study led to resolutions presented in the record. Not included in the record are several letters documenting the role of the Task Force in urging the Environmental Protection Agency to utilize DDT to control tussock moth infestations.

With the hiring of full time staff in 1976, the Task Force greatly increased its visibility. The main form of action is the Task Force resolutions, with vigorous follow-up by letter and personal contact. The 1976 resolutions are presented as part of the record.

FORWARD

The Western States Legislative Forestry Task Force is a permanent fact-finding body created in 1974 by the State Legislatures of California, Oregon, Washington, Idaho and Montana. Comprised of four legislators from each of the five member states, the Task Force is charged with the development of coordinated policies to guide the actions of federal agencies and the states so as to assure the maximum public benefit from the management of western timber resources, including those under federal juridiction.

On the basis of prior public hearings conducted in Idaho, Oregon and California, the Task Force adopted the following policy recommendations at its December 12-13, 1974 meeting in San Francisco.

PUBLIC EMPLOYMENT

Findings

Due to inadequate congressional appropriations, there exists a substantial backlog of reforestation and timber stand improvement work which needs to be undertaken on national forest system lands. In its February, 1974 report to the Congress, the Office of the Comptroller General urged that such work be funded to assure that future national timber demands are met. Current economic conditions have resulted in severe unemployment in the timber resource areas of the West. Increased public employment authorizations, particularly the recent expansion of the Comprehensive Employment and Training Act program, provide important opportunities for undertaking the recommended improvements on national forest lands.

Recommendation

It is recommended that Congress and the President of the United States provide the funding and authority necessary to expand public employment on the national forests directed at reforestation, timber stand improvement and related tasks in order to alleviate unemployment in the timber resources areas of the West and to assure future timber supplies for the nation.

It is recommended that each western state pursue, on an emergency basis and in cooperation with appropriate federal officials, the identification of specific public employment opportunities on national forest lands.

TIMBER SALVAGE

Findings

In its recent report on the subject to the Congress, the General Accounting Office concludes that the annual loss of timber due to natural mortality is equal to that amount harvested each year

from the national forests. Salvage or sanitation sales to recover dead or dying trees are, due to their small size and scattered location, difficult to negotiate under the limitations prescribed in existing federal law. The modernization of these limits or, in the alternatives, the express authorization of funds for the conduct of salvage or sanitation sales would contribute both to the biological integrity of the national forests and to the increased availability of forest products.

Recommendation

It is recommended that the Western States Legislative Forestry Task Force consult with the Chief of the United States Forest Service and interested members of Congress toward identifying the most effective means of expanding salvage and sanitation timber sales on the national forests.

NATIONAL ENVIRONMENTAL POLICY ACT

Findings

The National Environmental Policy Act has given increased visibility and improved public access to decisions affecting the management of the national forests. We heartily support such a purpose. Implementation of the Act has been handicapped, however, by inadequate statutory definition of those agency activities which come within its provisions requiring the preparation of environmental impact statements. Further, funds for implementing the Act (estimated at $22 million per year) have not been expressly authorized by Congress, but have been diverted, instead, from necessary on-going national forest protection and improvement programs.

The inadequacy of statutory standards and the insufficiency of implementation funds have given rise to litigation which has unnecessarily and unreasonably restrained the legitimate utilization of national forest resources.

Recommendation

It is recommended that appropriate committees of the Congress conduct oversight hearings concerning the impact of the National Environmental Policy Act on national timber management programs. Such hearings should evaluate the causes of legal actions currently restraining timber harvest programs and seek remedies to such disputes through the development of more precise statutory standards to guide implementation of the Act.

It is recommended further that funds for the implementation of the National Environmental Policy Act be so designated in the budget of the United States Forest Service in lieu of the present practice of diverting resource protection and improvement funds for such purpose.

FOREST ROAD FUNDING

Findings

United States Forest Service road construction standards, when applied to the development of roads required as a condition to timber sales, result in

roads which are superior in quality to those strictly required for the seasonal transport of forest products. The costs of such roads, beyond those costs properly allocable to timber sales activities, should be borne by the general public. Further, the excessive road development costs currently charged to timber sales reduce the net receipts from such sales and correspondingly reduce the shared revenue entitlements of local governments.

Recommendation

It is recommended that the United States Forest Service revise its policies for the allocation of costs to forest road developments to more accurately reflect the full range of public benefits accruing from improved national forest road facilities.

It is recommended, further, that Congress increase appropriations designated for national forest road development in order to facilitate resource protection and management capabilities and to enhance public use and enjoyment of the national timberlands.

RESOLUTION - FEBRUARY 22, 1976

RELATIVE TO THE CHRISTMAS TREE INDUSTRY

The Western States Legislative Forestry Task Force finds that the Christmas tree industry represents an important economic activity within the member states. The Task Force is concerned by evidence presented to it that U.S. Forest Service officials have failed to recognize adequately the potential role of the national forest system in the production of Christmas trees and, thereby, have diminished Christmas tree harvest opportunities, adversely affected the domestic Christmas tree industry and reduced economic opportunities in the forest industry communities.

The Task Force recommends that the U.S. Forest Service review Christmas tree culture and harvest activities on the national forest system, in cooperation with persons knowledgeable about the Christmas tree industry, toward devising policies and programs to enhance Christmas tree production thereon.

RESOLUTION - JULY 26, 1975

RELATIVE TO AMENDING THE WILDERNESS ACT TO PROVIDE A TIMBER REPLACEMENT PROVISION THEREIN

The Western States Legislative Forestry Task Force, having evaluated the national Wilderness Act program, finds that the unrestrained inclusion of public commercial forest land in the Wilderness Preservation System threatens to substantially diminish the timber production base of certain units of the national forest system, reducing, thereby, timber-related economic activity vital to the welfare of the people of the Western States.

The Task Force has determined that, in addition to wilderness classifications, other factors, such as disease and fire, have diminished the net timber productivity of the national forest system, diminishing, thereby, its ability to contribute adequately to the nation's forest products needs.

Finally, the Task Force finds that there is no deliberate national fiscal policy sufficient to enhance nor even maintain the timber productivity of national lands generally, nor to counteract timber losses attributable to wilderness classification of commercially-useful timber lands, specifically.

Based on the foregoing conclusions, the Western States Legislative Forestry Task Force recommends that the Wilderness Act be amended to provide that each legislative measure incorporating national lands in the Wilderness Preservation System must, as well, authorize and appropriate funds to the Department of Agriculture or Department of Interior, as appropriate, to permit such agency to replace, on national lands available for harvest, the timber production lost to harvest as result of such a wilderness measure.

RESOLUTION

Be it resolved this 23rd day of March 1976, by the Western States Legislative Forestry Task Force that this statement of position be presented to the Congress.

The Western States Legislative Forestry Task Force, created by the state legislatures of Washington, Oregon, California, Idaho and Montana, strongly commends those members of Congress concerned with the disruptive impact on forest resource management and the economy resulting from the Monongahela and Tongass court decisions.

States within the jurisdiction of the Ninth Circuit Court of Appeals harvest about 85% of the total national forest timber, pay about 90% of the national forest gross revenues, and receive about $112.5 million for roads and schools in national forest counties. Congressional action could directly and indirectly affect hundreds of thousands of jobs in the five western states.

The Western States Legislative Forestry Task Force also recognizes the need to preserve and enhance all of the productive elements of the forest resource base. We believe that this can best be accomplished by giving forest managers discretion in the use of proven management techniques.

We therefore wish to go on record as being in full support of the measure as introduced by Senator Humphrey and Congressman Johnson (S. 3091 and H.R. 12503).

It has also come to the attention of the Western States Legislative Forestry Task Force that the President's Budget for the 1977 Fiscal Year proposes to cut Clarke-McNary, Section 2 funds from the $22.596 million in congressional appropriations for the 1976 Fiscal Year to $11.712 million. In addition, the Administration has declared its intention to phase out CM-2 appropriations completely in the 1978 Fiscal Year. Congressional appropriations for forest fire prevention and suppression under Section 2 of the Clarke-McNary Act, have been a vital factor in the protection of forest and water resources in the United States for fifty years. Without this federal support many states could not maintain their forest fire protection programs at the current levels.

The Western States Legislative Forestry Task Force therefore, strongly urges Congress to restore the full $22.596 million CM-2 appropriations for the 1977 Fiscal Year and to resist any attempt to phase out CM-2 program in the future.

RESOLUTION

Be it resolved this 7th day of May, 1976, by the Western States Legislative Forestry Task Force, created by the state legislatures of Washington, Oregon, California, Idaho and Montana, that this resolution be presented to the Congress.

Whereas the Western States Legislative Forestry Task Force on March 23, 1976, resolved to support S. 3091 as introduced by Senator Humphrey;

Whereas S. 3091 has been significantly amended during the Senate mark-up sessions; and

Whereas the Western States Legislative Forestry Task Force opposes the following amendments:

1. Section 5, NATIONAL FOREST SYSTEM RESOURCE PLANNING (to amend in Section 6 of the Forest and Rangeland Renewable Resources Planning Act of 1974), subdivision (6) (H) (iv), stating:

"(iv) provide that increases in allowable harvest based on intensified management practices such as reforestation, thinnings, or tree improvement, shall be made only upon demonstration that such practices justify increased allowable harvests and that the outputs projected are being secured;"

2. Section 13, LIMITATIONS ON TIMBER REMOVAL (to amend new Sections 13 and 14 to the Forest and Rangeland Renewable Resources Planning Act of 1974) subdivision (a) stating:

" The Secretary of Agriculture shall limit the sale of timber from each national forest to a quantity equal to or less than a quantity which can be removed from such forest annually in perpetuity on a sustained-yield basis. However, the Secretary may exceed the quantity sales limitation from time to time in the case of any forest so long as the average sales of timber from such forest over any ten-year period do not exceed such quantity limitation. In those cases where a forest has less than two hundred thousand acres of commercial forest land, the Secretary may use two or more forest (sic) for purposes of determining (sic) the sustained yield."

3. Section 14, AMENDMENTS TO ORGANIC ACT (new Section 14) stating:

"(14) The length and the other terms of the contract shall be designated to promote orderly harvesting consistent with the principles set out in Section 6 of the Forest and Rangeland Renewable Resources Planning Act of 1974, as amended... The Secretary shall require the purchaser to file as soon as practicable after execution of a contract for any advertised sale with a term of two years or more, a plan of operation, which shall be subject to concurrence by the Secretary. The Secretary shall not extend any contract period with an original term of two years or more

unless he finds (A) that the purchaser has diligently performed in accordance with an approved plan of operation or (B) that the extension sould be in the public interest."

4. Section 20, TRAIL SYSTEMS ACT (amends Section 4 out of the Act) stating:

"Sec. 4. The Secretary is authorized to provide for the acquisition, construction, and maintenance of forest development roads within and near the national forests and other lands administered by the Forest Service in locations and according to specifications which will permit maximum economy in harvesting timber from such lands tributary to such roads and at the same time meet the requirements for protection, development, and management thereof, and for utilization of the other resources thereof. Financing of such roads may be accomplished (1) by the Secretary utilizing appropriated funds, (2) by requirements on purchasers of national forest timber and other products, including provisions for amortization of road costs in contracts, (3) by cooperative financing with other public agencies and with private agencies or persons, or (4) by a combination of these methods: or provided, that where roads of a higher standard than that needed in the harvesting and removal of the timber and other products covered by the particular sale are to be constructed the purchaser of the national forest timber and other products shall not be required to bear that part of the costs necessary to meet such higher standard, and the Secretary is authorized to make such arrangements to this end as may be appropriate. (16 U.S.C. 535)"

Be it resolved:

The Western States Legislative Forestry Task Force urges the United States Senate to defeat these amendments. The Task Force reaffirms its support of S. 3091 as introduced and should the amendments cited above not be defeated the Task Force will reluctantly be compelled to reverse its former position in support of S. 3091.

RESOLUTION

Be it resolved this 7th day of May, 1976, by the Western States Legislative Forestry Task Force, created by the state legislatures of Washington, Oregon, California, Idaho and Montana, that this resolution be presented to the Congress.

Whereas the federal government is a major landholder in the five Western States, and on many acres pay no local taxes;

Whereas The Public Land Law Review Commission concluded that existing revenue sharing laws are generally inadequate and have not kept pace with increasing financial needs of local jurisdictions;

Whereas previous in-lieu-of-tax proposals have been complex and expensive to administer;

Whereas local governments today, more than ever, badly need funds to support essential services;

Whereas H.R. 9719, in a simple and equitable manner, provides payments to local government for revenue losses cause by federal ownership;

Be it resolved:

The Task Force endorses H.R. 9719, as reported by the House Interior Committee and urges members of Congress to expedite its passage.

RESOLUTION

Be it resolved this 8th day of May, 1976, by the Western States Legislative Forestry Task Force, created by the state legislatures of Washington, Oregon, California, Idaho and Montana, that this resolution be presented to the Congress.

Whereas the Western States Legislative Forestry Task Force recognizes the need to protect water quality and strongly supports efforts to do so;

Whereas within the five Western States there are already programs of environmental control such as forest practices, coastal zone management, and stream channel alteration acts;

Whereas Section 208 of Public Law 92-500 provides that states shall have primary responsibility for monitoring water quality;

Whereas the present interpretation of Section 404 of Public Law 92-500 grants the Army Corps of Engineers powers of permit control over water quality beyond that intended by Congress, and this is an inappropriate function for the Corps and likely to create administrative confusion; and

Whereas immediate action, prior to July 1, is necessary to prevent the adverse effects of this interpretation from taking place;

Be it resolved:

The Western States Legislative Forestry Task Force supports the "Breaux Amendment" to H.R. 9560, as adopted by the House Committee on Public Works and Transportation on April 13, 1976, which clarifies the definition of "navigable waters" and the Army Corps of Engineers' authority to regulate dredge and fill activities.

RESOLUTION

Be it resolved this 8th day of August, 1976, by the Western States Legislative Task Force, created by the state legislatures of Washington, Oregon, California, Idaho and Montana, that this resolution be presented to the Congress.

Whereas the various multiple uses in the national forests compete for the land use base;

Whereas Congress has not reviewed the recommended plan proposed by the United States Forest Service under the Forest and Rangeland Renewable Resources Planning Act of 1974;

Whereas as a result Congress has failed to explicitly define priorities and national targets for the desired level of each use;

Whereas the failure to define priorities and target levels for each use has resulted in haphazard, de facto land use planning in the national forests;

Whereas, in the absence of targets, there has been a continuing withdrawal of national forest land for non-timber uses;

Be it resolved:

The Western States Legislative Forestry Task Force urges Congress to review the recommended plan submitted by the U.S. Forest Service under the Forest and Rangeland Renewable Resources Planning Act of 1974.

The Task Force further urges Congress to set national targets for the production of outputs from the national forests.

The Task Force also urges that Congress review the timber supply needs of the country to see that targets set for non-timber uses do not prevent the attainment of timber supply goals.

RESOLUTION

Be it resolved this 8th day of August, 1976, by the Western States Legislative Forestry Task Force, created by the state legislatures of Washington, Oregon, California, Idaho and Montana, that this resolution be presented to the Congress.

Whereas the Western States Legislative Forestry Task Force supports legislation that provides flexibility to the U. S. Forest Service to manage the national forests in their diverse conditions;

Whereas strong directives are proposed to protect the environment in the development of timber harvest plans;

Whereas HR 15069 is substantially consistent with the introduced version of HR 12503 as supported by the Task Force;

Be it resolved:

The Western States Legislative Forestry Task Force endorses HR 15069, the National Forest Timber Management Reform Act of 1976, as reported by the Forests Subcommittee of the House Agriculture Committee.

RESOLUTION

Be it resolved this 8th day of August, 1976, by the Western States Legislative Forestry Task Force, created by the states legislatures of Washington, Oregon, California, Idaho and Montana, that this resolution be presented to the Congress.

Whereas massive insect infestations of our national forests and nearby private timberlands have disrupted desirable long term management and multiple use goals;

Whereas the mountain pine beetle infestation alone has reached epidemic proportions and already destroyed well over a billion board feet;

Whereas current research levels are so inadequate and response times so slow as to allow defoliating and tree-boring insects to cause major damage directly and through the severe fire hazard presented by dead or defoliated trees;

Whereas it is well known that the younger and stronger trees produced by more intensive forest management are known to be far less vulnerable to insect infestation and fire;

Whereas projected losses will not only disrupt production of needed wood products, but will also intensify the destruction of wildlife habitat and increase levels of unemployment in the wood products and housing industries;

Therefore, be it resolved that the Western States Legislative Forestry Task Force urges Congress to:

(1) Order completion at the earliest possible time of the Western Forest Insect Issues Study now being conducted by the U.S. Forest Service;

(2) Fund an expanded insect research and control program for the western forests;

(3) Create summa. y procedures to reduce the time necessary to register and to apply approved pest controls;

(4) Fund more intensive timber management and salvage programs in areas of actual or high potential infestation;

(5) Instruct the U.S. Forest Service to develop cooperative programs with state and private owners to encourage maximum access to infested areas by, for example, waiving road fees on national forest roads.

STATEMENT BY THE WESTERN STATES LEGISLATIVE FORESTRY TASK FORCE TO THE GOVERNORS

My name is Barry Keene. I am a member of the Legislative Assembly in the State of California and am privileged to represent the North Coast Counties. I have, from its inception, been a member of the Western States Legislative Forestry Task Force. These remarks are on behalf of that Task Force.

The Western States Legislative Forestry Task Force was formed several years ago by concurrent actions of the State Legislatures in Montana, Idaho, Washington, Oregon and California. Each of the Legislatures appointed two Senators and two Representatives, or Assemblymen, to the Task Force. Creation of the Task Force reflected increasing concerns in our states about the management of the forest resources, particularly on Federal lands. The increasing importance of the forest resources to the economy of these states and the increasing demand for forest lands for recreation and wilderness uses was becoming apparent to all of our legislative bodies.

The first Chairman of the Task Force was Senator Randolph Collier of California. The present Chairman is Senator J. Wilson Steen from Idaho. We meet several times a year in the states represented on the

Task Force and have heard on the occasion of each of its meetings from recognized authorities representing a variety of viewpoints on various issues involving forest land management. The Task Force has studied and made its views known with respect to the implementation of the Resources Planning Act that was passed by Congress in 1974.

We were actively involved in seeking a resolution of the Monongahela problem which led to the passage of the National Forest Management Act in 1976. The Task Force has also presented positions in support of the traditional oral auction bidding procedure for Forest Service timber.

At the most recent meeting of the Legislative Forestry Task Force in Missoula, Montana, the Task Force discussed the second roadless area review and evaluation being carried on by the U. S. Forest Service. This issue is now generally known by the acronym of RARE II. The group unanimously felt that this roadless area question was the most serious forest resource issue with which we had yet dealt. It was this view that led to the unanimous decision to call for this meeting with the chief executive officers, or their representatives, of the five member states and Alaska. We wished to discuss the RARE II problem and to evaluate how each of the states might provide the most meaningful input to help resolve the problem.

The issue we are really addressing is how a large percentage of the National Forests in our states should be managed and for what purposes. A brief recital of how decisions have been made, or not made, for the National Forests will help to put our current dilemma in perspective. There are approximately 187 million acres of National Forest land in the National Forest System -- the national forests and national grasslands.

Management decisions on much of this land has not been difficult. Much of it is grassland and, therefore, its management for grazing and watershed protection has been almost a foregone conclusion. Significant parts of the System contain some of America's most treasured wilderness and have been so des' nated. Indeed, it is in the National Forests that the Wilderness System started nearly two generations ago.

However, at the beginning of this decade, the Forest Service had designated 50 percent of the total acreage as commercial forest land -- land capable of producing 20 cubic feet per acre per year of commercial forest crops, and also land that was, in fact, available for the harvest of commercial forest crops (as distinguished from commercial forest land in wilderness areas or other types of land withdrawals). It is important to keep in our mind that this represented 96 million acres of commercial forest land in the National Forest System. The annual allowable cut of 13.7 billion board feet was based on this acreage and the timber it contained.

Going back several decades, the planning on the commercial forest lands of the National Forest System has been conducted, summarized and published in documents called "Timber Management Plans". Until very recent years, the Timber Management Plan was the only planning document and was the key decision-making process respecting the commercial forest lands. The Timber Management Plan determined the management prescription for these forest lands. The plan considered all multiple use values, determined the volumes of standing timber, the current and prospective growth rates, applied Forest Service policies to the harvest scheduling, and for the ten-year period of the plan, determined an annual allowable

cut. This cut was the basis for the timber selling program. The procedures and requirements for timber management planning were and still are spelled out in regulations of the Secretary of Agriculture. Among other requirements, these regulations require that Timber Management Plans be redone every ten years.

In 1960, Congress passed the Multiple Use Sustained Yield Act which provided broad new guidelines for the management of the National Forests. After passage of this landmark piece of legislation, the National Forests started to develop Multiple Use Plans. Generally, such plans were prepared on each Ranger District. These plans, more precisely than ever before, guided management on the commercial forest lands and other lands in the Ranger Districts. Timber Management Plans, in turn, as they were revised on their ten-year cycle, reflected the management directions contained in these Multiple Use Plans.

It was in the late 50's and early 60's that the problem concerning the commercial forest lands surfaced. Commercial timber harvesting in the National Forests started in most areas after World War II. Prior to that time, commercial timber operations on the National Forests were either minor or nearly non-existent. We have, then, been harvesting timber from the National Forest commercial forest land base for about thirty years. I am told that on the average somewhere between 40 and 60 percent of the commercial forest land upon which the annual allowable cut is based, has been entered. That means some timber harvesting and roadbuilding has occurred on approximately that amount of the commercial land base. I do not have a firm estimate, but it appears reasonable that somewhere between 30 and 45 million acres of commercial forest land

base is unroaded, or roadless. Crucial to an understanding of our dilemma is a realization, however, that the timber sale programs on these Western forests over the past years have been based on all of the commercial forest land base, both roaded and unroaded. The timber sale programs have been based on the explicit assumption that the roadless area component of the commercial forest land base would, in due course, be developed or roaded in some fashion or other. In the late 50's and earliest years of the 60's significant controversy began to develop about the undeveloped or unroaded portions of the commercial forest land base. Pressure began to develop that these unroaded areas should remain unroaded and undeveloped.

Perhaps the first specific reflection of this concern was a letter from Senator Henry M. Jackson of the State of Washington to Secretary of Agriculture Orville Freeman in early 1961, raising concern about these undeveloped commercial forest lands in certain parts of the high country of the North Cascades. Senator Jackson requested that the Department of Agriculture review its policies regarding this high country. This request led to a thorough review on the National Forests in the Oregon/Washington region of management directions on the commercial forest lands in the high country. This study took place in 1961 and led to policy announcements in late 1962 known as the High Mountain Policy for Region Six. The policy delineated four broad resource associations. Each of these associations had key value delineations. In some associations, timber production was a key value and in other associations it was not. The Forest Service carefully stayed away from delineating

specific zones or uses on a map, but rather emphasized multiple use considerations, using the concept of key values. Also, in the decade of the 60's, was the great debate and study in the North Cascades in the State of Washington, leading to the creation by Congress of the North Cascades National Park.

Another key piece of legislation pertinent to today's dilemma was the Wilderness Act passed by Congress in 1964. That Act created a National Wilderness Preservation System. Only lands designated by Congress could be placed into this system, which was to be managed under specific legislative guidelines, calling for a concept of pure wilderness. The Wilderness Act blanketed into the Wilderness System all the existing wilderness and wild areas of the National Forests. Parts of the National Forest System designated at that time as primitive areas were to be studied within a ten-year time frame and recommendations made to Congress for inclusion or exclusion from the Wilderness System. Litigation after the passage of the Wilderness Act settled that lands contiguous to primitive areas under study should also be left in a primitive condition until these studies had been completed and a decision by Congress made. The 1964 Wilderness Act establishing the National Wilderness Preservation System contemplated that the System would be made up of lands from the national forests, national parks and wild life and game refuges, administered by the Fish and Wild Life Service. The national park and refuge lands were also to be studied within a ten-year time frame and recommendations made to Congress respecting lands within these two systems which should be a part of the Wilderness System.

Despite the deliberations and processes just enumerated, the controversy concerning the undeveloped or unroaded portions of the National Forest commercial forest land base continued to escalate through the decade of the 1960's. In response to this increasing controversy, then Chief of the Forest Service, Ed Cliff, by Forest Service Manual dated June, 1967, told the Regions that they should prepare an inventory of roadless areas. The Manual also prescribed standards for selecting the roadless areas and indicated that the inventory of roadless areas should be submitted by the Regions to the Chief's Office by June 30, 1970. In 1969, reflecting the fact that the Regions had not yet really begun to assemble this information, another Manual release was issued extending the deadline for submission of the material to the Chief's Office to June 30, 1972.

The objective of Chief Cliff, I understand, was to obtain an inventory of roadless areas (areas not already in the Wilderness System or in primitive areas then being studied) so that that portion of the roadless inventory which was thought to be suitable and needed as possible wilderness could be withdrawn from development of any kind (commercial forest land and timber withdrawn from the allowable annual cut base) until a more detailed study of each area's wilderness potential could be undertaken following the ten-year evaluation of the then existing primitive areas. It was Chief Cliff's hope that the remaining areas could continue under multiple use management, including timber harvesting, without controversy.

On January 1, 1970, fate intervened in the form of another landmark piece of legislation, the National Environmental Policy Act (NEPA).

Germane to our discussion, Section 102(c) of NEPA mandates that Federal decisions and proposed actions having a significant impact upon the environment should undergo a process known as the Environmental Impact Statement. NEPA mandates that actions under the purview of NEPA should be done by interdisciplinary teams and public involvement is mandated. The relationship between Section 102 of NEPA and proposed timber sales in roadless areas was not long in surfacing. Because of the implications of NEPA, Chief Cliff sent a memorandum to the Regions in 1971 which ordered them to submit their roadless inventories and their recommendations respecting the future of these roadless areas to Washington by June of 1972. The process, four years after the first Manual instruction, began in earnest. This study, announced in 1967, but really starting in 1971, is now known as RARE I (Roadless Area Review Evaluation -- first time). In June of 1972, the Regions did submit their list of roadless areas and their recommendations respecting those areas to Washington. 56 million acres of National Forest land (much of it commercial forest land) not then contained in any wilderness or primitive area, were identified. When the Regions presented their recommendations to Washington in the summer of 1972, it was stated that the lands not recommended by the Region for withdrawal for wilderness study would be immediately available for management, including timber harvesting. Environmental groups protested that there was grossly insufficient time in the summer of 1972 to evaluate 56 million acres of land. An impasse developed and the National Resources Defense Council (NRDC) took the Forest Service to Court. The NRDC asked the Court to mandate that no inventoried roadless area could be entered for development of any kind without going through

the procedure prescribed by Section 102(c) of NEPA. In other words, the inventoried roadless areas would have to undergo a land management planning process accompanied by an EIS before any development could take place. In an historic meeting which took place in the chambers of Federal District Judge Conte in San Francisco on December 1, 1972, the Forest Service agreed with the position of the NRDC and put out Forest Service Manual releases spelling out the new procedure. Based on these representations and the Manual releases, Judge Conte dismissed the lawsuit.

During 1973, the Forest Service concluded its RARE I process and issued its final EIS for RARE I -- a single document for the entire 56 million acres throughout the West. The RARE I decision was that about 12 million acres of the 56 million acres of roadless inventory should be withdrawn from any development pending detailed study and recommendation to Congress for wilderness. Concurrently, the annual allowable cut of the National Forests was reduced from 13.7 billion board feet to 13.3 billion board feet. The remaining 44 million acres of land as per the Conte lawsuit were to go through the land planning process, including EIS procedure. However, the commercial forest land in this 44 million acres continued to be a part of the allowable cut base upon which current timber sale programs are founded.

In the late 1960's, the Forest Service started discussing the pros and cons of a second planning system -- a system that was to be in addition to the Timber Management Plan System required by regulation. In 1972, instructions were sent by the Washington Office of the Forest

Service to the Regions describing this newly adopted second planning system referred to as Land Management Planning as distinct from Timber Management Planning. As a result of the Conte litigation, the Land Management Planning System of the Forest Service has blossomed and for several years now we have had parallel planning systems in effect.

Two seemingly minor, but truly significant, events followed. (1) The Forest Service designated on each of the National Forests large numbers of planning units for which Land Management Plans and EIS's would be prepared. On some forests, I understand as many as 60 individual units were to be planned. (2) Environmental groups made a presentation to then Secretary of Agriculture Earl Butz that in each Land Management Plan and EIS containing roadless areas, wilderness should be considered as an alternative. Secretary Butz concurred. In the past five years, some areas of the Western National Forests have gone through and completed Land Management Planning. Well over half of the roadless areas covered in these plans in the past few years are designated by the plans to remain roadless. Despite the fact that some progress has been made in five years in making land allocation decisions, in many parts of the West, Land Management Planning has bogged down, due to a series of appeals and threatened litigation. One of the principal forests in my own District, the Six Rivers National Forest, has yet to implement a final decision on a Land Management Plan. The result has been a serious deterioration in the timber sale program in that forest.

Two plans have been completed. One is under administrative appeal and the other is being contested in court. The USFS made a settlement

agreement which required them to produce a supplement to the EIS. Because of this, no timber sales can be offered in these units.

The result of the increasing inability of the Forest Service to make land management decisions respecting the roadless areas has meant that the current timber sale programs have had to be concentrated for many years in areas that had already been roaded and in areas from which timber had already been sold. In many of the Western National Forests, this process cannot continue without serious environmental damage. In some Western forests which were heavily roadless, the timber sale programs have already been eroded seriously or completely halted. The best public record to date of this spreading crisis and its impending severity is contained in the record of two U.S. Senate Energy Committee hearings conducted in the State of Idaho this year by Senator Frank Church. Many of the forest industry dependent communities in Idaho spelled out the urgency for resolving decisions on the roadless areas so that their communities could continue to exist, stark testimony to the fact that the Land Management Planning process of the Forest Service, encumbered as it is by NEPA, has bogged down.

The Department of Agriculture has recognized this crisis. Assistant Secretary of Agriculture Rupert Cutler announced earlier this year a new process called RARE II (Roadless Area Review and Evaluation -- second time). RARE II involved the making of a new inventory of roadless areas under significantly different criteria than in the RARE I process. On the 18th of November in the Federal Register, the new inventory was announced. The new inventory of roadless areas contains about 56

million acres. All of the RARE I areas selected for study for wilderness are now abolished and are made part of the RARE II roadless inventory of 66 million acres. It is the Department's intention to evaluate the 2,100-plus roadless areas containing this vast acreage of National Forest land and come up with decisions by the end of 1978. The decision would place this land into three categories. The first category will be lands to be submitted to Congress for inclusion in the National Wilderness Preservation System. The second category will be lands that should be continued under multiple use management, including timber harvesting. The third category of lands will be those where further study is required. The whole RARE II process will be accompanied with an Environmental Impact Statement. The impact statement will of necessity, be similar to the statement which accompanied the RARE I process. It will be nationwide in scope -- programmatic. Even though the Forest Service indicates the impact statement accompanying RARE II will in some way or other be broken down on a state-by-state basis, the type of EIS contemplated will, of necessity, be vastly different from the type of impact statement necessitated by the Conte litigation. Attorneys familiar with environmental law with whom I have discussed this subject are unanimous about two things: (1) the type of EIS contemplated by the Forest Service for returning roadless areas to multiple use management is unlikely to withstand legal challenge; and (2) even in the unlikely event that such a procedure would withstand legal challenge, tremendous delays caused by appeals and litigation before arriving at final decisions would be inevitable.

The course for resolving the roadless area problem has been blazed by Senator Church of Idaho in what is known as the "Gospel Hump Case". To eliminate the threat to a substantial Idaho community, caused by the inability of the Forest Service to make timber in roadless areas available for harvest, Senator Church asked that local environmental groups and local interested citizens negotiate for a compromise in the Gospel Hump area. The local groups, under dire economic duress, did finally agree to a Gospel Hump compromise. Senator Church has inserted that compromise in the American Endangered Wilderness Bill which is now going through Congress. The essence of the Gospel Hump compromise was the instant creation of a 206 thousand acre wilderness area, the circumvention of the National Environmental Policy Act for a few years with respect to the management of 45,000 acres which would be available immediately for timber harvest. With respect to an additional 92,000 acres, additional planning should take place for multiple use with the timber to continue as a part of the allowable harvest base. A key fact about the Gospel Hump legislation is that with respect to the lands to be returned to multiple use, the legislation bypasses the National Environmental Policy Act for a few years. NEPA is a creation of Congress and only Congress can change it.

The impact of one other recent piece of legislation deserves comment. The Resources Planning Act passed by Congress in 1974 required that the Department of Agriculture prepare an assessment of the fiber needs of the United States. The Act also required that the Department come up with a program for the National Forests that would best fulfill the need

No
PAGE 14
IN FILE

American Endangered Wilderness Bill. This bill contains several wilderness area designations in at least seven Western states. One of the things we are observing is that with respect to the decisions for wilderness designation in each state, the Congressional Delegation from that state has great influence. We are also observing that the process by which the Congress can take testimony and evaluate tradeoffs in their proper context is limited. Recognizing these realities, the Legislative Task Force feels that each Western state has a major role to play in evaluating the National Forest land situation in its state and in making its own recommendations to its own Congre ional Delegation respecting the resolution of RARE II. On several occasions this year, officials of the Department of Agriculture have urged environmental and user groups to get together and try to work out compromises. This process is unwise and unworkable. It is unrealistic to expect such agreements except under dire economic distress such as in Central Idaho. Where lies the public interest in such a process? We feel the states have a role in trying to evaluate the public interest in each state and that we may be able to assist our respective Congressional Delegations, leaving finally to Congress the responsibility of seeing that the national interest is satisfied. The Task Force recognizes that some states may not wish to become involved in this process. We also recognize that states who may become involved will do so in different ways. We only urge that each state does become involved and involved in depth.

In coming to grips with the roadless area problem, two basic steps are involved:

I. Collection and presentation of basic information

A. Preparation of maps and accompanying statistical information showing the commercial forest land base for each National Forest within a State at the beginning of this decade. Information is needed about the forest land base, by forest, that made up the 96 million acres of commercial forest land in the National Forest System which was mentioned above.

B. Preparation of map overlays and accompanying statistical data describing what has happened to the commercial forest land base, by forest, since the beginning of this decade.

C. Preparation of map overlays and statistical data relating to the RARE II inventory, including the amount of commercial forest land and timber inventory included.

D. Display of the current five-year timber sale program for each forest for the purpose of determining the degree of threat the roadless area problem has to the local communities. This information would indicate how much time there is left to resolve the problem.

E. Preparation of maps and accompanying data showing the existing wilderness areas, primitive areas officially designated wilderness study areas, areas withdrawn from timber harvest through other land designated, such as disbursed recreation zones, semi-primitive areas, high mountain zones, etc.

F. Accumulation of information, by states and forests, if possible, of the commercial forest land base upon which the RPA timber production goals were predicated.

G. Collection of information about the amount of wilderness areas, by states, upon which the RPA wilderness program was established.

H. Any other significant information.

Two types of assistance would be needed in obtaining this basic information. One would be forestry expertise that could obtain the basic forestry and land information necessary. In addition, expert public relations help would be required to assist in taking the basic information and putting it in form that could be readily understood by laymen such as ourselves and the general public. Too often masses of information become meaningless because they are simply incapable of being understood.

The Task Force sees some merit in the possibility of the data-gathering being done on a centralized basis. We note that the Pacific Northwest Regional Commission is now funded and is beginning a major forestry policy study. It might be possible for the acquisition of the data to be done under the leadership of the Northwest Regional Commission with the States of Montana and California contributing on some appropriate basis. The advantages of a centralized data-gathering operation are, among others, cost efficiency, standardization of data and concepts, and time. Time is of the essence in starting the collection of the basic data. We are assured of complete cooperation of the Forest Service in the effort.

II. Following the collection of the information there would then need to be an evaluation and, ultimately, a recommendation respecting

the disposition of the roadless areas contained in RARE II. Each state would have to decide this process for itself.

This Legislative Task Force would be pleased, from time to time, to provide a forum for reports on the activities and efforts of each of the states. Any other suggestions for help from the Task Force would be appreciated.

MEMO TO: Idaho Legislative Council

FROM: Senator J. Wilson Steen, Chairman
Western States Legislative Forestry Task Force

Since its inception, in 1974, the Western States Forestry Task Force has developed into an effective liaison between the legislative bodies of the member states, the national congress, and federal agencies involved with forest management.

As particular issues affecting forest management arise, i.e., clearcutting, sealed or oral bidding of timber sales, wilderness areas, drought, etc., the Task Force considers the issue or problem, especially with respect to legislative action that may be needed to help solve or relieve the problem.

The WSLFTF has experienced excellent cooperation from involved agencies of government, industry, and other interested groups who appear before the Task Force, giving testimony and answering questions.

After the Task Force arrives at a decision, their recommendation is usually submitted to all concerned in the form of a Resolution, many times supported by correspondence from each Task Force member to his Congressional Delegation, or from the Executive Secretary of the Western States Legislative Forestry Task Force.

Because of certain federal legislation and new agencies of the federal government, such as the EPA, it became apparent to some of the legislators of the western states that the impact on forest management would be far-reaching, therefore, the Western States Legislative Forestry Task Force was originated to give the five western states who possess and depend a great deal upon forest products a unified position when considering proposed changes of forest practices under the EPA and Resources Planning Act.

One of the first issues the Task Force became involved in was the clearcutting problem brought on by the injunction prohibiting clearcutting of forest lands after the Monongahela and Tongass National Forest decisions. The Task Force reviewed the case and decided it was important enough to travel to

Washington, D.C., as a full committee group to meet with out Western Congressmen and testify before Congressional committee hearings being held on proposed legislation concerning clearcutting in forest management. The Task Force believes this trip was effective in influencing Congress to take a moderate approach to clearcutting laws and regulations that apply to forest management practices in our western states.

Another issue of great importance to the existence of many western communities dependent upon forest products that the Task Force considered and took action on was sealed or oral bidding of timber sales on national forest land. There was a strong effort by a few congressmen to exclude oral bidding of timber sales because of the possibility of collusion among the bidders. After considerable study and information brought before the Task Force, the committee felt going to exclusive sealed bidding of timber sales would not be fair or beneficial to the forest product industry and took a position of opposing only sealed bidding and recommended both oral and sealed bidding be used in timber sales dependent upon circumstances of community dependence and collusive bidding practices. The Task Force felt strongly enough about this to send the Chairman to Washington, D.C., in February 1977, to testify before the Agriculture Department Forest sub-committee who was holding hearings on sealed and oral bidding practices of timber sales. The WSLFTF believes their input into this issue was beneficial in helping influence the drafting of new rules and regulations that appear to be reasonable for sealed and oral bidding of timber sales, and provides protection to communities dependent upon forest resources.

Other issues and problems considered by the Task Force have been water quality problems related to forest practices and management and the changes that would prevail if the Corps of Army Engineers were given exclusive management control over all waters of our nation under the Environmental Protection Act. The Task Force has taken the position that sufficient regulation and management of water quality as it relates to forest practices can be adequately administered by the individual states through their own environmental agencies and the Forest Practices Act, where enacted. The Task Force recommended the federal government retain the original definition of a navigable stream, as used by the Corps of Army Engineers in their past administrative functions and not give them full jurisdiction over all waters and wet lands of our country.

The latest concern and study being performed by the Task Force is on the drought and the effect it is having upon forest management. Considerable testimony was presented at the last Task Force meeting in San Francisco on June 4-5. Dr. Pierre St. Amand, who is with the U.S. Naval Meteorology and Weather Modification Department gave a very interesting speech on weather history, presenting a film made by using satellite weather surveillance photographs put together in a sequence covering the year of 1976. As the film progressed, Dr. St. Amand explained the action of the cloud movements and resulting weather conditions. The Task Force was surprised to learn there does not seem to be any research or extensive study, federal or state, in long range weather forecasting. Dr. St. Amand indicated there are possibly three studies being made on a university level, but their resources are limited because of funding. The Task Force did take action by drafting a resolution recommending federal and state support of an extensive study for long range weather forecasting. This could be quite important in determining programs for drought administration.

The issue of Instant Wilderness expansion was also reviewed at the San Francisco meeting. The Task Force has been considering various wilderness proposals throughout the existence of the committee. The instant expansion of wilderness boundaries without following previous study and hearing procedures was opposed by the committee. The Task Force felt an instant expansion of wilderness boundaries would result in a sudden adjustment affecting forest related industries thus causing an immediate change in the economic base of dependent communities. If further expansion of wilderness areas is needed and feasible it should be done after adequate study and on a time frame to provide community adjustment.

Many other forest management related subjects are also considered by the Task Force but we have covered only the major ones in this report because of the length of a report needed to detail the full work of the committee. Insect control, other diseases of timber, endangered species both fauna and flora, recreation uses, and wild life are some of the other subjects considered.

Respectfully submitted,

J. Wilson Steen

Representative Mike Miller
Chairman, Alaska Legislative Council
Pouch V
Juneau, Alaska 99811

Dear Representative Miller:

The Western States Legislative Forestry Task Force has authorized me to communicate with you in the hope of initiating a dialogue with the aim of bringing the great state of Alaska into the Task Force's membership.

The Task Force is comprised of twenty state legislators, (two Senators and two Representatives), from the states of Idaho, Montana, California, Oregon, and Washington. We meet approximately every two months to review national legislative proposals and to analyze actions and budgets of federal agencies having jurisdiction over public resource lands. After receiving expert testimony in various forestry-related matters and exchanging our ideas and opinions, we generally take action on common problems. As a member of the Oregon delegation since the creation of the Task Force, I can say we have defined a number of common problems and have taken concerted action all to the member states' benefit. The membership of the Task Force believes that Alaska may share the same concerns in forestry-related matters and that it would prove mutually beneficial if Alaska was a member of the Task Force.

For your information and review I am enclosing herewith copies of our Annual Report, dated December 15, 1976, which outlines our past activities and sets forth our income and budget; our financial summary as of April 30, 1977; and, a report submitted by our Chairman, Senator J. Wilson Steen of Idaho, to his Legislative Council.

We have just completed our August 13 and 14 meeting in Spokane, Washington, and I am enclosing herewith, in addition to the above, a copy of our agenda. Our next meeting will be held in Montana in October.

I sincerely hope you will find the material of interest and are able to consider our membership offer in the near future. We would be most happy to meet with you to discuss this matter further if you so desire.

Sincerely,

Representative
Bud Byers

Senate

JUNEAU, ALASKA

MEMO January 30, 1978

FROM SENATOR ZIEGLER

TO REPRESENTATIVE MALONE
REPRESENTATIVE COTTEN
REPRESENTATIVE OSTERBACK
REPRESENTATIVE COWPER

RE SJR 36

Representative Osterback has very courteously scheduled a hearing on the captioned resolution, pertaining to land allocation in the Tongass National Forest. It is temperate, moderate and merely urges the appropriate officials in Washington, in a gentle way, to allow the Forest Service a little more time within which to complete its homework.

I may be biased, but I can't see how anybody could object to the resolution. On the assumption that I am right, and Representative Osterback's committee moves the resolution, I would appreciate it if it could be promptly calendared, for it is the type ammunition which Representative Cowper can put to good use on the east coast.

Thanks for your anticipated cooperation.

PUBLIC NOTICE

ALASKA ESKIMO WHALING COMMISSION MANAGEMENT PLAN

Subpart A — Introduction

S100.1 Purpose of regulations

It is the purpose of the regulations contained herein to: (a) insure an efficient subsistence harvest of bowhead whales; and (b) provide a means within the Alaskan Eskimo customs and institution of limiting the bowhead whale harvest in order to prevent the extinction of such species.

S100.2 Scope of Regulations

The regulations contained herein apply to the subsistence hunting of bowhead whales by Eskimos located in the State of Alaska.

Subpart B — Alaska Eskimo Whaling Commission

S100.11 Powers

(a) The Alaska Eskimo Whaling Commission (hereinafter AEWC) is empowered to administer the regulations contained herein to insure that the purposes stated in S100.1 of these regulations are attained.

(b) The AEWC is empowered to enforce these regulations by:

(1) denying any person who violates these regulations the right to participate in hunting the bowhead whale.

(2) acting as an enforcement agent for any governmental entity authorized to enforce these regulations.

(c) The AEWC is empowered to promulgate interim regulations that are in addition to, but not in lieu of, regulations contained herein.

S100.12 Duties

(a) The AEWC shall administer and enforce the regulations contained herein (including any interim regulations).

(b) The AEWC shall conduct village educational programs to facilitate compliance with these regulations, including training programs for whaling captains and crews.

(c) The AEWC shall initiate research for improvement of the accuracy and reliability of weapons.

Subpart C — Regulations

S100.21 Definitions

(a) "bowhead whale" means a whale whose scientific name is Balean mysticetus and which migrates past whaling villages in Alaska.

(b) "captain" means the person in charge of a whaling crew.

(c) "harvest" means to kill and bring to shore or butchering area.

(d) "non-traditional weapons" means any instrument that could be used to harvest a bowhead whale that is not a traditional weapon.

(e) "Scientific Committee" means the committee established pursuant to S100.26 of these regulations.

(f) "traditional weapon" means a harpoon with line attached, darting gun, shoulder gun, lance or any other weapon approved by the AEWC with the concurrence of the Scientific Committee, as such a weapon in order to improve the efficiency of the bowhead whale harvest.

(i) "harpoon with line attached" means. . .

(ii) "darting gun harpoon" means. . .

(iii) "shoulder gun" means. . .

(iv) "lance" means. . .

(g) "whaling crew" means those persons who participate directly in the harvest or attempted harvest of the bowhead whale and are under the supervision of a captain.

(h) "whaling village" means an Alaska Eskimo village in which resides a whaling captain and crew which participates in the harvest or attempted harvest of bowhead whales.

(i) "whaling season" means customary period of time in which the bowhead whale is harvested in either spring or fall.

S100.22 Registration

(a) All whaling captains of whaling crews shall file and register with the AEWC on forms provided by the AEWC for that purpose which discloses his name, address, age, qualifications as captain, names of crew members, and his willingness to abide by the regulations of the AEWC and to require his crew to abide by those regulations.

(b) The AEWC shall take into account any reading or language difficulties in developing procedures and forms for registration.

S100.23 Reports

(a) Each whaling captain shall be responsible for keeping a written record of the number of whales —

(1) attempted to be be harvested by using traditional weapons but not harvested; or

(2) harvested by the captain or his crews.

(3) all sightings of bowhead whales.

(b) Each whaling captain shall report the date, place, and time of any striking not resulting in harvesting and shall describe —

(1) the size of the bowhead whale,

(2) any known later attempted harvest or actual harvest of said whale, and

(3) the reason for the captain or crew not harvesting the whale — e.g. environmental factors, the failure of traditional weapons, or other reason.

PUBLIC NOTICE CONTINUED

(c) Each whaling captain shall make such other reports as the AEWC requires in order to accomplish the purposes of the regulations herein or in order to advance the scientific knowledge of the bowhead whale.

S100.24 Permissable harvesting methods

(a) No whaling captain or crew shall harvest or attempt to harvest the bowhead whale in any manner other than the traditional harvesting manner.

(b) "Traditional harvesting manner" means:

(1) only traditional weapons shall be used; as defined in 100.21(f).

(2) the bowhead whale may be struck with a harpoon darting gun with line and float attached or simultaneously with harpoon and shoulder gun or darting gun.

(3) use of shoulder gun or darting gun:

(i) when accompanied by harpoon with or without darting gun

(ii) after a line has been secured to the bowhead whale

(iii) when pursuing a wounded bowhead whale with a float attached.

S100.25 Traditional proprietary claim

The bowhead whale shall belong to the captain and crew which first strikes the bowhead whale in the manner described in S100.24.

S100.26 Level of harvest

(a) The AEWC shall establish the levels of harvest and attempted harvest for each whaling village during each season. Such levels may be set by methods including, but not limited to, the following:

(i) Specification of number of whaling crews permitted to harvest or attempt to harvest bowhead whales during specified periods;

(ii) Specification of the size or age of whales which may be taken during specified periods, after consultation with the Scientific Committee.

(iii) Specification of the number of whales that may be taken by each crew.

(iv) Specification of the number of bowhead whales which may be harvested or attempted to be harvested by each village.

(b) The level of harvest supported by scientific data shall be no greater than that necessary to meet the nutritional needs of the Eskimo inhabitants of the State of Alaska.

(c) In establishing the levels of harvest and attempted harvest, the AEWC shall not establish levels of harvest or attempted harvest greater than the carrying capacity of the bowhead whale stock supporting scientific data.

(d) The carrying capacity of the bowhead whale stock shall be determined by a Scientific Committee appointed by the Polar Research Board of the National Academy of Sciences. The Scientific Committee shall consist of nine members who are qualified by reason of their education and experience to make objective determination concerning the carrying capacity of the bowhead whale stock.

(e) In determining the carrying capacity of the bowhead whale stock the Scientific Committee shall not consider any prospective threats to the species resulting from oil and gas development within the habitat of such species. This section may further be implemented by the Scientific Committee and the AEWC at a later date.

(f) The mortality rate for attempted harvest shall be determined by the Scientific Committee.

Subpart B — Penalties

S100.31 Denial of participation in harvest:

(a) Any person who the AEWC determines has violated the regulations contained herein shall, after opportunity for a hearing before the AEWC, be prohibited from harvesting or attempting to harvest the bowhead whale for a period of not less than one season nor more than five seasons.

(b) Any person who wilfully violates the regulations contained herein shall be subject to a fine of not more than $1,000 assessed by the AEWC. No person shall harvest or attempt to harvest the bowhead whale until such fine has been paid.

Special Committee
on Subsistence

Pouch V
State Capitol
Juneau, Alaska 99811

Minutes: February 16, 1978
Labor and Management Hearing Room 207, Assembly Building

The meeting was called to order by Rep. Nels A. Anderson, Jr., Chairman, at 2:40 p.m. Committee members in attendance were: Rep. William Akers, Rep. Sam Cotten, Rep. Steve Cowper, Rep. Joe Hayes, Rep. Al Nakak, and Rep. Nels A. Anderson. Rep. Leo Schaeffer was absent.

Rep. Thelma Buchholdt was present to testify on House Bills: 686 and 687; and House Joint Resolutions: 49 and 55. Also present was Rep. Al Osterback of the Resource Committee, George Utermohle, Research Analyst, and Joe Guthrie, Legislative Counsel.

Chairman Anderson gave an activity report and stated that a staff assistant has not been appointed, but that the secretarial position was filled by Elizabeth Ali.

Rep. Buchholdt stated that HB 686 and 687 were companion bills addressing bowhead whaling. She believes in the conservation of natural resources yet recognizes the need for the coastal people to hunt whales. She is convinced of this need and has had meetings regarding the bowhead whaling controversy. She attended the whaling conference in Pt. Barrow and learned from the hearings and the International Whaling Commission (IWC) at the meeting in Tokyo that Alaskans should get a better view of the issue so she has introduced these bills.

HB 687 would make a special appropriation to the Department of Fish and Game for disbursement to the Alaska Eskimo Whaling Commission (AEWC). Rep. Cowper asked who comprised the AEWC and how the money would be spent. The AEWC members are a group of whaling captains from St. Lawrence, Pt. Barrow, Savoonga, Pt. Hope, and Pt. Leigh. $250,000 appropriated from the general fund would enable the AEWC to: 1) gather data on the population, migration, and habits of whales; 2) monitor the subsistence harvest of whales; 3) reduce the number of whales struck and lost; and 4) present data gathered and represent the interest of the Alaskan subsistence whalers to the federal government and the IWC.

The IWC granted the AEWC a quota of 12 whales last year, this quota may change if it is known that there are more whales. Rep. Buchholdt asked that Sec. 2 of Senate Bill 440 sponsored by Senator Ferguson be amended to read: "This Act takes effect March 1, 1978".

Rep. Cowper felt that the committee needed to learn more about this issue. Howevever, Rep. Nakak said that the issues had been discussed to his satisfaction and that the intention of the bill was for the Alaskan Eskimo to be the vehicle to conduct a survey with the National Oceanic and Atmospheric Administration and other conservation groups on the ban on bowhead whaling. The agreement of AEWC and IWC sets a quota of 12 whales, but more information is needed for next years meeting.

Rep. Copwer said that the AEWC information was not accepted by the IWC at the Barrow meeting. He asked whether or not the IWC would accept the data gathered by AEWC. Rep. Anderson replied that when Sen. Poland and Rep. Osterback heard the AEWC, the Alaska Department of Fish and Game had neither the capability or the staff to give accurate data on the whale population and the number of whales lost. The federal government stated that neither side has any answers and that the AEWC could gather data.

Rep. Cowper said that the AEWC may gather data, but should have the sanction of the IWC. Rep. Buchholdt was informed in June last year that there would be a ban after the September hearing. The State Department included Alaskan Eskimos as delegates in the United States membership at the conference. The information given at this conference was conjecture and from various opinions. Funding would be necessary to authenticate the account, to study improved hunting methods, to reduce the number of whales lost, and to get an accurate number of whales. Rep. Cowper stated again that the AEWC must have the sanction of perhaps the U.S. Fish and Wildlife so that the IWC accepts AEWC information.

The IWC has no jurisdiction on subsistence whaling, and Rep. Buchholdt felt that if the Alaska State Legislature cosponsor a bill addressing this issue than the AEWC would have more clout. This would impact the federal government. Rep. Hayes pointed out that House Joint Resolution 49 defines the goals and objectives of the AEWC. The appropriation implements the proposed plan, defines the extent and functions of the AEWC.

Rep. Nakak informed the committee that whaling captains were meeting with arms campanies and manufacturers to improve antiquated hunting methods and guns.

Rep. Hayes told the committee that this bill should be reviewed before its gets to the House floor. Rep. Nakak replied that testimony material was not available and that the Alaska Department of Fish and Game has endorsed the AEWC management plan so that the Subsistence Committee does not have to convince the Department of Commerce or anyone else of the management plan. Rep. Anderson stated that House Bills 686 and 687 would go to the Resource and Finance Committees once they move from the Subsistence Committee.

Rep. Buchholdt said that House Joint Resolution 55 also addresses the whaling issue. HJR 55 requests the Secretary of Commerce to allocate adequate funding to a comprehensive long-term research program on the bowhead and other arctic whales; and to cooperate with

the State of Alaska and the AEWC in the management of the bowhead conservation program. Rep. Hayes felt that he did not have adequate background and would like to get more information. Rep. Anderson said that there is no satisfactory background, but would get a tape of the joint meeting. There has been no action taken to date so House Bills 686 and 687 should move into the Resource Committee. Rep. Nakak moved to pass HB 686. Motion passed.

A motion was made to amend HB 687, Sec. 2 to read: " This Act takes effect March 1, 1978". Rep. Nakak moved to pass HB 687, motion passed.

HJR 49 endorses the AEWC management plan and urges its full support before the International Whaling commission. Rep. Nakak said that the United States is not a whaling nation. The only people who hunt whales are represented by the AEWC. The motion to move HJR 49 passed.

Rep. Buchholdt is very interested in HJR 55 and wishes the legislature to address the conservation of bowhead whale issue. The resolution asks the United States to address this problem. The Congressional delegation has Senator Ted Stevens assurance that they will cooperate in this venture so this resolution should pass to show that the Alaska State Legislature will cooperate. Rep. Nakek moved to pass HJR 55. Rep. Anderson will ask Speaker of the House Malone to refer this resolution to the House Resource Committee.

Discussion of HJR 48 followed. This resolution is a reflection of the desire of rural people who wish recognition of their need to hunt spring birds. They know that there will be considerable resistance to the spring harvest of migratory birds, but it is necessary to augment their food stores when airplanes are unable to land in rural areas. The resolution requests the President of the United States to amend existing treaties to conform to the approach taken in the recent U.S.-U.S.S.R treaty, allowing rural residents of Alaska to hunt migratory game birds in the springtime if consistent with the conservation of migratory birds stocks.

Rep. Buchholdt sees the need for spring hunting from her experience in traveling up north. She said that the treaty has no regard for Native people. The conservation aspects are important and a measure is necessary to protect the birds. Rep. Nakek gave strong support to the resolution, but stated that is is controversial and asked to hold it and not pass it. He felt that Rep. Cotten should have the opportunity to view the resolution and state his opinion to the committee.

A motion was made by Rep. Nakak to adjourn. Rep. Anderson informed the committee of the upcoming Citizen's Participation Conference in Juneau on February 23, 24, and 25. George Utermohle and Joe Guthrie were recognized and thanked for their work in the committee.

HJR 48 was held over for the next meeting. The meeting adjourned at 3:30 p.m.

Respectfully submitted,

Elizabeth C. Ali

Elizabeth C. Ali, Secretary

CIAA AGREES WITH SJR49 BY SEN KERTTULA. HIS IS A REASONABLE APPROACH FOR HELPING SALMON RETURNS IN CONTRAST TO THOSE WHO WOULD CURTAIL ALL AQUACULTURE EFFORTS UNTIL THEY WERE ASSURED OPPORTUNITY TO HARVEST NOW REGARDLESS OF CONSEQUENCES. PLEASE SUPPORT THIS RESOLUTION AND HELP SALMON, NOT VESTED INTEREST GROUPS.

COOK INLET AQUACULTURE ASSN FLOYD E HEIMBUCH, MANAGER

95TH CONGRESS
2D SESSION

S. 2762

IN THE SENATE OF THE UNITED STATES

MARCH 17 (legislative day, FEBRUARY 6), 1978

Mr. GRAVEL introduced the following bill; which was read twice and referred to the Committees on Agriculture, Nutrition, and Forestry and Commerce, Science, and Transportation jointly by unanimous consent

A BILL

To provide for the development of aquaculture in the United States, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That this Act may be cited as the "National Aquaculture Organic Act of 1978".

SEC. 2. FINDINGS, PURPOSE, AND POLICY.

(a) The Congress finds the following:

(1) The world production of seafood has declined since 1970 and the harvest of some populations of fish and shellfish has exceeded levels of maximum sustainable yield.

(2) Certain stocks of fish and shellfish of importance to the United States are depleted, or are declining, and such depletion or decline has an undesirable impact on both commercial and recreational fisheries.

(3) There is an extensive market for seafood in the United States, but the United States imports in excess of 50 percent of its fish and shellfish for human consumption (which imports are ten times the level of exports), and this dependence on imports as a source of protein makes it difficult to insure continuous supplies and suggests that alternatives such as aquaculture be developed.

(4) Many segments of the world population are now facing serious nutritional deficiencies and food shortages due to adverse climatic conditions and the steady growth of population. These problems will become more severe, and the resulting demand for increased food production will have to be met chiefly through the application of scientific and technological advances from research on aquaculture and other food production systems.

(5) Aquaculture is contributing significantly to world food supplies with production equal to 10 percent of current landings of seafoods and has the potential for increase by a factor of five before the end of this century.

(6) Less than 3 percent of current United States fisheries production results from aquaculture but there is a good potential for expanding production from aquaculture to equal or exceed the worldwide average, thereby helping to provide United States consumers with stable supplies of high quality aquatic foods.

(7) Growth of aquatic plants is a source of food for human and animal consumption as well as a source of industrial materials and energy. The Congress recognizes the importance of developing aquaculture of both plant and animal species.

(8) The stocking of advanced life stages of fish and shellfish produced by aquaculture is a means of rebuilding and augmenting fish and shellfish populations and establishing new fisheries.

(9) The application of aquaculture technology offers opportunities for the recovery of wasted thermal energy, nutrients, and other resources and may be a more efficent use of these resources for food production than current methods of agriculture.

(10) Where water, whether fresh, brackish, or marine is suitable for aquaculture, appropriate consideration should be given to the utilization of such water for aquaculture along with the other uses of such water.

(11) Where land-use management policies may inhibit the development of aquaculture facilities in areas suitable for aquaculture, appropriate consideration should be given to the utilization of these areas for aquaculture along with the other uses of such areas.

(12) Current efforts to develop aquaculture in the United States are highly diffuse, and a strong commitment by the Federal Government will make aquaculture more efficient and competitive, thereby stimulating public and private investment and development.

(13) While many scientific and technological problems are unsolved, there is sufficient knowledge to further the development of aquaculture production systems for many species of fish and shellfish.

(14) The development of aquaculture in the United States has been limited by the inability of producers of aquatic species to obtain adequate capital and a reliable source of seed stock.

(15) Aquaculture in the United States has traditionally concentrated on a few aquatic species, but many others have a potential for commercial and other culture. However, the culture of additional species may include a higher degree of risk than the culture of traditional species, especially during the initial stages.

(16) Government programs that help to reduce the

risks associated with production of agricultural commodities have not been generally available to producers of those aquatic species in which the risk is high.

(17) The rehabilitation and enhancement of the publicly owned fish and shellfish resources are desirable applications of aquaculture technology as a means to increase the general public benefits to be derived from the utilization of these common property resources.

(18) Extensions of jurisdiction over marine resources by numerous nations have resulted in the exclusion of many fishing nations from traditional fishing areas and created a demand in those nations for aquatic foodstuffs. Aquaculture could supply this new demand.

(19) The Select Committee on Nutrition and Human Needs of the Senate has recommended an increase in the fish consumption of the American family. Aquaculture can help to carry out this recommendation.

(b) The purpose of this Act is to promote aquaculture in the United States by—

(1) declaring a national aquaculture policy;

(2) establishing and implementing a national plan for aquaculture; and

(3) developing programs and encouraging activities:

which will result in the coordination of domestic aquaculture efforts, the conservation of existing aquatic resources, the rehabilitation and enhancement of the publicly owned fish and shellfish stocks, the encouragement of commercial aquaculture activities, the creation of new industries and job opportunities, and other national benefits.

(c) Aquaculture has a high potential for agumenting existing commercial and sport fisheries, thereby increasing the supply of aquatic protein for both human and animal consumption and assisting the United States in meeting its future food needs and contributing to the solution of world food problems. It is, therefore, in the national interest, and it is the national policy, to encourage the development of aquaculture.

SEC. 3. DEFINITIONS.

As used in this Act—

(1) The term "aquaculture" means the propagation and rearing of aquatic species in controlled or selected environments, including ocean ranching.

(2) The term "aquaculture facility" means any land, structure, or other appurtenance, if such land, structure, and appurtenance is located within the United States, which is used for aquaculture, including, but not limited to, any laboratory, vehicle, hatchery, rearing pond, raceway, pen, incubator, or other equipment.

(3) The term "aquatic species" means any species, native or introduced, of finfish, mollusk or crustacean or other aquatic invertebrate, amphibian, reptile, or aquatic plant, other than any such species which is primarily used for ornamental purposes.

(4) The term "Fund" means the Federal Aquaculture Assistance Fund established by section 11.

(5) The term "person" means any individual who is a citizen or national of the United States and any corporation, partnership, association, or other entity (including, but not limited to, any community development corporation or fisherman's cooperative) organized or existing under the laws of any State.

(6) The term "Secretary" means the Secretary of Commerce.

(7) The term "State" means any of the several States, the District of Columbia, the Commonwealth of Puerto Rico, American Samoa, the Virgin Islands, Guam, the Trust Territory of the Pacific Islands, and any other Commonwealth, territory, or possession of the United States.

(8) The term "United States", when used in a geographical context, means all States.

SEC. 4. NATIONAL AQUACULTURE DEVELOPMENT PLAN.

(a) (1) Before the close of the 1-year period beginning on the effective date of this Act, the Secretary, after consultation with the Secretary of the Interior and the Secretary of Agriculture, shall prepare a national aquaculture development plan (hereinafter in this Act referred to as the "plan").

(2) (A) The Secretary shall, after consultation with the Secretary of the Interior and the Secretary of Agriculture, establish an advisory committee for the purpose of assisting the Secretary in formulating a plan responsive to the various regional needs, interests, and approaches to the concept of aquaculture.

(B) Such advisory committee shall be composed of regional subcommittees. The subcommittee regions shall be established as follows:

(i) Eight regional subcommittees shall be created which correspond in geographical composition to the eight regional divisions created under section 302 (a) of the Fishery Conservation and Management Act of 1976.

(ii) Other regional subcommittees shall be created by the Secretary to represent the remaining nonoceanic States which are not a part of the regional subcommittees created by clause (i) of this subparagraph. Such other regional subcommittees shall be established on the basis of the following criteria:

(I) geographical proximity of States to one another,

(II) similarity of States in aquacultural activities and potential, and

(III) other relevant factors.

(C) Membership of the regional advisory subcommittee from any region must include representatives of at least the following groups, where such groups exist in that region:

(i) State fish and game department;

(ii) commercial fishermen;

(iii) fishfood processors;

(iv) private sector aquaculture organizations;

(v) regional fishery management councils;

(vi) Federal Fish and Wildlife Agency;

(vii) recreational fishermen; and

(viii) educational institutions.

(D) The Governors of the various States shall appoint members to the regional advisory subcommittees.

(E) The members of the regional advisory committees established under subparagraph (B), while away from their homes or regular places of business in the performance of services for the committee, shall be allowed travel expenses, including per diem in lieu of subsistence, in the same manner as persons employed intermittently in the Government serv-

ice are allowed expenses under section 5703 of title 5, United States Code.

(b) The plan shall be formulated at the regional level and coordinated and finalized at the secretarial level. The final plan shall—

(1) identify those aquatic species (hereinafter referred to in this Act as "priority aquatic species") which the Secretary determines to have a potential for culturing on a commercial or other basis, which determination shall be made by the Secretary after taking into account—

(A) the extent of commercial aquaculture, if any, currently being carried out with respect to such species, and the projected biological and economic feasibility of culturing such species;

(B) the extent to which aquaculture research and development have been undertaken, within the public and private sectors, with respect to such species;

(C) the time and resources which will be required to develop aquaculture technology to the point where such species can be cultured on a commercial or other basis; and

(D) such other factors as the Secretary determines to be appropriate; and

(2) contain an aquaculture development program, prepared by the Secretary, for each priority aquatic species.

(c) The aquaculture development program contained in the plan for each priority aquatic species shall set forth those actions which the Secretary determines should be undertaken, and the period of time within which each such action should be completed, to provide for the culture of each such species on a commercial or other basis. Such actions, with respect to each priority aquatic species, shall include—

(1) such research and development, technical assistance, demonstration, extension education, and training as may be necessary and appropriate regarding—

(A) aquaculture facility design and operation,

(B) water quality management,

(C) utilization of waste products (including thermal effluents),

(D) nutrition and the development of economical feeds,

(E) life history, genetics, physiology, and pathology and disease control (including research regarding organisms which may not be harmful to fish and shellfish but are injurious to humans),

(F) processing and market development, and

(G) production management and quality control;

(2) research with respect to the effect of the culture of such species on estuarine and other water areas;

(3) the identification and analysis of any legal or regulatory constraints which may affect the culture of such species;

(4) the development of adequate supplies of seed stock;

(5) the construction, purchase, lease, or acquisition of necessary developmental aquaculture facilities; and

(6) such other actions relating to research and development, technical assistance, demonstration, extension education, and training as such Secretary deems necessary and appropriate.

(d) In preparing an aquaculture development program for any priority aquatic species, and in reviewing any such program pursuant to subsection (f), the Secretary shall, to the extent practicable, take into account any significant action which has been, or which is proposed to be undertaken by any other Federal agency, any State agency, or any person, and which may affect the accomplishment of the program.

(e) Each action under each aquaculture development

program prepared under this section for a priority aquatic species shall be implemented, either individually, jointly, or collectively, by the Secretary, the Secretary of the Interior, or the Secretary of Agriculture, as specified by the Secretary in the program on the basis of—

(1) responsibilities vested in the respective Secretaries by law or any executive action having the effect of law (including, but not limited to, Reorganization Plan Numbered 4 of 1970) ; and

(2) in cases where paragraph (1) does not apply, the experience, expertise, and other appropriate resources which the department, over which the Secretary concerned has jurisdiction, may have with respect to the action required under the program.

(f) (1) The Secretary, in consultation with the Secretary of the Interior, the Secretary of Agriculture, and the chief executive officer of any other Federal agency, any appropriate Regional Fishery Management Council, and any State agency which has significant functions which relate to aquaculture, shall review on an annual basis—

(A) each aquatic species not identified as a priority aquatic species; and

(B) the aquaculture development program established under the plan for each priority aquatic species to determine whether the actions specified in the program

are being accomplished on a successful and timely basis.

(2) If as a result of the review conducted pursuant to paragraph (1) (A), the Secretary determines, after taking into account the criteria set forth in subsection (b) (1), that any aquatic species has a potential for culturing on a commercial or other basis the Secretary shall by regulation amend the plan to identify such species as a priority aquatic species and prepare an aquaculture development program for such species pursuant to subsection (c).

(3) If as a result of the review conducted pursuant to paragraph (1) (B), the Secretary finds that—

(A) any action so specified should be revised, the Secretary shall make such revision to the program as he deems necessary and appropriate; or

(B) sufficient progress is not being made with respect to any such program or that actions taken under any such program indicate that culture of the priority aquatic species concerned is doubtful, the Secretary shall cancel the program.

The Secretary shall by regulation amend the plan whenever any revision or cancellation is made pursuant to this subsection.

SEC. 5. FUNCTIONS AND POWERS.

(a) In implementing the aquaculture development program prepared under section 4 for any priority aquatic

species, the Secretary, the Secretary of the Interior, or the Secretary of Agriculture, as the case may be, shall—

(1) provide advisory, educational, and technical assistance (including training) with respect to culture of the species to interested public and private organizations and individuals, but in providing such assistance, shall, to the maximum extent practicable, avoid duplication of like assistance provided by other Federal agencies;

(2) consult and cooperate with interested persons, Federal, State, and local government agencies, regional commissions, and educational institutions regarding the development of aquaculture technology;

(3) produce, under the authority of section 4(c)(4), and sell at cost seed stock for the priority aquatic species when privately produced seed stock is unavailable, unreliable, or not sufficient to meet production needs;

(4) encourage the implementation of aquaculture technology in the rehabilitation and enhancement of the publicly owned fish and shellfish stocks, as well as the promotion of private commercial aquacultural enterprises;

(5) assist the development of aquaculture by requiring that in areas where multiple land and water

uses exist, aquaculture should be viewed as an important use which should be given appropriate consideration; and

(6) prescribe such regulations as may be necessary to carry out such program.

(b) The Secretary, the Secretary of the Interior, or the Secretary of Agriculture may, incident to such Secretary's implementation of any aquaculture development program—

(1) for the purposes of assessing the biological and economic feasibility of any aquaculture system—

(A) conduct scale tests of the system, and, if necessary for the conduct of any such test, construct, operate, and maintain developmental aquaculture facilities, including, but not limited to, pilot plants for testing laboratory-scale results; and

(B) conduct such other tests or analyses as may be necessary;

(2) develop methods to enhance aquatic species stocks by aquaculture;

(3) carry out such studies and research with respect to aquatic species as may be appropriate regardless of whether such species is or has been identified as a priority aquatic species; and

(4) take such other actions as such Secretary deems necessary and appropriate.

(c) In addition to carrying out such other functions as are required under this Act, the Secretary shall—

(1) establish and maintain an aquaculture information center which shall function as a national clearinghouse for the collection, selection, analysis, and dissemination of scientific, technical, legal, and economic information relating to aquaculture;

(2) conduct appropriate surveys, in coordination with other agencies, of public and private aquaculture being carried out in the United States with respect to each aquatic species for the purpose of acquiring information on acreages, water use, production, culture techniques, and other relevant matters;

(3) arrange for the mutual exchange of information relating to aquaculture with foreign nations; and

(4) conduct a continuing study to determine which existing capture fisheries could be adversely impacted in the marketplace by competition from products produced by commercial aquaculture enterprises significantly aided under this Act, which study shall include an assessment of economic impact by species and by geographical region, and recommended measures to ameliorate any adverse impact. The Secretary shall report to Congress on the findings made under such study

no later than 2 years following the effective date of this Act and every 2 years thereafter.

Any production information submitted to the Secretary by any person under paragraph (2) shall be confidential and shall not be disclosed except to the Secretary, the Secretary of the Interior, or the Secretary of Agriculture, as the case may be, for purposes of carrying out this Act, the advisory committee which may be established under section 4(a) (2) (A), or when required under court order. The Secretary shall by regulation prescribe such procedures as may be necessary to preserve such confidentiality, except that the Secretary may release or make public any such information in any aggregate or summary form which does not directly or indirectly disclose the identity or business of any person who submits such information.

(d) (1) The Secretary, the Secretary of the Interior, and the Secretary of Agriculture are each authorized to accept any gift, temporary donation, or devise or bequest of real or personal property, or the proceeds therefrom, or interests therein, for use in carrying out any function that such Secretary may have under this Act. Any such acceptance may be subject to the terms of any restrictive or affirmative covenant, or condition of servitude, if such terms are deemed by the Secretary concerned to be in accordance with

law and compatible with the purpose for which acceptance is sought.

(2) Any gift or bequest of money, and any proceeds from the sale of other property received as a gift or bequest under this subsection, shall be deposited in a separate account in the Treasury and shall be disbursed upon the order of the Secretary concerned.

SEC. 6. COORDINATION OF FEDERAL AGENCY ACTIVITIES REGARDING AQUACULTURE.

(a) (1) There is established the Interagency Committee on Aquaculture (hereinafter in this section referred to as the "Committee") which shall be composed of the following officers or their designees:

(A) The Secretary, who shall be the Chairman of the Committee.

(B) The Secretary of the Interior.

(C) The Secretary of Agriculture.

(D) The Administrator of the Environmental Protection Agency.

(E) The Administrator of the Energy Research and Development Administration.

(F) The Commissioner of Food and Drugs.

(G) The Administrator of the Small Business Administration.

(H) The Chief of Engineers.

(I) The chief executive officer of any other Federal agency and any Regional Fishery Management Council which the Secretary finds to have significant functions which relate, or may relate, to the development of aquaculture.

(2) The functions of the Committee shall be—

(A) to ensure that there is a continuing exchange of information among the agencies represented on the Committee with respect to the nature and status of the programs or projects being carried out by such agencies which relate, or which may relate, to aquaculture in general or to the implementation of the plan; and

(B) to review on a continuing basis the relevant programs and projects of all Federal agencies to determine whether they are being carried out in compliance with subsection (b).

(b) Each Federal agency which has any function or responsibility with respect to aquaculture or has jurisdiction over any activity which affects, or may affect, the achievement of the purposes of this Act, shall, in consultation with the Secretary and to the maximum extent practicable, carry out such function, responsibility, and activity in a manner which is consistent with the purposes of this Act.

(c) Nothing in this Act shall be construed to amend,

repeal, or otherwise modify the authority of any Federal officer or any Federal agency to carry out any functions relating to aquaculture which are authorized under any other provision of law.

SEC. 7. CONTRACTS AND GRANTS.

(a) The Secretary may carry out any function under this Act, and the Secretary of the Interior or the Secretary of Agriculture may carry out any function relating to any aquaculture development program which he is specified to implement under the plan, through grants to, or contracts with, any other Federal agency, any agency of any State and, subject to the approval of the State, any agency of any political subdivision thereof, any regional commission, any educational institution, or any other person.

(b) Any contract entered into, or any grant made, pursuant to this section shall contain such conditions and limitations as the Secretary concerned shall by regulation prescribe as being necessary and appropriate to protect the interests of the United States; except that no contract may be entered into, and no grant may be made, pursuant to this section unless the applicant submits with his application therefor a certification from each appropriate State agency and each appropriate local government agency stating that nothing in the laws administered by such agency prevents

the carrying out of the project to which the contract or grant will be applied.

(c) The amount of any grant made pursuant to this section may not exceed one-half the estimated cost of the project for which the grant is made.

(d) Any person who receives a grant or contract under this section shall make available to the Secretary concerned and to the Comptroller General of the United States, or any of their authorized representatives, for purposes of audit and examination, any book, document, paper, and record that is pertinent to the funds received by such person under such grant or contract.

SEC. 8. GUARANTEES OF OBLIGATIONS ISSUED FOR AQUACULTURE FACILITIES.

(a) (1) The Secretary may, subject to the provisions of this section, guarantee, or make a commitment to guarantee, the payment of interest on, and the principal amount of, any obligation issued by an obligor for any of the following purposes:

(A) The financing of the construction, reconstruction, or reconditioning of any aquaculture facility (including the financing of the purchase cost of any aquaculture facility to be reconstructed or reconditioned); except that no obligation may be guaranteed under this section later than 2 years after the date

of the completion of the construction, reconstruction, or reconditioning of the aquaculture facility involved.

(B) The acquisition of stocks of aquatic species for any aquaculture facility.

(C) The financing of the initial operating expenses of any aquaculture facility.

(D) The financing of marketing operations exclusively for aquaculture products.

(E) The refinancing of any existing obligation issued for any of the purposes specified in subparagraph (A), (B), (C), or (D), whether or not guaranteed under this section, including, but not limited to, any short-term obligation incurred for the purpose of obtaining temporary funds for refinancing.

Guarantees and commitments to guarantee may be made under this section without regard to section 3679 (a) of the Revised Statutes of the United States (31 U.S.C. 665 (a)).

(2) The full faith and credit of the United States is pledged to the payment of all guarantees made under this section with respect to both principal and interest, including any interest, if provided for in the guarantee, which may accrue between the date of default under a guaranteed obligation and the payment in full of the guarantee.

(3) Any guarantee, or commitment to guarantee, made by the Secretary under this section shall be conclusive evi-

dence of the eligibility of the obligation for such guarantee, and the validity of any guarantee, or commitment of guarantee, so made shall be incontestable.

(4) The aggregate unpaid principal amount of all obligations guaranteed under this section and outstanding at any one time shall not exceed $500,000,000.

(b) (1) Obligations guaranteed under this section—

(A) shall have an obligor approved by the Secretary as being responsible and possessing the ability, experience, financial resources, and other qualifications necessary for the adequate operation and maintenance of the aquaculture facilities;

(B) shall be in an aggregate principal amount which does not exceed 87½ percent of the actual cost involved or the depreciated actual cost, as determined by the Secretary;

(C) shall have maturity dates satisfactory to the Secretary, but not to exceed 25 years;

(D) shall provide for payments by the obligor satisfactory to the Secretary; and

(E) shall bear interest (exclusive of charges for the guarantee and service charges, if any) at rates not to exceed such percentage per annum on the unpaid principal as the Secretary determines to be reasonable, taking into account the range of interest rates prevailing in

the private market for similar loans and the risks assumed by the Secretary.

(2) In guaranteeing any obligation under this section, the Secretary shall give preference to any person with 40 or fewer employees which, together with its affiliates, is primarily engaged in the business of aquaculture or commercial fishing for aquatic species.

(3) No obligation shall be guaranteed under this section unless the obligor conveys or agrees to convey to the Secretary such security interest as the Secretary may require to reasonably protect the interests of the United States.

(c) (1) The Secretary may charge a fee for any obligation guaranteed under this section, the amount of which shall be established by the Secretary by regulation but which may not exceed one-half of 1 percent per annum of the outstanding principal balance of the obligation. Fee payments shall be made by the obligor to the Secretary when moneys are first advanced under a guaranteed obligation and at least 60 days before each anniversary date thereafter.

(2) The Secretary shall charge and collect from the obligor such amounts as he may deem reasonable for the investigation of the application for any guarantee, for the appraisal of properties offered as security for any guarantee,

and for the inspection of such properties during construction, reconstruction, or reconditioning; except that such charges shall not aggregate more than one-half of 1 percent of the original principal amount of the obligation to be guaranteed.

(3) All fees and other amounts received by the Secretary under the provisions of this subsection shall be deposited in the Fund.

(4) Obligations guaranteed under this section, and agreements relating thereto, shall contain such other provisions with respect to the protection of the security interests of the United States (including acceleration and subrogation provisions and the issuance of notes by the obligor to the Secretary), liens and releases of liens, payments of taxes, and such other matters as the Secretary may prescribe.

(d) (1) In the event of a default, which has continued for 30 days, in any payment by the obligor of principal or interest due under any obligation guaranteed under this section, the obligee or his agent shall have the right to demand, at or before the expiration of such period as may be specified in the guarantee or related agreements, but not later than 90 days from the date of such default, payment by the Secretary of the unpaid principal amount of said obligation and of the unpaid interest thereon to the date of payment. Within such period as may be specified in the

guarantee or related agreements, but not later than 30 days from the date of such demand, the Secretary shall promptly pay to the obligee or his agent the unpaid principal amount of the obligation and unpaid interest thereon to the date of payment; except that the Secretary shall not be required to make such payment if before the expiration of such period he finds that there was no default by the obligor in the payment of principal or interest or that such default has been remedied before any such demand.

(2) Payments required to be made by the Secretary under paragraph (1) shall be made by the Secretary from the Fund.

(3) In the event of any payment by the Secretary under paragraph (1), the Secretary shall have all rights in any security held by him relating to his guarantee of such obligations as are conferred upon him under any security agreement with the obligor. Notwithstanding any other provision of law relating to the acquisition, handling, or disposal of property by the United States, the Secretary may, under such terms and conditions as the Secretary prescribes or approves, complete, recondition, reconstruct, renovate, repair, maintain, operate, or sell any property acquired by him pursuant to a security agreement with the obligor.

(4) After any default referred to in paragraph (1), the Secretary shall take such action against the obligor or

any other parties liable thereunder that, in his discretion, may be required to protect the interests of the United States. Any suit may be brought in the name of the United States or in the name of the obligee and the obligee shall make available to the United States all records and evidence necessary to prosecute any such suit. The Secretary may accept a conveyance of title to and possession of property from the obligor or other parties liable to the Secretary and may purchase the property for an amount not greater than the unpaid principal amount of such obligation and interest thereon. In the event the Secretary receives through the sale of property an amount of cash in excess of any payment made to an obligee under paragraph (1) and the expenses of collection of such amounts, he shall pay such excess to the obligor.

(5) Whoever, for the purpose of obtaining any loan or advance of credit from any person with the intent that an obligation relating to such loan or advance of credit shall be offered to or accepted by the Secretary to be guaranteed, or for the purpose of obtaining any extension or renewal of any loan, advance of credit, or mortgage relating to an obligation guaranteed by the Secretary, or the acceptance, release, or substitution of any security on such a loan, advance of credit, or for the purpose of influencing in any way the action of the Secretary under this section, makes,

passes, utters, or publishes, or causes to be made, passed, uttered, or published any statement, knowing the same to be false, or alters, forges, or counterfeits, or causes or procures to be altered, forged, or counterfeited, any instrument, paper, or document, or utters, publishes, or passes as true, or causes to be uttered, published, or passed as true, any instrument, paper, or document, knowing it to have been altered, forged, or counterfeited, or willfully overvalues any security, asset, or income shall be punished by a fine of not more than $5,000, or by imprisonment for not more than 2 years, or both.

(e) The Secretary shall promulgate such rules and regulations as may be deemed necessary or appropriate to carry out the purposes and provisions of this section.

(f) For purposes of this section—

(1) The term "actual cost" of an aquaculture facility, as of any specified date, means the aggregate, as determined by the Secretary, of—

(A) all amounts paid by, or for the account of, the obligor with respect to such facility on or before that date; and

(B) all amounts which the obligor is then obligated to pay from time to time thereafter, for the construction, reconstruction, or reconditioning of such facility.

(2) The terms "construction", "reconstruction", or "reconditioning" include, but are not limited to, designing, inspecting, outfitting, and equipping of the aquaculture facility involved.

(3) The term "depreciated actual cost" means the actual cost depreciated on a straightline basis over the useful life of the property involved as determined by the Secretary.

(4) The term "obligation" means any note, bond, debenture, or other evidence of indebtedness issued for one of the purposes specified in subsection (a).

(5) The term "obligee" means the holder of any obligation.

(6) The term "obligor" means any person primarily liable for payment of the principal of or interest on any obligation.

SEC. 9. DISASTER LOANS.

(a) (1) The Secretary may make one or more loans from the Fund to any person if—

(A) an aquaculture facility, or stock of aquatic species at the facility, or both, that is owned by such person is damaged or destroyed as a result of a natural disaster; or

(B) the stock of aquatic species at an aquaculture facility owned by such person is damaged or destroyed

by disease, pollution, or contamination (caused by reasons other than a natural disaster or the willful or negligent action of such person).

The purpose of any loan made by the Secretary under this section shall be to accomplish one or more of the following objectives:

(i) The repair, rehabilitation, or replacement of such facility.

(ii) The replacement of aquatic species stock.

(iii) To continue aquaculture operations while any such repair, rehabilitation, or replacement is in progress.

(iv) The purchase, construction, or reconstruction of an aquaculture facility at another location if the Secretary finds that—

(I) the damage to the facility is so extensive that its repair or rehabilitation is impracticable;

(II) the replacement of the destroyed facility at the same location is impracticable; or

(III) the pollution or contamination referred to in subparagraph (B) is likely to persist for such period of time that continued aquaculture operations at the same location are impracticable.

(v) To meet payments of principal and interest on any obligation of such person with respect to the facility or stock so damaged or destroyed for such period of time

as the Secretary deems appropriate, taking into account the degree of such damage or destruction.

(vi) To retire in full any such obligation.

(2) No loan may be made under this section for any damage or destruction—

(A) which is fully compensated for by insurance (including insurance paid under section 10) or otherwise; or

(B) for which assistance is available under any other Federal disaster assistance program.

(b) Any loan made pursuant to this section shall—

(1) mature in not more than 20 years;

(2) bear interest at a rate not less than the rate determined by the Secretary of the Treasury taking into consideration the average market yield on outstanding Treasury obligations of comparable maturity;

(3) be approved only upon the furnishing of such security or other reasonable assurance of repayment as the Secretary may require; and

(4) be subject to such other terms and conditions as the Secretary may require to protect the interests of the United States.

(c) The Secretary may consent to the modification of any term or condition of any loan made under this section, including, but not limited to, reduction of the rate of inter-

est, deferment of any installment of principal or interest, or change in any security requirement.

(d) All payments of principal and interest on loans made under this section shall be deposited into the Fund.

(e) For purposes of this section, the term "obligation" means any note, bond, debenture, or other evidence of indebtedness issued for the purpose of financing (1) the construction, reconstruction, or reconditioning of an aquaculture facility, (2) the initial operating expenses of any such facility, and (3) the acquisition of stock of aquatic species for any such facility.

(f) (1) Whoever makes any statement knowing it to be false, or whoever willfully overvalues any security for the purpose of obtaining for himself or for any applicant any loan under this section, or extension thereof by renewal, deferment of action, or otherwise, or the acceptance, release, or substitution of security therefor, or for the purpose of influencing in any way the action of the Secretary under this section, or for the purpose of obtaining money, property, or anything of value under this section, shall be punished by a fine of not more than $5,000, or by imprisonment for not more than 2 years, or both.

(2) Whoever, with the intent to defraud, knowingly conceals, removes, disposes of, or converts to his own use or to that of another, any property mortgaged or pledged to,

or held by, the Secretary pursuant to this section shall be punished by a fine of not more than $5,000, or by imprisonment for not more than 5 years, or both.

(g) No loan may be made by the Secretary under this section for any damage to, or destruction of, any aquaculture facility or stock of aquatic species which occurs on or after the close of the 5-year period beginning on the effective date of this Act.

SEC. 10. INSURANCE AGAINST CERTAIN LOSSES INCURRED IN AQUACULTURE FACILITY OPERATIONS.

(a) As used in this section, unless the context otherwise requires—

(1) The term "direct insurance" means any insurance described in paragraphs (2), (3), and (4).

(2) The term "essential liability insurance" means insurance against all sums which the owner of an aquaculture facility becomes legally obligated to pay as damages because of bodily injury or property damage caused by the aquaculture facility, the operation of such facility, or the aquatic species cultured at such facility.

(3) The term "essential property insurance" means insurance against direct loss of, or direct damage to, the real or personal property of an aquaculture facility caused by perils as they are defined and limited in

standard fire policies and extended coverage endorsements thereon as approved by the State insurance authority, and insurance against loss of, or damage to, the real or personal property of an aquaculture facility from such perils as the Secretary by regulation shall specify, including, but not limited to vandalism, malicious mischief, burglary, and theft.

(4) The term "essential stock insurance" means insurance against loss of, or damage to, any aquatic species being cultured at an aquaculture facility due to unavoidable or natural causes, including, but not limited to, drought, pollution, hail, frost, wind, winterkill, freeze, lightning, fire, excessive rain, flood, snow, wildlife, hurricane, tornado, insect or parasite infestation, disease, and such other unavoidable or natural causes as the Secretary by regulation shall specify.

(5) The term "insurer" includes any insurance company or group of companies under common ownership which is authorized to engage in the insurance business under the laws of any State.

(6) The term "owner" means any person having an insurable interest in an aquaculture facility or aquatic species stock.

(7) The term "pool" means any pool or association of insurers in any State which is formed, associated, or

otherwise created for the purpose of making insurance more readily available.

(8) The term "reasonable premium rate" means that premium rate determined by the Secretary, which would permit the purchase of any direct insurance coverage by a reasonably prudent person in similar circumstances with due regard to the costs and benefits involved.

(b) The Secretary may by regulation define any technical or trade term necessary in the administration of this section, insofar as any such definition is not inconsistent with the provisions of this section.

(c) (1) The Secretary shall conduct, within 6 months after the effective date of this Act, and annually thereafter, a study to determine whether direct insurance is generally available to owners at reasonable premium rates, through insurers, pools, or a suitable program adopted under State law.

(2) (A) If the Secretary finds, as a result of the study referred to in paragraph (1), that essential property insurance or essential liability insurance is not available at reasonable premium rates in any State and such insurance has not been provided by State action, the Secretary may establish a program to provide such insurance in such State, if the Secretary considers the issuance of such insurance neces-

sary and appropriate to carry out the purposes and policy of this Act.

(B) Any essential property insurance or essential liability insurance issued by the Secretary under this paragraph shall be subject to such terms and conditions, and to such deductibles and other restrictions and limitations as the Secretary deems appropriate; except that the Secretary may not provide essential property insurance or essential liability insurance with respect to—

(i) any aquaculture facility or stock of aquatic species which the Secretary determines to be uninsurable due to the failure of the owner to follow established principles for operating aquaculture facilities or culturing aquatic species, as the case may be; or

(ii) any aquaculture facility which the Secretary determines to lack reasonable protective measures to prevent loss or damage.

(3) (A) If the Secretary finds, as a result of the study referred to in paragraph (1), that essential stock insurance is not available at reasonable premium rates in any State and that such insurance has not been provided by State action, the Secretary shall establish a program to provide such insurance in such State.

(B) Any essential stock insurance issued by the Secretary under this paragraph shall be subject to such terms

and conditions and to such deductibles and other restrictions and limitations as the Secretary deems appropriate; except that the Secretary may not provide essential stock insurance with respect to any stock of aquatic species if the Secretary determines such stock to be uninsurable due to the failure of the owner to follow established principles for culturing aquatic species or due to the lack of reasonable protective measures at the aquaculture facility concerned to prevent the loss of, or damage to, the stock being cultured.

(d) (1) In determining the premium rate for any direct insurance offered from time to time under subsection (c) (2) or (3), the Secretary shall consult with persons knowledgeable and experienced in insurance, including, but not limited to, State insurance regulatory authorities, and may take into consideration with respect to the insurance concerned, the nature and degree of risk involved, the protective devices employed, the extent of past and anticipated losses, the prevailing rate for similar coverages, the economic importance of the insurance, and the relative abilities of the particular classes and types of insureds to pay the actual premium for such coverage.

(2) (A) The Secretary may not establish the premium rate for any direct insurance at less than 50 percent of the actual premium rate for such insurance.

(B) For purposes of subparagraph (A), the actual

premium rate for any direct insurance offered under this section shall be determined as follows:

(i) If insurance of the same kind is generally offered by insurers or pools in the State concerned, the actual premium rate shall be that rate which the Secretary determines to be the median premium rate for all such insurance so offered.

(ii) If insurance of the same kind is not generally offered by insurers or pools in the State concerned, the actual premium rate shall be that rate which the Secretary determines to be the rate at which insurers or pools in such State would offer such insurance, taking into account actuarially sound principles applicable to the elements making up such rate, including, but not limited to, claim losses, general administrative expenses, acquisition expenses, taxes, license fees, and profits.

In making determinations under clauses (i) and (ii), the Secretary shall consult with the insurance regulatory authority of the State concerned and any rate advisory organization licensed by such State.

(3) Nothing in this section shall be construed to prohibit or require either the adoption of uniform national rates or the periodic modification of the currently estimated reasonable premium rates for any particular coverage, class,

State, or risk on the basis of additional information or actual loss experience.

(e) (1) The Secretary may enter into any contract, agreement, treaty, or other arrangement with any insurer or pool to provide reinsurance coverage with respect to any direct insurance issued by such insurer or pool, in consideration of payment of such premiums, fees, or other charges by insurers or pools which the Secretary deems to be appropriate, after consultation with persons knowledgeable and experienced in insurance.

(2) Reinsurance issued under this subsection shall reimburse an insurer or pool for its total proved and approved claims for covered losses resulting from providing the direct insurance concerned during the term of the reinsurance contract, agreement, treaty, or other arrangement, over and above the amount of the insurer's or pool's retention of such losses, as provided in such reinsurance, contract, agreement, treaty, or other arrangement entered into under this section.

(3) Such contracts, agreements, treaties, or other arrangements may be made without regard to section 3679 (a) of the Revised Statutes of the United States (31 U.S.C. 665 (a)), and shall include any terms and conditions which the Secretary deems necessary to carry out the purposes of this section. The premium rates and terms and conditions of such contracts, agreements, treaties, or other ar-

rangements with an insurer or pool shall be uniform in any one year throughout the country.

(f) (1) All premiums received by the Secretary under this section shall be deposited into the Fund.

(2) The Secretary, in a suit brought in the appropriate United States district court, shall be entitled to recover from any owner, insurer, or pool the amount of any unpaid premium lawfully payable to the Secretary by such owner, insurer, or pool under any direct insurance or reinsurance issued under this section.

(3) No action or proceeding shall be brought for the recovery of any premium due the Secretary, or for the recovery of any premium paid to the Secretary in excess of the amount due, unless such action or proceeding is commenced within 5 years after the right accrued for which the claim is made; except that, if the insurer has made or filed with the Secretary a false or fraudulent statement or other document with intent to evade, in whole or in part, the payment of premiums, the claim shall not be deemed to have accrued until its discovery by the Secretary.

(g) In order to provide for maximum efficiency in the administration of the insurance and reinsurance program provided under this section, and in order to facilitate the expeditious payment of any claims under such program, the Secretary may enter into contracts with any insurer, pool,

or person, for the purpose of providing for the performance of any of the following functions:

(1) The estimation or determination of any amounts of payments for reinsurance or direct insurance claims.

(2) The receipt, disbursement, and accounting for funds in making payments for reinsurance and direct insurance claims.

(3) The auditing of the records of any insurer, pool, or person to the extent necessary to assure that proper payments are made.

(4) The establishment of the basis of liability for reinsurance or direct insurance payments, including the total amount of proved and approved claims which may be payable to any insurer, pool, or owner, and the total amount of premiums earned by any insurer or pool in the respective States from direct insurance or reinsurance.

(5) The provision of assistance in any manner provided for in the contract to further the purposes of this section.

(h) The Secretary may, with the consent of the agency concerned, accept and utilize, on a reimbursable basis, the officers, employees, services, facilities, and information of any Federal agency with respect to any insurance matter which is within the purview of this section.

(i) The Secretary may prescribe regulations establishing the general method or methods by which proved and approved claims for losses are paid under any direct insurance or reinsurance issued under this section. Proved and approved claims shall be paid from the Fund.

(j) The Secretary, in providing any direct insurance or reinsurance under this section may adjust and pay all claims for proved and approved losses covered by such insurance and, upon the disallowance by the Secretary, or upon the refusal of the claimant to accept the amount allowed upon any such claim, the claimant, within one year after the date of mailing of notice of disallowance or partial disallowance of the claim, may institute an action on such claim against the Secretary in the United States district court for the district in which the insured owner or reinsured insurer or pool resides or principally conducts business, and jurisdiction is hereby conferred upon such court to hear and determine such action without regard to the amount in controversy.

(k) The face amount of direct insurance and reinsurance coverage outstanding and in force at any one time under this section shall not exceed $1,000,000,000.

(l) No direct insurance or reinsurance may be issued by the Secretary under this section after the close of the 5-year period beginning on the effective date of this Act.

SEC. 11. FEDERAL AQUACULTURE ASSISTANCE FUND.

(a) There is established in the Treasury of the United States a Federal Aquaculture Assistance Fund. The Fund shall be available to the Secretary as a revolving fund for the purpose of carrying out, and administering, sections 8, 9, and 10. The Fund shall consist of—

(1) any sums appropriated to the Fund;

(2) any fees received by the Secretary in connection with any guarantee made under section 8;

(3) recoveries and receipts received by the Secretary under security, subrogation, and other rights and authorities under sections 8, 9, and 10;

(4) payments of principal and interest received by the Secretary under any loan made under section 9;

(5) premiums paid to, or recovered by, the Secretary for any direct insurance or reinsurance issued by the Secretary under section 10; and

(6) moneys deposited pursuant to the last sentence of subsection (b).

All payments made by the Secretary to carry out the provisions of sections 8, 9, and 10 (including reimbursements to other Government accounts) shall be paid from the Fund, only to the extent provided in appropriation Acts. Sums in the Fund which are not currently needed for the purposes of sections 8, 9, and 10 shall be kept on deposit or

invested in obligations of, or guaranteed by, the United States.

(b) If at any time the moneys in the Fund are not sufficient to pay any amount the Secretary is obligated to pay under section 8(d)(1) or any direct insurance or reinsurance claim under section 10, the Secretary shall issue to the Secretary of the Treasury notes or other obligations (only to such extent and in such amounts as may be provided for in appropriation Acts) in such forms and denominations, bearing such maturities, and subject to such terms and conditions as the Secretary of the Treasury prescribes. Such notes or other obligations shall bear interest at a rate determined by the Secretary of the Treasury, taking into consideration the current average market yield on outstanding marketable obligations of the United States of comparable maturities during the month preceding the issuance of such notes or other obligations. The Secretary of the Treasury shall purchase any notes and other obligations to be issued hereunder and for such purpose he may use as a public debt transaction the proceeds from the sale of any securities issued under the Second Liberty Bond Act, as amended, and the purposes for which securities may be issued under such Act, as amended, are extended to include any purchases of such notes and obligations. The Secretary of the Treasury at any time may sell any of the notes or other obligations acquired

by him under this subsection. All redemptions, purchases, and sales by the Secretary of the Treasury of such notes or other obligations shall be treated as public debt transactions of the United States. Moneys borrowed under this subsection shall be deposited in the Fund and redemptions of such notes and obligations shall be made by the Secretary from the Fund.

SEC. 12. REPORT AND RECOMMENDATIONS.

Before the close of the 90th day after the close of the 3-year period beginning on the effective date of this Act, the Secretary shall review the operation and effectiveness of the disaster loan program provided for under section 9 and the insurance program provided for under section 10 and shall submit a report thereon to the Congress, together with the recommendation of the Secretary as to whether or not either such program should be continued and, if the Secretary recommends continuation, such suggestions as the Secretary may have for improving the operation and effectiveness of such program.

SEC. 13. AUTHORIZATION OF APPPOPRIATIONS.

(a) For purposes of carrying out the provisions of this Act (other than sections 8, 9, or 10), there are authorized to be appropriated, notwithstanding any authorization for appropriations in any other Act in effect before the date of the enactment of this Act—

(1) to the Department of Commerce, not to exceed—

(A) $4,000,000 for the fiscal year 1979,

(B) $15,000,000 for the fiscal year 1980, and

(C) $17,000,000 for the fiscal year 1981;

(2) to the Department of the Interior, not to exceed—

(A) $2,000,000 for the fiscal year 1979,

(B) $7,500,000 for the fiscal year 1980, and

(C) $8,500,000 for the fiscal year 1981; and

(3) to the Department of Agriculture, not to exceed—

(A) $2,000,000 for the fiscal year 1979,

(B) $7,500,000 for the fiscal year 1980, and

(C) $8,500,000 for the fiscal year 1981.

(b) There are authorized to be appropriated, without fiscal year limitation, to the Fund such sums as may be necessary and appropriate for purposes of carrying out sections 8, 9, and 10; but not to exceed $500,000,000 for the purposes of section 8 and not to exceed $250,000,000 for the purposes of section 9.

SEC. 14. EFFECTIVE DATE.

This Act shall take effect October 1, 1978.

95TH CONGRESS
2D SESSION

S. 2762

A BILL

To provide for the development of aquaculture in the United States, and for other purposes.

By Mr. GRAVEL

MARCH 17 (legislative day, FEBRUARY 6), 1978

Read twice and referred to the Committees on Agriculture, Nutrition, and Forestry and Commerce, Science, and Transportation jointly by unanimous consent

United States of America

Congressional Record

PROCEEDINGS AND DEBATES OF THE 95th CONGRESS, SECOND SESSION

Vol. 124 WASHINGTON, FRIDAY, MARCH 17, 1978 No. 39

Senate

By Mr. GRAVEL:

S. 2762. A bill to provide for the development of aquaculture in the United States, and for other purposes; to the Committee on Commerce, Science, and Transportation and the Committee on Agriculture, Nutrition, and Forestry, jointly, by unanimous consent.

NATIONAL AQUACULTURE ORGANIC ACT OF 1978

● Mr. GRAVEL. Mr. President, I am introducing today legislation to focus national attention on the long neglected activity of aquaculture.

Aquaculture is the controlled cultivation of aquatic plants and animals. It is practiced in various degrees of intensity throughout the world and the time is now right for concerted action in the United States.

By introducing the National Aquaculture Organic Act of 1978, I hope to promote the concept of aquaculture by encouraging increased and coordinated activity in this area by public, private, educational, and almost any other, seriously interested party.

AQUACULTURE—AN OVERVIEW

The world activity in aquaculture is wide and varied. China has been cultivating fish for over 2000 years. Japan now produces more than 10 percent of its seafood needs through aquaculture. And Russia has been giving aquaculture increased attention.

The United States has been dabbling in various forms of aquaculture for a considerable period of time, but a Library of Congress report (aquaculture—1976—serial No. 94–31) indicates that aquaculture in the United States has grown insignificantly compared to such activities in other parts of the world. The species which are presently receiving the most attention in the United States are salmon, catfish, trout, oysters, crayfish, clams, and shrimp. The potential for increased production of these species, as well as the production of species heretofore uncultured in the United States is very promising.

My home State of Alaska has been involved in the cultivation of fin fish since the late 1800's. With more than 50 percent of the entire U.S. coastline located within the State of Alaska, one can understand why my interest in aquaculture is great. The potential for marine aquaculture development within Alaska is truly incredible, not to mention the vast possibilities for future freshwater-cultivation.

AQUACULTURE—MARKET POTENTIAL

World fishery resources were once thought to be practically unlimited. This has been clearly shown not to be the case. The world resources are now estimated by some experts to be capable of yielding a maximum global harvest of 100 to 150 million metric tons per year. More conservative estimates rarely exceed 100 million metric tons, including that of the National Oceanic and Atmospheric Administration, which estimates that the 100 million metric ton figure will be met by 1980. This suggests that a world shortage of fish products is possible in the foreseeable future.

World per capita fish consumption has increased over the past several years and in the United States alone has risen to a present level of 12.9 pounds per person per year. Reliable estimates project American consumption to increase to 15.2 pounds by the year 2000. A Library of Congress study has predicted that in the same period of time overall demand for seafood products in the United States, both edible and industrial, is expected to increase by a full 80 percent.

All these indicators suggest that the demand for fish products will only continue to increase in the years to come. With wild fish stock exploitation reaching maximum levels, per capita consumption of fish products on the rise, and the world population expected to increase from a level of 4 billion today to 6 billion by the turn of the century, aquaculture must be viewed as a promising possibility in helping to meet these food demands.

AQUACULTURE—ECONOMIC POTENTIAL

For a nation practically surrounded by water and replete with possible sites for raising inland fish species, fishery imports into the United States are surprisingly high. In 1976 the United States imported 4.6 billion pounds of edible fishery products valued at $1.7 billion, and 1.6 billion pounds of industrial fishery products worth $.5 billion. This adds up to $2.2 billion of American money sent abroad to purchase fishery products. The U.S. fishery exports in 1976 amounted to 241 million pounds, valued at only $330 million.

This leaves a net annual trade deficit of practically $2 billion for foreign fish products. Stated another way, close to 65 percent of fish consumed in the United States is imported from foreign countries.

The studious application of aquaculture techniques could help to reverse this unfavorable balance of trade situation. A promotion of aquaculture will result in the creation of many new jobs, fishery employment on a year-round rather than a seasonal basis, and an overall stability to the historical boom or bust fishery economy.

NATIONAL AQUACULTURE ORGANIC ACT—INTENT

Mr. President, the National Aquaculture Organic Act of 1978 will provide long overdue impetus to the promotion of aquaculture in the United States. My desire is to encourage the development of aquaculture of all types in all parts of the United States. This would include encouraging aquaculture for marine, as well as fresh water, species; for aquatic plants, as well as aquatic animals; for presently cultured species, as well as species as yet untested by the techniques of aquaculture; and for the rehabilitation and enhancement of public fisheries, as well as the promotion of commercial enterprises.

To accomplish these goals, my legislation designates the Department of Commerce as the agency with ultimate responsibility. The Commerce Department will, however, operate in close conjunction with the Departments of Agriculture and Interior, as both those Departments have proven themselves expert in many important aspects of aquaculture.

There are many facets to aquaculture, and I believe no single agency can or should be named the exclusive authority. The better approach is to tap the existing expertise of the several Departments and coordinate all aquaculture efforts through the Department of Commerce.

An Interagency Committee on Aquaculture will be formed to facilitate and coordinate information and activities among the three Departments, as well as all other agencies and parties involved.

My legislation also provides for the formulation of a national aquaculture development plan. This plan, to be drawn up in the year following enactment, will embody concrete suggestions on specific directions and priorities to pursue in the development of aquaculture in the United States.

A grant program will encourage participation in what is generally considered a rather expensive enterprise. These grants will allow the private entrepreneur to get involved in a venture that would otherwise, by virtue of prohibitive startup costs, be reserved for large corporations or the individual of great wealth.

A Federal aquaculture assistance fund is created for three purposes: First, to facilitate aquaculture financing by guaranteeing loans made to aquaculture operations since such loans have historically been unreasonably difficult to obtain; second, to make disaster loans for aquaculture stocks which are destroyed by unavoidable diseases; and third, to provide insurance coverage to aquaculture operations in those instances where insurance is not otherwise available.

NATIONAL AQUACULTURE ORGANIC ACT—COMPARISON TO OTHER AQUACULTURE LEGISLATION

Mr. President, the bill I offer today is in many respects similar to other pieces of aquaculture legislation already introduced in the Senate. S. 1043, introduced by Senator BENTSEN and of which I am a cosponsor, and S. 2218 and S. 2582, introduced by Senators STONE and WEICKER, respectively, all make numerous points which coincide with the proposals I have here. H.R. 9370, a House aquaculture bill that just recently passed that Chamber by a vote of 234 to 130, is also similar in many regards to this piece of legislation.

There are, however, three important new areas which my bill emphasizes, and I should like briefly to explain them.

First, unlike the other aquaculture legislation I would require that the national aquaculture development plan be formulated at the regional level in advisory subcommittees and finalized at the national level by the National Advisory Committee. In a country as large as ours, with aquaculture interests as varied as they are, regional input for this national plan is an absolute necessity.

To insure adequate input from interests as diverse as shrimp farmers in Florida, salmon ranchers in Alaska, oyster raisers in Maine, and catfish farmers in the Midwest, information must be gathered on a regional basis. Only persons intimately familiar with the regional needs and conditions of the various parts of this country can provide such particularized data.

Second, I add the enhancement and rehabilitation of traditional publicly owned fish stocks as a major goal to be addressed by this legislation. It seems obvious that in addition to encouraging development of commercial aquaculture for the private sector, we should not overlook the desirability of rehabilitating the numerous depleted fish stocks which are of vital importance to the public sector.

The third and final issue of importance is the problem of land and water access for aquaculture facilities. I believe the contributions which aquaculture can make in helping to meet nutritional needs, stimulating commercial activity, and enhancing existing fisheries warrant its being given due consideration in land and water use management deliberations.

Aquaculture is certainly an activity that has been neglected in this country for too long. The numerous benefits to be

gained—commercial, nutritional, and conservational, among others—have not yet been fully appreciated. Passage of this legislation will be a positive step toward translating these benefits into tangible realities.

Mr. President, I ask unanimous consent that the text of this bill be printed at this point in the RECORD.

There being no objection, the bill was ordered to be printed in the RECORD, as follows:

S. 2762

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That this Act may be cited as the "National Aquaculture Organic Act of 1978".

SEC. 2. FINDINGS, PURPOSE, AND POLICY.

(a) The Congress finds the following:

(1) The world production of seafood has declined since 1970 and the harvest of some populations of fish and shellfish has exceeded levels of maximum sustainable yield.

(2) Certain stocks of fish and shellfish of importance to the United States are depleted, or are declining, and such depletion or decline has an undesirable impact on both commercial and recreational fisheries.

(3) There is an extensive market for seafood in the United States, but the United States imports in excess of 50 percent of its fish and shellfish for human consumption (which imports are ten times the level of exports), and this dependence on imports as a source of protein makes it difficult to insure continuous supplies and suggests that alternatives such as aquaculture be developed.

(4) Many segments of the world population are now facing serious nutritional deficiencies and food shortages due to adverse climatic conditions and the steady growth of population. These problems will become more severe, and the resulting demand for increased food production will have to be met chiefly through the application of scientific and technological advances from research on aquaculture and other food production systems.

(5) Aquaculture is contributing significantly to world food supplies with production equal to 10 percent of current landings of seafoods and has the potential for increase by a factor of five before the end of this century.

(6) Less than 3 percent of current United States fisheries production results from aquaculture but there is a good potential for expanding production from aquaculture to equal or exceed the worldwide average, thereby helping to provide United States consumers with stable supplies of high quality aquatic foods.

(7) Growth of aquatic plants is a source of food for human and animal consumption as well as a source of industrial materials and energy. The Congress recognizes the importance of developing aquaculture of both plant and animal species.

(8) The stocking of advanced life stages of fish and shellfish produced by aquaculture is a means of rebuilding and augmenting fish and shellfish populations and establishing new fisheries.

(9) The application of aquaculture technology offers opportunities for the recovery of wasted thermal energy, nutrients, and other resources and may be a more efficient use of these resources for food production culture.

(10) Where water, whether fresh, brackish, or marine is suitable for aquaculture, appropriate consideration should be given to the utilization of such water for aquaculture along with the other uses of such water.

(11) Where land-use management policies may inhibit the development of aquaculture facilities in areas suitable for aquaculture, appropriate consideration should be given to the utilization of these areas for aquaculture along with the other uses of such areas.

(12) Current efforts to develop aquaculture in the United States are highly diffuse, and a strong commitment by the Federal Government will make aquaculture more efficient and competitive, thereby stimulating public and private investment and development.

(13) While many scientific and technological problems are unsolved, there is sufficient knowledge to further the development of aquaculture production systems for many species of fish and shellfish.

(14) The development of aquaculture in the United States has been limited by the inability of producers of aquatic species to obtain adequate capital and a reliable source of seed stock.

(15) Aquaculture in the United States has traditionally concentrated on a few aquatic species, but many others have a potential for commercial and other culture. However, the culture of additional species may include a higher degree of risk than the culture of traditional species, especially during the initial stages.

(16) Government programs that help to reduce the risks associated with production of agricultural commodities have not been generally available to producers of those aquatic species in which the risk is high.

(17) The rehabilitation and enhancement of the publicly owned fish and shellfish resources are desirable applications of aquaculture technology as a means to increase the general public benefits to be derived from the utilization of these common property resources.

(18) Extensions of jurisdiction over marine resources by numerous nations have resulted in the exclusion of many fishing nations from traditional fishing areas and created a demand in those nations for aquatic food-stuffs. Aquaculture could supply this new demand.

(19) The Select Committee on Nutrition and Human Needs of the Senate has recommended an increase in the fish consumption of the American family. Aquaculture can help to carry out this recommendation.

(b) The purpose of this Act is to promote aquaculture in the United States by—

(1) declaring a national aquaculture policy;

(2) establishing and implementing a national plan for aquaculture; and

(3) developing programs and encouraging activities;

which will result in the coordination of domestic aquaculture efforts, the conservation of existing aquatic resources, the rehabilitation and enhancement of the publicly owned fish and shellfish stocks, the encouragement of commercial aquaculture activities, the creation of new industries and job opportunities, and other national benefits.".

(c) Aquaculture has a high potential for augmenting existing commercial and sport fisheries, thereby increasing the supply of aquatic protein for both human and animal consumption and assisting the United States in meeting its future food needs and

contributing to the solution of world food problems. It is, therefore, in the national interest, and it is the national policy, to encourage the development of aquaculture.

SEC. 3. DEFINITIONS.

As used in this Act—

(1) The term "aquaculture" means the propagation and rearing of aquatic species in controlled or selected environments, including ocean ranching.

(2) The term "aquaculture facility" means any land, structure, or other appurtenance, if such land, structure, and appurtenance is located within the United States, which is used for aquaculture, including, but not limited to, any laboratory, vehicle, hatchery, rearing pond, race, cage, pen, incubator, or other equipment.

(3) The term "aquatic species" means any species, native or introduced, of finfish, mollusk or crustacean or other aquatic invertebrate, amphibian, reptile, or aquatic plant, other than any such species which is primarily used for ornamental purposes.

(4) The term "Fund" means the Federal Aquaculture Assistance Fund established by section 11.

(5) The term "person" means any individual who is a citizen or national of the United States and any corporation, partnership, association, or other entity (including, but not limited to, any community development corporation or fisherman's cooperative) organized or existing under the laws of any State.

(6) The term "Secretary" means the Secretary of Commerce.

(7) The term "State" means any of the several States, the District of Columbia, the Commonwealth of Puerto Rico, American Samoa, the Virgin Islands, Guam, the Trust Territory of the Pacific Islands, and any other Commonwealth, territory, or possession of the United States.

(8) The term "United States", when used in a geographical context, means all States.

SEC. 4. NATIONAL AQUACULTURE DEVELOPMENT PLAN.

"(a)(1) Before the close of the 1-year period beginning on the effective date of this Act, the Secretary, after consultation with the Secretary of the Interior and the Secretary of Agriculture, shall prepare a National Aquaculture Development Plan (hereinafter in this Act referred to as the 'plan').

"(2)(A) The Secretary shall, after consultation with the Secretary of the Interior and the Secretary of Agriculture, establish and advisory committee for the purpose of assisting the Secretary in formulating a plan responsive to the various regional needs, interests, and approaches to the concept of aquaculture.

"(B) Such advisory committee shall be composed of regional subcommittees. The subcommittee regions shall be established as follows:

"(i) Eight regional subcommittees shall be created which correspond in geographical composition to the eight regional divisions created under section 302(a) of the Fishery Conservation and Management Act of 1976.

"(ii) Other regional subcommittees shall be created by the Secretary to represent the remaining non-oceanic States which are not a part of the regional subcommittees created by clause (i) of this subparagraph. Such other regional subcommittees shall be established on the basis of the following criteria:

"(I) geographical proximity of States to one another,

"(II) similarity of States in aquacultural activities and potential, and

"(III) other relevant factors.

"(C) Membership of the regional advisory subcommittee from any region must include representatives of at least the following groups, where such groups exist in that region:

"(i) State fish and game departments;

"(ii) commercial fishermen;

"(iii) fishfood processors;

"(iv) private sector aquaculture organizations;

"(v) regional fishery management councils;

"(vi) Federal fish and wildlife agency;

"(vii) recreational fishermen; and

"(viii) educational institutions.

"(D) The governors of the various States shall appoint members to the regional advisory subcommittees.

"(E) The members of the regional advisory committees established under subparagraph (B), while away from their homes or regular places of business in the performance of services for the committee, shall be allowed travel expenses, including per diem in lieu of subsistence, in the same manner as persons employed intermittently in the Government service are allowed expenses under section 5703 of title 5, United States Code.

"(b) The plan shall be formulated at the regional level and coordinated and finalized at the secretarial level. The final plan shall—".

(1) identify those aquatic species (hereinafter referred to in this Act as "priority aquatic species") which the Secretary determines to have a potential for culturing on a commercial or other basis, which determination shall be made by the Secretary after taking into account—

(A) the extent of commercial aquaculture, if any, currently being carried out with respect to such species, and the projected biological and economic feasibility of culturing such species;

(B) the extent to which aquaculture research and development have been undertaken, within the public and private sectors, with respect to such species;

(C) the time and resources which will be required to develop aquaculture technology to the point where such species can be cultured on a commercial or other basis; and

(D) such other factors as the Secretary determines to be appropriate; and

(2) contain an aquaculture development program, prepared by the Secretary, for each priority aquatic species.

(c) The aquaculture development program contained in the plan for each priority aquatic species shall set forth those actions which the Secretary determines should be undertaken, and the period of time within which each such action should be completed, to provide for the culture of each such species on a commercial or other basis. Such actions, with respect to each priority aquatic species, shall include—

(1) such research and development, technical assistance, demonstration, extension education, and training as may be necessary and appropriate regarding—

(A) aquaculture facility and operation,

(B) water quality management,

(C) utilization of waste products (including thermal effluents),

(D) nutrition and the development of economical feeds,

(E) life history, genetics, physiology, and pathology and disease control (including research regarding organisms which may not be harmful to fish and shellfish but are injurious to humans),

(F) processing and market development, and

(G) production management and quality control;

(2) research with respect to the effect of the culture of such species on estuarine and other water areas;

(3) the identification and analysis of any legal or regulatory constraints which may affect the culture of such species;

(4) the development of adequate supplies of seed stock;

(5) the construction, purchase, lease, or acquisition of necessary developmental aquaculture facilities; and

(6) such other actions relating to research and development, technical assistance, demonstration, extension education, and training as such Secretary deems necessary and appropriate.

(d) In preparing an aquaculture development program for any priority aquatic species, and in reviewing any such program pursuant to subsection (f), the Secretary shall, to the extent practicable, take into account any significant action which has been, or which is proposed to be undertaken by any other Federal agency, any State agency, or any person, and which may affect the accomplishment of the program.

(e) Each action under each aquaculture development program prepared under this section for a priority aquatic species shall be implemented, either individually, jointly, or collectively, by the Secretary, the Secretary of the Interior, or the Secretary of Agriculture, as specified by the Secretary in the program on the basis of—

(1) responsibilities vested in the respective Secretaries by law or any executive action having the effect of law (including, but not limited to, Reorganization Plan Numbered 4 of 1970); and

(2) in cases where paragraph (1) does not apply, the experience, expertise, and other appropriate resources which the department, over which the Secretary concerned has jurisdiction, may have with respect to the action required under the program.

(f)(1) The Secretary, in consultation with the Secretary of the Interior, the Secretary of Agriculture, and the chief executive officer of any other Federal agency, any appropriate Regional Fishery Management Council, and any State agency which has significant functions which relate to aquaculture, shall review on an annual basis—

(A) each aquatic species not identified as a priority aquatic species; and

(B) the aquaculture development program established under the plan for each priority aquatic species to determine whether the actions specified in the program are being accomplished on a successful and timely basis.

(2) If as a result of the review conducted pursuant to paragraph (1)(A), the Secretary determines, after taking into account the criteria set forth in subsection (b)(1), that any aquatic species has a potential for culturing on a commercial or other basis the Secretary shall by regulation amend and plan to identify such species as a priority aquatic species and prepare an aquaculture development program for such species pursuant to subsection (c).

(3) If as a result of the review conducted pursuant to paragraph (1)(B), the Secretary finds that—

(A) any action so specified should be revised, the Secretary shall make such revision to the program as he deems necessary and appropriate; or

(B) sufficient progress is not being made with respect to any such program or that actions taken under any such program indicate that culture of the priority aquatic species concerned is doubtful, the Secretary shall cancel the program.

The Secretary shall by regulation amend the plan whenever any revision or cancellation is made pursuant to this subsection.

SEC. 5. FUNCTIONS AND POWERS

(a) In implementing the aquaculture development program prepared under section 4 for any priority aquatic species, the Secretary, the Secretary of the Interior, or the Secretary of Agriculture, as the case may be, shall—

(1) provide advisory, educational, and technical assistance (including training) with respect to culture of the species to interested public and private organizations and individuals, but in providing such assistance shall, to the maximum extent practicable, avoid duplication of like assistance provided by other Federal agencies;

(2) consult and cooperate with interested persons, Federal, State, and local government agencies, regional commissions, and educational institutions regarding the development of aquaculture technology;

(3) produce, under the authority of section 4(c)(4), and sell at cost seed stock for the priority aquatic species when privately produced seed stock is unavailable, unreliable, or not sufficient to meet production needs;

"(4) encourage the implementation of aquaculture technology in the rehabilitation and enhancement of the publicly owned fish and shellfish stocks, as well as the promotion of private commercial aquacultural enterprises;

"(5) assist the development of aquaculture by requiring that in areas where multiple land and water uses exist, aquaculture should be viewed as an important use which should be given appropriate consideration; and",

(6) prescribe such regulations as may be necessary to carry out such program.

(b) The Secretary, the Secretary of the Interior, or the Secretary of Agriculture may, incident to such Secretary's implementation of any aquaculture development program—

(1) for the purposes of assessing the biological and economic feasibility of any aquaculture system—

(A) conduct scale tests of the system, and, if necessary for the conduct of any such test, construct, operate, and maintain developmental aquaculture facilities, including, but not limited to, pilot plants for testing laboratory-scale results; and

(B) conduct such other tests or analyses as may be necessary;

(2) develop methods to enhance aquatic species stocks by aquaculture;

(3) carry out such studies and research with respect to aquatic species as may be appropriate regardless of whether such species is or has been identified as a priority aquatic species; and

(4) take such other actions as such Secretary deems necessary and appropriate.

(c) In addition to carrying out such other functions as are required under this Act, the Secretary shall—

(1) establish and maintain an aquaculture information center which shall function as a national clearinghouse for the collection, selection, analysis, and dissemination of scientific, technical, legal, and economic information relating to aquaculture;

(2) conduct appropriate surveys, in coordination with other agencies, of public and private aquaculture being carried out in the

United States with respect to each aquatic species for the purpose of acquiring information on acreages, water use, production, culture techniques, and other relevant matters;

(3) arrange for the mutual exchange of information relating to aquaculture with foreign nations; and

(4) conduct a continuing study to determine which existing capture fisheries could be adversely impacted in the marketplace by competition from products produced by commercial aquaculture enterprises significantly aided under this Act, which study shall include an assessment of economic impact by species and by geographical region, and recommended measures to ameliorate any adverse impact. The Secretary shall report to Congress on the findings made under such study no later than 2 years following the effective date of this Act and every 2 years thereafter.

Any production information submitted to the Secretary by any person under paragraph (2) shall be confidential and shall not be disclosed except to the Secretary, the Secretary of the Interior, or the Secretary of Agriculture, as the case may be, for purposes of carrying out this Act, the advisory committee which may be established under section 4(a)(2)(A), or when required under court order. The Secretary shall by regulation prescribe such procedures as may be necessary to preserve such confidentiality, except that the Secretary may release or make public any such information in any aggregate or summary form which does not directly or indirectly disclose the identity or business of any person who submits such information.

(d)(1) The Secretary, the Secretary of the Interior, and the Secretary of Agriculture are each authorized to accept any gift, temporary donation, or devise or bequest of real or personal property, or the proceeds therefrom, or interests therein, for use in carrying out any function that such Secretary may have under this Act. Any such acceptance may be subject to the terms of any restrictive or affirmative covenant, or condition of servitude, if such terms are deemed by the Secretary concerned to be in accordance with law and compatible with the purpose for which acceptance is sought.

(2) Any gift or bequest of money, and any proceeds from the sale of other property received as a gift or bequest under this subsection, shall be deposited in a separate account in the Treasury and shall be disbursed upon the order of the Secretary concerned.

SEC. 6. COORDINATION OF FEDERAL AGENCY ACTIVITIES REGARDING AQUACULTURE.

(a)(1) There is established the Interagency Committee on Aquaculture (hereinafter in this section referred to as the "Committee") which shall be composed of the following officers or their designees:

(A) The Secretary, who shall be the Chairman of the Committee.

(B) The Secretary of the Interior.

(C) The Secretary of Agriculture.

(D) The Administrator of the Environmental Protection Agency.

(E) The Administrator of the Energy Research and Development Administration.

(F) The Commissioner of Food and Drugs.

(G) The Administrator of the Small Business Administration.

(H) The Chief of Engineers.

(I) The chief executive officer of any other Federal agency and any Regional Fishery Management Council which the Secretary finds to have significant functions which relate, or may relate, to the development of aquaculture.

(2) The functions of the Committee shall be—

(A) to ensure that there is a continuing exchange of information among the agencies represented on the Committee with respect to the nature and status of the programs or projects being carried out by such agencies which relate, or which may relate, to aquaculture in general or to the implementation of the plan; and

(B) to review on a continuing basis the relevant programs and projects of all Federal agencies to determine whether they are being carried out in compliance with subsection (b).

(b) Each Federal agency which has any function or responsibility with respect to aquaculture or has jurisdiction over any activity which affects, or may affect, the achievement of the purposes of this Act, shall, in consultation with the Secretary and to the maximum extent practicable, carry out such function, responsibility, and activity in a manner which is consistent with the purposes of this Act.

(c) Nothing in this Act shall be construed to amend, repeal, or otherwise modify the authority of any Federal officer or any Federal agency to carry out any functions relating to aquaculture which are authorized under any other provision of law.

SEC. 7. CONTRACTS AND GRANTS.

(a) The Secretary may carry out any function under this Act, and the Secretary of the Interior or the Secretary of Agriculture may carry out any function relating to any aquaculture development program which he is specified to implement under the plan, through grants to, or contracts with, any other Federal agency, any agency of any State and, subject to the approval of the State, any agency of any political subdivision thereof, any regional commission, any educational institution, or any other person.

(b) Any contract entered into, or any grant made, pursuant to this section shall contain such conditions and limitations as the Secretary concerned shall by regulation prescribe as being necessary and appropriate to protect the interests of the United States; except that no contract may be entered into, and no grant may be made, pursuant to this section unless the applicant submits with his application therefor a certification from each appropriate State agency and each appropriate local government agency stating that nothing in the laws administered by such agency prevents the carrying out of the project to which the contract or grant will be applied.

(c) The amount of any grant made pursuant to this section may not exceed one-half the estimated cost of the project for which the grant is made.

(d) Any person who receives a grant or contract under this section shall make available to the Secretary concerned and to the Comptroller General of the United States, or any of their authorized representatives, for purposes of audit and examination, any book, document, paper, and record that is pertinent to the funds received by such person under such grant or contract.

SEC. 8. GUARANTEES OF OBLIGATIONS ISSUED FOR AQUACULTURE FACILITIES.

(a)(1) The Secretary may, subject to the provisions of this section, guarantee, or make a commitment to guarantee, the payment of interest on, and the principal amount of, any obligation issued by an obligor for any of the following purposes:

(A) The financing of the construction,

reconstruction, or reconditioning of any aquaculture facility (including the financing of the purchase cost of any aquaculture facility to be reconstructed or reconditioned); except that no obligation may be guaranteed under this section later than 2 years after teh date of the completion of the construction, reconstruction, or reconditioning of the aquaculture facility involved.

(B) The acquisition of stocks of aquatic species for any aquaculture facility.

(C) The financing of the initial operating expenses of any aquaculture facility.

(D) The financing of marketing operations exclusively for aquaculture products.

(E) The refinancing of any existing obligation issued for any of the purposes specified in subparagraph (A), (B), (C), or (D), whether or not guaranteed under this section, including, but not limited to, any short-term obligation incurred for the purposes of obtaining temporary funds for refinancing.

Guarantees and commitments to guarantee may be made under this section without regard to section 3679(a) of the Revised Statutes of the United States (31 U.S.C. 665(a)).

(2) The full faith and credit of the United States is pledged to the payment of all guarantees made under this section with respect to both principal and interest, including any interest, if provided for in the guarantee, which may accrue between the date of default under a guaranteed obligation and the payment in full of the guarantee.

(3) Any guarantee, or commitment to guarantee, made by the Secretary under this section shall be conclusive evidence of the eligibility of the obligation for such guarantee, and the validity of any guarantee or commitment of guarantee, so made shall be incontestable.

(4) The aggregate unpaid principal amount of all obligations guaranteed under this section and outstanding at any one time shall not exceed $500,000,000.

(b)(1) Obligations guaranteed under this section—

(A) shall have an obligor approved by the Secretary as being responsible and possessing the ability, experience, financial resources, and other qualifications necessary for the adequate operation and maintenance of the aquaculture facilities;

(B) shall be in an aggregate principal amount which does not exceed 87½ percent of the actual cost involved or the depreciated actual cost, as determined by the Secretary;

(C) shall have maturity dates satisfactory to the Secretary, but not to exceed 25 years;

(D) shall provide for payments by the obligor satisfactory to the Secretary; and

(E) shall bear interest (exclusive of charges for the guarantee and service charges, if any) at rates not to exceed such percentage per annum on the unpaid principal as the Secretary determines to be reasonable, taking into account the range of interest rates prevailing in the private market for similar loans and the risks assumed by the Secretary.

(2) In guaranteeing any obligation under this section, the Secretary shall give preference to any person with 40 or fewer employees which, together with its affiliates, is primarily engaged in the business of aquaculture or commercial fishing for aquatic species.

(3) No obligation shall be guaranteed under this section unless the obligor conveys or agrees to convey to the Secretary such security interest as the Secretary may require to reasonably protect the interests of the United States.

(c)(1) The Secretary may charge a fee for any obligation guaranteed under this section, the amount of which shall be established by the Secretary by regulation but which may not exceed one-half of 1 percent per annum of the outstanding principal balance of the obligation. Fee payments shall be made by the obligor to the Secretary when moneys are first advanced under a guaranteed obligation and at least 60 days before each anniversary date thereafter.

(2) The Secretary shall charge and collect from the obligor such amounts as he may deem reasonable for the investigation of the application for any guarantee, for the appraisal of properties offered as security for any guarantee, and for the inspection of such properties during construction, reconstruction, or reconditioning; except that such charges shall not aggregate more than one-half of 1 percent of the original principal amount of the obligation to be guaranteed.

(3) All fees and other amounts received by the Secretary under the provisions of this subsection shall be deposited in the Fund.

(4) Obligations guaranteed under this section, and agreements relating thereto, shall contain such other provisions with respect to the protection of the security interests of the United States (including acceleration and subrogation provisions and the issuance of notes by the obligor to the Secretary), liens and releases of liens, payments of taxes, and such other matters as the Secretary may prescribe.

(d)(1) In the event of a default, which has continued for 30 days, in any payment by the obligor of principal or interest due under any obligation guaranteed under this section, the obligee or his agent shall have the right to demand, at or before the expiration of such period as may be specified in the guarantee or related agreements, but not later than 90 days from the date of each default, payment by the Secretary of the unpaid principal amount of said obligation and of the unpaid interest thereon to the date of payment. Within such period as may be specified in the guarantee or related agreements, but not later than 30 days from the date of such demand, the Secretary shall promptly pay to the obligee or his agent the unpaid principal amount of the obligation and unpaid interest thereon to the date of payment; except that the Secretary shall not be required to make such payment if before the expiration of such period he finds that there was no default by the obligor in the payment of principal or interest or that such default has been remedied before any such demand.

(2) Payments required to be made by the Secretary under paragraph (1) shall be made by the Secretary from the Fund.

(3) In the event of any payment by the Secretary under paragraph (1), the Secretary shall have all rights in any security held by him relating to his guarantee of such obligations as are conferred upon him under any security agreement with the obligor. Notwithstanding any other provision of law relating to the acquisition, handling, or disposal of property by the United States, the Secretary may, under such terms and conditions as the Secretary prescribes or approves, complete, recondition, reconstruct, renovate, repair, maintain, operate, or sell any property acquired by him pursuant to a security agreement with the obligor.

(4) After any default referred to in paragraph (1), the Secretary shall take such action against the obligor or any other parties liable thereunder that, in his discretion, may be required to protect the interests of the United States. Any suit may be brought in the name of the United States or in the name of the obligee and the obligee shall make available to the United States

all records and evidence necessary to prosecute any such suit. The Secretary may accept a conveyance of title to and possession of property from the obligor or other parties liable to the Secretary and may purchase the property for an amount not greater than the unpaid principal amount of such obligation and interest thereon. In the event the Secretary receives through the sale of property an amount of cash in excess of any payment made to an obligee under paragraph (1) and the expenses of collection of such amounts, he shall pay such excess to the obligor.

(5) Whoever, for the purpose of obtaining any loan or advance of credit from any person with the intent that an obligation relating to such loan or advance of credit shall be offered to or accepted by the Secretary to be guaranteed, or for the purpose of obtaining any extension or renewal of any loan, advance of credit, or mortgage relating to an obligation guaranteed by the Secretary, or the acceptance, release, or substitution of any security on such a loan, advance of credit, or for the purpose of influencing in any way the action of the Secretary under this section, makes, passes, utters, or publishes, or causes to be made, passed, uttered, or published any statement, knowing the same to be false, or alters, forges, or counterfeits, or causes or procures to be altered, forged, or counterfeited, any instrument, paper, or document, or utters, publishes, or passes as true, or causes to be uttered, published, or passed as true, any instrument, paper, or document, knowing it to have been altered, forged, or counterfeited, or willfully overvalues any security, asset, or income shall be punished by a fine of not more than $5,000, or by imprisonment for not more than 2 years, or both.

(e) The Secretary shall promulgate such rules and regulations as may be deemed necessary or appropriate to carry out the purposes and provisions of this section.

(f) For purposes of this section—

(1) The term "actual cost" of an aquaculture facility, as of any specified date, means the aggregate, as determined by the Secretary, of—

(A) all amounts paid by, or for the account of, the obligor with respect to such facility on or before that date; and

(B) all amounts which the obligor is then obligated to pay from time to time thereafter, for the construction, reconstruction, or reconditioning of such facility.

(2) The terms "construction", "reconstruction", or "reconditioning" include, but are not limited to, designing, inspecting, outfitting, and equipping of the aquaculture facility involved.

(3) The term "depreciated actual cost" means the actual cost depreciated on a straightline basis over the useful life of the property involved as determined by the Secretary.

(4) The term "obligation" means any note, bond, debenture, or other evidence of indebtedness issued for one of the purposes specified in subsection (a).

(5) The term "obligee" means the holder of any obligation.

(6) The term "obligor" means any person primarily liable for payment of the principal of or interest on any obligation.

SEC. 9. DISASTER LOANS.

(a)(1) The Secretary may make one or more loans from the Fund to any person if—

(A) an aquaculture facility, or stock of aquatic species at the facility, or both, that is owned by such person is damaged or destroyed as a result of a natural disaster; or

(B) the stock of aquatic species at an aquaculture facility owned by such person is damaged or destroyed by disease, pollution, or contamination (caused by reasons other than a natural disaster or the willful or negligent action of such person).

The purpose of any loan made by the Secretary under this section shall be to accomplish one or more of the following objectives:

(i) The repair, rehabilitation, or replacement of such facility.

(ii) The replacement of aquatic species stock.

(iii) To continue aquaculture operations while any such repair, rehabilitation, or replacement is in progress.

(iv) The purchase, construction, or reconstruction of an aquaculture facility at another location if the Secretary finds that—

(I) the damage to the facility is so extensive that its repair or rehabilitation is impracticable;

(II) the replacement of the destroyed facility at the same location is impracticable; or

(III) the pollution or contamination referred to in subparagraph (B) is likely to persist for such period of time that continued aquaculture operations at the same location are impracticable.

(v) To meet payments of principal and interest on any obligation of such person with respect to the facility or stock so damaged or destroyed for such period of time as the Secretary deems appropriate, taking into account the degree of such damage or destruction.

(vi) To retire in full any such obligation.

(2) No loan may be made under this section for any damage or destruction—

(A) which is fully compensated for by insurance (including insurance paid under section 10) or otherwise; or

(B) for which assistance is available under any other Federal disaster assistance program.

(b) Any loan made pursuant to this section shall—

(1) mature in not more than 20 years;

(2) bear interest at a rate not less than the rate determined by the Secretary of the Treasury taking into consideration the average market yield on outstanding Treasury obligations of comparable maturity;

(3) be approved only upon the furnishing of such security or other reasonable assurance of repayment as the Secretary may require; and

(4) be subject to such other terms and conditions as the Secretary may require to protect the interests of the United States.

(c) The Secretary may consent to the modification of any term or condition of any loan made under this section, including, but not limited to, reduction of the rate of interest, deferment of any installment of principal or interest, or change in any security requirment.

(d) All payments of principal and interest on loans made under this section shall be deposited into the Fund.

(e) For purposes of this section, the term "obligation" means any note, bond, debenture, or other evidence of indebtedness issued for the purpose of financing (1) the construction, reconstruction, or reconditioning of an aquaculture facility, (2) the initial operating expenses of any such facility, and (3) the acquisition of stock of aquatic species for any such facility.

(f)(1) Whoever makes any statemen knowing it to be false, or whoever willfull overvalues an security for the purpose o obtaining for himself or for any applican and loan under this section, or extensior thereof by renewal, deferment of action, o otherwise, or the acceptance, release, or substitution of security therefor, or for the purpose of influencing in any way the actior of the Secretary under this section, or for the purpose of obtaining money, property or anything of value under this section, shall be punished by a fine of not more than $5,000, or by imprisonment for not more than 2 years, or both.

(2) Whoever, with the intent to defraud, knowingly conceals, removes, disposes of, or converts to his own use or to that of another, any property mortgaged or pledged to, or held by, the Secretary pursuant to this section shall be punished by a fine of not more than $5,000, or by imprisonment for not more than 5 years, or both.

(g) No loan may be made by the Secretary under this section for any damage to, or destruction of, any aquaculture facility or stock of aquatic species which occurs on or after the close of the 5-year period beginning on the effective date of this Act.

SEC. 10. INSURANCE AGAINST CERTAIN LOSSES INCURRED IN AQUACULTURE FACILITY OPERATIONS.

(a) As used in this section, unless the context otherwise requires—

(1) The term "direct insurance" means any insurance described in paragraphs (2), (3), and (4).

(2) The term "essential liability insurance" means insurance against all sums which the owner of an aquaculture facility becomes legally obligated to pay as damages because of bodily injury or property damage caused by the aquaculture facility, the operation of such facility, or the aquatic species cultured at such facility.

(3) The term "essential property insurance" means insurance against direct loss of, or direct damage to, the real or personal property of an aquaculture facility caused by perils as they are defined and limited in standard fire policies and extended coverage endorsements thereon as approved by the State insurance authority, and insurance against loss of, or damage to, the real or personal property of an aquaculture facility from such perils as the Secretary by regulation shall specify, including, but not limited to vandalism, malicious mischief, burglary, and theft.

(4) The term "essential stock insurance" means insurance against loss of, or damage to, any aquatic species being cultured at an aquaculture facility due to unavoidable or natural cases, including, but not limited to, drought, pollution, hail, frost, wind, winterkill, freeze, lightning, fire, excessive rain, flood, snow, wildlife, hurricane, tornado, insect or parasite infestation, disease, and such other unavoidable or natural causes as the Secretary by regulation shall specify.

(5) The term "insurer" includes any insurance company or group of companies under common ownership which is authorized to engage in the insurance business under the laws of any State.

(6) The term "owner" means any person having an insurable interest in an aquaculture facility or aquatic species stock.

(7) The term "pool" means any pool or association of insurers in any State which is formed, associated, or otherwise created for the purpose of making insurance more readily available.

(8) The term "reasonable premium rate" means that premium rate determined by the Secretary, which would permit the purchase of any direct insurance coverage by a reasonably prudent person in similar circumstances with due regard to the costs and benefits involved.

(b) The Secretary may by regulation define any technical or trade term necessary in the administration of this section, insofar as any such definition is not inconsistent with the provisions of this section.

(c)(1) The Secretary shall conduct, within 6 months after the effective date of this Act, and annually thereafter, a study to determine whether direct insurance is generally available to owners at reasonable premium rates, through insurers, pools, or a suitable program adopted under State law.

(2)(A) If the Secretary finds, as a result of the study referred to in paragraph (1), that essential property insurance or essential liability insurance is not available at reasonable premium rates in any State and such insurance has not been provided by State action, the Secretary may establish a program to provide such insurance in such State, if the Secretary considers the issuance of such insurance necessary and appropriate to carry out the purposes and policy of this Act.

(B) Any essential property insurance or essential liability insurance issued by the Secretary under this paragraph shall be subject to such terms and conditions, and to such deductibles and other restrictions and limitations as the Secretary deems appropriate; except that the Secretary may not provide essential property insurance or essential liability insurance with respect to—

(i) any aquaculture facility or stock of aquatic species which the Secretary determines to be uninsurable due to the failure of the owner to follow established principles for operating aquaculture facilities or culturing aquatic species, as the case may be; or

(ii) any aquaculture facility which the Secretary determines to lack reasonable protective measures to prevent loss or damage.

(3)(A) If the Secretary finds, as a result of the study referred to in paragraph (1), that essential stock insurance is not available at reasonable premium rates in any State and that such insurance has not been provided by State action, the Secretary shall establish a program to provide such insurance in such State.

(B) Any essential stock insurance issued by the Secretary under this paragraph shall be subject to such terms and conditions and to such deductibles and other restrictions and limitations as the Secretary deems appropriate; except that the Secretary may not provide essential stock insurance with respect to any stock of aquatic species if the Secretary determines such stock to be uninsurable due to the failure of the owner to follow established principles for culturing aquatic species or due to the lack of reasonable protective measures at the aquaculture facility concerned to prevent the loss of, or damage to, the stock being cultured.

(d)(1) In determining the premium rate for any direct insurance offered from time to time under subsection (c) (2) or (3), the Secretary shall consult with persons knowledgeable and experienced in insurance, including, but not limited to, State insurance regulatory authorities, and may take into consideration with respect to the insurance concerned, the nature and degree of risk involved, the protective devices employed, the

extent of past and anticipated losses, the prevailing rate for similar coverages, the economic importance of the insurance, and the relative abilities of the particular classes and types of insureds to pay the actual premium for such coverage.

(2)(A) The Secretary may not establish the premium rate for any direct insurance at less than 50 percent of the actual premium rate for such insurance.

(B) For purposes of subparagraph (A) the actual premium rate for any direct insurance offered under this section shall be determined as follows:

(i) If insurance of the same kind is generally offered by insurers or pools in the State concerned, the actual premium rate shall be that rate which the Secretary determines to be the median premium rate for all such insurance so offered.

(ii) If insurance of the same kind is not generally offered by insurers or pools in the State concerned, the actual premium rate shall be that rate which the Secretary determines to be the rate at which insurers or pools in such State would offer such insurance, taking into account actuarially sound principles applicable to the elements making up such rate, including, but not limited to, claim losses, general administrative expenses, acquisition expenses, taxes, license fees, and profits.

In making determinations under clauses (i) and (ii), the Secretary shall consult with the insurance regulatory authority of the State concerned and any rate advisory organization licensed by such State.

Nothing in this section shall be construed to prohibit or require either the adoption of uniform national rates or the periodic modification of the currently estimated reasonable premium rates for any particular coverage, class, State, or risk on the basis of additional information or actual loss experience.

(e)(1) The Secretary may enter into any contract, agreement, treaty, or other arrangement with any insurer or pool to provide reinsurance coverage with respect to any direct insurance issued by such insurer or pool, in consideration of payment of such premiums, fees, or other charges by insurers or pools which the Secretary deems to be appropriate, after consultation with persons knowledgeable and experienced in insurance.

(2) Reinsurance issued under this subsection shall reimburse an insurer or pool for its total proved and approved claims for covered losses resulting from providing the direct insurance concerned during the term of the reinsurance contract, agreement, treaty, or other arrangement, over and above the amount of the insurer's or pool's retention of such losses, as provided in such reinsurance, contract, agreement, treaty, or other arrangement entered into under this section.

(3) Such contracts, agreements, treaties, or other arrangements may be made without regard to section 3679(a) of the Revised Statutes of the United States (31 U.S.C. 665 (a)), and shall include any terms and conditions which the Secretary deems necessary to carry out the purposes of this section. The premium rates and terms and conditions of such contracts, agreements, treaties, or other arrangements with an insurer or pool shall be uniform in any one year throughout the country.

(f)(1) All premiums received by the Secretary under this section shall be deposited into the Fund.

(2) The Secretary, in a suit brought in the appropriate United States district court, shall be entitled to recover from any owner, insurer, or pool the amount of any unpaid premium lawfully payable to the Secretary by such owner, insurer, or pool under any direct insurance or reinsurance issued under this section.

(3) No action or proceeding shall be brought for the recovery of any premium due the Secretary, or for the recovery of any premium paid to the Secretary in excess of the amount due, unless such action or proceeding is commenced within 5 years after the right accrued for which the claim is made; except that, if the insurer has made or filed with the Secretary a false or fraudulent statement or other document with intent to evade, in whole or in part, the payment of premiums, the claim shall not be deemed to have accrued until its discovery by the Secretary.

(g) In order to provide for maximum efficiency in the administration of the insurance and reinsurance program provided under this section, and in order to facilitate the expeditious payment of any claims under such program, the Secretary may enter into contracts with any insurer, pool, or person, for the purpose of providing for the performance of any of the following functions:

(1) The estimation or determination of any amounts of payments for reinsurance or direct insurance claims.

(2) The receipt, disbursement, and accounting for funds in making payments for reinsurance and direct insurance claims.

(3) The auditing of the records of any insurer, pool, or person to the extent necessary to assure that proper payments are made.

(4) The establishment of the basis of liability for reinsurance or direct insurance payments, including the total amount of proved and approved claims which may be payable to any insurer, pool, or owner, and the total amount of premiums earned by any insurer or pool in the respective States from direct insurance or reinsurance.

(5) The provision of assistance in any manner provided for in the contract to further the purposes of this section.

(h) The Secretary may, with the consent of the agency concerned, accept and utilize, on a reimbursable basis, the officers, employees, services, facilities, and information of any Federal agency with respect to any insurance matter which is within the purview of this section.

(i) The Secretary may prescribe regulations establishing the general method or methods by which proved and approved claims for losses are paid under any direct insurance or reinsurance issued under this section. Proved and approved claims shall be paid from the Fund.

(j) The Secretary, in providing any direct insurance or reinsurance under this section may adjust and pay all claims for proved and approved losses covered by such insurance and, upon the disallowance by the Secretary, or upon the refusal of the claimant to accept the amount allowed upon any such claim, the claimant, within one year after the date of mailing of notice of disallowance or partial disallowance of the claim, may institute an action on such claim against the Secretary in the United States district court for the district in which the insured owner or reinsured insurer or pool resides or principally conducts business, and jurisdiction is hereby conferred upon such court to hear and determine such action without regard to the amount in controversy.

(k) The face amount of direct insurance

and reinsurance coverage outstanding and in force at any one time under this section shall not exceed $1,000,000,000.

(i) No direct insurance or reinsurance may be issued by the Secretary under this section after the close of the 5-year period beginning on the effective date of this Act.

SEC. 11. FEDERAL AQUACULTURE ASSISTANCE FUND.

(a) There is established in the Treasury of the United States a Federal Aquaculture Assistance Fund. The Fund shall be available to the Secretary as a revolving fund for the purpose of carrying out, and administering, sections 8, 9, and 10. The Fund shall consist of—

(1) any sums appropriated to the Fund;

(2) any fees received by the Secretary in connection with any guarantee made under section 8;

(3) recoveries and receipts received by the Secretary under security, subrogation, and other rights and authorities under sections 8, 9, and 10;

(4) payments of principal and interest received by the Secretary under any loan made under section 9;

(5) premiums paid to, or recovered by, the Secretary for any direct insurance or reinsurance issued by the Secretary under section 10; and

(6) moneys deposited pursuant to the last sentence of subsection (b)

All payments made by the Secretary to carry out the provisions of sections 8, 9, and 10 (including reimbursements to other Government accounts) shall be paid from the Fund, only to the extent provided in appropriation Acts. Sums in the Fund which are not currently needed for the purposes of sections 8, 9, and 10 shall be kept on deposit or invested in obligations of, or guaranteed by, the United States.

(b) If at any time the moneys in the Fund are not sufficient to pay any amount the Secretary is obligated to pay under section 8(d)(1) or any direct insurance or reinsurance claim under section 10, the Secretary shall issue to the Secretary of the Treasury notes or other obligations (only to such extent and in such amounts as may be provided for in appropriation Acts) in such forms and denominations, bearing such maturities, and subject to such terms and conditions as the Secretary of the Treasury prescribes. Such notes or other obligations shall bear interest at a rate determined by the Secretary of the Treasury, taking into consideration the current average market yield on outstanding marketable obligations of the United States of comparable maturities during the month preceding the issuance of such notes or other obligations. The Secretary of the Treasury shall purchase any notes and other obligations to be issued hereunder and for such purpose he may use as a public debt transaction the proceeds from the sale of any securities issued under the Second Liberty Bond Act, as amended, and the purposes for which securities may be issued under such Act, as amended, are extended to include any purchases of such notes and obligations. The Secretary of the Treasury at any time may sell any of the notes or other obligations acquired by him under this subsection. All redemptions, purchases, and sales by the Secretary of the Treasury of such notes or other obligations shall be treated as public debt transactions of the United States. Moneys borrowed under this subsection shall be deposited in the Fund and redemptions of such notes and obligations shall be made by the Secretary from the Fund.

SEC. 12. REPORT AND RECOMMENDATIONS.

Before the close of the 90th day after the close of the 3-year period beginning on the effective date of this Act, the Secretary shall review the operation and effectiveness of the disaster loan program provided for under section 9 and the insurance program provided for under section 10 and shall submit a report thereon to the Congress, together with the recommendation of the Secretary as to whether or not either such program should be continued and, if the Secretary recommends continuation, such suggestions as the Secretary may have for improving the operation and effectiveness of such program.

SEC. 13. AUTHORIZATION OF APPROPRIATIONS.

(a) For purposes of carrying out the provisions of this Act (other than sections 8, 9, or 10), there are authorized to be appropriated, notwithstanding any authorization for appropriations in any other Act in effect before the date of the enactment of this Act—

(1) to the Department of Commerce, not to exceed—

(A) $4,000,000 for the fiscal year 1979,

(B) $15,000,000 for the fiscal year 1980, and

(C) $17,000,000 for the fiscal year 1981;

(2) to the Department of the Interior, not to exceed—

(A) $2,000,000 for the fiscal year 1979,

(B) $7,500,000 for the fiscal year 1980, and

(C) $8,500,000 for the fiscal year 1981; and

(3) to the Department of Agriculture, not to exceed—

(A) $2,000,000 for the fiscal year 1979,

(B) $7,500,000 for the fiscal year 1980, and

(C) $8,500,000 for the fiscal year 1981.

(b) There are authorized to be appropriated, without fiscal year limitation, to the Fund such sums as may be necessary and appropriate for purposes of carrying out sections 8, 9, and 10; but not to exceed $500,000,000 for the purposes of section 8 and not to exceed $250,000,000 for the purposes of section 9

SEC. 14. EFFECTIVE DATE.

This Act shall take effect October 1, 1978.
