12. Currently there exist five recognized regional aquaculture associations in the State. They are Southern Southeast Regional Aquaculture Association, Northern Southeastern Regional Aquaculture Association, Prince William Sound Regional Aquaculture Association, Cook Inlet Regional

DOUGLAS POPE
LAWYER
912 W. 6th Ave.
Anchorage, Alaska
272-6225

Aquaculture Association, and Imarpik Regional Aquaculture Association in Dillingham. Organizational efforts are proceeding in other areas. Of the recognized aquaculture associations, three have implemented assessments pursuant to A.S. 16.10.530. Those are the Southern and Northern Regions in Southeast Alaska, and Cook Inlet Regional Aquaculture Association. The three section 530 assessment associations have specific rehabilitation and enhancement programs currently under way partially funded or guaranteed by the mandatory assessment. Prince William Sound Regional Aquaculture Association has a hatchery completed and fish returning. Imarpik Regional Aquaculture Association has been recognized by the Commissioner and has received the first $100,000.00 grant for organizational purposes. In the Southern region 800,000 Coho eggs have been incubated at Beaver Falls.

13. The law requires that boards of directors of each corporation include representatives of various user groups, including sport fishermen, processors, commercial fishermen, subsistence fishermen, and representatives of local communities. The blend of representatives required by law necessitate varying sizes in the board of directors in the different regions. For example, the by-laws of the Southern regional require 21 members on the board, whereas in Prince William Sound there are approximately 70 members on the board. In Southern Southeast board members are actively involved in management of the corporation. The board is composed of five committees, and every member of the board is assigned to a committee. Those committees are the Executive Committee, the Ways and Means Committee, The Personnel Committee, the Regional Planning Team and the Nomination and Board Development Committee. The Executive Committee is established in the by-laws, the other committees are working committees established at the direction of the

DOUGLAS POPE
LAWYER
912 W. 6th Ave.
Anchorage, Alaska
272-6225

board for the purpose of providing well researched recommendations to the board. Each committee is staffed with professional advisors pursuant to budget approval by the full board. Other than these standing committees there is from time to time special committees. For example there is currently a long range planning committee developing a five year plan for the corporation. The Regional Planning Team is developing specific plans for rehabilitation and enhancement projects which reflect the collective decision of the corporation and the Alaska Department of Fish and Game with primary focus on the social and economic benefits to the people of the region. The Personnel Committee recommends an employee wage and benefit policy to the full board, suggests performance standards and plans for the long-term requirements for the corporation. The Ways and Means Committee integrates proposed annual plans with the available budget, hires the outside auditors and supervises the financial controls of the corporation. The Nominations and Board Development Committee is responsible for the annual election of the board, and skills development for directors.

14. Fishermen elect 55% of the board. Members of other user groups, including subsistence fishermen and processors, are appointed by the full board of fishermen. The representative of the local communities is a former member of the Ketchikan Gateway Borough Assembly. He has been active as a board member in the affairs of the corporation and makes recommendations to the borough assembly on behalf of the regional association. The Beaver Falls temporary facility and the Whitman Lake hatchery required agreements with Ketchikan Public Utilities, a city owned public utility, which provides power and water to both the City and the Borough. The projects also required cooperation from the Cape Fox Village Native Association and Sealaska.

15. Board meetings are primarly held in Ketchikan,

DOUGLAS POPE
LAWYER
912 W. 6th Ave.
Anchorage, Alaska
272-8225

but the board members are flown in from various communities in Southern Southeast Alaska and Seattle. The corporation publishes a newsletter (see appendix), and holds public meetings in the various communities on a periodic basis. As part of regional planning the board expects to hold twice yearly meetings in the various communities for the purpose of public input to specific project proposals.

16. A necessary part of hatchery development is securing permits from various government agencies. Federal, state and local permits are required for access, water, egg takes and other essential aspects of salmon enhancement. (See examples in appendix). These permits are required of any public or private organization seeking to use public land or water.

17. Representatives of the corporation travelled to Washington, D.C. in 1978 to testify in Congress on the impact of D-2 legislation on fisheries enhancement. Prior to that testimony, the federal legislation would have effectively prohibited most salmon rehabilitation and enhancement projects on federal land by excluding the necessary permanent facilities, bypasses and other structures. After the effort by representatoves of the corporation and others at our urging, the legislation was amended to provide for adequate flexibility.

CHAPTER 88.
ASSESSMENT ON SALE OF SALMON

Section
10. Eligibility
20. Requests for institution of assessment
30. Review and approval of initial and final requests
40. Collection of assessment
50. Submission of initial and final requests
60. Prior action by a regional association
900. Definitions

3 AAC 88.010. ELIGIBILITY. Only a qualified regional association as defined in AS 16.10.380 is eligible to participate in the institution of an assessment under AS 16.10.530. (Eff. 5/24/78, Reg. 66)

Authority: AS 16.10.380
AS 16.10.510(4)
AS 16.10.530

3 AAC 88.020. REQUESTS FOR INSTITUTION OF ASSESSMENT. (a) A qualified regional association desiring to institute an assessment under AS 16.10.530 shall submit to the commissioner an initial request and, after approval of it, a final request.

(b) An initial request must consist of

(1) a letter of intent (including certification by the board of directors of the regional association) to seek an assessment, which letter must propose and describe

(A) the area to be covered by the assessment;

(B) the species of salmon to be included;

(C) the conditions of the assessment;

(D) the period during which the assessment will be in effect;

(E) the rate(s) of the assessment;

(F) designation of categories of salmon gear within the area to be subject to the assessment;

(G) detailed procedures for collection of the assessment, including timing, means, and method of cash transfers;

(H) designation of the trust account into which assessment funds will be deposited;

(I) procedures to be used in the implementation of any approved changes in the assessment, including increases, decreases, and discontinuation;

(J) procedures to be used by the regional association to comply with the terms and conditions of AS 16.10.530(c) and (f);

(K) procedures to be used by the regional association to comply with other provisions of applicable laws and regulations;

(2) a review of historic catch levels of salmon and present processing capabilities within the area to be covered by the assessment (catch and production statistics and other data supplied by the Department of Fish and Game may be used); and

(3) a statement of the purpose of the assessment, including, but not limited to, a description of the objectives to be accomplished by the regional association.

(c) A final request must be submitted by the regional association after approval by the commissioner of the initial request. The final request must consist of

(1) finalization of all proposals set forth in the initial request and a final description of them including the trust account agreement (which agreement must permit inspection of the account by the commissioner);

(2) evidence of compliance with AS 16.10.530(c), (e) and (f), including certification of election results. (Eff. 5/24/78, Reg. 66)

Authority: AS 16.10.510(4)
AS 16.10.530(a)

3 AAC 88.030. REVIEW AND APPROVAL OF INITIAL AND FINAL REQUESTS. (a) Upon receipt of an initial request, it will be reviewed by the commissioner for consistency with the intent and provisions of applicable laws and regulations. Factors which will be considered include, but are not limited to

(1) the recommendations of the

commissioner of fish and game, who will be consulted by the commissioner with respect to the initial and final request;

(2) the reasonableness of the assessment in view of the projected activities of the regional association as described and proposed in the materials submitted under sec. 20 of this chapter; and

(3) the likelihood of promoting, through the assessment, the interest of the public in fostering salmon enhancement efforts.

(b) If an initial request is approved by the commissioner, the commissioner will notify the regional association by letter and solicit submission of a final request after the prerequisite activities and procedures have taken place.

(c) Upon receipt of a final request, it will be given a final review by the commissioner for consistency with the intent and provisions of applicable laws and regulations. If the final request is approved by the commissioner, the commissioner will notify the regional association by letter and take the actions described in sec. 40(a) of this chapter.

(d) If an initial or final request is disapproved by the commissioner, he will notify the regional association of the reasons for the disapproval. (Eff. 5/24/78, Reg. 66)

Authority: AS 16.10.510(4)
AS 16.10.530

3 AAC 88.040. COLLECTION OF ASSESSMENT. (a) Upon approval of a final request from a regional association, the commissioner will give notice of the implementation of an assessment. Notice will be published in advance of the effective date at least twice in a newspaper of general circulation in the area of assessment. The notice will specify the area in which the assessment will be effective, the rate(s) of the assessment, the effective date, the purpose of the assessment, persons and species subject to the assessment, collection procedures, procedures for forwarding funds collected, and other details with respect to implementation of the assessment. The commissioner will, in his discretion, use other means to inform the public of a forthcoming assessment if he considers it necessary to reach persons who will be affected by it.

(b) Buyers of salmon shall collect, deduct, or withhold the assessment from fishermen at the time they purchase salmon or initiate a transaction to purchase salmon from a fisherman. For purposes of this section, completion of a fish ticket constitutes initiation of a transaction. Any subsequent consideration paid to fishermen for salmon taken is subject to the assessment and the appropriate amount must be collected and forwarded in accordance with the provisions of this section.

(c) Buyers of salmon shall accumulate assessment funds collected and shall forward those funds to the applicable trust account at times or intervals specified by the commissioner.

(d) Buyers of salmon shall keep records of assessment funds collected and forwarded (including the sources of those funds) in a manner recommended by the regional association and approved by the commissioner. The commissioner will, in his discretion, inspect and audit those records at any time consistent with AS 16.05.815. A regional association may request an inspection of assessment funds records by the commissioner, except that the cost of the inspection shall be borne by the association and the association shall not have access to individual financial records of fishermen and buyers of salmon.

(e) The commissioner will, in his discretion, require regional associations to include in their annual financial reports specified information relating to their participation in an assessment program. (Eff. 5/24/78, Reg. 66)

Authority: AS 16.10.470(6)
AS 16.10.510(4)
AS 16.10.530

3 AAC 88.050. SUBMISSION OF INITIAL AND FINAL REQUESTS. Regional associations shall submit initial and final requests for the institution of an assessment and related documents to the Division of Business Loans, Department of Commerce and Economic Development, Pouch D, Juneau, Alaska 99811. (Eff. 5/24/78, Reg. 66)

Authority: AS 16.10.510(4)

3 AAC 88.060. PRIOR ACTION BY A REGIONAL ASSOCIATION. A regional association which has taken action relating to the institution of an assessment before the effective date of this chapter, which action is determined by the commissioner to be in substantial conformity with provisions of this chapter, will, in the discretion of the commissioner, be considered to have complied with all or part of this chapter for purposes of its application. (Eff. 5/24/78, Reg. 66)

Authority: AS 16.10.510(4)
Sec. 18, ch 154, SLA 1977

3 AAC 88.900. DEFINITIONS. As used in this chapter

(1) "commissioner" means the commissioner of commerce and economic development or his designee; and

(2) "buyer of salmon" means any person, company, firm, partnership, or other organization or entity which purchases unprocessed salmon from the holder of a permit issued under AS 16.43 when such salmon were taken from an area in which an assessment is in effect. (Eff. 5/24/78, Reg. 66)

2. Special Harvest Areas

ARTICLE 1.
GENERAL

Section
5. General
10. Modifications of applicable regulations
15. Prohibitions

5 AAC 40.005. GENERAL. (a) The harvest of salmon inhabiting the water of the state, regardless of whether the salmon are naturally or artificially propagated, may be conducted only pursuant to regulations adopted by the Board of Fisheries.

(b) The harvest of salmon returning to a private nonprofit salmon hatchery will be governed by regulations adopted by the Board of Fisheries. The board will, in its discretion, develop harvesting regulations after review of the harvest plans or other materials, information and testimony (if any) presented by the regional associations, hatchery operators, the Department of Commerce and Economic Development, fishermen and other interested parties.

(c) Where hatchery returns enter a terminal location and can be harvested without significantly affecting wild stocks, a special harvest area will be designated and described by regulation adopted by the board. The board will, in its discretion, adopt additional regulations applicable to other matters necessary to accomplish the harvest in an orderly manner.

(d) A private nonprofit hatchery permit holder and his agents, contractees, and employees may harvest salmon for the hatchery only in the applicable special harvest area. This does not prevent a special harvest area from being open to commercial, sport, or subsistence fishing or any combination thereof to the extent provided in regulations adopted and orders issued under this chapter. Harvesting of salmon within the special harvest area, whether by the hatchery operator or the common property fisheries, will be opened and closed by regulation or emergency order.

(e) Special harvest area boundaries set out in this chapter may be altered by emergency order if necessary for proper management of natural stocks and hatchery stocks.

(f) Hatchery permit holders, their agents, contractees, and employees shall comply with all terms and conditions of the hatchery permit, applicable regulations and orders, and any additional requirements imposed by the commissioner to implement this chapter.

(g) Agents, contractees, and employees of a hatchery permit holder may harvest salmon for the hatchery in the special harvest area only if in possession of a written authorization from the hatchery permit holder and pursuant to its terms. The activities of persons in a special harvest area who are not a hatchery permit holder or an agent, contractee, or employee of the holder acting under the terms of a written authorization are governed by regulations governing commercial, sport, and subsistence fishing.

5 AAC 40.010. MODIFICATIONS OF APPLICABLE REGULATIONS. (a) Hatchery permit holders shall, with respect to salmon harvested by them (or their agents, contractees, or employees), comply with applicable provisions of 5 AAC 39.130(a) and (b) as though they were a purchaser of fish.

(b) Hatchery permit holders harvesting salmon within a special harvest area, to the extent those salmon are used as egg sources for brood stock, will be exempted by the commissioner from the provisions of AS 16.05.831 if the permit holder so requests. The commissioner may condition the exemption on terms he considers necessary to carry out the intent of AS 16.05.831.

(c) Hatchery permit holders conducting a hatchery harvest of salmon within a special harvest area are exempt from the provisions of 5 AAC 39.290.

(d) Fishermen taking salmon in a special harvest area under authorization from the hatchery permit holder and operating under an interim-use permit are exempt from the provisions of 5 AAC 39.120.

LEGISLATIVE AFFAIRS AGENCY

M E M O R A N D U M

April 17, 1978

SUBJECT: Proposed SCS CS for HB 477

TO: Senator Kay Poland
Chairman, Senate Resources Committee

FROM: James L. Baldwin
Legislative Counsel

I have been directed to present a memorandum discussing the constitutionality of legislation suggested by the Joint Federal - State Land Use Planning Commission for Alaska. The Commission would permit the director of the division of lands to grant a preference to local residents to purchase state land by lottery when land located near their residence is offered for sale.

A local preference right establishes a classification among state residents. The classification discriminates against non-local residents to the extent local residents do not compete for state land equally with non-local residents.

Traditionally, whenever a statute's constitutionality has been challenged, the courts test the validity of the statute under either the "rational basis standard" or the "compelling state interest standard." The United States Supreme Court announced the rational basis standard in F.S. Royster Guano Co. v. Virginia, 253 U.S. 412, 415. The Court explained that for a statute to survive judicial scrutiny under the rational basis test:

> [It must] be reasonable not arbitrary, and must rest upon some ground of difference having a fair and substantial relation to the object of the legislation, so that all persons similarly circumstanced shall be treated alike.

While under the "compelling state interest standard," the classification will withstand constitutional scrutiny only upon a clear showing that "the burden imposed is necessary to protect a compelling and substantial state interest." Oregon v. Mitchell, 400 U.S. 112, 238 (1970). The courts determine which standard of review to apply according to the type of personal right that is being invaded by the statute under review. If the right is characterized as "fundamental", the compelling state interest standard of review is applicable, while invasions of other non-fundamental rights of citizenship are reviewed under the rational basis standard of review.

The Alaska Supreme Court has further refined the rational basis standard by demanding that the legislature create classes that logically relate to the object of the legislation. Isakson v. Rickey, 550 P.2d 359 (Alaska 1976). This approach was presumably adopted out of frustration with the present system of characterizing the rights affected and then applying either of two standards of review - one that is nearly impossible to satisfy (compelling state interests standard) and the other that is easily satisfied (rational basis standard).

In addition to the standards judicially imposed, the Alaska State Constitution contains general requirements specifically applicable to the disposal of natural resources of the state.

These requirements are:

(1) Article VIII, Section 2 which directs the legislature to provide for:

> "... the utilization, development, and conservation of all natural resources belonging to the State, including land and waters, for the maximum benefit of its people." (emphasis added); and

(2) Article VIII, Section 17 which provides:

> Laws and regulations governing the use or disposal of natural resources shall apply equally to all persons similarly situated with reference to the subject matter and purpose to be served by the law or regulation.

THE COMMISSION'S PROPOSAL

The proposal presented by the Commission amends AS 38.05.055 by adding a new subsection to read:

> "The director may limit qualified applicants in a sale of land by lottery to residents of the local area."

The commission urged the following justification in support of its proposal:

> "This authority would be useful in cases where there was an identified need in the area for additional lands for homes and cabin sites for local people. By limiting qualified purchasers to local residents, the director could prevent the sale offering from being preempted by speculative purchasers from outside the local area."

The proposal was submitted in conjunction with another proposal to reduce the durational residency requirement contained in HB 477. After receiving advice from legislative counsel that all durational residency requirements are constitutionally suspect, the committee has indicated unwillingness to support a durational residency requirement of less than three years as presently contained in HB 477. The Commission's proposal as drafted lacks specificity since no boundaries for the local area are set, nor is there a durational residency requirement in the local area as a precondition for qualifying for a local preference. The Research Division of the Legislative Affairs Agency was requested to develop a factual survey of the distribution of state land in different localities of the state; that report is attached for your review. The purpose of this survey is to determine the extent to which residents currently residing in different regions of the state would be affected by granting preference rights for local land offerings. It was felt that the distribution of available state land may cause inequality in opportunity for the purchase of state lands for residents residing in a locality where state land is in limited supply. The survey seems to support the contention that the Commission's proposal creates a class of state residents who would always have a second priority preference right or at least have less opportunity to exercise a first priority preference right than other state residents who reside in areas of the state where there is an abundant supply of available state land.

LOCAL RESIDENCY REQUIREMENTS AND THE DISPOSAL OF STATE LAND

The U.S. Supreme Court has long recognized that the freedom to travel throughout the United States "uninhibited by statutes, rules, or regulations which unreasonably burden or restrict this movement" is a right of national citizenship but that right is not a fundamental right unless a right to receive a basic necessity of life is also impaired. Memorial Hospital v. Maricopa County, 415 U.S. 250 (1974). It could be argued that there also exists a right to freedom of travel or migration within a state without undue discrimination between rights and remedies available to state residents who choose to do so. The pivotal issue which determines the standard of judicial review is whether or not the right to purchase state land by state residents is a "basic necessity of life" to justify the characterization of that right as a fundamental right of citizenship. The Alaska Supreme Court has in three out of four cases struck down durational residency requirements and has done so by analyzing the invasion of personal rights on the basis of the right to travel and has not imposed the additional stipulation that the residency requirement also cause persons a denial of the necessities of life. The necessities of life referred to by the Court in Maricopa was the right to receive welfare payments or the right to obtain medical care after changing state residence. The basic necessities of life considered by the United States Supreme Court are more closely related to personal well-being than the right to purchase state land at a lottery sale. I conclude that a court would review a local preference that is not determined by a lengthy durational requirement by applying the less stringent "rational basis standard."

SUMMARY

In summary, past cases indicate that the Alaska Supreme Court has reviewed residency requirements strictly and characterizes the right to travel as a fundamental right; while the U.S. Supreme Court has indicated that it will apply the compelling state interest standard of review to legislation which infringes the right to travel only if the legislation also infringes upon a right to receive a basic necessity of life offered by the state to others similarly situated. Whether the Alaska Supreme Court will depart from its stricter standard and embrace the United States Supreme Court's position is unclear. The position of the United States Supreme Court regarding residency requirements for the purpose

of controlling utilization of natural resources is currently being considered by that court in Hicklin v. Orbeck, 565 P.2d 159 (Alaska 1977). That case involves a test of the constitutionality of the Alaska local hire law (AS 38.40).

In its brief, the state has argued that the state's right to control its land resources outweighs an individual's basic right to travel. Whether the outcome of Hicklin will cause the Alaska Supreme Court to review residency requirements under a less strict standard for review is unknown. What is readily ascertainable is that due to the unequal distribution of state land in localities of the state certain residents will be discriminated against in fact under the Commission's proposal. A local preference may not be justified under the Alaska Supreme Court's stricter rational basis standard of review. The requirement contained in Article VIII, section 17 of the Alaska State Constitution, set out above also causes me to question the legality of establishng discriminatory classifications based upon local residency for the disposal of state land.

MEMORANDUM

April 7, 1978

SUBJECT: Regional Resident Preference Rights

TO: The Honorable Kay Poland

FROM: George Utermohle
Research Analyst

In response to a request from Legislative Affairs Agency, Legal Division, we have reviewed the subject of regional resident preference rights for disposals of state land. In the following discussion, the number of persons who would receive a preference right to state land based upon residence in the region of the disposal is compared with the apparent amount of state land present in that region. The regions used in this discussion are based upon: (1) 1974 state house election districts; (2) existing state senate election districts; and (3) current state judicial districts.

The information which is necessary for a thorough analysis of the need for and subsequent impact of a regionalized resident preference system is not readily available or does not exist. In order to complete a thorough analysis of such a system we must know how much state land in each region is suitable for each type of use (residential, industrial, agricultural, etc.), what the demand is for each type, and what the state's schedule of land disposals is or might be. The cursory discussion which follows is intended as illustrative of what lands could be disposed by the state in each district and how many persons would receive a preference right to those lands.

1974 House Election Districts

There were twenty-two house election districts in 1974. If these districts were used as a basis for granting regional resident preference rights when state land is disposed, this would create 22 sub-groups within Alaska's population, each with a preference right to lands within their region.

The population and an estimate of the state land present within each house election district are listed in Table 1. For an explanation of how the amount of state land present in each district was estimated, see the section on Methodology.

The population of these districts ranges from 6,500 to 180,700 and the amount of state land present within each district varies from almost zero to 657 townships. There is no correlation between the population of a district and the amount of state land present. Many rural districts have relatively small populations but contain disproportionately large shares of state land. Likewise, the urbanized districts have little state land present relative to their population.

Senate Election Districts

There are 11 senate districts. These districts generally encompass two or more house districts and, thus, have larger populations and larger areas of state land within their boundaries. The population and the amount of state land present within each district are shown in Table II. For an explanation of how the amount of state land present within each district was determined, see the section on Methodology.

The population of the senate districts ranges from 13,300 to 180,700. The amount of land within these districts ranges from .5 to 1,092 townships. Since the senate districts are amalgamations of house districts, the relationships between population and the amount of state land present are similar for the two kinds of districts. Rural districts in Interior Alaska have much more state land present relative to their population. The urban districts, Anchorage and Fairbanks, have much less land present relative to their populations. Districts in Southeast Alaska have very little state land present.

Judicial Districts

There are four judicial districts in Alaska. These districts coincide with the major geographic regions of Alaska: Southeast, Southcentral and Southwest, Interior and Northeast, and the Northwest. The judicial districts were established for administrative purposes and are not related to population, which is the basis for election districts. The population and amount of state land present within each judicial district are listed in Table III. For an explanation of how the amount of state land present in each district was estimated, see the section on Methodology.

The population within the judicial districts ranges from 25,200 to 251,500. The amount of state land present within the districts ranges from 20 to 1,279 townships. The use of judicial districts has eliminated some of the variation that was found to exist between rural and urban election districts. However, the relative shortage of land in Southeast Alaska is unaffected by the use of judicial districts.

Methodology

The population of each district was established by using data supplied by the state revenue sharing program for fiscal year 1978 and currently available census data. The total state population is estimated to be 411,000. These figures include all civilians regardless of age residing in the state.

The amount of state land present in each district was established by counting the number of state selected, tentatively approved, and patented townships within each district as shown on the Bureau of Land Management land status map dated March, 1974. The amount of state land present within each district is all state land present without regard to suitability for settlement, present dedications as parks and refuges, existing disposals, and proposed disposals such as municipal land grants. It is important to note that the amounts of land listed as present in each district are merely indicative of the amount of state land present and does not represent a true and accurate accounting of the distribution of state land. These data are most valuable for comparative purposes.

The low amounts of land present in House Districts 1 and 2 are partly due to the methodology of this study. There is certainly some state land within House Election District 2 (Petersburg, Icy Strait), but there is not enough land in a sufficiently compact area to be represented on the land status map. Similar conditions exist in other parts of the state.

Discussion

As the size and number of districts increase, the number of persons eligible for preference rights within each district and the amount of land within each district decreases. However, it depends upon the system of establishing these districts as to whether the population and amount of state land involved decrease at the same rate. In the case of election districts, which are based upon population, the area of the district will decrease as the density of the population increases. This will result in more people exercising a preference right to a decreasing amount of state land. This is particularly true within those election districts which comprise Anchorage.

Judicial districts are established without much regard for land area or population. Also, there are only four judicial districts, which means that each district must contain more population and more area than would the more numerous election districts. The advantage of the judicial districts over the election districts as a basis for granting preference rights is that each person would be able to select from a greater variety of land types and locations. This would be a benefit to the resident of Anchorage or Kodiak who does not have large acreages of state land available due to competition for land and existing withdrawals of state land.

In all of the three districting proposals presented, there is little that can be done to increase the relative amount of state land present in Southeast Alaska. The current state tentative selections within the National Forests (400,000 acres) would, at best, increase the amount of state land in Southeast by 75 percent. This land may be suitable for settlement and may be enough to more than satisfy the demand for land

for decades, but the amount of state land present will never be comparable to other areas of the state.

There is no mechanism for determining what the demand is for land in each region of the state and how suitable the land in that region is to satisfy that demand. Without that kind of information on the demand for land and the suitability of the land, there is no way to know what effect preference rights will have on the ability of people to obtain the land that they need or want, when and where they desire.

Small districts such as the house election districts may limit the preference rights to smaller areas, but it ensures that a local resident will have the first opportunity to obtain land near his present home. For example, there may or may not be sufficient state land within the Anchorage house election districts to satisfy the demand, but limitation of the preference rights to small districts would assure that an Anchorage resident would have the first opportunity to obtain state land sold or leased within that district. Under the judicial district system, a resident of Cordova would have the same opportunity to obtain scarce land around Anchorage as would the resident of Anchorage.

However preferable it may be to limit preference rights to small districts such as house election districts in order to assure preference rights to local residents, it will do them no good if the state never [illegible]ses of land within that district. If the state seldom disposes of [illegible] within a particular house district, it would benefit the residents of that district to have preference rights to a larger area such as a senate or judicial district.

It is our hope that the brief foregoing discussion will aid you in identifying some of the factual issues inherent in the subject of regional preference rights.

Chairman

S 60 (rev. 6/77)

HB588

January 10, 1978

The Honorable Hugh Malone
Speaker of the House
Alaska State Legislature
Juneau, Alaska 99811

Dear Mr. Speaker:

Under the authority of art. III, sec. 18 of the Alaska Constitution, and in accordance with AS 24.30.060(b) and the Uniform Rules of the Alaska State Legislature, I am transmitting a bill appropriating $7,552,198.21 to the Department of Natural Resources, to implement ch. 113 SLA 1976 (Kachemak Bay). It is similar to the appropriation made in ch. 91 SLA 1977.

The purpose of the appropriation is to fulfill obligations of the State of Alaska under contracts with Shell Oil Company, Simasko Production Company, and Texas International Petroleum Corporation to repurchase all of their leases in Kachemak Bay. Pursuant to ch. 113 SLA 1976, the administration initiated negotiations with these companies and concluded agreements with them in June of 1977. Copies of the contracts are attached along with a breakdown of the purchase prices showing amounts for bonuses, rent, etc. It should be noted that the balance owed under the Shell contract is subject to adjustment upon tabulation of recent credits taken by Shell pursuant to the contract.

Ch. 113 SLA 1976 specifically authorized the commissioner of natural resources to use credits for future taxes and royalties of the lessees as part of the purchase price. The Shell contract takes advantage of roughly $2.4 million in credits over the next two years. Additionally, the state was able to conclude an agreement with Union Oil Company in the principal amount of $150,423, which will be entirely paid by future credits, foreclosing entirely the need for an appropriation.

This bill, along with the credit provisions of the contracts, concludes our monetary obligations for all but two of the leases. Two inexpensive leases along the shoreline of the Bay were required to be made subject to a condemnation action, since the state was unable to reach what we considered a fair agreement on these leases. We do not anticipate the judgment awarding compensation to be a significant sum of money.

Sincerely,

S/JSH

Jay S. Hammond
Governor

TO: Mike Harper, Chairman
Budget Review Committee

DATE: November 23, 1977

FILE NO:

Thru: R.E. LeResche, Commissioner
Department of Natural Resources

TELEPHONE NO:

FROM: Donald G. Wold, Executive Director
Alaska Royalty Oil & Gas Board

SUBJECT: FY 78 Supplemental Budget
Royalty Oil and Gas Board

Forwarded herewith is a completed "FY 78 Supplemental Request Analysis" to support our request for an additional $15,000 for Contractual Services (consultant fees) tc be used by the Alaska Royalty Oil and Gas Development Advisory Board and the Commissioner of Natural Resources in the review and analysis of proposals received from industry in response to the State solicitation entitled "Offer for Negotiated Sale of Prudhoe Bay Crude Oil, 150,000 Barrels Per Day."

In response to the above solicitation the State has received four (4) final proposals from companies offering to construct refineries and petrochemical plants ranging in size from 150,000 - 250,000 Barrels per Day and ranging in investment from $400 million to $2,500 million.

The evaluation of these proposals will require the retaining of three consultants with special expertise in law, finance, and engineering related to those process industries to insure that the States interests are protected in this large sale of the States resources.

The FY 78 Royalty Board budget for contractual services is $76,700 of which approximately $60,000 is currently available for these purposes.

A law firm has been retained to assist the State in the development of the contract for this sale, approximately $30,000 is required for these services. A technical engineering firm has been retained to assist in the technical evaluation of the projects proposed and $20,000 is required for these services. Financial consultants will be retained to assist in all aspects of the financing of the project and a minimum of $25,000 is required for these services.

Should you have any further questions please do not hesitate to call.

STATE of ALASKA

MEMORANDUM

TO: Robert LeResche
Commissioner

DATE: September 2, 1977

FILE NO:

TELEPHONE NO:

FROM: Dave Hanson, Chief
Planning and Research

SUBJECT: Justification for Supplemental funding for d-2 and land selections work

At your direction, the Planning and Research Section has recently become heavily involved in critically important Alaskan land issues to an extent not anticipated during the formation of the fiscal year 1978 budget last August. As a direct consequence of the Section's responsibility for the resource impact analysis of the various d-2 land proposals, assessment of State concerns associated with specific d-2 unit proposals, preparation of d-2 related resource impact presentations to Federal entitites such as the Department of Interior, the Office of Management and Budget, and various Congressional committees, along with the Section's responsibility for Statehood Entitlement Land Selections, the Section must augment its fiscal year 1978 budget by approximately $255,000. This memo is a justification for the supplemental funding which is essential to support the section's continued lead in these land issues through fiscal year 1978.

This memo is divided into the following parts:

1. A description of the unanticipated but unprecedented opportunity for substantial State input into the federal and Congressional deliberations on the d-2 land issues and timely action on Statehood Entitlement land selections;

2. A summary of the supplemental budget request;

3. An accounting of Section personnel and other budget allocations for FY 78 and an explanation of why the accelerated d-2 and land selections program budget demands cannot be met with the Section's present budget allocation.

The immediacy of the demands related to statehood land entitlement selections and the d-2 decision process emphasize the need for expedient consideration of this supplemental budget request. The Section will be able to provide the State with adequate backup in order to have a substantial impact on federal and Congressional considerations of d-2 proposals, and also will be able to honor the Governor's recent committment to indicate within ninety days approximately 60 million acres from which the State will select the remainder of its Statehood Entitlement. In considering this request, it should be recognized that the vast majority of the State's decisions concerning land selections and the national decisions concerning the allottment of d-2 lands will take place during the remainder of FY 78 and initial months of FY 79. Consequently, this is a singular and historic opportunity which will have enormous long term impact on Alaska.

Furthermore, the Governor's committment to a publicly accountable and analytical process of land selections should be recognized. Without this supplemental these services cannot be provided.

1. Land Selections and d-2 issue tasks and opportunities:

During the past eighteen months, the Department of Natural Resources Planning and Research Section has had the lead responsibility for establishing a land selections process which was publicly accountable and based upon the best analysis available as well as a detailed land resource inventory/analysis to form a basis for land selection decisions. The inventory/analysis system has already proved to be an invaluable tool for determining relevant resource values on Alaskan lands. The assessment was used in December of 1976, and April 1977 in making land selections totaling over 3.6 million acres and was frequently used by the Department in appraising land management options. The Department's inventory/analysis is the only system available to the State or Federal Government which can provide detailed assessment of the relative values of Alaskan lands.

Recently, you requested the Planning and Research Section to apply the resource inventory and assessment to the various d-2 proposals and prepare to use it to help provide a data base for the d-2 debate and identify State areas of interest within that debate. In view of the emergence of the Udall d-2 Bill in January of 1977 and the various pressures being applied nationally to Statehood selections rights, it became extremely important to identify both the relative value of those lands which the State might wish to select in the future and also to be able to defend rationally past selection actions and statehood entitlements. The use of the resource assessment to evaluate d-2 proposals, the development, on an accelerated basis, of the land selection system, and the need to apply this system to the selection of the majority of the remaining Statehood entitlement within FY 78, had not been envisioned in planning the FY 78 budget.

The opportunities and results related to these tasks, however, are overwhelming and require immediate action. As a result of the application of the resource assessment to the various d-2 proposals, the State is developing a rational and well justified position on d-2 issues. The depth of the analysis behind the State's position is greatly aiding our effectiveness with various federal agencies and Congressional committees. We have gained additional credibility with these agencies and committees by providing them with the best data base available for their consideration of d-2 issues. In addition, the Section has prepared large scale maps to convey State concerns with respect to the various d-2 proposals. These maps were critical in the State's recently successful effort to communicate its concerns to the federal government and will be used to help influence House and Senate d-2 committee positions.

The significance of these projects in providing an objective resource information and a reputable State land selection system which is necessary to deal with both the various d-2 issues and to effectively defend the State's position can hardly be overstated. The Department of Interior, the Federal Energy

Administration, the Office of Management and Budget, the State Federal Land Use Planning Commission, and both House and Senate committees dealing with the d-2 issues and overall land issues have recognized the State's efforts and complimented the system that has been developed.

In addition to the considerable effort relating directly to the d-2 issues, the Section has recently been obligated by the Governor to identify 60 million acres of land suitable for State selections on November 20. What this means is that the development of a publicly accountable land selection process will have to be greatly accelerated. This further means that most of the State land selection decisions will have to be made within the next year.

The need for accelerated determination of land selections, a greatly accelerated land selection process, and the need for detailed analyses of federal d-2 actions to protect statehood rights were neither foreseen nor expected during FY 78 budget formulation. It should also be noted that the total cost of this supplemental appropriation represents .7¢ per acre for the remaining Statehood land entitlement. We estimate the entire program to protect state interest in d-2 and select the remaining entitlement in a publicly accountable manner over the next two years will cost 1.7¢ per acre. It should be emphasized that in providing our input thus far, the Planning and Research Section has completely exhausted its budgetary options and must have supplemental funding to continue this effort into the future.

A description of the projects and budgetary requirements which the Planning and Research Section believe essential for the State's continued input into these land decisions is provided in the following pages.

2. Summary of Supplemental Budget Request

This Section sets forth a summary of the additional funding which would be required to complete the above tasks related to analysis of d-2 issues, provision for documentation and presentation of these issues to federal and State entities, completion of the establishment of a land selection process, and analyses and documentation required to identify proposed selections of an additional 60 million acres within ninety days. The summary of the budget requirements is set forth in tabular form below and is followed by a short explanation of each budget item. An appendix is attached to the supplemental request which sets forth in more detail the tasks to be covered by the supplemental funding.

Supplemental Budget Request

Personnel	Range	Budget
Research Analyst I (24 mos)	13	41,284
Associate Planner (12 mos)	17	27,630
Data Clerks (14 months)	9	18,707
Research Analyst II (4 mos)	16	7,440
Criteria document writer/analyst (3 mos)	18	7,100
Contingency hires		5,000
Cartographer (2½ mos)	13	3,750
	TOTAL	110,911

Contractual		
Systems Analyst (12 mos), programming		43,005
Computer time		36,000
D-2 data assessments and addendums, documentation and distribution		30,000
Criteria document publication, distribution, statewide public participation, review, and analysis		10,000
	TOTAL	120,005
Space		6,000
Commodities		3,000
Travel		10,000
Equipment		5,000
	TOTAL	24,000
	TOTAL SUPPLEMENTAL REQUEST	254,916

The following is a brief explanation of each of the budget items listed above in the order they are presented.

Research Analyst (24 mos): The Research Analyst I positions will be used to accomplish four tasks. These include preparation and manipulation of data within the computer system to handle routine requests for d-2 analysis and land selection scenarios; analysis of resource data for presentation to State, Federal and Congressional entities regarding d-2 impacts on state lands; development and application of accountable land selections processes for immediate selection demands; and finally completion of the required refinement and updating of the resource inventory which is to take place during the next six months.

Associate Planner (12 mos): The Associate Planner position will have responsibility for the overall direction of the d-2 analysis and preparation of presentations to be given on d-2 impacts on state lands. The Section's current Associate Planner position is responsible for completing selections activities which are related to the Governor's request and the establishment of an accountable process as well as its administration. The requested Associate Planner is definitely required to provide fulltime guidance on the d-2 issues and yet enable us to continue completing our selections responsibilities with existing personnel.

Data Clerk (14 mos): The Clerk personnel will be used for the very necessary and complicated function of continuing to check and double check resource and land status data to assure its validity before the conclusions from such computer runs and data are used in official presentations and positions. This element is central to the credibility of the entire system and the State's positions on d-2 and land selections. The credibility of our efforts are damaged if there are inaccuracies due to mechanical errors. The elimination or minimization of such errors is a prime responsibility of these data clerks. The work time needed to complete these tasks is considerable and cannot be overstated. The Data Clerks also assist in the preparation of the State's formal presentations and mechanical mapping activities.

Research Analyst II(4 mos): The Research Analyst II position is responsible for generating and analyzing the selections scenarios which must be completed to provide a basis for our identification of 60 million acres of land suitable for selection by late November and the narrowing down of these selection recommendations during the months which follow.

Criteria Document Writer Analyst (3 mos): In response to the Governor's request that our selection efforts be publicly accountable, a document must be written which explains the general criteria we use in the land selection process. A person to accomplish this during the immediate future is mandatory if this system is to be credibly presented to the Alaskan public.

Contingency Hires: The small amount of money for contingency hires is to cover unforeseen circumstances requiring clerical or mechanical work associated with putting together documents, presentations or booklets of data.

Cartographer (2½ mos): Though the majority of cartographic efforts associated with our land selection process and the d-2 analysis presentation process will be provided by Cartographers within the Section, the unexpected number of presentations and maps variations that will be needed in providing the d-2 assessment and the selections nominations require some additional cartographic time. This minimal 2½ months of cartographic time should enable us to complete these mapping projects on schedule.

Contractual

Systems Analyst (12 mos) Programming:

The focal point for our land selections efforts and our d-2 analysis rests on the ability of our computer system to be manipulated to provide information for the great variety of changing d-2 proposals and selections scenarios. Consequently, a large amount of computer programming and systems-analysts help is mandatory if any of this work is to get done. This system is still being modified to meet the new types of demands associated with d-2 and accelerated land selections which also require this manpower.

Computer Time:

During the first two months of FY 78, 150 hours of computer time has been required to complete the demanded d-2 analyses alone. In order to continue meeting the demands for d-2 analyses and manipulating this large amount of data for the accelerated land selection purposes, at least an additional 600 hours of computer time will be required. Due to the complexities of the d-2 and land selections systems, along with the large areas to be covered, require significant amounts of computer time.

d-2 Data Assessments and Addendums, Document Publication and Distribution:

The publication and distribution of the initial d-2 proposals assessments is estimated to cost in the range of over $20,000. It should be recognized that these are voluminous documents providing the data base for d-2 assessment work to be carried on by the State and interested parties within the State for the next year and a half. Addendums to this data for the final Department of Interior, and Congressional proposals will be necessary, and are estimated to require an additional $10,000 for printing, publication, and distribution costs.

Criteria Document Publication, Distribution, Statewide public Participation, Review, and Analysis:

In order to fulfill the Governor's mandate that our selection process be publicly accountable, we must set out criteria used in selections for public review and assure widespread awareness of these criteria and opportunities for public participation and comment. The cost provided for in this supplemental refer only to expected publication costs of

the criteria document. The Department is planning to cover the costs of public meetings from existing budgets.

Space: In order to provide facilities for the additional personnel, additional space is necessary.

Commodities: This small amount of commodities money is inserted for drafting materials, xeroxing, and telephone bills associated with the project including long distance calls to Washington, D. C., and other miscellaneous items.

Travel: During FY 78, at least ten trips to Washington of Section personnel will be necessary to assist in presentations of our d-2 assessment and land selections data to various federal departments, and Congressional committees and staffs. This amount of travel to D. C. was not expected at the time the budget was formed and actual travel demands may easily be in excess of this estimate.

Equipment: This covers the equipment necessary for the additional personnel including files, desks, and tables as well as storage facilities for the large amounts of computer data that will have to be referred to in the future which will result from the various phases of this project.

3. Present FY 78 Budget Allocations and Section Responsibilities

The Planning and Research Section of the Department of Natural Resources was allocated a budget of $367,000 for FY 78. The vast majority of this budget, $310,700, was allocated for personal services expenditures to support the Planning Section's ten permanent positions. These ten permanent positions include two clerical staff members, two cartographers, and six professional planner positions. The remainder of the budget was divided as follows:

Contractual Services	$33,500
Travel	14,500
Commodities	2,500
Equipment	400

The contractual services portion of the budget was divided between computer time for land selections, $10,000; computer time for water permits, $4,000; space rental, $10,000; and office equipment, drafting material, and publishing, $9,500.

The large portion of this budget, Personal Services Expenditures, provides little if any leeway for additional expenditures in other areas, and currently supports several high priority items. Of the six professional positions budgeted, one of the Natural and Physical Sciences Planner positions is being used for a special leasing advisory position which does not relate to the Section's efforts. Four of the other five professional positions are currently filled and the one unfilled position, a Principal Planner position, will be filled by October of this year. Consequently the Personal Services portion of the budget provides a leeway of only $9,000 due to the unfilled Principal Planner position during the first three months of Fiscal 1978.

The responsibilities being carried out by the five professional positions currently dealing with Section activities include such high priority items as coordination of the Delta Barley project; coordination and planning involvement in the recently passed homesite act; analysis of the recently authorized agricultural rights disposal and development statute; coordination of the Department's implementation of the recently passsed coastal management act and administration of federal monies provided to aid coastal management programs; coordination, and direction of the newly created Departmental water planning program and establishment of a new water section; establishment of the State's land selection program and provision for analysis and strategy for that program; analysis and data preparation for the establishment of the Department's general land management policies; involvement in the revision of the Department's classification system; and coordination of Department activities with the Department of Transportation, including the haul road question.

The Section also has responsibilities involved with coordination of all Department planning, analysis, and research efforts, as well as initiation of new programs between various federal land management agencies, native land owners, and the Department. The Section is also responsible for coordination of various review functions regarding policy decisions.

Finally, the Section manages a variety of land and water use planning programs throughout the State ranging from the Susitna Valley, Kenai Peninsula, Prince William Sound, the Fairbanks area, and the North Slope, as well as managing a major petroleum development study which will input directly to oil and gas leasing considerations on the North Slope. The section is also the lead agency for developing a computerized resource inventory and analysis system for the entire state. (This program provides the basic data for the d-2 and land selection assessment.) These projects all have high priority within the Department of Natural Resources and all have previous committments for final products under time deadlines. Elimination of these ongoing programs would severly hamper the management and administration processes of the Department. In addition approximately 33% of our budgeted professional manpower, 50% of our budgeted drafting manpower and 33% of our budgeted clerical manpower are presently involved in d-2, land selection, and selection process projects.

The largest budget unit after permanent personnel is Contractual Services which includes $33,500. The vast majority of this budget component has already been spent or committed in the support of computer services for our land selections and resource inventory efforts, rent payments, and support of existing office equipment, drafting material, and publication of already completed documents.

It is obvious from the above, that the current budget provides very little leeway for support of an accelerated land selection program and analysis of d-2 issues. The budget demands of these new programs fall primarily in the Contractual Services category for computer time, systems analyst time, publication of documents, and preparation of mapping materials. Another large portion of the demand budget falls in the area of Personal Services money for temporary employees to help with the vast amount of clerical and data gathering duties associated with an analysis of land selection issues and d-2 proposals.

The current budget as noted above provides barely $8-9,000 of excess money for temporary hires and absolutely no additional monies for the great amount of contractual services required. The possibility of using much additional time of the five permanent employees beyond that already allocated to the land selections process is slight and would not greatly change the need for additional monies. Most of the items being dealt with by the professionals are high priority items. As noted above, one of the professionals is already working fulltime on the land selection and d-2 issues under the present budget and at least two of the other professionals are already spending a large portion of the time on the land selections/d-2 issues.

Supplemental Request

Based upon the above description of the needs and analysis of current budget allocations and section committments, the Planning and Research Section hereby requests a supplemental budget appropriation of $254,916. The need for expeditious process of this request is obvious in view of the federal and Congressional deadlines regarding the d-2 issues, the Governor's ninety day committment to provide land selection nominations, and the immediate demand upon the Section for products in these areas which cannot be provided without this supplemental.

HB647

January 17, 1978

The Honorable Hugh Malone
Speaker of the House
Alaska State Legislature
Juneau, Alaska 99811

Dear Mr. Speaker:

Under the authority of art. III, sec. 18 of the Alaska Constitution, and in accordance with AS 24.30.060(b) and the Uniform Rules of the Alaska State Legislature, I am transmitting a bill making appropriation adjustments for the Department of Revenue.

This measure will permit the use of $109,000 originally appropriated for state-facilitated gas pipeline financing, which is no longer needed for that purpose, to conduct in-depth investigations of the bids for state royalty oil.

Fiscal information is enclosed.

Sincerely,

S/ JSH

Jay S. Hammond
Governor

STATE of ALASKA

MEMORANDUM

DEC - 5 1977
BUDGET & MANAGEMENT

TO: Ron Lind, Director
Division of Budget & Management
Office of the Governor

DATE : December 5, 1977

FROM: Norene Hirsh
Finance Officer
Department of Revenue

SUBJECT: FY 78 Supplemental Request
for Treasury Management

HB647

Attached please find our memo and FY 78 Supplemental Request.

Please note we are lasping $109,000 to investigate financing for the All - Alaska Gas Pipeline (item one on fiscal note CS HCR 27) and requesting a supplemental appropriation of $109,000 for the Financial Analysis of the Proposals to purchase the State's Royalty Oil.

The Supplemental Request is to remain under Treasury Management's administration.

Attachments

STATE of ALASKA

MEMORANDUM

TO: Ron Lind, Director
Division of Budget and Management
Office of the Governor

DATE : December 2, 1977

FROM: Jim Edenso
Deputy Commissioner
Department of Revenue

SUBJECT: Supplemental Appropriation to Pay for Financial Analysis of the Proposals to Purchase the State's Royalty Oil

The Alaska Royalty Oil and Gas Development Board requested the Department of Revenue by resolution to perform the above evaluation. It further requested that the Department hire an independent financial consultant to assist in the above analysis. The Department submitted a request for proposals to the following firms:

1. White Weld, Inc.
2. Kidder Peabody and Co.
3. Dillon, Read and Company, Inc.
4. Smith Barney, Harris Upham & Co., Inc.

The Department of Revenue elected to hire the firm of Smith Barney, Harris Upham & Co., Inc. to perform the financial analysis. The cost of the contract is not to exceed $100,000 plus expenses.

The 1977 legislature passed Committee Substitute for House Concurrent Resolution #27 directing the Department of Revenue to investigate financing an all-Alaska gas pipeline. The dollars appropriated for this investigation amounted to $59,000 in FY 1977 and $109,000 in FY 1978. The contract was let to Smith Barney, Harris Upham & Co., Inc. to perform the gas pipeline investigation.

The El Paso Gas Pipeline withdrew its application to construct an all-Alaska gas pipeline in September, 1977 and the Department of Revenue subsequently cancelled the contract with Smith Barney immediately upon learning of El Paso's application withdrawal.

The final billing for the gas pipeline investigation is in an amount of $50,000. It is expected that the $50,000 will be paid out of the FY 77 special appropriation under HCR #27.

The payment for the financial analysis of the proposals to purchase Alaska's royalty oil is expected to come from a supplemental appropriation utilizing the FY 78 residual dollar amount of $109,000 for investigating the financing of an all-Alaska gas pipeline. It is mandatory that the State fully analyze the ability of the firms proposing to purchase Alaska's royalty oil to implement their proposals.

The desirability of using a supplemental appropriation of $109,000 for the financial analysis of royalty oil sales rather than investigating the all-Alaska gas pipeline (which is now a moot question) is obvious. Should the State, for all intents and purposes, make a disposition which ultimately costs the State millions of royalty revenue dollars it will be most unfortunate. The kind of financial analysis contemplated will assist the State in making the most "correct" decision.

Your assistance in helping to approve a supplemental appropriation will be greatly appreciated.

AN OUTLINE FOR

THE STATE OF ALASKA

FOR A

NATIONAL d-2 INFLUENCE PROGRAM

Prepared for

Senator Joseph L. Orsini

by

Murray, Kraft & Rockey, Inc.
3925 Reka Drive
Anchorage, Alaska 99504

February 27, 1978

I INTRODUCTION

At the request of Senator Joe Orsini, Murray, Kraft & Rockey, Inc. has prepared the following prospectus, detailing estimated reach and frequency which might be achieved by the State of Alaska, should it desire to go to the American public with messages urging reasonable assignment of d-2 lands.

Obviously, close coordination with our congressional delegation would be required, since rather than "shot-gunning" advertising, our messages should be concentrated in those congressional districts wherein influence is required. However, for purposes of this outline, the agency has selected the 128 leading United States markets, and for purposes of budgeting have assigned market values to the total, based on two different media proposals, and the combination of both.

In order to produce a detailed plan, to include budget allocation by market and medium, with frequency and penetration figures, and specific costs, Murray, Kraft & Rockey, Inc. would require approximately two weeks' time and a preliminary budget of $3,500.

II THE SITUATION

Sometime this summer or fall, the Congress of the United States will consider one or more bills providing for assignment and disposition of the d-2 lands of the Alaska Native Claims Settlement Act. Within Alaska, it is generally conceded that a bill such as the Udall bill could work extreme hardship on Alaskans and our economy. On the other hand, recent events would seem to indicate that the environmental groups opposing a limited d-2 settlement have begun to lose some of their momentum. Obviously, in an election year politicians are inclined to vote "on the right side" on matters which either effect their constituency, or about which their constituents have strong feelings. To this point, most Americans (with the exception of Alaskans) have very little knowledge of, or interest in, the d-2 assignments. Therefore, their elected officials may cast their vote in Congress with relative impunity. As has been shown by the Panama Canal controversy, however, an involved constituency can drastically effect political outcomes. It would be our hope that the attached program could help Alaskans to achieve their goal of an equitable d-2 land settlement.

III OBJECTIVES

A. To reach a substantial portion of the constituents of those United States Senators and Representatives most subject to influence, with sufficient explanatory information, and enough frequency, to win them to Alaska's position.

B. To measure results, both before and after, in order to provide proof positive to these members of Congress that a vote favorable to Alaska's position will not harm them politically with their constituents, and in fact may be of positive benefit.

IV STRATEGY

A. Selection of Target. Immediate meetings with our Congressional Delegates and their staffs, and other resource persons in our nation's capitol, in order to ascertain which congressional districts should be reached. In general, we would tend to concentrate major effort on those votes most subject to influence. Secondary emphasis would be placed on those already supporting Alaska's cause, since these officials also require our assistance with their constituents. Final targets would be those adamant adversaries who are facing strong opposition in their bids for reelection.

B. Survey. As soon as target markets are selected, we would arrange for a survey which essentially would seek to determine what people now know about the d-2 lands issue, how important they consider it to be, and how they feel about it. This would be a bench-mark survey, and would precede the media program.

C. Creation of Program. Working with resource people from the State of Alaska, the agency would seek to create communications material which would educate,

inform and influence the general public. In all instances, materials would give every appearance of factuality and all information would be footnoted where necessary. Should radio be utilized, we would seek to find responsibile, nationally-known spokesmen to help promote Alaska's views.

D. Media Placement. The agency would contract with a nationally reputable media buying service, in order to ensure that materials are delivered to the media in a timely fashion, yet not so far in advance as to alert the opposition. Incidentally, it would be our contention that the Fairness Doctrine may not be invoked against radio stations carrying our messages should this media be selected. This is because of the "local controversy" aspect of past rulings. However, please bear in mind that each station must bear the responsibility for making determination as to whether provisions of the Fairness Doctrine should be afforded, if requested by the opposition. Naturally, fairness provisions apply only to broadcast--not print media.

V MEDIA PLAN

A. The following list of 128 markets constitutes a total population of 117,745,000 American citizens.

Alabama - Birmingham Metro, Mobile, Montgomery, Huntsville

Arizona - Phoenix Metro, Tucson

Arkansas - Little Rock, Fort Smith, Texarkana

California - Los Angeles, Oakland, San Francisco, San Diego

Colorado - Denver-Boulder, Colorado Springs, Pueblo

Connecticut - Hartford, Stamford-Norwalk

Delaware - New Castle, Wilmington

Florida - Dade County Metro, Orlando, Tampa, Talahassee

Georgia - Atlanta Metro, Augusta, Columbus, Savannah

Hawaii - Honolulu

Idaho - Boise City, Pocatello-Idaho Falls

Illinois - Chicago, Arlington, Madison, Rock Island

Indiana - South Bend, Evansville, Indianapolis

Iowa - Davenport, Des Moines, Cedar Rapids

Kentucky - Louisville, Ashland, Lexington

Louisiana - New Orleans, Baton Rouge, Jefferson, Shreveport

Maine - Portland, Augusta

Massachusetts - Boston, Springfield, New Bedford

Michigan - Lansing, Detroit, Grand Rapids, Flint

Minnesota - Minneapolis-St. Paul, Duluth

Mississippi - Jackson, Biloxi, Columbus, Greenville

Nebraska - Omaha, Grand Island, North Platte, Lincoln

Nevada - Las Vegas, Reno

New Hampshire - Manchester, Portsmouth-Exeter

New Jersey - Newark, Trenton, Camden, Patterson

New Mexico - Albuquerque Metro, Las Cruces

New York - New York, Buffalo, Albany

North Carolina - Raleigh-Durham, Charlotte, Greensboro

North Dakota - Fargo-Moorhead, Grand Forks, Minot

Ohio - Cleveland, Columbus, Cincinnati

Oklahoma - Oklahoma City, Tulsa

Oregon - Portland, Salem

Rhode Island - Warwick, Pawtucket

South Carolina - Spartanburg, Greenville, Charleston

Tennessee - Memphis, Nashville, Knoxville, Chattanooga

Texas - Dallas, Fort Worth, Houston, El Paso, San Antonio

Utah - Ogden, Salt Lake

Virginia - Newport News-Norfolk-Portsmouth, Richmond

Washington - Seattle-Tacoma, Olympia, Spokane

Washington, D. C.

West Virginia - Charleston, Huntington, Wheeling

Wyoming - Cheyenne, Casper

1. Plan No. 1 - Basic Radio, Supported by National Newspapers.

The agency would purchase an average of three adult stations per market, with a frequency of four spots per day per station for a period of three weeks. The number of stations per city would vary from one (in the smaller communities) to six (in Los Angeles and New York). This type of selection should deliver an estimated penetration of 60% of the total population, with a frequency per listener of 4.5 times. This amounts to total impressions of 317,915,000 generated in a 21-day period. In addition, radio would be supported by National newspaper schedules.

National Newspapers

Publication	Circulation
New York Times	1,479,862
Washington Post	762,825
Wall Street Journal	1,484,667
Christian Science Monitor	170,087
Total Circulation	3,897,441*

*for total readership of 7,210,266, at an average pass-along factor of approximately 1.85%.

Summary. In one three-week period, Americans receive 323,623,288 impressions urging their support of a reasonable d-2 legislation, under Plan No. 1.

2. Plan No. 2 - Local Newspaper Program.

Newspaper advertising generally tends to reach community thought leaders. We do not wish to appear to be the "blue-eyed Arabs" some of the eastern establishment is calling us. Therefore we feel that advertising should be less than full-page size, contain fairly detailed information, and although all advertising would follow a specific format, we would recommend that each succeeding ad would cover different aspects of the d-2 controversy. Frequency would be one ad per week, in the 128 foregoing markets. Ads would be approximately three-quarters of a page in size, and would appear in 217 newspapers, both morning and evening. Along with the New York Times and the Washington Post, we would once again recommend inclusion of the Wall Street Journal and the Christian Science Monitor--two of the nation's leading national newspapers.

Total combined circulation of all 217 newspapers is approximately 29,203,000. Applying the 1.85 pass-along factor, each ad would have theoretical exposure to 54,025,550 readers.

Multiplying this factor by three--the number of insertions--we would be exposed to a potential 162,076,650 readers. However, the nature of the subject and the ad would dictate against high readership. Therefore, if we assume that one-fourth of all readers actually see the ad, we would have a "noted" factor of 40,519,163. If, of this number, one-fourth read all or most of the ad--a fair average based on national readership surveys--we will have reached with our message a total of 10,129,791 Americans.

VI BUDGET

Plan I - Radio plus national newspapers. $750,000.

Plan II - Local newspaper advertising program. $727,600.

Obviously, the most effective program would combine these two, although not necessarily simultaneously. Rather, we would recommend a six-week program, initiated by radio, and culminating with the newspaper advertising. The total price for carrying out both newspaper and radio in 128 of the leading population centers of the United States would be $1,353,100.

In addition, we estimate the two national surveys at approximately $15,000 each, or a total of $30,000. It is imperative, in our opinion, that the surveys be taken, because we believe that this actual data will provide the basic vehicle for using our advertising effort to influence legislation.

VII CONCLUSION

The foregoing programs are estimated only, but in the agency's experience, should be reasonably accurate, and are inclusive enough to include such factors as creativity, production, and direct expense incurred in formulating and carrying out the program. As an item of general philosophy, we would urge that advertising messages concentrate on people--both the people of Alaska, and the people of the United States who will benefit from Alaskan resources which might otherwise be lost if an unduly restrictive d-2 act is passed. Again, because of the drastic fact of d-2 legislation on Alaskans in all walks of life, we would urge that primary consideration be given to working with Alaskan professional firms and suppliers. Finally, it is our contention that the media themselves will respond more favorably to advertising which is generated in, and from, Alaska--perhaps even to the extent of supplying favorable editorial support.

Wildlife management

Daily News Miner 3/9/78

By SEN. TED STEVENS

Of the many land use management issues involved in the congressional d-2 lands decision, perhaps the most misunderstood is that of wildlife management. There are a number of proposals now before Congress to change the present system of management on federal lands in Alaska.

Under existing law, the regulation of hunting, trapping or fishing of resident fish and wildlife is the responsibility of each individual state. This law, commonly known as the Sikes Act, applies uniformly throughout the country, and under its provision the State of Alaska is responsible for the enforcement of fish and game laws on federal lands in Alaska.

The original authority for the state to oversee fish and game management is found in the Alaska Statehood Act. Under that act, the secretary of interior certified that the state had "made adequate provision for the administration, management, and conservation" of fish and game to serve the national interest.

During the 20 years since statehood, the state has compiled a good record of managing Alaska's fish and game and has developed a number of sophisticated management techniques to deal with wildlife problems unique to Alaska.

Nevertheless, legislation has been introduced in Congress to change this system, but only in Alaska. A number of proposals would involve the federal government in the daily management of fish and game. These proposals ignore the fact that the federal government is already involved in fish and game management through numerous cooperative agreements between the Alaska Department of Fish and Game and various federal agencies in Alaska.

These agreements authorized under existing law provide the federal government with ample authority to protect the habitat—the actual land and water—and leave daily management to the more experienced state agency. This system applies nationwide and has proven itself to be a workable one.

The specific provisions proposed for d-2 legislation that would change this sytem would affect only Alaska. I will firmly oppose such provisions. I will not support any legislation dealing with wildlife management which treats Alaska differently from the other 49 states.

Regulation of fish and game resources is one which concerns all states, and Alaska was granted full rights of statehood under the Alaska Statehood Act. Any change in the system of fish and game management that applies solely to Alaska is a repudiation of the principles under which the State of Alaska was founded.

The governor and the Alaska State Legislature are presently considering changes in fish and game management. The right of the state to enact such changes is fully guaranteed under its constitution and the Statehood Act. This is the way changes in fish and game management policy should be made—not through unilaterial federal legislation. Alaska deserves to be treated as one of the 50 states in all matters, and not as a territory.

A number of d-2 lands provisions currently before Congress would change the present system of wildlife management on federal lands in Alaska. These provisions ignore the fact that the Alaska Department of Fish and Game has been properly and successfully managing the state's wildlife under constitutional authority for the past 20 years.

Certain provisions provide for complete federal takeover of fish and game management on federal lands. Other provisions would require only "federal oversight" over state management activities.

The rationale for these proposals is that the state without federal assistance cannot be expected to protect fish and game and at the same time ensure subsistence and sport hunters are able to use the game. I am opposed to any change in fish and game management which would provide for federal management or oversight. In the long run, such a provision would only serve to hasten the restriction and potential elimination of hunting on certain federal lands.

My experience during the recent bowhead whale controversy convinced me that there is tremendous antihunting pressure in Washington.

During the weeks which the administration was considering its position on the taking of bowhead whale by Alaskan Eskimos, certain environmental pressure groups spent thousands of dollars in a campaign against any taking of bowhead whales.

Full-page ads were placed in major East Coast newspapers, including the New York Times, the Washington Post, the Baltimore Sun, and the Boston Globe, urging the president to support a complete ban on the taking of the bowhead whales. The fact that the whale was taken only by residents of the North Slope of Alaska for subsistence did not matter to those who supported the ban.

These ads went so far as to state that the culture of the Eskimos was not dependent at all upon hunting the whale, even though at the time a number of Alaskans were in Washington to speak personally on the importance of bowhead whale hunting to the Eskimo culture.

Proponents of federal involvement in fish and game management argue that only the federal government can provide for subsistence needs of rural Alaskans. I reject that argument categorically. In the long run, the state is in a far better position to insure the needs of subsistence as well as sport hunting. To involve the federal government in the daily management of fish and game resources would be a great mistake, and I will oppose any such provision.

Instead, I have proposed in my d-2 legislation continuation of the state management of fish and game with a priority for subsistence uses when there is not enough game to go around. The subsistence preference would not be made on a racial or ethnic basis. With continued good management of the state's wildlife by the Alaska Department of Fish and Game, a scarcity of wildlife that would require the subsistence preference should not occur very often.

Small improvements

When the first committee print of H.R. 39 came out a few months back we observed that it had been amended to insure the elimination of sport hunting on all federal lands in Alaska in the next few years. The final committee print to come out of the Alaska Lands Subcommittee was changed quite a bit, but it's still totally unacceptable.

The subsistence section of the first committee print was the product of heavy lobbying in Washington by Alaskan Native leaders and lobbyist Stuart Udall, the former Interior Secretary and first brother of the House Interior Committee. It was aimed directly at the non-Native hunter in Alaska.

It took away Alaska's fish and game management on federal land and said the state could keep those rights only if it quickly adopted the kinds of fish and game regulations the Secretary of Interior demanded. Local councils were established to watch over hunting on these federal lands and advise the secretary how things were going. Only Natives could be on the councils and if the council advised the secretary that there was too much competition for game in an area the state had to give local Native subsistence hunters priority over local non-Native subsistence hunters and all sport hunters.

Committee Print 1 went through the usual amendment process in the Alaska Lands Subcommittee and the subsistance section, Title VII, was a prime target for amendments pushed by Alaska Congressman Don Young. Ron Sommerville of the Alaska Department of Fish and Game also contributed greatly to the amendment effort with his many weeks in Washington D.C. The result is a much-amended T e VII in Committee Print 3 of H.R. 39, which is t. version now being considered by the full Interior Committee.

Congressman Young's biggest success is getting the racial preferences out of the bill. There's no constitutional reason in the world why a Native living in the Alaskan bush should have greater hunting rights than a non-Native living in the next cabin down the river. This is especially true since the Alaskan Natives are getting millions of acres of private land turned over to village and regional corporations which will surely become private hunting reserves for their members.

The bill still retains the federal assumption of fish and game management, however. It only takes a quick reading of the 16-page Title VII to see that the state is forced to jump through all too many hoops and is bound too tightly between the federal government on one hand and the local councils on the other.

Our earlier words on this subject, for instance, pointed out that Title VII requires the state to give priority for subsistence uses over other consumptive uses of fish and game. This remains, and it's unfair in cas s where a game management problem is caused by the subsistence hunters and not sport hunters.

The local councils can recommend regulations to the state and the state must adopt them unless it can prove to the secretary of Interior that the regulations are not supported by substantia. evidence, violate recognized fish and game management principles or would be detrimental to subsistence needs. With the federal government's record on Alaskan game management it's easy to see who's side the secretary will take in any conflict between a local council against the state.

Congressman Young deserves a hearty pat on the back for his efforts on Title VII to date. Despite these small victories, however, the H.R. 39 is still completely unacceptable in its approach to fish and game management.

Wednesday we lost the fifth major try by Alaskans to get the d-2 bill on a more reasonable tract. Maybe now more Alaskans will realize that the whole philosophy and intent of H.R. 39 is defective and it's time to give up trying to improve it and renew our efforts to kill off the whole thing.

Mrs. Kay Poland, Chairman
Senate Resources Committee
Pouch V
Juneau, Alaska 99801

Dear Mrs. Poland,

Our group would like to speak against CSHB 652 in it's present form .

This legislation would appropriate monies for the Steering Committee to use to lobby on the d-2 issue.

We belive CSHB 652 should be more specific in the way this money will be used. There is no State position on most major points of the d-2 problem.

For instance, it would be our desire that any representative from the State tell others that Governor Hammond did not speak for the average Alaskan last August 12th when he testified before the House Subcommittee on Fisheries and Wildlife and the Environment, when he said "I would hope that this Congress establishes the priority of subsistence uses where there is a conflict. I believe that this is a legitimate subject for legislation, and hope that this principle, which has been State policy for some time, might be enacted into federal law." (Page 17 of his speech).

This is exactly what HR-39 does in Title VII, consisting of 16 pages of bureaucratic garbage. Doesn't Governor Hammond know there is already a conflict for every critter that moves?

We don't believe the average Alaskan wants a subsistence provision dictated in the d-2 legislation, especially if they have ever stopped to realize what a can of worms is being opened. It means federal strings tied to wildlife management, expensive over-sight of the State's programs (tieing up State employees and tax money) and a breech of the State's Constitution which says game will be managed for the common use.

Probably worst of all, they would be attempting to regulate something that no one has yet been able to define, for "subsistence" means different things to different people under different conditions. For instance, is a subsistence user one who spends all his time in a village or on a trapline? If so, how small of a village? Does the use of modern firearms and snow machines constitute subsistence hunting? How about the native that works at a high paying oil-field job; does he maintain subsistence hunting rights? How about the average trapper that spends three months on a trapline and nine months in Fairbanks, where he works three or four months at construction? How about the village resident who accompanies his urban relative afield to cover

for the game taken? How about the inevitable destruction of our game if left to regionalized regulation?

We would like to point out that this subsistence monster would be in court more than it would be out. It is an intolerable monstrosity concocted by bureaucrats and we don't think that those who foster it realize the ramifications or else they have ulterior motives that are not in the State's nor the resource's best interests. We believe the needs of bush residents and the wildlife can best be handled as they have been in the past--without any half-baked over-night plan hatched in Washington.

We have two suggestions we would like to make before our tax money is squandered on any nebulous d-2 lobbying effort:

1. A State position be formulated on major points of the d-2 legislation, including a stand against federal subsistence legislation.

2. Part of the money be ear-marked to bring Congressmen (particularly Senators) to Alaska to talk with the people who will be most affected by their actions.

Sincerely,
INTERIOR WILDLIFE ASSOCIATION

HB 652

STEERING COUNCIL FOR ALASKA LANDS

Rep. Steve Cowper, Chairman
(907) 465-3706

MEMORANDUM TO MEMBERS OF THE
HOUSE INTERIOR AND INSULAR AFFAIRS COMMITTEE

Subject: D-2 Legislation

The Steering Council for Alaska Lands has and will continue to present the balanced viewpoint of Alaskans on the D-2 issue. In many of these positions, we are in agreement with H.R. 39. Despite our efforts, the Alaska Coalition has persistently criticized our activities and distorted our position. Until today, we have chosen not to counter their allegations.

Unfortunately, a March 3, 1978, press release issued by the Coalition goes beyond the bounds of accuracy and propriety. We believe the record must be corrected so that this ill-conceived release does not influence the deliberations of the House Interior Committee at this critical juncture.

In our efforts to accurately represent the D-2 sentiment of Alaskans, the Steering Council commissioned a 42-question statewide survey on the issue. The preliminary results have just been received by the Council. The poll at no time asked Alaskans whether they favor or oppose H.R. 39. In fact, H.R. 39 is never mentioned in any of the questions.

The poll does indicate that the majority of Alaskans:

-favor giving permanent protection as parks and wildlife refuges to certain public lands in Alaska (61%)

-favor building surface transportation access to some or all parks in Alaska (78%)

-believe that Alaska's resources can be developed without destroying its wilderness, scenic and wildlife values (61%)

-find that some parks and refuges in the State are inaccessible because of the cost of getting there (62%).

We believe that the Council's poll reflects the diversity and complexity of the issues facing Alaskans and Congress in the D-2 legislation. The Council is appalled by the fallacious and irresponsible claim that the survey demonstrates majority support for the Alaska Coalition and H.R. 39.

The Council will soon provide the full 42-question survey to all members of the House of Representatives, so that the members can determine the facts for themselves.

Two recent statewide polls of Alaskans conducted by groups unaffiliated with the Council have been published in the Alaskan press. Both surveys ask State citizens what their feelings are toward H.R. 39. We report their published findings:

-a survey conducted for the State of Alaska's Commerce Department found 67% of Alaskans opposed to H.R. 39.

-a poll conducted for an Alaskan citizen's group found 64.7% opposed to H.R. 39.

We hope this memorandum sets the record straight.

ALASKA COALITION *"To Preserve Alaska's National Interest Wildlands"*

CONTACT: Rita Molyneaux
(202) 293-2732

IMMEDIATE RELEASE
March 3, 1978

ALASKANS FAVOR H.R. 39

The Alaska Coalition today claimed the support of the majority of Alaskans in the debate over protection of federal lands in Alaska.

Citing a survey conducted by the Steering Council for Alaskan Lands, a Coalition spokesperson reported, "Despite questions in the survey obviously slanted to elicit negative responses, Alaskans have endorsed the concept of H.R. 39."

The survey asked:

"Do you feel certain public lands in Alaska deserve receiving protection as national parks or wildlife refuges even though you may not be able to visit all of them?" Responses were:

61.0% Yes, deserve permanent protection

20.8 No

7.7 No opinion/unsure

10.5 Yes, though not in amounts reported

According to the Coalition the lively debate over the issue in Alaska has been an educational experience for Alaskans. Understanding of the complexities of the questions has built public support for the legislation protecting important wilderness and wildlife areas.

MATTERS RELATING TO COMMITTEE SUBSTITUTE FOR HOUSE BILL NO. 652

Madam Chairman and Members of the Committee:

My name is A. W. "Bud" Boddy. I am representing the Alaska Wildlife Federation, a statewide organization dedicated to the principles of wise use and proper management of our resources. We appreciate the opportunity of commenting on Committee Substitute for House Bill No. 652.

We are opposed to Committee Substitute HR652 in its present form and I hope to give the committee some of the reasons in the background as to our opposition. During the many hearings held by Mr. Seiberling and his committee on HR39, members of our organization testified as to their concern and opposition as to including the section on subsistence use in any Federal legislation. We believe this is a State problem and a State responsibility. It should be resolved at the State level. Our State Constitution specifies that the fish and game resources of Alaska belong to all of the people of the State. To our knowledge none of the proposed money would be used to assure the deletion and defeat of the subsistence section from HR39. We feel that this is another example of where the State rights are being eroded. Very briefly the legislation proposes to establish Regional Fish and Game Boards and would give priority to rural user groups. We note also that if the State does not adopt legislation following the guidelin established by the Secretary of Interior within a certain specified time, the Secretary of

Interior will have the authority to impose Federal regulations on public domain lands. We believe that it is impossible for anyone to identify a subsistence hunter or fisherman or a sports hunte · or fishermen, both take game and fish for food and family consumption. We would hope that this committee would endorse the following points for consideration prior to finalizing action on Committee Substitute 652.

1. We will work together and utilize our individual resources for the mutual benefit of all of our members on those matters which are of mutual concern.

2. We will support any forthcoming D-2 legislation ONLY to the extent that it will provide the maximum opportunity for Alaskan sportsmen to continue to participate in the wise management and utilization of fish and game resources within the State through a broad based concept of multiple land use.

3. We will only support legislation which does not discriminate between residents of the State of Alaska with regards to their Constitutional rights to share equitably in the utilization and enjoyment of the Fish and Game resources of the State.

4. We will vigorously oppose any legislation which threatens to take away from the State of Alaska the right to manage its own fish and game resources as provided for and guaranteed by the Alaska Statehood Act and the Constitution of the State.

We would again emphasize that if State funds are to be used, they be used in a manner which would include and

assure that the above points are included in any Federal legislation.

Again, we would emphasize support of the present fish and game management concept in the State of Alaska and believe that it should be retained and improved upon. We appreciate the opportunity of presenting our views to you today. If there are any questions, I would be most happy to try and answer them.

A. W. "Bud" Boddy, Representative of the Alaska Wildlife Federation

JAY S. HAMMOND
GOVERNOR

STATE OF ALASKA
OFFICE OF THE GOVERNOR
JUNEAU

July 9, 1975

Mr. Clark Engle
Vice President
International Professional
Hunters Association
4129 Lana Center
Anchorage, Alaska 99502

Dear Mr. Engle:

With only three votes in opposition, it is clearly evident that the Legislature desires to split the Board of Fish and Game. While I personally do not believe that such a move would significantly improve management of those resources, I am well aware that a veto is not likely to be sustained.

Quite probably little legislative attention will be given to other designs to improve Fish and Game Board performance, such as that sponsored by myself, until such time as the Legislature concludes that simply splitting the Board does not remedy the situation. While it remains untried, in all probability it will be viewed by many as a prime solution.

The bill presents significant problems which, hopefully, can be remedied through amendment next session. Many of these have been discussed with some advocates, and with the assurance that these will be addressed during the next session, I am permitting the bill to become law.

A chief concern with FCCSSB 131 is that the final version of the bill incorporates (an amendment providing what could be a sorely abused power to local advisory committees to arbitrarily close seasons.) Unlike existing law, such closures could not be overridden by any other authority even if the public interest and welfare required it.) If not unconstitutional, this provision is at least very dangerous and should be amended at the first opportunity. Should a local advisory committee, for example, choose to close a fishing season in order to exert economic leverage to improve prices, they would find to their dismay that the bill provides no mechanism by which the season could be reopened by either themselves or the Commissioner. Furthermore, should local advisory committees choose, they could severely inhibit the sport hunting and fishing capabilities of those who live elsewhere by simply closing the season.) It has been rumored that local advisory committees may well close the season on those

animals and fish which might be deemed trophy or recreational species and instead confine all activities to local subsistence efforts. While this may or may not be warranted, it is not likely to be viewed with enthusiasm by those who live in metropolitan areas.)

This legislation establishes separate regulatory authorities for Fish and Game management on the premise that each is unique and mutually exclusive in many ways. However, there are many common qualities which are biological, social, economic and administrative in nature. These qualities necessitate close and harmonious working relationships between the two boards. Unfortunately, the legislation fails to provide procedures to guide boards in dealing with shared responsibilities. Rules governing joint meetings and the transaction of official business are either missing or ambiguous. For example, there is not even a mechanism for dealing with tie votes. While exercise of goodwill might temporarily forestall serious problems, the act must be amended to give the boards the tools required.

While the legislation is intended to enlarge the roles of advisory committees and resource management, it actually introduces such ambiguity and vagueness as to render their operation difficult at best. The law fails to specify whether each board must establish and improve its own advisory committees or whether a single system of advisory committees serves both boards. In view of the problems already existing in relation to conduct of official business at joint board meetings, the successful operation of the advisory committee system is certain to be further hindered.

The splitting of regulatory authority between a fisheries board and a game board means that proper interest in geographical representation on these new boards cannot possibly be obtained by merely reappointing all of the former members of the Board of Fish and Game. While such members have served with devotion and distinction, it will be necessary to realign board membership with several appointments of Alaskans who have not formerly served. Moreover, it will be necessary to make some of these appointments very quickly in order to be able to deal with issues requiring immediate attention.

Since there are only seven members on each board, it is obvious that many areas of the State which previously had representation on the board dealing with both Fish and Game matters now have a member on one board only. Other areas will be denied any representation whatsoever. The new bill actually reduces the area of representation rather than expands it. I fear that once the public realizes such to be the case, there will be ongoing efforts

to constantly expand both boards in order to assure every area and every special interest adequate representation. This, of course, is one of the basic faults with the current board system, as it poses an absolute impossibility. Under such philosophy, adequate representation cannot be acquired without appointing everybody in the State to the Board of Fish and Game. Since the board members will now receive a hundred dollars a day while in session, the inclination to expand the board further should be resisted by the Legislature as it will be by this Administration. I have been assured by the proponents of the bill that they share this concern and will, as well, resist further enlargement.

Sincerely,

Jay S. Hammond
Governor

WE APLA ARE OPPOSED

TO THE PASSAGE OF H. B. 652, which would appropriate money for legislators to lobby on the D-2 land question.

WE BELIEVE THAT THERE ARE ONLY A SELECT FEW PEOPLE WHO UNDERSTAND THE MANY FACETS OF THE D-2 PROBLEM AND CAN ADEQUATELY TALK INTELLIGENTLY ABOUT THEM TO CONGRESSMEN. TO TALK ABOUT THE D-2 LANDS IN A GENERAL WAY WE BELIEVE ACCOMPLISHES VERY LITTLE. TO SPEND STATE MONEY WHICH REPRESENTS ALL THE TAXPAYERS IN THE STATE SHOULD BE DONE SO THAT ALL THE SPECIAL INTERESTS GET FAIR TREATMENT. TO OUR KNOWLEDGE NO LEGISLATOR HAS ADDRESSED HIMSELF TO LOBBYING AGAINST THE SUBSISTENCE SECTION IN HR 39. THIS SECTION ALONE CARRIES ABOUT 15 PAGES OF THE BILL AND HAS MANY RAMIFICATIONS.

BRIEFLY, IT SETS OFF THE SPORTS HUNTER FROM THE SUBSISTENCE HUNTER IN THE MATTER OF WHO SHOULD HARVEST FISH AND GAME SUPPLIES WHEN THERE IS A LIMITED SUPPLY. FURTHERMORE, IT ALLOWS THE SECRETARY OF INTERIOR TO IMPOSE FEDERAL CONTROL OF OUR FISH AND WILDLIFE ON FEDERAL DOMAIN, UNLESS THE STATE SUBMITS TO THEIR CRITERIA AND DOES EXACTLY WHAT THEY WANT. YESTERDAY SOME OF YOU MEMBERS UNDERSTAND LISTENED TO THE SECRETARY OF INTERIOR ANDRUS'S PROPOSAL OF RESTRICTED PUBLIC USE ON THE HAUL ROAD. EACH DAY SEEMS TO BRING FORTH MORE FEDERAL LEGISLATION ERODING STATE'S RIGHTS. WE THINK IT IS TIME THAT ALL ALASKANS CALL A HALT TO THE EROSION OF STATE RIGHTS AND MAKE A STRONG STAND TO SOLVE OUR OWN PROBLEMS ON THE STATE LEVEL.

THE TERM SUBSISTENCE IS DIFFICULT TO DEFINE BUT H.R. 39 SPELLS IT OUT, AND WE QUOTE FROM THE BILL: "DEFINITION SEC. 703. AS USED IN THIS ACT, THE TERM "SUBSISTENCE USES" MEANS CUSTOMARY AND TRADITIONAL USES IN ALASKA OF WILD, RENEWABLE RESOURCES FOR DIRECT PERSONAL OR FAMILY CONSUMPTION AS FOOD, SHELTER, FUEL, CLOTHING, TOOLS, OR TRANSPORTATION, FOR THE MAKING AND SELLING OF HANDICRAFT ARTICLES INCLUDING CLOTHING, OR FOR THE CUSTOMARY TRADE OR BARTER AMONG SUBSISTENCE USERS FOR PERSONAL OR FAMILY CONSUMPTION."

EVEN WITH THIS DEFINITION WE THINK IT IS GOING TO BE DIFFICULT FOR ANY ONE MAN OR AGENCY TO SEPARATE THE SPORTS HUNTER, WHO HAS CONSISTENTLY HELPED HIS FAMILY BUDGET BY HUNTING FOR AVAILABLE MEAT ANIMALS.

IF ANY STATE MONEYS ARE GOING TO BE APPROPRIATED WE WOULD SUGGEST THAT SOME SPECIFIC AMOUNT BE EARMARKED TO LOBBY IN WASHINGTON FOR THE DELETION OF ~~THE~~ SUCH SECTION AS SUBSISTENCE ~~SECTION~~. WE DO NOT UNDERSTAND WHY THE FEDERAL GOVERNMENT CAN'T SEE THAT THE SECTION IS UNWORKABLE AND WILL CAUSE NOTHING BUT STRIFE.

MR. CHAIRMAN, WE ARE DOUBLY CONCERNED BECAUSE OF THE GOVERNOR'S POSITION ON THIS ISSUE, AND HIS INVOLVEMENT IN ENCOURAGING THE FEDERAL GOVERNMENT TO PUT THIS SECTION INTO HR.39. I WOULD LIKE TO QUOTE FROM ONE OF HIS SPEECHES AUG 12 TO THE ~~XXXX

PRES. SCI OK PER PHONE

A meeting was held ~~Monday~~ December 6, 1977 which was heralded by those present as being a historic step towards establishing a unified voice to speak for all Alaskan Sportsmen on the vital issues confronting them today.

At this meeting the combined Boards of Directors of the Alaska Professional Hunters Association and the Alaska Chapter of the Safari Clbu International along with Mr. Bud Boddy representing the Alaska Chapter of the Nat'l Wildlife Federation joined hands in reaching the following agreements:

I - It is agreed that we will work together AND UTILIZE OUR INDIVIDUAL RESOURCES for the mutual benefit of all our members on those matters which are of mutual concern.

II - It is agreed that we feel ~~pending~~ the PROPOSED D2 legislation is premature and out of context in the orderly transfer of land management in the State of Alaska both with regards to the Alaska Statehood Act and also with regards to the Land Conveyance portions of the Native Land Claims Sttlemnt Act.

III - It is agreed that we ~~can~~ WILL support any forthcoming D2 legislation only to the extent that it will provide the maximum opportunity for Alaskan Sportsmen to continue to participate in the wise management and utilization of Fish and Game resources within the State through a broad based concept of multiple land use.

IV - It is agreed that we will ONLY support legislation which does not discriminate between residents of the State of Alaska with regards to their Constitutional Rights to share ~~in~~ equitably in the utilization and enjoyment of the Fish and Game resources of the State.

VI - It is agreed that we will vigorously oppose any legislation which threatens to take away from the State of Alaska the right to manage its own Fish and Game resources as provided for and guaranteed by the Alaska Statehood Act and the Constitution of the State.

We invite other concerned and interested groups to contact us at 279-7837

MEMORANDUM

To: STEVE COWPER
Chairman
Finance Committee

From: SHARON LONG
Administrative Assistant
(d)(2) Steering Council Budget

Date: February 22, 1978

Re: (d)(2) STEERING COUNCIL BUDGET

$ 85,722.00 STAFF AND OPERATIONS

-Rent and furnishings for offices at 1016 West 6th Avenue, Suite B Anchorage, Alaska 99501

-Plus salaries for staff

$ 12,000.00 PLANNING AND COUNCILING

-Media advice, national and regional

$102,500.00 TRAVEL/SPEAKERS BUREAU

-Includes $70,000.00 for "Speakers Bureau" which would cover Alaska representatives personally contacting every other State Legislature. And, Council members and staff travel for $32,500.00

$ 40,000.00 COMMUNICATIONS INTERNAL

-Telephone, telegraph, telex

$200,000.00 LEGAL REPRESENTATION

-Includes firms with Washington offices with entree to both minority and majority.

$ 15,000.00 SEMINAR/WORK SESSION

-on cooperative management of lands

$ 11,500.00 MATERIALS REPRODUCTION

-Copying of slides, maps, film segments, xeroxing of briefing books, legal opinions, memoranda, and legislation.

$ 13,000.00 PRINTING

-Brochures and other mail out materials.

$ 4,000.00 GRAPHICS DESIGN

-Brochure and report work

$ 6,000.00 RADIO PRODUCTION

-For productions of radio pieces for use in Congressional communications and key congressional districts in the lower 48.

$140,000.00 TV and for FILM PRODUCTION & BROADCAST TIME PURCHASE

-TV: Studio production time for information programs.

-FILM PRODUCTION: Possible expansion of existing film piece or production of new piece depending on conditions in Congress and the U.S.

-BROADCAST TIME PURCHASE: Radio or TV time purchase to air materials.

$ 50,000.00 SPACE PURCHASE

-For purchase of newspaper space in key regions.

$ 10,000.00 DIRECT MAIL

-Information dissemination to Congress, other legislatures, Alaska public.

$ 25,000.00	SURVEY RESEARCH

-For survey of Congressional attitudes and buying a couple questions in an existing Gallup or Harris type poll.

$ 13,000.00	SPECIAL CONSULTANTS

-Hire of individuals on short term basis with special knowledge or areas of influence in a specific issue area.

$ 12,500.00	EVALUATIONS AND REPORTS

-Reports concerning regionalized knowledge and evaluations such as in "Coalition of Western States" type programs.

$ 12,000.00	MISCELLANEOUS EXPENSES

-Such as Projector or video tape machine rentals, messenger service, publicatic subscriptions, transcriptions, paper, pencils, paper clips, push pins, typewriter ribbons, 3 ring binders, scotch tape, rubber bands, map pins, dictionary, phone message pads, etc.

$ 70,000.00	USA NEWS MEDIA CAMPAIGN

-An individual with nation wide entree to major editors and newspaper to conduct a 5 month nationwide newspaper visiting program.

$ 75,000.00	USA NEWS FEED OPERATION

-To set up and execute a system of feeding (d)(2) related News into the various states and regions. This would require relating "our" news to the pertinent issues of a specific state or region.

$831,222.00	TOTAL

Federal-State
Land Use Planning Commission
For Alaska

February 24, 1978

Honorable Steve Cowper
Chairman
D-2 Steering Council
Alaska House of Representatives
Pouch V
Juneau, Alaska 99811

Dear Steve:

As per our conversation, we have developed a preliminary outline for a work session/seminar on cooperative management of lands in Alaska. This seminar is needed to refine the present legislation proposed for the establishment of a Federal/State land use commission or other mechanisms for Federal/State cooperative and coordination of land management.

The intent is to bring to Alaska, five to seven people knowledgable and recognized in the fields of intergovernmental cooperation and land planning and management.

We are compiling a list of people which will include experts in land management systems, intergovernmental agencies, coastal zone management, etc. The list will be forwarded to you upon completion.

The estimated cost of bringing these people to Alaska for a week should not exceed $17,000. What we will obtain from the conference is:

1. Objective review of the present State and Federal relationships.

2. Evaluation of existing bills and preparation of proposed legislation for cooperative management stressing coordinated interagency, intergovernmental land management activities.

We regard this as an absolute priority for achievement of a successful (d)(2) solution. The Steering Council budget should receive the $17,000 because the Commission budget would require a Federal matching sum.

733 W. FOURTH AVENUE, SUITE 400
ANCHORAGE, ALASKA 99501

The following are what appears to me to be the appropriate steps to follow in organizing the seminar:

1. Selection of consultant panel (5 - 7 members).

2. Preparation of assignment and support materials by Commission staff for review by panel members prior to work session.

3. Five day work session in Anchorage with submission of advisory report.

4. Incorporation of recommendation from consultant report into legislative language.

Because of the pressure of time, it will be necessary to reach an early decision concering funding and selection of the consultant panel because of the lead time necessary to organize the panel, develop the assignment and support materials, and provide preparatory time by panel members prior to the initial work session.

We hope to be able to develop the conference for the week of March 27-31, 1978, dependent upon the availability of the consultant panel participants. This is the week that Senator Mike Gravel will be available to participate, and we hope that Governor Hammond will be able to attend as well as yourself and other Steering Council members.

John Katz of the Commission staff and Lidia Selkregg of the University of Alaska are coordinating the conference.

Sincerely,

Walt

HB.652

STEERING COUNCIL FOR ALASKA LANDS

Rep. Steve Cowper, Chairman
(907) 465-3706

MEMORANDUM TO MEMBERS OF THE
HOUSE INTERIOR AND INSULAR AFFAIRS COMMITTEE

Subject: D-2 Legislation

The Steering Council for Alaska Lands has and will continue to present the balanced viewpoint of Alaskans on the D-2 issue. In many of these positions, we are in agreement with H.R. 39. Despite our efforts, the Alaska Coalition has persistently criticized our activities and distorted our position. Until today, we have chosen not to counter their allegations.

Unfortunately, a March 3, 1978, press release issued by the Coalition goes beyond the bounds of accuracy and propriety. We believe the record must be corrected so that this ill-conceived release does not influence the deliberations of the House Interior Committee at this critical juncture.

In our efforts to accurately represent the D-2 sentiment of Alaskans, the Steering Council commissioned a 42-question statewide survey on the issue. The preliminary results have just been received by the Council. The poll at no time asked Alaskans whether they favor or oppose H.R. 39. In fact, H.R. 39 is never mentioned in any of the questions.

The poll does indicate that the majority of Alaskans:

-favor giving permanent protection as parks and wildlife refuges to certain public lands in Alaska (61%)

-favor building surface transportation access to some or all parks in Alaska (78%)

-believe that Alaska's resources can be developed without destroying its wilderness, scenic and wildlife values (61%)

-find that some parks and refuges in the State are inaccessible because of the cost of getting there (62%).

We believe that the Council's poll reflects the diversity and complexity of the issues facing Alaskans and Congress in the D-2 legislation. The Council is appalled by the fallacious and irresponsible claim that the survey demonstrates majority support for the Alaska Coalition and H.R. 39.

The Council will soon provide the full 42-question survey to all members of the House of Representatives, so that the members can determine the facts for themselves.

Two recent statewide polls of Alaskans conducted by groups unaffiliated with the Council have been published in the Alaskan press. Both surveys ask State citizens what their feelings are toward H.R. 39. We report their published findings:

-a survey conducted for the State of Alaska's Commerce Department found 67% of Alaskans opposed to H.R. 39.

-a poll conducted for an Alaskan citizen's group found 64.7% opposed to H.R. 39.

We hope this memorandum sets the record straight.

ALASKA COALITION *'To Preserve Alaska's National Interest Wildlands'*

CONTACT: Rita Molyneaux
(202) 293-2732

IMMEDIATE RELEASE
March 3, 1978

ALASKANS FAVOR H.R. 39

The Alaska Coalition today claimed the support of the majority of Alaskans in the debate over protection of federal lands in Alaska.

Citing a survey conducted by the Steering Council for Alaskan Lands, a Coalition spokesperson reported, "Despite questions in the survey obviously slanted to elicit negative responses, Alaskans have endorsed the concept of H.R. 39."

The survey asked:

"Do you feel certain public lands in Alaska deserve receiving protection as national parks or wildlife refuges even though you may not be able to visit all of them?" Responses were:

61.0% Yes, deserve permanent protection

20.8 No

7.7 No opinion/unsure

10.5 Yes, though not in amounts reported

According to the Coalition the lively debate over the issue in Alaska has been an educational experience for Alaskans. Understanding of the complexities of the questions has built public support for the legislation protecting important wilderness and wildlife areas.

Federal-State
Land Use Planning Commission
For Alaska

May 3, 1977

Honorable Jay S. Hammond
Governor
State of Alaska
Pouch A
Juneau, Alaska 99811

Dear Governor Hammond:

Tha Alaska Department of Fish and Game has presented a proposal to publish an Alaskan Fisheries Atlas (two volumes) and Volume II of Alaska's Wildlife and Habitat. These volumes, along with Volume I of Alaska's Wildlife and Habitat which was published in 1973, will provide the type of comprehensive fish and wildlife resource information that is needed by all agencies concerned with our natural resources.

The Joint Federal-State Land Use Planning Commission has assisted in this project and we will continue to support the proposal. We consider these publications to be both a timely and necessary component of the statewide resource inventory that is needed for land-use planning and management. It is our hope that your administration and the Alaska Legislature will assist the Alaska Department of Fish and Game in the publication of this valuable data.

Sincerely,

Walter B. Parker

Walter B. Parker
State Co-Chairman

State of Alaska

SUBJECT: Federal Assistance in the Production and Publication of Three Books on Alaska Fish and Wildlife

Recently I have learned about the difficulties your Department has encountered in funding the compilation and printing of three books on Alaska's Fish and Wildlife. I hate to add to your problems, but I find it necessary to deny your revised program request to receive and expend book sale revenues (program receipts) to finance the production of these books. Your request to interpret book sale revenues as trust funds does not meet the criteria set forth in the Attorney General's definition of trust or custodial funds (see memo from Ron Lind, Director, Division of Budget & Management, to All Commissioners, dated 9/20/77).

I understand the value of this proposed project and believe that it will provide innumerable benefits to non-resident as well as resident Alaskans. I am pleased to see that various federal agencies recognize the importance of this project and are interested in contributing approximately $179,000 to defray the total production costs of these books. As long as federal funds are available, I would favorably welcome your request for FY 78 supplemental funds ($262,500 program receipts) to finance the State's share of this project. As you know, the Legislature is the final authority for appropriating monies for state expenditures. However, I assure you that I will do my utmost to secure passage of a supplemental appropriation for this project.

HB683

January 25, 1978

The Honorable Hugh Malone
Speaker of the House
Alaska State Legislature
Juneau, Alaska 99811

Dear Mr. Speaker:

Under authority of art. III, sec. 18 of the Alaska Constitution, and in accordance with AS 24.30.060(b) and the Uniform Rules of the Alaska State Legislature, I am transmitting a bill making a special appropriation to the Department of Fish and Game for the purpose of publishing three Fish and Wildlife volumes. Two of the volumes will deal with fisheries and will be sold as a set, and the third volume will be Alaska's Wildlife and Habitat, Volume II. These volumes will be sold to the public, educational institutions, and governmental agencies.

Section 2 of this measure provides for a lapse date of June 30, 1979.

Fiscal information is attached.

Sincerely,

S/JSH

Jay S. Hammond
Governor

STATE of ALASKA

MEMORANDUM

DEC 22 1977
BUDGET & MANAGEMENT

TO: Ron Lind, Director
Division of Budget and Management
Office of the Governor

DATE: December 15, 1977

FILE NO:

TELEPHONE NO:

FROM: Ronald O. Skoog
Commissioner
Department of Fish and Game

SUBJECT: FY'78 Supplemental Request: Fish and Wildlife Volumes

The Department of Fish and Game requests a supplemental in the amount of $217,900 in program receipts in order to complete funding for the publication of three fish and wildlife volumes. This money will supplement $200,000 in Federal and private funds which have been requested through the revised program process in Jeff Morrison's memo to you of November 1, 1977. The revised program requesting these funds was scheduled for hearing by the Legislative Budget and Audit Committee on December 16. This meeting has now been postponed.

Jeff Morrison's memo of November 1 went into great detail regarding the subject matter and purpose of the three volumes in this project. I am attaching a copy of his memorandum for your reference. Also attached is a memorandum from Governor Hammond to me dated September 27 in which he indicates his favorable approval of our request for FY'78 supplemental funds for this project. If the supplemental request for the necessary program receipts is not approved, then it will be necessary to abandon the project.

I trust that all of the attachments will provide sufficient information regarding this supplemental request. In the event that legislative budget and audit committee approval is delayed or denied, it may be necessary to include an additional $200,000 in Federal receipts in our supplemental request and increase it to a total of $417,900.

Your favorable consideration of this supplemental request will be most appreciated.

STATE of ALASKA

MEMORANDUM

TO: Ron Lind, Director
Budget and Management Division
Office of the Governor

DATE: November 1, 1977

FILE NO:

TELEPHONE NO:

FROM: Jeff Morrison, Director
Division of Administration
Department of Fish and Game

SUBJECT: Request to Receive and Expend $200,000 in Federal and Private Funds

The Department of Fish and Game requests the authority to receive and expend $200,000 in Federal and private funds. The funds will be expended in the compilation and printing of three comprehensive volumes on Alaska's fish and wildlife. These funds will be supplemented by a request of $317,900 in program receipts which will be requested as a FY'78 Supplemental Budget Request. Authorization for the Federal and private funds is requested at this time so that the Department may actively solicit Federal and private sources for their participation in this project.

Actual implementation of the project will not commence until sufficient funds from Federal and private sources are committed. Once these funds are committed however, the Department will commence preparation of the fish and wildlife volumes so that, assuming the FY'78 supplemental appropriation passes, printing of the documents may be started as soon as possible.

Two of the volumes will deal with fisheries and will be sold as a set. We expect to print 2,000 sets for sale initially. The third volume will be a companion volume to the existing book published by the Department, Alaska's Wildlife and Habitat. This existing volume deals with information on the distribution and general habitat requirements of big game, marine mammals, waterfowl and sea birds. The companion volume will deal with fur bearers, small game, upland game birds and selected raptors. There will be 1,500 copies of the third volume printed initially. The format of the three proposed volumes will be basically the same as the existing volume.

The selling price of the volumes will be determined by the degree of participation (financially) from Federal and private sources. The Department currently has verbal committments for almost $100,000 in Federal funds. At this level, the volumes would sell for about $58 each, and the project would require a total supplemental budget of $317,900 in program receipts. If the full $200,000 in Federal and private funds is realized, the volumes would sell for about $40 each, and the project would require a total supplemental budget of $217,900 in program receipts. At present, we must plan for a supplemental request of $317,900, with $100,000 of this amount earmarked as miscellaneous. This amount will be transferred to other line items if additional Federal or private funds are not committed. Total project expenditures will be $417,900, to be funded as follows:

	RP	FY"78 SUPPLEMENTAL
Personal Services	98.9	
Printing Costs (Contractual)	32.1	217.9
Other Contractual Expenditures	59.0	
Commodities	10.0	
Miscellaneous		100.0
Total	200.0	317.9

Since this project will continue past June 30, 1978, we request that this revised program be authorized to continue into FY'79. We have attached revised program forms. Signed Federal contracts will be forwarded on receipt.

LETTER OF INTENT
TO ACCOMPANY HOUSE BILL 704

The purpose of this bill is to provide a one-time only appropriation for the Division of Land and Water Management in order that they may clear up their backlog by June 30, 1979. The employees authorized will be separated out for budget purposes, and additional personnel for the future will be considered separately and in the normal course of budget proceedings.

Steve Cowper, Chairman
House Finance Committee

LETTER OF INTENT

9 February 1978

The Honorable Hugh Malone
Speaker
Alaska House of Representatives
Pouch V
Juneau, Alaska 99811

Dear Mr. Speaker:

This letter is to accompany House Bill 704, reported from the House Committee with a "Do Pass" recommendation on HB 704.

The bill provides for an appropriation to the Department of Natural Resources, Division of Land and Water Management, to reduce the backlog of land and water applications.

The Committee requests that the Department of Natural Resources, Division of Land and Water Management, review the regulations, statutes and procedures presently being used for land and water applications with an eye toward simplifying and expediting the process. The Committee requests that the Division prepare a report to be submitted to the next session of the Legislature proposing any statutory changes they believe desirable to bring about a swifter and less complicated procedure.

Sincerely,

Alvin Osterback, Chairman
House Resources Committee

III. ANALYSIS (See Fiscal Note Preparation Instructions, Section III)

A. Assumptions:

I. The backlog that will be reduced consists of:

1. Serialized case files.
2. Request for timber (firewood, houselogs and sales)
3. Un-serialized requests that are waiting for some kind of action.

II. The backlog as of December 31, 1977 is:

1. Southeast District - 625 (Up from 549 as of 4-1-77)
2. Southcentral District - 3,622 (Up from 3,212 as of 4-1-77)
3. Northcentral District - 1,026 (Up from 928 as of 4-1-77)

(Continued on attached sheet)

IV. DATE 2-8-78 PREPARED BY Doug K. Hollett
AGENCY Division of Land Water Management
PHONE 279-5577

Original: Legislative Finance
cc: Budget and Management
Prime Sponsor (First Legislator Named)

33-001 (Rev. 12/77)

III. That it takes approximately three man days per case by the District personnel.

IV. That a large number of Southcentral District cases will take less than the three man days due to the old practice of accepting applications with no pre-adjudication.

LAND AND WATER MANAGEMENT 323 E. 4TH AVENUE – ANCHORAGE 99501

March 20, 1978

MAR 23 1978

Honorable Hugh Malone, Speaker
Alaska House of Representative
Pouch V
Juneau, Alaska 99811

Dear Hugh:

Your letter of February 21 asked me about plans for implementing our backlog reduction program for which House Bill 704 would appropriate $1,200,000.

I believe we can substantially reduce the number of backlog items by contacting the applicants. I suspect that a number of them will prove to be no longer interested in the purpose for which the application was originally submitted. Additionally, I think we would be safe in rejecting applications on areas where we do not now have title or in which we will not receive title for the foreseeable future.

The next step would be to segregate the applications by geographic location. One step in our processing is to contact other agencies as to the effect of issuance of the application on fish and game resources as well as water quality. By batching such applications we would substantially reduce the workload on these other agencies.

I also anticipate instituting a sort of traveling processing team which would go into a community for a few days a week and work on applications in that area. This would give them an opportunity to do necessary field examinations as well as make the personal contact which might very well expedite the processing.

Incidentally, we have instituted new application procedures which will screen applications eliminating those which are inappropriate because of ownership or which are inconsistent with an existing classification which is unlikely to be changed. We think that this procedure will go a long ways towards keeping our backlog within manageable porportions in the future.

As a general statement I would expect the most of our existing adjudicators would be supervising units of new personnel who would be

10-J4LH

doing essentially the same steps that they have been doing in the process. That is, the water adjudicator rather than working on the cases themselves will supervise a group of people who have received basic training in the elements of adjudication of water applications and who would proceed with the process.

I have asked our districts and sections to prepare organizational charts indicating how these personnel would be integrated into the existing organizations. I will be happy to provide copies to you as soon as they are finalized. In the meantime if you have any further questions, please do not hesitate to contact me.

Yours truly,

George L. Hollett

STATE OF ALASKA
DEPARTMENT OF FISH AND GAME
JAY S. HAMMOND, GOVERNOR
OFFICE OF THE COMMISSIONER
SUBPORT BUILDING
JUNEAU 99801

June 10, 1978

The Honorable Kay Poland
Alaska State Legislature
Pouch V
Juneau, Alaska 99811

Dear Senator Poland:

Yesterday you requested the Department to poll the Board of Game to determine their views regarding CSHB 960 (Finance)am as written regarding the "subsistence issue" and the establishment of a "Division of Subsistence" in the Department by legislative mandate. Insofar as was possible we contacted the Board members yesterday afternoon and evening with the results as indicated below. Six of the seven members were reached--Jim Rearden, Clint Buckmaster, Charles Evans, Darrell Farmen, Pete Nelson, and Sam Harbo; Sidney Huntington was not available.

(1) All six were opposed to the legislation as written; I feel confident in saying that I believe Sidney Huntington also would be opposed.

(2) Four, and to that I would add Huntington to make five, were opposed to any such legislation being passed regardless of language; two--Chuck Evans and Clint Buckmaster--felt they could support CSHB 960 if the Department's suggested amendments were adopted.

In addition, we attempted to poll the Board of Fisheries as well, but were less successful. Only four of the seven were reached--Nick Szabo, Gordon Jensen, Herman Schroeder, and Calvin Fair. All were opposed to CSHB 960 as written. Szabo was opposed to any legislation being passed. Jensen, Schroeder, and Fair felt they could support the bill if the Department's suggested amendments were adopted.

I will stick my neck out and say that I think all members of the two Boards believe that there is little need for this kind of legislation and that the subsistence question can be handled quite adequately under a modified

regulatory system (which we are working on now). I believe too that all would object to the Legislature establishing any organizational unit within the Department by State law, as has been done already with regard to the Fisheries Rehabilitation, Enhancement and Development Division.

The Department would like to propose two additional amendments to CSHB 960. Again, both were overlooked in our previous review and, again, I apologize for that lack. Our proposals are as follows:

(1) p.5 Sec. 11 (Sec. 10 as per Dept.'s earlier recommendations) AS 16.05.257(h)(2) lines 26-29.

We suggest the elimination of this section, and instead leave the existing language presently in the Statutes. Present language reads as follows:

> (2) "subsistence hunting area" means an area designated by the board as primarily important for subsistence use and in which it is unlikely that subsistence needs will be met if recreational hunting, including hunting for trophy purposes, is permitted or if certain methods and means are continued. (s 1 ch 199 SLA 1975; am s 2 ch 269 SLA 1976)

The language stated in CSHB 960 would be too narrow and I believe not in compliance with the State Constitution because of discrimination in permitting only subsistence hunting in a "subsistence hunting area." The existing Statute language is more flexible in that control of hunting also could be handled via "methods and means," as well as by other regulatory constraints.

(2) p.6 Sec. 14. AS 16.05.930(e), lines 17-18.

Language here needs to recognize the responsibility of the Boards to set regulations. I suggest that it be amended to the following:

Line 17-18 "...except that the appropriate Board or the Commissioner by delegation of the appropriate Board may prohibit....

Thanks again for allowing us to state our views regarding this important piece of legislation.

Sincerely,

Ron Skoog

Ronald O. Skoog

Kay –

here are some other ideas I gave the Browns on land credits.

Walt

Federal-State
Land Use Planning Commission
For Alaska

March 9, 1978

Honorable Jay S. Hammond
Governor of Alaska
Pouch A
Juneau, Alaska 99811

Dear Governor Hammond:

In reviewing the concept of land credits, one of the major problems as we defined it to you in our letter of March 3 was to mitigate the effects of those persons who would acquire land with no object other than for resale. After reviewing other land distribution programs, including past State programs, it seems to us that combining your concept of land credits with some use requirements on land might be a most attractive system for placing land in private hands and insuring an orderly development of the State.

Under this proposal, land credits would be acquired by residency in the manner in which you have proposed. However, in order to validate his land credits the individual would have to place improvements upon the land he secured. The value of the improvements would then validate his land credits up to the total amount which the individual has credited.

For example, a person with 15 years residence would have $15,000 in credits. If he purchased land from the State to the value of $20,000 and then placed $20,000 in improvements upon that land, he would validate all of his credits and in essence acquire the land for only $5,000, the difference between his credits and the total purchase price.

Cash could always be substituted for land credits, thus, individuals who did not want to make improvements now are not foreclosed from either land purchase or the later use of their credits.

In this system, the individual with long residency will still, in essence, acquire free land or almost free land, but he must use it thereby contributing to the total development of the State. This would insure that lands would not be taken out of production to be held for long periods

733 W. FOURTH AVENUE, SUITE 400
ANCHORAGE, ALASKA 99501

purely for speculative purposes as has happened to so much of the land sold under earlier State sales and acquired under Federal homestead programs. This system could be applied on any State land disposal program including commercial lands if desirable. The residency requirement will largely insure that it will be used primarily for residences, farms, and other individual type uses, rather than corporate uses.

I believe a large segment of the public would find this a most attractive addition to land credits because it would benefit that segment of society which was contributing the most to the State overall. It would also allow the substitution of "sweat equity" for cash, thus allowing persons to contribute up to 60 or 70 percent of the total value in their own labor.

I do not believe that the problems of assessing improvements would be insurmountable. I also believe that a system of conveying interim title could be worked out which would satisfy the financial institutions which would be involved in financing these improvements.

Sincerely,

/s/ Walter B. Parker

March 2, 1978

Honorable Jay S. Hammond
Governor of Alaska
Pouch A
Juneau, AK 99811

RE: Proposed Alaska Homestead Land Credit Act

Dear Governor Hammond:

We have reviewed the proposed Alaska Land Credit Act as incorporated in the draft of February 24, and we ask you to consider the following points:

1. Generation of Purchasing Power: On the basis of rough estimates, it is clear that the Act would generate an immense amount of potential purchasing power which can be applied to State lands. [redacted]ent population levels, $200,000,000 worth of credits would be added each year (400,000 x $500). In addition, as soon as the Act takes effect, there will be a backlog of purchasing power held by people who have resided in Alaska for more than a year. Time does not allow for a complete estimate of this backlog, but it is fairly safe to assume that there is a core of at least 100,000 long-term Alaskan residents who have been in the State for 20 years. Their accumulated purchasing power alone amounts to $1,000,000,000 (100,000 x 20 years x $500).[1]

   Only a faction of this purchasing power will be exercised immediately. Census data indicates that roughly 40 percent of the recipients of credits will be below the 18-year-old age limit and many people will choose to accrue several credits before using them. Instead of immediate spending of credits, there will be a gradual build up of purchasing potential as people store their credits, as $200,000,000 or more worth of credits is added each year, and as new citizens reach the age of 18. From the preceding estimates, it is reasonable to assume that by 1985 there will be at least $1,000,000,000 worth of land credits held by people over 18.

---

1. The attached memo to Michael C.T. Smith supports these estimates. Average residency of the total Anchorage population is 9.4 years.

733 W. FOURTH AVENUE, SUITE 400
ANCHORAGE, ALASKA 99501

2. Land Demand: The credit system will make potential purchasers of State land out of people who have never entertained the idea of acquiring State property before. People will strive to buy land whether or not they need it for use purposes, simply to cash in on their credits. Credits will give every citizen a vested interest in rapid State land disposal and the Administration will be subjected to enormous pressures to put land on the market as rapidly as possible regardless of the supply of available land on the private market and regardless of whether State land is actually needed for use purposes. Some lands may be used, but turning credits into cash would inevitably be the overwhelming objective of most people.

3. Land Supply: The question then becomes whether the Administration can make lands available in quantities that will match the purchasing power generated by the land credit system and, more basically, whether this is desirable in terms of public and private costs and benefits. In answering the first question, it is important to recognize the real requirements in terms of time and money for making State lands available for conveyance to private citizens. To give private citizens marketable title and reasonably useable and accessible land, lands must be surveyed and rights-of-way or easements fitting the topography must be reserved to and through lands which are conveyed. Otherwise, public and private lands beyond will be land-locked and rendered useless and valueless. These requirements--survey and access reservation--are minimal. Lands should also be inventoried so that suitable lands are made available. There should be a process of consultation with local government. Under the State Constitution, public notice is required before any land may be disposed.

All these components of a responsible land offering require time and people. Between 1964 and 1974, during the most intense era of State land disposal, when land was disposed in 20- and 40-acre tracts, with nothing more than paper section line access, the State was only able to sell 138,000 acres and to lease 323,000 acres, an average of about 46,000 acres per year over a period of about 10 years.

If the State were to try again to make about 50,000 acres available each year--which, as under the previous program, would also necessitate selling land without useable access in tracts far larger than required for individual use--it still would not be able to satisfy the purchasing power generated by land credit build up. At an average value of $1,000 per acre, 50,000 acres per year would only provide $50,000,000 worth of available land. This amounts to only one-quarter of the amount of credit value added each year and one-twentieth the build up in credits anticipated by 1985.

4. Impact on Other Uses: This lag between the build up of spendable credits and the supply of available State land will generate intense pressures to put land on the market, simply so people can cash in their credits. In relation to this pressure, actual land needs for individual use will cease to be a significant consideration. It will be argued that by granting credits, the State assumes an obligation to make lands with a commensurate amount of real estate value available for private acquisition. Since real estate values diminish rapidly as one moves to inaccessible lands far from communities and road and water access, the pressure will be to dispose much of the State lands near road access, waters, and communities. But these are also the lands that often have conflicting values for other purposes. Under the demand/supply ratios that we have projected, it will be extremely difficult to maintain an appropriate balance between lands for private use and accessible public lands that can be used for resource development and for hunting, fishing, snowmobiling, skiing, and other public purposes.

5. Impact of the Bill on Land Prices: Two possible outcomes may result, depending upon disposal procedures followed. Assuming the State lands are made available at a fixed price at or below "fair market value," then the effect of the program will lead to an overall decrease in land prices or result in a lower growth rate for land prices than would occur in the absence of such a program. The reasoning is as follows: Creation of land credits, applicable only to State land disposals, will shift land demands from the private sector to State lands, resulting in decrease in demand for land in the private sector. Secondly, after initial disposal of State lands, these lands become part of the aggregate supply of private sector lands. In other words, there will have been an increase in the supply of private sector lands. The effect of both the demand and supply schedule shifts will be to reduce overall land prices, either in absolute terms or with respect to the rate of growth.

It is worth noting that this program would be concurrent with transfer of lands to the Natives under ANCSA. This increase in the supply of private sector lands will also exert downward pressures on overall land prices. At the same time, the land credit program, also creating downward pressure on land prices, tends to reduce the value of Native lands.

The second possible outcome occurs if State lands are disposed of under a competitive bidding process. In this case, the individual can be expected to pay, as a maximum, an amount equal to that which would have prevailed in the private sector. However, to this maximum "out of pocket" figure may be added the value of land credits (since they are "free" and cannot be

used otherwise) thus resulting in a dollar transaction figure greater than that which would have occurred in the private sector. The result in this case is an artificial inflation of land prices. While such inflation may not be sustained by the private sector (the private sector will not pay more for a parcel acquired in such a manner than the parcel would have traded for in the private sector) the State may help perpetuate such prices if future State land value appraisals reflect these transactions.

6. Impact of "Re-disposal": A situation may develop in which individuals attempt to "cash in" their land credits. Since these credits are not transferable or assignable, the only way to convert them to cash is to acquire land and dispose of the land in the private sector. Since the land was acquired using free land credits, an individual may be willing to dispose of his land for substantially less than the initial transaction price. In this case, the overall effect on land prices would be downward.

An alternative scenario of some importance is one in which a major land acquiring corporation offers to "cash out" land credits. This might result in the corporation acquiring a large number of scattered tracts, or alternatively might provide a means for acquiring large contiguous tracts. In short, the land credits proposal may provide a device for concentrating land ownership.

7. Constitutionality: While our staff has not yet had an opportunity to do detailed research, we have reservations about the constitutionality of Section AS 38.05.057(d). Even though the residency period for initial qualification to participate in the program is relatively short, this subsection is suspect because it provides for the accrual of benefits on the basis of durational residency. This preference for long-term residents over short-term residents may abrogate provisions of the Constitution which were adopted to foreclose states from providing special benefits to their own citizens, a situation which occurred frequently under the Articles of Confederation, the precursor of the Constitution. In examining the constitutionality of subsection (d), this central tenet must be viewed within the context of a few cases which have permitted states to provide limited preferences to local residents in the allocation of natural resources. Because subsection (d) is so integral to the conceptual foundation upon which the land credit act is premised, we believe that the type of research which we are suggesting must be undertaken before this draft legislation is finalized.

8. Difficulty in Administering Residency Requirement: Beyond the legal considerations just mentioned, we believe that subsection (d) would be extremely difficult to administer. The enactment of this subsection would necessitate the creation of a large and costly bureaucracy to determine the validity of hundreds of thousands of residency claims, each of which would involve different sets of facts. Even if such a bureaucracy were established, the difficulties inherent in disproving a claim of residency and the great monetary benefits involved could well generate widespread abuse of the program. This possibility is increased in the situation under discussion here, because the draft legislation does not mandate objective criteria for proof of residency. In our opinion, the likelihood of future administrative and pragmatic problems associated with the implementation of subsection (d) should weigh heavily in any decision to propose the land credit act.

9. Leasing: We note that Section 2(a) of the bill refers to leases, whereas Section 2(e) says that credits cannot be used for lease payments. We expect that the practical effect of such a prohibition would be to virtually eliminate leasing as a tool for State land availability, since any State land program to which credits cannot be applied would be very unpopular. That outcome would be unfortunate, since leasing is well suited as a means of protecting long run public interests while allowing current use. Because trust land transactions must be at market value, trust lands must be exempted from any credit program. If this is done, there is no reason to exempt leased lands in general.

10. Growth Inducement: Essentially, the program pays people $500 per year to live in Alaska. Such a program is bound to generate considerable national publicity. The program's potential to attract people to Alaska should be considered.

In summary, we think that the land credit program will generate additional pressures for very rapid disposal of State lands that may jeopardize sound land administration. Although similar pressures would occur under a homestead program, the pressure generated by the land credit approach would be more pervasive, since benefits would accrue to each citizen automatically without any significant initiative. Moreover, since land credits could be applied to most State land disposal programs, the effects described above would affect State land administration on an across the board basis. Clearly, we want to make lands available for private use, but this can be done effectively under an array of well suited programs without a credit system. The land policy bill, developed in cooperation with members of your Administration, embodies this concept.

We appreciate the complexity of current circumstances surrounding State land issues, and complement you on the consideration that is being devoted to this extremely important matter. The Commission and its

staff stand ready to help in anyway that we can as your deliberations continue.

Sincerely,

Walter B. Parker

Population and Residency in Alaska

This memorandum is in response to your request for background data on Alaska's population and average length of residence within the state. Specifically, it is addressed to three questions:

1. How many persons in Alaska's population are 18 years or older? How many are younger than 18?

2. What are the average years of residence for persons 18 years and over and for persons under 18 years of age?

3. Are there distinctive patterns of change in the age distribution of Alaska's population and in the average length of residency?

As you know, we have reached the late intercensal years and accurate population information has become extremely scarce. Even estimates of total state population from different credible sources show significant divergence. Detailed data on demographic characteristics such as age and residency are practically nonexistent. Notions for these will have to be distilled from other types of information found to be available and pertinent. Thus, the best we have at hand is an assortment of rule-of-thumb indicators which, despite built-in limitations, provide a basis for making some reasonable conjectures.

1. How many persons are 18 years or older? The Alaska Department of Labor estimated the July 1976 state population to be 413,289 persons. The U.S. Census Bureau's conservative estimate of 382,000 people generally is considered less reliable. However, the Bureau develops its population total with an age profile component:

	Percentage
	9.7
5-17	27.5
18-44	46.3
45-64	14.1
65 and over	2.4

Applying these results to Labor's estimate of 413,289 people, approximately 63 percent, or 259,000 persons, would be 18 years of age or over, while 153,700 persons would be under 18.

2. What are the average years of residence for these groups?

First, only three sources of information were found to shed light on this issue. A 1977 survey in the Anchorage area gave the following years of residency distribution for about 1200 households:

Years of Residence in Anchorage	Percentage of Households
0-1.9	19.8
2-3.9	17.6
4-7.9	21.0
8-14.9	16.0
15-24.9	15.5
25+	8.0

Mean years of residence = 9.4 years

Median years of residence = 6.0 years.

A similar 1976 survey of 408 households in the North Star Borough yielded these findings:

Years of Residence in North Star Borough	Percentage of Households
0-1	26
2-3	18
4-10	23
11-20	17
20+	16

Median years of residence = 6.4 years

Although these results are for households instead of individuals, they can probably be taken as indicative for the latter. Only about 15 percent of the respondents in both surveys indicated they had lived somewhere else in Alaska prior to moving to their respective municipality. Thus, something like 6 to 10 years would probably provide a fair range for average length of residence for people in these two major population centers of Alaska.

There is very little basis for determining how residency differs for people under and over 18 years of age. The 1970 census for Alaska does suggest some basis for guessing derived from the responses to the question: Where did you live in 1965?

a. one-third of the children between 0 and 9 years of age were 5 year residents;

b. 40 percent of the children ages 10 to 19 were 5 year residents;

c. only about 14 percent of people 20 to 29 were 5 year residents;

d. between 25 and 30 percent of the people between 30 and 44 years were 5 year residents;

e. over half of the people 45 years and older were 5 year residents.

3.

No longstanding trends were
quick review of changes in t
of Alaska's population since

	1960	1970
Under 18:	*39.8%	39.9%

HB
763

HOUSE RULES COMMITTEE LETTER OF INTENT TO ACCOMPANY HB 763

It is the intent of the Legislature that after passage of HB 763 the board of directors of the Commercial Fishing and Agriculture Bank shall institute a plan of work to include:

(1) work with federal farm credit system representatives to develop policies and agreements formalizing the working relationship between the bank and the Spokane Bank for Cooperatives and the Federal Intermediate Credit Bank of Spokane;

(2) the completion of sufficient market research to determine the initial capital needs of the bank and projections for future capital requirements; and

(3) the completion of a financial proposal to be submitted to the commissioner of revenue in support of a preferred stock offering memorandum, specifying the board's suggestions for terms of the stock and a schedule of stock repurchase by the bank.

MEMORANDUM

SUBJECT: HB 763: W.O. #15/R

TO: The Honorable Alvin Osterback

FROM: John Williams
Research Analyst

You have asked that we prepare an analysis of HB 763, an Act relating to commercial fishing and agriculture. Following is a general description of the bill. We will first discuss the bill from a general perspective and then specifically address the issues of the purpose of the development bank, the structure, financial aspects, and the eligibility requirements.

OVERVIEW

HB 763 repeals the commercial fishing loan act (AS 16.10.300-370) and creates the Commercial Fishing and Agriculture Cooperative Development Bank (it does not repeal the Alaska Agricultural Loan Act--AS 3.10). The bank is subject to the provisions of the cooperative corporation laws (AS 10.15.005-600) except as otherwise specifically provided for in the bill.

The bank is to be initially capitalized via purchase by the State of non-voting preferred stock in the corporation. The initial seed money is to be repaid to the State within 20 years from the profits of the bank and from the purchase of stock by fishermen and farmers. If the State's initial investment is not returned within 20 years, the commissioner of Commerce and Economic Development may dissolve the corporation.

The bank may borrow money, lend money, guarantee loans, joint venture in loans with institutions of both the public and private sectors, hold equity interest in enterprises of its members (not to exceed 49%), and may issue bonds.

PURPOSE

Section 2 of HB 763 describes five purposes of the Act (economic assistance for Alaskan commercial fishermen and farmers, to encourage utilization of agrarian and fishery resources, encourage technological devel-

opment in those two renewable resource industries, and to promote a more rapid development of the agricultural industry). The bill will also have the effect of encouraging members of those industries to form cooperatives and perform decision making through peer group processes. The intended impact, however, is to insure the availability of financial resources for expansion of the fishing and agricultural industries in the State.

STRUCTURE

The bank is clearly modeled after components of the federal farm credit system, which were initially financed by the federal government and subsequently fully owned and financed by the members. The federal seed money was repaid, at which time federal involvement in the system was terminated (other than as a regulatory overseer).

The Commercial Fishing and Agriculture Cooperative Development Bank is established as an instrumentality of but separate from the Department of Commerce and Economic Development (Sec. 3). It is governed by a Board of Directors (three in number), with the initial directors appointed by the Governor. Subsequent directors are elected by the shareholders and serve three year terms. The directors are charged with filing the articles of incorporation and with adopting bylaws. They shall also establish the value for and issue stock in the bank, as well as set out a schedule of guidelines for loans made by the bank. A director of the bank is prohibited from voting on matters for which he or she has a conflict of interest (Sec. 41.45.190).

FINANCIAL ASPECTS

Capitalization

The bank is initially capitalized by the sale of preferred stock to the State (60-80% of issuance) and to members. Membership stock is issued in the amounts and with the value determined by the Board of Directors.

Sections 41.45.120-180 provides for bonding powers. The bank may issue bonds at its discretion, except that the maturity of any issue may not exceed 30 years, and the bank may not pledge the full faith and credit of the State. All property and bond issuances of the bank are tax exempt and legal investments for fiduciaries.

Sec. 41.45.210(15) allows the bank to borrow money and issue secured or unsecured evidence of indebtedness.

Lending

As mentioned earlier, the bank is fashioned after the farm credit system. To be eligible to borrow from the bank, a lendee must be a participant in the bank. The farm credit system specifies that a member must own at least 10% of the value in stock of an outstanding loan. A minimum participation is not specified in HB 763.

The bill leaves broad discretion to the Board of Directors in determining loan policy. Sec. 41.45.210 specifies that the bank may make variable rate or fixed rate loans, provide for extensions of loan terms (for poor fishing or farming seasons), make loans jointly with other public or private institutions, guarantee or endorse obligations of other corporations, and accept subordinate leins as security.

Sec. 41.45.210(18) allows the bank to provide "technical services" to shareholders to enhance their ability to obtain financial assistance from the bank.

Investments

The bank is given broad powers to invest its resources. Sec. 41.45.210(7) provides for the bank to "invest in projects conducted by shareholders of the bank by purchase of the capital stock of corporations involved in such projects, except that no investment in capital stock may exceed 49 per cent of the capital stock of a corporation". Subparagraph (8) of the same section provides for the bank to invest in projects relating to the development of farms, storage and processing of farm produce, etc. except that no investment may exceed 49% of the capital stock. There is no similar provision specifically allowing the bank to invest in "vertically integrated" fishing operations.

ELIGIBILITY

Sec. 41.45.210(1) describes the eligibility requirements. Applicants must be members of the bank to be eligible to receive loans. Eligible recipients are defined as "commercial fishermen and farmers or...corporations, partnerships, or joint ventures 51 per cent of which are owned by commercial fishermen or farmers who are state residents...."

Eligible activities do not appear to be limited to strictly fishing or farming. Subparagraphs (7) and (8) of Sec. 41.45.210 allow the bank to invest in activities conducted by shareholders of the bank. Subparagraph (7) is not specific as to what kinds of projects the bank may invest in, other than the projects must be projects "conducted by the shareholders". Subparagraph (8) specifies that bank investments may be made in the development and operation of vertically integrated activities relating to farming.

The bill is not specific as to what loan applications are eligible for consideration by the bank, except that loans are made only to members and members must be either commercial fishermen or farmers. Loan applications submitted by members for projects outside the purview of either fishing or agriculture are presumably eligible, unless otherwise provided for by the Board of Directors in the articles of incorporation or bylaws.

March 27, 1978

Rep. Al Osterback, Chairman
House Resources Committee
Pouch V State Capitol
JUNEAU, AK 99811

Dear Al:

As reported to your office by phone on March 27, I would recommend that the Resources Committee consider the following changes to HB763:

1) Section 1 - FINDINGS

The concept of the target group for assistance throughout Section 1 (fishermen and farmers) could be expanded to include processing firms and other businesses whose primary function is to service farmers and fishermen, by referring to "agriculture and fishing businesses" instead of "farmers and fishermen". This would appear to make the FINDINGS more consistent with Sec. 41.45.210 POWERS OF THE BANK as written (and as proposed for change in the remainder of this letter).

Sec. 41.45.210 POWERS OF THE BANK

Para (1) line 25, remove; replace with , and to seafood and agriculture processors, marketers and firms providing technical services to the agriculture and fishing industries for projects which will establish a facility within Alaska or which will establish or expand a market for the harvests of resident commercial fishermen or farmers.

Para (7) and (8) could be clarified by merging them and defining target projects as defined under para (1). This could be done by adding of the type approved under para (1) of this section at the end of line 7. Paragraphs (7) and (8) would then be replaced by a single paragraph:

(7) invest in projects conducted by shareholders of the bank of the type approved under para (1) of this section by purchase of the capital stock of corporations involved in such projects, except that no investment in capital stock may exceed 49 percent of the capital stock of a corporation;

I am hopeful that these comments will be of assistance. If any clarification is needed, please contact me.

Sincerely,

Franklin L. Orth
Senior Economist

ALASKA TROLLERS ASSOCIATION

P.O. BOX 5825
KETCHIKAN, ALASKA 99901
907-225-9638
January 27,1978

The Honorable Mike Miller
Pouch V
Juneau, Alaska, 99811

Dear Representative Miller;

The Alaska Trollers Association Logbook Program, now entering its third year, has been deemed an important and needed undertaking by fishermen, resource managers and ocean scientists. The enclosed letters of commendation from the North Pacific Fishery Management Council and the National Marine Fisheries Service bear this out. Much of the initial two years has been devoted to generating interest and cooperation for the program, training fishermen in data collection techniques and determining the types of information that could best be obtained. Even so, much useful information has already been obtained. Attached is a list of the reports available from our office.

The Logbook Program is the only source of information providing detailed catch and fishing effort data for the Alaska power troll salmon fishery. It also provides virtually the entire data base for determining abundance, distribution and migration patterns of marine mammals in southeast Alaska waters and for monitoring trends in the southeast Alaska marine ecosystem. In 1978, with only a small increase in time and effort for participating fishermen, the Logbook Program will be used to help obtain better information for recoveries of tagged salmon, better understanding of incidence of salmon diseases and parasites and better knowledge of the accuracy of the Alaska fish ticket data collection system.

None of the above information can be feasibly collected by existing state, federal or private agencies. The cost of ship-time and personnel alone would be prohibitive - roughly $2.7 million! Only Alaska Trollers Association can provide such data at a relatively modest cost, since we rely on voluntary efforts of fishermen. However, we do require a central office staffed with a biologist and secretary-administrator to ensure efficient management and coordination of the Program.

To date we have received a grant of $40,000 from the State of Alaska for fiscal year 1977 (administered through a contract with A.D.F.& G. to University of Alaska Sea Grant Program). We had also anticipated receiving a grant of $25,000 from the federal government (through Outer Continental Shelf Environmental Assessment Program) but have run into delays due to a series of unfortunate misunderstandings. Although we have sufficient funds to print 1978 Logbooks and Annual Reports on 1977 Logbook data, we are in need of funds to run our office for the remainder of fiscal year 1977. We need an additional $20,000 to continue operations on a "bare bones" level. Therefore, we are asking that you support a request for $20,000 in supplemental funding from the State Legislature 1978 fiscal year budget to go to our Logbook Program. Additionally, we hope you will ensure that our program is funded in the 1978 fiscal year budget at the increased level of $65,000. Considering the amount of valuable information our program is able to provide just in the area of fisheries, this is certainly a modest and reasonable funding request.

Fishermen have long desired a voice in the management of the resource they depend upon for their livelihood, and are certainly in the best position to collect much needed information. The Logbook Program has shown that fishermen are responsive and responsible resource users. We hope that you will help us in our efforts to continue and improve our Logbook Program. Please let us know if we can provide you with any further information. We look forward to hearing from you.

Sincerely yours,

Ed Linkous

Mr. Ed Linkous
Alaska Trollers Association
P. O. Box 5825
Ketchikan, AK 99901

Dear Ed,

The North Pacific Council asked me to write to the Alaska Trollers Association through you, commending you and your organization for the objective response you made to the first draft of the Council's management plan for the troll salmon fishery and your help in developing additional material for their consideration when they adopted the plan.

As you will recall, the Council, at the December meeting, was enthusiastic about the Alaska Trollers Association's logbook program recognizing the value of the information that can be derived from this voluntary effort. They want to work closely with you, both in that program and in the development of revisions to the troll management plan.

We are planning on holding a one-day work session to develop research proposals for the troll fishery along the lines suggested by the Council at its last meeting. It will be held in Juneau as early in January as we can schedule everyone. We'd like to have one or two representatives from the Trollers and your fishery biologist, Mr. Stephen Fried attend. Don Collingsworth will be coordinating the workshop and will keep you advised of the time and place. The Council will fund travel for up to two of your members and Mr. Fried for this workshop.

Sincerely,

Jim H. Branson

Ketchikan, AK 99901

Dear Ed:

Jon Rowley delivered a progress report at a recent Interagency Technical Committee meeting which summarized the Troll Log Book Program for 1977.

We were pleased with the progress of this cooperative program and believe that it should be continued and refined. In addition to the data generation potential, the Troll Log Program elicits vastly improved communications between fishermen, scientists and administrators.

We support the Troll Log Program and will do all we can to assist it.

Sincerely,

Harry L. Rietze
Director, Alaska Region

S 60 (rev. 6/77)

Testimony Before
Alaska Senate Resources Committee
on
CSHB 815

My name is Thomas H. Krueger. I am an attorney for Exxon Company, U.S.A. and am located in Los Angeles. I appreciate the opportunity to appear before this Committee and present testimony for Exxon.

CSHB 815 operates to amend various chapters in Titles 31 (Oil and Gas) and 38 (Public Lands) of the Alaska statutes. Much of the Bill deals with unitization and unitized operation of oil and gas pools. Exxon is and has long been a strong supporter of unitized operations designed to enhance recovery, promote resource conservation, prevent waste, eliminate unnecessary operations and safeguard correlative rights of the parties involved. Thus, we are interested greatly in presenting our views on this Bill to the Committee.

Several portions of CSHB 815 appear to be proper and acceptable revisions of the State's oil and gas law, and we will not take up your time discussing these provisions. There are, however, three areas in the Bill that are of considerable concern to us.

Section 7 of the Bill, which amends the unitization provisions of A.S. 31.05.110(b), deletes one of the findings of the Department of Natural Resources ("DNR") essential to a DNR order of unitization. Under current law, the DNR must find, among other things, that unitization and the adoption of a unitized method(s) are "for the common good and will result in the general advantage of the owners of the oil and gas rights within the pool or portion of it directly affected." The Bill proposes to eliminate the finding of resultant general advantage to the affected property owners, leaving only the finding that unitization and adoption of one or more unitized methods of operations are for the "common good". Significantly, "common good" is not defined.

In Exxon's view, unitization should result to the general advantage of the owners of the oil and gas rights, including the royalty owners directly affected, as well as to the "common good". If it does not, it should not be ordered by the State. The current provision is fair and should not be changed.

Under the Bill, the DNR could make the requisite finding that unitization, etc. are for the "common good" in a context where it would not result in

the general advantage of the owners of the oil and gas rights directly affected thereby. If DNR-ordered unitization were approved in such a context, serious constitutional questions could arise as applied to property owners who, in fact, were not benefited by and did not approve unitization, etc. of their interests. These questions could take the form of deprivations of liberty and property without due process of law.

(2) Underlifting and overlifting

Section 10 of the Bill, which would apply to all units created after June 30, 1978, allows underlifting and overlifting of unit production only when it does not create waste; and, regardless of waste, underlifting and overlifting may be permitted by the commissioner for temporary periods when there are extraordinary disruptions to the owner's production disposal systems. Further, this section restricts the recovery of underlifted oil to a daily rate not to exceed 10 percent of a working or royalty interest owner's share of daily production at the time of underlift recovery.

Exxon strongly supports the prevention of waste, but does not consider the first portion of this section to be necessary. Waste is already prohibited by the statutes and the Department of Natural Resources is fully empowered to carry out the purposes of AS 31.05.

As to the part of this section which limits the rate of recovery of underlifted oil, we see no need for the restriction that is imposed or for the state to intervene in this area. The details of underlifting and overlifting are matters that can best be worked out satisfactorily by the oil and gas resource owners. By imposing this restriction, which produces no apparent benefit to anyone, unforeseen future problems may be created.

3. Sections 11 and 16 of the Bill would remove the requirement that state-ordered unitization be acceptable to 62.5% of the lessees and 62.5% of the royalty owners within the unit area (with certain exclusions). Under these provisions, the State, without working or royalty owner concurrence, could mandate unitization, including the details of unit participation, unitized management of further development and operation of the unit area, cost and expense apportionment, financing, etc.

(3)

Exxon believes that unitized operations are best accomplished through voluntary agreement between the persons whose property interests would be affected. In this way, interested persons are consulted and mutual agreement reached in a manner satisfactory to those concerned. This promotes harmony and contributes to the achievement of

unit operations. Under present law, compulsory unitization must be acceptable to working and royalty interest owners of at least 62.5 percent of the unit area, thereby insuring comfortable majority support and satisfaction. This provides some degree of assurance both that only meritorious unit projects are considered and approved and that the State will not be forced to act on applications for unitization which are lacking in merit and reasonable support.

Exxon Company, U.S.A. is presently participating in more than 370 reservoir-wide and field-wide unitization projects throughout the United States, all of which have been formed voluntarily or with majority consent of both royalty and working interests. We have found that when a project has merit, its benefit will be recognized by the resource holders and it will be implemented. In our experience, we have seen no need for government-dictated unitization; however, we do support the concept of state-ordered unitization where majority, but not total, agreement is reached for unitization amongst the participants.

We question that enactment of Sections 11 and 16 would serve to benefit all interest owners in a pool since the sections eliminate the necessity for working and royalty interest approval for State unitization as provided under current Alaska law. There is no

need for this legislation since (a) to Exxon's knowledge, no unitization project which was needed in the State of Alaska has failed to materialize as a result of failure to reach sufficient agreement among the persons affected, and (b) present conservation laws contain sufficient authority for unitization and conservation of oil and gas resources. If the Bill is enacted, the only way that a dissatisfied person could object to State-ordered unitization affecting him would be to resort to litigation.

Finally, if the State were to undertake unitization by unilateral action, it would be put in the position of addressing many complex technical, operating, financial and legal issues normally handled by the operators. This would require a large expansion of its staff, and could delay the unitization process. Many of these issues that the State would set itself up to resolve would impact only upon the working interest owners and not upon the State.

In summary, Exxon believes that there is no need to change existing law on this subject and supports retention of voluntary and majority consent unitization as presently provided for in the statutes.

In summary, Exxon opposes that portion of Section 7 of the Bill which removes the required finding that unitization and adoption of unitized method(s) will result in the general advantage of the owners of the oil and gas rights. Present law on this subject is reasonable and fair and should not be changed. In addition, Exxon is opposed to Section 10 of the Bill since the provisions it adds concerning underlift and overlift appear to be unnecessary. The restriction on the rate of recovery of underlifted oil could cause problems in the future. Finally, we are strongly opposed to Sections 11 and 16 which allow for unitization by unilateral state action.

March 1, 1978

MEMORANDUM

SUBJECT: HB 815 (W.O. #12/R)

TO: The Honorable Al Osterback, Chairman
House Resources Committee

FROM: Richard G. Haggar
Research Analyst

This memorandum is in response to your request that we prepare a summary analysis of HB 815, relating to oil and gas conservation.

Section 1

Amends AS 31.05.030(d) and allows the Department of Natural Resources to require oil or gas well operators to measure and monitor pressures within oil or gas pools. Such pressure monitoring would provide an additional source of information for state conservation authorities in terms of seeing that state conservation objectives are met.

Section 2

Amends AS 31.05.030(e) and allows the Department of Natural Resources to regulate the production rate of oil and gas from a well or property for purposes of meeting state conservation objectives.

Section 3

Amends AS 31.05.030(a)(1) and allows the Department of Natural Resources to require that oil or gas well operators make, and file the results of, flow test information from wells drilled for oil or natural gas. Such flow test information would be covered under the confidentiality provisions of AS 31.05.035(c).

Section 4

Amends AS 31.05.035(c) and provides that only operators of oil and natural gas wells may require confidential treatment of data submitted to the Department of Natural Resources in relation to state conservation requirements. The current statute does not specify which parties may require confidential treatment of data.

Section 5

Amends AS 31.05.060 by adding a new subsection (b) which requires that any action by the Department of Natural Resources under AS 31.05 that has state-wide or general application will be performed in accordance with the Administrative Procedure Act (AS 44.62), except that any action by the Department under AS 31.05 with respect to a single well or field will be performed in accordance with regulations of the department designed to afford persons affected by the action notice and an opportunity to be heard.

Section 6

Amends AS 31.05.110(b) by removing the requirement that a unitization agreement, if promulgated, "...will result in the general advantage of the owners of the oil and gas rights within the pool or portion of it directly affected..."

Section 7

Amends AS 31.05.110(c) in the following manner:

1. Makes discretionary the Department of Natural Resources' authority to determine the size and area of operating units.

2. Revises the terms by which the department determines the area of an operating unit from "...the area of a pool or portion of it..." to "...the boundary of the area...".

3. Makes discretionary the department's authority to limit unitization agreements to single pools or portions of single pools.

4. Removes the requirement that unitization agreements can cover only those areas of a pool or pools which have been defined and determined to be productive of oil and gas by actual drilling operations.

Section 8

Amends AS 31.05.110(h) by deleting references to "one-eigth" landowner royalty shares. The amendatory language would take into account circumstances where the landowners royalty share was other than one-eighth (12.5%).

Section 9

Amends AS 31.05.110(i) by forbidding either underlifting or overlifting of an "aliquot" (a fraction) of unit production unless an emergency order for such under- or overlifting is approved by the department. "Emergency order" is not, however, defined either in HB 815 or the current statute.

Section 10

Amends AS 31.05.170(11) by defining the drilling of unnecessary wells to carry out the general conservation purposes of AS 31.05 as "waste".

Section 11

Amends AS 31.05.170(12) by clarifying the definition of a "cubic foot of natural gas" and by changing the pressure measurement base for defining a "cubic foot of natural gas" from 14.65 pounds per square inch absolute to 14.73 pounds per square inch absolute (conforming Alaska's law to both federal standards and those of the Interstate Oil Compact).

Section 12

Amends AS 38.05.180 relating to the leasing of public lands, by adding the requirement that no lease under section 180 may be issued without inclusion of the language of AS 31.05.110(h) (providing for the assessment of unitization costs) as part of the lease. Section 12 also provides that leases issued in violation of this requirement shall be construed as containing the language of AS 31.05.110(h).

Section 13

Amends AS 43.55.140(2) relating to Alaska's oil and gas severance tax, by changing the pressure measurement base for defining "one cubic foot of gas" from 14.65 pounds per square inch absolute to 14.73 pounds per square inch absolute (again, conforming Alaska's law to the federal and Interstate Oil Compact standard).

Section 14

Provides that the Act will take effect July 1, 1978.

Juneau, Alaska 99801

May 15, 1978

SENATOR ROLAND

Senator Chancy Croft
Alaska State Senate
Pouch V
Juneau, Alaska 99811

Dear Senator Croft:

As the sponsor of Senate Bill 503, relating to the establishment of an Oil and Gas Conservation Commission, you already know that the House has passed House Bills 815 and 830 on much the same subject.

There is, however, a small technical change which could be made to your bill or to the appropriate House bill, which change would have a potential benefit to the State of Alaska in excess of $135 million.

The details of the cost savings to the State are related in the accompanying letters to Representatives Chatterton and Malone and to Secretary Schlesinger.

Put simply, the suggested change would give the state the option of keeping its "excess" or "surplus" oil in the ground until markets can be found which have low transportation costs & consequent high royalty income levels--or until the Federal government can be persuaded to compensate Alaska for continued production on behalf of the East Coast even at low royalty rates for Alaska.

The change involves giving the Commission the right to set prorationing rates for "conservation or marketing purposes". (The underlined words need to be added to either the House bill or to your bill to make the Commission's rights explicit rather than implicit.)

The other change to reach this desirable end is in the definition section: the definition of "waste" should include "the production of oil or gas at a rate greater than economic market demand."

As the letter to Representative Buchholdt points out, "economic market demand" is purposely left vague to allow the Commission to decide whether to maximize production or revenue, whether or not to leave oil excess to West Coast demand in the ground or to produce oil to satisfy East Coast demand.

Since legislators are used to arguments from self-interest, I suggest 10% of the savings come to me; these small changes will in any case benefit Alaska--and the oil companies--greatly by reducing high

transportation costs on the "excess" oil. Or--and this may be ultimately the more likely possibility--the fact that Alaska has given itself this power may mean that the Federal government will either be willing to compensate Alaska for excess production on behalf of East Coast consumer states or will be willing to aid Alaska in realizing the Japanese barrel-for-barrel swap.

In short, this is a change which benefits Alaska: please do what is possible to add these suggested words.

Sincerely and cordially,

Dr. Joe Sonneman
Five Star Consulting and Research

P.S.: There is one oversight: as production is scheduled to rise to 2 million barrels a day, the actual potential cost to the State of Alaska from continuing production of the "excess" oil will be substantially more than $135 million over the three year period; the potential savings will also be more, therefore, if the change in SB503 or HB815 is effected.

Title 31 - Chapter 05 - The States Oil and Gas Conservation Act was adopted in 1955 by the Territorial Legislature. The Act is virtually the Interstate Oil Compact Commission's Model Act. No substantive changes have been made to the Act since adaption, 23 years ago. The Model Act was drafted primarily for the purpose of providing States with the authority to protect correlative rights of private mineral land owners and prohibit waste.

HB 815 except for Section 15 deals solely with amendments to the Oil and Gas Conservation Statute 31-05. The intent of the bill is to improve Statute for application to Alaska which is primarily a public lands state rather than a private lands state typified by the uplands of oil producing south 48 states.

HB 815 incorporates in addition to the sponsors proposals amendments to Statute requested by the Department of Natural Resources and amendments to Statute requested by the industry. Several sections of the bill address requirements for the Industry, additional data deemed necessary to insure Alaska protection of correlative rights and prevention of waste. Other sections address housekeeping amendments to facilitate better administration of the Act.

The most substantive change to existing statute is provided by Section 16 of the bill. This is a policy question.

Current law 31.05.110(d) in addition to permitting voluntary unitization of many oil and gas leases in to one cooperative reservoir management unit, provides the State with the authority to mandate unitization providing that 62.5% or more of the lessees approve and 62.5% or more of the lessors approve.

Section 16 of the bill repeals the proviso for 62.5% or more approval; thus providing the State with the power to mandate unitization of Oil and Gas leases when deemed necessary to protect correlative rights and prevent waste.

You may ask why this power is needed. Oil and Gas reservoirs almost always have a habit of occuring beneath leases having different owership interests. Unless the entire reservoir is managed as one unit "waste" as defined by Statute will generally occur and in fact waste as defined by Statute will most often be necessary to protect correlative rights. We have a show window example of such waste existing on State lands today. We need the statutory hammer to force unitization. After all, because of our severance tax law we have a vested interest in maximizing the ultimate recovery of oil and gas from all lands within the State regardless of ownership.

ACO 885861

Of lesser significance are Sections 10 and 15 of the bill. Section 10 permits underlifting/overlifting of unit production only when it will not create waste excepting for temporary periods where the Commission finds extraordinary conditions have occurred.

Section 15 requires that all future oil and gas lease forms include the language set forth within the quotation marks. We would not be in the court today if such language had been adopted in earlier years.

III. ANALYSIS (See Fiscal Note Preparation Instructions, Section III)

Salaries, equipment and other provisions for three Commissioners, three personal secretaries and one Administrative Assistant to make the organization semi-independent. This assumes that budgeting, personnel, and fiscal work or basic administrative support would be provided by Department of Natural Resources or some other existing department. Existing staffing of the present Division of Oil and Gas would be utilized in total in the new Commission. The entire staff would have to relocate.

III. ANALYSIS (See Fiscal Note Preparation Instructions, Section III)

These estimates assume that the present Oil and Gas Conservation Committee would be selected for the new Commission serving in the dual capacity as Commissioner (Chief Petroleum Engineer), Commissioner (Chief Petroleum Geolcgist) and Commissioner (Director). Since there is not sufficient top level work to keep three commissioners busy, a savings of approximately $400,000/year could be realized in this manner. Help is needed at the lower levels.

MEMORANDUM

March 21, 1978

SUBJECT: Draft Resources Committee Substitute for SSHB 830

TO: The Honorable C. V. "Chat" Chatterton

FROM: Gregg K. Erickson
Director of Research

As you directed, we have engrossed the language you presented us yesterday into a work draft committee substitute for SSHB 830. The draft committee substitute is attached herewith.

Although we have incorporated your language into SSHB 830, as you specifically directed, we would caution that doing this has introduced a number of uncertainties into the bill. Among these are the following:

1. Sec. 31.05.015 COMPENSATION OF MEMBERS OF THE COMMISSION. By deleting the phrase "equal to that of a commissioner of a principal executive department" after the word "salary", you are presumably reserving to later legislative action the establishment of commissioners' salaries. If this is to be done in the course of the budgetary process, I would suggest that the staff of the Legislative Finance Division be contacted to insure that the salary allocation is made a separate line item, or that other appropriate steps are taken to insure that legislative intent with respect to salaries, whatever it might be, is fulfilled. If it is the legislative desire to have the members of this commission treated for salary purposes the same way as members of all other regulatory commissions, then it will be necessary to amend the Alaska Salary Commission Act (AS 39.23.060) in order to include the commission in the purview of the salary review body.

2. Sec. 31.05.023(b) and (c). The effect of your change to subsection (b) is to place the professional staff of the commission and the personal secretaries of each commissioner in the exempt service. If this is your intention, it would be desirable, although not strictly required, that a conforming amendment to AS 39.25.110 be adopted as well. The effect of your change will be to give the commission pretty much complete discretion with respect to establishing the salaries of its

AGO 885845

professional staff members (with the exception of the executive director) and the commissioner's personal secretaries, subject only to the overall constraint of having to live within their budget. Since you did not delete (d), we assume you wish to leave the executive director's salary pegged to that of a commissioner of a principal executive department.

3. Sec. 31.05.025 CONFLICT OF INTEREST. The language you provided would make employees, consultants and members of the commission subject to AS 39.50 and AS 39.51. We would call your attention to the fact that *Sec. 2 of the bill already brings the commissioners under chapter 50. If it is desired to bring the employees and consultants of the department under this chapter, amendment to AS 39.50 will be required. Bringing consultants and employees under AS 39.50 will, of course, mean that they will be subject to the full public disclosure requirements now imposed on legislators and other "public officials" as defined in that chapter.

Subsection (b) of this section gives the governor authority to determine whether a conflict of interest exists, presumably based on the disclosures required under AS 39.50. It is not clear, however, what action the governor would take if he determines such a conflict exists, or what authority the governor would have in the event a member, consultant or employee of the commission disagreed with the governor's determination that a particular holding would impair the person's ability to act in the "best interests of the people of Alaska".

AS 31.51 will need to be amended if it is desired to bring consultants under its provisions.

4. Sec. 31.05.026 RELATIONSHIP TO DEPARTMENT OF NATURAL RESOURCES. We are not clear as to your intent in adding subsection (d). If subsection (c) is to be superseded, then it probably should be deleted as well. It would appear that your intent in (d) is to vest all information gathering responsibility in the commission. This could create difficulties for the department if it attempts to require persons conducting geophysical exploration or drilling on state lands to provide it with information to assist the state in planning for and conducting the leasing of oil and gas lands. Furthermore, it is not clear what exemptions would be allowed to "the general rule" that is described in subsection (d).

With respect to subsection (e) we are not clear as to the intent or effect of the first sentence. The second sentence of this subsection appears to encourage interagency agreements, but by enumerating the areas to which such agreements may be

entered into, and by specifying that they may be only for "the sole purpose of efficiency" the sentence could be construed as limiting such agreements to the areas enumerated, and for the purpose specified. Subsection (f) seems to speak to the same material as contained in subsections (a) and (b). We cannot judge what its effect would be, either taken together with (a) and (b) or standing alone.

A prior scheduling commitment to another committee will prevent us from attending your markup hearing this afternoon, but we hope these comments may be helpful.

COMMENTS FROM AN ECONOMICS PERSPECTIVE ON HOUSE BILL NO. 854 IN THE LEGISLATURE IN THE STATE OF ALASKA TENTH LEGISLATURE -- SECOND SESSION

by

Walter J. Mead

Professor of Economics

University of California

Santa Barbara, California

May 15, 1978

AGO 546796

This analysis will concentrate attention on major issues of House Bill No. 854 on which economic analysis can shed some light.

In general, it is clear that the Bill is patterned after proposed amendments to the Outer Continental Shelf Lands Act of 1953 now being considered by the U.S. Congress. There is an implied assumption that the State of Alaska can benefit by following Washington's legislative lead. Almost every Economist specialized in energy economics who has reviewed the record of federal energy legislation has concluded that a half-century of federal interference in the energy industry has been counterproductive. Such interference has not served the general welfare.

Enclosed as Appendix A is a reprint of my own analysis of President Carter's National Energy Program. This analysis includes an appraisal of past Federal energy policies. There is no evidence in the record to indicate that the State of Alaska will benefit in any way from following the lead of the Federal government in the energy policy area.

With respect to future joint state-federal leases in the Beaufort Sea, the State of Alaska is likely to commit a strategic error if it adopts leasing policies parallel to the revised OCS bill. If Alaska and the Federal government have nearly identical leasing provisions, then the Federal government is likely to determine lease policy for the joint sales. On the other hand, if the State of Alaska retains its present

bonus bidding system with the options currently provided, then Alaska is more likely to determine the outcome. As will be shown below, lease systems other than bonus biddings will yield less Economic Rents to government. This loss in income is of little concern to the Federal government, but is of great concern to the State of Alaska. If the arguments made below are acceptable, then the State of Alaska would be well advised to retain its present leasing system.

I. BIDDING ALTERNATIVES

House Bill No. 854 provides the Commissioner with a choice of several leasing methods. In order to simplify the analysis we will concentrate attention on four bid variables. (1) Bonus, (2) Royalty, (3) Profit-Share and, (4) Work-Commitment bidding. Each of these four bid variables is, in turn, paired with a variety of fixed payment requirements.

Before discussing each of these leasing alternatives, it would be useful to identify the basic economics involved. The oil and gas resources in the ground belong to the people of the State of Alaska. In turning over to lessees rights to explore for and produce any oil and gas found on leases, the people, through their government, are entitled to receive what economists call the "economic rent". This is the difference between the value of oil and gas produced, and the total necessary cost of exploration, development, and production, including in costs a competitive rate of return for the lessee. The important economic relationships are illustrated in Figure 1.

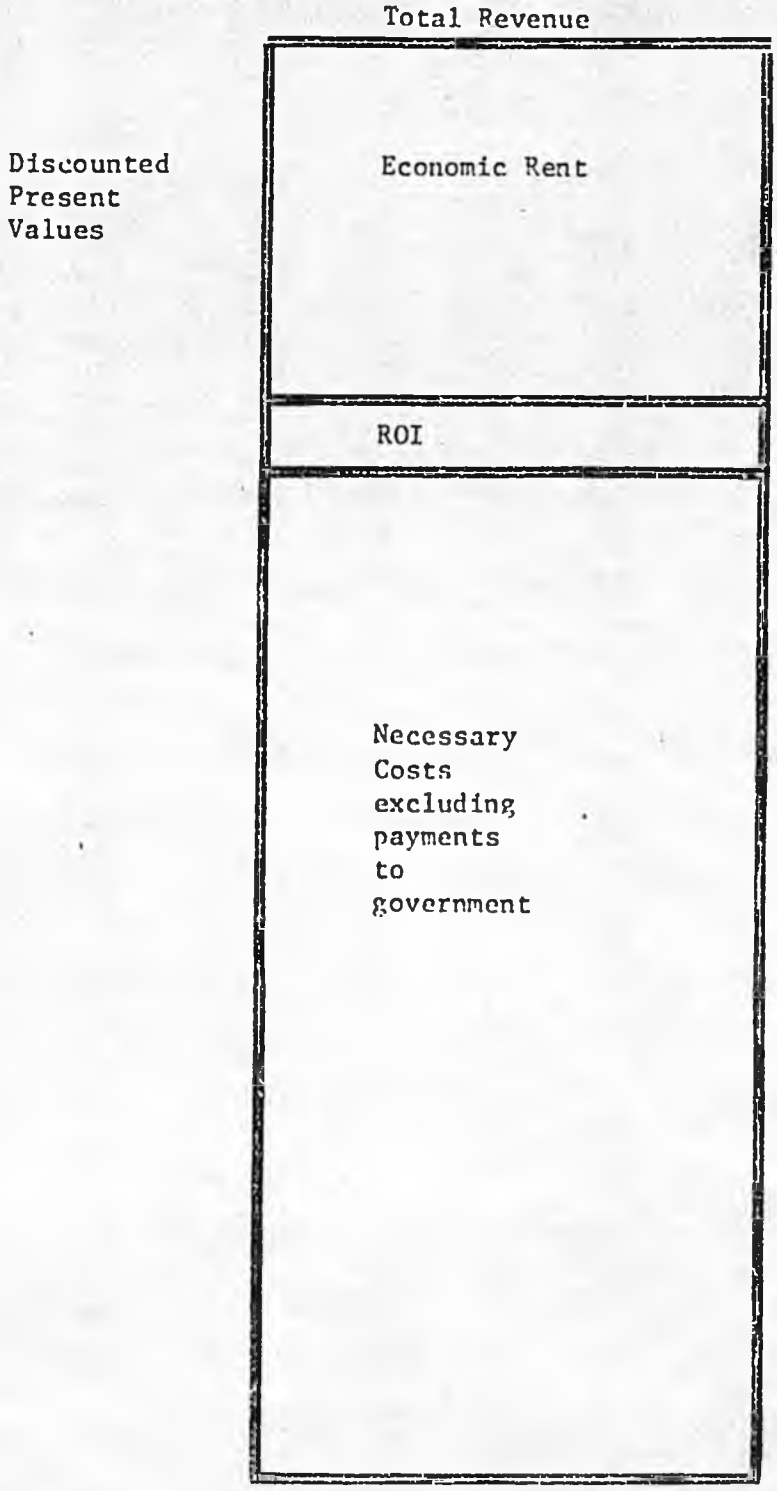
Because outlays and incomes flow at different points in time, it is necessary to use comparable values. This is done through the process of discounting future dollars to a common point in time. (Using a 10% discount rate, $1.10 next year is worth only $1.00 today.) In order to avoid the "apples and oranges" problem, all revenues and outlays represented in Figure 1 are shown as "Discounted Present Values."

The vertical distance in the diagram represents the discounted present value of total revenue obtainable from a given oil or gas lease. The middle segment of the figure represents the "necessary costs" of exploring for and producing oil and gas from a lease. However, payments to the government are not included in these costs.

The ROI segment of the figure represents the Return on the Investment for all capital costs incurred by the lessee. This ROI is assumed to be a necessary minimum as determined by competition.

The residual revenue, after all necessary costs including normal profit, is the Economic Rent collectible by the landowner.

Figure 1 is constructed on the assumption that maximum efficiency is obtained. If a leasing policy introduces inefficient operations, then costs will be higher than necessary and Economic Rent will be relatively low. It is important to realize that the total receipts of the government from an oil and gas lease do not necessarily correspond with the maximum obtainable Economic Rent. Rent is maximized only



Total Revenue
Discounted Present Values
Economic Rent
ROI
Necessary Costs excluding payments to government

under efficient conditions of production. A good leasing system then collects all of the economic rent.

(1) Bonus Bidding

Under bonus bidding a single lump sum is offered. The principal advantage of the bonus bid variable is that it is the most efficient system available. If the bonus payment is not accompanied by a fixed royalty payment, it does not impose on each barrel of oil (or gas) produced a charge which represents part of the economic rent payment. The only charges against each unit of output is the real economic cost (labor, electricity, maintenance) of producing another barrel of oil. This important fact leads to efficient business judgments concerning investments in secondary and tertiary recovery, and the optimum shut down point when a well approaches exhaustion.

Since only a lump sum payment to the government is required, this system is inexpensive to administer. The less the administration cost, the greater is the economic rent colletible by the government.

Finally, because the operator receives the residual value after the bonus payment and all economic costs of oil and gas production, the operator has the highest possible incentive to operate his lease efficiently.

Maximum efficiency should be of interest to all segments of society, and especially to the people of Alaska as the resource owners. Maximum efficiency means that resource (cost) input is minimized relative to product output. This is a goal of conservation. With maximum efficiency, the State

of Alaska will receive the highest possible payments. Maximum efficiency also produces lowest possible costs to consumers.

The above points can be illustrated by reference to Figure 1. The ROI is limited by competition in the long run. If inefficiency is built into the leasing system, them the "Necessary Costs" sector of Figure 1 will be large, reducing Economic Rent available to the state. Similarly, if the leasing system imposes unnecessary administrative costs on the lessee, then Economic Rents are again lowered. Any unnecessary administrative costs paid for by the state, come out of the Economic Rents directly.

The corresponding disadvantages of bonus bidding are two-fold.

First, bonus bidding requires "front end money." The lump sum bid must be paid before drilling has identified any reserves. There may be anti-competitive consequences arising from this "front end money" problem. Smaller, less well financed firms, may not be able to participate in bidding competition to the extent that they might wish. However, the severity of this problem may not be significant. Through widespread use of joint bidding, smaller firms, in fact, have been able to enter even the expensive OCS lease auctions through joining with other small firms and with large firms.

In order to reduce the "front end money" even further, the State might consider introducing a schedule of delayed payments. The only risk that the State would undertake through a delayed payment schedule is the risk that poorly financed

firms would "walk away" from part of their bonus payment obligation.

Oil exploration, development and production in a hostile environment requires a high degree of technological expertise as well as financial and operational integrity. The companies with this level of technological expertise are generally financially responsible firms.

Second, there is no one-to-one relationship between the bonus payment to government and the value of any oil and gas reserves ultimately found. In the extreme, this problem is illustrated by the Prudhoe Bay lease where probable value exceeds the bonus payment (and all future royalty and severance payments) by a large amount, and by the Destin Anticline offshore from Florida where the bonus payment was extremely large and revenues were zero. Even for productive wells there is usually not a perfect match between outlay and income. However, recent research on Federal OCS leases shows that, in the aggregate, under bonus bidding, with a fixed royalty, there is a very close match between costs plus payments to the government, on the one hand, and the discounted present value of oil and gas production from such leases, on the other hand.

Evidence from OCS Leasing. The record of production from all 839 leases issued by the Federal government in the Gulf of Mexico region of the Outer Continental Shelf between

the years 1954 and 1962 has been analyzed.[1] This record shows that of these 839 Federal leases, 522 (62%) produced only dry holes. Another 132 (16%) leases were productive but unprofitable. Only 185 (22%) were profitable. Effective competition requires that these profitable leases produce revenue flows sufficient to cover not only their own full costs but the bonus and exploration costs of all dry holes as well.

The rate of return that all lessees earned on their investment (bonus, exploration, development, etc.) in these leases has been estimated. Precise information on all leases is available showing bonus, rent, and royalty payments, together with oil and gas production by year through 1976. The value of such production is also known with precision. Estimates were made of pre-lease geological and geophysical exploration costs, post-lease exploration costs, development outlays, and production costs. Forecasts were made of oil and gas production from 1977 through projected closedown of each well. In addition, oil and gas prices and costs of production were forecast. With these outlays and income flows, the rate of return earned by lessees has been estimated. The results show that lessees earned a 9.5% rate of return before taxes on their investment. This ROI is low relative

to competitive performance elsewhere in the U.S. economy. The interpretation of the results is as follows:

1. Competition for Federal leases from 1954 through 1962 was intense.

2. The federal government received more than a "Fair Market Value" for these leases. This does not mean that the Federal government received all of the Economic Rent which might be collected under most efficient conditions. As will be shown later, the fact that royalty payments were required introduces some economic inefficiency therby reducing the collectible Economic Rents.

3. The bonus bidding system, in the aggregate, is an effective method of collecting Economic Rent.

(2) Royalty Bidding.

Under royalty bidding, interested parties bid a percentage of gross wellhead value payable to the government for each and every barrel of oil or thousand cubic feet of gas produced from a lease. There are two advantages of royalty bidding:

First, payments to the government correspond with production. If a lease is found to be dry, then no payments are required. If a lease is highly productive, then payments correspond with the value of production. Royalty is calculated as some specified percent of production, or of the value of production at wellhead.

Second, in the absence of a fixed bonus, no "front-end" payment is required. This may stimulate additional competition. Firms are able to obtain leases with no payment being made to the government prior to production from such leases.

However, there are also substantial disadvantages arising out of a royalty bidding system.

First, royalty bidding is inefficient for three reasons. The royalty payment is a bid percentage of the gross (not net) wellhead value. It, therefore, requires a significant payment to the government in addition to the real cost of producing every barrel of oil or thousand cubic feet of gas. The first inefficiency is due to premature abandonment of leases. The problem is illustrated in Figure 2. The State of Alaska currently requires a 12.5% fixed royalty payment from oil and gas production. In addition, the State imposes a severance tax on production. This tax has the same effect as a royalty. The two payments together are shown in Figure 2 as a 20% royalty charge.

Costs of production are low in the initial phase of reservoir life. With the passage of time, reservoir pressure declines as economically recoverable output is produced. In the absence of any royalty charge, production would be carried to point Q_1. Beyond that point, the cost of producing an additional unit of output is higher than its value. At point Q_1, the value of the resources used up to produce the last barrel of oil is exactly equal to the value

Incremental Cost No Royalty

of the oil produced. Social waste would result from production beyond, or short of, this point.

Where a 20% combination royalty and severance tax is levied, production would be terminated at Q_2. If bidding takes place on the royalty, the royalty payments would rise to higher levels. Figure 2 illustrates a 40% combination royalty and severance tax. With this payment, the property illustrated in Figure 2, would be abandoned at Q_3. Thus a royalty leads to premature abandonment of valuable resources. It is correct to describe this as "premature abandonment" because the royalty payments are merely transfer payments from the operator to the government. They are not true economic costs in the sense that labor and materials are economic costs.

Returning to Figure 1, the effect of premature abandonment on Economic Rent can be shown. Because total revenue with a royalty payment is lower than it would be if no royalty were required, the Total Revenue column would be lower than shown in the diagram. But necessary costs and profits (ROI) would be reduced only slightly. Therefore, premature abandonment causes Economic Rents to be lower than their potential. This means that the people of the State of Alaska sacrifice money income due to a royalty payment requirement. Social costs are borne by all of the people. This is always the result when scarce resources are wasted. In the royalty case, the higher the royalty payment, the greater the loss in Economic Rent.

Where bidding takes place on the basis of a royalty payment, the loss to government in Economic Rent and to the people of a nation in lost resources can be substantial. An 80% royalty payment when oil is priced at $10.00 per barrel at wellhead requires a payment to the state of $8.00 per barrel. This means that when real economic costs reach $2.00 per barrel, this real cost together with the $8.00 transfer payment results in extremely early abandonment.

The second inefficiency in royalty payments arises from the fact that some smaller fields, which would be profitable to operate under low or zero royalty payments, become submarginal with higher royalty payments. In this case, a discovered field would be termed uneconomic to operate and would not be developed. This results in a monetary loss to the State of Alaska, and a social cost to the entire nation.

A third inefficiency arising out of royalty payments is that they reduce the incentive of operators to invest in more intensive management of their reserves. For example, secondary and tertiary recovery investments in some cases will not be undertaken. Without royalty payments, some of these investments might return an attractive rate of return, say 20% ROI; whereas with royalty payments the ROI might fall to the unattractive or negative category and investments would not be undertaken.

In terms of Figure 1, foregoing recovery investments reduce Total Revenue below the optimum level with the result that Economic Rents are less than what could be collected under efficient leasing terms.

Premature abandonment, however, can be avoided by successive reduction of royalty to zero. Everybody gains from reducing royalties to zero relative to fixed royalties. Profits to the operator would increase, additional royalties would accrue to the State, because premature abandonment would be avoided, employment would be higher, and the nation would receive additional oil production at social benefits which are greater than social costs.

A second disadvantage of the royalty system is that it may simply tie up leases without cost to the lessee. With no bonus payment, he may have no investment whatsoever in the lease. He has only a commitment to pay royalties in the event of production. This is a free option to buy. If other lessees are nearby who have invested bonuses in leases and are engaged in exploratory activity, the lessee with a royalty lease will probably choose to wait for the results of drilling by others. However, if a small fixed royalty is also required along with the contingent royalty payment, the royalty lessee has less of an incentive to do nothing. However, a pure bonus bid provides a maximum incentive to proceed quickly with exploration.

In an economic sense, any royalty should be reducible to zero prior to abandonment. The U.S. Interior Secretary has authority to do this, but has never exercised his authority possibly because of the administrative difficulty. There is no objective way to inexpensively determine when royalties should

be eliminated. If bidders, at the point of lease sale, understand that royalties will be reduced to zero to avoid premature abandonment, then they will place a higher value on the lease. Competition for the lease will force them to bid higher bonus payments. In this event, more oil is produced and the State would collect increased Economic Rents.

House Bill No. 854 also provides for a sliding royalty scale, "according to the volume of production." If a sliding scale is used, the inefficiencies and consequent losses in Economic Rent analyzed above would still appear. Any investment in secondary and tertiary recovery would still be retarded. Such investments cause output to increase, and therefore incur higher royalty obligations. The net effect would still reduce the ROI on the investment. In cases where the ROI is shifted from attractive to unattractive or negative levels, the state would suffer a loss of Economic Rents. Further, expensive administrative costs are incurred. There is no efficient and objective means of setting sliding scale royalty rates. If royalty rates are made purely a function of production, then the operator has an incentive to reduce production below the most efficient rate which would maximize the Economic Rent. Government administrators may try to avoid this problem with careful surveillance of the operator and careful, but subjective, determination of sliding scale royalty rates. But this requires expensive administration.

The cost of this bureaucracy may be shown in Figure 1 as a negative charge against Economic Rent. A relatively

high level of rent might be collected, but some of it will be dissipated in administrative costs and will not accrue to the people of Alaska. In addition, the lessees must also maintain staff personnel in order to develop and analyze data, and negotiate with their government counterparts. This raises costs to the lessee beyond those which are represented to be "necessary costs" in Figure 1. This means that Economic Rents are doubly reduced and payments available to the State decline even further.

In summary, royalty payments result in reduced efficiency and therefore in reduced Economic Rents. The larger the royalty payments, the greater the loss in Economic Rent. Sliding scale royalty rates will avoid premature abandonment if they are reduced to zero at appropriate points. However, sliding scale royalties artificially discourage investments in secondary and tertiary recovery, lead to abandonment of wells that are economically operable, and also result in wasteful administration costs, all of which lower Economic Rents available to the State.

(3) Profit-Share Bidding.

Under profit share bidding, each bidder offers a percent of the net profit for each lease to be paid to the State. There are four possible advantages of profit share bidding as follows:

First, it is an improvement over royalty bidding in that the profit share to be paid to the State is based on

net income (profit) rather than gross income. This means that as a field approaches exhaustion, its profit declines towards zero. Unless the profit share bidding system also requires a fixed royalty payment, the problem of premature abandonment is avoided.

Second, profit share bidding avoids the front end loading problem that is characteristic of bonus bidding, unless profit share bidding is paired with a fixed bonus requirement. No payments are due to the State until production appears and profits accrue to the operator. In the absence of front end payments, smaller less well financed operators may enter the bidding competition and possibly win leases. As indicated in the analysis above (page 8), this problem is of minor importance from a competitive performance viewpoint.

Third, payments correspond with benefits. Dry holes require no profit share payment. Conversely, the occasional rich discovery producing high profits results in larger payments to the State. This would avoid some of the political embarrassment associated with the Prudhoe Bay situation.

Fourth, hopefully, a pure profit share bidding arrangement may constrain over-zealous regulators and environmentalists from imposing uneconomic costs on oil exploration and production. Under the profit share system, any economic waste is clearly shared by the operator and the government.

Returning to Figure 1, when unnecessary costs are imposed on operators after a lease sale has taken place, both the ROI and the Econor ic Rent segments of the chart are reduced. It should be pointed out that when a government engages in such post-bidding practices, bidders will quickly learn to anticipate a repetition in subsequent sales. Such expectations will be factored into future bid calculations such that in subsequent leases the entire cost of uneconomic regulations is borne by the government in the form of reduced Economic Rent.

There are also substantial disadvantages involved in the profit share bidding system.

First, while the layman may consider computation of profit to be a simple and straight-forward calculation, in fact, a wide variety of accepted accounting procedures are used. There are two general concepts of profit which may be identified.

(1) Bidding may take place on an accounting concept of profit in which fixed costs and overhead costs, along with all operating costs, are deducted from gross revenue in order to obtain net profit.

(2) Net profit may be defined as operating profits in which fixed costs and overhead are not allowed as reportable expenses.

Within each general classification a multitude of problems immediately appear. For example: (1) The process of trading oil between separate companies is widespread in this industry, and an arm's length sale of oil may not take place.

Prices must be carefully analyzed. This requires unnecessary administrative expense by both lessee and lessor. (2) Where a company wishes to do some research and development concerned with oil exploration and production, it is likely to do so on leases involving profit share payments rather than on other company production. (3) Where a company has a mixture of highly efficient and less efficient drilling rigs or drill ships, it is likely to use the poor equipment on the profit share lease and reserve the best equipment for other company operations. (4) Where a company needs to train crews in drilling and reservoir development, it is likely to do its training on profit sharing leases. (5) "Gold-plating" is likely to occur on profit share leases where the share paid to government is high and the retained share is low. Evidence of this practice may be found in the Long Beach (Wilmington) field where profit shares paid to the government are extremely high. (6) In profit share leases, public relations expenditures are likely to be high. This will be particularly true when expenditures for P. R. produce benefits for the lessee company as a whole. (7) In the event of supply shortages such as occurred in 1973 and 1974, available supplies are likely to be allocated to non-profit share leases first.

Companies differ in their level of efficiency. In order for the State to select the highest bidder it should evaluate probable efficiency of each competing bidder. While

this is desirable, it is also expensive and probably impossible. But it means that the high profit share bidder is not necessarily the operator that will produce the most Economic Rent for the State.

In order to avoid the problems listed above, as well as others not listed, the State will probably determine that it must carefully police lessee operations. This, of course, requires additional administrative costs. Again in terms of Figure 1, one should expect not only the necessary cost of production to be incurred, but also unnecessary costs as well. But these costs reduce the Economic Rents available to the State. Also, the added policing function by the State involves additional administrative costs which must be paid for out of the State's Economic Rents. Further, because the interpretation of profit is difficult, one must expect litigation of disputes. This requires expensive attorney fees and court costs for both the operator and the government. All of these expenses further reduce available Economic Rents.

Second, in addition to the profit share bid, one must also consider the corporate income tax for it too is a profit share payment. With percentage depletion allowance totally phased out for all integrated oil companies and reduced for smaller non-integrated firms, the corporate income tax will approach a 48% effective rate at the federal level. Any state income taxes will increase this rate even further. Using a 48% corporate income tax paired with a 30% profit share

bid results in an effective profit share (or tax) rate of 63.6%. Thus, out of every additional dollar saved through efficiency, the company retains 36.4¢. Where an 80% profit share bid is paired with a 48% corporate income tax, the effective tax rate is 89.6%. This leaves only 10.4¢ on the dollar, as a reward for efficiency. This incentive is too small to produce maximum efficiency. In terms of Figure 1, expenses will be higher than necessary with the result that Economic Rents available to the State are sacrificed.

Third, as in the case of royalty payments, profit share payments discourage investments in intensive field management including well workovers, pressure maintenance projects, and secondary recovery investments. Some super-marginal investments will become submarginal and will be passed over. The lost net benefits are borne by the State in the form of reduced Economic Rents, and by all citizens in the form of resource waste.

Fourth, further experiment with profit share bidding is not needed. Instead of engaging in such wasteful bidding practices, researchers from the State of Alaska can easily examine the Long Beach record. In that case the profit share bid for the largest operating interest amounted to 94.56% of accounting profit being paid to the State. While this may sound good for the lessor, the profit share retained by the lessee (after profit share payment to the State, after management fee, and after income taxes) is only 0.75%. In effect, there is no efficiency incentive.

As a substitute, the Department of Oil Properties of the City of Long Beach has developed a 50 person permanent staff to supervise and police the operators. Administrative interference with the operation of the field becomes a necessity. The Long Beach-Wilmington contract provides that

> The City Manager... shall exercise supervision and control of all day-to-day unit operations... and... shall make determinations and grant approvals in writing as he may deem appropriate for the supervision and direction of day-to-day operations of the Field Contractor, and the Field Contractor shall be bound by and shall perform in accordance with such determination....

A spokesman for one operator has stated that "Hassle after hassle has developed regarding charges to the net profits account."[2] All of the problems outlined above can be verified in the Long Beach situation including the "gold-plating" problem.

In summary, while profit share bidding avoids some of the problems present in both bonus bidding and royalty bidding, it has its own set of serious problems. Economic analysis clearly indicates that Economic Rents received by the State would be substantially lower under profit share bidding than under bonus bidding.

(4) Work Commitment Bidding.

Under this system the bidder would specify in detail precisely the dollar amount of investments he would make in exchange for a lease. Presumably this means that the bidder

---

[2] W. J. Mead, "Federal Public Lands Leasing Policies." Quarterly of Colorado School of Mines, October, 1969, p. 212.

would cost-out his entire exploration, development and production program.

The disadvantages of this system are overwhelming.

First, it is questionable whether the Commissioner and his staff will be in a position to determine the most efficient work program. If it selects any program other than the most efficient one, then Economic Rents are reduced as previously illustrated with reference to Figure 1.

Second, experience in North Sea work program bidding has shown that when it becomes known what type of work commitment is viewed with favor by the sale administrators, firms will concentrate their efforts and corresponding dollar amounts in that direction. In the early North Sea leases it became known that the bidder offering to drill the most holes would win the leases. The result was excessive drilling. But this practice reduced Economic Rents available to the British government.

There is no practical way the number of wells to be drilled can be specified in advance. The optimum number of wells to be drilled must be determined as experience in drilling a specific lease is gained. Similarly, other characteristics of a work program can best be determined after the presence or absence of reserves has been determined.

Third, if the winner is determined on the basis of the dollar amount of his work commitment, then the State sacrifices receipt of all or part of a cash bonus and receives in exchange only a work commitment. If bidder selection is

not based on the highest dollar amount of the work commitment, then there is no objective way in which the winner can be selected. This opens up a possibility of corruption of government officials.

Fourth, any work commitment must be policed. Administrators must carefully monitor all provisions of the work commitment to assure compliance. Consequently, adminstrative costs will be relatively high. Correspondingly, the lessee must maintain added staff in order to negotiate with government staff. Further, costing out the dollar value is an expensive process. If the State is to select the winner on the basis of the high dollar amount, then it must verify the costs claimed. All of this added administrative cost comes out of Economic Rents.

Fifth, a minor amount of specific work programs can be accomplished by a bonus bidding arrangement or other bid forms without resorting to a work commitment program. This may be accomplished by simply writing into the contract specific requirements. In any event, specific work requirements such as environmental safeguards should be justified by evidence that their benefits exceed their costs. Unless they are economically justified, they are not part of necessary costs as shown in Figure 1. Economically unjustified environmental or other work requirements, in the long run, simply reduce Economic Rents available to the State.

There is no need for the State of Alaska to experiment with the work commitment bidding form. There is abundant experience in both British and Norwegian North Sea experience. This experience has been evaluated by Kenneth Dam.[3] Dam reported that "the discretionary system turns out to be a most expensive subsidy."

While most of the British experience has been under a discretionary system in which a work program has been specified, the British leased 15 blocks by competitive bonus bidding in 1971. If these blocks had been leased by the discretionary system, the British would have failed to receive 37 million pounds ($90 million) the total amount of the bonus bids. The only offsetting gain to the government would be the incremental value of the work program. However, it is probable that the operators would have engaged in an optimal work program without bidding a specified work commitment.

The work commitment bidding system is probably the most expensive in terms of lost Economic Rents. While House Bill No. 854 provides for a fixed cash bonus, or fixed royalty, or fixed sliding scale royalty, or fixed net profits share in addition to the work commitment, it is highly unlikely that fixed payments would have a value to the people of Alaska equal to a bonus bid in the absence of the work commitment.

---

[3] K. W. Dam, Oil Resources. Chicago: University of Chicago Press, 1976.

The work commitment option provision in the February 17, 1978 draft has been replaced by an exploration incentive credit system. This system has many of the same problems listed above. If 50% of the cost of drilling or exploratory work is to be deducted from payments to the State, then the after-payments and after-tax cost of drilling and exploratory work becomes cheap for the lessee. This leads to wasteful drilling and exploration. The people of Alaska pay the bill.

III. CONCLUSIONS

Economic analysis indicates that sealed bonus bidding without a fixed royalty is the most efficient system available and would, in the long run, maximize Economic Rents payable to Alaska.

Passage of House Bill No. 854 would appear to convert a reasonably effective bonus bidding system presently in use in Alaska, into a system which will virtually guarantee a loss of Economic Rents. This burden will be borne by the people in Alaska in terms of foregone money income, and by the entire nation in the form of inefficient use of scarce resources.

PACIFIC GAS AND ELECTRIC COMPANY AND
PACIFIC ALASKA LNG ON HB 854

My name is Norman Gorsuch and I am the registered representative for Southern California Gas Company, Pacific Gas and Electric Company and Pacific Alaska LNG. We are very seriously concerned about paragraph Z on page 11 of the proposed legislation. That paragraph would grant the State the right to purchase as much as all of the volume of gas produced from a lease issued by the State for in state use. Arguably, because of a possible ambiguity in the language, this right can be exercised subsequent to the execution of the lease contract without notice having been given prior to the lease sale.

Affiliates of these companies are now actively engaged in financing drilling for gas reserves by oil companies holding leases located in the Cook Inlet area. In addition, Pacific Gas and Electric Company is a partner in a lease recently acquired at the Lower Cook Inlet sale held by the Federal Government. To date, these companies have expended $35,000,000 in payments to producers to fund the drilling of gas wells in the Cook Inlet area. In addition, these companies plan to expend another $35,000.000 over the next few years in similar ventures.

Pacific Gas and Electric and Southern California

Gas Companies are the largest public gas supply utilities in Calfiornia. Together they have delivered as much as 5 billion cubic feet of gas per day in California to residential and commercial customers. A recent staff report by the California Public Utilities Commission found that both utilities should expedite the acquisition of future gas supplies in Alaska. The Public Utilities Commission Staff most particularly urged rapid pursuit by these companies of their Cook Inlet Liquified Natural Gas project. This project consists of a proposed facility in Kenai to liquify and ship 400 million cubic feet of gas per day to these companies in California. The capital investment in 1977 dollars projected for this facility and related pipelines is $850,000,000. This project will not require any State financing nor does the project require the State royalty gas in Cook Inlet to make it economically feasible. At the present time, these companies have under committment approximately 800 billion cubic feet of gas in the Cook Inlet area. They will need approximately 1.3 trillion cubic feet for the first phase of the project which would be for 200 million cubic feet of LNG per day with a total of approximately 3.6 trillion cubic feet for a 400 million cubic feet per day throughput. It is contemplated by both companies that all of these gas reserves will be found by an agressive gas drilling program in the Cook Inlet area. These companies are also committed to invite the gas distribution public utilities in the Cook

Inlet area to participate in any of these ventures if those companies so desire. A subsidiary of Alaska Interstate Company is currently participating in a prospect being drilled at Stump Lake.

Southern California Gas Company and Pacific Gas and Electric have plans to continue to explore for gas reserves in southern Alaska. Long range plans contemplate the purchase of gas discovered in southcentral Alaska and a committment of the gas to this and future LNG projects.

Paragraph Z would effectively frustrate the plans of these companies in several ways and adversly affect gas exploration and development in Southcentral Alaska, First, these companies are financing this exploration program to obtain guaranteed gas supplies. They would not benefit from the receipt of money from the State for the acquisition of the gas supplied from State leases. Furthermore, under a ruling by the California Public Utilities Commission, the gas consumers of these two companies pay in their gas rates the carrying charges on the capital investment required to fund this drilling in expectation of the gas coming to California. Second, this provision in future gas leases would effectively deny financing for this Cook Inlet project and other LNG ventures should they materialize as no lender will advance capital if the project is not assured of a gas supply. Third, this provision would

effectively frustrate certification by the Federal Energy Regulatory Commission of this project and any future gas projects simply because the applicant seeking a certificate from the Federal Energy Regulatory Commission could not guarantee a supply of gas so long as the State arguably has an option to purchase as much as all of it in all future leases. Fourth, if a well prospect after being drilled shows a low potential for oil but a high potential for gas, it is uneconomic for the oil producer to develop that gas field unless a public utility funds development costs for the purpose of acquiring the gas from the producer. Fifth, there is no economic incentive for oil producers and drilling companies to drill for gas in the Cook Inlet area and in southcentral Alaska generally because there is no market for such gas at this time.

The Cook Inlet LNG project proposed by these companies when constructed and in operation, will provide a self sustaining market for this gas and future LNG projects when completed would provide markets for future gas discoveries.

Sixth, the existence of this provision effectively encumbers the ability of any lessee to sell gas to anyone if the state could arguably come in and execute its purchase right at any time during the gas production phase. The lessee would in no way be able to finalize a sale of the gas from the lease.

Obviously, the funding of exploration gas wells in Alaska by these utilities adds to the proven gas reserves under state lands and increases future state supplies of royalty gas. It also increases future income to the state from its severance taxes, ad valorem oil and gas property taxes and income taxes.

We urge the deletion of paragraph Z of the bill as it relates to the state's gas purchase option.

At a minimum we urge the inclusion of language in paragraph Z similar to that contained in the House Resources Committee version of the bill which places an absolute percentage limitation on the amount of gas which can be purchased by the state pursuant to this provision and makes it clear that this option must be exercised or made known to the lease bidders no later than the date of the announcement of the lease sale. These provisions would eliminate the ambiguity which does now exist in the section and avoid any possible interpretation that this right would be exercised after the lease was issued and accepted by the lessees. In addition by placing an absolute percentage limitation on this right to purchase, companies can plan to receive at least the balance of the gas from a lease for purposes of bidding, financing and operations planning.

Introduced: 2/17/78
Referred; Resources and Finance

IN THE HOUSE

BY THE RULES COMMITTEE BY REQUEST OF THE GOVERNOR

HOUSE BILL NO. 854

IN THE LEGISLATURE OF THE STATE OF ALASKA

TENTH LEGISLATURE - SECOND SESSION

A BILL

For an Act entitled: "An Act relating to the leasing and exploration of state land for oil and gas development."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

Section 1. AS 38.05.180 is repealed and re-enacted to read:

Sec. 38.05.180. OIL AND GAS LEASING. (a) The legislature finds that

(1) the people of Alaska have an interest in the development of the state's oil and gas resources to

(A) maximize the economic recovery of the resources;

(B) minimize the exploitation of these natural resources in protection of the public interest;

(C) maximize competition among parties seeking to explore and develop the resources;

(D) maximize use of Alaska's human resources in the development of the resources;

AGO 546830

SUGGESTED REVISION OF HOUSE BILL NO. 854

NOTE: Suggestions to language are underlined in draft below, which also contains unchanged sections from original bill (at left). Although we reproduce many unchanged sections from the original bill below without specific suggestions, it should be understood that this does not constitute an endorsement of the language or the concepts involved, as we discuss many problems generally in the commentary preceding this addendum. We reproduce these sections only to facilitate reading of the language and comparing it to the original. In some cases we will note a specific deletion from the original bill, which is intended to draw the reader's attention to a specific problem with the original section.

Section 1. AS 38.05.180 is repealed and re-enacted to read:

Sec. 38.05.180. OIL AND GAS LEASING. (a) For the purpose of establishing the basic policy of the state for the development of its oil and gas resources the legislature finds that

(1) the people of Alaska have an interest in the development of the state's oil and gas resources to

(A) maximize the recovery of Alaska's resources consistent with the economic and energy needs of Alaska and the rest of the United States;

(B) encourage prompt exploration and competition among parties seeking to explore and develop the resources;

(C) maximize use of Alaska's human resources in the development of the resources;

(2) it is in the best interests of the state to encourage an assessment of its oil and gas resources and to allow the maximum flexibility in the methods of issuing leases to

(A) recognize the many varied geographical regions of the state and the different costs of exploring for oil and gas in these regions;

(B) recognize the need for stimulating development in particular regions of the state;

(C) minimize the adverse impact of exploration, development, production, and transportation activity on the environment of the state;

(D) maximize state revenue from profitable oil and gas production, while minimizing revenue from unsuccessful exploration and from marginal economic oil and gas production.

(b) The commissioner shall prepare, review, revise, and maintain an oil and gas leasing program as follows:

(2) it is in the best interests of the state to allow flexibility in the methods of issuing leases, where consistent with the findings stated in (1) above, and to encourage industry to assess, explore, develop and produce those areas of state lands which are likely to contain significant oil and gas resources and which are found to be compatible with such activity, in accordance with a publicly reviewed leasing program so structured as to permit all interested parties to rely on its consistent implementation once formulated and adopted. Such plan shall:

(A) recognize the many varied geographical regions of the state and the different potential in such areas with respect to environmental values, oil and gas potentials, exploration and development costs, and economic needs of these areas and balance these competing values as nearly as possible in the best interest of the state.

(B) maximize state revenue potential from areas which appear to offer the possibility of profitable oil and gas development.

(b) The commissioner shall prepare, review, revise, and maintain an oil and gas leasing program consistent with the above findings as follows:

AGO 546831

(1) The leasing program shall be submitted to the legislature for its information within 10 days after the convening of each regular session of the legislature. The leasing program must indicate as precisely as practicable the size, timing, and location of leasing activity which the commissioner determines will best meet state needs for the following five-year period. The commissioner shall establish the timing and location of leasing, tothe maximum extent practicable, so as to obtain a balance between the potential for environmental damage, the potential for the discovery of oil and gas and the potential for adverse impact on the local communities in the state.

(2) After the leasing program has been prepared by the commissioner, a lease shall be issued if it is for an area included in the leasing program; however, leasing may continue until January 1, 1980 or until a program is prepared, whichever is sooner, and leasing under (t) of this section may be excepted from the leasing program if the commissioner finds it to be in the best interest of the state.

(3) The commissioner shall review the leasing program at least once each year, at which time he may revise and reapprove the program.

(4) The commissioner shall, by regulation, establish procedures for

(1) The status of the current leasing program shall be reported to the to the legislature for its information within 10 days after the convening of each regular session of the legislature. The leasing program must indicate as precisely as practicable the size, timing, and location of leasing activity which the commissioner determines will best meet state needs for the following five-year period. The commissioner shall establish the timing and location of leasing, to the maximum extent practicable, so as to obtain a balance between the potential for environmental damage, the potential for the discovery of oil and gas and the potential for adverse impact on the local communities in the state.

(2) The commissioner may lease lands for oil and gas development until July 1, 1980 or until a program is prepared and adopted by him, whichever is sooner.

(3) The commissioner shall establish the conditions and stipulations under which each tract in a sale area may be leased and prepare sample lease documents as required. No lease stipulation or condition may be subsequently altered except upon a finding by the commissioner that the change is required for substantial and significant reasons and that without the change the state's interests would be materially and adversely affected. The commissioner shall. by regulation, establish procedures for

AGO 546832

(A) receipt and consideration of nominations for any area to be offered for lease or to be excluded from leasing;

(B) public notice of and participation in development of the leasing program;

(C) review by federal and local government agencies which may be affected by the proposed leasing;

(D) consultation with local governments, oil and gas lesssees and permittees, and others engaged in activity on state land;

(E) coordination of the program with the management program developed under the Coastal Zone Management Act of 1972; and

(F) the use of the capabilities and resources of all state agencies in preparation of the leasing program, and for the provision by agencies to the commissioner of any nonproprietary information he requests.

(5) At the time the commissioner submits the leasing program to the legislature, as required by (1) of this subsection, he shall also submit to the legislature for its information, a report concerning the use of the various leasing methods provided for in (c) of this section. The report must include:

(A) receipt and consideration of nominations for any area to be offered for lease or to be excluded from leasing;

(B) public notice of and participation in development of the leasing program and the form of the lease for each sale.

(C) review by appropriate federal and local government agencies which may be affected by the proposed lease sale;

(D) consultation with affected local governments, oil and gas lessees and permittees, and others engaged in activity on state land;

(E) coordination of the program with the management program developed under the Coastal Zone Management Act of 1972; and

(F) the use of the capabilities and resources of all state agencies in preparation of the leasing program, and for the provision by agencies to the commissioner of any nonproprietary information he requests;

(G) any other matters required by law for the disposition of oil and gas rights on state lands.

(4) At the time the commissioner reports the status of the current leasing program to the legislature, as required by (1) of this subsection, he shall also report to the legislature the use of the various leasing methods provided for in (c) of this section. The report must include:

HOUSE BILL 854

(A) the schedule of all lease sales held during the preceeding calendar year and the bidding method or methods utilized;

(B) the schedule of all lease sales to be held the following year and the bidding method or methods to be used;

(C) the benefits and costs associated with conducting lease sales using the various bidding methods;

(D) the reasons why a particular bidding method was selected; and

(E) if applicable, the reason why more than 50 per cent of the area leased in the upcoming year was or is to be leased under one particular bidding method.

SUGGESTED REVISION OF HOUSE BILL 854

(A) the schedule of all lease sales held during the preceeding five calendar years and the bidding method or methods utilized;

(B) the schedule of all lease sales to be held during the balance of the current leasing program and the bidding method or methods to be used, if determined;

(C) the benefits and costs associated with conducting lease sales using the various bidding methods;

(D) the reasons why a particular bidding method was selected;

(E) deleted

AGO 546834

(c) The commissioner may issue oil and gas leases on state land to the highest responsible qualified bidder determined by competitive bidding under regulations adopted by the commissioner. Bidding may be by sealed bid or according to any other bidding procedure the commissioner determines is in the best interests of the state. Whenever, under any of the leasing methods listed in this subsection, a royalty share is reserved to the state, it is free of all lease or unit expenses, including but not limited to separation, cleaning, dehydration, gathering, salt water disposal, and preparation for transportation off the lease or unit area. Following a pre-sale analysis, the commissioner may choose at least one of the following leasing methods:

(c) The commissioner may issue oil and gas leases on state land to the highest responsible qualified bidder determined by competitive bidding under regulations adopted by the commissioner. Bidding may be by sealed bid or according to any other bidding procedure the commissioner determines is in the best interest of the state and insures fairness to all participants. Whenever, under any of the leasing methods listed in this subsection, a royalty share is reserved to the state, it is free of all lease or unit expenses, including but not limited to separation, cleaning, dehydration, gathering, salt water disposal, and preparation for transportation off the lease or unit area. Following a pre-sale analysis, conducted under regulations required by (3), the commissioner may choose one or more of the following leasing methods or adopt any other method consistent with the legislative findings in (a)(1) which insures basic fairness to all responsible qualified bidders, but if a system other than bonus bidding is to be used, the commissioner must find that (i) bonus bidding will not achieve the best interests of the state and (ii) his (her) selected method will.

AGO 546835

(1) bonus bidding

(A) a cash bonus bid with a fixed royalty share reserved to the state of not less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease;

(B) a cash bonus bid with a fixed royalty share reserved to the state based on a sliding scale according to volume of production but in no event less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease;

(2) royalty bidding

(A) a fixed cash bonus with a royalty share reserved to the state as the bid variable but not less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease;

(B) a fixed cash bonus with a royalty share reserved to to the state based on a sliding scale according to the volume of production as the bid variable but not less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease;

(1) bonus bidding

(A) a cash bonus bid with a fixed royalty share reserved to the state of not less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease;

(B) a cash bonus bid with a fixed royalty share reserved to the state based on a sliding scale according to volume of production but in no event less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease;

(2) royalty bidding

(A) a fixed cash bonus with a royalty share reserved to the state as the bid variable but not less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease;

(B) a fixed cash bonus with a royalty share reserved to the state based on a sliding scale according to the volume of production as the bid variable but not less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease;

AGO 546836

(3) net profit bidding

(A) a cash bonus bid with a fixed royalty share reserved to the state of not less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease and a fixed share or the net profit derived from the lease of not less than 30 per cent reserved to the state;

(B) a fixed cash bonus with the share of the net profit derived from the lease reserved to the state as the bid variable;

(C) a fixed cash bonus with a fixed royalty share reserved to the state of not less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease with the share of the net profit derived from the lease reserved to the state as the bid variable;

(D) the share of the net profit derived from a lease reserved to the state under this subsection is royalty sale proceeds for the purpose of the Alaska Permanent Fund under AS 37.10.065;

(4) a work commitment bid with a fixed cash bonus, or a fixed royalty or a fixed sliding scale royalty or a fixed net profits share reserved to the state, or any combination of these methods, at the discretion of the commissioner, with a work commitment stated in a dollar amount as the bid variable; however, in no event may a royalty share

(3) net profit bidding

(A) a cash bonus bid with a fixed royalty share reserved to the state of not less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease and a fixed share or the net profit derived from the lease of not less than 30 per cent reserved to the state;

(B) a fixed cash bonus with the share of the net profit derived from the lease reserved to the state as the bid variable;

(C) a fixed cash bonus with a fixed royalty share reserved to the state of not less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease with the share of the net profit derived from the lease reserved to the state as the bid variable;

(D) the share of the net profit derived from a lease reserved to the state under this subsection is royalty sale proceeds for the purpose of the Alaska Permanent Fund under AS 37.10.065;

(4) a work commitment bid with a fixed cash bonus, or a fixed royalty or a fixed sliding scale royalty or a fixed net profits share reserved to the state, or any combination of these methods, at the discretion of the commissioner, with a work commitment stated in a dollar amount as the bid variable; however, in no event may a royalty share

AGO 546837

reserved to the state be less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease.

(d) To prolong the economical life of an oil and gas field, the commissioner shall adopt regulations for all bidding methods to allow reduction of royalty to compensate for increasing costs in the later stages of production decline. The commissioner may grant such a reduction of royalty so long as the reduced royalty begins nc sooner than two years after initial production from the lease.

(e) The commissioner may, in his discretion, defer any part of the payment of a cash bonus, under (c) of this section, according to a schedule announced at the time of the announcement of the lease sale, but such payment shall be made in total no later than five years from the date of the lease sale.

reserved to the state be less than 12 1/2 per cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease.

(d) To prolong the economic life of an oil and gas field, the commissioner shall adopt regulations for all bidding methods to allow reduction of royalty of leases within the field to compensate for increasing costs in the later stages of production decline. The commissioner may not grant such a reduction of royalty until two years' initial production from the field has occurred and each lessee requesting the reduction has made a clear showing that the revenue from all hydrocarbons produced from the field is insufficient to produce a reasonable rate of return with respect to that lessee's total investment therein.

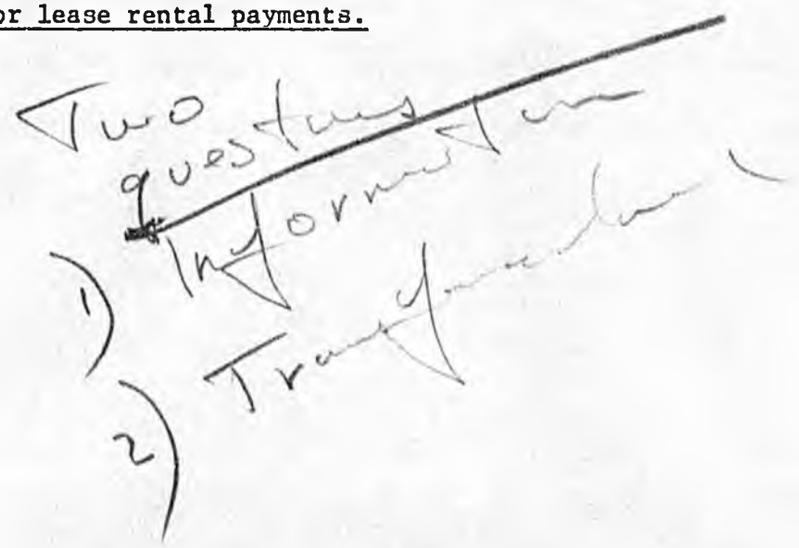
(e) Deleted

AGO 546838

(f) The commissioner may withhold acreage from leasing in a particular lease sale.

Deleted

(f) The commissioner may provide for the establishment of a drilling incentive credit system whereby all exploratory wells will earn credit based on the footage drilled and the region in which the well is sited. The credit formula used shall provide to the company drilling the well credits equal to no more than one half of the cost of the well. Such credits can be used for a bid in the state lease sale, or for royalty payments or lease rental payments.



AGO 546839

HOUSE BILL 854

(g) The commissioner shall adopt regulations governing the calculation of net profits for lease sales under (c)(3) of this section. In the event of any dispute between the state and a lessee concerning the calculation of the net profits under the regulation adopted under this subsection, the burden of proof is on the lessee.

(h) The commissioner shall adopt regulations governing the exploration work commitment leasing method under (c)(4) of this section. The commissioner shall require either (i) a cash deposit for 20 per cent of the work commitment or, (ii) a performance bond, in form and substance and with a surety satisfactory to the commissioner, in the principal amount of 20 per cent of the exploration work commitment assuring the commissioner that the commitment will be faithfully discharged in accordance with this section, the regulations, and the lease. A lessee who fails to discharge a work commitment in its entirety is liable to the state for the undischarged portion of the commitment. At his discretion, the commissioner may terminate the work committment if he finds that the work would be unnecessary or cumulative.

SUGGESTED REVISION OF HOUSE BILL NO. 854

(g) The commissioner shall define all terms and adopt all regulations necessary for a reasonable understanding and evaluation of a particular bidding method prior to the public announcement of the terms of proposed sale employing that method.

(h) Deleted.

AGO 546840

(i) At his discretion, the commissioner may enter into an agreement whereby, with the consent of the lessee, the state's royalty share of oil and gas production may be stored or retained in storage by the lessee, or the commissioner may enter into an agreement with one or more of the affected field lease holders to trade current royalty production from a field for a like amount, kind, and quality of future production, on the condition that the state receives back its stored or traded royalty share during the first half of the estimated field life or no later than 15 years after start of production, whichever is sooner.

(i) At his discretion, the commissioner may enter into an agreement whereby, with the consent of the lessee, the state's royalty share of oil and gas production may be stored or retained in storage by the lessee, or the commissioner may enter into an agreement with one or more of the affected field lease holders to trade current royalty production from a field for a like amount, kind, and quality of future production, on the condition that the state receives back its stored or traded royalty share during the first half of the estimated field life or no later than 15 years after start of production, whichever is sooner.

HOUSE BILL 854

(j) An oil and gas lease must cover a reasonably compact area not exceeding 5,760 acres, and must be for a period of five years. The commissioner may grant a lease for a term greater than five years but not to exceed 10 years, where he finds that the longer period is necessary to encourage exploration and development in areas where environmental condiditons severly restrict operations. An oil and gas lease shall be automatically renewed if and for so long thereafter as oil or gas is produced in paying quantities from the lease or, if the lease is committed to a unit approved by the commissioner. A lease issued under this section covering land on which there is a well capable of producing oil or gas in paying quantities does not expire because the lessee fails to produce oil or gas unless the lessee is allowed reasonable time to place the well on a producing status. Upon renewal, the commissioner may increase lease rentals so long as the increased rental rate does not exceed 150 per cent of the rate of the preceding year. The commissioner may provide by regulation and in the lease that the lessee may earn production rights only to the depth drilled at the beginning of production from the lease. If drilling has commenced on the expiration date of the primary term of the lease and is continued with reasonable diligence, including such operations as redrilling, sidetracking, or other means necessary to reach the originally proposed bottom hole location, the lease continues in effect until 90 days after drilling has ceased and for so long thereafter as oil or gas is pro-

AGO 546842

SUGGESTED REVISION OF HOUSE BILL NO. 854

(h) An oil and gas lease must cover a reasonably compact area not exceeding 5,760 acres, unless tract size in adjacent lands, economic or geological factors relating to that locality require a larger area, and must have a term of ten years. The commissioner may grant a lease for a term less than ten years, but not less than five years, and only where the commissioner finds that environmental and economic conditions do not severely restrict operations. An oil and gas lease shall be automatically renewed if and for so long thereafter as oil or gas is produced in paying quantities from the lease or, if the lease is committed to a unit approved by the commissioner. A lease issued under this section covering land on which there is a well capable of producing oil or gas in paying quantities does not expire because the lessee fails to produce oil or gas unless the lessee is allowed reasonable time to place the well on a producing status. Upon renewal, the commissioner may increase lease rentals so long as the increased rental rate does not exceed 150 per cent of the rate for the preceding year. If drilling has commenced on the expiration date of the primary term of the lease and is continued with reasonable diligence, taking into account the limitations imposed on dirlling operations by Alaskan environmental conditions and including such operations as redrilling, sidetracking, or other means necessary to reach the originally proposed bottom hole location, the lease shall continue in effect until 90 days after drilling has ceased and for so long thereafter as there is a well thereon capable of producing oil or gas in paying quantities.

HOUSE BILL 854

(k) The commissioner may establish by regulation that after a well has been plugged and abandoned, the rental rate which was in effect during the year of abandonment is maintained for the remainder of the term. Rental is payable in advance and continues until income to the state from royalty, net profit, or exploration work commitment exceeds rental income to the state for that year; after the rental income schedule has been exceeded for three consecutive years, the rental terminates. Oil and gas leases shall provide for payment to the state of rental on the following basis:

(1) for the first year, $1.00 per acre;

(2) for the second year, $1.50 per acre;

(3) for the third year, $2.00 per acre;

(4) for the fourth year, $2.50 per acre;

(5) for the fifth year, $3.00 per acre;

SUGGESTED REVISION OF HOUSE BILL NO. 854

(i) The commissioner may establish by regulation that after a well has been plugged and abandoned, the rental rate which was in effect during the year of abandonment is maintained for the remainder of the term. Rental is payable in advance and continues until income to the state from royalty, net profit, or exploration work commitment exceeds rental income to the state for that year; after the rental income schedule has been exceeded for three consecutive years, the rental terminates. Oil and gas leases shall provide for payment to the state of rental on the following basis:

(1) for the first year, $1.00 per acre;

(2) for the second year, $1.50 per acre;

(3) for the third year, $2.00 per acre;

(4) for the fourth year, $2.50 per acre;

(5) for the fifth year, $3.00 per acre;

AGO 546843

(l) Upon timely application as provided by regulation, the state may issue to the holder of a federal or private lease, a state shorelands lease covering land within the exterior boundaries of the federal or private lease which has been excluded on the basis of navigability or which is later administratively or judicially determined to be shoreland. The term of such a state shoreland lease shall be the same as the term of the federal or private lease, but may not exceed five years.

(j) Upon timely application as provided by regulation, the state may issue to the holder of a federal or private lease, a state shorelands lease covering land within the exterior boundaries of the federal or private lease which has been excluded on the basis of navigability or which is later administratively or judicially determined to be shoreland. The term of such a state shoreland lease shall be the same as the term of the federal or private lease.

HOUSE BILL 854

(m) To conserve the natural resources of all or a part of an oil or gas pool, field, or like area, whether or not the part is then subject to a cooperative or unit plan of development or operation, lessees and their representatives may unite with each other, or jointly or separately with others, in collectively adopting or operating under a cooperative or a unit plan of development or operation of the pool, field, or like area, or a part of it, when determined and certified by the commissioner to be necessary or advisable in the public interest. The commissioner may, with the consent of the holders of leases involved, establish, change, or revoke drilling, producing, rental minimum royalty, and royalty requirements of the leases and adopt regulations with reference to the leases, with like consent on the part of the lessees, in connection with the institution and operation of a cooperative or unit plan as he determines necessary or proper to secure the proper protection of the public interest. The commissioner may require oil and gas leases issued under this section to contain a provision requiring the lessee to operate under a reasonable cooperative or unit plan, and he may prescribe a plan under which the lessee must operate. The plan must adequately protect all parties in interest, including the state.

SUGGESTED REVISION OF HOUSE BILL NO. 854

(k) To promote the most efficient development of the natural resources of all or part of an oil or gas pool, field, or like area, whether or not the part is then subject to a cooperative or unit plan of development or operation, lessees and their representatives may unite with each other, or jointly or separately with others, in collectively adopting or operating under a cooperative or a unit plan of development or operation of the pool, field, or like area, or a part of it, when determined and certified by the commissioner to be necessary or advisable in the public interest. The commissioner may, with the consent of the holders of leases involved, establish, change, or revoke drilling, producing, rental minimum royalty, and royalty requirements of the leases and adopt regulations with reference to the leases with like consent on the part of the lessees, in connection with the institution and operation of a cooperative or unit plan as he determines necessary or proper to secure the proper protection of the public interest. The commissioner may require oil and gas leases issued under this section to contain a provision requiring the lessee to operate under a reasonable cooperative or unit plan, and he may prescribe a plan under which the lessee must operate. The plan must adequately protect all parties in interest, including the state.

AGO 546845

(n) A plan authorized by (m) of this section, which includes land owned by the state, may contain a provision vesting the commissioner, or a person committee, or state agency with authority to modify from time to time the rate of prospecting and development and the quantity and rate of production under the plan. All leases operated under a plan approved or prescribed by the commissioner are excepted in determining holdings or control under sec. 140 of this chapter. The provisions of this section concerning cooperative or unit plans are in addition to, and do not affect AS 31.05.

(o) Producing acreage on a known geologic structure of a producing oil or gas field is excluded from chargeability as against the acreage limitation provisions of sec. 140 of this chapter.

(l) A plan authorized by (j) of this section, which includes land owned by the state, may contain a provision vesting the commissioner, or a person, committee, or state agency with authority to modify from time to time the rate of prospecting and development and the quantity and rate of production under the plan. All leases operated under a plan approved or prescribed by the commissioner are excepted in determining holdings or control under sec. 140 of this chapter. The provisions of this section concerning cooperative or unit plans are in addition to, and are subject to the state's authority to prohibit waste of oil and gas in AS 31.05.

(m) Producing acreage on a known geologic structure of a producing oil or gas field is excluded from chargeability as against the acreage limitation provisions of sec. 140 of this chapter.

HOUSE BILL 854

(p) When separate tracts cannot be individually developed and operated in conformity with an established well-spacing or development program, a lease, or a portion of a lease, may be pooled with other land, whether or not owned by the state, under a communitization or drilling agreement providing for an apportionment of production or royalties among the separate tracts of land comprising the drilling or spacing unit when determined by the commissioner to be in the public interest. Operations or production under the agreement are considered as operations or production as to each lease committed to the agreement.

(q) The commissioner may, on conditions which he prescribes, approve drilling, or development contracts made by one or more lessees of oil or gas leases, with one or more persons, when, in his discretion, the conservation of natural resources or the public convenience or necessity requires it or the interests of the state are best served. All leases operated under approved drilling or development contracts, and interests under them, are excepted in determining holding or control under sec. 140 of this chapter. Drilling or development contracts may include, at the discretion of the commissioner, provisions authorizing the state to share in the costs of exploration.

AGO 546847

SUGGESTED REVISION OF HOUSE BILL NO. 854

(n) When separate tracts cannot be indivudually developed and operated in conformity with an established well-spacing or development program, a lease, or a portion of a lease, may be pooled with other land, whether or not owned by the state, under a communitization or drilling agreement providing for a apportionment of production or royalties among the separate tracts of land comprising the drilling or spacing unit when determined by the commissioner to be in the public interest. Operations or production under the agreement are considered as operations or production as to each lease committed to the agreement.

(o) The commissioner may, on conditions which he prescribes, approve drilling, or development contracts made by one or more lessees of oil or gas leases, with one or more persons, when, in his discretion, the conservation of natural resources or the public convenience or necessity requires it or the interests of the state are best served. All leases operated under approved drilling or development contracts, and interests under them are excepted in determining holding or control under sec. 140 of this chapter. Drilling or development contracts may include, at the discretion of the commissioner, provisions authorizing the state to share in the costs of exploration.

HOUSE BILL 854

(r) To avoid waste or to promote conservation of natural resources, the commissioner may authorize the subsurface storage of oil or gas whether or not produced from state land, in land leased or subject to lease under this section. This authorization may provide for the payment of a storage fee or rental on the stored oil or gas, or instead of the fee or rental, for a royalty other than that prescribed in the lease when the stored oil or gas is produced in conjunction with oil or gas not previously produced in paying quantities.

(s) Each oil or gas lease issued by the state must contain a provision requiring the lessee to furnish the Department of Labor a quarterly report regarding the employment of state residents on the leased property. The commissioner of labor shall adopt regulations necessary to implement this subsection. No lease issued under this chapter is valid unless it contains provisions requiring the employment of qualified Alaska residents in accordance with AS 38.40.030, and complies in all respects with the requirements of ch. 40 of this title.

SUGGESTED REVISION OF HOUSE BILL NO. 854

(p) To promote conservation of natural resources, the commissioner may authorize the subsurface storage of oil or gas whether or not produced from state land, in land leased or subject to lease under this section. This authorization may provide for the payment of a storage fee or rental on the stored oil or gas, or, instead of the fee or rental, for a royalty other than that prescribed in the lease when the stored oil or gas is produced in conjunction with oil or gas not previously produced in paying quantities.

(q) Each oil or gas lease issued by the state must contain a provision requiring the lessee to furnish the Department of Labor a quarterly report regarding the employment of state residents on the leased property. The commissioner of labor shall adopt regulations necessary to implement this subsection. No lease issued under this chapter is valid unless it contains provisions requiring the employment of qualified Alaska residents in accordance with AS 38.40.030, and complies in all respects with the requirements of ch. 40 of this title.

AGO 546848

HOUSE BILL 854

(t) Notwithstanding any other provision of this section, land which has been offered for lease within the previous five years but which received no bids at competitive sale may be, at the discretion of the commissioner, immediately offered for lease, under regulations adopted by him, upon terms appearing most advantageous to the state, including leasing non-competitively. The commissioner shall use a sliding scale royalty based upon such formulae as he determines to be in the public interest but not less than 12 1/2 per cent at the beginning of production from the lease in amount or value of the production removed or sold from the lease or unit area encompassing the lease. A lease must provide for payment to the state of rental but need not adhere to the rental schedule in (k) of this section nor to the 5,760-acres-per-lease limitation in (j) of this section. The lease term may not exceed five years except as provided in (j) and (k).

AGO 546849

SUGGESTED REVISION OF HOUSE BILL NO. 854

(t) Notwithstanding any other provision of this section, land which has been offered for lease within the previous five years but which received no bids at competitive sale may be, at the discretion of the commissioner, immediately offered for lease, under regulations adopted by him, upon terms appearing most advantageous to the state, including leasing non-competitively. The commissioner shall use a sliding scale royalty based upon such formulae as he determines to be in the public interest but not less than 12 1/2 per cent at the beginning of production from the lease in amount or value of the production removed or sold from the lease or unit area encompassing the lease. A lease must provide for payment to the state of rental but need not adhere to the rental schedule in (k) of this section nor to the 5,760-acres-per-lease limitation in (j) of this section. The lease terms may not exceed five years except as provided in (j) and (k).

HOUSE BILL 854

*Sec. 2. AS 38.05.135(b) is repealed and re-enacted to read:

(b) When minerals are to be leased, in addition to any other notice given, notice must also be given as provided in secs. 305 and 345 of this chapter.

*Sec. 3. AS 38.05.140(c) is amended to read:

(c) No person may take or hold at one time phosphate leases on state lands exceeding the aggregate 10,240 acres. No person may take or hold sodium leases or permits for up to 15,360 acres. No person may take or hold at any one time oil or gas leases exceeding in the aggregate 200,000 (500,000) acres granted on tide and submerged lands, and 400,000 acres on all land (LANDS) other than tide and submerged land (LANDS), including leases held both as lessee and under option or operating agreement from others. A person has five years from the effective date of this Act to conform to the 200,000-acre upland limitation. Where more than a single person holds an interest in an oil or gas lease, each person shall be charged only with that percentage of the total acreage which corresponds to its percentage share of the total beneficial interest in the lease.

*Sec. 4. AS 38.05.145(b) is repealed.

SUGGESTED REVISION OF HOUSE BILL NO. 854

*Sec. 2. AS 38.05.135(b) is repealed and re-enacted to read:

(b) When minerals are to be leased, in addition to any other notice given, notice must also be given as provided in secs. 305 and 345 of this chapter.

*Sec. 3. AS 38.05.140(c) is amended to read:

(c) No person may take or hold at one time phosphate leases on state lands exceeding the aggregate 10,240 acres. No person may take or hold sodium leases on state lands, exceeding in the aggregate acreage 5,120 acres, except that the commissioner may, where it is necessary in order to secure the economic mining of sodium compounds, permit a person to take or hold sodium leases or permits for up to 15,360 acres. No person may take or hold at any one time oil or gas leases exceeding in the aggregate 500,000 acres granted on tide and submerged lands, and 400,000 acres on all land (LANDS) other than tide and submerged land (LANDS), including leases held both as lessee and under option or operating agreement from others. Where more than a single person holds an interest in an oil or gas lease, each person shall be charged only with that percentage of the total acreage which corresponds to its percentage share of the total beneficial interest in the lease.

*Sec. 4. AS 38.05.145(b) is repealed.

AGO 546850

(u) The commissioner may, by regulation, restrict joint bidding by major or multi-national oil and gas companies to encourage competition.

(v) The State has the right to purchase not more than 16 2/3 per cent of the volume of oil and up to 100 per cent of the volume of gas produced from a lease issued in accordance with this section, at the regulated price, or, if no regulated price applies, at the fair market value at the point of sale, except that any oil or gas obtained by the state as royalty or net profits shall be credited against the amount that may be purchased under this subsection. Oil and gas purchased under this section may be used by the state in the same manner as it uses its royalty oil and gas.

(w) A lessee or permittee conducting any exploration for, or development or production of, oil or gas on state land shall provide the commissioner access to all data obtained from that activity and shall provide copies of specific data, as the commissioner may request.

(delete)

(r) The commissioner may reserve the right to purchase not more than 16 2/3 per cent of the volume of oil and gas produced from a lease issued in accordance with this section, at the regulated price, or, if no regulated price applies, at the fair market value at the point of sale, except that any oil or gas obtained by the state as royalty or net profits shall be credited against the amount that may be purchased under this subsection. Oil and gas purchased under this section may be used by the state in the same manner as it uses its royalty oil and gas.

(s) A lessee or permittee conducting any exploration for, or development or production of, oil or gas on state leases shall provide the commissioner access to all <u>noninterpretive</u> data obtained from that activity and shall provide copies of specific <u>noninterpretive</u> data, as the commissioner may request. <u>Such data shall be held confidential by the commissioner upon request of the lessee or permittee as provided in AS 38.05.035. The commissioner shall, by regulation, establish procedures for each office where such data is filed governing access to and the safekeeping of the data.</u>

AGO 546851

How to Bid for Offshore Rights

Several systems have been proposed to replace the present "bonus-bid" method of assigning leases on offshore oil prospects to developers. Of these, Professor John W. Devanney III of M.I.T. opts for "percentage-of-excess-profits" bids (*see p. 42*). Other proposed arrangements include work obligation permits and various forms of royalty bidding.

The Work Obligation Permit Plan

Under the work obligation permit plan, developers would submit exploratory and provisional drilling plans for a given tract. The government would choose the developer with the most aggressive, best-considered plan, and the developer would then be responsible for agreed-upon amounts of royalties and/or lease rentals. Under this system, used currently by the Norwegians and the British in the North Sea, the great bulk of any economic rent would be transferred to the developer, and a portion of this rent would be returned to the public in the form of corporate income taxes. Of the possible methods reviewed here, this is clearly the most favorable to the developer.

Administering this method to maximize national income depends on the skill and honesty of administrators. There are temptations for prospective developers to submit work plans which represent over-development of the resource so they will be judged the most aggressive, and administrators will have to be wise enough to recognize such over-development and refuse it. The decisions to be made in choosing the "best" work plan are necessarily judgemental, and they are an open invitation to the influence of special interests and even to corruption.

But beyond the possibilities of incompetency or corruption which may result in loss of national income is the basic fact that most of the economic rent goes to the developer. Professor Devanney concludes that work obligation permitting is clearly not desirable, from a nondeveloper point of view. Indeed, as soon as it became clear that economic rent was associated with North Sea oil, the British and Norwegians moved away from this practice.

Royalty Bidding

Royalty bidding involves competitive bidding on a share of the actual gross revenues — generally a percentage of market value — associated with the resource. This method has long been used in state sales of rights, and the federal government experimented with it in the Gulf of Mexico in 1974.

Compared with bonus bidding, royalty bidding transfers some of the risk prior to exploratory drilling from the developer to the public. This helps maintain competition among bidders, for large amounts of up-front capital are not necessary, and the need for large bidding combines disappears.

However, there are other problems. While the method could theoretically give most of the revenues from offshore oil to the public, it could also reduce the total size of the offshore oil pie. This is because the royalty bid, unlike the bonus bid, affects the developer's marginal expenses. For instance, if a developer overestimates production from a certain tract, he will freeze himself into a royalty bid that makes it unprofitable for him to develop the smaller, and thus more expensive, oil find that is actually made. He will refuse to develop it, and the national income will suffer. This risk may especially affect secondary and tertiary production from a tract; such oil will be more expensive than primary oil but still less costly than foreign crude.

Proponents of royalty bidding offer two possible resolutions of this dilemma — re-leasing and renegotiation. The former proposes that if a developer decides not to produce a tract he must turn it back to the government, with all equipment intact, and the government may lease the tract anew, presumably to a different developer at a lower royalty. This would discourage expensive techniques to enhance oil recovery, because the original leaseholder may choose merely to take out the flush production before releasing a tract back to the government. This will be costly to the public, since processes for secondary and tertiary recovery of oil must begin early in a field's life to be most effective. There is also the possibility of excessive administrative costs associated with the negotiations necessary for re-leasing.

Advocates of renegotiation propose that if a developer feels he cannot develop a field at his bid royalty, he should be able to present his evidence to the regulatory body which should be empowered to grant him a decrease if it finds his presentation viable. The obvious problems here are in the regulatory body's verification of the developer's data. The capital-intensiveness of offshore oil makes any estimate extremely sensitive to the cost of capital, and that information is often confidential.

Other potential problems introduced by renegotiation include temptations for developers to "goldplate" a project since additional expenses could come off the royalty — i.e., out of the public's pocket. A developer might deliberately bid high initially in order to obtain a tract, anticipating that he will renegotiate later; and he might go through a whole series of renegotiations as his costs for enhanced recovery techniques begin to appear.

Some have suggested a compromise between bonus bidding and royalty bidding, in which developers would enter a "high" fixed royalty plus a bonus bid of up-front payments. This would decrease the size of bonus bids and aid competition, say its advocates. Unfortunately, this presents the same can of worms as straight royalty bidding.

Installment bonus bidding has also been suggested. This means a developer would pay his bonus in three installments — immediately, after three years, and after five years. He could surrender the lease before the last two payments if things failed to work out. But this presents the same pie-reducing problems as royalty bidding; if a developer originally bid $600 million and after exploratory drilling found oil worth only $350 million, he would abandon the tract rather than pay the final installments even though national income would be increased by $350 million if the find were developed.

There are advantages, however, in installment bonus bidding. There is an automatic re-leasing provision, which could assure that tracts were re-opened for development; and the marginal costs of the oil are not affected, which means that the developer has incentives to invest early in enhanced recovery.

However, the massive amounts of up-front money involved in even a one-third installment payment of a bonus bid will probably still frighten away many bidders. And many bidders would increase their total bonus bids considerably, knowing that they could thus avoid paying additional installments.

AGO 546913

ALBERTA, CANADA

Exploratory Drilling Incentive System

A report from Alberta Energy and Natural Resources states the exploratory drilling incentive principles adopted for wells spudded between Jan. 1, 1978 and March 31, 1981 were announced by the government last fall and will be defined in detail in the Exploratory Drilling Incentive Regulation, 1978 when it is issued in the near future.

This regulation, however, may not be available to industry prior to the commencement of the drilling activity it affects. Accordingly, the essential details respecting the forthcoming program are described herewith.

The department expects that the principles and details outlined here will be incorporated, without a change in meaning, into the 1978 Regulation. If, however, such a change does occur, the 1978 Regulation would, of course, take precedence.

(1) Commencement Date of the Forthcoming Program

As previously indicated, an incentive exploratory well in good standing will be

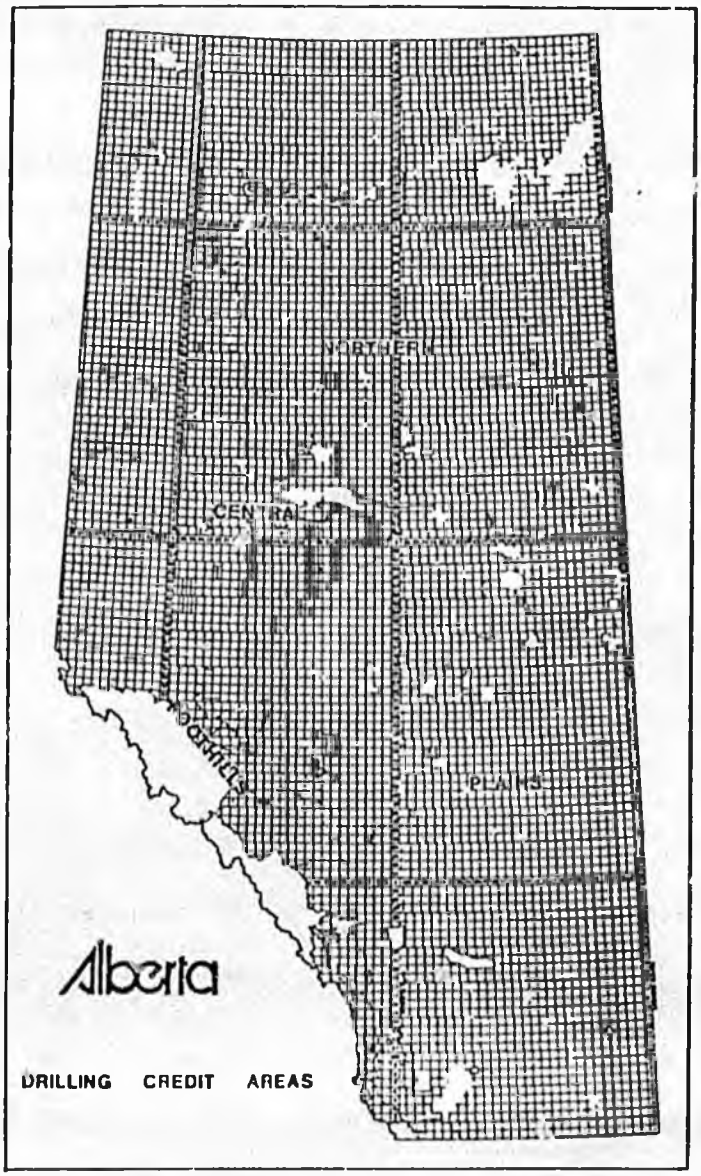

Figure 1

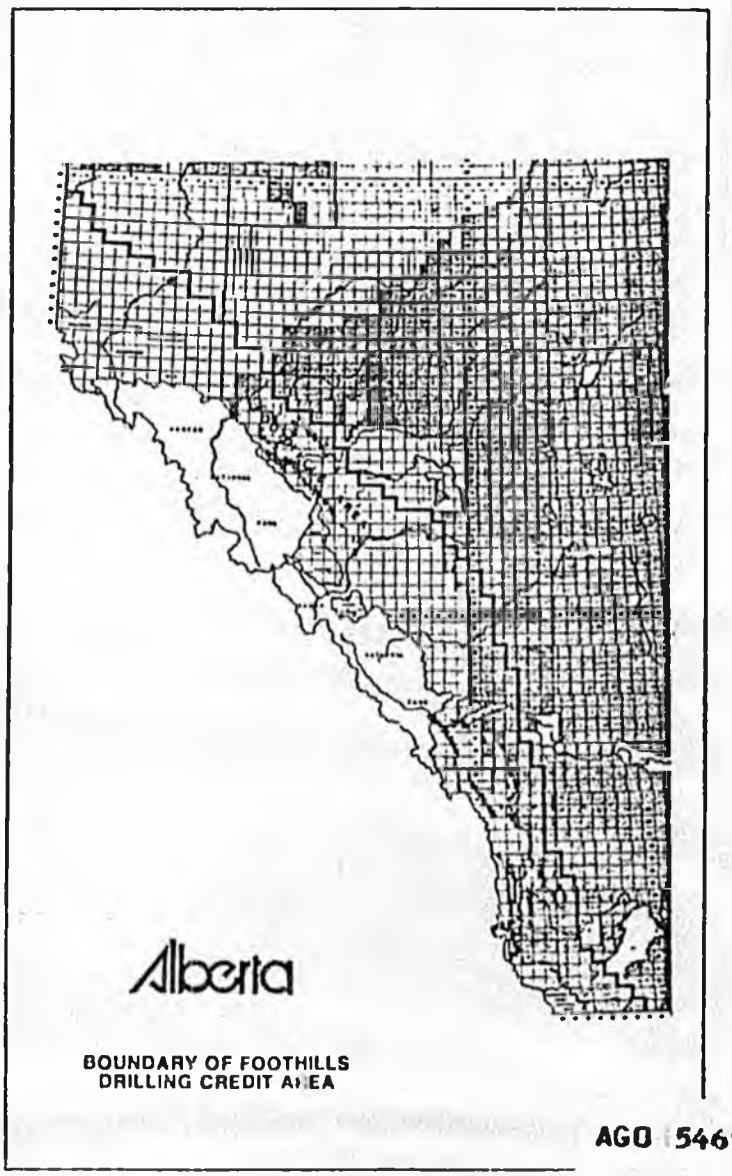

Figure 2

subject to the 1978 Regulation if it commences drilling on or after Jan. 1, 1978. This provision will not be affected if the licensing or certification date is before 1978.

(2) Drilling Credit Areas

Figure 1 shows the drilling credit areas as they will be defined under the 1978 Regulation. The Plains and Foothills Areas have not been changed. The subsisting Northern Area, however has been divided into the new Central and Northern Areas shown by the illustration. The boundary between the two new areas was defined by the Department on the basis of well cost data and topographic and access considerations.

Figure 2 is provided for the convenience of industry to depict the irregular eastern boundary of the Foothills Area. A similar map was issued by the Board in 1974.

(3) Drilling Credit Schedules

Drilling credits under the 1978 Regulation will be determined from Schedules F

SCHEDULE F

Applicable to the Class A Interval of an Incentive Exploratory Well that Commences Drilling on or after January 1, 1978

The Class A interval of an incentive exploratory well that commences drilling on or after January 1, 1978 shall be determined by the Board as the interval below the depth of 2,000 feet that

(i) has not been duplicated by a drilled and abandoned well within one and one-half miles.

(ii) occurs more than 500 feet below the base of the deepest accumulation of crude oil or natural gas that in the opinion of the Board has been penetrated by another well within three miles, and

(iii) occurs immediately below the base of the member or formation containing the deepest oil sands deposit that in the opinion of the Board may underlie the location of the said incentive exploratory well.

Where neither (ii) nor (iii) above applies, the Class A interval shall be determined from the depth of 2,000 feet to the total depth of the said incentive exploratory well.

	Basis for Credit Plains Area		Basis for Credit Central Area		Basis for Credit, Northern and Foothills Areas	
Depth, Feet	Cumulative Dollars	Incremental $/Foot	Cumulative Dollars	Incremental $/Foot	Cumulative Dollars	Incremental $/Foot
2,000	0	20	0	30	0	40
3,000	20,000	18	30,000	25	40,000	35
4,000	38,000	18	55,000	25	75,000	40

Figure 4

AGO 546916

and G *(Figures 3 and 4)*. The schedules reflect the government's decision to exclude the upper 2,000 feet from the forthcoming program, and to increase the credits for qualifying wells deeper than about 3,500 feet. For wells greater than 5,000 feet in depth, the increase is between approximately 25 and 45 percent, the difference being justified by the Department's comprehensive well cost study. An exception applies to the new Northern Area, for which credit increases at certain depths exceed 45 percent to correspond with Foothills credits.

(4) Royalty Exemptions

(4.1) Eligibility

Crude oil or gas production must originate from a Class A or Class B interval to qualify for a royalty exemption. Production from any source shallower than 2,000 feet will thus not qualify for royalty exemption under the 1978 Regulation. An exception to the foregoing exclusion is found under the following circumstances: If conventional crude oil is produced from a source shallower than 2,000 feet in the new Northern Area, and if the 2,000-foot interval would have qualified as Class A or Class B footage pursuant to the 1974 Regulations, the crude oil production will be eligible for the normal royalty exemption applicable to deeper production.

(4.2) Duration

The royalty exemptions authorized under the 1978 Regulation will apply to the initial 60 crude oil-producing months or the initial 12 gas-producing months at the well, commencing with the first month in which the crude oil or gas would otherwise be subject to royalty payment.

Additional details concerning these and other principles relating to the forthcoming program will be specified in the 1978 Regulation. If any questions arise after the 1978 Regulation is studied, they may be referred to J. R. Pow or F. Phillips of the Energy Resources Conservation Board, if they pertain to the certification of a well or the determination of its Class A or Class B interval, or to C. R. Smith or E. Saldanha of the Department, if they are concerned with establishing credit or granting royalty exemption. □

Work Commitment Bidding

GREGG K. ERICKSON

One result of the growing concern in the United States over energy matters has been an increased attention to public policies governing the development of Outer Continental Shelf (OCS) oil and gas resources. The institutional structure under which all such development has thus far taken place was established in 1953 by the Outer Continental Shelf Lands Act.[1] This unamended statute provides the Secretary of the Interior with authority to sell oil and gas leases to the public on the basis of cash or royalty bids offered at sealed bid auctions.

The practice of the United States government since the first such sale in 1954 has been to offer relatively small quantities of offshore acreage on an irregular basis, soliciting always cash rather than royalty rate bids. In recent years, the rate at which acreage has moved to market has been accelerating. However, the average per acre bonus received by the government has also increased, partially reflecting worldwide supply conditions. The fact that bids are received in sealed envelopes has resulted in the winning bid being two, three, or several times the amount of the next highest bid.

Among criticisms of present policy is the assertion that this method of lease allocation diverts undesirably large amounts of *front-end money* into the coffers of the government landowner, money that could, would, and should otherwise be used for development of the resource itself.[2] One possible remedy would involve implementation of the existing statutory authority to substitute royalty rate bids, with fixed and presumably low cash bonuses. The problems created by royalty bidding, principally the premature shutdown effect and the potential for speculator induced misallocation of leases, have been well discussed in the literature. More importantly, they are well understood by persons influencing both public and private mineral resource management policies.[3]

An alternative proposed remedy to this same perceived problem is less well understood. Based in part on the method of lease allocation used in the offshore areas of the United Kingdom, it would allocate exploitation rights to the firm that would commit itself to spending the greatest sum in developing the resource. Sealed bids would be solicited as under the present system, but instead of cash the bid variable would be the *work commitment*. Proponents of this system claim that it will divert money the government

AGO 546919

landowner would otherwise receive via bonuses into exploration and development expenditures.[4] These additional increments of expenditure, it is further suggested, will increase future production to such an extent that the government landowner will be able to recoup the foregone bonus income in the form of the consequentially increased royalty and tax revenue. Ancillary benefits in the form of employment, resource self-sufficiency, and improved trade balances are also sometimes claimed or alluded to.

To an economist these arguments may not seem too persuasive. Nevertheless, no one appears to have devoted much effort to analyzing the economic implications of such a system, and certainly not in a form that would be comprehensive to the noneconomist policy maker.[5] This is unfortunate not only because of the substantial public and private interests involved; the system has significant implications for minerals other than petroleum and in places other than the United States OCS. The purpose here is to provide such an analysis.

EVALUATION OF WORK COMMITMENT BIDDING

In evaluating something new the first step is usually to establish a standard against which it can be measured. In this context, the system of competitive cash bidding has long attracted economists concerned with the problem of natural resource allocation, not only as an ideal against which the performance of other systems might be measured, but as a practical and proven technique for bringing resources into productive employment.

Under an idealized competitive cash bidding arrangement, bidders determine the amount they can afford to offer for a mineral lease by a very simple process: they subtract their expected costs of extraction from their expected revenues. The resulting residual is the maximum the prospective bidder can offer for the tract without buying himself an expected loss. Competition, of course, implies that multiple firms will be preparing bids on each tract.

Assuming no uncertainty about the amount of oil to be found or the price that oil will eventually bring, and disregarding the time value of money, the firm with the lowest expected costs of extraction will be capable of submitting the highest, and thus the winning, bid. This is good from society's standpoint, since it means that the resource will be developed with the minimum expenditure of scarce goods and services. The resource's contribution to economic welfare will be greater than it would have been had the tract been awarded to any of the other, less efficient bidders.

Under a work commitment system each prospective bidder will be asking himself: What is the maximum amount I can promise to spend on the development of this tract and still expect to break even? Since any cash bonus

AGD 546920

that would have been offered to acquire a tract under the traditional system is no longer necessary, the amount of that bonus may clearly be diverted to the work commitment without raising costs beyond the breakeven point. What is not quite so obvious, however, is that the amount a bidder will promise to spend under the commitment system will exceed the sum of the cash bonus and the amount that he would have allocated to development of the tract under the cash bonus system.

This follows from the fact that any additional increment of expenditure can almost always be spent in a way that will bring about some increase in output from the tract and a corresponding increase in revenue.

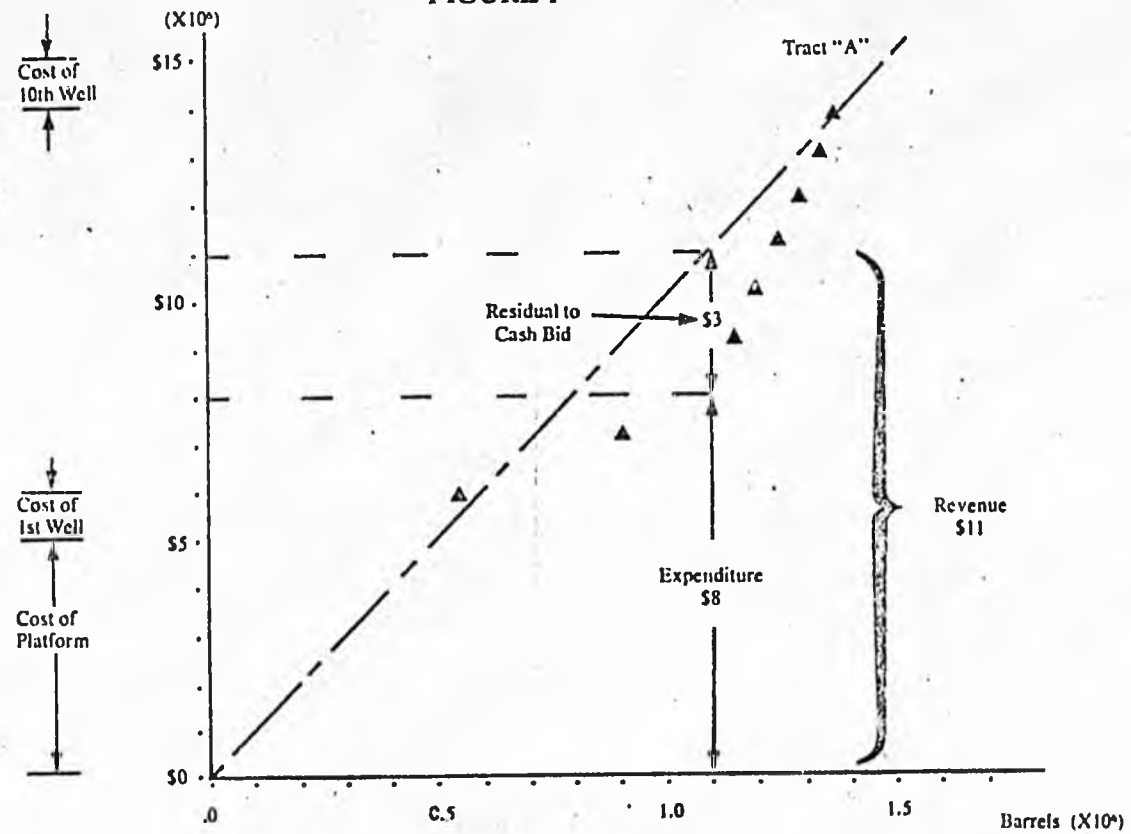
This is most easily demonstrated with a numerical example. Let us assume that a prospective bidder, in determining how much of a cash bonus he can offer for an oil and gas lease on a hypothetical tract A, has calculated the relationship between expenditures on development of the tract and expected production, and that the results of his calculations appear as plotted in Figure 1.

The vertical axis in this graph (and those that follow) measures dollars expended in the tract's development, dollars that we assume will be spent for construction of a platform and the drilling from it of wells. The horizontal scale measures the output that results from that expenditure, denominated in millions of barrels of oil. The relationship between those barrels of output and the revenue they bring their producer (at an assumed price of $10 per barrel) is shown, through appropriate choice of scales, by the dashed 45° straight line running upward to the right. By this means, the vertical scale can be used to show the value of output as well as the cost of production.

In Figure 1, the point closest to the origin indicates that with one platform and one well this operator would expend $6 million (vertical scale) producing an output of 550,000 barrels of oil, worth $5.5 million (determined by the intersection of the 45° line with a line drawn vertically from .55 million barrels). Moving upward and to the right, each subsequent point reflects seriatum the increases in expenditures and output resulting from the drilling of additional wells.

The general shape of the curve defined by these points is characteristic of situations where one major input to the productive process (in this case land) is held constant, while other inputs (in this case wells) are varied. The output curve originates at the lower left hand corner, but it rises vertically at first because the initial input of investment is unproductive: a platform and oil well costs a certain amount, and an expenditure of anything less than that threshold amount produces no oil. The cost of subsequent wells is assumed to be $1 million, no matter how many wells are drilled, creating a curve that looks like a staircase where each increment of cost (representing a new well) creates a new step. The fact that the staircase steepens as we move

FIGURE 1



AGO 546922

to the right is a reflection of the diminishing returns, in terms of oil produced, to each additional well drilled into the fixed geographic area encompassed by the lease.

Naturally the prospective bidder will be looking for the point on this output curve that puts his costs as far below the 45° line (his output-revenue function) as possible. As shown in Figure 1, the maximum cash bid this operator could afford to make on tract A (and still expect to break even) is $3 million, which—if he is the winner—would require him to drill three wells.

Consider now the situation this bidder would face were a work commitment bidding system adopted. The question that now confronts him is: How much can I spend (or how many wells can I drill) on tract A and still break even? The answer is clearly $14 million (representing nine wells), indicated on the right side of Figure 2 by the output curve for tract A.

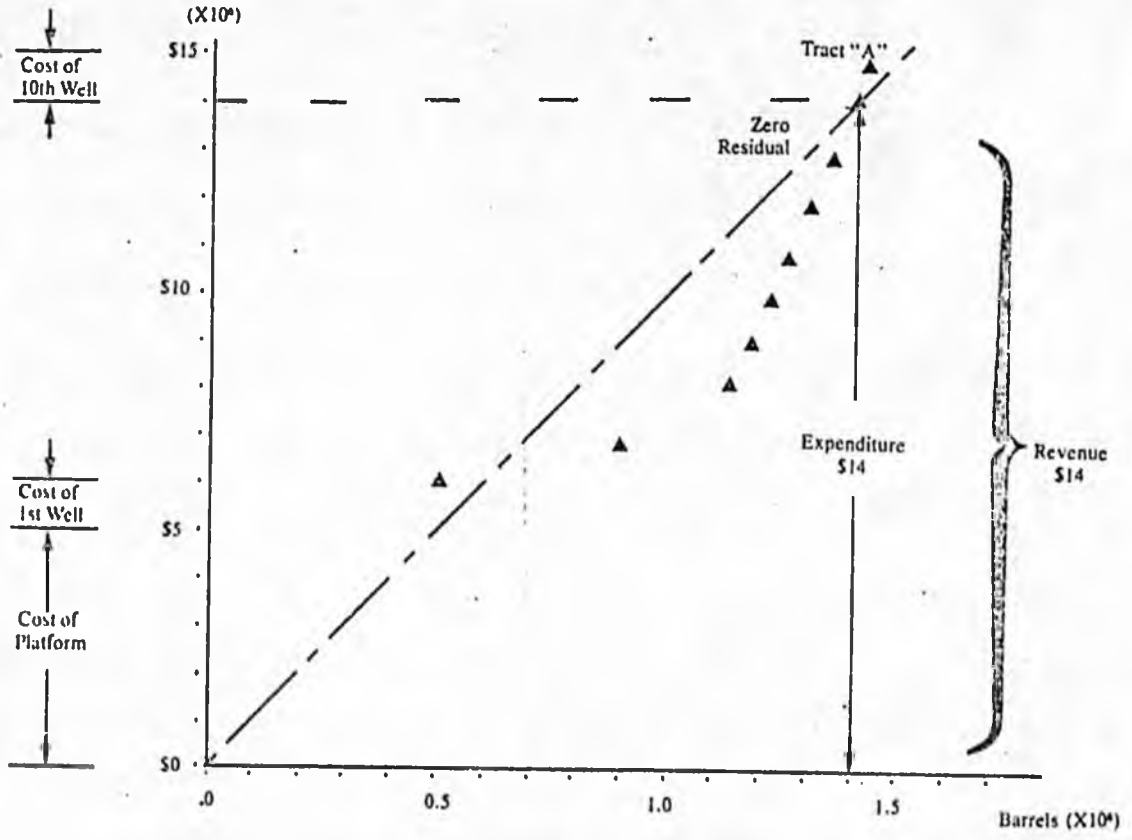
If the bidder wins tract A under a work commitment system, his oil output will be 1.4 million barrels (Figure 2) as compared to the 1.1 million barrels (Figure 1) that he would have produced had he won the tract in a cash bonus sale.

If the success of a mineral resource management policy is measured by the physical quantities of the mineral educed from the earth, the work commitment bidding is clearly superior. A resource's contribution to economic welfare, however, is not its total output (whether measured in dollars or physical quantities) but is the residual left over when the costs of all inputs to the productive process (other than the resource itself) are subtracted from the value of the outputs. In the case of tract A this residual is maximized at $3 million, when the value of the inputs is $8 million. As the input expenditure is increased above this optimum point, the residual—the resource's potential contribution to economic welfare—is gradually dissipated until, at the point where the value of inputs reaches $14 million, there is no more residual left to be dissipated.

In this particular example, the increase in output that would result from a switch to work commitment bidding ($3 million) happens to equal the amount of the residual. This coincides with the fact that the expenditure of each additional $1 million above $8 million (three wells) contributes exactly $500,000 to revenue. If the incremental contribution of the fourth and succeeding wells were greater, for example $750,000, the slope of the output curve traced by these points would be flatter, as shown by the squares in Figure 3, and the increase in production from a switch to commitment bidding would be much greater. To put it another way, it would take twice as large an increase in expenditure to dissipate the $3 million residual.

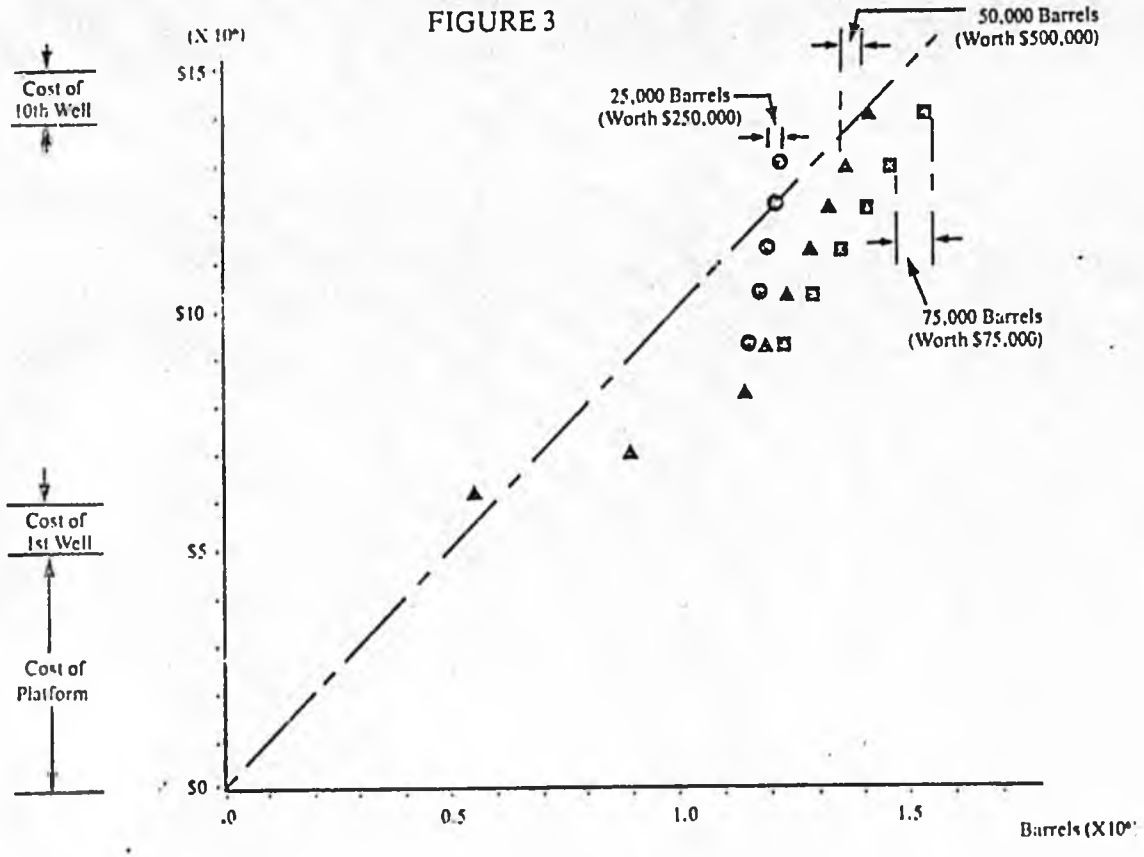
AGO 546923

FIGURE 2



AGO 546924

FIGURE 3



AGD 546925

On the other hand, a smaller incremental contribution to output and revenue by the fourth and succeeding wells (for example, an increase of only $250,000 in revenue for each $1 million well) would trace a steeper curve such as the one defined by the circles in Figure 3. The addition to revenue would clearly be less than the $3 million residual sacrificed to obtain it, which is another way of saying that the increase in production would be worth less than the bonus bid sacrificed to obtain it.

TRANSFERABILITY OF COMMITMENTS

Clearly the previously discussed simple work commitment bidding system results in more intensive development of the tract to which it is applied. Clear also is the fact that this effect is dependent on the characteristics of the tract to which it is applied, and in particular on the efficiency with which the successive increments of additional expenditures required under the commitment can be put to work to increase output.

One way to increase this efficiency is to allow an operator who assumes a work commitment in the course of acquiring a particular tract to fulfil that commitment through expenditures on a different tract or tracts.

For example, assume that a bidder has acquired both tract A and tract B as shown in Figure 4. If the work commitment assumed in order to acquire a tract must be fulfilled on that same tract, then his maximum commitment on A (Figure 2) is $14 million; and on B (as indicated in Figure 4 by the dashed lines) it is $8 million. Total output from the two tracts will be 2.2 million barrels.

TABLE 1

WORK COMMITMENT BIDDING

	Output (bbl's)	Revenue ($)	Expenditure ($)	Residual ($)
Tract A	1.4	14	14	0
Tract B	0.8	8	8	0
	2.2	22	22	0

Note: All figures in millions

If the operator is allowed to bid on the two tracts jointly or is otherwise permitted to shift a commitment made to acquire one to the other, then his total work commitment will rise to $24 million, with a corresponding increase in output. As shown in Figure 4, this is possible by operating tract A at the point on the output curve which produces the greatest residual and by transfering that residual, as an internal subsidy, to tract B, where, as indicated by the flatter slope of the output curve, it can be utilized more efficiently. The numbers are summarized in Table 2.

EXTENT OF DEVELOPMENT

In the above examples work commitment bidding has been shown to result in a more intensive development of tracts than would be obtained under cash bidding arrangements. If commitment transfers are permitted among tracts, such a system will also bring about more extensive development.

Consider the output curve of tract C in Figure 5. Tract C is clearly something of a "dog," because there is no point at which the output function crosses the 45° "breakeven" line. Under cash bidding, tract C would elicit no interest at all; even if given away free, it would not be developed.

Under a work commitment system, however, tract C may very well be acquired and drilled. Assume that a firm has already acquired tracts A and B as a package with a work commitment of $24 million and that neither tract has yet been drilled. The firm is now offered tract C. How much of a work commitment can the firm offer for it?

The firm had previously planned to use the $3 million residual generated on tract A to internally subsidize tract B. If tract C is added to the inventory, the firm could apply to C $1.5 million of the internal subsidy that would have otherwise gone to tract B and thereby make the development of tract C a feasible proposition. The calculation is shown in Table 3.

TABLE 3

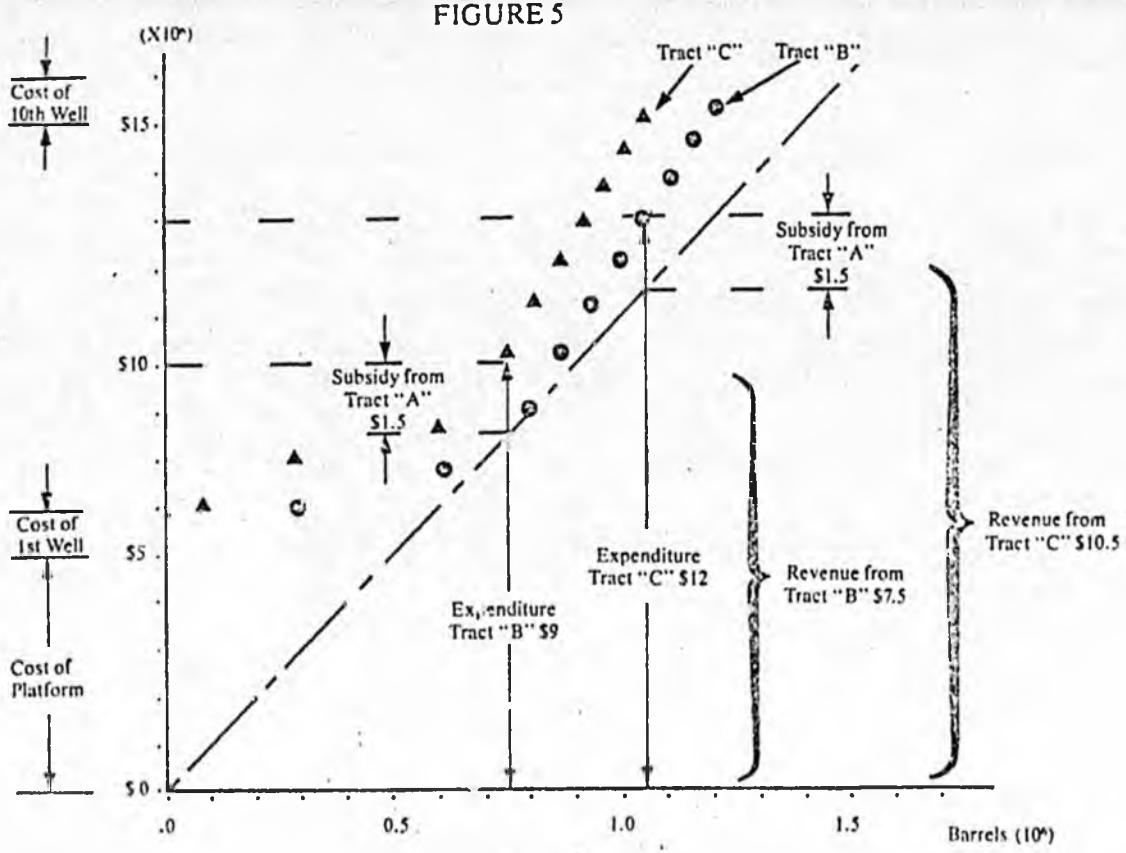
WORK COMMITMENT BIDDING
(Internal Subsidy Allowed)

	Output (bbl's)	Revenue ($)	Expenditure ($)	Residual ($)
Tract A	1.10	11.0	8.0	3.0
Tract B	1.05	10.5	12.0	(1.5)
Tract C	0.75	7.5	9.0	(1.5)
	2.90	29.0	29.0	0

Note: All figures in millions

AGO 546928

FIGURE 5



AGO 546929

Development of the three-tract package under the work commitment system will be feasible with a total expenditure of $29 million. Since he has already been committed to spending $24 million of this, in the course of acquiring tracts A and B, the maximum commitment bid this operator can afford to make on tract C is $5 million.

Besides illustrating the mechanism through which commitment bidding induces more extensive resource development, the tract C example also indicates how the system (with internal subsidies allowed) may work to the advantage of the firms that can acquire the most tracts. Theoretically, a newcomer with no existing inventory of tracts would be unable to make any commitment bid on tract C.

A way of evading this problem would be to make the commitments transferable. This would allow operator Jones to legally assume the obligations to which operator Smith has committed himself in the course of acquiring tracts from the government. Presumably, operator Smith would pay Jones for the favour.

The prospective bidders in these examples have been endowed with the ability to foresee accurately and precisely the output curve associated with every tract. In practice this is not the case. If there is any characteristic that sets the exploration phase of the petroleum and mineral industries apart from other businesses, it is the everyday uncertainty with which its participants must learn to cope. It is perfectly possible, for example, that Smith might acquire tract C with a work commitment bid of $14 million on the mistaken belief that its output curve is that of tract A. After building a platform and drilling the first four wells, the true shape of the curve—and the firm's predicament—would reveal itself. The required $14 million expenditure applied to tract C would leave Smith with a net loss of about $4 million. If he could somehow shed $5 million of the $14 million commitment, Smith would be able to operate the tract with only four wells already drilled and thereby cut his losses to the more acceptable level of $1.5 million. Smith would be willing to pay up to $2.5 million in cash to unload the $6 million obligation, since that is the amount of his maximum additional loss if he can't get rid of it.

Any other operator who is facing or expects to face an output curve with a flatter slope than that faced by Smith will be able to make a mutually beneficial deal with him, since, for the other party, an additional expenditure of $5 million will bring in more than the maximum $2.5 million that Smith will be willing to pay.

Besides putting the small firm in a better position to compete and mitigating the problems of uncertainty for all firms, large and small, a system which allowed the free exchange of work commitments would have the further and more important advantage of maximizing the overall

AGO 546930

efficiency with which work commitments are utilized. To the extent to which such a market was effective in bringing potential commitment offerers together with potential commitment takers, it would ensure that everyone would be operating at a point where a small increase in expenditure by one operator would produce no more and no less additional revenue than would the same increase applied to any other operator.

A minor but interesting benefit of a market in commitments would be the information it would provide concerning the efficiency with which the work commitment system is eliciting additional output.

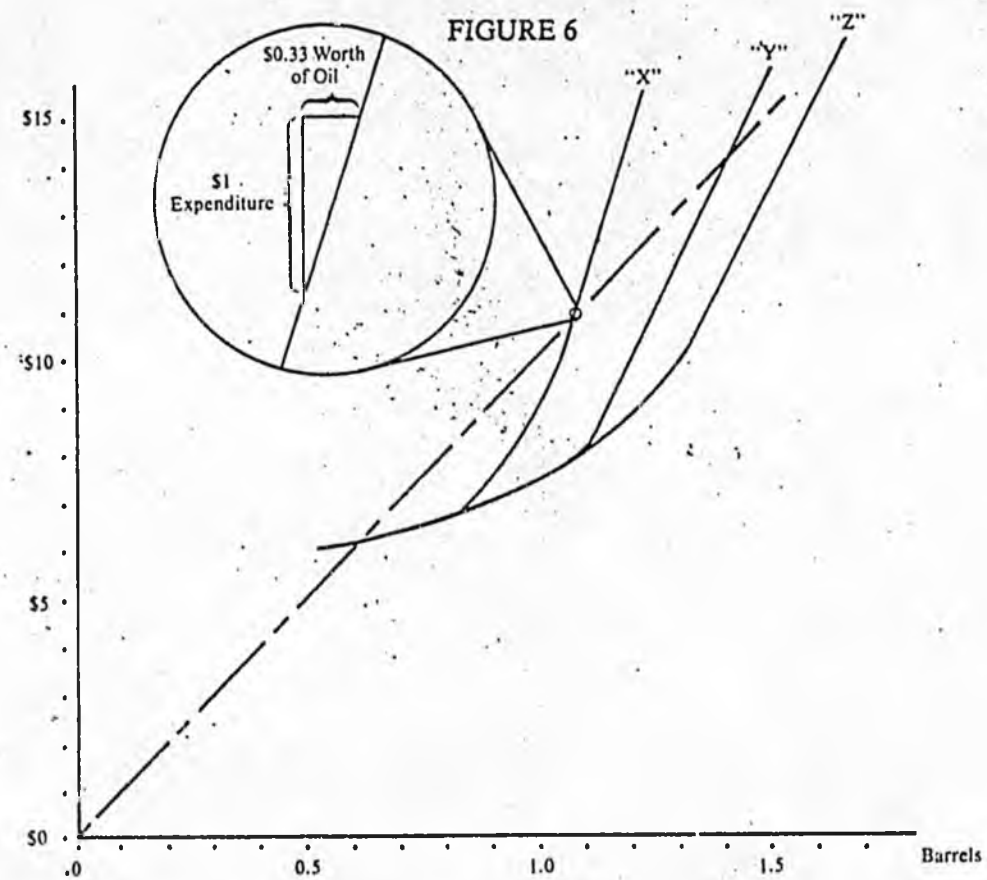
This can be understood by applying the concept of the output curve (hitherto used in relation to individual tracts) to the entire universe of tracts being offered under the commitment bidding system. By combining all such tracts and treating them as a single entity, an overall output curve similar to Figure 6 can be drawn. Just as in the case of an individual tract, the point where the curve dips farthest below the 45° breakeven line will be the optimum operating point, the point which results in the resource's largest contribution to economic welfare. The distance between the breakeven line and the output curve at that point is the measure of that contribution, and it is equal to the income that would come to the government landowner were a competitive bidding system utilized. It is this residual—the difference between total revenues and total costs—that the public will be sacrificing to subsidize output.

The efficiency with which the subsidy provided by the work commitment system works to increase output will be a function of the output curve's shape to the right of the point where bonus income would be maximized. Three hypothetical configurations for this part of the curve are shown, and the difference this shape makes to the level of additional output educed by the sacrifice of the residual can be seen. The significance of the price at which commitments change hands will be determined by the slope of the output curve at the point where it intersects the 45° breakeven line. Curves Y and Z both cross at an angle which indicates that, at that point, $1 of expenditure produces $0.50 worth of additional output. In either situation the market price for assumption of a $1 million commitment would be $500,000. Curve X, however, crosses the line at a steeper slope (as shown in the inset), indicating that $1 of expenditure will produce $0.32 worth of additional output. If curve Z accurately represents the overall output curve, the market price for the assumption of a $1 million work commitment will be about $333,000.

From a policy standpoint these numbers, whatever they may be, have considerable significance since they can be used to compare the efficiency of the work commitment system in eliciting additional output with whatever other alternative policies may be available. For example, if the market for

AGO 546931

FIGURE 6



AGO 546932

commitments indicates that the last dollar of subsidy transferred is producing only 33 cents worth of additional oil, it may very well be that another source of oil development—for example, tar sand or oil shale—could be found that would give a better return.[6]

THE TIME FACTOR

To simplify the discussion of the work commitment system, the time dimension of both expenditures and income has thus far been ignored. Since a dollar in hand today is worth more than the promise of a dollar tomorrow, it has been assumed that all bidders have used a discounting mechanism to take account of the time value of money. Thus, they would reduce all amounts of both expenditure and income streams to their *present value*, that is, the lump sum that the bidder would be willing to receive or give in exchange for the specified income or expenditure stream.

If a work commitment system is to be implemented, it will be necessary to take careful account of the fact that a commitment fulfilled in the next year will have a very different impact on output from one of the same amount fulfilled ten years hence.

If the public is going to give up its bonus income to subsidize output, the time when that subsidy takes effect will presumably make some difference. Of course, some arbitrary time limit could be established for the fulfilment of commitments exactly as the United States government sets the five-year term on the OCS oil and gas leases it sells. If free exchanges of commitments are allowed, anyone who wished to distribute expenditures over a time frame incompatible with his commitments could simply enter the market and adjust his inventory of commitments accordingly.

Another way of handling the problem would be simply to apply some appropriate interest rate to every commitment assumed and specify that the amount of expenditure required under that commitment must increase by the amount of the compound interest accumulated in the period between the assumption of the commitment and its fulfilment.

CONCLUSION

The adoption of a work commitment bidding system implies a judgment that existing institutions for private exploitation of public resources result in a suboptimal rate of resource development.

Any argument for the adoption of such a system must first establish that this is in fact the case. Secondly, it must prove that the work commitment approach is the least costly method of achieving the desired higher rate of exploitation.

AGO 546933

In comparing various alternative ways of achieving higher output against the work commitment system, some important features of that system are certain to stand out. First, and probably most significant, is the simple fact that the work commitment system results in a subsidy. As such, the criteria for its evaluation should be no less stringent than those applied to a direct appropriation of public funds or a tax concession adopted for the same purpose.

Secondly, the cost of the subsidy conferred under the work commitment approach is impossible to determine *a priori* and difficult of determination after the fact. If there exists a "right" level of subsidy it will be mostly a matter of luck if the foregone public revenue happens to equal that amount. For similar reasons, the benefits of the subsidy in terms of the total increase in output, development, or whatever, are not amenable to accurate quantification. As a consequence, it is doubly difficult to evaluate the system's relative efficiency.

Finally, a properly designed work commitment system allocates the uncertain amount of the subsidy in a fashion that tends to squeeze the maximum additional output from every dollar of subsidy. It does this more or less automatically. This characteristic means that the transfer of resources occasioned by the subsidy needs no affirmative action on the part of policy makers—as does a direct appropriation of public funds—in order to be continued. This fact, however, combined with the intrinsic uncertainty concerning the subsidy's magnitude makes it easier for vested interests to perpetuate such a subsidy long after any real justification for it has passed.

AGO 546934

4. Arguments for the work commitment system are expounded in detail in I. White, D. Kash et al., *North Sea Oil and Gas: Implications for Future United States Development* (Norman: University of Oklahoma Press, 1973).

5. Kenneth Dam has touched on some of these matters, however, in "Oil and Gas Licensing in the North Sea", *Journal of Law and Economics* 8(October 1965) and "Pricing of North Sea Gas in Britain," *Journal of Law and Economics* 13 (April 1970). Dam recognizes the subsidy for what it is and concludes that it is unjustified.

6. If it is determined that only a portion of the residual should be applied as a subsidy, this could be accomplished by offering only a portion of the tracts on the commitments bid basis, but allowing the fulfilment of a commitment on any tract acquired from the government. Since the reduction in the subsidy will move the operating point to the left on the output curve (Figure 5) to a point at which its slope is flatter, the result will be a higher assumption price for commitments. The commonsense explanation is that the optimum amount of total expenditure will be reduced only slightly; but that acreage over which commitments that can be fulfilled by that expenditure will be reduced relatively more. Another alternative would be to combine the work commitment system with a royalty, net profits share, or other form of deferred rent collection. This is in fact the arrangement pertaining in the North Sea sector. If the government takes a very high net profit share, the amount of the subsidy will be substantially reduced.

7. There are certain circumstances where a work commitment system could result in no more extensive or intensive development. This would be the case if the commitment were devoted to an activity not contributing to output. For example, if a government awarded a mineral concession to the operator who promised to build the largest smelter, no increase in mine output would result (unless the location of the smelter made lower grade ores profitable to mine).

AGO 546935

Petroleum Leasing in British Columbia

DALE R. JORDAN

FACTORS AFFECTING THE LEVEL OF EXPLORATION

From data published by the provincial department of mines and petroleum resources, it would seem that exploratory drilling in British Columbia in 1974 was in a static position and may even have been declining. There was a 22 per cent drop in the number of exploratory wells drilled in 1973 compared with 1972, and a corresponding drop in the footage drilled. This decline in activity appeared to be continuing into 1974, with drilling down 10 per cent in the first seven months. This apparent decline in exploration for oil and gas in British Columbia came at a time when the demand for oil and gas was high. Prices for oil and gas had increased dramatically, and considerable concern was being expressed over national self-sufficiency in all forms of energy supplies. By comparison, exploration activity in Alberta showed the opposite pattern. In Alberta, exploratory drilling in 1973 increased 50 per cent over 1972. Statistics published by the Daily Oil Bulletin showed that during the first several months of 1974 there was a further increase over the same period in 1973.

What caused the static or possible decline of exploratory drilling in British Columbia at this particular period of strong demand and high price? There are several answers, and formulated theoretical solutions must be viewed in the light of political judgment where governments demand a greater share of resource revenues. Certainly, the federal budget proposals in the spring of 1974 discouraged exploration for oil and gas in Canada; however, it would seem that provincial government policies were largely responsible for any discouragement felt by the oil and gas explorer.

In this article I attempt to set out some of the basic causes that contributed to the 1974 situation in British Columbia. These causes are identified and any suggested solutions are offered in the realization that there is a danger of oversimplifying complex problems and the possible effects of implementing partial solutions.

For any analysis to be meaningful, a proper perspective must be maintained. One of the overriding factors influencing the oil and gas explorer's decision making is the number of geological prospects. In British Columbia, the potential hydrocarbon-bearing portion is thought to be

AGO 546936

restricted to the northeast part of the province. The western boundary of this 51,000 square miles is the Rocky Mountains. In 1974, an estimated 37 per cent of the oil and 18 per cent of the gas in this area had been found, leaving an estimated 0.82 billion barrels of oil and 47.56 trillion cubic feet of gas still to be discovered. Although there was considerable potential still remaining for the oil and gas explorer, the area was small compared to Alberta and Saskatchewan, and it was much smaller than the vast geological potential north of the 60th parallel.

Another factor that depressed the enthusiasm of the explorer was the apparent lack of multizone prospects. Drilling a well to test only one potential horizon increases the risk factor significantly.

Before leaving the subject of the province's hydrocarbon potential, it should be remembered that several basins existed, both offshore and in the interior, containing substantial deposits of sedimentary rock that have not been explored to any great extent. Generally, the known geology in these basins discouraged any extensive exploration. Possibly, the very expensive exploration needed in the basins required special consideration before their potential could be fully realized. This special consideration might take the form of a reduced royalty on any hydrocarbon discovered, or of a joint participation scheme whereby the British Columbia government might share in the risks involved.

Another factor to be taken into account by the oil and gas explorer when selecting his areas of interest is the access to those tracts that he feels have hydrocarbon potential. Again, British Columbia was at a disadvantage in 1974 when compared with Alberta and Saskatchewan. Access to this already restricted basin area was affected by muskeg conditions over much of the plains and by deep river valleys in the foothills. These conditions involve greater expense in conducting exploratory work, and the oil and gas explorer would often be confined to only a four-month work year, because of such terrestrial conditions. The problem of limited access presents a very real constraint on attracting the oil and gas explorer and is relevant when considering any changes in land tenure and revenue sharing.

Another important parameter in any deliberation affecting oil and gas exploration is the availability of funds for exploration.

As a general rule, funds generated from production are used to finance exploration. It seems that the risk factor employed by financial institutions effectively discourages the use of debt capital as a source of exploration funds. It is not uncommon to read that an oil and gas producer has arranged for a substantial loan, but this will nearly always be for a specific purpose related to the development of a new reservoir of oil or gas. The discovery of this reservoir would have been funded out of the company's cash flow.

AGO 546937

When an oil or gas explorer's cash flow comes from production outside any particular province, then for money for exploration to flow into that province, that jurisidiction must have a framework of leasing and revenue sharing that can favourably compete with other areas also requiring exploration.

It would seem that cash flows from Canadian production will continue to be a major source of exploration funds. In the case of the integrated companies (those having refinery capacity), this will be true under almost any condition short of expropriation.

However, within this framework these funds will generally gravitate to where they can expect the greatest return. It may not be enough for a province to show that it will ensure that the successful explorer will receive a reasonable rate of return. It may well be that the successful criterion for increasing the level of exploratory drilling will be a division of revenues such that the oil and gas explorer will have a sufficient cash flow for an active exploration programme, as compared with other jurisidictions. The explorers who have a cash flow generated from production and the flexibility to determine the best place to reinvest these funds have the responsibility of ensuring that they can go to where they can expect to return the greatest profit.

The ability of the producer to channel cash flow from one jurisdiction to another depends largely upon the particular laws in force where the oil or gas is being produced. The provinces of Alberta and Saskatchewan tend to attempt to discourage the outward flow of funds generated from production in their particular provinces. In both provinces, this discouragement took the form of a high royalty, coupled with a drilling incentive programme, designed to encourage continued exploration.

In Saskatchewan, the mineral tax and the royalty surcharge took away from the producer all of the recent price increases and, in fact, returned to the producer a smaller amount per barrel than he was receiving prior to the price increases. As an inducement to continued exploration in Saskatchewan, an incentive programme was developed, whereby the producer was allowed to retain an additional 30¢ for every barrel produced, providing this money was used for drilling wells, for waterflood projects, research, and other specified purposes in Saskatchewan. This incentive had not been in effect long enough in 1974 to permit a complete analysis of its performance; however, it was really restricted to only those companies that already had production in Saskatchewan. A review of these companies shows that the producers with the majority of the production were the so-called Majors, which raised the question as to whether or not these Majors were prepared to continue to explore in Saskatchewan under any conditions. It is more probable that the exploration philosophy of the

AGO 546938

Majors directed that they use their exploration funds searching for high reserve reservoirs (which generally means exploring outside Saskatchewan).

To encourage explorers who do not have production in Saskatchewan, the government provided an incentive credit of about 30 per cent of the costs of drilling exploration wells. This credit could then be used to reduce any royalty or mineral tax obligations that may accrue.

In Alberta, in 1974, there was also an incentive programme for exploration drilling. This incentive took the form of a credit which could be subsequently used to satisfy most of the cash obligations that may arise by virtue of the royalty obligation, rental payments and mineral taxes, and could also be used to purchase oil and gas leases. Credits established in Saskatchewan could not be used to purchase leases. The formula which determined the amount of credit that could be established for any particular exploration well was predicated upon the area of the province in which the well was located and the depth of the well. This formula was expected to return to the explorer by way of credit approximately one-third of his drilling costs.

The principal producers of crude oil in Alberta were much the same as in Saskatchewan—they were the Majors in the oil and gas industry. Again, as in Saskatchewan, it would seem that the interest of the Majors in continuing to explore in Alberta had become blunted, not because of any particular rules, but more through the apparent lack of sufficient high reserve potential which this type of company must search for.

In Alberta, in 1974 the royalty was structured to increase not only when the production increased but also when the price increased. Alberta had also adopted a new oil/old oil concept, whereby royalties were considerably reduced on what was termed new oil, which, of course, had the affect of increasing the producer's cash flow and encouraging the development expenditures. This old/new concept applied as well in the case of natural gas. Saskatchewan also had provision for a reduction in its mineral tax and royalty surcharge for new oil. This reduction was gradually phased out after a few years. Alberta, in 1974, had the lowest rate of royalty on oil and gas, received the highest price for its natural gas and had a price for crude oil equivalent to the other provinces, all of which means that in Alberta the producer of oil and gas received a higher rate of return and, consequently, had more money available to him for exploration purposes than the producer in Saskatchewan or British Columbia.

While the incentive programme adopted in Alberta and Saskatchewan offered encouragement to drill exploration wells, any analysis of the performance of a similar programme which might be suggested for the province of British Columbia must be coupled with the consideration of a lower royalty and subsequent higher cash flows to the producer.

AGO 546939

This type of incentive can only be effective if the producer is also offered a return on his development expenditures that is competitive with other jurisdictions into which the oil and gas explorer is free to go.

Another source of money for drilling exploratory wells previously used in North America has been the drilling fund. The drilling fund usually takes the form of buying a number of shares in a limited partnership. The attraction to the investor apart from the possibility of participating in oil and gas discoveries, is the income tax feature in the United States which permits all intangible drilling expenses to be written off in the year that expenditures were made. This can be done without qualifying under any principal business rules, as prevails in Canada. It is this principal business rule that has to the present time precluded the tapping of a similar source of exploration funds in Canada.

It is estimated that between 250 and 400 million dollars are generated annually through the sale of shares in drilling funds in the United States. The United States government, in an attempt to encourage further exploration within its own borders, has chosen to reduce the amount that can be written off against income for income tax purposes when the funds are spent outside the United States. This move precipitated the drying up of exploration funds in Canada which previously came from this source.

Over the past few years other extractive industries, particularly mining, have been channelling considerable amounts of their cash flows into oil and gas exploration. These endeavours have usually taken the form of funding a subsidiary company. The continuation of this type of fund for the purposes of exploring for oil and gas will depend upon the success of the subsidiary companies and also upon the influence that mining taxes will have upon the parent companies' cash flows.

A few years ago it was quite popular for large United States gas utility companies to provide exploration funds on the basis that they would have first call on any gas produced and exported for sale to the United States. This source of exploration funds has also dried up almost completely as a result of decisions by the National Energy Board concerning the exporting of gas and, as a result of rulings by the Federal Power Commission in the United States, which have not allowed these utility companies to include these expenditures in their rate base. The Federal Power Commission looks upon this type of exploratory funding as a mortgage loan, rather than as a prepayment for gas, as the utility companies would prefer.

THE LEASING SYSTEM

The 1974 system of leasing in British Columbia will now be reviewed, and I will attempt to analyse its effectiveness in relation to the relatively small

AGO 546940

hydrocarbon potential area, lack of access, difficult terrain, and exploration funds generally coming from cash flows.

The system of granting oil and gas rights on crown lands in British Columbia invoved in 1974 an exploration grant called a "permit," a subsidiary exploration grant called a "drilling reservation," and a development grant called a "lease."

Permits, which can involve upwards of 100,000 acres, could only be acquired through a competitive cash bidding system at sales which were usually held four times a year.

The permits were classified from A to D, depending upon their accessibility and the terrain conditions. The class D permits were for offshore areas. One purpose for classifying permits was to allow them, where the working conditions were difficult, to have a longer life than was otherwise provided.

Permit classification also determined the minimum amount of work the permit owner was obligated to spend in any year. These minimum work obligations were more stringent for the Class A permit, where access and terrain problems were minimal. The significance of this particular requirement was lost because, in order to conduct an equivalent amount of exploration, particularly drilling, the costs involved in the offshore areas far exceed those which would be expended on a class A type permit. The sections of the Petroleum and Natural Gas Act that governed the permit work obligations did not specify any specific exploration programme, but only that a certain amount of money be spent during each term of the permit. This obligation to spend money in exploring on a permit could be satisfied by grouping several permits together, so that expenditures incurred in exploring on any one permit would satisfy the work obligation of the grouped permits. This grouping provision is important because it allowed an explorer to acquire large tracts of land for a short period in order to conduct extensive geophysical exploration.

This obligation to spend money on exploring on a permit could also be satisfied by paying the money to the British Columbia Crown. This would seem to be about as negative a provision as one could imagine, assuming, of course, that the government of British Columbia was interested in ensuring that the companies holding permits were the ones prepared to actively explore. If the removal of this system would give rise to problems, as in the case of an explorer unable to work a permit through no fault of his own, then a far better system would be to provide a means where work obligations could be accumulated and satisfied in the following year.

Permits were valid for one year and could be renewed annually, for a period ranging from five to eight years, providing the company was not in default.

AGO 546941

When a permit holder had expended the minimum amount of money exploring on a permit or group of permits or had paid the money to the government, he was entitled to convert the permit into leases. To do this the permit holder had to relinquish 50 per cent of the land back to the Crown. Land selected for conversion into leases could not be in a consolidated block, but had to be in a number of leases, which had to corner one another, or be separated by at least two units—approximately one mile. The maximum size of the lease was six units—approximately three miles square.

This system of exploratory permit and subsequent conversion of half of the land to lease on a chequerboard fashion was similar to that used in Saskatchewan and part of Alberta. The system probably had its beginning in Alberta. It was designed to ensure that when crude oil was discovered, the Crown would be returned some prospective areas which were subsequently sold. This system worked reasonably well, particularly in Alberta, where some substantial discoveries of crude oil were made during the existence of the exploration agreement. Unfortunately, in the vast number of cases a discovery was not made, and the chequerboard pattern for leases led to fragmentation of rights throughout the area formerly comprising the permit. This effect tended to discourage other explorers from entering the area, and this system of selecting leases also prompted the need for the drilling reservation, which generally covered that 50 per cent of the land returned to the Crown.

Seemingly, in those parts of the province having relatively easy terrestrial access and where the potential hydrocarbon-bearing formations were not too deep, this system of chequerboard leasing may be satisfactory. However, in areas where access is a major cost and where deep expensive drilling is required, it tended to discourage anyone other than the holder of the 50 per cent leases from entering the area to explore. Certainly in offshore areas where seabed drilling cost is many times greater than land drilling, this system of lease selection is most unsatisfactory.

Leases granted on crown land in British Columbia in 1974 had a primary term of ten years, renewable for further ten-year periods if particular circumstances existed which generally related to production.

The acquisition of leases in British Columbia was handled in 1974 in two separate ways. First was the way previously mentioned, which was the result of having a permit and then earning the right to acquire leases of 50 per cent of the land. The second was through the competitive cash bidding at one of the quarterly sales held by the British Columbia Crown.

There was no obligation at that time on the part of the lessee to drill a well during the initial term of the lease. A 1974 amendment to the Petroleum and Natural Gas Act, however, permitted the minister to forward a notice to

AGO 546942

drill when he considered that development of the lease was not active enough. This amendment seemed to suggest that before the minister would consider sending a notice, there would, in fact, have been a discovery made on the lease. Thus, in sending the notice, the minister was merely requiring development drilling. It seemed most unlikely that the wording of this section would be interpreted such that the minister could require exploratory drilling on existing leases.

There was an apparent trend to shorten the term of leases, with Saskatchewan granting only five-year primary terms. However, in British Columbia the term of 10 years was not excessive when one considers the short period of four to five months when work can be done in the area of hydrocarbon potential. This is quite different from most of the areas in Alberta and Saskatchewan, where drilling and other geophysical operations can be conducted all the year round.

The government of British Columbia appeared to feel that a large number of leases were held by companies not particularly active in exploring in the province and that something should be done to discourage these holdings, so that lands could be offered to others who were prepared to explore. These feelings may have promoted some of the 1974 changes in the Petroleum and Natural Gas Act, whereby the rental on leases was increased from one dollar an acre to two dollars an acre. The effect of this change seemed likely to be the return to the Crown of some acreage which, under the previous rental of one dollar an acre per year, would have been retained by the lessee. However, one must assume that for the most part relinquished leases would be the least attractive, and leases with potential, even though the lessee was not prepared to conduct any immediate exploration programme, would be retained, and the two dollars an acre would be paid. The greatest effect that this rental of two dollars an acre per year seemed likely to have was to deter other explorers from entering the province. It is one thing to create a system designed to discourage excess holdings by companies not prepared to explore immediately, and quite another thing to expect these same rules to promote the entry of new companies and increase exploration activities.

The royalties on crude oil in British Columbia were essentially the highest in Canada in 1974. The rate was 40 per cent for a well producing 1,000 barrels a month and further escalated to about 58 per cent when the monthly production reached 10,000 barrels. It would seem that this royalty level, which directly affected the producer's cash flow, could only act as a deterrent to increasing the level of exploration in British Columbia much beyond its historical pattern of about fifty to sixty exploration wells a year. Other changes that may be made in regulations designed to encourage greater exploration activity will never perform to their full potential until

AGO 546943

the producer's return is comparable with what he can obtain in other jurisdictions.

GOVERNMENT OPTIONS

We can now examine the options available to the British Columbia government in 1974. First, the government could maintain the existing regulations without change; or they could have stricter enforcement of the rules, further reducing cash flows to the producer, making it more difficult to operate; and thirdly, they could make changes designed to encourage greater exploration activity in the province. In each of these options it is assumed that some accommodation could be made between the provincial and federal authorities with regard to the revenue-sharing aspect. If it could not, then it would seem almost certain that exploration activity would decline, not only in British Columbia but also in the rest of Canada, and that even significant changes in the regulations would fail to act as an effective inducement to continued exploration.

In the first instance, if the government were to resist changes to its rules and to continue the existing level of royalty, it could expect to receive about the same amount of exploratory drilling as there has been in the past. This is evident from the sale in August 1974, where some 7.2 million dollars was paid for the right to acquire oil and gas permits, drilling reservations, and leases. This was certainly an indication that the oil industry was not prepared to write British Columbia off because of its high royalties and rather stringent regulations. There are several reasons for this. Companies have enjoyed a general increase in their cash flow, and in 1974 enough cash flow was available to pursue exploration in a province where the rates of royalty would reduce their return on invested capital as compared to other jurisdictions—for example, Alberta or the United States. The intensive competitiveness in the oil and gas industry distinguishes it from all other industries. Companies that have invested a great deal of time and money developing the geological potential of a particular area and have found that it fits their exploration parameters are prepared to offer a good deal of bonus money when this land becomes available through a competitive sale. Also, because a number of years usually elapses between acquiring an exploration permit and the development of and production from any discoveries, the economic climate may change such that what at one time is not attractive may become economic at the time of production.

If the government of British Columbia wished to discourage continued exploration by the existing oil and gas explorers and to discourage entry by newcomers, they could most effectively do this by again raising the rates of royalty and making the tenure of agreements shorter than they were. This

AGO 546944

type of action would cause the companies exploring in the province and those contemplating doing so to restrain their activities; exploration would then stagnate.

Presumably, such action by the British Columbia government would not occur without consideration of these consequences and the recognition that a different vehicle should enter the void left by the existing explorers. This could take the form of a public company, such as the British Columbia Petroleum Corporation; alternatively, the government might feel that, given time, the major oil and gas producers, the fully integrated companies, may finish their exploration for high-reserve reservoirs in other parts of Canada and be prepared to return to British Columbia to look for the remaining reserves which they may need to supply their refineries.

To give any support to this latter proposition, one would have to presuppose that the exploration presently being carried on by the Majors in Canada in the Northwest Territories, in the Arctic Islands, and in the offshore areas of eastern Canada will be unsuccessful and that they will have to lower their sights, accept a lesser prospect, and return. This is very difficult to support, considering the successes already achieved in the Northwest Territories, particularly in the Delta, and in the Arctic Islands. Also, there is a vast geological potential remaining as assessed against the very few wells that have been drilled...

The supposition that a provincial public corporation could enter the exploration field and its endeavours be more beneficial to the province than the present system raises many questions about the corporation's practical efficiency and about the possible political repercussions. This article's purpose is not to examine the political repercussions that might occur when dry holes are drilled with public funds; however, we should examine some of the practical considerations involved in the operation of a public company which has an almost exclusive area within which to explore as a result of discouraging the private sector. For the government to discourage both the existing explorer and the entry of any new ones and to expect the public corporation to be able to fill this void suggests that the government is saying, "If the private companies do it, so can we." Now remember that the private companies comprise all the oil and gas explorers working in the province and those contemplating doing so, given the right opportunities. All these companies have geological staffs, many of whom will be geologists who devote most of their time over a considerable number of years entirely to the study of British Columbia's geology. The public corporation could not expect to have such an extensive source of expertise as that available in the free enterprise system. And so the public corporation would suffer from a reduction in the number of ideas generated.

It is not unusual in oil and gas exploration, with its inherent problem of

AGO 546945

scientific interpretation and evaluation of geological prospects, to find that one company will acquire a block of land, will explore it, and perhaps even drill on it before deciding the search is unsuccessful. The company will then return the land to its owner, the Crown. This does not mean that there are not any commercial hydrocarbons underlying this land; but rather that that particular company was unable to find them. To find these hydrocarbon deposits, a second, a third, or a fourth company should acquire this land, and, if this is done often enough, the hydrocarbon will be encountered, and production will follow. The problem with the public company being the only explorer in the province is that, unless it is fortunate enough to make the initial discovery, it is very doubtful whether there would be enough enthusiasm to have a second, third, or perhaps even a fourth try at that particular prospect, with the result that the discovery would not be made. This is surely the worst thing that could happen and is probably the most damning argument against a public corporation moving into an area with an almost exclusive right to explore.[1]

If the British Columbia government wishes to increase the level of exploration in the province and so lead, hopefully, to a greater number of discoveries and a better position of self-sufficiency in their own requirements, there are several measures which could be taken to promote such a situation.

The first step that can and must be taken is to increase the cash flow to the producer and to assure the newcomer that if he makes a commercial discovery, he will receive a sufficient return to expand his exploration endeavours in the province. This action should take the form of restructuring the royalty on oil and probably renegotiating the contracts on gas existing between the producer and British Columbia Petroleum Corporation. The 1974 royalty rate on oil was determined by production at the wellhead, with the price not being a factor at all. This means that if the price paid to the producer for a barrel of crude oil should decrease from the present level, then the producer will suffer a decrease in his cash flow, thus his future available financing to continue exploration endeavours in British Columbia will be diminished. A preferred structure on royalty would take into account the possibility of a rising and falling price for the product so that the producer, out of whose cash flows exploratory drilling is carried out, would be the last one to suffer in the case of a decrease in price for both oil or gas. Probably this might best be accomplished by the producer selling his crude oil to the British Columbia Petroleum Corporation in the way gas is sold, but with a better pricing adjustment mechanism than that which exists with the gas contracts.

Another measure that should be taken would be a redesigning of the exploration agreement. This could be done to ensure that the holder could

AGO 546946

only earn leases after he had conducted actual work on the permit or in the area within reasonable proximity, and that his earnings would be restricted to a consolidated block rather than come from a sprinkling of leases throughout the permit area. This feature alone would help to ensure exploration, because the permit holder must be satisfied that he is getting, at least in his mind, the right half of the permit under lease.

The manner of acquiring oil and gas rights should be reviewed. As mentioned previously, the only method of acquiring an exploration permit under the present rule is through a competitive cash bidding system usually held on a quarterly basis. There are probably several instances where an oil and gas explorer would have been quite prepared to drill wells in British Columbia if he could have acquired the land for a minimal amount rather than having to use money he would put into exploration to purchase land through the cash bidding system. The rentals and fees charged should be the same as in Alberta, if only to appear competitive in this particular area.

CONCLUSION

The exploration for oil and gas in British Columbia cannot be considered in isolation. The proportion of the reserves of oil and gas remaining to be discovered will depend upon the number of exploration dollars allocated to the task. British Columbia's competitive position for these exploration dollars will depend in large measure on its royalty and land tenure policies.

AGO 546947

Cash Bonus Bidding for Mineral Resources

WALTER J. MEAD

Mineral leasing policy alternatives arise out of the fact that governments own mineral resources but, in general, do not engage in mineral esource recovery and processing. Hence, a need arises to transfer publicly owned resources to private enterprise at a price which will reflect the "fair market value" of the resource. The following analysis will, first, explore the problems to be solved by a bidding policy and, second, evaluate the cash bonus method of bidding for mineral leases.

THE PROBLEMS TO BE SOLVED

There are three problems which must be solved by any leasing system. First, the leasing system must as objectively as possible determine who or what firm is to be given the right to exploit publicly owned mineral resources. Second, a price must be determined which the lessee is to pay to the government for the right to recover mineral resoures held in trust for its citizens. Third, assuming that a nation wishes to economize on the use of its scarce resources and to maximize the standard of living of its citizens over time, the leasing system must result in an efficient method of production.

As a prerequisite to a discussion of mineral leasing alternatives there should be a clear statement of the goal(s) to be achieved. It is probably true that economists as a group have a preference for a single goal, declaring it to be one of economic efficiency. Natural resources available to any economy are scarce by definition. Achieving the highest possible standard of living requires that scarce resources be utilized with a maximum of efficiency. If resources are sold at a price below their true value, then the products into which they are converted may also be underpriced. If demand elasticities are less than zero, then the flow of resources into products and the flow of products within the current period will be excessive. Present overconsumption of products and resources will be at the expense of future consumption.

One way of achieving maximum economic efficiency is to price all resources at their "fair market value." Such pricing allows a government the opportunity of capturing the economic rent. Resources should be sold

AGO 546948

for the difference between future revenues and costs, appropriately discounted to their present value. The economic principle relating prices, costs, and money flows at different points in time in order to estimate present value (*PV*) is shown in the following formulation:

$$PV = \sum_{i=0}^{n} \frac{P_iQ_i - C_i}{(1+r)^i}$$

P_iQ_i is the value of the gross income flow at different points in time, C_i represents associated costs, and r represents the interest rate at which future money flows are discounted to the present. The formula clearly shows that higher future prices will increase present values while higher future costs will lower present values. Further, the greater the uncertainty and risk associated with production, the smaller will be present value. Firms utilize some variation of this present value formula in calculating their individual bids. Estimates of the quantity of minerals recoverable from a given tract will, of course, vary widely from firm to firm.

If mineral leases are sold for less than the fair market value as indicated in the above formula, then resources may be used at an excessively rapid rate, and the public, as owners of the resource, will fail to receive their full economic rent. On the other hand, if mineral resources are sold at prices in excess of the fair market value then, in the long run, some operators will be forced out of business. Use of such mineral resources in the present period will be at a suboptimal rate and the public owners will receive more than their normal economic rents.

In the past, Canada apparently has transferred some of its mineral and timber resources through various negotiated transactions rather than by utilizing the auction market approach. Similarly, other foreign governments have traditionally taken the negotiated sale approach in entering into long term oil concessions.

There are major problems involved in the negotiated approach. The correct present value of natural resources is extremely difficult to ascertain. There is no objective test in advance of ultimate production that can indicate the precise present value of mineral resources. By their nature they must first be discovered. Their presence, quantity, and quality are in doubt. With the government as the seller, negotiating with a single buyer, traditional problems of bilateral monopoly are encountered. The seller is interested in maximizing price, while the buyer is interested in minimizing price. Given this uncertainty plus opposing objectives, the civil servant is placed in a difficult position.

A visitor to Canada is reluctant to criticize Canadian experience which has circumvented the market place. Fortunately there is abundant experience within the United States to indicate the shortcomings of the negotiated approach to pricing. We may formulate two general laws which

AGO 546949

seem to govern when prices are determined or may be influenced by administrative judgement. First, the buyer will always complain. If the buyer believes that market prices can be reduced by protesting that they are too high, then complaints based on the argument that the operator cannot make a "fair profit" because prices are set too high could be endless. In the timber context, there are two cases where elaborate reports have been written protesting the high price of timber. One, presented by the Simpson Timber Company, protested against the high price of stumpage set by the United States forest service for the Shelton Sustained Yield Unit Agreement. Timber, in this case, is not sold at auction; its price is determined by the United States forest service. In the second case, the Edward Hines Lumber Company protested against the high cost of timber for its southeastern Oregon lumber mill. The timber was sold at an auction where competition was so weak that, in effect, it was sold at the administratively determined minimum price. By protesting, the company apparently felt that minimum prices could be reduced. In this instance, local community help was solicited on the grounds that if the company failed to make a fair profit, it would be forced to curtail operations. Under auction market procedures the government is relatively free from constant complaint and protest, because it is the impersonal market that determines the price rather than a civil servant. Under auction bidding procedures the buyers themselves set the price in competition with one another.

A second general law is that, where prices are set through administration, the government will always set prices short of the fair market value. A bureaucracy will rarely choose the path that makes its position unpleasant. Low prices are believed to generate less criticism and complaint than high prices. Where there is no auction market to test administrative judgement concerning the fair market value, we have no means to prove the second law. Sales of timber in the United States offer an opportunity to test the administratively determined price. Timber is sold by the forest service on the basis of an appraised fair market value, which becomes the minimum price acceptable to the government. Auction bidding begins at this price. In the four years from 1959 through 1962, competitive bidding for timber in the United States Douglas fir region produced an average high bid price that exceeded the forest service statement of fair market value (the appraised price) by 46 per cent.[1] In this case, the interests of the public were protected, at least in part, by reasonably effective competition. In the absence of this competitive check it is quite likely that the appraised prices would have been even lower. The shortcomings of the negotiated approach should lead to auction bidding wherever competition is possible.

CASH BONUS BIDDING

Before bidding can take place, a decision must be made between oral and

AGO 546950

sealed bidding. Bidding in either form may start with a stated or unstated minimum acceptable price. In the case of timber sales in the United States, the minimum acceptable price is given by the appraised price, and most timber auctions are conducted under oral auction procedures. On the other hand, in the case of oil and gas leases conducted by the federal government in the United States, the minimum acceptable price is not published, and bidding is normally by sealed bidding procedures. The government retains the right to "reject any and all bids." After bids have been received, it determines whether or not the high bid was adequate.

The factors important in choosing between oral and sealed bidding methods are as follows;

a. Of prime importance is the extent of competition. If competition is weak, then sealed bidding with its element of uncertainty makes collusive arrangements more difficult to enforce. Under sealed bidding rules there is no second chance to bid at any given sale. In contrast, under oral bidding procedures, a collusive arrangement can be policed by the participants during bidding. Further, there is always doubt about how many bidders may appear at a given sale. In oral bidding where only one bidder is present, he will bid the minimum; whereas, in sealed bidding a bidder would probably offer an amount which he believes will win the sale under conditions of more than one bidder.
b. In the timber industry where fixed investments in milling facilities normally exist prior to sales, the buyer needs a means of ensuring access to specific raw materials and specific locations. Oral auction procedures provide this means through the opportunity to cast reaction bids. In contrast, in oil and gas bidding fixed investments are made after winning a sale, hence there is less need to protect one's position through the opportunity to react to the bids of others.
c. Where the severed resource is relatively immobile, as in the case of timber, it is of greater importance that a specific nearby sale be obtained; therefore the oral auction procedures are more appropriate. In the case of oil and gas, the severed resource is highly mobile, so obtaining a specific sale is of less importance. In this case sealed bidding is not disadvantageous.
d. Where the resource to be auctioned is not homogeneous, it may be necessary for a firm to obtain a specific sale. Where this is true, the opportunity to make more than one bid to protect one's need for a specific type of resource may be of great importance. Only oral bidding facilitates this subsequent bidding opportunity.
e. Financial planning often requires that a firm carefully limit its financial exposure. Where this is necessary, oral bidding offers greater control over a total resource-financial commitment. In the case of sealed bidding,

AGO 546951

firms may be unexpectedly successful and in the process win more sales than were desired or can be successfully financed. On the other hand, a firm's sealed bidding may be totally unsuccessful so that it becomes undercommitted. This shortcoming of sealed bidding may be corrected where resources may be freely transferred among interested buyers. This procedure is normally followed in the case of oil and gas leasing in the United States.

f. Oral bidding requires more on-the-spot decision making than does sealed bidding; therefore, oral bidding requires that a higher level of executive talent be present at the moment of the auction. In contrast, decisions made on the basis of a sealed bid offer no opportunity for subsequent action on the auction floor; therefore, the presence of expensive executive talent is not necessary.

g. The "free rider" is a problem for serious bidders under oral bidding conditions. A serious bidder will carefully examine the potential productivity of a proposed lease sale. This may, as in the case of minerals, require large investments. Under oral bidding conditions, a "free rider" can observe who is bidding, then, if he is confident that they have done their homework, he can continue to outbid them until they reach their maximum and he will win the sale. His purchase is therefore based on someone else's calculations and he, in turn, has saved the cost of the pre-exploration appraisal. Sealed bidding does not offer the free rider the same opportunity.

Once a decision has been made in favour of oral or sealed bidding, then a choice must be made on the object of bidding. A cash bonus bid is one alternative. Additional alternative bidding objects are shown in Table 1.[2]

Bonus bidding is the standard procedure used by the United States government in all of its Outer Continental Shelf (OCS) programmes. Using the present value formula given earlier, potential bidders presumably estimate the present value of the probable mineral recoverable from a tract of land. The formula provides for adequate recovery of capital and compensation for risk, uncertainty, and profit.

One strong advantage that can be claimed on behalf of a bonus system relative to royalty bidding is that it requires a lump sum payment and correspondingly modest royalty payments. Because royalty payments are due on each barrel of oil or unit of natural gas produced (or other mineral), such charges become part of the marginal cost. At the margin of production this is a transfer cost rather than a real social cost. Royalty bidding thus leads to premature abandonment of an oil or gas well. To the extent that royalty payments are required in addition to the cash bonus, there will be premature abandonment of the lease.

The disadvantages of bonus bidding are numerous. First, while the

GD 546952

technology for oil exploration prior to drilling has been advanced in the last century, exploration is still subject to extremely high risk. Drilling is the only definitive test to determine the presence of oil or gas. Thus, bonus bids must be submitted by bidders and accepted or rejected by the government when neither the buyer nor the seller knows whether and in what quantities oil is present. This places the seller in a position of accepting millions of dollars for nothing but the right to spend several more millions drilling potentially dry holes. In cases in which a rich oil field is found, returns to the lessee will be and must be very high.

Second, under current procedures a bonus must be paid when the bid is submitted. When the bonus bid is large, it will represent a very heavy cash drain to the bidder far in advance of any revenue which may be generated from the oil or gas produced from the lease. This significant *front-end loading* of capital costs effectively excludes a small operator from winning leases as a solo bidder, creating an additional barrier to entry into the oil and gas production market. To overcome this entry barrier, firms commonly form joint ventures and bid jointly for a lease.

Third, because the bonus is calculated on a present value basis, the government is forced to accept discount rates used by private enterprise. If private enterprise discount rates are unreasonably high from a social standpoint, then bonus payments to the government will be correspondingly low.

Possible variations of the bonus bidding form are shown in Table 1. The present United States system includes fixed royalty requirements (typically 12½ per cent or 16⅔ per cent of wellhead value). However, a bonus bid might be paired with a sliding scale royalty requirement, permitting the royalty rate to be reduced as a field declines in productivity. As the point of economic abandonment is approached, the royalty rate might be reduced substantially or even eliminated. This procedure would, in turn, eliminate a marginal cost of production that is not a real social cost, and it would permit continued production from a field until the real marginal costs equaled the marginal value of production. This is the optimum point for well abandonment from an economic point of view. If at the time that a bonus bid was submitted all bidders understood that the royalty rate would be reduced to zero under the conditions specified above, the present value of the lease would be increased by an amount equal to the present value of reduced future royalty payments. Thus a tradeoff would be effected from royalty payments to bonus payments. The principal impediment to a sliding scale lies in the difficulty of clearly identifying various points at which royalty rates would be reduced. The lessee would have an economic incentive to manage his production in such a way that minimization of royalty payments would be an operating objective, rather than economic efficiency.

AGO 546953

TABLE 1

ALTERNATIVE BIDDING FORMS

Bonus Bidding
- a. with a fixed royalty requirement
- b. with a sliding scale royalty requirement
- c. without a royalty
- d. with or without a rental payment
- e. with a profit share
- f. with delayed bonus payments

Royalty Bidding
- a. flat (nonvariable) royalty
- b. sliding scale royalty
- c. with a fixed bonus requirement or no bonus

Profit Share Bidding
- a. net profit or gross profit
- b. with fixed bonus requirement or no bonus
- c. with a royalty requirement or no royalty

Combination of Bonus and Royalty Bidding

Bidding on the Work Programme

The royalty problem, together with the administrative problem of reducing royalty rates under a sliding scale, might be avoided entirely by using a bonus bid without a royalty payment. However, this procedure would simply magnify all three of the problems associated with bonus bidding listed above.

Present procedures in the United States include modest rental charges payable between the points of sale and production. When production begins, rental payments cease and royalty payments take over. Rental payments in OCS oil and gas lease income are insignificant. In 1972, they amounted to 0.3 per cent of total revenue from such leases.[3] The rental requirement apparently was introduced to motivate the lessees toward early production. If they were of significant size, this result would in fact occur, because rents cease when production begins.

To overcome the front-end-loading problem, provision might be made for delayed payment of the bonus. The problem that would follow from this procedure is that in some cases where no minerals were found, lessees would elect a bankruptcy route. In this event, an unfair bidding situation would be created. Responsible firms in business on a perpetual basis would not follow a bankruptcy procedure and would, therefore, be at a bidding disadvantage with respect to others that contemplated bankruptcy in the event of a "dry hole."

A bill currently pending before the United States Congress provides for a 55 per cent fixed share of net profits in lieu of the existing fixed royalty payment accompanying the bonus bid. The winner would still be

AGO 546954

determined on the basis of a cash bonus. A profit share payment would avoid the above problems associated with royalty payments. As a given lease approaches exhaustion and its point of economic abandonment, profits would also approach zero and payments would decline proportionately to zero. If the profit share was calculated on the basis of net accounting profits including fixed costs, then the profit share payment would decline to zero prior to the point of economic abandonment. The latter point is reached only when marginal cost (not total costs) equals the marginal revenue. There is nothing wrong with this system providing both parties understand how it works and bidders understand it at the time they submit their bonus bids. The proposed 55 per cent profit share is high and is likely to lead to inefficient operations. A profit share payment is approximately the same as an income tax on each well and is additional to the existing income tax. When the profit share payment is added to the existing income tax, a large part of the penalty for wasteful operations will have been shifted from the operator to the government. While a bonus bid paired with a fixed profit share payment has merit, a 55 per cent profit share added to normal income taxes is inappropriately high from an economic point of view.[4]

Some data are available to permit a partial evaluation of the effectiveness of bonus bidding with a fixed royalty. The United States experience with OCS bidding provides a record of thirty-five oil and gas lease sales during the period November 1954 to 29 May 1974. In addition, three sulphur lease sales and two salt lease sales have been conducted on the OCS. The record may be evaluated in terms of the number of bidders competing for each sale, the conditions of entry of new firms, the record of joint bidding, the extent of concentration among winning firms, the trend in price bid per acre, the resale record of tracts where the initial bid was refused by the seller, and the rate of return earned by the winning bidders. Data pertaining to OCS bidding as follows:

a. For oil and gas lease sales there has been an average of 3.6 bidders competing for each tract receiving bids. The trend from 1954 to date has been one of increasing bidder activity. From 1954 to 1966 the average number of bidders per tract was 2.7. From 1967 to date the average increased to 3.9. From the seller's point of view, even more bidders would be preferred. Given the fact of relatively few bidders, sealed bidding procedures would appear to be more appropriate than oral auction.
b. Entry into the oil and gas auction markets appears to be relatively free. In the first 1954 federal lease offshore from Louisiana, 199 tracts were offered. Ninety-seven of these tracts received 327 bids from 22

AGO 546955

different firms, some of which bid in joint bidding combinations. From 1954 to 28 March 1974, an additional 110 firms won tracts as solo bidders or joint bidders with 1 or more other firms. Thus, in addition to the unsuccessful bidders who also perform a competitive function in the bidding process, there were 132 separate firms participating as winning bidders in thirty-three OCS lease sales.[5]

c. Entry by relatively small firms into OCS lease sale bidding is facilitated through joint bidding. Joint bidding by two or more firms each unable to bid solo has the effect of increasing competition. On the other hand, when two or more large firms fully able to bid separately combine to submit a single bid, the effect may be to reduce the number of competitors. However, if through joint bidding, even among large firms, a combination of, say, four firms bids more than four times as frequently as the individuals would have bid solo, then the effect of joint bidding can again be procompetitive.

d. The record shows some tendency toward concentrating winning OCS bids in relatively few hands; however, the extent of concentration also appears to be declining over time. For the nineteen oil and gas OCS lease sales which took place from 1954 through 1966, the eight largest buyers, sale by sale, purchased 85.5 per cent of the tracts. In the fourteen sales from 1967 to 28 March 1974, the percentage of total tracts purchased by the eight largest buyers declined to 62.0.[6]

Using the 184 leases issued in the 1954 and 1955 Louisiana oil and gas lease sales, a multiple regression analysis tested the proposition that firm size was positively related to the high bid by tract as the dependent variable. If large firms are able to outbid smaller firms, then one would expect a positive relationship. The regression analysis revealed no significant relationship between size class of firm (the eight big firms versus all others) and the amount of the winning bid. The same regression equation revealed that the high bid was also independent of whether firms bid jointly or solo. Further, the most significant independent variable related to high bid was number of bidders; the greater the number of bidders competing for any given tract, the higher will be the resulting winning bid. The total value of oil and gas production accumulated through 1967 was also positively related to the high bid. As one would expect the number of acres in the tract leased is also related to the high bid. Estimated water depth as a proxy for development cost was not significantly related to the high bid.[7]

e. Data on the average price bid per acre indicates that with the passage of time the effective high bid per acre has increased substantially. For the entire period 1954 through to 28 March 1974, the average high bid per acre amounted to $1,257.50. For the 1954-1966 period the average was

$301.71 per acre. This increased more than sevenfold to $2,219.90 per acre for the period beginning in 1967. This increase is only partially accounted for by higher crude oil prices. The average price of crude oil increased from $2.89/bbl. in the earlier period, to $3.69/bbl. in the later period. Even this increase would be offset by an unknown decrease in the probability of finding oil, and by increased costs of exploration and production.

f. Lease sales through 1 October 1964 show that of the 1,377 tracts receiving bids, seventy-eight high bid offers were rejected by the government. Subsequently, 26 of these tracts were reoffered and leases awarded. For these 26 tracts, the initial rejected high bid average amounted to $42.41 per acre. The subsequently accepted high bid on resale averaged $411.38. Thus, where bids were found to be inadequate and subsequently reoffered, competition increased bonus payments on these rejected tracts nearly tenfold.

g. The most conclusive test of the workability of cash bonus bidding based on the United States record of OCS oil and gas lease sales is in terms of the rate of return on capital earned by the successful bidders. An analysis has been made of 184 offshore Louisiana oil and gas tracts leased in 1954 and 1955. Precise data are available on bonus payments, rental payments, oil and gas royalty payments, and production of oil and gas during the period from 1954 through 1967. Cost estimates were made for exploration, well drilling and equipment, and operation. Annual cost and annual wellhead values were discounted to obtain a net internal rate of return. The calculations indicate that these early OCS leases generated a 7.5 per cent before tax rate of return to the lessees.[8] Given the fact that oil companies pay relatively low U.S. income tax rates, the after tax rate of return would be only modestly lower than the 7.5 per cent before tax rate of return. This net yield clearly does not reflect monopoly power; it shows an excessive degree of competition.

On the basis of this evidence we conclude that competitive bidding for oil and gas leases is sufficiently strong to protect the public interest inobtaining competitive values for its oil and gas resources. This conclusion is further supported by evidence presented above indicating an increase in the average number of bidders and a substantial increase in the average price bid per acre for oil and gas leases.

CONCLUSIONS

This article has examined the problems to be solved by any leasing system used to transfer publicly owned mineral resources to private firms for processing. The cash bonus bidding system has been used extensively in

AGO 546957

the United States, particularly in the leasing of OCS mineral resources. That record has been examined in some detail. While cash bonus bidding embodies problems which have been identified, it also appears to be an economically efficient method of resource conveyance. The United States record indicates that competition has been effective, if not overly effective, in permitting the government to capture the full economic rent. In addition, bonus bidding avoids a major problem of a popular alternative, that of royalty bidding. It appears to be far superior to a negotiated approach in solving the three critical problems of resource leasing: selecting the operator, determining a fair market value, and creating a climate for efficient mineral resource recovery.

The Role of Public Enterprise

ARLON R. TUSSING

My remarks are, firstly, about the role of governmental enterprise generally and, secondly, about some of the considerations involved in using governmental enterprise to foster greater control by the citizens of Canada and British Columbia over their own mineral industries. My view is that governmental ownership of producing operations is not generally the most effective way of accomplishing the social ends for which it is currently being advocated in these industries. Nevertheless, I have a few suggestions how some of the major disadvantages of public enterprise with respect to efficiency and responsibility might be overcome.

Government owned enterprises in the English-speaking countries have seldom owed their existence to an anticapitalist ideology. It is, in fact, hard to detect any systematic difference in motive, organization, or operation between the national, state and provincial, or municipal enterprises established during the incumbency of labour, socialist, and agrarian radical parties and those implemented by Tories of various names and complexions.

Despite the vast amount of existing governmental enterprise today in capitalist countries, and despite the importance of socialist movements and socialist thought in the history of modern civilization, the scholarly literature on public enterprise is remarkably skimpy. Rigorous comparisons —theoretical or empirical—of the economic performance of governmental and private enterprises in the same industry are, to the extent I can determine, nonexistent.

GOVERNMENT OWNERSHIP

The case for government ownership of undeveloped land and natural resource stocks rests on a broader base than that for government ownership of producing enterprises. The intrinsic value of any resource in its natural state is the difference between the value of goods that can be produced from it and the cost (in terms of labour, capital, materials, and organization) required to produce those goods. The size of this residual is not the product

AGO 546960

of any person's labour or enterprise; most of the economic value of an *in situ* resource and its appreciation over time result from such diffuse causes as the increase in population, the general advance of technology, the decline in real transport costs, or directly from governmental outlays on roads or geological mapping. On these grounds, it has become almost an axiom of distributive justice (however commonly violated) that the intrinsic value of natural resources should not be privately appropriated.

Other classical grounds for government ownership of natural resources are the desire to control external costs or capture external benefits of their exploitation, and the expected divergence of private capital costs from the social rate of time preference, which is said to result in too rapid (or too slow) development of the resource. I am skeptical about the universal applicability of the last of these arguments; who, indeed, knows what society's true discount rate should be, and why are politicians and civil servants expected to be more sensitive to it than to entrepreneurs? This reservation notwithstanding, I believe that a presumption in favour of government ownership of undeveloped land and resources is generally justified.

Turning to productive enterprise, however, there are three main economic rationales for government ownership in a capitalist society. First is the use of the state to establish or maintain productive activity that would not be profitable as private enterprise, but whose external benefits are deemed to justify a subsidy out of the public exchequer. A subsidy does not, of course, require state ownership, because either private or governmental enterprise could enjoy that subsidy. In either case, support could take the direct form of providing capital or operating expenses from the Treasury or the indirect form of tax exemptions and the use of public resources at less than their cost of fair market value. State ownership, however, may well make a subsidy more palatable to the public, because it does not conspicuously enrich (or appear to enrich) a few private entrepreneurs.

Within the category of public ownership as a vehicle for subsidization are the numerous instances of private enterprise socialized because of chronic insolvency or imminent liquidation, including the Canadian National Railways, most of the British Labour Party's nationalizations after World War II, and the recent takeover of rail passenger transportation by the United States government.

In other cases, the motive for government ownership has been the creation of "public goods," products (or by products) of an enterprise whose value a private owner could not expect to recover by market pricing. Examples of such externalities are flood control by hydropower projects and the promotion of literacy and national unification by the postal system.

Military necessity has been another justification for producing goods in state enterprises which might not meet the test of the private market.

AGO 546961

Nineteenth-century America had government lead mines and arsenals and plantations for naval stores; the processing of nuclear fuels now remains a governmental activity on security grounds. Many public transportation and communications ventures were begun as defence projects in Alaska, the Yukon, and British Columbia: examples are the ALCAN highway and the White Alice communications system.

Second among the rationales for public enterprise is the perceived inability of private business, because of the great size or risk of the venture in question, to assemble sufficient capital. This tradition in North America began with state ventures in canal and rail development in the early nineteenth century, then extended to river control and irrigation projects, and continues into the present in enterprises like COMSAT and Panarctic Oils. In many of these cases, the proposed activity was expected to be self-sufficient in the long run, on the basis of the revenues from its product or service, but state initiative was seen as necessary to take advantage of scale economies or to overcome high risk threshholds.

The third circumstance seen to justify government ownership is possession by an enterprise of monopoly power and/or exceptionally rich natural resources, either of which can produce substantial "unearned profits" or rents. Government ownership is one means either of preventing monopoly exploitation of consumers (or monopsony exploitation of workers and sellers) or of collecting for the public treasury monopoly profits or resource rents that would otherwise be captured by the private owners.

Government takeover of profitable businesses has been rare in the English-speaking world. There have been a few instances of ideologically motivated nationalization, but it is instructive to note that these have often been reversed, as in the cases of the iron and steel industry in Britain and, more recently, the grain trade in India. The remaining cases have principally been those of utilities—grain elevators, street railways, water, electrical or telephone systems—which had a monopoly ("natural" or otherwise) in a local service area. In the last category it is often hard to distinguish between the instances where government took over to prevent private exploitation of monopoly power and those in which government saw a monopoly as an opportunity to exploit an assured source of revenue for itself.

There are, of course, a variety of cases which overlap two or all three of these categories. Economic development of a poor or sparsely settled region is often advanced as a justification for public enterprise in transport, communications, or electrical power. In these instances the premise is often that the region lacks capital or capital markets and only the state can mobilize resources on the desired scale. At the same time, the project is seen to encourage growth by its ability to widen markets or otherwise cut costs for commodity producing sectors of the regional economy. Once estab-

AGO 546962

lished, moreover, such an enterprise may have a monopoly status, with the power to abuse or exploit that status, and seem thereby to demand public control or ownership.

Many governmental enterprises (and regulated utilities, which they resemble in important respects) combine subsidies for some activities with appropriation of monopoly rents or resource rents from others. A common practice in both regulated private firms and government enterprise in transportation, communications, and utilities is *cross-subsidization*, in which monopoly profits earned from one area, line of business, or class of customers are dissipated in subsidizing others that are deemed to be socially meritorious. Thus, airline and railroad tariffs on heavily travelled route segments typically exceed cost (including a "fair" return), while service on lower density segments is provided at a loss. Hydroprojects in the Western United States typically subsidize users of irrigation water from revenues earned by water sales to municipalities and industry and by sales of electric power. In Alaska, revenues from both state and federal timber sales are sacrificed to support otherwise uneconomic lumber and pulp mills.

Turning to the mineral industries of Western Canada, there is little evidence that suggests they need to be subsidized by formation of a public corporation or otherwise. The province of British Columbia does not have, for example, a great but decaying industry upon which the community depends both for energy and employment, as the British had in the coal mines of the 1940's.

The British Columbia-Yukon Chamber of Mines may occasionally assert that each mining job generates seven additional jobs in supporting industries, but there is no respectable analytical foundation for such a claim. Even if the extractive industries had such an employment multiplier, it does not necessarily follow that job creation *per se* is a benefit that deserves subsidization from the public purse, much less the creation of a government enterprise. New employment opportunities are a *net* benefit to the existing community only to the extent that they are filled by residents who would otherwise be unemployed or working at more poorly paid jobs. In an "open economy" like that of British Columbia or Alaska, there is no predictable relationship between local job creation and local unemployment, because new employment opportunity attracts immigrants who tend to offset the employment gain. Even if the new jobs directly created were reserved for long-time residents, displacement of residents from old to new jobs and their replacement by nonresidents can be expected to make overall unemployment rates relatively unresponsive to employment growth.[1]

National self-sufficiency in minerals and the earning or retention of foreign exchange are sometimes claimed as external benefits of mining that justify preferential treatment. In Canada, paradoxically, some of those

AGO 546963

(including the National Energy Board) who place the highest priority on national self-sufficiency in one or another mineral resource tend to advance policies that *deter* investment, on the grounds that the beneficiary of current development tends to be the export market, at the cost of future diminished Canadian self-reliance. In this country, moreover, balance of payment effects are often used as part of a case *against* mineral development for export rather than in favour of it. In a world of floating exchange rates, however, one might question whether there is any relevance at all to the balance of payments problem in its usual sense. Finally, the impacts upon environmental quality and the dispersion of population are more likely to be regarded as external *costs* of mining than as *benefits* that justify the government's promotion of mining ventures that otherwise would not be self-supporting.

It is hard to make a respectable case that mining (including oil and gas production) creates beneficial *externalities* for the surrounding community, as distinct from the net value of the minerals produced, or the factor payments (wages, profit, rents, and taxes) which make up that value. The current Canadian interest in state enterprise in the mineral industries does not seem, in summary, to be a result of the belief that they are inevitably unprofitable under private enterprise. On the contrary, it rests in part upon the notion that mineral extraction can indeed be very profitable, and that unearned profits (rents) ought to be controlled and disbursed in socially approved ways. This attitude is sometimes experienced as a concern whether the people of the nation or of the province, who are the nominal owners of its natural resources, are receiving as high a return for the products of their land as they might. One issue is, in short, whether the state is effectively maximizing its revenues from disposal of minerals.

Where effective capital markets exist together with a large enough number of potential operators to create workable competition for resource rights, the government (as landlord and/or sovereign) is more likely to maximize its revenues if it does *not* engage in production. This conclusion does not presume that particular government owned entities are necessarily less enterprising and less effective in cost control than profit motivated private corporations. There may well be a bias against efficiency in most forms of state enterprise, if only because their owners (the public) and managers do not have a clearly defined standard of performance as private managers have in the imperative to maximize the present worth of their firms. But more importantly, by operating a productive enterprise in the extractive industries, the government loses the ability it would otherwise have as landowner to exploit the competition among potential private operators.

At oil and gas lease auctions in the United States, for example, the bid prices on a single tract may vary by a factor of two, ten, or even one

AGO 546964

hundred. These variations reflect widely differing geological evaluations of the tract, exploration strategies, and capital and other costs. Thus each tract tends to be won by the bidder with the *most favourable combination of capital cost and expectations* among all the bidders regarding future product prices, the particular tract's recoverable reserves, and their development and lifting costs. The landlord (state or private) who operates on his own land, however, would have only one management team, one exploration strategy, one team of geologists and engineers, and one supply function for capital. Only by rare accident would the landlord's *actual* performance over the average of all his properties tend to be better than the *expectations* of the most optimistic bidder. If, therefore, he were to lease each tract to the highest bidder among the competing operators, he might anticipate receiving a greater net revenue on each property than he could expect from developing the property himself.

The foregoing prediction is implicitly supported by empirical studies of United States Outer Continental Shelf leasing by Walter Mead and others, who show that successful bidders on the average earn a discounted cash flow rate of return on lease acquisition costs substantially less than the oil industry's average rate of return on capital (see Mead's article, "Cash Bonus Bidding for Mineral Resources," contained in this volume).

The effective use of competition to optimize revenues does not dictate the use of a cash bonus bidding system for *all* minerals or even for petroleum under every circumstance. The degree of knowledge or uncertainty regarding the volume and value of minerals present and their cost of extraction, the relative weight of fixed and variable costs in total extraction costs, the number of potential competitors, and the relative preferences of the government and private operators for certain present income versus uncertain future income are all appropriate considerations in the choice of leasing or disposal systems and taxes on the mineral industries. These questions have been discussed elsewhere,[1] and other articles in this volume give close attention to the relative merits of location, leasing, and sale as systems for disposing of minerals; to royalties and severance taxes, and whether they should be reckoned on gross value or net profits; to bidding on cash bonuses, deferred bonuses, gross or net royalty rates; to the use of acreage rentals; to the optimum size and configuration of tracts; to the amount of geological information the landlord ought to obtain and publish before opening land for lease or disposal; and to the duration of the primary term of a lease or permit, its terms for renewal, and so on.

In summary, state enterprise in the business of developing and producing minerals is surely *one* way to capture and redistribute resource rents, but it is unlikely to be as effective a device for maximizing those rents as the combination of a leasing system that takes full advantage of competition

AGO 546965

among private firms (considering the technology and institutional characteristics of each branch of the mining industry) and an appropriate tax system.

The most powerful cases for public enterprise in developing regions (like much of Western Canada and the Territories) relate to transport facilities which create external economies for other economic sectors, including mining. In these instances, both the first motive for socialization (the desire to subsidize) and the second (the need to overcome barriers of scale and risk) may justify investment by the government on projects into which private enterprise will not venture. Neither of these motives, however, creates a case for state enterprise in mineral extraction. Capital and enterprise for mineral exploration and development are plentiful and mobile. Specialized technical inputs, such as geophysical surveys, drilling, and heavy construction can be purchased on contract in a highly competitive market (so that great petroleum and mining companies carry out very few of these activities themselves). Capital sums in the hundreds of millions, or even billions of dollars can be mobilized privately, even without government guarantees, for projects like the Trans-Alaska pipeline, in remote regions.

Development of minerals, like the collection of revenues from their development, is likely to be more rapid and more efficient if it utilizes the diversity of skills, techniques, enterprise, and access to capital in the private economy and the competition between firms differently endowed in these respects. Nationalization or municipalization of producing operations, in my view, has an inevitable price—both in state revenues and in social efficiency—the payment of which must be justified on other grounds.

The hard core of Canadian interest in public enterprise today seems to stem not from a perceived shortage of capital and entrepreneurship (much less an ideological opposition to capitalistic enterprise as such), but from a perceived surplus of foreign capital and entrepreneurship. The problem, it seems, is to assure that mineral development (and, presumptively, related activities like oil refining or oil and gas transportation) are under the control of Canadians or the people of British Columbia, rather than great multinational (read United States) corporations.

It is probably not politic of me as an American to ask what practical difference the nationality of a company's owners or management makes as long as it is subject to the same laws (and obeys them) and pays its proper share of taxes. Foreign companies in Canada have often been berated for not paying enough taxes, but it was after all a *Canadian* decision, reflecting a long-standing Canadian developmental philosophy that the extractive industries should remain largely untaxed. The satisfactions and grievances of Americans regarding the major oil companies apply in the same way to

AGD 546966

Mobil and Texaco, which are domestically controlled, as they do to Shell and Sohio, which are foreign controlled. I am afraid I don't see how any more in the way of real resources for Canadians could be squeezed from a government owned business than could be squeezed from American or Canadian owned private enterprise under a well designed leasing and tax system. Nevertheless, one billion American dollars invested in Canada is more conspicuous than one billion Canadian dollars invested in the United States, and the nationality of your managers and stockholders obviously does make a difference to many Canadians. (I must confess, also, that some Americans become hysterical about the very idea of the Arabs or Persians taking over United States businesses.)

Government enterprise is one way to "nationalize" the mineral industries, but it is not, of course, the *only* possible way to foster Canadian equity and enterprise. Stricter nationality criteria could well be applied to holders of claims and leases or of permits to build pipelines, concentrating plants, and refineries. Such policies raise the further question, however, whether there is in fact enough private equity capital and enterprise in Canada to effectively take the place of foreign equity and enterprise. This is an empirical question to which I do not have an answer. If the answer is negative, consideration must be given to the fact that establishing a government enterprise does not *create* any new Canadian resources. It only uses tax money or potential resource revenues to bid capital and talent away from some other employment in Canada. The cost of Canadianization (either by restrictive licensing of private industry or by government enterprise) may be minimal, however, if preferences for nationals result in bidding home significant amounts of Canadian capital and Canadian talent which would otherwise be employed in other countries. (Presumably, the net effects of even these moves would have to take into consideration remittances that would otherwise flow back to Canada from investments abroad.)

Government capital need not be regarded strictly as a *substitute* for private capital, Canadian or foreign. In North America during the first half of the nineteenth century, and in almost every country at one time or another, state companies were used as a vehicle to *attract* foreign debt or equity capital, usually British, to ventures they would not otherwise consider. A government owned (or guaranteed) railroad company was often naively regarded by Lombard Street as a safe investment, while the promotions of unknown overseas entrepreneurs were viewed with little regard in the world's principal money market.

The use of government participation is still a major instrument for encouraging foreign investment in developing areas. Joint ventures between American, European, or Japanese private companies and governmental entities of the host country are common in almost all the extractive

AGO 546967

industries and in many countries at different levels of economic development. Canada has at least one government enterprise created largely with this function in mind, Quebec's SOQUEM, whose activity consists mainly of joint ventures in mineral exploration with private companies. Petro Canada also *seems* to be interested in this kind of approach.

In addition to being a means by which domestic enterprise becomes a trustworthy borrower (or partner) of foreign capital, state enterprise can also be a means of offsetting a shortage of domestic equity and entrepreneurship. In this role, it has one advantage over promotion of domestic private enterprise through nationality restrictions on investment, management or licences: it avoids the spectre of open discrimination, which could lead to retaliation and might otherwise undermine trade and investment relationships that are beneficial to Canada. The nearly open border allows this country to draw on a much larger pool of capital, technology, and talent than it would with policies fostering autarky. Although this openness is a major element in the ambiguity and insecurity of Canada's national identity, its economic benefits to Canada are relatively greater than they are to the United States. (That is, its impact on the size of the resource pool available to Canada is greater than on the size of the pool available to the United States.) It is therefore a circumstance to be modified only carefully and selectively. Establishing a provincial oil company is one way of containing the side effects of a move in the direction of autarky in a single industry. Such a move might, in fact, limit these side effects even in the industry in question. Suppose the best candidate for executive officer for a British Columbia based oil company were a Texan; there might well be fewer misgivings about hiring him to work for the province than about his heading a subsidiary of an American private firm.

I will conclude this article with some suggestions for the structure and policy of public corporations in the mineral industry, suggestions aimed at combining some of the best features of government and private enterprise, rather than their worst.

First, before establishing a governmental enterprise, be clear what its purpose is to be, what the incentive for the management to accomplish that purpose will be, and, quite rigorously, what will be the measure of the enterprise's success. (I owe this first and most vital point to Milton Moore's critique of the draft of this article.)

Second, do not set up a monopoly. There is no surer formula for inefficiency and social irresponsibility. Economies of scale do exist in mining and petroleum exploration, but they are very small when compared to some other industries or relative to the opportunities for development in an area the size of British Columbia. In petroleum refining, the minimum efficient size of a refinery is probably about the size of the British Columbia

AGO 546968

market for petroleum products, but if a new government owned refinery needs a monopoly or protectionist legislation to be profitable, it will almost certainly be a serious burden on consumers. Industries in which scale economies are narrow and where ingenuity and intuition are still crucial, as in mineral exploration or onshore oil and gas production, are probably not the most appropriate candidates for nationalization; but where it is determined to establish a state enterprise, consideration might be given to the establishment of more than one competing public enterprise.

Third, do not clothe the corporation in sovereign immunities. Such immunity can be, and often is, a cover for inefficiency, irresponsibility, and even lawlessness. The corporation should be suable; it should pay taxes or their equivalent (federal, provincial, and local); and it should be subject to environmental and safety laws and regulations and, above all, subject to the bankruptcy laws. Its operations should not be protected by any version of an official secrets act. There is no good reason why the directors, officers, and employees should be excused from the same civil and criminal liability for their actions to which their counterparts in private enterprise are subject.

I would urge hesitation even in providing guarantees for the corporation's debt. A public mining or oil corporation will be pursuing a line of business in which private enterprise regularly borrows money without such guarantees. The more intense scrutiny of bankers and underwriters toward a corporation whose debt must stand on its own merit might well save the corporation's owners—the public—more money than the small interest differential associated with government guarantees.

Fourth, give the public and the corporation's officers and staff a material interest in its success and its efficiency. The government need not hold all the shares but only a controlling interest, not necessarily even a majority. One block of shares (enough to elect at least one director) can be held in trust for the company's employees and voted by them. The remainder of the shares would be offered to the public; they would be voted by their owners and publicly traded. Not only would this provision broaden interest and participation in management, but the market price of publicly traded shares would be a continuing indicator of management performance and of the value of the government's equity. I see no compelling reason to restrict share ownership to residents; it might in fact be useful to encourage minority participation by major oil companies or mining companies. A residence requirement for shareholders, however, would reinforce symbolically the corporation's identity as a national or provincial instrument, and would, of course, limit remittance of dividends abroad.

Fifth, the corporation's policies should be responsive to public policy but not bend to every political wind. I would suggest that only a minority of the

AGO 546969

government directors serve at the pleasure of the Cabinet and be regarded as spokesmen for its policies. The remaining directors representing the government's equity would be chosen indirectly for long and staggered terms.

Sixth, the corporation should be under pressure to pay dividends. A majority of the shares (and directors) should represent parties who have a material interest that the corporation *not* retain, reinvest, or dissipate all its earnings: private shareholders, the employees, and the members who serve at the pleasure of the Cabinet (who would presumably be responsive to the fiscal interest of the government). The influence of this group will be a constant corrective to tendencies of management, inside directors, and permanent directors toward complacency, empire building, pyramid building, or gold plating.

Seventh, maintain a clear distinction between the corporation and the government as landowner. The public enterprise should obtain resource rights on crown lands only in competition with other prospective operators. The corporation should not receive a concealed (and indeterminate) subsidy by access to resources at no charge or at a lower price than a competitor might offer. If it must have a preferent right, let it be at most a right to match the highest bidder.

A preferent right on the best offshore leases is a feature of the federal oil and gas corporation (FOGCO), proposed recently in the United States Congress. In view of the prices oil companies have been recently willing to spend in these lease sales, such a preference would guarantee that FOGCO would appear profitable, however incompetent its management, and that the federal treasury would lose billions of dollars in lease revenues.

Eighth, take advantage of the division of labour and competition. The corporation should not attempt to do for itself the things that even the greatest oil and mining companies contract out to others, such as seismic surveying, core drilling, well drilling, well logging, and construction. There is virtually no chance that a state corporation could improve on the performance of private firms in these exceedingly competitive areas.

In summary, I am generally skeptical of the case for public enterprise in the minerals industry but hopeful that such enterprises could be established free of many of their usual shortcomings, providing some thought is given to their purpose, organization, and standards of performance.

Notes

1. In a study aimed at projecting the employment impact of the Trans-Alaska pipeline, we found that *unemployment* in individual labour market areas was almost totally insensitive to the level of *employment*; that is, on a *net* basis, at least, new jobs in Alaska's petroleum and wood products industries and government were entirely filled by immigrants. [Arlon R. Tussing; George W. Rogers; and Victor Fischer; with Richard Norgaard, and Gregg Erickson, *The Alaska Pipeline Report: Alaska's Economy and Gas Industry Development and Impact of Building and Operating the Trans-Alaska Pipeline*, Institute of Social, Economic and Government Research Report no. 31 (Fairbanks: University of Alaska, 1971)].

Rep. Al Osterback
Chairman
House Natural Resources Committee
Alaska State House of Representatives
Juneau, Alaska

Dear Rep. Osterback:

When I testified before your committee two weeks ago on H.B. 854, I indicated then that Sohio Petroleum Company would be willing to submit additional information in written form to the committee, in further consideration of changes in Alaska's oil and gas leasing policies.

In this regard, attached is a memorandum, "Experimentation in Alaska's Oil and Gas Leasing Program: An Analysis of Leasing Policy Issues Raised in H.B. 854," prepared by our staff in Anchorage. An addendum presents suggestions for new language in certain sections of H.B. 854 that in our opinion would improve the bill from the State's standpoint as well as that of industry's. We hope you will consider our suggestions as constructive, if critical.

In general, we feel that H.B. 854 as it is now written would create a bias in the State's leasing system toward experimentation with procedures that are unusual and new in Alaska. Our suggested language changes would essentially create a bill that would give the Commissioner of Natural Resources the flexibility that he desires, but with a bias instead toward relying on well-known and proven leasing systems, unless special circumstances would call for the use of an alternative bidding system.

We are also concerned over the extent to which the Administration, in proposing H.B. 854, has simply tracked many concepts (and copied specific language in many cases) from OCS bills now in Congress, without an apparent close examination as to whether these specific provisions proposed for federal OCS sales are really appropriate for the State of Alaska.

We hope you will find this information useful in your consideration of H.B. 854.

With regards,

D.S. Mace
Assistant General Manager

PART I: AT THE CROSSROADS

I. THE IMPORTANCE OF OIL AND GAS POLICY DECISIONS

A. Global Prospects

The Workshop on Alternative Energy Strategies (WAES), a two-year international energy and economic project, directed by the Massachusetts Institute of Technology, recently released their final report which indicated that:

(1) All energy resources and conservation measures must be developed vigorously to meet total projected demand in the period 1985 - 2000; and

(2) Energy policy decisions made now will be the critical determinants as to whether or not sufficient incremental supplies will be available to meet demand in the years ahead.

In other words; according to the WAES Report:

> The years up to 1985 are critical ones...We are...on the threshhold of a critical decision period. We cannot afford to waste the years immediately ahead if we are to have any large-scale energy options available before the end of the century. The time for decisive action is now. 1/

In this environment, the importance of H.B. 854, the Administration's proposed oil and gas leasing bill, cannot and must not be underestimated, as Alaska's oil and gas resources can and will play an important role in determining the future global energy, economic and political balance. The critical nature of energy decision-making at this time is further underscored by the following conclusions stated in the WAES Report:

1/ ENERGY:GLOBAL PROSPECTS, 1985-2000, Report of the Workshop on Alternative Energy Strategies, M.I.T. Professor Carroll L. Wilson, Project Director McGraw-Hill Book Company, San Francisco, 1977.

(1) The supply of oil will fail to meet increasing demand before the year 2000, most probably between 1985 and 1995...(p.3)

(2) Demand for energy will continue to grow even if governments adopt vigorous policies to conserve energy...(p. 4)

(3) The continued growth of energy demand requires that energy resources be developed with the utmost vigor...(p.4)

(4) Even if there are no governmental constraints on oil production, oil supply will meet demand only under the most optimistic assumptions about gross additions to reserves...(p.145)

(5) Possible constraints on oil production by members of OPEC are likely to cause oil supply to peak at the latest some-time around 1990 although lower production limits could bring this date forward into the early 1980's...(p.145)

(6) All the effort put into oil exploration around the world over the past one hundred years has only yielded 240 large oil fields...(p.123)

(7) With only a small chance of either discovering a new Middle East or discoveries in the Middle East as large as in the past, the past rate of genuine new discoveries can only be achieved if a large number of smaller producing areas are found. (p.122)

(8) Given lead times of 5-10 years or more for many projects, failure to make necessary near-term commitments or to resolve a variety of current restraints on production, or to develop future supplies may foreclose some options for 1985. (p.265)

(9) Failure to recognize the importance and validity of these findings and to take appropriate and timely action will almost certainly result in a world different from the one on which these projections have been based. (p.5)

(10) Failure to act could lead to substantially higher energy prices as the supply/demand imbalance becomes more apparent with the consequent frustration of the aspirations of the less developed countries. The major political and social difficulties that might arise could cause energy to become a focus for confrontation and conflict. (p.5)

(11) The longer the world delays facing this issue the more serious the outcome will be. Even with prompt action the margin between success and failure in the 1985-2000 period is slim. Time has become one of the most precious of our resources. (p.5) 2/ (Emphasis added)

2/ Ibid., pages as indicated above.

Another important point in the Report relates to the size of future oil fields. Worldwide, over 30,000 oil fields have been discovered, but about 75 percent of the oil lies within 240 large fields, each with over 500 million barrels of recoverable reserves. 3/

Out of the tens of thousands of producing oil fields in North America, there are only five fields that have recoverable reserves of more than 500 million barrels (Prudhoe Bay, which is new; and Elk Hills and Wilmington in California, and East Texas and Yates in Texas, all of which are old fields). Despite a great deal of exploration in North America, there has been no recent discoveries of fields more than 500 million barrels, except Prudhoe Bay. In other words, the probabilities of finding large new fields on the order of Prudhoe Bay has significantly diminished, not only globally, but also in the United States.

The WAES Report also makes clear that in certain environments, such as the North Sea, a 500 million barrel field is at the economic margin. 4/ Because of the particularly harsh environment in Alaska's North Slope, and elsewhere in the unexplored part of the State, a field that may contain even more than 500 million barrels of oil could be right on the edge of economic viability in Alaska, given the uniquely high costs and transportation difficulties.

While all of the above has critical implications both for the United States and Alaska, there are yet another set of reasons why we believe that the designing of the future oil and gas leasing program in Alaska deserves serious and careful consideration.

3/ Ibid., p.123

4/ Ibid.

B. Alaskan Outlook

In a sense, the State of Alaska is facing on a smaller scale some of the same problems described earlier on a global scale. Whereas world oil production may begin to decline in about seven years, so also will Prudhoe Bay. This fact has important implications to all Alaskans and, in view of the revenue needs of the State, it would appear to be in the State's interest to encourage a steady, ongoing oil and gas development program in parts of the State with petroleum potential. But the historic rate of genuine new discoveries can only be achieved worldwide if a large number of small producing areas are found. Likewise the future of petroleum discoveries in Alaska will most probably involve smaller fields which will be more costly to develop.

Actually, the possibility of finding another Prudhoe Bay-sized field in Alaska is extremely remote. Further, because of the very high costs of operating in much of Alaska, the size of a discovery must be larger in Alaska than it would in other states to make the project economic. Even the Lisburne and Kuparuk oil pools, which according to State estimates range in potential from one to two billion barrels, are marginally economic and may be typical, in terms of economics, of many future oil and/or gas finds in Alaska. All this tends to suggest that Alaska is special and needs to pay closer attention to the development of her resource policy than a State like Louisiana, for example.

Some have argued that Alaska might be better off 'sitting on' her potential oil and gas resources and waiting for the world oil price to rise even further. Dr. Arlon Tussing, an Alaskan economist and advisor to the Senate Energy Committee, considers this attitude, "simplistic" and "naive."

In real terms, world oil prices may stabilize as a result of a prolonged period of relatively low economic growth which would result in lower growth rates for energy consumption than is generally projected. Additionally, as global attention is increasingly focused on energy, the drive to conserve energy and to develop heavier oils, such as Athabascan tar sands, Rocky Mountain oil shale and Orinoco tar belt; and substitutes for conventional oil and gas will increase. Again, to quote Dr. Tussing, "if you choose to 'sit on' your oil and the decision was wrong, the resultant imbalances could be serious."

A final serious consideration for Alaska relates to a realistic assessment of the growth of State spending. While this subject cannot be addressed in the analysis, there is reason to believe that Alaska's revenue needs in future years requires continuous exploration and development of her oil and gas resources so that new revenues will be coming in as Prudhoe Bay starts to decline. This is especially true when one considers the long lead times involved in exploration and production in the frontier areas of Alaska, where a decade may be needed to find, prove up and begin to develop a field, and where transportation problems can be enormously complex.

C. Implications

Being at the economic/energy crossroads globally -- and in Alaska -- would seem to suggest that it is of critcal importance to the State to (1) carefully delineate its goals with respect to a new oil and gas leasing bill and (2) ensure that the proposed legislation, in its implementation, will achieve the desired goals outlined in the legislation. With this in mind, it would appear appropriate both to review the goals outlined for H.B. 854 and to analyze some of the broad issues raised by the draft legislation.

II. OBJECTIVES FOR ALASKA'S OIL AND GAS LEASING PROGRAM

> "As a prerequisite to a discussion of mineral leasing alternatives there should be a clear statement of the goal (s) to be achieved." 5/

A. Objectives Outlined for H.B. 854

To analyze the objectives outlined for H.B. 854, there are two relevant source documents: the Governor's letter of transmittal and the language contained in the "findings" section of H.B. 854. Both contain ambiguities and sources of conflict that deserve serious attention.

This is important in that the goals and objectives outlined in the legislation reflect the intent of the Legislature, in offering guidance to the Commissioner of Natural Resources.

As described in the bill [Sec. 38.05.180(a)(1)(A-D)] the State's goals are to:

(A) maximize the economic recovery of these natural reosurces in protection of the public interest;

(B) minimize the exploitation of these natural resources in protection of the public interest;

(C) maximize competition among parties seeking to explore and develop the resources;

(D) maximize use of Alaska's human resources;

While (D) is clearly in the State's interest, (B) appears to be in direct conflict with (A) and, in and of itself, could certainly be interpreted to mean more than one thing, e.g., 'sit on' the oil until later or 'protect the environment' or 'don't develop at all,' depending on one's definition of the "the public interest." One might also raise the question as to

---

5/ Walter J. Mead, "Cash Bonus Bidding for Mineral Resources," Mineral Leasing as an Instrument of Public Policy, ed. M. Crommelin and A. Thompson, British Columbia Institute for Economic Policy Analysis Series, 1977, p.46

whether (C) could conflict with (A) or is even a necessary goal for the State of Alaska's leasing program or whether the goal to "maximize competition" means having more companies bidding or more competition among current bidders. In short, while goals (A) and (D) appear well-defined, there are important questions that could be raised with respect to the other goals as stated.

If one looks to the Governor's letter of transmittal for guidance on the matter, one becomes more confused. Some of what is presented as broad goals are in fact provisions of the bill related to goals which may in actuality work against the achievement of the overall broad objectives. What appear to be the three major goals of the legislation are presented in paragraph 3 of the Governor's February 17 letter of transmittal on H.B 854:

> "The proposed changes will update the leasing law to provide increased public control over exploration, development, and production from state land, obtain a fair return from our non-renewable resources, and, at the same time, provide land from which explorers may find new energy supplies."

Yet the letter lists six "important state objectives," which include items such as reducing "the length of the term of a lease from ten years to five years..." The reduction of a lease term should not be listed as an "important state objective," it would seem, in that it is not an objective but rather a provision designed to achieve the State objective of assuring "that exploration begins promptly once State land is leased." Whether or not reducing lease terms is the best means to assure prompt exploration or not is not the issue here, but rather the importance of clearly delineating goals (prompt exploration) as opposed to suggested means of implementation (reduce length of term of lease).

While clarifying what are the State's goals may seem academic, the exercise would seem worthwhile, particularly since what are described as "important State objectives" in the Governor's letter appear to conflict with the goals stated in H.B. 854. If it is a State goal in H.B. 854 to maximize competition, for example, then increasing rentals on fields may not be in the State's interest at all and should certainly not be listed as one of the "important State objectives" in the Governor's transmittal letters.

Thus, it would appear to be in the State's interest to set out more clearly, and in some order of priority, what the State is really seeking to do in this legislation. The Commissioner of Natural Resources, who would be designing the leasing program today, and future Commissioners who will be administering the program in future years, need to know what the State really intends and what is most important, given the energy and economic environment today and the future needs of Alaskans. If the Commissioner is given clear guidance by the Legislature as to the overall goals, then the State should be able to rely on the Commissioner to use his judgment and discretion in designing a program that is the best interests of the State.

In addition to the ambiguity relating to the State's most important objectives related to H.B. 854, we are also concerned that the overall legislation would actually deny the Commissioner the very object the bill's proponents suggest they are seeking to guarantee, i.e., flexibility so that the Commissioner may design a program best suited to achieving the State's broad goals. Instead of really allowing flexibility, this bill appears to put stress on the Commissioner by (1) requiring him (her) in many instances to adopt changes; and (2) setting limits on those changes;

and (3) forcing him (her) to account for why this or that was not done, for example, as opposed to merely requesting information as to why what is planned or was done is planned or was done.

Based on studies we have analyzed, we would also suggest that "maximum" experimentation in bidding at this time may not be in the State's interest any more than it is the Federal Government's interest. While we will go into this subject in some detail in Section III, we think it important to highlight here that the Alaska Legislature should be aware that, in many respects, H.B. 854 appears to copy the Federal draft legislation. A brief review of the goals related to the Federal bills would thus appear to be in order.

B. Objectives Related to Federal Legislation

It is noteworthy that the Governor's letter of transmittal states that the "proposed changes will update the leasing law to provide increased public control over exploration, development and production from State land..." (emphasis added). Many in Washington D. C. have been working for years to amend the laws affecting OCS oil and gas exploration and development so as to be able to establish a Federal oil and gas corporation (popularly known by the opponents of the concept as "FOGCO").

While we do not mean to suggest here that the drafters of H.B. 854 are aiming to establish an Alaskan State drilling corporation, we do think it pertinent for the State to analyze the goals and provisions of H.B. 854 in terms of where it would take Alaska, if enacted as presently conceived. Would the result be more exploration and development by private companies, or would the result be added complications in petroleum development and the eventual need for Alaska to establish its own "FOGCO?" We would offer two cautionary notes.

First, Dr. Arlon Tussing has pointed out that "the scholarly literature on public enterprise is remarkably skimpy. Rigorous comparisons - theoretical or empircal - of the economic performance of governmental and private enterprises in the same industry are, to the extent I can determine, nonexistent." 6/

Second, from our own limited experience of government drilling corporations, we would tend to concur with Dr. Tussing's conclusion that a State FOGCO is, as Dr. Tussing says, "unlikely to be as effective a device for maximizing [resource] rents as the combination of a leasing system that takes full advantage of competition among private firms (considering the technology and institutional characteristics of each branch of the ...industry) and an appropriate tax system." 7/

There are a host of reasons given by economists why government drilling corporations (would not) do not serve the public interest, 8/ but the point here is that certainly many companies and analysts view the Federal draft legislation - upon which Alaska's H.B. 854 appears to be patterned - as the first step towards the creation of a FOGCO, especially in that this type of legislation greatly increases the amount of uncertainty and risk related to what is already an uncertain and risky business, that of exploring for oil and gas.

6/ Arlon R. Tussing, "The Role of Public Enterprise," Mineral Leasing as an Instrument of Public Policy, British Columbia Institute for Economic Policy Analysis, 1977, p.163.

7/ Ibid., pp. 168-169

8/ See also "Natural Gas Policy Issues and Options," Prepared at the Request of Henry M. Jackson, Pursuant to R. Res. 45, A National Fuels and Energy Policy Study, Serial No. 93-20 (92-55), 1973, pp. 108-109.

C. Alaska's Leasing Objectives: Problems and Priorities

As the discussion above indicates, we see a host of problems both with the explicit and implicit objectives for H.B. 854. To summarize, we are concerned with:

(1) The Governor's Letter of Transmittal - As this letter is part of the legislative package, it will be used as a reference when, assuming H.B. 854 is passed, a future Commissioner seeks guidance in decision-making. The fact that it confuses objectives and provisions is of concern, especially where some of the provisions that are listed as "important objectives" may be counter-productive to the goals of the legislation.

(2) The Goals Listed in H.B. 854 - At least one goal (B) could be interpreted in drastically different ways, and it is unclear what goals really are most important nor how several of the goals interrelate.

(3) Implicit Goals - While the bill's supporters contend that an important purpose of H.B. 854 is to provide the Commissioner of Natural Resources with flexibility in administering the leasing program, several provisions would not only deny real flexibility but also would require justifications for non-experimentation, in effect putting political pressure on the Commissioner to experiment in bidding practices, for example, even though such experimentation may not be, in the Commissioner's judgment, in the best interests of the State of Alaska.

(4) Following the Federal Trend - We are concerned that H.B. 854, in many ways, parallels many of the provisions in the bills passed by the U. S. House and Senate. Whereas the ultimate goal (implicit or explicit) of many supporters of the Federal legislation may be the establishment of a federal drilling corporation, we would question whether or not it is in

Alaska's best interest to so closely follow the Federal lead in this area at this time...or any time. We would also caution the State, particularly about (1) the reasons why data gathering is viewed as the first step in establishing government drilling corporations; (2) the lack of hard evidence and the experimental nature of using different bidding methods; and (3) the issues related to competition and joint bidding.

To take care of the above-described problems relating to objectives, we would like to suggest some new language in the opening section of the bill (see Attachment I). We have sought, through the proposed changes, to highlight the fact that prompt exploration is an important goal which should be stated in the legislation and that this goal is inextricably related to the overall State goal of maximizing State revenue. We have sought also to provide flexibility for the Commissioner without forcing him (implicitly or explicitly) into experimentation. These and other proposed amendments are further explained in the following two sections.

III. BROAD ISSUES AND OBJECTIVES

A. Data Acquisition: How Useful?

While we understand the State's desire to know more about the potential oil and gas resources underlying State lands, we would reiterate what we and other companies have previously stated: obtaining more data from the companies does not necessarily put the State in a better position to evaluate potential resources. In fact the opposite could be true; government officials, looking at company data, might well understate the potential value of proposed lease acreage because of the general conservative nature of a government compared with, for example, the daringness of one Company geologist willing to stake a professional career on an interpretation of exploratory data. It could also be argued that the very nature of a large government agency makes it easier to hide errors of judgment whereas the company which decides to "go" on a project can hold specific employees more accountable for errors of judgment. But the most important fact to remember is that regardless of how much data the State may obtain, the State will never know what it does or does not have unless the State drills.

Since you may not wish to simply take a company's word for it, the following quotation is presented to underscore the importance of drilling as a means of obtaining useful information and to highlight the relative lack of usefulness of data without drilling. This excerpt is from the writings of an acknowledged expert in leasing policy, Professor Walter Mead, University of Southern California at Santa Barbara:

> "...while the technology for oil exploration prior to the drilling has been advanced in the last century, exploration is still subject to extemely high risk. Drilling is the only definitive test to determine the presence of oil or gas. Thus, bonus bids must be

> submitted by bidders and accepted or rejected by the government when neither the buyer nor the seller knows whether and in what quantities oil is present..." 9/ (Emphasis added)

It would seem obvious, therefore, that if the companies -- with all their data and experience -- don't know at the time of a lease sale whether they've just spent millions for the right to put millions more into drilling potentially dry holes, then the government, with the same data, could hardly be better off. And having all the data of all the companies doesn't necessarily lower the risk of error for the government in that the view supported by most of the data of most of the companies (data that might suggest that "Tract 20" is worthless, for example) could be wrong.

Because more is not necessarily better in the exploration data game, many companies do in fact view data acquisition by the government as the first step which will inevitably lead -- and naturally extend to -- the establishment of government drilling corporations. And, as previously noted, Dr. Arlon Tussing does not view "governmental ownership of producing operations" as "the most effective way of accomplishing the social ends for which it is currently being advocated..." 10/

Additionally, Dale R. Jordan details some of the more severe problems of esblishing government drilling corporations:

> "...This article's purpose is not to examine the political repercussions that might occur when dry holes are drilled with public funds; however, we should examine some of the practical considerations involved in the operation of a public company which has an almost exclusive area within which to explore as a result of discouraging the private sector. For the government to discourage both the existing explorer and the entry of any new ones and to expect the public corporation to be able to fill this void suggests that the government is saying, "if the private companies do it, so can we."

9/ Mead, op. cit., p.51.

10/ M. Crommelin and A. Thompson, "Introduction," Mineral Leasing as an Instrument of Public Policy, British Columbia Institute for Economic Policy Analysis, 1977, p.xvi.

Now remember that the private companies comprise all the oil and gas explorers working in the province and those contemplating doing so, given the right opportunities. All these companies have geological staffs, many of who will be geologists who devote most of their time over a considerable number of years entirely to the study of British Columbia's geology. The public corporation could not expect to have such an extensive source of expertise as that available in the free enterprise system. And so the public corporation would suffer from a reduction in the number of ideas generated.

It is not unusual in oil and gas exploration, with its inherent problem of scientific interpretation and evaluation of geological prospects, to find that one company will acquire a block of land, will explore it, and perhaps even drill on it before deciding the search is unsuccessful. The company will then return the land to its owner, the Crown. This does not mean that there are not any commercial hydrocarbons underlying this land; but rather that that particular company was unable to find them. To find these hydrocarbon deposits, a second, a third, or a fourth company should acquire this land, and, if this is done often enough, the hydrocarbon will be encountered, and production will follow. The problem with the public company being the only explorer in the province is that, unless it is fortunate enough to make the initial discovery, it is very doubtful whether there would be enough enthusiasm to have a second, third or perhaps even a fourth try at that particular prospect, with the result that the discovery would not be made. This is surely the worst thing that could happen and is probably the most damning argument against a public corporation moving into an area with an almost exclusive right to explore. 11/

B. Experimentation in Leasing: How Successful?

The simple answer to the above question is "No one knows." The U. S. Government tried royalty bidding on eight tracts in an October 1974 lease sale with questionable results. It appears that neither the industry participants nor government officials found the experiment to be particularly successful.

According to The Oil and Gas Journal, "operators say they doubt royalty bidding will ever surface again except in areas where production is almost certain or possibly in drainage-tract sales. Development of wildcat acreage

---

11/ Dale R. Jordan, "Petroleum Leasing in British Columbia," Ibid., pp. 252-253.

can prove too costly on a royalty bid basis, despite the absence of high front-end expenditures normally budgeted under the traditional bonus-bid system." 12/

Similarly, Energy Secretary Schlesinger appeared to be disenchanted with the royalty bidding experience in Louisiana in that, in a letter to Interior Department Secretary Andrus, Schlesinger apparently stated that the Department of Energy has reservations about the effectiveness of the royalty method based on past experience in the Gulf of Mexico. It appears in fact that Schlesinger raised the same objections to the royalty system as had been raised by industry and formerly by officials in the Department of Interior, i.e., that royalty bidding leads to early abandonment of leases because declining production eventually makes the lease unprofitable under a high royalty arrangement.

Significantly, the Department of Energy and the Interior Department are considering the formation of a task force of experts to help analyze pros and cons of the various systems being proposed in the Federal legislation (which were largely copied in H.B. 854). A key problem seems to be a dearth of experts, however, in that few governments have undertaken experiments in bidding practices long enough or in a manner similar enough as that envisioned in the proposed Federal and State legislation, and to paraphrase Dr. Arlon Tussing's comments: scholarly, empirical analysis of the different bidding systems appears to be 'remarkably skimpy.'

One source document, from which we have already quoted, appears to be quite useful, however. Published by the British Columbia Institute for Economic Policy Analysis, Mineral Leasing as an Instrument of Public Policy,

---

12/ Mike Long, "Royalty-bidding experiment turns sour," Oil and Gas Journal, May 2, 1977, p.32.

contains articles by an international and interdisciplinary group of economists, mining engineers, businessmen and industry consultants. In an introductory section, Dr. Mason Gaffney describes the report as "an outstanding contribution to a rapidly growing field of study."

Our greatest concern with the proposed legislation is reflected in many of the articles in the British Columbia Institute's report. The publication cites significant problems with many of the bidding systems proposed in H.B. 854. Since each new system is so experimental, moreover, the likelihood of the Alaska's experiments not succeeding is high. An additional concern is that it would be years before the success or lack of success with a given system can be determined.

An example of our concern relates to the use of royalty bidding. Dr. Arlon Tussing, Dr. Walter Mead and others (including now Energy Secretary Schlesinger) have raised objections to royalty bidding for a variety of reasons. In the Report, Professor Hayne E. Leland, University of California at Berkeley, echoes some of their concerns and ours:

> "Competitive bidding theory makes clear that undesirable consequences may follow from royalty or profit share bidding. If there are no bonus payments required, speculative bidding may lead to extremely high royalties or profit shares being bid, with development occuring only in the most favorable circumstances. This happens because firms have little or nothing to lose by bidding high and then failing to explore or develop..." 13/ (Emphasis added)

Gregg Erickson, a well-known Alaskan economist, in his article on "Work Commitment Bidding," suggests that the problems associated with royalty bidding are well known:

> "The problems created by royalty bidding, principally the premature shutdown effect and the potential for speculator induced misallocation of leases, have been well discussed in the literature. More importantly, they are well understood by persons influencing both public and private mineral resource policies." 14/ (Emphasis added)

13/ Hayne Leland, "Comment," British Columbia Institute Report, p.60.

14/ Gregg Erickson, "Work Commitment Bidding," Ibid., p.61.

Yet, it is not clear to us that royalty bidding problems are well understood by the officials who will guide the Department of Natural Resources in leasing decisions in the next few critical years or in the future.

A specific example of why we are concerned relates to the material prepared by the Department of Natural Resources to accompany H.B. 854, entitled "Two Views on Bidding Strategies." Not only are the numerous problems and dangers of royalty bidding (cited by Meade, Erickson and others in the University of British Columbia Report) not even mentioned, but also, after three short descriptive phrases under the heading "Royalty Bid-Fixed Bonus," the Department of Natural Resources, with no further comment, analysis, or explanation, simply states: "The Beaufort Sale is an ideal candidate for a royalty bidding scheme." (Emphasis added)

We view such remarks by the State Administration with concern. As indicated previously, many who have taken the time to study the various proposed bidding methods in depth list extensive problems with various schemes for royalty bidding (see also Attachment 2) and, would hesitate to use royalty bidding schemes of any sort except in drainage sales or where there are known, proven reserves (as mentioned above in the Leland citation). The Beaufort Sea is believed to have a high potential for discovery, but, as in the Gulf of Alaska, the drilling of wells may result in no discoveries, or discoveries of marginal fields. No discoveries - with royalty bidding - means no income for the State of Alaska. And, as royalty bidding adds risk for the State, another quote from Leland is perhaps appropriate here:

> "Note that if the lessor is such that leasing forms a substantial fraction of its revenue (for example the State of Alaska), it may not be optimal to transfer risk from firms to the lessor. Thus, lease contracts which might be appropriate to the federal government may not be appropriate for regional governments". 15/ (Emphasis added)

15/ Leland, op cit., p.60.

In view of the Department of Natural Resources' apparent current ease of decision-making with regard to where and how the current competitive-bid lease system should be abandoned, we feel it important to stress that we concur both with Mason Gaffney and Gregg Erickson as to where the burden of proof should lie, i.e., with those who would change the current system--not, as is implied and indirectly stated in H.B. 854, upon the Commissioner who would be cautious about a great deal of experimentation. In this regard, we believe we are safe in assuming that Gregg Erickson's statement below with respect to the work commitment bidding system would apply to any new proposed bidding system:

> "The adoption of a work commitment bidding system implies a judgment that existing institutions for private exploration of public resources result in a suboptimal rate of resource development.
>
> Any argument for the adoption of such a system must first establish that this is in fact the case..." 16/

Similarly, though in a more general way, Mason Gaffney warns:

> "To serve his citizens best, the statesman should...resist the temptation to use his power to manipulate and control...on the too easy presumption that the market has no rationale or normative value of its own. Generations of economists have established that it has, and governments seeking to improve on it need face a certain burden of proof." 17/

One final point: The effects of the cash bonus bidding method, though not perfect, have been rigorously scrutinized, with over 20 years of experience as a basis for analysis. And, according to Professor Mead's extensive studies related to the results of 35 oil and gas lease sales during the period November 1954 to May 29, 1974, bonus bidding with a fixed royalty is effective:

16/ Erickson, op cit., p.75.

17/ Gaffney, op cit., p.3.

> "On the basis of this evidence, we conclude that competitive bidding for oil and gas leases is sufficiently strong to protect the public interest in obtaining competitive values for its oil and gas resources. This conclusion is further supported by evidence presented above indicating an increase in the average number of bidders and a substantial increase in the average price bid per acre for oil and gas leases". 18/

Thus, it is our judgment that, although in certain, special circumstances, changes in the bidding approach may be advantagous to the State, several factors should be remembered. First, the State currently depends on the petroleum production for some 70 percent of its revenue, most of which is from a field that will begin to decline in about seven years. New exploration in Alaska is vitally needed.

Second, although oil companies by the nature of their business deal daily in risk and uncertainty, there is no question but that, to the extent the State can reduce uncertainty and foster confidence with regard to the use of new bidding systems, oil and gas exploration will be encouraged.

Third, because the new systems are experimental, we would suggest that the burden of proof for adopting a new system for any lease sale be placed on the Department of Natural Resources because the use of any new system involves greater risks and uncertainty not only for the companies but also for the State. The proposed amendments contained in Attachment 1 reflect this analysis and these conclusions.

18/ Mead, op cit., p.55.

C. Oil and Gas Leasing: How Competitive?

Much has been said in recent years about the competitiveness or lack of competition in oil and gas exploration and development. Concern has risen particularly with respect to joint ventures in general and joint bidding in particular. Although the formation of joint venture groups for lease sale bidding facilitates ease of entry in high-risk ventures, and allows producers to spread their financial investments in an effort to minimize overall risks, the sheer numbers of joint ventures have been interpreted by some as 'fostering something other than competition.'

The two theories about the nature of joint bidding in Federal lease sales (collusive vs. risk-sharing purposes) have been tested by University of North Carolina Professor Edward Erickson and M.I.T. Professor Robert Spann. As they reported in testimony before the U.S. Senate Commerce Committee, the observed patterns of bidding partnerships are most consistent with the hypothesis that joint bidding is a means of risk-sharing, not collusion. 19/ Among the ways in which competition might be fostered rather than reduced by joint arrangements are the following:

Because risks are shared, the cost of capital per unit of supply increment is less, so that entry barriers are lowered in high risk ventures;

Because of joint agreements, smaller independents can and do form independent and successful groups for bidding purposes in Federal lease sales, as evidenced by data on successful bidders in the June 1973 Federal lease sale;

19/ In their study of the 1972 and 1973 Federal offshore lease sales, Erickson and Spann found that membership of bidding groups varies from year to year; market shares for members fluctuate from one year to the next; the most frequent bidding group is a combination of majors and smaller firms, but majors bid alone, as do smaller firms; single firm bids are frequently made by the largest firms, but other firms are also successful single firm bidders, and bidding groups which contain a large number of firms are predominantly composed of smaller firms. They also concluded that the incidence of joint bidding increased as the size of the firm decreased; there was a heavy incidence of joint bidding partnerships between unlike firms; smaller firms use joint bidding ventures as a vehicle for entry into offshore activity. "Competition in the Field Markets for New Natural Gas Supplies," Statement before Senate Commerce Committee, November 8, 1973.

Because of the number of large and small producer combinations and the frequency with which new groups are formed with different members, producers are able to become involved in many projects so that competition is spread through many projects.

Since joint operating agreements also expressly provide for separate marketing of production from joint ventures, it would appear safe to conclude that risk-sharing through joint ventures need not make competition less intense. By facilitating ease of entry, joint ventures by domestic petroleum companies may indeed make competition more intense. 20/

The work of Professor Mead tends to underscore the findings of Erickson and Spann:

> "The most conclusive test of the workability of cash bonus bidding based on the United States record of OCS oil and gas lease sales is in terms of the rate of return on capital earned by the successful bidders. An analysis has been made on 184 offshore Louisiana oil and gas tracts leased in 1954 and 1955. Precise data are available on bonus payments, rental payments, oil and gas royalty payments, and production of oil and gas during the period from 1954 through 1967. Cost estimates were made for exploration, well drilling and equipment, and operation. Annual cost and annual wellhead values were discounted to obtain a net internal rate of return. The calculations indicate that these early OCS leases generated a 7.5 per cent before tax rate of return to the lessees. Given the fact that oil companies pay relative low U.S. income tax rates, the after tax rate of return would be only modestly lower than the 7.5 per cent before tax rate of return. This net yield clearly does not reflect monopoly power; it shows an excessive degree of competition". 21/ (Emphasis added).

In fact, two studies conducted under the auspices of the United States Geological Survey (both authored jointly by Dougherty of the University of Southern California and Lorenz of the U.S.G.S.) have indicated that the restriction of joint-bidding has failed to achieve its objectives in Federal OCS lease sales.

20/ In the last analysis, if the formation of such groups constituted monopoly power, one would expect to see some results where such groups are formed, e.g., a non-random bid price pattern in Federal lease sales.

21/ Mead, op. cit., p.55.

Major conclusions were:

1. The ban of joint-bidding by major oil companies may in fact have acted to broaden the overall influence of major companies in a given sale. The percentage of all bids and the number of bids per lease in which a major oil company was involved actually increased, which in turn may have increased the total amount of acreage in which major companies participated during this period.

2. When the U.S.G.S studies compared solo bids to joint-bids on given tracts, it was concluded that the joint-bidders tended to go after more highly sought-after leases and that they tended to bid higher on the average than sole-bidding competitors.

From a practical standpoint, allowing joint-bidding has important advantages to the State as well as to the industry, in terms of overall economic efficiency, environmental effects of exploration activity, and flexibility.

For example: Often, a given company may have a great deal of geologic and geophysical data in an area, but for one reason or another does not have the cash on hand to fully utilize its data in a competitive-bonus sale. In this kind of situation, it would make sense to join with another company that has the necessary investment capital and does not have the data.

If the two were unable to combine in partnership, a situation could develop where one company had to duplicate seismic and geologic information already held by the other company. Ironically, a situation would then develop where overall competition in the sale would be reduced, because one company with cash reserves would have expended part of its funds in gaining data, while the other company with information would be limited in participation

because of its cash limitations. Also, there would be the obvious environmental effect of the increased seismic and other activity, including, possibly, the drilling of wells, that would go along with the need to gain additional data.

In view of all of the above, we wonder why the State Administration proposes to ban joint bidding among "major and multinational oil and gas companies" (terms which are not defined in H.B. 854). Again, is the State simply following the Federal government's lead? If so, we would repeat Leland's cautionary note that it may not be in the State of Alaska's best interest so to do.

NOTE: The fact that Sohio/BP has proposed amendments to some sections of H.B. 854 does not mean that the Company endorses the bill in its entirety with the proposed amendments nor that we endorse the provisions to which we did not offer amendments. Part I of this paper is meant to clarify many of the concerns we have with H.B. 854 conceptually as well as in detail, concerns which, as shown in Part I, have been expressed in the analytical literature on the subject of the bill.

PART II: H.B. 854: PROBLEMS AND SUGGESTED AMENDMENTS

I. PROPOSED AMENDMENTS TO MAJOR PROVISIONS

A. Objectives (findings):

As explained in Part I above, we feel strongly that the language pertaining to the State's objectives as contained in the "findings" section of H.B. 854, should be amended to clarify the State's major goals in its leasing program. This section will and should be used by the Commissioner of Natural Resources in carrying out the Department's responsibilities under the proposed act in the "best interests" of the State.

These suggested amendments to H.B. 854 are particularly important in that, as explained before, some of the "important goals" outlined in the Governor's letter of transmittal appear to conflict with the apparent goals expressed in H.B. 854.

Suggestions: (Refer to attached draft language, Attachment 1, Page 1 and 2).

We suggest amending (A) to reflect the global and Alaskan energy/economic outlook. We also substituted the goal of encouraging prompt exploration and competition, in place of the ambiguous language of the original (B).

On Page 2, under (2), our amending language was designed to reduce uncertainty with regard to the implementation of the program. The language would allow flexibility, but only where consistent with the findings in (1).

Changes in (A) and (B) on Page 2 simplify the language in the original bill to reach the same goals, listed in (A) through (D) in H.B. 854.

B. Procedures

On Page 2, in (B), we suggest that the Commissioner be required to make his lease sale program consistent with the objectives in the bill.

Under (1), on Page 3 of the draft, we suggest that the status of the current leasing program shall be reported to the legislature, rather than, "submitted."

Section (2) clarifies ambiguous language in the same section of the original bill.

Section (3), also on Page 3, provides more certainty in lease stipulations and conditions by adopting language already contained in proposed state pre-leasing regulations.

On Page 4, under (B) in the suggested language, we suggest permitting the public to comment on the form of the lease sale as well as the leasing program itself.

Changes in (C) and (D) are being suggested to make the language more specific to reduce unnecessary delays and the potential for litigation, by adding "appropriate" federal agencies, "affected" local governments, etc...

Section (G) was added to clarify that (A) through (F) do not supercede Section 305 and 345 of the Alaska Lands Act, which provide for extensive review by affected municipalities and Alaska Native groups.

On Page 5 of the draft language, in (A), we would suggest that the Commissioner review bidding methods and leasing procedures used in the previous five years, rather than one year.

We suggest deleting (E) in the original H.B. 854 because we feel that such a requirement would put the Commissioner under undue pressure to experiment. It would tend to undercut the overall goal of flexibility for the Commissioner.

C. Lease Methods

We suggest new language in (C) on Page 6 of the draft, to provide more flexibility to the Commissioner, to insure fairness to all participants, to insure that the program is consistent with legislative findings of H.B. 854, and to place the burden of proof for the need of change to an alternative bidding system on the Commissioner.

D. Reduction of Royalty

On Page 9 of the draft language, the purpose of our amending language is to make it more difficult for speculation in the bidding of royalties. Under the proposed language, the lessee would have to clearly show that a reduction in royalty is required. These amendments should help in avoiding the problem of irresponsible bidding during a royalty-bid sale.

E. Bonus Bid Deferral

We would propose deleting this language (E) in original bill, Page 9, because we think that the option to defer payment of bonuses would encourage speculation and could lead to charges of unfairness if lessees have the option to "renegotiate" bonuses.

F. Withholding Acreage

For a variety of reasons, we would propose deleting Section (F) in the original bill, page 10. This is similar to powers held by the Commissioner under existing statutes and, as such, is not objectionable.

However, the problem with withholding acreage is illustrated by the description of it as "the fifth bidding system" by the Department of Natural Resources. This is further amplified by written comments by DNR personnel, in Report 2-77, where the withholding of acreage was specifically recommended as a means of significantly increasing state income on the assumption that the withheld acreage would cover half a known geological structure.

In the example discussed in Report 2-77 under the title of "Percentage of Acreage Withheld Leasing," it is assumed that 60% of a structure is leased initially at odds of 1 success in 10 which, after exploration, improve to 9 in 10. The fallacy of the argument is that the authors, (and subsequent proponents of the idea), neglected to take into account the other nine instances where exploration shows the acreage to be more or less worthless. Although 4% (10% of the withheld 40%) would attract high bids, the average overall income should be no different than if the whole acreage had been leased initially.

The assumption that all closed geological structures contain hydrocarbons is attractive, but untrue. The ability to close the rare structures which are filled with hydrocarbons is not vested in the State's geologists or those of a single oil company. Consequently the chances of the State losing income by deliberately withholding leases over a structure far exceed the chances of it making a windfall profit from the procedure.

What is often forgotten in the use of the example of Prudhoe Bay to show how not to lease, is the fact that at the time of the geophysical recognition of the Prudhoe structure, a bigger and geologically more attractive structure was found a short distance away. This was known as

the "Colville High". The Colville structure was drilled in 1966 with disastrous results because it was discovered to be dry and devoid of prospects. Those results seriously downgraded the Prudhoe structure, in the following year. It is highly unlikely that even if the Commissioner has the choice of multiple bidding methods he would have leased the Prudhoe acreage by anything other than cash bonus bids. If he had guessed, the same way that industry did, that the Colville High was the better of the two structures and had deliberately withheld half of it from leasing, would he have dared, in the light of the drilling failures, to do the same for Prudhoe? Obviously he would not have risked a second debacle. It is annoying in the light of this history to read that DNR authors, in, "Two Views on Bidding Strategies", 1978, persist in misusing the Prudhoe Bay example to reach the incorrect conclusion that "Bonus bidding should not have been used in that instance."

G. Exploration Work Credit Program

This is a suggestion made before the House Resources Committee by Sohio in early hearings on H.B. 854, involving credits for exploration as an incentive.

A major objective of H.B. 854 is to maximize revenues to Alaska, but to do this it is essential that the State adopt policies which encourage a steady, ongoing exploration program on State lands. Many sections in H.B. 854, if enacted, could actually serve to dampen exploration, but one option the State Legislature could consider to add an incentive for exploration is a program similar to Albert'a Exploratory Drilling Incentive System. This kind of program has proven to be successful as a way of encouraging high levels of exploratory activity, and in Alberta has been largely responsible for the record-breaking levels of drilling

activity in recent years, and subsequent high rates of discoveries since it was introduced in 1974. This year, the program was extended, until 1981.

The system is simple and is based on a drilling credit which can be earned by all exploratory wells and which varies according to the footage drilled and the region drilled in. For example, under the Alberta system, a well drilled to 8,000 feet on the North Slope could earn a credit of, for example, $2 million, where a similar well on the Kenai Peninsula might qualify for a $1.5 million credit. Deeper wells could earn proportionately more, as would offshore wells. These credits could be scheduled to equal approximately one-third to one-half of the cost of a well in each region, and they could be used by the earning company against bonus bids in a State sale, or against lease rental payments of royalty payments. The result could be an influx of capital into Alaska, similar to what has taken place in Alberta. But since the Commissioner would control the incentive program by regulation, it would be capital that would be directed by the State to areas in which the State wished exploration to occur.

To allow the Commissioner the discretion to introduce such a drilling credit system, we have taken the liberty of proposing general language in section (f) that could be translated into detailed regulations for a successful incentive program (see Page 10).

The system would require control by the Department of Natural Resources, but it could operate with less manpower than is needed for the policing of net profit bidding or royalty-bidding systems. The benefits would be tangible and immediate, and would probably exceed, in terms of new revenues to Alaska, the theoretical and untried potential of royalty or net-profits bidding.

H. Terms and Regulations

On Page 11 of the draft, our proposed language in (G) would replace (G) and (H) in the original bill. Our language would be simpler and would accomplish the same purpose, we think.

I. Lease Terms

On Page 13 of the draft language, our new language in (H) would give the Commissioner the option to have five-year lease terms, but only where the Commissioner finds that environmental and economic conditions would not severely restrict operations. The original language in the bill requires a five-year lease unless severe environmental conditions require a longer period.

In most parts of Alaska, severe environmental conditions and remote exploration locations dictate that drilling and other exploration activity be done only on a seasonal basis. A five-year lease term would therefore place great strain on the operator in all parts of the State except for Cook Inlet or Southern Alaska locations where work can proceed year-round. Our proposed language would leave the 10-year lease term intact, although the Commissioner would have the option for shorter terms where environmental conditions permit.

Our proposed language would also give the Commissioner authority to go to larger lease tracts if circumstances require, if, for example, a work-commitment system is used.

J. 90-Day Provision

Also on Page 13 of the draft language, we also amend section (H) in language dealing with expiration of leases, to reflect unique Alaskan environmental problems in the term "reasonable diligence." This language

deals with activities that an operator may have underway at the time of the expiration of a lease. We would like to see environmental conditions taken into consideration by the Commissioner in delays that might affect an operator.

Also in section (H) on Page 13, we would suggest amending the language to reflect that a lease will be extended if there is a well capable of producing oil and gas, rather than a well producing oil and gas, as in the original language. Our reasoning is that there could be situations where a productive well has been drilled, but there are delays in building transportion systems to actually take the oil away.

K. Commissioner's Role in Conservation

On Page 17 of the draft, we propose new language that would clarify an apparent ambiguity in the original language regarding the Commissioner's conservation regulatory authority under Title 31 over pools unitized under this chapter. Our suggested language would reinforce the Commissioner's conservation authority, and would clarify this language.

L. Noncompetitive Leasing

Sohio-BP has no corporate position on noncompetitive leasing, but while some companies would like to have the option of noncompetitive leasing available, there may be situations where the State's broader public interest might not be served. Noncompetitive leasing can invite speculation in leases and in certain circumstances, there could be adverse environmental effects.

M. Joint Bidding Prohibitions

On Page 21 of the draft, the original language in the bill allows the Commissioner to restrict joint bidding by "major and multinational oil and gas companies" (these terms are nowhere defined). There are many serious problems that are discussed extensively in Part I, Section III C with respect to this provision. Based on the conclusions of the studies cited in this section ("Oil and Gas Leasing: How Competitive?"), we would suggest that it is neither necessary nor in the State's interest ot restrict joint bidding in any way. Such prohibitions not only restrict entry into Alaska leasing, but also could reduce potential revenues from lease sales. We would suggest deletion of this section from the bill.

N. State's Right to Purchase Oil and Gas

Section (v) on page 21 in H.B. 854 would include in leases a provision whereby the State would be allowed to puchase up to 100 percent of any gas discovered on State lands. This could be very harmful to the State in the long run, as it could effectively eliminate the financing of exploration programs by means of gas sale contracts. These contracts have been normal in Alaska, and in the past few years have contributed many millions of dollars to oil and gas drilling. This source of investment would be cut off and the proposed provision would only discourage exploration and the purposeful search for gas.

Under the terms of this section, contractual commitments would be impossible to make because the lessee would have no certainty of ownership of gas and would lose the right to dispose of his share of production to his best advantage, which could also be to the State's advantage. The result could be an increase in the risks and costs of exploration.

O. Data

In accordance with statements made by Administration officials with respect to the intent of the langugage in H.B. 854 relating to data acquisition and confidentiality, we have amended (w) of H.B. 854 on Page 21. Under our amended language in (s) on the same page, therefore, the Commissioner is given access only to noninterpretative data which shall be held confidential upon the request of the lessee or permittee as provided in AS 38.05.035. Additionally, in our (s) section, we have added that the Commissioner shall, by regulation establish procedures to govern access to and the safekeeping of such data.

As to the usefulness of such data acquisition, we would refer you to the analysis contained in PART I, Section III A above ("Data Acquisition: How Useful?"). This section additionally attempts to explain why data acquisition by the government is frequently viewed as the first step that inevitably leads to government drilling corporations.

P. Acreage Limitations

Section 3 AS 38.05.140(c) in H.B. 854 would limit any one company's onshore lease holdings to a limit of 200,000 acres. We would suggest that this limitation may be unnecessary in reaching the objective of encouraging competition and may, in fact, undercut the goal of maximizing competition on State lands simply because some companies are now near or at the proposed limit in terms of onshore acreage holdings. They would not be able to participate in future state sales for at least five years if this provision were enacted.

The limitation also seems to work against other objectives of H.B. 854. For instance, the Department of Natural Resources, in its comments on the proposed work commitment bidding method, acknowledges that large areas on the order of 100,000 acres are needed to make the type of bidding practical. Such acreage would be low potential, high risk land which would not normally be seriously considered for exploration. If the 200,000 acre maximum is retained, no responsible company could even bid on large work commitment parcels of this kind. Consequently, retention of this stipulation would narrow the leasing options available to the State and would be detrimental to the responsible assessment of State land.

II. SUMMARY AND CONCLUSIONS

In summary, we would offer these observations and conclusions:

1. H.B. 854 as currently drafted would create a State leasing system biased towards experimentation with procedures that are new and untried in Alaska. This may not be in the State's interest, because unusual leasing systems could lead to delays in petroleum development that could have serious consequences on future State revenues and Alaska's contribution toward U.S. energy needs.

2. The United States faces a critical energy-import problem that may have serious consequences for the Nation's economy. Alaska can contribute to the lessening of U.S. dependence on imported oil, but long lead times and large investments are needed to develop new petroleum discoveries in remote Alaskan locations. By enacting new leasing legislation that could lead to unusual and untried lease systems, the State could inadvertently delay exploration and development in remote Alaskan areas with resulting consequences in the global energy/economic sphere.

3. The State of Alaska faces a potentially serious revenue situation in the late 1980's as annual State expenditures increase and oil production from the Prudhoe Bay field begins to decline. Again, the long lead-times needed to find and develop new Alaskan oil discoveries would indicate that exploration must proceed soon on State lands to provide needed petroleum revenues.

4. Alternative bidding systems proposed in H.B. 854, although also proposed in OCS legislation now pending in Congress, have not had extensive use in the U.S., nor in very many other places in the world. Experience with royalty bidding in federal OCS sales has been dissappointing, and the federal government may now be reconsidering the use of alternate bidding systems other than the competitive bonus-bid procedures.

5. The majority of academic literature that we have been able to find supports the thesis that the traditional bidding methods have worked well in the leasing of public lands for petroleum development. Academic experts also seem to agree that alternative bidding systems present serious problems, except when used in certain special situations.

6. We have offered in Attachment 1 suggested language that would, we believe, improve many sections of H.B. 854, and give the Commissioner the flexibility he desires while at the same time encouraging the use of proven leasing systems unless special circumstances dictate the need for an alternate situation. Royalty-bidding in a drainage sale would be an example.

7. We have suggested an exploration work-credit program similar to a successful system used in Alberta that we believe would offer substantial incentives for increased Alaska oil and gas exploration.

LEASING METHODS EXAMINED

BUT NOT INCLUDED IN HB 854

1. The so-called "dual leasing" system which would authorize the State to issue separate exploration and production leases. Senator Ted Steven's amendment to S-9 would permit the exploratory lessee to share with the government (Federal) the costs of the exploratory drilling program, which would be managed by the lessee, in exchange for a share of the revenues received by the government from a subsequently issued production lease.

   The Administration believes that the State can know before it offers its land for drilling what development and production activities it expects to take place.

2. Dr. Mason Gaffney's ad valorem charge, or a "post" royalty system versus the "ante" systems in HB 854. In other words, the state determines its take before discovery, not after. Other governments, like the Canadian national, are going to the "post" systems, i.e. "progressive incremental royalty."

3. Incentives. There are no direct incentives to lessees contemplated in HB 854, except that "work commitment" would allow cash bonuses not to go to the government but instead used by industry for exploration.

4. Government equities in leases or state-owned and operated exploration companies are not envisioned in HB 854.

5. Oil Payment Bidding - shift royalty to rental.

6. Performance System which provides government with the authority to specify the exact rate and extent of resource development.

7. Share Bidding or Phillips Plan. Bonus bids are entered for the entire structure instead of for a specific tract. Based on their equity in the field, each company receives a percent of the profits or losses with a maximum percentage participation by any one company.

8. Alberta's so-called "checkerboard" leasing system wherein a reservation holder may apply for leases over not more than 50% of the area in the reservation in a checker-board pattern. These leases convey the right to produce and sell the Crown's oil and gas, and the government retains the right to alter unilaterally the terms and conditions of the arrangement.

Fax to: Bob Walker, Juneau May 26, 1978

From: Bleu Beathard, Anchorage

Proposed Amendments to HB 854
(In order of importance)

1. Section N, page 6, lines 20-25.

Delete first two sentences, replace with following:

An oil and gas lease must cover a reasonably compact area not exceeding 5,760 acres and must be for a period of ten years. The Commissioner may grant a lease for a term less than ten years but not less than five years if he finds that environmental conditions do not severely restrict operations.

2. Section 3 AS 38.05.140(c), page 12, lines 5-15.

Delete remainder of this section starting with sentence that begins No persons may take or hold, and replace with the following:

No persons may take or hold at any one time oil or gas leases exceeding in the aggregate 500,000 acres granted on tide and submerged lands and 500,000 acres on all lands other than tide and submerged lands, including leases held both as lessee and under option or operating agreement from others. Where more than a single person holds an interest in an oil or gas lease, each person shall be charged only with that percentage of the total acreage which corresponds to its percentage share of the total beneficial interest in the lease.

3. Section O, page 7, line 29.

Amend as follows:

for the fifth year and subsequent years, $3.00 per acre.

4. Section C, page 2.

Line 10 delete words third and fourth, change years to year.

Line 12 delete fourth.

Line 13 delete after the year.

THE LEGISLATURE OF THE STATE OF ALASKA

R F

IN THE FREE CONFERENCE COMMITTEE ON HB 854
MOVED BY SENATOR CROFT:

Add the following subsection to SCS CSHB 854 (Resources), renumber the succeeding subsections accordingly, and adopt the thus amended version as the Free Conference Committee Substitute for SCS CSHB 854.

(x) The commissioner may include in any oil and gas lease provisions giving the state the right to purchase at the prevailing price an amount of oil and an amount of gas equal to the percentage amounts reserved in the lease to the state as royalty. The provisions shall provide that the lessee shall be given the same notice of the exercise of the option to purchase as is required for the state's exercise of its option to take royalty in kind. The commissioner may not include these provisions in any lease unless the intention to include it in the lease is stated in the final notice of sale issued not less than 30 days before the date of the sale.

HOUSE JOURNAL

LETTER OF INTENT

CSHB 854 (RESOURCES)

The Honorable Hugh Malone
Speaker of the House
Alaska State Legislature

Dear Mr. Speaker:

The Resources Committee substitute for House Bill 854 makes numerous changes in the legislation as proposed by the Governor. Two of these changes involve the deletion of the following language:

1. Subsection (f) on page 6.

2. In subsection (j) the following sentence (at the top of page 8 in the original bill) - "The commissioner may provide by regulation and in the lease that the lessee may earn production rights only to the depth drilled at the beginning of production from the lease."

The record should show that the committee's intent in deleting these two items was not to limit the discretion of the Commissioner of Natural Resources in these areas, but simply the result of its determination that the authority in both of these areas is implied, and does not require special authorizing language in the bill.

Alvin Osterback

Alvin Osterback, Chairman
House Resources Committee

Date: 4/14/78

AGO 546861

DESCRIPTION OF LEASING METHODS IN HB854

Currently, the State of Alaska's leasing system is a cash bonus bid with a minimum fixed royalty of 12.5 percent. The methods outlined below include the present system with different fixed royalties, sliding scale royalty with bonus bid, sliding scale royalty bid with fixed bonus, net profit share bid with fixed bonus, royalty bid with fixed bonus and exploration work commitment. The basic elements of these methods are summarized below.

(1) Bonus Bid With Fixed Royalty

Bonus bid with fixed royalty is the system currently used by the State of Alaska. In a lease sale, the winning bid for a tract is the one which makes the highest sealed or auctioned cash bonus bid. There is also a minimum royalty of 12.5 percent. An advantage of this system is that government receives revenue regardless if there are economical quantities of oil or gas found and/or produced. To avoid early termination of production, royalties need to be flexible during a field's declining years.

(2) Sliding Scale Royalty With Bonus Bid (or Sliding Scale Bid with Fixed Bonus)

Under this system, the government receives a cash bonus bid and a sliding scale royalty. We used 12.5 percent as a minimum figure and 62.5 percent as a ceiling wherein the rate in any period is dependent upon the production of that period.

The royalty rate is graduated in much the same manner as the federal personal income tax. Table I gives two examples of a sliding scale royalty schedule. The royalty is progressive, that is, the royalty on additional production increases. For example, in the South Central Area, the initial 500 barrels pay a royalty of 12.5 percent, the next 500 barrels pay 25 percent. The royalty rate increases by 12.5 percentage points per 500 barrels until 2000 barrels of output are achieved. All production beyond 2001 barrels pays a royalty of 62.5 percent. Thus, if production reaches 5000 barrels, the average royalty rate is 50 percent. In the limit, the average rate would converge towards 62.5 percent as daily production continues to increase.

As field productivity declines and well production falls, the producer backs down the schedule and royalties decline. In order to optimally exploit the field, the royalties should decline to zero near the end of field life. Actually, final rates of five or six percent would result in minimal early shut down.

TABLE I
TYPICAL SLIDING SCALE ROYALTY SCHEDULES

SOUTH CENTRAL AREA

Daily Average Prod. Rate (Bbls./day)	Incremental Royalty Rate (%)	Royalty For Specific Producing Rates: Producing Rate (Bbls./day)	Royalty Production (Bbls./day)	Average Royalty Rate (%)
-500	12.5	500	62.5	12.50
501-1000	25.0	1000	187.5	18.75
1001-1500	37.5	1500	375.0	25.00
1501-2000	50.0	2000	625.0	31.25
2001-2500	62.5	2500	937.5	37.50
		3500	1562.5	44.64
		4500	2187.5	48.61
		5000	2500.0	50.00

NORTH SLOPE AREA

Daily Average Prod. Rate (Bbls./day)	Incremental Royalty Rate (%)	Royalty For Specific Producing Rates: Producing Rate (Bbls./day)	Royalty Production (Bbls./day)	Average Royalty Rate (%)
-1000	12.5	1000	125	12.50
1001-2000	25.0	2000	375	18.75
2001-3000	37.5	3000	750	25.00
3001-4000	50.0	4000	1250	31.25
4001 and above	62.5	5000	1875	37.50
		7000	3125	44.64
		9000	4375	48.61
		10000	5000	50.00

Note: The Sliding Scale Royalty Schedule for the North Slope area is significantly higher than for the South Central area because the higher North Slope operating costs result in a much higher economic limit.

Hopefully, this illustration clarifies the relationship between production rates and royalty rates.

Greater flexibility in setting the initial rate is the major advantage of this system while not running the risk of an uneconomically (for Industry) high royalty rate. On the other hand, to achieve an overall lower royalty payment, a company might spread out production over a longer period of time. Usually, however, because of the time value of money and increased operating costs, oil companies generally try to accelerate production.

(3) Net Profit Share Bid With Fixed Bonus
A small fixed bonus is required as earnest money. The bonus is low enough to encourage producers to bid a high net profit share while permitting profitable development.

(4) Royalty Bid With Fixed Bonus
This system utilizes the same method to calculate fixed bonus as described for Net Profit Share. The bid parameter is a function of production instead of net profits. Since the bonus is fixed, interested parties bid on the royalty rate that the government is to receive. The advantage of royalty bidding is that little front end money is needed by Industry. However, this could encourage speculation causing an overbid. Royalty bidding should encourage more competition among bidders and may allow the smaller companies a better chance of winning the tract.

(5) Work Commitment With Fixed Bonus, Royalty or Net Profit Share
The government itemizes the performance criteria such as the rate and amount of work to be performed on each tract. The total bid specified in dollar terms and a portion of the bid used for exploration and development activities. This system gives the government some control over the rate and extent of resource development.

TWO VIEWS ON BIDDING STRATEGIES

WEALTH MAXIMIZING STRATEGIES FROM THE STATE'S VIEWPOINT

The choice of bidding method cannot be made on the basis of any single criteria but is the result of evaluating a number of factors including but not limited to the potential economic payoff and physical characteristics of the lease area. HB854 offers essentially four leasing schemes: (1) Bonus Bid - Fixed Royalty, (2) Royalty Bid - Fixed Bonus, (3) Net Profit Bidding with Fixed Bonus, (4) Work Commitment with Bonus Bidding. These options will be briefly evaluated.

Bonus Bid - Fixed Royalty

If the royalty is fixed at 12-½%, there is no reason to use this option. It is of historical value only. At higher fixed royalties, it has some merit, but the higher fixed royalty means a lower bonus bid which is supposedly the advantage of the system. Private discount rates are too high for bonus bidding to be advantageous to the State. For example, a brief examination of an annuity table suggests that increases in the discount rate rapidly diminish the present value of a future income stream. This income stream can be interpreted as the discounted net revenues resulting from the potential discovery and development of an oil field. Table II illustrates the discount rate effect.

Table II
Present Value of an Annuity of $1 Million
(Values in 10°$)

Number of Years	Discount Rates					
	6%	10%	14%	16%	18%	20%
20	$11.470	$ 8.514	$6.623	$5.929	$5.353	$4.870
30	13.765	9.427	7.003	6.177	5.517	4.979
N	16.67	10.00	7.14	6.25	5.56	5.00

From the State's viewpoint, a 6% discount rate may properly reflect the present value of the income generated by the potential oil discovery. The industry, on the other hand, is likely to discount the future net income stream at much higher rates, say 20%. Thus, the maximum bid under ideal circumstances would be $5 million for an income stream that would yield net revenues of on million per year in perpetuity. Perpetuity is longer than the life of Prudhoe Bay.

Royalty Bid - Fixed Bonus

Relatively easy to administer - reduces risk and front end filter to the private sector. With sliding scale, most early shut down problems are avoided. The fact

that the State receives a revenue stream over a 20+ year time horizon also is an attractive feature. The Beaufort Sale is an ideal candidate for a royalty bidding scheme.

Net Profit Bidding

This is very attractive from a risk sharing point of view. All risks (geologic, exploration, development, and production costs as well as product price) are shared with the industry. Would increase exploration and development in remote high risk areas. May be useful where there is low probability of bid find. Under ideal circumstances (political) is the best of all possible options but does have serious administrative problems.

Work Commitment

Cases where State wants information and is willing to specify type of information desired. Good for high risk areas in remote locations. May also be used where the State wants more information before putting structures up for competitive bidding scheme.

On balance, the royalty bidding schemes represent a substantial improvement over bonus bidding and are administratively tractable. Given the time to build the expertise, it may be advisable to shift to profit sharing or ad valorem schemes.

MULTIPURPOSE STRATEGIES

Bonus Bids

Bonus bidding should be applied in cases where the State has either:

(a) A very great amount of knowledge about the resource, or
(b) The prospect is of extremely high risk, the lessor has little knowledge of the resource and expected value revenues would be marginal.

The first case (a) where tracts might be offered for Bonus Bidding could be that of a drainage or near drainage situation where the State wished to maximize its near term discounted revenues. It would be advisable to not offer all of the tracts for bonus bidding, but to withhold a percent of acreage to be sold at a later date, (Report 2-77). Also, since royalty and other bidding methods have shown to offer higher expected value revenues for lower risk cases it could be advisable to mix royalty bidding with the bonus bidding, a practice followed by the Federal Government in the recent Cook Inlet OCS sale.

In the second case (b), that of extreme high risk, bonus bidding can be used as a filter to determine the value of marginal tracts. This is discussed under the section on (t) low potential, high risk and previously leased.

AGD 546866

Report 2-77 indicates that for very high risk cases all bidding methods approach the same level of expected value income for the State. In cases of small and marginal potential reservoirs the bonus bid method with its ease of administration might afford optimum State revenues. Report 2-77 also indicates that in probability of success percents of 1 percent or less bonus bids could afford higher revenues, but the State should ensure that leasing under such high risk cases only occurs when sufficient knowledge is gained to indicate that the land to be leased is of such a low potential. For example, a geologic structure as large as the Prudhoe Bay anticline may have had a high degree of risk before it was drilled but its potential to hold enormous reserves was there. Bonus bidding should not have been used in that instance.

In summary, bonus bidding can be used when:

(1) Very small potential reservoirs are expected;

(2) Extreme risk is expected and the gaining of sufficient knowledge to determine the presence of reservoirs is unwarrented because of marginal to low potential indications.

(3) A sliding royalty should be considered in all bonus bid cases;

(4) This method could be used in a mixture with other methods such as royalty bidding;

(5) Also, in general, this method should only be considered when leasing in the less desirable state areas, i.e. those below the top 10 rank.

Royalty Bidding - Fixed Bonus

Report 2-77 indicates that royalty bidding and profit sharing deliver the highest expected value revenues to the State of all bidding methods. It is particularly effective where the probability of occurrence is high (i.e. low risk) and especially when the expected reservoirs are large. A sliding scale should be added in the declining production years to eliminate the problem of premature shut down. Cases for royalty bidding would be when:

(1) The State has enough knowledge to assess the size of potential traps.

(2) Potential reservoirs are not extremely small or of extreme risk.

The Beaufort Sea sale is a good example of a case for using Royalty bidding on tracts. In general, this method should be considered when leasing in the top 10 leasing areas on the desirability scale.

Net Profit Bidding

Net profit bidding would be most advantageous when costs and oil prices are in a state of extreme fluctuations making economic predictions unreliable. In remote high risk areas, this method might attract stronger bids than the royalty

or the bonus bid method.

Of the 35 potential State leasing areas, this method might be used to advantage on those areas below the top 10 in desirability.

Work Commitment

(See section (t)).

This bidding method can be best used where the State has a large (i.e. 100,000+ acres) area of probable low potential where industry has shown a general lack of interest in exploration and leasing. By offering a large area for lease to one lease owner, the State provides an extra incentive to undertake exploration and the State ensures the exploration by making the bid variable.

This method would be used in remote low potential high risk areas. Some of the State's 3 mile limit lands such as Area IX might be applicable to this method.

Low Potential & High Risk and Previously Leased Section (t)

On the basis of exploration knowledge, lack of interest by industry and reasonable analysis, the department may determine that lands have very low potential for oil and gas.

As a means of encouraging the evaluation and possible development of these low potential lands, the department could:

(1) Offer the lands for competitive lease using a bonus bid with sliding royalty. A minimum bid equal to the first year's rentals could be used to filter the bids. This should give a check on the potential of the lands. The sliding royalty would act as a safeguard for very low value bonus bid tracts if a discovery is made later on the lands.

(2) On tracts that receive no acceptable bids, the commissioner could hold a non-competitive similtaneous drawing after proper notice (30 days). Tracts not receiving applications for the drawing could then be opened for over the counter applications. Tracts could be offered at fixed 50¢/year rentals, 5 year terms. A sliding scale royalty would be used in all cases to provide a revenue safeguard against future potential discoveries.

(3) In some cases, all tracts not receiving acceptable bids could be aggregated into large blocks (100,000 acres or more) and offered for work commitment bidding or development contracts.

The Honorable Steve Cowper
Chairman
House Finance Committee
Alaska State Legislature
Pouch V - State Capitol
Juneau, AK 99811

Dear Steve:

I'd like to review and expand a bit on my discussion last week before your House Finance Committee with respect to CS for House Bill No. 854 -- specifically the proposed exploration incentive credit system.

You will recall that we had suggested the possibility that a minimum work obligation be set out by the Commissioner on every lease offered for competitive bidding. The purpose would be to discourage speculative lease holding and to ensure that the State will get the benefit of actual exploratory activity by each successful bidder. Competing companies would, of course, reckon on the minimum work obligations when they calculate their bids.

We further suggested before your Committee that the exploration incentive credit system (pp. 4-5) may not be an essential incentive, particularly if there are work obligations and especially where prospects are attractive. In any event, the specific provisions of the bill look to be extremely awkward.

If the Legislature feels they should provide the Commissioner with authority for an exploration incentive system, we think you might alternatively consider something along the following

. . . /

AGO 546828

lines. First, expenditures up to minimum work obligations would not qualify. Second, beyond that minimum, additional expenditures on drilling exploratory wells could qualify for incentive credits. Credits could be related to footage and region; credits should never exceed a specified percentage of well cost -- as provided in the bill. Third, such credits could be applied against lease rentals -- not only on the lease where the well is drilled, but on any rentals accruing on State leases. To the extent that exploratory drilling credits exceed a company's accrued rentals, they might perhaps be carried forward. This could be a somewhat simpler approach to an exploration incentive credit system. It would apparently obviate the provision now in the bill whereby the Legislature has to appropriate offsetting funds to reimburse the Alaska permanent fund and the Alaska renewable resources development fund.

The proposed credits for geophysical work on State land within two seasons of an announced lease sale look to be even less necessary. We can appreciate a company's concern that costly exploration outlays designed to provide information to that company in advance of a scheduled lease sale may lose its proprietary value if a lease sale is deferred and the period of confidentiality expires. You may want to consider, therefore, that the period of confidentiality shall be extended by the Commissioner for work done on or proximate to areas scheduled for leasing if the lease sale is deferred beyond its announced date -- but not beyond some limited extension, say, 12 to 18 months.

I hope these thoughts may be of interest. Don't hesitate to call if we can be of any help.

Best regards.

Cordially,

Milton Lipton

STATE OF ALASKA

JAY S. HAMMOND, GOVERNOR

DEPARTMENT OF NATURAL RESOURCES

MINERALS AND ENERGY MANAGEMENT / 323 E. 4TH AVENUE – ANCHORAGE 99501

July 1, 1977

To The Honorable Hugh Malone
Speaker of the House of Representatives
Box 9
Kenai, AK 99611

Dear Mr. Malone:

The Division of Minerals and Energy Management has been appointed the lead agency in developing the Alaskan Petroleum Leasing System. A major portion of the Leasing System is the development of policies and goals which the System will be expected to satisfy.

The staff of the division has prepared a preliminary list of possible leasing policies and criteria for evaluation leasing methods (see attachments). We are asking that all appropriate State and Federal agencies, legislative committees, and private parties provide input to the Alaskan Leasing System by reviewing the attached list, commenting on them, and adding policies and criteria that may have been ommitted.

Because of the necessity of arriving at the final leasing system as rapidly as possible, the time schedule for initial input into the policy segment is very tight. Please send your comments to the Division of Minerals and Energy Management at the letterhead address to the attention of Kristina O'Connor by July 15.

Thank you for your prompt attention to this very timely and important matter.

Sincerely,

Joseph P. Green KMO

Joseph P. Green
Director

OIL AND GAS LEASING PROGRAM

POLICY AND GOAL ANALYSIS

EXHIBIT I.

PROPOSED POLICY AND GOALS FOR THE ALASKA LEASING SYSTEM

Nonrenewable resources should be developed when a net benefit accrues to the State of Alaska, or as may become necessary from a national need.

I. ECONOMIC Leasing of state lands should provide economic benefit to the state by providing direct revenue and by contributing to the development of a broader business and industrial base.

A. The value of resource revenue to the state should exceed the appreciation of the resource if left undeveloped unless it becomes expedient to develop from an overriding need.

B. The state should receive true value from its resources.

C. Resultant development should contribute to development of other related resources, industries and associated businesses.

D. The state should encourage the reinvestment within Alaska of revenues derived from leasing and associated development.

E. One of the benefits of the leasing program should be the improvement and/or establishment of transportation, communication and related facilities

F. The leasing program must be stable and predictable for the benefit of the state and industry.

CRITERIA FOR EVALUATION OF LEASING METHODS

1. Encourage active exploration and development.
2. Receive equitable compensation for the State's resources.
3. Maximize production from existing fields, encourage development of marginal fields, and use of enhanced recovery projects, and discouraging premature shut down of marginal production.
4. Encourage appropriate capitalization.
5. Encourage the State and Industry to maximize discounted cash flow.
6. Encourage preleasing exploration but discourage duplication.
7. Promote bidding competition and increase numbers of bidders.
8. Allow the State to share good fortune of increased reserves and value of crude oil.
9. State should realize only minimal income from dry structures.
10. State and industry to maximize advantages in Federal income tax laws.
11. State to stabilize petroleum exploitation so that prospective lesees can be sure "ground-rules" won't be subject to frequent change.
12. Leasing system to reduce industry risk by small front end filter.
13. Discourage speculation and over bidding.
14. State equity to be based on value of reserves discovered.
15. Maximize State control over amount of State's revenue.
16. Minimize State control over industry
17. State to maintain right to take royalty oil and gas in kind.
18. Effeciency of administration and operation.
19. Criteria for selection of successful bidders.

OIL AND GAS LEASING PROGRAM

POLICY AND GOAL ANALYSIS

EXHIBIT I.

PROPOSED POLICY AND GOALS FOR THE ALASKA LEASING SYSTEM

Nonrenewable resources should be developed when a net benefit accrues to the State of Alaska, or as may become necessary from a national need.

I. ECONOMIC Leasing of state lands should provide economic benefit to the state by providing direct revenue and by contributing to the development of a broader business and industrial base.

A. The value of resource revenue to the state should exceed the appreciation of the resource if left undeveloped unless it becomes expedient to develop from an overriding need.

B. The state should receive true value from its resources.

C. Resultant development should contribute to development of other related resources, industries and associated businesses.

D. The state should encourage the reinvestment within Alaska of revenues derived from leasing and associated development.

E. One of the benefits of the leasing program should be the improvement and/or establishment of transportation, communication and related facilities

F. The leasing program must be stable and predictable for the benefit of the state and industry.

G. The system should attempt to maximize ultimate oil and gas recovery consistant with sound economic practices and increase State employment.

II. POLITICAL: The leasing program should result in improved political harmony between local communities, state and federal government.

A. The leasing program should be compatible with development plans prepared by community, federal and other management groups such as native corporations and beneficial special interest associations.

B. Industrial resources needed for development in Alaska and distribution of the products should be planned to minimize adverse impact on other states or regions.

III. SOCIAL: Leasing should serve to improve the social well-being of Alaskan citizens.

A. The leasing policy should consider the effect a particular resource development would have upon the desired lifestyle of the majority of Alaskan people as well as upon local and statewide historical and cultural values.

B. A demographic study to minimize or determine cost effectiveness of the negative effects of resource development should be made a part of the leasing study.

C. The leasing program should encourage such social benefits as cultural and recreational activities; and improved medical, communication, transportation facilities, and general life style.

CRITERIA FOR EVALUATION OF LEASING METHODS

1. Encourage active exploration and development.
2. Receive equitable compensation for the State's resources.
3. Maximize production from existing fields, encourage development of marginal fields, and use of enhanced recovery projects, and discouraging premature shut down of marginal production.
4. Encourage appropriate capitalization.
5. Encourage the State and Industry to maximize discounted cash flow.
6. Encourage preleasing exploration but discourage duplication.
7. Promote bidding competition and increase numbers of bidders.
8. Allow the State to share good fortune of increased reserves and value of crude oil.
9. State should realize only minimal income from dry structures.
10. State and industry to maximize advantages in Federal income tax laws.
11. State to stabilize petroleum exploitation so that prospective lesees can be sure "ground-rules" won't be subject to frequent change.
12. Leasing system to reduce industry risk by small front end filter.
13. Discourage speculation and over bidding.
14. State equity to be based on value of reserves discovered.
15. Maximize State control over amount of State's revenue.
16. Minimize State control over industry
17. State to maintain right to take royalty oil and gas in kind.
18. Effeciency of administration and operation.
19. Criteria for selection of successful bidders.

IV. ENVIRONMENTAL: Leasing and development should be conducted with minimal environmental damage and should occur only where benefits exceeds losses.

A. The leasing program must minimize the adverse environmental effects on subsistence and recreational hunting and fishing, water and air pollution, and on asthetic values.

B. Industry is to be encouraged to use methods and technology to minimize environmental problems and reduce need for scarce or limited resources such as water and gravel.

C. Hydrocarbon development when possible should utilize those renewable resources which are available so as to conserve and delay the exhaustion of non-replaceable resources.

V. RESOURCE MANAGEMENT: Alaska's resources should be developed only if there is a need for the resource and only if the state receives true value in return.

A. Lease planning should consider the timing and maximum efficient use of associated renewable and nonrenewable resources. (e.g. fresh water and gravel on the North Slope, excess hydroelectric power, etc.)

B. The Alaska Leasing System must be consistant with national and State goals in the area of energy conservation and development of alternate energy resources.

U.S.A. AGO 546761 +

GOVERNMENT INCENTIVES TO EXPLORATION

FIGURE 1

Alberta's oil and gas resources extend over most of the province and constitute a major source of energy. To expedite the location of such resources, the Government of Alberta on July 28, 1972, approved the Natural Resource Revenue Plan. A main feature of this plan was an increase in annual revenues to the Government of about 70 million dollars commencing in 1973. The Alberta government felt this to be a fair and reasonable additional return to the citizens of Alberta for their ownership of a depleting and non-renewable resource. This dollar figure has increased since the initiation of the program due to the escalating price of crude oil.

To offset this increase in revenues from industry and to stimulate increased exploratory activity in Alberta, the Government implemented the Exploratory Drilling Incentive System. The program has undergone several modifications since it was introduced, but essentially consists of a monetary credit for an exploratory well drilled for oil or gas. The credit may be applied against taxes payable under The Freehold Mineral Taxation Act,

.....2

royalties, rentals, fees and bonuses on petroleum and natural gas Crown minerals rights. A producing incentive exploratory well may also qualify for royalty or mineral taxation exemptions.

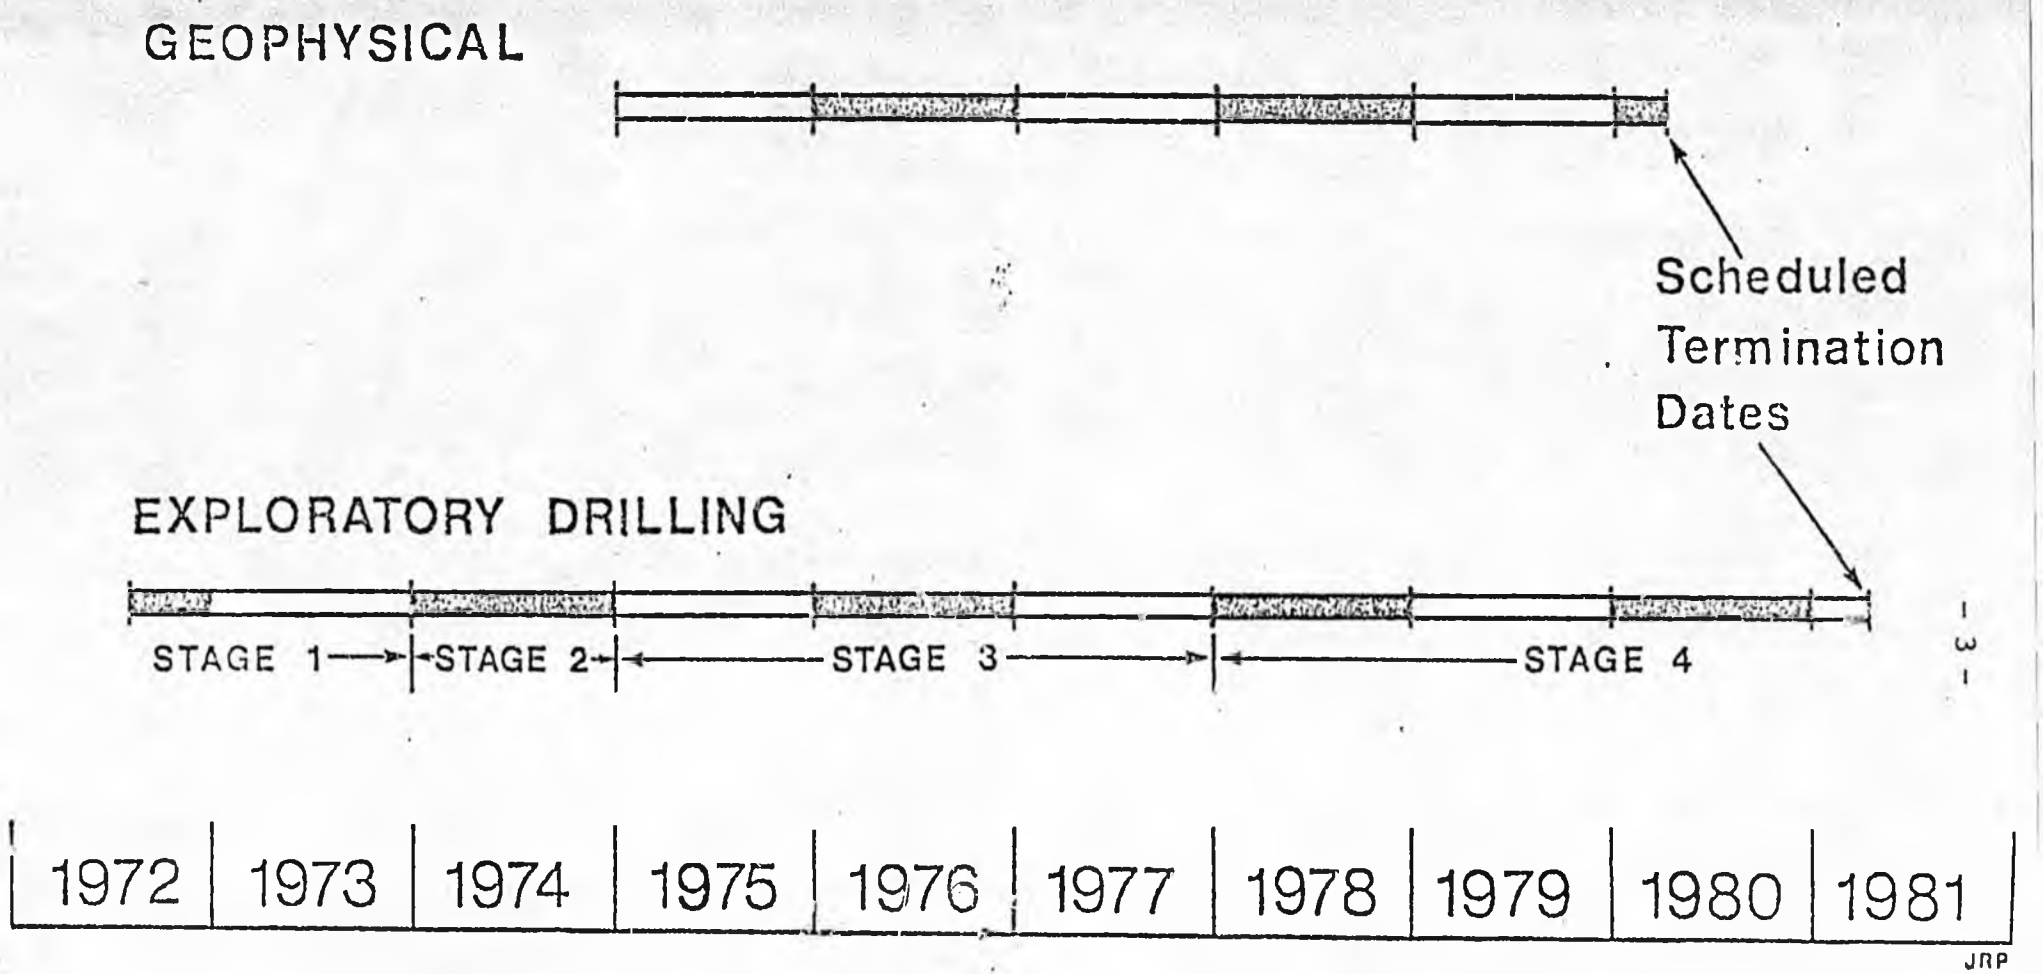
The Exploratory Drilling Incentive System is administered jointly by the Alberta Department of Energy and Natural Resources and the Alberta Energy Resources Conservation Board. Determination of qualifying footage upon completion or abandonment of the incentive exploratory well is made by the Board. Determination of the credit to be established is made by the Department.

Due to the close relationship between geophysical and drilling activity, it is found desirable to provide incentives for geophysical exploration. It is considered vital to maintain a high level of geophysical work to ensure the continuity of the search for new oil or gas reserves.

Therefore, the Alberta Government, in taking a second step toward maintaining the necessary level of petroleum activity in the province, implemented on January 1, 1975, the Geophysical Incentive Program.

The credit for a geophysical incentive program is determined from a

.....3



DURATION OF INCENTIVE PROGRAMS

FIGURE 2

formula based on the number of miles of subsurface coverage recorded and the geographical area in which the survey was conducted. The incentive credits maybe applied against revenues owing to the Crown, for bonuses on petroleum and natural gas, Crown mineral rights, fees, rentals, royalties and freehold mineral taxes.

FIGURE 2

The Exploratory Drilling Incentive System was implemented on August 1, 1972, and was scheduled to be in existence for a period of five years terminating on December 31, 1977.

After an extensive government task force study, an amendment was introduced extending the Exploratory Drilling Incentive System to March 31, 1981.

At the time the Drilling Incentive program was implemented, it was estimated that only 50% of ultimate oil and gas reserves in Alberta had been discovered. Exploratory activity had declined and many companies with substantial land holdings were apparently shifting their exploratory activity to the frontier areas. For this reason, the Government tried to "tie-in" the Natural Resource Revenue Plan with the Exploratory Drilling Incentive System to benefit those

.....4

operators who undertook exploration in Alberta.

Between 1964 and 1969, the number of new field wildcat wells drilled in Alberta maintained fairly high levels - about 500 wells per year. In 1971, this number dropped to about 300 wells per year.

A further indication of both the decline and shift in exploratory activity was indicated by seismic crew activity in Canada. Seismic activity dropped from a peak of 972 crew months in 1967 to a 1970 low of 724 crew months.

The shift of activity away from Alberta during 1970 and 1971 was of greater significance. From 1961 to 1967, close to 70% of Canada's geophysical activity occurred in Alberta. In 1968 and 1969, Alberta accounted for just over 60% of the total. In 1970, more Canadian seismic activity occurred outside Alberta than in Alberta.

There was a substantial drop in bonuses from the sale of Crown mineral rights. During the period 1965 to 1969, these revenues averaged $100 million per year. In 1970 and 1971, these revenues dropped to about $25 million per year.

INCENTIVE WILDCAT WELL

AUGUST 1, 1972 TO DECEMBER 31, 1973

FIGURE 3

AGO 546197

The Exploratory Drilling Incentive System, within the Natural Resource Revenue Plan, was designed to stimulate the discovery of crude oil reserves and shift exploratory activity back to the province by providing substantial rewards to the wildcat entrepreneur.

The objective of the Exploratory Drilling Incentive System was to encourage high risk exploratory drilling and increase the drilling activity in remote locations at a time when this type of drilling was declining in the province. The tendency in Alberta was to explore in known and reasonably accessible regions rather than stepping out in the search for new fields.

The Exploratory Drilling Incentive System has had several amendments since its original inception.

FIGURE 3

From August 1, 1972 to December 31, 1973, the program related to wells that were classified by the Energy Resources Conservation Board as "New Field Wildcats" under the "Lahee" classification system. A formula was derived which enabled the establishment of a credit equalling approximately 30% of the cost

of the well. The total footage of a new field wildcat qualified for incentive credit. A five-year crude oil royalty "holiday" was granted.

During this 17 month period, $16 million in drilling credits were earned by industry.

FIGURE 4

From January 1, 1974 to December 31, 1974 the program was expanded to include, along with the new field wildcats, about one-quarter of the more remote new pool wildcats and deeper pool footage. Figure 4 shows the principles that were adopted on January 1, 1974. The footage shown in white is known as Class "A" footage and it earned as credits, approximately 40% of the total recognized cost of the well. The Class "B" footage is applicable where a dry hole is within one and one half miles of the well. Class "B" footage earned about 30% support.

FIGURE 5

During this period, drilling costs were increased and a cost distinction was made for wells located in the Foothills, Northern and Plains regions.

.....7

These areas, as modified on February 26, 1975, are shown on Figure 5. Added features included a two-year natural gas royalty "holiday" and authorization for credits to be used to defray bonus payments tendered for Crown oil and gas mineral rights. The credits could continue to be used to offset payments due for royalty, rental or freehold mineral tax.

On January 15, 1974, the Alberta Petroleum Marketing Commission was created. Prior to its creation incentive credits established could be used by the holder to satisfy oil Crown royalty payments. This was discontinued on January 15, 1974 by the Commission.

During this 12 month period, the credits amounted to roughly $20 million and involved almost 600 wells.

From January 1, 1975 to December 31, 1977, the Government increased the benefits of the Exploratory Drilling Incentive System by expanding recognized well costs and by increasing the credit support for Class "A" and "B" footage to approximately 50% and 37½% respectively.

FIGURE 6

AGD 546774

FIGURE 6

Commencing January 1, 1978 the drilling credit areas have been redefined. The Plains and Foothills Areas are unchanged, but the former Northern Area was divided into a Central and Northern Area. The boundary between the two new areas was defined on the bais on well costs, topographic and access considerations. The amendments also include the upper 2,000 feet of sediments from receiving any incentive credit and increase the credits for qualifying wells deeper than 3,500 feet.

For wells greater than 5,000 feet in depth, the incentive is increased by 25% to 45% depending on the location of the well.

FIGURE 7

There has been a considerable increase in the number of exploratory wells drilled in Alberta since inception of the incentive program in 1972. There were 1,058 exploratory wells drilled in 1972 compared with 2,303 drilled in 1977. The number of wells qualifying for incentive footage in 1972 was 190 compared to 1,215 in 1977. An increase is expected in 1978. The number of new pool

FIGURE 9

AGO 546777

wildcats and deeper pool tests have increased since the program began, but the number of new field wildcats have declined.

FIGURE 8

The amount of exploratory footage drilled in 1977 exceeded all previous years. Footage for new field wildcats remained similar to 1976 at 1½ million feet, new pool wildcats increased to 5¼ million from 4¼ million feet in 1976, and deeper pool tests increased to 3/4 million feet from 1/2 million feet. The amount of footage certified under the program has increased since inception, equally divided between New Pool Wildcats and New Field Wildcats. In 1977 a total of 2½ million feet were certified to receive incentive footage. This figure shows an increase of 32% from the first full year the program was in operation.

Normally, 100% of the new field wildcat footage, 20% of the new pool wildcat footage, and 80% of the deeper pool test footage qualified for incentive benefits.

FIGURE 9

The average well depths per year has shown a gradual decrease from the period 1971 to 1976, but a slight upswing occurred in 1977. New field wildcats

.....10

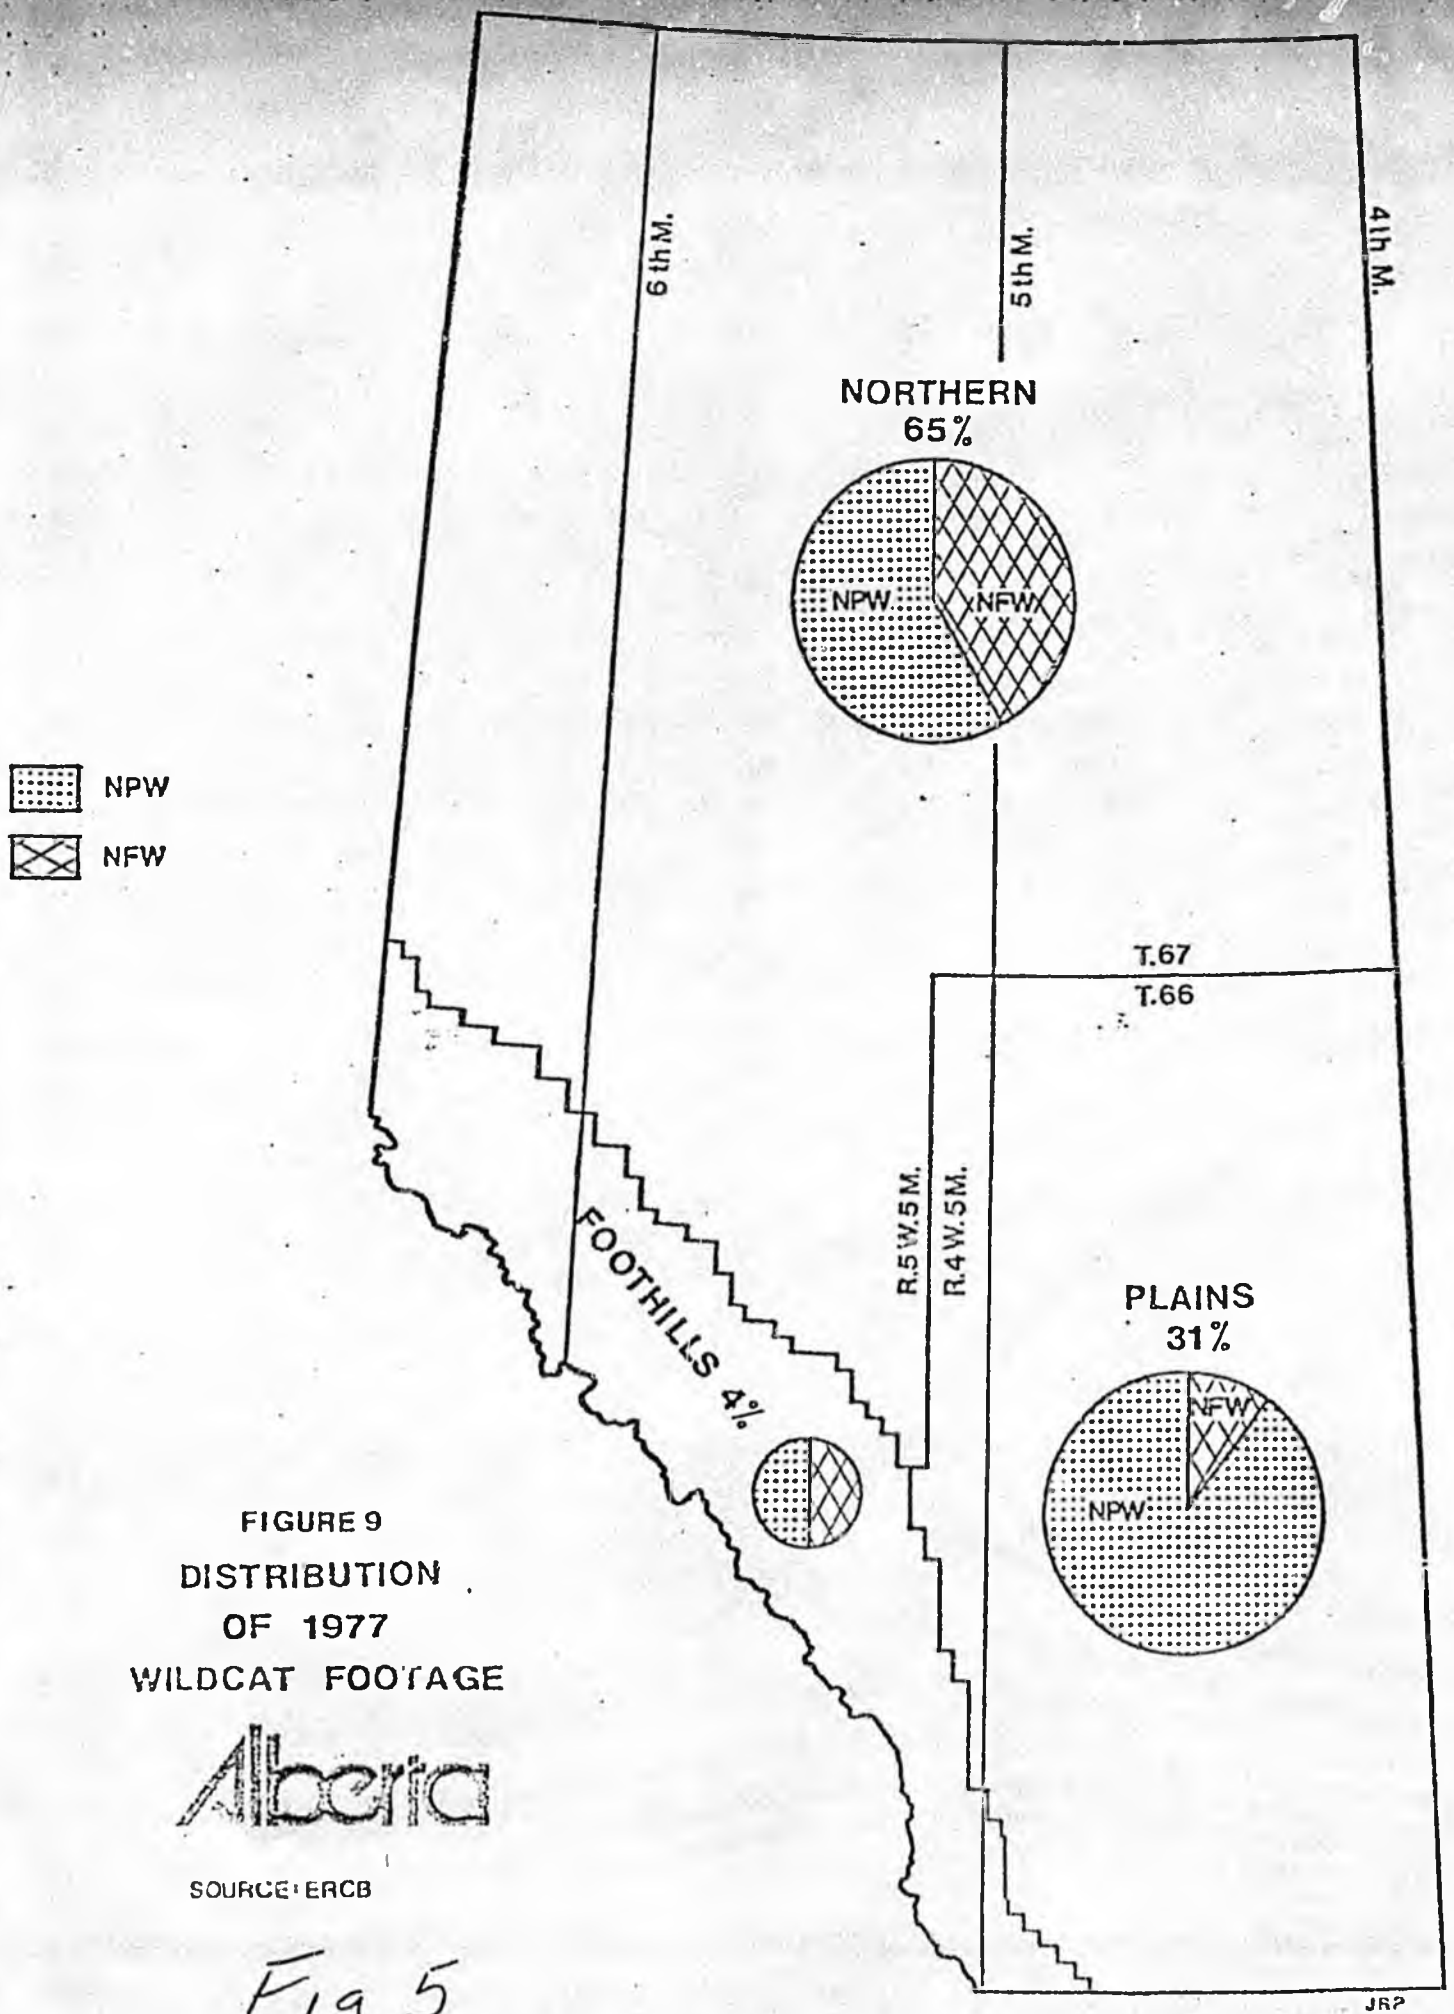

FIGURE 9

DISTRIBUTION OF 1977 WILDCAT FOOTAGE

Alberta

Fig 5

AGO 546779

averaged 4,800 feet in 1977, new pool wildcats averaged 4,100 feet, and deeper pool tests averaged 1,000 feet.

FIGURE 5

The majority of the exploratory footage drilled in 1977 was in the Northern Areas. The total footage drilled here was 65% of the total exploratory footage. Of this 65%, new pool wildcats constituted 65% and new field wildcats 36%.

Exploratory drilling in the Plains Area accounted for 31% of the total, with new pool wildcats forming 90% of the figure, and new field wildcats about 10%. Drilling footage in the Foothills Area constituted 4% of the total. Of this 4%, half were classed as new pool wildcats and half as new field wildcats. Deeper pool tests formed less than 10% of the total exploratory footage for the province in 1977.

These figures indicate a shift of emphasis since 1976 from the Plains Area to the more remote Northern Area. In both areas, the total footage of new field wildcats has taken a considerable drop from the 1976 figures. New field wildcat footage in the Foothills Area has increased.

.....11

Geophysical Incentive Program

On January 1, 1975, the Alberta Government implemented the Geophysical Incentive Program to stimulate the level of seismic exploratory activty in Alberta. The program was scheduled to terminate on March 31, 1978. This program has been extended to March 31, 1980 through a recent amendment to the Regulations. The Government recognizes the positive effects improved geophysical techniques have on drilling success rates and feels geophysical work must be encouraged to search for the less obvious hydrocarbon accumulations.

The Geophysical Incentive Program is administered by the Department of Energy and Natural Resources.

Geophysical activities, primarily in the form of reflection surveys, provide the initial technical basis on which many exploration "plays" for new oil and gas deposits are planned. Such surveys have performed a key role in finding many of the prolific reef accumulations of hydrocarbons in the Alberta plains. Geophysical data is essential to interpreting the complex rock structures of the foothills which are expected to contain major new deposits of hydrocarbons.

.....12

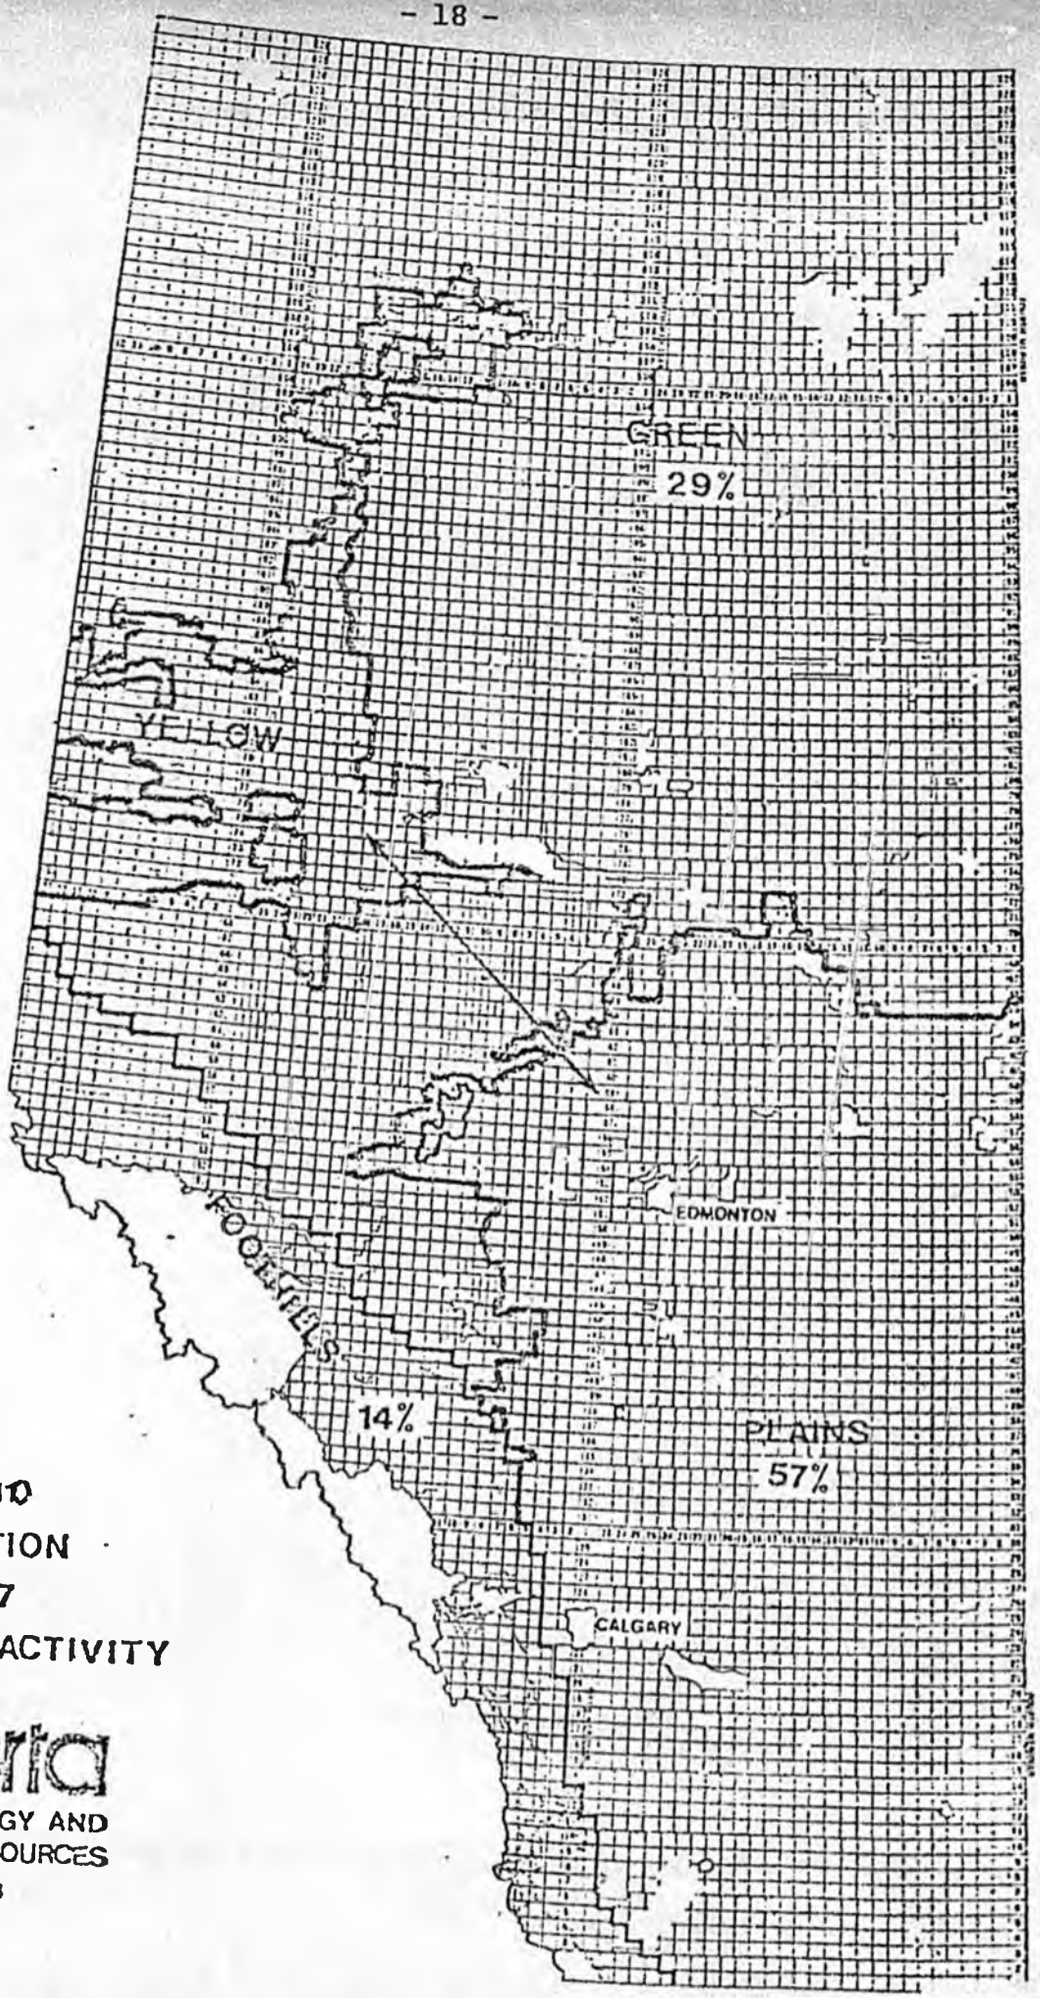

FIGURE 10
DISTRIBUTION
OF 1977
GEOPHYSICAL ACTIVITY

Alberta
ENERGY AND
NATURAL RESOURCES
JUNE, 1978

AGO 546782

The main features of the Geophysical Incentive Program are:

(a) The incentive will apply to seismic surveys certified after January 1, 1975.

(b) Incentive credits are established in the name of the licensee however, these credits may be allocated to partners sharing in the cost of the seismic program.

FIGURE 10

The incentive credits are determined from a formula based on the number of miles of subsurface coverage and the area in which the survey is conducted. Surveys carried out in difficult terrain in the Foothills and Green Areas receive a larger incentive credit than surveys carried out in the Plains region.

The determination of credit for a certified geophysical incentive program was calculated on the number of miles of minimum (400%) subsurface coverage by the following equation:

Credit (dollars) = 500 K M

Where K is the incentive factor for different geographic areas in Alberta where the program was conduted M is the number of miles of minimum subsurface

.....13

coverage.

The incentive credits may be applied in the same manner as the exploratory drilling incentive credits. A licensee may apply for the monetary equivalent of the credit where he is not the owner of a mineral agreement or a freehold mineral right.

Any geophysical information and data obtained pursuant to a geophysical incentive program must be made available by the licensee to any person for a period of not less than five years

(a) three years after the date the program was certified.

(b) at a cost to that person of 60% of the credit determined for each mile of minimum subsurface coverage.

Amendments to the Geophysical Incentive Program effective April 1, 1978, reducing credit by 50% will result in a phase down of the program.

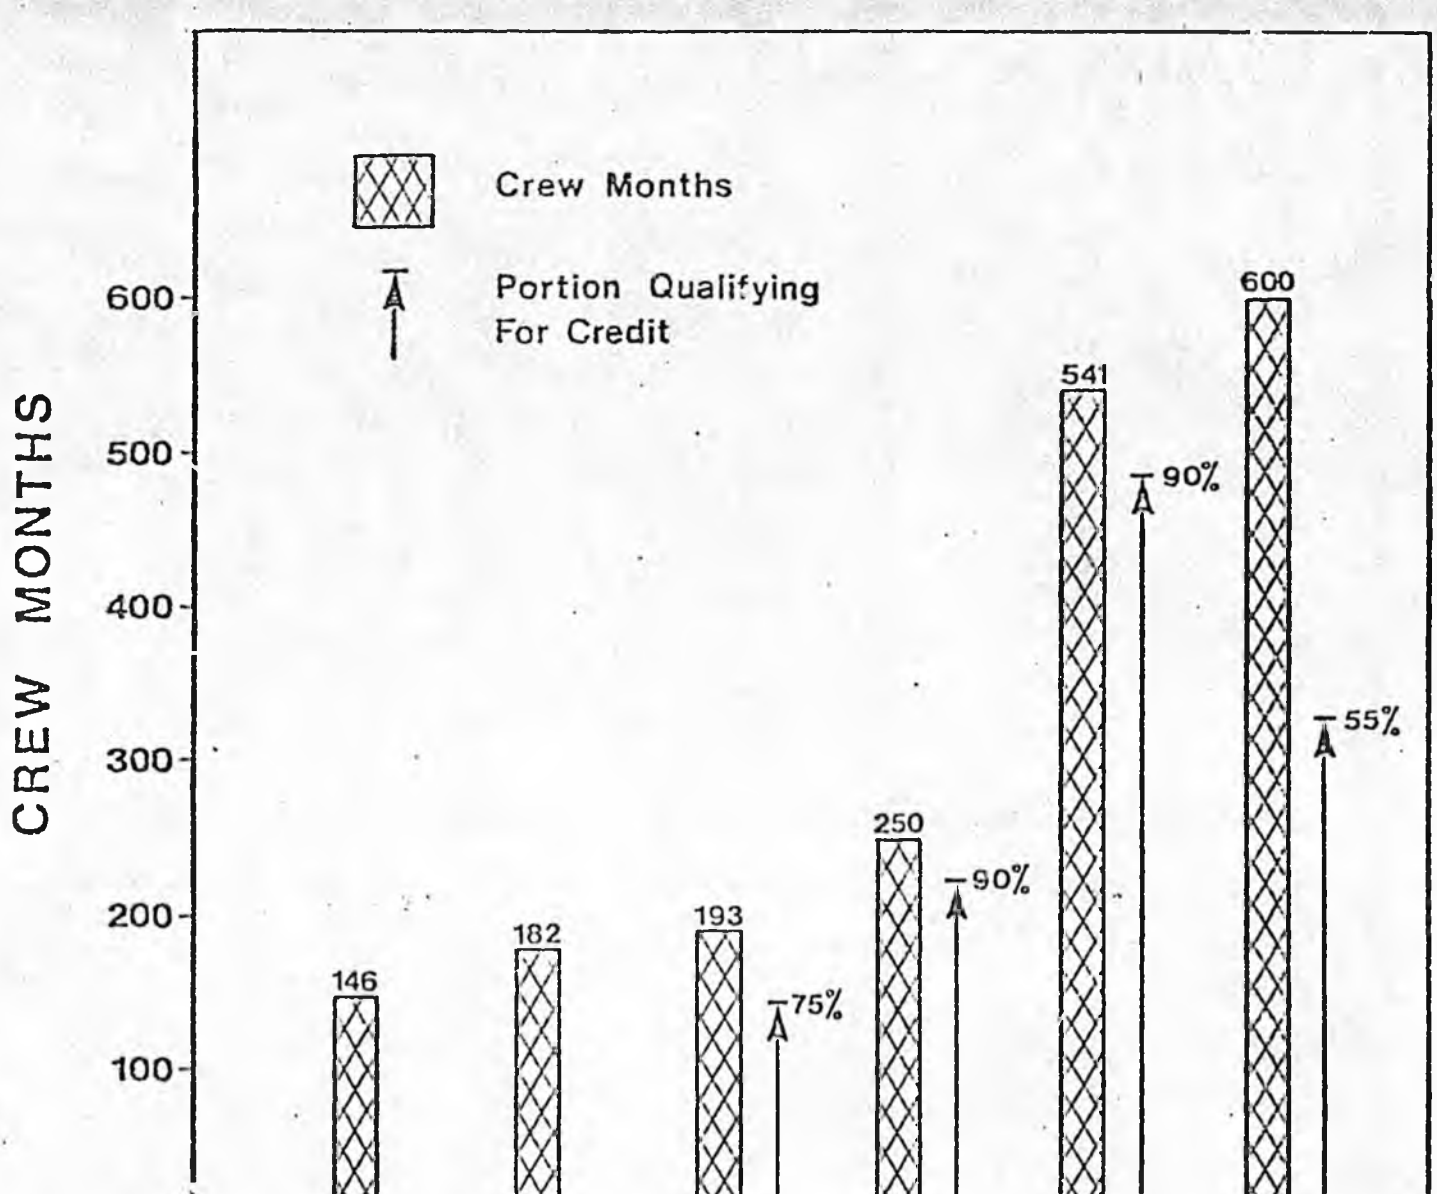
Credit (dollars) = 250 K M

The minimum subsurface requirements have been increased requiring 600% in the white and yellow area and 1200% in Foothills and Northern Areas.

AGO 546784

The total number of miles of subsurface coverage in 1977 that qualified for incentive credit was 28,000 miles. This figure reflects an increase of

.....14



SEISMIC ACTIVITY & PORTION QUALIFYING FOR INCENTIVE CREDIT

FIGURE 12

AGO 546785

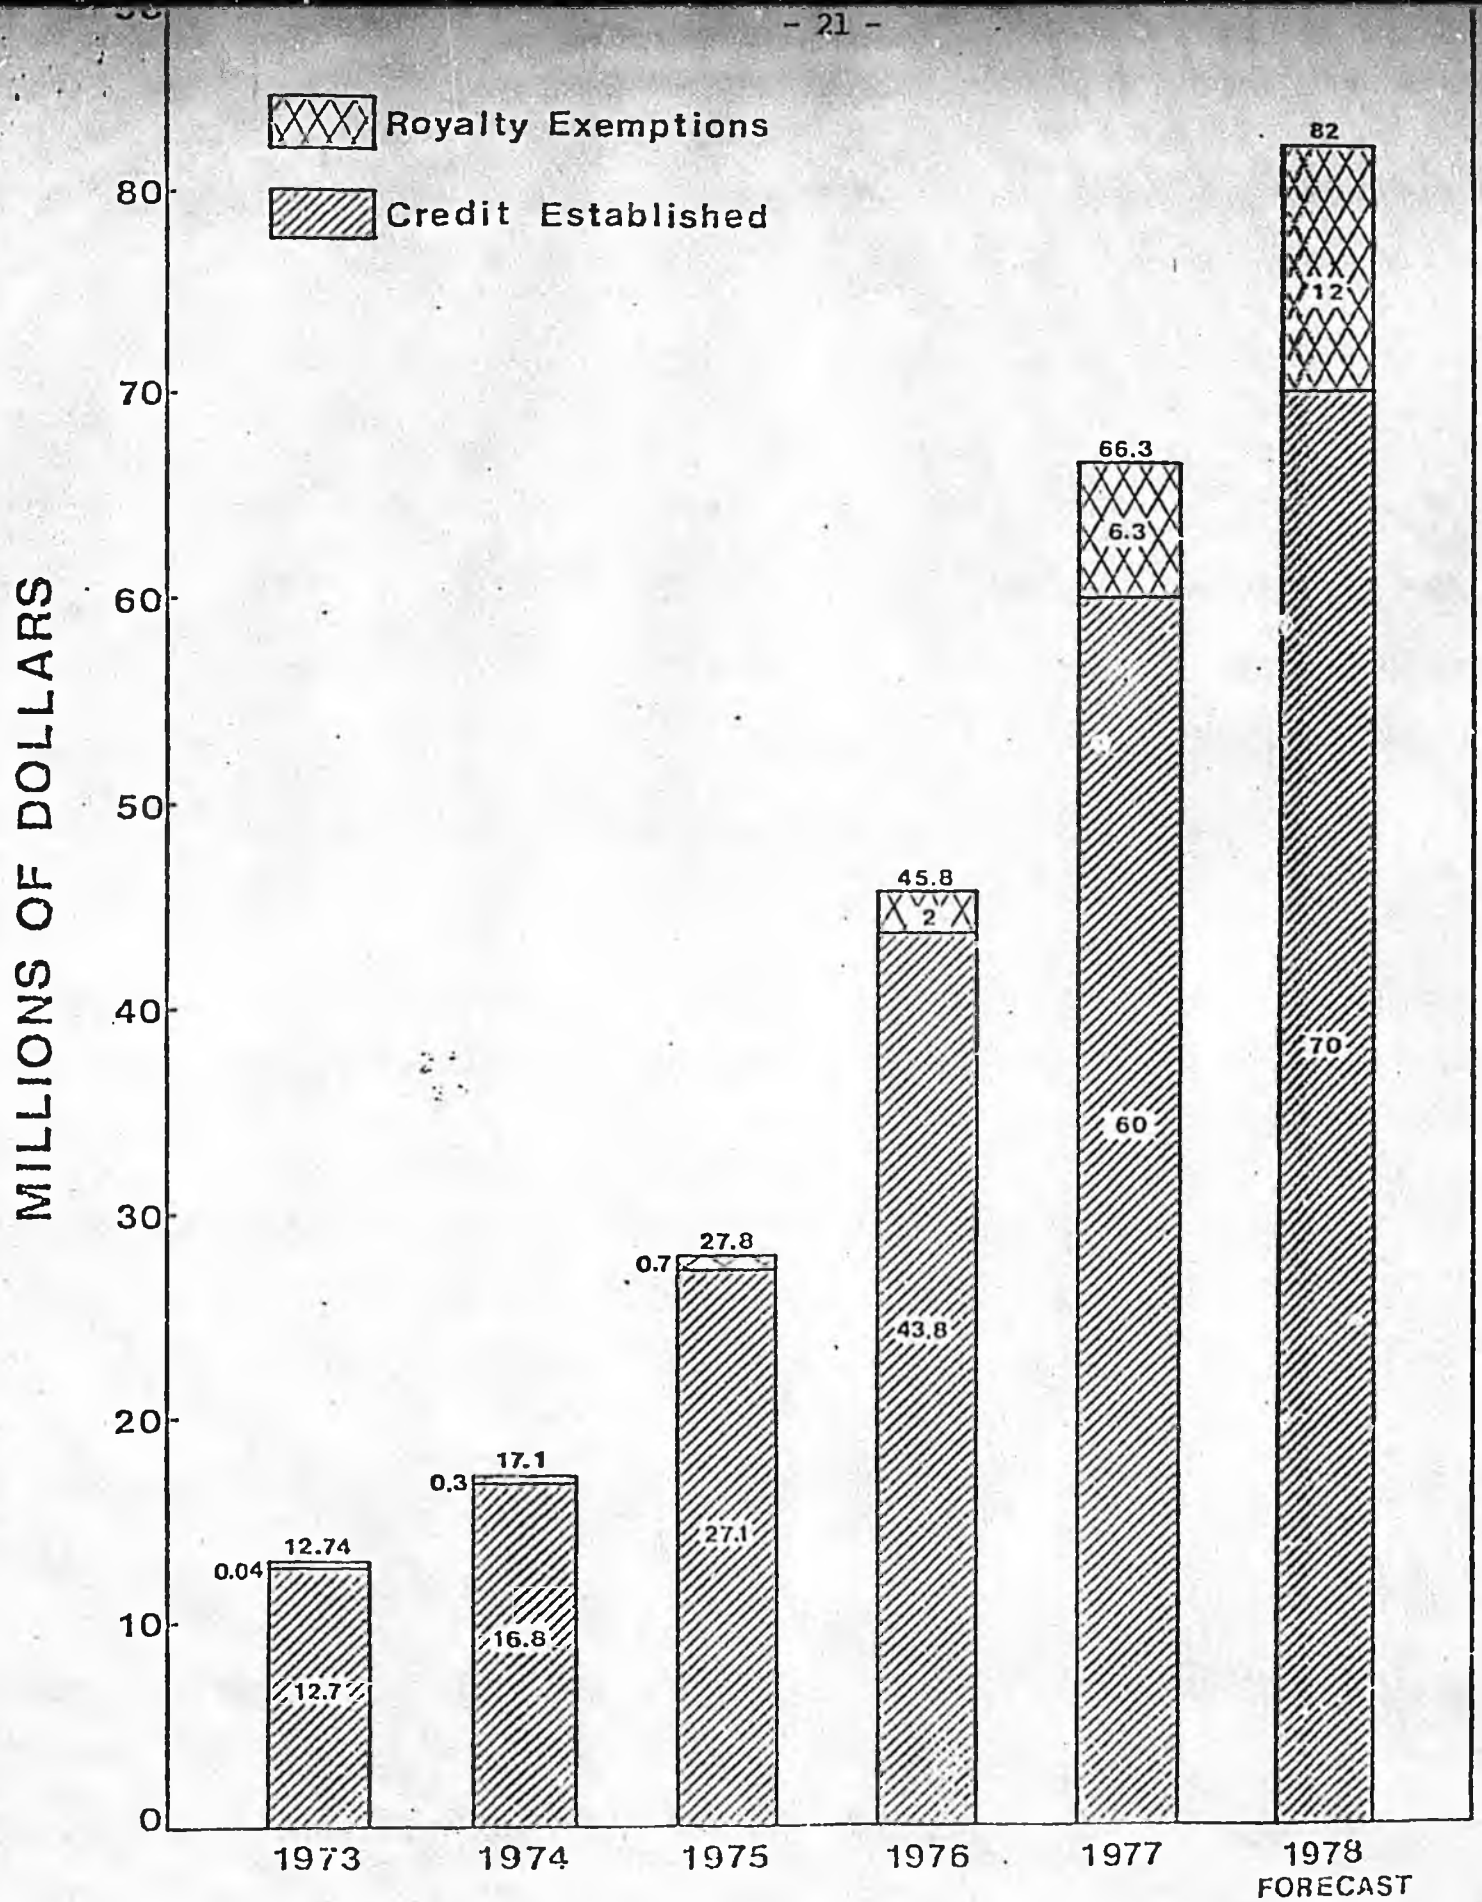
82% over the 1976 figure of 15,400 miles. Of this total, 16,105 miles was in the Yellow-Plains Area, 7,994 miles was in the Green Area and 3,921 miles was in the Foothills Area. These figures show an increase in activity in the Yellow-Plains Area, a decrease in the Foothills Area and unchanged activity in the Green Area.

FIGURE 12

This figure shows the crew activity from 1973 to 1978. In 1977 there were 541 crew months of activity, compared with 193 crew months in 1975 the first year the incentive program was in operation. The forecast is that the number of crew months will continue to increase.

In 1976 and 1977, 90% of the programs conducted in the province were certified under the Geophysical Incentive Program Regulations compared with 75% in 1975. The amendments effective April 1, 1978 are expected to reduce the number of programs submitted to the Department for credit. It is estimated that 55% of the programs shot in Alberta will receive incentive credits.

.....15



INCENTIVE COSTS ASSOCIATED WITH DRILLING ACTIVITY

AGO 546787

FIGURE 13

Energy & Natural Resources, June 1978

FIGURE 13

The Exploratory Drilling Incentive System and the Geophysical Incentive Program were initially devised to reduce the burden placed on industry when the Natural Resource Revenue Plan was initiated. The incentive programs were meant to reduce the increased royalties owed on Crown oil and gas mineral rights by financing a portion of the exploration costs. These incentive costs have escalated considerably in the years since the inception of the programs from a few million dollars to tens of millions of dollars per year.

The total costs to the Alberta Government for credit, royalty exemptions, cash refunds and administration of the programs amounted to over $90 million in 1977.

The cost for the Exploratory Drilling Incentive System in 1977 was 66.3 million dollars. This figure shows an increase over the 1973 costs of 12.7 million dollars. The credit established in 1978 is forecast to be $82 million. During the same period royalty exemptions have increased from $0.04 million to $6.3 million. It is forecast that royalty exemptions will reach $12 million in 1978.

SALES OF CROWN OIL AND GAS MINERAL RIGHTS

FIGURE 16

Energy & Natural Resources, June 1978

AGO 546791

FIGURE 14

$21.9 million was established as credit in 1977 for the Geophysical Incentive Program. This is an increase of more than 300% over the credit established in the first year the of the program. It is estimated that $12 million will be established as credit in 1978.

The cash refunded has increased from $1.9 million in 1975 to $6.3 million in 1977. We believed that in 1978 cash refunds will total $4 million.

FIGURE 15

In 1973, total administration costs were $70,000 roughly $50,000 for the ERCB and $20,000 for the Department. In 1977, these figures had risen to about $200,000 - $125,000 for the ERCB and $75,000 for the Department. It is expected that these figures will remain constant in 1978.

FIGURE 16

The revenue generated through sales of Crown oil and gas mineral rights has tripled from 1972 to 1976. During 1977 sales increased from $160 million to $579.7 million. The forecast for 1978 is 400 million.

.....17

We recognize three factors which may exist when exploration is supported by an incentive program.

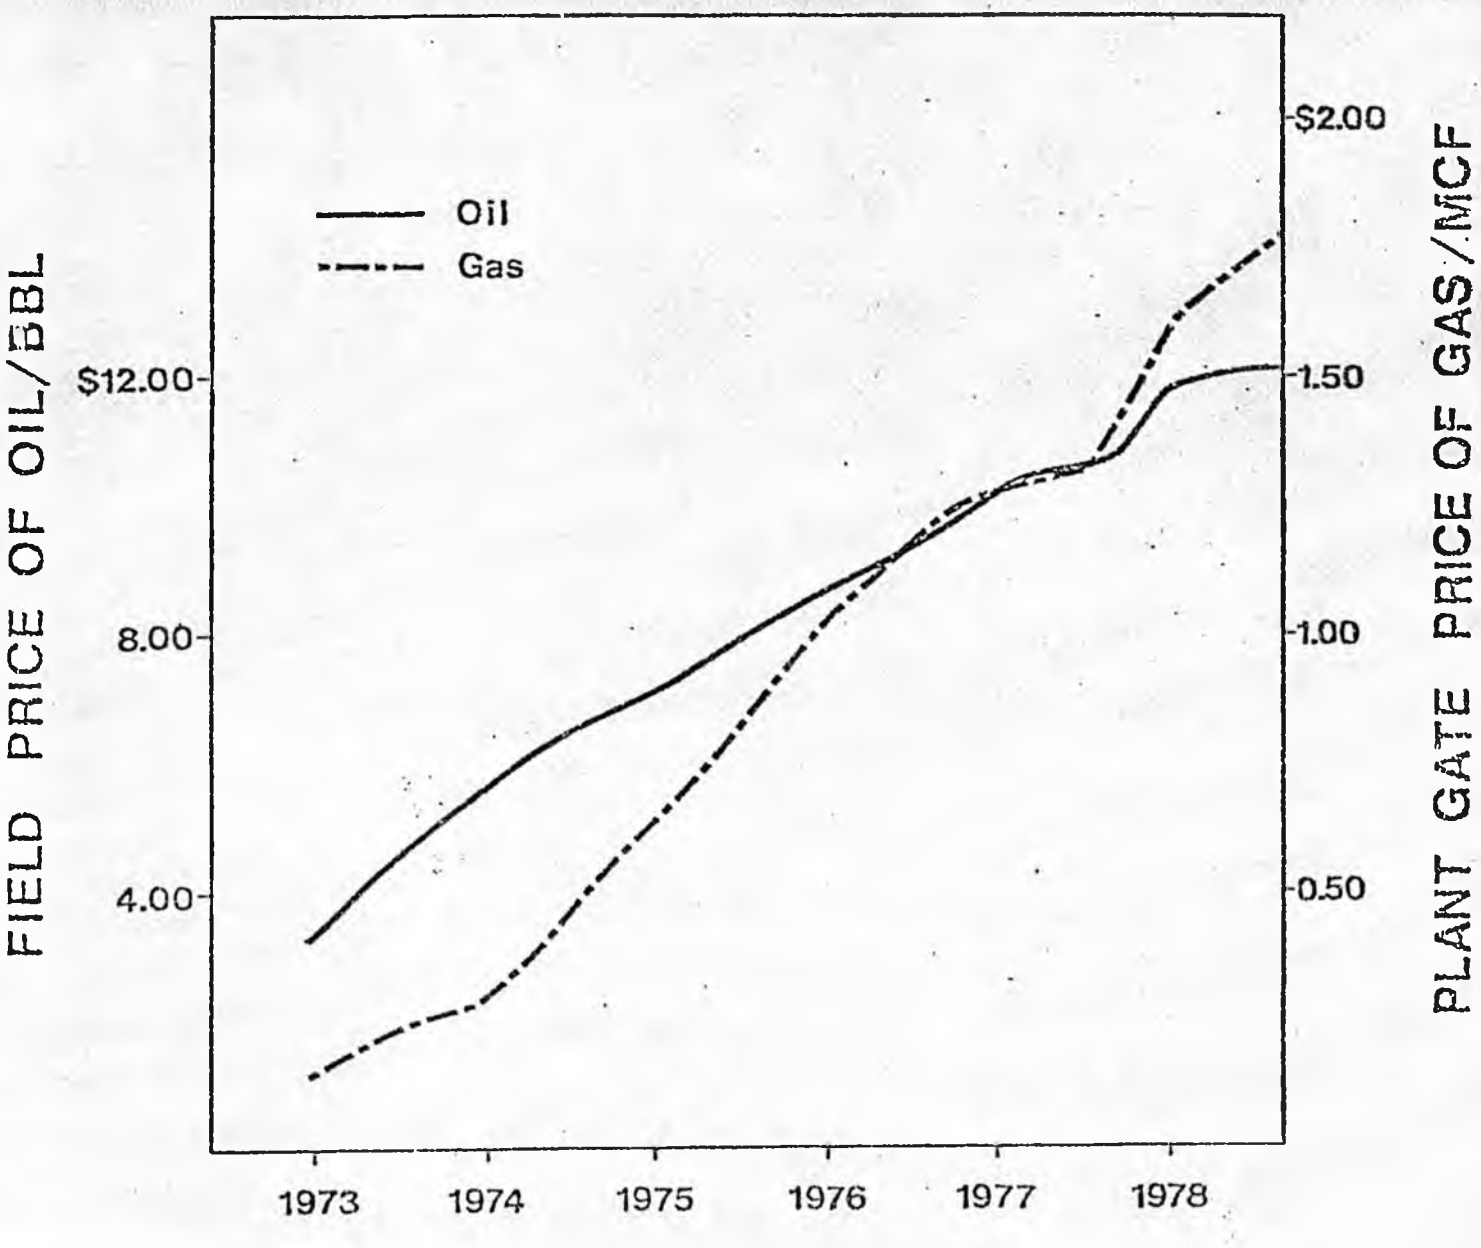
(a) The activity may have occurred even if it had not been supported by an incentive program.

(b) The exploration activity was advanced to take advantage of the programs before their scheduled termination dates.

(c) The activity may not be performed in the forseeable future without incentive support.

The second and third considerations appear in the present situation to be applicable. The programs have been directly responsible for the discovery of large additional reserves and have encouraged high risk deep drilling in the foothills region.

Although the definite effects of the programs on exploration activity cannot be quantitatively assessed, the general trend has shown a considerable increase in exploration activity since inception of the programs.



PRICE OF CRUDE OIL & NATURAL GAS

1973 - 1978

FIGURE 17

Energy & Natural Resources, June 1978

AGO 546794

STATE'S RIGHT TO PURCHASE OIL & GAS IN HB 854

The State has the right in HB 854(v) to purchase not more than 16 2/3% of the oil and up to 100% of the gas at the regulated price or fair market value at the point of sale. The right to purchase is needed to protect the "in kind" taking of its royalty by Alaska, a sale of said royalty, and a subsequent reduction of the royalty in the later stages of production (d).

New Mexico, 1973, enacted a law which gives it the right to reserve an option to purchase at any time at the prevailing market price any or all minerals, including oil and gas, produced from State land. Thus, New Mexico may purchase 100% of the oil and gas found on State land.

Whereas the New Mexico Commissioner is authorized to waive the reservation option with respect to any specific mineral, he may not do so for oil or gas.

The Act, Chapter 26 of the Session Laws of 1973, has never been exercised by New Mexico; thus no opportunity has been given to test its constitutionality.

If Alaska were to reserve an option to purchase up to the amount of the royalty, fixed or bid, an equivalent net profit share would have to be determined.

TESTIMONY ON H.B. 854

Mr. Chairman, members of the committee, my name is John Carson, and I appreciate the opportunity to comment on House Bill 854.

I've been a petroleum geologist for 22 years, and I'm presently Division Geologist in Alaska for Chevron U.S.A., the principal domestic oil and gas subsidiary of the Standard Oil Company of California. I've lived and worked in this state, and since 1965, I've been actively involved in all state lease sales and the two OCS sales in the Gulf of Alaska and the Lower Cook Inlet.

Chevron is aware of the amount of preliminary work done by the state administration and the Department of Natural Resources in researching and drafting this legislation.

We commend efforts in drafting legislation that proposes a five-year leasing program for Alaska. We believe the state should be encouraged in its effort to establish and maintain such a long-term program, with appropriate industry participation.

Members of the committee, the petroleum industry--as indicated by its response to your solicitations--clearly desires a realistic plan that can serve as the basis for an effective working relationship between the industry and the state.

Frankly, we believe the proposed legislation will inhibit or prevent orderly development of oil and gas resources in Alaska--to the detriment of the state government, its taxpayers and my own industry.

AGO 546748

I will say candidly that this legislation is untenable from our point of view. If enacted into law, H.B. 854 would have a serious and far-reaching impact on my own company, and would give us serious cause to reconsider our exploration activities in the high-cost, high-risk frontier state lands of Alaska.

The situation we face today reminds me of a quote I heard the other day attributed to an executive of Walt Disney Productions, which recently announced that it was abondoning its latest recreation complex because of excessive and oppressive regulation.

The Walt Disney executive blamed the end of the project on, and I quote: "An irresponsible proliferation of delays, the never-ending requests for more irrelevant information and studies, and bureaucratic sidetracking and meanderings into unreasonable alternatives."

I realize this is the first of many hearings on this legislation, but H.B. 854, as now written, would be counter-productive. It actually would be a step backward at the very time our nation desperately needs an effective oil and gas exploration program.

Generally stated, we object to provisions covering: (1) the wide variety of bidding methods to be employed; (2) the Commissioner's access to all the lessee's data, including proprietary data; (3) the state's call on production; (4) short and restrictive lease term and conditions; (5) the need for the Commissioner to submit and defend his lease plan before the legislature; (6) the Commissioner's right to ban joint bidding by major companies; and (7) reduced acreage chargeability on state uplands.

Time does not permit me to discuss in detail each of the provisions, but I will attempt to outline our most significant objections:

First, the wide variety of bidding methods:

In advocating numerous bidding schemes--actually a shift from only cash bonus bidding, a system that has worked well--the administration hopes to maximize its financial return from state lands.

But Chevron believes a move away from the cash bonus method means the perilous abandonment of a proven concept that has brought stability to the state's leasing program. The bonus system would be replaced by an array of untested leasing methods, particularly in the frontier areas.

We believe this provision, if enacted, will transform Alaska into a trial-and-error laboratory in oil and gas leasing. It means replacing orderly development with uncertainty and the unknown. It's not a gamble Chevron feels is worth taking.

Before discussing each bidding system, all concerned parties should be aware that a move away from cash bonus bidding will result in three key developments:

First, it will shift a substantial part of the burden of risk from industry to the taxpayer.

Second, it will serve as a substantial deterrent to exploration and development, and

Third, it will cause the rapid and constant growth of state agencies to administer, evaluate and audit the leases and subsequent production. This places increasing demands on taxpayers to support this bureaucracy.

Chevron believes these are unacceptable consequences which would be intolerable to the taxpayers and leaders of this state.

As you know, cash bonus bidding provides that leases be awarded to the highest cash bonus bidder. This bonus is paid before the lessee can proceed with exploratory drilling on the lease.

The other bid methods provide for bid variables such as royalty, net profit, or work commitment. In these cases, the state receives nothing other than perhaps a small fixed bonus at the time of leasing. Other revenue is not forthcoming under the royalty and net profit schemes unless there is production. Simply stated: No production, no revenue.

In our opinion, cash bonus bidding is the only method that will strongly encourage the petroleum industry to lease and explore the state land.

We further believe that this method will result in the production of the most oil and gas and consequently will provide the most revenue, both to the state and the petroleum industry.

The other methods, employing biddable royalties and net profits, reduce the incentive to explore and produce. These alternatives, particularly in the case of biddable royalties, serve to shorten the economic life of the fields--resulting in less production and, therefore, less revenue.

Cash bonus bidding is particularly advantageous to the lessor in frontier areas of high risk. Most of Alaska's lands are in this category.

Now let's compare other proposed bidding methods with traditional cash bonus bidding. Because of time limitations, I can only touch briefly on these, but I am prepared to go into more detail if questions arise.

The royalty bidding method, although it allows oil and gas companies to acquire land with little cash, is a strong deterrent to early drilling. Very simply, it is easier and cheaper to wait on others to bear the risk and expense of exploratory drilling.

Having spent little capital to acquire the lease, an operator is tempted not to spend a dime to evaluate the lease, hoping an adjacent leaseholder may do it for him. Carried to the extreme, the effect of this would be that no wells would be drilled to evaluate the leases. This same problem is inherent in the net profits system, which I'll talk about shortly. On the other hand, when cash bonus is involved, the winning bidder has a strong incentive for early drilling because his bonus investment is earning him nothing.

In cash bonus bidding the state assumes none of the risk but still receives revenue from leases, whether or not they are productive.

The advantages of this system were clearly demonstrated a few years ago in the sale of federal leases off the coasts to Mississippi, Florida and Louisiana. Successful bidders paid $743 million for several tracts on one structure, the Destin Anticline, and spent over 10 million dollars drilling seven dry holes on the structure--all at no cost to the taxpayer. Under royalty or net profit bidding, the government would have received nothing.

What would government have received if it had sold the Gulf of Alaska on a royalty bid basis? As in the Gulf of Mexico case I previously cited, nothing. Should the taxpayer and the government be forced to suffer the loss of more than one-half billion dollars--when to date, no royalty appears forthcoming?

The NPRA comes to mind as another example of an area adjudged to possess high potential, but which so far is a disappointment. Again, if sold on a royalty bidding method, the lessors would have received nothing to date.

Let me emphasize that in all these cases, the areas were considered extremely attractive to both the industry and government. These are precisely the types of areas in which the state might be enticed to use a royalty or net profit bidding method. Yet none of these has led to any discovery or government revenue.

Proponents of royalty bidding believe it encourages competition among bidders and allows the small company and the independent improved entry into oil and gas lease bidding. Cash bonus bidding usually is blamed for tending to discourage small companies from bidding.

This is not supported by the facts. Small companies gain entry into the sale by joining with a larger company or with several other smaller companies. In the recent Lower Cook Inlet sale, independents and smaller companies bid on royalty and cash bonus tracts with about the same frequency as the majors. Of the 34 companies which bid in the sale, 18 were smaller companies. These 18 made successful cash bonus bids on 26 tracts, of which 13 were sold for more than one million dollars. Moreover, the small companies are represented in half of the top tracts of the sale.

The second proposed bidding method we are concerned about is net profit bidding. This system has most of the disadvantages of royalty bidding plus two more: It requires a huge staff to administer and audit.

For example, each property would require a battery of accountants to audit the companies' production and costs. Just as in the case of royalty bidding, the risks are passed on to the government. Furthermore, net profit bidding discourages cost-effective, efficient development practices.

Work commitment bidding is the least onerous alternative to cash bonus bidding methods and would be beneficial, provided that it is enforceable. We view this method with some caution because of the uncertainty of the conditions under which it might be imposed.

At this point, I would like to summarize why we believe a majority of the industry prefers cash bonus as the best method for both the state and the energy explorers.

First, we believe it is the foundation for all free enterprise contract arrangements;

Second, it is the simplest and easiest to determine and administer by all parties;

Third, it is fair and equitable; by this I mean that all parties travel at their own risk, and finally,

The right to explore is paid for in advance.

In 1977 the Department of Natural Resources completed a report entitled, "A Study of Petroleum Leasing Methods and Possible Alternatives." H.B. 854 apparently is based on this study and its conclusions.

In this study, a great deal of attention is given to the "percentage of acreage option." We assume this is the reason for granting the Commissioner authority to withhold acreage from any sale areas under Section 180 (c) (4) (f). Under this scheme, certain amounts of acreage would be withheld from a sale so that following a discovery the state could collect a windfall on drainage acreage sales. This is a workable approach only if you know which acreage to withhold and on which structures. This is rarely the case, as we saw in the MAFLA, Gulf of Alaska and NPRA. Furthermore, industry cannot bid or drill on only portions of prospects in high risk or high cost areas which predominate in Alaska.

I would like to make a few more comments about the Department of Natural Resources' report. The one overriding conclusion of that study was that a variety of bidding methods, widely employed, would increase the state's return from its commitment of oil and gas properties.

Chevron believes this conclusion is biased against cash bonus bidding, and we feel that the odds are against anyone knowing all they need to know to use the right method at the right time. The state, even if armed with a skilled staff and large amounts of data, can hope to do no better than an individual company in evaluating potential and risks, and these companies are more often wrong than right in their appraisals.

We believe the state's report, and particularly its main bias against cash bonus bidding, is based on a few but major faulty economic assumptions.

First, the authors of the report assume that the industry will make an 18 percent rate of return. Although this is very desirable, and would not be out of line considering the high risk involved, past experience shows that the industry has averaged no more than seven to eight percent from OCS ventures which approximates Alaska lands, according to several exhaustive studies. For example, in May 1977 Prof. Walter J. Mead of U.C. Santa Barbara testified before a U.S. House of Representatives Committee that weighted average rate of return from 184 leases issued in the Gulf of Mexico in 1954-55 amounted to only 7½ percent before taxes. This sale period was selected because these leases have a 20-year production history which provides a comprehensive data base.

Second, no reduction of state income was assumed in royalty cases, but it almost certainly will occur. The economic limit of a field is going to be greatly influenced by the amount of royalty. The higher the royalty, the earlier the economic limit is reached. When an operator can no longer produce oil or gas profitably the result will be oil and gas left in the ground and neither industry, nor the state, will make any money on it.

* * *

Next, I would like to turn to the provision of the bill that would require the lessee or permittee to make available to the Commissioner all data obtained from exploration and production activities on the lease or permit. We believe this provision raises fundamental questions about the appropriateness of the state's entry into the exploration business, and secondly, points to grave problems--from our point of view--about the preservation of confidentiality.

should but
The language in the proposed legislation does not distinguish between, "raw", "processed" and "interpretative" data. We are unalterably opposed to providing the state with the results of the efforts of our interpretative staff. Industry cannot operate under this law. We urge the committee to delete this section.

We are also opposed to giving the state our basic geophysical data. We are not convinced that the state can hold this data confidential because of its large staff and turnover rate. Any leak of this sensitive information to our competitors definitely will have an immediate and adverse impact on our exploration program in this state.

The third provision we object to (Sec. 38.05.180(v)) gives the state the right to purchase up to 16 and two-thirds percent of the lessee's share of the oil and up to 100 percent of the lessee's gas.

We are not opposed to the state's right to take its royalty share of oil or gas in kind, but we oppose any provisions which empowers the state to take any portion of the lessee's share.

In order to justify the risk and expense of exploration and development, and be able to satisfy its contractual commitments, the lessee must retain the right to dispose of all of its share of production. Without this right, the state of Alaska lands become less desirable to explore and develop. We believe this is another step toward the state's entry into the oil and gas business, which should stay with private industry.

It seems inconceivable to Chevron that the state would take a portion of the lessee's share when that is the very incentive for industry to explore in the state initially.

Another provision we oppose is Paragraph Q. Paragraph Q refers to drilling and development contracts and to the authority of the state to share in the cost of exploration.

We're not clear on the meaning and intent of this paragraph. If it means the state intends to become a working interest participant in leases, then we strongly object.

Our next objection concerns the terms and conditions of the lease itself. Because of the remoteness of most of Alaska's land and the seasonal restriction on operations, Chevron prefers a ten-year primary lease term. We feel this length of time is necessary to adequately evaluate a lease under Alaskan conditions.

There is one provision which would allow the Commissioner to grant rights on leases only to the depth drilled at the time production begins. Chevron is at a total loss to see how this provision can benefit the state in any way. It will certainly cause waste in time and money for the industry because wells will be drilled far beyond primary objectives--just to ensure earning the rights of a normal lease. In effect, this will delay production and thereby delay revenue to the state.

Considering the geological, legal and practical ramifications of this provision, one must conclude that it is totally unacceptable to the industry and can do the state no good. It should be stricken from the bill.

Our next objection is to any effort to restrict joint bidding between majors or multinational companies. In Alaska, particularly, with its accompanying expensive costs of exploration and production, it is essential for large and small companies to be able to join together to share the risk.

A ban on joint bidding by majors does not necessarily increase state income. In fact, a recent study by the Department of Interior showed that joint bidders tend to bid higher, on the average, than solo bidding competitors. (November 1976 issue of the Journal of Petroleum Technology.)

The next provision we wish to discuss deals with the need for the Commissioner to submit and defend his leasing program to the legislature. We prefer that the various reporting methods set out in this section not be prescribed in law. We believe this review is an administrative function and that public hearings are an adequate and effective vehicle for gathering comments and reactions to the proposed action. Neither the timber leases nor any other types of state lease are submitted to the legislature, and to require this approach in law for the petroleum industry will lead to further delays in development of the state's natural resources. Particularly objectionable to us is the requirement that the Commissioner must defend his previous year's program and explain why he used certain methods. This is certain to toss the entire leasing program into an interminable bureaucratic morass.

And finally we oppose the provision which deals with acreage chargeability. We believe the reduction to 200,000 acre limitation on uplands is arbitrary and unjustified. The 500,000 acre limitation in this state, where there are large areas of state lands potentially available for bid, is not unreasonable. A large acreage position is necessary as an incentive for an operator to explore frontier areas.

In closing, Mr. Chairman, Chevron believes H.B. 854 is an unreasonable, unwise and unworkable piece of legislation that simply is not in the best interest of the citizens of Alaska.

As I said at the outset of my remarks, my own company would be faced with the prospect of seriously reassessing its current and future exploration activities on Alaska state lands if this bill is enacted.

It is our opinion that this legislation will only serve to inhibit or prevent the orderly exploration and development of Alaska's oil and gas properties.

We oppose a shift away from the successful cash bonus bidding system because we believe that the cash bonus ensures a fair and equitable return to the state, as well as ensuring the fair share of any revenue resulting from production.

It is conceivable that Prudhoe Bay may not have been found if royalty or net profits bidding or percentage acreage option had been employed.

Mr. Chairman, members of the committee, we have serious concern that if this legislation becomes law, the ultimate losers will be the citizens of this state, as well as the consumers of oil and gas.

Thank you for giving Chevron this opportunity to comment on this proposed legislation.

TESTIMONY ON COMMITTEE SUBSTITUTE FOR HOUSE BILL 854 (FINANCE)

PRESENTED BEFORE THE

SENATE RESOURCES COMMITTEE

BY

J. R CARSON

CHEVRON, USA, INC.

May 22, 1978

Juneau, Alaska

AGO 546716

TESTIMONY ON H.B. 854

Madam Chairman, members of the committee, my name is John Carson, and I appreciate the opportunity to comment on Committee Substitute for House Bill 854. (Finance)

I am a petroleum geologist and I'm presently Division Geologist in Alaska for Chevron U.S.A., the principal domestic oil and gas subsidiary of the Standard Oil Company of California. Since 1965, I've been actively involved in all state lease sales and the two OCS sales in the Gulf of Alaska and the Lower Cook Inlet.

Chevron is aware of the amount of preliminary work done by the state administration and the Department of Natural Resources in researching and drafting this legislation.

We commend efforts in drafting legislation that proposes a long term leasing program for Alaska. We believe the state should be encouraged in its effort to establish and maintain such a program, with appropriate industry participation.

Members of the committee, the petroleum industry--as indicated by its response to the State's solicitations--clearly desires a realistic plan that can serve as the basis for an effective working relationship between the industry and the state.

Frankly, we believe the proposed legislation will inhibit or prevent orderly development of oil and gas resources in Alaska--to the detriment of the state government, its taxpayers and my own industry.

I will say candidly that this legislation is untenable from our point of view. If enacted into law, Committee Substitute for House Bill 854 would have a serious and far-reaching impact on my own company, and would give us serious cause to reconsider our exploration activities in the high-cost, high-risk frontier state lands of Alaska.

854 as now written would be counter-productive. It actually would be a step backward at the very time our nation desperately needs an effective oil and gas exploration program.

Generally stated, we object to provisions covering: 1) the wide variety of bidding methods to be employed; 2) the Commissioner's access to all the lessee's data, including proprietary data; 3) the state's call on production; 4) short and restrictive lease term and conditions; 5) the need for the Commissioner to submit and defend his lease plan to the legislature, and 6) the Commissioner's right to ban joint bidding for approval.

Time does not permit me to discuss in detail each of the provisions, but I will attempt to outline our most significant objections:

First, the wide variety of bidding methods, starting on page 3, section (f):

In advocating numerous bidding schemes--actually a shift from only cash bonus bidding, a system that has worked well--the administration hopes to maximize its financial return from state lands.

AGO 546718

But Chevron believes a move away from the cash bonus method means the perilous abandonment of a proven concept that has brought stability to the state's leasing program. The bonus system would be replaced by an array of untested leasing methods, particularly in the frontier areas.

We believe this provision, if enacted, will transform Alaska into a trial-and-error laboratory in oil and gas leasing. It means replacing orderly development with uncertainty and the unknown. It's not a gamble Chevron feels is worth taking.

Before discussing each bidding system, all concerned parties should be aware that a move away from cash bonus bidding will result in three key developments:

First, it will shift a substantial part of the burden of risk from industry to the taxpayer.

Second, it will serve as a substantial deterrent to exploration and development, and

Third, it will cause the rapid and constant growth of state agencies to administer, evaluate and audit the leases and subsequent production. This places increasing demands on taxpayers to support this bureaucracy.

Chevron believes these are unacceptable consequences which would be intolerable to the taxpayers and leaders of this state.

As you know, cash bonus bidding provides that leases be awarded to the highest cash bonus bidder. This bonus is paid before the lessee can proceed with exploratory drilling on the lease.

The other bid methods provide for bid variables such as royalty, net profit, or work commitment. In these cases, the state receives nothing other than perhaps a small fixed bonus at the time of leasing. Other revenue is not forthcoming under the royalty and net profit schemes unless there is production. Simply stated: No production, no revenue.

In our opinion, cash bonus bidding is the only method that will strongly encourage the petroleum industry to lease and explore the state land.

We further believe that this method will result in the production of the most oil and gas and consequently will provide the most revenue, both to the state and the petroleum industry.

The other methods, employing biddable royalties and net profits, reduce the incentive to explore and produce. These alternatives, particularly in the case of biddable royalties, serve to shorten the economic life of the fields--resulting in less production and, therefore, less revenue.

Cash bonus bidding is particularly advantageous to the state in frontier areas of high risk. Most of Alaska's lands are in this category.

Now let's compare other proposed bidding methods with traditional cash bonus bidding. Because of time limitations, I can only touch briefly on these, but I am prepared to go into more detail if questions arise.

The royalty bidding method, although it allows oil and gas companies to acquire land with little cash, is a strong deterrent to early drilling. Very simply, it is easier and cheaper to wait on others to bear the risk and expense of exploratory drilling.

Having spent little capital to acquire the lease, an operator is tempted not to spend a dime to evaluate the lease, hoping an adjacent leaseholder may do it for him. Carried to the extreme, the effect of this would be that no wells would be drilled to evaluate the leases. This same problem is inherent in the net profits system, which I'll talk about shortly. On the other hand, when cash bonus is involved, the winning bidder has a strong incentive for early drilling because his bonus investment is earning him nothing.

In cash bonus bidding the state assumes none of the risk but still receives revenue from leases, whether or not they are productive.

The advantages of this system were clearly demonstrated a few years ago in the sale of federal leases off the coasts of Mississippi, Alabama, Florida and Louisiana. Successful bidders paid $743 million for several tracts on one structure, the Destin Anticline, and spent over 10 million dollars drilling seven dry holes on the structure--all at no cost to the taxpayer. Under royalty or net profit bidding, the government would have received nothing.

What would government have received if it had sold the Gulf of Alaska on a royalty bid basis? As in the Gulf of Mexico case I previously cited, nothing. Should the taxpayer and the government be forced to suffer the loss of more than one-half billion dollars--when to date, no royalty appears forthcoming?

The NPRA comes to mind as another example of an area adjudged to possess high potential, but which so far is a disappointment. Again, if sold on a royalty bidding method, the lessors would have received nothing to date.

Let me emphasize that in all these cases, the areas were considered extremely attractive to both the industry and government. These are precisely the types of areas in which the state might be enticed to use a royalty or net profit bidding method. Yet none of these has led to any discovery or government revenue.

Proponents of royalty bidding believe it encourages competition among bidders and allows the small company and the independent improved entry into oil and gas lease bidding. Cash bonus bidding usually is blamed for tending to discourage small companies from bidding.

This is not supported by the facts. Small companies gain entry into the sale by joining with a larger company or with several other smaller companies. In the recent Lower Cook Inlet sale, independents and smaller companies bid on royalty and cash bonus tracts with about the same frequency as the

AGO 546722

majors. Of the 34 companies which bid in the sale, 18 were smaller companies. These 18 made successful cash bonus bids on 26 tracts, of which 13 were sold for more than one million dollars. Moreover, the small companies are represented in half of the top bonus tracts of the sale.

Provisions are made for reducing the royalty in the event the lessee cannot operate profitably. While we agree that such a provision may be necessary, we think this only serves to point up a major weakness of royalty bidding. Due to the highly competitive nature of the business, industry is encouraged to bid and agree to terms that may be truly ridiculous. Another commission will almost certainly be necessary to review and rule on the long list of plaintiffs for reduced royalties.

The second proposed bidding method we are concerned about is net profit bidding. This system has most of the disadvantages of royalty bidding plus one more: It requires a huge staff to administer and audit. For example, each property would require a battery of accountants to audit the companies' production and costs. Just as in the case of royalty bidding, the risks are passed on to the government. Furthermore, net profit bidding discourages cost-effective, efficient development practices.

At this point, I would like to summarize why we believe a majority of the industry prefers cash bonus as the best method for both the state and the energy explorers.

First, we believe it is the foundation for all free enterprise contract arrangements;

Second, it is the simplest and eas_ st to determine and administer by all parties;

Third, it is fair and equitable; by this I mean that all parties travel at their own risk, and finally,

The right to explore is paid for in advance.

In 1977 the Department of Natural Resources completed a report entitled, "A Study of Petroleum Leasing Methods and Possible Alternatives." H.B. 854 apparently is based on this study and its conclusions.

I would like to make a few comments about the Department of Natural Resources' report. The one overriding conclusion of that study was that a variety of bidding methods, wisely employed, would increase the state's return from its commitment of oil and gas properties.

Chevron believes this conclusion is biased against cash bonus bidding, and we feel that the odds are against anyone knowing all they need to know to use the right method at the right time. The state, even if armed with a skilled staff and large amounts of data, can hope to do no better than an individual company in evaluating potential and risks, and these companies are more often wrong than right in their appraisals.

We believe the state's report, and particularly its main bias against cash bonus bidding, is based on a few but major faulty economic assumptions.

AGO 546724

First, the authors of the report assume that the industry will make an 18 percent rate of return. Although this is very desirable, and would not be out of line considering the high risk invclved, past experience shows that the industry has averaged no more than seven to eight percent from OCS ventures which approximates Alaska lands, according to several exhaustive studies. For example, in May 1977 Prof. Walter J. Mead of U.C. Santa Barbara testified before a U.S. House of Representatives Committee that weighted average rate of return from 184 leases issued in the Gulf of Mexico in 1954-55 amounted to only 7½ percent before taxes. This sale period was selected because these leases have a 20-year production history which provides a comprehensive data base.

Second, no reduction of state income was assumed in royalty cases, but it almost certainly will occur. The economic limit of a field is going to be greatly influenced by the amount of royalty. The higher the royalty, the earlier the economic limit is reached. When an operator can no longer produce oil or gas profitably the result will be oil and gas left in the ground and neither industry, nor the state, will make any money on it.

Next, I would like to turn to the provision of the bill that would require the lessee or permittee to make available to the Commissioner all data obtained from exploration and production activities on the lease or permit. Found on p. 11 - section (aa). We believe this provision raises fundamental

questions about the appropriateness of the state's entry into the exploration business, and secondly, points to grave problems--from our point of view--about the preservation of confidentiality.

The language in the proposed legislation is not clear as to what non-interpretive data will be required. If the intent is to provide access to data existing prior to the lease, we are unalterably opposed. "Non-interpretive" is a loaded word which needs strict definition.

We are also opposed to giving the state our basic geophysical data. We are not convinced that the state can hold this data confidential because of its large staff and turnover rate. Any leak of this sensitive information to our competitors definitely will have an immediate and adverse impact on our exploration program in this state.

The third provision we object to gives the state the right to purchase a specified volume of the lessee's oil or gas. This is found on p. 11, section (Z).

We are not opposed to the state's right to take its royalty share of oil or gas in kind, but we oppose any provisions which empowers the state to take any portion of the lessee's share.

In order to justify the risk and expense of exploration and development, and be able to satisfy its contractual commitments, the lessee must retain the right to dispose of all of its share of production. Without this right, the state of

Alaska lands become less desirable to explore and develop. We believe this is another step toward the state's entry into the oil and gas business, which should stay with private industry.

It seems inconceivable to Chevron that the state would take a portion of the lessee's share when that is the very incentive for industry to explore in the state initially.

If such a clause remains in the bill, Chevron feels it is mandatory that the state make its intention known on this matter prior to the lease sale. Otherwise, it will be totally inoperable. The industry, without contractual commitments for its product, cannot bid on oil and gas leases.

Our next objection concerns the terms and conditions of the lease itself. I refer to p. 6, section (n). Because of the remoteness of most of Alaska's land and the seasonal restriction on operations, Chevron prefers a ten-year primary lease term. We feel this length of time is necessary to adequately evaluate a lease under Alaskan conditions. We appreciate that the proposed legislation gives the Commissioner the right to grant a ten-year lease under certain conditions. However, it should be stated that this decision will be made and announced prior to this sale.

Our next objection is to any effort to restrict joint bidding, found on p. 10, section (y). In Alaska, particularly, with its accompanying expensive costs of exploration and production, it is essential for large and small companies to be able to join together to share the risk.

AGO 546727

A ban on joint bidding does not necessarily increase state income. In fact, a recent study by the Department of Interior showed that joint bidders tend to bid higher, on the average, than solo bidding competitors. (November 1976 issue of the Journal of Petroleum Technology.)

The final provision we wish to discuss deals with the need for the Commissioner to submit and defend his leasing program to the legislature. See p. 1, section (b). We prefer that the various reporting methods set out in this section not be prescribed in law. We believe this review is an administrative function and that public hearings are an adequate and effective vehicle for gathering comments and reactions to the proposed action. Neither the timber leases nor any other types of state leases are submitted to the legislature, and to require this approach in law for the petroleum industry will lead to further delays in development of the state's natural resources. Particularly objectionable to us is the requirement that the Commissioner must defend his previous year's program and explain why he used certain methods. This is certain to toss the entire leasing program into an interminable bureaucratic morass.

In closing, Madam Chairman, Chevron believes CS for H.B. 854 is an unreasonable, unwise and unworkable piece of legislation that simply is not in the best interest of the citizens of Alaska.

AGO 546728

As I said at the outset of my remarks, my own company would be faced with the prospect of seriously reassessing its current and future exploration activities on Alaska state lands if this bill is enacted.

It is our opinion that this legislation will only serve to inhibit or prevent the orderly exploration and development of Alaska's oil and gas properties.

We oppose a shift away from the successful cash bonus bidding system because we believe that the cash bonus ensures a fair and equitable return to the state, as well as ensuring the fair share of any revenue resulting from production.

It is conceivable that Prudhoe Bay may not have been found if royalty or net profits bidding or percentage acreage option had been employed. Our sincere suggestion is to retain the leasing statute now in effect and supplement it with provisions for a long term leasing program.

Madam Chairman, members of the committee, we have serious concern that if this legislation becomes law, the ultimate losers will be the citizens of this state, as well as the consumers of oil and gas.

Thank you for giving Chevron this opportunity to comment on this proposed legislation.

H.B. 854
Gov's. Bill

TESTIMONY ON

ALASKA LEASING POLICY BILL

(H.B. 854)

By
Rod L. Boane
Alaska District Manager
Exxon Company, U.S.A.

Before The
State of Alaska
House Resources Committee

Juneau, Alaska

March 17, 1978

AGO 546703

Mr. Chairman and Members of the Committee --

I am Rod L. Boane, District Manager for the Alaska Exploration District of Exxon Company, U.S.A. I appreciate the opportunity to be here today and present the views of my Company concerning the proposed Leasing Policy Bill.

First, let me say that Exxon believes the existing provisions of Section 38.05.180 of the Alaska Statutes are quite satisfactory in administering adequate control over exploratory and development activities on State leases. Therefore, we do not believe these new amendments to the Statutes are needed to protect the public interest. On the contrary, we think the proposed amendments would create unnecessarily involved and cumbersome procedures that will neither foster needed exploration nor benefit the State of Alaska. Although we take exception to almost all features of the proposed amendments, in the interest of time, I intend to discuss only the more troublesome provisions, with particular emphasis on the proposed bidding methods.

Exxon believes that the best method for awarding leases is on a cash bonus basis. This system has several advantages which I would like to review.

- First, the successful bidder sees very strong incentives to explore and develop rapidly and to recover the maximum economic volume of hydrocarbons at the lowest possible cost. This is necessary in order for him to maximize the return on the cash bonus invested.

- Second, under the cash bonus system, the State bears none of the risk that commercial reserves will not be found. This risk is placed directly on industry where it belongs. This is a particularly critical concept in Alaska which is still essentially a frontier province where very little exploratory drilling has occurred and thus very little is known about the oil and gas potential of most of the State. When one further takes into account the fact that Alaska is a very high cost area due to its remoteness and harsh operating environment, it should be easy to see that the exploration risks and costs are indeed great. The Gulf of Alaska history should prove this point as, thus far, no commercial discovery has been made.

- Third, under the cash bonus system there is no possible way that the awards will be made in an arbitrary manner since the highest bid is obvious.

- Finally, the system is simple and inexpensive to administer, and its integrity is unaffected by future events. The State would not have to expand its staff to implement this system.

Now I would like to compare the alternate bidding methods proposed in this legislation to conventional cash bonus bidding with fixed royalty. Basically, the proposed alternative bidding methods fall into one of three categories. The first category involves some form of royalty bidding. The second category uses

some form of net-profit bidding. The third category uses some form of work commitment. All three categories require a cash bonus, either as a bid variable or a fixed amount. Let's first examine the royalty bidding systems.

(1) It is not uncommon for operators to discover reserves of lesser magnitude than anticipated. With high fixed royalty, some of these discoveries could not be developed profitably unless the State agreed to accept a lower royalty than originally bid. Downward adjustment in royalty rate prior to any development would be difficult to administer and could undermine the integrity of this bidding system.

(2) With royalty bidding, the successful bidder does not have a strong incentive for rapid exploration and development since front-end cash investment is small. Speculators could therefore see incentives to acquire leasehold interest, and then wait in hopes that they will be able to cash in on the discoveries made by others. This situation would obviously result in delayed exploration and development activities.

(3) With exclusive royal bidding, the public bears the major portion of the exploration risk because if the tract doesn't contain commercial hydrocarbon reserves, as the majority will not, the public receives no compensation whatever. As an example, the State received $900 million in bonus for acreage on the North Slope in the September 1969 sale. Under a royalty bidding system the State would have received little income to date. We strongly believe that risk-taking and its associated rewards or losses are more properly the province of private enterprise.

The second royalty bidding system involves a sliding scale royalty system which would be difficult to monitor and, practically speaking, would make it impossible to compare bids unless you know the total reserves, the price at which production would be sold, and the rate of production. Sliding royalty could result in widely differing positions on prudent development. Also, unitization of tracts would be a very complex and difficult job.

With these comments in mind, let's review recent experience with royalty bidding in the Federal sector. A program of experimentation began with the recent sale in the Lower Cook Inlet. Thirty-four percent of the tracts were put up for royalty bidding. Selection of these tracts was in such a manner that they were scattered over the entire sale area. When this type of tract distribution is coupled with a forced unitization lease stipulation, it is not difficult to conclude that the owners of the royalty tracts have no incentive for rapid evaluation. They can just sit back and wait for the owners of cash bonus tracts to do the initial drilling. They can then join the units covering any reservoirs that extend under their tract.

After the Cook Inlet sale, this problem apparently became obvious to the Department of Interior. For the North Atlantic Sale (Sale #42), they attempted to "fix" this problem by grouping the royalty tracts together and having them removed from the cash bonus tracts. They further expanded the experiment by having a group of cash bonus tracts that had a fixed royalty of 40 percent.

Industry comments relating to royalty bidding have apparently begun to create some concerns about this system. In the upcoming South Atlantic Sale (Sale #43), we see another attempt to "fix" difficulties in the previous system. Tracts are being offered by cash bonus bidding with a sliding scale royalty. They have attempted to "fix" the unitization problem by again grouping the sliding scale royalty tracts together. However, they did not address how a group of sliding scale royalty tracts or sliding scale royalty and cash bonus tracts would be unitized.

Now that this experimentation process has begun, we see the continuing creation of new difficulties and complexities as attempts are made to correct previous difficulties and problems. It appears that this process is going to have a "snow-balling" effect and may eventually reduce competition. In this situation, only the companies that can afford to dedicate a large professional staff to the long unitization negotiations and wait long periods for initial production will servive. This certainly does not promote increased competition.

Now let's look at the second bidding category a profit-sharing system, which has most of the same adverse characteristics as royalty bidding, but with four added complications and disadvantages.

(1) Using net profits will be much like selecting a contractor to perform a job. The operating efficiency of the bidder could become an important consideration in determining which of

several bidders had submitted the high bid inasmuch as the gross proceeds to be received by the public would be a direct function of the efficiency of the operator. Thus, the successful bidder would no longer be obvious. Since the relative operating efficiency of companies cannot be determined quantitatively, the Commissioner would be vulnerable to charges that bid awards were being made in an arbitrary or discriminatory manner.

(2) A profit-sharing system would be difficult and costly to administer. A large administrative organization would likely be established to audit and monitor the continuing activities of lessees. Discretionary judgments would be required by the State with regard to what costs were to be included or rejected in the profit base. This system could lead to State control of expenditures.

(3) A profit-sharing system would significantly reduce the incentive for a successful bidder to operate at maximum efficiency. Any prudent operator utilizes a priority system when restraints of either manpower or materials create limitations. When these restraints exist, net-profit tracts will have low priority. The result - reduction of efficiency. It would also reduce the timing and incentive for development of advanced technology currently in progress by industry.

(4) Most important, sharing in net profits would signal the State's entry into the production phase of the oil business. It might be politically and economically difficult for the State not

to be deeply involved in decisions about day-to-day operations and thereby become an operating partner. This step would not be consistent with the maintenance of a strong private enterprise system either within the oil industry or within the State itself.

The third category of bidding system is work commitment which can be combined with any of the other methods. A work commitment bid becomes a form of cash bonus bidding. If an operator has a high interest in a tract, he will bid a work commitment which is equivalent to what he would bid in a cash bonus system. In many instances, this committment would be much larger than required for evaluation. If early exploration results are negative, the operator remains committed to drill more wells than would normally be prudent or necessary.

The provision that the Commissioner can terminate a work commitment further complicates the issue. Termination of a work commitment for one operator would undoubtedly result in inequities because he has received an unfair competitive advantage. Continuation of this practice could result in extremely high work commitments in anticipation of cancellation after performing only a portion of the work.

A work commitment bid will be nothing more than a form of cash bonus. The same result can be accomplished more easily and efficiently with a cash bonus bid.

Now I would like to discuss a few other provisions which give us concern.

(1) AS38.05.180(v) Right to Purchase - The provision gives the State the right to purchase not more than 16 2/3 percent of the oil and 100 percent of the gas. The most onerous portion of this provision is the right of the State to purchase 100 percent of the gas.

The present and potential supplies of gas within Alaska far exceed reasonably anticipated demands by the State residents. Therefore, to find a market, this gas will have to move into interstate commerce. This requirement, that the State could remove the gas from the market, could severely hamper a producer's ability to market the reserves. Without a reasonable expectation that the developed gas can be marketed, there is greatly reduced incentive to explore.

It would also retard development of natural gas for State residents. The risk that the gas could be diverted would have significant impact on ventures to install gas transportation systems.

In addition to these concerns, it raises other questions such as:

1. Determination of fair market value
2. Use of gas for lease fuel
3. Timing and rate of production - could the State control these to satisfy their own requirements or desires?

(2) AS380.05.180(w) - Exxon is strongly opposed to this proposed section which requires any lessee or permittee conducting exploration for, or development or production of, oil or gas on State land, to provide the Commissioner access to all data obtained from such activity and to provide copies of such specified data, as the Commissioner may request. Access to all data could potentially permit endless intrusions into private business. Much of this data is very costly. In a competitive industry such as ours, a considerable amount of data is proprietary. Disclosure of this type of data could result in the loss of a competitive edge. In none of the other producing states are operators required to provide access to all data. In addition, we feel that any such requirement would, in effect constitute a "taking" for which compensation by the State would be required. We believe this proposed amendment is unnecessary and should be deleted because the existing regulations provide the State with adequate control over exploration and development activities.

(3) AS38.05.100(1) - We are strongly opposed to the concept of earning production rights only to the depth drilled at the beginning of production from a lease. We are not aware of this language in lease forms for any other producing state.

This language is somewhat similar to that commonly used by a lessee in "farming out" acreage for the purpose of evaluating specific geologic objectives by a third party. In a frontier

province like Alaska it doesn't make any sense to place such restrictions in the lease form. The idea should be to give the lessee maximum flexibility in evaluating his acreage - not to curtail or to require unreasonable and costly actions on his part. We, therefore, strongly suggest that this language be deleted.

We also recommend that reworking be added to the list of actions which will hold a lease in force. In fact, a grace period of 60 days should be allowed between cessation of production and initiation of drilling or reworking operations. This useful and desirable feature is in the present law.

(4) AS38.05.180(j) Lease Term - A five-year primary lease term is very restrictive in Alaska. The remote location of most prospects, rugged terrain, short construction season, and reduced drilling season, either necessary or imposed, make completion of the exploration cycle a difficult and time-consuming process. Once a discovery is made, additional drilling is required before an estimate of the field size can be made. All of the previously mentioned factors affect this drilling too. Once the lengthy process of discovering a field and establishing its commerciality is complete, the long development phase must begin. We strongly recommend that the 10-year lease term be retained.

(5) AS38.05.180(c) Uplands Acreage Limitation - The proposed 200,000-acre limitation on all lands other than tide and submerged lands is very restrictive compared with the current 500,000-acre limitation in a State like Alaska which has so many frontier

interior basins to explore. In a hostile high cost environment such as Alaska, a large block of acreage may be necessary in order to justify exploration. We believe the proposed 200,000-acre limitation would be a strong disincentive of an operator to explore these frontier interior basins and strongly recommend maintenance of the current 500,000-acre limitation.

(6) AS38.05.180(u) Joint Bidding - The provision allowing the Commissioner to restrict joint bidding, if he so desires, could prohibit the involvement of some companies most capable of operating in the Alaskan environment.

A study was performed by the University of Southern California and the USGS to determine the effects of restricting majors from bidding jointly in the OCS. They concluded that on the average, this restriction resulted in more bids per lease by the major oil companies.

(7) Legislative Review - We object to the requirement for submission of the leasing program for annual review by the Legislature because we believe it will result in unnecessary delays in implementing leasing programs.

(8) AS38.05.180(q) Drilling and Development Contracts - The proposed amendment which would allow the State to share in exploration costs is inconsistent with the provisions of the lease agreement, as the State's royalty interest is free of all exploration

and development costs. If this is intended to allow the State to share in working interest, we are opposed since it would signal entrance of State Government into the oil and gas business.

In closing, I would like to reiterate that Exxon believes the current leasing statutes and the implementing and regulations have served the State and industry well and do not need to be changed.

Passage of this bill will require the State to embark into an experimental program. Because these systems are unknown, many mistakes will be made. New "wrinkles" will be tried in order to correct these mistakes. In fact, the State of Alaska will find itself taking a course which is identical to the course presently being followed by the Federal Government. The end result will be an extremely complex system which may allow only a few companies to survive.

This concludes my prepared testimony, and I will be happy to answer any questions which you may have.

Telephone 907/274-1511

May 22, 1978

Ms. Kay Poland, Chairman
Senate Resources Committee
Pouch V
Juneau, AK 98911

Dear Ms. Poland:

We wish to submit herein Marathon's thoughts, concerns and suggestions regarding the proposed legislation entitled "An Act relating to the leasing and exploration of state land for oil and gas development".

First and most important, the present statues and regulations have worked well for the State and they have a background for proper legal interpretation and understanding. The State has under the existing laws authority to protect itself and to judge whether it is receiving fair value for leases sold at that time with the then known information. Hind sight makes instant experts of persons unknowledgeable in a given field of endeavor. Oil and Gas exploration is a risk business and it deals with many unknowns until it has the opportunity to prove or disprove a theory or imagitative interpretation by drilling a test well. Therefore it is our

AGO 546699

feeling that the proposed legislation being considered here today is unnecessary.

Specific comments to provision of HR 854 are as follows: 38.05.180(b) requires the commissioner to annually submit a proposed leasing schedule, wherein the legislature has the opportunity to disapprove all or part of it. It has long been the theory that the legislature makes the law and the Administration implements them. This proposed procedure gets the legislature involved with implementation of the laws. We feel there is much more important work for the legislature than looking at a specific leasing schedule, unless of course, there has been some impropriety.

38.05.180(f) provides for numerous bidding methods the commissioner may use to issue oil and gas leases. Other than the cash bonus bid and a fixed royalty reserved to the state, we believe the systems would not be in the best interest of the State of Alaska. When royalty bidding and net profits bidding methods are used the citizens of the state are then assuming a portion of the risk. Also, these methods will require additional personnel to administer and could result in less net return to the citizens. The small population of the State of Alaska does not need laws that would enlarge the bureaucratic organization.

When leases in a given area have various royalty provisions it would be difficult if not impossible for the individual companies to agree on a unit operation. With

differing royalty provisions the companies would have different economic incentives and philosophies which would be impossible to overcome.

In Section 38.05.180(n), we encourage its modification to provide for ten (10) year term leases as provided for in existing statues. The short operating seasons and continuing environmental concerns and lengthy process to obtain permits to drill are reasons to justify a ten (10) year term lease.

In line 11 on page 7 of this same section, it is recommended that the words "or is capable of" be added following the word "produced". This would in our opinion clarify the intent. Also we recommend the following sentence be added to this section "No lease issued under this section expires because operation or production is suspended under an order, or with the consent of the commissioner".

In Section 38.05.180(o), we recommend that a fixed rental be established for a lease and that it continue for the life of the lease or until production commences. That a minimum royalty be established and it be payable at the expiration of each lease year beginning on or after a discovery of oil and gas in paying quantities on the lands leased. Also that there be no dual payment of rental and royalties as presently provided for in the proposed leasing bill.

In Section 38.05.180(z), we feel the provision for the

state to take or purchase any volumes of discovered hydrocarbons over and above the reserved royalty share would be counter productive. Such provisions could eliminate or impair the ability of lessees to utilize gas sale contracts or production payments as a method of financing, likewise discourage exploration.

In 38.05.180(aa), we have strong misgivings about furnishing data as provided for therein. Information garnered from ones own initiative and imagination is valuable and proprietary and should be retained by ones own self. These provisions will certainly be counter productive.

In our statement, we have voiced some of our concerns and objections as well as some suggested modifications to HR 854, however, it is our hope that this proposed legislation will languish in committee without further action. We feel the existing law is satisfactory and workable. HR 854 will create confusion and misunderstanding in its implementation and will unnecessarily enlarge the bureaucratic organization and we recommend its rejection.

Very truly yours,

Morris L. Lowman
Senior Landman

cc: Resource Committee Members

AOGA COMMENTS -- HOUSE BILL NO. 854

Comments on Section 1:

Sec. 38.05.180(a)(1)(B)

In the description of the legislative purposes of this bill, there is a negative connotation given the word "exploitation" in Sec. 38.05.180(a)(1)(B). This section in general suggests sinister motives to the oil and gas industry which need to be "minimized." A possible modification should read, "regulate the development of these natural resources in protection of the public interest."

Sec. 38.05.180(a)(2)

Underlying this section is the notion that it is in the State's best interest to maximize the leasing methods available to the State. However, it is our view that the new leasing methods proposed are largely untested and may result in reduced revenues to the State. Further, it is not at all clear how a unit agreement could ever be formulated for a group of lessees who had obtained their leases under a combination of the proposed bidding methods.

Sec. 38.05.180(b)

This section deals with the Commissioner's obligations to prepare a leasing program for the following 5 year period and his obligation to keep the legislature informed. We are in favor of such a long-range leasing program and support the State's acknowledged

goal of "stability and predictability" in a petroleum leasing program. However, the long-range benefits intended and the State's goal are frustrated by the ability, and, indeed requirement, that the Commissioner review and possibly revise the leasing program at least annually. Perhaps the possibility of revision could be limited to the last two years of the ongoing five year programs so that industry could expend exploration dollars with some certainty that a sale will be held. Alternatively, Sec. 38.05.180(b)(3) should be deleted.

The annual submission to the legislature of the leasing program, although for "its information," would seem to presuppose further modification of the leasing program. Again, opportunity for yearly modification of the leasing program abrogates the State's goal of a stable and predictable petroleum leasing system. As an alternative to reporting to the legislature, the Commissioner could be required to make an annual public report of the leasing program.

Additionally, in Sec. 38.05.180(b)(5)(E), the Commissioner is required to justify in his report to the legislature why more than 50 percent of an area is leased under any one method of leasing. This requirement of justification seems to be an incentive, if not explicit direction, to utilize the full array of leasing alternatives for any one sale and to, in effect, "experiment".

The language in Sec. 38.05.180(b)(2) is extremely confusing and should be clarified. Further, it is not clear whether or not this section is directed to or will have any effect, intended or otherwise, on the Beaufort Sea sale.

Sec. 38.05.180(c)

This section authorizes four generic categories or methods of leasing: (1) "Bonus bidding," (2) "Royalty bidding," (3) "Net profit bidding," and (4) a "Work commitment bid." Several combinations or variations of methods are authorized under each of the generic headings.

The first method of conventional bonus bidding has the best overall record from the lessor's standpoint. A study of federal OCS sales through 1975 showed that industry had invested $35 billion in bonuses, exploration and development on OCS leases while receiving $22 billion in revenue.

Net profit bidding opens up a multitude of problems as to the definition of "net profit." This method would allow many companies to get into a land position for speculative purposes. It is a

fierce deterrent to early drilling as it is far easier and cheaper to wait out the competition. It is extremely cumbersome to administer and audit, and is even more costly to operate than royalty bidding methods.

The last method of bidding, a work commitment for a lease which cannot, by definition, exceed 5,760 acres, seems completely unworkable as such an area is much too small. This method is usually used in European and mid-east concessions or Canadian permits or reservations which share a common characteristic of being very large geographic areas.

In each of the four leasing methods, the language describing the State's royalty is troublesome. Each description of the State's royalty provides, "... royalty share reserved to the state of not less than 12 1/2 cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease ...." (emphasis added) This language would preclude anything but 100 percent state units. Unitization of lands involving federal or native lands and state lands would be impossible because of the inability of the participants to give the state at least 12-1/2 percent of the production from the "unit area encompassing the [state] lease."

Further, it should be noted that all of the methods and components of the alternate leasing methods will necessitate substantial increases in the budgets and personnel of the agencies involved.

Finally, if some minimum flexibility in leasing methods is desired, the same could be accomplished with minor changes in the existing law.

Sec. 38.05.180(d)

This section allows the Commissioner to reduce royalty when production becomes uneconomical, but only after two years of production. The most recent federal leases require only one year of production, which would be more in line with the stated goal of the bill to minimize revenue from marginal production. Given the explicit description of the royalty in Sec. 38.05.180(c) as "not less than 12 1/2 percent ...," it is not clear whether the Commissioner could ever reduce royalty to any figure below 12 1/2 percent.

Sec. 38.05.180(e)

This section purportedly authorizes the Commissioner to defer payment of any part of a cash bonus bid, provided the bonus is paid within five years. This authority is in direct conflict with AS 38.05.335(c), neither referenced nor repealed by the bill, which requires a deposit of 20 percent, in cash, of the bid.

Sec. 38.05.180(f)

This section authorizes the Commissioner to withhold acreage from leasing in a particular sale. It is assumed that the motive of

this provision is a desire to increase the state's income from leasing by leasing, for example, only part of a structure, and then, once proven productive, leasing the remainder for higher amounts. However, this authority to withhold acreage can just as easily decrease the state's income, in the event the first acreage leased is found non-productive.-- which is usually the case. In essence, this section is authorization for the Commissioner to "gamble" on the productivity of state lands.

This section also seems unfair to the first lessees, who, if the first tracts leased prove productive, are faced with the prospect of having to buy themselves back into the fruits of their own risk at a higher rate.

Sec.'s 38.05.180(g) and (h)

These sections relate net profits and work commitment leasing which, as previously discussed, are ill-advised.

Sec. 38.05.180(i)

There are no objections to this section so long as the trading or storage of royalty oil remains and is clearly the subject of mutual agreement.

Sec. 38.05.180(j)

This section concerns several of the provisions to be included in state oil and gas leases:

First, this section reduces the primary term of state leases from 10 to 5 years. It should be understood that in most areas of Alaska the ability to carry out exploration work is limited to a four month period per year, consequently a five year lease allows only 1-2/3 years of exploratory work. This is clearly insufficient in such a high cost, high risk area.

Second, this section provides that a state lease will be "renewed", if and for so long thereafter as oil and gas is produced in paying quantities or if the lease is committed to a unit. The term "renewed" should be replaced with the term "extended" as this is the long-understood and recognized effect of production or commitment to a unit.

Third, the section's provision concerning shut-in wells should be clarified, since, in its present form, it appears as though the shut-in well must be located on the land prior to the issuance of a lease.

Fourth, this section authorizes the Commissioner to increase rentals up to 150 percent of the preceding year's rate and to provide that a lessee earns production rights only to the depth drilled at the beginning of production. Both of these provisions should be deleted as unnecessary and unworkable.

As to rental increases, as noted, Alaska is already a high cost, high risk area. The prospect of substantial rental increases

during the primary term of a lease will serve only to curb exploration not encourage it.

The provision concerning production rights only as to the depth drilled is unnecessary and unfair. Aside from an obvious example of the lessee drilling into the top of a reservoir and being mechanically unable to go deeper and thereby losing the main body of the reservoir, it also could result in split ownership of a lease with one party having to drill through another's rights to reach his own with possible damage to the upper reservoir resulting.

Finally, the means of extending a lease by drilling are set forth in this section. Given the seasonal nature of drilling in Alaska, the 90 day grace period after drilling has ceased should be expanded if further drilling is prevented by environmental considerations or other circumstances imposed by the State.

Sec. 38.05.180(k)

The increased rentals proposed in this section will discourage exploration and will not increase income to the State because the extra expense will be compensated by lower bid totals. The present $1.00 per acre per year rental should be retained.

Further, this section alters substantially the nature of the ordinary rental provisions in oil and gas leases. The rental to be paid under these provisions is no longer a delay rental. This

section provides, "Rental is payable in advance and continues until income to the state from royalty, net profit, or exploration work commitment exceeds rental income to the state ... for three consecutive years ...." There is no provision for credit or set-off of rental paid during those three years against the state's income from production. Consequently, for the first three years of production, the state would receive both rental income and production income.

Sec. 38.05.180(l)

This section should be modified to provide that the state shall issue a State shorelands lease, as AS 38.05.180 presently reads. Also, the Commissioner should be given the discretion to grant a shorelands lease in excess of five years.

Sec.'s 38.05.180(m) and (n)

These two sections concern the unitization of state leases and are re-enactments of present law. However, given the alternate leasing methods of the bill, and the previously discussed, implicit direction to the Commissioner to "experiment" with these methods, unitization of state leases will be extremely difficult, if not impossible.

It is entirely reasonable to assume that under this bill, a proposed unit will be composed of leases involving highly disparate royalty percentages and one net profits or other kind

of lease. The extreme difficulty of applying these completely different lease burdens to the production allocated to each lease under a proposed unit are obvious. These difficulties constitute a disincentive to unitization and therefore nullify the conservation benefits of unitization.

Sec. 38.05.180(o)

This section concerns the acreage chargeability of KGS leases and is unobjectionable.

Sec. 38.05.180(p)

This section is a re-enactment of the present authorization for the pooling of state leases. Like the provisions concerning unitization, the problems inherent in alternate leasing methods will make pooling more difficult, to the detriment of the conservation objectives of pooling.

Sec. 38.05.180(q)

This section authorizes the State to share in the costs of exploration under a drilling or development contract. Oil and gas exploration is extremely risky and historically the province of private enterprise. Financial participation by the state in an exploration venture raises fundamental questions as to the appropriate role of state government. Given the fact that most wells drilled are unsuccessful, and the substantial sums involved in drilling in Alaska, additional challenges may be anticipated as to the authority or wisdom of the State to participate in a particular drilling project.

AGO 546693

Sec. 38.05.180(r)

This section is a re-enactment of present law concerning the subsurface storage of oil or gas on state leases. However, the present law's provision concerning the extension of the lease used for storage for the period of storage and so long thereafter as oil and gas are produced was deleted. This extension provision should be retained.

Sec. 38.05.180(s)

This section concerns the employment of state residents on state leases is substantially the same as the existing law.

Sec. 38.05.180(t)

This section is an attempt by the state to encourage exploration on lands on which no bids have been tendered. This philosophy is laudable. However, the Commissioner should not be restricted by the leasing details of this section.

Sec. 38.05.180(u)

This section would restrict joint bidding and should be deleted. Joint bidding can very well be to the advantage of the state as it tends to increase the size of the bids submitted and facilitates the exploration process. See, for example, the paper in the November 1976 issue of "Journal of Petroleum Technology" in which the authors conclude that "joint bidders tend to bid on more sought-after (and apparently more valuable) leases and that they tend to bid higher, on the average, than solo-bidding

competitors". Industry testimony before the U.S. Senate has indicated that since the first OCS sale in 1954, 172 companies have purchased OCS leases. 42% of these leases were not purchased by the major companies, and in recent years the smaller companies have increased their share of OCS production at the expense of the major oil companies.)

Depending on the content of the regulations adopted, this section may violate Article 8, §17 of the Alaska Constitution. This Constitutional provision requires that laws and regulations governing the use or disposal of natural resources must apply equally to all persons "similarly situated".

Sec. 38.05.180(v)

This section grants the state an unfettered option to purchase 16-2/3 percent of oil and up to 100 percent of gas produced from a state lease. This section will in effect eliminate the lessee's ability to use the gas sales contract as a method of financing. Consequently, gas exploration in Alaska will be discouraged if not precluded. Similarly, if the state should wait several years before deciding to take up to 100 percent of the gas, the discoveror of a gas field would be deprived of all income from his legally obtained gas, because he could not enter into a contract with any other user. This section would also eliminate or impair the ability of lessees to utilize the production payment as a method of financing, likewise discouraging exploration.

Sec. 38.05.180(w) This section requires state access to all of a permittee or lessee's exploration data and should be eliminated from the bill. This section is, in essence, a confiscation of valuable proprietary data, for the sole purpose of deciding whether the explorer has found anything or not. If the state decides he has, the area could then be thrown open to all other competitors, thereby removing any incentive for an aggressive company to be a leader or employ innovative ideas to discover new resources. This section completely removes that incentive, and thereby will cause significant state natural resources to remain unsought.

In addition, grave problems as to the preservation of the confidential nature of the data are inherent in this section. It is common knowledge that such information is extremely confidential and closely guarded by the individual members of the industry.

The existing law upon which the oil and gas industry has relied for the confidentiality of information is contained in AS 38.05.035(a)(9)(C). This existing provision requires the director to keep geological, geophysical and engineering data confidential "upon request of the persons supplying the information." As the Bill's provision requires disclosure of information to the Commissioner, not the director, and since it requires also access, as distinct from supplying copies, are the confidentiality provisions incumbent upon the director not

AGO 546696

applicable to the information required to be disclosed to the Commissioner?

If this section is to be applicable to existing exploration data, then the Commissioner's access and utilization of such existing data is almost certainly an unconstitutional taking of this valuable and expensive property. If the Commissioner is to be allowed access at all to such data, such access should be limited to future data only. Further, there should be a requirement of the adoption of regulations prescribing the confidentiality of this data and the addition of statutory criminal penalties for intentional disclosure of such data.

Section 2

There are no objections to this section concerning notice of mineral leasing.

Section 3

This section would amend AS 38.05.140(c) to reduce the upland acreage limitation from 500,000 acres to 200,000 acres. In Alaska, where there are large areas of state lands which are potentially eligible for bid, a 500,000 acre limitation, which the present statute contemplates, is not unreasonable. The effect of a 200,000 acre limitation would clearly be to limit the participation of those individuals who are most active in exploration business in Alaska, i.e., those individuals who have

historically submitted the highest bids to the state. It is not at all clear why the state would seek to discourage, rather than to encourage, the continued involvement of those individuals in Alaska. Further, this section's applicability to the holding of existing lessee's -- requiring them to reduce their holdings within 5 years -- is an unconstitutional taking of leasehold estates.

LIPTON on LEASING

The following notes summarize Lipton's major points on proposed leasing legislation in his testimony before the Senate Resources Committee on 1/28, 3/15, and 4/28. The initial two testimonies relate to HB 854, while the latter refers to changes later incorporated into CS HB 854 (Finance).

.2 line 3
B 854

Subsection (d) of the initial findings contains an unusual but exemplary approach to leasing - that is to "maximize state revenue from profitable oil and gas production, while minimizing revenue from unsuccessful exploration and from marginal economic oil and gas production." (Deleted in present version)

With respect to the eight leasing methods proposed, his specific comments were confined to:

Royalty Bidding - a method not preferable except when the lease is on a known structure with known risks. There is a potential problem if royalty bidding is permitted as an option and if the commissioner is also given discretion to abate royalties where there is an insufficient rate of return. The successful bidder may overbid a royalty with the expectation of a future royalty reduction. The section on abatement (page 5, line 18 CS HB 854) is still present, but modified from original bill.

Net Profit Bidding - this method may be attractive to both the state and the industry under certain circumstances. Allows the oil company to keep more front-end captial for exploration. (Retained in CS HB 854)

AGO 5466 81

Work Commitment Bidding - not a particularly useful method. May cause company to over-commit itself in relationship to actual profitability of the lease, resulting in premature abandonment. (Deleted in CS HB 854)

Lipton's general comment on the leasing methods is that it may not be desirable to itemize 7 or 8 options with minimum fixed commitments on each variable. The commissioner should have greater flexibility to design the lease sale to conform to the structures to be leased.

.6 line 15 HB 854 "The commissioner may withhold acreage from leasing in a particular lease sale." This is an important section as it may often be in the state's best interest to do so. Suggested a more positive statement to encourage utilization of this authority. (Deleted in CS HB 854)

.7 line 15 HB 854 There should be a provision for reasonable extension of exploration deadline beyond 5 years under certain circumstances. The bill allows for leases up to 10 years - but does not specifically address extensions of 5 year leases. (Same in both versions)

11 line 13 HB 854 This section authorizes the award of non-competitive leases when no bids have been received at a sale. Lipton advises against this because changing circumstances may result in a favorable lease agreement later if the state is not too hasty. (Modified in CS to prohibit non-competitive leasing)

p.12 line 1 HB 854 Gives the state the right to purchase up to 16 2/3% of oil and 100% of gas from a lease at fair market value. Lipton cautions state to use this judiciously as it may hurt the leaseholders under some conditions. CS HB 854 was rewritten to delete specific percentages, but still allows the state to buy "specified volumes" cited in the lease.

.6 line 22 B 854

Work Obligations - should be made a part of every lease agreement - This section is modified but still present in CS HB 854 (Finance). The committee might consider changing may to shall on page 4, line 26 in the CS.

.5 line 2 S HB 854 Finance)

Exploration Credits - See attached letter from Lipton to Cowper dated May 5, 1978.

.11 line 7 S HB 854 Finance)

Confidentiality of Exploration Data - there should be a provision to extend the period of confidentiality beyond two years if a scheduled lease sale is postponed.

CHAPTER 81: OIL AND GAS PRELEASING PROCEDURES

ARTICLES

1. (GENERAL PROVISIONS) AFFECTED LANDS AND EXCEPTIONS
2. PRELEASING PROCEDURES
3. SOCIAL, ECONOMIC, AND ENVIRONMENTAL ANALYSIS
4. ALASKAN ADVISORY COMMITTEE ON LEASING
5. NOTICE AND REVIEW
6. DEFINITIONS

ARTICLE 1: AFFECTED LANDS

SECTION

10. General Provision
20. Joint Federal-State Beaufort Sea Lease Sale
30. Limited Acreage Provision
40. Drainage Situation Provision

11 AAC 81.110. General Provision. (a) These regulations apply only to competitive leasing as specified in AS 38.05.020, 38.05.135, 38.05.145, 38.05.180.

11 AAC 81.120. Joint Federal-State Beaufort Sea Lease Sale (a) The proposed joint Federal-State Beaufort Sea Lease Sale is exemted from the requirements of these regulations.

ROUGH DRAFT ONLY

11 AAC 81.130. Limited Acreage Provision (a) Should an area of up to but not greater than one township in area be deemed leasable, the Commissioner may at his discretion, offer the area for lease under the following method.

1) The Commissioner will publish a notice of intent to lease and a notice of public hearing.

2) The Commissioner will hold the public hearing in the affected area to guage public opinion to the proposed lease sale.

3) Upon completion of subsection two the Commissioner will publish a notice of a lease sale and a chart delineating the tracts to be offered.

11 AAC 81.140 Drainage Situation Provision (a) Should a situation arise whereby the leasing of land by another party adjacent to State owned lands, threaten the mineral interest of the State lands through possible drainage situations, the

Commissioner may, at his discretion, offer that threatened land for leasing under the following methods:

1) The Commissioner will publish a notice of intent to lease and a call for public reaction and nomination.

2) Upon completion of subsection 1 and receipt of nominations, the Division will prepare an economic analysis on the sale area.

3) The Commissioner will then call for and hold a public hearing within the affected area to gauge public sentiment to the proposed lease sale.

4) The Commissioner, taking into account information gathered at the public hearing, will issue a list of the tracts proposed to be leased and a notice of a lease sale.

5) Lands offered for lease under this section may total no more than 100,000 acres.

90. Final Lease Conditions Set and Notice of Lease Sale

ROUGH DRAFT ONL

11 AAC 81.210 Notice and Publication. (a) The commissioner, at a date no greater than 24 months prior to any proposed lease sale, will publish a set of charts with accompanying written descriptions adequately locating the general geographic area in which the proposed lease sale will be.

(b) The commissioner will, concurrent with provision (a) cause to be published a notice for the Solicitation of Comments.

Chapter 81: Oil and Gas Pre-Leasing Procedures.

Due to a new article one being inserted into this chapter, articles 1 - 5 of the previous draft are now 2 - 6 with article six being re-titled to read "Definitions." Within article six, sections 520 and 530 have been deleted.

Article 2: Pre-Leasing Procedures

1) 11 AAC 81.210 Notice and Publication (a) The phrase ...date no less than 18 months prior..., has been amended to read...date no greater than 24 months.... The phrase...any lease sale, will cause to be published...has been amended to read ...any proposed lease sale, will publish.

2) 11 AAC 81.230 Initial Tract Selection (a) The phrase...date no less than 16 months prior to any lease sale..., has been amended to read...date no greater than two months after the first notice date of the Solicitation of Comments period,.... The phrase "utilizing industry and public comments" has been added to the end of the sentence.

3) 11 AAC 81.240 Social, Economic, and Environmental
a) the phrase "each tract, group of tracts, and/or," has been deleted.
b) the phrase "all or part of" has been deleted.
e) New Paragraph
From the date of notification by the commissioner of his decision under section 230 of this article, the concerned state agencies will have a maximum of four months in which to prepare their components of the SEEA.

4) 11 AAC 81.250 Public Hearings on Social, Economic, and Environmental Analysis.
c) ...date no less than nine months prior to the lease sale, has been amended to read...date no greater than three months after the completion of the SEEA.

5) 11 AAC 81.260 Final SEEA and Specific Tract Selection
c) ...date no less than six months prior to the lease sale, has been amended to read"...a date no greater than 12 months from the date of notice of Solicitation of Comments under section 10 of this article.
c) The commissioner will, upon completion of paragraph (c) of this section, announce to the public a date by which, barring unforeseen circumstances, the proposed lease sale will be held.

6) 11 AAC 81.280. Public Hearings on Lease Stipulations
c) ...date no less than four months prior to the lease sale has been amended to read...date no greater than three months from the date of completion of paragraph (c) section 60 of this article.

7) 11 AAC 81.290 Final Lease Stipulations Set and Notice of Lease Sale (a)
(a) a) ...date no less than three months prior to the lease sale, has been amended to read...date no greater than four months from the date of completion of paragraph (c section 60 of this article.

8) 11 AAC 81.320 Economic Component (c)...committee not less than 14 months prior to the lease sale, has been amended to read...committee not greater than one month after completion of section 40 article two of this chapter.

9) 11 AAC 81.420 Composition of Committee (a) the phrase "the Division of

ROUGH DRAFT ONLY

Minerals and Energy Management will be represented on this committee by both its leasing and petroleum managers."

b) the phrase "leasing manager of the" has been inserted between the words "by the"...and;;;"Division of....

c) A new paragraph has been added - "For each lease sale, a delegate from the borough government affected by the sale, will be invited to participate on the committee.

LEGISLATIVE AFFAIRS AGENCY

MEMORANDUM May 30, 1978

SUBJECT: CSHB 854 and the Effects of Using Multiple Oil and Gas Leasing Methods on Unitization

TO: The Honorable Kay Poland

FROM: Gregg K. Erickson
Director of Research

Summary

At the Senate Resources Committee meeting on Friday you received testimony to the effect that the use of differing leasing methods on adjacent tracts, as would be permitted under HB 854, would make it difficult to establish unitized development and production of the pools over which those tracts lie. Generally, our studies of this question, which we have conducted since the matter was first raised several months ago, do not support this conclusion. On the contrary, they show that the incentives to unitize will not be seriously reduced by diverse lease arrangements, and that the difficulties of reaching unit agreements will not be increased as a result of this diversity.

The Incentive To Unitize

Unit arrangements exist and are encouraged by state policy because centralized, unitized operation of an oil or gas field can and usually will result in substantial reduction in the expenses of extracting the resource, and in absolute gains in the total amount of oil and gas recovered. That the potential for these gains exists is, under the circumstances we have had in Alaska, almost never a matter of contention among the leaseholders who would be a party to a unit.[1] The most

---

[1] See Bradner, Tim, "Oil and Gas Regulation in Alaska," *Alaska Review of Business and Economic Conditions*, 1971.

AGO 546672

important question here is therefore: Will the use of differing leasing systems as contemplated in HB 854 significantly reduce the incentive to unitize that is provided currently by the very real benefits of joint, unitized field development and operations?

We think not. At a high royalty rate, as might be encountered under straight royalty bidding, the benefits in the form of increased production are, of course, shared with the landowner on the basis of the royalty percentage. But all the benefits in the form of reduced costs remain with the lessee. In a net profits arrangement the benefits of increased production and reduced expense are both shared with the lessor, but still leave the lessee with substantial incentive to partake of the advantages of unitization. Naturally, if the royalty or net profits rates were set at or close to 100 percent these incentives would disappear, but so would the incentive to develop the tract at all.

Difficulties in Unitization

Despite the retention of a clear incentive to unitize under a mixture of leasing methods as in HB 854, it is possible that a mixture of systems might create a practical barrier to unitization. This might occur, for example, if the differing lease terms made it impossible for the lessees to agree on the proper apportionment of the unit's expenses and produced oil and gas.

Current Alaska law provides only general guidance as to how this allocation is to be made.[2] The usual practice has been to allocate the costs and production generally on the basis of the costs and production that would accrue to an individual leaseholder were he to operate the tract on an individual, non-unitized basis. Another method less frequently employed, but used, at least partly, in the formation of the Prudhoe Bay unit, is to allocate expenses and actual production on the basis of the original petroleum in place underneath each lease. Other factors, or combinations of these factors, may also be considered, and one study has distinguished examples of 42 different methods of apportioning participation.[3]

---

[2] AS 31.05.110(c) provides that "each plan of unitization shall contain fair, reasonable and equitable provisions for...the division of interest or formula for the apportionment and allocation of the unit production, among and to the several separately owned tracts within the unit area such as will reasonably permit persons otherwise entitled to share in or benefit by the production from such separately owned tracts to produce and receive, instead thereof, their fair, equitable and reasonable share of the unit production or other benefits of it; a separately owned tract's equitable, and reasonable share of the unit production shall be measured by the value of each such tract for oil and gas purposes and its contributing value to the unit in relation to like values of other tracts in the unit, taking into account [1] *acreage*, [2] *the quantity of oil and gas recoverable from it*, [3] *location on the structure*, [4] *its probable productivity of oil and gas in the absence of unit operations*, [5] *the burden of operations to which the tract will or is likely to be subjected*, or so many of these factors, or such [6] *other pertinent engineering*, [7] *geological* or [8] *operating factors* as may be reasonably susceptible of determination...." (emphasis and numbers added)

[3] A. A. Khan and H. H. Power, "An Analysis and Comparison of Engineering Bases of Participation in Unit Agreements," *IOCC Committee Bulletin*, December 1960, p. 101.

Reaching an agreement on the theoretical basis for allocating participation and resolving all the associated technical issues can be a complex, difficult and protracted process. Although all parties usually have a clear view of the overall benefits to be gained from unitization, some may "hold out" in hopes that by doing so they may be able to extract a better deal from their fellow lessees concerning the allocation of the benefits of unitization.[4]

The question here, though, is whether differing lease arrangements will make reaching an agreement *more* difficult. In our view, the question answers itself when considered in the context of Alaska's unitization law and the permissible bases for apportionment of participating unit interests enumerated therein.[5] For example, is the "acreage" in a lease altered by the fact the lease contains profit sharing arrangements? Is the "location or the structure" affected by the royalty arrangements? Or are the "engineering, geologic or operating factors" influenced by either? We believe it is obvious that they are not.

---

[4] For a listing of the problems that can arise in unitization negotiations see Stephen McDonald, *Petroleum Conservation in the United States: An Economic Analysis* (Resources for the Future, Washington: 1971), pp. 198-201.

[5] AS 31.05.110(c). See note 2, *supra*.

A Final Point

As a final point, we note that tracts bearing differing royalty burdens have already been included in units, in Alaska and elsewhere, wherever individual holders of federal and state noncompetitive leases have sold those leases while retaining overriding royalties. Moreover, differing lease arrangements are likely to exist in the future side by side wherever Native corporation or federal and state oil and gas lands are contiguous. It is possible, of course, that if the legislature gives the commissioner of Natural Resources authority to use alternative leasing methods that these differences may be reduced or eliminated.

SUBJECT: Sliding Scale Royalty Considerations, Examples, Bidding Methods

Our proposed legislation, House Bill No. 854, contains provisions for utilizing sliding scale royalties as the fixed parameter in some bidding methods and as the bid parameter in others. Since there have been several questions on how we would set up a sliding scale royalty schedule for use as the fixed parameter and how we would request and evaluate sliding scale royalty bids, I have prepared this discussion and some examples.

The basic elements of my recommendations are that production steps will be in multiples of the approximate economic limit (1000 B/D, 2000 B/D, 3000 B/D, etc.). The percent royalty to be applied to each production step is based on increasing by equal increments (x+y, x+2y, etc.), the royalty percentage applied to the base (economic limit) production step. This criteria will make it easy to definitely determine the top bid when industry is asked to bid the sliding scale royalty reserved to the state. For example: The production rate steps are fixed (1000 B/D, 2000 B/D, etc.) as is 12.5% royalty at 1000 B/D, industry then bids on the equal incremental royalty percent increases to be applied to the higher steps.

I noticed that in Jack Roderick's letter to the commissioner, he is also looking at sliding scale royalty schedules. His schedules and discussion should be compared to my data as set out in this memo.

AGO 546740

TO: Joe Green
FROM: Blair Wondzell
RE: Sliding Scale Royalty Schedules

TYPICAL SLIDING SCALE ROYALTY SCHEDULES

NORTH SLOPE AREA

Daily Average Prod. Rate (Bbls./day)	Incremental Royalty Rate (%)	Royalty For Specific Producing Rates: Producing Rate (Bbls./day)	Royalty Production (Bbls./day)	Equivalent Royalty Rate (%)
-1000	12.5	1000	125	12.50
1001-2000	25.0	2000	375	18.75
2001-3000	37.5	3000	750	25.00
3001-4000	50.0	4000	1250	31.25
4001 and above	62.5	5000	1875	37.50
		7000	3125	44.64
		9000	4375	48.61

SOUTH CENTRAL AREA

Daily Average Prod. Rate (Bbls./day)	Incremental Royalty Rate (%)	Royalty For Specific Producing Rates: Producing Rate (Bbls./day)	Royalty Production (Bbls./day)	Equivalent Royalty Rate (%)
-500	12.5	500	62.5	12.50
501-1000	25.0	1000	187.5	18.75
1001-1500	37.5	1500	375.0	25.00
1501-2000	50.0	2000	625.0	31.25
2001-2500	62.5	2500	937.5	37.50
		3500	1562.5	44.64
		4500	2187.5	48.61

Note: The Sliding Scale Royalty Schedule for the North Slope area is significantly higher than for the South Central area because the higher North Slope operating costs result in a much higher economic limit.

AGO 546741

TO: Joe Green
FROM: Blair Wondzell
RE: Sliding Scale Royalty Schedules

SLIDING SCALE ROYALTY
Considerations, Example Schedules, Bidding Methods

CONSIDERATIONS:

1. Sliding scale royalty use is based on the intent that the ownership royalty share be small from economically marginal production and be large from very profitable production.

2. Ideally, at production rates below the economic limit there should be no royalty. ("EL" is herein defined as the production rate necessary to pay direct operating costs; overhead and amortization are not included). Immediately above the EL level or rate of production, industry's share should include an amount for pay back of investment - beyond this pay-back production rate, the State and industry should share the profits which are represented by production. Based on royalty rates actually bid, at very high well rates the State's royalty share should exceed 50%. As the field declines, individual well rates would decline with a corresponding decrease in average or equivalent royalty; therefore, if the State is to obtain a field life average royalty in the 50% range, royalty rates during the peak production years must be higher than the intended overall average equivalent royalty rates.

3. Computer programs for the determination of the correct slide/percent royalty do not, to my knowledge, exist. Because of the many estimated factors which would go into such a program (normal capital, operating cost, production rates, and number of wells producing), the results would be somewhat unreliable.

4. The problem of setting the slide steps and royalty rates can be solved from another direction, however. A good schedule can be obtained based on logical reasoning consistent with the guidelines stated in paragraph #2 above.

5. Since State statutes require a minimum royalty of 12.5%, the "ideal" situation is not obtainable. However, it can be approximated by gradually increasing State royalty - above the EL production rates - to a partial sharing and then to a full sharing of the production. Following are typical sliding scale royalty schedules for the North Slope Area and for the South Central Area.

6. Sliding scale royalty bidding may be a future bidding method. This can be handled in at least 2 ways.

Method #1: Industry can be requested to furnish a sliding scale royalty bid with the only provision being that the minimum royalty be 12.5%. The determination of the winning bid would require multiple economic computer analyses. These analyses would be based on a multitude of estimates and would therefore vary depending on estimates of the input parameters. Industry would most likely, and justifiably, contest the awarding of bids by this method.

Method #2: Industry can be requested to bid royalty percentages having equal incremental increases which will be applied to preset production steps: or industry can be requested to bid the equal increment production steps for preset royalty percentages. Bids based on either of these alternates (preset production steps or preset royalty percentages) can be precisely compared to one another and the winning bidder can easily and definitely be determined.

Method #2 types of a sliding scale royalty bid is shown in the following examples:

EXAMPLE

LEASE AWARDS

A lease will be awarded on each tract to the responsible qualified bidder offering the highest percentage royalty for the production steps as specified below under Bid Method . . . . .

ALTERNATE I

Royalty percentages bid, preset production steps.

BID METHOD

All bidders must designate the percentage royalty reserved to the State for each of the below listed production steps which are average daily production rates based on monthly production volumes for each well as defined in regulations _____. Minimum royalty percentage as required by State Statutes is 12.5%. A royalty percentage of 12.5% is specified for the base production step which is 0 to 1000 B/D and will be

TO: Joe Green
FROM: Blair Wondzell
RE: Sliding Scale Royalty Schedules

increased in equal increments for each subsequent production step. The following production steps will be utilized:

Average Daily Production Rate (Bbls./day)	Incremental Royalty Rate (%)
0-1000	x (must be 12.5%)
1001-2000	x+y
2001-3000	x+2y
3001-4000	x+3y
4001 and above	x+4y

ALTERNATE 2

Production steps bid, preset royalty percentages.

BID METHOD

All bidders must designate the daily average per well production steps for the royalty percentages reserved to the State which are listed below. The daily average production steps are based on the monthly production volumes from each well as defined in regulation _____. The production steps above the base step will be increased by equal increments. The following royalty percentages reserved to the State will be utilized.

Incremental Royalty Rate (%)	Average Daily Production Rate (Bbls./day)
12.5	x
25.0	x+y
37.5	x+2y
50.0	x+3y
62.5	x+4y and above

THE FOLLOWING DOCUMENT(S) MAY NOT FILM LEGIBLY BECAUSE OF POOR QUALITY OF THE ORIGINAL.

Bonus Bids

Bonus bidding should be applied in cases where the state has either.

(a) A very great amount of knowledge about the resource or

(b) The prospect is of extremely high risk, the lessor has little knowledge of the resource and expected value revenues would be marginal.

The first case (a) where tracts might be offered for Bonus Bidding could be that of a drainage or near drainage situation where the state wished to maximize its near term discounted revenues. It would be advisable to not offer all of the tracts for bonus bidding, but to withhold a percent of acreage to be sold at a later date, (Report 2-77). Also, since royalty and other bidding methods have shown to offer higher expected value revenues for lower risk cases it could be advisable to mix royalty bidding with the bonus bidding, a practice followed by the Federal Government in the recent Cook Inlet OCS sale.

In the second case (b), that of extreme high risk, bonus bidding can be used as a filter to determine the value of marginal tracts. This is discussed under the section on (t) low potential, high risk and previously leased.

Report 2-77 indicates that for very high risk cases all bidding methods approach the same level of expected value income for the state. In cases of small and marginal potential reservoirs the bonus bid method with its ease of administration might afford optimum state revenues. Report 2-77 also indicates that in probability of success percents of 1 percent or less bonus bids could afford higher revenues, but the state should ensure that leasing under such high risk cases only occurs when sufficient knowledge is gained to indicate that the land to be leased is of such a low potential. For example, a geologic structure as large as the Prudhoe Bay anticline may have had a high degree of risk before it was drilled but its potential to hold enormous reserves was there. Bonus bidding should not have been used in that instance.

In summary, bonus bidding can be used when

(1) Very small potential reservoirs are expected;

(2) Extreme risk is expected and the gaining of sufficient knowledge to determine the presence of reservoirs is unwarranted because of marginal to low potential indications.

(3) A sliding royalty should be considered in all bonus bid cases;

(4) This method could be used in a mixture with other methods such as royalty bidding;

(5) Also, in general, this method should only be considered when leasing in the least desirable state areas, i.e. those below the top 10 rank.

Royalty Bidding/Fixed Bonus

Report 2-77 indicates that royalty bidding and profit sharing deliver the highest expected value revenues to the state of all bidding methods. It is particularly effective where the probability of occurrence is high (i.e. low risk) and especially when the expected reservoirs are large. A sliding scale should be added in the declining production years to eliminate the problem of premature shut down. Cases for royalty bidding would be when

(1) The state has enough knowledge to assess the ~~risk~~ Degree of potential Target.

(2) Potential reservoirs are not extremely small or of extreme risk.

The Beaufort Sea sale is a good example of a case for using Royalty bidding on tracts. Ingeneral, this method should be considered when leasing in the top 10 leasing areas on the desirability scale.

Net Profit Bidding

~~Net profit bidding would be most advantageous when costs and prices~~ ~~[illegible] the advantages of the royalty~~ ~~bid would be used in the opposite location.~~ In remote high risk areas, this method might attract stronger bids than the royalty or the bonus bid method.

Of the 35 potential state leasing areas, this method might be used to advantage on those areas below the top 10 in desirability.

Work Commitment

(See section (2)).

This bidding method can be best used where the state has a large (i.e. 100,000+ acres) area of probable low potential where industry has shown a general lack of interest in exploration and leasing. By offering a large area for lease to one lease owner the state provides an extra incentive to undertake exploration and the state encourages exploration by making it the bid variable.

This method would be used in remote low potential high risk areas. Some of the states 3 mile limit lands such as Area M might be ~~used applicable~~ applicable to this method.

Low Potential & High Risk and Previously Leased Section (c)

On the basis of exploration knowledge, lack of interest by industry and reasonable analysis, the department may determine that lands have very low potential for oil and gas.

As a means of encouraging the evaluation and possible development of these low potential lands the department could:

(1) Offer the lands for competitive lease using a bonus bid with a sliding royalty. A minimum bid equal to the first year's rentals could be used to filter the bids. This should give a check on the potential of the lands. The sliding royalty would act as a safeguard for very low value bonus bid tracts if a discovery is made later on the lands.

(2) On tracts that receive no acceptable bids, the commissioner could hold a non-competitive similtaneous drawing after proper notice (30 days). Tracts not receiving applications for the drawing could then be opened for over the counter applications. Tracts could be offered at fixed 50¢/year rentals, 5 year terms. A sliding scale royalty would be used in all cases to provide a revenue safeguard against future potential discoveries.

(3) In some cases, all tracts not receiving acceptable bids could be aggregated into large blocks (100,000 acres or more) and offered for work commitment bidding or development contracts.

THE PRECEDING DOCUMENT(S) MAY NOT FILM LEGIBLY BECAUSE OF POOR QUALITY OF THE ORIGINAL.

STATE of ALASKA

MEMORANDUM

DEPARTMENT OF NATURAL RESOURCES
DIVISION OF MINERALS AND ENERGY MANAGEMENT

TO: Robert E. LeResche
Commissioner Natural Resources

DATE: February 28, 1978

FILE NO:

TELEPHONE NO:

FROM: [redacted]

SUBJECT: Rationale and Apparent Objections to HB 854- Oil and Gas leasing Bill.

Predictability, certainty and an acceptable political climate. These are the three things the petroleum industry looks for in an area attractive for exploration.

I contend it is the availability of land, not the method by which land is offered, that is the critical consideration. In other words, Alaska will become more attractive, less subject to severe criticism by the industry, once land is made available for leasing. The methods of leasing will quickly become secondary.

This contention, of course, will be disputed by the industry. They will argue that because the law allows administrators to choose from a wide variety of leasing methods the industry will remain uncertain about what to expect. I contend that the industry will be given plenty of advance notice of what method will be used in a sale and will therefore have enough time to plan financial strategy.

Industry's contention that Alaska must compete with other areas in the world within company budgets is, of course, correct. This does not mean, however, that Alaska has to settle on one, or perhaps two, leasing methods so as to make the Alaska budget dollar compete within a particular company. The company can estimate how much Alaska's prospective oil is worth to them and can calculate how much will be spent on a particular sale based on the method of lease offering, along with a multitude of other considerations. My basic assumption, of course, is that the oil is here and, eventually, the companies will come looking for it.

Which brings me back to my first point. Certainty and predictability will be established once the industry is convinced that a regular, stable procedure for offering oil and gas lands has been established by Alaska. Once lands are available and administrators are directed to offer leases to the public, most of the pressure will relax.

Industry's objection to the two reports to the legislature by the executive, I think, dramatizes my point. I think the industry will eventually accept the 5-year leasing program as a giant step toward predictability and, even though given wide public accountability, will come to believe that the report will not result in more governmental interference. Industry looks,

however, I think on the annual leasing method report as a way for the legislature to probably work its way into the day-to-day leasing decisions best left to the governor. They fear "politics" in leasing, and I am less sure of this one that I am the leasing program report.

The underlying criticism of HB 854 you will hear, I believe, is that Alaska is "experimenting" with leasing methods. We are said to be trying to adapt all the good features used in other states and jurisdictions and are trying to make them work where they were not designed to work. Alaska is frontier; Alaska is different, goes the argument.

I believe I was to take the first cut at a comprehensive review of Alaska's oil and gas leasing law following Dr. Gaffney's study. I do not claim infallibility but I do claim to have weighed the many considerations which make Alaska like and unlike other jurisdictions. As I have told you, I have tried to confront, head-on, the question of the question of the number of participants in exploration in Alaska. You have mentioned the concept of "incentives", at least as it applies to information, and I have indicated that whereas incentives are not directly dealt with in the legislation I think we may get there in the future.

So, with that background let me set forth the rationale for and some of the anticipated objections to HB 854.

Several concepts were examined and rejected. Found to be not applicable, at least at this time, are the so-called dual-leasing system (Ted Stevens' amendment to S-9). Congress may yet include something like it in OCS legislation. Also, the concept which involves distinguishing between exploration leases and those development and production activities which would be allowed after oil or gas is discovered. We have not included this concept because we believe that Alaska can know before it offers its land for drilling what development and production activities it expects to take place. (Incidentally, the conference committee on S-9 and HR 1614 is scheduled shortly.)

We examined the "ante" versus "post" royalty impact. The post (after) charge is the economic recommendation Dr. Mason Gaffney drew in his study of February, 1977 for the legislature. Dr. Gaffney concluded that the ideal way for a government (any lessor) to determine its economic rent was to determine such rent after a discovery at the price then existing and based upon the size of the field discovered. Determining the value of the field after the discovery is much like the present

calculations of the reserves tax. Its newness, being untried and the unsettling effect its introduction and application would have had on exploration activities in Alaska we felt would be primarily negative. Also, we felt that the legislature could follow-up on Dr. Gaffney's recommendations if they wished. Canada, in its new law for leasing of the North and offshore, has proposed a "progressive incremental royalty" similar in concept to Dr. Gaffney's ad valorem charge. Perhaps, it will be in Alaska's future.

We examined the incentive programs existing in the Province of Alberta, and other jurisdictions, and determined that although some incentives may be needed in the future, they should not be dealt with in this bill. Giving direct tax and other incentives to exploration operators may be necessary, particularly to stimulate the much needed geological and geophysical information data, but we felt future legislatures could deal with this basic policy charge. Rather than incentives, we believe the pace of exploration can best be determined at the time and by the terms of the original lease. And, as I note later, the work commitment lease method can be used to offer incentives.

We examined the trends all over the world toward governments retaining ownership interests (equity) in leases, and toward government-owned and operated exploration companies. We rejected both of these ideas for Alaska. Equity interests in leases makes no sense so long as the state has the flexibility to deal with the many and varied leasing situations which will confront it. Government sponsored exploration, if at all, can be achieved by contract with industry rather than by bureaucrats.

Again, the petroleum industry, not unlike any business, needs certainty and predictability in order to be comfortable doing business. A "stable and predictable leasing policy" - Tom Kelly. "The industry will initially tend to go where it's wanted and an orderly contract and dependable lease sale schedule would undoubtedly provide an impetus to further exploration in the state" - Pennzoil.

The state's need for a flexible, comprehensive, all-inclusive means of leasing appears to conflict with the industry's desire for predictability. One company (Chevron) in an informal paper went so far as to say that giving these many alternatives to the state (HB 854, before a significant change) amounts to "overkill" and makes Alaska an "experimental laboratory in oil and gas leasing." They conclude by saying: "We consider this to be capricious".

AGO 546732

In the name of predictability and certainty, oil operators of size almost without exception opt for the cash bonus bid with a fixed royalty as the preferred leasing method. They want

I believe Alaska needs a flexible leasing law so that it may adjust to changes as they occur. The world, national and Alaska energy and oil and gas future is in a state of flux and will remain so for the two decades for which this bill is designed to accomodate. No one can be sure what future developments in energy will be and particularly in Alaska where exploration condition are so diverse.

Alaska is now one of the largest oil owning entities in the world. It will be dealing with petroleum matters, directly, for at least the next two decades, probably much longer. It's immediate future depends in large part on how it deals with petroleum matters. As such, it should become familiar with most of the alternative methods it can use to control petroleum exploration. HB 854, we believe, once it is enacted and in operation will provide the industry the certainty it requires. Admittedly, it calls for State land to be offered by methods including but also other than bonus bid where feasible. The bill introduces more alternatives than now exist, but once these methods are in place and have been used, we believe, most uncertainty will disappear.

One last word on flexibility. In addition to the State, the Federal government and Native Regional Corporations will be leasing land for oil and gas exploration for the next several decades. Terms and conditions under which leases are issued by these entities will include all the variables addressed in HB 854, and, undoubtedly, more. To protect its interest and to operate effectively in this constantly changing exploration picture, the State needs a flexible leasing law by which to respond.

Following, are an itemized list of the objections which I anticipate will be made to HB 854.

1. Term of 5 years. All operators want a lease term as long as possible. In HB 854, Commissioner can go up to 10 years if "extreme conditions, etc." exist. The majors usually know what they intend doing when they bid and lease. The smaller companies will argue that they need more time to put drilling blocks together. The State's interest is to have leases explored and it is not in having leased acreage on the books paying rentals only. Deals can be made in five years. Drilling should proceed as soon as possible, or the land should be offered again to a more agressive operator.

   The time between Cook Inlet lease sales in 1962 and 1965 until first production was begun from Middle Ground,

McArthur, Trading Bay and Granite Point averages under 4 years. Note this is production, not beginning drilling date. Average time from sale to drilling in New Mexico is 6 years.

As I have indicated before, I believe this is the most important term in the lease. The ideal would be for the commissioner to have discretion to set the length of the lease, but I do not believe the legislature or the industry would accept such discretionary authority.

2. Methods of leasing

a. Royalty bidding creates no incentive to develope leases (Chevron). This is particularly true if "surrounding leasehold were such that early evaluation was likely" -(Champlin Petroleum). Same lack of incentive argument is said to apply to high net profits and/or work commitment.

Loss of revenue to state, too risky and premature shutdown problem - (SE Alaska Empire editorial; a reprint of Fairbanks News-Miner editorial, 1977-no date) Rumor has it the USGS in Anchorage (Jones, et al) don't like royalty bidding and DOI forced it on So. Cook Inlet sale. But ARCO's first location appears to be on a royalty tract.

b. Work commitment is faulted for several reasons. Economists, including Gregg Erickson, see it as stimulating activity which the marketplace would not otherwise require. In fact, it can be used to stimulate exploration and, specifically, to acquire exploration information in areas which otherwise might not be explored. There can be an element of incentive in this method.

Tom Kelly sees the use of work commitments as pre-empting small companies. (It is interesting to note that Chevron favored the work commitment so long as the bonus or royalty was fixed and the work commitment was the sole biddable factor). Kelly sees it discouraging the promoting of participations (partners?) in drilling deals because the amount of dollars bid has been fixed. Frankly, I don't quite understand his argument, and contrary to hurting the small companies, I believe it could be used to encourage them to explore. Kelly believes a work commitment works best when it is negotiated and I agree with

him, but we agree that it is unlikely that the Alaskan legislature and public would condone negotiated lease terms by public officials. (unlike royalty sales.)

c. No mention is made of sliding scale royalty by any of the AOGA participants or companies who replied to your letter. All in the department, including Easy Gilbreth and Pedro Denton (from past memorandum in file), feel this is a most satisfactory answer. We are preparing several sliding scale examples for the Cook Inlet and the North Slope so as to focus on the factors which must be taken into consideration in setting the appropriate scale for an area.

d. Net profit will be objected to because it gets the government into the oil company's books and it will will be more costly to administer. Economists Lipton, Erickson, et al will argue it returns the most to the state.

Most economists will agree, I believe, it is the best way if "gold plating" can be controlled, but there seems to be disagreement as to whether it is best used where risks are high or low. Government encroachment will underlie the opponent's arguments.

3. The acreage limitation of 200,000 acres on state uplands (rather than present 500,000) has been objected to thus far only by a few majors. The reduction in the maximum is obviously aimed at the larger companies, and we should so state directly. (A list of state leaseholdings as of 2/10/78 is attached).

Some background may be helpful. No other state that I am aware of, has an acreage limitation. But no other state is Alaska's size nor has any state tens of millions of acres available to lease.

The Federal government has an acreage maximum for its land within each state. During Alaska's territorial days the Federal oil and gas acreage limitation in Alaska was 100,000 acres. In other states it was 46,080.

After 1961, Alaska's rose to 300,000 in the Northern district (approximately north of the Yukon River) and 300,000 in the Southern district. These apply today. Presently the acreage limitation is 246,080 acres of Federal leases per state, other than Alaska.

Finally, note that in HB 854 companies are given five years from the effective date of the act to comply with the 200,000 acre maximum.

Hopefully, a lesser upland acreage maximum in Alaska will act as, albeit a small, incentive for companies other than the majors now here to explore in Alaska.

4. The state's right to purchase up to 16 2/3% of the oil and 100% of the gas will be opposed on the grounds that it is a negative incentive for integrated companies who wish to find and use the oil and gas. We should be careful of this one, but suffice to say that in 1972 New Mexico passed a similar law (N. Mexico can purchase 100% of gas and oil), which though never exercised or tested in court, remains on the books. (a copy attached).

5. Rentals may be opposed as being too high. The authority of the commissioner to up the rental at least 150% each year on shut-in leases may begin to bind the operator without a market, but there is no easy answer to the shut-in field unless we investigate something like the reserves tax concept, which I don't believe will solve the problem.

6. Leases offered noncompetitively after receiving no bids appear to be favored by the industry. Tom Kelly comments that such leases should be offered immediately (automatically?) after the competitive sale.

Please note that HB 854(t), as written, allows the commissioner three options. He can offer tracts immediately, at any time up to 5 years after receiving no bids, or not at all. If he intended to offer tracts noncompetitively immediately after a competitive sale he would so announce in the notice of the competitive sale.

The problem inherent in giving the administrator this many options, it will be argued, is that unpredictability will occur. Unless the operator knows before hand that he can fill out his block of acreage, he is at a distinct disadvantage. The administrator should take these matters into consideration before he notices a sale.

Milton Lipton, Gregg Erickson and others may oppose this open-ended authority to lease noncompetitively following an unsuccessful competitive sale on the grounds that an administrator might rig a competitive sale so that it will not elicit bids so that an immediate noncompetitive lease can be awarded. I don't think such a hit-and-run transaction can exist these days, particularly with HB 854's public disclosure procedures, but, perhaps, I'm too naive.

7. Sealed bids or oral auction or sliding sealed bids (like Alberta). HB 854 permits the commissioner to use any or all of these. Sealed bids will be most commonly used. They are easy to administer. Oral bidding is used in New Mexico and Colorado. Champlin recommends oral bidding on "low potential" land so as to avoid preparing bid forms and "leaving money on the table." New Mexico, on the contrary, uses oral bidding about 50% of the time when it perceives that there will be alot of competition in a sale. About 50% of the time New Mexico offers tracts by sealed bid.

   Alberta allows bidders to slide bids from one tract to another in a sale. Thus, if bidder A's sealed bid fails to win on tract 1, he can direct his bonus be slid to tract 2, and so on.

   Tom Kelly, when commissioner, had his staff investigate this sliding bid method in Alberta in hopes that it might be used for the 1969 Prudhoe Bay $900 million sale. The idea was rejected because the industry objected on the grounds that it would cause too much uncertainty so close to the time of sale. Score one for certainty. Obviously, the advantage to the state would be that more money would be paid at the sale if bids were allowed to slide. Before actually using this system, Alberta's procedures should be studied again.

8. By regulation, the lessee may earn only to the depth drilled(j). I envision that the state would not invoke this right until it felt deeper horizons contained oil, and then would give the lessee a reasonable time to explore deeper. If the lessee failed to drill deeper, the deeper horizons would be offered at a competitive lease sale. Alberta woke up to this problem late and solved it by changing terms of existing lease contracts with all that political controversy.

   I will ask Peter Froehlich to research whether this issue of drilling deeper might not be solved by tightening-up terms of the lease form to require due diligence by the operator at the request of the state.

CHAPTER 26

AN ACT

RELATING TO STATE LANDS; REQUIRING THE COMMISSIONER OF PUBLIC LANDS TO RESERVE CERTAIN RIGHTS TO THE STATE IN LEASES OR OTHER CONVEYANCES OF STATE LANDS GRANTING ANY INTEREST IN OR RIGHTS TO MINERALS OF WHATSOEVER KIND, INCLUDING OIL AND GAS; PROVIDING FOR A WAIVER OF THE REQUIRED RESERVATION; PROVIDING FOR DISPOSAL OF RESERVED MINERALS.

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF NEW MEXICO:

Section 1. COMMISSIONER OF PUBLIC LANDS TO RESERVE CERTAIN RIGHTS TO THE STATE IN LEASES OR OTHER CONVEYANCES OF ANY MINERAL INTERESTS OR RIGHTS TO MINERALS IN STATE LANDS.--In any lease or other conveyance of state lands granting any interest in or rights to minerals of whatsoever kind, including oil and gas, in those lands executed by the commissioner of public lands after the effective date of this section, the following reservation of rights to the state shall be made: "The state has a continuing option to purchase at any time and from time to time, at the market price prevailing in the area on the date of purchase, all or part of any minerals (specify the minerals) that may be produced from the lands covered by this lease (or other conveyance).".

Section 2. WAIVER OF REQUIREMENTS FOR RESERVATION OF RIGHTS IN LEASES OR CONVEYANCE FOR SPECIFIC MINERALS--PROCEDURES FOR WAIVER.--

A. The commissioner of public lands may waive by written order the reservation of rights required under Section 1 of this act in respect to any specific mineral, other than fossil fuels, for which

HB 441
approved March 9, 1973

AGO 546739

there is no significant consumptive use within the state, but such order may be made only:

(1) after written notice is mailed by certified mail at least twenty days before the hearing required by Paragraph (3) of this subsection to the governor;

(2) after notice of the hearing required by Paragraph (3) of this subsection is posted in the same manner as notice of public sale of mineral leases is required to be posted under Section 7-9-34 NMSA 1953;

(3) after a public hearing on the issue of waiver under this subsection has been held by the commissioner of public lands or his designated representative in accordance with procedures adopted by the commissioner of public lands; and

(4) if the commissioner of public lands finds after considering the evidence produced at the hearing that a waiver of the provision would be in the best interests of the trust beneficiaries considering long-range and short-range benefits.

B. A waiver granted under Subsection A of this section shall be limited to a definite period of time not to exceed five years. Waivers may be renewed by the commissioner but only after following the procedure required under Subsection A of this section.

Section 3. DISPOSAL OF MINERALS BY COMMISSIONER OF PUBLIC LANDS.--The commissioner of public lands shall dispose of any minerals reserved under this act at the best price available in order to gain the maximum benefit for the trust beneficiaries.

TESTIMONY ON
ALASKA LEASING POLICY BILL
(H.B. 854)

BY

ROD L. BOANE

ALASKA DISTRICT MANAGER

EXXON COMPANY, U.S.A.

BEFORE THE

STATE OF ALASKA

SENATE RESOURCES COMMITTEE

JUNEAU, ALASKA

MAY 22, 1978

AGD 546659

MADAM CHAIRMAN AND MEMBERS OF THE COMMITTEE --

I AM ROD L. BOANE, DISTRICT MANAGER FOR THE ALASKA EXPLORATION DISTRICT OF EXXON COMPANY, U.S.A. I APPRECIATE THE OPPORTUNITY TO BE HERE TODAY AND PRESENT THE VIEWS OF MY COMPANY CONCERNING THE PROPOSED LEASING POLICY BILL.

FIRST, LET ME SAY THAT EXXON BELIEVES THE EXISTING PROVISIONS OF SECTION 38.05.180 OF THE ALASKA STATUTES ARE QUITE SATISFACTORY IN ADMINISTERING ADEQUATE CONTROL OVER EXPLORATORY AND DEVELOPMENT ACTIVITIES ON STATE LEASES. FURTHERMORE, THE EXISTING LEASING PROVISIONS HAVE BEEN VERY SUCCESSFUL IN PROVIDING THE INCENTIVE FOR THE PETROLEUM INDUSTRY TO DISCOVER PRUDHOE BAY, THE LARGEST OIL FIELD IN NORTH AMERICA, PLUS FOUR OTHER MAJOR OIL FIELDS INCLUDED IN THE TOP 100 OIL FIELDS IN THE U.S. IN OTHER WORDS, THE SUCCESS OF THE CURRENT SYSTEM IS AN ESTABLISHED FACT, AND IS A TRIBUTE TO THE FORESIGHT OF THE FIRST LEGISLATURE WHICH ENACTED THE PRESENT LEASING ACT SOME EIGHTEEN YEARS AGO. INSTEAD OF REPEALING THE PRESENT LEASING SYSTEM, WHAT IS NEEDED TO REJUVENATE EXPLORATION ACTIVITY IN ALASKA IS A RESTORATION OF COMPETITIVE LEASE SALES UNDER THE CURRENT PROVISIONS OF AS 38.05.180. THEREFORE, WE DO NOT BELIEVE THESE NEW AMENDMENTS TO THE STATUTES ARE NEEDED TO PROTECT THE PUBLIC INTEREST. ON THE CONTRARY, WE THINK THE PROPOSED AMENDMENTS WOULD CREATE UNNECESSARILY INVOLVED AND CUMBERSOME PROCEDURES THAT WILL NEITHER FOSTER NEEDED EXPLORATION NOR BENEFIT THE STATE OF ALASKA. ALTHOUGH WE TAKE EXCEPTION TO MANY OF THE FEATURES OF THE PROPOSED

AMENDMENTS, IN THE INTEREST OF TIME, I INTEND TO DISCUSS ONLY THE MORE TROUBLESOME PROVISIONS, WITH PARTICULAR EMPHASIS ON THE PROPOSED BIDDING METHODS.

EXXON BELIEVES THAT THE BEST METHOD FOR AWARDING LEASES IS ON A CASH BONUS BASIS WITH A FIXED ROYALTY WHICH IS IN THE CURRENT LAW. THIS SYSTEM HAS SEVERAL ADVANTAGES WHICH I WOULD LIKE TO REVIEW.

FIRST, THE SUCCESSFUL BIDDER SEES VERY STRONG INCENTIVES TO EXPLORE AND DEVELOP RAPIDLY AND TO RECOVER THE MAXIMUM ECONOMIC VOLUME OF HYDROCARBONS. THIS IS NECESSARY IN ORDER FOR HIM TO MAXIMIZE THE RETURN ON THE CASH BONUS INVESTED.

SECOND, UNDER THE CASH BONUS SYSTEM, THE STATE BEARS NONE OF THE RISK THAT COMMERCIAL RESERVES WILL NOT BE FOUND. THIS RISK IS PLACED DIRECTLY ON INDUSTRY WHERE IT BELONGS. THIS IS A PARTICULARLY CRITICAL CONCEPT IN A FRONTIER PROVINCE SUCH AS ALASKA WHERE VERY LITTLE EXPLORATORY DRILLING HAS OCCURRED AND THUS VERY LITTLE IS KNOWN ABOUT THE OIL AND GAS POTENTIAL OF MOST OF THE STATE. THE GULF OF ALASKA HISTORY SHOULD PROVE THIS POINT AS, THUS FAR, NO COMMERCIAL DISCOVERY HAS BEEN MADE. ANOTHER EXAMPLE OF THIS POINT IS THE NORTH SLOPE SALE OF 1969.

THIRD, UNDER THE CASH BONUS SYSTEM THERE IS NO POSSIBLE WAY THAT THE AWARDS WILL BE MADE IN AN ARBITRARY MANNER SINCE THE HIGHEST BID IS OBVIOUS. THIS IS NOT THE CASE FOR OTHER SYSTEMS WHICH WE WILL DISCUSS LATER.

FINALLY, THE SYSTEM IS SIMPLE AND INEXPENSIVE TO ADMINISTER. THE STATE WOULD NOT HAVE TO EXPAND ITS STAFF TO CONTINUE THE CASH BONUS SYSTEM, WHEREAS OTHER SYSTEMS WILL REQUIRE A LARGER STAFF. THE INTEGRITY OF THE SYSTEM WOULD NOT BE AFFECTED BY FUTURE EVENTS SUCH AS REDUCTION OF ROYALTY OR DETERMINATION OF OPERATORY EFFICIENCY. THESE PROBLEMS WILL BE DISCUSSED LATER.

PROPONENTS OF ALTERNATE BIDDING HAVE STATED THAT CASH BONUS BIDDING DOES NOT ENSURE THE PUBLIC A FAIR RETURN ON ACREAGE LEASED. THEY ALSO ARGUE THAT CASH BONUS BIDDING REDUCES COMPETITION. WE DISAGREE WITH THESE STATEMENTS, AND I'LL DISCUSS GULF OF MEXICO EXPERIENCE WHICH IS THE BASIS FOR OUR CONCLUSIONS. IT SHOULD BE NOTED THAT IN A HIGH COST, HIGH RISK ENVIRONMENT, COMPETITION WILL REMAIN HIGH ONLY IF THE POTENTIAL FOR HIGH REWARD EXISTS. THIS ALLOWS THE FEW SUCCESSES TO COVER THE COSTS OF THE MANY FAILURES.

THE GULF OF MEXICO IS ONE AREA THAT HAS HAD ENOUGH SALES, DISCOVERIES, AND PRODUCTION TO ALLOW AN EVALUATION OF THE CASH BONUS SYSTEM. DATA PUBLISHED BY THE U.S.G.S. SHOWS THAT THE GOVERNMENT HAS RECEIVED AN EXCELLENT RETURN. FROM 1953 THROUGH 1976, BONUSES, RENT, AND ROYALTY PAID TO THE U.S. GOVERNMENT HAVE AMOUNTED TO 83% OF THE TOTAL OCS REVENUE. NUMEROUS STUDIES HAVE BEEN CONDUCTED THAT INDICATE THAT INDUSTRY RETURN ON OCS OPERATIONS IS ABOUT 7%.

Source	Date Issued	Period Covered	DCF - % BFIT	DCF - % AFIT
Barrow, T.D.	1967	1951-65		7.0
DOE Tech. Bull. 5	1970	1965-67	5.6	
Nanz, R. H.	1975	1964-73		5.0
Nanz, R. H.	1976	1945-73		7.0
Mead, W. J.	1977	1954-55	7.5	
DOI	1975	1954-68	9.0	
Bybee, R. W.	1970	1954-69		6.0

These studies indicate that industry has not earned an excessive return.

For this same time period, new bidders have been successful in purchasing acreage in all but 3 of the 24 general sales. A total of 172 companies have been successful in purchasing acreage in the OCS (as of 1/1/77). This does not support the claim that cash bonus bidding restricts competition. It is also difficult to conclude that an industry which is earning a 7% rate of return is non-competitive. In fact, this would lead one to draw the conclusion that competition for OCS leases under the cash bonus system has been intense.

Now I would like to compare the alternate bidding methods proposed in this legislation to the current system of cash bonus bidding with fixed royalty. Basically, the proposed alternative bidding methods fall into two categories. The first category involved some form of royalty bidding. The second category uses some

FORM OF NET-PROFIT BIDDING. BOTH CATEGORIES REQUIRE A CASH BONUS, EITHER AS A BID VARIABLE OR A FIXED AMOUNT. LET'S FIRST EXAMINE THE ROYALTY BIDDING SYSTEMS.

(1) IT IS NOT UNCOMMON FOR OPERATORS TO DISCOVER RESERVES OF LESSER MAGNITUDE THAN ANTICIPATED. WITH HIGHER ROYALTY, WHICH WOULD BE EXPECTED UNDER A ROYALTY BID SYSTEM, SOME OF THESE DISCOVERIES COULD NOT BE DEVELOPED PROFITABLY UNLESS THE STATE AGREED TO ACCEPT A LOWER ROYALTY THAN ORIGINALLY BID. DOWNWARD ADJUSTMENT IN ROYALTY RATE PRIOR TO ANY DEVELOPMENT WOULD BE DIFFICULT TO ADMINISTER AND COULD UNDERMINE THE INTEGRITY OF THIS BIDDING SYSTEM. SECTION 38.05.180(J) ALLOWS THE COMMISSIONER TO ADOPT REGULATIONS FOR REDUCTION OF ROYALTY AFTER TWO YEARS OF PRODUCTION. THIS WILL NOT ALLOW DEVELOPMENT OF MARGINAL RESERVES SINCE NO PRUDENT OPERATOR WILL DEVELOP A PROPERTY KNOWING THAT IT WILL BE UNECONOMICAL, BUT IN HOPES OF OBTAINING A LOWER ROYALTY AFTER TWO YEARS.

(2) WITH ROYALTY BIDDING, THE SUCCESSFUL BIDDER DOES NOT HAVE A STRONG INCENTIVE FOR RAPID EXPLORATION AND DEVELOPMENT SINCE FRONT-END CASH INVESTMENT IS SMALL. SPECULATORS COULD THEREFORE SEE INCENTIVES TO ACQUIRE LEASEHOLD INTEREST, AND THEN DELAY EXPLORATORY DRILLING IN HOPES THAT OTHER NEARBY OPERATORS WILL CONDUCT EXPLORATION. IF THESE OPERATORS ARE SUCCESSFUL, THE SPECULATORS CAN CASH IN WITH MINIMAL RISK. THIS SITUATION WOULD OBVIOUSLY RESULT IN DELAYED EXPLORATION AND DEVELOPMENT ACTIVITIES.

(3) WITH EXCLUSIVE ROYALTY BIDDING, THE PUBLIC BEARS THE MAJOR PORTION OF THE EXPLORATION RISK BECAUSE IF THE TRACT DOESN'T CONTAIN COMMERCIAL HYDROCARBON RESERVES, AS THE MAJORITY WILL NOT, THE PUBLIC RECEIVES NO COMPENSATION WHATEVER. WE STRONGLY BELIEVE THAT RISK-TAKING AND ITS ASSOCIATED REWARDS OR LOSSES ARE MORE PROPERLY THE PROVINCE OF PRIVATE ENTERPRISE.

ANOTHER ROYALTY BIDDING SYSTEM INVOLVES SLIDING SCALE ROYALTY WHICH CAN EITHER BE THE BID VARIABLE OR USED IN COMBINATION WITH A CASH BONUS BID. IN THE CASE WHERE THE SLIDING SCALE ROYALTY IS THE BID VARIABLE, IT WILL BE EXTREMELY DIFFICULT TO COMPARE BIDS UNLESS YOU KNOW THE TOTAL RESERVES, THE PRICE AT WHICH PRODUCTION WOULD BE SOLD, AND THE RATE OF PRODUCTION. SHOULD PRODUCTION BE ESTABLISHED, SLIDING ROYALTY COULD CAUSE WIDELY DIFFERING POSITIONS TO DEVELOP BETWEEN OPERATORS AND THE STATE. IN AN EFFORT TO MAXIMIZE ITS INCOME, THE STATE COULD REQUIRE OPERATORS TO MAKE INVESTMENTS FOR PRODUCTION INCREASES WHICH WOULD EARN A MARGINAL OR SUBMARGINAL RETURN. THIS COULD RESULT IN PREMATURE ABANDONMENT OF THE PROPERTY. ALSO, UNITIZATION OF TRACTS WITH DIFFERENT ROYALTY BASES OR SLIDING SCALE TRACTS WITH CASH BONUS TRACTS WOULD BE A VERY COMPLEX AND DIFFICULT JOB AND COULD DELAY DEVELOPMENT OF A DISCOVERY.

NOW LET'S LOOK AT THE SECOND BIDDING CATEGORY, A PROFIT-SHARING SYSTEM, WHICH HAS MOST OF THE SAME ADVERSE CHARACTERISTICS AS ROYALTY BIDDING, BUT WITH FOUR ADDED COMPLICATIONS AND DISADVANTAGES.

(1) USING NET PROFITS WILL BE MUCH LIKE SELECTING A CONTRACTOR TO PERFORM A JOB ON A COST-PLUS BASIS. THE OPERATING EFFICIENCY OF THE BIDDER COULD BECOME AN IMPORTANT CONSIDERATION IN DETERMINING WHICH OF SEVERAL BIDDERS HAD SUBMITTED THE HIGH BID INASMUCH AS THE PROCEEDS TO BE RECEIVED BY THE PUBLIC WOULD BE A DIRECT FUNCTION OF THE EFFICIENCY OF THE OPERATOR. THUS, THE SUCCESSFUL BIDDER WOULD NO LONGER BE OBVIOUS. SINCE THE RELATIVE OPERATING EFFICIENCY OF COMPANIES CANNOT BE DETERMINED QUANTITATIVELY, THE COMMISSIONER COULD BE VULNERABLE TO CHARGES THAT BID AWARDS WERE BEING MADE IN AN ARBITRARY OR DISCRIMINATORY MANNER. THIS WOULD AFFECT THE INTEGRITY OF THE SYSTEM AS WAS PREVIOUSLY MENTIONED.

(2) A PROFIT-SHARING SYSTEM WOULD BE DIFFICULT AND COSTLY TO ADMINISTER. A LARGE ADMINISTRATIVE ORGANIZATION WOULD LIKELY BE ESTABLISHED TO AUDIT AND MONITOR THE CONTINUING ACTIVITIES OF LESSEES. DISCRETIONARY JUDGMENTS WOULD BE REQUIRED BY THE STATE WITH REGARD TO WHAT COSTS WERE TO BE INCLUDED OR REJECTED IN THE PROFIT BASE.

(3) A PROFIT-SHARING SYSTEM WOULD SIGNIFICANTLY REDUCE THE INCENTIVE FOR A SUCCESSFUL BIDDER TO OPERATE AT MAXIMUM EFFICIENCY. ANY PRUDENT OPERATOR UTILIZES A PRIORITY SYSTEM WHEN RESTRAINTS OF EITHER MANPOWER OR MATERIALS CREATE LIMITATIONS. WHEN THESE RESTRAINTS EXIST, NET-PROFIT TRACTS WILL HAVE LOW PRIORITY. THE RESULT - REDUCTION OF EFFICIENCY. IT WOULD REDUCE THE INCENTIVE FOR EARLY DEVELOPMENT OF TECHNOLOGY BY INDUSTRY. UNDER A PROFIT-

SHARING SYSTEM, TECHNOLOGY WILL ONLY BE DEVELOPED WHEN IT IS NEEDED AND THE COSTS OF THIS DEVELOPMENT WOULD BE SHARED WITH THE STATE. THIS WOULD LEAD TO DELAYS IN DEVELOPMENT OF NEEDED RESERVES.

(4) MOST IMPORTANT, SHARING IN NET PROFITS WOULD SIGNAL THE STATE'S ENTRY INTO THE PRODUCTION PHASE OF THE OIL BUSINESS. IT MIGHT BE POLITICALLY AND ECONOMICALLY DIFFICULT FOR THE STATE NOT TO BE DEEPLY INVOLVED IN DECISIONS ABOUT DAY TO DAY OPERATIONS AND THEREBY BECOME AN OPERATING PARTNER. THIS TYPE OF INVOLVEMENT WOULD REQUIRE A LARGE TECHNICAL STAFF TO BE EMPLOYED BY THE STATE. THIS STEP BY THE STATE WOULD WEAKEN THE PRIVATE ENTERPRISE SYSTEM WITHIN THE OIL INDUSTRY AND DIMINISH FREE ENTERPRISE IN THE STATE OVERALL.

NOW I WOULD LIKE TO DISCUSS A FEW OTHER PROVISIONS WHICH GIVE US CONCERN.

(1) AS38.05.180(z) RIGHT TO PURCHASE - THE PROVISION GIVES THE STATE THE RIGHT TO PURCHASE A SPECIFIED VOLUME OF OIL AND GAS. THE VAGUENESS OF THIS PROVISION MAKES IT VERY ONEROUS TO THE INDUSTRY. THE PROVISION DOES NOT SPECIFY WHEN THE ACTUAL QUANTITY WILL BE SPECIFIED. WILL IT BE PUBLISHED AT THE TIME THE LEASE SALE SCHEDULE IS PUBLISHED? IF IT IS NOT, AN OPERATOR MAY RUN THE RISK OF OBTAINING GEOPHYSICAL DATA IN PREPARATION FOR THE SALE AND THEN FINDING HE'S NOT INTERESTED WHEN THE STATE THROUGH ITS OPTION TO PURCHASE PRODUCTION, DEPRIVES HIM THE FREEDOM TO MARKET AND/OR USE THE PRODUCTION HE HOPES TO DEVELOP.

IT WOULD APPEAR THAT A SPECIFIED VOLUME COULD RANGE FROM THE STATE'S ROYALTY SHARE UP TO A MAXIMUM OF 100%. BASED ON PRIOR VERSIONS OF THE BILL, IT SEEMS REASONABLE TO ASSUME THAT THE STATE'S PRIMARY INTEREST IS IN PURCHASING A LARGE PORTION OF THE GAS.

HOWEVER, THE PRESENT AND POTENTIAL SUPPLIES OF GAS WITHIN ALASKA FAR EXCEED REASONABLY ANTICIPATED DEMANDS BY THE STATE RESIDENTS. THEREFORE, TO FIND A MARKET, THIS GAS WILL HAVE TO MOVE INTO INTERSTATE COMMERCE. THIS REQUIREMENT, THAT THE STATE COULD REMOVE THE GAS FROM THE MARKET, COULD SEVERELY HAMPER A PRODUCER'S ABILITY TO MARKET THE RESERVES. WITHOUT A REASONABLE EXPECTATION THAT GAS CAN BE MARKETED, THERE IS GREATLY REDUCED INCENTIVE TO EXPLORE.

IT WOULD ALSO RETARD DEVELOPMENT OF NATURAL GAS FOR STATE RESIDENTS. THE RISK THAT THE GAS COULD BE DIVERTED WOULD HAVE SIGNIFICANT IMPACT ON VENTURES TO INSTALL GAS TRANSPORTATION SYSTEMS.

IN ADDITION TO THESE CONCERNS, IT RAISES OTHER QUESTIONS SUCH AS:

1. DETERMINATION OF FAIR MARKET VALUE
2. TIMING AND RATE OF PRODUCTION - COULD THE STATE CONTROL THESE TO SATISFY THEIR OWN REQUIREMENTS OR DESIRES?

(2) <u>AS38.05.180(N) LEASE TERM</u> - A FIVE-YEAR PRIMARY LEASE TERM IS VERY RESTRICTIVE IN ALASKA. THE REMOTE LOCATION OF MOST

PROSPECTS, RUGGED TERRAIN, SHORT CONSTRUCTION SEASON, AND REDUCED DRILLING SEASON, EITHER NECESSARY OR IMPOSED, MAKE COMPLETION OF THE EXPLORATION CYCLE A DIFFICULT AND TIME-CONSUMING PROCESS. ONCE A DISCOVERY IS MADE, ADDITIONAL DRILLING IS REQUIRED BEFORE AN ESTIMATE OF THE FIELD SIZE CAN BE MADE. ALL OF THE PREVIOUSLY MENTIONED FACTORS AFFECT THIS DRILLING TOO. ONCE THE LENGTHY PROCESS OF DISCOVERING A FIELD AND ESTABLISHING ITS COMMERCIALITY IS COMPLETE, THE LONG DEVELOPMENT PHASE MUST BEGIN. WE STRONGLY RECOMMEND THAT THE 10-YEAR LEASE TERM BE RETAINED.

(3) AS38.05.140(c) UPLANDS ACREAGE LIMITATION - THE PROPOSED 300,000-ACRE LIMITATION ON ALL LANDS OTHER THAN TIDE AND SUBMERGED LANDS IS RESTRICTIVE COMPARED WITH THE CURRENT 500,000-ACRE LIMITATION IN A STATE LIKE ALASKA WHICH HAS SO MANY FRONTIER INTERIOR BASINS TO EXPLORE. IN A HOSTILE HIGH COST ENVIRONMENT SUCH AS ALASKA, A LARGE BLOCK OF ACREAGE MAY BE NECESSARY IN ORDER TO JUSTIFY EXPLORATION. WE BELIEVE THE PROPOSED 300,000-ACRE LIMITATION WOULD REDUCE THE INCENTIVE OF AN OPERATOR TO EXPLORE THESE FRONTIER INTERIOR BASINS AND STRONGLY RECOMMEND MAINTENANCE OF THE CURRENT 500,000-ACRE LIMITATION.

(4) AS38.05.180(y) JOINT BIDDING - THE PROVISION ALLOWING THE COMMISSIONER TO RESTRICT JOINT BIDDING, IF HE SO DESIRES, COULD PROHIBIT THE INVOLVEMENT OF SOME COMPANIES MOST CAPABLE OF OPERATING IN THE ALASKAN ENVIRONMENT.

A STUDY WAS PERFORMED BY THE UNIVERSITY OF SOUTHERN CALIFORNIA AND THE USGS TO DETERMINE THE EFFECTS OF RESTRICTING MAJORS

FROM BIDDING JOINTLY IN THE OCS. THEY CONCLUDED THAT ON THE AVERAGE, THIS RESTRICTION RESULTED IN MORE BIDS PER LEASE BY THE MAJORS. THE STUDY ALSO SHOWED THAT THE NUMBER OF BIDS BY NON-MAJORS EITHER BIDDING ALONE OR IN COMBINES NOT INCLUDING A MAJOR, DECREASED SHARPLY. ("STATISTICAL ANALYSIS OF SOLO AND JOINT BIDS FOR FEDERAL OFFSHORE OIL AND GAS LEASES", SPE #6517 BY ELMER L. DOUGHERTY AND JOHN LOHRENZ.) FROM THIS DATA, IT DOES NOT APPEAR THAT THE RESTRICTION OF JOINT BIDDING BY MAJORS HAS RESULTED IN ANY INCREASED COMPETITION BY THE NON-MAJORS.

(5) AS38.05.180(i) INCENTIVE CREDIT - THIS PROVISION ALLOWS THE COMMISSIONER TO ESTABLISH AN EXPLORATION INCENTIVE CREDIT SYSTEM. IN ORDER TO OBTAIN CREDIT FOR GEOPHYSICAL WORK, THE OPERATOR MUST RELEASE THE INFORMATION TO THE PUBLIC FOLLOWING THE SALE. WE OBJECT TO THE REQUIREMENT FOR RELEASE OF THIS DATA.

THE PROVISION DOES NOT ESTABLISH A TIME REQUIREMENT FOR THE RELEASE OF THIS DATA. I ASSUME THE RELEASE WOULD BE REQUIRED BEFORE ANY CREDIT COULD BE RECEIVED. RELEASE OF THIS DATA COULD COST AN OPERATOR ANY COMPETITIVE EDGE WHICH HE MIGHT HAVE ON LEASING ACREAGE THAT IS RELEASED BY A LESSEE AND RENOMINATED. IN ADDITION, RELEASE OF THIS DATA TO THE PUBLIC COULD RESULT IN THE DISCLOSURE OF PROPRIETARY RECORDING TECHNIQUES AND THEREFORE RESULT IN THE POSSIBLE LOSS OF A TECHNOLOGICAL ADVANTAGE.

IN CLOSING, I WOULD LIKE TO REITERATE THAT EXXON BELIEVES THE CURRENT LEASING STATUTES AND THE IMPLEMENTING REGULATIONS

HAVE SERVED THE STATE AND INDUSTRY WELL AND DO NOT NEED TO BE CHANGED.

THIS CONCLUDES MY PREPARED TESTIMONY, AND I WILL BE HAPPY TO ANSWER ANY QUESTIONS WHICH YOU MAY HAVE.

* * * * *

ALASKA OIL AND GAS ASSOCIATION TESTIMONY on CSHB 854
Senate Resources Committee
May 24, 1978

I am KEITH ARNOLD, Public Affairs Manager for the Alaska Oil and Gas Association, a trade association whose 25 member companies are engaged in or have an interest in oil and gas activities in Alaska, including exploration, production, transmission, refining and marketing.

The basic position of our Association is that because Alaska's present leasing system has worked well for the state, major changes--such as those proposed in the bill before you--should be subjected to the most careful, deliberate study possible. We believe this has not yet been accomplished The current law is sufficient. It has encouraged industry to lease, explore, discover and develop oil and gas resources with confidence, and sometimes success.

Our remarks will attempt to highlight provisions of the bill we consider particularly counterproductive. We understand several companies will comment individually on the bill and that specific suggestions reflecting individual views may be offered.

We have several areas of particular concern to call to your attention and we will try to identify them as briefly as possible:

The item on page one, line 27, paragraph (b), calls for annual legislative review of the Commissioner's leasing program. Traditionally it has been the function of the Administrative branch of state governments to administer the use of state lands. The annual submission of the leasing program to the legislature would seem to presuppose

further modification of the leasing program. We believe that the program should be administered totally on the basis of its merits and it should remain out of the political arena.

Next please refer to page 3, paragraph (f). We favor the traditional method of wellhead pricing and are opposed in principle to the state receving a free ride on the gathering systems and high grading of the oil or gas. The very essence of a reserved royalty share is that the mineral estate owner keeps a portion of whatever is found and produced from the leased land. Such reserved shares become possessory immediately at the point shares can be reduced to physical possession, i.e., at the wellhead. Whatever the quality of the production, the royalty share is the property of the royalty owner to be disposed of in accordance with the terms of the lease contract. A shifting of the royalty owner's share of costs to the lessee of the expense of processing for market, and preparation for transportation off the lease will necessitate an attendant reduction in the bid to cover the greatest potential cost which could occur in the event of production.

Various leasing methods are also proposed in paragraph (f). In advocating a move away from bonus bidding one should consider that the risk burden is being shifted from the oil industry to the public, that the rate of exploration and development is being impeded, and that the growth of state agencies to administer and audit such systems is inevitable.

Our member companies prefer the cash bonus bid and fixed royalty arrangement. This method historically has generated the greatest dollar value to the state. Tracts receiving abnormally high royalty bids are not the first to be explored or developed and are held, in many instances, for speculation. This same premise also applies to "net profits."

Regarding Section 38.05.180 (j), we concur with the ability (authority) of the Commissioner to reduce the royalty in the interest of conservation and to encourage the greatest ultimate recovery of oil or gas. However, we believe a requirement that the Commissioner find a need for such reduction, based on two years of uneconomic production, is wasteful. Two years is too long.

Section (k), on page 6, gives the Commissioner authority to defer payment of any part of a cash bonus bid for a period of five years. Such a provision would encourage speculation with the state's assets by parties who have no intention of conducting expensive exploration programs but rather, hope to capitalize on any enhancement in value caused by the work of others in the vicinity of their lease. This is not in the best interest of the state.

It is common knowledge that Alaska is a high-cost, high-risk area for our industry. Exploration and drilling seasons are short. For these reasons, we respectfully request that you give favorable attention to the retention of the ten-year primary term for leases.

If cash bonus/fixed royalty is adopted as the bidding method and the 10 year term remains in the Law, the benefits to the state will be greater, in the long-run, than the experimentation proposed in CSHB 854.

Sections (n) and (o), dealing with rentals, are both counter productive and regressive. Alaska is already a high-cost, high-risk area. The prospect of substantial rental increases during the primary term of the lease can only discourage exploration interest in Alaska--not encourage it. The extra expense for rentals will have to be compensated for by lower bid totals. Further, these high fixed costs will lessen the amount of cash flow dollars that otherwise would be available for exploration work. Subsection (o) alters substantially the nature of the ordinary rental provisions in oil and gas leases. The rental to be paid under these provisions is no longer a delay rental. Also, there is no provision for credit or set-off of "rental" paid during those three years against the state's income from production. Consequently, we find ourselves in the absurd situation during the first three years of production, paying the state both a rental and royalty payment at the same time. This means, we are paying for the privilege of deferred drilling, after drilling operations have been completed and in addition, paying production income during this same period of time.

Section 38.05.180(y) would restrict joint bidding and should be deleted. Joint bidding can very well be to the advantage of the

AGO 546654

state as it tends to increase the size of the bids submitted and facilitates the exploration process. See, for example, the paper in the November 1976 issue of "Journal of Petroleum Technology" in which the authors conclude that "joint bidders tend to bid on more sought-after (and apparently more valuable) leases and that they tend to bid higher, on the average, than solo-bidding 'competitors.' Industry testimony before the U.S. Senate has indicated that since the first OCS sale in 1954, 172 companies have purchased OCS leases. Forty-two percent of these leases were not purchased by the major companies.

Depending on the content of the regulations adopted, this section may violate Article 8, Section 17, of the Alaska Constitution. This Constitutional provision requires that laws and regulations governing the use or disposal of natural resources must apply equally to all persons "similarly situated."

A provision giving the state the right to purchase a specified volume of oil and gas (Section 38.05.180(z)) would, in our opinion, be considered objectionable to any potential participant at a state lease sale whether a major oil company or the smallest independent. It virtually eliminates the lessee's ability to use a gas sales contract as a method of financing. A discoverer of a gas field could find it impossible to market the discovered reserves. This would inevitably result in a disincentive to explore with adverse results for both the state, as owner of the resource, and for its residents whose needs for fuel could be drastically affected.

As our Association has previously testified at public hearings dealing with similar provisions in proposed amendments to the Alaska Administrative Code, we believe that a provision in paragraph (aa) for state access to a lessee's exploration data constitutes an invasion of industry's proprietary property for the sole purpose of enabling the state to decide whether the area in which the exploring party is working should or should not be thrown open to his competition. It should be obvious that this can only result in a substantial reduction in incentive to undertake exploration work in the future, the performance of which is significantly in the state's best interest.

If the section is to be considered applicable to existing exploration data, then the Commissioner's access, and utilization thereof, is almost certainly an unconstitutional taking of a valuable private property.

The proposed bill also would amend Section 38.05.140(c) to reduce the upland acreage limitation from 500,000 to 300,000 acres. In Alaska, where there are large areas of state lands which are potentially eligible for bid, a 500,000 acre limitation, which the present statute contemplates, is not unreasonable. The effect of a 300,000 acre limitation would clearly be to limit the participation of those individuals who are most active in exploration business in Alaska, i.e., those individuals who have historically submitted the highest bids to the state. It is not at all clear why the state would seek to discourage, rather than to encourage, the continued

AGO 546656

involveme of those individuals in Alaska. Further, this section's applicability to the holding of existing lessees--requiring them to reduce their holding within 10 years--is an unconstitutional taking of leasehold estates.

In summary we offer the following:

We believe the existing law has worked very well over the last 18 years to protect the interests of all the citizens of the State of Alaska. The present law provides important public benefits that are seriously lacking in the proposed bill, such as:

(a) protection to the state from having to take "exploration risk" when selling leases;

(b) assurance the state will get the fair market value of what the state offers for sale by utilizing a proven unhampered competitive, free-enterprise open market system;

(c) ease of administration minimizing the number of state employees and overhead expense;

(d) assurance that all citizens, bot individual and corporate, are treated equally under the law;

(e) legislative and judicial history that gives relative stability in interpretation and operation;

(f) allowance of latitude to lease lands in low interest or high-risk areas non-competitively to avoid the bureaucratic expense of competitive sales;

(g) and recognition that the geological and geophysical data gleaned from an exploration operation is the 'stock-in-trade' of the explorationist and is proprietary in a competitive industry. The present law also recognizes that forced disclosure of proprietary data will discourage exploration. Research and development to find better methods of obtaining usable data will also suffer.

In conclusion, we strongly urge retention of leasing procedures that exist under present regulations. The effect of the sweeping provisions of CSHB 854 should be studied carefully before further consideration is given to the measure. We urge that you do not adopt CSHB 854.

It is our belief that the current method is not only fair to industry but also is in the best interest of the people of the State of Alaska.

Thank you.

THE MINES AND MINERALS ACT

GEOPHYSICAL INCENTIVE PROGRAM REGULATION, 1978

(filed April 26, 1978)

1 In this regulation

(a) "certificate" means a certificate issued for a program under this regulation;

(b) "Department" means the Department of Energy and Natural Resources;

(c) "foothills area", "green area", "yellow area" and "plains area" mean the respective areas of Alberta described in Schedule C to this regulation;

(d) "geophysical incentive program" means a program certified by the Minister as an incentive program under this regulation;

(e) "geophysical information and data" means all field data, field reports and the standard processed sections that are stacked after filtering and correction for statics and normal moveout;

(f) "Geophysical Regulations" means the Geophysical Regulations filed as Alberta Regulation 26/59, as amended;

(g) "licence" means a licence issued pursuant to Part 9 of The Mines and Minerals Act;

(h) "licensee" means the holder of a licence under which a program is conducted;

(i) "line" means a portion of a program;

(j) "minimum subsurface coverage" means the coverage obtained when seismic pulses generated from not less than 6 different energy source positions in the yellow area and plains area or 12 different energy source positions in the green area and foothills area are reflected from a subsurface point;

(k) "Minister" means the Minister of Energy and Natural Resources;

(l) "permit" means a permit to operate geophysical equipment issued pursuant to the Geophysical Regulations;

(m) "program" means a survey conducted by the use of the geophysical prospecting technique known as the seismic reflection method for the purpose of exploring for petroleum or natural gas or both.

AGO 546630

2 This regulation applies to a program for which an application for a certificate is received by the Minister before April 1, 1980.

3 (1) A licensee may, in accordance with this regulation, apply to the Minister to have a program certified as a geophysical incentive program.

(2) The application shall be submitted by the licensee and shall be in Form of Schedule A to this regulation.

(3) Where a program qualifies as a geophysical incentive program, the Minister shall issue a certificate for the program in Form 2 of Schedule A to this regulation.

(4) A copy of the certificate shall be sent to the licensee.

4 A certificate is subject to the following conditions:

(a) that the licensee shall allow the Minister, or any person authorized by the Minister for the purpose, to have access to any field data or field reports obtained by the licensee or his representatives during the course of conducting the program, and

(b) that the licensee and his representatives shall render to the Minister or the person authorized by him under clause (a) such assistance as may be necessary for the purposes of enabling the Minister or that person to inspect the field data or field reports.

5 (1) Within 120 days of completing a geophysical incentive program, or on or before August 1, 1980, whichever is earlier, the licensee shall submit to the Minister a final report on the program in Form 3 of Schedule A to this regulation.

(2) A final report submitted by the licensee under subsection (1) shall be accompanied by a copy of the computer stacking diagram for each line in the program.

(3) The final report on a geophysical incentive program shall be made on behalf of the licensee by a professional geophysicist within the meaning of The Engineering and Related Professions Act.

(4) At any time following submission to the Minister of the final report on a geophysical incentive program, the licensee shall make available to the Department upon request all geophysical information and data obtained from the program.

6 Subject to subsection (3), where a geophysical incentive program

(a) is conducted under a certificate for which an application is received by the Minister after March 31, 1978, and before April 1, 1980,

(b) is completed to the satisfaction of the Minister, and

(c) is reported on within the time and in the manner prescribed by section 5,

the Minister shall

(d) determine a credit for the program in accordance with Schedule B to this regulation, and

(e) notify the licensee of the credit as determined.

(2) The mileage upon which a determination of credit for a geophysical incentive program is based shall never exceed the number of miles of minimum subsurface coverage approved for the program, but where the number of miles of minimum subsurface coverage in a geophysical incentive program as determined from the final report and computer stacking diagrams is less than the mileage approved for the program, the Minister shall base his determination of credit for the program upon the size of the program as ascertained from the computer stacking diagrams.

(3) The Minister shall not determine a credit for a program under subsection (1) where he is satisfied that

(a) the program fails to meet minimum subsurface coverage,

(b) the program is not conducted in accordance with generally accepted standards of geophysical practice, or

(c) the recording of the program has commenced before a certificate for the program is issued under section 3.

(4) Subsection 3(c) does not apply to a geophysical incentive program for which an application for certification is received by the Minister during April, 1978.

(5) When submitting a final report on a program under section 5, the licensee shall inform the Minister in writing as to the manner of allocation of the credit among the persons specified by the licensee as being participants who have contributed to the actual cost of conducting the program and, subject to subsection (6) and section 7, the credit shall be allocated and established in the records of the Department accordingly.

(6) If the licensee fails to comply with subsection (5), the credit shall be established in the records of the Department in the name of the licensee.

7 Notwithstanding sections 6 and 9, the Minister may withhold from establishment in the records of the Department or from utilization, 25% of the credit determined by the Minister for a geophysical incentive program until the Minister receives evidence satisfactory to him that the program was conducted in accordance with the Geophysical Regulations, and that the surface of the land on which the program was conducted has been adequately reclaimed.

8 (1) Subject to subsection (2), credit established in the records of the Department under section 6 is not transferable.

(2) Any credit held in the records of the Department in the name of a licensee or of a party to whom credit has been allocated under section 6 may be transferred to any other person where that person provides evidence satisfactory to the Minister

(a) that he has acquired the assets and liabilities of the licensee or party in whose name the credit is being held, and

(b) that the licensee or party in whose name the credit is being held has ceased to carry on business in Alberta, or, being a corporation, is dissolved or is struck off the register pursuant to The Companies Act.

9 (1) Credit established in the records of the Department pursuant to section 6 may, upon the written request of the holder thereof, and subject to procedures established by the Department, be applied in satisfaction of

(a) money payable by him with respect to any applications made and agreements made or entered into under Part 5 of The Mines and Minerals Act,

(b) royalty payable on petroleum and natural gas obtained pursuant to an agreement made or entered into under Part 5 of The Mines and Minerals Act,

(c) interest on money payable under any agreement made or entered into under Part 5 of The Mines and Minerals Act, or

(d) taxes levied under The Freehold Mineral Taxation Act on petroleum or natural gas rights,

and becoming due and payable on or before December 31, 1987.

(2) Where a licensee submits a request to the Minister for the monetary equivalent of the credit being held in the name of the licensee in the records of the Department and provides evidence satisfactory to the Minister that he is neither the registered owner under The Land Titles Act of a petroleum or natural gas right as defined in The Freehold Mineral Taxation Act nor the holder of an agreement under Part 5 of The Mines and Minerals Act, the Minister may pay to the licensee upon submission of the request the monetary equivalent of the credit.

10 (1) It is a condition of every certificate that geophysical information and data obtained pursuant to the geophysical incentive program for which the certificate is issued shall be made available by the licensee under whose licence the program was conducted 3 years after the date upon which the geophysical incentive program is certified

(a) to any person requesting the data in writing within 20 days after receipt by the licensee of the written request for the data and thereafter for a period of not less than 5 years, and

(b) at a cost to that person of

(i) $300.00 for each mile of minimum subsurface coverage in the yellow area or plains area to which the geophysical information and data to be acquired relates,

(ii) $600.00 for each mile of minimum subsurface coverage in the green area to which the geophysical information and data to be acquired relates, and

(iii) $900.00 for each mile of minimum subsurface coverage in the foothills area to which the geophysical information and data to be acquired relates,

and of the expense of reproducing the geophysical information and data requested.

(2) The minimum amount of geophysical information and data which may be purchased pursuant to a written request under subsection (1) shall be the lesser of the geophysical information and data relating to

(a) 5 miles of minimum subsurface coverage, or

(b) the minimum subsurface coverage in a line.

(3) If a licensee, within the 3-year period referred to in subsection (1),

(a) withdraws from Alberta and ceases carrying on business in Alberta, or

(b) being a corporation, is dissolved or is struck off the register pursuant to The Companies Act,

he shall place in trust with a person approved by the Minister all the geophysical information and data obtained pursuant to geophysical incentive programs that were conducted under his licence until the 3-year period has expired, and thereafter for an additional period of 5 years, and any credit held in the name of the licensee in the records of the Department shall be cancelled.

11 (1) Where geophysical information and data obtained from a geophysical incentive program for which no credit is determined by the Minister under this regulation is not made available in accordance with section 10 by the licensee, the Minister may cancel

(a) his licence,

(b) his permit, and

(c) any credit held in his name in the records of the Department.

(2) Where geophysical information and data obtained from a geophysical incentive program for which credit is established in the records of the Department is not made available in accordance with section 10 by the licensee, the Minister may cancel

(a) his licence,

(b) his permit,

(c) any credit established for the program in the records of the Department, and

(d) any credit held in the records of the Department in the name of the licensee.

12 Any of the powers of the Minister under this regulation may be exercised by any employee of the Department authorized in writing by the Minister for that purpose.

SCHEDULE B

DETERMINATION OF CREDIT

The credit in dollars for a geophysical incentive program, shall be calculated in accordance with the following equation:

$$\text{Credit (In dollars)} = 250 KM$$

where K is the incentive factor for the area of Alberta described in Schedule C in which the geophysical incentive program was conducted,

and

M is the number of miles of minimum subsurface coverage in the area.

Incentive Factors

For the purposes of section 6 and this Schedule, the incentive factors established for the areas of Alberta described in Schedule C are as follows:

(a) 1 for the yellow area and the plains area,

(b) 2 for the green area, and

(c) 3 for the foothills area.

FOOTHILLS AREA

The Foothills Area consists of the lands in Alberta listed below and those lands within Alberta located south and west of the listed lands:

Township 1, Range 24; Township 2, Range 25; Township 3, Range 26; Township 4, Range 27; Township 5, Range 28; and Townships 6 to 11 inclusive, Range 29, all west of the 4th Meridian;

and

Townships 12 and 13, Range 1; Townships 14 to 20 inclusive, Range 2; Townships 21 and 22, Range 3; Townships 23 to 28 inclusive, Range 4; Townships 29 and 30, Range 5; Townships 31 to 34 inclusive, Range 6; Townships 35 and 36, Range 7; Township 37, Range 8; Township 38, Range 9; Townships 39 and 40, Range 10; Township 41, Range 11, 12 and 13 inclusive; Township 42, Range 14; Township 43, Ranges 15 and 16; Township 44, Range 17; Townships 45 and 46, Range 18; Townships 47 and 48, Range 19; Township 48, Range 20; Township 49, Ranges 21 and 22; Township 50, Range 23; Townships 51 and 52, Range 24; Townships 53 and 54, Range 25, Township 54, Range 26; Townships 55 and 56, Range 27, all west of the 5th meridian;

and

Township 56, Range 1; Townships 57 and 58, Range 2; Township 58, Range 3; Townships 59 and 60, Range 4; Township 60, Ranges 5 and 6; Township 61, Ranges 7 and 8; Township 62, Ranges 9 and 10; Township 63, Range 11; Townships 64 and 65, Range 12;and Township 66, Ranges 13 and 14, all west of the 6th meridian.

GREEN AREA

The green area consists of that part of Alberta in which public lands are classified as forest land not available for agricultural development other than grazing by an order of the Minister pursuant to Section 12 of The Public Lands Act effective to November 30, 1974, but does not include those lands described in this Schedule as the Foothills Area.

YELLOW AREA

The yellow area consists of that part of Alberta in which public lands are classified as being adaptable to any kind of disposition by an order of the Minister pursuant to Section 12 of The Public Lands Act effective to November 30, 1974.

PLAINS AREA

The plains area consists of the remaining lands in Alberta not described in the Foothills Area, the Green Area or the Yellow Area.

HOUSE JOURNAL

LETTER OF INTENT

CSHB 854 (RESOURCES)

The Honorable Hugh Malone
Speaker of the House
Alaska State Legislature

Dear Mr. Speaker:

The Resources Committee substitute for House Bill 854 makes numerous changes in the legislation as proposed by the Governor. Two of these changes involve the deletion of the following language:

1. Subsection (f) on page 6.

2. In subsection (j) the following sentence (at the top of page 8 in the original bill) - "The commissioner may provide by regulation and in the lease that the lessee may earn production rights only to the depth drilled at the beginning of production from the lease."

The record should show that the committee's intent in deleting these two items was not to limit the discretion of the Commissioner of Natural Resources in these areas, but simply the result of its determination that the authority in both of these areas is implied, and does not require special authorizing language in the bill.

Alvin Osterback

Alvin Osterback, Chairman
House Resources Committee

LEGISLATIVE AFFAIRS AGENCY

MEMORANDUM

June 16, 1978

SUBJECT: Suggested Technical Amendments to HB 854

TO: The Free Conference Committee on HB 854

FROM: Gregg K. Erickson
Director of Research

We suggest that you may wish to consider the following technical amendments to the oil and gas leasing bill. Page and line numbers referred to SCS CS HB 854 (2nd Rules).

P.#- SIDE
By SIDE ANALYSIS

p. 2

1. Page 2, lines 9-13: Delete the word "and" on Line 9 and substitute the word "or". Insert a period after the word "issued" on line 10, and delete all remaining material on lines 10-13.

The change suggested above is unnecessary if the House's position on legislative review is accepted by the Free Conference Committee. However, if the provision for legislative review is deleted, as was the case in the Senate bill, the change suggested here would appear to eliminate possible confusion over the legislature's roll, and would eliminate any doubt concerning whether an area proposed in the third (but not the fourth) year preceding leasing, could be leased.

p. 6

2. Page 4, lines 23 and 25: Delete the last sentence in subsection (h) and substitute the following material, "The Commissioner may waive a work commitment, or portion of it if, based on the results of exploration in the area surrounding lease, a lease holder demonstrates that there is a substantial probability that the lease is incapable of producing oil or gas."

We believe this language to be a clearer expression of what we understand to be the intent of this sentence.

p. 17

3. Page 12, line 19; Delete the word "this" and substitute "the leasing program submitted to the first session of the 11th Legislature."

Administration officials have suggested that restatement rather than the use of the pronoun would eliminate any possible confusion on this subsection.

AGO 546974

Statement of David S. Mace
Sohio Petroleum Company
before the
Senate Resources Committee
Alaska State Legislature
May 22, 1978

As Assistant General Manager, I am pleased to have the opportunity to present the views of Sohio Petroleum Company, a Division of Sohio Natural Resources Company, with respect to the House-passed version of H.B. 854.

We strongly feel that the oil and gas leasing bill merits thoughtful study, as its implementation will determine the State's ability to conduct an effective leasing program in the future. Since the industry's ability and willingness to participate in future lease sales will be determined by the manner in which future administrations administer the State's leasing bill, it is vitally important that the provisions contained therein give clear guidance to the Department of Natural Resources (DNR).

Although the House has significantly improved the bill as originally introduced, we feel that there are key provisions that should be further amended. Additionally, we strongly believe that further consideration should be given to the exclusion of several of the proposed bidding methods and to the general concept of experimentation in Alaska's leasing program.

Prior to describing the specific problems we see in H.B. 854, I should like to outline for you why we feel that Alaska should, particularly at this time, pay close attention to energy policy development in general and its leasing program in particular. To put it in a nutshell, world supplies of conventional oil and gas have shrunk and are narrowing rather quickly; the chances of finding another Prudhoe Bay-sized field--anywhere in the U.S.--are next to zero. Thus policy decisions affecting oil and gas are crucial if Alaska is to find and develop her remaining petroleum resources, thereby strengthening the future economic outlook for all Alaskans and the political/economic outlook for the United States.

PART I: AT THE CROSSROADS

THE IMPORTANCE OF OIL AND GAS POLICY DECISIONS

Global Prospects

The Workshop on Alternative Energy Strategies (WAES), a two-year international energy and economic project, directed by the Massachusetts Institute of Technology, recently released their final report which indicated that:

(1) All energy resources and conservation measures must be developed vigorously to meet total projected demand in the period 1985 - 2000; and

(2) Energy policy decisions made now will be the critical determinants as to whether or not sufficient incremental supplies will be available to meet demand in the years ahead.

In other words; according to the WAES Report:

> The years up to 1985 are critical ones...We are...on the threshhold of a critical decision period. We cannot afford to waste the years immediately ahead if we are to have any large-scale energy options available before the end of the century. The time for decisive action is now. 1/

In this environment, the importance of the Federal and State petroleum leasing programs affecting Alaska cannot and must not be underestimated. Whether or not Alaska's oil and gas resources can and will be developed will be an important factor not only for Alaska but also for the United States as a determinant in the future global energy, economic and political balance. The critical nature of energy decision-making at this time is further underscored by the following conclusions stated in the WAES Report:

1/ ENERGY:GLOBAL PROSPECTS, 1985-2000, Report of the Workshop on Alternative Energy Strategies, M.I.T. Professor Carroll L. Wilson, Project Director McGraw-Hill Book Company, San Francisco, 1977.

(1) The supply of oil will fail to meet increasing demand before the year 2000, most probably between 1985 and 1995...(p.3)

(2) Demand for energy will continue to grow even if governments adopt vigorous policies to conserve energy...(p. 4)

(3) The continued growth of energy demand requires that energy resources be developed with the utmost vigor...(p.4)

(4) Even if there are no governmental constraints on oil production, oil supply will meet demand only under the most optimistic assumptions about gross additions to reserves...(p.145)

(5) Possible constraints on oil production by members of OPEC are likely to cause oil supply to peak at the latest some-time around 1990 although lower production limits could bring this date forward into the early 1980's...(p.145)

(6) All the effort put into oil exploration around the world over the past one hundred years has only yielded 240 large oil fields...(p.123)

(7) With only a small chance of either discovering a new Middle East or discoveries in the Middle East as large as in the past, the past rate of genuine new discoveries can only be achieved if a large number of smaller producing areas are found. (p.122)

(8) Given lead times of 5-10 years or more for many projects, failure to make necessary near-term commitments or to resolve a variety of current restraints on production, or to develop future supplies may foreclose some options for 1985. (p.265)

(9) Failure to recognize the importance and validity of these findings and to take appropriate and timely action will almost certainly result in a world different from the one on which these projections have been based. (p.5)

(10) Failure to act could lead to substantially higher energy prices as the supply/demand imbalance becomes more apparent with the consequent frustration of the aspirations of the less developed countries. The major political and social difficulties that might arise could cause energy to become a focus for confrontation and conflict. (p.5)

(11) The longer the world delays facing this issue the more serious the outcome will be. Even with prompt action the margin between success and failure in the 1985-2000 period is slim. Time has become one of the most precious of our resources. (p.5) 2/ (Emphasis added)

2/ Ibid., pages as indicated above.

Another important point in the Report relates to the size of future oil fields. Worldwide, over 30,000 oil fields have been discovered, but about 75 percent of the oil lies within 240 large fields, each with over 500 million barrels of recoverable reserves. 3/

Out of the tens of thousands of producing oil fields in North America, there are only five fields that have recoverable reserves of more than 500 million barrels (Prudhoe Bay, which is new; and Elk Hills and Wilmington in California, and East Texas and Yates in Texas, all of which are old fields). Despite a great deal of exploration in North America, there has been no recent discoveries of fields more than 500 million barrels, except Prudhoe Bay. In other words, the probabilities of finding large new fields on the order of Prudhoe Bay has significantly diminished, not only globally, but also in the United States.

The WAES Report also makes clear that in certain environments, such as the North Sea, a 500 million barrel field is at the economic margin. 4/ Because of the particularly harsh environment in Alaska's North Slope, and elsewhere in the unexplored part of the State, a field that may contain even more than 500 million barrels of oil could be right on the edge of economic viability in Alaska, given the uniquely high costs and transportation difficulties.

While all of the above has critical implications both for the United States and Alaska, there are yet another set of reasons why we believe that the designing of the future oil and gas leasing program in Alaska deserves serious and careful consideration.

Alaskan Petroleum Outlook

In a sense, the State of Alaska is facing on a smaller scale some of the same problems described earlier on a global scale. Whereas world oil production may begin to decline in about seven years, Prudhoe Bay will begin to decline within the decade. This fact has important implications to all Alaskans and, in view of the revenue needs of the State, it would appear to be critically important for the State to ensure and encourage a steady, strong and ongoing oil and gas development program in Alaska. But the historic rate of genuine new discoveries can only be achieved worldwide if a large number of small producing areas are found. Likewise, the future of petroleum discoveries in Alaska will most probably involve smaller fields which will be more costly to develop.

As previously noted, the possibility of finding another Prudhoe Bay-sized field in Alaska--or anywhere--is extremely remote. Further, because of the very high costs of operating in much of Alaska, the size of a discovery must be larger here than it need be in other states to make the project economic. Even the Lisburne and Kuparuk oil pools, which according to State estimate range in potential from one to two billion barrels, may be marginally economic and typical of many future oil and/or gas finds in Alaska. All this tends to suggest that Alaska needs to pay closer attention to the development of her resource policy than a state like Louisiana, for example.

Some have argued that Alaska might be better off 'sitting on' her potential oil and gas resources and waiting for the world oil price to rise even further. Dr. Arlon Tussing, an Alaskan economist advisor to the Senate Energy Committee, considers this attitude, "simplistic" and "naive".

In real terms, world oil prices may stabilize as a result of a prolonged period of relatively low economic growth which would result in lower growth rates for energy consumption than is generally projected. Additionally, as global attention is increasingly focused on energy, the drive to conserve energy and to develop heavier oils, such as Athabascan tar sands, Rocky Mountain oil shale and Orinoco tar belt--and substitutes for conventional oil and gas--will increase. Again, to quote Dr. Tussing, "if you choose to 'sit on' your oil and the decision was wrong, the resultant imbalances could be serious."

A final serious consideration for Alaska relates to a realistic assessment of the future revenue needs of the State. Projections indicate that Alaska's revenue problems in future years require a significant expansion of petroleum exploration and development activity now so that new sources of revenue will be available as Prudhoe Bay declines. This is an especially critical consideration in view of the long lead times involved in exploration and production in the frontier areas of Alaska. In some areas, it can take a decade to find, prove up and begin to develop a field, and transportation problems can be enormously complex, causing further delays.

Implications

Being at the economic/energy crossroads globally -- and in Alaska -- would seem to suggest that it is of vital importance to the State to (1) carefully delineate its goals with respect to a new oil and gas leasing bill and (2) ensure that the proposed legislation, in its implementation, will achieve the desired goals outlined in the legislation. With this in mind, I would like to address some of the specific, critical problems we foresee if H.B. 854 were to be implemented in its current version. Additional, I would like to present some of the experts' views with respect to several broad issues raised by the draft legislation.

PART II: CRITICAL CONCERNS WITH H.B. 854

Bidding Methods - Experimentation

No one knows how beneficial experimentation in bidding methods will be. The U. S. Government tried royalty bidding on ten tracts in an October 1974 lease sale with questionable results. It appears that neither the industry participants nor government officials found the experiment to be particularly successful.

According to The Oil and Gas Journal, "operators say they doubt royalty bidding will ever surface again except in areas where production is almost certain or possibly in drainage-tract sales. Development of wildcat acreage can prove too costly on a royalty bid basis, despite the absence of high front-end expenditures normally budgeted under the traditional bonus-bid system." 5/

Similarly, Energy Secretary Schlesinger appeared to be disenchanted with the royalty bidding experience in Louisiana in that, in a letter to Interior Department Secretary Andrus, Schlesinger apparently stated that the Department of Energy has reservations about the effectiveness of the royalty method based on past experience in the Gulf of Mexico. It appears in fact that Schlesinger raised the same objections to the royalty system as had been raised by industry and formerly by officials in the Department of Interior, i.e., that royalty bidding leads to early abandonment of leases because declining production eventually makes the lease unprofitable under a high royalty arrangement.

5/ Mike Long, "Royalty-bidding experiment turns sour," Oil and Gas Journal, May 2, 1977, p.32.

Significantly, the Department of Energy and the Interior Department are considering the formation of a task force of experts to help analyze pros and cons of the various systems being proposed in the Federal legislation (which were largely copied in H.B. 854). Apparently, there is considerable disagreement between the two agencies as to the merit of the sliding scale royalty systems used in the last two lease sales, as well as to the efficacy of using other bidding methods. A key problem in forming a task force seems to be a dearth of real experts, however, in that few governments have undertaken experiments in bidding practices long enough or in a manner similar enough as that envisioned in the proposed Federal and State legislation, and to paraphrase Dr. Arlon Tussing's comments: scholarly, empirical analysis of the different bidding systems appears to be 'remarkably skimpy.'

One source document appears to be quite useful, however. Published by the British Columbia Institute for Economic Policy Analysis, Mineral Leasing as an Instrument of Public Policy, contains articles by an international and interdisciplinary group of economists, mining engineers, businessmen and industry consultants. In an introductory section, Dr. Mason Gaffney describ the report as "an outstanding contribution to a rapidly growing field of study."

Our greatest concern with the proposed legislation is reflected in many of the articles in the British Columbia Institute's report. The publication cites significant problems with many of the bidding systems proposed in H.B. 854. Since each new system is so experimental, the likelihood of the Alaska's experiments not succeeding is high. An additional concern is that it would be years before the success or lack of success with a given system can be determined.

An example of our concern relates to the use of royalty bidding. Dr. Arlon Tussing, Dr. Walter Meade and others (including now Energy Secretary Schlesinger) have raised objections to royalty bidding for a variety of reasons. In the Report, Professor Hayne E. Leland, University of California at Berkeley, echoes some of their concerns and ours:

> "Competitive bidding theory makes clear that undesirable consequences may follow from royalty or profit share bidding. If there are no bonus payments required, speculative bidding may lead to extremely high royalties or profit shares being bid, with development occuring only in the most favorable circumstances. This happens because firms have little or nothing to lose by bidding high and then failing to explore or develop..." 6/ (Emphasis added)

Gregg Erickson, a well-known Alaskan economist, in his article on "Work Commitment Bidding," suggests that the problems associated with royalty bidding are well known:

> "The problems created by royalty bidding, principally the premature shutdown effect and the potential for speculator induced misallocation of leases, have been well discussed in the literature. More importantly, they are well understood by persons influencing both public and private mineral resource policies". 7/ (Emphasis added)

Yet, it is not clear to us that royalty bidding problems are well understood by the officials who will guide the Department of Natural Resources in leasing decisions in the next few critical years or in the future.

A specific example of why we are concerned relates to the material prepared by the Department of Natural Resources to accompany H.B. 854, entitled "Two Views on Bidding Strategies." Not only are the numerous problems and dangers of royalty bidding (cited by Meade, Erickson and others in the University of British Columbia Report) not even mentioned,

---

6/ Hayne Leland, "Comment," British Columbia Institute Report, p.60

7/ Gregg Erickson, "Work Commitment Bidding," Ibid., p.61.

but also, after three short descriptive phrases under the heading "Royalty Bid-Fixed Bonus," the Department of Natural Resources, with no further comment, analysis, or explanation, simply states: "The Beaufort Sale is an ideal candidate . . . royalty bidding scheme." (Emphasis added)

We view such remarks by the State Administration with concern. As indicated previously, many who have taken the time to study the various proposed bidding methods in depth list extensive problems with various schemes for royalty bidding (see also Part 3) and, would hesitate to use royalty bidding schemes of any sort except in drainage sales or where there are known, proven reserves (as mentioned above in the Leland citation). The Beaufort Sea is believed to have a high potential for discovery, but, as in the Gulf of Alaska, the drilling of wells may result in no discoveries, or discoveries of marginal fields. No discoveries - with royalty bidding - means no income for the State of Alaska. And, as royalty bidding adds risk for the State, another quote from Leland is perhaps appropriate here:

> "Note that if the lessor is such that leasing forms a substantial fraction of its revenue (for example the State of Alaska), it may not be optimal to transfer risk from firms to the lessor. Thus, lease contracts which might be appropriate to the federal government may not be appropriate for regional governments". 8/ (Emphasis added)

Future administrations working with the proposed leasing statutes may have multiple choices of bidding methods available to them. We feel it important to stress that we concur both with Mason Gaffney and Gregg Erickson as to where the burden of justification of such decisions should lie, i.e., with those who would change the current system of cash bonus bidding. In this regard, we believe we are safe in assuming that Gregg Erickson's

---

8/ Leland, op cit., p.60.

statement below with respect to the work commitment bidding system would apply to any new proposed bidding system:

> "The adoption of a work commitment bidding system implies a judgment that existing institutions for private exploration of public resources result in a suboptimal rate of resource development.
>
> Any argument for the adoption of such a system must first establish that this is in fact the case..." 9/

Similarly, though in a more general way, Mason Gaffney warns:

> "To serve his citizens best, the statesman should...resist the temptation to use his power to manipulate and control...on the too easy presumption that the market has no rationale or normative value of its own. Generations of economists have established that it has, and governments seeking to improve on it need face a certain burden of proof." 10/

One final point: The effects of the cash bonus bidding method, though not perfect, have been rigorously scrutinized, with over 20 years of experience as a basis for analysis. And, according to Professor Mead's extensive studies related to the results of 35 oil and gas lease sales during the period November 1954 to May 29, 1974, bonus bidding with a fixed royalty is effective:

> "On the basis of this evidence, we conclude that competitive bidding for oil and gas leases is sufficiently strong to protect the public interest in obtaining competitive values for its oil and gas resources. This conclusion is further supported by evidence presented above indicating an increase in the average number of bidders and a substantial increase in the average price bid per acre for oil and gas leases". 11/

Thus, it is our judgment that, although in certain, special circumstances, changes in the bidding approach may be advantagous to the State, several factors should be remembered. First, the State currently depends on the petroleum production, some for 70 percent of its revenue, most of which is from a field that will begin to decline in about seven years. New exploration in Alaska is vitally needed.

9/ Erickson, op cit., p.75.

10/ Gaffney, op cit., p.3.

11/ Mead, op cit., p.55.

Second, although oil companies by the nature of their business deal daily in risk and uncertainty, there is no question but that, to the extent the State can reduce uncertainty and foster confidence with regard to the use of new bidding systems, oil and gas exploration will be encouraged.

Third, because the new systems <u>are</u> experimental, we would suggest that the burden of proof for adopting a new system for any lease sale be placed on the Department of Natural Resources because the use of any new system involves greater risks and uncertainty not only for the companies but also for the State.

Lease Terms (y) and (z)

As currently proposed in H.B. 854 the lease stipulations include a normal lease life of five years duration; leases can only be prolonged to ten years in areas where environmental conditions severely restrict operations. It is our understanding from testimony given to the House Resources Committee by personnel of DNR that severely restrictive environmental conditions are interpreted to include moving ice zones in the Beaufort Sea, but not onshore conditions on the North Slope. As this latter area can only be explored by winter operations, a five year lease would only allow 1-2/3 years of exploration time. From a practical standpoint this is not sufficient, and such a restriction would make it physically impossible for an operator to explore a reasonable number of leases.

The cost of exploratory wells in environmentally difficult areas of Alaska, both onshore and offshore, can now be expected to exceed 10 million dollars and sometimes reach 20 million dollars per well. With such large amounts of money involved, exploratory wells are high risk ventures which must be very carefully planned to obtain the greatest return, not only in oil and gas discovered, but also in geological data obtained. Consequently, a company's exploratory program on Alaskan leases must be systematic and careful and can no longer follow the philosophy of "wildcatting." Such a logical approach cannot be rushed in its implementation, and the restriction of leases to a five year term would inevitably result in many leases not receiving the exploratory attention they might deserve. They would be relinquished without having been drilled, and would therefore diminish in value due to their apparent unimportance to the lessee with consequent loss to the State.

To counteract this situation, and allow operators to assess the true value of their landholdings, we are proposing that the normal term of a lease should be ten years, except in those areas where the Commissioner determines that environmental and economic restrictions on operations are not a factor. Since many of the future lease sales will be in hostile environmental areas, it is in the State's interest, we feel, to ensure that sufficient time is permitted for a proper evaluation of the lease areas.

Furthermore, we feel that the bill should specify that, prior to the lease sale, in the tract terms, the State will provide specific information related to provision (z), i.e., the percentages of oil and gas that the State intends to require for in-state use. Otherwise, it becomes impossible realistically to bid on the proposed tracts.

Joint Bidding - Its Effect on Competition (y)

Much has been said in recent years about the competitiveness or lack of competition in oil and gas exploration and development. Concern has risen particularly with respect to joint ventures in general and joint bidding in particular. Although the formation of joint venture groups for lease sale bidding facilitates ease of entry in high-risk ventures, and allows producers to spread their financial investments in an effort to minimize overall risks, the sheer numbers of joint ventures have been interpreted by some as 'fostering something other than competition'.

The two theories about the nature of joint bidding in Federal lease sales (collusive vs. risk-sharing purposes) have been tested by University of North Carolina Professor Edward Erickson and M.I.T. Professor Robert Spann. As they reported in testimony before the U.S. Senate Commerce Committee, the observed patterns of bidding partnerships are most consistent with the hypothesis that joint bidding is a means of risk-sharing, not collusion.12/ Among the ways in which competition might be fostered rather than reduced by joint arrangements are the following:

Because risks are shared, the cost of capital per unit of supply increment is less, so that entry barriers are lowered in high risk ventures;

Because of joint agreements, smaller independents can and do form independent and successful groups for bidding purposes in Federal lease sales, as evidenced by data on successful bidders in the June 1973 Federal lease sale;

12/ In their study of the 1972 and 1973 Federal offshore lease sales, Erickson and Spann found that membership of bidding groups varies from year to year; market shares for members fluctuate from one year to the next; the most frequent bidding group is a combination of majors and smaller firms, but majors bid alone, as do smaller firms; single firm bids are frequently made by the largest firms, but other firms are also successful single firm bidders, and bidding groups which contain a large number of firms are predominantly composed of smaller firms. They also conclude that the incidence of joint bidding increased as the size of the firm decreased; there was a heavy incidence of joint bidding partnerships between unlike firms; smaller firms use joint bidding ventures as a vehicle for entry into offshore activity. "Competition in the Field Markets for New Natural Gas Supplies," Statement before the Senate Commerce Committee, November 8, 1973.

AGO 546989

Because of the number of large and small producer combinations and the frequency with which new groups are formed with different members, producers are able to become involved in many projects so that competition is spread through many projects.

Since joint operating agreements also expressly provide for separate marketing of production from joint ventures, it would appear safe to conclude that risk-sharing through joint ventures need not make competition less intense. By facilitating ease of entry, joint ventures by domestic petroleum companies may indeed make competition more intense. 13/

The work of Professor Mead tends to underscore the findings of Erickson and Spann:

> "The most conclusive test of the workability of cash bonus bidding based on the United States record of OCS oil and gas lease sales is in terms of the rate of return on capital earned by the successful bidders. An analysis has been made on 184 offshore Louisiana oil and gas tracts leased in 1954 and 1955. Precise data are available on bonus payments, rental payments, oil and gas royalty payments, and production of oil and gas during the period from 1954 through 1967. Cost estimates were made for exploration, well drilling and equipment, and operation. Annual cost and annual wellhead values were discounted to obtain a net internal rate of return. The calculations indicate that these early OCS leases generated a 7.5 per cent before tax rate of return to the lessees. Given the fact that oil companies pay relative low U.S. income tax rates, the after tax rate of return would be only modestly lower than the 7.5 per cent before tax rate of return. <u>This net yield clearly does not reflect monopoly power; it shows an excessive degree of competition</u>". 14/ (Emphasis added).

In fact, two studies conducted under the auspices of the United States Geological Survey (both authored jointly by Dougherty of the University of Southern California and Lorenz of the U.S.G.S.) have indicated that the <u>restriction of joint-bidding has failed</u> to achieve its objectives in Federal OCS lease sales.

13/ In the last analysis, if the formation of such groups constituted monopoly power, one would expect to see some results where such groups are formed, e.g., a non-random bid price pattern in Federal lease sales.

14/ Mead, <u>op. cit.</u>, p.55.

Major conclusions were:

1. The ban of joint-bidding by major oil companies may in fact have acted to broaden the overall influence of major companies in a given sale. The percentage of all bids and the number of bids per lease in which a major oil company was involved actually increased, which in turn may have increased the total amount of acreage in which major companies participated during this period.

2. When the U.S.G.S studies compared solo bids to joint-bids on given tracts, it was concluded that the joint-bidders tended to go after more highly sought-after leases and that they tended to bid higher on the average than sole-bidding competitors.

From a practical standpoint, allowing joint-bidding has important advantages to the State as well as to the industry, in terms of overall economic efficiency, environmental effects of exploration activity, and flexibility.

For example: Often, a given company may have a great deal of geologic and geophysical data in an area, but for one reason or another does not have the cash on hand to fully utilize its data in a competitive-bonus sale. In this kind of situation, it would make sense to join with another company that has the necessary investment capital and does not have the data.

If the two were unable to combine in partnership, a situation could develop where one company had to duplicate seismic and geologic information already held by the other company. Ironically, a situation would then develop where overall competition in the sale would be reduced, because one company with cash reserves would have expended part of its funds in gaining data, while the other company with information would be limited in participation

because of its cash limitations. Also, there would be the obvious environmental effect of the increased seismic and other activity, including, possibly, the drilling of wells, that would go along with the need to gain additional data.

In view of all of the above, it is very doubtful that joint bidding will adversely affect competition, and it is more likely to enhance competition and result in financial advantages to the State as well as oil companies. In this instance, the Federal Governments stance on restricting joint bidding appears to be counter-productive, and it is not in the State of Alaska's best interest to follow that lead.

Minimum Work Commitments (h)

The current language of H.B. 854 permits the Commissioner to impose a minimum work commitment on a lessee. The only reasons we can deduce for including the provision is to overcome the problems inherent in royalty and net profit bidding procedures. Both these methods inadvertently encourage a lessee to sit on a lease as long as possible without carrying out any work, because the lessee has no meaningful financial involvement in the lease. Consequently, under royalty or net profit bidding, the leaseholder will tend to prefer to 'sit on' the lease in the hope that neighboring leaseholders will, by their efforts, help indicate the true potential of the lease. Conversely, minumum work commitments are not necessary on leases won with a cash bonus bid because the lessee has an obvious financial incentive to produce a profit from his cash investment in the lease as soon as possible.

No responsible bidding company will bid on a lease which it thinks is devoid of prospects unless the bidding method imposes no appeciable risk or financial outlay to the company. Under these circumstances, i.e., when royalty or net profit bidding are used, the company has an inducement to try to obtain the acreage because of the slim chance that its assessment of the poor potential of the land is wrong. To prevent the company from doing nothing with this lease, the Commissioner has to impose a work commitment on it. But if the lessee views the lease prospects as negligible, the lessee will expend money for exploration only up to the amount equal to the work commitment imposed by the State.

The question arises: is this result in the State's best interest? Instead of obtaining maximum exploration on tracts with maximum potential,

the State, under royalty and net profits bidding, will encourage, through work commitments, capital outlays on tracts with minimum potential. And the capital outlays will most likely be a waste of dollars, producing no ultimate gain for the State.

If the cash bonus bidding system is not utilized on a particular lease, however, the level of fixed cash bonus imposed with the bidding system chosen can be made sufficiently large to ensure adequate and prompt exploration. Thus, we recommend that (h) be deleted from H.B. 854.

Data Acquisition by the State

While we understand the State's desire to know more about the potential oil and gas resources underlying State lands, we would reiterate what we and other companies have previously stated: obtaining more data from the companies does not necessarily put the State in a better position to evaluate potential resources. In fact the opposite could be true; government officials, looking at company data, might well understate the potential value of proposed lease acreage because of the general conservative nature of a government compared with, for example, the daringness of one Company geologist willing to stake his professional career on his interpretation of exploratory data. It could also be argued that the very nature of a large government agency makes it easier to hide errors of judgment whereas the company which decides to "go" on a project can hold specific employees more accountable for errors of judgment. But the most important fact to remember is that regardless of how much data the State may obtain, the State will never know what it does or does not have unless the State drills.

Since you may not wish to simply take a company's word for it, the following quotation is presented to underscore the importance of drilling as a means of obtaining useful information and to highlight the relative lack of usefulness of data without drilling. This excerpt is from the writings of an acknowledged expert in leasing policy, Professor Walter Meade, University of Southern California at Santa Barbara:

> "...while the technology for oil exploration prior to the drilling has been advanced in the last century, exploration is still subject to extemely high risk. Drilling is the only definitive test to determine the presence of oil or gas. Thus, bonus bids must be submitted by bidders and accepted or rejected by the government when neither the buyer nor the seller knows whether and in what quantities oil is present..." 15/ (Emphasis added)

15/ Mead, op. cit., p.51.

It would seem obvious, therefore, that if the companies -- with all their data and experience -- don't know at the time of a lease sale whether they've just spent millions for the right to put millions more into drilling potentially dry holes, then the government, with the same data, could hardly be better off. And having all the data of all the companies doesn't necessarily lower the risk of error for the government in that the view supported by most of the data of most of the companies (data that might suggest that "Tract 20" is worthless, for example) could be wrong.

Because more is not necessarily better in the exploration data game, many companies do in fact view data acquisition by the government as the first step which will inevitably lead -- and naturally extend to -- the establishment of government drilling corporations. And, as previously noted, Dr. Arlon Tussing does not view "governmental ownership of producing operations" as "the most effective way of accomplishing the social ends for which it is currently being advocated..." 16/

Additionally, Dale R. Jordan details some of the more severe problems of esblishing government drilling corporations:

> "...This article's purpose is not to examine the political repercussions that might occur when dry holes are drilled with public funds; however, we should examine some of the practical considerations involved in the operation of a public company which has an almost exclusive area within which to explore as a result of discouraging the private sector. For the government to discourage both the existing explorer and the entry of any new ones and to expect the public corporation to be able to fill this void suggests that the government is saying, "if the private companies do it, so can we."

16/ M. Crommelin and A. Thompson, "Introduction," Mineral Leasing as an Instrument of Public Policy, British Columbia Institute for Economic Policy Analysis, 1977, p.xvi.

Now remember that the private companies comprise all the oil and gas explorers working in the province and those contemplating doing so, given the right opportunities. All these companies have geological staffs, many of who will be geologists who devote most of their time over a considerable number of years entirely to the study of British Columbia's geology. The public corporation could not expect to have such an extensive source of expertise as that available in the free enterprise system. And so the public corporation would suffer from a reduction in the number of ideas generated.

It is not unusual in oil and gas exploration, with its inherent problem of scientific interpretation and evaluation of geological prospects, to find that one company will acquire a block of land, will explore it, and perhaps even drill on it before deciding the search is unsuccessful. The company will then return the land to its owner, the Crown. This does not mean that there are not any commercial hydrocarbons underlying this land; but rather that that particular company was unable to find them. To find these hydrocarbon deposits, a second, a third, or a fourth company should acquire this land, and, if this is done often enough, the hydrocarbon will be encountered, and production will follow. The problem with the public company being the only explorer in the province is that, unless it is fortunate enough to make the initial discovery, it is very doubtful whether there would be enough enthusiasm to have a second, third or perhaps even a fourth try at that particular prospect, with the result that the discovery would not be made. This is surely the worst thing that could happen and is probably the most damning argument against a public corporation moving into an area with an almost exclusive right to explore. 17/

17/ Dale R. Jordon, "Petroleum Leasing in British Columbia," Ibid., pp. 252-253

SUMMARY AND CONCLUSIONS

In summary, we would offer these observations and conclusions:

1. H.B.854, as currently drafted, would create a State leasing system containing many experimental procedures that are new and untried in Alaska. This may not be in the State's interest, because unusual leasing systems could lead to delays in petroleum development that could have serious consequences on future State revenues and Alaska's contribution toward U.S. energy needs.

2. The State's future revenue problems should not be underestimated. The State of Alaska may face an extremely serious revenue situation in the late 1980's as oil production from the Prudhoe Bay field begins to decline. The long lead-times needed to find and develop new Alaskan oil discoveries would indicate that exploration must expand rapidly on State lands to provide needed petroleum revenues for the future.

3. Alternative bidding systems proposed in H.B. 854, although also proposed in OCS legislation now pending in Congress, have not had extensive use in the U.S., nor in very many other places in the world. Experience with royalty bidding in Federal OCS sales has apparently been dissappointing, and the Federal government is giving serious attention to the use of alternate bidding systems.

4. The majority of academic literature that we have been able to find supports the thesis that the traditional bidding methods have worked well in the leasing of public lands for petroleum development. Academic experts also seem to agree that alternative bidding systems present serious problems, except when used in certain special situations.

5. The bill must be clarified where judgmental factors in its administration are critical to the success of the leasing program. The life span of a lease in years must be compatible with the extreme environmental and economic constraints placed on exploration activity in Alaska. To underestimate those constraints will result in unacceptably short lease terms, with a consequent reduction in exploratory work carried out on the leases. A decrease in exploration leads directly to a reduction in discoveries, production and State revenues.

6. Section (2) needs to be clarified in that, as currently drafted, the financing of exploration ventures based on a commitment of future production, would be impossible.

7. Work commitments are not as effective as higher bonus bids in encouraging prompt exploration of worthwhile leases, as work commitments, particularly in conjunction with royalty bidding schemes, work against the State's best interests in developing promising acreage.

How to Bid for Offshore Rights

Several systems have been proposed to replace the present "bonus-bid" method of assigning leases on offshore oil prospects to developers. Of these, Professor John W. Devanney III of M.I.T. opts for "percentage-of-excess-profits" bids (*see p. 42*). Other proposed arrangements include work obligation permits and various forms of royalty bidding.

The Work Obligation Permit Plan

Under the work obligation permit plan, developers would submit exploratory and provisional drilling plans for a given tract. The government would choose the developer with the most aggressive, best-considered plan, and the developer would then be responsible for agreed-upon amounts of royalties and/or lease rentals. Under this system, used currently by the Norwegians and the British in the North Sea, the great bulk of any economic rent would be transferred to the developer, and a portion of this rent would be returned to the public in the form of corporate income taxes. Of the possible methods reviewed here, this is clearly the most favorable to the developer.

Administering this method to maximize national income depends on the skill and honesty of administrators. There are temptations for prospective developers to submit work plans which represent over-development of the resource so they will be judged the most aggressive, and administrators will have to be wise enough to recognize such over-development and refuse it. The decisions to be made in choosing the "best" work plan are necessarily judgemental, and they are an open invitation to the influence of special interests and even to corruption.

But beyond the possibilities of incompetency or corruption which may result in loss of national income is the basic fact that most of the economic rent goes to the developer. Professor Devanney concludes that work obligation permitting is clearly not desirable, from a nondeveloper point of view. Indeed, as soon as it became clear that economic rent was associated with North Sea oil, the British and Norwegians moved away from this practice.

Royalty Bidding

Royalty bidding involves competitive bidding on a share of the actual gross revenues — generally a percentage of market value — associated with the resource. This method has long been used in state sales of rights, and the federal government experimented with it in the Gulf of Mexico in 1974.

Compared with bonus bidding, royalty bidding transfers some of the risk prior to exploratory drilling from the developer to the public. This helps maintain competition among bidders, for large amounts of up-front capital are not necessary, and the need for large bidding combines disappears.

However, there are other problems. While the method could theoretically give most of the revenues from offshore oil to the public, it could also reduce the total size of the offshore oil pie. This is because the royalty bid, unlike the bonus bid, affects the developer's marginal expenses. For instance, if a developer overestimates production from a certain tract, he will freeze himself into a royalty bid that makes it unprofitable for him to develop the smaller, and thus more expensive, oil find that is actually made. He will refuse to develop it, and the national income will suffer. This risk may especially affect secondary and tertiary production from a tract; such oil will be more expensive than primary oil but still less costly than foreign crude.

Proponents of royalty bidding offer two possible resolutions of this dilemma — re-leasing and renegotiation. The former proposes that if a developer decides not to produce a tract he must turn it back to the government, with all equipment intact, and the government may lease the tract anew, presumably to a different developer at a lower royalty. This would discourage expensive techniques to enhance oil recovery, because the original leaseholder may choose merely to take out the flush production before releasing a tract back to the government. This will be costly to the public, since processes for secondary and tertiary recovery of oil must begin early in a field's life to be most effective. There is also the possibility of excessive administrative costs associated with the negotiations necessary for re-leasing.

Advocates of renegotiation propose that if a developer feels he cannot develop a field at his bid royalty, he should be able to present his evidence to the regulatory body which should be empowered to grant him a decrease if it finds his presentation viable. The obvious problems here are in the regulatory body's verification of the developer's data. The capital-intensiveness of offshore oil makes any estimate extremely sensitive to the cost of capital, and that information is often confidential.

Other potential problems introduced by renegotiation include temptations for developers to "goldplate" a project since additional expenses could come off the royalty — i.e., out of the public's pocket. A developer might deliberately bid high initially in order to obtain a tract, anticipating that he will renegotiate later; and he might go through a whole series of renegotiations as his costs for enhanced recovery techniques begin to appear.

Some have suggested a compromise between bonus bidding and royalty bidding, in which developers would enter a "high" fixed royalty plus a bonus bid of up-front payments. This would decrease the size of bonus bids and aid competition, say its advocates. Unfortunately, this presents the same can of worms as straight royalty bidding.

Installment bonus bidding has also been suggested. This means a developer would pay his bonus in three installments — immediately, after three years, and after five years. He could surrender the lease before the last two payments if things failed to work out. But this presents the same pie-reducing problems as royalty bidding; if a developer originally bid $600 million and after exploratory drilling found oil worth only $350 million, he would abandon the tract rather than pay the final installments even though national income would be increased by $350 million if the find were developed.

There are advantages, however, in installment bonus bidding. There is an automatic re-leasing provision, which could assure that tracts were re-opened for development; and the marginal costs of the oil are not affected, which means that the developer has incentives to invest early in enhanced recovery.

However, the massive amounts of up front money involved in even a one-third installment payment of a bonus bid will probably still frighten away many bidders. And many bidders would increase their total bonus bids considerably, knowing that they could thus avoid paying additional installments.

ALBERTA, CANADA

Exploratory Drilling Incentive System

A report from Alberta Energy and Natural Resources states the exploratory drilling incentive principles adopted for wells spudded between Jan. 1, 1978 and March 31, 1981 were announced by the government last fall and will be defined in detail in the Exploratory Drilling Incentive Regulation, 1978 when it is issued in the near future.

This regulation, however, may not be available to industry prior to the commencement of the drilling activity it affects. Accordingly, the essential details respecting the forthcoming program are described herewith.

The department expects that the principles and details outlined here will be incorporated, without a change in meaning, into the 1978 Regulation. If, however, such a change does occur, the 1978 Regulation would, of course, take precedence.

(1) Commencement Date of the Forthcoming Program

As previously indicated, an incentive exploratory well in good standing will be

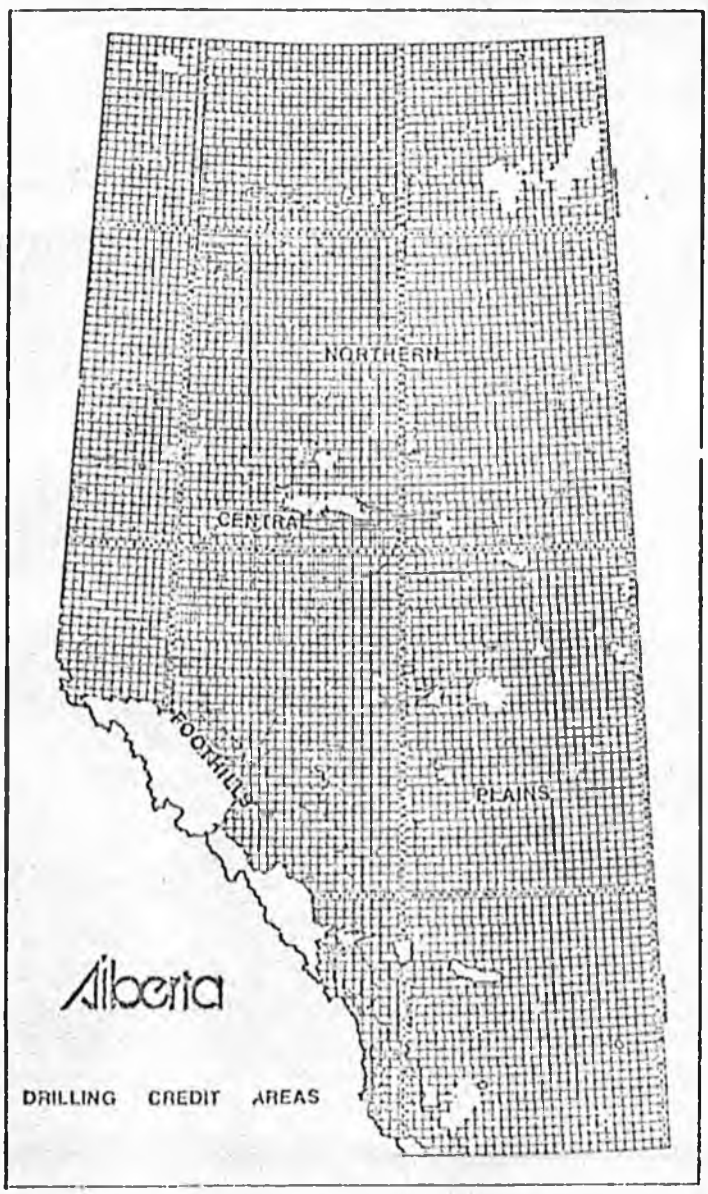

Figure 1

Figure 2

subject to the 1978 Regulation if it commences drilling on or after Jan. 1, 1978. This provision will not be affected if the licensing or certification date is before 1978.

(2) Drilling Credit Areas

Figure 1 shows the drilling credit areas as they will be defined under the 1978 Regulation. The Plains and Foothills Areas have not been changed. The subsisting Northern Area, however has been divided into the new Central and Northern Areas shown by the illustration. The boundary between the two new areas was defined by the Department on the basis of well cost data and topographic and access considerations.

Figure 2 is provided for the convenience of industry to depict the irregular eastern boundary of the Foothills Area. A similar map was issued by the Board in 1974.

(3) Drilling Credit Schedules

Drilling credits under the 1978 Regulation will be determined from Schedules F

SCHEDULE F

Applicable to the Class A Interval of an Incentive Exploratory Well that Commences Drilling on or after January 1, 1978

The Class A interval of an incentive exploratory well that commences drilling on or after January 1, 1978 shall be determined by the Board as the interval below the depth of 2,000 feet that

(i) has not been duplicated by a drilled and abandoned well within one and one-half miles.

(ii) occurs more than 500 feet below the base of the deepest accumulation of crude oil or natural gas that in the opinion of the Board has been penetrated by another well within three miles, and

(iii) occurs immediately below the base of the member or formation containing the deepest oil sands deposit that in the opinion of the Board may underlie the location of the said Incentive exploratory well.

Where neither (ii) nor (iii) above applies, the Class A interval shall be determined from the depth of 2,000 feet to the total depth of the said Incentive exploratory well.

	Basis for Credit Plains Area		Basis for Credit Central Area		Basis for Credit, Northern and Foothills Areas	
Depth, Feet	Cumulative Dollars	Incremental $/Foot	Cumulative Dollars	Incremental $/Foot	Cumulative Dollars	Incremental $/Foot
2,000	0	20	0	30	0	40

Figure 3

SCHEDULE G

Applicable to the Class B Interval of an Incentive Exploratory Well that Commences Drilling on or after January 1, 1978

The Class B interval of an incentive exploratory well that commences drilling on or after January 1, 1978 shall be determined by the Board as the interval below the depth of 2,000 feet that

(i) has been duplicated by a drilled and abandoned well within one and one-half miles.

(ii) occurs more than 500 feet below the base of the deepest accumulation of crude oil or natural gas that in the opinion of the Board has been penetrated by another well within three miles, and

(iii) occurs immediately below the base of the member or formation containing the deepest oil sands deposit that in the opinion of the Board may underlie the location of the said Incentive exploratory well.

Where neither (ii) nor (iii) above applies, the Class B interval shall be determined from the depth of 2,000 feet to the total depth of the said Incentive exploratory well.

18,000	1,500,000	360	1,800,000	400	1,930,000	420

Figure 4

ACO 547003

and G *(Figures 3 and 4)*. The schedules reflect the government's decision to exclude the upper 2,000 feet from the forthcoming program, and to increase the credits for qualifying wells deeper than about 3,500 feet. For wells greater than 5,000 feet in depth, the increase is between approximately 25 and 45 percent, the difference being justified by the Department's comprehensive well cost study. An exception applies to the new Northern Area, for which credit increases at certain depths exceed 45 percent to correspond with Foothills credits.

(4) Royalty Exemptions

(4.1) Eligibility

Crude oil or gas production must originate from a Class A or Class B interval to qualify for a royalty exemption. Production from any source shallower than 2,000 feet will thus not quality for royalty exemption under the 1978 Regulation. An exception to the foregoing exclusion is found under the following circumstances: If conventional crude oil is produced from a source shallower than 2,000 feet in the new Northern Area, and if the 2,000-foot interval would have qualified as Class A or Class B footage pursuant to the 1974 Regulations, the crude oil production will be eligible for the normal royalty exemption applicable to deeper production.

(4.2) Duration

The royalty exemptions authorized under the 1978 Regulation will apply to the initial 60 crude oil-producing months or the initial 12 gas-producing months at the well, commencing with the first month in which the crude oil or gas would otherwise be subject to royalty payment.

Additional details concerning these and other principles relating to the forthcoming program will be specified in the 1978 Regulation. If any questions arise after the 1978 Regulation is studied, they may be referred to J. R. Pow or F. Phillips of the Energy Resources Conservation Board, if they pertain to the certification of a well or the determination of its Class A or Class B interval, or to C. R. Smith or E. Saldanha of the Department, if they are concerned with establishing credit or granting royalty exemption. □

Work Commitment Bidding

GREGG K. ERICKSON

One result of the growing concern in the United States over energy matters has been an increased attention to public policies governing the development of Outer Continental Shelf (OCS) oil and gas resources. The institutional structure under which all such development has thus far taken place was established in 1953 by the Outer Continental Shelf Lands Act.[1] This unamended statute provides the Secretary of the Interior with authority to sell oil and gas leases to the public on the basis of cash or royalty bids offered at sealed bid auctions.

The practice of the United States government since the first such sale in 1954 has been to offer relatively small quantities of offshore acreage on an irregular basis, soliciting always cash rather than royalty rate bids. In recent years, the rate at which acreage has moved to market has been accelerating. However, the average per acre bonus received by the government has also increased, partially reflecting worldwide supply conditions. The fact that bids are received in sealed envelopes has resulted in the winning bid being two, three, or several times the amount of the next highest bid.

Among criticisms of present policy is the assertion that this method of lease allocation diverts undesirably large amounts of *front-end money* into the coffers of the government landowner, money that could, would, and should otherwise be used for development of the resource itself.[2] One possible remedy would involve implementation of the existing statutory authority to substitute royalty rate bids, with fixed and presumably low cash bonuses. The problems created by royalty bidding, principally the premature shutdown effect and the potential for speculator induced misallocation of leases, have been well discussed in the literature. More importantly, they are well understood by persons influencing both public and private mineral resource management policies.[3]

An alternative proposed remedy to this same perceived problem is less well understood. Based in part on the method of lease allocation used in the offshore areas of the United Kingdom, it would allocate exploitation rights to the firm that would commit itself to spending the greatest sum in developing the resource. Sealed bids would be solicited as under the present system, but instead of cash the bid variable would be the *work commitment*. Proponents of this system claim that it will divert money the government

AGO 547005

landowner would otherwise receive via bonuses into exploration and development expenditures.[4] These additional increments of expenditure, it is further suggested, will increase future production to such an extent that the government landowner will be able to recoup the foregone bonus income in the form of the consequentially increased royalty and tax revenue. Ancillary benefits in the form of employment, resource self-sufficiency, and improved trade balances are also sometimes claimed or alluded to.

To an economist these arguments may not seem too persuasive. Nevertheless, no one appears to have devoted much effort to analyzing the economic implications of such a system, and certainly not in a form that would be comprehensive to the nonceconomist policy maker.[5] This is unfortunate not only because of the substantial public and private interests involved; the system has significant implications for minerals other than petroleum and in places other than the United States OCS. The purpose here is to provide such an analysis.

EVALUATION OF WORK COMMITMENT BIDDING

In evaluating something new the first step is usually to establish a standard against which it can be measured. In this context, the system of competitive cash bidding has long attracted economists concerned with the problem of natural resource allocation, not only as an ideal against which the performance of other systems might be measured, but as a practical and proven technique for bringing resources into productive employment.

Under an idealized competitive cash bidding arrangement, bidders determine the amount they can afford to offer for a mineral lease by a very simple process: they subtract their expected costs of extraction from their expected revenues. The resulting residual is the maximum the prospective bidder can offer for the tract without buying himself an expected loss. Competition, of course, implies that multiple firms will be preparing bids on each tract.

Assuming no uncertainty about the amount of oil to be found or the price that oil will eventually bring, and disregarding the time value of money, the firm with the lowest expected costs of extraction will be capable of submitting the highest, and thus the winning, bid. This is good from society's standpoint, since it means that the resource will be developed with the minimum expenditure of scarce goods and services. The resource's contribution to economic welfare will be greater than it would have been had the tract been awarded to any of the other, less efficient bidders.

Under a work commitment system each prospective bidder will be asking himself: What is the maximum amount I can promise to spend on the development of this tract and still expect to break even? Since any cash bonus

AGO 547006

that would have been offered to acquire a tract under the traditional system is no longer necessary, the amount of that bonus may clearly be diverted to the work commitment without raising costs beyond the breakeven point. What is not quite so obvious, however, is that the amount a bidder will promise to spend under the commitment system will exceed the sum of the cash bonus and the amount that he would have allocated to development of the tract under the cash bonus system.

This follows from the fact that any additional increment of expenditure can almost always be spent in a way that will bring about some increase in output from the tract and a corresponding increase in revenue.

This is most easily demonstrated with a numerical example. Let us assume that a prospective bidder, in determining how much of a cash bonus he can offer for an oil and gas lease on a hypothetical tract A, has calculated the relationship between expenditures on development of the tract and expected production, and that the results of his calculations appear as plotted in Figure 1.

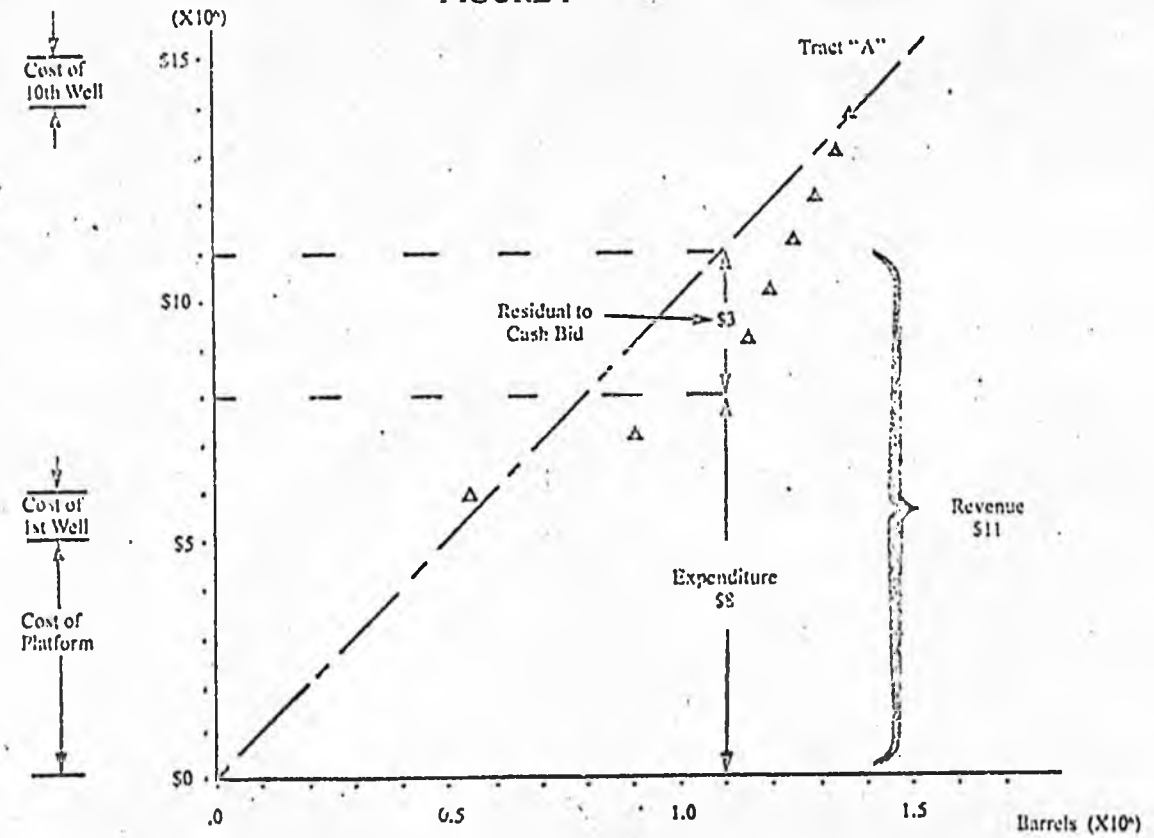
The vertical axis in this graph (and those that follow) measures dollars expended in the tract's development, dollars that we assume will be spent for construction of a platform and the drilling from it of wells. The horizontal scale measures the output that results from that expenditure, denominated in millions of barrels of oil. The relationship between those barrels of output and the revenue they bring their producer (at an assumed price of $10 per barrel) is shown, through appropriate choice of scales, by the dashed 45° straight line running upward to the right. By this means, the vertical scale can be used to show the value of output as well as the cost of production.

In Figure 1, the point closest to the origin indicates that with one platform and one well this operator would expend $6 million (vertical scale) producing an output of 550,000 barrels of oil, worth $5.5 million (determined by the intersection of the 45° line with a line drawn vertically from .55 million barrels). Moving upward and to the right, each subsequent point reflects seriatum the increases in expenditures and output resulting from the drilling of additional wells.

The general shape of the curve defined by these points is characteristic of situations where one major input to the productive process (in this case land) is held constant, while other inputs (in this case wells) are varied. The output curve originates at the lower left hand corner, but it rises vertically at first because the initial input of investment is unproductive: a platform and oil well costs a certain amount, and an expenditure of anything less than that threshold amount produces no oil. The cost of subsequent wells is assumed to be $1 million, no matter how many wells are drilled, creating a curve that looks like a staircase where each increment of cost (representing a new well) creates a new step. The fact that the staircase steepens as we move

AGO 547007

FIGURE 1



AGO 547008

to the right is a reflection of the diminishing returns, in terms of oil produced, to each additional well drilled into the fixed geographic area encompassed by the lease.

Naturally the prospective bidder will be looking for the point on this output curve that puts his costs as far below the 45° line (his output-revenue function) as possible. As shown in Figure 1, the maximum cash bid this operator could afford to make on tract A (and still expect to break even) is $3 million, which—if he is the winner—would require him to drill three wells.

Consider now the situation this bidder would face were a work commitment bidding system adopted. The question that now confronts him is: How much can I spend (or how many wells can I drill) on tract A and still break even? The answer is clearly $14 million (representing nine wells), indicated on the right side of Figure 2 by the output curve for tract A.

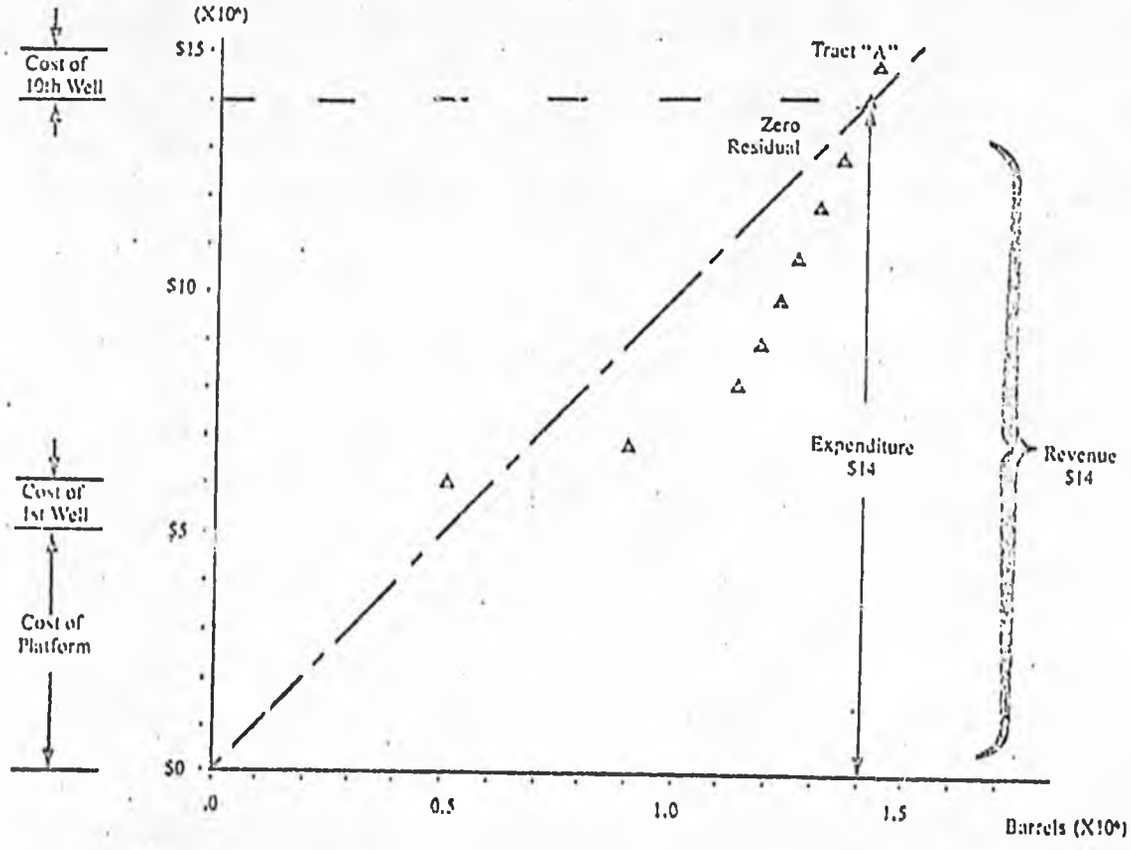
If the bidder wins tract A under a work commitment system, his oil output will be 1.4 million barrels (Figure 2) as compared to the 1.1 million barrels (Figure 1) that he would have produced had he won the tract in a cash bonus sale.

If the success of a mineral resource management policy is measured by the physical quantities of the mineral educed from the earth, the work commitment bidding is clearly superior. A resource's contribution to economic welfare, however, is not its total output (whether measured in dollars or physical quantities) but is the residual left over when the costs of all inputs to the productive process (other than the resource itself) are subtracted from the value of the outputs. In the case of tract A this residual is maximized at $3 million, when the value of the inputs is $8 million. As the input expenditure is increased above this optimum point, the residual—the resource's potential contribution to economic welfare—is gradually dissipated until, at the point where the value of inputs reaches $14 million, there is no more residual left to be dissipated.

In this particular example, the increase in output that would result from a switch to work commitment bidding ($3 million) happens to equal the amount of the residual. This coincides with the fact that the expenditure of each additional $1 million above $8 million (three wells) contributes exactly $500,000 to revenue. If the incremental contribution of the fourth and succeeding wells were greater, for example $750,000, the slope of the output curve traced by these points would be flatter, as shown by the squares in Figure 3, and the increase in production from a switch to commitment bidding would be much greater. To put it another way, it would take twice as large an increase in expenditure to dissipate the $3 million residual.

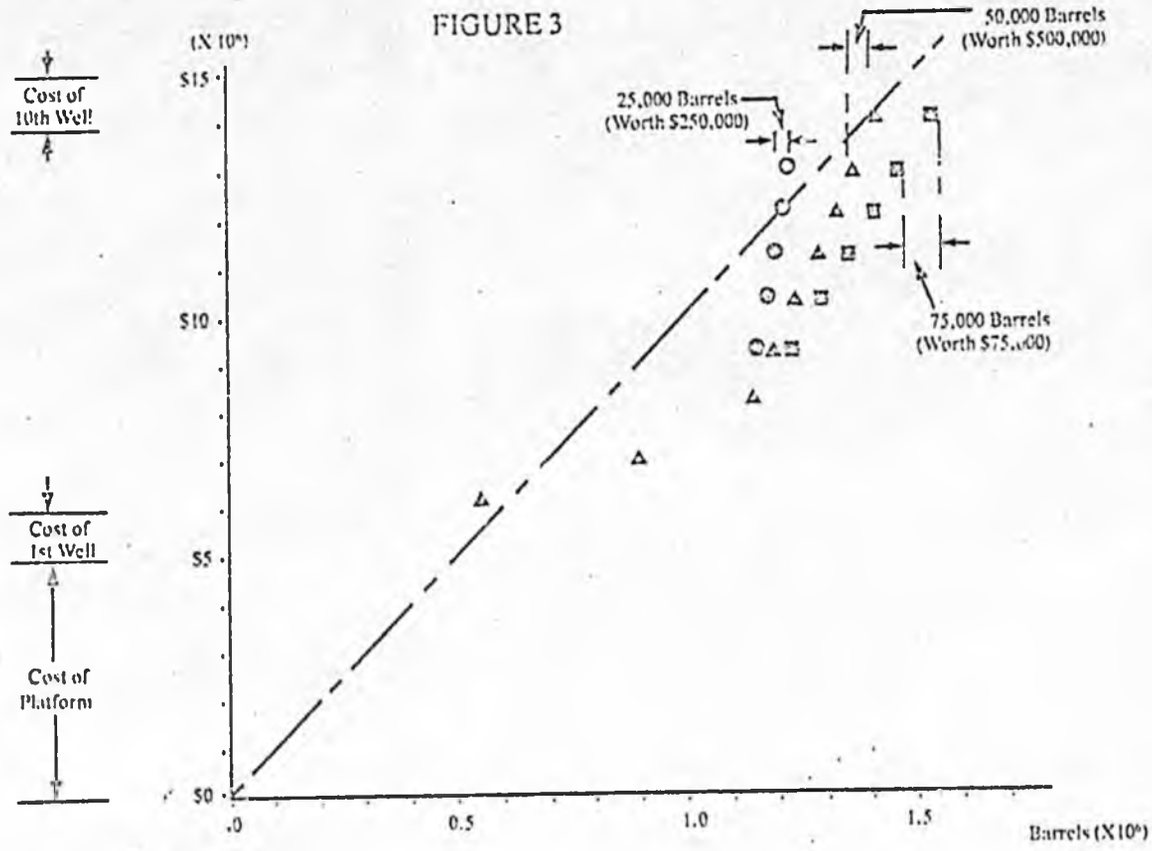
AGO 547009

FIGURE 2



AGO 547010

FIGURE 3



AGO 547011

On the other hand, a smaller incremental contribution to output and revenue by the fourth and succeeding wells (for example, an increase of only $250,000 in revenue for each $1 million well) would trace a steeper curve such as the one defined by the circles in Figure 3. The addition to revenue would clearly be less than the $3 million residual sacrificed to obtain it, which is another way of saying that the increase in production would be worth less than the bonus bid sacrificed to obtain it.

TRANSFERABILITY OF COMMITMENTS

Clearly the previously discussed simple work commitment bidding system results in more intensive development of the tract to which it is applied. Clear also is the fact that this effect is dependent on the characteristics of the tract to which it is applied, and in particular on the efficiency with which the successive increments of additional expenditures required under the commitment can be put to work to increase output.

One way to increase this efficiency is to allow an operator who assumes a work commitment in the course of acquiring a particular tract to fulfil that commitment through expenditures on a different tract or tracts.

For example, assume that a bidder has acquired both tract A and tract B as shown in Figure 4. If the work commitment assumed in order to acquire a tract must be fulfilled on that same tract, then his maximum commitment on A (Figure 2) is $14 million; and on B (as indicated in Figure 4 by the dashed lines) it is $8 million. Total output from the two tracts will be 2.2 million barrels.

TABLE 1

WORK COMMITMENT BIDDING

	Output (bbl's)	Revenue ($)	Expenditure ($)	Residual ($)
Tract A	1.4	14	14	0
Tract B	0.8	8	8	0
	2.2	22	22	0

Note: All figures in millions

If the operator is allowed to bid on the two tracts jointly or is otherwise permitted to shift a commitment made to acquire one to the other, then his total work commitment will rise to $24 million, with a corresponding increase in output. As shown in Figure 4, this is possible by operating tract A at the point on the output curve which produces the greatest residual and by transfering that residual, as an internal subsidy, to tract B, where, as indicated by the flatter slope of the output curve, it can be utilized more efficiently. The numbers are summarized in Table 2.

AGO 547012

	2.4	24	24	0

Note: All figures in millions

EXTENT OF DEVELOPMENT

In the above examples work commitment bidding has been shown to result in a more intensive development of tracts than would be obtained under cash bidding arrangements. If commitment transfers are permitted among tracts, such a system will also bring about more extensive development.

Consider the output curve of tract C in Figure 5. Tract C is clearly something of a "dog," because there is no point at which the output function crosses the 45° "breakeven" line. Under cash bidding, tract C would elicit no interest at all; even if given away free, it would not be developed.

Under a work commitment system, however, tract C may very well be acquired and drilled. Assume that a firm has already acquired tracts A and B as a package with a work commitment of $24 million and that neither tract has yet been drilled. The firm is now offered tract C. How much of a work commitment can the firm offer for it?

The firm had previously planned to use the $3 million residual generated on tract A to internally subsidize tract B. If tract C is added to the inventory, the firm could apply to C $1.5 million of the internal subsidy that would have otherwise gone to tract B and thereby make the development of tract C a feasible proposition. The calculation is shown in Table 3.

TABLE 3

WORK COMMITMENT BIDDING
(Internal Subsidy Allowed)

	Output (bbl's)	Revenue ($)	Expenditure ($)	Residual ($)
Tract A	1.10	11.0	8.0	3.0
Tract B	1.05	10.5	12.0	(1.5)
Tract C	0.75	7.5	9.0	(1.5)
	2.90	29.0	29.0	0

Note: All figures in millions

AGO 547014

commitments indicates that the last dollar of subsidy transferred is producing only 33 cents worth of additional oil, it may very well be that another source of oil development—for example, tar sand or oil shale—could be found that would give a better return.[6]

THE TIME FACTOR

To simplify the discussion of the work commitment system, the time dimension of both expenditures and income has thus far been ignored. Since a dollar in hand today is worth more than the promise of a dollar tomorrow, it has been assumed that all bidders have used a discounting mechanism to take account of the time value of money. Thus, they would reduce all amounts of both expenditure and income streams to their *present value*, that is, the lump sum that the bidder would be willing to receive or give in exchange for the specified income or expenditure stream.

If a work commitment system is to be implemented, it will be necessary to take careful account of the fact that a commitment fulfilled in the next year will have a very different impact on output from one of the same amount fulfilled ten years hence.

If the public is going to give up its bonus income to subsidize output, the time when that subsidy takes effect will presumably make some difference. Of course, some arbitrary time limit could be established for the fulfilment of commitments exactly as the United States government sets the five-year term on the OCS oil and gas leases it sells. If free exchanges of commitments are allowed, anyone who wished to distribute expenditures over a time frame incompatible with his commitments could simply enter the market and adjust his inventory of commitments accordingly.

Another way of handling the problem would be simply to apply some appropriate interest rate to every commitment assumed and specify that the amount of expenditure required under that commitment must increase by the amount of the compound interest accumulated in the period between the assumption of the commitment and its fulfilment.

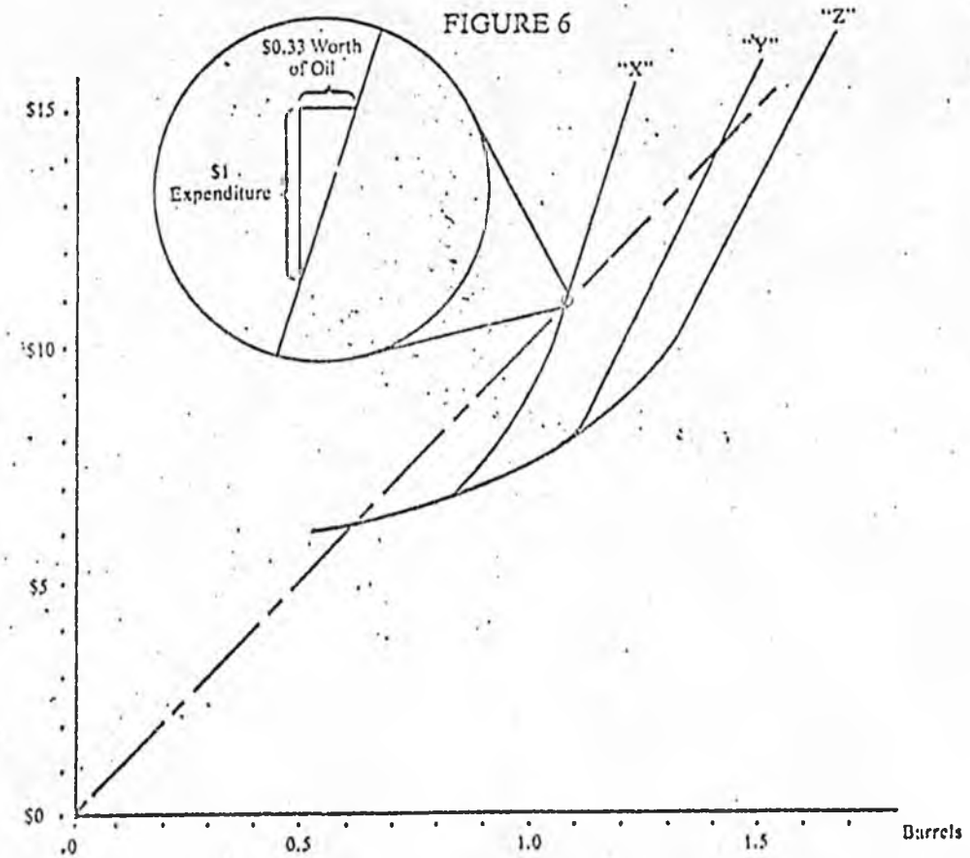
CONCLUSION

The adoption of a work commitment bidding system implies a judgment that existing institutions for private exploitation of public resources result in a suboptimal rate of resource development.

Any argument for the adoption of such a system must first establish that this is in fact the case. Secondly, it must prove that the work commitment approach is the least costly method of achieving the desired higher rate of exploitation.[7]

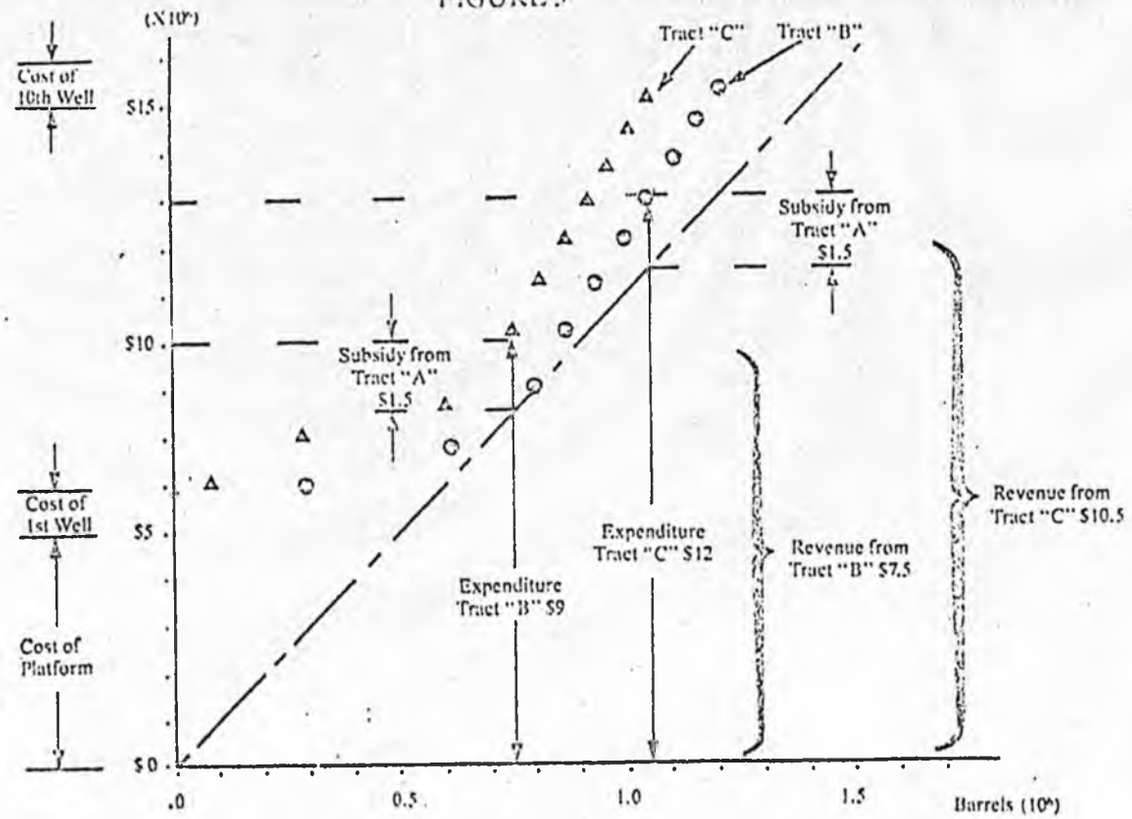
AGO 547015

FIGURE 6



AGO 547016

FIGURE 5



AGO 547017

Development of the three-tract package under the work commitment system will be feasible with a total expenditure of $29 million. Since he has already been committed to spending $24 million of this, in the course of acquiring tracts A and B, the maximum commitment bid this operator can afford to make on tract C is $5 million.

Besides illustrating the mechanism through which commitment bidding induces more extensive resource development, the tract C example also indicates how the system (with internal subsidies allowed) may work to the advantage of the firms that can acquire the most tracts. Theoretically, a newcomer with no existing inventory of tracts would be unable to make any commitment bid on tract C.

A way of evading this problem would be to make the commitments transferable. This would allow operator Jones to legally assume the obligations to which operator Smith has committed himself in the course of acquiring tracts from the government. Presumably, operator Smith would pay Jones for the favour.

The prospective bidders in these examples have been endowed with the ability to foresee accurately and precisely the output curve associated with every tract. In practice this is not the case. If there is any characteristic that sets the exploration phase of the petroleum and mineral industries apart from other businesses, it is the everyday uncertainty with which its participants must learn to cope. It is perfectly possible, for example, that Smith might acquire tract C with a work commitment bid of $14 million on the mistaken belief that its output curve is that of tract A. After building a platform and drilling the first four wells, the true shape of the curve—and the firm's predicament—would reveal itself. The required $14 million expenditure applied to tract C would leave Smith with a net loss of about $4 million. If he could somehow shed $5 million of the $14 million commitment, Smith would be able to operate the tract with only four wells already drilled and thereby cut his losses to the more acceptable level of $1.5 million. Smith would be willing to pay up to $2.5 million in cash to unload the $6 million obligation, since that is the amount of his maximum additional loss if he can't get rid of it.

Any other operator who is facing or expects to face an output curve with a flatter slope than that faced by Smith will be able to make a mutually beneficial deal with him, since, for the other party, an additional expenditure of $5 million will bring in more than the maximum $2.5 million that Smith will be willing to pay.

Besides putting the small firm in a better position to compete and mitigating the problems of uncertainty for all firms, large and small, a system which allowed the free exchange of work commitments would have the further and more important advantage of maximizing the overall

AGO 547018

efficiency with which work commitments are utilized. To the extent to which such a market was effective in bringing potential commitment offerers together with potential commitment takers, it would ensure that everyone would be operating at a point where a small increase in expenditure by one operator would produce no more and no less additional revenue than would the same increase applied to any other operator.

A minor but interesting benefit of a market in commitments would be the information it would provide concerning the efficiency with which the work commitment system is eliciting additional output.

This can be understood by applying the concept of the output curve (hitherto used in relation to individual tracts) to the entire universe of tracts being offered under the commitment bidding system. By combining all such tracts and treating them as a single entity, an overall output curve similar to Figure 6 can be drawn. Just as in the case of an individual tract, the point where the curve dips farthest below the 45° breakeven line will be the optimum operating point, the point which results in the resource's largest contribution to economic welfare. The distance between the breakeven line and the output curve at that point is the measure of that contribution, and it is equal to the income that would come to the government landowner were a competitive bidding system utilized. It is this residual—the difference between total revenues and total costs—that the public will be sacrificing to subsidize output.

The efficiency with which the subsidy provided by the work commitment system works to increase output will be a function of the output curve's shape to the right of the point where bonus income would be maximized. Three hypothetical configurations for this part of the curve are shown, and the difference this shape makes to the level of additional output educed by the sacrifice of the residual can be seen. The significance of the price at which commitments change hands will be determined by the slope of the output curve at the point where it intersects the 45° breakeven line. Curves Y and Z both cross at an angle which indicates that, at that point, $1 of expenditure produces $0.50 worth of additional output. In either situation the market price for assumption of a $1 million commitment would be $500,000. Curve X, however, crosses the line at a steeper slope (as shown in the inset), indicating that $1 of expenditure will produce $0.33 worth of additional output. If curve Z accurately represents the overall output curve, the market price for the assumption of a $1 million work commitment will be about $333,000.

From a policy standpoint these numbers, whatever they may be, have considerable significance since they can be used to compare the efficiency of the work commitment system in eliciting additional output with whatever other alternative policies may be available. For example, if the market for

AGO 547019

In comparing various alternative ways of achieving higher output against the work commitment system, some important features of that system are certain to stand out. First, and probably most significant, is the simple fact that the work commitment system results in a subsidy. As such, the criteria for its evaluation should be no less stringent than those applied to a direct appropriation of public funds or a tax concession adopted for the same purpose.

Secondly, the cost of the subsidy conferred under the work commitment approach is impossible to determine *a priori* and difficult of determination after the fact. If there exists a "right" level of subsidy it will be mostly a matter of luck if the foregone public revenue happens to equal that amount. For similar reasons, the benefits of the subsidy in terms of the total increase in output, development, or whatever, are not amenable to accurate quantification. As a consequence, it is doubly difficult to evaluate the system's relative efficiency.

Finally, a properly designed work commitment system allocates the uncertain amount of the subsidy in a fashion that tends to squeeze the maximum additional output from every dollar of subsidy. It does this more or less automatically. This characteristic means that the transfer of resources occasioned by the subsidy needs no affirmative action on the part of policy makers—as does a direct appropriation of public funds—in order to be continued. This fact, however, combined with the intrinsic uncertainty concerning the subsidy's magnitude makes it easier for vested interests to perpetuate such a subsidy long after any real justification for it has passed.

AGO 547020

4. Arguments for the work commitment system are expounded in detail in I. White, D. Kash et al., *North Sea Oil and Gas: Implications for Future United States Development* (Norman: University of Oklahoma Press, 1973).

5. Kenneth Dam has touched on some of these matters, however, in "Oil and Gas Licensing in the North Sea" *Journal of Law and Economics* 8(October 1965) and "Pricing of North Sea Gas in Britain," *Journal of Law and Economics* 13 (April 1970). Dam recognizes the subsidy for what it is and concludes that it is unjustified.

6. If it is determined that only a portion of the residual should be applied as a subsidy, this could be accomplished by offering only a portion of the tracts on the commitments bid basis, but allowing the fulfillment of a commitment on any tract acquired from the government. Since the reduction in the subsidy will move the operating point to the left on the output curve (Figure 5) to a point at which its slope is flatter, the result will be a higher assumption price for commitments. The commonsense explanation is that the optimum amount of total expenditure will be reduced only slightly; but that acreage over which commitments that can be fulfilled by that expenditure will be reduced relatively more. Another alternative would be to combine the work commitment system with a royalty, net profits share, or other form of deferred rent collection. This is in fact the arrangement pertaining in the North Sea sector. If the government takes a very high net profit share, the amount of the subsidy will be substantially reduced.

7. There are certain circumstances where a work commitment system could result in no more extensive or intensive development. This would be the case if the commitment were devoted to an activity not contributing to output. For example, if a government awarded a mineral concession to the operator who promised to build the largest smelter, no increase in mine output would result (unless the location of the smelter made lower grade ores profitable to mine).

Petroleum Leasing in British Columbia

DALE R. JORDAN

FACTORS AFFECTING THE LEVEL OF EXPLORATION

From data published by the provincial department of mines and petroleum resources, it would seem that exploratory drilling in British Columbia in 1974 was in a static position and may even have been declining. There was a 22 per cent drop in the number of exploratory wells drilled in 1973 compared with 1972, and a corresponding drop in the footage drilled. This decline in activity appeared to be continuing into 1974, with drilling down 10 per cent in the first seven months. This apparent decline in exploration for oil and gas in British Columbia came at a time when the demand for oil and gas was high. Prices for oil and gas had increased dramatically, and considerable concern was being expressed over national self-sufficiency in all forms of energy supplies. By comparison, exploration activity in Alberta showed the opposite pattern. In Alberta, exploratory drilling in 1973 increased 50 per cent over 1972. Statistics published by the Daily Oil Bulletin showed that during the first several months of 1974 there was a further increase over the same period in 1973.

What caused the static or possible decline of exploratory drilling in British Columbia at this particular period of strong demand and high price? There are several answers, and formulated theoretical solutions must be viewed in the light of political judgment where governments demand a greater share of resource revenues. Certainly, the federal budget proposals in the spring of 1974 discouraged exploration for oil and gas in Canada; however, it would seem that provincial government policies were largely responsible for any discouragement felt by the oil and gas explorer.

In this article I attempt to set out some of the basic causes that contributed to the 1974 situation in British Columbia. These causes are identified and any suggested solutions are offered in the realization that there is a danger of oversimplifying complex problems and the possible effects of implementing partial solutions.

For any analysis to be meaningful, a proper perspective must be maintained. One of the overriding factors influencing the oil and gas explorer's decision making is the number of geological prospects. In British Columbia, the potential hydrocarbon-bearing portion is thought to be

AGO 547022

restricted to the northeast part of the province. The western boundary of this 51,000 square miles is the Rocky Mountains. In 1974, an estimated 32 per cent of the oil and 18 per cent of the gas in this area had been found, leaving an estimated 0.82 billion barrels of oil and 47.56 trillion cubic feet of gas still to be discovered. Although there was considerable potential still remaining for the oil and gas explorer, the area was small compared to Alberta and Saskatchewan, and it was much smaller than the vast geological potential north of the 60th parallel.

Another factor that depressed the enthusiasm of the explorer was the apparent lack of multizone prospects. Drilling a well to test only one potential horizon increases the risk factor significantly.

Before leaving the subject of the province's hydrocarbon potential, it should be remembered that several basins existed, both offshore and in the interior, containing substantial deposits of sedimentary rock that have not been explored to any great extent. Generally, the known geology in these basins discouraged any extensive exploration. Possibly, the very expensive exploration needed in the basins required special consideration before their potential could be fully realized. This special consideration might take the form of a reduced royalty on any hydrocarbon discovered, or of a joint participation scheme whereby the British Columbia government might share in the risks involved.

Another factor to be taken into account by the oil and gas explorer when selecting his areas of interest is the access to those tracts that he feels have hydrocarbon potential. Again, British Columbia was at a disadvantage in 1974 when compared with Alberta and Saskatchewan. Access to this already restricted basin area was affected by muskeg conditions over much of the plains and by deep river valleys in the foothills. These conditions involve greater expense in conducting exploratory work, and the oil and gas explorer would often be confined to only a four-month work year, because of such terrestrial conditions. The problem of limited access presents a very real constraint on attracting the oil and gas explorer and is relevant when considering any changes in land tenure and revenue sharing.

Another important parameter in any deliberation affecting oil and gas exploration is the availability of funds for exploration.

As a general rule, funds generated from production are used to finance exploration. It seems that the risk factor employed by financial institutions effectively discourages the use of debt capital as a source of exploration funds. It is not uncommon to read that an oil and gas producer has arranged for a substantial loan, but this will nearly always be for a specific purpose related to the development of a new reservoir of oil or gas. The discovery of this reservoir would have been funded out of the company's cash flow.

AGO 54?023

When an oil or gas explorer's cash flow comes from production outside any particular province, then for money for exploration to flow into that province, that jurisidiction must have a framework of leasing and revenue sharing that can favourably compete with other areas also requiring exploration.

It would seem that cash flows from Canadian production will continue to be a major source of exploration funds. In the case of the integrated companies (those having refinery capacity), this will be true under almost any condition short of expropriation.

However, within this framework these funds will generally gravitate to where they can expect the greatest return. It may not be enough for a province to show that it will ensure that the successful explorer will receive a reasonable rate of return. It may well be that the successful criterion for increasing the level of exploratory drilling will be a division of revenues such that the oil and gas explorer will have a sufficient cash flow for an active exploration programme, as compared with other jurisidictions. The explorers who have a cash flow generated from production and the flexibility to determine the best place to reinvest these funds have the responsibility of ensuring that they can go to where they can expect to return the greatest profit.

The ability of the producer to channel cash flow from one jurisdiction to another depends largely upon the particular laws in force where the oil or gas is being produced. The provinces of Alberta and Saskatchewan tend to attempt to discourage the outward flow of funds generated from production in their particular provinces. In both provinces, this discouragement took the form of a high royalty, coupled with a drilling incentive programme, designed to encourage continued exploration.

In Saskatchewan, the mineral tax and the royalty surcharge took away from the producer all of the recent price increases and, in fact, returned to the producer a smaller amount per barrel than he was receiving prior to the price increases. As an inducement to continued exploration in Saskatchewan, an incentive programme was developed, whereby the producer was allowed to retain an additional 30¢ for every barrel produced, providing this money was used for drilling wells, for waterflood projects, research, and other specified purposes in Saskatchewan. This incentive had not been in effect long enough in 1974 to permit a complete analysis of its performance; however, it was really restricted to only those companies that already had production in Saskatchewan. A review of these companies shows that the producers with the majority of the production were the so-called Majors, which raised the question as to whether or not these Majors were prepared to continue to explore in Saskatchewan under any conditions. It is more probable that the exploration philosophy of the

AGO 547024

Majors directed that they use their exploration funds searching for high reserve reservoirs (which generally means exploring outside Saskatchewan).

To encourage explorers who do not have production in Saskatchewan, the government provided an incentive credit of about 30 per cent of the costs of drilling exploration wells. This credit could then be used to reduce any royalty or mineral tax obligations that may accrue.

In Alberta, in 1974, there was also an incentive programme for exploration drilling. This incentive took the form of a credit which could be subsequently used to satisfy most of the cash obligations that may arise by virtue of the royalty obligation, rental payments and mineral taxes, and could also be used to purchase oil and gas leases. Credits established in Saskatchewan could not be used to purchase leases. The formula which determined the amount of credit that could be established for any particular exploration well was predicated upon the area of the province in which the well was located and the depth of the well. This formula was expected to return to the explorer by way of credit approximately one-third of his drilling costs.

The principal producers of crude oil in Alberta were much the same as in Saskatchewan—they were the Majors in the oil and gas industry. Again, as in Saskatchewan, it would seem that the interest of the Majors in continuing to explore in Alberta had become blunted, not because of any particular rules, but more through the apparent lack of sufficient high reserve potential which this type of company must search for.

In Alberta, in 1974 the royalty was structured to increase not only when the production increased but also when the price increased. Alberta had also adopted a new oil/old oil concept, whereby royalties were considerably reduced on what was termed new oil, which, of course, had the affect of increasing the producer's cash flow and encouraging the development expenditures. This old/new concept applied as well in the case of natural gas. Saskatchewan also had provision for a reduction in its mineral tax and royalty surcharge for new oil. This reduction was gradually phased out after a few years. Alberta, in 1974, had the lowest rate of royalty on oil and gas, received the highest price for its natural gas and had a price for crude oil equivalent to the other provinces, all of which means that in Alberta the producer of oil and gas received a higher rate of return and, consequently, had more money available to him for exploration purposes than the producer in Saskatchewan or British Columbia.

While the incentive programme adopted in Alberta and Saskatchewan offered encouragement to drill exploration wells, any analysis of the performance of a similar programme which might be suggested for the province of British Columbia must be coupled with the consideration of a lower royalty and subsequent higher cash flows to the producer.

AGO 547025

This type of incentive can only be effective if the producer is also offered a return on his development expenditures that is competitive with other jurisdictions into which the oil and gas explorer is free to go.

Another source of money for drilling exploratory wells previously used in North America has been the drilling fund. The drilling fund usually takes the form of buying a number of shares in a limited partnership. The attraction to the investor apart from the possibility of participating in oil and gas discoveries, is the income tax feature in the United States which permits all intangible drilling expenses to be written off in the year that expenditures were made. This can be done without qualifying under any principal business rules, as prevails in Canada. It is this principal business rule that has to the present time precluded the tapping of a similar source of exploration funds in Canada.

It is estimated that between 250 and 400 million dollars are generated annually through the sale of shares in drilling funds in the United States. The United States government, in an attempt to encourage further exploration within its own borders, has chosen to reduce the amount that can be written off against income for income tax purposes when the funds are spent outside the United States. This move precipitated the drying up of exploration funds in Canada which previously came from this source.

Over the past few years other extractive industries, particularly mining, have been channelling considerable amounts of their cash flows into oil and gas exploration. These endeavours have usually taken the form of funding a subsidiary company. The continuation of this type of fund for the purposes of exploring for oil and gas will depend upon the success of the subsidiary companies and also upon the influence that mining taxes will have upon the parent companies' cash flows.

A few years ago it was quite popular for large United States gas utility companies to provide exploration funds on the basis that they would have first call on any gas produced and exported for sale to the United States. This source of exploration funds has also dried up almost completely as a result of decisions by the National Energy Board concerning the exporting of gas and, as a result of rulings by the Federal Power Commission in the United States, which have not allowed these utility companies to include these expenditures in their rate base. The Federal Power Commission looks upon this type of exploratory funding as a mortgage loan, rather than as a prepayment for gas, as the utility companies would prefer.

THE LEASING SYSTEM

The 1974 system of leasing in British Columbia will now be reviewed, and I will attempt to analyse its effectiveness in relation to the relatively small

AGO 547026

hydrocarbon potential area, lack of access, difficult terrain, and exploration funds generally coming from cash flows.

The system of granting oil and gas rights on crown lands in British Columbia invoved in 1974 an exploration grant called a "permit," a subsidiary exploration grant called a "drilling reservation," and a development grant called a "lease."

Permits, which can involve upwards of 100,000 acres, could only be acquired through a competitive cash bidding system at sales which were usually held four times a year.

The permits were classified from A to D, depending upon their accessibility and the terrain conditions. The class D permits were for offshore areas. One purpose for classifying permits was to allow them, where the working conditions were difficult, to have a longer life than was otherwise provided.

Permit classification also determined the minimum amount of work the permit owner was obligated to spend in any year. These minimum work obligations were more stringent for the Class A permit, where access and terrain problems were minimal. The significance of this particular requirement was lost because, in order to conduct an equivalent amount of exploration, particularly drilling, the costs involved in the offshore areas far exceed those which would be expended on a class A type permit. The sections of the Petroleum and Natural Gas Act that governed the permit work obligations did not specify any specific exploration programme, but only that a certain amount of money be spent during each term of the permit. This obligation to spend money in exploring on a permit could be satisfied by grouping several permits together, so that expenditures incurred in exploring on any one permit would satisfy the work obligation of the grouped permits. This grouping provision is important because it allowed an explorer to acquire large tracts of land for a short period in order to conduct extensive geophysical exploration.

This obligation to spend money on exploring on a permit could also be satisfied by paying the money to the British Columbia Crown. This would seem to be about as negative a provision as one could imagine, assuming, of course, that the government of British Columbia was interested in ensuring that the companies holding permits were the ones prepared to actively explore. If the removal of this system would give rise to problems, as in the case of an explorer unable to work a permit through no fault of his own, then a far better system would be to provide a means where work obligations could be accumulated and satisfied in the following year.

Permits were valid for one year and could be renewed annually, for a period ranging from five to eight years, providing the company was not in default.

AGO 547027

When a permit holder had expended the minimum amount of money exploring on a permit or group of permits or had paid the money to the government, he was entitled to convert the permit into leases. To do this the permit holder had to relinquish 50 per cent of the land back to the Crown. Land selected for conversion into leases could not be in a consolidated block, but had to be in a number of leases, which had to corner one another, or be separated by at least two units—approximately one mile. The maximum size of the lease was six units—approximately three miles square.

This system of exploratory permit and subsequent conversion of half of the land to lease on a chequerboard fashion was similar to that used in Saskatchewan and part of Alberta. The system probably had its beginning in Alberta. It was designed to ensure that when crude oil was discovered, the Crown would be returned some prospective areas which were subsequently sold. This system worked reasonably well, particularly in Alberta, where some substantial discoveries of crude oil were made during the existence of the exploration agreement. Unfortunately, in the vast number of cases a discovery was not made, and the chequerboard pattern for leases led to fragmentation of rights throughout the area formerly comprising the permit. This effect tended to discourage other explorers from entering the area, and this system of selecting leases also prompted the need for the drilling reservation, which generally covered that 50 per cent of the land returned to the Crown.

Seemingly, in those parts of the province having relatively easy terrestrial access and where the potential hydrocarbon-bearing formations were not too deep, this system of chequerboard leasing may be satisfactory. However, in areas where access is a major cost and where deep expensive drilling is required, it tended to discourage anyone other than the holder of the 50 per cent leases from entering the area to explore. Certainly in offshore areas where seabed drilling cost is many times greater than land drilling, this system of lease selection is most unsatisfactory.

Leases granted on crown land in British Columbia in 1974 had a primary term of ten years, renewable for further ten-year periods if particular circumstances existed which generally related to production.

The acquisition of leases in British Columbia was handled in 1974 in two separate ways. First was the way previously mentioned, which was the result of having a permit and then earning the right to acquire leases of 50 per cent of the land. The second was through the competitive cash bidding at one of the quarterly sales held by the British Columbia Crown.

There was no obligation at that time on the part of the lessee to drill a well during the initial term of the lease. A 1974 amendment to the Petroleum and Natural Gas Act, however, permitted the minister to forward a notice to

AGO 547028

drill when he considered that development of the lease was not active enough. This amendment seemed to suggest that before the minister would consider sending a notice, there would, in fact, have been a discovery made on the lease. Thus, in sending the notice, the minister was merely requiring development drilling. It seemed most unlikely that the wording of this section would be interpreted such that the minister could require exploratory drilling on existing leases.

There was an apparent trend to shorten the term of leases, with Saskatchewan granting only five-year primary terms. However, in British Columbia the term of 10 years was not excessive when one considers the short period of four to five months when work can be done in the area of hydrocarbon potential. This is quite different from most of the areas in Alberta and Saskatchewan, where drilling and other geophysical operations can be conducted all the year round.

The government of British Columbia appeared to feel that a large number of leases were held by companies not particularly active in exploring in the province and that something should be done to discourage these holdings, so that lands could be offered to others who were prepared to explore. These feelings may have promoted some of the 1974 changes in the Petroleum and Natural Gas Act, whereby the rental on leases was increased from one dollar an acre to two dollars an acre. The effect of this change seemed likely to be the return to the Crown of some acreage which, under the previous rental of one dollar an acre per year, would have been retained by the lessee. However, one must assume that for the most part relinquished leases would be the least attractive, and leases with potential, even though the lessee was not prepared to conduct any immediate exploration programme, would be retained, and the two dollars an acre would be paid. The greatest effect that this rental of two dollars an acre per year seemed likely to have was to deter other explorers from entering the province. It is one thing to create a system designed to discourage excess holdings by companies not prepared to explore immediately, and quite another thing to expect these same rules to promote the entry of new companies and increase exploration activities.

The royalties on crude oil in British Columbia were essentially the highest in Canada in 1974. The rate was 40 per cent for a well producing 1,000 barrels a month and further escalated to about 58 per cent when the monthly production reached 10,000 barrels. It would seem that this royalty level, which directly affected the producer's cash flow, could only act as a deterrent to increasing the level of exploration in British Columbia much beyond its historical pattern of about fifty to sixty exploration wells a year. Other changes that may be made in regulations designed to encourage greater exploration activity will never perform to their full potential until

AGO 547029

the producer's return is comparable with what he can obtain in other jurisdictions.

GOVERNMENT OPTIONS

We can now examine the options available to the British Columbia government in 1974. First, the government could maintain the existing regulations without change; or they could have stricter enforcement of the rules, further reducing cash flows to the producer, making it more difficult to operate; and thirdly, they could make changes designed to encourage greater exploration activity in the province. In each of these options it is assumed that some accommodation could be made between the provincial and federal authorities with regard to the revenue-sharing aspect. If it could not, then it would seem almost certain that exploration activity would decline, not only in British Columbia but also in the rest of Canada, and that even significant changes in the regulations would fail to act as an effective inducement to continued exploration.

In the first instance, if the government were to resist changes to its rules and to continue the existing level of royalty, it could expect to receive about the same amount of exploratory drilling as there has been in the past. This is evident from the sale in August 1974, where some 7.2 million dollars was paid for the right to acquire oil and gas permits, drilling reservations, and leases. This was certainly an indication that the oil industry was not prepared to write British Columbia off because of its high royalties and rather stringent regulations. There are several reasons for this. Companies have enjoyed a general increase in their cash flow, and in 1974 enough cash flow was available to pursue exploration in a province where the rates of royalty would reduce their return on invested capital as compared to other jurisdictions—for example, Alberta or the United States. The intensive competitiveness in the oil and gas industry distinguishes it from all other industries. Companies that have invested a great deal of time and money developing the geological potential of a particular area and have found that it fits their exploration parameters are prepared to offer a good deal of bonus money when this land becomes available through a competitive sale. Also, because a number of years usually elapses between acquiring an exploration permit and the development of and production from any discoveries, the economic climate may change such that what at one time is not attractive may become economic at the time of production.

If the government of British Columbia wished to discourage continued exploration by the existing oil and gas explorers and to discourage entry by newcomers, they could most effectively do this by again raising the rates of royalty and making the tenure of agreements shorter than they were. This

AGO 547030

type of action would cause the companies exploring in the province and those contemplating doing so to restrain their activities; exploration would then stagnate.

Presumably, such action by the British Columbia government would not occur without consideration of these consequences and the recognition that a different vehicle should enter the void left by the existing explorers. This could take the form of a public company, such as the British Columbia Petroleum Corporation; alternatively, the government might feel that, given time, the major oil and gas producers, the fully integrated companies, may finish their exploration for high-reserve reservoirs in other parts of Canada and be prepared to return to British Columbia to look for the remaining reserves which they may need to supply their refineries.

To give any support to this latter proposition, one would have to presuppose that the exploration presently being carried on by the Majors in Canada in the Northwest Territories, in the Arctic Islands, and in the offshore areas of eastern Canada will be unsuccessful and that they will have to lower their sights, accept a lesser prospect, and return. This is very difficult to support, considering the successes already achieved in the Northwest Territories, particularly in the Delta, and in the Arctic Islands. Also, there is a vast geological potential remaining as assessed against the very few wells that have been drilled.

The supposition that a provincial public corporation could enter the exploration field and its endeavours be more beneficial to the province than the present system raises many questions about the corporation's practical efficiency and about the possible political repercussions. This article's purpose is not to examine the political repercussions that might occur when dry holes are drilled with public funds; however, we should examine some of the practical considerations involved in the operation of a public company which has an almost exclusive area within which to explore as a result of discouraging the private sector. For the government to discourage both the existing explorer and the entry of any new ones and to expect the public corporation to be able to fill this void suggests that the government is saying, "If the private companies do it, so can we." Now remember that the private companies comprise all the oil and gas explorers working in the province and those contemplating doing so, given the right opportunities. All these companies have geological staffs, many of whom will be geologists who devote most of their time over a considerable number of years entirely to the study of British Columbia's geology. The public corporation could not expect to have such an extensive source of expertise as that available in the free enterpris system. And so the public corporation would suffer from a reduction in the number of ideas generated.

It is not unusual in oil and gas exploration, with its inherent problem of

AGO 547031

scientific interpretation and evaluation of geological prospects, to find that one company will acquire a block of land, will explore it, and perhaps even drill on it before deciding the search is unsuccessful. The company will then return the land to its owner, the Crown. This does not mean that there are not any commercial hydrocarbons underlying this land; but rather that that particular company was unable to find them. To find these hydrocarbon deposits, a second, a third, or a fourth company should acquire this land, and, if this is done often enough, the hydrocarbon will be encountered, and production will follow. The problem with the public company being the only explorer in the province is that, unless it is fortunate enough to make the initial discovery, it is very doubtful whether there would be enough enthusiasm to have a second, third, or perhaps even a fourth try at that particular prospect, with the result that the discovery would not be made. This is surely the worst thing that could happen and is probably the most damning argument against a public corporation moving into an area with an almost exclusive right to explore.

If the British Columbia government wishes to increase the level of exploration in the province and so lead, hopefully, to a greater number of discoveries and a better position of self-sufficiency in their own requirements, there are several measures which could be taken to promote such a situation.

The first step that can and must be taken is to increase the cash flow to the producer and to assure the newcomer that if he makes a commercial discovery, he will receive a sufficient return to expand his exploration endeavours in the province. This action should take the form of restructuring the royalty on oil and probably renegotiating the contracts on gas existing between the producer and British Columbia Petroleum Corporation. The 1974 royalty rate on oil was determined by production at the wellhead, with the price not being a factor at all. This means that if the price paid to the producer for a barrel of crude oil should decrease from the present level, then the producer will suffer a decrease in his cash flow, thus his future available financing to continue exploration endeavours in British Columbia will be diminished. A preferred structure on royalty would take into account the possibility of a rising and falling price for the product so that the producer, out of whose cash flows exploratory drilling is carried out, would be the last one to suffer in the case of a decrease in price for both oil or gas. Probably this might best be accomplished by the producer selling his crude oil to the British Columbia Petroleum Corporation in the way gas is sold, but with a better pricing adjustment mechanism than that which exists with the gas contracts.

Another measure that should be taken would be a redesigning of the exploration agreement. This could be done to ensure that the holder could

AGO 547032

only earn leases after he had conducted actual work on the permit or in the area within reasonable proximity, and that his earnings would be restricted to a consolidated block rather than come from a sprinkling of leases throughout the permit area. This feature alone would help to ensure exploration, because the permit holder must be satisfied that he is getting, at least in his mind, the right half of the permit under lease.

The manner of acquiring oil and gas rights should be reviewed. As mentioned previously, the only method of acquiring an exploration permit under the present rule is through a competitive cash bidding system usually held on a quarterly basis. There are probably several instances where an oil and gas explorer would have been quite prepared to drill wells in British Columbia if he could have acquired the land for a minimal amount rather than having to use money he would put into exploration to purchase land through the cash bidding system. The rentals and fees charged should be the same as in Alberta, if only to appear competitive in this particular area.

CONCLUSION

The exploration for oil and gas in British Columbia cannot be considered in isolation. The proportion of the reserves of oil and gas remaining to be discovered will depend upon the number of exploration dollars allocated to the task. British Columbia's competitive position for these exploration dollars will depend in large measure on its royalty and land tenure policies.

Cash Bonus Bidding for Mineral Resources

WALTER J. MEAD

Mineral leasing policy alternatives arise out of the fact that governments own mineral resources but, in general, do not engage in mineral resource recovery and processing. Hence, a need arises to transfer publicly owned resources to private enterprise at a price which will reflect the "fair market value" of the resource. The following analysis will, first, explore the problems to be solved by a bidding policy and, second, evaluate the cash bonus method of bidding for mineral leases.

THE PROBLEMS TO BE SOLVED

There are three problems which must be solved by any leasing system. First, the leasing system must as objectively as possible determine who or what firm is to be given the right to exploit publicly owned mineral resources. Second, a price must be determined which the lessee is to pay to the government for the right to recover mineral resoures held in trust for its citizens. Third, assuming that a nation wishes to economize on the use of its scarce resources and to maximize the standard of living of its citizens over time, the leasing system must result in an efficient method of production.

As a prerequisite to a discussion of mineral leasing alternatives there should be a clear statement of the goal(s) to be achieved. It is probably true that economists as a group have a preference for a single goal, declaring it to be one of economic efficiency. Natural resources available to any economy are scarce by definition. Achieving the highest possible standard of living requires that scarce resources be utilized with a maximum of efficiency. If resources are sold at a price below their true value, then the products into which they are converted may also be underpriced. If demand elasticities are less than zero, then the flow of resources into products and the flow of products within the current period will be excessive. Present overconsumption of products and resources will be at the expense of future consumption.

One way of achieving maximum economic efficiency is to price all resources at their "fair market value." Such pricing allows a government the opportunity of capturing the economic rent. Resources should be sold

AGO 547034

for the difference between future revenues and costs, appropriately discounted to their present value. The economic principle relating prices, costs, and money flows at different points in time in order to estimate present value (PV) is shown in the following formulation:

$$PV = \sum_{i=0}^{n} \frac{P_iQ_i - C_i}{(1+r)^i}$$

P_iQ_i is the value of the gross income flow at different points in time, C_i represents associated costs, and r represents the interest rate at which future money flows are discounted to the present. The formula clearly shows that higher future prices will increase present values while higher future costs will lower present values. Further, the greater the uncertainty and risk associated with production, the smaller will be present value. Firms utilize some variation of this present value formula in calculating their individual bids. Estimates of the quantity of minerals recoverable from a given tract will, of course, vary widely from firm to firm.

If mineral leases are sold for less than the fair market value as indicated in the above formula, then resources may be used at an excessively rapid rate, and the public, as owners of the resource, will fail to receive their full economic rent. On the other hand, if mineral resources are sold at prices in excess of the fair market value then, in the long run, some operators will be forced out of business. Use of such mineral resources in the present period will be at a suboptimal rate and the public owners will receive more than their normal economic rents.

In the past, Canada apparently has transferred some of its mineral and timber resources through various negotiated transactions rather than by utilizing the auction market approach. Similarly, other foreign governments have traditionally taken the negotiated sale approach in entering into long term oil concessions.

There are major problems involved in the negotiated approach. The correct present value of natural resources is extremely difficult to ascertain. There is no objective test in advance of ultimate production that can indicate the precise present value of mineral resources. By their nature they must first be discovered. Their presence, quantity, and quality are in doubt. With the government as the seller, negotiating with a single buyer, traditional problems of bilateral monopoly are encountered. The seller is interested in maximizing price, while the buyer is interested in minimizing price. Given this uncertainty plus opposing objectives, the civil servant is placed in a difficult position.

A visitor to Canada is reluctant to criticize Canadian experience which has circumvented the market place. Fortunately there is abundant experience within the United States to indicate the shortcomings of the negotiated approach to pricing. We may formulate two general laws which

AGO 547035

seem to govern when prices are determined or may be influenced by administrative judgement. First, the buyer will always complain. If the buyer believes that market prices can be reduced by protesting that they are too high, then complaints based on the argument that the operator cannot make a "fair profit" because prices are set too high could be endless. In the timber context, there are two cases where elaborate reports have been written protesting the high price of timber. One, presented by the Simpson Timber Company, protested against the high price of stumpage set by the United States forest service for the Shelton Sustained Yield Unit Agreement. Timber, in this case, is not sold at auction; its price is determined by the United States forest service. In the second case, the Edward Hines Lumber Company protested against the high cost of timber for its southeastern Oregon lumber mill. The timber was sold at an auction where competition was so weak that, in effect, it was sold at the administratively determined minimum price. By protesting, the company apparently felt that minimum prices could be reduced. In this instance, local community help was solicited on the grounds that if the company failed to make a fair profit, it would be forced to curtail operations. Under auction market procedures the government is relatively free from constant complaint and protest, because it is the impersonal market that determines the price rather than a civil servant. Under auction bidding procedures the buyers themselves set the price in competition with one another.

A second general law is that, where prices are set through administration, the government will always set prices short of the fair market value. A bureaucracy will rarely choose the path that makes its position unpleasant. Low prices are believed to generate less criticism and complaint than high prices. Where there is no auction market to test administrative judgement concerning the fair market value, we have no means to prove the second law. Sales of timber in the United States offer an opportunity to test the administratively determined price. Timber is sold by the forest service on the basis of an appraised fair market value, which becomes the minimum price acceptable to the government. Auction bidding begins at this price. In the four years from 1959 through 1962, competitive bidding for timber in the United States Douglas fir region produced an average high bid price that exceeded the forest service statement of fair market value (the appraised price) by 46 per cent.[1] In this case, the interests of the public were protected, at least in part, by reasonably effective competition. In the absence of this competitive check it is quite likely that the appraised prices would have been even lower. The shortcomings of the negotiated approach should lead to auction bidding wherever competition is possible.

CASH BONUS BIDDING

Before bidding can take place, a decision must be made between oral and

AGO 547036

sealed bidding. Bidding in either form may start with a stated or unstated minimum acceptable price. In the case of timber sales in the United States, the minimum acceptable price is given by the appraised price, and most timber auctions are conducted under oral auction procedures. On the other hand, in the case of oil and gas leases conducted by the federal government in the United States, the minimum acceptable price is not published, and bidding is normally by sealed bidding procedures. The government retains the right to "reject any and all bids." After bids have been received, it determines whether or not the high bid was adequate.

The factors important in choosing between oral and sealed bidding methods are as follows:

a. Of prime importance is the extent of competition. If competition is weak, then sealed bidding with its element of uncertainty makes collusive arrangements more difficult to enforce. Under sealed bidding rules there is no second chance to bid at any given sale. In contrast, under oral bidding procedures, a collusive arrangement can be policed by the participants during bidding. Further, there is always doubt about how many bidders may appear at a given sale. In oral bidding where only one bidder is present, he will bid the minimum; whereas, in sealed bidding a bidder would probably offer an amount which he believes will win the sale under conditions of more than one bidder.
b. In the timber industry where fixed investments in milling facilities normally exist prior to sales, the buyer needs a means of ensuring access to specific raw materials and specific locations. Oral auction procedures provide this means through the opportunity to cast reaction bids. In contrast, in oil and gas bidding fixed investments are made after winning a sale, hence there is less need to protect one's position through the opportunity to react to the bids of others.
c. Where the severed resource is relatively immobile, as in the case of timber, it is of greater importance that a specific nearby sale be obtained; therefore the oral auction procedures are more appropriate. In the case of oil and gas, the severed resource is highly mobile, so obtaining a specific sale is of less importance. In this case sealed bidding is not disadvantageous.
d. Where the resource to be auctioned is not homogeneous, it may be necessary for a firm to obtain a specific sale. Where this is true, the opportunity to make more than one bid to protect one's need for a specific type of resource may be of great importance. Only oral bidding facilitates this subsequent bidding opportunity.
e. Financial planning often requires that a firm carefully limit its financial exposure. Where this is necessary, oral bidding offers greater control over a total resource-financial commitment. In the case of sealed bidding,

firms may be unexpectedly successful and in the process win more sales than were desired or can be successfully financed. On the other hand, a firm's sealed bidding may be totally unsuccessful so that it becomes undercommitted. This shortcoming of sealed bidding may be corrected where resources may be freely transferred among interested buyers. This procedure is normally followed in the case of oil and gas leasing in the United States.

f. Oral bidding requires more on-the-spot decision making than does sealed bidding; therefore, oral bidding requires that a higher level of executive talent be present at the moment of the auction. In contrast, decisions made on the basis of a sealed bid offer no opportunity for subsequent action on the auction floor; therefore, the presence of expensive executive talent is not necessary.

g. The "free rider" is a problem for serious bidders under oral bidding conditions. A serious bidder will carefully examine the potential productivity of a proposed lease sale. This may, as in the case of minerals, require large investments. Under oral bidding conditions, a "free rider" can observe who is bidding, then, if he is confident that they have done their homework, he can continue to outbid them until they reach their maximum and he will win the sale. His purchase is therefore based on someone else's calculations and he, in turn, has saved the cost of the pre-exploration appraisal. Sealed bidding does not offer the free rider the same opportunity.

Once a decision has been made in favour of oral or sealed bidding, then a choice must be made on the object of bidding. A cash bonus bid is one alternative. Additional alternative bidding objects are shown in Table 1.[2]

Bonus bidding is the standard procedure used by the United States government in all of its Outer Continental Shelf (OCS) programmes. Using the present value formula given earlier, potential bidders presumably estimate the present value of the probable mineral recoverable from a tract of land. The formula provides for adequate recovery of capital and compensation for risk, uncertainty, and profit.

One strong advantage that can be claimed on behalf of a bonus system relative to royalty bidding is that it requires a lump sum payment and correspondingly modest royalty payments. Because royalty payments are due on each barrel of oil or unit of natural gas produced (or other mineral), such charges become part of the marginal cost. At the margin of production this is a transfer cost rather than a real social cost. Royalty bidding thus leads to premature abandonment of an oil or gas well. To the extent that royalty payments are required in addition to the cash bonus, there will be premature abandonment of the lease.

The disadvantages of bonus bidding are numerous. First, while the

AGO 547038

technology for oil exploration prior to drilling has been advanced in the last century, exploration is still subject to extremely high risk. Drilling is the only definitive test to determine the presence of oil or gas. Thus, bonus bids must be submitted by bidders and accepted or rejected by the government when neither the buyer nor the seller knows whether and in what quantities oil is present. This places the seller in a position of accepting millions of dollars for nothing but the right to spend several more millions drilling potentially dry holes. In cases in which a rich oil field is found, returns to the lessee will be and must be very high.

Second, under current procedures a bonus must be paid when the bid is submitted. When the bonus bid is large, it will represent a very heavy cash drain to the bidder far in advance of any revenue which may be generated from the oil or gas produced from the lease. This significant *front-end loading* of capital costs effectively excludes a small operator from winning leases as a solo bidder, creating an additional barrier to entry into the oil and gas production market. To overcome this entry barrier, firms commonly form joint ventures and bid jointly for a lease.

Third, because the bonus is calculated on a present value basis, the government is forced to accept discount rates used by private enterprise. If private enterprise discount rates are unreasonably high from a social standpoint, then bonus payments to the government will be correspondingly low.

Possible variations of the bonus bidding form are shown in Table 1. The present United States system includes fixed royalty requirements (typically 12½ per cent or 16⅔ per cent of wellhead value). However, a bonus bid might be paired with a sliding scale royalty requirement, permitting the royalty rate to be reduced as a field declines in productivity. As the point of economic abandonment is approached, the royalty rate might be reduced substantially or even eliminated. This procedure would, in turn, eliminate a marginal cost of production that is not a real social cost, and it would permit continued production from a field until the real marginal costs equaled the marginal value of production. This is the optimum point for well abandonment from an economic point of view. If at the time that a bonus bid was submitted all bidders understood that the royalty rate would be reduced to zero under the conditions specified above, the present value of the lease would be increased by an amount equal to the present value of reduced future royalty payments. Thus a tradeoff would be effected from royalty payments to bonus payments. The principal impediment to a sliding scale lies in the difficulty of clearly identifying various points at which royalty rates would be reduced. The lessee would have an economic incentive to manage his production in such a way that minimization of royalty payments would be an operating objective, rather than economic efficiency.

TABLE I

ALTERNATIVE BIDDING FORMS

Bonus Bidding
- a. with a fixed royalty requirement
- b. with a sliding scale royalty requirement
- c. without a royalty
- d. with or without a rental payment
- e. with a profit share
- f. with delayed bonus payments

Royalty Bidding
- a. flat (nonvariable) royalty
- b. sliding scale royalty
- c. with a fixed bonus requirement or no bonus

Profit Share Bidding
- a. net profit or gross profit
- b. with fixed bonus requirement or no bonus
- c. with a royalty requirement or no royalty

Combination of Bonus and Royalty Bidding

Bidding on the Work Programme

The royalty problem, together with the administrative problem of reducing royalty rates under a sliding scale, might be avoided entirely by using a bonus bid without a royalty payment. However, this procedure would simply magnify all three of the problems associated with bonus bidding listed above.

Present procedures in the United States include modest rental charges payable between the points of sale and production. When production begins, rental payments cease and royalty payments take over. Rental payments in OCS oil and gas lease income are insignificant. In 1972, they amounted to 0.3 per cent of total revenue from such leases.[1] The rental requirement apparently was introduced to motivate the lessees toward early production. If they were of significant size, this result would in fact occur, because rents cease when production begins.

To overcome the front-end-loading problem, provision might be made for delayed payment of the bonus. The problem that would follow from this procedure is that in some cases where no minerals were found, lessees would elect a bankruptcy route. In this event, an unfair bidding situation would be created. Responsible firms in business on a perpetual basis would not follow a bankruptcy procedure and would, therefore, be at a bidding disadvantage with respect to others that contemplated bankruptcy in the event of a "dry hole."

A bill currently pending before the United States Congress provides for a 55 per cent fixed share of net profits in lieu of the existing fixed royalty payment accompanying the bonus bid. The winner would still be

AGO 547040

determined on the basis of a cash bonus. A profit share payment would avoid the above problems associated with royalty payments. As a given lease approaches exhaustion and its point of economic abandonment, profits would also approach zero and payments would decline proportionately to zero. If the profit share was calculated on the basis of net accounting profits including fixed costs, then the profit share payment would decline to zero prior to the point of economic abandonment. The latter point is reached only when marginal cost (not total costs) equals the marginal revenue. There is nothing wrong with this system providing both parties understand how it works and bidders understand it at the time they submit their bonus bids. The proposed 55 per cent profit share is high and is likely to lead to inefficient operations. A profit share payment is approximately the same as an income tax on each well and is additional to the existing income tax. When the profit share payment is added to the existing income tax, a large part of the penalty for wasteful operations will have been shifted from the operator to the government. While a bonus bid paired with a fixed profit share payment has merit, a 55 per cent profit share added to normal income taxes is inappropriately high from an economic point of view.[4]

Some data are available to permit a partial evaluation of the effectiveness of bonus bidding with a fixed royalty. The United States experience with OCS bidding provides a record of thirty-five oil and gas lease sales during the period November 1954 to 29 May 1974. In addition, three sulphur lease sales and two salt lease sales have been conducted on the OCS. The record may be evaluated in terms of the number of bidders competing for each sale, the conditions of entry of new firms, the record of joint bidding, the extent of concentration among winning firms, the trend in price bid per acre, the resale record of tracts where the initial bid was refused by the seller, and the rate of return earned by the winning bidders. Data pertaining to OCS bidding as follows:

a. For oil and gas lease sales there has been an average of 3.6 bidders competing for each tract receiving bids. The trend from 1954 to date has been one of increasing bidder activity. From 1954 to 1966 the average number of bidders per tract was 2.7. From 1967 to date the average increased to 3.9. From the seller's point of view, even more bidders would be preferred. Given the fact of relatively few bidders, sealed bidding procedures would appear to be more appropriate than oral auction.
b. Entry into the oil and gas auction markets appears to be relatively free. In the first 1954 federal lease offshore from Louisiana, 199 tracts were offered. Ninety-seven of these tracts received 327 bids from 22

AGO 547041

different firms, some of which bid in joint bidding combinations. From 1954 to 28 March 1974, an additional 110 firms won tracts as solo bidders or joint bidders with 1 or more other firms. Thus, in addition to the unsuccessful bidders who also perform a competitive function in the bidding process, there were 132 separate firms participating as winning bidders in thirty-three OCS lease sales.[5]

c. Entry by relatively small firms into OCS lease sale bidding is facilitated through joint bidding. Joint bidding by two or more firms each unable to bid solo has the effect of increasing competition. On the other hand, when two or more large firms fully able to bid separately combine to submit a single bid, the effect may be to reduce the number of competitors. However, if through joint bidding, even among large firms, a combination of, say, four firms bids more than four times as frequently as the individuals would have bid solo, then the effect of joint bidding can again be procompetitive.

d. The record shows some tendency toward concentrating winning OCS bids in relatively few hands; however, the extent of concentration also appears to be declining over time. For the nineteen oil and gas OCS lease sales which took place from 1954 through 1966, the eight largest buyers, sale by sale, purchased 85.5 per cent of the tracts. In the fourteen sales from 1967 to 28 March 1974, the percentage of total tracts purchased by the eight largest buyers declined to 62.0.[6]

Using the 184 leases issued in the 1954 and 1955 Louisiana oil and gas lease sales, a multiple regression analysis tested the proposition that firm size was positively related to the high bid by tract as the dependent variable. If large firms are able to outbid smaller firms, then one would expect a positive relationship. The regression analysis revealed no significant relationship between size class of firm (the eight big firms versus all others) and the amount of the winning bid. The same regression equation revealed that the high bid was also independent of whether firms bid jointly or solo. Further, the most significant independent variable related to high bid was number of bidders; the greater the number of bidders competing for any given tract, the higher will be the resulting winning bid. The total value of oil and gas production accumulated through 1967 was also positively related to the high bid. As one would expect the number of acres in the tract leased is also related to the high bid. Estimated water depth as a proxy for development cost was not significantly related to the high bid.[7]

e. Data on the average price bid per acre indicates that with the passage of time the effective high bid per acre has increased substantially. For the entire period 1954 through to 28 March 1974, the average high bid per acre amounted to $1,257.50. For the 1954-1966 period the average was

$301.71 per acre. This increased more than sevenfold to $2,219.90 per acre for the period beginning in 1967. This increase is only partially accounted for by higher crude oil prices. The average price of crude oil increased from $2.89/bbl. in the earlier period, to $3.69/bbl. in the later period. Even this increase would be offset by an unknown decrease in the probability of finding oil, and by increased costs of exploration and production.

f. Lease sales through 1 October 1964 show that of the 1,377 tracts receiving bids, seventy-eight high bid offers were rejected by the government. Subsequently, 26 of these tracts were reoffered and leases awarded. For these 26 tracts, the initial rejected high bid average amounted to $42.41 per acre. The subsequently accepted high bid on resale averaged $411.38. Thus, where bids were found to be inadequate and subsequently reoffered, competition increased bonus payments on these rejected tracts nearly tenfold.

g. The most conclusive test of the workability of cash bonus bidding based on the United States record of OCS oil and gas lease sales is in terms of the rate of return on capital earned by the successful bidders. An analysis has been made of 184 offshore Louisiana oil and gas tracts leased in 1954 and 1955. Precise data are available on bonus payments, rental payments, oil and gas royalty payments, and production of oil and gas during the period from 1954 through 1967. Cost estimates were made for exploration, well drilling and equipment, and operation. Annual cost and annual wellhead values were discounted to obtain a net internal rate of return. The calculations indicate that these early OCS leases generated a 7.5 per cent before tax rate of return to the lessees.[4] Given the fact that oil companies pay relatively low U.S. income tax rates, the after tax rate of return would be only modestly lower than the 7.5 per cent before tax rate of return. This net yield clearly does not reflect monopoly power; it shows an excessive degree of competition.

On the basis of this evidence we conclude that competitive bidding for oil and gas leases is sufficiently strong to protect the public interest in obtaining competitive values for its oil and gas resources. This conclusion is further supported by evidence presented above indicating an increase in the average number of bidders and a substantial increase in the average price bid per acre for oil and gas leases.

CONCLUSIONS

This article has examined the problems to be solved by any leasing system used to transfer publicly owned mineral resources to private firms for processing. The cash bonus bidding system has been used extensively in

AGO 547043

the United States, particularly in the leasing of OCS mineral resources. That record has been examined in some detail. While cash bonus bidding embodies problems which have been identified, it also appears to be an economically efficient method of resource conveyance. The United States record indicates that competition has been effective, if not overly effective, in permitting the government to capture the full economic rent. In addition, bonus bidding avoids a major problem of a popular alternative, that of royalty bidding. It appears to be far superior to a negotiated approach in solving the three critical problems of resource leasing: selecting the operator, determining a fair market value, and creating a climate for efficient mineral resource recovery.

AGO 547045

The Role of Public Enterprise

ARLON R. TUSSING

My remarks are, firstly, about the role of governmental enterprise generally and, secondly, about some of the considerations involved in using governmental enterprise to foster greater control by the citizens of Canada and British Columbia over their own mineral industries. My view is that governmental ownership of producing operations is not generally the most effective way of accomplishing the social ends for which it is currently being advocated in these industries. Nevertheless, I have a few suggestions how some of the major disadvantages of public enterprise with respect to efficiency and responsibility might be overcome.

Government owned enterprises in the English-speaking countries have seldom owed their existence to an anticapitalist ideology. It is, in fact, hard to detect any systematic difference in motive, organization, or operation between the national, state and provincial, or municipal enterprises established during the incumbency of labour, socialist, and agrarian radical parties and those implemented by Tories of various names and complexions.

Despite the vast amount of existing governmental enterprise today in capitalist countries, and despite the importance of socialist movements and socialist thought in the history of modern civilization, the scholarly literature on public enterprise is remarkably skimpy. Rigorous comparisons —theoretical or empirical—of the economic performance of governmental and private enterprises in the same industry are, to the extent I can determine, nonexistent.

GOVERNMENT OWNERSHIP

The case for government ownership of undeveloped land and natural resource stocks rests on a broader base than that for government ownership of producing enterprises. The intrinsic value of any resource in its natural state is the difference between the value of goods that can be produced from it and the cost (in terms of labour, capital, materials, and organization) required to produce those goods. The size of this residual is not the product

AGO 547046

of any person's labour or enterprise; most of the economic value of an *in situ* resource and its appreciation over time result from such diffuse causes as the increase in population, the general advance of technology, the decline in real transport costs, or directly from governmental outlays on roads or geological mapping. On these grounds, it has become almost an axiom of distributive justice (however commonly violated) that the intrinsic value of natural resources should not be privately appropriated.

Other classical grounds for government ownership of natural resources are the desire to control external costs or capture external benefits of their exploitation, and the expected divergence of private capital costs from the social rate of time preference, which is said to result in too rapid (or too slow) development of the resource. I am skeptical about the universal applicability of the last of these arguments; who, indeed, knows what society's true discount rate should be, and why are politicians and civil servants expected to be more sensitive to it than to entrepreneurs? This reservation notwithstanding, I believe that a presumption in favour of government ownership of undeveloped land and resources is generally justified.

Turning to productive enterprise, however, there are three main economic rationales for government ownership in a capitalist society. First is the use of the state to establish or maintain productive activity that would not be profitable as private enterprise, but whose external benefits are deemed to justify a subsidy out of the public exchequer. A subsidy does not, of course, require state ownership, because either private or governmental enterprise could enjoy that subsidy. In either case, support could take the direct form of providing capital or operating expenses from the Treasury or the indirect form of tax exemptions and the use of public resources at less than their cost of fair market value. State ownership, however, may well make a subsidy more palatable to the public, because it does not conspicuously enrich (or appear to enrich) a few private entrepreneurs.

Within the category of public ownership as a vehicle for subsidization are the numerous instances of private enterprise socialized because of chronic insolvency or imminent liquidation, including the Canadian National Railways, most of the British Labour Party's nationalizations after World War II, and the recent takeover of rail passenger transportation by the United States government.

In other cases, the motive for government ownership has been the creation of "public goods," products (or by products) of an enterprise whose value a private owner could not expect to recover by market pricing. Examples of such externalities are flood control by hydropower projects and the promotion of literacy and national unification by the postal system.

Military necessity has been another justification for producing goods in state enterprises which might not meet the test of the private market.

AGO 547047

Nineteenth-century America had government lead mines and arsenals and plantations for naval stores; the processing of nuclear fuels now remains a governmental activity on security grounds. Many public transportation and communications ventures were begun as defence projects in Alaska, the Yukon, and British Columbia: examples are the ALCAN highway and the White Alice communications system.

Second among the rationales for public enterprise is the perceived inability of private business, because of the great size or risk of the venture in question, to assemble sufficient capital. This tradition in North America began with state ventures in canal and rail development in the early nineteenth century, then extended to river control and irrigation projects, and continues into the present in enterprises like COMSAT and Panarctic Oils. In many of these cases, the proposed activity was expected to be self-sufficient in the long run, on the basis of the revenues from its product or service, but state initiative was seen as necessary to take advantage of scale economies or to overcome high risk threshholds.

The third circumstance seen to justify government ownership is possession by an enterprise of monopoly power and/or exceptionally rich natural resources, either of which can produce substantial "unearned profits" or rents. Government ownership is one means either of preventing monopoly exploitation of consumers (or monopsony exploitation of workers and sellers) or of collecting for the public treasury monopoly profits or resource rents that would otherwise be captured by the private owners.

Government takeover of profitable businesses has been rare in the English-speaking world. There have been a few instances of ideologically motivated nationalization, but it is instructive to note that these have often been reversed, as in the cases of the iron and steel industry in Britain and, more recently, the grain trade in India. The remaining cases have principally been those of utilities—grain elevators, street railways, water, electrical or telephone systems—which had a monopoly ("natural" or otherwise) in a local service area. In the last category it is often hard to distinguish between the instances where government took over to prevent private exploitation of monopoly power and those in which government saw a monopoly as an opportunity to exploit an assured source of revenue for itself.

There are, of course, a variety of cases which overlap two or all three of these categories. Economic development of a poor or sparsely settled region is often advanced as a justification for public enterprise in transport, communications, or electrical power. In these instances the premise is often that the region lacks capital or capital markets and only the state can mobilize resources on the desired scale. At the same time, the project is seen to encourage growth by its ability to widen markets or otherwise cut costs for commodity producing sectors of the regional economy. Once estab-

AGO 547048

lished, moreover, such an enterprise may have a monopoly status, with the power to abuse or exploit that status, and seem thereby to demand public control or ownership.

Many governmental enterprises (and regulated utilities, which they resemble in important respects) combine subsidies for some activities with appropriation of monopoly rents or resource rents from others. A common practice in both regulated private firms and government enterprise in transportation, communications, and utilities is *cross-subsidization*, in which monopoly profits earned from one area, line of business, or class of customers are dissipated in subsidizing others that are deemed to be socially meritorious. Thus, airline and railroad tariffs on heavily travelled route segments typically exceed cost (including a "fair" return), while service on lower density segments is provided at a loss. Hydroprojects in the Western United States typically subsidize users of irrigation water from revenues earned by water sales to municipalities and industry and by sales of electric power. In Alaska, revenues from both state and federal timber sales are sacrificed to support otherwise uneconomic lumber and pulp mills.

Turning to the mineral industries of Western Canada, there is little evidence that suggests they need to be subsidized by formation of a public corporation or otherwise. The province of British Columbia does not have, for example, a great but decaying industry upon which the community depends both for energy and employment, as the British had in the coal mines of the 1940's.

The British Columbia-Yukon Chamber of Mines may occasionally assert that each mining job generates seven additional jobs in supporting industries, but there is no respectable analytical foundation for such a claim. Even if the extractive industries had such an employment multiplier, it does not necessarily follow that job creation *per se* is a benefit that deserves subsidization from the public purse, much less the creation of a government enterprise. New employment opportunities are a *net* benefit to the existing community only to the extent that they are filled by residents who would otherwise be unemployed or working at more poorly paid jobs. In an "open economy" like that of British Columbia or Alaska, there is no predictable relationship between local job creation and local unemployment, because new employment opportunity attracts immigrants who tend to offset the employment gain. Even if the new jobs directly created were reserved for long time residents, displacement of residents from old to new jobs and their replacement by nonresidents can be expected to make overall unemployment rates relatively unresponsive to employment growth.[1]

National self-sufficiency in minerals and the earning or retention of foreign exchange are sometimes claimed as external benefits of mining that justify preferential treatment. In Canada, paradoxically, some of those

AGO 547049

(including the National Energy Board) who place the highest priority on national self-sufficiency in one or another mineral resource tend to advance policies that *deter* investment, on the grounds that the beneficiary of current development tends to be the export market, at the cost of future diminished Canadian self-reliance. In this country, moreover, balance of payment effects are often used as part of a case *against* mineral development for export rather than in favour of it. In a world of floating exchange rates, however, one might question whether there is any relevance at all to the balance of payments problem in its usual sense. Finally, the impacts upon environmental quality and the dispersion of population are more likely to be regarded as external *costs* of mining than as *benefits* that justify the government's promotion of mining ventures that otherwise would not be self-supporting.

It is hard to make a respectable case that mining (including oil and gas production) creates beneficial *externalities* for the surrounding community, as distinct from the net value of the minerals produced, or the factor payments (wages, profit, rents, and taxes) which make up that value. The current Canadian interest in state enterprise in the mineral industries does not seem, in summary, to be a result of the belief that they are inevitably unprofitable under private enterprise. On the contrary, it rests in part upon the notion that mineral extraction can indeed be very profitable, and that unearned profits (rents) ought to be controlled and disbursed in socially approved ways. This attitude is sometimes experienced as a concern whether the people of the nation or of the province, who are the nominal owners of its natural resources, are receiving as high a return for the products of their land as they might. One issue is, in short, whether the state is effectively maximizing its revenues from disposal of minerals.

Where effective capital markets exist together with a large enough number of potential operators to create workable competition for resource rights, the government (as landlord and/or sovereign) is more likely to maximize its revenues if it does *not* engage in production. This conclusion does not presume that particular government owned entities are necessarily less enterprising and less effective in cost control than profit motivated private corporations. There may well be a bias against efficiency in most forms of state enterprise, if only because their owners (the public) and managers do not have a clearly defined standard of performance as private managers have in the imperative to maximize the present worth of their firms. But more importantly, by operating a productive enterprise in the extractive industries, the government loses the ability it would otherwise have as landowner to exploit the competition among potential private operators.

At oil and gas lease auctions in the United States, for example, the bid prices on a single tract may vary by a factor of two, ten, or even one

AGO 547050

hundred. These variations reflect widely differing geological evaluations of the tract, exploration strategies, and capital and other costs. Thus each tract tends to be won by the bidder with the *most favourable combination of capital cost and expectations* among all the bidders regarding future product prices, the particular tract's recoverable reserves, and their development and lifting costs. The landlord (state or private) who operates on his own land, however, would have only one management team, one exploration strategy, one team of geologists and engineers, and one supply function for capital. Only by rare accident would the landlord's *actual* performance over the average of all his properties tend to be better than the *expectations* of the most optimistic bidder. If, therefore, he were to lease each tract to the highest bidder among the competing operators, he might anticipate receiving a greater net revenue on each property than he could expect from developing the property himself.

The foregoing prediction is implicitly supported by empirical studies of United States Outer Continental Shelf leasing by Walter Mead and others, who show that successful bidders on the average earn a discounted cash flow rate of return on lease acquisition costs substantially less than the oil industry's average rate of return on capital (see Mead's article, "Cash Bonus Bidding for Mineral Resources," contained in this volume).

The effective use of competition to optimize revenues does not dictate the use of a cash bonus bidding system for *all* minerals or even for petroleum under every circumstance. The degree of knowledge or uncertainty regarding the volume and value of minerals present and their cost of extraction, the relative weight of fixed and variable costs in total extraction costs, the number of potential competitors, and the relative preferences of the government and private operators for certain present income versus uncertain future income are all appropriate considerations in the choice of leasing or disposal systems and taxes on the mineral industries. These questions have been discussed elsewhere,[3] and other articles in this volume give close attention to the relative merits of location, leasing, and sale as systems for disposing of minerals; to royalties and severance taxes, and whether they should be reckoned on gross value or net profits; to bidding on cash bonuses, deferred bonuses, gross or net royalty rates; to the use of acreage rentals; to the optimum size and configuration of tracts; to the amount of geological information the landlord ought to obtain and publish before opening land for lease or disposal; and to the duration of the primary term of a lease or permit, its terms for renewal, and so on.

In summary, state enterprise in the business of developing and producing minerals is surely *one* way to capture and redistribute resource rents, but it is unlikely to be as effective a device for maximizing those rents as the combination of a leasing system that takes full advantage of competition

AGO 547051

among private firms (considering the technology and institutional characteristics of each branch of the mining industry) and an appropriate tax system.

The most powerful cases for public enterprise in developing regions (like much of Western Canada and the Territories) relate to transport facilities which create external economies for other economic sectors, including mining. In these instances, both the first motive for socialization (the desire to subsidize) and the second (the need to overcome barriers of scale and risk) may justify investment by the government on projects into which private enterprise will not venture. Neither of these motives, however, creates a case for state enterprise in mineral extraction. Capital and enterprise for mineral exploration and development are plentiful and mobile. Specialized technical inputs, such as geophysical surveys, drilling, and heavy construction can be purchased on contract in a highly competitive market (so that great petroleum and mining companies carry out very few of these activities themselves). Capital sums in the hundreds of millions, or even billions of dollars can be mobilized privately, even without government guarantees, for projects like the Trans-Alaska pipeline, in remote regions.

Development of minerals, like the collection of revenues from their development, is likely to be more rapid and more efficient if it utilizes the diversity of skills, techniques, enterprise, and access to capital in the private economy and the competition between firms differently endowed in these respects. Nationalization or municipalization of producing operations, in my view, has an inevitable price—both in state revenues and in social efficiency—the payment of which must be justified on other grounds.

The hard core of Canadian interest in public enterprise today seems to stem not from a perceived shortage of capital and entrepreneurship (much less an ideological opposition to capitalistic enterprise as such), but from a perceived surplus of foreign capital and entrepreneurship. The problem, it seems, is to assure that mineral development (and, presumptively, related activities like oil refining or oil and gas transportation) are under the control of Canadians or the people of British Columbia, rather than great multinational (read United States) corporations.

It is probably not politic of me as an American to ask what practical difference the nationality of a company's owners or management makes as long as it is subject to the same laws (and obeys them) and pays its proper share of taxes. Foreign companies in Canada have often been berated for not paying enough taxes, but it was after all a *Canadian* decision, reflecting a long-standing Canadian developmental philosophy that the extractive industries should remain largely untaxed. The satisfactions and grievances of Americans regarding the major oil companies apply in the same way to

AGO 547052

Mobil and Texaco, which are domestically controlled, as they do to Shell and Sohio, which are foreign controlled. I am afraid I don't see how any more in the way of real resources for Canadians could be squeezed from a government owned business than could be squeezed from American or Canadian owned private enterprise under a well designed leasing and tax system. Nevertheless, one billion American dollars invested in Canada is more conspicuous than one billion Canadian dollars invested in the United States, and the nationality of your managers and stockholders obviously does make a difference to many Canadians. (I must confess, also, that some Americans become hysterical about the very idea of the Arabs or Persians taking over United States businesses.)

Government enterprise is one way to "nationalize" the mineral industries, but it is not, of course, the *only* possible way to foster Canadian equity and enterprise. Stricter nationality criteria could well be applied to holders of claims and leases or of permits to build pipelines, concentrating plants, and refineries. Such policies raise the further question, however, whether there is in fact enough private equity capital and enterprise in Canada to effectively take the place of foreign equity and enterprise. This is an empirical question to which I do not have an answer. If the answer is negative, consideration must be given to the fact that establishing a government enterprise does not *create* any new Canadian resources. It only uses tax money or potential resource revenues to bid capital and talent away from some other employment in Canada. The cost of Canadianization (either by restrictive licensing of private industry or by government enterprise) may be minimal, however, if preferences for nationals result in bidding home significant amounts of Canadian capital and Canadian talent which would otherwise be employed in other countries. (Presumably, the net effects of even these moves would have to take into consideration remittances that would otherwise flow back to Canada from investments abroad.)

Government capital need not be regarded strictly as a *substitute* for private capital, Canadian or foreign. In North America during the first half of the nineteenth century, and in almost every country at one time or another, state companies were used as a vehicle to *attract* foreign debt or equity capital, usually British, to ventures they would not otherwise consider. A government owned (or guaranteed) railroad company was often naively regarded by Lombard Street as a safe investment, while the promotions of unknown overseas entrepreneurs were viewed with little regard in the world's principal money market.

The use of government participation is still a major instrument for encouraging foreign investment in developing areas. Joint ventures between American, European, or Japanese private companies and governmental entities of the host country are common in almost all the extractive

AGO 547053

industries and in many countries at different levels of economic development. Canada has at least one government enterprise created largely with this function in mind, Quebec's SOQUEM, whose activity consists mainly of joint ventures in mineral exploration with private companies. Petro Canada also *seems* to be interested in this kind of approach.

In addition to being a means by which domestic enterprise becomes a trustworthy borrower (or partner) of foreign capital, state enterprise can also be a means of offsetting a shortage of domestic equity and entrepreneurship. In this role, it has one advantage over promotion of domestic private enterprise through nationality restrictions on investment, management or licences: it avoids the spectre of open discrimination, which could lead to retaliation and might otherwise undermine trade and investment relationships that are beneficial to Canada. The nearly open border allows this country to draw on a much larger pool of capital, technology, and talent than it would with policies fostering autarky. Although this openness is a major element in the ambiguity and insecurity of Canada's national identity, its economic benefits to Canada are relatively greater than they are to the United States. (That is, its impact on the size of the resource pool available to Canada is greater than on the size of the pool available to the United States.) It is therefore a circumstance to be modified only carefully and selectively. Establishing a provincial oil company is one way of containing the side effects of a move in the direction of autarky in a single industry. Such a move might, in fact, limit these side effects even in the industry in question. Suppose the best candidate for executive officer for a British Columbia based oil company were a Texan; there might well be fewer misgivings about hiring him to work for the province than about his heading a subsidiary of an American private firm.

I will conclude this article with some suggestions for the structure and policy of public corporations in the mineral industry, suggestions aimed at combining some of the best features of government and private enterprise, rather than their worst.

First, before establishing a governmental enterprise, be clear what its purpose is to be, what the incentive for the management to accomplish that purpose will be, and, quite rigorously, what will be the measure of the enterprise's success. (I owe this first and most vital point to Milton Moore's critique of the draft of this article.)

Second, do not set up a monopoly. There is no surer formula for inefficiency and social irresponsibility. Economies of scale do exist in mining and petroleum exploration, but they are very small when compared to some other industries or relative to the opportunities for development in an area the size of British Columbia. In petroleum refining, the minimum efficient size of a refinery is probably about the size of the British Columbia

AGO 547054

market for petroleum products, but if a new government owned refinery needs a monopoly or protectionist legislation to be profitable, it will almost certainly be a serious burden on consumers. Industries in which scale economies are narrow and where ingenuity and intuition are still crucial, as in mineral exploration or onshore oil and gas production, are probably not the most appropriate candidates for nationalization; but where it is determined to establish a state enterprise, consideration might be given to the establishment of more than one competing public enterprise.

Third, do not clothe the corporation in sovereign immunities. Such immunity can be, and often is, a cover for inefficiency, irresponsibility, and even lawlessness. The corporation should be suable; it should pay taxes or their equivalent (federal, provincial, and local); and it should be subject to environmental and safety laws and regulations and, above all, subject to the bankruptcy laws. Its operations should not be protected by any version of an official secrets act. There is no good reason why the directors, officers, and employees should be excused from the same civil and criminal liability for their actions to which their counterparts in private enterprise are subject.

I would urge hesitation even in providing guarantees for the corporation's debt. A public mining or oil corporation will be pursuing a line of business in which private enterprise regularly borrows money without such guarantees. The more intense scrutiny of bankers and underwriters toward a corporation whose debt must stand on its own merit might well save the corporation's owners—the public—more money than the small interest differential associated with government guarantees.

Fourth, give the public and the corporation's officers and staff a material interest in its success and its efficiency. The government need not hold all the shares but only a controlling interest, not necessarily even a majority. One block of shares (enough to elect at least one director) can be held in trust for the company's employees and voted by them. The remainder of the shares would be offered to the public; they would be voted by their owners and publicly traded. Not only would this provision broaden interest and participation in management, but the market price of publicly traded shares would be a continuing indicator of management performance and of the value of the government's equity. I see no compelling reason to restrict share ownership to residents; it might in fact be useful to encourage minority participation by major oil companies or mining companies. A residence requirement for shareholders, however, would reinforce symbolically the corporation's identity as a national or provincial instrument, and would, of course, limit remittance of dividends abroad.

Fifth, the corporation's policies should be responsive to public policy but not bend to every political wind. I would suggest that only a minority of the

AGO 547055

government directors serve at the pleasure of the Cabinet and be regarded as spokesmen for its policies. The remaining directors representing the government's equity would be chosen indirectly for long and staggered terms.

Sixth, the corporation should be under pressure to pay dividends. A majority of the shares (and directors) should represent parties who have a material interest that the corporation *not* retain, reinvest, or dissipate all its earnings: private shareholders, the employees, and the members who serve at the pleasure of the Cabinet (who would presumably be responsive to the fiscal interest of the government). The influence of this group will be a constant corrective to tendencies of management, inside directors, and permanent directors toward complacency, empire building, pyramid building, or gold plating.

Seventh, maintain a clear distinction between the corporation and the government as landowner. The public enterprise should obtain resource rights on crown lands only in competition with other prospective operators. The corporation should not receive a concealed (and indeterminate) subsidy by access to resources at no charge or at a lower price than a competitor might offer. If it must have a preferent right, let it be at most a right to match the highest bidder.

A preferent right on the best offshore leases is a feature of the federal oil and gas corporation (FOGCO), proposed recently in the United States Congress. In view of the prices oil companies have been recently willing to spend in these lease sales, such a preference would guarantee that FOGCO would appear profitable, however incompetent its management, and that the federal treasury would lose billions of dollars in lease revenues.

Eighth, take advantage of the division of labour and competition. The corporation should not attempt to do for itself the things that even the greatest oil and mining companies contract out to others, such as seismic surveying, core drilling, well drilling, well logging, and construction. There is virtually no chance that a state corporation could improve on the performance of private firms in these exceedingly competitive areas.

In summary, I am generally skeptical of the case for public enterprise in the minerals industry but hopeful that such enterprises could be established free of many of their usual shortcomings, providing some thought is given to their purpose, organization, and standards of performance.

AGO 547056

Notes

1. In a study aimed at projecting the employment impact of the Trans-Alaska pipeline, we found that *unemployment* in individual labour market areas was almost totally insensitive to the level of *employment*; that is, on a *net* basis, at least, new jobs in Alaska's petroleum and wood products industries and government were entirely filled by immigrants. [Arlon R. Tussing; George W. Rogers; and Victor Fischer, with Richard Norgaard, and Gregg Erickson, *The Alaska Pipeline Report: Alaska's Economy and Gas Industry Development and Impact of Building and Operating the Trans-Alaska Pipeline*, Institute of Social, Economic and Government Research Report no. 31 (Fairbanks: University of Alaska, 1971)].

AGO 547057

TEXACO'S TESTIMONY CONCERNING CS FOR HOUSE BILL NO. 854
PRESENTED TO THE STATE OF ALASKA SENATE RESOURCES COMMITTEE
ON MAY 22, 1978

Texaco is opposed to CSHB 854, the State Leasing and Exploration Bill, in its entirety for reasons which we will enumerate in our following comments.

It is our firm belief that the present Statute AS 38.05.180, in effect since 1959, has proven equitable to both the State and the oil industry and has served to maximize economic benefits to the State. We firmly believe that industry competition has fluorished under the present regulations, to the State's benefit.

In reviewing the proposed bill, #854, we would like to point out some of the areas that we believe are not in the best interest of the State and do not follow the goals stated in (a) (2) (A) and (B) (Page 1).

Legislative Review of Leasing Programs-Section (b) (Page 1)

We completely concur with proposed long range leasing programs giving industry sufficient lead time to acquire subsurface information and to budget costs of lease acquisitions and subsequent exploratory drilling. However, should annual reviews result in major revisions or reductions in areas to be leased, or complete elimination of sale areas, substantial

human and monetary efforts by both State and industry personnel will have been wasted. We believe this would be contrary to: 1) the State's goal of a stable and predictable petroleum leasing program, and 2) the State's interest in maximizing the economic recovery of its resources.

Leasing Methods-Section (f) (1) through (7) (Pages 3 & 4)

Paragraph (1) providing for bonus bidding with a fixed royalty is the most desirable and will have the greatest economic benefit to the State. Experimenting with other types of bidding, i.e., royalty, sliding scale royalty and net profits variables, places a greater risk on the State of the loss of revenue. As an example, let's use the Gulf of Alaska OCS sale. To date, 8 wildcat wells have been drilled without a single commercial hydrocarbon discovery; a very discouraging situation. Had the Federal Government resorted to bidding methods other than the conventional bonus bid, the result would have been a loss of $400 million+ in needed revenue. Although State lands have great potential for discovery of hydrocarbon reserves, it must be clearly realized that these lands have thus far been virtually unexplored. Undesirable consequences may result from royalty or net profits bidding. These bidding methods which allow many companies to establish a land position with very little cash outlay is a deterrent to early drilling. These companies would probably drill only

under the most favorable conditions as it would be much easier and cheaper to await the results of exploration in the same general area by competitive lease holders. In view of these conditions, the State can ill afford to assume the risk of experimenting with alternate types of bidding.

Minimum Work Commitment-Section (h) (Pages 4 & 5)

This section enables the Commissioner to impose a minimum work commitment on any oil and gas lease, with penalties for noncompliance. That is a very poor provision, for these reasons: A work commitment is sensible only when applied to entire concessions or other large geographical areas. Applied to individual leases, it is unworkable. If a dry well is drilled on an adjacent lease, and if it proves that there is no hope for oil or gas on the subject lease, then it would be senseless waste of exploration dollars to carry out the work commitment. It would serve the State much more effectively if that lease were surrendered, with the money saved to explore elsewhere, where there is a more reasonable chance for a discovery.

Defferal of Cash Bonus-Section (k) (Page 6)

This section allows the Commissioner to defer any part of a cash bonus payment, allowing up to 5 years for full payment.

This is in direct conflict with AS 38.05.335(c), which requires a deposit of 20 percent of the bid in cash. Moreover, it opens the possibility for a bidder to deposit a small fraction of the cash bonus, and then to default on the balance no oil or gas is indicated by his neighbors' drilling programs. It also appears to conflict with section (a) (1) (A), to "maximize the economic recovery of the resources."

Lease Term-Section (n) (Pages 6 & 7)

This section mandates a 5-year term for oil and gas leases, with a possible extension to 10 years where operations are restricted by the environment. As the great majority of the State is subject to environmental conditions which limit an exploration season to about 4 winter months, a 5-year lease allows only 1 and 2/3 years of exploratory work. This is quite insufficient in such high-risk, high-cost areas of Alaska. We therefore would urge that the present statute be maintained whereby leases contain a 10-year primary term.

Non-Competitive Leasing-Section (x) (Page 10)

The proposed bill requires competitive leasing for all State lands. This basis may be good for many areas within the State having a high prospective value; however, this system is not suitable for low prospective areas, many of which would

attract little or no bids at a competitive sale. In line with the objective to maximize the economic recovery, the State should provide for non-competitive leasing in certain areas of low prospectiveness and in instances where tracts received no bids in an earlier competitive lease sale. This procedure is comparable to that used very successfully by the Federal Government and would provide additional revenue to the State.

Joint Bidding Restriction-Section (y) (Pages 10 & 11)

Texaco believes that the State would lose revenue by adopting a policy of restricting joint bidding. The theory of the author of the bill was that one must restrict joint bidding in order to promote competition. This, however, may have the opposite effect since many small companies, or large companies with limited budgets, may be precluded from participating in a competitive sale if joint bidding is not permitted. Joint bidding combinations may be the only means of acquiring lease acreage for these companies. In addition, the federal experiment in joint bidding restrictions on the OCS has not demonstrated that any additional revenue has been received by the government as a result of higher bids. On the contrary, a recent study indicated that higher bonus bids were received in joint bidding rather than by sole company bidding.

State's Call on Oil and Gas Production-Section (z) (Page 11)

Texaco objects to the State having a call on production for the reason that it will discourage oil and gas exploration within the State. An increasing number of wells are being drilled within the State as a result of financing from various utility companies interested primarily in the production to serve their customers. If the State were to include a call on production in excess of its royalty share, this will effectively preclude the utility form of financing from future exploration, reduce industry exploration on State lands, and, therefore, not be in the State's best interest.

State Access to Exploratory Data-Section (aa) (Page 11)

Texaco is particularly opposed to supplying any of its valuable proprietary seismic data to the State.

This section would remove the incentive for an aggressive company to be a leader in initiating new or innovative ideas in an effort to discover new resources. It is common knowledge that geophysical data, in particular, is extremely confidential and closely guarded by the individual members of the industry. Leakage of this information, whether by accident or other means, could cost an individual company its competitive advantage in a given area, expecially an area which has

heretofore been relatively unexplored. We believe such a requirement would discourage rather than promote exploration of the State's lands.

Acreage Limitations-Section 3(c) (Page 11)

The acreage limitations should apply only to non-competitive leases. To limit the amount of competitive acreage a company holds effectively precludes that company from participating in some future leases sales at such time as its lease holdings approach the limitation figure. This reduces the competition by lowering the number of companies bidding for the leases, which will most likely reduce the revenue to the State.

In the event the State insists on limiting oil and gas lease holdings by an individual or company, Texaco requests that the present statute providing for the holding of leases on 500,000 acres of tide and submerged lands, and 500,000 acres of all lands other than tide and submerged lands be maintained in effect.

Summary

There are numerous other conflicts and ambiguities contained in this bill which we are sure your Committee will detect in

your review of the various sections. After a thorough review of CSHB No. 854, taking into account the testimony and comments presented by various individuals, we sincerely trust that your Committee will determine that: 1) such legislation will not fully accomplish the intent set forth in Section (a) (1) and (2); 2) that such legislation may in fact seriously discourage and delay an assessment of the State's oil and gas resources; and 3) that your deliberations will result in your finding the existing leasing statute AS 38.05.180 to be in the best interests of the State and the most equitable for the State and industry to work in concert in accomplishing the desired goals.

Claude H. Brown

STATE OF ALASKA
THE LEGISLATURE

LEGISLATIVE AFFAIRS AGENCY

POUCH Y - STATE CAPITOL
JUNEAU, ALASKA 99811
907-465-3800

MEMORANDUM

April 4, 1978

SUBJECT: Oil and Gas Leasing Bill: Major Issues in Drafting CS for HB 854

TO: The Honorable Hugh Malone
The Honorable Merle Snider

FROM: Gregg K. Erickson
Director of Research

Here, as you requested, is our list of some major issues the committee will probably want to address in drafting a committee substitute for this bill. They are listed in no particular order.

1. DEGREE OF LEGISLATIVE INVOLVEMENT IN THE LEASING PROCESS. As currently written, the legislature would not be involved in any formal way in the leasing process, except as a recipient of information from the department. We discuss this issue in more detail in an accompanying memorandum.

2. WORK COMMITMENT BIDDING. Work commitment bidding, including the system of drilling incentives proposed by BP/Sohio, implies a subsidy from the state in favor of oil exploration and/or development. If the committee decides that such a subsidy is desirable, then the question of whether or not this is the most appropriate method of providing it should be addressed. Finally, the committee may wish to put some limitation on the extent of the subsidy, and consider the specific terms under which it is offered. For example, the period of time over which the commitment can be worked off, and its transferability among lessees and between tracts are all issues which you might wish to consider.

3. NON-COMPETITIVE LEASING. HB 854 would allow non-competitive leasing where tracts have been offered under competitive conditions but where no bids have been received. Theoretically, tracts could be offered with very high minimum bids, or with other terms which make them very unattractive. This would ensure a lack of competitive interest, and make it possible for the lands to be reclassified as non-competitive, and essentially given away. If noncompetitive leasing is to be retained, the committee should probably review the question of whether these arrangements are appropriate.

AGO 547072

4. REDUCTION OF ROYALTY. This provision has been fairly widely criticized by the various witnesses before the committee, particularly in combination with the royalty bidding arrangements.

5. NET PROFITS BIDDING. The bill has been criticized for being insuffici tly precise about how the net profits would be calculated. The department has indicated that this can and would be taken care of in regulations. The committee could attempt to provide a general description of this calculation in the bill.

6. ROYALTY BIDDING WITHOUT THE SLIDING SCALE. Almost all economists who've looked closely at this method have been critical of it.

7. PUBLIC OUTCRY BIDDING. HB 854 allows this method of bidding; a number of scholarly studies have indicated a tendency toward collusive and non-competitive behavior in situations where natural resources are disposed of by this method.

8. ONE HUNDRED PERCENT GAS ROYALTY RESERVATION TO THE STATE. It has been asserted fairly convincingly that this provision will reduce gas company interest in exploration. On the other hand, particularly in the Cook Inlet Basin, the utility of having large gas reserves controlled by the state may be very high.

9. FIVE YEAR LEASE TERM. Most economists and the Department of Natural Resources would argue for the shorter term. Most industry representatives believe longer terms are necessary in many circumstances.

10. MINIMUM LEASE SIZE. Under the bill before you, individual leases are limited to 5,760 acres except under non-competitive leasing. It is clear from testimony of the department that it is contemplated that larger tracts should be made available in cases of low potential lands. Most economists and industry represenatives would agree. The department seems to believe that it could amalgamate tracts, in which case the acreage limitation would be of no effect. The committee may want to retain the existing acreage limitation, but provide that the commissioner may lease much larger tracts when he makes specified findings.

11. ACREAGE LIMITATIONS. The maximum acreage that can be held by any one lessee is reduced in this bill over present law. Apparently, two companies would be affected by this reduction. The provision has been criticized by the industry. It becomes more significant as the term of lease is increased, so this provision should probably be considered together with number 9, above.

12. STATUS OF EXISTING OFFERS FOR NON-COMPETITIVE OIL AND GAS LEASES. No non-competitive oil and gas leases have been issued during the past two years, although many offers have been made for such leases under the existing law. Options for dealing with these "prior rights" will be discussed in a later memorandum.

13. RESTRICTION OF JOINT BIDDING. The committee may want to require such restrictions, or it may want to eliminate the provision entirely. Federal regulations currently limit joint bidding between the twelve largest oil companies. A similar provision is in pending federal legislation.

14. ACCESS TO AND CONFIDENTIALITY OF EXPLORATION DATA. The industry seems to generally oppose this provision. The department believes it is very important but would be willing to specify that the confidentiality of this information would be as established in current law.

GKE:jm

File HB854

NOTE: Professor Norgaard in his study which accompanied Dr. Mason Gaffney's leasing policy study recommends a "more sophisticated analysis" of the affect of bonus bidding in Cook Inlet. See Recommendation III. B. 1 on page 25, attached. A comparison of other bidding methods could be done, also.

UNCERTAINTY, COMPETITION, AND LEASING POLICY

by

Richard B. Norgaard*

B. Bonus Bids and Rent Collected by the State

It is now well known to Alaskans that approximately 90 percent of the Prudhoe Bay field was acquired by ARCO and British Petroleum in mid-1960's sales which, along with considerable other Arctic Slope acreage, brought $10,500,000 in bonus bids. After oil was discovered, the small amount of remaining Prudhoe Bay acreage brought $900 million in bonus bids. Clearly, had the state known

*Associate Professor of Agricultural and Resource Economics and a member of Energy and Resources Group, University of California, Berkeley.

about the Prudhoe Bay field in advance, between $5 billion and $10 billion more would have been collected in bonus bids. Several years after the sale, petroleum prices tripled. Presuming that industry had not predicted this increase at the time of the sale, then the state probably "lost out" on perhaps an additional $15 billion to $30 billion. Prudhoe Bay is clearly a "tough luck" story for the state, and industry is quick to point out that at other times and places they have bid large bonuses and lost. Offshore Cook Inlet is undoubtedly more representative than Prudhoe Bay due to the larger number of sales and smaller size of fields discovered.

The discounted value of oil produced and estimated to be produced from Lease Sales 7 and 9 is $1.3 billion (Table 3, column 7). Ideally, we would like to determine what portions of this value have gone to cover production costs, what portion has been collected in royalties and similar per barrel taxes, and what portions of the remaining amount were paid in lease bonuses and retained by the industry. The following discussion will be complicated by (1) imprecise measures of the value of future natural gas production; (2) imprecise estimates of production costs; (3) uncertain shares of rent collected or to be collected by royalties, severance taxes, and other taxes; (4) the value of oil and gas in fields which are under lease but have not yet produced; and (5) the number of lease sales to be included in the analysis. The effect of alternative assumptions for items 1 through 5 could be incorporated a computer-modeled sensitivity analysis. For the purposes of this report assumptions will be made which are biased in favor of the effectiveness of the bonus bid as an instrument for collecting rent. If the bonus bid appears to be ineffective under these favorable assumptions, then we can be reasonably confident that it, in fact, has been ineffective.

Natural gas sales from Cook Inlet fields are now approximately 11 percent of the value of oil sales. This percentage, however, has been increasing historically and is expected to continue to increase significantly in the future. Nevertheless, the discounted value of oil will only be increased by 13 percent to $1.5 billion to account for gas sales. Production costs (exclusive of interest charges since petroleum flows have been discounted to the present) in 1975 dollars are assumed to be $1.25 per barrel, which may be somewhat low, or $2.50 per barrel which is definitely high. The average wellhead price of crude oil in 1975 dollars reached a high in 1965 of $5.66 a barrel, declined to $4.26 in 1973, rose dramatically to $5.38 in 1974, and is likely to increase gradually in the future. Nevertheless, for this analysis, we assume a constant price of $5.00 per barrel. The state collects a 12.5 percent royalty, a severance tax of 3 percent to 8 percent depending on the rate of production, and has occasionally levied other smaller production taxes as well as occasionally granted discovery credits. For the purposes of this analysis, we assume these payments average 20 percent of the value of petroleum produced which is undoubtedly somewhat higher than actually the case. Lastly, we assume that all the oil and gas fields that will ever be produced up to Lease Sale 16 are now producing, and we assume that these 11 sales constitute a meaningfully large sample.

Given the above assumptions, production costs plus royalties and related payments come to 0.45 to 0.70 of the discounted value of the petroleum. The 0.30 to 0.55 remaining share has a discounted value of $450 million to $825 million. What proportion of this amount was collected in lease bonus payments? The value of the lease bonus payments discounted to 1961, roughly the year of the sales for the tracts in which oil was discovered, equals $74 million. Thus, assuming the high production cost estimate, bonus bids transferred 16 percent

of the remaining rent, after royalties, etc., to the state. With the low production cost estimate, this percentage diminishes to 9 percent. Even given the favorable assumptions, the effectiveness of the bonus bid as a method for transferring rent to the state appears to be very low.

RECOMMENDATION III.B.1. The Department of Natural Resources should conduct a more sophisticated analysis along the above lines, with attention given to the sensitivity of the conclusions to alternative assumptions.

One might still argue that offshore Cook Inlet is another bad-luck example for the state of Alaska but that, with a large number of sales, the state will earn a fair return over the long run. This may be true in theory. But given the tremendous variations around the mean which are possible due to the great uncertainties involved, the state should (1) consider whether it has enough petroleum lands to lease to be reasonably certain that the law of large numbers is relevant and (2) whether it has sufficient planning expertise and access to capital to cope with the variations in bonus bid flows over time.

RECOMMENDATION III.B.2. The Department of Natural Resources should employ a statistician to assess alternative confidence limits about the mean for bonus bid revenues in 2-year, 5-year, and 10-year intervals given the projected pace of acreage to be leased in the future.

IV. Conclusions

The lease bonus bid appears to have been between 5 and 20 percent effective as a means of collecting rent over and above that collected through royalties. Its historic ineffectiveness may be due to extensive risk discounting on the part of industry, low levels of competition and the use of game theory by industry in determining bids, simply bad luck, or a combination of all of these. Regardless of the reason, both the theory and evidence brought out in this report suggest the state of Alaska should seriously consider alternative leasing systems, initiating or participating in presale exploration, acquiring the expertise to establish competitive bid rejection values for each tract, or a combination of all three of these.

This portion of the overall study does not address alternative lease terms or procedures for determining lease winners. If the state retains the lease bonus bid approach, especially with current royalty levels, its effectiveness can be increased in two interrelated ways. First, the state could contract or provide incentives for limited exploratory drilling with public dissemination of information prior to lease sales. This information could reduce uncertainty substantially and thereby increase the level of competition. Second, the state could, itself, behave as a bidder by establishing competitive bid rejection criteria for each tract. Such an approach at least would increase the level of competition substantially, for example, from 2.2 to 3.2 serious bidders on likely tracts in Lease Sale 9. But more importantly, the state's bid could reduce the effectiveness of game theoretic strategies significantly, thereby having a bigger impact than merely increasing the number of bidders. Each of these approaches can be developed over time with increasing intensity or sophistication. There effectiveness and cost can be monitored and optimal levels roughly

determined. These proposals cannot be rejected on the grounds that staffing and expenditures comparable to Exxon's exploration division would be required.

Even if the lease bonus bid approach is abandoned, some changes along the above lines would probably be desirable. First, there is no known perfect set of lease terms or procedures of determining lease winners under conditions of uncertainty and limited competition. While other leasing strategies may be better, there will probably still be advantages to reducing uncertainty and increasing competition. Second, the state could better plan sales over time and predict revenue flows if it had information on areas to be leased. Again, such information might be gathered by initiating or providing incentives to industry to drill. Or it may be sufficient for the state to participate in industry-initiated seismic exploration and to employ several seismologists or contract for the analysis of seismic data.

In summary, the Department of Natural Resources should seriously consider increasing its level of expertise and role in exploration, incrementally over time but substantially during the next 5 to 10 years.

Notes on HB 854

1. 5-year leasing program submitted to each regular Legislature specifying land to be leased in the 3rd and 4th years after the year in which leasing program is submitted. The 1979 through 1983 leasing program will be submitted to next year's Legislature.

   THIS WILL PERMIT THE LEGISLATURE, THE PUBLIC AND THE OIL & GAS COMPANIES TO KNOW LONG-RANGE LEASING PLANS OF ANY PARTICULAR GOVERNOR OR COMMISSIONER OF NATURAL RESOURCES.

2. Commissioner would also submit an annual report to the Legislature on the bidding methods used, or proposed to be used, and why.

   THIS WILL HELP ALL ALASKANS TO UNDERSTAND BETTER THE ECONOMICS OF OIL EXPLORATION.

3. Methods include:

   a. Cash bonus with a fixed royalty of not less than 12½% (present method);

   b. net profit bidding, and

   c. royalty bidding, but only where "unleased acreage is subject to drainage by offsetting wells."

4. A "minimum work commitment" may be included in a lease. (to be amended?)

5. Exploration incentive credits -- based on footage drilled and geophysical work done -- can be made part of the lease and may be taken against royalties; rentals and taxes, but may not exceed 50% of the payment toward which it is being applied.

   THE CREDIT SYSTEMS WILL PROBABLY NOT BE NEEDED AT THIS TIME, BUT SHOULD BE IN THE LAW TO PERMIT THEIR USE IN THE FUTURE, IF NECESSARY.

6. The Commissioner may reduce royalty but only when a clear showing is made by the lessee that in the later stages of production his rate of return, based on his total investment in the field, is insufficient.

   ANOTHER SECTION OF THE LAW IS AMENDED TO DELETE COMMISSIONER'S EXISTING POWER TO REDUCE ROYALTY AT ANY TIME.

7. The lease term is reduced from 10 years to 5 years, except when "environmental conditions severely restrict operations", the term can then be 10 years.

IT IS IN THE STATE'S INTEREST TO HAVE THE LESSEE EXPLOR AS QUICKLY AS POSSIBLE AFTER HAVING BEEN AWARDED A LEA OR RETURN IT TO THE STATE FOR RE-LEASING.

8. Rentals have been increased from $1.00 per acre to $1.00 - 1st year; $1.50 - 2nd year; $2.00 - 3rd year; $2.50 - 4th year and $3.00 for the 5th and following years. "Shut-in" field rentals may be increased but not to exceed 150% of the rate for the preceding year.

9. The existing law concerning unitization has been left as is. (See HB 815)

10. Leases which draw no bids may be offered by another competitive method but the rental may be less and the lease size greater.

11. All non-interpretive data obtained from activity on the lease may be made available to the State by the lessee, but the information shall be controlled by the existing law on confidentiality.

Re: Issuance of non-competitive oil and gas leases in Susitna Basin

Dear Dr. LeResche:

It has just come to my attention that you or Governor Hammond will be announcing within the next few days that a relatively small area near Flaxman Island on the North Slope will soon be opened for competitive oil and gas leasing, and that many non-competitive oil and gas (and coal?) leases will finally be issued by the State pursuant to applications filed by numerous individuals as long as 2½ years ago. It is also my understanding that you will be announcing your intention to reject all currently pending non-competitive lease applications filed by oil and gas companies in Susitna Basin (many were filed nearly 2 years ago), in order that the land now covered by those applications might be reclassified for competitive oil and gas leasing only.

Your proposed North Slope competitive lease sale will surely generate spirited bidding because of Exxon's recent nearby oil discovery. And, you are certainly to be commended for acting affirmatively at long last on those non-competitive oil and gas lease applications which so many individuals filed in good faith so many years ago. If you have been adivsed that competitive interest will be high in those areas which are now covered by oil company applications for non-competitive leases in Susitna Basin, however, then your advisors are sadly out of touch with reality.

As an independent geologist who makes his living principally from oil and gas leasing activities, and as the one person who has more leasing experience in Susitna Basin than any other individual, I can assure you on the basis of real world experience that interest in Susitna Basin is extremely low at this time despite Union Oil Company's current reconnaissance seismic activities in the southwestern corner of the basin.

Rejection of oil company applications in Susitna Basin at this time will serve only to dampen what little interest there is in Susitna Basin already. Even if competitive interest were eventually to develop in the basin, however, required cumbersome and time consuming pre-leasing and leasing procedures would necessarily result in undue delays in exploration and development activities. If it is your intention to encourage early exploration for natural gas and/or oil in Susitna Basin, therefore, you will approve, rather than reject, all oil company non-competitive oil and gas

AGO 547083 +

lease applications in the Basin, forthwith, just as you contemplate doing for those non-competitive lease applications which were filed by individuals in the area.

Please bear in mind that Susitna Basin is an extremely low-priority geologic province where oil possibilities are believed to be nil and possibilities for natural gas are marginal at best. The sedimentary section is thin in Susitna Basin, and structural information there is extremely scarse.

Moreover, hundreds of thousands of acres remain unleased (or even applied for) in the basin, despite the fact that this land has been available for non-competitive oil and gas leasing for many years now. I also wish to stress that Texaco dropped its oil and gas leases on over 150,000 acres in Susitna Basin after first conducting an extensive seismic program there some eight years ago. Furthermore, to my knowledge Texaco has no plans to drill its remaining 70,000 acres of leases in the basin before they expire next December.

I also think you should know that oil companies haven't exactly been stumbling all over themselves trying to buy my leases in Susitna Basin, either. It took me 7½ years to sell my 40,000-acre Yentna River lease block (to Union Oil Company and Pacific Lighting) in the southwest part of the basin, for example, and, after nearly eight years, I still haven't found any takers for my 47,000-acre Highway Bridge lease block in the east-central part of the basin despite the fact that Union Oil Company is now conduct seismic operations only 25 miles away. As a matter of fact, I still own leases in the immediate vicinity of Union's current shooting area which I haven't yet been able to sell or farm out!

I caution you not to interpret as an indication of high general interest the over-the-counter non-competitive oil and gas lease applications which Amarex Inc. and Gas Supply Corporation of Alaska (GASCOA, a subsidiary of Anchorage Natural Gas) filed jointly on 40,000 acres in the southeastern part of the basin, and on 36,000 acres in the north-central part of the basin nearly two years ago. These companies are so cautious about Susitna Basin, in fact, that, prior to filing the aforementioned applications, they were unwilling to purchase either my Yentna River lease block (which Union Oil and Pacific Lighting now own) or my Highway Bridge lease block, even for as little as $3.00 per acre (my rental investment at that time). In their view, there were (and still are) simply too many geological unknowns in Susitna Basin to justify spending more than a state filing fee of $20.00 per application plus the required annual rental of 50¢ per acre for leases there. Inasmuch as Amarex and GASCOA filed their applications with my help, I can also attest to the fact that their applications cover prospects which are inferred, only, on the basis of best-guess extrapolations from old, incomplete, and now publicly available seismic data which Pure Oil Company filed with the U.S.G.S. over 14 years ago.

Neither should you misconstrue Union Oil Company's recent over-the-counter filings for oil and gas leases in Susitna Basin as an indication that an abundance of favorable geological data is available in that area.

As a matter of fact, in filing its recent applications for non-competitive oil and gas leases on approximately 100,000 acres west of Mt. Yenlo, Union Oil Company had even less geological information to go on than Amarex and GASCOA had when they filed their aforementioned applications elsewhere in Susitna Basin. No outcrops are present where Union filed, for example, and neither has any seismic exploration ever been conducted in the area. Moreover, it should be obvious from the simple rectangular pattern of Union's filings west of Mt. Yenlo that the company hasn't the foggiest notion of what to expect geologically in the area. It would therefore be unrealistic, indeed, to expect Union (or anyone else, for that matter) to pay any more for leases in the area than the small filing fees and rentals which are presently required for state non-competitive leases.

Amarex, GASCOA (now McAlester Fuel Company), and Union Oil Company obviously filed their respective non-competitive oil and gas lease applications in Susitna Basin with the intention of eventually exploring large areas where geologic information is currently sparse or non-existent. In data deficient areas such as these, however, history shows that 90% or more of the land will be condemned geologically by future exploration. These companies are therefore faced with the unpleasant task of condemning most is not all of their respective areas of interest as cheaply as possible!

In these circumstances, of course, it would be totally unrealistic to expect that any of the aforementioned companies (or any others) would suddenly become spirited bidders for competitive leases in any of the geologically questionable areas mentioned above. In fact, it is safe to say that no exploration whatsoever will be initiated in the aforementioned areas by either Amerex, McAlester, or Union Oil unless inexpensive non-competitive leases are first issued to them by the State pursuant to their currently pending applications

The facts make it clear that reclassification of the aforementioned areas for competitive leasing, only, would result in postponement, if not total abandonment, of new exploration and development efforts in Susitna Basin. The question is, however, "Can the State afford to block exploration in Susitna Basin at this time in hopes that competitive interest in the area may pick up at some indefinite time in the future?" I don't believe it can. Here's why.

As you know, Mr. Pat Dobey of the Division of Minerals and Energy Management here in Anchorage has warned the Administration and the public that the Anchorage Bowl area will be faced with a critical shortage of natural gas by 1985 (just seven years from now), unless more discoveries are made in south-central Alaska soon, or, in the alternative, unless a state-built-or-subsidized gas pipeline is laid from Prudhoe Bay to Anchorage.

It would of course be unwise for the State to spend taxpayers' money on a gas pipeline from Prudhoe Bay to Anchorage, when oil companies such as those who have filed for non-competitive leases in Susitna Basin appear ready, willing, and able to spend money from the private sector to explore for and develop natural gas reserves right here in Anchorage's own back yard.

It therefore behooves the State to approve the aforementioned oil companies' non-competitive oil and gas lease applications, forthwith, in order to clear the way for new exploration in Susitna Basin as soon as possible. Remember, Anchorage is rapidly running out of gas, and new discoveries of oil and gas generally require lead times ranging from five to ten years. The State simply cannot afford to hold up development in Susitna Basin any longer. To do so would be totally irresponsible.

While new exploration in Susitna Basin could be highly beneficial to the State of Alaska in general, and to Anchorage natural gas consumers in particular, it could also result in a significantly broadened tax base for the Matanuska-Susitna Borough in which Susitna Basin is situated. Obviously, any further impediments to early leasing, exploration, and development in the aforementioned areas will definitely not be in the best interests of the Matanuska-Susitna Borough. It is therefore to be expected that your proposal to reclassify lands for competitive leasing in Susitna Basin will be denounced by the Matanuska-Susitna Borough Assembly and Planning Department when your competitive reclassification proposal comes up for notice and review pursuant to Section 38.05.305 of the Alaska Statutes. Undue delay in broadening the borough's tax base could be avoided, of course, if you would simply approve all currently pending oil-company (and individually-filed) applications for non-competitive oil and gas leases in Susitna Basin forthwith.

While I believe you can justify immediate approval of all pending non-competitive oil and gas lease applications in Susitna Basin on the basis of the foregoing reasons alone, you must of course also consider the moral and legal aspects of your forthcoming proposal to reject all lease applications filed by oil companies while approving similar applications filed by individuals.

First of all, it must be remembered that all of the now-pending applications were filed in good faith pursuant to laws and regulations which were in effect when the applications were filed (and still are in effect). Moreover, it clear that most of these applications would have been approved already, were it not for the current land freeze.

The land freeze, of course, was originally designed to protect certain aggrieved parties until such time that their grievances could be reconciled by the courts and/or the Legislature (these grievances have since been reconciled). It was not intended to be used as a means of cheating oil companies out of non-competitive oil and gas leases when it was first instituted, and it should not be used as a weapon to be turned against oil companies now.

The oil companies which are involved here (and individuals, too, for that matter) have filed their lease applications pursuant to laws and regulations which are supposed to protect their first-priority rights to the lands in which they have revealed their interest to the world in good faith (their areas of interest are described in their applications, of course, and their applications are on public file for all to see). Accordingly, use of the land freeze as a means of selectively blocking the issuance of leases to

oil companies, while allowing the issuance of such leases to individuals, not only would constitute a reprehensible breach of trust on the part of the admininstation but also would serve double duty as an arbitrary and capricious abuse of administrative power which probably could be challenged successfully in court.

While oil and gas possibilities in Susitna Basin are generally considered to be marginal (even by those oil companies now holding oil and gas leases and lease applications in the area), the element of surprise in oil and gas exploration is such tnat significant reserves of oil and gas could nevertheless be discovered there. For a low-priority area such as Susitna Basin, however, economic incentives for exploration must be unusually attractive. You can provide this needed incentive, of course, simply by making it easy for everyone (including oil companies) to assemble large blocks of inexpensive non-competitive oil and gas leases in the area.

An early increase in the rate of exploration and development in Susitna Basin will clearly bring economic benefits not only to the State but to the Matanuska-Susitna Borough as well. It will also provide new jobs for oil workers, and it will stimulate new business for the service companies. Moreover, by making it known that you are clearing the way for possible early discoveries which could prevent the occurrence of an impending natural gas crisis in the Anchorage area, you could make considerable political hay in this important election year.

The foregoing observations make it obvious that competitive leasing will not stimulate urgently needed new exploration for oil and gas in Susitna Basin, whereas non-competitive oil and gas leasing will. I therefore urge you to reconside your present plans to reclassify lands in Susitna Basin for competitive leasing only, and, instead, to approve all presently pending applications which oil companies and individuals alike have filed for non-competitive oil and gas leases in the area to date. I also urge you to lift the current land freeze in order to clear the way for future non-competitive oil and gas leasing in Susitna Basin. The sooner you take these important steps, of course, the sooner exploration can get under way, and the better it will be for all parties concerned.

Very truly yours,

L. C. LOVELY

STATE OF ALASKA

DEPARTMENT OF NATURAL RESOURCES

OFFICE OF THE COMMISSIONER

JAY S. HAMMOND, GOVERNOR

11TH FLOOR, STATE OFFICE BLDG.
POUCH M — JUNEAU 99811

for HB 854

April 21, 1978

RECEIVED
APR 24 1978
Div. of Minerals & Energy Mgt.
Anchorage, Ak.

Honorable D. R. Getty, Minister
Alberta Energy and Natural Resources
319 Legislative Building
Edmonton, Alberta, Canada
T5K, 2B6

Dear Mr. Getty:

Governor Hammond's recently introduced oil and gas leasing legislation for Alaska has now had incorporated into it by the legislature a drilling and geophysical incentive credit system similar to Alberta's. We have looked at the concept and, based on what we know, believe that the system could become useful in Alaska. However, we do need help in understanding how it has actually worked in your province.

Could we ask your assistance in explaining the operations of the system, both conceptually and technically, to some members of our legislature. The bill, HB 854, a copy of which is enclosed, is expected to begin Senate committee hearings sometime in May.

It would be of particular help to us if someone from your department could come to Anchorage to brief my staff and to Juneau to testify before the Senate Natural Resources Committee. We would, of course, cover all expenses. The exact dates of the visit would have to wait on the progress of the bill, but it is likely to be in mid or late May, 1978.

Over the past several years, Jack Roderick, my Special Projects Coordinator, who has been in charge of this particular legislation, has kept in contact with Michael J. Day, and others, in your minerals disposition division, on land tenure matters and he, or someone of your choice, would be most welcome. I will have Mr. Roderick arrange for the visit, subject to your authorization.

AGO 547090

Thank you for your assistance in this matter. We believe Alaska can benefit from Alberta's experience with the exploration incentive credit system.

Sincerely yours,

Robert LeResche
Commissioner

MEMORANDUM

File copy
O&G Leasing

TO: Robert E. LeResche, Commissioner
Department of Natural Resources

DATE: December 22, 1977

FILE NO:

TELEPHONE NO:

FROM: Jack Roderick
Special Coordinator

SUBJECT: Meeting with AOGA landmen
Juneau, 12/15/77
Proposed Leasing Legislation

Presented copies of draft oil and gas legislation to oil company representatives (Alaskan Oil and Gas Association land and legal committee) at a meeting in Baranof Hotel, Juneau on December 15, 1977. This is the same proposed legislation which was presented to Speaker Hugh Malone's ad hoc leasing committee on December 9th in Anchorage. A 3-hour give-and-take discussion was had. Representing the State in addition to Roderick were Joe Green and Pat Dobey. Carl Smith took notes.

In the order of discussion the oil company representatives felt:

1) No need to change existing laws, leasing or other.

2) Opposed to Commissioner having to "report" to legislature, either 5-year leasing program, or annual leasing methods. Feel executive should maintain complete control over leasing i.e. "keep politics out", perhaps a Leasing Board, like Louisiana, Colorado, etc., (a) and (b).

3) Opposed to requirement that federal agencies must be consulted prior to leasing. Failure to consult might result in law suit, (b) (4) (C).

4) Opposed to restricting any one leasing method to no more than 50% of area, (5) (E).

5) Opposed to royalty, net profits and work commitment type bidding (c) (but see Chevron's position, attached.) BP thought that allowing the Commissioner to postpone any part of the payment of the cash bonus would result in the state being "ripped off" by the irresponsible operator.

6) Opposed to permitting legislature by joint legislation to disapprove new leasing method, (g). Stated that State Attorney General believes this kind of attempted delegation is unconstitutional.

7) Questioned whether State should have the right to store or trade its royalty even with "consent of the majority" of the effected field lease holders". (j) Phillips (Swetnam)

8) Pointed out that (k) as written would allow State to terminate a 5-year lease which was capable of production in paying quantities but had no market available. Recognized State's need not to allow fields to remain "shut-in".

9) Opposed to accelerating rentals of this magnitude. (Roger Herrera, BP, suggested "freezing" rentals after a dry-hole, thereby giving incentive to drill quickly and yet continue to explore.) (l).

AGO 547092

TO: R. E. LeResche
FROM: J. Roderick
DATE: 12/22/77
SUBJ: Meeting with AOGA landmen, Juneau, 12/15/77 - Proposed Leasing Legislation

10) Suggested that a State "shorelands" preference lease, due to a determination of navigability, be given on fee (Native) acreage, also, (m).

11) Didn't believe development contracts are workable and certainly opposed to State sharing in "the costs of exploration." (r)

12) Favored lands being offered non-competitively if no bids received at first sale. (u) Stressed the need for lands to be made available on a regular, continuous basis.

13) Opposed to restriction on joint bidding.(v)

14) Opposed to State's right to "purchase not to exceed 16 2/3% by volume of the oil and gas produced". Might accept an amount equal to original royalty in lease.(w)

15) Opposed to State's right to "all data". (x)

16) Opposed to lowering acreage limitation on uplands to 200,000 acres. Pointed out that there would have to be a "phase-in" period during which companies now at the maximum would be allowed to continue to lease. Otherwise, those companies who have acted aggressively in the past would be penalized. Sec. 3 (c).

Summary: AOGA Land and Legal Committee believes that the Legislature asked the Administration to review not revise oil and gas leasing law. Present bonus bid system is sufficient. Federal OCS law still not passed by Congress. Royalty bids on OCS will result in "less money to U.S. government." State administration should maintain complete and strict control over leasing; legislature should be informed only as they are presently.

Proposed law will hinder, not help, exploration in Alaska. "This will kill exploration in Alaska. We are categorically opposed to it." Herrera, BP. The methods, other than bonus bid, will not work. Work commitments will be impossible to administer.

Cash or performance bond requirment will discourage exploration even if commissioner can credit work against cash deposit. Perhaps statewide performance bond based on a percentage of amount bid would satisfy.

Reaction was as I expected. Despite the overwhelming negativism, some constructive ideas came from the exchange.

Recommendations:

1) Redraft legislation taking into account some of AOGA's suggestions. This has been done (see attached draft #8, in which I have made the changes noted below.)

Key issues still appear to be:

TO: R. E. LeResche
FROM: J. Roderick
DATE: 12/22/77
SUBJ: Meeting with AOGA landmen, Juneau, 12/15/77 - Proposed Leasing Legislation

a. executive-legislature relationship (have retained the "reports" to legislature).

b. number and kind of leasing alternatives (have retained net profits and work commitments).

c. escalating rentals and lease term (have shortened to 5 years).

d. "shut-in" status of fields (have added "reasonable" time in which to produce).

e. state's right to purchase oil and gas (have retained 16 2/3%).

f. acreage limitation reduction on uplands (have included a "phase-in period).

g. restriction on joint bidding (have retained).

h. maintenance of non-competitive leasing in some form (have specified "noncompetitive" as option).

i. state's right to store or trade (have retained).

2) Contact Hugh Malone to see how extensive a leasing law change is possible in the upcoming legislative session. If taken at their word, AOGA is prepared to fight "any change" in the oil and gas leasing statute.

3) I believe AOGA realizes that Alaska will eventually demand to have at least as much flexibility in leasing as the Federal government. I believe our fortunes ride to some extent on the OCS legislation now pending in in the U.S. House and for that reason I feel we should follow the OCS legislation closely and time our legislative effort accordingly.

4) Contact independent oil operators who will support methods of leasing which the major oil companies may oppose. (See enclosed sample letter for you to send to attached list of "independents" and others, including the AFN.)

5) It appears as if the high tax, low development profile of the State government over the past few years have the major oil companies in a fighting mood. The "tax ads" are the leading edge of the attack. Any leasing changes will be caught in the 1978 "political" year. Thus, consultations with key legislators is doubly important. The key policy decision remains: what changes are essential to proceed at this time toward the Beaufort lease sale in 1979 and beyond?

6) You will need to consider the disposition of the noncompetitive offers which were chosen in simultaneous drawings several years back, and over-the-counter offers. Also, the question of pending Federal oil and gas offers which appear to have a State preference right at the time

TO: R. E. LeResche
FROM: J. Roderick
DATE: 12/22/77
SUBJ: Meeting with AOGA landmen, Juneau, 12/15/77 - Proposed Leasing Legislation

of TA under existing law. The draft legislation no longer grants an automatic preference right to these Federal oil and gas offerors, so the status of these pending offers will come into question.

I will be willing to meet with you at any time to decide what course of action should be taken on these matters.

HAVE ENTIRE THING PUT IN MY HB 854 FILE

MEMORANDUM

March 28, 1978

SUBJECT: Comparison of Statements by Milton Lipton on Oil and Gas Leasing Policy (W.O. 5195)

TO: The Honorable Hugh Malone

FROM: Gregg K. Erickson
Director of Research

As you requested, we have analyzed recent statements by Mr. Milton Lipton concerning oil and gas leasing policy, and compared these with the positions taken in late 1969 and early 1970 by Mr. Lipton (Economic Considerations for Alaska's Future Oil and Gas Leasing Policy, W. J. Levy Consultants Corporation, N. Y., 1970). Although a number of the points discussed in the 1970 memorandum were not the subject of more recent comments, and vice-versa, we generally find the Lipton positions to have been consistent. We have summarized some of the high points and are attaching a copy of the 1970 memorandum.

In general, the 1970 memorandum made its strongest recommendation with respect to the rate at which lands are made available for exploration. It was suggested that a continuous and steady supply of exploration acreage would be appropriate, but that the state should feel no compunction about withholding acreage for future lease sales adjacent to lands being currently disposed of. With respect to leasing systems, the memorandum expressed general approval of the competitive leasing system currently in place, a somewhat qualified disapproval of royalty bidding, and a strong disapproval (with only minor exceptions) to the use of non-competitive leasing systems.

In 1970, as this year, Lipton argued for the establishment of work obligations in leases, but did not consider their use as a bid variable. The sliding scale royalty device, though not considered as a bid variable, was given a qualified endorsement as a lease term. However, from the context, it appears that Lipton's 1970 discussion contemplated that the highest royalty rate in the sliding scale would be 25 percent, substantially lower than the percentages presented in the hypothetical calculations made by the Department of Natural Resources.

All of the foregoing positions are consistent with Lipton's most recent testimony. In one minor change of emphasis, Mr. Lipton now seems to have some question about the desirability of acreage limitations. In the 1970 memorandum, these were explicitly endorsed.

AGO 547101 +

Net profits leasing and work commitment bidding were not discussed at all in the 1970 memorandum.

Please let us know if you need a more detailed analysis of any of these points.

MEMORANDUM

SUBJECT: Legislative Role in Leasing of Oil and Gas Land - HB 854

TO: The Honorable Hugh Malone
The Honorable Merle Snider

FROM: Gregg K. Erickson
Director of Research

In testimony and private conversations concerning HB 584, administration representatives have strongly argued against any direct legislative involvement in the oil and gas leasing process. This opposition creates an important political dimension to the decision as to how (or whether) the legislature should be involved in this process. The purpose of this memorandum, however, is to explore other aspects of this issue, and to present some options for your consideration.

As currently structured, HB 854 would place the legislature in an almost totally passive position with respect to leasing. The administration would be required to make certain reports to the legislature, but any other direct influence would have to be through enactment of future legislation (including appropriations). Two major areas where some legislators might desire a more active involvement are in the choice of leasing systems, and in the selection and scheduling of acreage to be offered for lease. In each of these cases, legislative involvement could take the form of:

AGO 547103

1. A requirement that the leasing program (bidding systems) be approved in advance by joint resolution, or

2. A stipulation that the leasing program (bidding systems chosen) would be subject to a legislative veto, by joint resolution or by simple resolution of either house.

If you desire to include either of these methods (with respect to the choice of acreage, the choice of systems, or both), we would suggest that the formal document to be acted on by the legislature be a two or three year "program" and that the commissioner be required to update this each year. A legislative veto could stop all leasing, or it could simply mean that the program would go forward under the previously approved plan.

While we have not secured a formal legal opinion on the requirement for legislative approval, or legislative veto, informal consultation indicates that both systems have been used in the past in other instances, and that both would be constitutionally sustainable.

In a sense, a committee decision to advocate legislative approval of individual leasing decisions, implies that the committee cannot or is unwilling to deal in a comprehensive way with the various issues that will arise in the course of the life of this act. In any event, if the

legislature decides not to formally inject itself into the leasing process, it is likely to want a much more tightly drawn and carefully conceived piece of legislation. On the other hand, a bill which includes a provision for legislative veto could probably be written allowing much more latitude for the commissioner in his conduct of leasing policy.

Finally, it should be noted that legislature could specify more formal oversight of the leasing function without intruding directly into the leasing process. For example, the bill could require that a standing or special committee of the legislature, or a legislative staff agency submit formal reports to the legislature each year on the manner which the legislative policy is being carried out.

MEMORANDUM

SUBJECT: Leasing of State Land for Oil and Gas Development - HB 854 (W.O. #11/R)

TO: The Honorable Alvin Osterback

FROM: Gregg K. Erickson
Director of Research

You requested that we provide an analysis of this bill. We have done this below in a cursory manner, and have attached additional material provided by the Department of Natural Resources (DNR). We have also noted some areas where we see potential problems. You will undoubtedly be taking a great deal of testimony on this bill from DNR, the legislature's consultants (Milton Lipton and Mason Gaffney), and the industry. After you have heard the testimony we would be pleased to address any points that you may at that time wish to have analyzed in depth.

Under current law the state is restricted to leasing oil and gas lands under the bonus bid system, or by the non-competitive system, which is essentially a lottery. However, the use of the non-competitive system has been of little importance during the past fifteen years, since all lands of medium or high potential have been classified so as to make them only eligible for bonus bidding.

In recent years other jurisdictions, most notably the federal government, have been moving towards expanding the number of bidding systems that could be used in leasing oil and gas lands. The U.S. Senate and House of Representatives have passed different versions of a bill that would accomplish this, and are about to enter conference on this legislation.

The legislation before your committee, HB 854, resembles this federal legislation in a number of important ways. The major thrusts of both the Alaska bill and the federal legislation are directed at expanding a number of leasing systems that may be used by the government in disposing of its land, increasing the opportunities for smaller firms to participate in development of oil and gas resources, and at insuring that the government achieves an appropriate return for the leasing of its oil and gas lands. In addition, the federal legislation establishes

AGO 547106 +

procedures for coordination and review of federal leasing plans by adjacent states, and establishes institutional arrangements for protection of the environment.

The attached material headed "Description of Leasing Methods in HB 854" sets out in summary form the systems that would be allowable under the Alaska legislation as it now stands. Also attached is a memorandum from Mr. Jack Roderick to Commissioner LeResche which describes the rationale which went into choosing these systems. This particular memorandum has been released by the Department with the request that its circulation be restricted to legislators and legislative staff. All the other attached material may be released to the public, if you so choose.

Some points which you may particularly wish to look into in your consideration of HB 854 are noted below:

1. Legislative Review. The legislation calls for submission by the commissioner to the legislature of an annual "leasing program". The administration apparently intends that no lease would be issued unless "it is for an area included in" the program (page 2, line 19). If this is indeed the intent, it perhaps could be clarified by amending language at this point. In any case, the you should note that the bill has been carefully drafted to avoid any active involvement in leasing policy by the legislature. This, of course, is no change from the current policy, but under HB 854 the latitude of the commissioner, in choosing leasing systems and in other matters, has been substantially increased, and the legislature may wish to be more involved.

2. Expenses Charged Against Royalty Oil. The bill contains language (subsection (c), on page 4) which would insure that future leases are not subject to the same sort of dispute over the cleaning and dehydration costs as the state is now litigating with the Prudhoe Bay producers.

3. Choice of Leasing Systems by the Commissioner. Nowhere in the bill does the legislature give the Commissioner of Natural Resources any guidance as to when he should or should not use a particular leasing system. The commissioner is required, in his annual "leasing program" submission, to explain to the legislature why he believes a particular system should be used in a particular area. However, the choice and the adequacy of the justification remain beyond legislative review. In the attached material DNR has provided some explanation as to the conditions that would call for the use of one system or another. The legislature may wish to consider these explanations, and - if it agrees with them - may wish to include language within the law to give the commissioner (and future commissioners) guidance along these lines.

4. Work Commitment Bidding. Paragraph (4) (on page 5) would establish work commitment bidding as a leasing alternative. Under this system the bid variable would be the amount of effort the lessee agrees to expend in exploring the land. Use of this alternative will, on the average, result in less revenue to the state, with the revenue that is foregone by the state being expended in developing resources that would otherwise be uneconomic. This is a clear instance of economic subsidy. The legislature may wish to consider whether this subsidy is desirable, and if so, whether this is the most efficient way to provide it.

5. Commissioner's Discretionary Authority to Reduce Royalty. The commissioner now has authority to reduce the royalty rate on tracts having marginal production. So far as we know this authority has never been utilized. Subsection (d) of the proposed law (page 6) retains this authority to lower royalties. It becomes much more significant in the context of this bill, however, because of its use of royalty bid and sliding scale royalty leasing systems. Particularly in the case of the royalty bid arrangement, a lessee may, with a very high royalty bid, acquire a tract on the assumption that the commissioner will reduce that royalty if and when production is developed. The legislature may wish to consider the possibly of limiting this authority to only to royalties paid ~~the~~ WHEN production level is within the lowest block of the royalty schedule, i.e., at the bottom of the "sliding scale".

6. Non-competitive Bidding. HB 854 would allow the commissioner, at his discretion, to offer acreage on a lottery system if the acreage had not received a bid in an earlier competitive sale. The legislature should be aware that this system, in combination with initial offerings at unrealistically high minimum bids, could be used to give away the state's oil and gas resources to private individuals or firms.

We will be pleased to examine these or other questions in more detail. We are confident that Mr. Lipton, Professor Gaffney, and the industry will raise additional questions that the legislature may also wish to examine.

May 30, 1978

SUBJECT: CSHB 854 and the Effects of Using Multiple Oil and Gas Leasing Methods on Unitization

TO: The Honorable Kay Poland

FROM: Gregg K. Erickson
Director of Research

Summary

At the Senate Resources Committee meeting on Friday you received testimony to the effect that the use of differing leasing methods on adjacent tracts, as would be permitted under HB 854, would make it difficult to establish unitized development and production of the pools over which those tracts lie. Generally, our studies of this question, which we have conducted since the matter was first raised several months ago, do not support this conclusion. On the contrary, they show that the incentives to unitize will not be seriously reduced by diverse lease arrangements, and that the difficulties of reaching unit agreements will not be increased as a result of this diversity.

The Incentive To Unitize

Unit arrangements exist and are encouraged by state policy because centralized, unitized operation of an oil or gas field can and usually will result in substantial reduction in the expenses of extracting the resource, and in absolute gains in the total amount of oil and gas recovered. That the potential for these gains exists is, under the circumstances we have had in Alaska, almost never a matter of contention among the leaseholders who would be a party to a unit.[1] The most

---

[1] See Bradner, Tim, "Oil and Gas Regulation in Alaska," *Alaska Review of Business and Economic Conditions*, 1971.

important question here is therefore: Will the use of differing leasing systems as contemplated in HB 854 significantly reduce the incentive to unitize that is provided currently by the very real benefits of joint, unitized field development and operations?

We think not. At a high royalty rate, as might be encountered under straight royalty bidding, the benefits in the form of increased production are, of course, shared with the landowner on the basis of the royalty percentage. But all the benefits in the form of reduced costs remain with the lessee. In a net profits arrangement the benefits of increased production and reduced expense are both shared with the lessor, but still leave the lessee with substantial incentive to partake of the advantages of unitization. Naturally, if the royalty or net profits rates were set at or close to 100 percent these incentives would disappear, but so would the incentive to develop the tract at all.

Difficulties in Unitization

Despite the retention of a clear incentive to unitize under a mixture of leasing methods as in HB 854, it is possible that a mixture of systems might create a practical barrier to unitization. This might occur, for example, if the differing lease terms made it impossible for the lessees to agree on the proper apportionment of the unit's expenses and produced oil and gas.

Current Alaska law provides only general guidance as to how this allocation is to be made.[2] The usual practice has been to allocate the costs and production generally on the basis of the costs and production that would accrue to an individual leaseholder were he to operate the tract on an individual, non-unitized basis. Another method less frequently employed, but used, at least partly, in the formation of the Prudhoe Bay unit, is to allocate expenses and actual production on the basis of the original petroleum in place underneath each lease. Other factors, or combinations of these factors, may also be considered, and one study has distinguished examples of 42 different methods of apportioning participation.[3]

---

[2] AS 31.05.110(c) provides that "each plan of unitization shall contain fair, reasonable and equitable provisions for...the division of interest or formula for the apportionment and allocation of the unit production, among and to the several separately owned tracts within the unit area such as will reasonably permit persons otherwise entitled to share in or benefit by the production from such separately owned tracts to produce and receive, instead thereof, their fair, equitable and reasonable share of the unit production or other benefits of it; a separately owned tract's equitable, and reasonable share of the unit production shall be measured by the value of each such tract for oil and gas purposes and its contributing value to the unit in relation to like values of other tracts in the unit, taking into account [1] *acreage*, [2] *the quantity of oil and gas recoverable from it*, [3] *location on the structure*, [4] *its probable productivity of oil and gas in the absence of unit operations*, [5] *the burden of operations to which the tract will or is likely to be subjected*, or so many of these factors, or such [6] *other pertinent engineering*, [7] *geological* or [8] *operating factors* as may be reasonably susceptible of determination...." (emphasis and numbers added)

[3] A. A. Khan and H. H. Power, "An Analysis and Comparison of Engineering Bases of Participation in Unit Agreements," *IOCC Committee Bulletin*, December 1960, p. 101.

Reaching an agreement on the theoretical basis for allocating participation and resolving all the associated technical issues can be a complex, difficult and protracted process. Although all parties usually have a clear view of the overall benefits to be gained from unitization, some may "hold out" in hopes that by doing so they may be able to extract a better deal from their fellow lessees concerning the allocation of the benefits of unitization.[4]

The question here, though, is whether differing lease arrangements will make reaching an agreement *more* difficult. In our view, the question answers itself when considered in the context of Alaska's unitization law and the permissible bases for apportionment of participating unit interests enumerated therein.[5] For example, is the "acreage" in a lease altered by the fact the lease contains profit sharing arrangements? Is the "location or the structure" affected by the royalty arrangements? Or are the "engineering, geologic or operating factors" influenced by either? We believe it is obvious that they are not.

---

[4] For a listing of the problems that can arise in unitization negotiations see Stephen McDonald, *Petroleum Conservation in the United States: An Economic Analysis* (Resources for the Future, Washington: 1971), pp. 198-201.

[5] AS 31.05.110(c). See note 2, *supra*.

A Final Point

As a final point, we note that tracts bearing differing royalty burdens have already been included in units, in Alaska and elsewhere, wherever individual holders of federal and state noncompetitive leases have sold those leases while retaining overriding royalties. Moreover, differing lease arrangements are likely to exist in the future side by side wherever Native corporation or federal and state oil and gas lands are contiguous. It is possible, of course, that if the legislature gives the commissioner of Natural Resources authority to use alternative leasing methods that these differences may be reduced or eliminated.

cc: Members, Senate Resources Committee
The Honorable Chat Chatterton
The Honorable Hugh Malone
Mr. Phil Holdsworth

yle
HB 854
o&g leasing

March 8, 1973

Robert LeResche
Commissioner

Position Paper on HB 854
Oil and Gas Leasing

Here is a clause-by-clause analysis of HB 854. Coupled with my memo to you of February 28, 1973, you should have much of the information needed for the hearings scheduled before the House Resources Committee on March 16 and 17. Note that I am already recommending amendments. Perhaps we should offer them on the 16th. Milton Lipton is to testify after us on the 16th; Mason Gaffney will testify on the 17th.

Section 1

(a) Purpose clauses - self explanatory

Choice of the phrase ".....minimize the exploitation of these natural resources...."
(1)(B) meaning to reduce uneconomic exploration, may be unfortunate. These words do not mean that leasing is opposed. Likewise the phrase "....while minimizing revenue from unsuccessful exploration " (1)(D) which means the state's desire to share less in bonuses and more ... oyalties, etc.

(b) Five year leasing program. As precisely as practicable, the commissioner determines the size, timing and location of leasing which he expects to take place during the following five-year period. He "approves" the program and must review "at least once each year." We may wish to change this to "no more than once each year" if more stability is desired. He may "revise" and "reapprove" the leasing program.

The leasing program is submitted to the legislature "for its information" (not approval) within 10 days after the convening of each regular session. The first leasing program is due on or before January 1, 1980.

(4) Leasing program procedures. An AMENDMENT deleting "by regulation" will be necessary. We believe it will be sufficient for the commissioner to establish procedures for the formulation review and revisions to the leasing program. Pre-leasing regulations, which apply to the sales, will be in addition to these leasing program procedures. Should regulations be required for the leasing program, any revisions by the commissioner would probably require a formal hearing or hearings. We feel this would not be necessary.

Included in the procedures will be nominations of areas to be included or excluded from the leasing program, and notice to the federal and local governments and to the public who wish to participate in the development of a leasing program are called for, as well as coordination with the CZM program.

Perhaps an AMENDMENT specifying which federal (Dept. of Interior?) and local (boroughs?) agencies should review.

AGO 547058

(5) Annual bidding method report is submitted to legislature within 10 days of the convening of each regular session. The report includes:

(A) A schedule of all lease sales held during preceding year and bidding method or methods used;

(B) Schedule of all lease sales to be held the next year and bidding method or methods proposed to be used;

(C) Cost-benefit analysis associated with each method;

(D) Reasons why a bidding method was selected;

(E) The reasons why more than 50% of the area leased in the upcoming year is to be leased under one particular bidding method;

(HR 1614, the House OCS bill, requires that sliding scale royalty, net profits and work commitment bidding methods be used not less than 20% nor more than 50% of the time.

This provision applies for 5 years, but can be waived by the Secretary. S9 requires, for five years, that bonus bidding not be used more than 50% of the time in areas where there has been "no development" prior to October 1, 1975. The Secretary determines these areas.)

(c) HB 854 requires that all lands will be first offered competitively. Only one bid variable will be used in any bidding method. Bids will be sealed, or other methods can be used. The state's royalty share will be free of all lease or unit expenses, including separation, cleaning, etc. costs.

Following a pre-sale analysis, the commissioner may choose at least one of the following leasing methods (which are all included in HR 1614 or S9):

(1) Bonus bidding

(A) Cash bonus bid with a fixed royalty - this is the present competitive method

(B) Cash bonus bid with a sliding scale royalty (see B. Mondzell's Memo dated 3/1/73 attached)

(2) Royalty bidding

(A) Fixed bonus with royalty as the bid variable

(B) Fixed bonus with sliding royalty as the bid variable

(3) Net profit bidding

(A) Cash bonus bid, fixed royalty, not less than 30% net profit (in OCS legislation 30% net profits equates to 12½% royalty)

(B) Fixed bonus, bid net profit--this is the only bidding method that does not require of royalty of not less than 12½%. "In kind" taking is protected by the state's right to purchase (v).

(C) Fixed bonus, fixed royalty, bid net profit

(D) Net profit share is "royalty" for Permanent Fund

(4) Work commitment bidding

Fixed bonus, or fixed royalty, or fixed sliding scale royalty, or fixed net profit, or any combination. Work commitment bid in dollars. 20% of the dollar amount bid in cash or performance bond required at the time of bid.

State may recover unperformed amount. Commissioner may terminate if work is unnecessary or cumulative. Regulations will permit the inclusion of all costs, except lessee's general overhead, toward work commitment. (S-9 requires 100% cash or performance bond. HR 1614 fixes a bonus at not less than $62 per hectare ($25/acre) and fixes the royalty at 12½% or 30% net profits.)

(d) Regulations allowing reduction of royalty during declining production, beginning two years after initial production. (HR 1614 allows the Secretary to eliminate any royalty at any time.)

(e) Commissioner may defer any part of the payment of the cash bonus up to five years.

(HR 1614 - same)

(f) Commissioner may withhold acreage from particular sale - this provision may be unnecessary unless legislature feels authority should be specified in order to withhold a tract from leasing block.

(g)(h) Regulations governing net profits and work commitments will be adopted. (Question: Should definition of allowable costs in net profits and work commitment be in the bill? Ad Hoc leasing committee thought not.)

(i) With consent of the leaseholder, state may store or trade its royalty. (HB 815 addresses this matter and appears to prohibit all storing; i.e. underlifting or overlifting.)

(j) Maximum size of lease is 5,760 acres, except subsec.(t). Presently, uplands 2,560 acres, offshore 5,760 (same as OCS).

Lease term 5 years, (except up to 10 years if environmental conditions severely restrict operations) or so long as produced in paying quantities (same as OCS). Unit or drilling will hold a lease. Commissioner must give

reasonable time to place a shut-in well on producing status (same as existing law). Rental may be increased not to exceed 150% of the rental the preceding year for a lease held past the primary 5-year term. (Presently a minimum royalty of $1/acre is charged on shut-in leases). By regulation, commissioner may require the lessee to drill deeper or the deeper horizons revert to state for resale. (Perhaps this requirement to drill deeper can be accomplished by inserting stronger due diligence language in lease contract.)

(k) Freeze rental at abandonment or until royalty, net profit or work commitment exceeds rental for 3 consecutive years.

Rentals are:
Year 1 = $1.00/acre
Year 2 = $1.50/acre
Year 3 = $2.00/acre
Year 4 = $2.50/acre
Year 5 = $3.00/acre

(present rentals - competitive $1/acre; noncompetitive .50¢/acre)

(l) May issue holder of a federal or private lease or state shorelands lease within its boundaries. Term may not exceed 5 years. (These are lands determined to be "navigable" during lease term.)

(m)(n) Unitization (existing law). No changes.

(p) Pooling for well spacing (existing law). No changes.

(q) Development or drilling contracts (existing law). State may share in the costs of exploration (new). These contracts have been authorized for years, but never used. We did not delete from HB 854 in order to allow the legislature to decide to eliminate or to keep. Work commitment and subsection(t) could replace these contracts. (S9, OCS, Federal government can share in exploration costs.)

(r) Subsurface storage (existing law). AMENDMENT. By error last line in existing law was not included. Should be added.

(s) Lessee's report on "local hire" (existing law). Provision required in lease (new).

(t) Tracts receiving no bids may be offered on flexible terms including noncompetitive. [illegible] include a sliding scale royalty. Rentals may be less than in subsec(k) and tracts may exceed 5,760 acres in size.

(u) Authority to restrict joint bidding by major or multi-national oil and gas companies to encourage competition.

(HR (HR 1614 restricts joing bidding to companies who have 1.6 million barrels or more per day production. Also, anti-trust review by the Attorney General and the Federal Trade Commission is required.)

(v) State may purchase up to 16.66% of oil and 100% of gas production at the regulated price or fair market value. Purchased petroleum may be used as "in-kind" royalty.

(w) The commissioner is given the right to obtain "all data" obtained from exploration, development or production from the lease. This is simply the lessor's recognized right to have what information it deems necessary to intelligently manage its land. (Title 30, Section 251.12, Code of Federal Regulations gives the Secretary the right to inspect and select for at least one year any or all geological or geophysical data collected by the lessee. This includes geophysical data, processed geophysical information and reprocessed information. It does not include interpreted geological or geophysical information. Data must be kept confidential for ten years after the issuance of the permit, and, then, processed, reprocessed and interpreted geophysical information is released to the public. Geological data and analyzed and interpreted geological information obtained from deep strategraphic tests are released five years after completion of the test well or 60 calendar days after the issuance of the first Federal lease within 50 geographic miles of the test site, whichever is earlier.)
POSSIBLE AMENDMENT TO INCLUDE CONFIDENTIAL STATUTE AS 38.05.035

Section 2

Notice requirements of AS 38.05.135(b) retained for competitive sales; deleted for noncompetitive

Section 3

Upland acreage limitation reduced from 500,000 acres to 200,000 acres. Offshore maximum acreage remains at 500,000 acres. AS 38.05.140(c)

Section 4

The priority given a Federal oil and gas offer to a state noncompetitive lease is extinguished. AS 38.05.145(b) This provision now provides that if lands on which a federal oil and gas noncompetitive lease offer exists is classified as competitive by the state within 90 days of receipt of tentative approval from Interior, the priority given the Federal offeror to a state noncompetitive lease is extinguished. I believe an AMENDMENT to HB 654 will be necessary to specify that as of the effective date of the Act all state lands will be classified as competitive. Thus, any lands which subsequently are tentatively approved will not grant a priority to a noncompetitive offer. Approximately 80 Federal offers have earned a preference right and will be awarded state noncompetitive leases under the existing law. The amendment will need to protect these existing rights.

HB 654 will also need an AMENDMENT to AS 38.05.180 which will specify the extension rights of existing state noncompetitive leaseholders. Under AS 38.05.180(c) upon expiration of the initial five-year term of a noncompetitive lease the lessee is entitled to a five-year extension unless the lands are determined to be competitive in which case the lease is extended for only two years.

TO: LeRESCHE
FROM: RODERICK

The AMENDMENT should read:

"A noncompetitive lease existing at the affective date of this Act shall be extended for a period of two years and so long thereafter as oil and gas is produced in paying quantities. A noncompetitive lease extended under this paragraph is subject to the rules and regulations in force at the expiration of the initial five-year term of the lease. No extension may be granted, however, unless within a period of 90 days before the expiration date an application for extension is filed by the record title holder or an assignee whose assignment has been filed for approval, or an operator whose operating agreement has been filed for approval."

TESTIMONY ON

ALASKA LEASING POLICY BILL

(H.B. 854)

By
Rod L. Boane
Alaska District Manager
Exxon Company, U.S.A.

Before The
State of Alaska
House Resources Committee

Juneau, Alaska

March 17, 1978

AGO 547114 +

Mr. Chairman and Members of the Committee --

I am Rod L. Boane, District Manager for the Alaska Exploration District of Exxon Company, U.S.A. I appreciate the opportunity to be here today and present the views of my Company concerning the proposed Leasing Policy Bill.

First, let me say that Exxon believes the existing provisions of Section 38.05.180 of the Alaska Statutes are quite satisfactory in administering adequate control over exploratory and development activities on State leases. Therefore, we do not believe these new amendments to the Statutes are needed to protect the public interest. On the contrary, we think the proposed amendments would create unnecessarily involved and cumbersome procedures that will neither foster needed exploration nor benefit the State of Alaska. Although we take exception to almost all features of the proposed amendments, in the interest of time, I intend to discuss only the more troublesome provisions, with particular emphasis on the proposed bidding methods.

Exxon believes that the best method for awarding leases is on a cash bonus basis. This system has several advantages which I would like to review.

- First, the successful bidder sees very strong incentives to explore and develop rapidly and to recover the maximum economic volume of hydrocarbons at the lowest possible cost. This is necessary in order for him to maximize the return on the cash bonus invested.

- o Second, under the cash bonus system, the State bears none of the risk that commercial reserves will not be found. This risk is placed directly on industry where it belongs. This is a particularly critical concept in Alaska which is still essentially a frontier province where very little exploratory drilling has occurred and thus very little is known about the oil and gas potential of most of the State. When one further takes into account the fact that Alaska is a very high cost area due to its remoteness and harsh operating environment, it should be easy to see that the exploration risks and costs are indeed great. The Gulf of Alaska history should prove this point as, thus far, no commercial discovery has been made.

- o Third, under the cash bonus system there is no possible way that the awards will be made in an arbitrary manner since the highest bid is obvious.

- o Finally, the system is simple and inexpensive to administer, and its integrity is unaffected by future events. The State would not have to expand its staff to implement this system.

Now I would like to compare the alternate bidding methods proposed in this legislation to conventional cash bonus bidding with fixed royalty. Basically, the proposed alternative bidding methods fall into one of three categories. The first category involves some form of royalty bidding. The second category uses

some form of net-profit bidding. The third category uses some form of work commitment. All three categories require a cash bonus, either as a bid variable or a fixed amount. Let's first examine the royalty bidding systems.

(1) It is not uncommon for operators to discover reserves of lesser magnitude than anticipated. With high fixed royalty, some of these discoveries could not be developed profitably unless the State agreed to accept a lower royalty than originally bid. Downward adjustment in royalty rate prior to any development would be difficult to administer and could undermine the integrity of this bidding system.

(2) With royalty bidding, the successful bidder does not have a strong incentive for rapid exploration and development since front-end cash investment is small. Speculators could therefore see incentives to acquire leasehold interest, and then wait in hopes that they will be able to cash in on the discoveries made by others. This situation would obviously result in delayed exploration and development activities.

(3) With exclusive royalty bidding, the public bears the major portion of the exploration risk because if the tract doesn't contain commercial hydrocarbon reserves, as the majority will not, the public receives no compensation whatever. As an example, the State received $900 million in bonus for acreage on the North Slope in the September 1969 sale. Under a royalty bidding system the State would have received little income to date. We strongly believe that risk-taking and its associated rewards or losses are more properly the province of private enterprise.

The second royalty bidding system involves a sliding scale royalty system which would be difficult to monitor and, practically speaking, would make it impossible to compare bids unless you know the total reserves, the price at which production would be sold, and the rate of production. Sliding royalty could result in widely differing positions on prudent development. Also, unitization of tracts would be a very complex and difficult job.

With these comments in mind, let's review recent experience with royalty bidding in the Federal sector. A program of experimentation began with the recent sale in the Lower Cook Inlet. Thirty-four percent of the tracts were put up for royalty bidding. Selection of these tracts was in such a manner that they were scattered over the entire sale area. When this type of tract distribution is coupled with a forced unitization lease stipulation, it is not difficult to conclude that the owners of the royalty tracts have no incentive for rapid evaluation. They can just sit back and wait for the owners of cash bonus tracts to do the initial drilling. They can then join the units covering any reservoirs that extend under their tract.

After the Cook Inlet sale, this problem apparently became obvious to the Department of Interior. For the North Atlantic Sale (Sale #42), they attempted to "fix" this problem by grouping the royalty tracts together and having them removed from the cash bonus tracts. They further expanded the experiment by having a group of cash bonus tracts that had a fixed royalty of 40 percent.

Industry comments relating to royalty bidding have apparently begun to create some concerns about this system. In the upcoming South Atlantic Sale (Sale #43), we see another attempt to "fix" difficulties in the previous system. Tracts are being offered by cash bonus bidding with a sliding scale royalty. They have attempted to "fix" the unitization problem by again grouping the sliding scale royalty tracts together. However, they did not address how a group of sliding scale royalty tracts or sliding scale royalty and cash bonus tracts would be unitized.

Now that this experimentation process has begun, we see the continuing creation of new difficulties and complexities as attempts are made to correct previous difficulties and problems. It appears that this process is going to have a "snow-balling" effect and may eventually reduce competition. In this situation, only the companies that can afford to dedicate a large professional staff to the long unitization negotiations and wait long periods for initial production will servive. This certainly does not promote increased competition.

Now let's look at the second bidding category a profit-sharing system, which has most of the same adverse characteristics as royalty bidding, but with four added complications and disadvantages.

(1) Using net profits will be much like selecting a contractor to perform a job. The operating efficiency of the bidder could become an important consideration in determining which of

several bidders had submitted the high bid inasmuch as the gross proceeds to be received by the public would be a direct function of the efficiency of the operator. Thus, the successful bidder would no longer be obvious. Since the relative operating efficiency of companies cannot be determined quantitatively, the Commissioner would be vulnerable to charges that bid awards were being made in an arbitrary or discriminatory manner.

(2) A profit-sharing system would be difficult and costly to administer. A large administrative organization would likely be established to audit and monitor the continuing activities of lessees. Discretionary judgments would be required by the State with regard to what costs were to be included or rejected in the profit base. This system could lead to State control of expenditures.

(3) A profit-sharing system would significantly reduce the incentive for a successful bidder to operate at maximum efficiency. Any prudent operator utilizes a priority system when restraints of either manpower or materials create limitations. When these restraints exist, net-profit tracts will have low priority. The result - reduction of efficiency. It would also reduce the timing and incentive for development of advanced technology currently in progress by industry.

(4) Most important, sharing in net profits would signal the State's entry into the production phase of the oil business. It might be politically and economically difficult for the State not

to be deeply involved in decisions about day-to-day operations and thereby become an operating partner. This step would not be consistent with the maintenance of a strong private enterprise system either within the oil industry or within the State itself.

The third category of bidding system is work commitment which can be combined with any of the other methods. A work commitment bid becomes a form of cash bonus bidding. If an operator has a high interest in a tract, he will bid a work commitment which is equivalent to what he would bid in a cash bonus system. In many instances, this committment would be much larger than required for evaluation. If early exploration results are negative, the operator remains committed to drill more wells than would normally be prudent or necessary.

The provision that the Commissioner can terminate a work commitment further complicates the issue. Termination of a work commitment for one operator would undoubtedly result in inequities because he has received an unfair competitive advantage. Continuation of this practice could result in extremely high work commitments in anticipation of cancellation after performing only a portion of the work.

A work commitment bid will be nothing more than a form of cash bonus. The same result can be accomplished more easily and efficiently with a cash bonus bid.

Now I would like to discuss a few other provisions which give us concern.

(1) AS38.05.180(v) Right to Purchase - The provision gives the State the right to purchase not more than 16 2/3 percent of the oil and 100 percent of the gas. The most onerous portion of this provision is the right of the State to purchase 100 percent of the gas.

The present and potential supplies of gas within Alaska far exceed reasonably anticipated demands by the State residents. Therefore, to find a market, this gas will have to move into interstate commerce. This requirement, that the State could remove the gas from the market, could severely hamper a producer's ability to market the reserves. Without a reasonable expectation that the developed gas can be marketed, there is greatly reduced incentive to explore.

It would also retard development of natural gas for State residents. The risk that the gas could be diverted would have significant impact on ventures to install gas transportation systems.

In addition to these concerns, it raises other questions such as:

1. Determination of fair market value
2. Use of gas for lease fuel
3. Timing and rate of production - could the State control these to satisfy their own requirements or desires?

(2) AS380.05.180(w) - Exxon is strongly opposed to this proposed section which requires any lessee or permittee conducting exploration for, or development or production of, oil or gas on State land, to provide the Commissioner access to all data obtained from such activity and to provide copies of such specified data, as the Commissioner may request. Access to all data could potentially permit endless intrusions into private business. Much of this data is very costly. In a competitive industry such as ours, a considerable amount of data is proprietary. Disclosure of this type of data could result in the loss of a competitive edge. In none of the other producing states are operators required to provide access to all data. In addition, we feel that any such requirement would, in effect, constitute a "taking" for which compensation by the State would be required. We believe this proposed amendment is unnecessary and should be deleted because the existing regulations provide the State with adequate control over exploration and development activities.

(3) AS38.05.100(1) - We are strongly opposed to the concept of earning production rights only to the depth drilled at the beginning of production from a lease. We are not aware of this language in lease forms for any other producing state.

This language is somewhat similar to that commonly used by a lessee in "farming out' acreage for the purpose of evaluating specific geologic objectives by a third party. In a frontier

province like Alaska it doesn't make any sense to place such restrictions in the lease form. The idea should be to give the lessee maximum flexibility in evaluating his acreage - not to curtail or to require unreasonable and costly actions on his part. We, therefore, strongly suggest that this language be deleted.

We also recommend that reworking be added to the list of actions which will hold a lease in force. In fact, a grace period of 60 days should be allowed between cessation of production and initiation of drilling or reworking operations. This useful and desirable feature is in the present law.

(4) AS38.05.180(j) Lease Term - A five-year primary lease term is very restrictive in Alaska. The remote location of most prospects, rugged terrain, short construction season, and reduced drilling season, either necessary or imposed, make completion of the exploration cycle a difficult and time-consuming process. Once a discovery is made, additional drilling is required before an estimate of the field size can be made. All of the previously mentioned factors affect this drilling too. Once the lengthy process of discovering a field and establishing its commerciality is complete, the long development phase must begin. We strongly recommend that the 10-year lease term be retained.

(5) AS38.05.180(c) Uplands Acreage Limitation - The proposed 200,000-acre limitation on all lands other than tide and submerged lands is very restrictive compared with the current 500,000-acre limitation in a State like Alaska which has so many frontier

interior basins to explore. In a hostile high cost environment such as Alaska, a large block of acreage may be necessary in order to justify exploration. We believe the proposed 200,000-acre limitation would be a strong disincentive of an operator to explore these frontier interior basins and strongly recommend maintenance of the current 500,000-acre limitation.

(6) AS38.05.180(u) Joint Bidding - The provision allowing the Commissioner to restrict joint bidding, if he so desires, could prohibit the involvement of some companies most capable of operating in the Alaskan environment.

A study was performed by the University of Southern California and the USGS to determine the effects of restricting majors from bidding jointly in the OCS. They concluded that on the average, this restriction resulted in more bids per lease by the major oil companies.

(7) Legislative Review - We object to the requirement for submission of the leasing program for annual review by the Legislature because we believe it will result in unnecessary delays in implementing leasing programs.

(8) AS38.05.180(q) Drilling and Development Contracts - The proposed amendment which would allow the State to share in exploration costs is inconsistent with the provisions of the lease agreement, as the State's royalty interest is free of all exploration

and development costs. If this is intended to allow the State to share in working interest, we are opposed since it would signal entrance of State Government into the oil and gas business.

In closing, I would like to reiterate that Exxon believes the current leasing statutes and the implementing and regulations have served the State and industry well and do not need to be changed.

Passage of this bill will require the State to embark into an experimental program. Because these systems are unknown, many mistakes will be made. New "wrinkles" will be tried in order to correct these mistakes. In fact, the State of Alaska will find itself taking a course which is identical to the course presently being followed by the Federal Government. The end result will be an extremely complex system which may allow only a few companies to survive.

This concludes my prepared testimony, and I will be happy to answer any questions which you may have.

* * * * *

TESTIMONY ON H.B. 854

Mr. Chairman, members of the committee, my name is John Carson, and I appreciate the opportunity to comment on House Bill 854.

I've been a petroleum geologist for 22 years, and I'm presently Division Geologist in Alaska for Chevron U.S.A., the principal domestic oil and gas subsidiary of the Standard Oil Company of California. I've lived and worked in this state, and since 1965, I've been actively involved in all state lease sales and the two OCS sales in the Gulf of Alaska and the Lower Cook Inlet.

Chevron is aware of the amount of preliminary work done by the state administration and the Department of Natural Resources in researching and drafting this legislation.

We commend efforts in drafting legislation that proposes a five-year leasing program for Alaska. We believe the state should be encouraged in its effort to establish and maintain such a long-term program, with appropriate industry participation.

Members of the committee, the petroleum industry--as indicated by its response to your solicitations--clearly desires a realistic plan that can serve as the basis for an effective working relationship between the industry and the state.

Frankly, we believe the proposed legislation will inhibit or prevent orderly development of oil and gas resources in Alaska--to the detriment of the state government, its taxpayers and my own industry.

AGO 547127

I will say candidly that this legislation is untenable from our point of view. If enacted into law, H.B. 854 would have a serious and far-reaching impact on my own company, and would give us serious cause to reconsider our exploration activities in the high-cost, high-risk frontier state lands of Alaska.

The situation we face today reminds me of a quote I heard the other day attributed to an executive of Walt Disney Productions, which recently announced that it was abondoning its latest recreation complex because of excessive and oppressive regulation.

The Walt Disney executive blamed the end of the project on, and I quote: "An irresponsible proliferation of delays, the never-ending requests for more irrelevant information and studies, and bureaucratic sidetracking and meanderings into unreasonable alternatives."

I realize this is the first of many hearings on this legislation, but H.B. 854, as now written, would be counter-productive. It actually would be a step backward at the very time our nation desperately needs an effective oil and gas exploration program.

Generally stated, we object to provisions covering: 1) the wide variety of bidding methods to be employed; 2) the Commissioner's access to all the lessee's data, including proprietary data; 3) the state's call on production; 4) short and restrictive lease term and conditions; 5) the need for the Commissioner to submit and defend his lease plan before the legislature; 6) the Commissioner's right to ban joint bidding by major companies; and 7) reduced acreage chargeability on state uplands.

Time does not permit me to discuss in detail each of the provisions, but I will attempt to outline our most significant objections:

First, the wide variety of bidding methods:

In advocating numerous bidding schemes--actually a shift from only cash bonus bidding, a system that has worked well--the administration hopes to maximize its financial return from state lands.

But Chevron believes a move away from the cash bonus method means the perilous abandonment of a proven concept that has brought stability to the state's leasing program. The bonus system would be replaced by an array of untested leasing methods, particularly in the frontier areas.

We believe this provision, if enacted, will transform Alaska into a trial-and-error laboratory in oil and gas leasing. It means replacing orderly development with uncertainty and the unknown. It's not a gamble Chevron feels is worth taking.

Before discussing each bidding system, all concerned parties should be aware that a move away from cash bonus bidding will result in three key developments:

First, it will shift a substantial part of the burden of risk from industry to the taxpayer.

Second, it will serve as a substantial deterrent to exploration and development, and

Third, it will cause the rapid and constant growth of state agencies to administer, evaluate and audit the leases and subsequent production. This places increasing demands on taxpayers to support this bureaucracy.

Chevron believes these are unacceptable consequences which would be intolerable to the taxpayers and leaders of this state.

As you know, cash bonus bidding provides that leases be awarded to the highest cash bonus bidder. This bonus is paid before the lessee can proceed with exploratory drilling on the lease.

The other bid methods provide for bid variables such as royalty, net profit, or work commitment. In these cases, the state receives nothing other than perhaps a small fixed bonus at the time of leasing. Other revenue is not forthcoming under the royalty and net profit schemes unless there is production. Simply stated: No production, no revenue.

In our opinion, cash bonus bidding is the only method that will strongly encourage the petroleum industry to lease and explore the state land.

We further believe that this method will result in the production of the most oil and gas and consequently will provide the most revenue, both to the state and the petroleum industry.

The other methods, employing biddable royalties and net profits, reduce the incentive to explore and produce. These alternatives, particularly in the case of biddable royalties, serve to shorten the economic life of the fields--resulting in less production and, therefore, less revenue.

Cash bonus bidding is particularly advantageous to the lessor in frontier areas of high risk. Most of Alaska's lands are in this category.

Now let's compare other proposed bidding methods with traditional cash bonus bidding. Because of time limitations, I can only touch briefly on these, but I am prepared to go into more detail if questions arise.

The royalty bidding method, although it allows oil and gas companies to acquire land with little cash, is a strong deterrent to early drilling. Very simply, it is easier and cheaper to wait on others to bear the risk and expense of exploratory drilling.

Having spent little capital to acquire the lease, an operator is tempted not to spend a dime to evaluate the lease, hoping an adjacent leaseholder may do it for him. Carried to the extreme, the effect of this would be that no wells would be drilled to evaluate the leases. This same problem is inherent in the net profits system, which I'll talk about shortly. On the other hand, when cash bonus is involved, the winning bidder has a strong incentive for early drilling because his bonus investment is earning him nothing.

In cash bonus bidding the state assumes none of the risk but still receives revenue from leases, whether or not they are productive.

The advantages of this system were clearly demonstrated a few years ago in the sale of federal leases off the coasts to Mississippi, Florida and Louisiana. Successful bidders paid $743 million for several tracts on one structure, the Destin Anticline, and spent over 10 million dollars drilling seven dry holes on the structure--all at no cost to the taxpayer. Under royalty or net profit bidding, the government would have received nothing.

What would government have received if it had sold the Gulf of Alaska on a royalty bid basis? As in the Gulf of Mexico case I previously cited, nothing. Should the taxpayer and the government be forced to suffer the loss of more than one-half billion dollars--when to date, no royalty appears forthcoming?

The NPRA comes to mind as another example of an area adjudged to possess high potential, but which so far is a disappointment. Again, if sold on a royalty bidding method, the lessors would have received nothing to date.

Let me emphasize that in all these cases, the areas were considered extremely attractive to both the industry and government. These are precisely the types of areas in which the state might be enticed to use a royalty or net profit bidding method. Yet none of these has led to any discovery or government revenue.

Proponents of royalty bidding believe it encourages competition among bidders and allows the small company and the independent improved entry into oil and gas lease bidding. Cash bonus bidding usually is blamed for tending to discourage small companies from bidding.

This is not supported by the facts. Small companies gain entry into the sale by joining with a larger company or with several other smaller companies. In the recent Lower Cook Inlet sale, independents and smaller companies bid on royalty and cash bonus tracts with about the same frequency as the majors. Of the 34 companies which bid in the sale, 18 were smaller companies. These 18 made successful cash bonus bids on 26 tracts, of which 13 were sold for more than one million dollars. Moreover, the small companies are represented in half of the top tracts of the sale.

The second proposed bidding method we are concerned about is net profit bidding. This system has most of the disadvantages of royalty bidding plus two more: It requires a huge staff to administer and audit.

For example, each property would require a battery of accountants to audit the companies' production and costs. Just as in the case of royalty bidding, the risks are passed on to the government. Furthermore, net profit bidding discourages cost-effective, efficient development practices.

Work commitment bidding is the least onerous alternative to cash bonus bidding methods and would be beneficial, provided that it is enforceable. We view this method with some caution because of the uncertainty of the conditions under which it might be imposed.

At this point, I would like to summarize why we believe a majority of the industry prefers cash bonus as the best method for both the state and the energy explorers.

First, we believe it is the foundation for all free enterprise contract arrangements;

Second, it is the simplest and easiest to determine and administer by all parties;

Third, it is fair and equitable; by this I mean that all parties travel at their own risk, and finally,

The right to explore is paid for in advance.

In 1977 the Department of Natural Resources completed a report entitled, "A Study of Petroleum Leasing Methods and Possible Alternatives." H.B. 854 apparently is based on this study and its conclusions.

In this study, a great deal of attention is given to the "percentage of acreage option." We assume this is the reason for granting the Commissioner authority to withhold acreage from any sale areas under Section 180 (c) (4) (f). Under this scheme, certain amounts of acreage would be withheld from a sale so that following a discovery the state could collect a windfall on drainage acreage sales. This is a workable approach only if you know which acreage to withhold and on which structures. This is rarely the case, as we saw in the MAFLA, Gulf of Alaska and NPRA. Furthermore, industry cannot bid or drill on only portions of prospects in high risk or high cost areas which predominate in Alaska.

I would like to make a few more comments about the Department of Natural Resources' report. The one overriding conclusion of that study was that a variety of bidding methods, widely employed, would increase the state's return from its commitment of oil and gas properties.

Chevron believes this conclusion is biased against cash bonus bidding, and we feel that the odds are against anyone knowing all they need to know to use the right method at the right time. The state, even if armed with a skilled staff and large amounts of data, can hope to do no better than an individual company in evaluating potential and risks, and these companies are more often wrong than right in their appraisals.

We believe the state's report, and particularly its main bias against cash bonus bidding, is based on a few but major faulty economic assumptions.

First, the authors of the report assume that the industry will make an 18 percent rate of return. Although this is very desirable, and would not be out of line considering the high risk involved, past experience shows that the industry has averaged no more than seven to eight percent from OCS ventures which approximates Alaska lands, according to several exhaustive studies. For example, in May 1977 Prof. Walter J. Mead of U.C. Santa Barbara testified before a U.S. House of Representatives Committee that weighted average rate of return from 184 leases issued in the Gulf of Mexico in 1954-55 amounted to only 7½ percent before taxes. This sale period was selected because these leases have a 20-year production history which provides a com= prehensive data base.

Second, no reduction of state income was assumed in royalty cases, but it almost certainly will occur. The economic limit of a field is going to be greatly influenced by the amount of royalty. The higher the royalty, the earlier the economic limit is reached. When an operator can no longer produce oil or gas profitably the result will be oil and gas left in the ground and neither industry, nor the state, will make any money on it.

* * *

Next, I would like to turn to the provision of the bill that would require the lessee or permittee to make available to the Commissioner all data obtained from exploration and production activities on the lease or permit. We believe this provision raises fundamental questions about the appropriateness of the state's entry into the exploration business, and secondly, points to grave problems—from our point of view—about the preservation of confidentiality.

(subsection (aa))

should but
The language in the proposed legislation does not distinguish between, "raw", "processed" and "interpretative" data. We are unalterably opposed to providing the state with the results of the efforts of our interpretative staff. Industry cannot operate under this law. We urge the committee to delete this section.

We are also opposed to giving the state our basic geophysical data. We are not convinced that the state can hold this data confidential because of its large staff and turnover rate. Any leak of this sensitive information to our competitors definitely will have an immediate and adverse impact on our exploration program in this state.

The third provision we object to (Sec. 38.05.180(v)) gives the state the right to purchase up to 16 and two-thirds percent of the lessee's share of the oil and up to 100 percent of the lessee's gas.

We are not opposed to the state's right to take its royalty share of oil or gas in kind, but we oppose any provisions which empowers the state to take any portion of the lessee's share.

In order to justify the risk and expense of exploration and development, and be able to satisfy its contractual commitments, the lessee must retain the right to dispose of all of its share of production. Without this right, the state of Alaska lands become less desirable to explore and develop. We believe this is another step toward the state's entry into the oil and gas business, which should stay with private industry.

It seems inconceivable to Chevron that the state would take a portion of the lessee's share when that is the very incentive for industry to explore in the state initially.

Another provision we oppose is Paragraph Q. Paragraph Q refers to drilling and development contracts and to the authority of the state to share in the cost of exploration.

We're not clear on the meaning and intent of this paragraph. If it means the state intends to become a working interest participant in leases, then we strongly object.

Our next objection concerns the terms and conditions of the lease itself. Because of the remoteness of most of Alaska's land and the seasonal restriction on operations, Chevron prefers a ten-year primary lease term. We feel this length of time is necessary to adequately evaluate a lease under Alaskan conditions.

There is one provision which would allow the Commissioner to grant rights on leases only to the depth drilled at the time production begins. Chevron is at a total loss to see how this provision can benefit the state in any way. It will certainly cause waste in time and money for the industry because wells will be drilled far beyond primary objectives--just to ensure earning the rights of a normal lease. In effect, this will delay production and thereby delay revenue to the state.

Considering the geological, legal and practical ramifications of this provision, one must conclude that it is totally unacceptable to the industry and can do the state no good. It should be stricken from the bill.

Our next objection is to any effort to restrict joint bidding between majors or multinational companies. In Alaska, particularly, with its accompanying expensive costs of exploration and production, it is essential for large and small companies to be able to join together to share the risk.

A ban on joint bidding by majors does not necessarily increase state income. In fact, a recent study by the Department of Interior showed that joint bidders tend to bid higher, on the average, than solo bidding competitors. (November 1976 issue of the Journal of Petroleum Technology.)

The next provision we wish to discuss deals with the need for the Commissioner to submit and defend his leasing program to the legislature. We prefer that the various reporting methods set out in this section not be prescribed in law. We believe this review is an administrative function and that public hearings are an adequate and effective vehicle for gathering comments and reactions to the proposed action. Neither the timber leases nor any other types of state lease are submitted to the legislature, and to require this approach in law for the petroleum industry will lead to further delays in development of the state's natural resources. Particularly objectionable to us is the requirement that the Commissioner must defend his previous year's program and explain why he used certain methods. This is certain to toss the entire leasing program into an interminable bureaucratic morass.

And finally we oppose the provision which deals with acreage chargeability. We believe the reduction to 200,000 acre limitation on uplands is arbitrary and unjustified. The 500,000 acre limitation in this state, where there are large areas of state lands potentially available for bid, is not unreasonable. A large acreage position is necessary as an incentive for an operator to explore frontier areas.

In closing, Mr. Chairman, Chevron believes H.B. 854 is an unreasonable, unwise and unworkable piece of legislation that simply is not in the best interest of the citizens of Alaska.

As I said at the outset of my remarks, my own company would be faced with the prospect of seriously reassessing its current and future exploration activities on Alaska state lands if this bill is enacted.

It is our opinion that this legislation will only serve to inhibit or prevent the orderly exploration and development of Alaska's oil and gas properties.

We oppose a shift away from the successful cash bonus bidding system because we believe that the cash bonus ensures a fair and equitable return to the state, as well as ensuring the fair share of any revenue resulting from production.

It is conceivable that Prudhoe Bay may not have been found if royalty or net profits bidding or percentage acreage option had been employed.

Mr. Chairman, members of the committee, we have serious concern that if this legislation becomes law, the ultimate losers will be the citizens of this state, as well as the consumers of oil and gas.

Thank you for giving Chevron this opportunity to comment on this proposed legislation.

Rep. Al Osterback
Chairman
House Natural Resources Committee
Alaska State House of Representatives
Juneau, Alaska

Dear Rep. Osterback:

When I testified before your committee two weeks ago on H.B. 854, I indicated then that Sohio Petroleum Company would be willing to submit additional information in written form to the committee, in further consideration of changes in Alaska's oil and gas leasing policies.

In this regard, attached is a memorandum, "Experimentation in Alaska's Oil and Gas Leasing Program: An Analysis of Leasing Policy Issues Raised in H.B. 854," prepared by our staff in Anchorage. An addendum presents suggestions for new language in certain sections of H.B. 854 that in our opinion would improve the bill from the State's standpoint as well as that of industry's. We hope you will consider our suggestions as constructive, if critical.

In general, we feel that H.B. 854 as it is now written would create a bias in the State's leasing system toward experimentation with procedures that are unusual and new in Alaska. Our suggested language changes would essentially create a bill that would give the Commissioner of Natural Resources the flexibility that he desires, but with a bias instead toward relying on well-known and proven leasing systems, unless special circumstances would call for the use of an alternative bidding system.

We are also concerned over the extent to which the Administration, in proposing H.B. 854, has simply tracked many concepts (and copied specific language in many cases) from OCS bills now in Congress, without an apparent close examination as to whether these specific provisions proposed for federal OCS sales are really appropriate for the State of Alaska.

We hope you will find this information useful in your consideration of H.B. 854.

With regards,

Assistant General Manager

PART I: AT THE CROSSROADS

I. THE IMPORTANCE OF OIL AND GAS POLICY DECISIONS

A. Global Prospects

The Workshop on Alternative Energy Strategies (WAES), a two-year international energy and economic project, directed by the Massachusetts Institute of Technology, recently released their final report which indicated that:

(1) All energy resources and conservation measures must be developed vigorously to meet total projected demand in the period 1985 - 2000; and

(2) Energy policy decisions made now will be the critical determinants as to whether or not sufficient incremental supplies will be available to meet demand in the years ahead.

In other words; according to the WAES Report:

> The years up to 1985 are critical ones...We are...on the threshhold of a critical decision period. We cannot afford to waste the years immediately ahead if we are to have any large-scale energy options available before the end of the century. The time for decisive action is now. 1/

In this environment, the importance of H.B. 854, the Administration's proposed oil and gas leasing bill, cannot and must not be underestimated, as Alaska's oil and gas resources can and will play an important role in determining the future global energy, economic and political balance. The critical nature of energy decision-making at this time is further underscored by the following conclusions stated in the WAES Report:

1/ ENERGY:GLOBAL PROSPECTS, 1985-2000, Report of the Workshop on Alternative Energy Strategies, M.I.T. Professor Carroll L. Wilson, Project Director McGraw-Hill Book Company, San Francisco, 1977.

(1) The supply of oil will fail to meet increasing demand before the year 2000, most probably between 1985 and 1995...(p.3)

(2) Demand for energy will continue to grow even if governments adopt vigorous policies to conserve energy...(p. 4)

(3) The continued growth of energy demand requires that energy resources be developed with the utmost vigor...(p.4)

(4) Even if there are no governmental constraints on oil production, oil supply will meet demand only under the most optimistic assumptions about gross additions to reserves...(p.145)

(5) Possible constraints on oil production by members of OPEC are likely to cause oil supply to peak at the latest some-time around 1990 although lower production limits could bring this date forward into the early 1980's...(p.145)

(6) All the effort put into oil exploration around the world over the past one hundred years has only yielded 240 large oil fields...(p.123)

(7) With only a small chance of either discovering a new Middle East or discoveries in the Middle East as large as in the past, the past rate of genuine new discoveries can only be achieved if a large number of smaller producing areas are found. (p.122)

(8) Given lead times of 5-10 years or more for many projects, failure to make necessary near-term commitments or to resolve a variety of current restraints on production, or to develop future supplies may foreclose some options for 1985. (p.265)

(9) Failure to recognize the importance and validity of these findings and to take appropriate and timely action will almost certainly result in a world different from the one on which these projections have been based. (p.5)

(10) Failure to act could lead to substantially higher energy prices as the supply/demand imbalance becomes more apparent with the consequent frustration of the aspirations of the less developed countries. The major political and social difficulties that might arise could cause energy to become a focus for confrontation and conflict. (p.5)

(11) The longer the world delays facing this issue the more serious the outcome will be. Even with prompt action the margin between success and failure in the 1985-2000 period is slim. Time has become one of the most precious of our resources. (p.5) 2/ (Emphasis added)

2/ Ibid., pages as indicated above.

Another important point in the Report relates to the size of future oil fields. Worldwide, over 30,000 oil fields have been discovered, but about 75 percent of the oil lies within 240 large fields, each with over 500 million barrels of recoverable reserves. 3/

Out of the tens of thousands of producing oil fields in North America, there are only five fields that have recoverable reserves of more than 500 million barrels (Prudhoe Bay, which is new; and Elk Hills and Wilmington in California, and East Texas and Yates in Texas, all of which are old fields). Despite a great deal of exploration in North America, there has been no recent discoveries of fields more than 500 million barrels, except Prudhoe Bay. In other words, the probabilities of finding large new fields on the order of Prudhoe Bay has significantly diminished, not only globally, but also in the United States.

The WAES Report also makes clear that in certain environments, such as the North Sea, a 500 million barrel field is at the economic margin. 4/ Because of the particularly harsh environment in Alaska's North Slope, and elsewhere in the unexplored part of the State, a field that may contain even more than 500 million barrels of oil could be right on the edge of economic viability in Alaska, given the uniquely high costs and transportation difficulties.

While all of the above has critical implications both for the United States and Alaska, there are yet another set of reasons why we believe that the designing of the future oil and gas leasing program in Alaska deserves serious and careful consideration.

3/ Ibid., p.123

4/ Ibid.

B. Alaskan Outlook

In a sense, the State of Alaska is facing on a smaller scale some of the same problems described earlier on a global scale. Whereas world oil production may begin to decline in about seven years, so also will Prudhoe Bay. The fact has important implications to all Alaskans and, in view of the revenue needs of the State, it would appear to be in the State's interest to encourage a steady, ongoing oil and gas development program in parts of the State with petroleum potential. But the historic rate of genuine new discoveries can only be achieved worldwide if a large number of small producing areas are found. Likewise the future of petroleum discoveries in Alaska will most probably involve smaller fields which will be more costly to develop.

Actually, the possibility of finding another Prudhoe Bay-sized field in Alaska is extremely remote. Further, because of the very high costs of operating in much of Alaska, the size of a discovery must be larger in Alaska than it would in other states to make the project economic. Even the Lisburne and Kuparuk oil pools, which according to State estimates range in potential from one to two billion barrels, are marginally economic and may be typical, in terms of economics, of many future oil and/or gas finds in Alaska. All this tends to suggest that Alaska is special and needs to pay closer attention to the development of her resource policy than a State like Louisiana, for example.

Some have argued that Alaska might be better off 'sitting on' her potential oil and gas resources and waiting for the world oil price to rise even further. Dr. Arlon Tussing, an Alaskan economist and advisor to the Senate Energy Committee, considers this attitude, "simplistic" and "naive."

In real terms, world oil prices may stabilize as a result of a prolonged period of relatively low economic growth which would result in lower growth rates for energy consumption than is generally projected. Additionally, as global attention is increasingly focused on energy, the drive to conserve energy and to develop heavier oils, such as Athabascan tar sands, Rocky Mountain oil shale and Orinoco tar belt; and substitutes for conventional oil and gas will increase. Again, to quote Dr. Tussing, "if you choose to 'sit on' your oil and the decision was wrong, the resultant imbalances could be serious."

A final serious consideration for Alaska relates to a realistic assessment of the growth of State spending. While this subject cannot be addressed in the analysis, there is reason to believe that Alaska's revenue needs in future years requires continuous exploration and development of her oil and gas resources so that new revenues will be coming in as Prudhoe Bay starts to decline. This is especially true when one considers the long lead times involved in exploration and production in the frontier areas of Alaska, where a decade may be needed to find, prove up and begin to develop a field, and where transportation problems can be enormously complex.

C. Implications

Being at the economic/energy crossroads globally -- and in Alaska -- would seem to suggest that it is of critcal importance to the State to (1) carefully delineate its goals with respect to a new oil and gas leasing bill and (2) ensure that the proposed legislation, in its implementation, will achieve the desired goals outlined in the legislation. With this in mind, it would appear appropriate both to review the goals outlined for H.B. 854 and to analyze some of the broad issues raised by the draft legislation.

II. OBJECTIVES FOR ALASKA'S OIL AND GAS LEASING PROGRAM

> "As a prerequisite to a discussion of mineral leasing alternatives there should be a clear statement of the goal (s) to be achieved." 5/

A. Objectives Outlined for H.B. 854

To analyze the objectives outlined for H.B. 854, there are two relevant source documents: the Governor's letter of transmittal and the language contained in the "findings" section of H.B. 854. Both contain ambiguities and sources of conflict that deserve serious attention.

This is important in that the goals and objectives outlined in the legislation reflect the intent of the Legislature, in offering guidance to the Commissioner of Natural Resources.

As described in the bill [Sec. 38.05.180(a)(1)(A-D)] the State's goals are to:

(A) maximize the economic recovery of these natural reosurces in protection of the public interest;

(B) minimize the exploitation of these natural resources in protection of the public interest;

(C) maximize competition among parties seeking to explore and develop the resources;

(D) maximize use of Alaska's human resources;

While (D) is clearly in the State's interest, (B) appears to be in direct conflict with (A) and, in and of itself, could certainly be interpreted to mean more than one thing, e.g., 'sit on' the oil until later or 'protect the environment' or 'don't develop at all,' depending on one's definition of the "the public interest." One might also raise the question as to

---

5/ Walter J. Mead, "Cash Bonus Bidding for Mineral Resources," Mineral Leasing as an Instrument of Public Policy, ed. M. Crommelin and A. Thompson, British Columbia Institute for Economic Policy Analysis Series, 1977, p.46

whether (C) could conflict with (A) or is even a necessary goal for the State of Alaska's leasing program or whether the goal to "maximize competition" means having more companies bidding or more competition among current bidders. In short, while goals (A) and (D) appear well-defined, there are important questions that could be raised with respect to the other goals as stated.

If one looks to the Governor's letter of transmittal for guidance on the matter, one becomes more confused. Some of what is presented as broad goals are in fact provisions of the bill related to goals which may in actuality work against the achievement of the overall broad objectives. What appear to be the three major goals of the legislation are presented in paragraph 3 of the Governor's February 17 letter of transmittal on H.B 854:

> "The proposed changes will update the leasing law to provide increased public control over exploration, development, and production from state land, obtain a fair return from our non-renewable resources, and, at the same time, provide land from which explorers may find new energy supplies."

Yet the letter lists six "important state objectives," which include items such as reducing "the length of the term of a lease from ten years to five years..." The reduction of a lease term should not be listed as an "important state objective," it would seem, in that it is not an objective but rather a provision designed to achieve the State objective of assuring "that exploration begins promptly once State land is leased." Whether or not reducing lease terms is the best means to assure prompt exploration or not is not the issue here, but rather the importance of clearly delineating goals (prompt exploration) as opposed to suggested means of implementation (reduce length of term of lease).

While clarifying what are the State's goals may seem academic, the exercise would seem worthwhile, particularly since what are described as "important State objectives" in the Governor's letter appear to conflict with the goals stated in H.B. 854. If it is a State goal in H.B. 854 to maximize competition, for example, then increasing rentals on fields may not be in the State's interest at all and should certainly not be listed as one of the "important State objectives" in the Governor's transmittal letters.

Thus, it would appear to be in the State's interest to set out more clearly, and in some order of priority, what the State is really seeking to do in this legislation. The Commissioner of Natural Resources, who would be designing the leasing program today, and future Commissioners who will be administering the program in future years, need to know what the State really intends and what is most important, given the energy and economic environment today and the future needs of Alaskans. If the Commissioner is given clear guidance by the Legislature as to the overall goals, then the State should be able to rely on the Commissioner to use his judgment and discretion in designing a program that is the best interests of the State.

In addition to the ambiguity relating to the State's most important objectives related to H.B. 854, we are also concerned that the overall legislation would actually deny the Commissioner the very object the bill's proponents suggest they are seeking to guarantee, i.e., flexibility so that the Commissioner may design a program best suited to achieving the State's broad goals. Instead of really allowing flexibility, this bill appears to put stress on the Commissioner by (1) requiring him (her) in many instances to adopt changes; and (2) setting limits on those changes;

and (3) forcing him (her) to account for why this or that was not done, for example, as opposed to merely requesting information as to why what is planned or was done is planned or was done.

Based on studies we have analyzed, we would also suggest that "maximum" experimentation in bidding at this time may not be in the State's interest any more than it is the Federal Government's interest. While we will go into this subject in some detail in Section III, we think it important to highlight here that the Alaska Legislature should be aware that, in many respects, H.B. 854 appears to copy the Federal draft legislation. A brief review of the goals related to the Federal bills would thus appear to be in order.

B. Objectives Related to Federal Legislation

It is noteworthy that the Governor's letter of transmittal states that the "proposed changes will update the leasing law to provide increased public control over exploration, development and production from State land..." (emphasis added). Many in Washington D. C. have been working for years to amend the laws affecting OCS oil and gas exploration and development so as to be able to establish a Federal oil and gas corporation (popularly known by the opponents of the concept as "FOGCO").

While we do not mean to suggest here that the drafters of H.B. 854 are aiming to establish an Alaskan State drilling corporation, we do think it pertinent for the State to analyze the goals and provisions of H.B. 854 in terms of where it would take Alaska, if enacted as presently conceived. Would the result be more exploration and development by private companies, or would the result be added complications in petroleum development and the eventual need for Alaska to establish its own "FOGCO?" We would offer two cautionary notes.

First, Dr. Arlon Tussing has pointed out that "the scholarly literature on public enterprise is remarkably skimpy. Rigorous comparisons - theoretical or empircal - of the economic performance of governmental and private enterprises in the same industry are, to the extent I can determine, nonexistent." 6/

Second, from our own limited experience of government drilling corporations, we would tend to concur with Dr. Tussing's conclusion that a State FOGCO is, as Dr. Tussing says, "unlikely to be as effective a device for maximizing [resource] rents as the combination of a leasing system that takes full advantage of competition among private firms (considering the technology and institutional characteristics of each branch of the ...industry) and an appropriate tax system." 7/

There are a host of reasons given by economists why government drilling corporations (would not) do not serve the public interest, 8/ but the point here is that certainly many companies and analysts view the Federal draft legislation - upon which Alaska's H.B. 854 appears to be patterned - as the first step towards the creation of a FOGCO, especially in that this type of legislation greatly increases the amount of uncertainty and risk related to what is already an uncertain and risky business, that of exploring for oil and gas.

C. Alaska's Leasing Objectives: Problems and Priorities

As the discussion above indicates, we see a host of problems both with the explicit and implicit objectives for H.B. 854. To summarize, we are concerned with:

(1) The Governor's Letter of Transmittal - As this letter is part of the legislative package, it will be used as a reference when, assuming H.B. 854 is passed, a future Commissioner seeks guidance in decision-making. The fact that it confuses objectives and provisions is of concern, especially where some of the provisions that are listed as "important objectives" may be counter-productive to the goals of the legislation.

(2) The Goals Listed in H.B. 854 - At least one goal (B) could be interpreted in drastically different ways, and it is unclear what goals really are most important nor how several of the goals interrelate.

(3) Implicit Goals - While the bill's supporters contend that an important purpose of H B. 854 is to provide the Commissioner of Natural Resources with flexibility in administering the leasing program, several provisions would not only deny real flexibility but also would require justifications for non-experimentation, in effect putting political pressure on the Commissioner to experiment in bidding practices, for example, even though such experimentation may not be, in the Commissioner's judgment, in the best interests of the State of Alaska.

(4) Following the Federal Trend - We are concerned that H.B. 854, in many ways, parallels many of the provisions in the bills passed by the U. S. House and Senate. Whereas the ultimate goal (implicit or explicit) of many supporters of the Federal legislation may be the establishment of a federal drilling corporation, we would question whether or not it is in

Alaska's best interest to so closely follow the Federal lead in this area at this time...or any time. We would also caution the State, particularly about (1) the reasons why data gathering is viewed as the first step in establishing government drilling corporations; (2) the lack of hard evidence and the experimental nature of using different bidding methods; and (3) the issues related to competition and joint bidding.

To take care of the above-described problems relating to objectives, we would like to suggest some new language in the opening section of the bill (see Attachment I). We have sought, through the proposed changes, to highlight the fact that prompt exploration is an important goal which should be stated in the legislation and that this goal is inextricably related to the overall State goal of maximizing State revenue. We have sought also to provide flexibility for the Commissioner without forcing him (implicitly or explicitly) into experimentation. These and other proposed amendments are further explained in the following two sections.

III. BROAD ISSUES AND OBJECTIVES

A. Data Acquisition: How Useful?

While we understand the State's desire to know more about the potential oil and gas resources underlying State lands, we would reiterate what we and other companies have previously stated: obtaining more data from the companies does not necessarily put the State in a better position to evaluate potential resources. In fact the opposite could be true; government officials, looking at company data, might well understate the potential value of proposed lease acreage because of the general conservative nature of a government compared with, for example, the daringness of one Company geologist willing to stake a professional career on an interpretation of exploratory data. It could also be argued that the very nature of a large government agency makes it easier to hide errors of judgment whereas the company which decides to "go" on a project can hold specific employees more accountable for errors of judgment. But the most important fact to remember is that regardless of how much data the State may obtain, the State will never know what it does or does not have unless the State drills.

Since you may not wish to simply take a company's word for it, the following quotation is presented to underscore the importance of drilling as a means of obtaining useful information and to highlight the relative lack of usefulness of data without drilling. This excerpt is from the writings of an acknowledged expert in leasing policy, Professor Walter Mead, University of Southern California at Santa Barbara:

> "...while the technology for oil exploration prior to the drilling has been advanced in the last century, exploration is still subject to extemely high risk. Drilling is the only definitive test to determine the presence of oil or gas. Thus, bonus bids must be

> submitted by bidders and accepted or rejected by the government when neither the buyer nor the seller knows whether and in what quantities oil is present..." 9/ (Emphasis added)

It would seem obvious, therefore, that if the companies -- with all their data and experience -- don't know at the time of a lease sale whether they've just spent millions for the right to put millions more into drilling potentially dry holes, then the government, with the same data, could hardly be better off. And having all the data of all the companies doesn't necessarily lower the risk of error for the government in that the view supported by most of the data of most of the companies (data that might suggest that "Tract 20" is worthless, for example) could be wrong.

Because more is not necessarily better in the exploration data game, many companies do in fact view data acquisition by the government as the first step which will inevitably lead -- and naturally extend to -- the establishment of government drilling corporations. And, as previously noted, Dr. Arlon Tussing does not view "governmental ownership of producing operations" as "the most effective way of accomplishing the social ends for which it is currently being advocated..." 10/

Additionally, Dale R. Jordan details some of the more severe problems of esblishing government drilling corporations:

> "...This article's purpose is not to examine the political repercussions that might occur when dry holes are drilled with public funds; however, we should examine some of the practical considerations involved in the operation of a public company which has an almost exclusive area within which to explore as a result of discouraging the private sector. For the government to discourage both the existing explorer and the entry of any new ones and to expect the public corporation to be able to fill this void suggests that the government is saying, "if the private companies do it, so can we."

9/ Mead, op. cit., p.51.

10/ M. Crommelin and A. Thompson, "Introduction," Mineral Leasing as an Instrument of Public Policy, British Columbia Institute for Economic Policy Analysis, 1977, p.xvi.

Now remember that the private companies comprise all the oil and gas explorers working in the province and those contemplating doing so, given the right opportunities. All these companies have geological staffs, many of who will be geologists who devote most of their time over a considerable number of years entirely to the study of British Columbia's geology. The public corporation could not expect to have such an extensive source of expertise as that available in the free enterprise system. And so the public corporation would suffer from a reduction in the number of ideas generated.

It is not unusual in oil and gas exploration, with its inherent problem of scientific interpretation and evaluation of geological prospects, to find that one company will acquire a block of land, will explore it, and perhaps even drill on it before deciding the search is unsuccessful. The company will then return the land to its owner, the Crown. This does not mean that there are not any commercial hydrocarbons underlying this land; but rather that that particular company was unable to find them. To find these hydrocarbon deposits, a second, a third, or a fourth company should acquire this land, and, if this is done often enough, the hydrocarbon will be encountered, and production will follow. The problem with the public company being the only explorer in the province is that, unless it is fortunate enough to make the initial discovery, it is very doubtful whether there would be enough enthusiasm to have a second, third or perhaps even a fourth try at that particular prospect, with the result that the discovery would not be made. This is surely the worst thing that could happen and is probably the most damning argument against a public corporation moving into an area with an almost exclusive right to explore. 11/

B. Experimentation in Leasing: How Successful?

The simple answer to the above question is "No one knows." The U. S. Government tried royalty bidding on eight tracts in an October 1974 lease sale with questionable results. It appears that neither the industry participants nor government officials found the experiment to be particularly successful.

According to The Oil and Gas Journal, "operators say they doubt royalty bidding will ever surface again except in areas where production is almost certain or possibly in drainage-tract sales. Development of wildcat acreage

---

11/ Dale R. Jordan, "Petroleum Leasing in British Columbia," Ibid., pp. 252-253.

can prove too costly on a royalty bid basis, despite the absence of high front-end expenditures normally budgeted under the traditional bonus-bid system." 12/

Similarly, Energy Secretary Schlesinger appeared to be disenchanted with the royalty bidding experience in Louisiana in that, in a letter to Interior Department Secretary Andrus, Schlesinger apparently stated that the Department of Energy has reservations about the effectiveness of the royalty method based on past experience in the Gulf of Mexico. It appears in fact that Schlesinger raised the same objections to the royalty system as had been raised by industry and formerly by officials in the Department of Interior, i.e., that royalty bidding leads to early abandonment of leases because declining production eventually makes the lease unprofitable under a high royalty arrangement.

Significantly, the Department of Energy and the Interior Department are considering the formation of a task force of experts to help analyze pros and cons of the various systems being proposed in the Federal legislation (which were largely copied in H.B. 854). A key problem seems to be a dearth of experts, however, in that few governments have undertaken experiments in bidding practices long enough or in a manner similar enough as that envisioned in the proposed Federal and State legislation, and to paraphrase Dr. Arlon Tussing's comments: scholarly, empirical analysis of the different bidding systems appears to be 'remarkably skimpy.'

One source document, from which we have already quoted, appears to be quite useful, however. Published by the British Columbia Institute for Economic Policy Analysis, Mineral Leasing as an Instrument of Public Policy,

---

12/ Mike Long, "Royalty-bidding experiment turns sour," Oil and Gas Journal, May 2, 1977, p.32.

contains articles by an international and interdisciplinary group of economists, mining engineers, businessmen and industry consultants. In an introductory section, Dr. Mason Gaffney describes the report as "an outstanding contribution to a rapidly growing field of study."

Our greatest concern with the proposed legislation is reflected in many of the articles in the British Columbia Institute's report. The publication cites significant problems with many of the bidding systems proposed in H.B. 854. Since each new system is so experimental, moreover, the likelihood of the Alaska's experiments not succeeding is high. An additional concern is that it would be years before the success or lack of success with a given system can be determined.

An example of our concern relates to the use of royalty bidding. Dr. Arlon Tussing, Dr. Walter Mead and others (including now Energy Secretary Schlesinger) have raised objections to royalty bidding for a variety of reasons. In the Report, Professor Hayne E. Leland, University of California at Berkeley, echoes some of their concerns and ours:

> "Competitive bidding theory makes clear that undesirable consequences may follow from royalty or profit share bidding. If there are no bonus payments required, speculative bidding may lead to extremely high royalties or profit shares being bid, with development occuring only in the most favorable circumstances. This happens because firms have little or nothing to lose by bidding high and then failing to explore or develop..." 13/ (Emphasis added)

Gregg Erickson, a well-known Alaskan economist, in his article on "Work Commitment Bidding," suggests that the problems associated with royalty bidding are well known:

> "The problems created by royalty bidding, principally the premature shutdown effect and the potential for speculator induced misallocation of leases, have been well discussed in the literature. More importantly, they are well understood by persons influencing both public and private mineral resource policies." 14/ (Emphasis added)

13/ Hayne Leland, "Comment," British Columbia Institute Report, p.60.

14/ Gregg Erickson, "Work Commitment Bidding," Ibid., p.61.

Yet, it is not clear to us that royalty bidding problems are well understood by the officials who will guide the Department of Natural Resources in leasing decisions in the next few critical years or in the future.

A specific example of why we are concerned relates to the material prepared by the Department of Natural Resources to accompany H.B. 854, entitled "Two Views on Bidding Strategies." Not only are the numerous problems and dangers of royalty bidding (cited by Meade, Erickson and others in the University of British Columbia Report) not even mentioned, but also, after three short descriptive phrases under the heading "Royalty Bid-Fixed Bonus," the Department of Natural Resources, with no further comment, analysis, or explanation, simply states: "The Beaufort Sale is an ideal candidate for a royalty bidding scheme." (Emphasis added)

We view such remarks by the State Administration with concern. As indicated previously, many who have taken the time to study the various proposed bidding methods in depth list extensive problems with various schemes for royalty bidding (see also Attachment 2) and, would hesitate to use royalty bidding schemes of any sort except in drainage sales or where there are known, proven reserves (as mentioned above in the Leland citation). The Beaufort Sea is believed to have a high potential for discovery, but, as in the Gulf of Alaska, the drilling of wells may result in no discoveries, or discoveries of marginal fields. No discoveries - with royalty bidding - means no income for the State of Alaska. And, as royalty bidding adds risk for the State, another quote from Leland is perhaps appropriate here:

> "Note that if the lessor is such that leasing forms a substantial fraction of its revenue (for example the State of Alaska), it may not be optimal to transfer risk from firms to the lessor. Thus, lease contracts which might be appropriate to the federal government may not be appropriate for regional governments". 15/ (Emphasis added)

15/ Leland, op cit., p.60.

In view of the Department of Natural Resources' apparent current ease of decision-making with regard to where and how the current competitive-bid lease system should be abandoned, we feel it important to stress that we concur both with Mason Gaffney and Gregg Erickson as to where the burden of proof should lie, i.e., with those who would change the current system--not, as is implied and indirectly stated in H.B. 854, upon the Commissioner who would be cautious about a great deal of experimentation. In this regard, we believe we are safe in assuming that Gregg Erickson's statement below with respect to the work commitment bidding system would apply to any new proposed bidding system:

> "The adoption of a work commitment bidding system implies a judgment that existing institutions for private exploration of public resources result in a suboptimal rate of resource development.
>
> Any argument for the adoption of such a system must first establish that this is in fact the case..." 16/

Similarly, though in a more general way, Mason Gaffney warns:

> "To serve his citizens best, the statesman should...resist the temptation to use his power to manipulate and control...on the too easy presumption that the market has no rationale or normative value of its own. Generations of economists have established that it has, and governments seeking to improve on it need face a certain burden of proof." 17/

One final point: The effects of the cash bonus bidding method, though not perfect, have been rigorously scrutinized, with over 20 years of experience as a basis for analysis. And, according to Professor Mead's extensive studies related to the results of 35 oil and gas lease sales during the period November 1954 to May 29, 1974, bonus bidding with a fixed royalty is effective:

16/ Erickson, op cit., p.75.

17/ Gaffney, op cit., p.3.

> "On the basis of this evidence, we conclude that competitive bidding for oil and gas leases is sufficiently strong to protect the public interest in obtaining competitive values for its oil and gas resources. This conclusion is further supported by evidence presented above indicating an increase in the average number of bidders and a substantial increase in the average price bid per acre for oil and gas leases". 18/

Thus, it is our judgment that, although in certain, special circumstances, changes in the bidding approach may be advantagous to the State, several factors should be remembered. First, the State currently depends on the petroleum production for some 70 percent of its revenue, most of which is from a field that will begin to decline in about seven years. New exploration in Alaska is vitally needed.

Second, although oil companies by the nature of their business deal daily in risk and uncertainty, there is no question but that, to the extent the State can reduce uncertainty and foster confidence with regard to the use of new bidding systems, oil and gas exploration will be encouraged.

Third, because the new systems are experimental, we would suggest that the burden of proof for adopting a new system for any lease sale be placed on the Department of Natural Resources because the use of any new system involves greater risks and uncertainty not only for the companies but also for the State. The proposed amendments contained in Attachment 1 reflect this analysis and these conclusions.

18/ Mead, op cit., p.55.

C. Oil and Gas Leasing: How Competitive?

Much has been said in recent years about the competitiveness or lack of competition in oil and gas exploration and development. Concern has risen particularly with respect to joint ventures in general and joint bidding in particular. Although the formation of joint venture groups for lease sale bidding facilitates ease of entry in high-risk ventures, and allows producers to spread their financial investments in an effort to minimize overall risks, the sheer numbers of joint ventures have been interpreted by some as 'fostering something other than competition.'

The two theories about the nature of joint bidding in Federal lease sales (collusive vs. risk-sharing purposes) have been tested by University of North Carolina Professor Edward Erickson and M.I.T. Professor Robert Spann. As they reported in testimony before the U.S. Senate Commerce Committee, the observed patterns of bidding partnerships are most consistent with the hypothesis that joint bidding is a means of risk-sharing, not collusion. 19/ Among the ways in which competition might be fostered rather than reduced by joint arrangements are the following:

Because risks are shared, the cost of capital per unit of supply increment is less, so that entry barriers are lowered in high risk ventures;

Because of joint agreements, smaller independents can and do form independent and successful groups for bidding purposes in Federal lease sales, as evidenced by data on successful bidders in the June 1973 Federal lease sale;

19/ In their study of the 1972 and 1973 Federal offshore lease sales, Erickson and Spann found that membership of bidding groups varies from year to year; market shares for members fluctuate from one year to the next; the most frequent bidding group is a combination of majors and smaller firms, but majors bid alone, as do smaller firms; single firm bids are frequently made by the largest firms, but other firms are also successful single firm bidders, and bidding groups which contain a large number of firms are predominantly composed of smaller firms. They also concluded that the incidence of joint bidding increased as the size of the firm decreased; there was a heavy incidence of joint bidding partnerships between unlike firms; smaller firms use joint bidding ventures as a vehicle for entry into offshore activity. "Competition in the Field Markets for New Natural Gas Supplies," Statement before Senate Commerce Committee, November 8, 1973.

Because of the number of large and small producer combinations and the frequency with which new groups are formed with different members, producers are able to become involved in many projects so that competition is spread through many projects.

Since joint operating agreements also expressly provide for separate marketing of production from joint ventures, it would appear safe to conclude that risk-sharing through joint ventures need not make competition less intense. By facilitating ease of entry, joint ventures by domestic petroleum companies may indeed make competition more intense. 20/

The work of Professor Mead tends to underscore the findings of Erickson and Spann:

> "The most conclusive test of the workability of cash bonus bidding based on the United States record of OCS oil and gas lease sales is in terms of the rate of return on capital earned by the successful bidders. An analysis has been made on 184 offshore Louisiana oil and gas tracts leased in 1954 and 1955. Precise data are available on bonus payments, rental payments, oil and gas royalty payments, and production of oil and gas during the period from 1954 through 1967. Cost estimates were made for exploration, well drilling and equipment, and operation. Annual cost and annual wellhead values were discounted to obtain a net internal rate of return. The calculations indicate that these early OCS leases generated a 7.5 per cent before tax rate of return to the lessees. Given the fact that oil companies pay relative low U.S. income tax rates, the after tax rate of return would be only modestly lower than the 7.5 per cent before tax rate of return. This net yield clearly does not reflect monopoly power; it shows an excessive degree of competition". 21/ (Emphasis added).

In fact, two studies conducted under the auspices of the United States Geological Survey (both authored jointly by Dougherty of the University of Southern California and Lorenz of the U.S.G.S.) have indicated that the restriction of joint-bidding has failed to achieve its objectives in Federal OCS lease sales.

20/ In the last analysis, if the formation of such groups constituted monopoly power, one would expect to see some results where such groups are formed, e.g., a non-random bid price pattern in Federal lease sales.

21/ Mead, op. cit., p.55.

Major conclusions were:

1. The ban of joint-bidding by major oil companies may in fact have acted to broaden the overall influence of major companies in a given sale. The percentage of all bids and the number of bids per lease in which a major oil company was involved actually increased, which in turn may have increased the total amount of acreage in which major companies participated during this period.

2. When the U.S.G.S studies compared solo bids to joint-bids on given tracts, it was concluded that the joint-bidders tended to go after more highly sought-after leases and that they tended to bid higher on the average than sole-bidding competitors.

From a practical standpoint, allowing joint-bidding has important advantages to the State as well as to the industry, in terms of overall economic efficiency, environmental effects of exploration activity, and flexibility.

For example: Often, a given company may have a great deal of geologic and geophysical data in an area, but for one reason or another does not have the cash on hand to fully utilize its data in a competitive-bonus sale. In this kind of situation, it would make sense to join with another company that has the necessary investment capital and does not have the data.

If the two were unable to combine in partnership, a situation could develop where one company had to duplicate seismic and geologic information already held by the other company. Ironically, a situation would then develop where overall competition in the sale would be reduced, because one company with cash reserves would have expended part of its funds in gaining data, while the other company with information would be limited in participation

because of its cash limitations. Also, there would be the obvious environmental effect of the increased seismic and other activity, including, possibly, the drilling of wells, that would go along with the need to gain additional data.

In view of all of the above, we wonder why the State Administration proposes to ban joint bidding among "major and multinational oil and gas companies" (terms which are not defined in H.B. 854). Again, is the State simply following the Federal government's lead? If so, we would repeat Leland's cautionary note that it may not be in the State of Alaska's best interest so to do.

NOTE: The fact that Sohio/BP has proposed amendments to some sections of H.B. 854 does not mean that the Company endorses the bill in its entirety with the proposed amendments nor that we endorse the provisions to which we did not offer amendments. Part I of this paper is meant to clarify many of the concerns we have with H.B. 854 conceptually as well as in detail, concerns which, as shown in Part I, have been expressed in the analytical literature on the subject of the bill.

PART II: H.B. 854: PROBLEMS AND SUGGESTED AMENDMENTS

I. PROPOSED AMENDMENTS TO MAJOR PROVISIONS

A. Objectives (findings):

As explained in Part I above, we feel strongly that the language pertaining to the State's objectives as contained in the "findings" section of H.B. 854, should be amended to clarify the State's major goals in its leasing program. This section will and should be used by the Commissioner of Natural Resources in carrying out the Department's responsibilities under the proposed act in the "best interests" of the State.

These suggested amendments to H.B. 854 are particularly important in that, as explained before, some of the "important goals" outlined in the Governor's letter of transmittal appear to conflict with the apparent goals expressed in H.B. 854.

Suggestions: (Refer to attached draft language, Attachment 1, Page 1 and 2).

We suggest amending (A) to reflect the global and Alaskan energy/economic outlook. We also substituted the goal of encouraging prompt exploration and competition, in place of the ambiguous language of the original (B).

On Page 2, under (2), our amending language was designed to reduce uncertainty with regard to the implementation of the program. The language would allow flexibility, but only where consistent with the findings in (1).

Changes in (A) and (B) on Page 2 simplify the language in the original bill to reach the same goals, listed in (A) through (D) in H.B. 854.

B. Procedures

On Page 2, in (B), we suggest that the Commissioner be required to make his lease sale program consistent with the objectives in the bill.

Under (1), on Page 3 of the draft, we suggest that the status of the current leasing program shall be reported to the legislature, rather than, "submitted."

Section (2) clarifies ambiguous language in the same section of the original bill.

Section (3), also on Page 3, provides more certainty in lease stipulations and conditions by adopting language already contained in proposed state pre-leasing regulations.

On Page 4, under (B) in the suggested language, we suggest permitting the public to comment on the form of the lease sale as well as the leasing program itself.

Changes in (C) and (D) are being suggested to make the language more specific to reduce unnecessary delays and the potential for litigation, by adding "appropriate" federal agencies, "affected" local governments, etc...

Section (G) was added to clarify that (A) through (F) do not supercede Section 305 and 345 of the Alaska Lands Act, which provide for extensive review by affected municipalities and Alaska Native groups.

On Page 5 of the draft language, in (A), we would suggest that the Commissioner review bidding methods and leasing procedures used in the previous five years, rather than one year.

We suggest deleting (E) in the original H.B. 854 because we feel that such a requirement would put the Commissioner under undue pressure to experiment. It would tend to undercut the overall goal of flexibility for the Commissioner.

C. Lease Methods

We suggest new language in (C) on Page 6 of the draft, to provide more flexibility to the Commissioner, to insure fairness to all participants, to insure that the program is consistent with legislative findings of H.B. 854, and to place the burden of proof for the need of change to an alternative bidding system on the Commissioner.

D. Reduction of Royalty

On Page 9 of the draft language, the purpose of our amending language is to make it more difficult for speculation in the bidding of royalties. Under the proposed language, the lessee would have to clearly show that a reduction in royalty is required. These amendments should help in avoiding the problem of irresponsible bidding during a royalty-bid sale.

E. Bonus Bid Deferral

We would propose deleting this language (E) in original bill, Page 9, because we think that the option to defer payment of bonuses would encourage speculation and could lead to charges of unfairness if lessees have the option to "renegotiate" bonuses.

F. Withholding Acreage

For a variety of reasons, we would propose deleting Section (F) in the original bill, page 10. This is similar to powers held by the Commissioner under existing statutes and, as such, is not objectionable.

However, the problem with withholding acreage is illustrated by the description of it as "the fifth bidding system" by the Department of Natural Resources. This is further amplified by written comments by DNR personnel, in Report 2-77, where the withholding of acreage was specifically recommended as a means of significantly increasing state income on the assumption that the withheld acreage would cover half a known geological structure.

In the example discussed in Report 2-77 under the title of "Percentage of Acreage Withheld Leasing," it is assumed that 60% of a structure is leased initially at odds of 1 success in 10 which, after exploration, improve to 9 in 10. The fallacy of the argument is that the authors, (and subsequent proponents of the idea), neglected to take into account the other nine instances where exploration shows the acreage to be more or less worthless. Although 4% (10% of the withheld 40%) would attract high bids, the average overall income should be no different than if the whole acreage had been leased initially.

The assumption that all closed geological structures contain hydrocarbons is attractive, but untrue. The ability to close the rare structures which are filled with hydrocarbons is not vested in the State's geologists or those of a single oil company. Consequently the chances of the State losing income by deliberately withholding leases over a structure far exceed the chances of it making a windfall profit from the procedure.

What is often forgotten in the use of the example of Prudhoe Bay to show how not to lease, is the fact that at the time of the geophysical recognition of the Prudhoe structure, a bigger and geologically more attractive structure was found a short distance away. This was known as

the "Colville High". The Colville structure was drilled in 1966 with disastrous results because it was discovered to be dry and devoid of prospects. Those results seriously downgraded the Prudhoe structure, in the following year. It is highly unlikely that even if the Commissioner has the choice of multiple bidding methods he would have leased the Prudhoe acreage by anything other than cash bonus bids. If he had guessed, the same way that industry did, that the Colville High was the better of the two structures and had deliberately withheld half of it from leasing, would he have dared, in the light of the drilling failures, to do the same for Prudhoe? Obviously he would not have risked a second debacle. It is annoying in the light of this history to read that DNR authors, in, "Two Views on Bidding Strategies", 1978, persist in misusing the Prudhoe Bay example to reach the incorrect conclusion that "Bonus bidding should not have been used in that instance."

G. Exploration Work Credit Program

This is a suggestion made before the House Resources Committee by Sohio in early hearings on H.B. 854, involving credits for exploration as an incentive.

A major objective of H.B. 854 is to maximize revenues to Alaska, but to do this it is essential that the State adopt policies which encourage a steady, ongoing exploration program on State lands. Many sections in H.B. 854, if enacted, could actually serve to dampen exploration, but one option the State Legislature could consider to add an incentive for exploration is a program similar to Alberta's Exploratory Drilling Incentive System. This kind of program has proven to be successful as a way of encouraging high levels of exploratory activity, and in Alberta has been largely responsible for the record-breaking levels of drilling

activity in recent years, and subsequent high rates of discoveries since it was introduced in 1974. This year, the program was extended, until 1981.

The system is simple and is based on a drilling credit which can be earned by all exploratory wells and which varies according to the footage drilled and the region drilled in. For example, under the Alberta system, a well drilled to 8,000 feet on the North Slope could earn a credit of, for example, $2 million, where a similar well on the Kenai Peninsula might qualify for a $1.5 million credit. Deeper wells could earn proportionately more, as would offshore wells. These credits could be scheduled to equal approximately one-third to one-half of the cost of a well in each region, and they could be used by the earning company against bonus bids in a State sale, or against lease rental payments of royalty payments. The result could be an influx of capital into Alaska, similar to what has taken place in Alberta. But since the Commissioner would control the incentive program by regulation, it would be capital that would be directed by the State to areas in which the State wished exploration to occur.

To allow the Commissioner the discretion to introduce such a drilling credit system, we have taken the liberty of proposing general language in section (f) that could be translated into detailed regulations for a successful incentive program (see Page 10).

The system would require control by the Department of Natural Resources, but it could operate with less manpower than is needed for the policing of net profit bidding or royalty-bidding systems. The benefits would be tangible and immediate, and would probably exceed, in terms of new revenues to Alaska, the theoretical and untried potential of royalty or net-profits bidding.

H. Terms and Regulations

On Page 11 of the draft, our proposed language in (G) would replace (G) and (H) in the original bill. Our language would be simpler and would accomplish the same purpose, we think.

I. Lease Terms

On Page 13 of the draft language, our new language in (H) would give the Commissioner the option to have five-year lease terms, but only where the Commissioner finds that environmental and economic conditions would not severely restrict operations. The original language in the bill requires a five-year lease unless severe environmental conditions require a longer period.

In most parts of Alaska, severe environmental conditions and remote exploration locations dictate that drilling and other exploration activity be done only on a seasonal basis. A five-year lease term would therefore place great strain on the operator in all parts of the State except for Cook Inlet or Southern Alaska locations where work can proceed ye r-round. Our proposed language would leave the 10-year lease term intact, although the Commissioner would have the option for shorter terms where environmental conditions permit.

Our proposed language would also give the Commissioner authority to go to larger lease tracts if ircumstances require, if, for example, a work-commitment system is used.

J. 90-Day Provision

Also on Page 13 of the draft language, we also amend section (H) in language dealing with expiration of leases, to reflect unique Alaskan environmental problems in the term "reasonable diligence." This language

deals with activities that an operator may have underway at the time of the expiration of a lease. We would like to see environmental conditions taken into consideration by the Commissioner in delays that might affect an operator.

Also in section (H) on Page 13, we would suggest amending the language to reflect that a lease will be extended if there is a well capable of producing oil and gas, rather than a well producing oil and gas, as in the original language. Our reasoning is that there could be situations where a productive well has been drilled, but there are delays in building transportion systems to actually take the oil away.

K. Commissioner's Role in Conservation

On Page 17 of the draft, we propose new language that would clarify an apparent ambiguity in the original language regarding the Commissioner's conservation regulatory authority under Title 31 over pools unitized under this chapter. Our suggested language would reinforce the Commissioner's conservation authority, and would clarify this language.

L. Noncompetitive Leasing

Sohio-BP has no corporate position on noncompetitive leasing, but while some companies would like to have the option of noncompetitive leasing available, there may be situations where the State's broader public interest might not be served. Noncompetitive leasing can invite speculation in leases and in certain circumstances, there could be adverse environmental effects.

M. Joint Bidding Prohibitions

On Page 21 of the draft, the original language in the bill allows the Commissioner to restrict joint bidding by "major and multinational oil and gas companies" (these terms are nowhere defined). There are many serious problems that are discussed extensively in Part I, Section III C with respect to this provision. Based on the conclusions of the studies cited in this section ("Oil and Gas Leasing: How Competitive?"), we would suggest that it is neither necessary nor in the State's interest ot restrict joint bidding in any way. Such prohibitions not only restrict entry into Alaska leasing, but also could reduce potential revenues from lease sales. We would suggest deletion of this section from the bill.

N. State's Right to Purchase Oil and Gas

Section (v) on page 21 in H.B. 854 would include in leases a provision whereby the State would be allowed to puchase up to 100 percent of any gas discovered on State lands. This could be very harmful to the State in the long run, as it could effectively eliminate the financing of exploration programs by means of gas sale contracts. These contracts have been normal in Alaska, and in the past few years have contributed many millions of dollars to oil and gas drilling. This source of investment would be cut off and the proposed provision would only discourage exploration and the purposeful search for gas.

Under the terms of this section, contractual commitments would be impossible to make because the lessee would have no certainty of ownership of gas and would lose the right to dispose of his share of production to his best advantage, which could also be to the State's advantage. The result could be an increase in the risks and costs of exploration.

O. Data

In accordance with statements made by Administration officials with respect to the intent of the langugage in H.B. 854 relating to data acquisition and confidentiality, we have amended (w) of H.B. 854 on Page 21. Under our amended language in (s) on the same page, therefore, the Commissioner is given access only to noninterpretative data which shall be held confidential upon the request of the lessee or permittee as provided in AS 38.05.035. Additionally, in our (s) section, we have added that the Commissioner shall, by regulation establish procedures to govern access to and the safekeeping of such data.

As to the usefulness of such data acquisition, we would refer you to the analysis contained in PART I, Section III A above ("Data Acquisition: How Useful?"). This section additionally attempts to explain why data acquisition by the government is frequently viewed as the first step that inevitably leads to government drilling corporations.

P. Acreage Limitations

Section 3 AS 38.05.140(c) in H.B. 854 would limit any one company's onshore lease holdings to a limit of 200,000 acres. We would suggest that this limitation may be unnecessary in reaching the objective of encouraging competition and may, in fact, undercut the goal of maximizing competition on State lands simply because some companies are now near or at the proposed limit in terms of onshore acreage holdings. They would not be able to participate in future state sales for at least five years if this provision were enacted.

The limitation also seems to work against other objectives of H.B. 854. For instance, the Department of Natural Resources, in its comments on the proposed work commitment bidding method, acknowledges that large areas on the order of 100,000 acres are needed to make the type of bidding practical. Such acreage would be low potential, high risk land which would not normally be seriously considered for exploration. If the 200,000 acre maximum is retained, no responsible company could even bid on large work commitment parcels of this kind. Consequently, retention of this stipulation would narrow the leasing options available to the State and would be detrimental to the responsible assessment of State land.

II. SUMMARY AND CONCLUSIONS

In summary, we would offer these observations and conclusions:

1. H.B. 854 as currently drafted would create a State leasing system biased towards experimentation with procedures that are new and untried in Alaska. This may not be in the State's interest, because unusual leasing systems could lead to delays in petroleum development that could have serious consequences on future State revenues and Alaska's contribution toward U.S. energy needs.

2. The United States faces a critical energy-import problem that may have serious consequences for the Nation's economy. Alaska can contribute to the lessening of U.S. dependence on imported oil, but long lead times and large investments are needed to develop new petroleum discoveries in remote Alaskan locations. By enacting new leasing legislation that could lead to unusual and untried lease systems, the State could inadvertently delay exploration and development in remote Alaskan areas with resulting consequences in the global energy/economic sphere.

3. The State of Alaska faces a potentially serious revenue situation in the late 1980's as annual State expenditures increase and oil production from the Prudhoe Bay field begins to decline. Again, the long lead-times needed to find and develop new Alaskan oil discoveries would indicate that exploration must proceed soon on State lands to provide needed petroleum revenues.

4. Alternative bidding systems proposed in H.B. 854, although also proposed in OCS legislation now pending in Congress, have not had extensive use in the U.S., nor in very many other places in the world. Experience with royalty bidding in federal OCS sales has been dissappointing, and the federal government may now be reconsidering the use of alternate bidding systems other than the competitive bonus-bid procedures.

5. The majority of academic literature that we have been able to find supports the thesis that the traditional bidding methods have worked well in the leasing of public lands for petroleum development. Academic experts also seem to agree that alternative bidding systems present serious problems, except when used in certain special situations.

6. We have offered in Attachment 1 suggested language that would, we believe, improve many sections of H.B. 854, and give the Commissioner the flexibility he desires while at the same time encouraging the use of proven leasing systems unless special circumstances dictate the need for an alternate situation. Royalty-bidding in a drainage sale would be an example.

7. We have suggested an exploration work-credit program similar to a successful system used in Alberta that we believe would offer substantial incentives for increased Alaska oil and gas exploration.

April 6, 1978

The Honorable Alvin Osterback
Chairman, Resource Committee
Alaska House of Representatives
Pouch V
Juneau, Alaska 99811

Dear Chairman Osterback:

Recently, Mr. Mark Singletary provided the Resources Committee with verbal testimony reflecting Atlantic Richfield Company's reaction to proposals contained in HB 854.

Attached is written commentary on HB 854 which I would respectfully request that the Committee consider and include in the official record of these proceedings.

Sincerely,

Dave Harbour
Director
Alaska State and Local
Government Relations

AGO 547181

ATLANTIC RICHFIELD COMPANY COMMENTS ON
HOUSE BILL 854

"An Act relating to the leasing and exploration of state land for oil and gas development."

April 6, 1978

Comments on Section 1:

Sec. 38.05.180(a)(1)(B)

In the description of the legislative purposes of this bill, there is a negative connotation given the word "exploitation" in Sec. 38.05.180(a)(1)(B). This section in general suggests sinister motives to the oil and gas industry which need to be "minimized." A possible modification should read, "regulate the development of these natural resources in protection of the public interest."

Sec. 38.05.180(a)(2)

Underlying this section is the notion that it is in the State's best interest to maximize the leasing methods available to the State. However, it is our view that the new leasing methods proposed are largely untested and may result in reduced revenues to the State. Further, it is not at all clear how a unit agreement could ever be formulated for a group of lessees who had obtained their leases under a combination of the proposed bidding methods.

Sec. 38.05.180(b) AGO 547182

This section deals with the Commissioner's obligations to prepare a leasing program for the following 5 year period and his obligation to keep the legislature informed. We are in favor of such a long-range leasing program and support the State's acknowledged

goal of "stability and predictability" in a petroleum leasing program. However, the long-range benefits intended and the State's goal are frustrated by the ability, and, indeed requirement, that the Commissioner review and possibly revise the leasing program at least annually. Perhaps the possibility of revision could be limited to the last two years of the ongoing five year programs so that industry could expend exploration dollars with some certainty that a sale will be held. Alternatively, Sec. 38.05.180(b)(3) should be deleted.

The annual submission to the legislature of the leasing program, although for "its information," would seem to presuppose further modification of the leasing program. Again, opportunity for yearly modification of the leasing program abrogates the State's goal of a stable and predictable petroleum leasing system. As an alternative to reporting to the legislature, the Commissioner could be required to make an annual public report of the leasing program.

Additionally, in Sec. 38.05.180(b)(5)(E), the Commissioner is required to justify in his report to the legislature why more than 50 percent of an area is leased under any one method of leasing. This requirement of justification seems to be an incentive, if not explicit direction, to utilize the full array of leasing alternatives for any one sale and to, in effect, "experiment".

The language in Sec. 38.05.180(b)(2) is extremely confusing and should be clarified. Further, it is not clear whether or not this section is directed to or will have any effect, intended or otherwise, on the Beaufort Sea sale.

Sec. 38.05.180(c)

This section authorizes four generic categories or methods of leasing: (1) "Bonus bidding," (2) "Royalty bidding," (3) "Net profit bidding," and (4) a "Work commitment bid." Several combinations or variations of methods are authorized under each of the generic headings.

The first method of conventional bonus bidding has the best overall record from the lessor's standpoint. A study of federal OCS sales through 1975 showed that industry had invested $35 billion in bonuses, exploration and development on OCS leases while receiving $22 billion in revenue.

Net profit bidding opens up a multitude of problems as to the definition of "net profit." This method would allow many companies to get into a land position for speculative purposes. It is a

fierce deterrent to early drilling as it is far easier and cheaper to wait out the competition. It is extremely cumbersome to administer and audit, and is even more costly to operate than royalty bidding methods.

The last method of bidding, a work commitment for a lease which cannot, by definition, exceed 5,760 acres, seems completely unworkable as such an area is much too small. This method is usually used in European and mid-east concessions or Canadian permits or reservations which share a common characteristic of being very large geographic areas.

In each of the four leasing methods, the language describing the State's royalty is troublesome. Each description of the State's royalty provides, "... royalty share reserved to the state of not less than 12 1/2 cent in amount or value of the production removed or sold from the lease or unit area encompassing the lease ...." (emphasis added) This language would preclude anything but 100 percent state units. Unitization of lands involving federal or native lands and state lands would be impossible because of the inability of the participants to give the state at least 12-1/2 percent of the production from the "unit area encompassing the [state] lease."

Further, it should be noted that all of the methods and components of the alternate leasing methods will necessitate substantial increases in the budgets and personnel of the agencies involved.

Finally, if some minimum flexibility in leasing methods is desired, the same could be accomplished with minor changes in the existing law.

Sec. 38.05.180(d)

This section allows the Commissioner to reduce royalty when production becomes uneconomical, but only after two years of production. The most recent federal leases require only one year of production, which would be more in line with the stated goal of the bill to minimize revenue from marginal production. Given the explicit description of the royalty in Sec. 38.05.180(c) as "not less than 12 1/2 percent ...," it is not clear whether the Commissioner could ever reduce royalty to any figure below 12 1/2 percent.

Sec. 38.05.180(e)

This section purportedly authorizes the Commissioner to defer payment of any part of a cash bonus bid, provided the bonus is paid within five years. This authority is in direct conflict with AS 38.05.335(c), neither referenced nor repealed by the bill, which requires a deposit of 20 percent, in cash, of the bid.

Sec. 38.05.180(f)

This section authorizes the Commissioner to withhold acreage from leasing in a particular sale. It is assumed that the motive of

this provision is a desire to increase the state's income from leasing by leasing, for example, only part of a structure, and then, once proven productive, leasing the remainder for higher amounts. However, this authority to withhold acreage can just as easily decrease the state's income, in the event the first acreage leased is found non-productive.-- which is usually the case. In essence, this section is authorization for the Commissioner to "gamble" on the productivity of state lands.

This section also seems unfair to the first lessees, who, if the first tracts leased prove productive, are faced with the prospect of having to buy themselves back into the fruits of their own risk at a higher rate.

Sec.'s 38.05.180(g) and (h)

These sections relate net profits and work commitment leasing which, as previously discussed, are ill-advised.

Sec. 38.05.180(i)

There are no objections to this section so long as the trading or storage of royalty oil remains and is clearly the subject of mutual agreement.

Sec. 38.05.180(j)

This section concerns several of the provisions to be included in state oil and gas leases:

AGO 547187

First, this section reduces the primary term of state leases from 10 to 5 years. It should be understood that in most areas of Alaska the ability to carry out exploration work is limited to a four month period per year, consequently a five year lease allows only 1-2/3 years of exploratory work. This is clearly insufficient in such a high cost, high risk area.

Second, this section provides that a state lease will be "renewed", if and for so long thereafter as oil and gas is produced in paying quantities or if the lease is committed to a unit. The term "renewed" should be replaced with the term "extended" as this is the long-understood and recognized effect of production or commitment to a unit.

Third, the section's provision concerning shut-in wells should be clarified, since, in its present form, it appears as though the shut-in well must be located on the land prior to the issuance of a lease.

Fourth, this section authorizes the Commissioner to increase rentals up to 150 percent of the preceding year's rate and to provide that a lessee earns production rights only to the depth drilled at the beginning of production. Both of these provisions should be deleted as unnecessary and unworkable.

As to rental increases, as noted, Alaska is already a high cost, high risk area. The prospect of substantial rental increases

AGO 547188

during the primary term of a lease will serve only to curb exploration not encourage it.

The provision concerning production rights only as to the depth drilled is unnecessary and unfair. Aside from an obvious example of the lessee drilling into the top of a reservoir and being mechanically unable to go deeper and thereby losing the main body of the reservoir, it also could result in split ownership of a lease with one party having to drill through another's rights to reach his own with possible damage to the upper reservoir resulting.

Finally, the means of extending a lease by drilling are set forth in this section. Given the seasonal nature of drilling in Alaska the 90 day grace period after drilling has ceased should be expanded if further drilling is prevented by environmental considerations or other circumstances imposed by the State.

Sec. 38.05.180(k)

The increased rentals proposed in this section will discourage exploration and will not increase income to the State because the extra expense will be compensated by lower bid totals. The present $1.00 per acre per year rental should be retained.

Further, this section alters substantially the nature of the ordinary rental provisions in oil and gas leases. The rental to be paid under these provisions is no longer a delay rental. This

AGO 547189

section provides, "Rental is payable in advance and continues until income to the state from royalty, net profit, or exploration work commitment exceeds rental income to the state ... for three consecutive years ...." There is no provision for credit or set-off of rental paid during those three years against the state's income from production. Consequently, for the first three years of production, the state would receive both rental income and production income.

Sec. 38.05.180(1)

This section should be modified to provide that the state shall issue a State shorelands lease, as AS 38.05.180 presently reads. Also, the Commissioner should be given the discretion to grant a shorelands lease in excess of five years.

Sec.'s 38.05.180(m) and (n)

These two sections concern the unitization of state leases and are re-enactments of present law. However, given the alternate leasing methods of the bill, and the previously discussed, implicit direction to the Commissioner to "experiment" with these methods, unitization of state leases will be extremely difficult, if not impossible.

It is entirely reasonable to assume that under this bill, a proposed unit will be composed of leases involving highly disparate royalty percentages and one net profits or other kind

of lease. The extreme difficulty of applying these completely different lease burdens to the production allocated to each lease under a proposed unit are obvious. These difficulties constitute a disincentive to unitization and therefore nullify the conservation benefits of unitization.

Sec. 38.05.180(o)

This section concerns the acreage chargeability of KGS leases and is unobjectionable.

Sec. 38.05.180(p)

This section is a re-enactment of the present authorization for the pooling of state leases. Like the provisions concerning unitization, the problems inherent in alternate leasing methods will make pooling more difficult, to the detriment of the conservation objectives of pooling.

Sec. 38.05.180(q)

This section authorizes the State to share in the costs of exploration under a drilling or development contract. Oil and gas exploration is extremely risky and historically the province of private enterprise. Financial participation by the state in an exploration venture raises fundamental questions as to the appropriate role of state government. Given the fact that most wells drilled are unsuccessful, and the substantial sums involved in drilling in Alaska, additional challenges may be anticipated as to the authority or wisdom of the State to participate in a particular drilling project.

AGO 547191

Sec. 38.05.180(r)

This section is a re-enactment of present law concerning the subsurface storage of oil or gas on state leases. However, the present law's provision concerning the extension of the lease used for storage for the period of storage and so long thereafter as oil and gas are produced was deleted. This extension provision should be retained.

Sec. 38.05.180(s)

This section concerns the employment of state residents on state leases is substantially the same as the existing law.

Sec. 38.05.180(t)

This section is an attempt by the state to encourage exploration on lands on which no bids have been tendered. This philosophy is laudable. However, the Commissioner should not be restricted by the leasing details of this section.

Sec. 38.05.180(u)

This section would restrict joint bidding and should be deleted. Joint bidding can very well be to the advantage of the state as it tends to increase the size of the bids submitted and facilitates the exploration process. See, for example, the paper in the November 1976 issue of "Journal of Petroleum Technology" in which the authors conclude that "joint bidders tend to bid on more sought-after (and apparently more valuable) leases and that they tend to bid higher, on the average, than solo-bidding

competitors". Industry testimony before the U.S. Senate has indicated that since the first OCS sale in 1954, 172 companies have purchased OCS leases. 42% of these leases were not purchased by the major companies, and in recent years the smaller companies have increased their share of OCS production at the expense of the major oil companies.)

Depending on the content of the regulations adopted, this section may violate Article 8, §17 of the Alaska Constitution. This Constitutional provision requires that laws and regulations governing the use or disposal of natural resources must apply equally to all persons "similarly situated".

Sec. 38.05.180(v)

This section grants the state an unfettered option to purchase 16-2/3 percent of oil and up to 100 percent of gas produced from a state lease. This section will in effect eliminate the lessee's ability to use the gas sales contract as a method of financing. Consequently, gas exploration in Alaska will be discouraged if not precluded. Similarly, if the state should wait several years before deciding to take up to 100 percent of the gas, the discoveror of a gas field would be deprived of all income from his legally obtained gas, because he could not enter into a contract with any other user. This section would also eliminate or impair the ability of lessees to utilize the production payment as a method of financing, likewise discouraging exploration.

Sec. 38.05.180(w) This section requires state access to all of a permittee or lessee's exploration data and should be eliminated from the bill. This section is, in essence, a confiscation of valuable proprietary data, for the sole purpose of deciding whether the explorer has found anything or not. If the state decides he has, the area could then be thrown open to all other competitors, thereby removing any incentive for an aggressive company to be a leader or employ innovative ideas to discover new resources. This section completely removes that incentive, and thereby will cause significant state natural resources to remain unsought.

In addition, grave problems as to the preservation of the confidential nature of the data are inherent in this section. It is common knowledge that such information is extremely confidential and closely guarded by the individual members of the industry.

The existing law upon which the oil and gas industry has relied for the confidentiality of information is contained in AS 38.05.035(a)(9)(C). This existing provision requires the director to keep geological, geophysical and engineering data confidential "upon request of the persons supplying the information." As the Bill's provision requires disclosure of information to the Commissioner, not the director, and since it requires also access, as distinct from supplying copies, are the confidentiality provisions incumbent upon the director not

applicable to the information required to be disclosed to the Commissioner?

If this section is to be applicable to existing exploration data, then the Commissioner's access and utilization of such existing data is almost certainly an unconstitutional taking of this valuable and expensive property. If the Commissioner is to be allowed access at all to such data, such access should be limited to future data only. Further, there should be a requirement of the adoption of regulations prescribing the confidentiality of this data and the addition of statutory criminal penalties for intentional disclosure of such data.

Section 2

There are no objections to this section concerning notice of mineral leasing.

Section 3

This section would amend AS 38.05.140(c) to reduce the upland acreage limitation from 500,000 acres to 200,000 acres. In Alaska, where there are large areas of state lands which are potentially eligible for bid, a 500,000 acre limitation, which the present statute contemplates, is not unreasonable. The effect of a 200,000 acre limitation would clearly be to limit the participation of those individuals who are most active in exploration business in Alaska, i.e., those individuals who have

historically submitted the highest bids to the state. It is not at all clear why the state would seek to discourage, rather than to encourage, the continued involvement of those individuals in Alaska. Further, this section's applicability to the holding of existing lessee's -- requiring them to reduce their holdings within 5 years -- is an unconstitutional taking of leasehold estates.

Differences Between House and Senate
Versions of HB 854
(Page Numbers Refer to Side-by-Side Analysis)

	Senate	House
1.	Senate added word "physical"(p.1)	
2.		Gives legislature right to "veto" any part of leasing program (p.2).
3.	Includes words "pipeline quality" in description of how royalty shall be delivered (p.4).	
4.		Sliding scale royalty allowed, with bonus as bid variable (p.4).
	REDUCTION of WORK COMMITMENTS	
5.		Sliding scale royalty allowed as bid variable (p.5).
6.	Allows straight royalty bidding, but only in "drainage" situations (p.5).	Allows straight royalty bidding (p.5).
7.		Commissioner may defer bonus bid payment (p.8).
8.	Calls generally for ten year term (p.9).	
9.	Rental terminates whenever royalty is greater (p.10).	Rental terminates when royalty is greater for three consecutive years (p.10).
11.		Includes provision for reduction of royalty (p.11).
12.		Requires use of sliding scale royalty for reoffered leases (p.14).
13.		Provides for possible restriction on joint bidding (p.14).
14.		Provides for possible inclusion in lease of provision under which producers could be required to sell for instate use (p.14).

AGO 547197

Senate

House

15. Changed "activity" to "lease" in section giving commissioner access to "noninterpretive data" (p.15).

16. Senate made technical amendment: "lands" to "land" (p.16).

17. Retains 500,000 acre limitation contained in current law (p.16).

18. Senate made conforming amendment to 38.05.140(d). Effect is to insure that (j) of both bills has intended result of setting standards for royalty reduction.

How to Bid for Offshore Rights

Several systems have been proposed to replace the present "bonus-bid" method of assigning leases on offshore oil prospects to developers. Of these, Professor John W. Devanney III of M.I.T. opts for "percentage-of-excess-profits" bids (*see p. 42*). Other proposed arrangements include work obligation permits and various forms of royalty bidding.

The Work Obligation Permit Plan

Under the work obligation permit plan, developers would submit exploratory and provisional drilling plans for a given tract. The government would choose the developer with the most aggressive, best-considered plan, and the developer would then be responsible for agreed-upon amounts of royalties and/or lease rentals. Under this system, used currently by the Norwegians and the British in the North Sea, the great bulk of any economic rent would be transferred to the developer, and a portion of this rent would be returned to the public in the form of corporate income taxes. Of the possible methods reviewed here, this is clearly the most favorable to the developer.

Administering this method to maximize national income depends on the skill and honesty of administrators. There are temptations for prospective developers to submit work plans which represent over-development of the resource so they will be judged the most aggressive, and administrators will have to be wise enough to recognize such over-development and refuse it. The decisions to be made in choosing the "best" work plan are necessarily judgemental, and they are an open invitation to the influence of special interests and even to corruption.

But beyond the possibilities of incompetency or corruption which may result in loss of national income is the basic fact that most of the economic rent goes to the developer. Professor Devanney concludes that work obligation permitting is clearly not desirable, from a nondeveloper point of view. Indeed, as soon as it became clear that economic rent was associated with North Sea oil, the British and Norwegians moved away from this practice.

Royalty Bidding

Royalty bidding involves competitive bidding on a share of the actual gross revenues — generally a percentage of market value — associated with the resource. This method has long been used in state sales of rights, and the federal government experimented with it in the Gulf of Mexico in 1974.

Compared with bonus bidding, royalty bidding transfers some of the risk prior to exploratory drilling from the developer to the public. This helps maintain competition among bidders, for large amounts of up-front capital are not necessary, and the need for large bidding combines disappears.

However, there are other problems. While the method could theoretically give most of the revenues from offshore oil to the public, it could also reduce the total size of the offshore oil pie. This is because the royalty bid, unlike the bonus bid, affects the developer's marginal expenses. For instance, if a developer overestimates production from a certain tract, he will freeze himself into a royalty bid that makes it unprofitable for him to develop the smaller, and thus more expensive, oil find that is actually made. He will refuse to develop it, and the national income will suffer. This risk may especially affect secondary and tertiary production from a tract; such oil will be more expensive than primary oil but still less costly than foreign crude.

Proponents of royalty bidding offer two possible resolutions of this dilemma — re-leasing and renegotiation. The former proposes that if a developer decides not to produce a tract he must turn it back to the government, with all equipment intact, and the government may lease the tract anew, presumably to a different developer at a lower royalty. This would discourage expensive techniques to enhance oil recovery, because the original leaseholder may choose merely to take out the flush production before releasing a tract back to the government. This will be costly to the public, since processes for secondary and tertiary recovery of oil must begin early in a field's life to be most effective. There is also the possibility of excessive administrative costs associated with the negotiations necessary for re-leasing.

Advocates of renegotiation propose that if a developer feels he cannot develop a field at his bid royalty, he should be able to present his evidence to the regulatory body which should be empowered to grant him a decrease if it finds his presentation viable. The obvious problems here are in the regulatory body's verification of the developer's data. The capital-intensiveness of offshore oil makes any estimate extremely sensitive to the cost of capital, and that information is often confidential.

Other potential problems introduced by renegotiation include temptations for developers to "goldplate" a project since additional expenses could come off the royalty — i.e., out of the public's pocket. A developer might deliberately bid high initially in order to obtain a tract, anticipating that he will renegotiate later; and he might go through a whole series of renegotiations as his costs for enhanced recovery techniques begin to appear.

Some have suggested a compromise between bonus bidding and royalty bidding, in which developers would enter a "high" fixed royalty plus a bonus bid of up-front payments. This would decrease the size of bonus bids and aid competition, say its advocates. Unfortunately, this presents the same can of worms as straight royalty bidding.

Installment bonus bidding has also been suggested. This means a developer would pay his bonus in three installments — immediately, after three years, and after five years. He could surrender the lease before the last two payments if things failed to work out. But this presents the same pie-reducing problems as royalty bidding; if a developer originally bid $600 million and after exploratory drilling found oil worth only $350 million, he would abandon the tract rather than pay the final installments even though national income would be increased by $350 million if the find were developed.

There are advantages, however, in installment bonus bidding. There is an automatic re-leasing provision, which could assure that tracts were re-opened for development; and the marginal costs of the oil are not affected, which means that the developer has incentives to invest early in enhanced recovery.

However, the massive amounts of up-front money involved in even a one-third installment payment of a bonus bid will probably still frighten away many bidders. And many bidders would increase their total bonus bids considerably, knowing that they could thus avoid paying additional installments.

AGO 547199 -f

ALBERTA, CANADA

Exploratory Drilling Incentive System

A report from Alberta Energy and Natural Resources states the exploratory drilling incentive principles adopted for wells spudded between Jan. 1, 1978 and March 31, 1981 were announced by the government last fall and will be defined in detail in the Exploratory Drilling Incentive Regulation, 1978 when it is issued in the near future.

This regulation, however, may not be available to industry prior to the commencement of the drilling activity it affects. Accordingly, the essential details respecting the forthcoming program are described herewith.

The department expects that the principles and details outlined here will be incorporated, without a change in meaning, into the 1978 Regulation. If, however, such a change does occur, the 1978 Regulation would, of course, take precedence.

(1) Commencement Date of the Forthcoming Program

As previously indicated, an incentive exploratory well in good standing will be

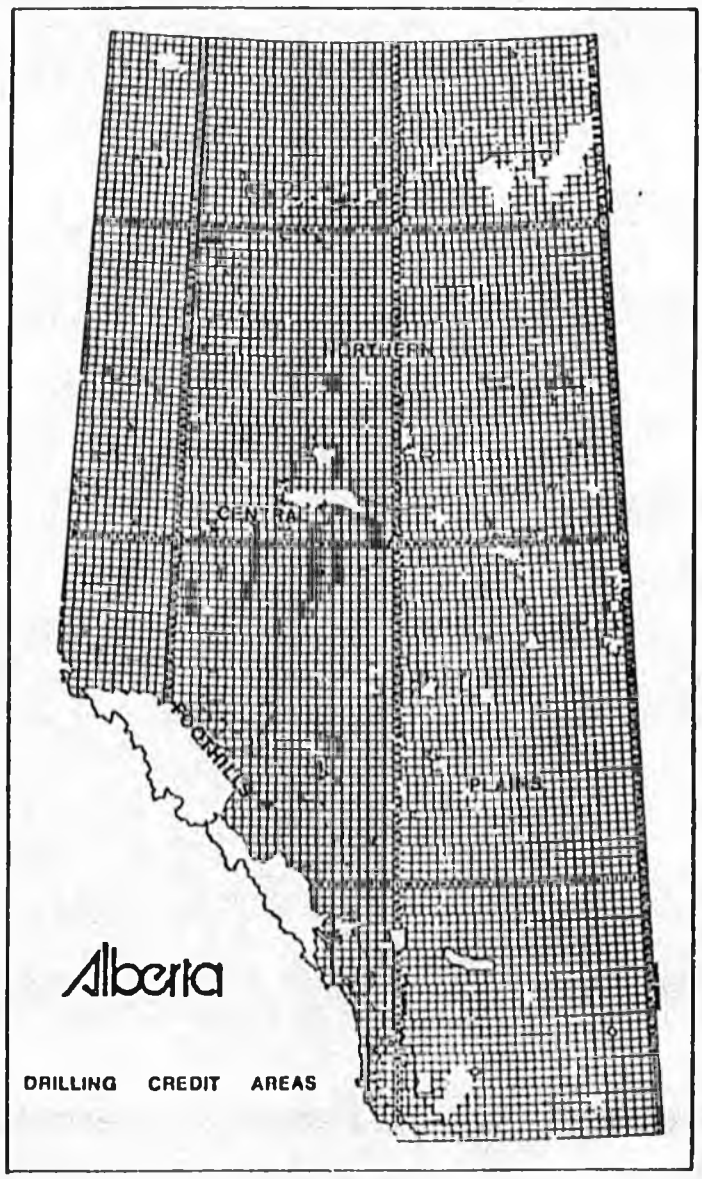

Figure 1

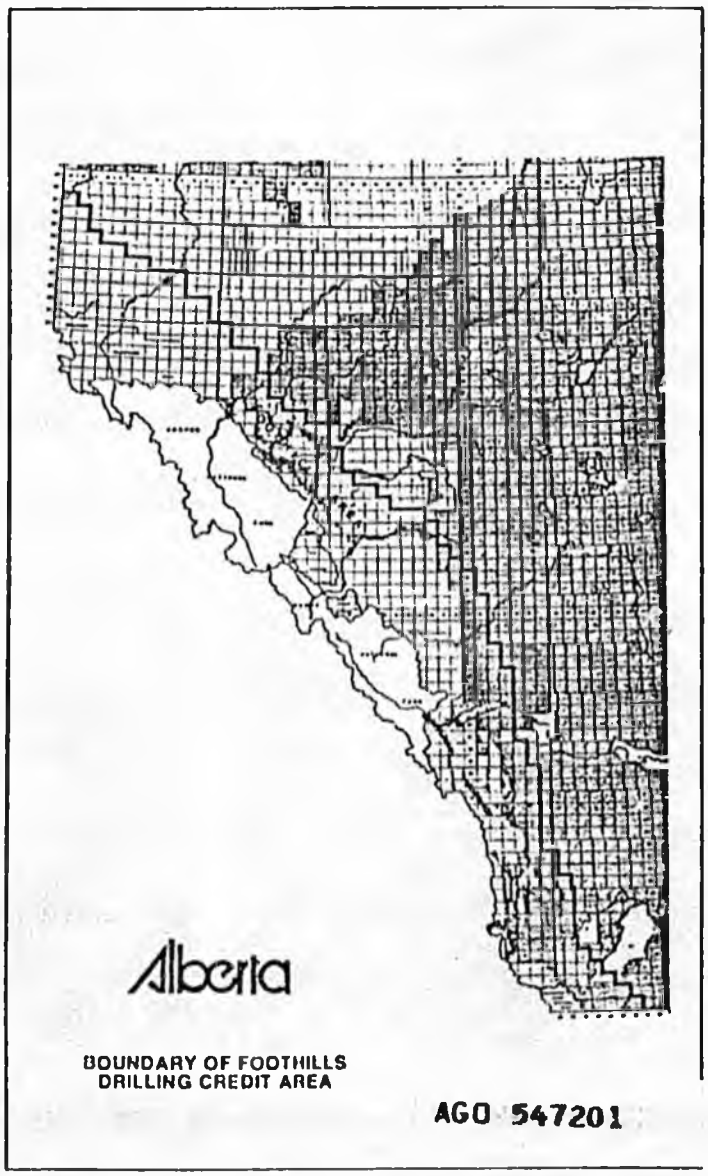

Figure 2

subject to the 1978 Regulation if it commences drilling on or after Jan. 1, 1978. This provision will not be affected if the licensing or certification date is before 1978.

(2) Drilling Credit Areas

Figure 1 shows the drilling credit areas as they will be defined under the 1978 Regulation. The Plains and Foothills Areas have not been changed. The subsisting Nortnern Area, however has been divided into the new Central and Northern Areas shown by the illustration. The boundary between the two new areas was defined by the Department on the basis of well cost data and topographic and access considerations.

Figure 2 is provided for the convenience of industry to depict the irregular eastern boundary of the Foothills Area. A similar map was issued by the Board in 1974.

(3) Drilling Credit Schedules

Drilling credits under the 1978 Regulation will be determined from Schedules F

SCHEDULE F

Applicable to the Class A Interval of an Incentive Exploratory Well that Commences Drilling on or after January 1, 1978

The Class A interval of an incentive exploratory well that commences drilling on or after January 1, 1978 shall be determined by the Board as the interval below the depth of 2,000 feet that

(i) has not been duplicated by a drilled and abandoned well within one and one-half miles.

(ii) occurs more than 500 feet below the base of the deepest accumulation of crude oil or natural gas that in the opinion of the Board has been penetrated by another well within three miles, and

(iii) occurs immediately below the base of the member or formation containing the deepest oil sands deposit that in the opinion of the Board may underlie the location of the said incentive exploratory well.

Where neither (ii) nor (iii) above applies, the Class A interval shall be determined from the depth of 2,000 feet to the total depth of the said incentive exploratory well.

	Basis for Credit Plains Area		Basis for Credit Central Area		Basis for Credit, Northern and Foothills Areas	
Depth, Feet	Cumulative Dollars	Incremental $/Foot	Cumulative Dollars	Incremental $/Foot	Cumulative Dollars	Incremental $/Foot
2,000	0	20	0	30	0	40
3,000	20,000	18	30,000	25	40,000	35
4,000	38,000	18	55,000	25	75,000	40
5,000	56,000	20	80,000	25	115,000	35

11,000	300,000	100	390,000	110	480,000	120
12,000	400,000	110	500,000	160	600,000	180
13,000	510,000	160	660,000	200	780,000	210
14,000	670,000	210	860,000	240	990,000	260
15,000	880,000	280	1,100,000	350	1,250,000	350
16,000	1,160,000	340	1,450,000	400	1,600,000	425
17,000	1,500,000	500	1,850,000	550	2,025,000	575
18,000	2,000,000	500	2,400,000	550	2,600,000	575

Figure 3

SCHEDULE G

Applicable to the Class B Interval of an Incentive Exploratory Well that Commences Drilling on or after January 1, 1978

The Class B interval of an incentive exploratory well that commences drilling on or after January 1, 1978 shall be determined by the Board as the interval below the depth of 2,000 feet that

(i) has been duplicated by a drilled and abandoned well within one and one-half miles.

(ii) occurs more than 500 feet below the base of the deepest accumulation of crude oil or natural gas that in the opinion of the Board has been penetrated by another well within three miles, and

(iii) occurs immediately below the base of the member or formation containing the deepest oil sands deposit that in the opinion of the Board may underlie the location of the said incentive exploratory well.

Where neither (ii) nor (iii) above applies, the Class B interval shall be determined from the depth of 2,000 feet to the total depth of the said incentive exploratory well.

	Basic for Credit Plains Area		Basic for Credit Central Area		Basis for Credit, Northern and Foothills Areas	
Depth, Feet	Cumulative Dollars	Incremental $/Foot	Cumulative Dollars	Incremental $/Foot	Cumulative Dollars	Incremental $/Foot
2,000	0	15	0	20	0	28
3,000	15,000	14	20,000	20	28,000	29
4,000	29,000	14	40,000	20	57,000	29
5,000	43,000	14	60,000	19	86,000	24

7,000	75,000	25	105,000	30	140,000	40
8,000	100,000	30	135,000	40	180,000	45
9,000	130,000	40	175,000	50	225,000	60
10,000	170,000	55	225,000	65	285,000	75
11,000	225,000	65	290,000	90	360,000	95
12,000	290,000	90	380,000	120	455,000	125
13,000	380,000	120	500,000	150	580,000	155
14,000	500,000	160	650,000	180	735,000	190
15,000	660,000	210	830,000	270	925,000	275
16,000	870,000	270	1,100,000	300	1,200,000	310
17,000	1,140,000	360	1,400,000	400	1,510,000	420
18,000	1,500,000	360	1,800,000	400	1,930,000	420

Figure 4

AGO 547202

and G *(Figures 3 and 4)*. The schedules reflect the government's decision to exclude the upper 2,000 feet from the forthcoming program, and to increase the credits for qualifying wells deeper than about 3,500 feet. For wells greater than 5,000 feet in depth, the increase is between approximately 25 and 45 percent, the difference being justified by the Department's comprehensive well cost study. An exception applies to the new Northern Area, for which credit increases at certain depths exceed 45 percent to correspond with Foothills credits.

(4) Royalty Exemptions

(4.1) Eligibility

Crude oil or gas production must originate from a Class A or Class B interval to qualify for a royalty exemption. Production from any source shallower than 2,000 feet will thus not qualify for royalty exemption under the 1978 Regulation. An exception to the foregoing exclusion is found under the following circumstances: If conventional crude oil is produced from a source shallower than 2,000 feet in the new Northern Area, and if the 2,000-foot interval would have qualified as Class A or Class B footage pursuant to the 1974 Regulations, the crude oil production will be eligible for the normal royalty exemption applicable to deeper production.

(4.2) Duration

The royalty exemptions authorized under the 1978 Regulation will apply to the initial 60 crude oil-producing months or the initial 12 gas producing months at the well, commencing with the first month in which the crude oil or gas would otherwise be subject to royalty payment.

Additional details concerning these and other principles relating to the forthcoming program will be specified in the 1978 Regulation. If any questions arise after the 1978 Regulation is studied, they may be referred to J. R. Pow or F. Phillips of the Energy Resources Conservation Board, if they pertain to the certification of a well or the determination of its Class A or Class B interval, or to C. R. Smith or E. Saldanha of the Department, if they are concerned with establishing credit or granting royalty exemption. □

Four Articles from Mineral Leasing as an Instrument of Public Policy, British Columbia Institute for Economic Policy Analysis, 1977:

1. Gregg K. Erickson, "Work Commitment Bidding"
2. Dale R. Jordan, "Petroleum Leasing in British Columbia"
3. Walter J. Mead, "Cash Bonus Bidding for Mineral Resources"
4. Arlon R. Tussing, "The Role of Public Enterprise"

Work Commitment Bidding

GREGG K. ERICKSON

One result of the growing concern in the United States over energy matters has been an increased attention to public policies governing the development of Outer Continental Shelf (OCS) oil and gas resources. The institutional structure under which all such development has thus far taken place was established in 1953 by the Outer Continental Shelf Lands Act.[1] This unamended statute provides the Secretary of the Interior with authority to sell oil and gas leases to the public on the basis of cash or royalty bids offered at sealed bid auctions.

The practice of the United States government since the first such sale in 1954 has been to offer relatively small quantities of offshore acreage on an irregular basis, soliciting always cash rather than royalty rate bids. In recent years, the rate at which acreage has moved to market has been accelerating. However, the average per acre bonus received by the government has also increased, partially reflecting worldwide supply conditions. The fact that bids are received in sealed envelopes has resulted in the winning bid being two, three, or several times the amount of the next highest bid.

Among criticisms of present policy is the assertion that this method of lease allocation diverts undesirably large amounts of *front-end money* into the coffers of the government landowner, money that could, would, and should otherwise be used for development of the resource itself.[2] One possible remedy would involve implementation of the existing statutory authority to substitute royalty rate bids, with fixed and presumably low cash bonuses. The problems created by royalty bidding, principally the premature shutdown effect and the potential for speculator induced misallocation of leases, have been well discussed in the literature. More importantly, they are well understood by persons influencing both public and private mineral resource management policies.[3]

An alternative proposed remedy to this same perceived problem is less well understood. Based in part on the method of lease allocation used in the offshore areas of the United Kingdom, it would allocate exploitation rights to the firm that would commit itself to spending the greatest sum in developing the resource. Sealed bids would be solicited as under the present system, but instead of cash the bid variable would be the *work commitment*. Proponents of this system claim that it will divert money the government

AGO 547205

landowner would otherwise receive via bonuses into exploration and development expenditures.[4] These additional increments of expenditure, it is further suggested, will increase future production to such an extent that the government landowner will be able to recoup the foregone bonus income in the form of the consequentially increased royalty and tax revenue. Ancillary benefits in the form of employment, resource self-sufficiency, and improved trade balances are also sometimes claimed or alluded to.

To an economist these arguments may not seem too persuasive. Nevertheless, no one appears to have devoted much effort to analyzing the economic implications of such a system, and certainly not in a form that would be comprehensive to the noneconomist policy maker.[5] This is unfortunate not only because of the substantial public and private interests involved; the system has significant implications for minerals other than petroleum and in places other than the United States OCS. The purpose here is to provide such an analysis.

EVALUATION OF WORK COMMITMENT BIDDING

In evaluating something new the first step is usually to establish a standard against which it can be measured. In this context, the system of competitive cash bidding has long attracted economists concerned with the problem of natural resource allocation, not only as an ideal against which the performance of other systems might be measured, but as a practical and proven technique for bringing resources into productive employment.

Under an idealized competitive cash bidding arrangement, bidders determine the amount they can afford to offer for a mineral lease by a very simple process: they subtract their expected costs of extraction from their expected revenues. The resulting residual is the maximum the prospective bidder can offer for the tract without buying himself an expected loss. Competition, of course, implies that multiple firms will be preparing bids on each tract.

Assuming no uncertainty about the amount of oil to be found or the price that oil will eventually bring, and disregarding the time value of money, the firm with the lowest expected costs of extraction will be capable of submitting the highest, and thus the winning, bid. This is good from society's standpoint, since it means that the resource will be developed with the minimum expenditure of scarce goods and services. The resource's contribution to economic welfare will be greater than it would have been had the tract been awarded to any of the other, less efficient bidders.

Under a work commitment system each prospective bidder will be asking himself: What is the maximum amount I can promise to spend on the development of this tract and still expect to break even? Since any cash bonus

AGO 547206

that would have been offered to acquire a tract under the traditional system is no longer necessary, the amount of that bonus may clearly be diverted to the work commitment without raising costs beyond the breakeven point. What is not quite so obvious, however, is that the amount a bidder will promise to spend under the commitment system will exceed the sum of the cash bonus and the amount that he would have allocated to development of the tract under the cash bonus system.

This follows from the fact that any additional increment of expenditure can almost always be spent in a way that will bring about some increase in output from the tract and a corresponding increase in revenue.

This is most easily demonstrated with a numerical example. Let us assume that a prospective bidder, in determining how much of a cash bonus he can offer for an oil and gas lease on a hypothetical tract A, has calculated the relationship between expenditures on development of the tract and expected production, and that the results of his calculations appear as plotted in Figure 1.

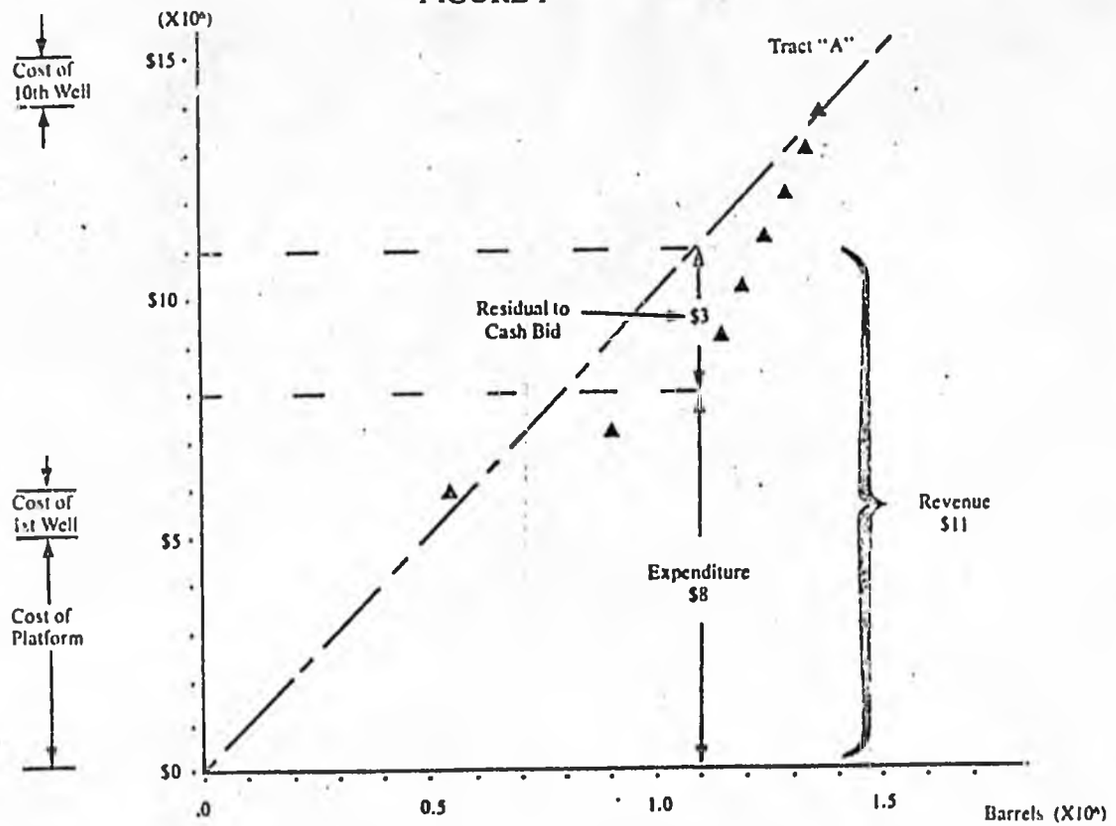
The vertical axis in this graph (and those that follow) measures dollars expended in the tract's development, dollars that we assume will be spent for construction of a platform and the drilling from it of wells. The horizontal scale measures the output that results from that expenditure, denominated in millions of barrels of oil. The relationship between those barrels of output and the revenue they bring their producer (at an assumed price of $10 per barrel) is shown, through appropriate choice of scales, by the dashed 45° straight line running upward to the right. By this means, the vertical scale can be used to show the value of output as well as the cost of production.

In Figure 1, the point closest to the origin indicates that with one platform and one well this operator would expend $6 million (vertical scale) producing an output of 550,000 barrels of oil, worth $5.5 million (determined by the intersection of the 45° line with a line drawn vertically from .55 million barrels). Moving upward and to the right, each subsequent point reflects seriatum the increases in expenditures and output resulting from the drilling of additional wells.

The general shape of the curve defined by these points is characteristic of situations where one major input to the productive process (in this case land) is held constant, while other inputs (in this case wells) are varied. The output curve originates at the lower left hand corner, but it rises vertically at first because the initial input of investment is unproductive: a platform and oil well costs a certain amount, and an expenditure of anything less than that threshold amount produces no oil. The cost of subsequent wells is assumed to be $1 million, no matter how many wells are drilled, creating a curve that looks like a staircase where each increment of cost (representing a new well) creates a new step. The fact that the staircase steepens as we move

AGO 547207

FIGURE 1



AGO 547208

to the right is a reflection of the diminishing returns, in terms of oil produced, to each additional well drilled into the fixed geographic area encompassed by the lease.

Naturally the prospective bidder will be looking for the point on this output curve that puts his costs as far below the 45° line (his output-revenue function) as possible. As shown in Figure 1, the maximum cash bid this operator could afford to make on tract A (and still expect to break even) is $3 million, which—if he is the winner—would require him to drill three wells.

Consider now the situation this bidder would face were a work commitment bidding system adopted. The question that now confronts him is: How much can I spend (or how many wells can I drill) on tract A and still break even? The answer is clearly $14 million (representing nine wells), indicated on the right side of Figure 2 by the output curve for tract A.

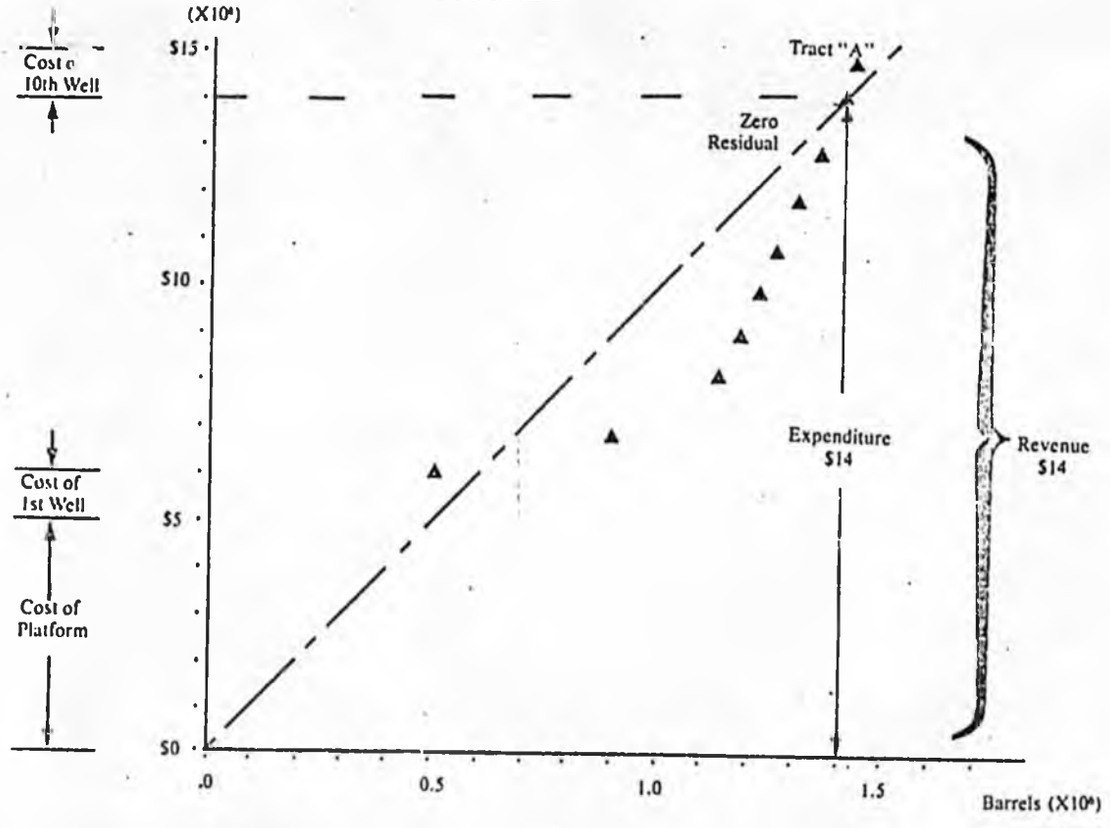
If the bidder wins tract A under a work commitment system, his oil output will be 1.4 million barrels (Figure 2) as compared to the 1.1 million barrels (Figure 1) that he would have produced had he won the tract in a cash bonus sale.

If the success of a mineral resource management policy is measured by the physical quantities of the mineral educed from the earth, the work commitment bidding is clearly superior. A resource's contribution to economic welfare, however, is not its total output (whether measured in dollars or physical quantities) but is the residual left over when the costs of all inputs to the productive process (other than the resource itself) are subtracted from the value of the outputs. In the case of tract A this residual is maximized at $3 million, when the value of the inputs is $8 million. As the input expenditure is increased above this optimum point, the residual—the resource's potential contribution to economic welfare—is gradually dissipated until, at the point where the value of inputs reaches $14 million, there is no more residual left to be dissipated.

In this particular example, the increase in output that would result from a switch to work commitment bidding ($3 million) happens to equal the amount of the residual. This coincides with the fact that the expenditure of each additional $1 million above $8 million (three wells) contributes exactly $500,000 to revenue. If the incremental contribution of the fourth and succeeding wells were greater, for example $750,000, the slope of the output curve traced by these points would be flatter, as shown by the squares in Figure 3, and the increase in production from a switch to commitment bidding would be much greater. To put it another way, it would take twice as large an increase in expenditure to dissipate the $3 million residual.

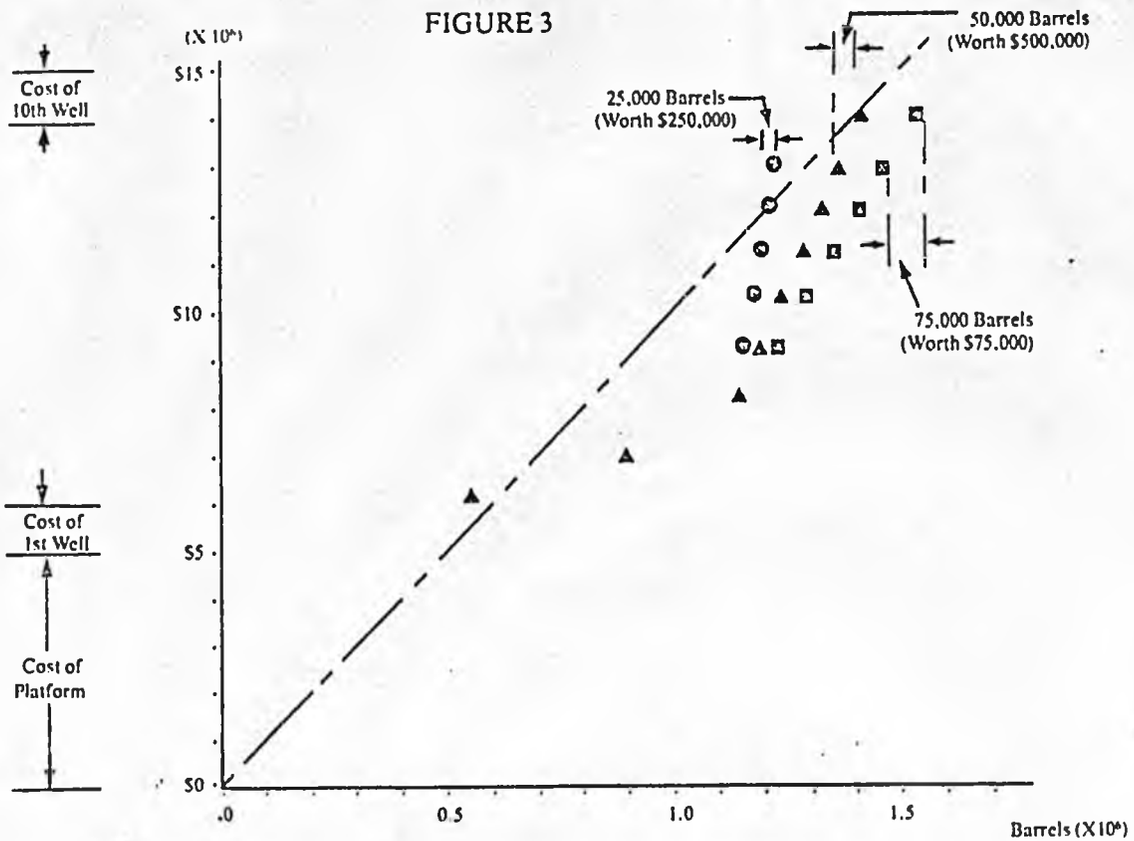
AGO 547209

FIGURE 2



AGO 547210

FIGURE 3



67

AGO 547211

On the other hand, a smaller incremental contribution to output and revenue by the fourth and succeeding wells (for example, an increase of only $250,000 in revenue for each $1 million well) would trace a steeper curve such as the one defined by the circles in Figure 3. The addition to revenue would clearly be less than the $3 million residual sacrificed to obtain it, which is another way of saying that the increase in production would be worth less than the bonus bid sacrificed to obtain it.

TRANSFERABILITY OF COMMITMENTS

Clearly the previously discussed simple work commitment bidding system results in more intensive development of the tract to which it is applied. Clear also is the fact that this effect is dependent on the characteristics of the tract to which it is applied, and in particular on the efficiency with which the successive increments of additional expenditures required under the commitment can be put to work to increase output.

One way to increase this efficiency is to allow an operator who assumes a work commitment in the course of acquiring a particular tract to fulfil that commitment through expenditures on a different tract or tracts.

For example, assume that a bidder has acquired both tract A and tract B as shown in Figure 4. If the work commitment assumed in order to acquire a tract must be fulfilled on that same tract, then his maximum commitment on A (Figure 2) is $14 million; and on B (as indicated in Figure 4 by the dashed lines) it is $8 million. Total output from the two tracts will be 2.2 million barrels.

TABLE 1

WORK COMMITMENT BIDDING

	Output (bbl's)	Revenue ($)	Expenditure ($)	Residual ($)
Tract A	1.4	14	14	0
Tract B	0.8	8	8	0
	2.2	22	22	0

Note: All figures in millions

If the operator is allowed to bid on the two tracts jointly or is otherwise permitted to shift a commitment made to acquire one to the other, then his total work commitment will rise to $24 million, with a corresponding increase in output. As shown in Figure 4, this is possible by operating tract A at the point on the output curve which produces the greatest residual and by transfering that residual, as an internal subsidy, to tract B, where, as indicated by the flatter slope of the output curve, it can be utilized more efficiently. The numbers are summarized in Table 2.

EXTENT OF DEVELOPMENT

In the above examples work commitment bidding has been shown to result in a more intensive development of tracts than would be obtained under cash bidding arrangements. If commitment transfers are permitted among tracts, such a system will also bring about more extensive development.

Consider the output curve of tract C in Figure 5. Tract C is clearly something of a "dog," because there is no point at which the output function crosses the 45° "breakeven" line. Under cash bidding, tract C would elicit no interest at all; even if given away free, it would not be developed.

Under a work commitment system, however, tract C may very well be acquired and drilled. Assume that a firm has already acquired tracts A and B as a package with a work commitment of $24 million and that neither tract has yet been drilled. The firm is now offered tract C. How much of a work commitment can the firm offer for it?

The firm had previously planned to use the $3 million residual generated on tract A to internally subsidize tract B. If tract C is added to the inventory, the firm could apply to C $1.5 million of the internal subsidy that would have otherwise gone to tract B and thereby make the development of tract C a feasible proposition. The calculation is shown in Table 3.

TABLE 3

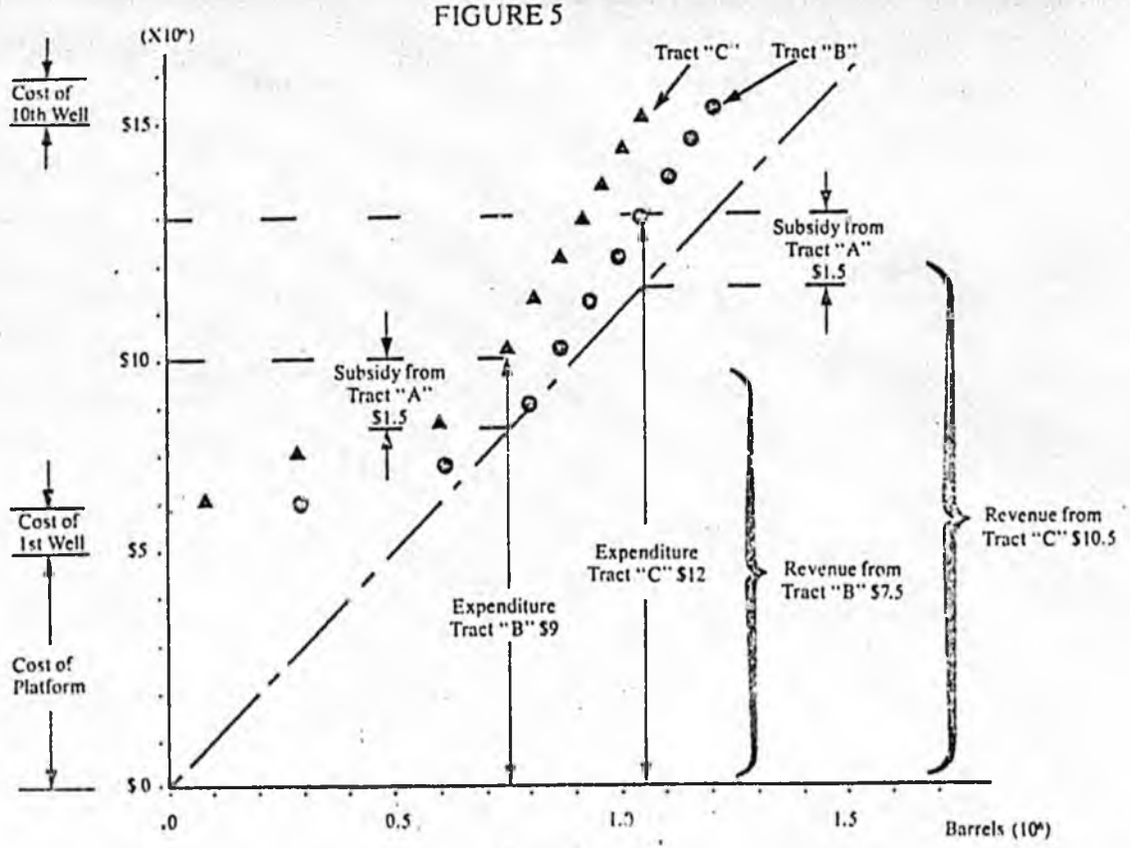
WORK COMMITMENT BIDDING
(Internal Subsidy Allowed)

	Output (bbl's)	Revenue ($)	Expenditure ($)	Residual ($)
Tract A	1.10	11.0	8.0	3.0
Tract B	1.05	10.5	12.0	(1.5)
Tract C	0.75	7.5	9.0	(1.5)
	2.90	29.0	29.0	0

Note: All figures in millions

AGO 547214

FIGURE 5



AGO 547215

Development of the three-tract package under the work commitment system will be feasible with a total expenditure of $29 million. Since he has already been committed to spending $24 million of this, in the course of acquiring tracts A and B, the maximum commitment bid this operator can afford to make on tract C is $5 million.

Besides illustrating the mechanism through which commitment bidding induces more extensive resource development, the tract C example also indicates how the system (with internal subsidies allowed) may work to the advantage of the firms that can acquire the most tracts. Theoretically, a newcomer with no existing inventory of tracts would be unable to make any commitment bid on tract C.

A way of evading this problem would be to make the commitments transferable. This would allow operator Jones to legally assume the obligations to which operator Smith has committed himself in the course of acquiring tracts from the government. Presumably, operator Smith would pay Jones for the favour.

The prospective bidders in these examples have been endowed with the ability to foresee accurately and precisely the output curve associated with every tract. In practice this is not the case. If there is any characteristic that sets the exploration phase of the petroleum and mineral industries apart from other businesses, it is the everyday uncertainty with which its participants must learn to cope. It is perfectly possible, for example, that Smith might acquire tract C with a work commitment bid of $14 million on the mistaken belief that its output curve is that of tract A. After building a platform and drilling the first four wells, the true shape of the curve—and the firm's predicament—would reveal itself. The required $14 million expenditure applied to tract C would leave Smith with a net loss of about $4 million. If he could somehow shed $5 million of the $14 million commitment, Smith would be able to operate the tract with only four wells already drilled and thereby cut his losses to the more acceptable level of $1.5 million. Smith would be willing to pay up to $2.5 million in cash to unload the $6 million obligation, since that is the amount of his maximum additional loss if he can't get rid of it.

Any other operator who is facing or expects to face an output curve with a flatter slope than that faced by Smith will be able to make a mutually beneficial deal with him, since, for the other party, an additional expenditure of $5 million will bring in more than the maximum $2.5 million that Smith will be willing to pay.

Besides putting the small firm in a better position to compete and mitigating the problems of uncertainty for all firms, large and small, a system which allowed the free exchange of work commitments would have the further and more important advantage of maximizing the overall

AGD 547216

efficiency with which work commitments are utilized. To the extent to which such a market was effective in bringing potential commitment offerers together with potential commitment takers, it would ensure that everyone would be operating at a point where a small increase in expenditure by one operator would produce no more and no less additional revenue than would the same increase applied to any other operator.

A minor but interesting benefit of a market in commitments would be the information it would provide concerning the efficiency with which the work commitment system is eliciting additional output.

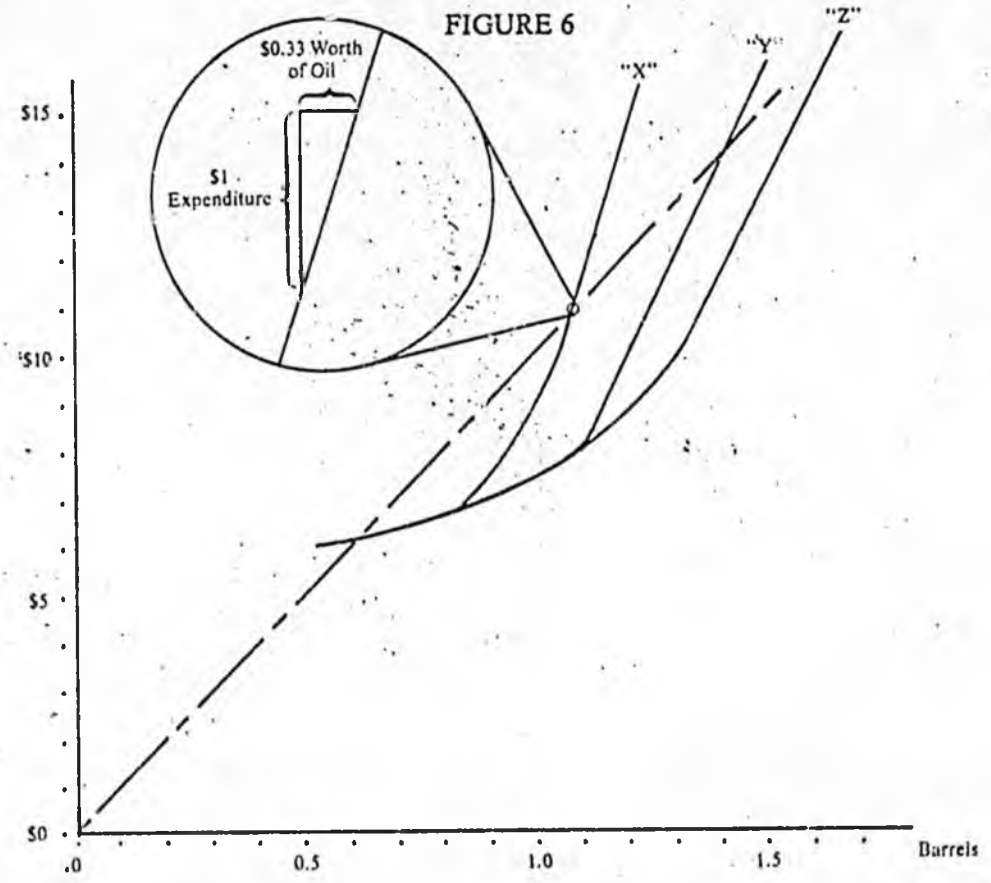
This can be understood by applying the concept of the output curve (hitherto used in relation to individual tracts) to the entire universe of tracts being offered under the commitment bidding system. By combining all such tracts and treating them as a single entity, an overall output curve similar to Figure 6 can be drawn. Just as in the case of an individual tract, the point where the curve dips farthest below the 45° breakeven line will be the optimum operating point, the point which results in the resource's largest contribution to economic welfare. The distance between the breakeven line and the output curve at that point is the measure of that contribution, and it is equal to the income that would come to the government landowner were a competitive bidding system utilized. It is this residual—the difference between total revenues and total costs—that the public will be sacrificing to subsidize output.

The efficiency with which the subsidy provided by the work commitment system works to increase output will be a function of the output curve's shape to the right of the point where bonus income would be maximized. Three hypothetical configurations for this part of the curve are shown, and the difference this shape makes to the level of additional output educed by the sacrifice of the residual can be seen. The significance of the price at which commitments change hands will be determined by the slope of the output curve at the point where it intersects the 45° breakeven line. Curves Y and Z both cross at an angle which indicates that, at that point, $1 of expenditure produces $0.50 worth of additional output. In either situation the market price for assumption of a $1 million commitment would be $500,000. Curve X, however, crosses the line at a steeper slope (as shown in the inset), indicating that $1 of expenditure will produce $0.33 worth of additional output. If curve Z accurately represents the overall output curve, the market price for the assumption of a $1 million work commitment will be about $333,000.

From a policy standpoint these numbers, whatever they may be, have considerable significance since they can be used to compare the efficiency of the work commitment system in eliciting additional output with whatever other alternative policies may be available. For example, if the market for

AGO 547217

FIGURE 6



AGO 547218

commitments indicates that the last dollar of subsidy transferred is producing only 33 cents worth of additional oil, it may very well be that another source of oil development—for example, tar sand or oil shale—could be found that would give a better return.[6]

THE TIME FACTOR

To simplify the discussion of the work commitment system, the time dimension of both expenditures and income has thus far been ignored. Since a dollar in hand today is worth more than the promise of a dollar tomorrow, it has been assumed that all bidders have used a discounting mechanism to take account of the time value of money. Thus, they would reduce all amounts of both expenditure and income streams to their *present value*, that is, the lump sum that the bidder would be willing to receive or give in exchange for the specified income or expenditure stream.

If a work commitment system is to be implemented, it will be necessary to take careful account of the fact that a commitment fulfilled in the next year will have a very different impact on output from one of the same amount fulfilled ten years hence.

If the public is going to give up its bonus income to subsidize output, the time when that subsidy takes effect will presumably make some difference. Of course, some arbitrary time limit could be established for the fulfilment of commitments exactly as the United States government sets the five-year term on the OCS oil and gas leases it sells. If free exchanges of commitments are allowed, anyone who wished to distribute expenditures over a time frame incompatible with his commitments could simply enter the market and adjust his inventory of commitments accordingly.

Another way of handling the problem would be simply to apply some appropriate interest rate to every commitment assumed and specify that the amount of expenditure required under that commitment must increase by the amount of the compound interest accumulated in the period between the assumption of the commitment and its fulfilment.

CONCLUSION

The adoption of a work commitment bidding system implies a judgment that existing institutions for private exploitation of public resources result in a suboptimal rate of resource development.

Any argument for the adoption of such a system must first establish that this is in fact the case. Secondly, it must prove that the work commitment approach is the least costly method of achieving the desired higher rate of exploitation.[7]

AGO 547219

In comparing various alternative ways of achieving higher output against the work commitment system, some important features of that system are certain to stand out. First, and probably most significant, is the simple fact that the work commitment system results in a subsidy. As such, the criteria for its evaluation should be no less stringent than those applied to a direct appropriation of public funds or a tax concession adopted for the same purpose.

Secondly, the cost of the subsidy conferred under the work commitment approach is impossible to determine *a priori* and difficult of determination after the fact. If there exists a "right" level of subsidy it will be mostly a matter of luck if the foregone public revenue happens to equal that amount. For similar reasons, the benefits of the subsidy in terms of the total increase in output, development, or whatever, are not amenable to accurate quantification. As a consequence, it is doubly difficult to evaluate the system's relative efficiency.

Finally, a properly designed work commitment system allocates the uncertain amount of the subsidy in a fashion that tends to squeeze the maximum additional output from every dollar of subsidy. It does this more or less automatically. This characteristic means that the transfer of resources occasioned by the subsidy needs no affirmative action on the part of policy makers—as does a direct appropriation of public funds—in order to be continued. This fact, however, combined with the intrinsic uncertainty concerning the subsidy's magnitude makes it easier for vested interests to perpetuate such a subsidy long after any real justification for it has passed.

3. In recent testimony before the Senate Interior Committee, industry representatives were unanimous in their opposition to royalty rate bidding. *Outer Continental Shelf Oil and Gas Development Hearings Before the Subcommittee on Minerals, Materials, and Fuels of the Committee on Interior and Insular Affairs* (United States Senate, 93rd Congress, Second Session: May 6,7,8,10,1974).

AGO 547220

4. Arguments for the work commitment system are expounded in detail in I. White, D. Kash et al., *North Sea Oil and Gas: Implications for Future United States Development* (Norman: University of Oklahoma Press, 1973).

5. Kenneth Dam has touched on some of these matters, however, in "Oil and Gas Licensing in the North Sea", *Journal of Law and Economics* 8(October 1965) and "Pricing of North Sea Gas in Britain," *Journal of Law and Economics* 13 (April 1970). Dam recognizes the subsidy for what it is and concludes that it is unjustified.

6. If it is determined that only a portion of the residual should be applied as a subsidy, this could be accomplished by offering only a portion of the tracts on the commitments bid basis, but allowing the fulfilment of a commitment on any tract acquired from the government. Since the reduction in the subsidy will move the operating point to the left on the output curve (Figure 5) to a point at which its slope is flatter, the result will be a higher assumption price for commitments. The commonsense explanation is that the optimum amount of total expenditure will be reduced only slightly; but that acreage over which commitments that can be fulfilled by that expenditure will be reduced relatively more. Another alternative would be to combine the work commitment system with a royalty, net profits share, or other form of deferred rent collection. This is in fact the arrangement pertaining in the North Sea sector. If the government takes a very high net profit share, the amount of the subsidy will be substantially reduced.

7. There are certain circumstances where a work commitment system could result in no more extensive or intensive development. This would be the case if the commitment were devoted to an activity not contributing to output. For example, if a government awarded a mineral concession to the operator who promised to build the largest smelter, no increase in mine output would result (unless the location of the smelter made lower grade ores profitable to mine).

AGO 547221

Petroleum Leasing in British Columbia

DALE R. JORDAN

FACTORS AFFECTING THE LEVEL OF EXPLORATION

From data published by the provincial department of mines and petroleum resources, it would seem that exploratory drilling in British Columbia in 1974 was in a static position and may even have been declining. There was a 22 per cent drop in the number of exploratory wells drilled in 1973 compared with 1972, and a corresponding drop in the footage drilled. This decline in activity appeared to be continuing into 1974, with drilling down 10 per cent in the first seven months. This apparent decline in exploration for oil and gas in British Columbia came at a time when the demand for oil and gas was high. Prices for oil and gas had increased dramatically, and considerable concern was being expressed over national self-sufficiency in all forms of energy supplies. By comparison, exploration activity in Alberta showed the opposite pattern. In Alberta, exploratory drilling in 1973 increased 50 per cent over 1972. Statistics published by the Daily Oil Bulletin showed that during the first several months of 1974 there was a further increase over the same period in 1973.

What caused the static or possible decline of exploratory drilling in British Columbia at this particular period of strong demand and high price? There are several answers, and formulated theoretical solutions must be viewed in the light of political judgment where governments demand a greater share of resource revenues. Certainly, the federal budget proposals in the spring of 1974 discouraged exploration for oil and gas in Canada; however, it would seem that provincial government policies were largely responsible for any discouragement felt by the oil and gas explorer.

In this article I attempt to set out some of the basic causes that contributed to the 1974 situation in British Columbia. These causes are identified and any suggested solutions are offered in the realization that there is a danger of oversimplifying complex problems and the possible effects of implementing partial solutions.

For any analysis to be meaningful, a proper perspective must be maintained. One of the overriding factors influencing the oil and gas explorer's decision making is the number of geological prospects. In British Columbia, the potential hydrocarbon-bearing portion is thought to be

AGO 547222

restricted to the northeast part of the province. The western boundary of this 51,000 square miles is the Rocky Mountains. In 1974, an estimated 32 per cent of the oil and 18 per cent of the gas in this area had been found, leaving an estimated 0.82 billion barrels of oil and 47.56 trillion cubic feet of gas still to be discovered. Although there was considerable potential still remaining for the oil and gas explorer, the area was small compared to Alberta and Saskatchewan, and it was much smaller than the vast geological potential north of the 60th parallel.

Another factor that depressed the enthusiasm of the explorer was the apparent lack of multizone prospects. Drilling a well to test only one potential horizon increases the risk factor significantly.

Before leaving the subject of the province's hydrocarbon potential, it should be remembered that several basins existed, both offshore and in the interior, containing substantial deposits of sedimentary rock that have not been explored to any great extent. Generally, the known geology in these basins discouraged any extensive exploration. Possibly, the very expensive exploration needed in the basins required special consideration before their potential could be fully realized. This special consideration might take the form of a reduced royalty on any hydrocarbon discovered, or of a joint participation scheme whereby the British Columbia government might share in the risks involved.

Another factor to be taken into account by the oil and gas explorer when selecting his areas of interest is the access to those tracts that he feels have hydrocarbon potential. Again, British Columbia was at a disadvantage in 1974 when compared with Alberta and Saskatchewan. Access to this already restricted basin area was affected by muskeg conditions over much of the plains and by deep river valleys in the foothills. These conditions involve greater expense in conducting exploratory work, and the oil and gas explorer would often be confined to only a four-month work year, because of such terrestrial conditions. The problem of limited access presents a very real constraint on attracting the oil and gas explorer and is relevant when considering any changes in land tenure and revenue sharing.

Another important parameter in any deliberation affecting oil and gas exploration is the availability of funds for exploration.

As a general rule, funds generated from production are used to finance exploration. It seems that the risk factor employed by financial institutions effectively discourages the use of debt capital as a source of exploration funds. It is not uncommon to read that an oil and gas producer has arranged for a substantial loan, but this will nearly always be for a specific purpose related to the development of a new reservoir of oil or gas. The discovery of this reservoir would have been funded out of the company's cash flow.

AGO 547223

When an oil or gas explorer's cash flow comes from production outside any particular province, then for money for exploration to flow into that province, that jurisidiction must have a framework of leasing and revenue sharing that can favourably compete with other areas also requiring exploration.

It would seem that cash flows from Canadian production will continue to be a major source of exploration funds. In the case of the integrated companies (those having refinery capacity), this will be true under almost any condition short of expropriation.

However, within this framework these funds will generally gravitate to where they can expect the greatest return. It may not be enough for a province to show that it will ensure that the successful explorer will receive a reasonable rate of return. It may well be that the successful criterion for increasing the level of exploratory drilling will be a division of revenues such that the oil and gas explorer will have a sufficient cash flow for an active exploration programme, as compared with other jurisidictions. The explorers who have a cash flow generated from production and the flexibility to determine the best place to reinvest these funds have the responsibility of ensuring that they can go to where they can expect to return the greatest profit.

The ability of the producer to channel cash flow from one jurisdiction to another depends largely upon the particular laws in force where the oil or gas is being produced. The provinces of Alberta and Saskatchewan tend to attempt to discourage the outward flow of funds generated from production in their particular provinces. In both provinces, this discouragement took the form of a high royalty, coupled with a drilling incentive programme, designed to encourage continued exploration.

In Saskatchewan, the mineral tax and the royalty surcharge took away from the producer all of the recent price increases and, in fact, returned to the producer a smaller amount per barrel than he was receiving prior to the price increases. As an inducement to continued exploration in Saskatchewan, an incentive programme was developed, whereby the producer was allowed to retain an additional 30¢ for every barrel produced, providing this money was used for drilling wells, for waterflood projects, research, and other specified purposes in Saskatchewan. This incentive had not been in effect long enough in 1974 to permit a complete analysis of its performance; however, it was really restricted to only those companies that already had production in Saskatchewan. A review of these companies shows that the producers with the majority of the production were the so-called Majors, which raised the question as to whether or not these Majors were prepared to continue to explore in Saskatchewan under any conditions. It is more probable that the exploration philosophy of the

AGO 547224

Majors directed that they use their exploration funds searching for high reserve reservoirs (which generally means exploring outside Saskatchewan)

To encourage explorers who do not have production in Saskatchewan, the government provided an incentive credit of about 30 per cent of the costs of drilling exploration wells. This credit could then be used to reduce any royalty or mineral tax obligations that may accrue.

In Alberta, in 1974, there was also an incentive programme for exploration drilling. This incentive took the form of a credit which could be subsequently used to satisfy most of the cash obligations that may arise by virtue of the royalty obligation, rental payments and mineral taxes, and could also be used to purchase oil and gas leases. Credits established in Saskatchewan could not be used to purchase leases. The formula which determined the amount of credit that could be established for any particular exploration well was predicated upon the area of the province in which the well was located and the depth of the well. This formula was expected to return to the explorer by way of credit approximately one-third of his drilling costs.

The principal producers of crude oil in Alberta were much the same as in Saskatchewan—they were the Majors in the oil and gas industry. Again, as in Saskatchewan, it would seem that the interest of the Majors in continuing to explore in Alberta had become blunted, not because of any particular rules, but more through the apparent lack of sufficient high reserve potential which this type of company must search for.

In Alberta, in 1974 the royalty was structured to increase not only when the production increased but also when the price increased. Alberta had also adopted a new oil/old oil concept, whereby royalties were considerably reduced on what was termed new oil, which, of course, had the affect of increasing the producer's cash flow and encouraging the development expenditures. This old/new concept applied as well in the case of natural gas. Saskatchewan also had provision for a reduction in its mineral tax and royalty surcharge for new oil. This reduction was gradually phased out after a few years. Alberta, in 1974, had the lowest rate of royalty on oil and gas, received the highest price for its natural gas and had a price for crude oil equivalent to the other provinces, all of which means that in Alberta the producer of oil and gas received a higher rate of return and, consequently, had more money available to him for exploration purposes than the producer in Saskatchewan or British Columbia.

While the incentive programme adopted in Alberta and Saskatchewan offered encouragement to drill exploration wells, any analysis of the performance of a similar programme which might be suggested for the province of British Columbia must be coupled with the consideration of a lower royalty and subsequent higher cash flows to the producer.

AGO 547225

This type of incentive can only be effective if the producer is also offered a return on his development expenditures that is competitive with other jurisdictions into which the oil and gas explorer is free to go.

Another source of money for drilling exploratory wells previously used in North America has been the drilling fund. The drilling fund usually takes the form of buying a number of shares in a limited partnership. The attraction to the investor apart from the possibility of participating in oil and gas discoveries, is the income tax feature in the United States which permits all intangible drilling expenses to be written off in the year that expenditures were made. This can be done without qualifying under any principal business rules, as prevails in Canada. It is this principal business rule that has to the present time precluded the tapping of a similar source of exploration funds in Canada.

It is estimated that between 250 and 400 million dollars are generated annually through the sale of shares in drilling funds in the United States. The United States government, in an attempt to encourage further exploration within its own borders, has chosen to reduce the amount that can be written off against income for income tax purposes when the funds are spent outside the United States. This move precipitated the drying up of exploration funds in Canada which previously came from this source.

Over the past few years other extractive industries, particularly mining, have been channelling considerable amounts of their cash flows into oil and gas exploration. These endeavours have usually taken the form of funding a subsidiary company. The continuation of this type of fund for the purposes of exploring for oil and gas will depend upon the success of the subsidiary companies and also upon the influence that mining taxes will have upon the parent companies' cash flows.

A few years ago it was quite popular for large United States gas utility companies to provide exploration funds on the basis that they would have first call on any gas produced and exported for sale to the United States. This source of exploration funds has also dried up almost completely as a result of decisions by the National Energy Board concerning the exporting of gas and, as a result of rulings by the Federal Power Commission in the United States, which have not allowed these utility companies to include these expenditures in their rate base. The Federal Power Commission looks upon this type of exploratory funding as a mortgage loan, rather than as a prepayment for gas, as the utility companies would prefer.

THE LEASING SYSTEM

The 1974 system of leasing in British Columbia will now be reviewed, and I will attempt to analyse its effectiveness in relation to the relatively small

AGO 547226

hydrocarbon potential area, lack of access, difficult terrain, and exploration funds generally coming from cash flows.

The system of granting oil and gas rights on crown lands in British Columbia invoved in 1974 an exploration grant called a "permit," a subsidiary exploration grant called a "drilling reservation," and a development grant called a "lease."

Permits, which can involve upwards of 100,000 acres, could only be acquired through a competitive cash bidding system at sales which were usually held four times a year.

The permits were classified from A to D, depending upon their accessibility and the terrain conditions. The class D permits were for offshore areas. One purpose for classifying permits was to allow them, where the working conditions were difficult, to have a longer life than was otherwise provided.

Permit classification also determined the minimum amount of work the permit owner was obligated to spend in any year. These minimum work obligations were more stringent for the Class A permit, where access and terrain problems were minimal. The significance of this particular requirement was lost because, in order to conduct an equivalent amount of exploration, particularly drilling, the costs involved in the offshore areas far exceed those which would be expended on a class A type permit. The sections of the Petroleum and Natural Gas Act that governed the permit work obligations did not specify any specific exploration programme, but only that a certain amount of money be spent during each term of the permit. This obligation to spend money in exploring on a permit could be satisfied by grouping several permits together, so that expenditures incurred in exploring on any one permit would satisfy the work obligation of the grouped permits. This grouping provision is important because it allowed an explorer to acquire large tracts of land for a short period in order to conduct extensive geophysical exploration.

This obligation to spend money on exploring on a permit could also be satisfied by paying the money to the British Columbia Crown. This would seem to be about as negative a provision as one could imagine, assuming, of course, that the government of British Columbia was interested in ensuring that the companies holding permits were the ones prepared to actively explore. If the removal of this system would give rise to problems, as in the case of an explorer unable to work a permit through no fault of his own, then a far better system would be to provide a means where work obligations could be accumulated and satisfied in the following year.

Permits were valid for one year and could be renewed annually, for a period ranging from five to eight years, providing the company was not in default.

AGO 547227

When a permit holder had expended the minimum amount of money exploring on a permit or group of permits or had paid the money to the government, he was entitled to convert the permit into leases. To do this the permit holder had to relinquish 50 per cent of the land back to the Crown. Land selected for conversion into leases could not be in a consolidated block, but had to be in a number of leases, which had to corner one another, or be separated by at least two units—approximately one mile. The maximum size of the lease was six units—approximately three miles square.

This system of exploratory permit and subsequent conversion of half of the land to lease on a chequerboard fashion was similar to that used in Saskatchewan and part of Alberta. The system probably had its beginning in Alberta. It was designed to ensure that when crude oil was discovered, the Crown would be returned some prospective areas which were subsequently sold. This system worked reasonably well, particularly in Alberta, where some substantial discoveries of crude oil were made during the existence of the exploration agreement. Unfortunately, in the vast number of cases a discovery was not made, and the chequerboard pattern for leases led to fragmentation of rights throughout the area formerly comprising the permit. This effect tended to discourage other explorers from entering the area, and this system of selecting leases also prompted the need for the drilling reservation, which generally covered that 50 per cent of the land returned to the Crown.

Seemingly, in those parts of the province having relatively easy terrestrial access and where the potential hydrocarbon-bearing formations were not too deep, this system of chequerboard leasing may be satisfactory. However, in areas where access is a major cost and where deep expensive drilling is required, it tended to discourage anyone other than the holder of the 50 per cent leases from entering the area to explore. Certainly in offshore areas where seabed drilling cost is many times greater than land drilling, this system of lease selection is most unsatisfactory.

Leases granted on crown land in British Columbia in 1974 had a primary term of ten years, renewable for further ten-year periods if particular circumstances existed which generally related to production.

The acquisition of leases in British Columbia was handled in 1974 in two separate ways. First was the way previously mentioned, which was the result of having a permit and then earning the right to acquire leases of 50 per cent of the land. The second was through the competitive cash bidding at one of the quarterly sales held by the British Columbia Crown.

There was no obligation at that time on the part of the lessee to drill a well during the initial term of the lease. A 1974 amendment to the Petroleum and Natural Gas Act, however, permitted the minister to forward a notice to

AGO 547228

drill when he considered that development of the lease was not active enough. This amendment seemed to suggest that before the minister would consider sending a notice, there would, in fact, have been a discovery made on the lease. Thus, in sending the notice, the minister was merely requiring development drilling. It seemed most unlikely that the wording of this section would be interpreted such that the minister could require exploratory drilling on existing leases.

There was an apparent trend to shorten the term of leases, with Saskatchewan granting only five-year primary terms. However, in British Columbia the term of 10 years was not excessive when one considers the short period of four to five months when work can be done in the area of hydrocarbon potential. This is quite different from most of the areas in Alberta and Saskatchewan, where drilling and other geophysical operations can be conducted all the year round.

The government of British Columbia appeared to feel that a large number of leases were held by companies not particularly active in exploring in the province and that something should be done to discourage these holdings, so that lands could be offered to others who were prepared to explore. These feelings may have promoted some of the 1974 changes in the Petroleum and Natural Gas Act, whereby the rental on leases was increased from one dollar an acre to two dollars an acre. The effect of this change seemed likely to be the return to the Crown of some acreage which, under the previous rental of one dollar an acre per year, would have been retained by the lessee. However, one must assume that for the most part relinquished leases would be the least attractive, and leases with potential, even though the lessee was not prepared to conduct any immediate exploration programme, would be retained, and the two dollars an acre would be paid. The greatest effect that this rental of two dollars an acre per year seemed likely to have was to deter other explorers from entering the province. It is one thing to create a system designed to discourage excess holdings by companies not prepared to explore immediately, and quite another thing to expect these same rules to promote the entry of new companies and increase exploration activities.

The royalties on crude oil in British Columbia were essentially the highest in Canada in 1974. The rate was 40 per cent for a well producing 1,000 barrels a month and further escalated to about 58 per cent when the monthly production reached 10,000 barrels. It would seem that this royalty level, which directly affected the producer's cash flow, could only act as a deterrent to increasing the level of exploration in British Columbia much beyond its historical pattern of about fifty to sixty exploration wells a year. Other changes that may be made in regulations designed to encourage greater exploration activity will never perform to their full potential until

AGO 547229

the producer's return is comparable with what he can obtain in other jurisdictions.

GOVERNMENT OPTIONS

We can now examine the options available to the British Columbia government in 1974. First, the government could maintain the existing regulations without change; or they could have stricter enforcement of the rules, further reducing cash flows to the producer, making it more difficult to operate; and thirdly, they could make changes designed to encourage greater exploration activity in the province. In each of these options it is assumed that some accommodation could be made between the provincial and federal authorities with regard to the revenue-sharing aspect. If it could not, then it would seem almost certain that exploration activity would decline, not only in British Columbia but also in the rest of Canada, and that even significant changes in the regulations would fail to act as an effective inducement to continued exploration.

In the first instance, if the government were to resist changes to its rules and to continue the existing level of royalty, it could expect to receive about the same amount of exploratory drilling as there has been in the past. This is evident from the sale in August 1974, where some 7.2 million dollars was paid for the right to acquire oil and gas permits, drilling reservations, and leases. This was certainly an indication that the oil industry was not prepared to write British Columbia off because of its high royalties and rather stringent regulations. There are several reasons for this. Companies have enjoyed a general increase in their cash flow, and in 1974 enough cash flow was available to pursue exploration in a province where the rates of royalty would reduce their return on invested capital as compared to other jurisdictions—for example, Alberta or the United States. The intensive competitiveness in the oil and gas industry distinguishes it from all other industries. Companies that have invested a great deal of time and money developing the geological potential of a particular area and have found that it fits their exploration parameters are prepared to offer a good deal of bonus money when this land becomes available through a competitive sale. Also, because a number of years usually elapses between acquiring an exploration permit and the development of and production from any discoveries, the economic climate may change such that what at one time is not attractive may become economic at the time of production.

If the government of British Columbia wished to discourage continued exploration by the existing oil and gas explorers and to discourage entry by newcomers, they could most effectively do this by again raising the rates of royalty and making the tenure of agreements shorter than they were. This

AGO 547230

type of action would cause the companies exploring in the province and those contemplating doing so to restrain their activities; exploration would then stagnate.

Presumably, such action by the British Columbia government would not occur without consideration of these consequences and the recognition that a different vehicle should enter the void left by the existing explorers. This could take the form of a public company, such as the British Columbia Petroleum Corporation; alternatively, the government might feel that, given time, the major oil and gas producers, the fully integrated companies, may finish their exploration for high-reserve reservoirs in other parts of Canada and be prepared to return to British Columbia to look for the remaining reserves which they may need to supply their refineries.

To give any support to this latter proposition, one would have to presuppose that the exploration presently being carried on by the Majors in Canada in the Northwest Territories, in the Arctic Islands, and in the offshore areas of eastern Canada will be unsuccessful and that they will have to lower their sights, accept a lesser prospect, and return. This is very difficult to support, considering the successes already achieved in the Northwest Territories, particularly in the Delta, and in the Arctic Islands. Also, there is a vast geological potential remaining as assessed against the very few wells that have been drilled.

The supposition that a provincial public corporation could enter the exploration field and its endeavours be more beneficial to the province than the present system raises many questions about the corporation's practical efficiency and about the possible political repercussions. This article's purpose is not to examine the political repercussions that might occur when dry holes are drilled with public funds; however, we should examine some of the practical considerations involved in the operation of a public company which has an almost exclusive area within which to explore as a result of discouraging the private sector. For the government to discourage both the existing explorer and the entry of any new ones and to expect the public corporation to be able to fill this void suggests that the government is saying, "If the private companies do it, so can we." Now remember that the private companies comprise all the oil and gas explorers working in the province and those contemplating doing so, given the right opportunities. All these companies have geological staffs, many of whom will be geologists who devote most of their time over a considerable number of years entirely to the study of British Columbia's geology. The public corporation could not expect to have such an extensive source of expertise as that available in the free enterprise system. And so the public corporation would suffer from a reduction in the number of ideas generated.

It is not unusual in oil and gas exploration, with its inherent problem of

AGO 547231

scientific interpretation and evaluation of geological prospects, to find that one company will acquire a block of land, will explore it, and perhaps even drill on it before deciding the search is unsuccessful. The company will then return the land to its owner, the Crown. This does not mean that there are not any commercial hydrocarbons underlying this land; but rather that that particular company was unable to find them. To find these hydrocarbon deposits, a second, a third, or a fourth company should acquire this land, and, if this is done often enough, the hydrocarbon will be encountered, and production will follow. The problem with the public company being the only explorer in the province is that, unless it is fortunate enough to make the initial discovery, it is very doubtful whether there would be enough enthusiasm to have a second, third, or perhaps even a fourth try at that particular prospect, with the result that the discovery would not be made. This is surely the worst thing that could happen and is probably the most damning argument against a public corporation moving into an area with an almost exclusive right to explore.

If the British Columbia government wishes to increase the level of exploration in the province and so lead, hopefully, to a greater number of discoveries and a better position of self-sufficiency in their own requirements, there are several measures which could be taken to promote such a situation.

The first step that can and must be taken is to increase the cash flow to the producer and to assure the newcomer that if he makes a commercial discovery, he will receive a sufficient return to expand his exploration endeavours in the province. This action should take the form of restructuring the royalty on oil and probably renegotiating the contracts on gas existing between the producer and British Columbia Petroleum Corporation. The 1974 royalty rate on oil was determined by production at the wellhead, with the price not being a factor at all. This means that if the price paid to the producer for a barrel of crude oil should decrease from the present level, then the producer will suffer a decrease in his cash flow, thus his future available financing to continue exploration endeavours in British Columbia will be diminished. A preferred structure on royalty would take into account the possibility of a rising and falling price for the product so that the producer, out of whose cash flows exploratory drilling is carried out, would be the last one to suffer in the case of a decrease in price for both oil or gas. Probably this might best be accomplished by the producer selling his crude oil to the British Columbia Petroleum Corporation in the way gas is sold, but with a better pricing adjustment mechanism than that which exists with the gas contracts.

Another measure that should be taken would be a redesigning of the exploration agreement. This could be done to ensure that the holder could

AGO 547232

only earn leases after he had conducted actual work on the permit or in the area within reasonable proximity, and that his earnings would be restricted to a consolidated block rather than come from a sprinkling of leases throughout the permit area. This feature alone would help to ensure exploration, because the permit holder must be satisfied that he is getting, at least in his mind, the right half of the permit under lease.

The manner of acquiring oil and gas rights should be reviewed. As mentioned previously, the only method of acquiring an exploration permit under the present rule is through a competitive cash bidding system usually held on a quarterly basis. There are probably several instances where an oil and gas explorer would have been quite prepared to drill wells in British Columbia if he could have acquired the land for a minimal amount rather than having to use money he would put into exploration to purchase land through the cash bidding system. The rentals and fees charged should be the same as in Alberta, if only to appear competitive in this particular area.

CONCLUSION

The exploration for oil and gas in British Columbia cannot be considered in isolation. The proportion of the reserves of oil and gas remaining to be discovered will depend upon the number of exploration dollars allocated to the task. British Columbia's competitive position for these exploration dollars will depend in large measure on its royalty and land tenure policies.

AGO 547233

Cash Bonus Bidding for Mineral Resources

WALTER J. MEAD

Mineral leasing policy alternatives arise out of the fact that governments own mineral resources but, in general, do not engage in mineral resource recovery and processing. Hence, a need arises to transfer publicly owned resources to private enterprise at a price which will reflect the "fair market value" of the resource. The following analysis will, first, explore the problems to be solved by a bidding policy and, second, evaluate the cash bonus method of bidding for mineral leases.

THE PROBLEMS TO BE SOLVED

There are three problems which must be solved by any leasing system. First, the leasing system must as objectively as possible determine who or what firm is to be given the right to exploit publicly owned mineral resources. Second, a price must be determined which the lessee is to pay to the government for the right to recover mineral resoures held in trust for its citizens. Third, assuming that a nation wishes to economize on the use of its scarce resources and to maximize the standard of living of its citizens over time, the leasing system must result in an efficient method of production.

As a prerequisite to a discussion of mineral leasing alternatives there should be a clear statement of the goal(s) to be achieved. It is probably true that economists as a group have a preference for a single goal, declaring it to be one of economic efficiency. Natural resources available to any economy are scarce by definition. Achieving the highest possible standard of living requires that scarce resources be utilized with a maximum of efficiency. If resources are sold at a price below their true value, then the products into which they are converted may also be underpriced. If demand elasticities are less than zero, then the flow of resources into products and the flow of products within the current period will be excessive. Present overconsumption of products and resources will be at the expense of future consumption.

One way of achieving maximum economic efficiency is to price all resources at their "fair market value." Such pricing allows a government the opportunity of capturing the economic rent. Resources should be sold

AGO 547234

for the difference between future revenues and costs, appropriately discounted to their present value. The economic principle relating prices, costs, and money flows at different points in time in order to estimate present value (*PV*) is shown in the following formulation:

$$PV = \sum_{i=0}^{n} \frac{P_iQ_i - C_i}{(1+r)^i}$$

P_iQ_i is the value of the gross income flow at different points in time, C_i represents associated costs, and r represents the interest rate at which future money flows are discounted to the present. The formula clearly shows that higher future prices will increase present values while higher future costs will lower present values. Further, the greater the uncertainty and risk associated with production, the smaller will be present value. Firms utilize some variation of this present value formula in calculating their individual bids. Estimates of the quantity of minerals recoverable from a given tract will, of course, vary widely from firm to firm.

If mineral leases are sold for less than the fair market value as indicated in the above formula, then resources may be used at an excessively rapid rate, and the public, as owners of the resource, will fail to receive their full economic rent. On the other hand, if mineral resources are sold at prices in excess of the fair market value then, in the long run, some operators will be forced out of business. Use of such mineral resources in the present period will be at a suboptimal rate and the public owners will receive more than their normal economic rents.

In the past, Canada apparently has transferred some of its mineral and timber resources through various negotiated transactions rather than by utilizing the auction market approach. Similarly, other foreign governments have traditionally taken the negotiated sale approach in entering into long term oil concessions.

There are major problems involved in the negotiated approach. The correct present value of natural resources is extremely difficult to ascertain. There is no objective test in advance of ultimate production that can indicate the precise present value of mineral resources. By their nature they must first be discovered. Their presence, quantity, and quality are in doubt. With the government as the seller, negotiating with a single buyer, traditional problems of bilateral monopoly are encountered. The seller is interested in maximizing price, while the buyer is interested in minimizing price. Given this uncertainty plus opposing objectives, the civil servant is placed in a difficult position.

A visitor to Canada is reluctant to criticize Canadian experience which has circumvented the market place. Fortunately there is abundant experience within the United States to indicate the shortcomings of the negotiated approach to pricing. We may formulate two general laws which

AGO 547235

seem to govern when prices are determined or may be influenced by administrative judgement. First, the buyer will always complain. If the buyer believes that market prices can be reduced by protesting that they are too high, then complaints based on the argument that the operator cannot make a "fair profit" because prices are set too high could be endless. In the timber context, there are two cases where elaborate reports have been written protesting the high price of timber. One, presented by the Simpson Timber Company, protested against the high price of stumpage set by the United States forest service for the Shelton Sustained Yield Unit Agreement. Timber, in this case, is not sold at auction; its price is determined by the United States forest service. In the second case, the Edward Hines Lumber Company protested against the high cost of timber for its southeastern Oregon lumber mill. The timber was sold at an auction where competition was so weak that, in effect, it was sold at the administratively determined minimum price. By protesting, the company apparently felt that minimum prices could be reduced. In this instance, local community help was solicited on the grounds that if the company failed to make a fair profit, it would be forced to curtail operations. Under auction market procedures the government is relatively free from constant complaint and protest, because it is the impersonal market that determines the price rather than a civil servant. Under auction bidding procedures the buyers themselves set the price in competition with one another.

A second general law is that, where prices are set through administration, the government will always set prices short of the fair market value. A bureaucracy will rarely choose the path that makes its position unpleasant. Low prices are believed to generate less criticism and complaint than high prices. Where there is no auction market to test administrative judgement concerning the fair market value, we have no means to prove the second law. Sales of timber in the United States offer an opportunity to test the administratively determined price. Timber is sold by the forest service on the basis of an appraised fair market value, which becomes the minimum price acceptable to the government. Auction bidding begins at this price. In the four years from 1959 through 1962, competitive bidding for timber in the United States Douglas fir region produced an average high bid price that exceeded the forest service statement of fair market value (the appraised price) by 46 per cent.[1] In this case, the interests of the public were protected, at least in part, by reasonably effective competition. In the absence of this competitive check it is quite likely that the appraised prices would have been even lower. The shortcomings of the negotiated approach should lead to auction bidding wherever competition is possible.

CASH BONUS BIDDING

Before bidding can take place, a decision must be made between oral and

AGO 547236

sealed bidding. Bidding in either form may start with a stated or unstated minimum acceptable price. In the case of timber sales in the United States, the minimum acceptable price is given by the appraised price, and most timber auctions are conducted under oral auction procedures. On the other hand, in the case of oil and gas leases conducted by the federal government in the United States, the minimum acceptable price is not published, and bidding is normally by sealed bidding procedures. The government retains the right to "reject any and all bids." After bids have been received, it determines whether or not the high bid was adequate.

The factors important in choosing between oral and sealed bidding methods are as follows;

a. Of prime importance is the extent of competition. If competition is weak, then sealed bidding with its element of uncertainty makes collusive arrangements more difficult to enforce. Under sealed bidding rules there is no second chance to bid at any given sale. In contrast, under oral bidding procedures, a collusive arrangement can be policed by the participants during bidding. Further, there is always doubt about how many bidders may appear at a given sale. In oral bidding where only one bidder is present, he will bid the minimum; whereas, in sealed bidding a bidder would probably offer an amount which he believes will win the sale under conditions of more than one bidder.
b. In the timber industry where fixed investments in milling facilities normally exist prior to sales, the buyer needs a means of ensuring access to specific raw materials and specific locations. Oral auction procedures provide this means through the opportunity to cast reaction bids. In contrast, in oil and gas bidding fixed investments are made after winning a sale, hence there is less need to protect one's position through the opportunity to react to the bids of others.
c. Where the severed resource is relatively immobile, as in the case of timber, it is of greater importance that a specific nearby sale be obtained; therefore the oral auction procedures are more appropriate. In the case of oil and gas, the severed resource is highly mobile, so obtaining a specific sale is of less importance. In this case sealed bidding is not disadvantageous.
d. Where the resource to be auctioned is not homogeneous, it may be necessary for a firm to obtain a specific sale. Where this is true, the opportunity to make more than one bid to protect one's need for a specific type of resource may be of great importance. Only oral bidding facilitates this subsequent bidding opportunity.
e. Financial planning often requires that a firm carefully limit its financial exposure. Where this is necessary, oral bidding offers greater control over a total resource financial commitment. In the case of sealed bidding,

AGO 547237

firms may be unexpectedly successful and in the process win more sales than were desired or can be successfully financed. On the other hand, a firm's sealed bidding may be totally unsuccessful so that it becomes undercommitted. This shortcoming of sealed bidding may be corrected where resources may be freely transferred among interested buyers. This procedure is normally followed in the case of oil and gas leasing in the United States.

f. Oral bidding requires more on-the-spot decision making than does sealed bidding; therefore, oral bidding requires that a higher level of executive talent be present at the moment of the auction. In contrast, decisions made on the basis of a sealed bid offer no opportunity for subsequent action on the auction floor; therefore, the presence of expensive executive talent is not necessary.

g. The "free rider" is a problem for serious bidders under oral bidding conditions. A serious bidder will carefully examine the potential productivity of a proposed lease sale. This may, as in the case of minerals, require large investments. Under oral bidding conditions, a "free rider" can observe who is bidding, then, if he is confident that they have done their homework, he can continue to outbid them until they reach their maximum and he will win the sale. His purchase is therefore based on someone else's calculations and he, in turn, has saved the cost of the pre-exploration appraisal. Sealed bidding does not offer the free rider the same opportunity.

Once a decision has been made in favour of oral or sealed bidding, then a choice must be made on the object of bidding. A cash bonus bid is one alternative. Additional alternative bidding objects are shown in Table 1.[2]

Bonus bidding is the standard procedure used by the United States government in all of its Outer Continental Shelf (OCS) programmes. Using the present value formula given earlier, potential bidders presumably estimate the present value of the probable mineral recoverable from a tract of land. The formula provides for adequate recovery of capital and compensation for risk, uncertainty, and profit.

One strong advantage that can be claimed on behalf of a bonus system relative to royalty bidding is that it requires a lump sum payment and correspondingly modest royalty payments. Because royalty payments are due on each barrel of oil or unit of natural gas produced (or other mineral), such charges become part of the marginal cost. At the margin of production this is a transfer cost rather than a real social cost. Royalty bidding thus leads to premature abandonment of an oil or gas well. To the extent that royalty payments are required in addition to the cash bonus, there will be premature abandonment of the lease.

The disadvantages of bonus bidding are numerous. First, while the

AGO 547238

technology for oil exploration prior to drilling has been advanced in the last century, exploration is still subject to extremely high risk. Drilling is the only definitive test to determine the presence of oil or gas. Thus, bonus bids must be submitted by bidders and accepted or rejected by the government when neither the buyer nor the seller knows whether and in what quantities oil is present. This places the seller in a position of accepting millions of dollars for nothing but the right to spend several more millions drilling potentially dry holes. In cases in which a rich oil field is found, returns to the lessee will be and must be very high.

Second, under current procedures a bonus must be paid when the bid is submitted. When the bonus bid is large, it will represent a very heavy cash drain to the bidder far in advance of any revenue which may be generated from the oil or gas produced from the lease. This significant *front-end loading* of capital costs effectively excludes a small operator from winning leases as a solo bidder, creating an additional barrier to entry into the oil and gas production market. To overcome this entry barrier, firms commonly form joint ventures and bid jointly for a lease.

Third, because the bonus is calculated on a present value basis, the government is forced to accept discount rates used by private enterprise. If private enterprise discount rates are unreasonably high from a social standpoint, then bonus payments to the government will be correspondingly low.

Possible variations of the bonus bidding form are shown in Table 1. The present United States system includes fixed royalty requirements (typically 12½ per cent or 16⅔ per cent of wellhead value). However, a bonus bid might be paired with a sliding scale royalty requirement, permitting the royalty rate to be reduced as a field declines in productivity. As the point of economic abandonment is approached, the royalty rate might be reduced substantially or even eliminated. This procedure would, in turn, eliminate a marginal cost of production that is not a real social cost and it would permit continued production from a field until the real marginal costs equaled the marginal value of production. This is the optimum point for well abandonment from an economic point of view. If at the time that a bonus bid was submitted all bidders understood that the royalty rate would be reduced to zero under the conditions specified above, the present value of the lease would be increased by an amount equal to the present value of reduced future royalty payments. Thus a tradeoff would be effected from royalty payments to bonus payments. The principal impediment to a sliding scale lies in the difficulty of clearly identifying various points at which royalty rates would be reduced. The lessee would have an economic incentive to manage his production in such a way that minimization of royalty payments would be an operating objective, rather than economic efficiency.

AGO 547239

TABLE I

ALTERNATIVE BIDDING FORMS

Bonus Bidding
- a. with a fixed royalty requirement
- b. with a sliding scale royalty requirement
- c. without a royalty
- d. with or without a rental payment
- e. with a profit share
- f. with delayed bonus payments

Royalty Bidding
- a. flat (nonvariable) royalty
- b. sliding scale royalty
- c. with a fixed bonus requirement or no bonus

Profit Share Bidding
- a. net profit or gross profit
- b. with fixed bonus requirement or no bonus
- c. with a royalty requirement or no royalty

Combination of Bonus and Royalty Bidding

Bidding on the Work Programme

The royalty problem, together with the administrative problem of reducing royalty rates under a sliding scale, might be avoided entirely by using a bonus bid without a royalty payment. However, this procedure would simply magnify all three of the problems associated with bonus bidding listed above.

Present procedures in the United States include modest rental charges payable between the points of sale and production. When production begins, rental payments cease and royalty payments take over. Rental payments in OCS oil and gas lease income are insignificant. In 1972, they amounted to 0.3 per cent of total revenue from such leases.[1] The rental requirement apparently was introduced to motivate the lessees toward early production. If they were of significant size, this result would in fact occur, because rents cease when production begins.

To overcome the front-end-loading problem, provision might be made for delayed payment of the bonus. The problem that would follow from this procedure is that in some cases where no minerals were found, lessees would elect a bankruptcy route. In this event, an unfair bidding situation would be created. Responsible firms in business on a perpetual basis would not follow a bankruptcy procedure and would, therefore, be at a bidding disadvantage with respect to others that contemplated bankruptcy in the event of a "dry hole."

A bill currently pending before the United States Congress provides for a 55 per cent fixed share of net profits in lieu of the existing fixed royalty payment accompanying the bonus bid. The winner would still be

AGO 547240

determined on the basis of a cash bonus. A profit share payment would avoid the above problems associated with royalty payments. As a given lease approaches exhaustion and its point of economic abandonment, profits would also approach zero and payments would decline proportionately to zero. If the profit share was calculated on the basis of net accounting profits including fixed costs, then the profit share payment would decline to zero prior to the point of economic abandonment. The latter point is reached only when marginal cost (not total costs) equals the marginal revenue. There is nothing wrong with this system providing both parties understand how it works and bidders understand it at the time they submit their bonus bids. The proposed 55 per cent profit share is high and is likely to lead to inefficient operations. A profit share payment is approximately the same as an income tax on each well and is additional to the existing income tax. When the profit share payment is added to the existing income tax, a large part of the penalty for wasteful operations will have been shifted from the operator to the government. While a bonus bid paired with a fixed profit share payment has merit, a 55 per cent profit share added to normal income taxes is inappropriately high from an economic point of view.[4]

Some data are available to permit a partial evaluation of the effectiveness of bonus bidding with a fixed royalty. The United States experience with OCS bidding provides a record of thirty-five oil and gas lease sales during the period November 1954 to 29 May 1974. In addition, three sulphur lease sales and two salt lease sales have been conducted on the OCS. The record may be evaluated in terms of the number of bidders competing for each sale, the conditions of entry of new firms, the record of joint bidding, the extent of concentration among winning firms, the trend in price bid per acre, the resale record of tracts where the initial bid was refused by the seller, and the rate of return earned by the winning bidders. Data pertaining to OCS bidding as follows:

a. For oil and gas lease sales there has been an average of 3.6 bidders competing for each tract receiving bids. The trend from 1954 to date has been one of increasing bidder activity. From 1954 to 1966 the average number of bidders per tract was 2.7. From 1967 to date the average increased to 3.9. From the seller's point of view, even more bidders would be preferred. Given the fact of relatively few bidders, sealed bidding procedures would appear to be more appropriate than oral auction.
b. Entry into the oil and gas auction markets appears to be relatively free. In the first 1954 federal lease offshore from Louisiana, 199 tracts were offered. Ninety-seven of these tracts received 327 bids from 22

AGO 547241

different firms, some of which bid in joint bidding combinations. From 1954 to 28 March 1974, an additional 110 firms won tracts as solo bidders or joint bidders with 1 or more other firms. Thus, in addition to the unsuccessful bidders who also perform a competitive function in the bidding process, there were 132 separate firms participating as winning bidders in thirty-three OCS lease sales.[5]

c. Entry by relatively small firms into OCS lease sale bidding is facilitated through joint bidding. Joint bidding by two or more firms each unable to bid solo has the effect of increasing competition. On the other hand, when two or more large firms fully able to bid separately combine to submit a single bid, the effect may be to reduce the number of competitors. However, if through joint bidding, even among large firms a combination of, say, four firms bids more than four times as frequently as the individuals would have bid solo, then the effect of joint bidding can again be procompetitive.

d. The record shows some tendency toward concentrating winning OCS bids in relatively few hands; however, the extent of concentration also appears to be declining over time. For the nineteen oil and gas OCS lease sales which took place from 1954 through 1966, the eight largest buyers, sale by sale, purchased 85.5 per cent of the tracts. In the fourteen sales from 1967 to 28 March 1974, the percentage of total tracts purchased by the eight largest buyers declined to 62.0.[6]

Using the 184 leases issued in the 1954 and 1955 Louisiana oil and gas lease sales, a multiple regression analysis tested the proposition that firm size was positively related to the high bid by tract as the dependent variable. If large firms are able to outbid smaller firms, then one would expect a positive relationship. The regression analysis revealed no significant relationship between size class of firm (the eight big firms versus all others) and the amount of the winning bid. The same regression equation revealed that the high bid was also independent of whether firms bid jointly or solo. Further, the most significant independent variable related to high bid was number of bidders; the greater the number of bidders competing for any given tract, the higher will be the resulting winning bid. The total value of oil and gas production accumulated through 1967 was also positively related to the high bid. As one would expect the number of acres in the tract leased is also related to the high bid. Estimated water depth as a proxy for development cost was not significantly related to the high bid.[7]

e. Data on the average price bid per acre indicates that with the passage of time the effective high bid per acre has increased substantially. For the entire period 1954 through to 28 March 1974, the average high bid per acre amounted to $1,257.50. For the 1954-1966 period the average was

AGO 547242

$301.71 per acre. This increased more than sevenfold to $2,219.90 per acre for the period beginning in 1967. This increase is only partially accounted for by higher crude oil prices. The average price of crude oil increased from $2.89/bbl. in the earlier period, to $3.69/bbl. in the later period. Even this increase would be offset by an unknown decrease in the probability of finding oil, and by increased costs of exploration and production.

f. Lease sales through 1 October 1964 show that of the 1,377 tracts receiving bids, seventy-eight high bid offers were rejected by the government. Subsequently, 26 of these tracts were reoffered and leases awarded. For these 26 tracts, the initial rejected high bid average amounted to $42.41 per acre. The subsequently accepted high bid on resale averaged $411.38. Thus, where bids were found to be inadequate and subsequently reoffered, competition increased bonus payments on these rejected tracts nearly tenfold.

g. The most conclusive test of the workability of cash bonus bidding based on the United States record of OCS oil and gas lease sales is in terms of the rate of return on capital earned by the successful bidders. An analysis has been made of 184 offshore Louisiana oil and gas tracts leased in 1954 and 1955. Precise data are available on bonus payments, rental payments, oil and gas royalty payments, and production of oil and gas during the period from 1954 through 1967. Cost estimates were made for exploration, well drilling and equipment, and operation. Annual cost and annual wellhead values were discounted to obtain a net internal rate of return. The calculations indicate that these early OCS leases generated a 7.5 per cent before tax rate of return to the lessees.[8] Given the fact that oil companies pay relatively low U.S. income tax rates, the after tax rate of return would be only modestly lower than the 7.5 per cent before tax rate of return. This net yield clearly does not reflect monopoly power; it shows excessive degree of competition.

On the basis of this evidence we conclude that competitive bidding for oil and gas leases is sufficiently strong to protect the public interest in obtaining competitive values for its oil and gas resources. This conclusion is further supported by evidence presented above indicating an increase in the average number of bidders and a substantial increase in the average price bid per acre for oil and gas leases.

CONCLUSIONS

This article has examined the problems to be solved by any leasing system used to transfer publicly owned mineral resources to private firms for processing. The cash bonus bidding system has been used extensively in

AGO 547243

the United States, particularly in the leasing of OCS mineral resources. That record has been examined in some detail. While cash bonus bidding embodies problems which have been identified, it also appears to be an economically efficient method of resource conveyance. The United States record indicates that competition has been effective, if not overly effective, in permitting the government to capture the full economic rent. In addition, bonus bidding avoids a major problem of a popular alternative, that of royalty bidding. It appears to be far superior to a negotiated approach in solving the three critical problems of resource leasing: selecting the operator, determining a fair market value, and creating a climate for efficient mineral resource recovery.

The Role of Public Enterprise

ARLON R. TUSSING

My remarks are, firstly, about the role of governmental enterprise generally and, secondly, about some of the considerations involved in using governmental enterprise to foster greater control by the citizens of Canada and British Columbia over their own mineral industries. My view is that governmental ownership of producing operations is not generally the most effective way of accomplishing the social ends for which it is currently being advocated in these industries. Nevertheless, I have a few suggestions how some of the major disadvantages of public enterprise with respect to efficiency and responsibility might be overcome.

Government owned enterprises in the English-speaking countries have seldom owed their existence to an anticapitalist ideology. It is, in fact, hard to detect any systematic difference in motive, organization, or operation between the national, state and provincial, or municipal enterprises established during the incumbency of labour, socialist, and agrarian radical parties and those implemented by Tories of various names and complexions.

Despite the vast amount of existing governmental enterprise today in capitalist countries, and despite the importance of socialist movements and socialist thought in the history of modern civilization, the scholarly literature on public enterprise is remarkably skimpy. Rigorous comparisons —theoretical or empirical—of the economic performance of governmental and private enterprises in the same industry are, to the extent I can determine, nonexistent.

GOVERNMENT OWNERSHIP

The case for government ownership of undeveloped land and natural resource stocks rests on a broader base than that for government ownership of producing enterprises. The intrinsic value of any resource in its natural state is the difference between the value of goods that can be produced from it and the cost (in terms of labour, capital, materials, and organization) required to produce those goods. The size of this residual is not the product

AGO 547246

of any person's labour or enterprise; most of the economic value of an *in situ* resource and its appreciation over time result from such diffuse causes as the increase in population, the general advance of technology, the decline in real transport costs, or directly from governmental outlays on roads or geological mapping. On these grounds, it has become almost an axiom of distributive justice (however commonly violated) that the intrinsic value of natural resources should not be privately appropriated.

Other classical grounds for government ownership of natural resources are the desire to control external costs or capture external benefits of their exploitation, and the expected divergence of private capital costs from the social rate of time preference, which is said to result in too rapid (or too slow) development of the resource. I am skeptical about the universal applicability of the last of these arguments; who, indeed, knows what society's true discount rate should be, and why are politicians and civil servants expected to be more sensitive to it than to entrepreneurs? This reservation notwithstanding, I believe that a presumption in favour of government ownership of undeveloped land and resources is generally justified.

Turning to productive enterprise, however, there are three main economic rationales for government ownership in a capitalist society. First is the use of the state to establish or maintain productive activity that would not be profitable as private enterprise, but whose external benefits are deemed to justify a subsidy out of the public exchequer. A subsidy does not, of course, require state ownership, because either private or governmental enterprise could enjoy that subsidy. In either case, support could take the direct form of providing capital or operating expenses from the Treasury or the indirect form of tax exemptions and the use of public resources at less than their cost of fair market value. State ownership, however, may well make a subsidy more palatable to the public, because it does not conspicuously enrich (or appear to enrich) a few private entrepreneurs.

Within the category of public ownership as a vehicle for subsidization are the numerous instances of private enterprise socialized because of chronic insolvency or imminent liquidation, including the Canadian National Railways, most of the British Labour Party's nationalizations after World War II, and the recent takeover of rail passenger transportation by the United States government.

In other cases, the motive for government ownership has been the creation of "public goods," products (or by products) of an enterprise whose value a private owner could not expect to recover by market pricing. Examples of such externalities are flood control by hydropower projects and the promotion of literacy and national unification by the postal system.

Military necessity has been another justification for producing goods in state enterprises which might not meet the test of the private market.

AGO 547247

Nineteenth-century America had government lead mines and arsenals and plantations for naval stores; the processing of nuclear fuels now remains a governmental activity on security grounds. Many public transportation and communications ventures were begun as defence projects in Alaska, the Yukon, and British Columbia: examples are the ALCAN highway and the White Alice communications system.

Second among the rationales for public enterprise is the perceived inability of private business, because of the great size or risk of the venture in question, to assemble sufficient capital. This tradition in North America began with state ventures in canal and rail development in the early nineteenth century, then extended to river control and irrigation projects, and continues into the present in enterprises like COMSAT and Panarctic Oils. In many of these cases, the proposed activity was expected to be self-sufficient in the long run, on the basis of the revenues from its product or service, but state initiative was seen as necessary to take advantage of scale economies or to overcome high risk threshholds.

The third circumstance seen to justify government ownership is possession by an enterprise of monopoly power and/or exceptionally rich natural resources, either of which can produce substantial "unearned profits" or rents. Government ownership is one means either of preventing monopoly exploitation of consumers (or monopsony exploitation of workers and sellers) or of collecting for the public treasury monopoly profits or resource rents that would otherwise be captured by the private owners.

Government takeover of profitable businesses has been rare in the English-speaking world. There have been a few instances of ideologically motivated nationalization, but it is instructive to note that these have often been reversed, as in the cases of the iron and steel industry in Britain and, more recently, the grain trade in India. The remaining cases have principally been those of utilities—grain elevators, street railways, water, electrical or telephone systems—which had a monopoly ("natural" or otherwise) in a local service area. In the last category it is often hard to distinguish between the instances where government took over to prevent private exploitation of monopoly power and those in which government saw a monopoly as an opportunity to exploit an assured source of revenue for itself.

There are, of course, a variety of cases which overlap two or all three of these categories. Economic development of a poor or sparsely settled region is often advanced as a justification for public enterprise in transport, communications, or electrical power. In these instances the premise is often that the region lacks capital or capital markets and only the state can mobilize resources on the desired scale. At the same time, the project is seen to encourage growth by its ability to widen markets or otherwise cut costs for commodity producing sectors of the regional economy. Once estab-

AGO 547248

lished, moreover, such an enterprise may have a monopoly status, with the power to abuse or exploit that status, and seem thereby to demand public control or ownership.

Many governmental enterprises (and regulated utilities, which they resemble in important respects) combine subsidies for some activities with appropriation of monopoly rents or resource rents from others. A common practice in both regulated private firms and government enterprise in transportation, communications, and utilities is *cross-subsidization*, in which monopoly profits earned from one area, line of business, or class of customers are dissipated in subsidizing others that are deemed to be socially meritorious. Thus, airline and railroad tariffs on heavily travelled route segments typically exceed cost (including a "fair" return), while service on lower density segments is provided at a loss. Hydroprojects in the Western United States typically subsidize users of irrigation water from revenues earned by water sales to municipalities and industry and by sales of electric power. In Alaska, revenues from both state and federal timber sales are sacrificed to support otherwise uneconomic lumber and pulp mills.

Turning to the mineral industries of Western Canada, there is little evidence that suggests they need to be subsidized by formation of a public corporation or otherwise. The province of British Columbia does not have, for example, a great but decaying industry upon which the community depends both for energy and employment, as the British had in the coal mines of the 1940's.

The British Columbia-Yukon Chamber of Mines may occasionally assert that each mining job generates seven additional jobs in supporting industries, but there is no respectable analytical foundation for such a claim. Even if the extractive industries had such an employment multiplier, it does not necessarily follow that job creation *per se* is a benefit that deserves subsidization from the public purse, much less the creation of a government enterprise. New employment opportunities are a *net* benefit to the existing community only to the extent that they are filled by residents who would otherwise be unemployed or working at more poorly paid jobs. In an "open economy" like that of British Columbia or Alaska, there is no predictable relationship between local job creation and local unemployment, because new employment opportunity attracts immigrants who tend to offset the employment gain. Even if the new jobs directly created were reserved for long-time residents, displacement of residents from old to new jobs and their replacement by nonresidents can be expected to make overall unemployment rates relatively unresponsive to employment growth.[1]

National self-sufficiency in minerals and the earning or retention of foreign exchange are sometimes claimed as external benefits of mining that justify preferential treatment. In Canada, paradoxically, some of those

AGO 547249

(including the National Energy Board) who place the highest priority on national self-sufficiency in one or another mineral resource tend to advance policies that *deter* investment, on the grounds that the beneficiary of current development tends to be the export market, at the cost of future diminished Canadian self-reliance. In this country, moreover, balance of payment effects are often used as part of a case *against* mineral development for export rather than in favour of it. In a world of floating exchange rates, however, one might question whether there is any relevance at all to the balance of payments problem in its usual sense. Finally, the impacts upon environmental quality and the dispersion of population are more likely to be regarded as external *costs* of mining than as *benefits* that justify the government's promotion of mining ventures that otherwise would not be self-supporting.

It is hard to make a respectable case that mining (including oil and gas production) creates beneficial *externalities* for the surrounding community, as distinct from the net value of the minerals produced, or the factor payments (wages, profit, rents, and taxes) which make up that value. The current Canadian interest in state enterprise in the mineral industries does not seem, in summary, to be a result of the belief that they are inevitably unprofitable under private enterprise. On the contrary, it rests in part upon the notion that mineral extraction can indeed be very profitable, and that unearned profits (rents) ought to be controlled and disbursed in socially approved ways. This attitude is sometimes experienced as a concern whether the people of the nation or of the province, who are the nominal owners of its natural resources, are receiving as high a return for the products of their land as they might. One issue is, in short, whether the state is effectively maximizing its revenues from disposal of minerals.

Where effective capital markets exist together with a large enough number of potential operators to create workable competition for resource rights, the government (as landlord and/or sovereign) is more likely to maximize its revenues if it does *not* engage in production. This conclusion does not presume that particular government owned entities are necessarily less enterprising and less effective in cost control than profit motivated private corporations. There may well be a bias against efficiency in most forms of state enterprise, if only because their owners (the public) and managers do not have a clearly defined standard of performance as private managers have in the imperative to maximize the present worth of their firms. But more importantly, by operating a productive enterprise in the extractive industries, the government loses the ability it would otherwise have as landowner to exploit the competition among potential private operators.

At oil and gas lease auctions in the United States, for example, the bid prices on a single tract may vary by a factor of two, ten, or even one

AGO 547250

hundred. These variations reflect widely differing geological evaluations of the tract, exploration strategies, and capital and other costs. Thus each tract tends to be won by the bidder with the *most favourable combination of capital cost and expectations* among all the bidders regarding future product prices, the particular tract's recoverable reserves, and their development and lifting costs. The landlord (state or private) who operates on his own land, however, would have only one management team, one exploration strategy, one team of geologists and engineers, and one supply function for capital. Only by rare accident would the landlord's *actual* performance over the average of all his properties tend to be better than the *expectations* of the most optimistic bidder. If, therefore, he were to lease each tract to the highest bidder among the competing operators, he might anticipate receiving a greater net revenue on each property than he could expect from developing the property himself.

The foregoing prediction is implicitly supported by empirical studies of United States Outer Continental Shelf leasing by Walter Mead and others, who show that successful bidders on the average earn a discounted cash flow rate of return on lease acquisition costs substantially less than the oil industry's average rate of return on capital (see Mead's article, "Cash Bonus Bidding for Mineral Resources," contained in this volume).

The effective use of competition to optimize revenues does not dictate the use of a cash bonus bidding system for *all* minerals or even for petroleum under every circumstance. The degree of knowledge or uncertainty regarding the volume and value of minerals present and their cost of extraction, the relative weight of fixed and variable costs in total extraction costs, the number of potential competitors, and the relative preferences of the government and private operators for certain present income versus uncertain future income are all appropriate considerations in the choice of leasing or disposal systems and taxes on the mineral industries. These questions have been discussed elsewhere,[1] and other articles in this volume give close attention to the relative merits of location, leasing, and sale as systems for disposing of minerals; to royalties and severance taxes, and whether they should be reckoned on gross value or net profits; to bidding on cash bonuses, deferred bonuses, gross or net royalty rates; to the use of acreage rentals; to the optimum size and configuration of tracts; to the amount of geological information the landlord ought to obtain and publish before opening land for lease or disposal; and to the duration of the primary term of a lease or permit, its terms for renewal, and so on.

In summary, state enterprise in the business of developing and producing minerals is surely *one* way to capture and redistribute resource rents, but it is unlikely to be as effective a device for maximizing those rents as the combination of a leasing system that takes full advantage of competition

AGO 547251

among private firms (considering the technology and institutional characteristics of each branch of the mining industry) and an appropriate tax system.

The most powerful cases for public enterprise in developing regions (like much of Western Canada and the Territories) relate to transport facilities which create external economies for other economic sectors, including mining. In these instances, both the first motive for socialization (the desire to subsidize) and the second (the need to overcome barriers of scale and risk) may justify investment by the government on projects into which private enterprise will not venture. Neither of these motives, however, creates a case for state enterprise in mineral extraction. Capital and enterprise for mineral exploration and development are plentiful and mobile. Specialized technical inputs, such as geophysical surveys, drilling, and heavy construction can be purchased on contract in a highly competitive market (so that great petroleum and mining companies carry out very few of these activities themselves). Capital sums in the hundreds of millions, or even billions of dollars can be mobilized privately, even without government guarantees, for projects like the Trans-Alaska pipeline, in remote regions.

Development of minerals, like the collection of revenues from their development, is likely to be more rapid and more efficient if it utilizes the diversity of skills, techniques, enterprise, and access to capital in the private economy and the competition between firms differently endowed in these respects. Nationalization or municipalization of producing operations, in my view, has an inevitable price—both in state revenues and in social efficiency—the payment of which must be justified on other grounds.

The hard core of Canadian interest in public enterprise today seems to stem not from a perceived shortage of capital and entrepreneurship (much less an ideological opposition to capitalistic enterprise as such), but from a perceived surplus of foreign capital and entrepreneurship. The problem, it seems, is to assure that mineral development (and, presumptively, related activities like oil refining or oil and gas transportation) are under the control of Canadians or the people of British Columbia, rather than great multinational (read United States) corporations.

It is probably not politic of me as an American to ask what practical difference the nationality of a company's owners or management makes as long as it is subject to the same laws (and obeys them) and pays its proper share of taxes. Foreign companies in Canada have often been berated for not paying enough taxes, but it was after all a *Canadian* decision, reflecting a long-standing Canadian developmental philosophy that the extractive industries should remain largely untaxed. The satisfactions and grievances of Americans regarding the major oil companies apply in the same way to

AGO 547252

Mobil and Texaco, which are domestically controlled, as they do to Shell and Sohio, which are foreign controlled. I am afraid I don't see how any more in the way of real resources for Canadians could be squeezed from a government owned business than could be squeezed from American or Canadian owned private enterprise under a well designed leasing and tax system. Nevertheless, one billion American dollars invested in Canada is more conspicuous than one billion Canadian dollars invested in the United States, and the nationality of your managers and stockholders obviously does make a difference to many Canadians. (I must confess, also, that some Americans become hysterical about the very idea of the Arabs or Persians taking over United States businesses.)

Government enterprise is one way to "nationalize" the mineral industries, but it is not, of course, the *only* possible way to foster Canadian equity and enterprise. Stricter nationality criteria could well be applied to holders of claims and leases or of permits to build pipelines, concentrating plants, and refineries. Such policies raise the further question, however, whether there is in fact enough private equity capital and enterprise in Canada to effectively take the place of foreign equity and enterprise. This is an empirical question to which I do not have an answer. If the answer is negative, consideration must be given to the fact that establishing a government enterprise does not *create* any new Canadian resources. It only uses tax money or potential resource revenues to bid capital and talent away from some other employment in Canada. The cost of Canadianization (either by restrictive licensing of private industry or by government enterprise) may be minimal, however, if preferences for nationals result in bidding home significant amounts of Canadian capital and Canadian talent which would otherwise be employed in other countries. (Presumably, the net effects of even these moves would have to take into consideration remittances that would otherwise flow back to Canada from investments abroad.)

Government capital need not be regarded strictly as a *substitute* for private capital, Canadian or foreign. In North America during the first half of the nineteenth century, and in almost every country at one time or another, state companies were used as a vehicle to *attract* foreign debt or equity capital, usually British, to ventures they would not otherwise consider. A government owned (or guaranteed) railroad company was often naively regarded by Lombard Street as a safe investment, while the promotions of unknown overseas entrepreneurs were viewed with little regard in the world's principal money market.

The use of government participation is still a major instrument for encouraging foreign investment in developing areas. Joint ventures between American, European, or Japanese private companies and governmental entities of the host country are common in almost all the extractive

AGO 547253

industries and in many countries at different levels of economic development. Canada has at least one government enterprise created largely with this function in mind, Quebec's SOQUEM, whose activity consists mainly of joint ventures in mineral exploration with private companies. Petro Canada also *seems* to be interested in this kind of approach.

In addition to being a means by which domestic enterprise becomes a trustworthy borrower (or partner) of foreign capital, state enterprise can also be a means of offsetting a shortage of domestic equity and entrepreneurship. In this role, it has one advantage over promotion of domestic private enterprise through nationality restrictions on investment, management or licences: it avoids the spectre of open discrimination, which could lead to retaliation and might otherwise undermine trade and investment relationships that are beneficial to Canada. The nearly open border allows this country to draw on a much larger pool of capital, technology, and talent than it would with policies fostering autarky. Although this openness is a major element in the ambiguity and insecurity of Canada's national identity, its economic benefits to Canada are relatively greater than they are to the United States. (That is, its impact on the size of the resource pool available to Canada is greater than on the size of the pool available to the United States.) It is therefore a circumstance to be modified only carefully and selectively. Establishing a provincial oil company is one way of containing the side effects of a move in the direction of autarky in a single industry. Such a move might, in fact, limit these side effects even in the industry in question. Suppose the best candidate for executive officer for a British Columbia based oil company were a Texan; there might well be fewer misgivings about hiring him to work for the province than about his heading a subsidiary of an American private firm.

I will conclude this article with some suggestions for the structure and policy of public corporations in the mineral industry, suggestions aimed at combining some of the best features of government and private enterprise, rather than their worst.

First, before establishing a governmental enterprise, be clear what its purpose is to be, what the incentive for the management to accomplish that purpose will be, and, quite rigorously, what will be the measure of the enterprise's success. (I owe this first and most vital point to Milton Moore's critique of the draft of this article.)

Second, do not set up a monopoly. There is no surer formula for inefficiency and social irresponsibility. Economies of scale do exist in mining and petroleum exploration, but they are very small when compared to some other industries or relative to the opportunities for development in an area the size of British Columbia. In petroleum refining, the minimum efficient size of a refinery is probably about the size of the British Columbia

AGO 547254

market for petroleum products, but if a new government owned refinery needs a monopoly or protectionist legislation to be profitable, it will almost certainly be a serious burden on consumers. Industries in which scale economies are narrow and where ingenuity and intuition are still crucial, as in mineral exploration or onshore oil and gas production, are probably not the most appropriate candidates for nationalization; but where it is determined to establish a state enterprise, consideration might be given to the establishment of more than one competing public enterprise.

Third, do not clothe the corporation in sovereign immunities. Such immunity can be, and often is, a cover for inefficiency, irresponsibility, and even lawlessness. The corporation should be suable; it should pay taxes or their equivalent (federal, provincial, and local); and it should be subject to environmental and safety laws and regulations and, above all, subject to the bankruptcy laws. Its operations should not be protected by any version of an official secrets act. There is no good reason why the directors, officers, and employees should be excused from the same civil and criminal liability for their actions to which their counterparts in private enterprise are subject.

I would urge hesitation even in providing guarantees for the corporation's debt. A public mining or oil corporation will be pursuing a line of business in which private enterprise regularly borrows money without such guarantees. The more intense scrutiny of bankers and underwriters toward a corporation whose debt must stand on its own merit might well save the corporation's owners—the public—more money than the small interest differential associated with government guarantees.

Fourth, give the public and the corporation's officers and staff a material interest in its success and its efficiency. The government need not hold all the shares but only a controlling interest, not necessarily even a majority. One block of shares (enough to elect at least one director) can be held in trust for the company's employees and voted by them. The remainder of the shares would be offered to the public; they would be voted by their owners and publicly traded. Not only would this provision broaden interest and participation in management, but the market price of publicly traded shares would be a continuing indicator of management performance and of the value of the government's equity. I see no compelling reason to restrict share ownership to residents; it might in fact be useful to encourage minority participation by major oil companies or mining companies. A residence requirement for shareholders, however, would reinforce symbolically the corporation's identity as a national or provincial instrument, and would, of course, limit remittance of dividends abroad.

Fifth, the corporation's policies should be responsive to public policy but not bend to every political wind. I would suggest that only a minority of the

AGO 547255

government directors serve at the pleasure of the Cabinet and be regarded as spokesmen for its policies. The remaining directors representing the government's equity would be chosen indirectly for long and staggered terms.

Sixth, the corporation should be under pressure to pay dividends. A majority of the shares (and directors) should represent parties who have a material interest that the corporation *not* retain, reinvest, or dissipate all its earnings: private shareholders, the employees, and the members who serve at the pleasure of the Cabinet (who would presumably be responsive to the fiscal interest of the government). The influence of this group will be a constant corrective to tendencies of management, inside directors, and permanent directors toward complacency, empire building, pyramid building, or gold plating.

Seventh, maintain a clear distinction between the corporation and the government as landowner. The public enterprise should obtain resource rights on crown lands only in competition with other prospective operators. The corporation should not receive a concealed (and indeterminate) subsidy by access to resources at no charge or at a lower price than a competitor might offer. If it must have a preferent right, let it be at most a right to match the highest bidder.

A preferent right on the best offshore leases is a feature of the federal oil and gas corporation (FOGCO), proposed recently in the United States Congress. In view of the prices oil companies have been recently willing to spend in these lease sales, such a preference would guarantee that FOGCO would appear profitable, however incompetent its management, and that the federal treasury would lose billions of dollars in lease revenues.

Eighth, take advantage of the division of labour and competition. The corporation should not attempt to do for itself the things that even the greatest oil and mining companies contract out to others, such as seismic surveying, core drilling, well drilling, well logging, and construction. There is virtually no chance that a state corporation could improve on the performance of private firms in these exceedingly competitive areas.

In summary, I am generally skeptical of the case for public enterprise in the minerals industry but hopeful that such enterprises could be established free of many of their usual shortcomings, providing some thought is given to their purpose, organization, and standards of performance.

AGO 547256

Notes

1. In a study aimed at projecting the employment impact of the Trans-Alaska pipeline, we found that *unemployment* in individual labour market areas was almost totally insensitive to the level of *employment*; that is, on a *net* basis, at least, new jobs in Alaska's petroleum and wood products industries and government were entirely filled by immigrants. [Arlon R. Tussing; George W. Rogers; and Victor Fischer; with Richard Norgaard, and Gregg Erickson, *The Alaska Pipeline Report: Alaska's Economy and Gas Industry Development and Impact of Building and Operating the Trans-Alaska Pipeline*, Institute of Social, Economic and Government Research Report no. 31 (Fairbanks: University of Alaska, 1971)].

(10/1/77) Draft subject to significant and/or substantial changes at any time.)(Draft 5)

REVISED DRAFT

A BILL

For an Act entitled: "An Act relating to the leasing and exploration of state land for oil and gas development."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

*Section 1. AS 38.05.180 is repealed and re-enacted to read:

Sec. 38.05.180 OIL AND GAS LEASING.

(a) Purpose. The legislature finds and declares that

(1) the people of Alaska have an interest in the development of the State's oil and gas resources potential to

(A) maximize the economic recovery of this important natural resource;

(B) control the exploitation of this natural resource so as to protect the public interest;

(C) maximize the competition among parties seeking to obtain the the right to explore and develop the state's oil and gas resources.

(2) the interest of the state is to encourage an assessment of its oil and gas resources and that will allow the maximum flexibility in the methods of awarding the leases to

(A) recognize the many and varied geographical regions of the state and the different costs of exploring for oil and gas in these regions;

(B) recognize the need for stimulating development in particular regions of the state;

(C) minimize the adverse impact of exploration,development, production and transportation activity on the environment of the state;

(D) maximize the state's share from profitable oil and gas production, while minimizing revenue from unsuccessful exploration wells and from marginal economic oil and gas production.

ROUGH DRAFT

(b) Leasing Program.

(1) The commissioner shall prepare and periodically revise, and maintain an oil and gas leasing program. This leasing program shall be submitted to the legislature for its information within 10 days of the convening of a regular session of the legislature. The leasing program shall indicate as precisely as practicable the size, timing, and location of leasing activity which the commissioner determines will best meet state needs for the following five-year period. The commissioner shall elect the timing and location of leasing, to the maximum extent practicable, so as to obtain a proper balance between the potential for environmental damage, the potential for the discovery of oil and gas and the potential for adverse impact on the local communities in the state.

(2) After the leasing program has been approved by the commissioner, no lease shall be issued unless it is for an area included in the approved leasing program and unless it contains provisions consistent with the approved leasing program, except that leasing shall be permitted to continue until such program is approved and for so long thereafter as such program is under judicial or administrative review. Leasing under paragraph (t) of this Act may be excepted from the leasing program if in the judgment of the commissioner it appears most advantageous to the state. written

(3) The commissioner shall review the leasing program approved under this section at least once each year, and he may revise and reapprove such program, at any time, in the same manner as originally developed.

(4) The commissioner shall, by regulation, establish procedures for

(A) receipt and consideration of nominations for any area to be offered for lease or to be excluded from leasing;

(B) public notice of and participation in development of the leasing program;

ROUGH DRAFT

(C) review by the Federal and local governments which may be impacted by the proposed leasing;

(D) periodic consultation with the Federal and local governments, oil and gas lessees and permittees, and representatives of other individuals or organizations engaged in activity in or on state land; and

(E) coordination of the program with the management program developed by the state under the Coastal Zone Management Act of 1972.

(F) the commissioner shall utilize the existing capabilities and resources of all state agencies in preparing the leasing program, and such agencies shall provide the commissioner with any nonproprietary information he requests.

(5) Within 10 days of the convening of a regular session of the lesiglature, the commissioner shall report to the legislature with respect to the use of the various bidding methods provided for in this Act. Such report shall include:

(A) The schedule of all lease sales held during the preceding calendar year and the bidding method or methods utilized;

(B) The schedule of all lease sales to be held the following year and the bidding method or methods to be utilized;

(C) The benefits and costs associated with conducting lease sales using the various bidding methods;

(D) If applicable, the reasons why a particular bidding method was selected; and

(E) If applicable, the reason why more than 50% of the area leased in the upcoming year, was or is to be leased under one particular bidding method.

ROUGH DRAFT

(c) The commissioner is authorized to grant to the highest responsible qualified bidder, by competitive bidding under regulations promulgated in advance, oil and gas leases on state land. The bidding shall be by sealed bid, and at the discretion of the commissioner, shall be on the basis of

(1) Royalty

(A) cash bonus bid with a royalty at not less than a 12½ percent reserved to the state which may be taken in kind or in value;

(B) a cash bonus bid with a royalty based on a sliding scale reserved to the state but not less than 12½ percent at the beginning of the lease period which may be taken in kind or in value;

(C) a fixed cash bonus with a royalty based on a sliding scale reserved to the state as the bid variable but not less than 12½ per cent at the beginning of the lease period which may be taken in kind or in value;

(2) Net profit

(A) cash bonus bid with a royalty at not less than 12½ percent which may be taken in kind or in value and a fixed share of the net profit of not less than 30 percent reserved to the state;

(B) fixed cash bonus with the net profit share reserved as the bid variable;

(C) fixed cash bonus bid with a royalty at not less than 12½ percent which may be taken in kind or in value and a percent of the net profit share reserved to the state as the bid variable.

(3) Work commitment bid based on a dollar amount for exploration with a fixed cash bonus and a fixed royalty, but not less than 12½ percent at the beginning of the lease period which may be taken in kind or in value.

(d) The commissioner may, in his decretion, defer any part of the payment of the cash bonus, as authorized in paragraph c of this Act, according to a schedule announced at the time of the announcement of the lease sale, but such payment shall be made in total no later than five years from the date of the lease sale.

(e) The commissioner is authorized to withhold acreage from leasing in a particular lease sale.

(f) The commissioner may utilize other leasing methods after public hearings, unless the legislature by joint resolution disapproves within thirty days after receipt of notice of the proposed bidding method.

(g) At least ninety days prior to notice of any lease sale under paragraph (c) (2), the commissioner shall by regulation establish rules to govern the calculation of net profits. In the event of any dispute between the state and a lessee concerning the calculation of the net profits under the regulation issued pursuant to this paragraph, the burden of proof shall be on the lessee. In determining the attribution of profits between oil and gas, costs, other than those directly attributable to the production of either oil or gas, shall be allocated proportionately based on the Btu equivalent values of the respective amounts of oil and gas produced.

(h) At least ninety days prior to notice of any lease sale under paragraph (c)(3), the commissioner shall by regulation establish rules to govern the work committment option. The commissioner shall require either (i) cash deposit for the full amount of the work commitment or, (ii) a performance bond, in form and substance and with a surety satisfactory to the commissioner, in the principal amount of such exploration work commitment assuring the commissioner that such commitment shall be faithfully discharged in accordance with this section, the regulation and the lease. As provided in the regulation, the principal amount of such

AGO 54762

ROUGH DRAFT

cash deposit or bond may be periodically reduced upon proof, satisfactory to the commissioner, that a portion of the exploration work commitment has been satisfied.

(i) At the discretion of the commissioner, he may enter into an agreement or may initiate a request whereby with the consent of the majority of the effected field lease holders, the state's royalty oil and gas production may be stored or retained in storage, or the commissioner may enter into an agreement with one or more of the effected field lease holders to trade current royalty production from a field for a like amount, kind andquality of future production, provided the state receives back its stored or traded royalty oil and gas during the first half of the field life or no later than 15 years after start of production.

(j) An oil and gas lease shall cover a reasonably compact area not exceeding 5,760 acres, and be for a period of five years. An oil and gas lease may be extended for an additional five years if the commissioner determines the extension is in the best interest of the state and he bases his decision on a showing by the lessee of due exploration diligence as defined by regulation; however, rental rates will continue to increase as if the lease had originally been made for the extended period. An expiring oil and gas lease shall be automatically renewed if and for so long thereafter as oil or gas is produced in paying quantities from the lease or, if the lease is committed to a unit approved by the commissioner. A temporary cessation of production approved by the commissioner does not constitute grounds for nonrenewal or cancellation of the lease. If drilling has commenced on the expiration date of the primary term of the lease and is continued with reasonable diligence, such operations to include redrilling, sidetracking or other means necessary to reach the originally proposed

bottom hole location, the lease shall continue in effect until 90 days after drilling has ceased and for so long thereafter as oil or gas is produced in paying quantities.

(k) Oil and gas leases shall provide for payment to the state of rental on the following basis:

(1) for the first through third years, $1.00 per acre annually

(2) for the fourth and fifth years, $2.00 per acre annually

(3) for the sixth year, $4.00 per acre

(4) for the seventh year, $8.00 per acre

(5) for the eighth year, $12.00 per acre

(6) for the ninth year, $24.00 per acre

(7) for the tenth year, $36.00 per acre

(8) for the eleventh year and beyond, rental rate is 150% of the preceding year.

The commissioner may establish by regulation, that after a discovery has been made which is capable of producing in paying quantities, the rental rate which was in effect during the year of discovery is maintained for the following 5 years. Rental is payable in advance and continues until income to the state from royalty, net profit or the base parameter of other leasing methods exceeds rental income to the state for that year; after the rental income schedule has been exceeded for three consecutive years, the rental shall terminate.

(l) Upon timely application as provided by regulation, the state may issue to the holder of a federal lease a state shorelands lease covering land within the exterior boundaries of the federal lease which has been excluded on the basis of navigability or which are later administratively or judicially determined to be "shorelands."

(m) To conserve the natural resources of all or a part of an oil or gas pool, field, or like area, whether or not the part is then subject to a cooperative or unit plan of development or operation, lessees and their representatives may unite with each other, or jointly or separately with others, in collectively adopting or operating under a cooperative or a unit plan of development or operation of the pool, field, or like area, or a part of it, when determined and certified by the commissioner to be necessary or advisable in the public interest. The commissioner may, with the consent of the holders of leases involved, establish, alter, change, or revoke drilling, producing, rental, minimum royalty, and royalty requirements of the leases and make regulations with reference to the leases, with like consent on the part of the lessees, in connection with the institution and operation of a cooperative or unit plan as he determines necessary or proper to secure the proper protection of the public interest. The commissioner may provide that oil and gas leases issued under this section shall contain a provision requiring the lessee to operate under a reasonable cooperative or unit plan, and he may prescribe a plan under which the lessee shall operate. The plan shall adequately protect all parties in interest, including the state.

(n) A plan authorized by (m) of this section, which includes land owned by the state, may contain a provision vesting the commissioner, or a person, committee, or state agency with authority to alter or modify from time to time the rate of prospecting and development and the quantity and rate of production under the plan. All leases operated under a plan approved or prescribed by the commissioner are excepted in determining holdings or control under section 140 of this chapter. The provisions

of this section concerning cooperative or unit plans are in addition to, and do not affect AS 31.05.

(o) Producing acreage on a "known geologic structure" of a producing oil or gas field is excluded from chargeability as against the acreage limitation provisions of section 140 of this chapter.

(p) When separate tracts cannot be individually developed and operated in conformity with an established well-spacing or development program, a lease, or a portion of a lease, may be pooled with other land, whether or not owned by the state, under a communitization or drilling agreement providing for an apportionment of production or royalties among the separate tracts of land comprising the drilling or spacing unit when determined by the commissioner to be in the public interest. Operations or production under the agreement shall be considered as operations or production as to each lease committed to the agreement.

(q) The commissioner may, on conditions which he prescribes, approve drilling, or development contracts made by one or more lessees of oil or gas leases, with one or more persons, when, in his discretion, the conservation of natural resources or the public convenience or necessity requires it or the interests of the state are best served. All leases operated under approved drilling, or development contracts, and interests under them are excepted in determining holding or control under section 140 of this chapter. Drilling or development contracts may include, if in the judgment of the commissioner it appears most advantageous to the state, provisions for the state to share in the costs of exploration.

(r) To avoid waste or to promote conservation of natural resources, the commissioner may authorize the subsurface storage of oil or gas

whether or not produced from state land, in land leased or subject to lease under this section. This authorization may provide for the payment of a storage fee or rental on the stored oil or gas, or, instead of the fee or rental, for a royalty other than that prescribed in the lease when the stored oil or gas is produced in conjunction with oil or gas not previously produced in paying quantities.

(s) Each oil or gas lease issued by the state shall contain a provision requiring the lessee to furnish the Department of Labor a quarterly report regarding the employment of state residents on the leased property. The commissioner of labor shall promulgate regulations necessary to carry out the provisions of this subsection.

(t) Lands which have been offered for lease within the previous five years but which received no bids at public auction may, at the discretion of the commissioner, be immediately offered for lease under regulations promulgated in advance upon terms appearing most advantageous to the state. The commissioner shall utilize a sliding scale royalty based upon such formulae as he determines to be equitable. In establishing sliding scale royalty formulae the commissioner shall take into consideration operating, secondary and enhanced recovery costs.

(u) The commissioner may, by regulation, restrict joint bidding.

(v) The state shall have the right to purchase not to exceed 16 2/3% by volume of the oil and gas produced pursuant to a lease issued in accordance with this Act, at the regulated price, or, if no regulated price applies, at the fair market value at the well-head of the oil and gas saved, removed or sold, except that any oil or gas obtained by the state as royalty, net profits, or other leasing method shall be credited

against the amount that may be purchased under this subsection. Oil and gas purchased under provisions of this section may be utilized by the state in the same manner as it utilizes its royalty oil and gas.

(w) Any lessee or permittee conducting any exploration for, or development or production of, oil or gas pursuant to this Act shall provide the Commissioner access to all data obtained from such activity and shall provide copies of such specific data, as the commissioner may request.

Section 2. AS 38.05.13 is deleted.

Section 3. AS 38.05.140(c) is amended to read:

"(c) No person may take or hold at one time phosphate leases on state lands exceeding in the aggregate 10,240 acres. No person may take or hold sodium leases or permits during the life of sodium leases on state lands, exceeding in the aggregate acreage 5,120 acres, except that the commissioner may, where it is necessary in order to secure the economic mining of sodium compounds, permit a person to take or hold sodium leases or permits for up to 15,360 acres. No person may take or hold at any one time oil or gas leases exceeding in the aggregate 500,000 acres granted on tide and submerged lands, and (500,000) 200,000 acres on all lands other than tide and submerged lands, including leases held both as lessee and under option or operating agreement from others. Where more than a single person holds an interest in an oil or gas lease, each person shall be charged only with that percentage of the total acreage which corresponds to its percentage share of the total beneficial interest in the lease."

Section 4. AS 38.05145(b) is deleted.

Section 5. AS 38.05.335(c) is deleted.

(10/1/77) Draft subject to significant and/or substantial changes at any time.)(raft 6)

A BILL

For an Act entitled: "An Act relating to the leasing and exploration of state land for oil and gas development."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

*Section 1. AS 38.05.180 is repealed and re-enacted to read:

Sec. 38.05.180 OIL AND GAS LEASING.

(a) Purpose. The legislature finds and declares that

(1) the people of Alaska have an interest in the development of the State's oil and gas resources potential to

(A) maximize the economic recovery of this important natural resource;

(B) control the exploitation of this natural resource so as to protect the public interest;

(C) maximize the competition among parties seeking to obtain the right to explore and develop the state's oil and gas resources.

(2) the interest of the state is to encourage an assessment of its oil and gas resources and that will allow the maximum flexibility in the methods of awarding the leases to

(A) recognize the many and varied geographical regions of the state and the different costs of exploring for oil and gas in these regions;

(B) recognize the need for stimulating development in particular regions of the state;

(C) minimize the adverse impact of exploration, development, production and transportation activity on the environment of the state;

(D) maximize the state's share from profitable oil and gas production, while minimizing revenue from unsuccessful exploration wells and from marginal economic oil and gas production.

(b) Leasing Program.

(1) The commissioner shall prepare and periodically revise, and maintain an oil and gas leasing program. This leasing program shall be submitted to the legislature for its information within 10 days of the convening of a regular session of the legislature. The leasing program shall indicate as precisely as practicable the size, timing, and location of leasing activity which the commissioner determines will best meet state needs for the following five-year period. The commissioner shall elect the timing and location of leasing, to the maximum extent practicable, so as to obtain a proper balance between the potential for environmental damage, the potential for the discovery of oil and gas and the potential for adverse impact on the local communities in the state.

(2) After the leasing program has been approved by the commissioner, no lease shall be issued unless it is for an area included in the approved leasing program and unless it contains provisions consistent with the approved leasing program, except that leasing shall be permitted to continue until such program is approved and for so long thereafter as such program is under judicial or administrative review. Leasing under paragraph (t) of this Act may be excepted from the leasing program if in the judgment of the commissioner it appears most advantageous to the state.

(3) The commissioner shall review the leasing program approved under this section at least once each year, and he may revise and reapprove such program, at any time, in the same manner as originally developed.

(4) The commissioner shall, by regulation, establish procedures for

(A) receipt and consideration of nominations for any area to be offered for lease or to be excluded from leasing;

(B) public notice of and participation in development of the leasing program;

(C) review by the Federal and local governments which may be impacted by the proposed leasing;

(D) periodic consultation with the Federal and local governments, oil and gas lessees and permittees, and representatives of other individuals or organizations engaged in activity in or on State land;

(E) coordination of the program with the management program developed by the state under the Coastal Zone Management Act of 1972; and

(F) the commissioner shall utilize the existing capabilities and resources of all state agencies in preparing the leasing program, and such agencies shall provide the commissioner with any nonproprietary information he requests.

(5) Within 10 days of the convening of a regular session of the legislature, the commissioner shall report to the legislature with respect to the use of the various bidding methods provided for in this Act. Such report shall include:

(A) the schedule of all lease sales held during the preceding calendar year and the bidding method or methods utilized;

(B) the schedule of all lease sales to be held the following year and the bidding method or methods to be utilized;

(C) the benefits and costs associated with conducting lease sales using the various bidding methods;

(D) if applicable, the reasons why a particular bidding method was selected; and

(E) if applicable, the reason why more than 50% of the area

leased in the upcoming year, was or is to be leased under one particular bidding method.

(c) The commissioner is authorized to grant to the highest responsible qualified bidder, by competitive bidding under regulations promulgated in advance, oil and gas leases on state land. The bidding shall be by sealed bid, and at the discretion of the commissioner, based on a pre-sale analysis, of at least one of the following:

(1) Royalty

(A) cash bonus bid with a royalty at not less than 12½ percent reserved to the state which may be taken in kind or in value;

(B) a cash bonus bid with a royalty based on a sliding scale reserved to the state but not less than 12½ percent at the beginning of the lease period which may be taken in kind or in value;

(C) a fixed cash bonus with a royalty based on a sliding scale reserved to the state as the bid variable but not less than 12½ percent at the beginning of the lease period which may be taken in kind or in value;

(D) a fixed cash bonus with a royalty bid less than 12½ percent, to be taken in kind or in value.

(2) Net profit

(A) cash bonus bid with a royalty at not less than 12½ percent which may be taken in kind or in value and a fixed share of the net profit of not less than 30 percent reserved to the state;

(B) fixed cash bonus with the net profit share reserved as the bid variable;

(C) fixed cash bonus bid with a royalty at not less than 12½ percent which may be taken in kind or in value and a percent of the net profit share reserved to the state as the bid variable.

(3) Work commitment bid based on a dollar amount for exploration with a fixed cash bonus and a step royalty, but not less than 12½ percent at the beginning of the lease period which may be taken in kind or in value.

AGO 547272

(d) Regulations shall be established for all bidding methods to allow reduction of royalty to compensate for ~~their~~ those increasing costs in the later ~~states~~ stages of production decline, to prolong the economic life of the field.

(e) The commissioner may, in his discretion, defer any part of the payment of the cash bonus, as authorized in paragraph (c) of this Act, according to a schedule announced at the time of the announcement of the lease sale, but such payment shall be made in total no later than five years from the date of the lease sale.

(f) The commissioner is authorized to withold acreage from leasing in a particular lease sale.

(g) The commissioner may utilize other leasing methods after public hearings, unless the legislature by joint resolution disapproves within thirty days after receipt of notice of the proposed bidding method.

(h) At least ninety days prior to notice of any lease sale under paragraph (c) (2), the commissioner shall by regulation establish rules to govern the calculation of net profits. In the event of any dispute between the state and a lessee concerning the calculation of the net profits under the regulation issued pursuant to this paragraph, the burden of proof shall be on the lessee. In determining the attribution of profits between oil and gas, costs, other than those directly attributable to the production of either oil or gas, shall be allocated proportionately based on the Btu equivalent values of the respective amounts of oil and gas produced.

(i) At least ninety days prior to notice of any lease sale under paragraph (c)(3), the commissioner shall by regulation establish rules to govern the work commitment option. The commissioner shall require either (i) cash deposit for the full amount of the work commitment or, (ii) a performance bond, in form and substance and with a surety satisfactory to the commissioner, in the principal amount of such exploration work commitment assuring the commissioner that such commitment shall be faithfully discharged in accordance with this section, the regulation and the lease. As provided in the regulation, the principal amount of

such cash deposit or bond may be periodically reduced upon proof, satisfactory to the commissioner, that a portion of the expioration work commitment has been satisfied.

(j) At the discretion of the commissioner, he may enter into an agreement or may initiate a request whereby with the consent of the majority of the effected field lease holders, the state's royalty oil and gas production may be stored or retained in storage, or the commissioner may enter into an agreement with one or more of the effected field lease holders to trade current royalty production from a field for a like amount, kind and quality of future production, provided the state receives back its stored or traded royalty oil and gas during the first half of the field life or no later than 15 years after start of production.

(k) An oil and gas lease shall cover a reasonably compact area not exceeding 5,760 acres, and be for a period of five years. An oil and gas lease may be extended for an additional five years if the commissioner determines the extension is in the best interest of the state and he bases his decision on a showing by the lessee of due exploration diligence as defined by regulation; however, rental rates will continue to increase as if the lease had originally been made for the extended period. An expiring oil and gas lease shall be automatically renewed if and for so long thereafter as oil or gas is produced in paying quantities from the lease or, if the lease is committed to a unit approved by the commissioner. A temporary cessation of production approved by the commissioner does not constitute grounds for nonrenewal or cancellation of the lease. If drilling has commenced on the expiration date of the primary term of the lease and is continued with reasonable diligence, such operations to include drilling, sidetracking or other means necessary to reach the originally proposed bottom hole location, the lease shall continue in effect until 90 days after drilling has ceased and for so long thereafter as oil or gas is produced in paying quantities.

(l) Oil and gas leases shall provide for payment to the state of rental on the following basis:

(1) for the first year, $1.00 per acre

(2) for the second year, $1.50 per acre

(3) for the third year, $2.00 per acre

(4) for the fourth year, $2.50 per acre

(5) for the fifth year, $3.00 per acre

(6) for the sixth year, $4.00 per acre

(7) for the seventh year, $8.00 per acre

(8) for the eighth year, $12.00 per acre

(9) for the ninth year, $24.00 per acre

(10) for the tenth year, $36.00 per acre

(11) for the eleventh year and beyond, rental rate is 150% of the preceding year.

The commissioner may establish by regulation, that after a discovery has been made which is capable of producing in paying quantities, the rental rate which was in effect during the year of discovery is maintained for the following 5 years. Rental is payable in advance and continues until income to the state from royalty, net profit or the base parameter of other leasing methods exceeds rental income to the state for that year; after the rental income schedule has been exceeded for three consecutive years, the rental shall terminate.

(m) Upon timely application as provided by regulation, the state may issue to the holder of a federal lease a state shorelands lease covering land within the exterior boundaries of the federal lease which has been excluded on the basis of navigability or which are later administratively or judicially determined to be "shorelands."

(n) To conserve the natural resources of all or a part of an oil or gas pool, field, or like area, whether or not the part is then subject to a cooperative or unit plan of development or operation, lessees and their representatives may unite with each other, or jointly or separately with others, in collectively adopting or operating under a cooperative or a unit plan of development or operation of

the pool, field, or like area, or a part of it, when determined and certified by the commissioner to be necessary or advisable in the public interest. The commissioner may, with the consent of the holders of leases involved, establish, alter, change, or revoke drilling, producing, rental, and royalty requirements of the leases and make regulations with reference to the leases, with like consent on the part of the lessees, in connection with the institution and operation of a cooperative or unit plan as he determines necessary or proper to secure the proper protection of the public interest. The commissioner may provide that oil and gas leases issued under this section shall contain a provision requiring the lessee to operate under a reasonable cooperative or unit plan, and he may prescribe a plan under which the lessee shall operate. The plan shall adequately protect all parties in interest, including the state.

(o) A plan authorized by (m) of this section, which includes land owned by the state, may contain a provision vesting the commissioner, or a person, committee, or state agency with authority to alter or modify from time to time the rate of prospecting and development and the quantity and rate of production under the plan. All leases operated under a plan approved or prescribed by the commissioner are excepted in determining holdings or control under section 140 of this chapter. The provisions of this section concerning cooperative or unit plans are in addition to, and do not affect AS 31.05.

(p) Producing acreage on a "known geologic structure" of a producing oil or gas field is excluded from chargeability as against the acreage limitation provisions of section 140 of this chapter.

(q) When separate tracts cannot be individually developed and operated in conformity with an established well-spacing or development program, a lease, or a portion of a lease, may be pooled with other land, whether or not owned by the state, under a communitization or drilling agreement providing for an apportionment of production or royalties among the separate tracts of land comprising the drilling or spacing unit when determined by the commissioner to be in the public interest.

Operations or production under the agreement shall be considered as operations or production as to each lease committed to the agreement.

(r) The commissioner may, on conditions which he prescribes, approve drilling, or development contracts made by one or more lessees of oil or gas leases, with one or more persons, when, in his discretion, the conservation of natural resources or the public convenience or necessity requires it or the interests of the state are best served. All leases operated under approved drilling, or development contracts, and interests under them are excepted in determining holding or control under section 140 of this chapter. Drilling or development contracts may include, if in the judgment of the commissioner it appears most advantageous to the state, provisions for the state to share in the costs of exploration.

(s) To avoid waste or to promote conservation of natural resources, the commissioner may authorize the subsurface storage of oil or gas whether or not produced from state land, in land leased or subject to lease under this section. This authorization may provide for the payment of a storage fee or rental on the stored oil or gas, or, instead of the fee or rental, for a royalty other than that prescribed in the lease when the stored oil or gas is produced in conjunction with oil or gas not previously produced in paying quantities.

(t) Each oil or gas lease issued by the state shall contain a provision requiring the lessee to furnish the Department of Labor a quarterly report regarding the employment of state residents on the leased property. The commissioner of labor shall promulgate regulations necessary to carry out the provisions of this subsection.

(u) Lands which have been offered for lease within the previous five years but which received no bids at public auction may, at the discretion of the commissioner, be immediately offered for lease under regulations promulgated in advance upon terms appearing most advantageous to the state. The commissioner shall utilize a sliding scale royalty based upon such formulae as he determines to be equitable and may exclude rental schedule in subsection (l) of this act. In establishing sliding scale royalty formulae the commissioner shall take into

consideration operating, secondary and enhanced recovery costs.

(v) The commissioner may, by regulation, restrict joint bidding.

(w) The state shall have the right to purchase not to exceed 16 2/3% by volume of the oil and gas produced pursuant to a lease issued in accordance with this Act, at the regulated price, or, if no regulated price applies, at the fair market value at the well-head of the oil and gas saved, removed or sold, except that any oil or gas obtained by the state as royalty, net profits, or other leasing method shall be credited against the amount that may be purchased under this subsection. Oil and gas purchased under provisions of this section may be utilized by the state in the same manner as it utilizes its royalty oil and gas.

(x) Any lessee or permittee conducting any exploration for, or development or production of, oil or gas on state land shall provide the commissioner access to all data obtained from such activity and shall provide copies of such specific data, as the commissioner may request.

Section 2. AS 38.05.135(b) is deleted.

Section 3. AS 38.05.140(c) is amended to read:

"(c) No person may take or hold at one time phosphate leases on state lands exceeding in the aggregate 10,240 acres. No person may take or hold sodium leases or permits during the life of sodium leases on state lands, exceeding in the aggregate acreage 5,120 acres, except that the commissioner may, where it is necessary in order to secure the economic mining of sodium compounds, permit a person to take or hold sodium leases or permits for up to 15,360 acres. No person may take or hold at any one time oil or gas leases exceeding in the aggregate 500,000 acres granted on tide and submerged lands, and (500,000) 200,000 acres on all lands other than tide and submerged lands, including leases held both as lessee and under option or operating agreement from others. Where more than a single person holds an interest in an oil or gas lease, each person shall be charged only with that percentage of the total acreage which corresponds to its percentage share of the total beneficial interest in the lease."

Section 4. AS 38.05.145(b) is deleted.

Section 5. AS 38.05.335(c) is deleted.

full leasing of

A BILL

For an Act entitled: "An Act relating to the leasing and exploration of state land for oil and gas development."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

*Section 1. AS 38.05.180 is repealed and re-enacted to read:

Sec. 38.05.180 OIL AND GAS LEASING.

(a) Purpose. The legislature finds and declares that

(1) the people of Alaska have an interest in the development of the State's oil and gas resources potential to

(A) maximize the economic recovery of this important natural resource;

(B) control the exploitation of this natural resource so as to protect the public interest;

(C) maximize the competition among parties seeking to obtain the right to explore and develop the state's oil and gas resources.

(2) the interest of the state is to encourage an assessment of its oil and gas resources and that will allow the maximum flexibility in the methods of awarding the leases to

(A) recognize the many and varied geographical regions of the state and the different costs of exploring for oil and gas in these regions;

(B) recognize the need for stimulating development in particular regions of the state;

(C) minimize the adverse impact of exploration, development, production and transportation activity on the environment of the state;

(D) maximize the state's share from profitable oil and gas production, while minimizing revenue from unsuccessful exploration wells and from marginal economic oil and gas production.

AGO 547279

(b) Leasing Program.

(1) The commissioner shall prepare and periodically revise, and maintain an oil and gas leasing program. This leasing program shall be submitted to the legislature for its information within 10 days of the convening of a regular session of the legislature. The leasing program shall indicate as precisely as practicable the size, timing, and location of leasing activity which the commissioner determines will best meet state needs for the following five-year period. The commissioner shall elect the timing and location of leasing, to the maximum extent practicable, so as to obtain a balance between the potential for environmental damage, the potential for the discovery of oil and gas and the potential for adverse impact on the local communities in the state.

(2) After the leasing program has been approved by the commissioner, a lease shall be issued if it is for an area included in the approved leasing program and if it contains provisions consistent with the approved leasing program, except that leasing shall be permitted to continue until such program is approved and for so long thereafter as such program is under judicial or administrative review. Leasing under paragraph (t) of this Act may be excepted from the leasing program if in the finding of the commissioner it appears most advantageous to the state.

(3) The commissioner shall review the leasing program approved under this section at least once each year, and he may revise and reapprove such program, at any time, in the same manner as originally developed.

(4) The commissioner shall, by regulation, establish procedures for

(A) receipt and consideration of nominations for any area to be offered for lease or to be excluded from leasing;

(B) public notice of and participation in development of the leasing program;

AGO 547280

(C) review by Federal and local government agencies which may be impacted by the proposed leasing;

(D) periodic consultation with local governments, oil and gas lessees and permittees, and representatives of other individuals or organizations engaged in activity in or on State land;

(E) coordination of the program with the management program developed by the state under the Coastal Zone Management Act of 1972; and

(F) the commissioner shall utilize the existing capabilities and resources of all state agencies in preparing the leasing program, and such agencies shall provide the commissioner with any nonproprietary information he requests.

(5) Within 10 days of the convening of a regular session of the legislature, the commissioner shall report to the legislature with respect to the use of the various bidding methods provided for in this Act. Such report shall include:

(A) the schedule of all lease sales held during the preceding calendar year and the bidding method or methods utilized;

(B) the schedule of all lease sales to be held the following year and the bidding method or methods to be utilized;

(C) the benefits and costs associated with conducting lease sales using the various bidding methods;

(D) if applicable, the reasons why a particular bidding method was selected; and

(E) if applicable, the reason why more than 50% of the area leased in the upcoming year, was or is to be leased under one particular bidding method.

(c) The commissioner is authorized to grant to the highest responsible qualified bidder, by competitive bidding under regulations promulgated in advance, oil and gas leases on state land. The bidding shall be by sealed bid, and at the

discretion of the commissioner, based on a pre-sale analysis, of at least one of the following:

(1) Royalty

(A) cash bonus bid with a royalty at not less than 12½ percent reserved to the state which may be taken in kind or in value;

(B) a cash bonus bid with a royalty based on a sliding scale reserved to the state but not less than 12½ percent at the beginning of production from the lease which may be taken in kind or in value;

(C) a fixed cash bonus with a royalty based on a sliding scale reserved to the state as the bid variable but not less than 12½ percent at the beginning of production from the lease which may be taken in kind or in value;

(D) a fixed cash bonus with a royalty bid not less than 12½ percent, to be taken in kind or in value.

(2) Net profit

(A) cash bonus bid with a royalty at not less than 12½ percent which may be taken in kind or in value and a fixed share of the net profit of not less than 30 percent reserved to the state;

(B) fixed cash bonus with the net profit share reserved as the bid variable;

(C) fixed cash bonus bid with a royalty at not less than 12½ percent which may be taken in kind or in value and a percent of the net profit share reserved to the state as the bid variable.

(3) Work commitment bid based on a dollar amount for exploration with a fixed cash bonus and a sliding scale royalty, but not less than 12½ percent at the beginning of production from the lease which may be taken in kind or in value.

(d) Regulations shall be established for all bidding methods to allow reduction of royalty to compensate for these increasing costs in the later stages of production decline, to prolong the economic life of the field. The commissioner

may grant such reduction so long as it takes affect no sooner than 2 years after beginning of production from the lease.

(e) The commissioner may, in his discretion, defer any part of the payment of the cash bonus, as authorized in paragraph (c) of this Act, according to a schedule announced at the time of the announcement of the lease sale, but such payment shall be made in total no later than five years from the date of the lease sale.

(f) The commissioner is authorized to withold acreage from leasing in a particular lease sale.

(g) At least ninety days prior to notice of any lease sale under paragraph (c) (2), the commissioner shall by regulation establish rules to govern the calculation of net profits. In the event of any dispute between the state and a lessee concerning the calculation of the ret profits under the regulation issued pursuant to this paragraph, the burden of proof shall be on the lessee.

(h) At least ninety days prior to notice of any lease sale under paragraph (c)(3), the commissioner shall by regulation establish rules to govern the work commitment bidding method. The commissioner shall require either (i) cash deposit for 20% of the work commitment or, (ii) a performance bond, in form and substance and with a surety satisfactory to the commissioner, in the principal amount of 20% of such exploration work commitment assuring the commissioner that such commitment shall be faithfully discharged in accordance with this section, the regulation and the lease. As provided in the regulation, the amount of such cash deposit or the principal amount of the bond may be periodically reduced upon proof, satisfactory to the commissioner, that a portion of the exploration work commitment has been satisfied.

(i) At the discretion of the commissioner, he may enter into an agreement or may initiate a request whereby with the consent of the majority of the affected field lease holders, the state's royalty oil and gas production may be stored or retained in storage, or the commissioner may enter into an agreement with one or

more of the effected field lease holders to trade current royalty production from a field for a like amount, kind and quality of future production, provided the state receives back its stored or traded royalty oil and gas during the first half of the field life or no later than 15 years after start of production.

(j) An oil and gas lease shall cover a reasonably compact area not exceeding 5,760 acres, and be for a period of five years. An expiring oil and gas lease shall be automatically renewed if and for so long thereafter as oil or gas is produced in paying quantities from the lease or, if the lease is committed to a unit approved by the commissioner. A temporary cessation of production approved by the commissioner does not constitute grounds for nonrenewal or cancellation of the lease. A lease issued under this section covering lands on which there is a well capable of producing oil or gas in paying quantities shall not expire because the lessee fails to produce oil or gas unless the lessee is allowed reasonable time within which to place the well on a producing status. The commissioner may impose lease rentals past the original term of the lease so long as the rental rate does not exceed 150% of the preceding year. If drilling has commenced on the expiration date of the primary term of the lease and is continued with reasonable diligence, such operations to include drilling, sidetracking or other means necessary to reach the originally proposed bottom hole location, the lease shall continue in effect until 90 days after drilling has ceased and for so long thereafter as oil or gas is produced in paying quantities.

(k) Oil and gas leases shall provide for payment to the state of rental on the following basis:

(1) for the first year, $1.00 per acre

(2) for the second year, $1.50 per acre

(3) for the third year, $2.00 per acre

(4) for the fourth year, $2.50 per acre

(5) for the fifth year, $3.00 per acre

The commissioner may establish by regulation, that after a well has been plugged and abandoned, the rental rate which was in effect during the year of abandonment is maintained for the remainder of the term. Rental is payable in advance and continues until income to the state from royalty, net profit or the base parameter of other leasing methods exceeds rental income to the state for that year; after the rental income schedule has been exceeded for three consecutive years, the rental shall terminate.

(l) Upon timely application as provided by regulation, the state may issue to the holder of a federal or fee lease a state shorelands lease covering land within the exterior boundaries of the federal or fee lease which has been excluded on the basis of navigability or which are later administratively or judicially determined to be "shorelands." The length of term of such state shorelands lease shall be the same as the term of the federal or fee lease, but not to exceed five years.

(m) To conserve the natural resources of all or a part of an oil or gas pool, field, or like area, whether or not the part is then subject to a cooperative or unit plan of development or operation, lessees and their representatives may unite with each other, or jointly or separately with others, in collectively adopting or operating under a cooperative or a unit plan of development or operation of the pool, field, or like area, or a part of it, when determined and certified by the commissioner to be necessary or advisable in the public interest. The commissioner may, with the consent of the holders of leases involved, establish, alter, change, or revoke drilling, producing, rental, and royalty requirements of the leases and make regulations with reference to the leases, with like consent on the part of the lessees, in connection with the institution and operation of a cooperative or unit plan as he determines necessary or proper to secure the proper protection of the public interest. The commissioner may provide that oil and gas leases issued under this section shall contain a provision requiring the lessee to operate under a reasonable cooperative or unit plan, and he may prescribe a plan

under which the lessee shall operate. The plan shall adequately protect all parties in interest, including the state.

(n) A plan authorized by (m) of this section, which includes land owned by the state, may contain a provision vesting the commissioner, or a person, committee, or state agency with authority to alter or modify from time to time the rate of prospecting and development and the quantity and rate of production under the plan. All leases operated under a plan approved or prescribed by the commissioner are excepted in determining holdings or control under section 140 of this chapter. The provisions of this section concerning cooperative or unit plans are in addition to, and do not affect AS 31.05.

(o) Producing acreage on a "known geologic structure" of a producing oil or gas field is excluded from chargeability as against the acreage limitation provision of section 140 of this chapter.

(p) When separate tracts cannot be individually developed and operated in conformity with an established well-spacing or development program, a lease, or a portion of a lease, may be pooled with other land, whether or not owned by the state, under a communitization or drilling agreement providing for an apportionment of production or royalties among the separate tracts of land comprising the drilling or spacing unit when determined by the commissioner to be in the public interest. Operations or production under the agreement shall be considered as operations or production as to each lease committed to the agreement.

(q) The commissioner may, on conditions which he prescribes, approve drilling or development contracts made by one or more lessees of oil or gas leases, with one or more persons, when, in his discretion, the conservation of natural resources or the public convenience or necessity require it or the interests of the tate are best served. All leases operated under approved drilling, or development contracts, and interests under them are excepted in determining holding or control under section 140 of this chapter. Drilling or development contracts may include, if in the judgment of the commissioner it appears most advantageous to the state,

to share in the costs of exploration.

(r) To avoid waste or to promote conservation of natural resources, the commissioner may authorize the subsurface storage of oil or gas whether or not produced from state land, in land leased or subject to lease under this secti This authorization may provide for the payment of a storage fee or rental on the stored oil or gas, or, instead of the fee or rental, for a royalty other than that prescribed in the lease when the stored oil or gas is produced in conjunction with oil or gas not previously produced in paying quantities.

(s) Each oil or gas lease issued by the state shall contain a provision requiring the lessee to furnish the Department of Labor a quarterly report regardi the employment of state residents on the leased property. The commissioner of lab shall promulgate regulations necessary to carry out the provisions of this subsect

(t) Lands which have been offered for lease within the previous five years but which received no bids at public auction may, at the discretion of the commissioner, be immediately offered for lease under regulations promulgated in advance upon terms appearing most advantageous to the state, including leasing noncompetitively. The commissioner shall utilize a sliding scale royalty based upon such formulae as he determines to be equitable but need not adhere to the rental schedule in subsection (k) of this act nor to 5,760 acres per lease. Lease term may not exceed five years except for the renewal provisions of subsecti (k) of this act.

(u) The commissioner may, by regulation, restrict joint bidding.

(v) The state shall have the right to purchase not to exceed 16 2/3% by volume of the oil and gas produced pursuant to a lease issued in accordance with this Act, at the regulated price, or, if no regulated price applies, at the fair market value at the well-head of the oil and gas saved, removed or sold, except that any oil or gas obtained by the state as royalty, net profits, or other leasi method shall be credited against the amount that may be purchased under this sub-section. Oil and gas purchased under provisions of this section may be utilized

by the state in the same manner as it utilizes its royalty oil and gas.

(w) Any lessee or permittee conducting any exploration for, or development or production of, oil or gas on state land shall provide the commissioner access to all data obtained from such activity and shall provide copies of such specific data, as the commissioner may request.

Section 2. AS 38.05.135(b) is amended to read:

"(b) When minerals are to be leased on a competitive basis, in addition to any other notice given, notice shall also be given as provided in Section 305 and 345 of this chapter."

Section 3. AS 38.05.140(c) is amended to read:

"(c) No person may take or hold at one time phosphate leases on state lands exceeding in the aggregate 10,240 acres. No person may take or hold sodium leases or permits during the life of sodium leases on state lands, exceeding in the aggregate acreage 5,120 acres, except that the commissioner may, where it is necessary in order to secure the economic mining of sodium compounds, permit a person to take or hold sodium leases or permits for up to 15,360 acres. No person may take or hold at any one time oil or gas leases exceeding in the aggregate 500,000 acres granted on tide and submerged lands, and (500,000) 200,000 acres on all lands other than tide and submerged lands, including leases held both as lessee and under option or operating agreement from others. A person shall have five years from the effective date of this Act to conform to the 200,000 acre uplands limitation. Where more than a single person holds an interest in an oil or gas lease, each person shall be charged only with that percentage of the total acreage which corresponds to its percentage share of the total beneficial interest in the lease."

Section 4. AS 38.05.145(b) is deleted.

HB854

APR 25 1978

April 21, 1978

Honorable D. R. Getty, Minister
Alberta Energy and Natural Resources
319 Legislative Building
Edmonton, Alberta, Canada
T5K, 2B6

Dear Mr. Getty:

Governor Hammond's recently introduced oil and gas leasing legislation for Alaska has now had incorporated into it by the legislature a drilling and geophysical incentive credit system similar to Alberta's. We have looked at the concept and, based on what we know, believe that the system could become useful in Alaska. However, we do need help in understanding how it has actually worked in your province.

Could we ask your assistance in explaining the operations of the system, both conceptually and technically, to some members of our legislature. The bill, HB 854, a copy of which is enclosed, is expected to begin Senate committee hearings sometime in May.

It would be of particular help to us if someone from your department could come to Anchorage to brief my staff and to Juneau to testify before the Senate Natural Resources Committee. We would, of course, cover all expenses. The exact dates of the visit would have to wait on the progress of the bill, but it is likely to be in mid or late May, 1978.

Over the past several years, Jack Roderick, my Special Projects Coordinator, who has been in charge of this particular legislation, has kept in contact with Michael J. Day, and others, in your minerals disposition division, on land tenure matters and he, or someone of your choice, would be most welcome. I will have Mr. Roderick arrange for the visit, subject to your authorization.

AGO 547289

Thank you for your assistance in this matter. We believe Alaska can benefit from Alberta's experience with the exploration incentive credit system.

Sincerely yours,

Robert LeResche
Commissioner

STATE of ALASKA

MEMORANDUM

TO: The Honorable Kay Poland
Chairman, Senate Resources Committee

DATE: June 8, 1978

FILE NO:

TELEPHONE NO:

FROM: Peter B. Froehlich
Assistant Attorney General

SUBJECT: HB 907 (Repeal of the Land Registration Act) and Escheat of Land

At the hearing on this bill before your committee on June 7, a concern was expressed by committee members that if AS 34.10 was repealed, there would be no means to get abandoned land outside municipalities back into private use. I am writing to address that concern and to explain the escheat laws which satisfy it far better than AS 34.10.

There was also some speculation at the hearing that this was the primary purpose of the Land Registration Act when it was first enacted in 1953. However, the Act is ill suited to satisfy this purpose because it has no effect on land once the required statement of real property ownership is filed. In other words, if a land owner filed a statement and then abandoned his land or died without leaving a will or heirs, the Land Registration Act would not result in foreclosure. Foreclosure occurs only when an otherwise known land owner or transferee fails to file a statement and likewise to pay the resulting penalty. Since the Land Registration Act has been in effect for over 25 years now, it is safe to assume that most, if not all, currently patented land for which no statement has ever been filed, has already been foreclosed. Therefore, the Land Registration Act, if retained, will only affect newly patented land and land which is transferred (after a statement was once filed).

Escheat, on the other hand, covers all private land, whether a statement of real property ownership has ever been filed or not, and whether it is ever transferred between private owners or not. AS 09.50.070-160 and AS 13.11.025 establish the procedures by which land escheats to the state. Essentially, if a land owner dies without a will or heirs, his land (along with other assets) passes immediately to the state. (AS 13.11.025). The state nearly always learns of such a situation, usually from the court appointed personal representative. Also, AS 13.06.035 creates a presumption of death if a person is absent without word or explanation for 5 years. (AS 13.06.035(3)). The state would not learn of this situation as easily, but nothing in the Land Registration Act provides any assistance

either. */ The attorney general then brings an action in superior court to verify and formalize the state's title. (AS 09.50.100). The commissioner of revenue may then tell the escheated real property at auction. (AS 09.50.120(b)). If a person appears within 7 years after the judgment verifying the state's title, the commissioner of revenue must convey either the escheated property or proceeds from its sale, less expense. (AS 09.50.110).

It should be apparent then, that the escheat statutes (first enacted in 1962, 9 years after the current Land Registration Act) adequately satisfy the concern for recycling abandoned land back into private use, and much more so than the Land Registration Act. I therefore urge the committee to pass out HB 907 to eliminate the needless burden of the Act on both landowners and the Division of Lands.

Incidently, I have just received figures from the Division of Lands indicating that of the 46, 900 acres foreclosed under AS 34.10, 84% have been redeemed or repurchased, 13.5% have been sold at auction and only 2.5% remain in state ownership.

I will be available to explain this memo, the Land Registration Act, and the escheat laws further to the committee at its next hearing.

PBF:bvd

cc: Senate Resources Committee
Pat Conheady, DNR
Alice Iliff, DOL

---

*/ If a statement was filed, the Act has no effect. If no statement was ever filed, the land has probably either already been foreclosed or its existence is not known because no deed was ever recorded.

STATE OF ALASKA

DEPARTMENT OF NATURAL RESOURCES

TO: House Resources Committee

DATE: 4/27/78

FILE NO:

TELEPHONE NO:

FROM: Alice L. Iliff
Research Analyst

SUBJECT: HB 907: Repeal of AS 34.10
(Land Registration Act)

This vestige of territorial law requires that for any land situated outside a borough or city where local land ownership records are kept, its owner must file a "statement of real property ownership". The statute may have had a legitimate purpose as a temporary transitional device accompanying the installation of a recording system in territorial days, as it encouraged the introduction of land ownership information into the public record. Today, its reason for being is much more speculative.

To induce compliance with the filing requirement of the statute, it provides for modest financial penalties in the event of a failure to file. Once assessed, a penalty becomes a lien against the property. The lien is subject to foreclosure under the statute, but if (as is usually the case) the landowner fails to respond to the lien foreclusure action by answering the petition, the land owner may "redeem" the property during the first year following its "foreclosure". After the expiration of this one-year redemption period, the procedure departs from the usual foreclosure model. Instead of selling the property to satisfy the lien and turning the overage in proceeds back to the owner, the State simply keeps the property. The land may be "repurchased" by its owner, but that right of repurchase is extinguished if the land is disposed of into private ownership by the State or is held by the State for and devoted to a "public purpose" and improvements are constructed upon it. Since the existence of these rights of repurchase makes management of the land as public domain difficult and expensive (administrative costs exceeding $30,000 per year for approximately 140 parcels with negligible return), the State can only derive a benefit from this forfeited land by disposing of it into private ownership by sale. The parcels usually have changed hands since foreclosure, resulting in time consuming administrative problems for both the State and the innocent victims.

There is no longer any public purpose served by this statute. From the beginning, the only legitimate purpose of the law was to compel landowners to identify their land holdings and place them on the record. But where recordable transactions (conveyances, mortgages, and the like) take place, the advantages of recording alone induce the new owner or mortgagee to record. Another purpose commonly attributed to the law, that of providing a record of land ownership in the unorganized borough to satisfy various public and private information needs, is illusory. The recording system itself satisfies this purpose - incompletely, albeit, but just as effectively as the superfluous statement file requirement does.

Assume that there were some legitimate public policy served by a law requiring land owners to file statements of real property ownership. It is clear that the penalty and lien foreclosure devices in the statute have not been effective in securing compliance with that filing requirement

Filing a statement (or, more to the underlying objective, getting private land holdings on the record) can be encouraged by a "carrot", by a "stick", or by a combination of the two. The "carrot" in this case is the recording law itself - the landowner whose interest is recorded enjoys an important priority over he who does not record. This legal protection is a "carrot" sufficient to induce all who are aware of the recording law to use it, irrespective of the existence of any penalties for nonuse of the system.

The "stick" to induce filing is a penalty fee backed up by the lien foreclosure mechanism. This has apparently not been effective. People file because they want the benefits of the recording system; people fail to file because they are unaware of the existence of the system and the benefits which would inure to them from using it. A penalty mechanism will only encourage compliance by those who are already aware of the system but would not otherwise use it - a negligible class of persons.

A principal problem with the foreclosure action as a compliance mechanism is that it is only inflicted upon those landowners whose land holdings have been discovered due to the recordation of a conveyance. The recording of the conveyance itself, with or without an accompanying ownership statement, fulfills the legislative goal of getting land onto the public records. In these cases, the need for a statement is superfluous and the idea of penalizing the person for failing to file one borders on the absurd. In other words, when scrutinized against the actual operation of the statute, the reasoning underlying the foreclosure mechanism is seen to be circular: (1) the objective of the law is to get land holdings on the record; (2) the foreclosure process exists to encourage compliance with the law in order to satisfy that objective; (3) the only lands which are subjected to foreclosure are those whse existence comes to the attention of the Division of Lands when they are recoreded; (4) at that point, the lands have entered into the recording system and the legislative objective has been met.

In summary,

1. There is no valid public purpose served by the land registration statute. To the extent that there is any need to have a public record of land holdings in the unorganized borough, that need is fully met by the existing recording system, supplemented by the land status records of State and Federal governments.

2. The filing requirement of the land registration law imposes an undesirable paperwork burden and expense upon private landowners. This burden should not exist without some countervailing public policy.

3. Administration of the law costs the State $30,000 to $50,000 every year in employee time that could be better utilized for other effort Trying to administer AS 34.10 in light of Native lands conveyances, homesites, and any other upcoming programs of land disposal will be impossible due to lack of staff and monies, as well as inequities of this law that have been perpetrated for years to the disadvantage of the public. There is consensus among all agencies involved that the statute is unnecessary.

4. Because of the existence in perpetuity of rights of repurchase on foreclosed lands, the State cannot effectively manage these properties as public land. It can only derive benefit from them by disposing of them back into private ownership at the expense of innocent holders of repurchase rights.

5. Taking a person's land away for failure to file a superfluous piece of paper is bad public policy. It is even worse when the person failed to file simply because the person was ignorant of the filing requirement.

For all of these reasons, the statute should be repealed.

)HB 907

March 24, 1978

The Honorable Hugh Malone
Speaker of the House
Alaska State Legislature
Juneau, Alaska 99811

Dear Mr. Speaker:

Under the authority of art. III, sec. 18 of the Alaska tution, and in accordance with AS 23.30.060(b) and the Uniform Rules of the Alaska State Legislature, I am transmitting a bill repealing the Land Registration Law, AS 34.10.

The Land Registration Law is a vestige of territorial days which requires that private owners of land outside cities and boroughs file statements of real property ownership. Modest penalties are imposed for failure to file. These penalties become liens against property which may be foreclosed, resulting in forfeiture of the land to the state. After foreclosure, the land may be redeemed for a period of one year, but it is also subject to a continuous "right of repurchase" by the former owner and his assigns. This right to repurchase is extinguished only by disposal of the land or construction of a public building upon it. These repurchase rights inhibit effective management of land gained by foreclosure and have been the subject of abuse by industrious opportunists who, although they have never had any relationship with either the foreclosed land or its owners, obtain some colorable interest in the land and attempt to reap a windfall by repurchasing it.

The requirement of filing statements of real property ownership is somewhat obscure and often ignored by landowners. It does not enhance the existing recording system and government records which, according to the Division of Lands, fully meet any need for public record of land holding outside of municipalities. Penalizing an individual for failure to file a superfluous document is, in my view, bad public policy, especially when the individual probably does not know of the requirement to file.

Administration of the Land Registration Law costs the state $30,000 - $50,000 per year with negligible return. Costs could easily triple with the huge amounts of land soon to be placed in private ownership, including native selections and state and municipal land disposals. It seems senseless to continue the burden of this law on taxpayers, land owners, and state agencies.

State agencies and staff involved concur in the desirability of repealing this law and incurring the substantial time and money savings which would result.

This bill would repeal the entire Land Registration Law (AS 34.10), except for one provision (AS 34.10.170) which states that land obtained by foreclosure under the chapter may be administered and disposed of in the same manner as other state land. The bill also includes a provision which continues, for three years after enactment, current rights to repurchase land lost by foreclosure; then, after published notice, those rights of formerly indefinite duration are terminated, thus clearing the state's title to that land.

The Land Registration Law is outdated, nearly universally unpopular, costly and burdensome to administer, often unfair, and yields little, if any, benefit to the state. Therefore, I urge its repeal by passage of this bill.

Sincerely,

JSH

Jay S. Hammond
Governor

III. ANALYSIS (See Fiscal Note Preparation Instructions, Section III)

Repeal of this law will not incur additional funds. It is estimated that approximately $30,000 to 50,000 will be saved by the various agencies which administer this statute, including the Dept. of Natural Resources, the Department of Law, the District Recrder's Office, and the Court System. These savings will be reallocated to existing programs.

Governor

STATE of ALASKA

MEMORANDUM

TO: Ron Lind, Director
Division of Budget & Management

DATE: March 29, 1978

FILE NO:

TELEPHONE NO:

FROM: Chuck Taylor, Budget Analyst
Division of Budget & Management
Office of the Governor

SUBJECT: Supplemental Appropriation for the Department of Natural Resources

The Department of Natural Resources, Federal-State Land Use Planning Commission (FSLUPC), requests a supplemental appropriation of $139,200. The FSLUPC states that this supplemental is necessary to carry forward its major objectives in cooperative management. The FSLUPC has adequate budget resources in its FY 79 budget to complete its tasks, but cannot continue its present level of effort in FY 78 without a supplemental.

It should be noted that the FSLUPC has also submitted a $139,200 supplemental request to the federal government for their share of the costs. Confirmation has not yet been received whether the federal government will support a supplemental request.

This supplemental will fully fund the State's share of the unbudgeted items described below. 1) The Commission has unanticipated wages increases ($34,300). 2) The FSLUPC will provide updated information on lands available for State selection ($16,400). 3) Until Congress enacts (d)(2) legislation, the FSLUPC will continue to serve congressional committees in an advisory capacity. Therefore, an office was established in Washington, D.C. ($32,500). 4) The FSLUPC has been making recommendations to improve coordination between the State and Federal governments. The Commission has already undertaken this in critical areas of transportation, data collection, and fish and game management. Additional funding is requested for the Alaska Resource Information System (ARIS), transportation planning, and ecological reserves ($45,600). 5) Also, the FSLUPC will continue its review of the proposed easements across native selected lands. A final assessment of the status of the Acts Implementation with alternative resolutions to present and potential problems will be transmitted to the federal government ($10,400).

02.001B (Rev. 10/76)

STATE of ALASKA

MEMORANDUM

TO: Avrum Gross, Attorney General
Department of Law

DATE: March 30, 1978

FILE NO:

TELEPHONE NO:

FROM: Ronald B. Lind, Director
Division of Budget & Management
Office of the Governor

SUBJECT: Supplemental Appropriation Legislation for the Department of Natural Resources

Please prepare a supplemental appropriation bill for the Department of Natural Resources, "Federal-State Land Use Planning Commission", in the amount of $139,200 from the general fund. These funds will be used to fund unanticipated wage increases and full operation of the Federal-State Land Use Planning Commission during FY 79.

Request for Budget Supplementary FY 1978

Objectives:

The primary goals of the Commission are to plan for the wisest and best use and management of public lands in Alaska consistent with national and State interests, and to insure that the economic growth of Alaska is orderly and compatible with environmental values and the well-being of the State's residents. Toward the attainment of these goals, the Commission's work program has the following objectives:

(1) to recommend classification and management policies for Federal lands in Alaska to Federal executive departments and to Congress;

(2) to recommend to the Governor and the Legislature of the State of Alaska policies for the management of the State's public domain;

(3) to seek resolutions to conflicts and promote coordination among the Federal and State governments and Native corporations in land use matters; and

(4) to assist in the implementation of the Alaska Native Claims Settlement Act.

It is unable to carry forward the major objectives in cooperative management it has launched over the past five years without supplementary budget help. These consist of data systems and mapping coordination or the Alaska Resource Information System (ARIS); research coordination, now incorporated in the Ecological Reserves Council; and new examinations of cooperative management between Federal, State, and local systems.

There is also a great need to provide further assistance to village corporations on land management problems which is incorporated in this request.

Budget Options

	Total Commission Supported Funding	State*	Federal*
State Lands	$ 32,778	$ 16,389	$ 16,389
Federal Lands	65,040	32,520	32,520
Cooperative Management	91,132	45,566	45,566
Claims Settlement Act	20,856	10,428	10,428
Unanticipated Wage Increases	68,618	34,309	34,309
Total	$278,424	(2) $139,212	$139,212

(2) To cover remainder of Federal fiscal year thru September 1978

The Commission has received no supplemental appropriation for wage increases or increased inflationary costs since the FY 1978 budget was submitted. Its major efforts on conveyance of Native lands, State lands, and (d)(2) lands are using its resources to the limit. Unanticipated actual costs for personnel services not requested in FY 78 budget are as follows:

- o General wage increase
- o Adjustment to cost of living allowance
- o Executive pay level increases

Total unanticipated increase to overall payroll budget is $68,618.

1. Policies for the management of the State of Alaska's public domain.

Personal Services	$28,430
Travel	4,348
	$32,778

The Commission will provide updated information on lands available for State selection. Modifications in existing land classification procedures used by the State will be recommended to assure compatibility of State practices with those being developed by the Bureau of Land Management for Alaska's National Resource Lands.

The Commission will expand on its analysis of the State of Alaska's Park system, as a component of a statewide recreational system and will analyze private demands for disposal of State lands and suggest alternative procedures designated to protect public interests. Comment on disposal plans and procedures will then be provided the State Department of Natural Resources and the Alaska Legislature on an ongoing basis.

2. To recommend classification and management policies for Federal lands in Alaska to Federal executive departments and to Congress.

Until Congress has enacted (d)(2) legislation, the Commission will continue to serve congressional committees in an advisory capacity. It will comment on the environmental, socioeconomic, and management implications of proposals before Congress, and identify alternative means of addressing major issues. It was necessary to establish an office in Washington, D.C. to serve as a coordination center between the Commission and various committees.

Personal Services	$56,664
Travel	3,918
Contract Services	4,458
	$65,040

3. Cooperative Management.

The Commission was mandated to:

> make recommendations to improve coordination and consultation between the State and Federal governments in making resource allocation and land use decision.

It has already undertaken this in the critical areas of transportation, data collection and inventory, research coordination, and fish and game management. It has budget resources to undertake a more comprehensive approach in its 1979 budget but cannot mount a major effort in 1978 without this supplemental or other funding.

a. Alaska Resource Information System (ARIS)

ARIS is the key tool to cooperative management systems. It forces interagency cooperation. It is entering a period of technical development where large sums will be spent by Federal and State agencies on data systems and mapping. It is imperative to continue this effort until the Users and Technical Committee of ARIS is well established and institutionalized as an independent Federal/State effort.

Personal Services	$49,265
Travel	2,089
	$51,354

b. Transportation Planning

There was a need to develop criteria for the evaluation of transportation proposals and make recommendations pertaining to the reservation of corridors across (d)(2) lands, this included the use of the North Slope Haul Road, which parallels the Trans-Alaska Pipeline and currently provides the only ground access to the Alaskan Arctic.

Personal Services	$17,208
Travel	2,180
Contract Fee	7,000
	$26,388

c. Ecological Reserves

Coordination for this Council is established within the University of Alaska faculty. The Commission has already committed $16,000 to support of the management coordinator. The research coordinator has developed the Ecological Reserves System report for the Commission in FY 1977. This budget is

necessary to carry out the recommendation of the Ecological Reserves Council and continue this program as a part of the overall land planning process in Alaska.

Personal Services	$11,222
Travel	2,168
	$13,390

4. To assist in the implementation of the Alaska Native Claims Settlement Act.

The Commission will continue its review of proposed easements across Native-selected lands. It will also continue to review small Federal withdrawals, which have been tentatively selected by Native corporations. Planning assistance to Native corporations will also be provided, and several small instructive publications will be modified and reprinted.

A final assessment of the status of the Act's implementation with alternative resolutions to present and potential problems will be transmitted to the Federal executive and to Congress. The Commission will remain prepared to provide clarification of legal issues to Native corporations and to comment on any proposed amendments to the Alaska Native Claims Settlement Act.

Personal Services	$18,556
Travel	2,300
	$20,856

The Commission will undertake this mandate to the limit of its present resources, but will be unable to carry out this mission in its normal thorough fashion due to erosion of the projected 1978 budget by inflation and wage increases.

The extra funds requested will make it possible to carry forward this program at usual standards.

IN THE HOUSE BY THE FINANCE COMMITTEE

CS FOR HOUSE BILL NO. 960 (Finance) am

IN THE LEGISLATURE OF THE STATE OF ALASKA

TENTH LEGISLATURE - SECOND SESSION

A BILL

For an Act entitled: "An Act relating to fish and game management."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

HB 506

* Section 1. INTENT. The legislature finds that there is a need to develop a statewide policy on the utilization, development and conservation of fish and game resources, and to recognize that those resources are not inexhaustible and that preferences must be established among beneficial users of the resources. The legislature further determines that it is in the public interest to clearly establish subsistence use as the priority beneficial use of Alaska's fish and game resources and to recognize the needs, customs and traditions of Alaskan residents. The legislature further finds that beneficial use of those resources by all state residents should be carefully monitored and regulated, with as much input as possible from the affected users, so that the viability of fish and game resources is not threatened and so that resources are conserved in a manner consistent with the sustained-yield principle.

* Sec. 2. AS 16.05.090 is amended by adding a new subsection to read:

(c). ~~There is established in the Department of Fish and Game~~ The Commissioner shall establish in the Commissioner's office a ~~division~~ DEPARTMENTAL SECTION of subsistence hunting and fishing.

* Sec. 3. AS 16.05 is amended by adding new sections to read:

Sec. 16.05.094. DUTIES OF ~~DIVISION~~ SECTION OF SUBSISTENCE HUNTING AND FISHING. The ~~division~~ SECTION of subsistence hunting and fishing shall

(1) compile existing data and conduct studies to gather information, including data from subsistence users, on all aspects of the role of subsistence hunting and fishing in the lives of the resi-

dents of the state;

(2) quantify the amount, nutritional value, and extent of dependence on food acquired through subsistence hunting and fishing;

(3) make information gathered available to THE PUBLIC, ~~other~~ appropriate agencies, AND OTHER ORGANIZED BODIES; ~~and the legislature in a form suitable for use in developing policies relating to land, water or resource use~~;

(4) assist the DEPARTMENT AND ~~legislature or~~ the Board of Fisheries AND ~~or~~ the Board of Game in determining what uses of fish and game, as well as which users and what methods, should be termed subsistence uses, users, and methods;

(5) evaluate the impact of state and federal laws and regulations on subsistence hunting and fishing and, when corrective action is indicated, make recommendations to the DEPARTMENT; ~~governor and the legislature~~;

(6) make recommendations to the DEPARTMENT ~~Board of Game and the Board of Fisheries~~ regarding adoption, amendment, and repeal of regulations AFFECTING ~~relating to~~ subsistence hunting and fishing;

~~(7) contract with organizations or individuals capable of assisting the division in carrying out its duties~~;

(7) (8) participate with other divisions in the preparation of statewide and regional management plans so that those plans reorganize and incorporate the needs of subsistence users of fish and game.

* Sec. 4. AS 16.05.251 is amended by adding a new subsection to read:

(13) (N) ~~The Board of Fisheries shall adopt regulations in accordance with the Administrative Procedure Act (AS 44.62)~~ permitting the taking of fish for subsistence uses unless the board determines, in accordance with the Administrative Procedure Act, that adoption of such regulations will jeopardize or interfere with the maintenance of fish stocks on a sustained-yield basis. Whenever it is necessary to restrict the taking of fish to assure the maintenance of fish stocks on a sustained-yield

basis, or to assure the continuation of subsistence uses of such resources, subsistence use shall be the priority use. If further restriction is necessary, the board shall establish restrictions and limitations on and priorities for these consumptive uses on the basis of the following criteria:

(1) customary and direct dependence upon the resource as the mainstay of one's livelihood;

(2) local residency; and

(3) availability of alternative resources.

* Sec. 5. AS 16.05.255 is amended by adding new subsections to read:

(11) (b) ~~The Board of Game shall adopt regulations in accordance with the Administrative Procedure Act (AS 44.62)~~ permitting the taking of game for subsistence uses unless the board determines, in accordance with the Administrative Procedure Act, that adoption of such regulations will jeopardize or interfere with the maintenance of game resources on a sustained-yield basis. Whenever it is necessary to restrict the taking of game to assure the maintenance of game resources on a sustained-yield basis, or to assure the continuation of subsistence uses of such resources, subsistence use shall be the priority use. If further restriction is necessary, the board shall establish restrictions and limitations on and priorities for these consumptive uses on the basis of the following criteria:

(1) customary and direct dependence upon the resource as the mainstay of one's livelihood;

(2) local residency; and

(3) availability of alternative resources.

~~(c) In accordance with sound game management practices, the Board of Game shall establish open seasons for game species which coincide with the time of year when each species is most edible.~~

Anti-Waste

* Sec. 6. AS 16.05.257(a) is amended to read:

(a) The Board of Game, at its regularly scheduled annual meetings or other meetings shall consider and may adopt regulations providing for subsistence hunting in a game management unit or subunit or a portion of a unit or subunit upon

(1) recommendation of the department, based on biological evidence;

(2) the recommendation [MAJORITY VOTE] of the active local advisory committees for that game management unit or subunit or a portion of a unit or subunit;

(3) the written petition of not less than 100 interested residents of that game management unit or subunit; or

(4) the written petition of not less than 25 interested residents of an area which is requested for establishment as a subsistence area within a game management unit or subunit.

* Sec. 7. AS 16.05.257(c) is repealed and re-enacted to read:

(c) No regulations may be adopted by the Board of Game under (a), (b) or (f) of this section unless, in addition to the requirements of AS 44.62.180 - 44.62.290, the department

(1) holds public hearings, after reasonable notice, at least 30 days before the meeting at which the regulation is to be adopted, with at least one of the hearings being held in close proximity to the area potentially affected;

(2) presents at the hearings the ~~information provided for~~ BIOLOGICAL EVIDENCE REQUIRED in (e) of this section;

(3) makes the ~~information provided for~~ BIOLOGICAL EVIDENCE REQUIRED in (e) of this section available to the appropriate advisory committees and to petitioners if consideration of adoption of regulations was prompted by petitions under (a)(3) or (4) of this section; ~~comments shall be received by the board~~

~~until 10 days before any adoption of regulations~~.

* Sec. 8. AS 16.05.257(d) is amended to read:

(d) A petition submitted under (a)(3) - (4) of this section shall contain a complete description of the area requested as a subsistence area and a specification of the species within the area considered necessary for subsistence use. A petition or request made under (a)(2), (3) or (4) of this section must be filed with the department at least 75 days before the ~~next scheduled meeting of the board~~. request meeting at which the petition is to be considered

~~* Sec. 9. AS 16.05.257(e) is repealed and re-enacted to read:~~

~~(e) The department shall investigate every petition or request made under (a)(2), (3) or (4) of this section and provide the following information: (1) the concentration and carrying capacity of the species to be affected; (2) the concentration of other species; (3) the extent of competition of other species with the affected species in the area; (4) the current hunting practices in the area, including numbers of animals taken and by what methods and means, whether the take is subsistence or recreational, and characteristics of the hunters; (5) the past and present dependence of persons in the area for subsistence use of a species; (6) the biomass of the species to be affected; (7) the population trends in the area; and (8) whether the population is able to support a nonsubsistence harvest~~. habitat of the species to be affected

* Sec. ~~10~~ 9. AS 16.05.257(h)(1) is amended to read:

(1) "subsistence hunting" means the taking of game animals by a state resident for subsistence uses by means defined by the Board of Game [FOOD OR CLOTHING FOR PERSONAL OR IMMEDIATE FAMILY USE];

* Sec. ~~11~~ 10. AS 16.05.257(h)(2) is repealed and re-enacted to read:

(2) "subsistence hunting area" means an area in which only subsistence hunting of the affected species is permitted and which is managed for maximum food potential.

* Sec. ~~12~~ 11. AS 16.05.257 is amended by adding a new subsection to read:

(i) The Board of Game may make no decision denying, creating or changing a subsistence hunting area unless based on specific written findings of fact regarding all the information provided in accordance with (e) of this section. ~~No subsistence hunting area may be created if the board determines that creation of such an area will jeopardize or interfere with the maintenance of game populations on a sustained yield basis.~~

* Sec. ~~13~~ 12. AS 16.05.290 is amended to read:

Sec. 16.05.290. COMPENSATION OF BOARD MEMBERS. Each member of a board is entitled to travel expenses, [AND $100] per diem, and $100 in compensation for each day going to and from and for each day in actual attendance at board meetings and other meetings or conferences authorized by a board.

DELETE * Sec. 13. AS 16.05.300 IS AMENDED by adding a new subsection TO READ: (c)

* Sec. 14. AS 16.05.930 is amended by adding a new subsection to read:

(e) This chapter does not prevent the traditional barter of fish and game taken by subsistence hunting or fishing, except that the commissioner may prohibit the barter of subsistence-taken fish and game by regulation, emergency or otherwise, if a determination on the record is made that the barter is resulting in a waste of the resource, damage to fish stocks or game populations, or circumvention of fish or game management programs.

* Sec. 15. AS 16.05.940 is amended by adding new paragraphs to read:

(26) "subsistence uses" means the customary and traditional uses in Alaska of wild, renewable resources for direct personal or family consumption as food, shelter, fuel, clothing, tools, or transportation, for the making and selling of handicraft articles out of nonedible by-products of fish and wildlife resources taken for personal or family consumption, and for the customary ~~trade~~, barter or sharing

INSERT — p.6, line 15

* Sec. ~~11~~ 13. AS 16.05.300. Board Meetings (a) Each board shall hold at least one meeting a year and as many other meetings as it considers necessary. Each board shall select the time and place in the state for the transaction of business. Each board shall maintain its office at the principal office of the department.

(b) In addition, the Board of Fisheries shall hold at least one meeting or hearing a year in each of the following general areas:

(1) Upper Yukon - Kuskokwim - Arctic
(2) Western Alaska (including Kodiak)
(3) Southcentral
(4) Prince William Sound (including Yakutat)
(5) Southeast

(c) In addition, the Board of Game shall hold at least one meeting or hearing a year in each of the following general areas:

(1) Arctic - Yukon - Kuskokwim
(2) Southwestern Alaska
(3) Interior
(4) Southcentral
(5) Southeast.

for personal or family consumption; for the purposes of this paragraph, "family" means all persons related by blood, marriage, or adoption, and any person living within the household on a permanent basis;

(27) "barter" means the exchange or trade of fish or game, or their parts — taken by subsistence users.

(A) for other fish or game or their parts; or

(B) for other food or for nonedible items if the exchange is of a limited and noncommercial nature.

MEMORANDUM

DATE: May 30, 1978

TO: All Senators

FROM: Rep. Nels A. Anderson, Jr., Chairman

SUBJECT: CSHB 960 (Finance) am

Attached find CSHB 960 (Finance) am, a bill outline and letter of intent for your information.

This comprehensive subsistence bill is the result of ten months of work by the Interim Committee on Subsistence and the Special Committee on Subsistence. The Administration and the Department of Fish and Game have frequently stated that subsistence should be the priority use of fish and game and yet up until this point have had no progress in coming to grips with the issue.

This bill provides the Department of Fish and Game a directive in establishing subsistence as the highest priority use and establishes a division of subsistence so that the legislature and the Department of Fish and Game can gain knowledge of this complex issue.

LETTER OF INTENT

CSHB 960 (FINANCE) AM: "An Act relating to fish and game management."

This bill is intended to provide a coordinated plan for clarifying what subsistence use of fish and game is and for documenting subsistence uses so that they can be integrated into fish and game management planning. The bill also provides a legislative framework for the State's policy of recognizing subsistence as the priority use of fish and game.

Section two: This section provides for the creation of a division of subsistence hunting and fishing. Presently, the Department of Fish and Game has divisions of commercial fishing, sport fishing and game. As subsistence is to be the highest priority of the Department of Fish and Game, there is an obvious need for the gathering of information about subsistence hunting and fishing and the making of informed recommendations to the boards of fisheries and game. Presently, research is not being specifically directed towards the subsistence hunting and fishing economy of the state. Rather, specific species studies are conducted to determine the health of the species and the harvest to be allowed. This method does not consider the entire range of resources available to subsistence users and therefore does not allow for realistic regulations based upon the overall needs of the subsistence users. A division of subsistence given the tasks set forth in section four would have the information to make recommendations as to the needs of the subsistence users.

Section three: Duties of the division of subsistence hunting and fishing.

Sections four and five: These two sections, which are virtually identical for the Boards of Fisheries and the Board of Game, are intended to statutorily set out the priority given to subsistence use of the fish and game resources. While there are presently regulations for subsistence fishing, there is no mechanism for the promulgation of subsistence hunting regulations except with the creation of subsistence hunting areas pursuant to A.S. 16.05.257. Section seven would allow for these regulations so that subsistence hunting could be distinguished by separate regulations from sports hunting. Further, these sections set forth a priority of users if restrictions are needed because of the unavailability of resources. The priority list is an attempt to insure that those with the most dependence upon the fish and game resources are the last to be restricted.

If there is a need to restrict the taking of fish or game in order to avoid damaging the fish stocks or game populations, or in order to assure that subsistence users may continue to take fish or game, it is the intent of the Committee that sports or commercial use be restricted before subsistence use. If these restrictions are inadequate, restriction of subsistence use as well is authorized based upon the dependence on the resource, the local residence of the subsistence user, and the availability of alternate resources. It is the intent of the committee that decisions and determinations by the Board of Fisheries and the Board of Game will be subject to complete public scrutiny and that reasons will be given for any action or any failure to act.

Subsection C is intended to ensure that game meat is not wasted as a result of a hunt which is not allowed during a portion of the year when the meat is not edible. As the game resources are very limited, this subsection makes certain that the entire animal can be utilized.

Section six: This section does two things. First, it makes clear that the Board of Game must consider subsistence hunting area proposals at its regularly scheduled annual meeting. Second, it allows the Board of Game to consider recommendations from the active local advisory committees which are located in the area where the subsistence hunting proposal is being made without also needing a recommendation from the other advisory committees which have concurrent jurisdiction, in the game management unit or subunit affected. Therefore, if five local advisory committees have concurrent jurisdiction, it is only necessary to have the committee located in the affected area to make its recommendation rather than other committees which may not have any interest in the area being proposed.

Section seven: This section deals with the problem of not having sufficient information to present to the Board of Game when they are making their determinations. If the Board of Game is required to make investigations and present this information at the hearings, the participants will be able to make relevant comments. Subsection (C) (3) allows for the petitioners to dispute the investigations which have been made. Presently most of the hearings only deal with the participants personal observations. More meaningful hearings would be conducted if biological and user information were required.

Section eight: This section mandates a seventy-five (75) day period by shich time a petition must be filed with the Department of

Fish and Game. This time period is included to enable the Department to make the investigation required under section eleven.

Section nine: This section requires the Department of Fish and Game to make detailed investigation concerning subsistence hunting area proposals. The Board of Game has rejected proposals in the past stating that they did not have enough information before them to justify their creation. The only agency which is capable of providing this information is the Department of Fish and Game. Therefore, to require the Department to make this investigation would force the Board of Game to make its decisions based upon the relevant data rather than being able to deny them out of hand. As the Board has not approved any of the proposals in the past, the changes in this section would require the Board to follow the legislative history of the law and would provide a mechanism for reviewing the Board's decision.

Section ten: This section expands the uses which can be made of game taken in subsistence areas. Presently, the uses allowed are much more restrictive than the customary and traditional uses made of fish and game.

Section eleven: The definition of subsistence hunting is changed so that non-subsistence hunting of the species which is the subject of a petition or report will not be allowed. Sports hunting of other species is allowed so long as the subsistence hunting is not interfered with.

Section twelve: This section, like section eleven is intended to assure that any decisions reagarding subsistence zones made by the Board of Game are made on the basis of adequate information.

Section thirteen: This section provides for a $100 dollar per day compensation fee to be given to members of the Board of Fisheries and the Board of Game in addition to travel expenses and $100 per day per die.

Section fourteen: This section provides for the barter of subsistence caught fish and game as barter is defined in section seventeen, subsection 27 below. As barter is customary and traditional use of fish and game products, there is no necessity for it to be outlawed as is presently the case. However, if barter is to be allowed, the Department of Fish and Game should be allowed to control it so that there are no abuses. This is provided for in section sixteen. Barter is a means of rounding out a subsistence users diet and simply because one resource is available in an area and another is not should not force people to consume only what they can take themselves. The

definition of barter specifically prohibits the selling of subsistence caught fish and game but does not limit what other consideration can be given.

Section fifteen: Subsection (26) defines what uses can be made of subsistence caught fish and game. It allows it to be used for dirct personal or family consumption, for barter as defined in subsection (27) and for sharing the subsistence caught fish and game with other persons. This subsistence caught fish and game which is shared can then only be used for personal or family consumption. This subsection also broadens the definition of family to include the extended family situation.

Perspective

Subsistence Issue Neglected Too Long

By Joe La Rocca

Both as a matter of equity, and as a strategic move to upgrade state and federal relationships in Alaska, the bill to create a division of subsistence hunting and fishing within the State Department of Fish and Game which passed the State House last Friday is an idea whose time is long overdue.

Although it wasn't designed nor, I think, intended to do so, the bill – if enacted into law – will go a long way towards reenforcing the state's recently-threatened right to manage resident wildlife species in Alaska.

It will also officially elevate the subsistence hunting and fishing ethics to the same practical stature as sport fishing, sport hunting and commercial fishing which have, for too long, enjoyed management priority over subsistence uses of Alaska's wildlife resources.

The state's dominant non-Native politicians have, since statehood, steadfastly ignored the urgency of the subsistence hunting and fishing issue, maintaining from the start three roughly co-equal divisions within the Department of Fish and Game to handle sport fishing, sport hunting and commercial fishing needs.

But they persistently neglected the fourth need that oozed around the edges of the other three, despite the warnings of a few foresighted individuals who, over the years, have unsuccessfully urged the politicians to give equal symbolic and tangible status to the subsistence hunting and fishing ethic.

Their failure to do so at – or soon after – statehood inevitably precipitated the bitter rift which has today corroded relationships – perhaps irreversibly – between Alaska's Native and non-Native people, and brought all wildlife in Alaska to the disastrous brink of federal control, with the active consent of Alaska's Native leaders.

Successive state administrations, including this one, have claimed that they, and their appointed boards of fish and game, have consistently recognized subsistence as the priority use of fish and game resources where there were conflicts with other consumptive uses. But their claims are largely false. Management of the state's resident fish and game species has, over the years, been pervasively biased in favor of sport and commercial interests, while subsistence uses have been systematically accorded step-child status.

The bill approved by the House last Friday purports to establish subsistence use as the priority beneficial use of Alaska's fish and game resources. But is suspect that, as a practical political matter, subsistence uses will achieve under it, at best, equal management status and treatment with sport and commercial uses if the Senate also passes, and the governor approves – and effectively implements – the statute.

Enactment of the measure should, I think, help to stem the tide of federal encroachment upon the state's right to manage resident species which drew its principal impetus in recent years from the divisive subsistence issue and the state's prolonged failure to attempt to resolve it rationally.

The bill was less than perfect when it came from committee to the floor of the House, and Friday's House action in amending the bill on the floor represented one of those rare occasions when rational considerations prevailed over political expedience.

There were two critical floor amendments which the House wisely adopted. One, authored by Rep. Sam Cotten, (D-Eagle River), removed a lengthy section which would have created a permanent interim committee of the legislature on subsistence. Supporters of Cotten's amendment correctly argued that such a move would have set a dangerous precedent that would inevitably have led to irresistible pressures for similar concessions to other special interests.

The second amendment, offered by Rep. Dick Eliason, R-Sitka, removed a provision which would have unnecessarily added two more seats to the Boards of Fisheries and the Board of Game, thus making it more difficult for both to function effectively.

Although he was justifiably motivated by ethnic self-interest, the bill's architect, Rep. Nels Anderson, (D-Dillingham), and those who supported his efforts, have served transcendant state interests as well, which have been neglected too long.

Even now, the measure is probably imperfect, and experience under it over time is likely to dictate changes needed to refine it further, or adapt it to unforeseen circumstances. But it signifies an important first step and establishes a useful framework which can be fleshed out by future legislatures, if and when necessary.

Hopefully, the Senate and governor will agree, and readily ratify the action of the House of Representatives.

AGENCY Fish and Game
PHONE 465-4120

Original: Legislative Finance
cc. Budget and Management
Prime Sponsor (First Legislator Named)

I. Sections 2-4 establish a Division of Subsistance.

In addition to a Headquarters staff of director, deputy director, secretary, and administrative assistant, work would be accomplished by regional positions with clerical support at range 18 in Juneau, Anchorage, Kodiak, Fairbanks, Barrow, Bethel, Dillingham, Galena, Kotzebue, and Nome. Range 18 is the same level as Fisheries or Game Biologist III. This is the project manager level and would be expected to have a broad range of professional experience as well as the ability to interact well with the public. Travel is provided at $3,000 for regional positions, and $4,000 for the director and deputy. Contractual funds are for phones, printing, advertising, and space rental. (Figures assume 600/mo. for regional space and phones; 1,000/yr. for regional printing; 700/mo for HQ space and phones; 3,000/yr for HQ printing and miscellaneous). New equipment is needed for all positions.

Line item costs for the Division of Subsistance are as follows:

100 -	699.9	400 -	4.5
200 -	38.0	500 -	35.3
300 -	93.4		

Line item 500 is reduced to 3.0 for FY '80 and beyond.

II. Section 5 adds two members each to the Boards of Fisheries and Game.

The cost of each additional Fisheries Board member would be $1,500 in travel and $4,500 in per diem. The cost of each additional Game Board member would be $1,000 in travel and $2,200 in per diem. These figures do not include the additional compensation addressed in section 15 of the bill. Total cost of section 5 is $18,400, all in line 200.

III. Section 15 provides additional compensation for Board members.

Board members currently receive $100 per diem per day. The effect of section 15 would be to reduce the per diem to the same as that paid other state employees (this fiscal note assumes an average of $60), and to add compensation of $100 per day for Board members. Actual per diem paid would be reduced from $49,800 in FY '79 (both boards) to $29,900 in line item 200. Compensation of $100 per day would add $49,800 in line item 100.

IV. Section 20 creates a permanent Interim Subsistance Committee of the Legislature. There is no fiscal impact of this action in the Department of Fish and Game. However, the Division of Legislative Affairs would be fiscally impacted by this section.

STATE OF ALASKA

JAY S. HAMMOND, GOVERNOR

DEPARTMENT OF FISH AND GAME

OFFICE OF THE COMMISSIONER

SUBPORT BUILDING
JUNEAU 99801

June 10, 1978

The Honorable Kay Poland
Alaska State Legislature
Pouch V
Juneau, Alaska 99811

Dear Senator Poland:

Yesterday you requested the Department to poll the Board of Game to determine their views regarding CSHB 960 (Finance)am as written regarding the "subsistence issue" and the establishment of a "Division of Subsistence" in the Department by legislative mandate. Insofar as was possible we contacted the Board members yesterday afternoon and evening with the results as indicated below. Six of the seven members were reached--Jim Rearden, Clint Buckmaster, Charles Evans, Darrell Farmen, Pete Nelson, and Sam Harbo; Sidney Huntington was not available.

(1) All six were opposed to the legislation as written; I feel confident in saying that I believe Sidney Huntington also would be opposed.

(2) Four, and to that I would add Huntington to make five, were opposed to any such legislation being passed regardless of language; two--Chuck Evans and Clint Buckmaster--felt they could support CSHB 960 if the Department's suggested amendments were adopted.

In addition, we attempted to poll the Board of Fisheries as well, but were less successful. Only four of the seven were reached--Nick Szabo, Gordon Jensen, Herman Schroeder, and Calvin Fair. All were opposed to CSHB 960 as written. Szabo was opposed to any legislation being passed. Jensen, Schroeder, and Fair felt they could support the bill if the Department's suggested amendments were adopted.

I will stick my neck out and say that I think all members of the two Boards believe that there is little need for this kind of legislation and that the subsistence question can be handled quite adequately under a modified

regulatory system (which we are working on now). I believe too that all would object to the Legislature establishing any organizational unit within the Department by State law, as has been done already with regard to the Fisheries Rehabilitation, Enhancement and Development Division.

The Department would like to propose two additional amendments to CSHB 960. Again, both were overlooked in our previous review and, again, I apologize for that lack. Our proposals are as follows:

(1) p.5 Sec. 11 (Sec. 10 as per Dept.'s earlier recommendations) AS 16.05.257(h)(2) lines 26-29.

We suggest the elimination of this section, and instead leave the existing language presently in the Statutes. Present language reads as follows:

> (2) "subsistence hunting area" means an area designated by the board as primarily important for subsistence use and in which it is unlikely that subsistence needs will be met if recreational hunting, including hunting for trophy purposes, is permitted or if certain methods and means are continued. (s 1 ch 199 SLA 1975; am s 2 ch 269 SLA 1976)

The language stated in CSHB 960 would be too narrow and I believe not in compliance with the State Constitution because of discrimination in permitting only subsistence hunting in a "subsistence hunting area." The existing Statute language is more flexible in that control of hunting also could be handled via "methods and means," as well as by other regulatory constraints.

(2) p.6 Sec. 14. AS 16.05.930(e), lines 17-18.

Language here needs to recognize the responsibility of the Boards to set regulations. I suggest that it be amended to the following:

Line 17-18 "...except that the appropriate Board or the Commissioner by delegation of the appropriate Board may prohibit....

Thanks again for allowing us to state our views regarding this important piece of legislation.

Sincerely,

Ron Skoog

Ronald O. Skoog
Commissioner

REPRESENTATIVE NELS A. ANDERSON, CHAIRMAN

June 6, 1978

Senator Kay Poland, Chairman
Senate Resources Committee
Alaska State Legislature
Pouch V
Juneau, Alaska 99811

Subject: CSHB 960 (Finance) am

Dear Senator Poland:

At the hearing on the subsistence bill in your committe on June 5, it was clear that one major issue was whether the proposed new Division of Subsistence Hunting and Fishing should be deleted in favor of a new section of subsistence which would operate directly out of the Commissioner's office. I would just like to reiterate my opposition to that change and exlplain why.

As the testimony at your hearing indicated, Commissioner Skoog's proposed amendment would cut off any meaningful communication between this section and the legislature, the Governor or the Boards of Fish and Game. The Commissioner's proposed amendments on page two, lines 5 - 6, and 7 and 13 assure that the legislature will not have the benefit of the section's expertise on subsistence, except as it is filtered through the Commissioner's office. The amendment on page two, lines 14 - 15 assures that those same subsistence experts will not have the same freedom in presenting regulation proposals to the Board of Game and Fisheries that the existing divisions presently enjoy.

During the Subsistence Committees' 4 day teleconference on the creation of a subsistence division, the major fear of the majority of the 79 people who testified was that the commissioner would stifle the activities of such a division.

For this reason, the original HB 960 required the governor to appoint the head of the subsistence division rather than the Commissioner. This provision was deleted in committee. That deletion was acceptable to me but I strongly reject the Commissioner's attempts to further erode the bill by attempting to eliminate the division and replace it with a section which would operate as personal staff to the Commissioner.

Further, without the ability to collect data on subsistence needs independent of the special interests of the other divisions, the "section" of subsistence would be dependent on information from the other divisions that has been shown in the part to be inadequate or geared toward sports and commercial interests. Independent field workers to address subsistence issues are mandatory and are only possible if a division is created.

To see how a "section" of subsistence would operate, one only need look at the existing Habitat Protection Section of the Department. According to Keith Specking, legislative assistant to the Governor, in his Organization Review of the Department in December 1977, the following finding applies to the existing Habitat Protection Section, which is seven or eight years old.

> "THE ROLE OF THE HABITAT PROTECTION SECTION NEEDS TO BE MORE DEFINED.
>
> That finding is based on the following management observation:
>
> THERE HAS BEEN A LACK OF CLEAR DESIGNATION FOR THE HABITAT PROTECTION SECTION'S INVOLVEMENT IN THE DEVELOPMENT, REVIEW, AND MANAGEMENT OF THE TERMS OF COOPERATIVE AGREEMENTS.
>
> ... THE HABITAT PROTECTION SECTION HAS HAD INSUFFICIENT PERSONNEL TO PROVIDE A PROFESSIONAL AND COMPREHENSIVE RESPONSE TO INTENSIVE SHORT - TERM PLANNING REQUESTS.
>
> THERE IS CURRENTLY NO MECHANISM FOR HABITAT PROTECTION SECTION'S INVOLVEMENT IN RESEARCH AND SURVEY AND INVENTORY ACTIVITIES TO FILL DATE VOIDS WHERE LINE DIVISIONS CANNOT ADEQUATELY RESPOND TO RESEARCH REQUESTS.

If this is the case with the existing habitat section, I am sure that a subsistence section would be even more loosely structured and ineffective. We should not create a section of subsistence that has no defined role, no power, inadequate personnel, and no research and data collection capability. Creating a division as provided for in the present bill would ensure that subsistence was dealt with effectively in a scientific manner rather than in a vague and politically oriented manner.

Commissioner Skoog's attempt to reduce the proposed new division to a toothless "section" is even more serious when veiwed in the content of his other ill-advised proposed changes. 1) to leave to the discretion of the Department whether or not to create a subsistence preference (page 2, lines 23 - 24 and page 3, lines 11 - 12). 2) to delete the detailed information necessary to determine whether a subsistence game zone should be created and leave in the present, hopelessly general "biological evidence" provision in existing law (page 5, lines 10 - 21).

Thank you very much for your consideration of this matter.

Sincerely,

Nels

STATE OF ALASKA

JAY S. HAMMOND, GOVERNOR

DEPARTMENT OF FISH AND GAME

OFFICE OF THE COMMISSIONER

SUBPORT BUILDING
JUNEAU 99801

June 7, 1978

The Honorable Kay Poland
Senate Resources Committee
Alaska State Legislature
Pouch V
Juneau, Alaska 99811

Dear Senator Poland:

It has just come to my attention that there would be one other discrepancy in the current Title 16 statutes should the present CSHB 960 pass in the legislature. A change would be necessary in AS 16.05.940 Definitions relative to definition number (17) "subsistence fishing." Presently this definition reads as follows:

> (17) "subsistence fishing" means the taking, fishing for, or possession of fish, shellfish, or other fishery resources for personal use and not for sale [OR BARTER] with gill net, seine, fish wheel, long line, or other means defined by the Board of Fisheries;

It would be necessary to eliminate "or barter" from this definition in order to comply with the language in CSHB 960. Actually it would be well to eliminate these words from that definition regardless of whether the bill passes or not, because it has caused numerous problems with our enforcement people in many areas of Western Alaska where barter has been a traditional activity. If this latter action were taken, then the definition proposed for "barter" should be added to the section.

Sorry for not having addressed this problem either in my testimony or in my June 6 letter. Thank you for your consideration.

Sincerely,

Ronald O. Skoog
Commissioner

STATE OF ALASKA

JAY S. HAMMOND, GOVERNOR

DEPARTMENT OF FISH AND GAME

OFFICE OF THE COMMISSIONER / SUPPORT BUILDING
JUNEAU 99801

June 6, 1978

The Honorable Kay Poland
Senate Resources Committee
Alaska State Legislature
Pouch V
Juneau, Alaska 99811

Dear Senator Poland:

I would like to comment further upon the language in CSHB 960 (Finance) am, relative to certain sections upon which there seems to be some controversy. My comments below follow the section numbers as referred to in the Bill.

Section 2. AS 16.05.090. I would like to restate the Department's position that the duties proposed for a "subsistence group" within the Department of Fish and Game could be better served by having that "group" designated as a "Section" in the Commissioner's Office. In that position the Section would carry greater authority in dealing with the other Divisions--Sport Fish, Commercial Fisheries, and Game--in providing the necessary coordination between the staff biologists of these Divisions and the "subsistence" staff in providing for adequate regulatory proposals to the Boards.

Section 8. AS 16.05.257(e). We still are concerned that the proposed wording used presently in the Bill will be too demanding on our staff biologists to supply all of the requested information for every such request. I had recommended in my testimony yesterday that this new language be deleted and that the existing language in Title 16 remain. The eight kinds of information identified as required would create a great burden upon Department staff. In substitute I recommend instead that the following language preface the existing language in AS 16.05.257(e):

> The department shall investigate every petition or request made under (a)(2), (3) or (4) of this section and provide the biological evidence needed to evaluate each such petition or request. No subsistence area may be created under this section if the Board of Game determines that biological evidence indicates that the creation

of such an area is likely to adversely affect a resource in that it would fall below the level of sustained yield determined to be adequate.

Section 15. AS 16.05.940(26). "Subsistence uses." I would recommend that if "subsistence uses" is to be defined that it might be best to follow the definition that currently is in the (d)(2) legislation now before Congress, as it seems likely that this definition will survive in whatever legislation finally emerges. That definition is as follows:

(26) "Subsistence uses" means the noncommercial, customary and traditional utilization within the State of wild, renewable resources for--

(1) direct personal or family use for food, shelter, fuel, clothing, tools, or transportation;

(2) the making and selling of handicraft articles (including clothing), but only out of nonedible byproducts of fish and wildlife taken for such personal or family use; or

(3) customary trade, barter, or sharing among subsistence users for personal or family use.

Section 15. AS 16.05.940(27). I reiterate my statement that the definition of "barter" should try to exclude the commercial aspects of any exchange. In this respect I think that the definition as contained in Senator Hohman's SB 506 (shown below) is quite appropriate. It eliminates the commercial problem while recognizing the "traditional" barter or trade being carried out by rural residents.

"Barter" means to exchange, trade for, or otherwise give and receive subsistence-taken fish or game or their parts in exchange for other subsistence-taken fish or game or their parts.

We have attached a revised fiscal note to cover the suggested changes to AS 16.05.300.

Sincerely,

Ron Skoog

Ronald O. Skoog

III. ANALYSIS (See Fiscal Note Preparation Instructions, Section III)

This Fiscal Note is prepared using CSHB 960 (Finance) am as a base, and incorporating changes suggested by the Department of Fish and Game in testimony before the Senate ResourceCommittee on June 5, 1978. See reverse side for detailed explanation.

IV. DATE June 6, 1978 PREPARED BY J Morrison

AGENCY Fish and Game

PHONE 465-4120

Original: Legislative Finance
cc: Budget and Management
Prime Sponsor (First Legislator Named)

33 001 (Rev. 12/77)

Sections referred to are sections as renumbered in suggested changes to Bill by Department of Fish and Game.

I. Sections 2-3 establish a Section of Subsistance in the Office of the Commissioner.

In addition to a Headquarters staff of section chief (24), assistant chief (22), secretary, and administrative assistant, work would be accomplished by regional positions with clerical support at range 18 in Juneau, Anchorage, Kodiak, Fairbanks, Barrow, Bethel, Dillingham, Galena, Kotzeube, and Nome. Range 18 is the same level as Fisheries or Game Biologist III. This is the project manager level and would be expected to have a broad range of professional experience as well as the ability to interact well with the public. Travel is provided at $3,000 for regional positions, and $4,000 for the chief and assistant chief. Contractual funds are for phones, printing, advertising, and space rental. (Figures assume 600/mo. for regional space and phones; 1,000/yr. for regional printing; 700/mo. for HQ space and phones; 3,000/yr for HQ printing and miscellaneous). New equipment is needed for all positions.

Line item costs for the Division of Subsistance are as follows:

100 - 691.7	400 - 4.5
200 - 38.0	500 - 35.3
300 - 93.4	

Line item 500 is reduced to 3.0 for FY '80 and beyond.

II. Section 12 provides additional compensation for Board members.

Board members currently receive $100 per diem per day. The effect of section 12 would be to reduce the per diem to the same as that paid other state employees (this fiscal note assumes an average of $60), and to add compensation of $100 per day for Board members. Actual per diem paid would be reduced from $49,800 in FY '79 (both boards) to $29,900 in line item 200. Compensation of $100 per day would add $49,800 in line item 100.

III. Section 13 requires the Board of Game to meet at least once in each of five specified areas of the state (this new section recommended to be added by Department of Fish and Game).

This fiscal note assumes that three board members would attend 5 additional meetings with an average of four days in travel status for each member. Average travel cost per member per meeting is assumed to be $350; average per diem is $60 plus $100 per day compensation as allowed by section 12 of this bill. Total impact is as follows:

100 - 6,000
200 - 8,800

IV. DATE May 2, 1978 PREPARED BY Bill Morrison
AGENCY Fish & Game
PHONE 465-4120

Original: Legislative Finance
cc: Budget and Management
Prime Sponsor (First Legislator Named)

38-001 (Rev. 12/77)

I. Sections 2-4 establish a Division of Subsistance

In addition to a Headquarters staff of director, deputy director, secretary, and administrative assistant, work would be accomplished by regional positions with clerical support at range 18 in Juneau, Anchorage, Kodiak, Fairbanks, Barrow, Bethel, Dillingham, Galena, Kotzebue, and Nome. Range 18 is the same level as Fisheries or Game Biologist III. This is the project manager level and would be expected to have a broad range of professional experience as well as the ability to interact well with the public. Travel is provided at $3,000 for regional positions, and $4,000 for the director and deputy. Contractual funds are for phones, printing, advertising, and space rental. (Figures assume 600/mo. for regional space and phones; 1,000/yr. for regional printing; 700/mo for HQ space and phones; 3,000/yr for HQ printing and miscellaneous). New equipment is needed for all positions.

Line item costs for the Division of Subsistance are as follows:

100 -	699.9	400 -	4.5
200 -	38.0	500 -	35.3
300 -	93.4		

Line item 500 is reduced to 3.0 for FY '80 and beyond.

II. Section 5 adds two members each to the Boards of Fisheries and Game

The cost of each additional Fisheries Board member would be $1,500 in travel and $4,500 in per diem. The cost of each additional Game Board member would be $1,000 in travel and $2,200 in per diem. These figures do not include the additional compensation addressed in section 15 of the bill. Total cost of section 5 is $18,400, all in line 200.

III. Section 15 provides additional compensation for Board members.

Board members currently receive $100 per diem per day. The effect of section 15 would be to reduce the per diem to the same as that paid other state employees (this fiscal note assumes an average of $60), and to add compensation of $100 per day for Board members. Actual per diem paid would be reduced from $49,800 in FY '79 (both boards) to $29,900 in line item 200. Compensation of $100 per day would add $49,800 in line item 100.

IV. Section 20 creates a permanent Interim Subsistance Committee of the Legislature. There is no fiscal impact of this action in the Department of Fish and Game. However, the Division of Legislative Affairs would be fiscally impacted by this section.

Prime Sponsor (First Legislator Named)

33-001 (Rev. 12/77)

My name is Sidney Huntington. My address is P.O. Box 49, Galena, AK 99741. I've lived in Alaska for 60 years. For 35 of those years, I made my living by trapping and hunting. Presently, I own and operate a small retail business in Galena. During the summer I do commercial fishing and also buy and sell fish commercially. I am presently serving on the Game Board of Alaska. I also have served as a member of different school boards for the past 18 years. Right now I belong to the Galena City School Board.

I find myself in a rather difficult position developing testimony to what I consider counteracting our Federal Government because of some very undesireable conditions and situations they seem to want us to live by and with in the future. Conditions promoted by politicians, mostly from the Lower 48. Things such as the D-2 Bill or what have you - all brought upon us by a compromised Land Claims Settlement Bill. The results of a mass of rotten politicians maneuvering against the voting citizens of Alaska. Since The Bill Passed

Alaska is large and in the state there are many different conditions. At times it calls for different methods of handing situations at hand in each separate area. For instance, the Eskimo living in the Point Barrow area hasn't the slightest idea how the Eskimo in the Chevak area lives.

You have the Indians in the Interior who used early day methods and had a more primitive live that can in no way compare with either the Eskimo of the South or on the Chain. Go to the sub-areas of Anchorage or any other larger city, no one way of life is exactly the same as another. Only that he or she is alive. Yet Mr. Udal's or whoevers bill, we may have to live by, applies to all who lives on or off this land. Sounds like some quack doctor prescription - what's od for one is good for all until you are all dead.

To put subsistence into practice before attempting to define it or say how you are going to use it, where you are going to use it, and who is going to use it will make it much harder to define. Everybody needs it now and then.

There are possibly areas where you may not have much trouble applying more subsistence if it was the people's desire to eliminate what little they now have. It might do right well along coastal areas. I've never lived there, though I am sure no resource can stand up anywhere under pressures that this fast moving new way of life man has developed. It destroys the habitat and eliminates the resources. Keeping up with the Joneses takes more dollars than it use to. How you acquire those dollars, who is to care? You have the right given you by subsistence to use that God given resource until it is no more. Blame the Department of Fish and Game when it is gone. It has got to be their fault.

I can in no way see the complete management of the resources and habitats by local control, by however many regions you want. I can see it on an advisory capacity regionally or on an . wide basis made up of people with a high concern for the resources and not for themselves. The people would be trained by the Department of Fish and Game to function as a board, to operate in the most productive manner and to get the most out of the habitat and fish and game resources. These resources are products that are renewable, almost yearly sometimes. They have been used as food and have been the very livelihood of people over many years in the past. With proper management and much effort, these resources would and should feed many more, for years to come.

One of the biggest factors against these very game resources is in most areas. The people themselves, living in their own areas, are over-hunting, hunting out of season, and killing unnecessarily, at times. These factors and many more boil down to destruction of our resources

Looking back over the years, I see two outstanding factors that almost eliminated two species of game. One is the geese on the Huslia and Dalby Rivers. The numbers of those geese are still not yet up to its normal level or what it used to be. We used to hunt those geese about the 20th of July when the older

geese or the goslin could not yet fly. We killed hundreds of them with clubs and ground-sluiced them with shotguns. In a very few years, there were no more. What brought this on? The outboard motor did. When an outboard motor you could cover hundreds of miles over night and see hundreds of geese. The old Indians used only birch bark canoes, only going a short distance getting just a few geese from one flock. They did not hurt the resource.

The beaver is the other animal which was almost eliminated. I remember so clearly, in the early 1900's, beaver pelts were selling at high prices, about $6.00 each. Heavy shooting with rifles was used to take the beaver, both in the fall and the spring. The beaver was almost eliminated by 1922. At that time the law stepped in - I mean LAW - The season for harvesting beaver was closed - Period. By 1926, it reopened only to have it closed again. The take was heavy as the price was up to $40.00 each. They opened the season again in 1929 for trapping only. Again, the expert subsistence user got his 22 rifle out and began crack shooting the beaver in the eye or the mouth leaving no bullitt mark anywhere. A high take out on the Innoko River was 140 beaver for a short spring hunt. The local Game Warden at that time was Sam White whom many people highly respected. He put into effect the now standing season, March 31 - with all beaver being tagged and sealed within 30 days. He went from camp to camp or village and taught anyone interested how to trap beaver. That set is still being used today. I do say the population of beaver is good today because, it was caught in time to make a recovery. So, I say again, be careful with subsistence. The above people were much more dependent on subsistence at that time than we are so today, but greed got the best of them. I know because, I was one of them.

To say local management and control would be sure death to our available resources. Greed alone is cutting them short. With all the high powered mechanized equipment that is readily available, the resources have nocchance. When the good Lord created Alaska, he did it so as to provide for a certain number of people who could exist on the resources this land could provide, I am sure.

With modern methods and means, a good portion of the resources have been reduced due to the high priority given the dollar. With most of the gold gone, nearly all of the salmon gone at one point, the timber going, only one noticeable item seems to grow in number each year. That is the people, demanding more from our fast depleting resources. All demanding the same right to use all of the fish, all of the game, all of the time.

With the people here now, and more coming all the time, our fish and game is not going to stand the pressure. To top it off, we even let any foreigner from other countries load up with guns and ammo to roam at will, to destruct our game and possibly the habitat. No questions asked.

The members of the Game board are unable at times to cope with do-gooders in the Lower 48 and in Alaska. We have our hands tied by Wolf lovers with warped minds- most likely warped by communistic teachings to disrupt our way of life.

The harvest of moose is heavy and getting heavier each year by adding more hunters from all directions - with the wolf taking a very healthy share. The do-gooders have done their best to disrupt our efforts to manage predator control. This control is a proven tool. To manage and maintain a good healthy number of moose and other game by thinning out a few wolves which is a very valuable fur bearing animal. Not a big game species, unless you want your dog classed as big game also.

The Federal government D-2 land or what ever concept is adopted, the management of our fish and game should be done by the State of Alaska. Preferably by a game board or whatever, to include predator control on all land in Alaska, not to eliminate but control to maintain the resources with high priority given to any part of the game resource showing signs of weakening.

I feel it is very unconstitutional to use the word subsistence to define the way of life of one person over another. Being so our government says we do just that, it seems that we are being forced to discriminate against each other both here in Alaska and other citizens who make up the U.S. A very undesireable condition.

Remember, over-practice of subsistence in some areas, when made into law, eliminates certain species in that area because

it will be over exercised and will mean ruination to most other resources and habitats also.

Those that promoted the concept of subsistence so strongly are not going to shoulder the blame, but will put the blame directly on the Department of Fish & Game whether it is in operation or not. I feel sure that the Dept. of Fish & Game is being forced to accept whatever concept is adopted - That concept could be rotten.

Who is eligible for subsistence? I am sure there is no way anyone could define it so it will be honest and fair to everyone in an area or region. If there were no one getting food stamps or on welfare, it would be somewhat easier to determine who is eligible for subsistence.

Our older people are a thousand times better off then they were in say 1925, which I am sure they deserve.

Is a man, 35 years old, with a family of ten and has a small income more eligible than a man, 50 years old, with a family of three? If a man lived in Alaska for 60 years and had a healthy income but used subsistence type food all of his life, is he cut off from subsistence? Where does the well-to-do or somewhat wealthy woman that has supplied food for her family all her life from the local resources stand?

There are many more circumstances to confront us. Each one is just as discriminative as any other you might want to bring up. I see no fair way or means to really honestly define subsistence for one citizen over another. It is a task like it would be to tell one of my children that he should get more than the other.

Our fish and game should be managed by the State of Alaska Gambe board and State what have you. There should be well trained advisory boards on a regional basis. They will be on an advisory capacity only. The training to be done by qualified staff or personell.

More active Field Law Enforcement officers are needed to enforce the laws. Foreigners from other countries should not be allowed to hunt without a guide to roam free our land and to destroy our game. Our game can not be killed to leave the meat rot in the field.

If, under any adopted subsistence regulation, it is found that our fish and game resources will not maintain a productive level because of over hunting by any hunters, subsistence or otherwise, ~~eliminating~~ subsistence permits could be issued, or else all hunting stopped. This would provide the desireable amount of subsistence needed. The subsistence regulation that is adopted will determine how much subsistence is needed.

I do not think any law has been made that says the State of Alaska or the Department of Fish & Game deprives anyone the use of the resource as a subsistence need. There are regulations that say you must do things in season. All seasons should be recognized if we are going to preserve our resources. Even if the subsistence law was passed, you still should have to abide with the law. I don't see any gain in not doing so. To break the laws would promote hardship on the so-called subsistence user in the future. The season for harvesting the animal resource, that is getting fewer in number would have to be closed until their population remained to a desired level. Don't kill just because you may have the right as a subsistence user to do so.

I can't forsee our Federal Government and the people who help run our United States be so small minded as to want us citizens of the U.S. because we live in Alaska to accept such undesireable legislation. I am sure in many instances that it could be fatal to some if not all our fish and game resources.

Thank you for letting me express what I feel.

PO BOX 4-1932
ANCHORAG AK 99509

THE FOLLOWING IS A COPY OF A TELEGRAM SENT JUNE 7, 1978, TO SENATOR POLAND RE HB 960 (SUBSISTENCE PRIORITY BILL):

WE URGE YOU TO DEFEAT THIS BILL IN THE SENATE.

THE IMPORTANCE OF LEGITIMATE SUBSISTENCE NEEDS HAVE BEEN ADEQUATELY PROVIDED FOR BY STATUTES AND POLICIES OF THE FISHERIES AND GAME BOARDS.

THIS BILL IS TOTALLY UNNECESSARY AS IT IS CUMBERSOME, EXPENSIVE, AND WOUD ESTABLISH AN ADDITIONAL BUREAUCRACY WHICH FURTHER COMPLICATES THE ALREADY COMPLICATED ISSUE OF FISH AND GAME MANAGEMENT. IF WE THINK IN TERMS OF SPENDING VAST SUMS OF MONEY, THE FUNDS SHOULD BE USED IN FIELD WORK TO ENHANCE FISH AND WILDLIFE POPULATIONS INSTEAD OF ESTABLISHING ANOTHER ADMINISTRATIVE DIVISION TO ADDRESS A PROGRAM THAT IS ALREADY BEING ADEQUATELY ADMINISTERED.

Sidney Huntington, an Athabascan Indian, struck out on his own trapline, by himself, at age twelve. He earned his own living, even at that age, and is completely self-taught. His formal education stopped at the third grade.

From that beginning, Sidney has lived from the land, and grown in every aspect of human development. Today, after more than sixty years of self-teaching and application, he and his wife have a grown family of twelve sons and daughters (one son won the world's longest dog sled race, the Iditarod, a few years ago; another is on the Alaska Board of Fish; one is President of Doyon, Ltd., the largest land-holding corporation in the world ; a daughter is attending the University of Alaska, etc.) Sidney runs a small, but thriving mercantile company in his home in Galena. He is still famous for his hand-crafted wooden river boats which ply the Yukon and helps hundreds of natives make a living from the fishery resource. He offers a fish-buying service for the middle Yukon.

For thirty-five years he earned a living from the land and its fish and game resources, hunting, fishing, and trapping. All of his life he has been intimately involved with individual self-sufficiency and local uses and users of fish and game. He knows the people and he knows the resources.

Just as he has shown a deep concern for proper education of future generations of Alaskans by devoting some eighteen years of service on various school boards; he likewise shows a deep concern for the fish and wildlife resources for all Alaska, and has served first on the Joint Boards of Fish and Game in 1974, and since that time on the Alaska State Board of Game.

Jim Rearden, a well-respected outdoor writer, most knowledgeable game manager, current and past member of the Alaska Board of Game pays Sidney a most worthy compliment,"I have watched and been actively involved with fish & game management policies in Alaska since statehood, both as a department employee, and for the past twelve years, as a board member. Without qualification or reservation, I can say Sidney Huntington is by far the best Native representative we have ever had on either board for nineteen years, since inception as a State." Jim goes on to explain, "to him, the resources are of primary importance, and he is equally concerned about all of Alaska."

Sidney speaks with frankness and a far-sighted wisdom which all Americans would do well to heed.

Address Reply to Office Indicated: ☐ Anchorage; ☐ Fairbanks; ☐ Juneau

My name is Sidney Huntington. My address is P.O. Box 49, Galena, AK 99741. I've lived in Alaska for 60 years. For 35 of those years, I made my living by trapping and hunting. Presently, I own and operate a small retail business in Galena. During the summer I do commercial fishing and also buy and sell fish commercially. I am presently serving on the Game Board of Alaska. I also have served as a member of different school boards for the past 18 years. Right now I belong to the Galena City School Board.

I find myself in a rather difficult position developing testimony to what I consider counteracting our Federal Government because of some very undesireable conditions and situations they seem to want us to live by and with in the future. Conditions promoted by politicians, mostly from the Lower 48. Things such as the D-2 Bill or what have you - all brought upon us by a compromised Land Claims Settlement Bill. The results of a mass of rotten politicians maneuvering against the voting citizens of Alaska. Since The Bill Passed

Alaska is large and in the state there are many different conditions. At times it calls for different methods of handing situations at hand in each separate area. For instance, the Eskimo living in the Point Barrow area hasn't the slightest idea how the Eskimo in the Chevak area lives.

You have the Indians in the Interior who used early day methods and had a more primitive live that can in no way compare with either the Eskimo of the South or on the Chain. Go to the sub-areas of Anchorage or any other larger city, no one way of life is exactly the same as another. Only that he or she is alive. Yet Mr. Udal's or whoevers bill, we may have to live by, applies to all who lives on or off this land. Sounds like some quack doctor prescription - what's good for one is good for all until you are all dead.

To put subsistence into practice before attempting to define it or say how you are going to use it, where you are going to use it, and who is going to use it will make it much harder to define. Everybody needs it now and then.

There are possibly areas where you may not have much trouble applying more subsistence if it was the people's desire to eliminate what little they now have. It might do right well along coastal areas. I've never lived there, though I am sure no resource can stand up anywhere under pressures that this fast moving new way of life man has developed. It destroys the habitat and eliminates the resources. Keeping up with the Joneses takes more dollars than it use to. How you acquire those dollars, who is to care? You have the right given you by subsistence to use that God given resource until it is no more. Blame the Department of Fish and Game when it is gone. It has got to be their fault.

I can in no way see the complete management of the resources and habitats by local control, by however many regions you want. I can see it on an advisory capacity regionally or on an area wide basis made up of people with a high concern for the resources and not for themselves. The people would be trained by the Department of Fish and Game to function as a board, to operate in the most productive manner and to get the most out of the habitat and fish and game resources. These resources are products that are renewable, almost yearly sometimes. They have been used as food and have been the very livelihood of people over many years in the past. With proper management and much effort, these resources would and should feed many more, for years to come.

One of the biggest factors against these very game resources is in most areas. The people themselves, living in their own areas, are over-hunting, hunting out of season, and killing unnecessarily, at times. These factors and many more boil down to destruction of our resources

Looking back over the years, I see two outstanding factors that almost eliminated two species of game. One is the geese on the Huslia and Dalby Rivers. The numbers of those geese are still not yet up to its normal level or what it used to be. We used to hunt those geese about the 20th of July when the older

geese or the goslin could not yet fly. We killed hundreds of them with clubs and ground-sluiced them with shotguns. In a very few years, there were no more. What brought this on? The outboard motor did. When an outboard motor you could cover hundreds of miles over night and see hundreds of geese. The old Indians used only birch bark canoes, only going a short distance getting just a few geese from one flock. They did not hurt the resource.

The beaver is the other animal which was almost eliminated. I remember so clearly, in the early 1900's, beaver pelts were selling at high prices, about $6.00 each. Heavy shooting with rifles was used to take the beaver, both in the fall and the spring. The beaver was almost eliminated by 1922. At that time the law stepped in - I mean LAW - The season for harvesting beaver was closed - Period. By 1926, it reopened only to have it closed again. The take was heavy as the price was up to $40.00 each. They opened the season again in 1929 for trapping only. Again, the expert subsistence user got his 22 rifle out and began crack shooting the beaver in the eye or the mouth leaving no bullitt mark anywhere. A high take out on the Innoko River was 140 beaver for a short spring hunt. The local Game Warden at that time was Sam White whom many people highly respected. He put into effect the now standing season, March 31 - with all beaver being tagged and sealed within 30 days. He went from camp to camp or village and taught anyone interested how to trap beaver. That set is still being used today. I do say the population of beaver is good today because, it was caught in time to make a recovery. So, I say again, be careful with subsistence. The above people were much more dependent on subsistence at that time than we are so today, but greed got the best of them. I know because, I was one of them.

To say local management and control would be sure death to our available resources. Greed alone is cutting them short. With all the high powered mechanized equipment that is readily available, the resources have nocchance. When the good Lord created Alaska, he did it so as to provide for a certain number of people who could exist on the resources this land could provide, I am sure.

With modern methods and means, a good portion of the resources have been reduced due to the high priority given the dollar. With most of the gold gone, nearly all of the salmon gone at one point, the timber going, only one noticeable item seems to grow in number each year. That is the people, demanding more from our fast depleting resources. All demanding the same right to use all of the fish, all of the game, all of the time.

With the people here now, and more coming all the time, our fish and game is not going to stand the pressure. To top it off, we even let any foreigner from other countries load up with guns and ammo to roam at will, to destruct our game and possibly the habitat. No questions asked.

The members of the Game board are unable at times to cope with do-gooders in the Lower 48 and in Alaska. We have our hands tied by Wolf lovers with warped minds- most likely warped by communistic teachings to disrupt our way of life.

The harvest of moose is heavy and getting heavier each year by adding more hunters from all directions - with the wolf taking a very healthy share. The do-gooders have done their best to disrupt our efforts to manage predator control. This control is a proven tool. To manage and maintain a good healthy number of moose and other game by thinning out a few wolves which is a very valuable fur bearing animal. Not a big game species, unless you want your dog classed as big game also.

The Federal government D-2 land or what ever concept is adopted, the management of our fish and game should be done by the State of Alaska. Preferably by a game board or whatever, to include predator control on all land in Alaska, not to eliminate but control to maintain the resources with high priority given to any part of the game resource showing signs of weakening.

I feel it is very unconstitutional to use the word subsistence to define the way of life of one person over another. Doing so our government says we do just that, it seems that we are being forced to discriminate against each other both here in Alaska and other citizens who make up the U.S. A very undesireable condition.

Remember, over-practice of subsistence in some areas, when made into law, eliminates certain species in that area because

it will be over exercised and will mean ruination to most other resources and habitats also.

Those that promoted the concept of subsistence so strongly are not going to shoulder the blame, but will put the blame directly on the Department of Fish & Game whether it is in operation or not. I feel sure that the Dept. of Fish & Game is being forced to accept whatever concept is adopted - That concept could be rotten.

Who is eligible for subsistence? I am sure there is no way anyone could define it so it will be honest and fair to everyone in an area or region. If there were no one getting food stamps or on welfare, it would be somewhat easier to determine who is eligible for subsistence.

Our older people are a thousand times better off then they were in say 1925, which I am sure they deserve.

Is a man, 35 years old, with a family of ten and has a small income more eligible than a man, 50 years old, with a family of three? If a man lived in Alaska for 60 years and had a healthy income but used subsistence type food all of his life, is he cut off from subsistence? Where does the well-to-do or somewhat wealthy woman that has supplied food for her family all her life from the local resources stand?

There are many more circumstances to confront us. Each one is just as discriminative as any other you might want to bring up. I see no fair way or means to really honestly define subsistence for one citizen over another. It is a task like it would be to tell one of my children that he should get more than the other.

Our fish and game should be managed by the State of Alaska Gambe board and State what have you. There should be well trained advisory boards on a regional basis. They will be on an advisory capacity only. The training to be done by qualified staff or personell.

More active Field Law Enforcement officers are needed to enforce the laws. Foreigners from other countries should not be allowed to hunt without a guide to roam free our land and to destroy our game. Our game can not be killed to leave the meat rot in the field.

If, under any adopted subsistence regulation, it is found that our fish and game resources will not maintain a productive level because of over hunting by any hunters, subsistence or otherwise, ~~discriminating~~ subsistence permits could be issued, or else all hunting stopped. This would provide the desireable amount of subsistence needed. The subsistence regulation that is adopted will determine how much subsistence is needed.

I do not think any law has been made that says the State of Alaska or the Department of Fish & Game deprives anyone the use of the resource as a subsistence need. There are regulations that say you must do things in season. All seasons should be recognized if we are going to preserve our resources. Even if the subsistence law was passed, you still should have to abide with the law. I don't see any gain in not doing so. To break the laws would promote hardship on the so-called subsistence user in the future. The season for harvesting the animal resource, that is getting fewer in number would have to be closed, until their population remained to a desired level. Don't kill just because you may have the right as a subsistence user to do so.

I can't forsee our Federal Government and the people who help run our United States be so small minded as to want us citizens of the U.S. because we live in Alaska to accept such undesireable legislation. I am sure in many instances that it could be fatal to some if not all our fish and game resources.

Thank you for letting me express what I feel.

HB
963

To: Sen. Sumner?
Brown Bay Brown?
Re: questions you raised on HB 963 in Sen. Resources meeting 6/9

Before any oil that is transported through the TAPS could be exported/exchanged, a number of provisions in five separate federal statutes would have to be satisfied. One of these statutes, Export Administration Amendments of 1977, would require the President to make five specific findings and submit them to Congress, which has one-house veto authority. The President would specifically have to find that such exports of Alaska oil "will not diminish the total quantity or quality of petroleum available in the United States; will have a positive effect on consumer oil prices by decreasing the average crude oil acquisition costs of refiners; will be made only pursuant to contracts which may be terminated if the petroleum supplies of the United States are interrupted or seriously threatened; are in the national interest; and are in accordance with the provisions of the act."

The Exports Administration Amendments are not the only restrictions on export of Alaska crude, but they seem to be the most restrictive.

Now, as this relates to the state statute that would be amended by HB 963, it has been pointed out by the administration that arranging a Japanese swap would be facilitated if the administration had the authority to do this (on a short-term basis) without legislative approval. I outlined some of the reasons for this proposed change in a memo to Hugh Malone, which is attached. After this matter was brought to Malone's attention, he proposed the addition of Sec. 1 (a) to his original bill, and it was adopted by the House Resources Committee.

AGO 566533

X

(Malone wanted more restrictive language than I proposed in memo.)

Another reason pointed out by Arlon Tussing is that export/exchange of state royalty oil might be more acceptable politically to the Carter administration than export of the producers' oil, given all the hostility toward the producers in Congress. Tussing has suggested that the state administration might negotiate a specific deal with a Japanese refiner and request that Carter make his require findings on this particular contract. That would focus the national attention and debate on the state, rather than on the producers.

I have some fairly detailed information on the federal restrictions on exports, if you'd like to see it.

Alaska State Legislature

Senate

JUNEAU, ALASKA

May 23, 1978

TO: Hugh Malone, Speaker of the House

FROM: Kay Brown

RE: Legislative approval for short-term royalty oil sales

Proposed language for addition to HB 963:

* Section 1. AS 38.06.055 is amended to read:

(a) In addition to the approval by the board required under §50 of this chapter, no sale, exchange or other disposition of oil or gas or of the rights or waiver of the rights to receive future production of royalty oil or gas may be made by the Commissioner of Natural Resources under AS 38.05.183 without the prior approval of the legislature by a concurrent resolution concurred in by a majority of the members of each house except for sales, exchanges, or other dispositions made for a term of no more than one year [WHICH MAY BE ENTERED INTO TO RELIEVE A SHORTAGE OF STORAGE CAPACITY]. Any short-term sale, exchange or other disposition entered into pursuant to the authority of this subsection shall not be renewed without the prior approval of the legislature by a concurrent resolution concurred in by a majority of the members of each house.

Renumber sections and leave (b) and (c) as they are in HB 963.

AGO 566535

It has been pointed out by administration spokesmen working on the West Coast surplus problem, that current state law requiring legislative approval for royalty oil sales could make it difficult for state royalty oil to be used as the oil proposed for exchange.

Timing is the major problem. For example, if a swap package (which included export of Alaska royalty oil to Japan) were to be approved by President Carter and the Congress over the interim, the state administration would not be able to move forward with the deal until legislative approval was granted. Six months' notice will be required to switch from in-value to in-kind taking, and Fred Boness says the administration would not give tnis notice to the producers without first getting legislative approval. Even if legislative approval came as early as next January, the oil could not actually be exported until next summer. Further, if the Alpetco contract is approved, the Prudhoe Bay royalty oil will be available for exchange for only 25 months, which also increases the urgency for expeditious action. (Boness disagrees that Alpetco is a significant problem. If a deal were arranged, he says, it would probably be in Alpetco's interest and they would probably agree to continue the sale should it extend into their contract.)

Another problem is credibility. Boness believes it will be difficult for the administration to negotiate a deal with the Japanese

refiners and participate in working out the total swap package if it must be presented to the legislature for approval. Further, he thinks it is unlikely that the Carter Administration would consider favorably the export of state royalty oil given these legislative roadblocks.

I discussed this problem briefly with Arlon Tussing this morning and he agreed with Boness that some waiver of legislative approval would make a conditional sale or swap much easier to accomplish. I will discuss this with Tussing in more detail at the meeting in Seattle on Wednesday. It is not clear to me whether failure to change the statute would be a significant obstacle.

I have also spoken briefly to Rader, Chatterton, Miles and Gardner about this proposed change. They all agreed that such a change might be needed to accommodate this particular problem, but Miles expressed some reservations.

Practically, it seems apparent it is going to be quite difficult to get something through the legislature this session. However, since almost $300 thousand has been appropriated to work on this problem, it would be a shame to see a swap aborted because the legislature failed to amend this statute.

AMENDMENT

Dated May 17, 1978

to the

AGREEMENT FOR THE SALE AND

PURCHASE OF STATE 'YALTY OIL

THIS AMENDMENT entered into as of the 17th day of May, 1978, by and between THE STATE OF ALASKA, hereinafter called the "Seller," acting by and through its Commissioner of Natural Resources, and ALASKA PETROCHEMICAL COMPANY, an Alaska corporation, hereinafter called the "Buyer," and being the Amendment to the Agreement between Seller and Buyer entered into February 22, 1978.

WITNESSETH:

WHEREAS, an Agreement for the Sale and Purchase of State Royalty Oil was duly executed on February 22, 1978, between the State of Alaska, as Seller, and Alaska Petrochemical Company, as Buyer ("Agreement"); and

WHEREAS, the Agreement may be amended under Article XXII thereof; and

WHEREAS, Seller and Buyer desire to clarify certain intentions of the Buyer and Seller therein;

NOW THEREFORE, in consideration of the representations, covenants and conditions herein contained, Seller and Buyer hereby amend the Agreement as follows:

1. Article 1.13 is hereby amended by adding the following sentence at the end of Article 1.13:

"Total Project Costs shall not include any amounts paid for the purchase of crude oil."

2. Article I is hereby further amended by the addition of Article 1.14 which reads as follows:

"1.14 The terms "committed to be expended" as used in Article 1.13 and "commit to expend" as used in Article 10.2 shall mean contractually binding agreements, contracts and purchase orders."

3. Article 2.2 is hereby amended by the addition of a sentence at the end of such Article 2.2 as follows:

"Notwithstanding any other provision of this Article 2.2 Buyer shall not be entitled to receive delivery of any royalty crude oil hereunder until (a) Buyer has actually expended at least $100 million in Total Project Costs, and (b) at least twenty-five (25) months have passed since the Effective Date."

4. Article II is further amended by the addition of a new Article 2.7, to read as follows:

"2.7 Reduction of Quantity of Oil Deliverable to Buyer. Notwithstanding any provision of Article II requiring Seller to deliver to Buyer quantities of crude oil up to 150,000 barrels per day, in the event six years after the Effective Date the

capacity of the Petrochemical Facility is less than 150,000 barrels per day, the maximum quantities deliverable by Seller for the remaining term of this Agreement shall be reduced to that quantity equal to the capacity of the Petrochemical Facility at such time. Coincident with such reduction, the figure "145,000 barrels" appearing several places in Article 2.4 shall be reduced by a like amount. For the purposes of determining capacity under this Article 2.7, the capacity of the Petrochemical Facility shall not be diminished or reduced because of temporary reductions due to market conditions or shutdowns in the Petrochemical Facility, regardless of cause."

5. The first sentence of Article 4.2.1 is hereby amended and revised to read as follows:

"4.2.1 Construction Obligations. In consideration of the obligations assumed by each party herein, Buyer will proceed with reasonable diligence to design, construct, start up and thereafter initiate operation of a petrochemical manufacturing and fuels refining facility in the State of Alaska with capacity to process at least 150,000 barrels of crude oil per day."

IN WITNESS WHEREOF, the Seller has caused this Agreement to be executed by its Commissioner of Natural Resources and the Buyer has caused this Agreement to be executed by its

Chairman of the Board, thereunto duly authorized by its Board of Directors in accordance with the certified seal, duly attested, to be affixed hereto, as of the day and year first above written.

JAY S. HAMMOND, GOVERNOR

11TH FLOOR, STATE OFFICE BLDG.
POUCH M — [illegible]

May 17, 1978

RECEIVED
MAY 18 1978
NORTH POLE REFINING
11:00 am

Mr. L. F. DeLong
North Pole Refining
P. O. Box 5028
North Pole, Alaska 99705

Dear Mr. DeLong:

During Legislative hearings on the contract between the State and Earth Resources Company of Alaska a question was raised concerning the relationship between North Pole's right to take royalty oil from lesses other than Prudhoe Bay and the similar provision in the Alpetco contract. I responded that there was no conflict because North Pole's right was only to unobligated oil. However, upon reviewing the executed draft of the Agreement I noted that such language was missing from Article 2.1.2.

I, therefore, checked earlier drafts of the Agreement. In the March 16, 1978, draft the words "if such oil is available and unobligated." Conclude the first sentence of Article 2.1.2. These words are dropped in the March 27, 1978, draft, however, my working copy of that draft contains a penned notation that those words are missing and should be added.

I have discussed this omission with Mr. Silides and he concurs with me that the omission is an oversight which occurred during preparation of the final copy for execution. The final executed contract therefore should contain the words "if such oil is available and unobligated." at the end of the first sentence in Article 2.1.2.

In order to affirm this correction, I am asking that you sign this letter and return it to me.

Sincerely,

Fred Boness

Frederick H. Boness
Deputy Commissioner

I concur that Article 2.1.2 should contain the inclusion discussed in this letter.

CONSULTING ENGINEERS PLANNERS SURVEYORS

Mr. L.F. DeLong, President
North Pole Refinery
Post Office Box 5028
North Pole, Alaska 99705

May 19, 1978

Dear Mr. DeLong,

Reference is made to Deputy Commissioner Fred Boness' letter to you dated May 17, 1978 regarding an omission in the final draft of the North Pole Refinery - State of Alaska Agreement for the purchase of royalty oil.

He is correct in saying that the words "if such oil is available and unobligated" were in the March 16, 1978 draft which was approved by both parties for presentation to the Royalty Oil Board on that date.

The request for reinsertion of the words is technically in order since their omission was inadvertent. As a practical matter, NPR obviously cannot nominate oil the State does not have, nor is there anything in your Agreement that interferes with the State's right to sell oil from the other leases for in-state use to other refiners. This is in contrast to the ALPETCO contract which dedicates oil to their exclusive use.

The basis of your Agreement is in-state use, and the recent actions of the Legislature confirms their total support to this concept. Obviously, you cannot object to the sale of royalty oil to others for in-state use. But it is a certainty, however, that you would invoke all of the elements of AS 38.05.183 if royalty oil were in any way being exported during a need for that oil to satisfy the local product market need.

Therefore, since the chance opportunity has been given to both parties to fully clarify the situation, I recommend that the correction should read "if such oil is available and unobligated to in-state use", and that Mr. Boness' letter be redrafted to reflect the added clarifying clause.

Very truly yours,

George C. Silides

AGO 785724

MEMORANDUM

TO: Senator Mike Colletta May 15, 1978

FROM: George C. Silides, P.E.

SUBJECT: Summary -- Salient features of North Pole Refinery Royalty Oil contract.

1. The crude oil is to provide an assured supply to an existing facility serving the Fairbanks North Star Borough and Interior Alaska.

2. Any and all royalty oil purchased under this Agreement shall be processed at Purchaser's refinery at North Pole, Alaska.

3. Purchaser is obligated to buy a minimum of 5000 barrels/day.

4. Maximum quantity may not exceed 35,000 barrels/day from all sources combined.

5. Chief source of supply is the leases of the present Prudhoe Bay Unit Agreement (Exhibit "A").

6. If the present leases cannot supply the required volumes, North Pole Refinery may purchase royalty oil from other leases, provided that, firstly, NPR is unable to buy the needed oil from the producers; secondly, that the oil has not not been earlier obligated by the State; and thirdly, the additional oil is required to fulfill contract obligations in supplying the local market. NPR is not guaranteed that additional oil will be available at the time of need. Please note this very distinct difference with the ALPETCO contract.

7. Price is the same as if the State had taken its oil in value. NPR is also obligated for any additional costs which may be legally incurred because of taking in kind, such as cleaning and dehydrating. (Presently under litigation by the State with producers)

8. NPR takes delivery at the Lease and is responsible for the transportation of the oil.

9. Payment is monthly.

10. Security acceptable to the State must be provided.

11. NPR is responsible for disposing of all oil nominated. State is protected in the event of force majeure at NPR. State must make good faith effort to relieve NPR in the event of force majeure.

AGO 785725 +

12. Contract may be terminated by the State upon default of contract provisions by NPR.

13. NPR may terminate upon giving eight (8) months notice.

14. By advance agreement the supplier/purchaser relationship ends upon termination. This has been given OK by the FEA.

15. Contract may be amended between the parties, subject to approval by the Royalty Board and the Legislature, for each amendment.

Summary
Earth Resources Company of Alaska
Agreement for the Sale and
Purchase of State Royalty Oil

Earth Resources Company (North Pole Refining) owns and operates a 22,600 barrels per calendar day refinery at North Pole, Alaska. They are currently running approximately 20,000 barrels per day of North Slope crude and producing approximately 8,500 barrels per day of refined products for the Fairbanks area market. The remaining residual oil is returned to the TAP line. The products produced are Jet Fuel, Arctic Diesel, #1 and #2 Fuel Oil, and Industrial Turbine Fuel.

This company has been purchasing crude oil from the Prudhoe Bay producers (Exxon, Arco, Sohio and others) since the start of the refinery. They desire to purchase royalty oil to supplement their current purchases and to acquire a secure long-term source of supply.

This sales agreement provides that NPR may purchase up to 15% of the royalty oil from Prudhoe Bay plus additional quantities which are unobligated and available from Prudhoe Bay or other leases but not to exceed a total of 35,000 BPD. Should NPR not purchase a minimum of 5,000 BPD for three consecutive months, the State may cancel the Agreement.

As you know, NPR returns to the pipeline portions of the crude oil that are not marketed. They have also agreed to sell this return oil to other royalty oil purchases on fair and reasonable terms.

The price that NPR shall pay for this oil is equal to the amount the State would have received had the royalty oil been taken in-value. The price term is the same as included in the Alpetco contract.

The Point of Delivery, Passage of Title, and Responsibility passes from the State to NPR at the same point the State takes delivery. (This will be Pump Station #1.)

The State must provide crude oil for pipeline fill for NPR to fulfill NPR's tariff obligation. The State will receive payment for this quantity of crude oil upon termination of the Agreement.

NPR has agreed to process all royalty oil purchased at their North Pole refinery except in a force majeure situation or if NPR desires to trade or exchange this crude for other Alaskan crude or products. Should NPR desire to export products produced from the State, they agree to first consult with the Commissioner of Natural Resources to insure that such products are surplus to the State's needs.

The term of the Agreement is for 25 years or until the year 2003. NPR may terminate the Agreement on eight months notice. The State may terminate if NPR defaults under terms of the Agreement.

To secure payment for crude purchased by NPR, the State will receive either purchase money security interest in all oil delivered and products produced, or a letter of credit will be provided by NPR.

The provisions relating to Equal Opportunity Employment, Local Hire, and Oil Spill are the same as the Alpetco contract.

STATE OF ALASKA
DEPT. OF ENVIRONMENTAL CONSERVATION

JAY S. HAMMOND, GOVERNOR

POUCH O – JUNEAU 99811

March 22, 1978

The Honorable Kay Poland
Chairman
Senate Resources Committee
Pouch V
Juneau, Alaska 99811

Dear Madam Chairman:

During the hearings on CSHJR 60 which were held by your Committee, and during Senate floor debate, there were concerns raised that the Legislature--through its support of the resolution--might be supporting a cleanup program that would be all-encompassing and over-reactionary in its scope. As I have testified before your Committee, the Department intends to focus its efforts on those federal facilities which have long-standing solid waste problems. For example, the open dump at the Air Force's Barter Island DEWLine site (photographs attached) has been a problem for years. Despite years of prodding from EPA and officials of the Arctic National Wildlife Range, the Air Force refused to do anything about the problem. However, now that Congress has given the State of Alaska--and other states--authority to require federal agencies to comply with State solid waste rules, we are making the Air Force clean up this area.

Our priority list for cleanup has not been put into final form yet, but we have decided upon priority ranking for some federal facilities and lands. They are:

1. Top priority--active DEWLine sites which generally have open dumps which are--at best--serious problems.

2. No. 2 priority--inactive DEWLine sites. At several locations, the Air Force just shut down the site, left a mess and walked away. We intend to make them clean up the problems but do not intend to make them remove buildings which might provide shelter for a hunter in trouble or a downed airplane pilot.

3. No. 3 priority--federal lands which have been transferred to the Natives under the Alaska Native Claim Settlement Act. A good example of this problem is the 7,500 barrels which have been stacked for years at Manning Point near

Barter Island. According to information we have, those barrels were placed on the Point by the Air Force. However, the Kaktovik Inupiat Corporation has patented the land and the Air Force was reluctant to clean up the barrels and associated debris. We are, however, requiring in a solid waste permit to the Air Force that they must clean up the debris in cooperation with the corporation.

Other priorities have not been established, but I want to assure you and other members of the Senate that the Department is not planning to require cleanup actions which would be a wasteful expenditure of public funds. We want the large, long-standing messes cleaned up; we want the federal government to meet the same requirements that industry and municipalities must meet.

As I mentioned in the Committee hearings, the Department worked closely with Senator Gravel, the National Governors' Association and Congress to get the Alaska Federal lands study, and the requirement for federal agencies to obtain State permits, written into the Resource Conservation and Recovery Act. The purpose of those amendments was to have Congress direct the federal agencies to identify, and then clean up, solid waste problems in Alaska's federal lands. Again, I want to stress that we intend to focus our efforts on major, long-standing problems, and not on minor ones.

Sincerely,

Jerry Reinwand

Jerry Reinwand
Deputy Commissioner

STATE OF ALASKA
DEPT. OF ENVIRONMENTAL CONSERVATION

JAY S. HAMMOND, GOVERNOR

POUCH O – JUNEAU 99811

March 22, 1978

The Honorable Kay Poland
Chairman
Senate Resources Committee
Pouch V
Juneau, Alaska 99811

Dear Madam Chairman:

As you requested at Monday's meeting of the Senate Resources Committee, I have attempted to draft amendments to CSHJR 60 which will answer the concerns of certain members which have been expressed both in Committee and on the Senate floor. The proposed amendments are:

1. On page 1, line 27 add a new section:

   WHEREAS, federal cleanup programs to remove the debris should focus on those sites at which serious environmental and health problems are created by the solid waste, such as the open dumps which exist at the DEWLine sites along the Arctic coast; and

This proposed amendment would clarify the Legislature's intent that federal cleanup action should focus on major environmental problems, and should not deal with inconsequential problems such as those noted by Senator Huber (five-gallon fuel cans in the Arctic National Wildlife Range).

2. On page 2, lines 3, 4 and 5, delete:

   "Solid wastes identified in the preliminary and final reports prepared under the dictates of Section 3 of the Resource Conservation and Recovery Act of 1976 (P.L. 94-580) so that. . ."

3. On page 2, line 7, make the following changes:

   between "(P.L. 92-203)" and "can" add: "so that it"; and

   delete "expeditiously"; and

   between "eliminated" and "and" add: "in an expeditious and cost effective manner;"

These changes would change the paragraph to read:

"BE IT RESOLVED that the Alaska Legislature strongly urges all federal agencies administering public lands in Alaska to take swift action to remove or dispose of solid waste debris on Alaska's federal land and land transferred under the Alaska Native Claims Settlement Act (P.L. 92-203) so that it can be eliminated in an expeditious and cost effective manner; and be it"

These changes specifically address Senator Huber's concern that the paragraph, as originally written, would put the Legislature on record as supporting removal of all of the solid waste identified in the extensive inventories which are contained in the two solid waste reports mandated by the Resource Conservation and Recovery Act.

In addition to the proposed changes to the resolution, I offer for your consideration two additional items which may be useful to clarify Legislative intent on this matter. The first is a draft letter of intent which focuses on the concerns of Committee members. The second is a letter from me to you, with attached photographs of the Barter Island DEWLine site open dump, which you may wish to distribute to your fellow members of the Senate when the resolution comes to the floor. The intent of my letter, and the photographs, is to clarify the Department's priorities regarding our solid waste cleanup on federal lands program. These two items may or may not have value; I simply offer them for your consideration.

If I may be of further assistance to you on this matter, please do not hesitate to contact me.

Sincerely,

Jerry Reinwand
Deputy Commissioner

DEPT. OF ENVIRONMENTAL CONSERVATION

JAY S. HAMMOND, GOVERNOR

POUCH O -- JUNEAU 99811

February 7, 1978

The Honorable Steve Cowper
Chairman
House Finance Committee
Pouch V
Juneau, Alaska 99811

Dear Mr. Chairman:

Al Eagle and Chris Noah have informed me of your interest in the Department's efforts to persuade the Federal government to clean up existing solid waste problems on its lands. I thought that some background information on this matter might be useful to you.

Two years ago we worked closely with Senator Gravel, who is a ranking member of the Senate Environment and Public Works Committee and the National Governors' Association, to win Congressional approval of several provisions to the 1976 Resource Conservation and Recovery Act. The key provision waived the federal government's sovereign immunity, thereby requiring federal facilities to obtain State permits for solid waste disposal sites. The definition of a disposal site was purposefully written to be sweeping in its scope so that abandoned junk on federal lands could be regulated under a State's solid waste management program.

Another important provision which we were successful in placing in the Act mandates the federal government to complete a study of the federal lands solid waste problem in Alaska. The results of the study are to be submitted to Congress, together with any recommendations for action to correct the problem. I understand that Chris has given you a copy of the first report which was completed in October. A second report will be completed in mid-April and submitted to Congress. This Department is coordinating the study--at EPA's request--and we will be using the data gathered to design a comprehensive program to require the federal government to clean up the problems.

During the course of the study, we pinpointed several extremely serious problems which warrant immediate attention. One problem is the environmental messes that exist at certain active DEW line sites. Through our permit programs, we are requiring the Air Force to take action to correct them. I

have enclosed a copy of the draft permit which we are proposing to issue to the Air Force for its Barter Island site. The draft permit is being circulated to the Air Force and interested members of the public for review and comment. When we have received comments from the Air Force and public, we will sift through them to determine if changes should be made in finalizing the permit.

We plan to take similar action where problems exist on federal lands throughout the State. The message we are sending to the federal government is that we want compliance with State solid waste laws and regulations, and we want compliance to be accomplished in an expeditious manner.

If you have any questions on this matter, please do not hesitate to contact me or my Deputy Commissioner Jerry Reinwand.

Sincerely,

Ernst W. Mueller

WASTE DISPOSAL PERMIT
(SOLID WASTE MANAGEMENT PERMIT)

Permit No. NR-1-78 Date of Issuance:

This Waste Disposal Permit is issued to Department of the Air Force, Detachment 3, 46th Aerospace Defense Wing (ADCOM), Petersen Air Force Base, Colorado 80914, for the operation and maintenance of a solid waste facility located in SE 1/4, Sec. 13, T9N, R34E Umiat Meridian, at Barter Island DEW Line Station, Alaska

and is subject to the conditions and stipulations in sections A.1 through D.9, of this permit and the applicable State laws and regulations.

This permit is issued under provisions of Alaska Statutes, AS 46.03.100-110, Water, Air, and Environmental Conservation, Alaska Administrative Code as amended or revised, and other applicable State laws and regulations.

This permit is effective upon issuance and expires July 31, 1980; it may be terminated or modified in accordance with AS 46.03.120.

This permit is not valid until signed by the Deputy Commissioner of the Department of Environmental Conservation.

Deputy Commissioner
Department of Environmental Conservation

A. SITE PREPARATION--The permittee shall

1. Submit to this department for approval, on or before April 15, 1978. A disposal site development and operation plan for the permitted facility. The plan shall include:

   a. detailed facility maps or plan sheets showing existing contours, proposed developments, type of landfill method (trench or area), locations, diminsions and order of refuse cell construction and proposed finished site contours.

   b. description of the existing site soil profile.

   c. detailed narrative of the proposed developments including step by step descriptions of the proposed operating procedures for trench excavation, cell construction, scrap metal recovery and other activities associated with operation of the disposal facility.

   Upon receiving departmental approval, this permit will be amended to incorporate the approved plan activities as an integral part of the permit.

2. Maintain a working copy of the department approved development and operational plan from A.1. at Bar-M for use in constructing and operating the facility.

3. Submit a proposed schedule of operating hours and days to this department for review and approval within thirty days of the date of issuance of this permit.

4. Erect and maintain signs informing users of the site operating hours and rules, and signs directing users to the active dumping point.

B. CLEAN UP OF EXISTING SOLID WASTE--The permittee shall:

1. Remove all solid wastes from the existing open dump and transfer it to the proposed facility. Salvageable metal shall be separated and stockpiled in the proposed reclaimable metal holding area. The remaining solid waste shall be landfilled in accordance with the department approved site development plan specified in A.1. All solid wastes shall be transferred and processed, and the existing dump closed and restored not later than September 15, 1978.

2. Collect all solid wastes from the shallow waters, inter-tidal areas and beaches near the Bar-M station and the affected portions of the Arctic Wildlife Range. Collected wastes shall be transported to the proposed landfill for processing and disposal as specified in B.1.

3. Transport the abandoned metal tower located about one and one-half miles from the existing open dump to the proposed reclaimable metal holding area, on or before September 15, 1978.

4. Cleanup and restore the Manning Point site by September 15, 1979. Cleanup activities shall be coordinated with the North Slope Borough and the Kaktovik Inupiat Corporation. A plan for the cleanup will be submitted to the North Slope Borough, the Kaktovik Inuipiat Corporation and this department's Northern Region Office at least 90 days before the initiation of any cleanup action. The cleanup shall include at a minimum:

   a. Collection and removal from Alaska of all P.O.L. barrels by September 15, 1979.

   b. Removal of all collapsed buildings, and collection of all miscellaneous solid waste. Scrap lumber and wood may be open burned under terms of an Open Burning Permit to be obtained from the department's Northern Regional Office. All other materials shall be transported to the proposed landfill for salvage or disposal.

   c. Surface rehabilitation, including reseeding of disturbed areas, shall be accomplished no later than September 15, 1979.

5. Remove from Alaska, no later than September 15, 1979, all salvageable and reclaimable materials collected during the cleanup operations.

C. OPERATION--The permittee shall:

1. Consolidate and compact the deposited wastes into cells in accordance with the approved submittal required in A.1., above.

2. Cover the compacted refuse with at least six inches of compacted soil at the end of each operating day.

3. Separate salvageable metals and stockpile them in the reclaimable metals holding area indicated on the permit application. The accumulated wastes shall be transported South to a processing center and the holding area cleaned out at least once each year.

4. Collect all littered and windblown wastes in and adjacent to the disposal facility at least once each month and return them to the active dumping point for burial.

5. Prohibit open burning on the landfill and immediately extinguish any fires that may occur.

6. Prohibit the deposition of waste oil and petroleum products and chemical and hazardous wastes.

7. Incinerate all combustible and putrescible waste generated at the Bar-M station prior to disposal.

8. Comply with all portions of the permit application not otherwise addressed herein.

D. GENERAL

1. The permittee shall allow the Commissioner of Environmental Conservation or his authorized representative, upon presentation of credentials,

a. to enter upon the permittee's premises where waste collection or disposal works are located at such times and upon such terms as the Department may reasonably require, and
b. at reasonable times, to have access to and to be allowed to copy any records required to be kept under the terms and conditions of this permit and to inspect any monitoring equipment or monitoring method required in this permit.

2. Availability of Records

Except for information relating to secret processes or methods of manufacture, all records and reports prepared in accordance with the terms of this permit shall be available for public inspection at the offices of the Alaska Department of Environmental Conservation.

3. Civil and Criminal Liability

Nothing in this permit shall be construed to relieve the permittee from civil or criminal penalties for noncompliance, whether or not such noncompliance is due to factors beyond his control, including but not limited to accidents, equipment breakdowns, or labor disputes.

4. Property Rights

The issuance of this permit does not convey any property rights in either real or personal property, or any other privileges; nor does it authorize any injury to private property or any invasion or personal rights, nor any infringements of federal, State or local laws and regulations.

5. Severability

The provisions of this permit are severable and, if any provision of this permit or the application of any provision of this permit to any circumstances is held invalid, the application of such provision to other circumstances and the remainder of this permit shall not be affected thereby. Notwithstanding the above, in the event that such invalidation materially alters the scope or conditions of this permit, the Department shall have the right, at its sole option, to terminate the permit.

6. State Laws

Nothing in this permit shall be construed to preclude the institution of any legal action or relieve permittee from any responsibilities, liabilities, or penalties established pursuant to any applicable State law or regulation.

7. Posting of Permit

The permittee shall post conspicuously and maintain a copy of this permit at the disposal facility.

8. Transfers

This permit is not transferable and is the property of the State of Alaska, Department of Environmental Conservation. Should operation

of the facility be contracted or a change in contractors be made, the new contractor shall be notified in writing of the existence of the permit and its conditions. A copy of the written notification shall be forwarded to the Commissioner of the Department of Environmental Conservation.

9. This permit shall be amended to provide for the upgrading or closure of the site, if the facility is classified as an "open dump" in accordance with the inventory and definitions being developed by the Environmental Protection Agency under the Resource Conservation and Recovery Act of 1976, P.L. 94-580.

updating of standards for recovered materials and for the use of recovered materials in various industrial, commercial, and governmental uses.

"DEVELOPMENT OF MARKETS FOR RECOVERED MATERIALS

"SEC. 5003. The Secretary of Commerce shall within two years after the enactment of this Act take such actions as may be necessary to— 42 USC 6953.

"(1) identify the geographical location of existing or potential markets for recovered materials;

"(2) identify the economic and technical barriers to the use of recovered materials; and

"(3) encourage the development of new uses for recovered materials.

"TECHNOLOGY PROMOTION

"SEC. 5004. The Secretary of Commerce is authorized to evaluate the commercial feasibility of resource recovery facilities and to publish the results of such evaluation, and to develop a data base for purposes of assisting persons in choosing such a system. 42 USC 6954.

"Subtitle F—Federal Responsibilities

"APPLICATION OF FEDERAL, STATE, AND LOCAL LAW TO FEDERAL FACILITIES

"SEC. 6001. Each department, agency, and instrumentality of the executive, legislative, and judicial branches of the Federal Government (1) having jurisdiction over any solid waste management facility or disposal site, or (2) engaged in any activity resulting, or which may result, in the disposal of solid waste or hazardous waste shall be subject to, and comply with, all Federal, State, interstate, and local requirements, both substantive and procedural (including any requirement for permits or reporting or any provisions for injunctive relief and such sanctions as may be imposed by a court to enforce such relief), respecting control and abatement of solid waste or hazardous waste disposal in the same manner, and to the same extent, as any person is subject to such requirements, including the payment of reasonable service charges. Neither the United States, nor any agent, employee, or officer thereof, shall be immune or exempt from any process or sanction of any State or Federal Court with respect to the enforcement of any such injunctive relief. The President may exempt any solid waste management facility of any department, agency, or instrumentality in the executive branch from compliance with such a requirement if he determines it to be in the paramount interest of the United States to do so. No such exemption shall be granted due to lack of appropriation unless the President shall have specifically requested such appropriation as a part of the budgetary process and the Congress shall have failed to make available such requested appropriation. Any exemption shall be for a period not in excess of one year, but additional exemptions may be granted for periods not to exceed one year upon the President's making a new determination. The President shall report each January to the Congress all exemptions from the requirements of this section granted during the preceding calendar year, together with his reason for granting each such exemption. 42 USC 6961.

Exemptions.

Presidential report to Congress.

SOLID WASTE CLEANUP ON FEDERAL LANDS IN ALASKA

Study.
42 USC 6981 note.

SEC. 3. (a) The President shall direct such executive departments or agencies as he may deem appropriate to conduct a study, in consultation with representatives of the State of Alaska and the appropriate Native organizations, to determine the best overall procedures for removing existing solid waste on Federal lands in Alaska. Such study shall include, but shall not be limited to, a consideration of—

(1) alternative procedures for removing the solid waste in an environmentally safe manner, and

(2) the estimated costs of removing the solid waste.

Report to congressional committees.

(b) The President shall submit a report of the results together with appropriate supporting data and such recommendations as he deems desirable to the Committee on Public Works of the Senate and to the Committee on Interstate and Foreign Commerce of the House of Representatives not later than one year after the enactment of the Solid Waste Utilization Act of 1976. The President shall also submit, within six months after the study has been submitted to the committees, recommended administrative actions, procedures, and needed legislation to implement such procedures and the recommendations of the study.

Llangollen Landfill, Del., leachate control research program.
42 USC 6981 note.

SEC. 4. (a) In order to demonstrate effective means of dealing with contamination of public water supplies by leachate from abandoned or other landfills, the Administrator of the Environmental Protection Agency is authorized to provide technical and financial assistance for a research program to control leachate from the Llangollen Landfill in New Castle County, Delaware.

Cooperation with EPA.

(b) The research program authorized by this section shall be designed by the New Castle County areawide waste treatment management program, in cooperation with the Environmental Protection Agency, to develop methods for controlling leachate contamination from abandoned and other landfills that may be applied at the Llangollen Landfill and at other landfills throughout the Nation. Such research program shall investigate all alternative solutions or corrective actions, including—

(1) hydrogeologic isolation of the landfill combined with the collection and treatment of leachate;

(2) excavation of the refuse, followed by some type of incineration;

(3) excavation and transportation of the refuse to another landfill; and

(4) collection and treatment of contaminated leachate or ground water.

Such research program shall consider the economic, social, and environmental consequences of each such alternative.

(c) The Administrator of the Environmental Protection Agency shall make available personnel of the Agency, including those of the Solid and Hazardous Waste Research Laboratory (Cincinnati, Ohio), and shall arrange for other Federal personnel to be made available, to provide technical assistance and aid in such research. The Administrator may provide up to $250,000, of the sums appropriated under the Solid Waste Disposal Act, to the New Castle County areawide waste treatment management program to conduct such research, including obtaining consultant services.

42 USC 6901 note.

HJR 60

STATE OF ALASKA

DEPT. OF ENVIRONMENTAL CONSERVATION

JAY S. HAMMOND, GOVERNOR

POUCH O – JUNEAU 99811

February 22, 1978

The Honorable Alvin Osterback
Chairman
Resources Committee
House of Representatives
Pouch V
Juneau, Alaska 99811

Dear Mr. Chairman:

I understand that your Committee is planning to receive testimony on House Joint Resolution No. 60 (requesting the federal government to remove solid waste on land in Alaska in accordance with the Resource Conservation and Recovery Act). This department played an active role in shaping several provisions of the Federal Resource Conservation and Recovery Act (RCRA). To provide you with some background information on the issue addressed by HJR 60, I thought that it might be useful to include some history of our involvement with the Act and our basic rationale for the provisions which we persuaded Congress to include in the law.

Two years ago Deputy Commissioner Reinwand and I worked closely with the National Governors' Association and Senator Gravel, who is a ranking member of the Senate Environment and Public Works Committee, to win congressional approval of several provisions to the 1976 Resource Conservation and Recovery Act. The key provision waived the federal government's sovereign immunity, thereby requiring federal facilities to obtain state permits for solid waste disposal sites. The definition of a disposal site was purposefully written to be sweeping in its scope so that abandoned junk on federal lands could be regulated under a state's solid waste management program.

Another important provision which we were successful in placing in the Act mandates the federal government to complete a study of the federal lands solid waste problem in Alaska. The results of the study are to be submitted to Congress, together with any recommendations for action to correct the problem. A second report will be completed in mid-April and submitted to Congress. This department is coordinating the study--at EPA's request--and we will be using the data gathered to design a comprehensive program to require the federal government to clean up the problems.

During the course of the study, we pinpointed several extremely serious problems which warrant immediate attention. One problem is the environmental messes that exist at certain active DEWLine sites. Through our permit programs we are requiring the Air Force to take action to correct them. I have enclosed a copy of the draft permit which we are proposing to issue to the Air Force for its Barter Island site. The draft permit is being circulated to the Air Force and interested members of the public for review and comment. When we have received comments from the Air Force and public, we will sift through them to determine if changes should be made in finalizing the permit.

We plan to take similar action where problems exist on federal lands throughout the State. The message we are sending to the federal government is that we want compliance with State solid waste laws and regulations, and we want compliance to be accomplished in an expeditious manner.

Therefore, we support the thrust of HJR 60 and deeply appreciate the Legislature's interest in this matter. However, there are a few technical changes which we would like to recommend that the Committee consider. They are:

1. On page 2, line 1, we recommend that the words "the Environmental Protection Agency to implement" be stricken, and replaced with: "all federal agencies administering public lands in Alaska to take swift action to remove or dispose of solid wastes identified in."

   The rationale for this change is that the appropriate land management agencies, not EPA, should be responsible for cleaning up the existing solid waste problems.

2. On page 2, line 7, we recommend the inclusion of the following paragraph:

   "BE IT FURTHER RESOLVED that the Alaska Legislature strongly supports the Department of Environmental Conservation in its regulatory programs to require federal agencies to take action to solve the long-standing environmental problems created by the solid waste which the federal government has left throughout the State."

   This paragraph would buttress the Department's current and planned efforts to require the federal government to solve the solid waste problem in an expeditious manner.

Support from the Legislature would strengthen the Department's efforts in dealing with the federal agencies.

3. On page 2, line 11, between the words "Congress" and "and" insert: "the Honorable Jennings Randolph, Chairman of the Senate Environment and Public Works Committee, the Honorable Harley O. Staggers, Chairman of the House Committee on Interstate and Foreign Commerce."

We recommend inclusion of these two members of Congress as they chair the committees which have jurisdiction over solid waste legislation.

If you have any questions on this matter, please do not hesitate to contact me or my Deputy Commissioner Jerry Reinwand.

Sincerely,

Ernst W. Mueller
Commissioner

Enclosure

STATEMENT OF

JERRY REINWAND
DEPUTY COMMISSIONER
DEPARTMENT OF ENVIRONMENTAL CONSERVATION

REGARDING
HOUSE JOINT RESOLUTION NO. 60
BEFORE THE
HOUSE RESOURCES COMMITTEE

JUNEAU, ALASKA
FEBRUARY 24, 1978

Mr. Chairman, members of the Committee, my name is Jerry Reinwand and I am Deputy Commissioner of the Alaska Department of Environmental Conservation. It is with a great deal of pleasure that I testify today on HJR 60.

The focus of the resolution--encouraging the federal government to clean up the long-standing solid waste problems which various agencies have left scattered throughout the State--is of great concern to the Department. In fact, we have been working on a solution to the problem for more than two years. A substantial part of that effort involved joining hands with the National Governors' Association and other groups to persuade Congress to give Alaska and other states the legal tools to require federal agencies to clean up their environmental blights. In the 1976 Resource Conservation and Recovery Act Congress gave the states this authority. A brief history of our effort is contained in Commissioner Mueller's letter to Chairman Osterback; therefore, I will not repeat it in this testimony.

However, I would like to inform the Committee of the Department's plans regarding cleanup on federal lands. Due to two key provisions of the Act (dealing with federal facilities compliance and the Alaska lands study) we now know with certainty the extent and location of the problem areas. We are in the final stages of establishing a priority list of areas which warrant immediate attention. Our initial targets will be the inactive and active DEWLine sites in the Arctic, and the abandoned solid waste on National Petroleum Reserve in Alaska.

To implement the cleanup at the DEWLine sites, we are in the process of issuing permits to the Air Force which will require the problem to essentially be solved by this fall. The permits will establish specific timetables for completing sequential phases of the cleanup. In the past, the Air Force has promised to take steps to solve sewage disposal and solid waste problems at the DEWLine sites, but these promises were little more than lip service in lieu of action. We do not intend to allow the Air Force to repeat this pattern of inaction. We want compliance with all permit conditions and we intend to take legal action, if necessary, to obtain compliance.

To insure that the Air Force complies with permit conditions, we are considering naming in each permit the Secretary of Defense, Secretary of the Air Force, Director of the Headquarters Aerospace Defense Command in Colorado (the official who is responsible for DEWLine operations in Alaska) and the

chief of each DEWLine site as the officials who are responsible to assure that permit conditions are met. By targeting these top federal officials as persons who are clearly responsible for permit compliance, we should cut through the perennial bureaucratic smokescreen which in the past has clouded efforts to determine who is responsible for implementing cleanup action. Under our proposed plan, everyone from the Secretary of Defense on down would know that the Department is demanding compliance and will not hesitate to grab the federal government's top officials by the scruff of the neck and haul them into State Court to achieve compliance. We think this approach is necessary if we are to short-circuit the bureaucratic finger-pointing and buck-passing which has occurred when federal agencies have failed to live up to their promises. In the past, when promised action failed to materialize, the federal agency attempted to tag either some faceless Washington, D. C., bureaucrat or its contractors as the culprits. Under our proposed plan of action this bureaucratic buck-passing will cease; all fingers of responsibility will clearly point to the Secretary of Defense as the person who is ultimately responsible for assuring compliance.

In closing I would ask the Committee's indulgence in allowing me to make one final comment which may be editorial in nature. It reflects my personal views and is not in any way to be construed as the position of the Department. As the solid waste study has shown, the federal government has littered Alaska's landscape by sprinkling solid waste across federal lands for more than 30 years. With the exception of recent cleanup

efforts in National Petroleum Reserve in Alaska, the federal land management agencies have done virtually nothing to address these problems. Instead, they have ignored them. Put simply, the federal government's track record on this aspect of land management is--at best--abysmal.

This smudged page of Alaska's environmental history has somehow been overlooked by the federal bureaucracy which is presently clamoring to place vast tracts of Alaska's lands in single-purpose classifications categories. The silent but ever-present underlying theme championed by the bureaucracy is that such action is necessary in order to protect Alaska from Alaskans. I submit that such logic is not only convoluted, it is erroneous. As was clearly demonstrated in the study, the federal government has proven for more than three decades that it is incapable of handling such routine land management and environmental problems as properly disposing of its garbage and other solid waste. I leave you to draw your own conclusions regarding the federal government's ability to act as an environmental custodian of the proposed D-2 lands, but you can color me skeptical.

Mr. Chairman, that concludes my testimony; if you or any members of the Committee have any questions, I shall be most happy to attempt to answer them.
