Representative Alvin Osterback
Co-Chairman, Resources Committee
House of Representatives
Pouch V
Juneau, Alaska 99811

Dear Representative Osterback and Committee Members,

As a former member of the Guide Board, I have an abiding interest in its success. Any objective study or audit of the Board will show that a lot has been accomplished in the face of adversity. The Board, through its dedicated chairman, has accomplished the near-impossible in straightening out and bringing some degree of professionalism to the guiding business.

Because of this, we are distressed that a more positive report regarding the sunset review did not come out of your committee (House Journal, No. 29, 3-13-80). We are particularly concerned about paragraphs 5 and 5a. Surely the clean bill given the Board by the Division of Legislative Audit and by the Senate Commerce Committee this year warrant better than a one year extension by your committee! What long range plans can be carried out with a restriction like that? What further miracles must the Board perform to be given a pat on the back and encouraged rather than have additional road blocks thrown in the way?

Judging from Represenative Rick Halford's request to the AG's office for a legal review of the Board, he may have had an adverse affect on your committee's report. It would appear to us, based on wording in Halford's request, that his personal and family problems with the Board may be coloring his views.

It is rumored in Fairbanks that Representative Halford has had lucrative summer flying contracts for the Game Department. Until this is checked out, we can only question the propriety of such practices by a legislator and wonder about conflict of interest problems--moral, if not legal. Maybe the AG should be asked about this?

The Guide Board needs assistance and encouragement, not unnecessary impediments. Much has been accomplished and much more can be accomplished if the Board is given a chance. It doesn't appear your committee is giving it that chance.

Sincerely,
Interior Wildlife Assoc.

Bud Wiese
Director

Licensing

STATE OF ALASKA
Guide Licensing and Control Board
May, 1979

Findings

The Guide Licensing and Control Board functions to establish guiding areas, limit the number of guides in areas, and assure that a guide is competent enough to care for himself and others in the remote setting. Guides are also concerned with environmental conservation and animal husbandry. Regulation of this profession is in the best interests of the State and should be continued. The Board is carrying out its duties in a responsible manner and appears to be meeting needs and demands reasonably; therefore, we believe the Board also should be continued. Guides and their clients are also subject to Alaska Department of Fish and Game hunting regulations.

Section 1, ch. 106, SLA 1976, provides: "Purpose. It is the purpose of this Act to protect the safety of the citizens of the state and better manage and protect its resources by licensing persons who transport hunters for hire so that reasonable standards and guidelines will be met and activities affecting the state's game resources will be more accurately monitored and assessed."

I. General Information

A. Regulated Parties

1. Master Guides
2. Registered Guides
3. Class-A Assistant Guides
4. Assistant Guides
5. Transporters

B. Definitions

"(2) 'guide,' 'guides' or 'guiding' means assisting another person to take game with the intent of receiving monetary or material remuneration for the services, by accompanying and directing that person personally or through a licensed assistant guide for the duration of a hunt, and not solely for the purpose of providing transportation services;

(5) 'transporting' or the 'activity of transporting' means conveying a person by any lawful means to an area for remuneration or material benefit in excess of normal operating costs, when the primary purpose of the person being conveyed is the taking of big game and the associated removing of big game meat and parts of big game after big game has been taken; big game as used in this paragraph means game which, if taken by a nonresident, would require a big game tag." (AS 08.54.240)

C. Nature and Composition of Board

1. Board members and terms:

Three-year term (no restrictions regarding consecutive terms or number of terms).

Marcus F. Jensen (Chairman)	ends June 15, 1980
Clark Engle	ends June 15, 1981
Glen Glenzer	ends June 15, 1980
Charles Keim	ends June 15, 1979
Hubert Weise	ends June 15, 1979
Norman Sutliff	ends June 15, 1979
Donald Harris	ends June 15, 1981

2. Representation:

Profession - 3
Public = 4

3. Qualifications:

"...No more than three members of the board shall have a guide license. The other members shall have a general knowledge of the game resources of the state. A minimum of 10 years residence in the state is required for all members of the board." AS 08.5..010

D. Licensing Data

Current licenses (effective May, 1979)

Master guides	=	35
Registered guides	=	268
Class-A assistants	=	95
Assistant guides	=	413
Transporters	=	47
Total		858

All licentiates in this profession are in-State.

E. Fees

1.	master guide license, annual	$75.00
2.	registered guide license, annual	75.00
3.	class-A assistant guide, annual	15.00
4.	assistant guide license, annual	10.00
5.	transporter license	10.00
6.	examination fee	25.00

(Also subject to Fish and Game fees under AS 16.05.340(e).)

(EXCLUDES DIVISION OF OCCUPATIONAL LICENSING ADMINISTRATIVE OVERHEAD)

G. Complaints

Enforcement of Guide Licensing and Control statutes and regulations is the responsibility of the Department of Public Safety, Division of Fish and Wildlife Protection. An Anchorage based Assistant Attorney General is specifically designated for the Board. Sixty-

one investigations were reported to have been conducted by the Division of Fish and Wildlife Protection during the period from April, 1977 through April, 1979. During this same period 35 accusations were filed for disciplinary hearings before the Board.

II. Analysis

A. To what extent has the Guide Licensing and Control Board operated in the public interest?

The Board operates to protect the public interests by controlling hunting activity, promoting hunter safety, and protecting wildlife resources. Accordingly, the Board has statutory responsibility for: (1) preparation, grading and administration of examinations; (2) passing on applicant qualifications; (3) regulation of guide activity and performance standards; (4) maintaining a current register; (5) maintaining and publishing a list of active registered or master guides; (6) regulating guide activities and conduct; (7) revocation, denial and suspension of licenses; (8) establishing geographical guiding quotas; and (9) adoption of procedural and substantive regulations concerning guiding.

Special permit provisions exist for qualified applicants who are limited by language barriers. Candidates for examination who may not fully understand the English language may be given the examination orally in their native language. The Board has recently concentrated a great deal of effort in recruiting qualified guides from remote bush and coastal areas. A separate guiding district has been created (making a total of 27) which includes all western, northwestern and northern Alaska coastal areas north of latitude 50° north for the purpose of regulating marine mammal hunting. Board members have traveled to outlying villages to educate the populace on guide qualifications and to take applications for licensure. Meetings in Nome and/or Kotzebue are planned in 1979 assuming an Arctic guide program is started.

Examinations given by the Guide Licensing and Control Board are Board constructed. Only applicants for registered guide status must take a written examination. Oral examinations are administered by the Board to candidates for both registered and master guide. A passing score of 80% must be achieved. Even though the Board has failed applicants on the basis of the oral examination, it has not made or kept a record of these proceedings. The Board should record all oral examinations in support of its determinations and should ensure that its reasons for denial of applications and licenses are cited in meeting minutes and in notices to the applicant. Review indicated that this procedure is not always followed.

State licensure constitutes exclusive permission to engage in an activity that would otherwise be unlawful. Board procedures are designed to assure that those persons so licensed and engaged are qualified by virtue of past experience and demonstrated competence.

The Anchorage office of the Division of Fish and Wildlife Protection maintains records and files on all enforcement activities and on all guides. These records are complete and up to date. Individual guide files contain all relevant information from initial licensure to latest renewal. A transfer of the Board and regulation to the Division of Fish and Wildlife Protection should be given consideration, particularly in view of the fact that the division has responsibility for enforcement of guiding laws. In a memorandum dated November 8, 1978, to the Office of the Governor, an official of the Department of Public Safety indicated that such a transfer would be favorable. The Board also has indicated support for this proposal.

The Guide Licensing and Control Board is active in disciplinary proceedings concerning the profession. A number of hearings have been held by the Board and subsequent action taken. Viability of enforcement is

largely due to authorization of investigation, administrative support services and Department of Law assistance assigned particularly to guide activities.

AS 08.54.190(a) provides that all licenses expire every year on December 31. As of May, 1979, 858 licenses were in effect and the number increases every year. A statutory amendment should be considered which would allow for biennial renewal.

AS 08.54.200(c)(3) makes revocation of a guide license mandatory upon conviction of two violations of federal or State sport fish, game or guide statutes or regulations. The Board is presently given no discretion or latitude by which it may consider the seriousness of offenses or lesser disciplinary action such as suspension; the most minor violations must result in license revocation. SB 101, with which the board is in agreement, was introduced during the 1979 session of the Legislature (see Appendix A). Passage of this bill would allow the Board to take disciplinary action commensurate with the nature of offenses.

Transporters are required by AS 02.05.040 (the Alaska Air Commerce Act of 1960) to have "in force a certificate issued by the commission [Alaska Transportation Commission] authorizing that person to engage in air commerce as a certificated carrier, contract carrier, or air taxi operator." Title 02, § 170(f), also requires filing of game transporter reports with the Department of Fish and Game. The Alaska Business Act (43.70) requires that transporters maintain a current business license. An abundance of regulations covering this subject also exists under AS 16.05, Fish and Game Code. Licensed guides are exempt from license requirements for transporters. In view of the enforcement and regulatory difficulties encountered in this area, and the fact that transporters are otherwise regulated, it is suggested that appropriate revisions be made to Guide Licensing statutes.

12 AAC 38.055 provides for a limited time waiver of guide area use requirements in case of death of a permit holder. During this period "an heir may apply to the board for a reassignment of the permit to a person designated by the heir" (emphasis added). In case of mental incompetence, a guardian may, during this same limited period "apply to the board for a reassignment of the permit to a person designated by the guardian" (emphasis added). It is questionable whether designation of permit holders should be done by heirs and guardians and whether preference should be given by the Board to persons so designated. It should not be a function of a State board to protect the monetary interests of a licentiate. Rather, the Board should consider the qualifications of all applicants, as is done in other instances, and grant permits on that basis alone.

B. To what extent has the operation of the Guide Licensing and Control Board been impeded or enhanced by existing statutes, procedures and practices which it has adopted, or any other matter, including budgetary, resource and personnel matters?

Resources and services provided for this Board far exceed those provided for other boards and commissions under Title 8. As previously noted, enforcement and investigation of its statutes and regulations is adequately handled by the Department of Public Safety. The Board has been assigned an Assistant Attorney General, located in Anchorage, and issues have been pursued actively, both by the Department of Law and by the Board. Other support staff is provided by the Division of Occupational Licensing and is presently adequate. Employee turnover has impeded to some extent continuity and follow through on Board requests.

The Board has not been particularly impeded by budgetary constraints. Meetings and/or hearings have been scheduled as necessary. A special appropriation in the amount of $10,000 was made by the Legislature in 1979 to allow the Board to conduct hearings and formulate procedures

related to hunting of marine mammals. Fees and revenues for all boards and commissions under the jurisdiction of the Division of Occupational Licensing are collected through the Division and are deposited into a general fund. Monies deposited and withdrawn are identified by codes so that direct board revenues and expenses may be determined.

The Board has expressed a desire to repeal statutes in Title 8 concerning transporters (§§ 142, 144 and 146). Interpretation of AS 08.54.130(2) has apparently caused some confusion in that it is not clear whether the supervisor of a Class-A assistant should be in the guide unit or merely giving direction from any location in the State. AS 08.54.190(a) should be amended to allow for biennial rather than annual renewal of licenses. SB 101, introduced in 1979, would give the Board some latitude in disciplinary actions where guide have been convicted of federal or State sport fish, game or guide laws.

Examinations for registered and master guides are given once a year in November or December, in Anchorage. Control and security of testing materials is maintained by the Department of Public Safety. Board regulations state that applicants who fail either the written or oral test may not be reexamined for six months. An annual examination procedure means that an applicant who fails will miss an entire subsequent hunting season before he can take the next examination. It is suggested that consideration be given to scheduling two examinations each year in two areas of the State to coincide with regular Board meetings.

Public members are included in the composition of the Board. Total membership of seven is felt to be adequate. Terms of membership are three years, however, at least two members have served since the Board was established in 1973.

C. To what extent has the Guide Licensing and Control Board recommended statutory changes which are generally of benefit to the public interest?

In 1976 statutory amendments concerned regulation of transporters and "housekeeping" items. One significant 1976 amendment mandated that the Board "establish a quota of licensed operating guides who may operate within designated geographical game units or subunits of the state and provide for an equitable and reasonable procedure for limiting the number of guides to that quota" (AS 08.54.040(a)(8)). The Board has recently accomplished this directive.

Statutory recommendations made by the Board have been cited previously.

D. To what extent has the Guide Licensing and Control Board encouraged interested persons to participate in and report to it concerning the making and effect of its regulations and decisions, or to report to it concerning the effectiveness, economy, and availability of service which it has provided?

Guide Board meetings and hearings are well attended by interested parties. Petitioners before the Board will not even have their petitions considered unless they or their representative(s) are present. Any party possibly affected by a petition is also notified that the matter will be discussed so they may participate.

There is evidence to indicate that Board members have made themselves visible and available to members of the public and the industry. Some members have spent a considerable amount of time on personal correspondence and even personal visits with interested parties in some cases. For instance, members have traveled to Nunivak to meet with and recruit potential guides.

Public interests are felt to be furthered by the presence of public members on professional boards. "In recent years a number of states have added one or more public members (citizens with no particular interest in the occupation or profession governed by the board) to licensing boards in an effort to ensure that the interests of the public would be represented in decisionmaking."[1] The State of California, which provides for a one-third public membership on health care boards and a public majority on others, has indicated that its experience with public members has been highly rewarding.

E. How efficiently are public inquiries or complaints regarding the Guide Licensing and Control Board processed and resolved?

Routine correspondence regarding Board activities may be responded to by the Division of Fish & Wildlife Protection, the Division of Occupational Licensing or by individual Board members. Review of Board files indicates that responses generally are made in an appropriate and timely manner.

Sixty-one investigations were reported to have been conducted by the Division of Fish and Wildlife Protection during the period from April, 1977 through April, 1979. Thirty-five Accusations for Disciplinary Hearings before the Board were filed during this time.

---

[1] Shimberg, B. and Roederer, D., Occupational Licensing: Questions a Legislator Should Ask, The Council of State Governments, Lexington, Kentucky, March, 1978, pg. 20.

At least one complaint regarding the examination was filed with the Office of the Ombudsman and was determined by that office to have been partially justified.

F. To what extent does the Guide Licensing and Control Board present qualified applicants to serve the public?

Individuals seeking licensure must submit fees and qualifying documents to the administrative agency for consideration by the Board. Examinations for registered and master guides are given annually. Applicants who are qualified and/or demonstrate a specified level of knowledge and proficiency are issued a license.

Licensure does not, however, guarantee assignment of hunting units. This is also determined by past use, animal resources and number of guides already in the area, and compatibility with present users and facilities. Current policy limits the number of hunting units that a guide may be certified for; past assignments in excess of the general limit were not rescinded but once lost or forfeited are usually reassigned to another qualified applicant. These procedures are intended to comply with § 040(a)(8).

G. To what extent have State personnel practices, including affirmative action requirements, been complied with by the Guide Licensing and Control Board in its own activities, and in its area of activity or interest?

Board staff consists of the support services of a licensing examiner employed by the Division of Occupational Licensing (also responsible for

two other boards) who is hired through the State Personnel System and is subject to affirmative action.

Licenses are issued on the basis of specific criteria. Affirmative action requirements are not applicable to these licensure qualifications.

H. To what extent are statutory, regulatory, budgetary, or other changes necessary to enable the Guide Licensing and Control Board to better serve the interests of the public?

Transfer of licensing and record keeping functions to the Department of Public Safety would contribute to continuity and centralization of Board operations. Enforcement and investigative services provided by that Department, and the services of the Department of Law, have proved satisfactory.

AS 08.54.190(a) should be amended to allow for biennial renewals. § 200(c)(3) should be amended to vest some disciplinary discretion with the Board in instances concerning convictions of minor violations. §§ 142, 144 and 146, concerning transporters, should be repealed. This intent was also expressed by the Board by resolution at its April 3, 1979 meeting.

The Board should review its regulations with respect to implications that heirs and guardians of permit holders may designate successors. The Board should also consider regulatory clarification of "supervision" as cited in § 130(2).

The Board should reconsider its policy of scheduling examinations only annually and only in Anchorage.

Article 1. Guide Licensing and Control Board.

Section
10. Creation and membership of board
20. Appointment and term of office
30. Chairman of board
40. Powers and duties
45. Special guiding permit
50. Board regulations
60. Board hearing
70. Compensation and expenses

Sec. 08.54.010. Creation and membership of board. There is created the Guide Licensing and Control Board consisting of seven members. No more than three members of the board shall have a guide license. The other members shall have a general knowledge of the game resources of the state. A minimum of 10 years residence in the state is required for all members of the board. (§ 1 ch 17 SLA 1973)

Sec. 08.54.020. Appointment and term of office. The members of the board shall be appointed by the governor and confirmed by the legislature for staggered terms of three years or until their successors are appointed. Initial terms are as follows: three members for one year, two members for two years, and two members for three years. A member may be removed at the pleasure of the governor. (§ 1 ch 17 SLA 1973)

Sec. 08.54.030. Chairman of board. The board shall elect one of its members as chairman. (§ 1 ch 17 SLA 1973)

Sec. 08.54.040. Powers and duties. (a) Except as provided in § 45 of this chapter, the board shall

(1) prepare, grade and administer examinations;

(2) determine and pass on qualifications of applicants for licenses and authorize the issuance of licenses to those who qualify;

(3) establish guide performance standards and regulate activity;

(4) compile, maintain and publish a guide register of guides who have not been convicted of a violation of a federal or state sport fish, game, or guiding statute or regulation; a guide listed in the register whose license is revoked or suspended shall be removed from the register while his license is revoked or suspended;

(5) compile, maintain and publish a record of registered or master guides who have completed a contract hunt in any of three years immediately preceding the publishing of the record;

(6) prohibit guiding activities which are unsportsmanlike, unethical, unsafe, against principles of conservation, degrading to the guiding profession, or which adversely affect the natural resources;

(7) after a hearing, revoke, suspend or deny renewal of a license in accordance with § 200 of this chapter;

(8) establish a quota of licensed operating guides who may operate within designated geographical game units or subunits of the state and provide for an equitable and reasonable procedure for limiting the number of guides to that quota; preference shall be given to qualified available and willing licensed guides who reside within the designated game unit or subunit.

(b) If a person is unable to competently understand the written portion of an examination given under (a)(1) of this section, he shall be given the complete examination orally in a language which he understands. (§ 1 ch 17 SLA 1973; am § 1 ch 133 SLA 1976)

Sec. 08.54.045. Special guiding permit. This chapter does not limit the power of the board or its authorized designee, to issue a special guiding permit, in place of a guide license, to a person to guide in a specifically designated area, if the person is considered sufficiently experienced to perform the services of a guide and is limited solely by language barriers from securing a regular guide license. (§ 1 ch 17 SLA 1973)

Sec. 08.54.050. Board regulations. The board shall adopt procedural and substantive regulations, under the Administrative Procedure Act (AS 44.62), required by this chapter or reasonably necessary for its administration. (§ 1 ch 17 SLA 1973)

Sec. 08.54.060. Board hearing. The Administrative Procedure Act (AS 44.62) applies to proceedings and hearings under this chapter. (§ 1 ch 17 SLA 1973)

Sec. 08.54.070. Compensation and expenses. Members of the board receive no salary, but are entitled to per diem and travel expenses authorized by law for other boards. (§ 1 ch 17 SLA 1973)

Article 2. Licensing.

Section
100. Qualifications for a master guide license
110. Qualifications for registered guide license

190. Expiration and renewal
200. Grounds for disciplining a licensee
210. Unlawful acts
220. Injunction against unlawful action

Sec. 08.54.100. Qualifications for a master guide license. A person is entitled to be licensed as a master guide if he

(1) has legally hunted in the state for a part of each of 10 years during which time a substantial source of his income was from guiding or related activities directly contributing to his experience and competency as a guide;

(2) meets all the requirements of a registered guide and has been actively engaged in licensed guiding activities in the state for at least five years preceding application;

(3) has not been convicted of a violation of federal or state sport fishing, game or guiding laws or regulations within the preceding five years;

(4) has consistently performed in a superior manner as evidenced by required reports submitted to the board and by inquiries made by the board to at least two of the guide's clients of record; and

(5) meets additional qualifications which the board may require. (§ 1 ch 17 SLA 1973)

Sec. 08.54.110. Qualifications for registered guide license. A person is entitled to be licensed as a registered guide if he

(1) is 21 years of age or more;

(2) is a resident of the state and maintains a permanent place of abode in the state;

(3) has practical field experience in the handling of firearms, hunting, judging trophies, field preparation of trophies, first aid and photography;

(4) is familiar with the terrain and transportation problems in the district for which the license is requested;

(5) has passed the qualification examination prepared and administered by the board;

(6) has demonstrated to the board sufficient standards of competence and ethical conduct and has not been convicted of a crime involving moral turpitude;

(7) has legally hunted in the state for all or part of each of five years in a manner directly contributing to his experience and competency as a guide;

(8) has been licensed as and performed the services of an assistant guide in the state for a part of each of three years;

(9) submits a written recommendation to the board from a registered guide for whom the applicant has worked;

(10) is capable of performing the physical duties associated with guiding activities;

(11) has been favorably recommended in writing by two hunters that he has guided or assisted in guiding during each year of his three years as an assistant guide, whose recommendations have been solicited by the board from a list provided by the applicant;

(12) meets additional qualifications which the board may require. (§ 1 ch 17 SLA 1973)

Sec. 08.54.120. Qualifications for a class-A assistant guide license. A person is entitled to be licensed as a class-A assistant guide if he

(1) has been employed for at least one season as a licensed assistant guide;

(2) has had at least 20 years experience in the guide district in which he is to be employed; for the purposes of this paragraph physical presence at some time of the year during each of the 20 years constitutes adequate evidence of experience, and military service outside the state for no more than six years shall be accepted as part of the required 20 years experience;

(3) has been recommended in writing as qualified by a registered or master guide to the board. (§ 1 ch 17 SLA 1973)

Sec. 08.54.130. Privilgeges and limiations of class-A assistant guides. A class-A assistant guide

(1) may not contract for hunts;

(2) shall be under the supervision of a registered or master guide who has contracted with the client for whom the class-A assistant guide is conducting the hunt;

(3) may take charge of a camp and conduct hunts from it without the registered or master guide necessarily being present in the area if the registered or master guide is physically present in the state and is actively supervising in guiding activities. (§ 1 ch 17 SLA 1973)

Sec. 08.54.140. Qualifications for assistant guide license. A person is entitled to be licensed as an assistant guide if he

(1) is 19 years of age or more;

(2) is a resident of the state;

(3) is favorably recommended to the board, in writing, by a registered guide;

(4) meets additional qualifications which the board may require;

(5) is in sound physical condition. (§ 1 ch 17 SLA 1973)

Sec. 08.54.142. Qualification for transporter license. (a) No person may engage in the activity of transporting unless he is licensed as a transporter under this chapter. A person may be licensed as a transporter if he

(1) is a resident of the state;

(2) is familiar with the terrain and transportation problems in the district or districts for which the license is requested;

(3) obtains a business license to do business as a transporter under AS 43.70.030.

(b) No person may engage in the activity of transporting by air without an air commerce certificate as required by AS 02.05.040. (§ 2 ch 106 SLA 1976)

Sec. 08.54.144. Restriction to transportation. (a) A licensed transporter may transport persons whose primary purpose is the taking of big game or the associated removing of big game meat and parts of big game, with the intent of receiving monetary or material remuneration for the transportation.

(b) Air carriers who transport person between airports, landing strips or other landing areas officially listed in the United States government Flight Information Publication, Alaska Supplement, as revised, or the United States government Sectional Aeronautical Charts, as revised, are exempted from the license requirements for transporters under this chapter but shall comply with the reporting provisions as prescribed in AS 02.05.170(f).

(c) Master guides, registered guides, class-A assistant guides or assistant guides are exempted from the license requirements for transporter under this chapter but shall comply with the reporting provisions as prescribed in AS 02.05.170(f). (§ 2 ch 106 SLA 1976)

Sec. 08.54.146. Transporter report. A transporter shall maintain a record of (1) the names and addresses of all persons he transports; (2) the type of game transported; (3) an estimate of the quantity of meat transported; (4) the date of transporting; and(5) if known, the locality where the game was taken. The report shall be submitted to the Department of Fish and Game within 90 days after transporting the game. After receiving a report required under this section, the Department of Fish and Game shall send a copy of it to the Department of Public Safety. (§ 2 ch 106 SLA 1976; am § 4 ch 133 SLA 1976)

Sec. 08.54.150. Responsibility of registered or master guide for violations. A registered or master guide contracting for a hunt is equally responsible under § 200 of this chapter for a violation of a federal or state sport fish, game or guide statute or regulation committed by a class-A assistant guide or assistant guide while in the course of his employment. (§ 1 ch 17 SLA 1973)

Sec. 08.54.170. License fees. (a) License fees for engaging in the profession of guiding are:

(1)	master guide license, annual.....	$75
(2)	registered guide license, annual.....	75
(3)	class-A assistant guide, annual.....	15
(4)	assistant guide license, annual.....	10

(b) The license fee for a master guide, registered guide, class-A assistant guide or assistant guide license is in addition to the fee required for a hunting or fishing license.

(c) The license fee for a transporter is $10. (§ 1 ch 17 SLA 1973; am § 3 ch 106 SLA 1976)

Sec. 08.54.180. Examination fee. An applicant for a guide examination shall pay a fee of $25. (§ 1 ch 17 SLA 1973)

Sec. 08.54.185. Additional fees. In addition to the license and examination fees provided for under this chapter, master guides and registered guides are subject to fees imposed under AS 16.05.340(e). (§ 4 ch 268 SLA 1976)

Sec. 08.54.190. Expiration and renewal. (a) A master guide, registered guide, class-A assistant guide, assistant guide or transporter license expires on December 31, following issuance.

(b) No license may be issued to a class-A assistant guide or assistant guide who has failed to renew his license for two consecutive years unless he again meets the qualifications for initial issuance of the license.

(c) A master or registered guide who fails to renew a license is not required to requalify under § 100(2) or § 110(8) of this chapter, respectively. (§ 1 ch 17 SLA 1973; am § 12 ch 127 SLA 1974; am § 4 ch 106 SLA 1976)

Sec. 08.54.200. Grounds for disciplining a licensee. (a) The board shall hold a hearing to determine if disciplinary action is necessary if

(1) complaints concerning the licensee have been filed with the board from three or more clients of separate parties; or

(2) a licensee has been charged with a violation of federal or state sport fish, game or guide statutes or regulations; or

(3) a licensee has been convicted of a violation of federal or state sport fish, game or guide statute or regulation.

(b) After a hearing, the board may revoke, suspend, or deny renewal of a license if the board finds that the licensee

(1) engaged in unethical activity, unsafe activity, or activity which adversely affects the natural resources of the state when such activity is unrelated to the legal and legitimate purposes of the contract hunt; or

(2) violated a provision of a federal or state sport fish, game or guide statute or regulation.

(c) After a hearing, the board shall revoke a license if the board finds that the licensee

(1) does not meet the qualifications specified by statute or regulation for the class of license held;

(2) is incompetent as a master guide, registered guide, class-A assistant guide, or assistant guide;

(3) has been convicted of two violations of federal or state sport fish, game or guide statutes or regulations.

(d) No person who is disciplined under this section may engage in any guiding or transporting activity during the period of license revocation or disciplinary action. No person licensed under this chapter may hire or work for a guide whose license is suspended or revoked under this section.

(e) If the board revokes a license it shall notify the Department of Revenue, and the person whose license has been revoked shall return the license to the Department of Commerce and Economic Development. (§ 1 ch 17 SLA 1973; am § ch 43 SLA 1975; am § 5 ch 106 SLA 1976; am § 47 ch 218 SLA 1976)

Sec. 08.54.210. Unlawful acts. (a) It is unlawful for

(1) a master guide, registered guidge, class-A assistant guide, assistant guide or transporter to fail to timely report to the Department of Public Safety, division of fish and wildlife protection, and in no event later than 30 days, violations by a client of a state fish, game or guiding statute or regulation;

(2) a master guide, registered guide, class-A assistant guide, assistant guide or transporter to aid the commission of a violation of this chapter or of AS 16.05 or a regulation promulgated under either chapter, or permit the commission of a violation in his sight without attempting to prevent it, short of using force, and without reporting it;

(3) a person to guide or transport as defined in this chapter without being licensed under this chapter and without having the license in his actual possession; however, for purposes of transporting by air, in the case of a corporation, company, partnership or other business entity, the license may remain at the principal place of business of the business entity;

(4) a person to advertise as or represent himself to be a licensed master guide, registered guide, class-A assistant guide, assistant guide or transporter without being currently licensed, or to falsely advertise services;

(5) a person to guide as defined in this chapter without having a current valid hunting and fishing license in his possession.

(6) a master or registered guide to employ or have under his supervision more than three assistant guides at the same time.

(7) a person to guide as defined in this chapter without paying a fee as prescribed in AS 16.05.340(e).

(b) A person who violates (a)(1)-(6) of this section is guilty of a misdemeanor and upon conviction is punishable by a fine of not more than $1,000 or by imprisonment for not more than one year, or by both, and may have his license revoked for a period up to five years. However, a person who engages in guiding or transporting activity during the period his license is suspended or revoked under this chapter is guilty of a felony punishable, upon conviction, by a fine of not more than $5,000 and by imprisonment for not less than one year nor more than three years. In addition to punishment for a felony, all guns, fishing tackle, boats, aircraft, automobiles or other vehicles, camping gear and other equipment and paraphernalia used in, or in aid of, guiding or transporting activity engaged in during the period of suspension or revocation shall be confiscated by persons authorized to enforce this chapter. A person who violates (a)(7) of this section, upon conviction, is subject to the same license revocation provision as for a violation of (a)(1)-(6) of this section and, in addition, is punishable by a fine of not more than $5,000, or by imprisonment for not more than one year, or by both. (§ 1 ch 17 SLA 1973; am §§ 3, 4 ch 43 SLA 1975; am § 6 ch 106 SLA 1976; am § 3 ch 133 SLA 1976; am §§ 5, 6 ch 268 SLA 1976)

Sec. 08.54.220. Injunction against unlawful action. When in the judgment of the board a person or corporation or other entity has engaged in an act in violation of § 130 and §§ 200-210 of this chapter or the regulations promulgated under them, the board may apply to the appropriate court for an order enjoining the act. Upon a showing by the board that the person is engaging in the act, the court shall grant injunctive relief or other appropriate order without bond. (§ 1 ch 17 SLA 1973; am § 5 ch 43 SLA 1975)

Article 3. General Provisions.

Section
240. Definitions

Sec. 08.54.240. Definitions. In this chapter

(1) "board" means the Guide Licensing and Control Board;

(2) "guide", "guides" or "guiding" menas assisting another person to take game with the intent of receiving monetary or material remuneration for the services, by accompanying and directing that person personally or through a licensed assistant guide for the duration of a hunt, and not solely for the purpose of providing transportation services;

(3) "resident" means a person who maintains a place of residence within the state; has not claimed residency in another state for

the immediately preceding 12 months; shows by all attending circumstances that his intent is to make this state his permanent residence;

(4) "unethical activity" means

(A) deception in any degree involving prospective or actual clients either before, during, or following contract hunts;

(B) misrepresentation either through private communication or public advertising of the nature, type, duration, cost, or other conditions of contract hunts.

(C) making a guaranty that a species or certain number of species of game will be taken on a contract hunt.

(5) "transporting" or the "activity of transporting" means conveying a person by any lawful means to an area for remuneration or material benefit in excess of normal operating costs, when the primary purpose of the person being conveyed is the taking of big game and the associated removing of big game meat and parts of big game after big game has been taken; big game as used in this paragraph means game which, if taken by a nonresident, would require a big game tag. (§ 1 ch 17 SLA 1973; am §§ 7, 8 ch 106 SLA 1976; am § 2 ch 33 SLA 1976)

CHAPTER 38. GUIDE LICENSING

Article
1. Examinations (12 AAC 38.010)
2. Guide Register (12 AAC 38.020)
3. General Provisions (12 AAC 38.030–12 AAC 38.190)

ARTICLE 1. EXAMINATIONS

Section
10. Examinations

12 AAC 38.010. EXAMINATIONS. (a) The application for a guide examination must be made at least five months before the examination date on a form provided by the board. The application for examination shall include a listing of all hunters the applicant has guided or assisted in guiding during his apprenticeship and a letter of recommendation from any registered or master guide for whom he has worked.

(b) Guide examinations will be administered by the board or its authorized representatives at times and places as announced by the board.

(c) The registered guide examination will be composed of written and oral portions designed to reveal the actual qualifications of the candidate to practice guiding in the district or districts of his choice. However, a prospective guide unable to competently understand the written portion of the examination may be granted a guide license based on the outcome of the oral examination augmented by his experience. A score lower than 80 percent on either the written or oral portion of the test shall indicate inadequate qualifications. A person failing to achieve 80 percent or more on either the written or oral portion of the examination may not be reexamined for six months.

(d) A person contesting the results of any portion of the registered guide examination shall direct his appeal and the grounds therefor in writing to the chairman of the Guide Licensing and Control Board, Department of Commerce, Division of Occupational Licensing, Pouch D, Juneau, Alaska 99811, at least 30 days before the board meeting following the examination. (Eff. 6/28/74, Reg. 50)

Authority: AS 08.54.050

ARTICLE 2. GUIDE REGISTER

Section
20. Guide register

12 AAC 38.020. GUIDE REGISTER. (a) On December 31 of the register year, the names of all persons holding a master guide or registered guide license shall be entered by the board, on a register maintained by the board and shall be published for distribution to the public.

(b) All guides shall advise the board of their current address and all changes of address. (Eff. 6/28/74, Reg. 50; am 2/25/77, Reg. 61)

Authority: AS 08.54.040(a)(4) and (5)
AS 08.54.050

ARTICLE 3. GENERAL PROVISIONS

Section
30. Licenses
40. Restriction to districts
50. (Repealed)
51. Guiding area permits
52. Guide prohibited from using a guiding area not assigned to him or her
53. Application and qualification for guiding area permit
54. Reassignment of guiding area permit
55. Death or mental incapacity of guiding area permit holder
56. Changes to guiding area permi
57. Minimum use of guiding area
58. Grounds for revocation or suspension of a guiding area permit
60. Statement of financial remuneration
70. Responsibility of guide to his client
80. Survival gear
90. Presence of guide required
100. Taking of game by guides
110. Transporting meat
120. Cooperation with officials
130. (Repealed)
140. Requirements for a registered guide license
150. Requirements for a master guide
160. Improper certification
170. Improper reporting
180. Guiding ethics
190. Definitions

12 AAC 38.030. LICENSES. (a) A person must purchase his registered guide license within one year of passing the guiding examination or his eligibility lapses.

(b) An application for a guide license shall be made to the Division of Occupational Licensing, Department of Commerce, Pouch D, Juneau, Alaska 99811. (Eff. 6/28/74, Reg. 50)

Authority. AS 08.54.050

12 AAC 38.040. RESTRICTION TO DISTRICTS. (a) A guide may conduct guiding activities only in districts for which he is certified.

(b) Twenty-six guide districts are established and defined as being identical to those areas described as game management units by the Board of Fish and Game in 5 AAC 90.010, as of January 1, 1974, with the addition of two subdistricts

(1) 18A – Nunivak Island and all waters within one mile of that island;

(2) repealed 6/6/79;

(3) 27 – Marine Mammals, including all the area between the western boundaries of districts 17, 18, 22, 23 and 26, except that area included in 18A, north of latitude 50 degrees north and east of the Convention Line of 1867 between the United States and the Union of Soviet Socialist Republics and south of latitude 75 degrees north.

(c) A guide licensed under AS 08.54 as of the effective date of this section is restricted to certification to guide in those districts for which he is certified on that date.

(d) After the effective date of this section, all guides applying for new certification are limited to a total of three districts including those districts for which they were certified as of that date.

(e) A master guide or registered guide may serve as a class A assistant guide in districts for which he is not certified.

(f) Notwithstanding any provision of this section, a guide may petition the board for a transfer of certification to another district if he demonstrates to the satisfaction of the board

(1) that he will incur substantial hardship if a transfer is not permitted as evidenced by

(A) substantial land withdrawals from hunting within his district;

(B) significant reclassifications of land within his district;

(C) depletion of game as evidenced by actions of the Department of Fish and Game; or

(D) other demonstrations of hardship; and

(2) that he is qualified to guide in the district to which he wishes to be transferred. (Eff. 6/28/74, Reg. 50; am 2/25/77, Reg. 61; am 6/6/79, Reg. 70)

Authority: AS 08.54.040(a)(3) and (6)
AS 08.54.050

12 AAC 38.050. REGISTRATION OF MAIN CAMP. Repealed 5/12/78.

12 AAC 38.051. GUIDING AREA PERMITS. (a) Guiding area permits will be issued by the board to guides qualifying under secs. 53 and 54 of this chapter for exclusive or joint use of a specified area in order to limit the number of guides allowed to guide for big game animals in that area.

(b) The board will determine the size, boundaries and number of guiding areas assigned to a master or registered guide and is not limited by number or boundaries of guide districts which may be included.

(c) Each guiding area will be assigned a unique identification code. (Eff. 5/12/78, Reg. 66)

Authority: AS 08.54.040(a)(3),(6) and (8)
AS 08.54.050

12 AAC 38.052. GUIDE PROHIBITED FROM USING A GUIDING AREA NOT ASSIGNED TO HIM OR HER. No guide may contract guided big game hunts in an exclusive guiding area not assigned to him or her unless written permission to do so is obtained from the guide

to whom the guiding area is assigned. If more than one guide holds a permit for joint use of the guiding area, written permission must be obtained from each holder of a permit. The written permission must include the effective and expiration dates of use and the identity and number of the big game species to be hunted,

and must be dated and signed by all of the persons holding a permit for the guiding area. This written permission must be on the person of the guide conducting the hunt or in the base camp from which the hunt is conducted. (Eff. 5/12/78, Reg. 66)

Authority: AS 08.54.040(a)(3),(6) and (8)
AS 08.54.050

12 AAC 38.053. APPLICATION AND QUALIFICATION FOR GUIDING AREA PERMIT. (a) An applicant for initial issuance of a guiding area permit must, at the time of application and at the time the application is reviewed by the board, be a registered or master guide in good standing and must be certified in the district or districts in which the applied-for guiding area is located.

(b) In order to be considered, an applicant must submit to the board, on or before the published deadline, an application which describes the proposed geographic boundaries of the guiding area being applied for and a 1:250,000 scale map showing the proposed boundaries.

(c) Each application must include satisfactory documentation of the applicant's past use, occupancy, or financial investment in the guiding area applied for. The application may include other relevant information if it is substantiated by satisfactory documentation.

(d) The board will, in its discretion, issue a permanent guiding area permit to a qualified applicant who can substantiate his or her use, occupancy, or financial investment in the guiding area for at least three of the five years immediately preceding the published deadline for filing the application for that particular unit. The board will, in its discretion, issue a temporary guiding area permit to a qualified applicant who can substantiate his or her use, occupancy or financial investment in the guiding area for at least two of the five years immediately preceding the published deadline for filing the application for that particular unit.

(e) The holder of a temporary guiding area permit may apply for a permanent permit after one additional year of use, in the temporary guiding area. (Eff. 5/12/78, Reg. 66)

Authority: AS 08.54.040(a)(3),(6) and (8)
AS 08.54.050

12 AAC 38.054. REASSIGNMENT OF GUIDING AREA PERMIT. (a) Guiding area permits are not transferable by the permit holder. The board will, in its discretion, reassign a guiding area permit

(1) upon the death of the permit holder or upon a judicial determination that the permit holder is mentally incompetent;

(2) upon revocation or suspension of a guiding area permit;

(3) if the permit holder voluntarily relinquishes the guiding area permit; and

(4) upon application for reassignment.

(b) Under (a)(4) of this section, a permit holder may apply to the board for reassignment of his or her guiding area permit to a designated master or registered guide; the application must be made jointly by the permit holder and the designated master or registered guide. Approval of the reassignment will be given only upon a finding by the board, after notice and opportunity for a hearing, that the designated registered or master guide is qualified to guide in the area, is certified in the district or districts in which the applied-for guiding area is located, and that the reassignment is consistent with the public interest. The board will consider the designated master or registered guide's past use, occupancy, or financial investment in the guiding area and other relevant and reliable information in determining whether the designated master or registered guide is qualified.

(c) Except as otherwise provided in this chapter, an applicant for a guiding area permit which is to be reassigned must meet the requirements of sec. 53(a) of this chapter and make application in the manner prescribed for initial issuance of a guiding area permit.

(d) If an applicant cannot establish past use of the guiding area to be transferred or is not certified in the district or districts in which the guiding area is located, the board will consider experience and current use in another area of similar terrain if the applicant can establish to the satisfaction of the board that he or she is competent because of other relevant factors to conduct guiding activities in the guiding area.

(e) The board will consider the recommendations of the prior holder of the guiding area permit to be reassigned and will, in areas of joint use, consider the recommendations of the other holders of permits for the guiding area. (Eff. 5/12/78, Reg. 66)

Authority: AS 08.54.040(a)(3),(6) and (8) AS 08.54.050

12 AAC 38.055. DEATH OR MENTAL INCAPACITY OF GUIDING AREA PERMIT HOLDER. (a) Upon the death of a holder of a guiding area permit, the board will, in its discretion, grant a waiver, for a time specified by the board, of the requirements of sec. 57 of this chapter if application is made by the estate within 90 days after death. Failure to make application within 90 days is considered a voluntary relinquishment of the permit. At any time during the period of the waiver, an heir may apply to the board for a reassignment of the permit to a person designated by the heir.

(b) Upon a judicial determination that a guiding area permit holder is mentally incompetent, the board will, in its discretion, grant a waiver, for a time specified by the board, of the requirements of sec. 57 of this chapter if application is made by the permit holder's guardian within 90 days after a judicial determination of the permit holder's mental incompetency. Failure to make application within 90 days is considered a voluntary relinquishment of the permit. At any time during the period of the waiver the guardian may apply to the board for a reassignment of the permit to a person designated by the guardian. (Eff. 5/12/78, Reg. 66)

Authority: AS 08.54.040(a)(3),(6) and (8) AS 08.54.050

12 AAC 38.056. CHANGES TO GUIDING AREA PERMIT. Petitions for changes to the size or boundary of a guiding area, for reassignment of a guiding area permit, or for any other changes affecting the guiding area, will be accepted for all guide districts and will be reviewed at a regularly scheduled meeting of the board. Each petitioner will be advised of the date and place of the meeting when his or her petition is scheduled for review. A petition will not be reviewed by the board if the petitioner or a person authorized in writing by the petitioner as his or her designee fails to appear at the time of the scheduled review. If the petition concerns a joint use guiding area permit, each holder of a permit for that guiding area will be furnished a copy of the petition and advised of the date and place when the petition is scheduled to be reviewed and may appear before the board and present testimony relevant to the petition. (Eff. 5/12/78, Reg. 66)

Authority: AS 08.54.040(a)(3),(6) and (8) AS 08.54.050

12 AAC 38.057. MINIMUM USE OF GUIDING AREA. Each holder of a guiding area permit must conduct at least two contracted hunts within two consecutive calendar years in the guiding area as evidenced by statements of financial remuneration filed in accordance with sec. 60 of this chapter. Failure to do so for any two consecutive calendar years may result in revocation of the guiding area permit unless the permit holder can demonstrate to the satisfaction of the board that circumstances beyond his control precluded conducting the required hunts. (Eff. 5/12/78, Reg. 66)

Authority: AS 08.54.040(a)(3),(6) and (8) AS 08.54.050

12 AAC 38.058. GROUNDS FOR REVOCATION OR SUSPENSION OF A GUIDING AREA PERMIT. The board will, in its discretion, revoke or suspend a guiding area permit or permits if the permit holder

(1) violates a federal or state sport fish, game or guiding statute or regulation, which violation occurred while guiding;

(2) has his guide license revoked or suspended or is denied renewal of a license for violation of a federal or state sport fish or game or guiding statute or regulation other than for nonpayment of current license fees;

(3) is found by the board to have misused a guiding area. (Eff. 5/12/78, Reg. 66)

Authority: AS 08.54.040(a)(3),(6) and (8) AS 08.54.050

12 AAC 38.060 STATEMENT OF FINANCIAL REMUNERATION. (a) Before hunting with his or her client, a guide shall complete or have completed a statement of financial remuneration in triplicate on a form provided by the board for this purpose and shall state

(1) that he received financial or material remuneration for his services;

(2) the dates of the contract hunt;

(3) the species to be hunted for;

(4) the legal signature of the guide and his client;

(5) the typed or printed name and address of the guide and his client;

(6) the guiding area permit unique identifying code assigned under sec. 51(c) of this chapter.

(b) The original of the statement required in (a) of this section shall be sent to the Department of Public Safety, Division of Fish and Wildlife Protection, Records Section, P.O. Box 6188 Annex, Anchorage, Alaska 99502, within 21 days after completion of the hunt.

(c) The guide is responsible for furnishing one copy of the statement to his client.

(d) One copy of the statement shall be filed in camp for the duration of the hunt and thereafter at the guide's regular place of business for four years, and shall be produced for inspection upon request by an agent of the Department of Public Safety. (Eff. 6/28/74, Reg. 50; am 5/12/78, Reg. 66)

Authority: AS 08.54.050

12 AAC 38.070. RESPONSIBILITY OF GUIDE TO HIS CLIENT. (a) It is the responsibility of a guide to ascertain that a client has a proper license and appropriate tags and harvest reports, in his possession, for the big game species being hunted before hunting. The guide is responsible for attaching appropriate tags to any game taken by his client and is responsible for having all game sealed or marked as required by Alaska Department of Fish and Game regulations.

(b) A guide shall take every reasonable measure to assure the safety and comfort of his clients. He is responsible for having available the following:

(1) adequate first aid supplies;

(2) sufficient food to provide for emergencies that might render the party immobile;

(3) shelter which is normally considered satisfactory and comfortable under field conditions;

(4) transportation or communications or arrangements to obtain them without hardship or unreasonable delay. (Eff. 6/28/74, Reg. 50)

Authority: AS 08.54.050

12 AAC 38.080. SURVIVAL GEAR. A guide is responsible for assuring that each aircraft operated by him, and used in any phase of a hunt conducted by him, carries survival gear as required by AS 02.35.110. (Eff. 6/28/74, Reg. 50)

Authority: AS 08.54.050

12 AAC 38.090. PRESENCE OF GUIDE REQUIRED. A master, registered or class A assistant guide must be in the field and participating in the conduct of the guided hunt whenever assistant guides are guiding. (Eff. 6/28/74, Reg. 50; am 11/2/75, Reg. 56)

Authority: AS 08.54.050

12 AAC 38.100. TAKING OF GAME BY GUIDES. (a) No guide may take big game animals or marine mammals while acting as a guide, except in cases of actual emergency when a bear or other animal is attacking or when a bear or other animal is about to escape after being wounded. It is then the duty of the guide to take such actions as he considers necessary.

(b) It is unlawful for a master guide, registered guide, class A assistant guide or assistant guide guiding a hunter for walrus to take or assist in taking any walrus other than the animal taken by the client he is guiding; however, one crewman other than the guide may take one single cow walrus and its calf if this taking does not exceed the bag limit as prescribed by regulations of the Board of Game. (Eff. 6/28/74, Reg. 50; am 6/12/77, Reg. 62)

Authority: AS 08.54.050

12 AAC 38.110. TRANSPORTING MEAT. A guide is responsible for transporting the meat of big game animals, except bear, wolves, and wolverine, taken by his client from the site of the kill to its destination or to a common carrier

for shipping to its destination for the purpose of human consumption. If the meat is delivered to a person other than the person who took the animal, a signed and dated statement or receipt stating the kind and quantity of meat received in approximate pounds or named portions of the carcass must be obtained from the recipient and presented upon request to any officer authorized to enforce this chapter. (Eff. 6/28/74, Reg. 50)

Authority: AS 08.54.050

12 AAC 38.120. COOPERATION WITH OFFICIALS. Failure on the part of a guide to assist the Departments of Fish and Game and Public Safety in determining the truth of any statements reported in accordance with secs. 30 – 180 of this chapter is considered a violation of ethical conduct. (Eff. 6/28/74, Reg. 50)

Authority: AS 08.54.050

12 AAC 38.130. REQUIREMENTS FOR AN ASSISTANT GUIDE LICENSE. Repealed 5/12/79.

12 AAC 38.140. REQUIREMENTS FOR A REGISTERED GUIDE LICENSE. In addition to the requirements of AS 08.54.110, to be qualified for a registered guide license, a person must

(1) demonstrate to the board that he has spent 90 days in the field acting as an assistant guide as certified by the master or registered guides who employed him;

(2) not have violated a federal or state sport fish, game or guide statute or regulation or engaged in unethical activity, unsafe activity or activity which adversely affects the natural resources of the state for the preceding five years. (Eff. 6/28/74, Reg. 50)

Authority: AS 08.54.050
AS 08.54.110(12)

12 AAC 38.150. REQUIREMENTS FOR A MASTER GUIDE. In addition to the requirements of AS 08.54.100, to be qualified for a master guide license a person must have acted as a registered guide for 12 consecutive years. (Eff. 6/28/74, Reg. 50)

Authority: AS 08.54.050
AS 08.54.100(5)

12 AAC 38.160. IMPROPER CERTIFICATION. No master or registered guide may improperly certify that a person has met the qualifications for a guide license. (Eff. 6/28/74, Reg. 50)

Authority: AS 08.54.050

12 AAC 38.170. IMPROPER REPORTING. No guide may knowingly falsify any information required to be set out on any form required by the Alaska Department of Fish and Game or the Guide Licensing and Control Board. (Eff. 6/28/74, Reg. 50)

Authority: AS 08.54.050

12 AAC 38.180. GUIDING ETHICS. Unethical activity includes, but is not limited to

(1) not fully cooperating with state and federal wildlife officials or not abiding by and advising clients and personnel of all applicable conservation and game laws and regulations or condoning their violation;

(2) misrepresenting or not clearly defining rates, accommodations and services to prospective clients prior to booking and acceptance of deposit, or otherwise misleading prospective clients through false or fictitious advertising;

(3) being unwilling or incapable of making financial restitution to a client for any breach of contract by the guide or his employees, owing to no fault of the client;

(4) not advising clients of game population to the best of the guide's ability based on past performances in hunting areas and advising him of his chances of encountering the species he desires in the time allotted;

(5) making "guarantees" as to the success of a hunt or the number of pieces of game to be collected;

(6) not maintaining and providing stock,

mechanical equipment, gear, food supplies and facilities to a quality and condition to provide services equal to or better than described in the guide's advertising, correspondence, verbal declaration or contractual agreements;

(7) not maintaining a neat, orderly and sanitary camp at all times, or not providing reasonably well-prepared, palatable and balanced camp meals for clients and personnel in keeping with the conditions of the hunt;

(8) contracting for more hunts or for more hunters at any one time than the guide or his employees can adequately facilitate rendering services for;

(9) hiring guides that are improperly licensed, or ill trained in the arts of woodsmanship, judging trophies, cooking, first aid, photography, firearms, trophy preparation and caring for clients;

(10) failing, while guiding a client, to take all precautions if an animal is wounded;

(11) failing to use every means at his disposal to bag any wounded animal while it is in danger of escaping, or if in a serious emergency, human life or well-being is endangered;

(12) filling a client's game tag or bag limit;

(13) failing, barring unforeseen conditions, to properly prepare, according to generally accepted procedures, all antlers, horn, hides and capes to be delivered to the taxidermist or to the client at the conclusion of a hunt in a satisfactory and unspoiled condition;

(14) failing to endeavor to salvage all meats of trophies taken by his client, in accordance with existing state law;

(15) promoting hunting or the taking of trophies by means other than fair chase: specifically, the pursuit of a trophy in an illegal or unsportsmanlike manner, by herding, driving or chasing of animals with the use of any mechanically powered equipment;

(16) failing to practice sound wildlife conservation or failing to create an awareness of conservation needs and practices during his associations with the public. (Eff. 6/28/74, Reg. 50)

Authority: AS 08.54.040(6)
AS 08.54.050

12 AAC 38.190. DEFINITIONS. Unless otherwise indicated, in this chapter

(1) "competence" means a professional standard of conduct which satisfactorily implements, under field conditions, the knowledge and qualifications of a guide;

(2) "transport" means shipping, carrying, importing, exporting, or receiving or delivering for shipment, carriage or export;

(3) "board" means the Alaska Guide Licensing and Control Board. (Eff. 6/28/74, Reg. 50)

PURPOSE AND SCOPE OF THE REVIEW

Purpose

In accordance with the intent of Alaska Statutes 24.20.271(1) and 44.66.050 (sunset legislation), an audit of the Guide Licensing and Control Board was conducted to review Board activities and accomplishments to determine if the Board has been operating in an effective, efficient and economical manner.

As required by legislative intent, this report shall be considered during the legislative oversight function in determining whether the Guide Licensing and Control Board should be reestablished. The law currently specifies that this Board will terminate on June 30, 1980 but will continue until June 30, 1981 for the purpose of concluding its affairs.

Scope

The major areas reviewed were the Board's operations and its licensing, administration, complaint, examination and affirmative action functions. Our review consisted of analyzing and evaluating the following:

(1) Applicable statutes and Board regulations;

(2) discussion with the Board and questionnaires sent to Board members;

(3) tests of records and documents of the Board, the Division of Occupational Licensing (OL), Department of Commerce and Economic Development and the Division of Fish and Wildlife Protection - Investigation Section, Department of Public Safety;

(4) interviews with OL employees, Fish and Wildlife Protection employees, Division of Game employees, Department of Revenue employees, employees in the Office of the Governor and employees in the Attorney General's Office;

(5) complaints filed with the Division of Fish and Wildlife Protection, the Ombudsman's Office, the Attorney General's Office, the Equal Employment Opportunity Office and the Human Rights Commission;

(6) questionnaires sent to 180 State licensed Registered and Master Guides.

Scope Constraint

This review was hampered by the Board not having established and reported financial and program plans as required by AS 37.07.050 nor has it developed and reported performance information required by AS 37.07.090.

ORGANIZATION AND FUNCTION

The Guide Licensing and Control Board was established by the 1973 Session Laws of Alaska and succeeds the Board of Fish and Game, Department of Fish and Game, which previously regulated the guiding industry. The seven member Board is appointed by the Governor with confirmation by the Legislature and is restricted to having no more than three members as licensed guides. Board members serve staggered terms of three years or until their successors are appointed.

The Board is organized under the Department of Commerce and Economic Development, Division of Occupational Licensing. Two budgeted positions, a Guide Investigator and Administrative Assistant, in the Department of Public Safety, Division of Fish and Wildlife Protection, have been provided to assist in the licensure and investigations of guides.

The function of the Board is primarily regulatory, mandated by AS 08.54.040. Accordingly, the Board has the capacity to administer examinations; determine qualifications of guides; establish performance standards and regulate activities; maintain guide registers; prohibit harmful guiding activities; conduct hearings regarding licensure; and establish quotas of guides for specified geographical areas (exclusive guiding areas). The Board through the assignment of exclusive guiding areas limits hunting pressure by guides within a specific geographical area.

In addition, the Board licenses "transporters", a licensed "transporter" is a person who transports hunters for hire.

REPORT CONCLUSION

Policy Issues

This review contains policy issues raised as a result of our evaluation of various Board practices. The final policy decisions affecting these practices are not within the scope of this review but require legislative consideration. In debating these issues, the legislative oversight committees should consider the findings and alternatives presented in this report in reaching their decision.

Report Conclusion

In our opinion, the Guide Licensing and Control Board should be continued. For the following reasons, we believe the regulation and licensing of guides is needed to protect the public's health, safety and welfare:

A. This profession involves contracting for hunting game that could result in severe physical harm if practiced by incompetent persons. Potential harmful results include injury or death to the hunter due to neglect or carelessness on the part of the guide.

B. Other users of game resources, such as the general public and subsistance hunter, can be directly or indirectly affected by guiding activities. For example, overhunting by guides in an area not only depletes the game resources available to the general public but also adversely affects the subsistance hunters in that area.

C. In order to protect the public without unduly restricting individual rights, AS 16.05.407(a) exempts Alaskan residents from requiring the services of a guide.

While the reasons above indicate that the Board should continue to license and regulate guides, certain changes need to be implemented in order for the Board to more effectively serve the public.

The Board should seek legislation to have the guide licensing function transferred to the Department of Public Safety. Currently, staff support for the Board is being provided by two departments - the Department of Public Safety and the Department of Commerce and Economic Development. Personnel in both Departments believe that the licensing function as well as enforcement would be enhanced by consolidation of the two functions in one department (see Recommendation No. 1).

The Board should seek legislation to have the transporter laws (Alaska Statutes 08.54.142, 144, 146 and 08.54.170(c)) repealed, as they are confusing and of little value (see Recommendation No. 2).

The Board should continue its efforts to make the statutes and regulations more relevant and workable (see Recommendation No. 3).

The Department of Revenue should collect fees from guides as required by statute (see Recommendation No. 4).

The Board should establish formal goals, objectives and quantifiable measures (see Recommendation No. 5).

FINDINGS AND RECOMMENDATIONS

Findings and Recommendations No. 1 through No. 3 are addressed to the Guide Licensing and Control Board, No. 4 is addressed to the Department of Revenue, No. 5 is addressed to the Division of Occupational Licensing (OL) and should be read in conjunction with "A Performance Review of the Division of Occupational Licensing, Department of Commerce and Economic Development, October 30, 1978".

Recommendation No. 1

The Guide Licensing and Control Board should seek legislation to have the guide licensing function transferred to the Department of Public Safety.

Staff support for the Guide Licensing and Control Board is currently being provided by two departments - the Department of Commerce and Economic Development (DCED), Division of Occupational Licensing (OL) and the Department of Public Safety (DPS), Division of Fish and Wildlife Protection (F&WP).

Applications for guide licenses are required by Alaska Statute 08.01.060 to be sent to DCED. A licensing examiner in the Division of Occupational Licensing (OL) in Juneau receives the application and fees and, upon authorization from the Board, issues the license. The licensing examiner also provides other administrative and clerical support to the Board. In addition, the licensing examiner maintains files on each individual licensee, and copies of the material in the files are sent to the Division of Fish and Wildlife Protection in Anchorage.

The Division of Fish and Wildlife Protection (F&WP), Investigation Section in Anchorage has two budgeted positions, a Guide Investigator and an Administrative Assistant, assigned to provide assistance in the licensure and investigation of guides. F&WP is also responsible for the enforcement of guide related statutes and regulations. In addition, F&WP maintains current and complete history files on all licensed guides as well as maintaining files on all the exclusive/joint use guiding areas.

Personnel in both OL and F&WP have stated that the licensing and investigative services provided to the Guide Licensing and Control Board should be consolidated within one agency. OL personnel have stated that public convenience, and staff availability would be enhanced by the consolidated effort. F&WP personnel believe that the licensing function as well

as enforcement would be enhanced by consolidation of the two functions. A reduction in operating costs should result to OL, based on the reduced work load of the licensing examiner, who estimates that she spends approximately 2/3 of her time on Guide Board related matters.

Recommendation No. 2

The Guide Licensing and Control Board should seek legislation to have the "transporter laws" repealed.

The purpose of the "transporter laws" (Alaska Statutes 08.54.142,.144.,146 and 08.54.170(c)) is to protect the safety of the citizens of the State and better manage and protect its resources by licensing persons who transport hunters for hire so that reasonable standards and guidelines would be met and activities affecting the State's game resources would be more accurately monitored and assessed.

In our opinion, the "transporter laws" are not needed to protect the safety of the public or manage the game resources.

Personnel in the Department of Public of Safety, Division of Fish and Wildlife Protection, consider the "transporter laws" confusing and difficult to enforce. In addition, we found the information and reports that transporters are required to file are not being used and are not needed to manage the game resources of the State. Furthermore, air transporters' flying safety qualifications and aircraft safety are regulated by the Federal Aviation Administration.

Recommendation No. 3

The Board should continue its efforts to make the statutes more clear, relevant and workable.

Over the past several years the Board has been adopting regulations to make the statutes more clear, relevant and workable. However, we noted several statutes which need further consideration. For example:

A. AS 08.54.142.144, .146 and 08.54.170(c) as discussed in Recommendation No. 2, the Board should seek legislation to have the "transporter laws" repealed.

B. AS 08.54.190(a) requires an annual renewal of guide licenses. This conflicts with AS 08.01.100(a) which requires biennial renewal of occupational licenses. It also creates additional administrative effort for both the Division of Occupational Licensing and the licensee, with no demonstrable benefit to the public.

C. AS 08.54.110(6) pertaining to moral turpitude is considered to be vague and should be repealed as the regulation (12 AAC 38.180) defining unethical activity provides sufficient public protection in this area.

D. AS 08. 54.200(c)(3) is considered to be unduly restrictive because it requires the Board to revoke a guide's license upon two convictions of federal or State sport fish, game or guide violations regardless of how minor the violations may have been or how long ago they may have occurred.

E. AS 08.54.130(2) requiring a Class-A assistant guide to be under the supervision of a registered or master guide is considered vague. The term "supervision" should be clarified to indicate exactly what constitutes supervision during the conduct of a hunt.

Recommendation No. 4

The Department of Revenue should collect fees from guides as required by statute.

Alaska Statute 16.05.340(e) effective January 1, 1977 requires licensed master and registered guides to pay a fee in the following amounts for each caribou, sheep, moose, brown or polar bear taken on a guided hunt over a specified number:

1) over 5 up to a total of 10 per season - $20;

2) over 10 up to a total of 25 per season - $100;

3) over 25 per season - $500.

Executive Order No. 17 requires the Department of Revenue to collect and account for all revenues incidental to the regulation and management of Alaska's fish and game resources. The Department has not developed forms and procedures necessary to collect and account for revenue under AS 16.05. 340(e).

Recommendation No. 5

The Board should establish formal goals, objectives and quantifiable measures which should be included in the Division of Occupational Licensing's (OL's) budget document.

Objectives describe what an agency or Board is seeking to accomplish during a specific year. Well formulated objectives are capable of measurement and should include numerical targets so that actual accomplishments can be compared with stated targets. Without goals and objectives, the Board's performance cannot be adequately evaluated and analyzed.

OL establishes its own budget goals and objectives. The budget documents do not include any goals or measures for individual boards. Without the Board's goals and measures being identified or measured, neither the Governor's Office nor the Legislature can evaluate the Board's performance.

ANALYSIS OF PUBLIC NEED

Limited Analysis

The following analysis of Board activities relate to the public need factors defined in the "sunset" law. This analysis is not intended to be all inclusive, but addresses those areas we were able to cover within the scope of our review.

I. The extent to which the board, commission or program has operated in the public interest.

1. The Board has adopted regulations defining unethical conduct which clarify and strengthen the professional's responsibility to the public.

II. The extent to which the operation of the board, commission, or agency program has been impeded or enhanced by existing statutes, procedures, and practices which it has adopted, and any other matter, including budgetary, resource, and personnel matters.

1. The Division of Fish and Wildlife Protection, Department of Public Safety, has handled investigations of complaints in a timely and effective manner.

2. The Board is required to license and regulate transporters under AS 08.54.142, .44, .146 and AS 08.54.170(c). Board members, personnel in the Departments of Public Safety and Fish and Game consider these statutes to be confusing and of little value (see Recommendation No. 2).

III. The extent to which the board, commission or agency has recommended statutory changes which are generally of benefit to the public interest.

1. Although the statutes and regulations governing Board activities should be subjected to further review, the Board has adopted revisions to its regulations that significantly improve their clarity and applicability (see Recommendation No. 3)

IV. The extent to which the board, commission or agency has encouraged interested persons to report to it concerning the effect of its regulations and decisions on the effectiveness of service, economy of service, and availability of service which it has provided.

1. The public is invited to attend Board meetings and to give their input about the workings of the Board. Notices of meetings are advertised in each of three newspapers throughout the State. In addition, guides are notified by registered mail of meetings that might affect them.

V. The extent to which the board, commission or agency has encouraged public participation in the making of its regulations and decisions.

1. As stated under criteria IV, the public is invited, by published notices in newspapers, to attend Board meetings to give their input about Board regulations or submit written testimony.

VI. The efficiency with which public inquiries or complaints regarding the activities of the board, commission or agency filed with it, with the department to which a board or commission is administratively assigned, or with the office of the ombudsman have been processed and resolved.

1. Since 1977, five complaints have been filed with the Ombudsman's Office concerning guides and/or the Board. All five cases were relatively minor and were all resolved satisfactorily.

2. During the period between April 1977 and April 1979, the Investigative Support Unit of the Division of Fish and Wildlife Protection, Department of Public Safety conducted 61

investigations involving all classifications of guides. During this same period, 35 accusations were filed for Disciplinary Hearings before the Board. Many of the Disciplinary Hearings resulted in the Board taking action such as suspending or revoking a guide's license.

VII. The extent to which a board or commission which regulated entry into an occupation or profession has presented qualified applicants to serve the public.

1. As of June, 19, 1979 approximately 39 Master Guides, 289 Registered Guides, 116 Class-A Assistant Guides, 468 Assistant Guides and 48 Transporters are licensed in Alaska.

VIII. The extent to which state personnel practices, including affirmative action requirements, have been complied with by the board, commission or agency to its own activities and the area of activity or interest.

1. The applications pertaining to licensing of guides and transporters contain requests for information such as birthdate, birthplace, marital status, sex and whether the applicant is a citizen of the United States. These requests may be violations of the Equal Employment Opportunity requirements. However, some of this information may be necessary to confirm an applicant's qualifications. We recommend that the requirements for licensure be analyzed to determine if a valid need for the information exists (see the OL Performance Audit Report).

2. Although the Board does not have a formal affirmative action plan, it has been making an effort to increase the participation of Native Alaskans in the guiding industry. For example, in August 1979, two Board members, a Fish and Game Biologist and the Chairman of the Interim Subsistence Committee in the State House of Representatives went to several native villages along the Arctic coast for the purpose of explaining the guiding business and how the natives along the Arctic coast can become licensed to guide for marine mammals such as walrus. In addition, a

Board meeting has been scheduled to be held in Nome at the end of November 1979, in order to orally examine native applicants for guide licenses. We recommend that the Board continue its efforts to include more Native Alaskans in the guiding industry.

IX. The extent to which statutory, regulatory, budgeting or other changes are necessary to enable the agency, board or commission to better serve the interests of the public and to comply with the factors enumerated in this subsection.

1. Staff support for the Guide Licensing and Control Board is currently being provided by two departments. In our opinion, consolidation of the licensing and investigation functions would result in a more efficient, economical and effective performance of both functions (see Recommendation No. 1).

2. Please refer also to the previous section of this report, Findings and Recommendations.

APPENDIXES

APPENDIX A

GUIDE LICENSING AND CONTROL BOARD
REVENUES COMPARED WITH EXPENDITURES
Fiscal Year 1978
(UNAUDITED)

Average Revenue (Schedule 1, Note 1 and Note 2)		$ 40,157
Expenditures-OL (Note 3)	$38,843	
Expenditures-F&WP (Note 3)	77,24_	116,086
Excess of Expenditures over Revenues		$(75,929)

Schedule 1
Types of Revenues

Revenues	Amount	Collection Time
Master Guide License	$75	Annually
Registered Guide License	$75	Annually
Class-A Assistant Guide License	$15	Annually
Assistant Guide License	$10	Annually
Transporter License	$10	Annually
Application For A Guide Examination	$25	With Application
Late Renewal Penalty	$10	With Late Payment

Note 1

Although guide and transporter licenses are renewed annually, we calculated and reported an average of the revenues collected in Fiscal Years 1977 and 1978 in order to present a fair representation of collected revenues.

Note 2

The average revenue amount reported does not include revenue obtained from the sale of game tags or hunting licenses. It only includes revenue obtained from fees required to obtain and/or renew guide licenses.

Note 3

Expenditures include those made by Board members, such as travel and per diem, and an allocated percentage (estimated) of total administrative expenses of OL. Also included were expenditures which were charged to the Board by the Department of Public Safety, Division of Fish and Wildlife Protection - Investigation Section. The amount reported does not include expenditures for efforts of other departments, such as the Department of Law, that may be assisting the Board, OL and the Division of Fish and Wildlife Protection.

Note: The examinations (written and oral) for a Registered Guide license are given once a year in late November or during December.

APPENDIX C

QUESTIONNAIRE SENT TO BOARD MEMBERS

1. What do you believe to be the goals and objectives of the Guide Licensing and Contol Board?

Description	Number of Board Members' Responses (See Notes 1, 2 and 3)
A. To establish a viable guiding industry.	2
B. To assure public protection by allowing adequate entrance of qualified guides into the guiding business.	1
C. To establish a conservation program for game management through the use of exclusive guiding areas.	1
D. To set standards of conduct such as a Code of Ethics.	1

2. How does the Board measure its progress in meeting its goals and objectives? Please specify.

Description	Number of Board Members' Responses
A. By the establishment of exclusive guiding areas by game management units.	3
B. Proposed regulations are scheduled for hearings.	1
C. Guide exams are scheduled and given.	2
D. Hearings on accounts are scheduled and handled.	1
E. Monitor political issues that affect the guides and/or the guiding industry.	1
F. Progress is measured by the support of the majority of ethical guides/businessmen even while they remain as the Board's constant critic/mentor.	1

3. What evidence exists demonstrating that the absence of guide regulations and/or the Board would be detrimental to the public's best interest? Please explain.

Description	Number of Board Members' Responses
A. The Guide Board has the power to act against the license of an errant guide. This power appears to be the greatest deterrent the guides willingly recognize.	2
B. Because the Board has spread out the guiding pressure, the public now has a better chance at a good hunting trip. Guides themselves have endorsed the program of exclusive guide areas as a way to conserve game.	2
C. Prior to the Board's existence, unqualified people set themselves up as "guides" to an unknowing public--particularly those outside Alaska. This resulted in hunters leaving the State bitterly disappointed.	1
D. Through the use of Regulations - Code of Ethics, qualifications and tests, exclusive guiding areas, etc., society is starting to recognize and respect the guide as a professional.	1

4. A. Is the staff from the Department of Commerce and Economic Development and/or the Department of Public Safety adequate to perform and enforce all laws and regulations relating to the Guide Licensing and Control Board?

Description	Number of Board Members' Responses
A. Yes. A workable staff has been established. Complaints (founded and unfounded) have dropped over 60% since the Board has been established according to a Public Safety spokesman.	1
B. Yes. All staff personnel are doing a good job. There is some delay and confusion in handling inquiries and license	

4. (Cont'd.)

	Number of Board Members' Responses
research due to the support staff being split into two departments.	1
C. *More support for the enforcement end of the guiding industry is needed.*	1

4. B. What staff support services are provided adequately/inadequately?

Description

A. *Guides, Guide Board files and exclusive guide area maps are handled very well. Support from the AG's Office is good at this time.*	1
B. *Staff support now is the best it has ever been.*	1
C. *The Board needs more travel and per diem so it can meet in other places in the State besides Anchorage, Fairbanks, and very seldom Juneau.*	1

4. C. Are investigations performed adequately/inadequately?

Description

A. *Yes. Present investigations are very thorough.*	1
B. *Yes. The biggest improvement in the last year is in the timeliness of investigations and hearings. This is mainly due to the fact the Attorney General's Office has assigned a special attorney to handle our cases.*	2

5. Are the Board functions and activities and/or the guiding industry hampered by any statutes or regulations which you believe to be obsolete, vague or unduly restrictive? Please list and explain.

Description	Number of Board Members' Responses
A. Yes. Some statutes and regulations are obsolete, vague and unduly restrictive. The Board and an advisory committee appointed by the Board are reviewing this. Statutes and regulations are a part of each Board meeting, and only with input from the public and the AG's Office can these be evaluated and changed when needed.	1
B. The Guide Board set up a joint committee with the professional guides to examine problems concerning regulations or statutes. The joint committee has made recommendations to the Board concerning changes needed in the regulations and statutes.	2

6. Has the Board recommended any statutory changes which are generally in the public's best interest? Please list and explain.

Description	Number of Board Members' Responses
A. Believe the Board has recommended changes in the statutes, but without researching, can not list.	1
B. The Board just passed a regulation establishing an Arctic Coast guide unit, which would be called Guide Unit 27. In future programs we will be assigning guides for the taking of marine mammals.	1
C. 1) Establishment of Exclusive Guiding areas;	1
2) placing more emphasis upon the guides' recommendations for assistant guides;	1

7. What changes could be made to the Board which would improve its service to the public and guiding industry? Please discuss.

Description	Number of Board Members' Responses
A. Believe the Board has served the public interests and the guiding industry very well.	1
B. Have enough funds to pay for a public address system at our meetings.	1
C. My experience on the Board has finally convinced me that the mere increase in numbers would make it more efficient, more fair. I believe that with a couple more meetings each year, the Board would have more time before each meeting for discussion.	1

8. In your opinion, what effect have exclusive and joint use guiding areas had on the guiding profession and the game resources of the State? Are exclusive and joint use guiding areas beneficial to the Alaskan public? Please discuss.

Description	Number of Board Members' Responses
A. Exclusive and Joint Use Guiding Areas have given guides an incentive to better manage the game resources in their areas.	1
B. They have provided the public the following benefits; 1) less guide pressure in areas of high game count; 2) better guide service; 3) more game available to the hunter; 4) over all better public acceptance of hunting as a sport, not a slaughter as some special interest groups would like the public to believe.	1
C. With the help of Exclusive Guiding Areas, the Board has largely brought illegal guiding activities under control.	1

9. Any other comments?

Description	Number of Board Members' Responses
A. Believe the news media has to be used to better inform the public of guiding and/or hunting.	1
B. Fees from guides and guiding activity should reimburse the State for the costs of the Guide Board and related activity of other Departments. The Board should be kept active for a minimum of another four years so that the effect of its performance can be adequately measured.	1
C. The Board has passed a regulation setting forth an offshore guide area in the Arctic. This area could offer guided hunts for walrus, seal, whales, and polar bear. There are many non-residents who are interested in these types of hunts. If the Native hunters become interested in the guiding profession it could add a great deal to their economy. Our Board is going to try to make a personal survey with the Arctic villages to see if they are interested in a guide program. I feel that the Guide Board is working fairly with the Attorney General's Office, Public Safety, Commerce Department and the professional guides. Our program is pretty well understood by the guides and we have made every effort to be as fair as possible. D-2 land settlement might cause the Board to re-evaluate what could be done for those guides put out of business. We would ask for public input and information from the Dept. of Game as to what possibilities are open to us.	1
D. The exclusive guiding areas (EGA) are starting to work for the good of all. The removal of the EGA system now would be chaotic. The greatest losses would be to the game populations, the Alaska general public and the industry itself.	1

Note 1

Number of Board Members 7

Number of Board Members' Responses 4

Note 2

Some Board Members responded to each question with several answers. Therefore, total responses to a question may exceed the number of Board members.

Note 3

Comments were all reviewed and considered in the performance of our audit, and are briefly summarized in this appendix.

APPENDIX D

QUESTIONNAIRE SENT TO LICENSED MASTER GUIDES AND LICENSED REGISTERED GUIDES

The following questionnaire was sent to licensed master and registered guides (see Note 1). For each question on the questionnaire we have noted the percentage of yes and no responses. We have also shown the most typical written comments for each question as compiled from the questionnaire (see Note 2).

		% of Responses (See Note 1)		
		Yes	No	No Opinion
1.	Do you believe the Guide Licensing and Control Board has operated in the public's and guiding industry's best interest?			
	Comments:	72%	26%	2%
	Yes. Competition for hunting areas has been reduced tremendously since assigned areas were implemented by the Board. Action by the Board against unethical operations has had a good effect on the industry.			
2.	Would the absence of the Board be detrimental to the public's best interest?			
	Comments:	68%	29%	3%
	Yes. The Board is necessary if we are to regulate the guiding profession.			
3.	Are there any statutes or regulations which you believe to be obsolete, vague or unduly restrictive?			
	Comments:	51%	35%	14%
	Yes. The three assistant guide limit is unduly restrictive. The transporter law should be deleted, as all it does is legalize a bunch of $10 guides who are not restricted to area, ethics.			

		% of Responses		
		Yes	No	No Opinion
4.	Are you aware of any discriminatory practices by the Board with regard to an individual's race, religion, color, national origin, age or sex?			
	Comments:	*10%*	*88%*	*2%*
	Yes. No comments were received for the 10% yes responses.			
	No. In fact they go overboard to be fair.			
5.	Do you believe that Alaska's licensing requirements (for assistant guide, Class-A assistant guide, registered guide and master guide) are adequate and effective in ensuring that the public is protected?			
	Comments:	*72%*	*24%*	*4%*
	Yes. The requirements are adequate.			
	No. Tests should be much more rigid and cover broader areas.			
6.	Are there any additional statutes, regulations or licensing requirements needed to ensure the public is adequately protected?			
	Comments:	*30%*	*59%*	*11%*
	Yes. There should be a legal limit placed on the number of guides because there is a limited amount of game.			
	No. We have too many statutes and regulations on the books now.			
7.	Do you have any complaints concerning the service provided by the staff support of the:			
	1) Department of Commerce and Economic Development, Division of Occupational Licensing?	*13%*	*[illegible]*	*[illegible]*
	2) Department of Public Safety, Division of Fish and Wildlife Protection?	*30%*	*59%*	*11%*

	% of Responses		
	Yes	No	No Opinion

7. (Cont'd.)

Comments:

Yes. The Department of Commerce and Economic Development is too slow in getting licenses issued.

No. Staff support has been good.

Yes. Protection officers seem to tend to be more interested in making cases than working to prevent offenses. By the same token, they spend time checking sport fishermen for licenses rather than work on more important offenses.

Favoritism. Harassment of some well meaning and hardworking guides.

No. They have been doing a good job.

8. Do you believe that the examination given by the Board for a registered guide license is a fair and reasonable test of a guide's professional knowledge and ability? 79% 14% 7%

Comments:

Yes. Between the written and oral exams an applicant gets adequate testing.

No. Some emphasis should be placed on contracts, civil rights and legal rights. A guide should also be required to attend a First Aid course or an adequate substitute.

9. Do you feel that the issuance of exclusive and joint use guiding area permits is in the best interests of the public and the guiding industry? 83% 14% 3%

Comments:

Yes. It is the only way to preserve our industry and maintain a healthy game population.

No. Areas are unfairly proportioned with little or no standardization. The big money operators were given huge tracts,

	% of Responses		
	Yes	No	No Opinion

9. (Cont'd.)

much of which they seldom if ever use. This has eliminated the opportunity for many newer and smaller guide operations to have any area at all.

10. Do you believe that there is a need for licensure of all transporters in the State? — 42% | 51% | 7%

Comments:

Yes. One of the biggest abuses of the wildlife resource in Interior Alaska has been by transporters (pilots without guide licenses) who act, for all practical purposes as guides.

No. A so called transporter does the same job as a guide and should be qualified as a guide. It's a way around the guide law, and has been abused by many Air Taxi operators and residents.

11. Any other comment, to assist us in evaluating the public need for the Board and/or its performance:

The Guide Board has worked very hard for the guiding industry. I believe that should the Guide Board be dissolved, the guiding industry would die. There is evidence that guiding brings a lot of money into the State that stays here. I strongly recommend the Guide Board be retained.

I believe the Guide Board should be abolished. They have been given too much power. If you aren't friends or have the money you are out. Who needs them!

Note 1

Number of questionnaires sent to licensed master guides and licensed registered guides.	180
Number of responses.	91
Response Rate.	51%

Note 2

Comments were all reviewed and considered in the performance of our audit, and are briefly summarized in this appendix.

GOVERNOR

STATE OF ALASKA
OFFICE OF THE GOVERNOR
JUNEAU

SEP 28 1979
LEGISLATIVE AUDIT

September 28, 1979

Mr. Gerald Wilkerson
Legislative Auditor
Division of Legislative Audit
Pouch W
Juneau, Alaska 99811

Dear Mr. Wilkerson:

We have reviewed the enclosed Department of Commerce and Economic Development response to your preliminary report entitled:

"A Performance Review of the Guide Licensing and Control Board -July 17, 1979"

Additionally, we have reviewed the interim response data submitted by the Departments of Revenue and Public Safety and are forwarding them to you.

You will note that the Department of Revenue is consulting with the Department of Law concerning Recommendation No. 4 and that they plan to make an official response within ten days. Also, the Department of Public Safety has indicated that there have been no changes of substance since their response to your interim letter. Accordingly, they and we feel that the original response is adequate and self-explanatory.

Sincerely,

Richard A. Smith
State Internal Auditor

JAY S. HAMMOND, GOVERNOR

DEPARTMENT OF COMMERCE & ECONOMIC DEVELOPMENT

OFFICE OF THE COMMISSIONER / POUCH D – JUNEAU 99811

September 27, 1979

RECEIVED
SEP 28 1979
LEGISLATIVE AUDIT

Mr. Gerald Wilkerson, C.P.A.
Division of Legislative Audit
Pouch W
Juneau, Alaska 99811

Dear Mr. Wilkerson:

The following comments are in response to the Performance Review of the Guide Licensing and Control Board, as submitted by the Division of Legislative Audit.

Recommendation No. 1: Agree. We believe that consolidation of guide licensing and control into one agency would enhance efficiency of operations, avoid duplication, and be less confusing. Transfer of licensing to the Department of Public Safety would not, however, have a significant effect in reducing Division of Occupational Licensing operating costs. We still would maintain equipment, overhead expenses, and the licensing examiner who is also currently responsible for two other boards. The reducation in workload would result in rea.location of duties from other high volume areas.

Recommendation No. 2: Agree. The division and the board are in agreement with this recommendation and will be preparing appropriate statutory amendments for consideration during the 1980 legislative session.

Recommendation No. 3: Agree. The board works on a continual basis to make its statutes and regulations comprehensible and relevant. The division will assist the board in these efforts.

Recommendation No. 4: N/A

Recommendation No. 5: Agree. All boards and commissions were requested to submit this information fc inclusion in the FY '81 budget document. The Guide Licensing and Control Board has complied with that request.

Thank you for the opportunity to respond to this report and for the time and effort expended by you and your staff.

Sincerely,

Bertram L. Wagnon
Acting Commissioner

BLW/kb

Gerald Wilkerson, Director
Legislative Auditor
Division of Legislative Audit

August 10, 1979

William R. Nix, Commissioner
Department of Public Safety

Interim Letter No. 1
Guide Licensing and
Control Board

Having reviewed the Interim Letter No. 1 concerning the sunset audit conducted by your agency of the Guide Licensing and Control Board, I offer the following comments:

Recommendation No. 1

The Guide Licensing and Control Board should seek legislation to have the guide licensing function transferred to the Department of Public Safety.

This department endorses this recommendation. The duplicated efforts currently practiced by two departments will be eliminated and all guide licensing functions placed under one authority. This will greatly simplify the citizens involvement with guide licensing functions. Additionally, it will eliminate the need to correct numerous errors that currently occur due to a split in the duties and responsibilities.

Recommendation No. 2

The Guide Licensing and Control Board should seek legislation to have the "transporter laws" repealed.

Again the department endorses this recommendation. As written the transporter laws do not serve a useful purpose in enforcement, game management, or protection of the resources. Some discussion between the Department of Fish and Game and the Department of Public Safety on this subject last year indicated that they share our opinion. To a large degree, our functions with the transporter laws overlaps that of the Federal Aviation Administration.

Recommendation No. 3

The Board should continue its efforts to make the statutes more clear, relevant and workable.

In general, many of the statutes and regulations are confusing to the public and our protection officers. It does little good to have statutes on the book and regulations

promulgated if the public doesn't understand them. In response to the examples you cited I offer the following:

A. This was covered in our response to recommendation number 2. This law is not only unworkable, but does not serve the purpose for which it was intended.

B. This may not be as confusing as it sounds because all fish and game licenses are renewed annually. If the guide licensing functions are placed under one authority (recommendation #1) it may eliminate the problems.

C. We admit that the term moral turpitude is vague; yet, ethical conduct or ethical activity, as recommended by the auditor, only applies to persons acting in the guide profession after a license is secured. Section 08.54.110(6) speaks to the qualifications for a registered guide license and the wording "has not been convicted of a crime involving moral turpitude" gives us a court established precedent for requesting applicants fingerprints and for conducting background investigations. If "moral turpitude" is repealed, some substitute qualification should be found that continues to give us the ability to eliminate applicants with serious criminal backgrounds.

D. The department agrees with the auditor that this section is very restrictive. The same intent could probably be accomplished by changing the word shall to may. Other statutes such as AS 08.54.200(b) and AS 08.54.200(c) give the board the authority to revoke licenses for other types of violations.

E. We would like to caution trying to define "supervision" as it could end up in the same category as "participate in a hunt" (AS 38.090) or "cooperate with officials" (AS 38.120). For purposes of enforcement, we feel that the current wording is sufficient.

Recommendation No. 4

The Board should establish formal goals, objectives and quantifiable measures which should be included in the in the Division of Occupational Licensings' budget document.

I feel that the board does have definate objectives and would have no reluctance to stating those objectives.

If you have additional questions or need a comment clarified, please feel free to contact me.

SEP 28 19

LEGISLATIVE AUDIT

TO Richard Smith, Director
Internal Audit Division
Department of Administration

DATE: September 28, 1979

FILE NO

TELEPHONE NO

FROM Thomas K. Williams, Commissioner
Department of Revenue JKD for

SUBJECT Legislative Audit's Performance Review of the Guide Licensing & Control Board

RECOMMENDATION NO. 4 - THE DEPARTMENT OF REVENUE SHOULD COLLECT FEES FROM GUIDES, AS REQUIRED BY STATUTE.

This law requires the participation of several State agencies. In 1976, the Department of Revenue met with the Departments of Law, Fish and Game, Commerce, Public Protection, and the Guide Licensing and Control Board.

The determination at that time was that the Guide Board, working with the Department of Commerce, was the only State agency that could effectively collect fees. The Guide Board and the Department of Law were to resolve the various problems and formulate the policy and procedures.

In the first week of October, the Department of Law is to release a memorandum which will set the guidelines and recommend appropriate action by each participating agency.

The Department of Revenue would like to defer an official response to Recommendation No. 4 until the Department of Law's memorandum has been reviewed. We request a ten-day postponement.

Mr. Gerald L. Wilkerson, CPA
Legislative Auditor

Dear Mr. Wilkerson:

Thanks for the copy of the preliminary audit of the Guide Board. Pine caught up with me in Port Angeles a couple of days ago. I notice that the chairman of the Board is requested to provide you with a response within 20 days. The last communication I received from Marcus Jensen via a copy of a letter to someone else indicated that he would not be back in Alaska until the latter part of October. He then will be in Juneau for a time until he goes to deer camp. My reaction to the audit is that it is both thorough and perceptive.

Sincerely,

Charles D. Kamm
Member

REP. PAT CARNEY • REP. C.V. CHAT CHATTERTON • REP. SAM COTTEN
REP. DICK ELIASON • REP. JACK FULLER • REP. RICK HALFORD

Article 1. Guide Licensing and Control Board.

Section	Section
10. Creation and membership of board	45. Special guiding permit
20. Appointment and term of office	50. Board regulations
30. Chairman of board	60. Board hearing
40. Powers and duties	70. Compensation and expenses

Sec. 08.54.010. Creation and membership of board. There is created the Guide Licensing and Control Board consisting of seven members. No more than three members of the board shall have a guide license. The other members shall have a general knowledge of the game resources of the state. A minimum of 10 years residence in the state is required for all members of the board. (§ 1 ch 17 SLA 1973)

Sec. 08.54.020. Appointment and term of office. The members of the board shall be appointed by the governor and confirmed by the legislature for staggered terms of three years or until their successors are appointed. Initial terms are as follows: three members for one year, two members for two years, and two members for three years. A member may be removed at the pleasure of the governor. (§ 1 ch 17 SLA 1973)

Sec. 08.54.030. Chairman of board. The board shall elect one of its members as chairman. (§ 1 ch 17 SLA 1973)

Sec. 08.54.040. Powers and duties. (a) Except as provided in § 45 of this chapter, the board shall

(1) prepare, grade and administer examinations;

(2) determine and pass on qualifications of applicants for licenses and authorize the issuance of licenses to those who qualify;

(3) establish guide performance standards and regulate activity;

(4) compile, maintain and publish a guide register of guides who have not been convicted of a violation of a federal or state sport fish, game, or guiding statute or regulation; a guide listed in the register whose license is revoked or suspended shall be removed from the register while his license is revoked or suspended;

(5) compile, maintain and publish a record of registered or master guides who have completed a contract hunt in any of three years immediately preceding the publishing of the record;

(6) prohibit guiding activities which are unsportsmanlike, unethical, unsafe, against principles of conservation, degrading to the guiding profession, or which adversely affect the natural resources;

(7) after a hearing, revoke, suspend or deny renewal of a license in accordance with § 200 of this chapter;

(8) establish a quota of licensed operating guides who may operate within designated geographical game units or subunits of the state and provide for an equitable and reasonable procedure for limiting the number of guides to that quota; preference shall be given to qualified

available and willing licensed guides who reside within the designated game unit or subunit.

(b) If a person is unable to competently understand the written portion of an examination given under (a)(1) of this section, he shall be given the complete examination orally in a language which he understands. (§ 1 ch 17 SLA 1973; am § 1 ch 133 SLA 1976)

Effect of amendment. — The 1976 amendment added paragraph (8) of subsection (a).

Sec. 08.54.045. Special guiding permit. This chapter does not limit the power of the board or its authorized designee, to issue a special guiding permit, in place of a guide license, to a person to guide in a specifically designated area, if the person is considered sufficiently experienced to perform the services of a guide and is limited solely by language barriers from securing a regular guide license. (§ 1 ch 17 SLA 1973)

Sec. 08.54.050. Board regulations. The board shall adopt procedural and substantive regulations, under the Administrative Procedure Act (AS 44.62), required by this chapter or reasonably necessary for its administration. (§ 1 ch 17 SLA 1973)

Editor's note. — Section 6, ch. 17, SLA 1973, provides: "A regulation promulgated by the Guide Licensing and Control Board in effect before March 14, 1973 remains in effect after that date until revoked or modified by the Guide Licensing and Control Board created by this Act."

Sec. 08.54.060. Board hearing. The Administrative Procedure Act (AS 44.62) applies to proceedings and hearings under this chapter. (§ 1 ch 17 SLA 1973)

Sec. 08.54.070. Compensation and expenses. Members of the board receive no salary, but are entitled to per diem and travel expenses authorized by law for other boards. (§ 1 ch 17 SLA 1973)

Article 2. Licensing.

Section		Section	
100.	Qualifications for a master guide license	144.	Restriction to transportation
110.	Qualifications for registered guide license	146.	Transporter report
120.	Qualifications for a class-A assistant guide license	150.	Responsibility of registered or master guide for violations
130.	Privileges and limitations of class-A assistant guides	170.	License fees
140.	Qualifications for assistant guide license	180.	Examination fee
142.	Qualification for transporter license	185.	Additional fees
		190.	Expiration and renewal
		200.	Grounds for disciplining a licensee
		210.	Unlawful acts
		220.	Injunction against unlawful action

Sec. 08.03.010. Termination, continuation and reestablishment of regulatory boards. (a) Boards listed in this subsection have a termination date of June 30, 1979:

(1) Board of Chiropractic Examiners (AS 08.20.010);
(2) Board of Dental Examiners (AS 08.36.010);
(3) State Medical Board (AS 08.64.010);
(4) Board of Nursing (AS 08.68.010);
(5) Board of Dispensing Opticians (AS 08.71.010);
(6) Board of Examiners in Optometry (AS 08.72.010);
(7) Board of Pharmacy (AS 08.80.010);
(8) Board of Veterinary Examiners (AS 08.98.010);
(9) Board of Psychologist and Psychological Associate Examiners (AS 08.86.010);
(10) Board of Nursing Home Administrators (AS 08.70.010);
(11) Physical Therapy Board (AS 08.84.010).

(b) Boards listed in this subsection have a termination date of June 30, 1980:

(1) Board of Public Accountancy (AS 08.04.010);
(2) Board of Barber Examiners (AS 08.12.010);
(3) Collection Agency Board (AS 08.24.011);
(4) Board of Hairdressing and Beauty Culture Examiners (AS 08.28.010);
(5) Board of Electrical Examiners (AS 08.40.010);
(6) State Board of Registration for Architects, Engineers and Land Surveyors (AS 08.48.011);
(7) Guide Licensing and Control Board (AS 08.54.010);
(8) Board of Marine Pilots (AS 08.62.010);
(9) Real Estate Commission (AS 08.88.011);
(10) Board of Welding Examiners (AS 08.99.010);
(11) Board of Governors of the Alaska Bar Association (AS 08.08.040).

(c) Upon termination, each board listed in (a) and (b) of this section shall continue in existence until June 30 of the next succeeding year for the purpose of concluding its affairs. During this period, termination does not reduce or otherwise limit the powers or authority of each board. One year after the date of termination, a board not continued shall cease all activities.

(d) The termination, dissolution, continuation or reestablishment of a regulatory board shall be governed by the legislative oversight procedures of AS 44.66.050.

(e) A board scheduled for termination under this chapter may be continued or reestablished by the legislature for a period not to exceed four years. (§ 2 ch 149 SLA 1977)

Sec. 44.66.050. Legislative oversight. (a) Before the termination, dissolution, continuation or reestablishment of a board or commission under AS 08.03.010 or § 10 of this chapter, or of an agency program under §§ 20 and 30 of this chapter, a committee of reference of each house, which shall be the standing committee of legislative jurisdiction as provided in the Uniform Rules of the Legislature, shall hold one or more hearings to receive testimony from the public, the commissioner of the department having administrative responsibility for each named board, commission, or agency program, and the members of the board or commission involved. The hearings may be joint hearings. The committee shall also consider the proposed budget of the board, commission, or agency program, prepared in accordance with AS 37.07.050(f), and the performance audit of the activities of the board, commission, or agency program, prepared by the legislative audit division as prescribed in AS 24.20.271(1). The committee may consider any other report of the activities of the board, commission or program, including but not limited to annual reports, summaries prepared by the Legislative Affairs Agency, and any evaluation or general report of the manner of conduct of activities of the board, commission, or agency program prepared by the office of the ombudsman.

(b) During a public hearing, the board, commission or agency shall have the burden of demonstrating a public need for its continued existence or the continuation of the program, and the extent to which any change in the manner of exercise of its functions or activities may increase efficiency of administration or operation consistent with the public interest.

(c) A determination as to whether a board or commission or agency program has demonstrated a public need for its continued existence shall take into consideration the following factors:

(1) the extent to which the board, commission or program has operated in the public interest;

(2) the extent to which the operation of the board, commission, or agency program has been impeded or enhanced by existing statutes, procedures, and practices which it has adopted, and any other matter, including budgetary, resource, and personnel matters;

(3) the extent to which the board, commission or agency has recommended statutory changes which are generally of benefit to the public interest;

(4) the extent to which the board, commission or agency has encouraged interested persons to report to it concerning the effect of its regulations and decisions on the effectiveness of service, economy of service, and availability of service which it has provided;

(5) the extent to which the board, commission or agency has encouraged public participation in the making of its regulations and decisions;

(6) the efficiency with which public inquiries or complaints regarding the activities of the board, commission or agency filed with it, with the department to which a board or commission is administratively assigned, or with the office of the ombudsman have been processed and resolved;

(7) the extent to which a board or commission which regulates entry into an occupation or profession has presented qualified applicants to serve the public;

(8) the extent to which state personnel practices, including affirmative action requirements, have been complied with by the board, commission or agency to its own activities and the area of activity or interest; and

(9) the extent to which statutory, regulatory, budgeting or other changes are necessary to enable the agency, board or commission to better serve the interests of the public and to comply with the factors enumerated in this subsection.

(d) As to each board, commission, or agency program assigned to it for purposes of review, the committee of reference shall, not later than the 60th day of the legislative session, submit a report to the presiding officer of the house. The report shall contain a summary of the findings of the committee as to the compliance of the board, commission or program with the factors enumerated in (c) of this section, together with a summary or recommendations of the committee as to each of the following:

(1) an identification of the problems or the needs that the programs and activities of the board, commission or agency are intended to address;

(2) a statement, to the extent practicable, of the objectives of the program of the board, commission, or agency program, and its anticipated accomplishments;

(3) an identification of any other programs having similar, conflicting or duplicate objectives;

(4) an assessment of alternative methods of achieving the purposes of the program;

(5) an assessment of the consequences of eliminating the board, commission or program and consolidating its activities with another program, or of funding it at a lower level;

(6) a justification for the recommended continuation or extension of the board, commission or program, and an explanation of the manner in which it avoids duplication of or conflict with other efforts; and

(7) any other information which, in the opinion of the committee, would improve the performance of the board, commission or agency with respect to its representation of and responsiveness to the public interest.

(e) The committee of reference may introduce a bill providing for the reorganization or continuation of the board, commission or agency program. No more than one board, commission, or agency program shall be continued or reestablished in any legislative bill, and the board,

DRAFT - adopted

March 11,1980

The Honorable Terry Gardiner
Speaker of the House
Alaska State Legislature
Pouch V
Juneau, Alaska 99811

Dear Mr. Speaker:

Your House Resources Committee has had under consideration for "Sunset" review the Guide Licensing and Control Board persuant to your referral under AS 44.66.050 and AS 08.03.010.

In accordance with statuatory requirements a public hearing was held on the review of this board at which testimony was taken from members of the board and of the profession as well as from the administrative agencies dealing with the operation and enforcement of Guide Board functions.

Directed, in part, by the report prepared by the Division of Legislative Audit the Committee took into consideration the factors required to be evaluated under AS 44.66.050(c).

Your Resources Committee thereby makes the following findings:

1. That the licensing of Guides is needed to protect the safety and welfare of the public and to protect the Resources of the State of Alaska.

2. That the licensing function as it applies to guides should be transferred from Occupational Licensing to Public Safety.

3. That the "Transporter Laws" should be repealed as unworkable.

4. That certain other statututs changes primarily those listed in the audit report be included in the "Sunset" legislation to be introduced by this committee.

5. That the Guide Licensing and Control Board be continued for one year during ich time....

   a. the Department of Law is requested to perform a complete legal audit of the minutes and records of the Board to determine whether their procedures and actions have been in full compliance with the Alaska Constitution and all applicable statutes.

   b. ~~a legislative committee~~ a legislatively directed study can evaluate and recommend specific statuatory changes under which rural residents can enter the guiding profession and receive the maximum benefits from local guiding activities.

~~A bill will be introduced by the Resources Committee reflecting the findings and recommendations in the letter.~~

Respectfully submitted,

Rep. Alvin Osterback
Co-Chairman
House Resources Committee

Members

Alaska State Legislature

REPRESENTATIVE
Rick Halford

House of Representatives

To: Office of the Attorney General

From: Representative Rick Halford

Date: March 10, 1980

Request: Legal Review of the Powers, Duties and Performance of the State Guide Licensing and Control Board

The House Resources Committee is considering the merits of continuation or termination of the Guide Licensing and Control Board under the Sunset review process. Because the Guide Board's mandate and procedures have been the subject of numerous legal questions, it seems appropriate to request that your department review certain issues which are beyond the expertise of Legislative audit.

A substantial portion of the Guide Board's time, since its creation, has been devoted to the development and implementation of a limited entry system under the terminology of "exclusive guide areas". Specific questions include:

1) Does the exclusive guide area system comply with the provisions of Article I, Section I of the State Constitution and the further provisions of Article VIII, Section 17 in concept (if carried out properly).

2) If the system is conceptually within Constitutional bounds, does the method of implementation used by the Guide Licensing and Control Board comply with all applicable Consititutional and Statuatory provisions.

These two questions are basic to the entire area system which has been in place for several years:

1) If guide A is cited for guiding in an area assigned to guide B, and guide A is willing to go through the entire legal appeal process, will he win if he is in every other way legal to guide in the area in question?

2) Do the broad protections applied to a guide's license in the Herscher case logically extend to the exclusion from using that license under the exclusive areas?

It would also be useful to have copies of all past correspondence between your office and the Department of Public Safety or the Guide Board on this subject.

(2) employ a person whose duties require expertise in determining or reducing the hazards of radiation.

(b) As used in this section, "state agency" or "agency of the state" means a state department or agency, whether in the legislative, judicial, or executive branch, including such entities as the Alaska State Housing Authority; "state agency" or "agency of the state" does not include the University of Alaska, a municipality, or an agency of a municipality.

(c) As used in this section, "radiation" does not mean radiation emitted from a Federal Communications Commission licensed facility emitting radiation of a wave length longer than one centimeter and an average power output not exceeding two kilowatts. (§ 2 ch 172 SLA 1978)

Cross reference. — As to radiation protection, see AS 18.60.475.

Chapter 66. Review of the Activities of Agencies, Boards and Commissions.

Section		Section	
10.	Termination of state boards and commissions	30.	Program identification
20.	Agency programs	50.	Legislative oversight
		60.	Existing claims

Cross reference. — As to the termination, continuation and reestablishment of regulatory boards, see AS 08.03.010.

Editor's note. — Section 1, ch. 149, SLA 1977, provides: "The legislature finds that the substantial increase in the number of state agencies, boards and commissions, and the proliferation of rules and regulations which each has adopted have contributed to a public disenchantment with the operation of state government, and that there is need for an effective and regular system of scrutiny of the programs and activities of all agencies, boards and commissions. The legislature further finds that the establishment of a system for periodic review by the public and the executive and legislative branches of certain state agencies, boards and commissions will help the governor and the legislature to determine the need for the continued existence of each of the agencies, boards and commissions."

Sec. 44.66.010. Termination of state boards and commissions. (a) Boards and commissions listed in this subsection expire on the date set out after each:

(1) Alcoholic Beverage Control Board (AS 04.05.010) — June 30, 1979;

(2) Alaska Transportation Commission (AS 42.07.011) — June 30, 1979;

(3) State Board of Parole (AS 33.15.010) — June 30, 1980;

(4) Alaska Public Utilities Commission (AS 42.05.010) — June 30, 1980;

(5) Alaska Pipeline Commission (AS 42.06.010) — June 30, 1981;

(6) Alaska Council on Science and Technology (AS 44.19.181) — June 30, 1983;

(7) Alaska Renewable Resources Corporation (AS 37.12.010) — June 30, 1982.

(b) Upon termination, a commission listed in (a) of this section shall continue in existence until June 30 of the next succeeding year for the purpose of concluding its affairs.

(c) A commission scheduled for termination under this chapter may be continued or reestablished by the legislature for a period not to exceed four years. (§ 3 ch 149 SLA 1977; am § 3 ch 101 SLA 1978; am § 10 ch 1979 SLA 1978)

Effect of amendments. — The first 1978 amendment added paragraph (6) of subsection (a). The second 1978 amendment added paragraph (7) of subsection (a).

Sec. 44.66.020. Agency programs. (a) Agency programs and activities listed in this subsection which are specifically designated as provided in § 30 of this chapter are subject to termination during the regular legislative session convening in the month and year set out after each:

(1) programs in the budget categories of general government, public protection, and administration of justice — January, 1980;

(2) programs in the budget categories of education and the University of Alaska — January, 1981;

(3) programs in the budget categories of health and social services — January, 1982;

(4) programs in the budget categories of natural resources management, development and transportation — January, 1983.

(b) An agency program or activity designated in (a) of this section shall be subject to termination during the regular legislative session convening four years after the preceding review and may be subject to termination at any time upon the recommendation of the Legislative Budget and Audit Committee and the concurrence of the legislature as if under § 30 of this chapter. (§ 3 ch 149 SLA 1977)

Sec. 44.66.030. Program identification. During the legislative session preceding each of the years set out in § 20 of this chapter, the Legislative Budget and Audit Committee shall designate, not later than March 1 of those years, the programs and activities within each program category which shall be subject to termination in the next fiscal year. The recommendations of the Legislative Budget and Audit Committee shall be submitted to the respective houses of the legislature in the form of a bill which, if enacted into law, would terminate those designated programs and activities on or before July 1 of the following year. (§ 3 ch 149 SLA 1977)

Sec. 44.66.050. Legislative dissolution, continuation or r under AS 08.03.010 or § 10 c under §§ 20 and 30 of this c house, which shall be the star as provided in the Uniform R more hearings to receive test of the department having adn board, commission, or agency or commission involved. Sec. 44.66.050. Legislative oversight. (a) Before the termination, dissolution, continuation or reestablishment of a board or commission under AS 08.03.010 or § 10 of this chapter, or of an agency program under §§ 20 and 30 of this chapter, a committee of reference of each house, which shall be the standing committee of legislative jurisdiction as provided in the Uniform Rules of the Legislature, shall hold one or more hearings to receive testimony from the public, the commissioner of the department having administrative responsibility for each named board, commission, or agency program, and the members of the board or commission involved. The hearings may be joint hearings. The committee shall also consider the proposed budget of the board, commission, or agency program, prepared in accordance with AS 37.07.050(f), and the performance audit of the activities of the board, commission, or agency program, prepared by the legislative audit division as prescribed in AS 24.20.271(1). The committee may consider any other report of the activities of the board, commission or program, including but not limited to annual reports, summaries prepared by the Legislative Affairs Agency, and any evaluation or general report of the manner of conduct of activities of the board, commission, or agency program prepared by the office of the ombudsman.

(b) During a public hearing, the board, commission or agency shall have the burden of demonstrating a public need for its continued existence or the continuation of the program, and the extent to which any change in the manner of exercise of its functions or activities may increase efficiency of administration or operation consistent with the public interest.

(c) A determination as to whether a board or commission or agency program has demonstrated a public need for its continued existence shall take into consideration the following factors:

(1) the extent to which the board, commission or program has operated in the public interest;

(2) the extent to which the operation of the board, commission, or agency program has been impeded or enhanced by existing statutes, procedures, and practices which it has adopted, and any other matter, including budgetary, resource, and personnel matters;

(3) the extent to which the board, commission or agency has recommended statutory changes which are generally of benefit to the public interest;

(4) the extent to which the board, commission or agency has encouraged interested persons to report to it concerning the effect of its regulations and decisions on the effectiveness of service, economy of service, and availability of service which it has provided;

(5) the extent to which the board, commission or agency has encouraged public participation in the making of its regulations and decisions;

(6) the efficiency with which public inquiries or complaints regarding the activities of the board, commission or agency filed with it, with the department to which a board or commission is administratively assigned, or with the office of the ombudsman have been processed and resolved;

(7) the extent to which a board or commission which regulates entry into an occupation or profession has presented qualified applicants to serve the public;

(8) the extent to which state personnel practices, including affirmative action requirements, have been complied with by the board, commission or agency to its own activities and the area of activity or interest; and

(9) the extent to which statutory, regulatory, budgeting or other changes are necessary to enable the agency, board or commission to better serve the interests of the public and to comply with the factors enumerated in this subsection.

(d) As to each board, commission, or agency program assigned to it for purposes of review, the committee of reference shall, not later than the 60th day of the legislative session, submit a report to the presiding officer of the house. The report shall contain a summary of the findings of the committee as to the compliance of the board, commission or program with the factors enumerated in (c) of this section, together with a summary or recommendations of the committee as to each of the following:

(1) an identification of the problems or the needs that the programs and activities of the board, commission or agency are intended to address;

(2) a statement, to the extent practicable, of the objectives of the program of the board, commission, or agency program, and its anticipated accomplishments;

(3) an identification of any other programs having similar, conflicting or duplicate objectives;

(4) an assessment of alternative methods of achieving the purposes of the program;

(5) an assessment of the consequences of eliminating the board, commission or program and consolidating its activities with another program, or of funding it at a lower level;

(6) a justification for the recommended continuation or extension of the board, commission or program, and an explanation of the manner in which it avoids duplication of or conflict with other efforts; and

(7) any other information which, in the opinion of the committee, would improve the performance of the board, commission or agency with respect to its representation of and responsiveness to the public interest.

(e) The committee of reference may introduce a bill providing for the reorganization or continuation of the board, commission or agency program. No more than one board, commission, or agency program shall be continued or reestablished in any legislative bill, and the board,

commission, or agency progra

MARCUS F. JENSEN
P. O. BOX 2220
JUNEAU, ALASKA 99803

April 22, 1980

Representative Alvin Osterback
Alaska State Legislature
Resources Committee of the House of Representatives
Juneau, Alaska

Dear Representative Osterback:

I have just received copy of a letter sent to you by the Alaska Professional Hunters Association. I would be surprised if you would give credence to an unsigned letter. Unsigned letters are often from "mad letter writers".

The contents of the letter surprises me, as it would appear to have been written by someone who is not registered to guide in Unit 4, which is Southeastern Alaska.

Notification of the meeting in Fairbanks was handled the same way every meeting is handled when petitions are to be presented. All guides involved were sent a letter personally. Some of these guides answered by letter, and some testified in person.

I have guided in Unit 4 for over 30 years, and until last year the Southeastern guides honored their word in respect to not guiding in my particular area. The reason for their sudden change is the fact that the Game Board has a closure on what they call the "inside" and left the fringe on the "outside" open ten days longer. I have been very conservative in the number of contracts I take because of the public hunting pressure in the area as well.

No guide in Southeastern Alaska would object to my area if he would agree to an exclusive area for himself which would automatically reduce his number of contracts from eight or ten to three or four at the most. This is really what the controversy is all about. There has been too much guiding pressure on the "inside". Too many guides still have the attitude that the will shoot the last cub bear for a dollar. I am enclosing copy of a letter from the Game Biologist in Unit 4. He estimated at that time only 25 bear should be taken and since the guides and the public split the total take that would mean only 12 bear for the guides and their assistants. He has probably increased that 25 figure to 40 since the letter was written, which would allow in the neighborhood of 20 bear for the guides. The guides' success ratio for the number of contracts is very low - around 50%. If trophy bear were taken the percentage would be considerably lower than 50% because most of the takable bear have been shot.

To give you a better example of what is happening in Unit 4 I refer you to contracts of a guide named John Erickson. He had 10 hunters contracts in spring of 1979. Of those ten, four got no bear, and four took bear under five feet. I am enclosing some of the sealing certificates to give you an idea of what I mean. When the going rate for a hunt is four to five thousand dollars I think it behooves the guiding profession to give the hunter more chance for a trophy bear.

I do not think the action of the Guide Licensing and Control Board should be criticized for trying to save a small area from being totally raped. The petitions that guides from Unit 4 are putting in now will be handled in an orderly manner by the staff and the Board.

As chairman of the Guide Licensing and Control Board, and as an Alaska resident for over 50 years, and as a registered guide for some 35 years, I have been criticized by some guides for my strong stand against guides who want to rape the game resources. A stand like this doesn't necessarily make everyone love you. A situation happened last spring where two guides took over 30 grizzlies in Unit 23. I was very upset over this and wanted to bring the guides before our Board for a hearing. I am now in the process of scheduling a meeting with the Kotzebue Native Corporation on this subject of game resource. I have made every effort to work with the Natives and intend to continue to do so in the future. Some guides criticize me for this.

I would hope that the House Resource Committee appreciate what most of our Board members are trying to do for the State of Alaska, and that is weed out the "bandits" who are raping our resource, and develop exclusive guide areas for the protection of the resource and improved game management.

Respectfully yours,

Mark Jensen

Dear Representative Osterback:

We have had a situation that came up during the recent Guide Board meeting that was held in Fairbanks, Alaska that may be worthy of some consideration by your committee in evulating the conduct of the Board under Sunset review. These tapes and the transcript of the meeting should be available to your committee at the Department of Commerce.

Mark Jensen, the Chairman of the Guide Board, was awarded the only exclusive guide area in Units 1 thru 4 in Southeastern Alaska. The area awarded was the total outside coast of Chichasof Island. This was done over the objections of all Southeastern guides, who testified in person or by letter, who had joint use of this area. Their right to hunt this area has been taken away and given to one man without the consideration of the other twenty guides.

We would like to point out that APHA has no objection to Mr. Jensen having an exclusive guide area but it was the manner in which this was done. This was, in the eyes of the guiding industry, a flagrant abuse of power by the Chairman to serve his own personal financial interests.

APHA believes that this action by the Board should be revoked and an opportunity given to all guides in Southeastern Alaska to apply to the Board for an exclusive area.

The next Guide Board meeting should be held in Juneau, not in Fairbanks, so that all petitions to be considered would allow maximum participation by the Southeastern guides.

Sincerely,

THE BOARD OF APHA

P.S. IT is interesting to note that the only Board Member, wh could see how unfair this action was and voted against i was a full-time guide. We believe at least three full-time guides should be on the Board.

April 9, 1979

Mr. Marcus Jensen
P.O. Box 2220
Juneau, AK 99803

Dear Marc:

The Alaska Board of Game has now met and taken action on the Unit 4 brown bear situation. I am writing you at this earliest possible moment so that you can adjust your schedule to conform to the Board's action.

The Board adopted a substantially shortened season which will go into effect at the start of the new regulatory year, July 1. The season the Board adopted is as follows: September 15-May 20 for Admiralty and the east side of Baranof and Chichagof and September 15-May 31 for the west side of Baranof and Chichagof. The line of division between east and west Baranof and Chichagof is shown on the enclosed map. To eliminate the possibility of an excessive harvest this coming spring season, the Board has directed the Commissioner of the Department of Fish and Game to adopt an Emergency Order, effective immediately, which implements the season outlined above. Therefore, the closing date for this spring season, 1979, will end May 20 for Admiralty and the eastern side of Baranof and Chichagof and May 31 for the western side of Baranof and Chichagof.

The Board has also directed the Department of Fish and Game to closely monitor hunting during the spring 1979 season; and if it appears the kill will exceed 25 bears on Admiralty, east Baranof, and east Chichagof, the Commissioner will close the season in these areas by Field Announcement. The season on west Baranof and west Chichagof will remain open until May 31.

Sincerely yours,

Loyal J. Johnson

Dear Mark:

Sometimes people are apt to forget that when a person takes on a public chore and serves gratis, he doesn't give up his individual rights. Following the action of the Guide Licensing and Control Board this past week while it was reexamining the status of Unit #4 concerning Brown Bear and Exclusive and Joint Usage Guiding Areas, you no doubt are wondering if you'll ever get what you, like other guides, set out to get--an Exclusive Guiding Area, which is what you have wanted all along. I want it to be a matter of record that you put in for an EGA at the onset. Most of the guides in the Panhandle (the preponderance of whom in no way had "rights" that would measure up to yours) opted for joint usage in Units1-4. You regretfully went along with the rest, at the Board's insistence. Later, long before this recent reexamination, you again requested your EGA. The Board, still trying to make the collective Joint Usage work, felt you should withdraw the second request. It was not accepted.

This past week as the Board learned that there is a growing pressure on a fairly static resource (Brown Bear) but decided to maintain the status quo, it also learned that not all the guides who agreed at the initial meeting on this subject to respect your area of operations were doing so. The Board, therefore, encouraged you to again petition for your EGA, and the guides present pretty well agreed that they would have no objection to your doing so. There was general recognition that your rights, based on the criteria the Board has shaped over time, are on or are very close to the very foundation stone.

Times and circumstances change, as does makeup of various organizations. Memory falters and fades. I feel that because of all these factors I should put together this brief summary inasmuch as I have attended all meetings on this subject as it touches Units 1-4, and wish you well.

Fraternally,
Charles J. Keim

College, Alaska 99735

Dear Sam:

I understand that your Game Board is meeting in Anchorage starting December 2, 1980. With that in mind, I am proposing to schedule our Guide Licensing and Control Board meeting for November 29 so that we wouldn't completely overlap your meeting. Would it be possible for our two boards to spend a half a day together discussing topics that should probably be identified ahead of time where we have a mutual interest. I think it might be very helpful in the long run to have both boards understand their particular role in this game resource management. If you would approve of such a meeting, I would suggest you contact our staff at the above address, Atten: Inv. William Bellingar, and make any suggestions you might think would be helpful.

Thank you.

Very truly yours,

Marcus Jensen/jan Lahl

Box 686
Kotzebue, Alaska 99752

Dear Mr. Lincoln:

Thank you for your letter of February 8, 1980. I certainly appreciate your desire to meet with our board and discuss game resources. I think communication is very important as an improvement in game management. It is our understanding that the Game Board meeting will start December 2 in Anchorage. If there is no objection from our board members, I would like to start the Guide Board meeting agenda on November 29 so that we could handle some of our workload and still be able to meet with the Game Board members. On that basis, I would set a tentative agenda for November 29, in the afternoon starting at 1:00 pm. This schedule would be to hear people from your organization and some of the qualified people such as professional guides and the public, plus biologists that are acquainted with the area. I think an open meeting such as you have suggested is useful for all parties concerned. I think we would be establishing a little bit of history to sit down together and discuss all types of resource problems. It might be well to include in our agenda some comments on marine mammals, even though federal legislation is needed to commercialize this resource. I would hope that some time in the near future you can prepare a tentative agenda with a list of speakers and topics and the board will do the same from the board members and the guiding profession. If your correspondence could be addressed to the Department of Public Safety, address above, Attention: Inv. William Bellingar, the staff will keep you up to date as progress is made on the agenda.

Very truly yours,

Marcus Jensen / Jean Lobo

TO WHOM IT MAY CONCERN:

Attached hereto you will find a letter from Karl Lane, addressed to the Guide Licensing & Control Board to be used at our February meeting in Juneau, on Unit 4. I regret to say that this letter was misplaced and was not read at that meeting.

I have known Karl Lane for many years, I have worked on his boat and I have a great deal of respect for the man himself, and his operation as a guide. It is unfortunate that open friction developed on my request for a small area.

Karl's letter shows a great deal of understanding and foresight in the changes that are about to occur in this area. The constant change creates problems for the guiding industry. Conditions will not improve - they will gradually deteriorate. The exclusive guide area has been very effective in the Interior of Alaska, where most all guides are satisfied that it is the best approach. I would hope that the Board and the guides will develop some of the thoughts in Karl's letter and bring them to a conclusion.

Sincerely yours,

Marcus Jensen

Marcus F. Jensen, Chairman
Guide Licensing & Control Board

PS. A REMINDER! September 1 is the deadline for filing applications for areas! MJ.

Guide Licensing and Control Board
Division of Occupational Licensing
Pouch D
Juneau, Alaska 99811

Gentlemen:

Although I will not be present to give oral testimony at the Feb.13th thru 16th meeting of the Guide Board, I wish to assure you that I am still deeply concerned about the problems and future of brown bear guiding in Southeast Alaska and offer the following written testimony for consideration.

Somehow there must be found a way to reduce the guiding pressure by cutting down the number of active guide and also closing the loopholes that permit guides licensed for the area to sign contracts for guides not licensed for the area. This is being done by a few guides at the present time and it could allow an unlimited number to operate in Unit 4 and defeats any conservation measure you pass.

I would be in favor of exclusive areas if there is a proviso allowing Joint-Use if the individual guides so wish. The reason being that there is no fair way of dividing a country that is already split by different opening and closing dates for conseration reasons. There is also the problem of constant changing development in the logging industry. For example, the northern, eastern and southern coastlines of Chichagof Island will have intensive road building in '81 and full scale logging in '82. This will eliminate most of Chichagof. The northeast portion of Baranof will have the same development.

I would not be in favor of an exclusive area being transfered for any monetary value. If exclusive areas are issued to guides, they should be passed on to next qualified guide when the guide holding the area is not active for more than one season. The price of limited entry fishing permits are unfair.

If you are successful in limiting the guides to around ten or so, I have even been thinking of the possibility of cutting this number in half by guiding alternate years. For example, if you still had eight or ten guides which is still too many in my estimation, four or five guides with their clients would easily take one half of the quota of bears that the Game has set and the other half would surely be taken by the increase of resident hunting effort. A guided hunting trip would again have some quality and the bears would have a better chance of recovering.

Sincerely,

Karl Lane

Dear Mark:

Sometimes people are apt to forget that when a person takes on a public chore and serves gratis, he doesn't give up his individual rights. Following the action of the Guide Licensing and Control Board this past week while it was reexamining the status of Unit #4 concerning Brown Bear and Exclusive and Joint Usage Guiding Areas, you no doubt are wondering if you'll ever get what you, like other guides, set out to get--an Exclusive Guiding Area, which is what you have wanted all along. I want it to be a matter of record that you put in for an EGA at the onset. Most of the guides in the Panhandle (the preponderance of whom in no way had "rights" that would measure up to yours) opted for joint usage in Units1-4. You regretfully went along with the rest, at the Board's insistence. Later, long before this recent reexamination, you again requested your EGA. The Board, still trying to make the collective Joint Usage work, felt you should withdraw the second request. It was not accepted.

This past week as the Board learned that there is a growing pressure on a fairly static resource (Brown Bear) but decided to maintain the status quo, it also learned that not all the guides who agreed at the initial meeting on this subject to respect your area of operations were doing so. The Board, therefore, encouraged you to again petition for your EGA, and the guides present pretty well agreed that they would have no objection to your doing so. There was general recognition that your rights, based on the criteria the Board has shaped over time, are on or are very close to the very foundation stone.

Times and circumstances change, as does makeup of various organizations. Memory falters and fades. I feel that because of all these factors I should put together this brief summary inasmuch as I have attended all meetings on this subject as it touches Units 1-4, and wish you well.

Fraternally,

The Honorable Jay S. Hammond
Governor of Alaska
Pouch A
Juneau, Alaska 99811

Dear Governor Hammond:

A certain decision during the last meeting of the Guide Licensing and Control Board has caused a not insignificant consternation among the active licensed game guides of our industry. On a 3-1 vote of the four Board members present, an exclusive guide area was permitted to Mr. Marcus Jensen, Chairman of this board.

This questionable decision comes at a time when this very Board and the policies adopted to administer the professional game guiding industry are being reviewed by this legislature. One of our concerns is that this action could bring about unfavorable reaction from the reviewing committee, which might jeopardize a basically sound Board and the concept of exclusive guide areas developed over the last several years. To negate the compromise, made by some 253 permit holders, who gave rather than gained, in order to allow a maximum number of licensed guides to participate in the limited game resources of Alaska would be disasterous. The Board and the exclusive or joint-use guiding areas has and is working to protect one of Alaska's most significant natural renewable resources, and should be continued.

Equally important, have the rights of other joint permit holders in Game Management Unit Four been safe guarded and considered during deliberation on the Jensen decision?

A closer look and re-evaluation would be in order. Of course, all interested parties should be allowed to participate so the facts can be aired and evaluated.

Sincerely,

ALASKA PROFESSIONAL HUNTERS ASSOCIATION, INC.

STATE OF ALASKA
OFFICE OF THE GOVERNOR
JUNEAU

February 11, 1980

Mr. Mark Jensen
Chairman
Guide Licensing and
Control Board
P.O. Box 2220
Juneau, Alaska 99803

Dear Mark:

This is in response to your request that I consider making changes in the membership of the Guide Licensing and Control Board. I appreciate your concerns in this matter and am sympathetic to the problems you have recently had to shoulder.

Even so, given the extreme sensitivity of the situation currently facing the Board and its members, I feel it would be inappropriate to force any changes in the Board composition until the larger issue before the State Senate has been resolved.

Your task, though a difficult one, is one you have handled with your characteristic tact and I am confident of your abilities to weather the current storms. If I can be of any assistance to you, please do not hesitate to ask.

Sincerely,

Jay S. Hammond
Governor

12 AAC 38.030. LICENSES. (a) A person must purchase his registered guide license within one year of passing the guiding examination or his eligibility lapses.

(b) An application for a guide license shall be made to the Division of Occupational Licensing, Department of Commerce, Pouch D, Juneau, Alaska 99811. (Eff. 6/28/74, Reg. 50)

Authority: AS 08.54.050

12 AAC 38.040. RESTRICTION TO DISTRICTS. (a) A guide may conduct guiding activities only in districts for which he is certified.

(b) Twenty-six guide districts are established and defined as being identical to those areas described as game management units by the Board of Fish and Game in 5 AAC 90.010, as of January 1, 1974, with the addition of two subdistricts

(1) 18A – Nunivak Island and all waters within one mile of that island;

(2) repealed 6/6/79;

(3) 27 – Marine Mammals, including all the area between the western boundaries of districts 17, 18, 22, 23 and 26, except that area included in 18A, north of latitude 50 degrees north and east of the Convention Line of 1867 between the United States and the Union of Soviet Socialist Republics and south of latitude 75 degrees north.

(c) A guide licensed under AS 08.54 as of the effective date of this section is restricted to certification to guide in those districts for which he is certified on that date.

(d) After the effective date of this section, all guides applying for new certification are limited to a total of three districts including those districts for which they were certified as of that date.

(e) A master guide or registered guide may serve as a class A assistant guide in districts for which he is not certified.

(f) Notwithstanding any provision of this section, a guide may petition the board for a transfer of certification to another district if he demonstrates to the satisfaction of the board

(1) that he will incur substantial hardship if a transfer is not permitted as evidenced by

(A) substantial land withdrawals from hunting within his district;

(B) significant reclassifications of land within his district;

(C) depletion of game as evidenced by actions of the Department of Fish and Game; or

(D) other demonstrations of hardship; and

(2) that he is qualified to guide in the district to which he wishes to be transferred. (Eff. 6/28/74, Reg. 50; am 2/25/77, Reg. 61; am 6/6/79, Reg. 70)

Authority: AS 08.54.040(a)(3) and (6)
AS 08.54.050

12 AAC 38.050. REGISTRATION OF MAIN CAMP. Repealed 5/12/78.

12 AAC 38.051. GUIDING AREA PERMITS. (a) Guiding area permits will be issued by the board to guides qualifying under secs. 53 and 54 of this chapter for exclusive or joint use of a specified area in order to limit the number of guides allowed to guide for big game animals in that area.

(b) The board will determine the size, boundaries and number of guiding areas assigned to a master or registered guide and is not limited by number or boundaries of guide districts which may be included.

(c) Each guiding area will be assigned a unique identification code. (Eff. 5/12/78, Reg. 66)

Authority: AS 08.54.040(a)(3),(6) and (8)
AS 08.54.050

12 AAC 38.052. GUIDE PROHIBITED FROM USING A GUIDING AREA NOT ASSIGNED TO HIM OR HER. No guide may contract guided big game hunts in an exclusive guiding area not assigned to him or her unless written permission to do so is obtained from the guide

to whom the guiding area is assigned. If more than one guide holds a permit for joint use of the guiding area, written permission must be obtained from each holder of a permit. The written permission must include the effective and expiration dates of use and the identity and number of the big game species to be hunted,

and must be dated and signed by all of the persons holding a permit for the guiding area. This written permission must be on the person of the guide conducting the hunt or in the base camp from which the hunt is conducted. (Eff. 5/12/78, Reg. 66)

Authority: AS 08.54.040(a)(3),(6) and (8)
AS 08.54.050

12 AAC 38.053. APPLICATION AND QUALIFICATION FOR GUIDING AREA PERMIT. (a) An applicant for initial issuance of a guiding area permit must, at the time of application and at the time the application is reviewed by the board, be a registered or master guide in good standing and must be certified in the district or districts in which the applied-for guiding area is located.

(b) In order to be considered, an applicant must submit to the board, on or before the published deadline, an application which describes the proposed geographic boundaries of the guiding area being applied for and a 1:250,000 scale map showing the proposed boundaries.

(c) Each application must include satisfactory documentation of the applicant's past use, occupancy, or financial investment in the guiding area applied for. The application may include other relevant information if it is substantiated by satisfactory documentation.

(d) The board will, in its discretion, issue a permanent guiding area permit to a qualified applicant who can substantiate his or her use, occupancy, or financial investment in the guiding area for at least three of the five years immediately preceding the published deadline for filing the application for that particular unit. The board will, in its discretion, issue a temporary guiding area permit to a qualified applicant who can substantiate his or her use, occupancy or financial investment in the guiding area for at least two of the five years immediately preceding the published deadline for filing the application for that particular unit.

(e) The holder of a temporary guiding area permit may apply for a permanent permit after one additional year of use, in the temporary guiding area. (Eff. 5/12/78, Reg. 66)

Authority: AS 08.54.040(a)(3),(6) and (8)
AS 08.54.050

12 AAC 38.054. REASSIGNMENT OF GUIDING AREA PERMIT. (a) Guiding area permits are not transferable by the permit holder. The board will, in its discretion, reassign a guiding area permit

(1) upon the death of the permit holder or upon a judicial determination that the permit holder is mentally incompetent;

(2) upon revocation or suspension of a guiding area permit;

(3) if the permit holder voluntarily relinquishes the guiding area permit; and

(4) upon application for reassignment.

(b) Under (a)(4) of this section, a permit holder may apply to the board for reassignment of his or her guiding area permit to a designated master or registered guide; the application must be made jointly by the permit holder and the designated master or registered guide. Approval of the reassignment will be given only upon a finding by the board, after notice and opportunity for a hearing, that the designated registered or master guide is qualified to guide in the area, is certified in the district or districts in which the applied-for guiding area is located, and that the reassignment is consistent with the public interest. The board will consider the designated master or registered guide's past use, occupancy, or financial investment in the guiding area and other relevant and reliable information in determining whether the designated master or registered guide is qualified.

(c) Except as otherwise provided in this chapter, an applicant for a guiding area permit which is to be reassigned must meet the requirements of sec. 53(a) of this chapter and make application in the manner prescribed for initial issuance of a guiding area permit.

(d) If an applicant cannot establish past use of the guiding area to be transferred or is not certified in the district or districts in which the guiding area is located, the board will consider experience and current use in another area of similar terrain if the applicant can establish to the satisfaction of the board that he or she is competent because of other relevant factors to conduct guiding activities in the guiding area.

(e) The board will consider the recommendations of the prior holder of the guiding area permit to be reassigned and will, in areas of joint use, consider the recommendations of the other holders of permits for the guiding area. (Eff. 5/12/78, Reg. 66)

Authority: AS 08.54.040(a)(3),(6) and (8) AS 08.54.050

12 AAC 38.055. DEATH OR MENTAL INCAPACITY OF GUIDING AREA PERMIT HOLDER. (a) Upon the death of a holder of a guiding area permit, the board will, in its discretion, grant a waiver, for a time specified by the board, of the requirements of sec. 57 of this chapter if application is made by the estate within 90 days after death. Failure to make application within 90 days is considered a voluntary relinquishment of the permit. At any time during the period of the waiver, an heir may apply to the board for a reassignment of the permit to a person designated by the heir.

(b) Upon a judicial determination that a guiding area permit holder is mentally incompetent, the board will, in its discretion, grant a waiver, for a time specified by the board, of the requirements of sec. 57 of this chapter if application is made by the permit holder's guardian within 90 days after a judicial determination of the permit holder's mental incompetency. Failure to make application within 90 days is considered a voluntary relinquishment of the permit. At any time during the period of the waiver the guardian may apply to the board for a reassignment of the permit to a person designated by the guardian. (Eff. 5/12/78, Reg. 66)

Authority: AS 08.54.040(a)(3),(6) and (8) AS 08.54.050

12 AAC 38.056. CHANGES TO GUIDING AREA PERMIT. Petitions for changes to the size or boundary of a guiding area, for reassignment of a guiding area permit, or for any other changes affecting the guiding area, will be accepted for all guide districts and will be reviewed at a regularly scheduled meeting of the board. Each petitioner will be advised of the date and place of the meeting when his or her petition is scheduled for review. A petition will not be reviewed by the board if the petitioner or a person authorized in writing by the petitioner as his or her designee fails to appear at the time of the scheduled review. If the petition concerns a joint use guiding area permit, each holder of a permit for that guiding area will be furnished a copy of the petition and advised of the date and place when the petition is scheduled to be reviewed and may appear before the board and present testimony relevant to the petition. (Eff. 5/12/78, Reg. 66)

Authority: AS 08.54.040(a)(3),(6) and (8) AS 08.54.050

12 AAC 38.057. MINIMUM USE OF GUIDING AREA. Each holder of a guiding area permit must conduct at least two contracted hunts within two consecutive calendar years in the guiding area as evidenced by statements of financial remuneration filed in accordance with sec. 60 of this chapter. Failure to do so for any two consecutive calendar years may result in revocation of the guiding area permit unless the permit holder can demonstrate to the satisfaction of the board that circumstances beyond his control precluded conducting the required hunts. (Eff. 5/12/78, Reg. 66)

Authority: AS 08.54.040(a)(3),(6) and (8) AS 08.54.050

12 AAC 38.058. GROUNDS FOR REVOCATION OR SUSPENSION OF A GUIDING AREA PERMIT. The board will, in its discretion, revoke or suspend a guiding area permit or permits if the permit holder

(1) violates a federal or state sport fish, game or guiding statute or regulation, which violation occurred while guiding;

(2) has his guide license revoked or suspended or is denied renewal of a license for violation of a federal or state sport fish or game or guiding statute or regulation other than for nonpayment of current license fees;

(3) is found by the board to have misused a guiding area. (Eff. 5/12/78, Reg. 66)

Authority: AS 08.54.040(a)(3),(6) and (8) AS 08.54.050

12 AAC 38.060. STATEMENT OF FINANCIAL REMUNERATION. (a) Before hunting with his or her client, a guide shall complete or have completed a statement of financial remuneration in triplicate on a form provided by the board for this purpose and shall state

accounting for and custody of state revenues which are only incidental to the Department's regulation and management of the fish and game resources of the State of Alaska,

"THEREFORE IT IS ORDERED

"1. All duties, functions and powers relative to the collection, accounting for and custody of state revenues, which are only incidental to the regulation and management of the fish and game resources of the State of Alaska, at present performed by the Department of Fish and Game, are transferred to the Department of Revenue.

"2. The Department of Revenue shall be deemed and held to constitute a continuation of the Department of Fish and Game with the same force and effect, as to the transferred functions, powers and duties as if the functions, powers and duties had not been transferred.

"3. All funds appropriated to the Department of Fish and Game prior to the transfer of those functions, powers and duties attributable to the transferred functions, powers and duties are transferred to appropriate line items in the appropriation of the Department of Revenue.

"4. This order shall become effective at a date hereafter to be designated.

"Dated November 24, 1961"

Alaska's fish and game laws are applicable as federal law on military reservations. 1964 Op. Att'y Gen., No. 2.

Hunting or fishing at a military reservation must be in accord with Alaska laws regulating seasons, bag limits, methods of taking, etc. 1964 Op. Att'y Gen., No. 2.

But military personnel are not required to comply with licensing requirements while on reservation. 1964 Op. Att'y Gen., No. 2.

Since AS 16.05.940(14) does not grant special resident privileges to military personnel, which is a requisite for requiring them to purchase licenses for use on military reservations under 10 U.S.C. 2671(a)(2), they cannot be required to do so. 1964 Op. Att'y Gen., No. 2.

ALR reference. — Applicability of state fishing license laws or other public regulations to fishing in private lake or pond, 15 ALR2d 754

Sec. 16.05.335. Complimentary licenses. The commissioner of revenue shall annually, at the request of the governor, provide him with not to exceed 50 complimentary fishing and hunting licenses and appropriate big game tags which the governor may distribute to distinguished visitors to Alaska at his discretion for their use in any one season during their visits to the state. The complimentary license for sport fishing or hunting or both shall be inscribed by the governor with the inclusive dates for its authorized use. The governor shall advise the Department of Fish and Game on any complimentary issuances, which information shall be available to the public. (§ 1 art II ch 94 SLA 1959; am § 1 ch 61 SLA 1962; am § 1 ch 31 SLA 1963; am § 1 ch 6 SLA 1965)

Sec. 16.05.340. License and tag fees. (a) Fees for licenses and tags are as follows:

(1) Resident sport fishing license $10

However, the fee is 25 cents for a resident who is blind.

(2) Resident hunting license 12

(3) (A) Resident hunting and trapping license 15

(B) Resident trapping license 3

(4) Resident hunting and sport fishing license 22

(5) Resident hunting, trapping, and sport fishing license 25

However, the fee is 25 cents for the head of a family or a dependent member of his family or one solely dependent upon himself for support upon proof presented by the applicant that the applicant (A) is obtaining or has obtained assistance during the preceding six

months under any state or federal welfare program t aid the indigent, or (B) has an annual family gross income of less than $3,600 for the year preceding application.

(6) Visitor's special sport fishing license — valid for the period inscribed on the license

(A) For 10-day license	15
(B) For one-day license	5
(7) Nonresident sport fishing license	30
(8) Nonresident hunting license	60
(9) Nonresident hunting and sport fishing license	90

A nonresident may not take a big game animal without previously purchasing a numbered, nontransferable, appropriate tag, issued to him as provided in (16) of this subsection. The tag shall be affixed to the animal immediately upon capture and shall remain affixed until the animal is prepared for storage, consumed, or exported.

(10) Nonresident hunting and trapping license	200
(11) Repealed by § 2 ch 32 SLA 1968.	
(12) Repealed by § 2 ch 32 SLA 1968.	
(13) Fur dealers:	
(A) Resident fur dealer license	50
(B) Nonresident fur dealer license	200
(14) Taxidermists:	
(A) Resident taxidermy license	75
(B) Nonresident taxidermy license	200
(15) Fish, fur or game farming license	100
(16) Nonresident big game tags:	
(A) Bear, black, each	100
(B) [deleted]	
(C) Bear, brown or grizzly, each	250
(D) Bear, polar, each	250
(E) Bison, each	250
(F) Caribou, each	200
(G) Deer, each	35
(H) Elk, each	125
(I) Goat, each	125
(J) Moose, each	200
(K) Sheep, each	250
(L) Walrus, each	250
(M) Wolf, each	50
(N) Wolverine, each	50
(17) Repealed by § 2 ch 32 SLA 1968.	
(18) Resident tags for bear, brown or grizzly, each	25
(19) Resident or nonresident permit application fee (all species for which a limited drawing is conducted, except musk oxen)	5

(b) The commissioner of fish and game may issue without cost a permit to collect fish and game, including fur animals, subject to the

limitations and provisions he considers appropriate, for scientific, propagative, or educational purpose. In addition, the commissioner may issue a permit for (1) the collecting of wild fur animals for fur farming, or (2) the recapturing of fur animals that have escaped from fur farms. The annual fee for a permit for collecting fur animals for fur farming purposes is $100. A tag issued but not used for an animal may be used to satisfy the tagging requirement for any other animal of the species named for which the tag fee is of equal or less value.

(c) The commissioner of revenue may issue a duplicate license or a duplicate tag as a replacement for a license or tag issued under (a) of this section. A fee of $2 shall be charged for each duplicate license or tag and the duplicate shall not be issued unless the commissioner of revenue or his delegate is satisfied that the original has been lost or destroyed. This subsection does not apply to a 25-cent license issued under (a) (5) of this section.

(d) Members of the military service on active duty who are permanently stationed in the state, and their dependents, who do not qualify as residents under § 940(14) of this chapter, may obtain special nonresident military small game and sport fishing licenses at the rates for resident hunting and sport fishing licenses, but may not take a big game animal without previously purchasing a regular nonresident hunting license and a numbered, nontransferable appropriate tag, issued at the nonresident rate, under (a)(16) of this section.

(e) Each master guide licensed under AS 08.54.100 and each registered guide licensed under AS 08.54.110 shall pay a fee in the following amount for each caribou, sheep, moose, brown or grizzly bear and polar bear taken on a hunt guided by or under the active supervision of the guide:

(1) polar, brown or grizzly bear:

(A) for each polar, brown or grizzly bear taken over a total of 5 polar, brown or grizzly bear per season and up to a total of 10 polar, brown or grizzly bear — $20;

(B) for each polar, brown or grizzly bear taken over a total of 10 polar, brown or grizzly bear per season and up to a total of 25 polar, brown or grizzly bear — $100;

(C) for each polar, brown or grizzly bear taken over a total of 25 polar, brown or grizzly bear per season — $500;

(2) moose:

(A) for each moose taken over a total of 5 and up to a total of 10 per season — $20;

(B) for each moose taken over 10 and up to a total of 25 per season — $100;

(C) for each moose taken over 25 per season — $500;

(3) sheep:

Chapter 01. Centralized Licensing.

Section		Section	
10.	Applicability of chapter	80.	Department regulations
20.	Board organization	87.	Powers and duties of department
25.	Public members	90.	Applicability of the Administrative Procedure Act
30.	Quorum	100.	License renewal, lapse and reinstatement
40.	Transportation and per diem	105.	Penalty for improper payment
50.	Administrative duties of department	110.	Definitions
60.	Application for license		
70.	Administrative duties of boards		

Sec. 08.01.010. Applicability of chapter. This chapter applies to the

(1) Board of Public Accountancy;

(2) Board of Barber Examiners;

(3) Repealed by § 6 ch 32 SLA 1971.

(4) Board of Chiropractic Examiners;

(5) Board of Hairdressing and Beauty Culture Examiners;

(6) Board of Dental Examiners;

(7) Board of Electrical Examiners;

(8) State Board of Registration for Architects, Engineers and Land Surveyors;

(9) State Medical Board;

(10) Board of Nursing;

(11) Board of Examiners in Optometry;

(12) Board of Pharmacy;

(13) Real Estate Commission;

(14) Board of Veterinary Examiners;

(15) Board of Psychologist and Psychological Associate Examiners;

(16) Collection Agency Board;

(17) Board of Welding Examiners;

(18) Board of Marine Pilots;

(19) Board of Dispensing Opticians;

(20) Guide Licensing and Control Board;

(21) State Physical Therapy Board. (§ 1 ch 59 SLA 1966; am § 2 ch 136 SLA 1967; am § 2 ch 101 SLA 1968; am § 2 ch 143 SLA 1968; am § 2 ch 151 SLA 1968; am § 1 ch 106 SLA 1970; am § 6 ch 32 SLA 1971; am § 4 ch 179 SLA 1972; am § 2 ch 45 SLA 1973; am § 14 ch 65 SLA 1973; am § 1 ch 43 SLA 1975; am § 1 ch 43 SLA 1977)

Effect of amendments. — The first 1973 amendment added paragraph (19).

The second 1973 amendment inserted "and Psychological Associate" in paragraph (15).

The 1975 amendment added paragraph (20).

The 1977 amendment added paragraph (21).

Editor's note. — Section 2, ch. 59, SLA 1966, provides: "The Department of Commerce shall provide for the orderly transfer of the service functions which are to be performed by the department under this chapter."

Section 4, ch. 59, SLA 1966, provides: "A provision in existing law which conflicts with this Act is superseded by this Act."

Legislative committee reports. — For report on ch. 143, SLA 1968 (HB 707), see 1968 House Journal, p. 836. For report on ch. 32, SLA 1971 (HB 111 am), see 1971 House Journal, p. 138.

Sec. 08.03.010. Termination, continuation and reestablishment of regulatory boards. (a) Boards listed in this subsection have a termination date of June 30, 1979:

(1) Board of Chiropractic Examiners (AS 08.20.010);

(2) Board of Dental Examiners (AS 08.36.010);

(3) State Medical Board (AS 08.64.010);

(4) Board of Nursing (AS 08.68.010);

(5) Board of Dispensing Opticians (AS 08.71.010);

(6) Board of Examiners in Optometry (AS 08.72.010);

(7) Board of Pharmacy (AS 08.80.010);

(8) Board of Veterinary Examiners (AS 08.98.010);

(9) Board of Psychologist and Psychological Associate Examiners (AS 08.86.010);

(10) Board of Nursing Home Administrators (AS 08.70.010);

(11) Physical Therapy Board (AS 08.84.010).

(b) Boar[illegible]ted in this subsection have a termination date of June 30, 1980:

(1) Board o[illegible]blic Accountancy (AS 08.04.010);

(2) Board of Barber Examiners (AS 08.12.010);

(3) Collection Agency Board (AS 08.24.011);

(4) Board of Hairdressing and Beauty Culture Examiners (AS 08.28.010);

(5) Board of Electrical Examiners (AS 08.40.010);

(6) State Board of Registration for Architects, Engineers and Land Surveyors (AS 08.48.011);

(7) Guide Licensing and Control Board (AS 08.54.010);

(8) Board of Marine Pilots (AS 08.62.010);

(9) Real Estate Commission (AS 08.88.011);

(10) Board of Welding Examiners (AS 08.99.010);

(11) Board of Governors of the Alaska Bar Association (AS 08.08.040).

(c) Upon termination, each board listed in (a) and (b) of this section shall continue in existence until June 30 of the next succeeding year for the purpose of concluding its affairs. During this period, termination does not reduce or otherwise limit the powers or authority of each board. One year after the date of termination, a board not continued shall cease all activities.

(d) The termination, dissolution, continuation or reestablishment of a regulatory board shall be governed by the legislative oversight procedures of AS 44.66.050.

(e) A board scheduled for termination under this chapter may be continued or reestablished by the legislature for a period not to exceed four years. (§ 2 ch 149 SLA 1977)

Sec. 08.54.100. Qualifications for a master guide license. A person is entitled to be licensed as a master guide if he

(1) has legally hunted in the state for a part of each of 10 years during which time a substantial source of his income was from guiding or related activities directly contributing to his experience and competency as a guide;

(2) meets all the requirements of a registered guide and has been actively engaged in licensed guiding activities in the state for at least five years preceding application;

(3) has not been convicted of a violation of federal or state sport fishing, game or guiding laws or regulations within the preceding five years;

(4) has consistently performed in a superior manner as evidenced by required reports submitted to the board and by inquiries made by the board to at least two of the guide's clients of record; and

(5) meets additional qualifications which the board may require. (§ 1 ch 17 SLA 1973)

Editor's note. — Section 3, ch. 17, SLA 1973, provides: "A person licensed as a registered or master guide, class-A assistant guide or assistant guide as of March 14, 1973 shall, upon application, be issued a registered guide license, master guide license, class-A assistant guide license or assistant guide license, respectively."

Sec. 08.54.110. Qualifications for registered guide license. A person is entitled to be licensed as a registered guide if he

(1) is 21 years of age or more;

(2) is a resident of the state and maintains a permanent place of abode in the state;

(3) has practical field experience in the handling of firearms, hunting, judging trophies, field preparation of trophies, first aid and photography;

(4) is familiar with the terrain and transportation problems in the district for which the license is requested;

(5) has passed the qualification examination prepared and administered by the board;

(6) has demonstrated to the board sufficient standards of competence and ethical conduct and has not been convicted of a crime involving moral turpitude;

(7) has legally hunted in the state for all or part of each of five years in a manner directly contributing to his experience and competency as a guide;

(8) has been licensed as and performed the services of an assistant guide in the state for a part of each of three years;

(9) submits a written recommendation to the board from a registered guide for whom the applicant has worked;

(10) is capable of performing the physical duties associated with guiding activities;

(11) has been favorably recommended in writing by two hunters that he has guided or assisted in guiding during each year of his three years as an assistant guide, whose recommendations have been solicited by the board from a list provided by the applicant;

(12) meets additional qualifications which the board may require. (§ 1 ch 17 SLA 1973)

Cross reference. — See editor's note under AS 08.54.100.

Sec. 08.54.120. Qualifications for a class-A assistant guide license. A person is entitled to be licensed as a class-A assistant guide if he

(1) has been employed for at least one season as a licensed assistant guide;

(2) has had at least 20 years experience in the guide district in which he is to be employed; for the purposes of this paragraph physical presence at some time of the year during each of the 20 years constitutes adequate evidence of experience, and military service outside the state for no more than six years shall be accepted as part of the required 20 years experience;

(3) has been recommended in writing as qualified by a registered or master guide to the board. (§ 1 ch 17 SLA 1973)

Cross reference. — See editor's note under AS 08.54.100.

Sec. 08.54.130. Privileges and limitations of class-A assistant guides. A class-A assistant guide

(1) may not contract for hunts;

(2) shall be under the supervision of a registered or master guide who has contracted with the client for whom the class-A assistant guide is conducting the hunt;

(3) may take charge of a camp and conduct hunts from it without the registered or master guide necessarily being present in the area if the registered or master guide is physically present in the state and is actively supervising in guiding activities. (§ 1 ch 17 SLA 1973)

Sec. 08.54.140. Qualifications for assistant guide license. A person is entitled to be licensed as an assistant guide if he

(1) is 19 years of age or more;

(2) is a resident of the state;

(3) is favorably recommended to the board, in writing, by a registered guide;

(4) meets additional qualifications which the board may require;

(5) is in sound physical condition. (§ 1 ch 17 SLA 1973)

Cross reference. — See editor's note under AS 08.54.100.

Sec. 08.54.142. Qualification for transporter license. (a) No person may engage in the activity of transporting unless he is licensed as a transporter under this chapter A person may be licensed as a transporter if he

(1) is a resident of the state;

(2) is familiar with the terrain and transportation problems in the district or districts for which the license is requested;

(3) obtains a business license to do business as a transporter under AS 43.70.030.

(b) No person may engage in the activity of transporting by air without an air commerce certificate as required by AS 02.05.040. (§ 2 ch 106 SLA 1976)

Editor's note. — Section 1, ch. 106, SLA 1976, provides: "**Purpose.** It is the purpose of this Act to protect the safety of the citizens of the state and better manage and protect its resources by licensing persons who transport hunters for hire so that reasonable standards and guidelines will be met and activities affecting the state's game resources will be more accurately monitored and assessed."

Section 10, ch. 106, SLA 1976, provides: "Nothing in this Act gives a person licensed as a transporter a right as an air carrier which he does not otherwise hold under law."

Sec. 08.54.144. Restriction to transportation. (a) A licensed transporter may transport persons whose primary purpose is the taking of big game or the associated removing of big game meat and parts of big game, with the intent of receiving monetary or material remuneration for the transportation.

(b) Air carriers who transport persons between airports, landing strips or other landing areas officially listed in the United States government Flight Information Publication, Alaska Supplement, as revised, or the United States government Sectional Aeronautical Charts, as revised, are exempted from the license requirements for transporters under this chapter but shall comply with the reporting provisions as prescribed in AS 02.05.170(f).

(c) Master guides, registered guides, class-A assistant guides or assistant guides are exempted from the license requirements for transporters under this chapter but shall comply with the reporting provisions as prescribed in AS 02.05.170(f). (§ 2 ch 106 SLA 1976)

Editor's note. — Section 10, ch. 106, SLA 1976, provides: "Nothing in this Act gives a person licensed as a transporter a right as an air carrier which he does not otherwise hold under law."

Sec. 08.54.146. Transporter report. A transporter shall maintain a record of (1) the names and addresses of all persons he transports; (2) the type of game transported; (3) an estimate of the quantity of meat

transported; (4) the date of transporting; and (5) if known, the locality where the game was taken. The report shall be submitted to the Department of Fish and Game within 90 days after transporting the game. After receiving a report required under this section, the Department of Fish and Game shall send a copy of it to the Department of Public Safety. (§ 2 ch 106 SLA 1976; am § 4 ch 133 SLA 1976)

Revisor's note (1976). — AS 08.54.146 was added by § 2, ch. 106, SLA 1976, and amended by § 4, ch. 133, SLA 1976. Since the two acts appear to be inconsistent, and ch. 106 is superseded by ch. 133, only the later enactment has been given effect here.

Effect of amendment. — Section 4, ch. 133, SLA 1976, substituted "ninety days" for "thirty days" in the second sentence.

Editor's note. — Section 10, ch. 106, SLA 1976, provides: "Nothing in this Act gives a person licensed as a transporter a right as an air carrier which he does not otherwise hold under law."

Sec. 08.54.150. Responsibility of registered or master guide for violations. A registered or master guide contracting for a hunt is equally responsible under § 200 of this chapter for a violation of a federal or state sport fish, game or guide statute or regulation committed by a class-A assistant guide or assistant guide while in the course of his employment. (§ 1 ch 17 SLA 1973)

Sec. 08.54.170. License fees. (a) License fees for engaging in the profession of guiding are:

(1) master guide license, annual	$75
(2) registered guide license, annual	75
(3) class-A assistant guide, annual	15
(4) assistant guide license, annual	10

(b) The license fee for a master guide, registered guide, class-A assistant guide or assistant guide license is in addition to the fee required for a hunting or fishing license.

(c) The license fee for a transporter is $10. (§ 1 ch 17 SLA 1973; am § 3 ch 106 SLA 1976)

Effect of amendment. — The 1976 amendment added subsection (c).

Editor's note. — Section 10, ch. 106, SLA 1976, provides: "Nothing in this Act gives a person licensed as a transporter a right as an air carrier which he does not otherwise hold under law."

Sec. 08.54.180. Examination fee. An applicant for a guide examination shall pay a fee of $25. (§ 1 ch 17 SLA 1973)

Sec. 08.54.185. Additional fees. In addition to the license and examination fees provided for under this chapter, master guides and registered guides are subject to fees imposed under AS 16.05.340(e). (§ 4 ch 268 SLA 1976)

Legislative committee report. — For report on ch. 268, SLA 1976 (FCCS HCS CSSSSB 335), see 1976 House Journal, p. 910.

Article 3. General Provisions.

Section
240. Definitions

Sec. 08.54.240. Definitions. In this chapter

(1) "board" means the Guide Licensing and Control Board;

(2) "guide", "guides" or "guiding" means assisting another person to take game with the intent of receiving monetary or material remuneration for the services, by accompanying and directing that person personally or through a licensed assistant guide for the duration of a hunt, and not solely for the purpose of providing transportation services;

(3) "resident" means a person who maintains a place of residence within the state; has not claimed residency in another state for the immediately preceding 12 months; shows by all attending circumstances that his intent is to make this state his permanent residence;

(4) "unethical activity" means

(A) deception in any degree involving prospective or actual clients either before, during, or following contract hunts;

(B) misrepresentation either through private communication or public advertising of the nature, type, duration, cost, or other conditions of contract hunts.

(C) making a guarantee that a species or certain number of species of game will be taken on a contract hunt.

(5) "transporting" or the "activity of transporting" means conveying a person by any lawful means to an area for remuneration or material benefit in excess of normal operating costs, when the primary purpose of the person being conveyed is the taking of big game and the associated removing of big game meat and parts of big game after big game has been taken; big game as used in this paragraph means game which, if taken by a nonresident, would require a big game tag. (§ 1 ch 17 SLA 1973; am §§ 7, 8 ch 106 SLA 1976; am § 2 ch 107 SLA 1976)

Effect of amendments. — The first 1976 amendment deleted "accompanying, guiding, or" preceding "assisting another person" near the beginning of paragraph (2), added the language beginning "by accompanying and directing that person" to the end of that paragraph, and added paragraph (5).

The second 1976 amendment added paragraph (4)(C).

Editor's note. — Section 10, ch. 106, SLA 1976, provides: "Nothing in this Act gives a person licensed as a transporter a right as an air carrier which he does not otherwise hold under law."

IN THE SENATE BY THE COMMERCE COMMITTEE

CS FOR SENATE BILL NO. 574

IN THE LEGISLATURE OF THE STATE OF ALASKA

ELEVENTH LEGISLATURE - SECOND SESSION

A BILL

For an Act entitled: "An Act continuing the existence of the Guide Licensing and Control Board and amending the law relating to its powers and responsibilities; and providing for an effective date."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

* Section 1. AS 08.54.010 is amended to read:

Sec. 08.54.010. CREATION AND MEMBERSHIP OF BOARD. There is created in the division of fish and wildlife protection, Department of Public Safety, the Guide Licensing and Control Board consisting of seven members. Three [NO MORE THAN THREE] members of the board shall be actively involved in guiding [HAVE A GUIDE LICENSE]. The other members shall have a general knowledge of the game resources of the state but may not (1) be engaged in guiding; (2) be associated by legal contract with a guide except as a consumer of the services provided by the guide; or (3) have a direct financial interest in a guide business. A minimum of 10 years residence in the state is required for all members of the board.

* Sec. 2. AS 08.540.020 is amended to read:

Sec. 08.54.020. APPOINTMENT AND TERM OF OFFICE. The members of the board shall be appointed by the governor and confirmed by the legislature for staggered terms of three years or until their successors are appointed. Initial terms are as follows: three members for one year, two members for two years, and two members for three years. A member may be removed at the pleasure of the governor. A person may not be appointed to the board for more than two consecutive terms.

* Sec. 3. AS 08.54.030 is amended to read:

Sec. 08.54.030. CHAIRMAN OF BOARD. The board shall annually elect one of its members as chairman and one of its members as vice-chairman. A person elected as chairman may not serve for more than two consecutive years.

* Sec. 4. AS 08.54.170(a) is amended to read:

(a) License fees for engaging in the profession of guiding are:

(1) master guide license, biennial [ANNUAL]. . . $200 [$75]

(2) registered guide license, biennial [ANNUAL]. $200 [75]

(3) class-A assistant guide, biennial [ANNUAL] . $ 50 [15]

(4) assistant guide license, biennial [ANNUAL] . $ 30 [10]

* Sec. 5. AS 08.54 is amended by adding a new section to read:

Sec. 08.54.182. EXAMINATION. The qualification examination required to be passed by persons seeking licensure under AS 08.54.100 and 08.54.110 shall be administered twice a year in both Juneau and Anchorage.

* Sec. 6. AS 08.54.190(a) is amended to read:

(a) A master guide, registered guide, class-A assistant guide, or assistant guide [OR TRANSPORTER] license expires on December 31 of the calendar year following the calendar year in which the license was issued [FOLLOWING ISSUANCE].

* Sec. 7. AS 08.54.190(b) is amended to read:

(b) No license may be issued to a class-A assistant guide or assistant guide who has failed to renew his license for four [TWO] consecutive years unless he again meets the qualifications for initial issuance of the license.

* Sec. 8. AS 08.54.200(a) is amended to read:

(a) The board shall hold a hearing to determine if disciplinary action is necessary if

(1) complaints concerning the licensee have been filed with the board from three or more clients of separate parties within the past five years; or

(2) [A LICENSEE HAS BEEN CHARGED WITH A VIOLATION OF FEDERAL OR STATE SPORT FISH, GAME OR GUIDE STATUTES OR REGULATIONS; OR]

(3) a licensee has been convicted of a violation of federal or state sport fish, game or guide statute or regulation.

* Sec. 9. AS 08.54.200(c) is amended to read:

(c) After a hearing, the board shall revoke, suspend, or deny renewal of a license if the board finds that the licensee

(1) does not meet the qualifications specified by statute or regulation for the class of license held;

(2) is incompetent as a master guide, registered guide, class-A assistant guide, or assistant guide;

(3) has been convicted of two violations of federal or state sport fish, game or guide statutes or regulations within the past five years.

* Sec. 10. AS 08.54.210(a)(1) is amended to read:

(1) a master guide, registered guide, class-A assistant guide, or assistant guide [OR TRANSPORTER] to fail to timely report to the Department of Public Safety, division of fish and wildlife protection, and in no event later than 30 days, violations by a client of a state fish, game or guiding statute or regulation;

* Sec. 11. AS 08.54.210(a)(2) is amended to read:

(2) a master guide, registered guide, class A assistant guide, or assistant guide [OR TRANSPORTER] to aid the commission of a violation of this chapter or of AS 16.05 or a regulation adopted [PROMULGATED] under either chapter, or permit the commission of a violation in his sight without attempting to prevent it, short of using force, and

without reporting it;

* Sec. 12. AS 08.54.210(a)(4) is amended to read:

(4) a person to advertise as or represent himself to be a licensed master guide, registered guide, class-A assistant guide, or assistant guide [OR TRANSPORTER] without being currently licensed, or to falsely advertise services;

* Sec. 13. AS 44.41.020 is amended to read:

Sec. 44.41.020. DUTIES OF DEPARTMENT. (a) The Department of Public Safety shall administer functions relative to the protection of life and property.

(b) The Department of Public Safety shall administer the Guide Licensing and Control Board established under AS 08.54.010.

* Sec. 14. AS 08.03.010(c) is amended by adding a new paragraph to read:

(2) Guide Licensing and Control Board (AS 08.54.010) -- June 30, 1984.

* Sec. 15. AS 08.01.010(20); AS 08.03.010(b)(7); AS 08.54.100(5), 08.54.110(12), 08.54.142, 08.54.144, 08.54.146, 08.54.170(c), 08.54.240(5); and AS 16.05.340(e) are repealed.

* Sec. 16. This Act takes effect immediately in accordance with AS 01.10.070(c).

STATE OF ALASKA

JAY S. HAMMOND, GOVERNOR

DEPARTMENT OF LAW

OFFICE OF THE ATTORNEY GENERAL

POUCH K-STATE CAPITOL
JUNEAU, ALASKA 99811

April 29,. 1980 465-3600

Guide Licensing and Control Board
Department of Commerce and
Economic Development
Pouch D
Juneau, Alaska 99811

Gentlemen:

At the April 1980 Guide Board meeting in Fairbanks, the board granted a petition from Chairman Mark Jensen requesting he be granted exclusive use of a portion of Chicagof Island. At the time the board action occurred, Assistant Attorney General Liza Fussner advised you that the board's action was illegal. The board nonetheless granted the petition.

I have enclosed a copy of a memorandum from Ms. Fussner to Tom Koester, head of the Resources Division in my office. Because of the sensitive nature of this action involving as it does the Chairman of the Guide Board, I reviewed the matter personally and I believe that Ms. Fussner's advice to you is sound. The action of the board cannot be supported by law.

I have been advised that litigation will be commenced immediately to contest the board's action. Since we have already advised you the action is illegal, we will be forced to concede that illegality in court. Moreover, since we have advised you of the impropriety of your action and the board has nonetheless taken the action, there is a very real possibility that individual members of the board may be liable for damages, court costs, and possible attorney fees of any successful litigant.

I realize this is a difficult situation, but it is only going to get more difficult if nothing is done promptly. I strongly urge the board to immediately convene, by phone if necessary, to reconsider its action and rescind the decision. Full notice should be given to Mr. Jensen who will be free to contest the matter if he so chooses.

I would be happy to discuss this with you by phone or in person at your earliest convenience. Obviously, it is not pleasant for me to suggest this type of action to a state board, but my responsibilities under the laws of the state simply afford me no room for latitude.

Yours very truly,

Avrum M. Gross
Attorney General

STAN FROST, REGISTERED GUIDE #17

March 26, 1980

COPY

Bud Wiese
Interior Wildlife Association of Alaska
Box 60255
Fairbanks, Alaska 99701

Dear Bud:

I was very disappointed to see your name at the bottom of the letter of March 20th to Representative Osterback.

Bud, I have always had great respect for you, and still believe that you were one of the best Guide Board members we ever had. You never pre-judged anyone and always tryed to get both sides of a problem BEFORE you made a decision. Your stabilizing influence on the board is sincerely missed by the guiding industry.

I can not help but believe that you have been missled by, Mark's personal ammosity towards me in making the unsubstanuated statements you made in this letter. --- When you, unfairly attack one of my family, and insinuate that the personal integrity of Rick is questionable, by inudendo and not having the balls to come right out with factual charges is something I can not understand.

You ,yourself, as a member of the guide board, REQUIRED facts and did not condemm a man on the emotional outburst of someone who may have an ax to grind.

You made a lot of decisions which affected the lives of many guides when you were on the Board. some guides disagreed with your decisions, You were not always right, but you made a judgement believing you made the best one. and in most cases I think you made good decisions.
You expected the guides to accept your actions, right or wrong, and would be very upset if you received a letter claiming that your personal and family problems entered into your decision. ---------- That statement you made was strictly uncalled for. --- I believe you owe both Rick & I an explaination of that statement----

You, as one who was on the Board during the formative years, I would like to remind you of a few FACTS:

(1) During the first years of the Guide Board, I was President of the Alaska Professional Hunters Assocc. and was always-(and still am) in favor of a Guide Board for the good of the guiding industry. Both you and I differed with Rick's ideas many times, but that does not mean he did not also have some good ideas also.

(2) Rick Halford has always been against the way the guide board has allocated areas, and A.P.H.A. has also complained about the way area's were given out because you had no set criteria and changed it from area to area.....BUT basicly the Guide Board has been a stabilizing influence on the guiding industry. But even you must agree,--If what the guide board is doing will not hold up in Law, The board must be given the chance to correct it. The Board should not be afraid of a Legal review of the regulations. If they are, something is very wrong!!!!

The next to the last para. of your letter really disturbes me. This is nothing but a muck racking attempt to discredit a Representative who differs with your thinking. Some of you take any criticism of the board as a personal insult, which is totally wrong.....I have differed with Rick many times, and he with me, and will contuinue to do so, but I don't try to discredit him.

....Do you really know what you are saying ???

You are insinuating that Rick has used his position as a State Representative for personal profit.....Bud I'm suprised at you....and dissapointed.. Rick flew for the Game Department, Before he was a State Representative. Just think about it,---you are in the trucking business,--if you were elected to the House, would you turn down the State contract you had for the past few years, and go out of business, because you were elected ?????? I hope you don't try to kid yourself when you answer that question.

Bud, you should listen to Mark, just like you listened to the guides when they testified before you----with an open mind----then get the other side of the story .... Don't go off half cocked. Its not like you to get involved in, gossip, muck-racking, or dwelving into the personal, and family life of anyone in an attempt to rationalize your position, especially when you don't know what you are talking about.

Take Chuck Grays letter to Rep. Osterback, it was excellant and was, to the point, concize, & factual with no bullshit about anyone. He put his points of disagreement across very well.

We should all learn something when we compare these two letters complaining about the same things. I know I sure have. We all get carried away at times and Bud, I think that you owe Rick an apology as soon as possibly.

Looking forward to hearing from you.

Stan Frost

CHARLES GRAY
311 Slater Street
FAIRBANKS, ALASKA 99701

March 21, 1980

Representative Alvin Osterback
Co-Chairman, Resources Committee
House of Representatives
Pouch V
Juneau, Alaska 99811

Dear Mr. Osterback,

As one of 10 guides who spontaneously appeared in Fairbanks for the recent Senate Commerce Committee teleconference on the sunset provision for the Guide Board, I want to tell you that we are all disappointed in the lukewarm endorsement for the Board that came out of your committee. When I say "we", I assume the others will be, too, for they all spoke highly of the Board's accomplishments.

Thanks to the Board, a guide can now concentrate on producing a quality hunt instead of trying to out-fox other guides that are vying for the same area. I would also call your attention to the fact that two of the five biggest vacuum cleaning outlaws have been put out of business by the Board.

I particularly feel it is unfair to only recommend a temporary one year extension of the Board while the Department of Law looks for problems. Instead of causing the Board trouble, you should be praising them for accomplishing the near-impossible.

As for paragraph 5b of your report to the House Speaker, it appears your committee is suggesting a special class of citizen be created to accommodate rural residents. While I won't attempt to probe the constitutionality of this, I would remind you that the function of the Board is to upgrade the guiding profession. Guides have to handle a lot of correspondence, contracts and other business functions that cannot be neglected in a profession.

Now having said that, I would point out that the Board bends over backwards to accommodate native people that genuinely want to get into guiding. Examples would be some of the walrus hunters on St. Lawrence Island and muskoxen guides on Nunivak. At the Board's request, I am presently assisting a native guide from Arctic Village to prepare his case for a guiding area. This fellow, whom I helped into the guiding business many years ago, has failed to show up at Board meetings on several occasions when contenders for the area have been greatly inconvenienced by this fact. Still the Board has kept his application open long after it would

have been closed for any white guide. I don't object to this; I think it is good that the Board goes the extra mile, but I fail to see how you can expect them to do more, by any stretch of the imagination.

I sincerely hope you will take these comments as constructive and informative and see your way clear to give the Board greater assistance, for none of the guides I know want to return to the chaos we had prior to the formation of the Guide Board.

Sincerely,

Chuck Gray

March 27, 1980

Rep. Al Osterback, Chairman
Puoch V
Juneau, Alaska 99811

Dear Mr. Chairman,

This letter is in regards to the Sunset Review of the Guide License and Control Board. As a member of said board, I feel I must comment on the review and a copy of a letter of a request by Rep. Rick Halford, to attorney general's office about a legal audit.

First, I would like to comment on Rep. Halford. It has come to my attention that certain people have made accusations against him. They say he has a conflict of interest, he is letting his family get in his way of making good judgement, etc. I want you to understand I am not a fan of Rep. Halford's, in fact, we very seldom agree on most facts. However, I do think Rep. Halford is an honest legislator and his integrety, as far as I am concerned, has never been in doubt. To say he has a conflict of interest is ridiculous and the family problem is even more ridiculous.

I feel this attack on him was due to him asking for a legal audit. As one of the board members, I say it is about time and I welcome a legal audit. I cannot understand anyone not wishing to adhere to the constitution, and after all, that is what is expected of us.

Now, I would like to comment on the review finding by the House Resources.

No. 1 I am happy to see you find need for the board, for safety and welfare of the public. I feel you have left out one important thing, that is, the great need by the industry, for a board, to better the guiding industry.

No. 2 I disagree with finding in this case. The board should not be under public safety. A seperation of the police and the board should be distinct. The reason given me for putting it under protection is commerce does not do its job. If this is true and I believe it is, the legislator should shape the bureaucracy up, not transfer the problem.

No. 3 The transporter law, like many laws, was designed to correct a problem. And like many other laws, it failed miserably,

in fact it caused more problems. All this law did was to license a $10.00 guide.

No. 4 This finding has much merit. For years we have been trying to change some simple statutes. I shall list them, these will not be in there order of importance.

(a) Repeal of the guide head tax (Alaska Statute Sec. 16.05.340). This head tax is the most unfair, and I believe, it is a discriminatory tax. It sets the guide aside and taxes him and does not tax any other user of the natural resources, such as resident hunter, timber people, commerical fishermen, sports fishermen, miner, subsistance hunter and fishermen. You must remember, we do not shoot the game, all we do is provide a service for a hunter. The hunter has already paid for the right to hunt by buying a license and tags. I take note of the lack of tax on bird watchers who takes pictures, etc. I encourage you to repeal this law.

(b) In the guide law (Sec. 08.54.200) grounds for disciplining a licensee. According to this statute, the board must have a hearing, if a licensee has had 3 or more complaint letters from Clients. There is no time element on this, these complaints could be 10 or 15 years apart. I suggest the mandatory section be removed. Leave it up to the board, there are times when one complaint should be heard. All complaints should be investigated and the results should be presented to the board.

(c) Sec. 08.54.200 grounds for disciplining a license Section (C) No. (3) It is mandatory the board revoke a license if a licensee is convicted of two violations. This manadatory section should be removed also. Some convictions do not merit revoking a license. Example (a guide is convicted of forgetting his license one year, 10 years later he is convicted of not having proper survival gear in the aircraft, the guide claims the gear was stolen. It would be mandatory for the board to revoke his license for 5 years. I say leave this decision to the board, do not make it mandatory.

(d) New sections to be added. The board will advertise to the public for proposals to change guide regulation and will consider them and take action at least once a year. At this time the public has no way to submit a proposed change of regulation unless the board chairman O.K.'s them or one of the board members submit them. This should be set up simular to Game Board.

(e) New section to be added. Annual election of chairman and vice chairman. Chairman and vice chairman will only serve 2 consecutive years. Mark Jenson has been Chairman for 6 years and he has been a very dedicated chairman, however, I think it is healthy for a board to have a new chairman every two years for new thinking, new ideas, a new outlook on matters.

(f) New section. Guide Board members must attend at least 3/4th of the meetings each year, and registered guide members of the board must be active. To prove activity they must have at least 5 financial renumeration statements on file, per year. It does no no good to have a guide on the board that is not active, he is out of the main stream of the industry.

No. 5 I hope the legislators do not hamstring the board by continuing the board for just one year. We are only allowed 3 meetings a year, by the commerce dept. They tell us they have no more funds. There is only a certain amount one can expect from a board that will be in session for 15 days a year. Possibly the answer to that, if you do continue us for just one year is, set asside a special appropriation for more meetings and longer meetings.

(5b) Last but not least this deals with rural resident guides. I am happy to see our rural resident s taken care of. However, let me caution you, make dam sure that all guides, whether they be rural or urban, be treated equal. Do not make the la double standard.

I realize I have been long winded, as I usually am, but I feel you should get as much imput from all segment of the guiding industry. Only then can you make workable laws.

Sincerely,

Clark L. Engle

Guide Licensing Study

RE: Summary of activities and recommendations
INTERIM GUIDE LICENSING STUDY

February 6, 1980

In 1979, the legislature appropriated funds to study problems experienced by Native Alaskans in becoming licensed guides. Although I chaired the committee, Representative Fuller took responsibility for carrying out the study and preparing the final report. Rep. Fuller's committee on subsistence was active during the interim, and the activities of the guide licensing committee seemed sufficiently compatible for a concurrent effort.

Representative Fuller and Mr. Marcus Jensen (Chairman of the Guide Licensing and Control Board) traveled to Gambell, Savoonga and Shismaref. Meetings were held in each village to discuss HB 405, a bill which would change the guide licensing requirements in the newly created game management unit #27 (Arctic coast). The state of Alaska remanded management authority for the walrus to the federal government during the summer, and when future walrus hunting may occur under state auspices is uncertain. Representative Fuller met with the Commissioners and staff of the Eskimo Walrus Commission and will be kept current on the changing situation with walrus.

The committee's efforts then focused on Nunivak and Nelson Islands, to review the effects of the musk ox herds on local residents. The final report of the Guide Licensing Committee contains a thoroughly documented chronology of events leading to the establishment of a permit hunt for musk ox, and how the residents of Nunivak Island have participated in those hunts. A brief synopsis of significant events is appended to this summary.

The report's findings may be summarized as follows:

- Residents of Nelson Island have been unequivocal in their opposition to the institution of permit hunts for musk ox. Native land ownership patterns on Nelson Island could effectively preclude such a hunt even if one were established, but the management policy adopted by the Board of Game in 1976 does accord village wishes considerable respect. Due to the limited food resources on the island, residents have indicated a desire to harvest musk oxen for food.

- Unlike the residents of Nelson Island, Nunivak Islanders support the permit hunt for musk ox. This support is based on the abundance of alternative subsistence resources available on the island, the economic benefits of the biannual hunt, and a cultural orientation that is more comfortable with the intrusion of non-Natives into the area.

Memo re: Guide Licensing Study

- Acrimony on the part of Mekoryuk residents towards the guide from Fairbanks who contracts for many of the permit hunts is considerable. The lack of coordination between ADF&G, the U.S. Fish and Wildlife Service, the Game Board and other entities involved prior to the establishment of the hunt is the basis for the ill-feeling. The tension caused by a years'-long chain of misunderstandings and misrepresentations will not abate quickly.

- A system of local control over the permit hunts, coupled with a probationary period before being licensed as a registered guide, would have encouraged higher performance standards by Native guides than have been attained under the present system.

- A separate "special outfitter" guide classification, such as allowed in Montana statutes (RCM 87-4-129), allows the holder to contract for particular services in limited locations. Careful review of Alaska's practice of granting exclusive guiding areas would be necessary to determine the feasibility of this proposal.

- A subsistence hunt for both bulls and cows on Nelson Island would enable residents to obtain a needed supply of fresh meat and would enhance management efforts. The $500. resident tag fee for either sex is a major impediment to the initiation of a cow hunt. Local residents cannot afford the fee, and sport hunters balk at spending the several thousand dollars in

tage, travel and associated costs to harvest an animal of less than trophy quality.

- Passage of HB 167, which would allow an open season for subsistence hunting of musk ox on the basis of a permit drawing in the local villages, is recommended. The bill also waives the game tag fee for such hunts.

Both Representative Fuller and I have complete copies of the final report and all other documentation regarding the interim study in our files. If you or any members of the Legislative Council would like copies of these materials, please contact one of us.

Thank you.

RESOLUTION #
79-04

WHEREAS, Village of Mekoryuk has big game hunting (musk-ox, walrus) and

WHEREAS, There are no guides required by law for residents of Alaska to hunt: and

WHEREAS, Only few non-residents come to hunt: and

WHEREAS, There is local registered guide that can co-sign contract for non-resident hunters: and

WHEREAS, The master guide working is not keeping his word in spring of 1979, as far as helping assistant guides to obtain credit for their registered guide licenses; and

WHEREAS, He has shown disrespect to the native village of Mekoryuk in a public meeting: and

THEREFORE BE IT RESOLVED, that said guide board and involved agencies take necessary action and comply with the request of Native Village of Mekoryuk; and

THEREFORE BE IT FURTHER RESOLVED, That the resolution 79-12-01 submitted by AVCP to the Govenor of Alaska, regarding exclusive guiding rights for Nunivak Islanders be adhered to.

CHAIRMAN, IRA

SECRETARY/TREASURER

March 19 1979
Date

RECEIVED
3-27-79

We, the people of Mekoryuk, petition the State of Alaska, guide board, the legislature and other agencies involved to remove Lynn Castle, master guide, from Nunivak Island and its surrounding waters for being an undesireable in our community. Said person has showed no respect for the citizens of Nunivak Island in the business sense and has created hard feelings among the citizens of Nunivak. Neither does he keep his business promises. We would like to include all of the outsider guides from Alaska, that conduct hunts here on Nunivak Island. The citizens would like to conduct their own hunts. The people are also petitioning the state of Alaska to work out a viable solution to solve existing problem of guiding since it is now an impossibility to obtain a guide license with the present situation. The men were licensed without required apprenticeship time as the animal involved, in this case is the musk-ox and was politically oriented. The people of Nunivak feel that the musk-ox hunts were initiated for the benefits of all not just a couple of persons, and since these licenses were issued for purpose to hunt on Nunivak Only, which is game management unit eighteen (18) with the present law it is required that an assistant guide take out or help with at least two (2) clients per year and some here have not taken anyone out inside the required time. The men are grateful of the guide board to have issued the licenses but are unable to utilize same.

October 26, 1979

Mr. Edward J. Shavings, Sr.
P.O.Box 31
Mekoryuk, Alaska 99630

Dear Ed:

I just got back to Alaska and have had a chance to read your letter of Sept. 26, addressed to Mr. Bellingar.

I called Mekoryuk Wednesday and talked to a chap by the nameof Joe who said that you were not available. I relayed the message to him to have you contact Mr. Bellingar's office if you wanted to be heard on the musk ox hunt at our December 1st meeting in Anchorage.

Last winter petition from the village was sent to me in regard to Lynn Castle's guiding on the island. Lynn Castle has a very good reputation as a guide and outfitter and I was sorry to see that a complaint would be filed against him by the village.

The Guide Licensing and Control Board is anxious to hear testimony from both sides when problems arise. If it is impossible to attend the December meeting I might say that we will have a spring meeting, sometime in March, in either Anchorage or Fairbanks.

Mr. Bellingar's phone number in Anchorage is 264-5675, if you would like to call him.

With kindest regards,

Sincerely yours,

Marcus

Marcus F. Jensen, Chairman
Guide Licensing and Control Board

Representative Philip Guy

Chronology of events

Nunivak Island Musk Oxen Herd

1927 The Territorial Legislature asks Congress for funds to re-establish the musk oxen in Alaska.

1929 President Hoover withdraws Nunivak Island as a wildlife refuge. No comment or input was sought from the island's residents.

1930 Congress appropriates $40,000 for the musk oxen project. 34 animals were captured in Greenland and brought to Alaska, where they are held in Fairbanks.

1935 Two bulls and two cows were moved to Nunivak Island.

1936 The other musk oxen in Fairbanks were moved to Nunivak Island.

1962 A cooperative management agreement was signed between U.S. Fish and Wildlife Service and the Alaska Department of Fish and Game regarding musk oxen describing herd uses:

1) transplant programs
2) domestication programs
3) public permit and/or subsistence hunting to take place when herd size reached 500 animals.

1968 ADF&G Commissioner Nelson writes to Governor Hickel "it should also be noted that this hunt could be of important economic benefit to the Eskimo people of Nunivak Island. They could provide housing, food, transportation and guiding services."

1968/
1973 Each year the Board of Game recommends institution of bull musk oxen hunt, but recommendation is vetoed either by the state of federal authorities.

1968/
1971 Date uncertain. First petition from Mekoryuk villagers supporting the establishment of a sport hunt received by the state government.

1969 Alaska Legislature enacts AS 16.05.345, authorizing ADF&G to issue big game tags for musk oxen hunts authorized by the Board of Game.

1971 ADF&G Commissioner Noerenberg writes to Governor Egan "Natives of Nunivak Island have never voiced any desire to harvest musk oxen, but have petitioned the Board of Game to establish a sport hunting season. Guide fees, and money spent for food, lodging and native crafts by hunters would contribute much more to these peoples economy than just the value of the musk oxen meat, hides and other by-products.

1973 ADF&G publishes musk oxen management policy stating recreational use most important and that " the Department does not consider the taking of musk oxen primarily for food a wise use."

1973 ADF&G biologist travels to Mekoryuk touting economic benefits to be derived from village participation in sport hunts and encouraging villagers to send another petition. He gave instructions to villagers regarding the particulars of the petition--what to say, where to send, what to include in a cover letter to the Governor

1973 September 13, Governor Egan receives a petition signed by 68 Mekoryuk residents asking for the establishment of a sport hunt.

1975 The Board of Game passes two resolutions relating to musk oxen management.

1) opposing the transplant of 40 head to the Soviet Union, and;
2) establishing a "Provisional Muskox Policy" which included a requirement that management proposals be submitted to affected residents for their input.

1975 Fish and Wildlife Service releases environmental impact statement which estimates the population of the Nunivak herd at 600 and promugates regulations for a permit bull hunt. Regulations required that planes land in the village, but did not require employment of local guides or local purchase of food or lodging.

1975 ADF&G regional supervisor travels to Mekoryuk and meets with villagers about the hunt. He gives the impression that all participating hunters will be required to hire a resident to accompany them during the hunt.

1975 ADF&G regional supervisor meets with Guide Licensing Board to request special guiding permits under their authority to grant such under AS 8.54.045 for Mekoryuk residents. Guide Board denies request based on rationale that applicants had not been prevented from securing a registered guide license through the normal channels solely because of language difficulties, but rather because they did not have the requisite history as assistant guides.

1975 On the eve of the hunt, ADF&G regional supervisor travels to Mekoryuk with non-Native registered guide from Fairbanks who will run the hunt. Villagers are extremely unhappy, as for years state and federal officials and their own regional corporation had been encouraging support of sport musk oxen hunting for the economic and employment opportunities that would accrue to the residents of Nunivak Island.

1976 The Chairman of the Guide Licensing and Control Board meets with Mekoryuk villagers and accepts $10. from each of the 40 men to enroll them as assistant guides, even though he is well aware that for that number to be employed 14 licensed guides would have to be guiding musk oxen hunts.

1976 The Mayor of Mekoryuk wri es a letter following the fall hunt expressing dissatisfaction that so few residents were being employed as assistant guides, that thos: who were being employed were causing disruption in the village, and that meat was being wasted by the hunters.

1977 Prior to fall 1977 hunt, "without exception the hunters were extremely pleased with their hunting experience," according to the ADF&G biologist responsible for checking permit holders upon their return to Bethel. However, during the fall hunt the biologist noted that considerable dissatisfaction was expressed by hunters concerning the performance of the Native guides in the field. Most of the complaints involved field activities such as judging trophies, boning out meat,etc.

1977 FWS and ADF&G sign a new agreement for the management of the musk oxen herd:

1) herd to be maintained at 500 animals
2) permit hunts to be reviewed annually by both agencies **
3) permit hunting system to be developed jointly by both agencies

**Review process has not taken place

1979 Only one licensed Native guide in Mekoryuk

1979 Musk oxen herd estimated at 572 animals. The cows are not hunted due to unsuitability as trophy animals (small size, small horns). Resident fee for either sex animal is $500. Sport hunters are not willing to invest large sums of money for a cow hunt. The local residents are unable to afford the tag fee.

Alaska House of Representatives

COMMITTEE ON NATURAL RESOURCES
POUCH V • JUNEAU, ALASKA 99811

April 28, 1980

Avrum M. Gross
Attorney General
State of Alaska
Pouch K
Juneau, AK 99811

Dear Attorney General Gross:

It has come to my attention that there appears to be a serious controversy brewing in the Guide Industry that may well require your attention. According to some registered Guide, the Guide Licensing and Control Board violated the "spirit," if not the intent of the law by granting Board Chairman, Marcus Jensen, exclusive guiding privileges in Southeast Alaska, along the outer coast of Chichagof Island. The action was taken at the February meeting of the Guide Board, held in Fairbanks, and recently reaffirmed by the Board on a 3-1 vote.

Since the Guide Board action, myself and other legislators have received numerous complaints from some Guides insisting that the action was unwarranted, unethical and perhaps illegal. I can readily understand jealousy and competition might be the motivating factor for these complaints, but it would seem that an investigation may well be appropriate to determine if there has been any wrong-doing.

I'm enclosing copies of letters which I have received that pertain to this matter. I feel that an investigation by the properly constituted legal authorities of the State of Alaska is in order. Thank you in advance.

Sincerely,

Alvin Osterback

Juneau, Alaska

Dear Representative Osterback:

I have just received copy of a letter sent to you by the Alaska Professional Hunters Association. I would be surprised if you would give credence to an unsigned letter. Unsigned letters are often from "mad letter writers".

The contents of the letter surprises me, as it would appear to have been written by someone who is not registered to guide in Unit 4, which is Southeastern Alaska.

Notification of the meeting in Fairbanks was handled the same way every meeting is handled when petitions are to be presented. All guides involved were sent a letter personally. Some of these guides answered by letter, and some testified in person.

I have guided in Unit 4 for over 30 years, and until last year the Southeastern guides honored their word in respect to not guiding in my particular area. The reason for their sudden change is the fact that the Game Board has a closure on what they call the "inside" and left the fringe on the "outside" open ten days longer. I have been very conservative in the number of contracts I take because of the public hunting pressure in the area as well.

No guide in Southeastern Alaska would object to my area if he would agree to an exclusive area for himself which would automatically reduce his number of contracts from eight or ten to three or four at the most. This is really what the controversy is all about. There has been too much guiding pressure on the "inside". Too many guides still have the attitude that they will shoot the last cub bear for a dollar. I am enclosing copy of a letter from the Game Biologist in Unit 4. He estimated at that time only 25 bear should be taken and since the guides and the public split the total take that would mean only 12 bear for the guides and their assistants. He has probably increased that 25 figure to 40 since the letter was written, which would allow in the neighborhood of 20 bear for the guides. The guides' success ratio for the number of contracts is very low - around 50%. If trophy bear were taken the percentage would be considerably lower than 50% because most of the takable bear have been shot.

To give you a better example of what is happening in Unit 4 I refer you to contracts of a guide named John Erickson. He had 10 hunters contracts in spring of 1979. Of those ten, four got no bear, and four took bear under five feet. I am enclosing some of the sealing certificates to give you an idea of what I mean. When the going rate for a hunt is four to five thousand dollars I think it behooves the guiding profession to give the hunter more chance for a trophy bear.

I do not think the action of the Guide Licensing and Control Board should be criticized for trying to save a small area from being totally raped. The petitions that guides from Unit 4 are putting in now will be handled in an orderly manner by the staff and the Board.

As chairman of the Guide Licensing and Control Board, and as an Alaska resident for over 50 years, and as a registered guide for some 35 years, I have been criticized by some guides for my strong stand against guides who want to rape the game resources. A stand like this doesn't necessarily make everyone love you. A situation happened last spring where two guides took over 30 grizzlies in Unit 23. I was very upset over this and wanted to bring the guides before our Board for a hearing. I am now in the process of scheduling a meeting with the Kotzebue Native Corporation on this subject of game resource. I have made every effort to work with the Natives and intend to continue to do so in the future. Some guides criticize me for this.

I would hope that the House Resource Committee appreciate what most of our Board members are trying to do for the State of Alaska, and that is weed out the "bandits" who are raping our resource, and develop exclusive guide areas for the protection of the resource and improved game management.

Respectfully yours,

Mark Jensen

Capitol Building
Juneau, Alaska 99811

Dear Jay,

In reference to the problems of Guide License and Control Board in the last month, I reluctantly feel I must put my thought on paper to you.

It was quite a shock to see the Senate not wish to continue the Guide License and Control Board under the sunset review. I guess it should not have been, politics being politics, but after being on the Board for seven (7) years and attempting to get some sensible regulation through to protect the industry and the people of the state, I find all was for naught. As I said it was quite a shock to find I apparently did everything wrong for seven (7) years or was it that the Board did not bow to political powers in Juneau or was it, we did not bow to native interest over and above the white man's interest or was it internal problems?

I don't know the answers to these questions, possibly it's a combination of all. However, I do know one thing and that is, we must at all cost, continue the guide law, guide area and the guide Board. If any or all three of these are thrown out the chaos will destroy a still viable industry.

I have had twenty or thirty phone calls a day since the Senate took action and all but one was against doing away with the Guide Board. One other point I learned, in the vote of the Senate, four (4) Senators voted negative, because they wished to remove the chairman of the Board, Marc Jensen. I can not buy that Marc is the basic problem. I believe they are using him as an excuse to sunset the Guide Board. You know Marc and I have many scars from the battles on this Board, some still healing from the last meeting. The Board, Marc, myself and every member on the Board have made mistakes, we are not fortunate enough to have a direct line to the Gods as some politication in Juneau apparently have.

However, the mistakes tne Board have made as a whole or individually are not irreversible. The action of the Senate could be irreversible if something isn't done quickl Certainly the Senate action would abrogate the mistakes but it would also do away with a of the sound regulation needed to bring the guiding industry into prospective.

I can not emphasize enough the urgency in acting now on this matter. I suggest you remove all current members of the Board and replace them with new blood. I also encourage you to push as hard as possible to have the House pass legislation to continue the Guide Board.

With this done, the continuation of the Board will allow us to return to our prime concern and this is going hunting.

I appricate all you have done in the past in backing the Board and its members and can only hope you extend that extra push now, that we all need so much.

Sincerely

Clark L. Engle

BC-GUIDE INVESTIGATION;450
JUNEAU (AP) - A STATE LAWMAKER HAS ASKED THE ATTORNEY GENERAL TO INVESTIGATE A DECISION BY THE STATE GUIDE LICENSING AND CONTROW BOARD TO GRANT ITS CHAIRMAN AN EXCLUSIVE GUIDING AREA.
REP. ALVIN OSTERBACK, D-SAND POINT, WHO IS CO-CHAIRMANH OF THE HOUSE RESOURCES COMMITTEE, SENT A LETTER TO ATTORNEY GENERAL AVRUM GROSS ON MONDAY REQUESTING AN INVESTIGATION TO DETERMINE IF THE BOARD VIOLATED EITHER THE INTENT OR THE ''SPIRIT'' OF STATE LAW.
THE BOARD GRANTED CHAIRMAN MARCUS JENSEN EXCLUSIVE GUIDING PRIVILEGES ALONG THE OUTER COAST OF CHICHAGOF ISLAND, A PRIME HUNTING AREA IN SOUTHEAST ALASKA. THE BOARD TOOK THE ACTION AT A FEBRUARY MEETING IN FAIRBANKS, AND RECENTLY REAFFIRMED THE DECISION.
IN HIS LETTER TO GROSS, OSTERBACK SAID HE AND OTHER LEGISLATORS ''HAVE RECEIVED NUMEROUS COMPLAINTS FROM SOME GUIDES INSISTING THAT THE ACTION WAS UNWARRANTED, UNETHICAL AND PERHAPS ILLEGAL.''
OSTERBACK SAID HE CAN ''READILY UNDERSTAND JEALOUSY AND COMPETITION MIGHT BE THE MOTIVATING FACTOR FOR THESE COMPLAINTS, BUT IT WOULD SEEM THAT AN INVESTIGATION MAY WELL BE APPROPRIATE TO DETERMINE IF THERE HAS BEEN ANY WRONGDOING.''
OSTERBACK SAID HE RECEIVD A

HUNTERS' ASSOCIATION PRESIDENT'S LETTER FROM PHIL DRIVER REQUESTING AN IN-
VESTIGATION.

THE LETTER STATES THAT THE DE-
CISION TO GIVE JENSEN AN EX-
CLUSIVE GUIDE AREA ''COULD JEOP-
ARDIZE A BASICALLY SOUND BOARD
AND THE CONCEPT OF EXCLUSIVE
GUIDE AREAS DEVELOPED OVER THE
LAST SEVERAL YEARS.''

DRIVER SAID THE ''BOARD AND
THE EXCLUSIVE OR JOINT-USE GUID-
ING AREAS HAS AND IS WORKING TO
PROTECT ONE OF ALASKA'S MOST
SIGNIFICANT NATURAL RENEWBLE RE-
SOURCES; AND SHOUD BE CONTIN-
UED.''

BUT HE QUESTIONED WHETHER
THE RIGHTS OF ''OTHER JOINT PER-
MIT HOLDERS IN GAME MANAGE-
MENT UNIT 4 HAVE BEEN SAFE-
GUARDED AND CONSIDERED DURING
DELIBERATION ON THE JENSEN DECI-
SION.''

JENSEN SAID HE HAS GUIDED IN
UNIT 4, WHICH INCLUDES CHICHA-
GOF ISLAND, FOR MORE THAN 30
YEARS.

''UNTIL LAST YEAR THE SOUTH-
EASTERN GUIDES HONORED THEIR
WORD IN RESPECT TO NOT GUIDING
IN MY PARTICULAR AREA,'' JENSEN
SAID IN A LETTER TO USTERBACK.
''THE REASON FOR THEIR SUDDEN
CHANGE IS THE FACT THAT THE

WHAT THEY CALL THE ''INSIDE'' AND
LEFT THE FRINGE ON THE ''OUTSIDE''
OPEN 10 DAYS LONGER.''

JENSEN SAID HE HAS ''BEEN

JENSEN SAID THE EXTENT OF
HUNTING PRESSURE IN CERTAIN
AREAS IS AT THE CENTER OF THE

[redacted]

CONTROVERSY.

''THERE HAS BEEN TOO MUCH GUIDING PRESSURE ON THE ''INSIDE.'' TOO MANY GUIDES STILL HAVE THE ATITUDE THAT THEY WILL SHOOT THE LAST CUB BEAR FOR A DOLLAR;'' JENSEN SAID. ''I DO NOT THINK THE ACTION OF THE GUIDE LICENSING AND CONTROL BOARD SHOULD BE CRITICIZED FOR TRYING TO SAVE A SMALL AREA FROM BEING TOTALLY RAPED.''

Dear Representative Osterback:

We have had a situation that came up during the recent Guide Board meeting that was held in Fairbanks, Alaska that may be worthy of some consideration by your committee in evulating the conduct of the Board under Sunset review. These tapes and the transcript of the meeting should be available to your committee at the Department of Commerce.

Mark Jensen, the Chairman of the Guide Board, was awarded the only exclusive guide area in Units 1 thru 4 in Southeastern Alaska. The area awarded was the total outside coast of Chichasof Island. This was done over the objections of all Southeastern guides, who testified in person or by letter, who had joint use of this area. Their right to hunt this area has been taken away and given to one man without the consideration of the other twenty guides.

We would like to point out that APHA has no objection to Mr. Jensen having an exclusive guide area but it was the manner in which this was done.. This was, in the eyes of the guiding industry, a flagrant abuse of power by the Chairman to serve his own personal financial interests.

APHA believes that this action by the Board should be revoked and an opportunity given to all guides in Southeastern Alaska to apply to the Board for an exclusive area.

The next Guide Board meeting should be held in Juneau, not in Fairbanks, so that all petitions to be considered would allow maximum participation by the Southeastern guides.

Sincerely,

THE BOARD OF APHA

P.S. IT is interesting to note that the only Board Member, wl could see how unfair this action was and voted against was a full-time guide. We believe at least three full-time guides should be on the Board.

TO WHOM IT MAY CONCERN:

Attached hereto you will find a letter from Karl Lane, addressed to the Guide Licensing & Control Board to be used at our February meeting in Juneau, on Unit 4. I regret to say that this letter was misplaced and was not read at that meeting.

I have known Karl Lane for many years, I have worked on his boat and I have a great deal of respect for the man himself, and his operation as a guide. It is unfortunate that open friction developed on my request for a small area.

Karl's letter shows a great deal of understanding and foresight in the changes that are about to occur in this area. The constant change creates problems for the guiding industry. Conditions will not improve - they will gradually deteriorate. The exclusive guide area has been very effective in the Interior of Alaska, where most all guides are satisfied that it is the best approach. I would hope that the Board and the guides will develop some of the thoughts in Karl's letter and bring them to a conclusion.

Sincerely yours,

Marcus Jensen

Marcus F. Jensen, Chairman
Guide Licensing & Control Board

Guide Licensing and Control Board
Division of Occupational Licensing
Pouch D
Juneau, Alaska 99811

Gentlemen:

Although I will not be present to give oral testimony at the Feb.13th thru 16th meeting of the Guide Board, I wish to assure you that I am still deeply concerned about the problems and future of brown bear guiding in Southeast Alaska and offer the following written testimony for consideration.

Somehow there must be found a way to reduce the guiding pressure by cutting down the number of active guide and also closing the loopholes that permit guides licensed for the area to sign contracts for guides not licensed for the area. This is being done by a few guides at the present time and it could allow an unlimited number to operate in Unit 4 and defeats any conservation measure you pass.

I would be in favor of exclusive areas if there is a proviso allowing Joint-Use if the individual guides so wish. The reason being that there is no fair way of dividing a country that is already split by different opening and closing dates for conseration reasons. There is also the problem of constant changing development in the logging industry. For example, the northern, eastern and southern coastlines of Chichagof Island will have intensive road building in '81 and full scale logging in '82. This will eliminate most of Chichagof. The northeast portion of Baranof will have the same development.

I would not be in favor of an exclusive area being transfered for any monetary value. If exclusive areas are issued to guides, they should be passed on to next qualified guide when the guide holding the area is not active for more than one season. The price of limited entry fishing permits are unfair.

If you are successful in liriting the guides to around ten or so, I have even been thinking of the possibility of cutting this number in half by guiding alternate years. For example, if you still had eight or ten guides which is still too many in my estimation, four or five guides with their clients would easily take one half of the quota of bears that the Game has set and the other half would surely be taken by the increase of resident hunting effort. A guided hunting trip would again have some quality and the bears would have a better chance of recovering.

Sincerely,

Karl Lane

JAY S. HAMMOND, Governor
P.O. Box 499
Sitka, AK 99835

April 9, 1979

Mr. Marcus Jensen
P.O. Box 2220
Juneau, AK 99803

Dear Marc:

The Alaska Board of Game has now met and taken action on the Unit 4 brown bear situation. I am writing you at this earliest possible moment so that you can adjust your schedule to conform to the Board's action.

The Board adopted a substantially shortened season which will go into effect at the start of the new regulatory year, July 1. The season the Board adopted is as follows: September 15-May 20 for Admiralty and the east side of Baranof and Chichagof and September 15-May 31 for the west side of Baranof and Chichagof. The line of division between east and west Baranof and Chichagof is shown on the enclosed map. To eliminate the possibility of an excessive harvest this coming spring season, the Board has directed the Commissioner of the Department of Fish and Game to adopt an Emergency Order, effective immediately, which implements the season outlined above. Therefore, the closing date for this spring season, 1979, will end May 20 for Admiralty and the eastern side of Baranof and Chichagof and May 31 for the western side of Baranof and Chichagof.

The Board has also directed the Department of Fish and Game to closely monitor hunting during the spring 1979 season; and if it appears the kill will exceed 25 bears on Admiralty, east Baranof, and east Chichagof, the Commissioner will close the season in these areas by Field Announcement. The season on west Baranof and west Chichagof will remain open until May 31.

Sincerely yours,

Loyal J. Johnson

15 February 1980
Juneay, Alaska

Dear Mark:

Sometimes people are apt to forget that when a person takes on a public chore and serves gratis, he doesn't give up his individual rights. Following the action of the Guide Licensing and Control Board this past week while it was reexamining the status of Unit #4 concerning Brown Bear and Exclusive and Joint Usage Guiding Areas, you no doubt are wondering if you'll ever get what you, like other guides, set out to get--an Exclusive Guiding Area, which is what you have wanted all along. I want it to be a matter of record that you put in for an EGA at the onset. Most of the guides in the Panhandle (the preponderance of whom in no way had "rights" that would measure up to yours) opted for joint usage in Units1-4. You regretfully went along with the rest, at the Board's insistence. Later, long before this recent reexamination, you again requested your EGA. The Board, still trying to make the collective Joint Usage work, felt you should withdraw the second request. It was not accepted.

This past week as the Board learned that there is a growing pressure on a fairly static resource (Brown Bear) but decided to maintain the status quo, it also learned that not all the guides who agreed at the initial meeting on this subject to respect your area of operations were doing so. The Board, therefore, encouraged you to again petition for your EGA, and the guides present pretty well agreed that they would have no objection to your doing so. There was general recognition that your rights, based on the criteria the Board has shaped over time, are on or are very close to the very foundation stone.

Times and circumstances change, as does makeup of various organizations. Memory falters and fades. I feel that because of all these factors I should put together this brief summary inasmuch as I have attended all meetings on this subject as it touches Units 1-4, and wish you well.

Fraternally,
Charles J. Keim
Member, GL&CB

Juneau Empire 4/25/80

Controversy looms for Southeast guides

By CRAIG MEDRED
Empire Staff Reporter

Like brown bears fighting to the death to protect their territory, Southeast Alaska guides appear headed for a bitter struggle with the chairman of the state's Guide Licensing and Control Board — himself a Southeast guide.

A board decision granting chairman Marcus Jensen of Juneau exclusive guiding rights on the outer coast of Chichagof Island, about 80 miles west of here, has other guides hopping mad.

"We're going to go all the way to the Supreme Court on it if we have to (to take the exclusive privilege away from Jensen)," said Karl Lane, one of the most highly respected guides in Southeast.

"Historically, we've all hunted the outside of Chichagof. I'm going to hunt it this year, regardless,..." the Juneau-based guide said.

"It's a real rotten thing to do."

"I think it was the crummiest, lousiest thing I ever saw," said John Erikson, a Tok-based guide who hunts Southeast brown bears in the spring.

By granting Jensen an exclusive guiding area, the board effectively closed the outer coast of Chichagof to 17 other Southeast brown bear guides and raised a host of questions as to board conduct.

"In the past, the board has always accommodated the guides," said board member Clark Engle, the only board member to vote against Jensen's special area. "...A majority of the guides in Southeast didn't want it.

"I don't know (why the board did it). I've tried to analyze it myself.

"There's an awful lot of people who are unhappy," he said, including the state's largest guide organization.

An "abuse of power?"

"This was, in the eyes of the guiding industry, a flagrant abuse of power by the chairman to serve his own personal financial interests," the Alaska Professional Hunters Association, Inc., charged in a letter to state Rep. Al Osterback, D-Sand Point, co-chairman of the House Resources Committee.

"We would like to point out that the APHA has no objection to Mr. Jensen having an exclusive guide area, but it was the manner in which this was done.

"The area awarded was the total outside coast of Chichagof Island. This was done over the objections of all Southeastern guides, who testified in person or by letter, who had joint use of this area. Their right to hunt this area has been taken away and given to one man without the consideration of the other 20 guides," the letter said.

The vote granting Jensen the exclusive area was taken in a public meeting in Fairbanks after considerable discussion, also in a public meeting, about what the board should do.

The action was reaffirmed on a 3-1 vote during a conference call among board members Thursday.

No earlier action "probably a mistake"

Charles Keim, a member of the board, a guide, a former journalism professor at the University of Alaska and a respected Alaska outdoors writer, defends the board's action, saying there may be too many guides now working in Southeast.

Keim contends the board "probably made a mistake" years ago when it combined all Southeast hunting districts into one exclusive guiding area and gave all guides the right to roam that area.

"Jensen did not go along with that. We probably made a mistake," Keim said. "It might be a good idea to re-examine the whole guiding system in Southeast Alaska.

"What we did for Jensen will probably have to be done for the rest of the guides," Keim said.

Too many guides and too few bears

He suggested restricting all to separate, small portions of Southeast which would support limited hunting. He also suggested eliminating some guides — comparing the bear-guide problem to the salmon-fishermen crisis which sparked limited entry.

It was for just that reason Jensen says he pushed for his exclusive guiding area, something the guide board refused four times before.

"I have been very conservative in the number of contracts I take because of the public hunting pressure in the area...," Jensen said in a letter to Osterback.

"No guide in Southeastern Alaska could object to my area if he would agree to an exclusive area for himself which would automatically reduce his number of contracts from eight to 10, to three or four at most. This is really what the controversy is all about. There has been too much guiding pressure on the 'inside.' Too many guides still have the attitude that they will shoot the last cub bear for a dollar," Jensen said.

Alaska Department of Fish and Game records would tend to support that contention.

"Quality" of the hunt suffers

Those records show guided hunters shooting increasing numbers of bears under 6 feet from the nose to the tail. A 6-foot brown bear is considered a "respectable" trophy. State law requires all nonresident hunters to hire a guide when hunting brown bear.

Lane, one of the few Southeast guides whose hunters did not take a bear under 6 feet last year, says the quality of guided bear hunting here has definitely been deteriorating.

Lane points no fingers, but Jensen has singled out Erikson. Erikson says he needs guiding to survive, but "to Jensen, it's a game." Jensen works as a lobbyist when he isn't guiding.

Hunters guided by Erikson, according to Fish and Game records, last spring took brown bears 3 feet 8 inches, 4 feet 11 inches and 6 feet 1 inch, in addition to three bears over 6 feet.

A bear is a bear is a bear

Erikson, who said he guided eight hunters last spring, pointed to a success rate of 75 percent, not counting one missed bear.

"I have no trouble finding bear," he said. "Maybe somebody wants size; somebody else wants quality.

"If you wanted to kill a big brown bear, you wouldn't go Southeast anyway. The whole thing of it is, if the hunter's happy, that's the whole thing.

"Like I said, I don't give a damn about the bear size," Erikson said.

He defends the small bears by adding a salted hide can shrink 3 feet. A 4-foot hide would probably come from a bear about 6 feet, he said.

Lane, one of the main advocates of "quality hunting" over the years, said a 9-foot bear taken on the first day of a 14-day hunt can "shrink over 8 inches."

"There's never been a hide shrunk 3 feet," he countered.

More small bears taken in 1979

Still, Erikson said, "I don't think there's too many bears being taken. I see lot of bear."

To that, Fish and Game biologists have mixed reactions. They say bear numbers appear to be healthy, although nowhere near as high as the mid-1970s, but they note the population does appear to be heavy with young bears.

A comparison between 1975 and 1979, when the brown bear season was drastically shortened, does show a marked difference in the bears taken. In 1975, 53 percent of the bears taken on guided hunts were over 6 feet. They had an average age of 8.3 years.

In contrast, only about 40 percent of the bears taken by guided hunters in 1979 were over 6 feet. Their average age was 7.1 years. Remove Lane — whose hunters took six bears, all over six feet — from the sample and 50 percent of the bears taken on guided hunts were under 6 feet.

That, Keim says, raises serious questions as to the quality of a Southeast hunt.

Is a 4-foot brown bear a quality hunt?

"I'm absolutely, totally opposed to an assembly-line use of our resource. It's totally demeaning to the hunt," Keim said.

"I think a thorough investigation into this matter will probably disclose some guides are more interested in the money than the resource," he said.

Keim contends something has to be done.

"We simply can't have a true wilderness experience if guides are going to have their hunters take home 3-foot-8-inch bear," he said.

Lane said he would like to see the number of Southeast guides reduced to five or six. "That's not possible," he added. Limited entry is the perfect parallel, "but they won't do it," Lane said.

He said there is too much political pressure.

"There was nobody in favor of it (Jensen's exclusive guide area), because this joint-use thing was working as good as can be expected," Erikson said.

Residents hunters shoot small bears, too

Half the problem, he added, is an increase in resident hunters.

"You're not going to stop the residents," Erikson said. "You're overpopulated with government employees, and the first thing they want to do when they come to Alaska is shoot a bear."

Fish and Game figures show resident hunters, who are not required to have a guide, took 18 brown bears last year, of which five — or about 29 percent — were under 6 feet. Guided hunters in 1979 took 34 bears, of which 14 — or about 41 percent — were under 6 feet.

In fact, figures indicate resident hunters appear to have been getting more selective, while guides have been getting less. In 1975, when resident hunters took 43 bears and guided hunters 41, 53 percent of the bears shot by residents were under 6 feet.

"Weed out the 'bandits'"

"As chairman of the Guide Licensing and Control board, and as an Alaska resident for over 50 years, and as a registered guide for some 35 years, I have been criticized by some guides for my strong stand against guides who want to rape the game resources," Jensen said in the letter to Osterback.

"I would hope that the House Resource Committee appreciates what most of our board members are trying to do for the state of Alaska, and that is weed out the 'bandits' who are raping our resource and develop exclusive guide areas for the protection of the resource and improved game management."

As it gets harder and harder to find a big bear, though, not even Jensen is immune to the pressure from guided hunters who want a brown bear no matter what size.

A hunter guided by Jensen last year took a 5-foot-6-inch bear, and another hunter, guided by an assistant guide working for Jensen, took a 4-foot-7-inch bear.

"The older bears don't come to the beach anymore," Erikson said. "A bear is a bear whether he's an 8-foot, a 6-foot or a 10-foot."

MEMORANDUM State of Alaska

TO: Tom Koester
Assistant Attorney General
Juneau

DATE: April 23, 1980

FILE NO:

TELEPHONE NO: 276-3550

FROM: AVRUM M. GROSS
ATTORNEY GENERAL

By:
Sarah Elizabeth Fuhrmeister
Assistant Attorney General

SUBJECT: Petition of Marcus Jensen For Exclusive Guide Area In Southeast Alaska

At the March 1980 Guide Licensing and Control Board meeting in Fairbanks, the board heard and considered a "petition" from Chairman Mark Jensen requesting that he be granted exclusive use of a portion of Chichagof Island, in Southeast Alaska. Mr. Jensen did not participate as a board member during the consideration of his petition. The basis for his bringing a petition was 12 AAC 38.056 "Changes to Guiding Area Permit" which authorizes the board to hear petitions for changes that will affect a guiding area and requires that if an area is held in joint use, each holder of the permit for the guiding area must be furnished a copy of the petition and notified of the date and place where he can present testimony on the petition. There are no other regulations that set standards by which a board will decide whether to grant or deny petitions.

The board has a procedure for granting exclusive guide areas. This is set out in regulations 12 AAC 38.051 - .058. In essence, the regulatory scheme provides that the board set a deadline for applications for a given game management unit, it receives applications that indicate a guide's desired exclusive guide area, including a map of proposed geographic boundaries, and the board will in its discretion issue a permit if a guide has demonstrated his "use, occupancy or financial investment" in the area for the requisite number of years as provided in 12 AAC 38.053(d). The board has construed this to mean if a guide can substantiate his use of an area by means of statements of financial remuneration for two years he is entitled to a temporary area.

In considering Mark Jensen's "petition", the board did not follow the normal procedure for granting exclusive guide areas as described above. The board had not set a deadline for applications from all Southeast guides for exclusive guide areas. In fact, when the board initially decided to initiate a program of exclusive guiding areas in

1975-76, the board at the urging of the approximately 20 active guides in Southeast, decided to leave all of game management units 1 - 4 as one large joint use area, so all guides would have an opportunity to hunt the area rather than attempt to carve it into small exclusive guide areas and assign them as has been done in the interior. One reason for this difference is the manner of hunting in Southeast Alaska, primarily by using boats, mooring them in small bays and inlets.

The board's administrative arm, the Guide Investigation Office at Department of Public Safety, Anchorage, complied with the provisions of 12 AAC 38.036 by notifying other Southeast guides that Mr. Jensen intended to seek an exclusive area in the area already assigned to all the guides in joint use. Virtually all the Southeast guides objected to granting Mark Jensen an area. To my knowledge the board has never in the past used the petition mechanism as a vehicle for granting exclusive guide areas, nor ever carved out an exclusive guiding area within an area already assigned in joint use.

It is my opinion that the board's action in granting Mark Jensen an exclusive guide area in unit 4, when the board had not solicited applications from all Southeast guides, was not consistent with statutory or constitutional standards for the following reasons:

1. Granting Mark Jensen an exclusive guide area denied other Southeast guides the Constitutional right of equal protection, since other Southeast guides are similarly situated in joint use of the entire Southeast panhandle, and were not provided an equal opportunity to come before the board with their own petitions or applications for exclusive guiding areas.

2. The board's action violated principles of due process notice, in that the board had not taken action to set a deadline for applications from all guides in joint use for them to seek exclusive guide areas, and therefore had not given adequate notice to all guides that they could submit similar petitions or applications for an exclusive guide area.

3. The board's action does not comply with AS 08.54.040 which allows the board to "establish a quota of licensed operating guides who may operate within designated geographical units or subunits of the state and provide for [illegible] equitable and reasonable procedure

for limiting the number of guides to that quota; preference shall be given to qualified, available and willing licensed guides who reside within the designated unit or subunit." The board had not established a procedure for limiting the number of guides to the quota under the mechanism of the petition procedure. The petition procedure in essence singled out one guide for consideration for an exclusive guide area without considering other guides who may wish to have exclusive guiding areas in Southeast.

To my knowledge, the board has never granted an exclusive guide area within a joint use area by means of a petition. It had been my advice to the board that such action should not be taken until sufficient criteria are established for this procedure by regulation. The board had rejected the petition initially during the board meeting, but reconsidered it late in the afternoon on Friday after I had had to leave the meeting in order to attend to another matter in Anchorage. At my request the board convened a conference call on April 24 to consider a telegram from F. W. Ingledue, an affected guide, who objected to the board's action and requested reconsideration; I again reiterated that it was my opinion that the board's action was not legally defensible, was not based on sufficient standards for handling petitions, and should be rescinded.

In retrospect, I think that probably where a petition such as the one Mr. Jensen brought before the board is contested by other affected guides, the matter should be heard as a formal APA hearing, with a hearing officer appointed, rather than treated as day to day business of the board and not as a formal hearing. You may wish to consult with Bruce Botelho, with whom I have already spoken about this problem. Thank you for your assistance.

Gentlemen:

At the April 1980 Guide Board meeting in Fairbanks, the board granted a petition from Chairman Mark Jensen requesting he be granted exclusive use of a portion of Chicagof Island. At the time the board action occurred, Assistant Attorney General Liza Fussner advised you that the board's action was illegal. The board nonetheless granted the petition.

I have enclosed a copy of a memorandum from Ms. Fussner to Tom Koester, head of the Resources Division in my office. Because of the sensitive nature of this action involving as it does the Chairman of the Guide Board, I reviewed the matter personally and I believe that Ms. Fussner's advice to you is sound. The action of the board cannot be supported by law.

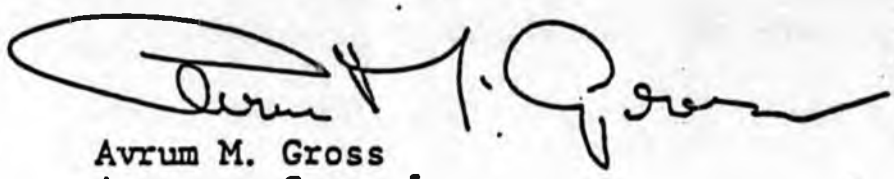
I have been advised that litigation will be commenced immediately to contest the board's action. Since we have already advised you the action is illegal, we will be forced to concede that illegality in court. Moreover, since we have advised you of the impropriety of your action and the board has nonetheless taken the action, there is a very real possibility that individual members of the board may be liable for damages, court costs, and possible attorney fees of any successful litigant.

I realize this is a difficult situation, but it is only going to get more difficult if nothing is done promptly. I strongly urge the board to immediately convene, by phone if necessary, to reconsider its action and rescind the decision. Full notice should be given to Mr. Jensen who will be free to contest the matter if he so chooses.

03-C3LM

I would be happy to discuss this with you by phone or in person at your earliest convenience. Obviously, it is not pleasant for me to suggest this type of action to a state board, but my responsibilities under the laws of the state simply afford me no room for latitude.

Yours very truly,



Avrum M. Gross
Attorney General

Representative Osterback April 28, 1980

PRESS RELEASE File

Representative Osterback, Chairman of the House Resources Committee has been requested by the Alaska Professional Hunters Ass Inc. to investigate actions of the Guide Licensing and Control Board which gives an exclusive guide area to Mr. Marcus Jensen, Chairman of the Board. The letter was signed by Mr. Phil Driver, President of the Hunter's Assn. This letter further alledges that the action (giving Jensen an exclusive guide area) could bring about unfavorable reactions from the reviewing committee which might jeopardize a basically sound board and the concept of exclusive guide areas developed over the last several years. The Alaska Professional Hunters Assn., Inc. further questions -- "have the rights of other joint permit holders in Game Management Unit Four been safe guarded and considered during deliberation on the Jensen decision"?

File

Representative Osterback today further stated, that the entire controversy which has surrounded the Guide Licensing and Control Board causes a serious credibility gap. I, personally, do not want to be involved with this controversy. However, since the issue of exclusive guide areas came to the attention of the Legislature by Senator Frank Ferguson in 1977 much controversy has existed.

I have by letter toda, requested the Attorney General to investigate the complaints I have received from guides insisting that the action was unwarranted, unethical and perhaps illegal.

"Personally", Osterback further contended, "I do not want to be involved, but since 1977 nothing has emerged but problems, accusations and serious credibility

has shaded the Guide Licensing and Control Board.

"I'm personally sick and tired of it and plan on getting to the root problem of this entire controversy before I leave Juneau this session."

The Honorable Jay S. Hammond
Governor of Alaska
Pouch A
Juneau, Alaska 99811

Dear Governor Hammond:

A certain decision during the last meeting of the Guide Licensing and Control Board has caused a not insignificant consternation among the active licensed game guides of our industry. On a 3-1 vote of the four Board members present, an exclusive guide area was permitted to Mr. Marcus Jensen, Chairman of this board.

This questionable decision comes at a time when this very Board and the policies adopted to administer the professional game guiding industry are being reviewed by this legislature. One of our concerns is that this action could bring about unfavorable reaction from the reviewing committee, which might jeopardize a basically sound Board and the concept of exclusive guide areas developed over the last several years. To negate the compromise, made by some 253 permit holders, who gave rather than gained, in order to allow a maximum number of licensed guides to participate in the limited game resources of Alaska would be disasterous. The Board and the exclusive or joint-use guiding areas has and is working to protect one of Alaska's most significant natural renewable resources, and should be continued.

Equally important, have the rights of other joint permit holders in Game Management Unit Four been safe guarded and considered during deliberation on the Jensen decision?

A closer look and re-evaluation would be in order. Of course, all interested parties should be allowed to participate so the facts can be aired and evaluated.

Sincerely,

ALASKA PROFESSIONAL HUNTERS ASSOCIATION, INC.

Re: Confirmation of Members
of Boards and Commissions

Dear Governor Hammond:

You have asked us for an opinion as to the propriety under the State Constitution of the Legislature's confirming your appointments to State Boards and Commissions.

Under the Constitution, Article 3, Sections 25 and 26, the Legislature's power to confirm your appointments to executive positions is limited to those positions specified by the Constitution, that is, heads of the principal departments and the members of boards and commissions which are at the head of principal departments or quasi-judicial or regulatory agencies. Bradner vs. Hammond, 553 P.2d 1 (Alaska 1976).

We have accordingly prepared an alphabetical listing of all the State boards and commissions in Alaska and have indicated for each the statute under which its members are appointed, whether that statute requires legislative confirmation, and whether the Constitution requires or permits legislative confirmation. The list follows:

Administration of Justice, Governor's Commission on the.
AS 44.19.746. Confirmation is not required by statute or the Constitution.

Aging, Governor's Advisory Committee on.
There is no statute on this one and no confirmation would be required by statute or Constitution.

Alcoholic Beverage Control Board.
AS 4.05.010 and 39.05.060. This is a regulatory board and requires confirmation under the statutes and the Constitution.

Alcoholism, Advisory Board on.
AS 47.37.070. Confirmation is not required under either statute or the Constitution.

Architect, Engineer & Land Surveyors, State Board of Reg. for
Arts, Alaska State Council on the.
AS 44.19.900. This board is made expressly not subject to legislative confirmation under the statute, and of course, is not subject to confirmation under the Constitution.

Assessment Review Board, State.
AS 43.56.040. This is a quasi-judicial agency and must be confirmed under both the statute and the Constitution.

Athletic Commission.
AS 05.05.010. This is a regulatory board and is subject to confirmation under both the statute and the Constitution.

Barber Examiners, Board of.
AS 08.12.010. This is a regulatory board and must be confirmed under the Constitution, even though not required by statute.

Bristol Bay Regional Development Council.
Chapter 4, SSSLA 1974, and Chapter 209, SLA 1976. No confirmation is required under either the statute or the Constitution.

Capital Site Selection Committee.
AS 44.06.110. Confirmation is not required under either the statute or the Constitution.

Chiropractic Examiners, Board of.
AS 08.20.010. This is a regulatory board and confirmation is required under the Constitution, even though not required under the statute.

Code Revision Commission.
AS 24.20.075. Confirmation is not required by either the statute or the Constitution.

Collection Agency Board.
AS 08.24.011. This is a regulatory board and confirmation is required under the Constitution, even though not required by the statute.

Commercial Fisheries Entry Commission.
AS 16.43.020. This is a regulatory commission and confirmation is required under both the statute and the Constitution.

Comprehensive Health Advisory Council.
AS 18.07.020. Confirmation is required by the statute; however, this is not a quasi-judicial or regulatory agency, and confirmation is not permissible under the Constitution.

Commission for Northern Operations of Rail Transportation and Highways.
AS 44.19.704 and 39.05.060. Confirmation is required under the latter statute but cannot be required under the Constitution.

Dental Examiners, Board of.
AS 8.36.010. This is a regulatory board, and confirmation is required under both the statute and the Constitution.

Developmental Disability Planning and Advisory Council.
This is created under federal law and confirmation is not required.

Development Corporation, Alaska State.
AS 44.59.010. Confirmation is required by the statute; however it cannot be required under the Constitution.

Dispensing Opticians, Board of.
AS 08.71.010. This is a regulatory board, and while not required by statute, confirmation is required under Constitution.

Drug Abuse, Advisory Board on.
AS 44.29.030. Confirmation is not required under either the statute or the Constitution.

Education, Board of.
AS 14.07.075. This is head of a principal department, and confirmation is required under both the statute and the Constitution.

Educational Broadcasting Commission, Alaska.
AS 14.40.700. Confirmation is not required under either the statute or the Constitution.

Electrical Examiners, Board of.
AS 08.40.010. This is a regulatory board, and confirmation is required under the statute and the Constitution.

Employment of the Physically Handicapped, Governor's Committee on.
AS 23.15.220. Confirmation is not required under either the statute or the Constitution.

Environmental Advisory Board.
AS 44.46.030. Confirmation is not required under either the statute or the Constitution.

Equal Employment Opportunity Committee.
This board is created by administrative order, and confirmation is not required.

Fisheries, Board of.
AS 16.05.221(a). This is a regulatory board and confirmation is required by both the statute and the Constitution.

Fisheries Council.
This board was created by administrative order, and confirmation is not required.

Fishermen's Fund Advisory and Appeals Council.
AS 23.35.010. Confirmation is not required by the statute or the Constitution.

Game, Board of.
AS 16.05.221(b). This is a regulatory board, and confirmation is required by the statute and the Constitution.

Geographic Board, State.
AS 44.19.360. Confirmation is not required by the statute or the Constitution.

Growth Policy Council, Alaska.
This board was created by administrative order and confirmation is not required by statute or the Constitution.

Guide Licensing and Control Board.
AS 08.54.010. This is a regulatory board, and confirmation is required by both the statute and the Constitution.

Hair Dressing and Beauty Cultural Examiners, Board of.
AS 08.28.010. This is a regulatory board, and while confirmation is not required by the statute, it is required by the Constitution.

Historical Commission, Alaska.
AS 41.19.461. Confirmation is not required by the statute or by the Constitution.

Historic Site Advisory Committee.
AS 41.35.110. Confirmation is required by the statute; however, confirmation is not permissible under the Constitution.

Housing Authority, Alaska State
AS 18.55.020; 39.05.060. Confirmation is not required by the former statute but it is by the latter. Confirmation is not permissible under the Constitution.

Housing Finance Corporation, Alaska.
AS 18.56.010. Confirmation is not required by the statute or by the Constitution.

Human Rights, State Commission for.
AS 18.80.010 This is a quasi-judicial agency, and confirmation is required by the statute and by the Constitution.

International Development Commission, Alaska.
AS 44.19.400. Confirmation is not required by the statute or by the Constitution.

Investment Advisory Committee.
AS 37.10.010(f). Confirmation is not required by the statute or the Constitution. (The presence of legislators on this committee is probably not permissible under the constitutional prohibition against dual office holding. Alaska Constitution, Art. 2, Sec. 5).

Judicial Council.
Alaska Constitution, Art. 4, Sec. 8. The non-attorney members, and solely the non-attorney members, are subject to legislative confirmation.

Judicial Qualificiations, Commission on.
Alaska Constitution Art 4. Sec. 10. The two members who are non-lawyers and non-judges are subject to legislative confirmation.

Juvenile Justice and Delinquency Commission.
This board is created under federal law and no confirmation is required.

King Crab Marketing and Quality Control Board, Alaska.
AS 18.90.040. This board has regulatory powers and confirmation is required by the statute and the Constitution.

Land Use Planning Commission, Joint Federal-State.
AS 41.40.020. Confirmation is not required by statute or by the Constitution.

Law of the Sea, Commission on the Conference of the.
AS 44.19.789. Confirmation is not required by the statute or by the Constitution.

Libraries, Advisory Council on.
This board is the creature of federal law, and no confirmation is required.

Local Boundary Commission.
AS 44.19.250; 39.05.060. The former law does not require confirmation, but the latter does; however, that is not permissible under the Constitution.

Manpower Planning Council, State.
This is also a creature of federal law, and no confirmation is required.

Manpower Services Council, State.
This group is also a creature of federal law and no confirmation is required.

Marine Pilots, Board of.
AS 08.62.010. This is a regulatory board and confirmation is required by the statute and the Constitution.

Medical Board, State.
AS 08.64.100. This is a regulatory board and confirmation is required by the statute and the Constitution.

Medical Indemnity Corporation of Alaska (MICA).
AS 21.88.030. Confirmation is required by statute but is not permissible under the Constitution.

Mental Health Advisory Council.
AS 47.30.605. Confirmation is not required by statute or the Constitution.

Municipal Bond Bank Board.
AS 44.58.010. Confirmation is required by statute; however, confirmation is not permissible under the Constitution.

Nursing, Board of.
AS 08.68.010. This is a regulatory board, and while not required by statute, confirmation is required by the Constitution.

Nursing Home Administrators, Board of.
AS 08.70.010. This is a regulatory board, and while not required by statute, confirmation is required by the Constitution.

Occupational Safety and Health Review Board.
AS 18.60.057. This is a quasi-judicial board, and confirmation is required by the statute and the Constitution.

Oil and Gas Conservation Commission

Optometry, Board of Examiners in.
AS 08.72.010. This is a regulatory board, and while not required by statute, confirmation is required by the Constitution.

Pacific Marine Fisheries Commission.
AS 16.45.020. Confirmation is required by the statute; however, confirmation is not permissible under the Constitution.

Parole, State Board of.
AS 33.15.010. Confirmation is required by the statute; however, confirmation is not permissible under the Constitution.

Personnel Board (also acts as Public Employees Retirement Board and Labor Relations Board).
AS 39.25.060. This is a regulatory board and also a quasi-judicial agency, and confirmation is required by the statute and the Constitution.

Pharmacy, Board of.
AS 08.88.010. This is a regulatory board, and confirmation is required by the statute and the Constitution.

Physical Therapy Board, State.
AS 08.84.010. This is a regulatory board, and while not required by statute, confirmation is required by the Constitution.

Pioneers Home Advisory Board, Alaska.
AS 44.21.100. Confirmation is not required by the statute or the Constitution.

Pipeline Commission, Alaska.
AS 46.06.020. This is a regulatory board and confirmation is required by the statute and the Constitution.

Police Standards Council, Alaska.
AS 18.65.140. Confirmation is not required by the statute or by the Constitution.

Post-Secondary Education, Alaska Commission on.
AS 14.40.903. Confirmation is required by the statute; however, confirmation is not permissible under the Constitution. (The presence of legislators on this Commission is highly questionable under the separation of powers doctrine and the prohibition against dual office holding).

Professional Teaching Practices Commission.
AS 14.20.380. This commission has quasi-judicial powers, and confirmation is required by the statute and by the Constitution.

Psychologist and Psychological Associate Examiners, Board of.
AS 08.86.010. This is a regulatory board, and confirmation is required by the statute and by the Constitution.

Public Accountancy, Alaska State Board of.
AS 08.04.010. This is a regulatory board, and while not required by the statute, confirmation is required by the Constitution.

Public Offices Commission, Alaska.
AS 15.13.020(b). This is a quasi-judicial commission, and while not required by statute, confirmation is required by the Constitution. (The method of appointment to this commission is highly suspect under the Constitution Art 2. Secs. 25 and 26).

Public Offices Salary Commission.
AS 39.23.010. Confirmation is not required by statute or by the Constitution.

Public Utilities Commission, Alaska.
AS 42.05.010. This is a regulatory board, and confirmation is required by the statute and by the Constitution.

Real Estate Commission.
AS 08.88.011. This is a regulatory board, and confirmation is required by the statute and the Constitution.

Regents Board, University of Alaska.
Alaska Constitution. Art. 7 Sec. 3; AS 14.40.120.
Confirmation is required by the Constitution.

Royalty Oil and Gas Development Advisory Board.
AS 38.06.010. Confirmation is required by the statute; however, confirmation is not constitutionally permissible.

Rural Affairs Commission.
AS 44.19.720. Confirmation is not required by the statute or by the Constitution.

Small Business Corporation of Alaska.
AS 44.60.020. Confirmation is not required by the statute or by the Constitution.

Soil Conservation Board, Alaska.
AS 41.10.040. Confirmation is required by the statute; however, confirmation is not permissible under the Constitution.

Teacher's Retirement Board, Alaska.
AS 14.25.035. Confirmation is not required by the statute or by the Constitution.

Tourism Advisory Board.
AS 44.33.190; 39.05.060. Confirmation is not required by the former, but it is required by the latter. However, confirmation is not permissible under the Constitution.

Transportation Commission, Alaska.
AS 42.07.011. This is a regulatory board, and confirmation is required by the statute and the Constitution.

Transportation Planning Committee.
Administrative Order No. 33. No confirmation is required by statute or the Constitution.

Veterinary Examiners, Board of.
AS 8.98.010. This is a regulatory board, and confirmation is required by the statute and by the Constitution.

Violent Crimes Compensation Board.
AS 18.67.020. This is a quasi-judicial agency, and while not required by the statute, confirmation is required by the Constitution.

Vocational Education Advisory Council, Alaska State.
This is a creature of federal law, and confirmation is not required by statute or by the Constitution.

Water Resources Board.
AS. 46.15.190. Confirmation is required by the statute; however, confirmation is not permissible under the Constitution.

Welding Examiners, Board of.
AS 8.99.101. This is a regulatory board, and while not required by the statute, confirmation is required by the Constitution.

Western Interstate Commission for Higher Education.
AS 14.40.690. Confirmation is required by the statute; however, confirmation is not permissible under the Constitution.

Workman's Compensation Board, Alaska.
AS 23.30.005. This is a quasi-judicial agency, and confirmation is required by the statute and by the Constitution.

Yukon-Taiya Commission.
AS 44.20.010. Confirmation is not required by the statute or by the Constitution.

Summarizing the above, there are 41 boards which do not require confirmation under the applicable statutes and the Constitution. There are 27 boards that require confirmation under both the applicable statutes and the Constitution. There are 13 regulatory or quasi-judicial boards which must be confirmed by the legislature under the Constitution but which are not required to be by the applicable statutes. There are 14 boards which require confirmation under the applicable statutes, but which are not subject to confirmation under the Constitution.

It is our opinion that you should submit the names of your appointees to the boards and commissions which are subject to confirmation under the Constitution. You need not submit appointees for confirmation that under the Constitution are not subject to that requirement. You are, of course, free to do so as an advisory matter relying upon the legislative vote as an indication of the legislature's views on the appointment, but under the Constitution, if the appointee is not required to be confirmed, a legislative decision not to confirm the appointee would be of no legal effect. The appointment would be valid in any event.

Yours very truly,

Avrum M. Gross
Attorney General

hearings

Resume of Robert J. Simon

1. Born: September 17, 1925, Valentine, Nebraska
2. Graduated from highschool 1943
3. US. Navy, October 1943 - June 1946
4. Bachelor of Science in Fisheries, University of Washington 1953
5. Territory of Alaska, Department of Fisheries and Department of Fish and Game, sport fish biologist 1953-1958, Fairbanks and Kodiak
6. State of Alaska, Department of Fish and Game, commercial fisheries biologist, Kodiak 1959-61; Regional Supervisor 1961-1972
7. National Marine Fisheries Service, Chief, State/Federal Relationships 1972-1976; Chief of Management Operations 1977 (resigned in July)
8. Commissioner, Alaska Commercial Fisheries Entry Commission, July 17, 1977 - July 1, 1980

I realize this is quite brief - there should be a more complete one in my personnel file.

BJS

PROFESSIONAL VITAE

Name: Samuel James Harbo, Jr.

Birthdate: March 3, 1929

Education:

B.S. University of Nebraska, 1951
-- University of California (Berkeley), Sept. 1954 - Jan. 1956
M.S. University of Alaska, 1958
Ph.D. North Carolina State University, Raleigh, 1972

Employment:

University of Alaska, Chairman, Wildlife and Fisheries Program, current; Associate Professor, 1971-current; Assistant Professor, 1965-1971; Instructor of Biometrics, 1964-1965; Acting Head, Department of Wildlife Management, 1968-1969.

North Carolina State College, U.S. Public Health Service, Biomath Fellowship, 1963-1964.

North Carolina State College, Cooperative Wildlife Statistics Project, Research Assistant, 1961-1964.

Alaska Department of Fish and Game, Nome, Alaska, Research Biologist, 1959-1961.

U.S. Fish and Wildlife Service, Cold Bay, Alaska, Biologist, May-Dec., 1958.

Publications:

1958. An investigation of mink in interior and southeastern Alaska. Unpubl. M.S. thesis, University of Alaska.

1969. Revision of the sailfish genus Istiophorus. Copeia, 1969(1): 34-44 (with J. E. Morrow).

1972. An aerial census of ringed seals, Phoca (Pusa) hispida Schriber, along the Northern Coast of Alaska. Arctic 25(4): 280-90 (with J. Burns).

1972. Modeling forest succession. Ph.D. dissertation. North Carolina State University, Raleigh.

1973. Discussion of Environmental Planning and Ecological Possibilities by S. A. Bella and W. S. Overton. J. of Envir. Eng. Div. Proc. of Am-Soc. Civil Eng. 99: 385-87 (with F. C. Dean).

1977. Surveys of Spotted Seals, Phoca vitulina Largha, in the ice front of Bering Sea. Presented at Second Conference on the Biology of Marine Mammals (with J. Burns).

1978. Moose Survey Techniques. Presented to No. Amer. Moose Conference (with W. C. Casaway and S. D. DuBois).

Paper Presented: Statistical Considerations in Bird Censuses and Indices. 1974 Northern Bird Resources Workshop.

Various Unpublished Papers and Completion Reports Dealing with Marine Mammals:

1959. A study of the walrus and the King Island economy. Alaska Dept. of Fish and Game. 47 pp.

1960. Walrus Biology and Status: Annual Project Report, Federal Aid in Wildlife Restoration Act, Project W-6-R-1. 3 pp.

1960. Walrus Harvest and Utilization. Annual Project Report, Federal Aid in Wildlife Restoration Act, Project W-6-R-1. 13 pp.

1960. Seals, Magnitude and Characteristics of Harvest. Annual Project Report, Federal Aid in Wildlife Restoration Act, Project W-6-R-1. 12 pp.

1961. Walrus Biology and Population Status. Annual Project Report, Federal Aid in Wildlife Restoration Act, Project W-6-R-2. 27 pp.

1961. Walrus Harvest and Utilization. Annual Project Report, Federal Aid in Wildlife Restoration Act, Project W-6-R-2. 25 pp.

1961. Seals, Magnitude and Characteristics of Harvest. Annual Project Report, Federal Aid in Wildlife Restoration Act, Project W-6-R-2. 2 pp.

Additional Duties: Statistical consulting regarding fisheries and wildlife problems with numerous federal and State agencies and private groups (since 1963).

Chairman, Alaska Board of Game (since 1976).

BJS

STATE OF ALASKA

JAY S. HAMMOND, GOVERNOR

BOARD OF FISHERIES/BOARD OF GAME
DEPARTMENT OF FISH AND GAME

SUBPORT BUILDING
JUNEAU, ALASKA 99801

May 5, 1980

Dear Members of the Alaska State Legislature:

I just learned that a recent interpretation of Alaska's Statutes on Boards and Commissions requires my reappointment to the Alaska Board of Fisheries and confirmation by the Legislature during this session. I am scheduled to leave May 6 to begin my fishing season and request that, under the circumstances, I be permitted to submit this written statement instead of appearing personally before you for a confirmation hearing.

Having served five years on the Fisheries Board, I find its primary function has been resolving allocation decisions for the various user groups, gear types, and geographic areas that compete for Alaska's fisheries resources. The Board also has served as a buffer between the public and the professional staff of the Alaska Department of Fish and Game.

I feel that all Alaskans should have an opportunity to share in our fisheries resource wealth. Unfortunately, those resources are not always abundant enough to completely satisfy the desires of all potential users. The burden then is upon the Board to decide the most beneficial uses among competing alternatives. Hopefully, through the intensive and extensive public participation process the Board has developed, a rational approach to distributing our fisheries resources has resulted.

I feel that it is desirable to have various geographic areas and user groups represented on the Board. I do not feel that a member should be an advocate of a particular user group or geographic area, but that he should bring to the Board his special expertise, knowledge, and experience with the group or area. Because of Alaska's vastness and the complexity of our fisheries resource management problems, it is impossible for each member to be an expert on all issues. We must of necessity depend on each other. However, in bringing our own special knowledge to the work of the Board, we must be motivated by a primary interest in the general good of the State and its resources.

With another term on the Board, I would like to work toward accomplishing two things which could be considered outside the Board's usual sphere:

1) There needs to be a strengthening of communication between the Board and the Legislature. The Legislature created the Board to carry

out certain responsibilities involving the State's fisheries resources and the people's use of them. Unfortunately, because of lack of understanding, the Board and Legislature have at times worked at cross-purposes. Issues have arisen about which the Board has received literally days of testimony and that the Board has debated at length. The Board's solutions have been in the best interest of the State's resources but have not always been politically popular. On several of these issues the Legislature has subsequently taken action in a way that negated the Board's decisions. I feel that if better communication had existed between the Board and the Legislature, the Legislature would have been aware of the reasons for the Board's actions and the Board and Legislature would have been able to work in concert instead of in conflicting directions. This improved communication would also give the Board a clearer view of the direction the Legislature wishes to go in management of the State's fisheries resources.

2) Even though a recent survey showed most Alaskans favored reducing the level of state government, I don't believe the survey reflected the true attitudes of the users of fish and game resources toward resource management. During Board meetings over the last five years, countless people have attended to vent their frustrations about the inadequate research, management, and protection that Alaska gives its fish and game resources. Too often inadequate information has resulted in either an over-harvest or an under-harvest, neither of which is in the State's best interest. Inadequate protection continues to jeopardize the entire future of the resources. One of our State's primary industries, our greatest renewable resource, generating millions of dollars into Alaska's economy, surely deserves more financial support. Every dollar appropriated is an investment that will return many-fold to the State's citizens.

Thank you for your consideration and for allowing me to present my views in written form. I have found membership on the Board of Fisheries to be a great challenge, and I hope I will be allowed to serve Alaska and its resources for another term.

Sincerely,

Nich Szabo

Dear Mr. Osterback:

In response to your letter dated March 17, you will find enclosed my resumé for your review. I will be unable to attend the hearing on April 10, as I will be attending the Alaska King Crab Marketing and Quality Control Board meeting in Anchorage at that time.

In January I was notified by Governor Hammond of my appointment to the Board and last month was sworn in before a judge here in Kodiak.

If there are any questions as to my qualifications, please do not hesitate to call me at my office (486-3266) or write.

Sincerely,

Ed Van Fleet/cmk

GOVERNOR

STATE OF ALASKA
OFFICE OF THE GOVERNOR
JUNEAU

January 11, 1980

Mr. Edwin L. Van Fleet
P. O. Box 1848
Kodiak, Alaska 99615

Dear Mr. Van Fleet:

I am pleased to inform you of your appointment to the Alaska King Crab Marketing and Quality Control Board, with a term ending August 26, 1981. I appreciate your willingness to serve your State.

You are now accepting important responsibilities on behalf of Alaska. Alaska will be a greater place in which to live because of the willingness of citizens such as yourself to devcte time and talent in service to our State.

In order to complete your appointment, it will be necessary to fill out the enclosed forms, each of which should be notarized and then returned to me as soon as possible. Upon completion of these forms, you will possess the authority to exercise the powers and perform the duties of your office pending confirmation by the Legislature. A formal certificate of appointment will be sent to you upon legislative confirmation of your appointment. Alaska Statutes also require the filing of a conflict of interest form within 30 days of this appointment. The Alaska Public Offices Commission will send copies of the necessary forms to you.

Finally, it is my strong belief that serving on any of Alaska's boards and commissions is both a privilege and a responsibility. Therefore, I expect each appointee to attend at least 75 percent of the meetings. If circumstances arise preventing that, I ask you to request replacement so the board will be able to continue to function efficiently.

Again, I am pleased to be able to appoint you and thank you for your willingness to serve your State.

Sincerely,

Jay S. Hammond
Governor

RESUMÉ

Edwin Lewis Van Fleet
P.O. Box 1848
Kodiak, Alaska 99615

PERSONAL DATA:

Date of Birth:	December 15, 1951
Age:	28
Height and Weight:	6'0", 195 lbs.
Marital Status:	Married, wife Judy, 2 children
Special Interests:	Mariculture, SCUBA Diving
Hobbies:	Fishing, Swimming, Karate
Memberships:	World Mariculture Society International Oceanographic Foundation Kodiak Seafoods Processors Assn., Secretary/Treasurer Kodiak Overall Economic Development Committee King Crab Marketing and Quality Control Board

EDUCATION:

1975 Attended "Better Process Control", a Food and Drug Course sponsored by the University of Alaska. Received Retort Operators Certificate.

1972-1974 Attended California Polytechnic State University, San Luis Obispo, California. Graduated December 1974 with B.S. Degree in Biological Sciences, concentrating in the field of Marine Biology. Activities: Involved in soft-ball, football, handball, karate, and SCUBA diving.

Important Courses In Which I Have Received Credit

Zoology (2 years)	Marine Microbiology
Botany (1 year)	Marine Biology
Inorganic Chemistry (1 year)	Marine Resources
Organic Chemistry	Biology of Fishes
Biochemistry	Mariculture Engineering (1 yr.)
Estuary Studies	Welding
Bacteriology	Physiology
Entomology	Genetics

Report Writing: The Feasibility of Lobster Mariculture
Senior Thesis: The Effects of Temperature and Salinity on Ocean Shrimp.

1970-1972 Attended Cuesta College, San Luis Obispo, California. A.A. Degree in Biology.
Activities: Active member of the "Special Estuary Studies" Program. Participated in Karate and SCUBA Diving.

1966-1970 Attended Atascadero High School, Atascadero, California. Graduated in June 1970.
Awards and Activities: Bank of America Award for Foreign Languages (Spanish).
Track Team (2 yrs.), Swimming Team, (4 yrs.).

Employment:

1975-present Del Monte Corporation.
I am currently the Superintendent for Alaska Packers Association, a subsidiary of Del Monte Corporation, in Kodiak, Alaska. To date, I am the youngest person holding this position within the corporation. My promotion record and job experience is as follows:

June 1975-December 1975
"Production-Management Trainee" in Kodiak, Alaska.

January 1976-April 1977
"Process Supervisor" tranferring to Chignik, Alaska.

May 1977-July 1977
"General Plant Supervisor" in Chignik, Alaska.

August 1977-present
"Plant Superintendent" transferring back to Kodiak.

While in Chignik, I was responsible for all aspects of Crustacea (shrimp, king crab, and tanner crab) and frozen salmon and halibut processing. This included: organizing an average of 50 employees into 5 crews to unload vessels and maintain line production, calculating hourly production efficiency, equating raw and finished product data, performing minor "in line" repairs, and keeping inventory of all production materials and rate of consumption.

I was also in charge of all "in plant" labor relations and bunkhouse regulations. Upon the Superintendent's absence, I was in charge of the entire operation.

As Superintendent, I am responsible for maintaining optimum production within or below projected costs. Reporting to me are the Office Manager/Accountant, three Secretaries, the Quality Control Supervisor, and the General Plant Supervisor with his two Process Supervisors and combined crews of 75 processors.

Daily procedures include raw product scheduling via Single Side Band radio with a fleet of 10 shrimp and 7 crab vessels, production inspections, various office procedures, and public relations. Currently, I am compiling budget proposals and cost estimates for the next fiscal year.

1966-1975 Van Fleet Roofing, San Luis Obispo, California.
I worked with my father in the roofing business and purchased the company from him in 1972. I operated the company while attending college, thus enabling me to pay all my college expenses. I was a Roofing Contractor responsible for locating and bidding jobs, supervising and working with my crew in the roof application, billing, and collecting.

1972-1973 Capen-Van Fleet Commercial Fishing, San Luis Obispo, California. In November 1972, I, along with my partner, purchased a 35 ft. commercial fishing boat. After overhauling the vessel, it was used for salmon trolling and cod fishing out of Morro Bay, Calif.

1970-1972 Bekins Van Line.
I was a relief driver for trancontinental drivers during the summer months.

ADDITIONAL SKILLS AND EXPERIENCES:

1959-1970 Agriculture related experiences--Creston, California. From ages 8-18 I resided on a small ranch with my parents and two younger brothers. During this time I acquired many skills including:

Animal Husbandry--owned and operated cow/calf operation

Dry land farming	General Carpentry
Gardening	Fence Building
Pest Control	Chain saw operation
Controlled burning	Cement finishing

1966 Travel-Mexico
I lived in central Mexico, near Guadalaraja, for 3 months and attended daily Spanish lessons.

1975-1977 Additional Skills-Alaska Packers Assn., Chignik, Alaska. I gained skills in welding all types of metals, grinder overhaul, and conveyor fabrication while working with the maintenance crew during off seasons. While in Chignik, I was responsible for maintaining the refrigeration compressors and diesel generators in the engineer's absence.

Education:

Yakima High School, Yakima, Washington
Yakima Valley Junior College
University of Washington
Member, Alaska Bar

Employment:

9/61 to date	U.S. Department of the Interior	
	Regional Coordinator of Interior's ten bureaus in Alaska (office now entitled Secretary's Special Assistant in Alaska).	1/
	Assigned Washington, D. C., August, 1969. There served as Chief, Alaska Pipeline Staff, (BLM) on detail to Department. IGPA detail to State 8/77.	2/
12/58 - 9/61	Executive Assistant to Governor William A. Egan	3/
4/53 - 12/58	Private practice of law including engagements with POL pipeline contractors (Haines-Fairbanks) and as executive vice president D. J. Belcher & Associates, Ithaca, New York	4/
1/55 - 1/59	Member, Alaska Legislature (House) Majority Leader Chairman, Rules Committee, Member, Ways & Means Committee Member, Interim Legislative Council	
11/55-2/56	Delegate, Alaska Constitutional Convention Chairman, Rules Committee Secretary, Natural Resources Committee	5/
12/47 - 4/53	Administrative Assistant to Governor Ernest Gruening	
	Secretary of Alaska (Presidential appointment)	6/
4/46 - 12/47	Attorney General's Office, Territory of Alaska; Director, Alaska Office of Vocational Rehabilitation; Lands Consultant, Alaska Development Board.	7/

1/42 - 4/46	Army of the United States - Alaska, Pacific, U. S.
1/39 - 1/42	U. S. Department of Justice U. S. Attorney's Office, Fairbanks, Alaska
Other:	Placer mining Timber Cruising Fairbanks City Assessor
Publications:	"Vocational Rehabilitation in Alaska" (1947).
	"Federal Land Policy - Its Effect on Development and Settlement of Alaska (1947)
	"Alaska" - Colliers' Yearbook (various years)
	"Native Alaska's Needs" - Alaska Methodist University series (1966).
	"Momentum for the Claims Issue" - 5/27/68 ANCHORAGE DAILY NEWS
	"The National Interest - and the Department of the Interior - in Alaska" (1969) (with technical assistance).
	"Land - Bridge to Community", a paper delivered before the Alaska Humanities Forum, University of Alaska, November 1974.
	Numerous executive messages, committee reports, position papers and statements for use before Legislative and Congressional committees.
	Legislative drafting including:
	1953 amendment to 48 USC 353 to permit the mineral leasing of Alaska school sections under provisions of the Mineral Leasing Act.
	1953 bill which created the Territorial Department of Lands, forerunner of Alaska Department of Natural Resources.
	Chapter 9, Session Laws of Alaska 1957 which provided for condemnation for oil and gas pipelines and related facilities.
	Proposed concept and format for "Federal Withdrawal and Reservation Atlas of Alaska" and accompanying 147-page key; published 1958.

Contributor to:

Alaska Native Affairs (1962) a report to the Secretary of Interior

Westward Alaska (1965)

Report to President's Review Committee (1965)

Alaska Natives and the Land (1968)

Transportation and Economic Development in Alaska (1968)

(The last four above were publications of the Federal Field Committee for Development Planning in Alaska created by E.O. 11182).

Land Resource Development in the Developing Countries (1971).

Assigned primary responsibility by Under Secretary (USDI) for preparation of Vol. 5 (Alternatives), Final Environmental Impact Statement, Proposed Trans-Alaska Pipeline. While a contributor to text, primary function was to enlist competent assistance in a host of disciplines, organize the effort and oversee performance and scheduling to completion. Role resembled that earlier occupied with respect to preparation of the three volume Rampart Project Field Report, although was performed in a far more rigorous time frame.

Awards:

Distinguished Service Award, Department of the Interior, 1968.

Secretarial Commendation for "outstanding services in support of the development of the Alaska Oil Pipeline Program," 1974.

Footnotes (Representative activities):

1/ Coordinated preparation of Interior's field report on proposed Rampart Dam Project compiled under leadership of Bureau of Reclamation. Reference: Henry P. Caulfield, Jr., Colorado State University, Fort Collins, Colorado.

Formed first interagency environmental group in government to develop working relationships with North Slope oil industry. Group was formed for better meeting Interior's responsibilities on North Slope and was nucleus of that later charged with field responsibility for developing pipeline standards and stipulations.

Member, Federal Field Committee for Development Planning in Alaska representing ten Interior bureaus (1964-69). Earlier, had drafted joint letter to the President from Alaska's Governor and Congressional delegation proposing executive creation of such Committee. Examples of policy fields treated: Native Land Claims, Resource Development, Power, Transport, Socio/Economic/Ethnic relationships.

Following 1964 Alaska earthquake chaired field extension of the "Anderson Commission", the Presidentially appointed Washington based interdepartmental group charged with earthquake reconstruction. Reference: Dwight Ink, College of Public Affairs, American University, Washington, D. C.

Twice represented U. S. in negotiating international highways matters in Ottawa. Reference: Canadian Desk, U. S. Department of State.

Advisor to Secretary's Alaska Native Task Force (1962); advisor to Governor's Pribilof Commission (1965); member of Advisory Committee, Federal Power Commission's "Alaska Power Survey" (1966-68).

2/ Assigned responsibility 1971 for preparation Alternatives section, Vol. 5, Final Environmental Impact Statement, Trans-Alaska Pipeline, (an engagement subsequently shared widely).

3/ Policy, legislative and administrative assistance to first elected Governor of Alaska during transition to Statehood (1958-1961). Under Executive Succession Act by designation of Governor, with Legislative confirmation, named first in non-elective succession.

4/ Pipeline engagement featured government and labor relations. Assignment with D. J. Belcher & Associates (an engineering/ natural resources/photogrammetry firm) arose from its planned expansion into Alaska and Yukon Territory to conduct a comprehensive natural resource inventory.

5/ Only lawyer on Committee and key draftsman of Article VIII - Natural Resources.

6/ As acting Governor led Territorial participation in negotiations leading to settlement of last major West Coast maritime strike affecting Alaska between years 1952-1971.

7/ Successive engagements immediately following separation from military service. Inaugurated vocational rehabilitation for the handicapped in Alaska under appointment of Alaska Board of Education.

I lived in central Mexico, near Guadalaraja, for 3 months and attended daily Spanish lessons.

1975-1977 Additional Skills-Alaska Packers Assn., Chignik, Alaska. I gained skills in welding all types of metals, grinder overhaul, and conveyor fabrication while working with the maintenance crew during off seasons. While in Chignik, I was responsible for maintaining the refrigeration compressors and diesel generators in the engineer's absence.

*Mr. Marvin Taylor, Skagway, term expiring 06-01-83
Mr. David George, Juneau, term expiring 06-01-80
*Mr. Jack Maroni, Ketchikan, term expiring 06-01-83

*Reappointed

We have scheduled a hearing to consider several of these appointments on April 10, but have already received responses from two of the individuals saying they are unable to attend. Before trying to schedule another time, I want to establish whether it is necessary to request attendance by all or any of these appointees. If you have strong feelings about any of these individuals, and believe it is necessary or desireable to require their presence, please let me know by April 2. I will request resume's for our consideration from those individuals the committee does not express desire to interview in person. Resume's sent by the 2 who are unable to attend on April 10th are attached for your consideration.

CO CHAIRMEN
REP. ALVIN OSTERBACK (465-3715) • REP. BILL MILES (465-3779)
VICE CHAIRMAN
REP. FRED ZHAROFF
REP. PAT CARNEY • REP. C.V. "CHAT" CHATTERTON • REP. SAM COTTEN

The Honorable Alvin Osterback, Chairman
House Resources Committee
House of Representatives
Pouch V
Juneau, Alaska 99811

Dear Representative Osterback:

A conflict in schedule prevents me from attending my reappointment hearing to the Alaska King Crab Marketing and Quality Control Board being held by your committee in Juneau on April 10.

I will be in Anchorage attending the Alaska King Crab Marketing and Quality Control Board Meeting scheduled April 8 through April 10 and also the "Tell It Like It Is" Meeting April 11 and 12.

Enclosed is a brief resume' requested for use by the committee.

Please let me know if I can be of further assistance to your committee.

Sincerely,

Charles R. Knapp

Charles R. Knapp

Married
Homeowner, Kodiak, Alaska
Honorable Discharge, U.S. Navy 12-14-48.

March 21, 1980

Alaska House of Representatives
Committee of Natural Resources
Pouch V
Juneau, Alaska 9811

Gentlemen:

I am in receipt of your letter dated March 18, 1980 requesting my presence at a hearing scheduled for April 10 to answer questions and to present my views and background with regards to my recent appointment as a member to the Alaska Board of Fisheries. I sincerely regret to inform you that I will be unable to attend the hearing at the time scheduled as I will be engaged in very important business that affects my future to a large degree. I will be in town again April 18-20. I plan to participate in the Herring Fishery at Togiak which will commence about May 1, so that does not give either of us much time to schedule another hearing if you desire to do so. I did, however, participate in the full hearings of the Board of Fisheries during Dec. 79 and Jan. 80 and my voting record is a matter of public record. I do want to emphasize though, my thoughts regarding any action I may take, and that is Prudent & Intelligent management of the resource first and foremost.

Senator Bill Sumner requested a resume from me in February which I sent to him. As I did not keep a copy of it, perhaps you could request a copy from him and if that will suffice, Great.

Again, I am deeply regret not being able to meet with your committee at this time. However I am

Respectfully Yours,

Griffin Quinton

Griffin Quinton
1514 Primrose Street
Anchorage, Alaska 99504

February 29,1980

Bill Sumner
Alaska State Senator
Juneau, Alaska

Dear Senator,

In answer to your February 20th letter requesting a resume regarding my gubernatorial appointment to the Alaska Board of Fish, I submit the following.

I was born in Anchorage, Alaska May 18, 1924 and have been a lifelong resident of the Territory and State. I am married (32) years) and have three children.

My primary interests are; Commercial Fish (20) years experience from which I derive a major portion of my income, Sports Fish; my major form of recreation, also hunting and skiing both downhill and crosscountry. I am also interested in placer gold mining and have several properties which I am developing.

In 1942 I went to Rainy Pass and with Bud Branham built Ra[illegible] Pass Lodge which is still in operation. I however severed all interests in it in 1947 due to operations and policy differences. Iam a veteran (1943-1945) and was a bomber pilot with the 8th Air Force in Europe. I was employed by the Department of Army at Fort Richardson from 1952 until I retired in 1975. During that time I was General Foreman of the Roads, Grounds and Land Management Branch of the Facilities Engineer. One of my responsiblities was Fort Richardson wild-life management and planning and operational management of the Fort Richardson Fish hatchery until its transfer to the State of Alaska in 1974. During the winter 1975-1976 I worked on the Trans-Alaska Pipeline as a lowboy driver. In January 1977 I was employed by the State of Alaska as Chief of Airport operations. When the Department of Public Works merged with the Department of Highways to become the Department of Transportation I became Maintenance and Operations Manager for the Central Division. I resigned in February 1978 due to a salary dispute. From May 1978 through November 1978 I was employed by Taylor Enterprises, a pipeline construction company as Superintendent of construction.

Hoping this resume will provide the information you request, I am

Respectfully Yours,

Griffin E. Quinton
1514 Primrose Street
Anchorage,Alaska

Resume', March, 1979

4-22-25 - Born Petaluma, California. Father taught agriculture in high school.

1950 to date - Resident of Alaska: resident of Homer since 1955.

1943-45 - USNR, served as sonar operator on a destroyer escort in the Central Pacific. Saw 30 months of active duty.

1947 - Summer, Fishery Patrol Agent, U.S. Fish and Wildlife Service, at Chignik, Alaska. Four months employment.

1948 - Awarded a Bachelor of Science degree in Fish and Game Management by Oregon State College, Corvallis.

1950 - Awarded a Master of Science degree in Wildlife Conservation by the University of Maine, Orono.

1950-54 - Head, Department of Wildlife Management, University of Alaska, and Assistant Leader, Alaska Cooperative Wildlife Research Unit, College.

1954-1959 - Free-lance outdoors writer-photographer and registered big game guide. Guided in the Brooks Range, on the Alaska Peninsula, on the Kenai Peninsula. Helped to organize,and served as a member on, the Homer-Seldovia Advisory Committee to the Territorial Board of Fisheries

1959-1969 - Fisheries biologist, Alaska Dept. Fish and Game, including 9 years as Area Biologist in charge of the Cook Inlet commercial fishery.

1970 to date - Outdoors Editor, ALASKA magazine.

1970, and 1973 to date - Member, Alaska Board of Fish and Game and Member, Alaska Board of Game, appointed by Governors Miller, Egan, Hammond.

1976-77 - Member, National Advisory Committee on Oceans and Atmosphere, appointed by President Gerald Ford.

1976 to date - Alaska Field Editor, OUTDOOR LIFE magazine.

In addition I have commercial fished for salmon in Cook Inlet with my own boat, seining and gillnetting (1970-77); worked as a section hand on the Alaska Railroad (1950); as a carpenter, a construction laborer; and as a clerk in a trading post (1955-58); and I hunted seals for their hides and the $3 bounty (1957-58).

I am married to the former Audrey Roberts, who was born in Dillingham, Alaska. We have in the past 13 years raised three adopted Native children. I have five children by a former marriage, of which three live in Alaska - Mary Bookman, Anchorage; Michael Rearden, Kodiak; and Nancy Kleine, Perryville.

Name: Gordon Jensen

Position: Nominee for membership on Alaska State Board of Fisheries

Address: Box 264
Petersburg, Alaska 99833
Telephone: 772-4705

Occupation: Commercial fisherman since 1937

Previous Experience on State and National Boards, etc.:

First appointed in 1961 to the Alaska State Board of Fish and Game. Have served continuously since then. Elected Chairman of the Board three times. Currently Vice-Chairman of the Board of Fisheries. When the Board of Fisheries and Board of Game meets in joint session, serve as Chairman of that group.

Have been an Advisor to the American Section of the International Pacific Fisheries Commission since the early sixties.

Member of the North Pacific Fisheries Management Council since 1977.

Member of the Petersburg Vessel Owners Association.

Resume for HOUSE RESOURCES COMMITTEE of EMIL NORTON for appointment to the ALASKA KING CRAB MARKETING and QUALITY CONTROL BOARD

Name.....Emil Norton

Date of birth.....November 16, 1922

Ethnic origin..... Native of Kodiak

Marital status.....Married to Frieda R. Lorenson for 26 years. Four Children, Cathy a schoolteacher, Felecia a college student in second year, Emil R. II a college student first year, and Vicki a sophomore in high school.

Occupation.....Started work for Kadiak Fisheries Company in 1937. In 1949 was appointed to Cannery Foreman. In 1958 started crab (king) operations for same company. Have been superintendent of the Kodiak plant since then. In 1968 COLUMBIA-WARDS FISHERIES purchased all of Kadiak Fisheries Company holdings in Alaska. I have been with CWF since that date. I have been assooiated with king crab since 1941 when Island SeaFoods a local plant started to experiment with canning this product. I helped Pete DeVeau with the mechanical part of his operations.

When the King Crab Board was first conceived there were 3 of us from Kodiak appointed. I declined to the other two so another person from another area could participate. In 1962 I was appointed again and I have been a part of this board since then. I have been a part of the technical committee since 1960 forming the rules and regulations for all the king crab operators to process by.

I have been active in Community affairs in Kodiak for many years. Serving on various committees and boards and organizations with a good record of attendance. Also have military service of two years.

After over 40 years in the fishing industry with salmon, halibut, king and tanner crab being the most important species I've been associated with I just can't list all the qualificationsI might possess.

CHAIRMAN'S LETTER OF INTENT

The Honorable Hugh Malone, Speaker
House of Representatives

Dear Mr. Speaker:

The House Resources Committee held confirmation hearings on the appointment of Ronald Skoog to the position of Commissioner of the Department of Fish and Game today. I have indicated that I support the appointment of Mr. Skoog. My support is based on his assurances to the committee that he intends to travel extensively in rural Alaska to meet with the Advisory Boards of Fisheries and Game to be informed of local problems. I believe that this local contact between citizens of the state and the Commissioner of Fish and Game is extremely important.

Sincerely,

Alvin Osterback, Chairman

Dear Mr. Maroni:

The Speaker of the House of Representatives has referred your reappointment to the Board of Marine Pilots to the House Resources Committee for consideration. We have scheduled a hearing to consider your confirmation on Thursday, April 10, at 3:00 p.m. in room 118 in the Capitol building in Juneau. We request that you attend that meeting to answer any questions that the committee has and to present your views and background. Please bring with you a brief resume' for the committee to review.

It is important for the committee to have a chance to meet and talk with you but, if it is impossible for you to attend, please send a resume' before the meeting date. The committee will consider it to see if that would be sufficient to take action on your appointment.

Please let us know soon if you will be able to attend the hearing.

983-2500

Dear Mr. Taylor:

The Speaker of the House of Representatives has referred your reappointment to the Board of Marine Pilots to the House Resources Committee for consideration. We have scheduled a hearing to consider your confirmation on Thursday, April 10, at 3:00 p.m. in room 118 in the Capitol building in Juneau. We request that you attend that meeting to answer any questions that the committee has and to present your views and background. Please bring with you a brief resume' for the committee to review.

It is important for the committee to have a chance to meet and talk with you but, if it is impossible for you to attend, please send a resume' before the meeting date. The committee will consider it to see if that would be sufficient to take action on your appointment.

Please let us know soon if you will be able to attend the hearing.

Sincerely,

Alvin Osterback

STATE OF ALASKA

JAY S. HAMMOND, GOVERNOR

BOARD OF FISHERIES/BOARD OF GAME
DEPARTMENT OF FISH AND GAME

SUBPORT BUILDING
JUNEAU, ALASKA 99801

April 11, 1980

House Resources Committee
Alaska State Legislature
Pouch V
Juneau, Alaska 99811

Gentlemen:

During my confirmation hearing before the Committee yesterday, one of the questions asked of me was the adequacy of our support staff, to which I answered that it was doing an excellent job as far as I was concerned. I, however, neglected to address one very important support activity we look to in Board deliberations.

The local Advisory Committee and Regional Council participation is becoming increasingly important to our hearings--there is nothing like on-site information. I believe that more interfacing between Advisory Committees and Regional Councils throughout the year on issues of mutual interest and their decisions conveyed to the Boards of Fisheries and Game at the public hearings conducted by the Boards is vital in the decision-making process. These activities, however, require adequate funding for travel and per diem to promote and ensure those meetings.

I wish I had remembered to address this matter eyeball to eyeball. I didn't, so am writing this letter to express my concern in the matter.

Sincerely,

Griffin E. Quinton
Alaska Board of Fisheries

COMMITTEE ON NATURAL RESOURCES
POUCH V • JUNEAU, ALASKA 99811

TO: The Honorable Governor Hammond
Alaska State Governor

DATE: May 15, 1980

FROM: Alvin Osterback
Chairman
Hou e Resources

SUBJECT: Illegal Boards

Our records reflect that the following names have not come down and must be confirmed:

Game Board	Fish Board
Clint Buchmaster	Chris Goll
Joel Bennett	Jim Huntington
Darrell Farmen	

It has come to my attention that the following Guide Board members have been serving illegally for a year:

Charles Keim - ends 6/15/79
Norman Sutliff - ends 6/15/79
William Stoecker - ends 6/15/79

It is my contention that actions of this board has been illegal since last June. Since the above three individuals have been serving without confirmation for one year.

The following name of Marcus F. Jensen, Chairman, Guide Board ends June 15, 1980. That name should have been sent down to this legislative session as well as Glenn Glenzer. I also contest that these two Board members cannot legally serve after June 15, 1980 unless confirmed by this Eleventh Legislative Session.

Your prompt action in this regard is requested.

April 30, 1980

Jay S. Hammond
Governor of Alaska
Office of the Governor
Pouch A
Juneau, AK. 99811

Dear Governor Hammond:

I am concerned that this session may adjourn very soon and I do not have the list of names to be confirmed by the Boards of Fish and Game, namely seven.

My staff informed your office last week and Mr. Waldrop very rudely informed us you were in the process of getting the names down to the Resources Committee.

I am concerned that Sec. 39.05.080 be followed as legally no one can serve on any Board or Commission without the approval of the Legislature.

Those names are:

Game Board	Fish Board
Sam Harbo	Nick Szabo
Clint Buchmaster	Chris Goll
Joel Bennett	Jim Huntington
Darrell Farmen	

Your concern is appreciated. Please see letter attached from our legal counsel Billy Berrier.

Thank you.

LEGISLATIVE AFFAIRS AGENCY

MEMORANDUM April 29, 1980

SUBJECT: Confirmation requirements

TO: Representative Alvin Osterback

FROM: Billy G. Berrier
Director
Division of Legal Services

You have asked whether the governor is required this session to submit to the legislature for confirmation names of appointees to vacancies which require confirmation if the vacancy occurs July 1, 1980 or before.

AS 39.05.080(1)(C) explicitly requires this submission providing:

> Sec. 39.05.080. PROCEDURE FOR ALL APPOINTMENTS. Appointments shall be made in the following manner:
>
> (1) The appointing authority shall, within 30 days of the convening of the legislature in regular session, present to the legislature for confirmation the names of the following persons: (A) persons appointed to a position or membership who have not previously been confirmed by the legislature or either house of it; (B) persons appointed by him subject to confirmation to fill an existing position or membership vacancy; (C) persons to be appointed subject to confirmation to fill a position or membership the term of which shall expire before July 2, following the session of the legislature. If an appointment is made after the deadline but while the legislature is in session, the appointing authority shall, within five calendar days after the appointment is made, present to the legislature for confirmation the name of the person appointed. The deadline may be extended by the legislature by the approval of a concurrent resolution.

This is within the purpose of the statute setting out confirmation procedure. AS 39.05.070 provides:

> Sec. 39.05.070. PURPOSE. It is the purpose of §§ 70 - 110 of this chapter to provide procedural uniformity in the exercise of appointive powers conferred by the legislature to eliminate, insofar as possible, recess or interim appointments except in the event of death, resignation, inability to act or other removal from office and the exercise, insofar as possible, of appointive powers only when the legislature is in session.

The confirmation power is part of the appointing power of the executive and is limited to the power expressly granted to the legislature (Bradner v. Hammond, 553 P.2d 1 (Alaska 1976)). The confirmation process is not prescribed or referred to in the constitution and an orderly process to carry out constitutional mandates is allowable even though the substantive power is circumscribed.

In my opinion, the confirmation requirement in (C) is procedural. It does not affect the scope of the confirmation power since all persons who fall under it are otherwise required to be confirmed.

In my opinion the submission is required.

Questions:

Sec. 37.12.090 requires annual report to legislature — is that available?

Sec. 37.12.100 Annual audit
Is that available?

Why aren't Commissioners here when were asked well in advance and they told Chairman Osterback at 5:00 yesterday afternoon that 2 of the Commissioners would be here for this meeting??

Sec. 37.12.120 Requires Public access to information. How is that requirement met?

consultation with the Department of Fish and Game, shall determine which communities are economically impacted fishing communities.

(b) If the economic disaster is due to a fisheries failure based on consideration of need, the legislature may appropriate to the Alaska economic disaster impact fund from the renewable resource fund (ch. 130, SLA 1974). If there is an insufficient balance in the renewable resource fund to meet emergency needs that may be determined under the provisions of AS 44.33.285, the legislature may appropriate from the general fund. The Alaska economic disaster impact fund balance may not exceed $5,000,000. The commissioner of revenue, after determining that there is in the Alaska economic disaster impact fund a surplus above an amount sufficient to meet anticipated demands, may invest the surplus as provided in ch. 10 of this title. Interest derived from investment of these surplus funds shall be deposited to the renewable resource fund. If the economic disaster is due to other than a fisheries failure, the legislature may appropriate from the general fund to the Alaska economic disaster fund to meet emergency needs.

(c) Unappropriated or otherwise unencumbered balances remaining in the Alaska economic disaster impact fund at the close of each fiscal year shall not lapse as provided in AS 37.25.010 but shall be available in perpetuity for fund purposes.

(d) Within the first 10 days of each legislative session the commissioner of commerce and economic development shall submit to the legislature a detailed report of all expenditures from the fund and all actions taken under AS 44.33.285. (§ 9 ch 277 SLA 1976)

Cross references. — As to the Alaska Renewable Resources Investment Fund, see AS 37.11.050 et seq. As to termination of the Alaska Renewable Resources Corporation, see AS 44.66.010.

Editor's note. — Section 1, ch. 179, SLA 1978, provides: DECLARATION OF POLICY. It is the policy of the state to

"(1) rehabilitate, enhance, and develop its renewable resources and, insofar as is consistent with sound resource management policies, develop its human resources by providing maximum opportunities for employment and a higher standard of living for its citizens; and

"(2) utilize the funds set aside under ch. 11 of this title to further the (A) development of renewable resources that will contribute to a stable self-sustaining state economy, employment opportunities, and lifestyle alternatives for its citizens, and (B) commercial, traditional, and common uses of the state's renewable resources."

Section 2, ch. 179, SLA 1978, provides: FINDINGS. (a) The legislature finds that Alaska has renewable resources that are not being utilized to their full potential. Many problems which confront the state, including high unemployment and unstable economy, could be mitigated by the expanded use and development of its renewable resources.

"(b) It is further found that Alaska's economy has historically depended upon sporadic and non-stable development.

"(c) It is further found that several key factors have contributed to the slow development of renewable resource industries, including,

"(1) insufficiency of research and development financing and venture capital financing;

"(2) a lack of knowledge within the business and financial communities about conditions affecting renewable resource industrial development in the state and a lack of scientific information concerning many resources; and

"(3) a lack of technology appropriate to Alaska.

"(d) It is further found that the state's policy of assisting the development of viable industries is best accomplished by providing assistance to the private sector to identify and demonstrate new products, markets, and technologies."

Legislative history report. — For report on ch. 179, SLA 1978 (HB 682), see 1978 House Journal, p. 830.

Sec. 37.12.010. Alaska Renewable Resources Corporation created. There is created the Alaska Renewable Resources Corporation to carry out the purposes of this chapter. The corporation is a public corporation of the state and an instrumentality of the state within the Department of Revenue, but has a legal existence independent of and separate from the state. The exercise by the corporation of the powers conferred by this chapter is considered an essential function of the state. (§ 3 ch 179 SLA 1978)

Sec. 37.12.015. Purposes. The purposes of the corporation are to

(1) facilitate the rehabilitation, enhancement, and development of the state's renewable resources so as to strengthen the self-sustaining sectors of the state economy;

(2) sponsor research and development of technologies and innovations for the rehabilitation and enhancement of the state's renewable resources to achieve an appropriate use of the resources;

(3) identify new products, markets, and technologies for renewable resource industries in the state which will constitute an appropriate use of the resources; stimulate the research and development of these products, markets, and technologies; assist in the demonstration of their technical and economic feasibility; and assist in their introduction into commercial markets. (§ 3 ch 179 SLA 1978)

Sec. 37.12.020. Allocation. (a) There shall be allocated to the corporation from the receipts described in AS 37.11.020 five per cent of the total receipts paid the state from mineral lease bonuses and rentals for state land and royalties derived from minerals produced on state land. Payments of the amount allocated by this section shall be made to the corporation by the Department of Revenue on a monthly basis.

(b) Fifty per cent of all actual receipts of the corporation, from whatever source except receipts from the corporation's investments, shall be deposited into the renewable resources investment fund (AS 37.11.050). (§ 3 ch 179 SLA 1978)

Sec. 37.12.025. Board of trustees. A board of trustees of the corporation is established as its governing body. (§ 3 ch 179 SLA 1978)

Sec. 37.12.030. Composition of the board of trustees. The board of trustees consists of three members appointed by the governor and confirmed by a majority of the members of the legislature in joint session. The board shall annually elect a chairman from among its members. A chairman may not succeed himself. (§ 3 ch 179 SLA 1978)

Sec. 37.12.035. Term of office. The members of the board of trustees shall be appointed for terms of four years, and they may be reappointed. Terms shall be staggered. The initial terms shall be one member serving for two years, one member serving for three years, and one member serving for four years. (§ 3 ch 179 SLA 1978)

Sec. 37.12.040. Removal and vacancies. (a) The governor may remove a board member from office by and with the consent of a majority of the members of the legislature in joint session. A removal by the governor shall be in writing and state the reason for removal. If the legislature is not in session, the governor may suspend a member of the board. Upon suspension, a board member may not participate in board business and may not be counted for the purpose of establishing a quorum. A suspended member shall continue to receive his salary as a board member until the legislature in joint session consents to his removal. The joint session shall be held within 30 days from the date of removal if the removal occurs while the legislature is in session or within 30 days of convening of the legislature if the legislature is not in session. If the legislature refuses to consent to his removal, the board member shall be reinstated to his position.

(b) A vacancy on the board shall be promptly filled by appointment by the governor and confirmation by a majority of members of the legislature in joint session. An appointee to fill a vacancy shall hold office for the balance of the term for which his predecessor on the board was appointed. If a vacancy arises on the board while the legislature is not in session, the governor may appoint an interim board member until such time as the legislature in joint session fails to confirm the interim member's appointment.

(c) A vacancy on the board does not impair the authority of a quorum of the board to exercise all the powers and perform all the duties of the board. (§ 3 ch 179 SLA 1978)

Sec. 37.12.045. Qualifications of board members. (a) No person may be appointed to the board who has not been a resident of the state for at least three years.

(b) No member of the board may hold any other state or federal office, position, or employment, whether elective or appointive, except as a member of the armed forces of the United States or the state. (§ 3 ch 179 SLA 1978)

Sec. 37.12.050. Quorum. Two members of the board constitute a quorum for the transaction of business and the exercise of the powers and duties of the board. (§ 3 ch 179 SLA 1978)

Sec. 37.12.055. Compensation of board members. Board members are in the exempt service under AS 39.25 and receive an annual salary within Range 30 of the salary schedule for state employees established by AS 39.27.011. (§ 3 ch 179 SLA 1978)

Sec. 37.12.060. Employment of personnel. The board may employ and determine the salary of an executive director. The executive director may, with the approval of the board, select and employ additional staff as necessary. The executive director and all employees of the board are in the exempt service under AS 39.25. (§ 3 ch 179 SLA 1978)

Sec. 37.12.065. Conflicts of interest. (a) Members of the board of trustees are subject to the provisions of AS 39.50.

(b) No member or employee of the board may acquire an interest, direct or indirect, in a corporation, company, association, or project owned, controlled, or invested in by the corporation. If a member or employee owns or controls such an interest, he shall immediately disclose the interest in writing to the board and refrain from participating in any manner in any activity relating to that interest. (§ 3 ch 179 SLA 1978)

Sec. 37.12.070. Powers. In carrying out the corporate powers of the corporation, the board may

(1) adopt, alter, and use a corporate seal;

(2) prescribe, adopt, amend, and repeal bylaws;

(3) sue and be sued in the name of the corporation;

(4) enter into any agreements necessary to the exercise of its powers and functions;

(5) accept grants from and contract with the federal government and the state or its political subdivisions and to that end comply with the provisions of federal, state, or local programs where necessary, except that it may not enter into any agreements whereby any permanent state

or local government position is funded or partially funded in connection with a project;

(6) accept grants and loans from other sources than those in (5) of this section to be held and used for the purposes of the corporation;

(7) appear in behalf of the corporation before boards, commissions, departments, or other agencies of municipal, state, or federal government;

(8) acquire, hold, use, lease, sell, or otherwise dispose of property of any kind, real, personal, or mixed, or any interest in it;

(9) hold, as a means of securing the providing of financial assistance, patents, copyrights, trademarks, royalties, or any other evidences of protection or exclusivity issued under the laws of the United States or any state or nation;

(10) prepare, publish, and distribute technical studies, reports, bulletins and other materials it considers appropriate;

(11) invest, in such form as it considers appropriate, in projects which are economically viable and income-producing;

(12) provide grants for projects having broad public application which do not have direct income-producing potential;

(13) adopt regulations governing the exercise of its corporate powers;

(14) deposit funds, or invest surplus funds through the treasury division of the Department of Revenue which may invest in any investments authorized in AS 39.35.110 so long as its investment policy is consistent with the prudent-man rule;

(15) do all acts and things necessary or desirable to carry out the purposes of the corporation. (§ 3 ch 179 SLA 1978)

Sec. 37.12.075. Duties. In carrying out the purposes of this chapter, the board shall

(1) seek to maintain the productivity of healthy renewable resources and expand the productivity of depleted or underutilized renewable resources;

(2) provide financial assistance for projects which the board finds will accomplish the purposes of the corporation as set out in § 15 of this chapter;

(3) promote the utilization of the state's renewable resources in the state and the development of import substitution and export markets;

(4) annually prepare long-range operating and financial plans and the budget for the forthcoming year;

(5) monitor approved projects for compliance with this chapter and provide operational and performance evaluations (post-audits) of projects receiving financial assistance and an overall assessment, expressed in qualitative and quantitative terms, of the degree to which the purposes of the corporation, as set out in § 15 of this chapter, have been achieved; and

(6) attempt to fund activities which will tend to maximize returns to the state and local governments and its citizens in such forms as tax revenues and resident employment and income. (§ 3 ch 179 SLA 1978)

Sec. 37.12.080. Financial assistance. (a) In providing financial assistance, the board shall

(1) consider the proposals of qualified applicants only after the applicant has submitted a detailed proposal in the form prescribed by the board; no assistance may be approved by the board unless it finds, in writing, that

(A) the proposed project, if successful, will further the purposes of the corporation as set out in § 15 of this chapter;

(B) the application contains an adequate plan for project implementation, including, when applicable, a complete business, financial and marketing plan for commercial activities;

(C) sufficient capital is not available from other sources on reasonable terms;

(D) the applicant has agreed that if new renewable resource industrial activity results from the proposed project, his best efforts will be employed to keep that activity in the state for a minimum period of time specified by the board;

(E) the applicant demonstrates that sufficient technical and business expertise to accomplish the objectives of the proposed project is available;

(F) all costs, including additional governmental cost, associated with and ancillary to the project and future obligations generated by the project have been identified, including any necessary operating, maintenance, or other support costs for the life of the project;

(G) potential resource use conflicts that may result from the proposed project are identified and evaluated, and when necessary, plans to mitigate or resolve those conflicts and to preserve for the future options for the use of the state's renewable resources are included in the application;

(2) use the financial mechanism most appropriate to the conditions of the applicant and the proposed project and which will most effectively utilize the funds available; grants may be made by the board of up to 90 per cent of the total project costs for the following purposes:

(A) projects for the applied research and development of products, technologies, or innovations for the rehabilitation, enhancement, or development of the state's renewable resources;

(B) projects for the demonstration, on a one-time basis, of the economic or technical feasibility of a new product, market, or technology involving a renewable resource; or

(C) projects for the rehabilitation, enhancement, or development of a common-property resource where the benefits from the project cannot be captured by any single economic unit;

(3) in evaluating projects, consider the preferences and priorities of the residents of the region in which the project is to be located;

(4) require investments made by the corporation to be secured by means determined to be appropriate by the board.

(b) The board may not

(1) invest or otherwise provide assistance of more than five per cent of the resources of the corporation or $1,500,000, whichever is less, in a single project or applicant unless the legislature has approved the investment by concurrent resolution;

(2) invest in more than 49 per cent of the outstanding corporate stock or other corporate obligations issued by an applicant unless the legislature has approved the investment by concurrent resolution;

(3) make a loan for a period in excess of 30 years unless the legislature has approved the loan by concurrent resolution;

(4) assume the responsibility for management of any project in which it has invested and may not exercise voting rights for that purpose or for any other purpose which is within the scope of managerial control; or

(5) provide funds to any state agency unless that expenditure is included in the corporation's annual budget;

(6) allocate to grants more than 10 per cent of the annual appropriation of the corporation.

(c) Nothing in this section prevents the board from taking such action and exercising such rights as it considers necessary for the protection of its financial interests in the event of

(1) actual or threatened default on any of the board's investments;

(2) actual or threatened insolvency of a project in which the board has made an investment; or

(3) any other immediate or actual circumstance or event which jeopardizes an investment made by the board.

(d) Projects for which financial assistance is granted shall comply with all applicable provisions of law. (§ 3 ch 179 SLA 1978)

Sec. 37.12.085. Eligibility for financial assistance. The board may provide financial assistance if it finds that an applicant is qualified to receive assistance. An applicant is qualified if

(1) he has submitted a proposal to the board in accordance with § 80(a)(1) of this chapter

(2) he is a resident of the state for three years or, if the applicant is a partnership, corporation, or other association, the majority interest is beneficially owned by residents of the state and a majority of the owners are residents of the state; and

(3) his projects which have previously received financial assistance from the corporation, if any, have complied with all requirements of that assistance and have performed with sufficient success or promise to warrant further aid. (§ 3 ch 179 SLA 1978)

Sec. 37.12.090. Reports and publications. (a) The board shall prepare and distribute in non-technical language meterials describing the purposes and activities of the corporation.

(b) The board shall publish an annual report for the governor, the legislature, and the public at the time of submitting its annual budget request. Each annual report shall include financial statements and audit reports, a statement detailing the sources from which the corporation received money, a statement detailing the investments made by the corporation, a summary and evaluation of the data required by § 75(5) and (6) of this chapter, a list of public facilities required by or complementary to the corporation's investment activity, and any other information that the board of trustees believe would be of interest to the recipients of the report. (§ 3 ch 179 SLA 1978)

Sec. 37.12.095. Budget and appropriations. (a) The corporation may expend money only as appropriated by the legislature. The corporation is subject to the Executive Budget Act (AS 37.07) except as provided in (b) and (c) of this section.

(b) The budget of the corporation shall include the categories and amounts of proposed financial assistance broken down by financing mechanism and resource sector affected and all funds received by the corporation whether through allocations made by this chapter, appropriation, or otherwise. The total amount of the corporation's operating budget shall be specified separately in its budget and be appropriated from the general fund.

(c) The unexpended and unobligated portion of the appropriations, other than appropriations for operating expenses, does not lapse into the general fund at the end of a fiscal year, but remains available for appropriation as provided in this section in subsequent fiscal years. (§ 3 ch 179 SLA 1978)

Sec. 37.12.100. Annual audit. The corporation shall have its financial record audited annually by an independent outside auditor. The legislative auditor may prescribe the form and content of the financial record of the corporation and shall have access to these records at any time. (§ 3 ch 179 SLA 1978)

Sec. 37.12.105. Cooperation with other agencies. All departments, agencies, and public corporations of the state shall provide information, services and facilities to the corporation on its request. The corporation shall reimburse the department, agency, or corporation for expenses reasonably incurred on the corporation's behalf. (§ 3 ch 179 SLA 1978)

Sec. 37.12.110. Tax exemption. The corporation is exempt from all taxes and assessments in the state. All security instruments issued by the corporation, their transfer, and their income are exempt from all taxes and assessments in the state. (§ 3 ch 179 SLA 1978)

Sec. 37.12.115. Technical assistance. (a) The corporation may provide financing for pre-investment activities including feasibility studies, when, in its opinion, the proposed project is of high priority and the financing is not available from other sources on reasonable terms and conditions. Amounts so advanced may form a part of a later investment if the enterprise or project is financed by the corporation.

(b) The corporation may provide funding for technical and management advice and assistance to qualified applicants as it considers necessary in the circumstances. (§ 3 ch 179 SLA 1978)

Sec. 37.12.120. Public access to information. Information in the possession of the corporation is a public record, except that information which discloses the particulars of the business or affairs of a private enterprise or investor is confidential and is not a public record. Confidential information may be disclosed only for the purposes of an official law enforcement investigation or when its production is required in a court proceeding. These restrictions do not prohibit the publication of statistics presented in a manner that prevents the identification of reports, items, persons, or enterprises. (§ 3 ch 179 SLA 1978)

Sec. 37.12.125. Definitions. In this chapter, unless the context otherwise requires,

(1) "applicant" means a person making application to the corporation for financial assistance;

(2) "board" means the Board of Trustees of the Alaska Renewable Resources Corporation;

(3) "corporation" means the Alaska Renewable Resources Corporation;

(4) "project" means products, markets, innovation, or technological developments for the rehabilitation, enhancement, or development of renewable resources and includes applied research for those products, markets, or technological developments;

(5) "rehabilitation, enhancement, and development" means any activity or program which improves the health and well-being of a renewable resource or renewable resource population leading to an increase in the quality or productivity of the resource and to an increase in the benefits derived from the resource to the citizens of the state;

(6) "renewable resource" means non-human living organisms; natural components of the environment, including the air, land, and water; and energy systems which are naturally recurring or replenished. (§ 3 ch 179 SLA 1978)

Chapter 14. Trust Funds.

Article

1. Mental Health Fund (§§ 37.14.010 — 37.14.050)
2. University Fund (§§ 37.14.060 — 37.14.100)
3. Public School Fund (§§ 37.14.110 — 37.14.150)
4. Custody and Investment of Trust Funds (§§ 37.14.160 — 37.14.170)

(3) should the Legislative Budget and Audit Committee recommend within the 45-day period that the state not initiate the additional activity, the governor shall again review the revised program and if he determines to authorize the expenditure, he shall provide the Legislative Budget and Audit Committee with a statement of his reasons before commencement of expenditures under the revised program.
(am §§ 4, 5 ch 60 SLA 1979)

Effect of amendments.
The 1979 amendment, effective May 19, 1979, substituted "an act making the transfers between appropriations" for "(h) of this section" at the end of the second sentence of subsection (e) and rewrote subsection (h).

As the rest of the section was not affected by the amendment, it is not set out.

Chapter 12. Alaska Renewable Resources Corporation.

Section
70. Powers

Sec. 37.12.070. Powers. In carrying out the corporate powers of the corporation, the board may

(16) [**Terminates June 30, 1984**] provide funds to the Alaska Council on Science and Technology, to be awarded and administered in the manner prescribed by AS 44.19.181 — 44.19.189 when the funds are to be expended to accomplish a corporate purpose under AS 37.12.015.
(am § 2 ch 56 SLA 1979)

Effect of amendment. — The 1979 amendment, effective July 1, 1979, added paragraph (16).

As the rest of the section was not affected by the amendment, it is not set out.

Editor's note. — Section 1, ch. 56, SLA 1979, effective July 1, 1979, provides: "FINDINGS. The legislature finds that there is a need for development of small-scale and low-cost alternatives for Alaskans in regard to building design, food production, recycling, transportation, energy generation, waste disposal, and small-scale residential and industrial enterprise. Therefore, the legislature finds that the development and wider use of low-cost and small-scale technologies appropriate to Alaska should be encouraged."

Section 8, ch. 56, SLA 1979, effective July 1, 1979, provides for the termination of the act relating to northern technology on June 30, 1984. As part of that act, AS 37.12.070(16) will terminate on that date.

Chapter 15. State Bonding Act.

Article 3. International Airports Revenue Bonds.

Section
410. Bond authorization

Sec. 37.15.410. Bond authorization. For the purpose of providing part or all of the money to be used, with or without any grants or other money which may become available, the issuance and sale of revenue

INVESTMENTS

TEPA, Inc. Anchorage	Chemical treatment of fish waste for protein production	$550.0

Alaska House of Representatives

COMMITTEE ON NATURAL RESOURCES
POUCH V • JUNEAU, ALASKA 99811

MEMORANDUM

TO: The Honorable Terry Gardiner
Speaker of the House

DATE: May 5, 1980

FROM: Alvin Osterback, Chairman
House Resources Committee

SUBJECT: ~~"TEPPA" Files~~ in Renewable Resources

Terry please see the attached information regarding "TEPPA". I feel it is necessary to subpoena these records.

Sec. 24.25.010 (b) refers to subpoena powers. I will ask my committee to sign in favor of the subpoena.

Sufficient time has passed for Renewable Resources to get the records. I have not put out any press releases to date on this issue.

The Honorable Alvin Osterback, Chairman
House Resources Committee
Pouch V
Juneau, Alaska 99811

Dear Representative Osterback:

I have requested that the public record information in the possession of the Corporation be forwarded to Juneau. I expect the courier service to deliver the files later this morning.

I am enclosing for your information a copy of that portion of the ARRC statute regarding the confidentiality of its files relating to the particulars of an applicant's proprietry business and commercial information. This same provision is accorded all other loan application files in the possession of state agencies. The obvious rationale is identical to that of the privacy provisions for personal and business income tax returns.

Enclosed is a recent letter regarding the subject of confidentiality of ARRC's files which may be of interest to you.

To reiterate again, the trustees of ARRC would be pleased for an opportunity to meet with you or the Committee on Natural Resources to discuss any activities of interest and concern to the committee. Particularly, we would be pleased to review the circumstances leading up to and including the negotiations regarding the award of financial assistance to TEPA, Inc.

Yours truly,

Phil Hubbard

Sec. 37.12.115. TECHNICAL ASSISTANCE. (a) The corporation may provide financing for pre-investment activities including feasibility studies, when, in its opinion, the proposed project is of high priority and the financing is not available from other sources on reasonable terms and conditions. Amounts so advanced may form a part of a later investment if the enterprise or project is financed by the corporation.

(b) The corporation may provide funding for technical and management advice and assistance to qualified applicants as it considers necessary in the circumstances.

Sec. 37.12.120. PUBLIC ACCESS TO INFORMATION. Information in the possession of the corporation is a public record, except that information which discloses the particulars of the business or affairs of a private enterprise or investor is confidential and is not a public record. Confidential information may be disclosed only for the purposes of an official law enforcement investigation or when its production is required in a court proceeding. These restrictions do not prohibit the publication of statistics presented in a manner that prevents the identification of reports, items, persons, or enterprises.

Sec. 37.12.125. DEFINITIONS. In this chapter, unless the context otherwise requires,

(1) "applicant" means a person making application to the corporation for financial assistance;

(2) "board" means the board of Trustees of the Alaska Renewable Resources Corporation;

(3) "corporation" means the Alaska Renewable Resources Corporation;

(4) "project" means products, markets, innovation, or technological developments for the rehabilitation, enhancement, or development of renewable resources and includes applied research for those products, markets, or technological developments;

(5) "rehabilitation, enhancement, and development" means any activity or program which improves the health and well-being of a renewable resource or renewable resource population leading to an increase in the quality or productivity of the resource and to an increase in the benefits derived from the resource to the citizens of the state;

(6) "renewable resource" means non-human living organisms; natural components of the environment, including the air, land, and water; and energy systems which are naturally recurring or replenished.

* Sec. 4. AS 37.11.040 is amended to read:

Sec. 37.11.040. FUND BALANCES. Unappropriated or otherwise unencumbered balances remaining in the Alaska renewable resources development fund at the close of each fiscal year shall be transferred to the Alaska renewable resources investment fund.

Dear Commissioner Hubbard:

I was somewhat dismayed at your telephone call to me on April 30, 1980 at 5:00 p.m. I specifically requested the "TEPPA" file - not a meeting with you. You informed me that you could not give me a copy of the file regarding the "TEPPA" transaction.

I ask you under what authority you refuse me the file? Public funds were used in the transaction and I believe I have access to that information?

Your response is requested as I asked for the file by today, May 1, 1980.

Cordially yours,

Alvin Osterback

Re: Alaska Renewable Resources Corporation; audits by Attorney General and Legislative audit

Dear Wil:

This is to confirm the understanding we reached on Tuesday, April 8, 1980, respecting the audits of the Alaska Renewable Resources Corporation to be conducted by the Office of the Attorney General and by the Division of Legislative Audit.

There is a controversy over whether the investigative powers of those two state agencies include the right of access to the records of the Alaska Renewable Resources Corporation. The Office of the Attorney General and the Division of Legislative Audit maintain that their power to examine corporation records is without limitation. The corporation maintains that it owes a fiduciary duty to applicants to preserve the confidentiality of information which discloses the particulars of the business or affairs of a private enterprise or investor. The basis of this duty is found in the Legislature's directive to the corporation in Alaska Statute 37.12.120. The corporation maintains that it is bound to preserve the confidentiality of such information, and that it can be required to release that information only in extraordinary ~~circumstances~~, as provided by the statute. The interpretation given to that statute by the Office of the Attorney General and the Division of Legislative Audit is that, while the statute may prevent access by a member of the general public to confidential information, the corporation must nevertheless give those two state agencies access to any and all corporate files as they may request.

While there remains a dispute as to the meaning of Alaska Statute 37.12.120, the corporation has concluded that at least in the peculiar circumstances of this controversy,

compliance with the conditions set out below will enable it to meet its obligations under the statute. In reaching this agreement the corporation has placed substantial reliance on the position of the Office of the Attorney General that it and the Division of Legislative Audit have plenary power to examine the records of the corporation.

It is understood that the Office of the Attorney General is conducting an investigation of the records of the corporation for the limited purpose of examining the basis for the corporation's providing financial assistance to Tepa, Inc. The specific question to be addressed in the course of that investigation is the legality of the use by Tepa, Inc., of a portion of that financial assistance to locate, at least initially, part of its physical plant outside of the state of Alaska. All of the corporation's records relating to providing financial assistance to Tepa, Inc., will be made available to the Office of the Attorney General. It is understood that any files which disclose the particulars of the business or affairs of a private enterprise or investor, unless having some relevance to the objective of the investigation, will not be examined. A trustee or other representative of the corporation will be permitted to inspect any notes taken or copies of corporate records made in the course of the investigation before those notes or copies are removed from the corporation's offices. Finally, in view of the fact that the corporation is placing substantial reliance on the interpretation of Alaska Statute 37.12.120 made by the Office of the Attorney General, that office agrees to indemnify and hold harmless the corporation and its trustees and employees against any claims arising from the release of corporation records in connection with the investigation.

It is understood that the Division of Legislative Audit will conduct an investigation of all records of the corporation relating to providing financial assistance to applicants. The purpose of the audit is to determine if the corporation's performance in the course of providing financial assistance to applicants conforms to law and to the directives of the Legislature as found in the corporation's enabling legislation, the legislative history of that legislation and the appropriations to the corporation. All records of the corporation relating to providing financial assistance to applicants will be provided. It is understood that any files which

disclose the particulars of the business or affairs of a private enterprise or investor will not be examined where they do not relate to the object of the audit. A trustee or other representative of the corporation will be permitted to inspect any notes taken or copies of corporate records made in the course of the investigation before those notes or copies are removed from the corporation's offices. Finally, the Office of the Attorney General agrees to indemnify and hold harmless the corporation and its trustees and employees against any claims arising from the release of corporation records in connection with the investigation.

Unless I hear from you otherwise, I will assume that this letter correctly sets out the substance of our agreement.

Sincerely yours,

William T. Council

Effect of amendment. — The 1978 amendment rewrote this section.

Sec. 24.20.570. Definitions. In §§ 500 — 560 of this chapter "board" means the Legislative Board of Retirement Benefits. (§ 4 ch 121 SLA 1978)

Chapter 25. Witnesses.

Section
10. Issuance and form of subpoena
20. Service of subpoena
30. Disobeying subpoena or refusing to testify
40. Arrest for disobedience to subpoena
50. Witness fees and mileage
60. Oath and penalty for violation of oath
70. Grant of immunity on claim of privilege of self-incrimination
80. Punishment for disobedience to subpoena or refusal to testify

Sec. 24.25.010. Issuance and form of subpoena. (a) A subpoena requiring the attendance of a witness before either house of the legislature may be issued by the president or the speaker.

(b) A subpoena requiring the attendance of a witness before a standing or special committee of the legislature may be issued by the chairman of a committee when authorized to do so by a majority of the membership of the committee and with the concurrence of the president or the speaker, or with the concurrence of the house or the senate.

(c) A subpoena requiring the attendance of a witness before an interim committee established by either house of the legislature, or by both, may be issued by the chairman of a committee when authorized to do so by a majority of the membership of the committee and with the concurrence of the president or the speaker.

(d) The subpoena is sufficient if

(1) it states before whom the proceeding is held;

(2) it is addressed to the witness;

(3) it requires the attendance of the witness at a time and place certain;

(4) it is signed

(A) by the president or the speaker under (a) of this section, or

(B) by the committee chairman with the concurrence of the president or the speaker under (b) and (c) of this section.

(e) This section does not apply to the Legislative Council nor to the Legislative Budget and Audit Committee. (§ 4-4-1 ACLA 1949; am § 1 ch 94 SLA 1975)

Cross references. — For legislative council's power to issue subpoenas, see AS 24.20.060(2). For legislative budget and audit committee's power to issue subpoenas, see AS 24.20.201(a) (2).

Effect of amendment. — The 1975 amendment rewrote this section.

Testing validity or scope of command of subpoena duces tecum in proceeding before legislative committee, 130 ALR 339.

Sec. 24.25.020. Service of subpoena. A person over the age of 19 years who is competent as a witness in the state courts may serve the subpoena. His affidavit that he delivered a copy to the witness is evidence of service. (§ 4-4-2 ACLA 1949; am § 8 ch 245 SLA 1970)

Legislative committee report. — Chapter 245, SLA 1970 (HCSSB 399 am H), was identical to CSHB 406 (Jud.). For report on CSHB 406 (Jud.), see 1970 House Journal Supplement No. 6.

Sec. 24.25.030. Disobeying subpoena or refusing to testify. If a witness neglects or refuses to obey a subpoena, or neglects or refuses to testify or to produce upon reasonable notice any material and proper books, papers or documents in his possession or under his control, the senate or house of representatives may by resolution entered on its journal commit him for contempt. If contempt is committed before a committee, the committee shall report the contempt to the senate or house of representatives, as the case may be, for such action as may be considered necessary. (§ 4-4-3 ACLA 1949)

Am. Jur. and ALR references. — 12 Am. Jur., Contempt, § 54; 49 Am. Jur., States, Territories and Dependencies, § 39.

Perjury or false swearing as contempt, 11 ALR 343; 73 ALR 817.

Sec. 24.25.040. Arrest for disobedience to subpoena. A witness who neglects or refuses to attend in obedience to subpoena may be arrested by the sergeant-at-arms and brought before the senate or house of representatives, as the case may be. The only warrant or authority necessary authorizing arrest is a copy of a resolution of the senate or house of representatives signed by the president of the senate or speaker of the house of representatives, as the case may be, and countersigned by the secretary of the senate or the clerk of the house of representatives, as the case may be. (§ 4-4-4 ACLA 1949)

Sec. 24.25.050. Witness fees and mileage. A person appearing before

either house, or both, or a legislative committee in response to a subpoena is entitled to $20 for each day's attendance, and for the time necessary in coming and returning to his place of residence and mileage at the rate of 15 cents a mile for the distance traveled in going to and returning from the place of attendance. The witness fee and mileage fee shall be paid out of the state treasury upon presentation of a certificate of attendance and mileage due, signed by the presiding officer of the house which authorized issuance of subpoena. (§ 4-4-5 ACLA 1949; am § ch 31 SLA 1951)

Sec. 24.25.060. Oath and penalty for violation of oath. The president of the senate and speaker of the house of representatives and the chairman of every committee of either body may administer an oath to a witness appearing before the respective bodies. A person who wilfully swears or affirms falsely concerning any matter material to the subject under investigation or inquiry is guilty of perjury and upon conviction is punishable by imprisonment for not less than one year nor more than five years. (§ 4-4-6 ACLA 1949)

Am. Jur. and ALR references. — 41 AM. Jur., Perjury, § 1 et seq.

Perjury or false swearing as contempt, 11 ALR 342; 73 ALR 817.

Sec. 24.25.070. Grant of immunity on claim of privilege of self-incrimination. (a) A person called as a witness before the senate, house of representatives, or a committee of either or both, who refuses to answer any question or to produce any book, paper or document relating to the matter under inquiry, on the ground that the answer or the production may tend to incriminate him, may be granted immunity from punishment for the offense to which the question or evidence relates by resolution of the house which is conducting the inquiry. The resolution shall be entered upon its journal, and the witness may then be compelled to answer the question or produce the evidence.

(b) If a witness is granted immunity and compelled to testify or produce evidence after claiming the privilege of self-incrimination, he may not thereafter be prosecuted in any court for the offense to which the question or evidence relates. (§ 4-4-7 ACLA 1949)

Am. Jur. and ALR references. — 58 Am. Jur., Witnesses, §§ 46, 434.

Privilege against self incrimination, 120 ALR 1102.

Waiver of privilege, 144 ALR 1007.

Sec. 24.25.080. Punishment for disobedience to subpoena or refusal to testify. A person subpoenaed as provided in this chapter who fails, neglects or refuses to attend at the time and place where his presence is required, or fails, neglects or refuses to produce the books, papers, or instruments or other evidence designated in the subpoena, or who having attended in response to the subpoena, or having appeared voluntarily, refuses to testify as to any material and proper matter

RESOURCES COMMITTEE
HOUSE OF REPRESENTATIVES
ALASKA STATE LEGISLATURE

In the Matter of the Investigation)
of Certain Matters Concerning the)
Alaska Renewable Resources Corporation)

SUBPOENA DUCES TECUM

TO: Philip Hubbard, Trustee
Dean Olson, Trustee
William Spear, Trustee
Alaska Renewable Resources Corp.
2nd Floor, Madsen Building
Juneau, Alaska 99801

Under the authority of art. II of the Alaska Constitution, and in accordance with AS 24.25.010(b), the Resources Committee of the Alaska House of Representatives directs you to appear at Room 116 of the State Capitol Bldg Building, Juneau, Alaska, on May 8, 1980, at [redacted] o'clock to give testimony on:

1. The reasons for the resignation of Jack Milnes as a trustee of the Alaska Renewable Resources Corporation (ARRC).

2. The recent financial assistance agreement between ARRC and TEPA, Inc.

3. Major problems currently facing ARRC.

In addition, you are to produce at that time and place all correspondence, applications, and other records pertaining to items 1 and 2 above.

Information made confidential by AS 37.12.120, and which is required by this subpoena to be produced, must be identified as such by ARRC. The House Resources Committee and all other legislators and staff participating in this investigation will keep that information confidential.

DATED: May 5, 1980
Juneau, Alaska

Alvin Osterback, Co-chairman
Resources Committee
House of Representatives
Alaska State Legislature

Bill Miles, Co-chairman
Resources Committee
House of Representatives
Alaska State Legislature

CONCUR:

Terry Gardiner
Speaker of the House
Alaska State Legislature

consultation with the Department of Fish and Game, shall determine which communities are economically impacted fishing communities.

(b) If the economic disaster is due to a fisheries failure based on consideration of need, the legislature may appropriate to the Alaska economic disaster impact fund from the renewable resource fund (ch. 130, SLA 1974). If there is an insufficient balance in the renewable resource fund to meet emergency needs that may be determined under the provisions of AS 44.33.285, the legislature may appropriate from the general fund. The Alaska economic disaster impact fund balance may not exceed $5,000,000. The commissioner of revenue, after determining that there is in the Alaska economic disaster impact fund a surplus above an amount sufficient to meet anticipated demands, may invest the surplus as provided in ch. 10 of this title. Interest derived from investment of these surplus funds shall be deposited to the renewable resource fund. If the economic disaster is due to other than a fisheries failure, the legislature may appropriate from the general fund to the Alaska economic disaster fund to meet emergency needs.

(c) Unappropriated or otherwise unencumbered balances remaining in the Alaska economic disaster impact fund at the close of each fiscal year shall not lapse as provided in AS 37.25.010 but shall be available in perpetuity for fund purposes.

(d) Within the first 10 days of each legislative session the commissioner of commerce and economic development shall submit to the legislature a detailed report of all expenditures from the fund and all actions taken under AS 44.33.285. (§ 9 ch 277 SLA 1976)

Cross references. — As to the Alaska Renewable Resources Investment Fund, see AS 37.11.050 et seq. As to termination of the Alaska Renewable Resources Corporation, see AS 44.66.010.

Editor's note. — Section 1, ch. 179, SLA 1978, provides: DECLARATION OF POLICY. It is the policy of the state to

"(1) rehabilitate, enhance, and develop its renewable resources and, insofar as is consistent with sound resource management policies, develop its human resources by providing maximum opportunities for employment and a higher standard of living for its citizens; and

"(2) utilize the funds set aside under ch. 11 of this title to further the (A) development of renewable resources that will contribute to a stable self-sustaining state economy, employment opportunities, and lifestyle alternatives for its citizens, and (B) commercial, traditional, and common uses of the state's renewable resources."

Section 2, ch. 179, SLA 1978, provides: FINDINGS. (a) The legislature finds that Alaska has renewable resources that are not being utilized to their full potential. Many problems which confront the state, including high unemployment and unstable economy, could be mitigated by the expanded use and development of its renewable resources.

"(b) It is further found that Alaska's economy has historically depended upon sporadic and non-stable development.

"(c) It is further found that several key factors have contributed to the slow development of renewable resource industries, including,

"(1) insufficiency of research and development financing and venture capital financing;

"(2) a lack of knowledge within the business and financial communities about conditions affecting renewable resource industrial development in the state and a lack of scientific information concerning many resources; and

"(3) a lack of technology appropriate to Alaska.

"(d) It is further found that the state's policy of assisting the development of viable industries is best accomplished by providing assistance to the private sector to identify and demonstrate new products, markets, and technologies."

Legislative history report. — For report on ch. 179, SLA 1978 (HB 682), see 1978 House Journal, p. 830.

Sec. 37.12.010. Alaska Renewable Resources Corporation created. There is created the Alaska Renewable Resources Corporation to carry out the purposes of this chapter. The corporation is a public corporation of the state and an instrumentality of the state within the Department of Revenue, but has a legal existence independent of and separate from the state. The exercise by the corporation of the powers conferred by this chapter is considered an essential function of the state. (§ 3 ch 179 SLA 1978)

Sec. 37.12.015. Purposes. The purposes of the corporation are to

(1) facilitate the rehabilitation, enhancement, and development of the state's renewable resources so as to strengthen the self-sustaining sectors of the state economy;

(2) sponsor research and development of technologies and innovations for the rehabilitation and enhancement of the state's renewable resources to achieve an appropriate use of the resources;

(3) identify new products, markets, and technologies for renewable resource industries in the state which will constitute an appropriate use of the resources; stimulate the research and development of these products, markets, and technologies; assist in the demonstration of their technical and economic feasibility; and assist in their introduction into commercial markets. (§ 3 ch 179 SLA 1978)

Sec. 37.12.020. Allocation. (a) There shall be allocated to the corporation from the receipts described in AS 37.11.020 five per cent of the total receipts paid the state from mineral lease bonuses and rentals for state land and royalties derived from minerals produced on state land. Payments of the amount allocated by this section shall be made to the corporation by the Department of Revenue on a monthly basis.

(b) Fifty per cent of all actual receipts of the corporation, from whatever source except receipts from the corporation's investments, shall be deposited into the renewable resources investment fund (AS 37.11.050). (§ 3 ch 179 SLA 1978)

Sec. 37.12.025. Board of trustees. A board of trustees of the corporation is established as its governing body. (§ 3 ch 179 SLA 1978)

Sec. 37.12.030. Composition of the board of trustees. The board of trustees consists of three members appointed by the governor and confirmed by a majority of the members of the legislature in joint session. The board shall annually elect a chairman from among its members. A chairman may not succeed himself. (§ 3 ch 179 SLA 1978)

Sec. 37.12.035. Term of office. The members of the board of trustees shall be appointed for terms of four years, and they may be reappointed. Terms shall be staggered. The initial terms shall be one member serving for two years, one member serving for three years, and one member serving for four years. (§ 3 ch 179 SLA 1978)

Sec. 37.12.040. Removal and vacancies. (a) The governor may remove a board member from office by and with the consent of a majority of the members of the legislature in joint session. A removal by the governor shall be in writing and state the reason for removal. If the legislature is not in session, the governor may suspend a member of the board. Upon suspension, a board member may not participate in board business and may not be counted for the purpose of establishing a quorum. A suspended member shall continue to receive his salary as a board member until the legislature in joint session consents to his removal. The joint session shall be held within 30 days from the date of removal if the removal occurs while the legislature is in session or within 30 days of convening of the legislature if the legislature is not in session. If the legislature refuses to consent to his removal, the board member shall be reinstated to his position.

(b) A vacancy on the board shall be promptly filled by appointment by the governor and confirmation by a majority of members of the legislature in joint session. An appointee to fill a vacancy shall hold office for the balance of the term for which his predecessor on the board was appointed. If a vacancy arises on the board while the legislature is not in session, the governor may appoint an interim board member until such time as the legislature in joint session fails to confirm the interim member's appointment.

(c) A vacancy on the board does not impair the authority of a quorum of the board to exercise all the powers and perform all the duties of the board. (§ 3 ch 179 SLA 1978)

Sec. 37.12.045. Qualifications of board members. (a) No person may be appointed to the board who has not been a resident of the state for at least three years.

(b) No member of the board may hold any other state or federal office, position, or employment, whether elective or appointive, except as a member of the armed forces of the United States or the state. (§ 3 ch 179 SLA 1978)

Sec. 37.12.050. Quorum. Two members of the board constitute a quorum for the transaction of business and the exercise of the powers and duties of the board. (§ 3 ch 179 SLA 1978)

Sec. 37.12.055. Compensation of board members. Board members are in the exempt service under AS 39.25 and receive an annual salary within Range 30 of the salary schedule for state employees established by AS 39.27.011. (§ 3 ch 179 SLA 1978)

Sec. 37.12.060. Employment of personnel. The board may employ and determine the salary of an executive director. The executive director may, with the approval of the board, select and employ additional staff as necessary. The executive director and all employees of the board are in the exempt service under AS 39.25. (§ 3 ch 179 SLA 1978)

Sec. 37.12.065. Conflicts of interest. (a) Members of the board of trustees are subject to the provisions of AS 39.50.

(b) No member or employee of the board may acquire an interest, direct or indirect, in a corporation, company, association, or project owned, controlled, or invested in by the corporation. If a member or employee owns or controls such an interest, he shall immediately disclose the interest in writing to the board and refrain from participating in any manner in any activity relating to that interest. (§ 3 ch 179 SLA 1978)

Sec. 37.12.070. Powers. In carrying out the corporate powers of the corporation, the board may

(1) adopt, alter, and use a corporate seal;

(2) prescribe, adopt, amend, and repeal bylaws;

(3) sue and be sued in the name of the corporation;

(4) enter into any agreements necessary to the exercise of its powers and functions;

(5) accept grants from and contract with the federal government and the state or its political subdivisions and to that end comply with the provisions of federal, state, or local programs where necessary, except that it may not enter into any agreements whereby any permanent state

or local government position is funded or partially funded in connection with a project;

(6) accept grants and loans from other sources than those in (5) of this section to be held and used for the purposes of the corporation;

(7) appear in behalf of the corporation before boards, commissions, departments, or other agencies of municipal, state, or federal government;

(8) acquire, hold, use, lease, sell, or otherwise dispose of property of any kind, real, personal, or mixed, or any interest in it;

(9) hold, as a means of securing the providing of financial assistance, patents, copyrights, trademarks, royalties, or any other evidences of protection or exclusivity issued under the laws of the United States or any state or nation;

(10) prepare, publish, and distribute technical studies, reports, bulletins and other materials it considers appropriate;

(11) invest, in such form as it considers appropriate, in projects which are economically viable and income-producing;

(12) provide grants for projects having broad public application which do not have direct income-producing potential;

(13) adopt regulations governing the exercise of its corporate powers;

(14) deposit funds, or invest surplus funds through the treasury division of the Department of Revenue which may invest in any investments authorized in AS 39.35.110 so long as its investment policy is consistent with the prudent-man rule;

(15) do all acts and things necessary or desirable to carry out the purposes of the corporation. (§ 3 ch 179 SLA 1978)

Sec. 37.12.075. Duties. In carrying out the purposes of this chapter, the board shall

(1) seek to maintain the productivity of healthy renewable resources and expand the productivity of depleted or underutilized renewable resources;

(2) provide financial assistance for projects which the board finds will accomplish the purposes of the corporation as set out in § 15 of this chapter;

(3) promote the utilization of the state's renewable resources in the state and the development of import substitution and export markets;

(4) annually prepare long-range operating and financial plans and the budget for the forthcoming year;

(5) monitor approved projects for compliance with this chapter and provide operational and performance evaluations (post-audits) of projects receiving financial assistance and an overall assessment, expressed in qualitative and quantitative terms, of the degree to which the purposes of the corporation, as set out in § 15 of this chapter, have been achieved; and

(6) attempt to fund activities which will tend to maximize returns to the state and local governments and its citizens in such forms as tax revenues and resident employment and income. (§ 3 ch 179 SLA 1978)

Sec. 37.12.080. Financial assistance. (a) In providing financial assistance, the board shall

(1) consider the proposals of qualified applicants only after the applicant has submitted a detailed proposal in the form prescribed by the board; no assistance may be approved by the board unless it finds, in writing, that

(A) the proposed project, if successful, will further the purposes of the corporation as set out in § 15 of this chapter;

(B) the application contains an adequate plan for project implementation, including, when applicable, a complete business, financial and marketing plan for commercial activities;

(C) sufficient capital is not available from other sources on reasonable terms;

(D) the applicant has agreed that if new renewable resource industrial activity results from the proposed project, his best efforts will be employed to keep that activity in the state for a minimum period of time specified by the board;

(E) the applicant demonstrates that sufficient technical and business expertise to accomplish the objectives of the proposed project is available;

(F) all costs, including additional governmental cost, associated with and ancillary to the project and future obligations generated by the project have been identified, including any necessary operating, maintenance, or other support costs for the life of the project;

(G) potential resource use conflicts that may result from the proposed project are identified and evaluated, and when necessary, plans to mitigate or resolve those conflicts and to preserve for the future options for the use of the state's renewable resources are included in the application;

(2) use the financial mechanism most appropriate to the conditions of the applicant and the proposed project and which will most effectively utilize the funds available; grants may be made by the board of up to 90 per cent of the total project costs for the following purposes:

(A) projects for the applied research and development of products, technologies, or innovations for the rehabilitation, enhancement, or development of the state's renewable resources;

(B) projects for the demonstration, on a one-time basis, of the economic or technical feasibility of a new product, market, or technology involving a renewable resource; or

(C) projects for the rehabilitation, enhancement, or development of a common-property resource where the benefits from the project cannot be captured by any single economic unit;

(3) in evaluating projects, consider the preferences and priorities of the residents of the region in which the project is to be located;

(4) require investments made by the corporation to be secured by means determined to be appropriate by the board.

(b) The board may not

(1) invest or otherwise provide assistance of more than five per cent of the resources of the corporation or $1,500,000, whichever is less, in a single project or applicant unless the legislature has approved the investment by concurrent resolution;

(2) invest in more than 49 per cent of the outstanding corporate stock or other corporate obligations issued by an applicant unless the legislature has approved the investment by concurrent resolution;

(3) make a loan for a period in excess of 30 years unless the legislature has approved the loan by concurrent resolution;

(4) assume the responsibility for management of any project in which it has invested and may not exercise voting rights for that purpose or for any other purpose which is within the scope of managerial control; or

(5) provide funds to any state agency unless that expenditure is included in the corporation's annual budget;

(6) allocate to grants more than 10 per cent of the annual appropriation of the corporation.

(c) Nothing in this section prevents the board from taking such action and exercising such rights as it considers necessary for the protection of its financial interests in the event of

(1) actual or threatened default on any of the board's investments;

(2) actual or threatened insolvency of a project in which the board has made an investment; or

(3) any other immediate or actual circumstance or event which jeopardizes an investment made by the board.

(d) Projects for which financial assistance is granted shall comply with all applicable provisions of law. (§ 3 ch 179 SLA 1978)

Sec. 37.12.085. Eligibility for financial assistance. The board may provide financial assistance if it finds that an applicant is qualified to receive assistance. An applicant is qualified if

(1) he has submitted a proposal to the board in accordance with § 80(a)(1) of this chapter;

(2) he is a resident of the state for three years or, if the applicant is a partnership, corporation, or other association, the majority interest is beneficially owned by residents of the state and a majority of the owners are residents of the state; and

(3) his projects which have previously received financial assistance from the corporation, if any, have complied with all requirements of that assistance and have performed with sufficient success or promise to warrant further aid. (§ 3 ch 179 SLA 1978)

Sec. 37.12.090. Reports and publications. (a) The board shall prepare and distribute in non-technical language meterials describing the purposes and activities of the corporation.

(b) The board shall publish an annual report for the governor, the legislature, and the public at the time of submitting its annual budget request. Each annual report shall include financial statements and audit reports, a statement detailing the sources from which the corporation received money, a statement detailing the investments made by the corporation, a summary and evaluation of the data required by § 75(5) and (6) of this chapter, a list of public facilities required by or complementary to the corporation's investment activity, and any other information that the board of trustees believes would be of interest to the recipients of the report. (§ 3 ch 179 SLA 1978)

Sec. 37.12.095. Budget and appropriations. (a) The corporation may expend money only as appropriated by the legislature. The corporation is subject to the Executive Budget Act (AS 37.07) except as provided in (b) and (c) of this section.

(b) The budget of the corporation shall include the categories and amounts of proposed financial assistance broken down by financing mechanism and resource sector affected and all funds received by the corporation whether through allocations made by this chapter, appropriation, or otherwise. The total amount of the corporation's operating budget shall be specified separately in its budget and be appropriated from the general fund.

(c) The unexpended and unobligated portion of the appropriations, other than appropriations for operating expenses, does not lapse into the general fund at the end of a fiscal year, but remains available for appropriation as provided in this section in subsequent fiscal years. (§ 3 ch 179 SLA 1978)

Sec. 37.12.100. Annual audit. The corporation shall have its financial record audited annually by an independent outside auditor. The legislative auditor may prescribe the form and content of the financial record of the corporation and shall have access to these records at any time. (§ 3 ch 179 SLA 1978)

Sec. 37.12.105. Cooperation with other agencies. All departments, agencies, and public corporations of the state shall provide information, services and facilities to the corporation on its request. The corporation shall reimburse the department, agency, or corporation for expenses reasonably incurred on the corporation's behalf. (§ 3 ch 179 SLA 1978)

Sec. 37.12.110. Tax exemption. The corporation is exempt from all taxes and assessments in the state. All security instruments issued by the corporation, their transfer, and their income are exempt from all taxes and assessments in the state. (§ 3 ch 179 SLA 1978)

Sec. 37.12.115. Technical assistance. (a) The corporation may provide financing for pre-investment activities including feasibility studies, when, in its opinion, the proposed project is of high priority and the financing is not available from other sources on reasonable terms and conditions. Amounts so advanced may form a part of a later investment if the enterprise or project is financed by the corporation.

(b) The corporation may provide funding for technical and management advice and assistance to qualified applicants as it considers necessary in the circumstances. (§ 3 ch 179 SLA 1978)

Sec. 37.12.120. Public access to information. Information in the possession of the corporation is a public record, except that information which discloses the particulars of the business or affairs of a private enterprise or investor is confidential and is not a public record. Confidential information may be disclosed only for the purposes of an official law enforcement investigation or when its production is required in a court proceeding. These restrictions do not prohibit the publication of statistics presented in a manner that prevents the identification of reports, items, persons or enterprises. (§ 3 ch 179 SLA 1978)

Sec. 37.12.125. Definitions. In this chapter, unless the context otherwise requires,

(1) "applicant" means a person making application to the corporation for financial assistance;

(2) "board" means the Board of Trustees of the Alaska Renewable Resources Corporation;

(3) "corporation" means the Alaska Renewable Resources Corporation;

(4) "project" means products, markets, innovation, or technological developments for the rehabilitation, enhancement, or development of renewable resources and includes applied research for those products, markets, or technological developments;

(5) "rehabilitation, enhancement, and development" means any activity or program which improves the health and well-being of a renewable resource or renewable resource population leading to an increase in the quality or productivity of the resource and to an increase in the benefits derived from the resource to the citizens of the state;

(6) "renewable resource" means non-human living organisms; natural components of the environment, including the air, land, and water; and energy systems which are naturally recurring or replenished. (§ 3 ch 179 SLA 1978)

Chapter 14. Trust Funds.

Article

1. Mental Health Fund (§§ 37.14.010 — 37.14.050)
2. University Fund (§§ 37.14.060 — 37.14.100)
3. Public School Fund (§§ 37.14.110 — 37.14.150)
4. Custody and Investment of Trust Funds (§§ 37.14.160 — 37.14.170)

(3) should the Legislative Budget and Audit Committee recommend within the 45-day period that the state not initiate the additional activity, the governor shall again review the revised program and if he determines to authorize the expenditure, he shall provide the Legislative Budget and Audit Committee with a statement of his reasons before commencement of expenditures under the revised program.
(am §§ 4, 5 ch 60 SLA 1979)

Effect of amendments.
The 1979 amendment, effective May 19, 1979, substituted "an act making the transfers between appropriations" for "(h) of this section" at the end of the second sentence of subsection (e) and rewrote subsection (h).

As the rest of the section was not affected by the amendment, it is not set out.

Chapter 12. Alaska Renewable Resources Corporation.

Section
70. Powers

Sec. 37.12.070. Powers. In carrying out the corporate powers of the corporation, the board may

(16) [**Terminates June 30, 1984**] provide funds to the Alaska Council on Science and Technology, to be awarded and administered in the manner prescribed by AS 44.19.181 — 44.19.189 when the funds are to be expended to accomplish a corporate purpose under AS 37.12.015.
(am § 2 ch 56 SLA 1979)

Effect of amendment. — The 1979 amendment, effective July 1, 1979, added paragraph (16).

As the rest of the section was not affected by the amendment, it is not set out.

Editor's note. — Section 1 ch. 56, SLA 1979, effective July 1, 1979, provides: "FINDINGS. The legislature finds that there is a need for development of small-scale and low-cost alternatives for Alaskans in regard to building design, food production, recycling, transportation, energy generation, waste disposal, and small-scale residential and industrial enterprise. Therefore, the legislature finds that the development and wider use of low-cost and small-scale technologies appropriate to Alaska should be encouraged."

Section 3 ch. 56, SLA 1979, effective July 1, 1979, provides for the termination of the act relating to northern technology on June 30, 1984. As part of that act, AS 37.12.070(16) will terminate on that date.

Re: Alaska Renewable Resources Corporation Subpoena

Dear Representative Osterback:

As requested by your committee's assistant, Diane Morrison, you will find the following documents attached for your use:

- a subpoena duces tecum for the three trustees of the Alaska Renewable Resources Corporation;

- an affidavit of service.

In order to make this subpoena valid, you must have the authorization of a majority of your committee and get Speaker Gardiner's concurrence, in accordance with AS 24.25.010(b). Also it must be served in accordance with AS 24.25.020.

Yours truly,

AVRUM M. GROSS

MEMORANDUM OF THE CHAIRMAN

To Members of the Senate Committee on Energy and Natural Resources:

The Alaska Natural Gas Transportation Act (Public Law 94–586), passed by Congress on October 1, 1976, and signed by the President on October 22, 1976, established a special decisionmaking process for the selection of a transportation system to move natural gas from the North Slope of Alaska to United States markets. The act was designed to expedite the selection of such a transportation system and to provide for the participation of the President and Congress in the final decision. Ordinarily, the Federal Power Commission has the final authority to approve proposed natural gas transmission systems.

As mandated by the act, the FPC reported its recommendations to the President on May 2, 1977, and other Federal departments and agencies submitted their comments and responses to the FPC report on July 1, 1977. The President is directed by the act to issue a decision as to whether or not a transportation system for the delivery of Alaska natural gas should be approved and, if so, to designate such a system.

Pursuant to the act, the President's decision designating an approved transportation system for the delivery of Alaska natural gas shall take effect upon the enactment of a joint resolution of Congress. Beginning on the date after the receipt of such decision, the Congress has 60 calendar days of continuous session to enact a joint resolution. If not approved within 60 days, the act allows the President an additional 30 days to propose a new decision.

In order to provide members of the committee, the Congress, and the public with access to the various reports and comments submitted by the FPC and other Federal departments and agencies, I have asked that the President's decision transmitted to the Congress on September 22, 1977, and selected summaries of relevant documents be assembled in a committee print and made available.

HENRY M. JACKSON, *Chairman.*

DECISION OF THE PRESIDENT

DECISION ON AN ALASKA

NATURAL GAS TRANSPORTATION

SYSTEM

PREFACE - STATUTORY REQUIREMENTS FOR A DECISION ON AN ALASKA NATURAL GAS TRANSPORTATION SYSTEM

Section 7(a)(4) of the Alaska Natural Gas Transportation Act of 1976 (ANGTA) states:

> If the President determines to designate for approval a transportation system for delivery of Alaska natural gas to the contiguous States, he shall in such decision-
>
> (A) describe the nature and route of the system designated for approval;
>
> (B) designate a person to construct and operate such a system, which person shall be the applicant, if any, which filed for a certificate of public convenience and necessity to construct and operate such system;
>
> (C) identify those facilities, the construction of which, and those operations, the conduct of which, shall be encompassed within the term "construction and initial operation" for purposes of defining the scope of the directions contained in Section 9 of this Act, taking into consideration any recommendation of the Commission with respect thereto; and
>
> (D) identify those provisions of law, relating to any determination of a Federal officer or agency as to whether a certificate, permit, right-of-way, lease, or other authorization shall be issued or be granted, which provisions he finds (i) involve determinations which are subsumed in his decision and (ii) require waiver pursuant to Section 8(g) in order to permit the expeditious construction and initial operation of the transportation system.

As part of these determinations, an Agreement on Principles concluded with the Government of Canada prescribes various terms and conditions applicable to the construction and operation of the pipeline. The Agreement on Principles is attached hereto as Section 7 of this Decision and made an integral part of the Decision by this reference.

With the incorporation of the aforesaid Agreement, and the finding that it is in the national interest to expeditiously undertake to construct an Alaska Natural Gas Transportation System, the system designation and related statutory determinations are as follows:

SECTION 1 - DESIGNATION OF PERSON TO CONSTRUCT AND OPERATE THE SYSTEM

The Alcan Pipeline Company, now a wholly owned subsidiary of Northwest Pipeline Corporation[1/], or its successor, is hereby designated to construct and operate the portion of the system within the State of Alaska.

The Northern Border Pipeline Company, a partnership consisting of subsidiaries or affiliates of Columbia Gas Transmission Corporation, Michigan-Wisconsin Pipeline Company, Natural Gas Pipeline Company of America, Northern Natural Gas Company, Panhandle Eastern Pipe Line Company, and Texas Eastern Transmission Corporation, or its successor, is hereby designated to construct and operate the portion of the system from the United States-Canada border near Monchy, Saskatchewan, to a point near Dwight, Illinois.

The Alcan Pipeline Company, or its successor, and the Northern Border Pipeline, or its successor, shall be publicly held corporations or general or limited partnerships, open to ownership participation by all persons

---

1/ Northwest Pipeline owns and operates a 4,300-mile pipeline system for transporting gas in the states of Colorado, Idaho, Nevada, Oregon, Utah, Washington, and Wyoming. Northwest Pipeline is a wholly-owned subsidiary of Northwest Energy Company, a holding company whose principal asset is all the outstanding common stock of Northwest Pipeline.

without discrimination, except producers of Alaskan natural gas.

The Pacific Gas Transmission Company is hereby designated to construct and operate the portion of the system from the United States/Canada border near Kingsgate, British Columbia, to the border between the States of California and Oregon.

The Pacific Gas and Electric Company is hereby designated to construct and operate the portion of the system from the border between the States of California and Oregon through the State of California.

SECTION 2 - DESCRIPTION OF THE NATURE AND ROUTE OF THE APPROVED SYSTEM

The Alcan system is an overland pipeline system to transport natural gas from the Prudhoe Bay area of Northern Alaska through Alaska and Canada into the Midwest and Western sections of the contiguous United States. See Exhibit 1.

The expected volume of gas to be available initially from the Prudhoe Bay field is 2.0 to 2.5 billion cubic feet per day (bcfd). The system described herein is designed to handle this througnput volume. The capacity of the system could be increased in the future to accommodate additional volume throughput by construction of additional facilities.

Alcan Pipeline Route in Alaska

The proposed Alcan pipeline will commence at the discharge side of the gas plant facilities in the Prudhoe Bay field. The pipeline will parallel the Alyeska oil pipeline southward from the North Slope of Alaska, cross the Brooks Range through the Atigun Pass, and continue on to Delta Junction.

At Delta Junction, the Alcan Pipeline will diverge fro the Alyeska oil pipeline and follow the Alaska Highway and the Haines oil products pipeline right-of-way, passing near the towns of Tanacross, Tok, and Northway Junction

Whitehorse
El Paso Project
Dwight
Antioch
Los Angeles
System Map of the
ALCAN Project
and
El Paso Alaska Project

in Alaska. The right-of-way of the Haines oil products pipeline is at present approximately fifty feet wide and is closely parallel to the Alaska Highway. The Alcan pipeline will then connect with the proposed new facilities of Foothills Pipe Lines (South Yukon) Ltd. at the Alaska/Yukon Territory border.

From Prudhoe Bay to Delta Junction, Alcan expects to construct its line approximately eighty feet from the Alyeska oil pipeline. As proposed by Alcan, construction will be carried out by extending the existing Alyeska work pads. However, Alyeska advised Alcan that its "preliminary general guidelines" indicate that the Alyeska and Alcan lines must be separated by 100 to 200 feet where blasting to build the pipeline trench would occur (approximately 350 miles of pipeline length). Additional studies will determine the minimum distance between the Alyeska oil pipeline and the Alcan line that is necessary to permit safe construction and operation.

Alcan Pipeline Route Through Canada

The Canadian portion of the Alcan Project will commence at the Alaska/Yukon border in the vicinity of the towns of Border City, Alaska and Boundary, Yukon.

From the Alaska/Yukon border, the Foothills Pipe Lines (South Yukon) Ltd. pipeline will proceed south until it

reaches the White River (milepost 44), where it will take a more eastward course across the Yukon Territory. The pipeline will cross the Territory generally parallel to the Alaska Highway. Along most of the pipeline route through the Yukon, the separation between the pipeline route and highway route will be approximately one mile. There will be several points, however, where the pipeline route will divert substantially from the route of the Alaska Highway. These departures from the Alaska Highway route will permit the pipeline to continue on a more direct course than if it were to follow the Alaska Highway.

At approximately milepost 246, the pipeline will be routed north of Whitehorse and cross the Yukon River near the intersection of the Alaska and Klondike Highways. Near this intersection, approximately 9 miles northwest of Whitehorse, the pipeline will be constructed to permit a later connection with the proposed Dempster Line from the Mackenzie Delta, if and when the Dempster Line is constructed.

After it crosses the Yukon River north of Whitehorse, the pipeline will turn southeast and again travel parallel to the Alaska Highway, entering British Columbia at approximately milepost 397 and reentering the Yukon Territory at approximately milepost 435. The pipeline will continue

to follow the Alaska Highway eastward through the Yukon Territory and again cross the border into British Columbia, approximately twelve miles southwest of Watson Lake, Yukon. At this point, the Foothills Pipe Lines (South Yukon) Ltd. pipeline will terminate, and the Foothills Pipe Line (North B.C.) Ltd. interconnecting pipeline will commence.

After it passes the British Columbia border, the pipeline will proceed generally southeast across the northeastern part of the Province to the British Columbia/ Alberta border, crossing the existing Westcoast Transmission Company Ltd. main line some 35 miles south of Fort Nelson. At Boundary Lake on the British Columbia-Alberta border, the pipeline would connect with the Foothills Pipe Lines (Alta.) Ltd. pipeline. In Alberta, the Foothills Pipe Lines (Alta.) Ltd. pipeline will proceed generally southeast from Boundary Lake to Gold Creek Junction. After Gold Creek Junction, the pipeline will follow the existing Alberta Gas Trunkline Co., Ltd. (AGTL) pipeline right-of-way to James River Station.

From James River Station, the western leg of the pipeline will proceed separately to the south, approximately following the existing AGTL right-of-way to the Alberta/ British Columbia border near Coleman, Alberta. It will then connect with the Foothills Pipelines (South B.C.)

Ltd. pipeline, continue to the southwest across British Columbia, and finally connect with the Pacific Gas Transmission (PGT) pipeline at the United States/Canada border near Kingsgate, British Columbia. The pipeline route through southern British Columbia will generally parallel the existing pipeline route of Alberta Natural Gas Company Ltd.

For the eastern leg from the James River Station, the pipeline will proceed generally to the southeast until it reaches the Alberta/Saskatchewan border near Empress, Alberta. The eastern leg will then connect with the Foothills Pipe Lines (Sask.) Ltd. pipeline. The pipeline will then continue to the southeast across Saskatchewan and join with the Northern Border Pipeline system at the United States/Canada border near Monchy, Saskatchewan.

Alcan Pipeline Route in the Contiguous United States

On the western leg, the Alaska gas will be transferred at the United States-Canada border near Kingsgate, British Columbia, to the PGT system. The PGT system will transport the gas through northern Idaho, southeast Washington, and central Oregon. At the Oregon/California border, the gas will be transferred to enter the Pacific Gas and Electric Company (PG&E) system and will then be transported throughout California.

On the eastern leg the Alaska gas will be transferred at the Saskatchewan/Montana border from the Canadian-owned portion of the Alcan system to the Northern Border Pipeline system. The Northern Border Pipeline system will then transport the gas across the northeast corner of Montana, the southwest section of North Dakota, the northeast section of South Dakota, the southwest corner of Minnesota, and the northeast section of Iowa, and finally bring the gas just south of Chicago to Dwight, Illinois.

Exhibit 2 on the following page illustrates the respective routes of the eastern and western legs of the Alcan system and their relationship to the existing gas pipeline network in the United States.

SECTION 3 - IDENTIFICATION OF FACILITIES INCLUDED WITHIN "CONSTRUCTION AND INITIAL OPERATION"

General Project Description

This section identifies the facilities for the Alcan project which will be entitled to the expedited authorization process prescribed in Section 9 of ANGTA. The facilities which are to be covered are those in the U.S. which are adequate for a throughput of up to 2.4 bcfd and are included in the revised Alcan filing submitted to the Federal Power Commission (FPC) in March 8, 1977. If any modifications to those facilities are required by the Agreement on Principles between the U.S. and Canada, those modified facilities will also be entitled to the expedited authorization process in Section 9.

Uncertainties remain as to the future level of gas exports from Canada's historical gas supply sources. The actual division of Alaska gas among the various regions of the contiguous United States awaits conclusion of gas sales contracts. Routing and design work should be sufficiently complete to allow final certification in late 1978 or early 1979. The final design and location of the facilities, however, will be within the general description set forth.

The gas transportation system will utilize a 48-inch diameter pipeline from Prudhoe Bay to James River, Alberta.

From James River, gas destined for the midwestern and eastern states will be transported through a 42-inch diameter pipeline to Monchy, Saskatchewan, and gas destined for the western states will be transported through a 36-inch pipeline to Kingsgate, British Columbia. PGT and PG&E will complete looping[2/] as necessary of their existing pipeline systems from the Idaho-British Columbia border to Antioch, California (near San Francisco) with a 36-inch diameter pipeline.

All of the pipeline in Alaska and the first forty-one miles of pipeline in the Yukon lie in the continuous and discontinuous permafrost region.[3/] This section will be operated in a chilled state (i.e., below 32°F.) to prevent degradation of the permafrost regime. Gas chilling

---

2/ "Looping" is construction of a pipeline parallel to and interconnected with an existing pipeline. Looping may extend to part or all of an existing line.

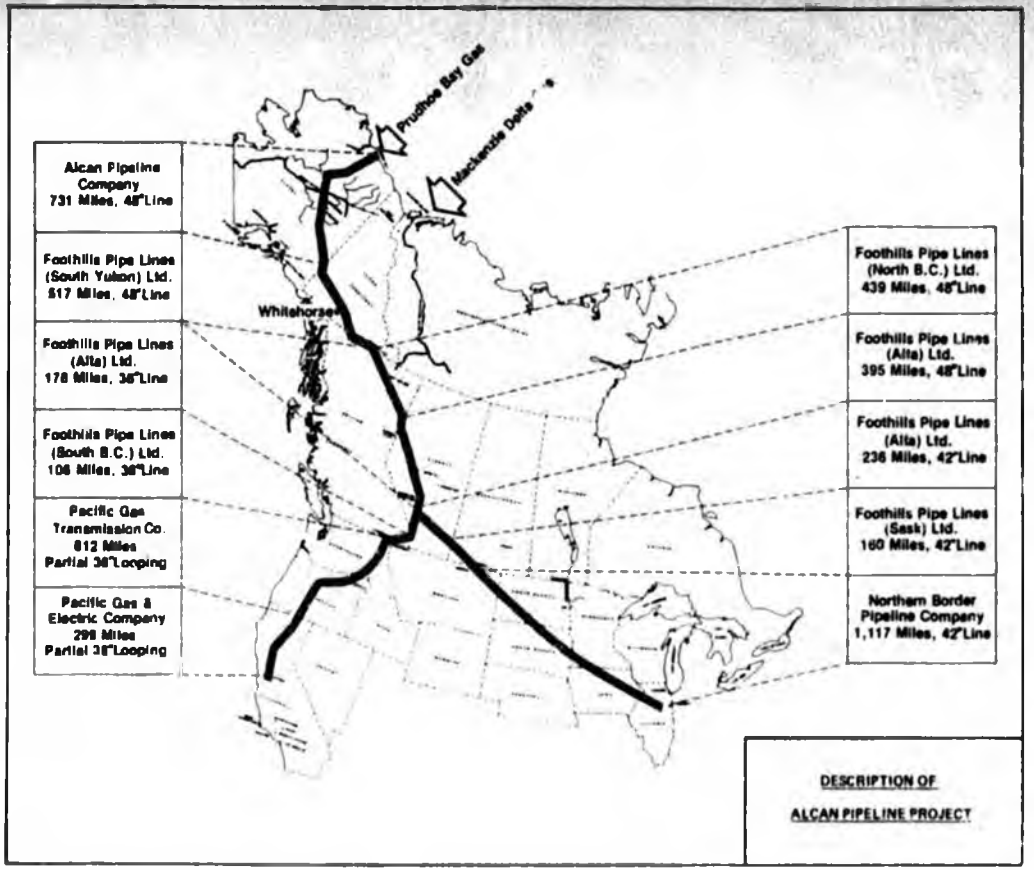
3/ By definition, permafrost consists of soil, rock, or other earth material, the temperature of which remains at or below 32°F. (0°C) continuously for two or more years. Its distribution is not uniform. Factors controlling the distribution of permafrost include the glacial and climatic history of the area, thermal properties of the earth material, ambient temperature, insulation properties of overburden, and amount of exposure to sun (e.g., shading caused by orientation of topographic features). The permafrost would be continuous along approximately the first 240 miles of the pipeline (to near the South Fork of the Koyohuk River). Along the remaining pipeline route to the Yukon border, the permafrost would be discontinuous.

will be accomplished by propane refrigeration systems at all compressor stations in Alaska.

The length of the various pipeline segments will be as follows:

Company	Location	Length (Miles)
Alcan Pipeline Company	Alaska	731
Foothills Pipe Lines (South Yukon) Ltd.	Yukon	517
Foothills Pipe Lines (Sask.) Ltd.	Saskatchewan	160
Foothills Pipe Lines (North B.C.) Ltd.	Yukon/B.C. Border to B.C./Alberta Border	439
Foothills Pipe Lines (South B C.) Ltd.	Coleman to Kingsgate	106
Foothills Pipe Lines (Alta.) Ltd.	B.C./Alberta to James River	395
	James River to Colemen	176
	James River to Empress	235
Total Alaska and Canada		2,759
Pacific Gas Transmission Co.	Kingsgate to Malin	612
Pacific Gas & Electric Co.	Malin to Antioch	299
Northern Border Pipeline Co.	Monchy to Dwight	1,117
Total Contiguous States		2,028
Total System Length		4,787

Exhibit 3 on the next page identifies and locates the various pipeline segments.



Prudhoe Bay Gas
Mackenzie Delta Gas
Alcan Pipeline Company 731 Miles, 48"Line

Foothills Pipe Lines (Sask) Ltd. 160 Miles, 42"Line
Northern Border Pipeline Company 1,117 Miles, 42"Line
DESCRIPTION OF
ALCAN PIPELINE PROJECT

Peak-day capacity utilizing nine compressor stations (see item 4 below) will be 2.6 bcfd, with an average daily volume of 2.4 bcfd. By installation of intermediate compressor stations, the system could be increased to 3.4 bcfd peak capacity, with an average day capacity of 3.2 bcfd. The system capacity could be further increased by addition to the compressor horsepower at each station.

Alcan Compressor Stations and Refrigeration Facilities in Alaska

Centrifugal compressors, powered by natural gas-fueled turbine engines, will be used on the Alcan system. In order to minimize thawing of the permafrost soil, the discharge gas at each compressor station in Alaska will be chilled by a propane refrigeration plant. The following describes the required compression and refrigeration facilities. All of these facilities are required for construction and initial operation.

Station	Milepost	Number of Gas Compressors	Total Installed Horsepower (ISO) Gas Compression	Gas Refrigeration
AL-1	75.0	1	26,500	7,660
AL-2	133.0	1	26,500	7,660
AL-3	242.3	1	26,500	13,830
AL-4	331.8	1	26,500	13,830
AL-5	418.8	1	26,500	13,830
AL-6	504.7	1	26,500	13,830
AL-7	589.9	1	26,500	13,830
AL-8	673.4	1	26,500	13,830
	TOTAL	8	212,000	98,300

Other Alcan Pipeline Facilities in Alaska

Metering facilities for the measurement of gas flow and gas quality will be required in Alaska at the Prudhoe Bay receipt point, at the Fairbanks sales point, and at the transfer point on the Alaska-Yukon border.

A central operating center, located in Fairbanks, will monitor and control all compressor station operations.[4/]

Alcan will utilize staging areas established for the Alyeska oil pipeline at Prudhoe Bay, Fairbanks, and Valdez. Material storage sites will be located at Anchorage, Seward, and Whittier, and at selected locations along the pipeline route.

Existing transportation and communication facilities will be utilized to the fullest extent practicable. Short lateral roads will be constructed to pipeline facilities as required.

Permanent bases for operating and maintaining the system will be selected and located after defining areas in which common problems may occur due to similarities of terrain and

---

4/ The compressor stations will be automated for remote control of all normal functions, including discharge gas temperature.

climate. The bases will be located at or near compressor stations to avoid duplication of permanent above-ground facilities. Materials and various spare parts will be located at the bases to facilitate maintenance and repair operations.

All of these facilities will be required for construction and initial operation.

Lower 48 Facilities

For purposes of this part of the Decision, the facilities described generally below are deemed necessary for construction and initial operation, and will be entitled to expedited issuance of authorizations pursuant to Section 9 of ANGTA, provided that the final certification of such facilities shall be determined by reference to the size necessary to provide the transportation capacity certified to the FPC[5/] by the Secretary of Energy, as set forth in the terms and conditions section.

5/ The final certification function currently resides with the Federal Power Commission under the Natural Gas Act. On October 1, 1977, the Department of Energy will be activated pursuant to the Department of Energy Organization Act, Public Law 95-91, and the functions of the FPC under the Natural Gas Act will be transferred in part to the Federal Energy Regulatory Commission (FERC). Therefore, where reference is made herein to future actions of the FPC, they will be carried out by either the Secretary or the FERC, as the case may be, as of October 1, 1977.

In order to deliver gas contemporaneously to points both east and west of the Rocky Mountains in the lower continental United States, the Alcan system will bifurcate at James River, Alberta and form a Western Leg and an Eastern Leg. First, the Western Leg is described below, and then the Eastern Leg.

Western Leg

Alaskan gas will be transferred at the Canada/United States border near Kingsgate, British Columbia, to Pacific Gas Transmission Company (PGT). PGT will transport the gas through Idaho, Washington, and Oregon. At the Oregon/California border, the gas will enter the intrastate facilities of Pacific Gas and Electric Company (PG&E). The gas will be transported throughout much of California through existing and expanded intrastate gas pipelines.

The additional Western Leg facilities which are part of the Alcan project are those covered by the "1580 Design." The major component of this expansion will add approximately 873 miles of looping and result in complete looping of the 917-mile PGT/PG&E system from the Canada/United States border to Antioch, California (near San Francisco). The two parallel lines will be operated as a single system. Various modifications to the existing compression facilities will be required. However, the increase in system

capacity of 659 mmcfd could be achieved without installation of additional compression horsepower or increase of compression fuel usage. A minor addition of facilities south of Antioch may be made at a later date, depending on conditions prevailing at that time. All Western Leg facilities which are part of the Alcan project are subject to Section 9 of ANGTA.

The Eastern Leg

The Alcan system will transport Alaskan gas for delivery to Midwestern and Eastern markets in the lower continental United States through an Eastern Leg. The Eastern Leg will commence at the bifurcation point of the main express line at James River, Alberta and terminate at Dwight, Illinois (near Chicago). Total length of the Eastern Leg will be 1,352 miles, including 235 miles in Canada and 1,117 miles in the United States. All pipeline for the Eastern Leg will be 42 inches in diameter.

Alaskan gas will be transferred at the Saskatchewan/Montana border from the Canadian-owned portion of the Alcan system to the Northern Border Pipeline system (Northern Border). The Northern Border system will travel diagonally across Montana, North Dakota, South Dakota, Minnesota, and Iowa, and terminate near Chicago, Illinois. Along this

route, direct deliveries of gas will be made by Northern Border into the systems which cross the pipeline: Natural Gas Pipeline Company of America, Northern Natural Gas Company, and Michigan-Wisconsin Pipeline Company. Other purchasers will receive Alaska gas by displacement.[6/]

The specific facilities that will be required to interconnect the various pipelines to receive gas from the Northern Border system, either by direct delivery or by displacement, will be determined when gas sales contracts have been executed. Final design of the required facilities will depend upon the division of Alaskan gas among the various pipeline companies and various regions of the contiguous States. Final design will be complete at the time of final system certification in late 1978 or early 1979. All facilities which are part of the Northern Border system are necessary for construction and initial operation, and all facilities which are part of the Northern Border system as finally certified by the FPC are subject to Section 9 of ANGTA.

6/ "Displacement" of gas is a method by which gas may be supplied to a purchaser from close by in exchange for gas sold to the purchaser elsewhere. Displacement, which is a commonly used method in the gas industry, eliminates the cost of physically transferring gas between markets.

SECTION 4 - DELINEATION OF PROVISIONS OF LAW THAT ARE SUBSUMED IN THIS DECISION AND REQUIRE WAIVER

Under Section 7(a)(4)(D) of ANGTA, the President shall

> identify those provisions of law, relating to any determination of a Federal officer or agency as to whether a certificate, permit, right-of-way, lease, or other authorization shall be issued or be granted, which provisions the President finds (i) involve determinations which are subsumed in his decision and (ii) require waiver pursuant to section 8(g) in order to permit the expeditious construction and initial operation of the transportation system.

At this time, however, there are only two statutory provisions that involve determinations subsumed in this decision and require waiver pursuant to section 8(g) of ANGTA.7/

Under Section 3 of the Natural Gas Act (15 U.S.C. 717b), the Federal Power Commission must issue an order to authorize any export of natural gas; such an order shall

---

7/ Section 8(g)(1) of ANGTA states that the President will have the opportunity at a later date to identify and seek waiver of additional provisions of law. This subsection states:

> At any time after a decision designating a transportation system is submitted to the Congress pursuant to this section, if the President finds that any provision of law applicable to actions to be taken under subsection (a) or (c) of section 9 require waiver in order to permit expeditious construction and initial operation of the approved transportation system, the President may submit such proposed waiver to both Houses of Congress.

issue unless the Commission finds that the export is not consistent with the public interest.

In addition, under Section 103 of the Energy Policy and Conservation Act, the President is required to promulgate a general rule prohibiting exports of natural gas from the U.S., except that he may permit those exports which he determines to be consistent with the national interest and with the purposes of the Act (Section 103(b)(1)). To make such a determination, Section 103(d)(1) directs the President to take into account the need to leave uninterrupted or unimpaired "exchanges in similar quantity for convenience or increased efficiency of transportation with persons or the government of a foreign state."

As a result of the recent Agreement on Principles between the United States and Canada, Alcan will be required to make available limited quantities of Alaskan gas to communities in the Yukon Territory and the western provinces, subject to provision of replacement gas downstream in Canada. This transaction will be an export requiring separate authorizations under the above mentioned two statutes.

The requirements arising under Section 3 of the Natural Gas Act and under Section 103 of the Energy Policy and Conservation Act could be met without waiver of these provisions, but additional, and unnecessary, FPC and Presidential action would be required. Accordingly, both of these statutory subsections shall be waived for the exchange of gas mentioned herein.

SECTION 5 - TERMS AND CONDITIONS AND ENFORCEMENT

To ensure the proper management and timely completion of the construction of the designated transportation system, the following general terms and conditions shall be appropriately incorporated into any certificate, right-of-way, lease, permit or authorization directed to be made by any Federal officer or agency.

As described more fully below, these terms and conditions will be followed by a set of stipulations establishing general standards of environmental and construction performance, and the procedures for the submission and approval of construction plans and environmental safeguards, and then by site specific terms and conditions issued prior to actual construction of any pipeline segment. The terms and conditions described here are not meant to limit or foreclose the adoption of such stipulations and terms and conditions but are intended to begin the process by which a set of effective and workable safeguards are evolved. There is contemplated cooperative action by the Federal and Alaska State Governments in the development and enforcement of stipulations and site specific terms and conditions. Similar cooperative action is contemplated with the governments of all affected states.

Under the proposal made at the end of this section for the organizational involvement of the Federal Government with the successful applicant, the Federal Inspector for construction of the transportation system shall have supervision authority over the enforcement of these terms and conditions subject to the ultimate authority of the Executive Policy Board described below.

Terms and Conditions

The terms and conditions proposed for inclusion into this Congressional authorization are set forth, by category, as follows:

I. Construction Costs and Schedule Management and Organization

1. Prior to the issuance of the certificate, the successful applicant shall provide a detailed overall management plan, to be approved by the Federal Inspector, for the preconstruction and the construction phases of the transportation system project. The successful applicant shall define its relationship with the execution contractors, and shall give consideration to various management approaches -- such as Fast Track, Stage Design, and other management

approaches -- that will facilitate the cost-effective, environmentally sound, and timely construction of the project.

2. The successful applicant may not use cost-plus type contracts with execution contractors, except where the Federal Inspector determines that special conditions warrant this type of contract. Otherwise, the applicant shall use fixed-price contracts, including the firm fixed-price, the fixed-price with escalation, and fixed-price incentive type of contract.

3. The successful applicant shall specify for approval of the Federal Inspector the insurance, bonding, and any other prequalification requirements for all consultants and execution contractors.

Construction Cost and Schedule Control Techniques

4. Prior to the initiation of construction, the successful applicant shall provide a detailed analysis and description of its proposed cost and schedule control techniques. The applicant shall give particular consideration to cost and manpower control and manpower estimating techniques.

5. Prior to the initiation of construction, the successful applicant shall develop and submit to the Federal Inspector a final design, design-cost estimate, and construction schedule. This design cost estimate and schedule must represent a construction design of at least 70 percent (or greater) of the total system, and the remainder may not represent any one contiguous or specific type of construction or geologic situation (e.g., river crossings, discontinuous permafrost, or elevated pipeline). The Federal Inspector may relax the above specified minimum percentage requirement, with the consent of the Executive Policy Board, if he finds there are extenuating circumstances that warrant such an action.

General Operating Strategies

6. The successful applicant shall develop and submit to the Federal Inspector cost-effective and feasible methods for supplying general and specialized equipment, as well as repair facilities and spare-part inventories, to the execution contractors. The applicant

shall give consideration to various techniques of equipment provision, including use of equipment pools, equipment leasing or buy-backs.

7. Prior to the initiation of construction, the successful applicant shall supply detailed information to the Federal Inspector on its labor relations procedures, and indicate the proposed means to address and resolve disputes arising under collective bargaining agreements.

8. In entering into contracts with execution contractors, the successful applicant shall seek to incorporate techniques for resolving disputes arising under such contracts without recourse to litigation.

Quality Assurance and Control Procedures

9. The successful applicant shall provide to the Federal Inspector a detailed description of quality assurance and control procedures that will be implemented prior to the start of construction. Such a description must at least include provisions for quality assurance and control procedures for environmental protection, corrosion, pipeline and compressor-station

welds, pipeline placement, equipment and other appropriate matters.

Procedures for Enforcement of Terms and Conditions

10. The successful applicant may not initiate activity on any aspect of the pipeline until authorization to proceed with construction, including site-specific terms and conditions for that aspect of the pipeline, has been issued and procedures for enforcement of terms and conditions have been established by the appropriate Federal officers.

Minority Business Enterprise Participation

11. The successful applicant shall develop and submit to the Federal Inspector for approval a plan for taking affirmative action to ensure that no person shall on the grounds of race, creed, color, national origin or sex be excluded from receiving or participating in contracts for management, engineering design or construction activity. The successful applicant shall require each of his contractors and subcontractors having contracts valued at $150,000 or more to develop similar plans providing the assurances specified in the preceding sentence.

II. Safety and Design

1. The successful applicant shall construct, operate, maintain and terminate the pipeline in accordance with Federal gas pipeline safety regulations. The applicant shall ensure that construction and operating specifications are in accordance with good engineering practice, both to maintain the safety and the integrity of the pipeline and to protect the health and safety of project personnel and the general public.

2. The successful applicant may not begin construction of any pipeline segment until the Federal Inspector has approved the design of that segment, including technical construction specifications, having had sufficient time to review the design.

3. The successful applicant shall establish a procedure for briefing the Federal Inspector, or his designated representative, on a regular basis concerning the status of the project during the design, construction, testing and start-up phases.

4. The successful applicant shall establish a procedure to ensure access to all project facilities by the Federal Inspector, or his designated representative, in the performance of official duties.

5. The successful applicant shall submit a plan or procedure for conducting its own inspections of project facilities during construction, to be approved by the Federal Inspector.

6. The successful applicant shall provide a seismic monitoring system, to be approved by the Federal Inspector, and shall ensure that there are adequate procedures for the safe shut-down of the project under severe seismic conditions.

III. Environment

1. The successful applicant shall construct, operate, maintain and terminate the pipeline with maximum concern for the protection of environmental values. A set of stipulations containing the general standards of environmental and construction performance, and the procedures for the

submission and approval of construction plans and environmental safeguards will be developed by the concerned government agencies and must be accepted by the applicant as a condition of his right to proceed over public lands. Additional "site-specific" terms and conditions will be incorporated in authorizations to proceed with construction issued by the appropriate Federal agency, into particular certificates, rights-of-way, permits and other authorizations to protect and enhance environmental values during the design, construction and operation of the pipeline. These additional "site specific" terms and conditions will be issued as appropriate to minimize disturbance from construction and operation of the pipeline to rivers and other water bodies and adjacent land and vegetation; to protect wildlife and endangered species and maintain forest, agricultural and other resource productivity; to control the risks of pipeline ruptures, leaks and hazards; to maintain air and water quality values; to make provision for control and disposal of sewage, garbage, wastes

and toxic substances; and take other measures necessary for protection of the environment during the design, construction and operation of the pipeline.

2. The successful applicant shall prepare a plan of operations which integrates environmental protection with the proposed schedule of construction and operations, the proposed supervisory and technical staffing, the proposed quality control programs, and the proposed quality assurance programs. In preparation and implementation of this plan, the successful applicant shall provide for timely integration of environmental mitigation and restoration practices with the activity which creates the need for the restoration or mitigation.

3. The successful applicant shall develop and submit to the Federal Inspector an effective plan for implementation of specific environmental safeguards through an educational program for field personnel prior to and during construction, operation, maintenance and termination of the pipeline.

4. The successful applicant shall establish an effective pipeline-performance monitoring system of inspection and instrumentation to insure performance in keeping with environmental concerns.

IV. Finance

1. The successful applicant shall provide for private financing of the project, and shall make the final arrangement for all debt and equity financing prior to the initiation of construction.

2. If the direct capital cost estimates excluding interest during construction for the overall project in 1975 constant dollars filed with the FPC immediately prior to certification, adjusted to reflect design changes to increase capacity that result from the Agreement on Principle between the United States and Canada, materially and unreasonably exceed the comparable capital cost estimates filed by Alcan with the Federal Power Commission on March 8, 1977, Section 6, page 2, the FPC may not issue a certificate for the project. If these final capital cost estimates are not excessive under the above standard, the FPC may use these final estimates for the U.S.

segments as the basis for fixing a variable rate of return on equity that will reward the applicant for project completion under budgeted cost and penalize the applicant for project completion above budgeted cost. The variable return shall be set to provide substantial incentives to construct the project without incurring overruns. These final capital cost estimates need not be the design-cost estimates based on the system design which must subsequently be submitted to the Federal Inspector. The applicant shall, however, submit to the FPC for approval on a timely basis all components of construction work in progress.

3. Neither the successful applicant nor any purchaser of Alaska gas for transportation through the system of the successful applicant shall be allowed to make use of any tariff by which or any other agreement by which the purchaser or ultimate consumer of Prudhoe Bay natural gas is compelled to pay a fee, surcharge, or other payment in relation to the Alaska

natural gas transportation system at any time prior to completion and commissioning of operation of the system.

4. The Alcan Pipeline Company, or its successor, and the Northern Border Pipeline, or its successor, shall be publicly held corporations or general or limited partnerships, open to ownership participation by all persons without discrimination, except producers of Alaskan natural gas.

V. Antitrust

1. The successful applicant shall exclude and prohibit producers of significant amounts of Alaska gas, or their subsidiaries and affiliates, from participating in the ownership of the Alaska natural gas transportation system, except that such producers may provide guarantees for project debt. The aforesaid producers of Alaska gas may not be equity members of the sponsoring consortium, have any voting power in the project, have any role in the management or operations of the project, have any continuing financial obligation in relation to debt guarantees associated

with initial project financing after the project is completed and the tariff is put into effect, or impose conditions on the guarantees of project debt permitted above which may give rise to competitive abuse, including power to veto pro-competitive policies.

2. All agreements for the sale of Alaska gas made between the aforesaid producers and purchasers who are shippers through the Alaska natural gas transportation system shall be fully disclosed to the Federal Power Commission, and all collateral agreements made between the same parties with respect to the sale of Alaska gas shall also be fully disclosed. All contracts for sale of Alaska gas, for all collateral agreements to these contracts, shall be submitted for approval by the Federal Power Commission.

VI. Certification of Facilities

1. Prior to the issuance of a certificate of public convenience and necessity to Northern Border Pipeline or to Pacific Gas Transmission Company, the Secretary of Energy shall certify to the Federal Power Commission whether there

has been any material change in the facts regarding future potential gas supplies for the East or West since the date of this Decision that would warrant certification of such facilities at a different rated capacity than authorized herein. If the Secretary certifies that there has been a material change in the facts, he shall instead certify to the Commission the capacity at which he has determined a certificate of public convenience and necessity should be issued and the reasons therefor, which capacity shall be determined in a manner that is as consistent as possible with the reasons for the initial authorization, as set forth in the Report submitted to the Congress pursuant to Section 7(b) of the Alaska Natural Gas Transportation Act, Public Law 94-586. The certificate issued by the FPC shall be consistent with the Secretary's determination.

Enforcement

To enforce the terms and conditions proposed above, and to carry out the duties of the office assigned and set forth by section 7(a)(5)(A)-(E) of ANGTA, an appropriate and qualified individual shall be appointed by the President

to serve as the Federal Inspector, with the advice and consent of the Senate. Upon approval of the Presidential designation of an Alaska natural gas transportation system, the Federal Inspector shall:

(A) establish a joint surveillance and monitoring agreement, approved by the President, with the State of Alaska similar to that in effect during construction of the trans-Alaska oil pipeline to monitor the construction of the approved transportation system within the State of Alaska;

(B) monitor compliance with applicable laws and the terms and conditions of any applicable certificate, rights-of-way, permit, lease, or other authorization issued or granted;

(C) monitor actions taken to assure timely completion of construction schedules and the achievement of quality of construction, cost control, safety, and environmental protection objectives and the results obtained therefrom;

(D) have the power to compel, by subpoena if necessary, submission of such information as he deems necessary to carry out his responsibilities; and

(E) keep the President and the Congress currently informed on any significant departures from compliance and issue quarterly reports to the President and the Congress concerning existing or potential failures to meet construction schedules or other factors which may delay the construction and initial operation of the system and the extent to which quality of construction, cost control, safety and environmental protection objectives have been achieved.

In addition to these duties and responsibilities, the President will submit to Congress, upon approval of the Presidential decision, a limited executive reorganization plan to transfer to the Federal Inspector field-level

supervisory authority over enforcement of terms and conditions from those Federal agencies having statutory responsibilities over various aspects of an Alaska natural gas transportation system. The respective Federal agencies would retain their existing statutory authority pursuant to section 9(a) of ANGTA, to issue on an expedited basis the necessary certificates, permits, rights-of-way and other authorizations, and to prescribe any appropriate terms and conditions that are permissible under present law. The Agency Authorized Officers would directly represent the statutory authority of the respective Federal agencies in the field on all matters pertaining to construction of the pipeline. However, the Federal Inspector would have the necessary field-level supervisory authority to overrule the enforcement action of an Agency Authorized Officer, whenever the Federal Inspector determined that such a decision was warranted.

The President's supervision of the Federal Inspector will be carried out by an Executive Policy Board. The Board would be made up of the Secretaries of the Interior, Energy, Transportation, the Administrator of the Environmental Protection Agency, and the Chief of the Army Corps of Engineers, or their Deputies (or senior officers who have

been delegated authority over gas pipeline matters), as well as the Federal Inspector, who is the non-voting Chairman of the Board. The Board will provide policy guidance to the Federal Inspector, and act as an appellate body to resolve differences among the agencies and the Federal Inspector, including differences that may arise when the Federal Inspector overrules an enforcement action of an Agency Authorized Officer. The Board shall expeditiously resolve any such appeal with a limited period of time that shall be prescribed. The President will authorize by Executive Order the creation of the Executive Policy Board pursuant to his power under Section 301 of Title 3, and will delegate the necessary authority to the Board to carry out its functions. The Board shall be paramount for policy-making purposes on all matters pertaining to construction of an Alaskan natural gas transportation system; the Federal Inspector shall shall be the agent or conduit of the Board in such matters, and shall also have the necessary supervisory power over field level decisions.

98-820 O - 77 - 4

SECTION 6 - PRICING OF ALASKA GAS

Final financing for an Alaska natural gas transportation project cannot be arranged until the producer-owners of the Prudhoe Bay gas execute sales contracts. Without such contracts, no gas can be transported, and financing consequently would be unobtainable. Producers cannot be expected to negotiate sales contracts until a price has been established with a reasonable degree of certainty. If this project is to proceed expeditiously, the field price of the gas should be established as soon as possible.

Because no contracts for gas sales in interstate commerce have been concluded and submitted to the FPC for approval, the FPC has not, to date, attempted to determine the costs of providing the gas in order to establish what might be a just and reasonable (cost-based) wellhead price. The FPC, in fact, has excluded the Alaska gas from its national rate proceedings; Alaska costs and related reserve data have been excluded from all statistics underlying FPC rate determinations.

Alaska gas is produced in association with oil; therefore, it is impossible to determine precisely the costs of finding, developing and producing only the gas. Cost allocation and, therefore, cost-based pricing is

somewhat arbitrary. Because of the difficult and arbitrary nature of the allocation problem, the FPC in recent years has priced gas on the basis of the cost of only non-associated gas in each producing area, and then allowed the same price to be paid for associated gas produced in that area as well. Were the FPC to initiate a price proceeding under the Natural Gas Act, it is expected that its procedures and subsequent litigation over cost allocation and other matters would likely exceed a period of 18 months.

The Administration's proposed National Energy Act is before the Congress. That Act provides a basis for moving from cost-based pricing to commodity-value pricing. That transition is essential to restoring the balance between natural gas supply and demand. Under the gas pricing provisions in the National Energy Plan, Alaska gas would be classified as "old gas under a new contract" subject to a $1.45 per mcf ceiling price.

If, on the other hand, proposals to deregulate natural gas prevail, serious uncertainties and delays concerning the development of any Alaskan natural gas transportation

project could result. If producers are inclined to insist on prices of $2.00 per mcf or higher, questions concerning the saleability of the gas and the financeability of the project will arise. Such price levels could result in an additional $20 billion in consumer charges, as well as the added costs of any delays in project construction.

This decision, therefore, calls for enactment of a gas pricing approach similar to that contained in the National Energy Plan. That approach also provides a mechanism for allocating the cost of more expensive supplies to lower-priority users, rather than the residential and commercial users who have less capacity to convert to other fuels. The gas pricing policies which are part of the National Energy Plan are fair and equitable, and should apply to both the production and sale of Alaska gas.

SECTION 7 - AGREEMENT BETWEEN THE UNITED STATES OF AMERICA AND CANADA ON PRINCIPLES APPLICABLE TO A NORTHERN NATURAL GAS PIPELINE

The Government of the United States of America and the Government of Canada,

Desiring to advance the national economic and energy interests and to maximize related industrial benefits of each country, through the construction and operation of a pipeline system to provide for the transportation of natural gas from Alaska and from Northern Canada,

Hereby agree to the following principles for the construction and operation of such a system:

1. Pipeline Route

The construction and operation of a pipeline for the transmission of Alaska natural gas will be along the route set forth in Annex I, such pipeline being hereinafter referred to as "the Pipeline". All necessary action will be taken to authorize the construction and operation of the Pipeline in accordance with the principles set out in this Agreement.

2. Expeditious Construction; Timetable

a) Both Governments will take measures to ensure the prompt issuance of all necessary permits, licenses, certificates, rights-of-way, leases and other authorizations

required for the expeditious construction and commencement of operation of the Pipeline, with a view to commencing construction according to the following timetable:

- Alaska - January 1, 1980
- Yukon - main line pipe laying January 1, 1981
- Other construction in Canada to provide for timely completion of the Pipeline to enable initial operation by January 1, 1983.

b) All charges for such permits, licenses, certificates, rights-of-way, leases and other authorizations will be just and reasonable and apply to the Pipeline in the same non-discriminatory manner as to any other similar pipeline.

c) Both Governments will take measures necessary to facilitate the expeditious and efficient construction of the Pipeline, consistent with the respective regulatory requirements of each country.

3. Capacity of Pipeline and Availability of Gas

a) The initial capacity of the Pipeline will be sufficient to meet, when required, the contractual requirements of United States shippers and of Canadian shippers. It is contemplated that this capacity will be 2.4 billion cubic feet per day (bcfd) for Alaska gas and 1.2 bcfd for northern Canadian gas. At such time as a lateral pipeline

transmitting Northern Canadian gas, hereinafter referred to as "the Dempster Line", is to be connected to the Pipeline or at any time additional pipeline capacity is needed to meet the contractual requirements of United States or Canadian shippers, the required authorizations will be provided, subject to regulatory requirements, to expand the capacity of the Pipeline in an efficient manner to meet those contractual requirements.

b) The shippers on the Pipeline will, upon demonstration that an amount of Canadian gas equal on a British Thermal Unit (BTU) replacement value basis will be made available for contemporaneous export to the United States, make available from Alaska gas transmitted through the Pipeline, gas to meet the needs of remote users in the Yukon and in the provinces through which the Pipeline passes. Such replacement gas will be treated as hydrocarbons in transit for purposes of the Agreement between the Government of Canada and the Government of the United States of America concerning Transit Pipelines, hereinafter referred to as "the Transit Pipeline Treaty". The shippers on the Pipeline will not incur any cost for provision of such Alaska gas except those capital costs arising from the following provisions:

i) the owner of the Pipeline in the Yukon will make arrangements to provide gas to the communities of Beaver Creek, Burwash Landing, Destruction Bay, Haines Junction, Whitehorse, Teslin, Upper Liard and Watson Lake at a total cost to the owner of the Pipeline not to exceed Canadian $2.5 million;

ii) the owner of the Pipeline in the Yukon will make arrangements to provide gas to such other remote communities in the Yukon as may request such gas within a period of two years following commencement of operation of the Pipeline at a cost to the owner not to exceed the product of Canadian $2500 and the number of customers in the communities, to a maximum total cost of Canadian $2.5 million.

4. Financing

a) It is understood that the construction of the Pipeline will be privately financed. Both Governments recognize that the companies owning the Pipeline in each country will have to demonstrate to the satisfaction of the United States or the Canadian Government, as applicable, that protections against risks of non-completion and interruption are on a basis acceptable to that Government before proof of financing is established and construction allowed to begin.

b) The two Governments recognize the importance of constructing the Pipeline in a timely way and under effective cost controls. Therefore, the return on the equity investment in the Pipeline will be based on a variable rate of return for each company owning a segment of the Pipeline, designed to provide incentives to avoid cost overruns and to minimize costs consistent with sound pipeline management. The base for the incentive program used for establishing the appropriate rate of return will be the capital costs used in measuring cost overruns as set forth in Annex III.

c) It is understood that debt instruments issued in connection with the financing of the Pipeline in Canada will not contain any provision, apart from normal trust indenture restrictions generally applicable in the pipeline industry, which would prohibit, limit or inhibit the financing of the construction of the Dempster Line; nor will the variable rate of return provisions referred to in subparagraph (b) be continued to the detriment of financing the Dempster Line.

5. Taxation and Provincial Undertakings

a) Both Governments reiterate their commitments as set forth in the Transit Pipeline Treaty with respect to

non-discriminatory taxation, and take note of th statements issued by Governments of the Provinces of British Columbia, Alberta and Saskatchewan, attached hereto as Annex V, in which those Governments undertake to ensure adherence to the provisions of the Transit Pipeline Treaty with respect to non-interference with throughput and to non-discriminatory treatment with respect to taxes, fees or other monetary charges on either the Pipeline or throughput.

b) With respect to the Yukon Property Tax imposed on or for the use of the Pipeline the following principles apply:

i) The maximum level of the property tax, and other direct taxes having an incidence exclusively, or virtually exclusively, on the Pipeline, including taxes on gas used as compressor fuel, imposed by the Government of the Yukon Territory or any public authority therein on or for the use of the Pipeline, herein referred to as "the Yukon Property Tax", will not exceed $30 million Canadian per year adjusted annually from 1983 by the Canadian Gross National Product price deflator as determined by Statistics Canada, hereinafter referred to as the GNP price deflator.

ii) For the period beginning January 1, 1980, and ending on December 31 of the year in which leave to open the Pipeline is granted by the appropriate regulatory authority, the Yukon Property Tax will not exceed the following:

1980--$5 million Canadian

1981--$10 million Canadian

1982--$20 million Canadian

Any subsequent year to which this provision applies--$25 million Canadian.

iii) The Yukon Property Tax formula described in subparagraph (b)(i) will apply from January 1 after the year in which leave to open the Pipeline is granted by the appropriate regulatory authority until the date that is the earlier of the following, hereinafter called the tax termination date:

A) December 31, 2008, or

B) December 31 of the year in which leave to open the Dempster Line is granted by the appropriate regulatory authority.

iv) Subject to subparagraph (b) (iii), if for the year ending on December 31, 1987, the percentage increase of the aggregate per capita revenue derived from all

property tax levied by any public authority in the Yukon Territory (excluding the Yukon Property Tax) and grants to municipalities and Local Improvement Districts from the Government of the Yukon Territory as compared to aggregate per capita revenue derived from such sources for 1983 is greater than the percentage increase for 1987 of the Yukon Property Tax as compared to the Yukon Property Tax for 1983, the maximum level of the Yukon Property Tax for 1987 may be increased to equal the amount it would have reached had it increased over the period at the same rate as the aggregate per capita revenue.

v) If for any year in the period commencing January 1, 1988, and ending on the tax termination date, the annual percentage increase of the aggregate per capita revenue derived from all property tax levied by any public authority in the Yukon Territory (excluding the Yukon Property Tax) and grants to municipalities and Local Improvement Districts from the Government of the Yukon Territory as compared to the aggregate per capita revenue derived from such sources for the immediately preceding year exceeds the percentage increase for that year of the Yukon Property

Tax as compared to the Yukon Property Tax for the immediately preceding year, the maximum level of the Yukon Property Tax for that year may be adjusted by the percentage increase of the aggregate per capita revenue in place of the percentage increase that otherwise might apply.

vi) The provisions of subparagraph (b)(i) will apply to the value of the Pipeline for the capacities contemplated in this Agreement. The Yukon Property Tax will increase for the additional facilities beyond the aforesaid contemplated capacity in direct proportion to the increase in the gross asset value of the Pipeline.

vii) In the event that between the date of this Agreement and January 1, 1983, the rate of the Alaska property tax on pipelines, taking into account the mill rate and the method of valuation, increases by a percentage greater than the cumulative percentage increase in the Canadian GNP deflator over the same period, there may be an adjustment on January 1, 1983, to the amount of $30 million Canadian described in subparagraph (b) (i) of the Yukon Property Tax to reflect this difference. In defining the Alaska

property tax for purposes of this Agreement, the definition of the Yukon Property Tax will apply mutatis mutandis.

viii) In the event that, for any year during the period described in subparagraph (iii), the annual rate of the Alaska property tax on or for the use of the Pipeline in Alaska increases by a percentage over that imposed for the immediate preceding year that is greater than the increase in percentage of the Yukon Property Tax for the year, as adjusted, from that applied to the immediately preceding year, the Yukon Property Tax may be increased to reflect the percentage increase of the Alaska property tax.

ix) It is understood that indirect socioeconomic costs in the Yukon Territory will not be reflected in the cost-of-service to the United States shippers other than through the Yukon Property Tax. It is further understood that no public authority will require creation of a special fund or funds in connection with construction of the Pipeline in the Yukon, financed in a manner which is reflected in the cost of service to U.S. shippers, other than through the Yukon Property Tax. However, should public authorities

in the State of Alaska require creation of a special fund or funds, financed by contributions not fully reimbursable, in connection with construction of the Pipeline in Alaska, the Governments of Canada or the Yukon Territory will have the right to take similar action.

c) The Government of Canada will use its best endeavors to ensure that the level of any property tax imposed by the Government of the Northwest Territories on or for the use of that part of the Dempster Line that is within the Northwest Territories is reasonably comparable to the level of the property tax imposed by the Government of the Yukon Territory on or for the use of that part of the Dempster Line that is in the Yukon.

6. Tariffs and Cost Allocation

It is agreed that the following principles will apply for purposes of cost allocation used in determining the cost of service applicable to each shipper on the Pipeline in Canada:

a) The Pipeline in Canada and the Dempster Line will be divided into zones as set forth in Annex II. Except for fuel and except for Zone 11 (the Dawson-Whitehorse portion of the Dempster Line), the cost of service to each

shipper in each zone will be determined on the basis of volumes as set forth in transportation contracts. The volumes used to assign these costs will reflect the original BTU content of Alaskan gas for U.S. shippers and Northern Canadian gas for Canadian shippers, and will make allowance for the change in heat content as the result of commingling. Each shipper will provide volumes for line losses and line pack in proportion to the contracted volumes transported in the zone. Each shipper will provide fuel requirements in relation to the volume of his gas being carried and to the content of the gas as it affects fuel consumption.

b) It is understood that, to avoid increased construction and operating costs for the transportation of Alaskan gas, the Pipeline will follow a southern route through the Yukon along the Alaska Highway rather than a northern route through Dawson City and along the Klondike Highway. In order to provide alternative benefits for the transportation of Canadian gas to replace those benefits that would have been provided by the northern route through Dawson City, U.S. shippers will participate in the cost of service in Zone 11. It is agreed that if cost overruns on construction of the Pipeline in Canada do not exceed filed costs set forth in Part D of Annex III by more than 35

percent, U.S. shippers will pay the full cost of service in Zone 11. U.S. shipper participation will decline if overruns on the Pipeline in Canada exceed 35 percent; however, at the minimum the U.S. shippers' share will be the greater of either two-thirds of the cost of service or the proportion of contracted Alaska gas in relation to all contracted gas carried in the Pipeline. The proportion of the cost of service borne by U.S. shippers in Zone 11 will be reduced should overruns on the cost of construction in that Zone exceed 35 pe ent after allowance for the benefits to U.S. shippers derived from Pipeline construction cost savings in other Zones. Notwithstanding the foregoing, at the minimum, the U.S. shippers' share will be the greater of either two-thirds of the cost of service or the proportion of contracted Alaska gas in relation to all contracted gas carried in the Pipeline. Details of this allocation of cost-of-service are set out in Annex III.

c) Notwithstanding the principles in subparagraphs (a) and (b), in the event that the total volume of gas offered for shipment exceeds the efficient capacity of the Pipeline, the method of cost allocation for the cost of service for shipments of Alaskan gas (minimum entitlement 2.4 bcfd) or Northern Canadian gas (minimum entitlement 1.2 bcfd) in

V8-226 0 • 77 • 6

excess of the efficient capacity of the Pipeline will be subject to review and subsequent agreement by both Governments; provided however that shippers of either country may transport additional volumes without such review and agreement, but subject to appropriate regulatory approval, if such transportation does not lead to a higher cost of service or share of Pipeline fuel requirements attributable to shippers of the other country.

d) It is agreed that Zone 11 costs of service allocated to U.S. shippers will not include costs additional to those attributable to a pipe size of 42 inches. It is understood that in Zones 10 and 11 the Dempster Line will be of the same gauge and diameter and similar in other respects, subject to differences in terrain. Zone 11 costs will include only facilities installed at the date of issuance of the leave to open order, or that are added within three years thereafter.

7. Supply of Goods and Services

a) Having regard to the objectives of this Agreement, each Government will endeavor to ensure that the supply of goods and services to the Pipeline project will be on generally competitive terms. Elements to be taken into account in weighing competitiveness will include price, reliability, servicing capacity and delivery schedules.

b) It is understood that through the coordination procedures in Paragraph 8 below, either Government may institute consultations with the other in particular cases where it may appear that the objectives of subparagraph (a) are not being met. Remedies to be considered would include the renegotiation of contracts or the reopening of bids.

8. Coordination and Consultation

Each Government will designate a senior official for the purpose of carrying on periodic consultations on the implementation of these principles relating to the construction and operation of the Pipeline. The designated senior officials may, in turn, designate additional representatives to carry out such consultations, which representatives, individually or as a group, may make recommendations with respect to particular disputes or other matters, and may take such other action as may be mutually agreed, for the purpose of facilitating the construction and operation of the Pipeline.

9. Regulatory Authorities: Consultation

The respective regulatory authorities of the two Governments will consult from time to time on relevant

matters arising under this Agreement, particularly on the matters referred to in paragraphs 4, 5 and 6, relating to tariffs for the transportation of gas through the Pipeline.

10. Technical Study Group on Pipe

a) The Governments will establish a technical study group for the purpose of testing and evaluating 54-inch 1120 pounds per square inch (psi), 48-inch 1260 psi, and 48-inch 1680 psi pipe or any other combination of pressure and diameter which would achieve safety, reliability and economic efficiency for operation of the Pipeline. It is understood that the decision relating to pipeline specifications remains the responsibility of the appropriate regulatory authorities.

b) It is agreed that the efficient pipe for the volumes contemplated (including reasonable provision for expansion), subject to appropriate regulatory authorization will be installed from the point of interconnection of the Pipeline with the Dempster Line near Whitehorse to the point near Caroline, Alberta, where the Pipeline bifurcates into a western and an eastern leg.

11. Direct Charges by Public Authorities

a) Consultation will take place at the request of either Government to consider direct charges by public

authorities imposed on the Pipeline where there is an element of doubt as to whether such charges should be included in the cost of service.

b) It is understood that the direct charges imposed by public authorities requiring approval by the appro riate regulatory authority for inclusion in the cost of service will be subject to all of the tests required by the appropriate legislation and will include only

i) those charges that are considered by the regulatory authority to be just and reasonable on the basis of accepted regulatory practice, and

ii) those charges of a nature that would normally be paid by a natural gas pipeline in Canada. Examples of such charges are listed in Annex IV.

12. Other Costs

It is understood that there will be no charges on the Pipeline having an effect on the cost of service other than those:

i) imposed by a public authority as contemplated in this Agreement or in accordance with the Transit Pipeline Treaty, or

ii) caused by Acts of God, other unforeseen circumstances, or

iii) normally paid by natural gas pipelines in Canada in accordance with accepted regulatory practice.

13. Compliance with Terms and Conditions

The principles applicable directly to the construction, operation and expansion of the Pipeline will be implemented through the imposition by the two Governments of appropriate terms and conditions in the granting of required authorizations. In the event of subsequent non-fulfillment of such a term or condition by an owner of the Pipeline, or by any other private person, the two Governments will not have responsibility therefor, but will take such appropriate action as is required to cause the owner to remedy or mitigate the consequences of such non-fulfillment.

14. Legislation

The two Governments recognize that legislation will be required to implement the provisions of this Agreement. In this regard, they will expeditiously seek all required legislative authority so as to facilitate the timely and efficient construction of the Pipeline and to remove any delays or impediments thereto.

15. Entry Into Force

This Agreement will become effective upon signature and shall remain in force for a period of 35 years and thereafter until terminated upon 12 months' notice given in writing by one Government to the other, provided that those provisions of the Agreement requiring legislative action will become effective upon exchange of notification that such legislative action has been completed.

IN WITNESS WHEREOF the undersigned representatives, duly authorized by their respective Governments, have signed this Agreement.

DONE in duplicate at Ottawa in the English and French languages, both versions being equally authentic, this _____ day of _____, 1977.

The Pipeline Route

In Alaska:

The Pipeline constructed in Alaska by Alcan will commence at the discharge side of the Prudhoe Bay Field gas plant facilities. It will parallel the Alyeska oil pipeline southward on the North Slope of Alaska, cross the Brooks Range through the Atigun Pass, and continue on to Delta Junction.

At Delta Junction, the Pipeline will diverge from the Alyeska oil pipeline and follow the Alaska Highway and Haines oil products pipeline passing near the towns of Tanacross, Tok, and Northway Junction in Alaska. The Alcan facilities will connect with the proposed new facilities of Foothills Pipe Lines (South Yukon) Ltd. at the Alaska-Yukon border.

In Canada:

In Canada the Pipeline will commence at the Boundary of the State of Alaska, and the Yukon Territory in the vicinity of the towns of Border City, Alaska and Boundary, Yukon. The following describes the general routing of the Pipeline in Canada:

From the Alaska-Yukon border, the Foothills Pipe Lines (South Yukon) Ltd. portion of the Pipeline will proceed in a southerly direction generally along the Alaska Highway to

a point near Whitehorse, Yukon, and thence to a point on the Yukon-British Columbia border near Watson Lake, Yukon, where it will join with the Foothills Pipe Lines (North B.C.) Ltd. portion of the Pipeline.

The Foothills Pipe Lines (North B.C.) Ltd. portion of the Pipeline will extend from Watson Lake in a southeasterly direction across the north eastern part of the Province of British Columbia to a point on the boundary between the Provinces of British Columbia and Alberta near Boundary Lake where it will interconnect with the Foothills Pipe Lines (Alta.) Ltd. portion of the Pipeline.

The Foothills Pipe Lines (Alta.) Ltd. portion of the Pipeline will extend from a point on the British Columbia-Alberta boundary near Boundary Lake in a southeasterly direction to Gold Creek and thence parallel to the existing right-of-way of the Alberta Gas Trunk Line Company Limited to James River near Caroline.

From James River a "western leg" will proceed in a southerly direction, generally following the existing right-of-way of the Alberta Gas Trunk Line Company Limited to a point on the Alberta-British Columbia boundary near Coleman in the Crow's Nest Pass area. At or near Coleman the Foothills Pipe Lines (Alta.) Ltd. portion of the Pipeline will interconnect with the Foothills Pipe Lines (South B.C.) Ltd. portion of the Pipeline.

ANNEX I

The Foothills Pipe Lines (South B.C.) Ltd. portion of the Pipeline will extend from a point on the Alberta-British Columbia boundary near Coleman in a southwesterly direction across British Columbia generally parallel to the existing pipeline facilities of Alberta N tural Gas Company Ltd. to a point on the International Boundary Line between Canada and the United States of America at or near Kingsgate in the Province of British Columbia where it will interconnect with the facilities of Pacific Gas Transmission Company.

Also, from James River, an "eastern leg" will proceed in a southeasterly direction to a point on the Alberta-Saskatchewan boundary near Empress Alberta where it will interconnect with the Foothills Pipe Lines (Sask.) Ltd. portion of the Pipeline. The Foothills Pipe Lines (Sask.) Ltd. portion of the Pipeline will extend in a southeasterly direction across Saskatchewan to a point on the International Boundary Line between Canada and the United States of America at or near Monchy, Saskatchewan where it will interconnect with the facilities of Northern Border Pipeline Company.

ANNEX II

Zones for the Pipeline and the Dempster Line in Canada

Zone 1 Foothills Pipe Lines (South Yukon) Ltd.
Alaska Boundary to point of interconnection with the Dempster Line at or near Whitehorse.

Zone 2 Foothills Pipe Lines (South Yukon) Ltd.
Whitehorse to Watson Lake.

Zone 3 Foothills Pipe Lines (North B.C.) Ltd.
Watson Lake to point of interconnection with Westcoast's main pipeline near Fort Nelson.

Zone 4 Foothills Pipe Lines (North B.C.) Ltd.
Point of interconnection with Westcoast's main pipeline near Fort Nelson to the Alberta-B.C. border.

Zone 5 Foothills Pipe Lines (Alta.) Ltd.
Alberta-B.C. border to point of bifurcation near Caroline, Alberta.

Zone 6 Foothills Pipe Lines (Alta.) Ltd.
Caroline, Alta. to Alberta-Saskatchewan border near Empress.

ANNEX II

Zone 7 Foothills Pipe Lines (Alta.) Ltd.
Caroline to Alberta-B.C. border near Coleman.

Zone 8 Foothills Pipe Lines (South B.C.) Ltd.
Alberta-B.C. border near Coleman to B.C.-U.S. border near Kingsgate.

Zone 9 Foothills Pipe Lines (Sask.) Ltd.
Alberta-Saskatchewan border near Empress to Saskatchewan-U.S. border near Monchy.

Zone 10 Foothills Pipe Lines (North Yukon) Ltd.
Mackenzie Delta Gas fields in the Mackenzie Delta, N.W.T., to a point near the junction of the Klondike and Dempster highways just west of Dawson, Yukon Territory.

Zone 11 Foothills Pipe Lines (South Yukon) Ltd.
A point near the junction of the Klondike and Dempster highways near Dawson to the connecting point with the Pipeline at or near Whitehorse.

ANNEX III

Cost Allocation in Zone 11

The cost of service in Zone 11 shall be allocated to United States shippers on the following basis:

i) There will be calculated, in accordance with (iii) below, a percentage for Zones 1 - 9 in total by dividing the actual capital costs by the filed capital costs and multiplying by 100. If actual capital costs are equal to or less than 135% of filed capital costs, then United States shippers will pay 100% of the cost of service in Zone 11. If actual capital costs in Zones 1 - 9 are between 135% and 145% of filed capital costs, then the percentage paid by United States shippers will be adjusted between 100% and 66 2/3% on a straight-line basis, except that in no case will the portion of cost of service paid by United States shippers be less than the proportion of the contracted volumes of Alaskan gas at the Alaska-Yukon border to the same volume of Alaskan gas plus the contracted volume of Northern Canadian gas. If the actual capital

costs are equal to or exceed 145% of filed capital costs, the portion of the cost of service paid by United States shippers will be not less than 66 2/3% or the proportion as calculated above, whichever is the greater.

ii) There will be calculated a percentage for the cost-overrun on the Dawson to Whitehorse lateral (Zone 11). After determining the dollar value of the overrun, there will be deducted from it:

(a) the dollar amount by which actual capital costs in zones 1,7,8 and 9 (carrying U.S. gas only) are less than 135% of filed capital costs referred to in (iii) below;

(b) in each of Zones 2, 3, 4, 5 and 6 the dollar amount by which actual capital costs are less than 135% of filed capital costs referred to in (iii) below multiplied by the proportion that the U.S. contracted volume bears to the total contracted volume in that zone.

ANNEX III

If the actual capital costs in Zone 11, after making this adjustment, are equal to or less than 135% of filed capital costs, then no adjustment is required to the percentage of tne cost of service paid by United States shippers as calculated in (i) above. If, however, after making this adjustment, the actual capital cost in Zone 11 is greater than 135% of the filed capital cost, then the proportion of the cost of service paid by United States shippers will be a fraction (not exceeding 1) of the percentage of the cost of service calculated in (i) above, where the numerator of the fraction is 135% of the filed capital cost and the denominator of the fraction is actual capital cost less the adjustments from (a) and (b) above. Notwithstanding the adjustments outlined above, in no case will the percentage of the actual cost of service borne by United States

ANNEX III

shippers be less than the greater of 66 2/3% or the proportion of the contracted volumes of Alaskan gas at the Alaska-Yukon border to the same volume of Alaskan gas plus the contracted volume of Northern Canadian gas.

iii) The "filed capital cost" to be applied to determine cost overruns for the purpose of cost allocation in (i) and (ii) above will be:

The Pipeline in Canada (Zones 1 - 9)[1/]	"Filed Capital Cost" Estimates for the Pipeline in Canada (millions of Canadian dollars)
48" - 1260 lb. pressure pipeline -	3,873
or 48" - 1680 lb. pressure pipeline -	4,418
or 54" - 1120 lb. pressure pipeline -	4,234

1/ These filed capital costs include and are based upon (a) a 1260 psi, 48-inch line from the Alaska-Yukon border to the point of possible interconnection near Whitehorse; (b) a 1260 psi, 48-inch; or 1680 psi, 48-inch; or 1120 psi 54-inch line from the point of possible interconnection near Whitehorse to Caroline Junction; (c) a 42-inch line from Caroline Junction to the Canada-U.S. border near Monchy, Saskatchewan; and (d) a 36-inch line from Caroline Junction to the Canada-U.S. border near Kingsgate, British Columbia. These costs are escalated for a date of commencement of operations of January 1, 1983.

98-226 O - 77 - 6

ANNEX III

"Filed Capital Cost" estimates for the Pipeline in Canada (millions of Canadian dollars)

Zone 11 of the Dempster Line[2/]

30" - Section of Dempster line from Whitehorse to Dawson	-	549
or 36" - Section of Dempster line from Whitehorse to Dawson	-	585
or 42" - Section of Dempster line from Whitehorse to Dawson	-	705

Details for Zones 1 - 9 are shown in the following table:

2/ The costs are escalated for a date of commencement of operations of January 1, 1985.

ANNEX III

Filed Capital Costs for the Pipeline in Canada

Zone	48" 1120 psi $ million (Canadian)	48" 1090 psi $ million (Canadian)	54" 1120 psi $ million (Canadian)
1	707	707	707
2	721	664	805
3	738	650	303
4	380	488	456
5	677	859	813
6	236	236	236
7	126	126	126
8	83	83	83
* 9	205	205	205
Total Zones 1-9	3,873	4,418	4,234

*The last compression station in Zone 9 includes facilities to provide compression up to 1440 psi.

ANNEX III

It is recognized that the above are estimates of capital costs. They do not include working capital, property taxes or the provision for road maintenance in the Yukon Territory (not to exceed $30 million Canadian).

If at the time construction is authorized, both Governments have agreed to a starting date for the operation of the Pipeline different from January 1, 1983, then the capital cost estimates shall be adjusted for the difference in time using the GNP price deflator from January 1, 1983. Similarly at the time construction is authorized for the Dempster Line, if the starting date for the operation agreed to by the Canadian Government is different from January 1, 1985, then the capital cost estimate shall be adjusted for the difference in timing using the GNP price deflator from January 1, 1985. The diameter of the pipeline in Zone 11, for purposes of cost allocation, may be 30", 36" or 42", so long as the same diameter pipe is used from the Delta to Dawson (Zone 10).

The actual capital cost, for purposes of this Annex will be the booked cost as of the date "leave to open" is granted plus amounts still outstanding to be accrued on a basis to be approved by the National Energy Board. Actual

capital costs will exclude working capital, property taxes, and direct charges for road maintenance of up to $30 million Canadian in the Yukon Territory as specifically provided herein.

For purposes of this Annex above, actual capital costs will exclude the effect of increases in cost or delays caused by actions attributable to the U.S. shippers, related U.S. pipeline companies, Alaskan producers, the Prudhoe Bay deliverability or gas conditioning plant construction and the United States or State Governments. If the appropriate regulatory bodies of the two countries are unable to agree upon the amount of such costs to be excluded, the determination shall be made in accordance with the procedures set forth in Article IX of the Transit Pipeline Treaty.

The filed capital costs of facilities in Zones 7 and 8 will be included in calculations pursuant to this Annex only to the extent that such facilities are constructed to meet the requirements of U.S. shippers.

ANNEX IV

Direct Charges by Public Authorities

*1. Crossing damages (roads, railroad crossings, etc.; this item is usually covered in the crossing permit).

*2. Road damages caused by exceeding design load limits.

*3. Required bridge reinforcements caused by exceeding design load limits.

4. Airfield and airstrip repairs.

5. Drainage maintenance.

6. Erosion control.

7. Borrow pit reclamation.

8. Powerline damage.

9. Legal liabilityfor fire damage.

10. Utility system repair (water, sewer, etc.)

11. Camp waste disposal.

12. Camp site reclamation.

13. Other items specified in enviromental stipulations.

14. Costs of surveillance and related studies as required by regulatory bodies or applicable laws.

---

* In the case of these items and all other road related charges by public authorities, total charges in the Yukon Territory shall not exceed Canadian $30 million.

ANNEX V

British Columbia Statement

The Government of the Province of British Columbia agrees in principle to the provisions contained in the Canada-United States Pipeline Treaty of January 28, 1977, and furthermore British Columbia is prepared to cooperate with the Federal Government to ensure that the provisions of the Canada-United States Treaty, with respect to non-interference of throughput and non-discriminatory treatment with respect to taxes, fees or other monetary charges on either the pipeline or throughput, are adhered to. Specific details of this undertaking will be the subject of a Federal-Provincial Agreement to be negotiated at as early a date as possible. Such Agreements should guarantee that British Columbia's position expressed in its telegram of August 31 is protected.

ANNEX V

Alberta Statement

The Government of the Province of Alberta agrees in principle to the provisions contained in the Canada-United States Pipeline Treaty of January 26, 1977, and furthermore, Alberta is prepared to cooperate with the Federal Government to ensure that the provisions of the Canada-United States Treaty, with respect to non-interference of throughput and non-discriminatory treatment with respect to taxes, fees, or other monetary charges on either the Pipeline or thoughput, are adhered to. Specific details of this undertaking will be the subject of a Federal-Provincial Agreement to be negotiated when the Canada-United States protocol or understanding has been finalized.

ANNEX V

Saskatchewan Statement

The Government of Saskatchewan is willing to cooperate with the Government of Canada to facilitate construction of the Alcan Pipeline through southwestern Saskatchewan and, to that end, the Government of Saskatchewan expresses its concurrence with the principles elaborated in the Transit Pipeline Agreement signed between Canada and the United States on January 28, 1977. In so doing, it intends not to take any discriminatory action towards such pipelines in respect of throughput, reporting requirements, and environmental protection, pipeline safety, taxes, fees or monetary charges that it would not take against any similar pipeline passing through its jurisdiction. Further details relating to Canada-Saskatchewan relations regarding the Alcan Pipeline will be the subject of Federal-Provincial agreements to be negotiated after a Canada-United States understanding has been finalized.

FPC LETTER TO THE PRESIDENT

FEDERAL POWER COMMISSION,
Washington, D.C., May 2, 1977.

The President,
The White House,
Washington, D.C.

DEAR MR. PRESIDENT: Enclosed is the recommendation of the Federal Power Commission pursuant to Section 5 of the Alaska Natural Gas Transportation Act of 1976. We have come to the following basic conclusions:

1. It is in the best interests of the citizens of the United States that a system be built in the near future to transport natural gas from the North Slope of Alaska to the contiguous United States.

2. Three competing groups have applied for a certificate of public convenience and necessity to construct and operate such a system. They are the Alaskan Arctic Gas Pipeline Company, El Paso Alaska Company, and Alcan Pipeline Company. The first and third applicants propose overland systems, while the second is a pipeline and tanker route.

3. We recommend that an overland system through Canada be selected, if such a route is made available by the Government of Canada on acceptable terms and conditions. If appropriate, discussion could be undertaken after the completion of proceedings before their National Energy Board. Until the Canadian Government has made a decision whether a land route is available, it would be premature for this Commission to recommend a route, unconditionally.

4. In making a decision between the two overland routes, it will become obvious to the reader of this recommendation that additional information is needed as well as an understanding of the intentions of the Government of Canada. Based on today's circumstances, reasonable men can disagree on the right course of action. Under present circumstances and expectations, Chairman Dunham recommends Alcan, Commissioner Watt Alcan, Commissioner Holloman Arctic, Commissioner Smith Arctic.

Commissioners Holloman and Smith recommend that an overland system through Canada be selected. Section 5(d) of the Alaska Natural Gas Transportation Act precludes the Commission from basing its recommendation upon the fact that Canadian authorities have not at this time rendered a decision authorizing a pipeline system to transport Alaskan natural gas through Canada. They, therefore, recommend approval of the Arctic proposal, conditioned upon timely affirmative decisions by the Government of Canada to make the route available and, after development, to allow simultaneous transportation of Canadian natural gas reserves from the Mackenzie Delta. In the absence of a Canadian determination that development and transportation of Mackenzie reserves should be permitted, the Alcan project should be approved, subject to the Government of Canada's making the route available on acceptable terms and conditions. In the absence of

timely and acceptable agreements with the Canadian Government to make a route available for an overland system, a United States pipeline and tanker system can be built and can deliver gas to the contiguous United States at an economical price, and the El Paso project should be selected.

5. In the absence of agreement with the Canadian Government, a United States pipeline can be built in Alaska and a tanker system can deliver the gas to the contiguous United States at an economical price.

6. Any of the proposed systems can be financed without extraordinary risk-bearing by consumers or taxpayers, if investors are allowed the opportunity to earn an adequate return commensurate with the unusual size and degree of risk in this project. Alternatively, consumers and taxpayers could assume the risks of noncompletion of the system or interruption of service in return for a lower delivered cost of gas.

In reaching these conclusions, we have exhaustively considered the massive record compiled here and material outside the record, as directed by the Alaska Natural Gas Transportation Act. Our full recommendation covers hundreds of points. In the last analysis, we find the following items to be the most important and we recommend that you and the Congress direct your attention primarily to the confirmation or modification of these conclusions.

A. At least 20 trillion cubic feet of producible natural gas exist at Prudhoe Bay in Alaska, enough to provide about five percent of our natural gas consumption for the next 25 years. These volumes are adequate to support an economical transportation system.

B. This gas must be produced and delivered to markets both for its own value as energy and because its extraction is necessary to avoid a long-term reduction in oil production from Prudhoe Bay.

C. This gas can be delivered to the contiguous United States and successfully marketed by any one of the three competing applicant groups: Arctic, Alcan and El Paso.

D. Each system will have some adverse environmental impacts. We believe all of these impacts to be acceptable, given proper precautionary measures. Arctic would involve crossing the Arctic National Wildlife Range, and other lands now little used by man. The other projects would generally follow existing utility corridors—a distinct environmental advantage.

E. An overland route can deliver each unit of gas more cheaply than a land and water route using liquefied natural gas technology. If Canadian gas is also developed, the sharing of facilities will lower Arctic's cost of service to Americans slightly below that of Alcan.

F. Calculations of Net National Economic Benefit produce the same relative results for the three systems. El Paso has an advantage in this analysis, because all of its tax payment go to the United States, and virtually all of its wage and material payments go to Americans.

G. Using our best estimate of the likely ultimate construction cost (not the applicants' figures), El Paso's system would require the least capital, with Alcan and Arctic costing somewhat more.

H. Arctic has the greatest risk of major cost overruns beyond our estimate, primarily because of its difficult winter construction schedule. El Paso is least vulnerable to such overruns.

I. Each of the systems can be constructed basically in the manner proposed, with the qualifications and conditions contained in our report.

J. Each of the systems should operate reliably once service begins. El Paso has a slightly higher likelihood of service interruption due to its complex nature and greater seismic risk.

K. El Paso would be the easiest system to finance because of its slightly lower initial cost and because of Federal guarantees of bonds for its tankers under Title XI of the Merchant Marine Act.

L. All of the above cost conclusions assume the simultaneous development and transportation of Canadian reserves in the Mackenzie Delta. Arctic's proposed route has the advantage of passing directly through this area. Should the Canadian Government decide not to proceed with the development of those reserves at this time, the overall balance of cost advantages shifts to Alcan.

M. Should additional gas be found in the vicinity of the transportation system, expansion capability could become important. Arctic can expand to deliver up to 3.5 billion cubic feet per day (Bcfd) from Prudhoe Bay, at a small cost. Any such expansion would lower the unit cost of gas delivered. Alcan is designed to start at 2.4 Bcfd, but can expand to 3.2 Bcfd at a small additional cost. El Paso can also expand its pipeline deliveries to 3.2 Bcfd at low cost, but its costs for ships, terminal facilities, and operating expenses will rise more rapidly proportionate to increased deliveries.

N. The North Slope gas should be distributed as widely as possible throughout the United States. Wide distribution will encourage broad-based financing for the chosen project, an important consideration in an undertaking of this size. Furthermore, because there is always some threat of service interruption, no area of the country should be allowed to become too heavily dependent on the Alaskan gas.

O. A choice must be made as to who shall bear the ultimate risks of project failure, service interruption, or massive cost overruns. If investors are to bear them, they will expect a commensurate return. If they do not receive such a return, the project cannot be privately financed. If consumers or taxpayers bear the risks, their charges, in the event of success, should be lowered in return for the service they have rendered. Our recommendation outlines the dimensions of each plan and contains specific suggestions for implementing either approach.

The decision now before you, we recognize, will significantly influence this Nation's energy future. Therefore, beyond providing our best thinking in these recommendations, the commissioners and staff of the Federal Power Commission stand ready to assist you in every way.

Sincerely yours,

RICHARD L. DUNHAM,
Chairman.

JAMES G. WATT,
Vice Chairman.

DON S. SMITH,
Commissioner.

JOHN H. HOLLOMAN III,
Commissioner.

FPC NEWS RELEASE NO. 23113

FEDERAL POWER COMMISSION,
Washington, D.C., May 2, 1977.

FPC RECOMMENDS OVERLAND ROUTE FOR TRANSPORTATION OF ALASKAN NATURAL GAS

The Federal Power Commission today recommended an overland pipeline route to bring Alaskan natural gas to contiguous U.S. markets, but split on which of the two proposed overland routes to specifically recommend.

Chairman Richard L. Dunham and Commissioner James G. Watt recommend the Alcan proposal, and Commissioners Don S. Smith and John H. Holloman III recommended the Arctic Gas proposal. All three proposals are described in the accompanying fact sheet (News Release No. 23112).

The Commission found that all three proposals are technically and economically feasible and that a system should be built to bring the natural gas to the lower 48 market. It said the benefits of Alaskan gas would help meet the energy needs of our society and fully justify the costs and risks involved.

However, it found an overland route preferable because of its greater reliability, easier expansibility, greater efficiency in terms of gas consumed in route, and lesser environmental impact.

The Canadian portions of the proposed overland routes are still subject to approval of the Canadian Government. The Commission said that in deciding between the two overland routes, additional information is needed as well as an understanding of the intentions of the Government of Canada. "Based on today's circumstances, reasonable men can disagree on the right course of action," the Commission said.

Commissioners Holloman and Smith pointed out that the Alaska Natural Gas Transportation Act precludes the Commission from basing its recommendation on the fact that Canadian authorities have not at this time rendered a decision authorizing a pipeline system through Canada. They therefore recommend approval of the Arctic Gas proposal, conditioned on favorable decisions by the Canadian government to make the route available and permit Canadian natural gas reserves from the Mackenzie Delta to be transported by the same system. Absent a favorable decision concerning the Mackenzie Delta reserves, they would recommend approval of the Alcan project. If Canada disallows an overland pipeline route, they would approve the El Paso project.

Today's approximately 500-page recommendation follows over three years of hearings and consideration by the FPC, and compilation of a 45,000-page record. FPC Administrative Law Judge Nahum Litt last February 1 recommended approval of the Arctic Gas pro-

posal. The Commission heard oral argument in the proceeding the first week of April.

The Alaskan Natural Gas Transportation Act of 1976 required the FPC to make a recommendation to the President by May 1, which fell on a Sunday. The President is to make a recommendation to Congress by September 1, but may postpone his decision until up to December 1, at his discretion.

The Commission said in making today's recommendation it is acting in an advisory capacity to the President, setting forth the strengths and weaknesses of the various options.

The three competing applications are by Alaskan Arctic Gas Pipeline Company, known as the Arctic Gas Study Group, a consortium of U.S. and Canadian companies; by El Paso Alaska Company; and by Alcan Pipeline Company.

The Pruhoe Bay Field contains the largest unit of reserves yet discovered on the North American continent—virtually every estimate exceeds 20 trillion cubic feet of proven producible reserves, enough to provide about 5 percent of our gas consumption for the next 25 years. The gas can be produced for sale in four or five years.

The Commission found the system approved should be designed to carry initially 2 to 2.5 billion cubic feet daily, with expansibility in the 1 to 1.5 range. Under the three proposals, the earliest the gas could reach the lower 48 states is 1981 (under Alcan's proposal).

The cost of the three projects were estimated by the applicants in the $6.5 to $6.7 billion range, in 1975 dollars. By the time the project is built the impact of inflation undoubtedly would drive the cost in nominal dollars to $10 billion or more. There are risks of cost overruns and delays in completion, it said, but in each instance the risk is well within an acceptable range. There is virtually no chance that any system would become so costly as to be uneconomic, it stated.

The Commission recommended rolled-in pricing be used, meaning the price of the Alaskan gas would be averaged in with all other gas in the purchaser's system. This would assist in obtaining the critical financing, the FPC noted. Federal financial assistance was not recommended by the Commission. However, it said if this is to be avoided, innovative approaches will be needed to meet the greatest financing challenge ever considered by the FPC. A choice must be made, the FPC said, as to who shall bear the ultimate risk of project failure, severe interruption, or massive cost overruns—private investors or consumers. Should the former be chosen, the rate of return would have to be an adequate incentive to invest—in the 11 to 18 percent range. Should consumers and taxpayers bear the risk, their charges should be lower.

It is imperative that the price of Prudhoe Bay gas be established as soon as possible, the FPC declared, and proposed to establish in the near future a proceeding to determine that price. It will also examine pricing mechanisms other than setting a fixed price, it added, such as formula pricing. However, it said that since its authority to approve such a pricing procedure could be challenged, it urged the President to submit legislation to authorize it to determine field or wellhead rates for Prudhoe Bay gas on the basis of market factors and alternative fuel prices.

Adverse environmental impacts of all three projects can be substantially avoided or mitigated, the FPC found. All three applicants demonstrated their technical ability and determination to reduce to acceptable levels the environmental impacts.

Of the three proposed systems the Commission concluded that Alcan promises the least environmental impact, if proper mitigative actions are taken. However, it rejected Alcan's contention that alignment in an existing utility corridor is a compelling reason to choose one transportation system over another. While some construction and operation impacts would be smaller, the FPC said, the overall decrease is not substantial. Each system must be judged on its own total impact, the Commission stated.

Substantial evidence in the record supports the feasibility of winter construction, the FPC said, which Arctic Gas would use wholly and the other two would use in part. Machines can be prepared and men equipped to enable construction to proceed in all except the most severe conditions, it said. Winter construction poses greater economic risks than summer construction, the FPC stated, but it is clear that in Arctic regions winter construction is environmentally sounder.

The Commission said it intends to implement the requirements for a western leg to deliver gas directly to the U.S. west coast, but at this time does not believe it necessary to make a final decision as to what new facilities would be needed. That decision can be deferred until about two years before delivery is to begin, it said. However, the Commission found the Oxnard, Calif., site should be the first choice for a west coast ship terminal and regasification facilities should El Paso be granted a certificate.

90-226 O—77——7

FPC NEWS RELEASE NO. 23112

[No. 23112 (accompanies FPC Release No. 23113)]

FEDERAL POWER COMMISSION,
Washington, D.C., May 2, 1977.

ALASKAN NATURAL GAS FACT SHEET

This Federal Power Commission proceeding involves three competing projects proposing significantly different approaches to delivering natural gas from the Prudhoe Bay Area of Alaska's North Slope to markets in the lower 48 states. The 200-square mile Prudhoe Bay Field is estimated to contain 22.5 trillion cubic feet in proven reserves of natural gas.

Under the Alaska Natural Gas Transportation Act of 1976 (Public Law No. 94–586), passed by Congress October 1, 1976, and signed into law by the President October 22, the FPC has made its recommendations to the President today on the selection of a transportation route for the gas.

The different proposals considered by the Commission are:

Alaskan Arctic Gas Pipeline Company (CP74–239, et al.).—This project involves the construction of about 3,600 miles of new pipeline and about 900 miles of looped (connected and parallel to existing lines) pipeline. The pipeline, ranging in diameter from 30 to 48 inches, would pick up United States reserves in Prudhoe Bay, Alaska, and Canadian reserves in the Mackenzie Delta, Northwest Territories, and proceed to Caroline Junction, Alberta, where the system would divide, with one leg extending into the Pacific Northwest down to California, and the other crossing the U.S. border into Montana and southeast into Illinois. Gas would move to eastern markets by displacement. This project includes transmission facilities proposed by several other Canadian and American companies—Canadian Arctic Gas Pipeline Limited, Alberta Natural Gas Company Limited, Pacific Gas Transmission Company, Pacific Gas and Electric Company, and Northern Border Pipeline Company.

The project facilities are designed to deliver at least 2.2 billion cubic feet of gas daily to U.S. markets and will cost an estimated $6.73 billion (U.S. share of total cost expressed in 1975 dollars).

El Paso Alaska Company (CP75–96).—This company would build an 809-mile 42-inch pipeline from Prudhoe Bay along the Alyeska oil pipeline corridor to a liquefaction facility at Point Gravina on the south coast of Alaska. The liquefied natural gas would be transported across water by a fleet of 8 cryogenic tankers 1,900 nautical miles to Point Conception, California, where it would be regasified. Gas would flow to midwest and east markets by displacement. The project is estimated to cost $6.57 billion (expressed in 1975 dollars) and would be capable of delivering an estimated 2.1 billion cubic feet of gas per day.

Alcan Pipeline Company (Alcan II proposal) and Northwest Pipeline Corporation, along with several Canadian companies (Foothills Pipe Lines Ltd., Westcoast Transmission Company Limited, Alberta Gas Trunk Line Limited), propose construction of about 3,900 miles of new pipeline and 900 miles of looped pipeline. A 48-inch pipeline would pick up Prudhoe Bay reserves and follow the Alyeska oil route as far as Delta Junction, Alaska, and from there would run parallel to the Alcan Highway partway to the James River Junction in Alberta. From James River, gas destined for eastern U.S. markets would be transported through a 42-inch pipeline to Monchy, Saskatchewan, and gas destined for the western United States would be transported through a 36-inch pipeline to Kingsgate, British Columbia. Alcan plans to use the same lower U.S. facilities as those proposed by Arctic Gas. The project would cost an estimated $6.76 billion (in 1975 dollars) and would deliver at least 2.2 billion cubic feet per day.

In its original application, *Alcan Pipeline Company*, Northwest Pipeline Corporation, and the Canadian companies involved proposed construction of about 3,000 miles of new pipeline and 1,600 miles of looped pipeline. The pipeline, ranging in diameter from 30 to 48 inches, would pick up Prudhoe Bay reserves and follow the Alyeska oil pipeline route as far as Delta Junction, Alaska, and from there would parallel the Alcan Highway to a connection with Canadian pipelines in British Columbia and Alberta, where the system would split the gas between western U.S. and midwest U.S. shippers. Gas would also flow to the east by displacement. This system would deliver approximately 2.0 billion cubic feet per day and would deliver gas both into the Pacific Northwest and across a route similar to the Artic Gas project extending from northeastern Montana into Illinois. The proposed project will cost an estimated $6.28 billion (as filed).

In connection with both the original and revised Alcan proposals, an associated, although independent project, Maple Leaf, is proposed to deliver Canadian reserves from the Mackenzie Delta to Southern Canadian markets.

CHRONOLOGY

March 21, 1974—Alaskan Arctic Gas Pipeline Company application filed.

September 24, 1974—El Paso Alaska Company application filed.

January 23, 1975—FPC order consolidating both applications (in Docket No. CP75-96, et al.).

April 7, 1975—Hearings began before FPC Administrative Law Judge Nahum Litt.

November 21, 1975—FPC staff Draft Environmental Impact Statement issued.

April 7, 1976—Final Environmental Impact Statement issued.

July 9, 1976—Alcan Pipeline Company and Northwest Corporation application filed.

September 1976—Supplemental Final Environmental Impact Statement issued.

November 12, 1976—Hearings concluded. (There were a total of 253 days of hearings resulting in 44,458 pages of transcript together with numerous exhibits.)

December 7, 1976--Final Position Brief of the Commission Staff issued.

December 14, 1976—FPC issued Order No. 558 prescribing procedures pursuant to the Alaska Natural Gas Transportation Act of 1976.

February 1, 1977—Initial decision issued by Judge Litt, recommending approval of Alaskan Arctic Gas Pipeline Company project.

March 1, 1977—Briefs on exceptions to the Judge's decision filed by FPC staff and parties in the proceeding.

March 8, 1977—Alcan Pipeline Company filed amended application.

March 22, 1977—Supplemental information filed by parties to the proceeding.

April 4–8, 1977—Oral argument held before Federal Power Commission.

April 8, 1977—FPC staff report on Alcan revised proposal and other supplemental information filed.

May 2, 1977—The Federal Power Commission made its recommendation to the President.

September 1, 1977—The President to make his recommendation to Congress. He may postpone his decision until up to December 1, at his discretion.

Sixty days after the President's recommendation, Congress may enact a joint resolution. The Alaskan Natural Gas Transportation Act of 1976 (in section 8) provides dates for further executive and legislative review, if necessary.

Maps of the proposed Alaskan natural gas transportation systems accompany this fact sheet.

REPORT OF THE ATTORNEY GENERAL TO THE PRESIDENT

JULY 1977.

This Report is submitted to the President pursuant to Section 6 of the Alaska Natural Gas Transportation Act of 1976. Section 6 of the Act directs that any Federal officer or agency may submit written comments to the President with respect to the recommendation and report of the Federal Power Commission and alternative methods for transportation of Alaska natural gas for delivery to the contiguous states.[1] This Report is principally concerned with item (6)—the impact upon competition of the respective proposed transportation systems.

The Department of Justice has done an extensive analysis of this subject in the Report of the Attorney General submitted to the Congress pursuant to Section 19 of the Act. Rather than repeat what already has been said therein, we are appending a copy of our Report to Congress. We believe that the contents of that Report fully set forth the antitrust implications of the various proposed projects.

The remainder of this Report will summarize briefly the areas of agreement or disagreement with the Federal Power Commission's competitive analysis in its Recommendation to the President. Also, in accordance with Section 6(c) we discuss the question of waiver of law.

I. IMPACT ON COMPETITION: SUMMARY OF RECOMMENDATIONS OF THE FEDERAL POWER COMMISSION AND THE DEPARTMENT OF JUSTICE

The Federal Power Commission concludes generally that the certification of any one of the proposed systems will not have a significant impact upon competition among pipelines. The Department has reached the same overall conclusion.

The Commission has encouraged the participation of producers of substantial amounts of gas in the pipeline joint venture in order to contribute their significant financial resources to aid in the financing of the pipeline. The Department disagrees. We have recommended in the Report to Congress that an ownership interest, or participation in any form in the transportation system, by producers of significant amounts of natural gas, or their subsidiaries or affiliates, should be prohibited. The license to be issued to the selected system should contain a condition which prevents participation in any manner by such gas producers.

The Federal Power Commission has stated that it is strongly in favor of widespread distribution of Alaskan natural gas in order to limit reliance on Alaskan gas, to create incentives for participation in displacement arrangements and to provide easier private financing. The Department has stated that if, because of continued wellhead price

[1] Attorney General Bell did not participate in the preparation of this Report due to conflict of interest considerations. Responsibility for this Report was delegated by Mr. Bell to Deputy Attorney General Flaherty.

regulation, market forces are not permitted to operate to allocate gas in the most efficient manner, then the possibility of a regulatory allocation mechanism should be examined if widespread distribution of Alaskan natural gas is believed to be in the national interest.

The Commission is of the view that Section 13(a) imposes common carrier obligations upon the selected transportation system. The Commission indicates that this is a procompetitive result but may impact adversely upon the ability of the system to secure private financing. The Department disagrees. Section 13(a) of the Act provides for equal access to the gas transportation system based upon ownership or lack thereof. But it is unclear whether this provision was intended to create common carrier status for the transportation system. It is our view that common carrier status for all facilities constructed or utilized as an integral part of the system carrying gas to the lower 48 states is desirable and Section 13(a) should be clarified to unambiguously create such status. Additionally, we do not view Section 13(a) to be an impediment to private financing. Moreover, to ensure the equal access provided for by Section 13(a), Congress should consider legislation to grant the Commission, or its successor agency, the authority to order prorationing of pipeline capacity among shippers when gas is available in excess of pipeline capacity.

The Federal Power Commission approves of displacement arrangements as the most efficient mechanism for distribution of the Alaskan gas. The Commission, however, is fearful that such arrangements could create the potential for collusive market conduct. Thus the Commission would permit only those practices which are indispensable to the successful operation of the displacement procedure. The Department agrees that the efforts to work out displacement schemes may produce collusive behavior. We have recommended that if a system requiring displacement of gas is authorized, Government agencies should monitor any meetings of the transmission companies concerning reallocation. The plans for the meetings and the displacement programs resulting from the meetings should be subject to scrutiny and approval by Government agencies.

The Commission indicates that as a result of the implementation of an all-events, cost-of-service tariff, the producers may be able to exercise market power over the shippers if the producers know whatever price they charge will be passed on to the consumer. The Department, on the other hand, is concerned that the proposed pipeline capacities be evaluated carefully since the potential for adoption of an all-events cost-of-service tariff has diminished the incentives of the proponents to properly determine and propose the most efficient pipeline size.

The Commission indicates that the contracting process for the purchase of Alaskan gas has not been competitive. Among the elements the Commission points to as indicative of the noncompetitive nature of this process is the existence of side arrangements. The Commission has concluded that in the absence of full-fledged price competition, the producers have used side arrangements as a means of favoring companies which can provide other benefits. The use of a widespread distribution scheme may reduce the likelihood of such restrictive side arrangements. The Department's view is somewhat different. To minimize the distortion of Commission regulation from side arrangements for

various forms of compensation collateral to sales contracts for Alaskan gas, such arrangements should be disclosed and subjected to Commission scrutiny. As long as there is wellhead price regulation, the Commission, or its successor agency, should examine carefully each Alaskan gas purchase contract and disapprove or condition each such contract that it finds not in the public interest. In addition to the recommendations in the Report to Congress, we note further that the Commission should assess the impact of such arrangements in various producing fields because of the widespread existence of "favored-nation" clauses. Price increases which at first may appear innocuous, may have a greater impact throughout the field due to price increases in other contracts with such clauses.

In summary, while the Department agrees with the Commission's overall conclusion that certification of any of the proposed transportation systems will not have any significant impact upon competition, we have indicated our differences with other conclusions. We urge the President to consider each of these matters carefully and to append to any license the conditions we have suggested in our Congressional Report and which have been reiterated in this Report.

II. Waivers of Law

Section 6(c) of the Act directs each Federal officer or agency to report to the President actions to be taken by such officer or agency necessary or related to the construction and initial operation of the approved transportation system and to include recommendations with respect to any provision of law to be waived upon recommendation by the President to the Congress. It is the Department's view that no action must be taken by the Attorney General under section 9(a) of the Act—action which is necessary or related to the construction and initial operation of the approved transportation system. Furthermore, it is the Department's view that none of the antitrust laws should be waived by the President.

Section 14 of the Act states:

> Nothing in the Act, and no action taken hereunder, shall imply or effect an amendment to, or exemption from any provision of the antitrust laws

It is plain from this provision that Congress did not mean for the antitrust laws to be waived in any manner and intended that they remain in full force and effect.

Many of the competitive effects indicated in the accompanying Report are prospective in nature. Thus, their full impact may not be known until the transportation system is built and operating. In light of this situation, it is the Department's view that none of the antitrust laws should be waived. The transportation system and its owners ought to be subjected to the full panoply of the antitrust laws and their possible enforcement should any violations of these laws appear in the future.

III. Conclusion

I conclude that antitrust considerations do not militate against selection of any of the three proposed projects as the transportation system for moving Alaskan natural gas to the lower 48 states; nor do

competitive considerations point to selection of one of the three projects in preference of the other two. The problems we have identified in this Report and our Report to Congress may impact on any selected project and, therefore, do not make one project seem more desirable than the others.

We have proposed several conditions which ought to be appended to a license issued to any of the proposed transportation systems. These recommendations are in the Report to Congress appended to this Report and are summarized in the Conclusion of the appended Report.

Respectfully submitted.

PETER F. FLAHERTY,
Deputy Attorney General.

REPORT OF THE ATTORNEY GENERAL TO CONGRESS

(JULY 1977)

EXECUTIVE SUMMARY

This report is submitted to Congress in compliance with Section 19 of the Alaska Natural Gas Transportation Act of 1976. That provision requires the Attorney General to conduct a thorough study of the antitrust issues and problems relating to the production and transportation of Alaskan natural gas.

Based on our analysis of all information currently available, we find that antitrust considerations do not militate against selection of any of the three proposed projects as the transportation system for moving Alaskan natural gas to the Lower 48 states; nor do competitive considerations point to selection of one of the three projects in preference to the other two. Although we have identified several potential antitrust problem areas associated with the projects, these problems may impact on any project that is selected and thus do not make one project seem more desirable than the others.

This report has identified several potential competitive problem areas, which can be addressed through: (1) the imposition of tions upon the license issued to whichever project is chosen; (2) enactment of legislation; and (3) collateral action by the Federal Power Commission, or its successor agency. Since some of the identified problems are not directly associated with the transportation of natural gas but are associated with the sale of natural gas, these problems would have to be addressed in the context of the required examination of the gas purchase contracts.

The report first provides a general introduction to the three proposed projects, the methods of transportation and routes proposed and the participants in each proposed project. There are two overland pipeline projects proposed by Alcan and Arctic Gas, and a combination pipeline and liquified natural gas tanker system proposed by El Paso.

(1) The Alcan route follows the Alaska oil pipeline route to Fairbanks and then follows the Alcan Highway through Canada. Alcan has proposed two different sized pipelines. Originally Alcan proposed a 42-inch pipeline but more recently has proposed a 48-inch pipeline similar to that of Arctic Gas.

(2) The Arctic Gas route proceeds east from the North Slope to the Mackenzie Delta of Canada, where it is expected additional gas reserves will be developed. The route then proceeds south through Canada to the United States border.

(3) The El Paso project calls for a pipeline to follow the Alaska oil pipeline to Point Gravina on Prince William Sound. There the gas would be converted to liquid natural gas and shipped by tanker to the coast of California.

(a) *Arctic Gas.*—
Alaska Arctic Gas Pipeline Company
Canadian Arctic Gas Pipeline Company, Ltd.
Alberta Natural Gas Company, Ltd.
Northern Border Pipeline Company
Pacific Gas Transmission Company
Pacific Gas and Electric Company

The first two above are shell companies, formed to construct and operate the pipeline in Alaska and Canada. Owners of the two companies are:

American Members:
Columbia Gas Transmission Corporation
Michigan Wisconsin Pipe Line Company
Natural Gas Pipe Line Company of America
Northern Natural Gas Company
Pacific Gas & Electric Company
Pacific Lighting of California
Panhandle Eastern Pipe Line Company
Texas Eastern Transmission Corporation

Canadian Members:
Alberta Natural Gas Company, Ltd.
The Consumers' Gas Company
Canada Development Corporation
Gulf of Canada, Ltd.
Imperial Oil, Ltd. (a 70 percent owned subsidiary of Exxon)
Northern and Central Gas Company, Ltd.
Shell Canada, Ltd.
TransCanada PipeLines, Ltd.
Union Gas, Ltd.

(b) *Alcan.*—
Alcan Pipeline Company (a wholly-owned subsidiary of Northwest Pipeline Company)
Alberta Gas Trunk Line Company, Ltd.
Alberta Gas Trunk Line (Canada), Ltd.
Westcoast Transmission Company, Ltd.
Foothills Pipeline (Yukon), Ltd.

(c) *El Paso.*—The El Paso project is proposed by El Paso Alaska Company, a wholly owned subsidiary of El Paso Natural Gas Company.

The gas transportation and distribution industries are not highly concentrated on a national basis at this time. Although standard industry concentration measures are less meaningful in the natural gas industry because it is pervasively regulated and because pipelines are to a great extent natural monopolies; these ratios and individual company shares do give an indication of the relative industry positions of the prospective Alaskan natural gas participants.

The proponents of the El Paso project control 8.2 percent of gas supplies from all sources (as of 1974), the Alcan American proponent controls 4.3 percent and the Arctic Gas American proponents control 36 percent of gas supplies from all sources. Although there is some danger that the sponsors of the Arctic Gas project, if they were the only purchasers of Alaskan gas, could use their control of Alaskan gas in combination with their control of other gas supplies to manipulate

displacement plans to their own advantage or to affect regional competition among pipelines, regulation by the Federal Power Commission minimizes this danger.

Present Federal Power Commission regulation of city gate prices also appears to preclude an opportunity for competitive abuse by the gas producers or transmission companies provided the price ceilings set by Federal Power Commission regulation are effective. However, if the regulation of the wellhead price of gas were relaxed and the Alaskan gas producing areas were workably competitive, producer ownership or control of the transportation system could circumvent Federal Power Commission regulation of the pipeline and monopoly profits could be taken by the integrated company by transferring some or all of the profits stemming from the transportation monopoly to unregulated upstream production operations through denial of access to non-owners and restricting downstream supply. If the regulation of the wellhead price of gas were relaxed and the Alaskan gas producing areas were not workably competitive, but were instead characterized by producer market dominance, gas supplies could be restricted at the production stage without any need to derive market power from the pipeline. However, such market power is not necessarily permanent and could be reduced by discovery and development of new fields by other producers, creating a situation where an integrated producer/pipeline owner would seek to restrict access and throughput to take monopoly profits. Therefore, we recommend that an ownership interest, or participation in any form in the transportation system, by one or more gas producers of significant amounts of gas be prohibited. The license to be issued to the selected system should contain a condition that prevents participation in any manner by such gas producers.

Ownership of a transportation system by the buyers of gas will not result in any potential anticompetitive conduct as long as Federal Power Commission regulation of city gate prices continues in the present mode, which it appears likely to do. If the regulatory scheme changes, potential monopsony problems can be cured by appropriate regulatory action. Therefore, we do not oppose ownership of the transportation systems by the buyers of the gas.

During the period from 1971 to 1975 the major North Slope producers, Exxon, ARCO and BP/Sohio entered into agreements to negotiate for the sale of their natural gas with various transmission companies, all members of the Arctic Gas consortium. These agreements called for advance payments from the transmission companies to help the producers develop the North Slope fields. In December, 1975, the Federal Power Commission struck down all advance payment contracts entered into after December 28, 1973, as not in the national interest. Thus, there is currently no plan for distribution of Alaskan gas.

Collateral to these advance payment agreements, the transmission companies entered into a variety of side arrangements with the producers. The side arrangements provided for renegotiation of existing gas sale contracts in the lower 48 states to raise prices or to permit revenue sharing between producer and pipeline with respect to existing production. These side arrangements are clear evidence of evasions of wellhead price regulation and demonstrate the extreme

difficulty of holding down the price of a scarce resource. Some pipeline companies would be disadvantaged in seeking to gain access to North Slope gas if these arrangements were to continue, since not all pipeline companies have existing relationships that can be altered or other goods or services to barter in addition to paying the wellhead price. The competitive effects of this disadvantage, if any, are uncertain. It may well be that the Federal Power Commission should require disclosure of all collateral considerations in our gas purchase agreement. The Commission could then carefully examine each Alaskan gas purchase contract and disapprove or condition any such agreement that it finds not to be in the public interest.

With current Federal Power Commission regulation of wellhead gas prices, competitive forces cannot operate to distribute gas in the most efficient manner. If a wide distribution of Alaskan natural gas is deemed important, it may be necessary to create a regulatory allocation mechanism.

Competition among pipelines for existing customers and new customers may exist in regional markets. Regional competition can be an important complement to regulation and its importance has been recognized by Congress, the courts and the natural gas industry. The potential for this competition should be preserved to the greatest extent practicable. Several problems associated with the operation of an Alaskan natural gas transportation system arise because of potential effects on this regional competition.

Equal access to the transportation system, as well as other competition rules, would be required if producers are permitted to participate in the Alaskan natural gas transportation system. Moreover, even where producers are not owners, equal access to a transportation system retains some importance as a means to preserve regional competition among pipeline companies by preventing owners of the transportation systems from denying or restricting access to other pipelines that might compete in regional markets.

Section 13(a) of the Alaska Natural Gas Transportation Act provides for equal access to a proposed transportation system. Although the Federal Power Commission interprets this provision to mean that an Alaskan natural gas transportation system must be operated as a common carrier, it is not clear this was the intention of Congress. Read literally, the statute merely provides that access cannot be denied based on ownership or the lack thereof. We believe that those facilities (pipelines, LNG facilities, etc.) constructed or utilized as an integral part of the system carrying gas to the lower 48 states should be operated as common carriers, with equal access thereto available to all purchasers and shippers of Alaskan natural gas. Congress ought to clarify the ambiguous language of existing Section 13(a) to clearly state that the Alaskan natural gas transportation system be operated as a common carrier.

Section 13(a) does not require the transportation system to implement a prorationing scheme in the event the system achieves full capacity, nor does it permit or require any government agency to order such prorationing. Such prorationing during the period of construction of additional capacity is necessary to insure no shipper may be competitively disadvantaged. To insure the equal access provided for under Section 13(a), we recommend that Congress consider granting

the Federal Power Commission authority, where gas is available in excess of pipeline capacity, to order prorationing of pipeline capacity among shippers.

It has been argued that retaining Section 13(a) may prove to be an impediment to financing. We find that Section 13(a) will not be such an impediment, since pipeline companies will be willing to invest in order to insure the construction of such a system. In addition, the possibility of receiving the substantial cash flows from the system which would result from ownership is another incentive to invest in the system.

It is likely that much of the Alaskan gas will be delivered throughout the lower 48 states by displacement rather than by direct delivery. Displacement is a process that would allow Alaska gas to be supplied to conveniently located customers of other pipeline systems that, in turn, could use their "displaced" gas to serve customers of other pipelines. Such a displacement scheme provides considerable savings and ease of delivery but also creates two potential problems. First, a transmission company could thwart the displacement plan by refusing to cooperate and displace gas in its system. To remedy this problem we recommend that legislation be enacted to give the Federal Power Commission, or its successor agency, authority to order participation in displacement programs for Alaskan natural gas.

Displacement also presents potential for anticompetitive activity because implementation of a displacement program requires pipeline companies to meet to agree upon supply reallocation. Obviously, the potential for anticompetitive agreements in the implementation of such a process exists, and almost regardless of the actual risks of such agreements being made, the public perception that such possibilities exist requires some antitrust protection.

This is not an insuperable problem. If the companies do no more than is reasonably necessary to effect the displacements, no antitrust issues should be presented. A method of insuring that no anticompetitive discussions or acts take place is to have interested government agencies monitor such meetings and to have proposed allocation plans subject to government review and approval.

An all-events cost-of-service tariff has been proposed that would guarantee to the owners full reimbursement of all costs associated with the operation of the transportation system. These costs would be passed on to the consumer. These guarantees extend to all unit transportation costs, even if underutilization of the pipeline makes the unit cost excessively high. Guaranteeing these costs would eliminate incentives for the transportation system owners to prudently determine pipeline size and propose the most efficient pipeline based upon expectations of deliverability.

The deliverability of the Prudhoe Bay reserves is unsettled and highly disputed. The forecasts vary substantially; however, 2.0 Bcf/d appears to be the most likely rate of deliverability. The producers have stated their opposition to any form of deliverability guarantee and, since gas and oil production are related, may in the future restrict or eliminate gas production in order to increase the production of higher-priced oil. With the best deliverability estimate being 2.0 Bcf/d and the possibility of less gas production, there is potential for under-

utilization of the transportation system. Underutilization will mean higher unit costs of transportation and under the proposed tariff, this higher transportation cost will be borne by the consumer. Deliverability should be carefully evaluated before a system is selected, and the high cost of constructing a system is undertaken. Further, the sizing of the proposed pipelines should be carefully evaluated, since the proposed tariff guarantees may have diminished incentives on the part of the proponents to determine and propose the most efficient pipeline size.

INTERAGENCY TASK FORCE ON ENVIRONMENTAL ISSUES

(JULY 1, 1977)

EXECUTIVE SUMMARY

ENVIRONMENTAL ISSUES

The Arctic Gas route would cross the Arctic National Wildlife Range (ANWR), which was established for the purpose of preserving its specific unique wildlife, wilderness, and recreational values. Its possible inclusion into protected wilderness status is still pending. The proposed pipeline construction activity would eliminate the impacted portion of the ANWR from wilderness status consideration.

Arctic Gas has not adequately demonstrated that they would be able to construct a pipeline from Prudhoe Bay through the Mackenzie Delta area within the proposed time frames; that their proposed mitigative measures would work as effectively as predicted; or that impacts to animal species and natural ecosystems would be short term or minimal. They have not demonstrated that their unconventional technology would work adequately in minimizing impact, or that if damage should occur, mitigative measures would be capable of restoring impacted habitat or animal populations. If the integrity of the ANWR were to be violated by the Arctic Gas pipeline, there could be a diminished degree of incentive in the future to restrict additional exploration or development in the impacted areas.

There is a continuing international cooperative effort to establish an international wildlife/wilderness reserve which would encompass the ANWR and the adjacent sensitive habitat in Canada.

The El Paso route includes both overland pipeline and ocean tanker transportation systems. A liquefied natural gas (LNG) facility in Alaska and one for regasification in California present serious potential for environmental degradation.

The proposed LNG plant at Gravina Point, Alaska would lie within a zone of very high seismicity in the Chugach National Forest. It is located on the shore of Prince William Sound where abundant commercial fisheries and other marine resources are found. An acceptable solution to the heated water discharge has not yet been proposed. El Paso has not presented baseline oceanographic studies necessary to determine if the proposed sea water cooling system is environmentally acceptable. Impacts from the proposed once-through cooling system include: (1) mortality of all living organisms trapped within the cooling system; (2) thermal shock; (3) changes in migration and feeding behavior of affected marine biota; and (4) the effect of toxic substances released in the effluent. The Environmental Task Force concludes that the proposed once-through cooling system would result in

severe damage to the marine biota, but the Maritime Administration advises that alternatives exist which could permit the LNG facility to become environmentally compatible with Prince William Sound.

The final segment of the pipeline route to Prince William Sound would cross about 33 miles of potential wilderness area in the Chugach National Forest. Although this area is recognized as a defacto wilderness, it is not considered as fragile or unique as the ANWR. The Gravina Point LNG facility would destroy at least one bald eagle nest and disrupt approximately 15 other nest sites and some winter feeding ground for the Sitka black-tailed deer.

Cape Starichkof, located on Cook Inlet, has been proposed as an alternative LNG terminal site. This alternative would avoid the defacto wilderness area within the Chugach National Forest. The route to Cook Inlet would parallel the southeastern boundary of Mount McKinley National Park and cross the Kenai National Moose Range. Seismic conditions are similar to those found at Gravina Point. The Environmental Task Force believes that further investigations of the Starichkof route and site are needed before a final choice is made between the Gravina and Starichkof options.

The proposed regasification sites would be located in southern California, an area of high seismicity. El Paso's proposed site is at Point Conception, which is a rural, grazing area; while the Oxnard alternative site is in an area already zoned for industrial development.

A unique mixture of northern and southern marine species exists off Point Conception. As proposed, the cooled water discharge from the plant would cause ecological changes in the outfall area, particularly critical to this unusual marine environment. The Oxnard alternative site does not have this unique marine community.

In addition, the Oxnard plant's chilled water discharge could be used at the Ormond Beach Generating Station to bring the combined effluent to approximately ambient seawater temperature.

The pipeline needed to connect the Point Conception regasification plant to existing transportation systems would traverse approximately 250 miles, crossing unstable soils within the Los Padres National Forest. By contrast, the connecting route from Oxnard would be approximately 50 miles long, with about 95 percent of the route following existing corridors.

The task force concludes that the Oxnard alternative site is environmentally preferable. However, pending California legislation would require a remote site for safety considerations. Only Point Conception would satisfy this requirement.

Although the Alcan route does not cross such critical environmental areas, as the ANWR and Chugach National Forest, each a de facto wilderness, there are other significant environmental concerns. Alcan's summer construction could cause unnecessary permafrost degradation. The task force believes that summer construction could be accomplished in an environmentally acceptable manner if scheduled during the spring and fall months when temperatures are near or below freezing. Such scheduling is feasible since only two to five percent of Alcan's Alaska route involves critical permafrost areas.

In northern Alaska, the Alcan and El Paso routes utilize the existing trans-Alaska oil pipeline (TAPS) corridor. They would further impact the migration route of the Central Arctic Caribou Herd and

Dall sheep near Atigun Pass, which is a critical salt lick and lambing area.

In Canada, the Alcan route would parallel the Alaska Highway through the Kluane National Park at the base of Sheep Mountain (Dall sheep area) and pass near the proposed Pickhandle Lake International Biological Program Ecological Reserve (sensitive waterfowl and moose area). The route also passes through grizzly bear denning and elk overwintering areas. Construction scheduling could avoid sensitive time periods for most of these species. The data base associated with Alcan's route is generally considered to be inadequate. Additional research and data collection are needed to define site-specific problems and appropriate mitigating measures.

All routes have the potential for impacting threatened, endangered, and protected species, including the polar bear which is a special protected species under International Treaty. Impact to these species and their habitat, after specific critical locations are identified, should be minimal along any of the proposed routes with approved mitigative scheduling and routing measures. Extra consideration should be given to protected species.

Trenching activities along Alcan's and Arctic Gas' proposed North Border route across the prairie pothole area in northern U.S. and Canada may cause drainage of potholes, and thus affect waterfowl habitat. Effectiveness of proposed mitigative measures to prevent drainage and other disturbances is uncertain.

In Public Law 93–153 (amending 1920 Mineral Leasing Act), Congress found utilization of existing corridors to be in the public interest by minimizing adverse environmental impacts due to the proliferation of separate rights-of-way. The utilization of rights-of-way in common should therefore be required to the extent practical. However, the task force believes that the environmental benefits attributable to requiring the use of common corridors must be evaluated individually.

The task force concludes that the Alcan route would make the best use of existing corridors. The El Paso route would utilize the Alyeska corridor but would establish a new right-of-way through the Chugach National Forest in Alaska and along most of the route in California. Except for the portion from Prudhoe Bay through the Mackenzie Delta, including the ANWR, the Arctic Gas route generally follows existing corridors or rights-of-way.

Each route crosses areas which are designated or proposed for designation under the Wild and Scenic Rivers Act, National Trails System Act, Land and Water Conservation Fund Act, and d–2 proposals (lands proposed for Federal designation). The task force suggests site-specific alignments be reviewed and measures taken to avoid such areas or minimize impacts. Either pipeline route through Canada would impact National or Provincial designated areas and proposed International Biological Program (IBP) reserves. The Canadian government will make the decision to authorize or reject these crossings.

Water will be required by all proposals for a variety of purposes. The availability of water on the North Slope during the winter season is extremely limited. Arctic Gas and El Paso propose to work from snow roads and work pads. For this purpose alone, the task force believes that a reasonable margin of water is available. When water demands for hydrostatic testing and camp use are added, winter water

supply may be insufficient. The three applicants propose different methods for testing pipeline integrity. Arctic Gas proposes a methanol-water testing plan, Alcan proposes water testing, and El Paso proposes air testing. Among these, the potential spills of the methanol-water test medium present the greater potential for environmental threat. The task force believes that air testing would be the most preferable environmentally and should be required for all applicants where feasible.

Compressor stations, LNG and regasification facilities, and tankers will all emit air pollutants. These emissions generally appear to fall within the allowable Federal air quality standards. They will also be required to comply with State air quality degradation laws.

Numerous archaeological and historic sites may be encountered along any of the routes; therefore, a comprehensive survey/salvage program is necessary for their protection. The Arctic Gas route has the greater potential for impacting cultural resources than either the El Paso or Alcan route.

Any of the three pipelines would accelerate a perhaps inevitable change in Alaskan native lifestyles. The Alaska Native Claims Settlement Act and construction of the Alyeska pipeline have already promoted the trend toward a mixed cash and subsistence economy. The El Paso and Alcan routes would affect a greater number of native villages than the Arctic Gas route, but these are along the Alyeska corridors where native life styles have already been impacted. Although the Arctic Gas route passes near the native village of Kaktovik in an undeveloped portion of northern Alaska, the native lifestyles have already been affected by the nearby DEW line (Defense Early Warning) sites. Native lifestyles would continue to change even in the absence of any of these projects; however, construction activities would accelerate the rate of change in native villages along the route.

We concur with the conclusions reached by the FPC in their "Recommendations to the President" and with the FPC Staff that each of the three pending proposals will have some adverse environmental impacts. If the Alaska gas is distributed on an equitable basis to the 48 States, the task force does not believe that the decreased air pollution in the lower 48 States as a result of Alaska natural gas being available will offset the environmental degradation resulting from the construction of a natural gas transportation system. The task force therefore concludes that a "no action" alternative would be environmentally superior.

However, if the Alaska gas were allocated to maximize air quality benefits the construction of a gas transportation system could be environmentally preferable from the standpoint of public health. It could displace 1 quadrillion Btu's/year of coal and could concentrate air quality benefits in select air quality control regions. It should be noted that the feasibility of this allocation scheme has not been demonstrated. An analysis of the pricing and distribution aspects of this scheme would have to be conducted.

The task force also concurs with the FPC Commissioners and the FPC Staff that, of the three proposed routes, Alcan's appears to promise the least environmental impact if proper mitigative actions are taken. This conclusion is based on the Alcan route's avoidance of: (1) the undeveloped area from Prudhoe Bay through the Mackenzie

Delta, including the Arctic National Wildlife Range and (2) the Chugach National Forest, both of which are de facto wilderness areas; and (3) thermal and chemical pollution from the LNG sites in Alaska and California. In addition, Alcan makes the best use of existing transportation corridors.

The task force finds the environmental impacts which would result from the Arctic Gas and El Paso routes to be different in nature, but comparable in magnitude. It is therefore difficult to rank the two systems strictly in terms of environmental impacts. However, it is our conclusion that the El Paso route would impact the environment less, on balance, than the Arctic Gas route. This conclusion is based on: (1) El Paso's avoidance of the Arctic National Wildlife Range and the Mackenzie Delta area (although it still does cross the Chugach National Forest); (2) the assumption that thermal and chemical pollution of the marine environment at the LNG sites in Alaska and California can be properly controlled through design modifications; and (3) the utilization of existing corridors, except for the approximately 40 miles in Alaska and most of the route of California.

The task force believes that the Arctic Gas route has the greatest potential for causing adverse environmental impacts. This conclusion is based on: (1) the crossing of the Arctic National Wildlife Range and the Mackenzie Delta area (although the route does not cross the Chugach National Forest and does not have the LNG siting problems); (2) the lack of permanent access along the North Slope for making summer repairs, should they be necessary; and (3) greater risks due to the distance to be traversed in the fragile Arctic. Finally, the creation of a new transportation system or corridor through this relatively undeveloped portion of Alaska and Canada would create environmental impacts which cannot be totally mitigated. The rest of the route generally follows existing corridors and rights-of-way.

TERMS AND CONDITIONS AND FEDERAL ORGANIZATION

The Federal Power Commission's "Recommendation to the President" found that formulation of specific terms and conditions was premature until a route has been selected and more detailed resource information is available. The FPC Recommendation made some tentative suggestions on the organization to administer terms and conditions and included a number of illustrative terms and conditions.

The FPC Recommendation did not adequately address the process by which all environmental concerns and resources may be considered government-wide (Federal-State-local) during the preparation and subsequent administration of terms and conditions.

The task force proposes continuation of the previously established Federal interagency group to work on terms and conditions. It also proposes environmental guidelines and a schedule which the group (supplemented by State agencies) could use in preparation of terms and conditions and development of the organization(s) to administer them.

REPORT ON CONSTRUCTION DELAY AND COST OVERRUNS

Executive Summary

Objective

The object of this report is to review the analysis and findings of the Federal Power Commission (FPC) in their Recommendation to the President: Alaska Natural Gas Transportation Systems with respect to the potential for schedule delay and cost overrun. The Commission's Findings are not fully specified, but a reasonable interpretation is presented on the following page and contrasted with the Lead Agency Findings.

Findings

This Lead Agency Report prepared by the Department of the Interior and the Department of Transportation generally agrees with the Commission's relative ranking among the projects with regard to the possibility of cost overrun and construction delay but differs sharply with respect to the magnitude of the overruns. The Federal Power Commission examined a number of sources of overrun and delay but they seemed to consider these in isolation; they did not fully evaluate the contribution of these sources collectively and interactively to their overall cost and time requirements for completing a long-term, complex construction project.

	Arctic Gas [2]	Alcan	El Paso
FPC findings: [1]			
Direct cost [3]	[4] 6,783	5,781	5,588
Total cost (includes financing) [3]	[4] 8,147	6,761	6,571
Full gas flow realized	(5)	(7)	(8)
Potential cost overrun (percent) [6]	5	5–10	7–10
Potential delay (months) [6]	12	9	0
Net national economic benefit [9] [10]	−7,122	7,652	5,798
Cost of service (dollars per mcf) [11]	1.72	1.79	2.09
Lead agency findings: [1]			
Expected direct cost overruns [3] [12]	[4] 2,506	1,864	1,736
Percent	37	32	31
Expected direct costs [3] [12]	9,289	7,645	7,324
Expected total cost overruns [3]	[4] 4,317	3,159	2,775
Percent	53	47	42
Expected total cost [13] (includes financing) [3]	12,464	9,920	9,328
Expected schedule delay (months)	20	17	15
Expected full flow date [14]	(15)	(16)	(17)
Expected net national economic benefits [9] [10]	3,311	4,825	3,908
Expected cost of service (dollars per mcf) [11]	2.15	2.09	2.26

[1] All values in 1... prices; assumed January 1978 go-ahead.
[2] Arctic Gas costs include Canadian share.
[3] Millions of dollars.
[4] U.S. share of Arctic direct costs is $5,621,000,000; U.S. share of Arctic direct cost overruns is approximately $2,000,000,000.
[5] U.S. share of Arctic total costs is $6,729,000,000; U.S. share of Arctic total cost overruns is approximately $3,432,000,000.
[6] June 1983.
[7] January 1983.
[8] November 1983.
[9] No NNEB or cost of service calculations are available based on these values.
[10] Present value discounted at 10 percent.
[11] Includes $1 per mcf wellhead price of gas, 20 yr average.
[12] The expected value is the mean or "average" of the estimated probability distribution.
[13] An upper bound, or "worst" case, may be estimated by adding 3 standard deviations to the expected value: Arctic Gas—$14,300,000,000, Alcan—$11,200,000,000 and El Paso—$9,900,000,000. The FPC estimate may be considered a reasonable lower bound.
[14] Both El Paso and Alcan have partial, but substantial, gas flows occurring 6 to 10 mo earlier.
[15] March 1985.
[16] July 1984.
[17] February 1985.

The FPC estimates range from 5 to 10 percent cost overruns for the proposals; this Report estimates direct cost overruns for the various proposals ranging from about 30 percent to about 40 percent; moreover, this Report finds that overruns on total costs including financing (allowance for funds used during construction) may range from 40 to 55 percent. The Commissioners have estimated potential delays ranging from 0 to 12 months; this Lead Agency Report anticipates delays ranging from 15 to 17 months.

This Report indicates the Arctic Gas proposal to contain the greatest uncertainty, while the Alcan and El Paso proposals contain less. Taking expected cost overruns and construction delays into account, the report finds that the Alcan proposal has the earliest expected delivery date and the least total cost, El Paso the next earliest delivery date and higher total cost, and Arctic Gas the latest delivery date and highest total expected cost.

Procedure

These estimates were arrived at on the basis of joint estimates of expected cost overruns and schedule delays by independent analysts familiar with each of the three proposed transportation systems and the Trans-Alaska Pipeline System. The FPC estimates are plausible but optimistic engineering estimates, while those presented here recognize that few major construction projects achieve the planned performance, cost and schedule goals. These estimates should be considered "expected value" estimates. It should be noted, that the results presented here do not indicate that a natural gas transportation system is uneconomic.

Other independent analyses, including the FENCO, Inc. risk analysis of Arctic Gas and Alcan for the Canadian Ministry of Energy, Mines, and Resources, the Resource Planning Associates, Inc., risk analysis of all three proposals for the Environmental Protection Agency, and the Department of Interior Report to Congress under Public Law 93–153 have concluded that all the applicants, but particularly Arctic Gas, are quite optimistic in their proposals. The major uncertainties that the FPC failed to assess realistically are highlighted below.

Construction and Productivity

The Commission concluded that Arctic Gas and El Paso have proposed "reasonable" construction programs while questioning the Alcan estimates of productivity. This report finds that Arctic Gas has seriously underestimated the economic costs of construction during the arctic winter. El Paso has also overestimated winter pipeline construction productivity and underestimated potential problems on the complex liquefaction plant. Alcan has overestimated the productivity of its rapid summer construction program, particularly because of the difficulty in supplying the skilled manpower necessary.

Snow Roads and Work Pads

The Commission has concluded that the proposed use of snow roads and snow work pads is a "feasible" arctic construction technique. This report finds that the economic feasibility of these techniques is extremely uncertain. The FPC hearing record indicates substantial controversy over even the technical feasibility. The record further indicates less than complete agreement on the availability of adequate snow and

water, particularly on the North Slope. The economic costs of a construction program relying on snow roads and snow work pads at the scale proposed by Arctic Gas—and to a lesser extent by El Paso—are very uncertain. There is no equivalent experience available; the concept has never been tested on a comparable scale. Alcan's construction plan avoids this risk since it relies on summer and conventional winter construction.

Construction Logistics and Transportation Corridors

The Commission found no substantial logistical problems for any of the applicants, nor did it emphasize any substantial advantage for a particular system because of its corridor. This report finds, to the contrary, that logistical problems beyond those anticipated by the applicants are highly probable.

Alyeska experience indicates that it is virtualy impossible to fully predict all requirements in advance and that supporting large scale construction efforts in remote regions of the arctic is extremely difficult. It is clear that alternatives and flexibility are essential for cost and schedule control—two elements limited in the Arctic Gas logistic plan. Arctic Gas must rely on a logistics system that is very seasonally oriented—use of snow roads in the winter and shipping on the Mackenzie River in the summer. Both El Paso and Alcan propose routes having access to virtually all weather transportation systems and other existing infrastructure.

Seismic Design

The Commission found that El Paso has an incomplete seismic design but that adequate time had been provided in the pre-construction schedule to complete the design at "some increases" in cost. The conclusion of this report is that the incomplete design work for the liquefaction plant at Point Gravina leaves substantial uncertainty in both cost and schedule. The record indicates substantial controversy regarding what design factors are acceptable, and there is little experience in designing large scale LNG facilities for a high degree of seismic protection. El Paso is judged to have underestimated the complexity of meeting stringent seismic standards, while neither Arctic or Alcan have a significant seismic problem.

Frost Heave/Thaw Settlement

The Commission concluded that there is ". . . no doubt that an adequate solution can be found . . ." although with ". . . sufficient expenditure of design, time and capital". This report concludes that the applicants may well have substantially underestimated the required design, time and capital.

The exact nature of the technical solution to frost heave/thaw settlement is still an unknown; some experts believe that portions of the gas line may have to be elevated. The economics of an as yet unproven solution are extremely difficult to estimate, particularly if it involves a relatively complex technology (e.g., electrical heating or buried supports).

Project Management and Scheduling

The Federal Power Commission did not address itself specifically to the question of management and scheduling although it did conclude that Arctic Gas and El Paso had presented reasonable programs for

executing feasible projects. This report finds project management and scheduling to be a crucial element in completing any of these large, complex, and remote projects in a timely and economic manner. The Alyeska experience is replete with situations where a problem in one area spilled over into other areas. All of the proposals contain large numbers of interactive elements for which a difficulty with one activity will adversely affect progress on another—resulting in possible delays. All of the projects contain a number of techniques which are relatively unproven in regular commercial application. The projects, through sheer magnitude, will draw on both labor and vendors having limited previous experience in this work.

Institutional Uncertainties

The FPC generally concluded that the applicants had alloted sufficient time during their pre-construction and construction phases to allow for resolution of a number of institutional issues. This report finds that several institutional issues pose major problems for the applicants, with substantial probability for schedule delay and cost overrun. Joint U.S.-Canadian decisions for Arctic Gas and Alcan have the potential for causing delays. Site selection and approval for El Paso's regasification terminal in California may cause some delay. Final right-of-way determination for all applicants is currently on an uncertain schedule. Governmental stipulations, regulations, and permits during construction by any applicant could cause construction delays. Finally, resolution of Canadian Native Claims is likely to cause significant delay for Arctic Gas and, to a lesser extent, Alcan.

Other Large Scale Construction Project Experience

Studies by Professor Mead and others indicate that the ability to accurately forecast the cost of large complex construction projects is very limited. Examples of such evidence are numerous and include Trans-Alaska Oil Pipeline (TAPS), North Sea Oil production, Trans-Peru Pipeline, METRO and Canadian Olympic facilities. These studies indicate that for construction projects involving long construction periods, new technology applications, extensive geotechnical work, and activity in remote areas, costs and schedules substantially beyond those estimated have almost always occurred and are likely to occur in the future.

Probably the most comparable projects is the TAPS project. An early, reliable cost estimate is considered to be the May 1974 estimate of $4.088 billion. In June 1975, a final, detailed estimate was made at $6.375 billion and now, only two years later, the final cost is expected to be at least $7.815 billion—a 23 percent overrun, excluding financing. In comparison, this Report estimates 30 to 40 percent cost overruns, excluding financing, for projects 4 to 7 years away from completion.

Operating Risks

This Lead Agency Report finds uncertainties and their economic impact to be less significant during the operating phase than during the pre-construction and construction phase. The risks of flow interruption and cost overruns during operations is greatest for El Paso because of its complex nature and seismic risk (a major earthquake in the vicinity of the liquefaction site could cause interruption of weeks to more than a year) while both Alcan and Arctic Gas are considered low risk.

REPORT ON SAFETY AND DESIGN

I. Summary

A. Introduction

The safety and design issues in the Alaska natural gas transportation system relate primarily to how a recommended system should be designed, constructed, and operated, and to a lesser degree, where such a system should be located. This report discusses the relative safety and design merits of the three alternatives considered in the Federal Power Commission (FPC) Recommendation to the President, May 1, 1977.

Each of the three systems proposed for transportation of natural gas from Alaska presents new challenges in design, construction, and planned operation. Information in the record detailing the applicants' approaches to meeting these challenges is exhaustive and much of it has been tested for accuracy by examination, rebuttal, and argument before the FPC and by its staff. In this report, the interagency participants who analyzed the FPC Recommendation and other relevant material discuss the principal concerns which remain to be decided relative to the safety and design of an Alaska gas transportation system and make their own recommendations on these matters.

The Department of Transportation (DOT) was lead agency in preparation of this issue report. Personnel from Departments of the Interior, Commerce, Federal Energy Administration, Energy Research and Development Administration, and the Environmental Protection Agency participated in review and analysis of the safety and design issues.

B. Conclusions

The safety and design issue interagency task group concludes, as did the FPC, that each of the systems, assuming proper design and construction, can operate safely and reliably. Although there are special technical problems peculiar to each of the systems which cannot be resolved at this time, it is incumbent on those Federal officers or agencies who are responsible for assuring pipeline safety to do all that is necessary to ensure, before initial operation, that the selected gas transportation system is designed and constructed in a manner consistent with Federal safety standards. Additional attention will need to be devoted especially to potential problems which may arise from the operation of the pipelines at high pressures and transporting chilled gas in discontinuous permafrost as well as the specific technical innovations present in liquefied natural gas (LNG) processing and storage in an active seismic area.

C. Safety

1. The principal element relative to safety for each of the three proposed pipeline systems is the type and design characteristics of the

pipe used in that system. Arctic Gas and Alcan plan to use high strength X–70 grade pipe for which a reference specification is not presently incorporated in the Federal gas pipeline safety standards. El Paso's proposed X-65 grade pipe is included in the standards. Planned operating pressures for Arctic Gas (1680 psig) and El Paso (1670 psig) are high by current industry practice; Alcan plans to operate at a more conventional 1260 psig; and each pipeline would be buried in permafrost areas and carrying prechilled gas. These design proposals present the problem areas which FPC has identified, i.e., frost heave, pipe metallurgy toughness, crack arrestor installation, pressure testing, and valve design—and for which the interagency group has developed solution approaches.

2. El Paso's proposal for pipeline transmission of gas across Alaska and marine shipment to California by tanker as LNG calls for decisions to be made about location of the LNG processing and storage facilities which will assure their safety in active seismic areas. Much discussion still surrounds the specific locations of El Paso's LNG facilities in southern Alaska (Gravina Point or Cape Starichkof) and in California (Point Conception or Oxnard). There are advantages and disadvantages in each proposed site and also a recognized need for further study and refinement of design on a site specific basis. California and Alaska State officials, too, have a major role in the LNG plant siting decision. The interagency group believes that those doubts do not preclude consideration of the pipeline LNG tanker proposal, but much work remains to be done both at the Federal and State levels to facilitate LNG plant site construction.

3. There are significant differences in the approaches each of the applicants would use in solving the problem of frost heave that pipelines can experience when buried in areas of discontinuous permafrost. Each will have to be adapted for the particular conditions encountered on a site-specific basis. Given the time to finalize route survey, field testing to determine soil conditions, and engineering design capability, each of the applicants should be able to solve the problem, although costs for doing so may vary.

4. Federal pipeline safety standards require that pipeline systems be pressure tested before tested before initial operation. The three applicants propose to meet this requirement in different ways. Arctic Gas and Alcan plan to use a hydrostatic test; Arctic Gas would prevent freezing of the test water in permafrost areas by addition of methanol, and Alcan would preheat the test water for this purpose. El Paso would use air as a test medium and thus keep water out of the line. Each proposal has its advantages and disadvantages. Hydrostatic tests permit higher pressure test levels than air testing under the U.S. standards and similarly would permit higher operating pressure under the Canadian standards. Also, the higher hydrostatic test pressure increases the probability of locating pipe defects prior to placing the pipeline in service. The Arctic Gas plan to use a water-methanol mixture presents environmental concerns relating to proper disposal and the effects of spills in the event of test failures. Alcan's plan to use heated water requires precise control to prevent freezing of water in the pipe. Also, heated water could cause degradation of frozen soil surrounding the pipe. Air has environmental advantages, but has limits in providing the highest degree of safety while testing the pipeline.

5. Each of the transportation systems can be adequately maintained, although permafrost soils and remote Arctic areas will require thorough advance planning and specialized equipment. This will be particularly true for the northern-most portions in the continuous permafrost tundra areas. Seismic factors may affect the repairability of a system, but proper design for seismic effects would be the primary means of assuring the safety and reliability of the LNG facilities or a pipeline crossing active faults. Further site specific designs, based upon geotechnic survey and test data, need to be refined to complete the design of the LNG plant and sections of either the El Paso or Alcan line which cross active faults. Testing to confirm presence of bedrock at the Gravina Point site selected by El Paso would be necessary should that proposed system be recommended.

6. In the design of the all-pipeline systems, there will be a need to coordinate specific U.S. and Canadian standards to achieve compatability in construction, inspection, maintenance, and operation, and thus assure dependability of service.

D. Efficiency

We concur, in general, with the FPC view that natural gas could be delivered and successfully marketed in the U.S. by any of the three proposals. However, there is a significant difference in the efficiency of each system based upon the quantity of gas needed to operate that system. The need to convert the gas to LNG and revaporize it gives a significant efficiency advantage to an all-pipeline system.

E. Potential Service Disruption

The FPC concluded that it is highly probable that each of the three systems can be operated with a reliability acceptable to the gas consumers of the United States. There is some concern about the possibility of a major Alaska seismic event disrupting delivery through the El Paso system. While this cannot be ruled out, we believe that the risk potential for such a disruption is very low. With regard to pipelines, their continuity of service is by far the best of any mode of transportation in the United States, and we believe the Canadian experience is comparable.

F. Expansion of Systems and Design Flexibility

Given the Arctic conditions and terrain, design flexibility and capability of expansion for the proposed systems can be provided best at the initial design stage of the pipeline. This may be done by increasing the diameter of the pipe to permit greater flow capacities and/or increasing the wall thickness or strength of the steel to allow higher operating pressures. Cost of increasing capacity by looping, (placing new pipe parallel to an existing one), a standard procedure in the lower 48, would be virtually prohibitive in the Arctic.

The Arctic Gas and Alcan are all-pipeline systems, and additional capacity may be provided at lower unit capital cost than for the initial capacity. However, for the El Paso combination pipeline and LNG tanker system, cost for additional capacity would increase roughly in proportion to the original unit cost. Arctic Gas and Alcan, utilizing the large diameter pipe with excess capacity, could expand by the addition of compressor horsepower alone. However, El Paso's additional capacity would require process plant additions and additional tankers for the marine leg.

G. Capability of Transporting Other Gas Reserves

In addition to known Prudhoe Bay gas reserves, each of the systems could have future access to reserves developed in the Beaufort Sea, the National Petroleum Reserve in Alaska, or from the Arctic National Wildlife Range. Only the Arctic Gas system would have the capability to transport gas from the Mackenzie Delta or offshore in northern Canada. The El Paso and Alcan systems, with short connecting lines, could transport gas from either the central Alaskan basins, or from the Gulf of Alaska. While the central basins are not considered to have a large gas reserve potential, the Gulf of Alaska could contain considerable gas reserves.

H. FPC Summaries of Evidence and FPC Conclusions on Safety and Design

We have no disagreement with the way FPC summarized evidence and positions of interested parties as they were presented in the FPC Recommendation to the President with regard to safety, design, efficiency, and flexibility. Nor do we have significant differences or criticisms with the way the FPC developed its conclusions.

I. Other Factors for Possible Presidential Consideration

While we do not have additional details with regard to their impact, there is a possibility that reductions in existing gas pipeline system load factors could place detrimental financial effects on some existing gas pipeline systems as a result of the new Alaska natural gas transportation. This would deserve study of cost and economic elements in other issue reports to determine the possible effects upon safety and maintenance of systems already in place. Additional attention also needs to be given to effective monitoring of a gas transportation system as extensive as any of the three proposals.

J. Terms and Conditions

There are a number of significant problems identified in the Terms and Conditions as presented in the FPC Recommendation to the President which will require further definition and clarification. These include, for example, (1) applicability of Terms and Conditions to that portion of the pipeline system in the lower 48 States; (2) Federal Inspector's role in enforcing compliance with the Terms and Conditions; and (3) conflicts of jurisdiction between Federal agencies.

II. Pipeline and Marine Safety

A. Introduction

The design, construction, operation, and maintenance of any Alaska natural gas pipeline and LNG terminal facilities must meet the Federal gas pipeline safety standards contained in 49 CFR Part 192; the reporting requirements of Part 191; and with respect to the LNG facility, possibly Part 193, a new part for which an Advance Notice of Proposed Rulemaking was recently issued by the Department of Transportation.

All three applicants plant to utilize advanced technology in the design, construction, and operation of the gas transportation systems proposed, and doubts have been raised as to their ability to comply

with applicable Federal gas pipeline safety standards. In potential noncompliance situations, the operator of the proposed system must change design plans, petition DOT for rulemaking action to modify the regulations, or request a waiver from those regulations providing data to support such a waiver and assure pipeline safety. While we concur with the FPC Recommendation conclusion that "each of the systems can be constructed basically in the manner proposed with the qualifications and conditions contained in our report" . . . "and each of the systems should operate reliably once service begins" (page 4, paragraphs i and j), we have several concerns regarding system safety and design.

REPORT ON NATIONAL ECONOMIC BENEFITS

The FPC "Recommendation to the President" compared the three alternative systems against two criteria:

Net national economic benefits—a measure of the discounted benefits and costs of the projects.

Cost of service—a measure of the cost of delivering natural gas to consumers (including an assumed wellhead price of $1.00 per MCF).

All systems had substantial net benefits (from $5.8 billion to $8.2 billion) and a cost of service that was judged competitive with alternate fuels (a high of $2.26 per MCF).

Alcan and Arctic had the highest net benefits and a lower cost of service than El Paso.

This Task Force report examines the sensitivity of the FPC findings to different discount rates, cost overruns, and schedule delays and calculates new employment impacts.

The new findings using the expected values for overruns and delays indicate that all of the systems still have positive net benefits ($3.3 billion to $4.8 billion) although reduced from the FPC levels and have increased costs of service (a high of $2.50 per MCF) which are still competitive with alternative fuels.

Alcan has the highest benefits with El Paso second. The rank changes because El Paso was judged to have a lower likelihood of substantial overruns. El Paso remains with the highest cost of service.

A sensitivity analysis shows that net benefits will be reduced to zero if either of the following occurs (assuming a discount rate of 10 percent and constant real gas prices):

a construction delay greater than four years;

construction cost increases of more than 100 percent; and

a reduction in throughput from 2.4 BCFD to less than 1.2 BCFD.

El Paso has claimed large relative employment impacts for the El Paso system (730,000 person years versus 235,000 person years for Alcan). This report finds that the relative differences between systems are considerably smaller (271,000 person years for El Paso versus 240,000 person years for Alcan).

TABLE A.—EFFECT ON NNEB OF EXPECTED PROJECT COST OVERRUN AND SCHEDULE DELAY[1]

[In millions of 1975 dollars]

	Arctic			El Paso			Alcan

REPORT ON SUPPLY DEMAND AND ENERGY POLICY

Executive Summary

This report combines two working group reports: one on supply of, demand for and cost of Alaska gas,[1] and a second on the relationship of an Alaska gas transportation system project to the President's proposed National Energy Plan (NEP). The first chapter presents a detailed supply-demand analysis of an Alaska gas project by itself, and is an extension of a comment on the findings of the Federal Power Commission (FPC).[2] Chapter II considers an Alaska gas project in the context of the NEP. The third chapter discusses alternative uses of the Alaska gas resource in the event that none of the proposed transportation systems is determined to be in the national interest.

The FPC found that the Prudhoe Bay Oil Pool contains 22.2 to 23.7 tcf of recoverable gas reserves (40 tcf in-place), enough to support sales of at least 2.0 bcfd.[3] They also found some possibility of increased delivery from the North Slope, and recommended that any certificated transportation system be designed to initially carry 2.0 to 2.5 bcfd, and be capable of expansion for an additional 1.0–1.5 bcfd. They also found that gas resources in Canada's Mackenzie Delta are only adequate to support deliverability of 1.0 bcfd.

In this report, the United States Geological Survey of the Department of the Interior concurs with and elaborates on the FPC findings on gas production potential for Alaska's North Slope, but concludes that a lower figure, 0.6–0.7 bcfd, is more appropriate for Mackenzie Delta deliverability. Because of the lack of field production experience, assessments of reservoir behavior involve some uncertainty. The unit production plan submitted to the State of Alaska by the Prudhoe Bay producers requests authorization for the sale of a minimum 2.0 bcfd of gas to a pipeline, on the grounds that such sales can be made without a significant reduction in oil recovery over the life of the field. The producer's plan is based on the results of the reservoir engineering studies which indicate that gas production, accompanied by water injection, will actually increase oil recovery slightly. There is a small risk that gas deliveries from the Prudhoe Bay oil pool would have to be reduced after production has begun, but that risk is considered negligible, particularly as other reserves are available to make up any possible shortfall from the main pool.

In a comparison of the effects of the three proposed transportation systems on consumption, shortages and prices, there is no overwhelming evidence that any one of the three proposed systems should be

[1] Throughout this report, the term "Alaska gas" is used to refer to natural gas from the area north of Alaska's Brooks Range, when gas production from south of the Brooks Range was intended to be included, it is specifically identified.

[2] "Recommendation to the President: Alaska Natural Gas Transportation Systems," Federal Power Commission, May 1, 1977 hereafter referred to as "the FPC recommendation."

[3] bcfd: billion cubic feet per calendar day.

either chosen or eliminated from consideration. There are differences, but they are so small when compared to the uncertainties in the specification of gas distribution and transportation costs as to prevent the selection of a particular system on this basis.

As Alaska gas will amount to approximately 5 percent of total natural gas consumption at the time it becomes available, the principal impact of Alaska gas on natural gas supply and demand will be a small increase in natural gas consumption and a relatively large reduction in natural gas shortages which are expected in the absence of any other action. By reducing the potential shortage, and thus the demand for substitute fuels, the delivery of Alaska gas will cause oil imports to be less than if no delivery system were constructed.

The delivered price of Alaska gas could be higher than the FPC's estimate of the market value price if: (1) the FPC established a field price that was greater than about $1.50 in 1985 or about $2.00 in 1990 (both in 1975 dollars); (2) project cost overruns were such that a fixed field price plus the escalated transportation costs exceeded market value; or (3) cost overruns were such that, under a formula pricing approach, the transportation cost plus the minimum field price exceeded market value. With continued price regulation and rolled-in (average cost) pricing, delivered prices in excess of market value would probably not change the basic conclusion that when significant shortages exist, Alaska gas would be accepted and would increase total consumption by satisfying the demand of industrial customers.

Under rolled-in pricing, the effect of Alaska gas on the average interstate city gate (wholesale) price can be analyzed to determine the marketability of Alaska gas. If we assume that large scale industrial fuel switching may take place only when the average price of gas reaches the price of substitute fuels, such as distillate fuel oil, Alaska gas (as a relatively small portion of total supply) could reach extremely high prices before encountering marketing problems. An analysis of the weighted average city gate price for the Nation and for FEA Region V (6 Midwestern States), which receives a large portion of the Alaska gas, suggests that the Alaska gas delivered price would have to be in excess of $10/mcf before either the national or regional average price reached parity with distillate.

Under an incremental pricing scheme, which would allocate higher priced gas to lower priority users (the industrial sector), the factor determining the maximum price of Alaska gas will be the nature of the industrial sector demand for gas. Under this pricing scheme, Alaska gas would most likely be competing with other incremental gas, such as imported LNG, in order to serve higher priority industrial customers, rather than with other fuels, such as distillate. The price of incremental LNG in 1985 has been estimated at $3.70/mcf and in 1990, $4.50/mcf. These figures probably represent the lower end of a range of prices at which Alaska gas can be marketed, with the upper bound determined by the characteristics of the industrial sector demand.

The FPC recommendation concludes that any decision as to the need for additional new facilities for delivering Alaska gas to the Western States (a Western leg) be deferred for one to two years. This deferral will not delay delivery of gas to the Western States, since the lead

time for construction of the entire pipeline is two to three years greater than that for a Western leg. Moreover, sufficient information is still not available to make an informed judgement as to the extent of idle capacity that may occur in the future on existing gas importation systems as a result of changes in the level of gas exports from Canada. This task force finds no reason to differ with the FPC recommendation on the issue of construction of a Western leg.

A method of distributing Alaska gas within the lower-48 States, known as displacement, has been proposed. By this method, natural gas from existing lower-48 deposits would be rerouted using system which are, to a large extent, already in place, thus reducing both the time required to effect delivery and the funds required to build a transportation system. Available pipeline capacities in the lower-48 appear to be sufficient to deliver Alaska gas by displacement. Actual physical capacity is not the problem, even if proposed Mexican imports are included in estimates of supply. The real issue in displacement is cost-sharing; as gas shipments change as a result of displacement, the average cost of service to customers will change depending on the magnitude of the change in shipments and other factors. The differential cost changes to customers of different pipelines create a problem of cost distribution directly related to the displacement scheme. All three proposed Alaska gas systems depend on deliveries by displacement to some degree. This report concludes that these problems are manageable; last winter's experience with emergency gas deliveries by displacement confirmed that these problems can be resolved, although not without some difficulties. Special legislative authorities, similar to those granted under the Emergency Natural Gas Act passed last winter, might be helpful to resolve cost-sharing problems during non-emergency circumstances.

The NEP does not contain proposals which directly relate to delivery of Alaska gas. It does, however, propose several actions which could affect the need for this gas or the timing of its delivery by stimulating additional domestic natural gas production and by reducing industrial and utility demand. The proposed plan would stimulate additional production by allowing higher well-head prices for new production. The plan would lower industrial and utility sector demand for natural gas by extending the current mandatory program for conversion to alternative fuels, by imposing fuel use taxes on industrial and utility consumers, and by offering rebates on these gas taxes as consumers install equipment to consume coal.

We project that, in 1985, with the implementation of the NEP, there will be a temporary alleviation of the natural gas shortage. By 1990, substantial shortages reappear. Alaska gas, to the extent that it is available in 1985, will trade off against and thus reduce the level of foreign imports. It could, therefore, serve to reduce our dependence on potentially interruptible foreign sources, regardless of its impact on the gas supply and demand balances. The elimination of a gas shortage is dependent on the achievement of the NEP's objectives in the areas of coal conversion, demand reduction through conservation, and expansion of energy supplies in the lower-48 States. Alaska gas in the mid-1980's would serve as a hedge or cushion to insure that natural gas shortages do not occur even after NEP implementation.

There are additional potential gas resources that have been considered as possible hedges against shortages in the mid 1980's. These include accelerated OCS leasing schedules, coal gasification, increased imports from Mexico, unconventional sources such as Devonian shale, Western tight sands, methane from coal seams and geopressured brines, and other technological advances in resource recovery. Implementation of all of the alternatives which are price-competitive with Alaska gas, and an Alaska gas project itself, are required to close the supply gap projected for 1990.

After 1990, gas from unconventional sources should become available in substantial quantities on the assumption that depletion of conventional gas supplies will have forced prices up to levels where unconventional sources can be competitive. Large-scale coal gasification is the source which is expected to limit the price at which competing sources can be sold. Current estimates place gas from at $4 to $5.50 per mcf wholesale (1975 dollars), including 30 cents to $1.00 per mcf to transport the gas to the city gate.

In 1990 and after, the market position of Alaska gas seems assured. Due to declining deliverability of lower-48 conventional gas reserves, an Alaska gas project would go from a position of one of the more expensive sources of gas in 1985 to one of the less expensive sources in 1990. The timing and nature of this transition presents a possible option to the President of delaying for a few years implementation of one of the competing gas transportation projects. The President, in reaching his decision, should carefully consider the benefits versus the possible consequences of delay.

In the event that implementation of one of the competing gas transportation system proposals is determined not to be in the national interest, there are alternative uses for the Alaska gas resource. Although conversion to methanol results in a substantial loss of the energy value of the gas, there is a large and growing market for that product in the lower 48 states, particularly in the industrial sector. Methanol delivered from the North Slope is not currently competitive with alternative sources, but it may well be before the end of this century.

Another possible use is conversion to ammonia and urea products. North Slope production costs are naturally quite high. However, the growth in ammonia and urea production itself could absorb all North Slope annual gas production at around the year 2000.

Other gas transportation alternatives considered include icebreaking LNG tankers. There has been recent Canadian interest in using such tankers in bringing out gas from the Arctic Islands. The cost of liquefaction on the North Slope would be higher than in South Alaska, but it is conceivable that gas might be delivered to the East Coast in this manner at a cost comparable to that for East Coast delivery under any of the 3 proposed transportation system projects considered here.

REPORT ON SOCIOECONOMIC IMPACTS

Preface

This report is one of several written by agencies of the Federal Government on various issues pertinent to the President's decision on the alternative Alaska natural gas systems. Section 6(a) of the Alaska Natural Gas Transportation Act of 1976 specifies that the Federal agencies must submit by July 1, 1977 any information useful to the President supplementing that contained in the Federal Power Commission Recommendation of May 2, 1977.

This report contains comments on the socioeconomic impact analyses submitted to the Federal Power Commission during its proceedings, and on the Commission Recommendation itself. The purpose of the analyses in the report is to present and discuss some important factors which appear to be significant enough for consideration in the President's overall decision. Given this specific purpose and the massive amount of evidence which has accumulated in the past three years, this report is not intended to be a comprehensive review or an analysis independent of previous work. Detailed questions must be referred to documents such as the Socioeconomic Briefs filed with the FPC, the Interior Department Final Environmental Impact Statement, the Berger Inquiry Report, Judge Litt's Decision, or the Commission Recommendation.

This report was prepared by Ernest S. Ting, Office of Coastal Zone Management, National Oceanic and Atmospheric Administration at the request of Dr. Edward Miller, Acting Deputy Assistant Secretary for Energy and Strategic Resource Policy.

The Commission Recommendation, May 2, 1977

The Federal Power Commission's overall conclusion was that the socioeconomic impacts of the pipeline proposals "offer little guidance for the final choice among the competing applicants." [1]

In the Commission's view the socioeconomic benefits from any of the three proposals are "overwhelming" and are largely independent of the exact route. The primary benefits which were identified by Judge Litt and quoted by the Commission are the large sums received by the State of Alaska in the form of royalty gas payments and severence taxes. Also among the benefits cited were revenues from property taxes, and personal and corporate income taxes. The Commission notes that these benefits will be accompanied by increased public expenditures, but claims that such expenditures will stimulate economic activity and improve the "general economic well-being of Alaska." [2] Nevertheless, the Commission warns that "substantial social and economic disloca-

[1] Federal Power Commission, "Recommendation to the President," May 1, 1977, p. VI-27.
[2] "Recommendation to the President," p. I-31.

tions" should be expected in the State of Alaska during the construction phase.[3]

The Commission concentrates its concern in Alaska, noting that the primary socioeconomic impacts "which are definable," especially for the United States, are in that relatively undeveloped state. For the lower 48 states and Canada increases in public revenues are cited as the principal impacts; other effects are considered minor except for the influence on the traditional lifestyle of native communities in the Yukon and Northwest Territories.

In considering the preferred route among the three systems, the Commission detailed several concerns in Alaska: population growth, employment and unemployment, cost of public services and facilities, effects on income and spending, demand for housing, public safety and recreation, and intrastate use of royalty gas. The report summary asserts that the El Paso system would create the largest impacts with "more jobs, more personal income, more property subject to tax, and more indirect economic activity . . . but would also require more social services and would probably be associated with the highest unemployment."[4] Impacts associated with the Arctic system would be "much smaller" and the Commission states that Alcan impacts would fall somewhere in between. The FPC decision also notes the possibility that lower transportation costs associated with Arctic may produce greater royalty income to Alaska, but in its final assessment the Commission finds no compelling reason to choose one system over the others on the basis of socioeconomic impacts.

Issues Discussed

Issues which have been identified by the Commission and interested parties include:

1. What will be the increase in population associated with each proposal? What will be the availability of housing in the affected communities for the additional population?

2. What are the public fiscal impacts of the various proposals, i.e., what are the effects on State and local revenues, and expenditures for public services and infrastructure? Will there be a strain on available public services and facilities?

3. How much additional employment will be provided by each proposal? What will be the effect on unemployment? Who will obtain any additional jobs: native residents, non-native Alaskans, or inmigrating job-seekers? What are the "long-term" employment possibilities associated with each proposal, as opposed to temporary construction employment?

4. What will be the effect of each proposal on personal and corporate income, on the price of goods and services?

5. What will be the effects of each proposal on native community life-styles? What social problems might be expected to arise with the rapid growth or change of the rural villages?

6. Is the intrastate use of royalty gas in Alaska a factor in the consideration of the various proposals? If it is, how does this factor affect the evaluation of each proposal?

---

[3] *Ibid.*
[4] *Ibid.*, p. IV–27.

7. In terms of the distribution of benefits and costs among regions of the United States, and particularly between Alaska and the lower 48 States, where does the public interest lie? Is it in the public interest to subsidize the economic development of Alaska at the cost to lower 48 States of a higher delivered-gas price?

Summaries of Positions and Evidence of Interested Parties

APPLICANTS

1. Alaskan Arctic Gas Pipeline Company

In its extensive brief, Arctic maintains that its proposal is the most beneficial to the State of Alaska since it will provide large benefits and cause the least socioeconomic cost.[5] This assessment is based on the assertion that the major socioeconomic benefits from any pipeline project will be from severence taxes and royalties, and that such benefits are roughly equal for all three projects.[6]

Arctic further states that since its system has only a relatively short section in Alaska, and that section is in the much less accessible northern portion of the State, the impacts of the Arctic Gas System on public facilities and services will be much less than the impacts of the El Paso and Alcan systems. The magnitude of the population effects is smaller, fewer communities in the State of Alaska are affected, and prospective immigration by out-of-state job seekers is discouraged by the inaccessibility and seasonal construction schedule of the North Slope.

Arctic responds to the contention that the other two proposals provide greater benefits to the Alaskan economy because of their greater lengths in Alaska by characterizing the severance tax and royalty revenues as primary in magnitude and as long-term benefits as opposed to short-term construction employment.[7]

Excerpts from the Arctic socioeconomic brief illustrate the contentions. "Compared to severance taxes and royalties, all other benefits to the state will be transitory and miniscule. (T)he importance of gas-related employment is . . . negligible . . ." Other revenues, i.e., property tax and corporate income tax revenues, are said to be small; personal income tax revenues important only for the relatively short period of construction.

The Arctic Gas System is the only proposal which would not provide the possibility of delivering royalty gas for use in Southern Alaska. Arctic discounts any benefits claimed by the State of Alaska from industrial development induced by the intrastate availability of North Slope natural gas, alleging that the State has not been able to present any solid evidence either on the basis of past experience in Cook Inlet or firm expressions of industry interest that such industrial uses will occur. In addition, Arctic notes that possibility of an exchange agreement in which Cook Inlet gas could be provided in Southern Alaska in return for North Slope royalty gas.

---

[5] Brief of Arctic Gas Project on Socioeconomic Issues, p. 2.

[6] Arctic points out that if the gas transportation costs are lowest with the Arctic system, as projected, and if wellhead prices are deregulated, severance tax and royalty income to Alaska may actually be largest with the Arctic system.

[7] Dr. David Kresge, Tr. 33,709–33,710.

[8] Brief of Arctic Gas Project on Socioeconomic Issues, pp. 12–13.

Arctic cites estimates that in the case of the Alyeska construction as many as 56,000 in-migrants may have entered Alaska in 1975 alone, and that 35 percent of the adult in-migrants had specific job waiting for them. These unemployed increased the public welfare burden in Alaska, and the entire growth in population caused a great increase in demand for public facilities and services. Arctic states that the large increase in demands for goods resulted in shortages and rapid price rises, and alleges that similar occurrences could be expected with the large impacts on the State of either the El Paso or Alcan route.

The following projections of peak construction—induced population increases in Alaska are mentioned by Arctic:[9]

	El Paso	Alcan	Arctic
FPC	24,100		3,000
DOI	33,300	33,400	4,800
State of Alaska	6,470		16,618
El Paso Alaska Co	3,900		
URSA (Arctic consultant)			2,600

The large size of the El Paso and Alcan impacts is emphasized. In addition, Arctic cites an estimate that 40 percent of the Alyeska construction workers sent their paychecks out of state, a statistic which would indicate that much of the increase in per capita income during the construction phase does not remain in the State.

Arctic criticizes the impact of El Paso on small Alaskan communities by citing the El Paso projection of the pipeline—impacted population of the Cordova-McCarthy census division:[10]

1977	2,400
1979	9,100
1982	4,100

Once again Arctic emphasizes the strain on and costs of increased but transitory demand for public services and infrastructure.

Arctic claims that its extensive planning with the citizens of Kaktovik, the principal village impacted by the Arctic System, will "maximize benefits and avoid dislocation."[11] Alcan is critized for not having yet acted on plans to carry out similar activities.

Finally, in Canada Arctic plans to locate hiring halls in larger southern metropolitan areas, thereby discouraging migration of unemployed workers to the more fragile and rural Yukon and Northwest Territories.

2. El Paso Alaska Company

After reviewing the methodology behind the projections made by various parties before the Commission, El Paso goes on to state that its projections and those of the FPC and the State of Alaska all agree that the socio-economic impacts from the El Paso proposal would be greater than the impacts from Alcan or Arctic. The key to El Paso's argument is its assertion that the greater impacts reflect greater benefits to the State of Alaska.

[9] Arctic Brief, pp. 24-26.
[10] Arctic Brief, p. 45.
[11] Ibid.

After illustrating how its proposal would provide the greatest impact in terms of population and absolute employment, El Paso also asserts that it would provide the greatest impact on aggregate personal income and in-state spending, citing the FPC FEIS projections.[12]

In regard to per capita personal income, the projections of the FPC in its FEIS show a drop after the first several years of construction and operation of the project.[13] El Paso's consultant on socioeconomic impacts alleges that this downturn can be explained as a lowering of the average as later growth in the eco..omy increases employment in the trades and services industries, which are lower-paying.

El Paso asserts that the "revenues accruing to the State and local governments as a result of the project will exceed increased public service costs throughout the life of the project," [14] and that the improvement in financial capacity will allow those governments to provide exanded services.

El Paso also cites benefits from the availability of gas to potential consumers along the Trans-Alaska route, and claims that the natural gas pipeline construction will provide employment for some of the Alyeska workers, thereby easing the severe unemployment following completion of the oil pipeline.

The endorsement of both the State of Alaska and the City of Cordova is claimed by the El Paso applicants. The State has expressed public support based on arguments quite similar to those used by El Paso. Among the benefits cited by the Alaska Commissioner of Revenue is his estimate of an additional $126 million in direct revenues to the State from the El Paso system as compared with the Arctic system.

El Paso cites statements by the City of Cordova, the City Manager and the president of the local Chamber of Commerce expressing support for the economic stimulus effects of the El Paso system. The statement by the City of Cordova indicates recognition of "significant and far-reaching effects on the economic, social and environmental well-being of the Cordova Community," but also expresses the belief that "the great majority" of these effects are "beneficial." [15]

The Cordova statement asserts that most elements of the community look forward to increased business from construction workers and "the stabilizing influence on the Cordova economy which the 300 permanent highly-skilled jobs at the LNG will provide, as well as the potential tax base which its siting on Gravina Peninsula will afford." The city also offers the following evaluation, "El Paso's Trans-Alaska Gas Project is precisely the type of controlled development needed by the Cordova community, the State of Alaska and the entire United States." [16]

An attorney for Chugach Natives, Inc. and the Eyak Corporation claims support for the Gravina Point terminus for its contribution to diversifying the Cordova economy.[17]

El Paso's final point is that since impacts will be concentrated in Alaska and particularly at Cordova, the views of the respective governments and citizens should be "determinative of the question of benefit." [18]

---

[12] El Paso Brief, pp. 9–10.
[13] FPC, FEIS, p. I-C129.
[14] El Paso Initial Brief, p. 15.
[15] El Paso Initial Brief, pp. 17–18.
[16] *Ibid*, p. 18.
[17] *Ibid*, pp. 19–20.
[18] *Ibid*.

In its reply brief El Paso criticizes Arctic's suggestion that its lower cost of transportation may provide higher revenues to the State of Alaska, noting that such an outcome is possible only if Congress were to de-regulate the wellhead price of Alaskan gas for intrastate sale.

El Paso also responds by disagreeing with Arctic on the importance of benefits other than royalty payments and severance taxes. Population, employment and income effects are emphasized as substantial benefits to the State of Alaska.

3. Alcan Pipeline Company

Alcan describes the general economic impact of their proposed system as increasing the growth rate of the State of Alaska and directing that growth toward regions affected by the pipeline route. As concluded by other parties in similar statements before the Commission, Alcan says its system "would have a significantly greater economic impact on Alaska than the Arctic Gas proposal, but a somewhat lesser impact than the El Paso proposal." [19]

The following impacts are outlined in Alcan's socioeconomic brief: [20]

(*a*) Addition to Gross State Product (GSP) peaks during the construction phase in 1980 at $210 million. GSP impact is concentrated in the Fairbanks and Interior regions during construction (which is completed in 1983) and later increments shift to the Anchorage region. This regional distribution of impacts over time holds true for all of the economic impacts discussed in the brief.

(*b*) Additional employment peaks in 1980 at 20,278 and drops significantly immediately after completion of construction, rising gradually thereafter. Anchorage region employment is more stable than the Interior and Fairbanks region employment which depends heavily on the construction sector.

Real wages and salaries follow patterns similar to that of employment.

(*c*) Population impact also peaks in 1980, at 28,692, with regional distribution similar to that of employment impacts.

(*d*) Personal income peaks in 1980 and 1983. After 1983 the effect of the project is to lower real per capita income. The explanation for this effect is the same as for El Paso: later increments of employment are in lower-paying support services as compared with high-paying construction jobs.

(*e*) Impact on state revenues in 1984 and 1990,[21] ranging from $185 million to $446 million in 1984, dropping after construction and increasing thereafter to a range of $182 million to $387 million in 1990. Local revenues behave similarly, peaking in 1981, 1984, and 1990.

State revenues are largely composed of "petroleum sector taxes and charges" during construction and "direct taxes and royalties" during operations, while increased local revenues are largely from property taxes and sales taxes.[22]

---

[19] Alcan Initial Brief, p. 4.

[20] *Ibid.*, pp. 2–10. Quantitative results are from an application of the MAP model by the University of Alaska ISEGR to the Alcan system, construction assumed to begin in 1978, operation in 1981.

[21] 1990 is the last year of the model simulation.

[22] Alcan Initial Brief, p. 9.

Alcan asserts that, "In the case of both state and local governments, expenditure impacts will tend to follow the same pattern as revenue impacts." [23]

Regarding negative impacts of their proposal, Alcan states that "the positive benefits to the local communities and people, as well as to the state as a whole, will far exceed any negative social impacts that may occur." [24] The claim is made that the Alcan Project will ease the post-Alyeska transition, and that most of the communities to be affected by Alcan have already made some adjustments to accommodate larger-scale development through their Alyeska experience.

It is apparent from Alcan's brief, however, that there are a few native communities along the Alaska Highway portion of the route which certainly will be significantly affected, with a "lessening of cultural traditions" and the emigration of youth in search of high wages in pipeline employment. The most significantly-impacted communities are expected to be Dot Lake, Tanacross, Tetlin and Northway.[25]

Benefits predicted by Alcan for native communities include additional employment, job training and the "awarding of construction-related contracts to native claims act corporations and other native-owned firms." [26]

Finally, in Canada Alcan says benefits will be of similar nature as those in Alaska, and socioeconomic costs are minor, in part because of the use of the established Alaska Highway corridor. Regarding native claims, Alcan expresses optimism for settlement in the Yukon while expressing severe doubts about Arctic's ability to surmount native claims disputes in the Mackenzie Valley.[27]

In its Reply Brief Alcan attacks the arguments of Arctic, asserting that (1) the benefits other than severance taxes or royalties, such as employment, personal income, other government revenues and development of the economy, are undervalued by Arctic, and (2) the transportation cost of the Alcan system is *lower* than Arctic and consequently, if there is any difference, royalties would be higher with the Alcan system.

STATE OF ALASKA

Alaska expresses its strong desire and need to develop a stable, diverse economy and "social environment," in contrast with the boom-bust cycles of previous extractive industries. The State suggests that the Commission should use as a criterion for judging the natural gas systems the "lasting contribution to Alaska's healthy growth each would make." [28] The Alaskan Statehood Act is even cited as containing Congressional intent to promote the independence and growth of the State economy.

The State also emphasizes repeatedly the necessity of having royalty gas for use within Alaska to promote industrial development.

Overall the State of Alaska favors a trans-Alaska route, and in particular the El Paso proposal, believing that the greater economic impacts will expand the economy to a more viable size and provide much greater revenues for expenditure on public facilities and services.

Other Major Relevant Reports

INTERIOR DEPARTMENT FEIS (MARCH 1976)

In Alaska the Interior Final Environmental Impact Statement predicts beneficial effects on unemployment, but that assessment was based on the assumption that preparatory construction work would begin in 1976.

The FEIS also indicates the likelihood of "major and significant adverse impacts" from the Arctic system on the wildlife on which the native subsistence lifestyle is based. As a result the loss of traditional culture is accelerated.[29]

In Canada the economic impact of Arctic would be largely limited to a few communities (Inuvik, Norman Wells and Fort Simpson), according to the FEIS. Employment of local labor would be over 2,000 at peak construction but perhaps only 200 in operation.[30]

With regard to the native claims issue, the Interior FEIS states: [31]

> One of the constraints in the Canadian Government guidelines for northern pipelines (Department of Indian Affairs and Northern Development, 1972) is that; "Any certificate issued will be strictly conditioned in respect of . . . the protection of the rights of northern residents, . . . " Furthermore, the stated government policy is that any decisions made concerning northern pipelines will be without prejudice to Indian land claims and treaty rights.
>
> The extent to which land claim settlements and other legal prerogatives of local residents may determine the granting of the proposed pipeline construction permit is not clear. The attitude of the local residents, as interpreted from limited and subjective surveys, seems to range from full acceptance to complete rejection of the proposed pipeline project. Berger Inquiry—Canada (May 9, 1977 Report).

On May 9, 1977 the Report of Justice Thomas R. Berger on the Mackenzie Valley Pipeline Inquiry was released to the public. The report is an advisory document for the Minister of Indian and Northern Affairs on the social, economic and environmental impacts of a natural gas pipeline through the northern Yukon and Mackenzie Valley.

The major recommendations of the report are that (1) no pipeline should be constructed through the northern Yukon because of environmental impacts, and (2) any Mackenzie Valley pipeline should be postponed for at least ten years to allow for settlement of native claims. In addition, Judge Berger expresses his opinion that the evidence before the Inquiry indicates that the Alcan route may be satisfactory from an environmental viewpoint.

The report discusses the testimony of one thousand witnesses at thirty-five community hearings in the Yukon and Northwest Territories. Judge Berger explains the heavy dependence of native culture on the subsistence lifestyle, on unrestricted use of land for hunting, fishing and trapping, on sharing and strong community identity.

Quoting from the report: [32]

[32] Berger Inquiry Report, pp. xxiv-xxv.

Another recent report of interest is the study of effects on the national economy, "Employment Impact of the Alternative Proposals for the Alaska Natural Gas Pipeline" by the Federal Energy Administration.

The native people insist that the settlement of native claims should be a beginning rather than an end of the recognition of native rights and native aspirations. In my opinion, a period of ten years will be required in the MacKenzie Valley and Western Arctic to settle native claims and to establish the new institutions and new programs that a settlement will entail. No pipeline should be built until these things have been achieved.

It would therefore be dishonest to try to impose an immediate settlement that we know now—and that the native people will know before the ink is dry—will not achieve their goals. They will soon realize—just as the native people on the prairies realized a century ago—that the actual course of events on the ground will deny the promises that appear on paper. The advance of the industrial system would determine the course of events, no matter what Parliament, the courts, this Inquiry or anyone else may say.

Conceptual and Substantive Deficiencies In Prior Analyses

There are several general concepts or major issues which have not been adequately addressed in most prior analyses and arguments presented before the Commission. These include:

1. *Gross "Benefits" from Employment versus Net Socioeconomic Impacts.*—In the briefs of the State of Alaska and El Paso especially, the socioeconomic impact assessments fail to account for or give sufficient weight to the costs of an expanded population in terms of cost of public services, and capital and operating costs of public facilities. In addition, the question of whether Alaskan or in-migrants fill new pipeline-related jobs is crucial to the accurate measure of net benefits from increased employment.

2. *Aggregate System Impact versus Maximum Local Impacts.*—Emphasis in some of the briefs tends to be on a comparison of the total impacts of each of the three systems. It is important to give due weight to examining the impacts on individual communities, particularly native villages. In addition, the distribution problem created when the taxable property of a project is located in one community, but the public services and facilities are needed in another needs to be examined more thoroughly for each of the proposed routes.

3. One problem concerns the tendency to view the *degree* of change (in population, for example) as the sole relevant measure of socioeconomic impact on a community. Consideration of the *rate* of change might be an important factor in assessing the severity of the impacts from each of the proposals, but little attention is given to this possibility. This point is particularly relevant to the native communities. It is often said that the native economy will undergo a transformation from a subsistence basis to a wage basis regardless of whether a pipeline is constructed. It is nevertheless important to assess the rate of change as a determinant of the magnitude of impacts.

4. *Social and Cultural Problems, Native Claims.*—The briefs filed before the FPC generally focused on the narrower implications of the pipeline systems for state and local economies. The effects of any pipeline system on social and cultural concern such as alcoholism, and the tendency toward cultural breakdown in impacted native villages has not been discussed in enough detail. The entire issue of the desires of native communities and native claims has been given a cursory treatment in several socioeconomic impact discussions.

ANALYSIS

The following discussions are intended to facilitate the evaluation of the Alaska Natural Gas Transportation Systems.

1. Each of the three proposed systems will create a large amount of additional employment during construction and a generally small amount following completion of construction. Since it is unlikely that construction on a natural gas system would start soon enough to capture a large portion of the workers laid off from the Alyeska construction, a large construction work force would tend to continue the disequilibrium characteristic of the Alaskan economy.[33] Since it has a much smaller construction workforce than the El Paso and Alcan systems, the Arctic Gas System would have less of the effect of perpetuating large unemployment than would the other two systems. El Paso has the largest long-term operation employment in Alaska with its LNG terminal, but even that number is relatively small (300 at the terminal). Many of the unemployed from Alyeska were originally immigrants who may be encouraged to extend their stay in Alaska in hopes of obtaining a construction job if either the El Paso or Alcan route is certified. In addition, more Alaskan residents and natives will be attracted into the high-wage construction market, leaving behind lower-income but more stable, longer-term livelihoods. Unemployment following the completion of either of the two longer routes is likely to be very high. The development of enough new industry in southern Alaska to absorb the unemployed is highly speculative at this time.

2. It is generally considered in the best interests of the State of Alaska to establish a stable economy, less dependent on the large and transitory disruptions of the extractive industries, particularly oil and gas development. This transformation of the economy can be attained by reducing reliance on large construction projects, diversifying the commercial and industrial base and strengthening long-term employment opportunities. The State of Alaska proposes to accomplish this transformation with a Trans-Alaska natural gas pipeline, thereby encouraging rapid development of infrastructure to support enlarged economic activity and making gas available for new industrial uses. This strategy will work if businesses indeed are willing to make major investment in southern Alaska. If successful the State will have rapid development, but in the interim will incur major socioeconomic dislocations. The El Paso proposals would probably provide the greatest stimulus to the Alaskan economy, with lesser effects attributable to Alcan and the smallest impact by the Arctic system. Combined with the massive revenues from North Slope oil production, however, any of the systems would provide Alaska with sufficient amounts of funds to greatly expand services.

The question of whether the availability of North Slope natural gas is an important ingredient in the diversification of the Alaskan economy is unsettled for at least two reasons. There is the possibility that exchange agreements could provide Southern Alaska with Cook Inlet natural gas in trade for the state's royalty gas from the North Slope,

[33] The Anchor Times of May 28, 1977 reports a rise in the state unemployment rate from 14.1 to 15.5 percent during April, attributed by State Labor Department economists to Alyeska lay-offs. Another state economist is quoted as expecting 12,000 additional lay-offs (7.5% of the total state workforce) with the completion of construction.

eliminating the need for a Trans-Alaska pipeline to provide gas for industial uses within the state. It is not clear, however, whether there are enough natural gas reserves in the Cook Inlet area to provide significant amounts of gas to the state over the next couple of decades.

Second, the potential for industrial development based on the use of natural gas is uncertain. There is only a limited amount of experience from the relatively modest petrochemical development around Cook Inlet as a guide to industry interest in Alaskan gas.

Summarizing, with regard to the royalty gas question El Paso and Alcan may have an advantage, but the magnitude of any such advantage is open to wide debate.

3. In his initial decision, FPC Administrative Law Judge Nathum Litt raised the issue of inter-regional distribution of benefits. Specifically Judge Litt addressed the question of whether it was appropriate for the Commission to consider the benefits of induced economic development for the State of Alaska in its decision on certification. Litt observed that since the transportation cost for gas delivered via the El Paso route would be substantially higher than that of alternative routes, a decision which gave positive weigh to the induced development benefits implied a policy of subsidizing Alaskan economic development by forcing the lower 48 States to pay a higher delivered price for North Slope gas. Litt concluded on the basis of legal precedent that such a consideration was an inappropriate basis for a Commission decision. The President, however, has the option of including regional economic benefits in his deliberation.

4. The net revenue benefit of each of the proposals of the State of Alaska and local communities is rarely estimated in the evidence, particularly that presented by the applicants or the state. Since Alaska is largely undeveloped, even relatively small increases in population can put a severe strain on local public services and facilities. A population increase of over 30,000 in the entire state due to the El Paso or Alcan system implies very substantial public expenditures despite the fact that much of the route for those pipelines would be identical to that of Alyeska. Based on induced population and revenue projections, it appears that the *net* revenues from the three systems over the construction period might be comparable; much larger revenues associated with a trans-Alaska route such as El Paso being offset to a substantial degree by much larger public expenditures for expanded facilities and services to support in-migrants.

Of course the longer systems would also provide larger net revenues in later years of operation, after infrastructure adjustments had been made to accommodate the expanded population.[34]

The preceding net revenue analysis is based on public revenues and expenditures for state, regional and local governments *combined*. In regard to impacts on local government fiscal conditions alone, the selective and *timely* provision of financial assistance by the State of Alaska, regional corporations or pipeline firms will be critical in avoiding the imposition of severe hardships on rural communities along any pipeline route.

---

[34] FPC FEIS, pp. I-C144-148. Arctic Initial Brief, pp. 24-30. Gladstone Associates report for Office of Coastal Zone Management, NOAA, U.S. Department of Commerce, "2nd Technical Memorandum: Per Capita Standardized Unit Costs, Current Cost Multipliers and Local Area Multipliers," pp. 1-7, 1-13.

Communities impacted by Alyeska may be able to absorb the impacts of a natural gas pipeline without severe difficulty. Along the El Paso and Alcan routes cities such as Fairbanks and Delta Junction would utilize their already enlarged capacity of public facilities and services.

Other less developed communities, e.g., Kaktovik along the Arctic route, Dot Lake, Tanacross, Ttelin and Northway along the Alcan route, and Cordova along the El Paos route, will face major challenges to accommodate the effects of nearby construction activity. Those communities which experience a pipeline-induced increase in population may face the following two fiscal problems: (1) the need for increased public expenditures arises immediately, but any property tax revenues do not materialize until later years, and (2) a community that bears the burden of public expenditures may not have taxing powers over the lands through which the pipeline passes. The most dramatic example of these problems would be at Cordova if the El Paso system were constructed. Major population impacts (a four-fold increase in two years, according to El Paso projections) and additional public expenditures associated with the LNG terminal construction would center on Cordova, but property tax revenues would be based at Gravina Point. The state may wish to arrange for a transfer of revenues to resolve the jurisdictional problem and a loan arrangement to resolve the timing ("front-end financing") problem.[35]

5. In a number of socioeconomic analyses it is stated that the transformation of small communities, particularly native villages, from a subsistence economy to a predominantly wage-based economy will likely occur even if a pipeline is not constructed. Construction of a pipeline will increase the rate at which this transformation takes place.

Such statements, made without further qualification, fail to note the likelihood that rapid development will encourage severe social problems such as crime, family disintegration and alcoholism. Experience with industrial development in Alaska and Northwestern Canada has shown that these tendencies are present to an especially alarming degree when native populations, strongly dependent on cultural ties for personal identity and economic survival, are exposed to the radically different "modern" lifestyle. Native lifestyles, dependent on land which is unrestricted by ownership rights, are incompatible with the foot-loose and money-oriented lifestyles of pipeline construction workers.[36]

The most sensitive native settlements which could be affected by a natural gas pipeline are probably those in the isolated northern Yukon and Mackenzie Delta along the Arctic route. Native communities along the Alaskan Highway (which is followed by Alcan) have already been exposed to development forces, and pipeline impacts would be less traumatic. Nevertheless, the certification of any pipeline would ac-

---

[35] For facilities supporting energy activities which are coastal-dependent there is currently a Federal assistance program (specifically the Coastal Energy Impact Program administered by the Office of Coastal Zone Management of the National Oceanic and Atmospheric Administration, U.S. Dept. of Commerce) to provide loans and bond guarantees to aid communities with the front-end financing problem.

[36] "Northern Frontier, Northern Homeland: The Report of the Mackenzie Valley Pipeline Inquiry" by Justice Thomas Berger contains an illuminating and detailed, if not entirely objective description of social, cultural, economic, and political problems concerning native communities in Canada.

celerate the weakening of the native lifestyle and the spreading of social problems.

6. Of all the socioeconomic cons. rations, the most significant factor in a choice among the alternative pipeline proposals may be the Canadian native claims issue. The issue of native claims in the Mackenzie Valley and control over land uses in the region is highly charged, and settlement, viewed by many to be a prerequisite for any development, is not considered likely in the near future.

Justice Berger, in his "Report of the Mackenzie Valley Pipeline Inquiry," expresses the firm belief that:

> . . . the native people must be allowed a choice about their own future. If the pipeline is approved before a settlement of claims takes place, the future of the North—and the place of the native people of the North— , in effect, have been decided for them."

The apparently poor chances of early settlement bined with the vehement insistence of native groups and the Berger Inquiry that any pipeline through the Mackenzie Valley be delayed until the settlement of native claims, could pose a barrier to early construction of a Trans-Canadian pipeline, especially the Arctic system.

Conclusion

The major conclusions are:

The decision of the Government of Canada, currently expected to be announced before the deadline for the final U.S. decision, could rule out either the Arctic or Alcan route because of the adverse effects on the cultural stability of native communities and the resulting social problems.

The El Paso system provides a somewhat greater opportunity for intrastate use of royalty gas than does the Alcan system because of the possibility of coastal industrial development with El Paso. Such additional development could provide beneficial employment and income effects.

In general both the economic development and dislocation impacts in Alaska would be greatest with the El Paso system, smallest with the Arctic system, and would fall in-between with the Alcan system.

Although the public revenue impacts of the three alternative systems would be greatest from El Paso, next largest from Alcan, and least from the Arctic proposal, the public expenditures required to serve the induced population growth also would be in that order. As a result, *net* revenue benefits during the construction period in particular may be much less than some previous analyses have implied.

The El Paso system would concentrate severe disruptive impacts on the City of Cordova, whereas the Alcan system would create significant but much smaller impacts on several native villages along the Alaska Highway.

Since there may be instances (e.g., Cordova) in which local government revenues of impacted rural communities may not cover public expenditures, the selective and timely provision of

---

[27] Berger Inquiry Report, p. xxiv.

financial assistance by the State government, regional corporations or pipeline firms may be helpful in avoiding severe hardships.

In summary, the significance of socioeconomic impacts for the overall route decision depends on the weight given to impacts disruptive of social and cultural structure as opposed to economic development considerations. If factors such as adverse effects on native communities and local lifestyles are given primary importance, the Arctic and El Paso routes would tend to suffer in a comparison with Alcan. If more importance is placed on a route which will stimulate the Alaskan economy, the El Paso route clearly has the advantage, followed by Alcan.

REPORT OF TASK FORCE ON INTERNATIONAL RELATIONS

FPC Conclusions and Recommendations

The initial decision on the transportation of Alaskan natural gas, prepared by Administrative Law Judge Litt, and issued by the FPC on February 1, 1977, contains a chapter on Canadian issues. The main points of the chapter are:

Just, reasonable and non-discriminatory provincial treatment of transit pipelines is provided for under the Canadian constitution.

The applicants agree that ratification of the United States-Canada Transit Pipeline Agreement will not end negotiations with Canada.

It is assumed that early development of known hydrocarbons reserves is as important to Canada as to the United States.

It is unlikely that native claims will significantly modify the Canadian Government's energy decisions.

Arctic Gas and Alcan argued that a joint project through Canada is not dependent upon a United States-Canada treaty. However, a treaty would regularize and simplify the procedures for obtaining joint approvals.

The treaty, which spells out reasonable practices of ordinary good business, does not add substantially to the expectation that a relationship which has been historically workable will remain workable.

It is expected that amendments to the treaty will be required and made from time to time.

If a pipeline for Alaskan gas is built across Canada, it is reasonable to assume that the Government of Canada will have an interest in promoting the pipeline's economic viability.

On May 2, 1977, the Federal Power Commissioners recommended that the President select an overland transportation system through Canada, if such a route is made available by the Government of Canada on acceptable terms and conditions. In their analysis, the commissioners confined themselves for the most part to U.S. issues. Only two issues related to United States-Canadian international relations were mentioned:

In reference to the "western leg" of the Arctic Gas Project, the FPC said that if Canadian gas exports to the United States are terminated upon expiration of present licenses, sufficient idle pipeline capacity will be available to move Alaskan gas to the West Coast without construction of the western leg.

Arctic Gas and Alcan will have similar socio-economic impacts in Canada. Total population and employment changes will not be great. The major impact will be on the traditional life-style of native communities along the pipeline right-of-way.

Positions of the Parties

The Federal Power Commission heard evidence concerning (1) United States-Canadian relations, (2) the Canadian decision process, (3) Canadian constitutional law.

The briefs submitted by the three applicants on the United States-Canadian issues involved in transporting Alaskan gas across Canada covered security, taxation, and political factors. El Paso emphasized the uncertainties and compromises inherent in dealing with a foreign government. Arctic Gas and Alcan argued that the Government of Canada would have an interest in the success of a commercial venture for the transportation of Alaskan gas which involves Canadian companies. Canada would therefore be unlikely to take action contrary to the interests of its own citizens. In addition, the United States and Canada have a long tradition of successful cooperation which can reasonably be expected to continue in the case of a transportation system for Alaskan gas.

The Federal Power Commission also heard evidence concerning the Canadian decision process on the pipeline. The argumentation focused on the settlement of native claims along the proposed pipeline right-of-way. El Paso pointed out the problems involved in the settlement of native claims along the rights-of-way of Arctic Gas and Alcan. El Paso expressed the opinion that the Government of Canada's failure to settle the claims could delay a trans-Canadian pipeline decision for years.

Alcan argued that the claims problem is less serious along its proposed right-of-way in the southern Yukon than along the Arctic Gas route in the Mackenzie Valley.

The Commission also heard several days of testimony on Canadian constitutional law. El Paso's witnesses described the powers exercised by the Canadian provinces and implied that the provinces could delay or prevent construction of a transit pipeline, or could impose intolerable tax burdens.

Arctic Gas and Alcan witnesses argued that Canadian constitutional law confers upon the Federal Government of Canada unquestionable authority to implement a decision in favor of a transit pipeline.

Relevant Factors

Canadian Decision Process

The Government of Canada has been studying the proposals for the transportation of Alaskan natural gas across its territory since 1974. Separate studies are being conducted by the National Energy Board (NEB), the Berger Commission, the Alaska Highway Gas Pipeline Inquiry Board, and the Alaska Highway Gas Pipeline Environmental Assessment and Review Panel.

The National Energy Board is analyzing the relationship of the Canadian Arctic Gas, the Alcan, and the Maple Leaf projects to Canada's energy needs. The Board must determine whether any of the pipeline projects are and will be required by the present and future public convenience and necessity. The Board's findings will be submitted to the Government of Canada for its consideration in early July. The Canadian Cabinet may accept or reject the NEB's decision on a pipeline, but may not change it except by legislation.

The Berger Commission is looking into the social, economic and environmental impact of the Canadian Arctic Gas and Mapleleaf Pipeline projects in the Yukon and Northwest Territories. The Commission released the first part of its report on May 9, 1977. It recommended that no pipeline be built across the Northern Yukon, and that 10 years elapse before a pipeline is built in the Mackenzie River Valley. Part II of the report, recommending terms and conditions to be applied in the event that a pipeline is built, is expected later during the summer of 1977. The report is not binding on the Government of Canada and does not address all the factors which the Canadian Government will consider before reaching a final decision.

The Alaska Highway Gas Pipeline Inquiry Board will report on the social and economic aspects of the Alcan project in the southern Yukon. The report i to be submitted to the Canadian Cabinet by August 1. 1977.

The Alaska Highway Gas Pipeline Environmental Assessment and Review Panel, directed by Dr. H. M. Hill, is analyzing the environmental impact of the Alcan project in the Yukon. Dr. Hill's report is to be completed by August 1.

On April 28, 1977, Canadian Prime Minister Trudeau appointed Mr. Basil Robinson as Northern Pipeline Commissioner. Mr. Robinson will coordinate the activities of the various agencies of the Canadian Government in reaching a decision, and will be the Canadian Government's point of contact with the U.S. Government as the two decision-making processes unfold.

All inputs related to the pipeline decision required by the Government of Canada are expected to be at hand by early August 1977. The Canadian parliament is expected to debate the pipeline issue in July, before the Canadian Government makes its decision, and again in August.

Commenting upon the timing of the Canadian decision, Canadian Prime Minister Trudeau, during his visit to Washington in February, 1977, indicated that Canada would make a determined effort to accommodate to the anticipated U.S. decision timetable.

Settlement of Native Claims

It is the policy of the Federal Government of Canada to recognize the existence of a native interest in those areas of Canada in which the native interest has not been settled by treaty or superseded by law. The Government of Canada believes it is desirable to address the native claims issue expeditiously and, if at all possible, before a pipeline is built. However, the Government of Canada has never taken the position that it is necessary to reach a settlement before hand. It is expected that the Government of Canada will reach a decision on the pipeline issue within the anticipated US timetable, regardless of the status of the settlement of native claims. Moreover, if the United States and Canada agree to cooperate on a gas pipeline, that agreement would have to be based on an understanding that construction can be carried out expeditiously. Construction would not, therefore, be delayed by the settlement of native claims which could, if necessary, go forward concurrently.

Canadian Legal Environment

Two procedures exist for seeking review of an NEB decision related to the gas pipeline. First, Section 18 of the NEB Act permits parties to NEB proceedings to appeal questions of law or jurisdiction to the Federal Court of Appeals of Canada. Such appeals are discretionary for the Court; a court must grant leave for appeal. An application for appeal must be filed within one month of the NEB's action, unless the court or a judge finds that special circumstances allow some longer time. Once leave is granted, the appeal must be entered within 60 days.

We are informed by Canadian authorities that there should be no plausible challenge to the jurisdiction of the NEB or any significant question of law arising from its decisions. Section 44 of the NEB Act gives the NEB broad discretion in deciding on applications of public convenience and necessity for pipelines.

Judicial review of NEB action would more likely be sought under the Federal Courts Act. Under that Act, the NEB could be overturned if it "failed to observe a principle of natural justice", "acted beyond or refused to exercise its jurisdiction", "erred in law in making its decisions", or "based its decision or order on an erroneous finding of fact that it made in a perverse or capricious manner or without regard to the material before it".

We understand that the Canadian courts have left great discretion to the administrative board or body involved. We know of no case in which an NEB decision to issue a certificate of public convenience and necessity has been effectively challenged in the courts.

It should also be noted that Canadian law places comparatively stringent limits on standing to sue. We understand that, in general, only parties to Administrative proceedings can seek judicial review of agency action.

Under Canadian law, the scope of review of NEB decisions is narrower than comparable review of the decisions of U.S. regulatory agencies.

If the Federal Government of Canada makes a decision in favor of an overland route for Alaskan gas, no further provincial permits are required. The successful applicant will be authorized to proceed in acquiring land for the pipeline right-of-way through normal commercial contract negotiations. If necessary, the Federal Government of Canada will exercise the right of eminent domain to assure that a right-of-way can be obtained.

Implementation of a Canadian decision in favor of a trans-Canadian gas pipeline will require a permit from the Department of Indian and Northern Affairs to allow use of federally-owned land in the Yukon and Northwest Territories. However, it is expected that issuance of such a permit would be pro forma if a favorable decision is reached by the Federal Government of Canada.

The Canadian procedures for implementing a decision on the gas pipeline appear to be less complicated than procedures in the United States where state approvals are required for right-of-way acquisition, exploitation of mineral resources, and construction of port and regasification facilities. Delays related to approval by regulatory authorities are less likely to occur in Canada than in the United States.

United States-Canada Transit Pipeline Agreement

The Trans-Alaska Pipeline Authorization Act of 1973 (Public Law 93-153) authorized and requested the President to determine whether the Government of Canada would be willing to permit the construction of pipelines across Canada to carry oil and gas from Alaska's North Slope to markets in the lower 48 states and terms and conditions which might apply to such a pipeline. In response to this Congressional mandate, the Department of State began negotiations in 1974 which led to the Transit Pipeline Agreement signed on January 28, 1977. The President sent the Agreement to the Senate on March 30, 1977, for advice and consent to ratification. The Senate Foreign Relations Committe held hearings on June 7, 1977, and its report is expected to be complete in July. The agreement includes the following basic elements:

It covers all existing or future pipelines which transit the territory of each party;

It covers all forms of hydrocarbons including crude oil, petroleum products, natural gas, petrochemical feedstocks and coal slurries;

It provides for reciprocity of obligations on the part of both parties;

It does not provide for approval of any specific proposals to construct a transit pipeline across the territory of either country, but it makes provision for possible protocols on specific pipeline projects if they are deemed necessary;

It provides a guarantee of throughput, by which public authorities in both countries are prohibited, except under specified emergency circumstances, from interfering with or impeding hydrocarbons moving in transit pipelines;

It provides for non-discriminatory treatment of hydrocarbons transiting either country, which ensures that public authorities in both countries will be prevented from discriminating against transit pipelines with regard to taxes and other monetary charges;

It assures "in bond" treatment for hydrocarbons moving in transit pipelines;

It confirms the jurisdiction of normal regulatory authorities over transit pipelines and requires that their action be reasonable and non-discriminatory;

It provides for equitable sharing of pipeline capacity in the event of emergencies on a predetermined basis;

It provides for binding arbitration in the event of disputes which cannot be resolved by negotiation; and

It is of long duration—thirty five years—and may be terminated after the end of this period only if ten years prior notice is given.

The Agreement provides very strong assurances of non-interference with the flow of hydrocarbons in transit. Even in emergency situations, the Agreement spells out the terms governing the operation of pipelines carrying hydrocarbons in transit commingled with indigenously-produced hydrocarbons. Both the United States and Canada recognize that security of throughput is a fundamental requirement, and both

countries have made binding, reciprocal commitments to non-interference.

The Agreement does not bar real property taxes by either provinces or states. However, under the provisions of the British North American Act and the terms of the Agreement, the provinces would be prevented from taxing the throughput of pipelines or levying discriminatory charges on transit pipelines. The Federal Government of Canada has accepted the obligation to ensure that the exercise of the taxing power of the provinces shall be applied in a non-discriminatory manner.

In the United States, where a ratified treaty becomes the supreme law of the land, the U.S. Federal Government has the authority to prevent states from discriminating against transit pipelines and is committed to do so by the Agreement.

Whether discrimination against a transit pipeline exists is determined by comparison with similar pipelnes. The Agreement provdes that "similar" pipelines include both inter-provincial and inter-state pipelines and intra-provincial and intra-state pipelines. This definition is sufficiently broad to assure that an adequate basis for comparison can be found within the jurisdictions which would be involved if a trans-Canadian route for Alaskan gas is approved.

The hydrocarbons moving through a transit pipeline are accorded the equivalent of "in bond" treatment under the terms of the Agreement and may not be taxed by provincial, state, or Federal authorities in either country.

The non-discrimination protections contained in the Agrement prevent the imposition of taxes on transit pipelines which are not also applicable to similar, non-transit pipelines. Therefore, the Agreement assures that transit pipelines will not be taxed in a discriminatory manner to generate funds for the settlement of native claims.

The United States-Canada Transit Pipeline Agreement does not settle all issues related to a trans-Canadian pipeline for Alaskan natural gas. Rather, the Agreement provides fundamental guarantees and a framework for the terms and conditions which would be applicable. If Canada decides to offer an overland route, further discussions with the Government of Canada will be needed to answer specific questions related to financing arrangements, pipeline tariffs, expansion of the pipeline's capacity, requirements for purchasing goods and services in Canada, the possibility of construction delays, and arrangements for inspection of the pipeline.

Financing

The question of financing a trans-Canadian pipeline for Alaskan gas has not been formally discussed with the Government of Canada. If an overland route is offered by Canada, and if it is necessary for either Government to participate in financing, financial arrangements could be dealt with in a protocol to the United States-Canada Transit Pipeline Agreement.

Impact on United States-Canadian Relations

The United States and Canada have a long tradition of cooperation on mutually beneficial projects, such as the Saint Lawrence Seaway, the Alaskan Highway, the environmental clean-up of the Great Lakes, and the transpotration of Canadian hydrocarbons across the United States. A decision to construct a trans-Canadian pipeline for Alaskan

natural gas would be in keeping with this cooperative tradition which is in the interest of both countries. However, both Governments have made clear that a decision on the gas pipeline will be made on its own merits.

Regardless of the outcome of the gas pipeline decision, a community of interest will remain, tending to draw the United States and Canada together. A relationship which is basically friendly and cooperative will continue.

Canadian Transit Pipelines in the United States

Most of Canada's oil and natural gas reserves are located in the western provinces of Alberta, Saskatchewan, and British Columbia. However, energy consumption is greatest in the industrialized, eastern provinces of Ontario and Quebec.

Canadian crude oil moves from the producing provinces in the west to the consuming provinces in the east via the Interprovincial Pipeline System. The two branches of the Interprovincial system transit the United States; one north of Lake Michigan, and the other to the south of the Lake.

Canadian natural gas is carried from west to east via the TransCanada/Great Lakes Gas Transmission system. The system transports about 300 billion cubic feet of gas per year across the United States to markets in eastern Canada. In addition, TransCanada/Great Lakes delivers Canadian gas to U.S. markets in the Midwest.

Imported crude oil is carried via a transit pipeline from Portland, Maine to Montreal. In 1976, 300,000 barrels per day of crude oil were delivered to Montreal through the Portland pipeline.

Conclusion

It is the conclusion of the Task Force on International relations that a viable option exists for the transportation of Alaskan natural gas across Canada, provided that the Government of Canada offers an overland route across its territory. A trans-Canadian gas pipeline would benefit from the protection afforded by the United States-Canada Transit Pipeline Agreement, and from the long tradition of cooperation between the two countries.

Canadian constitutional law provides clear authority to the Federal Government of Canada to make and implement a decision concerning a transit pipeline for Alaskan gas. In addition, the Government of Canada has accepted the obligation to ensure that the exercise of the taxing power of the provinces shall be applied in a non-discriminatory manner.

The Task Force agrees with Federal Power Commission Administrative Law Judge Litt that in light of the history of successful cooperation with Canada in other areas, it is reasonable to expect the Government of Canada to act responsibly in the case of a pipeline carrying Alaskan gas.

The Task Force further concludes that regardless of the outcome of the gas pipeline decision, United States-Canadian relations will continue to be friendly and cooperative.

REPORT ON NATIONAL SECURITY IMPLICATIONS

Introduction

The Federal Power Commission "Recommendation To The President, Alaska Natural Gas Transportation Systems" did not include a statement on the national security implications of the proposed transportation systems. The Department of Defense (DOD) provided a study which addressed that subject to the Department of Interior (DOI) and the Federal Power Commission (FPC). Both agencies included the study in their evaluations of the proposed transportation systems. The following report summarizes the consideration given to national security during the review and evaluation of the three proposed Alaska Natural Gas Transportation Systems.

CONTENTS

A. Principal Elements

1. Department of Defense position on the national security implications of an overland Alaska/Canadian route and an Alaska pipeline/cryogenic tanker system.
2. Summary of DOD testimony given before Federal Power Commission Administrative Law Judge Nahum Litt presented by Rear Admiral C. Monroe Hart, Director for Energy, DOD.
3. Defensibility
   (*a*) Peacetime—Internal security responsibilities of each nation.
   (*b*) Wartime—
      (1) If both Canada and the United States are involved.
      (2) If the United States is unilaterally involved.
4. Vulnerability

The considered effect on national security if no gas transportation system is approved.

B. Summary of the position of interested parties before the FPC

C. Federal Power Commission conclusions on the implications to national security

D. Conclusions.

Discussion of Principal Elements

1. THE DOD POSITION ON NATIONAL SECURITY IMPLICATIONS

In accordance with Public Law 93–153 the Secretary of the Interior submitted a report to Congress[1] regarding the fensibility of two systems for transporting Alaskan North Slope natural gas to the contiguous 48 States. The DOI report covered the results of a study

[1] Alaskan Natural Gas Transportation Systems, a Report to Congress Pursuant to Public Law 93–153. U.S. Department of Interior, December 1975.

predicated upon an analysis of two hypothetical competitive delivery systems similar in certain respects to the proposals of the Alaskan Arctic Gas Pipeline Company, which would traverse Canada from the North Slope to the northern border of the lower 48 States; and the El Paso Alaska Company, which would traverse Alaska to its southern coast and then continue via liquefied natural gas (LNG) tanker to California.

The DOD submitted a study to the DOI for inclusion in the report which addressed the national security implications of these two hypothetical systems. The study was prepared by the Joint Staff of the Office of the Joint Chiefs of Staff. This study was the basis for the National Security Section (pages 170–172) of the DOI report. The conclusions of the DOD study, and as reflected in the DOI report, were that "analysis of military factors alone would not indicate an overriding preference for one route over the other." The DOI report further concluded that, ". . . where a foreign country is involved, it would appear that the nonwar security risks may be greater." These conclusions were reached prior to submission of the Alcan Trans-Canada route proposed by the Northwest Pipeline Company. It is the opinion of the DOD that the evaluation of the national security factors related to the hypothetical Trans-Canada route is equally applicable to a route similar to that proposed for the Alcan route.

2. SUMMARY OF DOD TESTIMONY BEFORE THE FEDERAL POWER COMMISSION

The DOD Director for Energy, Rear Admiral C. Monroe Hart in testimony before the FPC Administrative Law Judge Nahum Litt, validated for the record that the national security section of the DOI report to Congress was provided by the DOD. Admiral Hart was examined by Judge Litt; directly examined by Mr. Heisler, an FPC lawyer; and cross-examined by Mr. R. Clyde Hargrove, representing Alaskan Arctic Gas Pipeline Co., and by Mr. William Wise, representing El Paso Alaska Co. The examinations by these persons were concerned with the relative ease of protection of the two transportation systems and in that context addressed both military and civilian law enforcement, their availability and probable use in peace and war. Also, the key points of system vulnerability which would offer the greatest potential for maximum disruption to system operation were discussed; these were:

(*a*) Typical points at which concentration of pipeline or facilities would offer the greatest attraction and opportunity for greatest crippling damage such as:

(1) The Yukon River crossing in Alaska where both gas and oil lines will cross the river on a single bridge.

(2) The gas liquefaction plant on Prince William Bay.

(3) The parallel crude oil and gas pipelines through Alaska.

(4) The Prudhoe Bay producing fields and the gas and oil processing plants.

(5) The length of the gas pipeline in Northwest Canada which would be more difficult to patrol. It was noted that threats of sabotage against the Alaskan Arctic Gas pipeline have already been made.

(*b*) The relative difficulty of providing protection for key points such as the above examples was examined and the following criteria were considered.

(1) Points of concentration such as the Yukon River crossing and the processing facilities at Prudhoe Bay and Prince William Sound offer attractive targets for terrorists, saboteurs, para military groups and wartime attack, but they also offer the greatest opportunity for concentrated protection.

(2) Remote portions of a pipeline, particularly those portions through the northernmost sections of Northwest Canada, offer an attraction for destruction because of the difficulties of restoration due to long distances for transportation of repair equipment plus weather and physical limitations of access. However, for similar reasons the successful completion of an act of destruction is also much more difficult to accomplish in such remote and environmentally hostile areas.

(3) With regard to the protective forces which would be available in peacetime and wartime, it is considered that in both the United States and Canada peacetime security will be provided by company surveillance and inspection and by the normal law enforcement organizations, and in wartime these organizations would continue their service with military assistance as needed.

The testimony and examination did not alter the conclusions of the DOD study on National Security that an analysis of military factors alone would not indicate an overriding preference for one route over the other.

3. DEFENSIBILITY

(*a*) Peacetime—It will be the responsibility of each nation to provide internal national security for those portions of the Alaska natural gas transportation system and facilities within its borders. It is expected that the security provided for the Alaska natural gas system will be no different than that currently provided for oil and gas pipelines now operating in both nations where the companies which own and operate those systems provide for their day-to-day security and are dependent upon local police and law enforcement officials for additional protection when necessary.

(*b*) Wartime—

(1) If both nations are involved.

The established Canadian-United States defense arrangements for the North American continent are predicated upon mutual defense through binational coordination. No specific civilian installation or locality is singled out for added protection, only the umbrella of continental military defense will normally be provided. If necessary, military assistance would be furnished in support of the normal company and local police and law enforcement organizations. For example, no unusual military precautions were taken for the United States owned and operated Haines-Fairbanks Alaskan petroleum pipeline during the Korean War, 295 miles of which traverse Canadian soil.

(2) If the United States is unilaterally involved.

Canada and the United States are bound together by tradition and treaty and have a long record of close cooperation in national security

matters. Materials are readily available to each country under normal conditions. It is considered that this long-standing cooperation would continue to exist and all materials normally available would continue to be available from Canada as a matter of mutual need, friendly cooperation and treaty obligation.

4. VULNERABILITY

National security rests heavily upon readily available energy from secure sources and the growing dependence of the nation upon imported oil from non-secure sources poses grave dangers to national security. Oil imports now amount to approximately 49 percent of the total national petroleum consumption and the addition of the Alaskan natural gas to the national energy matrix will help to minimize the current requirement for imported oil and reduce that dependence. The completion of a transportation system for delivery of Alaskan North Slope natural gas to the contiguous 48 States must be considered an *important national security objective.*

Summary of the Position of Interested Parties Before the Federal Power Commission

Representatives of the Alaskan Arctic Gas Pipeline Company, the El Paso Alaska Company and the Alcan Pipeline Company appeared before the Federal Power Commission. The positions of the first two companies regarding national security were as described in Discussion paragraph 2 above. Neither they nor the Alcan Pipeline Company disagreed with the Department of Defense position on national security as described in Discussion paragraph 1 above. The consensus was that the problems are primarily systems related and that danger due to hostile acts is of concern but is considered to be less likely to disrupt pipeline operation than system failures.

Federal Power Commission Conclusion on the Implications to National Security

The study on national security prepared by the Joint Staff of the Joint Chiefs of Staff, as it appeared in the December 1975 Department of Interior Report to Congress, was incorporated into the evaluation of the Federal Power Commission without objection.

CONCLUSIONS

The growing dependence of the nation upon imported oil presents a grave danger to the national security. The addition of the Alaskan North Slope natural gas to the energy matrix of the nation can help reduce the volume of imported oil requirements and thereby contribute to an improved national security posture. The completion of a transportation system for delivery of Alaskan North Slope natural gas to the contiguous 48 States must be considered an important national security objective. Of the three transportation systems proposed, there is no overriding preference for one route over another when analysis is based on military factors alone.

REPORT ON FINANCING AN ALASKA NATURAL GAS TRANSPORTATION SYSTEM

(July 1, 1977)

Executive Summary and Conclusions

The Alaska Natural Gas Transportation Act of 1976 ("the Act") permits Executive Branch Departments and Agencies to comment upon the Federal Power Commission's May 1, 1977, *Recommendation to the President*. One specific subject appropriate for comment under the Act is "sources of financing for capital costs."

The Act also requires the President to submit to Congress "a financial analysis for the transportation system designated for approval," along with a determination of whether he "reasonably anticipates that the system designated by him can be privately financed, constructed, and operated."

The following Report on Financing Issues is submitted in response to the above statutory provisions. The Report was written by the Department of the Treasury (the Lead Agency) with the direct contribution of other interested Federal agencies. Pursuant to the Act, the views of all interested Federal officers and agencies were solicited and have been incorporated into this Report.

The basic issue addressed in this report is *how each of the three proposed projects could be financed*. The sources of funds available are therefore identified.

The principal conclusion of this report is *that there is good reason to anticipate that an economically viable system to transport natural gas from Alaska to the lower 48 states can be privately financed*—that is, without Federal financing assistance. A private financing, however, will be difficult, if not impossible, to arrange without *prior resolution of a number of issues*. In fact, the actual likelihood that a private financing may be accomplished can be determined only *after* these issues have been resolved.

Certain of the unresolved issues directly affect the economic viability of a transportation system, and, as such, the willingness of the private sector to invest in such a project. Other unresolved issues bear upon what party or combination of parties would assume the unusual risks perceived to be associated with the construction of such a system.

The most important issues that must be resolved before any financing can be arranged include:

1. The mechanism by which the wellhead price for gas is determined;

2. The method by which gas will be priced to the ultimate consumer;

3. The authorization of a sufficient flow of gas by the State of Alaska;

4. Negotiation of sales contracts between gas producers and gas transmission companies;

5. A determination of the rate of return that the Government will allow on investment in a transportation system;

6. Formation of a final consortium of equity investors in the project;

7. Determination of the extent to which benefiting parties (including the producers of the gas, the State of Alaska, and gas consumers) will provide financing support to the project.

As stated above, there is good reason to anticipate that, once these issues are resolved, an economically viable Alaska natural gas transportation system could be financed without Federal financing assistance.

The Federal Government has the ability to resolve a number of the issues

The report discusses how the resolution of these issues would affect the overall financeability of an Alaskan gas transportation system and thereby affect the need for Federal financing assistance. The discussion on each issue is summarized below.

1. *The price gas producers will receive for the gas* (the "field price").—The Federal Power Commission is currently responsible for establishing a field price. In its *Recommendation to the President*, the Commission noted that prompt establishment of the field price of Alaskan gas was important, but to date the Commission has not made any publicly announced moves to establish the price. The Administration's selection of an acceptable methodology for determining the field price would facilitate a financing.

2. *The price gas consumers would pay for Alaskan gas.*—Two methods of pricing the gas to the ultimate consumer were suggested by the Federal Power Commission:

(*a*) "*rolled-in*" *pricing*, which averages the cost of Alaskan gas with that of gas from other sources, and

(*b*) "*incremental*" *pricing*, under which consumers pay the full marginal costs associated with producing and transporting Alaskan gas.

A third approach to pricing of gas in general is identified in the Administration's National Energy Plan, which combines aspects of both roller-in and incremental pricing. Adoption by the Administration of "rolled-in" pricing for Alaskan gas would go farthest to facilitate financing the transportation system. The approach recommended in the National Energy Plan could go equally far *if* the Administration properly structures the pricing mechanism contained in that approach. Fully "incremental" pricing would make the financing more difficult.

3. *Approval of sales contracts.*—The Federal Power Commission's authority to approve sales contracts allows it to condition approval upon formation of a large creditworthy sponsoring consortium. Specific direction for such action from the President would facilitate a private financing.

4. *Rate of return.*—Government approval of an adequate rate of return on investment in the project would facilitate a financing.

5. *Consumer participation in the financing.*—Finally, approval by the Administration of a method to allow consumer participation in

the financing would facilitate a financing. Consumers could participate by securing the project's debt through a tariff that would be paid under any circumstances.

The Federal Power Commission Recommendation to the President

In its May 1 recommendation, the Federal Power Commission found that the private benefits of a system are substantial and *did not recommend* Federal financing assistance for an Alaskan gas transportation system. It further outlined financing methods under which the Commission found the project's risks bearable without Federal financing assistance.

The Commission broadly illustrated two financing plans—the first pressing oil companies (who will produce the gas) to help sponsor the project, and the second requiring consumers to participate in the financing.

The most important aspect of the Commission's Recommendation was its apparent willingness to place substantial financial risks on gas consumers if it is ultimately found necessary—that is, if such groups as gas pipeline companies, the gas producers, and the State of Alaska together are unable to fully secure the project debt.

The discussion of financing in the Commission's *Recommendation* was general and theoretical; it lacked a detailed financial analysis of capital market capacity and an analysis of the financial capacity of the potential project sponsors.

While the Commission did not resolve any major issues in its Recommendation, it in no way restricted the President's decision in regard to the financing. The net result is that all options for financing of an Alaskan gas transportation system are open.

Financing Without Federal Financing Assistance

As noted, the report concludes that there is good reason to anticipate a private financing of an economically viable transportation system. The analysis shows that *the capital markets do have the capacity to supply the basic funds required by any of the three projects.* The analysis also shows that *the capacity exists in the private sector to finance any of the proposed projects.*

The report contains a financial analysis of the capacity of the private parties who would benefit directly from an Alaskan gas transportation system to invest directly in or otherwise assist the financing of a system. The potential direct beneficiaries are identified below:

1. *Gas transmission and distribution companies.*—The analysis concludes that a consortium composed of those companies that have shown an interest in a project have *ample* capacity to provide the equity portion of any of the proposed projects (and have sufficient capacity to provide the equity even in the event of 80% cost overruns). This conclusion even assumes there would be *no* payments made by potential consumers during the construction period.

2. *The gas producers.*—The producers (essentially three major oil companies—Exxon, Atlantic Richfield, and Standard Oil of Ohio) stand to benefit handsomely from the sale of their gas, and such sale requires a transportation system.

These companies clearly have the financial capacity to support the financing of a gas transportation system.

3. *The State of Alaska.*—Alaska will benefit from royalties on the sale of the gas, the construction activity itself, and the availability of the gas for industrial development in the State. Revenues accruing to the State from the production and sale of *oil* are being channeled into a fund dedicated to Alaska's future development. Such a fund gives the State substantial capacity with which to support a financing.

4. *Potential gas consumers.*—Consumers could provide a substantial source of financial support for a transportation system.

Financing Alternatives

The report discusses four distinct financing alternatives.

1. *Sponsor Guaranteed Financing* (illustrated in the Federal Power Commission *Recommendation to the President*).— The analysis concludes that a traditional financing guaranteed by gas pipeline companies and the State of Alaska, while preeminently desirable, would be difficult to arrange. The gas transmission and distribution companies do not have sufficient financing capacity to underwrite an entire project. *Were the gas producers to participate substantially in the financing, this alternative would be viable.*

2. *Consumer Guaranteed Financing* (also illustrated in the Federal Power Commission *Recommendation to the President*).—The analysis shows that gas consumers have the capacity to guarantee the debt and equity financing, thereby reducing the financing costs. However, this alternative presents important questions of public policy and energy financing policy which remain to be resolved

3. *Mixed Sponsor and Consumer Alternative.*—The report concludes that participation by all the potential beneficiaries—including gas transmission and distribution companies, the gas producers, the State of Alaska, and consumers—would form the most equitable and practical aproach to financing a transportation system. One feasible method would be for each potential beneficiary to guarantee the debt of an identifiable segment of whichever system is designated.

4. *Federal Financing Assistance Alternative.*—A number of methods by which the U.S. Government could assist the financing are discussed in the report. None is recommended because Federal financing assistance was found unnecessary.

Canadian Issue

The two trans-Canada projects propose to raise substantial funds in Canada. The Canadian Department of Finance thus far has opposed governmental guarantees for a project. If ultimately a trans-Canada route is selected and governmental debt guarantees are found necessary, the nature and negotiation of those guarantees will present complex issues requiring close cooperation with the Government of Canada.

Federal Financing Assistance

In general, capital is allocated and utilized most efficiently when its movement is subject to the disciplines and the profit incentives of the market system. Thus, if energy or other government policy imperatives dictate that Federal financial assistance be provided, the degree of such assistance *should be the minimum necessary to achieve such policy objectives.* Also, the financial assistance should be provided in a manner that will facilitate, rather than impede, the operations of

the market system. Finally, *the interests of the taxpayers granting such assistance must be vigilantly protected* and taxpayers should be adequately compensated for their financial support.

If overriding energy policy and credit market considerations do dictate that government assistance be provided for the Alaskan gas project, care must be taken to offset the serious possible consequences of Federal assistance. One serious concern is that Federal financial assistance will create *subsidies which may cause an underpricing of gas and a misallocation of scarce energy and economic resources.* Another serious concern is that assistance by the government in this instance will set a precedent which will make it difficult to find willing parties to support other large energy projects without government assistance. Such a precedent could have long term adverse consequences for the national economy.

Even if Federal assistance were ultimately found necessary to finance the project, it should not be provided *in lieu of* risk bearing by other parties. *Direct beneficiaries of the project should remain obligated to bear the project risks to the largest extent feasible*, and any taxpayer risk should be residual and subordinate.

NATIONAL ENERGY BOARD, OTTAWA, CANADA

Fact Sheet Regarding National Energy Board Decision on the Northern Gas Pipeline Applications

The National Energy Board on 4 July 1977 released its decision on the Northern Gas Pipeline Applications. The following information concerning the functions and responsibilities of the Board, the Applications and the Board's Findings, Decisions and Recommendations is provided for ease of reference.

THE BOARD

The National Energy Board—NEB or Board—is an agency established by legislation by the Government of Canada enacted in 1959. The agency consists of nine full-time members and a staff of some 325 employees, among whom are engineers, environmentalists, economists, accountants, lawyers and other specialists, who act as advisers to the Board.

The Board's responsibility is to control and regulate certain aspects of the energy industry in Canada to ensure that the public interest is protected at all times. It does this by the issuance of certificates of public convenience and necessity which authorize the construction and operation of interprovincial and international pipelines and international power lines and by the issuance of licenses for the export of oil, the import and export of natural gas and the export of electricity.

No pipeline can be built or operated in Canada across provincial or international boundaries unless a certificate has been issued by the NEB. The certificate becomes effective only with the approval of the Governor in Council.

Before the Board reaches a decision on any major pipeline project, it holds a public hearing to examine the proposal and to afford an opportunity for those found to be interested persons under the NEB Act to take part in, adduce evidence, and argue their case or otherwise make submissions.

THE APPLICANTS

During 1974 and 1975, the Board received competing applications and submissions related to the planned construction of a northern gas pipeline. The first application to move northern gas to southern markets was submitted in March 1974 by Canadian Arctic Gas Pipeline Limited under Part III of the NEB Act to construct and operate a new 48-inch diameter main pipeline system and interconnections with existing and proposed new facilities, for the purpose of transporting Prudhoe Bay and Beaufort Basin gas southward. The most northerly section of mainline would run 178 miles from the Alaska-Yukon border to Tununuk Junction, N.W.T.; a supply line would run 19 miles from the Taglu Field on Richards Island to Tununuk Junction to join the

main line. The main line would continue south to Parsons Lake junction where it would be joined by a 30-inch diameter supply lateral from Parsons Lake on the east. The main line would then proceed south along the Mackenzie River Valley into Alberta where, near Caroline, it would split into two delivery lines—one a 48-inch diameter line to Empress, Alberta and thence a 42-inch diameter line to Monchy, Saskatchewan; and the other a 36-inch diameter line to Coleman, Alberta, where the delivery lines would interconnect with the facilities of other pipeline companies. In June 1975, Alberta Natural Gas Company Ltd. applied to the Board for a certificate to construct additional facilities required to transport gas to be obtained through the proposed CAGPL system.

In a competing application, Foothills Pipe Lines Ltd. applied in March of 1975 for a certificate of public convenience and necessity to construct and operate a pipeline and connected works to move natural gas from the Beaufort Basin of the western Arctic to southern Canada and Northwest Territories communities. The proposed pipeline would connect with facilities of Trunk Line (Canada) and Westcoast just north of the 60th parallel. Foothills proposed to construct some 817 miles of 42-inch diameter line from Richards Island along the Mackenzie River Valley. It also proposed to construct 15 miles of 30-inch diameter line as a lateral connection from a point east of Parsons Lake, N.W.T. to a point of connection with the main transmission line some 51 miles south of the Richards Island point of commencement of the main line.

In May 1975, the Alberta Gas Trunk Line (Canada) Limited applied to construct and operate approximately 81 miles of the Foothills 42-inch diameter line from a point 6.5 miles north of the 60th parallel to existing or new Alberta Gas Trunk Line facilities at a point near Zama Lake, Alberta.

The Alberta Gas Trunk Line Company Limited owns and operates a natural gas gathering and transmission system within Alberta. It did not file an application but in a submission in May 1975 undertook to construct and operate certain facilities of Trunk Line (Canada) subject to federal jurisdiction. Originally in the hearings Westcoast Transmission Company Limited submitted an application with respect to an extension of its main line as a companion application in the Foothills project. On July 1, 1976 Westcoast proposed to extend its facilities to interconnect with those of CAGPL if that project were approved.

In August and September 1976 a third set of applications for pipeline construction by a group of associated companies generally called the Foothills (Yukon) Project Group was filed with the Board. These applicants, Foothills (Yukon), Westcoast and Alberta Gas Trunk Line (Canada), proposed to move Alaska gas through Canada to markets in the lower 48 states of the United States. This proposal included construction of a Foothills (Yukon) 42-inch diameter line from an interconnection with Alcan Pipeline Company at the Alaska-Yukon border, through the Yukon to the B.C. border where it would connect with a 42-inch diameter extension of Westcoast; a 36-inch diameter Trunk Line (Canada) line would interconnect existing facilities of Trunk Line in Alberta with another extension of Westcoast, and a Foothills (Yukon) 36-inch diameter line would be constructed from

Trunk Line's facilities at Empress, Alberta to the international border near Monchy, Saskatchewan.

In late February 1977 the Foothills (Yukon) Group filed with the Board an alternative proposal to construct a 48-inch diameter pipeline system, without using the existing Westcoast and Trunk Line facilities. It involved the construction of an "express line" through Yukon, and generally along existing routes in northern British Columbia and Alberta, plus a new Westcoast line parallel to the existing Alberta Natural Gas route in southeaster British Columbia.

On 16 March 1977 the Foothills (Yukon) Group withdrew the 42-inch diameter system applications; thus the only Foothills (Yukon) system considered by the Board in its report is the 48-inch diameter line.

FINDINGS

Based on all the evidence adduced at hearings and submitted by applicants, interveners and interested persons, the Board has made a number of findings, upon which its decisions were based. The more significant of the findings, contained in its Reasons for Decision dated dated June 1977, are outlined below.

The Board finds that a pipeline to transport Mackenzie Delta gas to Canadian markets will be needed during the first half of the 1980's. In support of this finding the Board can to the following conclusions:

(1) There will be a need for additional gas for Canadian markets over and above that forecast to be available from conventional areas to meet the "Most Likely" forecast of Canadian demand plus existing export commitments as early as 1981 or as late as 1985 depending on certain policy options open to governments.

(2) If existing authorized exports of gas were eliminated or were phased out, the "Most Likely" Canadian requirements could be met until about 1990, but the Board does not recommend such action.

(3) The Board endorses a vigorous conservation policy and in its "Most Likely" forecast of Canadian gas demand has endeavoured to realistically assess the degree to which Canadians will be responsive to the conserver ethic; however the Board rejects the proposition urged on it by several public interest groups that a pipeline from the Mackenzie Delta should be denied so as to reinforce the limitation in the rate of growth of the demand for energy.

(4) The current established reserves of the Mackenzie Delta total 5.3 Tcf, with 5.1 of this being economic to connect to planned gas processing plants. Having in mind a pipeline to the south, these reserves would support deliverability of 700 to 800 MMcf per day.

(5) Of the several new large sources of energy available to Canada in the near future, Delta gas is about the lowest cost, in current dollar terms.

Although additional work would be required in the final design process for each of the pipelines being applied for, the Board believes that from an engineering point of view any of these could be built to the satisfaction of the Board.

The Board has specific socio-economics concerns related to a pipeline route up the Mackenzie Valley.

The Board has specific environmental concerns related to a pipeline route from the Alaska-Yukon border to Tununuk Junction.

The social and economic impact of the Foothills (Yukon) project could be held to tolerable levels. The environmental concerns associated with this project can be overcome by avoidance or mitigative measures.

A crucial question in regard to any land bridge proposal for the transmission of United States gas through Canada is whether the project has the potential for bringing Delta gas to Canadian markets and the Foothills (Yukon) project has such a potential in the form of a Dempster link.

The precise timing of the need of a Dempster link is not known today, but the planning for the Foothills (Yukon) project should be compatible in all respects with the addition of such a link, if certificated in the near future.

A necessary complement to the undertaking given by the principals of Foothills (Yukon) to undertake the construction of a Dempster link would be a rerouting of the Alaska Highway line via Dawson, Yukon. Such diversion would reduce the cost of transportation of Delta gas by some 12 cents per Mcf while increasing the cost of transmission of United States gas by six cents per Mcf or less. In certificating the Foothills (Yukon) project, the Board would require a diversion of the route through Dawson. The preliminary financing plan of CAGPL would be acceptable to the Board, with two exceptions—

(*a*) CAGPL would have to provide for majority Canadian control of the equity of its company; and

(*b*) the Board rejects the recommendation of CAGPL that the Canadian Government should provide financial backstopping to the project.

The Board shares the view of the financial advisers to the Foothills project that it could not be financed at this time on the basis of Mackenzie Delta reserves already discovered and could not be justified on economic grounds.

The Foothills (Yukon) Project Group did not request backstopping by the Canadian Government. There are matters of fundamental concern to the Board, however, in the financing and ownership of the Foothills (Yukon) project. These relate to the possible impairment of the credit capability of Trunk Line and Westcoast by their unequivocal undertakings to complete the project irrespective of cost overruns, in providing a land bridge for United States gas. The Board believes some restructuring of the corporate setup of the Foothills (Yukon) project would be necessary. Furthermore, the financial plan of the project should exclude any possible inhibition in providing a Dempster link at a later stage.

To ensure that the objectives of the companies owning and operating each segment of the Foothills (Yukon) project would be consistent with the broader purposes of an integrated interprovincial pipeline, with uniformity of design and tariffs but with decentralization of construction and operation to those companies operating pipelines in the same area, the Board would favour having the pipeline segments south of the 60th parallel owned by federally incorporated subsidiaries of Foothills (Yukon) with, say, 51 per cent ownership and the re-

mainder, say 49 per cent ownership, vested in the pipeline company operating in the area.

The Board believes that construction of the pipeline se, ents south of the 60th parallel should be carried out by the companies familiar with the areas concerned and would favour the proposed ANG pipeline subject to the corporate restructuring mentioned above. Similarly, while having no corresponding applic tion, the Board would look favour on the construction and operation of the pipeline segment in Saskatchewan by TransCanada on a basis similar to that outlined for Trunk Line, Westcoast and ANG.

The Board believes that innovative tariffs would be needed to provide for maximum private sector financing of a northern pipeline. To this end, for this project, it endorses the principle of an "all events" tariff and the need for supplemental agreements with shippers covering the period before the tariff proper comes into effect.

Using the unit costs of transportation filed by the Applicants, and recognizing some limits on comparability, the Board finds that:

(1) For the transportation of Alaska gas from Prudhoe Bay to the 49th parallel, the differences in the unit costs of transportation via CAGPL and via Foothills (Yukon) are relatively small;

(2) the CAGPL project would provide significantly lower unit costs for the transportation of Delta gas to Empress than the Foothills project;

(3) providing the Dempster link to Dawson, which would involve the re-routing of the Foothills (Yukon) 48-inch diameter pipeline in the Yukon, would increase the unit costs of transporting Prudhoe Bay gas to the lower 48 states slightly while providing significantly lower transportation costs to Canadian shippers of Delta gas;

(4) With a throughput of 12 Bcf per day from the Delta and 2 Bcf per day from Alaska, the cost of transmission of Delta gas to Empress appears to be approximately the same for the CAGPL and Foothills (Yukon) projects.

As to the total estimated capital costs, due to the difficult conditions for the northern Yukon and Cross-Delta sections, the Board could visualize a cost overrun of 20 to 35 per cent occurring in the CAGPL project. In the case of Foothills (Yukon) the Board judges that the cost of construction has been under-estimated and it could visualize a cost overrun of 20 to 30 per cent occurring.

The Applicants all estimated relatively high levels of Canadian content for their proposed pipelines—in the range of 80 to 90 percent. The Board's overall assessment is that Foothills and Foothills (Yukon) projects showed overall Canadian content estimates averaging somewhat higher than those indicated by CAGPL.

The evidence of the effect of the pipeline projects on the macroeconomy of Canada was uniform in assessing that none of them would cause severe problems.

The results of cost-benefit analyses, which excluded environmental and social costs and which would differ between CAGPL and Foothills (Yukon), indicate that the net economic benefits would be somewhat greater for the CAGPL project than for the Foothills (Yukon) project.

The Board is not involved in the merits of native land claims per se, or their settlement; these are matters under direct negotiation between

the native peoples and the federal government. The Board was concerned, however, with the interrelation of the resolution of a land claims settlement with the perceptions of Northerners of whether a pipeline should be built, and if, so, where and when.

The Board's assessment of the socio-economic impact of a pipeline in the north is one of broad judgment. The north at this time may be said to be a land in transition and for the individual native northerner, the situation seems to be one of turmoil caused by fear of further white encroachment, and a striving to retain the essentials of a life close to the land from a non-viable base in a community. The added problems relating to the possible construction of a pipeline only compound an already confused situation. In the Yukon, the opening up of the Alaska Highway in 1942 and the fact that the Yukon economy and institutions are more developed, that the land claims negotiations appear to be more advanced, that a smaller number of native peoples would be affected and that the Yukon Indians do not appear to be passing through the phase of a major restructuring of their society, as the Dene appear to be, lead the Board to conclude that the socio-economic impact on the pipeline corridors would, on balance, be more favorable along the Alaska Highway than in the Mackenzie Valley.

The Board believes that identifiable indirect costs of a pipeline project north of the 60th parallel should be borne by the pipeline company. These costs, related to such things as in-migration, provision of additional municipal, social, and health services, are difficult to measure with precision, and it would recommend to the government that an agreement be entered into with a certificate holder to provide funds for such costs. The Board would further recommend that the obligation be limited to $200 million.

There would be need of a government agency to monitor socio-economic matters, and if a certificate were granted, the Board would recommend to the government that it immediately create effective machinery for this purpose.

Based on the evidence put before it, the Board has concluded that the CAGPL Prime Route, both the Northern Yukon coastal and Cross-Delta sections, would be environmentally unacceptable. The Interior Route, presented as a less desirable alternative by CAGPL, would also be environmentally unacceptable to the Board.

The Board has concluded that the environmental concerns associated with the Foothills (Yukon) route relate to impacts which can be overcome by avoidance or mitigative measures.

Environmental information on a Dempster link is sparse and an application for a certificate to construct and operate a pipeline from the Delta to connect with the 48-inch diameter pipeline would have to be supported by detailed environmental studies. Likewise, environmental studies related to a diversion of the 48-inch diameter pipeline through Dawson would require the immediate study of related environmental impacts and subsequent filing of such studies with the Board.

DECISIONS AND RECOMMENDATIONS

The Board's decisions and recommendations to the Governor in Council follow:

(1) The Foothills pipeline cannot be financed; it would not offer the lowest cost means of transporting Mackenzie Delta gas to market

and a pipeline should not be built along the Mackenzie Valley at this time. The Board therefore denies the application of Foothills Pipe Lines Ltd.

(2) For the reasons stated in (1), the Board also denies the applications of Westcoast Transmission Company Limited and Alberta Gas Trunk Line (Canada) Limited for certificates for facilities which would interconnect with those of Foothills.

(3) The CAGPL project is based on incompatible time constraints; on the one hand the urgent need to connect Alaska gas to United States markets and on the other, the need for more time to resolve socio-economic concerns before a pipeline could be built in the Mackenzie Valley.

(4) The Prime Route proposed by CAGPL from the Alaska-Yukon border to Tununuk Junction, including the Cross-Delta segment, is environmentally unacceptable to the Board, as is the alternative Interior Route.

(5) For the reasons stated in (3) and (4), the Board denies the application of CAGPL.

(6) The Foothills (Yukon) project generally offers the preferred route for transporting Alaska gas to markets in the lower 48 States. However, the Board believes certain changes to the project as applied for are desirable in the Canadian public interest.

(7) The Board is prepared to issue certificates of public convenience and necessity for the various pipeline segments of the Foothills (Yukon) project subject to conditions. The Board is recommending to the Governor in Council, however, that approval be withheld until the following have been accomplished:

(i) That appropriate amendments to existing applications have been filed with the issuance of the certificates in the names of subsidiary companies of Foothills (Yukon) for the segments of the project in northern British Columbia, Alberta and south-eastern British Columbia. Fifty-one percent of the voting shares in each of the subsidiary companies would be owned by Foothills (Yukon) and 49 percent in each by Westcoast, Alberta Gas Trunk Line and ANG (or Westcoast, if not acceptable to ANG), respectively.

(ii) That agreements have been entered into by Foothills (Yukon) with the Government of Canada whereby Foothills (Yukon) or any successor, would undertake the following:

(*a*) to conduct feasibility studies with respect to the construction of a gas pipeline of no less than 30-inch diameter from the Mackenzie Delta parallel to the Dempster Highway connecting Delta gas to the Foothills (Yukon) system near Dawson City, Yukon, and on or before 1 July 1979 make an application to the National Energy Board for a certificate of public convenience and necessity for such pipeline;

(*b*) to agree to provide capacity in the main 48-inch diameter pipeline from the point of connection of the Dempster lateral to such point or points on the 48-inch diameter system in Canada deemed necessary to effect delivery of Delta gas to southern Canadian markets, such capacity to be provided by 1 January 1984 or such later date as deemed necessary by the government; and

(*c*) to provide payment upon the request of the Government of Canada of a sum of money which would be used by the government to pay for socio-economic indirect costs of the pipeline project north of the 60th parallel incurred during a period expiring two years after leave had been granted by the Board to open the pipeline. The Board recommended that the obligation be limited to $200 million.

REPORT TO THE PRESIDENT ON ENVIRONMENTAL IMPACTS OF PROPOSED ALASKA GAS TRANSPORTATION CORRIDORS BY THE COUNCIL OF ENVIRONMENTAL QUALITY

SUMMARY

BACKGROUND

Since the discovery of large oil and natural gas reserves in the Prudhoe Bay fields in Alaska, several routes have been proposed to transport this gas to the lower 48 states.

A North Slope/MacKenzie Valley corridor, sponsored by Alaskan Arctic Gas Company, would traverse Alaska's North Slope, cross into Canada at the MacKenzie River Delta, and run south along the river and hence into the Midwest; a western leg would transport gas to the western states.

An Alaska LNG route proposed by the El Paso Alaska Company would follow the oil pipeline to a new terminal site on Prince William Sound where the gas would be liquefied and shipped by tanker to southern California.

The Fairbanks Alternative corridor sponsored by the Alcan Pipeline Company would parallel the existing oil pipeline as far as Fairbanks and then follow the Alcan Highway through Canada. Some of the gas would be routed to the West Coast via a western leg, and most would go through Alberta and Saskatchewan to U.S. markets in the Midwest and the East.

All three corridors were analyzed in the environmental impact statement process of the Department of the Interior and the Federal Power Commission.

Recognizing an urgent national need for additional natural gas supplies, the Congress enacted the Alaska Natural Gas Transportation Act of 1976 to provide the means for a sound and expeditious decision by the President and the Congress on which, if any, transportation system should be built. To avoid the delays of possible litigation, the Act precludes judicial review of the environmental impact statements required by the National Environmental Policy Act (NEPA).

Under Section 6(d) of the Alaska Gas Act, the Council on Environmental Quality is directed to present to the President its views on the legal and factual sufficiency of the impact statements and on other environmental matters that we consider relevant. CEQ is also directed to provide members of the public with an opportunity to present oral and written data, views, and arguments on the impact statements. A total of four days of public hearings were held in Anchorage and Washington, D.C., with written and oral testimony submitted by over 70 persons and organizations representing a wide spectrum of interests. These hearings were extremely informative and helpful to the Council in reaching its conclusions.

Sufficiency of the Environmental Impact Statements

Because of the magnitude of the competing proposals and the abbreviated schedule for decisionmaking under the Alaska Gas Act, the decision at hand is to select a particular gas transportation route. It is the sufficiency of the environmental impact statements *for this limited purpose* that is considered here—not their sufficiency for determining precise alignments, facility locations, and other site-specific data.

After careful review of the impact statements and testimony submitted at our hearings, we have concluded that:

Although they have shortcomings, the environmental impact statements are legally and factually sufficient under the National Environmental Policy Act for purposes of selecting the corridor and basic technology for a gas transportation system. Indeed, the NEPA process led directly to the development of the Fairbanks Alternative, the corridor that we believe to be environmentally preferable, as noted below.

Although the impact statements provide the information necessary to select a corridor and the basic technology for a gas transportation system, they lack the data required for specific decisions concerning route alignments, project designs, mitigation measures, and facility siting. NEPA requires a continuous review of environmental factors and alternatives by agencies with authority over the approved gas transportation system. Environmental assessments, EIS supplements, or new impact statements may be required, depending upon the significance of impacts and the degree to which they have already been treated. Major design, engineering, or other site-specific decisions that follow the selection of a corridor and technology must be considered in one of these types of NEPA analyses.

Environmental Impacts of Alternative Corridors

The impact statements and other public documents provide a wealth of information on the environmental impacts of each of the three corridors. Altogether, they permit a fair comparison of the significant environmental impacts that we believe are most relevant to the decision before the President and the Congress. We found that:

The North Slope/MacKenzie Valley corridor is the most environmentally destructive of the three routes being considered. Intrusion into the wilderness stretching from the Canning River in Alaska to the MacKenzie Delta in Canada would be massively disruptive. We disagree strongly with the Federal Power Commission's conclusion that this corridor is environmentally acceptable.

This corridor would pass through parts of Alaska and Canada that are now hardly affected by industrial man's influence: Of its 195 miles in Alaska, 135 miles would cross the narrow coastal plain of the 8.9-million acre Arctic National Wildlife Range Established to preserve unique wildlife, wilderness, and recreational values, the Range stands out at the last unspoiled area of its kind in the entire Northern Hemisphere.

The proposed North Slope/MacKenzie Valley pipeline would cut an east-west corridor across this unmarred landscape, requiring new port facilities, airstrips, helipads, gravel borrow areas and compressor stations as well. Although the land loss seems insubstantial when

compared to the total Range, the harm likely to occur to wildlife and wilderness values there is vastly out of proportion to acreage figures.

The litany of measures proposed to protect the Range from pipeline construction is a testimony to scientific, technological, and management ingenuity. The applicant proposes to build that portion of the pipeline entirely in one winter, using only snow roads that vanish with the spring melt. We are skeptical about whether it could be done. The risks of failure are impressive and their consequences irremedial. Experience suggests that economic pressure to complete such a pipeline on schedule would not yield to the onset of spring and the wildlife that might stand in the way.

We must also note the widespread concern that such a gas line could invite an oil line and perhaps a permanent road, so as eventually to become a permanent corridor. A gas line across the Arctic Range and Northern Yukon to the MacKenzie Delta would invite the exploration of oil and gas that may well exist within the Range or in the Beaufort Sea. The future of the Arctic Range must lie in the permanent dedication of this rich and unique area to wilderness. This is also the conclusion of the State of Alaska and every environmental organization appearing at our hearings.

The wilderness and wildlife values of the Range, along with the pipeline route, also extend into Canada, to the MacKenzie Delta. Natives there, who constitute the majority of the population in the Northern Arctic, have vigorously opposed any pipeline either across the North Slope or up the MacKenzie River, fearing its effects on their way of life and its interference with their land claims settlement. Canadian Justice Thomas Berger, who investigated the social and environmental impacts of this route for the Canadian government, recommended that to protect these people and the environment on which they depend, no pipeline be built across the North Slope.

The Fairbanks Alternative corridor would largely follow existing transportation corridors, with no large-scale intrusion into wilderness areas or destruction of wilderness values. We find, in agreement with the Federal Power Commission, that it is the most environmentally acceptable of the three corridors.

But some of its environmental risks are still unknown. The preliminary state of the design effort suggests substantial uncertainty about fundamental concepts. Measures to deal with frost heave, thaw settlement, and summer construction, for example, are only roughly sketched. Still to be developed is site-specific information, such as stream crossings and additional workpad construction mileage.

On the other hand, it appears that the gas line could be safely constructed relatively near the oil pipeline across the existing workpad. The existing haul road along the oil pipeline would also be used, as would many of the existing campsites and other facilities. Further advantages can result from the availability of information on the geology, soils, stream characteristics, and wildlife, all of which would aid in controlling impacts of the Fairbanks Alternative as far as Delta Junction, where it would depart from the oil pipeline.

Social and growth impacts of both the Fairbanks Alternative and the Alaska LNG route will obviously be greater in Alaska than those of the North Slope/MacKenzie Valley corridor. Although no accurate measures of these impacts have been made, the Alyeska experi-

ence has prepared residents for what to expect. Many government, labor, and business interests as well as some Alaskan natives desire the growth effects of another pipeline project and believe its impacts can readily be absorbed.

A Canadian Inquiry headed by Dean K.M. Lysyk is now investigating the effects of the Fairbanks Alternative on the native claims settlement issue in the Southern Yukon. The report is intended to provide Canada with the social impact information needed to make a decision on this route.

The Alaska LNG alternative presents risks to the environment, to public safety, and to system intergrity not present with the overland corridors. Its significantly greater consumption of energy should also be viewed as an environmental cost, and it would have the greatest impact on Alaskan fisheries. It is possible that the Alaska LNG corridor and technology can be environmentally acceptable. At present, however, we are faced with significant uncertainties about thermal impacts, seismic design, ultimate suitability of the LNG plant sites proposed in Alaska and southern California, and the safety risks of LNG tanker traffic. This system would be environmentally acceptable only on condition that more specific analyses of alternative LNG facility sites and mitigation measures are conducted prior to any certification.

Because the Alaska LNG pipeline corridor makes the most extensive use of the existing oil pipeline corridor, its social, economic, and environmental impacts in Alaska would be similar to those of the Fairbanks Alternative. In its last 43 miles, however, the corridor would cross the Chugach National Forest, a roadless area of great scenic beauty, to Point Gravina, where the gas would be liquefied, and from there transported by tankers to California, gasified, and sent to U.S. markets.

The most serious potential impacts of the LNG facility at Point Gravina are those associated with the seawater cooling system. According to the best evidence, the LNG plant as proposed would probably affect the marine ecology of Orca Bay substantially. Because the area is a valuable source of salmon and other commercial species, it could have profound effects on the local economy as well. But precise conclusions cannot be drawn because no substantial investigation of the Bay has been undertaken, and the water-related LNG plant systems remain undefined. Without this information it is impossible to determine whether the site at Point Gravina is environmentally acceptable or another is preferable. It seems likely, however, that an environmentally acceptable plant could be designed and constructed.

Similar problems arise with seismic design at the Gravina site. Earthquakes and resultant tsunamis present serious threats. The applicant asserts that a safe plant could be designed once Gravina conditions (e.g., the existence and depth of bedrock) are satisfactorily investigated. Although this assertion has not been successfully challenged, the necessary proof must await further site investigation and actual plant design.

From Point Gravina LNG tankers would leave for a California gasification site—Point Conception or Oxnard appear to be the current leading alternatives. Here complex land use, thermal discharge,

and safety issues must still be resolved by the state and federal governments.

LNG tanker accidents can have major consequences. Tanker collisions or rammings and groundings could lead to vapor clouds, LNG pool fires, and accidents at the LNG facility—with possibly fatal effects. The analyses of LNG public safety risks on the record are inconclusive. Although it is not now possible to establish the level of public safety risk imposed by an LNG facility, it is possible to reduce substantially the consequences of events by remote location of facilities away from people.

The Alaska LNG system is therefore unique, and it is difficult to analyze because of the inherent uncertainties posed. Mitigation of its environmental impacts and safety risks will be possible, but only at considerable, heretofore unestimated, expense.

We must note that the environmental damage inflicted by any of these transport systems will be significant. Thus we recommend that the need for Alaska gas, the parts of the country that it would benefit, and the alternative energy supplies that they might receive now or at some later date be subject to the most careful scrutiny before a final decision is reached.

We have defined our environmental impact considerations as solely a function of corridor and technology, independent of the project sponsor. Although Alcan has proposed the least environmentally risky corridor—the Fairbanks Alternative—its proposal is the least well-developed of the three. And although we find the North Slope/Mackenzie Valley corridor unacceptable on environmental grounds, we note that Arctic Gas has provided environmental analyses of a depth and quality clearly superior to those of the other applicants.

Our conclusion that the Fairbanks Alternative corridor is the least environmentally damaging route assumes the strict application of environmental criteria in a full interdisciplinary review during the engineering design, construction scheduling, and route selection process. We also assume that the federal government will establish coherent stipulations, terms, and conditions and stringently enforce the environmental and public safety conditions in the field.

It will not suffice to rely on the project sponsor's "quality control" to protect the environment or to ensure compliance with government-imposed conditions. Effective enforcement will require a central federal authority and a new organizational structure to resolve interagency conflicts over jurisdiction and policy. In any case, we believe that the public would be well served by a citizen monitoring capability, staffed and federally supported to observed and report on pipeline construction, and well coordinated with the government monitoring structure.

PUBLIC VIEWS PRESENTED TO THE COUNCIL ON ENVIRONMENTAL QUALITY

Witnesses found the environmental impact statements in compliance with the National Environmental Policy Act but several shortcomings were noted. Critics argued that the statements were too long and cumbersome and lacked explicit comparisons of the three corridors. Some also believed that the statements had omitted specific information or analyses, such as recent design and alignment changes

in two of the proposals, long-range effects of pipeline construction, and comprehensive information on impacts in Canada.

The issues of greatest concern to witnesses included:

Impacts on the Arctic National Wildlife Range.

Social and economic impacts in Alaska.

Impacts on Canada, especially on Canadian natives.

The net national economic costs and benefits of transporting Alaskan natural gas.

Regional distribution of Alaskan gas to the lower 48 states.

Implications for future resource development in the North.

Pipeline construction monitoring.

Other prominent issues were impacts on Alaska's fisheries and effects on coal gasification development.

Environmental groups testifying and the State of Alaska were unanimous in their opposition to the North Slope/MacKenzie Valley corridor; most environmental organizations strongly preferred the Fairbanks Alternative to the other corridors. Representatives of the State of Alaska and Alaskan business, labor, and local governments testifying favored the Alaska LNG route, believing it to hold the greatest social and economic benefits for the state. Many major Midwest, East Coast, and California gas distributors and transmission companies support the North Slope/MacKenzie Valley corridor. They believe the Arctic Gas proposal to be the most reliable and one that will ensure delivery of the greatest volumes of gas directly to markets.

MAY 9, 1977.

REPORT OF JUSTICE THOMAS R. BERGER ON THE MACKENZIE VALLEY PIPELINE INQUIRY

> "It will be for the Government of Canada, when my report and the National Energy Board's report is before it, to weigh Canada's need for frontier gas, and the impact of the construction of a pipeline on the north and on northern peoples, and then to decide if a pipeline should be built and, if it is to be build, then where and by whom it should be built. These are political decisions, to be taken by those who have been elected to make such decisions."
>
> Thomas R. Berger, *Queens Quarterly, Vol. 83, No. 1, Spring 1976.*

The Mackenzie Valley Inquiry was established on March 21, 1974 by Order-in-Council of the Government of Canada. The attached is the first of a two-volume advisory report to the Minister of Indian and Northern Affairs, prepared by the Commissioner of Inquiry, Justice Thomas R. Berger. In this first volume, Justice Berger addresses the overall social, environmental and economic impacts of proposed natural gas transportation systems on the Yukon and Northwest Territories. Specific emphasis is placed on the possible impacts of competing Mackenzie Valley pipeline projects sponsored by Canadian Arctic Gas Pipeline Ltd. and Foothills Pipelines Ltd. The second volume, scheduled for later release, will present recommended terms and conditions that might be imposed on the right of way if a pipeline is built.

The recommendations flowing from the Mackenzie Valley Pipeline Inquiry should not be construed as representing the policies of the Canadian Government or any Department thereof. It is common practice in Canada to establish Commissions of this kind to study policy options. While the Government is under no obligation to accept Justice Berger's recommendations, they will, of course, be given serious consideration.

The Berger reports, the National Energy Board findings and inputs from Government and public sources will all contribute to the review process leading toward final Government decisions.

MACKENZIE VALLEY PIPELINE INQUIRY, COMMISSIONER,
MR. JUSTICE THOMAS R. BERGER

OTTAWA,
May 9, 1977.

Berger Report: Northern Frontier, Northern Homeland.

Mr. Justice Thomas R. Berger's report of the Mackenzie Valley Pipeline Inquiry, tabled in the House of Commons today, recommends that, on environmental grounds, no pipeline should be built across the

Northern Yukon. It is, on the other hand, feasible, from an environmental point of view, to build a pipeline along the Mackenzie Valley to transport gas from the Arctic. However, construction of a pipeline along the Mackenzie Valley should be postponed for 10 years to allow sufficient time for a just settlement of native claims. The Judge indicates that on the basis of the evidence brought before the Inquiry, the alternative overland route to carry Alaskan gas to markets in the United States, along the Alaska Highway crossing the southern Yukon is environmentally preferable to the proposed crossing of the Northern Yukon.

Judge Berger's recommendations do not mean that Canadians "must renounce their northern gas and oil." The report said that if the Government of Canada accepts the recommendations contained in this report, Canadians can build "a Mackenzie Valley pipeline at the time of their own choosing, along a route of their own choice."

Judge Berger said that the decisions facing Canadians about the North

> are not . . . simply about northern pipelines. They are decisions about the protection of the northern environment and the future of the northern peoples. . . . The North is a region of conflicting goals; preferences and aspirations . . . [where] the pipeline represents the advance of the industrial system to the Arctic. . . . The impact of a pipeline will bear especially upon the native people. . . . The conflict focuses on the pipeline. For some in Northern Canada, the North is a frontier, for others, it is a homeland, Judge Berger said.

Judge Berger set out the assumptions behind his recommendations:

> I have proceeded on the assumption that, in due course, the industrial system will require the gas and oil of the Western Arctic, and that they will have to be transported along the Mackenzie Valley to markets in the South. I have also proceeded on the assumption that we intend to protect and preserve Canada's northern environment and that, above all else, we intend to honour the legitimate claims and aspirations of the native people. All of these assumptions are embedded in the federal government's expressed northern policy for the 1970s.

Two pipeline companies, Canadian Arctic Gas Pipeline Ltd. and Foothills Pipe Lines Ltd., have proposed pipelines to bring gas from the Arctic along the Mackenzie Valley to consumers in the South. Arctic Gas proposes to bring Alaskan gas from Prudhoe Bay via the Northern Yukon, hook up with gas from the Mackenzie Delta and deliver to markets in Canada and the United States. Foothills proposes to bring Canadian gas south from the Mackenzie Delta.

The mandate of the Mackenzie Valley Pipeline Inquiry was to determine the social, environmental and economic impact of the construction of a gas pipeline and the cumulative impact of an energy corridor from the Arctic, and to recommend the terms and conditions that ought to be imposed on any right-of-way if such a pipeline were to be built.

This is Volume I of the report of the Inquiry. It deals with the broad social, economic and environmental impacts of the pipeline and

corridor. It contains basic recommendations to assist the Government in determining when a pipeline should be built, where it should be built and who should build it.

Volume II of the report is in preparation and will be available this summer. It will contain terms and conditions to be imposed if a pipeline is built.

Volume I includes an opening letter to Mr. Allmand, the Minister of Indian and Northern Affairs, which is a summary of Judge Berger's recommendations.

Key recommendations are as follows:

Judge Berger said: "I recommend that no pipeline be built and no energy corridor be established across the Northern Yukon along either route." This means that the report rejected both the Coastal and Interior Routes proposed by Arctic Gas to bring gas from Alaska to the United States.

Judge Berger said that if the pipeline is built along the Coastal Route and an energy corridor is established, "I foresee that, within our lifetime, the Porcupine caribou herd [one of the last great caribou herds in North America], will be reduced to a remnant." "The preservation of the Porcupine caribou herd is incompatible with the building of a gas pipeline and the establishment of an energy corridor through its calving grounds."

The Arctic Gas pipeline and energy corridor along the Interior Route in the Northern Yukon "would have a devastating impact on the people of Old Crow," Judge Berger said. "All the people in the village told me they are opposed to the pipeline. They fear it will destroy their village, their way of life, and their land."

The report recommended that a National Wilderness Park be established in the Northern Yukon contiguous to Alaska's Arctic National Wildlife Range "to protect the wilderness, the caribou, birds and other wildlife." "Oil and gas exploration, pipeline construction and industrial activity must be prohibited within the Park and the native people must continue to have the right to hunt, fish and trap."

Regarding the alternate proposal to carry Alaskan gas along the Alaska Highway Route across the southern Yukon, Judge Berger said:

> Some of the concerns about wildlife, wilderness, and engineering and construction that led me to reject the corridor across the Northern Yukon do not appear to apply in the case of the Alaska Highway Route. It is a route with an established infrastructure. In my view, the construction of a pipeline along this route would not threaten any substantial populations of any species in the Yukon or in Alaska. But I am in no position to endorse such a route: an assessment of social and economic impact must still be made and native claims have not been settled.

Judge Berger views the Mackenzie Delta-Beaufort Sea area as a "major petroleum province in the making" and regards the pipeline as the trigger for expanded oil and gas exploration and development. He rejected the Arctic Gas proposed route across the Mackenzie Delta in order to protect the Delta's unique ecosystem, the birds and the white whales.

Judge Berger recommended a white whale sanctuary be established in west Mackenzie Bay to protect the calving grounds for the 5,000-strong white whale herd. "If the herd is driven from its calving area, it will die out," Judge Berger said. In the sanctuary, "oil and gas exploration and development would be forbidden at any time of the year."

Much of the oil and gas potential of the region is believed to lie offshore beneath the Beaufort Sea. The report recognized that it has been considered to be in the national interest to begin delineating the extent of these reserves but urged restraint in approving future exploration and development. "The greatest concern in the Beaufort Sea is the threat of oil spills." Judge Berger said: "In my opinion, the techniques presently available will not be successful in controlling or cleaning up a major spill in this remote [Arctic] area."

"Therefore, I urge the Government of Canada to ensure that improvements in technology for prevention . . . and clean-up of spills precede further advance of industry in the Beaufort Sea." In addition, Canada is "pioneering on this frontier and establishing the standards that may well guide other circumpolar countries in future Arctic drilling."

Another key recommendation is that "a period of 10 years will be required in the Mackenzie Valley and Western Arctic to settle native claims, and to establish the new institutions and new programs that a settlement will entail. No pipeline should be built until these things have been achieved." But solely from an environmental point of view, Judge Berger said, "I have concluded that it is feasible . . . to build a pipeline and to establish an energy corridor along the Mackenzie Valley, running south from the Mackenzie Delta to the Alberta border."

"The pipeline companies see the pipeline as an unqualified gain to the North," but "it is an illusion to believe that the pipeline will solve the economic problems of the North." the report said. The Arctic Gas project has been described as one of the greatest construction projects, in terms of capital expenditure, ever contemplated by private enterprise. The Arctic Gas pipeline would require 6,000 construction workers North of 60, a hugh infrastructure of wharves, warehouses and airstrips, and fleets of aircraft, tractors, earth-movers, trucks and trailers. "The pipeline contractors and unions have made it plain that native northerners are not qualified to hold down skilled positions in pipeline construction." Once the pipeline is built there will be about 250 jobs, mostly of a technical nature, that will require qualified personnel from the South.

Judge Berger said:

> I am convinced that non-renewable resources need not necessarily be the sole basis of the northern economy in the future. . . . A strengthening of renewable resource harvesting in the North—the fortification of the native economy—would enable native people to enter the industrial system without becoming completely dependent on it.
>
> An economy based on modernization of hunting, fishing and trapping, on efficient game and fisheries management, on small-scale enterprise, and on the orderly development of gas and oil resources over a period of years—this is no retreat

into the past; rather, it is a rational program for northern development based on the ideals and aspirations of northern native peoples.

The report stated: "The social costs of building a pipeline now will be enormous, and no remedial programs are likely to ameliorate them." The great majority of the 1,000 witnesses that spoke to the Inquiry in the 35 community hearings expressed their fears of what a pipeline would bring: "an influx of construction workers, more alcoholism, tearing of the social fabric, injury to the land, and the loss of their identity as a people." Judge Berger said, "I am persuaded that these fears are well founded."

The report recommended that "the native people must be allowed a choice about their own future. If the pipeline is approved before a settlement of claims takes place, the future of the North—and the place of the native people in the North—will, in effect, have been decided for them." "It would therefore be dishonest to try to impose an immediate settlement that we know now—and that the native people will know before the ink is dry—will not achieve their goals. They will soon realize—just as the native people on the prairies realized a century ago as the settlers poured in—that the actual course of events on the ground will deny the promises that appear on paper."

The report pointed out that "the pipeline companies are obviously having trouble in designing their proposal to deal with frost heave" of the buried refrigerated pipeline. Judge Berger expressed his concern about construction scheduling too: "I am not persuaded that Arctic Gas can meet its construction schedule across the Northern Yukon."

Given such uncertainties "it seems to me unreasonable that the Government of Canada should give unqualified approval to a right-of-way or provide financial guarantees to the project without a convincing resolution of these concerns."

The report also recommended that the Government develop an independent body of knowledge on the northern environment, environmental impact, and engineering design and construction under Arctic and permafrost conditions to fill critical gaps in information and to provide government with the knowledge it will need in making an intelligent disposition of northern development proposals.

In the epilogue to the report, Judge Berger referred to the statements made at the Inquiry by native people who said they would be prepared to give up their lives to stop the pipeline if it were to proceed before there had been a settlement of native claims. He said: "I have given the most anxious consideration to whether or not I should make any reference in this report" to the statements made at the Inquiry about possible "violent reaction to the pipeline if it were built without a just settlement of native claims." "I have concluded that they cannot be ignored." "No one who heard them could doubt that they were said in earnest." "I do not want anyone to think I am predicting an insurrection. But I am saying there is the real possibility of civil disobedience and civil disorder that—if they did occur—might well render orderly political evolution of the North impossible.

Public Law 94-586
94th Congress

An Act

To expedite a decision on the delivery of Alaska natural gas to United States markets, and for other purposes.

Oct. 22, 1976
[S. 3521]

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

Alaska Natural Gas Transportation Act of 1976.

SHORT TITLE

SECTION 1. This Act may be cited as the "Alaska Natural Gas Transportation Act of 1976".

15 USC 719 note.

CONGRESSIONAL FINDINGS

SEC. 2. The Congress finds and declares that—

15 USC 719.

(1) a natural gas supply shortage exists in the contiguous States of the United States;

(2) large reserves of natural gas in the State of Alaska could help significantly to alleviate this supply shortage;

(3) the expeditious construction of a viable natural gas transportation system for delivery of Alaska natural gas to United States markets is in the national interest; and

(4) the determinations whether to authorize a transportation system for delivery of Alaska natural gas to the contiguous States and, if so, which system to select, involve questions of the utmost importance respecting national energy policy, international relations, national security, and economic and environmental impact, and therefore should appropriately be addressed by the Congress and the President in addition to those Federal officers and agencies assigned functions under law pertaining to the selection, construction, and initial operation of such a system.

STATEMENT OF PURPOSE

SEC. 3. The purpose of this Act is to provide the means for making a sound decision as to the selection of a transportation system for delivery of Alaska natural gas to the contiguous States for construction and initial operation by providing for the participation of the President and the Congress in the selection process, and, if such a system is approved under this Act, to expedite its construction and initial operation by (1) limiting the jurisdiction of the courts to review the actions of Federal officers or agencies taken pursuant to the direction and authority of this Act, and (2) permitting the limitation of administrative procedures and effecting the limitation of judicial procedures related to such actions. To accomplish this purpose it is the intent of the Congress to exercise its constitutional powers to the fullest extent in the authorizations and directions herein made, and particularly with respect to the limitation of judicial review of actions of Federal officers or agencies taken pursuant thereto.

15 USC 719a.

DEFINITIONS

15 USC 719b.

SEC. 4. As used in this Act:

(1) the term "Alaska natural gas" means natural gas derived from the area of the State of Alaska generally known as the North Slope of Alaska, including the Continental Shelf thereof;

(2) the term "Commission" means the Federal Power Commission;

(3) the term "Secretary" means the Secretary of the Interior;

(4) the term "provision of law" means any provision of a Federal statute or rule, regulation, or order issued thereunder; and

(5) the term "approved transportation system" means the system for the transportation of Alaska natural gas designated by the President pursuant to section 7(a) or 8(b) and approved by joint resolution of the Congress pursuant to section 8.

FEDERAL POWER COMMISSION REVIEWS AND REPORTS

Proceedings, suspension. 15 USC 719c. 15 USC 717w.

SEC. 5. (a)(1) Notwithstanding any provision of the Natural Gas Act or any other provision of law, the Commission shall suspend all proceedings pending before the Commission on the date of enactment of this Act relating to a system for the transportation of Alaska natural gas as soon as the Commission determines to be practicable after such date, and the Commission may refuse to act on any application, amendment thereto, or other requests for action under the Natural Gas Act relating to a system for the transportation of Alaska natural gas until such time as (A) a decision of the President designating such a system for approval takes effect pursuant to section 8, (B) no such decision takes effect pursuant to section 8, or (C) the President decides not to designate such a system for approval under section 8 and so advises the Congress pursuant to section 7.

(2) In the event a decision of the President designating such a system takes effect pursuant to this Act, the Commission shall forthwith vacate proceedings suspended under paragraph (1) and, pursuant to section 9 and in accordance with the President's decision, issue a certificate of public convenience and necessity respecting such system.

(3) In the event such a decision of the President does not take effect pursuant to this Act or the President decides not to designate such a system and so advises the Congress pursuant to section 7, the suspension provided for in paragraph (1) of this subsection shall be removed.

Recommendation, submittal to President.

(b)(1) The Commission shall review all applications for the issuance of a certificate of public convenience and necessity relating to the transportation of Alaska natural gas pending on the date of enactment of this Act, and any amendments thereto which are timely made, and after consideration of any alternative transportation system which the Commission determines to be reasonable, submit to the President not later than May 1, 1977, a recommendation concerning the selection of such a transportation system. Such recommendation may be in the form of a proposed certificate of public convenience and necessity, or in such other form as the Commission determines to be appropriate, or may recommend that no decision respecting the selection of such a transportation system be made at this time or pursuant to this Act. Any recommendation that the President approve a particular transportation system shall (A) include a description of the nature and route of the system, (B) designate

a person to construct and operate the system, which person shall be the applicant, if any, which filed for a certificate of public convenience and necessity to construct and operate such system, (C) if such recommendation is for an all-land pipeline transportation system, or a transportation system involving water transportation, include provision for new facilities to the extent necessary to assure direct pipeline delivery of Alaska natural gas contemporaneously to points both east and west of the Rocky Mountains in the lower continental United States.

(2) The Commission may, by rule, provide for the presentation of data, views, and arguments before the Commission or a delegate of the Commission pursuant to such procedures as the Commission determines to be appropriate to carry out its responsibilities under paragraph (1) of this subsection. Such a rule shall, to the extent determined by the Commission, apply, notwithstanding any provision o law that would otherwise have applied to the presentation of data, views, and arguments. Rule.

(5) The Commission may request such information and assistance from any Federal agency as the Commission determines to be necessary or appropriate to carry out its responsibilities under this Act. Any Federal agency requested to submit information or provide assistance shall submit such information to the Commission at the earliest practicable time after receipt of a Commission request. Cooperation.

(c) The Commission shall accompany any recommendation under subsection (b) (1) with a report, which shall be available to the public, explaining the basis for such recommendation and including for each transportation system reviewed or considered a discussion of the following: Report, public availability.

(1) for each year of the 20-year period which begins with the first year following the date of enactment of this Act, the estimated—

(A) volumes of Alaska natural gas which would be available to each region of the United States directly, or indirectly by displacement or otherwise, and

(B) transportation costs and delivered prices of any such volumes of gas by region;

(2) the effects of each of the factors described in subparagraphs (A) and (B) of paragraph (1) on the projected natural gas supply and demand for each region of the United States and on the projected supplies of alternative fuels available by region to offset shortages of natural gas occurring in such region for each such year;

(3) the impact upon competition;

(4) the extent to which the system provides a means for the transportation to United States markets of natural resources or other commodities from sources in addition to the Prudhoe Bay Reserve;

(5) environmental impacts;

(6) safety and efficiency in design and operation and potential for interruption in deliveries of Alaska natural gas;

(7) construction schedules and possibilities for delay in such schedules or for delay occurring as a result of other factors;

(8) feasibility of financing;

(9) extent of reserves, both proven and probable and their deliverability by year for each year of the 20-year period which

begins with the first year following the date of enactment of this Act;

(10) the estimate of the total delivered cost to users of the natural gas to be transported by the system by year for each year of the 20-year period which begins with the first year following the date of enactment of this Act;

(11) capability and cost of expanding the system to transport additional volumes of natural gas in excess of initial system capacity;

(12) an estimate of the capital and operating costs, including an analysis of the reliability of such estimates and the risk of cost overruns; and

(13) such other factors as the Commission determines to be appropriate.

(d) The recommendation by the Commission pursuant to this section shall not be based upon the fact that the Government of Canada or agencies thereof have not, by then rendered a decision as to authorization of a pipeline system to transport Alaska natural gas through Canada.

Transportation system, recommendation, submittal to President.

(e) If the Commission recommends the approval of a particular transportation system, it shall submit to the President with such recommendation (1) an identification of those facilities and operations which are proposed to be encompassed within the term "construction and initial operation" in order to define the scope of directions contained in section 9 of this Act and (2) the terms and conditions permitted under the Natural Gas Act, which the Commission determines to be appropriate for inclusion in a certificate of public convenience and necessity to be issued respecting such system. The Commission shall submit to the President contemporaneously with its report an environmental impact statement prepared respecting the recommended system, if any, and each environmental impact statement which may have been prepared respecting any other system reported on under this section.

15 USC 717w.

Environmental impact statement, submittal to President.

OTHER REPORTS

Comments, submittal to President.
15 USC 719d.

Public availability.

SEC. 6. (a) Not later than July 1, 1977, any Federal officer or agency may submit written comments to the President with respect to the recommendation and report of the Commission and alternative methods for transportation of Alaska natural gas for delivery to the contiguous States. Such comments shall be made available to the public by the President when submitted to him, unless expressly exempted from this requirement in whole or in part by the President, under section 552(b)(1) of title 5, United States Code. Any such written comment shall include information within the competence of such Federal officer or agency with respect to—

(1) environmental considerations, including air and water quality and noise impacts;

(2) the safety of the transportation systems;

(3) international relations, including the status and time schedule for any necessary Canadian approvals and plans;

(4) national security, particularly security of supply;

(5) sources of financing for capital costs;

(6) the impact upon competition;

(7) impact on the national economy, including regional natural gas requirements; and

(8) relationship of the proposed transportation system to other aspects of national energy policy.

Comments, submittal to President.

(b) Not later than July 1, 1977, the Governor of any State, any municipality, State utility commission, and any other interested person may submit to the President such written comments with respect to the recommendation and report of the Commission and alternative systems for delivering Alaska natural gas to the contiguous States as they determine to be appropriate.

Report to President.

(c) Not later than July 1, 1977, each Federal officer or agency shall report to the President with respect to actions to be taken by such officer or agency under section 9(a) relative to each transportation system reported on by the Commission under section 5(c) and shall include such officer's or agency's recommendations with respect to any provision of law to be waived pursuant to section 8(g) in conjunction with any decision of the President which designates a system for approval.

Report to President.

(d) Following receipt by the President of the Commission's recommendations, the Council on Environmental Quality shall afford interested persons an opportunity to present oral and written data, views, and arguments respecting the environmental impact statements submitted by the Commission under section 5(e). Not later than July 1, 1977, the Council on Environmental Quality shall submit to the President a report, which shall be contemporaneously made available by the Council to the public, summarizing any data, views, and arguments received and setting forth the Council's views concerning the legal and factual sufficiency of each such environmental impact statement and other matters related to environmental impact as the Council considers to be relevant.

PRESIDENTIAL DECISION AND REPORT

15 USC 719e.

SEC. 7. (a)(1) As soon as practicable after July 1, 1977, but not later than September 1, 1977, the President shall issue a decision as to whether a transportation system for delivery of Alaska natural gas should be approved under this Act. If he determines such a system should be so approved, his decision shall designate such a system for approval pursuant to section 8 and shall be consistent with section 5(b)(1)(C) to assure delivery of Alaska natural gas to points both east and west of the Rocky Mountains in the continental United States. The President in making his decision shall take into consideration the Commission's recommendation pursuant to section 5, the report under section 5(c), and any comments submitted under section 6, and his decision to designate a system for approval shall be based on his determination as to which system, if any, best serves the national interest.

Transmittal to Congress, delay.

(2) The President, for a period of up to 90 additional calendar days after September 1, 1977, may delay the issuance of his decision and transmittal thereof to the House of Representatives and the Senate, if he determines (A) that there exists no environmental impact statement prepared relative to a system he wishes to consider or that any prepared environmental impact statement relative to a system he wishes to consider is legally or factually insufficient, or (B) that the additional time is otherwise necessary to enable him to make a sound decision on an Alaska natural gas transportation system. The President shall promptly, but in no case any later than September 1, 1977, notify the House of Representatives and the

Notice to Congress.

Senate if he so delays his decision and submit a full explanation of the basis of any such delay.

(3) If, on or before May 1, 1977, the President determines to delay issuance and transmittal of his decision to the House of Representatives and the Senate pursuant to paragraph (2) of this subsection, he may authorize a delay of not more than 90 days in the date of taking of any action specified in sections 5 and 6. The President shall promptly notify the House of Representatives and the Senate of any such authorization of delay and submit a full explanation of the basis of any such authorization.

Notice to Congress.

(4) If the President determines to designate for approval a transportation system for delivery of Alaska natural gas to the contiguous States, he shall in such decision—

(A) describe the nature and route of the system designated for approval;

(B) designate a person to construct and operate such a system, which person shall be the applicant, if any, which filed for a certificate of public convenience and necessity to construct and operate such system;

(C) identify those facilities, the construction of which, and those operations, the conduct of which, shall be encompassed within the term "construction and initial operation" for purposes of defining the scope of the directions contained in section 9 of this Act, taking into consideration any recommendation of the Commission with respect thereto; and

(D) identify those provisions of law, relating to any determination of a Federal officer or agency as to whether a certificate, permit, right-of-way, lease, or other authorization shall be issued or be granted, which provisions the President finds (i) involve determinations which are subsumed in his decision and (ii) require waiver pursuant to section 8(g) in order to permit the expeditious construction and initial operation of the transportation system.

Chairman, appointment.

(5) After a decision of the President designating an Alaska natural gas transportation system takes effect under section 8, the President shall appoint an officer of the United States, with the advice and consent of the Senate, or designate a board (consisting of such an officer, so appointed with the advice and consent of the Senate, as chairman and such other individuals as the President determines appropriate to serve on such board by reason of background, experience, or position) to serve as Federal inspector of construction of such transportation system, except that no such individual or officer may have a financial interest in the approved transportation system. Upon enactment of a joint resolution pursuant to section 8 approving such a system the Federal inspector shall—

Joint surveillance and monitoring agreement, establishment.

(A) establish a joint surveillance and monitoring agreement, approved by the President, with the State of Alaska similar to that in effect during construction of the trans-Alaska oil pipeline to monitor the construction of the approved transportation system within the State of Alaska;

(B) monitor compliance with applicable laws and the terms and conditions of any applicable certificate, rights-of-way, permit, lease, or other authorization issued or granted under section 9;

(C) monitor actions taken to assure timely completion of construction schedules and the achievement of quality of construction, cost control, safety, and environmental protection objectives and the results obtained therefrom;

(D) have the power to compel, by subpena if necessary, submission of such information as he deems necessary to carry out his responsibilities; and

(E) keep the President and the Congress currently informed on any significant departures from compliance and issue quarterly reports to the President and the Congress concerning existing or potential failures to meet construction schedules or other factors which may delay the construction and initial operation of the system and the extent to which quality of construction, cost control, safety and environmental protection objectives have been achieved.

(6) If the President determines to designate for approval a transportation system for delivery of Alaska natural gas to the contiguous States, he may identify in such decision such terms and conditions permissible under existing law as he determines appropriate for inclusion with respect to any issuance or authorization directed to be made pursuant to section 9.

(b) The decision of the President made pursuant to subsection (a) of this section shall be transmitted to both Houses of Congress and shall be considered received by such Houses for the purposes of this section on the first day on which both are in session occurring after such decision is transmitted. Such decision shall be accompanied by a report explaining in detail the basis for his decision with specific reference to the factors set forth in sections 5(c) and 6(a), and the reasons for any revision, modification of, or substitution for, the Commission recommendation. Transmittal to Congress.

(c) The report of the President pursuant to subsection (b) of this section shall contain a financial analysis for the transportation system designated for approval. Unless the President finds and states in his report submitted pursuant to this section that he reasonably anticipates that the system designated by him can be privately financed, constructed, and operated, his report shall also be accompanied by his recommendation concerning the use of existing Federal financing authority or the need for new Federal financing authority. Financial analysis.

(d) In making his decision under subsection (a) the President shall inform himself, through appropriate consultation, of the views and objectives of the States, the Government of Canada, and other governments with respect to those aspects of such a decision that may involve intergovernmental and international cooperation among the Government of the United States, the States, the Government of Canada, and any other government.

(e) If the President determines to designate a transportation system for approval, the decision of the President shall take effect as provided in section 8, except that the approval of a decision of the President shall not be construed as amending or otherwise affecting the laws of the United States so as to grant any new financing authority as may have been identified by the President pursuant to subsection (c).

CONGRESSIONAL REVIEW

SEC. 8. (a) Any decision under section 7(a) or 8(b) designating for approval a transportation system for the delivery of Alaska natural gas shall take effect upon enactment of a joint resolution within the first period of 60 calendar days of continuous session of Congress beginning on the date after the date of receipt by the Senate and House of Representatives of a decision transmitted pursuant to section 7(b) or subsection (b) of this section. 15 USC 719f

(b) If the Congress does not enact such a joint resolution within such 60-day period, the President, not later than the end of the 30th day following the expiration of the 60-day period, may propose a new decision and shall provide a detailed statement concerning the reasons for such proposal. The new decision shall be submitted in accordance with section 7(c) and transmitted to the House of Representatives and the Senate on the same day while both are in session and shall take effect pursuant to subsection (a) of this section. In the event that a resolution respecting the President's decision was defeated by vote of either House, no new decision may be transmitted pursuant to this subsection unless such decision differs in a material respect from the previous decision.

(c) For purposes of this section—

(1) continuity of session of Congress is broken only by an adjournment sine die; and

(2) the days on which either House is not in session because of an adjournment of more than 3 days to a day certain are excluded in the computation of the 60-day calendar period.

(d)(1) This subsection is enacted by Congress—

(A) as an exercise of the rulemaking power of each House of Congress, respectively, and as such it is deemed a part of the rules of each House, respectively, but applicable only with respect to the procedure to be followed in that House in the case of resolutions described by paragraph (2) of this subsection; and it supersedes other rules only to the extent that it is inconsistent therewith; and

(B) with full recognition of the constitutional right of either House to change the rules (so far as those rules relate to the procedure of that House) at any time, in the same manner and to the same extent as in the case of any other rule of such House.

"Resolution"

(2) For purposes of this Act, the term "resolution" means (A) a joint resolution, the resolving clause of which is as follows: "That the House of Representatives and Senate approve the Presidential decision on an Alaska natural gas transportation system submitted to the Congress on ————, 19 , and find that any environmental impact statements prepared relative to such system and submitted with the President's decision are in compliance with the Natural Environmental Policy Act of 1969."; the blank space therein shall be filled with the date on which the President submits his decision to the House of Representatives and the Senate; or (B) a joint resolution described in subsection (g).

42 USC 4321 note.

Referral to congressional committees.

(3) A resolution once introduced with respect to a Presidential decision on an Alaska natural gas transportation system shall be referred to one or more committees (and all resolutions with respect to the same Presidential decision on an Alaska natural gas transportation system shall be referred to the same committee or committees) by the President of the Senate or the Speaker of the House of Representatives, as the case may be.

(4)(A) If any committee to which a resolution with respect to a Presidential decision on an Alaska natural gas transportation system has been referred has not reported it at the end of 30 calendar days after its referral, it shall be in order to move either to discharge such committee from further consideration of such resolution or to discharge such committee from consideration of any other resolution with respect to such Presidential decision on an Alaska natural gas transportation system which has been referred to such committee.

(B) A motion to discharge may be made only by an individual favoring the resolution, shall be highly privileged (except that it may not be made after the committee has reported a resolution with respect to the same Presidential decision on an Alaska natural gas transportation system), and debate thereon shall be limited to not more than 1 hour, to be divided equally between those favoring and those opposing the resolution. An amendment to the motion shall not be in order, and it shall not be in order to move to reconsider the vote by which the motion was agreed to or disagreed to. Debate limitation.

(C) If the motion to discharge is agreed to or disagreed to, the motion may not be made with respect to any other resolution with respect to the same Presidential decision on an Alaska natural gas transportation system.

(5)(A) When any committee has reported, or has been discharged from further consideration of, a resolution, but in no case earlier than 30 days after the date of receipt of the President's decision to the Congress, it shall be at any time thereafter in order (even though a previous motion to the same effect has been disagreed to) to move to proceed to the consideration of the resolution. The motion shall be highly privileged and shall not be debatable. An amendment to the motion shall not be in order, and it shall not be in order to move to reconsider the vote by which the motion was agreed to or disagreed to.

(B) Debate on the resolution described in subsection (d)(2)(A) shall be limited to not more than 10 hours and on any resolution described in subsection (g) to one hour. This time shall be divided equally between those favoring and those opposing such resolution. A motion further to limit debate shall not be debatable. An amendment to, or motion to recommit the resolution shall not be in order, and it shall not be in order to move to reconsider the vote by which such resolution was agreed to or disagreed to or, thereafter within such 60-day period, to consider any other resolution respecting the same Presidential decision.

(6)(A) Motions to postpone, made with respect to the discharge from committee, or the consideration of a resolution and motions to proceed to the consideration of other business, shall be decided without debate.

(B) Appeals from the decision of the Chair relating to the application of the rules of the Senate or the House of Representatives, as the case may be, to the procedures relating to a resolution shall be decided without debate.

(e) The President shall find that any required environmental impact statement relative to the Alaska natural gas transportation system designated for approval by the President has been prepared and that such statement is in compliance with the National Environmental Policy Act of 1969. Such finding shall be set forth in the report of the President submitted under section 7. The President may supplement or modify the environmental impact statements prepared by the Commission or other Federal officers or agencies. Any such environmental impact statement shall be submitted contemporaneously with the transmittal to the Senate and House of Representatives of the President's decision pursuant to section 7(b) or subsection (h) of this section. 42 USC 4321 note. Submittal to congressional committees.

(f) Within 20 days of the transmittal of the President's decision to the Congress under section 7(b) or under subsection (b) of this section, (1) the Commission shall submit to the Congress a report commenting on the decision and including any information with regard to that decision which the Commission considers appropriate, Report, submittal to Congress.

Hearings. Report, submittal to Congress.

and (2) the Council on Environmental Quality shall provide an opportunity to any interested person to present oral and written data, views, and arguments on any environmental impact statement submitted by the President relative to any system designated by him for approval which is different from any system reported on by the Commission under section 5(c), and shall submit to the Congress a report summarizing any such views received. The committees in each House of Congress to which a resolution has been referred under subsection (d)(3) shall conduct hearings on the Council's report and include in any report of the committee respecting such resolution the findings of the committee on the legal and factual sufficiency of any environmental impact statement submitted by the President relative to any system designated by him for approval.

Congressional committee hearings.

Waiver, submittal to Congress.

(g)(1) At any time after a decision designating a transportation system is submitted to the Congress pursuant to this section, if the President finds that any provision of law applicable to actions to be taken under subsection (a) or (c) of section 9 require waiver in order to permit expeditious construction and initial operation of the approved transportation system, the President may submit such proposed waiver to both Houses of Congress.

(2) Such provision shall be waived with respect to actions to be taken under subsection (a) or (c) of section 9 upon enactment of a joint resolution pursuant to the procedures specified in subsections (c) and (d) of this section (other than subsection (d)(2) thereof) within the first period of 60 calendar days of continuous session of Congress beginning on the date after the date of receipt by the Senate and House of Representatives of such proposal.

(3) The resolving clause of the joint resolution referred to in this subsection is as follows: "That the House of Representatives and Senate approve the waiver of the provision of law ( ) as proposed by the President, submitted to the Congress on , 19 ." The first blank space therein being filled with the citation to the provision of law and the second blank space therein being filled with the date on which the President submits his decision to the House of Representatives and the Senate.

(4) In the case of action with respect to a joint resolution described in this subsection, the phrase "a waiver of a provision of law" shall be substituted in subsection (d) for the phrase "the Alaska natural gas transportation system.".

AUTHORIZATIONS

15 USC 719g.

SEC. 9. (a) To the extent that the taking of any action which is necessary or related to the construction and initial operation of the approved transportation system requires a certificate, right-of-way, permit, lease, or other authorization to be issued or granted by a Federal officer or agency, such Federal officer or agency shall—

(1) to the fullest extent permitted by the provisions of law administered by such officer or agency, but

(2) without regard to any provision of law which is waived pursuant to section 8(g) issue or grant such certificates, permits, rights-of-way, leases, and other authorizations at the earliest practicable date.

(b) All actions of a Federal officer or agency with respect to consideration of applications or requests for the issuance or grant of a certificate, right-of-way, permit, lease, or other authorization to which subsection (a) applies shall be expedited and any such application or

request shall take precedence over any similar applications or requests of the Federal officer or agency.

(c) Any certificate, right-of-way, permit, lease, or other authorization issued or granted pursuant to the direction under subsection (a) shall include the terms and conditions required by law unless waived pursuant to a resolution under section 8(g), and may include terms and conditions permitted by law, except that with respect to terms and conditions permitted but not required, the Federal officer or agency, notwithstanding any such other provision of law, shall have no authority to include terms and conditions as would compel a change in the basic nature and general route of the approved transportation system or those the inclusion of which would otherwise prevent or impair in any significant respect the expeditious construction and initial operation of such transportation system. Terms and conditions.

(d) Any Federal officer or agency, with respect to any certificate, permit, right-of-way, lease, or other authorization issued or granted by such officer or agency, may, to the extent permitted under laws administered by such officer or agency add to, amend or abrogate any term or condition included in such certificate, permit, right-of-way, lease, or other authorization except that with respect to any such action which is permitted but not required by law, such Federal officer or agency, notwithstanding any such other provision of law, shall have no authority to take such action if the terms and conditions to be added, or as amended, would compel a change in the basic nature and general route of the approved transportation system or would otherwise prevent or impair in any significant respect the expeditious construction and initial operation of such transportation system.

(e) Any Federal officer or agency to which subsection (a) applies, to the extent permitted under laws administered by such officer or agency, shall include in any certificate, permit, right-of-way, lease, or authorization issued or granted those terms and conditions identified in the President's decision as appropriate for inclusion except that the requirement to include such terms and conditions shall not limit the Federal officer or agency's authority under subsection (d) of this section.

JUDICIAL REVIEW

SEC. 10. (a) Notwithstanding any other provision of law, the actions of Federal officers or agencies taken pursuant to section 9 of this Act, shall not be subject to judicial review except as provided in this section. 15 USC 719h.

(b)(1) Claims alleging the invalidity of this Act may be brought not later than the 60th day following the date a decision takes effect pursuant to section 8 of this Act.

(2) Claims alleging that an action will deny rights under the Constitution of the United States, or that an action is in excess of statutory jurisdiction, authority, or limitations, or short of statutory right may be brought not later than the 60th day following the date of such action, except that if a party shows that he did not know of the action complained of, and a reasonable person acting in the circumstances would not have known, he may bring a claim alleging the invalidity of such action on the grounds stated above not later than the 60th day following the date of his acquiring actual or constructive knowledge of such action.

(c)(1) A claim under subsection (b) shall be barred unless a complaint is filed prior to the expiration of such time limits in the United States Court of Appeals for the District of Columbia acting as a

Special Court. Such court shall have exclusive jurisdiction to determine such proceeding in accordance with the procedures hereinafter provided, and no other court of the United States, of any State, territory, or possession of the United States, or of the District of Columbia, shall have jurisdiction of any such claim in any proceeding instituted prior to or on or after the date of enactment of this Act.

(2) Any such proceeding shall be assigned for hearing and completed at the earliest possible date, shall, to the greatest extent practicable, take precedence over all other matters pending on the docket of the court at that time, and shall be expedited in every way by such court and such court shall render its decision relative to any claim within 90 days from the date such claim is brought unless such court determines that a longer period of time is required to satisfy requirements of the United States Constitution.

USC prec. title 1.

(3) The enactment of a joint resolution under section 8 approving the decision of the President shall be conclusive as to the legal and factual sufficiency of the environmental impact statements submitted by the President relative to the approved transportation system and no court shall have jurisdiction to consider questions respecting the sufficiency of such statements under the National Environmental Policy Act of 1969.

42 USC 4321 note.

SUPPLEMENTAL ENFORCEMENT AUTHORITY

Compliance order or civil action. 5 USC 719i.

SEC. 11 (a) In addition to remedies available under other applicable provisions of law, whenever any Federal officer or agency determines that any person is in violation of any applicable provision of law administered or enforceable by such officer or agency or any rule, regulation, or order under such provision, including any term or condition of any certificate, right-of-way, permit, lease, or other authorization, issued or granted by such officer or agency, such officer or agency may—

(1) issue a compliance order requiring such person to comply with such provision or any rule, regulation, or order thereunder, or

(2) bring a civil action in accordance with subsection (c).

(b) Any order issued under subsection (a) shall state with reasonable specificity the nature of the violation and a time of compliance, not to exceed 30 days, which the officer or agency, as the case may be, determines is reasonable, taking into account the seriousness of the violation and any good faith efforts to comply with applicable requirements.

Civil penalty.

(c) Upon a request of such officer or agency, as the case may be, the Attorney General may commence a civil action for appropriate relief, including a permanent or temporary injunction or a civil penalty not to exceed $25,000 per day for violations of the compliance order issued under subsection (a). Any action under this subsection may be brought in any district court of the United States for the district in which the defendant is located, resides, or is doing business, and such court shall have jurisdiction to restrain such violation, require compliance, or impose such penalty or give ancillary relief.

Jurisdiction.

EXPORT LIMITATIONS

15 USC 719j. 15 USC 717w.

SEC. 12. Any exports of Alaska natural gas shall be subject to the requirements of the Natural Gas Act and section 103 of the Energy

Policy and Conservation Act, except that in addition to the requirements of such Acts, before any Alaska natural gas in excess of 1,000 Mcf per day may be exported to any nation other than Canada or Mexico, the President must make and publish an express finding that such exports will not diminish the total quantity or quality nor increase the total price of energy available to the United States. 42 USC 6212. Presidential finding, publication.

EQUAL ACCESS TO FACILITIES

SEC. 13. (a) There shall be included in the terms of any certificate, permit, right-of-way, lease, or other authorization issued or granted pursuant to the directions contained in section 9 of this Act, a provision that no person seeking to transport natural gas in the Alaska natural gas transportation system shall be prevented from doing so or be discriminated against in the terms and conditions of service on the basis of degree of ownership, or lack thereof, of the Alaska natural gas transportation system. 15 USC 719k

(b) The State of Alaska is authorized to ship its royalty gas on the approved transportation system for use within Alaska and, to the extent its contracts for the sale of royalty gas so provide, to withdraw such gas from the interstate market for use within Alaska; the Federal Power Commission shall issue all authorizations necessary to effectuate such shipment and withdrawal subject to review by the Commission only of the justness and reasonableness of the rate charged for such transportation.

ANTITRUST LAWS

SEC. 14. Nothing in this Act, and no action taken hereunder, shall imply or effect an amendment to, or exemption from, any provision of the antitrust laws. 15 USC 719l

AUTHORIZATION

SEC. 15. There is hereby authorized to be appropriated beginning in fiscal year 1978 and each fiscal year thereafter, such sums as may be necessary to carry out the functions of the Federal inspector appointed by the President with the advice and consent of the Senate under section 7. 15 USC 719m

SEPARABILITY

SEC. 16. If any provision of this Act, or the application thereof, is held invalid, the remainder of this Act shall not be affected thereby. 15 USC 719n

CIVIL RIGHTS

SEC. 17. All Federal officers and agencies shall take such affirmative action as is necessary to assure that no person shall, on the grounds of race, creed, color, national origin, or sex, be excluded from receiving, or participating in any activity conducted under, any certificates, permit, right-of-way, lease, or other authorization granted or issued pursuant to this Act. The appropriate Federal officers and agencies shall promulgate such rules as are necessary to carry out the purposes of this section and may enforce this section, and any rules promulgated under this section through agency and department provisions and rules which shall be similar to those established and in effect under title VI of the Civil Rights Act of 1964. Discrimination, prohibition. 15 USC 719o. Rules. 42 USC 2000d et seq.

REPORT ON THE EQUITABLE ALLOCATION OF NORTH SLOPE CRUDE OIL

Report to Congress. 43 USC 1651 note.

SEC. 18. Within 6 months of the date of enactment of this Act, the President shall determine what special expediting procedures are necessary to insure the equitable allocation of north slope crude oil to the Northern Tier States of Washington, Oregon, Idaho, Montana, North Dakota, Minnesota, Michigan, Wisconsin, Illinois, Indiana, and Ohio (hereinafter referred to as the "Northern Tier States") to carry out the provisions of section 410 of Public Law 93-153 and shall report his findings to the Congress. In his report, the President shall identify the specific provisions of law, which relate to any determination of a Federal officer or agency as to whether to issue or grant a certificate, permit, right-of-way, lease, or other authorization in connection with the construction of an oil delivery system serving the Northern Tier States and which the President finds would inhibit the expeditious construction of such a system in the contiguous States of the United States. In addition the President will include in his report a statement which demonstrates the impact that the delivery system will have on reducing the dependency of New England and the Middle Atlantic States on foreign oil imports. Furthermore, all Federal officers and agencies shall, prior to the submission of such report and further congressional action relating thereto, expedite to the fullest practicable extent all applications and requests for action made with respect to such an oil delivery system.

43 USC 1651 note.

ANTITRUST STUDY

Report to Congress. 15 USC 719 note.

SEC. 19. The Attorney General of the United States is authorized and directed to conduct a thorough study of the antitrust issues and problems relating to the production and transportation of Alaska natural gas and, not later than six months following the date of enactment of this Act, to complete such study and submit to the Congress a report containing his findings and recommendations with respect thereto.

EXPIRATION

15 USC 719 note.

SEC. 20. This Act shall terminate in the event that no decision of the President takes effect under section 8 of this Act, such termination to occur at the end of the last day on which a decision could be, but is not, approved under such section.

Approved October 22, 1976.

Oct. 22, Presidential statement.

A REPORT OF THE UPPER TANANA REGIONAL FORUM

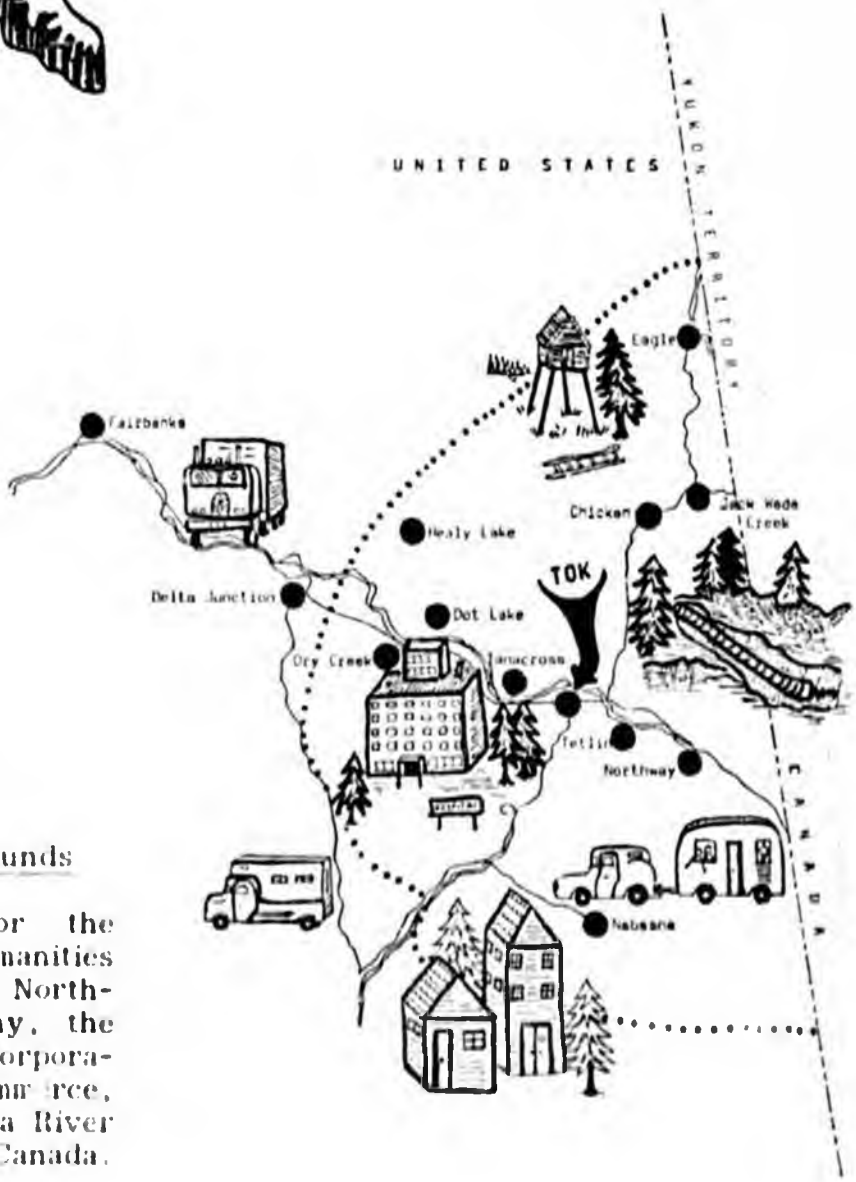
ON THE IMPACT OF CONSTRUCTION AND OPERATION OF THE

ALCAN GAS PIPELINE

Held April 8-9, 1978 at the Tok School in Tok, Alaska

Published September, 1979 by

The Fairbanks Town and Village Association for Development, Incorporated in cooperation with the residents of Tok, Alaska and the communities in the Upper Tanana River basin. With research and writing assistance by Wordsmith's of Fairbanks.



Financed and made Possible with funds and participation from

The National Endowment for the Humanities, the Alaska Humanities Forum, the State of Alaska, Northwest Alaskan Pipeline Company, the Upper Tanana Development Corporation, the Tok Chamber of Commerce, the people of the Upper Tanana River basin, the United States and Canada.

To the Residents of the Upper Tanana River Basin:

At the annual Board of Directors meeting in December 1977, Mellie Terwilliger, representing the Tok community, asked for Board support for a forum to be held in Tok, Alaska to give residents in the area an opportunity to have a general discussion about the Alcan Gas Pipeline.

The Board agreed and authorized the Executive Director, Mr. Smetzer, to work with community leaders and with organizations in the region already active in discussions with gas pipeline officials to help set up a public forum.

Through the enthusiastic and capable effort of dozens of people in the area a forum steering committee was formed, topics selected, agendas established, publicity issued, people invited, and the forum conducted. The forum could never have occurred without the efforts of these dedicated people.

Funds for preliminary work and for the main costs of the forum were approved by the Alaska Humanities Forum and the National Endowment for the Humanities with supplemental travel funds for outlying villages supplied by Northwest Alaskan Pipeline Company. Funds for the preparation of this report were provided through the State of Alaska by means of a legislative appropriation initiated by the Upper Tanana region's representative in the Alaska Senate, Senator John Sackett.

Participation in the forum itself by residents in the region, by state and federal officials, by visiting Canadians, and by officials of Northwest Energy Company was well over 350 people.

Both the staff of the Association and the many Board members who attended the forum in April 1978 were pleased to have had the opportunity to work with and to assist the people of Tok and the Upper Tanana in meeting with key gasline officials and in discussing the many, many, significant issues and problems which must be considered and resolved in the construction and operation of the project.

Though almost everyone at the forum expressed their pleasure with it, it is within this crucible of the project itself that the success or failure of the forum will be determined.

President Carter, speaking from Kansas City on July 15th of this year pledged the full resources of the federal government to assure early construction of the gasline. The federal Congress is considering legislation designed to provide impact assistance to areas like the Upper Tanana which must, ultimately, live with and deal with the human, social, economic, and political disruption and opportunity which accompanies such massive projects.

In view of these things, we believe this report is most timely. We sincerely hope it is also useful to those of you who live in Tok and the several small communities in the headwaters of the Tanana River.

Sincerely,

Chris Anderson, President
FTVAD Board of Directors

PREFACE

Residents of the Upper Tanana Region are asking questions today about changes that will come about in their communities over the next three to five years with construction of the Northwest Alaskan Pipeline Project. Approximately 140 miles of the 731-mile Alaskan section of the gasline will pass through the region and close to the "highway communities".

In order to prepare and plan for the activity to be generated by a project of this size, residents of the region need information. They had some questions they wanted answered:

- How many people will the project bring?
- Will there be employment opportunities for residents?
- How will it affect existing lifestyles in the area?
- Will it tap our existing resources and services and to what extent?

These questions were but a few raised at the Upper Tanana Regional Forum, held in Tok, Alaska, April 8 and 9, 1978. Nearly 400 residents of the area met to ask these questions of each other, gasline officials and resource people from state, federal and Canadian government agencies. The forum, sponsored by the Fairbanks Town and Village Association for Development, Inc., at the request and with the extensive cooperation of the Tok Chamber of Commerce, the Upper Tanana Development Corporation and many residents, and with financing through a grant from the Alaska Humanities Forum, provided as many new questions as it did answers. But those attending expressed in their evaluations of the two-day event, that it was an opportunity to begin the information exchanging process. It was a chance to identify areas of common concern and avenues of communication for making those concerns known to the parties who can do something about them.

This report is a summary of the meetings and discussions at the forum, and an update on gasline impact related activities in the Upper Tanana Region since the forum.

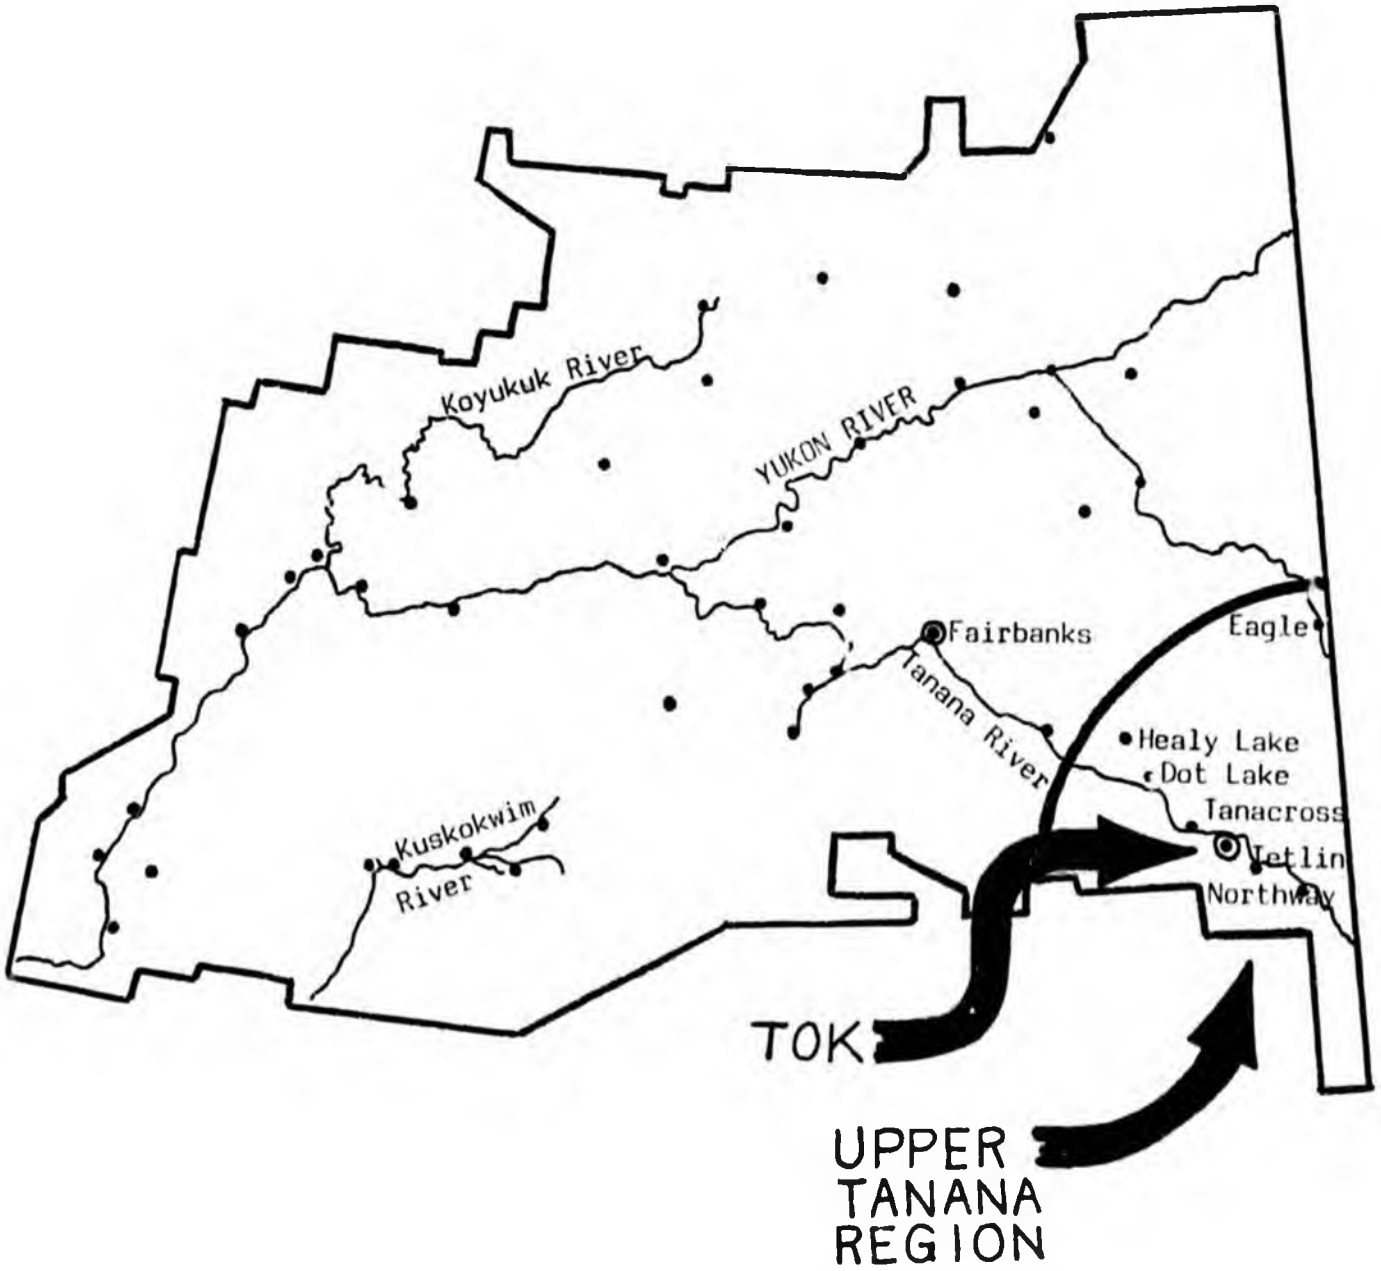
UPPER TANANA REGION



INTRODUCTION TO TOK AND THE UPPER TANANA REGION

INTRODUCTION

1. HISTORY AND GEOGRAPHY

The Upper Tanana Region lies in the southeastern corner of the Yukon River drainage of Interior Alaska. The area includes several early settlements of the Tanana and Nabesna Indians, a nomadic hunting, fishing and trading people who occupied the territory since before written history.

The oldest known archeological site in Alaska was found at Healy Lake and radiocarbon dated to 11,000 years ago.

Non-natives began settling in the area in the later 1800s in order to trade furs, and, near the turn of the century, to mine gold. The Forty-Mile area - Chicken, Jack Wade Creek, Nabesna - is mir ral rich with approximately 505,000 ounces of lode and placer extracts recorded.

Permanent non-native settlement after Alaska statehood has always been marked by military interest beginning with the development of Fort Egbert at Eagle, Alaska. Eagle is also the site of the first incorporated municipal government in the Interior, and it continues to be the only municipal government in the Upper Tanana region.

With the beginning of World War II major developments began occurring in the region with the construction of the Alcan Highway and the lend lease exchange program with Russians. Most recently the Coast Guard has completed construction of a Loran C site at Tok thus continuing the military's active interest in the community.

Renewable resource potential is high in the area with several hydro-electric sites, arable lands for agriculture and potentially abundant commercial forests.

Continued uncertainty surrounding Alaska's federal lands have stifled development in the region as it has in the rest of Alaska.

2. PEOPLE AND ECONOMY

The region is primarily a trade and service center for overland transportation, including a strong tourist trade of visitors entering the state via the Alaska Highway. Many residents work construction trades during the summer months and trap and hunt during the winter. The primary employment of the region is in state or federal government or in service jobs catering to the tourist, transportation, energy and communications industries. Recently with the completion of a Loran C Navigation System operated by the Coast Guard Tok also has a large permanent military establishment.

Alaska Power and Telephone Company serves Tok and Tanacross; all other communities in the region generate their own electrical power. All water systems in the region are privately owned wells, and sewerage systems consist of septic tanks and cisterns. Solid waste disposal is managed at a landfill in the Tok area. Public safety is provided by six Alaska State Troopers: four in Tok and two in Northway. A volunteer fire department serves Tok, Tanacross and nearby residents. Medical services are available at a clinic in Tok, served by a physician's assistant, and first aid and preventive medicine services are provided through village clinics, staffed by health aides. One ambulance serves the entire region, with about six people trained as emergency medical technicians. Social services are provided through a variety of state and native corporation agencies. The Alaska Gateway School District operates schools in five communities for 434 students. Twenty-two students in Tetlin attend an eight grade school operated by the Bureau of Indian Affairs, and about 75 students are enrolled in correspondence programs. The University of Alaska has an extension office in Tok.

Location

Tok is located at the junction of the Alaska and Glenn Highways. It is 205 miles from Fairbanks, 328 miles from Anchorage, 555 miles from Juneau and 1577 miles from Seattle via the Alaska Marine Highway.

Population as of December 31, 1977*

Tok	735
Dot Lake	266
Mentasta	152
Northway	378
Tanacross	128
Tetlin	107
Eagle	150

In addition, the region is home to a few hundred "bush" residents.

* Source: Division of Public Health, Department of Health and Services, Tok Office.

Climate

Period	Average Temperature Min.	Mean	Max.
January	-27.8	-15.3	- 2.7
July	42.8	55.8	69.3
Annual	11.7	25.0	38.3

Average annual precipiation: 8.9 inches
Elevation: 1,635 feet

Local Government

Eagle, the oldest incorporated city in the region, was allowed by the U.S. federal government to incorporate at the turn of the century. The remaining communities in the region are unincorporated. None is in an organized borough. The region is served by six Alaska State Troopers.

Industry

Tok is the major overland point of entry from Canada. Another point of entry is located at Boundary, Alaska on the road from Dawson City, Yukon Territory. The region is primarily a trade and service center for overland transportation, including a strong tourist trade.

Regional Employment (Estimated Year-Round)

Agriculture	0
Construction	40-60
State & Fed. Govt.	73
Finance	4
Mining	10
Manufacturing/processing	20-30
Service	50
Trade	30
Transportation, communication	10
Education	47

Hunting, Fishing, Trapping

Many area residents are employed in construction industries during summers and trap and hunt for a living during winters. Over 170,000 acres in the region are traversed by traplines.

Military

The United States Coast Guard maintains and operates a Loran C station in Tok. The station transmits radio-navigational signals and services the Gulf of Alaska. The signal power of the transmitter is 1 million watts Twelve people are attached to this full-time facility.

Regional Medical Facilities

One clinic, serviced by a physician's assistant; one Public Health Service nurse. Hospitalization is available in Glennallen, Fairbanks, and Anchorage. Tok has ambulance and emergency medical technician service.

Regional Educational Facilities

Rural Educational Attendance Area #16 operated schools with 35 classrooms for 434 students, 36 teachers, and 2 principals in Tok, Dot Lake, Mentasta, Eagle, and Northway. The Bureau of Indian Affairs operates an 8-grade school in Tetlin for 22 students and 1 teacher. Tanacross will have a school in September 1979. Completion of the new school is set for the second semester.

Transportation

Trucking: Lynden Transfer; K & W Trucking; Tok Distributors; Midnight Sun Distributing; Sea-Land; Weaver Brothers
Airlines: 40-Mile Air Taxi - charter service
Bus Service: Alaska-Yukon Motorcoaches - scheduled service
Taxi: Rapid Richard's Taxi Service in Tok serves communities within a 50-mile radius

Churches

Roman Catholic	Assembly of God
Baptist	Faith Chapel

Public Utilities as of Spring 1978

Tok is serviced by Alaska Power & Telphone Company. Utility rates for private residences are:

First 100 kwh	$.13/kwh
Second 100 kwh	.12/kwh
Next 800 kwh	.095/kwh
Over 1,000 kwh	.08/kwh

Telephone monthly rates are $15 for businesses and $12 for private residences.

Housing

1-bdrm. apt. rent: $250/month
2-bdrm. apt. rent: $350/month
3-bdrm. apt. rent: $400/month

Communications

Radio Station: Armed Forces Radio Network, received locally
Television Stations: KTVF and KUAC, Fairbanks, received locally via repeaters
Newspapers: Mukluk News, published in Tok on first and third Thursdays of month; The Spieler, published in Tok on second and fourth Thursdays of month

Recreational Facilities

Tok: VFW Hall; Recreation Center and movie theater; gymnasium; hockey rink; dog-mushing trails; campgrounds

Dot Lake, Eagle, Mentasta, Northway: gymnasiums; hockey rinks

Recreation in the Tok region also includes hunting, fishing, hiking, snowmobiling, snowshoeing, cross-country skiing.

* *

These facts were in part gathered by the State Department of Commerce and Development. Although for the Tok area, they are fairly representative of the entire region; Tok is the center of activity for the surrounding communities.

3. POLITICS AND GOVERNMENT

> From the Native population to the Alaskan individualists in both the bush and town, Tok area residents seem to enjoy the status quo, with its freedom from governmental taxation. (All Alaska Weekly April 14, 1978.)

Eagle is the oldest and only incorporated city in the Upper Tanana Region. The remaining communities have no formalized local government and none is in an organized borough. Access to governmental agencies that provide services in the region is fairly open to residents who have some intermediary, such as a regional or village corporation, or an interest group such as the Chamber of Commerce. On an individual basis, some residents find communication with state agencies and pipeline officials a simple matter; others do not.

Within the region support for a concept of local or regional government to act as the representative for the interests of the area is mixed, and discussion of local government is heated.

"Interest groups" in the area who act, to some extent, as channels for information to and from residents with regard to impact include: Tanana Chiefs Health Authority, United Crow Band, Upper Tanana Development Corporation, Tanana Community Clinic, Tok Chamber of Commerce, Alaska Public Health Service, Alaska Division of Tourism; (Tok Visitors Center), Alaska State Troopers, Upper Tanana Regional Council on Alcoholism and other state and private agencies.

4. THE ALCAN GAS PIPELINE

Northwest Alaskan Pipeline Company is a subsidiary of Northwest Pipeline Corporation of Salt Lake City, and will be the operating partner of six major U.S. gas companies to construct a natural gas pipeline from Prudhoe Bay to the Canadian border.

The pipeline route will parallel the Alyeska oil pipeline for 539 miles to Delta Junction. It will then proceed southeasterly toward Canada along the Haines utility corridor and the Alaska Highway. The Alaskan section of the project will consist of 48-inch pipe.

Design and planning for the line have begun and will continue through 1980. It was anticipated that civil construction would begin in 1980, with pipeline construction start-up in 1981. Delays with financing, however, have pushed back the construction schedule at least one year, according to pipeline company officials.

The project is estimated to provide some 1,500 to 10,000 jobs in Alaska, with some permanent staff in Alaska after the pipeline construction is completed.

The State of Alaska has developed stipulations for a lease agreement with the pipeline company, and hearings have been held in Fairbanks and in Tok to gather public comment on the stipulations, which cover areas ranging from right-of-way and land acquisition to provision of impact information services by the company.

While many unanswered questions still exist with regard to the project, observers have noted the Northwest Alaskan Pipeline Company is gathering information from communities along the route at a much earlier time and in a much more comprehensive fashion that was done prior to construction of the trans-Alaska oil pipeline in 1974.

5. THE ISSUES

Gas Pipeline Employment

One of the most talked about issues regarding the gasline construction is employment. Some observers in the Upper Tanana Region have commented that they fear people in the region are counting too heavily on pipeline jobs to solve the area's unemployment problems, which are significant.

Exact unemployment figures for the Upper Tanana are difficult to come by because of the regional statistical boundary designations used to show workforce and unemployment used by the State Department of Labor (Tok, Tetlin and Northway are part of the "Fairbanks District" and the remainder of the region is lumped in with the "Upper Yukon District", which stretches from Boundary and Eagle to Fort Yukon). An informed source in the department suggested that a reasonable estimate for rural areas in the Interior would be triple the rate for the Fairbanks District unemployment figures. In July 1978, that figure was 14.7. According to recent Alaska Department of Labor statistics for March 1979 the Fairbanks rate is 15.5. This would put unemployment in the Upper Tanana Region, according to the informal formula, at more than 46.5%.

The Northwest Alaskan Pipeline Company has said it is committed to using qualified Alaskans as much as possible in the construction of the gasline, but there are still several problems associated with viewing the gasline as the employment panacea in the Upper Tanana Region:

- There will be an estimated 1,300 to 10,000 jobs on the total project, significantly fewer than on the oil pipeline;
- Many of the jobs available require skills that few people in the region have; and the laborer's jobs will be short-term at best;
- Training programs, though available through the University of Alaska extension in Tok, do not focus on construction employment. Training for construction jobs comes primarily through union apprenticeship programs;
- While the project will provide some permanent jobs, they will be of the type that require specialized skills that cannot be gained in short courses or on-the-job training in the period of time left before construction begins. In the 200-mile stretch between Delta Junction and the Canadian border, fewer than 50 permanent operations and maintenance jobs may be available;
- Even with local hire preference and job training, experience with the oil pipeline showed that people from rural areas could not afford to wait for dispatch from union halls in Fairbanks, and the time required for notification and travel from a village to Fairbanks often meant the job was gone by the time a worker got to the union hall.

State and Federal Government

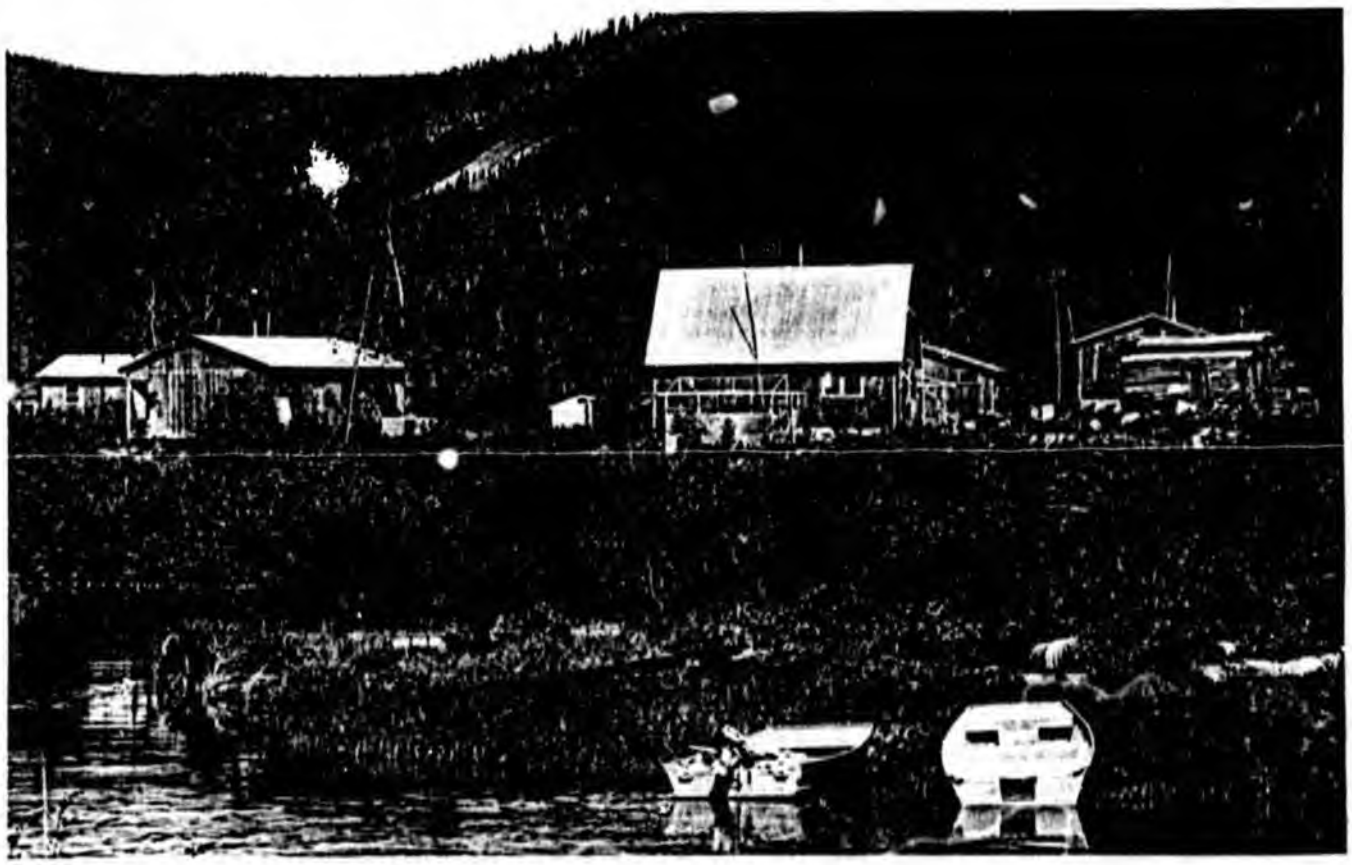
Residents of the Upper Tanana whether or not they choose to adopt some form of local or regional government will have to rely heavily on the sovereignty and public protection responsibilities of state and federal governments during the period of construction and operation of the gas pipeline to protect their individual and community interests.

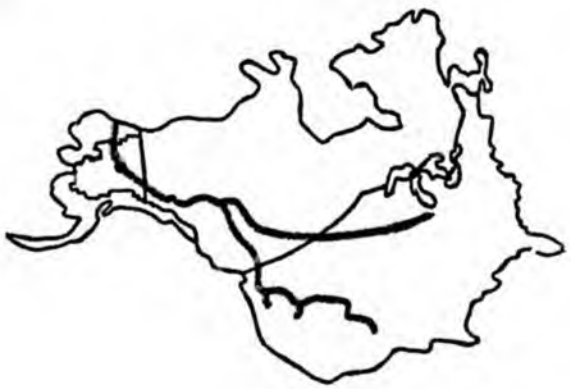
Despite expressions of concern and despite some isolated efforts to deal with the problems of "impact", neither the state nor the federal government have established either plans, programs, procedures or policies necessary for the exercise of those responsibilities.

In the 18 months since the forum, other than the work by the state's single socio-economic impact coordinator on stipulations - a position vacant since September 1 - there has been no significant effort by the state to examine the record of Trans-Alaska pipeline impact and to define its responsibilities to protect the public interest.

In order to anticipate problems similar to TAP which will surely accompany Alcan construction precious time is being lost which cannot be regained.

The federal government has progressed somewhat further on the issue in that the President has recommended and Congress is actively considering legislation to assist small communities in their efforts to cope with National Interest Energy Projects. There are some important concepts within the proposed federal legislation which it is in the state's interest to consider. However no such consideration is underway.





METHODOLOGY AND ORGANIZATION OF THE FORUM

METHODOLOGY AND ORGANIZATION

The methodology and organization of the Upper Tanana Regional Forum was similar to the organization of a forum held in April, 1975 in Fairbanks and titled "Fairbanks and Interior Alaska; a one day community forum on growth."

The Fairbanks forum, like the Upper Tanana forum, was initiated by interested local groups and individuals who then asked for organizational and financing assistance by the Fairbanks Town and Village Association.

Early front-end financing - critical to the success of the two forums - was in both cases made available by the Alaska Humanities Forum with funds from the National Endowment for the Humanities.

Structurally, these forums steer away from a rigorous format with formal presentations by a series of prominent speakers. Rather, a flexible and dynamic exchange of opinions and information between various public and private officials, citizens and taxpayers under several loosely defined but generally recognized topics seems the best way to achieve the goals of the sponsoring organizations: to help local people figure out how these massive projects affect them as individuals in their jobs, their family affairs and their neighborhoods.

Basically the individual forum participant should be encouraged and should have every opportunity to formulate and express their personal concerns directly to the visiting officials who must sooner or later make decisions on those concerns.

From this fundamental principle followed the organization of both forums into about 10 general topics each conducted in separate rooms under the rather minimal authority of a discussion chairman or chairwoman.

Selection of topics, lists of people to invite, and general interpretations of what kind of issues and questions were most current in the Upper Tanana Region were the responsibility of a local steering committee representing several interested groups in the Upper Tanana Regio .

The members of the committee included the following people:

Norman "Wally" Wallis:
President, Chamber of Commerce; Owner Tok Spieler; Runs State Manpower Office

Ron Taylor:
Board of Directors; Chamber of Commerce; Manager, Alaska National Bank of the North

Charlie Biederman:
Director, Upper Tanana Regional Council on Alcoholism, Inc.; Alcoholism and Recreation

Doug Euers:
Board of Directors, Chamber of Commerce; Owner, Douglas Excavating; Board Member, Fairbanks Town and Village Association

Mellie Terwilliger:
Director, Tok Chamber of Commerce; Secretary of the Board of Directors, Fairbanks Town and Village Association; Retired Storekeeper

Bob Lohr:
Executive Director, Upper Tanana Development Corporation, (RurAL CAP)

The Committee met frequently to discuss these matters and to decide on topics and to establish the agenda for the forum. The topics selected and the people selected to chair the discussions were:

Business and Tourism:
Paul Smith

Public Utilities and Telecommunications:
Mark Springer

Job Training and Placement:
Dave Maxwell

Social Services (Housing, Health, Alcoholism
Lousie Griffin

Public Safety/Legal Services/Fire Protection:
Dottie Eshbaugh

Highways and Transportation:
Harold Johnson

Education:
Carl Peterson

Women's Concerns:
Mellie Terwilliger

Rural and Native Concerns:
Bob Brean and Glen Marunde

Land and Agriculture:
Bill Arpino

To help the discussion chairman or chairwoman keep the discussions at least somewhat relevant to the general topic, information packets were prepared, and each group was charged with identifying its own issues within the topic, exploring them and preparing a series of recommendations for resolving them.

These reports of each committee were presented to the assembled forum participants and, once they were typed and duplicated, they became the basis for the formal report of the forum.

Coordination, communications, publicity, preparation of materials, housing and transportation of forum participants, recording discussions, preparing follow-up materials and reports for both forums required two dedicated people full time for at least six weeks prior to the forum, and at least three weeks after. These two people, Chuck Marunde and Su Emry, were, in turn, backed by the enthusiasm and voluntary efforts of literally hundreds of people in the community.

Therefore, the committee reports in this document are preserved without editing in the same form as they were originally approved by the respective committees on the day of the forum. Since it has been over one year since the forum we have tried to update information and repond to some of the issues raised in the committee in the section titled "After the Forum."

The "After the Forum" section was developed during interviews with discussion charimen and women during the summer and fall of 1978 and were reviewed with people in Tok during a meeting held on December 1 of that year.

We hope this document will be used in formulation of public policy and programs necessary for the preparation, construction and operation of the Alcan Gas Pipeline. Those who use it for that purpose, however, whether they be residents of the Upper Tanana Region, officials of state or federal government or industry spokesmen, should recognize that decisions on this project in this phase are highly fluid and dynamic. Fundamental assumptions relevant today can be rendered irrelevant and invalid tomorrow by national and international events far beyond the control of the residents of the Upper Tanana.

At the community level this problem, seldom acknowledged by public officials with mitigating responsibilities, is one of worst and most disruptive of the "impact" problems. The lead time in advance of construction mobilization is the most precious resource people living and working in a small community have available to them. It is in this period where the public costs of impact assistance are least expensive and the potential savings of tax dollars the greatest.

Failure by government agencies to supply information, statements of policy, and decisions of responsible officials to interested local groups will be the most expensive failure of all and the one which is easiest and cheapest to avoid in this phase of project development.

COMMITTEE SESSION REPORTS

a. BUSINESS AND TOURISM COMMITTEE

DISCUSSION GROUP CHAIRMAN: Paul Smith

COMMITTEE ASSISTANTS: Terry Kirkendall
Carol Donnelly

Approximately 30 people attended the sessions of the Business and Tourism Committee. Concern was voiced on several topics. The concerns that the committee would most like to draw to the attention of Northwest Alaskan Pipeline Company, the State of Alaska, and the Upper Tanana region include:

1. One of the most widely discussed topics regarded the highway during the actual construction of the gas pipeline. Tourism is Tok's main business, and the people of the community feel that the gas line equipment could hinder the flow of traffic in the summer. The immediate effect, and the long-range effect, on our tourist trade is of major concern to the community. We would like to hear from Northwest and the State of Alaska concerning how they plan to ensure that tourists will be able to travel the highway unhindered during gas line construction. It was suggested that the State of Alaska and Northwest work jointly on this.

2. The committee discussed with Northwest representatives and the state representative the importance of providing training to local people for any permanent jobs resulting from the gas pipeline. The committee expressed the hope that all the jobs could be filled by local personnel, as there is a shortage of year-round employment in our region. At this point in time, most of the jobs are seasonal and tourist-related.

3. Small businesses in the region have a very difficult time in securing small business loans at this time. There was some concern expressed regarding the increased purchase of stock during gas pipeline construction. In order to ensure that local residents, tourists, and pipeline employees will be able to purchase supplies, it will require larger stock purchases and more storage area. Availability of loan funds, state or federal, and associated agencies to handle this need were discussed. The committee would like to know how Northwest handles payments of contracts to local vendors. There was some concern regarding delayed payments holding up resupplying.

4. Several people expressed an interest in small investors investing in the gas pipeline. They wondered if it would be possible that Northwest would make shares of common stock available to area residents.

Several other areas of discussion included impact on postal service, the local banks, the dump, additional local traffic, and highway safety. It was mentioned that shuttle buses might possibly be available. A question was raised regarding whether or not there would be a possibility of a gas line takeoff point at Tok.

Some recommendations made to the committee were to appoint a group of people to represent the community in dealing with Northwest and the state. It was also suggested that it might be beneficial to meet with the Chamber of Commerce in Delta Junction to discuss the problems that they had during the impact of oil pipeline construction.

AFTER THE FORUM ...

Business and Tourism

The greatest single concern expressed by committee participants was the unknown effect of gasline construction on the region's tourist industry.

Although Tok is the primary tourist center, it was felt that an overloading of the existing transportation routes would negatively effect all of the road communities, and increase travel hazards.

Central to this was consideration of motorist safety in moving along any pipeline service route. (i.e., With heavy equipment and pipe hauling trucks traveling the highway, the incidence of motor vehicle accidents would increase.)

Generally, the communities felt that while pipeline construction would be of overall benefit to the area, it was of greater import to retain the tourist and visitor function as a primary economic base.

A substantive recommendation that the State of Alaska and Northwest work closely in dealing with this problem was advanced, and is further dealt with in the Highways and Transportation section.

According to Business and Tourism Committee Chairman Paul Smith, these questions have been brought before the State Tourism Advisory Board, with the recommendation that the State and Northwest jointly undertake an information program nationwide to inform motorists of the potential problems, while encouraging vehicular travel.

The Business and Tourism Committee also underscored the desire for permanent local employment with the pipeline company, noting that most jobs in the Upper Tanana Region are seasonal, and tourist related.

A third, and relatively complex area, concerning small business operations was addressed. Local merchants and firms want to be in a position to provide materials, supplies and warehousing on a local vendor basis. However, existing state and federal small business loan practices make loan availability difficult.

The overall desire by local business people seemed to be for a "liberalizing" of state and federal loan policies, to encourage investment in these vendor operations.

Incidental to the above was a request for general information on how Northwest would handle payments to local vendors. The general implication was that during the trans-Alaska pipeline system project, small contractors had to wait for extended periods of time for payment, and this affected their reorder capacity.

According to Committee Chairman Smith, Section 4.2.3 of the Right-of-Way Stipulations agrees to conditions of prompt payment and submissions of orders of appropriate vendor scale.

Other areas of business concern were impacts on postal services, local banks, and community facilities such as the local dump.

The Alaska Congressional delegation has been approached on the postal service question and it is being examined at the federal level.

The remaining question of overload of business services remains unanswered at this time, and will probably not be resolved until such time as the gas project enters a "start-up" phase.

Some interest was indicated for a "gas take-off point" to be located at some point within the area. Representative Leslie R. Swanson had introduced legislation to provide such connections, and area residents wanted to know if they might qualify as a "take-off" area.

The question remains unanswered at this time, largely because the submitted legislation did not pass during the preceding legislative session.

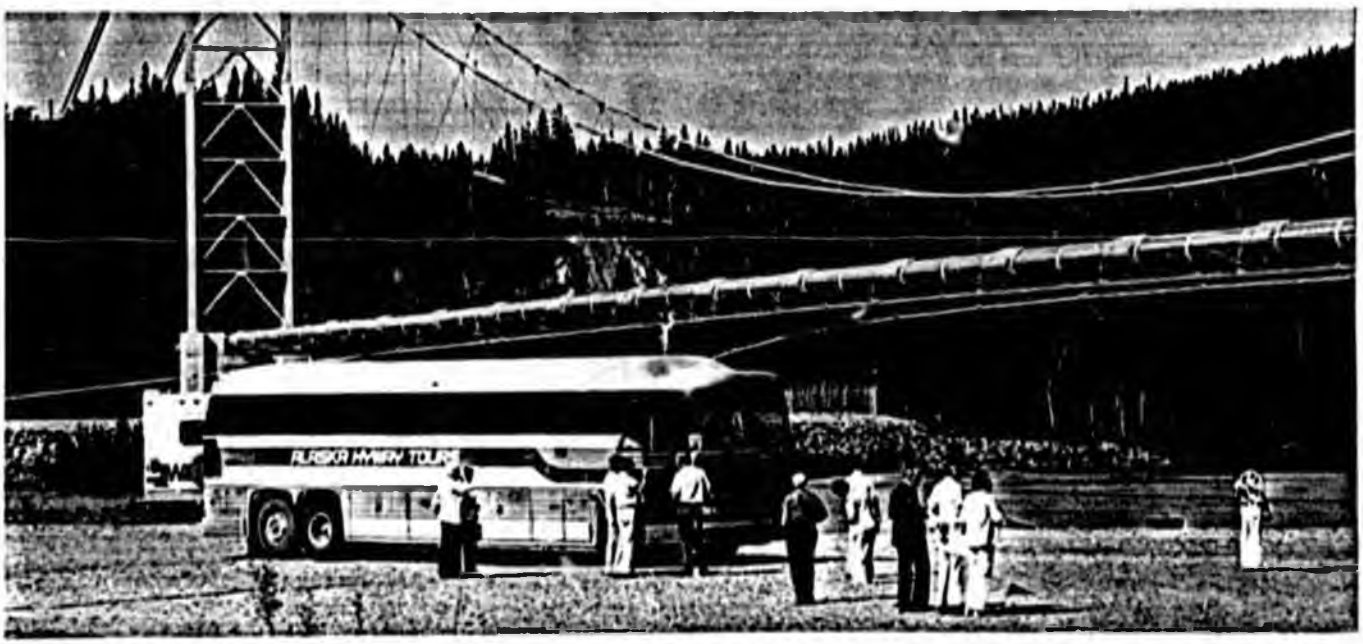
The largest unresolved issue which affects the region and subsequent impact planning is the matter of representation authority. Local residents feel a need for a pipeline impact and coordination office in the region, in order to improve communications with the State of Alaska and the pipeline company.

No uniform method of selecting the impact coordinator was set forth, but the desire for a "watchdog" or ombudsman-like position is readily apparent.

The larger issue of representation and governance will be addressed elsewhere.

It should also be noted that the general concerns expressed by the Business and Tourism Committee were by and large Tok specific, and did not extend to most of the outlying towns and villages.

Despite this, there are clear indications that village native corporations in Dot Lake, Tanacross and Northway are making positive plans to enter the pipeline contract market, and compete openly with the Tok business community. Generally this may be viewed positively, but the long term effect of sub-regional competition remains unknown.



b. PUBLIC UTILITIES AND TELECOMMUNICATIONS

DISCUSSION GROUP CHAIRMAN: Mark Springer

COMMITTEE ASSISTANTS: Merritt Bartlett
Tom Donnelly

The Public Utilities and Telecommunications Committee had about 15-20 people, including Ben Agee, President of RCA Alascom, and Ralph Wilson and Merritt Bartlett of Alaska Power and Telephone Company. At the outset, let it be noted that despite the statement in the information packet that stated that APT is not an Alaska-based firm, their business is in Alaska, and it is actually a matter of economics (favorable to the consumer) that their office is in Port Townsend.

The major point brought out in discussions with the utilities is that they stand ready to provide a desired service. It should be noted that APT is looking toward permanent demand as its planning baseline, and they, for instance, do not want to be saddled with expanded generating capacity, when in fact it is needed for only a short time. The general tone of concern toward pipeline impact is modulated by the idea that pipeline construction and support-related impact on the public utilities will be short-term and that, whatever it is, it can be met.

RCA Alascom has potential facilities existing in the Tok station to provide any and all desired telecommunications services within weeks (if not days) of requests. Rate structures were discussed, and the general concensus was that public utilities are not the most profitable businesses in Alaska. In fact, times are tough.

The state representatives, Messrs. Rusnell, Miller, and Lowery, helped out during discussions of water and sewerage and contributed a few words about dumps. Once again, the impact was considered to be of a short-term nature. Tok is located atop a thick bed of gravel with underlying (40-60 feet) aquifers, which are the community's water supply. Sewerage disposal is primarily cesspools, septic tanks, or leach fields. The consideration postulated was one of housing density as the most impacting feature of population growth on the water table. The subject of sewerage water systems was considered as an option and, of course, should remain in the minds of everyone. Solid waste disposal remains a very real and current issue. Tok does not have a legal landfill dump because of a tremendous amount of bureaucratic lands-claim red tape. A compactor transfer system is considered to be a possible viable option; however, it would no doubt prove to be an expensive proposition.

On the subject of taking gas out of the pipeline, nobody knows too much about it. APT has the capability of powering their generator sets with natural gas. The entire matter of taking gas out revolves around the cost issue. And for serious planning to occur firm cost figures and technical information are required.

RCA Alascom has 10 supergroups going east-west and west-east. They have two or three supergroups east-west and west-east potentially available. A supergroup is composed of 60 channels. DATA lines (voice grade) are presently in use in Tok. Telex service is available. RCA's main node in the Upper Tanana Valley is the TD-2 microwave path. A 4-ghz radio system is presently in use, and the option exists to add an entirely separate new microwave radio system.

There are eight (plus three and five to be hooked up) long-distance circuits in the APT switching office. It is a 1,000-line office. At the present time 200 lines are in use.

RCA says that a satellite TV broadcast earth station is available. They can also handle television channels on the microwave system. It would have to be a commercial venture.

APT is concerned with permanent facility planning. They could build a transmission line for $2 million to hook up to the Golden Valley Electric Association from Delta Junction.

Both RCA and APT expressed a policy of being able to meet demand on any foreseeable scale. There is still uncertainty concerning the location of pipeline facilities.

AFTER THE FORUM ...

Public Utilities and Telecommunications

Generally reported concensus of Forum participants indidates that impact in the public utilities and existing communications areas will be relatively short-lived, and not beyond the present production capacity of locally owned utility providers.

Alaska Power and Telephone is presently operating a 1,000 line local telephone grid at approximately 20% of capacity, and does not anticipate any undue delay in providing direct service to customers. This is reinforced by RCA AlasCom's service facilities, which, according to AlasCom President Ben AGee should meet community demands "within weeks, if not days". The RCA system possesses redundant

long-line channels, and voice grade data links are in use in the area. Further, Telex service is available, and an option exists to add an entirely separate new microwave radio system.

Current entertainment program capacity is available through a satellite TV earth station, and some entertainment programming is operating via microwave paths.

Power and electrical generation capacity, according to APT representatives Wilson and Bartlett, is capable of meeting any expected power demands. Further, the company does not wish to make any inordinate investments which will leave them with an excessive generation capacity after line completion.

The general attitude of the primary utility agencies is that the expected impact will not exceed existing capacity, and no major capitalization for facilities is required.

The issue of sewerage and water facilities is a continuing problem, but will not be readily resolved without a local agency to assume service responsibility. According to Alaska Department of Environmental Conservation representatives Rusnell, Miller and Lowery, the demand for service will be relatively short-lived, and the major considerations of consumption will be housing density in any given area.

Existing water and sewer systems are privately owned, with wells, cesspools and septic tanks predominating. Any large scale service system thus would exceed subsequent user capacity. No discussion of construction of public use laundromat/shower facilities was entered, but the idea would probably be met with resistence by local motel and campground operators.

There is a continuing problem in the Tok area and in the other villages with solid waste disposal. Tok does not have a "legal" landfill, ostensibly because of excessive governmental and administrative "red tape".

According to Utilities and Telecommunications Committee Chairman Mark Springer, the Bureau of Land Management has appointed an individual to supervise the existing land fill, but the facility is almost filled to capacity.

Subsequent resolution of this problem will hinge on solution of the Alaska lands issue, and possible development of a local governance structure.

The final area of discussion concerned the installation of a gas "take-off point" for local consumption. APT states that they have the capacity to utilize natural gas for energy production, but until a state position on gas use is established, the point cannot be directly addressed.

Again, it should be noted that the public utility and communications issues directly affect the Tok area, and do not generally reflect the concerns of the remaining road communities. This may be attributed to limited outlying participation, and a lack of clear understanding by conference participants of the legalities and ramifications of utility policies.

c. LAND AND AGRICULTURE

DISCUSSION GROUP CHAIRMAN: Bill Arpino

COMMITTEE ASSISTANTS: Doug Euers
Robin Brean

The Land and Agriculture Committee met on the afternoon of April. Approximately 50 people were in attendance, representing private citizens, landowners, contractors, the State of Alaska, federal agencies, Native corporations, environmental groups, and Canadian representatives.

The two general areas of concern were pipeline routing conflicts and area land use planning. In the Tok area there are definite problems with the proposed alignment:

1. It is too close to the community.
2. There are conflicts with present recreation trails and public roads.
3. There are conflicts with land usage by the local trap shooting club and by the Tok Dog Mushers Association.
4. Historical sites may be impacted.
5. Private land and homes are located on the proposed alignment.
6. The gas line might be hazardous to residential and business concerns.

Northwest Alaskan Pipeline Company indicated that changes in the alignment are possible to accommodate local land usage. A willingness on Northwest's part to meet community needs in routing was indicated. Tok is not the only area of concern. There are possible conflicts along the highway at Delta Junction, Dot Lake, Riverside, Northway, and Lakeview.

The right-of-way over private land was discussed. Northwest would negotiate with landowners for easements, but they will have the right of eminent domain. Condemnation and just compensation would take place if negotiation was unsuccessful. This procedure would be used only for right-of-way acquisition and not for compressor station or construction camp sites.

Placing the gas line and the proposed railroad on the same right-of-way was discussed in general terms; this is a possibility that should be looked into to minimize disruptive activities.

A strong need was indicated for some type of central organization to represent Tok or the Tok area, which would be responsible for answering questions and inquiries relating to the gas line by any parties involved. At the present time there is no such organization that has the authority to speak for the area's population.

The concensus of the group was that there is a need for an area land-use plan. Some considerations to be included in the plan should be:

1. An inventory of existing trails should be compiled.
2. An inventory of present land usage should be understood.
3. How and in what direction, if any, should the town expand?
4. Should more state land be sold? If so, then where? What types and sizes of parcels should be considered?
5. Soil testing should be completed.
6. Agricultural land needs to be identified in order to become available.
7. The state timber disposal method should be changed.

The above-mentioned comments, concerns, and viewpoints were gathered in only two hours of good discussion. We have just scratched the surface, and more input is needed if the present and future needs of this area are to be met during gas pipeline impact.

AFTER THE FORUM...

Land and Agriculture

Participants in the Upper Tanana Regional Forum expressed substantial concerns over future land use and planning, on the part of Northwest and for agricultural development.

Generally, the areas residents felt that the proposed pipeline route was not satisfactory for the following reasons:

1. The proposed route is too close to the communities. (Especially important in Tok.)

2. The proposed route is in direct conflict with existing recreational trails and public roads.

3. There are conflicts by local sporting and dog mushing clubs over land to be used for the pipeline.

4. No adequate solutions to recovery or protection of historical and cultural sites has been advanced.

5. The proposed route will be over some private lands and homesites, and residents are concerned that right-of-way condemnations will not result in tendering of a fair value for selected lands.

6. The potential hazards to residences and businesses has not been dealt with adequately.

Northwest Pipeline indicated during the Forum that it would be willing to negotiate changes in the right-of-way alignment to accommodate local land use, to the extent possible. This action would apply uniformly to all communities along the corridor. In fact, modifications of the route, subsequent to the Forum have moved the route further north of town, and primarily onto State lands.

Further, it was Northwest's desire to build as far north of Tok, and away from the communities as possible, to further minimize hazards.

The issue of easements and condemnation authority was responded to by pipeline company officials who indicated that they would pursue individual negotiations where possible, but that condemnation authority would be sought, to resolve any unsuccessfully negotiated agreements. This authority will be further defined by the State of Alaska in subsequent right-of-way agreements with Northwest.

Pipeline officials stressed that the above procedure would not apply in the matter of setting up construction camps and compressor stations.

Panel discussants suggested that a future use of the pipeline corridor might include authorization for the Alaska Railroad in extending its operations to the Canadian border. The expected effect would be to minimize disruptions during future construction.

During the forum, area residents conceded a strong need for creation of a central organization which could assume a responsible information role with all groups in the region, and begin the process of land use planning. No organization presently exists, and models for such a structure are not uniformly accepted.

Group concensus for an area land use plan focussed on the following:

1. An inventory of existing trails should be compiled.

2. An inventory of existing land use patterns should be assembled an made understandable to all potential users.

3. How, and in what direction, if any, should Tok expand? (This question may be appropriate for any community located within the pipeline corridor.)

4. Should more state land be sold? If so, where? What types and sizes of land parcels should be considered?

5. Soil testing, throughout the region, should be completed.

6. Agricultural lands should be identified, in order to ensure their future availability.

7. State timber disposal methods should be modified or changed.

In a subsequent interview with Land and Agriculture Committee Chairman Bill Arpino, it was learned that some of the previously stated concerns may have been modified. Generally residents of the Tok area have settled into a "wait and see" attitude, and are less prone to see pipeline impact as a major event.

Land use planning and selection of a representative body are still under consideration, but no concrete action has been taken to date.

Further, Chairman Arpino indicated that the opening of an impact office, while desirable from a public relations standpoint, was not as essential as previously stated. He suggests that it would not be appropriate for Northwest to open such an office, but that a neutral third party could serve as a reliable information conduit, and be well-grounded in the affairs of the community by the time that actual line construction begins.

d. PUBLIC SAFETY

DISCUSSION GROUP CHAIRMAN: Dottie Eshbaugh

COMMITTEE ASSISTANTS: Bob Stuart
George Cole
Tony Conrad

The discussion groups in this committee varied from 10 to 30 throughout its sessions.

Alaska State Trooper staff and facilities were discussed. Tok Corporal Cole stated that there are presently four public safety officers stationed at Tok and two at Northway. An employee of the local alcoholism program stated that much of the area's present criminal activity is alcohol-related. Tok Trooper Stuart described the local trooper post as a holding facility with three bunks. He feels that the present facilities will be of adequate size (in most cases) if proper transportation can be arranged. Also needed to make this possible is good coordination with personnel working with alcoholics and juveniles.

Public Safety Deputy Director Sydnam stated that they know that there will be increased safety problems. He anticipates that at least one additional safety officer will be placed in Tok and that there are possibilities for getting constables in some of the villages.

Roy David of the Tetlin Village Council stated that cooperation between troopers and the village is needed. Having a constable in Tetlin would be good. They have seen that the constable in Northway did help that village. He anticipates serious problems during impact, since there are already serious ones involving both drugs and alcohol.

The alternate health aide and alcoholism counselor for Dot Lake stated that something should be done about the expected increase in alcoholism problems. Discussion followed.

A Northwest representative stated that the camps will not be dry but that beer halls will not be established in the camps.

It was felt that the Tok area recreation facility should be used to offer activities programs under good supervision.

The Tok Volunteer Fire Department stated that their greatest need is for another fire truck. Also, more training is needed.

Another concern previously discussed and acted on by members of the committee was the need to protect pedestrians. Specific recommendations have been made to build a bicycle path, or pedestrian overpass, and to lower and move the speed limit signs.

AFTER THE FORUM...

Public Safety

Considerations of public safety generally centered on the availability of enforcement officers, holding facilities and enforcement of speed and highway regulations for protection of pedestrians.

According to an employee of the Tok Alcoholism Center, most of the criminal activity in the region is alcohol related. This is a recurring problem in rural and interior Alaska, and is not expected to change significantly.

Alaska State Trooper George Cole noted that the existing holding facility should prove adequate to local needs, providing adequate transportation can be arranged to move detainees to more secure locations (i.e. Fairbanks).

The Alaska Department of Public Safety is looking to increase staffing in the Tok region, and is re-examining the possibility of placing constables in the road villages.

Health aides and alcoholism counselors noted that an increase in consumption is to be expected, based on the Fairbanks experience, and some degree of pre-planning must be done to prepare for the accompanying criminal activity and welfare needs. This is coupled with statements by Northwest officials indicating the camps will not be dry, although beer halls will not be constructed or set up in the camps.

To some extent the social problems of construction impact may be modified through sound programs that could be established through the Tok Recreational Center.

Fire protection is generally deemed adequate in the Tok area, through the existing seven member volunteer fire department. Primary need by the VFD is another fire truck, and this problem is replicated in the remaining villages. Training is a continuing problem, but shared training between Northwest camps and the road communities may be an alternative to alleviate the potential costs of training.

Finally, pedestrian and bicycle traffic safety are major concerns of Tok residents, and increased emphasis on enforcement is desired.

e. EDUCATION

DISCUSSION GROUP CHAIRMAN: Carl Peterson

COMMITTEE ASSISTANT: Dave Maxwell

The following items were listed by the committee as concerns:

I. Education Training

A. Who?

1. Alaska Gateway School District
2. University of Alaska Extension Center

B. What?

1. Responsibility Training
2. Career Education and Counseling
3. Employment Information
4. Survival Skills (Personal and Employment)

II. Facilities

A. Existing Program
B. Anticipated Expansion

1. May not need additional facilities
2. Present facilities may well need upgrading
3. Obtaining needed expansion - state, local bonds
4. Facility maintenance

III. Recreation

A. Swimming pool and maintenance and supervision
B. Do we want to be in the recreation business?

IV. Types of jobs to prepare for:

A. Security Occupations
B. Building Maintenance Trades
C. Office Occupations
D. Hotel/motel Restaurant Management
E. Communications
F. Road Maintenance
G. Laundry
H. Transportation
I. Vehicle Maintenance
J. Health Care
K. Child Care

The program of the University of Alaska, Tok Regional Center, was explained and its budget discussed. During this session, 103 students are being serviced in credit classes, 15 students in non-credit classes, and 17 students in public service classes. The committee was not optimistic about the budget's increasing. Grants are an unstable basis for funding. The Regional Center intends to offer as many vocational/technical programs as possible.

Ralph Rudzik, principal at Northway School, stated that there are no jobs in his area and feels that vocational skill education would be the best help. Rosemarie Maher of Northway noted that around 30 people have traveled to up to four training areas. They do not like city life. This is a difficult question. Some may be gone up to five years in order to gain necessary skills. Sharon Young, president of the regional school board, stressed the importance of survival skills needed for city life. The committee discussed the need for these skills, such as the need for a vocational counselor, education in filling our forms, guidance for people from smaller communities who have relocated to cities for training.

The committee mentioned the importance of training local people for permanent jobs. Training might not always result in the kinds of skills that unions need at a certain time. On-the-job training during construction of the oil pipeline resulted in almost 200 permanent jobs. We need to work to set up permanent positions. It was noted that many jobs will be in building maintenance trades. Are these the jobs that local people would like to have?

Don MacKinnon of the Alaska Department of Education mentioned that residents want to be assured of getting a job after they complete extensive training for a certain occupation. The committee discussed the problems of responsibilities that go with jobs and trying to eliminate high turnovers in personnel. It was wondered what part schools could play in responsibility training and encouraging people to stay in the area.

The committee noted that not many jobs that could result from pipeline construction are long-term jobs but that many benefits can come from lower-paying, longer-term jobs.

MacKinnon stated that the major responsibility is with the Department of Education. There is grant money available for hard-pressed areas. The Department is responsible for providing for long-term facilities. The department is connected with the Seward Skill Center. Development of curriculum is a local responsibility. Some kinds of vocational plans can recieve extra funding. He predicted that this area could undergo a 10-15% increase in student population. (During pipeline construction, Valdez had a much higher increase in student population. Cordova experienced a 6% increase in student population.) It was noted that many workers and their families have stayed in Valdez.

The committee stressed that it is important to think about the post-construction period and who will remain here then. It was noted that many construction workers travel to larger communities to find work. A Canadian pointed out that it was difficult to control any kind of impact into a community.

A discussion of building needs and a swimming pool followed, and the cost of the support of a pool was questioned. The cost of maintaining the Cordova pool is $120,000 per year. Fees bring in $18,000 to $20,000 per year. The remainder is funded by the school ($50,000) and the city. Use of the recreational facilities at the schools was discussed. It was noted that the gas pipeline will be built by specialists who seldom take their families with them. During peak gas pipeline construction, the number of employees is expected to be one-half the number at the peak of oil pipeline construction. The overall effect of this on the educational system in the region is estimated to be 10% over present enrollment.

There are no final details yet concerning permanent positions to be generated by the compressor sites in the region. In the 200-mile stretch between Delta Junction and the Canadian border, fewer than 50 permanent operations and maintenance jobs may be available. Small contracts aside from the pipeline construction itself could include pipeyard, maintenance shop, and housing construction. Service contracts expected to become available before and during pipeline construction could include facilities maintenance, health service, and child care.

AFTER THE FORUM...

Education

The education Committee addressed the overall educational needs of the region, and spent a substantial part of its time discussing the overall employment and training opportunities available to area residents. Comments and concerns closely followed those addressed under Job Training and Placement.

Significant, however, was consideration in this committee of village needs and an understanding of their respective employment requirements.

Although some training and vocational education programs are established throughout the state, rural representatives have found them less than adequate for villagers. The major drawback, as expressed, is that the high concentration urban areas are not compatible with village life styles, and the combined effect of "culture shock" and high costs virtually insures failure by the rural area participant.

Don MacKinnon of the State Department of Education noted that there are grant programs available to hard-pressed, impacted communities to assist in local training programs, and that this area was of singular importance to the department.

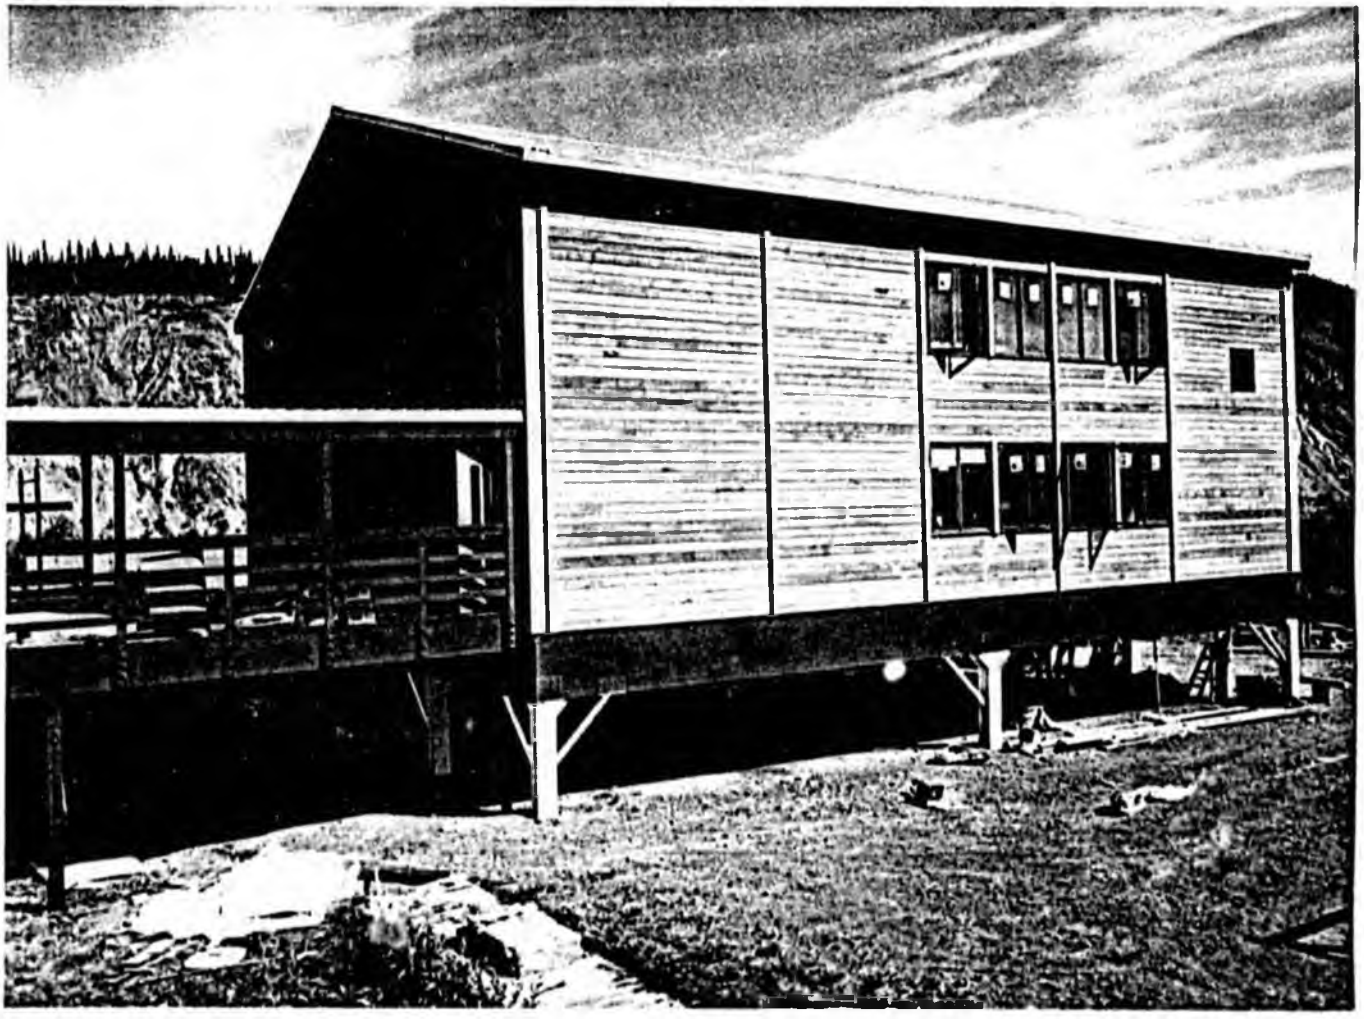
According to Gateway School District Superintendent Carl Peterson, no new school construction is anticipated, as existing facilities should handle any anticipated increase in enrollments. The construction of a school in Tanacross which is underway now is expected to relieve any pressure that might come to bear on the school in Tok.

Whether or not this remains the fact depends heavily on the population influx. MacKinnon noted during the proceedings that Valdez and Cordova saw a substantial student population increase during the oil pipeline construction, and predicted an approximate enrollment rise of 15% for the Tok area. On the other hand, school enrollments were the one impact pressure Fairbanks was prepared to handle, and enrollments never did increase to the level of predictions before construction. Without more hard data on the estimated numbers of jobs, the extent to which they will be filled by in-migrants, and whether those itinerant workers will bring their families, it is nearly impossible to predict what pressures construction will bring to bear on the Gateway School District.

Area building needs and desires were discussed, including construction of a double-duty swimming pool/water reservoir. Cited construction costs indicate that such a program for the Tok region would incur prohibitive maintenance and operating costs.

Superintendent Peterson stated that his major concern during the construction phase would be loss of skilled maintenance and clerical personnel to higher paying jobs. While some of the turnover could be handled from the existing labor pool, it would result in a destabilization of the administrative routine.

In summation, the overall educational and standard training needs can be handled through the existing structure, with a minimum need for new or special programs. However, local skill training for construction employment in all areas remains unresolved.



THE LOCAL DECISION MAKING PROCESS:

Comments by Forum Speakers

Comments submitted during the Upper Tanana Regional Forum by invited participants from the State of Alaska, Northwest Pipeline and related areas focused on the larger implications of pipeline development as it will affect the small communities of the Upper Tanana Region.

Tom di Zerega, Vice President for Northwest Pipeline Corporation, outlined the overall construction timetable for the project, and stressed the energy company's commitment to "...identify all cultural resources along the route so that we may take proper mitigating measures".

Di Zerega had outlined the construction timetables, noting that a 1983 completion deadline was expected, with various stages of construction start-up planned beginning in 1979.

Dr. Mim Dixon, keynote speaker and former Fairbanks Pipeline Impact Information Center Director, told conference participants that impact planning should begin at the earliest possible time. She urged the communities to "plan for what you want your community to be 10 years from now", and present these desires to the pipeline company.

She suggested the possibility that the construction companies might be willing to build facilities on a turn-key basis that would permit community acceptance of the buildings when the construction effort was completed.

No discussion of potential pipeline impact can be considered complete without a partial discussion of the net effect of local government structures on the impacted areas. Governor Jay Hammond addressed the issue by stating, "I'm not going to counsel you that local government is the way to go in this area, but..."

Hammond stated that he had previously voted against a local government structure for his home district, but subsequently modified his views when local residents discovered that borough power permitted residents to do things that "we wouldn't have been able to do without it".

The local government/representational issue is described by some residents as a "hot potato", which will not be easily resolved.

According to comments recorded in the All Alaska Weekly article on the forum, "In an attempt to fill the representational void, Bob Lohr, Executive Director of the Upper Tanana Development Corporation, warily tried to get the forum to discuss formation of a task force to follow through on the work so far accomplished.

"The subject was apparently too sensitive and ended with only one comment, terse and angry, from Rosemarie Maher, President of the Northway Native Association, who flatly opposed it.

"Maher feels that the natives from outlying villages were not adequately represented in the forum's work and therefore should not be put in a position to accept the task force only because they were absent."

Summary remarks by local residents in attendance indicated that the forum served a valuable role in initiating discussion on the future changes, but subsequent to the proceedings, according to local spokesman Glen Marunde, much of the enthusiasm had evaporated.

f. WOMEN'S CONCERNS

DISCUSSION GROUP CHAIRMAN: Mellie Terwilliger

This region is a classic example of rural Alaska. Immense areas of land, mountains, and water. Small clusters of people, 50 to 100 miles apart. Extremely long, extremely cold winters. We look forward to the gas pipeline for the jobs and business it will bring. We know that our Canadian friends down the line are in the same situation as we. And we know the end result will be good for the people of the Lower 48. We want to plan to make the best of things to come to our region.

We have some fears about the great influx of transient workers. We are already accustomed to a great influx of tourists every summer. Now, perhaps, we can have the means to plan to give comfort and strength to all the people of the region, to the tourists, and to the pipeline workers.

Women are a cohesive force in a wilderness. Women mean homes, children, schools, churches, clubs, stability.

It is difficult to deliver services to rural Alaska. To accomplish this we endorse the concept of sub-regional delivery of services of state and federal agencies, and industry with local hire.

We want to thank the Tok Chamber of Commerce, the Upper Tanana Development Corporation, and the Fairbanks Town and Village Association, especially its director, Jerry Smetzer, for the opportunity to air our concerns to those people able to help us women with them.

The committee also supports a regional pipeline impact office, day-care centers for working mothers, a regional labor union office, medical care and counseling for students, a swimming pool (which could be housed in a reservoir for fire protection), increased community services, a consumer protection agency office, support of an loans for marketable arts and crafts, expansion and strengthened financial support of the public health clinic, and the promotion of winter tourism (which could create more jobs).

8. RURAL AND NATIVE CONCERNS

DISCUSSION GROUP CO-CHAIRMEN: Bob Brean
Glen Marunde

COMMITTEE ASSISTANTS: Roy David
Rosemarie Maher

Participation in this committee exceeded that of any of the other committees. Although the largest room was selected for rural and Native concerns, there was little elbow space left. Several issues were covered. Some of them were: the protection of subsistence life style during construction of the gas pipeline; right-of-way, alignment, and access of pipeline; job training; minority hire and human rights; fish and game concerns; and individual access and input with regard to issues concerning the pipeline.

The subsistence life style issue consumed much conversation. It was decided that corridor restrictions would not be effective in protecting local life styles. There were not used in Glennallen's portion of the oil pipeline, and Tok is similar. There would be easy access to the corridor in the Delta-Border segment of alignment. One possibility to protect local subsistence hunting and fishing would be strict residency card requirements. The 30-day residency decision by the Supreme Court was discussed, and Governor Hammond stated that only through a constitutional amendment could that ruling be altered. Residence as a means to achieve solutions to several problem areas was discussed at length in regard to local hire, the taking of game, human rights, and so on. Another undesirable effect of subsistence protection through corridor restrictions is that villages like Dot Lake, Tanacross, and Northway, which lie on the pipeline, would find their freedom restricted. This was a major concern of Chief Andrew Isaac.

Right-of-way was covered by Northwest officials. Negotiation with private landowners on the right-of-way was brought up. Trapline rights will be negotiable, as stated by Morris Thompson. There was wide support for the Bureau of Land Management to get out of the picture as soon as possible on Native claims lands so that corporations and villages could be free to do their own negotiating without interference. Canadian representatives stated that many of the problems that we have with regard to residency requirements and land claims can be handled on a different basis in Canada, because our constitutions are not the same.

Job training specifically for pipeline-related jobs was well discussed. The possibility of the state's handling of a training school program was raised. A current Canadian project, Nortran, was discussed.

Minority hire and human rights seemed to go together and were discussed simultaneously. One of the human-rights resource persons stated that their office still has 300 human-rights violations relating to minority hire to process. The tools at their disposal are, at best, cumbersome. Spud Williams of the Tanana Chiefs Conference said that the Human Rights Office is basically a good vehicle to help to enforce minority hire but was very slow. Larry Means of the Department of the Interior explained that new regulations providing assistance to minority business related to pipeline activity were being drawn up. These plans were to be tailored specifically for the Northwest pipeline.

The fish and game session met in the afternoon. There was passive support for a bill being considered in the legislature that would decentralize the Department of Fish and Game by the creation of 12 regional fish and game boards to bring the decision process closer to the people. A requirement for all out-of-state hunters to use guides was discussed as a means to restrict hunting by pipeline workers. There may be questions of constitutionality in a previous Supreme Court ruling.

There is a strong concern about community, village, and/or individual input into the decision-making process used by state, federal, and Northwest officials in all matters pertaining to the gas pipeline. The use of the State Office of the Pipeline Coordinator as a clearinghouse between government, the prime contractor, and community and/or individual residents was discussed. Another suggestion was for the creation of an office for an ombudsman-type position for gas-pipeline-related problems only. Such a position may be incorporated into the pipeline coordinator's office. The need for safeguards to keep the expanded version of the pipeline coordinator's office from becoming too powerful was mentioned. Maximum use of local hearings was encouraged in access and input discussions.

AFTER THE FORUM...

The Political Issues

The Committee on Rural and Native Concerns was the most heavily attended, with the bulk of rural forum-goers concentrating in this area.

Central to all discussions was the absolute need to preserve indigenous subsistence rights during and after the construction effort. Incorporated also were issues of employment, training, the role of village corporations and tribal government, and the establishment of standards common for all impacted communities as opposed to the dominant population center.

The relative effects of residence preference were discussed, with an eye toward controlling non-Native and non-resident access to traditional use areas. Governor Hammond noted that such preferential resident use could only be addressed through a state consitutional amendment.

This restrictive use plan has been further complicated by the U.S. Supreme Court ruling striking down all provisions of the resident hire law. No subsequent formal resolution has been set forth.

There was a uniform desire to have the native lands issue resolved, to permit the affected villages to enter into private negotiations with the pipeline contractor and avoid the "meddling" of federal agencies. This is an issue whose solution again is postponed with the failure of Congress to pass any D-2 legislation this year.

Generally discussions joined on the Alaska Native issue recapitulated the continuing problem of the rights and prerogatives of the small communities in managing and ordering their own business affairs.

It is important to note that this committee provided the focus for many of the rural participants to express their sense of alienation and separation from the larger decision making process, and to vocalize their desire to have a more substantial say in subsequent planning and development schemes.

In post-forum interviews, Committee Co-Chairman Glen Marunde indicated that the issues addressed in the forum had been allowed to fall dormant by the committee participants. However, Chief Andrew Isaacs of Dot Lake indicated that the level of village involvement has not declined, but the major concern of the older native people is the right of full participation for their young people. In hearings on the lease stipulations for the pipeline, Isaacs commented that he really did not approve of the line going through traditional hunting and fishing areas, but that if the young people could no longer make a living at subsistence, they would have to earn money, and he hoped the pipeline was one way to do that.

h. HIGHWAYS AND TRANSPORTATION

DISCUSSION GROUP CHAIRMAN: Harold Johnson

COMMITTEE ASSISTANTS: Fred Pride
Arthur Warbelow

Discussion in this group covered many areas of interest with approximately 30 people in attendance.

It was brought to the attention of those present that the highway between Miles 75 and 83 of the Tok Cutoff is very narrow and needs repair before pipeline hauling begins. This is also true of the section between Miles 39 and 49 of the Tok Cutoff. Sections of the Alaska Highway that are narrow and in need of repair include Miles 1329 to 1362 (Dot Lake), 1362 to 1378, and 1235 to 1301 (Tetlin Junction). The possibility of emergency funds to be used on these sections was discussed. Without improvements on some sections of the highway, there would be a significant and generally unacceptable level of danger during pipeline activities.

The current location of the truck weight scale was discussed and a relocation was termed feasible in order to allow more room downtown at peak traffic periods. This also reduces the risk of automobile accidents and increases the safety factor for residents.

It was stated that the Northway road needs work and that bridges in that area will also need work with increased truck traffic.

There was discussion on the Tanacross airport and Rudy Hartsell's small airstrip. With increased air traffic in the area and likely increased use of these strips, would the users such as Northwest, be willing to "foot the bill" for a portion of the maintenance expense? That question can easily be solved in the case of a private strip, but not so for Tanacross. There is no air traffic control to monitor air traffic.

The need for bicycle paths or walks in impacted areas such as Tok was considered.

AFTER THE FORUM ...

Highways and Transportation

Area residents generally felt the need for a broad range of improvements to the existing air and surface transport system.

Significant improvements to the road system are desired at the Johnson River, Dot Lake and Tetlin, with additional improvements sought at Northway. Discussion of bridge improvement and upgrading was also joined, and some concern was expressed over those stretches of road connecting with the Canadian leg of the construction project.

It should be noted that the State Department of Transportation and Public Facilities has added substantial request monies for improvements on the Alaska Highway. Status of that funding is not presently known.

Tok residents also requested a relocation of the truck weight scales to a more remote location. The general argument is that such relocation will eliminate a fair amount of heavy vehicle congestion in the community, and thereby serve as a positive safety factor. No new location has as yet been agreed on.

The area of air transportation is largely unresolved. Questions were raised by Tok residents questioning whether Northwest could be induced to carry part of the costs of airport operation in Tanacross, despite the absence of any local airport operations authority. The issue is moot for use of private airstrips, but is not clear for the larger Tanacross facility.

1. JOB TRAINING AND PLACEMENT

DISCUSSION GROUP CHAIRMAN: Dave Maxwell

COMMITTEE ASSISTANT: Norman Wallis

State Commissioner of Labor Ed Orbeck discussed the state hire law with the committee. The National Labor Relations Board has accepted the Alaska local hire law. But even if the Alaska state statutes on local hire were determined to be unacceptable to the courts, the employer and the union could negotiate a local-hire agreement on their own.

Willie Lewis of Local 942 (Laborers) talked about minority hire. He also mentioned the possibility that his union may establish some sort of training facility in Tok with preference given to union members.

The succestion was made that two people from a village might alternate in a job on the pipeline. This would not only help to assure local employment but would also allow more flexibility to employees from the villages.

It was brought up that several years from now (1980 or 1981) there would be many people who could claim that they were Tok residents for a year or two. It should be considered that what we need to realize is that if we are not careful, we could have many of the same problems that Delta Junction underwent in regard to local hire.

It is important to understand how many people, in Tok for instance, are interested in being foremen, powdermen, general laborers, cat operators, heavy truck drivers (to cite a few). This would be invaluable in realizing what kind of training programs to initiate in the area.

For the permanent compressor station jobs that will open up after construction, it was mentioned that there should be some sort of local-hire preference. There should be some preference for locals in the training programs or in the selection of personnel for these positions.

AFTER THE FORUM ...

Job Training and Placement

Closely related to the question of overall pipeline employment is the consideration of the nature and type of training that would be available to area residents, with positive guarantees of employment once training has been completed.

As previously noted, the Northwest Pipeline Company has expressed a desire to utilize as much of the local labor force as possible, but the ramifications of the U.S. Supreme Court decision in striking down "resident hire" may complicate that intent.

Nevertheless, the local awareness of the need for skill training and placement cannot be too forcefully stated.

Testimony by area residents during the Upper Tanana Regional Forum indicates that there is a high incidence of clerical and secretarial skills, but a shortage of trained workers in the construction and building trades. According to Job Training and Placement Committee Chairman Dave Maxwell, the Tok area has to import numbers of people to work on many local construction jobs and existing service jobs (hotel, motel and restaurant).

As a result, most of the local interest and desire is focused on jobs such as heavy equipment operation, heavy truck driving, vehicle maintenance or explosives handling to name a few. In most cases, the University extension center is not an appropriate setting for teaching of these skills.

Laborers Local 942 representative Willie Lewis stated during the forum that there is a possibility that his union would establish an "entry level and recertification" training center in Tok, but according to Maxwell, they have not made any followup moves.

No other craft or trade unions appear to have taken area training into consideration, and it is probable that any such programs would continue to be operated out of the Fairbanks center.

Area residents indicated a desire for vocational/ technical training either through the Gateway School District (REAA) or the University of Alaska Cooperative Extension Service or the community colleges. However, the concensus was that it was probably too late to organize such a program and that the UA/union liaison might be politically impossible to start up.

An additional note, according to Maxwell, is that the UA extension center in Tok has done some test marketing to schedule vocational/ technical training, but has been unable to get people to sign up

for classes. He cited as an example a course in commercial baking - a skill that could be marketed in a pipeline camp as well as on a permanent basis in the community. No one signed up.

The communities generally expressed a desire for on-going, postpipeline jobs, working in such areas as the Northwest compressor stations. This employment area will not generally provide much, as the expected number of permanent jobs will be around fifty. Further, there will be technical jobs for which local training efforts may not be adequate.

Job placement during the pipeline building effort may be a problem not only because of the court decisions on resident hire, but because of the concentration of hiring hall, contractors and support services in the Fairbanks area. Some discussions of consolidating labor halls in the Tok area has been advanced, and the Tanana Chiefs Conference has been exploring avenues to underwrite minority hire, but to date no substantial policies have been generated.

During the forum, some innovative recommendations were set forth to permit or encourage greater use of the labor force. One notable suggestion was to consider using two persons from a given village in one work position, thus giving the employee a greater personal flexibility to meet his/her needs, and extend the number of employable positions.

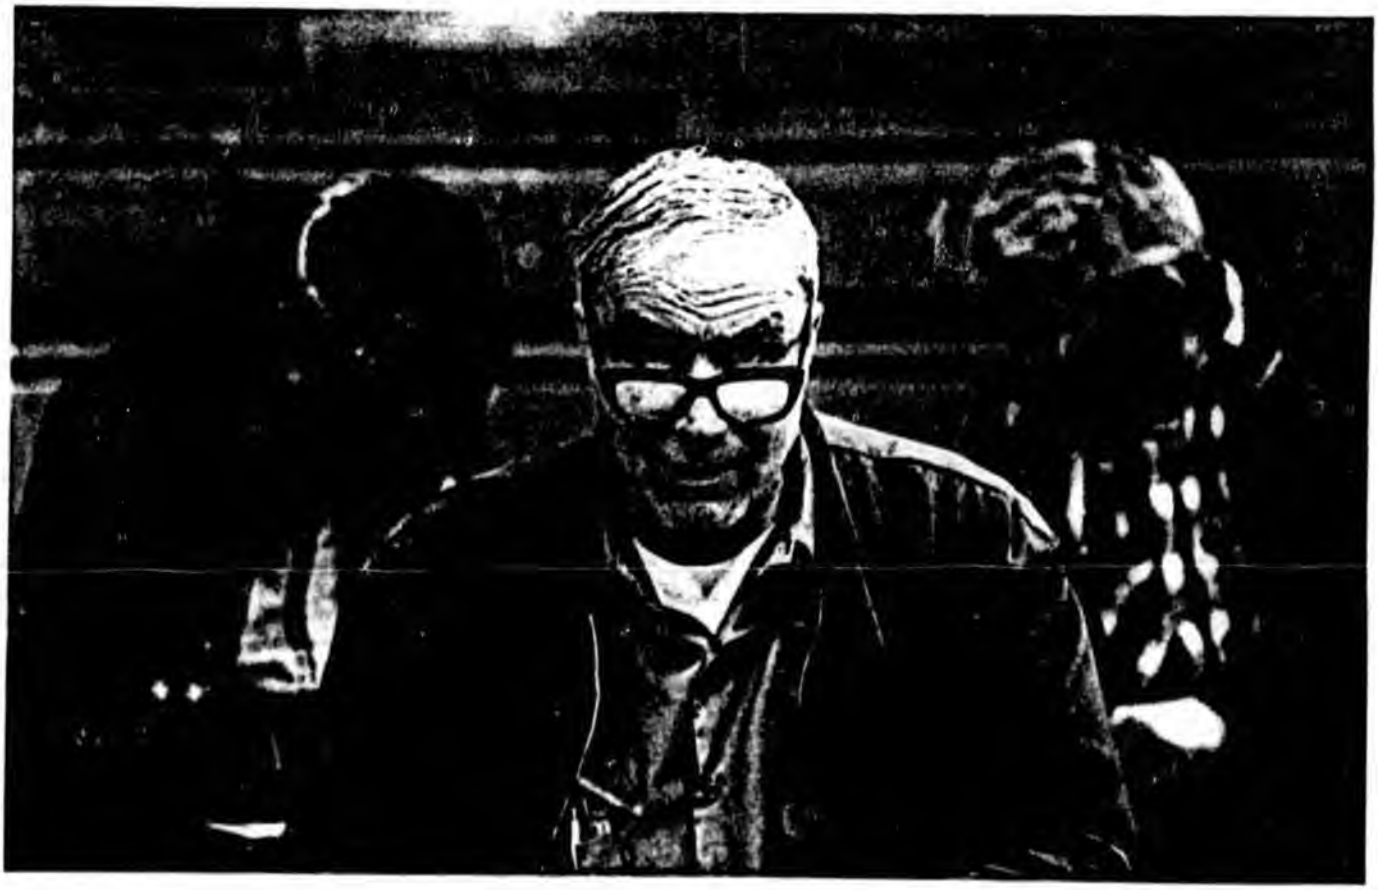
Another such suggestion was to eliminate the single 12-hour shift, with its attendant seven-day work week, and substitute two eight-hour shifts, again on a seven-day cycle. Such recommendations are of course speculative at this point, and will be the management prerogative of Northwest.

In summary, the training and placement questions continue to dominate, and are unlikely to be resolved until such time as the State of Alaska can re-examine its role in setting preferential hiring practices, and set up a coordinated, functioning program to support the Alaska Highway communities.

Further delays in resolution may be expected due to shifting community needs and perceptions especially if the local desire remains fixed only on direct construction employment.

Central to the entire discussion is the area's expressed wish for more substantive information than has been provided to date. The need for "more meat" (information) is a recurring theme throughout this report, and will be so addressed.

In a post-forum interview with Training and Placement Committee Chairman Maxwell, he noted that there had been an increase in demand for Emergency Medical Technicians through the Alaska State Troopers. He felt this was generated by the Upper Tanana Regional Forum, and that as discussions and impact planning continued, more such employment and training options might be generated.



J. SOCIAL SERVICES

DISCUSSION GROUP CHAIRMAN: Louise Griffin

COMMITTEE ASSISTANTS: Cathie Ipalook
Bob Lohr
John Klaus

Myra Jones of the Tanana Valley Community Clinic in Tok gave an overall report of the health services that are presently available in Tok and the surrounding area. A description was given of the clinic, health personnel on staff, and the ambulance service. The need for an expanded clinic was stressed. The clinic is not equipped to handle emergencies involving two or more people at one time. There is a space deficiency - no holding beds, no emergency room. It was stated that the Tok area needs a usable facility not only during the pipeline construction era but present and in the future.

Barbara Wihlborg - public health nurse, Tok itinerant - gave the boundaries that she covers and a summary of the services from her clinic with the emphasis being on prevention/education. She also gave an overall summary of the health aide program in the surrounding villages. It was very evident that additional personnel are needed in the Public Health Clinic.

The need for mental health services was discussed. It was stated that a proposal has been submitted to the state, asking for funding for a full-time clinical psychologist to be stationed in Tok, providing services to the surrounding area.

Jerry Taylor, ambulance coordinator, spoke on the ambulance service. One ambulance based in Tok covers the entire area (Border, Duffy's, Taylor Highway, Dot Lake, Johnson River). We have only three active emergency medical technicians and four or five drivers. There will definitely be an increase in auto accidents. Therefore, there is a need for another emergency vehicle, which should be based in Northway. Education and training for additional personnel should be available.

We have had very little contact with the state Emergency Medical Service program. More bush area representation is needed for this program. Ms. Wihlborg expressed a strong desire to serve on the state EMS program. Fred McGinnis, Deputy Commissioner of the Department of Health and Social Services, stated that he will request Mr. Scott, director of EMS, to visit Tok soon.

Governor Hammond stated that they are definitely concerned with health care budgets but that appropriate revenue is needed. Morris Thompson of Northwest stated that he was not prepared to say whether Northwest is planning on using our health-care facilities, equipment, and personnel, because the company is at present in the construction design phase. The company would negotiate with Tok. The company would have its medical experts and associates look at the local situation, facilities, and so on with the possibility of arranging contractual agreement.

Thompson was asked about the highway villages in regard to using facilities and health aides. He stated that this would all be taken into consideration. If Northwest used the local and village facilities, then there is the possibility of helping to provide equipment and helping Tok with the proposed clinic addition.

Dottie Eshbaugh of the local alcoholism program reviewed present program services and stated that they are barely keeping up with the problems now. Since there will definitely be added stress during pipeline activities, the alcohol program hopes to avoid some of the problems by being able to plan ahead. A suggestion was made to give local people addresses and contact names so that the Tok area can start its planning.

Discussion was held on the housing situation. A suggestion was made to meet with Glennallen on the impact problems that they experienced. The local housing situation here at present was discussed. It was brought out that we really do not have excess or "any" housing available. Interest was expressed for what, if any, plans that the old RCA housing might have.

Also, it was suggested that people who have private wells here should make application to the Department of Natural Resources for a permit for water rights and have it recorded, because anyone can come along and use that water source (such as for industrial use).

It was suggested that a rent review board be established in Tok. Also, it was brought out that the peak demand for housing will cover quite a short period of time.

The Assistance to the Elderly Program was reviewed. It is felt that the elderly will get a lot of the costs of the pipeline and very few of the benefits. The program will be doing an on-going assessment of needs, planning for the cost of living rise, and so on.

It was suggested that the Alyeska camp facilities be looked into for uses such as clinic, housing, fire protection facility - whatever.

A suggestion was made that we should define whom our people are for contacts for possible future contractual agreements or referrals to the various existing businesses, agencies, and organizations, since at present there is no local government.

Discussion was held concerning the closure of the Office of the Division of Family and Children in Tok in 1976. The services now include only fee agents with the exception of Eagle; this is not sufficient. It was suggested that the State of Alaska reopen the local office with a full-time eligibility worker who can also issue food stamps. The time frame involving food stamp application through complete procedure involves at least six weeks. Elderly people especially need immediate help rather than delay. A medical eligibility worker who could issue coupons should also be included. It was mentioned that the Salvation Army (Anchorage) is talking about the possibility of setting up a place in Tok.

The possibility of a permanent impact information center was discussed.

The Social Service Committee also endorsed the idea of a permanent task force to follow up on the forum and to become a point of contact for gas pipeline related issues and problems.

The task force could include representatives of the communities in the Upper Tanana, village corporations and other interested local groups, as well as state, federal and Northwest representatives for communication purposes.

The Committee also recommended that an impact information center by established in Tok during the coming summer which would be operated in a manner similar to that of the Fairbanks Impact Information Center during the oil line construction and further suggested that a task force could act as an advisory board to the center.

AFTER THE FORUM ...

Population Growth

Central to all discussions of potential gas pipeline impact is an assessment of expected population changes, in whole numbers, as well as locale.

Because Tok is central to the proposed effort, it is logical to assume that any significant population increase will center there. This will probably include transient and non-pipeline people, plus families and others involved in secondary aspects of pipeline work.

No adequate numbers can be forecast, but it may also be expected that because the overall life of the construction project is significantly less than the trans-Alaska pipeline system, and because the total number of workers is less, that the route communities should see less of a population influx in real numbers.

Some aspect of community out-migration should also be anticipated, with the accompanying change in community cultural factors.

Although not specifically addressed, the potential populations of communities such as Eagle or Chicken may increase with the incidence of out-migration by older residents of some of the road communities.

It should also be noted that population growth estimates for Fairbanks, in its pipeline impact planning, did not take into account the fact that in-migrants seeking pipeline jobs did not bring families with them. While housing, utilities and traffic reflected pressure of population growth, services, particularly the schools, did not reflect the same pressures, because the worker population was mainly transient.

Health and Social Services

Primary concerns expressed during the Forum centered on provision of adequate emergency medical care, on a scale equal to impact; expansion of mental health programs; balancing social service delivery with accountability by Northwest, the effected communities and the State of Alaska.

The overwhelming concensus of community participants was that existing levels of medical care are far below present needs, in both facility and personnel provisions. With the advent of pipeline construction the number of motor vehicle accidents is expected to increase, in addition to attendant types of medical emergencies. It was pointed out the present clinic facility is capable of handling only two persons at one time, and any major traffic or industrial accident would be impossible to deal with.

Existing ambulance service is provided by a single vehicle and three emergency medical technicians over a route extending from the Johnson River Crossing to the Canadian border, and up the Taylor Highway. The need for an additional vehicle is self-evident, as is an increase in available staff. (Nine additional EMTs are available now after a training course offered through the University of Alaska extension service in Tok, and the Alaska State Troopers indicated in a post-forum interview that an additional ambulance would soon be forthcoming.)

Area residents stated that they have had little continuing contact with the State Division of Emergency Medical Services, and that this lack of contact has hampered development in the Upper Tanana Region. It is expected that the communications gap will be reconciled in the near future, particularly since a resident of the region recently has been appointed to the Emergency Medical Services Advisory Board.

Health care in the surrounding villages was deemed adequate with the exception that only one public health nurse is expected to serve the entire region. Additionally, residents pointed out the high costs of evacuation transportation and the relative lack of authority given to village health aides in determining what constitutes a medical emergency. This latter issue is being dealt with through the Tanana Chiefs Health Authority and will probably not measurably affect subsequent pipeline impact.

Health and Social Services Committee Chairwoman Dottie Eshbaugh stressed the need for improved and expanded mental health programs, based in part on the trans-Alaska pipeline experience in Fairbanks; the expected increase in alcohol-related problems; and the creation of unrealistic expectations of wealth and employment by local people seeking to benefit from pipeline construction. (In effect, many residents will be subjected to forms of "culture shock" which can only be addressed through a rounded mental health counseling program.)

A proposal to locate a trained clinicial psychologist in the Tok area is being developed, but nothing has matured to date. It was pointed out that the psychologist for the Division of Mental Health located in Fairbanks and technically designated to serve Tok rarely visits the community. A request was sent requesting a resident psychologist for Tok.

It should be noted that Governor Jay Hammond expressed during the committee's deliberations the state's continuing concern over delivery of medical and mental health services, but said that appropriate revenue is needed to justify further capital outlays.

The community recently received an $85,000 grant to expand the existing clinic, but this may not be enough to provide for facilities and equipment. Further, no programs presently provide for funding of additional physicians assistants, mental health counselors or public health nurses.

During the forum, Northwest Pipeline officials were unable to state whether they expected to interface with the existing health care delivery systems, or would generate their own, largely because preplanning had not yet begun in this area. The company was only in the primary construction design phase.

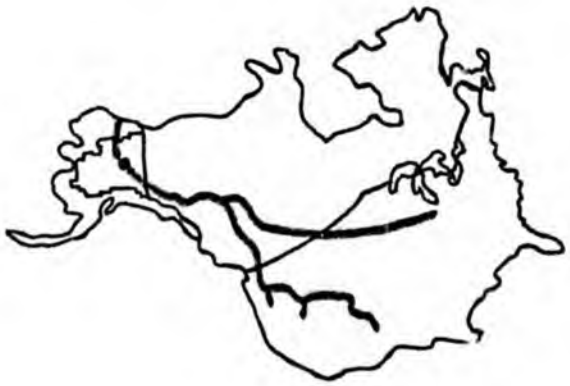
Northwest Pipeline Vice President Morris Thompson stated that highway village use of camp medical facilities would be taken into consideration, and a reciprocal use agreement could be considered if Northwest utilized any of the area's medical services.

Additional discussion was entered on the availability of housing, with the observation that there is no "excess" housing in any of the areas along the proposed pipeline route. Some local construction is anticipated - in fact one apartment complex already is under construction in Tok - but concensus appears that supply will lag behind demand for housing.

Further areas of social concern are programs to assist elderly residents to offset the negative effects of construction induced inflation. On a larger scale, the committee suggested that it was appropriate to begin the pre-planning approach to monitor cost of living increases, needs assessments, etc.

Closure of the office of the Division of Family and Children's Services, food stamp eligibility programs and related welfare and assistance programs were also discussed, with emphasis placed on establishing a "fast response" process to deal with the more pressing human needs. Since the forum, the Division of Family and Children's Services has re-funded a position for a child protection worker in Tok. This person also provides family counseling and referrals.

Although the primary discussions in this committee centered on problems in the Tok area, concerns and programs suggested affect all communities within the construction corridor and their committee hoped their discussions will improve services throughout the Upper Tanana.



ANALYSIS & SUMMARY

THE PLANNING PROCESS AND ACCESS TO DECISION AGENCIES

Underscoring all aspects of the Upper Tanana Regional Forum were the unspoken fears of forced governmental organization and the concerns of small communities remote from the decision making channels.

It would appear that the communities are fundamentally divided on their approaches to the governmental function, in part because they have existed in relative comfort, free from the incursions of regulatory bodies. This attitude expresses itself in emotive terms of self-sufficiency; disregard for non-regional ideas of development and/or growth; and the characteristic provincialism of "We don't give a damn how they do it (outside/up the road/over there)".

In the reality of trying to make desires known to the state, the pipeline company or other decision making agencies, the attitude is carried out through factions and interest groups vying to make their voice heard as the representative voice of the community. In post-forum interviews, members of the community who had access to government through some group or agency found they had little or no trouble reaching decision makers. Individuals who had no such channel, such as a village corporation, felt powerless in the decision making process. They felt they had no access to state or federal agencies, and the best that could be hoped for was to avoid being affected too much.

In contrast to the groups and individuals who expressed a sentiment of anti-government "meddling", there are those in the region who, while they agree with their neighbors on the value of frontier self-sufficiency, turn to grant agencies, government funding and other government avenues to provide services and some capital improvements.

In questioning residents on the options for some representative voice that would transcend the factions and speak for the region as a whole (rural, ruban, white, native, business, labor) there were many possible solutions, but no concensus. Alternatives varied from incorporation to town meetings; from a non-profit corporate structure to a third party ombudsman-like position established through the pipeline company.

There seemed to be agreement that there needed to be some means of communication with the state and the pipeline company, but little or no agreement on where it should come from. Perhaps this confusion on who or what should serve as spokesman for the region can be traced back to the fact that there are no clearly defined regional goals. Hence, interest groups or factions express their individual interests, which may or may not be the interests of their neighbors vis a vis the future growth and development of the region.

No clear picture of the potential future of the Upper Tanana Region can emerge from this intial forum, as the range of considerations has only just been addressed.

Clearly participants have expressed a need to initiate a planning process to anticipate the nature and type of change which is forthcoming, however, lack of concensus is forming this planning function seems to be traceable to the area's political differences.

MAJOR POLICY QUESTIONS
and
DRAFT RECOMMENDATIONS

Prepared by:
The Fairbanks Town and Village
Association, with Wordsmith's.

TWO MAJOR POLICY QUESTIONS

ONE:

Northwest Energy President John McMillan has asked the State of Alaska to consider investing one billion dollars of tax exempt bonding and one-half billion dollars in direct cash participation in the project.

The authors of these recommendations do not feel sufficiently qualified to make a recommendation on this fundamental policy question. Rather the individual residents of the Upper Tanana Region have much to gain or lose by the decision of the State of Alaska on McMillan's request. The issue is complex and any attempt to synthesize and summarize the current status of the project resks considerable misunderstanding in this kind of document. Therefore we will only list some recent events which should be of interest to residents of the Upper Tanana.

Recent Events:

Spring, 1978:
- Governor Hammond states that the Office of Pipeline Coordinator will be located in Fairbanks.

March, 1979:
- Governor Hammond names Avrum Gross, Bob LeResche, Charles Webber and Thomas K. Williams to study state investment in pipeline

March, 1979:
- Hammond orders State Pipeline Coordinator's Office opened in Fairbanks. "...early summer '79". Mo Matthews resigns. Charles Behlke named to replace Matthews.

March 1, 1979:
- Northwest opens state headquarters in Fairbanks

March 3, 1979:
- Canada's new Prime Minister reaffirms Canadian commitment to the project.

April 2, 1979:
- President Carter asks Congress to consider a limited reorganization plan which will establish the Office of the Federal Pipeline Inspector. Congressional approval expected in late June.

May 1979:
- Financing for continued operation of the state Pipeline Coordinator's Office, dropped earlier in the Legislative session, is restored.

May 1979:
- FERC requires that Northwest prepare and disseminate an "informational handbook" describing the project and, among other conditions, a toll free telephone line for use by affected landowners along the route.

May 15, 1979:
- Alaska Legislature creates and finances joint special gas pipeline interim committee with Rep. Charles Parr, Rep. Joe Hayes, Rep. C.V. Chatterton, Sen. Bill Sumner, Sen. Frank Ferguson, Rep. Bill Miles, Sen. Mike Colletta and Rep. Terry Gardiner as members.

June 1979:
- White House nominates John Rhett as federal inspector and creates, by executive order, an executive policy board to provide federal policy for the gasline.

June 19..:
- Department of Interior grants provisional approval of gasline route.

June 14, 1979:
- Northwest request federal approval for gasline route generally 60-80 feet from trans-Alaska pipeline pad.

July 1979:
- President Carter, speaking nationwide on energy crisis, pledges full support for an expedited federal approval of the gasline.

August 1979:
- The Alaska Economic Report states:

State investment in the Northwest gas pipeline may not be possible due to a stepped up federal momentum and the failure of the Alaska Legislature to act in the recent special session.

Non-participation on the state's part may represent:

(1) Freedom from a questionable investment burden;

(2) A lost opportunity for the state for a significant investment and to be an internal participant in the gas transportation policy.

(3) Lastly, non-participation may mean a lost opportunity by the state to stake-out and command significant key position in what may be North America's "energy corridor" -- the Alaska Highway.

September 1979:
- Fairbanks municipal and business leaders propose that FERC change the location of the gas conditioning plant from Prudhoe Bay to Interior Alaska. FERC member Matthew Holden states that because of President Carter's instructions that all regulatory processing affecting the gas pipeline be expedited there is little possibility that the decision can be changed.

Legislation to provide the financing sought by John McMillan has been introduced in the Legislature and will be considered during the interim.

Residents of the Upper Tanana Region should communicate their feelings on the legislation directly to their elected representatives in the legislature.

Those are:

Senator John Sackett, Galena
Pouch V
Juneau, Alaska 99811
465-4928 in Juneau
279-3343 in Anchorage
789-8001 in Ruby

Representative Pappy Moss, Big Delta
Pouch V
Juneau, Alaska 9981
465-4928 in Juneau
895-4385 in Big Delta

TWO:

The second major policy question has to do with current efforts by the federal government to establish a program to assist small communities facing massive national interest energy developments such as the Alcan gas pipeline. Legislation has been developed by Congress with the support of the White House to establish this assistance program. However, the legislation (S-1493 "The Inland Energy Development Impact Assistance" Bill) is going through extensive hearings and amendments in Congress, and its fate is uncertain. Because of the Association's earlier work relevant to the impact of the trans-Alaska oil pipeline construction we have been active in trying to develop a bill which would provide assistance based on local interpretations by local people of impact problems at the local level rather than through the state-federal task force approach contemplated in the original bill.

S.1493 would have placed federal impact assistance authority in the Economic Development Administration of the U.S. Department of Commerce. However the crush of legislative business created uncertainty in the progress of the bill. In order to assure consideration in this session of Congress, Senator Gary Hart of Colorado, an original sponsor and a prime mover of the impact assistance legislation, offered an amendment to Section 601 of the proposed energy act currently awaiting final action in the Senate Energy Committee, chaired by Senator "Scoop" Jackson of Washington.

The amendment, if adopted by Congress would amend 601 to broaden the interpretation of energy impact in order to create and finance an impact assistance program similar in concept to that embodied in S.1493, but administered by the Farmers Home Administration of the U.S. Department of Agriculture.

FTVAD has reviewed the Hart proposal and will recommend that the Alaska Congressional delegation co-sponsor and support the Hart bill with some suggested minor amendments based on the following considerations:

FTVAD has offered formal testimony on the original inland energy impact assistance bill. The testimony was inserted into the hearing record on the bill on May 10, 1978 - one month after the Tok Forum - by Senator Gravel. Essentially our testimony supported a federal impact assistance program which provided "front end" impact planning funds directly to established local organizations at the earliest possible moment. FTVAD opposed the imposition of a predesigned federal impact assistance program on local people and opposed assigning federal authority and thus total control of the timing, pacing and amount of impact assistance funds and programs solely to the Office of the Governor.

Our position is unchanged. In order to assure a bill which fully reflects that position FTVAD will suggest amendments which authorize the governor allow federal impact assistance to flow directly from the federal government to competent local organizations in the "impacted" areas.

Though the policies and actions of the governor will be critical to the success of any federal impact assistance program, the State of Alaska does not have such policies established with which to guide the Governor's actions. Worse the state does not have any clear authority and responsibility established which would lead to the creation of such policies and to the development of programs, legislation and financing necessary to implement them in the Interior of Alaska in anticipation of the gasline.

At the staff level the State of Alaska has demonstrated little initiative in dealing with the complex human problems which result from the social, economic and political impact of massive energy development projects.

Even with a priority commitment at the highest level of state government such deficiencies cannot be overcome in less than a year ... a year in which regulatory processing of the gasline is being expedited by order of the President, and precious irreplacable time for local and regional anticipatory planning is rapidly disappearing.

Given these facts, which become more urgent with each passing day, FTVAD believes an amendment to the Hart proposal which allows the governor - perhaps by executive order - to authorize federal impact assistance to flow directly to the areas affected is timely and necessary.

DRAFT RECOMMENDATIONS

1. HEALTH AND SOCIAL SERVICES

Establish a formal health services delivery program, in conjunction with the Tanana Chiefs Conference, to address medical emergencies; availability of disaster equipment and training; and initiate disaster preparedness training through the State Division of Emergency Medical Services.

Concurrently initiate discussions with Northwest Pipeline to address total package costs for joint use medical facilities.

Seek immediate funding to set up staff clinicians and social workers to deal with social and psychological problems. (Include those problems unique to the area, and those brought on by pipeline impact.)

2. LAND USE PLANNING AND AGRICULTURAL DEVELOPMENT

Land use planning should be accomplished by a locally based planning authority, and should incorporate a full inventory of available recreational and sport lands plus an evaluation of agricultural development plans for the entire region.

Concurrently this effort must incorporate local concerns for continuing subsistence land use, and provision for local control of non-resident hunters and sport fishermen.

3. EMPLOYMENT AND TRAINING PROGRAMS

Regional, local and private sector corporations should initiate discussions to assure some measure of resident hire during all phases of the pipeline construction effort. This may entail direct contact to statewide labor unions to discuss creation of a joint hiring hall in the Tok area; creation of uniform contracting, payment and dispatch procedures with the prime contractor; and generation of formal agreements with the Alaska Department of Labor and the University of Alaska to establish multiple level training and recertification centers for employees selected out of the Tok area. (See also recommendations of the final report of the Rural Impact Information Program.)

4. HOUSING DEVELOPMENT

The area will need to conduct a vacancy survey of existing housing, plus an areawide evaluation of anticipated new housing construction to include trailer parks, lodges and possible multiple-family dwellings.

5. TRANSPORTATION

In addition to the surface transportation needs addressed in the body of this report, all communities will need to examine their air transport needs to define existing and anticipated costs, regularity of service, and means of expanding existing services.

6. COMMUNITY FACILITIES

The Fairbanks Town and Village Association, through work conducted in its Rural Capital Improvements Program during 1978, found that communities in the Upper Tanana Region have expressed needs for a variety of basic public facilities. Many of these facilities were discussed at the Forum.

Because the project will begin as a massive construction project it is essential that, in the earliest stages of design, needed community facilities are recognized and understood by the pipeline builders. It will be essential that all major parties in the project, both public and private, be alert to opportunities to construct support facilities for the project which can be utilized by communities after construction.

A very significant missed opportunity on the trans-Alaska pipeline was the failure by Alyeska to design and construct its pump stations for the purpose of capture and utilization of waste heat. Waste heat from the pump stations is on the order of a million btu's a minute ... probably enough to heat 50 homes year round or a 20-30 acre greenhouse plus 20-30 acres of garden.

This kind of oversight in design should never be repeated.

7. STATE AND LOCAL GOVERNMENT

The communities in question will need to conduct an internal evaluation of expectation and desires for future governmental services. Existing state programs may prove inadequate to meet local needs, and in the absence of an accepted local or sub-regional governing structure the area may be at a con-

siderable disadvantage in dealing with state and federal agencies and the project sponsors. Such internal evaluation should be conducted by residents of the region with staff assistance and financing by appropriate agencies of state and federal government, and should investigate mechanisms for local administration of state and federal programs through quasi-public grant agencies and should be thoroughly explored as should service district concepts, shared responsibility structures (i.e., service districts, etc.).

Central to the question of future demands on governmental bodies should be straightforward public debates on the potential for organizing as a third class or home rule borough.

8. STATE OF ALASKA REPONSIBILITY

The State of Alaska should open an inpact offfice and finance an impact infomation and coordination office in or near Tok. The responsibilities of this office would be to:

a. Advocate for the Upper Tanana Region in dealings with the state, federal pipeline officials, pipeline company management.

b. Provide direct liaison from the Upper Tanana Region to the Office of the Governor, the federal pipeline coordinator, and Northwest Energy.

c. Provide information to residents and seek resolution of issues and problems discussed at the Forum, outlined in these report recommendations and/or arising during the period of pipeline construction impact.

d. Provide a central contact for residents of the region for all communications with state agencies regarding pipeline construction.

It is recommended further that this office operate under the direction of a local advisory committee made up of representatives from the communities in the Upper Tanana Region; that this advisory committee meet monthly, and that the meetings be provided for in a budget for the office.

A suggested first year budget for the committee and the office is $150,000.

9. U.S. FEDERAL RESPONSIBILITY

The U.S. federal government should move quickly to pass legislation and provide financing for an impact assistance program geared toward the specific requirements of small communities which will be affected by pipeline construction.

10. THE RELATIONSHIP BETWEEN THE SMALL COMMUNITIES OF ALASKA AND THE UPPER TANANA REGION AND COMMUNITIES IN CANADA WHICH WILL BE AFFECTED BY THE GAS PIPELINE

The similarities in the problems of impact which will affect the residents of these small communities will far outweigh the differences which can be attributed to their national origins. In the experience of the Fairbanks Town and Village Association the Canadians have, in some important respects, progressed much further in the resolution of local impact problems than either Alaska or the U.S. federal government.

As a follow-up to the extensive participation in the Tok Forum by Canadians, both the state and the U S. federal government should begin providing continuing opportunities and financial assistance for travel and discussions between residents of the small Canadian and small Alaskan communities which will be affected by the Alcan gas pipeline project.

RECOMMENDATIONS TO THE STATE FOR PREPARING FOR FUTURE "IMPACT" SITUATIONS IN RURAL AREAS

From the "Final Report of the Rural Impact Information Program", published June 1977 by the Fairbanks Town and Village Association For Development, Incorporated

Recommendation 1:

Data on conditions in rural communities should be gathered and published on a regular basis, not just during impact periods. Adequate planning for impact situations is not possible without an understanding of existing conditions. A meaningful analysis of impact is impossible without baseline data with which to make comparisons.

Recommendation 2:

State record-keeping should allow retrieval of information relating specifically to rural areas. Most state departments currently divide the state into regions containing at least one urban area, and regional reports make it impossible to differentiate between statistics for rural and urban areas.

Recommendation 3:

State departments should monitor the demands made upon their services as a result of impact and should evaluate the adequacy of their response to those demands. The monitoring effort should continue throughout the impact period and should not be limited to providing justification for increased budgets.

Recommendation 4:

Impact assistance in the form of grants or loans should be provided to communities early enough to allow for adequate planning and preparation. Funding should be continued throughout the impact period so that an evaluation process can be maintained and the accuracy of projected impacts can be confirmed or denied.

Recommendation 5:

Increase in population should not be the only criterion for determining a community's need for impact assistance. Some communities that do not experience population growth nonetheless experience indirect impacts such as loss of valuable manpower. Assistance to these communities might take the form of training of additional members of the community in vital skills so that the loss of one resident does not endanger the delivery of a community service.

Recommendation 6:

Planning for vocational training programs should be based upon a manpower skill survey of the resident population and an accurate assessment of manpower needs on the project. Training should begin early enough to allow completion of a course before actual work on the project begins, and the skills taught should be transferable to other jobs.

Recommendation 7:

A special effort should be made to provide rural communities with information on jobs and business opportunities resulting from the new development. Of particular importance are procedural manuals for joining unions and obtaining training and employment assistance.

Recommendation 8:

Employment and training assistance programs should be coordinated to avoid duplication of effort and to make maximum use of existing services and facilities.

Recommendation 9:

State regulated services such as transportation and communications should be monitored to ensure that services to rural areas are not curtailed because of new commitments to large industrial development projects.

Following is a summary of 58 questionnaires returned after the Upper Tanana Regional Forum.

EVALUATION

What discussion groups did you attend?

No tally was taken of this portion of the survey.

THE DISCUSSION GROUPS

1. Did you have a chance to talk and express your opinion?

YES	NO	NO RESPONSE	YES/ NO
56	2		

2. Did you learn anything new in the discussion group?

YES	NO	NO RESPONSE	YES/ NO
53	3	2	

3. Was your discussion group leader fair to all points of view?

YES	NO	NO RESPONSE	YES/ NO
52	2	3	1

4. Do you agree with the final report of your discussion group?

YES	NO	NO RESPONSE	YES/ NO
34	5	18	1

5. Were the State, Federal, Canadian, and Northwest Alaskan Pipeline officials helpful? Did they have answers for questions raised by people in the discussion groups?

YES	NO	NO RESPONSE	YES/ NO
41	5	6	6

THE GENERAL ASSEMBLY

1. Did you meet and talk to new people at the forum?

YES	NO	NO RESPONSE	YES/ NO
53		5	

2. What was good about the forum?

Exchange of views - future contacts established

A good start - what's the followup?

Everyone very helpful.

A beautiful opportunity to meet and talk with various people on areas of concern to them.

Meet new people and learn more experience and meet lots people there.

All of it.

Good about the forum:

1. Good physical organization.
2. Excellent situations for meeting wide range of people in many fields of expertise, including locals.
3. Tok community residents put a good deal of energy and thought into questions on impact prior to meetings.

I thought the forum provided for an excellent exchange of information between the local people and state/federal/Northwest Alaska Pipeline Company representatives.

The opportunity to discuss problems with the people who will be involved with and responsible for the impact.

The fact that it was done and something positive started.

It seemed to me the ordinary townspeople both appreciated the opportunity to express their opinions and views to their government leaders and the pipeline officials. I also sensed they took pride in themselves that they could bring off a public discussion of this kind. Also the involvement of the Native people was heartening.

Chance to exchange ideas!

Diversity of topics and people. Good training for people to do another foru

It got Tok and highway people talking and thinking seriously about what is going to happen to them. Healthy situation when a community has a planning period.

Good exchange.

Discussion information interchange. Excellent facility for forum (school). Atmosphere for discussion excellent. Everybody was in the right spirits (psychological not liquid). Resulting information interchange excellent.

Everything of vital interest was pretty well covered.

Presented true needs of community that might not otherwise ever be presented. Brought issues before Northwest that were vital for them to know - especially that pipeline was placed in a poor position.

Personally, it allowed me to meet new people and learn more about how Alaskans are reacting to the gas pipeline. Generally, it was a positive forum for communicating ideas and examining the future. Much, however, depends on the final report and what is done with it.

New communications with local and statewide people (getting to know people!).

It was a great opportunity to swap ideas concerning the pipeline, and to meet new people.

Very good. Very informative and enlightening. Interesting, giving a person an understanding of what's involved.

The effort by a community to plan for future.

Should have heightened awareness of potential impact.

1. The packets and the information they contained:

   a. They were thorough and helpful - good to have info on the meeting, on Tok, on the area - maps etc. Good to explain the issues and questions relating to the issues and the factual data. This was obviously lots of work - a job well done.

   b. Room reservations - care and feeding of attendees was well done. Thank you.

2. Having the Governor and so many commissioners so that people could be heard directly - also there were a great many sensitive, thoughtful, knowledgeable state agency people present - who really did want to listen to Upper Tanana residents! Creating an atmosphere to draw these people was what made the forum a success.

3. Leaving plenty of "free" time to attendees to talk amongst themselves and get a feeling for Tok.

This forum was organized in such a way that individuals could express their thoughts and needs; however, within the group sessions there was also another opinion, often, that permitted greater understanding of the situation. The leaders of the small groups possibly could have had a brief training session in structure of such a session; however, the two groups that I attended either had all variables present in the room or tended to bring in the necessary individuals.

Liked the fact both government and NW gas pipeline representives were present.

I feel the forum raised many important issues, but the actual accomplishment of the committee session was very vague, or nothing actually was talked about on Sunday.

Chance for people to meet and discuss many issues - not just pipeline.

Gave some crucial answers.

Meeting people who had information we wanted - or knew people who had.

Local participation.

I meet with people and talking about concerns, lots of things.

Got the people thinking.

The concept of formalizing a forum of this nature is in itself highly commendable, and hopefully will set a precedent of public input and private/interagency interface that will be maintained throughout this gasline endeavor. It certainly deepened my insights into certain local concerns by adding local perspectives I had not previously considered.

Met a lot of people and had opportunity to sit and discuss things informally. It was a good opportunity for many state agencies and interested citizens to come together and talk to each other.

Well organized, thorough, good representation from Canada, good representation by agencies, important to have had politicians present and held accountable. Presence of Mim Dixon was good, but useful only if experience is used to get impact projections as fast as possible from Northwest's earliest possible labor projections.

I feel that alot of good came out of the forum It gave all interested people a chance to ask questions to the various guests that will be involved in the gasline. The forum was a good chance for many people (local) to make contact with people of state, federal, N.W., etc.

The local people did let the guests know what their concerns were. And how they thought they would be affected, service-wise as well as community-wise.

3. What was wrong with the forum?

No real solutions to expressed concerns were found.

Not enough meat.

I sense too much expectancy on local part to have gasline solve some local economic problems.

Need more active in town. UTRCA, State Trooper, Public Safety and Fire Protection and good leadership.

Speaker system of low quality.

Wrong with the forum:

1. Poor deployment of resource people. Especially pipeline officials.
2. Objectives of workshops and forum not clear to participants.
3. Not clear what happens next.
4. Much of the forum was oriented too much to Tok and very little devoted to the regional towns and villages needs.

The lack of final answers to some problems and questions. Hopefully more information will become available to us as a result of this forum.

Acoustics in auditorium were quite poor. It was impossible to understand many of the speakers.

Nothing.

I thought the committee chairpersons could have been more dynamic and forceful in their presentations especially in the summaries.

Uneveness of authority levels among agency representatives. Two-day format might have been unnecessary if organization and preparedness had been a little tighter. Land and Agriculture committee had no feedback opportunity to assure representativeness of final report. This committee was most congenially and democratically run, but was (perhaps unavoidably) vulnerable to insertion of non-central matters. It is hard to see why "Land" and "Agriculture" were considered as of parallel importance, as the group's title suggests, especially in the absence of an agrarian social segment, and in the possible absence of an appropriate resource base.

Perhaps more local people could have participated considering the numbers and quality of guests and forum participants (state, federal, Canadian, etc.)

Not enough hard facts from NWAP available at this early date.

Lack of clear objectives for each committee.
Poor deployment of resource people.
Second day was not necessary under original agenda, as it turned out.

Bad acoustics except for last day.

Forum groups tended to be too large. Perhaps could have been more of an emphasis on making specific recommendations. Specific commitments to local concerns should have been sought from the pipeline company, i.e., re-routing of pipeline, compensation for trappers.

Generally, it was too loose.

Nothing.

Saturday session a bit long. Discussion groups and other events somewhat loosely organized. Acoustics in the gym poor - almost impossible to hear summarizations.

No direction to questions asked. Although categorized it sounded too general.

1. Though it was no one' fault and I have no ideas on how to improve it - there were not enough local residents speaking out - the public servants came to listen but not enough was said to them. Perhaps it got said in other ways than in the forum.

2. Some of the sessions could have been slightly more structured - but this is hard to do - there were lots of legal/technical questions that agency people did not answer thoroughly.

3. Some of the rooms did not lend themselves to discussions - the chemistry room was a terrible place to discuss anything.

Very little wrong - probably best meeting of this type I've attended; could have had more assembly structure.

Not enough local (esp. Native) vocal input.

Bad mike, P.A. system in main room difficult to hear.

Nothing wrong with it.

Needed more participation from areas outside of Tok.

Not enough input from local people.

Acoustics' accommodations were very bad. Much of the general assembly presentations were inaudible, strongly contributing to the paucity of general participation. There was some public misconceptions concerning feasible objectives of this forum at this point. There was some bitching about lack of concrete answers available to public comment by the relevant agencies. Concrete decisions are not available at this time, and attempts to provide them would be premature. Decisions have not been made or finalized and the goal of this forum was to allow opportunity for front-end public participation in the decision making, not to dictate what the decision/policies are.

The group workshops lacked direction and were not led to any goal or objective. Also the people who should have been here to answer questions did not attend. I think the workshop should have been structured better.

Discussion groups needed more direction and guidance as to level of detail to be discussed so recommendations for action could be made stronger. Need follow-up. Need more Native voice. Need better P.A. system. Need more emphasis on actual impacts (from out of region).

4. What issues were not discussed that should have been, in your opinion?

Where do we go from here? - was not addressed in any detail.

Potential ice fog problems from trucks, etc.

Tok need good leadership council; pride and cooperate together, that's my opinion.

What is to be done next (followup).

In the Rural and Native Concerns group it appeared to me there was an excessive amount of time spent on fish and game regulations and subsistence hunting. But on second thought this also indicated what is upper-most and important in the mind of the Native.

There was little opportunity to discuss what kind of land use planning was wanted by local people, and several people appeared to want planning in order to facilitate pre-conceived land-use developments, suggesting that the community as a whole either does not really want land-use planning, or wants it for the wrong reasons. Further discussion would help allow people to press for the planning approach which suits them, and allow them to discern between self-serving and people-serving approaches.

I think we heard them all.

I cannot identify any additional issue subjects.

What should be done in Tok to get a coherent viewpoint.

Environmental impact - fish and wildlife.

We should have had some input on what we could have done to answer some of these questions.

More about what could have been learned from Alyeska mistakes - maybe I just didn't get to enough workshops

Telephone - RCA

More discussion on local government - pros and cons.

Not enough concern directed to long-term, post-construction impact.

Immediate tasks ahead for local people and groups. What form should information be submitted in to be most effective? Need an action mechanism for proposing specific government action and industry commitment.

OTHER COMMENTS:

Our group felt we had just scratched the surface and were pleased to be talking about things we never had a chance to.

I DON'T want an impact committee as suggested by Bob Lohr.

I believe there was by far more good than wrong with the forum. In fact the only wrongs I can think of were trifle and caused from or because this is the first time something of this sort has been done, at least in our area.

Many straight answers were asked for and answers received fromt those involved. Suggestions were given and received. The community was well represented. Too often a "very select few" are contacted or aware of issues. And "too" often these self selected have acted or not acted, usually in their own interest or strong opinion. Much work and effort was put forth by all. As a local I'll bet those people went away with bent and bruised ears. And from the looks of local bar business probably hangovers.

Extremely well organized and represented. Many factors - outline of questions for committees was very good and well followed. Pertinent subjects were covered. Northwest officials very cooperative - Tok people very hospitable. Meetings on Sunday unnecessary - could have been accomplished in one day.

The forum raised many points to be covered and questions to be answered by Northwest.

Most areas were covered.

The only negative part of the forum was the impossibility to attend all committee meetings.

Problems:

1. Some workshops too large.
2. Topics too fragmented.
3. Too much focus on pipeline. Too little on more general planning that would have looked at p.l. as one of several things that will go on around here during next decade.
4. Native concerns, which seem very large and important, not given enough attention - e.g., lumped in with "Rural."
5. Perhaps not enough background on what happened to communities as a result of Alyeska.

But a good and useful forum and well worth attending.

I enjoyed attending and believe the forum was very informative in many ways. I would like to see a task force organized to carry on and keep ahead or informed on all our concerns.

The forum was a delightful rewarding experience. The people and organizations responsible deserve a lot of credit.

It was a revelation to see people of opposing factions sit down together and express opinions and concerns. Maybe there's hope for us yet.

Basically very good thing for the community, I think.

The situation of Native Alaskan participation will have to be dealt with in a more equitable manner in the future. With a due respect for Tok and its citizens, the area has more to it than the one community.

The rural peoples not only must be allowed, but must be positively encouraged, to speak up in defense of their own interests. It is no longer sufficient for the Indian people to sit silent, only to go away with the same frustrations.

Everything was fine.

Not enough local emphasis on the real situation involving controls, legal entities where state monies be distributed. Or in other words, although many good ideas and concepts were discussed, many people still believe that they can exert meaningful power and authority without troubling themselves in becoming an organized municipality or another form of government such as a borough. I think that the people here be enlighted or educated to the fact of its obligations should they become legal recipients of monies on a continuing basis from the state and federal governments. Realizing that the majority of people in the area do not desire organized government in the usual forms it should have been clearly brought out in all of the committees that in many categories, this may be an absolute necessity.

I believe relying on distribution of monies and general powers through organized Native associations is not enough.

If there is to a pipeline impact, then the area will almost practically be required to be organized to deal with it.

I heard Governor Hammond speak but he didn't say anything about Native concerns or didn't say anything about Native people in our region.

I think that more turnout from the Tok area should have been in order.

Where the pipeline is going to lay outside of Tok.

I think that the Northwest Alaska Pipeline Co. officials were not ready to answer a lot of the questions that were asked of them. I strongly feel that Tok needs a pipeline impact office.

I understand from talking to other people that some of the committees were not well organized and left many people unsatisfied.

I did learn a lot, met alot of nice people and was thankful for the experience.

I would like to see some kind of follow-up and completion of ideas, suggestions and opinions, I don't feel an impact office in Tok is a good idea at this time. I think people need to think about it and later decide the best route to pursue.

The following is an analysis of data gathered from 71 questionnaires returned in response to a survey sponsored by the Tok Business and Professional Womens' Club.

UPPER TANANA REGIONAL WOMEN'S QUESTIONNAIRE

Tok, Tanacross, Dot Lake, Healy Lake, Mentasta, Northway, Tetlin, Chicken, Boundary, Eagle, and Highways

4. Number of children in school:

# IN SCHOOL	RESPONSE
0	28
1	17
2	6
3	8
4	4
5	2

5. Do you feel a day care center is needed in your community?

YES	NO
48	22

6. Would you be willing to donate some time to the center?

YES	NO
25	39

7. Do you have any job training experience?

YES	NO
57	14

8. What skills can you offer:

Child Care	6	Waitress	6
Office	7	Cook	7
Nursing	5	Secretary	4
Teacher	3	Sewing	3
Clerk/Typist	-	Food Service	2
Pre-school	2	Social Work	2
Crafts	2	Music	1
Cleaning	1	Cashier	1
Baker	1	Manage Athletics	1
Native Crafts	1	Clerk	1
Fine Arts	1	Lab Technician	1
Library	1	Dental Assistant	1
Checker	1	Health Aide	1
Maid	1	Bookkeeper	1
Restaurant	1	Storekeeper	1
Lodge Work	1	Many	2
Health Education	1	None	2
Newspaper Editor/ Reporter	1		

9. If trained, which of the following occupations would you choose:

Sewing	15	Engine Repair	1
Teaching	14	Mechanics	2
Counseling	15	Office Machines	9
Child Care	12	Accounting	10
Legal Services	5	Carpentry	1
Cottage Work	7	Athletics	1
Nurse	9	Secretary	17
Cook	7	Lumberjack	1
Waitress	4		

Others
- Commercial Art
- Ceramics
- Art
- Music Teacher

10. Would you like to see a job training program in your community:

YES	NO
63	8

11. Would you work in a craftshop or workshop?

YES	NO
46	21

12. Would you consider working out of you home in Cottage Industries?

YES	NO
35	29

13. How many hours a week would you prefer to work?

40 hours	20
30 hours	6
20 hours	9
4-80 hours	16

14. Income:

$ - $ 5,000	10
5,001 - 10,000	6
10,001 - 15,000	6
15,001 - 20,000	5
20,001 - 25,000	4
25,001 - 30,000	4
30,001 - 35,000	0
35,001 & above	4

15. Do you need more legal services?

YES	NO
35	29

16. Would you like to see more financial services?

YES	NO
41	25

17. Would you like o see more health services?

YES	NO
58	14

18. Should there be an SBA (Small Business Administration) office in your area?

YES	NO
44	23

19. You would like to see which of the following fulltime professionals in your area:

Doctor	50	Optometrist	20
Midwife	10	Pediatrician	30
Counselor	30	None of the Above	5
Dentist	39		

Others:

Lawyer	3	Psychologist	3
Insurance	1	Veterinarian	3
Beautician	1	Hospital	1
Legal Service	1		

20. How many months in a year do you work?

0 months	5
1 to 3 months	7
4 to 6 months	3
7 to 9 months	5
10 to 12 months	36

21. Do you belong to any labor unions?

YES	NO
2	67

22. Would you like to see expanded road and air services?

YES	NO
51	36

23. You would like your community's economic and social growth in the next ten years to be:

Rapid	4
Average	36
Slow	20
Zero	10

24. Do you work and live in the same community?

YES	NO
60	8

25. What community is nearest your home?

Tok	39
Dot Lake	6
Tanacross	5
Eagle	4
Boundary	2
Chistochina	1
Mentasta	1

26. What is the highest grade you completed?

High School:		College:	
6th	3	13	6
8th	4	14	5
9th	2	15	3
10th	1	16	5
11th	2	16+	4
12th	34	Vocational Education	2

27. Would you like to see some womens' athletic programs?

YES	NO
54	14

28. What would you like to do in your spare time?

Sew	10	Read	5
Crafts	4	Sleep	3
Paint	3	Club Work	2
Ski	2	Art	3
Outdoors	2	Cook	2
Swim	2	Trap	2
Rest	2	Run Horseback Field Trips	1

Bowl	1	My own thing	1
Collect Artifacts	1	Beadwork	1
Hunt	1	Visit	1
Show Dogs	1	Picnic	1
Garden	1	Play with children	1
Embroider	1	Dance	1
Fly	1	4-H Club Work	1
Draw	1	Music	1
Knit	1	What spare time?	1
Travel	1		
Everything	1		

29. With gasline impact and the great influx of people into your area, would you like to see more law enforcement?

YES	NO
52	15

30. Does the idea of a local union office appeal to you?

YES	NO
35	31

31. Does your community need more insurance services?

YES	NO
45	21

32. Do you see a need for any of the following legal services:

Child and Spouse Abuse	20
Child support and alimony	14
Counseling	24
Consumer Protection (Agency)	29

33. Would you like a womens' credit union office?

YES	NO
32	34

34. Do you want more involvement in the arts (music, painting, tapestries, etc.)?

YES	NO
54	16

35. Do you think that more women should serve in public office?

YES	NO
47	18

36. If there is a question in your mind that we have not addressed in this questionnaire, please write it down and answer it to your heart's desire.

In rural Alaska their are many housewives who could use a few dollars extra - spare some time in doing piecework, hand work - either at home or a few hours a day in a little warehouse, shop, manufactory, etc. Done on a region-wide basis supplies could be purchased in quantity and finished product sold by a regional marketing office. This plan would help households financially and greatly brighten the lives of women at home, especially during long winter months.

I would like to see some way to organize service agencies and manpower. Perhaps a local government is the best way to do this.

Question 34 answers No. 28 for me thank you for your consideration for having asked the community.

We need a CPA (Consumer Protection Agency) because we are tired of the big Tok rip-off in all goods and services. If not number one, they are a close second as being the highest in cost of food throughout the whole state (Dec. issue Alaska Magazine).

I don't look forward to more growth in the area. Populati' has already tripled since I moved here three years ago. What I would like to see -and I realize it is at cross purposes with no growth - is to have land made available so that people could live without worrying about hassles with bureaucracy - not this 40-160 acre deal, but something better than mining claims for those of us who don't wish to mine.

Will the Town and Village Assoc. sponsor or continue cooperation with local people throughout impact. Will same local leadership continue giving direction or guidance? Its been great! Congratulations and thanks!

BPW should advocate better local roads, we are not getting it from Juneau. We need better housing for the lowly taxpayer, who at present is certainly the minority.

If people desire all these extras, they should live in Fairbanks or Anchorage where they are already offered

Natives from the villages should get jobs on the pipeline also women.

Loose dog control. Protective signs for children and dogs crossing highway. Setting aside an area for a park for the town. Roadside stands allowed somewhere in Tok in summer to sell own handmade articles or produce.

A planning committee to guide the beautifying of our city. Preserving of trees, allowing for parks, fountains and memorial statuary. Also we should beautify our cemetery, family plots, etc. Business district and residential areas. Loose dog control. Allowing proper signs for businesses. Perserve our individuality.

I think the local clubs function very well and with an addition of people will flourish. I don't think Tok needs any more give-away programs which benefit only a few. If people wish to be more involved, the opportunity is already here. Government sponsored programs in Tok have gone overboard and we don't need any more.

People who fill this out should mean what they say. Especially if there is job open.

I feel Tok needs many services, but I don't believe these services should be funded by the government. We need to get away from government subsidizing.

As we grow I'm sure other matters will appear to our needs.

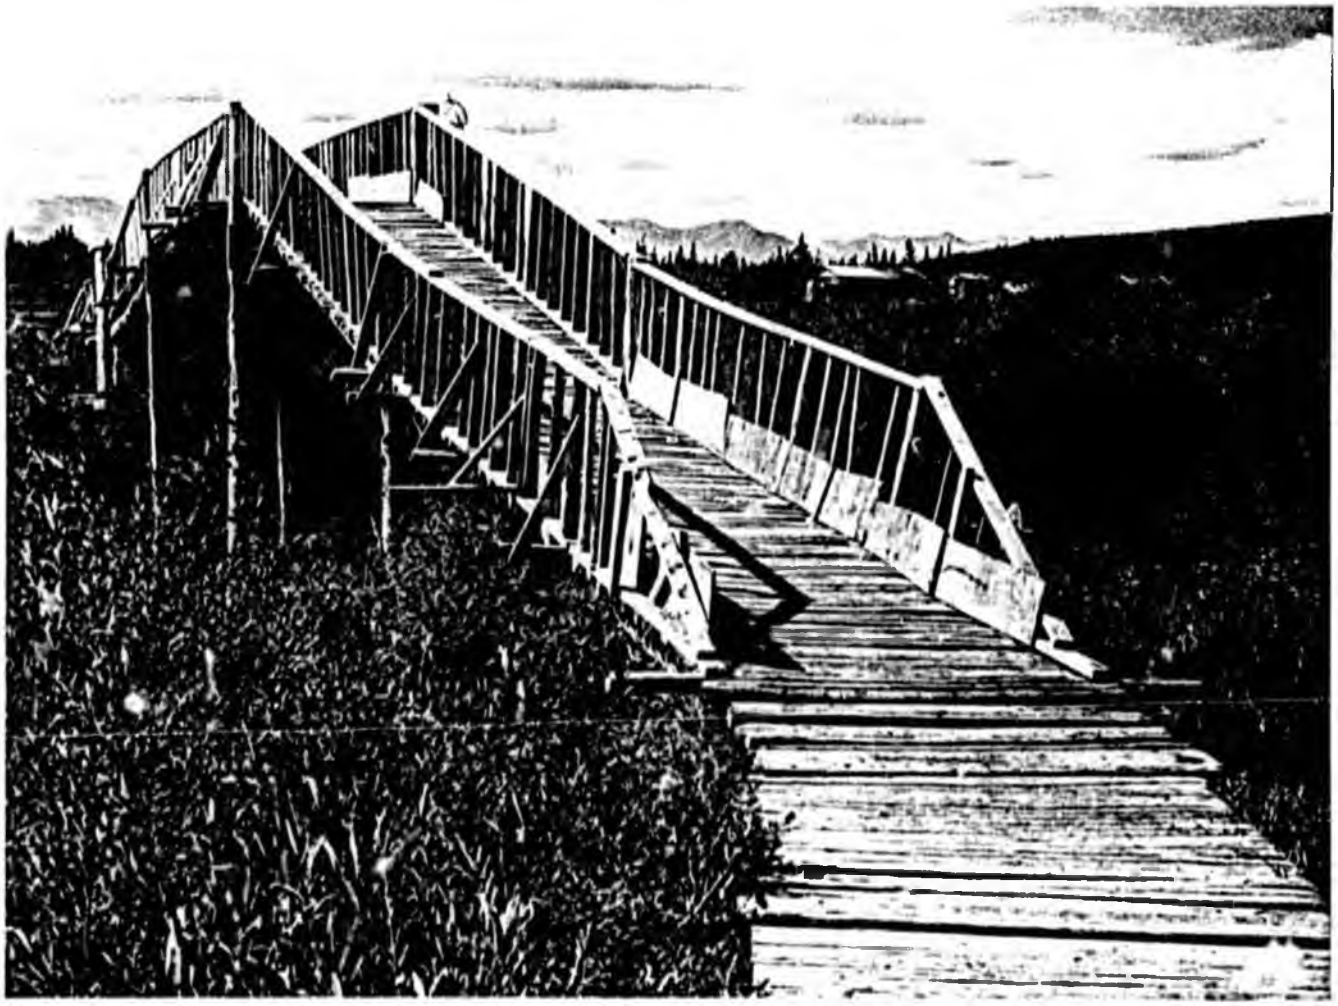
Would like to see credit union office for everyone (not just women).

We don't need more regulations and government. If women would worry more about their children and families we won't need more social services.

The projects which you have in mind: are they to the benefit of all, to employ unqualified people, personal friends and so on.

I would only like to see law enforcement expanded if needed during pipeline impact. Our law enforcement agency is more than adequate. I am not in favor of any more government agencies in Tok. I am not in favor of a local government of any kind!!!

This questionnaire does not appear to be designed for persons from larger cities and therefore makes it difficult to answer your questions since we already have many of these services.



Foster gas ... FROM WASHINGTON

NO. 1244 ... for week ended January 17, 1980

FERC Conditionally Approves Construction of Portion of Western Leg of ANGTS

On 1/11/80 the FERC approved construction of the first 160 miles of the Western Leg segment of the Alaska Natural Gas Transportation System between Kingsgate, British Columbia and Stanfield, Oregon, just below the Washington-Oregon border. At the same time, the Commission decided that it would issue separate decisions with respect to the remainder of the Western Leg and the Eastern Leg segments now consolidated in the Northwest Alaskan Pipeline Co. proceeding (CP78-123 et al.). The Commission decided to approve early construction of the initial 160 miles of the Western Leg in order to, among other things, facilitiate financing for the remainder of the project and spread the demand for labor and capital over a longer period of time, thus lessening their costs.

Background

On 6/7/78 the FERC conditionally authorized Northwest Alaskan to import a total of 1.04 Bcf of Canadian gas from Pan-Alberta Gas Ltd. over an initial contract term of six years, subject to extension for up to six additional years (subsequently extended to a primary term of 12 years) at the border price established under Canadian law. The import total includes 800,000 Mcf/d to be received at Monchy, Saskatchewan (for the Eastern Leg) and 240,000 Mcf/d to be received at Kingsgate (for the Western Leg). Subsequently, two sets of applications relating to the Western and Eastern Leg segments were filed in regard to the "prebuilding" of the project. Specifically, Northwest Alaskan (CP79-59) applied to sell up to 240,000 Mcf/d of Alberta gas to Pacific Interstate Transmission Co. for ultimate delivery (less fuel and line loss) to markets in Southern California. Related applications were filed by Pacific Gas Transmission Co. (CP79-60), Northwest Pipeline Corp. (CP79-56), El Paso Natural Gas Co. (CP79-57) and Pacific Interstate (CP79-58) to accomplish delivery of this gas from the international boundary near Kingsgate to the Arizona-California border. Subsequently, applications were filed for the Eastern Leg from Monchy to Dwight, Illinois.

Thereafter, the Commission consolidated all of the applications and divided the proceeding into three phases. Phase I was designed to examine the relationship between the prebuild project and implementation of the ANGTS; Phase II to examin generally the merits of the prebuild project; and Phase III to evaluate proposals to import Canadian gas which may be competitive with the prebuild proposal. Phase II was subsequently divided again for separate consideration of the Western and Eastern Legs. The initial decision procedure was then waived for each of the phases.

Initial briefs were filed with respect to the Western Leg by various parties. The FERC Staff and the California Public Utilities Commission opposed prebuilding only a portion of the Western Leg to Stanfield, Oregon so as to transport primarily the Pan-Alberta volumes. Instead, they preferred constructing the entire Western Leg to Antioch, California as contemplated in the President's Decision approving the Alcan-Foothills ANGTS (which suggested that prebuilding of certain ANGTS facilities might be appropriate). The entire Western Leg project, as approved by the President, would involve construction of 341 miles of 36-inch pipeline looping in the PGT system from Kingsgate to Malin, Oregon and some 143 miles of 36-inch pipeline looping on the PG&E system between Malin and Antioch. South of Antioch up to 104 miles of 36-inch pipeline looping on the PG&E system will be required. However, the only ANGTS facilities involved in the sponsors' proposal, on the other hand, would be the initial 160 miles of 36-inch looping along the PGT system from Kingsgate to Stanfield, Oregon. After that, the sponsors' proposal deviates from the Western Leg route designated in the President's Decision. Specifically,

the system of Northwest Pipeline Corp. would be augmented by installation of 350 miles of pipeline looping from Stanfield to Burley, Idaho, and certain segments of El Paso's San Juan Triangle facilities would be augmented.

The Staff emphasized that only 16% of the Western Leg of the ANGTS would be prebuild under the sponsors' proposal. The majority of the facilities proposed and costs therefor would involve substantial augmentation of non-ANGTS facilities of Northwest and El Paso and would not be used to transport the anticipated volumes of Alaskan gas. The remaining 84% of the Western Leg ANGTS would be required to be built to transport Alaskan gas. Staff and the California PUC urged that the sponsors' proposal be rejected and that construction be exclusively along the Western Leg ANGTS designated in the President's Decision. This, Staff argued, would be more economical; provide greater additional capacity at a lesser cost to the California consumer; and would provide additional benefits of more gas from other Canadian sources, while minimizing environmental effects. The California PUC stressed that the project's proposal "could saddle the ratepayers with a depreciation life as short as six years with no possibility of revision after Alaskan gas begins to flow." Moreover, California PUC added, it involves unnecessary facilities and could actually cause displacement from California of less expensive gas. 1/

The Staff and California PUC also argued that any export permit issued by the NEB for less than the volume proposed to be imported would bring the project "into question." The Staff stressed that the Western Leg proposal is "critically dependent" on the NEB granting a license to export 240,000 Mcf/d for a firm 12 years. "Any reduction in either the daily volumes or the term of the license vitally affects the economics of the sponsors' proposals and would require reopening the record should the sponsors continue to seek Commission approval of their proposed facilities." The California PUC urged the Commission to determine that the Canadian export permits would be sufficient before any prebuilding can commence.

Subsequently, the NEB authorized new exports of gas to the U.S. totalling 3.75 Tcf through 12/31/87. The NEB approved the full amount of exports applied for by 10 companies in the first five years (1980-1984), but approved lesser amounts through 1987. As a result, the NEB approved exports of 1.8 Bcf by Pan-Alberta instead of the total of 4.9 Bcf as sought. (See REPORT NOS. 1209, pp19-21; 1233, pp3-4; 1238, pp1-2; 1239, pp8-11; 1242, p10.)

FERC Orde.

With respect to routing of the Western Leg, the FERC could not choose between the sponsors' proposal and the alternative favored by the Staff and California PUC. First, the Commission noted, the sponsors stated in their brief that their proposal is unworkable without changes in the recent export decision of the NEB and suggested approval subject to a change in the NEB decision. The Commission concluded that such a condition, as well as outright rejection, would be inappropriate, and it will hold most of the applications for the sponsors' proposal in abeyance pending further advice on any modification of the NEB decision or the sponsors' proposal.

1/ In Report No. 1239, p10, it was stated that the CPUC urged that the Western Leg be rejected. Inadvertently omitted, however, was the CPUC's further suggestion that the prebuild application be refiled to include construction along the Western Leg ANGTS as designated in the President's Decision.

However, the Commission observed that partial looping of the Kingsgate to Stanfield segment is common to both alternative routing proposals, and is also the "pacing item" for beginning deliveries in the fall of 1980. "The Commission believes that acceptance of some risks are in order given the urgent national priority of the ANGTS in both the U.S. and Canada. Thus, the Commission believes that it must find an acceptable basis for certificating a portion of the ANGTS project now." Accordingly, the Commission concluded that the public convenience and necessity requires approving the partial looping proposed for the Kingsgate to Stanfield segment of the PGT system based on the NEB's export license, and the expectation that Alaskan volumes will be flowing through those facilities before expiration of that license. With about 10% of the country's proven domestic gas reserves located at Prudhoe Bay, and national expediting legislation in place in both countries, "the Commission believes that certification of these facilities now is not an unreasonable exposure for PGT's customers. On the contrary, this country will obtain a timely addition to its natural gas supplies from the new export license just granted."

The Commission also approved provision of the transportation service through existing facilities of Northwest and El Paso to Pacific Interstate Transmission Co. for the 1980-1981 heating season under FERC-approved tariffs in existence at that time. "The Commission is confident that any additional transportation and facilities proposals growing out of any further consideration by th NEB will have been developed and submitted for timely consideration and approval prior to the end of that period."

While approving portion of the Western Leg facilities, the FERC found the record in Phase I concerning the benefits of prebuilding "disappointingly vague." For example, the Commission explained, there is no conclusive evidence indicating that prebuilding will expedite completion of th entire ANGTS or assure financing for the remainder of the system. "With or without prebuilding, the evidence indicates that Alaskan gas will not begin to flow through the ANGTS until at least 1984." The Commission noted that addition of Albertan gas into the system will reduce the unit cost of service for the Alaskan gas, prebuilding will get the ANGTS project started sooner, and it will spread the demand for labor and capital over a longer period of tir , thus lessening the likelihood of increased abor and material costs and cc truction delay costs due to increased demand. Also, the Commission added, prebuilding will facilitate, although not assure, financing of the remainder of the project. Based on these factors, the Commission concluded that prebuilding will produce "some tangible benefits to the remainder of the ANGTS."

The Commission rejected a recommendation by the Staff that satisfactory commitments for debt and equity financing for the entire ANGTS be in place before commencement of construction of the prebuild facilities so as to protect consumers of Canadian gas from paying excessive charges if prebuilding is not economically justified on a stand-alone basis (Alberta volumes only) and the ANGTS is not completed. In support, the Commission said, the Staff conducted an economic study which concluded that the Western Leg would not be viable on a stand-alone basis and that if the entire ANGTS were not completed, SoCal's customers would pay excessive charges for Alberta gas. While taking issue with the Staff's study, the sponsors conceded that their proposal would not be viable on a stand-alone basis if the NEB decision is not modified.

The Commission concluded that while noncompletion is always a possibility, it is convinced that the entire ANGTS will be completed. First, the Commission explained, about 10% of the country's known domestic reserves are located at Prudhoe Bay, expediting legislation is in place in both countries, and a signed agreement

committing them to implementation exists. Moreover, the price for the gas is reasonable when compared to alternative fuels and there are sufficient economic benefits so as to justify approval. Hence, there is no need for the specific condition recommended by the Staff since adoption would delay the flow of Canadian gas from Alberta for one to two years and could also eliminate or reduce the benefits associated with prebuilding. This conclusion, the Commission added, is premised upon the price for the prebuild volumes being determined in a manner consistent with other Canadian gas exports.

On the question of gas supply, the Commission noted the sponsors' contention that Pan-Alberta has sufficient gas reserves under contract to provide Northwest Alaskan with 1.04 Bcf/d over a 12-year period. The Staff, on the other hand, contended that because Pan-Alberta might be the source of supply for another project designed to extend Canada's gas system eastward from Montreal to the Maritime Provinces, Pan-Alberta cannot demonstrate sufficient supplies under contract for both projects. Accordingly, Staff urged that any certificate be conditioned upon a showing by Pan-Alberta that there are sufficient deliverable volumes to satisfy both projects for the life of the prebuild facilities. The Commission concluded that Pan-Alberta's gas supply is adequate to support its contracts with Northwest Alaskan, and approval of the prebuild project will stimulate exploration and make more reserves available to Pan-Alberta. However, the Commission observed, it is reasonable to assume that Canada will not authorize any export for Pan-Alberta unless all domestic requirements can be met. Hence, there is no need for the condition suggested by the Staff.

Turning to rate and tariff matters, the Commission first rejected PGT's proposal that the costs associated with the additional partial looping and compression on its system be recovered from Pacific Interstate over the term of the latter's export authorization for Canadian gas, and that Pacific Interstate bear an allocated portion of the costs of the facilities which are considered to be used to serve all PGT's customers. PGT also proposed to carry this tariff treatment forward to Alaskan gas once it begins to flow. In all authorizations to date, the Commission said, costs and volumes associated with additional services proposed by PGT to PG&E were rolled in with other costs and volumes for the purposes of determining the rates for service to PG&E and Northwest Pipeline under PGT's cost of service tariff. All facilities, whether compression or pipeline looping, were deemed to be totally integrated and used for all services rendered by PGT.

In determining the proper tariff treatment here, the Commission decided to focus on the characteristics of the service to be performed by PGT. First, the Commission said, the transportation by PGT for Pacific Interstate is similar to services it now performs for Northwest Pipeline and PG&E. None of the characteristics of the proposed service for Pacific Interstate are different from those of the existing services. All services are firm and none are seasonal or peaking in nature. The transportation of all gas through PGT's system is and will continue to be a conventional transportation arrangement. Furthermore, the Commission continued, the additional facilities will be operationally integrated with PGT's existing facilities. Both the existing, partially looped facilities and the additional looping and compression facilities will be used for all services. Furthermore, the Commission found it significant that the additional facilities are a prebuild portion of facilities necessary to transport Alaskan gas whose beneficiaries will also be Northwest and PG&E. Hence, it would make little sense to separate the costs and volumes associated with the transportation of gas from Alaska and for Pacific Interstate on the one hand from costs and volumes associated with transportation of gas for PG&E and Northwest on the other hand, as PGT proposes.

The FERC conceded that facilities required for this project and completion of the Western Leg are more costly than existing facilities which have been substantially depreciated, and the effect of rolled-in tariff treatment will be to increase the rates for PGT's services to Northwest and PG&E. However, in the past, both have received cost benefits under the cost of service tariff from the depreciated existing facilities and will continue to receive them in the future along with all PGT's customers. Moreover, PG&E and Northwest have derived significant benefits from the cheap expansibility of the existing pipeline in the form of reduced rates with each increment of additional throughput added to its system. Nevertheless, limits of this cheap expansibility of the existing line have now been reached. "The Commission sees no reason why the existing customers should now have what amounts to a priority for rate and tariff purposes on the existing pipeline, a priority which results from PGT's departure from the rolled-in treatment accorded additional compression and pipeline looping facilities in the past, coupled with complete insulation from the costs associated with the additional facilities." While a goal of regulation is to match costs incurred with benefits received to specific consumers, the Commission added, there are times when this is "not worth the administrative costs and inconvenience, and this is one of those occasions. The rolled-in tariff and financing approach will make PG&E customers pay more now in order to pay less later, but it has the advantage of making the PGT looping proposed as part of this proceeding supportable based on currently authorized exports of Canadian gas. We hope that the project sponsors are successful in obtaining additional volumes of gas exports; however, more than two years after approval of the ANGTS by the President and the Congress, the time has come to take the first step toward implementation of this massive project."

However, the Commission added, if after further NEB action on the gas exports, the three principally affected parties -- PGT, Pacific Interstate and the California PUC -- are able to agree on tariff and financing proposals superior to the rolled-in approach, the Commission will be prepared to reconsider its decision on that issue.

On other matters, the Commission (1) concluded that no changes to the depreciation provisions of PGT's cost of service tariff need be made -- because the Canadian export authorizations issued to PGT's supplier, all of which expire before 1992, continue to be a valid measure of the useful life of the PGT system; (2) declined to modify PGT's existing rate of return -- because that is not properly a subject of concern in this certificate proceeding; and (3) reaffirmed an earlier conclusion that a resale restriction in the Northwest Alaskan/Pan-Alberta contracts authorizing the latter to terminal sales if the former resells exported Alberta gas in the U.S. to any purchaser not a partner in ANGTS does not violate a provision of the ANGTA which requires, among other things, that nonowner shippers be afforded equal access to the pipeline -- because such provision seeks to protect shippers of gas -- in particular, nonowner suppliers -- and does not protect the purchasers of gas who are the only ones subject to the contract restriction.

D.C. Circuit Holds that Regulatory Agency Member Not Disqualified from Rulemaking Proceeding Without Showing of "Unalterably Closed Mind" on Critical Issues

On 12/27/79 the U.S. Court of Appeals for the D.C. Circuit reversed a decision of U.S. District Court of the District of Columbia which upheld a petition by the Association of National Advertisers, Inc. et al. prohibiting Michael Pertschuk, Chairman of the Federal Trade Commission, from participating in a pending rulemaking concerning children's advertising on TV on the ground he had prejudged issues involved therein. The D.C. Circuit concluded that "an agency member may be disqualified from such a proceeding only when there is a clear and convincing showing that he has an unalterably closed mind on matters critical to the disposition of the rulemaking." In so holding, the Court agreed with arguments of the FTC and seven other federal regulatory agencies, including the FERC, that the lower court's decision would have "a potentially chilling effect on otherwise legitimate public discussion of important regulatory policy questions and hamper the policymaking process." 1/

In the lower court case, the National Advertisers charged that Mr. Pertschuk made public statements concerning regulation of childern's advertising that demonstrated prejudgment of specific factual issues sufficient to preclude his ability to serve as an impartial arbiter. The Chairman had made several public comments about children's susceptibility to advertising and about how the FTC might reach the conclusion that such advertising is "deceptive." Later, the FTC began a rulemaking proceeding to consider certain restrictions on advertising directed to children. The lower court first noted that the FTC rulemaking is governed by the Magnuson-Moss Act, which imposed additional procedures -- including trial-type hearings in some cases -- on conventional notice and comment rulemaking. For that reason, the lower court applied the strict disqualification test applicable to adjudication -- as specified in the D.C. Circuit's decision in Cinderella Career and Finishing Schools, Inc. v. FTC, 425 F.2d 583 -- i.e., whether "a disinterested observer may conclude that [the agency member] has in some measure adjudged the facts as well as the law of a particular case in advance of hearing it."

In seeking rehearing before the D.C. Circuit, the FTC argued that the standard for disqualification of an administrative decisionmaker in an adjudication -- relied on by the lower court -- differs from the standard in rulemakings, and that, under any disqualification standard, Chairman Pertschuk could not be found to have prejudged issues in contravention of due process. In an amici curiae brief filed by the FERC and six other regulatory agencies, the "critical distinctions" between rulemaking and adjudication were also stressed. Rulemaking, they declared, is "different in concept, and different in procedures." By definition, they explained, rulemaking is the process for developing an agency statement of a general or particular applicability and future effect designed to implement, interpret or prescribe law or policy. This process is typically concerned with broad policy considerations rather than review of individual conduct. And this conceptual distinction, which is clearest in cases of informal rulemaking where there are no hearing requirements, remains valid no matter what the particular procedural format. "The mere presence of hearings, for example, ought not to convert what is really a rulemaking into adjudication."

1/ On 1/7/80 Chairman Pertschuk withdrew from the case because his involvement may strengthen supporters of legislation to bar the FTC from issuing a rule to restrict TV commercials aimed at children.

The regulatory agencies called attention to the D.C. Circuit's holding in another case that rulemaking "is not to be shackled, in the absence of clear and specific Congressional requirement, by importation of formalities developed for the adjudicatory process and basically unsuited for policy rulemaking." They urged that the adjudicatory concept of disqualification employed by the lower court is one of those "formalities developed for the adjudicatory process and basically unsuited for policy rulemaking. . . . The Cinderella concept -- that a member must be disqualified if he or she 'has in some measure' prejudged the facts or law -- simply does not blend with the rulemaking process."

The regulatory agencies further observed that a rulemaking proceeding begins with a notice of proposed rulemaking, a document which "inevitably shows that the agency 'has in some measure' prejudged issues." As a practical matter, they continued, such notice normally reflects a substantial step along the way from an idea to a final rule. In important rulemakings, moreover, the idea will have been closely examined by Staff experts and agency members themselves. Drafts of the notice and accompanying statements may well have been rewritten after direct consultation with and upon instructions from agency members. The more important the rulemaking, the closer the personal involvement of the agency member is likely to be. "Devoting that kind of attention to major policymaking questions is, after all, just what the agency member is suppose to be doing."

However, the regulatory agencies continued, if the Cinderella test is to go beyond adjudication into rulemaking, "there is an obvious anomaly." On the one hand, the agency is not suppose to give the appearance that it has in some measure adjudged the facts as well as the law of the proceeding. But at the same time, it is also suppose to issue a notice which inherently reflects at least a preliminary judgment -- often formed after considerable thought -- about the very subject matter of the controversy. "We think it apparent that a literal application of the Cinderella test is wholly unsuited for the rulemaking process."

Furthermore, the regulatory agencies stressed, the extension of the Cinderella approach to rulemaking would have a "chilling effect on the public expression of views about important subjects. From a policy standpoint, we believe that the law ought to recognize and accommodate this important informational aspect of an agency's work. The rules should encouurage -- not deter -- agency members from speaking out openly on the very kinds of broad policy questions likely to lie at heart of the most significant rulemakings."

The regulatory agencies also emphasized the affirmative duty that they have to report and inform the public on issues involving the industries they regulate. The FERC, for example, is authorized to publish and make available to state commissions and municipalities information about matters investigated under the Natural Gas Act and the Federal Power Act. "These responsibilities reflect the public's legitimate interest in knowing how agency members think about important policy questions. We think it vital that these considerations not be subordinated to a notion drawn from adjudication (where this informational role is far less important) that there is something wrong with an agency member telling the public his or her preliminary views about a pending issue. Just as legislators may approach their tasks with preliminary views -- the typical Congressional hearing opens with a statement reflecting substantial prejudgment about the problem -- so may agency members."

While arguing for the inapplicability of strict adjudicatory standard of the Cinderella case to rulemaking, the agencies recognized that the need for some kind of a standard to deal with extraordinary situations. Accordingly, they suggested a standard which would allow disqualification in any kind of rulemaking only when there has been "a clear and convincing showing that the agency member has an unalterably closed mind on matters critical to the disposition of the proceeding. This formulation would ensure that any agency member who cannot meaningfully fulfill his or her responsibility under the [Administrative Procedure Act] would be disqualified."

The D.C. Circuit first held that the FTC proceeding was rulemaking notwithstanding the additional procedures required by the Magnuson-Moss Act. The Court stressed that it never intended the Cinderella rule to apply to a rulemaking procedure such as the one under review here. "Legislative facts adduced in rulemaking partake of agency expertise, prediction and risk assessment." In the Cinderella case, the Court noted, it was able to "cleave fact from law" in deciding whether particular factual issues had been prejudged. "In the rulemaking context, however, the factual component of the policy decision is not easily assessed in terms of an empirically verifiable condition. Rulemaking involves the kind of issues 'where a month of experience will be worth a year of hearings' Application of Cinderella's strict law-fact dichotomy would necessarily limit the ability of administrators to discuss policy questions. The legitimate function of a policymaker, unlike an adjudicator, demands interchange and discussion about important issues. We must not impose judicial roles upon administrators when they perform functions very different from those of judges."

Furthermore, the D.C. Circuit continued, the Cinderella view of a neutral and detached adjudicator "is simply an inapposite role model for an administrator who must translate broad statutory commands into concrete social policies. If an agency official is to be effective, he must engage in debate and discussion about the policy matters before him. As this Court has recognized before, 'informal contacts between agencies and the public are the 'bread and butter' of the process of administration.'" The Court concluded that a Commissioner should be disqualified "only when there has been a clear and convincing showing that the agency member has an unalterably closed mind on matters critical to the disposition of the proceeding." In this case, the Court said, Chairman Pertschuk's remarks, considered as a whole, represent discussion "and perhaps advocacy, of the legal theory that might support exercise of the Commission's jurisdiction over children's advertising. The mere discussion of policy or advocacy on a legal question, however, is not sufficient to disqualify and administrator."

The Court's decision was signed by Circuit Judge Tamm. Circuit Judge Leventhal (prior to his recent death) concurred in a separate statement. Circuit Judge MacKinnon dissented on the ground, among others, that the "unalterably closed mind" standard is improper here because of the adjudicatory overtones of the Magnuson-Moss Act. Moreover, he stated that the "closed mind" test is so overly strict as to make it practically impossible to prove.

Fourth Circuit Refers Certain Issues in Case Involving Gas Shortage on Transco's System to FERC

On 1/8/80 the U.S. Court of Appeals for the Fourth Circuit granted a motion by Transcontinental Gas Pipe Line Corp. that it hold in abeyance review of an award of $23.8 million in damages by a North Carolina federal district court as a result of curtailments to certain customers, and refer to the FERC certain underlying issues involving, among others, the reasons for shortages on Transco's system. The Court, however, refused to vacate the lower court's judgment. CF Industries, Inc. and Farmers Chemical Association, Inc. v. Transcontinental Gas Pipe Line Corp., Nos. 79-1359 and 79-1366.

This case arose out of civil damage suit filed against Transco by CF Industries and Farmers in connection with the curtailment on Transco's system beginning in 1971. On 2/16/79 a jury in the North Carolina court awarded $23.8 million in damages to CF and to Farmers based on Transco's liability in contract, negligence and promissory estoppel. Earlier, the lower court twice refused Transco's appeal that certain issues raised in the case falling within the expertise of the FERC and which have an impact upon its regulatory responsibility be referred to the Commission.

On 2/28/79 Transco filed a petition (TC79-8) requesting the Commission to (1) institute a proceeding into circumstances which resulted in the gas shortage on its pipeline system, the effects of its gas tariff curtailment provisions and service agreements and Commission orders, rules and regulations, and the effect on the Commission's ability to carry out its responsibilities by the damage award; and (2) issue a declaratory order holding, among other things, that the shortage on Transco's system was caused by factors beyond its control, Transco reacted thereto in good faith and in a prudent manner, its curtailment tariff provisions and service agreements are in compliance with Commission rules and regulations (and therefore represent a defense to any claims for damages), and that any such award would constitute an undue preference and discrimination under the Natural Gas Act and adversely affect the Commission's ability to fairly allocate supplies available to Transco.

On 8/17/79, the Commission (1) agreed that a proceeding should be instituted on the effects of Transco's gas curtailment provisions and service agreements and Commission orders, rules and regulations, including whether any undue preference or advantage is involved with the award of damages; and (2) granted that portion of the request for a declaratory order holding that Transco's curtailment tariff provisions and service agreements are in compliance with Commission rules and regulations. The Commission denied Transco's request for a proceeding and declaratory order in all other respects.

In subsequent applications for rehearing by Transco, INGAA and others, it was argued that the Commission must inquire into the facts and circumstances of the shortage on Transco's system in order to determine whether it properly carried out its gas acquisition, transportation, inventory or sales activities. This same issue, it was noted, is also involved in other cases where pipelines are being sued.

Transco also filed a petition in the Fourth Circuit for review of the damage award, in which it requested the Court to refer the underlying issues involving the shortage on its system to the Commission. In an amicus curiae brief, the FERC asserted that the Court should vacate the lower court's judgment and remand with instructions to refer issues subject to the Commission's primary jurisdiction --

i.e., concerning the interpretation and effect of the certificate, tariffs and service agreements, and orders, rules and regulations as they affect the litigation. However, the Court should not direct the referral of the question of ultimate liability in the damage action, including whether compliance with Transco's tariff provisions is a complete defense to any claims for damages for breach of contract -- because "that responsibility belongs to the courts." (See REPORT NOS. 1224, pp16-18; 1231, pp22-25.)

In its decision, the Fourth Circuit agreed with a conclusion reached by the Fifth Circuit in a 1976 case involving a similar controversy that deference to the primary jurisdiction of the Commission is particularly appropriate in the complex area of natural gas curtailment. The Fourth Circuit quoted the Fifth Circuit's decision that "referral is particularly appropriate. While the Federal Power Commission's jurisdiction is somewhat limited, the Natural Gas Act, as interpreted by the courts, has provided the Commission with the statutory basis for pervasive regulation of the curtailment question . . . . The Commission is presently involved in resolving issues which have a direct impact on similar litigation involving curtailment plans. The advisability of invoking primary jurisdiction is greatest when the issue is already before the agency . . . . The Commission, moreover, is reviewing in some detail the facts and circumstances that resulted in the present shortage in order to determine what is a fair, equitable, permanent curtailment plan. Indeed, this court has already stated in a similar action that referral to the FPC is preferred.'"

The Fourth Circuit also noted that in one of its own prior cases it "recognized the unique expertise of the Commission . . . ." In that case, the Court said, it found the Commission to be "'a far more appropriate body than a district court'" to make a determination requiring a balancing of conflicting needs and interests of all consumers of the gas supplier involved.

However, the Fourth Circuit agreed with the FERC's position that the Commission does not have authority to adjudicate ultimate liability in the pending damage action since this responsibility rests solely on the Court, and that any inquiry by the Commission into the effect of a damage award against Transco on the Commission's ability to carry out its responsibilities, including allocation of Transco's gas supplies, would be premature and speculative at this point.

The Fourth Circuit concluded that the Commission has the authority under the Natural Gas Act to investigate the causes of a gas shortage on any particular pipeline system, and such an investigation and determination "would be appropriate and helpful in the pending litigation." But the Court decided not to approve the suggestion of the Commission and Transco that the lower court's judgment be vacated and the case remanded with instructions to refer the specified issues to the Commission for the exercise of its primary jurisdiction, with the lower court proceeding stayed pending final Commission action. Instead, the Fourth Circuit decided that the appeals pending with respect to the lower district court action should be held in abeyance and that certain facts and issues be referred to the Commission for its determination and decision, after which the Court would consider the appeals and determine the proper procedure.

Specifically, the Court directed the Commission to consider (1) the facts and circumstances resulting in the shortage on Transco's system that allegedly resulted in the loss claim by CF Industries and Farmers; (2) the meaning and interpretation of Transco's gas tariff curtailment provisions and service agreements and of Commission orders, rules and regulations relating to curtailments in the event of shortage, and the effect of such provisions on Transco's

responsibility to its customers; (3) whether undue preference or advantage is created by the damage award and what administrative action, if any, should be taken; (4) the meaning and effect of Transco's contracts and related certificates authorizing service to distributor customers; and (5) any other findings the Commission deems appropriate and relevant.

* * * * *

On 1/17/80 FERC Administrative Law Judge Steven M. Charno granted a motion by Transco that the procedural schedule in the investigation (TC79-8) ordered by the Commission's 8/17/79 order on the effects of Transco's gas curtailments and service agreements and Commission orders, rules and regulations be suspended pending Commission action in response to the Fourth Circuit's decision described above. In support, Transco noted that the issues referred to the Commission by the Court are broader than, and in conflict with, issues which the Commission set for hearing in its 8/17/79 order. Hence, the procedural schedule should be suspended to prevent potentially wasteful effort by the parties until the Commission has acted with respect to the Court's referral order.

Supreme Court Asked to Review Conflicting Decisions of D.C. Circuit and Fifth Circuit Ruling on Commission's Power to Impose a 30-Day Timing Requirement on Advance Payments Covered by Order No. 465

During the past month, petitions for writ of certiorari were filed in the U.S. Supreme Court by Tennessee Gas Pipeline Co. and the FERC to review conflicting decisions by the D.C. Circuit and the Fifth Circuit in regard to the Commission's power to impose a 30-day timing requirement on producer expenditure on advance payments received under Order No. 465 in determining whether such advances are "reasonable and appropriate" for rate base treatment. The FERC requested review of the Fifth Circuit's decision only if the Supreme Court grants Tennessee's petition for certiorari to review the D.C. Circuit's decision. Tennessee Gas Pipeline Co. v. FERC (No. 79-962) and FERC v. United Gas Pipe Line Co. (No. 79-1055).

First, on 12/19/79, Tennessee Gas Pipeline Co. asked the Supreme Court to review a D.C. Circuit decision issued 6/20/79 (Tennessee Gas Pipeline Co. v. FERC, No. 77-1496) which, among other things, remanded FPC Opinion Nos. 769 and 769-A denying inclusion of some $100 million of front-end advance payments made by Tennessee (RP73-113) to producers under agreements executed in 1973. In that year, the Commission's advance payment program was governed by Order No. 465 which required merely that advances be "reasonable and appropriate" in order to qualify for rate base treatment. Subsequently, in Order No. 499 governing the advance payment program during the years 1974 and 1975, the Commission clarified that advances must be expended by producers within a "reasonable time" after inclusion thereof in the pipeline's rate base. In Opinion No. 769 (issued 7/9/76), the Commission ruled for the first time that advance payments not expended by producers within 30 days are "presumptively extravagant" and hence not "reasonable and appropriate" for inclusion in the advancing pipeline's rate base. While conceding that Order No. 465 did not contain any timing requirement, the Commission declared that the "reasonable and appropriate" standard was consistent with well-established principles of regulatory law that "extravagant or unnecessary costs cannot be passed along to customers through rates." Further, the Commission stated, "it has not been suggested by Tennessee that a producer in the conduct of its own business would borrow money and pay interest thereon far in excess of the time it is needed. Nor do we think Tennessee could make such a showing. We find, therefore, that front-end advance payments are presumptively extravagant." In Opinion No. 769-A (issued 5/31/77), the Commission denied that application of a timing standard to advances under Order No. 465 constituted retroactive ratemaking since the

"reasonable and appropriate" standard, which pervaded all of the advance payment rulemaking orders, "necessarily covered such unnecessary and extravagant costs as those resulting from front-end advances."

On appeal, the D.C. Circuit partly affirmed and partly remanded Opinion Nos. 769 and 769-A, as well as FPC orders in two other cases which similarly applied a 30-day standard in disallowing rate base inclusion of advance payments by Transcontinental Gas Pipe Line Corp. and Michigan Wisconsin Pipe Line Co. pursuant to both Order Nos. 465 and 499. The Court concluded that the Commission correctly rejected the pipelines' position that the front-end advances were dictated by "good faith business judgments" given the competitive conditions at the time and hence were "reasonable and appropriate" for purposes of inclusion in the rate base. The Court said the pipelines had the burden of demonstrating affirmative evidence in favor of "extended" front-end advances, especially in view of the traditional "used and useful" public utility concept on which the Commission has consistently relied. At the same time, the Court held that the Commission's 30-day rule focused too narrowly on a line-of-credit approach and, as a result, the Commission "failed to evaluate fully and fairly the reasonableness of the protective mechanisms adopted by particular pipelines to fulfill their obligation of vigilance in the consumers' interest." The Fifth Circuit accordingly remanded the cases for a more extensive and flexible inquiry into the reasonableness of attempts to protect ratepayers from excessive costs. On 10/31/79 the Court denied rehearing and suggestions for rehearing en banc. (See REPORT NO. 1214, pp18-21.)

The D.C. Circuit's decision was issued two days prior to a Fifth Circuit decision (United Gas Pipe Line Co. v. FERC, No. 78-1091) which overturned Opinion Nos. 815 and 815-A denying rate base inclusion of some $24 million of advance payments by United Gas Pipe Line (RP74-20, RP74-83) under Order Nos. 465 and 499 because the advance payments had not been expended by the recipient producers within 30 days. The Fifth Circuit reversed the Commission's denial of rate base treatment for advance payments governed by Order No. 465. As applied to these payments, the Court said the 30-day standard "arbitrarily imposes a new dimension and a new restraint . . . . The law will not tolerate this sort of after-the-fact, in fact retroactive, imposition of standards." In regard to the advances covered by Order No. 499, the Fifth Circuit reversed and remanded the Commission's application of the 30-day rule as "unreasonably harsh." The "relatively vague" timing guideline imposed in Order No. 499, the Court said, did not constitute sufficient notice to pipelines that all advances should be made on a 30-day installment basis. On 8/8/79 the Court denied FERC's petition for rehearing. (See REPORT NO. 1217, pp16-17.)

In still another case, the Seventh Circuit on 1/5/79 reversed and remanded an FPC order of 6/3/77 which applied the 30-day rule in denying rate base treatment for front-end advance payments by Natural Gas Pipeline Co. of America (RP73-110). Natural's advances were all made pursuant to Order No. 499. The Seventh Circuit held that imposition of the 30-day standard represented a retroactive modification of Order No. 499, which merely required that advances must be expended within a "reasonable time" after their inclusion in a pipeline's rate base.

In seeking Supreme Court review of the D.C. Circuit's decision of 6/20/79, Tennessee contended that the Court's holding regarding Order No. 465 advances conflicted directly with the Fifth Circuit's decision in the United case described above. Further, the D.C. Circuit's rationale that imposition of an implicit timing requirement is not impermissible retroactive rulemaking conflicts with the Seventh Circuit's decision in the Natural Gas Pipeline case dealing with Order No. 499 advances. Proper resolution of this conflict is of "critical importance" to the

natural gas industry, Tennessee declared, since it involves the ultimate disposition of substantial Order No. 465 advance payments made by interstate pipelines generally. In this regard, Tennessee noted that nearly 99% of the $.5 billion total committed by interstate pipelines under the advance payments program represented front-end advances of the type involved in this case. Moreover, Tennessee added, even though the advance payment program has now been terminated prospectively as to new agreements, the problem is of continuing importance to the administration of jurisdictional rate increases filed under advance payment contracts which remain in effect.

The second petition for certiorari was filed on 1/5/80 by the Solicitor General, on behalf of the FERC, to review the Fifth Circuit's decision in the United case with respect to advances under Order No. 465. (The petition does not request review of the Fifth Circuit's remand of the Commission's disallowance of front-end advances under Order No. 499.) The FERC asked that its petition for certiorari be granted only if the Supreme Court grants review of the D.C. Circuit's decision in the Tennessee case. The Commission noted the direct conflict between the Fifth Circuit and D.C. Circuit decisions respecting the Commission's power to impose a timing requirement on Order No. 465 advances. However, while the FERC agrees with the D.C. Circuit's holding on this issue, it does not advocate Supreme Court review of the interpretation of Order No. 465, which "governs only contracts executed in 1973 under a terminated experimental program." Consequently, the FERC intends to oppose the petition for writ of certiorari in the Tennessee case (No. 79-962). However, if the Supreme Court grants Tennessee's petition for review in that case, it should also grant review in the United case "so that the interpretation of Order No. 465 will be uniform for pipelines and consumers throughout the country."

Tenneco, FERC, INGAA File Complaints and Requests for Injunctive Relief Enjoining Enforcement of Louisiana Statute on Intrastate Purchasers' Right of First Refusal

During the past several weeks, Tenneco, Inc., the FERC and the Interstate Natural Gas Association of America (INGAA) have filed complaints for declaratory judgment and injunctive relief with the U.S. District Court for the Middle District of Louisiana (Civil Action Nos. 80-17 et al.) in regard to a recently enacted Louisiana statute, effective 9/7/79, which provided Louisiana intrastate purchasers of natural gas with a right of first refusal for all natural gas not committed or dedicated to interstate commerce prior to 9/7/79 effective date of that statute. 1/

The Louisiana Act (No. 732) amended the state's Natural Resources and Energy Act of 1973 to require that "producer-sellers" of natural gas not committed or dedicated to interstate commerce prior to 9/7/79 obtain a state certificate of public convenience and necessity before allowing the introduction of such gas into any interstate pipeline system. The Act further requires producer-sellers to make a bona fide offer to sell such gas to intrastate natural gas transporters before committing the supply to interstate commerce. Noncompliance with the Act is not excused by contractual obligations, and criminal penalties are set forth for violations. Interim regulations implementing the Act were promulgated on 10/28/79 by the Louisiana State Conservation Commission.

1/ The District Court originally set a 1/18/79 date for a hearing on the preliminary injunction request, but this date was extended indefinitely by request of the State of Louisiana.

In its complaint and request for a preliminary injunction, Tenneco asserted, among other things, that the Act "has had a chilling effect on the willingness of sellers to contract for sale in interstate commerce." Tenneco cited eight contracts which it has entered into with producers since the enactment date of the legislation but for which no deliveries have commenced owing to the requirements of the Louisiana statute. Moreover, Tenneco stated that the requirements of the Act have hampered its efforts to negotiate further contracts and thereby limited its ability to fulfill the natural gas requirements of its customers.

As further support for its complaint and request for a preliminary injunction, Tenneco contended that the Act (1) unconstitutionally discriminates against interstate commerce by creating an undue preference for intrastate purchasers; (2) constitutes a prohibited burden on interstate commerce in violation of the Commerce Clause of the U.S. Constitution; (3) conflicts with federal statutes and is hence void under the Supremacy Clause of the U.S. Constitution; and (4) contradicts the responsibilities of the FERC in the exercise of its jurisdiction under the Natural Gas Act and the NGPA.

The FERC, in its complaint in intervention, also asserted that the Louisiana statute violates the Commerce and Supremacy Clauses of the U.S. Constitution and conflicts with the FERC's exclusive jurisdiction over interstate pipeline transactions. Additionally, FERC cited the deleterious effect the Act will have on future additional gas supplies for the interstate market. "At a minimum," FERC's complaint stated, "this provision will delay the attachment of new gas supplies . . . at the worst, it will reduce the new gas supplies available to the interstate pipelines to the extent that intrastate purchasers exercise their right to purchase such gas."

INGAA also cited the above arguments of Tennessee and FERC in support of its complaint and request for declaratory judgment and injunctive relief. Additionally, the complaint stated that the Louisiana Act, in depriving member companies of INGAA of their freedom to contract with whomever they choose, violates those companies' rights under the provisions of the 14th Amendment of the U.S. Constitution.

FERC Law Judge Finds Violations of Natural Gas Act by National Fuel Companies

On 1/11/80 FERC Law Judge George P. Lewnes issued an initial decision finding that National Fuel Gas Supply Corp. and National Gas Storage Corp. violated the Natural Gas Act and the U.S. Criminal Code in connection with certain construction activities related to development of storage fields in western New York. Judge Lewnes recommended that the violations be referred to the Department of Justice for criminal prosecution.

This proceeding was initiated by the FERC on 12/19/77 in response to a complaint by Fair Environmental Deals for United People (CP77-590) directed to activities of the National Fuel Companies (or their predecessors-in-interest) around Allegany County, New York from January 1975 through July 1977. These activities related, in part, to a long-term storage project whereby National Fuel Supply (CP77-492 et al.) proposes to abandon, and National Gas Storage proposes to acquire, three separate storage fields -- West Independence, East Independence and Beech Hill -- located in Allegany County. After further development, the three fields would be connected via 17.7 miles of new pipeline to National Fuel Supply's interstate transmission system in Potter County, Pennsylvania. The proposed project, estimated to cost nearly $50 million over a three-year period, would enable long-term storage service by National Gas Storage to six nonaffiliated utility customers in aggregate amounts increasing to 22 Bcf by 1980. By order dated 2/1/77, the FPC scheduled hearings on the proposed project to consider various unresolved questions, including environmental impact, rate level and rate form, conditions (if any) to be attached to construction of the proposed facilities, financing, and the impact on existing customers of the National Fuel Companies of developing storage facilities to serve six offsystem distributors. The Commission subsequently consolidated applications by Transcontinental Gas Pipe Line Corp., Columbia Gas Transmission Co. and Tennessee Gas Pipeline Co. to transport storage injection and withdrawal volumes for the six distributor customers. In June 1979, the Commission approved construction of a portion of the facilities.

Specifically, FEDUP -- which described itself as a "nonprofit, unincorporated public benefit association" representing residents in the immediate vicinity of the challenged activities -- asserted that the National Fuel Companies had unlawfully constructed facilities in the Beech Hill, West Independence and East Independence areas for transportation and storage of interstate gas in violation of the Natural Gas Act; had provided false information to the Commission for the purpose of unlawfully evading jurisdiction over reworking of 13 wells at the West Independence Field (CP76-364); and had provided false information in various maps submitted to the Commission. (See REPORT NOS. 1127, pp29-31; 1136, pp30-31.)

In his initial decision, Judge Lewnes stated that the National Fuel Companies violated the Natural Gas Act by substantially installing compressor units at the West Independence Field two months before Commission approval; reworking 21 wells at the Beech Hill Field without authorization; and commencing installation of compressor facilities at the Beech Hill Field. He also found that the companies violated the U.S. Criminal Code by providing false information in a map of the West Independence storage pool.

Most of these violations, he said, involved the installation of facilities and reworking of wells for the storage facilities before the necessary Commission authorization had been given. He stated that the companies' self-imposed time schedule for completing the storage facilities was the principal motivating force for the violations. "The substantial evidence . . . forces the conclusion that these illegal actions were not merely apparent willful and knowing violations, but rather were deliberate and result-oriented."

In support of his conclusion, Judge Lewnes observed, among other things, that the Commission had set the storage proposal for hearing and, on a number of occasions, specifically denied requests by the companies for temporary authorization for portions of the construction. Nevertheless, the companies illegally commenced portions of the project without authorization.

With respect to the violations of the Natural Gas Act, Judge Lewnes noted the Commission's policy that if any illegal action appears to have been taken willfully and knowingly, it would refer the case to the Department of Justice. "The character of every act depends upon the circumstances in which it was done. Here, there is nothing in the factual circumstances as would militate against a referral."

As noted, the Law Judge found a violation of the U.S. Criminal Code by the National Fuel Companies by virtue of their providing false information to the Commission in a map of the West Independence storage pool. He said that the motive for this falsification was the companies' need for a storage permit from the New York State Department of Environmental Conservation prior to development of the storage facility. The New York agency requires that an applicant hold 75% of the storage rights under the land inside the pool boundary before a permit will be issued. The record shows, he said, that the company engaged in a "knowing and willful falsification" in drawing a false boundary of the storage pool on the map submitted to the Commission.

In urging that this violation also be referred to the Justice Department, Judge Lewnes noted that there is no discretionary authority vested in an agency to determine whether to transmit evidence of an apparent violation of a federal statute of general applicability (the U.S. Criminal Code). Hence, "it is obligatory on the part of the Commission to transmit the evidence adduced and the related findings and conclusions to the Attorney General . . . ."

Finally, the Law Judge stated that the violations (except with respect to the map) "were undertaken with the prior willful and knowing authorization of Mr. John A. Comet," former President of the National Fuel Companies. In this connection, Judge Lewnes stated that the inquiry here should not be limited to whether there has been a corporate violation. "Obviously, merely pursuing a corporate entity as opposed to individual corporate officers for a statutory violation is of little consequence. Monetary fines paid by a corporate body for illegal undertakings of its officers in the corporate name does not provide a deterring desideratum. The courts have recognized this and where appropriate, have permitted the prosecution of an officer or employee of a corporation for illegal acts done on behalf of a corporate employer."

FERC Approves Settlement Filed by Reversionary Mineral Interest Owners to Resolve Pricing Issues Raised by Southland Royalty-Type Sales

On 1/17/80 the FERC approved a settlement offer submitted by four reversionary mineral interest owners -- Dore Corp. (CI76-315 and CS76-639), Sullivan-Wells Co. (CI76-316 and CS76-460), Briercrest Oil Co. (CI76-396 and CS76-762) and Fort Worth National Bank et al. (CI76-587) -- to resolve a number of Southland Royalty-type cases currently pending before the Fifth Circuit on judicial review. 1/

The above producers were lessors under various 50-year oil and gas leases which expired during the first half of 1976. At that time, mineral interest rights in nine wells reverted to the lessors. The reversionary interest owners were ordered by the FPC on 3/12/76 and 7/6/76 to continue -- pending the outcome of litigation in the Southland Royalty case involving the question of continued dedication of gas to interstate commerce following expiration of 50-year leases -- the jurisdictional sales made by large producer lessees to interstate pipeline purchasers prior to expiration of the leases in question. These sales were made b the previous lessees at rates of 18.0¢ or 23.5¢. The Commission included protective provisions specifying that continued deliveries by the reversionary mineral interest owners during the interim period until resolution of the Southland Royalty case would be without prejudice to their position regarding the dedication status of the gas involved. Subsequently, the FPC denied applications filed by three of the mineral interest owners for small producer certificates to sell the subject gas at 130% of the national new gas rate set in Opinion No. 699-H. The Commission held, among other things, that the reversionary owners were bound to the rates charged by their respective large producer predecessors.

A total of six petitions were filed by the several mineral interest owners in the Fifth Circuit (Dore Corp. and Sullivan-Wells Co. et al. v. FERC, Nos. 76-2428 et al.) for review of the above described orders requiring continued interstate deliveries and prescribing rates for these deliveries. The Court ordered these proceedings held in abeyance until the final outcome of the Southland Royalty litigation (which was decided by the Supreme Court on 5/31/78). More recently, proceedings before the Fifth Circuit have been further deferred pending settlement discussions between the mineral interest owners, certain other producers, purchasers of the gas involved, and the FERC Staff. (See REPORT NO. 1240, App. p12.)

The settlement offer -- filed 12/7/79 by the four reversionary mineral interest owners -- provides for (1) continuation of sales to the interstate buyers currently receiving the gas under interim protective orders; (2) collection in the future of the maximum lawful price applicable to small producer replacement contracts under Section 104 of the NGPA (or the maximum lawful price under Sections 102, 103, 107 and 108 for any gas qualifying for these prices); (3) retention of all sums collected in the past pursuant to interim protective orders up to the applicable small producer replacement contract rates for the time periods involved (67.6¢/Mcf from 7/27/76 until 1/1/77, 68.9¢/Mcf until 1/1/78, 70.[illegible]¢/Mcf until 12/1/78, 77.1¢/MMBtu until 1/1/79, and thereafter as adjusted for inflation in accordance with regulations under the NGPA), subject to adjustment for Btu, taxes, and gathering allowance where applicable; and (4) withdrawal of petitions for review presently pending in the Fifth Circuit. (See REPORT NO. 1239, pp13-15.)

1/ Since the records in these proceedings have not been filed with the Court, the Commission retains jurisdiction to consider the settlement offer.

The Commission cited the Tenth Circuit's decision issued 4/23/79 in Getty Oil Co. v. FERC (No. 77-1993) as relevant to the situation here. In that decision, the Court reversed the Commission denial's of rate increases to new gas ceilings sought by Getty under the "rollover" contract policy on the ground that the underlying 1967 contract had not run its full primary term -- which, the Commission ruled, was a necessary condition to qualify sales under a new contract for "rollover" treatment -- but rather had terminated prematurely upon triggering of a pressure clause. The Tenth Circuit held that rejection of Getty's rate increases was based on a new interpretation of the Commission's contract replacement policy which should not have been applied retroactively to Getty whose contract expired prior to issuance of Opinion No. 770-A due to circumstances beyond the parties' control. (See REPORT NO. 1208, pp22-23.)

Specifically, the Commission declared "The normal expiration of the lease agreements in the instant case prior to the issuance of Opinion No. 770-A fits into the general category of cases covered by the Getty court decision. The expiration of the leases was beyond the control of either the seller or the buyer to the gas sales contract, and thus the seller upon executing a new contract was entitled to 'rollover' treatment."

Industrial Gas Users Protest Transco's Interruption of Transportation Under Order No. 533 Program

On 1/3/80 the FERC issued notice of separate complaints filed 12/20/79 by two groups of high priority industrial gas users -- Cerro Wire & Cable Co. et al. (CP80-153) and American Bakeries Co. et al. (CP80-184) -- with respect to Transcontinental Gas Pipe Line Corp.'s interruption of transportation of direct purchase gas under the Order No. 533 program. 1/

According to the complaints, Transco advised in early December that it would terminate Order No. 533 transportation service on 12/17/79 for a period of 30 to 90 days because of insufficient mainline capacity to render this and other higher priority services. As a result, the complaints charged, the industrial users here involved have been compelled to incur additional expense to replace their "self-help" direct purchase gas, while Transco is "forcing" additional gas on its customers that will be used in large part as low priority boiler fuel. Further, the

---

1/ Cerro Wire & Cable (CP79-309), together with six other industrial buyers, previously petitioned the FERC on 5/2/79 to issue an expedited declaratory order respecting their eligibility to a two-year extension of certain Order No. 533 transportation service provided by Transco (CP77-240). The petition stated that Transco had refused to seek authorization to extend this service both because the supply in question appeared to be available for purchase by the pipeline itself absent the Order No. 533 arrangements, and because the seven industrial buyers would not suffer any curtailment of natural gas deliveries from their distributor supplier until at least the end of the 1979 summer season. Cerro Wire & Cable et al. cited a sworn affidavit by producers of the subject supply indicating unwillingness to make sales to an interstate pipeline. Hence, since the gas will not be available to Transco, the industrial buyers contended they are eligible to receive a two-year extension of transportation service under the Order No. 533 direct purchase program. Subsequently, Cerro Wire & Cable et al. withdrew their petition for a declaratory order following Transco's agreement to request a two-year extension of transportation service (CP77-240). This extension was granted by order dated 10/31/79. (See REPORT NO. 1210, pp28-29.)

complaints continued, wells dedicated to the industrial buyers are in danger of being shut in, with resultant damage to the reservoirs, loss of production and, in the case of wells facing water encroachment, a permanent loss of reserves. Transco's actions were also said to constitute a severe, perhaps "crippling" blow to the entire Order No. 533 direct purchase program.

Cerro Wire & Cable et al. contended that Transco's interruption of transportation constitutes (or will soon constitute) an unauthorized abandonment of certificated service. American Bakeries et al. noted that Order No. 533 transportation certificates contemplate interruptions "of an absolutely necessary, short-term nature." Here, however, "Transco -- in a period of relatively warm weather -- is cutting off high priority load to empty storage and in effect force the use of natural gas for low priority boiler fuel." Such interruption may constitute an "unlawful abandonment." Both complaints cited a D.C. Circuit decision in 1976 (Reynolds Metals Co. v. FPC, 534 F.2d 379) holding that a 62% reduction in volumes transported to an industrial customer represented a partial abandonment requiring authorization under Section 7(b) of the Natural Gas Act.

Cerro Wire & Cable et al. and American Bakeries et al. requested the FERC to call an immediate conference for the purpose of requiring Transco to explain in detail the reasons for its interruption of transportation service, to determine whether this interruption comports with the public convenience and necessity, and to reinstate the presently interrupted service pending such determination.

On 1/10/80 Transco moved for summary dismissal of the complaints. Transco stressed that Order No. 533 transportation service is subject to interruption pursuant to contractual arrangements among Transco, end users and end users' distributor-suppliers. Consequently, Transco is not violating any contractual or certificate obligations by interrupting these interruptible services. Moreover, Transco noted, Order No. 533 transportation makes use of temporarily unused pipeline capacity built for -- and dedicated to - serving Transco's commitments to long-term firm service customers. Transco is now required to interrupt these services because its mainline capacity is fully used to render other service obligations of a higher priority. 1/ Under these circumstances, it is "utterly absurd" to suggest that such interruption constitutes an "unlawful abandonment."

Transco also disputed that the D.C. Circuit's decision in Reynolds Metals supports the complainants' position. That decision, Transco stated, involved a permanent reduction in firm service. By contrast, the situation here involves a reduction in interruptible transportation service which will continue only as long as Transco's mainline capacity is fully utilized by other services.

1/ An attachment to Transco's filing indicated that the pipeline's mainline capacity is expected to remain fully utilized until mid-March to meet firm service requests of its resale, direct industrial and firm transportation customers, as well as requests for storage withdrawals under Rate Schedule WSS. In addition, Transco expects utilization of its mainline cpaacity on most days to render interruptible delivery obligations from the Washington Storage Field, or to eliminate an existing temporary imbalance between nominations and withdrawls of storage gas.

Even assuming that the above interruptions in Order No. 533 transportation service were found to violate contractual or certificate obligations, Transco said the requested emergency relief would still be unwarranted because the distributors serving the complainant end users have advised that adequate supplies are available for these customers Hence, there is no threat that any of the industrial users' plants will be forced to shut down for lack of gas supply. Further, Transco noted, in early September it advised all end users, distributors and producers involved in Order No. 533 transactions that mainline capacity limitations were anticipated "on a significant number of days during the 1979-1980 winter season," and that interruption of Order No. 533 interruptible transportation services would be required. This early notification, on its face, "undercuts . . . any claim of dire emergency" except "that brought on by complainants' own failure to give proper attention to Transco's notice."

* * * * *

More recently, on 1/15/80, the Commission granted Transco's request (CP80-55) to amend 19 certificates for transportation of Order No. 533 direct purchase gas so as to eliminate end-use restrictions. This action was consistent with Order No. 52 (RM80-1), issued 10/5/79, which adopted an interim rule removing conditions on transportation of Order No. 533 gas prohibiting the buyer from using any interstate supplies for other than high priority feedstock or process requirements. The Commission concluded that this end-use limitation placed Order No. 533 customers at a disadvantage in light of the drop in curtailment levels and was contrary to the national need to promote displacement of fuel oil. Accordingly, the interim rule provided that industrial customers may receive natural gas for low priority uses without jeopardizing their right to purchase direct sale gas under Order No. 533. (See REPORT NOS. 1230, pp10-11; 1237, pp16-18.)

Transco requested amendment of the 19 transportation certificates only through the period ending 5/31/80. In support of this limitation, Transco stated that interstate pipelines now have parity of access to onshore supplies and that improvement in the interstate supply situation has substantially mitigated or eliminated the threat of curtailment to high priority industrial uses.

Two of the 19 certificates covered by Transco's application to amend involve transportation for certain of the industrial customers joining in the American Bakeries et al. complaint described above.

FERC Determines Equity Rate of Return of 12.5 Percent for Consolidated Gas Supply and Arkansas Louisiana

On 1/11/80 the FERC issued Opinion Nos. 70 and 71 deciding rate of return and certain other issues in rate proceedings of Consolidated Gas Supply Corp. (RP78-52 and RP79-22) and Arkansas Louisiana Gas Co. (RP77-54 et al.).

In Opinion No. 70, the Commission approved a common equity rate of return of 12.5% for Consolidated Supply in two separate cases covering the period 7/1/78 to the present. Based on the capital structure of Consolidated Supply's parent -- Consolidated Natural Gas Co. -- in the two cases (reflecting a common equity ratio of 53.8% in RP78-52 and 56.1% in RP79-22), this determination resulted in overall rates of return of 10.19% and 10.34%.

The FERC Opinion affirmed the results reached by Administrative Law Judge Stephen L. Grossman in an initial decision issued 7/3/79, although modified some of the details of that decision. (See REPORT NO. 1216, pp19-20.) Among other things, the Commission agreed with the Law Judge in rejecting the company's equity return recommendations in the range of 14.5% to 15.5% because of reliance on studies which examined only the cost of equity of Consolidated Natural and failed to adjust for the lower business risk of Consolidated Supply. Consolidated Natural (through subsidiaries other than Consolidated Supply), the Commission noted, is actively engaged in gas exploration and other production activities involving large capital expenditures and higher risk than traditional utility activities. Consolidated Supply engages in natural gas transmission and distribution, as well as some exploration and development. However, since Consolidated Supply recovers most of its exploration and development expenses on a cost of service basis through tariffs charged to customers for transmission and distribution services, it faces "significantly less risk" with respect to production activities than nonpipeline producers unable to automatically passthrough their production costs in this manner. Further, the Commission added, there is no basis for the contention that Consolidated Supply's customers have benefitted substantially from Consolidated Natural's production activities and hence should bear the risk of these activities through the subsidiary's allowed rate of return. Consolidated Natural is fully compensated for the risks of its production activities through rates charged to Consolidated Supply for gas, the Commission declared. Hence, Consolidated Supply is "properly viewed" as similar in risk to a natural gas pipeline engaged in gas transmission and sale.

The Commission also agreed with the Law Judge that the zone of reasonableness is in the range of 12% to 14% for determining a return on equity for Consolidated Supply. This range, the Commission said, is indicated by final Commission orders fixing equity returns for pipelines since 1977, and is confirmed by other evidence in the record respecting long-term public utility bond yields and composite equity earnings by U.S. industry.

In arriving at a specific equity allowance for Consolidated Supply, the FERC made a separate determination in each case, thereby rejecting the Law Judge's single determination for the two consecutive periods. In both cases, however, the Commission reached the same result. In RP78-52 (applicable to rates which were in effect from 7/1/78 through 6/30/79), the Commission concluded that Consolidated Supply should be allowed 12.5% on common equity -- toward the lower end of the zone of reasonableness -- because of a thicker than average equity ratio and reduced business risks brought about by improvement in the company's gas supply and total gas sales. As a further consideration, the Commission noted that Consolidated Supply plans a reduced construction budget, so that there is no need

for a higher rate of return due to capital requirements which might strain the company's financial resources. In RP79-22 (applicable to rates which went into effect on 7/1/79), the Commission held that the impact of increasing interest rates and bond yields was offset by the continued increase in Consolidated Natural's equity ratio. Consequently, the Commission adopted the same 12.5% return on equity found reasonable in the prior docket.

In Opinion No. 71, the FERC similarly approved a common equity rate of return of 12.5% for Arkansas Louisiana Gas Co. This was somewhat lower than the common equity allowance of 12.75% determined by Administrative Law Judge Isaac Benkin in an initial decision issued 4/26/79. The Commission concluded that the Law Judge gave insufficient consideration to Arkla's relatively high equity ratio of 54%, which served to reduce the company's financial risk. In addition, the Commission disagreed with Judge Benkin's reference to Arkla's need for additional capital to support ongoing exploration and development of gas reserves in the Deep Anadarko Basin. The Commission said Arkla's gas exploration and production operations apparently will be carried out by its affiliate, Arkla Exploration Co. However, even if this were not the case, any gas reserves produced in the future presumably will be sold to Arkla's customers at NGPA prices. Since the new gas prices established by the NGPA are "adequate to compensate producers for the costs and risks associated with producer operations, including the cost of acquiring capital," the Commission did not consider "an increment to Arkla's otherwise reasonable rate of return for pipeline operations to compensate for the cost of capital employed in its production operations . . . to be reasonable or necessary." Accordingly, the Commission declined to allow a higher rate of return in this proceeding as a result of Arkla's possible need for additional capital to undertake gas exploration activities in the Deep Anadarko Basin.

At the same time, the Commission agreed with Judge Benkin's conclusions regarding the inadequacies of the evidence presented by both the company and Staff. Arkla submitted a DCF market-oriented analysis and comparable earnings evidence to support its requested equity rate of return of 15.32%. The Staff recommended an equity allowance of 11.5% on the basis of a comparable earnings study. The Commission said the company's DCF presentation must be rejected because it related to Arkla's overall consolidated activities, with no attempt to separate the risks associated with the company's utility and nonutility operations. However, the Commission declared, the rate of return to be determined in this proceeding should reflect only the risks of Arkla's natural gas pipeline operations. The Commission found Arkla's comparable earnings presentation to be similarly defective in focusing on a group of integrated gas companies which, like Arkla, engage in retail gas distribution and gas exploration and production operations in addition to natural gas transmission. "The result, again, is a potential distortion in the assessment of risk associated with Arkla's natural gas pipeline operations." The Commission also faulted Staff's comparable earnings study of major Class A and B pipelines for failure to demonstrate that risks of this group are representative of those attributable to Arkla's pipeline operations.

A further issue decided by the Commission in both Opinion Nos. 70 and 71 involves the treatment of gains realized by the two pipelines on long-term debt reacquired before maturity at a purchase price below face value. In each case, the Commission adhered to the policy established in 1970 in Opinion No. 583 (re Manufacturers Light & Heat Co.) which held that all gains realized from the reacquisition of debt securities, irrespective of the date reacquired, must be amortized over the remaining life of the reacquired securities, and that the total amortized amount attributable to the test year must be applied to reduce the utility's cost of long-term debt. Arkla contended that no gain on reacquired debt should be

considered for ratemaking purposes, while Consolidated argued that any adjustment to debt cost should reflect only the gain on debt reacquired after 1/1/74 (the effective date of amended Commission regulations prescribing accounting and reporting treatment for gain on reacquired debt) and that application of the policy in Manufacturers would constitute retroactive ratemaking.

The FERC denied any retroactivity involved in application of the Manufacturers policy since there is no alteration of Commission approved rates for past periods. Rather, "debt reacquisitions prior to the test year are examined only for the purpose of determining the amount of gain allocable to th test year. Gain from reacquisitions which is allocable to periods prior to the test year is not recaptured as a credit against the test year cost of debt. Although past financial transactions of the company prior to the test year are examined (just as past financings are used whenever the embedded cost of debt is calculated), it is solely for the purpose of calculating cost of debt for the test year."

* * * * *

A few days previously, on 1/9/80, the FERC denied rehearing of Opinion No. 68, issued 11/19/79, which affirmed an initial decision determining a common equity rate of return of 12.73% for Kansas-Nebraska Natural Gas Co. (RP78-10). The initial decision concluded that neither the company nor the Staff had presented evidence which supported their specific equity return recommendations of 14.5% and 12.25%, respectively. Consequently, while noting continuing inflationary pressures on the cost of capital and the probability of a continuing long-term downward trend in the company's gas reserves, the Law Judge found no reason to change the common equity rate of return of 12.73% approved in Kansas-Nebraska's most recent rate case (RP77-5). 1/

Application of the 12.73% equity allowance to the settlement capitalization in the RP78-10 proceeding -- 40.5% long-term debt, 7.3% preferred stock and 50.8% common equity -- resulted in an overall rate of return of 10.51%.

In denying rehearing of Opinion No. 68, the Commission rejected Kansas-Nebraska's contention that it had ignored changes in interest rates and inflation since 1976, and had ignored prior Commission precedent. "The Commission is aware of inflation and interest rates, but Kansas-Nebraska has not met its burden to show with specificity how these general market conditions support either a rate of return in the very high range for which it argues, or a complete overhaul of rate of return analysis for the gas industry as a whole." In short, the Commission was unconvinced by Kansas-Nebraska's arguments absent a "nexus between generalized proof and the company's own situation," or a substantial showing that precedent should not be followed.

1/ This equity allowance was part of a rate settlement in the RP77-5 proceeding, which was approved by order dated 7/20/77.

ERA Grants Northern Project to Import Canadian SNG by Displacement at Base Import Price of $3.45 per MMBtu

On 1/15/80 the ERA issued Opinion No. 13 granting an application by Northern Natural Gas Co. (78-002-NG) to import about 10 Bcf annually of Canadian SNG by displacement from Union Gas Co. Ltd. over a five-year period beginning in the 1979-1980 heating season at a base price of $3.45/MMBtu, equal to the current authorized Canadian border price, plus storage charges. Opinion No. 13 was issued on rehearing of Opinion No. 5 (issued 3/8/79) which denied Northern's application to import the Canadian SNG at a cost during the first year (1978-1979) of $3.86/MMBtu escalating to $5.33/MMBtu by the fifth year. In Opinion No. 5, the ERA concluded that the import price was too high and Northern failed to demonstrate significant regional or national need for the SNG supply. In Opinion No. 13, the ERA found that the projected composite import price of $4.01/MMBtu for the 1979-1980 heating season (based upon the current border price of $3.45/MMBtu) compares favorably with the cost of primary alternate fuels in Northern's service area, and the SNG is needed in part to displace fuel oil and thereby reduce U.S. dependence on imported oil.

In December 1977, Northern contracted with Union Gas to purchase volumes equivalent to the aggregate Btu content of SNG which Union had previously contracted to purchase from Petrosar Ltd. The SNG is produced at Petrosar's petrochemical-refinery complex near Sarnia, Ontario using Canadian crude oil as feedstock. Deliveries to Northern -- up to 75,000 Mcf -- were to be made only in winter months (November through March), and Union would store SNG volumes received from Petrosar for Northern's account during the remaining months of each year. It was proposed that deliveries be accomplished through displacement of natural gas volumes to TransCanada PipeLines Ltd. at the Michigan-Ontario border near St. Clair, Michigan for further delivery and sale to Union. On days when Northern requested SNG from Union, TransCanada would reduce its deliveries to Union, and Great Lakes would deliver equivalent volumes by displacement to Northern at existing points of interconnection.

In its application, Northern estimated the average cost of the above supply at $3.86/Mcf (U.S.) during the first year, increasing to $5.33/Mcf in 1982-1983. This rate included both the SNG purchase cost and the cost of the storage service to be rendered by Union. The SNG purchase rate would be determined by formula geared in part to Petrosar's feedstock cost. The storage rates would include a monthly demand charge of $2.25/Mcf multiplied by the difference between the daily contract demand (75,000 Mcf) and the average daily level of deliveries under the Petrosar contract to Union during each month, plus commodity charges of 4.5¢/Mcf for all volumes injected into storage and 4.0¢/Mcf for all volumes withdrawn from storage. No charge was proposed by either Great Lakes or TransCanada for delivery of gas by displacement to Northern.

In Opinion No. 5, the ERA stated that the $3.86/Mcf first year cost projected by Northern is sharply higher than the price applicable to domestic new natural gas under Section 102 of the Natural Gas Policy Act ($2.06 as of November 1978). ERA further noted that (1) the proposed import price exceeded the then current authorized border rate of $2.16/MMBtu, and (2) Union offered the SNG to Canadian distributors at a price lower than the price offered to Northern but received no firm offers. As a further reason for denial, ERA held that Northern did not adequately demonstrate a regional need for the subject gas. ERA made clear that denial of Northern's import application was without prejudice in that Northern was free to restructure its project in a manner likely to satisfy criteria set forth in this and prior ERA import decisions.

In its subsequent application for rehearing, Northern stated that as a result of ERA's decision that the cost of the SNG import was too high, it agreed with Union to "a substantially lower price . . . which is demonstrably equitable to U.S. consumers." Specifically, the price to be paid to Union will be the Canadian border export price ($2.30/MMBtu effective 5/1/79), plus 56¢/MMBtu as a storage charge which will remain constant throughout the four-year life of the contract. The 56¢ component is a negotiated charge for storage services to be performed by Union for Northern.

On 5/2/79 the ERA granted rehearing of Opinion No. 5 on the ground that the restructured project may meet the criteria set forth in that Opinion. 1/ (See REPORT NOS. 1149, pp31-32; 1194, pp23-24; 1200, pp18-20; 1204, pp21-23; 1208, pp21-22.)

In Opinion No. 13, the ERA first noted that the base price of $3.45/MMBtu is equal to the current border price established by the Canadian National Energy Board for gas exported to the U.S. designed to equal the substitution value of Canadian imports of foreign crude oil. Previously, the ERA said the DOE has recognized that imported natural gas can have a certain commodity value in excess of normal costs of production, delivery and markup; this has been the case with natural gas imported from Canada since 1974. Moreover, both the U.S. and Canada have recognized that the commodity price established for export sales of gas will not only reflect substitution cost for foreign crude oils imported into Canada, but should be generally competitive with the alternate fuels with which it is competing in the respective service areas.

In order to test this latter point, the ERA contacted energy officials in the 10 states served by Northern to obtain the most current information on wholesale price and type of fuel which competes predominantly with natural gas. That survey, the ERA said, showed that No. 2 fuel oil and propane are the primary alternate fuels in six states, with virtually no No. 6 fuel oil being used therein. No. 2 fuel is a primary alternate fuel in three of the remmaining states, with residual fuel oil used in substantial (although secondary) volumes. The State of Michigan reported Nos. 4, 5 and 6 residual fuel oil as being the primary alternate energy source. The ERA noted that average wholesale prices for No. 2 fuel oil ranged from $4.96 to $7.75/MMBtu; propane varied between $4.20 and $5.08/MMBtu; and residual fuel oil sold for $3.22 to $3.66/MMBtu.

The ERA concluded that while the projected composite import price of the SNG here involved for the 1979-1980 heating season of $4.01/MMBtu is somewhat in excess of the price of the residual fuel oils in the 10-state service area, the proposed composite price compares favorably with the range of prices in which the current primary alternate fuel in the service area -- No. 2 fuel oil -- is selling.

1/ A proceeding in the FERC (CP78-237) is also going forward with respect to rates for sales and storage of the imported SNG. On 9/27/79 Northern submitted a stipulation whereby it agreed to (1) recover through its PGA rate filings the gas purchase costs based on the Canadian border export price, and (2) include in its commodity rate for jurisdictional market area sales (until the effective date of its next general rate increase) a surcharge of $0.0092/Mcf, effective 10/27/79, to recover that portion of the cost applicable to storage service rendered by Union. In subsequent comments, the Staff and others generally supported the stipulation, although the Staff recommended that it be rejected without prejudice to a later filing after the ERA determines whether to permit the import. Alternatively, the Staff would accept the stipulation subject to a different method of computing the storage charge. (See REPORT NO. 1236, pp29-30.)

The ERA authorized import of the SNG at the base price of $3.45/MMBtu, subject to further reivew and authorization for any increase. "A blanket approval of any future change in the Canadian border price for exported natural gas would be inappropriate; accordingly, the composite import price approved here must be reviewed anew if the border price is raised during the term of the import project."

Next, Opinion No. 13 discussed the $0.56/MMBtu charge separately negotiated for specific storage services to be performed by Union for Northern. Northern contended that the current average on-system storage cost incurred to store gas in its company-owned fields is in the range of $0.55 to $0.60/MMBtu -- although no such storage is available for additional supplies. Northern also emphasized that its cost of obtaining lease storage services from other companies would range from $0.90 to $1.10/MMBtu. Hence, while the $0.56 storage fee does not represent Union's cost to store the gas, it is a negotiated price which is consistent with, if not more favorable than, alternative storage services available to Northern.

The ERA stated that as a matter of policy, it will not approve a higher price negotiated by commercial firms where a general commodity-based border price for imported gas is established by the supplying country and approved by the U.S. However, exceptions will be made where the foreign supplier is providing a "special service that is distinct and separate from services which are a normal aspect of production, processing and delivery . . . which would therefore normally be covered in the commodity export price." In this case, the ERA said, Northern adequately demonstrated that the storage service being provided by Northern "is a distinct and separate service that is not ordinarily provided to importers of Canadian gas." First, ERA said, Northern will have the advantage of being able to withdraw the gas supply only during the peak winter months which requires that the SNG be stored during the summer months. "This is a unique service that is not ordinarily covered in the commodity export price." Second, Northern demonstrated that these same storage services would not be obtained in the U.S. at a lower cost.

However, the ERA stressed, Northern did not show that the price proposed to be paid to Union is consistent with its actual costs, and is in fact higher than Union charges its Canadian customers for storage services. Based on such charges, the ERA calculated that the charge to Northern for storing the SNG here involved could be as low as $0.19/Mcf when assessed against the maximum yearly contractual deliveries of 10 Bcf. Furthermore, the ERA added, there is a question of the proper treatment of interest charges which Union incurs on carrying costs associated with storing the SNG which it does not incur for existing storage customers in Canada. Northern proposed to calculate this interest factor on an average unit cost of $4.70 for each Mcf of SNG held in storage. Hence, interest would be determined on the acquisition cost of a single, isolated supply of gas -- the SNG Union purchases from Petrosar -- as opposed to the average acquisition cost of the full supply of gas purchased and placed in storage, despite the standard practice in both countries of computing interest on the average acquisition cost of all gas available for service supply.

The ERA could find "no compeling reason . . . in this case to warrant deviation from this standard." Therefore, the ERA said it will approve a separate storage service charge only on condition that it is the sum of (1) the direct storage costs calculated in accordance with Union's rate schedule applicable to its Canadian customers; and (2) a working capital allowance based on the cost of carrying the volumes of gas held in storage for this project, the average cost of gas acquired by Union for its overall system supply, and the prime bank lending rates prevailing in Ontario, Canada. Opinion No. 13 set forth a specific formula for calculating this working capital allowance.

ERA Cites Uncertainty Over Available Natural Gas Supply in Extending Period for Final Decision on Temporary Exemptions for Powerplants from the Natural Gas Use Prohibitions Under Fuel Use Act

On 1/2/80 the ERA issued notice of an extension of time to 2/15/80 for issuance of final orders respecting temporary public interest exemptions from the natural gas use restrictions of Section 301 of the Powerplant and Industrial Fuel Use Act. ERA cited uncertainty over additional natural gas supplies (due in part to the success of its exemption program and other federal programs) as the chief reason for the extension.

Section 301 of the Fuel Use Act prohibits with certain limited exceptions the use of natural gas as a primary fuel in any powerplant. However, the Act also provided DOE with discretionary authority under Section 311 to exempt certain uses of natural gas. Last April, ERA exercised its authority under that section to formulate a Special Rule establishing procedures to govern applications for temporary public interest exemptions for up to five years from the Section 301 prohibitions on natural gas use. The Special Rule was proposed as a response to the then anticipated shortages of middle distillate fuel oil, given the availability of additional supplies of natural gas at that time. (See REPORT NO. 1204, pp1-2.)

Subsequently, ERA issued notice on 5/11/79 and 6/1/79 of petitions for public interest exemptions filed by some 60 electric utility companies with respect to use of natural gas in several hundred units at over 150 generating stations, and set forth proposed orders granting special exemptions for two years (subject to extension for one to three years). The proposed orders stated that the use of natural gas is preferred over petroleum to the extent that the near-term choice of fuel is limited to these two sources, and that expanded use of natural gas in the powerplants involved would help to reduce U.S. demand for imported petroleum products, protect the nation from the effects of any oil shortages and "cushion the impact of increasing world oil prices." Under Section 701(c)(3) of the Fuel Use Act, ERA has six months after a 45-day public comment period to issue a final decision on petitions for exemptions. The applicable six-month periods would have expired on 12/22/79 and 1/6/80 absent the present extension.

As noted, ERA cited concern over the availability of additional gas supplies as a main reason for its failure to act expeditiously on the exemption petitions. Specifically, ERA declared, additional natural gas supplies are less certain at the present time than at the beginning of 1979 when the Special Rule was first proposed. "This is in large part due to the success of this and other programs over the past several months to displace as much petroleum as possible with available supplies of natural gas." Further, ERA noted some question whether the collective demand for natural gas by users of middle distillates and residual fuel oil with a sulfur content of 0.5% which have already been granted public interest exemptions, or have applications for such exemptions pending, exceeds the available supply.

In view of this uncertainty, ERA said it has thus far processed applications only for those powerplants which will displace middle distillate or residual fuel oil with a sulfur content no higher than 0.5%. No action has yet been taken on other applications, pending completion of an analysis to determine whether the granting of public interest exemptions for powerplants burning residual fuel oil of greater than 0.5% sulfur will jeopardize the ability of powerplants burning lower sulfur residual oil or middle distillates to displace them with natural gas.

ERA invited written comments through 1/30/80 to assist in this analysis. Views are particularly requested on the appropriate scope of the Special Rule in light of natural gas supplies for the foreseeable future, and on what (if any) sulfur levels should be considered in reviewing petitions to use natural gas displacement of residual fuel oil.

FERC Releases Final Draft Rule to Govern Applications for Special Relief Rates Under NGPA; On-the-Record Panel Discussion Scheduled for February 11 Before the Commission to Explore Specific Issues

On 1/16/80 the FERC issued a draft final rule (RM79-67) establishing procedures to govern applications for special relief from maximum permissible ceiling prices under Section 104, 106 and 109 of the NGPA. Written comments are invited on the draft rule by 2/1/80. In addition, an on-the-record panel discussion before the Commission has been scheduled for 2/11/80 to permit exploration of specific issues with persons representing various points of view.

The draft final rule would essentially adopt the same regulatory framework set forth in a proposed rulemaking issued last August. Under this framework, different procedures would apply to the grant of special relief where (1) operation and maintenance costs of continued production from an existing well cannot be recovered if gas from the well is sold at the applicable maximum lawful price, and (2) additional planned investment necessary for continued production or reservoir development will not be made if the producer were held to the applicable maximum lawful price. A public hearing on the proposed rule was held before an FERC Staff panel on 9/26/79, and written comments were submitted by 21 interested parties. (See REPORT NO. 1229, pp12-17.

The draft final rule would incorporate various modifications and clarifications in response to the comments. However, the draft order would continue to exclude "sunk" costs from DCF and other cost computations on which special relief rates would be based. This exclusion of "sunk" was widely opposed by producer parties.

The Commission indicated that four major issues concerning the special relief rulemaking proposal had emerged in the course of deliberations, and that further public comments are requested on these issues.

The four issues relate to: (1) whether any limits should be placed on special relief rates granted by the Director of the Office of Pipeline and Producer Regulation or by the Commission (and, if so, at what levels); (2) whether producers should be allowed to switch from a special relief rate to another incentive rate under the NGPA, or whether such switching should be limited; (3) what procedures should be used for reviewing initially proposed special relief rates on the basis of actual expenditures; and (4) whether a fixed or indexed rate of return should be adopted for planned investment projects.

As noted, the Commission will convene an on-the-record panel discussion on 2/11/80 to explore the above issues. The draft rule has been chosen by the Commission as a vehicle for experimenting with use of the panel discussion technique to obtain public input. Commissioner Hall has been designated to select a panel of representatives with different points of view. Requests to participate in the discussion should be submitted by 2/1/80. Persons wishing to participate should attempt to group themselves on the basis of commonality of interests or provide information that would help in structuring a panel discussion. In addition, Commissioner Hall has been authorized to request the participation of persons whose views may not otherwise be represented but who are not filing written comments. Each

participant in the discussion may present a "very" brief prepared statement on the specified issues and will be asked to respond to questions from the Commission and from other panelists.

The draft final rule will be summarized in a subsequent REPORT.

FERC Schedules Prehearing Conference for February 28 on Proposal by Mobil Oil to Build Own Plant to Process Gas Currently Delivered to Getty Oil for Processing

On 1/14/80 the FERC consolidated -- and scheduled a prehearing conference for 2/28/80 -- applications by Mobil Oil Corp. (CI78-497 et al.), American Petrofina Co. of Texas, Joseph I. O'Neal, Jr. and Walter Duncan et al. to abandon their sales of casinghead gas produced from the Reincke and Von Roeder Fields, Borden County, Texas to the East Vealmoor gas processing plant in Howard County, Texas owned by Getty Oil Co., which delivers the residue gas to El Paso Natural Gas Co.

The producers' behind-the-plant percentage-type sales contracts with Getty have terminated (although the gas is still being delivered to Getty for processing) and Mobil now proposes to build its own gas processing plant to handle the volumes for direct sale to El Paso near the same delivery point used by Getty. The four producers and El Paso have agreed to new contracts covering the proposed direct sale of gas to El Paso.

In support, Mobil stressed that its plant will have a lower fuel consumption rate than Getty's plant, which will result in delivery of an additional 95,000 MMBtu per year to El Paso. Mobil also contended that additional competition in the processing industry in this area could stimulate further economic activities which would benefit the public.

In a petition to intervene and request for hearing, Getty responded that the proposed new plant of Mobil will remove about 12% of the input of the Getty plant, which will substantially reduce its economic life, cause premature abandonment, and will constitute an unnecessary duplication of facilities. Furthermore, Getty said, Mobil has no existing arrangements, plants or gathering facilities which would enable it to continue these interstate gas deliveries if the Getty plant fails. Also, Getty stressed, Mobil may intend to justify a higher price for its gas through the abandonment procedure. Getty added that the proposed new plant may not be economically feasible and the fuel efficiencies of both plants would be reduced if either operates at less than capacity.

In its order, the Commission concluded that a hearing should be held to determine whether the proposed abandonments are in the public interest.

Energy Information Administration Reports Only Slight Increase in U.S. Energy Consumption During First Three Quarters of 1979

On 1/4/80 the Energy Information Administration released the second in a new report series entitled "Quarterly Energy Indicators" which revealed that U.S. energy consumption (stated in equivalent amounts of crude oil) during the first three quarters of 1979 was 0.3% higher than during the same period of 1978. Consumption in the third quarter of 1979 averaged 33.9 million b/d or 2.4% lower than consumption during the third quarter of 1978.

The publication contains summary statistics on U.S. energy consumption, production and net imports during the third quarter of 1978 and the first three quarters of 1979, plus information on total energy consumption and shares of energy consumption by fuel type and major economic sector from 1973 through the third quarter of 1979. The first in this new report series was released by EIA on 1/15/79. (See REPORT NO. 1194, p36.)

During the first three quarters of 1979, the EIA report showed: (1) domestic energy production averaged 4.2% more than the same period of 1978 (natural gas production decreased by 3.4%); (2) net imports were 6.3% lower; and (3) natural gas consumption remained about the same. In the third quarter of 1979, gas consumption decreased 1.5% compared with the third quarter 1978 rate.

The natural gas share of total U.S. energy consumption -- expressed in terms of 12-month moving averages of annual rates -- declined from 30.2% in 1973 to 27.3% in 1976, 26.0% in 1977, 25.5% in 1978 and 25.1% in the first three quarters of 1979.

California PUC Terminates Long-Standing Proceeding to Determine Whether Certain California Gas Producers Should Be Regulated as Public Utilities

On 12/18/79 the California Public Utilities Commission terminated, effective 1/17/80, a show cause proceeding instituted in 1976 to determine whether California gas producers supplying Pacific Gas & Electric Co. should be regulated as public utilities. The PUC cited enactment of the Natural Gas Policy Act of 1978 as the prime reason for its determination that "the public interest will not be adversely affected if this proceeding is discontinued without prejudice to its being reopened at a later time should circumstances so require."

The show cause proceeding stems from a CPUC order dated 7/1/75 which granted PG&E a $36.4 million interim rate increase needed to offset increased costs (from 45¢ to 75¢/Mcf) for purchases of California gas. However, because of the lack of "meaningful evidence" regarding California wellhead production costs, the CPUC simultaneously directed its Legal Division to prepare an order to show cause to be served on all California gas producers serving PG&E. PG&E was also warned against further renegotiation of gas contracts during pendency of the proceeding. The show cause order was issued on 5/18/76, and subsequent orders prohibited PG&E from including any price escalation clauses which would provide for a higher price prior to 6/30/80 in renegotiated contracts. (See REPORT NO. 1010, pp23-24.)

No hearings were ever held in the proceeding.

COMMENTS
OF THE STATE OF ALASKA
IN RESPONSE TO
DRAFT SYSTEM DESIGN INQUIRY

The State of Alaska offers the following comments in response to the September 27, 1978 draft report of the Commission's Alaska Gas Project Office in its system design inquiry ("Draft Report"). The work of the Gas Pipeline Office displayed in the draft report is exceedingly useful but further inquiry is necessary. Alaska believes the further inquiry should occur in a hearing context and in the near future. Conversely, Alaska does not believe that the Commission now has the legal or factual foundation to issue an order establishing the system pressure. Alaska's comments will concentrate on the points that call for additional exploration or revised analysis in the near future.

1) One overall assumption, Alaska believes, colors the analysis. The report seems to assume a netback theory, i.e., that the price of the gas is free to rise to "absorb" any operating cost savings a higher pressure line would engender. The Gas Pipeline Office apparently believes that any decrease in transportation costs would automatically accure to the benefit of producers, not consumers. (See, e.g., Draft Report, p. 58).

Whatever the state of affairs previously, the case after passage of the Natural Gas Policy Act of 1978 is different. Section 109 of the Act establishes a ceiling

price for Prudhoe Bay unit gas. No one knows now whether that will be the ceiling price in fact or if a lower price will be all that purchasers of the gas are willing to pay. In either case, a contractual price will be established and that price will be what the producers receive for Prudhoe unit gas. Since the contracts are likely to be completed well before system design is settled, any reduction of operating costs due to higher pressure will not result in higher prices to producers.

For reserves beyond the control 2.0 bcfd, it is not clear what the pricing constraints will be. No one with sound mental health will predict what the ultimate effect of the "incremental pricing" rules mandated by NGPA will be. Even if a netback analysis is correct, producers would receive no more than the legislatively determined ceiling prices even if the cost of competing fuels were higher. Consumers would receive the benefit of greater gas supplies, both directly and indirectly (via industry). Thus, to the extent a netback theory means that higher prices to producers -- limited always by the ceiling prices of the NGPA -- might stimulate the development of new Alaska supplies and encourage conservation, those consequences should be perceived as benefits, not as detriments.

2) The Report also does not perceive any benefits to gas consumers from the added NGL's carrying capacity of higher (than 1200 psig) pressure lines. (Draft Report, p. 59). The Report reveals that the clear difference among

the various pressure systems in terms of the NGL carrying capacity is that a 1440 or 1680 psig line can carry a higher percentage (i.e. greater amounts) of butane. If the butane is left in the gas stream, its presence will raise the BTU value of the gas. Higher pressure operation would result then in the delivery of higher heating value gas. Gas consumers would receive a direct, valuable benefit: higher heating value than they would otherwise receive because of the presence of natural gas liquids not used for petrochemicals. In a sense, the overall quantity of gas delivered, measured in caloric terms, could be increased with higher pressure operation. So, while higher pressure operation offers the promise of lower transportation costs and greater efficiency with higher throughputs, it also may deliver to gas consumers the immediate benefit of higher gas supplies measured in terms of the heating value of the delivered gas. The gas contracts will shed light on this question but there is no present basis for assuming that butane will be stripped and separately sold.

3) One further aspect of the butane question deserves further thought. The Draft Report indicates that those quantities of butane not injected into the gas stream could be transported in the oil line. But the limiting factor is vapor pressure requirements in California. (Draft Report, pp. 15-16, 17). While existing vapor pressure requirements may not be insurmountable, tighter vapor restrictions by California to protect or improve the troublesome air quality of Southern California would prevent an economic

disposition of the butane that could not be transported in the gas line. A higher pressure line reduces or avoids tying disposition of these hydrocarbons to Southern California air quality.

4) The draft report notes that the removal of very high quantities of CO_2, as required by a one percent CO_2 standard, has the effect of reducing the NGL carrying capability of the gas stream and states that the savings on gas conditioning costs from leaving the CO_2 in the gas is more than offset by reduced transportation efficiency (Draft Report, p. 11). Alaska does not believe the latter conclusion is justified. The question of the appropriate CO_2 standard has never been addressed and examined adequately. The recent Parson's study of the conditioning plant suggests that it is cost effective to go to a less restrictive CO_2 standard. A three percent standard would save ten percent of the capital cost of the conditioning plant and could result in a reduction of the cost of service to the consumer by noticeable amounts. At the presentation of the conditioning study to FERC, representatives of ARCO have also suggested that the whole question of CO_2 removal should be re-examined. The State of Alaska believes that at least a three percent CO_2 standard is indicated. Whether this issue is properly explored as part of the system size inquiry, or during the hearings on system facilities applications is not clear, but at least the issue deserves greater investigation because of the possible consequences on reducing the overall cost of this system.

5) Alaska agrees with the comments herein of Atlantic Richfield. Alaska joins those comments in urging a 1440 psig system. As stated above, the additional NGL's carried by a 1440 system could result in immediate benefits to consumers. Moreover, a 1440 system has the promise of more efficient, lower cost operation as higher throughputs occur. Alaska believes the relatively small additional costs are a worthwhile premium for its future. Alaska does not perceive the necessary testing as favoring a 1260 psig have over a 1440 psig design, especially given the absence of solid evidence about the testing that ccurred and that must occur.

6) A historical reference will show how inverted the pressure question has become and why a 1440 line should not delay the project. During the FPC comparative hearing, Artic Gas and El Paso each proposed a 1680 psig line. Only Northwest, when it made its belated entry, proposed 1260 psig with a later increase to 1440. Everyone conceded that a line anywhere above approximately 1000 psig was a new undertaking, but the higher pressure of the El Paso and Arctic lines was not a significant issue although almost everything else was in that hotly contested hearing. A 1680 psig design was not regarded as calling for unusual testing delays or technological advances. Given the support of the Arctic Gas consortium and El Paso, a 1680 psig design represented the choice of a substantial part of the American natural gas pipelines.

The finding of Judge Litt confirms these facts:

> "Arctic Gas, El Paso and Alcan all propose to operate their pipeline systems at maximum pressures substantially in excess of levels currently in use in the industry. Nothing in the record suggests that these higher operating pressures cannot be achieved with pipe adequately designed for the purpose. This is not to say, however, that Alcan can reliably and economically achieve its suggested performance at 1440 psig with pipe ostensibly selected to operate at a maximum pressure of 1250 psig. It is found that the operating design pressures are logical extensions of existing pipeline operations and can be achieved here by those applicants making proposals to operate at the higher pressure." Initial Decision, El Paso Alaska Company, Dockets CP75-96, et al. (February 1, 1977).

If the President's choice had been otherwise, we doubt that any time would now be spent on the appropriateness of a 1680 design. It is true Northwest was selected but that does not change the critical fact that any pressure substantually above 1000 psig is an advance in existing technology. There is no convincing evidence in the Draft Report of the differentials in technology, if any, required for a 1260, a 1440, or a 1680 psig design. Thus, testing a 1440 system may not be significantly different than testing a 1260 system. This is what Exxon's comments state based on their actual experience with the Arctic Gas tests. (Draft Report, p. 17). Alaska suspects that there may be no actual differentials, but, in fact, the degree of technological advance is relatively the same for each as is the testing required. Similarly, the report does not adequately investigate whether there are differences in risks of cost overrun and delay with a 1440 or 1680 line. A risk assessment

is called for rather than reliance on theory. Choice of a 1440 psig design thus may not be radical but nearly as conservative a choice as the novel choice of 1260 psig.

7) We have seen that the operating assumption of the comparative hearing was that a 1680 line was acceptable and could be proven within the necessary construction timetables. There is record material about the testing requirements for the 1680 line which may not have been adequately mined to date. Nonetheless, Alaska recognizes Northwests' historic reluctance to venture above 1260 psig. What Alaska suggests, therefore, is that the Commission carefully examine the 1440 line.*/ The focus of the investigation revealed in the draft report has been on the comparative merits of the 1680 versus the 1260 lines. As indicated above, the 1440 line has considerable merit both in the early and later years of operation. Alaska believes this investigation could be conducted now on a hearing record in advance of the facilities' applications. Alaska does not believe, based on its

---

*/ It has recently come to Alaska's attention that it may be possible to achieve operating pressures approaching 1440 psig by relaxation of the "design factor" for the pipe Northwest proposes to use from .72 to .8. See 49 C.F.R. 192.111. This would not be a substantial change because the "relaxation" is only to the established Canadian standard. A waiver request would have to be presented to the Office of Pipeline Safety but a good case could be made that safety concerns would be satisfied by the relaxed design factor based on the record in Canada. This avenue is worthy of further investigation.

advisors, that the critical constraint or either the financing or planning of the pipeline is a question of system pressure. It is well known to all that gas contracts are a more critical element and that the apparently fragile nature of the gas pipeline financing is due at least as much to externalities to the project as to the project itself.**/

CONCLUSION

Alaska believes very much in the wisdom of proper advance planning for the future. While the Northwest 1260 proposal may appear to be an adequate compromise, based on the lowered expectations of the present, it would very well be less than optimally designed given the potential of Alaskan reserves. The costs of later adding capacity to the gas line are substantial and suggest the advantages of building extra capacity now as an insurance policy.

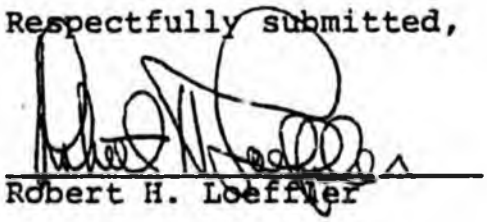
This is the decision reached by the President:

> "overall, considering the art of construction, inflationary impacts, and environmental impacts, the ultimate cost to consumers of providing capacity for increased gas throughout would be much lower if the capacity is provided initially by increasing the diameter or working pressure of the pipe, than if it is provided later by adding compressor horsepower or looping the pipeline." (Decision and Report to the Congress on the Alaska Natural Gas Transportation System, p. 194.)

**/ Alaska believes that it is better to decide the pressure question at a hearing in the near future than to leave the question to be resolved when the applications for the final authorization for these facilities are submitted, perhaps a year or so from now. By then any realistic possibility of increasing system pressure will be foreclosed by the argument that it is too late then to undertake the necessary evaluation and analysis.

For these reasons, Alaska suggests an investigation on the record of what appears to be the obvious advantages of a 1440 psig pipeline and deferral of any order establishing the pipeline's pressure until the completion of such a hearing.

Respectfully submitted,



Robert H. Loeffler

NOTICE OF

APPLICATION

RECEIVED MAR 2 7 1979

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

FERC

Alaskan Northwest Natural Gas Transportation Company) Docket No. CP78-123, et al.

NOTICE OF APPLICATION

(March 16, 1979)

Take notice th t on March 2, 1979, Alaskan Northwest Natural Gas Transportation Company (the Partnership)1/, P.O. Box 1526, Salt Lake City, Utah 84110, filed in Docket No. CP78-123, et al., an application pursuant to the Alaska Natural Gas Transportation Act of 1976 (ANGTA), the Natural Gas Act, the Decision and Report to Congress on the Alaska Natural Gas Transportation System as ratified by Congress (President's Decision) and the Commission's order vacating prior proceeding and issuing conditional certificate of public convenience and necessity, issued December 16, 1977, for an order approving the design specifications and initial system capacity of the Alaskan segment of the Alaska Highway Pipeline Project, all as more fully set forth in the application which is on file with the Commission and open to public inspection.

The President' Decision described the facilities necessary for the construction and initial operation of the system as follows:

1/ The application indicates that the Partnership is successor to Alcan Pipeline Company (Alcan) which filed its application with the Federal Power Commission (FPC) for authorization to construct a 42-inch pipeline in Alaska to be designed and operated at a maximum working pressure of 1260 psig. This proposal was amended to provide additional expansibility by increasing the pipeline diameter to 48 inches at the same design pressure, it is said.

"...The facilities which are to be covered are those in the U.S. which are adequate for a throughput of up to 2.4 bcfd and are included in the revised Alcan filing submitted to the Federal Power Commission (FPC) in March 8, 1977. If any modifications to those facilities are required by the Agreement on Principles between the U.S. and Canada, those modified facilities will also be entitled to the expedited authorization process in Section 9." (p. 13)

"The gas transportation system will utilize a 48-inch diameter pipeline from Prudhoe Bay to James River, Alberta." (p. 13)

"Peak-day capacity utilizing nine compressor stations will be 2.6 bcfd, with an average daily volume of 2.4 bcfd. By installation of intermediate compressor stations, the system could be increased to 3.4 bcfd peak capacity, with an average day capacity of 3.2 bcfd. The system capacity could be further increased by addition to the compressor horsepower at each station." (p. 17)

The Partnership summarizes its position as follows:

The Partnership requests an order from the Commission approving the design specification for the 48-inch pipeline with a maximum working pressure of 1260 psig and compressor station size and spacing for an initial capacity of 2.0 to 2.4 Bcfd expandable by the addition of intermediate compressor stations to an average daily volume of 3.2 Bcfd. This proposal is the same as was submitted to the Federal Power Commission in March, 1977.

The modification of facilities resulting from implementation of the Agreement on Principles did not affect the Alaskan segment of the project. The pipeline design in Canada commencing at the Alaska/Yukon border and continuing 260 miles to Whitehorse, Yukon, is a 48-inch pipeline with a maximum design pressure of 1260 psig; therefore, any increase in pressure of the Alaskan segment must consider the effect on the Canadian section of the project.

There are two reasons that the pressure for the Alaskan segment of the system might be increased. First is the expection that the volumes of gas available from new reserves (other than the presently proven reserves in the Prudhoe Bay Unit) with as reasonable period of time after deliveries commence is high enough that a higher pressure system might result in lower transportation costs over the life of the project. Second is the desirability of carrying

larger quantities of hydrocarbon liquids in the gaseous phase by increasing the design pressure. The State of Alaska has made available to the Partnership a recent proposal by Earth Resources Company of Alaska to move the location of the conditioning plant from Prudhoe Bay to Fairbanks, Alaska. To avoid building any conditioning facility at Prudhoe Bay the pressure of the pipeline system from Prudhoe Bay to Fairbanks would be increased to 1680 psig which, it is claimed, would accommodate all hydrocarbon liquids. At Fairbanks the plant would not only condition the gas for further transportation by removing carbon dioxide and sufficient hydrocarbon liquids to meet the requirements of the design pressure of 1260 psig to be utilized thereafter in Alaska and in a portion of the Yukon, Canada, but also would remove from the stream most of the ethane and all heavier hydrocarbons. These hydrocarbons would either be utilized within the state, such as for petrochemical development, or delivered by a new pipeline system to tidewater (Cook Inlet) for delivery to U.S. or foreign markets. The State of Alaska has requested that the Partnership delay its filing originally planned for February 1, 1979, in order to address the feasibility of this proposal. ...

The Partnership has concluded and will show herein that the proposed system is the best economic selection for delivery volumes up to 3.4 Bcfd and that there is no new evidence that this expansibility above the expected 2.0 Bcfd to be delivered from the presently proven reserves is inadequate.

As to liquid hydrocarbon carrying capacity the following conclusions are pertinent: (1) the pipeline design at 1260 psig can transport all of the ethane and propane that is available from the conditioning plant. The ethane would be the raw material for any in-state petrochemical development; therefore, the system design permits complete flexibility for ethane extraction in the future to meet the State of Alaska needs, (2) the increase in hydrocarbon liquids, primarily butane, that can be transported in the pipeline by increasing the pressure is about 5-11 thousand barrels per day and is a small volume in relation to the total oil and gas energy to be delivered which has alternative beneficial uses on the North Slope of Alaska, and (3) the increased volume of liquids that could be transported must be extracted in Alaska since the design pressure as approved by appropriate regulatory authorities in the first Canadian section is 1260 psig.

The Partnership has analyzed the proposal by Earth Resources Company of Alaska and has concluded that the necessary result of this proposal will render the primary pipeline project infeasible and, therefore, it should not be given further consideration.

In reviewing the design pressure decision the Partnership states that it has considered the following alternatives to the proposed system:

1. A 48-inch pipeline design for a maximum working pressure of 1400 psig. This system would result from the increase in the pipeline safety code requirement of 72 percent of the calculated design pressure to 80 percent. This alternative would require a change in the pipeline safety code or a waiver by the Department of Transportation. A portion of the system which follows the Haul Road would require a double waiver that the Department of Transportation has indicated would not be granted.

2. A 48-inch pipeline with a maximum working pressure of 1440 psig.

3. A 48-inch pipeline with a maximum working pressure of 1680 psig.

It is indicated that the present proposed system provides capacity equivalent to any of the competitive proposals which were considered by the Commission and the President and that the Partnership is not aware of any changes in circumstances or new additional gas reserve potential which would require reconsideration of the ultimate capacity to be provided by the pipeline system within Alaska.

Accordingly, the Partnership requests that the Commission issue an order accepting the design specifications for the system selected by the President for a 48-inch pipeline with the maximum working pressure of 1260 psig providing an initial system capacity of 2.0 to 2.4 Bcfd with expansibility by the addition of intermediate compressor stations up to 3.2 Bcfd for the Alaskan segment of the Alaska Highway Pipeline Project.

Any person desiring to be heard or to make any protest with reference to said application should on or before April 5,1979, file with the Federal Energy Regulatory Commission, Washington, D.C. 20426, a petition to intervene or a protest in accordance with the requirements of the Commission's Rules of Practice and Procedure (18 CFR 1.8 or 1.10) and the Regulations under the Natural Gas Act (18 CFR 157.10). All protests filed with the Commission will be considered by it in determining the appropriate action to be taken but will not serve to make the protestants parties to the proceeding.

Any person wishing to become a party to a proceeding or to participate as a party in any hearing therein must file a petition to intervene in accordance with the Commission's Rules. All persons who have heretofore filed need not file again.

Kenneth F. Plumb
Secretary

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Alaskan Northwest Natural Gas)
Transportation Company)

Docket CP78-123, et al

APPLICATION OF ALASKAN NORTHWEST
NATURAL GAS TRANSPORTATION COMPANY
FOR AN ORDER APPROVING THE DESIGN SPECIFICATIONS
AND INITIAL SYSTEM CAPACITY OF THE ALASKAN SEGMENT
OF THE ALASKA HIGHWAY PIPELINE PROJECT

Alaskan Northwest Natural Gas Transportation Company (the Partnership)[1/] pursuant to the Alaska Natural Gas Transportation Act of 1976 (ANGTA), the Natural Gas Act, the Decision and Report to Congress on the Alaska Natural Gas Transportation System as ratified by Congress (President's Decision) and the Commission's Order Vacating prior Proceeding and Issuing Conditional Certificate of Public Convenience and Necessity issued December 16, 1977, hereby applies for an order approving the design specifications and initial system capacity of the Alaskan segment of the Alaska Highway Pipeline Project.

In support thereof the Partnership would show as follows:

I

Background

The President's Decision issued by the President of the United States on September 22, 1977, and approved by Congress on November 22, 1977,[2/] described the facilities necessary for the construction and initial operation of the system. This identification of facilities was required in Section 7(a)(4) of ANGTA. The President's Decision provided that:

1/ The Partnership is successor to Alcan Pipeline Company. Alcan filed its application with the Federal Power Commission on July 9, 1976, for a 42-inch pipeline in Alaska to be designed and operated at a maximum working pressure of 1260 psig. This proposal was amended on March 8, 1977, to provide additional expansibility by increasing the pipeline diameter to 48 inches at the same design pressure.

2/ Public Law 95-158, 91 Stat. 1268.

"... The facilities which are to be covered are those in the U.S. which are adequate for a throughput of up to 2.4 bcfd and are included in the revised Alcan filing submitted to the Federal Power Commission (FPC) in March 8, 1977. If any modifications to those facilities are required by the Agreement on Principles between the U.S. and Canada, those modified facilities will also be entitled to the expedited authorization process in Section 9." (p. 13)

"The gas transportation system will utilize a 48-inch diameter pipeline from Prudhoe Bay to James River, Alberta." (p. 13)

"Peak-day capacity utilizing nine compressor stations will be 2.6 bcfd, with an average daily volume of 2.4 bcfd. By installation of intermediate compressor stations, the system could be increased to 3.4 bcfd peak capacity, with an average day capacity of 3.2 bcfd. The system capacity could be further increased by addition to the compressor horsepower at each station." (p. 17)

The President's Decision, therefore, adopts the system as proposed by the Partnership subject only to the changes which might result from the implementation of the Agreement on Principles between U.S. and Canada. The Agreement between the United States and Canada on Principles applicable to the Northern Natural Gas Pipeline (Agreement on Principles) provided that a technical study group would be established by the governments for the purpose of testing and evaluating various combinations of pressure and diameter "which would achieve safety, reliability and economic efficiency for operation of the Pipeline" (Section 10). The Agreement on Principles also provided that the decision on pipeline specifications would remain the responsibility of appropriate regulatory authorities.

U.S. and Canadian government technical representatives met in order to carry out the obligations of the Agreement. The final results of these discussions are reflected in the Statement of Position Regarding Selection of Pipe for the Whitehorse, Yukon, to Caroline, Alberta, Segment of the Foothills Pipeline System issued by the National Energy Board of Canada (NEB) on February 17, 1978. The NEB provided that an increase in the design pressur to 1680 psig would require thorough testing

estimated by the Canadian companies to delay the project up to two years. Therefore, the NEB did not change the design specifications for the pipeline segment from the Alaska/Yukon border to Whitehorse from the proposed 48-inch, 1260 psig system and selected a 56-inch, 1080 psig for the segment from Whitehorse, Yukon, to Caroline, Alberta, to accommodate reserves from the MacKenzie Delta region of Canada.

In order to resolve the design specifications for the Alaskan segment of the project the Director of the Alaska Gas Project Office of FERC (the Delegate) issued a report on September 27, 1978, and requested comments from the interested parties. Thereafter, the Delegate provided a period for reply comments and held an on-the-record conference among commenting parties on December 15, 1978. At the conclusion of the conference, the Delegate requested the Partnership to examine what would be involved in increasing the system pressure and whether such an increase is necessary or desirable. The Partnership has completed its review and also at the request of the Delegate, has met with several of the interested parties to present the conclusions of this review. The Partnership is now filing this Application for an order from the Commission to resolve the design specifications for the Alaskan segment of the project.

II

Summary of the Partnership's Position

The Partnership requests an order from the Commission approving the design specifications for the 48-inch pipeline with a maximum working pressure of 1260 psig and compressor station size and spacing for an initial capacity of 2.0 to 2.4 Bcfd expandable by the addition of intermediate compressor stations to an average daily volume of 3.2 Bcfd. This proposal is the same as was submitted to the Federal Power Commission in March, 1977.

The modification of facilities resulting from implementation of the Agreement on Principles did not affect the Alaskan segment of the project. The pipeline design in Canada commencing at the Alaska/Yukon border and continuing 260 miles to Whitehorse, Yukon, is a 48-inch pipeline with a maximum design pressure of 1260 psig, therefore, any increase in pressure of the Alaskan segment must consider the effect on the Canadian section of the project.

There are two reasons that the pressure for the Alaskan segment of the system might be increased. First is the expectation that the volumes of gas available from new reserves (other than

the presently proven reserves in the Prudhoe Bay Unit) within as reasonable period of time after deliveries commence is high enough that a higher pressure system might result in lower transportation costs over the life of the project. Second is the desirability of carrying larger quantities of hydrocarbon liquids in the gaseous phase by increasing the design pressure. The State of Alaska has made available to the Partnership a recent proposal by Earth Resources Company of Alaska to move the location of the conditioning plant from Prudhoe Bay to Fairbanks, Alaska. To avoid building any conditioning facility at Prudhoe Bay the pressure of the pipeline system from Prudhoe Bay to Fairbanks would be increased to 1680 psig which, it is claimed, would accommodate all hydrocarbon liquids. At Fairbanks the plant would not only condition the gas for further transportation by removing carbon dioxide and sufficient hydrocarbon liquids to meet the requirements of the design pressure of 1260 psig to be utilized thereafter in Alaska and in a portion of the Yukon, Canada, but also would remove from the stream most of the ethane and all heavier hydrocarbons. These hydrocarbons would either be utilized within the state, such as for petrochemical development, or delivered by a new pipeline system to tidewater (Cook Inlet) for delivery to U.S. or foreign markets. The State of Alaska has requested that the Partnership delay its filing originally planned for February 1, 1979, in order to address the feasibility of this proposal.3/

The Partnership has concluded and will show herein that the proposed system is the best economic selection for delivery volumes up to 3.4 Bcfd and that there is no new evidence that this expansibility above the expected 2.0 Bcfd to be delivered from the presently proven reserves is inadequate.

As to liquid hydrocarbon carrying capacity the following conclusions are pertinent: (1) the pipeline design at 1260 psig can transport all of the ethane and propane that is available from the conditioning plant. The ethane would be the raw material for any in-state petrochemical development, therefore, the system design permits complete flexibility for ethane extraction in the future to meet the State of Alaska needs, (2) the increase in hydrocarbon liquids, primarily butane, that can be transported in the pipeline by increasing the pressure is about 5-11 thousand barrels per day and is a small volume in relation to the total oil and gas energy to be delivered which has alternative beneficial uses on the North Slope of Alaska, and (3) the increased volume of

---

3/ The State of Alaska has also requested that consideration be given to reducing the cost of the conditioning plant and increasing the hydrocarbon liquid carrying capacity by increasing the allowable carbon dioxide content of the gas. The increase in hydrocarbon liquid carrying capacity is in direct proportion to the increase in carbon dioxide content, subject to fuel balance changes in the plant. Even considering fuel mix changes the liquid increase is relatively minor. This matter is unrelated to the decision of selection of the design pressure and is therefore better left to contractual negotiations between the shippers, producers and State of Alaska which should be occurring in the near future.

liquids that could be transported must be extracted in Alaska since the design pressure as approved by appropriate regulatory authorities in the first Canadian section is 1260 psig.

The Partnership has analyzed the proposal by Earth Resources Company of Alaska and has concluded that the necessary result of this proposal will render the primary pipeline project infeasible and, therefore, it should not be given further consideration.

III

Alternatives Considered

In reviewing the design pressure decision the Partnership has considered the following alternatives to the proposed system:

1. A 48-inch pipeline design for a maximum working pressure of 1400 psig. This system would result from the increase in the pipeline safety code requirement of 72% of the calculated design pressure to 80%. This alternative would require a change in the pipeline safety code or a waiver by the Department of Transportation. A portion of the system which follows the Haul Road would require a double waiver that the Department of Transportation has indicated would not be granted.

2. A 48-inch pipeline with a maximum working pressure of 1440 psig

3. A 48-inch pipeline with a maximum working pressure of 1680 psig.

In considering these alternatives it is helpful to review the proposals of the three projects which were heard by this Commission and ultimately provided the basis for the selection by the President. The Arctic Gas proposal was for a 48-inch pipeline and a maximum working pressure of 1680 psig. The Arctic Gas System, however, contemplated volumes of 2.25 Bcfd from Alaska and 2.25 Bcfd from the MacKenzie Delta region of Canada. Although the MacKenzie Delta reserves did not materialize as expected, Arctic Gas proposed a minimum of 1.25 Bcfd initially increasing to 2.25 Bcfd in the fifth year of operation from the MacKenzie Delta. Therefore, the Arctic Gas project always contemplated total volumes of 3.5 to 4.5 Bcfd.[4/] The El Paso

---

4/ Even though the Alaskan segment (195 miles) of the Arctic Gas project would carry only Alaskan gas the higher pressure syster was selected in order to minimize the number of compressor stations in the Arctic National Wildlife Range.

project proposed a 42-inch pipeline with a maximum working pressure of 1680 psig for volumes of 2.4 to 3.2 Bcfd. The original Alcan proposal contemplated a 42-inch pipeline in Alaska with a maximum working pressure of 1260 psig for initial volumes of 2.4 Bcfd. In order to provide additional expansibility this system was amended to provide for a 48-inch pipeline at the same design pressure for the same initial volume.

These comparisons are significant to show that the present proposed system provides capacity equivalent to any of the competitive proposals which were considered by the Commission and the President. As the Partnership will show, it is not aware of any changes in circumstances or new additional gas reserve potential which would require reconsideration of the ultimate capacity to be provided by the pipeline system within Alaska.

IV

Optimum Design Pressure

In order to select the optimum economic design pressure it is necessary to determine the transportation cost of service at various volume levels and then to analyze the most likely initial volume with a final judgment as to the appropriate expansibility.

A common method for making economic comparisons between various pipeline systems is a graphical analysis as shown on Exhibits Z-4 and Z-5. This type of analysis permits inclusion of all of the variables which affect the cost of transporting natural gas into one common measure, that is, the cost of service per million Btu. These variables include system pressure, compressor station spacing, compressor station size and operation costs, including fuel. Exhibit Z-4 has been prepared based upon capital costs in 1975 dollars as filed with the Commission and adjusted for varying design specifications. A fuel cost of $2.00 per million Btu has been assumed. This fuel cost in 1975 dollars may be high in light of the wellhead price established for the Prudhoe Bay field in the Natural Gas Policy Act of 1978 depending upon action by the Commission to establish regulations concerning the treatment of gathering, processing and compression charges prior to entering the pipeline system. The effect of a lower fuel cost is to increase the volume to be transported at the lowest cost of service for any design pressure. Even though the capital costs are based on 1975 dollars and hence not reflective of current costs, the relative difference in cost of service is still valid for comparison of each system.

Several conclusions are pertinent from this comparison. The minimum cost of service for a 48-inch, 1680 psig system is at a volume of 4.0 to 4.5 Bcfd which is compatible with the original Arctic Gas project proposal. The optimum volume or minimum cost of service for the 48-inch, 1260 psig system proposed by the Partnership is 3.0 to 3.5 Bcfd and is consistent with the Partnership's proposal for ultimately eighteen compressor stations in Alaska for an average daily volume of 3.2 Bcfd. The optimum volume or a minimum cost of service for a 48-inch, 1440 psig system is 3.5 to 4.0 Bcfd. Finally, the point at which the 48-inch, 1260 psig system is equivalent in cost of service to the 48-inch, 1440 psig system is approximately 3.4 Bcfd. Therefore, the 48-inch, 1260 psig system would deliver gas at a lower cost up to this volume.

Exhibit Z-5 has been prepared to show a comparison between a 42-inch, 1680 psig system (El Paso proposed a system of this size and pressure) and the 48-inch, 1260 psig system. This comparison shows that the transportation cost of service is approximately the same with either of these systems throughout the range of volumes transported.

The Partnership concludes that the proposed system without consideration of potential delays is the best economic selection for the Alaskan segment up to a volume of approximately 3.4 Bcfd.

The expected through-put volume is the prime consideration in assessing the expected transportation cost and thereby making the final judgment concerning the system design specifications. The State of Alaska, through its Department of Natural Resources, approved the proposed Producer Operating Plan for Prudhoe Bay in June, 1977. Under the Plan the delivery rate after processing would be 2.0 Bcfd. Providing a pipeline connection to Alaska will undoubtedly result in additional exploration and development and provide substantial additional gas reserves over the life of the project. The timing of these reserves additions is critical to the judgment concerning spare capacity that should be provided in the initial pipeline system.5/ The President's Decision concluded that:

5/ There is no limit to the capacity that can be provided if the pipeline is looped in the future with an additional, integrated pipeline. The issue here is the capacity that can be added with additional compression only.

> "The certain increase in supply from an Alaska gas project is estimated to be 0.7 tcf per year (2.0 bcfd) by 1985. By 1990, a volume greater than 0.9 tcf (2.4 bcfd) might be produced." (p. 90)

Extensive analysis of the proven reserves and deliverability as well as the potential supply was done as part of the FPC proceedings prior to the President's selection. The result of this analysis was expressed by the FPC in its Recommendations to the President dated May 1, 1977, wherein it concluded:

> "... Thus, we find the system should be designed to carry initially 2.0 to 2.5 Bcfd, and be capable of expansion to an additional 1.0-1.5 Bcfd..." (p. I-17)

Utilizing the State approved volume of 2.0 Bcfd, such action taken after the FPC recommendation, the addition of 1.0-1.5 Bcfd of expansibility would result in a total capacity of 3.0-3.5 Bcfd. The proposed ultimate capacity of 3.2 Bcfd for the 48-inch, 1260 psig system is completely consistent with this recommendation.

Subsequent to the FPC recommendation a Report of the Working Group on Supply, Demand and Energy Policy Impacts of Alaska Gas was prepared by several Federal agencies and submitted to the President on July 1, 1977, as part of system selection process. This report estimated that expected additions by 1985 to proved gas reserves in the Prudhoe Bay structure would add deliverability of 0.3 Bcfd (p. 19). The same report contained general estimates of other potential North Slope reserves by three independent groups and concluded that the North Slope is judged to contain major potential reserves (p. 22). The report, however, cautioned that the estimates were not prepared to be used as a basis for pipeline design since exploratory drilling away from Prudhoe Bay is sparse or lacking. The State of Alaska also submitted potential reserve estimates indicating a range of deliverability including the Prudhoe Bay Unit from 2.0 to 4.2 Bcfd with a median of 2.8 Bcfd. These expectations are consistent with the FPC recommendation.

The Partnership is not aware of any developments which would change these prior views and hence urges the Commission to continue to adopt its prior recommendation that the ultimate capacity of the proposed system is adequate.

V

Hydrocarbon Liquids

The State of Alaska has urged consideration of a higher pressure system as a potential advantage to be able to transport a greater volume of hydrocarbon liquids for possible extraction and benefit to the State through development of a petrochemical industry in Alaska. The proposed system can transport all of the material which would be used as a petrochemical raw material that can be made available at Prudhoe Bay and, therefore, does not offer any impediment to the State's present or future plans. The recommended raw material for a petrochemical plant is ethane and the proposed pipeline system can transport all of the ethane or propane that could be available in the gas stream from Prudhoe Bay.

Further, the Partnership believes that the most economic way of selling liquid hydrocarbons, if not used within the State, is by leaving these hydrocarbons in the gas stream and thereby achieving the greatest value for the State.

A higher pressure system would be able to carry some greater volumes of heavier hydrocarbons, primarily butane.[6/] However, these liquids are not useful in a petrochemical plant nor can they be transported in the Yukon, Canada, section of the line which is designed at 1260 psig. Therefore, it is best to retain these liquids on the North Slope for use as fuel, blending with the oil or reinjected into the reservoir.

The Partnership, as requested by the State of Alaska, has analyzed the impact of moving the conditioning plant from Prudhoe Bay to Fairbanks, Alaska. The Partnership has determined that if most of the ethane and all heavier hydrocarbons were removed at Fairbanks the total deliverable energy through the project would be reduced by 20% to 25%. This substantial reduction would render the project infeasible. First, the transportation costs would increase in about the same proportion, thereby jeopardizing the marketability of the remaining gas. Second, the volumes of gas would become small enough that potential purchasers would not be willing to undertake the substantial risks of this project for the supply to be made available.

6/ The increase is about five to eight thousand barrels per day at 1440 psig and eleven thousand barrels per day at 1680 psig which is less than 5% of the total liquid volumes in the raw gas.

The hydrocarbon liquids that would be extracted at Fairbanks, Alaska, as suggested by Earth Resources Company of Alaska would be about 168,000 barrels per day. In contrast, a world scale ethylene plant producing about one billion pounds of ethylene per year requires less than 30,000 barrels per day of ethane. Therefore, even assuming that petrochemical development is feasible there would be over 138,000 barrels per day (less plant fuel) of ethane and other hydrocarbons to transport to tidewater and market.7/ It simply does not make economic sense to extract a substantial portion of the stream to be sold as liquids by other means out of the State of Alaska. The most efficient way for the State to receive the highest value for its product that is not retained for use in the State is to keep it in the gas volumes to be sold through the Alaska Highway Pipeline Project.

The Partnership recommends that the selection of the 48-inch, 1260 psig system should not be revised due to hydrocarbon liquid considerations and that no further consideration should be given to moving the location of the conditioning plant to Fairbanks, Alaska.

VI

Financing Considerations

The selection of design pressure is not only contingent upon the ultimate capacity and transportation costs as analyzed in this application but also the resulting effect on project financability. The President's Decision requires that the Alaska Natural Gas Transportation System be privately financed. The Natural Gas Policy Act of 1978, recently passed by Congress, contains provisions which will assist in accomplishing the private financing of the project. Other matters remain to be resolved including: (1) issues of an incentive rate of return, as presently being addressed in the proceeding in Docket No. RM78-12; (2) approval of the cost of service tariff; and (3) the financial participation of each of the project beneficiaries including the project sponsors, the State of Alaska, major equipment suppliers and the producers. Resolution of these matters represents formidable financing tasks to be undertaken in the immediate future.

7/ Both Bonner & Moore (report dated January 23, 1978, prepared for the State of Alaska on the Utilization of Royalty Gas) and Earth Resources have stated that the feasibility of a petrochemical plant is only possible if all of the hydrocarbon liquids are extracted in order to reduce the unit cost of extraction even though only a small volume is needed for the petrochemical plant feedstock.

Recognizing this financing challenge, the Partnership believes that the imposition of a technological and cost-overrun risk, by increasing the pressure level of the system beyond the point which lenders believe is reasonable, will jeopardize an already difficult financing task. The reduction of volume if all hydrocarbon liquids are extracted would also jeopardize project financing. Imposition of these substantial additional risks is unnecessary since the potential benefits do not appear to outweigh the economic disadvantages, even without consideration of the added burden of financing difficulties. The position, from a financing viewpoint, has been described in the letter from Mr. Michael Stanfield, Vice President of Loeb, Rhoades, Hornblower & Company (Exhibit Z-6 attached hereto).

VII

Meetings With Interested Parties

The operating partner of the Partnership (Northwest Alaskan Pipeline Company) has met with certain of the parties interested in this decision. Meetings were held with representatives of the State of Alaska, Atlantic Richfield Company and the Department of Transportation. The information and conclusions described in this Application were reviewed with each party. No questions arose or new information which alters the Partnership's conclusions as to the appropriate design specifications.

VIII

The names, titles and mailing addresses of the persons to whom all correspondence and communications concerning this Application should be addressed are as follows:

Darrell B. MacKay
Vice President
Northwest Alaskan Pipeline Company
1801 K Street, N.W.
Suite 901
Washington, D.C. 20006

Jack D. Bachman, Esquire
General Counsel

Salt Lake City, Utah 84110

Rush Moody, Jr., Esquire
Akin, Gump, Hauer & Feld
1155 15th Street, N.W.
Washington, D.C. 20005

WHEREFORE, the Partnership respectfully requests that the Commission issue an order accepting the design specifications for the system selected by the President for a 48-inch pipeline with the maximum working pressure of 1260 psig providing an initial system capacity of 2.0 to 2.4 Bcfd with expansibility by the addition of intermediate compressor stations up to 3.2 Bcfd for the Alaskan segment of the Alaska Highway Pipeline Project. The Partnership urges the Commission to approve the order requested herein as soon as possible in order to avoid delay and eliminate uncertainty so that the Partnership may proceed with the steps necessary to finance and construct the system. The Commission has already recognized the importance of such expeditious action in its comments on the President's Decision where it stated that:

> "... Expeditious resolution of the pipe selection is of great importance to the Commission because final certification cannot proceed in its absence." (p. 64)

Respectfully submitted,

Darrell B. MacKay

Mr. James W. Allen
Vice President - Finance
Northwest Alaskan Pipeline Company
Post Office Box 1526
Salt Lake City, Utah 84110

Dear Jim:

I would like to respond to your questions regarding the effect higher pressures might have on the financing of the Alaska Gas Project. As you know, throughout the proceedings we have felt that if sufficient conventionality is maintained, the Project could be financed on a project financing basis. This viewpoint has been premised on the Project obtaining the two basic fundamentals of project financing - technical feasibility and economic viability.

I understand that various parties are suggesting that Alaskan Northwest should consider redesigning to a higher pressure (such as 1680 psi). If the fundamental financing structure is changed so that ironclad guarantees from other parties are made available for the Project's debt, then such a redesign is possible. However, if the Project is to be project-financed in a manner consistent with the President's Decision and Report, a substantially different design scenario is highly unlikely to be accommodated by project financing. Let me explain why with references to the fundamentals discussed above.

"Technical feasibility", in lenders' minds, may be paraphrased as "proven technology". Lenders loan money at commercial borrowing rates not at entrepreneurial risk rates. Accordingly, they do not take technological risk. The following examples illustrate the technological step out associated with 1680 psi:

1. The commonly used operating pressures for gas transmission lines does not exceed about 1200 psi worldwide,

2. A major project recently built in Iran was planned at higher pressures, but was redesigned and built at 1100 psi. I understand that the lower design was used due to the fear of ductile fracture. Such risk is compounded in the Alaskan climate

3. Currently no large diameter transmission lines operate at 1680 psi.

4. Exxon and Shell are currently building a line in the North Sea which will operate initially at 2160 psi; however, this line is a blow-down line (decreasing pressures without compression) which operates above 0° C. and which was not project financed.

Additionally, the Canadian participants in the Alaska Gas Project have been profoundly opposed to higher pressures from the outset. The burden of trying to convince lenders to the Alaska segment to assume a technological risk that the equity participants in Canada will not accept is not practical. Lenders will not step substantially into untried technological territory in a project financing of this magnitude.

Let me now turn to the economics of the Project. Lenders and equity holders must view the Project on the basis of the currently proven reserves, not on the basis of projected reserves. Additionally, the cost of service effect of additional capacity availability without additional throughput will endanger the economics of the Project. Lenders will recognize that the current design plan is consistent with both the FERC (at that time, FPC) and U.S.G.S. recommendations.

This Project currently is burdened with all too many unknowns and variables. To add the risk associated with possible excess capacity to the Project will further complicate financing.

Further, one must consider the equity holders' position. The equity holders are currently subject to a reduction in the return on the equity component of the capitalization in the event of service interruption or throughput declines. If the perceived fear of interruption is higher under the higher pressure case, then the chances of equity holders taking the same degree of risk at 1680 psi as at 1260 psi is small. In other words, absent some sharing of risk by consumers and FERC, I question the enthusiasm equity partners will indicate towards investing in the higher pressure system.

In conclusion, I would like to make a general comment. Over the life of this Project, we have strived to imaginatively structure the financing to provide for private financing. However, lenders

will only take a limited amount of risk, and we cannot expect the lending community to break from traditional rules to finance this Project. I urge you to strongly indicate our concern that a substantial technological jump cannot be achieved in the Proje t if private financing, as currently planned, is to be achieved.

Sincerely yours,

MICHAEL R. STANFIELD
Vice President
LOEB RHOADES, HORNBLOWER & CO.

CERTIFICATE OF SERVICE

I hereby certify that I have this day served the foregoing document upon each person designated on the official service list compiled by the Secretary in this proceeding in accordance with the requirements of § 1.17 of the Rules of Practice and Procedure.

Dated at Washington, D.C. this 2nd day of March, 1979.

FERC –
Pipeline Design
+ Capacity –
Comments of
AK
4/15/79

FERC

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Alaskan Northwest Natural Gas Transportation Company--- Pipeline Design and Capacity	)))	Docket No. CP78-123, et al.

COMMENTS OF THE STATE OF ALASKA

The State of Alaska ("Alaska") offers the following limited comments on the Delegate's Report on pipeline size and operating pressure for the Alaska segment of the Alaska Natural Gas Transportation System. Alaska adopts its comments filed April 5, 1979, as amplified and modified below.

Alaska recognizes, and appreciates, the Commission's concern for expeditious resolution of the issues surrounding the Northwest project. To a significant degree, Alaska shares the desire of the Commission for rapid decision making. For example, although Alaska had different views on the incentive rate of return than the Commission adopted, Alaska recognizes that the issues -- for the most part -- were matters of judgment and policy, ones that even if Alaska had had more time to comment, the final decisions were still within the Commission's discretion.

But in some areas quick and summary resolution is not compatible with either fairness or accuracy. Although a rulemaking proceeding can swiftly clear away non-contested areas, or resolve matters that will always be, in the last resort, subjects of the Commission's discretion, it simply cannot paper over serious questions of fact. When, during comments on rulemaking, a serious and substantial question of fact arises, the Commission cannot choose the assertions it wishes to believe. Not only will wishing not make it so, but also Commission policy and judgment will most probably not be realized in fact. One such question of fact arose during the comments on the CO2 standard concerning lower-48 practices. The actual practice in the lower-48 not only affected the allocation of costs between the Project and the producers, but also influences the Commission policy not to burden on lower-48 consumers with unnecessary costs.*/

---

*/ For example, to the extent that CO2 is 'removed' from LNG storage in the lower-48, the removal at Prudhoe Bay is simply an extra cost that may be borne by lower-48 consumers.

One other factual problem which also is of the same nature has arisen in this proceeding, relating to liquids carriage and the location of the conditioning plant.

Alaska has consistently taken the position that one of its prime concerns, and a concern of significance to the Commission, is preserving the option of maximum liquids transportation. And, related to this is the primary concern of both the Commission and Alaska that the entire system, both the conditioning plant and the pipeline, be constructed in the most efficient and least expensive manner practicable.

Unfortunately, a major component of the entire system's cost has not been adequately considered by the Commission. As a result, this Commission lacks complete information on not only a key feature in the design of the entire system, but also a major component of the financing cost of the entire project, and of the quality of the gas and gas liquids that could be made available not only to Alaska but lower-48 consumers as well.

In addition, lack of detailed information has severely hampered Alaska in deciding whether, to what degree, and on what conditions it will actively support this Project. Alaska even has a problem in deciding what it could trade-off if such trade-offs became necessary, because of confusion in the record and elsewhere as to what is practically available to all parties.

For these reasons, and in light of the Delegate's comments in his report on liquids' questions, Alaska wishes to present here an outline of its understanding of the "facts" of liquids' transportation, and some of the questions it has, and asks the Commission or other parties to correct on the record any mis-impressions Alaska may be under.

Alaska understands that a 1260, 48", 1% CO2 line could, as a practical matter, transport all the ethane, all the propane, and up to 25% (9,000 bbl/day) of the butane that could potentially be made available from Prudhoe Bay Unit.*/ Alaska also understands that raising the CO2 content of the pipeline will not significantly increase the liquids' carriage of the line, except insofar as more mcf's overall are transported.

With regard to liquids, however, the question is whether the maximum amount of liquids will be made available at the inlet

---

*/ Alaska understands that the chart attached as Exhibit B to our reply comments, which show a greater amount of butane being able to be transported, is, as a practical matter, impossible to obtain because some pentanes plus will remain with the sales gass, lowering the available capacity for other liquids.

to the pipeline. This is primarily due to: (1) the need for field and local fuel; (2) the need to supply TAPS with fuel; and (3) the process used to strip CO2 from the raw gas.

The Parsons design plans to condition the gas in a two-stage process. First, the gas will be chilled to -30°, which will drop out most of the butane, most of the pentane, about 60% of the propane, and very little of the ethane. The second stage is the removal of the CO2. The process chosen by Parsons is the SELEXOL CO2 removal process, which is a physical absorption system. One effect of this system is that 1/3 of the available ethane will be stripped along with the CO2 and, to the extent CO2 is not put in the pipeline, that ethane is lost to downstream use.

After stripping the CO2, the conditioned gas has a severely reduced liquids' ratio: ethane is reduced from 6.48% to 4.47% (with the remaining ethane mixed up with the CO2); propane is reduced from 3.48% to .08%, and butane is reduced from 1.66% to .03%.

At this point there are possible reblendings of the stripped propane and butane back into the conditioned gas before it enters the pipeline. This does not apply, however, to the lost ethane, which follow the extracted CO2.

Under the Parsons primary blending plan, 40 MMSCFD with a BTU content of 858 will go to TAPS, 399.4 MMSCFD with a BTU content of 825 will go for field fuel, and 192 MMSCFD with a BTU content of 475 will be used for local turbine fuel, and 56.7 MMSCFD with a BUT content of 212 will be used for local heater fuel. Except for TAPS fuel, the primary source of the field and local fuel will be the CO2/ethane stream, spiked as necessary with propane to reach the higher BTU requirements as necessary. Butane apparently is unacceptable for spiking pruposes, primarily because of surging.

Because of the need to spike the CO2/ethane stream to variously higher BTU contents, under half of the available propane will be injected into the sales gas stream. (24,270 bbl/day out of an available 52,350 bbl/day).

Although a rise to a 3% CO2 level would increase the propane in the pipeline gas by about 15,000 bbl/day, the amount of ethane would stay about the same, and the amount of butane would decrease (because more propane would take up the available space).

The major remaining problem is disposition of the butane. Since butane will not be used for field or local fuel, the only remaining place for butane is: (1) pipeline gas, (2) TAPS; or (3) reinjection. One problem with a 1260, 48" line is that even with the reduced amount of propane made available, at least 15%

of the butane cannot be placed in the gas pipeline. But in order for the butane to be transported through the TAPS line, the oil must be cooled substantially to meet the vapor pressure requirements of both the TAPS line and California. This requires field costs of approximately $60 million, along with additional costs in TAPS for the increased wax-buildup and other problems.

Therefore, it appears to Alaska that if present plans progress, the option of liquids' transportation sufficient to make a petrochemical industry feasible even if the option were more attractive in the future than now is severely, if not fatally, hampered. The selection of a physical, rather than chemical, absorption process is one problem. A chemical process could make available all the ethane, not just 66%; however, a chemical process, Alaska has been informed, requires 10-15% more fuel, is more expensive, and will have some adverse effects in meeting the field and local fuel problems. Although the field is designed to take alternatives to the proposed fuel stream, even if, say, methane is used, the present CO2 process would have to be completely changed to recover all the ethane.*/

Second, even if the conditioning plant could provide the line with all it could handle, most of the butane would be lost to the gas stream. Further, a substantial portion of butane is lost under any scenario for blending of the liquids.

Third, the location of a conditioning plant is also an issue; the material to be submitted by Earth Resources (i.e., the Litwin Study), indicates that substantial savings may be possible by locating the conditioning plant at Fairbanks and building a higher pressure line from Prudhoe to Fairbanks. Although Alaska recognizes that there would be added costs as well, and that it may be that when all problems are considered, including such things as field fuel, CO2 disposal, the accuracy and applicability of the Litwin study, etc., a conditioning plant at Fairbanks is infeasible, Alaska is not satisfied that the matter has even been addressed in any rigorous manner, although it hopes that it will be either here or in the environmental analysis to be conducted.

If there is to be any possibility that Alaska will participate in pipeline financing, the action must not only be economically attractive, but also politically and popularly attractive to the citizens of the state. One of the hopes of a major segment of the Alaska citizenry is the possibility of a major liquids'

---

*/ This is not to say that the Commission has jurisdiction over the plant but only to suggest a total system approach is lacking.

extraction and petrochemical facility in the Interior. In addition, although the present prevailing wisdom is that a petrochemical facility based upon the gas stream is economically infeasible, no one can predict the petrochemical future in the next 10 years, much less over the major portion of this pipeline's life.

Alaska believes that, where possible, the option of future liquids' transportation sufficient to support a petrochemical industry be kept open. Unfortunately, given both this Commission's present speed-up and the piecemeal resolution process, an overall resolution of all the competing problems if the present course continues is highly improbable.

Alaska would suggest that where problems like this arise, the Commission either hold hearings on particular factual matters where a factual conflict appears on the record; conduct an independent investigation to ascertain the correct answer; or devise some means of resolving the conflict rather than arbitrarily picking or choosing. Second, Alaska would also suggest that the Commission consider on the record matters which may not be directly before it in a narrow sense, since everything the Commission does impacts upon many other matters, such as financing and liquids, so that parties may have a complete understanding of where they stand and can make changes based both upon that understanding and upon an assurance that the Commission has considered their particular problems in some detail.

Finally, with regard to a final order on pressure and size, Alaska, without answers as to the relative expense of a conditioning plant at Fairbanks, the trade-offs of the costs of a higher pressure line, higher CO2 content, alternative CO2 removal systems, and other matters, cannot take an unconditional position. Neither, Alaska believes, can the Commission.

Respectfully submitted,

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Alaskan Northwest Natural Gas) Docket No. CP78-123, et al.
Transportation Company)

COMMENTS OF THE STATE OF ALASKA ON THE DESIGN SPECIFICATIONS AND INITIAL SYSTEM CAPACITY OF THE ALASKAN SEGMENT OF THE ALASKA HIGHWAY PIPELINE PROJECT

The State of Alaska ("Alaska") offers the following comments on the application of Alaskan Northwest Natural Gas Transportation Company ("the Partnership") for an order establishing the size and pressure of the Alaskan segment of the Alaska Highway Pipeline Project. The application, which was placed on public notice March 16, 1979, seeks an order establishing a maximum working pressure of 1260 psig and a size of 48-inches for the Alaskan segment.

As both the application and notice of application properly state, Alaska has been closely concerned with the possibilities for productive use within Alaska of natural gas liquids from the North Slope. This concern reaches not only the liquids' carrying capacity of the line, but also the location of the conditioning plant as it is affected by size and pressure considerations. And, Alaska has always favored the common sense approach of planning now for the future so that the line as built will be able to carry additional gas reserves should they become available. Alaska has worked closely with the Partnership to resolve these issues without foreclosing any realistic opportunities that would favor the utilization of liquids in Alaska.

As part of this effort, Alaska requested of the Partnership confirmation of the statement in the application that the proposed pipeline can transport all the ethane and propane that could be available in the gas stream from Prudhoe Bay. A copy of Alaska's request is Exhibit "A" hereto. The Partnership promptly responded by letter of its Vice President, Regulatory, Environmental and Civic Affairs. A copy of the response is Exhibit "B" hereto. Alaska requests

that the exchange of correspondence be brought to the Commission's attention when it acts upon the application.[1/]

Alaska has reviewed the application and associated material and has made the following assumptions as to the scope of the Order requested by the partnership.

Based on the representations of the Partnership stated in Exhibit "B," Alaska is presently satisfied that its concerns with liquids' carriage do not conflict with the entry of the requested order establishing size and pressure. If, in the future, other professional data should become available to Alaska which seriously conflicts with the representations in Exhibit B, Alaska then would have to consider whether to seek an appropriate procedure for the satisfactory resolution of the conflict. Alaska does not seek such a procedure now and does not expect to seek one in the future.

Alaska also shares what it believes is the operating assumption of all concerned: that the conditioning plant will be located at Prudhoe Bay. Alaska believes that all recognize that this matter will not be settled until gas sales contracts are negotiated and the Commission releases an Environmental Impact Statement concerning the alternative locations and configurations of the conditioning plant. If the contracts or the Environmental Impact Statement (or both) should establish that a place other than Prudhoe Bay is the most desirable site for the conditioning plant, or that a different configuration for the plant is more desirable, the Commission would have to ensure that the most desirable alternative were pursued. As part of this effort, the Commission might have to reconsider its pressure decision, at least with respect to the segment between Prudhoe Bay and the preferred site for the conditioning plant.

Alaska also understands that the matter of a minimum Btu requirement for pipeline quality gas will not be considered or established by the Commission in acting upon this application. This may fall within the omnibus tariff proceeding, the gas sales process, or, conceivably, elsewhere.

1/ The Alaska Gas Pipeline Office has conducted an informal inquiry on size and pressure questions. Alaska, among other parties, filed comments and participated in a conference that the Office called upon the subject. The Office also issued a draft report on this subject on September 27, 1978. Alaska recommends that the materials assembled in this inquiry be made a part of the official record of this proceeding.

Finally, Alaska is concerned with the CO_2 standard to be established for transportation of the North Slope gas. Alaska assumes that this matter also is not within the scope of an order establishing size and pressure, but will be resolved in the contracts, in the tariff proceeding, or in an entirely separate proceeding devoted to this question. In its reply comments in RM79-19, Alaska has urged a more liberal CO_2 carriage standard and a specific inquiry devoted to the question of the proper CO_2 standard. Alaska renews this suggestion and urges that it be pursued separately and apart from the conditioning cost proceeding.

Based on the stated assumptions as to the scope of the requested order, Alaska supports the application of the Partnership for an order establishing size and pressure.2/

Vice President
Northwest Alaskan Pipeline Company
Suite 901
1801 K Street, N.W.
Washington, D.C. 20036

Dear Darrell:

The Application of Alaskan Northwest Natural Gas Transportation Company for an Order Approving the Design Specifications and Initial System Capacity of the Alaskan Segment of the Alaska Highway Pipeline Project states that the 1260, 48" line could carry all the ethane and propane, and most of the butanes, that could be made available from the Prudhoe Bay Gas Stream, whether or not the conditioning plant made those amounts available. Application, 9. As you are aware, the amount of liquids able to be transported past Fairbanks is of vital concern to the State. Assuming this to be the case, then many of the State's concerns about the pressure and size of the line are alleviated, for the focus is then shifted to the amount of gas liquids that the conditioning plant will inject into the sales gas stream.

Unfortunately, beyond conclusory statements and summaries, there is no information in any public record which would allow an independent evaluation of your assessment of the liquids question. Since the matter is of vital concern to the State, we request that you make available to us sufficient detailed information which would allow an independent evaluation by a qualified engineer or other professional of the accuracy of your assessment.

Since the matter is of public concern to the State, we intend to make both the independent evaluation and your information a matter of public record.

Thank you for your consideration in this matter.

Sincerely yours,

Robert H. Loeffler

Robert H. Loeffler, Esq.
Isham, Lincoln & Beale
1050 17th Street, N.W.
Suite 701
Washington, D.C. 20036

Dear Bob:

The purpose of this letter is to respond to your request of March 23, 1979, for additional documentation concerning the statement in the Application of Alaskan Northwest Natural Gas Transportation Company for an Order Approving the Design Specifications and Initial System Capacity of the Alaskan Segment of the Alaska Highway Pipeline Project that

> "... the proposed pipeline system can transport all of the ethane and propane that could be available in the gas stream from Prudhoe Bay." (p. 9)

Attached are two exhibits which show the basis for this conclusion. Exhibit I summarizes the volume of liquids which would be transported in the pipeline at a design pressure of 1260 psig without regard to the conditioning plant process. Column (b) shows the gas composition at the point in the field where the oil and gas are separated. This composition was taken from the September, 1978 study report "Sales Gas Conditioning Facilities, Prudhoe Bay, Alaska" by the Ralph M. Parsons Company. Column (c) shows the barrels per day of ethane and heavier hydrocarbon liquids that would be contained in a total volume of raw gas of 2.8 Bcf per day. These calculations are determined from standard densities for each component. The volume of 2.8 Bcf per day is the approximate field production required to deliver 2.0 Bcf per day of conditioned gas in accordance with the Operating Plan approved by the State in June, 1977. Column (d) shows the quantities of liquids that would have to be removed to accommodate the hydrocarbon dew point specifications of -10°F at 1000 psia for the design pressure of 1260 psig. The basis of these calculations is described in connection with Exhibit II. It is important to

note that these volumes are determined without regard to equilibrium calculations related to a specific process. In actual practice some amount of ethane and propane would be removed and some amount of pentanes and heavier components would remain in the gas. This variation does not detract from the conclusion that the pipeline system at 1260 psig could transport all ethane and propane that is available in the raw gas. Column (e) is the difference between Columns (c) and (d) and shows the quantity of liquids that are available for fuel at Prudhoe Bay, for extraction at any point along the pipeline system in Alaska or for retention in the gas stream.

Exhibit II shows the phase envelope for a gas composition based on reducing the carbon dioxide content and removing the liquids shown in Column (d) of Exhibit I but retaining all of the ethane and propane in the pipeline gas stream. As described previously, this composition will be affected by the process utilized to condition the gas. For example, some amount of ethane and propane will be removed from the raw gas and consumed as local fuel irrespective of the gas conditioning process method actually employed. Any such reduction in ethane and/or propane content of the sales gas allows some additional butanes to be carried in the gas pipeline without exceeding the hydrocarbon dew point specification. However, this illustration shows the theoretical maximum amount of ethane and propane that could be made available to the pipeline. It can be seen that this mixture meets the required hydrocarbon dew point specification of -10°F, 1000 psia required to prevent retrograde condensation in the transmission system. A similar phase envelope for a similar mixture was previously submitted by EXXON to FERC April 3, 1978 (Figure 2, Curve 2 of the EXXON response).

We believe that the enclosed information is sufficient for an independent evaluation of these figures by a qualified engineer. I would like to reiterate as stated in our Application that since the recommended raw materials for a petrochemical plant are ethane and propane we are not inhibiting the State's flexibility to develop a petrochemical industry, at any time,

EXHIBIT "B"

if it is feasible. We continue to believe that the State will realize the most value from liquid hydrocarbons that are not utilized within the State by leaving these hydrocarbons in the gas stream for resale as part of the Alaska Highway Pipeline Project. We have no objection to your making this material a matter of public record and believe that it fully supports our position.

Very truly yours,

BILLING CODE 6450-01-M

Federal Energy Regulatory Commission

Advisory Committee on Revision of Rules of Practice and Procedure, Subcommittee on Ex Parte and Separation of Functions Meeting

May 25, 1979

Pursuant to provisions of the Federal Advisory Committee Act (Pub. L. 92–463, 86 Stat. 770), notice is hereby given that the Subcommittee on Ex Parte and Separation of Functions of the Advisory Committee on Revision of Rules of Practice and Procedure will meet on Friday, June 1, 1979 from 1 p.m., at the Federal Energy Regulatory Commission, 825 N. Capitol St., N.E., Hearing Room G, Washington, D.C. The urgency of the subject matter of the Subcommittee's work as well as the unavailability of Subcommittee members after June 8, 1979 requires scheduling of this meeting on June 1, 1979 notwithstanding the abbreviated notice period.

The purpose of the meeting is to prepare a report of the Subcommittee's recommendations concerning *ex parte* and separation of function matters. It is anticipated that the Subcommittee Report will be presented to the full Advisory Committee at a meeting which has been scheduled for June 8, 1979.

The meeting is open to the public. A transcript of the meeting will be available for public review and copying at FERC's Office of Public Information, Room 1000, 825 N. Capitol St., N.E., between the hours of 8:30 a.m. and 5:00 p.m. Monday through Friday except Federal Holidays. In addition, any person may purchase a copy of the transcript from the reporter.

Kenneth F. Plumb,

Secretary.

[Docket No. CP78-123 et al.]

Alaskan Northwest Natural Gas Transportation Co.—Pipeline Design and Capacity; Notice of Delegate Report and Order Inviting Comments

Issued May 17, 1979.

The Commission is issuing for comment a report submitted to it by its Alaskan Delegate. The report discusses the pipeline size and operating pressure for that segment of the Alaska Natural Gas Transportation System (ANGTS) which is to be constructed in Alaska by the Alaskan Northwest Natural Gas Transportation Company. In addition to other applicable law, this order is issued pursuant to the mandate of Section 9 of the Alaska Natural Gas Transportation Act, 15 U.S.C. § 719(g), and the President's *Decision and Report to Congress on the Alaska Natural Gas Transportation System (Decision)*, which mandates expeditious resolution of the matters discussed in the Delegate's report.

A. Background

On March 2, 1979 the Alaskan Northwest Natural Gas Transportation Company (Alaskan Northwest) filed with the Commission an application for an order to approve design specifications and initial system capacity for that portion of the ANGTS which is to be built by the applicant.[1]

Pursuant to Commission regulations, notice of the application was issued on March 16, 1979. Alaskan Northwest requests prompt action on its application so that it may proceed with steps necessary to financing and constructing the portion of the ANGTS for which it is responsible.

The Alaskan Delegate has submitted to the Commission a report concerning the diameter and maximum allowable operating pressure of the pipeline which is the subject of Alaskan Northwest's application. With respect to the design of the gas pipeline, the Delegate's report states that a 48-inch diameter was determined under the terms of the *Decision*. The Delegate's report states that with respect to the issue of what the maximum allowable operating pressure of the pipeline should be there is a three-fold question: given the extensive record already compiled in this proceeding,[2] whether significant new evidence is available on likely throughput volumes from the North slope which would be served by this system since the time of the *Decision* that would suggest that an operating pressure of greater than 1260 psig should be authorized. The Delegate states that he believes there is no new information and that the Commission should authorize a maximum allowable operating pressure of 1260 psig for the pipeline.

The Commission is issuing the Delegate's Report for comment by all parties of record in this proceeding. Comments should be filed by July 2, 1979. The parties may also file comments on Alaskan Northwest's application of March 2, 1979. Any party of record perceiving the need for a hearing to determine either the diameter or the maximum allowable operating pressure of the gas pipeline which is the subject of Alaskan Northwest's application should file a request to that end, by July 2, 1979, specifying the issues to be presented for determination and a brief summary of the evidence which the requesting party would present. The request should include a statement of all issues of material fact allegedly in dispute, and provide a reasonable justification as to why these issues cannot be fairly and adequately resolved on the basis of the record compiled before Judge Litt, the President's *Decision*, and the Delegate's Report.

Finally, the Commission notes that the sole issues that it intends to resolve through the procedures set forth below are: (a) the pipe diameter, and (b) the operating pressure, of the Alaska

[1] The portion involved is that segment of the ANGTS described in the President's *Decision* as lying within the State of Alaska. *Decision* at 6–7.

[2] That record includes the *Initial Decision* of the Commission, *In re El Paso Alaskan Co., et al.*, Docket No. CP75–96, *et al.* (Feb. 1, 1977), FPC *Recommendation to the President* (May 1, 1977), and the *Decision*.

[3] A copy of the Delegate's report is attached to this order. The views expressed therein do not necessarily reflect the views of the Commission.

pipeline segment discussed herein. In particular, the Commission does not intend to decide, on the basis of comments filed in response to this order, the issue of the appropriate CO_2 standard for the gas transported through the ANGTS.

The Commission orders: (1) The Alaskan Delegate will serve copies of this Order, and of his report, on all parties to Docket Nos. CP78–123, *et al.*

(2) Parties of record in Docket Nos. CP78–123, *et al.* may submit comments on the Alaskan Delegate's report, and on the March 2, 1979 application filed by Alaskan Northwest Natural Gas Transportation Company. Such comments may be filed on or before July 2, 1979, and should be served on all parties of record in Docket Nos. CP78–123, *et al.* The comments may address any issue of fact, law or policy pertinent to the matters raised in the report and the application.

(3) Any party of record in Docket No. CP78–123, *et al.* may file, on or before July 2, 1979, a request for an evidentiary hearing to determine the diameter or maximum allowable operating pressure of the gas pipeline described in Alaskan Northwest's March 2, 1979 application. Such request must specify the issues to be presented for determination at such a hearing, including a statement of all issues of material fact allegedly in dispute; a brief summary of the evidence that the requesting party would present; and a reasonable justification as to why such a hearing is necessary and why the issues cannot be fairly and adequately resolved on the basis of the record compiled before Judge Litt, the President's *Decision*, and the Delegate's Report. Copies of the request should be served on all parties to Docket Nos. CP78–123, *et al.*

By the Commission.

Kenneth F. Plumb,

Secretary.

Report of the Alaskan Delegate on the System Design Inquiry

I. Introduction

In his *Decision and Report to Congress on the Alaska Natural Gas Transportation System* the President said, "[t]he gas transportation system will utilize a 48-inch diameter pipeline from Prudhoe Bay to James River, Alberta * * *"[1] except as "* * * modifications to those facilities are required by the Agreement on Principles between the U.S. and Canada * * *." [2]

The *Decision* also said, "[the] facilities * * * are those in the U.S. which are adequate for a throughput of up to 2.4 [billion cubic feet per day] bcfd and are included in the revised Alcan filing submitted to the Federal Power Commission (FPC) in [sic] March 8, 1977." [3]

The report which accompanied the *Decision* went on to say, however, that—

> * * * Alcan should consider increasing the operating pressure and wall thickness of its 48-inch diameter pipeline in order to allow for more efficient increases in throughput rate for additional reserves which might be committed to the system from either Alaska or Canadian sources.[4]

The report also noted that—

> Overall, considering the arctic construction, inflationary impacts and environmental impacts, the ultimate cost to consumers of providing capacity for increased gas throughput would be much lower if the capacity is provided initially by increasing the diameter or working pressure of the pipe, than if it is provided later by adding compressor horsepower or looping the pipeline.[5]

After observing that the Agreement with Canada provides for use by Canada of the main line at a throughput up to 1.2 bcfd, the report concluded "* * * redesign of the system to enable inexpensive expansibility up to 3.9 to 4.0 bcfd south of Whitehorse, Yukon Territory, is essential." [6]

Accordingly, the Agreement on Principles provided for installation of a higher capacity system than that which had been proposed by the project sponsors for the segment which is to carry both U.S. and Canadian gas volumes, to be installed between Whitehorse, in the Yukon Territory, and the bifurcation point at James River, Alberta. The Agreement also provided for a technical study group to evaluate the alternative higher capacity systems which had been discussed by negotiators for the two countries in the course of reaching the Agreement.

U.S. and Canadian government technical representatives began meeting soon after the U.S. Congress approved the *Decision*. U.S. representatives favored a 48-inch pipeline system with a higher maximum allowable operating pressure, 1680 pounds per square inch guage (psig). They thought that the higher pressure system would require an increased investment, but would be more fuel-efficient than one of lower pressure.[7] For their part, Canadian representatives consistently expressed reservations about safety and reliability aspects of the higher pressure system, and the accuracy of the capital cost estimates for it, since it represented a greater technological step away from the present level of maximum operating pressures, which is about 1100 psig. Their preference was always for a larger diameter alternative with the same or slightly lower operating pressure.[8]

Due to the nature of their reservations and the risk of possible delays associated with testing the higher pressure system, the Canadian National Energy Board (NEB) chose a 56-inch diameter, 1080-psig system for the joint-use section. Consistent with all prior statements, their Statement of Position evidenced considerable concern over the safety and reliability aspects of the high-pressure design, plus concern over the adequacy of cost estimates and construction schedules for that system due to increased technological risks.

The Canadian decision also had the effect of narrowing somewhat the options for system design north of the joint-use section, compared to what the options might have been at the time of the *Decision*.[9] The options for the segment north of the Whitehorse then became the 1260 psig system proposed by the sponsoring companies, or a thicker walled 48-inch pipeline which would operate at a higher pressure.[10] The higher pressure choices seem to be the 1680 psig system, which had been the design of one of the competing proposals and has been favored by two of the three principal North Slope gas producers, and (2) an intermediate design which would operate at between

[2] *Ibid.*

[3] *Ibid.*

[4] Report accompanying *Decision* at 193.

[5] *Ibid.*, p. 194.

[6] *Ibid.*, p. 190. "The system" in this context refers to Alcan's March 8, 1977, proposal; the redesign south of Whitehorse refers to the agreement with the Canadian Government to use a higher capacity system between Whitehorse and the bifurcation point.

[7] At higher throughput volumes, the fuel savings more than offsets the increased investment costs of the higher pressure system, resulting in lower unit transportation charges.

[8] Increasing the diameter of the pipeline system for a given operating pressure and throughput rate also increases operating efficiency. However, for the alternative systems evaluated by the technical study group, the larger diameter systems were consistently less fuel efficient than the higher pressure system. Furthermore, the capacity of the larger diameter systems to carry natural gas liquids (NGL's) is less than that of the higher pressure one for any given operating temperature.

[9] The ability of the 56 inch system to transport NGL's limits the NGL's content in the gas stream delivered to it. Thus, increasing system pressure to increase NGL's carrying capacity is pointless beyond the limit imposed by the 56 inch system.

[10] Section 3 of the *Decision*, "identification of facilities included within Construction and Initial Operation' ", specifically references a 48-inch diameter pipeline from Prudhoe Bay to James River, Alberta except as modifications are required pursuant to the Agreement on Principles between the U.S. and Canada.

1400 and 1440 psig. As the lea time associated with full evaluation of either of these higher pressure alternatives could also affect the schedule for project implementation in this country, the Alaska Gas Project Office (AGPO) undertook this inquiry in an effort to facilitate a final FERC decision on the maximum allowable operating pressure.

Our process for studying the pressure question was to discuss it with interested parties and to prepare independent calculations of the expected transportation costs at different throughput rates, utilizing the alternative system configurations. We issued a draft report on the system design on September 27, 1978. We then provided a period for comments on the draft report and held an on-the-record conference among interested parties on December 15, 1978. At that conference I developed a proposition for resolution of the pressure question which served as the basis for the project sponsors' filing of March 2, 1979.[11]

This report summarizes the positions of the parties as expressed in our discussions with them, their comments on our draft report, and their remarks at the conference. It then presents the AGPO's findings and relevant findings in the *Initial Decision* in *El Paso Alaska Company, et al.*, Docket No. CP75-96, *et al.* (hereinafter referred to as the *Initial Decision*), the FPC *Recommendation to the President*, and the *Decision*.[12]

After my draft report had been circulated and comments initially solicited, a study of the required Prudhoe gas conditioning facility,[13] sponsored by a group of producers and pipeline companies, was made available to me. This study has not been formally filed with the Commission, nor evaluated by other experts. However, I believe it to be the most authoritative and accurate compilation and analysis of information available on the requirements for processing and conditioning the Prudhoe Bay gas, a on the characteristics of the sales g stream. As the report was made available to me in my capacity as the Commission's Alaskan Delegate, it appears in my public file and is available for inspection by any interested party or member of the general public in the Commission's office of Public Information.

The results of the study clarified certain concerns, and obviated others, particularly with respect to the disposition of the natural gas liquids (NGL's). I have maintained my description of the concerns expressed to me, but have tried to note the impact of the study results on those concerns as appropriate. I have also added a section to this report which applies the results of the study to the questions being considered here.

II. Positions of Interested Parties [14]

1. *State of Alaska.* Alaska conditionally supports a pipeline with a maximum operating pressure of 1260 psig.[15] Its support is conditioned upon the validity of certain assumptions mentioned in its comments on the project sponsors' March 2, 1979, application, all of which I believe to be true.

The State's principal objectives as expressed to us concerned the developing of an in-state manufacturing base to smooth out the "boom or bust" cycles of raw materials production industries. In the case of the Prudhoe Bay hydrocarbon resources, the State would like to develop a capability to convert some of these hydrocarbon resources into semi-finished and finished products. The State has previously used agreements for the sale of its royalty oil to encourage construction of additional refinery capacity in Alaska. An idea being discussed by State officials was development of a capability to manufacture various petrochemicals, which in part would use NGL's as feedstocks.

The State contracted with the consulting firm of Bonner and Moore for an analysis of the possibility of a world scale petrochemicals plant to be located in Fairbanks. The petrochemicals facility chosen for study would use ethane as a feedstock. At the time we talked with State officials, the State had no specific plans for utilization of propane and heavier NGL's but expressed a willingness to develop such plans if required to achieve their objectives with respect to in-state use of some of the Prudhoe Bay resources.

Additionally, State authorities expressed an interest in maximizing recovery of the total energy resources of the Prudhoe Bay deposit. The modes of disposition of produced hydrocarbons are:

(1) Transportation through the oil pipeline or a new NGL's pipeline,

(2) Transportation through the gas pipeline,

(3) Use within the field as fuel for production and processing and conditioning facilities,

(4) Fuel use for pump stations on the oil line and compressor stations on the gas line,

(5) Reinjection, and

(6) Some combination of the above.

The distribution of the NGL's among these various dispositions is a function of the designs of the oil pipeline and the gas pipeline, and of production and processing and conditioning facilities on the North Slope. It will not be completely settled until the designs for all of these facilities have been finalized. State officials expressed an interest in transportation of the NGL's away from the North Slope in order to deliver them to higher value uses. State officials were also concerned that any disposition of gas or NGL's by reinjection could cause some loss of ultimate recovery of that which is reinjected.[16]

Although the increased ability of the higher pressure alternatives to transport NGL's out of Alaska favors higher pressure, other aspects of the State's overall energy strategy place them beyond the [illegible].

The concern is over the impact of gas production on oil recovery. The State conservation authority now expects that there will be sufficient gas available for sale from the Prudhoe Bay Main Pool [illegible] to support gas sales of 2.0 bcfd. However, there is a small possibility that the total production history of the reservoir will require a reduction in the level of [illegible]. As this possibility is small, as I would accept Boroughs circumstances which cannot

[14] During the course of our investigation, interested parties were submitted written materials, or [illegible] in response to our requests. All of these [illegible] to the official docket of the proceedings [illegible] in all proceedings in Docket Nos. CP78-123, *et al.*, or Docket No. [illegible]. Those [illegible] are available for inspection by any member of the public in the Commission's Public Reference Room [illegible] Commission Order of December 10, 1979.

[15] Alaska's support is based on the Prudhoe Bay Royalty Oil and Gas Leases executed by the Commissioner of the Alaska Department of Natural Resources, the Prudhoe Bay Unit Agreement, and the Prudhoe Bay Unit Operating Agreement. See also Alaska Northwest Natural Gas Transportation Company, Docket Nos. CP78-123, *et al.*

[16] I have no quarrel with the concept of recovery of as many Btu's as is economically feasible, but I do not believe that it is necessary that the same amount of energy could be consumed in the reinjection process as would be provided by the additional oil recovered.

now be foreseen, State authorities cannot say with precision what allowable gas production might be in the event that production experience requires reduced gas sales. Reduced availability of gas would argue for a lower capacity transmission system.

Our principal discussions on these issues with Alaska State officials took place in early February, 1978, before the Canadian Government's decision to utilize the 56-inch, 1080 psig system for the Whitehorse-to-James River segment. Prior to that decision, some consideration was given to a very high pressure (2150 psig) system proposed by Exxon in order to eliminate the need for any gas processing and conditioning facility at the producing area on the North Slope. Moving the processing and conditioning facility to somewhere south of Prudhoe Bay was suggested so as to locate it where costs were less than at Prudhoe Bay. Colocation of such a facility with a petrochemicals manufacturing facility was thought possibly to yield some economies of scale for construction of both. As the State's economic analysis of petrochemicals development was observed to be very sensitive to feedstock costs, we thought that any colocation economies might improve the State's prospects for petrochemicals development. Because of this interest, we discussed the possibility of moving the processing and conditioning facility away from the North Slope with representatives of the North Slope producing companies. These discussions are summarized below.

Alaska observed that a 1400 psig or 1680-psig system can carry a higher percentage of the butanes in the gas phase than a 1200-psig system, other things being equal. Butanes raise the Btu value and, thus, the heating value of the gas. With respect to the disposition of the butanes through the oil pipeline, Alaska noted that California air quality regulations restricting the vapor pressure of crude oil could limit the butane content of crude oil. Because of the potential for air pollution, the vapor pressure of all crude oil entering California must be held to a very low level unless vapor recovery systems are installed for oil storage facilities. Injecting butane into the North Slope crude oil has the effect of increasing its vapor pressure at any given temperature. Keeping the vapor pressure down after butane injection requires cooling the oil which, in turn, could cause wax formation problems in the oil pipeline.

2. *Standard Oil of Ohio (Sohio).* Sohio believes that the maximum operating pressure should be 1260 psig.

At the time of our discussions with Sohio (March 15, 1978), the Canadian Government had made its decision to utilize the 56-inch, 1080-psig system for the Whitehorse-to-James River segment. Due to the hydrocarbon dew point characteristics of the gas stream at those operating conditions, the Canadian decision imposed a requirement for some NGL's removal prior to introduction of the raw gas stream into that Canadian portion of the system. The requirement for some processing and conditioning north of Whitehorse limits the question of where all processing and conditioning should take place.

The Sohio representatives maintained that, although construction costs on the North Slope are high, they are probably lower there than anywhere in inland Alaska, and probably also lower than anywhere in the Yukon Territory. The difference is that coastal locations can be served by barges transporting any large facility in modules, whereas an inland location requires transporting much smaller components with a concomitant requirement for much more extensive onsite assembly.[17] According to Sohio, very large processing and conditioning facilities can be constructed and loaded onto barges in the lower-48 states, where complete fabrication facilities are available and assembly costs are much lower. Any inland Alaska or Yukon location would preclude the use of large modules and would require construction from components small enough to be loaded onto railroad cars or trucks for transportation to the inland location. Assembly of the small components would then have to be done in remote locations of Alaska or the Yukon. The difficulty of extensive assembly in remote locations makes inland locations less competitive with coastal locations. Sohio concluded that, because of the ability to make full use of economies of scale in designing the facility and modularizing it for transportation, the cost of facilities would probably be less for Prudhoe Bay or another coastal location than for any inland location.

Having concluded that Prudhoe Bay is the optimal location for any facility required to be located along the pipeline route north of Whitehorse, the next question was how much of the processing and conditioning should be done there. Except for the very high pressure (2150 psig) alternative proposed earlier by Exxon, transportation of the CO_2, which comprises about 12 percent by volume of the unconditioned gas, is not cost effective according to Sohio.[18] The savings in gas conditioning costs made possible by leaving the CO_2 in the gas is more than offset by the reduced transportation efficiency for the other components of the gas caused by the presence of the CO_2. As the very high pressure system (2150 psig) had been ruled out by the Canadian Government's decision for the Whitehorse-to-James River segment, CO_2 removal is required north of Whitehorse and consequently should be done at Prudhoe Bay.

Once the CO_2 is removed, the ability of the gas stream to transport NGL's is reduced. Thus, operating the gas pipeline system without condensation would require some NGL's removal as a consequence of the decision to remove the CO_2, regardless of whether the 1260 psig or one of the higher pressure alternatives is utilized. The difference between the required processing and conditioning for the 1260 psig and 1680 psig alternatives is in the degree of NGL's removal. The requirement for the 1430 psig system is between those of the 1260 psig and the 1680 psig systems.

The advantages of modular construction suggest that, since some processing is required on the North Slope, it is most cost effective to do all of it there. The CO_2 produced in the course of conditioning the gas may be able to be utilized in combination with extracted NGL's as a low-Btu fuel to power field production operations, processing and conditioning plant operations, or perhaps pumping or compressor stations.[19]

The Sohio representatives saw little to be gained by increasing the operating pressure of the gas pipeline to 1680 psig. They saw no major processing and conditioning savings projected for the 1680 psig system, but additional compression costs would be substantial. Although it is possible that compression

[17] Modular construction not only allows assembly of a facility at a location where costs are lower, but also allows the use of very large processing vessels, enabling realization of considerable economies of scale in facility design and operation. The Parsons study provides some further discussion of the benefits of modular construction.

[18] In its comments on the draft report Alaska argued that it is cost effective to leave at least 3 percent of the CO_2 in the gas stream. A 3 percent standard, according to Alaska, would save 10 percent of the capital costs of the conditioning plant and could result in a reduction of the cost of service to the consumer by noticeable amounts. See also Notice of Proposed Rulemaking and Statement of Policy, Docket No. RM79-10, issued February 2, 1979, wherein the Commission proposes a policy by which producers shall bear the costs of conditioning facilities rather than consumers.

[19] This possibility is developed in some detail in the Parsons study.

facilities other than those currently used as part of oil production would not be required for operations at 1260 psig.[20] additional compression capacity would have to be installed to attain the higher pressure, and operating costs would be significantly increased.

On the other hand, the Sohio representatives felt that the 1260-psig gas pipeline design, plus slight alterations to the oil pipeline, if required, were the most cost-effective solutions to the problem of moving the NGL's. The pentanes and heavier hydrocarbons could be moved through the oil pipeline essentially without alterations; the propanes and lighter hydrocarbons would go through the gas pipeline at 1260 psig. Sohio maintained that between 62 and 75 percent of the butane could be moved through the gas pipeline with the 1260-psig design.[21] Cooling the oil line would be the only alteration required to move the rest of the butane.

Some cooling of the oil line is expected to be required when its throughput capacity is increased from 1.2 million to 1.5 million barrels per day. Sohio argued that the relatively small additional capital investment for additional cooling to allow transporting butanes, plus the very low operating cost of the cooling facilities, would make transportation through the oil line the more cost-effective solution for the remaining butane, particularly when compared to the high investment and operating cost for extra compression to 1650 psig. The extra cooling required to accomodate the butane would be less costly if installed at the time of the increase in oil line throughput capacity.

3. *Atlantic Richfield Company (ARCO).* Arco representatives confirmed what we had heard from Sohio regarding the possibility of moving some or all of the required gas processing facilities away from Prudhoe Bay. It was their view that the decision in Canada to use larger diameter pipe for the Whitehorse-to-James River segment precluded the use of the very high pressure alternative, for which the North Slope processing and conditioning facilities could have been eliminated. Thus, moving any of the required processing and conditioning steps south of Prudhoe Bay would result in some duplication of facilities, as removal of both CO_2 and most NGL's would be required somewhere north of Whitehorse. Arco representatives also concurred with Sohio's judgment that the savings available through modular construction would overwhelm any potential savings in moving facilities to inland locations with slightly more hospitable climates. Their estimate was that construction costs in Fairbanks or Haines, Alaska, would be as much as 50 percent higher than those at the North Slope because of the impact of modular construction.

The Arco representatives were concerned about the ability to dispose of the produced butanes if the lower pressure gas pipeline system were utilized. Their concerns were in the following three areas:

(1) Crude oil vapor pressure limitations in California. (See p. 8 *Supra*.)

(2) The west coast market for petroleum products cannot use additional large quantities of butane.

(3) In considering use of a blend of CO_2 and NGL for field fuel, the Arco representatives suggested that propane was a much better blending stock for the CO_2 than butane. Extremely close Btu control is required for efficient turbine operation, and Arco technical personnel expressed concern over possible problems with condensation in fuel lines and burner orifices if butane were to be used.[22]

The Arco representatives also had some different figures on the ability of the alternative gas pipeline systems to carry butane. Their figures showed the 1260 psig system would carry 25 to 60 percent of the available butane, while the 1680 psig system would carry 50 to 98 percent of the available butane.[23]

We asked some questions about alternative investment costs under different possible gasline system configurations. The figures we received suggested that a reduction in system operating pressure from 1680 psig to 1260 psig would require an additional investment on the order of $100 million (in 1978 dollars), consisting of $30 million in increased processing and conditioning facilities, and $47 to $75 million for some combination of cooling for the oil pipeline, modifications to field fuel facilities, and reinjection facilities if required.[24]

Arco argued in its comments on the draft of this report that the increased natural gas liquid carrying capability of the higher pressure systems would benefit the consumer. Arco argued that even if the transportation costs are lower for a pipeline with a 40 inch diameter which operates at a maximum pressure of 1260 psig and which transports 2 bcfd of gas, a pipeline operating at a maximum pressure of 1440 psig would carry more butanes which would have the dual benefit of providing more Btu's to the gas consumer and reducing the volumes of butanes which would have to be disposed of less economically. Use of butane as a field fuel on the other hand, would require expensive conversion of existing fuel equipment; reservoir injection of liquid butanes could result in the ultimate loss of a significant quantity of these liquids; and transporting butane in the oil pipeline would require cooling the crude oil. Moreover, Arco argued that as long as the oil pipeline is operating at capacity, the transportation of butanes would require a reduction of crude oil shipments or an expansion of the capacity of the oil pipeline.

4. *Exxon.* Exxon has argued that the pipeline should have a maximum operating pressure of at least 1680 psig. Exxon representatives concurred with the opinions of the other two producers that an inland location for any processing and conditioning facility would likely be more costly than locating it at Prudhoe Bay. They also confirmed that the constraint on the butane content of the crude oil is the restriction on crude oil vapor pressure for reasons of air pollution control in southern California.

Representatives of Exxon were involved in the testing associated with the evaluation of safety and design aspects of alternative pipeline system designs which was carried out by the Arctic Gas Study Group. They suggested

---

[20] Both Arco and Sohio pointed out in comments on this report in draft form that the raw gas compression facilities currently being utilized as part of oil production operations may continue to be required to maintain oil production even after gas sales commence. Thus, the availability of existing compression equipment for service in connection with gas sales is not assured.

[21] At the sales gas composition contemplated by the Parsons study, this proportion is even higher. See the discussion below of certain results of the Parsons study.

[22] In fact, the Parsons study concludes that propane injection into the fuel gas mixture is the optimal solution for the control of that stream. The sales gas mixture projected by Parsons has more capacity to transport butane than assumed by Arco, however, because of the reduced amount of propane required to be transported.

[23] See the discussion below of the Parsons study for further information on the NGL carrying capacity of the sales gas stream.

[24] In comments on my draft report, Sohio noted that Arco's $100 million figure must not have taken into account the reduced requirement for investment in sales gas compression facilities if the lower pressure gas pipeline system were utilized. Sohio's comments state:

"The net differential investment which would be required in the gas conditioning facilities and in various Prudhoe Bay field facilities to be compatible with a 1260 psig pipeline system is expected to add considerably less than the $100 MM [in 1978 dollars] estimated by ARCO, even when all butanes recovered are transported in the TAPS line in preference to blending them with the sales gas. Operating costs of oil coolers are also expected to be less than those related to additional gas compression. Sohio's Comments, page 2, October 27, 1978."

to us that there was little real safety difference between the 1260-psig and 1680-psig systems. The real safety question from their perspective is the proximity of either system to the oil pipline. The principal safety issue is what would happen to the oil pipeline in the event of a natural gas explosion and fire.

Exxon's concern in the comparison between 1260-psig and 1680-psig systems was the cost-of-service advantage of the higher pressure system. They had previously advocated a very high pressure (2150 psig) system to increase the cost-of-service advantage even further.

In our discussion with them, they emphasized the highly prospective nature of the Beaufort Sea area and its potential for discovery of additional gas reserves. They favor higher pressure generally because it will result in a more fuel-efficient system at all levels of throughput, and will have a higher throughput capacity with a lower cost-of-service at higher throughput volumes.

5. *Alaskan Northwest Natural Gas Transportation Company (Alaskan Northwest).* Alaskan Northwest is opposed to a pipeline with a maximum allowable operating pressure of either 1440 or 1680-psig. A major source of concern is its belief that a delay of up to 2 years could result from choosing a higher pressure system due to a need for extensive testing of the various components of such a system. The testing program required would include burst tests, test of crack arrestor designs, testing programs to validate valve designs, and lead times associated with high pressure compressor development. A delay of up to 2 years was estimated by the project sponsors to result in additional carrying charges of up to $1 billion.

Alaskan Northwest also shows a cost of service advantage for the lower pressure system at the throughput volumes they expect. The 1680-psig system does not become superior in performance until the throughput rate passes 3.6 bcfd according to its figures in its recent application.[25] Alaskan Northwest maintained that the point at which the 48-inch, 1260-psig system is equivalent in cost of service to the 48-inch, 1440-psig system is approximately 3.3 bcfd. Thus, the company concludes that the proposed system is the best economic selection up to a volume of approximately 3.3 bcfd prior to any consideration of potential delays. In its petition, Alaskan Northwest, citing findings in the *Decision* and the FPC *Recommendation to the President*, argues that 2.0–2.5 bcfd of gas will initially be available to the system and that the system should be capable of expansion by 1.0 to 1.5 bcfd to an ultimate system capacity in the range of 3.0 to 4.0 bcfd. In the application, Alaskan Northwest suggests that Alaska's interest in the development of a petrochemical industry should not dictate a decision in favor of a higher pressure line. Alaskan Northwest argues that the primary raw material for such a plant is ethane and that a 1260-psig system can transport all the ethane that could be available from Prudhoe Bay almost irrespective of the final configeration of any processing and conditioning plant, and therefore does not offer any impediment to the State's plans.

Alaskan Northwest maintains that the oil pipeline represents the most cost-effective way to move any available quantities of excess butane. Although an investment of up to $100 million (in 1978 dollars) could be required for additional processing and conditioning plant investment and cooling, fuel conversion or reinjection facilities, relative to what would be required for the 1260 psig system, a 1660 psig pipeline system would require $237 million more capital investment (expressed in 1975 dollars) than the 1260-psig system.

Alaskan Northwest also maintains that there is plenty of room in the California market for additional butane. Its figures show that California refineries produced about 100,000 barrels per day of butane in 1975. The extra butane left on the North Slope after that which can be transported in the 1260-psig gas pipeline system would be something less than 22,000 barrels per day at a gas sales rate of 2.0 bcfd depending on the components of the sales gas stream,[26] before any allowance for field fuel uses.

Another concern expressed by the project sponsors is the additional safety hazard associated with a higher pressure system. Higher pressure causes higher potential energy to be stored in the pipe, resulting in increased likelihood of damage to the oil pipeline in the event of a gas pipeline rupture. The project sponsors maintain that crack arrestors will be required for the 1440-psig or 1680-psig system, whereas they may not be required for the 1260-psig system.

The project sponsors are also concerned about the vulnerability of the higher pressure system to cost overruns. Their submissions includes a risk analysis of various factors which are likely to cause additional cost overruns with the higher pressure system. They feel that the risk of cost overrun is greatly reduced by staying closer to existing and proven lower-48 states pipeline technology.

Finally, Alaskan Northwest reacted negatively to my proposal discussed at the conference to build a pipeline which would operate initially at a pressure of 1260 psig but whose operating pressure could be increased to 1440-psig if there were an increase in gas volumes available for transporting. It argued that a pipeline should be operated at its maximum design pressure. It also noted that delay would be caused by the need to test such a system.

6. *The U.S. Department of Transportation.* Noting that it is a basic tenet of transportation system planning that a system should be designed to accommodate future growth, the Department of Transportation (DOT) argued that all the technical and economic data appear to them to support building a 1680-psig system. Moreover, the availability of capacity resulting from the construction of a 1680-psig system would encourage development and exploration in the total North Slope area. Citing a February, 1978 Technical Study Group evaluation of the 1680-psig system,[27] DOT argued the system could be built and operated safely and reliably.

As noted above, a proposal was considered at the conference to build a pipeline the operating pressure for which would initially be 1260 psig and would be capable of expansion to 1440 psig if there were an increase in gas volumes available for throughput. The concept was to alter the compressors and the spacing of the compressor stations in order not to foreclose the possibility of increasing the operating pressure later on. DOT indicated that its safety regulations required a thicker pipe wall for a pipeline operating at 1440 psig than for a pipeline operating at 1260

[25] "Application of Alaskan Northwest Natural Gas Transportation Company for an Order Approving the Design Specifications and Initial System Capacity of the Alaskan Segment of the Alaska Highway Pipeline," *op. cit.*

[26] The extra butane would be only about 4500 barrels per day at the sales composition projected by the Parsons study. See the discussion of the results of that study presented below. The Parsons study notes that the capacity of the system to transport butane could be increased by leaving more CO_2 in the sales gas, and recommends further study of the most cost-effective sales gas composition.

[27] "U.S. Government Safety and Reliability Evaluation of Different Pipe Size and Pressure Combinations for Alaska Gas Pipeline," attached to February 14, 1978, letter from Don S. Smith, Vice-Chairman of the FERC, to J. G. Stoddard, Chairman of the National Energy Board of Canada, transmitting the U.S. Government's views regarding pipe size selection for the Whitehorse-to-James River segment.

psig, and that it would be reluctant to waive these regulations where the pipeline was built along the Alyeska haul road. A substantial portion of the pipeline in Alaska will be built along the haul road.

III. Results of the Parsons Study

The Parsons study was undertaken by a group of gas producing and transmission companies [28] in order to develop a preliminary design for the facilities necessary to process and condition gas produced from the Prudhoe Bay Unit for transportation through the ANGTS. The principal tasks performed in the course of the study were:

Screening the processes available and selecting processes to recommend for CO_2 removal and hydrocarbon dewpoint control, respectively, and

Developing a process design for processing and conditioning the gas to meet an assumed set of pipeline delivery conditions and quantity and quality specifications.

The study represents a careful evaluation by a consultant to a group composed of both producers and transporters of the optimal distribution of the components of the raw gas stream, for conditions as they currently exist or are expected to exist, among field and process fuel uses on the one hand, and the sales gas stream on the other. The relevance of the study to this inquiry is in the study's indicated resolutions of questions regarding the optimal allocation of the NGL's and the impact of those resolutions on the requirement to transport NGL's away from the North Slope. The study team concluded that a physical solvent process is best for CO_2 removal. A characteristic of physical solvent processes is absorption of a significant quantity of hydrocarbons along with the CO_2. Much of the heavier hydrocarbon content is liquefied during the solvent regeneration process, and can thus be recovered. Significant amounts of ethane and propane remain in a gaseous phase, however, mixed with the extracted CO_2.

Because of its hydrocarbon content, the waste stream from the CO_2 removal process has useable fuel value. The study recommends that this CO_2/hydrocarbons mixture be used as fuel for the processing and conditioning facility itself. Any excess of this mixture over the requirements of the conditioning facility would be utilized in the other facilities at the Prudhoe Bay Unit after appropriate blending with other fuels (particularly propane) for heating value control.

Gas delivery and quality specifications assumed for purposes of the study were:

Delivery volume (nominal), 2.0 bcf.
Delivery Pressure, 1440 psig.
Delivery Temperature (max.), 25°F.
CO_2 content (max.), 1.0 Volume percent.
H_2S content (max.), 1.0 grain/100 SCF.
Hydrocarbon Dewpoint (max.), −10°F at 1,100 psia.
Water dewpoint (max.)., −35°F at 1,100 psia.

These specifications are similar to those which were part of the Alcan filing of March 8, 1977, except for the delivery pressure. The 1260 psig delivery pressure in that filing requires a more stringent hydrocarbon dewpoint standard, −10°F at 1,000 psia.

The results of the Parsons study with respect to allocation of recovered NGL's between fuel uses and addition to the sales gas stream is given in the following table, taken from the study itself:

When combined with the NGL's not recovered from the gas mixture produced by the CO2 removal process, the total allocation of NGL's between fuel uses and sales gas is estimated as follows:

Input (Billion Btu per day)		Sales Gas	Sales Liquids	Sales Total	Field Fuel	Fuel Use as percent of Input
C1	2101.7	1909.0	0	1909.0	192.7	9.2
C2	323.1	163.3	0	163.3	159.8	49.5
C3	249.2	91.4	0	91.4	157.8	63.3

	2955.6	2304.8	129.4	2434.2	521.4	17.6

Source: AGPO estimate from material balances in Parsons study

As can be seen from the table reproduced from the study, the sales gas stream will accommodate almost 98 percent of the recovered butane under the conditions assumed for the study. References to figure 2-1 from volume II of the study, reproduced on the next page, indicates that the 1269-psig system will accommodate 86 percent of the recovered butane, leaving only about 4500 barrels per day of butane for reinjection or transmission through the oil pipeline.

In a section entitled "Future Design Considerations" (Volume I, Section 12), the study recommended that the cost impact of possible alternative specifications for CO2 content and gas pipeline pressure be evaluated for the overall conditioning and gas transmission system. The study observed that a higher allowable CO2 content of the delivered gas will have a "significant" impact on the facilities costs. The State of Alaska has estimated that relaxing the CO2 standard from 1 percent to 3 percent would save 10 percent of the capital costs of the conditioning plant (see footnote 18, supra.). Our reading of the Parsons study would confirm this estimate.

BILLING CODE 6450-01-C

IV. Alaska Gas Project Office Analysis of Alternative Systems

The staff of the Alaska Gas Project Office prepared independent estimates of the capital costs and cost-of-service for the higher pressure systems for comparison with those submitted by Alaskan Northwest. Our results are plotted in figure 1 for a fuel cost of $1.60 (1975 dollars) per million British thermal units (mmBtu). Table 1 presents cost-of-service calculations for fuel prices of $1.00, $1.60 and $2.62 per mmBtu. The computed costs-of-service reflect the different heating values of the gas mixtures which would be transported at the different operating pressures.[29]

As can be seen on figure 1, higher throughput volumes favor one of the higher pressure alternatives. Likewise, table 1 shows that higher fuel costs reduce the threshold throughput rates at which the higher pressure systems have lower costs-of-service than the lower pressure alternatives.

Our method for preparing the capital cost estimates on which the cost-of-service estimates are based was to start with Alaskan Northwest's March 1977 estimates and adjust those estimates for the cost items which would change as a result of utilizing heavier pipe and higher operating pressures. This is essentially the same method utilized by Alaskan Northwest in preparing its capital cost estimates for the alternative systems. The explanatory material at the end of this section presents our capital cost estimates along with a discussion of how they were determined.

Table 2 presents a comparison of our constant-dollar capital cost estimates (excluding compression) for the 1260-psig and 1680-psig systems with Alaskan Northwest's.[30] As the table indicates, the largest difference in the constant dollar capital cost estimates for the 1680-psig system is only about 2 percent of the total estimate. Thus, the two sets of capital cost estimates must be considered very close.

Figure 2 is a plot of the cost-of-service for the 1260–psig and 1680–psig systems utilizing Alaskan Northwest's capital cost estimates, rather than ours. For a fuel cost of $1.60 per mmBtu, us of their capital cost estimates moves the nominal-dollar threshold for crossing over from the 1260 psig to the 1680 psig as the least cost system to 2.9 bcfd from our 2.65 bcfd. In constant dollars, the respective crossover points are closer, both being just under 3.0 bcfd.

Alaskan Northwest has expressed considerable concern over the possibility of delay inherent in a decision to utilize a higher pressure system. Alaskan Northwest has stated that a decision to utilize a higher pressure system would likely result in a delay of 2 years, resulting in an increase in nominal dollar capital costs of at least $1 billion.

U.S. Government technical experts considered this problem when the Canadian Government solicited our comments as input to its decision on pipe size for the Whitehorse-to-James River segment. At that time our experts concluded that some delay for requisite safety and reliability testing was possible, but could likely be avoided. Their conclusion was:

> We are in agreement that testing all three, or even two, pipe designs will delay completion of construction, perhaps for as long as the two years which the Canadians have predicted. Selection of any one of the size and pressure combinations to the exclusion of all others now or within the near future will permit the pipeline applicants to conduct burst test verification and initiate purchase of the pipe earlier in order to complete the pipeline within the time frame described in the U.S./Canadian agreement.[31]

That report went on to say that, although our experts believe that a confirmatory testing program could be designed for the higher pressure alternative which would have very little likelihood of failure, there was more risk of failure for a higher pressure alternative than for a lower pressure one. Specifically, the experts said:

> We recognize that the possibility of delays associated with testing of the 48-inch 1680 psig pipe may be slightly greater because of the higher pressure.[32]

The impact of delay, as well as the impact of a possibly higher tendency toward cost overrun for the higher pressure systems, is illustrated in figure 3. For a nominal dollar case, we have plotted the cost-of-service for a 1680-psig system with capital costs $1 billion higher than anticipated.[33]

BILLING CODE 6450-01-M

---

[29] The assumed heating value of the gas stream for these calculations was 1135 Btu/cubic foot at 1260 psig, 1140 Btu/cubic foot at 1440 psig, and 1154 Btu/cubic foot at 1680 psig. These values differ from those subsequently arrived at in the Parsons study, and would tend to make our cost of service calculations lower than they would be if we had used heating values closer to Parsons'.

The comparisons shown on figures 1, 2 and 3 in Tables 1, 2 and 3 include differences in gas conditioning plant costs for different pressure systems. Including such differences provides a more precise economic comparison of the various systems. The comparisons shown, however, may not represent true cost differences from the point of view of consumers since the cost of gas conditioning may be borne by the gas producers rather than the consumers. (See the Commission's Notice of Proposed Rulemaking in RM78-14, February 2, 1978.) However, as shown in Table 3, such differences in estimated gas conditioning costs resulting from a change in pressure represent only a very small portion of total costs. The effect of eliminating gas conditioning cost differences would be to move the curves slightly closer together, but would not change any conclusions resulting from analysis of figures 1, 2 and 3 Tables 1, 2 and 3.

[30] As shown in table 2, we have reallocated some capital costs for the 1260 psig system among the cost categories although our total capital costs are the same except for the extra costs of processing and conditioning. We have discussed this reallocation with Alaskan Northwest and they do not object.

[31] "U.S. Government Safety and Reliability Evaluation of Different Pipe Size and Pressure Combinations for Alaska Gas Pipeline," *Op. Cit.*, Executive Summary, pp. 1-2.

[32] *Ibid.*, p. 5. In comments on the draft of this report, DOT added, "Realistically, the only 'failure' that could occur relates to the effectiveness of pipe toughness alone to stop ductile fractures. The alternative simply is to add mechanical crack arrestors or rerun the tests with higher pipe. The latter may mean a 3–6 month delay at worst." (October 26, 1978, Comments, p.

[33] The choice of $1 billion as additional capital cost due to either delay or cost overrun is purely illustrative. Use of this example is not meant to imply that choice of the 1680 psig system would result in a $1 billion cost overrun. We do not now know whether choice of the 1680 psig system would result in any greater cost overruns than for the 1260 psig system.

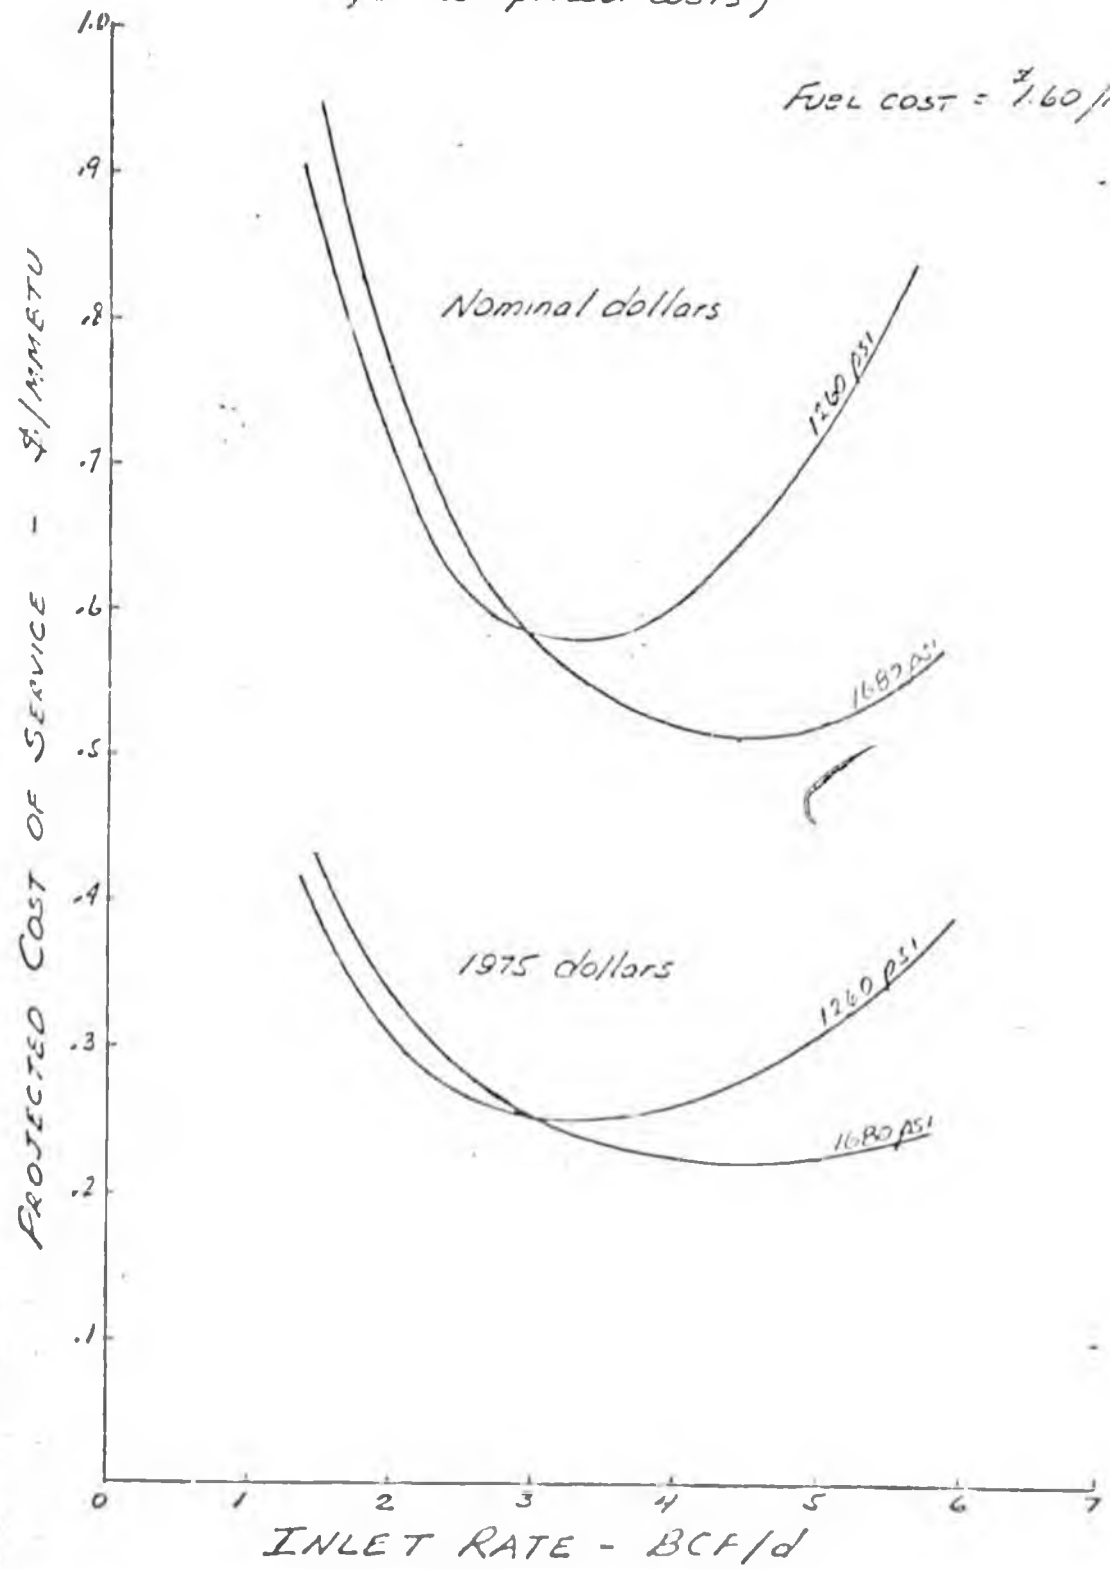
COST OF SERVICE - ALASKA

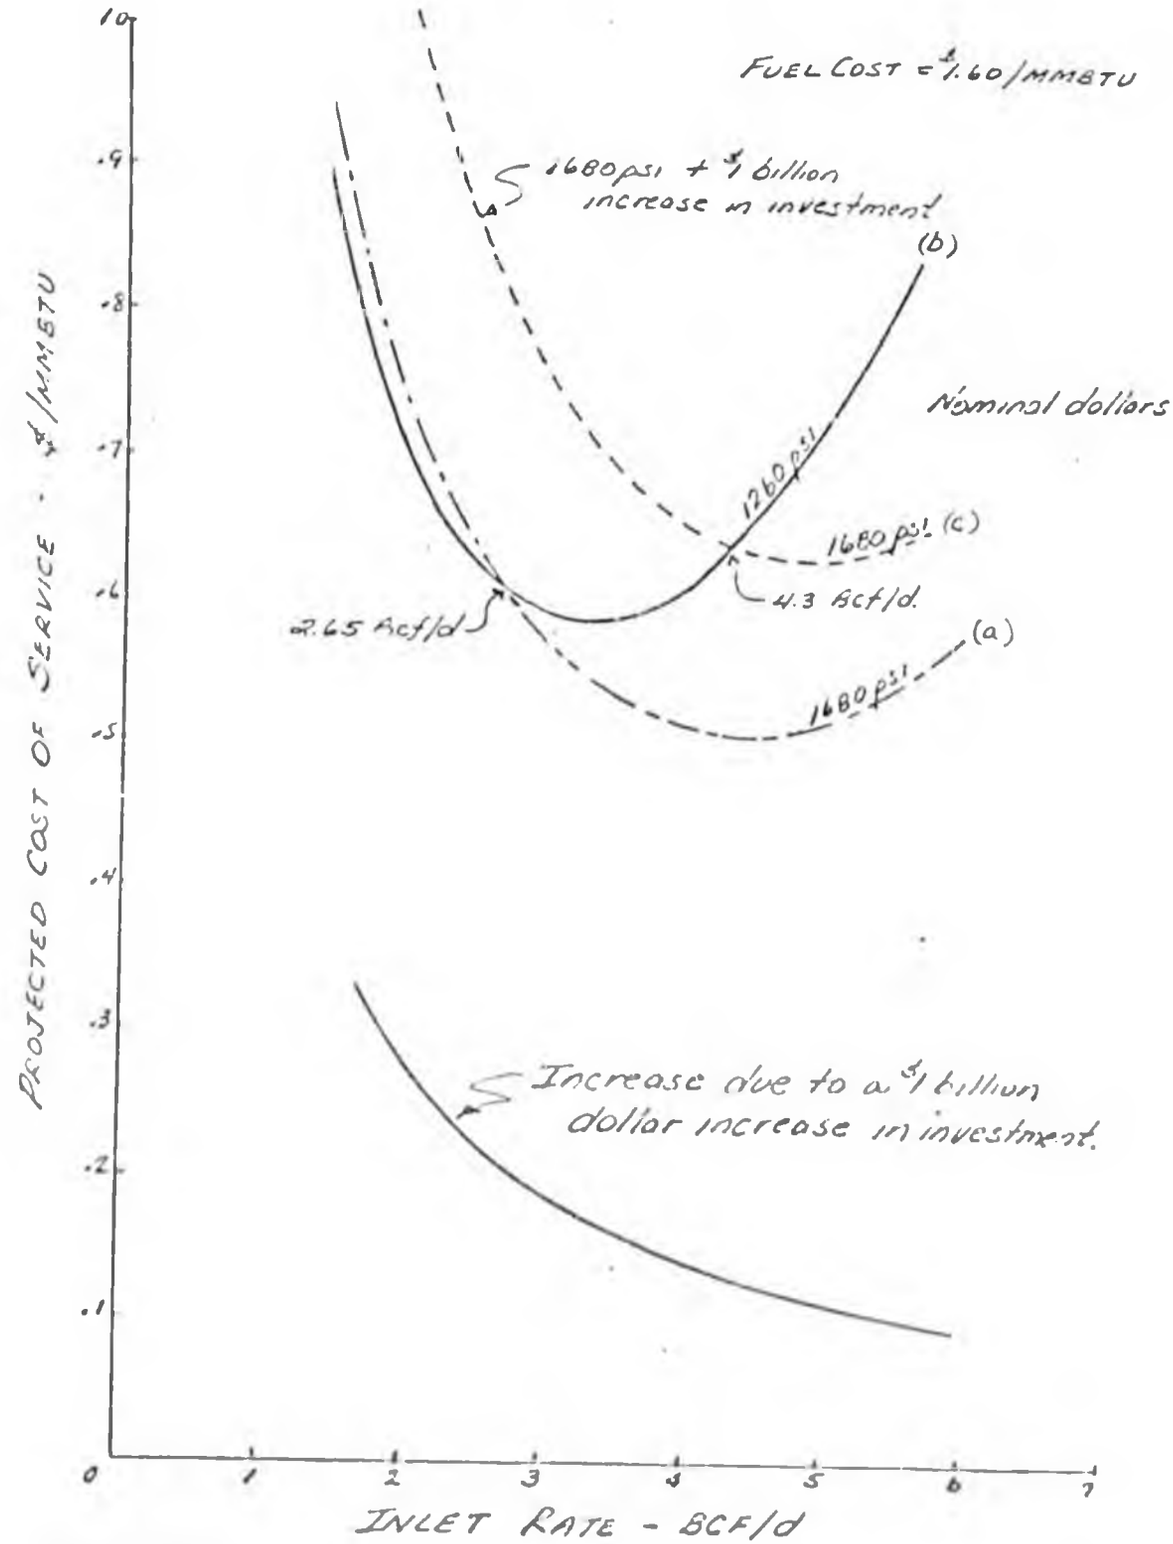
(Utilizing applicant's cost data except for compressor costs)



-31-

FIGURE 3

IMPACT OF AN INCREASE IN INVESTMENT UPON THE COST OF SERVICE



BILLING CODE 6450-01-C

As can be seen from figure 3, increased capital costs for the high-pressure systems relative to the low-pressure ones, whether due to time delays for testing or relatively higher cost overruns, would have the effect of moving upward the crossover point in throughput volume for going from the lower pressure system to a higher pressure one as the least-cost system. Our calculations show that the spread in unit cost of service, (constant 1975 dollars, fuel cost $1.60 per mmBtu) among the three systems amounts to less than 10 percent of the lowest one for throughput volumes up to about 3.5 bcfd. At higher throughput volumes, the cost of service plots for the three systems start to diverge more rapidly. Alaskan Northwest would put the throughput point at which the cost-of-service plots start to diverge closer to 4.0 bcfd.

The comparison of cost of service plots using our capital cost estimates with those using Alaskan Northwest's illustrates that small differences in assumptions or expectations about capital costs or other parameters can shift the crossover points noticeably.[34] Thus, I conclude that the precise crossover points are less significant for decisionmaking than the points where the cost-of-service plots start to diverge.

Our cost-of-service plot for the 1260-psig system includes the effect of the additional cost of the conditioning facilities to meet the pipeline quality specification at that pressure. This assumption provides an indication of the total system—pipeline plus conditioning facility—cost consequences of the 1260-psig decision. This difference partially explains the difference between our results and Alaskan Northwest's. Other likely sources of difference include:

Heating value of gas streams;

Computation of fuel use for compression and chilling; and

Our simplified cost of service computation methodology.

Explanation of Cost Differences for Various Size Systems

Table A-1 presents estimated investment cost for systems designed to operate at 1260, 1440 and 1680 psig.

Table A-2 summarizes the horsepower (hp) and fuel requirements for the three systems.

Methodology. Total capital costs for the 1260 psig base case system at a 2.4 bcfd throughput rate were taken from the capital cost data filed with the FPC by Alcan Pipeline Company in March 1977. Independent cost estimates were made for all items where costs should change materially as a result of utilizing heavier pipe with a greater wall thickness. These cost estimates are shown in table A-1. The estimated costs of all other (nonvariable) items were assumed to be equal to the difference between filed costs and the total cost of the variable items for the 1260 psig, 2.4 bcfd base case.

Compressor and fuel costs were calculated based upon computed requirements for the three systems for flow rates of 1.6, 2.4, 3.2, 4.0, 4.8 and 5.6 bcfd. An FERC computer model based upon American Gas Association (AGA) pipeline flow equations was used to determine compression and chilling hp and fuel requirements. The additional gas processing and conditioning plant costs relative to those for the 1680-psig system were added to the capital costs of the 1260-psig and 1410-psig systems as that difference could have been reflected in an increment to any gathering and conditioning allowance, if allowed by the Commission. Plant cost differences are based on cost differences included in the materials supplied by Arco, adjusted to 1975 dollars. All other capital costs are expressed in 1975 dollars.

As a result of the above methodology, total costs shown are expected to be only roughly correct. However, cost differences should be reasonably accurate.

Capital cost data from table A-1 and fuel requirements shown in table A-2 were used in an FERC cost of service model to compute an expected cost of-service for each case. As noted above, cost-of service differences should be more meaningful than cost of-service values for individual cases.

BILLING CODE 6450-01-M

[34] A difference of $77.9 million in relative capital cost, which amounts to 4.2 percent of Alaskan Northwest's estimate for the 1260-psig system and a similar proportion of the estimates for other systems, shifted the crossover point from 2.65 to 2.0 bcfd in the example given above.

BILLING CODE 6450-01-C

Alaska Gas Project Office Capital Cost Estimates

Items for Which Differences in Pipe Weight and Operating Pressure Result in Minimal Differences in Cost

The following activities during pipeline construction were assumed to have the same cost (or only minor cost differences) regardless of the pipe's weight or pressure rating:

1. Right-of-way procurement.
2. Clearing and grading.
3. Workpad and access roads.
4. Ditching.
5. Pipe alignment.
6. Field storage of pipe and materials.
7. Coat and wrap pipe.
8. Pipe inspection.
9. Padding and backfill.
10. Cleanup.
11. Resod.
12. Metering equipment.
13. Automation and telecommunications.
14. River crossings.

In actual practice, increasing the operating pressure should result in only minor differences in actual engineering and supervision costs. However, since these items are frequently considered as add-on items and are usually expressed as a percentage of other items, they were treated as a variable cost in this report.

Items Where Differences in Pipe Weight and Operating Pressure Will Change Costs

Pipe Costs. Pipe costs were computed assuming a 1975 base mill price of $550 per ton for 0.6-inch wall thickness, internally coated pipe, plus the following charges:

1. $10/ton additional cost for 0.688-inch wall thickness pipe.
2. $20/ton additional cost for 0.80-inch wall thickness pipe.
3. $50/ton additional cost for increased pipe toughness.
4. $30/ton increased mill cost-Canadian pipe.
5. $20/ton Yukon tax.

To compute tonnage requirements for pipe it was assumed that the heavier wall thickness required in Class II and III construction locations would increase requirements by 10 percent compared to the tonnage required if the entire line was considered no Class I construction.

Pipe Transportation. It was assumed that the pipe would be shipped from the mill to delivery points in Alaska by intercoastal vessels. The following delivery costs were assumed.

Dollar per ton (1975)

[illegible] Texas to Anchorage, Alaska	80
[illegible] Texas to Prudhoe Bay, Alaska	140
[illegible] Ontario, to Skagway, Alaska	100

Pipe delivered to Anchorage (or Seward), Alaska, that will be further shipped to Fairbanks, Alaska, via the Alaska railroad, was assumed to incure an additional charge of $20 per ton. Rail charges from Skagway, Alaska, to Whitehorse, Yukon, were assumed to be $10 per ton.

It was assumed that the pipe would be strung from pipe storage points in Prudhoe Bay, Fairbanks, Anchorage (or Valdez), Alaska, and Whitehorse, Yukon. The following pipe stringing costs were assumed:

Stringing Costs, Dollar Per Ton (1975)

	Wall thickness, inches		
	0.6	0.688	0.80
From			
Prudhoe Bay	21.60	19.80	24.30
Fairbanks—North	18.60	17.40	21.20
Fairbanks—East	15.10	14.20	17.00
Anchorage (Valdez)	15.10	14.20	17.00
Whitehorse	15.10	14.20	17.00

Higher costs were assumed north of the Yukon River. Stringing costs varied because of assumed truck weight limitations. For instance, it was assumed that only two double joints of 0.8-inch wall thickness pipe could be delivered per load compared to three double joints of 0.6-inch thickness pipe. The weight limitations assumed are probably conservative.

Welding. Alaskan Northwest has stated that increasing pipe weight and wall thickness reduces construction speed, due to increased welding requirements. They maintain that such reduced construction rate increases costs significantly more than just the increased welding costs, since a slower pace increases the cost of most construction activities. In contrast, others have stated that increasing wall thickness should not slow down construction.

Our knowledge of the welding procedure is that the stringer bead (the initial weld) is made by a stringer bead crew, which for 48-inch diameter pipe would likely consist of four welders. Upon finishing the stringer bead, the stringer bead crew moves forward to the next joint. Immediately following completion of the stringer bead, the hot pass bead is placed by the hot pass crew. Since the hot pass bead is applied at a slightly higher speed than the stringer bead, the hot pass crew usually has no trouble keeping up with the stringer crew. The filler and cap bead are made by separate crews. Normally, a filler and cap crew will stay with a weld until it is finished. Since more weld material must be placed by the filler and cap welders, there may be several filler and cap crews per stringer crew. When thicker wall pipe is welded, it is only necessary to add more filler and cap welders.

According to our understanding of the process, the only welding problem with thicker wall pipe is that 0.8-inch wall thickness pipe would add about 100,000 to 120,000 man-hours of additional welder time compared to that required for 0.6-inch wall thickness pipe. Assuming a 2-year construction period and 1600 man-hours per year per welder, this additional welding would require adding about 38 welders. There should be no changes in nondestructive testing requirements, and only minor increases in inspection and supervisory personnel.

Construction speed is determined by the speed of the stringer crew. Since the time to make the stringer pass is independent of wall thickness, welding speed, expressed as joints per day or miles per day, should not be a function of wall thickness. As a consequence, increasing the wall thickness of the pipe should not materially reduce construction speed.

Welding costs shown in table A-1 assume manual welding; automatic or semi-automatic machines could probably reduce costs and improve weld quality. Welding time is based upon a theoretical arc time assuming deposition of 0.8 pounds of weld material per minute; changing electrodes is allowed for by adding one-third again to the time spent depositing weld material. We then assume that 50 percent of welders' working time is spent on activities other than these two.

Double Jointing. It was assumed that automatic or semi-automatic welding machines would be utilized for doublejointing under controlled, indoor conditions. The principal differences in doublejointing costs for thicker wall pipe compared to thinner pipe would be an increase in machine and operator time.

Bending. It was assumed that bending costs for the 0.8 inch wall thickness pipe would be 10 percent greater than for pipe with 0.6 inch wall thickness, or about $0.75/foot increase.

Sidebooms—Support Tractors. It was assumed that the heavier pipe would necessitate heavier lifting equipment, with a resultant increase in fuel and amortization costs. No increase in operating personnel was assumed.

Concrete Weights. March 1977 filed costs were assumed for the base case. Costs for the heavier pipe were computed assuming that total costs for weights would be proportional to the

pipeline negative bouyancy without weights.

Valves and Fittings. Block valve costs of $90,000, $96,000 and $105,000 each were assumed for 1260 psig, 1440 psig and 1680 psig valves, respectively. Installed costs of valves and fittings were assumed to be seven times the valve costs. All costs are based upon 1975 prices.

Compression and Cooling. The high-pressure systems will increase compression and cooling requirements at Prudhoe Bay, but will reduce them at pipeline compressor stations. Computed horsepower requirements are shown on table A–2.

Compressors are now used to reinject produced gas. Existing first stage compressors compress the gas from about 550 psig at flow station discharge points to about 1705 psig. These compressors possibly would not need to be duplicated.[35]

V. Estimates of Throughput Volumes

As is apparent from the plots of transportation costs versus throughput volume, expected throughput volume is an important parameter in determining which of the alternative systems is the most cost-effective design. This section reviews the available information for guidance on this point.

1. *Findings in the Initial Decision.* The quantity of gas reserves on the North Slope of Alaska and the deliverability of these reserves was explorted in detail during the hearing before FPC Administrative Law Judge Litt in *El Paso Alaska Company, et al.*, Docket No. CP75-96, *et al.* Judge Litt concluded in the *Initial Decision* that, although the uncertainty of reservoir performance and the possible necessity of water injection precluded exact estimates as to the daily deliveries to be expected from the Prudhoe Bay Field, the weight of the evidence supported a finding that 2.0–2.5 bcfd of gas will initially be available from the Prudhoe Bay Field. (*Initial Decision* at 33.) The proven reserves in the Prudhoe Bay Oil Pool support this finding. If one includes additional reserves from the Sadlerochit, Lisburne, and Kuparuk resevoirs, this estimate may be conservative. Judge Litt noted in connection with the Lisburne and Kuparuk reserves that future development of complete disclosure of past drilling would be necessary to establish the producing capabilities of these formations. (*Initial Decision* at 31.)

Judge Litt also found that the evidence suggested that deliveries above the 2.0–2.5 bcfd level might be available from the North Slope region because of reserves other than in the Prudhoe Bay Field. (*Initial Decision* at 33.) However, he found that the evidence regarding such reserves was unclear and made no specific findings as to the volumes of gas which might be delivered from such reserves.

2. *Findings in the FPC Recommendation to the President.* The FPC stated in the *Recommendation to the President:*

"Thus, we conclude that it is reasonable to assume 2.0 to 2.5 Bcfd from Prudhoe Bay Oil Pool within five years after the commencement of oil production. There exists some possibility of increased delivery from the North Slope of perhaps as much as an additional 1.5 Bcfd from NPR–4 (Naval Petroleum Reserve No. 4), ANWR (The Arctic National Wildlife Range), and the Beaufort Sea, as well as other reservoirs in or near the Prudhoe Bay Oil Field. Thus, we find the system should be designed to carry initially 2.0–2.5 Bcfd, and be capable of expansion to an additional 1.0–1.5 Bcfd." (p. I–17)

3. *Findings in the Decision.* The report which accompanies the Decision notes that the increase in the nation's supply of natural gas from an Alaskan gas project is estimated to be 0.7 trillion cubic feet (tcf) per year (2.0 bcfd) by 1985. By 1988, a volume greater than 0.9 tcf per year (2.4 bcfd) might be produced, according to the report.

4. *State of Alaska.* The Prudhoe Bay Field is located on lands owned by the State of Alaska. Detailed information on the production potential of that field has been made available to the State in its capacity as royalty owner and conservation authority. At our request, the State's Department of Natural Resources prepared estimates of reserves and deliverability of gas from State lands in the North Slope region based on all information available to them. Those estimates suggest a deliverability range after 1988 of 2.0 to 4.2 bcfd from State lands (including the Prudhoe Bay Field) with the median estimate at 2.8 bcfd.

5. *U.S. Geological Survey.* As part of the July 1, 1977, reports to the President prepared under the terms of the Alaska Natural Gas Transportation Act (ANGTA), the U.S. Geological survey (USGS) compiled estimates of reserves and deliverability for all North Slope areas.[36] The USGS discussion cites three separate analyses of North Slope potential—its own, that of the Potential Gas Committee of the Colorado School of Mines, and that of the Division of Geological Survey of the State of Alaska—to conclude that there is a very high probability of substantial additional recoverable gas reserves in the North Slope area.

Converting potential reserve estimates into proven reserves dedicated to pipeline transportation is a demanding exercise in expectation. However, using the USGS figure of 19 tcf of potential reserves outside the Prudhoe Bay geologic structure, in conjunction with a rule of thumb for deliverabilty (1 bcfd production for 20 years requires at least 20 tcf of potential reserves), plus the State's figure for the Prudhoe Bay Field itself, these estimates suggest there is a 95 percent probability that deliverability from all North Slope producing areas will be at least 2.5 bcfd if production from all of those reserves overlaps through some period in the future, as seems highly likely. There is a small probability of North Slope deliverability going as high as 7.5 bcfd.

VI. Additional Considerations

Our discussions with interested parties suggested that considerations other than design costs and estimated throughput volumes are important to the choice of system operating pressure. This section presents short discussions of the most important of those considerations as we understand them.

1. *Vulnerability to Cost Overruns.* Some project sponsors have expressed the concern that a higher pressure system is more vulnerable to cost overruns. Some support for their concern can be found in the work of Professor Walter Mead of the University of California at Santa Barbara. In a recent study published by the American Enterprise Institute,[37] Professor Mead reported in a chapter on cost overruns (chapter 6) that an econometric analysis of past Defense Department projects "* * * indicated that cost overruns were significantly related to the length of time required for the development program and the ex-

[35] Sohio noted in its comments on our draft report that whether the compressors will need to be duplicated will depend on whether Prudhoe Bay working interest owners agree to release any of these facilities for gas sales service.

Arco also made this point in its comments on the draft report. It noted that the Prudhoe Bay owners installed compressors to reinject gas which is produced with crude oil. At the time gas sales commence the volume of gas which will have to be reinjected will be reduced by the volume of gas sales. However, these compressors may still be required for reinjecting a portion of the gas production in order to maintain crude oil production.

[36] *Report of the Working Group on Supply, Demand and Energy Policy Impacts of Alaska Natural Gas*, Federal Energy Administration, Department of Commerce, Department of the Interior, U.S. Geological Survey, Department of Transportation, Department of the Treasury, Energy Research and Development Administration, July 1, 1977.

[37] *Transporting Natural Gas from the Arctic: Alternative Systems*, Walter J. Mead, with Glenn W. Rogers and Rufus Z. Smith, American Enterprise Institute for Public Policy Research, Washington, D.C., August 1977.

of technological advance involved in the project." (p. 86) The implication is that the closer to known technology a project is, or more specifically, the more like a previously constructed project a succeeding one is, the better the cost estimates for the successor project and the less its tendency to cost overruns. To the extent that the 1260-psig system can be considered closer to known technology than either of the higher pressure alternatives, its tendency to cost overrun should be less. On an analogy to Professor Mead's discussions of Defense Department projects, this is appropriate.

Any difference in their respective tendencies toward cost overrun between the 1260-psig system and the higher pressure alternatives would have the effect of raising the crossover point where increased throughput volume makes a higher pressure system result in lower unit transportation charges. Figure 3 in the section which presented the results of our calculations (section IV, *supra*) shows the effect on the crossover point of an increase in capital costs for a high-pressure system. A similar effect on the crossover point would be realized if cost overruns had the effect of increasing the costs of a higher pressure system relatively more than those of the 1260-psig alternative.

2. *Impact on Financing.* The *Decision* requires that the Alaskan Natural Gas Transportation System be privately financed. Therefore, the impact of a decision to utilize a higher pressure system on the ability of the sponsors to obtain private financing is a major concern.

The risk of major cost overruns creates whatever risk there is of project non-completion, and presents the largest single financing problem for the project. Thus, if the lower pressure system is closer, to current gas pipeline industry practices, the analysis referred to by Professor Mead would suggest that utilizing the lower pressure alternative reduces the likelihood of major cost overruns and thereby facilitates financing. The effect of technological advances on the reliability of cost estimates was alluded to by the NEB in its February 19, 1978, "Statement of Position."[38]

In response to our request for more definitive information on the significance of the pressure question for financing, the project sponsors' principal financial advisers prepared a letter explaining the effect of a decision to utilize a higher pressure system on the financing proposals of the pipeline project. The gist of their concern is that a higher pressure system involves technological risks that lenders and potential equity investors simply will not accept.

3. *The Gas Consumers' Interest.* The interest of the gas consumer in the low-pressure/high-pressure decision is not obvious. Although a higher pressure system should result in lower transportation charges at higher levels of throughput, it is not assured that such reductions in transportation cost will accrue directly to the benefit to gas consumers.

The means by which delivered price is set for the gas to be transported by ANGTS does not lead to a clear-cut showing of consumer benefit. For the initial throughput volume, an expected 2.0 bcfd from the Main Pool Reservoir of the Prudhoe Bay Field, the delivered price will be the sum of the transportation charge and a wellhead price, plus an allowance for gathering and conditioning if allowed by the Commission. In this case, reduced transportation charges should be passed on to gas consumers as reductions in delivered prices.

In the next few years, however, high-priced sources of gas such as the Prudhoe Bay gas could rapidly exhaust the implicit subsidies provided by allowing the price of this gas to be averaged in with lower cost gas from conventional supply sources. As soon as the use of "rolled-in" pricing has raised the average price of all gas to approximate parity with the delivered price of alternate fuels, incremental gas sales are likely to be made only at prices set by competition with those of alternative fuels. At that point reductions in transportation charges would likely accrue to producers.[39]

Depending on the relationship of the netback to the field price from the market value of this gas on the one hand, and the maximum lawful ceiling price set by the NGPA on the other, possible Commission use of rolled-in pricing for other gas supply projects, and changes in the delivered prices of competing fuels, prices for North Slope gas sales after the initial 2.0 bcfd from the Main Pool Reservoir could be set by a netback from the delivered prices of competing fuels. In that event, reduced transportation charges for these incremental volumes would benefit the gas producers.

An efficient natural gas transportation system which encourages the development of additional supply through higher field prices is not without some consumer benefit. The point here is that an analysis of that benefit is not as simple as might be implied by a comparative evaluation of transporation cost curves.

4. *Alternative Investment Requirements.* Cooling the oil pipeline to move the butane which cannot be transported by the 1260-psig gas pipeline system appears to require a smaller capital investment than increasing the operating pressure of the gas pipeline. The figures provided by the gas pipeline project sponsors show an increased investment requirement of $237 million (in 1975 dollars) to go to the 1680-psig system. Using the oil pipeline would require (in 1978 dollars):[40]

[In millions of dollars]	
Increased investment in gas conditioning plant	30
Cooling facilities for oil pipeline	37-70
Total	67-100

Alternatively, if the reduction in gas pipeline pressure results in the use of butane as field fuel and/or disposition by reinjection, the following investments (in 1987$ dollars) would be required:[40]

[In millions of dollars]	
Increased investment in gas conditioning plant	30
Field fuel system investment	50
Injection investment	25
Total	105

As the likely outcome of decision to use the 1260-psig system would be a

[38] Point sufficient field welding tests and production trials are done to establish suitable procedures and the manpower and equipment requirements to achieve progress rates compatible with other crews, the National Energy Board feels the present cost comparisons (between standard-pressure and high pressure alternatives) based on normal procedures may not be valid." NEB Statement of Position, *op. cit.*, Technical Review, pp. 3-4.

[39] A limitation on such a potential benefit to producers will be the ceiling price on natural gas produced from Prudhoe Bay Unit established by § 109 of the Natural Gas Policy Act of 1978 (NGPA). The price of competing fuels may only determine the price of gas from the Prudhoe Bay Unit to the extent such a price is equal to or less than the ceiling price.

[40] All of these estimates are my interpretations of certain investment figures supplies by Arco. Arco did not provide any comment on this comparison as it appeared in my draft report.

Sohio pointed out in comments on my draft report that crude oil cooling costs were estimated by the R. M. Parsons Company to be about $55 million in 1978 dollars for the case of maximum volume of butanes (31,200 barrels/day) in the TAPS line, assumed to be operating at 1.5 million barrels/day throughput (maximum cooling required). Sohio also noted that oil cooling costs could be partly offset by the lower investment in gas-boost compression facilities required for 1260 psig operation, as compared to 1440 or 1680 psig. Sohio concludes:

"The net differential investment which would be required in the conditioning facilities and in various Prudhoe Bay Field facilities to be compatible with a 1260 psig pipeline system is expected to add considerably less than the $1681 million (in 1978 dollars) estimated by Arco, event when all butanes recovered are transported in the TAPS lines in preference to blending them with the sales gas. Operating costs of oil coolers are also expected to be less than those related to additional gas compression." (Sohio comments, October 27, 1978, p. 2)

combination of cooling the oil pipeline, use of the extra butane in the field, and reinjection, we believed approximately $100 million (in 1978 dollars), including the $30 million required for additional investment in the processing and conditioning facility, is a representative requirement for comparison with the $237 milllion (in 1975 dollars) additional investment requirement to increase the system operating pressure to 1680 psig. None of these figures consider operating costs, so any comparisons are necessarily incomplete.

The gas consumer would see the increased investment requirement in the form of increased transportation charges for gas delivered by a higher pressure system, at least for the first 2.0 bcfd of throughput. Although the increase in unit transportation charges would be tempered by the delivery of higher Btu gas, the additional Btu's per unit volume would not be enough to offset the higher tranportation charges until throughput volumes get higher than just those from the Main Pool Reservoir of the Prudhoe Bay Field.[41]

On the other hand, the oil consumer would not likely be directly affected by a requirement for additional investment in oil pipeline facilities. North Slope oil prices are effectively set through competition with imported oil, and can not be increased to consumers in order to recover additional transportation costs. Additional investment in the Trans-Alaska Pipeline System (TAPS) simply reduces the netback to the oil producers at the field. The consumer price impact of using the oil pipeline to carry the butane would only be felt as an increase in any processing and conditioning allowance which might have been allowed by the Commission to cover the $30 million extra investment required for the processing and conditioning plant.

The investment requirement not touched on in the preceding discussion is that which might be required for vapor recovery systems on storage tanks in areas where the higher vapor pressure caused by adding butane to the North Slope crude would cause unacceptable air pollution problems. Such ancillary investment requirements highlight the importance of the gas pipeline system design question for the North Slope gas producers, as well as for the gas pipeline project sponsors, and the degree of interest the producers should have in optimizing the design of all facilities involved in producing and transporting Prudhoe Bay hydrocarbon resources.

VII. Requirements for Resolution

I believe that the *Decision* creates a predisposition that the 1260-psig system is the one authorized by the President and the Congress by its reference to "the facilities * * * included in the revised Alcan filing submitted to the Federal Power Commission (FPC) on March 8, 1977."[42] Additional NGL's carrying capability of a higher pressure system might be a desirable feature, all other things being equal. However, a technical report filed with the State of Alaska by the major interest owners in the Prudhoe Bay Field (Arco, BP, Exxon and Sohio) in support of their proposed reservoir management plan states:

> Gas pipeline specifications are not currently known and final specifications may increase or decrease the volume of liquids which must be extracted from the gas to prevent condensation in the pipeline. Regardless of the final gas conditioning requirements, all liquids extracted will be used without waste, either to displace fuel gas or to be transported through the oil pipeline.[43]

I believe that the language in the Report accompanying the *Decision* suggesting that:

> * * * Alcan should consider increasing the operating pressure and wall thickness of its 48 inch diameter pipeline in order to allow for more efficient increases in throughput rate for additional reserves which might be committed to the system from either Alaska or Canadian sources * * *."[44]

would make the predisposition a rebuttable one on appropriate showings in a final authorization proceeding for these facilities. The discussion below highlights the principal factors which should be evaluated in such proceeding, should one be required to set this parameter. I believe that favorable findings in all three areas would be required to support a decision to increase the operating pressure of the Alaskan segment.

1. *Concurrence of the Canadian Government.* The Government of Canada, across whose territory some length of any of the 48 inch alternatives would have to pass,[45] has previously expressed severe reservations about the 1680-psig alternative on safety and reliability grounds. The Canadian project sponsors share those reservations. The U.S. project sponsors, while concerned about safety and reliability problems (particularly those associated with proximity to the Alyeska oil pipeline), are primarily concerned that uncertainties associated with the 1680-psig system would create significantly higher risks of construction delay and cost overrun than the 1260-psig alternative.

The hearing record on the safety and reliability aspects of the 1680-psig system was more extensively developed in Canada than in the U.S. proceedings before the FPC. Accordingly, although U.S. technical representatives continue to believe that the 1680-psig system can be constructed and operated safely and reliably,[46] Canadian authorities still have reservations about the high-pressure alternative based on the evidence presented to them.[47]

The U.S. project sponsors have also expressed concern about additional hazards of a higher pressure system because of proximity to the TAPS. The additional potential energy in a higher pressure system is thought to represent more of a threat to the structural integrity of the oil pipeline in the event of a gas pipeline rupture. On the other hand, technical representatives of Exxon, one of the principal owners of TAPS, did not feel there was any significant difference in hazard to the oil pipeline between the 1260 psig and 1680-psig alternatives.

A testing program involving the project sponsors, the owners of the oil pipeline and the Canadian Government

---

[41] Future gas volumes made available for shipment could have less NGL's content than the Prudhoe Bay accumulation, in which case the "dried" composite gas stream would have more capacity for Prudhoe Bay NGL's without increasing system operating pressure.

[42] *Decision, op. cit.* p. 13.

[43] Exhibit ALA-31 filed in proceedings before FPC, p. 10. Cited in *Comments on the "Decision and Report to Congress on the Alaska Natural Gas Transportation System"*, Federal Energy Regulatory Commission, October, 1977.

[44] *Decision, op. cit.*, p. 193.

[45] On February 17, 1978, the Canadian National Energy Board chose a large diameter (56 inch) alternative for the segment of the system through which both Canadian and U.S. gas volumes will flow, to be installed between Whitehorse, in the Yukon Territory, and the Interprovincial point near Lones River in Alberta. Although the operating pressure of the 56 inch system will be 1680 psig, its NGL's carrying capacity is not less than that of a 1680 psig system installed farther north. The reason is the difference in operating temperature: the 56 inch system will operate at a minimum of 40° F, while the northern portions of the system will have to be chilled to below the freezing point of water (32° F) to avoid thaw settlement problems in permafrost soils.

Permafrost soils, and consequently the need for operating the pipeline at or below 32° F, extend less than 100 miles into Canada. The operating temperature can be increased south of that point, allowing the operating pressure to be gradually lowered without losing significant NGL's carrying capacity. The 1680 psig system is, however, incompatible with the very high pressure (2150 psig) system advocated at one point by Exxon.

Thus, Canada would have to approve the use of a higher pressure system for a short distance from the Alaska/Yukon border if such a system is to be used in Alaska.

[46] "U.S. Government Safety and Reliability Evaluation of Different Pipe Size and Pressure Combinations for Alaska Gas Pipeline", *Op. Cit.*

[47] Their "Statement of Position" has previously been referenced. See page 4

would seem to be required prior to any decision to increase the operating pressure of the gas pipeline. Exxon representatives in particular have suggested that the required testing program would not be extensive, but we doubt they have tried to convince the Canadian Government or the Canadian project sponsors, both of whom would have to be satisfied with the testing program and its results before a decision to utilize a higher pressure system could be made.

2. *Satisfactory Distribution of Costs and Benefits.* In the preceding section, I discussed my concern that consumers might not be the primary beneficiaries of a decision to utilize a higher pressure system for the Alaska segment. Here I suggest briefly what types of analysis would be required to support a conclusion that consumers would benefit from higher pressure.

The first consideration is expectations about throughput volumes which would suggest that lower transportation costs are likely with higher pressure. A positive finding in this area would have to involve not only conclusions about ultimate throughput, but also the timing of throughput increases, as a decision to ask consumers to pay more now in order to pay less later would have to pass a present value test.

The North Slope producers either now have or will have the geophysical and drilling information which might support increased capacity in the delivery system. Much of this information may have been supplied by them to the State of Alaska and the USGS, but under confidentiality arrangements which effectively deny access to any parties not specifically granted permission by the producers. I believe that the burden of proof that a higher capacity system is required is on the producers.

A second consideration is the possibility of a differential tendency to cost overrun between the 1260 psig system and the higher pressure alternatives. As discussed in a previous section, such a tendency would displace upward the throughput volume threshold where a higher pressure alternative has a lower unit cost of service than the 1260 psig system. Further studies of the cost overrun problem are currently in progress,[48] and should be available for evaluation in the event that an initial burden of proof regarding volumes available for throughput had been satisfied.

3. *Resolution of Extraordinary Financing Problems.* I believe that requiring the chosen system to be privately financed is an integral part of an elaborate framework set out in the President's *Decision* to ensure that construction of the selected system is in the public interest. I also feel that it would be inappropriate for the Commission to make any decision which would undermine a component of that framework. I believe that a showing that any extraordinary financing problems associated with choosing a higher pressure system had been resolved would be an essential element in any such choice by the Commission.

VIII. Results of Conference

An earlier draft of this report was circulated for comment in late September 1978, to the parties with whom we had discussed this matter. The same draft was sent to all parties in Docket No. CP78–123, *et al.*, during November, 1978.

The comments I received indicated a number of corrections to be made which have been incorporated as appropriate but did not alter my basic assessment of the difficulties involved in reaching a determination to increase the operating pressure from the level which had been approved as part of the President's *Decision*.[49]

An on the record conference of interested parties was held on December 15, 1978. At that conference I presented a proposition, which had been suggested in the comments of the State of Alaska on my draft report, for consideration by the project sponsors and any other interested parties. That proposition was to first construct and operate the pipeline at 1260 psig, and then to increase operating pressure of the pipeline *if* sufficient throughput volumes became available during the operating life of the pipeline to warrant the increase. The State of Alaska suggested that it might be

> • • • possible to achieve operating pressures approaching 1440 psig by relaxation of the "design factor" for the pipe Northwest proposes to use from .72 to .8. See 49 CFR 192.111. This would not be a substantial change because the "relaxation" is only to the established Canadian standard. A waiver request would have to be presented to the Office of Pipeline Safety [Department of Transportation] but a good case would be made that safety concerns would be satisfied by the relaxed design factor based on the record in Canada. (November 17, 1978, Comments, p. 7)

The Department of Transportation (DOT) and its Office of Pipeline Safety were represented at my conference. Their representatives were not encouraging about the prospects for a waiver because of the proximity of the pipeline to the haul road which serves the North Slope producing area. DOT safety requirements are more stringent for gas pipelines which operate near highways;[50] thus, sufficient relaxation of the standard to accommodate an increase in operating pressure would likely require a double waiver. The DOT representatives advised use of thicker-wall pipe if higher operating pressures were to be attempted.

I closed the conference by requesting that the project sponsors present their views on the operating pressure question in detail to the State of Alaska and the DOT, both of whom appeared to favor a higher capacity system.[51] The sponsors were then to report to the Commission on their views regarding the possibility of increasing the system capacity, and on the results of their discussions of this matter with other interested parties. The sponsors' filing of March 2, 1979, requesting a Commission order finalizing the selection of 1260 psig as the operating pressure for the Alaska segment, is in compliance with my request. A copy of that filing is attached to this report.

IX. Conclusions and Recommendations

Relevant Considerations. As discussed in section IV above, the primary method of analysis to determine the appropriate throughput capacity for a gas pipeline is the comparison of plots of unit transportation cost vs. throughput volume for alternative system configurations. The project sponsors have attached such plots for the principal alternative systems as Exhibits Z–4 and Z–5 in their filing. Similar computations are also included in section IV of this report.

In my judgement, there are two factors in these comparisons which should be considered:

The least cost system at expected levels of throughput, and

Expectations about the throughput levels for which fuel penalties start to

---

[48] For example, the Rand Corporation has been studying this problem applied to coal gasification plants for the Department of Energy.

[49] The U.S. Department of Transportation expressed some concern over perverse incentives inherent in the way natural gas pipeline projects are regulated. I took note of their concerns but advised them that the Commission would likely be unable to resolve them.

[50] Whether the haul road is properly classified as a "highway" and thus imposes the more stringent safety standard on the gas pipeline, is a matter which I believe is still at issue.

[51] Arco representatives, both in their comments on my draft report and in their remarks at my conference, favored increasing the operating pressure but reducing the diameter of the gas pipeline system. Exhibit Z–5, attached to the project sponsors' March 2, 1979, filing, indicates that the operating efficiency characteristics of the 1260 psig, 42 inch system which Arco favors are essentially the same as those for a 1260 psig, 48 inch system.

significantly increase the unit transportation cost.

For expected levels of throughput up to 3.3 bcfd, the 1,260 psig system is indicated by the project sponsors' analysis. Although our analysis puts the crossover point from the 1,260 psig system to the 1,440-psig system slightly lower than the project sponsors',[32] our analysis also supports the 1,260-psig system if the expected levels are in the 2.8- to 2.9-bcfd range.

Perhaps more important, in my judgement, is an assessment of the likelihood that throughput levels will exceed the range of efficient operation for the recommended system. For the three systems which appear to be feasible for the Alaska segment—1,260, 1,440 and 1,680 psig systems—there is a considerable range of throughput volumes for which there is probably sufficient uncertainty the capital cost estimates upon which the cost of service calculations are based to prevent a definitive conclusion that one will have a lower unit cost of service than another. For example, if I arbitrarily pick a difference of 10 percent between the cost of service of the lowest and highest cost systems for a given throughput level as a difference which is significant, then the unit cost of service for all three systems would be essentially the same from a throughput of about 2.6 bcfd to almost 4.0 bcfd, according to Alaskan Northwest's Exhibit Z–4. Above 4.0 bcfd and below 2.6 bcfd, the three curves diverge more rapidly.

Our computations in section IV illustrate better the divergence of the "J-Curves" at higher throughput volumes because we have plotted them for a larger range of throughput. On the next page, I have used the data from my Figure 1 to plot the difference between the lowest and highest cost systems as a percent of the lowest cost system for various levels of throughput. Notice that because of differences in our respective capital cost figures, our 10 percent difference point is closer to 3.5 bcfd than Alaskan Northwest's 4.0 bcfd. However, the plot illustrates that, although the differences are small over a range of throughput, they increase rapidly as the upper end of the range of efficient operation for the 1,260-psig system is approached.

In section VII of this report, I discussed the difficult problems which would have to be resolved to reach a determination to increase the operating pressure of the Alaskan segment. I believe that the Commission need not address these problems unless there is a significant change in expectations about gas volumes available from the producing areas to be served by the ANGTS. In view of the difficulties discussed in my report and in view of the relatively small differences in unit costs of service over the range of at least 2.6 to 3.5 bcfd, I would recommend that you reaffirm the 1,260-psig system for the Alaskan segment unless you are provided with new information which demonstrates that there is a significant probability of volumes in excess of 4.0 bcfd in the area to be served by the ANGTS.

BILLING CODE 6450-01-M

[32] Our results put the crossover point at 2.6% to 2.0 bcfd, depending on certain assumptions about capital costs other than for compression. The remainder of the difference between our study and Alaskan Northwest's is in the installed cost of compression and chilling facilities. I would caution against assigning undue precision to the exact crossover points from one system to another. The differences between Northwest's capital cost estimates and ours for the 1,680 psig system is $30.1 million, or less than 3 percent of the base 1,260 psig estimate, whereas the expected cost overrun for the 1,260 psig case is about 30 percent of that estimate.

Status of Information. The information available at the time of the *Decision*, the results of the extensive analysis by the FPC and the July 1, 1977, *Report to the President of the Working Group on Supply, Demand and Energy Policy Impacts of Alaska Gas*, are cited in the project sponsor's filing. They cite the relevant conclusion the the *Decision* as the following:

> Peak-day capacity utilizing nine compressor stations will be 2.6 bcfd, with an average daily volume of 2.4 bcfd. By installation of intermediate compressor stations, the system could be increased to 3.4 bcfd peak capacity, with an average day capacity of 3.2 bcfd. The system capacity could be further increased by addition to the compressor horsepower at each station. (*Decision*, p. 17.)

I also note in the report accompanying the *Decision* the following passage:

> The routing of the Alcan system provides future access to reserves which might be discovered in the Beaufort Sea or elsewhere on the North Slope. Alcan similarly could transport gas from other areas of Alaska or even from the Gulf of Alaska by means or even from the Gulf of Alaska by means of somewhat longer supply laterals. Further, the agreement with Canada provides for the use by Canada of the Alcan main line at a throughout up to 1.2 bcfd. Therefore, redesign of the system to enable inexpensive expansibility up to 3.9 to 4.0 bcfd south of Whitehorse, Yukon Territory, is essential. (*Decision*, p. 186.)

I infer from this passage that the throughout volume anticipated at that time from sources in Alaska which might be connected to the ANGTS was in the range of 2.7 to 2.8 bcfd (3.9 to 4.0 bcfd less 1.2 bcfd).

Interestingly, the principal concern about throughput volume at the time of Congressional consideration of the *Decision* was that Prudhoe Bay Field production might not come up to expectations, and thus the system selected by the President might be too large for the available volumes.[54] Some perspective on the possibility that available volumes will be either higher or lower than expected was provided to us in the course of this inquiry by the State of Alaska. As both a royalty owner and the conservation authority for the primary prospective areas on the North Slope, the State's information on these areas must be presumed to be as complete as anyone's. I have reproduced on the next two pages a series of tables of expected reserves and deliverability, along with a map of the area covered by the estimates. As you can see from the tables, the estimated probability that available throughput volumes will be 4.2 bcfd is about the same as the probability that throughput will be only 2.0 bcfd. I don't see any basis in this information for changing from the 1260 psig system.

The CO_2 Standard. A matter which I feel ought to be considered further is the CO_2 standard for gas delivered to the pipeline. I mentioned above (p. 22) that the Parsons study recommends further study of possible alternative specifications for CO_2 content and gas pipeline pressure. Increasing the system operating pressure is difficult for all the reasons discussed above, but I believe changing the CO_2 specification is separable and should considered. The potential benefits to be derived from transporting more CO_2 include reduced conditioning costs, increased capacity for transporting NGL's, and possibly increased availability of NGL's (particularly propane) due to reduced fuel requirements of a less intensive processing and conditioning plant operation. The State of Alaska and Arco [54] raised the CO_2 issue in comments on the project sponsor's March 2, 1979 filing regarding system operating pressure. Sohio [55] has raised the subject of standards for "pipeline quality gas" in the Commission's omnibus rulemaking proceeding on tariff and rate of return issues in Docket No. RM78-12.

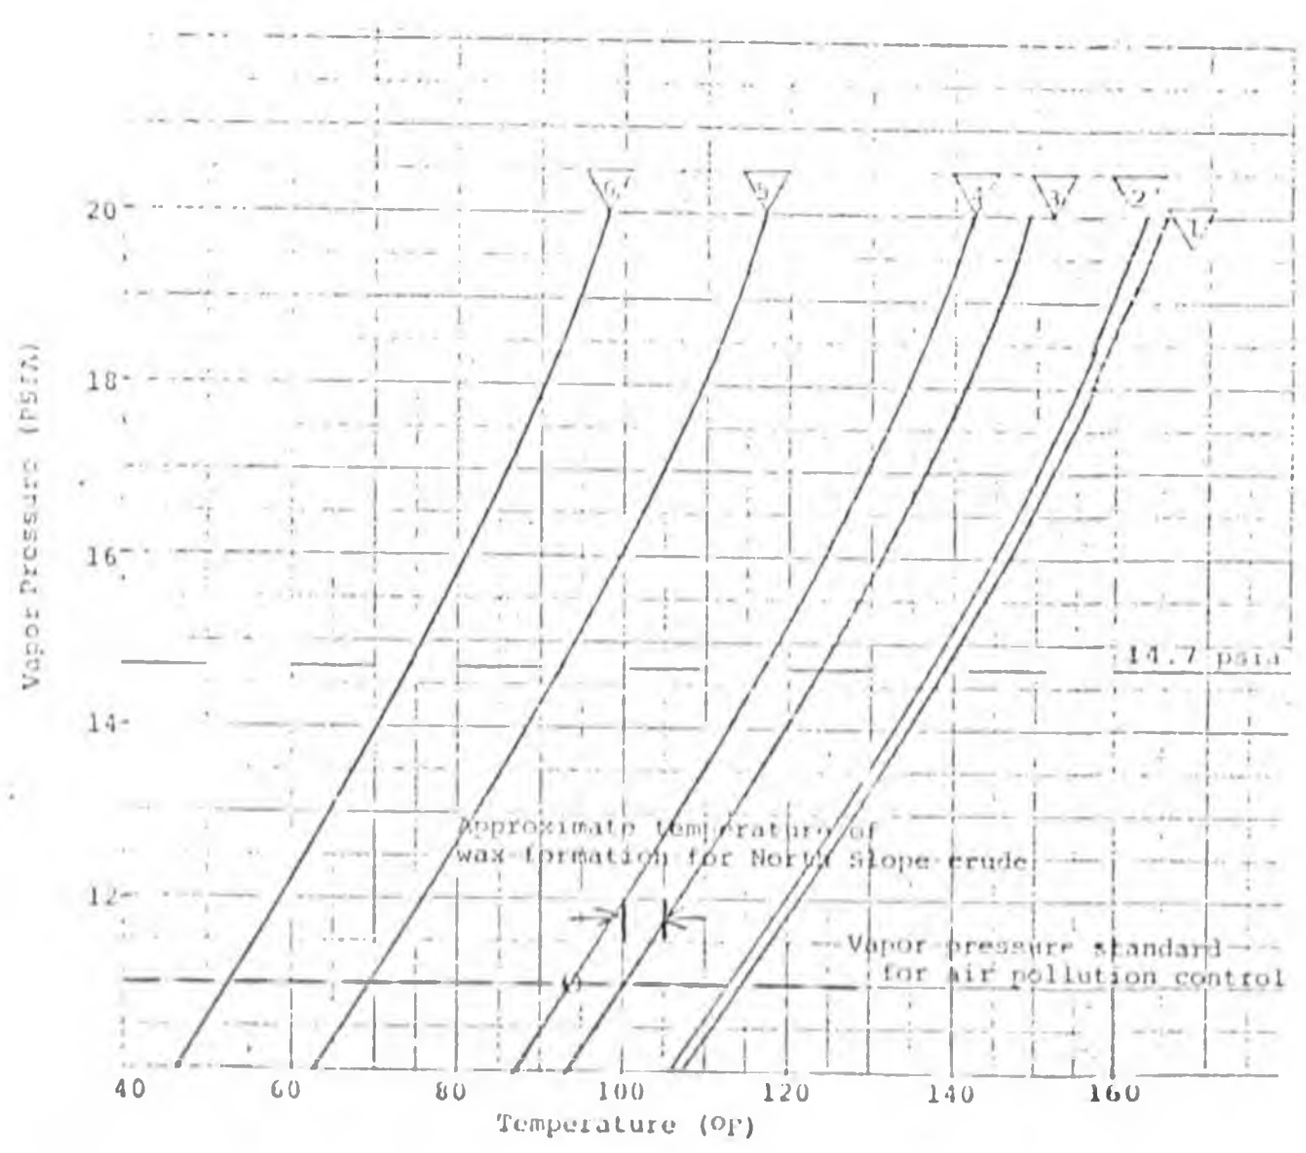
.0573	6	Crude + 50% C3, iC4+



The North Slope producers and the State of Alaska have an additional interest in this matter because of the impact of butane blending on the vapor pressure of North Slope crude. Exxon had furnished the plot of vapor pressures verses temperature for North Slope crude containing various amounts of NGL's which appears on the following page. I have super-imposed on that plot the approximate temperature range at which wax formation starts to be problem with the North Slope crude, and the vapor pressure standard for air pollution control in Southern California.

Wax formation limits the use of cooling as a technique for vapor pressure control. If cooling cannot be used, then vapor recovery systems must be installed on storage facilities to control emissions. Addition of any butane at all to the crude stream moves the vapor pressure at a given temperature from curve 2 toward curves 3 and 4. Because of the temperature limit imposed by wax formation, addition of any butane at all increases the likelihood that vapor recovery systems will be required, particularly if the vapor pressure standards is made more stringent. Thus, the North Slope producers have an interest in the CO_2 standard not only because of its impact on the cost of the conditioning facility, but also because of its impact on the capacity of the sales gas stream to transport NGL's particularly butane.

Increasing the CO_2 content of the gas stream may be cost-effective for the consumer also. Without pre judging how additional NGL's might be charged for transportation through the ANGTS, i.e., whether transportation charges would be on a cents per mmBtu basis or on some other basis, transportation of more of the Prudhoe Bay hydrocarbon reserve through the ANGTS offers the prospect of increased utilization of the facility, and, hence, lower, overall costs to consumers.

Increasing the CO_2 content of the sales gas stream would have the effect of shifting to consumers certain costs of processing the conditioning the Prudhoe Bay gas, an outcome which the Commission has expressed its intention to prohibit with its proposed policy regarding the recovery of certain "production-related" costs as defined in the Natural Gas Policy Act.[56] However, it is possible that some cost-shifting through relaxation of the CO_2 standard would be the optimal solution for the overall conditioning and gas transmission system.

Increasing the CO_2 content of the sales gas stream would pre-empt some of the ANGTS throughput capacity, but additional processing and conditioning facilities could be installed to remove the extra CO_2 if the additional capacity were required. This could be done without any loss of NGL's carrying capability if incremental volumes of natural gas have a lower NGL's content than the Prudhoe Bay gas.

The State of Alaska and Arco, in their above referenced comments on Alaskan Northwest's March 2 filing, have requested a Commission statement regarding the appropriate proceeding for resolution of the CO_2 content issue. I believe this issue is separable from the throughput capacity issue, because any capacity committed to CO_2 transportation when operations begin can be retrieved by installation of additional conditioning facilities if sufficient quantities of natural gas become available to require that capacity. Thus, I believe that the maximum allowable operating pressure question should be resolved independent of the CO_2 question, the latter being better addressed in RM78-12, wherein the Commission is considering the project company tariffs, or perhaps as an ancillary issue in RM79-19, regarding the responsibility for production related costs. It is the former proceeding in which the issue of appropriate standards for "pipeline quality gas" seems to me to be most directly before the Commission.

BILLING CODE 6450-01-M

[Docket Nos. G-4308, et al.]

Cities Service Co., et al.; Notice of Applications for Certificates, Abandonment of Service and Petitions To Amend Certificates [1]

May 22, 1979.

Take notice that each of the Applicants listed herein has filed an application or petition pursuant to Section 7 of the Natural Gas Act for authorization to sell natural gas in interstate commerce or to abandon service as described herein, all as more fully described in the respective applications and amendments which on file with the Commission and open to public inspection.

Any person desiring to be heard or to make any protest with reference to said applications should on or before June 1979, file with the Federal Energy Regulatory Commission, Washington, D.C. 20426, petitions to intervene or protests in accordance with the requirements of the Commission's Rules of Practice and Procedure (18 CFR 1.10). All protests filed with the Commission will be considered by it in determining the appropriate action to be taken but will not serve to make the protestants parties to the proceeding. Persons wishing to become parties to a proceeding or to participate as a party in any hearing therein must file petitions to intervene in accordance with the Commission's Rules.

Take further notice that, pursuant to the authority contained in and subject to the jurisdiction conferred upon the Federal Energy Regulatory Commission by Sections 7 and 15 of the Natural Gas Act and the Commission's Rules of Practice and Procedure a hearing will be held without further notice before the Commission on all applications in which no petition to intervene is filed within the time required herein if the Commission on its own review of the matter believes that a grant of the certificates or the authorization for the proposed abandonment is required by the public convenience and necessity. Where a petition for leave to intervene is timely filed, or where the Commission on its own motion believes that a formal hearing is required, further notice of such hearing will be duly given.

Under the procedure herein provided for, unless otherwise advised, it will be unnecessary for Applicants to appear or to be represented at the hearing.

Kenneth F. Plumb,
Secretary.

[56] See the Commission's Notice of Proposed Rulemaking in RM79-19, February 2, 1979.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Before Commissioners: Charles B. Curtis, Chairman;
Don S. Smith, Georgiana Sheldon,
Matthew Holden, Jr., and Geroge R. Hall.

Alaskan Northwest Natural Gas)
Transportation Company---) Docket No. CP78-123 et al.
Pipeline Design and Capacity)

NOTICE OF DELEGATE REPORT AND
ORDER INVITING COMMENTS

(Issued May 17, 1979)

The Commission is issuing for comment a report submitted to it by its Alaskan Delegate. The report discusses the pipeline size and operating pressure for that segment of the Alaska Natural Gas Transportation System (ANGTS) which is to be constructed in Alaska by the Alaskan Northwest Natural Gas Transportation Company. In addition to other applicable law, this order is issued pursuant to the mandate of Section 9 of the Alaska Natural Gas Transportation Act, 15 U.S.C. §719(g), and the President's Decision and Report to Congress on the Alaska Natural Gas Transportation System (Decision), which mandates expeditious resolution of the matters discussed in the Delegate's report.

A. Background

On March 2, 1979 the Alaskan Northwest Natural Gas Transportation Company (Alaskan Northwest) filed with the Commission an application for an order to approve design specifications and initial system capacity for that portion of the ANGTS which is to be built by the applicant. 1/

1/ The portion involved is that segment of the ANGTS described in the President's Decision as lying within the State of Alaska. Decision at 6-7.

Pursuant to Commission regulations, notice of the application was issued on March 16, 1979. Alaskan Northwest requests prompt action on its application so that it may proceed with steps necessary to financing and constructing the portion of the ANGTS for which it is responsible.

The Alaskan Delegate has submitted to the Commission a report concerning the diameter and maximum allowable operating pressure of the pipeline which is the subject of Alaskan Northwest's application. With respect to the design of the gas pipeline, the Delegate's report states that a 48-inch diameter was determined under the terms of the Decision. The Delegate's report states that with respect to the issue of what the maximum allowable operating pressure of the pipeline should be there is a threshold question: given the extensive record already compiled in this proceeding, 2/ whether significant new evidence is available on likely throughput volumes from the North Slope which would be served by this system since the time of the Decision that would suggest that an operating pressure of greater than 1260 psig should be authorized. The Delegate states that he believes there is no new information and that the Commission should authorize a maximum allowable operating pressure of 1260 psig for the pipeline.

The commission is issuing the Delegate's Report for comment by all parties of record in this proceeding. 3/

2/ That record includes the Initial Decision of the Commission, In re El Paso Alaskan Co., et al., Docket Nos. CP75-96, et al. (Feb. 1, 1977); FPC, Recommendation to the President (May 1, 1977); and the Decision.

3/ A copy of the Delegate's report is attached to this order. The views expressed therein do not necessarily reflect the views of the Commission.

Comments should be filed by July 2, 1979. The parties may also file comments on Alaskan Northwest's application of March 2, 1979. Any party of record perceiving the need for a hearing to determine either the diameter or the maximum allowable operating pressure of the gas pipeline which is the subject of Alaskan Northwest's application should file a request to that end, by July 2, 1979, specifying the issues to be presented for determination and a brief summary of the evidence which the requesting party would present. The request should include a statement of all issues of material fact allegedly in dispute, and provide a reasonable justification as to why these issues cannot be fairly and adequately resolved on the basis of the record compiled before Judge Litt, the President's Decision, and the Delegate's Report.

Finally, the Commission notes that the sole issues that it intends to resolve through the procedures set forth below are: (a) the pipe diameter, and (b) the operating pressure, of the Alaska pipeline segment discussed herein. In particular, the Commission does not intend to decide, on the basis of comments filed in response to this order, the issue of the appropriate CO_2 standard for the gas transported through the ANGTS.

The Commission orders:

(1) The Alaskan Delegate will serve copies of this Order, and of his report, on all parties to Docket Nos. CP78-123, et al.

(2) Parties of record in Docket Nos. CP78-123, et al. may submit comments on the Alaskan Delegate's report, and on the March 2, 1979 application filed by Alaskan Northwest Natural Gas Transportation Company. Such comments may be filed on or before July 2, 1979, and should be served on all parties of record in Docket Nos. CP78-123, et al. The comments may address any issue of fact, law or policy pertinent to the matters raised in the report and the application.

Project Office (AGPO) undertook this inquiry in an effort to facilitate a final FERC decision on the maximum allowable operating pressure.

Our process for studying the pressure question was to discuss it with interested parties and to prepare independent calculations of the expected transportation costs at different throughput rates, utilizing the alternative system configurations. We issued a draft report on the system design on September 27, 1978. We then provided a period for comments on the draft report and held an on-the-record conference among interested parties on December 15, 1978. At that conference I developed a proposition for resolution of the pressure question which served as the basis for the project sponsors' filing of March 2, 1979.11/

This report summarizes the positions of the parties as expressed in our discussions with them, their comments on our draft report, and their remarks at the conference. It then presents the AGPO's findings and relevant findings in the Initial Decision in El Paso Alaska Company, et al., Docket No. CP75-96, et al. (hereinafter referred to as the Initial Decision), the FPC Recommendation to the President, and the Decision. 12/

After my draft report had been circulated and comments initially solicited, a study of the required sales gas conditioning facility, 13/ sponsored by a group of producers and pipeline companies, was made available to me. This

---

11/ See "Application of Alaskan Northwest Natural Gas Transportation Company For An Order Approving the Design Specifications and Initial System Capacity of the Alaska Segment of the Alaska Highway Pipeline Project", filed in Alaska Northwest Natural Gas Transportation Company, Docket No. CP78-123, et al. on March 2, 1979. This application was noticed by the Commission on March 16, 1979.

12/ These discussions and the present report are a part of the AGPO's effort to "expeditiously and yet comprehensively gather the necessary information which the Commission will require before it can intelligently analyze and rule upon the future applications for permanent certification", as required by the Commission by order of December 16, 1977.

13/ "Sales Gas Conditioning Facilities, Prudhoe Bay, Alaska"; The Ralph M. Parsons Company; September, 1978 Study Report. The sponsors were 7 producing companies and 11 natural gas transmission companies. The study is referred to herein as "the Parsons study."

study has not been formally filed with the Commission, nor evaluated by other experts. However, I believe it to be the most authoritative and accurate compilation and analysis of information available on the requirements for processing and conditioning the Prudhoe Bay gas, and on the characteristics of the sales gas stream. As the report was made available to me in my capacity as the Commission's Alaskan Delegate, it appears in my public file and is available for inspection by any interested party or member of the general public in the Commission's Office of Public Information.

The results of the study clarified certain concerns, and obviated others, particularly with respect to the disposition of the natural gas liquids (NGL's). I have maintained my description of the concerns expressed to me, but have tried to note the impact of the study results on those concerns as appropriate. I have also added a section to this report which applies the results of the study to the questions being considered here.

II. POSITIONS OF INTERESTED PARTIES 14/

1. State of Alaska

Alaska conditionally supports a pipeline with a maximum operating pressure of 1260 psig. 15/ Its support is conditioned upon the validity of certain assumptions mentioned in its comments on the project sponsors' March 2, 1979, application, all of which I believe to be true.

The State's principal objectives as expressed to us concerned the developing of an in-state manufacturing base to smooth out the "boom-and-bust" cycles of raw materials production industries. In the case of its Prudhoe Bay hydrocarbon resources, the State would like to develop a capability to convert some of those hydrocarbon resources into semi-finished and finished products. The State has previously used agreements for the sale of its royalty oil to encourage construction of additional refinery capacity in Alaska. An idea being discussed by State officials was development of a capability to manufacture various petrochemicals, utilizing produced NGL's as feedstocks.

The State contracted with the consulting firm of Bonner and Moore for an analysis of the possibility of a world-scale petrochemicals plant to be located in Fairbanks. The petrochemicals facility chosen for study would use ethane as a feedstock. At the time we talked with State officials, the State had no specific plans for utilization of propane and heavier NGL's but expressed a willingness to

---

14/ During the course of our meetings with interested parties, most submitted written materials, usually in response to our requests. All of these materials were attached to the draft of this report, which was circulated to all parties in Docket No. CP78-123, et al., in late September 1978. Those materials have not been attached here in order to prevent repetition, but have been made part of the Alaskan Delegate's public file, required to be maintained by Commission Order of December 16, 1977.

15/ See "Comments of the State of Alaska on the Design Specifications and Initial System Capacity of the Alaskan Segment of the Alaska Highway Pipeline Project", filed in Alaska Northwest Natural Gas Transportation Company, Docket Nos. CP78-123, et al.

develop such plans if required to achieve their objectives with respect to in-state use of some of the Prudhoe Bay resources.

Additionally, State authorities expressed an interest in maximizing recovery of the total energy resources of the Prudhoe Bay deposit. The modes of disposition of produced hydrocarbons are:

(1) Transportation through the oil pipeline or a new NGL's pipeline

(2) Transportation through the gas pipeline

(3) Use within the field as fuel for production and processing and conditioning facilities

(4) Fuel use for pump stations on the oil line and compressor stations on the gas line

(5) Reinjection

(6) Some combination of the above.

The distribution of the NGL's among these various dispositions is a function of the designs of the oil pipeline and the gas pipeline, and of production and processing and conditioning facilities on the North Slope. It will not be completely settled until the designs for all of these facilities have been finalized. State officials expressed an interest in transportation of the NGL's away from the North Slope in order to deliver them to higher value uses. State officials were also concerned that any disposition of gas or NGL's by reinjection involves some loss of ultimate recovery of that which is reinjected. 16/

Although the increased ability of the higher pressure alternatives to transport NGL's might make Alaska favor higher pressure, another aspect of the State's overall concerns might incline them toward the 1260-psig system.

16/ Gas reinjection could increase oil recovery slightly, but reservoir studies to date suggest that approximately the same amount of energy could be consumed in the reinjection process as would be provided by the additional oil recovered.

This concern is over the impact of gas production on oil recovery. The State conservation authority now expects that there will be sufficient gas available for sale from the Prudhoe Bay Main Pool Reservoir to support gas sales of 2.0 bcfd. However, there is a small possibility that actual production history of the reservoir will require a reduction in the level of gas sales. As this possibility is small, and would occur through circumstances which cannot now be foreseen, State authorities cannot say with precision what allowable gas production might be in the event that production experience requires reduced gas sales. Reduced availability of gas would argue for a lower capacity transmission system.

Our principal discussions on these issues with Alaska State officials took place in early February, 1978, before the Canadian Government's decision to utilize the 56-inch, 1080-psig system for the Whitehorse-to-James River segment. Prior to that decision, some consideration was given to a very high pressure (2150 psig) system proposed by Exxon in order to eliminate the need for any gas processing and conditioning facility at the producing area on the North Slope. Moving the processing and conditioning facility to somewhere south of Prudhoe Bay was suggested so as to locate it where costs were less than at Prudhoe Bay. Colocation of such a facility with a petrochemicals manufacturing facility was thought possibly to yield some economies of scale for construction of both. As the State's economic analysis of petrochemicals development was observed to be very sensitive to feedstock costs, we thought that any colocation economies might improve the State's prospects for petrochemicals development. Because of this interest, we discussed the possibility of moving the processing and conditioning facility away from the North Slope with representatives of the North Slope producing companies. These discussions are summarized below.

Alaska observed that a 1400-psig or 1680-psig system can carry a higher percentage of the butanes in the gas phase than a 1260-psig system, other things being equal. Butanes raise the Btu value and, thus, the heating value of the gas. With respect to the disposition of the butanes through the oil pipeline, Alaska noted that California air quality regulations restricting the vapor pressure of crude oil could limit the butane content of crude oil. Because of the potential for air pollution, the vapor pressure of all crude oil entering California must be held to a very low

level unless vapor recovery systems are installed for oil storage facilities. Injecting butane into the North Slope crude oil has the effect of increasing its vapor pressure at any given temperature. Keeping the vapor pressure down after butane injection requires cooling the oil which, in turn, could cause wax formation problems in the oil pipeline.

2. Standard Oil of Ohio (Sohio)

Sohio believes that the maximum operating pressure should be 1260 psig.

At the time of our discussions with Sohio (March 15, 1978), the Canadian Government had made its decision to utilize the 56-inch, 1080-psig system for the Whitehorse-to-James River segment. Due to the hydrocarbon dew point characteristics of the gas stream at those operating conditions, the Canadian decision imposed a requirement for some NGL's removal prior to introduction of the raw gas stream into that Canadian portion of the system. The requirement for some processing and conditioning north of Whitehorse limits the question of where all processing and conditioning should take place.

The Sohio representatives maintained that, although construction costs on the North Slope are high, they are probably lower there than anywhere in inland Alaska, and probably also lower than anywhere in the Yukon Territory. The difference is that coastal locations can be served by barges transporting any large facility in modules, whereas an inland location requires transporting much smaller components with a concomitant requirement for much more extensive onsite assembly. 17/ According to Sohio, very large processing and conditioning facilities can be constructed and loaded onto barges in the lower-48 states, where

---

17/ Modular construction not only allows assembly of a facility at a location where costs are lower, but also allows the use of very large processing vessels, enabling realization of considerable economies of scale in facility design and operation. The Parsons study provides some further discussion of the benefits of modular construction.

complete fabrication facilities are available and assembly costs are much lower. Any inland Alaska or Yukon location would preclude the use of large modules and would require construction from components small enough to be loaded onto railroad cars or trucks for transportation to the inland location. Assembly of the small components would then have to be done in remote locations of Alaska or the Yukon. The difficulty of extensive assembly in remote locations makes inland locations less competitive with coastal locations. Sohio concluded that, because of the ability to make full use of economies of scale in designing the facility and modularizing it for transportation, the cost of facilities would probably be less for Prudhoe Bay or another coastal location than for any inland location.

Having concluded that Prudhoe Bay is the optimal location for any facility required to be located along the pipeline route north of Whitehorse, the next question was how much of the processing and conditioning should be done there. Except for the very high pressure (2150 psig) alternative proposed earlier by Exxon, transportation of the CO2, which comprises about 12 percent by volume of the unconditioned gas, is not cost effective according to Sohio. 18/ The savings in gas conditioning costs made possible by leaving the CO2 in the gas is more than offset by the reduced transportation efficiency for the other components of the gas caused by the presence of the CO2. As the very high pressure system (2150 psig) had been ruled out by the Canadian Government's decision for the Whitehorse-to-James River segment, CO2 removal is required north of Whitehorse and consequently should be done at Prudhoe Bay.

Once the CO2 is removed, the ability of the gas stream to transport NGL's is reduced. Thus, operating the gas pipeline system without condensation would require some NGL's removal as a consequence of the decision to remove the CO2, regardless of whether the 1260 psig or one of the higher pressure alternatives is utilized. The difference

---

18/ In its comments on the draft report Alaska argued that it is cost effective to leave at least 3 percent of the CO2 in the gas stream. A 3 percent standard, according to Alaska, would save 10 percent of the capital costs of the conditioning plant and could result in a reduction of the cost of service to the consumer by noticeable amounts. See also Notice of Proposed Rulemaking and Statement of Policy, Docket No. RM79-19, issued February 2, 1979, wherein the Commission proposes a policy by which producers shall bear the costs of conditioning facilities, rather than consumers.

between the required processing and conditioning for the 1260 psig and 1680 psig alternatives is in the degree of NGL's removal. The requirement for the 1440 psig system is between those of the 1260 psig and the 1680 psig systems.

The advantages of modular construction suggest that, since some processing is required on the North Slope, it is most cost-effective to do all of it there. The CO2 produced in the course of conditioning the gas may be able to be utilized in combination with extracted NGL's as a low-Btu fuel to power field production operations, processing and conditioning plant operations, or perhaps pumping or compressor stations. 19/

The Sohio representatives saw little to be gained by increasing the operating pressure of the gas pipeline to 1680 psig. They saw no major processing and conditioning savings projected for the 1680-psig system, but additional compression costs would be substantial. Although it is possible that compression facilities other than those currently used as part of oil production would not be required for operations at 1260 psig, 20/ additional compression capacity would have to be installed to attain the higher pressure, and operating costs would be significantly increased.

On the other hand, the Sohio representatives felt that the 1260-psig gas pipeline design, plus slight alterations to the oil pipeline, if required, were the most cost-effective solutions to the problem of moving the NGL's. The pentanes and heavier hydrocarbons could be moved through the oil pipeline essentially without alterations; the propanes and lighter hydrocarbons would go through the gas pipeline at 1260 psig. Sohio maintained that between

---

19/ This possibility is developed in some detail in the Parsons study.

20/ Both Arco and Sohio pointed out in comments on this report in draft form that the raw gas compression facilities currently being utilized as part of oil production operations may continue to be required to maintain oil production even after gas sales commence. Thus, the availability of existing compression equipment for service in connection with gas sales is not assured.

62 and 75 percent of the butane could be moved through the gas pipeline with the 1260-psig design. 21/ Cooling the oil line would be the only alteration required to move the rest of the butane.

Some cooling of the oil line is expected to be required when its throughput capacity is increased from 1.2 million to 1.5 million barrels per day. Sohio argued that the relatively small additional capital investment for additional cooling to allow transporting butanes, plus the very low operating cost of the cooling facilities, would make transportation through the oil line the more cost-effective solution for the remaining butane, particularly when compared to the high investment and operating cost for extra compression to 1680 psig. The extra cooling required to accommodate the butane would be less costly if installed at the time of the increase in oil line throughput capacity.

3. Atlantic Richfield Company (ARCO)

Arco representatives confirmed what we had heard from Sohio regarding the possibility of moving some or all of the required gas processing facilities away from Prudhoe Bay. It was their view that the decision in Canada to use larger diameter pipe for the Whitehorse-to-James River segment precluded the use of the very high pressure alternative, for which the North Slope processing and conditioning facilities could have been eliminated. Thus, moving any of the required processing and conditioning steps south of Prudhoe Bay would result in some duplication of facilities, as removal of both CO2 and most NGL's would be required somewhere north of Whitehorse. Arco representatives also concurred with Sohio's judgment that the savings available through modular construction would overwhelm any potential savings in moving facilities to inland locations with slightly more hospitable climates. Their estimate was that construction costs in Fairbanks or Haines, Alaska, would be as much as 50 percent higher than those at the North Slope because of the impact of modular construction.

21/ At the sales gas composition contemplated by the Parsons study, this proportion is even higher. See the discussion below of certain results of the Parsons study.

The Arco representatives were concerned about the ability to dispose of the produced butanes if the lower pressure gas pipeline system were utilized. Their concerns were in the following three areas:

(1) Crude oil vapor pressure limitations in California. (See p. 8 Supra.)

(2) The west coast market for petroleum products cannot use additional large quantities of butane.

(3) In considering use of a blend of CO2 and NGL for field fuel, the Arco representatives suggested that propane was a much better blending stock for the CO2 than butane. Extremely close Btu control is required for efficient turbine operation, and Arco technical personnel expressed concern over possible problems with condensation in fuel lines and burner orifices if butane were to be used.22/

The Arco representatives also had some different figures on the ability of the alternative gas pipeline systems to carry butane. Their figures showed the 1260-psig system would carry 25 to 60 percent of the available butane, while the 1680-psig system would carry 50 to 98 percent of the available butane. 23/

We asked some questions about alternative investment costs under different possible gasline system configurations. The figures we received suggested that a reduction in system operating pressure from 1680 psig to 1260 psig would require an additional investment on the order of $100 million (in 1978 dollars), consisting of $30 million in increased processing and conditioning facilities, and $37 to $75 million

---

22/ In fact, the Parsons study concludes that propane injection into the fuel gas mixture is the optimal solution for Btu control of that stream. The sales gas mixture projected by Parsons has more capacity to transport butane than assumed by Arco, however, because of the reduced amount of propane required to be transported.

23/ See the discussion below of the Parsons study for further information on the NGL's carrying capacity of the sales gas stream.

for some combination of cooling for the oil pipeline, modifications to field fuel facilities, and reinjection facilities if required. 24/

Arco argued in its comments on the draft of this report that the increased natural gas liquid carrying capability of the higher pressure systems would benefit the consumer. Arco argued that even if the transportation costs are lower for a pipeline with a 48 inch diameter which operates at a maximum pressure of 1260 psig and which transports 2 bcfd of gas, a pipeline operating at a maximum pressure of 1440 psig would carry more butanes which would have the dual benefit of providing more Btu's to the gas consumer and reducing the volumes of butanes which would have to be disposed of less economically. Use of butane as a field fuel on the other hand, would require expensive conversion of existing fuel equipment; reservoir injection of liquid butanes could result in the ultimate loss of a significant quantity of these liquids; and transporting butane in the oil pipeline would require cooling the crude oil. Moreover, Arco argued that as long as the oil pipeline is operating at capacity, the transportation of butanes would require a reduction of crude oil shipments or an expansion of the capacity of the oil pipeline.

4. Exxon

Exxon has argued that the pipeline should have a maximum operating pressure of at least 1680 psig. Exxon representatives concurred with the opinions of the other two producers that an inland location for any processing and conditioning facility would likely be more costly than locating it at Prudhoe Bay. They also confirmed that the constraint on the butane content of the crude oil is the restriction on crude oil vapor pressure for reasons of air pollution control in southern California.

24/ In comments on my draft report, Sohio noted that Arco's $100 million figure must not have taken into account the reduced requirement for investment in sales boost compression facilities if the lower pressure gas pipeline system were utilized. Sohio's comments state:

> The net differential investment which would be required in the gas conditioning facilities and in various Prudhoe Bay field facilities to be compatible with a 1260 psig pipeline system is expected to add considerably less than the $100 MM (in 1978 dollars) estimated by ARCO, even when all butanes recovered are transported in the TAPS line in preference to blending them with the sales gas. Operating costs of oil coolers are also expected to be less than those related to additional gas compression. Sohio's Comments, page 2, October 27, 1978.

Representatives of Exxon were involved in the testing associated with the evaluation of safety and design aspects of alternative pipeline system designs which was carried out by the Arctic Gas Study Group. They suggested to us that there was little real safety difference between the 1260-psig and 1680-psig systems. The real safety question from their perspective is the proximity of either system to the oil pipeline. The principal safety issue is what would happen to the oil pipeline in the event of a natural gas explosion and fire.

Exxon's concern in the comparison between 1260-psig and 1680-psig systems was the cost-of-service advantage of the higher pressure system. They had previously advocated a very high pressure (2150 psig) system to increase the cost-of-service advantage even further.

In our discussion with them, they emphasized the highly prospective nature of the Beaufort Sea area and its potential for discovery of additional gas reserves. They favor higher pressure generally because it will result in a more fuel-efficient system at all levels of throughput, and will have a higher throughput capacity with a lower cost-of-service at higher throughput volumes.

5. Alaskan Northwest Natural Gas Transportation Company (Alaskan Northwest)

Alaskan Northwest is opposed to a pipeline with a maximum allowable operating pressure of either 1440 or 1680 psig. A major source of concern is its belief that a delay of up to 2 years could result from choosing a higher pressure system due to a need for extensive testing of the various components of such a system. The testing program required would include burst tests, test of crack arrestor designs, testing programs to validate valve designs, and lead times associated with high pressure compressor development. A delay of up to 2 years was estimated by the project sponsors to result in additional carrying charges of up to $1 billion.

Alaskan Northwest also shows a cost of service advantage for the lower pressure system at the throughput volumes they expect. The 1680-psig system does not become superior in performance until the throughput rate passes 3.6 bcfd

according to its figures. In its recent application, 25/ Alaskan Northwest maintained that the point at which the 48-inch, 1260-psig system is equivalent in cost-of-service to the 48-inch, 1440-psig system is approximately 3.3 bcfd. Thus, the company concludes that the proposed system is the best economic selection up to a volume of approximately 3.3 bcfd prior to any consideration of potential delays. In its petition, Alaskan Northwest, citing findings in the Decision and the FPC Recommendation to the President, argues that 2.0-2.5 bcfd of gas will initially be available to the system and that the system should be capable of expansion by 1.0 to 1.5 bcfd, to an ultimate system capacity in the range of 3.0 to 4.0 bcfd. In the application, Alaskan Northwest suggests that Alaska's interest in the development of a petrochemical industry should not dictate a decision in favor of a higher pressure line. Alaskan Northwest argues that the primary raw material for such a plant is ethane and that a 1260-psig system can transport all the ethane that could be available from Prudhoe Bay almost irrespective of the final configuration of any processing and conditioning plant, and therefore does not offer any impediment to the State's plans.

Alaskan Northwest maintains that the oil pipeline represents the most cost-effective way to move any available quantities of excess butane. Although an investment of up to $100 million (in 1978 dollars) could be required for additional processing and conditioning plant investment and cooling, fuel conversion or reinjection facilities, relative to what would be required for the 1260-psig system, a 1680-psig pipeline system would require $237 million more capital investment (expressed in 1975 dollars) than the 1260-psig system.

Alaskan Northwest also maintains that there is plenty of room in the California market for additional butane. Its figures show that California refineries produced about 100,000 barrels per day of butane in 1975. The extra butane left on the North Slope after that which can be transported in the 1260-psig gas pipeline system would be something less than 22,000 barrels per day at a gas sales rate of 2.0 bcfd

---

25/ "Application of Alaskan Northwest Natural Gas Transportation Company for an Order Approving the Design Specifications and Initial System Capacity of the Alaskan Segment of the Alaska Highway Pipeline." op. cit.

depending on the other components of the sales gas stream, 26/ before any allowance for field fuel uses.

Another concern expressed by the project sponsors is the additional safety hazard associated with a higher pressure system. Higher pressure causes higher potential energy to be stored in the pipe, resulting in increased likelihood of damage to the oil pipeline in the event of a gas pipeline rupture. The project sponsors maintain that crack arrestors will be required for the 1440-psig or 1680-psig system, whereas they may not be required for the 1260-psig system.

The project sponsors are also concerned about the vulnerability of the higher pressure system to cost overruns. Their submissions included a risk analysis of various factors which are likely to cause additional cost overruns with the higher pressure system. They feel that the risk of cost overrun is greatly reduced by staying closer to existing and proven lower-48 states pipeline technology.

Finally, Alaskan Northwest reacted negatively to my proposal discussed at the conference to build a pipeline which would operate initially at a pressure of 1260 psig but whose operating pressure could be increased to 1440 psig if there were an increase in gas volumes available for transporting. It argued that a pipeline should be operated at its maximum design pressure. It also noted that delay would be caused by the need to test such a system.

6. The U.S. Department of Transportation

Noting that it is a basic tenet of transportation system planning that a system should be designed to accommodate future growth, the Department of Transportation (DOT) argued that all the technical and economic data appear to them to support building a 1680-psig system. Moreover, the availability of capacity resulting from the construction of a 1680-psig system would encourage development and exploration in the total North Slope area. Citing a February, 1978

26/ The extra butane would be only about 4500 barrels per day at the sales composition projected by the Parsons study. See the discussion of the results of that study presented below. The Parsons study notes that the capacity of the system to transport butane could be increased by leaving more CO2 in the sales gas, and recommends further study of the most cost-effective sales gas composition.

Technical Study Group evaluation of the 1680-psig system, 27/ DOT argued the system could be built and operated safely and reliably.

As noted above, a proposal was considered at the conference to build a pipeline the operating pressure for which would initially be 1260 psig and would be capable of expansion to 1440 psig if there were an increase in gas volumes available for throughput. The concept was to alter the compressors and the spacing of the compressor stations in order not to foreclose the possibility of increasing the operating pressure later on. DOT indicated that its safety regulations required a thicker pipe wall for a pipeline operating at 1440 psig than for a pipeline operating at 1260 psig, and that it would be reluctant to waive these regulations where the pipeline was built along the Alyeska haul road. A substantial portion of the pipeline in Alaska will be built along the haul road.

27/ "U.S. Government Safety and Reliability Evaluation of Different Pipe Size and Pressure Combinations for Alaska Gas Pipeline" attached to February 13, 1978, letter from Don S. Smith, Vice-Chairman of the FERC, to J.G. Stabback, Chairman of the National Energy Board of Canada, transmitting the U.S. Government's views regarding pipe size selection for the Whitehorse-to-James River segment.

III. Results of the Parsons Study

The Parsons study was undertaken by a group of gas producing and transmission companies 28/ in order to develop a preliminary design for the facilities necessary to process and conditic gas produced from the Prudhoe Bay Unit for transportation through the ANGTS. The principal tasks performed in the course of the study were

- o screening the processes available and selecting processes to recommend for CO2 removal and hydrocarbon dewpoint control, respectively, and
- o developing a process design for processing and conditioning the gas to meet an assumed set of pipeline delivery conditions and quantity and quality specifications.

The study represents a careful evaluation by a consultant to a group composed of both producers and transporters of the optimal distribution of the components of the raw gas stream, for conditions as they currently exist or are expected to exist, among field and process fuel uses on the one hand, and the sales gas stream on the other. The relevance of the study to this inquiry is in the study's indicated resolutions of questions regarding the optimal allocation of the NGL's and the impact of those resolutions on the requirement to transport NGL's away from the North Slope.

The study team concluded that a physical solvent process is best for CO2 removal. A characteristic of physical solvent processes is absorption of a significant quantity of hydrocarbons along with the CO2. Much of the heavier hydrocarbon content is liquefied during the solvent regeneration process, and can thus be recovered. Significant amounts of ethane and propane remain in a gaseous phase, however, mixed with the extracted CO2.

28/ Amerada Hess Corporation, Atlantic Richfield, Exxon Company U.S.A., Getty Oil Company, Mobil Oil Corporation, Natural Gas Corporation of California, Northern Natural Gas Company, Northwest Pipeline Corporation, Pacific Interstate Transmission Company (Arctic), Panhandle Eastern Pipeline Company, Phillips Petroleum Company, Sohio Petroleum Company, Southern Natural Gas Company, Tennessee Gas Pipeline Company, Texas Eastern Transmission Corporation, Texas Gas Transmission Corporation, Transcontinental Pipeline Corporation, United Gas Pipeline Company.

Because of its hydrocarbon content, the waste stream from the CO2 removal process has useable fuel value. The study recommends that this CO2/hydrocarbons mixture be used as fuel for the processing and conditioning facility itself. Any excess of this mixture over the requirements of the conditioning facility would be utilized in the other facilities at the Prudhoe Bay Unit after appropriate blending with other fuels (particularly propane) for heating value control.

Gas delivery and quality specifications assumed for purposes of the study were:

Delivery volume (nominal)	2.0 bcf
Delivery Pressure	1440 psig
Delivery Temperature (max.)	25°F
CO2 content (max.)	1.0 Volume %
H2S content (max.)	1.0 grain/100 SCF
Hydrocarbon Dewpoint (max,)	-10°F at 1,100 psia
Water dewpoint (max.)	-35°F at 1,100 psia

These specifications are similar to those which were part of the Alcan filing of March 8, 1977, except for the delivery pressure. The 1260 psig delivery pressure in that filing requires a more stringent hydrocarbon dewpoint standard, -10°F at 1,000 psia.

The results of the Parsons study with respect to allocation of recovered NGL's between fuel uses and addition to the sales gas stream is given in the following table, taken from the study itself:

	Propane	Butanes		Pentanes-plus
Net Extracted				
BPD	52,350	31,290		28,700
MMSCFD (1)	80.3	41.3		--
Disposition		Min.	Max.	
To Pipeline Gas				
BPD	24,270	-0-	30,602	-0-
MMSCFD (1)	37.2	-0-	40.4	-0-
To Fuel Gas Systems				
BPD	28,080	-0-	-0-	-0-
MMSCFD (1)	43.1	-0-	-0-	-0-
To Crude				
BPD	-0-	688	31,290	28,700

(1) Standard conditions - 14.5 psia and 60°F.
MMSCFD = million standard cubic feet per day.

Source: Table 6-3 from Volume I, p. 6-4.

When combined with the NGL's not recovered from the gas mixture produced by the CO2 removal process, the total allocation of NGL's between fuel uses and sales gas is estimated as follows:

Input	(Billion Btu per day)	Sales			Field Fuel	Fuel Use as percent of Input
		Gas	Liquids	Total		
C1	2101.7	1909.0	0	1909.0	192.7	9.2
C2	323.1	163.3	0	163.3	159.8	49.5
C3	249.2	91.4	0	91.4	157.8	63.3
C4	156.2	136.1	9.5	145.6	10.6	6.8
C5-plus	125.4	5.0	119.9	124.9	0.5	0.4
	2955.6	2304.8	129.4	2434.2	521.4	17.6

Source: AGPO estimate from material balances in Parsons study

As can be seen from the table reproduced from the study, the sales gas stream will accommodate almost 98 percent of the recovered butane under the conditions assumed for the study. References to figure 2-1 from volume II of the study, reproduced on the next page, indicates that the 1260-psig system will accommodate 86 percent of the recovered butane, leaving only about 4500 barrels per day of butane for reinjection or transmission through the oil pipeline.

In a section entitled "Future Design Considerations" (Volume I, Section 12), the study recommended that the cost impact of possible alternative specifications for CO2 content and gas pipeline pressure be evaluated for the overall conditioning and gas transmission system. The study observed that a higher allowable CO2 content of the delivered gas will have a "significant" impact on the facilities costs. The State of Alaska has estimated that relaxing the CO2 standard from 1 percent to 3 percent would save 10 percent of the capital costs of the conditioning plant (see footnote 18, supra.). Our reading of the Parsons study would confirm this estimate.

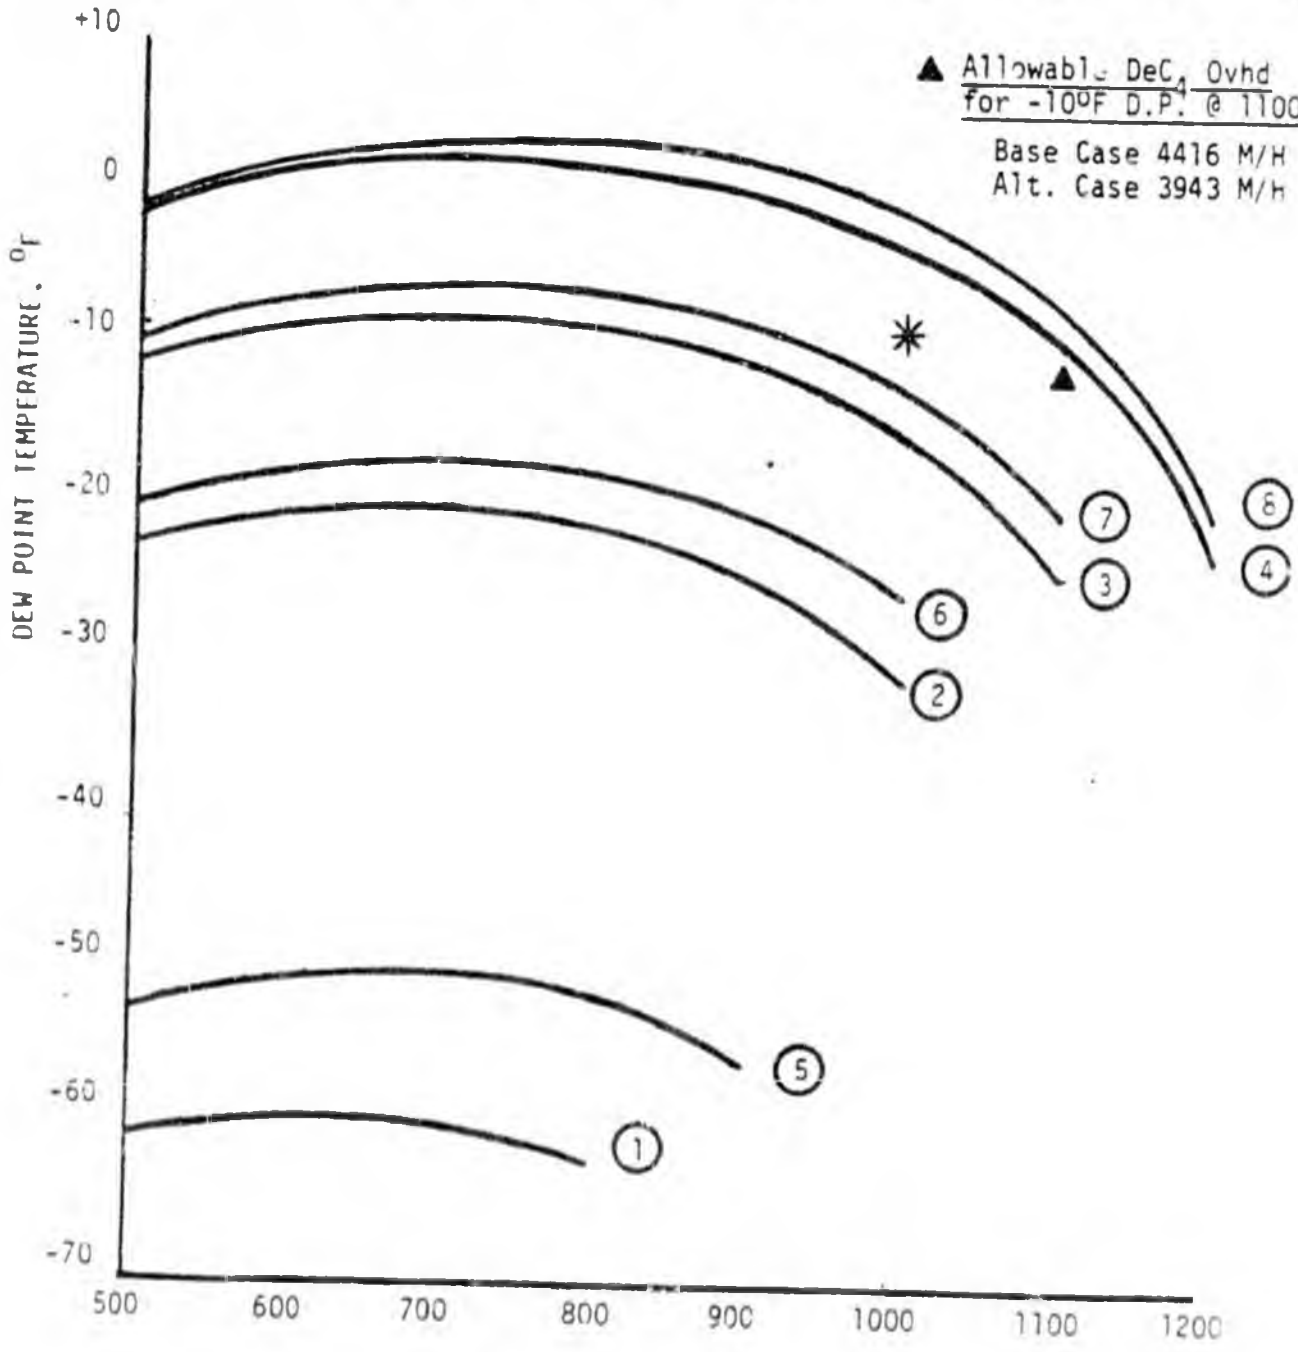

FIGURE 2-1

IV. ALASKA GAS PROJECT OFFICE ANALYSIS OF ALTERNATIVE SYSTEMS

The staff of the Alaska Gas Project Office prepared independent estimates of the capital costs and cost-of-service for the higher pressure systems for comparison with those submitted by Alaskan Northwest. Our results are plotted in figure 1 for a fuel cost of $1.60 (1975 dollars) per million British thermal units (mmBtu). Table 1 presents cost-of-service calculations for fuel prices of $1.00, $1.60 and $2.6[illegible] per mmBtu. The computed costs-of-service reflect the different heating values of the gas mixtures which would be transported at the different operating pressures. 29/

As can be seen on figure 1, higher throughput volumes favor one of the higher pressure alternatives. Likewise, table 1 shows that higher fuel costs reduce the threshold throughput rates at which the higher pressure systems have lower costs-of-service than the lower pressure alternatives.

29/ The assumed heating value of the gas stream for these calculations was 1135 Btu/cubic foot at 1260 psig, 1146 Btu/cubic foot at 1440 psig, and 1154 Btu/cubic foot at 1680 psig. These values differ from those subsequently arrived at in the Parsons study, and would tend to make our cost-of-service calculations lower than they would be if we had used heating values closer to Parsons'.

The comparisons shown on Figures 1, 2 and 3 in Tables 1, 2 and 3 include differences in gas conditioning plant costs for different pressure systems. Including such differences provides a more precise economic comparison of the various systems. The comparisons shown, however, may not represent true cost differences from the point of view of consumers since the cost of gas conditioning may be borne by the gas producers rather than the consumers. (See the Commission's Notice of Proposed Rulemaking in RM79-19, February 2, 1979.) However, as shown in Table 3, such differences in estimated gas conditioning costs resulting from a change in pressure represent only [illegible]y small portion of total costs. The effect of [illegible]ating gas conditiong cost differences would be to mov[illegible]e curves slightly closer together, but would not change any conclusions resulting from analysis of Figures 1, 2 and 3 and Tables 1, 2 and 3.

Our method for preparing the capital cost estimates on which the cost-of-service estimates are based was to start with Alaskan Northwest's March 1977 estimates and adjust those estimates for the cost items which would change as a result of utilizing heavier pipe and higher operating pressures. This is essentially the same method utilized by Alaskan Northwest in preparing its capital cost estimates for the alternative systems. The explanatory material at the end of this section presents our capital cost estimates, along with a discussion of how they were determined.

Table 2 presents a comparison of our constant-dollar capital cost estimates (excluding compression) for the 1260-psig and 1680-psig systems with Alaskan Northwest's. 30/ As the table indicates, the largest difference in the constant dollar capital cost estimates for the 1680-psig system is only about 2 percent of the total estimate. Thus, the two sets of capital cost estimates must be considered very close.

Figure 2 is a plot of the cost-of-service for the 1260-psig and 1680-psig systems utilizing Alaskan Northwest's capital cost estimates, rather than ours. For a fuel cost of $1.60 per mmBtu, use of their capital cost estimates moves the nominal-dollar threshold for crossing over from the 1260 psig to the 1680 psig as the least-cost system to 2.9 bcfd from our 2.65 bcfd. In constant dollars, the respective crossover points are closer, both being just under 3.0 bcfd.

Alaskan Northwest has expressed considerable concern over the possibility of delay inherent in a decision to utilize a higher pressure system. Alaskan Northwest has stated that a decision to utilize a higher pressure system would likely result in a delay of 2 years, resulting in an increase in nominal dollar capital costs of at least $1 billion.

U.S. Government technical experts considered this problem when the Canadian Government solicited our comments as input to its decision on pipe size for the Whitehorse-to-James River segment. At that time our experts concluded that some delay for requisite safety and reliability testing was possible, but could likely be avoided. Their conclusion was:

30/ As shown in table 2, we have reallocated some capital costs for the 1260-psig system among the cost categories, although our total capital costs are the same except for the extra costs of processing and conditioning. We have discussed this reallocation with Alaskan Northwest and they do not object.

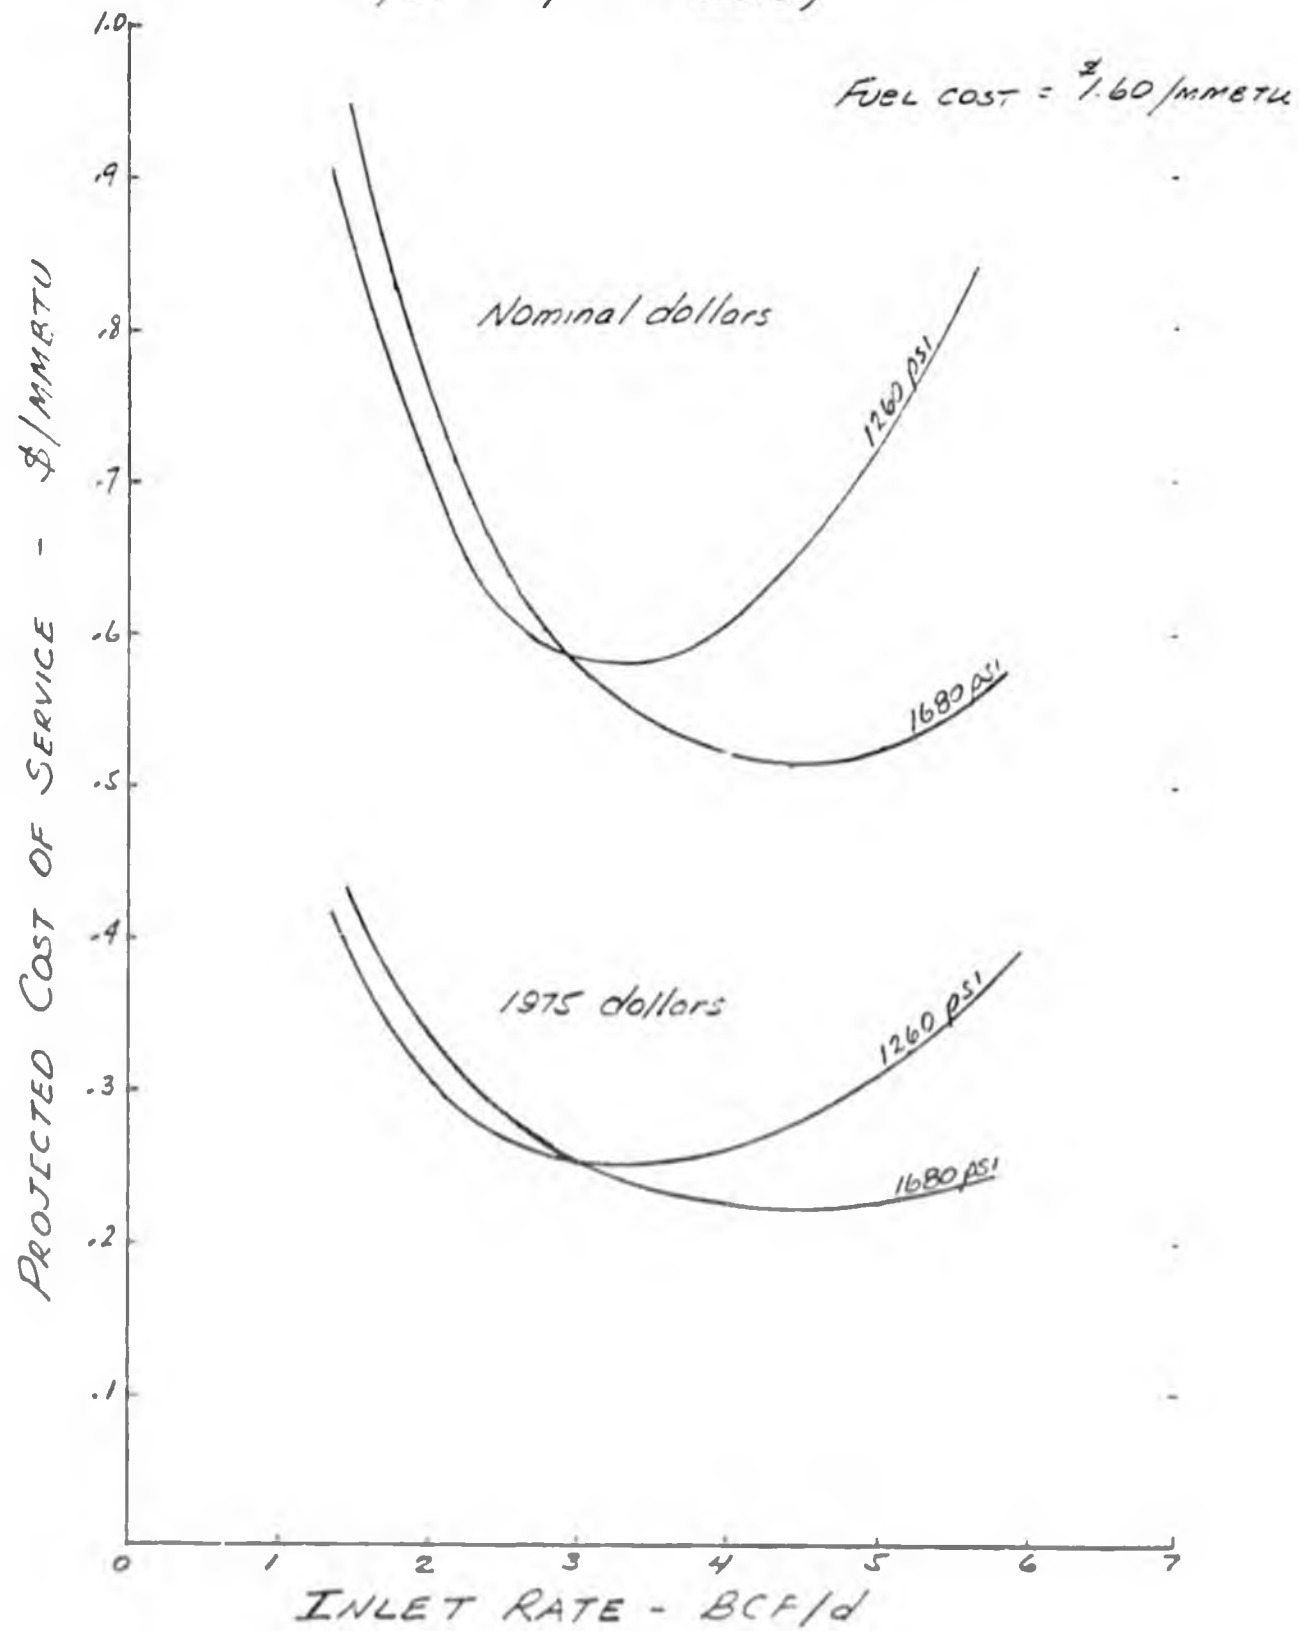
FIGURE 2

COST OF SERVICE - ALASKA

(Utilizing applicant's cost data except for compressor costs)



> We are in agreement that testing all three, or even two, pipe designs will delay completion of construction, perhaps for as long as the two years which the Canadians have predicted. Selection of any one of the size and pressure combinations to the exclusion of all others now or within the near future will permit the pipeline applicants to conduct burst test verification and initiate purchase of the pipe earlier in order to complete the pipeline within the time frame described in the U.S./Canadian agreement. 31/

That report went on to say that, although our experts believe that a confirmatory testing program could be designed for the higher pressure alternative which would have very little likelihood of failure, there was more risk of failure for a higher pressure alternative than for a lower pressure one. Specifically, the experts said;

> We recognize that the possibility of delays associated with testing of the 48-inch 1680 psig pipe may be slightly greater because of the higher pressure. 32/

The impact of delay, as well as the impact of a possibly higher tendency toward cost overrun for the higher pressure systems, is illustrated in figure 3. For a nominal dollar case, we have plotted the cost-of-service for a 1680-psig system with capital costs $1 billion higher than anticipated. 33/

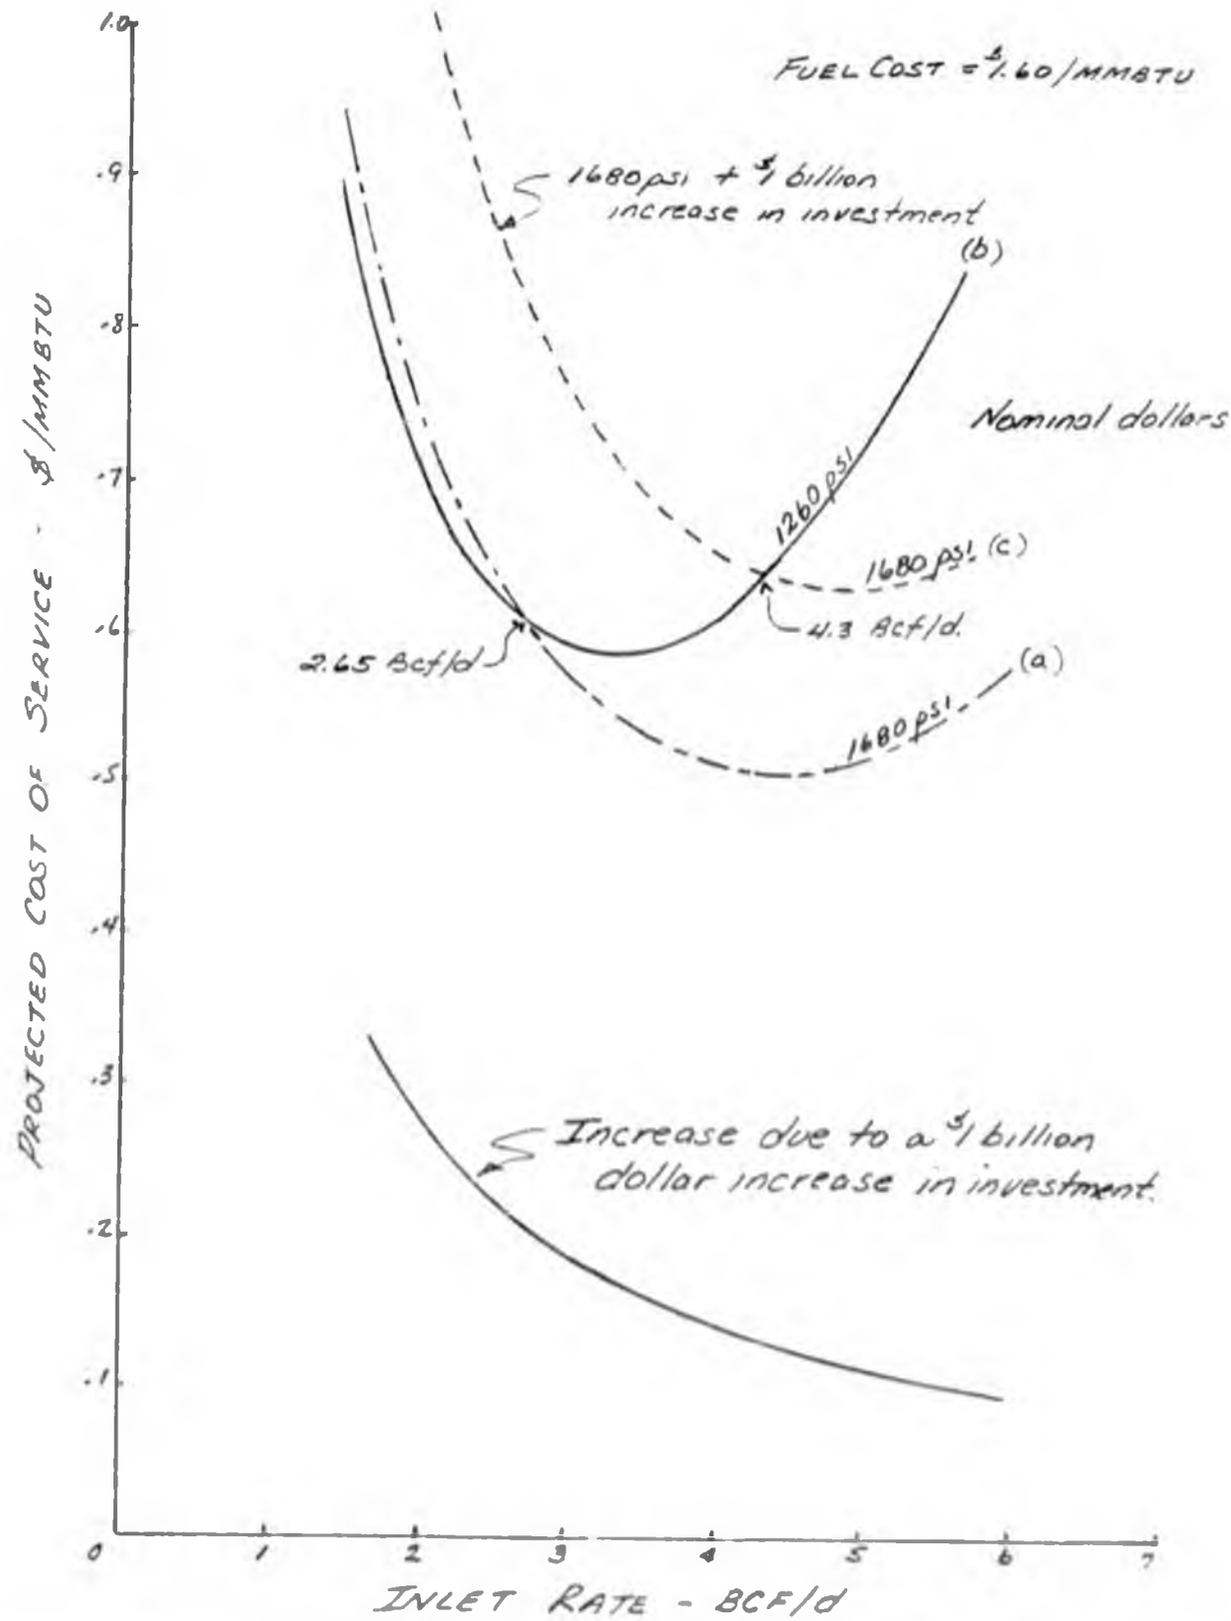
31/ "U.S. Government Safety and Reliability Evaluation of Different Pipe Size and Pressure Combinations for Alaska Gas Pipeline," Op. Cit., Executive Summary, pp. 1-2.

32/ Ibid., p. 5. In comments on the draft of this report, DOT added, "Realistically, the expected 'failure' that could occur relates to the effectiveness of pipe toughness alone to stop ductile fractures. The alternative simply is to add mechanical crack arrestors or rerun the tests with tougher pipe. The latter may mean a 3-6 month delay at worst." (October 26, 1978, Comments, p. 2)

33/ The choice of $1 billion as additional capital cost due to either delay or cost overrun is purely illustrative. Use of this example is not meant to imply that choice of the 1680 psig system would result in a $1 billion cost overrun. We do not now know whether choice of the 1680-psig system would result in any greater cost overruns than for the 1260-psig system.

FIGURE 3

IMPACT OF AN INCREASE IN INVESTMENT UPON THE COST OF SERVICE



As can be seen from figure 3, increased capital costs for the high-pressure systems relative to the low-pressure ones, whether due to time delays for testing or relatively higher cost overruns, would have the effect of moving upward the crossover point in throughput volume for going from the lower pressure system to a higher pressure one as the least-cost system. Our calculations show that the spread in unit cost of service, (constant 1975 dollars, fuel cost $1.60 per mmBtu) among the three systems amounts to less than 10 percent of the lowest one for throughput volumes up to about 3.5 bcfd. At higher throughput volumes, the cost of service plots for the three systems start to diverge more rapidly. Alaskan Northwest would put the throughput point at which the cost-of-service plots start to diverge closer to 4.0 bcfd.

The comparison of cost of service plots using our capital cost estimates with those using Alaskan Northwest's illustrates that small differences in assumptions or expectations about capital costs or other parameters can shift the crossover points noticeably. 34/ Thus, I conclude that the precise crossover points are less significant for decisionmaking than the points where the cost-of-service plots start to diverge.

Our cost-of-service plot for the 1260-psig system includes the effect of the additional cost of the conditioning facilities to meet the pipeline quality specification at that pressure. This assumption provides an indication of the total system-- pipeline plus conditioning facility-- cost consequences of the 1260-psig decision. This difference partially explains the difference between our results and Alaskan Northwest's. Other likely sources of difference include:

- o heating value of gas streams;
- o computation of fuel use for compression and chilling; and
- o our simplified cost-of-service computation methodology.

34/ A difference of $77.9 million in relative capital costs, which amounts to 4.2 percent of Alaskan Northwest's estimate for the 1260-psig system and a smaller proportion of the estimates for other systems, shifted the crossover point from 2.65 to 2.9 bcfd in the example given above.

EXPLANATION OF COST DIFFERENCES FOR VARIOUS SIZE SYSTEMS

Table A-1 presents estimated investment cost for systems designed to operate at 1260, 1440 and 1680 psig.

Table A-2 summarizes the horsepower (hp) and fuel requirements for the three systems.

Methodology

Total capital costs for the 1260-psig base case system at a 2.4 bcfd throughput rate were taken from the capital cost data filed with the FPC by Alcan Pipeline Company in March 1977. Independent cost estimates were made for all items where costs should change materially as a result of utilizing heavier pipe with a greater wall thickness. These cost estimates are shown in table A-1. The estimated costs of all other (nonvariable) items were assumed to be equal to the difference between filed costs and the total cost of the variable items for the 1260 psig, 2.4 bcfd base case.

Compressor and fuel costs were calculated based upon computed requirements for the three systems for flow rates of 1.6, 2.4, 3.2, 4.0, 4.8 and 5.6 bcfd. An FERC computer model based upon American Gas Association (AGA) pipeline flow equations was used to determine compression and chilling hp and fuel requirements. The additional gas processing and conditioning plant costs relative to those for the 1680-psig system were added to the capital costs of the 1260-psig and 1440-psig systems as that difference could have been reflected in an increment to any gathering and conditioning allowance, if allowed by the Commission. Plant cost differences are based on cost differences included in the materials supplied by Arco, adjusted to 1975 dollars. All other capital costs are expressed in 1975 dollars.

As a result of the above methodology, total costs shown are expected to be only roughly correct. However, cost differences should be reasonably accurate.

Capital cost data from table A-1 and fuel requirements shown in table A-2 were used in an FERC cost-of-service model to compute an expected cost-of-service for each case. As noted above, cost-of-service differences should be more meaningful than cost-of-service values for individual cases.

Alaska Gas Project Office Capital Cost Estimates

Items for which differences in pipe weight and operating pressure result in minimal differences in cost

The following activities during pipeline construction were assumed to have the same cost (or only minor cost differences) regardless of the pipe's weight or pressure rating:

1. Right-of-way procurement.
2. Clearing and grading.
3. Workpad and access roads.
4. Ditching.
5. Pipe alignment.
6. Field storage of pipe and materials.
7. Coat and wrap pipe.
8. Pipe inspection.
9. Padding and backfill.
10. Cleanup.
11. Resod.
12. Metering equipment.
13. Automation and telecommunications.
14. River crossings.

In actual practice, increasing the operating pressure should result in only minor differences in actual engineering and supervision costs. However, since these items are frequently considered as add-on items and are usually expressed as a percentage of other items, they were treated as a variable cost in this report.

Items where differences in pipe weight and operating pressure will change costs

Pipe Costs

Pipe costs were computed assuming a 1975 base mill price of $550 per ton for 0.6-inch wall thickness, internally coated pipe, plus the following charges:

1. $10/ton additional cost for 0.686-inch wall thickness pipe.

2. $20/ton additional cost for 0.80-inch wall thickness pipe.

3. $50/ton additional cost for increased pipe toughness.

4. $30/ton increased mill cost-Canadian pipe.

5. $20/ton Yukon tax.

To compute tonnage requirements for pipe it was assumed that the heavier wall thickness required in Class II and III construction locations would increase requirements by 10 percent compared to the tonnage required if the entire line was considered as Class I construction.

Pipe Transportation

It was assumed that the pipe would be shipped from the mill to delivery points in Alaska by intercoastal vessels. The following delivery costs were assumed.

	$/ton (1975)
Baytown, Texas, to Anchorage, Alaska	90
Baytown, Texas, to Prudhoe Bay, Alaska	140
Wellman, Ontario, to Skagway, Alaska	100

Pipe delivered to Anchorage (or Seward), Alaska, that will be further shipped to Fairbanks, Alaska, via the Alaska railroad, was assumed to incur an additional charge of $20 per ton. Rail charges from Skagway, Alaska, to Whitehorse, Yukon, were assumed to be $10 per ton.

It was assumed that the pipe would be strung from pipe storage points in Prudhoe Bay, Fairbanks, Anchorage (or Valdez), Alaska, and Whitehorse, Yukon. The following pipe stringing costs were assumed:

Stringing costs, $/ton (1975)

	Wall thickness, inches		
	0.6	0.686	0.80
From: Prudhoe Bay	21.60	19.80	24.30
Fairbanks - North	18.80	17.40	21.20
Fairbanks - East	15.10	14.20	17.00
Anchorage (Valdez)	15.10	14.20	17.00
Whitehorse	15.10	14.20	17.00

Higher costs were assumed north of the Yukon River. Stringing costs varied because of assumed truck weight limitations. For instance, it was assumed that only two double joints of 0.8-inch wall thickness pipe could be delivered per load compared to three double joints of 0.6-inch thickness pipe. The weight limitations assumed are probably conservative.

Welding

Alaskan Northwest has stated that increasing pipe weight and wall thickness reduces construction speed, due to increased welding requirements. They maintain that such reduced construction rate increases costs significantly more than just the increased welding costs, since a slower pace increases the cost of most construction activities. In contrast, others have stated that increasing wall thickness should not slow down construction.

Our knowledge of the welding procedure is that the stringer bead (the initial weld) is made by a stringer bead crew, which for 48-inch diameter pipe would likely consist of four welders. Upon finishing the stringer bead, the stringer bead crew moves forward to the next joint. Immediately following completion of the stringer bead, the hot pass bead is placed by the hot pass crew. Since the hot pass bead is applied at a slightly higher speed than the stringer bead, the hot pass crew usually has no trouble keeping up with the

stringer crew. The filler and cap bead are made by separate crews. Normally, a filler and cap crew will stay with a weld until it is finished. Since more weld material must be placed by the filler and cap welders, there may be several filler and cap crews per stringer crew. When thicker wall pipe is welded, it is only necessary to add more filler and cap welders.

According to our understanding of the process, the only welding problem with thicker wall pipe is that 0.8-inch wall thickness pipe would add about 100,000 to 120,000 man-hours of additional welder time compared to that required for 0.6-inch wall thickness pipe. Assuming a 2-year construction period and 1600 man-hours per year per welder, this additional welding would require adding about 38 welders. There should be no changes in nondestructive testing requirements, and only minor increases in inspection and supervisory personnel.

Construction speed is determined by the speed of the stringer crew. Since the time to make the stringer pass is independent of wall thickness, welding speed, expressed as joints per day or miles per day, should not be a function of wall thickness. As a consequence, increasing the wall thickness of the pipe should not materially reduce construction speed.

Welding costs shown in table A-1 assume manual welding; automatic or semi-automatic machines could probably reduce costs and improve weld quality. Welding time is based upon a theoretical arc time assuming deposition of 0.8 pounds of weld material per minute; changing electrodes is allowed for by adding one-third again to the time spend depositing weld material. We then assume that 50 percent of welders' working time is spend on activities other than these two.

Double Jointing

It was assumed that automatic or semi-automatic welding machines would be utilized for doublejointing under controlled, indoor conditions. The principal differences in doublejointing costs for thicker wall pipe compared to thinner pipe would be an increase in machine and operator time.

Bending

It was assumed that bending costs for the 0.8-inch wall thickness pipe would be 10 percent greater than for pipe with 0.6-inch wall thickness, or about $0.25/foot increase.

Sidebooms - Support Tractors

It was assumed that the heavier pipe would necessitate heavier lifting equipment, with a resultant increase in fuel and amortization costs. No increase in operating personnel was assumed.

Concrete Weights

March 1977 filed costs were assumed for the base case. Costs for the heavier pipe were computed assuming that total costs for weights would be proportional to the pipeline negative bouyancy without weights.

Valves and Fittings

Block valve costs of $90,000, $95,000 and $105,000 each were assumed for 1260 psig, 1440 psig and 1680 psig valves, respectively. Installed costs of valves and fittings were assumed to be seven times the valve costs. All costs are based upon 1975 prices.

Compression and Cooling

The high-pressure systems will increase compression and cooling requirements at Prudhoe Bay, but will reduce them at pipeline compressor stations. Computed horsepower requirements are shown on table A-2

Compressors are now used to reinject produced gas. Existing first stage compressors compress the gas from about 550 psig at flow station discharge points to about 1700 psig. These compressors possibly would not need to be duplicated.35/

35/ Sohio noted in its comments on our draft report that whether the compressors will need to be duplicated will depend on whether Prudhoe Bay working interest owners agree to release any of these facilities for gas sales service.

Arco also addressed this point in its comments on the draft report. It noted that the Prudhoe Bay owners installed compressors to reinject gas which is produced with crude oil. At the time gas sales commence the volume of gas which will have to be reinjected will be reduced by the volume of gas sales. However, these compressors may still be required for reinjecting a portion of the gas production in order to maintain crude oil production.

V. ESTIMATES OF THROUGHPUT VOLUMES

As is apparent from the plots of transportation costs versus throughput volume, expected throughput volume is an important parameter in determining which of the alternative systems is the most cost-effective design. This section reviews the available information for guidance on this point.

1. Findings in the Initial Decision

The quantity of gas reserves on the North Slope of Alaska and the deliverability of these reserves was explored in detail during the hearing before FPC Administrative Law Judge Litt in El Paso Alaska Company, et al., Docket No. CP75-96, et al. Judge Litt concluded in the Initial Decision that, although the uncertainty of reservoir performance and the possible necessity of water injection precluded exact estimates as to the daily deliveries to be expected from the Prudhoe Bay Field, the weight of the evidence supported a finding that 2.0 - 2.5 bcfd of gas will initially be available from the Prudhoe Bay Field. (Initial Decision at 33.) The proven reserves in the Prudhoe Bay Oil Pool support this finding. If one includes additional reserves from the Sadlerochit, Lisburne, and Kuparuk reservoirs, this estimate may be conservative. Judge Litt noted in connection with the Lisburne and Kuparuk reserves that future development or complete disclosure of past drilling would be necessary to establish the producing capabilities of these formations. (Initial Decision at 31.)

Judge Litt also found that the evidence suggested that deliveries above the 2.0 - 2.5 bcfd level might be available from the North Slope region because of reserves other than in the Prudhoe Bay Field. (Initial Decision at 33.) However, he found that the evidence regarding such reserves was unclear and made no specific findings as to the volumes of gas which might be delivered from such reserves.

2. Findings in the FPC Recommendation to the President.

The FPC stated in the Recommendation to the President:

> "Thus, we conclude that it is reasonable to assume 2.0 to 2.5 Bcfd from Prudhoe Bay Oil Pool within five years after the commencement of oil production. There exists some possibility of increased delivery from the North Slope of perhaps as much as an additional 1.5 Bcfd from NPR-4 (Naval Petroleum Reserve No. 4), ANWR (The Arctic National Wildlife Range), and the Beaufort Sea, as well as other reservoirs in or near the Prudhoe Bay Oil Field. Thus, we find the system should be designed to carry initially 2.0 - 2.5 Bcfd, and be capable of expansion to an additional 1.0 - 1.5 Bcfd." (p. I-17)

3. Findings in the Decision

The report which accompanies the Decision notes that the increase in the nation's supply of natural gas from an Alaskan gas project is estimated to be 0.7 trillion cubic feet (tcf) per year (2.0 bcfd) by 1985. By 1990, a volume greater than 0.9 tcf per year (2.4 bcfd) might be produced, according to the report.

4. State of Alaska

The Prudhoe Bay Field is located on lands owned by the State of Alaska. Detailed information on the production potential of that field has been made available to the State in its capacity as royalty owner and conservation authority. At our request, the State's Department of Natural Resources prepared estimates of reserves and deliverability of gas from State lands in the North Slope region based on all information available to them. Those estimates suggest a deliverability range after 1988 of 2.0 to 4.2 bcfd from State lands (including the Prudhoe Bay Field) with the median estimate at 2.8 bcfd.

5. U.S. Geological Survey

As part of the July 1, 1977, reports to the President prepared under the terms of the Alaska Natural Gas Transportation Act (ANGTA), the U.S. Geological Survey (USGS) compiled estimates of reserves and deliverability for all North Slope areas.36/ The USGS discussion cites three separate analyses of North Slope potential -- its own, that of the Potential Gas Committee of the Colorado School of Mines, and that of the Division of Geological Survey of the State of Alaska -- to conclude that there is very high probability of substantial additional recoverable gas reserves in the North Slope area.

Converting potential reserve estimates into proven reserves dedicated to pipeline transportation is a demanding exercise in expectation. However, using the USGS figure of 19 tcf of potential reserves outside the Prudhoe Bay geologic structure, in conjunction with a rule of thumb for deliverability (1 bcfd of production for 20 years requires at least 20 tcf of potential reserves), plus the State's figure for the Prudhoe Bay Field itself, these estimates suggest there is a 95 percent probability that deliverability from all North Slope producing areas will be at least 2.5 bcfd if production from all of these reserves overlaps through some period in the future, as seems highly likely. There is a small probability of North Slope deliverability going as high as 7.5 bcfd.

36/ Report of the Working Group on Supply, Demand and Energy Policy Impacts Of Alaska Gas; Federal Energy Administration; Department of Commerce; Department of the Interior-U.S. Geological Survey; Department of Transportation; Department of the Treasury; Energy Research and Development Administration; July 1, 1977.

VI. ADDITIONAL CONSIDERATIONS

Our discussions with interested parties suggested that considerations other than design costs and estimated throughput volumes are important to the choice of system operating pressure. This section presents short discussions of the most important of those considerations as we understand them.

1. Vulnerability to Cost Overruns

The project sponsors have expressed the concern that a higher pressure system is more vulnerable to cost overruns. Some support for their concern can be found in the work of Professor Walter Mead of the University of California at Santa Barbara. In a recent study published by the American Enterprise Institute,37/ Professor Mead reported in a chapter on cost overruns (chapter 6) that an econometric analysis of past Defense Department projects "...indicated that cost overruns were significantly related to the length of time required for the development program and the extent of technological advance involved in the project."(p. 86) The implication is that the closer to known technology a project is, or more specifically, the more like a previously constructed project a succeeding one is, the better the cost estimates for the successor project and the less its tendency to cost overruns. To the extent that the 1260-psig system can be considered closer to known technology than either of the higher pressure alternatives, its tendency to cost overrun should be less if an analogy to Professor Mead's analysis of Defense Department projects is appropriate.

Any difference in their respective tendencies toward cost overrun between the 1260-psig system and the higher pressure alternatives would have the effect of raising the crossover point where increased throughput volume makes a higher pressure system result in lower unit transportation charges. Figure 3 in the section which presented the results of our calculations (section IV, supra) shows the effect on the crossover point of an increase in capital costs for a

---

37/ Transporting Natural Gas from the Arctic: The Alternative Systems; Walter J. Mead, with George W. Rogers and Rufus Z. Smith; American Enterprise Institute for Public Policy Research, Washington, D.C.; August 1977.

high-pressure system. A similar effect on the crossover point would be realized if cost overruns had the effect of increasing the costs of a higher pressure system relatively more than those of the 1260-psig alternative.

2. Impact on Financing

The Decision requires that the Alaskan Natural Gas Transportation System be privately financed. Therefore, the impact of a decision to utilize a higher pressure system on the ability of the sponsors to obtain private financing is a major concern.

The risk of major cost overruns creates whatever risk there is of project non-completion, and presents the largest single financing problem for the project. Thus, if the lower pressure system is closer to current gas pipeline industry practices, the analysis referred to by Professor Mead would suggest that utilizing the lower pressure alternative reduces the likelihood of major cost overruns and thereby facilitates financing. The effect of technological advances on the reliability of cost estimates was alluded to by the NEB in its February 19, 1978, "Statement of Position."38/

In response to our request for more definitive information on the significance of the pressure question for financing, the project sponsors' principal financial advisers prepared a letter explaining the effect of a decision to utilize a higher pressure system on the financing proposals of the pipeline project. The gist of their concern is that a higher pressure system involves technological risks that lenders and potential equity investors simply will not accept.

3. The Gas Consumers' Interest

The interest of the gas consumer in the low-pressure/high-pressure decision is not obvious. Although a higher pressure system should result in lower transportation charges at higher levels of throughput, it is not assured that such reductions in transportation cost will accrue directly to the benefit of gas consumers.

38/ "Until sufficient field welding tests and production trials are done to establish suitable procedures and the manpower and equipment requirements to achieve progress rates compatible with other crews, the National Energy Board feels the present cost comparisons (between standard-pressure and high-pressure alternatives) based on normal procedures may not be valid." NEB Statement of Position, op. cit., Technical Review, pp. 3-4.

The means by which the delivered price is set for the gas to be transported by ANGTS does not lead to a clear-cut showing of consumer benefit. For the initial throughput volume, an expected 2.0 bcfd from the Main Pool Reservoir of the Prudhoe Bay Field, the delivered price will be the sum of the transportation charge and a wellhead price, plus an allowance for gathering and conditioning if allowed by the Commission. In this case, reduced transportation charges should be passed on to gas consumers as reductions in delivered prices.

In the next few years, however, high-priced sources of gas such as the Prudhoe Bay gas could rapidly exhaust the implicit subsidies provided by allowing the price of this gas to be averaged in with lower cost gas from conventional supply sources. As soon as the use of "rolled-in" pricing has raised the average price of all gas to approximate parity with the delivered price of alternate fuels, incremental gas sales are likely to be made only at prices set by competition with those of alternative fuels. At that point reductions in transportation charges would likely accrue to producers.39/

Depending on the relationship of the netback to the field price from the market value of this gas on the one hand, and the maximum lawful ceiling price set by the NGPA on the other, possible Commission use of rolled-in pricing for other gas supply projects, and changes in the delivered prices of competing fuels, prices for North Slope gas sales after the initial 2.0 bcfd from the Main Pool Reservoir could be set by a netback from the delivered prices of competing fuels. In that event, reduced transportation charges for these incremental volumes would benefit the gas producers.

An efficient natural gas transportation system which encourages the development of additional supply through higher field prices is not without some consumer benefit. The point here is that an analysis of that benefit is not as simple as might be implied by a comparative evaluation of transportation cost curves.

39/ A limitation on such a potential benefit to producers will be the ceiling price on natural gas produced from Prudhoe Bay Unit established by § 109 of the Natural Gas Policy Act of 1978 (NGPA). The price of competing fuels may only determine the price of gas from the Prudhoe Bay Unit to the extent such a price is equal to or less than the ceiling price.

Increased investment in gas conditioning plant:	$30 million
Field fuel system investment:	$50 million
Injection investment:	$25 million
Total:	$105 million

As the likely outcome of a decision to use the 1260-psig system would be a combinatior of cooling the oil pipeline, use of the extra butane in the field, and reinjection, we believe approximately $100 million (in 1978 dollars), including the $30 million required for additional investment in the processing and conditioning facility, is a representative requirement for comparison with the $237 million (in 1975 dollars) additional investment required to increase the system operating pressure to 1680 psig. None of these figures consider operating costs, so any comparisons are necessarily incomplete.

The gas consumer would see the increased investment requirement in the form of increased transportation charges for gas delivered by a higher pressure system, at least for the first 2.0 bcfd of throughput. Although the increase in unit transportation charges would be tempered by the delivery of higher Btu gas, the additional Btu's per unit volume would not be enough to offset the higher transportation charges until throughput volumes get higher than just those from the Main Pool Reservoir of the Prudhoe Bay Field. 41/

On the other hand, the oil consumer would not likely be directly affected by a requirement for additional investment in oil pipeline facilities. North Slope oil prices are effectively set through competition with imported oil, and can not be increased to consumers in order to recover additional transportation costs. Additional investment in the Trans-Alaska Pipeline System (TAPS) simply reduces the netback to the oil producers at the field. The consumer price impact of using the oil pipeline to carry the butane would only be felt as an increase in any processing and conditioning allowance which might have been allowed by the Commission to cover the $30 million extra investment required for the processing and conditioning plant.

41/ Future gas volumes made available for shipment could have less NGL's content than the Prudhoe Bay accumulation, in which case the "drier" composite gas stream would have more capacity for Prudhoe Bay NGL's without increasing system operating pressure.

The investment requirement not touched on in the preceding discussion is that which might be required for vapor recovery systems on storage tanks in areas where the higher vapor pressure caused by adding butane to the North Slope crude would cause unacceptable air pollution problems. Such ancillary investment requirements highlight the importance of the gas pipeline system design question for the North Slope gas producers, as well as for the gas pipeline project sponsors, and the degree of interest the producers should have in optimizing the design of all facilities involved in producing and transporting Prudhoe Bay hydrocarbon resources.

VII. REQUIREMENTS FOR RESOLUTION

I believe that the Decision creates a predisposition that the 1260-psig system is the one authorized by the President and the Congress by its reference to "the facilities...included in the revised Alcan filing submitted to the Federal Power Commission (FPC) on March 8, 1977."42/ Additional NGL's carrying capability of a higher pressure system might be a desirable feature, all other things being equal. However, a technical report filed with the State of Alaska by the major interest owners in the Prudhoe Bay Field (Arco, BP, Exxon and Sohio) in support of their proposed reservoir management plan states:

> Gas pipeline specifications are not currently known and final specifications may increase or decrease the volume of liquids which must be extracted from the gas to prevent condensation in the pipeline. Regardless of the final gas conditioning requirements, all liquids extracted will be used without waste, either to displace fuel gas or to be transported through the oil pipeline.43/

I believe that the language in the Report accompanying the Decision suggesting that:

> ...Alcan should consider increasing the operating pressure and wall thickness of its 48-inch diameter pipeline in order to allow for more efficient increases in throughput rate for additional reserves which might be committed to the system from either Alaska or Canadian sources...."44/

would make the predisposition a rebuttable one on appropriate showings in a final authorization proceeding for these facilities. The discussion below highlights the principal factors which should be evaluated in such proceeding, should one be required to fix this parameter. I believe that favorable findings in all three areas would be required to support a decision to increase the operating pressure of the Alaskan segment.

42/ Decision, op. cit., p. 13.

43/ Exhibit ALA-33 filed in proceedings before FPC, p. 16. Cited in Comments on the "Decision and Report to Congress on the Alaska Natural Gas Transportation System", Federal Energy Regulatory Commission, October, 1977.

44/ Decision, op. cit., p. 193.

1. Concurrence of the Canadian Government

The Government of Canada, across whose territory some length of any of the 48-inch alternatives would have to pass,45/ has previously expressed severe reservations about the 1680-psig alternative on safety and reliability grounds. The Canadian project sponsors share those reservations. The U.S. project sponsors, while concerned about safety and reliability problems (particularly those associated with proximity to the Alyeska oil pipeline), are primarily concerned that uncertainties associated with the 1680-psig system would create significantly higher risks of construction delay and cost overrun than the 1260-psig alternative.

45/ On February 17, 1978, the Canadian National Energy Board chose a large-diameter (56-inch) alternative for the segment of the system through which both Canadian and U.S. gas volumes will flow, to be installed between Whitehorse, in the Yukon Territory, and the bifurcation point near James River in Alberta. Although the operating pressure of the 56-inch system will be 1080 psig, its NGL's carrying capacity is not less than that of a 1680-psig system installed farther north. The reason is the difference in operating temperature: the 56-inch system will operate at a minimum of 40°F, while the northern portions of the system will have to be chilled to below the freezing point of water (32°F) to avoid thaw settlement problems in permafrost soils.

Permafrost soils, and consequently the need for operating the pipeline at or below 32°F, extend less than 100 miles into Canada. The operating temperature can be increased south of that point, allowing the operating pressure to be gradually lowered without losing significant NGL's carrying capacity. The 1080-psig system is, however, incompatible with the very high pressure (2150 psig) system advocated at one point by Exxon.

Thus, Canada would have to approve the use of a higher pressure system for a short distance from the Alaska/Yukon border if such a system is to be used in Alaska.

The hearing record on the safety and reliability aspects of the 1680-psig system was more extensively developed in Canada than in the U.S. proceedings before the FPC. Accordingly, although U.S. technical representatives continue to believe that the 1680-psig system can be constructed and operated safely and reliably,46/ Canadian authorities still have reservations about the high-pressure alternative based on the evidence presented to them.47/

The U.S. project sponsors have also expressed concern about additional hazards of a higher pressure system because of proximity to the TAPS. The additional potential energy in a higher pressure system is thought to represent more of a threat to the structural integrity of the oil pipeline in the event of a gas pipeline rupture. On the other hand, technical representatives of Exxon, one of the principal owners of TAPS, did not feel there was any significant difference in hazard to the oil pipeline between the 1260-psig and 1680-psig alternatives.

A testing program involving the project sponsors, the owners of the oil pipeline and the Canadian Government would seem to be required prior to any decision to increase the operating pressure of the gas pipeline. Exxon representatives in particular have suggested that the required testing program would not be extensive, but we doubt they have tried to convince the Canadian Government or the Canadian project sponsors, both of whom would have to be satisfied with the testing program and its results before a decision to utilize a higher pressure system could be made.

2. Satisfactory Distribution of Costs and Benefits

In the preceding section, I discussed my concern that consumers might not be the primary beneficiaries of a decision to utilize a higher pressure system for the Alaska segment. Here I suggest briefly what types of analysis would be required to support a conclusion that consumers would benefit from higher pressure.

46/ "U.S. Government Safety and Reliability Evaluation o Different Pipe Size and Pressure Combinations for Alask Gas Pipeline", Op. Cit.

47/ Their "Statement of Position" has previously been referenced. See page 4.

The first consideration is expectations about throughput volumes which would suggest that lower transportation costs are likely with higher pressure. A positive finding in this area would have to involve not only conclusions about ultimate throughput, but also the timing of throughput increases, as a decision to ask consumers to pay more now in order to pay less later would have to pass a present value test.

The North Slope producers either now have or will have the geophysical and drilling information which might support increased capacity in the delivery system. Much of this information may have been supplied by them to the State of Alaska and the USGS, but under confidentiality arrangements which effectively deny access to any parties not specifically granted permission by the producers. I believe that the burden of proof that a higher capacity system is required is on the producers.

A second consideration is the possibility of a differential tendency to cost overrun between the 1260-psig system and the higher pressure alternatives. As discussed in a previous section, such a tendency would displace upward the throughput volume threshold where a higher pressure alternative has a lower unit cost-of-service than the 1260-psig system. Further studies of the cost overrun problem are currently in progress,48/ and should be available for evaluation in the event that an initial burden of proof regarding volumes available for throughput had been satisfied.

3. Resolution of Extraordinary Financing Problems

I believe that requiring the chosen system to be privately financed is an integral part of an elaborate framework set out in the President's Decision to ensure that construction of the selected system is in the public interest. I also feel that it would be inappropriate for the Commission to make any decision which would undermine a component of that framework. I believe that a showing that any extraordinary financing problems associated with choosing a higher pressure system had been resolved would be an essential element in any such choice by the Commission.

48/ For example, the Rand Corporation has been studying this problem applied to coal gasification plants for the Department of Energy.

VIII. RESULTS OF CONFERENCE

An earlier draft of this report was circulated for comment in late September 1978, to the parties with whom we had discussed this matter. The same draft was sent to all parties in Docket No. CP78-123, et al., during November, 1978.

The comments I received indicated a number of corrections to be made which have been incorporated as appropriate but did not alter my basic assessment of the difficulties involved in reaching a determination to increase the operating pressure from the level which had been approved as part of the President's Decision.49/

An on-the-record conference of interested parties was held on December 15, 1978. At that conference I presented a proposition, which had been suggested in the comments of the State of Alaska on my draft report, for consideration by the project sponsors and any other interested parties. That proposition was to first construct and operate the pipeline at 1260 psig, and then to increase operating pressure of the pipeline if sufficient throughput volumes became available during the operating life of the pipeline to warrant the increase. The State of Alaska suggested that it might be

> ...possible to achieve operating pressures approaching 1440 psig by relaxation of the "design factor" for the pipe Northwest proposes to use from .72 to .8. See 49 CFR 192.111. This would not be a substantial change because the "relaxation" is only to the established Canadian standard. A waiver request would have to be presented to the Office of Pipeline Safety [Department of Transportation] but a good case would be made that safety concerns would be satisfied by the relaxed design factor based on the record in Canada (November 17, 1978, Comments, p. 7)

49/ The U.S. Department of Transportation expressed some concern over perverse incentives inherent in the way natural gas pipeline projects are regulated. I took note of their concerns but advised them that the Commission would likely be unable to resolve them.

The Department of Transportation (DOT) and its Office of Pipeline Safety were represented at my conference. Their representatives were not encouraging about the prospects for a waiver because of the proximity of the pipeline to the haul road which serves the North Slope producing area. DOT safety requirements are more stringent for gas pipelines which operate near highways50/; thus, sufficient relaxation of the standard to accommodate an increase in operating pressure would likely require a double waiver. The DOT representatives advised use of thicker-wall pipe if higher operating pressures were to be attempted.

I closed the conference by requesting that the project sponsors present their views on the operating pressure question in detail to the State of Alaska and the DOT, both of whom appeared to favor a higher capacity system.51/ The sponsors were then to report to the Commission on their views regarding the possibility of increasing the system capacity, and on the results of their discussions of this matter with other interested parties. The sponsors' filing of March 2, 1979, requesting a Commission order finalizing the selection of 1260 psig as the operating pressure for the Alaska segment, is in compliance with my request. A copy of that filing is attached to this report.

50/ Whether the haul road is properly classified as a "highway", and thus imposes the more stringent safety standard on the gas pipeline, is a matter which I believe is still at issue.

51/ Arco representatives, both in their comments on my draft report and in their remarks at my conference, favored increasing the operating pressure but reducing the diameter of the gas pipeline system. Exhibit Z-5, attached to the project sponsors' March 2, 1979, filing, indicates that the operating efficiency characteristics of the 1680-psig, 42-inch system which Arco favors are essentially the same as those for a 1260-psig, 48-inch system.

IX. CONCLUSIONS AND RECOMMENDATIONS

Relevant Considerations

As discussed in section IV above, the primary method of analysis to determine the appropriate throughput capacity for a gas pipeline is the comparison of plots of unit transportation cost vs. throughput volume for alternative system configurations. The project sponsors have attached such plots for the principal alternative systems as Exhibits Z-4 and Z-5 in their filing. Similar computations are also included in section IV of this report.

In my judgement, there are two factors in these comparisons which should be considered:

- The least-cost system at expected levels of throughput, and
- Expectations about the throughput levels for which fuel penalties start to significantly increase the unit transportation cost.

For expected levels of throughput up to 3.3 bcfd, the 1,260-psig system is indicated by the project sponsors' analysis. Although our analysis puts the crossover point from the 1,260-psig system to the 1,440-psig system slightly lower than the project sponsors',52/ our analysis also supports the 1,260-psig system if the expected levels are in the 2.8-to 2.9-bcfd range.

Perhaps more important, in my judgement, is an assessment of the likelihood that throughput levels will exceed the range of efficient operation for the recommended system. For the three systems which appear to be feasible for the Alaska segment--1,260, 1,440 and 1,680 psig systems--there is a considerable range of throughput volumes for which there is probably sufficient uncertainty the capital cost

---

52/ Our results put the crossover point at 2.65 to 2.9 bcfd, depending on certain assumptions about capital costs other than for compression. The remainder of the difference between our analysis and Alaskan Northwest's is in the installed cost of compression and chilling facilities.

I would caution against assigning undue precision to the exact crossover points from one system to another. The differences between Northwest's capital cost estimates and ours for the 1,680-psig system is $48.3 million, or less than 3 percent of the base 1,260-psig estimate, whereas the expected cost overrun for the 1260 psig case is about 30 percent of that estimate.

estimates upon which the cost of service calculations are based to prevent a definitive conclusion that one will have a lower unit cost of service than another. For example, if I arbitrarily pick a difference of 10 percent between the cost of service of the lowest and highest cost systems for a given throughput level as a difference which is significant, then the unit cost of service for all three systems would be essentially the same from a throughput of about 2.6 bcfd to almost 4.0 bcfd, according to Alaskan Northwest's Exhibit Z-4. Above 4.0 bcfd and below 2.6 bcfd, the three curves diverge more rapidly.

Our computations in section IV illustrate better the divergence of the "J-Curves" at higher throughput volumes because we have plotted them for a larger range of throughput. On the next page, I have used the data from my Figure 1 to plot the difference between the lowest and highest cost systems as a percent of the lowest cost system for various levels of throughput. Notice that because of differences in our respective capital cost figures, our 10-percent difference point is closer to 3.5 bcfd than Alaskan Northwest's 4.0 bcfd. However, the plot illustrates that, although the differences are small over a range of throughput, they increase rapidly as the upper end of the range of efficient operation for the 1,260-psig system is approached.

In section VII of this report, I discussed the difficult problems which would have to be resolved to reach a determination to increase the operating pressure of the Alaskan segment. I believe that the Commission need not address these problems unless there is a significant change in expectations about gas volumes available from the producing areas to be served by the ANGTS. In view of the difficulties discussed in my report and in view of the relatively small differences in unit costs of service over the range of at least 2.6 to 3.5 bcfd, I would recommend that you reaffirm the 1,260-psig system for the Alaskan segment unless you are provided with new information which demonstrates that there is a significant probability of volumes in excess of 4.0 bcfd in the area to be served by the ANGTS.

Status of Information

The information available at the time of the Decision, the results of the extensive analysis by the FPC and the July 1, 1977, Report to the President of the Working Group on Supply, Demand and Energy Policy Impacts of Alaska Gas, are cited in the project sponsors' filing. They cite the relevant conclusion in the Decision as the following:

> Peak-day capacity utilizing nine compressor stations will be 2.6 bcfd, with an average daily volume of 2.4 bcfd. By installation of intermediate compressor stations, the system could be increased to 3.4 bcfd peak capacity, with an average day capacity of 3.2 bcfd. The system capacity could be further increased by addition to the compressor horsepower at each station. (Decision, p. 17.)

I also note in the report accompanying the Decision the following passage:

> The routing of the Alcan system provides future access to reserves which might be discovered in the Beaufort Sea or elsewhere on the North Slope. Alcan similarly could transport gas from other areas of Alaska or even from the Gulf of Alaska by means of somewhat longer supply laterals. Further, the Agreement with Canada provides for the use by Canada of the Alcan main line at a throughput up to 1.2 bcfd. Therefore, redesign of the system to enable inexpensive expansibility up to 3.9 to 4.0 bcfd south of Whitehorse, Yukon Territory, is essential. (Decision, p. 196.)

I infer from this passage that the throughput volume anticipated at that time from sources in Alaska which might be connected to the ANGTS was in the range of 2.7 to 2.8 bcfd (3.9 to 4.0 bcfd less 1.2 bcfd).

Interestingly, the principal concern about throughput volume at the time of Congressional consideration of the Decision was that Prudhoe Bay Field production might not come up to expectations, and thus the system selected by the President might be too large for the available volumes. 53/ Some perspective on the possibility that available volumes will be either higher or lower than expected was provided to us in the course of this inquiry by the State of Alaska. As both a royalty owner and the conservation authority for the primary prospective areas on the North Slope, the State's information on these areas must be presumed to be as complete as anyone's. I have reproduced on the next two pages a series of tables of expected reserves and deliverability, along with a map of the area covered by the estimates. As you can see from the tables, the estimated probability that available throughput volumes will be 4.2 bcfd is about the same as the probability that throughput will be only 2.0 bcfd. I don't see any basis in this information for changing from the 1260 psig system.

The CO_2 Standard

A matter which I feel ought to be considered further is the CO_2 standard for gas delivered to the pipeline. I mentioned above (p. 22) that the Parsons study recommends further study of possible alternative specifications for CO_2 content and gas pipeline pressure. Increasing the system operating pressure is difficult for all the reasons discussed above, but I believe changing the CO_2 specification is separable and should be considered. The potential benefits to be derived from transporting more CO_2 include reduced conditioning costs, increased capacity for transporting NGL's, and possibly increased availability of NGL's (particularly propane) due to reduced fuel requirements of a less intensive processing and conditioning plant operation. The State of Alaska and Arco 54/ raised the CO_2 issue in comments

---

53/ See the very extensive discussions of this matter during the Senate consideration of the Decision. Hearings before the Committee on Energy and Natural Resources, United States Senate, on S.J. OIL AND GAS FIELDS OF THE ARCTIC NORTH SLOPE

on the project sponsors' March 2, 1979 filing regarding system operating pressure. Sohio 55/ has raised the subject of standards for "pipeline quality gas" in the Commission's omnibus rulemaking proceeding on tariff and rate of return issues in Docket No. RM78-12.

The North Slope producers and the State of Alaska have an additional interest in this matter because of the impact of butane blending on the vapor pressure of North Slope crude. Exxon had furnished the plot of vapor pressure vs. temperature for North Slope crude containing various amounts of NGL's which appears on the following page. I have superimposed on that plot the approximate temperature range at which wax formation starts to be a problem with the North Slope crude, and the vapor pressure standard for air pollution control in Southern California.

Wax formation limits the use of cooling as a technique for vapor pressure control. If cooling cannot be used, then vapor recovery systems must be installed on storage facilities to control emissions. Addition of any butane at all to the crude stream moves the vapor pressure at a given temperature from curve 2 toward curves 3 and 4. Because of the temperature limit imposed by wax formation, addition of any butane at all increases the likelihood that vapor recovery systems will be required, particularly if the vapor pressure standard is made more stringent. Thus, the North Slope producers have an interest in the CO2 standard not only because of its impact on the cost of the conditioning facility, but also because of its impact on the capacity of the sales gas stream to transport NGL's, particularly butane.

Increasing the CO2 content of the gas stream may be cost-effective for the consumer also. Without pre-judging how additional NGL's might be charged for transportation through the ANGTS, i.e., whether transportation charges would be on a cents per mmBtu basis or on some other basis, transportation of more of the Prudhoe Bay hydrocarbon reserve through the ANGTS offers the prospect of increased utilization of the facility, and, hence, lower overall costs to consumers.

55/ "Comments of Sohio Natural Resources Company on Notice of Proposed Rulemaking Issued April 6, 1979", filed in Determination of Incentive Rate of Return, Tariff and Related Issues, Docket No. RM78-12, on May 7, 1979.

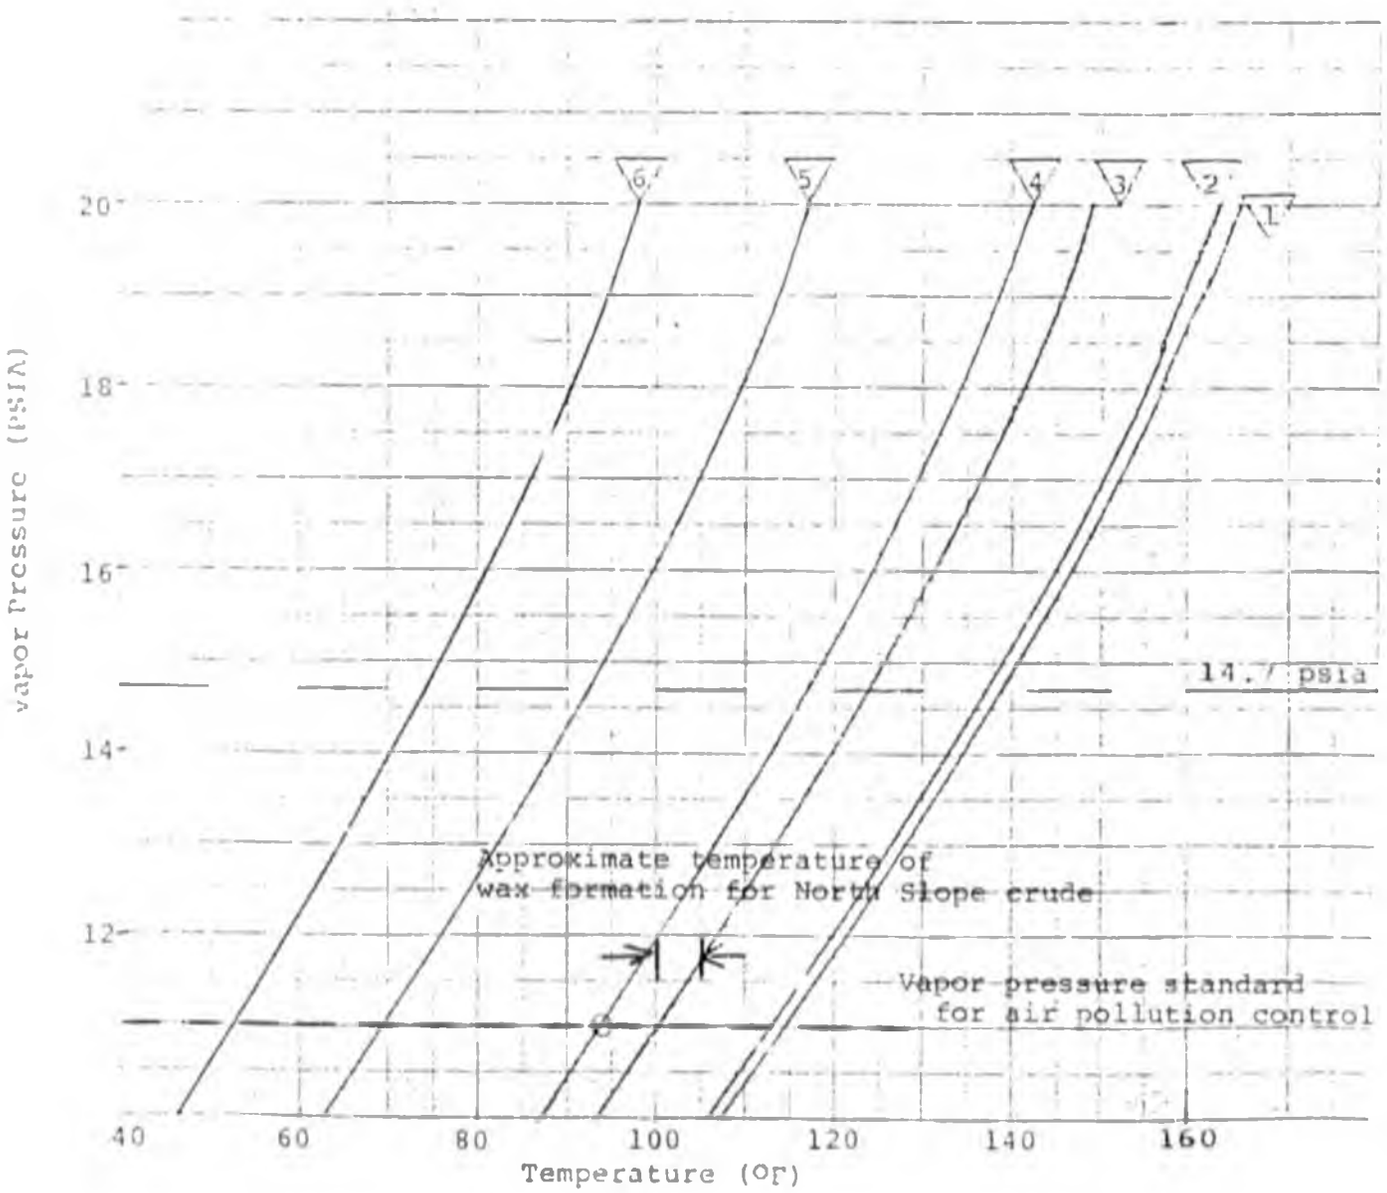
.0573	6 Crude + 50% C3, iC4+



Increasing the CO2 content of the sales gas stream would have the effect of shifting to consumers certain costs of processing and conditioning the Prudhoe Bay gas, an outcome which the Commission has expressed its intention to prohibit with its proposed policy regarding the recovery of certain "production-related" costs as defined in the Natural Gas Policy Act. 56/ However, it is possible that some cost-shifting through relaxation of the CO2 standard would be the optimal solution for the overall conditioning and gas transmission system.

Increasing the CO2 content of the sales gas stream would pre-empt some of the ANGTS throughput capacity, but additional processing and conditioning facilities could be installed to remove the extra CO2 if the additional capacity were required. This could be done without any loss of NGL's carrying capability if incremental volumes of natural gas have a lower NGL's content than the Prudhoe Bay gas.

The State of Alaska and Arco, in their above referenced comments on Alaskan Northwest's March 2 filing, have requested a Commission statement regarding the appropriate proceeding for resolution of the CO2 content issue. I believe this issue is separable from the throughput capacity issue, because any capacity committed to CO2 transportation when operations begin can be retrieved by installation of additional conditioning facilities if sufficient quantities of natural gas become available to require that capacity. Thus, I believe that the maximum allowable operating pressure question should be resolved independent of the CO2 question, the latter being better addressed in RM78-12, wherein the Commission is considering the project company tariffs, or perhaps as an ancillary issue in RM79-19, regarding the responsibility for production-related costs. It is the former proceeding in which the issue of appropriate standards for "pipeline quality gas" seems to me to be most directly before the Commission.

Alaskan Northwest Natural Gas Transportation Company--	Docket Nos. CP78-123, et al.
Pipeline Design and Capacity	

ORDER APPROVING ALASKA SEGMENT DESIGN SPECIFICATIONS AND INITIAL SYSTEM CAPACITY

(Issued August 6, 1979)

On March 2, 1979, Alaskan Northwest Natural Gas Transportation Company (Alaskan Northwest) filed an application pursuant to the Alaska Natural Gas Transportation Act of 1976 (ANGTA), the President's Decision 1/ and Section 7 of the Natural Gas Act, requesting that the Commission issue an order setting the design specifications and initial capacity for the Alaskan segment of the Alaska Natural Gas Transportation System. Notice of the application was issued on March 16, 1979. 2/ On May 17, 1979, the Commission issued an Order serving on all parties a copy of the Report of the Alaskan Delegate on the System Design Inquiry, 3/ and inviting comments on the Report as well as on Alaskan Northwest's application. Comments were received from Alaskan Northwest, the State of Alaska, and [illegible] Resources

---

1/ Executive Office of the President, Energy Policy and Planning, Decision and Report to Congress on the Alaska Natural Gas Transportation System (September, 1977).

2/ The Notice was published in the Federal Register on March 26, 1979 (44 FR 18050).

3/ The Delegate's Report addressed the matters which are the subject of this application, i.e., the [illegible] of the pipeline.

Company of Alaska. The May 17 Order [illegible] a procedure by which a hearing could be held on the factual questions involved in relating the diameter and operating pressure of the pipeline, if any party has requested such a hearing pursuant to the procedures specified.

The Delegate's Report contains [illegible] relevant portions of the President's Report accompanying the Decision, [illegible] issues, as well as various studies, reports, and [illegible] that were considered by the Delegate in selecting the design specifications for the pipeline. The Delegate's Report, including all of the materials cited or used in the preparation of the Report, 4/ and the application of Alaskan Northwest and exhibits thereto, along with the comments received in response to the May 17 Notice, constitute the record in this proceeding.

The Delegate's essential conclusions and recommendations in his Report were that the President's decision set the diameter of the pipeline at 48 inches, that the maximum allowable operating pressure should be set at 1,050 psig, and that the carbon dioxide

---

4/ These materials include, inter alia, written comments (including information responses) received by the Delegate during the course of preparation of an earlier draft of his Report, that earlier draft report, the comments received on that draft, the transcript of the conference he held, and various studies he had consulted in reaching his conclusions. Those studies include, inter alia, "September 1978 Study Report, Gas Conditioning Facilities, Prudhoe Bay, Alaska," prepared by the Ralph M. Parsons Co. [illegible] by a group of North Slope producers and potential shippers of the gas; that study was made available to the Delegate and to other government representatives in early October, 1978. As indicated in the Report, all of these materials are maintained in a [illegible] file in the Delegate's office, as required by the Commission's Order of December 15, 1977, and [illegible] available for reference and inspection by all parties.

content of the gas stream should be considered in a separate order. 5/ The specific issues raised by the Delegate are the same as those raised by Alaskan Northwest in its application, 6/ and are also the same as those in the Alcan proposal given to by the President's Decision.

The President's Decision decided that the pipeline will be constructed. 7/ However, the Decision creates a problem. The problem exists in the one authority given by the President and the Congress, by stating that the facilities are to be constructed subject to the provisions of terms as are included in the revised Alcan filing submitted to the Federal Power Commission (FPC) on March 2, 1977. 8/ The Alcan proposal was to operate the pipeline at a maximum pressure of 1260 psig. The language in the report accompanying the Decision suggesting that

> . . . Alcan should consider increasing the operating pressure and wall thickness of its 48-inch diameter pipeline in order to allow for more efficient increases in throughput rate for additional reserves which might be committed to the system from either Alaskan or Canadian sources. . . 9/

meaning?

5/ The Commission's May 17 Order stated that the carbon dioxide content issue would not be decided in response to comments received in this proceeding. On May 16, 1979, the Commission issued an order in Docket No. RM78-12, requesting submission in that docket of studies and comments with respect to the carbon dioxide content issue.

6/ Alaskan Northwest also seeks authorization for their proposed compressor station size and spacing. These are not addressed in the Delegate's Report but are part of the Alcan proposal. No comments were received on that subject.

7/ Decision at 13: "the gas transportation system will utilize a 48-inch diameter pipeline from Prudhoe Bay to James River, Alberta . . . except as modifications to those facilities are required by the Agreement on Principles between the U.S. and Canada. . . ."

8/ Decision at 13.

9/ Report [illegible] at 13.

would make the predisposition a rebuttable one on appropriate showings. The President's Decision also stated that the capacity of the system should be adequate for an average daily throughput of up to [illegible] billion cubic feet per day (Bcfd), [illegible] capacity of 2.2 Bcfd. 10/ [illegible] be satisfied by a combination of [illegible] 1260 psig pressure. The comments did not offer any new information as to the amount of gas that is expected to be available for transportation through the pipeline, nor any other information that would call for a different conclusion about the required capacity of the pipeline from that stated in the President's Decision.

The choice of operating pressure is important, not only because of the relationship of the pressure to the capacity throughput of the pipeline, but also because there is some relationship between the pressure and the ability of the gas stream to carry natural gas liquids. This latter relationship was the major focus of the comments received from the State of Alaska and Earth Resources. The State of Alaska 11/ [illegible] concern about the ability of the gas stream to carry natural gas liquids because Alaska would like to preserve the option of developing, in Alaska, a petrochemical petrochemical industry using the natural gas liquids. Alaska is concerned that an operating pressure of 1260 psig, in conjunction with other factors, such as the standard for carbon dioxide content in the gas stream and the type of process utilized for carbon dioxide removal, could preclude the development of a petrochemical industry in Alaska. Alaska is also concerned about the location of the conditioning facility, and believes that alternative sites (i.e., other than [illegible]) for the facility should be given serious consideration, either in this proceeding or in connection with the

---

10/ Decision at 13, 17.

11/ The State of Alaska filed two sets of comments, one on April 5, 1978, and [illegible] other on July 3, 1978.

environmental analysis 12/ and a [illegible] pressure bears upon the location of the conditioning facility because the proposal, involving location of the facility in Fairbanks, would require a higher operating pressure between Prudhoe Bay and Fairbanks. 13/

The comments filed by Earth Resources also focused upon the location of the conditioning facility, and supported locating the facility at Fairbanks. Both Earth Resources and Alaska referred to a study which purportedly shows that the costs of constructing the conditioning facility in Fairbanks would be lower than the costs of constructing it at Prudhoe Bay. 14/

The Delegate's Report indicates that the amount of natural gas liquids created in the gas stream is dependent upon the carbon dioxide content of the gas as well as the pressure. 15/ The Commission has previously indicated, by its Order issued May 16, 1979 in Docket Nos. RM78-12 and RM 78-19, that it will decide the appropriate carbon dioxide standard in an order to be issued in Docket No. RM78-12. For the reasons stated below, the Commission prefers to consider the complex liquids carrying issue in the context of the carbon dioxide proceeding rather than delaying a decision on the pressure.

No party questions the choice of 48 inches as the appropriate diameter for the pipe. In its comments Alaska does not specifically oppose the choice of 1260 psig as the appropriate pressure, nor does Alaska specifically advocate any particular alternative pressure. Instead, the basic thrust of Alaska's position is that the issue of the appropriate pressure is complex; that it is related to other issues, such as the liquids carrying capacity of the pipeline, the carbon dioxide content of the gas stream, and the various facilities that might be appropriate for processing and conditioning the gas; and that the Commission ought to delay its decision pending further factual inquiry.

12/ The Draft Environmental Impact Statement discussing inter alia the alternative sites for the conditioning facility was issued July 27, 1979.

13/ Comments of Earth Resources Company of Alaska (July 2, 1979).

14/ Other evidence in the record indicates the contrary. See the Delegate's Report at pp. 9-10, 12.

15/ Delegate's Report at pp. 10-11, 11-15.

Alaskan Northwest, [illegible] ...cally advocates the select... of [illegible] ...propriate operating pressure... above and in the Delegate's report, the Initial Decision itself creates a strong presumption in favor of that choice. The record before us supports the choice of 1250 psig, and does not support any other choice.

The basic issue, therefore, is whether [illegible] should decide the pressure now, or delay its decision pending further proceedings to establish a more extensive record. In this regard, Alaskan Northwest states in its comments that a choice of any pressure other than 1250 psig would substantially delay the project:

> . . . The partnership continues to assure the pipe size, design pressure and system capacities for which approval has been requested in connection with engineering, test program, and field programs which have been completed and are currently in progress. Any deviation from these specifications will result in a major delay of the project.

In light of the presumptions set forth in the Initial Decision, the partnership's reliance on its stated assumptions was certainly reasonable and well founded.

We would also note that the design of this system has a direct bearing on its cost, that a decision on the operating pressure is an essential prelude to refining the design, and that the project sponsor's ability to prepare detailed cost estimates has an obvious bearing on their ability to proceed with arrangements to obtain financing for the project. Thus, a delay in determining the pressure could have serious and wide ranging consequences in delaying the entire project.

The Congress, through its enactment of [illegible], and the President, through his Decision, have declared this project to be uniquely important to our nation's ability to obtain new sources of domestic energy. The entire thrust and purpose of NGPA, as well as its explicit mandate, is to expedite the authorization and operation of the [illegible]. [illegible] conclusion that we cannot and will not [illegible] action to fully [illegible].

We recognize that our decision may have some effect on the liquids carrying capacity of the pipeline, but the capacity is also affected by many factors, such as the carbon dioxide content of the [illegible] the nature of the condensate [illegible] We also recognize that the location of compressor stations affect on the location of these facilities. All of these considerations, however, [illegible] our decision. In light of the President's decision, the overriding consideration in determining the operating pressure of the pipeline is the pipeline's throughput capacity. 15/ As discussed above, absent evidence as to a need for increased capacity, the President's Decision creates a presumption that the operating pressure should be 1260 psig. There is no evidence in the record that the volume of gas expected to be transported through the pipeline from Prudhoe Bay has changed such as to indicate that increased pressure, and thereby increased capacity, are required. Accordingly, upon consideration of the record, the Commission has determined that the Alaska segment of the NGTS should be operated at a maximum allowable operating pressure of 1260 psig.

The Commission finds:

The design specifications and initial [illegible] capacity for the Alaskan segment of the Alaskan Natural Gas Transportation System, as proposed by Alaskan Northwest in its application filed on March 2, 1978, are required by the public convenience and necessity and should be incorporated as part of the conditional certificate of public convenience and necessity issued by the [illegible] Order of December 15, 1977 in this docket.

The Commission orders:

(A) The design specifications for the Alaskan segment of the Alaskan Natural Gas Transportation System shall be as follows:

1. 48-inch diameter pipe size;

2. 1260 psig maximum allowable operating [illegible]

15/ See Delegate's Report at p. 38.

Docket Nos. CP78-123,
et al.

(B) The certificate issued to [illegible] shall be incorporated into the [illegible] certificate of public convenience and necessity issued by the Commission's Order of December 16, 1977 in this docket, pursuant to the provisions of the Natural Gas Transportation Act, the President's decision, and the Natural Gas Act.

(C) This Order shall become effective on its date of issuance. Pursuant to sections 9 and 19 of the Natural Gas Transportation Act, this order constitutes final agency action and is not subject to the provisions for rehearing set forth in § 19 of the Natural Gas Act and in § 1.34 of the Commission's Rules of Practice and Procedure.

By the Commission.

Alaskan Northwest Natural Gas Transportation Company-- Pipeline Design and Capacity	)))	Docket Nos. CP78-123, et al.

ORDER APPROVING ALASKA SEGMENT DESIGN SPECIFICATIONS AND INITIAL SYSTEM CAPACITY

(Issued August 6, 1979)

On March 2, 1979, Alaskan Northwest Natural Gas Transportation Company (Alaskan Northwest) filed an application pursuant to the Alaska Natural Gas Transportation Act of 1976 (ANGTA), the President's Decision 1/ and Section 7 of the Natural Gas Act, requesting that the Commission issue an order setting the design specifications and initial capacity for the Alaskan segment of the Alaska Natural Gas Transportation System. Notice of the application was issued on March 16, 1979. 2/ On May 17, 1979, the Commission issued an Order serving on all parties a copy of the Report of the Alaskan Delegate on the System Design Inquiry, 3/ and inviting comments on the Report as well as on Alaskan Northwest's application. Comments were received from Alaskan Northwest, the State of Alaska, and Earth Resources

---

1/ Executive Office of the President, Energy Policy and Planning, Decision and Report to Congress on the Alaska Natural Gas Transportation System (September, 1977).

2/ The Notice was published in the Federal Register on March 26, 1979 (44 FR 18060).

3/ The Delegate's Report addressed the matters which were the subject of the application, i.e., the diameter of and maximum allowable operating pressure of the pipeline.

Company of Alaska. The May 17 Order also specified a procedure by which a hearing could be requested on the factual questions involved in determining the diameter and operating pressure of the pipeline. No party has requested such a hearing pursuant to the procedures specified.

The Delegate's Report contained a review of the relevant portions of the President's Decision, and the Report accompanying the Decision, that bear upon these issues, as well as various studies, reports, and comments that were considered by the Delegate in evaluating the design specifications for the pipeline. The Delegate's Report, including all of the materials cited or used in the preparation of the Report, 4/ and the application of Alaskan Northwest and exhibits thereto, along with the comments received in response to the May 17 Notice, constitute the record in this proceeding.

The Delegate's essential conclusions and recommendations in his Report were that the President's Decision set the diameter of the pipe at 48 inches, that the maximum allowable operating pressure should be set at 1260 psig, and that the carbon dioxide

4/ These materials include, inter alia, written comments (including information responses) received by the Delegate during the course of preparation of an earlier draft of his Report, that earlier draft report, the comments received on that draft, the transcript of the conference he held, and various studies he had consulted in reaching his conclusions. Those studies include, inter alia, "September 1978 Study Report, Sales Gas Conditioning Facilities, Prudhoe Bay, Alaska," prepared by the Ralph M. Parsons Company, and sponsored by a group of North Slope producers and potential shippers of the gas; that study was made available to the Delegate and to other government representatives in early October, 1978. As indicated in the Report, all of these materials are maintained in a public file in the Delegate's office, as required by the Commission's Order of December 16, 1977, and have been available for reference and inspection by all parties.

content of the gas stream should be considered in a separate order. 5/ The specifications recommended by the Delegate are the same as those proposed by Alaskan Northwest in its application, 6/ and are also the same as those in the Alcan proposal approved by the President's Decision.

The President's Decision decided that the diameter of the pipeline will be 48 inches. 7/ Moreover, the Decision creates a predisposition that the 1260 psig system is the one authorized by the President and the Congress, by stating that the facilities approved and subject to the provisions of ANGTA are those included in the revised Alcan filing submitted to the Federal Power Commission (FPC) on March 8, 1977. 8/ The Alcan proposal was to operate the pipeline at a maximum pressure of 1260 psig. The language in the Report accompanying the Decision suggesting that

> . . . Alcan should consider increasing the operating pressure and wall thickness of its 48-inch diameter pipeline in order to allow for more efficient increases in throughput rate for additional reserves which might be committed to the system from either Alaskan or Canadian sources. . . 9/

5/ The Commission's May 17 Order stated that the carbon dioxide content issue would not be decided in response to comments received in this proceeding. On May 16, 1979, the Commission issued an order in Docket No. RM78-12, requesting submission in that docket of studies and comments with respect to the carbon dioxide content issue.

6/ Alaskan Northwest also seeks authorization for their proposed compressor station size and spacing. These were not addressed in the Delegate's Report but were part of the Alcan proposal. No comments were received on that subject.

7/ Decision at 13: "the gas transportation system will utilize a 48-inch diameter pipeline from Prudhoe Bay to James River, Alberta . . . except as modifications to those facilities are required by the Agreement on Principles between the U.S. and Canada. . ."

8 / Decision at 13.

9/ Report accompanying Decision at 193.

would make the predisposition a rebuttable one on appropriate showings. The President's Decision also stated that the capacity of the system should be adequate for an average daily throughput of up to 2.4 billion cubic feet per day (Bcfd), and with increased compression, capable of increasing to an average daily capacity of 3.2 Bcfd. 10/ Those requirements would be satisfied by a combination of 48-inch pipe and 1260 psig pressure. The comments did not offer any new information as to the amount of gas that is expected to be available for transportation through the pipeline, nor any other information that would call for a different conclusion about the required capacity of the pipeline from that stated in the President's Decision.

The choice of operating pressure is important, not only because of the relationship of the pressure to the capacity throughput of the pipeline, but also because there is some relationship between the pressure and the ability of the gas stream to carry natural gas liquids. This latter relationship was the major focus of the comments received from the State of Alaska and Earth Resources. The State of Alaska 11/ expressed concern about the ability of the gas stream to carry natural gas liquids because Alaska would like to preserve the option of developing, in Alaska, a world-class petrochemical industry using the natural gas liquids. Alaska is concerned that an operating pressure of 1260 psig, in conjunction with other factors, such as the standard for carbon dioxide content in the gas stream and the type of process utilized for carbon dioxide removal, could preclude the development of a petrochemical industry in Alaska. Alaska is also concerned about the location of the conditioning facility, and believes that alternative sites (i.e., other than Prudhoe Bay) for the facility should be given serious consideration, either in this proceeding or in connection with the

---

10/ Decision at 13, 17.

11/ The State of Alaska filed two sets of comments, one on April 5, 1979, and another on July 2, 1979.

environmental analysis. 12/ The decision as to operating pressure bears upon the location of the conditioning facility because one proposal, involving location of the facility in Fairbanks, would require a higher operating pressure between Prudhoe Bay and Fairbanks. 13/

The comments filed by Earth Resources also focused upon the location of the conditioning facility, and supported locating the facility at Fairbanks. Both Earth Resources and Alaska referred to a study which purportedly shows that the costs of constructing the conditioning facility in Fairbanks would be lower than the costs of constructing it at Prudhoe Bay. 14/

The Delegate's Report indicates that the amount of natural gas liquids carried in the gas stream is dependent upon the carbon dioxide content of the gas as well as the pressure. 15/ The Commission has previously indicated, by its Order issued May 16, 1979 in Docket Nos. RM78-12 and RM 79-19, that it will decide the appropriate carbon dioxide st[illegible] in an order to be issued in Docket No. RM78-[illegible]r the reasons stated below, the Commission prefers to [illegible]onsider the complex liquids carrying issue in the context of the carbon dioxide proceeding rather than delaying a decision on the pressure.

No party questions the choice of 48 inches as the appropriate diameter for the pipe. In its comments Alaska does not specifically oppose the choice of 1260 psig as the appropriate pressure, nor does Alaska specifically advocate any particular alternative pressure. Instead, the basic thrust of Alaska's position is that the issue of the appropriate pressure is complex; that it is related to other issues, such as the liquids carrying capacity of the pipeline, the carbon dioxide content of the gas stream, and the various facilities that might be appropriate for processing and conditioning the gas; and that the Commission ought to delay its decision pending further factual inquiry.

12/ The Draft Environmental Impact Statement assessing inter alia the alternative sites for the conditioning facility was issued July 27, 1979.

13/ Comments of Earth Resources Company of Alaska (July 2, 1979).

14/ Other evidence in the record indicates the contrary. See the Delegate's Report at pp. 9-10, 12.

15/ Delegate's Report at pp. 19-21, 61-66.

Alaskan Northwest, the project sponsor, specifically advocates the selection of 1260 psig as the appropriate operating pressure, and indeed, as discussed above and in the Delegate's Report, the President's Decision itself creates a strong presumption in favor of that choice. The record before us supports the choice of 1260 psig, and does not support any other choice.

The basic issue, therefore, is whether the Commission should decide the pressure now, or delay its decision pending further proceedings to compile a more extensive record. In this regard, Alaskan Northwest states in its comments that a choice of any pressure other than 1260 psig would substantially delay the project:

> . . . The partnership continues to assume the pipe size, design pressure and system capacities for which approval has been requested in connection with engineering, test programs, and field programs which have been completed and are currently in progress. Any deviation from these specifications will result in a major delay of the project.

In light of the presumptions set forth in the President's Decision, the partnership's reliance on its stated assumptions was certainly reasonable and well founded.

We would also note that the design of the system has a direct bearing on its cost, that a decision on the operating pressure is an essential predicate to refining the design, and that the project sponsors' ability to prepare detailed cost estimates has an obvious bearing on their ability to proceed with arrangements to obtain financing for the project. Thus, a delay in determining the pressure could have serious and wide ranging consequences in delaying the entire project.

The Congress, through its enactment of ANGTA, and the President, through his Decision, have declared the ANGTS to be uniquely important to our nation's ability to obtain new sources of domestic energy. The entire thrust and purpose of ANGTA, as well as its explicit mandate, is to expedite the authorization, construction and operation of the ANGTS. Thus, the one decision that we cannot and will not make is a decision to delay making a decision.

We recognize that our decision may have some effect on the liquids carrying capacity of the pipeline, but the capacity is also affected by other factors, such as the carbon dioxide content of the gas stream as well as the nature of the conditioning and processing facilities. We also recognize that our decision may have some effect on the location of those facilities. All of those considerations, however, are secondary consequences of our decision. In light of the President's Decision, the overriding consideration in determining the operating pressure of the pipeline is the pipeline's throughput capacity. 16/ As discussed above, absent evidence as to a need for increased capacity, the President's Decision creates a presumption that the operating pressure should be 1260 psig. There is no evidence in the record that the volume of gas expected to be transported through the pipeline from Prudhoe Bay has changed such as to indicate that increased pressure, and thereby increased capacity, are required. Accordingly, upon consideration of the record, the Commission has determined that the Alaska segment of the ANGTS should be operated at a maximum allowable operating pressure of 1260 psig.

The Commission finds:

The design specifications and initial system capacity for the Alaskan segment of the Alaskan Natural Gas Trarsportation System, as proposed by Alaskan Northwest in its application filed on March 2, 1979, are required by the public convenience and necessity and should be incorporated as part of the conditional certificate of public convenience and necessity issued by the Order of December 16, 1977 in this docket.

The Commission orders:

(A) The design specifications for the Alaskan segment of the Alaskan Natural Gas Transportation System shall be as follows:

1. 48-inch diameter pipe size;

2. 1260 psig maximum allowable operating pressure;

16/ See Delegate's Report at p. 58.

3. compressor station size and spacing for an initial capacity of 2.0 to 2.4 Bcfd capable of expansion, through additional compression, to an an average daily volume of 3.2 Bcfd;

all as proposed by the application filed on March 2, 1979, in this docket.

(B) The requirements of ordering paragraph (A) above shall be incorporated into the conditional certificate of public convenience and necessity issued by the Commission's Order of December 16, 1977 in this docket, pursuant to the provisions of the Alaskan Natural Gas Transportation Act, the President's Decision, and the Natural Gas Act.

(C) This Order shall become effective on its date of issuance. Pursuant to sections 9 and 10 of the Alaska Natural Gas Transportation Act, this Order constitutes final agency action and is not subject to the provisions for rehearing set forth in § 19 of the Natural Gas Act and in § 1.34 of the Commission's Rules of Practice and Procedure.

By the Commission.

EXECUTIVE SUMMARY

This report addresses several major questions that relate to the Federal Energy Regulatory Commission's (FERC) deliberations concerning the proposed Alaska Natural Gas Transportation System (ANGTS):

- In light of recent changes in gas supply markets, are there still net benefits to the nation from proceeding with the proposed Alaskan gas pipeline project?
- If the potential benefits remain significant, why must low cost old gas subsidize the project through rolled-in pricing of Alaskan gas and why may special regulatory treatment, such as an "all events tariff" to insure debt repayment, be necessary?
- How does the planned implementation of ANGTS affect other potential gas supply opportunities, especially Mexican gas purchases?
- What policy options, such as gas conditioning charges and wellhead price ceiling levels, exist for reallocation of project costs, and how would these options affect the distribution of the project's opportunities and risks?

The analysis presented here concludes that the ANGTS project should provide significant economic benefits to the nation; nevertheless, serious obstacles to project implementation remain. At least one of these problems, the high initial cost of delivered natural gas, results from the traditional embedded historical cost method of ratemaking for gas regulation. The negative effects that this regulatory approach creates for the marketability of Alaskan gas can be counter-balanced to a large extent through another traditional practice of natural gas regulation, average cost pricing. Other problems revolve largely around questions of the equitable distribution of project

benefits and costs. Questions about how to allocate the opportunities and risks associated with the project's significant market, technological, and regulatory uncertainties present especially thorny problems.

Since these latter issues can only be resolved by policymakers' applying their judgment about what is equitable, this analysis can come to no conclusions about the appropriate path for policymakers to take. Instead, it seeks to analyze the extent to which the project could benefit the nation as a whole and specific parties such as gas producers or consumers under a variety of possible scenarios and policy decisions. This information should assist federal policymakers in weighing the significance of the policy questions concerning the ANGTS that they will face.

NET NATIONAL ECONOMIC BENEFIT

The Net National Economic Benefit (NNEB) measures the extent to which the value to the nation of Alaskan gas, delivered to energy users, exceeds the real resource costs to the nation of producing and transporting the gas. For this analysis:

NNEB = Delivered Gas Value
- Production Costs
- Transportation Costs
- Foreign Producer Benefits.

Briefly, these components are estimated in present value-equivalent terms and have the following definitions:[1/]

1/ See Section II of this report for an expanded discussion of the NNEB components and of the reasons for using a 6 percent after-tax real discount rate in calculating the present values.

Delivered gas value: the real resource costs to the nation of the alternative energy source likely to be used in the absence of Alaskan Prudhoe Bay gas.

Production costs: the incremental real resource costs incurred to produce the Prudhoe Bay gas,[2] including capital expenditures, income taxes on required revenues, ad valorem taxes, and operation and maintenance (O&M) expenditures, but excluding costs deemed for purposes of this analysis to be transfer payments within the U.S. economy (royalties and severance taxes).

Transportation costs: the incremental real resource costs incurred to move gas from Prudhoe Bay to the citygate in the lower-48 states, including capital expenditures, income taxes, ad valorem taxes, O&M expenditures for U.S. segments of the ANGTS, and U.S. cost of service payments to Canada for pipeline segments within its territory.

Foreign producer benefits: the share of the potential net national project benefits, in the form of payments to gas producers in excess of the real resource costs of production, which escapes the U.S. economy because a foreign firm owns a portion of the Prudhoe Bay gas.

The base case used for this analysis resembles the ANGTS scenario used for the NNEB discussion in the President's Decision.[3] In order to be consistent with the earlier discussion on this one point, the base case assumes a gas value equal to the wholesale price of distillate fuel. But in contrast to the President's Decision, the base case envisions more rapid world oil price escalation over time and applies a 6 percent real after-tax discount rate to account for consumers' time preferences.

2/ Incremental costs are costs in addition to any expenditures that would have been required in any case to produce oil at Prudhoe Bay.

3/ Executive Office of the President, Decision and Report to Congress on the Alaska Natural Gas Transportation System, Washington, D.C., September 1977. This is the set of assumptions leading to the results presented on pp. 93-98 of the President's Decision.

Under these base case assumptions, the NNEB and its components are estimated to be:

	(mid-1979 dollars)
Delivered Gas Value	$ 33.3 billion
- Production Costs	- 6.0
- Transportation Costs	-11.9
- Foreign Producer Benefits	- 0.5
NNEB	$ 14.9 billion[4/]

A high degree of uncertainty is associated with the base case NNEB estimate. Distillate fuel prices may differ from the assumed levels or Alaskan gas may not displace distillate because of changed project costs or altered availability of other fuels. The distillate price assumptions used for the base case, however, may be conservative; actual future oil price experience, we believe, would be more likely to increase the NNEB estimate than to decrease it. Moreover, worst case cost growth, as estimated by the Departments of the Interior and Transportation (in which the construction costs for both the Alaskan and Canadian segments would more than double over filed estimates), would reduce the NNEB to $10.4 billion (mid-1979 dollars), still a significant level.[5/] Finally, if fuel availability were to reduce the gas value to the price of residual fuel oil instead of distillate, the NNEB also

4/ Section II describes the discounting methodology. The President's Decision estimated the NNEB at $5.8 billion (1975 dollars). The major differences are the Decision's assumption of a constant future price (in real terms) for distillate oil and its use of a 10 percent real discount rate.

5/ U.S. Department of the Interior and U.S. Department of Transportation, Alaska Natural Gas Transportation Systems: White House Task Force Lead Agency Report on Construction Delay and Cost Overruns, July 1, 1977.

would remain significantly positive, $11.8 billion (mid-1979 dollars).

Across all reasonable scenarios, the ANGTS project appears to be economically efficient from a national perspective, in terms of reduced real resource costs for comparable amounts of energy use. But the project may not always provide economic benefits from the narrower perspective of gas consumers. The actual delivered cost of Alaskan gas to consumers compared to their alternative fuel choice—not simply the real resource costs incurred to produce and deliver it—determines the share, if any, of the national benefits accruing to gas consumers.

DELIVERED GAS COST

The delivered cost of Alaskan gas not only provides a necessary input to calculating the share of the NNEB captured by consumers but also provides important insights into problems that Alaskan gas could face in the energy marketplace. And since the success of the ANGTS as a private venture depends upon the marketability of the gas, the delivered costs of Alaskan gas also illuminate problems with obtaining private financing for the project.

The citygate cost of delivered Alaskan gas has four components: the price paid to producers for the gas at the wellhead, Alaskan state severance taxes imposed on gas production, any additional charges for conditioning the gas prior to introduction into the ANGTS, and the "cost of service" allowed to be charged by the project sponsors for transporting the gas from Prudhoe Bay to its markets. For the base case assumptions used in the NNEB analysis, the annuity-equivalent cost of delivered gas (in 1979 dollars) is estimated as follows:

Component	25-Year Annuity-Equivalent Cost[6/] (mid-1979 dollars)
Wellhead Gas Price	$1.68 per million Btu
Severance Taxes	0.17
Gas Conditioning Charges	0.00[7/]
Pipeline Cost of Service	1.33
Delivered Cost of Gas	$3.18 per million Btu

The delivered cost of gas hinges importantly on all four of its components. Because of this shared importance, focusing on one particular aspect of the delivered cost--typically potential ANGTS cost overruns and resulting pipeline cost of service increases--can ignore other important cost items. The price producers are allowed to charge, the taxes the state and federal governments are allowed to levy, and the locus of the gas conditioning charges all make important contributions to the cost consumers would pay for Alaskan gas.

Transportation costs (i.e., the pipeline cost of service associated with the ANGTS project) account for less than half of the citygate cost of the gas. In percentage terms, major changes in transportation assumptions do not

6/ The calculation of annuity-equivalents is described in Section III of this report. Briefly, it is a levelized unit cost which represents the constant unit amount that would yield a present value equal to the present value of the unit costs resulting from traditional gas ratemaking. This approach, we believe, represents an improvement over the arithmetic average approach used in the President's Decision because it incorporates a measure of consumers' time preference in a manner consistent with life-cycle cost decisionmaking.

7/ This zero gas conditioning charge is based on FERC's proposal for gas producers to pay gas conditioning costs. The imposition of gas conditioning charges would raise the delivered gas cost to $3.88 per million Btu. This issue is examined in the body of the report.

alter the citygate cost significantly. For example, the annuity-equivalent delivered cost would vary by less than 10 percent for any of the following events: a doubling of construction costs on the high risk segment of the ANGTS located in the harsh Alaskan environment,[8/] a doubling of Canadian segment construction costs, or a doubling of the gas flow rate assumed in the base case. For the worst case cost overrun scenario, the delivered cost estimate would be $3.55 per million Btu, 12 percent above the base case.

The traditional approach to ratemaking for gas pipeline tariffs—the so-called historical embedded cost method—would generate larger swings in the cost of gas from year to year than the annuity-equivalent cost changes resulting from any of the events mentioned in the previous paragraph. Because the historical embedded cost method of setting gas rates provides a constant rate of return on the remaining book value of the pipeline's initial capital investment, payments to provide the return to the pipeline and, in turn, the gas cost to pipeline customers would be highest in the first year of pipeline operation.

Thereafter, along with the remaining book value of the pipeline, the delivered gas cost would decline annually in real terms until the rate base is entirely depreciated (after 25 years of operation for the ANGTS). Afterward the pipeline would receive no further return on rate base, and delivered gas costs would consist only of the purchase costs of the gas at the wellhead plus pipeline O&M costs and other annual expenses, such as taxes. For example, the

8/ Compared to filed estimates.

following table illustrates the base case delivered costs over time (annuity-equivalent cost = $3.18 per million Btu):

	Delivered Gas Cost (mid-1979 dollars)
Year 1	$4.18 per million Btu
Year 10	2.98
Year 25	2.28

ALASKAN GAS VERSUS OTHER ENERGY ALTERNATIVES

The ANGTS project is expected to provide advantages to the nation and to consumers over alternative fuels. Under the base case assumptions:

- the annuity-equivalent price of Alaskan gas would be 12 percent below the assumed annuity-equivalent price for distillate fuel oil;
- over a 25-year project lifecycle, gas users could save $2.5 billion (mid-1979 dollars) with Alaskan gas compared to distillate fuel oil and $13.2 billion compared to Mexican natural gas keyed to distillate oil prices;
- the delivered price of Alaskan gas would be higher than the price of distillate at the citygate for the first seven years of the project based on historical embedded cost ratemaking, in spite of net benefits to consumers and the nation as a whole. For this and all other cases, high gas costs for the earliest project years result from the application of traditional ratemaking to the ANGTS. And these high initial rates would exacerbate the uncertainty associated with Alaskan gas marketability and with the financing of the project.

This analysis of the economic attractiveness to energy users under base case conditions indicates that, on a 25 year annuity-equivalent basis, Alaskan gas would be less expensive than distillate fuel oil, Mexican gas, or even

residual fuel oil.[9/] Thus, if it can be constructed at expected costs, the project would be in the national interest for any reasonable energy supply projections.

For the high cost case, the ANGTS project could benefit the nation if it substituted for residual fuel oil, but consumers might chose residual over the Alaskan gas. In fact, consumers would perceive a less than 2 percent annuity-equivalent price advantage from Alaskan gas compared to distillate fuel oil. The differences between the conclusions about the economic attractiveness of the proposed ANGTS project for gas users and for the nation result from the fact that participants other than consumers receive shares of the NNEB. This issue is addressed in Section V of the analysis.

The most important issue related to the market prospects for Alaskan gas is that the time-profile of delivered costs resulting from traditional cost of service ratemaking could create initial marketing difficulties for Alaskan gas, even when its lifecycle cost to consumers is lower than alternative fuels. As noted earlier, an historical embedded cost of service consists of annual operating expenditures plus a return on the book value, after depreciation, of the rate base. Since the rate base is highest in the project's earliest years, the cost of service is highest then as well. In turn, the

---

9/ These annuity-equivalents do not account explicitly for any atypical risks consumers might bear for the ANGTS project. And although Alaskan gas appears superior to Mexican gas on an annuity-equivalent cost basis, this does not mean that Mexican gas should not be imported. Policymakers must judge potential Mexican imports on their own merits compared to the alternative fuel that these imports might displace and any other relevant considerations.

initial delivered costs of Alaskan gas exceed the expected prices of alternative fuels. Consequently, the method of pipeline regulation can make Alaskan gas appear unattractive to potential customers early-on, even though the annuity-equivalent delivered cost would favor Alaskan gas from the outset (see Figure S-1).

DISTRIBUTIONAL ISSUES AND SPECIAL REGULATORY TREATMENT

The regulatory policy applied to the overall Alaskan gas project also can affect the recipients of the project's net economic benefits. This analysis examines the allocation of the net economic benefits, shown earlier, among gas consumers, the producers of Prudhoe Bay gas, the state of Alaska, the federal government, and gas pipelines. Under the base case assumptions, the NNEB would be captured as follows:

Consumers (fuel cost savings)	$ 2.7 billion (mid-1979)
Domestic Producers (extra profits)	3.7
Alaska (extra taxes and royalties)	4.7
Federal (extra taxes)	3.5
Pipelines (tax credit)	0.2
NNEB	$14.9 billion

These shares of the NNEB are illustrated in Figure S-2.

Very briefly, consumer benefits are the savings from purchasing Alaskan gas compared to alternatives. Domestic producer benefits are the profits after taxes that they receive over the minimum profits necessary to attract the producers to sell gas. Alaskan benefits measure the difference between actual tax and other revenues received by the state from the project and necessary state expenditures resulting from the project. Federal benefits are the federal income taxes levied on the gas producers' extra before tax pro-

FIGURE S-1

ALASKAN GAS AND THE BASE CASE ALTERNATIVE
FUEL PRICE PROJECTIONS

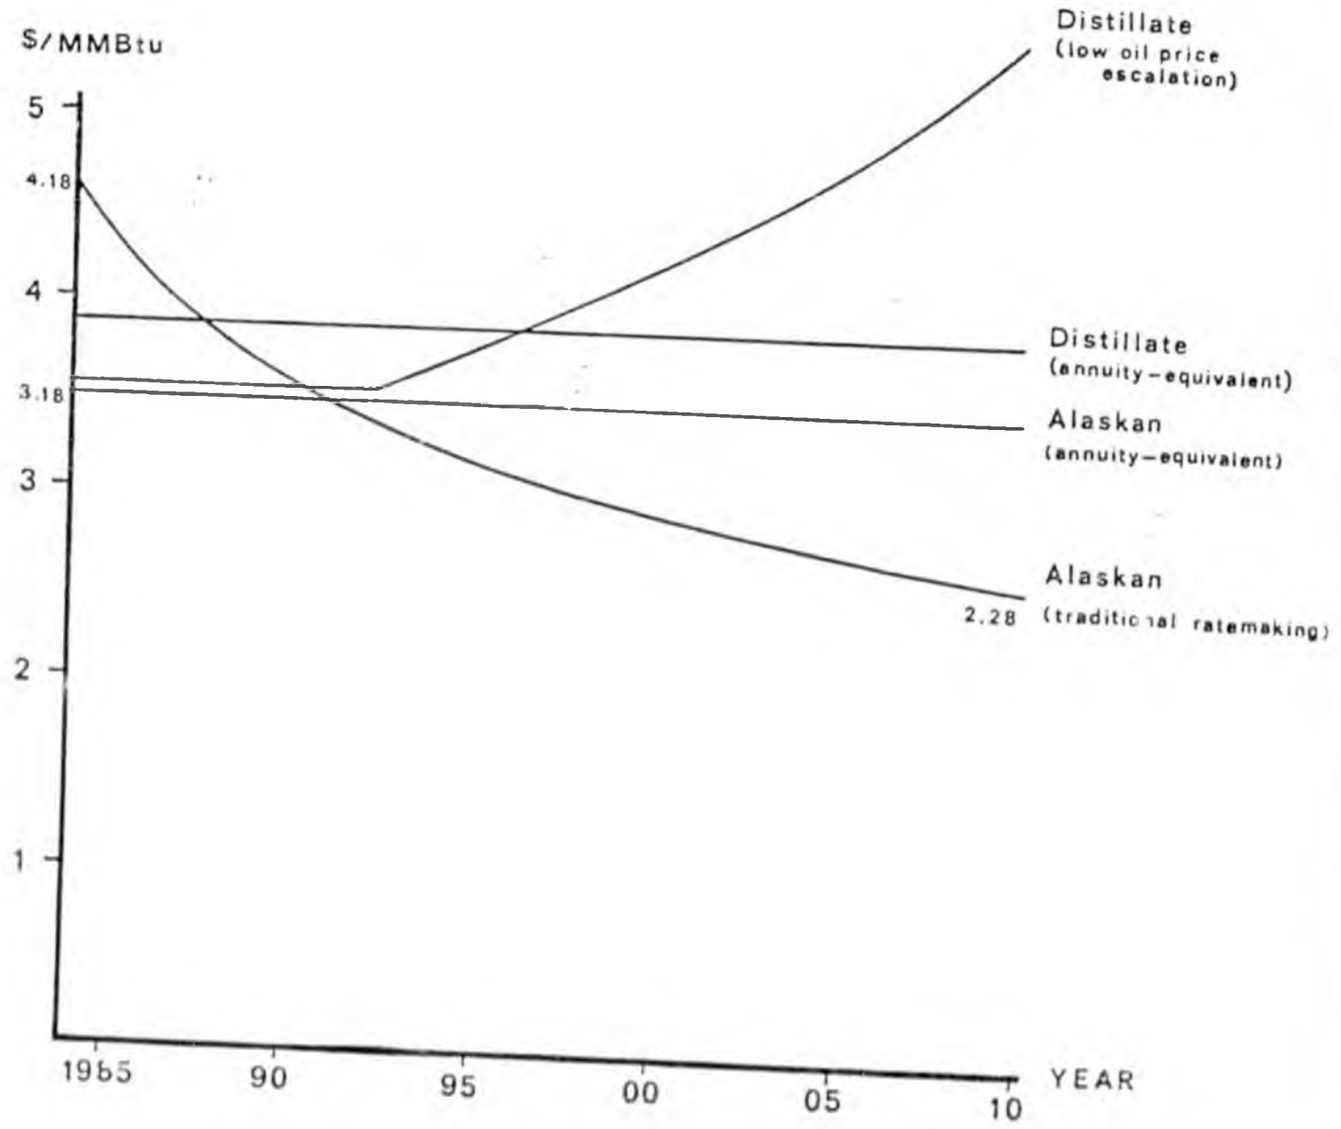

FIGURE S-2

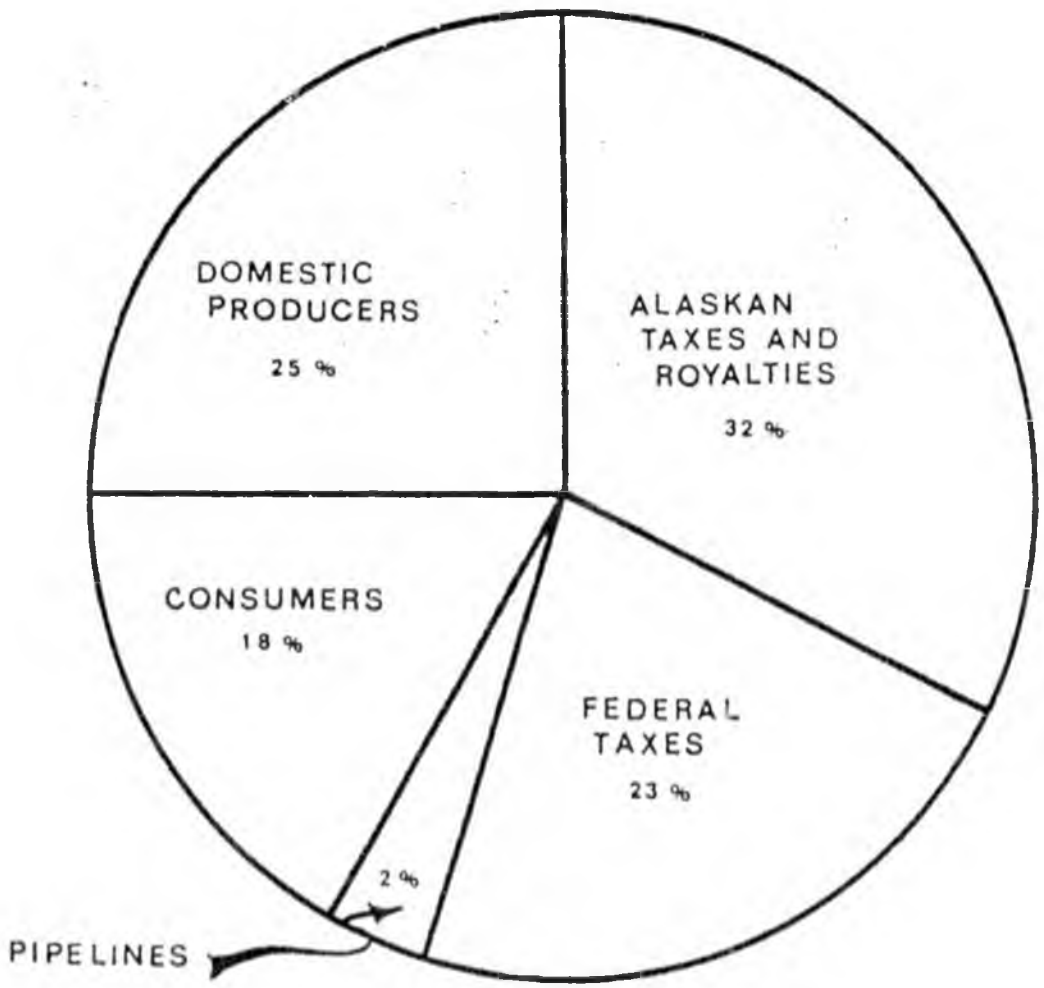
SHARES OF NET NATIONAL ECONOMIC BENEFIT
(Base Case Assumptions)



fits. And pipeline benefits result from the special treatment of the investment tax credit allowed for these companies where their regulators are not free to flow-through the savings of the credit to consumers immediately.[10/]

Several important points emerge from the distributional analysis:

- The consumer benefit is the only share of the NNEB that varies significantly if the ANGTS costs or the gas value change. Any increased national benefits caused by higher than assumed alternative fuel prices would accrue entirely to consumers. Conversely, any lower prices of alternative fuels and any pipeline cost overruns would mainly shrink the size of the consumer benefit.

- The share of the benefit captured by producers arises because the maximum price set by the NGPA for Prudhoe Bay gas would be significantly above the expected incremental costs of the gas production. Consequently, the Act potentially allocates the major share of the ANGTS project's NNEB to producers of Prudhoe Bay gas in the form of domestic "producers surplus." Also because a portion of the gas is owned by a foreign corporation, some potential NNEB would escape the U.S. economy in the form of foreign "producers' surplus."

- The domestic "producers surplus," however, would translate into above-normal accounting profits before taxes. Since these are subject to income taxes, a major share of the NNEB would be captured by state and federal governments in the form of extra tax revenues.[11/]

- In addition, Alaska would receive a further share of the NNEB in the form of severance taxes and royalty payments on the production of Prudhoe Bay gas. For the base case, the sum of all extra government revenues accounts for 55 percent of the total NNEB.

10/ The meaning and development of these shares are described in greater detail in Section V of the report.

11/ Normal taxes are considered as real resource costs rather than as transfers of wealth.

Under the basic regulatory framework assumed for this work, producer, state, and federal benefits would be largely independent of the cost or value of the gas to consumers. Consequently, under certain reasonable and feasible scenarios the project would benefit the nation but could harm gas consumers economically.[12/] One assumption about this framework is especially critical in this regard. Specifically, imposition of the full costs of gas conditioning on gas purchasers would reduce the consumer share of benefits considerably, with consumers being worse off, relative to using distillate fuel oil, by more than $1.9 billion (mid-1979 dollars). Consumers would not only be receiving Alaskan gas without any major price advantage, but they would also have to bear most of the significant project risks that other parties are unwilling or unable to bear in return for full access to various project opportunities.

In addition to the allocation of the project's direct costs and benefits, the ANGTS also involves significant opportunities and risks that various project participants would assume. These effects result from uncertainty about future gas markets, the future regulatory environment, and the technical feasibility of constructing the project at currently estimated costs.

Regulatory policy will affect the allocation of these project opportunities and risks among gas consumers and project participants in important ways. For example, the question of who should bear the risks of ANGTS cost overruns or the risk that Alaskan gas cannot be sold remains, to a large

12/ Table V-1 summarizes the results for the scenarios examined.

extent, unresolved. This analysis did not focus on these issues, but because the allocation of risks will ultimately affect the distribution of the actual NNEB, the issues are important and are discussed briefly in Section V.

Overall, this analysis has found that the nation could reap large benefits from the proposed ANGTS project. But significant issues remain to be resolved by the Commission and other policymakers. Because the potential benefits remain great, it also is in the nation's interest that some allocation of project risks, costs, and benefits sufficient to attract all the necessary parties to participate in the effort and, thus, to bring Alaskan gas to lower-48 markets be developed as soon as possible. It is hoped that this analysis can illuminate further the difficult balancing problem faced by FERC in this matter.

I. INTRODUCTION

In 1976, Congress passed the Alaska Natural Gas Transportation Act of 1976 (ANGTA) (i) "to provide a means for making a sound decision" that provided for Presidential and Congressional participation, "as to the selection of a transportation system for delivery of Alaska natural gas"; and if a system were approved, (ii) "to expedite its construction and initial operation."[1/] The first step in the process established by the ANGTA was completed in May 1977 when the former Federal Power Commission (FPC) transmitted its Recommendation to the President.[2/] In its report, the Commission assessed the gas supply increases possible through the Alaskan North Slope gas discoveries as "crucial to this Nation's economy and well-being."[3/] The Commission then recommended the Alcan pipeline proposal which envisioned building a gas pipeline along part of the Trans-Alaska Oil Pipeline System right-of-way, then proceeding through Canada and delivering gas to the Midwest and West Coast.

In September 1977, the second step in the process established by the ANGTA was completed when the President issued his Decision that also supported the proposed Alcan system, asserting that Alaskan gas deliveries could provide

2/ U.S. Federal Power Commission, Recommendation To The President: Alaska Natural Gas Transportation Systems, May 1977, (reprinted April 1978 by the U.S. Federal Energy Regulatory Commission), (hereafter referred to as the Recommendation to the President).

3/ Ibid., p. 1.

"critical supplies of Alaskan natural gas to U.S. markets."[4/] Congress then approved the President's Decision through a joint resolution. The concerns noted in the Commission's report and the President's Decision, which arose in the context of U.S. natural gas shortages during the early months of that year, focused primarily on insuring adequate supplies of natural gas to the highest priority gas consumers--homes, offices, and industries with special process needs for natural gas.[5/]

Events since 1977, however, have significantly alleviated earlier fears about natural gas shortages of emergency proportions in the near term. Specifically, the Natural Gas Policy Act of 1978 (NGPA), by providing the interstate market with a basis for better access to intrastate gas, appears to have alleviated the threat of immediate gas supply shortages for high priority gas customers. The new pricing mechanisms of the NGPA, along with the Powerplant and Industrial Fuel Use Act of 1978, also appear to have moderated demand for natural gas in the middle- to longer-term. Moreover, prospects have improved for increased natural gas imports from Canada and Mexico.

But while the short run natural gas supply picture has improved dramatically since 1977, the oil supply outlook has worsened, with domestic and world supplies becoming tight and with much elevated world oil prices. On the one hand, then, the improved near term natural gas supply picture raises new ques-

4/ Executive Office of the President, Decision and Report to Congress on the Alaska Natural Gas Transportation System, September 1977, p. xiv, (hereafter referred to as the President's Decision).

5/ Ibid., pp. 87-90.

tions about the old justification for proceeding at this time with the Alaska Natural Gas Transportation System (ANGTS). On the other, the increased likelihood of an oil supply crunch, during the early 1980's and beyond, raises new reasons for providing lower-48 markets access to known reserves of Alaskan gas.

As a result, the focus for interest in Alaskan natural gas has shifted away from simply avoiding natural gas supply shortages in the short run and toward insuring adequate supplies for high priority users and reducing energy imports in the middle- to long-term. The purpose of this report, then, is to analyze the major economic, market, and financing issues associated with the proposed ANGTS in light of these changed circumstances so that the Federal Energy Regulatory Commission (FERC) can use this assessment in deciding on the appropriate conditions to set for the ANGTS certificate of public necessity and convenience.

The changes in natural gas markets have created a situation in which the policy issues that accompany more widespread use of Alaskan gas are less straightforward than those associated with whether to maintain adequate gas supplies for today's high priority consumers. This analysis suggests a framework which can assist in illuminating these issues, based upon the following major policy questions that must yet be resolved by the Federal Energy Regulatory Commission as part of the process established by the ANGTA:

- Are there still net benefits to the nation from proceeding with the proposed Alaskan gas pipeline project?

- If the potential benefits remain significant, why must low cost old gas subsidize the project through rolled-in pricing of the Alaskan gas supplies and why may special regulatory treatment, such as "all events tariffs" to insure loan repayments even if no gas is ever delivered, be necessary?

- How does the planned implementation of the ANGTS affect other potential gas supply opportunities, especially Mexican gas purchases?

- What policy options, such as gas conditioning charges or wellhead price ceiling levels, exist for reallocation of project costs and how would these options affect the distribution of the project's net benefits?

This report first describes one key measure of whether the ANGTS project would be in the national interest, the Net National Economic Benefit (NNEB) and, then, explores the sensitivity of this measure to various future states of the world. The NNEB measures the attractiveness of the project from the national perspective, but since parties other than potential gas consumers may capture shares of the NNEB, the NNEB does not provide information about the potential attractiveness of delivered gas in energy markets. Therefore, this analysis also develops cost estimates for the delivered Alaskan gas and explores the sensitivity of these cost estimates to variations in several key parameters, including pipeline cost and gas flow rate changes.

Since the assessments of economic efficiency and marketability indicate that the project should benefit the nation and is potentially marketable, the analysis explores why traditional regulatory treatment in terms of pricing policy and allocation of project risks have presented problems for implementation of the project.

ASSESSING THE DESIRABILITY OF PROJECT IMPLEMENTATION

The first important policy question is whether the transportation of Alaskan gas to the lower-48 states can benefit the nation as a whole. Both the Federal Power Commission's Recommendation to the President and the President's Decision used a Net National Economic Benefit (NNEB) calculation as the primary indicator of project desirability from the national perspective.[6/]

The NNEB measure has important advantages and disadvantages. Most importantly, it provides a single measurement, in comparable terms, of the outlays of the nation's real resources required over time to bring Alaskan gas to consumers and the stream of benefits that result from their use of the gas. For the ANGTS, the benefits consist of the stream of real national resource expenditures otherwise required to provide consumers of Alaskan gas with an equivalent fuel. In this manner, the NNEB measures the economic efficiency of the ANGTS project. If the benefits are expected to exceed the costs, the NNEB is positive, and policymakers can conclude that the project would be efficient in an economic sense.

Although the NNEB calculation is a powerful indication of the merits of a project, its usefulness is more limited when decision makers must choose among several qualitatively different energy alternatives. When differences among alternative projects can be expressed entirely in a quantitative manner, the NNEB provides a means for direct comparison. Some projects, however, have

6/ This methodology was first applied to the Alaska gas pipeline in a Department of the Interior report, Alaska Natural Gas Transportation Systems: A Report to the Congress Pursuant to Public Law 93-153, December 1975.

characteristics which are difficult to assess objectively and quantitatively, including :

- technological and cost uncertainties for which statistically-significant experience does not exist;
- equity or distributional issues associated with the allocation of project costs and benefits; and
- externalities that are difficult to measure quantitatively such as the environmental benefits of additional natural gas use or the national security costs of energy imports.

Because criteria in addition to economic efficiency play an important role in decisions about U.S. energy policy, few opportunities arise for automatic decision making based on NNEB estimates or, for that matter, based on any strictly quantitative project assessment technique. Nevertheless, by serving as a benchmark, this NNEB analysis can help decision makers to focus their judgement on the worth of the qualitative advantages or disadvantages available from the alternatives applicable to an energy choice.

APPROACH TO FACILITATING IMPLEMENTATION

The ANGTS has generally been considered a private sector venture. Although federal loan guarantees for the ANGTS have been mentioned in the past and the Natural Gas Policy Act of 1978 (NGPA) permits rolled-in pricing of natural gas transported through the ANGTS in order to enhance its marketability, the NGPA Conference Report stipulates that no additional federal subsidy is to be provided to the pipeline.[1/] Thus, the federal government's major

1/ U.S. Congress, House of Representatives, "Natural Gas," Conference Report to accompany H.R. 5289, 95th Congress, 2d Session, Report No. 95-1752, October 10, 1978, p. 103.

policy choices with respect to ANGTS will be expressed in the regulations formulated by FERC and in the conditions imposed in the pipeline's certificate of public convenience and necessity under which the project must be privately implemented.

For the Alaskan natural gas pipeline project to advance successfully as a private venture, many independent parties, each from their separate perspectives, must all reach favorable decisions about the prospects for the project and the attractiveness of the gas it would deliver. Beyond the federal government, major participants include the pipeline venture partners, potential lenders, Prudhoe Bay gas producers, state and local governments, and potential gas customers for Alaskan gas at wholesale and retail levels. These parties have different and often contradictory objectives. Consequently, in its deliberations on appropriate Alaskan gas tariffs and cost and risk allocations, FERC faces a difficult task in balancing these interests in a way which allows private sector implementation of the pipeline project to generate the broader net national economic benefits which the ANGTS can provide.

For the ANGTS, the decision process most likely will be guided by the classic goals of utility regulation: efficiency, equity, and revenue generation.[8/] As mentioned earlier, a positive NNEB indicates that the ANGTS would be economically efficient over a wide range of plausible assumptions. FERC, however, must establish tariffs to be charged for transportation of the

8/ For an expanded discussion, see James C. Bonbright, Principles of Public Utility Rates, Columbia University Press, New York; 1961, pp. 291-294.

gas, and the tariff design may or may not encourage actual use of the gas in an economically efficient manner.

The important aspects of the equity goal are the fair allocation of costs to those benefitting from service and the minimization of windfall gains or losses among the relevant parties. Typically these first two goals, efficiency and equity, also must be weighed within the constraint that the tariffs must generate sufficient revenues to permit the pipeline owners to service their debt obligations and to earn a reasonable rate of return on their equity investment. For a project of the enormous scale, high unit costs, and large risks of the ANGTS, balancing these conflicting goals will be especially difficult.

The project sponsors expect a return on their equity investment commensurate with the technical, market, and regulatory risks that they accept. Potential lenders expect the funds that they lend to the project, as well as interest on their funds, to be repaid in any event.

Furthermore, each state or local regulatory body expects the terms of purchase offered to the gas distribution utilities within its jurisdiction to serve its constituents' interests as defined by its legislative authority. Finally, gas purchasers, both wholesale (direct industrial customers and distribution companies) and retail, expect Alaskan gas to be a competitively-priced and reasonably reliable fuel.

Thus, if the ANGTS is to proceed as a private venture it must deliver Alaskan gas at costs that allow the gas to be sold on terms which will be attractive to gas customers and will be acceptable to regulators. In princ-

iple, the marketability of the delivered gas could be assured in at least two ways. First, if Alaskan gas were delivered at low cost relative to other alternatives, sellers and their regulators could agree to prices naturally attractive to potential customers. Second, if Alaskan gas proved to cost more than alternative fuel options, then regulators could still utilize a gas pricing mechanism that would make the Alaskan gas supplies marketable. Since gas is generally priced on an average cost basis, high cost Alaskan gas could be averaged, or "rolled-in," with the "cushion" of lower cost gas to provide consumers with fuel priced below alternative fuels priced on an incremental cost basis.[9/] Traditional utility financing and ratemaking methods generate high costs for delivering gas in a project's early years followed by low costs late in the project's useful life. Consequently, a project which is desirable on a lifecycle cost basis may appear prohibitively expensive at the outset.

This traditional approach--the historical embedded cost method--derives an annual revenue requirement which includes a rate of return on a rate base, defined as the undepreciated book value of the pipeline capital investment. As depreciation erodes the rate base over time, the revenue requirement decreases, and assuming that the annual quantities of gas delivered remain constant the allowed unit cost of pipeline transportation decreases.

9/ The size of the old gas price "cushion" that will be available at the time of Alaskan gas deliveries is quite uncertain because (i) the quantities of old gas that will actually be made available in the future under existing contracts are not known with precision and (ii) the extent to which gas companies may use up any available cushion to bid up prices on decontrolled natural gas supplies is not well understood.

In the case of the ANGTS, high transportation costs in the early years of the pipeline's operation could create initial marketability problems for Alaskan gas. In facilitating marketability through additional regulatory action, care should be taken to differentiate between regulatory actions that simply compensate for the upside-down time-profile of traditional gas tariffs and other actions that subsidize a fundamentally uneconomic source of gas supply. Otherwise, the hidden subsidy of regulatory support of an uneconomic gas source could lead to the use of a high cost energy source instead of a lower cost (but unsubsidized) source. Whether rolled-in pricing of Alaska gas would prop up a fundamentally uneconomic project or, instead, would simply reverse the adverse effects of traditional ratemaking is evaluated throughout this analysis.

Assurances of Alaskan gas marketability would, in turn, improve the outlook for the pipeline project sponsors' ability to arrange financing. Uncertainty about project costs and about the prices of potential fuels which would compete with Alaskan gas largely cannot be eliminated until the ANGTS is actually built and operating. Because of these factors, plus the large scope of the venture, providers of equity and, in particular, debt most likely would support the project only if they perceive an irreversible commitment which would guarantee the marketability of the gas.[10/] If necessary, such a com-

10/ A lack of symmetry in the distribution of claims to any greater than expected benefits flowing from the project may reinforce this investor viewpoint. As will be shown in a later section, consumers capture almost all of the potential NNEB on the upside. And this absence of any major upside potential may justify project sponsors' and lenders' search for assurances that their investment and returns would be insured on the downside, at least with respect to catastrophic events.

mitment could be subject to conditions that the project demonstrate competent management, etc., but probably could not otherwise be a function of the ultimate actual costs for which Alaskan gas would be delivered or of the price of alternative fuels available when the ANGTS would become operational.

A final point about the history of natural gas regulation should be noted here. Theoretically, potential gas users should be indifferent between two long term supply contracts, one with a tariff high in the early years and low in later years resulting from the gas pipeline ratemaking methods and the other with equal annual payments whose present value, calculated at the purchaser's discount rate, equalled the present value of the traditional tariffs. Nevertheless, a large industrial gas user, which might purchase Alaskan gas directly from an interstate pipeline under a long term contract and a separate rate schedule, might be unwilling to do so. Interstate transmission companies and gas distribution utilities have been forced throughout the 1970's to curtail gas deliveries to customers deemed to be low priority by federal gas curtailments policy. As a result, large industrial customers have little confidence that the sanctity of any long term gas supply contract could be preserved in the face of shortages affecting higher-priority customers. And they suspect that once the Alaskan gas prices began to be more attractive, their gas supplies would be curtailed.

As a result, past and present natural gas regulation could be a major reason that a large, capital intensive gas supply project such as the ANGTS might require pricing or other regulatory arrangements different from those appropriate for conventional gas supplies. The ANGTS also involves serious uncer-

tainties in terms of both project costs and the atmosphere of public sentiment in which the project must be implemented. Therefore, unusual regulatory action might be required to develop an equitable allocation of the project's opportunities and risks.

ORGANIZATION OF THE REPORT

The next part of the report, Section II, shows that the ANGTS reasonably can be expected to produce an NNEB in the range of ten to twenty billion dollars (mid-1979 dollars). The analysis considers a number of alternative sets of assumptions and explores the sensitivity of the NNEB to changes in projected costs, gas values, and completion schedules.

Section III estimates the delivered cost of gas for the project under alternative assumptions. Both the time-profile of gas costs under traditional ratemaking and an annuity-equivalent cost are presented. This section also examines the sensitivity of the delivered cost of the gas to the relevant changes considered in Section II.

The fourth section utilizes the delivered gas cost information developed in Section III to analyze the potential marketability of natural gas from Alaska. It discusses the appropriate basis for comparing fuel alternatives from the perspective of the gas purchaser and notes the problems with the single-year and time-average comparisons that are encountered in many assessments of Alaskan gas and alternative energy supplies. This section also compares the time-profile of prices for Alaskan gas and alternative fuels. The implications for the nation of likely end user choices are also considered in this section.

Section V examines who would receive the project's benefits and who would pay for them. It also explores the reasons why so-called special tariff treatment, such as rolled-in pricing of some ANGTS costs and guaranteed repayment of lenders, may be necessary and appropriate despite the fundamental economic advantages of the pipeline project and probes whether these steps truly would represent "special" treatment for the ANGTS in the 1984 timeframe envisioned for initial operation of the project. The final section reviews the findings and conclusions of the analysis.

CAVEATS

Although the NNEB estimates in this analysis indicate that the project should benefit the nation under all but the most disastrous conditions, several caveats apply to the results. These caveats deal with the gas transportation costs, the gas value, the method for determining real resource costs, and some simplifying assumptions underlying our entire analysis.

An independent assessment of the reasonableness of the ANGTS cost estimates is beyond the scope of this analysis. Although we explore costs beyond the range considered feasible in the earlier Federal Power Commission analysis and the President's Decision, no more recent pipeline cost data are available to indicate whether the large overruns considered in Sections II and III are likely to occur. Rather, in light of the Trans-Alaska Pipeline System (TAPS) cost overrun experience, we elected to estimate the NNEB and the delivered cost of gas for a case where the cost overruns for the Alaskan segment of the ANGTS would be analogous to the TAPS experience.

The gas production costs used here are the latest estimates that we have found, but these estimates appear to be quite rough. Changes in these costs could affect NNEB estimates, but since these costs would not affect the well-head gas price over a wide range, production cost changes would not change the delivered cost of gas.

Gas conditioning costs are drawn from a September 1978 engineering study.[11/] In this analysis we assume that producers pay for gas conditioning as part of the production process; consequently, conditioning cost changes would have the same effects as changes in other gas production costs. The issue, however, of who will pay for gas conditioning is not yet resolved. If pipelines must pay these costs, then gas conditioning cost changes would affect the delivered gas cost as well as the NNEB estimates.[12/]

With respect to the marketability and financial feasibility of the Alaskan gas project, our analysis suggests that, if the ANGTS is built for its expected cost, then economically rational consumers with the correct information would agree to purchase the gas. Nevertheless, efforts to proceed with the project could be stymied by (i) institutional requirements that gas purchase commitments be made prior to finalizing the construction financing, (ii) uncertainty about Alaskan gas transportation costs and, (iii) uncertainty about the future prices of the fuels with which Alaskan gas must compete. And

11/ Ralph M. Parsons, Inc., "Sales Gas Conditioning Facilities, Prudhoe Bay, Alaska," September 1978.

12/ Since the reduction of production costs associated with pipeline payments for conditioning would lead to greater surplus producer revenues, it would increase the foreign producer benefits and, thus, lower the NNEB.

as mentioned earlier, the time-profile of traditional gas tariffs could also hinder efforts to market the gas. Since this analysis does not examine in detail where and to what class of users the gas might be sold, our conclusions about the marketability of Alaskan gas are necessarily based on broad comparisons of citygate costs of Alaskan gas and costs of alternative fuels.

Other important simplifying assumptions and caveats are presented where relevant throughout the remainder of this analysis.

II. PROJECT NET NATIONAL ECONOMIC BENEFITS

As noted in the introductory section, several measures are available for evaluating the attractiveness of the Alaskan natural gas project. Delivered cost of gas calculations focus on consumers by comparing the project's costs to potential gas users with their costs for alternative sources of fuel. Another approach focuses on the U.S. and examines the economic efficiency of the project; that is, it evaluates whether or not the project produces savings of real resources for the nation as a whole. The measure of these savings is called Net National Economic Benefit, or simply NNEB.

This section examines the attractiveness of the project according to this NNEB measure. It reviews the significance of the uncertainties surrounding the components of the NNEB analysis--most notably the project construction costs and the value of the gas to consumers. By examining the extent to which the NNEB varies over reasonable ranges of values for its components, policy-makers can assess their confidence in the conclusions drawn from the base case set of assumptions described later in this section.

Before proceeding, we should note that the NNEB and consumer cost measures can provide contradictory assessments of the attractiveness of the project. Some cases presented in this section describe situations which generate sizeable positive net national economic benefits but which also lead to streams of consumer costs for Alaskan gas in excess of the streams of costs for the fuel whose use would be displaced. The divergence between these two measures stems from the fact that NNEB considers the net benefits received by all project

participants including, but not limited to, consumer benefits. In this sense, the NNEB analysis does not assess the distribution of benefits among sectors of the economy. From the overall perspective of national economic efficiency, losses by consumers can be compensated for by increased gains to producers, pipeline companies, and the general taxpayers of the state of Alaska and of the federal government. The important distributional issues associated with the ANGTS project are examined in Section V.

COMPONENTS OF NNEB

Net national economic benefit, as noted before, is a measure of the project's net savings of real resources to the nation as a whole. The difference between real resource costs (or savings) and the normal accounting definitions of costs is a significant one. Real resource costs represent the economic costs associated with physical resources actually consumed in the production of goods and services and a return on these expenditures. Thus, all payments representing the transfer of purchasing power from one party to another without any utilization of resources would be excluded from real resource costs. For example, Alaskan state royalty and severance taxes appear to cover no specific consumption of real resources incurred by the state in connection with gas production. Instead, they merely transfer wealth from Prudhoe Bay gas producers, lower-48 gas consumers, or U.S. taxpayers to the state of Alaska; consequently, these two items have not been treated as real resource costs for purposes of the NNEB calculation.[1/]

1/ They, however, have been included in the calculation of the delivered cost of Alaskan gas which consumers would pay .

Included as components of real resource costs are all costs of material and labor, as well as allowances for taxes and returns on capital at rates that would be expected in normal business activity. This analysis groups the components of NNEB into the following four categories:

- Gas value: This value is the real resource savings that would result from using Alaskan gas instead of some other equivalent fuel; that is, it equals the unit price of the alternative fuel multiplied by the quantity of the fuel displaced by Alaskan gas.

- Production costs: These costs are the incremental real resource costs associated with gas production from Prudhoe Bay. As such, they do not include the costs of installing facilities which already are planned for the production of Prudhoe Bay oil. The major incremental costs of Prudhoe Bay gas production will be the capital investment for the gas conditioning system and water-flood facilities.[2/]

  Other real production costs include operation and maintenance of the production facilities as well as ad valorem taxes paid by producers. The latter have been included as a real resource cost on the assumption that these taxes serve as a surrogate measure of the infrastructure expenditures to which the Alaskan public would be committed in order to facilitate the gas production (e.g. additional roads and schools). For similar reasons, state and federal income taxes, at rates levied on normal levels of producer income from Prudhoe Bay gas production, are included as an approximation of the general government costs required to support the production activity. Also, inclusion of income taxes is necessary in order to maintain consistency with the treatment of other private sector investments and with other components of the NNEB calculation (i.e., the benefits stream), both of which include income taxes.[3/]

2/ Inclusion of gas conditioning cost as a production cost (rather than as a transportation cost) is based upon a proposed FERC rulemaking.

3/ The analysis imputes income taxes as a part of the calculation of the opportunity cost of capital by developing annuity-equivalent capital costs for the period of project operations, based on the actual capital outlays for the project and a 10 percent real before-tax discount rate. This approach, recommended by the Department of Energy (DOE), is described in greater detail in the discount rate discussion later in this section.

- Transportation costs: For the U.S. segments of the gas pipeline, these costs include constructi outlays as well as operation and maintenance expenses. Other U.S. costs include income taxes and state ad valorem taxes on the pipeline activities. For the Canadian segments of the line, the United States would incur real resource costs through cost of service payments to Canadian carriers. The U.S. share of Canadian pipeline costs depends upon relative shares of the total throughput as well as cost overruns on the Canadian segments. The formulae with which these shares are determined were established in the joint United States/Canada pipeline agreement.4/

- Net foreign profits: Foreign interests own a share of the Alaskan gas. The revenues to a foreign oil company that exceed direct and indirect gas production costs are essentially net project costs for the nation, since they escape our economy and, in so doing, provide no benefits for the United States.5/

The net national economic benefit of the proposed project is the present value of the stream of benefits that results from subtracting the three cost components from the gas value to consumers. That is:

NNEB = Gas value - Production costs - Transportation costs - Net foreign profits.

The estimates of gas value and costs affect the NNEB calculations in important ways, as does the choice of discount rate and time period over which the ANGTS project is examined. The discount rate chosen for the NNEB calculation ideally should represent society's rate of time preference; that is, the rate of return at which society is prepared to forego consumption today in

4/ Refer to President's Decision, pp. 47-83, for a summary of this agreement.

5/ Revenues paid to foreign nations are a real resource cost to the U.S. because they represent a future claim on U.S. goods and services.

trade for some greater amount of consumption later on.[6] The actual project life would depend upon the useful physical lifespan of the pipeline, the design capacity of the pipeline, and the magnitude of recoverable gas reserve which can be economically produced over time.

The remainder of this section describes the set of assumptions which describe the "base case" scenario and explores the sensitivity of the NNEB to alternative assumptions concerning the value of the delivered Alaskan gas, the project life, and the transportation costs.

BASE CASE ANALYSIS

The analysis of the ANGTS used for the President's Decision provides most of the baseline data for the base case used in this analysis. The President's Decision and our base case assume:

- Alaskan gas substitutes for imported distillate fuel oil on a one-for-one, energy equivalent basis and has a gas value equal to the wholesale price of distillate.[7]

6/ E. J. Mishan, Cost-Benefit Analysis, Praeger Publishers, New York, 1976, pp. 201-203.

7/ This assumption ignores potential changes in total U.S. energy consumption that could be caused by rolled-in or average pricing of Alaskan gas at the retail level compared to marginal cost pricing of distillate fuel oil. If considered fully, it is not clear whether careful consideration of differences in retail pricing would increase or decrease our NNEB estimates, but it is likely that the effect would be small compared to other factors ultimately likely to impinge on the NNEB. Furthermore, technically correct treatment of this effect is complicated by the fact that, early in the project life, Alaskan gas may cost more than the average of all other flowing gas; but late in the project life the opposite may occur. Finally, it also would require an assumption about whether biases of any similarly kind (e.g., domestic price controls on crude oil or refined petroleum products) will affect distillate prices over the life of the ANGTS project.

- strictly for purposes of simplifying the analysis, that a decrease in U.S. demand for world oil, provided through the development of Alaskan gas, would not affect world oil prices.
- an average pipeline construction cost overrun of 30 percent.
- a pipeline debt/equity ratio of 75/25.
- start-up in January 1984.
- gas deliveries to the pipeline of 2.4 Bcf/day and net gas deliveries at the citygate based on overall pipeline gas consumption for the original Arctic gas displacement scheme.8/
- the U.S. portion of cost of service payments for facilities shared with Canada vary as a function of relative volumes of U.S. and Canadian gas, with the U.S. share equal to 76.4 percent for U.S. shipments of 2.4 BCF/day and Canadian shipments of 1.2 BCF/day.
- the U.S. share of cost of service payments for the Dempster lateral varies on the basis of overruns on the Canadian main line, overruns on the Dempster line, and the relative U.S. and Canadian volumes of gas shipped.9/

The NNEB calculations in this analysis are denominated in mid-1979 dollars, and all benefit and cost streams are discounted to mid-1979 using a real after-tax discount rate of 4 percent. Cost data from the President's Decision, which had been denominated in 1975 dollars, were converted to mid-1979 dollars using the aggregate U.S. GNP implicit price deflator. Non-residential

8/ This scheme is used here because it is embedded in internal FERC models of the ANGTS project. To our knowledge, detailed documentation of this displacement plan is not available.

9/ A description of the formula for computing the U.S. share is shown in the President's Decision, op. cit., pp. 72-79 and 168-174.

construction price deflator projections were applied to construction costs.[10/]

Other important elements of the base case include the following:

- gas processing costs for a 2.4 Bcf/day output stream were based on a linear extrapolation to the higher capacity using best-available cost data for a 2.0 Bcf/day plant.[11/]
- incremental water-flood requirements were assumed to be approximately 73 percent of the Prudhoe Bay unit's total water-flood requirements.[12/]
- ad valorem taxes of 1.7 percent were applied to the depreciated book value of the pipeline and the depreciated replacement value of the gas production equipment.[13/]
- Alaskan state income taxes were assumed to be 9.4 percent of pipeline net income and "normal" producer net income.[14/]

10/ Data Resources Inc., The Data Resources U.S. Long-Term Review, Winter 1979 TRENDLONG 2003 projections. See Appendix G for the inflation adjustments used in this report.

11/ Ralph M. Parsons, Inc., "Sales Gas Conditioning Facilities, Prudhoe Bay, Alaska," September 1978.

12/ Water-flood facilities investment has been estimated at $2 billion (1979 dollars), as suggested in Oil and Gas Journal, February 26, 1979, p. 70. Half of the expenditures are assumed to occur in 1983 and half in 1984. The incremental portion of the outlays for water-flood facilities has been estimated by comparison of alternative production possibilities presented in a report by H. K van Pollen and Associates, Inc., Documentation of Input Variables, Northern Alaska Hydrocarbons Model, August 1978.

13/ The ad valorem rate and its application to the pipeline on the basis of depreciated book value are carried over from models used in connection with the President's Decision. It is our understanding that these taxes would be assessed at a 2.0 percent rate and would be based on replacement value; this, however, presents a minor difference that does not affect the results significantly.

14/ "Normal" net income is defined as that level yielding an overall 8 percent after-tax return on total capitalization. See Appendix A for the derivation of "normal" net income.

- federal income taxes were assumed to be 46 percent of pipeline net income (after state income taxes), adjusted for the effect of a 10 percent income tax credit.

- the rates of return on pipeline equity were based on the Commission's latest incentive rate of return proposal.15/

- foreign profit calculations were based on British Petroleum's 52 percent interest in Standard Oil of Ohio's 23.5 percent of Alaskan gas.16/

- low world oil price escalation, as defined in the Energy Information Administration Annual Report to Congress.17/

These inputs and assumptions yield an NNEB estimate of $14.9 billion (mid-1979 dollars). The components of this estimate are:

Gas value	$33.3 billion (mid-1979 dollars)
- Production costs	6.0
- Transportation costs	11.9
- Net foreign profits	0.5
NNEB	$14.9 billion

Thus, the proposed ANGTS project would provide significant economic benefits to the nation under the base case inputs and assumptions.

In contrast to ICF's base case estimate, the President's Decision estimated an NNEB of $5.8 billion (1975 dollars). The following table presents

15/ FERC, "Notice of proposed rulemaking to set values for incentive rate of return and establish change-of-scope and inflation adjustment procedures and request comments on filed tariffs," Docket No. RM 78-12, April 6, 1979.

16/ Sources: Arlon R. Tussing and Connie C. Barlow, "An Introduction to the Gas Industry with Special Reference to the Proposed Alaska Highway Gas Pipeline," Institute of Social and Economic Research, Anchorage, Alaska, October 25, 1978, p. I-37 and British Petroleum, Annual Report, 1978, p. 12.

17/ The President's Decision assumed a constant real oil price. President's Decision, p. 97.

our current understanding of the reconciliation between the earlier estimate and our current base case NNEB estimate.

Step		Billions
	President's Decision NNEB	$ 5.8 (1975 dollars)
1.	Denominate in mid-1979 dollars	+ 1.4 (mid-1979 dollars)
2.	Add Water-Flood Costs	- 1.6 (mid-1979 dollars)
3.	Adjust Transportation Costs	+ 0.2 (mid-1979 dollars)
4.	Unreconciled Changes	- 0.5 (mid-1979 dollars)
5.	Discount to mid-1979 Timeframe	+ 1.[illegible] (mid-1979 dollars)
6.	Change Discount Rate (10% to 6%)	+ 4.[illegible] (mid-1979 dollars)
7.	Alter Distillate Price Trajectory	+ 3.3 (mid-1979 dollars)
	ICF Base Case NNEB	$ 14.9 (mid-1979 dollars)

Some of these steps are simply accounting changes to update the basis for the estimate (steps 1, 5). Others incorporate later cost data and DOE's recently established standardized capital cost methodology (steps 2, 3).[18/] The 10 percent real discount rate used throughout the President's Decision is appropriate for considering a project's capital cost stream, and we adopt this same approach. For reasons elaborated later in this section, however, we believe that a 6 percent real discount rate is a more appropriate measure of society's time preference and, therefore, a preferable rate to use in discounting the project's overall streams of costs and benefits (step 6).

Finally, we believe that in light of recent world oil price developments an assumption of constant real prices would be optimistic beyond a reasonable limit. Instead, we have essentially applied the low oil price escalation expectations of the Energy Information Administration Annual Report to Congress to the distillate fuel oil price in the President's Decision (step 7).

18/ The DOE methodology is discussed later in this section.

About $0.5 billion (mid-1979 dollars) in difference remains unexplained (step 4).

SENSITIVITY ANALYSIS

Several of the input estimates used to calculate the NNEB could vary significantly from the base case values. Sensitivity analysis provides insights about the relative importance of changes in the discount rate, gas value, useful project life, and pipeline construction costs. In addition, the order of magnitude of the minimum likely effect of the ANGTS on world oil prices and required U.S. payments for imported oil are estimated because lowered world oil prices both benefits the nation and affects the value of Alaskan gas.

Discount Rate

The base case uses a 6 percent real after-tax discount rate to account for the time preference of society. No strong empirical basis currently exists to identify society's time prefecence, but the after-tax real rate of return on private investments represents one reasonable, yet conservative, approximation of this rate.[19/] The 6 percent rate chosen for the base case appears to approximate the private after-tax rate of return.

19/ Conservative refers to avoiding over-investment in capital-intensive projects such as the ANGTS. It is conservative, we believe, because the effects of personal income taxes on returns to individuals in the form of after-tax corporate income suggest the use of an even lower rate to represent social time preferences. Consequently, it could be argued that conservation recommends the lower rate to guard against under-investment in capital-intensive domestic energy supply and conservation projects.

This choice of discount rate is based mainly upon a recent Department of Energy (DOE) directive on standard financial treatment of cost estimates.[20] The directive recommends using a real rate of return on equity of 9.5 percent, after tax; a real interest rate on debt of 3 percent; and a 6 percent inflation rate.[21] Assuming an overall marginal corporate income tax rate of 50 percent a typical capital structure, comprised of one-third debt and two-thirds equity, yields a weighted-average after-tax rate of return of approximately 5.9 percent.

Although a 6 percent after-tax rate is, we believe, appropriate for discounting the project's overall resource cost and gas value flows, the Department of Energy (DOE) has recommended using a before-tax rate of 10 percent as a means of accounting for all the real resource costs associated with the capital expenditure portion of an energy project.[22] Use of a before-tax rate for capital expenditures captures the returns foregone on alternative private sector investments that would have accrued to (i) equity holders as dividends and/or capital gains, (ii) lenders as interest payments, and (iii) the government as corporate income taxes.[23] DOE recommends accounting for

20/ Attachment C of DOE, Stuart W. Ray, Policy and Evaluation, "Financial Costing Guidance for Policy and Fiscal Guidance," memorandum for distribution, March 28, 1979.

21/ DOE, Stuart W. Ray memo, op. cit., Attachment 6.

22/ DOE, Stuart W. Ray memo, op. cit., Attachment 6.

23/ Corporate income taxes are treated as real resource costs because they represent the project's "portion of the fixed costs of government operation." See DOE, Gary Dorman, "The treatment of taxes in cost benefit analyses," memorandum for Darius Gaskins, Deputy Assistant Secretary, Policy and Evaluation, August 8, 1978.

all of these opportunity costs of capital expenditures by using the before-tax, marginal rate of return on private sector investments, and it cites empirical evidence for using 10 percent as this marginal rate.[24/]

This analysis uses the 10 percent before-tax rate to estimate the real resource costs associated with the ANGTS project's capital expenditures because this approach is "neutral" with respect to any special tax treatment or financing methods available to this one project.[25/] The NNEB calculations implement this procedure by, first, annuitizing the project's capital expenditures using the 10 percent discount rate. Then, the project's overall benefit and cost streams (including the annuitized capital expenditures) are discounted at 6 percent in order to estimate the present value of the ANGTS project's overall NNEB.

Earlier work has included estimates based on a 10 percent rate of discount on the project's overall cost and benefit streams. Because this rate provides an extra-conservative appraisal of the project's net benefits, our analysis also presents NNEB estimates generated by applying a 10 percent discount rate to the project's overall benefit and cost streams whenever the information may provide useful insights. Under the base case assumptions, the NNEB estimated

---

24/ DOE, Gary Dorman, "Choosing the discount rate for NESS cost/benefit analyses," memorandum for Darius Gaskins, September 18, 1978.

25/ These "tax-neutral" cost estimates do not depend upon the corporate tax structure of the particular parties making the capital outlays, which is an appropriate feature for calculating net benefits from the national perspective. If actual tax payments were used as the real resource cost estimates, the NNEB estimate for the ANGTS project could vary significantly according to the share of capital outlays assumed to be made by oil companies and gas utilities.

using 10 percent is $8.1 billion, 46 percent below the base case estimate.

Gas Value

The base case assumes that Alaskan gas substitutes for distillate fuel oil on an energy-equivalent basis. It is worth reiterating that a primary reason for making this assumption is to maintain consistency with analyses prepared in connection with the President's Decision. We have performed no analyses to verify that Alaskan gas would substitute for distillate fuel oil rather than for less expensive fuels such as residual fuel oil.

Although OPEC oil prices have remained level in real terms, or even decreased slightly, for much of the period since the 1973 Arab oil embargo, recent events make such continued good fortune for oil consumers appear unlikely. Nevertheless, it is worth examining the economic attractiveness of ANGTS if oil prices were to remain constant in real terms throughout the project's life. The NNEB for a constant distillate fuel value, $11.6 billion, is 22 percent lower than the base case estimate (see Table II-1).

The base case projections of distillate fuel oil prices are drawn from the low price escalation scenario assumptions of the forthcoming Energy Information Administration's (EIA) Annual Report to Congress (ARC). The ARC's low price escalation assumptions are summarized in Table II-1.[26/]

26/ In constant 1979 dollars, the crude oil price assumed in this EIA case is $16.00 per barrel from now through 1992, after which it escalates at a real annual rate of 2.8 percent. This compares with crude oil (contract) prices today of approximately $18.00 per barrel and spot market transactions in the $30-35 per barrel range.

TABLE II-1

NNEB ESTIMATES FOR SELECTED GAS VALUE ASSUMPTIONS[a/]

Gas Value Equal to:	Price Trajectory	NNEB (mid-1979 billion dollars)
Distillate Fuel	Constant[b/]	$11.6 billion
	Low Escalation[c/]	14.9
	Medium Escalation[d/]	22.3
Residual Fuel	Low Escalation[e/]	11.8

a/ Base case assumptions for other parameters.

b/ Distillate price: constant $2.62/MMBTU (1975 $).

c/ Base case distillate price: constant $2.62/MMBTU (1975 $) through 1992; 2.8% real escalation annually thereafter; $5.15 (1978 $) ceiling price.

d/ Distillate prices: constant $2.62/MMBTU (1975 $) through 1985; 4.5% real escalation annually to 1990; 4.7% per year thereafter; $5.15 (1978 $) ceiling price.

e/ Residual price: constant $2.84/MMBTU (1978 $) through 1992; 2.8% real escalation thereafter.

NOTE: These projection rules are denominated here in differing-year dollars in order to correspond with the various sources from which they were derived. The base distillate price, $2.62, is the adjusted figure used in internal FERC models for the $2.50 (1975 dollars) figure in the President's Decision. The base residual price is derived from National Energy Supply Strategy data expressed in 1978 dollars. In our NNEB calculations, however, both base figures are converted to mid-1979 dollars and projected using the oil price escalation rules of the Energy Information Administration Annual Report to Congress (low price escalation: Series C low; medium price escalation: Series C).

Distillate fuel oil prices, however, may also escalate more rapidly than these low price escalation projections. Table II-1 also presents the NNEB estimate for the ARC medium price escalation scenario assumptions. This NNEB estimate, $22.3 billion, is 50 percent above the base case. Consequently, the future course of world oil prices exerts large leverage on the net benefits of the ANGTS project. If world oil prices rise faster than the base case assumptions, the benefits to the nation would increase. And as will be discussed later, consumers would capture the full share of the increased benefits.

Thus far, the discussion of the gas value has assumed that Alaskan gas would substitute for distillate fuel oil. If overall gas supplies were plentiful at the time Alaskan gas was delivered, Alaskan gas might displace residual fuel oil. As a consequence, the value of the Alaskan gas would be the lower price of residual fuel rather than the price of distillate fuel. Under low world oil price escalation, the NNEB estimate based on the price of residual fuel oil remains in excess of $11 billion (see Table II-1).

Project Life

Legislative guidelines emphasize a 20-year period for analysis of the cost of service issues associated with the ANGTS.[27/] In turn, most NNEB analyses of the ANGTS have examined a similar time period (25 years). The typical useful physical life of a pipeline, however, approaches 50 years; for example, the President's Decision mentions the likelihood that the ANGTS might operate

27/ For example, see the Alaskan Natural Gas Transportation Act of 1976, Section 5(c).

for more than 40 years.[28/]

There is a realistic possibility that sufficient Alaskan gas reserves will be developed to utilize the pipeline well past the 25-year period assumed in our NNEB calculations.[29/] The useful life of the pipeline exerts a strong influence on its economic value to the nation. If the ANGTS were to deliver 2.4 Bcf/day for 30 years, the NNEB would rise to $17.7 billion (mid-1979 dollars). And an even longer useful life would further increase the NNEB (see Table II-2).

TABLE II-2

NNER ESTIMATES FOR
ALTERNATIVE PROJECT LIFETIMES[a/]
(mid-1979 dollars)

Project Life	NNEB	
	(6% discount rate)	(10% discount rate)
20 years	$11.2 billion	$ 6.6 billion
25	14.9 billion	8.1 billion
30	17.7 billion	9.1 billion
50	23.5 billion	10.5 billion

a/ Base case assumptions used for other parameters.

The effect of the discount rate assumption, discussed previously, is especially dramatic in the case of an extended project life. With the 6 percent discount rate, the 50 year NNEB estimate would reach $23.5 billion, an

28/ President's Decision, p. 163.

29/ Data Documentation for Alaskan Hydrocarbons Supply Model, draft Technical Memorandum prepared by Division of Oil and Gas Analysis, Department of Energy, pp. 1^-12.

increase of 58 percent over the 25 year base case estimate.[30] In contrast, a 10 percent discount rate decreases both the absolute and relative importance of project benefits beyond the first 25 years. If a 10 percent discount rate were applied, doubling the life of the project would increase the present value of the NNEB by only 30 percent.

Pipeline Construction Costs

Few recent major construction projects have been completed at or below their initially estimated costs.[31] The cost overruns experienced by the Trans-Alaska Pipeline System (TAPS) were especially large. Compared with an original (adjusted) estimate of $1.6 billion, the capital cost of TAPS ultimately reached $7.7 billion, an increase of approximately 380 percent.[32] The unprecedented scale of the ANGTS project, coupled with the need to construct the Alaskan segment and a minor part of the Yukon segment in the same harsh Arctic environment in which TAPS was constructed, raises the prospect of large cost overruns for the Alaskan gas pipeline.

This section examines the potential effects of serious cost overruns for the Alaskan gas pipeline project. Importantly, the probability of large cost overruns varies significantly among the individual segments of the pipeline. In this context, then, the analysis examines how cost overruns on the various

30/ The 50-year case represents a rough estimate which excludes any additional capital expenditures required to extend the operational period.

31/ See Walter J. Mead, Transporting Natural Gas from the Arctic, American Enterprise Institute, 1977, pp. 88-89, for an illustrative list of recent projects.

32/ Ibid., pp. 88-89.

segments could affect expected costs and project benefits.

Lower-48. Gas pipeline construction in the lower-48 involves a low probability of major cost overruns. Typically, lower-48 gas pipelines are constructed at a cost within 5 percent of the initial estimate.[33/] Approximately 21 percent of the value of the ANGTS plant-in-service would reside in the lower-48.[34/] Since the danger of significant cost increases appears remote for the lower-48 segment of the project, this analysis focuses on the Alaskan and Canadian segments.

Alaska. The Alaskan segment of the ANGTS must be constructed in the same hostile environment that the TAPS project faced. There are, however, important differences in the construction of gas and oil pipelines, including the ability to pipe gas at temperatures low enough to avoid thawing permafrost and to lay gas pipeline in the ground rather than above it. Both of these differences should lessen the ANGTS construction problems, with the one exception of burying gas pipeline in areas of discontinuous permafrost, where the chilled gas may cause frost heaving.[35/] Discontinuous permafrost could be encountered along approximately half of the Alaskan segment.

Fortunately, the Northwest Alaskan Pipeline Co. (formerly Alcan) proposal for the Alaskan segment follows the TAPS project chronologically. Consequently, this second pipeline construction effort can take advantage of

33/ Private communication from FERC staff.

34/ The plant-in-service estimate is based on the base case figures for the first year of the ANGTS operation.

35/ For a more detailed discussion, see the President's Decision, pp. 187-188.

lessons learned about pipeline construction in an Arctic environment. Moreover, the Northwest project will utilize the infrastructure created by Alyeska, the TAPS project manager, thus minimizing the chance of infrastructure-generated cost increases or delays over the share of the Alaskan segment laid parallel to TAPS. The TAPS experience should also lessen the chance for labor supply problems in Alaska, because the first effort expanded Alaska's pool of skilled workers.[36/]

Despite these advantages, unforeseen technological and management problems are likely to occur. In order to cover such contingencies, the President's Decision incorporated a 30 percent cost increase and one year start-up delay in the Alcan's (now Northwest) initial estimates.[37/] Our base case assumptions also follow this precedent.

Nevertheless, the 380 percent cost overrun for TAPS suggests that the implications of even more substantial cost overruns should be explored. Table II-3 summarizes the effects on the base case NNEB of cost increases for the Alaskan segment of 30, 100, 200 and 400 percent over current filed estimates. Even at four times the filed cost estimates for construction of the Alaskan segment, the NNEB remains significantly positive, at approximately $10 billion (mid-1979 dollars).

Canada. The remaining 2,028 miles of the pipeline system would be constructed in Canada. Approximately 40 miles of the Canadian segment should experience similar difficulties associated with Arctic and semi-Arctic condi-

36/ Ibid., pp. 138-144.

c/ 132 percent Alaskan overrun, 102 percent Canadian overrun (derived from DOI/DOT "worst case" analysis). U.S. Department of the Interior, U.S. Department of Transportation, Alaska Natural Gas Transportation Systems: White House Task Force Lead Agency Report on Construction Delay and Cost Overruns, July 1, 1977.

tions. Other potential problems with the Canadian segment, however, could lead to significant cost increases, including:

- Canadian pipeline companies may have been over-optimistic in their construction labor productivity estimates for the ANGTS.38/
- Requirements for constructing the Canadian segments of the ANGTS with Canadian goods could (i) force builders to use more costly goods than necessary, or (ii) create artificial supply bottlenecks that directly or indirectly raise costs.

The President's Decision and our base case address this concern by incorporating a 40 percent cost overrun for the Canadian segment into the NNEB calculations. Table II-3 demonstrates the effect of even larger cost overruns for this segment. Note that Canadian actions leading to a 100 percent cost overrun would decrease the base case NNEB by approximately $1.3 billion, to $13.6 billion.

Combined Effects: The High Cost Scenario. Of course, major construction cost overruns may occur on both the Canadian and Alaskan segments of the ANGTS. The causes of such overruns could be either related or independent. Rather than continue to probe the implications of cost overruns for each segment separately throughout this report, this analysis examines one "high cost" scenario to understand the effects of catastrophic construction cost overruns.

This high cost case is based on earlier work by the Departments of the Interior and Transportation, which estimated the "worst case" cost experience

38/ Recommendation to The President, p. I-45.

for the three ANGTS proposals.[39/] The Task Force assessed the worst case scenario through the use of expert judgment on specific cost and schedule items for each proposed system. The worst case was then defined as the cost estimate located three standard derivations from the expected overrun; that is, the task force judged with almost 99.9 percent confidence that actual costs would not exceed the worst case amount.

This analysis adopts the earlier worst case analysis by applying a ratio, consisting of the worst case costs and expected costs, to the base case (expected) cost estimates employed in the President's Decision (adjusted to mid-1979 dollars),[40/] where:

$$\frac{\text{worst case cost}}{\text{expected cost}} = 1.466^{41/}$$

Next, lower-48 construction cost was assumed to equal expected levels; then, the overrun amount (in mid-1979 dollars) was allocated equally between the Alaskan and Canadian segments.[42/] This allocation results in an overrun of

39/ U.S. Department of the Interior, U.S. Department of Transportation, Alaska Natural Gas Transportation Systems: White House Task Force Lead Agency Report on Construction Delay and Cost Overruns, July 1, 1977, (hereafter called the Cost Overrun Task Force Report).

40/ Both the President's Decision and the Cost Overrun Task Force Report expect overall construction cost overruns of about 30 percent over filed cost estimates.

41/ Cost Overrun Task Force Report, p. 131.

42/ This rough allocation scheme is used in lieu of detailed quantitative data on the Cost Overrun Task Force Report's conclusions about where the overruns would occur. We believe it is a reasonable approach since the Alaskan segment involves greater technological and other uncertainties but the Canadian segment is larger in an absolute dollar sense.

approximately 137 percent over filed costs for the Alaskan segment and of approximately 108 percent for the Canadian segment. For this worst case of combined overruns, the NNEB estimate again remains significantly positive a $10.4 billion.

Project Delays

Delays of the ANGTS project could generate new problems or new opportunities for project supporters. Among the possible consequences, a delay could affect the quantity of gas available for shipment, the quantity of Alaskan ga demanded by consumers, the interest of potential lenders and equity investors in the project, or the value of the gas deliveries to the nation. These potential results are all important; however, all but the last effect are beyond the scope of this analysis.

If the project makes sense now, that is if its base case NNEB estimate is positive, then with other things equal, the sooner the project is undertaken the better off the nation would be. Because of society's time preference, a delay in starting the project would cause the NNEB to decline exponentially as a function of the length of time the project is postponed if the real value of all benefits and costs over the project's life were to remain constant and the NNEB were measured from the perspective of the NNEB's present value in mid-1979. For the base case, however, the gas value increases over time. With this assumption, a one-year delay prior to any ANGTS expenditures would

AGO 885923

reduce the base case estimated NNEB by $0.4 billion (mid-1979 dollars).[43/]

After some or all construction has been completed, project delay would lead to even greater decreases in NNEB. Not only would the net benefits be postponed but construction costs already would have been incurred. A one-year delay after the completion of the system's construction and prior to the delivery of any gas would generate greater adverse effects for the NNEB estimate than for any delay of the same length at any other point in the project life. Such a delay would reduce the estimated NNEB by $ 0.4 billion (mid-1979 dollars).

EFFECTS ON THE WORLD OIL PRICE

Our base case NNEB estimates include the direct economic efficiency benefits of substituting Alaskan gas for oil consumption but ignore any other significant effects of reducing U.S. oil use. The delivery of Alaskan natural gas to lower-48 energy markets, especially to distillate fuel oil users, would reduce U.S. oil imports. Decreased U.S. oil imports could reduce worldwide oil demand sufficiently to generate downward pressure on world oil prices.

Currently, a clear consensus does not exist concerning the reduction of world oil prices at all future points in time that would result from, say, a reduction in U.S. oil imports of 1 million barrels per day at all future points in time. In fact, DOE has considered estimates which range from $.10

43/ It appears that a one year delay, compared to the start date used throughout this analysis, is likely. See "U.S. delays threaten Alaskan gas line," Oil & Gas Journal, February 26, 1979, p. 50. We return to this delay issue in Section IV.

to $.70 per barrel for an import reduction of this magnitude.[44/]

Alaskan gas deliveries could replace approximately 430,000 barrels per day of oil imports over the project's life.[45/] Using the low end of the range of estimated world oil price effects ($.10 per barrel) and ignoring the offsetting effect on the gas value stemming from lower world oil prices, the ANGTS might easily produce annual savings of real resources, otherwise consumed by paymen s for oil imports, of $219 million (mid-1979 dollars) on a base of 6 million barrels of total annual oil imports.[46/] In turn, this would increase our base case NNEB estimate by $2.2 billion over a 25-year period. Importantly, higher estimates of the effect on world oil prices of cutting U.S. imports by 1 million barrels per day would increase this NNEB estimate approximately linearly.

ZERO BENEFITS SCENARIO

Given the high values of the NNEB estimates, it may be useful to explore the magnitude of ANGTS cost overruns that could negate the economic benefits from the delivery of Alaskan gas.[47/] Assume, (i) since the construction of

44/ The estimate at the low end of the range is based on analyses using an ICF world energy model described in ICF Incorporated, Imperfect Competition in the International Energy Market: A Computerized Nash-Cournot Model, May 1979.

45/ Based on 910 x 10^{12} Btus of net gas delivered per year and 5.825 million Btu per barrel of distillate oil (ignoring refinery Btu losses in the case where crude oil, rather than distillate would be imported).

46/ Approximately the level for 1995 in the Energy Information Administration's ARC, 1979, Series C.

47/ Gas production and gas conditioning cost overruns would also lower the NNEB estimates, but the cost behavior of such non-ANGTS elements are b yond the scope of this analysis. We believe, however, that s mply their small absolute size in the base case, compared to the ANGTS construction cost, makes them less critical from the standpoint of NNEB.

the Northern Border Pipeline and Western Leg segments is relatively straightforward, that their actual costs are as expected and (ii) that the Canadian segments are constructed for the worst case costs incorporated in the high cost scenario. Still, the Alaskan segment would have to experience an overrun of more than 400 percent over filed costs before the NNEB would fall to zero.

The TAPS experience certainly demonstrated that such overruns are not inconceivable for arctic pipeline construction projects. Nevertheless, only a similar catastrophic overrun, combined with other conservative features on the benefits side of the base case NNEB estimate, would make the ANGTS project economically inefficient from a national perspective.

These sensitivity analyses strongly suggest that, from the standpoint of the efficient use of the nation's economic resources, the Alaskan project appears highly desirable. Positive net national benefits for the project, however, do not mean that all the individual participants in the project share equally in these net benefits. This natural gas pipeline project must proceed in a regulated environment, and the regulations can affect the distribution of the net economic benefits among the participants in important ways. Moreover, the distribution of benefits could affect the likelihood of project implementation. The next section examines the regulated prices that consumers would face for Alaskan gas, and the succeeding sections explore the market position of delivered Alaskan gas and the distribution of project benefits among consumers, the ANGTS consortium members, and others.

III. DELIVERED COST OF ALASKAN GAS

The cost of delivering Alaskan gas at the citygate of lower-48 gas distribution utilities has four important components:

- the wellhead gas price
- state severance taxes on gas production
- any additional charges for gas conditioning
- the cost of service to transport the gas from Prudhoe Bay to the citygate.

This analysis uses the annuity-equivalent of the annual sum of these figures over 25 years of pipeline operations as its primary tool for assessing the attractiveness of Alaskan gas to potential customers. The strengths and weaknesses of this approach should emerge from discussions later in this section.

The wellhead gas price is one of the two most important factors in determining the cost of delivered Alaskan gas. Section 109 of the Natural Gas Policy Act of 1978 (NGPA) established a ceiling wellhead price of $1.45 per million Btu as of April 1977, plus inflation adjustments, for natural gas produced from the Prudhoe Bay unit and transported through the ANGTS.[1/] Although this amount was established as a maximum, it is generally considered to be the most likely price.[2/]

1/ The inflation adjustments are based on $1.45 effective April 20, 1977.

2/ This presumably reflects the effects of rolled-in pricing and/or the degree of competition at the field market for Alaskan gas. Analysis of this expectation and its policy implications is beyond the scope of this analysis.

The state of Alaska would impose a severance tax on Prudhoe Bay gas production equal to approximately 10 percent of the wellhead price. This would add approximately 15 cents to the wellhead ceiling price of $1.45 per million Btu in April 1977 terms.

A gas conditioning cost estimate of 35 cents has been used in the FPC's Recommendation, the President's Decision, and other government documents.[3/] A recently proposed FERC rule would require that all of these gas conditioning costs be recovered within the maximum price that gas producers may charge for their gas (i.e., $1.45 per million Btu, adjusted for inflation).[4/] Unless stated otherwise, this analysis assumes that the conditioning costs are covered within the producers' maximum lawful price; therefore, estimates of the delivered cost of gas include no additional conditioning charges.

The cost of service for transporting the gas through the ANGTS is the other important component of the delivered cost of Alaskan gas. This cost, however, is derived in a way that is significantly different from the other components. The three previous cost factors are expected to be relatively stable during the project's operating period. Calculated on a similarly stable basis, the annuity-equivalent cost of service is approximately the same size as the wellhead gas price.

3/ For example, see FERC, "Notice of Proposed Rulemaking and Statement of Policy," Treatment of Certain Production Related Costs, For Natural Gas to be Sold and Transported Through the Alaskan Natural Gas Transportation System, Docket No. RM79-19, February 2, 1979, p. 9, adjusted from 1975 to 1978 dollars.

4/ Ibid.

In contrast, the traditional historical embedded cost method of establishing the cost of service yields high costs in a project's early years and decreasing costs over time as the rate base is depreciated. From the first year of operation to the time when the rate base is fully depreciated, the difference in the cost of service can be large.[5/] The implications of the these time patterns of transportation cost are discussed in detail in our analysis of Alaskan gas marketability (see Section IV).

For our base case assumptions, the delivered cost of Alaskan gas consists of the following components:

	Annuity-Equivalent [6/] (mid-1979 dollars)
Wellhead Price of Gas	$1.68 per mmBtu
Severance Tax	0.17
Gas Conditioning Charge	.00
Pipeline Cost of Service	1.33
Delivered Cost of Gas	3.18

SENSITIVITY ANALYSIS

The delivered cost of Alaskan gas could change for many of the same reasons as the NNEB estimates. Variations of several of the inputs to the cost calculations are considered here, including:

5/ Under the base case assumptions, the pipeline cost of service would vary from $2.34 per million Btu in the first year to $0.43 per million Btu in the twenty-fifth year (mid-1979 dollars).

6/ Assuming a six percent discount rate and a 25-year project life.

- Construction costs
- Gas flow rates
- Length of project life
- Canadian energy decisions

In addition to these potential changes, which reside largely beyond the direct control of the federal regulatory process, two other variations are also considered, changes in allowed wellhead prices and reallocation of gas conditioning costs.

Construction Cost Changes

The potential for cost overruns and possible reasons for such problems have already been discussed in the NNEB sensitivity analysis (see Section II). Here we explore the implications of analogous events for the gas prices that consumers would face.

The first section of Table III-1 illustrates how changes in the expected costs of constructing the Alaskan leg of the pipeline system would affect delivered gas costs. In percentage terms, the delivered gas cost is not particularly sensitive to the costs of building the Alaskan segment. For example, if the Alaskan line were built for the costs filed by the ANGTS consortium, rather than for the 30 percent overrun assumed in the President's Decision, the delivered cost would decrease by 2 percent. On the other hand, if the Alaskan construction cost were twice as much as originally anticipated, the delivered cost would increase 5 percent above the base case. A disastrous 400 percent overrun on the Alaskan segment (i.e., 5 times the filed estimates) would increase the delivered gas cost by 25 percent.

At first glance, the insensitivity of the delivered gas cost to Alaskan segment overruns might appear surprising. But transportation costs represent only about 40 percent of delivered gas costs, and Alaskan segment costs are less than 40 percent of transportation costs for the base case. Consequently, this insensitivity should be expected.

The second section of Table III-1 explores how construction cost changes for the Canadian segment would affect the delivered cost of gas. Again, the sensitivity of delivered costs to construction costs for this part of the pipeline is not large. For example, if the line were built for its filed cost, rather than the 40 percent overrun assumed in the President's Decision, the delivered cost would decrease by 3 percent. If the Canadian segment, for which there should be relatively little technological uncertainty, were to double in cost from the filed estimates, the delivered cost would increase 4 percent from the base case. And even the "high cost" scenario described in the previous section (132 percent overrun for the Alaskan segment and 105 percent overrun for the Canadian segments), would yield a delivered gas cost only about 12 percent higher than the base case.

Gas Flow Rate Changes

Changes in the rate at which Alaskan gas flows through the ANGTS would also affect the cost of delivered gas. The net result stems from two effects, each moving in opposite directions. First, the flow of additional gas would spread common costs over a greater pool of gas supplies, thereby lowering unit costs. Second, a greater flow would require increased capital expenditures for compression capacity and increased fuel expenditures for each unit of gas

TABLE III-1

DELIVERED GAS COST ESTIMATES
FOR SELECTED CONSTRUCTION COST SCENARIOS [a]

delivered.[7/] Of course, a lower flow rate would have opposite effects.

Table III-2, below, presents the delivered cost estimates of Alaskan gas resulting from changes in the rates at which gas would flow through ANGTS.

TABLE III-2

EFFECTS OF GAS FLOW RATE CHANGES
ON COST OF DELIVERED GAS a/
(mid-1979 dollars)

Gas Flow Rate (Bcf/day)	Delivered Gas Cost b/ ($/mmBtu)	Change in Gas Cost From Base Case (percent)
2.0	$3.37	+6%
2.4	3.18	—
3.2	3.05	-4
4.0	3.09	-3
4.8	3.25	+2

a/ Base case assumptions used for other parameters.

b/ 25 year annuity equivalent, at the citygate.

If the flow rate were increased by one-third to 3.2 Bcf/day, the delivered cost of the gas would decrease by 4 percent to $3.05 per million Btu. A flow rate of 4.0 Bcf/ day would lower the delivered cost to $3.09 per million Btu, a level lower than the base case but higher than the 3.2 Bcf/day case. Given the current system design, this increase indicates that fuel use penalties would outweigh the capital cost economies of scale at an input flow rate equal

7/ If a flow rate higher than 2.4 Bcf/day were anticipated prior to system design, a system with lower unit costs could possibly be engineered. This analysis, however assumes that any flow rate changes are accommodated by changes in the system as now planned.

to or greater than 4.0 Bcf/day. If gas production rates were lower than expected, unit costs could increase to $3.37 per million Btu, or a 6 percent increase, for a 2.0 Bcf/day flow rate.[8/]

Project Life Changes

The base case delivered cost of Alaskan gas assumes a 25-year delivery period in order to develop the annuity-equivalent cost estimate. In the ANGTA, Congress expressed an interest in these cost estimates for a 20-year period.[9/] For a minimum likely useful project lifetime of 20 years, the delivered unit cost of gas would increase to $3.28 per million Btu. For 30 and 50 years, a first approximation of the delivered gas cost indicates decreases to $3.11 and $2.98 per million Btu, respectively.[10/] These figures are summarized in Table III-3.

Canadian Energy Actions

Two Canadian energy supply decisions could also affect the delivered cost of Alaskan gas. These two possible actions are (i) a reversal of the decision to move Mackenzie Delta gas through the ANGTS and (ii) early sales of Alberta gas through pre-built southern portions of the ANGTS.

8/ The fuel consumption behavior is extrapolated from data in FERC staff, Alaska Gas Project Office, System Design Inquiry draft paper, undated.

9/ ANGTA, Section 5(c).

10/ This approximation assumes no new capital expenditures are required to maintain the ANGTS for these longer periods.

TABLE III-3

DELIVERED GAS COST AS A FUNCTION OF LENGTH OF RELEVANT TIME PERIOD a/
(mid-1979 dollars)

Length of Time	Delivered Gas Cost a/ ($/mmBtu)	Change in Gas Cost From Base Case (percent)
20 years	$3.28	+3%
25 years	3.18	—
30 years	3.11	-2
50 years	2.98	-6

a/ Base case assumptions used for other parameters.

b/ 25-year annuity-equivalent, at the citygate.

Removing the requirement to ship Mackenzie Delta gas would eliminate the U.S. share of the cost of the Dempster Lateral, which would connect the Mackenzie Delta gas to the ANGTS. Conversely, this would also increase the U.S. share of the costs for the ANGTS Canadian segments. The combination of these countervailing effects is estimated to be an increase of 2 percent in the base case delivered gas costs, from $3.18 to $3.23 per million Btu.

The early delivery of Alberta "bubble" gas through pre-building of the southern portions of ANGTS would allow some of the pipeline's capital expenditures to be depreciated prior to initial deliveries of Alaskan gas. A precise estimate of how early deliveries would affect the figures for the delivered cost of gas is beyond the scope of this analysis.

Policy Actions

The FERC has proposed that "the Prudhoe Bay producers should be responsible for the construction and operation of the required conditioning facil-

ity."[11/] This analysis assumes that the maximum lawful price ($1.45 per million Btu, with adjustments) includes the payment of gas conditioning costs.

Alternatively, the Commission could decide to make gas consumers bear all or part of the gas conditioning costs. If the ANGTS consortium were required to provide gas conditioning facilities as a part of the pipeline system, the delivered cost of gas would increase by approximately 22 percent to $3.88 per million Btu (1979 dollars) under our base case assumptions.[12/]

Another regulatory issue concerns the maximum lawful price for Prudhoe Bay gas set by the NGPA (Section 109). On a present value basis at this price, the wellhead revenues would exceed estimated production costs (including royalty and severance taxes and a normal return on investment) and gas conditioning costs by $12.9 billion (mid-1979 dollars). Although Commission discretion in this area may be limited, reduction of these wellhead revenues could enhance Alaskan gas marketability and the welfare of gas consumers considerably, but only at the expense of Alaska and federal taxpayers and the gas producers.

11/ FERC, "Notice of Proposed Rulemaking and Statement of Policy," Treatment of Certain Production-Related Costs for Natural Gas to be Sold and Transported Through the Alaska Natural Gas Transportation System, Docket No. RM79-19, February 2, 1979, p. 12.

12/ See Appendix C. This $0.70 (1979 dollar) gas conditioning charge is roughly equivalent to the $0.60 charge mentioned in Foster Associates, Inc., "The Marketability of Prudhoe Bay Gas In The Lower 48 States," March 28, 1979, p. 1. Both the Foster Associates estimate and this analysis use Ralph M. Parson Co. data. The differences from the earlier estimate of $0.30 (1975 dollars) mentioned in the President's Decision, p. 95, can largely be explained through the charging of the maximum wellhead price for the gas consumed in the conditioning process rather than counting just the actual production costs for the gas used in conditioning.

GAS COST BEHAVIOR OVER TIME

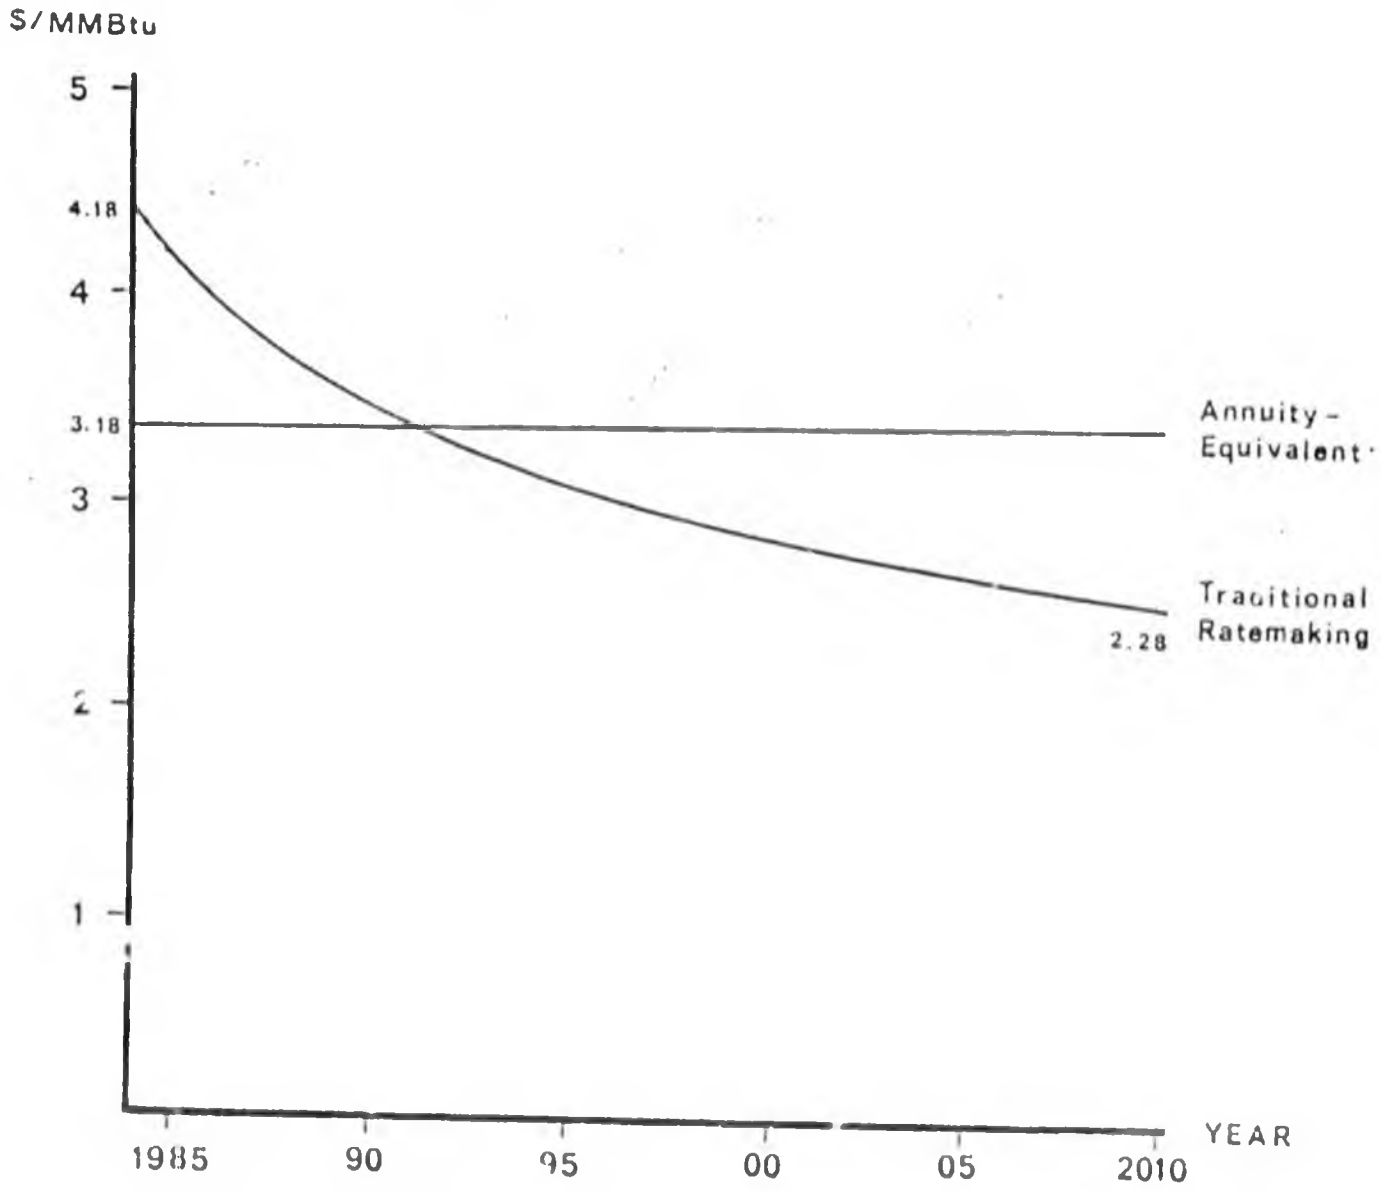
Thus far, our discussion of the delivered costs of Alaskan gas has focused on the annuity-equivalent cost. If, however, FERC were to apply the traditional historical embedded cost approach to the ANGTS ratemaking, the actual costs facing potential Alaskan gas purchasers would vary from year to year.[13/] Under traditional ratemaking, the pipeline cost of service includes a constant rate of return on the rate base, where the rate base is defined by the undepreciated book value of the pipeline investment. On this basis, the rate base is highest in the first year of service and, then, gradually decreases over time until the rate base is fully depreciated. Figure III-1 illustrates how the time-profile of the cost of service affects the yearly delivered cost of Alaska gas (in mid-1979 dollars).

The time pattern under traditional cost of service regulation yields costs which initially are much higher than the annuity-equivalent cost and decrease steadily to a level equal to O&M costs and other annual expenditures, well-below the annuity-equivalent cost. In principle, this artifact of traditional regulatory practice represents only one of several possible ANGTS cost profiles. One alternative would be a constant cost (in real or nominal dollars) equal to an annuity-equivalent value. It would also be possible to devise a gas rate schedule of equal present value that allowed lower costs in the

13/ The present value of the stream of these actual costs, however, would be equal to the present value of the annuity-equivalent cost.

FIGURE III-1

DELIVERED ALASKAN GAS COSTS
TRADITIONAL REGULATION VS. ANNUITY-EQUIVALENT



earlier years of the project and increased costs over time.[14/]

The importance of the annuity-equivalent gas costs and the time pattern traditional gas pipeline tariffs results from the opposite price signals ea: can transmit to gas customers. Earlier, Section II demonstrated the robust nature of the ANGTS NNEB estimates, which remain positive for any reasonable expectations for the project. But regardless of the magnitude of the potential national benefits of the Alaskan gas pipeline project, the proposed project must be implemented in order to realize these benefits. As mentioned in our introduction, the project can be completed only if its sponsors, other equity investors and lenders believe that the Alaskan gas delivered through the pipeline can be sold. This section has explored the range of annuitized costs which gas consumers would be required to pay if the project were implemented. In the next section, we begin to explore the market outlook for Alaskan gas.

14/ Although the former Interstate Commerce Commission approach has no unique methodological value, this pattern could be developed through the rate-making method used for oil pipelines, which allows a constant rate of return on a rate base defined by the replacement cost of the line. Alternatively, the depreciation schedule could be altered so that the resulting rates display less variation on a real cost basis than do gas rates based on traditional depreciation treatment.

IV. THE RELATION OF THE ANGTS TO THE U.S. ENERGY MARKET

The U.S. natural gas outlook differs radically from the situation perceived at the time the Alaskan Natural Gas Transportation Act of 1976 (ANGTA) was enacted. Then, Congress found that "a natural gas supply shortage exists in the contiguous States of the United States."[1/] The current outlook appears to be much improved because of legislated changes in natural gas wellhead pricing, end use pricing requirements and reforms, user energy conservation, and other factors. Also, large quantities of Mexican gas have been offered for sale to the U.S., and additional Canadian gas supplies may be offered for export.

In this updated context, this section analyzes whether (i) Alaskan gas can offer economic advantages as a substitute for distillate fuel oil, (ii) the Alaskan gas pipeline project compares favorably with another major potential new gas project--Mexican gas, and (iii) the project's benefits to the nation and to consumers remain if Alaskan gas replaces residual fuel oil rather than distillate.

BASIS FOR COMPARISON

As noted several times in earlier sections, the traditional gas pipeline cost-of-service ratemaking methods can provide misleading signals about the fundamental economic merits of a capital intensive gas supply project such as the ANGTS. For example, consider a comparison of first-year costs between a

1/ ANGTA, Section 2.

capital intensive gas project and an alternative gas project with low capital investment but with real cost growth built into the price term (e.g., a source whose price of gas, ex transportation, is tied by formula to a rapidly escalating world oil price). The first-year costs of the capital intensive project would include a return on the entire, undepreciated rate base. In contrast, the first-year costs for the latter project would precede the onset of any real cost growth caused by future world oil price increases. Thus, the worst year of the capital intensive project would be compared to the best year of the low investment project. A comparison of the last-year or average-year costs could be similarly inappropriate in an economic sense, even if it were to reverse the apparent relative attractiveness of the two alternatives.

Although one-year cost comparisons have appeared in analyses of the ANGTS,[2/] a more commonly used measure has been the simple arithmetic average of the annual costs. Since the arithmetic average may introduce only minor distortions when comparing projects with similar cost patterns over time, its use as a shortcut in comparing the ANGTS to other capital intensive alternatives may have been acceptable. But for comparing the ANGTS with other less capital intensive energy supply options (e.g., distillate fuel oil or Mexican gas), it is important to use a comparison technique that carefully incorporates the time value of money (Appendix E presents detailed examples of problems associated with the use of an arithmetic average).

2/ For instance, see Congressional Research Service, "Mexico's Oil and Gas Policy: An Analysis," prepared for the Committee on Foreign Relations, U.S. Senate and the Joint Economic Committee, December 1978, pp. 5, 48-49.

ICF INCORPORATED
AGO 885941

To account for the time value of money, this analysis calculates the equivalent cost of purchasing one unit (a million Btus) of energy if the price were the same (in real terms) in each year of the time period considered.[3/] In a manner consistent with lifecycle cost comparisons, these annuity-equivalent costs (or "levelized" costs) provide a basis for comparison among energy supply alternatives with radically different cost patterns over time. This concept was employed to develop the annuity-equivalent figures used in Section III. The following analyses of Alaskan gas versus other potential gas supplies and other energy sources use both annuity-equivalent values and annual time profiles to explore the market prospects for Alaskan gas.

ALASKAN GAS AND DISTILLATE FUEL OIL

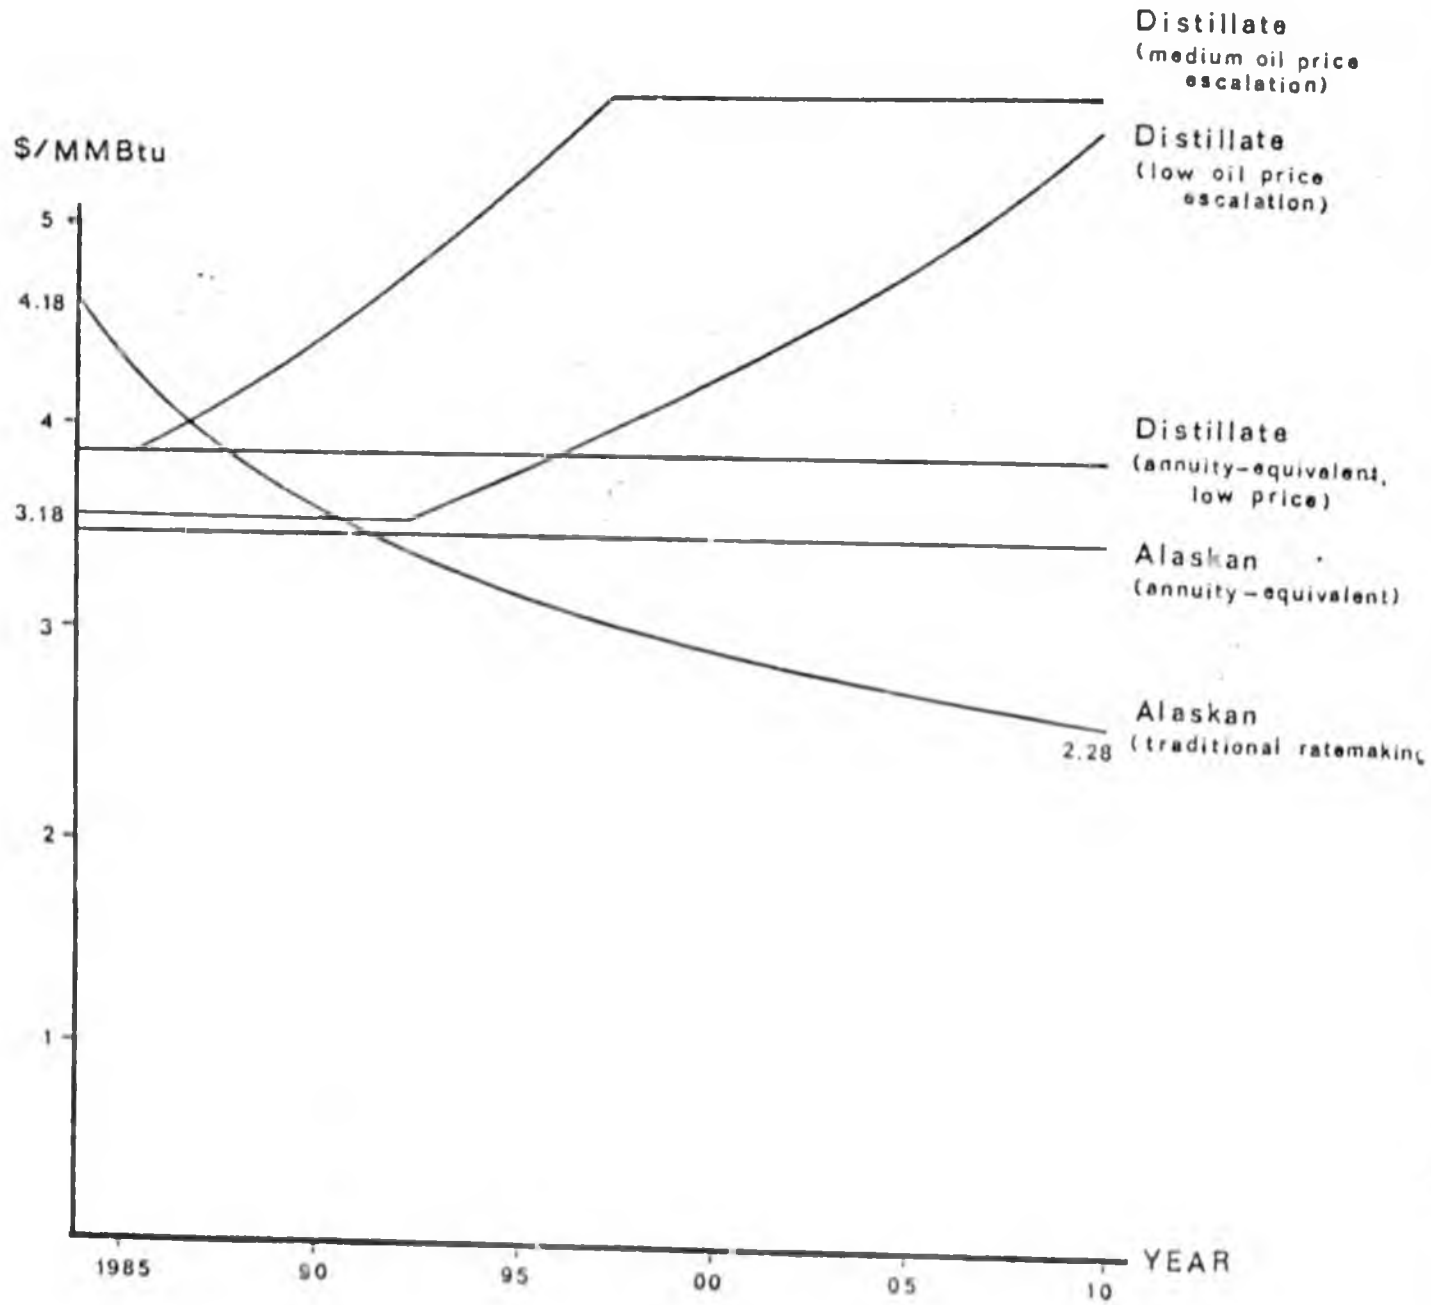
The NNEB analysis (Section II) found that, from a national perspective, the United States would gain large net benefits from the delivery of Alaskan natural gas. Under the base case assumptions, this benefit would be approximately $14.9 billion (mid-1979 dollars).

Despite advantages to the nation from implementing the ANGTS, the base case estimates indicate that potential Alaskan gas customers, if faced directly with the cost of Alaskan gas through a separate rate schedule, initially might prefer distillate fuel oil. This paradox stems from traditional cost of service ratemaking methods, under which customers for Prudhoe Bay gas could expect Alaskan gas costs well above distillate fuel oil costs in the early years of delivery (see Figure IV-1).

3/ See Appendix E for an expanded discussion of the annuity-equivalent concept.

FIGURE IV-1

ALASKAN GAS AND DISTILLATE FUEL COST PROJECTIONS
(1979 dollars)



Alternatively, these gas customers might compare the lifecycle costs of Alaskan gas with the similar costs of their other energy options.[4/] On this basis, the annuity-equivalent prices for a million Btu of distillate fuel oil (assuming the low cost escalation scenario) versus Alaskan gas (for a 25 year period) would be as follows:

Alaskan Gas (citygate)	$3.18 (mid-1979 dollars)
Distillate Fuel Oil (wholesale)	$3.60[5/]

Thus, energy users comparing a 25-year contract for distillate fuel or Alaskan gas would prefer Alaskan gas, other things being equal. Moreover, if distillate fuel oil prices were to rise according to the medium oil price escalation scenario, the Alaskan gas would look even more attractive:

Alaskan Gas (citygate)	$3.18 (mid-1979 dollars)
Distillate Fuel Oil (wholesale)	$4.41

THE MEXICAN GAS OPTION

Alaskan gas differs significantly from additional gas imports from Mexico or Canada. From the U.S. consumer's perspective, Alaskan gas would resemble a capital intensive project whose cost would be largely fixed while Mexican gas would resemble a project with high variable costs whose annual level would

4/ The President's Decision emphasized the displacement of wholesale distillate fuel oil by Alaskan gas. This emphasis on wholesale transactions is continued in this analysis of the market position of Alaskan gas; thus, any differences in costs for distribution of gas or oil to end users are not treated here.

5/ This is the distillate fuel oil annuity-equivalent the price projection used to develop the gas value in the NNEB calculations.

depend upon the price of a reference petroleum product.[6/] Other important differences include any national security consequences of domestic versus imported gas supplies and the possible influence of Mexican gas purchase arrangements, especially the price terms, on other energy supplies, particularly Canadian gas and Mexican oil.

Alaskan Versus Mexican Gas

The relationship between the costs of Alaskan and Mexican gas is traced over time in Figure IV-2. Clearly, a comparison of first-year costs tells a misleading story. As Table IV-1 illustrates, over a 25-year period consumers would prefer the Alaskan gas to the Mexican gas even if the Mexican gas price were tied to the residual fuel oil price.[7/] Table IV-2 compares the total costs to consumers for streams of Mexican and Alaskan gas, both delivered at the flow rate projected for the ANGTS. The present value of the savings available to consumers from Alaskan gas is significant, $13.2 billion (mid-1979 dollars), under the assumption that Mexican gas prices would be referenced to distillate (under low oil price escalation).

Even under the high construction cost ANGTS case, consumers would prefer Alaskan gas to Mexican gas pegged to distillate prices. Finally, the high

6/ Mexico has proposed distillate fuel, landed in New York harbor, as the reference price for its gas delivered at the U.S. border. The U.S., howeverr, has countered that domestic transportation costs from the border to the burner tip, added on top of a distillate-equivalent price, would render Mexican gas economically unattractive because it will be forced to compete with residual fuel oil in the U.S. industrial boiler market.

7/ This comparison is made at the citygate where the ANGTS would deliver Alaskan gas, and assumes that Alaskan gas is delivered at base case estimated costs.

cost ANGTS case, as shown in Table IV-2, still compares favorably to Mexican gas tied to residual fuel oil, even under low world price escalation.

Thus, the Alaskan gas supply option appears likely to provide gas customers with an economically superior alternative to Mexican gas.[8/] At least one important potential benefit from Mexican gas sales, however, is omitted in the above analysis, the effect of an agreement to purchase Mexican gas (or the lack of such an agreement) on the availability of Mexican oil. Yet, as the lifecycle cost comparisons of Table IV-2 indicate, under the base case assumptions consumers would have to save more than $13.2 billion on oil purchases to be compensated for the cost penalty they would incur through enforced purchases of Mexican rather than Alaskan gas. Mexico probably would offer its oil to U.S. purchasers at prices close to world prices. Consequently, direct economic efficiency benefits in the U.S. energy sector from Mexican oil deals alone may not attain such magnitudes and U.S. policymakers would need to look to other sectors or other effects, such as national security, to prefer Mexican gas over Alaskan gas.

Importantly, the purchase of Mexican gas supplies could also trigger cost increases for U.S. imports of Canadian gas. The cost of Canadian gas imports averaged approximately $2.16 per Mcf in 1978 (approximately $2.09 per million

8/ It is worth noting at this point that the recent Congressional Research Service (CRS) analysis of Mexican gas and oil, referenced earlier, came to the opposite conclusion about Alaskan gas because the CRS compared the two sources only on the basis of 1985 costs. In 1985, Alaskan costs would exceed Mexican because almost all of the ANGTS rate base is included while neither the real cost escalation in later years for Mexican gas nor the transportation costs to move Mexican gas to users were incorporated in the comparison.

Btu).[9] At the current level of gas imports, one trillion cubic feet annually, a Canadian demand for price parity at the border with Mexican gas would increase the cost of their gas by over one billion dollars (mid-1979) annually, or approximately $12 billion on a present value basis for a 25-year supply.[10]

But as suggested earlier, direct consumer or national economic efficiency benefits of larger energy purchases from Mexico may not be the consequences of most importance to U.S. policy. Instead, enhanced security of supplies, provided by a geographically closer and robust economic partner, and greater diversification away from Arab oil supplies may be the most important national benefits. But a preference for Mexican rather than Alaskan gas would require a judgement that consumer plus other national benefits from access to Mexican oil and gas exceed the $24.2 billion of NNEB lost when choosing Mexican gas over Alaskan.[11]

Rephrasing the Question

This analysis demonstrates that, under the narrow criterion of national economic efficiency in the U.S. energy sector, Alaskan gas would provide greater benefits than Mexican gas. As noted, our analysis does not grapple with the potentially more important issue of the benefits of any Mexican

9/ DOE/EIA-0147/8, Table 4, actually lists "Canadian and foreign" supplies.

10/ "Canada gas-export issue grows hotter," Oil and Gas Journal, October 9, 1978, p. 48.

11/ This figure is estimated by using the Mexican gas prices and the Alaska gas value in the NNEB calculation.

gas/oil linkage and its implications for U.S. oil imports strategy or even broader U.S. interests regarding trade and other matters of importance.

In this broader context, the question remains open whether the United States might benefit most from proceeding with both Alaskan and Mexican gas supply projects. Our logic in the Mexican versus Alaskan gas comparison does not illuminate the choice between Mexican gas and oil versus OPEC oil. The results only indicate that the Alaskan gas pipeline project should proceed. But policymakers could also judge the national interest to be well served by purchasing Mexican gas, for example, in order to reduce dependence on Middle East oil. This reduction could occur in two ways: (i) Mexican gas could substitute for oil consumption, and (ii) Mexican oil could replace OPEC oil. In this context, phrasing the question as a choice of either Mexican gas or Alaskan gas might frustrate policymaking. Rephrased, the more germane question concerns the attractiveness of Mexican energy on its own merits across the entire spectrum of the U.S. energy market and of our international affairs.

ALASKAN GAS AND ALTERNATIVE ENERGY SOURCES

In addition to understanding how Alaskan gas compares with distillate fuel oil and Mexican gas, it is also important to explore the implications of its substitution for other energy forms. Our earlie NNEB calculations set the value of Alaskan gas at the cost of distillate. Implicit in this valuation is the assumption that this gas would displace an energy-equivalent amount of distillate fuel. But Alaskan gas could substitute for other energy forms as well, which could lead to a substantially different estimate of the NNEB.

The assumption that Alaskan gas substitutes for distillate fuel sold at wholesale prices implies that large industrial operations are the marginal user of additional gas supplies. The choice of this assumption was based on a desire to maintain consistency with this one key assumption in the analyses associated with the President's Decision. Importantly, it is not a forecast that Alaskan gas, in fact, will be consumed by industry or, if consumed there, will displace distillate rather than residual fuel. If gas supplies were to tighten, Alaskan gas might displace other energy use. If the substitution occurred in the residential sector, the alternative fuel could be electricity, which is more costly than distillate fuel oil for certain residential uses not requiring electricity's special properties. To the extent Alaskan gas replaced such higher cost energy supplies, the NNEB would increase, and all of the additional benefits would be captured by consumers.

If, in contrast, gas supplies were quite plentiful and inexpensive during the 25-year life of the ANGTS, Alaskan gas might displace industrial boiler fuels costing less than distillate, such as residual fuel oil. If the value of Alaskan gas deliveries were equated with projected prices of residual (under a low escalation scenario), the NNEB estimate would shrink by $3.1 billion from the base case to a $11.8 billion level.

MARKET PROSPECTS FOR ALASKAN GAS

Table IV-3 (Column A) indicates that the nation would receive substantial benefits from the development of the Alaskan gas pipeline project even if the gas were valued at the cost of residual fuel oil and if construction of the ANGTS were to experience high cost overruns. Nevertheless, the project might

TABLE IV-3

BENEFITS OF ALASKAN GAS RELATIVE TO SELECTED
ALTERNATIVE FUEL OPTIONS
(mid-1979 dollars)

Energy Source Assumed Replaced[a/]	(A) NNEB	(B) Consumer Lifecycle Cash Savings
Base Case Cost:		
Distillate Fuel Oil	$14.9 billion	$3.9 billion
Residual Fuel Oil	11.8	0.8
High Cost:		
Distillate Fuel Oil	10.4	0.5
Residual Fuel Oil	7.3	2.6

a/ All fuel prices are assumed to follow low price trajectories as defined in Table II-1.

not attract potential gas customers who can obtain and use residual fuel oil. The reasons for this apparent contradiction include:

- the accrual, under base case assumptions, of most of the project's benefits to parties other than consumers, and
- the market disadvantage faced by Alaskan gas in the early years of the project stemming from traditional gas ratemaking methods.

Table IV-3 (Column B) illustrates the relative market attractiveness of Alaskan gas on the basis of lifecycle costs. Based on this comparison, energy consumers would be better off over the next 25 years with Alaskan gas than with either distillate or residual oil under the base case cost assumptions. Under the high cost ANGTS case, however, consumers would prefer Alaskan gas compared only with either distillate fuel oil (low price escalation) or more costly alternatives.

THE ANGTS DELAY OPTION

Suppose that the marketability of Alaskan gas hinged on the need to make its first-year delivered costs less than or equal to the price of distillate fuel oil. This supposition, coupled with the upside-down cost patterns caused by traditional ratemaking, would mean that Alaskan gas would not be marketable until distillate fuel oil prices reached $4.18 per million Btu (1979 dollars), which would not occur until 2002 under the base case assumptions or until 1991 under the medium oil price escalation assumption. The policy option implicit in this supposition--deferring the ANGTS well into the future--would cause significant economic loss from the national perspective.

AGO 885953

When considering project delays of several years, the uncertainties associated with estimating project costs and gas value are compounded significantly compared to the estimating problems already present for the base case. Nevertheless, despite the fact that no precise estimate of how a long delay might affect the NNEB is possible, an approximation can be made. For the low price escalation scenario described in Table II-1, applying the 6 percent discount rate would yield the following NNEB decreases through delay:

Years Delay	NNEB Loss
5	$1.5 (mid-1979 dollars)
10	$2.6
15	$4.1

Although these estimates are rough, they suggest that delay of the project in order to improve the prospects for initial marketability could generate some loss in national benefits.

Analyzing the NNEB to the nation as a whole has thus far helped to make this analysis more managable. In the next section, the question of how the NNEB would be distributed among sectors of the economy is explored.

V. THE DISTRIBUTION OF ALASKAN GAS COSTS AND BENEFITS

The assertions that the Alaskan gas pipeline project offers significant economic advantages and that the project can only proceed if offered special regulatory treatment appear to contradict each other. This apparent contradiction, however, stems from the nature of the uncertainties associated with this project and from the allocation of the accompanying opportunities and risks, as well as other project costs and benefits, among the project's participants.

In preceding sections, this analysis has dealt with project costs and benefits on an aggregate level, finding that the nation or consumers as a whole could receive substantial benefits from this project if current estimates are correct. But these costs and benefits will not accrue to all members of the economy in equal proportions. Consequently, it is important to identify more specifically who pays the project costs and who receives the project benefits.

This section begins by discussing how the base case NNEB would be distributed among the major participants of the project. Next, it considers the distribution of the NNEB under other conditions. Then, the opportunities and risks associated with the proposed pipeline are addressed. The section concludes with an examination of how the FERC regulations applied to the project could modify and allocate these opportunities and risks.

DISTRIBUTION OF NNEB

The net national economic benefits from the ANGTS project would be shared among gas consumers, Prudhoe Bay gas producers, the Alaskan government, the federal government, and pipeline owners. The net benefits captured by each of the participants would consist of the following:

Consumers: Consumer benefits consist of any savings from purchasing Alaskan gas instead of an alternative fuel.

Gas producers (domestic): Producer benefits accrue from the price received for the gas produced minus incremental production and gathering costs, incremental gas conditioning costs, royalty payments, and taxes (severance and income), further reduced by the benefits flowing to foreign interests.

Alaskan state government: Certain tax payments to Alaska are assumed to be surrogate measures of the real resource costs incurred to support the ANGTS. Revenues in excess of those required to cover such costs represent net benefits captured by Alaska. These include royalty payments plus severance and income taxes on producer revenues in excess of the incremental costs noted directly above.

Federal government: Taxes on a normal level of producer profits are also considered a surrogate for the real resource costs incurred across the overall U.S. economy to support the ANGTS. Federal income taxes levied on above-normal producer profits represent the share of the project's net benefits captured by the federal government and, in turn, the general taxpayer.

Pipeline Owners: Because the ANGTS would be regulated as a utility, its cost of service revenues would be "normal," by definition. The pipeline owners, however, are affected by an investment tax credit on the ANGTS segments constructed in the United States. This credit can be interpreted as capturing a share of the NNEB for pipeline owners because Internal Revenue Service and FERC rulings do not allow these credits to be flowed-through to consumers as they are received.[1/]

1/ Appendix F describes the methodology for calculating the NNEB shares in greater detail than provided by these five brief summaries of the benefits accruing to each of the major ANGTS participants.

Expected Benefits

Under the base case assumptions used throughout this analysis, the NNEB is expected to be $14.9 billion (mid-1979 dollars). This net benefit would be shared as follows:

Consumers	$ 2.7 billion (mid-1979)
Domestic Producers	3.7
Alaska	4.7
Federal	3.5
Pipeline Owners	0.2
Total NNEB	$14.9 billion

At the maximum wellhead price for Prudhoe Bay unit gas set by the NGPA, gas producer revenues would exceed their expected incremental production costs. In turn, this would allow gas producers and the Alaska and federal governments collectively to capture 80 percent of the base case NNEB. Among the major beneficiaries, the Alaska government would receive the largest share (32 percent of the NNEB). Gas producers would receive the next largest share (25 percent), followed by the federal government (23 percent). Under the base case, gas consumers would obtain a relatively moderate share of the NNEB (18 percent), and pipeline owners would receive a minor portion (2 percent).

Our base case assumes a 6 percent discount rate. Under a 10 percent rate, all participants' benefits decrease; nevertheless, the share of the project benefits captured by producers and the Alaska and federal government increases to 90 percent, because it is the consumer fuel savings which would be most drawn out over the 25-year life of the project.

ICF INCORPORATED
AGU 885957

Consumers	$0.6 billion (mid-1979)
Domestic Producer	2.2
Alaska	2.9
Federal	2.2
Pipeline Owners	0.3
Total NNEB	$8.1 billion

Other Projections

The participants' shares of net benefits also vary with changes in project costs, gas value, gas flow, or the locus of gas conditioning charges (see Table V-1 and Figure V-1). The producer benefits and, in turn, the Alaska and federal government benefits depend only upon the incremental production costs and the wellhead price of the gas. Consequently, consumers would absorb virtually all of the increased or decreased NNEB caused by variations in the gas value or in the ANGTS construction or other costs. Specifically, consumers benefits rise to $10.1 billion for the case incorporating medium oil price escalation and fall to a negative amount, $-1.9 billion, for the high cost ANGTS case. As might be expected, the benefits for all participants would grow if gas production increased to a level sufficient to flow 3.2 Bcf of Alaskan gas through the ANGTS each day.

Direct Redistribution

Regulation can directly affect the share of the NNEB received by gas producers and the Alaska and federal governments. The proposed FERC rule to include gas conditioning costs in the maximum lawful gas price is an example of such a regulatory action. Instead, if gas conditioning costs were added to the maximum wellhead price, consumer benefits would fall by almost $4.4 billion, under the base case assumptions, to a negative amount (-$1.7 billion).

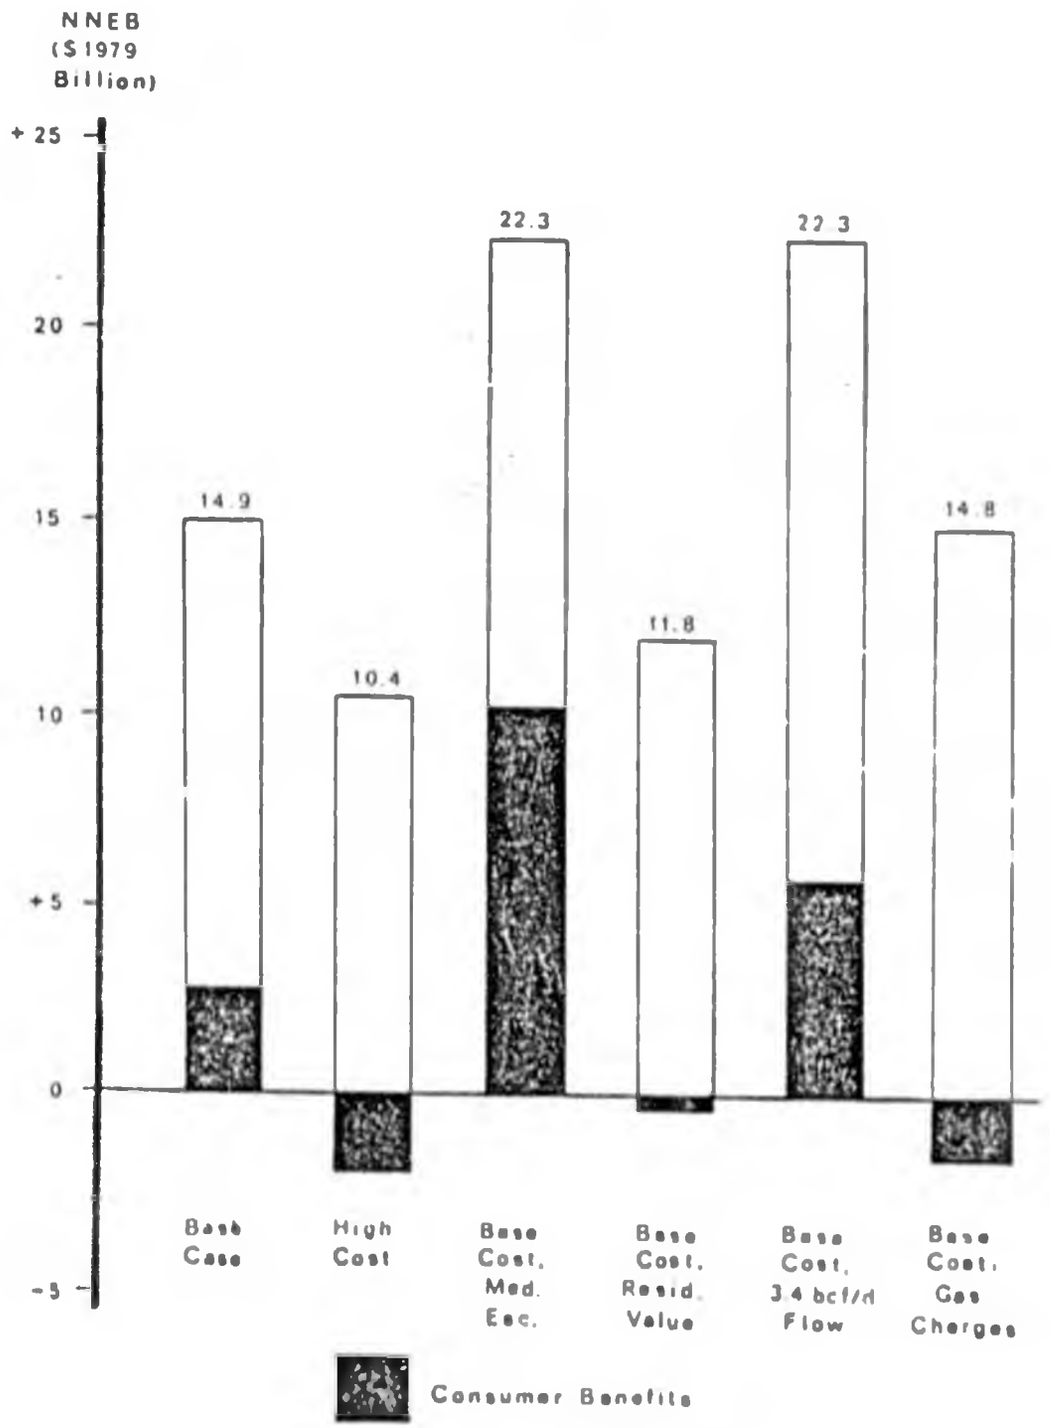
TABLE V-1

DISTRIBUTION OF NNEB FOR SELECTED SCENARIOS
(mid-1979 dollars)

Scenario	Net Benefits: Domestic Producer	Alaska	Federal Gov't.	Consumer	Pipeline Owners	Total NNEB
6 Percent Discount Rate						
Base Case	3.7	4.7	3.5	2.7	0.2	14.9
High Cost	3.7	4.7	3.5	-1.9	0.4	10.4
Base Costs, Medium Oil Price Escalation	3.7	4.7	3.5	10.1	0.2	22.3
Base Costs, Residual Oil Value, Low Escalation	3.7	4.7	3.5	-0.4	0.2	11.8
Base Costs, 3.2 Bcf/d Flow	5.2	6.4	5.1	5.4	0.2	22.3
Base Case With Gas Conditioning Charges	5.6	5.2	5.4	-1.7	0.4	14.8
10 Percent Discount Rate						
Base Case	2.2	2.9	2.2	0.6	0.3	8.1
High Cost	2.2	2.9	2.2	-2.5	0.4	5.2
Base Costs, Medium Oil Price Escalation	2.2	2.9	2.2	4.6	0.3	12.2
Base Costs, Residual Oil Value, Low Escalation	2.2	2.9	2.2	-1.3	0.3	6.3
Base Costs, 3.2 Bcf/d Flow	3.1	3.9	3.1	2.0	0.3	12.5
Base Case With Gas Conditioning Charges	3.4	3.1	3.3	-2.2	0.4	8.0

FIGURE V-1

ILLUSTRATION OF CONSUMER NNEB SHARES
(6% Discount Rate)



The countervailing increased share of the NNEB would be captured by the gas producers and the Alaska and federal governments. And because British Petroleum receives a share of the producer surplus through their ownership interest in SOHIO, the total NNEB actually would shrink somewhat.

Other actions which could alter the distribution of the base case NNEB include sharing gas conditioning costs between producers and consumers or lowering the maximum price of Prudhoe Bay gas.[2/] For example, if the lawful price were lowered to the level required to provide the gas producers with a typical industry rate of return on their incremental gas production investment, then the producers and governments' shares of the net benefits would fall to zero. Consumer benefits would grow by a corresponding amount, or $11.9 billion in the base case.

Distribution Among Consumer Classes

This analysis treats "consumers" as one aggregate group; however, not all gas consumers would receive identical shares of the "consumer benefit" discussed earlier. Presently, gas curtailment practices can be interpreted to infer that so-called "firm" gas customers, which already are hooked up to currently flowing gas, have first claim on future gas supplies. Since the costs of new gas supplies are expected to be well above the average cost of old gas now flowing in interstate markets, the purchased gas cost component of today's customers' retail gas prices would be lowest if no new customers what-

2/ Analysis of the legal basis for any of these potential actions is beyond the scope of this analysis.

soever, even high priority ones, were permitted to hook up and if new gas supplies were added only in sufficient amounts to meet existing firm customers' needs.

Wholesale and retail gas prices typically are set by, first, averaging the costs of cheap old gas and expensive new gas on a rolled-in basis and, then, adding an amount to recover fixed and other variable transmission and distribution costs. Consequently, today's gas users of all curtailment priority categories would be worse off if new supplies, added in order to serve new gas customers, increased average unit gas costs by more than larger sales volumes decreased average unit fixed and other costs associated with gas transmission and distribution. This effect, a cross-subsidy of sorts, can occur among members of the same curtailment priority categories (e.g., existing high priority customers and new high priority hookups) or between customer classes with different curtailment priorities. Finally, these cross-subsidies can disadvantage existing customers at the same time that expanding gas supplies and adding new customers, even those of the lowest curtailment priority, can benefit the nation as a whole.

The NGPA permits most of the costs of gas delivered by the ANGTS to be rolled-in. If at any point during its project life delivered Alaskan gas costs were lower or higher than the average costs of all other flowing gas, cross-subsidies of some kind probably would be generated. A meaningful analysis of these effects would require a full general-equilibrium analysis of the entire U.S. energy market, a task well-beyond the scope of this analysis.

Nevertheless, rolled-in pricing and historical embedded cost ratemaking for the ANGTS can generate cross-subsidies within the "consumer" group, and

the magnitude of any subsidies and the directions in which they cross between individual consumers can vary over the project's life. Although we did not estimate the magnitude or location of these effects, policymakers may wish to be aware of this potential when formulating an ANGTS regulatory policy.

DISTRIBUTION OF ANGTS OPPORTUNITIES AND RISKS

Previous sections of this analysis have identified numerous uncertainties associated with the ANGTS and with our estimates of the project's expected net national benefits, consumer costs, and shares of the benefits received by various project participants. Each uncertainty embodies an opportunity for better than expected consequences under certain outcomes and a risk of worse than expected results under others.[3/]

The legislative and legal framework surrounding the ANGTS project, as well as proposed and future federal regulatory actions, will determine the overall size of these "upside" opportunities and "downside" risks and their distribution among Prudhoe Bay gas producers, the Alaska and federal governments, and the project sponsors and their lenders. At this juncture, however, all of the regulatory actions affecting the size and distribution of the opportunities and risks are not fully defined and in place. Since the character of the actions are a major focus of current FERC work, they are discussed briefly here in order to connect them to the main thrust of our analysis (estimating the pipeline cost of service and the level and distribution of the NNEB).

3/ For purposes of this discussion, uncertainty refers to the probability of an outcome or event. We label the consequences associated with any one outcome an opportunity if they would increase the welfare of the nation as a whole or of a particular participant compared to the base case; conversely, we label adverse consequences as risks.

The legal and institutional arrangements surrounding the ANGTS appear to be taking a shape somewhat distinct from typical gas pipeline practices, perhaps a necessity for a project of the sheer size of the ANGTS and accompanied by its unique market, technological and regulatory uncertainties.[4/] In order to provide context for this discussion, we assume the following arrangements:

- At the wellhead, gas producers would receive the NGPA maximum lawful price but must absorb the full costs of gas conditioning;
- The project sponsors would confine their role to strictly providing transportation service. Lower-48 gas transmission companies and/or gas distribution utilities would purchase the Alaskan gas directly from Prudhoe Bay producers under long-term contracts with take-or-pay provisions.
- And where other gas distribution utilities would purchase Alaskan gas at the citygate, the purchase price plus ANGTS cost of service would be "rolled-in" with the transmission company's other sources of gas. These gas utilities also would purchase this gas on a take or pay basis. Direct-purchase utilities, as well as those purchasing at the citygate, would roll-in all of their purchased gas costs for sale at retail.

Although details of this description may not be fully correct, we believe for purposes of this analysis that it presents a sufficiently accurate picture of the kinds of arrangements ultimately likely to exist. If so, these kinds of conditions have important implications for the distribution of the ANGTS opportunities and risks.

4/ For an excellent discussion of this aspect of the ANGTS, see Arlon R. Tussing and Connie C. Barlow, Financing the Alaska Highway Gas Pipeline: What Is To Be Done? prepared for the Alaska Legislative Affairs Agency, Juneau, Alaska, April 1979.

In this context, the balance of this discussion evaluates the distribu of the ANGTS opportunities and risks under three kinds of outcomes: i) bet or worse cost experience at the gas production level of the overall project ii) better or worse experience in the portions of the project which may control the marketability of Alaskan gas and, iii) once constructed, catastroph failure to make the project operational, a possibility which may determine th financiability of the ANGTS. Across all three kinds of outcomes, however, it is important to note that the ability to market ANGTS gas and to finance the project are closely related.

CHANGED GAS PRODUCTION EXPERIENCE

Compared to the base case, gas production experience upstream from the ANGTS could prove in actual practice to be better or worse than expected, for three reasons. The incremental costs of the gas conditioning facility could underrun or overrun our base case estimate. Similarly, in order to maintain the level of crude oil recovery while selling gas from the Sadlerochit pool of the Prudhoe Bay field, more or less costly water-flooding might be required. Finally, even with substantial water-flooding, a large loss of crude oil recovery might occur.[5/]

The base case, as noted above, assumes that producers would condition the gas and would be paid the maximum wellhead price specified by the NGPA. Under these circumstances, more favorable production experience would increase the ANGTS project's NNEB over base case levels. The increase would be shared

5/ Although not considered in this analysis, one recent estimate is alledged to envisioned a catastrophic loss of 1.5 to 2.0 billion barrels of ultimate crude oil recovery.

among gas producers and the Alaska and federal government in their relative proportions shown under the base case. All other participants would be unaffected.

Conversely, a worse production experience would have the opposite effect. Up to the point where gas producers' "normal" profits begin to erode, the full effect would fall on these same three project participants. Beyond that point, these three participants could incur real resource costs greater than their revenues. And if incremental production costs ever exceeded incremental revenues, production would cease unless the wellhead price were altered, an action which would need to be evaluate in light of the overall project's economic merits at that point.

At the production level, then, the assumed institutional arrangements may allocate a large share of the NNEB to producers and governments. But their upside opportunities would depend upon their skill and luck in building the gas conditioning facilities and in developing the Prudhoe Bay gas field. Unless the experience worsened by an extreme amount, other participants would not feel an effect or face a decision problem.

The third outcome, an irreversible and substantial loss of crude oil recovery through Sadlerochit gas sales, is especially difficult to evaluate without a detailed reservoir simulation of production alternatives from the reservoir and a full, general-equilibrium analysis of the overall U.S. energy market. Importantly, however, trading the increased NNEB made available from the use of Prudhoe Bay gas from the ANGTS project for an equal or lesser decrease in NNEB from reduced Prudhoe oil recovery would not necessarily be imprudent. Undoubtedly, however, the distribution of national welfare would

be altered by trading increased gas production for decreased oil production, quite possibly to the disadvantage of the oil/gas producers and the Alaska and federal government.[6/]

CHANGED MARKET PROSPECTS

Once the project is certified and the pipeline is built and put into service, federal regulation will work to compel the ANGTS gas to enter the U.S. energy market, in the physical sense of molecules of Alaskan gas finding their way to the burner tip. But in an economic sense, changes from the base case could alter the market prospects of the project.[7/]

Four kinds of events could alter the base case market attractivenss of Alaskan gas. Two of these could be caused by changing either the value of the gas or its delivered cost. Because of changed fuel availabilities, Alaskan gas might displace a fuel other than distillate oil; conversely, changed world oil prices might alter the value of Alaskan gas as a substitute for distillate. Alternatively, the gas value could remain unchanged but its delivered costs could be higher or lower due to the ANGTS construction cost experience or Canadian actions, as discussed earlier in Section IV.

The other two causes of altered market prospects for Alaskan gas are more analytically complicated. On the optimistic side, extra gas reserves, on the North Slope or along the length of line, could facilitate a higher rate of gas flow through the system. And on the more pessimistic side, a cheaper source

6/ This analysis also was beyond the scope of this work.

7/ In the base case, it bears repeating that the opposite paradox may exist; that is, the project may make economic sense but encounter difficulties in the marketplace caused by traditional tariff practices.

of gas (measured in real resource cost terms) might become available after a firm and irreversible commitment was made to the ANGTS project. If this more economical source could not find a place in the market in the face of enforced marketability of ANGTS gas, Alaskan gas would, in effect, displace a cheaper source of gas rather than distillate fuel or another more expensive energy form.

All four kinds of these events would increase or decrease the ANGTS project's net economic benefits to the nation as a whole. As noted by our earlier sensitivity analysis, however, the effects would need to be of enormous proportions, relative to the base case assumptions, in order to negate all of the NNEB (see Section II).

With relatively minor exceptions, consumers would receive the full measure of this increased or decreased NNEB. Enforced marketability—applied through institutional arrangements, such as permitting ANGTS project sponsors to act strictly as providers of a transportation service; legal arrangements such as gas purchase contracts of a take-or-pay variety; and regulatory practices, such as rolled-in pricing—would shift almost all of the upside opportunities and downside risks associated with these four kinds of events to gas consumers.

Incentive Rate of Return

One exception to this pattern of opportunities and risks centers on the incentive rate of return (IROR) mechanism planned to be imposed on the project sponsors. The IROR would shift some of the opportunity and risk associated with construction cost uncertainties to the sponsors. By this reallocation, it is hoped that the IROR would reduce the probability of large construction cost overruns. As currently envisioned, the IROR would lower the overall rate

of return on the ANGTS consortium's equity investment if certain project c were to grow more than 30 percent over base estimates and would raise the r of return if actual costs prove to be less than estimated.

The effectiveness of an IROR scheme in discouraging cost overruns is not well understood. Reviews of similar incentive contracting by the Air Force have been inconclusive.[8/] Moreover, some believe that the TAPS project had greater incentives to avoid cost overruns because the revenues received by th oil companies were reduced dollar-for-dollar by "any and all cost overruns." Yet Mead estimates that Alyeska's costs increased by 23 percent annually after adjusting for inflation and changes in scope.[9/]

For the high construction cost case the imposition of the IROR penalty would only lower the annuity-equivalent cost of service by 8 percent relative to the cost of service for the same construction cost scenario without the IROR penalty.[10/] Thus, although the IROR mechanism would shift risks in a direction that should make those responsible for ANGTS more concerned about cost control, the incentives appear less strong than those asserted to have existed for the TAPS project.

8/ For instance see Robert Perry, et. al., System Acquisition Strategies, The Rand Corporation, R-733-PR/ARPA, June 1971; Frederic Scherer, The Weapons Acquisition Process: Economic Incentives, Harvard, 1964; and Robert Summers, Cost Estimates as Predictors of Actual Weapon Costs, The Rand Corporation, RM-3061-PR, March 1965.

9/ Mead, Transporting Natural Gas from the Arctic, pp. 88-89.

10/ This may overstate the effect of the IROR penalty because the existence of the "greater risk" from the IROR plan caused a higher base rate of return.

Increased Gas Flow

A second exception to exclusive consumer susceptibility to changed market prospects centers on the effect of an increased flow rate. In addition to the extra NNEB shown for this situation [11/] producers of the extra gas required to support a higher flow rate also might obtain some further national economic benefits. The size of the total NNEB effect, however, would depend on well-head pricing, the real resource costs of the extra production, and the national domocile of the firm owning the gas reserves.

Displacement of Cheaper Gas

The fourth situation, under which Alaskan gas would drive out a cheaper gas source, is included here simply to round out our presentation. At this juncture, we are not aware of any gas source which might be driven out by Alaskan gas and which might cost less to the U.S. in real resource terms. Clearly, this hypothetical event would reduce the NNEB. But until a specific alternative source could be identified and its real resource costs and delivered costs evaluated, the likelihood of this phenomenon and its effects on the magnitude and incidence of the NNEB are unclear.

Rolled-In Pricing

A final point concerning the distribution of risks and opportunities related to marketability of Alaskan gas concerns "rolled-in" pricing. The NGPA included an incremental pricing provision for high cost gas. This mechanism allocates a share of transmission companies' gas acquisition costs (generally those in excess of the pre-1977 ceiling price for new interstate

11/ Refer to the base costs, 3.2 Bcf/d flow scenarios of Table V-1.

natural gas) to a segregated account for passthrough to low priority users. This passthrough continues until their retail gas prices reach the level of a substitute fuel (distillate or, subject to certain findings, residual fuel oil).[12/] And over time as, first, all low-priority customers reach the substitute fuel price level and, then, all customers' gas prices reach that level, a situation akin to the longstanding tradition of rolled-in gas pricing once again will prevail in lower-48 retail gas markets.

In Section 208, however, the NGPA treats the Alaskan gas pipeline project in a manner consistent with traditional gas pricing. From the outset of its operations in 1984, the project's transportation costs and most of its gas acquisition costs would be rolled-in.

Rolled-in pricing of Alaskan may, in part, be necessary in order to ensure the marketability of Alaskan gas in the face of traditional methods of setting gas pipeline tariffs. Earlier, Figure IV-1 illustrated that delivered costs of Alaskan gas would initially be much higher than the "levelized" annuity-equivalent of these costs as well as the price of distillate fuel. Unless government or another institution intervenes as a financial intermediary to transform the upside-down tariffs into, say, a levelized cost, another mechanism must lower the apparent delivered costs of gas Alaskan gas during its early years. Rolled-in pricing is one such mechanism; consequently, it can help ameliorate any marketability problems caused by applying traditional pipeline ratemaking to gas delivered from Alaska.

12/ NGPA, Title II.

Importantly, the success of rolled-in pricing for this purpose depends upon the availability of cheaper old gas; unfortunately, the availability of cheaper gas is not fully guaranteed. Moreover, if cheaper gas were available, the extent to which the market problems of Alaskan gas are redressed by rolled-in pricing may not be as large as might at first appear.

Table V-3 presents illustrative U.S. average gas prices, with and without Alaskan gas, for 1985, 1990, and 1995. For the highest cost year (1985), the rolled-in cost of Alaskan gas would be $1.22 per million Btu lower than the cost associated with a separate rate schedule and traditional pipeline tariffs. This 1985 rolled-in cost, however, would be only $0.39 per million Btu below the "levelized" cost of Alaskan gas. By 1990, the Alaskan supplies would approximate average costs without Alaskan supplies, and the average price would exceed the levelized cost of Alaskan gas. Finally, on an annuity-equivalent basis, the delivery of Alaskan gas might decrease overall costs of gas for the 1984 to 2008 period.

To sum up, primarily gas consumers would be exposed to the upside opportunities and downside risks associated with the market attractiveness of Alaskan gas. But compared to gas producers who face the prospect of changed gas production experience, (along with the Alaska and federal governments) consumers' final outcome will be controlled to a much greater extent by remote events (world oil prices) and other project participants' skill and luck (the constructors of the ANGTS). Also, our sensitivity analysis indicates that the range of consequences, measured up and down with respect to their estimated share of the base case NNEB, is much wider for consumers, in both dollar and

TABLE V-2

b/ Assumes that Alaskan gas provides 5 percent of the gas supplies at the illustrative citygate.

c/ 25-year annuity-equivalent price, calculated using a 6 percent discount rate.

percentage terms, than for other participants (see Figure V-1). Unfortunately, the basis for assigning sensible probabilities to the variables which drive this range of outcomes, especially world oil prices and ANGTS construction costs, is weak.

CATASTROPHIC FAILURE TO OPERATE

Catastrophic failure alludes to the intervention of some event which interferes with operation of the ANGTS after some or all of its construction costs have been incurred. This interference could permanently prevent operation or, alternatively, could delay operation for a period of sufficient length to financially bankrupt the project sponsors in the face of large annual debt service requirements associated with the project's debt-laden capital structure.

If neither an "all events" tariff nor a loan guarantee is provided to the project, catastrophic failure to operate would create an opportunity loss to certain project participants and an actual net loss of NNEB for the nation as well as for certain other participants. Compared to the base case, consumers would face an opportunity loss whose magnitude would be bounded by the gas value, less the estimated delivered costs of gas. But to the extent that Prudhoe Bay gas later would become available for their use, this opportunity loss would be reduced. Similarly, gas producers and the Alaska and federal government would face some loss in an opportunity sense.

The tangible NNEB loss, however, would consist mainly of the real resources expended to build an inoperable pipeline. And this loss would fall on the project's investors. First, the ANGTS project's equity investors would lose an amount limited either by their legal liability or by their capacity to

pay. Then, its lenders would absorb the balance of the loss. Because the magnitude of the project is large compared to the equity-base of its sponsors and because 75 percent of the financing is expected to be in the form of debt, it is likely the bulk of the loss associated with a catastrophic failure to operate ultimately would impinge on the project's lenders.

IMPLICATIONS FOR FINANCING THE ANGTS

Financing problems alledged to be faced by the ANGTS may be rooted, in the most fundamental sense, in a lack of symmetry in opportunities and risks faced by project investors. This lack, in turn, stems from the size of the project; its technical, marketing, and regulatory uncertainties; and the high degree of leverage (or high fraction of debt financing) typically expected in a public utility venture. Compare the circumstances of the pipeline investors and the other participants:

- For any of the outcomes short of the catastrophic failure to operate, utility regulation would fix the rewards of the project sponsors and lenders to a "normal" return, adjusted only by the IROR mechanism instituted to stimulate construction cost control. Compared to the target (or center) rate of return, the full range of cost outcomes can swing the overall weighted average return to equity investors by approximately 2.5 percent upward (for filed costs) or 2.5 percent downward (for high costs) from the base case rate of 17.0 percent.[13/] Better or worse gas production experience or better or worse market attractiveness may improve the investors' confidence of receiving a "normal" return, but otherwise their "upside" opportunities and, importantly, their "downside" risks are constrained as long as the project is certified

13/ To a limited extent, the investment tax credit realized by the pipeline owners for actual capital expenditures could counteract the incentives sought through the IROR. We presume that FERC's IROR order will successfully negate any perverse incentives introduced by the ITC.

and it commences operation approximately on schedule. This, of course, is the tradition of public utility regulation in the U.S. And this tradition, in part, explains the large degree of financial leverage that regulated utilities typically achieve in their capital structures.

- Under a catastrophic failure to operate, however, investors may be faced with a real possibility of ruin. Consequently, the project holds out the prospect to investors of a catastrophic downside risk of unknown likelihood, a minor share of the NNEB in the best of circumstances (i.e., a tax credit benefit), and minor upside potential associated with the IROR mechanism.

These observations, if accurate, may explain why investors, particularly lenders, might seek insurance against a catastrophic event in the form of an "all events" tariff or a loan guarantee.

VI. FINDINGS AND CONCLUSIONS

This analysis has found that the proposed Alaskan gas pipeline project is likely to provide significant economic benefits to the nation. The expected net national economic benefit to the United States is estimated at $14.9 billion (mid-1979 dollars). Of course, the actual benefit will remain uncertain until the assumptions underlying the NNEB estimate are proven by time. For example, the NNEB could decrease to about $11 billion if the worst case cost overruns were to occur or if Alaskan gas were required to compete in lower-48 fuel markets with residual rather than distillate fuel oil. Alternatively, the NNEB could grow to $22.3 billion if the distillate price were to escalate at a medium, rather than a low, rate. On balance, however, the NNEB should remain positive over a wide range of future events. And this robustness of the NNEB supports a conclusion that the proposed ANGTS project would be in the nation's economic interest.

But within the larger context of net benefit to the nation as a whole, a second important measure of the desirability of the Alaskan gas pipeline project concerns the cost of the gas to customers in the lower-48. The analysis has found that the traditional regulatory approach for establishing the cost of service for gas transportation (and other institutional factors associated with gas regulation) has important implications for the desirability of Alaskan gas to consumers and, in turn, for its marketability.

Because traditional ratemaking methods would create time patterns for the delivered cost of Alaskan gas which would be upside-down compared to those of competing fuels, this analysis adopted an annuity-equivalent measure of the cost to consumers. On an annuity-equivalent basis, energy consumers would have a clear preference for Alaskan gas compared to distillate fuel oil. Further, this preference would persist even if Alaskan gas were used in the lower-48 as a substitute for cheaper fuels such as residual fuel.

Early-on in the project's life, however, traditional cost of service ratemaking would confront customers with an actual gas cost well above its annuity-equivalent cost. Later on, this ratemaking approach would make the actual delivered cost well-below the annuity-equivalent. As a result, purchasers offered a separate rate schedule for Alaskan gas would find the gas unattractive compared to distillate fuel in the project's early years. But taking the case of an industrial user offered a long-term contract under a separate rate schedule, priorities assigned industrial gas users during previous curtailments make it unlikely that such a user would have faith, say, in a long term Alaskan gas purchase contract.

Thus, this analysis found that if Alaskan gas were sold on a separate schedule, it could encounter serious short run marketability problems. These problems would arise from the regulatory method used to price the gas rather than from its underlying economic merits. In turn, if marketability of Alaskan gas were uncertain, then the ANGTS project sponsors would probably not succeed in arranging financing for the project.

These short-run concerns about the marketability and financing of the ANGTS project stem from one aspect of traditional ratemaking. But consistent

with another feature of traditional gas ratemaking in the U.S., the NGPA exempts gas transported through the ANGTS from the transitional incremental pricing provisions also contained in the Act. These conditions would allow essentially all of the costs associated with acquiring and transporting Alaskan natural gas to be averaged with gas transmission companies' and gas distribution utilities' other supplies of lower cost gas, if available. This analysis found that, although this rolled-in pricing policy may appear to be a major subsidy to the ANGTS project, Alaskan gas actually could lower the annuity-equivalent average price of the total U.S. natural gas supply over the next 25 years. Thus, rolled-in pricing would ameliorate the market obstacles initially facing the sale of Alaskan gas without the risk of proping up a fundamentally, economically unsound source of gas supply.

This conclusion—that the Alaskan gas project should be in the interests of both the nation and the nation's gas consumers—is valid if the ANGTS were constructed at a cost in line with current estimates. Consumers, however, could lose $2.2 billion if construction problems lead to the high cost case for the pipeline construction. Gas producers, the Alaskan and federal governments, and the pipeline owners still would benefit by more than $10 billion.

In addition to consumer benefits, analysis of the distribution of the NNEB from this project shows that the Prudhoe Bay gas producers benefit substantially in all cases. Surprisingly, however, even producers are not the major beneficiaries. Instead, the Alaskan state government and the federal government together are expected to obtain extra tax revenues well in excess of the benefits captured by consumers and producers. In turn, these extra taxes

ICF INCORPORATED

AGO 885979

would benefit all taxpayers, in the state and across the United States, in the form of otherwise reduced taxes.

The marketability of Alaskan gas, even given the rolled-in pricing provision of the NGPA is not without its uncertainty. Currently, any risks and opportunities associated with the market prospects of Alaskan gas appear as though they will be borne mainly by consumers. Market prospects for the gas, and the risk and opportunity position of consumers, could be altered dramatically by actions which would allocate a larger share of the net national economic benefits to gas users. A FERC proposed rule, which would require producers to pay gas conditioning costs, is assumed in this analysis to be implemented. This rule would allocate to consumers what otherwise would be even larger producer, Alaskan and federal shares of the NNEB. In addition, it should better insure the marketability of Alaskan gas and, in turn, the ANGTS consortium's ability to arrange project financing.

Any remaining marketability and financing problems will arise because of other important project uncertainties; for example, the risk of an enormous cost overrun or a catastrophic failure, arising from some yet unknown source, ultimately to make the project fully operational. Private lenders, who are expected to provide 75 percent of the required funds, are appropriately conservative. As a requirement for providing the large amount of debt to a single project of the ANGTS magnitude (requiring more than $10 billion of debt if built at estimated costs), lenders claim to need ironclad guarantees of repayment of all loans and interest in "all events", including project abandonment.

The NNEB estimates indicate that FERC should encourage the project's implementation in the interest of national economic efficiency; however, the problems of devising an equitable way to promote implementation remain, especially in the area of project financing. For example, an "all events" tariff could provide repayment assurance to lenders. The tariff, however, would shift almost all of the risk associated with catastrophic cost or technical problems to consumers of Alaskan gas. Since these consumers—especially in contrast to the general taxpayers of Alaska and of the entire U.S.—are not expected to be the major beneficiaries of the project under base case conditions, it may be appropriate to consider whether they alone should assume the full burden of these risks, however slight their likelihood of occurence. Importantly, the same line of reasoning may apply equally to the project's investors.

With one exception, there appear to be few feasible and desirable alternatives to consumer assumption of opportunities and risks associated with delivered gas value or cost. The one exception is that some of the risks of cost overruns may be allocated to the project sponsors through an incentive rate of return mechanism. Although an incentive rate of return tariff is certainly preferable to the traditional full cost of service tariff, its potential efficacy is uncertain.

Thus, there are important benefits to be reaped from proceeding with the Alaskan gas pipeline system, but there are also significant regulatory problems to be resolved to develop an equitable allocation of project costs and benefits that maintains consumer and investor interest in implementation of the proposed system.

ORDER NO. 31

ORDER SETTING VALUES FOR INCENTIVE RATE OF RETURN, ESTABLISHING INFLATION ADJUSTMENT AND CHANGE IN SCOPE PROCEDURES, AND DETERMINING APPLICABLE TARIFF PROVISIONS

(Issued: June 8, 1979)

I. INTRODUCTION

By this Order, the Federal Energy Regulatory Commission (Commission) resolves three complex and interrelated issues concerning the segments 1/ of the Alaska Natural Gas Transportation System (ANGTS) located in the United States: (1) the structure of the initial tariffs to be applied to the transportation of Alaskan gas; (2) the Incentive Rate of Return (IROR) mechanism and the values to be applied to

---

1/ These segments are on the Alaskan segment and the Eastern leg (Northern Border). The only tariffs currently before the Commission for approval are those filed by Alaskan Northwest Natural Gas Transportation Company on behalf of the Alaskan segment, and by Northern Border Pipeline Company on behalf of the Northern Border segment.

the separate elements of that mechanism; and (3) the rate of return on equity to be applied once the system becomes operational.

A. Scope of Order

This Order is divided into six major sections. Section II is concerned with the Incentive Rate of Return, its rationale and mechanism. The four parts to this section explore and define the incentive concept (Part A), the six IROR parameters (Part B), and the implementation of the incentive mechanism (Part C). Sections III and IV deal with particular adjusting mechanisms which are required for the proper implementation of the Incentive Rate of Return. These are the Adjustments for Inflation (Section III) and Change in Scope mechanisms and procedures (Section IV). Section V provides a general overview of the result of the IROR mechanism. Taken together, these four sections supplement the basic framework for an incentive mechanism, specified in Commission Order No. 17, 2/ which is designed

2/ Federal Energy Regulatory Commission, Order No. 17, "Order Attaching Incentive Rate of Return Conditions to Certificates of Public Convenience and Necessity, Docket No. RM78-12 (Dec. 1, 1978) confirmed, Order No. 17-A (Jan. 12, 1979).

to reward project sponsors for good management and effective control of costs.

The project sponsors' proposed tariffs are addressed in Section VI. The focus of that section is to resolve important issues which affect the risk to be borne by project sponsors in the construction and initial operation of the ANGTS. The relationship between the tariff issues and the IROR mechanism is important.

The last section (Section VII) addresses two procedural issues. These concern the use of the rulemaking process, and the relationship of this rulemaking to other pending proceedings pertinent to certification of the ANGTS. 3/

The resolution of tariff, incentive rate, and rate of return on equity issues for the Alaskan Northwest and Northern Border segments of the ANGTS are embodied in the text of this Order, and implemented though the ordering paragraphs and the terms and conditions.

3/ These proceedings focus upon issues surrounding the building of natural gas facilities which, prior to transporting gas as a part of the ANGTS, will be used to transport Canadian gas. See Northwest Alaskan Pipeline Company, Docket Nos. CP78-123, et al., "Order Consolidating Proceedings, Establishing Procedures, Granting Interventions and Initiating Hearings." (April 20, 1979.)

The project sponsors have earnestly sought that this Order, especially as it relates to the tariff structure, provide assurance to prospective equity investors and lenders. The concern of the sponsors is wellfounded. The Commission fully recognizes that equity investors and lenders will make critical decisions respecting the financing of construction of the ANGTS in reliance on this Order.

The Commission has articulated in great detail its rationale for this Order. Where reasoned alternatives were available, we have provided a thorough analysis of the issues and the basis for our conclusions. This thoroughness provides the investors' best security in relying on this Order.

B. Background

The Prudhoe Bay Field, on the north slope of Alaska, contains the largest single gas reservoir ever discovered on the North American continent. Virtually every estimate exceeds 26 trillion cubic feet of proven, recoverable natural gas reserves. This large deposit of natural gas could supply more than two billion cubic feet of natural gas per day (approximately five percent of the nation's current gas requirements) over a 25-year period.

In recognition of the potential importance of this domestic energy source, Congress passed the Alaska Natural Gas Transportation Act (ANGTA), Pub. L. No. 94-586, 90 Stat. 2903 (1976) (15 U.S.C. §§ 719-719m), which authorized the President to recommend a natural gas system to transport Alaskan natural gas to the contiguous lower-48 States. In September of 1977, the President rendered a decision that the Alcan Pipeline Company, because its proposal was environmentally and economically superior to competing proposals, should be granted the certificate to construct the ANGTS. 4/ Congress, by joint resolution, approved and adopted the President's selection in November of that year, H.J. Res. 621, Pub. L. No. 95-158, 91 Stat. 1268 (1977).

The ANGTS will be 4,800 miles in length, orginating on the north slope of Alaska and passing through Canada to the

---

4/ Executive Office of the President, Energy Policy and Planning, Decision and Report to Congress on the Alaska Natural Gas Transportation System (September 1977) [hereinafter cited as Decision]. The present sponsors for the Alaskan segment are the successors to the Alcan Pipeline Company; see, Northwest Alaskan Pipeline Company, Docket Nos. CP78-123, et al., "Order Transferring Conditional Certificate of Public Convenience and Necessity from Alcan Pipeline Company to Alaskan Northwest Natural Gas Transportation Company, Reviewing Relevant Portions of Underlying Partnership Agreement and Granting Intervention," (June 30, 1978). The sponsor for the Eastern Leg Segment is the Northern Border Pipeline Company.

lower-48 states. 5/ This system is expected to deliver about 2.4 billion cubic feet of natural gas per day to markets in the lower-48 States. At the time of the President's Decision the capital costs were estimated at $10.5 to $13.9 billion 6/, which would make the project the largest privately financed project i history. 7/

5/ The ANGTS will be a chilled, buried, natural gas pipeline that will run parallel to the Trans-Alaska Oil Pipeline, to Delta Junction, just south of Fairbanks. From there, it will run parallel to the existing Alcan Highway through southern Alaska and northwestern Canada to Caroline Junction, near Calgary, Alberta. (In addition to transporting Alaskan gas, this section may also carry Canadian gas from the Mackenzie Delta region to the Trans-Canada Pipeline at Empress, Alberta.) At Caroline Junction, the system will divide into two legs: the Eastern Leg (Northern Border pipeline in the United States), which will carry approximately two-thirds of the gas eastward to a point near Chicago, and the Western Leg, which will parallel an existing Pacific Gas Transmission Company pipeline, carrying the remaining one-third from Alberta to California. See Decision at 6-12.

The pipeline system in the U.S. will be built by three major pipeline companies. The Alaska segment, from Prudhoe Bay to the Yukon Border, will be constructed by the Alaskan Northwest Natural Gas Transportation Company. The Western Leg will be built by the Pacific Gas Transmission Company. The Northern Border segment will be built by the Northern Border Pipeline Company.

6/ Decision at 157.

7/ The sponsors state they are unable to provide current cost estimates, which have increased since 1977,

(Footnote continue on next page).

In the course of deciding the issues presented in this Order, the Commission has reviewed an extensive record compiled over the past several years in numerous proceedings. This includes the record developed prior to the President's Decision during the lengthy Alaska natural gas hearing in which the Commission first considered project alternatives, 8/ and the Recommendation submitted by the Federal Power

Worst Case	7 6	1.8	-0.1

Source: Federal Energy Administration, Department of Commerce, Department of the Interior--U.S. Geological Survey, Department of Transportation, Department of Treasury, Energy Research and Development Administration, "Report of the Working Group on Supply, Demand and Energy Policy Impacts of Alaska Gas." Table II-13, at 138 (July 1, 1977).

the selected project, as well as discussion of comparisons with the oil pipeline experience, was incorporated in the Report which accompanied the Decision. 17/ From that evaluation came an estimate of cost overruns under expected conditions, or an "expected overrun."

Second was the explicit recognition of the risk that cost overruns could be much different than the President's expected case, and the requirement that a framework be devised to minimize that risk. The framework, provided in the President's Decision, calls for the allocation of the project's risks among its various beneficiaries, and the organization of Federal Government interactions with the project to reduce those risks. 18/

The structure of government involvement includes a series of approvals designed to ensure that appropriate planning and analysis has been completed prior to construction,

---

17/ The Report, following page 84 of the Decision, accompanied the Decision to Congress and may be regarded as authoritative legislative history. Midwest Gas Transmission Co. v. FERC, 589 F.2d 603, 611 n.23 (D.C. Cir. 1978).

18/ Decision at 201-205.

and an organization of the government's enforcement responsibilities in a manner which will provide coordinated and efficient action. 19/ It is this framework in its entirety -- reduction of risks as much as possible through appropriate government involvement, and allocation of residual project risks among the project's various beneficiaries -- that will provide the greatest likelihood of obtaining the expected positive benefits of the project.

The President's Decision places a number of requirements on the Commission to implement the framework within which the project is to proceed. One of the most important is to establish a variable or incentive rate of return mechanism to relate the allowed rate of return for equity for this project to the actual capital cost as compared with projected cost. 20/

19/ Reorganization Plan No. 1 of 1979, submitted by the President to the Congress on April 2, 1979 pursuant to the provisions of 5 USCA §901 et seq.

20/ In the words of the Decision, the Commission was to fix "a variable rate of return on equity that will reward the applicant for project completion under budgeted cost and penalize the applicant for project completion above budgeted cost. The variable return shall be set to provide substantial incentive to construct the project without incurring overruns . . ." Decision at 36.

The consideration of the incentive rate of return mechanism and the project company tariffs will further assign appropriate risks to the project sponsors, and will establish the share of the cost overrun risk to be borne by gas consumers. The principal matters which rem in for Commission consideration are consideration of the shipper company tariffs (including pass-through of charges under the tariffs approved herein), 21/ and the costs of processing and conditioning the gas for pipeline entry. The latter of these two matters is the subject of a rulemaking proceeding currently pending before the Commission in Docket No. RM79-19. 22/

21/ The shipper companies have not yet filed their tariffs with the Commission.

22/ Before the Section 7 certification process for the ANGTS facilities is complete, the Commission must also approve (1) the certification cost and schedule estimates, and (2) the financing plans for the project's segments. Procedures for submission and consideration of certification costs and schedule estimates are being completed by the Commission's Alaska Delegate. These estimates could be filed now for the Northern Border and Western Leg segments of the ANGTS. For the Alaskan segment, these estimates must await the resolution of questions as to the maximum allowable operating pressure of that segment, and the proximity of that segment to the existing oil pipeline.

(Footnote continued on next page)

The final or ultimate cost of this project is now unknown; the best that can be done is to specify a probability distribution of possible final cost outcomes. The range of possible costs for a pipeline such as Northern Border is probably very narrow, whereas the range for the Alaska segment, with its inherent uncertainties regarding system design and logistics of construction, is likely to be much broader.

Cost estimates for most large projects tend to increase as more is known about the detailed design of the system. The classic example in this respect is the

---

22/ (Footnote cont'd.)

The Commission has noticed for comment (in Northwest Pipeline Co., Docket No. CP78-123, et al.) a report on system design issues (pipe diameter and operating pressure), and the Department of the Interior has expressed its intention to resolve, in the near future, at least provisionally, the proximity question. Financing plans for the "pre-built" portions of Northern Border and Western Leg (i.e., southern segments to be built in advance of the Alaska segment, to transport gas from Canada pending completion of the full system) are presently being considered in a proceeding before the Commission in Northwest Alaskan Pipeline Co., Docket No. CP78-123, et al. Other financing plans will be considered as they are filed.

AGO 885999

Trans-Alaska Oil Pipeline System (TAPS). The General Accounting Office (GAO) reports that, from an initial estimate of just over $1 billion at the time it was first planned in 1968, the cost estimates had risen to over $4 billion by May 1974 largely due to more detailed system definition and design, additions to the system size and sophistication, delay costs, and route and design changes. By the time the base control budget was established in early 1975, the cost estimates had grown to over $6 billion. 23/ The GAO reports that this tendency is not restricted to the oil pipeline, but is a common feature in other large projects. 24/

As discussed in considerably more detail in Section II.B.2 (the Center Point), the President's Decision took this tendency into account by allowing for expected overruns from the March 1977 estimates. Further review by the Commission suggests that 1.3 times the March 1977 estimate is a reasonable allow-

24/ Id. at 19-20.

ance for cost growth after this estimate is corrected for inflation and scope changes. However, as Alaskan Northwest points out, the estimte might well be expected to grow as more is known about the detailed requirements for the project's design.

The Commission's problem is to be fair to the project sponsors, given the realities of the cost estimation process, while protecting gas consumers from being exposed to an uneconomic project. The Commission's approach has been to structure the IROR mechanism to accommodate changes in cost estimates attributable to increasing knowledge of design requirements, through adoption of a liberal design change policy prior to the commencement of construction. However, the Commission insists that realistic cost estimates be provided to the government prior to the comencement of construction. This result is achieved by severely constraining the circumstances in which scope changes will be considered once construction has commenced.

The Commission views the IROR mechanism as one of a number of policy tools that the Federal government will use to ensure that the construction of the ANGTS continues to be in the public interest. The Commission

believes that the IROR mechanism it has developed can legitimately be expected to achieve the following objectives:

- o the development of the best possible cost estimates prior to commencement of construction; and
- o the provision of a workable incentive to construct the ANGTS within the parameters provided by approvals or authorizations which may be granted by the Commission and the Federal Inspector.

The President and the Congress found that adequate assurance of continued project viability, and appropriate completion guarantees from the project's direct beneficiaries, should allow the project to be financed in the private market. The Commission recognizes that, in order to achieve a privately financed project, debt service must be assured in all events once the system is complete. The Commission also recognizes that such assurance requires the approval of appropriate project company pro forma tariff provisions and service agreements, as well as assurance that the shippers who sign the service agreements can pass charges incurred under them through to their customers. The Commission observes that the parties are essentially unanimous in agreeing that assurance of pass-through is necessary.

However, certain mechanical and timing aspects of pass-through, as well as appropriate provisions for pass-through of charges incurred in Canada, of necessity are reserved for future proceedings when all tariffs are before the Commission.

The Commission recognizes the essential role of the project company tariffs with all of their attendant conditions in securing financing for the project. In its comments on the President's Decision, the Commission recognized that the Decision and the Agreement on Principles with Canada 25/ anticipated that these will be cost-of-service tariffs, as opposed to a stated rate, to ensure that revenues available to the project companies are adequate to meet their expenses irrespective of fluctuations in throughput volume or costs. We recognize that funds are to be advanced in reliance upon the regulatory approvals provided in this Order.

The size and potential importance of the ANGTS to U.S. energy supplies has led it to receive special

---

25/ The Decision incorporated an "Agreement on Principles" between the United States and Canada. Agreement on Principles Applicable to a Northern Natural Gas Pipeline, Decision, Section 7 at 47-83 (Sept. 20, 1977).

regulatory attention and priority. 26/ The Commission has created special administrative arrangements to expedite regulatory decisions and to assure that all necessary administrative resources are devoted to the analysis and resolution of matters in controversy. The Commission reaffirms its commitment to carry out its responsibilities under the President's Decision and ANGTA, as well as its general statutory responsibilities under the Natural Gas Act and the Natural Gas Policy Act as they pertain to this project, with maximum dispatch and full cognizance of the significance of this project for consumers and the nation as a whole. We believe we have provided in this Order the opportunity for the system equity capital suppliers to earn truly generous rates of return if they perform, and for U.S. energy users to obtain valuable natural gas supplies at a reasonable cost.

26/ Both the President and Congress have singled out the ANGTS for special treatment. The most obvious instance is the special legislation incorporated in ANGTA and Congressional approval of the Decision; see also the provisions of Title I of the Natural Gas Policy Act of 1978, Pub. L. No. 95-621, 92 Stat. 3550 (1978). The Department of Energy, National Energy Plan II (May 7, 1979) designates it as the top priority among potential supplemental sources of natural gas.

II. THE IROR MECHANISM

A. Concept and Structure

1. Concept

The President's Decision requires the use of a "variable" or incentive rate of return to deter cost growth during construction. 27/ The concept expressed in the President's Decision is straightforward: in order to provide an incentive for management to reduce costs, rates of return on equity should be increased if the actual construction costs of the project are controlled so as to be at or below the target estimates. In creating the incentive, the President sought to offer the project sponsors a positive reward for superior cost and schedule control, in a format that is not available under conventional public utility ratemaking practices. 28/

The traditional tool for cost control in natural gas pipeline construction has been regulatory oversight, with its attendant threat to disallow investments imprudently incurred during construction. Under traditional regulation,

---

27/ Decision at 36.

28/ The Commission recognizes that additional incentives to control the cost of gas delivered by this project are created by the sponsors' interest in ensuring marketability for the delivered gas and by the need to stay within the pool of funds committed by investors for construction.

before any costs may be disallowed for inclusion in rate base they must be shown to have been imprudently incurred. This approach, resting on hindsight, implies that only those costs attributable to patently unreasonable management action may be disallowed.

In competitive industries the rate of return on equity is usually related to cost control. The IROR attempts to establish the same rate-control relationship in a regulated situation. To reach this goal, the Commission has made use of the following principles in designing the IROR:

- o the IROR should provide incentives to reward cost control performance and avoid or minimize cost overruns;
- o the IROR should provide just and reasonable compensation for investors so that sufficient capital may be attracted to finance the project; and
- o the cost to consumers should be lower where cost overruns have been minimized and investors have received an incentive return.

To facilitate future regulation of the project, the IROR will be implemented by an equivalent one-time adjustment to the equity portion of the project's capital costs instead of varying the allowed rate of return on equity. 29/

29/ As explained more fully below, Section II.C., the adjustment is calculated from the discounted present value of the sums of return on equity and return of equity when the appropriate value from the IROR schedule is applied to the equity component of capital cost.

The IROR, then, is designed to complement the disallowance-of-cost mechanism by offering economic rewards for holding down costs. In addition to the standard process of allowing or disallowing costs according to the prudently-incurred standard, project managers will be rewarded for eliminating avoidable costs even though those costs (had they been incurred) might later withstand an allegation that they were not "prudent."

The consumer should be the chief beneficiary of the IROR. Under conventional regulatory practice, consumers may be forced to bear all cost overruns. Consumers traditionally bear not only the return and taxes associated with the additional capital necessary to finance the overruns, but also the depreciation expense associated with the return of that investment. Using IROR, however, the burden of cost overruns will be distributed between consumers and equity investors. While consumers will continue to bear the depreciation expense associated with such prudently incurred investment, they will bear only a portion of the return on the investment to finance such cost overruns. Thus, the IROR should lead to savings in construction costs, which will be divided between lower overall costs to consumers and higher returns to investors. The ultimate effect of applying the IROR will be to provide lower cost natural gas to consumers, with just and reasonable

returns to investors.

2. Structure

The IROR mechanism should provide significant incentives to control costs without placing risks on investors that inordinately increase the cost of capital since that cost is ultimately paid by consumers. The IROR mechanism cannot be examined in a vaccuum. Because the mechanism affects risk and the allowed rates of return on equity, it must be related to other factors that affect the rates, such as applicable tariff provisions. While the IROR mechanism must be evaluated in its entirety and not just on a component-by-component basis, the major elements should be examined before evaluating the expected end-result on rates.

The basic elements of the IROR mechanism are the Cost Performance Ratio and the associated IROR schedule of rates of return. The Cost Performance Ratio is the ratio of Actual Capital Costs (derived from the final construction costs) to the Projected Capital Costs (derived from estimated costs at the start of construction). 30/ The Cost Performance Ratio

---

30/ As explained in more detail below, in Sections III and IV, the ratio is adjusted for both inflation (an adjustment to Actual Costs) and for design and other scope changes (an adjustment to Projected Costs).

measures how well project management has succeeded in controlling the costs of the project. A ratio greater than 1.0 indicates that actual costs are greater than projected or budgeted costs; a ratio less than 1.0 indicates that actual costs are less than projected or budgeted costs.

The IROR schedule specifies an allowed rate of return for each Cost Performance Ratio. With an IROR mechanism, the lower the value of the Cost Performance Ratio, the higher will be the allowed rate of return, and vice-versa. Figure 1 illustrates this concept by showing a hypothetical IROR schedule. The curve in the figure slopes upward to the left, indicating that rates of return increase as actual costs are reduced to, or fall below, targeted costs (that is, the smaller the Cost Performance Ratio, the greater the rate of return.

Figure 1

Hypothetical Incentive
Rate of Return Mechanism

Rate of
Return on
Equity

IROR Schedule

1.0

Cost Performance Ratio

$= \frac{\text{Actual Capital Costs}}{\text{Projected Capital Costs}}$

The Projected Capital Costs of the project are based on the Certification Cost Estimates submitted to the Commission for approval prior to the issuance of final certificates of public convenience and necessity. These will be submitted in base-year prices and will not incorporate an allowance for future inflation. In addition to the direct construction costs, an interest or finance charge will be included to create an incentive to minimize delays in construction. Under the Decision, the Certification Cost Estimate must be compared to the earlier cost estimate submitted by the project sponsors in 1977, to see if the new estimate "materially and unreasonably exceeds" the earlier estimate. (Decision at 36-37.)

The Actual Capital Costs of the project are the direct costs of construction determined after two adjustments. First, since Projected Costs are calculated in base-year prices with no allowance for inflation, the Actual Capital Costs must be adjusted downwards (or deflated) to remove the effects of general inflation in the U.S. economy, in order to produce a measure of cost overrun for the project absent the effects of inflation. It is not equitable to penalize investors for their inability to estimate future inflation rates; thus, an inflation adjustment mechanism is specified to remove the

AGO 886010

effects of economy-wide inflation from Actual Capital Costs. Second, finance or interest charges are added to the direct costs.

Finally, it is unreasonable to penalize the equity investors for certain major events beyond their control that significantly increase construction costs if such events could not reasonably have been anticipated by the project sponsors in preparing their cost estimates. Examples of such events include war, natural disasters, design changes compelled by changes in government laws or regulations, and delays caused by government. Such events are defined as Changes in Scope, and the Projected Capital Costs will be adjusted to reflect these changes. This Order specifies the allowed Change in Scope events, and the procedures for altering the Projected Capital Costs to reflect these changes.

A full specification of the IROR structure must begin with the concept that the IROR schedule is to provide an opportunity for project sponsors to earn a rate of return adequate to attract capital so as to compensate investors for the financial and business risks of the project. 31/ This return would be earned at the expected Cost Performance

---

31/ This requirement is fully discussed below; see Section II.B.3 (the Operation Phase Rate).

Ratio. This rate of return is termed the Center Rate of Return (and the associated Cost Performance Ratio is the Center Point). If the realized Cost Performance Ratio is greater than the Center Rate, the IROR will be less than the Center Rate and vice-versa.

By this Order the Commission establishes a value for the Center Rate of Return which should compensate equity investors for the financial and business risks of investing in this project. This will be the sum of an "Operation Phase Rate" and two "risk premiums," a "Project Risk Premium" and an "IROR Risk Premium". The Operation Phase Rate is a rate of return to compensate investors for the risks incurred during the operation of the pipeline after construction is complete.

The Decision contemplates that tariff provisions during operation of the pipeline will be such that the risks during operation will be shared by gas consumers and equity investors. The service interruption provisions of the project tariffs will guarantee debt service once operations commence, but equity will remain at risk. The return on equity will be proportionate to the level of service performed, and for extended total service interruptions the return of equity will also be at risk. The Commission in this Order evaluates the remaining risks borne by investors, and compares them

with the risks of investing in conventional lower-48 natural gas pipelines in order to determine a reasonable value for the Operation Phase Rate. This rate of return will be the rate actually used to calculate the transportation charges of the project under the initial tariff approved by the Commission. This rate will also be used to calculate the allowance for equity funds used during construction in determining the rate base of the project. 32/

The Project Risk Premium is to compensate investors for the unusual risks of non-completion, and other risks borne by investors during the construction of the pipeline. It will be added to the Operation Phase Rate. The Decision requires that construction risks are to be borne by investors or other project beneficiaries and not by consumers during construction, (Decision at 120-21) and that charges to customers may not commence prior to the "completion and commissioning of operation of the system" (Decision at 37-38). 33/ In this Order

---

32/ While it will be the rate applied to the pro forma tariffs, the Operation Phase Rate may change over time once the pipeline is in operation, to remain comparable with rates of return earned on other investments having similar risks. See Section VI.B.8. (Review of Equity Rate of Returns).

33/ See Section VI.A.1 (Billing Commencement Date) for an analysis of this phrase.

the Commission evaluates these risks, and establishes values for the Project Risk Premium to compensate equity investors for bearing them.

Because the final costs of construction are unknown, the use of the IROR mechanism introduces uncertainty as to the ultimate rate of return that will be earned by the sponsors. For this reason, a second premium is added to the Operation Phase Rate, an IROR Risk Premium. This will compensate investors for risks created by the use of an IROR mechanism.

The Center Rate of Return is the sum of the Operation Phase Rate, the Project Risk Premium, and the IROR Risk Premium. This will be the rate of return allowed when actual costs (adjusted for inflation) equal expected costs (adjusted for scope changes). For higher values of the Cost Performance Ratio, the Incentive Rate will be reduced; cost growth will result in lower rates of return on equity. The extent of this reduction (or increase, if the Cost Performance Ratio is less than the Center Point) is determined by the Marginal Rate of Return.

The Marginal Rate of Return is an analytical concept used to derive the IROR schedule. It is the rate of return implicitly allowed on incremental investment either above or below base estimates. A low Marginal Rate would mean that the Incentive Rate will decline rapidly as cost increases

occur; a high Marginal Rate would mean that the Incentive Rate will decline only slightly as cost increases occur.

The Commission does not intend to use two rates of return, one on projected costs and one on overruns or underruns. Rather, a single Incentive Rate will be earned on all investment in the project; but this rate will be a weighted average of the Center Rate and the Marginal Rate. By simple mathematics, the averaging process gives more weight to the Marginal Rate as the Cost Performance Ratio increases. Thus, the Marginal Rate plays the major role in determining the incentive to reduce costs. To provide this incentive, the Marginal Rate must be low enough to make an investment in cost increases unattractive.

Though the President's Decision contemplated that the allowed rate of return would be variable, the Commission has previously recognized that an unusually high or low rate of return allowed over the 25-year (or longer) operating life of the pipeline could create complications for both future Commission regulation of the pipeline and future financing of expansions or additions. 34/ Consequently, the Commission

---

34/ See Order No. 17 (Docket No. RM78-12) (Dec. 1, 1978); see also Notice of Proposed Rulemaking, Docket No. RM78-12 (May 8, 1978); Revised Notice of Proposed Rulemaking, Docket No. RM78-12 (Sept. 15, 1978).

introduced the concept of a one-time adjustment to rate base that would have the same effect as varying the allowed rate of return over the operating life of the pipeline. The one-time adjustment is based on the principle that the same level of profitability can be achieved by allowing the Incentive Rate to be earned on a normal, unadjusted rate base, or by allowing the Operation Phase Rate to be earned on an appropriately adjusted rate base. By adjusting the rate base the same effect can be achieved as varying the allowed rate of return.

The one-time adjustment to the equity investment in the rate base of the project will be made shortly after the operation of the pipeline commences. Thereafter the Operation Phase Rate will be earned on the adjusted rate base. The size of the adjustment to the equity investment in the rate base will be derived from standard discounted cash-flow analyses. The one-time adjustment is such that the present worth of the return on equity and return of equity over the operating life of the pipeline (based on the Operation Phase Rate) is equivalent to the present worth of the returns from applying the Incentive Rate to the normal, unadjusted rate base.

B. Components

1. The Cost Performance Ratio

The basic concept of the Cost Performance Ratio was described above. This section provides a more specific description of its determination and use.

The Cost Performance Ratio is used to measure the degree of cost growth or reduction from the projected costs of the project. It is also used to measure the success of project management in reducing or controlling costs of construction. The measurement of cost growth or the success of management in reducing costs must take into account the following four factors:

(1) Cost growth due to general inflation within the economy can not be reduced or controlled by management and should not be included in the measurement of management's performance in reducing costs.

(2) Cost growth due to an extension of the construction schedule is as important as an increase in direct construction costs and should be included in the measurement of management's cost control performance. A longer construction schedule adds finance or interest charges to total costs, and these will be paid by the gas consumer.

(3) Certain major events may occur which could not have been anticipated by management, the cost impact of which are largely beyond the control of management, and which substantially increase costs. The impact of these events should not be included in the measurement of management's performance in controlling costs.

(4) The measurement of cost growth should be as simple and as uncomplicated as possible to avoid controversy about its use, and thereby avoid major administrative burdens on the Commission, the Federal Inspector, and the project management in implementing the IROR mechanism.

The measurement of cost growth established by the Commission in this Order (the Cost Performance Ratio) meets these four criteria. The Cost Performance Ratio is simply the ratio of actual costs to projected costs: Cost Performance Ratio equals the Deflated Actual Capital Costs divided by the Projected Capital Costs.

The Deflated Actual Capital Costs for the project will be calculated in three steps. First, the direct construction costs (labor, materials, services, etc.) actually

incurred in the construction of the project will be totaled for each quarter. 35/

Second, these quarterly expenditures will be deflated back to base-year prices by the use of a composite inflation index. This index is discussed in greater detail below in Section III. This index is designed to remove the effect of general inflation on those construction costs.

Finally, an interest charge or finance charge will be added to the total direct costs of the project. This charge, hereafter referred to as the Finance Charge, will be based on a Real Rate of Return. 36/ Since the effect of inflation has been removed from the calculation of direct costs, the rate of interest or return on equity used to calculate the Finance Charge will be a "real" rate with the effect

---

35/ In their initial comments, the project sponsors request the Commission to clarify when a particular expenditure will be deemed to have occurred since this is important for the inflation adjustment mechanism (Joint Comments at Tab. 2, p. 11). The Commission agrees with the sponsors that an expenditure for materials or services should be deemed to have occurred when the actual payment for those materials or services is made.

36/ This Finance Charge was referred to as an allowance for funds used during construction (AFUDC) in the Notice of April 6.

of inflation also removed. Actual market rates of interest in our economy today reflect or compensate investors for their expectations about future rates of inflation since inflation reduces the worth of their return from the investment.

The Projected Capital Costs (the denominator of the Cost Performance Ratio) will be calculated in four steps. First, the direct costs included in the Certification Cost Estimate, to be submitted to the Commission prior to the receipt of a final certificate of public convenience and necessity, will be divided into quarters depending on when they are expected to be incurred. Since these costs are already calculated from base-year prices, no adjustment for inflation is required.

Between the time the Certification Cost Estimate is prepared and the time when the final design and cost estimate is submitted to the Federal Inspector, 37/ certain changes in design or schedule may occur. The second step will be to adjust the Certification Cost Estimate to reflect these changes in design or schedule. 38/

37/ This final submission is mandated by the President's Decision. Decision at 29.

38/ Prices, however, will not be changed from those that prevailed in the base year for cost estimation.

After construction begins, certain events may occur which the Commission defines to be Changes in Scope for the project. (For a more complete description of these events, see Section IV.) Direct costs in the Certification Estimate will, in the third step, be adjusted to reflect the impact of these Changes in Scope should they occur.

Finally, a Finance Charge will be added to the adjusted direct costs using the Real Rate of Return to obtain the Projected Capital Costs.

The Commission believes that the ratio of these two measures of capital costs (Deflated Actual Capital Costs and Projected Capital Costs) provides the best practical measure of cost growth or overruns to be used to determine the extent of the project management's success in controlling costs. This Cost Performance Ratio meets the four criteria discussed above.

The Commission believes that it is important to include some type of interest charge or finance charge in the calculation of the Cost Performance Ratio since these charges are just as much a cost to consumers as is the cost of steel, labor, valves, etc. However, the Finance Charge should be calculated from a "real" or inflation-free rate of return. Calculation of such a real rate return is inherently

imprecise. The "real" rate is derived by subtracting an estimate of the rate of future inflation, expected by current investors from current market rates of interest and rates of return.

The Commission estimates the Real Rate to be 5 percent. This estimate is based on the following assumptions: (1) 25 percent equity capitalization earning a 14 percent return (a rate of return generally representative of current rates required by equity investors); (2) 75 percent debt capitalization earning an 11 percent interest rate (a rate generally representative of current rates of interest, for example the prime rate); and (3) an investor expectation of a long term inflation rate of 7 percent (a rate representative of recent rates of inflation in the U.S. economy). The Real Rate can then be derived from:

$$(0.25)(14\% - 7\%) + (0.75)(11\% - 7\%)$$
$$= (0.25)(7\%) + (0.75)(4\%)$$
$$= 1.75\% + 3\%$$
$$= 5\% \text{ (rounded)}$$

The project sponsors, with almost no justification, propose instead a rate of 1 percent. Though we are not confident that 5 percent is precisely the correct number, we are certain that 1 percent is too low.

A second criticism by the sponsors, put forward as a footnote, concerns the "cut off" date for accrual

of the Finance Charge. 39/ The intent of this footnote is unclear, but it shows a misunderstanding of the relationship between the accrual of the Finance Charge in calculating the Cost Performance Ratio, the accrual of AFUDC in the rate base of each pipeline segment, and the billing commencement date. The distinction between these concepts is important, and any confusion must be dispelled. Accrual of a Finance Charge in the Actual Capital Costs, and thus in the numerator of the Cost Performance Ratio, will cease for each segment of the project (Alaska or Northern Border) when construction of that segment has been completed even if, for whatever reason, another segment is not complete. The intent of this provision is to avoid penalizing investors in one segment for delay in another segment or in the start-up of gas production. 40/

39/ Joint Comments at 21 n. 12.

40/ The Commission Staff in their comments propose a variation on this approach which would add the "real" Finance Charge no longer being accrued in the Cost Performance Ratio of a completed segment, to the Cost Performance Ratio of those segments not completed, including if possible segments in Canada. (Initial Staff Comments at 48) This idea has some theoretical appeal since it would require the late segments to to bear an even greater Finance Charge in the Cost Performance Ratio, and thus give the investors

(Footnote continued on next page).

This procedure for including a Finance Charge derived from the Real Rate of Return in the Cost Performance Ratio of each segment must not be confused with Commission procedures for the inclusion of AFUDC in the actual rate base of each segment. Inclusion of AFUDC in the actual rate base will be calculated from rates of interest actually incurred during construction on project debt and the rate of return on equity allowed fo. purposes of calculating AFUDC. Accrual of AFUDC in the rate base of each segment will continue until billing under the full cost-of-service provisions of the tariff commences. For a more complete discussion of the billing commencement date, see Section VI.A.1.

40/ (Footnote cont'd.)

even greater incentive to complete construction. However, insofar as we would be obliged to further compensate investors for the additional risk this requirement would add, we do not believe its additional incentive benefits outweigh the additional costs that further compensation may impose on customers.

2. The Center Point

The Center Point Cost Performance Ratio should represent the best current estimate of the actual costs of the project, including any cost overruns relative to the Certification Cost Estimate approved by the Commission. 41/ This ratio has two significant functions.

First, if the Certification Cost Estimate, including likely cost overruns, "materially and unreasonably exceeds" the March, 1977 cost estimate filed by the project sponsor with the Federal Power Commission, then the Commission must carry out the mandate in the President's Decision to review the project and determine whether a certificate of public convenience and necessity should be granted. 41a/ In this review, both the Certification Cost Estimate and the Center Point Cost Performance Ratio are highly significant. The Certification Cost Estimate is important because it indicates, when compared with the March, 1977 estimate and after making proper allowances for price inflation, the growth in the projected costs as a result of the study and work on this project between March, 1977 and the preparation

---

41/ In statistical terms the Center Point is obtained by adding together each possible level of the Cost Performance Ratio multiplied by the probability of that Cost Performance Ratio occurring.

41a/ Decision at 36.

of the Certification Estimate.

The Center Point Cost Performance Ratio is important to this review because it also may have changed as a result of the study and work on the project. The Certification Cost Estimate will likely have grown from March, 1977 as a result of detailed planning and design, but the expected cost overrun associated with that estimate may have been altered, and hopefully reduced, by that planning and design. Thus, the Commission believes that the Center Point Cost Performance Ratio must be a part of the comparison of the Certification Cost Estimate with the March 1977 estimate since that review should consider whether or not the expectation of cost overrun has changed from that associated with the March 1977 cost estimates.

Second, the Center Point Ratio is important because it is the target outcome of the project. For example, a Center Point of 1.2 would indicate that a further 20 percent increase in costs is expected from the Certification Estimate, and that this would be the target for IROR purposes. The President's Decision envisioned that the Certification Cost Estimate would be used as the "basis for fixing a variable rate of return on equity that would reward the applicant for project completion under budgeted cost and penalize the

applicant for project completion above the budget cost." 42/ The Commission, therefore, after having determined that the Certification Cost Estimate does not unreasonably exceed the 1977 estimate, must select from all the possible outcomes a target Cost Performance Ratio to use as the Center Point in structuring the IROR schedule.

Common observation as well as historical and statistical studies 43/ of many different types of large projects have revealed a tendency for the estimates of total cost-to-completion to increase as a project moves over time from initial conception to completion. In the early stages of a project this growth often reflects the study required to turn an idea into a detailed set of plans and specifications. In the process of research, evaluation, planning, and budgeting, natural initial optimism is tempered by more realistic appraisals; and in the usual case, unperceived complexities are discovered and the difficulty of the required tasks becomes better understood.

42/ Decision at 37.

43/ See, e.g., W. Mead, G. W. Rogers, & R. Z. Smith, Transporting Natural Gas from the Arctic: The Alternative Systems, 89-94 (1977).

It would have been unrealistic had the President's Decision used the project sponsors' cost estimate in March 1977 as the basis for evaluating the economics of the project. Instead, the Decision factored in cost growth estimates of approximately 30 percent for the Alaska segment and 10 percent for the Northern Border segment, in the evaluations leading to approval of the project. 44/ The estimates that cost growth in excess

---

44/ The President's Decision contains two estimates of the extent of likely cost overruns in Alaska. The Report accompanying the Decision states that "[o]verall, it has been estimated that cost overruns of 30 percent or more should be expected in Alaska and Canada. . ." Decision at 150. The table of capital cost estimates on p. 157 of the Report, however, shows a 24 percent cost increase from the Base Case estimate in current or inflated dollars for Alaska. For Northern Border, the expected overrun is 10 percent. All of these estimates include finance charges or an allowance for funds used during construction derived from market rates of interest and rates of return on equity. The State of New York in its initial comments (p. 5) points out that the estimates of cost overruns in the Decision do not include an adjustment for inflation and route changes or other changes in scope. These points, however, do not mean that to the extent the Commission excuses cost increases resulting from design changes or change in scope events, the expected overruns should be less than estimated in the Decision. Inflation is fully accounted for in the Decision by the use of constant 1975 prices; moreover we cannot presume that the Decision considered change in scope variables in estimating costs for a given system.

of 30 percent for Alaska and 10 percent for Northern Border were not likely to occur were one basis for the finding that the project was in the public interest.

Several implications follow. Looking at the project at the time of submission of the Certification Estimate with the benefit of two or more years of intensive study, evaluation, planning, programming, and budgeting by the sponsors, it would be surprising if the new estimate did not reveal some cost-growth compared to the March, 1977 estimate, even allowing for price inflation. This would be a natural phenomenon reflecting, at a minimum, a better understanding and perspective on the project. 45/

Another implication is that after two or more years of work on this project, the Certification Cost Estimate should be a more accurate estimate of what the actual cost of the project will be upon its completion than the cost estimate made in 1977. It would be surprising to realize as large an

---

45/ The comments by the project sponsors list a number of reasons why they now expect the Certification Estimate to exceed the March 1977 estimate: (1) cost of restoring Alyeska work camps; (2) cost of restructuring Alyeska communications system; (3) higher estimate of costs to obtain Governmental approvals; a l (4) greater project management expenses. Joint Comments at 11-15.

amount of cost growth from the Certification Estimate as the expected amount of cost growth from the 1977 estimates. 46/

Because the Certification Cost Estimate will be the basis of the Commission's certification proceeding and the cornerstone of the allowed rate of return for this project, it is vital that the Commission have the most accurate and realistic set of cost estimates that can be obtained. There is need to deter both overly optimistic projections which might be offered in the hope that they would promote final certification of the project, and overly pessimistic projections which provide a large margin for error in cost estimates or an implicit allowance for large cost increases. The latter type of estimate would vitiate the intended motivational aspects of the IROR and could result in unreasonably high rates of return.

Considering that a 30 percent allowance for cost growth on the Alaska segment and 10 percent on Northern Border were allowed for in the President's Decision, it is unlikely that, on the sole basis that estimated costs had increased by 30

46/ The project sponsors, however, seem to expect as much cost growth from Certification Estimate as did the President from the March 1977 estimate. Joint Comments at 31. They argue that a 30 percent increase is likely from the Alaskan Certification Estimate and 20 % for Northern Border.

percent for the Alaska segment and 10 percent for Northern Border, the Commission could make a negative finding concerning the public interest of the project. On the other hand, if there were to be a substantial increase in the Certification Estimate over the March 1977 estimate without a substantial decrease in the expected cost overrun from the Certification Estimate, it would seem to follow that either the initial cost estimates used in the 1977 evaluation were badly mistaken or the nature of the project had changed considerably. In either situation the Commission would need to take these developments into consideration in connection with its certification responsibilities. 47/

The Commission has embodied these considerations in a procedure for determining the Center Point. It is contained in Condition No. 12 of the attached Terms and Conditions. The Incentive Rate of Return is based solely on the Certification Cost Estimate. However, in determining the value of the Center Point Cost Performance Ratio, the Commission will take into consideration the relationship between the Certification Cost Estimate and the March 1977

47/ In this connection, the Commission notes with concern the sponsors' comments regarding cost growth cited in footnotes 45 and 46, supra.

estimate, i.e., the cost growth between these two estimates during the intervening period. If a substantial amount of cost growth had already occurred, it would seem in accord with the basic thrust of the Presidential Decision to assume that most of the projected 30 percent cost growth had already occurred and that it would be unreasonable to expect a sizable amount of cost growth in the future. Conversely, should the two estimates show very little cost growth in the intervening period, it would seem reasonable to expect that most of the 30 percent cost growth envisioned in the Presidential Decision would occur in the future. 48/

The formula in Condition No. 12 expresses this concept mathematically. For example, if the Certification Cost Estimate were to exceed the March 1977 estimate for the Alaska segment by 20 percent, then in accord with the President's Decision, the Center Point would be set so as

---

48/ In response to earlier concern by the project sponsors, the Commission, in Order No. 17, made it clear that the Certification Estimate will be the basis for the IROR mechanism. Order No. 17, "Order Attaching Incentive Rate of Return Conditions to Certificates of Public Convenience and Necessity," Docket No. RM78-12 (Dec. 1, 1978). The Projected Capital Costs will be derived from the Certification Estimate. However, the Commission believes that it must consider the Decision's findings concerning likely overruns in choosing a Center Point.

to anticipate a further 10 percent cost growth between the time of the Certification Cost Estimate and completion of the project. 49/ To cite another hypothetical example, were the Certification Cost Estimate to exactly equal the March 1977 estimate then the formula would imply that the Center Point should be 1.3, which would provide for the 30 percent cost growth the Presidential Decision estimated would take place.

Of course, it may be that the project had so changed in nature and scope that the two cost estimates could be linked in the process of setting the Center Point. If this were so, the project sponsors should so inform the Commission and provide a detailed explanation of the nature of the changes which had caused the discontinuity in the project so that the Commission could have this information in conjunction with the certification function as well as for establishing a Center Point.

49/ In all cases allowance should be made for inflation so that the comparisons involve calculation of real growth, i.e., growth in resource requirements and not prices.

In the absence of an assertion of a major change in the basic nature of the project from that assumed in the Decision, the Commission will relate its determination of the Center Point to the cost growth that has taken place during the last two years. The mathematical relationship for the Alaska segment will be: Center Point = 1.3 x (March 1977 estimate in base year prices + Finance Charge)/ (Certification Cost Estimate + Finance Charge). For the Northern Border segment the relationship will be: Center Point = 1.1 x (March, 1977 estimate in base year prices + Finance Charge) / (Certification Cost Estimate + Finance Charge). Base-year prices are those used in preparing the Certification Estimate, and the Finance Charge is calculated from the Real Rate of Return defined below. 50/

In their comments on the Commission's April 6 notice, where the above procedure for determining the Center Point was proposed, the project sponsors criticize this proposal as basing the IROR mechanism on the March 1977 estimates submitted to this Commission and the President. As we stated in Order No. 17, the Commission does not intend to

---

50/ The Commission Staff in its initial comments (pages 58 and 60) supports this procedure and puts forth a number of the arguments given here advocating this procedure.

base the IROR mechanism on the March 1977 estimates. The attached terms and conditions clearly state that the Projected Capital Costs and the Cost Performance Ratio will be based on the Certification Estimates to be submitted to the Commission sometime in the future.

The Commission must have some basis, however, for determining the Center Point of the IROR schedule. The only information available to us now about the likely cost growth or the ultimate costs of the project including overruns are the conclusions reached in the President's Decision based on the March 1977 estimates. Those conclusions were based upon reasoned comparisons between the cost estimates of the competing projects, actual experience in the Alyeska System, the Recommendation submitted to the President by this Commission, and a number of intragency task force studies and numerous other information sources. Using this information, the Commission has established the above procedure to determine the Center Point.

The Commission, however, anticipates that additional information will be made available to us by the project sponsors about the expected ultimate cost of the project at the time they submit the certification cost estimates. If

this information is substantially different from that relied upon by the President in reaching his conclusions about cost growth, then the Commission would have to reconsider the issue of where the Center Point should be set. 51/ In such a situation the Commission would envision setting the Center Point as part of its overall review of Project costs using a procedure such as that set out below.

If the project sponsors believe that a major change in the basic nature of the project from that assumed in the Decision has occurred, and thus the above procedure for setting the Center Point is no longer applicable, then the sponsors, as part of their respective submissions of certification cost estimates, must at a minimum present evidence to the Commission on the following subjects:

(1) The nature of the changes in the project from that assumed at the time of the Decision, including a

---

51/ The project sponsors in their comments seem to advocate that the Commission now set a Center Point of 1.3 for Alaska and 1.2 for Northern Border based on the certification cost estimates which have not yet been submitted to us. The Commission has no factual basis or evidence to support such a determination. Since the Decision is the best estimate of the cost of the project available to us, the procedure or formula described above is the only method we can justify for setting the Center Point until such as time the project sponsors may provide us with additional evidence.

detailed explanation of why the Certification Cost Estimate has changed from the March, 1977 estimate. The Commission will later specify certain cost formats which the sponsors shall follow in submitting their Certification Estimates in order to allow the Commission to better assess the reason for the change in costs. (See Condition 8 of the attached terms and conditions). This information will assist the Commission in determining if the Certification Estimates materially and unreasonably exceed the March 1977 estimates as required by the Decision.

(2) The value or benefit to the Nation and gas consumers of construction of this project in light of the revised cost estimates. In other words, the sponsors must demonstrate that the project is still in the public interest given the changes in the project since the Decision.

(3) The cost increases or cost overruns above the Certification Estimates that may reasonably be expected to occur. The sponsors should explain what eventualities or contingencies are provided for in the Certification Estimates and the contingencies for which no costs have been included. As part of the

Certification Estimate, the sponsors should provide an analysis of the events that could cause cost increases from the Certification Estimate, the likelihood of these events, and their impact on costs. The Commission expects that the Certification Estimates will only include costs resulting from normal conditions to be expected during construction. Abnormal or unlikely events that could increase costs will be analyzed as part of the sponsors' submission concerning potential cost overruns from the Certification Estimate. 52/ The sponsors' analysis of the potential for cost increases from the Certification Estimate will then be used by the Commission in determining the Center Point. If a convincing case is made that the potential for cost increases beyond the Certification Estimate is substantial, then a reasonable value for the Center Point may be substantially greater than one. In any event, the Commission considers it unlikely that the Center Point would be less than one if the Certification Estimate is based on normal or probable conditions.

52/ Since the Certification Estimate will be revised as a result of design changes and other events prior to the Final Design, and for a limited number of Change in Scope events after the final design (see Section IV), the analysis of cost overruns should distinguish between events that are covered by the Change in Scope mechanism and those that are not.

3. The Operation Phase Rate

The Operation Phase Rate of return on equity is that rate which will compensate equity investors for the risks incurred during the actual operation of the pipeline. This rate will be used to calculate transportation charges pursuant to the tariff approved by the Commission after the one-time adjustment to the rate base. 53/

By way of background, the Commission notes that the natural gas transmission industry has had limited experience with project financing; the most expensive projects undertaken have been in the $500 million to $1.5 billion range. However, the ANGTS project is unique in that no other project of this magnitude and character has been undertaken.

53/ This rate will also be used to determine the equity component of the Allowance For Funds Used During Construction in the rate base of the project. Originally in Order No. 17, the Commission required that the AFUDC rate would be the Operation Phase Rate plus the Project Risk Premium. However, the methodology for determining the Project Risk Premium proposed by the project sponsor required knowing the AFUDC rate before calculating the Project Risk Premium. In order to solve this dilemma, the Commission now requires the use of the Operation Phase Rate to calculate AFUDC. However, as a compensating adjustment, the Project Risk Premium, and thus the Center Rate, have been increased from what they would have been assuming the higher AFUDC rate. See Section II.B.4., discussing the Project Risk Premium.

The Commission has adopted a general approach for determining the Operation Phase Rate. First, an estimate was made of the range of rates of return that appears reasonable, considering current financial market conditions and the risks of investing in conventional lower-48 natural gas pipelines. Second, the Commission has compared the operating risks of the Alaskan gas pipeline with the risks normally encountered during operation of conventional pipelines. Based on this comparison of risks, the Commission has determined that the Operation Phase Rate should be within the range of rates that is reasonable for conventional pipelines. 54/

A survey of rate cases (mostly settlements) during the years 1977, 1978, and early 1979, discloses that the rates of return allowed for lower-48 natural gas pipelines have been between 10.68 percent and 15.0 percent. The majority of returns fell within the narrower range of 12 to 14 percent. This survey is the point of departure for our analysis.

54/ Order No. 17 provides that the Operation Phase Rate shall be set by the Commission "within the general range of rates of return for other pipelines with similar operating risks" (Terms and Conditions, No. 12).

Apart from simply reviewing values allowed in the past, there are a number of alternative approaches used by financial analysts for estimating rates of return for utility rate-setting purposes. Without attempting to select a preferred approach from the array of methodological options, the Commission has examined three procedures to see what each implies as an appropriate reference value for lower-48 pipelines. No procedure can precisely determine a just and reasonable rate of return. Therefore, the Commission must exercise its judgment after reviewing the relevant information in order to determine an appropriate value for the Operation Phase Rate.

The general standards for establishing a just and reasonable return on common equity were set forth by the Supreme Court:

> [T]he return to the equity owner should be commensurate with returns on investments in other enterprises having corresponding risks. That return, moreover, should be sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital. 55/

55/ FPC v. Hope Natural Gas Co., 320 U.S. 591 (1944).

At the outset, it is readily acknowledged that assembling samples of enterprises "with corresponding risks" is a formidable task. It is difficult to specify risk measures that are both conceptually valid and also work. For this reason, virtually all methods used for recommending allowed rates of return share the weakness of relying on data for entities that may not be precisely comparable in risk.

The often-used "comparable earnings approach" examines rates of return on common equity earned in other businesses or industries with risks comparable to those of the natural gas pipeline industry. In their comments, Alaskan Northwest and Northern Border provided information as to returns earned by industry groups for the years 1973-1978. Looking at the average rate of return for all industries combined over the six-year period, the range has been approximately 11.7 to 15.4 percent. 56/

56/ Joint Comments, Tab 1. Data for natural gas utilities show returns in the range of 11.9-16.2 percent.

Another popular technique is the familiar "discounted cash flow" approach. This method attempts to determine the investors' required rate of return by estimating their expected return (dividends and capital appreciation) on the market price of common stock. The application of the discounted cash flow approach to the ANGTS indicates that the investors' required rate of return for natural gas pipeline companies is somewhere in the range of 14 to 16 percent. 57/

57/ Based on recent years' data for Moody's Natural Gas Transmission Company Average, it appears reasonable that investors might expect return on book equity to be 15-16 percent and dividend payout ratios to be 40-50 percent. (See Moody's Public Utility Manual at a16 (1978). Using growth from retained earnings as a proxy for growth in dividends, such data implies an expected growth in dividends of 7.5 to 9.6 percent. (Growth from retained earnings equals return on book equity times the retention rate, or 15 to 16 percent multiplied by 1 minus 40 to 50 percent). Combined with the average dividend yield of 6.7 percent for the first quarter of 1979, a range of 14.2 to 16.3 percent is produced. Since the market-to-book ratio of Moody's Natural Gas Transmission Company Average in recent years has fluctuated around 1.0, there is reason to believe that this calculated range is reasonable insofar as it approximates the earned returns on book equity in recent years.

Sponsors' consultant, also using a discounted cash flow approach, arrived at a range of 15.7 to 16.7 percent. (Joint Comments, Tab A.) In our judgment, this selection of a 9 to 10 percent expected growth in dividends is biased on the high side because of an incomplete and inadequate implementation of this approach. For example, we note the absence of historical book value growth rates for Moody's Natural Gas Transmission Company

(Footnote continued on next page).

The third approach examined by the Commission involves estimating the difference in return that equity investors require over the rate of interest prevailing on bonds. Since market-determined rates of interest are widely available and accepted as meaningful, a measure of the differential between equity return and prevailing interest rates using this information is practical and provides a plausible guide to the equity investors' required return.

Based on the proposition that over long periods an equilibrium is established between investors' earned returns and their required returns, one way to determine a differential between equity and debt returns is to observe the difference between returns realized on risk-less investments (such as U.S. Government bonds) and returns realized on investments in common stock, namely, dividends

---

57/ (Footnote cont'd).

Average even after the sponsors' favorable comments concerning the merit in using them to smooth fluctuations in earnings and to provide a longer term view of potential growth. (Joint Comments at Tab A.) Using the least-squares growth rate in average book value of 8.4 percent for the 1968-1977 period, we can derive an estimate of 15.1 percent for the investor's required return. Furthermore, the assumption of a dividend payout ratio as high as 60 percent in the analysis of the expected dividend growth rate was completely unsupported.

and capital appreciation. Using U.S. Treasury bond interst rates as the riskless rate measure, the equity differential has averaged between 5 and 6 percent over lengthy historical periods. 58/ Thus, adding these equity differentials to current Treasury bond interest rates of about 9 percent produces a required equity return in the range of 14 to 15 percent. 59/

58/ Ibbotson & Sinquefeld, "Stocks, Bonds, Bills and Inflation: Year by Year Historical Returns (1926-74)," Jnl. Bus. (Jan 1976); "Stocks, Bonds, Bills and Inflation: The Past (1926-1976) and the Future (1977-2000)," The Financial Analysts Research Foundation, 1977; see also, Levy "Stocks, Bonds, Bills and Inflation Over 52 Years," Jnl. Portfolio Mngt. at 18-19 (Summer 1978).

59/ Implicit in Hass' analysis of an Operation Phase Rate is a current required return of 15.7 percent for diversified natural gas transmission companies (a "riskless" rate of 9 percent plus an equity "risk premium" of 6.7 percent). See Hass Report at 16-20.

Sponsors' consultant employed the capital asset pricing model, a variant of the risk premium approach, and arrived at a rate of return of 17.33 percent for conventional lower-48 pipeline companies. (Joint Comments, Tab A.) Incorporated in this analysis was a market risk premium of 8.5 percent. The support for a required premium of this magnitude, however, was largely undocumented and unpersuasive. Substituting the 5 to 6 percent premium cited above, the result is a range of 13.9 to 14.9 percent. (Riskless Rate plus Beta times Market Risk Premium or 9.0 percent plus 0.98 times 5 to 6 percent.)

In summary, the Commission's recently allowed rates of return for lower-48 natural gas pipelines have generally fallen within the range of 12-14 percent. In addition, data for recent earned rates of return on common equity and two methods for estimating investors' required rates of return for lower-48 pipelines yield the following ranges:

Estimation Approach	Range of Rates
Comparable Earnings	12 to 15%
Discounted Cash Flow	14 to 16%
Equity Risk Premium	14 to 15%

Given this range of estimates, the Commission must exercise its judgment in determining the reference value for lower-48 pipelines. On balance, the Commission believes that under current market conditions a rate of return in the range of 12 to 15 percent is appropriate to use as a basis for setting the Operation Phase Rate for the ANGTS.

To use this range as a guide for setting the Operation Phase Rate, the Commission must assess how the risk exposure of investors in the ANGTS project during operation compares to the risk-exposure of pipeline investors in the lower-48 states. The Commission believes that the greatest risks faced by investors in the ANGTS will occur during the construction phase. 60/ The risk exposure the Commission is

---

60/ The Project Risk Premium is intended to compensate investors for these risks. See Section II.B.4 (Project Risk Premium).

is attempting to evaluate here concerns the relative risks of the ANGTS and lower-48 pipelines during the operational phase. To compare risks, we first examine why the Alaska project may have greater operating risks than lower-48 pipelines, then examine why risks during operation may be less than those faced by other pipelines. Finally, we weigh and balance the various factors.

Operating aspects of the Alaska project that may be regarded as more risky than operating conditions for lower-48 pipelines are the following:

Arctic operating environment. The project in Alaska will be operating in a harsh environment. The ANGTS could experience problems such as thaw settlement or frost heave affecting the reliability of operations. Innovative techniques such as gas refrigeration will have to be used because of the environment. Environmental restrictions, remote locations, and severe climate may affect the ability to repair the pipeline in the event of a service interruption.

High pressure pipeline. The project will be operating at higher pressure than is conventional. Although the Commission does not expect the higher pressure to affect operating reliability, confirmation will only come through operating experience.

High cost gas. Because of relatively high transportation costs, the gas transported through this system will be expensive compared to other sources of supply. Large cost overruns or partial service interruptions could result in even greater costs per unit of gas. Though the tariff approved by the Commission will allow for rates to recover the full cost of service once service commences (with the exception of equity charges in the event of service interruptions), difficulties in marketing the gas or in collecting the allowed revenues could conceivably occur.

Low equity capitalization. The proportion of equity in the capitalization of the pipeline is expected to be approximately 25 percent, in contrast to an industry average of about 50 percent. In the absence of other considerations, the higher degree of leverage increases the risks to equity investors should there be a diminution of revenues because the fixed costs of the project, including debt service must be paid prior to any return to equity. 61/

61/ Leverage should not be evaluated alone; it must be considered along with other factors of which the most important is the cost-of-service tariff which largely reduces the risk associated with a high proportion of equity investment.

There are also very significant risk-reducing features of this proposal. The most important are:

Cost-of-service form of tariff. By this Order, the project is granted a cost-of-service form of tariff instead of the conventional fixed-rate form. The cost-of-service tariff allows the project to charge rates adequate to recover its full cost of service, even if costs or throughput change over time, without the need for first filing a new rate schedule or obtaining this Commission's approval. In contrast to the fixed-rate tariff, changes in costs or throughput volumes are reflected immediately in the pipeline's rates, rather than after some period required for processing a rate-change application.

The commitment to allow a cost-of-service tariff is a major factor that offsets much of the risk exposure of investors in the ANGTS. The cost-of-service mechanism greatly reduces the risk of inability to earn an allowed return due to increases in cost or reduction in volumes. 62/

62/ Some risk that estimated throughput volumes may not be attained continues to exist. For example, as discussed more fully in the section on tariffs, the segment may be unable to transport the contract quantities because of a pipeline operating problem. If the diminution of service over a one month period amounts to more than 10 percent of contract throughput, the return on equity

(Footnote continued on next page).

With respect to the proposed capitalization, sponsors' consultant urges that the Commission continue to acknowledge the risk increasing effects of financial leverage by allowing a higher equity return for the "thinner" equity of the project. However, we feel that there is much merit in the Staff's argument that the cost-of-service and service interruption provisions in the tariff largely offset the financial risks associated with debt financing. Considering the risks associated with the relative proportions of debt to equity in the capital structure, we believe that the cost of service tariff provisions offset the high degree of leverage proposed by the sponsors and consequently, we feel that ANGTS will face lower financial risks than would conventional pipelines with the same equity capitalization but without the cost of service tariff.

62/ (Footnote cont'd).

will be proportionately reduced. Provision is made for possible makeup transportation at a later date. If all service is interrupted for more than 30 days (a most unlikely event), the return of equity may also be forfeited if the Commission finds that the cause of the interruption was within the project sponsors' control.

Tracking of costs by shippers. In order to further assure that revenues are adequate to cover the cost of service of the project, the Commission's policy will be to allow automatic tracking of Alaska gas transportation costs in the tariffs of gas shippers who are interstate pipelines under our jurisdication. The exact form or nature of the tracking mechanism must await specific applications from shippers to modify or amend their tariffs and may differ from shipper to shipper.

Large reserves-to-production ratio. The reserves of gas at Prudhoe Bay are very large (at least 26 trillion cubic feet) and can supply gas for the pipeline at a rate of 2.4 billion cubic feet per day for at least 20 years without exhausting the reserves. This reserve-to-production ratio is much larger than for most other natural gas pipelines and provides assurance that gas supply will be adequate to allow the full recovery of capital investment in the project. Thus, as compared to most pipelines that have reserve commitments that generate significant risk-exposure, the ANGTS is in an enviable position.

Rolled-in pricing. In order to reduce marketing risks for this relatively high cost gas, the Congress, as part of the Natural Gas Policy Act, directed that the transportation cost and wellhead price for this gas will be "rolled-in" or averaged with cheaper sources of supply and

sold to higher priority users. Thus, even if this gas is more expensive than some other sources of supply, potential problems of marketability are reduced since shippers are assured that they will not have to market this gas separately from other sources of supply.

Weighing all the risk-increasing and the risk-reducing factors, the Commission concludes that the risk exposure of ANGTS investors during the operation phase of the Alaska segment of the project will be somewhat higher than the risk-exposure of investors in the typical or average lower-48 pipeline. Thus, the Commission believes that an allowed Operation Phase Rate near the upper end of the range of rates discussed previously for lower-48 pipelines (12 to 15 percent) is reasonable for the Alaska segment of the project. The Commission selects 14 percent as the Operation Phase Rate for the Alaska segment. 63/

63/ Sponsors' asserted that the implementation of the comparable earnings approach confirmed the reasonableness of a previously deduced 18% return on common equity for the ANGTS project (as opposed to typical lower-48 pipelines). (Joint Comments at Tab A.) They initially contended, without adequate support, that the ANGTS project should be viewed as a relatively risky enterprise during its operation. This unsubstantiated position presumably underlies the 18% return recommendation. They then attempt to further justify this recommendation merely by noting that the 18% value falls in the upper deciles of the earned returns on common equity for over four thousand

(Footnote continued on next page).

63/ (Footnote cont'd).

publicly held corporations. The apparent rationale here is that risk and earned returns on common equity are directly related. The sponsors nowhere establish, however, that high earned returns on common equity are necessarily associated with high risk.

Hass recommended 14.4% as the Operation Phase rate for the Alaska segment and 12.5% for the Northern Border segment, Hass Report at 20, while Staff contended that 11.5% and 10.5 percent, respectively, are more appropriate. Initial Comments of the Commission Staff on Company Tariffs and Incentive Rate of Return, Docket No. RM78-12 at 76-77 (May 4, 1979). [Hereinafter Staff Initial Comments]. Both took the position that investors, primarily because of the cost-of-service tariff, would perceive the ANGTS project as being a less risky investment than investments in lower-48 pipelines. However, while Hass' analysis enables one to see the steps leading to his conclusion, Staff's analysis is wholly subjective and no attempt is made to justify the current appropriateness of a 13% allowed return for conventional pipeline companies or how Staff's risk analysis led it to conclude that 10.5 - 11.5 percent is a reasonable range for the ANGTS project. Although the Commission recognizes the risk reducing nature of many of the issues discussed by Staff, we believe that Staff's qualitative analysis does not give sufficient consideration to how the uncertainties associated with the ANGTS project will impact on investors' required returns.

Staff attempted to confirm the reasonableness of its recommendation by duplicating, with some adjustments, the type of risk premium approach employed by Hass. We believe, however, that Staff's version of the Hass approach is flawed in several respects. For example, the 12.9% figure that Staff used as representative of allowed return for natural gas pipeline in 1975 was not shown to be equal to the investors' required return. Furthermore, for the risk premium approach to have any validity, investors' required returns for debt and equity securities must be compared during the same time period. Staff, however, relates this 12.9% figure to a current riskless rate rather than the riskless rate

(Footnote continued on next page).

The Commission also concludes that the operation phase risk exposure of investors in the Northern Border segment is lower than the risk exposure of investors in the Alaska segment. The environmental and other risk-increasing factors pertinent to the Alaska segment are not as important here. The major risk imposed on investors by the tariff is that the return on equity or the return of equity may be reduced because of service interruptions.

The Northern Border system will be located in an area which is geologically more stable and readily accessible for any repair work which might be required. Along most

---

63/ (Footnote cont'd).

prevailing in 1975, as Hass did. Finally, Staff's downward adjustment of its derived 3.9% equity risk premium for the alleged lower risks of the ANGTS project by the same absolute percentage points as reflected in Hass' analysis, rather than by the same relative percentage, is questionable.

Hass also suggested the use of a rate indexed to interest rates, rather than a fixed-rate. Given current uncertainties with regard to inflation and capital market developments, there is undoubtedly some merit to such a proposal, as evidenced by the increasing use of variable or "floating" interest rates for long-term debt instruments. The Commission is aware that certain portions of the financial community are becoming more interested in the concept of indexing. At this point, however, the Commission does not believe that such a mechanism is necessary. Should the project sponsors discover that such a mechanism would facilitate project financing, the sponsors are certainly free to petition the Commission to impose such a condition.

of Northern Border's route, it will traverse areas which are already served by one or more of the major pipeline systems in the lower-48 transmission network. We believe that because of its location, the operating problems of the Northern Border segment will not be significantly greater than for other lower-48 pipelines. Consequently, the cost-of-service tariff, tracking provisions, and rolled-in pricing reduce the risks of this segment below that of the Alaska segment. The Commission finds, therefore, that 13 percent is a reasonable Operation Phase Rate for the Northern Border segment.

4. Project Risk Premium

The Project Risk Premium is added to the Operation Phase Rate to compensate investors for their risk exposure during the construction of the pipeline. The possibility of not completing the pipeline is the major risk faced by investors in the ANGTS. A key feature of the President's Decision is its emphasis that this risk of non-completion shall be borne by equity investors and other beneficiaries of the project, such as the State of Alaska or the producers at Prudhoe Bay, rather than by gas consumers or the general public through government loan guarantees. 64/ Consequently, the Decision states that charges may be levied on consumers only after the "completion and commissioning of operation of the system." 65/ If the project is abandoned prior to the initiation of service, investors cannot expect to recover their investment through charges on gas consumers.

The sponsors of the Alaskan segment presented a basic approach or methodology for determining these values of the Project Risk Premium in a paper submitted to the Alaskan Delegate on March 7, 1979, and distributed to all

---

64/ Decision at 124.

65/ Decision at 38.

interested parties. 66/ The Commission adopts the general methodology earlier used by the project sponsors, but disagrees with certain key parameter values. 67/ Use of more appropriate values results in a Commission estimate of the Project Risk Premium substantially lower than the sponsors' estimate. 68/

First, the Commission has assumed a seven-year schedule of testing and construction, beginning in 1978 and ending in 1984, instead of the longer eight-year schedule assumed by the project sponsors. Even a seven-year schedule is significantly greater in length than the schedule that was presented to the President and the Congress as part of the March 1977 cost estimate. That estimate was based on a construction schedule that would be essentially complete by

---

66/ A similar but more elaborate methodology was proposed by Hass, Hass Report at 20-40.

67/ Since the project sponsors in their comments make no reference to this methodology nor comment on the Commission's use of this approach, it is not clear whether they still advocate this approach.

68/ The April 6 Notice identified four issues the Commission believes are important in determining the Project Risk Premium and invited comments on these issues. Based on a review of these comments, the Commission has altered its view of the Project Risk Premium in a number of significant respects.

the end of 1981, with some additional work on compressor stations in 1982.

Second, the Commission has based its calculations on th assumption that there is at least a 67 percent chance that the current sponsors will be able to complete the system. In their paper, the sponsors assumed only a 30 to 40 percent probability of completing the system. The Commission's utilization of 67 percent by no means indicates its belief that the odds for completion of the project are two out of three. However, the Commission also cannot accept the sponsors' representation of a one out of three probability of project completion. The assumption chosen here merely makes certain that the Project Risk Premium compensates for a reasonable estimate of non-completion risk. 69/ The Commission believes that the low probability of success assumed by the sponsors contradicts the assurances given to the President and the Congress, at the time of the President's Decision, that this project could be privately financed under the conditions imposed by the Decision. Consequently, the Commission cannot accept the sponsors' assumptions, and does not believe that it is reasonable to allow a large Project Risk Premium on the basis that it is needed to compensate investors for an assumed small chance of successful completion.

Third, in calculating the Project Risk Premium the Commission makes no provision for the possibility that the

---

69/ The Commission notes, in this regard, that comments on the reasonableness of the assumptions concerning the probability of project abandonment and construction schedules were sought from the sponsors in the Notice of Proposed Rulemaking (at 26). None were forthcoming.

sponsors could recover part of their investment through charges on existing customers in the event of abandonment. The Commission believes that the President's Decision did not contemplate such charges, and that plans and present decisions should be made on the assumption that cost recovery from rate-paying consumers will not be allowed in case of abandonment. The Commission recognizes, however, that substantial tax savings could accrue to investors in the event of abandonment. The lost investment is a loss for tax purposes and would reduce the tax payments of the project sponsors by an amount approximately equal to one-half of the investment. 70/

Fourth, the project sponsors' paper and the Commission's April 6 Notice assumed substantially different values for the rate of return used to calculate the allowance for the funds used during construction (AFUDC) included as part of the "risk adjusted rate base." 71/ The project sponsors

---

70/ The only exception would be if a partner did not have a taxable income larger than the lost investment. Even in this event, loss carry forward provisions would allow the loss to be deducted from past and future income.

71/ The equity AFUDC rate is conceptually quite different from the actual rate the Commission will allow for determining AFUDC and it is used only to derive the theoretical construct of the "risk adjusted rate base".

proposed 15 percent, while the Notice proposed a lower rate of 9.5 percent. 72/ The Commission stated in the Notice that the risk of non-completion was essentially the only risk faced by investors during construction, and that this was compensated for by the "risk adjusted rate base" and the resulting Project Risk Premium. Under this concept, an equity AFUDC rate for calculating the "risk adjusted rate base" should be very low and incorporate no explicit compensation for risk. The Commission used 9.5 percent, which is comparable to the rate obtainable on low risk government securities.

72/ Staff's arguments in their initial comments recommending a 4.5 percent after-tax risk free equity AFUDC rate in calculating the risk adjusted rate base are not persuasive. Staff Initial Comments at 80. Staff is confused by the fact that the equity investors in the Alaska gas project are themselves likely to be corporations (the sponsor companies) rather than individual stockholders and thus must pay the corporate profits tax on any interest income at a rate of approximately 50 percent. Staff's argument is that a low risk alternative to an equity investment in the Alaska gas project would be an investment in government bonds from which the interest income would be subject to the corporate profits tax rate. This is misleading since the sponsoring companies can best be thought of as intermediaries for their own stockholders. The choice to a stockholder in a sponsor company is to invest in the Alaska project indirectly through the sponsor company or to invest in a low risk government security. From the perspective of a stockholder in a sponsor company, the interest income and the return on equity are both on the same tax basis (after corporate tax but prior to the personal income tax) and are in fact comparable.

AGO 886060

The project sponsors, on the other hand, asserted that the methodology for calculating the Project Risk Premium only explicitly compensated for the extraordinary risk of non-completion for this project, and that any compensation for the normal risks of building a pipeline, including a competitive pre-decision risk, must be incorporated in the value of the AFUDC equity rate. 73/ The Commission has been persuaded by these arguments and has used an equity AFUDC rate to calculate the "risk adjusted rate base" that is equal to the Operation Phase Rate of 14 percent.

Based primarily on the project sponsors' methodology, and using most of the same parameter values, with one important exception, the Commission has calculated a

---

73/ One particular risk for which this higher value of the equity AFUDC rate compensates is the risk incurred during competitive proceedings before this Commission. The Commission regards this risk as one of the normal risks of the pipeline business, for which the normal rate of return allowed regulated gas pipelines, and thus the Operation Phase Rate for this project, provides compensation. Thus, the Commission's calculation of the "risk adjusted rate base," and the Project Risk Premium, in this Order does not explicitly consider the probability of abandonment prior to the Decision and the issuance of the conditional certificates of public convenience and necessity in December 1977. In their initial comments, both the State of New York and the Upper Tanana Development Corporation argued against a higher Project Risk Premium to compensate for this risk, and no party argued for it.

Project Risk Premium of 2.0 percentage points for the Alaska segment. 74/

74/ The time profile of equity investment is taken from the response of the sponsor to an interrogatory from the Alaskan Delegate (dated May 3, 1979) which was served on all parties. As stated earlier, the probability of successful completion is assumed to be approximately 67 percent, making the chance of abandonment approximately one-in-three. The equity AFUDC rate used to calculate the "risk adjusted" and normal rate base is the Operation Phase Rate of 14 percent.

The calculations necessary to derive the Project Risk Premium for the Alaskan segment discussed herein are as follows:

	1978	1979	1980	1981	1982	1983	1984
Equity Investment (% of total)	9.0	5.3	5.3	20.1	27.5	20.1	12.7
Normal Rate Base (RBN) (14.0 % AFUDC rate)	10.26	17.74	26.26	52.85	91.60	127.34	159.64
Risk of Abandonment	.06	.12	.12	.05	.03	.01	.005
Risk Adjusted Rate Base (RBA) (14.0 % AFUDC rate)	10.63	19.66	31.00	59.23	100.89	138.88	173.42

Project Risk Premium = .1931 (173.42/159.64 - 1) = .0167

Applying a higher equity AFUDC rate (e.g., 14 percent vs 13 percent) to the RBA/RBN ratio results in a lower Project Risk Premium, other factors being equal. Under the conditions

(Footnote continued on next page.)

For the Northern Border segment, the construction p risks are considerably less than for the Alaska segment. Essentially, Northern Border will be of conventional pipe design, traversing areas where natural gas pipelines have previously been constructed. Thus, the likelihood of proj abandonment during construction due to extreme cost overru is virtually non-existent.

The required expenditures on pipeline design, engineeri and testing for Northern Border are of a lower magnitude relative to total costs than for the Alaskan segment. Hence, if Northern Border had to be abandoned during the early stage of pipeline design and engineering, the lost investment relative to total cost would be less than for Alaska.

74/ (Footnote cont'd)

above, as an example: Project Risk Premium at 14% = 1.67; at 13% = 1.87. As indicated above, the fact that the Commission specifies a lower AFUDC Rate than contemplated in Order No. 17, results in a higher Project Risk Premium and a higher Center Rate. The premium of 1.67% would be fair compensation for the risk-neutral investor who was willing to accept a fair gamble in the narrow statistical sense. The Commission, however, believes that the premium must be higher to compensate risk averse investors and has selected a value of 2.0%. For more information about the methodology, see Northwest Alaskan, "Determining Project Risk Premium," cited at n.11 above.

The Northern Border segment also has the potential for transporting gas from two sources of supply, Western Canada as well as Alaska. Because of the possibility of "pre-building" most of Northern Border to carry Canadian gas in advance of Alaskan gas, the risk of abandonment of Northern Border will be obviated sooner than the risk of abandonment of the Alaska segment.

Weighing all of these factors, the Commission concludes that the appropriate Project Risk Premium for the Northern Border segment is 1.5 percent.

5. IROR Risk Premium

The IROR Risk Premium is to compensate equity investors for the risks introduced by the variability in the allowed rate of return created by the IROR mechanism. The IROR Risk Premium, when added to the Operation Phase Rate and the Project Risk Premium, yields the Center Rate. 75/

The IROR Risk Premium compensates for the various uncertainties attendant to implementing a new regulatory mechanism. For example, since the Inflation Adjustment and Change in Scope mechanisms established in this Order have no prior history, some uncertainty exists regarding their implementation and their effects on the return that will finally be realized by investors in this project. As is discussed more fully in Section III, the composite inflation index required by the Commission may over or underestimate the actual inflationary experience

---

75/ In order for the ANGTS to obtain private equity financing, the IROR schedule must be designed in such a way that the statistical concept of the expected discounted stream of revenues (i.e. depreciation and return on equity) is at least equal to the expected discounted equity investment. Because of the design of the IROR schedule, the discounted expected returns to equity investors will exactly equal the expected equity investment if the Center Rate equals the cost of equity capital to the project, given the risks of the project.

of the project during construction. This creates additional uncertainty about the final outcome of the IROR mechanism. This uncertainty is the major reason why the Commission has decided to increase the IROR Risk Premium for Alaska from the 0.5 percent proposed in the April 6 Notice to the figure, established in this Order, of 1.5 percent. Similarly, the IROR Risk Premium for Northern Border has been increased from 0.25 percent to 0.5 percent.

Suppliers of very large sums of equity capital are likely to be risk averse. If presented two investments, both of which have the same average expected rate of return but one has a wide range of possible outcomes and one has a smaller range, most investors would prefer the latter. This would be true even if possible positive returns balance possible negative returns. Most investors prefer relative certainty to variability; therefore variable rates of return have to be higher than relatively sure rates of return.

Adoption of an IROR schedule confronts investors with a variable allowed rate of return in the form of a schedule of rates depending on cost control performance, rather than the single allowed rate of return as provided in the usual situation for public utility investment. Moreover, while

in the usual utility investment, actual or realized rates of return may vary from allowed rates of return due to unanticipated inflation, demand shifts, or other economic changes, this project could have more variance due to the inflation and Change in Scope adjustments. Thus, an IROR Risk Premium is necessary to attract private equity investment in the project as compensation to investors for the risk created by the variable allowed rate of return.

There is no clear basis for determining the trade-off between a single allowed rate of return and a schedule, but the Commission in its judgment has concluded that a 1.5 percent IROR Risk Premium is appropriate for the Alaskan segment and that a 0.5 percent IROR Risk Premium is appropriate for the Northern Border segment. 76/ These figures, when added to the Non-Incentive Rate, yield Center Rates of 17.5 percent and 15.0 percent, for the Alaskan and Northern Border segments, respectively.

76/ Hass concludes that ". . . the IROR Risk Premium does not need to be very high and could be set to zero with justification." Hass Report at 42. Project sponsors, on the other hand, have expressed a concern that uncertainties associated with the IROR mechanism compound the already formidable task of arranging private financing for the project.

The State of Alaska has argued in its comments that the IROR Risk Premium is unnecessary and inconsistent with the rationale presented for it by the Commission. It states that the expected rate of return, in the statistical sense, can never be less than the Non-Incentive Rate (that is, the sum of the Operation Phase Rate and the Project Risk Rate) and will probably exceed the Non-Incentive Rate. It concludes that there is no downside risk inherent in the IROR mechanism and that even a schedule which embodied no IROR Risk Premium would offer investors a schedule of returns which are higher than necessary to induce equity investment in the project.

The Commission is not persuaded by these arguments because they fail to address the fundamental issue of the variability of the earned rate of return relative to the Center Rate. The actual Cost Performance Ratio, and thus the Incentive Rate which will be achieved, is by no means known with certainty. By definition, there is some probability of a Cost Performance Ratio in excess of the Center Point. Therefore, investors face the possibility of receiving a rate of return less than the Center Rate, even though the expected rate of return (by the narrow statistical definition) may be in excess of the Non-Incentive Rate.

The IROR mechanism does confront investors with downside risk, and thus, a reasonable IROR Risk Premium is appropriate. 77/

The Commission Staff has proposed that no IROR Risk Premium should be incorporated into the IROR schedule. They assert that upside variance in returns (i.e., the contribution to that variance due to returns above the expected

---

77/ In addition, the Commission does not agree with the State of Alaska that an IROR schedule which embodied a zero IROR Risk Premium would offer investors higher returns than necessary. Although it is true, as the State of Alaska notes, that the statistical concept of the expected rate of return is likely to exceed the Center Rate, rational investors are not likely to base their investment decisions on the expected rate of return, per se. The expected rate of return is a weighted average of all possible rates of return, using as weights the assumed probabilities of each rate of return being received. Such a procedure does not take into consideration the different levels of investment associated with different allowed rates of investment return. A rate of return in excess of the Center Rate would be received on a smaller rate base than a rate of return which is less than the Center Rate. Thus, the dollar amount of gain, in an opportunity cost sense, from achieving a Cost Performance Ratio less than the Center Point by a certain percentage would be smaller than the dollar amount of loss resulting from achieving a Cost Performance Ratio in excess of the Center Point by the same percentage. In order to induce investment in the project, the expected discounted dollar amount of return to investors from the project must be at least equal to the expected discounted dollar amount of incremental investment. As was shown in the April 6 Notice, a zero IROR Risk Premium would produce an expected discounted return just equal to the investment.

AGU 886069

level) is a desirable feature to investors. They contend that since the upside variance due to the IROR mechanism is proportionally much greater than the downside variance (i.e., the contribution to total variance due to returns below the expected level), no IROR Risk Premium is needed.

This approach for assessing risk is one with which the Commission has had no previous experience. Even if the ratio of good or upside variance to bad or downside variance is a useful measure of risk, the Commission is uncertain as to how it should be employed in determining the IROR Risk Premium. While the Staff's approach is interesting, it is not sufficiently developed to constitute a reliable basis for Commission action.

In sum, in light of those attributes of the rate of return mechanism for this project that could produce a variance between actual and allowed rates of return greater than the variance usually observed in regulated situations, it is appropriate to establish a special IROR Risk Premium. The Commission's judgment is that on the basis of an overall assessment of the project, 1.5 percent is reasonable for Alaska and 0.5 percent is reasonable for the Northern Border.

6. Marginal Rate

a. Definition

The Marginal Rate is the return on the incremental dollar invested in moving from one Cost Performance Ratio to another. Alternatively, it can be thought of as the rate of return allowed on cost overruns or the rate of return enjoyed if costs can be reduced. However, as previously discussed in Section I, a single Incentive Rate will be earned on all investments in the project. The marginal rate is merely an analytical device for determining, in part, what the rate of return will be depending on cost performance.

This order establishes an overall schedule of rates of return called the IROR schedule, but implicit in any schedule is one or more Marginal Rates of Return. To illustrate this relationship between the overall IROR schedule and the Marginal Rate, consider the following abbreviated IROR schedule where the marginal rate is constant at 8 percent. When the marginal rate is applied to the additional equity investment, the average rate of return on equity (IROR) is reduced.

Equity Share of Capital Costs	Cost Performance Ratio	IROR
$ 1.2 million	1.2	18.29
1.3 million	1.3	17.50
1.4 million	1.4	16.82

Assume that the Cost Performance Ratio of 1.3 has already been reached shortly before project completion and the equity share of these costs is $1.3 million. But in order to complete the project, additional funds equal to 10 percent of projected costs must be expended. The equity share of this increase is $100,000. This increases the Cost Performance Ratio to 1.4. Because of this increase in costs, the IROR is reduced from 17.50 percent to 16.82 percent. This reduction occurs because the Marginal Rate implicit in this schedule is 8 percent and the equity investor will only earn an 8 percent return on his $100,000 investment. 78/ Conversely, if the project sponsor can find some way to reduce construction costs so as to reduce the Cost Performance Ratio from 1.4 to 1.3, then the equity

---

78/ The IROR for the Cost Performance Ratio of 1.4, i.e, 16.82 %, can be calculated as the weighted average of the 17.50 % return allowed for the 1.3 Cost Performance Ratio and the 8 % Marginal Rate earned on the $100,000 increase in costs.

The weights in the average are the share of the total investment earning each of the two rates of return.

(1.3/1.4) x (17.50 %) + (0.1/1.4) x (8.0 %)
= (0.92 %) x (17.50 %) + (0.071) x (8.0 %)
= 16.25 % + 0.57 %
= 16.82 %

Again, however, there is only one overall rate of return, in this case 16.82 %.

investor will have avoided investing $100,000 at the low Marginal Rate of 8 percent.

b. Impact of the Marginal Rate

The Marginal Rate plays three important roles in the IROR mechanism:

(1) Incentive to reduce costs. Because the Marginal Rate is the implicit rate of return allowed on all equity to finance increases in costs, this rate primarily determines the incentives to reduce costs created by the IROR. If the cost of capital is more than the allowed return, investors have a strong incentive to avoid making that investment. In addition to any other incentives already in existence, the Marginal Rate will create an incentive to reduce costs if the Marginal Rate is set below the cost of capital. 79/

79/ In their joint initial comments, the sponsors argue that the fundamental incentive to reduce or control cost: is the need to remain within the pool of funds committed to the project. (Joint Comments at 36.) We agree that this financial restriction will create a powerful and practical incentive. Marginal Rate is designed to discourage the expenditure of funds which exceed the cost estimates upon which the project was certificated. This is a separate and distinct issue from that raised by the sponsors of whether the funds will be available to finance will be available to finance cost overruns. The President's Decision is clear that the IROR must be constructed so as to create "substantial incentives" to reduce costs. The Commission, to meet this requirement, must consider the implicit Marginal Rate in the IROR schedule and compare it with the cost of equity capital for this project.

(2) Slope of IROR schedule. The Marginal Rate determines the steepness of the IROR curve. A low marginal Rate will mean that the Incentive Rate will decline more as cost overruns occur. A high Marginal Rate will mean that the Incentive Rate will decline slowly as cost increases occur. From another perspective, a low Marginal Rate creates greater risk or uncertainty about the final outcome since the range or variability of rates is large. A high Marginal Rate creates little or no variability, and provides a substantial likelihood that even if there is substantial cost growth relative to the projected costs the earned rate will be close to the Center Rate.

(3) Floor of the IROR schedule. If a constant Marginal Rate is used, the Marginal Rate then becomes the floor on the IROR schedule. Since the Marginal Rate is effectively the rate allowed on all cost increases, the Incentive Rate can never be reduced below the level of the Marginal Rate no matter how large the Cost Performance Ratio becomes.

AGO 886074

(c) Alternative Marginal Rates

In the Commission's April 6, 1977 Notice, in the comments received pursuant to this Notice, and in comments received in the earlier rulemakings dealing with the IhOR, a number of different methodologies or approaches have been advocated for determining the Marginal Rate. The fundamental principle in choosing a Marginal Rate is that it should be less than the cost of equity capital. However, the comments demonstrate considerable controversy about the appropriate measure of the cost of capital and how much less the Marginal Rate must be. Here, we will review briefly the alternative approaches suggested to the Commission and discuss their merits. The Commission, however, must exercise its best judgment and choose a reasonable value from the various values presented in the comments.

The highest value for the Marginal Rate has been advocated by the project sponsors, Northern Border and Northwest Alaska. That rate is 12 percent. Their argument is that the Marginal Rate only needs to be slightly less than the "rate potential investors will require to accept the Project's risks," or, in other words, only slightly less than the Operation Phase Rate plus the Project Risk Premium. (Initial Comments, page 30). This order specifies that rate to be 16.0% for the Alaska segment and 14.5% for Northern Border.

The Commission, however, believes that there are three compelling reasons why the Marginal Rate must be substantially less than the Operation Phase Rate plus the Project Risk Premium to create a significant incentive. First, the risk of an investment in this project is reduced substantially as the project nears completion. 80/ In fact, an investment just prior to completion has avoided all of the construction phase risks and is only confronted with the operation phase risks. Even adopting the sponsors' argument that the Marginal Rate need only be slightly less than the rate required to compensate for the risks of the project, the relevant rate is the Operation Phase Rate. This Order specifies an Operation Phase Rate of 14.0 percent for Alaska and 13.0 percent for Northern Border.

Second, the Commission believes that the incentive to reduce costs increases as the difference between the Marginal Rate and the rate that would otherwise be adequate compensation for the risks of investment increases. A Marginal Rate only slightly less than the Operation Phase Rate will only create a slight incentive to avoid overruns. In order to create a substantial incentive, the Marginal

---

80/ See, e.g., Northwest Alaskan, "Determination Project Risk Premium" at 39.

Rate must be substantially less than the Operation Phase Rate. 81/

Third, the Commission believes that it may be appropriate in determining the Marginal Rate to examine the cost of the funds used to make the equity investment in the project. If the equity investor can borrow a substantial portion of the funds to make the investment, then th · average cost of funds could be much less than the Operation Phase Rate. In the Commission's September 15, 1978, Revised Notice of Proposed Rulemaking (at page 45), an example was presented where equity investors could borrow 60 percent of the funds to make an equity investment in the Alaska gas project. This produced a weighted cost of capital funds of about 8 percent. 82/

The lowest value of the Marginal Rate was advocated in the comments by the Staff. The Staff argued th·t a zero Marginal Rate was appropriate by analogy to the proposed

---

81/ See, Initial Comments of the People of the State of California and the Public Utilities Commission of the State of California at 3 (May 4, 1979) which, for a similar reason, advocated a Marginal Rate of 5 %.

82/ This figure is derived from:

(share of equity) x (equity rate of return)
+ (share of debt) x (after-tax cost of debt)
= (0.4) x (13 %) + (0.6) x (5 %) = 8.2 %

tariff provisions that would reduce equity return in the event of a service interruption. Since the return on equity is reduced proportionately to the reduction in throughput resulting from a service interruption, the return on equity per thousand cubic feet (Mcf) of throughput would be constant 83/ This provision provides an incentive for sponsors to minimize or reduce service interruptions. The Staff argues that the same incentive should be provided to sponsors to reduce construction costs. A zero Marginal Rate would effectively keep the total dollar equity return constant for all levels of cost overruns or underruns and thus all levels of equity investment.

Though this analogy with the service interruption provision of the tariff is interesting, the Commission believes that the circumstances surrounding the two situations are quite different. In setting the Marginal Rate, the primary criterion is to reduce the equity return on cost increases to a level less than what equity can earn in other investments of similar risk. This same criterion is not relevant for the service interruption tariff provision. The

---

83/ The reduction in equity return only occurs if the service interruption reduces throughput to less than 90 % of the contracted quantities.

AGU 886078

Commission believes that a zero Marginal Rate would be unnecessarily below the rate of return necessary to create a substantial incentive to avoid cost overruns.

The project sponsors, in their initial comments, argue that a low Marginal Rate may well prevent the project from obtaining both equity and debt financing (Initial Comments, Tab 4, pp. 7-8, and pp. 18-21). The Commission believes that the IROR schedule will prevent equity financing only if potential investors perceive such a high probability of large cost overruns that the IROR mechanism would result in a low average rate of return. The Marginal Rate has been set at a relatively high level in part to assure that the Incentive Rate -- the rate that the project will actually earn -- will decline only gradually as actual costs exceed projected costs. As will be discussed in the later section dealing with the overall impacts of the IROR mechanism, the allowed rate of return for the project is competitive with other project investments in the gas industry and the economy in general. If investors perceive a high probability of such large overruns that the realized rate of return will be low, then it would seem to follow that the projected costs and estimates of cost overruns have grown to such an extent since the President's Decision that the construction of this project may not still be in the public interest.

The project sponsors list three reasons why a low equity return may prevent debt financing even if equity financing is available. 84/ All of these reasons are only relevant if there is a significant probability that large cost overruns will reduce the Incentive Rate to a low level. The project sponsors however, fail to mention what the Commission considers to be the greatest deterrent to the attraction of debt capital for this project, the threat of such a large amount of cost growth that the economic viability of the

---

84/ Initial Comments, Tab 4, at 7. These reasons are:

(1) The project must offer an equity return high enough to attract completion capital from investors who did not participate in the initial financing. The Commission's response is that the original investors may have to sacrifice some of their return in order to make the project attractive to new investors in the event of large overruns or else face the loss of their investment due to abandonment. A similar argument was made by the State of California in its initial comments (p. 3).

(2) Debt amortization schedules may require that the debt principal payments be funded in part from the equity returns. The Commission notes that the IROR mechanism does not interfere with the return of equity through depreciation but only reduces the return on equity. It would seem to be very unlikely that debt amortization would exceed the total depreciation expense for the project.

(3) Debt investors will consider debt coverage ratios in their decision to invest and the IROR may reduce these ratios. The Commission believes that the cost of service tariff for this project reduces the importance of conventional measures of debt coverage.

project would threaten the security of the debt investor. The IROR mechanism requires the project sponsors and other equity investors to suffer a low rate of return only if large cost overruns occur. If the equity investor is willing to go ahead with the project, then he must be confident that the cost estimates for the project are accurate and large cost overruns will not occur. The existence of equity investment, then, should assure the debt investors that large cost overruns will not occur. Thus the debt investment should be secure.

The Commission, in choosing a Marginal Rate, must balance the requirement in the Decision that the IROR mechanism provide "substantial incentives" with the need to attract equity and debt financing. The Commission has set a relatively high Marginal Rate. An 8 percent Marginal Rate will not lower the levels of the Incentive Rates unless very large cost overruns occur. However, we believe that an 8 percent Marginal Rate is sufficiently below the rates of

return that equity investors could earn elsewhere so as to provide a significant incentive for superior cost control. 85/

85/ The State of New York suggests that the Marginal Rate should be reduced for large values of the Cost Performance Ratio, but does not explain what specific benefit would result from this proposal. Comments of the Public Service Commission of the State of New York on Proposed Values for Incentive Rate of Return, Change of Scope and Inflation Adjustment and Tariff Issues, Docket No. RM78-12 at 6 (May 4, 1979). During this and the previous rulemakings dealing with the IROR mechanism, the Commission has examined a number of proposals for a non-constant Marginal Rate. Upon close re-examination of this issue, the Commission fails to see any significant benefits that would result from a non-constant Marginal Rate.

7. Synopsis of Components

The following table presents the determined values for the IROR parameters:

Parameter	Segment	
	Alaskan	Northern Border
Center Point 86/	1.30	1.10
Operation Phase Rate	14.00	13.00
Project Risk Premium	2.00	1.50
IROR Risk Premium	2.00	.50
Center Rate	17.50	15.00
Marginal Rate	8.00	8.00
Equity AFUDC Rate	14.00	13.00

With these values the entire range of the IROR schedule can be calculated. 87/ The result of the calculation is produced below in tabular form:

86/ These values for the Center Point are used only for illustration. The values for this component for each of the segments will be determined at a later date. See section II.B.2.

87/ The formulas by which the calculation would be made gives any Cost Performance Ratio (A) would be:

(1) For Alaska: $R = [(17.5)(1.3) + 8(A - 1.3)]/A$
$= 8 + 12.35/A$

(2) For Northern Border: $R = [(15.00)(1.1) + 8(A - 1.1)]/A$
$= 8 + 7.7/A$

Where: R = the incentive rate of return

INCENTIVE RATE OF RETURN

Cost Performance Ratio	Alaska	Northern Border
0.8	23.44	17.62
0.9	21.72	16.56
1.0	20.35	15.70
1.1	19.23	15.00
1.2	18.29	14.42
1.3	17.50	13.92
1.4	16.82	13.50
1.5	16.23	13.13
1.6	15.72	12.81
1.7	15.26	12.53
1.8	14.86	12.28
1.9	14.50	12.05
2.0	14.17	11.85
2.1	13.88	11.67
2.2	13.61	11.35
2.3	13.37	11.35
2.4	13.15	11.21
2.5	12.94	11.08

C. One-Time Adjustment to Rate Base

Order No. 17 specifies a procedure for determining a one-time adjustment to the rate base of the project, in lieu of using the Incentive Rate during the operating life of the project. This section reviews the rationale for this procedure, and describes how the one-time adjustment will be calculated, including examples. Also, this section discusses certain accounting, ratemaking, and tariff implications of the one-time adjustment that were not included in Order No. 17.

The preceding analysis of the IROR mechanism is based on the premise that the Incentive Rate would be applied to the actual equity component of the project's rate base to determine the cost of service. However, Order No. 17 requires an alternative but equivalent procedure. Instead of applying the Incentive Rate to a normal rate base, the Operation Phase Rate will be applied to an adjusted rate base. The adjustment to the capital structure and rate base will be such that the present worth of the future income or cash flow to equity investors will be the same as would result from using the Incentive Rate and an unadjusted rate base. The one-time adjustment would be amortized with the annual amortization charge included in the cost of service and the Operation Phase Rate would be earned on the unamortized portion of the one-time adjustment.

The Commission has adopted the one-time adjustment

approach for two reasons. First, the use of a one-time adjustment simplifies the determination of just and reasonable rates of return in the future, because the risks attached to the construction phase, including the risk of the IROR mechanism itself, are already recognized in the adjusted capital structure and rate base. By compensating for these risks through an adjustment to the project's rate base, future rate of return determinations need only address project risks and financial market conditions at the time of determination, not those risks associated with the construction of the project which took place in the past.

The second reason is to simplify future financing for, and rate determinations on, expansions or looping of the ANGTS. The risks of participation in this project prior to and during construction are significantly different from the risks associated with project investments made in the future when in an operational phase. 88/ The IROR mechanism is a concept

---

88/ The project sponsors have already provided some recognition of the changing nature of project risks as the project progresses with the discount schedule for late entry which was made part of their Partnership Agreement. The Commission endorsed that concept in approving the relevant portion of the Partnership Agreement, by Order of June 30, 1978, in Docket No. CP78-123 (at pp. 7-11), and seeks to reinforce it with the rate base adjustment methodology.

developed to recognize the project sponsors' performance in the initial construction phase only, and the resulting adjustment should not affect the return on future investment in an expansion of that project. The one-time adjustment ensures this result without the need for separate return determinations for investments made in the ANGTS at different times.

The Commission believes that the adjustment should be the present value of expected future cash flows 89/ resulting from the application of the difference between the Incentive Rate of Return and the Operation Phase Rate as applied to the equity-supplied capital of the system. 90/ Table illustrates how to calculate the one-time adjustment that

---

89/ The expected cash flow includes both the return on and the return of the one-time adjustment. The one-time adjustment is, in effect, additional equity provided to the project as a result of the performance of the sponsors during construction.

90/ Some of the comments argue that uncertainties about the future operation of the pipeline will make the present value of the return of equity and the return to equity uncertain, and thus make the precise size of the one-time adjustment uncertain. The Commission agrees that it is impossible to predict with certainty such things as throughput, tax rates, operation costs, or ultimate capacity. However, the type of cost-of-service tariff that this Commission is likely to approve will provide a high degree of certainty as to the return of equity and the return to equity over the life of the project, once the size of the equity investment and the allowed rate of return have been finalized.

is equivalent to an Incentive Rate of 17 percent when the Operation Phase Rate is 14 percent. Instead of earning a 17.5 percent return on the unadjusted equity investment in the project, the investor will earn a 14 percent return on a larger adjusted equity investment. Based on the assumption that the equity investment in the project will be reduced on a straight line basis over a 25-year period, Table 1 shows that the one-time adjustment should equal 18.3 percent of the original investment. 91/

Table 2 shows the one-time adjustment to the equity investment that results for each possible value of the Incentive Rate for both the Alaska segment and Northern Border. In the case of the Alaska segment, a Cost Performance Ratio less than 2.1 will result in an Incentive Rate greater than the Operation Phase Rate (14 percent), and thus in a positive one-time adjustment. For Cost Performance Ratios greater than approximately 2.1, the Incentive Rate will be less than the Operation Phase Rate, and the one-time adjustment will be negative.

91/ Using a 14 percent discount rate, the present worth of the return of and return on equity resulting from a 17.5 percent rate of return on an unadjusted equity investment of $100.00 is the same as the present worth of the return of and return on equity resulting from a 14 percent rate of return on an adjusted equity investment of $118.13.

TABLE 1

Example of One-Time Adjustment Calculation

Assumptions:
Operation Phase Rate - 14%
Incentive Rate - 17.5
Equity Investment - $100
Depreciation Period - 25 years

Year	Return of equity	Return * on equity	Total	Discounted Total (14% discount rate)
1	$4.00	$17.50	$21.50	$18.86
2	4.00	16.80	20.80	16.00
3	4.00	16.10	20.10	13.57
4	4.00	15.40	19.40	11.49
5	4.00	14.70	18.70	9.71

For accounting purposes, the one-time adjustment can be actually recorded as an adjustment to the original cost of plant in the accounting records of the project. This one-time adjustment could be entered into just one of the plant accounts specified by the Commission's Uniform System of Accounts or spread over a number of the plant accounts. Since the tariff of the project relies on the cost of plant as recorded according to Uniform System of Accounts, the one-time adjustment would be incorporated into the rate base of the project for ratemaking purposes. Thus, application of the provisions of the tariff to the project's rate base as specified by the adjusted account(s) would then yield the appropriate revenue streams.

The Commission rejects this approach for a number of reasons. First, it could result in a distorted picture of the actual earnings of the project. To record the adjustment as an increase in the original cost of the plant would be contrary to generally accepted accounting principles, since it would not be in accord with the cost concept of asset accounting. Also, it would violate the original cost concept of regulatory accounting. Other problems might arise in the future if there was a significant change in the project plant, such as an extraordinary retirement or replacement of a significant component of the project plant. If the original cost of this component also included some part of the one-

time adjustment, special recognition of this fact must be given in order to ensure continued recognition of the impact of the IROR on rates of return.

The Commission proposes instead to record the one-time adjustment as a memorandum entry in the project's accounts to be used for ratemaking purposes only. The purpose of the one-time adjustment is to reward or penalize the project sponsors for their performance during the construction phase of the project, and to compensate the investors for unusual risks involved in building a project of such magnitude. Under this proposal, the one-time adjustment would be treated as a matter of rates and rate of return on a given investment, not an adjustment of that investment.

The use of the memorandum entry concept will require modification of the tariffs to include a schedule of the one-time adjustment and its amortization over the project's life. Also, the definition of rate base will be changed to include the average remaining balance of the IROR one-time adjustment, and the definition of the components of cost of service will include the scheduled amortization of the IROR one-time adjustment for the tariff computation period. Finally, the equity in the project to be used for the rate determination

will include the unamortized one-time adjustment as an adjustment to book equity. 92/

92/ The one-time adjustment to rate base is a means of obtaining a desired result in an uncomplicated manner. The Commission realizes that there are many variables in the ratemaking process which will affect the results of any method used to implement the IROR. The Commission believes that the one-time adjustment, amortized over the life of the project, will result in the closest approximation of the desired results, and any differences will be minimal when reviewed over time.

III. ADJUSTING FOR INFLATION

The Commission believes that it is not reasonable to penalize project sponsors for cost increases resulting from general inflation in the nation's economy. As proposed in our Notice of April 6, the Commission will adjust the Actual Capital Costs to eliminate the effect of general inflation before calculating the Cost Performance Ratio and the IROR.

Extensive research has been done on this subject, and there is substantial information in the record on the appropriate inflation adjustment procedure. Both the Alaskan Delegate and the project sponsors have prepared papers on the inflation adjustment mechanism, and the comments received pursuant to the Commission's Notice of April 6 discuss the inflation adjustment mechanism in considerable detail.

The Commission has evaluated potential inflation adjustment mechanisms against four criteria. These are: (1) the accuracy with which the mechanism would adjust the actual costs of construction for general inflation in the nation's economy; (2) the extent to which it would provide incentives to reduce construction costs; (3) the burden on the Government and the sponsors of administering the inflation adjustment mechanism; and (4) the attendant risk and uncertainty to investors and lenders. Different proposals rank differently when judged by these criteria individually. The Commission must balance the conflicts or differences to arrive at the best possible solution under all of these criteria.

The Commission's proposal for an inflation adjustment mechanism has been criticized (for different reasons) by both the sponsors and the Commission's Staff in their comments. While the Commission has made some modifications in response to the technical criticisms of the sponsors, the Commission still believes that the proposal in the Notice achieves the best balance among the four goals.

The Commission's inflation adjustment mechanism has the following major features:

- o A hybrid or composite index of construction costs for this project will be constructed.
- o This index will be used to deflate Actual Capital Costs back to base year price levels for comparison with the Projected Capital Costs, also in base year prices.
- o The composite index will be a weighted average of 42 indices currently available from the Government or other recognized sources.
- o Each of the 42 indices will measure the price increase for one category of construction costs (e.g., valves, line pipe, welders, cement, and so forth).

- The weights to construct the average will change from quarter to quarter and will be based on the proportion of that cost category in the total costs for the project as taken from the estimates in the Certification Cost Estimate. (For example, if valves amount to 15 percent of total costs for a particular period, valves would be given a weight of 15 percent in the composite index for that period.)

- Weights to be used for any construction occurring after the end of the estimated construction period would be those weights used for the last year of construction in the estimated schedule.

This inflation adjustment mechanism is based in large part on the proposal made by the project sponsors in a paper submitted to the Alaskan Delegate on March 7 and later distributed to all other interested parties. 93/ In their comments on the April 6 Notice, the project sponsors are critical of the

---

93/ Northwest Alaskan, "Recommended Inflation Adjustment."

Commission's deviation from their proposal. The Commission's major reason for deviating from the sponsor's proposal is that the proposal would not adequately realize the goals of creating incentives to reduce costs and of limiting administrative burdens. The Commission's procedure results in some attendant uncertainty about the final outcome of the IROR mechanism or, in other words, uncertainty about the realized rate of return. As discussed in Section II.B.5. on the IROR Risk Premium, this is one reason why the Commission has increased the IROR Premium.

The first difference between the mechanism specified in this Order and that proposed by the sponsors is the weights to construct the composite index. The sponsors advocate using the actual costs incurred in each category during construction to determine the weights, while the Commission's procedure is to use the estimate of costs in each category found in the Certification Cost Estimate. There are two major advantages to using estimated costs rather than actual costs to derive the weights.

First, the use of actual costs as weights does not give any incentive to substitute low-cost items in one cost category for high-cost items in another category since the weights would be adjusted to offset this change. Using fixed weights based on estimated costs gives the sponsors a greater incentive to substitute low for high-cost items whenever

AGO 686098

possible, and thus t· achieve a lower Cost Performance Ratio (and a higher IROR).

Second, the determination of the weights prior to the start of construction as part of the certification process means that there will be one less issue or potential controversy to resolve during construction. In general, the project sponsors have emphasized the need to resolve all IROR parameters as soon as possible.

The use of actual costs to determine weights could result in a more accurate measure of inflation for each cost category than using estimated cost weights. However, we believe the overall accuracy of the estimates will be good, since any underestimation of inflation for one of the 40 or more categories will probably be offset by an overestimation in another category. Also, any inaccuracies are just as likely to benefit the project sponsors by overestimating inflation as to harm the sponsors by underestimating inflation.

The second and more important difference between the sponsor's proposal and the Commission's mechanism is in the use of actual prices paid as a measure of inflation. The sponsors argue that no existing index accurately measures their likely inflationary experience for steel prices and wage rates for labor. Though there is merit to this argument, the Commission cannot reconcile the use of actual prices to measure inflation with the requirement in the Decision that

the IROR mechanism must provide "substantial incentives" to reduce costs. Labor costs and steel costs will likely account for more than 75 percent of the total costs of this project. By using actual prices paid to measure inflation for these two cost categories, the Commission would in effect be eliminating any extra incentive created by the IROR mechanism 94/ for the sponsors to negotiate for lower wage rates or lower steel prices.

We do not believe that the use of existing indices for these two cost categories creates an inordinate amount of risk for the sponsors. Prices for all steel products generally follow the same price trends, and labor rates in all parts of the country for all skill categories also generally increase together. We do not deny that there may be some divergence in growth rates, but the sponsors are just as likely to benefit from differences as to be penalized.

As we stated in the April 6 Notice, the Commission expects that the Certification Cost Estimate will incorporate a premium for labor rates or steel prices if it can be shown that wages or steel prices for this project can be expected to be higher than other wage rates or steel prices incurred in other major construction projects in the lower-48 states.

94/ There may be other powerful incentives to bargain for lower wages and prices, but the IROR mechanism would not add to them in this case.

Labor prices in Alaska will be higher than in the lower-48, and prices of 48-inch pipe exceed the prices for 36-inch pipe (the largest diameter for which price indexes are available). 95/ However, there is no evidence that future increases in Alaska labor rates or future changes in prices for 48-inch steel would be greater than increases in other wage rates or other steel prices. In fact, there is at least some probability that increases will be smaller and that the sponsors will benefit from the inflation adjustment mechanism required by this Order. 96/

95/ In estimating the prices for labor or steel to be used in the Certification Cost Estimate, we believe that a reasonable procedure would be to estimate the premium (in percentage terms) that will have to be paid for Alaskan labor or 48-inch pipe above lower-48 prices for labor or 36-inch pipe during actual construction. These premiums should then be added to the base year prices for lower-48 labor or 36-inch steel pipe to determine base-year prices for Alaskan labor or 48-inch pipe. The Trans-Alaska Oil Pipeline experience could provide a starting point for determining the premium for labor.

96/ The sponsors argue that incorporating premiums for Alaskan labor or 48-inch pipe in their cost estimates will put them at a competitive disadvantage in their negotiations with labor unions or pipe manufacturers. Joint Comments at Tab 2, p. 10. Even if there was no IROR mechanism, and thus no inflation adjustment mechanism, the Commission would still expect the Certification Estimates to contain the best estimates possible for labor rates and steel pipe prices, including any premiums that the sponsors expect to pay over other more common labor rates or prices. Even assuming, arguendo, that the sponsors are correct, the argument would seem to apply with even more force to the situation where wage and price increases could be passed through to ratepayers by means of an inflation adjustment mechanism with no adverse impact on earnings.

The sponsors also object to the Commission's requirement to use the weights for the last scheduled period of construction to deflate costs during any period of schedule overrun. This may introduce some error, but again, the sponsors are just as likely to benefit as to be harmed. It is doubtful that any inaccuracies as a result of this arrangement could be substantial. The types and quantities of labor and material used during any period of schedule overrun should be similar to the types and quantities estimated to be us for the last period of the planned construction schedule. 97/

97/ The Commission Staff in their initial comments (pp.45-47) argue for a method of adjusting for inflation that would impose a much more severe penalty for schedule delay than would the Commission's mechanism. The Staff would not only use the same weights in the schedule overrun as used in the last scheduled period, but would also use the same values for the cost indices. In other words, there would be no adjustment for any inflation that occurred duri. the schedule overrun period. This proposal would result in an unneccessarily severe penalty for schedule delay. The true cost of schedule delay is measured by the time value of money, interest charges, or discount rates. The sponsors will be penalized for this cost since the Finance Charge will continue to be added to the Actual Capital Costs, thus increasing the Cost Performance Ratio and lowering the IROR. However, the increased costs due simply to inflation can not be considered an increase in the real costs of the project. In money terms, the costs have increased due to inflation, but then so have all other prices as well as the incomes of gas consumers. Since incomes are likely to increase in step with inflation, consumers are not really worse off simply because inflation has increased construction costs.

In their initial comments, the sponsors raise some technical issues concerning a few of the price indices proposed by the Commission in the Notice of April 6. Upon review, the Commission finds the sponsor's criticisms to be valid and the table of price indices included in Condition No. 18 has been modified to correct these errors.

IV. CHANGE IN SCOPE

A. Mechanism

The Change in Scope mechanism is an essential part of the overall Incentive Rate of Return mechanism. Its purpose is to protect the project sponsors against reductions in their rate of return caused by major events that drastically increase the cost of the project.

In formulating the Change in Scope mechanism the Commission had four goals in mind. 98/ The first was to avoid dilution of the incentive to reduce costs. The second was to limit the administrative burden of implementing the Change in Scope mechanism. The third was to develop clear and unambiguous rules, in order to minimize controversy and disagreement over when a Change in Scope event had occurred. The final goal was to avoid inadvertent, perverse incentives that might have a capricious effect on the project.

To best achieve and balance these four goals, the Commission proposed a Change in Scope mechanism that would only adjust the target cost for cost increases

---

98/ See April 6 Notice at 43-45 (mimeo).

resulting from four events. If any of these four events occur the Projected Capital Cost of the project will be altered prior to determining the Cost Performance Ratio. The events are (1) wars, (2) any disaster declared by the President of the United States pursuant to the Disaster Relief Act of 1974, Pub. L. 93-288, 88 Stat. 143, (3) major design changes compelled by changes in Federal or State laws or regulations applicable to natural gas pipelines enacted or adopted subsequent to the Federal Inspector's approval of the Final Design of the pipeline, and (4) major changes in pipeline routing or capacity ordered by Federal or State Governments for the ANGTS from that approved by the Federal Inspector in the Final Design of the pipeline. For the reasons stated below, this Order adds a fifth Change in Scope event: delay in the issuance of a government permit or certificate necessary for completion of the pipeline system, when such delay (a) occurs subsequent to approval of the Final Design, (b) occurs through no fault of the project sponsors, and (c) causes significant cost increases.

The Staff's comments seek clarification as to the nature and consequences of design changes and cost estimate revisions that occur subsequent to approval of the Certification Cost Estimate but prior to the approval

of the Final Design. This concern is also reflected in many of the comments of the project sponsors. These comments raise an important point which must be clarified at the outset.

The Change in Scope mechanism set forth above applies solely to changes that occur subsequent to the approval of the Final Design. Changes that occur subsequent to that date will be governed by the Change in Scope mechanism set forth in Condition No. 10, as implemented through the Change in Scope procedure set forth in Condition No. 11. Changes that occur prior to approval of the Final Design are governed by Condition No. 9. Such changes, for instance, could include design changes generated by new technology or further study by the project sponsors.

Condition No. 9 provides a strong incentive, and wide latitude, for the project sponsors to consider seriously and study intensively all of the problems and risks that they will confront, and to evaluate, propose and justify any design changes that they deem necessary and appropriate, including all of the cost consequences of such proposed changes. If properly justified as desirable changes in design that cause real changes in cost, those cost changes will then be reflected in revisions to the Certification Cost Estimate and the Projected Capital Costs (but not in the Center Point).

During the period between approval of the Certification Cost Estimate and approval of the Final Design, major permits or approvals from government agencies may be granted, including terms and conditions attached thereto. Thus, the sponsors can incorporate the effect of these terms and conditions in their final design and cost estimates. If the granting of the major permits takes longer than anticipated in the Certification Cost Estimate, thus delaying the final design, the Commission expects that the final design cost estimate will incorporate the effect of such delay, both in direct costs, in schedule, and in the projected allowance for funds used during construction. (The final construction schedule should also contain a schedule for the issuance of government permits during construction.) The Commission's goal is that, at the time of approval of the Final Design, all possible uncertainties surrounding the pipeline, whether the result of governmental permitting processes or inherent technical problems, will have been resolved to the maximum extent possible. Once the Final Design and cost estimate revisions have been approved, the project sponsors will be expected to build the pipeline, following that Final Design and construction plan, without significant deviation.

In sum, design changes prior to approval of the Final Design can be proposed by either the project sponsors or the Federal Inspector (through the process of the Inspector's review and approval of the Final Design). The Inspector's determination will be final (subject only to applicable judicial review), with respect to both changes in the design itself as well as cost revisions resulting from such changes. The Federal Inspector will make these determinations pursuant to such procedures as he may adopt. The Inspector will advise the Commission of his determinations, but they will not be subject to administrative review by the Commission.

Once the final design has been approved, however, the energies of the project sponsors, the Federal Inspector and the Commission should be devoted, to the maximum extent possible, to the expeditious construction of the pipeline system. By then, the project sponsors will have had ample opportunity to fully consider and evaluate all of the risks and problems inherent in the project, including the attendant cost implications. Thus, as of that point in time, all subsequent IROR cost changes will be governed by the much more restrictive provisions set forth in Conditions No. 10 and 11.

The Upper Tanana Development Corporation, while generally approving the concept of a limited scope change mechanism, proposes in its comments that "socio-economic expenditures" should be allowable as a fifth category of Change in Scope events. For the reasons discussed below, prudent expenditures of that nature should be included in the Certification Cost Estimate at the outset, and should not be included in the Change in Scope mechanism.

The project sponsors, in their comments, urge a substantially expanded range of events that would qualify as Changes in Scope. In particular, they urge inclusion of:

"(1) Changes caused by government requirements, delays in government approvals, and reimbursement for government oversight.

"(2) Standard force majeure conditions such as acts of God, earthquakes, abnormal weather, terrorism, sabotage, riots and civil disturbances, and embargos, strikes, work stoppages and slowdowns.

"(3) Field conditions not ascertainable at the time of final design.

"(4) Right-of-way acquisition where rights of eminent domain may not exist."

The Change in Scope mechanism must be examined in its proper context. First of all (unlike the scope change concept in the normal government contract context), it applies solely to determining the rate of return, and not the rate base itself. For instance, in the event of a small flood, fire, or landslide, etc., in which the project sponsors prudently incur unanticipated costs, those costs will be fully recoverable through inclusion in the rate base. All that is at issue here is the effect of such an occurrence on the allowed rate of return.

In this regard, the Commission is faced with a basic choice of alternatives. One alternative is to adopt the very broad range of eligible scope changes proposed by the sponsors, and to take account of that generous and protective approach by adopting a less generous Center Rate and Center Point. The other alternative is to impose a higher degree of risk on the sponsors, by restricting the range of scope changes, and to reflect that higher risk in determining the Center Rate of Return and the Center Point. We have chosen the latter course. 99/ Our reasons for that choice can best be explained through

---

99/ As discussed previously, this is policy reflected in the IROP Risk Premium; see Section II.B.5.

illustratives discussion of the project sponsors' proposed alternative.

We start with "abnormal weather." Arctic weather can be brutal. 100/ The project sponsors know that it is brutal; that is a risk that they can and must evaluate in planning the cost of the project, and it is a risk for which they are being compensated in their rate of return. Scope change applications and controversies in the context of the Alaska pipeline project would plunge the sponsors and the Federal Inspector into potentially endless inquiries into comparative temperatures, wind/chill factors, and thaw conditions (for which historic weather data may or may not be available), measured in terms of consecutive days of such weather, at particular geographic locations, over the past 20, 50 or 100 years, with commensurate time and motion studies of the effects of abnormally brutal weather (versus normally brutal weather) on labor productivity. This is precisely the diversion of engineering, scientific and legal time, expertise and expense that the Commission seeks to avoid. The

---

100/ See, e.g., J. London, To Build a Fire; R. Service, "The Cremation of Sam McGee."

project sponsors should evaluate weather problems realistically (including a factor for delays caused by abnormal weather) when preparing their Certification Cost Estimate (including the Center Point). Then, when abnormal weather occurs, the efforts of all concerned can be focused exclusively on coping with it.

Similarly, fires, floods, landslides and other "acts of God," as well as "terrorism, sabotage, riots and civil disturbances, and embargos, strikes, work stoppages and slowdowns" are all risks that the project sponsors can evaluate in advance, in the sense of considering a reasonable cost factor for some level of unanticipated and undesirable events that may occur during the course of the project. Some of these events can be influenced to at least some extent by the sponsors; others cannot, but steps can be taken to cope with their effects. With respect to truly catastrophic events which cannot reasonably be factored into cost planning, such as a war, or a severe earthquake or tsunami, etc., the Change in Scope mechanism affords protection of the rate of return.

With respect to field conditions, there is an economic trade-off. Field conditions can be ascertained

in advance through sampling and other scientific techniques. On the other hand, there comes a point at which the cost of elaborate advance ascertainment would exceed the cost of coping with whatever unexpected conditions may eventually be encountered. The project sponsors are in the best position to strike the proper balance between incurring the cost of totally comprehensive ascertainment in advance versus coping later with unanticipated conditions that had not been fully ascertained. The project sponsors should be the ones to make that judgment, to estimate their costs accordingly, and to bear the responsibility for whatever unanticipated conditions they eventually encounter.

Similarly, right-of-way acquisition is a problem that the project sponsors can and should evaluate when preparing their Certification Cost Estimate (including the Center Point).

Finally, regarding "changes caused by government," the Change in Scope mechanism does in fact provide rate of return protection with respect to major design changes compelled by changes in government laws or regulations applicable to gas pipelines, and with respect to government ordered major changes in the (Alaska segment) pipeline

routing or capacity. During the course of construction, it is probably inevitable that the Federal Inspector will require, and the project sponsors will themselves propose, numerous minor changes in design or routing, or even capacity. Again, this is an eventuality that the project sponsors should consider in preparing their Certification Cost Estimate, and one that the Commission itself has considered in setting the Center Rate and Center Point procedure. When such minor changes are determined to be either necessary or desirable, the energies of all concerned ought to be devoted to making those changes, unencumbered by diversions into the processing of scope change applications.

B. Provision for Delay

In their comments, the project sponsors also take the Commission to task for failing to fulfill an "unconditional assurance with regard to delays caused by the government." 101/ In response to the valid aspect of that criticism, the Commission has added a fifth Change in Scope event.

101/ Joint Comments at 20-22.

Most permits and certificates will be issued prior to approval of the Final Design. To the extent that delays occur in the issuance of those certificates or permits -- and regardless of the cause of those delays -- the project sponsors will have ample opportunity to seek appropriate adjustments in the Projected Capital Cost up to and at the time of approval of the Final Design. That procedure was discussed above.

Some permits, however, will not be applied for or granted until during the construction period. The Commission expects that a detailed timetable for application and issuance of the necessary permits will be established and agreed to by the project sponsors and government agencies, including State agencies as necessary and appropriate, as part of approval of the Final Design and Cost Estimates. 102/

Commission representatives have had extensive discussions with representatives of other government agencies regarding their permitting processes and the importance of timely issuance of permits, particularly during the

---

102/ Such a timetable, and establishing responsibility for adherence to that timetable, is within the contemplation of § 202(b) of Reorganization Plan No. 1 of 1979, transmitted by the President to the Congress on April 2, 1979.

construction period. Those agencies have been uniformly responsive to requirements for adhering to a permitting timetable. However, any agency's ability to adhere to the agreed schedule is directly related to the timely filing of all relevant applicant information by the project sponsors.

It is the Commission's expectation that all applications will be timely filed and all permits timely granted. If receipt of a permit is delayed because an application was not timely filed, or if the case for issuing the permit is not adequately set out, then the resulting increase in costs (and in Cost Performance Ratio) is a consequence of action (or inaction) by the project sponsors and should count against them. If, on the other hand, issuance of a permit during construction is delayed by the permitting agency, which fails to process the application to a conclusion, and the cost consequences of such action (or inaction) are significant, then some adjustment is appropriate. This Order revises the April 6 Notice by providing the Federal Inspector with discretion to treat as an allowable scope change event, government failure to take action toward issuing a required government permit, if such delay has significant cost consequences. Under no circumstances, however, shall a government denial of a permit or certificate be construed as a Change in Scope

event, unless such denial is subsequently reversed by a court on review; this provisions is directed solely to delay in processing of applications, and not to denial of the permit sought.

The IROR mechanism fully protects the project sponsors from one other form of delay that could otherwise have a potentially serious impact on the rate of return. The project sponsors or investors in any one segment, Alaskan or Northern Border, of the pipeline will not be responsible for cost increases resulting from construction delays in the other segments, or from a delay in the initiation of gas production at Prudhoe Bay. This is accomplished by defining the Actual Capital Cost for a segment as those costs incurred up to the point that that segment is capable of rendering service, even though other segments are not yet capable of delivery from Prudhoe Bay. In other words (for IROR purposes only), AFUDC will cease to be added to the Actual Capital Costs for a segment when that segment is complete and ready to begin transporting gas even if, for whatever reason, it is not actually transporting gas. (AFUDC will, of course, continue to accrue for rate base purposes.)

C. Procedure

When the project sponsors believe that a Change in Scope event (as defined above) has occurred, the project sponsors shall submit to the Federal Inspector both an explanation of the alleged Change in Scope and an estimate of the increase in Projected Capital Costs for the project. The Federal Inspector will evaluate the information submitted, and determine whether the event qualifies as a Change in Scope event and, if so, the appropriate adjustment to the Projected Capital Cost.

The Commission intends for the Federal Inspector to act on each Change in Scope case as expeditiously as possible after the alleged Change in Scope has occurred, pursuant to whatever appropriate procedural regulations the Inspector may promulgate. The Federal Inspector's decision will constitute final agency action, subject to applicable judicial review but not subject to review by the Commission. This procedure is designed to ensure prompt resolution of all Change in Scope issues.

The Staff's comments seek clarification of these procedures, on several points. First, the Staff suggests the possibility of the Federal Inspector, or some third party, seeking to obtain a reduction in the Projected Capital

Costs. Such a reduction presumably would be premised on potential - and sizable - construction cost savings that might emanate from (a) a war, (b) a natural disaster, (c) involuntary major design changes after the final design is approved, or (d) major changes in pipeline routing or capacity after the final design is approved. While the hypothetical symmetry of the Staff's suggestion is not devoid of surface appeal, we do not readily perceive how any of the above enumerated events could significantly reduce the total cost of the project. Moreover, even if a major change in design, routing or capacity could in fact significantly reduce the total cost, we would not want to discourage such changes by reducing the rate of return if such a change is implemented. Accordingly, and in order to preclude hypothetical uncertanties in this aspect of the IROR formula, we are limiting the Change in Scope procedure to changes submitted by the project sponsors.

Second, the Staff inquires as to whether interested parties, including the Staff, will be afforded an opportunity to participate in the Change in Scope proceedings before the Federal Inspector, and finally, whether the Inspector's decision could be appealed to the Commission.

The Change in Scope procedure is premised on Reorganization Plan No. 1 of 1979, as submitted by the President to the Congress on April 2, 1979. Section 102 of the Plan transfers to the jurisdiction of the Federal Inspector "[s]uch enforcement functions of . . . the Federal Energy Regulatory Commission related to compliance with: the certificates of public convenience and necessity, issued under Section 7 of the Natural Gas Act . . .." By incorporating the Change in Scope Mechanism and Procedure into conditions attached to the project sponsors' certificates, it is the Commission's intent and purpose to transfer to the Federal Inspector the jurisdiction to enforce and implement those conditions, by transferring to the Inspector's jurisdiction the authority to make the Change in Scope determinations. The Commission and the Inspector may, in the future, seek to further clarify the precise boundaries of their respective jurisdiction, on this or other matters, through means of an interagency agreement, as authorized by the last sentence of section 202 of the Reorganization Plan:

> Upon agreement between the Federal Inspector and the head of any agency, that agency may delegate to the Federal Inspector any statutory function vested in such agency related to the functions of the Federal Inspector.

While the Commission would have no objection to -- indeed, would welcome -- the opportunity for its Staff and other interested parties to participate in the Federal Inspector's deliberative processes, the Inspector should have the latitude to determine, in whatever appropriate procedural regulations the Inspector may promulgate, the nature and extent (if any) of such participation.

While it would not be implausible for the Commission to retain the power to make the Change in Scope determinations itself, the worst possible procedure would be for both the Inspector and the Commission to participate in that decisionmaking through seriatum administrative deliberations. ANGTA and the President's Decision mandate expedition in decisionmaking, and the project sponsors and their lenders and investors are entitled to receive the promptest possible determinations consistent with applicable requirements of due process. The Federal Inspector and his staff will be located at the scene of the pipeline, monitoring its construction on a full time, day-to-day basis. They will be in the best position to render prompt determinations of Change in Scope events and adjustments. Those determinations should be final, subject only to judicial review.

Finally, as indicated in the preceding section of this Order, the above described procedures will also be generally applicable to the Federal Inspector's approval of design changes, including resultant revisions in the Certification Cost E. imate, pursuant to the Inspector's approval of the Final Design.

V. END RESULTS

In responding to the Commission's proposal for an Incentive Rate of Return mechanism, the project sponsors have emphasized that, individual parameters aside, it is the end result which is all important: "[t]he end result. . . [should be] the final determination of an equitable, practical, and definitive IROR mechanism which will not prohibit financing." 103/ The Commission believes that the IROR mechanism and values established by this Order will in fact increase the prospects of obtaining private project financing. It remains the responsibility of the project sponsors to convince potential debt and equity investors of their ability to complete the project within a range of construction costs at which the average rate of return

---

103/ Joint Comments of Alaskan Northwest Natural Gas Transportation Co., and Northern Border Pipeline Co. at 7 (Docket No. RM78-12) (May 4, 1979) [hereinafter cited as Joint Comments]; see also Joint Comments at 6-7, 26-27, 30; Alaska Northwest Natural Gas Transportation Co., "Petition for Expedited Rulemaking and Issuance of Final Order Establishing Rate of Return Range" (Docket No. RM78-12) (Feb. 15, 1979).

is comparable to that which could be earned in alternative investment opportunities of comparable risk. 104/

As noted in the Introduction section of this Order, the Decision was written against a backdrop of concern for the impact of cost overruns on the economic benefits of ANGTS. In response to that concern, the President imposed a framework for project implementation designed to insure that the project would be of economic benefit to the nation. The IROR mechanism and values established by this Order play their role in that framework by providing ". . .substantial incentives to construct the project without incurring overruns." 105/

In evaluating the project's economic benefits to the nation, the President found that ". . .Alcan's direct costs could increase almost 124 percent over the cost overrun case before it would become socially

---

104/ In this vein, the Commission recognizes that not even Federal government debt instruments are completely free of uncertainty, and were the project sponsors to be able to find investments which were totally free of uncertainty and ambiguity, the Commission expects that the rates of return on those investments would be a mere fraction of those contained in this Order.

105/ Decision at 37.

uneconomic;. . ." 106/ The project sponsors have insisted that they not be exposed to the risk of earning less than 13 percent on equity. 107/ As Table 3 shows, rates of return less than 13 percent will not be reached until costs overrun the March 1977 estimates in the Decision by 140 percent in Alaska and 60 percent for Northern Border. 108/ Such large overruns approach the levels at which the analysis in the President's Decision suggests that the economics of the entire project should be reviewed.

If the project sponsors believe that the probability of earning less than 13 percent on equity is substantial, the procedure for setting the Center Point allows the project sponsors to argue for a different Center Point

---

106/ Decision at 180. The "Alcan" system referred to here is the precurser of the system proposed by the sponsors and now referred to as the ANGTS. See June 30 order.

107/ Joint Comments at 8.

108/ Note that the measurement of overruns excludes the effects of inflation, design changes prior to the final design, and certain changes in scope for the project.

and thus a different IROR schedule. The project sponsors may offer such arguments at the time they present their Certification Cost Estimates. Until such information or evidence concerning the ultimate costs of the project are presented, the Commission cannot conclude that the IROR mechanism required in this Order creates a significant probability that the Incentive Rate will be less than the 13 percent floor requested by the sponsors.

2.8	12.4	10.8	14.8	14.1	5.8	4.3

1/ These values are based on March 1977 cost estimates. They will be revised late upon the Certificate Cost Estimates if appropriate.

2/ Project sponsors propose that the Commission set these values now.

TABLE 3

AGO 886127

The sponsors have requested a floor of 13 percent on the Incentive Rate. They argue that the IROR must be within a "zone of reasonableness." 109/

In deciding rates of return, the Commission must balance the need to protect the consumer from unreasonably high rates while maintaining the financial

---

109/ Alaskan Northwest Natural Gas Co., "Petition for Expedited Rulemaking and Issuance of Final Order Establishing Rate of Return Range" (Docket No. RM78-12) (Feb. 15, 1979). In arguing for a "zone of reasonableness," Alaskan Northwest directs our attention to the standards of FPC v. Hope Natural Gas Co., 320 U.S. 591 (1944). Presumably the sponsors have in mind the following passage:

> The rate-making process under the [Natural Gas] Act, i.e., the fixing of "just and reasonable" rates, involves a balancing of the investor and the consumer interests. Thus we stated in the Natural Gas Pipeline Co. case that "regulation does not insure that the business shall produce net revenues.". . . But such considerations aside, the investor interest has a legitimate concern with the financial integrity of the company whose rates are being regulated. From the investor or company point of view it is important that there be enough revenue not only for operating expenses but also for the capital costs of the business. These include service on the debt and dividends on the stock. . . . By that standard the return to the equity owner should be commensurate with returns on investments in other enterprises having corresponding risks. That return, moreover, should be sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital. (320 U.S. at 603)(citations omitted)

integrity of the project and providing the investors an adequate return on investment. The Commission believes that this classic balancing test must be applied to the IROR in a manner consistent with the mandate of the President's Decision to establish an incentive to control costs. While the Commission must consider the financial integrity of the project, this consideration is tempered in light of the purpose of the incentive; the result must be just and reasonable and must not be confiscatory.

The IROR mechanism, with its inflation adjustment and scope change procedures, strikes the required balance. As advocated by the sponsors, the mechanism does have a de facto floor; this is the practical consequence of the Marginal Rate. More importantly, however, the IROR schedule provides, over the range of reasonable Cost Performance Ratios, a rate of return equal or greater to that advocated by the sponsors. This is the practical result of applying an average incentive rate over the range of Cost Performance Ratios. Given this result, the mechanism provided here cannot be considered either unjust or unreasonable; it certainly cannot

be construed as confiscatory. Investors, if they perform, are afforded ample opportunity to earn generous rates of return, while consumers will be able to obtain the natural gas they need at an acceptable price.

VI. Tariff Issues

This section of the Order addresses the proposed tariffs submitted by the project sponsors for the Alaskan and Northern Border segments of ANGTS. 110/ The Commission will accept the tariffs, subject to conditions described herein. The Commission shares the project sponsors' assessment of the importance and relevance of the tariffs. The tariffs are indeed the "economic lifeline" of the project. There must therefore be a degree of certainty for project sponsors and potential financers adequate to ensure that there will be a flow of revenues sufficient to service debt and pay all other current expenses once billing has been allowed to commence. The mechanisms for providing this assurance are described in the tariffs themselves and the Commission's considerations herein.

The Commission will resolve in this Order four tariff issues identified by the Alaskan Delegate as affecting the risk to be borne by project sponsors. The Commission will also decide in this Order certain other tariff issues that have been identified in the

---

110/ The proposed tariffs were filed on March 12, 1979, pursuant to the Commission's Order set forth in "Notice of Delegate Report and Order Directing Tariff Filing", Docket No. RM78-12 (February 22, 1979) [hereinafter Delegate's Report].

comments of parties and by the Commission's own analysis of the proposed tariffs. 111/

Not all tariff issues are to be decided in this rulemaking. The Commission reaffirms the April 6, 1979 Notice that reserved for resolution in a separate proceeding the issue of the depreciation rate to be used to calculate the cost of service for "pre-delivery" of Canadian gas transported through the Northern Borde. pipeline (Notice at 60-61). Further, the Commission will defer to the proceedings in Northwest Alaskan Pipeline Company, Docket Nos. CP78-123, et al., the question of whether, and to what extent, there should be any apportionment of costs of Northern Border's "pre-delivery" facilities between deliveries of "Canadian bubble" gas and future deliveries of Alaskan gas. The Commission views these issues to be more closely related to the questions to be decided in that certificate proceeding; hence, that proceeding is the more appropriate forum for their resolution.

111/ The Alaskan Delegate provided notice of these issues in letters addressed to the project sponsors. Those letters were dated April 20, 1979 and April 27, 1979. Copies of each were sent to all parties of record in this docket as well as in Northwest Alaskan Pipeline Company, Docket Nos. CP78-123, et al.

Another issue that will not be resolved here concerns specific mechanism(s) for shipper tracking. 112/ A tracking mechanism involves questions of the timing of any flow-through of charges, the necessity of being assured that there will be a matching of costs and revenues, and recognition that appropriate tracking mechanisms for individual shippers may vary because rate designs and rate forms will differ among shippers. Thus, appropriate flow-through arrangements can only be properly addressed when the individual shipper tariffs are filed with the Commission.

Although it would be premature to specify appropriate methods at this time, the Commission can state, however, that it is in basic agreement with the concept that any amounts paid ANGTS under a tariff approved by this Commission will be allowed to be included in the rates

---

112/ The Commission has previously addressed this issue. By motion dated April 18, 1979, Alaskan Northwest and Northern Border requested reconsideration of the Notice of Proposed Rulemaking in this docket. Specifically, petitioners requested that the Commission "provide for inclusion in [Docket No. RM78-12] of issues relating to shipper compary recovery of all amounts paid under the Alaskan Northwest and Northern Border tariffs." (Motion at 2.)

By order dated April 27, 1979, the Commission denied the motion but indicated that parties would not be precluded from commenting on the flow-through issue or from the filing of pro forma tariffs by the shippers. Parties filed comments on this issue but pro forma shipper tariffs were not filed.

of those shippers that are interstate gas pipeline companies, subject to appropriate reconciliation of all other aspects of ratemaking to ensure that there is no overcollection of costs attributable to the tracking arrangements themselves. Interstate gas pipeline companies shipping through the ANGTS system will be expected to pay all charges properly due to ANGTS. Any such amounts paid ANGTS will be allowed to be included in the rates of those shippers that are interstate gas pipeline companies. Allowance of those amounts will require that there is a matching of costs and revenues in order that overcollection or undercollection of fixed costs of the shipper company does not occur. 113/

113/ The possibility of overcollection (or undercollection) of fixed costs arises because the commodity charges included in interstate pipeline rates typically recover certain of the fixed costs. For example, under the United 25/75 cost apportionment approach 75 percent of the fixed costs of a shipper would be assigned to the commodity rates of the shipper. The unit amount of fixed costs to be recovered would be determined in a rate proceeding on the basis of the projected costs and throughput of the pipeline for the test period. As Alaskan gas begins to flow through the shipper's pipeline, it will recover the unit fixed costs included in the effective rates. Should the Alaska natural gas volumes not have been included in the billing determinants underlying the "base" charges, the result could be an over recovery of fixed costs, i.e., the fixed costs would be recovered by greater billing determinants than had been used to develop rates. The Commission will require assurance that any mechanism used to flow-through ANGTS costs will not result in this or a comparable situation.

The Commission also defers to a later date the resolution of the question of the permissible level of CO_2 that is to be contained in the gas. 114/ This issue was addressed in the comments of both the State of Alaska and Sohio Natural Resources Company. 115/ The permissible level of CO_2 is a significant issue that involves an evaluation of the impact of the different CO_2 levels on capital and operating costs. However, because of the absence of adequate data available on this record to enable complete evaluation of this issue, the Commission recently requested the parties to file additional information on this matter. 116/ The evaluation of the data filed in response to that request has not yet been completed. The Commission will, therefore, issue a separate order on this issue rather than withhold issuance of its disposition of the other issues raised in this rulemaking. An order establishing the CO_2 quality

---

114/ Questions concerning other quality standards are discussed at Section VI.B.5.

115/ Initial Comments of the State of Alaska at 6-7 (Docket No. RM78-12) (May 4, 1979); Comments of Sohio Natural Resources Company on Notice of Proposed Rulemaking Issued April 6, 1979, at 2 (Docket No. RM78-12) (May 7, 1979).

116/ Order Requesting Further Submission of Data, Views, and Comments (Docket Nos. RM78-12 and RM79-19) (issued May 16, 1979).

standard(s) will be issued as soon as the Commission can complete its evaluation of the additional material.

Finally, the Commission will decide in Docket No. RM79-19 the issue of cost responsibility for processing Prudhoe Bay gas to pipeline quality standards. The Notice of Proposed Rulemaking in Docket No. RM79-19 specified that the cost responsibility issue would be decided in that docket. 117/ The record being compiled in that rulemaking will provide the Commission with the information necessary to resolve the issue. Accordingly, the Commission will defer decision on those portions of the tariff that affect this issue. After the issue is resolved in Docket No. RM79-19, a supplementary order in this proceeding will be issued to reflect that resolution in the tariffs of the project sponsors.

117/ Federal Energy Regulatory Commission, "Treatment of Certain Production-Related Costs for Natural Gas to be Sold and Transported through the Alaska Natural Gas Transportation System: Notice of Proposed Rulemaking and Statement of Policy" (Docket No. RM79-19) (issued Feb. 2, 1979).

A. Issues Identified by the Alaskan Delegate

The four major tariff issues identified by the Alaskan Delegate are: (1 determination of the date on which the project sponsors will be permitted to commence billing their shipper-customers; (2) whether an interim rate should be imposed during the initial build-up phase of the project; (3) the extent to which the effect of a service interruption should be shared by the project sponsors as well as by shippers and consumers; and (4) the billing procedure to be used to levy charges for transportation services. 118/

1. Billing Commencement Date

At issue here is the appropriate interpretation of the President's Decision and the setting of the billing commencement date. The Alaskan and Northern Border segments of the system will be project financed, which means their debt will primarily be secured by the revenues they collect. Commencement of the collection of those revenues is triggered by the commencement of billing, and is, therefore, important to an assessment of project

118/ Report of the Alaskan Delegate on Tariff and Operation Phase Rate Issues 6-7, accompanying Notice of Delegate Report and Order Directing Tariff Filing (Docket No. RM78-12) (issued Feb. 22, 1979).

risk. The sooner billing can commence, the less risky the project will appear to potential investors.

The third finance condition in the President's Decision prohibits any payments by the purchaser or ultimate consumer of Prudhoe Bay gas "prior to completion and commissioning of operation of the system". 119/

Definition of this phrase does not appear in ANGTA, the President's Decision, the Natural Gas Act, or the Commission's Regulations. The Report of the Alaskan Delegate, however, offers four possible interpretations of when billing might commence:

1. Charges begin when all segments of the pipeline are complete and gas is being transported.
2. Charges begin when all segments are capable of rendering service, even if no gas is flowing.

119/ The third finance condition provides:

> 3. Neither the successful applicant nor any purchaser of Alaska gas for transportation through the system of the successful applicant shall be allowed to make use of any tariff by which or any other agreement by which the purchaser or ultimate consumer of Prudhoe Bay natural gas is compelled to pay a fee, surcharge, or other payment in relation to the Alaska natural gas transportation system at any time prior to completion and commissioning of operation of the system. Decision at 37-38.

3. Charges begin for each segment when it is complete and capable of rendering service.

4. Charges begin at a date certain.

The proposed tariff of Alaskan Northwest provides that "completion and commissioning" shall occur when the "Company's pipeline is capable of rendering service even if, for whatever reason, gas is not being delivered to, or transported through Company's pipeline system." (Section 1.10 of the General Terms and Conditions.) The tariff of Northern Border contains an identical provision (Section 1.10 of the General Terms and Conditions). Both tariffs would thus prescribe a billing commencement date that follows the third definition suggested by the Alaskan Delegate.

The project sponsors assert in their joint comments that the billing commencement date contemplated in the respective tariffs is both consistent with the President's Decision and promotes financing of the system. The sponsors argue initially that neither the Decision nor its accompanying Report address the specific question of the initiation of billing once a segment has been completed. 120/ Considering that argument, together with the requirement that the project must be privately

---

120/ Joint Comments at 48.

financed, the sponsors contend that the Commission must be presumed to have been given broad discretion in approving or fashioning conditions that would encourage private financing. Private financing can best be achieved, according to the sponsors, through Commission assurance that the billing commencement date for one segment will not be tied to the billing commencement date for another segment. 121/

Staff, on the other hand, relies on the President's Decision and accompanying Report to contest the billing commencement date set forth in the tariffs. 122/ Staff argues that in designating different companies to construct and operate different portions of the system, the President was fully aware of the distinction between the "system" and "portions" thereof. According to Staff, the President maintained that distinction in the third finance condition, which precludes any fee, surcharge, or other payment in relation to the ANGTS

121/ Id. at 49-50, 52-55.

122/ Staff, Initial Comments at 6-9. Staff also cites to the Initial Decision in El Paso Alaska Company, to the effect that until a company begins to provide service a "natural gas company" does not exist within the meaning of the Natural Gas Act and, consequently, no effect can be given to a tariff provision of a company that has not yet attained jurisdictional status. Id. at 6. The Commission finds it unnecessary to address this question in light of the determinations made here.

before completion and commissioning of operation of the system.

The Public Service Commission of the State of New York also challenges the tariff provisions defining the billing commencement date. While New York has no objection to "appropriate" billing should Northern Border "pre-build" all or a portion of its pipeline to transport Canadian gas, New York advocates billing consumers only for actual services rendered. 123/

In reaching its conclusion, the Commission has considered these arguments as well as the requirements of the President's Decision, its legislative history 124/, and the impact of alternative resolutions upon the financeability of the project.

123/ New York, Initial Comments at 6-7.

124/ The relevant legislative history accompanying the President's Decision consists of the Report Accompanying the Decision, as well as the House and Senate Reports to H.J. Res. 621 (P.L. 95-158, 91 Stat. 1268), which approved the Decision. The Congressional debates on H.J. Res. 621 do not focus on when billing should commence.

The Commission's resolution of the billing commencement date begins with the Commission's interpretation of the phrase "completion and commissioning of operation of the system." The Commission believes that the Decision is precise concerning the definition of the term "system." The Decision both refers to the system in its entirety and to the various segments in the United States and Canada that comprise the system. 125/ Thus, when the Decision uses the term "system," it is clear that the reference is to the entire system including all segments in the United States and Canada. The Commission concurs with Staff on their definition of the term "system."

However, neither the Decision nor the legislative history provides similar certainty in defining the phrase "completion and commissioning of operation." Thus, in specifying a billing commencement date, the Commission has had to consider the broad goals of ANGTA, principles of public

---

125/ For example, the Decision defines the system as an overland pipeline from Prudhoe Bay, Alaska, through Canada, to the Midwest and Western sections of the continguous United States (Decision at 6). Also, the Decision defines each of the separate segments and specifies the companies to own and operate each segment.

utility regulation as well as the objectives of this project as identified in the Decision.

Specifically, the Commission has considered the need to (1) equitably treat all parties including the project companies, their investors, the shippers and owners of the gas, and gas consumers; (2) provide incentives to avoid delay both in the completion of construction of all segments and in the start-up of gas production; and (3) reduce the ultimate cost to consumers. Billing commencement at the time when all segments are complete, tested and proved capable of operation satisfies these goals better than the other alternatives posited by the Alaskan Delegate and discussed by the Staff, the sponsors, and other parties.

Prior to commissioning the system for operation, all pipeline segments must be been tested and proved to be capable of operation. The Commission will rely upon the Federal Inspector to certify that the system is capable of performing the services for which it was certificated. In establishing this billing commencement date, the Commission limits the rate to be charged before initiation of service to a "Minimum Bill." The Minimum Bill shall be equal to actual operation and maintenance expenses, current taxes, plus debt service including interest and scheduled retirement, if the Federal Inspector certifies that the system is capable of performing the service even though no gas has been tendered for transportation. The

Commission concludes that this is a reasonable and fair burden to place on the various parties. First, sponsors have control over the coordination of the construction schedules of the various segments. Shippers or consumers should not be asked to bear the cost of poor coordination in the construction of the entire system. 126/ Once the system is complete, however, it would be unfair to impose a further burden on the project sponsors who are only the transporters of the gas for the shippers and who depend on shippers to tender gas to them. The Minimum Bill (equal to actual operation and maintenance expenses, current taxes, plus interest and scheduled retirement of debt) will allow the project companies to pass this portion of the total cost to the shippers. The mechanism and timing of the flow-through of the Minimum Bill is specifically reserved until such time as the proposed shipper tariffs are presented to the Commission. 127/

Finally, the Commission concludes that the specification of the date for billing commencement strikes the necessary balance between various costs to be borne by the consumer and risks to be borne by project sponsors.

This provision reduces the risk borne by investors in the project, especially debt holders, and this reduction in risk

---

126/ The Commission's choice of billing commencement date is not inconsistent with our earlier interpretation of the President's Decision in Alcan Pipeline Company, Docket Nos. CP78-123, et al., "Order Dismissing Petition for Declaratory Order" (March 24, 1978). In that order the Commission stated that the Decision precludes the shifting of the risk of non-completion to gas consumers. Once the system has been constructed and is capable of rendering service, that risk will have passed. It is at just that point that we have allowed charges to commence.

should facilitate the private financing of the project and thus the expeditious construction of this important source of natural gas. Also, this reduction of risks will tend to reduce both the rates of interest and rates of return necessary to attract private debt and equity investors. 128/ Interest charges and return on equity is a major portion of the cost of service for this pipeline. A lowering of such costs of financing could mean a substantial savings to consumers. 129/ The Minimum Bill will provide for debt service and thus reduce the finance charges to be borne by consumers (AFUDC) when service commences. 130/

This choice of a billing commencement date does create the possibility of the project companies billing shippers during a period when transportation service has not commenced. However, the Commission concludes that a long delay in the initiation of service after completion and commissioning is very unlikely. Incentives created by this definition of billing commencement, and the various controls and oversight authority granted to the Federal Inspector encourage coordination and timely commencement of service. First, insofar as most shippers are also going to be sponsors with an equity interest

---

128/ See, El Paso Alaska Company, Docket Nos. CP75-96, et al., Tr. at 29,620.

129/ See, New York, Initial Comments at 1.

130/ See, El Paso Alaska Company, Docket Nos. CP75-96, et al., Tr. at 35,514.

in the project, it would obviously be to their benefit to have the gas flowing at an early date rather than deferring cash flow to be realized from their equity share of the project. Thus, the Minimum Bill, which provides no return of or on equity, creates a cash flow incentive for the sponsors to consummate, in a timely manner, the necessary agreements with the gas producers and the transporter, as well as any new arrangements that may be required with the shippers' customers.

Additionally, it would appear to be in the producers' best interest to have producer-shipper contracts finalized at an early date and the conditioning plant ready when the system is prepared to transport gas. This is because of the expected flow of revenues to be realized by the producers from the sale of the gas and also because of the long-range planning required for efficient reservoir management of the Prudhoe Bay field.

Based upon the previous analysis and reasoning, the Commission concludes that the project companies may commence billing after the entire system is completed and tested for service. Tested for service does not require that the line be packed. The Commission's resolution also appears to be harmonious with the approach previously taken by the National Energy Board of Canada (NEB). The NEB uses the terminology

"leave to open" as the regulatory event which signifies the NEB's judgment that construction has been completed, the facility has been tested and is ready for service. It is noteworthy that the Foothills' proposed tariff provides that billing may commence only after all nine segments in Canada ... have been completed and commissioned for operatio... 131/

During the period between completion of the entire system and actual transportation of gas, the Minimum Bill will equal the actual operation and maintenance expenses, current taxes, and amounts necessary to service debt, including interest and scheduled retirement of debt. This level of reduced billing will continue until gas is tendered for transportation and service commences. Upon the initial transportation of gas by the system, the project sponsors will then be allowed to charge an interim rate. The next section of this Order specifies the level and duration of the interim rate.

131/ Foothills Pipelines (Yukon) Ltd., Gas Transportation Tariff, Sheet No. 201, filed April 1, 1979 (Section (1)(1.4), General Terms and Conditions):

> The term "Billing Commencement Date" shall mean the date when all Canadian Segments required in the transportation of that U.S. Gas have been completed and commissioned for operations. . .

The continuation of regulatory consultations as provided for in Section 9 of the Agreement Between the United States of America and Canada on Principles Applicable to a Northern Natural Gas Pipeline may result in a closer coordination of billing commencement in the U.S. and Canada.

2. Interim Rate

We have determined that charges should be permitted only after all segments of the system are completed and capable of rendering service. Next to be addressed are the related questions of the level of the charges to be initially imposed. At issue is whether the tariffs should provide for fixed, reduced charges during the initial operating period of the system or, alternatively, for full cost-of-service charges. For the reasons discussed below, the Commission will require that the tariffs provide for an interim rate scheme, which includes both a Minimum Bill to cover current expenses and debt service, and a fixed unit-rate to be applied to the actual gas throughput during the first year of operation or until the design throughput is attained. The rationale for requiring the interim rate scheme is that it recognizes that at the commencement of billing, either the gas throughput may be less than the design capacity, or the pipeline start-up and testing procedures may be completed prior to the ability of the shippers to tender gas for transportation.

During the proceedings in El Paso Alaska Company, Docket Nos. CP75-96, et al., two interim rate proposals were advanced. The first was a phasing proposal in which some portion of depreciation expense and return on rate base would have been deferred until full throughput capacity

was reached. The second proposal would have imposed a fixed reduced unit charge on the smaller initial volumes, with those revenues credited against the construction work in progress account. That reduced charge would have lasted for no more than one year.

The second proposal was endorsed by the Administrative Law Judge in his initial decision in El Paso Alaska Company. 132/ The President's Decision does not discuss the issue. The FPC's Comments on the Decision suggest, however, that an interim rate should be given consideration. 133/

The proposed tariffs of Northern Border and Alaskan Northwest each provide that billing would commence at the full cost-of-service charges. Although the project sponsors acknowledge that an interim rate provision can be incorporated into the tariffs, they are of the view that an interim rate would produce no material changes in the charges that would otherwise be collected under the tariffs. That view is based on the project sponsors assumption that beginning with the initial billing commencement date, their respective segments of ANGTS will be used essentially at their full design capacity.

132/ El Paso Alaska Co., Docket Nos. CP75-96, et al., "Initial Decision on Proposed Alaska Natural Gas Transportation Systems," at 409 (Feb. 1, 1977).

133/ Comments at 63.

The Commission, however, will require an interim rate because there are no assurances about the level of throughput that will be achieved during the initial period of operation. 134/ This is true particularly in light of the fact that charges will be permitted to commence upon completion and commissioning of operations. Because of the sheer size and complexity of this project it is reasonable to expect that the system may not be able to attain its design capacity throughput during the initial months of operation. Any throughput below the design capacity would result in higher unit charges to gas consumers if charges to the shippers were based upon the full cost-of-service computations.

To guard against that event, the Commission will require that an interim rate structure be established to be effective commencing upon completion and commissioning of operation, 135/ and terminating on the earlier of the first year of operation or upon attainment of design capacity throughput, whichever occurs earlier. 136/ The level of that interim rate is to be

---

134/ See Decision at 145-47.

135/ It must be made clear that this discussion pertains only to the methodology of the interim rate itself. The timing of the flow-through by the shippers of any charges resulting from the interim rate and the actual mechanics of the flow-through are not addressed in this order.

136/ See discussion in Section VI.A.1 (Billing Commencement).

computed on the basis of the projected cost-of-service for the first twelve months of operation divided by the system's design capacity throughput. The interim rate is to be a fixed unit charge (i.e., dollars per dekatherm) and is to be applied to the actual quantities of gas delivered through the system. The interim charge so computed will be effective commencing with the initial delivery of gas through the system. During the interim rate period, the expenses and revenues experienced by the transporter should be treated as "earnings and expenses during construction" and AFUDC should continue to be recorded in accordance with 18 C.F.R., Part 201, Gas Plant Instructions 3(17) and 3(18).

The Commission recognizes, however, that -- for some unknown and unforeseeable occurrence -- there could be a lapse between the time of completion and commissioning of operation of the system and the time when gas deliveries commence. As previously explained, 137/ such an event is unlikely because there are adequate incentives placed upon the transporters, shippers, and producers to commence gas deliveries at an early date. If, however, there were a delay in gas deliveries, no revenues would be generated from

---

137/ See Section VI.A.1. (Billing Commencement).

the interim rate described above. Additionally, if the quantity of initial gas flow were very small, the revenues might not be adequate to service debt and cover current expenses. The Commission will, therefore, permit the transporters to collect, as a "Minimum Bill," charges equal to actual operation and maintenance expenses, actual current taxes, and actual amounts necessary to service debt. It is the Commission's opinion that the tariffs should provide for a "Minimum Bill" as an aid in obtaining financing for this project.

The Commission also recognizes that a portion of the cost of service may have to be capitalized to the extent that costs exceed revenues. On balance, however, the interim rate adopted here appears preferable. It attains a reasonable balance between the need to obtain financing and protection for the consumers against excessive transportation charges during the system's start-up and testing period. Any capitalization of costs in excess of revenues would effectively be spread on a pro-rata basis to all shippers utilizing the system. An interim rate would also likely reduce the burden on those shippers utilizing the system to transport relatively small volumes of gas. Additionally, such a rate would tend to reduce inequities that may occur as a result of, possibly, different, higher charges imposed on shippers that initially use the system as compared to those that later use the system.

The type of interim rate prescribed by the Commission will operate as an incentive to the transporters to maximize the throughput because the revenues recouped from this type of rate will be increased as throughput is increased. The Commission's formula for developing an interim rate should also encourage early utilization of the system because the unit charge would be lower during this period as compared to full cost of service charges. The interim rate adopted by the Commission is also superior to alternatives proposed in the comments of parties and Staff. Further, the Commission's interim rate fully considers the concerns expressed by the project sponsors in their comments on an interim rate.

Staff supports the interim rate concept. 138/ The essential difference between the recommendation of Staff and the interim rate adopted by the Commission is that Staff would compute the interim rate based on the projected full cost of service for the first year of operation divided by the aggregate of the maximum annual contract entitlements.

The Commission is not persuaded that the result of dividing costs by maximum contract entitlements will achieve adequate protection against a high level of transportation

138/ Staff Initial Comments at 25-28.

charges during the initial months of operation of the system. It is not known at this time the extent to which the capacity of the system will be contracted for during those initial months of operation. That is one of the reasons underlying the Commission's determination that the interim rate prescribed here provides a significant measure of consumer protection without impairing the financeability of the project.

The interim rate adopted here also appears superior to the proposal of the Public Service Commission of the State of New York. New York argues neither for nor against adoption of an interim rate at this time. It suggests, rather, that a final determination on this matter be postponed to the future. 139/ Postponement can be achieved, according to New York, if the Commission were to provide that an interim rate would be prescribed if circumstances at the start-up date so warrant. To assess those circumstances New York proposes that the sponsors would be required, by a date set by the Commission, to file data about the expected level of initial operation. 140/

139/ New York, Initial Comments at 7.

140/ Id.

The Commission believes that its determination herein is more appropriate. In the Commission's view, the project sponsors and the finarcial community need a determination, at this time, about whether an interim rate will be required. Further, the interim rate prescribed here is sufficiently flexible so that the level of the rate will automatically adjust to the initial level of operation.

The Commission prescribed interim rate will also satisfy the concerns expressed by the State of California. California states that it has no basis for proposing implementation of a "complex" interim rate approach in the early months of operation. 141/ The interim rate described above is not complex. It strikes the necessary balance between protecting consumer interests during the initial months of operation of the system and the requirements for a revenue flow for the project sponsors.

141/ California, Initial Comments at 5.

The State of Alaska did not comment on the interim rate per se. Rather, Alaska's comments were directed to whether an attempt should be made to levelize the costs over the life of the project. Alaska, Reply Comments at 5-6. The interim rate issue that is addressed by the Commission should not be confused with any attempt to levelize costs over the whole life of the project. Rather, the interim rate is intended to guard against excessive transportation charges during the initial period of operation of the system.

California also cautions that the Commission should assure itself that the design capacity throughput will be achieved within a short period after the gas begins flowing. 142/ As stated above, this Commission does not have any assurances at this time about the number of months that will be required for the system to reach its design capacity. For this reason, the Commission will require the implementation of the interim rate described above, the effect of which will be that the average charge for gas transported through the system during the initial period of operation will not be excessively high.

Finally, the interim rate adopted here will provide the project sponsors with the assurances they sought. The sponsors state that they do not deny that an interim rate can be incorporated into the project tariffs provided that the interim rate expires on a date certain. 143/ The interim rate that the Commission will impose will expire, as indicated, upon the attainment of design capacity throughput or the end of the first year of operation, whichever occurs earlier. The Commission has also provided resolution of this issue at this time so that, as the sponsors argued,

---

142/ Id.

143/ Joint Comments at Tab 3, Pt. 2 at 7.

their ability to arrange timely financing for the project would not be impeded. The interim rate structure provided for here should be an aid in securing financing for the project. Further, should the project sponsors prove correct in their assumption, that the system will be used to its then-available capacity once operations begin, the revenues generated by the interim rate will equ te to the full cost-of-service.

AGO 886157

3. Service Interruption

The third issue identified by the Alaskan Delegate involves whether equity investors of either the Northern Border or Alaskan Northwest segment should be subject to a reduced return on equity if that segment is unable to fulfill its contract obligation to transport Alaska gas. Both the Administrative Law Judge in El Paso Alaska Company and the FPC in its Recommendation to the President endorsed such a provision.

Section 5 of Rate Schedule T-1 of each proposed tariff adopts the concept and provides for a reduction in charges should the pipeline be unable to accept and transport the contract gas tendered to it. The tariff provision reducing the charges to shippers would be applicable, however, only in those instances when the reduction in service for any one month was greater than 10 percent. 144/ In that event the adjustment to the monthly bill would reduce the return on equity and associated taxes. That reduction would be proportional to the percentage of volumes tendered but not transported. If the transporter is able subsequently to

---

144/ Any failure by the pipeline to accept less than 100% but more than 90% of the gas tendered by a shipper would be accounted for in the Make-Up Gas provision of the respective tariffs. This gas -- referred to as "No Billing Adjustment Gas" -- would be transported in subsequent months at no added charge to the shipper.

transport the volumes of gas to which a billing adjustment had previously been applied, the charge for that "Make-up Gas" transportation would be computed by using the same billing adjustment (i.e., the same $ 'Dekatherms). In summary, the tariffs have the effect of reducing charges to the shipper if the pipeline is unable to operate at 90 percent of the contracted transportation level, but permits the pipeline to recoup any such billing credits by transporting volumes in excess of the contract level in subsequent months.

Commission Staff argues that the service interruption provision of each of the proposed tariffs is inadequate. Staff contends that, under the proposed tariff arrangement the possibility exists that ultimate consumers may not receive gas because of the failure of one transporter to perform. Those consumers, however, would still be required to pay (1) the full costs of service of those segments able to perform; (2) a portion of the costs of that segment responsible for the service interruption; and (3) depending on the terms of the gas purchase contracts between producers and shippers (e.g., "take-or-pay clauses"), some or all of the shipper's contract obligation.

AGU 886159

To recognize this potential burden on consumers, Staff argues that a premium must be placed on performance. Staff, therefore, proposes that the tariff provide both a proportional reduction in return on equity for minor interruptions and a total cessation of recovery of equity investment for interruptions of 60 percent or more of the contract quantities.

In Staff's view the loss of equity investment is compatible with the President's Decision. The Report accompanying the Decision is said to establish that equity investment is to be placed at risk in all circumstances, including service interruption, and should interruption occur, only debt service would be maintained (see Report at 100-101).

There is no dispute about the necessity for a tariff provision that reduces the return on equity for service interruptions, and such a provision must be included in the tariff. The Commission views this tariff provision as striking a necessary and appropriate balance between the need to provide an incentive for maintaining uninterrupted service and yet realistically appraise the operating character of the pipeline. 145/ A reduction in charges to

---

145/ The Commission recognizes also the balancing of transporter/shipper interest provided through the "Tender Deficiency" provision under Section 3.1 of Rate Schedule OT-1, which permits the shippers to make up any deficiencies in the volumes of gas tendered for transportation during the same month in which the tender deficiency occurred or in the next following month.

shippers would provide an economic incentive for the project sponsors to maintain uninterrupted service to the maximum extent possible. The provision would simultaneously recognize that a pipeline cannot transport 100 percent of its contract gas every day. It would thus afford some measure of operating flexibility to the transporter through use of the 90 percent billing adjustment "ratchet" without any apparent long-term operating or economic hardship on the shippers.

As proposed by the project sponsors, another feature of the 90 percent billing adjustment ratchet is that there would be no limit imposed on the time available to transport the make-up volumes. Staff objects to that provision, arguing that the period for transporting make-up volumes should be limited to one year. According to Staff, the make-up volumes can be obtained only from "storage, reinjection, improved field deliverability or new discoveries." Each of these sources of increased gas supply will impose additional costs on shippers and producers. In such circumstances, Staff argues, the transporters should not be entitled to an unlimited make-up period because it would be contrary to the intent of a Minimum Bill provision and would also shift risks of interruption to the consumer.

Contrary to Staff's argument, the Commission concludes that a time limit for transporting make-up volumes should not be included in either of the tariffs. If the transportation

of make-up gas has no time limitations, a transporter will be required to discharge all obligations under the make-up gas provision of Rate Schedule T-1 before a charge can be assessed pursuant to Rate Schedule OT-1. The make-up gas provision of the Rate Schedule T-1 is to the consumer's benefit since the OT-1 charge would be higher than the make-up gas charge for "Billing Adjustment Gas" (i.e., gas which had been tendered but not transported, and for which an adjustment had been provided, equal to a proportional reduction in return on equity and associated taxes). Further, a transporter operating under an indefinite make-up period will be under a continuing obligation to ship "no billing adjustment gas" which had previously been tendered by a shipper A shipper is not charged for the transport of this gas, because no credit was received by the shipper at the time these volumes were tendered but not transported.

Consumers may also benefit from an indefinite make-up period. To the extent that make-up gas can be transported at a lower charge than other volumes of Prudhoe Bay gas, the lower costs and increased volumes would lower the average cost of all gas. That possibility would be cut off, however, were a one-year limit imposed on transporting make-up gas.

Finally, the Commission disagrees that the indefinite make-up period now provided in the pro forma tariffs will not put a premium on performance. Transporters are not

likely to delay the transportation of make-up gas, because such delay prevents recovery of the return on equity. Thus, any make-up provision is self-enforcing. Further, since there is a time value of money, the indefinite make-up provisions of the tariffs might provide a continuing incentive for transporters to perform make-up activities as quickly as possible, so that revenues will be forthcoming for their use sooner rather than later. That continuing obligation would not exist, however, if after one year from the service interruption the transporter, although permanently losing a portion of the return on equity, was also discharged from his make-up obligation and could charge at the then current transportation rates.

For the reasons set forth above, the Commission therefore approves the pro forma tariff provisions regarding the reduction in return on equity. Except for the period of time permitted to transport make-up volumes, there is unanimous agreement among participants that such a tariff provision is both fair and necessary.

There is substantial disagreement among participants, however, about whether there should be a loss of equity investment for major service interruptions. As discussed above, Staff would require a permanent reduction in the return of equity whenever transporters fail to transport 60 percent or more of their contract volumes. Tariff provisions similar to that proposed

by Staff were discussed in the initial decision in El Paso Alaska Company 146/ and in the FPC's Recommendation. 147/

The Commission has carefully examined this issue and concludes that in the event of an extended, total service interruption, the public convenience and necessity may require a reduction of, not only the return on equity, but also a disallowance of the return of equity. A tariff provision of this nature was before the President 148/ and complies with the conditions under which private financing was expected to occur:

> 1. The equity investment in the project would be placed at risk under all circumstances and the budgeted equity investment be considered the first funds spent. The rate of return on equity would compensate sponsors for bearing this risk.
>
> * * *
>
> 4. Provision of debt service in the event of service interruption would be borne by consumers through a tariff that becomes effective only after service commences. 149/

Unlike the Staff's proposal to reduce charges whenever the level of gas throughput falls below 60 percent of contract amounts, the reduction in charges described below will

---

146/ Docket Nos. CP75-96, et al., Initial Decision at 404 (Feb. 1, 1977).

147/ Recommendation at XII, 43.

148/ The private financing model discussed in the Recommendation would have reduced debt service.

149/ Recommendation at XII, 43.

become effective only in the event of an extended total cessation of service. As already discussed, the 90 percent billing adjustment ratchet for any service diminution below 90 percent of tendered gas will reduce charges to eliminate return on equity. However, once the transporters wholly fail to provide any service, it is appropriate that return of equity be subject to forfeiture.

The provision adopted here will be activated only in the event of the failure of the Alaskan segment or Northern Border segment to transport tendered volumes, and only when there is a total cessation of service for thirty consecutive calendar days. The provision would apply prospectively from the thirty-first day of service interruption, and would continue until such time as gas is again transported. Further, this provision will apply solely to that segment directly responsible for the service interruption. 150/ Specifically, the Commission will require that commencing with the thirty-first day of total service interruption, that portion of the transporters' charges attributable to equity costs (that

---

150/ For example, if the Alaskan segment of the system were inoperable but the Northern Border segment were operational, no adjustment would be made to the charges by Northern Border. Likewise, if one or more of the Canadian segments of the system were inoperable but the Alaskan segment and the Northern Border segment were operational, no adjustment would be made to the charges by either Alaskan Northwest or Northern Border.

portion of depreciation expense not necessary for debt service and associated taxes) shall be collected, subject to refund. Under no circumstance would debt service be impaired.

A Commission hearing will be convened as soon as practicable after the end of the first month of total cessation of service. At that time, the transporter will be provided the opportunity to demonstrate that the extremity of the circumstances surrounding the service interruption warrants retention of equity costs by the transporter. If the transporter can demonstrate that the failure to provide service was beyond the control of prudent management, the revenues collected subject to refund will be retained by the transporter. If such a showing is not made, the revenues collected subject to refund must be returned to the shippers together with appropriate interest.

While the Commission recognizes that consumers will be required to pay a portion of the transportation charges during the period that the Commission is considering whether equity costs should be refunded, that period should not be long. The ANGTA mandate to expedite will continue in force. The continued collection of equity costs by the transporter may also assist it in having revenues available to make necessary, and perhaps expensive, repairs to restore service.

Consumers, on the other hand, will have the assurance that refunds, with interest, will be provided should the transporter fail to demonstrate that the total cessation of service was not the result of management imprudence.

In that event, fairness requires that the appropriate transportation charge only recover actual operation and maintenance expenses, current taxes, and debt service. This reduced level of charges would continue until service is restored.

This procedure provides the assurance to investors that debt service will be covered in all events as was contemplated in the President's Decision. 151/ It also provides that shippers and consumers would not bear equity costs when management is unable to demonstrate that events surrounding the service interruption justify the retention of such equity costs by the transporter.

151/ Decision at 100-101.

4. Billing Procedure

The selection of the period and method to calculate shippers' transportation charges is the fourth issue affecting risk allocation for the Northern Border and Alaskan segments of the ANGTS project. 152/ According to the Alaskan Delegate, two alternative procedures were presented during the hearings in El Paso Alaska Company, Docket No. CP75-96, et al.

> The first would be to estimate the cost of service of the pipeline over a future six month period and then fix a constant monthly charge to recover this estimated six month cost of service. In the event that the estimate deviated from the actual cost of service, any accumulated undercharge would be added to, or any overcharge subtracted from the charge levied over the following six month period.
>
> The second approach . . . would be to simply bill shippers monthly for the actual costs of service incurred during the previous month. . . . This could result in charges changing from month to month but would avoid any overcharging or undercharging. (Delegate's Report at 13)

The Initial Decision in that proceeding recommended adoption of the six-month billing procedure. 153/ The Presiding Judge found that the six-month billing affected only the timing of recovery of the charged rates and, therefore, no adequate justification had been presented

---

152/ See Delegate Report at 13.

153/ Initial decision at 407-408.

for rejecting the proposal. He further postulated, however, that the monthly billing procedure would have also been acceptable. 154/

Each of the proposed tariffs before the Commission provides for a six-month billing procedure (see Section 6.8 of the General Terms and Conditions of the tariffs of Northern Border Pipeline and Alaskan Northwest Natural Gas Transportation Company). Commission approval of each of the tariff provisions is urged by the project sponsors as providing a mechanism to permit shipper tariff tracking provisions with transportation costs attributable to ANGTS. The proposal is also tentatively supported by New York. 155/

Staff acknowledges that the six-month billing procedure is neither unfair nor illegal. Staff contends, however, that billing shippers for the previous month's actual costs provides certain advantages: (1) it would simplify the tariff by eliminating the surcharges and carrying charges which occur with a six-month billing procedure; (2) it would reduce billing controversies regarding methods of estimation; and (3) it would simplify review of transporters' rates.

154/ Id.

155/ New York, Initial Comment, at 8.

Initially, the Commission agrees that the project sponsors' proposed method of billing is neither illegal nor unfair. Each transporter will determine monthly the difference between its actual cost of service and the total charges collected. That difference will be accounted for in the transporter's working capital allowance in rate base and, therefore, carrying charges will be recovered by the transporter when there have been undercollections or by the shipper when there have been overcollections.

Moreover, while Staff's arguments in favor of a monthly billing procedure are credible, the Commission finds that on balance the six-month billing procedure will be adopted. Although cost-of-service billing is typically done on an actual basis, a six-month billing procedure here would provide the transporter with a relatively stable flow of revenues. It would also enable the shippers to more accurately estimate their revenue requirements for the immediate future. 156/

The six-month billing procedure would also benefit the consumer by reducing the possibility of wide variations in monthly transportation charges. Such variations

---

156/ This feature may have significance in the Commission's consideration of the mechanics of flow through of the systems' charges by the shippers. The question of shipper tracking is discussed above. See Introduction to Section VI.

could be a result of the planned maintenance and scheduled down time proposed in the tariffs. Section 1.14 of the General Terms and Conditions of the Alaskan Northwest tariff and section 1.15 of the General Terms and Conditions of the Northern Border tariff show how the planned maintenance and scheduled down-time factors vary from month to month for the pipelines. Notwithstanding those monthly down-time variances, the January-June billing period contemplates effective operating days 157/ that are essentially identical to the effective operating days for the July-December billing period. Thus, the proposed six-month billing period -- which uses an estimating and subsequent balancing approach -- would tend to level off the monthly bills, and would appear to be consistent with and a desirable accompaniment to the planned operation of the pipeline.

The Commission will permit the billing procedures proposed by the transporters. However, the proposal to compute working capital allowance on the accumulated differences between the estimated cost-of-service and the

---

157/ Effective operating days are determined by multiplying calendar days for each month by the corresponding maintenance and down time factor. Effective operating days should translate, essentially, into relative volume throughput in each month.

actual cost-of-service will not be approved. Rather, carrying charges on such differences will be permitted in accordance with the Commission's Regulations. This approach is the normal treatment for similar amounts.

B. Other Tariff Issues

As noted at the outset of this discussion, several tariff issues have been identified through the comment procedure of this rulemaking, and as a result of the Commission's analysis of the proposed tariffs. Those issues are considered below.

1. Availability of Transportation Services

The Alaska Natural Gas Transportation Act states at Section 13(a) that "no person seeking to transport natural gas in the Alaska natural gas system shall be prevented from doing so or be discriminated against in the terms and conditions of service on the basis of the degree of ownership, or lack thereof, of the Alaska natural gas transportation system." A question has arisen about whether the availability clauses of the pro forma tariffs (§ 1 of Rate Schedule T-1 and § 1 of Rate Schedule OT-1) comply with this provision of ANGTA.

The pro forma tariffs each indicate that services will be available to any shipper under its service agreement. The tariffs do not specifically indicate, however, whether a service agreement will be available on a non-discriminatory basis. It is thus possible that the availability provisions of the pro forma tariffs do not comply with Section 13(a) of ANGTA.

In their joint comments, Alaskan Northwest and Northern Border state that the intent of each of the

tariff provisions was not to deny access to any person seeking to transport natural gas. 158/ Rather, the intent was to recognize that each transporter is a contract carrier.

Staff expresses its belief that the availability provisions were not intended to deny access to the pipeline but suggests that as now drafted the tariff provisions are ambiguous. Staff, therefore, proposes alternative language. 159/ For Rate Schedule T-1, Staff proposes:

> 1. Availability
>
> This Rate Schedule is available to any person desiring service as provided for by Section 13(a) of the Alaskan Natural Gas Transportation Act of 1976 after execution of a service agreement with the Company.

And for Rate Schedule OT-1, Staff further proposes:

> 1. Availability
>
> This Rate Schedule is available to any Shipper that is receiving service and has executed a service agreement under Rate Schedule T-1.

The Commission has reviewed the proposed changes offered by Staff. These changes better reflect the intention that the services should be made available on a nondiscriminatory basis. The proposed changes of Staff

---

158/ Joint Comments, Tab 3, Pt. 2 at 1-2.

159/ Staff Initial Comments at 42-43.

should be substituted for the availability provisions now contained in each of the pro forma tariffs.

2. Cost Allocation

Several cost allocation issues have been raised by the filing of the transporters' tariffs and the comments thereon. The central issues to be decided are:

a) Should costs be allocated to various shippers on the basis of the relative volume units (Mcf) transported through the system or, alternatively, on the basis of relative energy units (Dekatherms) transported through the system?

b) Should Alaskan Northwest's system be segregated into two zones for rate purposes, or should the costs be composited and allocated to various shippers on the basis of the number of miles of system used by each shipper?

The determination of each of these issues has a greater impact upon the State of Alaska than any other party. The issues are created, in the first instance, by the expected delivery of Prudhoe Bay gas within Alaska. As Alaska stated in its initial comments:

> Alaska has been pursuing and evaluating proposal to utilize natural gas liquids from Prudhoe Bay in Alaska as a feedstock for a new petrochemical facility. 160/

160/ Alaska, Initial Comments at 7; see also Alaska, Initial Comments at 10.

The Commission agrees with the statements included in Alaska's initial comments to the effect that the Alaskan Northwest portion of ANGTS is not contemplated to be a "dual-phase transportation facility" and that Alaskan Northwest's tariff is "constructed on the assumption that there would not be a separate transport of liquids." 161/ It is the Commission's understanding that all of the fluids moving through the Alaskan Northwest pipeline will be in a gaseous state. There will be no droplets, slugs, or phases (or any portion of the fluid to which any similar term can properly be applied) in the pipeline which will be in liquid form.

What must be considered, however, is that certain portions of the gaseous stream being transported are liquefiable in a hydrocarbon extraction plant. It seems apparent from Alaska's statements that it intends to extract, or cause to be extracted, certain liquefiable hydrocarbons from the total gas stream passing from Prudhoe Bay through the State of Alaska. The central question that must be addressed is how should transportation costs be allocated to any "off-take" of gas within

---

161/ Id. at 7 (statement attributed to Alaskan Northwest).

Alaska 162/ if the composition of the gas is changed by changed by extraction operations occuring after the gas has entered ANGTS. 163/ Alaska states in its reply comments:

> The cost allocation methodology is of no great consequence because whatever the cost allocation methodology, the bottom line will be that the entire cost of service is recovered. 164/

Alaska goes on to state:

> There is no question that Alaska must be charged a just and reasonable rate for its shipment. 165/

The Commission agrees with the latter statement but cannot accept the former assertion. The tariffs must provide a mechanism for allocating ANGTS's costs that gives proper recognition to the planned utilization of the project and the attendant cost responsibility. The consequence of an improper cost allocation method would be that certain shippers would be effectively subsidizing the operations of other shippers. Furthermore, it is important that guidance be given to the potential users of Alaskan gas so that they may evaluate their participation in this project.

162/ See Alaska, Initial Comments at 8-9 for detailed discussion of "Off-Take" considerations and legal requirement to permit in-state withdrawal of royalty gas.

163/ The determination of this question does not require the establishment of a "separate liquids rate," which was suggested as a possibility by Alaska.

164/ Alaska, Reply Comments at 4.

165/ Id.

For the reasons explained below, the Commission determines that energy units (Dekatherms) rather than volume units (Mcf) should be used as the basic allocation units for apportioning Alaskan Northwest's cost-of-service. Additionally, the Commission will require that distance (miles) be factored into the cost allocation procedures. Finally, the Commission will require that Northern Border's cost-of-service also be allocated on a Dekatherm-mile basis.

Consideration of the essential purpose of ANGTS and certain elementary chemical facts is basic to properly resolving the issue of cost allocation. The ANGTS is being constructed as a transportation system to deliver energy to Alaska and the contiguous forty-eight States. The value of the system to most of the gas consumers is the amount of energy that will be made available through the system. Various industrial customers could benefit more by extracting certain of the constituents from the gas stream because of the chemical and physical properties peculiar to those constituents. Therefore, the value of the ANGTS to certain industrial customers is derived more from the discrete chemical and physical properties of the components that can be extracted from the gas stream rather than from the heat energy value of the total gas stream being transported.

Products that normally would be removed in a hydrocarbon extraction process (ethane, propane, butanes and pentanes-plus) have a higher heat value per unit of volume than the principal constituent remaining after processing (methane). 166/ This is obvious from the following:

Gas Component	Heating Value (Dekatherms per Mcf)
Methane	1.0
Ethane	1.8
Propane	2.5
Butanes	3.3
Pentanes-plus	5.0+

Based upon the information presented in the proceedings before the FPC involving the competitive applications to construct an Alaska gas transportation system, 167/ the gas available at a gas processing and conditioning plant could have the following composition of hydrocarbons:

Gas Component	Percent 168/
Methane	85.1
Ethane	7.8
Propane	4.0
Butanes	1.2
Pentanes-plus	0.2

166/ Substantial amounts of methane could also be required in a fertilizer manufacturing complex.

167/ Docket Nos. CP75-96, et al.

168/ Docket No. CP75-96, et al., transcript at 19,496 (testimony of Exxon Corp.). Percentages do not add to 100% because carbon dioxide and nitrogen, which do not have any heating value, have been omitted.

The gas leaving Prudhoe Bay is sufficiently rich in liquefiable hydrocarbons (ethane and heavier hydrocarbons) to make extraction somewhere on ANGTS attractive. Alaska indicates that it may be economical to extract certain of the hydrocarbons within the State of Alaska. 169/ It is quite obvious from comparing the heating value of the various gas components with the indicated composition of gas leaving Prudhoe Bay, that removal of all or any portion of the components other than methane would significantly affect the heating value of the remaining gas stream. For example, the gas stream after processing at a hydrocarbon extraction plant could essentially have the following hydrocarbon composition:

Gas Component	Percent 170/
Methane	93.5
Ethane	3.0
Propane	1.0
Butanes	0.5
Pentanes-plus	0

The heating value of gas leaving a hydrocarbon extraction plant with the above illustrative composition would have a heating value of approximately 1054 Btu per cubic foot (1.054 Dekatherms/Mcf). The gas leaving Prudhoe Bay with the composition shown at page 195

169/ Alaska, Initial Comments at 7.

170/ As before, the percentages do not add to 100% because of the omission of carbon dioxide and nitrogen.

would have a heating value of 1148 Btu per cubic foot. The extraction operation depicted by this example results in a loss in heating value of 94 Btu per cubic foot, or eight percent.

The implied results of any extraction operation that removes any "heavy" hydrocarbons (ethane, propane, etc.) are quite clear. Those customers purchasing gas downstream from the extraction operation must purchase greater volumes of processed gas to produce the same amount of heat energy that lesser volumes of unprocessed gas would produce. The type of extraction operations described above would effectively deprive other gas consumers of useable amounts of heat energy. As has been shown, the magnitude of deprivation of usable heat energy is not in proportion to volumes of liquefiable components removed in the extraction operation but is related to the heating value of the components removed. Therefore, allocation of the ANGTS costs on a volumetric basis would not be proper if extraction operations change the composition of the gas received into the system.

Recognizing the potential that some processing of Alaska gas to remove liquefiable hydrocarbons will likely occur at some place along the ANGTS, 171/ the Commission

---

171/ See, e.g., Alaska, Initial Comments; see also proposed gas purchase contract between Northern Natural Gas Company and Exxon Corporation filed with the Commission May 2[illegible], 1979.

decided to address the cost allocation issue in that context in this Order. 172/ The Commission's goal is to require a cost allocation method that most equitably apportions ANGTS costs to all shippers. Failure to resolve the issue at this time would result in uncertainties of cost allocation and could result in the institution of another proceeding to deal with the issue.

This Commission does not know what form or to what extent extraction operations may eventually be conducted along the ANGTS, either in Alaska or at other locations. If the State of Alaska, or others, conduct hydrocarbon extraction operations similar to those illustrated above, equity and sound regulatory policy require that ANGTS costs be allocated on a heat energy or thermal (Dekatherm) basis rather than a volumetric basis. To guard against any inequitable apportionment of ANGTS costs which

---

172/ The Commission is also aware that cost allocation may be sensitive to the carbon dioxide content of the gas being transported. If gas were injected into the pipeline with a carbon dioxide content above that now contemplated by Alaskan Northwest's Tariff (1%), the system would have a greater capacity to transport liquefiable hydrocarbons. The system would then, however, be transporting a larger quantity of inert gases.

The Commission also recognizes that resolution of the cost allocation issue could impact the economic considerations of the carbon dioxide issue. Interested parties are invited to address this interrelationship in their reply comments on this issue pursuant to the Notice issued May 16, 1979, in this docket.

could be attendant with a volumetric cost allocation approach, the Commission will require that the costs of Alaskan Northwest and Northern Border be allocated on a thermal (Dekatherm) basis.

The Commission's determination to require that ANGTS costs be allocated on a heat energy (Dekatherm) basis rather than a volumetric (Mcf) basis is not reached based on an extensive review of incremental costs of transporting liquefiable hydrocarbons. Rather, the Commission views the heat energy basis as the most equitable method of allocating costs incurred by this system in rendering the services permitted under the pro forma tariffs. It may be argued, for example, that there is no substantial increase in the cost of transporting the various constituents of natural gas. What must be considered, however, is that the tariffs now proposed by the transporters are for the transportation of a common supply of natural gas. 173/ There are no announced plans for any shipper to tender discrete hydrocarbons or other gases for movement through the system. Therefore, any upstream off-take of liquefiable hydrocarbons would effectively mean that shippers with delivery points downstream of the extraction operations would have to contract for the delivery of a greater volume of gas to produce the same amount of heat energy that a

---

173/ Joint Comments Tab 3, Pt. 2 at 4-5.

lesser volume of unprocessed gas would produce. This feature is the basis for the Commission determination that energy units rather than volume units should serve as the basic cost allocation unit for the ANGTS.

Having determined that energy units (Dekatherm) rather than volume units (Mcf) should be used for cost allocation, the "zones versus mileage" issue must be decided. Three of the most commonly used methods of allocating an interstate gas pipeline's cost-of-service to sales and services performed in different geographical areas are (a) zone-gate method, (b) system-wide method, and (c) Mcf-mile or Dekatherm-mile method.

The zone-gate method allocates costs attributed to the first upstream zone between sales and services performed in that zone and sales and services performed in all downstream zones. The costs incurred in the second upstream zone, together with costs allocated to that zone from the first upstream zone, are composited and allocated between sales and services performed in the second upstream zone and sales and services performed in all zones downstream of that zone. The process is continued, sequentially, for all zones, resulting in the last downstream zone being assigned all costs incurred within that zone plus costs allocated to that zone from all upstream zones. This Commission has approved the zone-gate method in the past for a very limited number of interstate

gas pipelines based upon the peculiar circumstances surrounding their operations and expansion. 174/ This method would typically allocate more costs to downstream customers than other methods.

The system-wide method of cost allocation makes no distinction between the geographical locations where sales and services are performed. This method has been approved by the Commission for those pipelines whose diverse sources of gas supplies and whose operations are of such an integrated nature as to effectively reduce or greatly minimize any differences in the cost of providing sales and services in different geographical locations. 175/

The most commonly used cost allocation method for long-distance interstate gas pipelines is the Mcf-mile or Dekatherm-mile method. This method is premised on two essential principles: (1) the pipeline is a system designed to provide sales and services over a long distance, and (2) the costs of providing sales and services vary in relation to distance or the length of the system required to provide the particular sales or services.

174/ See, e.g. United Gas Pipe Line Company, Docket No. G-9547, 25 PPC 26 (Jan. 4, 1961).

175/ See, e.g., Consolidated Gas Supply Corporation, Opinion No. 819 (Aug. 12, 1977).

Alaskan Northwest proposes to allocate costs between its proposed two zones essentially on a zone-gate method. For the reasons set forth below, the Commission does not approve Alaskan Northwest's proposed zone-gate approach but will require that Alaskan Northwest's total cost-of-service be allocated on an energy-distance basis (Dekatherm-miles) between any gas delivered in Alaska and gas delivered to the Poothills system at the Alaska-Yukon border. There are not sufficient reasons at this time supporting the establishment of rate zones on any basis (zone-gate or otherwise) within the State of Alaska. Separate rate zones are normally supported by recognizing that precise allocation of costs cannot be made for a large number of delivery points over a relatively short distance, and by recognizing the administrative advantage (for both the seller and purchasers) of billing a particular customer or group of customers at the same rate for as much gas as possible. 176/ The gas delivery points in Alaska will likely be small in number; 177/ therefore, no administrative advantages

---

176/ The feature recognizes the intergrated nature of many distributor customer who have multiple gas receipt points.

177/ Alaska, Reply Comments at 3.

of separate rate zones are apparent. Additionally, it is reasonable to expect that proper cost responsibility can be ascertained for each gas delivery point in Alaska under the Dekatherm-miles basis. In summary, the circumstances of Alaskan Northwest do not conform to criteria historically utilized by the Commission for establishing zones.

The justifications offered by Alaskan Northwest for establishing two rate zones within the State of Alaska are generally as follows: 178/

(1) The cost of providing transportation service for gas delivered in Alaska can be more accurately ascertained by attributing the costs incurred within each zone to the shippers using the facilities in each zone;

(2) Alaskan Northwest will likely provide two categories of transportation service: gas transported for use in Alaska, and gas that completely transits the state;

(3) Substantial variations are expected in costs associated with the northern and southern portions of the Alaskan pipeline, with the portion north of

---

178/ "Responses to Data Requests by Alaskan Northwest and Northern Border" in response to a letter from the Commission's Director of the Alaska Gas Project Office, dated April 20, 1979; Joint Comments, Tab A, Pt. 2.

Delta Junction being the highest cost in terms of investment per mile or investment per unit of capacity.

The Commission is not persuaded that Alaskan Northwest's proposed zones will result in an equitable distribution of costs. Alaskan Northwest's suggestion that its proposed method of cost allocation may produce more accurate results is not totally convincing, because as Alaskan Northwest indicates, even under its proposed method, certain types of costs are not directly assignable to each zone and will have to be allocated. The company has proposed that such costs be assigned to each zone "in proportion to plant in service or the levels of contract service," without showing that the method would result in a fair and proper distribution of costs.

More important, however, is the fact that Alaskan Northwest's proposed cost allocation method does not adequately recognize the conditions under which the system will be designed, constructed and operated. During at least the initial operation of the system, it is anticipated that Alaska's share of gas will be shipped to the contiguous forty-eight States. Capacity will be provided for Alaskan royalty gas in not only the northern portion of Alaskan Northwest's pipeline but also in the southern portion. The extent to which Alaska may continue to utilize the southern portion of the system will obviously depend upon how much of its royalty gas entitlement it chooses

to "off-take" from the northern portion of Alaskan Northwest's pipeline. 179/ Alaska could very well choose to continue to ship a portion of its royalty gas through the southern portion of Alaskan Northwest's pipeline, either for use within the portion of the state south of Delta Junction 180/ or for shipment to the Alaska-Yukon border for delivery into the Foothills system.

Alaskan Northwest's characterization of two categories of transportation service is not adopted. The transportation services are essentially the same. Any differences in the services pertain only to the portion of the system (miles) used to provide the services, and the cost allocation method required by the Commission is intended to fully compensate for any such differences.

Differences in the costs of constructing and operating the northern portion versus the southern portion of the Alaskan Northwest pipeline do not, in themselves, require the establishment of zones. The higher costs of the northern portion (in terms of investment per mile or investment per unit of capacity) results from the planned long-term operation of ANGTS, and not because of discrete considerations relative to any "off-take" of gas by Alaska. Alaskan Northwest's proposed zones would likely mean higher cost

---

179/ See Alaska, Initial Comments at 8-9.

180/ Delta Junction is the point selected by Alaskan Northwest as the division between the two proposed zones.

assignment to Alaska over the long-term than would a distance-of-transportation allocation method. The likely results of Alaskan Northwest's proposed cost allocation method have not been justified.

Weighing all of the considerations, it is the Commission's judgment that Alaskan Northwest's proposed zone-gate method of cost allocation should not be approved. The Commission concludes that the most equitable procedure for allocating Alaskan Northwest's cost-of-service is embodied in an energy-distance basis (i.e., Dekatherm-miles), without the establishment of separate rate zones.

Northern Border proposes to allocate costs on an Mcf-mile basis. The Commission adopts the distance-weighing portion of Northern Border's proposal (i.e., miles), but, for the reasons already explained with respect to the effects of any hydrocarbon extraction operations, will require that energy units (Dekatherms) rather than volume units (Mcf) be used as the basic allocation unit. The Commission is not aware of any extraction operation plans on the Northern Border system. If gas entering and leaving the Northern Border system is not processed and remains of the same chemical composition, it would not matter whether volume units or energy units were used for cost allocation, because the results would be the same. However, the cost allocation method required by the Commission puts all parties

on notice of the economic context in which any contemplated extraction operations must be evaluated.

As a final point on cost allocation, it must be made clear that the Commission views the cost allocation requirements for the Alaskan Northwest and Northern Border segments of ANGTS to be quite distinct from the cost allocation requirements for the Foothills system. The Commission's determination that Alaskan Northwest's and Northern Border's costs-of-service should be allocated on an energy-distance basis (Dekatherm-miles) is dictated by the fact that there will likely be some extraction of various components of Prudhoe Bay gas. Even with extraction operations occuring in Alaska, the gas delivered to the Foothills system at the Alaska-Yukon border would probably have a higher heating value than any gas originating in the Mackenzie Delta area and introduced into the ANGTS at Whitehorse, Yukon Territory. The same heating value disparity could also be attendant with any other gas originating in other areas of Canada and introduced into the Foothills system. The reverse could also conceivably occur if gas input in Canada had a heating value higher than Alaska gas delivered at the Alaska-Yukon border.

In any event, the Agreement Between the United States of America and Canada on Principles Applicable to

a Northern Gas Pipeline (Agreement on Principles) has a firm mechanism established to give full recognition to any difference in the composition and quality of gas received by the system. 181/ If Canadian gas entered the pipeline system with a heating value less than the heating value of Alaska gas entering the pipeline system at the Alaska/Yukon border, the Agreement on Principles requires that any dilution in the heating value of Alaska gas would be fully recognized in the allocation of Foothills' cost-of-service and in gas deliveries. This adjustment would be necessary so that a disproportionate share of Foothills' cost-of-service would not be imposed on the American consumers. Specifically, the Agreement on Principles provides in pertinent part:

> It is agreed that the following principles will apply for purposes of cost allocation used in determining the cost of service applicable to each shipper on the Pipeline in Canada:
>
> a) The Pipeline in Canada and the Dempster Line will be divided into zones as set forth in Annex II. Except for fuel and except for Zone 11 (the Dawson-Whitehorse portion of the Dempster Line), the cost of service to each shipper in each zone will be determined on the basis of volumes as set forth in transportation contracts. The volumes used to assign these costs will reflect the original BTU content of Alaskan gas for U.S. shippers and Northern Canadian gas for Canadian shippers, and will make allowance for the change in heat content as the result of commingling. Each shipper will provide volumes for line losses and line pack in proportion to the contracted

---

181/ Decision at 47-66.

volumes transported in the zone. Each shipper will provide fuel requirements in relation to the volume of his gas being carried and to the content of the gas as it affects fuel consumption. 182/

The Commission's determination with respect to cost allocation for the Alaskan Northwest and Northern Border segments of the ANGTS does not in any way change the interpretations, or the application thereof, of the cost allocation methods defined and agreed to by the United States and Canada. The cost allocation procedures set forth in the Agreement on Principles for the Foothills segment are required because of the potential dilution of Alaska gas caused by commingling of that gas and Canadian gas that will likely have a lower heating value. While the cost allocation procedures required by the Commission for the Alaskan Northwest and Northern Border segments of ANGTS are necessary to properly allocate costs to any extraction operations that may be conducted on those two segments, it is the Commission's understanding that no extraction operations will be conducted on any ANGTS gas in transit through Canada. If any extraction operations were conducted, however, the allocation of Foothills' cost-of-service should fully account for any such operations.

182/ Id. at 57-58.

3. Accounting and Rate Treatment for Line Pack

The Staff's initial comments raised an issue related to line pack. The issue is succinctly described in the Staff's example:

> Suppose shippers A & B initially hold title to 100% of the line pack worth $10,000,000. Each files a rate application with the Commission to include $5,000,000 in rate base to recover carrying charges (return & taxes) on their line pack investment. Three months later, Shipper C, a new user of the system, begins transporting gas, and is assigned one-third of the existing line pack. Shipper C files a rate case and claims $3.3 million in rate base attributable to line pack. Unless Shippers A & B voluntarily reduce rates under Section 4 of the Act, the Commission, under current law would be required to approve the rate treatment sought by Shipper C without legal right to automatically lower the rates of Shippers A and B. 1/ Thus consumers would bear carrying charges on $13.3 million in total jurisdictional rate bases when the aggregate line pack investment is only $10 million.

1/ The Commission's only recourse would be to establish an investigation under Section 5 of the Natural Gas Act and order any resulting rate reduction to become effective prospectively after hearing. The hearing may involve a lengthy inquiry into all aspects of the Shippers' costs of service. 183/

The Staff's initial comments suggested two different approaches for handling the costs of line pack:

> . . . Either require ANGTS sponsors to pay 'rent' or carrying charges on line pack used by the system (these carrying charges would then be an operating expense for the pipeline and recoverable through the cost of service tariff) or require ANGTS shippers to automatically 'track' changes in line pack. 184/

183/ Staff, Initial Comments at 28-29.

184/ Id. at 29.

The reply comments of Northern Border and Alaskan Northwest assert that this issue should not be considered in this rulemaking. Instead, the project sponsors argue the matter should be decided in the proceeding that addresses the shipper tracking issue. 185/

Shippers will incur substantial costs in providing natural gas for line pack in order for their gas to be transported through the ANGTS. It is important that the shippers be able to recover the costs actually incurred. Therefore, any method for recovery should provide for adjustment when a shipper's line pack obligation changes (either increases or decreases) with attendant changes in cost. Staff has presented an alternative which would have the transporters compensate the individual shippers for the carrying costs on their separate line pack contributions and recover the amounts through the transportation tariffs. This would have the advantage of facilitating recovery of the actual costs borne by the shippers, but it would impose an unnecessary added cost recovery burden upon the transporters.

In the discussion on tracking of costs by shippers, the Commission expressed a receptiveness to proposals for automatic flow-through of ANGTS charges for shippers subject to the Commission's jurisdiction, provided such shippers make an appropriate showing that the flow-through

185/ Joint Reply Comments at 38.

mechanism will result in a matching of costs and revenues. The mechanism could also provide for recovery of actual costs attributable to line pack. 186/ The Commission will, therefore, defer the specification of any particular recovery mechanism pending receipt of the ANGTS cost flow-through proposals by individual shippers based upon their particular circumstances. Such proposals should include methods for recovery of line pack costs that will reflect actual cost incurrence based upon actual line pack obligations.

4. Lateral Line Policy

The pro forma tariff of Alaskan Northwest contains the following provision:

> Company will construct, operate and maintain lateral delivery lines on a nondiscriminatory basis and render related service under an appropriate Rate Schedule. Nothing in this policy statement shall require Company to file an application for a certificate of public convenience and necessity under Section 7(c) of the Natural Gas Act. . . . (Section 19.2 of the General Terms and Conditions)

By letter dated April 27, 1979, the Director of the Commission's Alaska Gas Project Office requested Alaskan Northwest to explain this provision. The primary concern was that the proposed tariff language could be interpreted as establishing a waiver of Alaskan Northwest's obligation to file for a certificate of public convenience and necessity if lateral delivery lines were constructed.

186/ See Section VI, Introduction.

The joint reply comments of Alaskan Northwest and Northern Border responded to the inquiry, indicating that the referenced language was only intended to clarify that Alaskan Northwest was under no obligation to file for a § 7(c) application at the request of a shipper or other party. If the company were to choose to construct lateral delivery lines, the comments assure the Commission that appropriate certificates of public convenience and necessity would first be sought. 187/

The Commission accepts the explanation set forth in the comments of the project sponsors. In order to avoid any subsequent confusion or controversy however, Alaskan Northwest should revise its tariff in accordance with the explanation provided in the comments and accepted by the Commission.

5. Certain Quality Standards Other Than CO_2 Content

The Commission indicated at the outset of this discussion of tariff issues that it would defer resolution of the issue of the permissible level of CO_2 content in the gas stream. Other issues related to quality standards can, however, now be addressed.

Questions have been raised by Sohio related to the quality standards for water content and sulfur (hydrogen sulfide, mercaptan sulfur, and total sulfur). Sohio contends that the tariff standards are excessive and

187/ Joint Reply Comment at 51.

not justified. Further, Sohio objects to the water quality standard being stated on a volume basis (pounds per Mcf) rather than on a dew-point temperature basis (degrees Fahrenheit), and the mercaptan sulfur standard being stated on a mass basis (grains per 100 cubic feet of gas) rather than a volume basis (parts per million). 188/ The quality standards stated in the pro forma tariffs are the standards that have been known to the parties for the past several years, and no other quality standards have been advanced and supported by any party.

The joint reply comments of Alaskan Northwest and Northern Border state:

> The project company tariffs have proposed stringent quality requirements because we believe it the obligation of the ANGTS project to provide the lowest possible reasonable cost of transportation. If producers such as Sohio have a proposal which would be consistent with the public interest which would demonstrate some benefit to the consuming public by relaxation of ANGTS quality standards, certainly Alaskan Northwest and Northern Border would be willing to consider such a proposal. 189/

The exact quality standards required for gas to be transported through ANGTS will, of course, depend upon the final design of the system. Absent a showing that the quality standards stated in the pro forma tariffs are not compatible with the approved final design of ANGTS,

---

188/ Sohio, Initial Comments at 1-3.

189/ Joint Reply Comments at 22.

the Commission has no basis for ordering different standards. Accordingly, the water and sulfur standards proposed by the transporters will be permitted to be included in the tariffs subject to any revisions that may be required to comport with the final pipeline system design.

6. Modification of Article 4 of the Service Agreement

Article 4 of the service agreement of each pro forma tariff contains language that has generated comments from the Staff and the States of Alaska and California. Article 4 in each agreement obligates a shipper to make payments to a transporter in accordance with the tariff "Rate Schedules, the General Terms and Conditions and the other applicable provisions of [the] Agreement".

The State of Alaska is concerned that there is no express recognition in Article 4 that a shipper's obligation to pay is qualified by the adjustments set forth in Section 5 of Rate Schedule T-1. Alaska, therefore, proposes that each service agreement be modified to state that the obligation of a shipper to pay is subject to the adjustments provided in Section 5 of Rate Schedule T-1 of each tariff. 190/

190/ Alaska Initial Comments at 9-10.

The reply comments of the project sponsors indicate that Section 5 billing adjustments are recognized in the service agreements because of the reference in each agreement to "Rate Schedules." The sponsors state that Article 4 of each agreement is neither intended to override nor qualify in any way the billing adjustments provided in Section 5 of Rate Schedule T-1. 191/

If the Commission determines, however, that explicit reference should be given to the relationship between the two provisions, then the project sponsors agree with Alaska that the relationship should be recognized in Article 4 of each service agreement. However, the sponsors disagree with Alaska about where the modification should appear.

The modification proposed by the State of Alaska provides:

> Shipper shall make payments to company in accordance with the rate schedules, the general terms and conditions and the other applicable terms and provisions of this agreement. Shippers obligation to pay its allocable share of company's cost of service shall be absolute and unconditional under any and all circumstances (subject only to the adjustments expressly provided for in Section 5 of Rate Schedule T-1). . . . 192/

191/ Joint Reply Comments at 32-35.

192/ Alaska, Initial Comments at Attachment B.

The project sponsors' alternative states:

> Shipper shall make payments to Company in accordance with the Rate Schedules (including Section 5 of Rate Schedule T-1), the General Terms and Conditions, and the other applicable terms and provisions of this Agreement. 193/

The sponsors argue that their proposed alternative is preferable. In their view, the language proposed by Alaska will not recognize that a shipper's payment obligation can be affected by tariff provisions other than Section 5. They cite Section 6 of the General Terms and Conditions -- which also addresses billing and payment matters -- as an example of a tariff provision that also affects a shipper's payment obligation. 194/

The Commission views modifications of the type proposed by Alaska to be beneficial when ambiguities can be clarified and possible disputes thereby avoided. On that basis, it appears appropriate to provide express recognition of the relationship between Article 4 of the service agreement and Section 5 of Rate Schedule T-1. However, because the method of clarification proposed by Alaska may itself create ambiguities, the alternative modification proposed by the project sponsors will be accepted.

193/ Joint Reply Comments at 33.

194/ Joint Reply Comments at 33.

Staff also voices concern with Article 4. Staff argues that Article 4 is duplicative of other provisions in the pro forma tariffs, e.g. § 6.3 of the General Terms and Conditions. Staff further argues that Article 4 should expressly release a shipper from his obligation to pay if there is a willful refusal on the part of a transporter to perform. 195/

The project sponsors respond that Article 4 is necessary to explicitly recognize that the obligation of a shipper to pay will be absolute and unconditional. The sponsors assert that the provision was insisted upon by the sponsors' financial advisors as a means of aiding the financing of the project.

Staff may be correct that Article 4 is duplicative of other provisions in the tariff. However, when that is the sole objection and there is no contention that Article 4 is contradictory of other tariff provisions or that it creates ambiguities, then the Commission is not inclined to order the deletion of the provision in the circumstances presented here. To the extent that Article 4 will aid the financing of the project and is merely duplicative of other provisions, the Commission will permit its retention in the tariffs.

195/ Staff Initial Comments at 17-19.

The sponsors also respond to the proposal of Staff that a release of payment obligations should occur if there is a willful refusal to transport gas. The sponsors argue that explicit recognition of a willful refusal to perform will not affect the reliability of service, since it is unlikely that a willful refusal would occur. That is so, according to the sponsors, because there could be private actions for damages and there is already included in the tariffs a provision that reduces the return on equity should a transporter fail to accept tendered gas. Finally, should there be a willful refusal to perform, the sponsors assert that the Commission can institute an investigation and issue a remedial order, if necessary. 196/

Although the Commission agrees that shippers should not be subject to a payment obligation where there is a willful refusal by a transporter to perform, the Commission cannot endorse the proposal of Staff. In the Commission's analysis, the unlikelihood of a willful refusal, together with the potential problems that may result from adoption of Staff's proposal, adequately argue against the proposal.

As stated by the project sponsors, the likelihood is small that transporters would willfully refuse

---

196/ Joint Reply comments at 34-35.

to perform. More importantly, however, the prospective definition of a "willful" failure to perform, and an appropriate remedy, is difficult, if not impossible.

In light of these considerations, the Commission is of the view that the better course of action would be to recognize that any shipper contending there was a willful failure to perform can seek appropriate relief through the Commission.

The State of California argues that Article 4 of the service agreement should not be construed to limit the Commission's authority to review recovery of equity investment in the event of project failure after operations commence. 197/ The Commission's review obligations under the Natural Gas Act, however, shall continue. California's concerns, therefore, are unnecessary.

7. Failure to Deliver Gas

Another issue identified by Staff concerns whether equity costs should be reduced because of a failure by a transporter to deliver gas, rather than a failure to take receipt of tendered gas. Staff argues that the shippers should be given "explicit protection against diversion or loss of gas supply after it enters the control of transporters." 198/

197/ California, Initial Comments at 6.

198/ Staff, Initial Comments at 17.

In their reply comments the project sponsors contend that this provision is unnecessary. They assert that no gas will knowingly be accepted that cannot be delivered. Further, the sponsors argue that a billing adjustment keyed to gas receipt rather than gas delivery would be easier to administer. If the billing adjustment were keyed to gas deliveries rather than gas receipts, the sponsors itemize three considerations that would complicate billing adjustments: "(i) the possibility of multiple delivery points, (ii) variations in fuel use and losses, and (iii) variations in seasonal capacity." 199/

The Commission agrees with the project sponsors. The billing adjustment procedure for failure to accept tendered gas presents a relatively simple approach to protect the shipper, and any modifications to the tariff that complicate that mechanism are not desirable. That factor, taken together with the unlikelihood that the transporters would accept gas when there is an anticipation that it cannot be delivered, is sufficient reason to reject Staff's proposal.

199/ Joint Reply Comments at 30-31.

8. Review of Equity Rate of Return

After completion and commissioning of operation, the rate of return on equity allowed by the Commission is termed the Operation Phase Rate. The value of this rate should be comparable to rates of return allowed for other pipelines with similar operating risks. Once in operation this rate should be altered to reflect any changes in rates allowed for other pipelines with similar risks or if risk factors for this project change. The issue first raised in the letter to the project sponsors from the Director of Alaska Gas Project Office (April 27, 1979) is what procedure should be used to review this rate of return and determine if a change is reasonable.

The Staff's initial comments argue that the Operation Phase Rate should automatically be adjusted through a formula tied to changes in capitalization. 200/ Though capitalization is an important factor in determining rates of return, this procedure would ignore other equally important factors such as overall changes in required rates of return in the nation's economy due to changes in inflationary expectations or changes in risk factors. 201/

200/ Staff, Initial Comments at 36-41.

201/ At the time of the submission of a financing plan the Commission will also review the proposed capitalization over the life of the project.
