DEPARTMENT OF TRANSPORTATION & PUBLIC FACILITIES
OPERATING BUDGET COMPARISON
AND NARRATIVE OVERVIEW
FY86 AUTHORIZED - FY88 GOVERNOR'S REQUEST
(in millions)

Source of Funding	FY86 Authorized	FY87 Authorized	FY87 Revised	FY88 Governor's Request*	$ Change FY87 Rev. to FY88
Gen. Fund	$177.8	$161.4	$143.4	$124.1	($19.3)
Other Funds	116.2	118.5	118.8	122.1	3.3
Dept. Totals	$294.0	$279.9	$262.2	$246.2	<$16.0>
% G.F. Change From Previous Year	<0.4>%	<9.2>%	<11.2>%	<13.5>%	

*Excludes $5.2 million switch to user fees for Dalton Highway toll charges.

General fund decrements totalling $21.1 million and one general fund increment for $1.8 million for Marine Highways Risk Management increases have been accepted by the Governor. This is a net reduction of $19.3 million for the Department of Transportation and Public Facilities (DOT&PF). This yields a 13.5% departmental reduction from the FY87 Revised general fund budget. Please note this includes a net reduction of approximately 14% for the Alaska Marine Highway System (AMHS) and a 13.1% cut for all remaining DOT&PF general funds.

In addition, it is proposed that $5.2 million be changed from general funds to user fees to reflect operation of the Dalton Highway as a toll road. This would bring the general fund (GF) reduction to $24.5 million, or 17.1% of the Department's FY87 Revised GF budget. However, since this proposal would require separate legislative action this funding change is being considered as a part of the proposal for new legislation rather than as a part of the Department's budget.

Excluding the AHMS, and the Dalton Toll proposal, a general fund reduction of 13.1% and $11.0 million from the FY87 Revised GF level of $84 million is proposed. This 13.1% reduction in FY88

would mean that units of the department other than AHMS have been reduced by 36.1% since the FY86 authorized GF budget.

A net reduction for the general fund portion must be viewed in light of the overall impact to revenue from cuts to the AMHS. The AMHS has a FY'87 general fund revised budget of approximately $60 million and a subsidy level of about $30 million. We have identified the impacts from reducing the subsidy level by about $6 million, which results in a total reduction to the AMHS general fund budget of about $8.4 million due to revenue cuts.

MAJOR HIGHLIGHTS

The following depicts the major impacts from adoption of these proposals:

(1) Elimination of all state maintenance on nearly 1,600 miles of roads currently on the state maintenance system that are not considered the highest priority routes, or do not require minimal maintenance efforts due to investment of federal funds;

(2) Elimination of all maintenance except for minimal safety repairs and physical highway protection (which adds a hidden cost for increased legal liability) for approximately 800 miles of highways that are not priority routes, but have federal investment requiring continued state efforts to protect this investment;

(3) Reduction of maintenance funding by another 8% on the remaining 2900 miles of roads, which means a total reduction well in excess of 25% for maintenance and operation of these facilities in less than 18 months;

(4) Elimination or reduction of airport maintenance by over 7%, with particular emphasis on daytime operations only and major reduction of winter maintenance at certain airports statewide;

(5) Substantial reductions in Marine Highway service including unmanned layup of 6 vessels for a total of 29 months. This will affect at least 230 crew members. This leaves the Southeast system with no change to summer service, but only one mainline vessel and one feeder vessel for the other 8 months of the year, and the Southwest system with single vessel service for 6 months and no service for 2 months during the winter.

(6) Institution of a toll or user fee charge of approximately $500 per trip, per 18-wheeler for commercial use of the James Dalton Highway north of the Yukon River, which

may lead to eventual closure due to inability to recover adequate fees;

(7) Elimination of maintenance for campgrounds, rest areas, turnouts and waysides, land fills, and litter pickup for state highways to preserve funds for essential M&O functions; and

(8) Reductions in facilities maintenance including janitorial services for state buildings from 5 to 3 days per week, grounds-keeping, and clearing of snow and ice from sidewalks and parking areas.

HIGHWAY MAINTENANCE & OPERATIONS

The impact to highway M&O is particularly troublesome when viewed in a longer term context. Since 1980, DOT&PF's responsibilities have grown over 10%, while available real dollars have decreased by nearly 30% under the FY'87 revised budget.

To gain additional perspective, consider the likely effects of the FY'87 reductions already taken:

(1) Little preventative maintenance anywhere on the system, which means little highway crack sealing, patching or resurfacing.

(2) Traffic services such as snow plowing, striping, and pothole patching can only be performed on a priority basis, and roads to recreational areas and low traffic rural and suburban areas can be plowed only if time permits; and

(3) Routine summer maintenance will have to be eliminated or drastically curtailed if extraordinary winter snow and ice conditions occur.

Following the M&O cuts in August 1986, it is no longer possible to cut further on the basis of a straight percentage decrease across the entire system. Instead, it has been necessary to structure further reductions on a programmatic basis by classifying the highway system as follows:

(1) Category I: Priority routes that provide the intrastate connecting system between the population and economic centers, airports, and major harbors, thereby covering Alaska's fundamental transportation links.

(2) Category II: Routes where the state has invested sufficient federal funds to contractually bind us to provide a minimum level of maintenance to realize anticipated service life of the constructed improvements.

(3) Category III: All other routes that the state currently has on the state maintenance system.

We have further differentiated the importance of state efforts for maintenance into eight groups. These are in increasing order of importance (1) snow and ice control on Category III roads within organized governmental units; (2) all activities on Category III roads within organized governmental units; (3) snow and ice control on Category II routes within organized governmental units; (4) snow and ice control for Category III routes outside governmental units; (5) snow and ice control on Category II roads outside governmental units; (6) all activities on Category III roads outside governmental units; (7) maintenance at 30% of historical levels for Category II roads within governmental units; and (8) maintenance at 30% of historical levels on Category II routes outside governmental units.

The basic assumption is that a currently organized governmental unit would be better able, and probably more likely, to assume maintenance responsibilities for routes within their boundaries than people outside of a governmental unit. Please note this may require legislative action to grant road powers in certain cases. This also recognizes that for many routes in rural areas there is not an identifiable user group to assume this responsibility. We have also assumed that while snow and ice control is important, it is less critical in the long run than basic life/safety and structural maintenance efforts, partially because of our agreement with the Federal Highway Administration (FHWA) to prevent highway deterioration.

While we tried to structure the decrements in increasing order of importance, and with as much individual selection as possible to allow decisions other than simply "take it or leave it," it is important to underscore the radical and severe nature of these proposals. First, these cuts have been prepared on top of other drastic cuts that we're currently managing, with cost data gaps regarding current performance. Second, there has been no public involvement to review and legitimize the methodology. Third, there may be administrative code and federal legal constraints hindering or preventing implementation of some of these proposals. Finally, there is probably a hidden cost of increased legal liability from implementing these proposals, which needs to be scrutinized.

AVIATION/BUILDING MAINTENANCE & OPERATIONS

The FY'87 aviation cuts have also severely curtailed preventative maintenance work, such as runway crack sealing and patching. Snow and ice removal may not always occur, depending on available manpower. Certified airports may not be open for all scheduled flights if safe operational conditions cannot be provided, or if overtime is not available to provide required crash/fire/rescue (CFR) services. Additional curtailment of routine summer maintenance efforts may also occur.

The proposed FY'88 decrements reduce these efforts further, and force more service elimination. Elimination of winter maintenance may force operators to perform their own snow control or to switch to a different airport. Reductions or elimination of CFR activities may restrict the types of aircraft now using certain runways. Specific impacts include the winter closure of Nome's North/South runway, and service reductions or eliminations at Barrow, Umiat, Northway, Bettles, Tanana, Unalakleet, Talkeetna, and Kotzebue. If significant cuts are pursued in the aviation M&O area, more work is needed to ensure an equitable level of service reductions statewide.

FY'87 reductions for building M&O have meant that efforts on heating and ventilation components have been limited to emergency repairs. Considerable deferred maintenance continues to accrue. Any FY'88 cuts would further exacerbate these problems.

ALASKA MARINE HIGHWAY SYSTEM

To date the AMHS has not incurred any substantial reductions in available general funds, although there have been service reductions to offset cost increases. Since the AMHS's portion of DOT&PF overall general fund budget is about 40%, it has become necessary to scrutinize all components carefully and to propose ways to achieve significant general fund reductions to accommodate your request.

Since the AMHS is a transportation entity that generates revenue, the true cost to the state is not the total general fund appropriation, but is the net general fund cost or subsidy. Accordingly, we have proposed three sets of decrements to reduce the net subsidy by about $6 million for FY'88. Although we have not structured our proposal in this fashion, we believe serious consideration should be given to changing the current budget method to provide program receipt authority to expend generated revenues, along with the general fund subsidy needed to achieve the selected service level. This separation in funding would make it clearer to all concerned there is a revenue aspect to the AMHS.

The following depicts the specific impacts from reducing the subsidy level by $6 million:

(1) Reduce M/V MALASPINA service by four months. Reduce M/V Taku service by six months. Both vessels would be placed in unmanned layup. In combination with the already scheduled layup of the M/V COLUMBIA for six months and the overhaul periods for every ship, this will leave only one mainline vessel in service from Seattle or Prince Rupert to Skagway for eight months of the year. This will impact approximately 164 crew members during this period.

(2) Reduce M/V AURORA service by four months resulting in single feeder vessel service in Southeast for eight months of the year versus the current four month period. The M/V CHILKAT would increase service by four months to supplement service between Ketchikan and Prince of Wales Island.

(3) Reduce M/V BARTLETT service by six months. The M/V TUSTUMENA will provide service for the entire Southwest system, resulting in general service reductions in the winter, particularly between Valdez and Cordova. There would be no service for two months during the winter.

There are several key assumptions under each scenario. The basic intent is to maximize service for Alaskans, at the expense of tourist business if necessary. Although no service or cost saving assumptions have been included for eliminating Seattle service since current data is inconclusive, we intend to continue reviewing this option as a means to improve service for Alaskans without increasing the subsidy. Another key assumption is that it would be more cost efficient to maintain the same level of summer service for the entire 1987 summer before instituting reductions. This is because of (1) the FY'87 budget authorizes initiation of this level; (2) these are the high revenue months; (3) we have already published our schedule and are accepting reservations; and (4) it would minimize the impact from implementing cuts immediately. If earlier implementation of service cuts is desired, we can analyze this further.

We have not made any assumptions regarding possible savings to minimize service cuts by fare increases. Further work is needed to ascertain what service level savings can be obtained without increasing the subsidy, although we believe there are some possibilities here. Finally, no assumptions have been made about further savings from negotiating wage and benefit concessions or

crew size reductions, or through major streamlining of the administrative side. Please also note there is an increment to fund additional risk management expenses not covered in the current base budget, which if not funded will cause a further reduction in service.

It is important to underscore that the proposed service cuts are not "set in concrete," but merely a general sense of what service levels would be by reducing the subsidy level by $6 million. On the other hand, our current review of available data suggests that changes fairly close to these would be needed to obtain the targeted level of savings. The AMHS is a difficult entity to analyze correctly to achieve the savings we believe can be made, while preserving essential service levels. Any decision to achieve major subsidy reductions will require more work together to ensure we have a rational proposal.

JAMES DALTON HIGHWAY

While the Dalton Highway remains an important transportation facility, we believe it is reasonable to consider covering all or some of the high annual M&O costs through a user fee or toll charge. This is not a new issue, as evidenced by the state's success in including the special provision in Sec. 1113 of the Alaska National Interest Lands Conservation Act, which allows the charging of tolls without facing an obligation to repay federal-aid highway money used to construct the road.

The primary user and beneficiary from continued operation are North Slope oil producers and Aleyska. While it can be argued that we'd be biting the hand that feeds us, and clearly there would be some reduction in tax receipts because of the additional costs, we know of no covenant or agreement requiring continuation of this support at our expense. The Department of Law has advised us that there may be some changes to state statutes needed prior to initiating this proposal.

The per mile M&O cost for the Dalton is higher by at least 70% than for any other major rural transportation route in Interior District. Further, it is worth noting that since state assumption of this responsibility in 1978, we have spent about $50 million in state capital dollars to support this function. While it is conceivable that the net effect over time might be closure of the road because aviation and/or marine modes are selected as the more economical means for support of North Slope oil activities, we believe these are exactly the type of hard choices Alaskans are facing under declining revenues.

Outside of the hue and cry from the oil industry, the other major group negatively impacted would be the trucking industry, particularly owner-operators. We are sympathetic to this concern in light of currently depressed conditions, but ultimately the most cost efficient means of transporting goods must be used to maintain economic stability and growth in Alaska. One answer, which incidentally might also help address the general complaints about "unfair" competition from the Alaska Railroad Corporation (ARRC), would be an interim state assisted training program to relocate trucking industry people into other job opportunities. Another entity that would be negatively impacted if the Dalton closed would be the ARRC since they now haul a fair portion of this business to Fairbanks. It might be necessary to contact them to obtain an assessment of this impact.

A toll to recover the full charge of the department's maintenance and operations costs for the Dalton Highway would mean a charge of about $500 per trip for an 18-wheeler. Our costs are estimated to be $5.2 million annually, approximately $4.3 million in Interior M & O's Highway and Aviation component and $.9 million in the Facilities component. In addition, we have requested an increment for $.4 million in user fees to cover the costs associated with collection of the toll charges (.3 million would be the

annual cost, plus a one time cost of moving and modifying the checkpoint facility). The proposed toll does not include the capital coats for resurfacing or major maintenance of this road.

ADMINISTRATION/PLANNING/DESIGN & CONSTRUCTION

During prior reduction reviews, considerable general funds reductions were obtained in these areas. A total of 30.5% of general funds have been cut in these areas between the FY'86 authorized and FY'87 revised budgets. For example, a considerable portion of the reductions made to achieve the FY'87 revised budget were in these areas, allowing AMHS and M&O cuts to be considerably less than otherwise would have been the case.

Our decrements do include some additional general fund cuts in the planning areas. Otherwise, we are not proposing any further cuts at this time. It appears that sizeable "fat" trimming has already occurred. There is also a potential problem of making reductions to the point that we face problems with the FHWA and Federal Aviation Administration as to whether we are maintaining sufficient state funded management and administration to continue qualifying for federal highway and aviation money. Finally, we do not want to propose any cuts in the administrative or accounting side at least until we have a better handle on the magnitude of those problems, and the level of resources needed to fix them.

One change in the transfer area warrants mention. We are proposing to raise the State Equipment Fleet (SEF) fixed fee rate from 51% of the budgeted FY'87 rate back to 72% of that rate. This rate was dropped as a one-time cost savings measure for FY'87, with an understanding that the rate would be re-instated to keep the Highway Working Capital Fund fiscally sound over the long term. It is our intention to maintain the 72% rate level for at least the next two years, and then reassess what, if any, additional adjustments are needed, particularly in light of possible reduced need for equipment due to other budget reductions. We project this increase will allow us to meet vehicle replacement demand, while maintaining a positive cash flow. This means increased fee costs of about $1.8 million for DOT&PF, which represents about 85% of the SEF's business.

REORGANIZATION SAVINGS

The attached budget submission includes some adjustments for organizational changes that have already been made, including the deletion of a net 5 PX positions based on already taken personnel actions. While further general fund savings are anticipated through additional reorganization and streamlining of current operations, we are not prepared to present any further proposals at this time.

The Commissioner wants to assess the overall operations for a period of time to ensure we don't destroy valuable portions of the organization that are working well. It may be that some of these savings won't materialize until mid to late FY'88 or at the start of FY'89. Accordingly, we respectfully request an understanding that any savings in these areas will be given priority consideration for use to restore reduced or deferred DOT&PF M&O activity.

REVENUE GENERATION

One way to offset some of the impact of both the proposed FY'88 and actual FY'87 reductions is to generate more revenue through our proposal to increase the motor fuel tax from 8¢ to 16¢ per gallon. We estimate this will generate approximately $20 million in additional revenue. We recommend using this increase to help local governments and communities to pay for the increased M&O costs for those roads and highways removed from the state maintenance system. There may be other ways to generate further receipts, such as airport landing and tie-down fees, to offset other reductions. We will continue to review these possibilities.

SUMMARY

DOT&PF provides the state with numerous, essential transportation services. There is no doubt that transportation serves a critical economic role in a state such as ours. We fear pursuing major cuts, particularly in highway and aviation M&O, will only exacerbate our current problems.

Accordingly, until we can develop some of these proposals more fully, including greater acceptance by local communities of many of these responsibilities, it is imperative that we carefully analyze adoption of the large reductions we have identified, and if possible, find other revenues to avoid drastic reductions.

OVERVIEW OF QUESTIONS ASKED BY HOUSE FINANCE COMMITTEE MEMBERS DURING A PRESENTATION BY THE DEPARTMENT OF TRANSPORTATION.

Tuesday, January 26 1987, Commissioner Gutierrez and staff for the Department of Transportation gave a budget presentation and overview to the House Finance Committee.

Attached please find the Department's proposed FY 88 budget from the Governor's office and an overview of the proposed budget changes and cuts.
Much of the information presented at this meeting is in the attached DOT overview report. Rather than be repetitive I felt it may be helpful to update you on some of the questions raised by House Finance Committee members at this meeting.

1. Why have such substantial cuts been made in the areas of M & O and to the Alaska Marine Highway System?

   In 1985, major cuts were made in the areas such as management and design and construction. No cuts have been made in the AMHS and very minimal cuts, have been made in M & O during the previous few years budget cuts. Another point to consider is that when looking at the cuts made to AMHS these cuts reflect cuts from the 1987 "actual" figure and not the revised figures - therefore, the cut to AMHS is actually less than in other areas.

2. How did the department go about categorizing Class 1, 11 and 111 roads - were they categorized on a user basis?

   No. The department felt that if roads were categorized on a user basis, heavily populated areas would have a great deal more Class 1 roads than rural areas. Several factors were taken into consideration including whether the road provides freight transportation needs (Valdez to Fairbanks), whether the road provides the only access to the area, how many people live in the area and numerous other factors where also taken into consideration. The department feels that this area is one that will need further consideration and will ask for community input and advice from local area DOT personnel to help prioritize the roads.

3. With the Capital Projects Cleanup, why can't we just get a computer print out of the total number of projects currently authorized? Then, compile a list of those projects that are physically under construction, complete these projects and start over again with all other projects so that are books and information would be correct and so that the problems with the Federal Government Highway on reimbursement of Federal dollars could be overcome? How long would it take to get this list?

It would be possible to compile a list and have it available in a very short time, 3-5 days. The department feels this would be very inaccurate as the problem is with billings not being made to projects. Therefore, it would take some time to figure out what monies had not been billed to projects and get the paper path moving along. Also, some projects are in the planning and design phase, some are under construction, some have been completed and require outstanding bills to be logged in before the project can be closed out. Because of the methods used for billing to the projects and the way in which project tracking has been done, the department now finds that there are currently thousands of projects that are in question.
Because of the poor accounting system information requested on projects before 1985 is difficult to provide accurately. The older the project, the harder it becomes to provide accurate information.

As of 6/30/85, the capital projects clean up list identified each project and the status of the project. When the department changed over to the new state accounting system this information was not recorded. The department is currently working on correcting the problems that exist.
Mr. Bob Poe has been hired to head up this project and the department is currently working on:

1. Correcting the Federal billing system problem. At the present time all bills submitted for Federal reimbursement receive a manual audit from the Feds before reimbursement is made. This is partly due to previous incorrect billings and also an inefficient system for compiling the bills.
   The department is in the process of requesting proposals for putting in place a system that will adequately perform all FHWA billings. The contract should be awarded within 45 days and the system should be in place in 6 months.

2. The department is also bringing on board two C.P.A.'s to help set up and administer the new accounting system.

4. Is there statutory language changes required to turn the Dalton Highway into a toll road? Is there anything that prevents turning a road that received consideral Federal funds into a toll road?

Based on discussions with the Department of law,DOT believes it advisable to amend As 19.40 to make it clear this arrangement would be legal, therefore yes, an amendment to the AS 19.40 would be required. The State of Alaska has a specific exemption from the requirements under Section 11.13 of the lands bill and relieves the state of any requirement to repay Federal monies used to build this road.

5. On the three tier maintenance program plan,is there some kind of legislation needed to establish a tier reduction program rather than the usual pro-rated reductions usually implemented?

The Department would like to investigate this further, As Mr. Hickey sees it now the statutes provide the Commissioner with a great deal of latitude to make these decisions. The department has administrative procedures in place as well as regulations which require the department to receive public input and recommendations however, at the present time it does not appear that anything legislative would be required.
This will need to be looked into further.

6. You refer to an increase in legal liability because of the reduced maintenance, could you explain further?

The Commissioner stated the department will have to state the level of service it will provide. He feels that if in fact,a road is open,there is a responsibility to provide a minimum level of maintenance on the road. The Commissioner is not sure what this level is and he feels the department will need to consult with the Attorney General's office for legal direction. However, he has raised the question and feels it must be addressed.

7. How will user fees on the Dalton Highway affect the lift axle? If the axle is on the truck would there be a toll for this axle? How is the department addressing the overall lift axle question?

In terms of the toll charge, if the axle were down and used for weight carrying purposes, it would be charged at the same level - $100/axle.
As far as the question on regulations, the department has suspended implementation of the regulation to give the department and the legislature a chance to look at some of the issues. There is considerable controversy about some of the issues and, frankly, with the rapid change in economic conditions this issue may require rethinking on how to phase in a proposal. The department still has some basic concerns. There are a lot of concerns about the safety of using the lift axle, the test performed by the department would suggest they are a problem and many drivers have stated to the department in hearings that they are a problem.

Enforcement is a problem because they are used for weight purposes at the scale houses and then in order to avoid wear and tear they are not used.
The department is looking at a new proposal that would allow for lift axles to continue under certain conditions such as Washington has just done.
Steerable as opposed to fixed
Certification from the manufacturer that they are properly guaged to carry the weight they are carrying
Controls on the outside only
The department is still looking into this but feels this type of proposal may be acceptable.

8. Do you envision the $20 million revenue from doubling the motor fuel tax coming back to municipal governments through some sort of statutory shared taxes or how do you envision this? How does the $20 million relate to the actual cost of maintaining roads today?

   The administration is going to propose legislation to provide for the pass back of this money. The total M & O cut talked about in Category 1 11 and 111 is about $10 million. With the cuts taken in the past plus this years $10 million total cuts in the past few years in M & O will total about $20 million. This therefore should be sufficient to offset these cuts.

9. Who would have to pay for use of the toll road?

   The proposal is a new proposal and has a charge for light vehicles, this charge would be less but there would be a charge for any user of the road on a structured basis.

10. Where do you place schools in the three category system?

    It would be catagorized depending on whether the school is on a route. If the school is on a category 111 route we would be looking for the schools to take on the responsibility.
    DOT may have to reconsider this categorizing and receive additional input.
    Concerns were expressed by Senator Fiscner about the roads to schools not being open and yet the constitutional requirement to provide education.
    DOT will have to consider this.

11. Why is there an increase in the total dollars for the state equipment fleet, state planning and research and yet dramatic cuts are shown for M & O. What are the philosophical goals of the department?

The administrative sections, planning, research and administration is roughly 12% of the overall general fund dollars of the department budget. In FY 87 revised a large cut was made in these areas and none in AMHS and very little in O & M. The department would be willing to look at the budget more closely as the figures shown are not set. Until the department has a better feel for things such as the Capital Project cleanup they did not want to get rid of any available personnel.

Brought by DOT

HOUSE/SENATE FINANCE COMMITTEE

BRIEFING PAPER

DEPARTMENT OF TRANSPORTATION AND PUBLIC FACILITIES

CAPITAL PROJECT CLEANUP

Excerpts from: Cowper Budget Transition Report - 12/15/86

Capital Project Clean-Up:

Description: At the present time ADOT&PF does not know the current financial status of a large number of capital projects being developed within the Department. It is likely that the appropriations for some of these projects have been over-spent or over-obligated.

Discussion: The current status of ADOT&PF CIP projects is due to insufficient accounting controls within past and present accounting systems. The previous statewide accounting system, PBA did not provide enough cost centers (collocation codes) to control the large number of capital projects which had been assigned to the Department. The problem was further compounded by pressure on the Department and project engineers to get the projects out on the "street", and a perception by state project managers that their first priority was to get the project built and secondly to build the project within budget. In fact the legislature has

historically appropriated up to 175% of the available Federal funds for a given fiscal year in capital projects to be built by ADOT&PF.

Project managers did not rely on the internal ADOT&PF system, FMS, because the quality of data provided by the system was not considered accurate for a variety of reasons. Unfortunately when the new statewide accounting system came on line, AKSAS, the same cost center problems were carried over to the new system even though this system was quite capable of handling most of ADOT&PF's needs for project financial control.

In 1983 the Sheffield Administration began to give serious attention to this problem. Numerous audits were performed to determine the actual status of the ADOT&PF CIP projects and by June 30, 1985 a fairly solid picture of the status of the projects was developed at a cost of over 1 million dollars. However nothing was done at that time to actually correct the problem. Since then the problem has grown worse due to the accounting control problems which were carried over to AKSAS. The problem still exists and will continue to represent an unknown exposure in terms of over-spent appropriations and missed Federal billings until the problem is finally cleaned up. In addition, some large amounts of general fund money may currently be committed to Federal match projects which have little chance of going into construction in the near term (within the next three years).

A further complication to the above problem is a recent decision by the FHWA not to accept any Federal billings produced by ADOT&PF's FMS system. The FHWA has determined that the FMS system is unreliable and is capable of producing and successfully passing one-sided accounting entries.

Recommendation: ADOT&PF should begin immediately to resolve the problems currently experienced with capital project balance information. Without this immediate action, ADOT&PF project managers will continue to doubt the validity of project data which they receive from the automated systems tracking their respective projects. The Department will also continue to be unable to determine whether project work is proceeding within the law and in an efficient manner. Finally, this clean-up effort may assist in identifying and receiving additional Federal dollars and in freeing up possible general fund dollars which are currently committed to projects which will not be developed in the near future.

Federal Billing System:

Description: As a result of problems experienced with the ADOT&PF FMS system the Federal Highway Administration, effective 11/28/86, suspended reimbursement of all future ADOT&PF Current Billing claims until the Department can provide assurances that project claims for reimbursement are accurate. Obviously until

this problem is cleared up the State will not be able to receive federal funds owed to it for work which could not be billed as a result of this action.

Discussion: Over the last five years the ADOT&PF has spent millions to develop financial information systems for its specific needs. Almost without exception these systems have either not been completed or when they were brought up, were not used. Based on a previous design of a financial information system (FIS) by Price Waterhouse, the Department is now considering the development of this system to address the federal billing problem and the project control issues that presently exist within ADOT&PF.

The ADOT&PF is strongly considering developing the system in conjunction with the Department of Administration so that the system can address the federal billing concerns of other departments as well as those of ADOT&PF. The current thinking on the system is that it would be developed as an integral part of the AKSAS system as opposed to a stand alone system that receives and sends data to AKSAS.

The positive points regarding developing this system as part of AKSAS is that it would be available to all other agencies who wish to perform federal billing automatically. However, from the ADOT&PF point of view there are a great many negatives. Developing a federal billing system within AKSAS is considerably more

complicated and will require some significant redesign to address the system requirements of the other agencies all of which are costly in terms of time and money. Developing FIS as part of AKSAS will also make the FIS system less responsive to changes in the way ADOT&PF is required to perform federal billing in the future.

The positive points with regard to developing FIS outside of AKSAS are that the system can be developed more quickly, for less cost, without redesign and will be more responsive to ADOT&PF's specific requirements as they may change in the future. In addition, ADOT&PF has had real success in developing systems which accurately and effectively interface with AKSAS. The negative to developing the FIS system outside of AKSAS is that it may not take the needs of all other agencies into consideration and may not be available to all other agencies.

Recommendation: The ADOT&PF should begin developing the FIS system as soon as possible. An RFP should be issued which solicits creative input from the vendor community on how to quickly, effectively and in a cost efficient manner address the Department's federal billing requirements. This RFP should not be issued with preconceived notions on the part of Department personnel on a specific solution or vendor (Price Waterhouse has received over 16 million in sole-source system development contracts in the State over the last 5 years with no involvement from their Anchorage office). The ADOT&PF should oversee the

issuance of this RFP and should contract to meet the specific federal billing needs of ADOT&PF. In the mean time, ADOT&PF should develop a manual system to run parallel to the development of FIS in order to perform continued federal billing. This manual process will also need to exist to support the Capital Project Cleanup effort.

Agency "Corporate Culture":

Description: ADOT&PF was in existence within Alaska before Statehood. As a result, this department has one of the strongest "corporate cultures" of any organization within the State Bureaucracy. Changing this culture in order to help it deal with the future changes will be key to successfully trimming down the cost of ADOT&PF and helping it run more efficiently.

Discussion: ADOT&PF engineers not only have a strong loyalty to ADOT&PF but also to their profession as engineers. When you combine this professional perspective with the previous flow of funds through ADOT&PF, it is not surprising to learn that many engineers in ADOT&PF do not consider it their responsibility to closely monitor the costs of a project as long as the project is well designed and constructed. This may also be fueled by the past pressure placed on ADOT&PF to get their appropriated capital projects out on the "street" as fast as possible. Under these types of pressures it may seem reasonable for a project manager to focus on building a project quickly and well regardless of the cost.

Project managers with ADOT&PF have complained with some real justification that the project management tools available to them to control project costs have been, at best, unreliable. The previous systems (PBA and FMS), which they have had at their disposal, provided untimely and often erroneous data.

Recommendation: Top level support from the commissioner and the Governor will be necessary to continually encourage ADOT&PF project managers to get control of project costs. The Capital Project Cleanup effort must be completed quickly so that the data the project managers currently receive from AKSAS is accurate, timely and reliable. Appropriate project management tools must also be made available to project managers to help them in getting control of project costs and maintaining control. Getting control of project budgets and expenditures should also help ADOT&PF step up its efforts to generate timely billings to the Federal government. One project management oriented system which the Department has recently brought into place in the Southeastern Region is the Project Cost Information System (PCIS) which should be examined more closely to see if it can be useful agency-wide.

THE ALASKA MARINE HIGHWAY - SOUTHEAST SYSTEM

A HOLISTIC CONCEPT

BY

REPRESENTATIVE BILL HUDSON

December 10, 1987

Executive Summary

INTRODUCTION: The Alaska Marine Highway System (AMHS) is fast approaching 25 years of service in Southeast Alaska and by all accounts has served well. The system consists of seven vessels serving 18 S.E. communities via an inter and intrastate Marine highway over 1000 nautical miles long, connecting this landlocked Alaskan region to Land highways at Prince Rupert and Seattle to the South and Haines and Skagway to the North.

PURPOSE OF THIS PAPER: I have prepared this paper to stimulate discussion and debate on issues surrounding the future of this our essential Marine Highway system.

It is my belief that we must find consensus for and immediately begin the implementation of a Marine Highway plan that will carry this system into the next 20 years of service!

GENERAL CONCEPT: I am proposing a holistic concept that addresses such issues as: Bellingham vs Seattle, Roads vs. Hi-Speed Ferries, System Marketing, Thru-Haul vs. Segmentation Scheduling, and the Need for Compatibility with Regional Economic Development Plans.

TIMELINESS: Given the fact that Marine Union contracts expire March 30, 1988, any operational changes contemplated in the next three years should be established soon.

Vessel age and years of hard use dictate a need for major rehabilitation and/or costly replacement within the next 5 - 10 years.

Southeast Alaska's regional economic development growth will depend on a future system that compliments and supports local independent visitor tourism, emerging seafood production in Southeast Alaska and other businesses relying on marine transportation.

Finally, like any $60 million a year transportation system, we must assure it remains alive and progressive - growing to meet the needs of our state and this region.

CONSIDER OUR PRESENT SYSTEM: Alaska operates this seven vessel fleet at about 67% capacity with far more offline-layup than most private or public shipping companies would.

The system was tailor made to meet peak summer demands and evolved to accommodate many smaller communities over the years.

Ships largely call through Southeast communities and I believe, unknowingly, discourage stopover travel. In fact, I suspect a careful review of traffic figures would show that most of the 45,000 passengers who annually embark at Prince Rupert and Seattle do not spend much time in Southeast communities, to the economic loss of these communities.

Some value added benefits to the system are being realized in every community, especially the larger towns like Juneau, Ketchikan and Sitka, but, every community is losing value because of short docking times, time of arrival and/or the location of our terminals.

Vessel fares are marginally at the point of diminished returns and do not encourage widespread local use.

The system marketing, advertising and promotion is almost non-existent and may be a prime reason why shoulder traffic has not increased appreciably.

RECOMMENDED CHANGES: I believe it is time to implement some of the changes proposed in the 1986 Southeastern Transportation Plan and the Southeast Conference Community Perspective Report. It is time to activly seek demonstration project funds to acquire two properly configured surface effect or conventional high speed vessels to employ in the Lynn Canal corridor between Juneau, Haines and Skagway, and between Ketchikan and Prince Rupert. I intend to approach our Congressional delegation for a realistic determination of this support.

It is time to consider moving our southern terminus from Seattle to Bellingham and to implement a sound marketing and sales program to increase year around passenger, vehicle and freight sales and service.

Traffic should analyze the probable effects of operating a turnaround schedule between Bellingham and Ketchikan interconnecting with an intrastate route between Ketchikan and Juneau with as-needed trips to Sitka. Under this model all mainline traffic would end in downtown Juneau and travellers would proceed north by road and hi-speed ferries.

With this move I recommend we consider the benefits of relocating the Juneau Auke Bay operations to a site in Echo Cove, and to operate directly into downtown Haines or to a terminal site closer to Juneau on the Chilkat Peninsula. Our long-term priority must remain for a road. Realistically we will likely have to wait for significant mining development or exceptional federal funding to justify constructing a $400 million dollar road between Juneau, Skagway and Haines .

I propose that the time saved by stopping mainline traffic in Juneau and relocating to Bellingham be allocated to longer dock time at smaller communities such as Petersburg and Wrangell for sightseeing, local shopping and other such economic benefits as well as to structure more frequent trips.

As a former Director of the AMHS, I understand the many complexities of this unique system and the time honored constraints. I am confident

that vessel employees, shipping and travel agency partners would be willing to consider some changes for the improvement of the system.

I realize the problems associated with changing a system that has operated essentially the same for 25 years; yet I urge change because the present system is becoming increasingly regressive, more costly and is out of sync with the original legislative intent and the economic development needs of the very communities it was created to serve.

I urge creative marketing, such as booking on-board, off-season conventions, university and school field trips, coordinated trip sales with B.C. ferries and perhaps it is time to offer space available travel as a negotiable labor contract provision in lieu of wages. I would consider offering a once a year space available round trip to Alaska residents (at least SE residents) at a minimal charge to garner the passenger service revenue at a time when passenger loads are down. A little revenue is better than no revenue - providing costs are offset to show some profit.

I recommend all changes be coordinated with the Southeast Conference members and Legislators as well as traditional users of the system. Alaskans should be able to use their only highway at less cost.

POTENTIAL BENEFITS OF CHANGE: I believe the changes I have proposed will increase revenue to the system, appreciably increase economic benefits to Southeast communities, increase employment for Southeast crew members, provide affordable, more frequent and dependable transportation

for all Southeast residents and essentially connect the 70,000 Southeast residents with the Yukon, British Columbia, and the rest of our State. Clearly these changes will increase the value added potentials in every community we serve.

I foresee greatly increased tourism activity, less costly travel between cities in Southeast Alaska and expanded travel between Southeast and our neighbors in the Yukon as well as two way travel between Southeast and the rest of our state. Southeast benefits because our highway now supports our ecomomic development plans and the rest of Alaska benefits because Southeast, especially our Capital city, is easier to access and the 70,000 people of SE Alaska can now travel to Anchorage easier and more frequently. Haines and Skagway benefit because they would have direct and frequent, affordable access to other SE markets and legislative activities.

Orienting the ferry system more to a hub in Ketchikan and one in Juneau may encourage many of those Seattle resident employers to relocate back to Alaska.

FINALLY: This paper is meant to be constructive. It should not be construed as a detailed plan, but rather a conceptual plan to build upon. We still need much debate and a whole lot of in-depth study on this vital system.

Whatever we do, we must begin to implement some of the changes to make the system more beneficial to the inevitable growth of our region.

I welcome your comments and input. I seek your support.

Respectfully submitted,

Bill Hudson

INTRODUCTION

INTRODUCTION

This report was commissioned by the Southeast Conference to provide a basic understanding of the importance of the Alaska Marine Highway System to the people of Alaska. The Southeast Conference is an organization of municipalities, chambers of commerce, groups and individuals representing the common interests of citizens, and businesses of Southeast Alaska. This year, the Conference is working on a variety of issues. They include economic development, educational services, fishing and timber enterprises, and transportation.

The general goal of the Conference is to represent the interests of the 70,000 people of Southeast Alaska on those issues where there is common accord and which significantly affect the economic well being of the entire region as well as the state.

While the Southeast Conference is working on a variety of issues, it has focused on the Alaska Marine Highway System as its top priority. This is because the economic stability and way of life of the entire region is so closely linked to the service level of the ferry system. At the time of its genesis in 1956, the establishment of the ferry system was the exclusive goal of the Southeast Conference, and the Conference does credit itself to a large degree for the birth of the ferry system in Southeast.

Now, more than twenty years have elapsed since the Malaspina, the Matanuska and the Taku were commissioned in the spring of 1963. During the past twenty-four years,

the ferry system has served the people of Southeast quite well. Sometimes, especially during recent prosperity, it was even taken for granted. But as times have changed from fat to lean, its budget attracts attention. As the ferry system is subjected to budgetary scrutiny, its crucial importance to the economy and way of life of all of Southeast and other regions is something which we implore be kept in mind. Accordingly, this report is intended to provide a basic understanding of the importance of the ferry system to Southeast and indeed to the entire state. To accomplish this, much of the report focuses on the roots of importance of the ferries in ways that are specific to each community. This perspective is developed to reveal the statewide dangers in dismantling such a broad foundation. In order to discover the particular importance of the ferries in each community, surveys and observations were conducted in each of them and inquiries made of local citizens and business people.

There have been many studies of the ferry system in the past, and there are volumes of reports, but it appears that none of these focuses attention on the critical importance of the evolved system to the communities themselves and ultimately the state.

At the same time as inquiry was made of the ways in which the system is important to each community, inquiry was also made about how the system might be improved and how it should be managed in light of the states' present revenue deficiencies. Thus, one section of the report is devoted

strictly to a set of recommendations and findings. Most of the recommendations merely reflect the views of the citizens of Southeast Alaska. Some, however, have been framed by the authors of this report as a result of their study efforts.

The Southeast Conference is well aware of the fact that the ferry system in Southeast is less than the whole; that the Southwest ferry system is also important. But for purposes of this report, and due to cost and urgency we were only able to focus on the Southeast System as representative of the state's economy as a whole.

The Conference is pleased to offer this report of important aspects of the ferry system which we submit respectfully as assistance to the Legislature and the Governor in their deliberations, and to the people of Alaska who we pray will continue to benefit from our endeavors. Further, we stand ready to serve on any taskforce, advisory board or commission which may be established to help improve the Alaska Marine Highway System.

April Lapham
1st Vice President of
the Southeast Conference,
Mayor of the City of Haines

Ernest E. Polley
President of the Southeast Conference
Mayor of the City & Borough of Juneau

II.

OVERVIEW

ALASKA MARINE HIGHWAY SYSTEM

SOUTHEAST ALASKA

OVERVIEW
ALASKA MARINE HIGHWAY SYSTEM
SOUTHEAST ALASKA

1988 marks the 25th year of service for the Alaska Marine Highway System (AMHS). While service began in 1963, the real origin of the system was a study by the W.C. Gilman Company of New York, commissioned by the U.S. Department of Commerce in 1958. The resulting report proposed the creation of a new and totally unique solution to the transportation needs of Southeast Alaska - a ferry system capable of carrying the same load that one would find on a normal stretch of asphalt highway connecting Southeast communities, if such a highway were feasible. Thus, through the sale of revenue bonds, the AMHS was born. For the first five years, the AMHS completely funded its operation out of receipts. In 1970, the State convinced the federal government that the system was indeed a "Marine Highway," and as such, began receiving federal maintenance funds on the basis of a determination that the AMHS was, by definition, a bridge 500 miles long.

Today the AMHS for Southeast Alaska is a system of seven vessels serving 18 communities in the Alexander Archipelago. The vessels consist of four "mainline" ferrys, and three vessels which serve what the managers of the system term a secondary system. The mainline vessels, consisting of the Motor Vessels Columbia, Malaspina, Matanuska, and Taku connect the large communities of southeast Alaska with each other and Prince Rupert, British Columbia and Seattle, Washington. The three smaller vessels consisting of the Motor Vessels Le Conte, Aurora, and Chilkat connect the smaller communities of southeast to each other and to the larger communities. The communities served by the mainline vessels are:

Ketchikan
Wrangell
Petersburg
Sitka
Juneau
Haines
Skagway

The communities constituting the "secondary system" are:

Metlakatla
Hollis (Hollis is the terminal for four Prince of Wales Island communities: Craig, Klawock, Hydaburg, Thorne Bay)
Hyder
Kake
Angoon
Tenakee Springs
Hoonah
Pelican

The largest vessel in the Southeast System is the M/V Columbia. It is 418 feet long, carries 1000 passengers and 180 vehicles. The M/V Matanuska and M/V Malaspina are the same size. Each is 408 feet long with a passenger capacity of 750 and a vehicle capacity of 120. The M/V Taku is 352 feet long with a passenger capacity of 500 and a vehicle capacity of 105. The M/V Le Conte and M/V Aurora are sister ships. They have identical capacities of 250 passengers and 47 vehicles. The M/V Chilkat, a smaller, aging vessel has a capacity of 75 passengers and 15 vehicles.

During the summer, the Columbia and the Matanuska are on the Seattle run, completing one round trip each week. During the winter period, from October 1 through April 30, there is only one vessel used on the Seattle run, usually either the Matanuska or the Malaspina. The Columbia is usually laid up for most of the winter due to its high operating cost. The Malaspina and the Taku operate between Prince Rupert and Skagway during the summer, completing the round trip in four days if Sitka is served once on each trip and three days if Sitka is not served. Typically each vessel stops at Sitka once each week. During much of the winter only one vessel is used on this route, due to lower traffic.

The Le Conte and Aurora serve the southeast secondary route, supplemented by the Chilkat. The Le Conte serves the northern panhandle and the Aurora serves the southern panhandle. During the summer, the Le Conte operates between Juneau, Sitka, and Petersburg, with stops at Hoonah, Tenakee Springs, Angoon, and Kake. The Le Conte is routed north to Haines and Skagway once or twice each week. The Aurora operates nearly every day between Ketchikan and Hollis, and during the summer, south to Hyder once each week. In October, 1986 the Aurora began serving Metlakatla as well. The Aurora is also used between Prince Rupert and Ketchikan once or twice each week. These vessels serve the same routes during the winter period, but on a reduced basis.

The Chilkat is used between Ketchikan, Hollis, and Metlakatla. The Chilkat makes two round trips on four days of each week during the summer. The ferry system states in its Draft System Plan dated November 1986 that the Chilkat will be retired soon.

In 1985 the Southeast System carried a total of 313,071 passengers. Of these, 235,850 passengers (75.3%) traveled between mainline ports. Tourist traffic is very heavy in the summer months. During July of 1982, a survey showed that approximately 80% of its mainline passengers live outside of Alaska. Of the remaining 20%, 12% were from S.E. Alaska and the remaining 8% were from other parts of the state. As of the time of the preparation of this report, traffic volume figures for 1986 were unavailable.

During 1985 the Southeast system carried a total of 79,780 vehicles. The largest percentage of these vehicles (17.6%) disembarked at Juneau. Of course, many of the vehicles travelling on the ferry system embarked and disembarked more than once as part of a single trip. 15.6% disembarked at Haines. 8% disembarked at Skagway.

The Alaska Marine Highway System, in its twenty-fifth year, is one of Alaska's success stories. We have in the Southeast AMHS a billion dollar infrastructure that is functioning remarkably well, considering the lack of attention it has had for fifteen years.

III.

EXECUTIVE SUMMARY

EXECUTIVE SUMMARY

This report describes the importance of the Alaska Marine Highway System (AMHS) from the community perspective. It has been developed to show how the economy and way of life of the people in Southeast Alaska has evolved in concert with the ferry system. It points out that budget and other decisions regarding the AMHS should take into consideration the importance of the ferry system in other than strictly economic terms; most particularly the sense of real security, reliability, and the affordable transportation which it offers to the traveling public. It explains the reality that dismantling this billion dollar infrastructure would be a severe blow not only to Southeast Alaska but to the entire state. The report shows how the ferry system is so interwoven in the economic fabric and well-being of Alaska that it deserves a fresh look; a commitment to efficient management and direction through prudent budget decisions. Further, it offers specific recommendations and findings to improve the system.

The ferry system is a vital component of the economy of Southeast Alaska. Therefore, any decision that may result in a general service reduction should be approached with great caution. It is an unfortunate reflection of our government that the rationale to reduce service seems based on the assumption that communities must suffer before management can become effective or labor brought to the table as a full partner in resolving the problems. As a matter of fact,

in most cases it costs at least 50% of vessel expense to lay-up. For example, the Bartlett cost 90% of operating expense to be put into lay-up. Therefore, it needs to generate only 10% of costs in revenue to be more cost effective to operate.

As this study began, the focus of the effort was that of discovering the relative ways in which the AMHS is important to each respective community served by the system. The inter-relationships developed with the rest of the State as a result of the ferry system were also explored. It was learned that not only is the system important in a general way for transportion of people, vehicles, and goods, but in particular ways. That is, a particular major component of a local economy has often developed with the ferry service, and vice versa.

The major component in some communities may be a single business, such as the case with the Hoonah Cold Storage. Hoonah Cold Storage depends on the ferry to ship out 100% of its fish products. This was almost two million pounds of salmon in 1986, and the business expects a 30% increase this year. In Sitka, a winter 'turnaround' run is the primary boost to the retail trade. It is an economic convenience, as well as being key to the delivery of important human services, for those who do not live in Sitka. The economy of the City of Skagway in recent years has become almost entirely based on tourism. Of course, the ferry system plays a very important role in bringing tourists to Skagway. The

AMHS brought 36,000 visitors to Skagway in 1986. Ketchikan faces a double-edged sword when the State considers reductions in ferry service. The mainline runs are extremely important because of the tourist trade, export of fisheries products, and the import of goods and supplies to furnish the area's retail demands. But the feeder ferries are critical for retail and commercial trade, fish transport, and winter economic activity. The economies of the people of Ketchikan would be severely impacted by a reduction in either mainline or feeder ferry service. There is one community, however, which appears to have an even deeper dependence on the ferry system: the City of Haines. There are so many business functions in Haines which have evolved with, and depend upon the ferries, it clearly would suffer the most immediate and significant effects of reductions in service. Haines is still the main embarkation and disembarkation point for people and goods destined for the interior or travelling south from the interior. Without the ferry system, Haines would simply be a place at the end of a very long spur road. These are but few examples of the community perspectives of the AMHS. The more enlightening and detailed reports are found in the Community Section. Reading that section is imperative in understanding the AMHS's relationship to developing economies. The particular ways the communities have used the ferries to develop and stafilize the economy of Southeast must be recognized.

Of course, the communities served by the ferry system are dependent on it in numerous general ways. These include the delivery of food, particularly fresh produce and dairy products; mail delivery; school travel; tourist travel; and the transportation of vehicles, equipment and general freight. In some cases, practically 100% of the fresh produce is delivered by ferry. In addition, all second and third class mail and surface parcel post from the lower 48 travels by ferry. The mail is ferried to Haines, Skagway, Petersburg, Wrangell, Sitka, Ketchikan, and Juneau, then shuttled to smaller communities.

During the school year, all school districts make use of the ferry system for student travel to a remarkable degree. Petersburg, Juneau, Wrangell, and Ketchikan report that a student group (averaging 30 students) from their high schools is going somewhere on the ferry system virtually every week of the school year. For purposes of school travel, both safety and cost considerations combine so that schools schedule events around the ferry schedule. And as funding for education decreases, the cost of flying is not a reasonable alternative for student travel.

The AMHS is also important to the health, welfare and safety of Southeast residents. Residents of the smaller communities depend on the system for transportation to larger communities to meet shopping, business, medical, and recreational needs. The selection of goods and services is extremely

limited in some small communities, making travel to larger communities a necessity. Thirteen of the nineteen SE communities we surveyed have no resident doctor; fourteen have no hospital. Travel by ferry to the larger communities is often the preferred mode of transportation, due to its safety, dependability, and people's fear of flying. The senior citizens of Southeast rely on the ferry system to a great degree, perhaps more than others. For them the ferries are safer, more accessible, and more dependable; as well as providing a far less costly means of transportation.

It is safe to say that almost all Southeast communities served by the AMHS are positively affected by the ferry transport of tourists into their community. Communities as small as Pelican notice an increase in business brought about by the arrival of a ferry. The Southeast communities, through the Southeast Alaska Marketing Council (SAMC), have been doing a great deal to encourage use of the AMHS. They have invested $400,000. in advertising to encourage the 'independent traveller' to visit SE Alaska. To date they have received 12,000 responses to their ads; 57% of these were interested in ferry travel as their means of transport. The SAMC supplies travel information to the respondents based on their interest.

The degree of general dependence on the ferry system by the various communities appears to rise in inverse proportion to the size of the community. The smaller the community, the more dependent it is likely to be on the ferry system for its

transportation needs. However, a reduction in service would adversely impact elements of all local economies.

In addition to the individual and general ways in which the various Southeast communities are dependent on the ferries, the system is an important source of jobs. The system employs approximately 900 people and there are more than 5,000 other people that depend on the system for their jobs. Table 5 which is appended to this report details the number of people directly employed by the AMHS in each community. Ketchikan is home for the largest number of employees of the ferry system: 294 employees.

It is also important to note that the system is not only important to the economy of Southeast, but to the state's overall economy - more important than is generally thought. In all, the Southeast system carried 313,071 passengers during 1985, the latest year for which figures are available. That same year the system transported 79,780 vehicles. The "Alaska Tourism Handbook," published by the Division of Tourism reveals that 60% of the summer travelers on the ferry system visit Anchorage and 59% visit Fairbanks. In addition, 40% of all winter traffic on the Southeast ferries is headed for the interior. Each year the AMHS carries thousands of tons of freight and millions of dollars of visitor revenues to the northern regions of the state. Each week semi-vans loaded with goods and supplies head for interior Alaska. Even more vans flow from the rest of the state, especially Anchorage to

points in Southeast.

The efforts of this study as indicated, included inquiring of local citizens and business people about how they are affected by the ferry system. But it also elicited opinions of how the AMHS could be more efficient. There was a remarkable consensus about whether budget reductions should automatically result in a commensurate reduction in service. Most people believe that large savings could be achieved by better management, privatization or cost reductions in areas such as marketing and food service, and a very close and serious scrutiny of current labor agreements in cooperation with the unions themselves. Some also expressed opinions that procurement of supplies and fuel throughout the system could be done much more efficiently.

It is apparent that any significant progress in these areas will take time. The answer lies in effective management and sufficient time to implement strategies. Therefore, it appears that for the present, the best that can be done is to begin to direct the system toward attainable goals with clearly defined strategies, some of which are offered in the Recommendations and Findings section of this report. In the short term, the system should maintain the current level of service with an authorization of 62.6 million for FY 88. In the long term, a work plan should be developed that sets objectives and milestones that cut costs and increase revenues. However, one of the most important recommendations must be

mentioned here, namely that of establishing an advisory board or task force of professionals, users and legislators to advise the Legislature, Governor, and managers of the AMHS on various aspects of operating the system. This system is in many ways an anomaly to normal government processes; it demands separate unique attention.

The AMHS is such a pervasive part of both the economy and way of life for the 70,000 people of Southeast that the proposed, but unneccesary reduction in service could severely cripple the communities of Southeast. The impact of any significant service reduction would also affect the economy of the rest of Alaska, further exascerbating the state's current economic and social situation.

This community perspective is hopefully the beginning of a fresh look at maintaining our AMHS System with reasonable approaches that go beyond the simplistic, devastating proposal to reduce service. This report provides an interesting review of the AMHS, and proposes a direction of effective management and prudent decisions henceforth. It is intended as a symbol of the efforts of the Southeast Conference to work hard in a cooperative spirit with the AMHS, for all Alaskans.

IV.

THE COMMUNITIES' PERSPECTIVE

KETCHIKAN

Ketchikan is the second largest community in Southeast Alaska, with 14,300 residents. It is situated on the southwest side of Revillagigedo Island. Ketchikan's economy is based primarily on fishing, lumber products, and tourism. As the southern-most Alaska municipality on the ferry system's mainline, it relates closely to Seattle and the coastal communities of Britsh Columbia. As the first Alaska stop not only for the mainline ferry, but for barge, jet, and cruiseship traffic as well, Ketchikan has developed a thriving "micro-economy" servicing those transportation systems. In the past month of March, a major vessel maintenance and drydock facility has begun operation, and has already performed maintenance on the AMHS vessels Bartlett and Matanuska. The facility is owned by the state but privately operated by Ketchikan Welding Works.

In its position as the first Alaska stop for both passenger and freight service from the South, Ketchikan has become a strong regional retail center, drawing from an area population of nearly 25,000 in an area generally referred to as Southern Southeast. Because of this position, both mainline and feeder ferries are extremely important to the community. In terms of ferry traffic, Ketchikan is the second busiest port in Southeast. In 1985 51,250 passengers embarked and 50,913 passengers disembarked in Ketchikan; 13,821 vehicles embarked and 13,965 vehicles disembarked. The mainline runs from Seattle and Prince Rupert in the south, to Haines, Sitka, and Juneau in the north providing a steady, dependable system for the delivery of freight, dry goods and produce, as well as tourists and vehicular traffic. The feeder ferries running between Southeast communities provide Ketchikan with the consumers for those products, both from an "import" and "export" perspective. In the sections of this report on Metlakatla and Prince of Wales Island, we discuss the import to the outlying communities of maintaining maximum possible service to Ketchikan. But Ketchikan's health and welfare is also very much dependent on the same service. The retail economy of Ketchikan has grown to the service demands of 25,000 - 30,000 year-round consumers, nearly half of whom depend upon the AMHS for access. A decrease in service of the feeder system would indeed have a dramatic affect on Ketchikan's private sector, which has invested heavily, and confidentally in their regional responsibilities.

A study conducted by the Ketchikan Gateway Borough of economic indicators showed that while Ketchikan's tourists are extremely important to the local economy, almost 95% of sales are by area residents, and over 20% of those are by

residents of outlying island communities. The study also found that the average tourist spends $28 per day in Ketchikan. The average ferry passenger, on the other hand, spends $55. Reductions of ferry service over the past winter between Ketchikan, Metlakatla, and Hollis have already resulted in a drop in retail sales. Several businesses have responded by conducting "road trips", taking limited inventories out to the islands for "trade shows". The result is some compensation to the island consumer for the lost accessability to goods, but their purchases are from considerably less selection, and at a higher price.

The mainline ferry is extremely important to Ketchikan's regional responsibilities, especially as it relates to fresh meats, produce, and dairy products. A reduction in service between Ketchikan and Seattle could have a dramatic affect on the quality of those products; a level of quality that all of Southeast has come to expect. By utilizing the ferry system rather than barge service, three days are saved in transit. Fresh pork and chicken are especially volatile products, and a reduction in service could affect their availability. A reduction in mainline service that would force milk to be barged would, at present costs result in a 14% increase in price to the consumer due to decreased shelf life. Such a scenario could also result in an inability to get fresh dairy products to some villages, camps and communities in a reasonable time and in reasonable condition.

The timber industry in Ketchikan also utilizes the ferry system extensively for supplies and freight, but not for shipping product. Ten per cent of their incoming freight arrives by mainline ferry into Ketchikan. However, after arrival, 25% of their outgoing freight leaves Ketchikan on the feeder runs. In addition, the ferry is used for employee and vehicle transport. Any immediate freight or supply needs are sent via ferry.

The fish processing industry in Ketchikan is also a major user of both mainline and feeder ferries. Nearly three hundred linear feet in van space is utilized weekly in the summer, exclusively for fish, between Hollis and Ketchikan. Salmon, black cod, halibut, and herring all are shipped via ferry year-round. The industry is a major seasonal employer. A large on-shore processor will employ as many as 200 people during the season. Winter cutbacks on the Ketchikan-Hollis run have, on occassion, forced some companies to charter their own boats to transport the fish. Good frequency of service on the feeder runs is of utmost importance to the industry. Their need is also a year-round need, as harvest of the different species takes place at different times.

Tourism is of course a major portion of the AMHS's

business, and much of that business is channelled to Ketchikan. As Alaska's first port of entry on the mainline, and also the first stop after 40 hours of travel, almost all passengers disembark for a break. This winter and spring, Alaska Airlines, the Port of Seattle, and the AMHS have jointly contributed to a program to promote the AMHS to Seattle area travel agents. Three lunches for nearly 225 travel agents have been held on board the Matanuska in Seattle, while four familiarization trips have been held for four hundred travel agents. The trip cost each agent $295 and includes a ferry stateroom from Seattle to Ketchikan, and a return by air. The target of the program is the 650 travel agencies in the Seattle area. The program has been so successful that plans are in the works to expand the effort to cover the entire west coast, though the program has revealed some serious flaws in the reservations system, which affect the willingness of travel agents to write AMHS tickets.

System wide, one of the major off-season users of the AMHS are school districts. All inter-school activities and competitions depend heavily on ferry transportation. Cuts in the Education Foundation Funding program have already resulted in dramatic reductions in activity budgets for all of Southeast. Ketchikan, for example, has at least one group traveling every weekend of the school year. Of a $140,000 activities budget, $100,000 goes to travel costs. That budget is a 50% reduction over the past year. 50% of student travel is by air; 50% by ferry. However, the cost ratio is 70/30, air over ferries.

Ketchikan faces a double-edged sword when the State considers reductions in ferry service. The mainline runs are extremely important because of the tourist trade, export of fisheries products, and the import of goods and supplies to furnish the area's retail demands. The feeder ferries are also extremely important because they transport the fish product for the fisheries, and the consumers for the retail and commercial trade. Cutbacks in either mainline or feeder ferry service would have a potentially devastating impact on the service the other can provide. Ketchikan, perhaps more so than most other Southeast communities, is subject to economy-wide repercussions from a loss or reduction of service by the AMHS.

HYDER

Hyder is an unincorporated community of 100 people located at the head of Portland Canal in southern Southeast Alaska. The community is the only one in Southeast accessible by road. The community economy has two primary sources; tourism and retailing, both of which derive from Hyder's "sister city" of Stewart, British Columbia.

More than 60,000 visitors arrive in Hyder every summer, primarily from the Trans-Canada highway. Via that route, Hyder is just a 20 hour drive from Seattle. The tourist trade supports one motel, one inn, three restaurants, and several gift shops. In addition, Hyder is a popular destination for Canadian residents of Stewart and the surrounding area. The principal reason for this is that Britsh Columbian bars close several hours earlier than than those operating under Alaska law in Hyder. One freight line also operates in Hyder, and the community is serviced by float plane from Ketchikan.

Hyder did not begin receiving ferry service until last year, and then only by legislative mandate. The service is for summer months only, and on a weekly basis. The intent of adding service to Hyder was to create an opportunity for a drive/ferry circle from Seattle, through Canada and then return by ferry through Hyder.

Traffic counts and analysis are not available for evaluation yet for this run. The trip is 144 miles from Ketchikan with no stops in-between. The trip takes eleven hours.

METLAKATLA

Metlakatla is a Tsimpshian Indian community of 1,100 residents on Annette Island. It is the southernmost of all Alaskan communities, being 12 miles south of Ketchikan. Metlakatla is not an incorporated municipality under state law. Rather, it is a federally created reservation, created by Congress nearly 100 years ago.

The two mainstays of the Metlakatla economy are a fish trap/cannery operation and a saw mill owned by Louisiana-Pacific. Both of these operations ship their products south by barge, but do rely on the ferry for supplies and equipment. The primary traffic on the Ketchikan-Metlakatla run has always been passengers, but the community does receive two vans/week of groceries. In 1985 Metlakatla embarked 5,974 passengers and 1632 vehicles. 5,651 passengers and 1706 vehicles disembarked.

Given its close proximity to Ketchikan, Metlakatla has interacted closely with Ketchikan for many years. This close interaction was made possible primarily because of daily service that was provided by the Alaska Marine Highway System. The service resembeled a commuter service. It allowed the Metlakatla residents to go into Ketchikan in the morning, take care of their business and return in the afternoon. The service was popular and well used. Indeed, the traffic apparently warranted a larger ferry for the run. Therefore, the Metlakatla terminal was modified to accommodate the larger Aurora. Formerly the Chilkat served the Ketchikan-Metlakatla run. The terminal modifications were completed by October of last year. But now the community must share the Aurora with the Prince of Wales Island communities, and they no longer enjoy the daily, over-and-back service they had for so long.

The reduction in service has created some serious problems and inconveniences. Since the residents can no longer go round trip to Ketchikan in a single day, they must overnight in Ketchikan. Usually this means paying for a hotel room. But on the reverse perspective, there are no hotels or motels in Metlakatla. The community had launched an aggressive tourism promotional effort based on the single day turn around service. Now, however, a day trip can only be accomplished if one flies at least one way. The reduction in service has also had the effect of jeopardizing the availability of emergency medical service. There are about 25 - 30 days a year when wind, fog or snow prevents planes from reaching the community. If an emergency should arise now during one of those periods, the ferry is simply less available as an alternative. Any further reductions in service to Ketchikan would seriously impact Metlakatla.

PRINCE OF WALES ISLAND

Prince of Wales Island is the largest island in Southeast Alaska. It is the site of five incorporated municipalities: Craig, population 1200; Klawock, population 600; Hydaburg, population 500; Thorne Bay, population 400; and Kasaan, population 100. In addition, Prince of Wales Island hosts several other unincorporated communities, villages, and logging camps. They include: Rowan Bay, Hobart Bay, Camp Island, Whale Pass, Dolomi, Port Alice, Chomley, Dana Bay, Shoal Cove, Notaki, Labouchere Bay, Coffman Cove, Polk Bay, Point Baker, Port Protection, Long Island, Warm Springs, Bell Island, Waterfall, and Steamboat Cove.

The residents of Prince of Wales Island apparently have not been informed of the State's recession. Existing industries on the island are going strong and local economies are experiencing something of a "mini-boom". Timber prices have begun to rebound which has made harvesting profitable again. In addition, both regional and village native corporations have extra incentive at this time to set aggressive logging schedules in order to take advantage of their ability, for another four years, to sell operating losses. The summer commercial salmon fishing industry is doing extremely well in the southern panhandle and is expected to continue on an up cycle.

In addition, communities on Prince of Wales are pursuing very aggressive economic development plans. A black cod bottom fishery is just beginning to turn the corner in Craig and Klawock. This past winter, over forty boats took part in the opening. Several areas along the west coast of the island have been identified as the best potential areas for mariculture of salmon, oysters, and seaweed. Additionally, several mining companies have been conducting tests and taking samples for a variety of minerals along some of the island's interior roads. Prince of Wales Island has the most extensive road system in Southeast Alaska. As such, it received a great deal of camper/RV/trailer use during both the summer tourist season and the fall hunting season. In addition, this summer two cruise ships a week will off-load tourists for a two-hour tour of Klawock and the surrounding area. This will be the second summer cruise ships have visited Prince of Wales Island.

Obviously, the communities of Prince of Wales depend a great deal on the AMHS to provide transportation and freight to their thriving economies. All economic development efforts, as well as existing industries, would not function without the AMHS. The cold storage in Craig, a major employer, sends all its fish to Ketchikan via ferry, both summer and winter. They already use the service to capacity. A loss or

reduction of service for the cold storage does not just mean more expense; it means the potential loss of the business itself. Quality is the single most important factor. Fresh fish must be processed and transported as quickly as possible. There exists a fear in Craig that if ferry service is reduced, off-shore processors and tenders will move into the area to service the fishermen on the fishing grounds, and that the Craig cold storage will be by-passed completely.

The lumber camps are supplied almost excusively by the ferry. Five refrigerator vans and four dry vans of groceries come onto the island every week via the ferry. All logging equipment, materials, parts, and supplies arrive by ferry. Forest Service vehicles come by ferry. Nearly all motorized vehicles on the island come and go via the ferry. In 1985 15,881 passengers and 4,739 vehicles embarked at Hollis. 16,591 passengers and 5,116 vehicles disembarked

Mail also arrives by ferry, as does an annual convoy of state road equipment. There is no doctor or dentist on the island, so patients must go to Ketchikan, as do participants in local alcohol rehabilitation and mental health programs. The ferry system is also heavily used by the island's senior citizens. Of course, the residents rely upon Ketchikan for regional shopping for all goods and services not available on the island, and the ferry is the chief mode of transportation.

Residents of the island have long been of the opinion that they are under serviced by the ferry system, and recent developments have not seemed to help. A facility upgrade at Metlakatla last summer now prevents the state's smallest ferry, the Chilkat from docking there. The Chilkat had regularly serviced Metlakatla. As a result, the Chilkat has been switched over to the Ketchikan-Hollis run, and the larger ferry, the Aurora, is utilized for the Metlakatla run, except for Tuesdays, when it goes to Hollis. So the Chilkat serves Hollis approximately six days a week. But it is seriously undersized for the daily trip across Clarence Strait. As a result, many of its trips are delayed or cancelled due to adverse weather and sea conditions. Further, because the Chilkat has such limited vehicle capacity (15 vehicles), competition is fierce for the Tuesday sailing on the Aurora. The situation has caused problems, inconveniences and added expense this past winter.

The real concern, however, is that even without any reduction in service from budget cuts, service to the island may not be adequate to support the burgeoning economy. The situation appears to be a lost opportunity for the ferry system, as well. The demand for service is there, almost all of it freight, which should make the run highly cost-effective for the ferry system. The residents hope the situation can be improved soon, as they must depend on consistent reliable ferry service - at least at the current level.

WRANGELL

The City of Wrangell is located on the northern tip of Wrangell Island, 89 miles northwest of Ketchikan. Its population as of July 1, 1986 was 2376. Bordered by Zimovia Strait, Wrangell is situated near the mouth of the Stikine River, which reaches into the Canadian interior. As the Stikine developed into a gateway for trappers and prospectors, the northern tip of Wrangell Island became a strategic location that was the key to Wrangell's early development as a military outpost, a fur trading center, and an outfitting, support and entertainment center during three successive gold rushes. Changing interests led to several boom and bust cycles in Wrangell's early history.

Today, Wrangell's economy is structured around harvesting and processing renewable resources of the area. The Alaska Lumber and Pulp sawmill employs up to 100 workers and is Wrangell's largest private employer. Fishing is Wrangell's other major resource based industry. More than 100 residents fish commercially, and for about half of these, fishing is their principal source of income. There are two seafood processors in Wrangell, with a combined workforce of about 100 workers during peak processing months each year. Most of the fish processed in Wrangell is canned, but there is an increasing demand for fresh fish. Presently, fresh fish is flown out of Wrangell, though the entire halibut harvest in 1986 (620,000 lbs.) was shipped via ferry. Expanded use of ferries for the shipment of fresh fish south is foreseeable, especially if jet service to Wrangell is suspended.

Recently, Wrangell has begun a conscious shift to develop its tourism potential. They are trying to encourage people to discover the unique attractions of Wrangell, including its petroglyph beach, access to the Stikine River and the hot springs, Chief Shakes Island which is home of many totems and carvings, and their 2 annual community festivals - Tent Days and the 4th of July. The ferry system plays an important role in tourism development and is viewed by Wrangell businesses as a key ingredient for the future. Wrangell, along with a number of other Southeast communities is currently engaged in a promotional campaign to lure the "independent traveler" back to Southeast. The "independent traveler" is seen as the person who eschews both group trips and package tours. Studies have shown that a high percentage of independent travelers choose the ferry as their mode of transportation. Even now, Wrangell's Economic Development Director estimates that 40% of Wrangell's visitors arrive by ferry on an annual basis. Further, he advised that approximately 70% of the guests of the city's four hotels arrive via ferry. During

the summer, a steady flow of recreational vehicles disembark from the ferry and use the RV parking area provided free of charge by the City. Their average stay in Wrangell is 5 days, during which time they help support local businesses. Needless to say, any cut back in ferry service would severely curtail the most important aspects of Wrangell's tourism potential.

The ferries are used for close to 100% of student travel. A minimum of one group of Wrangell High School students travels each week of the school year to athletic events, Close-up, RSVP, band performances, or Native Education functions. The ferries are also important to the Native people of Southeast as a whole. Travel between southeast villages and communities to attend potlatches, 40-day parties, 'Celebrations' of heritage, and Native dance performances most often occurs by ferry.

Like Petersburg, Wrangell is presently threatened with a loss of jet service. Should this occur, the importance of the ferries would expand suddenly, and dramatically. Ferry travel for business and pleasure has become a way of live for Wrangell residents - a way of life which would be jeopardized by reductions in ferry service.

PETERSBURG

The City of Petersburg is a fishing community of 3252 permanent residents located on the north end of Mitkof Island where Wrangell Narrows meets Frederick Sound. By air, it lies halfway between Juneau to the north and Ketchikan to the south. Petersburg grew up around a cannery established by a Norwegian immigrant named Peter Buschmann. The cannery began operating in 1900.

Today, fishing and seafood processing continue to be the mainstay of the town's economy, though wood processing has also been important at times. During the fishing season the town's population swells by an additional 600 seasonal workers who are employed in the town's three processing plants. This does not count the fishermen themselves and their crew who make Petersburg their home base during the fishing season. Managers of the processing plants estimate that about half of the seasonal workforce arrives on the ferry and departs in the same manner. The ferry system is used to ship fresh fish south to Seattle. Last year, the second largest processor in Petersburg shipped more fresh fish in this manner than by air. The use of the ferries for the purpose of shipping fish product south (and for other purposes as well) may suddenly increase in the foreseeable future. Both Petersburg and Wrangell are presently threatened with the loss of jet service if the present federal subsidy of that service should end. Last year the number of passengers arriving by air and by ferry into Petersburg was about the same: approximately 15,000 passengers by each mode. Therefore, the amount of passenger traffic into Petersburg by ferry could possibly double unless some alternate type of airplane service is provided.

Presently, during the month of March 1987, ferry service to Petersburg consists of an average of three mainline stops per week, north and south. It also presently has two feeder stops/week, north and south. During the summer season, service expands to an average of six mainline stops per week, north and south. Feeder service remains about the same. In 1985 15,650 passengers and 3,650 vehicles embarked in Petersburg. 15,720 passengers and 3717 vehicles disembarked.

It appears that in the case of both Petersburg and Wrangell, the ferry system is often the preferred alternative for persons travelling to Juneau, Ketchikan or Sitka because of the relative cost. One way passenger fare from Petersburg to Ketchikan is $24 by ferry and $76 by air. One way fare to Juneau is $26 compared to $73 by air. To Sitka it is $16 by ferry and $69 by air.

The ferry system is also important to Petersburg in general ways. A significant amount of the food consumed in Petersburg arrives by ferry, viz. 25 - 30% of all produce, meat, and dairy products. As with virtually all other Southeast communities, it is heavily used for student travel. Petersburg school officials report that at least one group per week, averaging 30 students per group, travels on the ferry throughout the entire school year. 85 - 90% of all student travel is via ferry. Also similar to other Southeast communities, all third class and fourth class mail (parcel post) comes by ferry.

KAKE

Kake, Alaska is a Tlingit community of approximately 600 residents located on the Northwest end of Kupreanof Island in Southeast Alaska. Its direct ferry connections are to Sitka (8 1/2 hours) and Petersburg (4 hours). In addition to being linked to these two communities by air, it has two direct flights to/from Juneau daily.

Fishing and seafood processing provide the main economic base to the town's economy. It is a community where subsistence hunting and fishing are still an important part of life. Timber harvesting has been important, but recently, poor market conditions have forced operators to severely cut back or suspend operations altogether.

Kake is in the unique position of having three community links which are important to it. Petersburg, Sitka, and Juneau all play a role for Kake's residents. Of the three communities Kake is linked to, Petersburg has become the most important, mainly due to its close proximity and its one day ferry turnaround service. Residents go to Petersburg to purchase items not available in Kake, to take care of their banking needs as there is no bank in Kake, and to take care of general business which they can't do in Kake. In addition, Cuprenof Seafoods, the seafood processing company in Kake is under the same ownership as Chatham Straits Seafoods in Petersburg. There is frequent transfer of equipment between the two by ferry. All of the goods sold by the largest store in Kake (approximately 70% of all goods sold in Kake) arrive by ferry from Petersburg. Also the bookkeeping office of this store is in Petersburg. This relationship requires frequent travel of personnel between the two communities. The non-native residents of Kake generally travel to Petersburg for their medical and dental needs, as they are not eligible for service by the regional health corporation in Sitka. This travel is usually scheduled around ferry service.

Sitka is important as a regional health center for the majority of Kake residents, as well as a somewhat larger shopping center than Petersburg. Round trip travel to Sitka by ferry is difficult as the ferry usually arrives very early in the morning and does not provide same day, or even next day return service. The cost to fly back is $75, as opposed to $14 on the ferry.

Juneau maintains its importance as a regional shopping and service center with Kake. However ferry service to and from Juneau is even more difficult and expensive than Kake to Sitka. The ferry situation for Kake residents tends to add to their isolation.

As with all other Southeast communities served by the ferries, the school district utilizes the ferry system a great deal for school travel. The athletic teams using the ferry include basketball, volleyball, and wrestling. Other student organizations utilizing the ferry are RSVP, student dancers, and the student council. The principal of the high school stated that without a doubt, any reduction in ferry service would concomittantly limit activities.

In 1985, 3,490 people boarded the ferry in Kake; 3,421 people arrived in Kake by ferry. There were 830 vehicle arrivals and departures. As with all other smaller communities served by the ferries, travel to meet medical needs and travel by senior citizens is greatly dependent upon the ferries. Kake's general dependence on the ferry is such that it would suffer greatly by any overall reduction in service; indeed residents would like to see it expanded.

ANGOON

Angoon is a Tlingit Indian village located on the southwest side of Admiralty Island. By ferry, it is halfway between Juneau to the north and east, and Sitka to the west. Angoon is the only permanent community on the island, and is considered to be the most traditional of all Tlingit communities in Southeast. Angoon's 700 residents have, for the most part, maintained their subsistence lifestyle, though commercial fishing is important. Angoon consistently registers the highest level of unemployment in the state, as well as the lowest income per capita.

Angoon is served by one main store. This main store carries a large inventory of fresh produce, dairy products, and meats as well as dry goods, and a variety of other items. All fresh produce, dairy products, meats, and some frozen foods are supplied by the ferry. Prior to its weekly ferry service, Angoon had no fresh or frozen foods available. The cost of flying them in makes the consumer cost prohibitive.

Beyond its dependence on the ferries for all fresh and frozen food, there are other significant dependencies. All food for the Senior Citizens Lunch Program arrives by ferry. All building contractors operating in Angoon use the ferry exclusively to transport equipment and machinery. The ferry also allows for both students and adults to be involved in sports programs. Despite its small size, Angoon consistently produces quality sports experiences. Angoon always places well in the annual Gold Medal Basketball Tournament in Juneau, for example. The City of Angoon, incidentally benefits by serving as the local agent for the ferry system. The city receives a 7% commission on ticket sales. Last year these commissions totalled $12,000 or about half the salary of the municipal secretary. As with other Southeast communities, Angoon depends heavily on the ferries for student travel. Prior to the establishment of ferry service, this function was extremely limited. In addition, the community utilizes the ferries for a wide variety of cultural events, such as potlatches, and forty day parties (a wake forty days after the passing of a loved one).

In 1985 4,834 passengers and 458 vehicles embarked at Angoon. 5,212 passengers and 465 vehicles disembarked.

The people of Angoon appreciate the service they now receive, but express apprehension at a possible reduction in service, especially a reduction in winter service. It is during the winter that they are most dependent on the ferries. Winter weather in Chatham Strait can be most vexing.

Wind, waves, snow and fog each or together can and often do prevent planes from getting in or out often for days at a time. During such times the ferry is the only means of transportation. Additionally, Angoon's dependence on the ferries for food is somewhat greater in the winter as it is then out of season for fishing and hunting. Lastly, Angoon's barge service in winter is less frequent than in summer, by two weeks. Consequently, even goods that might otherwise be brought by barge are shipped by ferry. In winter, Angoon receives two vans (approximately 4,000 lbs) of produce, milk, and supplies by ferry each week. Angoon is a prime example of the rule that dependency on the ferry system rises as the size of the community decreases. In the case of Angoon, even a slight reduction of its present service would hurt. Angoon has already experienced some reduction of service and it has hurt. Last winter the Juneau turnaround was discontinued. This created difficulties in terms of the arrangement that had existed for getting groceries from Juneau.

SITKA

The City and Borough of Sitka, Alaska is located on the west coast of Baranof Island. It is home to 8200 people. The borough's boundaries also include a large portion of Chichagof Island. Sitka was Alaska's first capital and also served as Alaska's capital during Russian settlement. Sitka's rich Russian heritage makes it a favorite stop for tourists. The Sitka Summer Music Festival has become one of the nation's premier chamber music festivals. Sitka is also home of Sheldon Jackson College, Southeast's only privately owned and operated college, and one of only two in the state. In addition, Mt. Edgecumbe High School, the state's only public boarding high school is in Sitka, as is Mt. Edgecumbe Hospital, which provides health services to Southeast's Native population. Sitka is also home to Alaska's shortest and most unusual fishing season. The Sitka sac-roe herring fishery lasts just a couple hours, but involves over 50 teams of seine boats, power skiffs, spotter planes, and tenders, all packed into just a couple small bays and inlets.

Sitka receives both mainline and feeder service from the AMHS. In March of this year, it averages a little more than one stop/week, north and south by mainline ferries, and about three stops/week by the LeConte. In summer this changes to an average of more than two stops per week by mainline ferries and less than two stops per week, north and south by feeder ferries. In 1985 18,381 passengers and 3,536 vehicles embarked at Sitka. 18,463 passengers and 4,002 vehicles disembarked.

One run that is both convenient for the communities it serves and to Sitka's economy is the Saturday feeder turnaround. This ferry leaves Juneau late Friday afternoon and picks up passengers from Hoonah, Tenakee Springs and Angoon enroute to Sitka. It arrives in Sitka at 8:00 a.m., then sails at 4:00 p.m. on the return trip. This run allows the residents of the smaller communities an opportunity to buy supplies without having to spend money on hotels or air fares, which could make their whole trip uneconomical. It is important to Sitka's retail economy as it is the only winter "boost" for the town. Sitka's winter economy is stronger than some other communities largely because of this "turnaround" run.

This "turnaround" run is also key to some important human services provided by the Southeast Regional Health Corporation hospital in Sitka. The hospital serves Native people from all of Southeast, and the ferries are the primary means of transportation for all who do not live in Sitka.

The importance of the Saturday turnaround is demonstrated by the fact that until the service was cut this past winter, the hospital's operations were specially geared for the Saturday turnaround. It would be fully staffed by physicans and dentists for their patients who would arrive on that ferry. When the turnaround service was cut this past winter, patient visits decreased significantly.

The ferry system also serves Sitka in more general ways. The U.S. Postal Service delivers 25,000 pounds of mail each week to the city via the ferries. Nearly 100,000 pounds of meat, produce, and dairy products are delivered each week by the ferries to Sitka grocery stores. One grocery store in Sitka estimates that 40% of its groceries come by ferry.

The AMHS is thus important both as a major support to the local retail and tourist trade, and as the primary method of transportation for clients of regional human services that are provided in Sitka.

TENAKEE SPRINGS

Tenakee Springs, also known as Tenakee, is a small community of about 125 people located on the north shore of Tenakee Inlet on the east side of Chichagof Island. It is about equidistant between Sitka and Juneau, 55 miles either way, or about 45 minutes by air. It is well known for its hot springs. Indeed, the existence of the springs is the reason for its founding. Early prospectors and miners apparently discovered the springs, and began using it as a winter haven - a place to wait out the cold winters while taking advantage of the natural springs. Tenakee became a booming resort, complete with card rooms and pool halls. Later, several canneries operated in the area, with the last one closing in 1974. Today Tenakee is a significant retirement community, a seasonal home for some, and a fishing community. The extent to which it is a seasonal home is significant - of the 125 houses and cabins in Tenakee, only 64 are occupied year-round. Of the year-round population, it is estimated that 30% is over 60 years of age.

Tenakee has a special nostalgic appeal. It has no roads. The only vehicles in Tenakee are a fuel truck, a fire truck, and some ATVs. It is a safe harbor for those who would live apart from modern world. Life in Tenakee has been described as "like turning the clock back 40 years."

Tenakee has three private businesses: the Blue Moon Cafe, the Tenakee Inn and Bar, which offers ten rooms in addition to its food and beverage service, and Snyder Mercantile, a general store selling food, basic hardware, drug items, and fuel. Snyder Mercantile also has five cabins, with another four or five planned. Owners of the Inn and the cabins estimate that 85% of their customers travel to Tenakee by ferry. The expansion of Snyder Mercantile is based on the assumption of continued ferry service, especially continued weekend service from Juneau.

When ferry service was initiated less than ten years ago, its residents chose to limit loading capabilities to passengers only. No vehicles can offload at Tenakee. Thus, use of the ferry for freight purposes by the community is limited. However, its use for passenger transport is quite important. The residents depend upon the ferry for trips to Juneau and Sitka for shopping and medical care. The residents especially appreciate the availability and dependability of the ferry during the winter. Since Tenakee has no land based airstrip, all planes coming in must land on the water. Boarding float planes is quite difficult for some of the older people, as well as for the wheelchair-bound residents. Therefore these residents have a greater degree of reliance on the ferries.

The residents have found that the introduction of ferry service has not impaired their lifestyle. Indeed, they now rely upon it as their primary mode of transportation.

PELICAN

Pelican is a fishing community of 200 permanent residents located on the Northwestern corner of Chichagof Island. Fishing and seafood processing are nearly the whole of Pelican's economy. Pelican Seafoods is the primary employer. During the fishing season, Pelican's population doubles in size, partially due to the increase in Pelican Seafood workers and partially due to an increase in the fishermen themselves. Seven million pounds of seafood are processed in Pelican per year.

Pelican is not accessible to any other community by road. Juneau is Pelican's primary source of goods and services, though Sitka also serves that function. Pelican has daily scheduled flights from Juneau and scheduled flights three times/week from Sitka. Direct air time is 45 minutes from Juneau. One way air fare is $72 from Juneau, three times the cost by ferry. Pelican does not have a landbased airfield. Therefore, only seaplanes can land in Pelican.

Ferry service is very limited to Pelican. Only one ferry per month travels to Pelican in winter, and two per month in the summer. However, Pelican residents do depend upon it. Because of the town's location, it has more weather problems and planes have a more difficult time getting in and out than with communities on the inside of the Archipelago. Almost every winter Pelican experiences a period of a week at a time without air service due to weather conditions. Some residents expressed the opinion that even though the ferry probably serves more people in the summer, it is more important to them to have good ferry service in the winter, when fewer flights are getting in, and when they don't have access to local boats to take them to town.

There is only one general store in Pelican, owned by Pelican Seafoods. Prices are high in the store. Thus, local residents try to avail themselves of the once/month ferry service which delivers groceries and goods for about half the cost of the general store. There are three restaurants in town, two of which close in the winter. Two of the three restaurants receive all their food and supplies by ferry.

Ferry service is important to Pelican both for passenger transport and some vehicles. Equipment of both the City and school District is sent to Juneau for maintenance. As with all other communities served by the ferries, elderly people much prefer the ferries. It is very difficult for them to attempt to board seaplanes. Also as with other Southeast communities, ferry service is viewed as very important for student travel. All student travel is planned around the ferry schedule. Pelican cannot afford a reduction in service.

HOONAH

Hoonah, Alaska is a Tlingit Indian community (pop. 906) located on Chichagof Island, 3 1/2 hours by ferry from Juneau and 20 minutes by air. Hoonah is not presently connected by road to any other town or village. However, there is a logging camp of approximately 250 people at peak season two miles from town.

Hoonah's economy has changed from a subssistence way of life to a varied one where commercial fishing forms the economic base. During the past five years, logging has also become important. However, in 1987 the loading of logs on ships bound for Japan will cease. This will reduce the number of Huna Totem shareholders employed in the industry by 32. This loss will dramatically affect local employment.

Hoonah is now looking at ways to diversify their economy. Tourism is an option being explored as a means to stabilize the economy. People involved in the operations of the Inn, the Lodge, the restaurant, and the City all spoke of promoting Hoonah as an entry point to Glacier Bay. Hoonah is the closest community to Glacier Bay with ferry service. It is this service that would be essential to the development of tourism for Hoonah.

Presently, the ferry system is essential to the community in a number of ways. 100% of the community's fresh produce, eggs, and bread arrives via the ferry, and 50% of the milk and other dairy products. A total of 8,000 lbs. of food arrives each week destined for three stores, two restaurants, and two food co-ops. An additional 6,000 lbs. of food is delivered each week via the ferry when the logging and fishing seasons are in full operation. 5,584 passengers and 1051 vehicles embarked in Hoonah in 1985. 5,947 passengers and 1172 vehicles disembarked. Perhaps just as important as the transportation of food into town, is the transportation of fish out of town. 100% of the fish from Hoonah Cold Storage is shipped on the ferry. During the fishing season, every northbound ferry (bound for Juneau) is used for the transport of fish. In 1986 approximately two million pounds of fish were shipped in this manner. This year, a 30% increase is anticipated, due to an increased freezer capacity. A common concern voiced by the owners of restaurants and stores stems from their limited storage capacity. The growth of their businesses without a corresponding increase in their storage capacity has resulted in a greater dependence on the ferry system.

In addition to the essential functions of food and fish transportation, there is the normal function of people transport. Hoonah, with its small population, has little selection of clothing, and its selection of items such as furniture,

appliances, and building materials is almost non-existent. For these items and many others there is a significant amount of commerce by the Hoonah residents with Juneau. The ferries provide both the cheapest and most convenient method for the Hoonah citizens to do their regional shopping.

As with other southeast communities, heavy use is made of the ferries during the school year for the transportation of school children for athletic, cultural, and music events. 50% of student travel is by ferry. Most Southeast school events are planned around the ferry schedule. In a time of decreasing revenues to the schools, any significant decrease in ferry service would limit student travel correspondingly.

Significant use of the ferries is made by people in need of medical treatment. Hoonah has limited medical facilities and staff. People travel to Juneau or Sitka to visit the doctor, enter the hospital, get prenatal care, have a baby, get more diagnostic tests, etc. Indeed, unless an emergency exists, it appears that the vast majority of patients and attendants utilize the ferry rather than flying. The Southeast Regional Health Corporation provides vouchers for patient transport by ferry, rather than by air, whenever possible.

In questioning the local citizens regarding their use of the ferries, it was discovered that people who prefer to ride the ferry do so for three reasons: 1) cost. The regular roundtrip airfare from Hoonah to Juneau is $94. But roundtrip fare on the ferry is only $20 (winter rate), and senior citizens and children under the age of six can ride the state ferries for free. 2) safety and the fear of flying. Numerous responses were received citing this as the reason for using the ferry. 3) people can take their car, which makes it much easier to operate in a larger city. Hoonah's senior citizens use the ferry almost exclusively in traveling from Hoonah.

The ferry is also important in the transport of vehicles, machinery, and equipment in and out of Hoonah. Whitestone Logging utilizes the service to bring in trucks and heavy equipment, as does the Forest Service and the Huna Totem Corporation. This year the water line installation should be completed and the roads are scheduled to be paved. Equipment used for these projects is transported on the ferry. In general, all regular size vehicles coming into or going out of Hoonah will be transported by ferry.

Hoonah is a prime example of a community which has both a general and particular dependence on the ferries. The general dependence has to do with the overall transportation needs of a small, isolated community. The particular needs are the dependence on the ferry to transport food into Hoonah and fish out.

JUNEAU

Juneau, Alaska, population 29,370, is Alaska's state capital and third largest city. It is located on the mainland, but is not connected by road to any other mainland community. It's closest link to mainland travel is with Haines, 75 miles to the north.

The discovery of gold in Juneau was the basis for Juneau's early growth. For centuries before this discovery, Tlingit Indians had established and enjoyed a sophisticated culture in the area. However, Juneau's destiny changed dramatically in 1880, when Joe Juneau and Richard Harris found gold. Within a few years Juneau became a center for large-scale hard-rock mining. Three gold mines, the Alaska-Juneau (AJ), the Alaska-Gastineau, and the Treadwell Gold Mining Co. were established and became world renowned. Treadwell production peaked in 1915, but closed two years later due to a cave-in which flooded the mines. The Alaska-Gastineau folded due to high costs in 1921. And the AJ mining was halted by the war in 1944.

By the time the mines closed, the government had been transferred to Juneau, establishing Juneau as Alaska's capital. Government remains the focal point. Today government employs one of every two Juneau workers. As in other Southeast communities, fishing is important in Juneau. Tourism is an ever-expanding industry. In the summer of 1985, Juneau was the most visited community in Alaska by vacation/pleasure visitors and the second most visited commmunity by all visitors.

Each year Juneau's population goes through seasonal cycles. In the winter, as host to Alaska's Legislature, Juneau is home to people from all over Alaska who come here to take part in Alaska's government. In the summer, Juneau is a bustling city, entertaining visitors from all over the world.

Many of these visitors come to Juneau by way of the Alaska Marine Highway System. In 1985, the ferries transported more than 60,000 passengers to Juneau and more than 14,000 vehicles. Juneau receives more ferry traffic than any other community in Alaska. Many of these travellers are tourists, but many are people from outlying communities coming to town to avail themselves of the shopping, medical, social service, and other service opportunities which are not available in their communities. Juneau has become a regional trade and travel center for the northern panhandle. Because it is the only community in northern southeast with year-round jet service, residents from the smaller communities travel to

ALASKA LEGISLATURE COMMITTEE FILES 1987 - 1988 8672
5126 HTRA COMM. MTGS: WRK. SESSION, AK. MARINE HWY. (FILE 1) 698

Juneau to connect with jet flights going both north and south. But in travelling to Juneau from the smaller communities, the residents often prefer to use the ferry system because of its lower cost, safety, and dependability.

Juneau has the widest selection of available goods in Southeast due to its frequent barge, ferry, and air service, and its population base. There are also more doctors, dentists, and medical specialists in Juneau than in other Southeast communities. The Southeast Alaska Regional Health Corporation operates a regional clinic in Juneau; and an alcoholism treatment facility as well as a shelter for battered women and children, serving northern southeast are in Juneau. Juneau is also the regional headquarters for many organizations and government agencies including, the Forest Service, the Bureau of Indian Affairs, the Coast Guard, the Postal Service, and many others. In general, people from all over Southeast travel to Juneau to meet their shopping, business, and medical needs. Frequent and dependable ferry service is essential to this travel.

The movement of construction equipment to smaller communities from Juneau by ferry is extremely important. Many Southeast communities do not have paving equipment, asphalt plants, cement trucks, a sufficient number of dump trucks for projects, or good crane trucks to complete certain projects. Contractors from Juneau have the equipment and move it with them to the communities for projects such as water line installation, paving roads, and building projects. The ferry is the only practical way to move it.

As with other Southeast communities, student travel by ferry has become very important. 95% of the student's travel is by ferry. Students travel in groups of 10-60 to sports activities, music and drama festivals, and to debate and foreign language conferences. There is approximately one of these groups from Juneau-Douglas High School travelling in SE Alaska each week. Any reduction in ferry service would mean a corresponding reduction in student travel.

The Gold Medal Tournament is an annual adult basketball tournament in which most of the Southeast communities participate. It is held in Juneau and attracts approximately 1,000 people. The demand for ferry service at tournament time is so great that walk-on reservations must be made to get on the ferry bringing participants and spectators into Juneau. This event may seem minimally important, but it is the highlight of many communities' spring and has become a social tradition throughout. Angoon even closes its schools to coincide with tournament time. Gatherings such as this decrease the isolation people begin to feel after a long, cold winter.

Juneau to the smaller communities is equally important. Juneau receives approximately 16 27-ft. vans each week from the south, loaded with groceries, mail, and supplies. The desire for quick, frequent dependable service are reasons freight companies cited for ferry use. Juneau is served by barge lines once a week. Ferries arrive from Seattle or Prince Rupert 3 times a week. Ferries are off-loaded quickly, with vans heading for their destination upon arrival. With barge service it takes longer from the time the barge docks, to the loading and delivery of containers. There is no benefit to shipping on the ferry from Seattle or Prince Rupert if the frequency is no better than that of the barge. Thus, if the Seattle and Prince Rupert runs are reduced in the winter from 3 to 1 per week, the ferry system would loose more than the corresponding reduction in revenues; it would loose the business of those who use the ferry for its more frequent deliveries from the south. Foodland, a local store, uses the ferry exclusively in order to insure the freshest produce, milk products, and meat by getting deliveries twice a week. This is not possible by using the barge. Contractors, hospitals, the fishing industry, and the forestry industry use the ferry for its speedy delivery.

The movement of freight out of Juneau to the smaller communities is of growing importance. People in the smaller communities have become accustomed to diets of fresh produce, meats, and dairy products. The ferries are the only cost effective way of providing these items to some communities. Since many of these commuities are served by barge once every 4-6 weeks, a reduction in ferry service would severely limit the availability of these products. Other freight such as car parts, hardware, furniture, fishing gear, etc. make up the bulk of items for transport to the smaller communities. As it is now, the car decks of the feeder ferries are oftentimes too full to carry all the traffic needing transport. A cut in the service offerred by these ferries would increase this problem and the ferries may get into the undesireable position of prioritizing users of the system.

In general, the ferry's importance to Juneau is derived from the transport of tourists and Southeast residents from outlying communities into Juneau, and the transport of freight out of Juneau.

HAINES

The City and Borough of Haines (pop. 1847) is located 75 miles north of Juneau on Lynn Canal. It is 1/2 hour from Juneau by air and 4 1/2 hours by ferry. Haines is connected by road to the interior. Twenty-two miles up this road is Klukwan, a small Chilkat Indian Village with a population of 192. Klukwan has no businesses, so it relies totally on Haines for goods and services. Haines is a major entry point for land travel from Southeast Alaska into Canada or the Interior of Alaska, and from the interior to Southeast, Prince Rupert, and Seattle. This function, however, is only possible because of the ferry system. Despite the still recent completion of the Klondike Highway connecting Skagway to Whitehorse, Haines may still be described as the northern terminus of the Marine Highway System. It is the Panhandle's closest link to the rest of Alaska.

The Haines economy in the past ten years has often seemed to be reacting to the on-again, off-again attempts to keep the sawmill operating. Presently, the sawmill is not operating. Fishing has been an important contributor to the economy, but has recently been facing tougher times. Now the community is turning towards its tourism potential as a means of finally stabilizing the Haines economy. This effort has been helped a great deal by the publicity and attention which has been given to the annual fall eagle migration to the Chilkat River. Work on promoting the eagle reserve as a place to visit is progressing, and a visitor information center is under construction. In addition, other efforts are being made to promote Haines as a place to visit rather than just pass through. The underling key ingredient for Haines' tourism potential is its accessability by ferry. Without the ferries, Haines becomes simply a place at the end of a very long spur road.

It is difficult to overemphasize the importance of the ferry system to the Haines economy. For example:

(1) There are five hotels in Haines (a total of 128 rooms), with a gross income of $625,000. The owners of the hotels state that 90% of their business is derived from travellers on the Marine Highway System.

(2) Even though Haines has little more than a thousand residents, it has 11 restaurants, seven of which remain open year-round. The owners of the restaurants estimate that 80% of their business is derived from ferry travellers.

(3) There are are four automobile service stations. The operators of these stations state that 40% of their business derives from ferry traffic.

(4) In 1985 43,534 passengers embarked at Haines, and 13,454 vehicles. 40,867 passengers and 12,424 vehicles disembarked. In comparison, Juneau, which had the highest number of disembarkations had only 1,650 more vehicles disembarking than Haines.

It appears that when people drive down from the interior to connect with the ferry, they have a strong desire not to miss their connection south. And so they arrive early - early enough to need accommodations. Other examples abound of the importance of the ferry system to th Haines community:

(5) Approximately 1/2 of the food in the grocery stores arrives via the ferry; restaurants and bars receive all their supplies by ferry.

(6) Approximately 1/2 of the construction materials sold in Haines arrives by ferry.

(7) The ferry system itself has 27 employees in Haines; including two seasonal and one part-time.

Of all the communities of Southeast Alaska, it is clear that Haines is the most vulnerable and would be hurt the most by any significant curtailment in ferry service. The community has experienced a taste of the impact of ferry service reductions this winter. Last winter Juneau residents could conveniently travel via ferry for the weekend to Haines. This year, however, the schedule will not allow them to go to Haines and return for the weekend. The result is that some businesses in Haines have had their worst winter ever. Indeed, a tour company that had planned some group tours to the Haines area to enjoy the eagle migration had to cancel their plans due to the scheduling difficulties.

Apart from the aspects already identified, it appears as well that Haines is more dependent upon the ferry system than other communities in terms of social and cultural events. Haines is the site of the annual Southeast Fair. The fair, scheduled every year in August, has become a major event. Last year, attendance was approximately 8,000. And the ferries play a vital role. The event has become such a popular one for for Juneau residents (and those travelling

through Juneau) that demand for space far exceeds capacity. To their credit, managers of the system have cooperated by scheduling an extra run to Haines. The ferries carry horses, other animals, and exhibits as well as people to the fair.

While the fair may be the largest event, there are other cultural events and ongoing functions which depend on the ferries. The famous Chilkat Dancers of Haines use the ferries exclusively in their regional tours. They report that approximately 25% of their audience for Haines performances stem from the ferries. Also, there is an annual drama festival and competition in the summer which draws people to Haines by ferry.

As with most other communities served by the ferries, school travel relies greatly on the ferry system. 90% of student travel from Haines is via ferry. The purposes include travel to the annual music festival (this year held in Ketchikan) and a foreign language festival in addition to athletic events. Choosing ferry travel over air is a matter of safety more than cost, according to the high school principal.

Finally, but not least, there are numerous ongoing people services and functions which depend upon the ferries in a manner which makes life in this and other smaller Southeast communites more manageable. There are only two doctors in Haines, one of which also serves Skagway. There is no hospital. People from both communities depend on the ferries for transportation to Juneau for medical treatment unless an emergency exists. Also, periodic visits to Haines are made by a veterinarian, an optometrist, and a chiropractor, all of whom use the ferry as they carry with them a fair amount of equipment. And, twice a month both the Public Defender and District Attorney along with a judge come to Haines for judicial proceedings. They usually fly, but schedule their visits according to the ferry schedule as a backup. The local magistrate estimates that it would cost the state approximately $1500/day should those three people get weathered in. Of course, as with Skagway and Hoonah, many residents depend upon the ferry to be able to travel to Juneau for consumer goods which are simply not available in their community. It is cheaper, safer, and more dependable than flying.

In this study and report, it appears to a significant degree that the importance of the ferries rises in inverse proportion to the size of the community. Haines happens to be the one example which demonstrates the rule most dramatically. The ferries quite simply are a major factor, not just to the economy, but to the quality of life.

SKAGWAY

The City of Skagway is located at the northern end of Lynn Canal. The current population is 790. It is 93 miles north of Juneau, 45 minutes by air and 6 1/2 hours by ferry. Like a great many other places in Alaska, it has had its economic ups and downs, but Skagway's history appears to have peaks and valleys which are both higher and lower than perhaps any other. Soon after its beginning, and at the height of the rush to the Klondike gold fields, Skagway (combined with nearby Dyea) was the largest city in Alaska (pop. 8500). Of course when the boom turned to bust, the population declined rapidly. Skagway might have turned into a ghost town were in not for the construction of the railroad in 1899. Eventually the railroad became the mainstay of the economy, transporting ore from the Yukon to Skagway to be loaded on ships, and tourists and freight north to Lake Bennett and Whitehorse. But the iron mines closed in 1981 forcing the railroad out of business in 1982. This put the very life of Skagway in jeopardy. But the opening of the Klondike Highway connecting Skagway with Whitehorse has given the town new vitality.

Now Skagway concentrates almost entirely on tourism and the ferries are an important component of this economy. 230,000 people visited Skagway last year. Skagway's population doubles in the Summer in an effort to accommodate their visitors.

While the vast bulk of tourists come by cruise ship, it is the visitors who come by ferry who spend money in local restaurants, hotels, service stations and grocery stores. This is because food and lodging is included in the cruise ship package. Thus, the 36,000 visitors who came by ferry in 1986 are an important component to these Skagway businesses. And, to an increasing degree, this component is not restricted to the Summer period. Skagway is working hard at encouraging Juneau residents to travel north for winter breaks. Since this winter is the first winter that the road to Whitehorse has remained open, visitors are being encouraged to come to Skagway for cross-country skiing or to go to Whitehorse. Due to the winter opening of the road, those business remaining open all report increased winter business. Of course, the ferries play an important role in making the increased winter traffic possible.

The opening of the road also means that tourists traveling north with their car now have the option of disembarking at Skagway. Thus, Skagway now joins Haines as an entry point for travel to the interior and Canada. The 1985 Port Traffic Summary Data indicates that 29,577 passengers and 5,731 vehicles embarked from Skagway. 31,522 passengers and 6,402 vehicles disembarked. Presently, (March 1987) Skagway receives four main-

line ferries/week, and one visit by the Le Conte. In the summer, service increases to five mainline ferries while service by the Le Conte remains about the same.

Like other Southeast communities, Skagway depends on the ferry system for its basic transportation needs. The ferry offers a low-priced, dependable means of transportation to Juneau with its greater selection of consumer goods and services. Since Skagway is situated in a narrow valley with steep mountains on either side, it receives winds from the north, especially in winter, which are severe. The winds make flights into Skagway uncomfortable and at times impossible. The ferry offers a dependable option. Most people schedule their departures according to the ferry schedule, so that even though they may plan to fly, they will not be stranded by a flight cancellation.

Skagway's health professional is a Physician's Assistant, with a doctor from Haines visiting once every two weeks. The ferry is an important link between Haines and Skagway for the transfer of medical supplies, drugs, and personnel. If people need more medical services than are available in Skagway, they usually travel to Juneau, and often by ferry.

Given the recent efforts by Skagway businesses to attract winter business, buoyed by the opening of the road for winter traffic, people in Skagway are naturally disheartened at the prospect of decreased ferry service. For it is the current level of ferry service which largely makes it possible for the winter business to grow. That is, the appeal is being made to Juneau residents for a winter foray to Skagway and Whitehorse, and such a visit by car necessarily involves use of the ferries.

V.

RECOMMENDATIONS AND FINDINGS

RECOMMENDATIONS AND FINDINGS

The intent of this section is to provide a helpful perspective of ways to improve our Alaska Marine Highway System (AMHS). We intend no offense. Indeed, this section, like each of the others is to lend assistance.

From the beginning, the goal of the AMHS has been to allow residents of Southeast access to the same transportation opportunities as those residents of areas on maintained road systems. The service has been treated fiscally as lump sum appropriations, turned over to an administrator for disbursement, much like other passthrough programs such as Education Foundation, Municipal Assistance, and Revenue Sharing. But there is a major difference: school districts and local governments statewide are not able to meet their own funding needs. For that matter, neither is the State's land based highway system. But the AMHS on the other hand, is entirely capable of providing most of its own revenues. It has in the past, and studies indicate that the system has the potential, in the short-term (within five years) to provide from 55 to 60 per cent of its operating costs through system receipts.

This potential, however, is dependent upon the continuation and expansion of service. The system generates no revenues sitting off-line at dockside, and in some cases may cost the system more than when operating and generating revenues. The system is a long way from realizing its revenue potential. The solution, however, does not lie in a change of schedule or reduction of service. It lies in necessary changes to the delivery of those services, specifically day-to-day operation, manning requirements, public perception, and management. The following are some areas revealed during this study where significant improvements could be made:

(1) Advisory Board

Foremost among our suggestions is that the Legislature and Governor form a small advisory board to work with the AMHS to develop goals and implement strategies over the next three years. This recommendation cannot be overstated. The board could well serve as the ingredient necessary to make the AMHS the paradigm of marine transportation and the backbone of economic development. The small board should be comprised of transportation and marketing professionals, legislators, and users.

(2) Vessel Lay-Up

One item that should play an important role in the decisions on funding levels are vessel lay-up costs and the amount

of time vessels spend in port for maintenance. Here is a listing of overhaul costs per week for each vessel, shown as a percentage of its weekly operating costs:

Aurora - 51.4%	Tustemena - 65.5%
Chilkat - 82%	Bartlett - 90.8%
LeConte - 49.8%	Columbia - 71.1%
Matanuska - 66.1%	Malaspina - 42.9%

Lastly, the Taku has a percentage of 50.3%.

If you accept the validity of the 1984 Task Force Report that the system could be providing 55 to 60 per cent of its own funding within five years, then only on the Malaspina would it cost significantly less to lay-up for maintenance than to operate. Further, the time periods for lay-ups for maintenance seem to be excessive. They range from a five week maintenance period for the Chilkat to 19 weeks for the Columbia. By contrast, the cruiseship Stardancer lays up for 8 days per year. All other maintenance is done on board, during operation.

Our recommendation is that the Legislature and Governor establish a five year series of attainable revenue goals as a percentage of operating cost, and that these goals be evaluated along with actual experience prior to each fiscal year appropriation. In this manner, the Legislature can encourage the system to eliminate those areas of apparent excess cost, such as the maintenance time on vessels.

(3) Inventory Control and Purchase of Provisions

Perhaps the most common complaint has been the warehousing of supplies, especially foodstuffs, and the system's inability to track those provisions. We came across a report dated August 4, 1983 from Gerald Wilkerson to members of the Legislative Budget and Audit Committee regarding an audit of AMHS warehouses in Seattle and Juneau. The State Accounting System (SAS) records for the inventory at the Seattle warehouse showed the Seattle inventory at $230,621.49; while the warehouse records showed inventory at $87,161.18, a difference of $143,460.31. Acting Deputy Commissioner Eugene Black attributed the discrepancy to inadequate reconciliation procedures between the AMHS warehouses and the State Accounting System. Indeed, there were consistent diferences between other AMHS records and the SAS. The Seattle finding stands out, however, because of Governor Sheffield's AHMS Task Force, which was conducting its ispections during the same general time period. In its official report dated April, 1984, the Task Force had the following to say about its inspection of the Seattle warehouse:

Stardancer goes South!

> The warehouse space at Pier 48 currently leased by the system is not being utilized to its fullest capacity. In addition, the main warehouse is disorganized with little control in effect. Both front and rear doors to the main warehouse were open with vehicles entering unrestricted. There appears to be excess warehouse capacity and minimal control of the main warehouse area.

In the same audit report, Wilkerson also points out another shortcoming that we feel warrants immediate attention. Wilkerson states:

> Juneau warehouse records do not provide historical detail of inventory transactions which would show all purchases, adjustments, and issuance of inventory items. By not having this detail, the disappearance of inventory and subsequent adjustment of records could go undetected.

Black responded that "the data processing program purchased for use at the warehouse does not have the capability of keeping transactions by item."

We are aware that the management is reviewing these cost saving measures. Our recommendation on this matter is that the Legislature and the Governor direct the AMHS to pusue "shipside" purchase of Provisions. That is, shifting to a system of little or no inventory. The benefits are several. There seems little justification for the amount of space currently being payed for in Seattle, especially if supplies were to be purchased "shipside". Inventory could be more easily tracked because everything purchased would actually make it onto the ship rather than be warehoused. It would also allow Alaska dollars to stay in Alaska, and help to support local economies along its routes, plus build a stronger relationship with the business community. An additional effort should be made to evaluate the current procedures for the purchase of fuel by AMHS. This particular purchasing strategy needs a review beyond our budget and timetable. However, it is equally important and seems to be an area which has been neglected. It is a complex question and entails cost comparisons of food purchase alternatives and warehouse efficiencies.

(3) <u>On-Shore Ship Services</u>

The system seems to have little or no control over docking costs, and certainly no consistency in approach. One

community charges the system $600 every time they tie up a boat, while another community provides the service gratis, in recognition of the importance of the ferry to the community. We do not suggest there is no reasonable explanation, we simply do not have one. A similar problem exists with on-shore agents at the various ports of call. Some are AMHS employees, some are contract agents. Some are dedicated to their work and represent the ferry system very well. They keep regular office hours, sell tickets, meet ships, help with tie-ups etc. Some (more likely to be contract agents) keep minimal staff and minimal office hours, do a poor job on-shore costs (such as tie-ups) that are billable directly to the AMHS, do not present a good impression to passengers, and collect a higher percentage of ticket sales than do travel agents.

Our recommendation is that the Legislature and Governor direct the AMHS to determine the most cost-effective method of handling on-shore services, and further direct that those costs and methods should be as consistent as possible throughout the system. Further, that the system should function within a strict set of guidelines to ensure a consistent level of service at a consistent cost.

(5) Ferry Freight

We found a tremendous dependence by some businesses on the ferry system for freight service, but also received many complaints regarding practices on the cargo deck that often cause inconveniences to clients. There was expressed to us a feeling that the AMHS did not consistently recognize the importance of their commercial clients as a source of revenues. One example given is that the system does not enforce its prepayment requirement on vehicles. The result is that commercial opportunities are lost when a passenger vehicle cancels, because there is no incentive for the person cancelling to notify the AMHS. There is then no opportunity for the space to be filled, though there may be a commercial carrier who would desire the space.

Our recommendation is that the Legislature and Governor instruct the AMHS to consider methods of maximizing revenues from commercial freight users through adjustments in scheduling or lay-up schedules so as to "cater" to commercial clients during periods of high freight volume, such as those noted in the community sections of this report.

(6) Promotion and Marketing

The AMHS is the largest public water transportation system in the United States. Southeast Alaska is one of the nation's major tourist destinations. In a recent survey, 58 percent

of all respondents identified the ferry system as their preferred method of travel to Alaska. Yet until just four months ago, very little effort was made at promoting the system "outside", and even less within Alaska. If the AMHS is to survive without dramatic reductions in services, major sources of revenue have to be identified. There is very nearly unlimited potential for "selling" the system, but several changes do need to occur to realize its tourism potential. We believe this can occur in concert with private enterprise, particularly during the winter months.

Our recommendation is that the Legislature and Governor instruct the AMHS to actively pursue changes within the reservation system that will expedite that system. Areas to be considered should include contracting out the reservation function or the training of the staff to experienced professionals within the travel industry; transferring reservations onto one of the major airlines computer systems so that no extra equipment would be needed by travel agents to write tickets for the ferry system; increase the commissions on tickets to at least minimum industry standards; actively recruit and pursue private/public partnerships in the marketing of the system; work closely with the State Division of Tourism for promotional purposes; initiate efforts to improve the impression the system presents at its Seattle and Prince Rupert terminals; provide training to employees in public contact positions, both on-shore and on-ship. Finally, the Legislature and Governor should urge the management and employees to help realize its potential.

(7) Operations

This brings us to our final "operational" recommendation, and the most common issue we found among systems users. We recommend that the AMHS conduct a thorough, comparative review of all contract provisions with organizations representing employees of the system. Further, that special attention be paid to provisions relating to manning requirements, seniority, training programs, assignment of duties, annual leave, sick leave, penalty and overtime compensation, ship-based versus shore-based compensation and benefits, call-out practices, and residency requirements. The various contracts should be consistent in the different provisions. In addition, a similar review should be conducted of the cost of administering the system, and appropriate recommendations made. The findings and recommendations of this contract review and the administrative review should be implemented at the earliest opportunity, in order to help stabilize the system's operating expenses at a level that will assure continued Legislative support. The labor forces of the AMHS are the element primarily responsible for the successes of the system and

maintaining its effectiveness through recent turmoil. They must be full partners in meeting the current challenges.

The conclusions reached by our research lead us to believe that much of the expense in operating the AMHS is not inherent in the ferry service itself. It appears rather to be entrenched in the delivery of that service by the AMHS. Ferry loads are adequate and the system is being used. For that reason, every effort should be made to avoid a reduction in actual service. By the same token, it is imperative that every effort be taken to encourage the system to streamline its delivery of service in an effort to increase revenue, without sacrificing its committment to basic transportation needs of all Southeast residents. It would be truly unfortunate if any reduction in funding should result strictly in a commensurate reduction in service without regard to other areas of the system. We see the decisions made this session as decisions affecting the entire future of the AMHS.

We feel strongly that there are quantifiable ways of both reducing the cost of operation, and at the same time increasing revenues. We urge your support of funding levels that will guarantee the continuation of the essential service level currently being provided by the AHMS. By the same token, we implore you to adopt an aggressive handling of the system's managerial and operational deficiencies. <u>On no level of management theory have we found justification for allowing a billion dollar infrastructure to sit idle</u>. It would be a questionable business decision to do so, and absolutely unacceptable as a matter of public policy. We urge the legislature and governor to fund the AMHS for FY 88 at a level of 62.6 million, and to adopt intent language that service levels be maintained. Since this is the first year of the session, we would also encourage the governor and the legislature to set some General Fund net operating goals for the AMHS for FY 88. A report from management on the status of that effort, with specific citations, should be requested for delivery to the Legislature by the first day of April, 1988.

Thank you for your consideration. We believe that a strong directive from the legislature and Governor to the management of the AMHS, combined with a maintenance level appropriation for FY 88, can assist the AMHS to make great strides toward ensuring that the system will continue to provide adequate levels of service to the State in the future. We do not pretend or suggest that all of our recommendations are absolutes. There is no claim that we have all the answers, but we believe in the viability and future of the ferry system.

strides toward ensuring that the system will continue to provide adequate levels of service to the State in the future. We do not pretend or suggest that all of our recommendations are absolutes. There is no claim that we have all the answers, but we believe in the viability and future of the ferry system.

A RESOLUTION BY THE SOUTHEAST CONFERENCE
RESOLUTION #87-1

WHEREAS, the Southeast Conference has completed a comprehensive review of the Alaska Marine Highway System's critical importance to Alaska communities; and,

WHEREAS, Alaska's rugged coastline prohibits road access to all but two of Southeast Alaska's twenty-four municipalities and boroughs; and,

WHEREAS, Southeast Alaska's severe and unpredictable weather frequently prohibits air access to those municipalities; and,

WHEREAS, the Alaska Marine Highway System is the foundation of Southeast Alaska's economy; and,

WHEREAS, the Alaska Marine Highway System is the primary and only dependable mode of transportation in Southeast Alaska; and,

WHEREAS, the Alaska Marine Highway System also provides a significant means of transportation to Southcentral and Interior Alaska that effects their economy; and,

WHEREAS, the Alaska Marine Highway System is critical to Southeast Alaska's fishing, timber, tourism, and retail industries; and,

WHEREAS, the Alaska Marine Highway System is also critical to the delivery of human services, such as health care and education; and,

WHEREAS, any reduction in the level of service in Southeast Alaska would have a dramatic affect on day-to-day life in Southeast;

THEREFORE, BE IT RESOLVED that the Southeast Conference respectfully urges Governor Cowper and the Fifteenth Alaska State Legislature to accept and implement to the maximum extent practical the recommendations presented by the Southeast Conference in the report entitled "The Alaska Marine Highway System: The Community Perspective;" and,

BE IT FURTHER RESOLVED that the Alaska Marine Highway System maintain its current level of service and be funded by an authorization of $62.6 million for fiscal year 1988.

Adopted by the Southeast Conference on the 7th day of April, 1987.

Ernest Polley, President

Chapter IV:	Recommendations for FY 1988 and Future Year SAMC Programs	22

INTRODUCTION

The Southeast Alaska Marketing Council (SAMC) is closing its first year of promotion specifically for the Southeast area of Alaska. SAMC was able to organize a full promotion program within a very short timespan since its inception in December, 1986. The funding and expertise for the program comes from both public and private sources and thus is called a cooperative marketing program.

Cooperative programs require a high degree of accountability in terms of program results, both measurable and unmeasurable. The return on investment must be sufficient to warrant future involvement of both public and private members, guaranteeing results in an environment where no one member has total control. To this end, the Southeast Alaska Marketing Council contracted with Data Decisions Group, Inc. (DDG) of Juneau, Seattle and Portland to evaluate the results of the 1987 Program and make recommendations for 1988 and beyond.

In the absence of primary research conducted specifically on the SAMC Program, DDG based its evaluation on extrapolated results from the State AVAMC Program (discussed at length in Chapter II), on a special analysis of Southeast Independent Visitors from the Alaska Visitor Statistics Program and on its 35 combined years of studying tourism in Alaska and worldwide. It is DDG's hope that this document will be of assistance to SAMC members and program planners.

Chapter I
DESCRIPTION OF SAMC PROGRAM

CHAPTER I: DESCRIPTION OF SOUTHEAST ALASKA MARKETING COUNCIL PROGRAM

In November of 1986 a group of representatives from both public and private sector organizations met officially for the first time as the Southeast Alaska Marketing Council (SAMC). The formation of the SAMC was prompted by a noticeable decrease in hotel room nights in Southeast despite an overall increase in visitors throughout the state. While all visitor sectors have gained substantially in Southcentral and Interior/Northern regions, only cruise traffic has seen major increases in Southeast.

SAMC members were reacting to statistics such as the following:

- Only 35% of Independent Pleasure visitors to Alaska visited Southeast in Summer 1985 compared to 78% visiting Southcentral and 57% visiting Interior/Northern.
- No Southeast land-based attractions make the top five state attractions list -- the first SE attraction on the list is Mendenhall Glacier visited by only 20% of independent visitors.
- The first SE community on the top ten most visited community list ranks No. 7 (Juneau drawing 27% of Independent Pleasure visitors). (see Appendix for details)

The function of the SAMC, as the marketing arm of the Southeast Alaska Tourism Council (SATC), is to develop and implement marketing plans to attract more independent travelers in Southeast. **Specific goals are:**

- **To increase hotel visitation**
- **To increase point of purchase activity among regional businesses**
- **To increase the visitor length of stay**
- **To increase number of points visited in Southeast**

To accomplish these goals, the SAMC was organized along the same cooperative lines as the statewide Alaska Visitors Association Marketing Council (AVAMC) with 13 members, including the nine largest financial contributors and three regional SATC representatives, and an unlimited number of expert advisors. The AVAMC is recognized as an enviable model for other states and destinations due to its successful blending of public and private marketing expertise and dollars.

The SAMC Cooperative Marketing Program was funded at $446,000 in 1987 and is projected at $400,000 for 1988. Public sector contributors in 1987 included the communities of Juneau, Ketchikan, Sitka, Skagway, Prince Rupert, Haines, Whitehorse, Petersburg and Wrangell plus the Alaska Marine Highway System. Public sector contributions are determined from a formula based on percent of population and percent of beds. Private sector contributors were Alaska Airlines, Glacier Bay Yacht Tours, Sheffield Hotels, Grayline of Alaska, Alaska Travel Adventures, Prewitt-Sitka, Temsco, Ingersoll Hotel/Waterfall Group, Baranof Lodge and AlaskaBound.

The Three-Year Goal of the SAMC Marketing Program is to

- increase overnight visitation to Southeast Alaska by 300,000 room nights.

The Target Audience of the SAMC Marketing Program is

- independent travelers using air, ferry and highway as their transportation modes.

The Focus of the SAMC Marketing Program is on

- increasing awareness of the Southeast region overall and of the air, ferry, and highway access to the region specifically.

The SAMC Program has been implemented for 1987 and is on the drawing boards for 1988. Eight components comprise the program for each year. The following list itemizes each component, its objectives, its elements and its allocation levels for 1987 and projected for 1988.

PROGRAM COMPONENTS

1. Participation in State of Alaska AVAMC Cooperative Marketing Program

Objectives: To obtain qualified Alaska prospect names/labels for Southeast brochure distribution. To establish Southeast as a recognized marketing entity in the statewide AVAMC cooperative marketing program. To gain exposure as an advertised marketing entity in the state Official Alaska & Canada's Yukon Vacation Planner Directory distributed to over 400,000 qualified potential visitors per year.

Elements: Purchase of 172,000 labels of respondents to national state advertising, most qualified as interested in visiting Alaska but not by cruiseship or package tour.

Purchase of AVAMC Marketing Partner status with option to purchase respondent labels.

1988 planned addition: Small (2") advertisement in the Official Alaska & Canada's Yukon Vacation Planner Directory which reaches over 400,000 qualified Alaska prospects each year.

Allocation: 1987: $17,000 (including $5000 retirement of SATC 1983 Travel Planner ad debt).

1988: $14,000

2. Consumer Advertising

Objectives: To establish consumer awareness of Southeast Alaska as a travel destination among prime travel markets for Alaska to reverse the declining trend of independent travel to Southeast.

To generate advertising responses for purpose of converting interested inquirers into Southeast visitors.

Elements: Full page color advertisements with response cards in two of Alaska's premium travel market consumer publications during the travel planning period:

- Sunset Magazine -- February, 1987
- National Geographic Western edition -- March, 1987

1988 planned addition: Alaska Magazine insertion

Allocation: 1987: $160,000 including $88,000 National Geographic insertion, $59,000 Sunset insertion and $13,000 photo usage, color production, misc.

1988: $160,000 (using same ad and adding Alaska Magazine insertion)

3. Collateral

Objectives: To increase consumer awareness of Southeast Alaska.

To increase consumer awareness of independent travel options in Southeast Alaska.

To produce a fulfillment piece to mail to potential visitors generated by Components 1 and 2 above.

Elements: Develop and produce colorful, glossy, high quality 16-page brochure including a response card directing prospects to SAMC member firms and communities.

The 1988 program may include an additional eight pages of directory. If so, the 1988 budget will increase beyond $70,000.

Print 200,000 copies of brochure.

Allocation: 1987: $95,000

1988: $70,000 (using same brochure as 1987, more if eight additional directory pages are added)

4. Mail Fulfillment

Objectives: Place Southeast brochure into the hands of AVAMC advertising respondents and SAMC advertising respondents.

Elements: Mail out of 200,000 brochures by Media Services, the state's mail fulfillment house.

Allocation: 1987: $50,000

1988: $50,000

5. Public Relations

Objectives: To enhance the effectiveness of advertising and direct mail programs by increasing awareness of and enhancing the image of Southeast Alaska by generating press coverage in prime national and regional markets and to special targeted audiences.

Elements: Retained national and state public relations professionals

Press Kit, including Southeast stories, photos and contacts, distributed to over 100 travel trade publications and newspaper travel editors throughout the U.S. and Canada.

Monthly stories and news releases in major U.S. markets and in Alaska.

An instate regional awareness element informs SAMC participants and Southeast residents on the use and effectiveness of the program.

1988 planned additions: Purchase of quality stories from freelance writers for the Press Kit, purchase of quality photos, retaining a clipping service, expanded Press Kit distribution, travel writer familiarization trips, special newspaper section advertising to obtain editorial space.

Allocation: 1987: $25,000

1988: $50,000

6. Research

Objectives: To measure effectiveness of SAMC Marketing Program components.

To profile the Southeast independent pleasure traveler to better market to that visitor and to enhance facility/attraction delivery.

To identify best media choices and advertising vehicles.

To determine best AVAMC list criteria for widest effective brochure distribution.

Elements: 1987: 1987/1988 Program Evaluation (this document)

AVSP Special Independent Pleasure Visitor Analysis

1988 planned: Conversion Study

Allocation: 1987: $13,000

1988: $20,000

7. Administration

Objectives: To provide an efficient implementation of the Southeast Alaska Marketing Council Marketing Programs.

Elements: Daily administrative functions

Preparation and production of annual report including funds spent, projects undertaken and, when available, an indication of results of the program.

Allocation: 1987: $21,000

1988: $28,000

8. Contingency

Objectives: To provide contingency funds for investment in program components determined to provide the greatest returns.

To provide for absorption of shortfalls in expected revenue, if any.

Allocation: 1987: $79,000

1988: $17,000

Chapter II
THE SAMC PROGRAM MODEL: STATE OF ALASKA COOPERATIVE MARKETING PROGRAM

CHAPTER II: THE SAMC PROGRAM MODEL: STATE OF ALASKA COOPERATIVE MARKETING PROGRAM
An Historical and Performance Review

1. Description and History

The Southeast Alaska Marketing Council Program is based on the State of Alaska's AVAMC Cooperative Marketing Program. The AVAMC Program has been hailed by destinations throughout the world for its successful blending of public and private sector funding and marketing expertise. The Travel Industry Association of America named Alaska's Cooperative Marketing Program the Number 1 marketing program of all 50 states in 1985.

The organizational structure of the AVAMC consists of a chairman plus fifteen members including the seven largest contributors to the program and a minimum of four members from instate, plus advisors. Currently, seven committees are functional: Advertising, Collateral, Fall/Winter/Spring, Overseas, Planning, Public Relations and Research. Each committee is chaired by a council member and is composed of two to four other council members.

The AVAMC Program is now in its 11th year. It has grown from a $793,000 program in FY 1976 to a $6.2 million program in FY 1987. **Its primary goals have been two-fold:**

- **To enhance the image of Alaska as an attractive vacation destination.**
- **To generate inquiries about Alaska so as to place in qualified prospects' hands the motivational and educational information necessary for conversion.**

The AVAMC annual program is composed of advertising primarily in consumer magazine publications and also in newspapers, television and trade publications. Other program components include a sizeable public relations effort, trade and consumer shows, travel agent direct mail and a consumer direct mail program in recent years. Rack brochures, posters, maps, Alaska films, slides and print photography for editorial use are also products of the AVAMC program.

The main annual program collateral piece is **The Alaska and Canada's Yukon Official Vacation Planner**, a 100+ page full color dual-purpose booklet. Its purposes are to motivate prospects to decide to visit Alaska and to educate those prospects on the variety of ways to plan an Alaska trip. The Vacation Planner includes over 1,200 free directory listings of visitor-related businesses in Alaska plus advertisements purchased by "marketing partners". Occasionally, the program also produces a travel agent sales manual edition of the Vacation Planner and a few times has split the contents of the Vacation Planner into smaller sized brochures each addressing itself to one of the two Vacation Planner purposes.

An immediate program benefit to individual "marketing partners" (those who purchase an advertisement in the **Vacation Planner** or contribute an equivalent amount) is the ability

to purchase mailing labels of consumer advertising respondents. These respondents qualify themselves on BRCs attached to the advertising as potential visitors interested in specific types of Alaska travel, accommodations and activities and state their year and season of intended visit, their past travel habits and their age.

Each year's AVAMC program has a **unique theme** which is reflected in all advertising and in most collateral. Some representative themes have been:

1977: America's New Frontier of Travel
1979: Alaska - America's Greatest Travel Adventure
1980: Alaska - The Travel Destination of the 80's
1981: Alaska! America's Biggest Travel Adventure
1982: Alaska - Spectacular Scenery is Just the Beginning
1983: Once You've Gone to Alaska, You Never Come All the Way Back
1984: Alaska Keeps Coming Back To Me / "100 Pages of Free Advice..."
1985: Alaska - "100 Pages of Free Advice..."
1986: "100 Pages of Free Advice for Anyone Wishing to Experience the Vacation of a Lifetime"
1987: "100 Pages of Free Advice..." / Alaska is the Mystery that I Will Never Tame (con't. television theme from 1983)

The AVAMC Program also responds to special interests of its members and conditions of the marketplace on an "as needed" basis. The **Fall/Winter/Spring market development campaign of 1986-87** is a prime example. The campaign consists of in-state advertising aimed at encouraging residents to invite their friends and relatives to vacation in Alaska during the off-season months. The F/W/S campaign also includes activity fairs, brochures and a product booklet sampling Alaska's various F/W/S attractions and activities.

Residents were asked in the advertising to send in a coupon with their friends' and relatives' names and addresses and the Division of Tourism would then mail out the F/W/S brochure and product booklet to them. The DOT also mailed these collateral pieces to a select list of winter travelers and to AVAMC advertising respondents who stated an interest in visiting in the fall, winter or spring months. The final program element, a companion to the advertising, was a direct mailing to Alaskans to get names of friends and relatives in the Lower 48 who are potential fall/winter/spring visitors. To date, the Fall/Winter/Spring campaign has generated 4,000 names of potential visitors. A conversion study to measure actual visitors generated will be performed during the summer.

Other special campaigns have addressed the potential Winter traveler and the Overseas market. A major campaign for the Overseas market is currently being researched and may be operational by FY 88. The second year of the F/W/S campaign will include a 24 page brochure and special mailings to *Alaska* magazine gift subscribers in the Lower 48 in addition to last year's efforts.

In summary, the major activities of the AVAMC Marketing Program are:

- Consumer magazine advertising which places the Vacation Planner in the hands of over 400,000 interested and qualified potential visitors, and generates names and addresses and phone numbers which can be used by marketing partners in their own individual sales efforts.

- Television commercials reaching millions of U.S. consumers with the Alaska travel message.

- Newspaper Sunday Supplement Travel Sections on Alaska nationwide.
- Extensive publicity and public relations.
- Distribution of over 700,000 Alaska Vacation Planners, the State's official travel brochure containing over 100 pages of photos and copy about Alaska, including over 1,200 free directory listings of visitor-related businesses in Alaska, plus marketing partner advertisements. The Planner also contains Reply Cards for readers to send for information from individual listings/advertisements.
- Rack brochures, posters, maps, travel agent manuals and other trade sales literature; Alaska films, slides and print photography for editorial use.
- Special marketing campaigns such as Fall/Winter/Spring promotions.
- Foreign marketing promotion in Canada, Germany, Great Britain and Japan.
- Long-term and short-term market planning
- Marketing research

The average industry member, whether in the public or private sector, has access to all AVAMC products listed above. The most used AVAMC products by industry members for their own sales efforts are:

- **listing or advertising in the Vacation Planner, and**
- **purchasing consumer advertising respondent mailing labels that can be selected for their own target audience's characteristics.**

2. Performance of AVAMC Program

Performance of a program with as many diverse components as the AVAMC program is difficult to measure. It is impossible to measure image enhancement efforts since their payoff is usually delayed in terms of actual visitation. The rationale behind image enhancement has always been, and is for all destinations, that such advertising is a long haul effort to familiarize and, in many cases, to rebuild the destination in the consumer's mind. When it has been sufficiently "rebuilt", the consumer is likely then and only then to respond to advertising which requires a call for action, such as a request for information. **Therefore, image (awareness) advertising enlarges the pool of potential visitors while response-oriented advertising provides the vehicle for that pool to take the first steps toward conversion to visitor status.**

The only part of the AVAMC program which can be quantifiably measured is direct response advertising. Since this part of the program generally accounts for the majority of program expenditures, measurement of this part is considered a good indication of the overall success of the program.

The effectiveness of direct response advertising has been measured every year except one since 1980 with Conversion Studies. The studies have measured the cost per inquiry, conversion rate, cost per conversion and return on investment for a variety of advertising vehicles. The number of inquiries is another indicator of success, albeit not as conclusive as actual conversion rates.

a. Number of Inquiries

NUMBER OF INQUIRIES (BRCs)

FY 1980	445,000
FY 1981	412,000
FY 1982	445,000
FY 1983	432,000
FY 1984	632,000
FY 1985	451,000
FY 1986	450,000
FY 1987	400,000

Response rates for the entire program appear to be declining somewhat as are response rates for individual consumer publications. This, however, reflects considerably lower media budgets as well as lower response goals.

NUMBER OF INQUIRIES FROM SELECTED PUBLICATIONS (thousands)

Magazine	1986 (1 p)	1985 (1 p)	1984 (1 p)	1983 (sprd)	1982 (sprd)	1981 (1 p)	1980 (1 p)	1978 (sprd)
Alaska	5.0	4.0	3.0	2.7	6.3	7.5	6.8	11.1[3]
Modern Maturity	92.5[1] 109.1	109.5	97.9	9.0[2]	16.0[2]	8.4[2]	-	-
National Geographic	55.9	72.7	94.8	33.0[1] 34.1	124.0[4]	84.0	157.4	130.6
Smithsonian	17.2	24.3	20.5	5.6	19.2	-	-	-
Southern Living	16.5	21.2	-	-	4.1	-	14.2	8.0
Sunset	13.9[1] 9.6	17.6	19.1	6.1	14.6	25.0	21.9	-

1 Two separate insertions of Image ads
2 Regional issues
3 Split-BRC 6190, without prepaid postage 4,941
4 Three pages and gatefold

Note: Image ads with BRCs were run in all 1983 insertions.
Source: "Analysis of the Alaska BRC Response Program: Fiscal years 1980-84" and "1986 Alaska Conversion Study".

The actual number of inquiries from publications used consistently in the last several years has declined recently (last two years). This is especially the case for *National Geographic, Smithsonian* and *Southern Living*. If *Modern Maturity* and *Sunset* had not had two insertions rather than the single insertion of previous years, their responses would also have declined. Only *Alaska* magazine of these consistently used publications shows not only stability but also an increase in responses.

b. Conversion Rates

CONVERSION RATES

FY 1980	10.5%
FY 1981	9.1%
FY 1982	7.7%
FY 1983	11.9%
FY 1984	9.3%
FY 1986	13.0%
Average	**10.3%**

Conversion rates show no real pattern from year to year overall. Specific publications, however, tend to have their own patterns.

CONVERSION RATES OF SELECTED PUBLICATIONS 1980-1986

Magazines	1986	1984	1983	1982	1981	1980
Modern Maturity	14	11	-	-	-	18
National Geographic	10	-	18	6	10	7
Smithsonian	11	7	-	6	-	-
Sunset	17	-	-	15	10	13
In-Flight Magazines	10	9	-	9	-	-
Travel Holiday	-	9	-	-	-	12
Alaska	24	-	-	-	-	-

Source: "Analysis of the Alaska BRC Response Program: Fiscal years 1980-84" and "1986 Alaska Conversion Study"

Although never measured before 1986, *Alaska* magazine registers the highest conversion rate this year and probably the highest in the program's history (24%). *Sunset* scores the next highest rate this year with 17%, continuing its consistent increases in effectiveness each year since 1981. *Modern Maturity* ranks third in conversion rates at 14%, also an increase over its last measurement in 1984. *Smithsonian* is fourth with 11%, also an increase over previous years. *National Geographic's* conversion rate of 10% is a decline from its last measurement of 18% but consistent with previous measurements before that.

c. Cost-Efficiency

The overall cost per inquiry, cost per conversion and return on investment of the AVAMC Cooperative Marketing Program for magazines shows a decline in cost-efficiency from 1980 to 1983, then an increase in 1984 declining again to 1986. Primary reasons for the variation are the use of spreads rather than one page ads for BRC response, and the inflationary cost increases of magazines from year to year. Cost per inquiry has increased from $1.56 in 1980 to $4.03 in 1986. Cost per conversion has increased from $14.83 in 1980 to $30.98 by last year. Not surprisingly, then, the actual return on investment (ROI) without including transportation to/from Alaska of these advertising buys decreased from $153.00 in 1981 to $106.51 in 1986. **This means that for every $1 spent in media space and card printing expenses to place an ad in an AVAMC-selected publication, the State of Alaska realized over $100 in direct visitor expenses -- a ratio of 1 to 100.**

This of course does not count the industry expenses such as fuel for the motorcoaches or food supplies for the cruiseships nor does it count the indirect expenses such as labor costs and taxes accrued. On the other half of the equation, though, it does not count the ad production costs nor the brochures sent to advertising respondents. In any event, the total economic impact of this visitor spending far exceeds the basic 1 to 100 ratio.

Specific publications vary in their cost-efficiency. In 1986, *Alaska* magazine was by far the most efficient with a cost per inquiry of $1.92, cost per conversion of $8.01 and ROI of $325 -- or a 1 to 300 return ratio. *Sunset* ranked third in efficiency with $5.48 cpi, $32.21 cpc and an ROI of $78. *National Geographic* trailed at #6 place (out of 8) with $5.98 cpi, $59.75 cpc and $60 ROI.

The following tables show the cost-efficiency of consistently used publications over time, in real dollars and, separately, adjusted for inflation. Adjustments for inflation show a definitely increased cost-efficiency for *Sunset* and *National Geographic* since their last readings in 1983/1984.

Chapter III
1987 SAMC PROGRAM EVALUATION

CHAPTER III: 1987 SAMC PROGRAM EVALUATION

This chapter will assess the **1987 SAMC Marketing Program** component by component. The assessment is based on Data Decisions Group's professional judgment grounded in 35 combined years of experience studying the visitor industry in Alaska and worldwide. Estimated numbers of visitors and economic impact data are based on the Alaska Visitor Statistics Program database and on extrapolations from AVAMC Marketing Program evaluations in the absence of primary research on the effectiveness of the SAMC Program specifically.

Overall, the 1987 SAMC Program is estimated to deliver 15,000 more visitors, 48,000 more room nights and $4.1 million more visitor dollars to Southeast Alaska in 1987 than would otherwise have occured. These estimates do not include future economic benefits to be reaped from the long-term awareness-building process of advertising. The estimates are the cumulative effect of the following program components.

One example of early impacts of the SAMC program is the record rate of bookings experienced by a major SAMC participant, the Alaska Marine Highway. Officials attribute part of their success to SAMC participation as well as an improved reservation system and more aggressive marketing.

1. Participation in AVAMC Cooperative Marketing Program

A $12,000 investment in 1987 purchased Marketing Partner status in the AVAMC program for SAMC which allowed purchase of 172,000 names and addresses of state advertising respondents. These respondents are Alaska prospects qualified by their committment to visit by requesting information and filling out a BRC card with pertinent information about themselves.

SAMC ordered 142,000 names of prospects who specified an interest in traveling to Alaska by means exclusive of package tours and/or cruiseships on their BRC interest/information card. SAMC also ordered another 30,000 names of state advertising respondents who did not specify any travel mode interest including package tours or cruiseships. These 172,000 qualified Alaska prospects were then mailed the 16-page Southeast Alaska brochure which included a response card directing prospects to SAMC member firms and communities.

To determine the effectiveness of this SAMC investment, we must look at the expected conversion rate of these prospects, at their length of stay in Southeast and at the amount of visitor dollars they spent in Southeast. We must estimate these impacts as additional impacts beyond the standard impact of the AVAMC program itself. In other words, how many **additional** dollars (visitors, room nights, etc.) did the SAMC program effect in Southeast?

The overall conversion rate of the 1986 AVAMC Program was 13%, that is, 13% of all 1985-86 advertising respondents actually visited Alaska in 1986. More of them will visit in 1987, 1988 and beyond but only the current year conversion rate is scientifically established. We know that package tour visitors convert at a much higher rate in the AVAMC program -- over 20%. Therefore, to allow the average to be 13%, independent visitors must convert at a lower than average rate. DDG estimates approximately an 8%

independent visitor conversion rate based on AVSP data and industry knowledge. This conversion rate means that **the 1987 SAMC message reached a total of 13,800 actual independent visitor parties, or 30,300 visitors due to its AVAMC investment.**

As a result of receiving the SAMC message and follow-up marketing from member firms and communities, it is conservatively expected that 40% of these visitors (12,100) will include Southeast in their plans if they were not intending a Southeast visit OR will extend their already planned stay. An average additional stay of an estimated 2 nights each would result in the following benefits:

SAMC 1987 AVAMC PROGRAM RESULTS
(Estimated)

Visitors	Room Nights	Visitor Dollars
12,100	24,200	$2,060,000[1]

Further economic benefits will be realized from two other sources: the indirect expenditures deriving from these direct expenditures, i.e. employee wages, instate operations costs and capital investment by transportation and tour companies, and both the direct and indirect expenses of those on the AVAMC lists who will visit in 1988 and beyond.

2. Consumer Advertising

The SAMC 1987 Program invested $88,000 in National Geographic (West Edition) advertising insertion costs, $59,000 in Sunset advertising insertion costs and approximately $13,000 in ad production costs. These dollars bought full page color advertising with response cards in two of Alaska's premium travel market consumer publications. The **primary purpose** of the advertising was to establish/increase consumer awareness of Southeast Alaska as a travel destination among prime travel markets for Alaska to reverse the declining trend of independent travel to Southeast. The **secondary purpose** was to generate advertising responses for the purpose of educating and converting interested inquirers into Southeast visitors.

As discussed in Chapter II (Performance of AVAMC Program), **it is impossible to measure awareness/image advertising efforts since their payoff is usually delayed in terms of actual visitation.** The rationale behind image enhancement has always been, and is for all "emerging" destinations, that such advertising is a long haul effort to familiarize and, in many cases, to rebuild the destination in the consumer's mind. When it has been sufficiently "rebuilt", the consumer is likely then and only then to respond to advertising which requires a call for action, such as a request for information.

Therefore, image (awareness) advertising enlarges the pool of potential visitors while response-oriented advertising provides the vehicle for that pool to take the first steps toward conversion to visitor status. Awareness advertising is essential to the success of later response-oriented

---

[1] Based on $85 per person per night Independent visitor expenditure figures, preliminary estimates from Alaska Visitor Statistics Program Visitor Expenditure Survey.

advertising. All destinations and nearly all products accept and work with this two-part promotion process.

We can measure the response-oriented aspect of the SAMC National Geographic and Sunset advertising, realizing that eliciting responses was not the primary purpose of the ads. It should also be noted that each of these issues was replete with Alaska cruise and tour advertising as well, all offering vehicles for response.

The ads generated approximately 11,500 inquiries, 6,500 from National Geographic and 4,700 from Sunset (and 250 publication-unspecified written responses). While not as high as expected, the response rate is roughly proportional to that generated by the State AVAMC program in those publications. Alaska inquiries are down this year and have been for many publications for the last few years (see Chapter II Performance of AVAMC Program). This is especially the case for National Geographic. Alaska placed two insertions in Sunset last year; otherwise its totals would also be down. The cause of such performance has not yet been determined. Theories run the gamut of reaching an Alaska plateau of awareness to having plumbed the existing "pool" created by initial image/awareness advertising. In the latter case, new image enhancement advertising would have to be placed to create a new "pool" of interested Alaska prospects.

The economic impact of the 11,500 responses can be calculated to give an immediate benefit picture of the SAMC 1987 Consumer Advertising component. These 11,500 responses represent 25,300 potential visitors, assuming the 2.2 Independent Pleasure party size identified in the AVSP. These potential visitors will probably convert at a higher rate than the generic statewide program because of the specific nature of the SAMC advertising - they are qualified **independent** Alaska prospects rather than just qualified Alaska prospects. Some, however, would probably have visited Alaska regardless of the SAMC advertising/brochure. An estimated conversion rate, therefore, would be 10% for National Geographic respondents and 17% for Sunset respondents -- the actual AVAMC conversion rates for these publications in 1986 (see Chapter II). This would produce the following number of visitors, additional room nights and additional visitor dollars based on the 8.2 night average stay of the Independent Pleasure visitor in Southeast[1] and the assumed $85 per person per night expenditure quoted under section 1 above.

SAMC 1987 CONSUMER ADVERTISING
MEASURABLE RESULTS
(Estimated)

	Visitors	Room Nights	Visitor Dollars
National Geographic	1,300	10,700	$ 906,000
Sunset	1,600	13,100	$1,115,000
TOTAL	**2,900**	**23,800**	**$2,021,000**

This high rate of impact for relatively few visitors stems from the above average length of stay of Southeast Independent Visitors. While the average Southeast visitor spends 5.6 nights in the region, the average Independent Southeast visitor spends 8.2 nights there.

[1] Number of nights based on Alaska Visitor Statistics Program Visitor Opinion Survey special analysis.

It should be noted that this $2,021,000 does not include any eventual economic impact of the awareness-building aspect of these advertisements or any indirect economic impacts.

3. Public Relations

In 1987 SAMC spent $25,000 on retaining national and state public relations firms to prepare and implement a first-year awareness-building effort. California-based Ginny Rodin Public Relations and Sharon Gaiptman Public Relations of Juneau developed a press kit sent to over 100 travel trade publications and newspaper travel editors. They also released news and human interest stories in major U.S. markets and in Alaska.

The majority of public relations efforts are not immediately measurable in quantifiable terms. They are aimed at image enhancement and awareness-building which results in enlarging the pool of interested prospects who will at some point down the line respond to a direct response program and will then be quantified. This stage of the process is, however, critical as has been pointed out several times in this document. Without "prepping" -- the purpose of image/awareness building -- no other steps in the conversion process can occur.

Public relations efforts provide the greatest possible reach of your message for the smallest possible expense. Stories and editorial in newspapers and on radio and even in magazines and on television are often zero cost ways to spread the message. The key to obtaining the best possible reach with the right messages is retaining the right public relations people with the proper skills and contacts. The second key is funding your public relations people well enough to allow them to accomplish your goal and not hamstring their efforts. The third key is monitoring your public relations people so that they are held accountable for implementing your goals. This is especially critical since vacation planning has a regular timeline to it and pr efforts must be sensitive to this.

The 1987 SAMC Public Relations component seems to have targeted the most critical initial audiences for this first year -- government, the trade, regional media, and mass newspaper readership. The Information Presentation will be valuable for community support. The Press Kit is a good basic packet, although additional contents would be helpful. The newsletter UPDATE will keep the tourism community apprised of program events and results.

Approximately 400 inquiries have been generated by the Public Relations component as of May 5, 1987. Since generating inquiries is not the goal of a public relations program, these 400 inquiries should be considered a bonus. Conversions and visitor expenditures will come from these inquiries in approximately the same proportions as for the other SAMC program components.

4. Research

Research provides direction for future program elements, allocations and overall strategy. It can analyze existing information or collect new information to monitor program effectiveness or to refine target markets and media choices.

The 1987 SAMC Program invested $8,200 in research to evaluate the 1987 Program and make recommendations for future programs based on existing information. The results of this research are in this document. Another $5,000 has been appropriated for a special analysis of the Southeast independent visitor in terms of travel patterns, party

characteristics, opinions about their Alaska trip and their Southeast trip in particular, trip planning information and demographics. Some of this information has been used on a preliminary basis in this document.

In light of the timing situation, an estimated evaluation of the SAMC Program is a good, adequate alternative to an official Conversion Study which would reliably quantify the measurable results of the program. The Independent Visitor Analysis should be invaluable in providing direction for future campaigns. No other community or private firm has requested a similar analysis, insuring Southeast's gameplan will be at least one step ahead of any other body catering to this audience.

5. Analysis of Measurable Impacts of Major SAMC Programs

The following is a tabular analysis of important economic impacts of the two major SAMC 1987 investments, the participation in the AVAMC Cooperative Marketing Program to obtain names of their advertising respondents to whom to mail SAMC brochures and SAMC's own consumer advertising program in National Geographic and Sunset. Due to the very different investments that National Geographic and Sunset represent, they are analyzed separately for cost-effectiveness.

The reader should note that, in slashed (/) entries in the table, the number before the slash shows the "cost per" based on total component costs while the number after the slash shows the same "cost per" based only on advertising insertion and card printing expenses. The cost-effectiveness of the AVAMC Program is always calculated by the latter method, as shown in Chapter II.

The analysis demonstrates several significant features of the 1987 SAMC program:

- The total cost of implementing the AVAMC program participation was higher than either *National Geographic* or *Sunset* total costs due to the large volume of brochures and mailing costs, even though no direct advertising costs were incurred.

- The AVAMC program component scores much higher on total cost per inquiry than either of the SAMC advertising placements because of zero advertising costs in spite of high fulfillment costs.

- The AVAMC program component also runs away with the honors on cost per conversion, 5 times as efficient as *Sunset* and 8 times as efficient as *National Geographic*.

- *Sunset* does nearly as well as the AVAMC component on cost per room night and even slightly better on final return on investment due to the long stays estimated for SAMC advertising-inspired visitors vs. the shorter add-on stay estimated for AVAMC-induced visitors.

- National Geographic simply did not generate as well as either of the other two components in terms of any cost-efficiency measure.

Measurable return on investment for the 1987 SAMC Program is an estimated $14 for every dollar spent. The AVAMC program component is estimated to add $16 to the Southeast economy for every $1 spent. *Sunset* is also estimated to add $16 for every $1. *National Geographic* is estimated at $9 for every $1 spent.

This is not a high return on investment as compared to the AVAMC Program which traditionally gets ROIs of about 100 to 1 (see Chapter II) but it must be remembered that the objectives of the two programs in the past several years are significantly different. The objective of the AVAMC Program has been to generate responses rather than increase the pool of awareness *from which* to generate responses. And, in fact, the response rate of the AVAMC Program is suffering now from what some think is an exhaustion of the established pool of aware and interested respondents without a replenishment of the pool itself.

In any case, the SAMC Program has generated an estimated $14 for every dollar spent that would not have entered the Southeast economy had the program not been in existence. This translates to an estimated $3,786,000 in new monies for regional coffers in 1987 alone. Again, this does not include any indirect visitor expenditures or future visitor expenditures based on the eventual payoff of image/awareness building.

ANALYSIS OF MEASURABLE IMPACTS OF MAJOR SAMC PROGRAMS
(Estimated)

	AVAMC	SAMC Advertising Component	
	Component	Sunset	National Geographic
Ad Insertion/Cost	$12,000	$59,000	$88,000
Ad Production	-	6,000	7,000
Brochures	76,000	2,200	3,100
Mail Fulfillment	40,000	1,200	1,600
TOTAL COST	**$128,000**	**$68,400**	**$99,700**
# Inquiries/Names	172,000	4,700	6,500
# Visitors	12,100	1,600	1,300
# Room Nights	24,200	13,100	10,700
Visitor Dollars	**$2,060,000**	**$1,115,000**	**$906,000**
Cost per Inquiry	$0.74 / 0.07	$14.55 / 12.55	$15.34 / 13.54
Cost per Conversion	10.58 / 0.99	42.75 / 36.88	76.70 / 67.70
Cost per Room Night	5.29 / 0.50	5.22 / 4.50	9.32 / 8.22
Return on Investment	16.09 / 17.17	16.30 / 18.90	9.09 / 10.30

TOTAL MEASURABLE PROGRAM:	$4,081,000.00	Visitor Dollars Income
	295,100.00	Program Expenditures
	$3,786,000.00	Program ROI (total)
	$13.83	Program ROI (per dollar)

Chapter IV
RECOMMENDATIONS FOR FY 1988 AND FUTURE YEAR SAMC PROGRAMS

CHAPTER IV: RECOMMENDATIONS FOR FY 1988 AND FUTURE YEAR SAMC PROGRAMS

The evaluation of the FY 1987 Southeast Alaska Marketing Council Program and the review of the AVAMC Cooperative Marketing Program provides the consulting team with a selection of suggestions for increasing the effectiveness of future year SAMC programs. Given the budget considerations in the public sector, as well as in the private sector, a productive and efficient program is essential. Following are specific component recommendations developed by Data Decisions Group for further enhancing the effectiveness of this pioneering regional economic development program.

1. Participation in AVAMC Cooperative Marketing Program

The evaluation of the measurable benefits of the AVAMC participation show this SAMC program to be highly productive. Screening of the labels for independents makes the mailout efficient and minimizes the amount of competition for these names. Package inquirers are heavily solicited as are some specific categories of independents. But few if any other entities blanket the independent inquirers. This means that for those who do convert to visitors, SAMC has the only message or at least the most comprehensive and attractive one. Since most independents had not intended to visit Southeast, the AVAMC program is an excellent means to expand the pool of Southeast visitors by getting their message to the existing pool of potential Alaska visitors.

Participation in the AVAMC is estimated to produce as much in direct results as the consumer advertising program and yet costs significantly less. However, the comparison is not exactly valid since the primary purpose of the advertising is image, not immediate response and conversion. The AVAMC program also achieves the image objective to the prime market of qualified Alaska prospects. This market, though, has already been primed to Alaska and is in the response stage of the conversion process. They are, therefore, further ahead, at least in the decision to visit the "generic" Alaska. The total cost of AVAMC participation will fall next year because the basic brochure production costs are already borne by the FY 1987 program.

AVAMC participation should be continued and the purchase of all available qualified names/labels should be the policy. Research should be conducted to determine the most effective breadth of label criteria. It may be that independent visitor conversions occur just as easily among those who have just not checked interest in package tour on their BRC as for those who have not checked either package tour or cruiseship travel or just not cruiseship travel. See section 6. Research in this chapter for recommendations.

SAMC should also consider participation in another phase of the AVAMC Program for 1988. The **State's F/W/S campaign** this next year will be soliciting names of residents' friends and relatives to whom to mail F/W/S brochures and will also be mailing to the Lower 48 gift subscription list of Alaska magazine. SAMC may want to take advantage of both lists to serve as a second tier for SAMC direct mail, especially since 37% of all Summer Southeast Independent Pleasure Visitors came because of friends and relatives instate.

The purchase of major advertising space in the Official Vacation Planner is of debatable value. First, the cost of a full or even half page is quite high. Second, the competition among advertisers in the book may detract from the overall impact of a Southeast ad. Also, the region receives some editorial coverage and the incremental impact of a large ad is questionable. Some presence in the Planner is necessary for participation and this presence should be more than a directory listing of the magnitude of those of small operators.

2. Consumer Advertising

Appealing to the potential Alaska visitor through advertising is a rapidly changing science and art. Responses to one of the most effective programs in the country -- the AVAMC Program -- are declining alarmingly in spite of the best travel marketing expertise on the West Coast. The SAMC is entering the market when some tried and true Alaska advertising vehicles are not producing at historical levels.

Two major factors have been identified which contribute to the State's advertising response decline. One reason is the increasing volume of brand advertising for Alaska travel products in recent years. The tens of millions of dolla· spent, primarily by cruise and tour companies, dilutes the pool responding directly to t' ·te's ads because they are aimed at roughly the same group of people. In reaction t· the SAMC is cautioned to consider timing and placement carefully to avoid excessiv· ·ge and response dilution.

The second theory for declining responses is the strong emphasis in the last few years on maximizing BRC responses from the known pool of Alaska visitor prospects. The same message to the same people in the same publications over several years was an effective way to maximize responses (and therefore conversions) among a limited, known group of people. In hindsight, this strategy seems to have maximized responses but has not replenished the pool of potential visitors who responded and/or converted. Now the AVAMC must look to new prospects or else remain dependent on a dwindling supply of known prospects who have Alaska at the top of their destination priority ladder. They must consider creating another pool, similar to the pool they created in the first several years of the AVAMC Program.

The lesson for SAMC programs, especially at this stage of introducing a "new" product, is to **first build a pool** through image and awareness advertising. Then and **only then** after a significant pool has been established can SAMC concentrate on maximizing direct responses. In other words, the original SAMC priorities -- awareness and image first -- were in the correct order and should be for some time. This is not to say that some SAMC component(s) cannot have direct response as an objective -- it is only to say that image and awareness-building must be priorities. As the SAMC program matures, a **healthy combination of awareness-building and direct response must be maintained.**

Information for the following recommendations came from the evaluation of the AVAMC and SAMC advertising placements, conversion study data, a review of travel planning habits of Southeast Independent Visitors and the professional background of the evaluation team.

- **Timing**

The prime travel magazines are heavy with Alaska advertising from October through March. Dilution can be minimized, especially for image advertising, by placement at the **front end (September/October) and the tail end (March/April)** of this period. Interestingly, SE Independent Visitors have rather lengthy planning periods compared to other Independent Visitors (average: 8.1 months from Alaska season/year decision, 3.7 months for trip planning). These lead times also tend to support beginning and end of planning period ad placements.

- **Advertising Placement**

Sunset and *Alaska* Magazine are considered excellent Alaska buys in general as they are by far the leaders in actual conversion to visitors, 17% for ***Sunset*** and a record 24% for ***Alaska*** Magazine. They are especially good for the Independent market because of the nature of their editorial content. *Sunset* is packed with do-it-yourself material for the middle to high-end Westerner. It also contains a plethora of mail order ads, another characteristic of readers who like to do it on their own.

Alaska is likewise full of special topic information for the independent planner. Further, *Alaska* has recently recruited a large number of new subscribers in regions which are good generators of independent Alaska travelers (The West and the Northern Tier Snowbelt). Placement in *Alaska* would mean excellent and economical exposure to new Alaska enthusiasts who are presumably new entries into the potential visitor pool. *Sunset*, given judicious timing of placement, should provide a good image base as well as generate quality inquiries for conversion.

National Geographic, though prestigious, may be perhaps too broad a vehicle for the target prospect market. The combination of very high cost for a very limited advertising budget coupled with low response and conversion even at the State level are factors which prevent recommending repeating in this publication. Long a staple of the DOT program and the package tour industry, its effectiveness may be on the decline at least for response generation purposes.

Though this report does not propose a media plan, there are some obvious publications worthy of consideration. In addition to *Sunset* and *Alaska* , the ***Milepost*** guidebook is another clear choice. Many more visitors than just highway travelers use this publication. Twenty-two percent of Southeast Independents in Summer 1985 used the *Milepost* as a source of trip planning information before leaving home. This is nearly double the percentage who said they used the State's Vacation Planner. Also, a surprising 28% of Southeast Independents were highway entries and 20% exited by highway. A publication such as the *Milepost* aimed directly at them puts the SAMC message on target.

Vertical interest publications are another cost-efficient vehicle for building awareness and generating recruits. Independents, not package visitors, are **sportfishing** participants. Thirty-six percent (36%) of Southeast Independents participate. Even higher percentages participate to some extent in **other outdoor activities**--hiking and wildlife and bird watching. Except for individual businesses, sportfishing is not heavily marketed either by the State or major tour companies. Yet a major element in the Alaska mystique is sportfishing. Were SAMC to position the region as the place for Alaska sportfishing at reasonable cost, an appeal to this vertical market may be effective.

National awareness coverage should be considered by SAMC under certain conditions. Media selected must provide a vertical interest group relevant to Alaska, cost of national coverage must be considered and impacts of ad sizes evaluated.

The highway entry and exit numbers also show that many Southeast Independents are in personal vehicles -- often RVs or campers. Placement in RV industry magazines could be productive for SAMC. In terms of response volume, the State has generated exceptionally heavy responses from occasional insertions in *Motorland.*

Finally, an asset of the region is the ferry system which is utilized by a majority of Southeast Independents. This use is in spite of virtually nonexistent marketing, a poor reservation system and service problems. Cruising the Inside Passage has almost universal appeal for packaged and independents alike. One way to take advantage of this asset but avoid dilution from package tours is the sell concept of the Inside Passage cruise ferry-style. Joint advertising efforts with the ferry system could generate more image and response mileage for both SAMC and the ferry system. The possibility of cooperative marketing also exists with the vehicle carrying cruiseship Stardancer provided Admiral Cruises would be willing to sell partial cruises so visitors could take their vehicles off the ship at locations other than the ends of the line.

- Advertising Copy

The advertisement in *Sunset* and *National Geographic* had several strong points for accomplishing its primary purposes of image and awareness. The subject matter was excellent. Glaciers/Scenic Beauty are invariably at the top of list in visitor studies of what people want to see in Alaska and in subject matter which they associate with the Alaska travel destination. Showing that Southeast has these attractions in spectacular fashion is a strong message. Showing people and activities lend emotion and fun to the image. An earlier State of Alaska study[1] established that people and activities had high motivational appeal in ads. The overall feeling of the ad was warm (both climatic and emotional) and inviting. The BRCs were convenient and readable. The up front position in *National Geographic* was excellent. The *Sunset* position was not as good but still fine. However, placement in an issue with fewer other BRCs would be preferable.

Suggestions for improving the ad's effectiveness include the following. The appearance of specific mode type equipment (helicopter) may cause some misinterpretation of the ad's sponsor. In any case the ad should show the sponsor (SAMC) prominently and in an official-appearing way. This will establish additional credibility with the result being to encourage the requesting of information plus establish the ad clearly as a destination ad. Southeast Alaska needs to become apparent immediately and it is not really noticeable until the reader is into the copy at the bottom right of the page.

The Seattle address detracts from the Alaska mystique. This is permissible for magazine subscriptions or cruise brochures but not for destination advertising. The Seattle address also adds to existing confusion over sponsor. A postage paid BRC would increase response provided the SAMC felt the additional postage dollars are worth the investment. The word "FREE" needs to be larger and more striking and needs to clearly designate specifically what it is that is free.

[1] Image/Season Expansion Advertising Focus Group Research, 1980.

If the sponsor, destination and what is free is clearly established, the confusion from the presence of the equipment is minimized. These improvements should increase the response production of the ad as well as its image and awareness appeal for Southeast as a destination.

3. Collateral

The collateral piece used for all fulfillment and for the AVAMC mail-out is an extremely attractive 16-page color piece. In our opinion it **achieves its primary purpose and has outstanding image impact.** Further, the reproduction quality of most photos is high. Photo selection is superb -- both in color and topic choice and variety. In short, the collateral piece is one of the highest quality seen in the promotion of Alaska tourism.

Suggestions for improvement center primarily around mechanics and content. We suggest the brochure be made to appear **more "official"** than it does. An extensive focus group research project for the Alaska Travel Planner found that, without the official aura, recipients tended to view it as a commercial mailing and not take it to heart as a destination promotional piece. Thus, "official" means the recipient will give it more credibility and correctly interpret the purpose of the piece. The **postcard** is somewhat incongruous but not particularly distracting. We suggest the **opening inside photo** be more spectacular than mood setting. The contents might also include a listing of the region's **top attractions,** since some of them may have more existing market presence than the region as a whole.

The white background for the **bingo card/postcard back** is the one detraction from the highly appealing mood of the piece. A toned background would make it more compatible. The content of the bingo card is informative and varied insuring wide distribution of benefits among communities and participants.

A consideration for the future may be inclusion of a **Southeast Travel Planning brochure** in the fulfillment package. The brochure would be similar in purpose to the SATC Travel Planner and would provide specific tools for trip planning. The most effective effort would be to coordinate this piece with the SATC effort as much as possible. Such a brochure might only be included in fulfillments of prospects who say they'll be coming in the next year or two, rather than a blanketing of all inquirers, some of whom will not be at the planning stage yet.

4. Mail Fulfillment

The only suggestion here is to listen to what those who have been dealing with your list management/fulfillment house for years have to say about Media Services' record on responsiveness and efficiency.

5. Public Relations

As discussed in Chapter III, there are three keys to a successful public relations effort. First, retain the right people with the proper skills and contacts. Second, fund them well enough to allow them to accomplish your goal and not hamstring their efforts. Third,

monitor them so they are held accountable for implementing your goals on the timeline needed for effective message communication.

The long distance relationship of SAMC's two public relations firms cannot help but be subject to occasional communications problems regardless of who the two firms are. It is, however, important to have both an Alaskan and Lower 48 presence. The 1988 effort, also, will not be hampered by the time constraints of 1987 which should also be avoided if at all possible in the future. Press kits should be distributed by end-October or to coincide with consumer advertising insertions, which means **planning must begin during the summer months of 1987.**

New stories for the press kits might be generated by travel writers invited to Southeast this summer as part of the first official Southeast **travel writer familiarization trip(s).** This is encouraged, especially since private member firms can be asked to provide air, lodging and hospitality for these influential people.

Another way to accomplish the goal of good public relations efforts -- providing the greatest possible reach of your message for the smallest possible expense -- is to take advantage of special newspaper travel sections where placing at least a small ad guarantees editorial space. This PR method is probably not particularly cost-effective if the ad package does not include editorial space.

The instate regional awareness element is a positive feature of the PR program. It contributes to an informed and supportive constituency.

All the above enhancements require additional dollars which SAMC has already budgeted for this component in 1988.

6. Research

The Number One priority for the SAMC research budget should be an annual **Conversion Study** to quantify the measurable results of the program. Conversion studies can serve a number of purposes, especially in the case of SAMC. They can identify the conversion rates among various target audience lists, the costs per inquiry and conversion for each and the actual return on investment for every dollar of advertising or program cost. These studies can also profile the converted visitor in terms of their demographics, their travel habits both outside and inside Alaska, their lifestyles and their trip planning steps.

Perhaps of even greater importance is the ability of an SAMC Conversion Study to **identify the broadest but most effective BRC criteria.** The study will cross-check what prospects say they are interested in on their BRC (travel mode, accommodations, activities, time of travel) against what they actually did as visitors. This will enable precise pinpointing of the criteria guaranteed to predict conversion. SAMC will not spend dollars blanketing a population not given to conversion to Alaska visitorship and will instead be able to concentrate their investment on nearly-sure bets. This, of course, will reflect only conversion likelihood that year and will not predict the effects of image/awareness building, so that program will need to be considered separately. The Conversion Study, however, will be able to tell SAMC whether the literature has made an impact on inquirers in terms of image/awareness building.

Other research to consider in 1988 and beyond includes **talking with Southeast visitors** in person or by telephone to determine what prompted them to visit Southeast in particular as well as how they first became aware of Southeast as a vacation destination. This would provide key input for advertising message content and placement.

Another project which would provide strategic planning information on the most effective ways to build awareness among prospective travelers would be a series of **focus groups with prospective travelers.** These groups would be held in major West Coast communities with people of the demographic and travel backgrounds shown to be typical of the Southeast visitor through the special AVSP analysis. Topics would include level of awareness of Southeast as a specific destination, image associations with Southeast, ways to encourage image enhancement among frequent travelers, identification of persuasive advertising copy and more. Two wonderful aspects of focus groups are the ability to show and hear tangible objects like ad boards or radio tapes and the ability for clients to sit behind a one-way mirror and view the entire proceedings. Clients can also have direct input into discussions through notes sent in to the moderator.

SIXTH
HIGH SPEED SURFACE CRAFT CONFERENCE & EXHIBITION

High-Speed Surface Craft

14-15 January 1988
Heathrow Penta, London

PROVISIONAL PROGRAMME

Organisers of the Sixth High Speed Surface Craft International Conference are pleased to announce the provisional programme of contributions for this unique forum devoted to discussion of latest developments in fast ferries and other rapid marine transport. The conference is designed to cover operations in a highly competitive market, as well as key topics in the design and building of new craft, with particular emphasis on assessing construction materials.

DAY 1

Operator's viewpoint: Red and White, USA, and Thames Line, UK
Construction and operation of a high speed passenger ferry: Stolkraft International, Australia
High performance propulsion: Servo Gear, Norway
Influence of shaft inclination on relative merits of propellers and water jets: A G Blyth, Naval Architect, UK
Design, development and testing of SES Jet Rider: Karlskronavarvet, Sweden, and SSPA Maritime Consulting, Sweden
Evaluation of a ride control system for SES: University College, London.

DAY 2

Role for composites in future marine transportation: Marchant Filer, UK
Fatigue properties of advanced laminated composites: Lloyds Register of Shipping, UK
High performance composites in sandwich panels: University of Southampton, UK
Advance material for high speed craft: Cougar Holdings, UK
Powering characteristics of hydrofoil craft: Maritime Research Institute, Netherlands
Case Studies in high speed surface craft: International Catamarans, Australia, and Marinteknik, Hong Kong.

DISPLAY SPACE

Companies are invited to take advantage of the exhibition area at the conference as an excellent opportunity to display equipment and services available to this rapidly expanding market. Such is the demand for the limited space available, that early bookings are advised.

CONFERENCE PAPERS

Following the conference a special bound volume will be published to include the papers presented plus others accepted but not read. Delegates will receive this volume as part of their registration.

To: Hawkedon International Conferences
Hawkedon House, 44 West Street,
Chipping Norton, Oxon, OX7 5ER, UK

JANE'S TRANSPORT PRESS

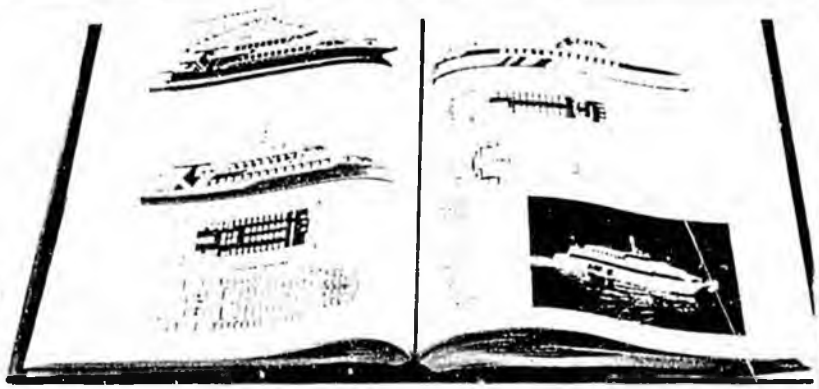
THE 1987 EDITION OF JANE'S HIGH-SPEED MARINE CRAFT AND AIR CUSHION VEHICLES IS NOW AVAILABLE.

ABSOLUTELY ESSENTIAL READING

This latest edition of Jane's High-Speed Marine Craft and Air Cushion Vehicles (formerly Jane's Surface Skimmers) containing 506 pages is more than 20% larger than the 1986 edition, which is a reflection of both the growth and speed of change within the high-speed marine industries.

Comprehensive sections on operator information giving full details of craft, contact names and addresses are a key feature of the work. However, the description of types both in service and in production occupies over 60% of the book.

Significant new developments in high-speed craft, particularly in the field of SES, Catamaran and monohull vessels, are covered. Jane's High-Speed Marine Craft and Air Cushion Vehicles continues to provide industry with the only up-to-date reference source available.



LIST OF CONTENTS

Builders and Designers
Operators
Principal Engineering Components
Services
Extensive Bibliography
Fully indexed

PRIORITY ORDER FORM OVERLEAF

THE ONLY COMPLETE LISTING IN EXISTENCE OF OPERATORS OF HIGH-SPEED CRAFT AND THEIR FLEETS.

OVER 400 NEW ILLUSTRATIONS, PHOTOGRAPHS AND DRAWINGS.

EXTENSIVELY REVISED, GREATLY INCREASED CONTENT, 506 PAGES.

NEW QUICK REFERENCE SECTION ON ENGINE APPLICATIONS.

COMPREHENSIVE INDEX NOW INCLUDING CRAFT NAMES INDEX.

SYMPOSIUM ON SMALL FAST WARSHIPS AND SECURITY VESSELS

The issue of this copy of the paper to be read at the above Symposium to be held at the Cunard International Hotel, Hammersmith, London W6 8DR from May 18-21, 1982 inclusive is on the express understanding that an abstract only may be published after May 21, 1982.

The Institution is not, as a body, responsible for the opinions expressed by individual authors or speakers.

United States Coast Guard Operational Evaluation of the Bell-Halter 110 Foot Surface Effect Ship

by Lieutenant Commander Kurt G. Zimmerman*

SUMMARY. After more than a year as a demonstrator crew boat, the Bell-Halter 110 Foot Surface Effect Ship (BH-110) was sold to the US Navy Surface Effect Ship Project Office (PMS-304) in October 1980. The Coast Guard provided supplemental funding to have certain modifications incorporated into the craft to convert it from a crew boat to a patrol boat. Following modification, the BH-110 SES was delivered to the Navy in May 1981 and subsequently transferred to the Coast Guard. The vessel was painted in Coast Guard colours and on 18 June 1981 it was placed into commissioned service for an operational evaluation of six months duration.

The vessel operated both singly and in conjunction with other vessels and aircraft in a variety of Coast Guard mission areas. Armed with 0·50 calibre machine guns, it was used to enforce both fishing and drug laws. Other mission operations included search and rescue, pollution control and enforcement, the servicing of aids-of-navigation, and military preparedness.

The conventional diesel power, the ship type handling characteristics, and the speed and seaworthiness of the craft all implied a potentially desirable craft. Although some specific vessel problems were identified as a result of the evaluation, the concept proved valuable in conducting US Coast Guard missions.

1. INTRODUCTION

The United States Coast Guard (USCG), an agency of the Department of Transportation, is responsible for enforcing government policies and providing humanitarian services on and near the territorial and contiguous zone waters of the United States. Although quite independent of the US Navy which is under the Department of Defense, the two agencies often work in close cooperation.

The United States Coast Guard utilises marine vehicles, ships and boats, to conduct its many missions. Although varied, the missions can be simplistically portrayed as a four sided figure. Side one is the enforcement of laws and treaties. This implements the Coast Guard's role as the government's marine police force. These missions include enforcing fishing rules and regulations, enforcing drug smuggling laws and the prevention of illegal alien immigration. Side two represents the humanitarian aspect of the service. These missions include searching for and rescuing people lost at sea from small boats, yachts, merchant ships, and aircraft. Towing disabled craft, and providing fire fighting and dewatering assistance to ships in need also fall within this category. The Coast Guard also places and repairs some 44,000 navigational buoys and other aids to navigation. The third side of the Coast Guard endeavours to protect natural resources. This field includes monitoring, containing, and assisting in cleaning up oil and hazardous substance spills. Oceanographic research and water quality monitoring are also included among the missions in this area. The fourth side of Coast Guard missions is military readiness. In time of war, the US Coast Guard joins the US Navy and carries out military operations.

It is against this background of Coast Guard multiple mission requirements that potential replacement vessels are tested. Vessels are sought which are capable of executing these multimission aspects. To that end, the Bell Halter Surface Effect Ship (SES) was evaluated.

2. VESSEL DESCRIPTION

The vessel ultimately used in the operational evaluation was constructed in 1978 by Bell Halter of New Orleans, Louisiana, as a demonstrator craft. Their purpose was to prove the concept that a surface effect ship could be built and operated effectively in the competitive arena of offshore oil field operations in the Gulf of Mexico. The technical characteristics of the demonstrator craft are shown in Table I.

TABLE I. Physical Characteristics of the Bell Halter 110 Foot SES Demonstration Craft

DIMENSIONS		
Length	110 ft	33·5 m
Beam	39 ft	11·9 m
Height (on cushion)	28 ft	8·5 m
Draught (on cushion)	4·6 ft	1·4 m
Height (off cushion)	22·6 ft	6·9 m
Draught (off cushion—normal)	7·7 ft	2·3 m
Draught (off cushion—maximum)	8·2 ft	2·5 m

MACHINERY

Propulsion — Two 16v-149TI Detroit D l Marine Engines
— Two 42 × 50·86 Gawn-Burrill subcavitating fixed pitch propellers

Lift System — Two 8v-92TI Detroit Diesel Marine Engines
— Two Double Inlet 42 inch diameter centrifugal fans

Generators — One 3-71 General Motors Diesel Generator (55 kw)
— One KATO KAMAG 14 generator driven from lift engine (40 kw)

PERFORMANCE

Maximum Cruise Speed	SS0	SS3
On Cushion	34 kts	28 kts
Off Cushion	19 kts	15 kts

Range at maximum speed — Sea State 3 — 500 n.m.

After launching, the craft was employed by Bell Halter in a series of demonstrations to the offshore petroleum industry, ferry boat operators, military organizations and representatives of foreign countries. The craft, a 110 foot (33·5 m) surface effect ship, alternatively called a rigid side wall hovercraft, was constructed of welded marine aluminium. It uses conventional diesel machinery and submerged marine propellers and rudders for high reliability and low fuel consumption. The vessel has a catamaran style hull form, with flexible skirts at the bow and stern to contain the air cushion (Fig. 1). The hull form is such that when off cushion, the waterline is well below the between hull cross structure, (see Fig. 2). Air is supplied to the cushion at three points along the hull from diesel driven lift fans supplying pressure at about 1·0 psi (703 kg/m^2). The bow seal system consists of eight finger-type segments. The stern seal is an arrangement of three horizontal tubular bags extending athwartships across the stern opening between the side hulls. Both sets of seals are supplied from the UK by Avon.

In the winter of 1979-1980 the vessel was used by Exxon in support of offshore oil rigs in the Gulf of Mexico. During this time it serviced rigs from 60 to 145 nautical miles from its home port in Louisiana, often carrying cargo up to 20,000 pounds.

3. INITIAL EVALUATION AND SUBSEQUENT MODIFICATIONS

Knowledge of the craft and its potential for service use generated interest in USCG circles and other governmental agencies. Although the US Navy was pursuing a large, high speed surface effect ship concept, the Bell Halter craft, with its diesel propulsion, seemed particularly suitable to Coast Guard needs.

In March 1980, a month long technical evaluation was conducted off Norfolk, Virginia, by the US Navy under the sponsorship of the US Coast Guard and the US Urban Mass

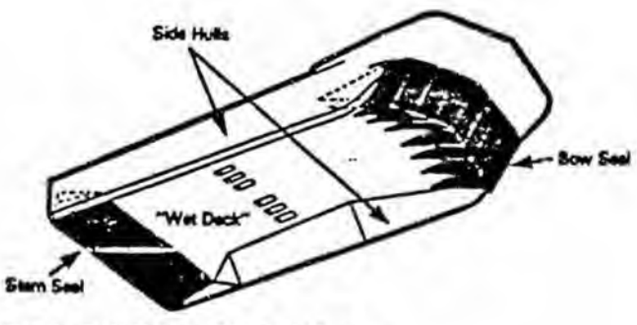

Fig. 1. Bell Halter SES Hull Form

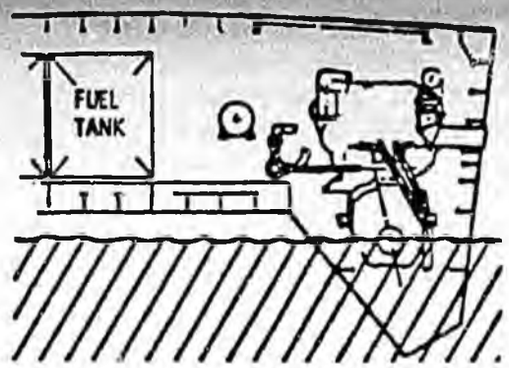

Fig. 2. Buoyant Sidehull Form

Transportation Administration. This test investigated technical performance of the craft and made direct comparisons to a Coast Guard 82 foot (25 m) patrol boat. It concluded 'the Bell Halter 110 foot SES is an effective and able marine vehicle that warrants consideration for varied future military and civilian applications'[1].

After the technical trials, the vessel was modified to satisfy the IMCO (International Governmental Maritime Consultative Organization) Resolution A. 373(x), Code of Safety for Dynamically Supported Craft. This was necessary before the craft was put into service for PEMEX in the Mexican oil industry in the Bay of Campeche.

In October, 1980, the US Navy Surface Effect Ship Project Office, with financial participation from the US Coast Guard Office of Research and Development, purchased the demonstrator vessel from Bell Halter. Under the terms of the procurement, certain modifications were to be made to the craft before delivery for a six month evaluation by the Coast Guard. At the completion of the USCG evaluation, the vessel would be lengthened by installation of a 50 foot (15·2 m) hull extension amidships. The US Navy would then take over the craft and test it in the new length-to-beam ratio configuration.

TABLE II. BH-110 SES Contract Modifications for Conversion to Cutter Use

1. Berthing for 14.
2. Additional heads and showers.
3. Install office space.
4. Add 400 gallon per day desalinator.
5. Add Food Stowage—freezer, refrigerator, dry food storeroom.
6. Add ice machine, mess deck tables.
7. Add supplemental fuel and water tanks.
8. Add ammunition stowage.
9. Provide Rigid Hull Inflatable ship's boat with hoist.
10. Install additional engineroom instrumentation.
11. Add towing bitt.
12. Add dedicated fire pump.
13. Add machine gun foundations and mounts.
14. Add anchors and anchor winch.
15. Paint boat to USCG standard colours.
16. Install transformer to allow connection to shore source of electrical power.
17. Install washing machine and clothes dryer.

These modifications to the craft before evaluation were made to change the configuration from a civilian passenger carrying crew boat to a craft capable of functioning as a Coast Guard patrol boat. The modifications are summarised in Table II.

In addition to these modifications, supplemental modifications were made in order to make the craft capable of conducting operations with other USCG vessels. These additional modi-

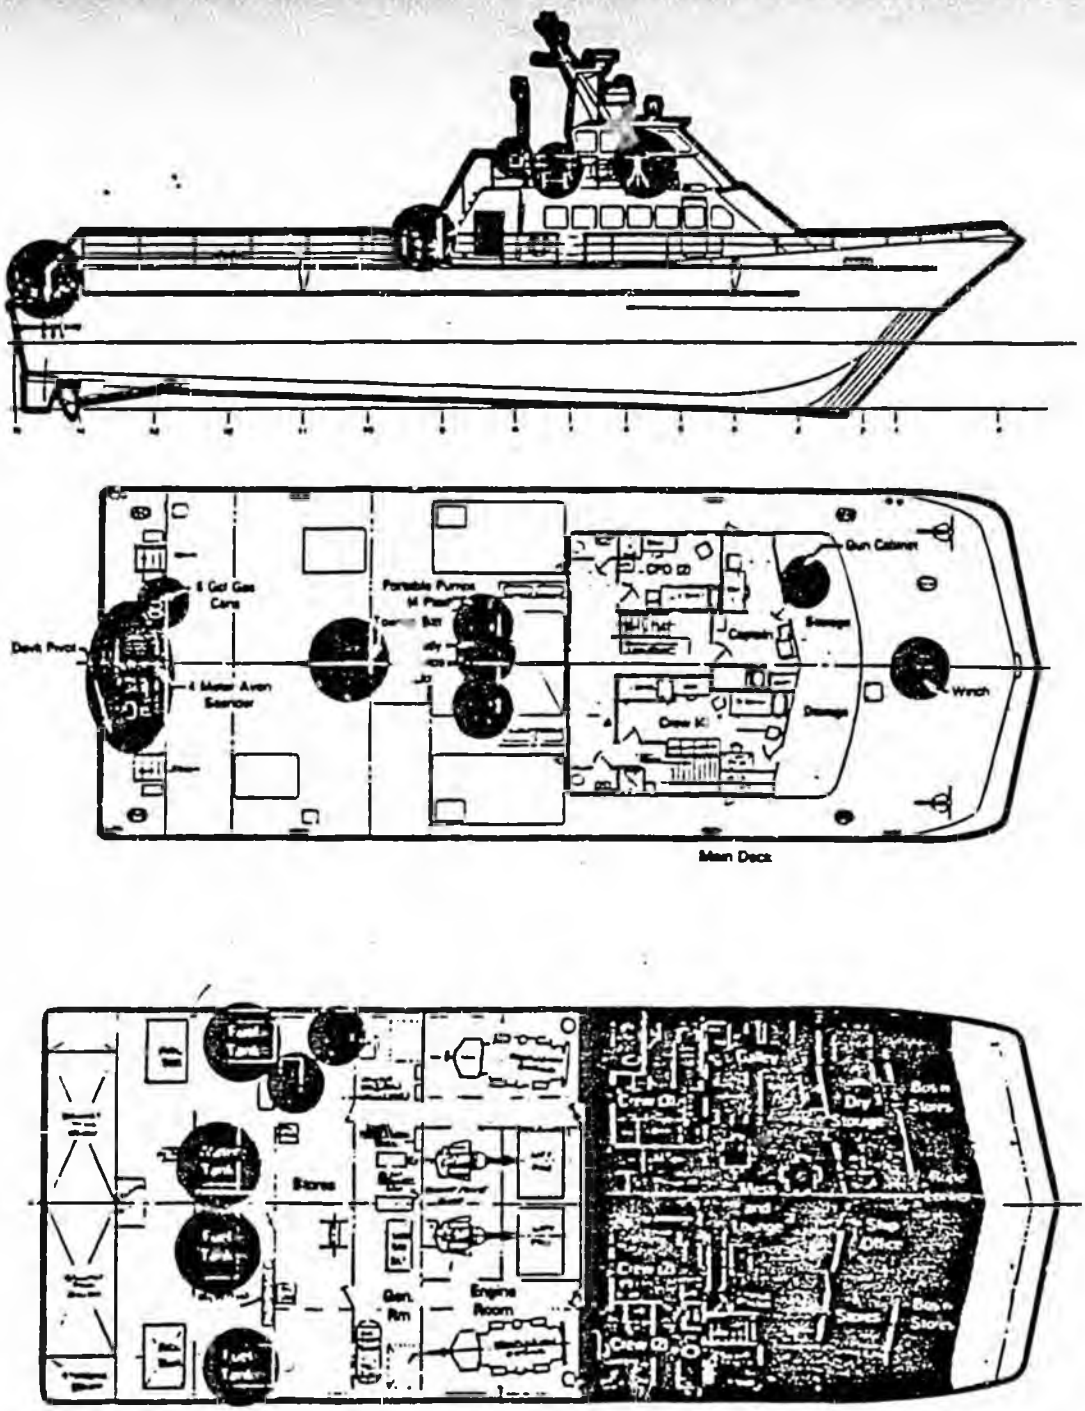

Fig. 3. USCGC DORADO Arrangements: Modifications shown highlighted

fications are shown in Table III. Fig. 3 shows the deck plan arrangements of the vessel as it was when placed into Coast Guard service.

The vessel was formally turned over to the US Coast Guard from the US Navy on June 12, 1981, and placed in commission on June 18, 1981, as the US Coast Guard Cutter DORADO (WSES-1). The crew personnel for CGC DORADO were taken directly from the USCGC POINT SPENCER, an 82 foot (25 m) patrol boat based in New Orleans.

The spirit of USN/USCG cooperation was continued with the assignment of two US Navy personnel to the crew for the duration of the Coast Guard trials. A US Navy senior petty officer was assigned as chief engineer, and the first assistant engineer was also a Navy petty officer. The crew personnel varied somewhat during the six months, depending on what

TABLE III. CG Installed Modifications to BH-110 SES

1. Provide secure weapons stowage.
2. Install telephone and interior communication circuits.
3. Install gyrocompass and gyro repeater units.
4. Install foundations for gasoline cans and portable pumps.
5. Install racks for firefighting foam.
6. Install electronics equipment.

missions were planned, but the typical composition of the eleven man crew is shown in Table IV. Special ratings were assigned when required to supplement operations of limited duration.

After commissioning, the DORADO was loaded with CG mission related equipment borrowed from POINT SPENCER,

TABLE IV. Typical Crew for USCGC DC)O (WSES-1)

VACANT BERTHS — Three — Temporary duty personnel as required.

and fully outfitted as a cutter. The loaded DORADO characteristics are shown in Table V. Performance of this configuration, as predicted by Bell Halter and as actually experienced, is shown in Fig. 4.

On June 20, 1981, the USCGC DORADO (WSES-1) departed on patrol and began the six month evaluation. During the evaluation, she participated in numerous missions demonstrating the usefulness of this craft concept for Coast Guard duties in the Gulf of Mexico.

On December 15, 1981, USCGC DORADO was decommissioned, Coast Guard peculiar equipment was removed, and the vessel was returned to US Navy custody. The craft is presently in New Orleans undergoing major structural modifications.

4. OPERATIONAL EVALUATION

The USCGC DORADO was in commissioned service for 181 days. The craft was underway 84 days; in a ready-for-sea standby status 47 days; and in a maintenance status 50 days during the trial period.

Maintenance requirements generally were similar or slightly less trouble than other Coast Guard cutters. The unpainted

(*Speed limit to prevent damage to stern seal when water is not blown out by lift fan).

interior of the aluminium hull proved quite easy to maintain. Two major repair efforts were required however.

On September 10, 1981, the DORADO experienced an engine room fire. There were no serious injuries, but the incident necessitated a return to New Orleans for two weeks to repair the fire damage. The fire was caused by a cracked lubricating oil line on the reduction gear which failed through fatigue due to vibrations. The installed fixed flooding carbon dioxide fire extinguishing system in the engine room successfully extinguished the fire.

The other major repair effort was the replacement of all eight bow seal fingers. On August 28, it was discovered that a number of bow finger seals had ripped causing the cushion pressure to be vented through the bow. This necessitated a return to port for repairs. Investigation revealed that two seals had failed. They had been created along the vertical centre axis for shipment prior to initial delivery. It was along this crease that two of the eight seals had failed, ripping nearly the entire length. Failure of two of the seals was sufficient to vent the cushion severely enough to prevent normal operation. The seals had between 350 and 400 hours of operation on them when failure occurred. As a preventative maintenance measure, all eight seals were replaced, since all had been received at the same time.

Replacement of the bow seal was surprisingly quick and easy. Four personnel from the ship's crew replaced all eight seals in two days (24 hours effort) while DORADO remained in the water at pier side. The last seal took only one hour to remove and replace. The replacement cost for new bow finger seals was quoted as $5300 each.

Although not confirmed by this trial, the cted life of the seals is estimated to be between 1500 to 2000 hours of operation. This figure is based on US Navy operating experience with test air cushion vehicles (Jeff A and B) and surface effect ships (100A and 100B).

During the Operational Evaluation, CGC DORADO was assigned to various commands along the Gulf of Mexico, and employed in different missions. Fig. 5 shows areas of operation. In June and early July the vessel was operated out of Galveston, Texas in fisheries law enforcement duties. This included boarding vessels for inspection of catch and cargo as well as identification of vessels.

In mid-July, the craft was based at Corpus Christi, Texas, and employed in search and rescue duties and law enforcement patrols. The particular emphasis was on prevention of drug smuggling.

In August CGC DORADO conducted missions servicing aids-to-navigation while based out of New Orleans. This included minor repairs to buoys as well as fixed aids-to-navigation and transporting equipment. Late in August, the vessel was one of many employed in a pollution control drill in and around the Louisiana Offshore Oil Port, working in conjunction with the US Coast Guard Gulf Strike Team hazardous substance spill control specialists.

Much of the operational evaluation was spent on multi-unit law enforcement patrols, in the southern portion of the Gulf of Mexico. These patrols involved coordinated operations with other Coast Guard units working to prevent the smuggling of drugs. These operations were from 7 to 10 days in duration usually requiring continuous operation at sea. Resupply, including fuel, was from larger Coast Guard units. The seaworthiness characteristics of DORADO provided very habitable conditions for the crew. They were well rested and remained alert. This is in sharp contrast to the case on normal patrol boat sized craft, where the crew is usually exhausted from merely operating the craft in rough seas. During one extended patrol of this type, the seas were running up to 16 feet, and the DORADO, by drifting, was able to experience less than 18 degree rolls.

During the operational evaluation, methods of operation were developed to maximise the DORADO's unique capabilities, while bypassing its negative features. Due to the broad beam and wide set screws, manoeuvrability was very good. Such a good degree of control was afforded by this and the one set of controls looking aft that the crew often boarded vessels directly from DORADO without resorting to the small boat carried aboard.

In order to conserve fuel vessel would frequently sprint to a picket position then shut down and drift. While maintaining a radar guard, DORADO could take advantage of the improved seakeeping to rest the crew and still be ready to respond to an interception when required.

During the six month period, CGC DORADO proved to be a vehicle capable of performing Coast Guard duties in law enforcement, including fisheries patrol as well as coastal smuggling prevention and as a choke point patrol vessel. As a search and rescue craft, it responded to calls for assistance, conducted searches, salvage and firefighting duties as well as performed towing of disabled craft. Multi-ship and aircraft operations, medical evacuations, and cargo carrying capability were also satisfactorily performed.

The large deck aft and relatively high speed and resistance to roll made vertical lift operations with helicopters particularly easy. While not suitably sized nor strengthened to land or refuel a helicopter, the aforementioned characteristics afforded helicopter pilots significantly more control and margin for error than conventional slower speed vessels. On one occasion a medical patient was evacuated from a conventional Coast Guard cutter and transported quickly to within range of land based helicopters. The personnel transfer was accomplished successfully and resulted in the patient reaching medical facilities 6 to 8 hours sooner than would have been possible with conventional vessels.

Speed was one of the obvious advantages of CGC DORADO. The craft was able to transit in excess of 30 knots in low sea states in spite of the operating displacement of 147 long tons (149 metric tonnes) which was well in excess of the designed displacement of 125 long tons (127 metric tonnes). This advantage continued even with speeds of 28 knots in seas up to eight feet. During one patrol CGC DORADO encountered 12 to 14 foot (3·6 to 4·3 m) seas, and swells to 18 feet (5·5 m). The crew was able to make good 16 knots into the seas, and 25 knots when running with the seas. This range of relatively constant high speeds with increasing sea states was found to be a particularly desirable feature. Once DORADO, responding to a call for assistance, beat a helicopter to the scene of a burning yacht. Slow speed operations, however, use considerable fuel, hence normal operations were usually conducted at or near full speed. Fig. 6 shows fuel consumption plotted against speed. The transit speed of around 30 knots had positive effect on crew morale as well. When on patrol in the Yucatan region, CGC DORADO could be ordered home, and within 19 hours grant liberty. Conventional cutters would take two days or more to cover the same distances. The high level vibrations and rapid speed of advance made conventional navigation methods near obsolete however. Automatic position plotters, using

o indicates USCG Bases from which CGC DORADO operated June-December 1981

Fig. 5. USCGC DORADO
Areas of Operation

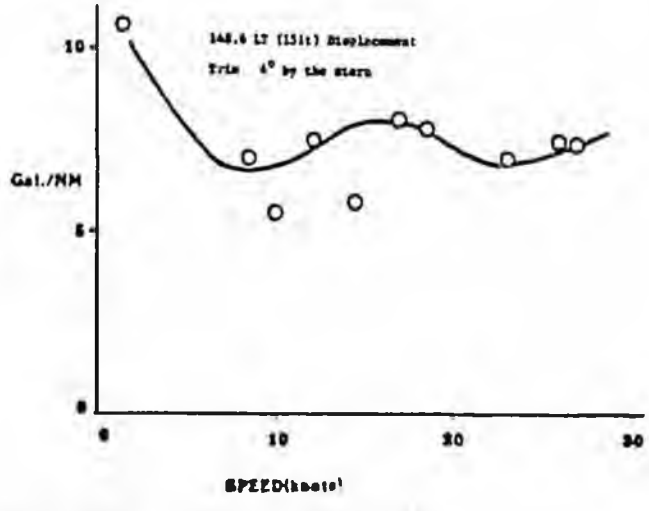

Fig. 6. Fuel Consumption versus Speed
Measured 2-3 December 1981

Loran-C, were utilised, and stabilised binoculars for bridge lookouts were a necessity.

Ship speed was found to be very sensitive to trim adjustment. At or near full load displacement, CGC DORADO was very sensitive to the position of its longitudinal centre of gravity. The crew had to become much more aware of trim than on a conventional ship, because improper trim would often prevent achievement of hump speed. Operations were then limited to between 18 to 22 knots until trim conditions were corrected.

The range for DORADO was about 1000 miles at a full speed of 30 knots. However, as sea state increased, fuel consumption remained almost constant at 160 gallons per hour according to the crew while transit speed decreased accordingly. Even with two ruptured bow seal fingers however, fuel consumption at full throttle was about the same rate of 160 gallons per hour while speed was only reduced to 18 knots.

The seaworthiness and habitability of CGC DORADO proved to be two particularly desirable features. With the broad beam, crew living conditions aboard compared more to shore side barracks than they did to shipboard conditions. Ship motions, particularly heaving and lurching, were rough during full speed operations and often prevented normal activities. However, due to the seaworthiness of the hull, either a course alteration, or a complete stop, would moderate motions to such a significant degree that activities approaching inport routine could be conducted. One method of operation that developed was to stop and drift once the operating area had been reached. This technique provided an extremely well rested and alert crew for when action was required, as well as a method to conserve fuel. This is in contrast to conventional vessels which would, of necessity, be steaming at slow speeds in their patrol areas.

Noise and vibration were two negative factors determined during the trial. The main engines were hard mounted to the aluminium hull structure, and as a result, transmitted engine noise throughout. The craft, being a prototype, has some insufficient propeller tip clearance induced vibrations. The propellers were turned down from 42 inch (1·06 m) to 40 inch (1·02 m) diameter before delivery to US Navy/US Coast Guard in a partially successful attempt to alleviate this source of vibration. The inherent pneumatic spring effect of the air cushion also contributed to the unusual motions. While the motions often seemed extreme to visitors, the fact remains the crew lived and functioned very well for the six month evaluation period.

The vibrations did contribute to numerous piping failures and hull cracks. These failures illustrate the need for care in designing aluminium craft. Flexible connections and more numerous pipe system supports would have reduced the occurrence of these failures. Strengthening of hull plating in discovered weak areas, as well as more use of continuous, rather than skip welding techniques would lessen the occurrence of hull cracks. Bell Halter has incorporated hull thickness changes on the next generation design of these vessels.

Operationally, the DORADO presented a small radar and visual target when viewed from a bow aspect. This was useful when coupled with the high speed of the vessel while the craft was being used in law enforcement missions.

The broad beam allowed large deck space aft, suitable for cargo. This area, however, was subjected to spray and was often quite wet when the craft was underway on cushion at high speeds. The widely separated propellers provided DORADO with excellent manoeuvrability at pier side and when alongside other vessels at sea. This feature, along with the stable ride was particularly useful when DORADO was resupplied by other Coast Guard cutters. The manoeuvrability, coupled with the variable deck height, due to lift engine throttle settings, was used to advantage by DORADO's crew during boardings and inspection of other vessels. DORADO would manoeuvre alongside, then adjust cushion height, to match deck levels, allowing the boarding crew to step directly from one ship to the other.

The broad beam, and shallow step aft also allowed easy boat launching and over the side operations. The crew reported a significantly improved sense of safety during these operations when compared to conventional patrol vessels. Items were easily launched and recovered off the stern platform. Small Coast Guard boats moored across the stern on occassion. Towing was likewise easy. The location of the tow bitt was found to be troublesome, as it rendered so much of the stern unusable (Fig. 2). The tow point could be moved further aft without detriment because of the wide set screws.

The crew learned to operate the craft quickly. The only controls beyond those found on a normal vessel were the lift engine controls. The large beam and draught, when off cushion, were factors the operators had to keep in mind when operating in restricted waters however.

The installed ground tackle proved inadequate. The two 90 pound Danforth type anchors, standard equipment aboard 95-foot patrol boats, proved inadequate to hold DORADO when trailing a pollution containment boom astern.

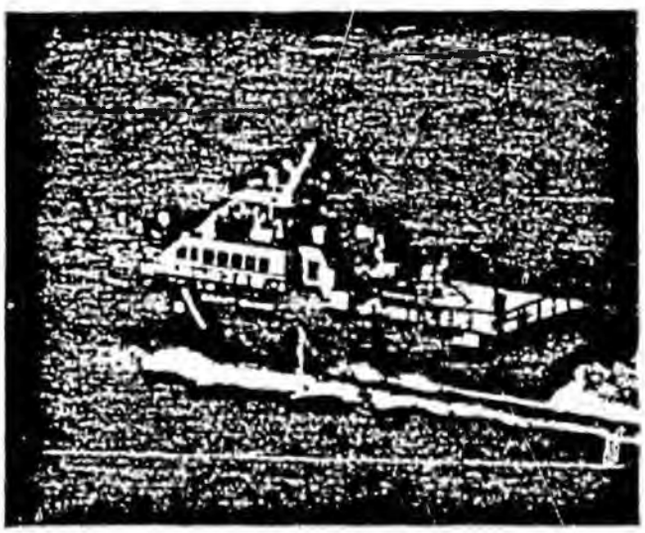

Fig. 8. USCGC DORADO aerial view from port quarter while operating on cushion.
Official US Coast Guard Photo.

The aluminium construction allowed f painted interior spaces, and hence reduced maintenance despite the increased area to be cleaned. The low melting point of aluminium requires adequate fire protection. The installed carbon dioxide fire extinguishing system and remote ventilation fan shut off switches proved vital during the evaluation of DORADO.

Engineering experience aboard CGC DORADO has shown the craft is within the scope of normal maintenance expertise found on other Coast Guard cutters. The diesel propulsion and conventional ship characteristics offered no problem for crew operations. The main diesel engines are common to those used on 95-foot Coast Guard patrol boats. The only feature unique to the DORADO are the bow and stern seals. There were no repairs made to the seal system, except direct replacement, so an assessment of the crew's capability to make repairs cannot be made.

The extensive use of aluminium pipe and the use of dissimilar metals in piping systems, such as brass valves, are a potential problem. The generous use of protective zincs is necessary for long term operation of craft similar to DORADO. Similarly, vibration mounts, flexible bulkhead penetrations, and more supports for pipes should be installed to reduce one of the major maintenance problems encountered on DORADO.

5. CONCLUSIONS

In summary, the six month operational evaluation of the USCGC DORADO proved that the SES concept can be valuably employed as a Coast Guard resource. The craft proved equal or more capable in conducting most of its missions than comparable Coast Guard cutters. While problems and limitations with the concept and this particular vessel exist, solutions are not beyond the reach of technology. On balance, the concept is valuable and useful in pursuit of many Coast Guard missions.

THE SURFACE EFFECT SHIPS (WSES)

The three U.S. Coast Guard Surface Effect Ships are a new concept in patrol craft. These rigid side wall hovercraft are used primarily for enforcement of laws and treaties, especially drug or illegal migrant interdiction and marine environmental protection.

With a maximum speed greater than 30 knots, the SESs assure rapid response for rescue cases, pollution containment and law enforcement while the thirty-nine foot beam provides a stable platform in most sea conditions. The ship is constructed of welded marine aluminum, has two 1800 horsepower diesel engines for propulsion, mounted in the side walls and two smaller diesels for lift.

The lift engines drive fans that create a pressurized air cushion under the vessel, which lifts the vessel, thus reducing drag and draft. The two solid side walls pierce the water surface, formimg a catamaran hull and the air cushion is sealed by flexible rubberized skirts at the bow and stern.

Because Surface Effect Ships are designed with low length to beam ratio they are stable at high speeds. When on cushion they have a shallow draft, which can still be maintained at low speeds. The large freeboard area can be adjusted by controlling the lift fans, a useful docking feature. Until wave height approaches the freeboard, speed and ride comfort are not reduced. SESs are highly maneuverable even at low speeds with propeller and rudder in each side hull.

The SESs were manufactured by Bell Halter Inc. in New Orleans, Louisiana. Detroit Diesel Division of General Motors built the 16V-149TIB marine engines in Detroit, Michigan.

1 - INTRODUCTION

EVALUATION OF CORRIDOR ALTERNATIVES - LYNN CORRIDOR

1 - INTRODUCTION

1.1 - General

As part of the update of the Southeast Alaska Transportation Plan, a number of studies were carried out relating to the provision of surface transportation services within subsections or corridors of the overall region. These subregional studies were used as a screening process, to examine a number of transportation options within a particular corridor in isolation from the balance of the system and to identify, at a restricted level of analysis, those options which seemed most promising and hence which warranted further consideration in the context of the total regional transportation system. In all, five corridor studies were carried out dealing with transportation issues and alternatives with regard to Juneau Access (Lynn/Taku Corridors), the Ketchikan-Southern Terminus Corridor, the Stikine Corridor, the Sitka Access Corridor, and the Prince of Wales Island Access Corridor.

This report describes the process and the findings of the corridor study relating to Juneau Access including the Lynn Canal and Taku River Corridors. It outlines the anticipated transportation requirements in the corridors, identifies the options which were considered, and describes the evaluation of the various options in terms of financial implications, user impacts and service/cost effectiveness.

1.2 - Description of Corridor

The Lynn Corridor analysis examined the provision of road and marine transportation services up and down the Lynn Canal, connecting the communities of Juneau, Haines and Skagway (see Figure 1). The corridor serves passenger and vehicle traffic between these three communities and also acts as the

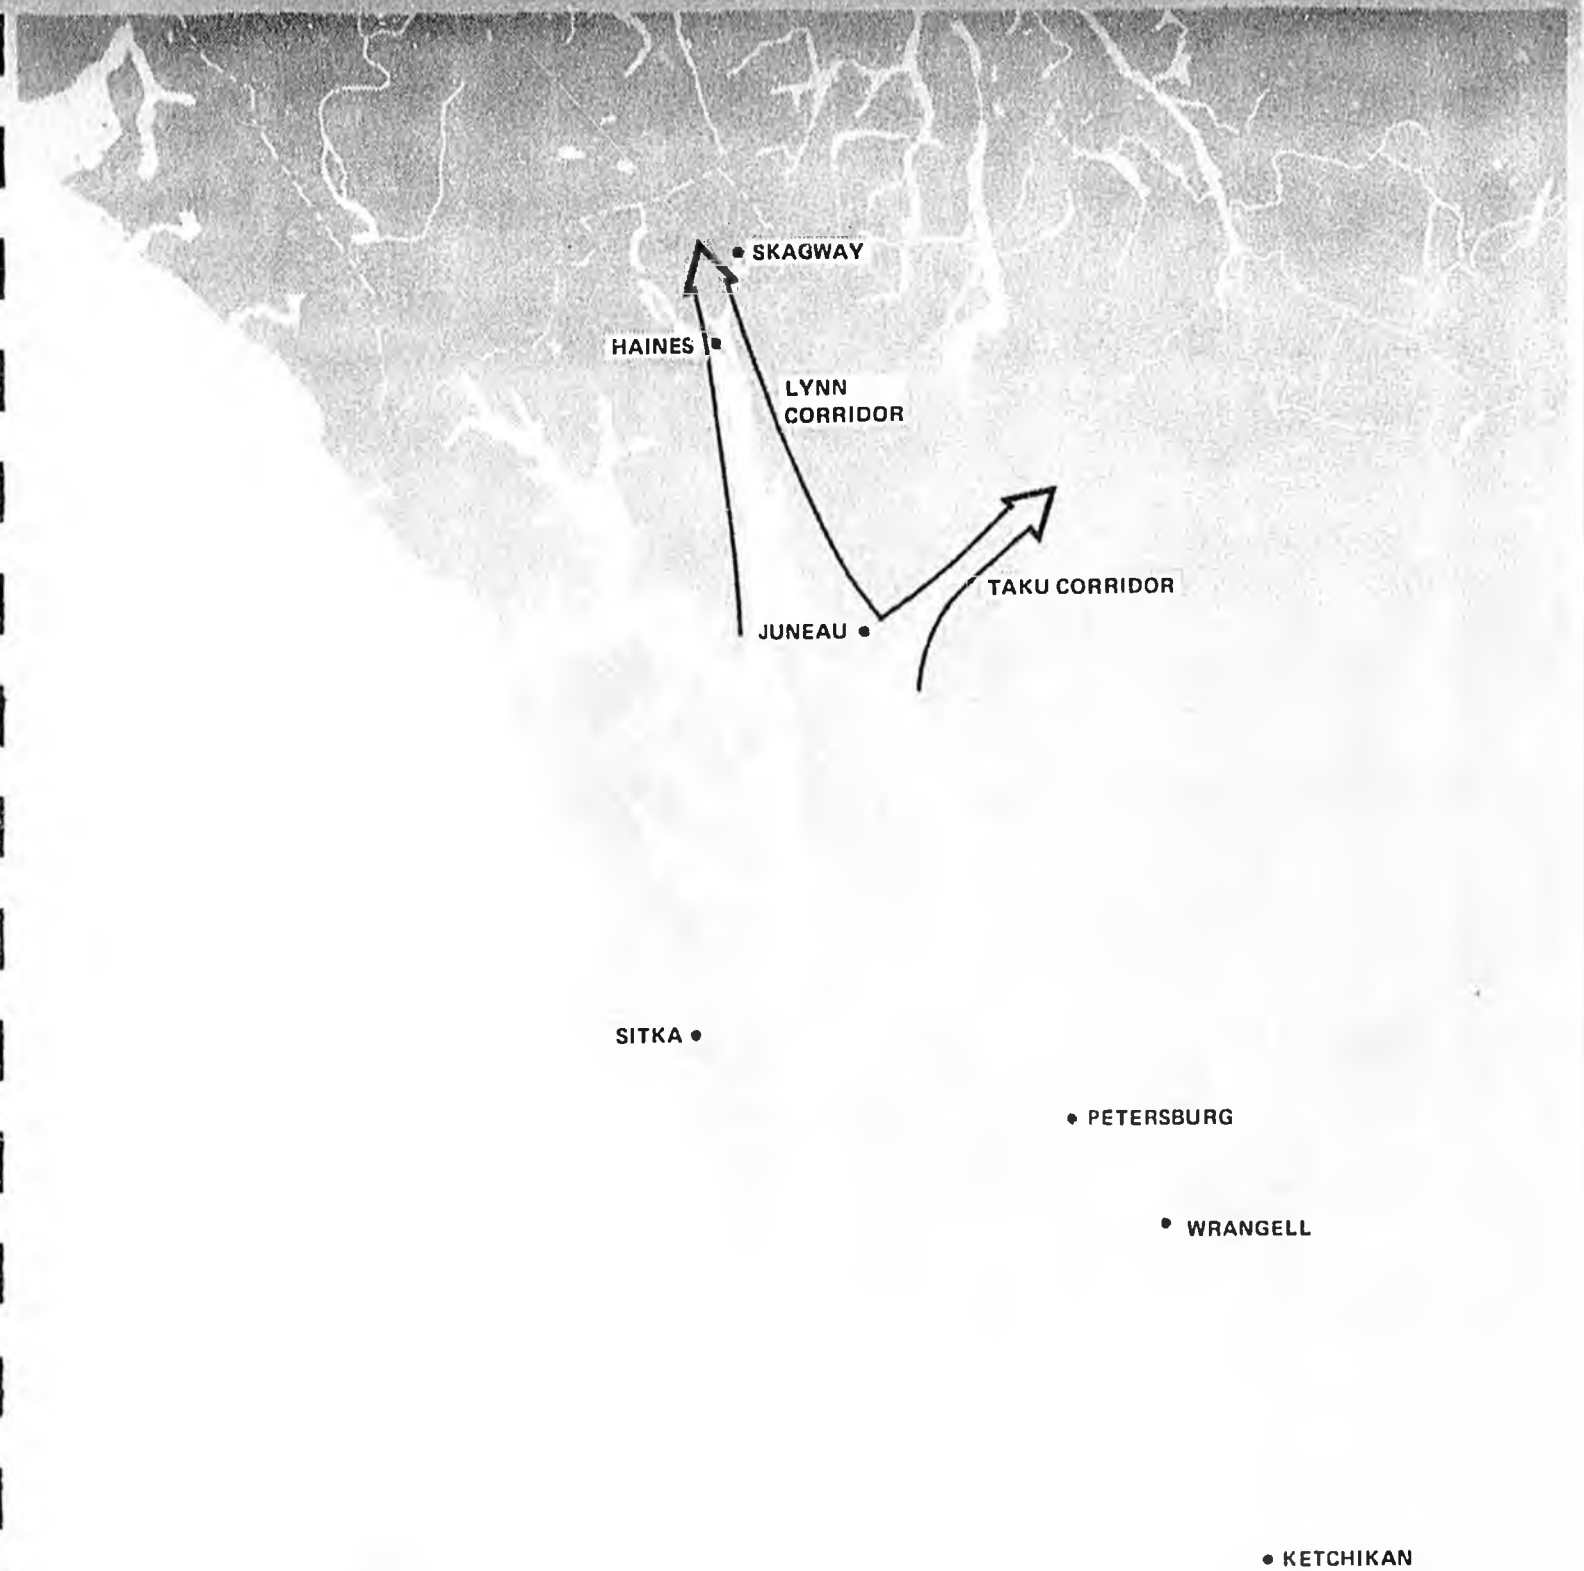

Figure 1

JUNEAU ACCESS CORRIDORS

northern terminus of the Southeast Marine Highway system. As such, it connects Haines, Skagway and points north with other southeast communities and with the Lower 48. The Taku Corridor analysis (see Figure 1) examined the possibility of utilizing the Taku River Valley as a means of connecting Juneau with the continental road system and hence, with other communities having access to the roads.

1.3 - Scope of Analysis

For the corridor analysis, the Lynn Canal was treated as a separate transportation system. The assessment of options considered only the provision of service within the Juneau-Haines-Skagway triangle without regard to connections required north and south of the corridor. Service options, financial implications and user impacts relate only to that portion of a trip which falls within the corridor boundaries. Impacts accruing outside the corridor as a result of different corridor options were included at the next stage of analysis as part of the assessment of regional systems.

Similarly, the Taku Corridor was regarded as a separate transportation system, primarily providing access between Juneau and the road systems of Yukon and Alaska. While the corridor could be used as a means of connecting with the Alcan Highway and hence, with the southbound Stewart-Cassiar Highway out of Watson Lake, this would involve a significant detour for traffic to and from the south and hence, was not considered to be a viable alternative for Marine Highway traffic to and from the Lower 48.

1.4 - Report Format

The balance of this report is divided into three sections. Section 2 discusses the key factors considered in defining corridor options and describes the physical and traffic components of the alternatives which were evaluated. Section 3 presents the findings of the financial analysis and user impact evaluations, and Section 4 provides a summary of conclusions and recommendations. Two Appendixes are also included which describe in detail

ALASKA LEGISLATURE COMMITTEE FILES 1987 - 1988 8672
5127 HTRA COMM. MTGS: WRK. SESSION, AK. MARINE HWY. (FILE 1) 695

the methodologies used in developing, costing and assessing corridor alternatives and discuss the theories and methods underlying the evaluation parameters.

2 - CORRIDOR ALTERNATIVES

2 - CORRIDOR ALTERNATIVES

2.1 - Corridor Issues

The Juneau Access Corridor, which currently consists of Marine Highway links between Juneau, Haines and Skagway, represents a problem within the regional transportation context on a number of fronts.

- The Lynn Canal is one of the most intensively used links in the Marine Highway system. In 1984 it carried more passengers than any other link and was second only to the combined Seattle/Prince Rupert to Ketchikan links in terms of total vehicles carried.

- Aggravating this problem, the Lynn traffic tends to be more concentrated into the peak summer months than traffic in other corridors.

- Over 35% of the traffic disembarking in the Lynn boards at either Seattle or Prince Rupert. This makes it difficult for passengers embarking within the Southeast Region to book space on the vessels.

- The Lynn ferry service represents the only surface link between Juneau, the State capital, and the rest of Alaska. For political reasons a faster, more frequent connection would be desirable.

In developing the Juneau Access Corridor alternatives, the key concerns therefore were how to provide additional capacity up the Lynn Canal and/or how to improve service (particularly travel time) between Juneau and the northern terminus.

With these factors in mind, eleven options were developed for the provision of transportation service in the Juneau Access Corridor, with nine involving service via the Lynn Canal and two involving service via the Taku River.

These are described, in terms of physical characteristics and traffic impacts, in the following sections. Figure 2 provides a map of the region showing the key points referred to in the description of alternatives.

2.2 - Base Case - Lynn Option 1

2.2.1 - Description

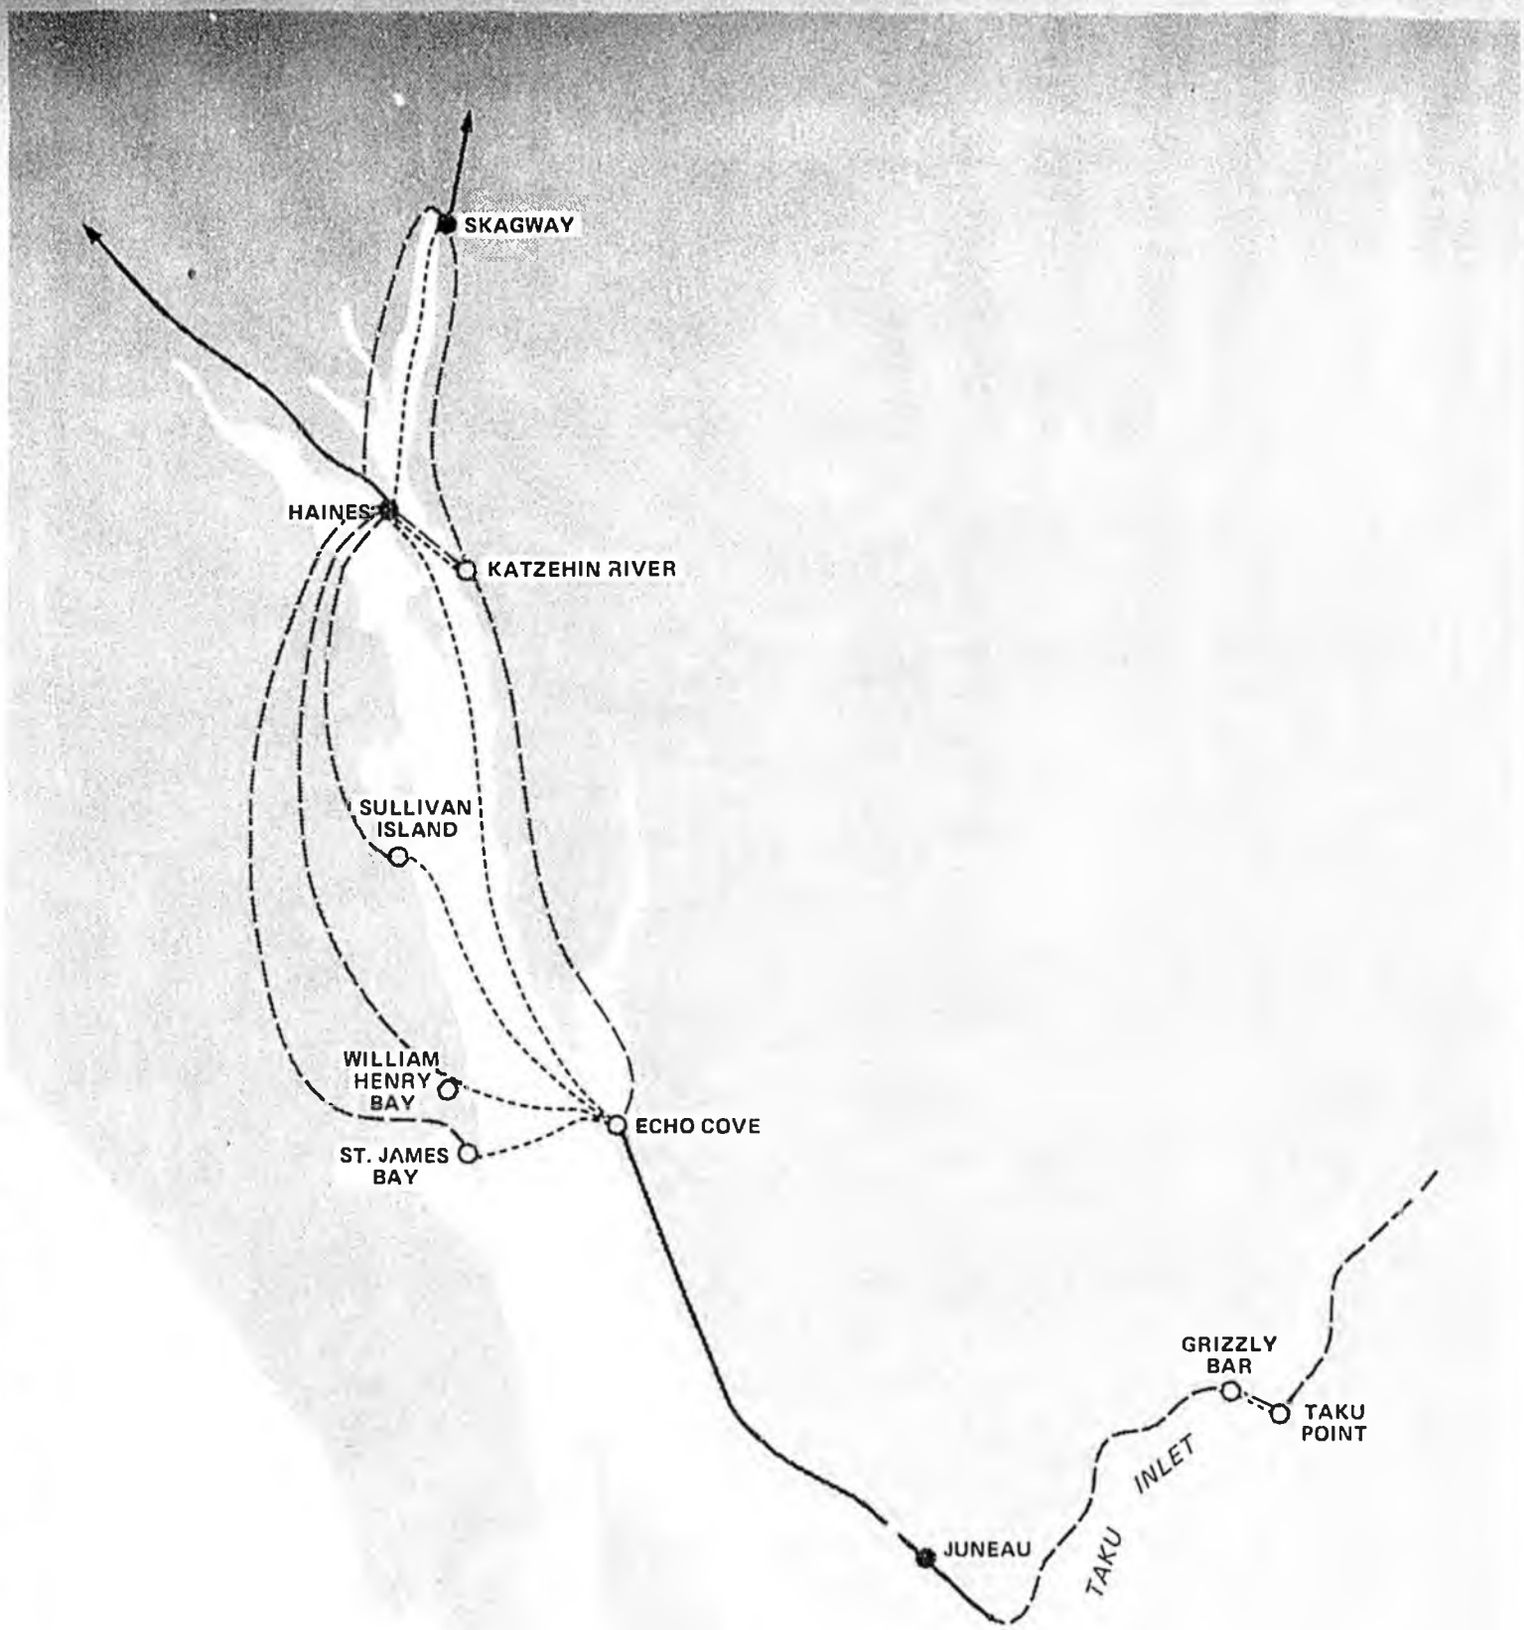
Option 1 involves continuation of the existing ferry service up the Lynn and serves as a base case against which other options can be evaluated. Under this option, peak season service would be provided twice weekly by the Taku, Malaspina and Matanuska, and once a week by the Columbia and the LeConte, giving a weekly total of eight trips.

The annual cost to the Marine Highway of serving the Lynn in this manner was estimated at $7.0 million for vessel operations and $0.4 million for port operations.

Capital costs associated with the existing fleet would add another $3.1 million to this cost. (These figures are based on an average Lynn transit time of 18 hours, multiplied by total hourly costs and total annual Lynn trips for each vessel.)

2.2.2 - Traffic

Under the base case scenario, tourist and resident traffic up the Lynn were assumed to grow at the rates presumed in the travel demand forecasts; viz 4.5% (to 1990) and 2.5% (1991-2005) for tourist traffic and 2.8% (to 1990) and 1% (1991-2005) for residents. Average peak daily demand within the corridor (total embarkations plus total through traffic) was projected at 965 passengers and 215 vehicles in 1990, increasing to 1340 passengers and 300 vehicles by 2005. Of these, approximately 15% were internal Haines/Skagway trips while the balance transitted the Juneau/Haines section of the corridor.



LEGEND

——— Existing Roads

— — — Potential Road Links

-------- Potential Ferry Links

NOTE:

Road links as shown do not necessarily represent proposed alignments.

Figure 2

JUNEAU ACCESS – CORRIDOR ALTERNATIVES

Since the 2005 figures for vehicle demand, when adjusted for links and direction, would exceed the capacity of the existing ferry system, consideration had to be given to assigning the cost of a new vessel to this option when demand reaches capacity (approximately 1998). It was noted, however, that the Lynn Corridor was not the only capacity constraint in the system. In fact, demand would exceed capacity out of Seattle in the early 1990s, thus prohibiting many Lynn-bound users from entering the system. Without new capacity out of Seattle, Lynn capacity problems would not arise since demand would not materialize. With new capacity out of Seattle, Lynn problems would also be eliminated since additional vessels would be in service.

This interaction raised problems with regard to the proportion and timing of new capacity costs which should be attributed to the Lynn Canal. Since this issue was to be dealt with in the system studies, it was decided to maintain the isolated 'corridor' perspective of this analysis by adding a vessel to the Lynn system in 1999 when additional Lynn capacity was needed, and assigning its cost to the Lynn in the same proportion as that of other vessels serving the corridor.

2.3 - All-Road Options - Lynn 2 and 3

2.3.1 - Description

The second and third Lynn Corridor alternatives involved linking the communities of Juneau, Haines and Skagway by road and terminating all marine operations north of Juneau.

Lynn 2, the more costly alternative, involved extending the existing road from Echo Cove up the east side of the Lynn to Skagway and building a bridge across the Chilkoot Inlet at the mouth of the Katzehin River to link Haines to the new road. Total capital cost of this option, which involved 76 miles of new road, was estimated at $440 million of which $290 million was for road construction and the remaining $150 million for the bridge. Annual

operating and maintenance costs for road upkeep were estimated at $2.07 million. Offsetting these were savings associated with closing the ferry terminals at Haines and Skagway--approximately $0.4 million per year.

Lynn 3 also involved building a road up the east side of the canal to Skagway. However, instead of a bridge crossing at Haines, a road would be built down the west side of the canal between Haines and Skagway. The total capital cost of this option, which required 109 miles of road construction, was estimated at $365 million, while road operating and maintenance costs were estimated at $2.52 million per year.

2.3.2 - Traffic

Projected Lynn traffic demand under the 'all road' options was expected to differ significantly from the 'base case' marine highway alternative. Passengers to and from points south of Juneau who were traveling with vehicles were assumed to switch to the road and continue their trip up the Lynn by car. Lynn foot passengers originating at or destined for points south of Juneau, however, were assumed, in large measure, to forego the trip up the Lynn rather than make arrangements to bring or rent a vehicle. Thus only 25% of Lynn foot passengers to and from points south of Juneau were presumed to shift to the road.

Travelers originating at or destined for Juneau were assumed more likely to have access to a vehicle and to make the trip up the Lynn even in the absence of ferry service. All Juneau O/D passengers were therefore forecast to switch to the road, and vehicle numbers were adjusted accordingly.

In addition to carrying traffic which would otherwise move on the Marine Highway, the direct road connections between Juneau, Haines and Skagway were also assumed likely to stimulate additional trips within the Lynn Corridor as a result of the lower cost and greater flexibility of road travel. These trips would largely originate among the residents of the area and would likely be related primarily to recreation/shopping/visiting activities.

Consideration was given to the possibility that some traffic might also be diverted from air but, in view of the frequency and speed of air service within the Lynn and the high proportion of business travelers on this mode, it was decided that such diversions would likely be small in number. The possibility of additional road traffic related to future resource development in the corridor was also reviewed and several potential developments were noted. However, since there are no committed plans for other development along the proposed road corridors beyond existing logging activities, this class of potential traffic, while recognized as a possible addition to demand, was excluded from the quantitative analysis.

Estimating the road-induced recreation type trips involved considerable subjective judgment. There were few data sources available which would assist in predicting the behavior of the local residents if a road were developed. Within Southeast Alaska there are no road links comparable to the proposed Lynn system either in terms of distances involved or the size and amenities of the communities at either end. Some travel propensity data were available for road developments in other parts of the United States and Canada but none represented a reasonable proxy for the Lynn Corridor.

In consequence, the travel propensity data on the two roads most comparable to the Lynn roads were reviewed (the road from Juneau to Echo Cove and the road from Petersburg to Blind Slough) and were adjusted to reflect the longer distances involved in the Juneau/Haines/Skagway trip and the high level of attractions within the Juneau community. It was judged, in light of these factors, that an average daily traffic level of .0075 vehicle trips per capita was appropriate, yielding a projected induced traffic volume of 94 000 vehicle movements in 1991 (the earliest possible time when the road could be operational) and 108 000 movements in 2005. Because of the heavy recreational focus of this traffic it was assumed that 50% of these movements would take place in the peak summer period with the balance divided equally between the shoulder and low seasons.

Total projected traffic on the Lynn roads, including the carryover from points south of Juneau, the existing Juneau/Haines/Skagway traffic, and the induced traffic would total 155 500 vehicle movements in 1991 and 189 100

vehicle movements in 2005 of which, on average, 52% would occur during the peak season. Peak average daily traffic would therefore be approximately 900 vehicle movements per day in 1991 and 1100 vehicle movements in 2005.

2.4 - West-Side Road Options - Lynn 4, 5 and 6

2.4.1 - Description

Lynn options 4, 5 and 6 assessed the potential for building roads up the west side of the Lynn Canal and linking these roads to the east side of the canal and Juneau via a shuttle ferry out of Echo Cove. Three variations of this concept were analyzed.

Lynn option 4 involved operating the shuttle ferry from Echo Cove approximately 17 miles across the canal to St. James Bay, and building a road from St. James Bay through Haines to Skagway--a total of 95 miles. Total construction cost, including ferry terminals at Echo Cove and St. James Bay was estimated at $240 million. Road maintenance and operation was estimated at $1.89 million per year and terminal operations at $0.2 million. Two 60-vehicle shuttle ferries connecting Echo Cove and St. James Bay represented an additional $7 million in capital cost, and added $4.2 million per year to operating expenses.

Lynn option 5 consisted of a shuttle ferry from Echo Cove to William Henry Bay (approximately 14 miles) and a road from William Henry Bay to Haines. Haines and Skagway would be linked by shuttle ferries similar to those operating out of Echo Cove. Total capital cost for the 45 miles of new road and the two new ferry terminals was estimated at $130 million, while road operating and maintenance costs were estimated at $1.14 million per year and terminal operations at $0.4 million. In addition, the four new shuttle ferries (2 on each link) would require an additional capital expenditure of $14 million and annual operating costs of $8.5 million.

Lynn option 6 involved running the shuttle ferry from Echo Cove north to Sullivan Island (approximately 30 miles) and building a connecting road from Sullivan to Haines. As in Option 5, Haines and Skagway would be joined by shuttle ferry. This option involved 21 miles of new road at a total cost (including ferry terminals) of $70 million. Annual road operating and maintenance costs were estimated at $0.9 million while terminal operating costs were estimated at $0.4 million. Four shuttle ferries were assumed at a total cost of $14 million capital and $8.5 million per year operations. However, under this option it is likely that, towards the end of the 1990s, an additional shuttle would be required on the Echo Cove- Sullivan Island link, since the longer voyage time significantly reduces the shuttles' daily ability to carry traffic.

2.4.2 - Traffic

In projecting demand on the three west side road options, the same assumptions were made regarding the diversion of existing ferry traffic as under the 'all-road' options; that is:

- all Lynn passengers with vehicles originating at or destined for points south of Juneau would divert to the road

- 25% of Lynn foot passengers to/from points south of Juneau would divert to the road while 75% would forego the trip

- all internal Lynn passengers (i.e., those traveling between Juneau, Haines and Skagway) would divert to the road/shuttle.

The ability of the road/shuttle options to generate new traffic, however, was judged to be lower than under the all road options. The main deterrent to high volumes of induced traffic was felt to be the potential delay associated with the shuttle ferry. With two ferries operating across the Lynn, the minimum interval between departures would be 1.5 hours on the William Henry Bay option, rising to as much as 2.75 hours on the Sullivan Island route. While this could be tolerable if the road trip could be timed so as to just connect with the ferry, in peak travel periods (e.g., on a

summer weekend) when as much as half the daily traffic may want to travel within a span of a few hours, a vehicle may have to wait for two or three ferries in order to be accommodated.

This peaking problem, together with the relatively long ferry trips, was felt to detract from the three road/shuttle options in terms of generating additional traffic within the Lynn Canal. It was therefore assumed that, under these three options, total induced traffic would amount to 23,500 vehicle trips in 1991, and 27,000 trips in 2005, or roughly one-quarter of the volumes induced under the all-road options.

Total projected traffic including carry over from the existing system and new induced travel would amount to 85 000 vehicle movements in 1991 and 108 000 movements in 2005, of which slightly over 50% would occur during the peak season. Average daily traffic in the peak would therefore be 490 vehicles per day in 1991 rising to 625 by 2005.

2.5 - East-Side Road/Shuttle Options - Lynn 7 and 8

2.5.1 - Description

Since the operational attractiveness of the all-road options (Lynn 2 and 3) was offset in part by the high cost of linking Haines to the road system (either through a bridge at Chilkat Inlet or a road from Haines to Skagway), it was decided to examine the possibility of building a road up the east side of the canal and connecting it to Haines via a shuttle ferry. A shuttle to Haines was considered to be potentially more attractive than an Echo Cove crossing first because of the shorter crossing time and secondly because the greater distance from Juneau might dissipate some of the peaking problems before the ferry crossing was reached.

Two variations on this concept were examined. In the first, Lynn 7, a road would be built to the Katzehin River with a shuttle ferry connection to Haines. Haines and Skagway would be linked by another ferry shuttle. Total

capital cost for 52 miles of new road and a terminal at Katzehin River was estimated at $210 million while road operating and maintenance costs were estimated at $1.56 million per year and terminal operating costs at $0.4 million. In addition, four shuttle ferries would be required at a total capital cost of $14 million plus $8.5 million per year for operations.

Lynn option 8 also involved a road to Katzehin River and a shuttle to Haines but under this option the road was continued up the east side of the canal from Katzehin to Skagway. Total road capital cost (including a Katzehin River shuttel ferry terminal) was estimated at $270 million while road maintenance and operations would require $1.94 million per year and terminal operations would require $0.2 million annually. Two shuttle ferries would also be required but it was felt that, with the road running direct to Skagway, the traffic demand on the shuttle would be lower than under other cross-canal options and smaller vessels could be used. Total ferry capital cost was therefore estimated at $4.0 million while total annual operating costs would be $3.0 million for the two vessels.

2.5.2 - Traffic

Total Lynn traffic under the east-side road shuttle options was predicted to reach the same levels as under the all-road alternatives (Lynn 2 and 3); that is, the standard share of carry over from existing ferry traffic and a high level of induced traffic in the corridor. It was felt that the induced traffic would be less deterred than in the west-side road shuttle options due to the short and frequent shuttle connection to Haines and to the reduced peaking problems associated with the greater distance from Juneau and the potential for intervening stopovers.

The distribution of induced traffic was assumed to differ somewhat from the all-road options. Under Lynn 7, where Haines and Skagway are connected by shuttle ferry, most of the induced traffic was presumed to travel between Juneau and Haines. Under Lynn 8, where the east road continued to Skagway, induced traffic was assumed to be spread more evenly between the two northern terminals.

2.6 - High-Speed Shuttle - Lynn Option 9

2.6.1 - Description

The final alternative considered for Lynn Canal service was the use of high-speed ferries to link Juneau, Haines and Skagway out of a terminal at Echo Cove. Echo Cove was chosen as the southern terminus both to avoid conflicts in operations at Auke Bay and because the lesser marine distances allowed higher utilization of the vessels.

Because of the large traffic volumes involved, it was judged that the most appropriate type of craft would be a large (40 vehicle, 180 passenger) high speed (46 mi/h) vessel of the surface-effect-ship class. The Bell-Halter 350B SES was selected as representative of this type of ship.

These ferries were conservatively assumed to make three round trips each during a 16 to 18-hour day in the peak season and two round trips per day over a 10 to 12-hour day in the off peak. Two ferries would be required during the early years, with a third being added in the mid-1990s as traffic volumes increase. Each ferry would cost approximately $12 million to purchase and approximately $4.2 million per year to operate. The capital cost of upgrading the road to Echo Cove and constructing a terminal there was estimated at $7 million. Road maintenance and operations would add approximately $0.6 million per year to the cost, while ferry terminal operations were estimated at $0.6 million annually.

2.6.2 - Traffic

Total projected traffic under the high-speed shuttle option was assumed to be the same as under the west-side road shuttle options (Lynn 4, 5 and 6); that is, the standard level of carry over from existing traffic and the lower level of induced traffic. This assumption may be somewhat optimistic since, with a 3-hour arrival interval between vessels during the early years, this option is particularly sensitive to peaking problems. On the other hand, the high-speed shuttle option is also more adaptable to a

reservations system than a cross-canal shuttle would be, and some peak-spreading should therefore be possible.

2.7 - Taku Corridor Options - Taku 1 and 2

2.7.1 - Description

In additon to the Lynn Canal routes, two other options were considered under the heading of "Juneau Access". These involved construction of road links up the Taku Inlet and Taku River valley to connect Juneau with the existing Yukon/British Columbia road out of Atlin, B.C.

The first option (Taku 1) involved extending the existing Thane Road up the west bank of Taku Inlet to Grizzly Bar, constructing a bridge to the east bank (Taku Point) and continuing along the east bank to the Canadian border. A total of 50.4 miles of new road would be required at a capital cost of $202.5 million. Road operating and maintenance cost would add a further $1.2 million per year.

The second option (Taku 2) followed the same route as the above. However, instead of building a bridge across the inlet at Grizzly Bar, two shuttle ferry terminals would be built and a small ferry used to cross to Taku Point. This option would involve 49.9 miles of new road at a capital cost (including terminals) of $143 million. Annual road maintenance and operations were estimated at $1.1 million. Capital cost for a small shuttle ferry would be in the order of $2 million while annual ferry operating costs would be in the order of $1.5 million.

While the Taku River options would provide competitive connections for travellers between Juneau and points in Yukon and Central Alaska, they would represent a poor alternative to the Marine Highway for travellers between Juneau and Haines/Skagway. Overland distances from Juneau to Skagway under these options would be approximately 300 miles (versus 93 by water) while overland distances to Haines would be almost 500 miles (versus 78 by water). Accordingly, in order to serve Haines and Skagway and provide them with

adequate links to the rest of the Southeast Region, it would probably be necessary to continue Marine Highway operations in the Lynn Canal either at or near existing levels. Thus, the Taku Corridor options, unlike the Lynn alternatives, would not provide any offsetting marine cost savings in the regional systems context.

It should also be noted that the road cost figures quoted earlier in this section cover only the portion from Juneau to the Canadian border. An additional 85 miles of new road would be required in British Columbia in order to connect the Taku Road with the road out of Atlin. In discussions with the B.C. Government, it was indicated that further road connections into the Atlin area were not regarded as a priority, particularly in light of government spending constraints and the more urgent needs for development funding elsewhere in the Province. Accordingly, there is some question with regard to the feasibility of a Taku connection, at least until such time as the B.C. Government indicates a positive interest in developing such a link.

2.7.2 - Traffic

Potential traffic on the Taku Corridor was difficult to estimate due to the lack of data with regard to the proportion of existing Lynn Corridor traffic which originated at or was destined for points north of Haines and Skagway and which hence might be induced to transfer to the road. Even if this were known, there is some question as to the portion which would divert to the Taku Road, particularly if they also embarked or disembarked at a point south of Juneau and hence were obliged to make part of the trip by ferry.

The most probable market for the Taku River road would likely consist of current vehicle traffic between Juneau and points north of Haines and Skagway. Some portion of this traffic might be captured by the road link. In addition, some induced traffic out of Juneau might be expected to use the new road. The volumes of both categories of traffic, however, are likely to be lower than those attracted to a new Lynn Canal route for two reasons. First, a Taku Road would be obliged to compete with ongoing Lynn ferry

service for traffic out of Juneau and secondly, it would not serve as an inducement factor for traffic out of Haines and Skagway but only for traffic out of Juneau.

2.8 - Summary of Costs

Table 2.1 presents a summary of the capital and operating cost associated with each of the Juneau Access options. For purposes of the summary, capital costs are presented both in total and on an annualized basis with the latter being calculated using a 5% - 30 year capital recovery factor for roads and terminals and a 5% - 15 year factor for vessels.

TABLE 2.1

JUNEAU ACCESS OPTIONS - SUMMARY OF COSTS

		TOTAL CAPITAL				ANNUALIZED COSTS

[1] $32.4 million represents Lynn Canal share of total capital value of existing mainline fleet (based on replacement cost).

[2] Presumes continued ferry service up Lynn Canal.

3 - EVALUATION OF ALTERNATIVES

3 - EVALUATION OF ALTERNATIVES

In order to assess the preferred options for service in the Juneau Access Corridor, a detailed assessment was carried out with regard to the financial and user impact implications of the various alternatives. The two Taku Corridor options were not included in this assessment primarily because they were very close, in cost terms, to the Lynn alternatives yet would serve lower traffic levels and would require extensive investment on the part of the British Columbia Government in order to be implemented.

3.1 - Financial Evaluations

The nine Lynn corridor alternatives were each evaluated from the viewpoint of financial impacts on the Marine Highway, on the State and on the users. Details of the methodologies and the basis for cost and revenue figures used in this analysis are outlined in Appendix A.

The findings of the financial analysis are summarized in Table 3.1. The table outlines the net present value of the 20-year total of costs and revenues associated with each option. Costs are categorized for the Alaska Marine Highway System, the State government (including the AMHS deficit) and the users. (Care should be taken in interpreting the 'costs to user' figures, however, since they relate to different levels of traffic and different types of demand. A more detailed analysis of 'cost to user', which adjusts for changing traffic levels and for the different characteristics of traffic served, is given in Section 3.2 which follows.)

As Table 3.1 indicates, from the State's viewpoint the least costly option for serving the Lynn Corridor is Lynn 1, the continuation of existing ferry service. The only ongoing cost which the State must bear is the Marine Highway deficit associated with the service. Furthermore, since the deficit shown includes an allowance for capital cost of the vessels, any federal contributions towards capital replacement would serve to further reduce the State's costs.

Cost per Effective Passenger Mile ($)	0.48	0.69	0.62	0.87	0.75	0.69	0.57	0.53	0.56

*Adjusted to reflect residual value at end of planning period.

As noted earlier, however, the continuation of existing service is expected to handle only the growth in existing corridor traffic, generating a total of 282.4 million effective passenger-miles of travel over the 20-year planning period. (Effective passenger-miles are calculated by multiplying the number of passengers on each link by the travel miles over the most direct route rather than over the actual route between two points. This eliminates the distortions which might arise in cases where a more circuitous route would appear to generate a greater number of passenger-miles of service.)

Lynn option 9, the high-speed ferry service, represents the next most attractive option from the viewpoint of State finances, followed, at some distance, by Lynn 6 (shuttle to Sullivan Island) and Lynn 5 (shuttle to William Henry Bay). All three provide roughly the same effective passenger-miles of service. The fourth of these 'medium-traffic' options, Lynn 4 (shuttle to St. James Bay), is considerably less attractive financially, chiefly due to the high cost of the road link between Haines and Skagway.

Turning to the four 'high-traffic' east road options, all are more costly than the 'medium-traffic' alternatives. Lynn 7 (road to Katzehin River, shuttle to Haines and Skagway) represents the least costly of these options from the viewpoint of State costs, followed closely by Lynn 8 (road to Skagway, shuttle from Katzehin River to Haines). Lynn options 2 and 3 (the all-road options) are the most costly from the State's perspective.

Table 3.1 also provides figures for the total combined cost (to users and State) and total combined cost per passenger-mile associated with each corridor option. Again from a financial perspective, the existing system appears to be the most attractive option, followed by the east road-shuttle to Haines (L8), the high-speed ferry (L9) and the east road-shuttle to Haines and Skagway (L7) options.

3.2 - Evaluation of Service/Cost Effectiveness

As noted earlier and explained in detail in Appendix A, the figures for cost per passenger mile do not represent a complete basis for comparison of the alternatives. First of all, by treating all passenger-miles on an equivalent basis, they fail to reflect the different types of demand being served, and hence the different values which users assign to the trips involved. Secondly, by considering only the financial aspects of the options, the cost figures do not reflect the different service characteristics of the corridor alternatives in terms of service frequency, flexibility and travel time.

In order to overcome these difficulties, a more comprehensive supplementary basis was developed for evaluating transportation alternatives which attempted to measure the net benefits to users in terms of cost and service and compare these benefits with the additional cost to the State associated with providing the new transportation service. This assessment of service-cost effectiveness for the Lynn Corridor options is described in the following sections.

3.2.1 - User Costs

The first component of user impacts was the potential benefit associated with lower user costs. The costs incurred by users of the Lynn systems were computed, for each option, by dividing the discounted user costs by the effective passenger-miles of service provided. Each option was then compared with the base case (option L1) to determine the user saving per mile of travel.

Savings accruing to 'base' users (i.e., those who would use the system under all options) were calculated by multiplying the saving per passenger-mile by the number of passenger miles of service provided under the base case, Lynn option 1. Savings to incremental users (i.e., those induced to use the system as a result of the improved service and/or cost) were calculated by

multiplying the difference between total passenger-miles and 'base' passenger miles by one-half the cost saving associated with the alternative.

The resultant discounted cost savings associated with each alternative (per passenger mile and in total) are shown in Table 3.2. As would be expected, the highest total savings arise under those options which minimize ferry travel, both because of lower per-mile costs and higher traffic volumes.

Table 3.3, however, compares user cost savings with the increase in costs incurred by the State. This alters the perspective somewhat with Lynn option 8 (road to Skagway, shuttle to Haines) clearly offering the highest user savings per dollar of government expenditure, followed respectively by options 3 (road/bridge), 2 (road/road) and 7 (road to Katzehin).

3.2.2 - User Time Benefits

Table 3.3 also indicates that, on a user cost savings basis alone, none of the Lynn options generates benefits equal to the additional costs incurred by government. However, the various corridor options do give rise to other user benefits, the most apparent and readily quantifiable of these being the time savings associated with improved speed and service frequency.

Table 3.4 shows the total estimated travel time over the three Lynn links under each option and the travel time savings relative to the base case (existing service). Travel times include road time (at 40 mph average speed), ferry port and sailing times, and delays associated with the interval between ferry arrivals. Option 9, the high-speed ferry, shows two travel times, one for a 2-vessel service and one for a 3-vessel service with the difference reflecting the higher service frequency in a 3-vessel operation.

Since it is difficult to establish a defensible value of time, particularly for a market as diverse as that using the Lynn Corridor, an 'imputed value' approach was used to assess time benefits associated with the corridor alternatives. Under this approach, the total travel time savings were calculated in terms of hours for each option. Next, the difference between

government costs and user cost savings was calculated to determine the value which user time savings would have to have in order for combined user cost and time savings to equal government costs. This 'required time value' was then divided by the hours saved in order to determine the required hourly value of time savings. As long as the actual value of time is assumed to exceed this rate, total user benefits will exceed government costs. Thus, the lower the required time value, the more likely it is that benefits will exceed costs.

Table 3.5 shows the results of these calculations. Required time values range from a low of $2.57 per hour under Lynn option 9 (high-speed ferry) to a high of $13.31 per hour under option 4 (St. James Bay). Several of the options require time values which appear reasonable relative to average hourly incomes (1983 Alaska per capita income converts to an equivalent of $8.50 to $10.00 per work hour). It should be noted, however, that many of the expected trips are recreation-related and that time value under these circumstances may be only a small proportion of hourly income.

In terms of comparative ranking, the analysis indicates that the options most likely to yield benefits in excess of costs are Lynn 9 (the high speed ferry) and Lynn 8 (east road to Skagway, shuttle to Haines). Both show imputed time values which are reasonable relative to incomes, although the high-speed shuttle shows a significant advantage in this regard.

3.2.3 - Other Considerations

While the above analysis presents an assessment of the quantifiable impacts associated with each corridor option, there are a number of other non-quantifiable issues which should be considered in selecting among the alternatives. Some of these are highlighted below.

Capacity is an issue which, while it has been taken into account in planning and defining the corridor options, warrants some further comment. The various system options have been costed on the basis of the minimum expenditure required to meet forecast demand. In the case of the road options, this results inevitably in considerable excess capacity since the minimum

TABLE 3.5

L9	High Speed Ferry	12.8	35.9	3.0	32.9	2.57

road is capable of carrying much higher traffic levels than those expected. If traffic levels were to exceed projections, however, the road options could accommodate this traffic without significant additional cost to the State. In the shuttle and high-speed ferry options, however, State costs would increase substantially if more capacity were required during the planning period.

A second consideration is flexibility which, in this context, refers to the ability of the transportation option to adapt to different traffic levels. Here the advantage lies with the existing system and the high-speed shuttle options since capacity can be tailored more closely to demand. If traffic growth does not meet expectations, vessels can be laid up, sold or diverted to other routes. In addition, cost savings can be obtained by reducing service in off-peak seasons. The road options represent a fixed link which can not be adapted, to a significant degree, to changes in the locations or level of demand.

Comfort and reliability are a third consideration. On this issue it is difficult to choose among the options. Comfort is a subjective issue and, while some would prefer driving themselves, others would prefer being carried on the ferry. On the other hand, the road options enable the user to stop en route and take advantage of intervening recreational opportunities--a choice not available to ferry users. All options are subject to delays due to inclement weather although the marine modes may have a slight advantage in winter.

Environmental impact should also be a consideration in assessing the various options. The road options are likely to create the most severe impacts in this regard since they infringe on the semi-wilderness nature of the Lynn's banks. However, intensive ferry operations out of Echo Cove (either high-speed or shuttle) will also impact on the existing environment there.

A final consideration which might be included in assessing the alternatives is the socioeconomic impact associated with construction and operation of the different options. This includes direct impacts such as employment, labor income and tax revenues, and also indirect impacts associated with

purchases of goods and services, income multiplier effects, and induced activity, if any, arising from the new transportation service. While a complete assessment of these impacts would require a separate and detailed analysis, it would be expected that higher levels of government expenditure on local labor and supplies would generate higher positive impacts. In consequence the road options, with their higher costs, are likely to rank higher than the ferry options in terms of socioeconomic benefits. On the other hand, there may be ways in which the government could spend the monies saved in the lower cost options which would generate higher socioeconomic returns than the road alternatives.

4 - SUMMARY AND CONCLUSIONS

4 - SUMMARY AND CONCLUSIONS

There are several options available for providing and improving transportation service in the Juneau Access Corridor. Of the alternatives examined, continuation of the existing service is the least costly from a government cost perspective.

The other corridor options, however, while more costly in financial terms, offer significant benefits to users in terms of travel cost and/or travel time savings.

The most attractive options appear to be option 9 (a high-speed ferry operating between Echo Cove, Haines and Skagway) and option 8 (a road up the east side of the Lynn to Skagway with a shuttle ferry operating between Haines and the Katzehin River). Both of these options could potentially generate benefits equal to their costs and both are superior to the other alternatives in this regard.

A closer examination of the two preferred options indicates some significant differences in the source and allocation of impacts. For example, the road-shuttle option shows only a small advantage over the high-speed ferry in travel time between Juneau and Haines and between Haines and Skagway, but a substantial saving on trips between Juneau and Skagway. The road-shuttle option also serves a greater number of passengers and generates higher cost savings to users both on a per-mile basis and in total. However, the road-shuttle option involves a significantly higher government outlay (an increase of $168 million over the base case versus an increase of only $38 million for the high-speed shuttle). As a result, it appears less attractive overall than the high-speed shuttle alternative.

The differences in the level and flow of benefits associated with these two options, together with the overall benefit potential which each showed in the analysis suggested that the limited corridor analysis was not a sufficient basis on which to choose between these alternatives. Accordingly

it was recommended that options 8 and 9 should both be retained for more detailed evaluation in the context of the total Southeast system.

APPENDIX A

EVALUATION METHODOLOGY

APPENDIX A

EVALUATION METHODOLOGY

A1 - GENERAL

The general method used to assess corridor alternatives consisted of five main steps

- o Forecast expected travel demand in the corridor over the next 20 years;
- o Define a range of possible methods of meeting this demand, and the equipment and/or infrastructure necessary to serve the traffic under each method;
- o Determine the associated capital and operating costs and revenues;
- o Calculate the financial impacts of each alternative from the viewpoint of the operator, the government and the user;
- o Calculate the service/cost effectiveness of each alternative and select the preferred option(s).

Each of these steps is described in greater detail in the following sections.

A2 - TRAVEL DEMAND

The forecasting of travel demand both within the Southeast Region as a whole and within particular corridors of the Region involved first analyzing the

existing patterns of traffic for both surface (marine, road) and air modes and identifying the factors which would cause this traffic to grow and change in the future.

Since the data regarding existing travel patterns was limited, this analysis was kept at a relatively simple level. Three factors were identified as the key issues impacting future travel demand. These were: regional population growth, growth in tourism, and changes in transportation service. The first two factors were deemed to cause general growth within the existing patterns of travel demand (or growth in 'base traffic') while the third was deemed to either increase or decrease the 'base traffic' demand within particular corridors.

To forecast "base traffic" demand (i.e., demand in the absence of service changes) existing travel was separated, on the basis of survey data, into tourist and nontourist traffic. This separation was done on a seasonal basis (in order to reflect the higher summer peaking in tourist travel) for both marine highway and air services. Tourist and nontourist components of existing traffic were then forecast, the former on the basis of expected growth in tourism travel to Alaska and the latter on the basis of expected population growth in the Southeast Region.

The growth rates assumed for tourism travel and for regional population were based on historic growth rates, tempered by concerns that with declining revenues and potential declines in government spending, these growth rates could not be maintained over the long-term. Consequently, tourism was assumed to grow at 4.5% annually to 1990 and at 2.5% annually thereafter. Regional population was assumed to grow at 2.8% per year to 1990, tapering off to 1% thereafter.

Over and above these population and tourism based growth rates, there was a special additional growth applied to air traffic, amounting to 1.4% per year. This additional growth reflected the long-term increase in the propensity of travelers to use the air mode--an increase which has generated growth in air traffic above and beyond that which can be explained by population and tourism growth alone.

The origin-destination patterns of this future 'base traffic' demand were assumed to follow the existing pattern of movements to, from and within the region. Therefore a growth in marine highway tourist demand, for example, would cause a corresponding percentage growth in traffic on all marine highway tourist-serving routes.

Once this 'base traffic' load had been calculated for the system and for the various corridors, adjustments were made to corridor demand to reflect the different service levels associated with corridor alternatives. These adjustments included diversion of traffic to a different port, loss of traffic, transfer between modes, and increases in traffic due to improved access depending on the service scenario. The particular adjustments associated with each corridor option are outlined in detail as part of the description of alternatives (Section A3).

A3 - DEFINITION AND DESCRIPTION OF CORRIDOR ALTERNATIVES

Having established the potential traffic demand within a corridor, the existing surface transportation service was reviewed and alternative road and marine options proposed which would increase capacity and or reduce operations costs. These alternative options were drawn from community suggestions, proposals put forward by the Department of Transportation, and new proposals put forward by the consultant.

An effort was made to develop a wide variety of corridor options in order to provide a range of costs and impacts for comparison purposes. Both capital (new roads, new ferries) and operational (new schedules) options were included when appropriate. In all cases the alternatives included a base-case 'no change' option against which new options could be assessed.

Once the corridor options had been defined, a detailed operating and investment schedule was laid out for each alternative specifying the traffic

to be served, the way in which it would be served, the timing of new road and new vessel requirements, and the operating schedules and procedures within the corridor. Traffic and operating procedures were both specified on a seasonal basis.

A4 - DEVELOPMENT OF COST DATA

Capital Costs - Roads

Capital costs for new road links were based on the Department of Transportation's per-mile costs of construction over various types of terrain. Routes were specified through detailed analysis of relief maps, through discussion with DOT/PF engineers and, where possible, through inspection of the area. Road links were then broken down into segments based on the severity of terrain and degree of construction difficulty, and the appropriate per-mile costs were applied.

Special structures such as bridges, tunnels, snowsheds, etc, were costed independently and included in total cost where required.

Capital Costs - Marine

Capital costs for marine facilities and equipment included costs of new terminal facilities, capital costs associated with the existing ships, and capital costs associated with new shuttle ferries, mainline ferries and high-speed craft. In the first two cases capital costs were based on Marine Highway data regarding terminal construction costs and expected replacement value of the existing fleet. In the case of new vessels, typical current construction costs for the type of vessel required were developed through discussions with shipyards, brokers, and manufacturers.

Operating Costs - Road

Operating costs for the road links included regular maintenance and winter snow removal. They were based on the actual costs per mile incurred by the DOT/PF.

Operating Costs - Marine

The operating costs for existing vessels and terminal facilities were based on the actual experience of the Marine Highway. Vessel costs were segregated into annual costs (major maintenance, overheads) seasonal costs (crew, stores and supplies) and daily costs (primarily fuel).

Operating costs for new vessels were based on Marine Highway experience in the case of mainline ferries, and on discussions with builders and other operators in the case of shuttle ferries and high-speed craft.

User Costs

Costs to users fall into three main categories: fares on existing ferries, fares on new ferries or new ferry routes, and vehicle operating costs on road links.

Fares on the existing ferry system were based on the current summer and winter rates for the Marine Highway. For new routes on existing vessels, fares were assumed to be the same per-mile as on current routes.

For new types of equipment (shuttle ferries, high-speed craft) it was initially assumed that fares would be set on the same basis as current ferry charges; that is, that fares would have to cover at least half of the total operating costs (excluding capital) of the new vessels. However, later analysis indicated that new vessels serving as a substitute for existing vessels generated sufficient savings elsewhere in the system that their fares could be maintained at existing fare levels and still lead to an overall improvement in the system operating cost recovery.

Accordingly current fare levels were used for traffic on these new vessels.

Vehicle operating costs on road links were based on the variable portion of average per-mile operating costs for mid-size automobiles. This was felt to be a fair representation of the mix of vehicles likely to be using the road. In actual fact, owners of vans and campers would pay more while owners of small cars would pay less.

In cases where corridor options required vehicles to divert from one port to another, vehicle operating costs were increased to include overnight accommodation if the diversion involved more than 12 hours driving time.

A5 - FINANCIAL ANALYSIS

The traffic, operating and cost data bases described above were then drawn together into a year-by-year financial analysis of each corridor alternative. Capital costs for roads, vessels and terminal facilities were assigned to the years in which they would be incurred. Road operating costs were based on miles of road in service, while marine operating costs were derived from the proposed Marine Highway schedules under each option.

User costs for each year were determined by first calculating the number of vehicles using the road links (either as a result of being diverted to another port and/or as a result of a new road link being available), and multiplying this number by the cost per vehicle over the relevant distance. A revised ferry demand matrix was then calculated (taking into account diverted and/or lost ferry traffic) and multiplied by the fares matrix to determine total fares paid to the Marine Highway.

The annual financial flows were then discounted at an interest rate of 5% to determine the net present value of capital, operating and user costs under each scenario.

A6 - EVALUATION OF SERVICE/COST EFFECTIVENESS

The financial evaluations provided an indication of the total costs to operators and users associated with the various corridor alternatives. They did not, however, reflect the differences among alternatives in terms of ability to serve demand and the quality of service provided.

In order to account for these differences, each corridor alternative was compared with the corridor 'base case' (which represented continuation of existing service) with respect to the number of passengers and vehicles served, the cost per user served, and the average travel time (including delays related to frequency of service). Appropriate values were assigned to the 'service' differences between the alternatives and the base case to represent the incremental benefit (cost) to the user. These user benefits (or costs) were then compared with the incremental cost (or cost saving) to the government to form a basis for evaluating service/cost effectiveness.

The approach to assigning values to 'service' differences varied somewhat between corridors due to the different focuses of the corridor alternatives. In the Lynn corridor, for example, the focus was on improving service through new modes and on generating traffic over and above existing demand. Measures were therefore required for the value of time and cost savings to existing and to new traffic. In the Ketchikan corridor, the focus was on the existing ferry system and on trying to adjust schedules so as to meet a higher portion of current demand in a cost-effective manner, and measures were primarily required for the costs of not meeting traffic needs or of meeting needs by diverting traffic to other ports.

In general, the following principles were used in assigning values to service differences.

- Cost savings to existing traffic - include the full dollar value of saving.

- o Cost savings to new traffic - include half of the difference between the fare (or travel cost) under the new option and the fare applicable under the base case (this presumes that traffic attracted as a result of less expensive service assigns a lower value to the trip).

- o Cost of failing to meeting demand - include the average surplus which the user would have enjoyed if space had been available. Surplus was calculated by postulating the shape of the demand curve for service and calculating the average difference between the maximum which users would have been willing to pay for the trip and the fares which would normally have been charged. (This is discussed in greater detail in Appendix B.)

- o Costs to diverted traffic - assume that users diverted to another port attribute a cost to the diversion equivalent to any out-of-pocket savings associated with using the new port. Thus users moved from one port to another were assumed to incur neither benefits nor costs. This assumption was necessary because the total trip cost from Seattle was lower via road to Prince Rupert than via direct ferry, yet demand continues to be strong out of Seattle. There is, therefore, some nonmonetary advantage to the direct ferry trip which offsets cost savings associated with diverting to Prince Rupert. This nonmonetary advantage could best be accounted for by assuming that diverted passengers assigned equal cost to trips out of either port.

- o Time savings to existing traffic - include the full number of hours saved in total travel time (sailing time, port time and delays related to schedule frequency).

- o Time savings to new traffic - include one half of the difference between total travel time under the new option and total travel time under the base case.

The user cost impacts (whether positive or negative) were calculated for each corridor option relative to the corridor base case. Total savings (or increases in user costs were then compared with the total additional cost (or saving) to the government associated with the new service.

If an option showed both lower user costs and lower government costs than the corridor base case, it was clearly preferable to both parties. If it showed higher costs to both users and the state, it would not be attractive to either party. If one group's costs increased while the other group's cost declined, then the preferred options were deemed to be those which yielded the highest user benefits (or lowest user costs) per dollar of government expenditure (or government cost saving).

Where time savings were a major factor in the benefits, an imputed value of time saved was calculated by comparing the number of hours saved with the net cost of providing the saving. This provided a measure of the value which must be assigned to time savings in order for project benefits to equal costs. The options which required the lowest hourly values to be assigned to time savings were chosen as the preferred options. (Additional discussion of the calculation of time savings is provided in Appendix B.)

APPENDIX B

EVALUATION OF USER IMPACTS – CORRIDOR AND SYSTEM ALTERNATIVES

APPENDIX B

EVALUATION OF USER IMPACTS - CORRIDOR AND SYSTEM ALTERNATIVES

B1 - COSTS OF UNMET DEMAND

In analyzing both short-run and long-run system options we are faced with a situation where the predicted level of demand for ferry service is not being met to the same degree in the various cases.

To assess the impact of system options on users and potential users in terms of the costs and/or benefits they incur under the various alternatives, it was therefore necessary to find some means of assigning a value to these differences in ability to meet demand. The method used was to derive an economic measure of the costs incurred by users (where users are defined as the total numbers requesting ferry service) as a result of changes in the ferry system. To assess these impacts, users were divided into three categories for the purpose of calculating costs: those served as requested, those served by diversion to alternate ports, and those not served under the particular option.

Those passengers who are served under all systems are indifferent between the options. Because the fare structure remains constant, they incur neither costs nor savings as a result of system changes and hence do not figure in the analysis.

Those passengers who are served by diversion to another port (normally from Seattle to Prince Rupert) are in a somewhat different category. If their costs were higher out of Prince Rupert they would be said to incur a cost as a result of the diversion--presumably a disbenefit of the system which forced them to divert. In actual fact, however, it was found that their out-of-pocket costs were lower as a result of the diversion--that in fact

there appeared to be a benefit to the user associated with systems which forced them to Prince Rupert for service. The difficulty with this hypothesis, however, was that despite the difference in cost, Seattle demand was consistently strong, and users were not making the seemingly logical decision to travel via Prince Rupert in preference to Seattle. It was therefore concluded that diversion to Prince Rupert involved some nonmonetary disbenefit to users which more than offset the cost savings. Thus, in the minds of users, it was "more costly" to travel via Rupert.

Unfortunately, to determine the extent to which diversion represents an increased cost to users would require an analysis of the price elasticities of demand for ferry services (i.e. how much dollar discrepancy would there have to be between costs out of Seattle and costs out of Prince Rupert before passengers would voluntarily shift to Rupert). In the absence of any data regarding price/demand relationships, it was decided to take a conservative approach and assume that the nonmonetary disbenefit of diversion would merely offset the monetary advantages. As such, users would be indifferent between Seattle and Prince Rupert departures and passengers would incur neither benefits nor costs as a result of diversion.

This left a third class of users to be dealt with in terms of user costs--those passengers who, as a result of lack of capacity, could not be served by the system. These passengers (and vehicles) may be presumed to incur some cost associated with the loss of ferry service. The question is what cost do they incur?

The generally accepted approaches to defining the cost of capacity shortfalls all relate to the concept of opportunity cost--what does the potential user forego, in dollars and/or utility, as a result of not being able to make the ferry trip? Obviously the answer to this lies in what the user is forced to do as an alternative. If he is planning a vacation and finds that he can substitute a trip to another destination which gives him the same pleasure for an equivalent cash outlay, he incurs no cost as a result of not getting on the ferry. Alternatively, if he chooses to go to Alaska via some other routing or mode (assuming alternatives are available), his cost is the sum of the additional dollars, time and nonmonetary costs he

incurs as a result of having to accept alternative transport. A third possibility would be that the user would decide not to make the trip in which case the cost he incurs is the loss of utility which he associated with the ferry trip.

Determining which definition of opportunity cost is most applicable to the unserved marine highway demand is a difficult task, and generalizations must be applied. Our choice for this study was to calculate opportunity cost based on the third concept; i.e. that the trip would not be made and the loss was therefore equivalent to the utility the user would have enjoyed had he been able to get on the ferry. A major factor in selecting this concept, particularly as opposed to the "cost of alternatives" method, was the absence of a clearly comparable alternative means of transport. The alternatives available (cruise ship, air, road) differ from the marine highway service in so many nonquantifiable aspects that an assessment of cost differences would entail substantial subjective judgments which could be difficult to establish and to defend.

The calculation of opportunity cost based on lost utility required an estimation of the value which potential users would assign to the trip. A base approximation of this utility is the price they would have been willing to pay--in this case the marine highway fare for passenger and vehicle trips. Accordingly, the opportunity cost associated with unserved traffic consists in part of the fares they would have paid had they been able to get on the ferry. Offsetting this opportunity cost, however, is the fact that the potential user can retain the monies he would otherwise have spent. (In our analytical process the loss associated with unpaid fares is borne by the marine highway.)

The fare level, however, represents only a part of the customer's lost utility. Assuming an elastic demand for ferry services (i.e. a sloping demand curve) some of the traffic demand would have been willing to pay more for the trip than the price set by the marine highway. In other words, they would assign a utility to the trip which exceeds the fare they would have to pay. This "surplus" utility is also lost when a potential user cannot be served.

To calculate this surplus, it is necessary to know the shape of the demand curve, or the relationship between the price of the service and the number of users willing to purchase it. Since no data was available on this subject, we adopted a conservative hypothesis that demand for marine highway services would fall to zero at the point where the price was equal to the cheapest cruise package over the same route. The average surplus per user is, therefore, one half the difference between the cruise price and the marine highway fare.

The lost surplus was calculated by multiplying average surplus by the number of unserved passengers under each system option, to give the net opportunity cost of unsatisified demand. (Annual figures were discounted to net present value so that they could be compared with AMH costs on a consistent basis.)

The above calculations account for the surplus associated with foregone passenger trips, but do not cover the surplus associated with vehicles which cannot be accommodated in the system. In order to estimate this lost vehicle-related surplus, it was assumed that the demand curve for vehicle trips has the same slope as that of passenger trips--in other words, that a proportionate increase in the price of each would lead to a proportionate decrease in demand. This assumption was used to calculate the average surplus associated with vehicle trips and hence the lost surplus as a result of unmet vehicle demand.

In summary, user costs under the various system alternatives were calculated only for those potential users who could not be accommodated by the system. Users who were either served as requested or served via diversion were assumed to incur neither benefits nor disbenefits from a cost viewpoint.

The cost assigned to the unsatisfied demand was calculated on the basis of net foregone utility which was in turn approximated by the total additional surplus utility which would have been enjoyed had demand been met by the system.

B2 - TRAVEL TIME DIFFERENCES

A second aspect of user impacts which had to be dealt with in the evaluation of alternatives was the level of service provided. The major significant differences among alternatives in terms of service quality related to travel time and frequency of service out of various ports.

In order to measure these differences we developed a travel time model which converted ferry schedules into a travel time matrix for all O/D combinations in the system. The model calculated the sum of sailing time (based on a weighted average speed for ships operating on the route), port time, and waiting times. Waiting times were related to frequency of service over a given link and transfer requirements

The frequency-related delay time was set at one-quarter of the average interval between ship calls, while the delay associated with transferring from one vessel to another was set at 12 hours (with the exception of the Columbia shuttle where passengers transferring at Ketchikan were assumed to be delayed an average of 36 hours due to shortage of capacity on vessels out of Prince Rupert).

Because of differences in traffic levels, it was not possible to merely compute the differences in total travel time among the system options. We therefore segregated travel times for those routes where traffic levels varied and calculated the average time per passenger on those routes and within the balance of the system. Peak, shoulder and low travel times were computed separately.

The average travel times under each alternative were compared with the base case times to determine time saved or lost per passenger served as a result of the new system.

To calculate total travel time impacts of a scenario, transferred passengers were eliminated since they are presumed to be indifferent to the combined time and cost effects of transferring. The remaining passengers carried

over the various routes were multiplied by the appropriate travel time changes to give gross time impacts (provided these passengers constituted part of the base demand for the system and did not represent induced traffic), while the passengers whose demand was not met by the system were multiplied by the change in travel time and the result deducted from gross impacts. This latter adjustment reflected the impact of the changed service level on the overall attractiveness of the voyage which the potential user could not take.

Finally, where new passenger traffic was induced on a particular link because of system changes (e.g. as in the long-run Lynn alternatives), the total time savings accruing to the induced passengers were divided in half on the principle that savings to marginal users represented a lower benefit than those accruing to "base demand" users.

The annual streams of net time impacts were discounted to present value at a 5% rate in order that they would be comparable with discounted cost figures.

&
PUBLIC FACILITIES
ALASKA MARINE HIGHWAY SYSTEM
BELLINGHAM ASSESSMENT

REPORT TO THE LEGISLATURE

STEVE COWPER, GOVERNOR
MARK S. HICKEY, COMMISSIONER

JANUARY, 1988

AMHS Report to the Legislature: Bellingham Assessment

I. Introduction

This report was produced by the Alaska Marine Highway System (AMHS) in response to legislative intent accompanying Chapter 95, SLA 87 (CHSSHB75, page 99). The issue identified by the legislative intent language, evaluation of Bellingham, Washington as an alternative to Seattle, Washington for the AMHS southern terminus, has been examined and the results are presented in this report.

Several general assumptions were made which underlie the analysis of all of the issues addressed here. For the purpose of comparison and in the absence of an actual traffic study, it was assumed that there would be no change in traffic level, passenger or vehicle, resulting from relocation of the AMHS southern terminus from Seattle to Bellingham. Obviously, relocating the terminus will have an effect, but the direction and magnitude of the effect could not be accurately determined absent a thorough study, although we know of no reason that would indicate that the overall impact would be large. Thus, for purposes of a fair comparison, the "no change" assumption was made.

Similarly, it was assumed that no change would be made in tariffs or fares as a result of any of the potential actions implicated in the issues raised by the legislative intent. A fair comparison of Seattle versus Bellingham as the System's southern terminus also requires that terminal facilities be assumed to be equivalent in quality and cost for purposes of present comparison. However, both facilities have existing advantages and disadvantages and these have been noted. While acknowledging a cooperative stance on the part of AMHS labor bargaining units, a conservative analysis requires that the labor agreements presently in force be used as the basis for cost estimation and

assessment of operational constraints. Finally, it was assumed that there is a continuing public mandate to provide service to Puget Sound. This final assumption may warrant more scrutiny prior to any final decision regarding southern terminus location.

It is important to bear in mind that the potential impact of the decision as to the location of the AMHS southern terminus operations in relation to AMHS operations overall is small. The annual expenditures for the Seattle facility including lease payments and head tax average approximately $210,000 per year. Using 1986 (when two vessels were in operation in the summer) as an example, Seattle embarkations represented 6.26% of the System's annual passenger load and 7.07% of its vehicle load. The revenue and expense contributions of the ships on this route are larger than these percentages of traffic would indicate. However, the revenue and expense data is not presently kept in a form that permits identification of specific revenue and expense contributions of each port in a route structure.

II. Fuel savings:

The last few years have seen considerable instability in oil and fuel prices and markets. Historic fuel prices were evaluated in an attempt to ascertain whether there were any consistent price or stability advantages to fuel delivered in either Seattle or Bellingham. Actual data that has been collected to date indicates that delivered fuel price at Bellingham has been consistently higher than at Seattle which tends to be a more competitive market, although the ARCO representative from Bellingham claims just the opposite. ARCO has as yet provided no actual historic price data.

From 1983 through 1986 data available to AMHS shows that fuel price

ranged from $.0165 to $.0225 higher at Bellingham averaging $.02 higher. In 1987 as prices continued to destabilize the range of difference was even greater, varying from $.01 to $.0225 and averaging $.0149

Fuel costs were analyzed using actual 1987 operations and currently available fuel price quotes. Only one fuel supplier (Texaco) was available to provide price quotes for fuel in both Seattle and Bellingham so those prices were used in calculating fuel cost estimates. ARCO has promised a fuel price quote in the near future and fuel cost calculations will be reviewed when that quote is received.

AMHS vessels were scheduled for 74 trips to Seattle in FY 87, the M/V Columbia for 22 trips, the M/V Matanuska for 44 trips and the M/V Malaspina for 8 trips. Using Bellingham as the AMHS southern terminus reduces the steaming distance by 66 miles each way or 132 miles per round trip for a total annual mileage saving of 9,768 miles. The shorter distance translates into an average time saving of approximately eight hours per round trip (using the scheduled speeds of the vessels—17.3 kts for the Columbia, and 16.5 kts for the Malaspina and Matanuska) as shown in the accompanying table. Time required for refueling in Seattle has no direct effect on time savings, since it is accomplished during the normal layover time.

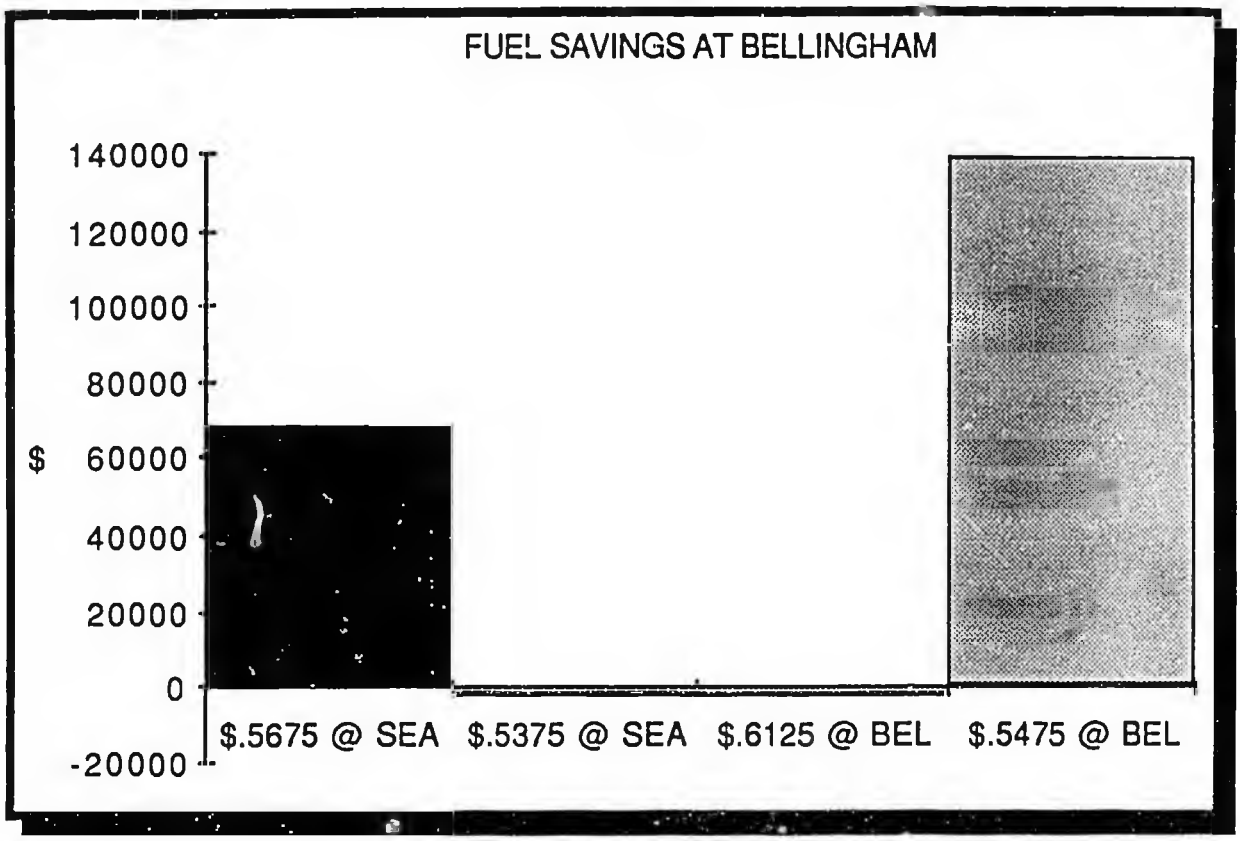
Based on the vessels used in FY 87, their scheduled speeds and fuel consumption rates used for the AMHS financial model (Columbia 413.5 gals./hr., Matanuska 241 gals./hr, and Malaspina 213.4 gals./hr.) this would save approximately 167,900 gallons of fuel each year or 2.4% of annual 1987 system fuel consumption. Based on fuel prices obtained in October 1987 the 2,337,834 gallons of fuel purchased in FY 87 in Seattle would cost

$1,326,721(at the then quoted price of $.5675). Using Bellingham the 2,169,934 gallons of fuel needed would cost $1,258,562 (at the then quoted price of $.58), for a savings of $68,159 or 1.6% of annual system fuel expense for 1987.

MILEAGE AND TIME SAVINGS AT BELLINGHAM

Ship	Trips	Dist Saved	Hrs Saved	Hrs/Trip	Fuel Saved
COL	22	2904	167.861	7.6	69410.6
MAT	44	5808	352	8.0	84832
MAL	8	1056	64	8.0	13657.6
Total	74	9768	583.861	7.9	167900

Fuel savings to be realized from using Bellingham, Washington as the System's southern terminus are very small in relation to the System's annual fuel budget ($4,359,000 in 1987). A factor far more influential than distance in the System's fuel cost structure is the price paid. A three cent decrease in the price of a gallon of fuel at Seattle eliminates any advantage in fuel savings at Bellingham (2,337,834 gals. X $.5375 = $1,256,585 at SEA vs. $1,258,562 at BEL, a difference of $2113 in favor of SEA). Conversely, an increase in price of two and one eighth cents at Bellingham negates any savings resulting from terminating at Bellingham (2,169,934 gals. X $.6125 = $1,329,084 at BEL vs. $1,326,721 at SEA for a difference of $2363 in favor of SEA).



If the time saved by terminating at Bellingham (approximately eight hours) is used to increase service there is no fuel saving, since vessels will be running additional trips using the time savings. Thus, if Bellingham is used as the System's southern terminus any large savings in fuel cost will have to be realized from a significantly lower delivered price for fuel at Bellingham which, historically, has not occurred.

III. Labor savings:

No significant labor cost savings have been identified from using Bellingham as the System's southern terminus under present labor agreements. Labor

costs for shoreside operations would not change under the assumption that traffic levels remain constant. Only a major change in the present vessel labor contracts would provide an opportunity for realization of labor cost savings resulting from the time saving to be had by terminating routes at Bellingham.

During the years that the existing AMHS labor agreements have evolved AMHS has operated on a 7 day cycle. Because this was generally taken as a given as new contract provisions were written, there are many clauses of the contracts which make it extremely expensive to depart from the 7 day cycle.

The existing contracts are based on 26 payperiods of 14 days (168 hours) in each year. AMHS crews in the Southeast System work seven 12 hour days each payperiod (84 hours), and are then off duty for the remaining 7 days in each payperiod. There are two crews for each vessel (an "A" crew and a "B" crew) consisting of two shifts each (one shift on duty and the other off duty), the ships being manned and operable on a twenty-four hour basis.

There are four clauses of the contracts that come into effect when crews are scheduled for more or less than 7 days. They are presented here only to assist in understanding the AMHS cost structure used for comparison of Seattle and Bellingham as southern terminus locations and the effects of variance from the present seven day route cycle. These contract provisions do not affect operating costs under the existing schedule (based on a seven day route cycle) as much as they affect costs under shorter or longer route cycles. The Inland Boatmen's Union (IBU) has acknowledged that these provisions would have to be renogiated if the time savings using Bellihgham were to be used to best advantage.

1. The labor contracts guarantee most employees 84 hours of pay each

payperiod. This provision is referred to as "minimum guarantee" pay.

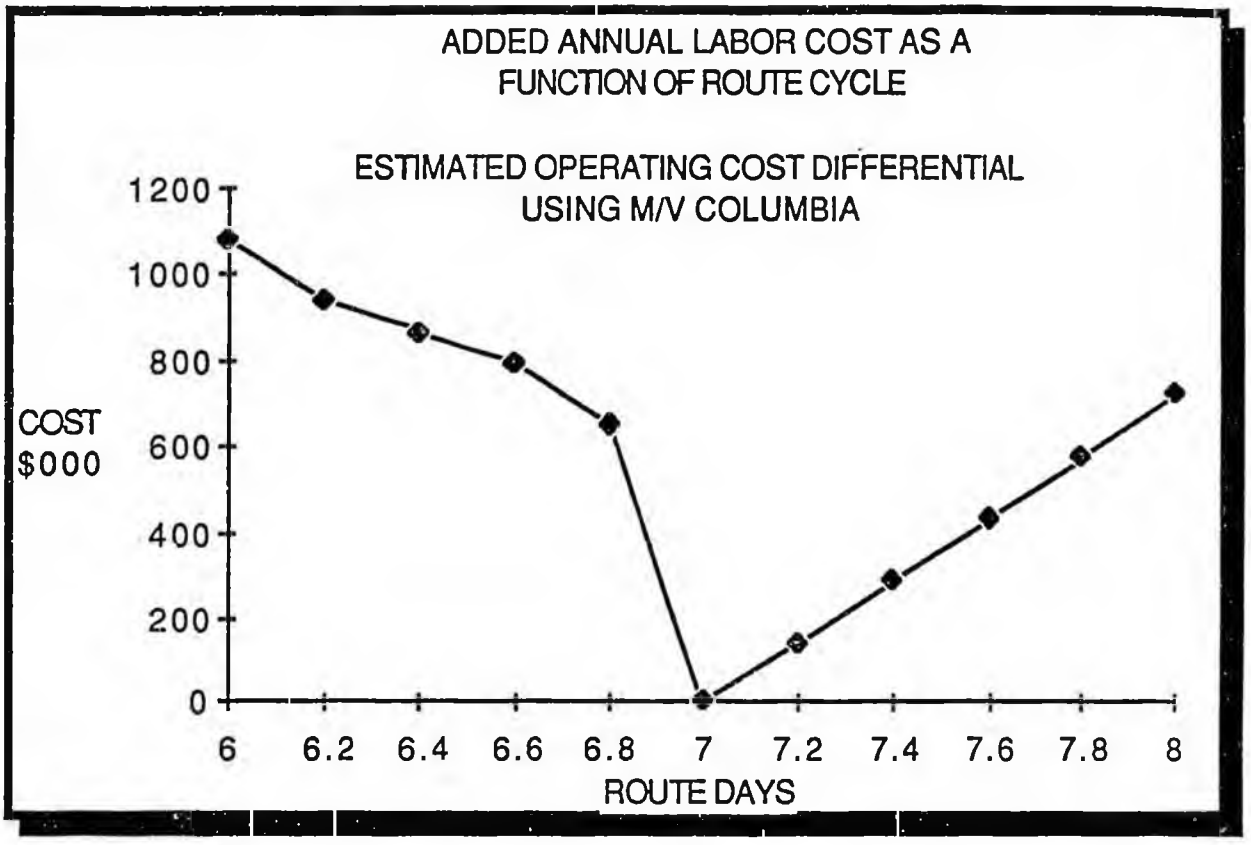
2. Overtime: For crewmembers working more than 84 hours in each payperiod the time above 84 hours is paid at 1.5 times the hourly rate.

3. Late Arrival: If a vessel is late in arriving for a crew change (i.e., more than one hour late), the crew is paid "late arrival" pay. The crewmembers "on watch" (actually working) are paid 1.5 times their regular pay. "Off watch" crewmembers (not actually working, but on the ship) are paid at their regular rate of pay, as if they were working, over and above their minimum guarantee. In addition, the other crew is being paid minimum guarantee (regular time), so the actual labor cost of operating the vessel is well in excess of the normal labor cost.

4. Early Callback: If a crewmember is assigned to begin work less than 7.0 days from the end of his/her previous assignment, he/she is paid "early callback" pay (1.5 times the regular rate), with a minimum of 12 hours of pay. This applies to both the "on watch" and the "off watch" crew members and is in addition to minimum guarantee pay.

It is important to note that these contract provisions often interact or compound raising labor costs significantly. Take, for example, the M/V Columbia operating on a regular 6.2 day route time. In any given payperiod one crew (say the "A" crew) will work 7.8 days while the "B" crew works 6.2 days. The "A" crew will be paid for late arrival, since it is 0.8 days over its normal 7 day work week. The "B" crew will be paid early callback since it had only 6.2 days off. In addition, the time over 7.0 days (0.8 days) for the "A" crew will be paid at overtime (1.5 times the hourly rate). The "B" crew will also be paid at the early callback rate for 0.8 days (with a minimum of 12 hours at this rate), since there was only 6.2 days between trips. In addition, the "B" crew is

paid minimum guarantee for 0.8 days, since it is scheduled for only 6.2 days. As the route time moves further from the seven day cycle, labor costs escalate significantly as illustrated in the accompanying chart.



On an annual basis these added costs would become significant. Assuming the previous example, if the time savings advantage of Bellingham is used to provide a slight increase in service (two additional trips in summer and two in winter for a total of four annually) the shorter route cycle out of Bellingham is estimated to cost an additional $2,244,500 over existing service to Seattle (or to Bellingham), not attempting to use the time saving.

Although the various labor agreement clauses were not adopted to institutionalize the seven day route cycle, the effect has been to make deviation from such a cycle extremely expensive. While the labor agreements provide for

re-negotiation of these issues at the time that they arise, absent such a re-negotiation of this structure, labor savings to be had in vessel operations with routes terminating at Bellingham are very small. In fact, it is very difficult to realize any service improvements (except longer Southeast Alaska port layovers discussed later) available from the time saved by terminating at Bellingham without triggering significant increases in vessel operating expense inherent in this labor structure. Thus, the structure of the current AMHS labor agreements do not add to the desirability of Bellingham as a port of call. The time saved on each trip by terminating at Bellingham would present the opportunity of reducing the risk of late arrivals for crew changes and would, thus save a small amount if service levels and route cycles remain as they presently exist.

IV. Lease savings & relative quality of passenger facilities offered by Bellingham vs. Seattle:

As of the date of this report lease costs for a terminal facility at Bellingham are unknown. The Port of Bellingham has allocated $2,000,000 for site improvements to accommodate AMHS use of its facility. As presently understood the Port does not intend to recover this investment directly from AMHS, although it must be assumed that a return on investment is expected in some manner, perhaps through a head tax or some other form of user fee. The lease with the Port of Seattle for the present facility expires in 1989, and costs for a renewal of the lease are also presently unknown. As mentioned previously in section I, the annual expenditures for the Seattle facility, including lease payments and head tax, average approximately $210,000 per year. At one time there were plans by the Port of Seattle for improvements to the Pier 48

area, but none have been presented recently. The Port of Seattle has expressed a willingness to work with the State and is currently making some structural improvements to the existing facility. (For details of the earlier Port of Seattle proposal see Development Feasibility of Pier 48, April 1985, prepared for the Port of Seattle by Leland & Hobson, Urban Land Economics.)

Each of the ports presently under consideration has certain advantages and disadvantages. Pier 48 at the Port of Seattle is a presently functional facility providing immediate access to downtown Seattle and to the rest of the greater Seattle area via public transportation. Although by no means optimum, all operational requirements are in place at Seattle including mooring and transfer structures, staging area, passenger ticketing and waiting facilities, longshoring arrangements, fueling arrangements, crew licensing requirements, coast guard regulatory requirements, etc. Pier 48 has its disadvantages as well. There are structural problems, some of which are in the process of being corrected by the Port of Seattle. The facility as a whole is aging and becoming increasingly difficult to maintain in an attractive manner consistent with the expectations of the traveling public, the waiting area in particular is only marginally acceptable. The location of the facility is a disadvantage as well as an advantage that it is in a traffic congested area of downtown Seattle that makes it difficult for the traveler to find and get to the facility. The present location also prevents expansion of the parking and staging area to accommodate future traffic growth. There is no dockside fueling capability, requiring that the vessel be moved to the fuel dock for fueling and then back to Pier 48 prior to departure, a more expensive process than if fueling were available at dockside.

Bellingham offers the advantage of slightly less trip distance from Alaskan

ports than Seattle, potentially reducing travel time for AMHS users, offering the potential of fuel savings due to the shorter distance and/or slower vessel speeds and scheduling flexibility. If AMHS labor contracts were changed to eliminate or significantly reduce the cost impacts of variances from the seven day route cycle, some additional service could be realized by the shorter running time to Bellingham.

Even if the time savings at Bellingham cannot be used to provide additional service due to increased labor cost, the time saved can be applied to minimize the risk of late arrival or to increase port time in Alaskan ports to the economic benefit of Alaskan communities. Dockside fueling is permissible at the existing Bellingham facility. Absent facility improvements, specific arrangements would have to be worked out, and it is understood that fuel delivery would be by common carrier (truck). Based on obtainable information from one supplier, this delivery method could increase the cost of fuel by as much as $.03 per gallon over the standard delivered price due to the increased cost of compliance with environmental regulations.

Disadvantages also exist at Bellingham but are not prohibitive. Shorter travel time will result in lower stewards revenues as those revenues are tied directly to the length of time that passengers spend on board the vessel. There are presently no terminal facilities available at Bellingham and it is not clear that the docking facility at the Port of Bellingham adequately meets operational requirements for vehicle and passenger transfer. There are use conflicts at the existing Bellingham facility which would also have to be resolved. Priority of use of the dock face among the various Port users (AMHS and commercial) would have to be resolved. Similarly, the dockside, presently used for cargo staging would have to be scheduled in such a way as to accommodate AMHS

vehicle parking and staging. Warehousing space in Bellingham would have to be acquired at an as yet undetermined cost. All operational requirements would have to be established at Bellingham including mooring and transfer structures, staging area, passenger ticketing and waiting facilities, longshoring arrangements, fueling arrangements, crew licensing requirements, coast guard regulatory requirements, etc.

Analysis of this issue shows that the most reliable way to evaluate potential lease costs at either Bellingham or Seattle, or, for that matter, at any other potential southern terminus port, is to invite proposals from all qualified parties for the provision of southern terminus facilities. In the alternative, another approach would be to enter into detailed negotiations with the ports which have presently expressed an interest (Seattle and Bellingham). To either end, an initial draft statement of the basic requirements for a southern terminus facility for AMHS has been prepared and is attached as Appendix A.

V. Other Issues:

A number of issues with cost impacts have been identified, but have not yet been resolved. Time required to fuel ships at Bellingham is unknown, as are any other incidental fueling costs (i.e., moving the ship for fueling, special fuel handling equipment or modifications to the vessels, personnel procedures or training requirements, etc.). Longshoring costs at Bellingham are unknown, but brief discussions with ILWU representatives indicate that such costs would be competitive with Seattle. Pilotage costs would be incurred in the first year until pilotage endorsements could be obtained by AMHS licensed crews. A U.S. Coast Guard certificate of adequacy would have to be obtained before the facility proposed for use at Bellingham could be used. Head tax assessments at

Bellingham are unknown as are such taxes at Seattle under a renewed lease. While such taxes are not a net cost to AMHS (being passed on to users through the fare structure) they could potentially influence fares to a degree that would adversely affect traffic.

Impacts to commercial users are unknown as well, although initial indications are that there would be at least a temporary adverse impact to such users from having to move goods, trailers, containers, etc. from central supply points in Seattle to Bellingham. These users will incur additional costs and time which may adversely affect product and service quality as well as add to Southeast Alaska consumer costs.

Generally speaking, Bellingham is not an end destination for the great majority of users of the AMHS Puget Sound service, whereas Seattle is the end destination for many such users. Thus terminating at Bellingham would result in a need to continue a trip by some other mode for almost all AMHS travelers. One of the primary origins or destinations for AMHS users, Seattle-Tacoma International Airport, is an additional ninety-six road miles from Bellingham or approximately two hours driving time (and longer during rush hours), with other Seattle area destinations being somewhat less.

AMHS passenger loads disembarking at Seattle average approximately 500 passengers and 90 vehicles with a peak of approximately 750 passengers and 140 vehicles. Of these passengers approximately 30% to 35% of the average load is without a vehicle and approximately 40% to 50% of peak loads are without vehicles. This translates into a demand on the public transportation system of 150 to 175 passengers on average and a peak of 300 to 375 passengers disembarking from the ferry and seeking transportation into or out

of Bellingham. Public transportation into and out of Bellingham and the Whatcom County area consists of air and bus service. Greyhound bus service provides five southbound and six northbound trips per day. Air service is provided from Bellingham airport to Seattle, Vancouver, Portland, and the San Juan Islands. PSA provides three jet flights to Seattle daily (except Sunday), Horizon Air provides nine commuter flights to Seattle daily, and San Juan provides nine Seattle commuter flights daily on weekdays and five flights a day on weekends. Thus there are twenty one flights per day to Seattle on weekdays. San Juan also provides five flights per weekday to Vancouver, two flights to Portland and one flight per weekday to the San Juan Islands. Both Bellingham airport and the Greyhound bus terminal are served by the Whatcom Transportation Authority, the agency which would also serve the proposed ferry terminal.

It is not expected that relocation to Bellingham would have much impact on tourist vehicle traffic, either north or southbound, since these travelers have the means (their vehicles) to reach either Bellingham or Seattle or to continue their journey upon arrival at either port. Likewise, tour groups traveling by bus would not likely be seriously affected. Operating from Bellingham would improve access to Canadian walk on traffic, being much closer to British Columbia ferry terminals.

A significant adverse impact may occur to tourist and Alaskan travelers without vehicles. For these travelers, the Seattle location is more conveniently accessed by public transportation (notwithstanding air, bus and rail access to Bellingham which must be obtained by making a change of some sort in Seattle in any event). Specifically for this group of Alaskan travelers, the present Seattle location makes a wide range of big city goods and services immediately

accessible upon arrival. Relocation to Bellingham would force this group of travelers to attempt to duplicate those goods and services in Bellingham, to change modes and continue their trip to access those goods and services in Seattle potentially requiring additional expense and inconvenience, or simply to choose direct air travel to Seattle for the same purpose. This group of travelers is a small percentage of overall traffic, especially in summer, but a larger portion in winter and is also the group most dependent on AMHS service. However, it should be remembered that the mission of the AMHS is efficiently delivered basic transportation and not necessarily the most convenient transportation as seen from the perspective of any individual user group.

Taking all of these factors into consideration and recognizing that a market assessment has not been performed, there would very likely be little or no overall negative impact on passenger or vehicle traffic resulting from the relocation of the southern terminus operations from Seattle to Bellingham. This conclusion should be confirmed by a more detailed investigation of the impacts to AMHS traffic that would be incurred by relocation.

Even with its attendant access difficulties, the present location at Pier 48 in Seattle is a known quantity, and a certain "good will" (in the business sense) has been established at and because of that location. Relocating will abandon that "good will" and trigger expenses for its reestablishment at the new location. On the positive side of this issue Bellingham has expanded its port operations in recent years through an aggressive and continuing marketing effort and there is a good potential for AMHS to benefit from this effort, somewhat offsetting the cost involved in reestablishing itself in the new location.

An operational impact that is real but as yet unquantifiable, is the impact on supply operations if the southern terminus is located at Bellingham. Supplies

presently delivered to the terminal at Seattle for use throughout the System would have to be delivered at Bellingham. It is not certain at this time whether such a change in delivery point would have an overall positive or negative impact on price or timeliness of delivery of necessary parts, tools and supplies.

Relocation expenses would be incurred (which are presently not known) for moving the furniture, equipment and supplies presently used or stored at the facility in Seattle. Seattle personnel will either have a long daily commute or will have to relocate to continue their employment. For those who choose to do neither, their will be a hidden cost to AMHS of acquiring and training replacements as well as the cost to the employees of replacing their jobs.

VI. Conclusion:

Based on this analysis, Bellingham is found to be an acceptable alternative location for AMHS southern terminus operations pending resolution of previously noted unresolved issues and clarification of the cost and quality of terminal facilities. Likewise, Seattle is and will remain an acceptable location for the AMHS southern terminus. Other alternative locations might also be workable, but have not been analyzed as part of this review.

Using Bellingham as the AMHS southern terminus could provide a small fuel cost saving if no additional service were attempted using the available time savings but such savings are very small in relation to the overall AMHS operational cost.. Bellingham also offers some additional scheduling flexibility. Seattle offers the convenience of proximity to city goods and services and an established location, but the detractions of the aging structure and traffic congestion force a reexamination of the location and a look at other useable

locations.

It is sufficient to say that Seattle and Bellingham both qualify as locations for AMHS southern terminus operations, though they both carry deficiencies that must be remedied before any long-term commitment is made in either location. Invitations for proposals from all qualified locations for the provision of southern terminus facilities is one reliable way of resolving these issues. Another way would be to enter into detailed negotiations with the ports which have presently expressed an interest (Seattle and Bellingham).

User desires, especially the desires of the users of the Puget Sound service, will be solicited and considered, though the final decision will not be made on the basis of this factor alone. One of the first tasks for the newly appointed AMHS Advisory Council will be to ascertain and communicate to DOT&PF management the needs and desires of the users of the Seattle service.

The following are the key factors which will weigh heavily in the decision as to which port will best serve AMHS needs: (1) the quality of facilities to be provided as well as the cost of those facilities, direct and indirect; (2) preferences of the users of the service as elicited by the AMHS Advisory Council and through other means; and (3) reasonable resolution of the issues relating to the needs of commercial users and walk-on passengers. The issue of AMHS southern terminus location, while not the most significant issue facing the AMHS this session deserves serious consideration by all. The Department will proceed with the solicitation of proposals or negotiations on a schedule which will accommodate public review of the results of the proposal or negotiation process and render a choice as to which port will be used by late summer or early fall of 1988.

DRAFT

BASIC TERMINAL REQUIREMENTS

Basin

Water Depth - -25 to -30 MLLW
Width - 250' Min
Length - 500 Min

Berth

Berth and Approach - Oriented such that last ¼ mile of approach and longitudinal axis of vessel in berth is nearly parallel to major wind and waves.

Moorings

Berthing Energy - Selected in accordance with rational design criteria and modified appropriately for exposure, etc.

Mooring Line Loads - 50 kips min.

Line Handler Access - Continuous throughout tie up points.

Transfer Structures

A) Layout to accommodate stern load.
B) All tidal flexibility with max. grade at ELW not to exceed 15% and max grade at EHW not to exceed 4%.
C) Capacity - AASHTO HS-20 with impact.
D) 16'0" min roadway width.
E) Separated and covered passenger access to upper passenger deck of vessel.

Electrical Power & Illumination - Adequate power should be provided to accommodate existing and future loads. Auxiliary power generation should be provided to power essential facilities in case of utility outage.

Illumination of parking, staging, and security areas should be at a level consistent with accepted standards for facility type. Linehandler accesses and mooring points shall be well illuminated and take into consideration potential conflicts with visibility of ships operators during berthing and approach maneuvers.

Parking and Staging

A) Area sized to accommodate 100 passenger vehicles and 20 vans (i.e., 20' - 40').

B) Vehicle staging area to have access control to accommodate orderly staging and maneuvering of embarking traffic, isolate staging operations from transient traffic and provide necessary staging security.

C) Staging lanes to be parallel and number required to be determined by ports served.

Parking: A) Facility should provide:
1) 20 short term parking spaces.
2) 10 long term parking spaces.
3) Employee parking - Based on number of shoreside employees and be totally separate from long or short term spaces provided.
4) Transient, bus and taxi, spaces should be provided to accommodate percentage of foot traffic anticipated and verified by real time analysis.

Traffic Flow

Embarking Traffic: Separate entrance with adequate traffic lanes to divert traffic to respective terminal operations (e.g., embarking, transient, short term, long term, etc.).

Disembarking Traffic: Separate exit lanes that do not conflict with embarking vehicle traffic and allows easy access to major transportation networks. Foot passenger access should be provided to a separate area that provides adequate ground transportation and information.

Passenger Terminal and Ticketing

Architecture and Landscaping: Alaskana, incorporating major elements of statewide culture and development, so as to provide a well rounded first impression of Alaska, its history and its people.

Baggage Handling - Provisions should be included to accommodate loading and unloading of passenger baggage via the existing ship baggage cart.

Ticketing and Waiting Area -	Areas required to accommodate passenger waiting and ticketing should be proportioned in accordance with accepted criteria and based on a current operational analysis of anticipated demand along with projections for future demand. An information center should be provided to answer questions regarding vessels, ports of call and general system information. Short term security storage should be provided.
Warehousing and Administration	Separate areas shall be provided to accommodate the existing port administration functions, as well as marshalling areas to accommodate existing provisioning requirements and general port storage volume.

SOUTHEAST ALASKA TRANSPORTATION PLAN

EXECUTIVE SUMMARY

Introduction

Since 1980, when the previous Transportation Plan for Southeast Alaska was adopted, many changes have occurred in both the needs and opportunities for transportation development within the Region. The Alaska Department of Transportation and Public Facilities therefore undertook, early in 1985, to prepare a formal update of the Transportation Plan in order to ensure that the planned policies and directions fully reflected the existing and anticipated needs and concerns with regard to regional transportation services.

Planning Process

The Department established a joint Technical Committee with representation from the Southeast Region Planning Division and the Alaska Marine Highway System, and engaged the consulting firm of Acres International Corporation to assist in defining and evaluating alternative transportation schemes.

The Department also solicited ongoing community involvement in the planning process through the distribution of newsletters and the insertion of newspaper advertisements advising of the planning effort and requesting comments and suggestions. Responses to these advertisements, as well as community comments put forward during other recent workshop/hearings processes, played a vital role in the formulation and assessment of transportation alternatives.

Plan Development

An initial step in the planning effort was to carry out a careful review of the goals which the revised Plan should strive to achieve. These were ultimately defined as:

- meet resident demands for travel to and within the Region;
- facilitate development of the regional economy by providing supporting transportation services;
- maintain fiscal responsibility through judicious allocation of public funds.

Unfortunately, the goals are not mutually compatible and, within the present economic environment, are not collectively achievable. One of the tasks in developing the proposed plan was to suggest a compromise that would enable a balance to be achieved between demands for services and the current and likely future fiscal environment.

The steps taken in developing the revised Transportation Plan involved first updating the projections for future transportation needs to, from and within the Region; reviewing the existing transportation system; and reviewing future prospects (technological and operational) for the provision of transportation services.

A wide range of alternatives were then postulated for both air and surface transportation services. Options were defined for both specified corridors nd for the Region as a whole and were defined for both the short-term and long-term planning horizons. These options were evaluated from a number of viewpoints including cost to the State, cost to the user, capacity to meet demand, service level, and service/cost effectiveness.

On the basis of these assessments, a proposed plan was formulated which attempted to balance between the anticipated needs of the residents in terms

of transportation and economic development and the constraints imposed by the need for fiscal responsibility.

This proposed plan was laid out in a Draft report and distributed to communities throughout the Southeast Region. A series of community workshops were conducted in 20 regional communities to present the plan, respond to questions and obtain residents' opinions on the plan and its components. Written comments from residents were also solicited. Community response to the Draft Plan was carefully assessed and, where possible, modifications were incorporated into the Final Plan in response to residents' concerns.

Regional Transportation Plan

The final Regional Transportation Plan foresees an ongoing role for both air and surface transport in the Region. In terms of aviation, the short-term focus is on completing current airport runway extensions at Klawock, Kake and Hoonah, on maintaining and improving existing airport facilities, on upgrading existing seaplane floats and on improving air navigation and safety through additions and improvements to navigation aids. In the longer-term, the focus is on maintaining options for further development of wheeled-aircraft facilities up to and including commuter aircraft standards.

In terms of marine transportation, the short-term focus is on improving marine highway services and revenues by scheduling a second mainline vessel to Seattle (where demand is strong) and providing initial high-speed ferry services in the Ketchikan-Prince of Wales-Clarence Straits region.

The longer-term plan focuses on additional use of high-speed ferries for intra-regional travel, particularly in the Sitka-Juneau and Juneau-Skagway corridors, thus providing improved access to residents and freeing up the mainline vessels to offer additional service and capacity out of the southern termini (Prince Rupert and Seattle). In addition, private operators would be encouraged to supplement peak season service out of Seattle by providing vessels with vehicle capacity.

In terms of road transportation, the short- and long-term focus is on maintaining and upgrading existing road links. While several new inter-community links were evaluated, it was concluded that, under current prospects for traffic growth, these links could be served in a more cost-effective manner by the Marine Highway. It was recommended, however, that the concept of a road up the east side of the Lynn Canal, connecting Juneau with either Haines or Skagway or both, be periodically re-evaluated, particularly once high-speed ferry service has been introduced.

Role of the Regional Plan

The Southeast Alaska Transportation Plan described in this document presents the Department of Transportation and Public Facilities' goals, policies, and general overall plan for maintaining and improving the State's regional air, land and marine transportation services and facilities. The Regional Plan recognizes the statewide aviation policies and standards established in the Alaska Aviation System Plan. The Regional Plan evaluates and compares air, land and marine alternatives to develop an integrated multi-modal transportation plan, which provides general direction to specific modal planning efforts such as airport master plans and the Alaska Marine Highway System plan.

These plans, together with community plans, provide direction in establishing regional transportation priorities and in developing the Department's 6-year Capital Improvement Program, which itemizes specific projects to be undertaken. Those projects which are scheduled in the first 1 or 2 years of a Capital Improvement Program are then submitted annually to the Legislature for funding.

1 - INTRODUCTION

1 - INTRODUCTION

1.1 - Background

In 1980, Southeast Alaska developed a long-range plan for the provision of transportation services within the Region. The plan defined operating concepts and facilities requirements and drew extensively on input from residents and research dating from 1977. In the period of time that has elapsed since this review, much has changed relative to the basic assumptions and concepts embodied in this plan.

The 1980 Plan, for example, saw increasingly scarce and expensive fuel impacting significantly on transportation both in and to Southeast Alaska. There were high expectations relative to resource development, growth in visitor travel and the ability of Alaska to fund new equipment to meet the needs of both resident and tourist. In addition, the possibility of a move the State capital gave an aura of uncertainty to perceived needs.

Since the implementation of the 1980 Plan, the move of the capital has been shelved, resource development has been constrained by lack of demand in world markets, and oil is readily available and relatively cheap. The change in fortune of the oil industry, while beneficial to the traveler, has seriously eroded State revenues. Thus, Southeast Alaska is faced with increasing demand for travel, but limited resources with which to meet that demand.

While the original Transportation Plan was always envisaged as a flexible planning tool that could, and would, be changed to adapt to different circumstances, the extreme changes that have occurred necessitated a formal update to review policies and direction and to determine the likely direction of transport within the region to the end of the century.

Accordingly, early in 1985 the Alaska Department of Transportation and Public Facilities undertook to update the 1980 Regional Transportation Plan in order to ensure that the planned development of transportation facilities

fully reflected the existing and anticipated needs and concerns within the region. A joint Technical Committee was established, comprised of representatives from the Southeast Region Planning Division and the Alaska Marine Highway System, and given the mandate to update and modify, as necessary, the 1980 Plan. In addition, the consulting firm of Acres International Corporation was engaged to assist the Technical Committee in defining and evaluating alternative transportation systems for the Region, and in formulating and presenting the updated Transportation Plan.

1.2 - Role of the Regional Plan

The Regional Transportation Plan is intended to present the Department of Transportation and Public Facilities' goals, policies, and general overall plan for maintaining and improving the State's regional air, land and marine transportation services and facilities. The Southeast Region Plan recognizes the statewide aviation policies and standards established in the Alaska Aviation System Plan.

In general terms, the Regional Plan evaluates and compares air, land and marine alternatives to develop an integrated multi-modal transportation plan, which provides general direction to specific modal planning efforts such as airport master plans and the Alaska Marine Highway System plan. These plans, together with community plans, provide direction in establishing regional transportation priorities and in developing the Department's 6-year Capital Improvement Program which itemizes specific projects to be undertaken. Those projects which are scheduled in the first 1 or 2 years of a Capital Improvement Program are then submitted annually to the Legislature for funding.

1.3 - Goals and Objectives

As part of the planning process, a careful review was carried out with regard to the goals which the updated Transportation Plan should strive to achieve. These were ultimately defined as:

- meet resident demands for transportation to and within the Region;
- facilitate development of the regional economy by providing supporting transportation services;
- maintain fiscal responsibility through judicious allocation of public funds.

Unfortunately, within the present economic environment, these goals are not collectively achievable, and one of the tasks of the proposed plan was to suggest a compromise that would enable a balance to be achieved within the current and likely future fiscal environment.

1.4 - Community Involvement

A key policy recommendation in the original Transportation Plan was to provide the opportunity for effective public participation in transportation decisions. In the past few years, the Department of Transportation and Public Facilities, Southeast Region and the Division of Alaska Marine Highway System have both maintained a program of community involvement in the ongoing planning process. In 1982, anticipating an update of the Regional Plan, the planning section held a series of community workshops to solicit opinions and concerns on the current transportation system. In addition, community hearings were held in conjunction with the studies of the 1984 Governor's Task Force on the Marine Highway.

As part of the present plan update, the planning team carefully reviewed the comments and issues which were raised at these community workshops and hearings. In order to ascertain whether additional concerns had arisen

since that time, a newsletter was sent to all parties who had previously expressed ongoing interest in the transportation system. The newsletter advised that the plan update was underway and requested that they inform the consultants of their current concerns and suggestions with regard to regional transportation. In addition, notices were inserted in all community newspapers throughout the Region advising the public of the planning effort and requesting their input. Many letters were received in response to these requests and the comments carefully noted in developing the plan revisions.

Once the Technical Committee and consultants had completed their evaluations, a 'Draft' updated Regional Transportation Plan was developed and distributed to the communities in February 1986. The Department and consultants then carried out a series of workshops in 20 communities throughout the Region during the latter half of April in order to present the Draft Plan to residents, respond to any questions, and solicit community reactions to the proposed Plan components. Subsequent to the workshops, communities and individuals were given the opportunity to provide additional comments in writing to the Department of Transportation up to the end of the first week in May.

Community reactions obtained through the workshops and through written replies were thoroughly reviewed and analyzed. In general, public response to the Plan was favorable with 80% of the participating communities according it an overall average rank of approval. Where negative comments and alternative suggestions were raised, they were carefully assessed and, insofar as possible, reflected in the final Regional Transportation Plan.

2 - PLANNING FRAMEWORK

ALASKA LEGISLATURE COMMITTEE FILES 1987 - 1988 8672
5128 HTRA COMM. MTGS: AK. MARINE HWY. (FILE 1) - (FILE 2) 700

2 - PLANNING FRAMEWORK

2.1 - General

In the years since the previous Transportation Plan was developed, a number of changes have occurred in the Southeast Alaska Region. Some of the changes have been generated internally but many have been generated by outside forces which have impacted on the needs and opportunities within the area.

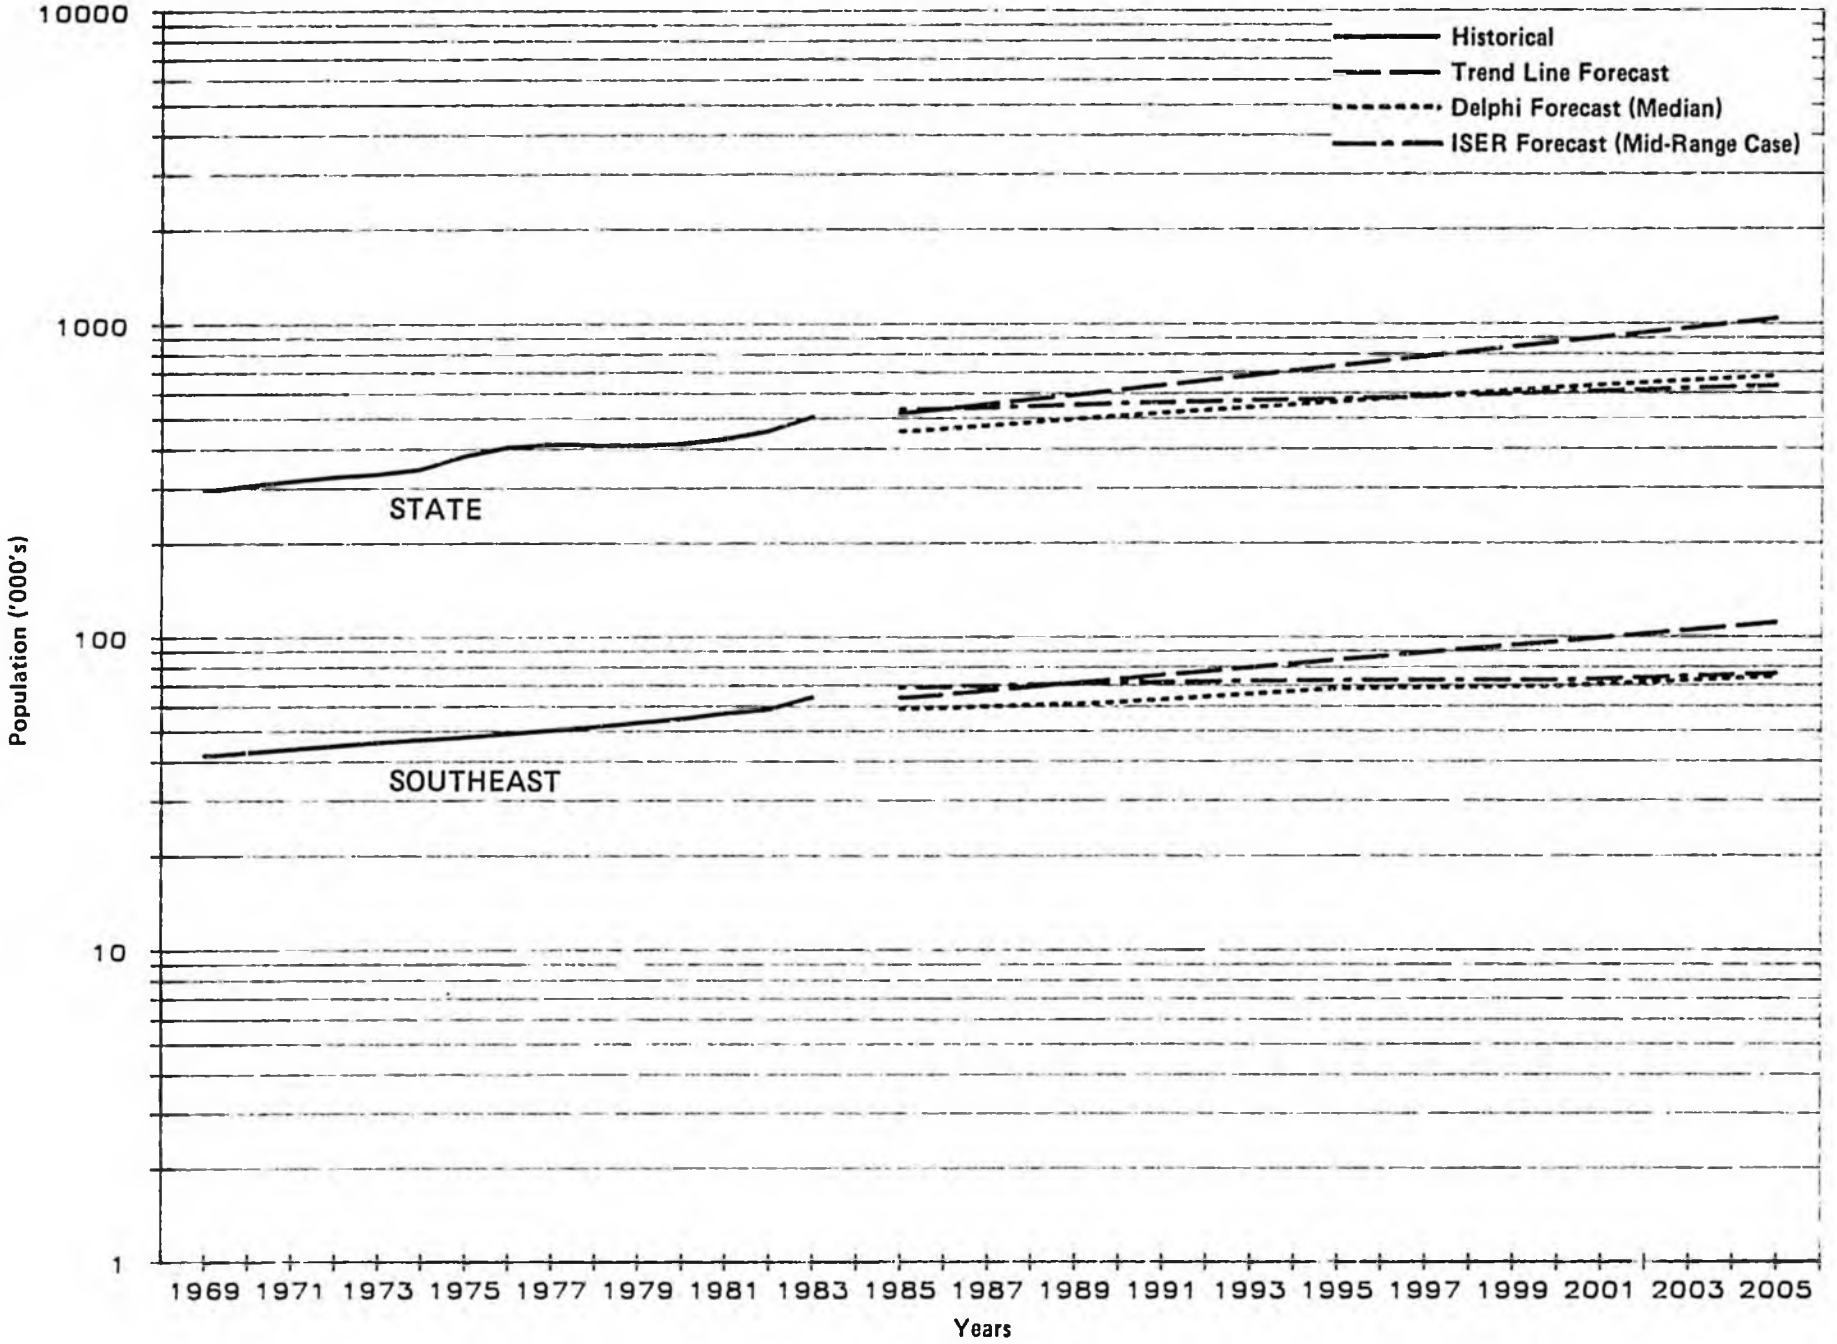
The intervening years have seen a marked decline, for example, in the resource markets on which a substantial portion of the Alaskan economy is based. Falling oil prices have placed downward pressure on government revenues, while poor markets for forest products and minerals have led to curtailment or deferral of projects which were originally planned for the early 1980s. These factors have led to an increasing reliance on the tourist market, which has remained strong in spite of generally poor economic conditions.

Within the region, shifts in population and income have altered the demand pattern for transportation services. In addition, system changes made as a result of the 1980 Plan have provided added information regarding the interactions between demand and services and have highlighted new areas of service shortfalls.

These factors have combined to create a new context in terms of transportation demand within the Region. At the same time, some significant changes have occurred in the supply side of the equation as new transportation technologies and new types of service have evolved as practical options.

As a result, there is a clear need to re-evaluate the transportation planning framework in terms of:

Figure 1
ALASKA POPULATION FORECASTS



- expected changes in the demand for service;
- the base or existing transportation system; and
- the technological changes which may be available for future integration into the transportation network of the Region.

2.2 - Population and Tourism Growth

The key factors contributing to changing demand for transportation services in Southeast Alaska are the growth in regional population and the growth in tourist traffic into the area. In a survey carried out in 1983, almost 60% of the air travelers and 40% of the Marine Highway users were Alaska residents. In addition, on the Marine Highway, almost 50% of the travelers (and over 70% of summer travelers) were tourists. These two markets, resident and tourist, clearly account for the major portion of transportation demand in the Region, and the future growth in these markets will play a key role in defining the need for transportation services.

In the past, population growth in the Southeast Alaska region has generally remained fairly stable and relatively strong. Since the late 1960s, the population of the Region has grown at a fairly consistent rate of 2.5% to 3.0% per year, somewhat lower than the State average of 3.5% but without the marked swings seen in statewide population trends.

In the late seventies it was expected that, provided the State capital was not moved from Juneau, the long-term population growth rate could be maintained at around 2.8%, with the Region's population increasing to over 100 000 persons by the year 2000. More recent forecasts, however, have been more pessimistic (see Figure 1, opposite). In part because of the Region's dependence on State government employment and the expected need to reduce State spending, these forecasts have generally predicted a decline in the long-term annual growth rate. A Delphi forecast prepared in 1983 projected regional population growth of less than 2.5% per year to 1990, declining to below 2% from 1990 to 2000 and less than 1.5% thereafter. The Alaska

Institute for Social and Economic Research, using the detailed State Economic Model, has projected even lower growth rates for Southeast population ranging from a low of less than 0.5% per year in their pessimistic case, up to an average of less than 1% in their optimistic scenario.

In light of these forecasts and the generally weak long-term prospects for the Region, it was decided, for planning purposes, to project that regional population could maintain its long-term growth rate (2.8%) through to the end of the 1980s but that growth thereafter was likely to decline and stabilize at a rate of 1% per year. Total regional population was forecast to reach 73 900 persons by 1990, and 85 800 by 2005.

The second key market for transportation services is tourist traffic. Relatively little data are available on the growth in this market, but indications are that visitor volumes have grown at an average annual rate of 4.5% in recent years. The long-term prospects for this market are strong as increasing proportions of the population find themselves with the leisure time and financial means to indulge their desire for travel.

It is too early to tell whether Alaska can sustain its share of this growing market, just as it is difficult to predict the portion of these visitors who will make use of State-operated transportation services (airports, roads and the Marine Highway). For planning purposes, however, it was assumed that tourist demand for transportation services into and within the Region would continue to grow at 4.5% per year to 1990 and would taper off to 2.5% per year thereafter.

2.3 - Existing Transportation System

The transportation system currently in place in Southeast Alaska has also changed somewhat since the introduction of the 1980 Transportation Plan. The existing network consists of three key components--the aviation, the marine and the road systems.

2.3.1 - Aviation System

Air traffic demands in Southeast Alaska are met by a range of carriers from intra- and inter-regional jet airlines through to small float-plane operators.

Two air carriers provide jet service to Southeast Alaska: Western Airlines and Alaska Airlines. Western flies a Seattle, Juneau and Anchorage route year-round with Boeing 727 aircraft and also provides a summer service into Ketchikan from Seattle. Alaska Airlines, the major large carrier in Southeast Alaska, provides service with Boeing 737/727 aircraft. It serves Yakutat, Juneau, Sitka, Petersburg, Wrangell and Ketchikan with at least two jet aircraft flights per day year-round, and serves Gustavus with one jet flight a day in the summer and with small aircraft service in the winter. During the summer of 1985, Juneau had nine Alaska Airlines flights a day scheduled, while Ketchikan and Sitka each had seven scheduled flights per day. All of the flights originate or terminate in Seattle, Anchorage or Fairbanks. With a total population of some 53 500 in 1983 for all the communities being served with jet aircraft, it can reasonably be argued that this airline service is excellent for the size of the communities and traffic demand.

The jet carriers also provide a substantial freight capability to and from the region carrying high-value perishable cargos as well as mail. On some flights, as much as half of the passenger bay is turned over to cargo while in other cases whole aircraft will be chartered to move full loads of fresh fish.

Commuter air service of the type that is common in the lower 48 States (that is twin-engined aircraft, usually turbo-props, carrying between 18 and 44 passengers) does not exist in Southeast Alaska. This is chiefly attributable to the high level of jet aircraft service provided to all the major communities in the Region and the lack of additional communities with sufficient traffic to justify intermediate sized aircraft.

Apart from jet services, there are a number of scheduled air taxi operations in the Southeast Region offering a wide range of services and service

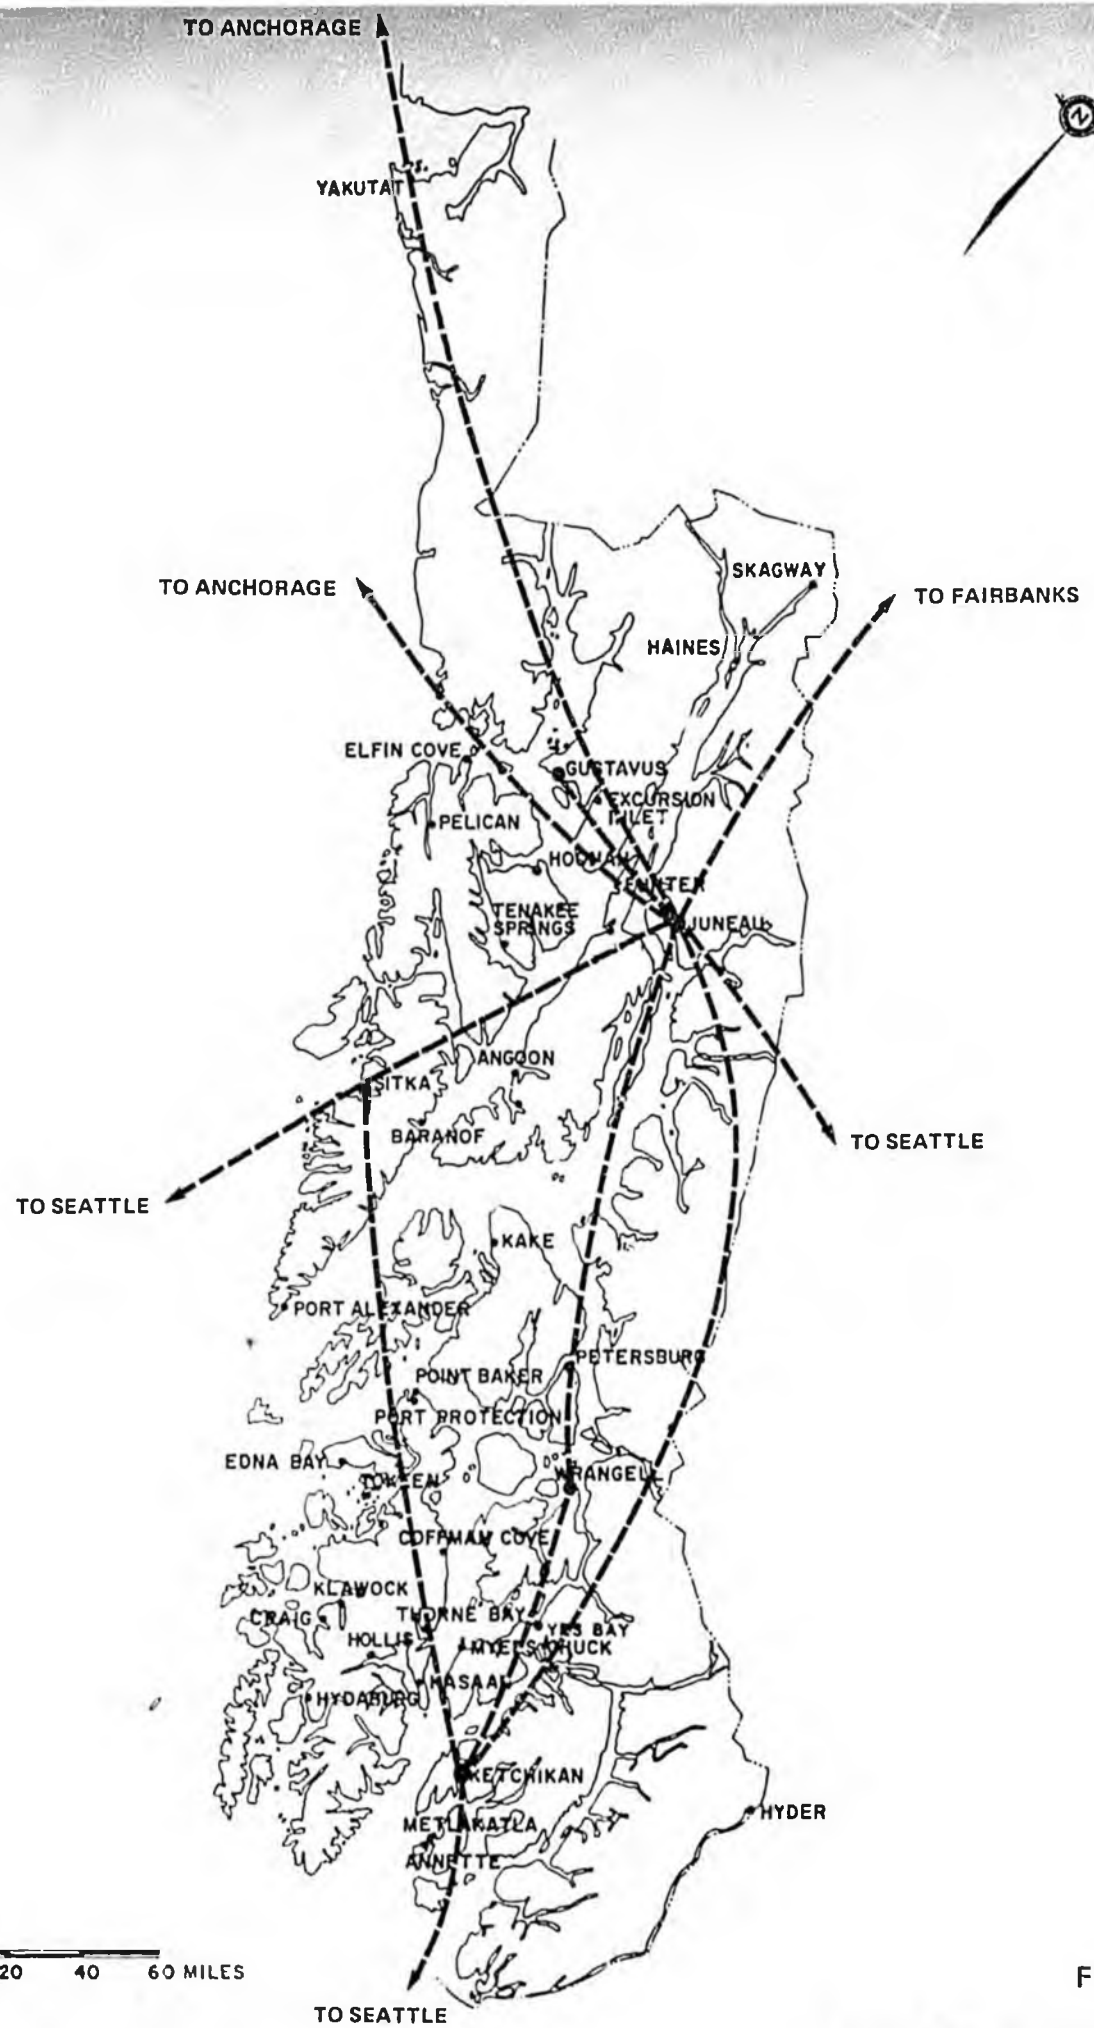


Figure 2

MAIN LINE JET SERVICE

frequencies into various communities. Operators are based in Juneau, Ketchikan, Petersburg, Wrangell, Sitka, Haines, Skagway, Yakutat, Klawock, Metlakatla and Gustavus, and generally provide a minimum of daily service to outlying communities carrying passengers, small freight and mail. Typically they provide service with float-equipped aircraft in the southern Panhandle, and wheel-equipped aircraft in the northern Panhandle. A summary of current (1985) jet and feeder services is provided in Figures 2, 3, and 4.

Air service operations in the region are supported by a network of some 140 airports, seaplane bases and heliports. Eight of the airports can presently accommodate jet aircraft although the Annette Island airport does not presently have scheduled jet aircraft flights. There are an additional 24 airstrips in the area that vary in size from a 1000-foot gravel beach at Pyramid Harbour to the Klawock runway, soon to be extended to 5000 feet.

Runways at the airports served by jet aircraft vary between 6003 by 150 feet at Wrangell to 8456 by 150 feet at Juneau. The runways place some limitations on the payload or fuel that an aircraft can carry but with the short stage lengths of most flights, the effect of this limitation is not unduly severe.

Of the airports that receive regularly scheduled jet aircraft flights, only Ketchikan International and Yakutat have full Instrument Landing Systems (ILS). The others have localizers without the glideslope (with the exception of Gustavus which has a VOR and an NDB approach). The main reason for the lack of full ILS facilities is terrain-induced distortion. The very high frequency transmissions tend to distort the direction of transmission and give false and unreliable readings to aircraft instruments; the glideslope portion of the ILS is particularly prone to this distortion.

Enroute low altitude airways over Southeast Alaska (below 18 000 feet) satisfy most I.F.R. requirements for aircraft operating at 10 000 feet or higher, with VORTAC transmitters located at Annette Island, Sitka, Sister's Island (near Juneau) and Yakutat while Level Island has a VOR/DME. For the purpose of civil aviation all five locations have Very High Frequency Omni Directional Radio Ranges (VOR) combined with Distance Measuring Equipment

Figure 3

WHEELED, SCHEDULED FEEDER AIR SERVICES

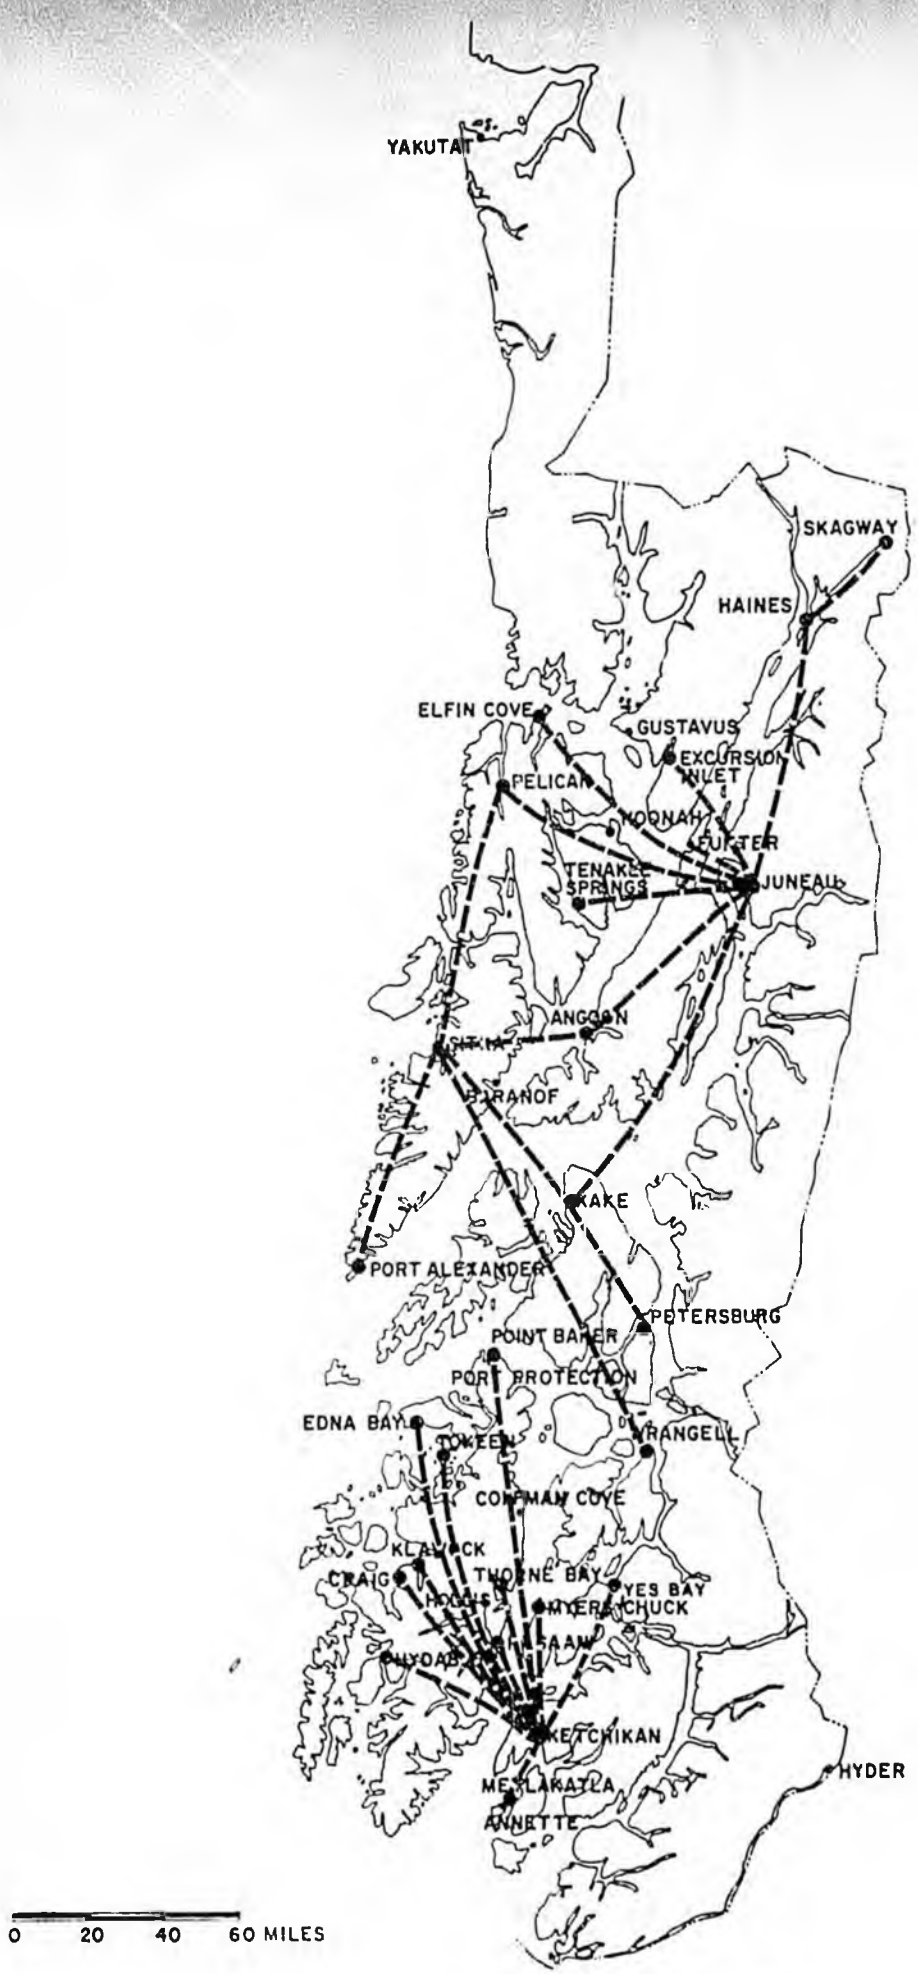

Figure 4

WATER-BASED, SCHEDULED FEEDER AIR SERVICES

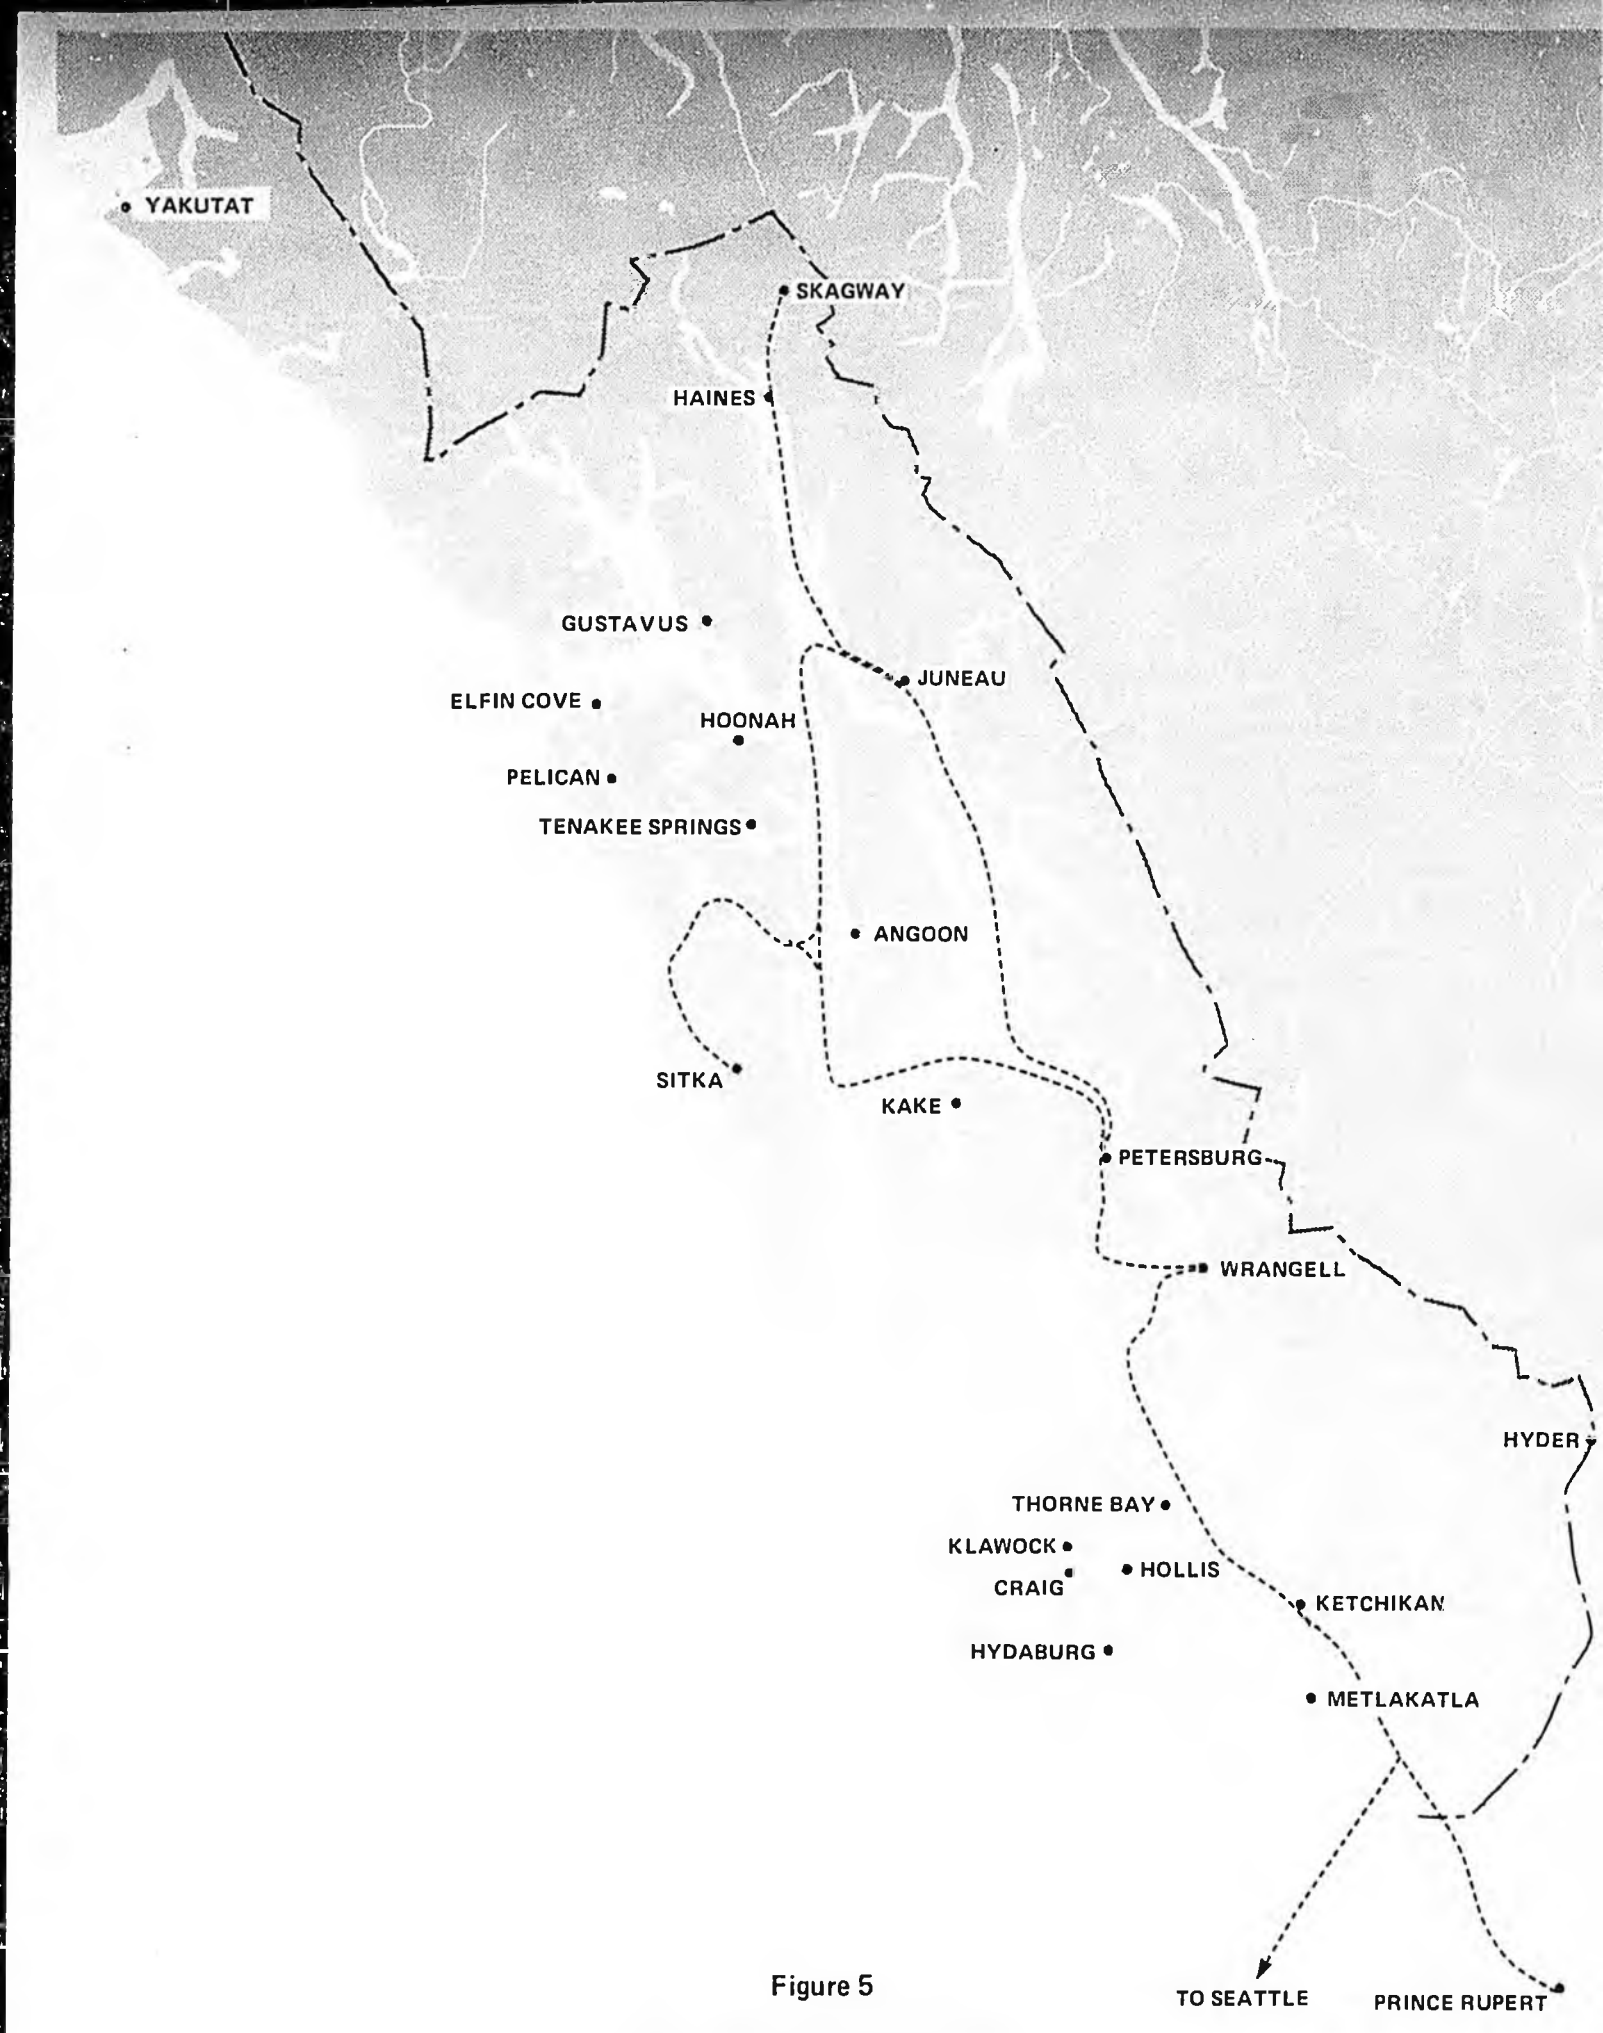

Figure 5

MAINLINE FERRY ROUTES

(DME). VORTAC indicates a combined VOR and Ultra High Frequency Tactical Air Navigation Aid (TACAN) which is used almost exclusively by military aircraft. It is, however, necessary to have line of sight to the transmitting stations to be able to use these facilities. The mountainous terrain of Southeast Alaska does not lend itself to good low altitude electronic navigation reception of these enroute VHF signals. Low frequency nondirectional beacons (NDB) are also used by aircraft for enroute navigation and nonprecision airport approaches. Although much less precise, the NDB allows aircraft with Automatic Direction Finding (ADF) radio to navigate on these signals even when it is impossible to maintain line of sight. NDB's are maintained as aircraft and marine navigation aids while any broadcast band commercial radio transmitter can be and often is used as an unofficial aircraft navigation aid by low flying aircraft.

2.3.2 - Marine System

The main component of the marine transportation system in Southeast Alaska is the Alaska Marine Highway ferry system. This operation provides surface links for passengers and vehicles both to, from and within the Southeast Region.

Seven vessels operate in the Southeast area. The four mainline vessels, the Columbia, Matanuska, Malaspina and Taku, operate between the southern road systems at Prince Rupert and Seattle and the northern road connections out of Haines and Skagway, providing a link for the through movement of traffic as well as carrying passengers and vehicles to and from the region and internally between a number of ports. All mainline vessels offer overnight accommodation for long-distance passengers.

During the 1985 peak season, one of these vessels, the Columbia, operated a weekly service between Seattle and Skagway. The other three vessels offered twice-weekly service out of Prince Rupert, making one three-day trip to Skagway via Clarence Straits and Stephens Passage, and one four-day trip travelling via Chatham Strait, and calling at Sitka (see Figure 5, opposite). During the 1986 season, both the Columbia and Matanuska will serve Seattle, leaving two vessels on the Prince Rupert routes. Vehicle capacities on the mainline vessels, adjusted for an average mix of small and

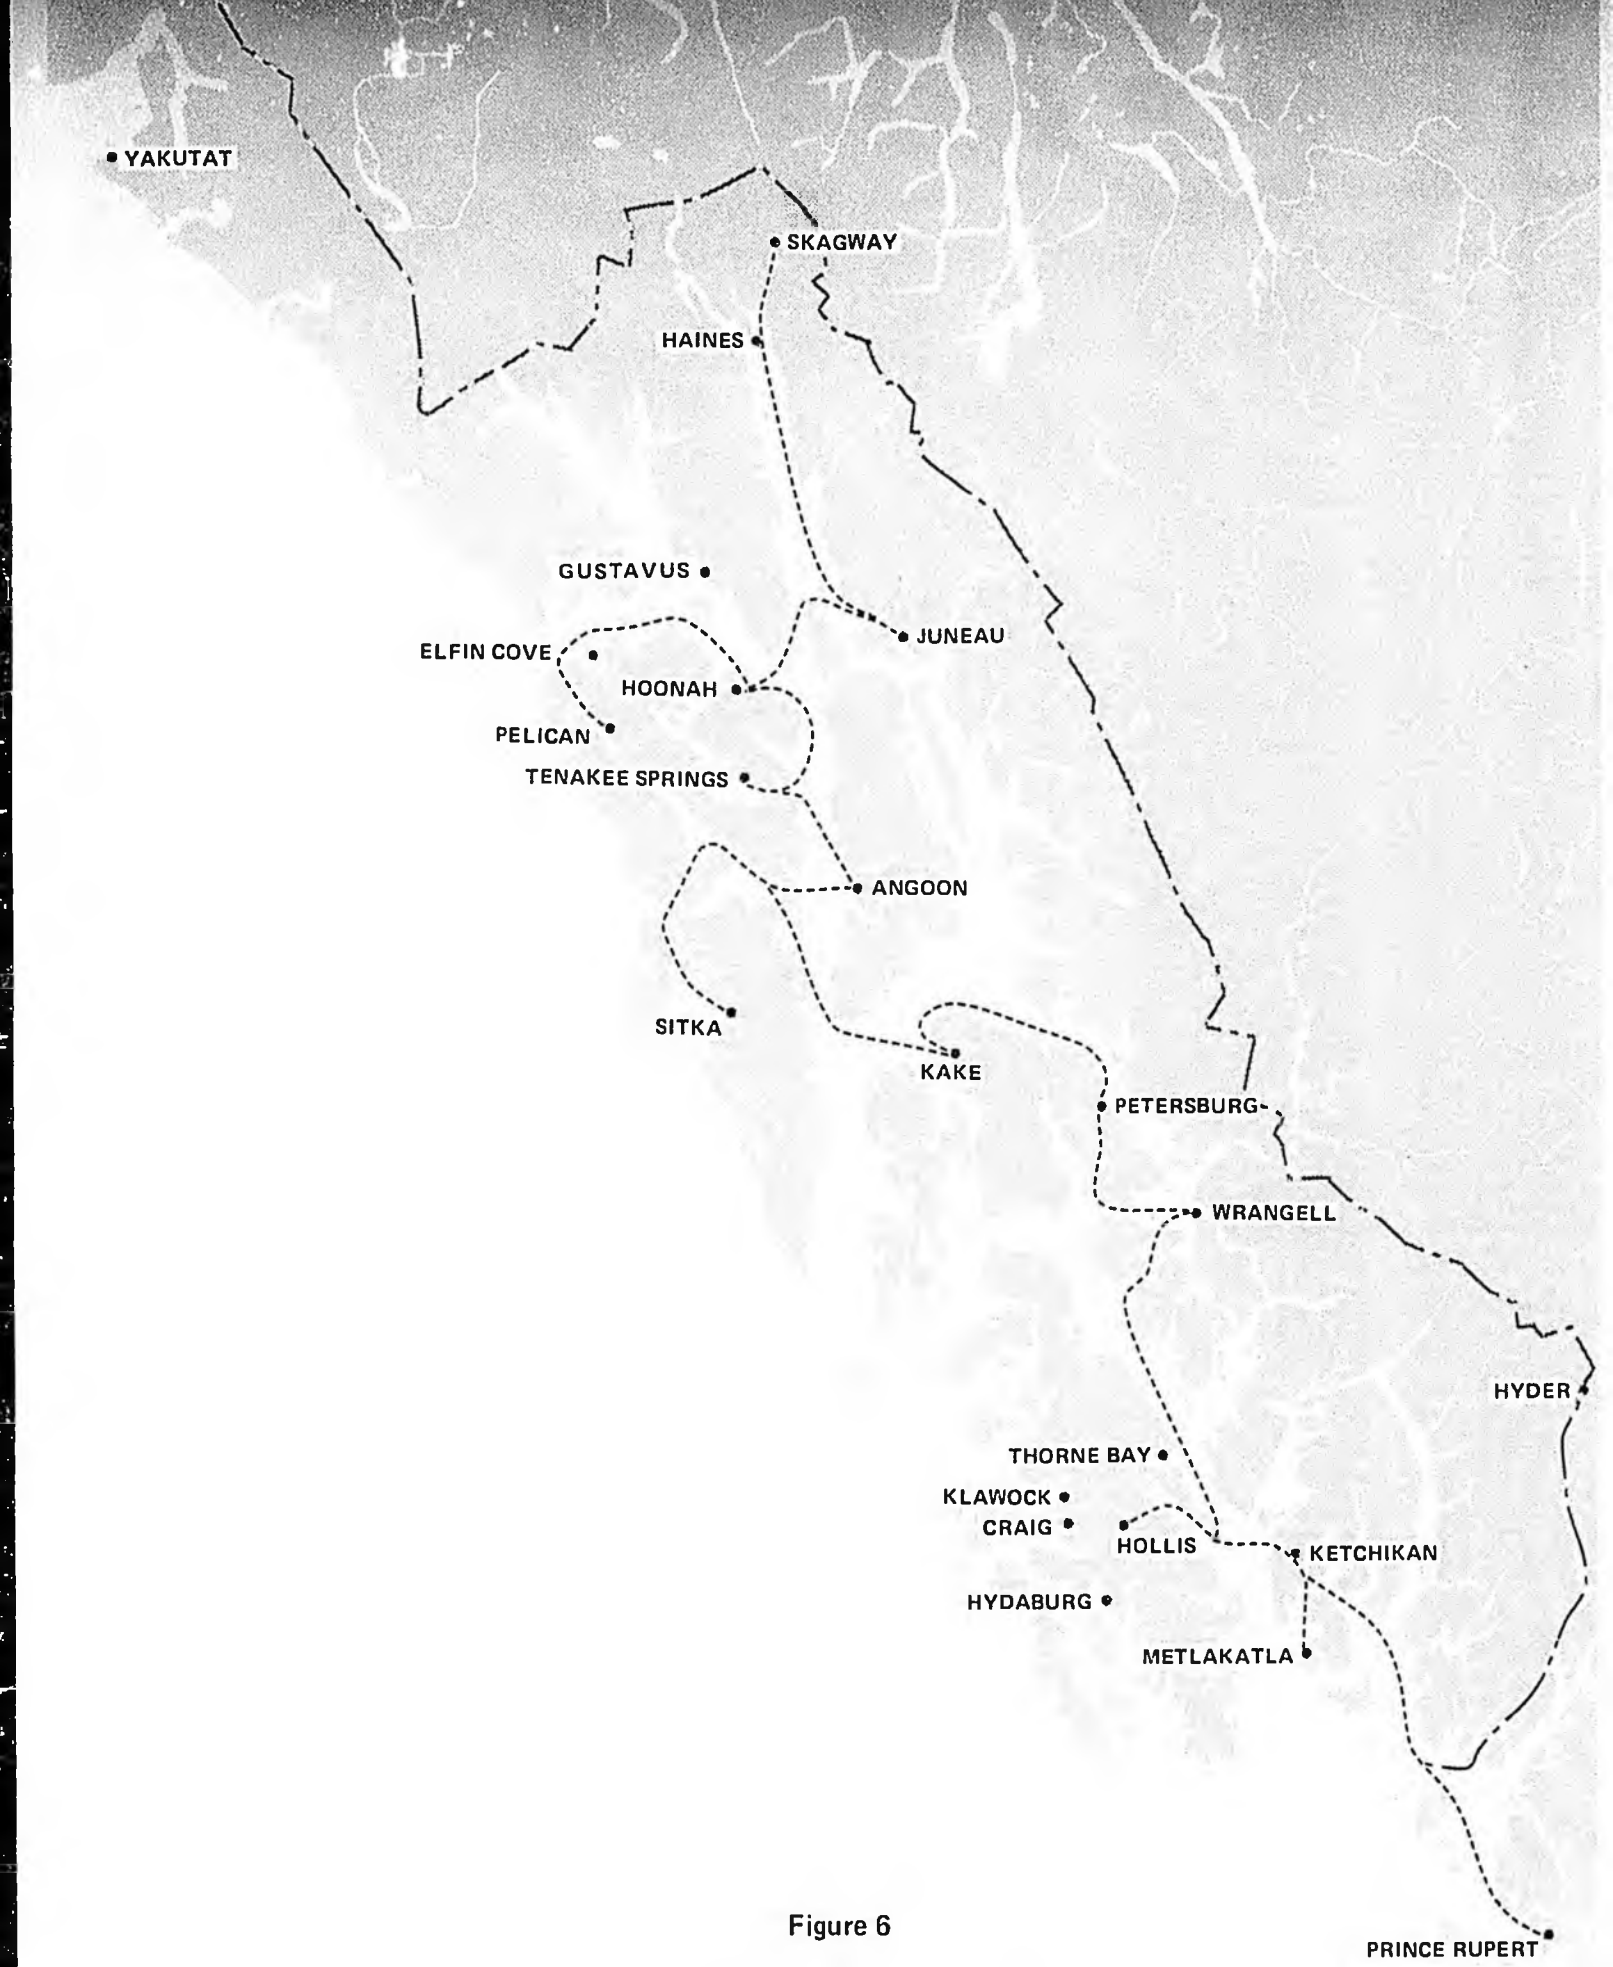

Figure 6

FEEDER FERRY ROUTES

large vehicles, range from 90 (for the Taku) to 155 (for the Columbia) while passenger capacities range from 500 to 750.

The three remaining vessels, the Aurora, LeConte and Chilkat, provide mainly internal feeder services carrying passengers and vehicles between the smaller communities and the mainline ports. The smaller of these, the Chilkat, operates between Ketchikan and Metlakatla and occasionally to Prince of Wales Island. The Aurora and LeConte, with 40-vehicle, 250-passenger capacity, provide connections between Prince of Wales Island and the Prince Rupert-Ketchikan-Petersburg corridor, and between communities in the Juneau-Sitka-Petersburg triangle (including Hoonah, Pelican, Tenakee Springs, Angoon and Kake) (see Figure 6, opposite). In 1986, the Aurora will provide service to Hyder once a week during the May to September period. The Hyder service will, however, be evaluated by the Alaska Marine Highway System to determine the level of service in the future.

In addition to serving passenger and vehicle traffic, the Marine Highway System acts as an important link for the movement of freight, carrying significant numbers of vans into and through the Region and between the various communities. This service supplements the activities of several tug-and-barge operators who also carry substantial volumes of freight, generally from Seattle, and distribute it to the Region's communities. The Marine Highway and the tug-and-barge operators together handle the majority of the general cargo type freight which supplies the needs of Southeast residents. In addition, the tug-and-barge companies carry a large portion of the Region's fish and seafood product (frozen and canned) to Seattle for further distribution. Finally, a number of ocean-going vessels provide freight capacity for the Region's exports of lumber and forest products.

The Region has a range of port facilities to serve the Marine Highway vessels. Seven communities have ferry terminals capable of handling the mainline vessels (Ketchikan, Wrangell, Petersburg, Sitka, Juneau, Haines and Skagway), while others can accommodate only the Aurora/LeConte class vessels (Hoonah, Tenakee Springs, Angoon, Pelican, Kake, and Hollis/Clark Bay). Two ports are also presently designed to handle the Chilkat (Hollis and Metlakatla) although renovations at Metlakatla will shortly allow the Aurora

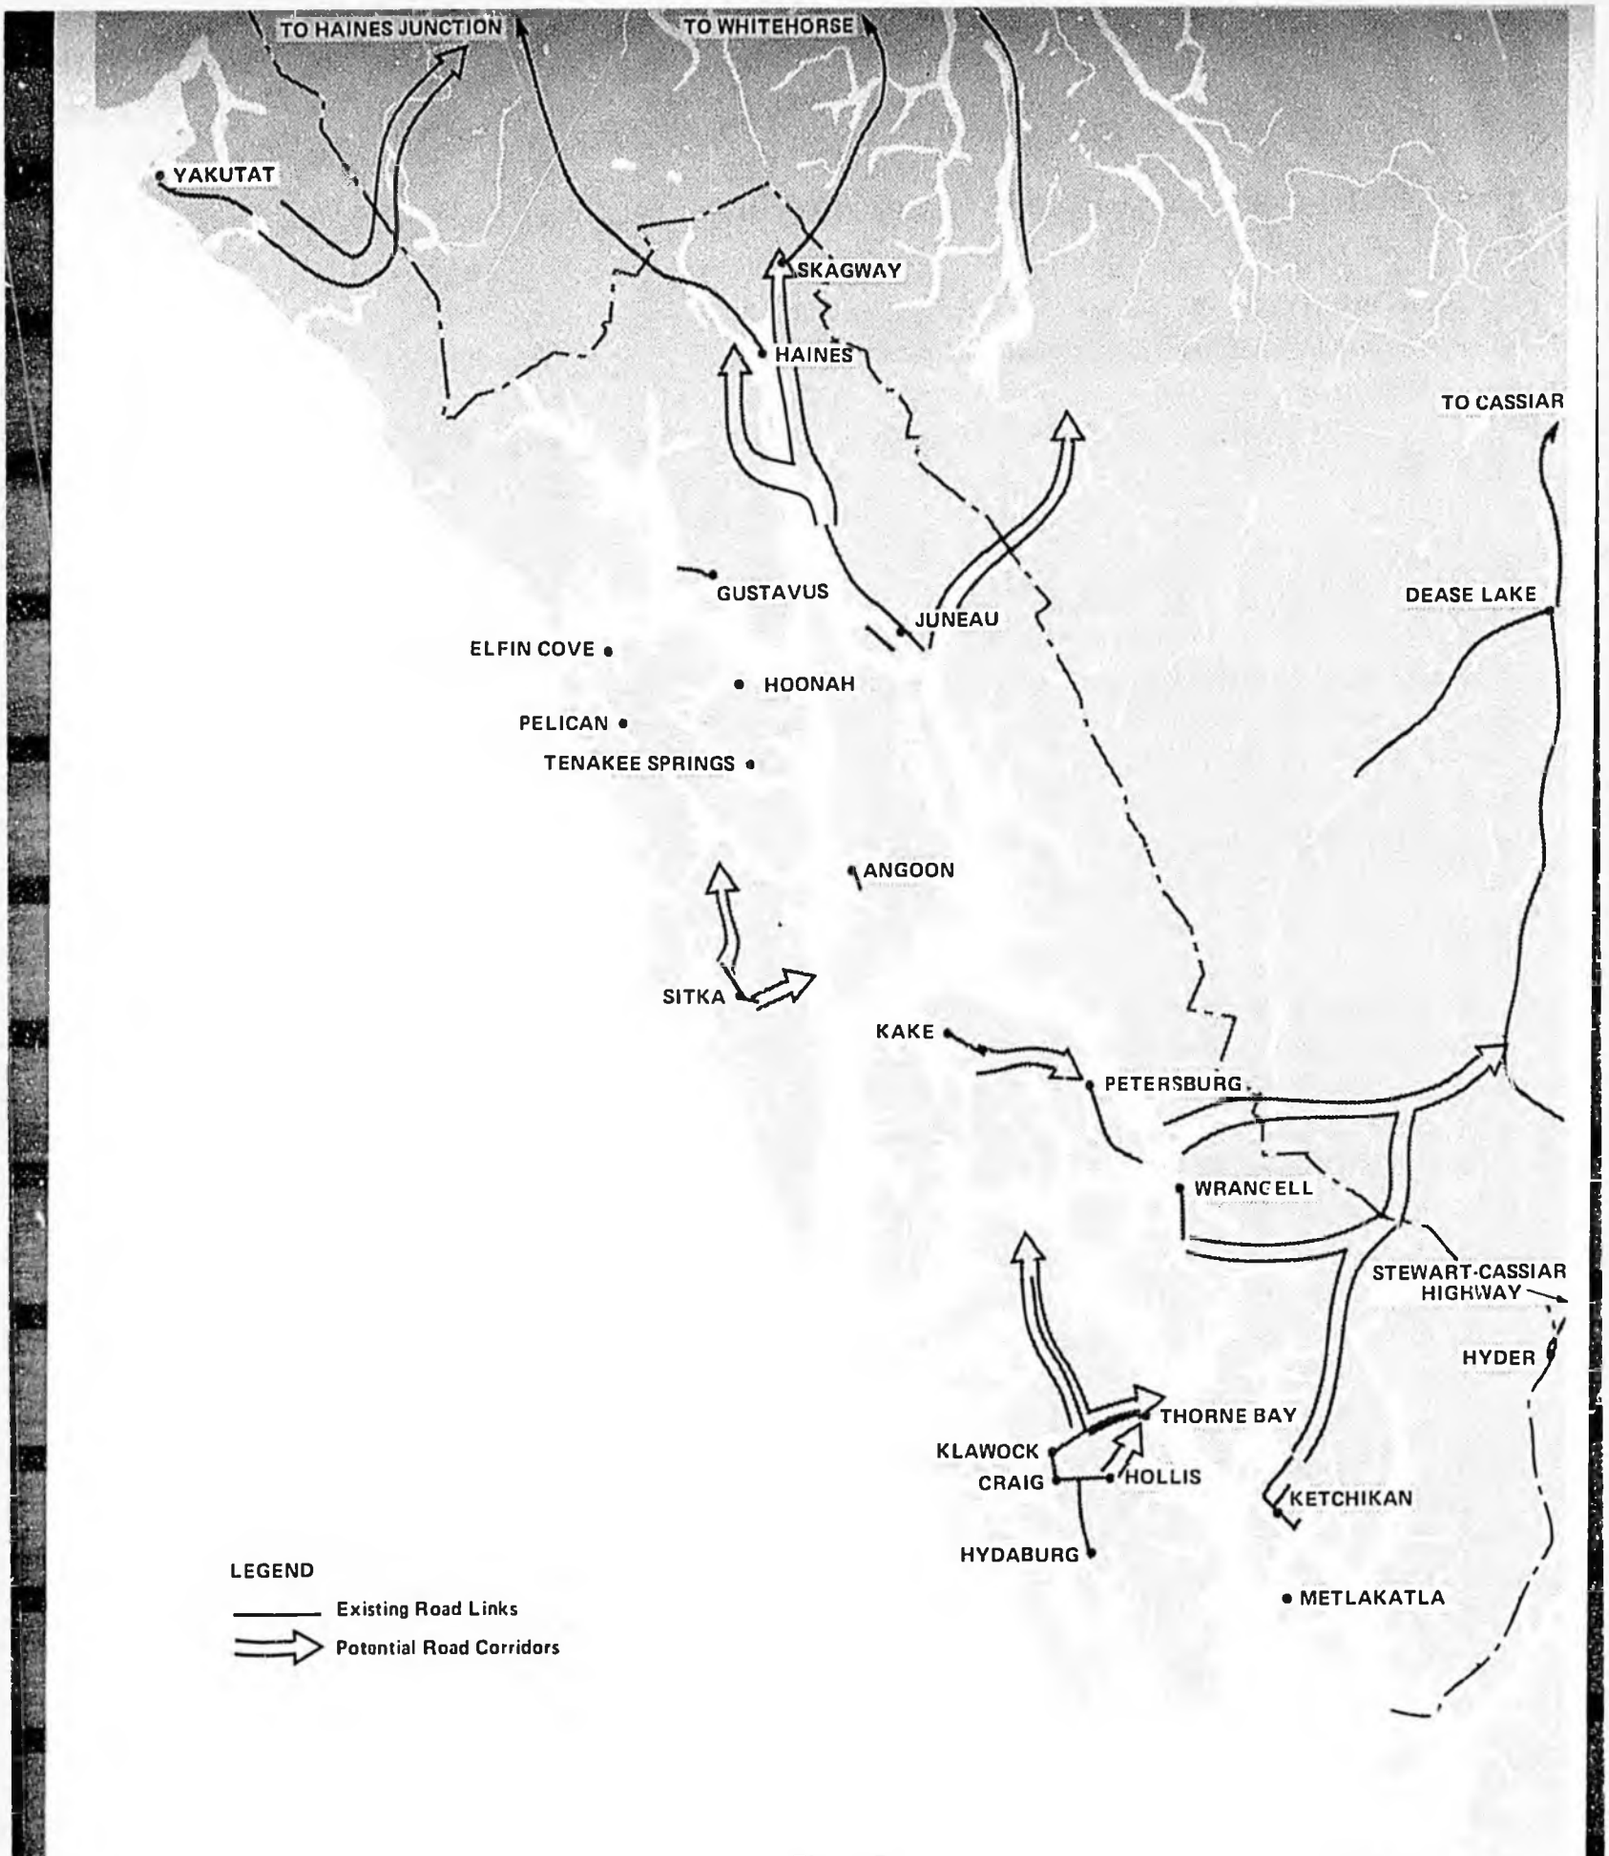

Figure 7

EXISTING ROAD SYSTEM AND ROAD CORRIDORS

to provide service but prohibit service by Chilkat. In addition, terminal facilities are planned at Hyder and Elfin Cove to allow ferry operations into those communities.

Terminal and port facilities for other marine movements (tug-and-barge and other freight operations) are, with few exceptions, provided by private industry. The level of facilities varies widely from terminals in the larger centers which are capable of handling containerized cargo to break-bulk, manual loading/unloading operations at smaller ports.

2.3.3 - Road System

The road system in Southeast Alaska is sharply constrained by the geography of the Region. Steep coastlines, multiple fjords and generally mountainous terrain make roads a costly option to construct and maintain. While there are some potential road corridors within the area, only a limited number have been developed (see Figure 7, opposite).

Access to the continental road system is provided at three points in the Region: Haines and Skagway in the north and Hyder in the south. Residents in other communities must use the Marine Highway to connect either with these roads or with the road system out of Prince Rupert or Seattle.

Within the Region, a substantial network of roads is operated and maintained to provide access between adjacent communities and links to nearby recreation areas. In addition, the US Forest Service has developed an extensive road network which, while not meeting State standards, provides some travel opportunity as well as a foundation for future road development. In general, however, with the exception of Prince of Wales Island communities, links between major towns within the Region are provided by air and by ferry.

TABLE 2.1

HIGH SPEED CRAFT
TYPES EVALUATED

		Passenger and Vehicle	Cost	Seakeeping	Comfort	Susceptibility to Strikes	Speed to Load	Comments
Air Supported	SRN4 MK2/3	yes	very high	moderate	fair	nil	fair	
	API-88	no	low	poor	good	nil	fair	
	Hovermarine	no	medium	poor-mod.	good	some	good	
	Bell Halter	yes	medium	mod.-good	fair	some	good	
Foil Supported	Jetfoil	no	high	mod.-good	excellent	high	poor	Production discontinued.
	Hydrofoil	no	medium	poor-mod.	fair	high	poor	
Displacement	Monohull	yes	high	moderate	fair	low	fair	
	Catamaran	yes	low-med.	mod.-good	fair-good	low-fair	fair	
	SWATH	yes	low-high	mod.-good	excellent	low-fair	good	Small Water Plane Area Twin Hull
Planing and other		no	low-med.	poor-mod.	poor-fair	low-fair	poor	

Types Excluded from Further Analysis - Reasons:

SRN4 Mk2/3 Excluded because of cost - approximately $40 to $50 million built in Britain, lack of licensing for US construction.

Monohull Excluded partly because of cost - $14 to $15 million built in Britain and high power requirements and thus fuel cost for its speed.

SWATH Excluded because of experimental nature and relatively high power requirements. Southeast Alaska waters are not rough enough sufficienty frequently to justify such a vessel.

2.4 - Projected Developments in Technology

In terms of new opportunities for the provision of transportation services, the consultants reviewed current and likely future technological developments in air, marine and road transportation that might impact Southeast Alaska. The detailed review is contained in the technology evaluation, but is summarized below.

2.4.1 - Air

No major technological developments were foreseen that would affect air transportation within Southeast Alaska. Although prop-fan aircraft are expected to come into service before the end of the century, they would not change the basic way in which air service would be provided. New developments in navigation aids, such as microwave landing systems, would make jet air travel to major airports more reliable and safer, while increasing navigation beacons and making changes in the VHF network would enhance the safety and reliability of small aircraft operations. However, technology-based changes in air travel within the region were viewed as evolutionary rather than revolutionary.

2.4.2 - Marine

Two main areas of technology development in the marine environment were expected to potentially have impacts on Southeast Alaska transportation: the possible introduction of high-speed craft to provide rapid surface transport between communities, and improvements to existing vessels to improve performance and efficiency.

A variety of high-speed craft were reviewed in terms of their potential for use in Southeast Alaska, including air supported, foil supported, and conventional displacement vessels. The assessment concentrated on existing vessels with a known operating history. However, new designs could offer potential and should be considered at the appropriate point in the design process. Table 2.1, opposite, lists the vessels evaluated and highlights

the findings with regard to a number of criteria. Table 2.2, opposite, outlines in detail some of the physical and operating specifications of these craft.

Two types of high-speed craft were chosen as representative of the type of vessels which could be appropriate for use in Southeast Alaska. The first was a catamaran hull, approximately 100-feet long, which would carry 10 to 15 vehicles and 80 to 100 passengers at speeds of up to 30 miles per hour (see Figure 8, overleaf). The second vessel type was a larger Surface Effect Ship (SES) capable of carrying approximately 40 vehicles and 200 passengers at speeds of up to 46 miles per hour (see Figure 9). The SES-type ferry would be capable of year-round operation in Southeast Alaska waters. The smaller catamaran type vessel would definitely be capable of summer and shoulder season operation. However, its performance during winter conditions, except on sheltered routes, is as yet unknown.

For purposes of evaluation, it was assumed that the existing docks and shore facilities could be used for high-speed craft without major modification. If this is not the case, funding for shore facilities would be required.

High-speed craft should not be looked on as total replacements for existing vessels. While they would enable better utilization of present vessels to be achieved during the summer and, if required, shoulder seasons, like all high-performance vessels, the high-speed ferries have limitations relative to payload and axle-loadings. For example, automobiles, campers, coaches, and lightly-loaded trucks and vans could be carried on the small high-speed catamaran, but not heavy vans such as refrigerated trailers with a full load of frozen fish. The larger vessel by comparison could carry heavy trailers, but the number would be limited by payload considerations. For this reason, at least some service by conventional vessels would likely be required on routes served by high-speed ferries.

The second area of marine technology development relates to improvements in the existing AMH vessels to improve their performance and reduce operating costs. Examples of such developments include:

Figure 8

HIGH SPEED CATAMARAN

Figure 9

110-ft SES HIGH-SPEED CRAFT

- hull redesign;
- improvements in propulsion and machinery;
- course-keeping and routing techniques;
- advanced machinery automation;
- improvement in hull surfaces;
- different grades of fuel; and
- adjustments to operating speed.

2.4.3 - Road

No technological developments were foreseen in the road sector that would change the way in which freight and resources are moved or in which tourists and residents would travel. It is expected that freight vehicles moving on the continental road system will increase in length, height, width and weight, making it more difficult for the existing ships to accommodate trucks and vans. In the future, certain road routes may be designated special log haul routes to support the timber industry. Overall, however, the freight business to Southeast Alaska, being a small specialized one, would likely not be impacted to any great extent by such changes for the foreseeable future.

2.5 - Alternative Marine Operating Options

While technological developments offer one possible source of change in transportation services, another source of change would involve continued use of conventional equipment to provide service but under a different operating environment. One option of this type in the marine area would involve increased reliance on private as opposed to State-operated services. A second operating option would involve the acquisition of a foreign flag vessel.

2.5.1 - Other Service Suppliers

The foreign flag liner operator has long been a part of the Alaskan cruise market. These operators brought in well over 100 000 tourists at the last

count and are expected to continue to bring in a significant number of visitors. A new factor in the market place, however, is the foreign flag ferry operator (who carries vehicles) working in competition with the Marine Highway for point to point travel. It is likely that such operators will increase their activity in the future from either Vancouver or Prince Rupert.

A further new development is that US flag operators are seriously considering building or converting vessels to serve the US cruise market and Alaska is identified by them as a prime destination. The vehicle carrying potential for such vessels is seen as an essential feature, with the result that there is a high probability the Marine Highway will see direct competition in Seattle before the mid-1990s.

Although this competition may skim off tourists from the Marine Highway and possibly reduce revenues, projected total departures from Seattle and Prince Rupert indicate that AMH vessels would still be operating close to capacity during the peak season. Thus the presence of private operators would serve as an effective complement to Marine Highway services. In addition, private operators may relieve the AMHS of the need to acquire additional mainline vessels in the 1990s, saving the State of Alaska several million dollars in fleet expansion costs.

2.5.2 - Acquisition of Foreign Flag Vessels

A second new service option for the Region would be for the Marine Highway to acquire and operate a foreign-built ferry. Should a new mainline vessel be necessary, a foreign flag vessel could provide the required increase in capacity at a cost well below that of a new US-built vessel.

The Marine Highway has had experience with foreign flag vessels with the M/V 'Wickersham'. The experience was not altogether favorable because it was intended to use the vessel in the Seattle/Southeast Alaska trade which required a waiver from the Jones Act. Such waivers are only given for

purposes of national defense, and thus the 'Wickersham' was not acceptable on an ongoing basis.

However, the possibility of the AMH using a foreign flag vessel entirely within the requirements of US maritime legislation is feasible. Such a vessel could operate from Vancouver or Prince Rupert and carry tourists or residents from port of embarkation to port of disembarkation. The only restriction would be that the ship could not carry passengers between ports in Southeast Alaska. Such a vessel operating out of Vancouver or Prince Rupert could materially increase AMH capacity and release existing vessels to operate on those routes that require a US flag ship (i.e., US to US links).

This is essentially the service that Sundance Cruises is providing between Vancouver, BC and Skagway, AK with the M/V 'Stardancer'. The AMH would prefer that private operators continue to provide such service where possible since they can generally operate at lower costs due to their greater flexibility in crewing and their options to utilize the vessels in other areas during the off season.

3 - REGIONAL TRANSPORTATION ALTERNATIVES

3 - REGIONAL TRANSPORTATION ALTERNATIVES

3.1 - General

Development of the updated transportation plan was based in large measure upon a process whereby a wide range of transportation options were defined for the Region and were then evaluated in terms of:

- compatibility with goals of the regional transportation system, and
- effectiveness in terms of both the service provided and the level of costs incurred.

These alternatives covered the provision of transportation service by both air and surface (marine and road) modes for the movement of cargo, passengers and vehicles.

In defining the alternatives, recognition was given to the expressed concerns and desires of the communities and also to the perceived requirements, limitations and opportunities associated with growth, development and new technology. As a result, the options developed for evaluation encompassed not only capital improvements (acquisition of new vessels, road and facilities construction) but also changes to the operating systems with a view to improving either the service provided, the system capacity and/or the ongoing operating costs.

3.2 - Aviation System Alternatives

In terms of long range transportation planning for the aviation sector, a number of issues have arisen in recent years which required analysis in terms of defining the direction of facilities planning. These included:

- the probable ongoing impacts of airline deregulation and, related to this;

- the possible removal of Essential Air Services (EAS) subsidies for Yakutat, Gustavus, Petersburg and Wrangell, and the consequent impact on air services;

- potential development of a commuter airline service in the region;

- future requirements for runway rather than float plane facilities.

3.2.1 - Deregulation and Subsidies

The long-term effects of air service deregulation in Southeast Alaska are likely to be complex and, in many cases, unsatisfactory, as competition and profit pressures lead to a concentration of services on some routes and a decline in services on others.

For the Lower 48, deregulation of the airline industry has meant more carriers providing more flights at lower fares between large cities that are good traffic generators, often at the expense of reduced or discontinued service to smaller communities. Competition has increased on the heavily traveled routes, causing downward pressure on airline profits, and forcing them to cut back on service into smaller communities.

In addition, the relationship between airlines and government has changed somewhat under deregulation. The protection which government once provided to the carriers has been withdrawn, and as a result, government agencies have more difficulty influencing airline policies. Thus, government recommendations for service beyond those that are market justified will be very difficult to encourage without direct subsidies.

It was recognized at the time of legislation that deregulation of the airline industry would force the discontinuation of services into many smaller communities that relied heavily on air travel. An Essential Air Services Subsidy was therefore developed with a ten-year sunset clause to ease the transition to deregulation. Four communities in Southeast Alaska currently receive jet service under the EAS subsidy program: Yakutat, Gustavus, Wrangell and Petersburg. All communities except Gustavus receive

at least seven round trip flights per week year-round with aircraft having seating capacity in excess of 60 seats. Gustavus receives this level of service during the summer, but during off-peak periods, air services may be reduced to two flights per week with smaller aircraft.

The US Department of Transportation has selected Alaska Airlines to provide essential air service to these Southeast communities from October 1, 1985 through December 31, 1986 at which time the Essential Air Services subsidy is scheduled to expire.

While jet aircraft may not be the least-cost (lowest subsidy) method of providing service to these communities, it offers an extremely high quality of service and a good level of air freight capacity. The chief drawback is a lower service frequency than might be offered by smaller commuter aircraft. However, the availability of daily service without transfer to Seattle and Anchorage and the adequate freight capacity affords offsetting benefits.

The future of these services, however, has been a point of uncertainty throughout the planning exercise and is still in a state of transition. Whether the subsidies will be allowed to expire as scheduled, and whether jet service will continue with or without financial support, are both questions to which no confirmed answers are as yet available. Thus, from the planning perspective, the only definitive recommendation which can be made is that, if the EAS subsidies are allowed to expire, the Department of Transportation should closely monitor the impact on services into Southeast communities.

3.2.2 - Development of Commuter Airline Service

Although the quality of jet services in the Region has been very good, the possible future viability of a regional commuter air service for the Southeast remains an ongoing point of interest. An analysis was therefore carried out with regard to the conditions under which such an operation might prove viable.

TABLE 3.1

AIRCRAFT PRODUCTIVITY EVALUATION

Aircraft Type	Piper Navajo	Twin Otter DHC-6-300	Beech 1900	Shorts 360	HS 748
Hours per year per Aircraft	2,000	2,000	2,000	2,000	2,000
Number of Aircraft	2.5	2.5	2.5	2.5	2.5
Maximum Passenger Capacity	9	20	19	36	48
Load Factor	60%	60%	60%	60%	60%
Average Ground Speed (80% of Long Range Cruise)	138	133	200	162	215
Revenue Passenger Miles per year (million)	3.7	8.0	11.4	17.5	31.0

To assess this viability, five different aircraft types were examined. It was assumed that at least three aircraft would be necessary to provide an economic fleet and that each aircraft would fly approximately 2000 hr/yr with an average of one-half aircraft tied up for maintenance. Break-even operations, based on the experience of other carriers, were assumed to require a 60% load factor.

Table 3.1, opposite, shows the assessment of the required number of revenue passenger-miles of traffic which would be required for viable operation with various commuter aircraft types. Required annual passenger-miles range from 3.7 million with a fleet of Piper Navajos to 31.0 million with a fleet of HS748s.

With the ongoing provision of jet service into the major communities, it was assumed that the commuter service could only compete in areas not served by jet flights. Of these areas, those with the greatest traffic potential (together with estimated passenger-miles of traffic) are shown below.

Major Traffic Sectors -
Southeast Alaska - Non-Jet

Sector	Annual No. of Passengers	Distance	Annual Revenue Passenger-Miles
Haines-Juneau	9 500	75	412 500
Skagway-Juneau	5 000	95	475 000
Hoonah-Juneau	10 580	45	472 500
Kake-Petersburg	1 400	35	49 000
Craig-Ketchikan	6 500	60	390 000
Klawock-Ketchikan	5 800	60	348 000
Metlakatla-Ketchikan	14 900	20	298 000
TOTAL			2 745 000

These figures suggest that even with the smallest aircraft and 100% of the above air traffic markets, a commuter air service would be unlikely to prove viable at present traffic levels. Since the commuter service would also have to compete with air-taxi operators on these routes, it was concluded that a commuter service was unlikely to materialize until such time as a reduction in jet service and/or a significant growth in demand provided a traffic base sufficient to financially support its operation.

3.2.3 - Float Versus Airstrip Development

The evolution of air services in Southeast Alaska has been to start with float equipped aircraft, advance to amphibious aircraft, further advance to wheeled aircraft, and then to have larger and faster aircraft provide the air service. The prime reason for the evolution is improved safety, service and reliability, and reduced costs.

Float equipped operations offer a number of advantages in Southeast Alaska and have provided a vital transportation link. Since most communities are located on shorelines, float-equipped aircraft can land in close proximity. In addition, float planes are able to alight, in acceptable water conditions, if VFR conditions deteriorate during a flight - an important consideration when operating in the fast-moving weather systems common in the area.

On the other hand, float equipped aircraft are expensive to purchase, maintain and operate. Floats are costly to install and reduce the payload and speed of the aircraft, while corrosion from salt water operations leads to increased maintenance and overhaul expense.

An analysis was therefore carried out to assess whether there was an economic justification for promoting wheel based operations (by development of additional airstrips) rather than continuing to develop seaplane facilities.

While it is impossible to generalize about the cost of seaplane docks and runway facilities, some approximate order-of-magnitude numbers were

developed. Based on relative capital and operating costs the additional cost of a runway operation as opposed to a float facility would be in the order of $350,000 per year. In order to financially justify runway development, users would have to realize savings equivalent to this amount. Since annual passenger volumes into the larger seaplane communities average in the order of 1500 to 3500 passengers, it is clear such financial savings are unlikely to be achieved. It was therefore concluded that runway development cannot be justified on the basis of economics but must rather be justified on the grounds of service, safety, convenience and other nonfinancial factors.

3.3 - Surface System Alternatives - Corridors

3.3.1 - General

The definition of alternatives for the provision of surface transportation services was based on the premise that road and marine highway options should be viewed as complementary parts of an integrated system rather than evaluated as separate services. Since options regarding road construction in many areas materially affect the pattern of marine highway operations and conversely, changes in marine highway services influence the viability of many road options, the two modes were evaluated jointly as part of the 'surface transportation system'.

In reviewing the various options which were available in terms of providing surface transportation services, it became apparent that many of the options represented alternative means of dealing with problems in a single subsection of the overall region and, to some extent, could be segregated from the balance of the system for evaluation purposes. Rather than dealing with each of these options in a 'total region' context, it was decided to carry out a pre-evaluation process whereby service options within a subregion or 'corridor' were compared with one another in order to identify the preferred alternatives for meeting transportation needs in that area.

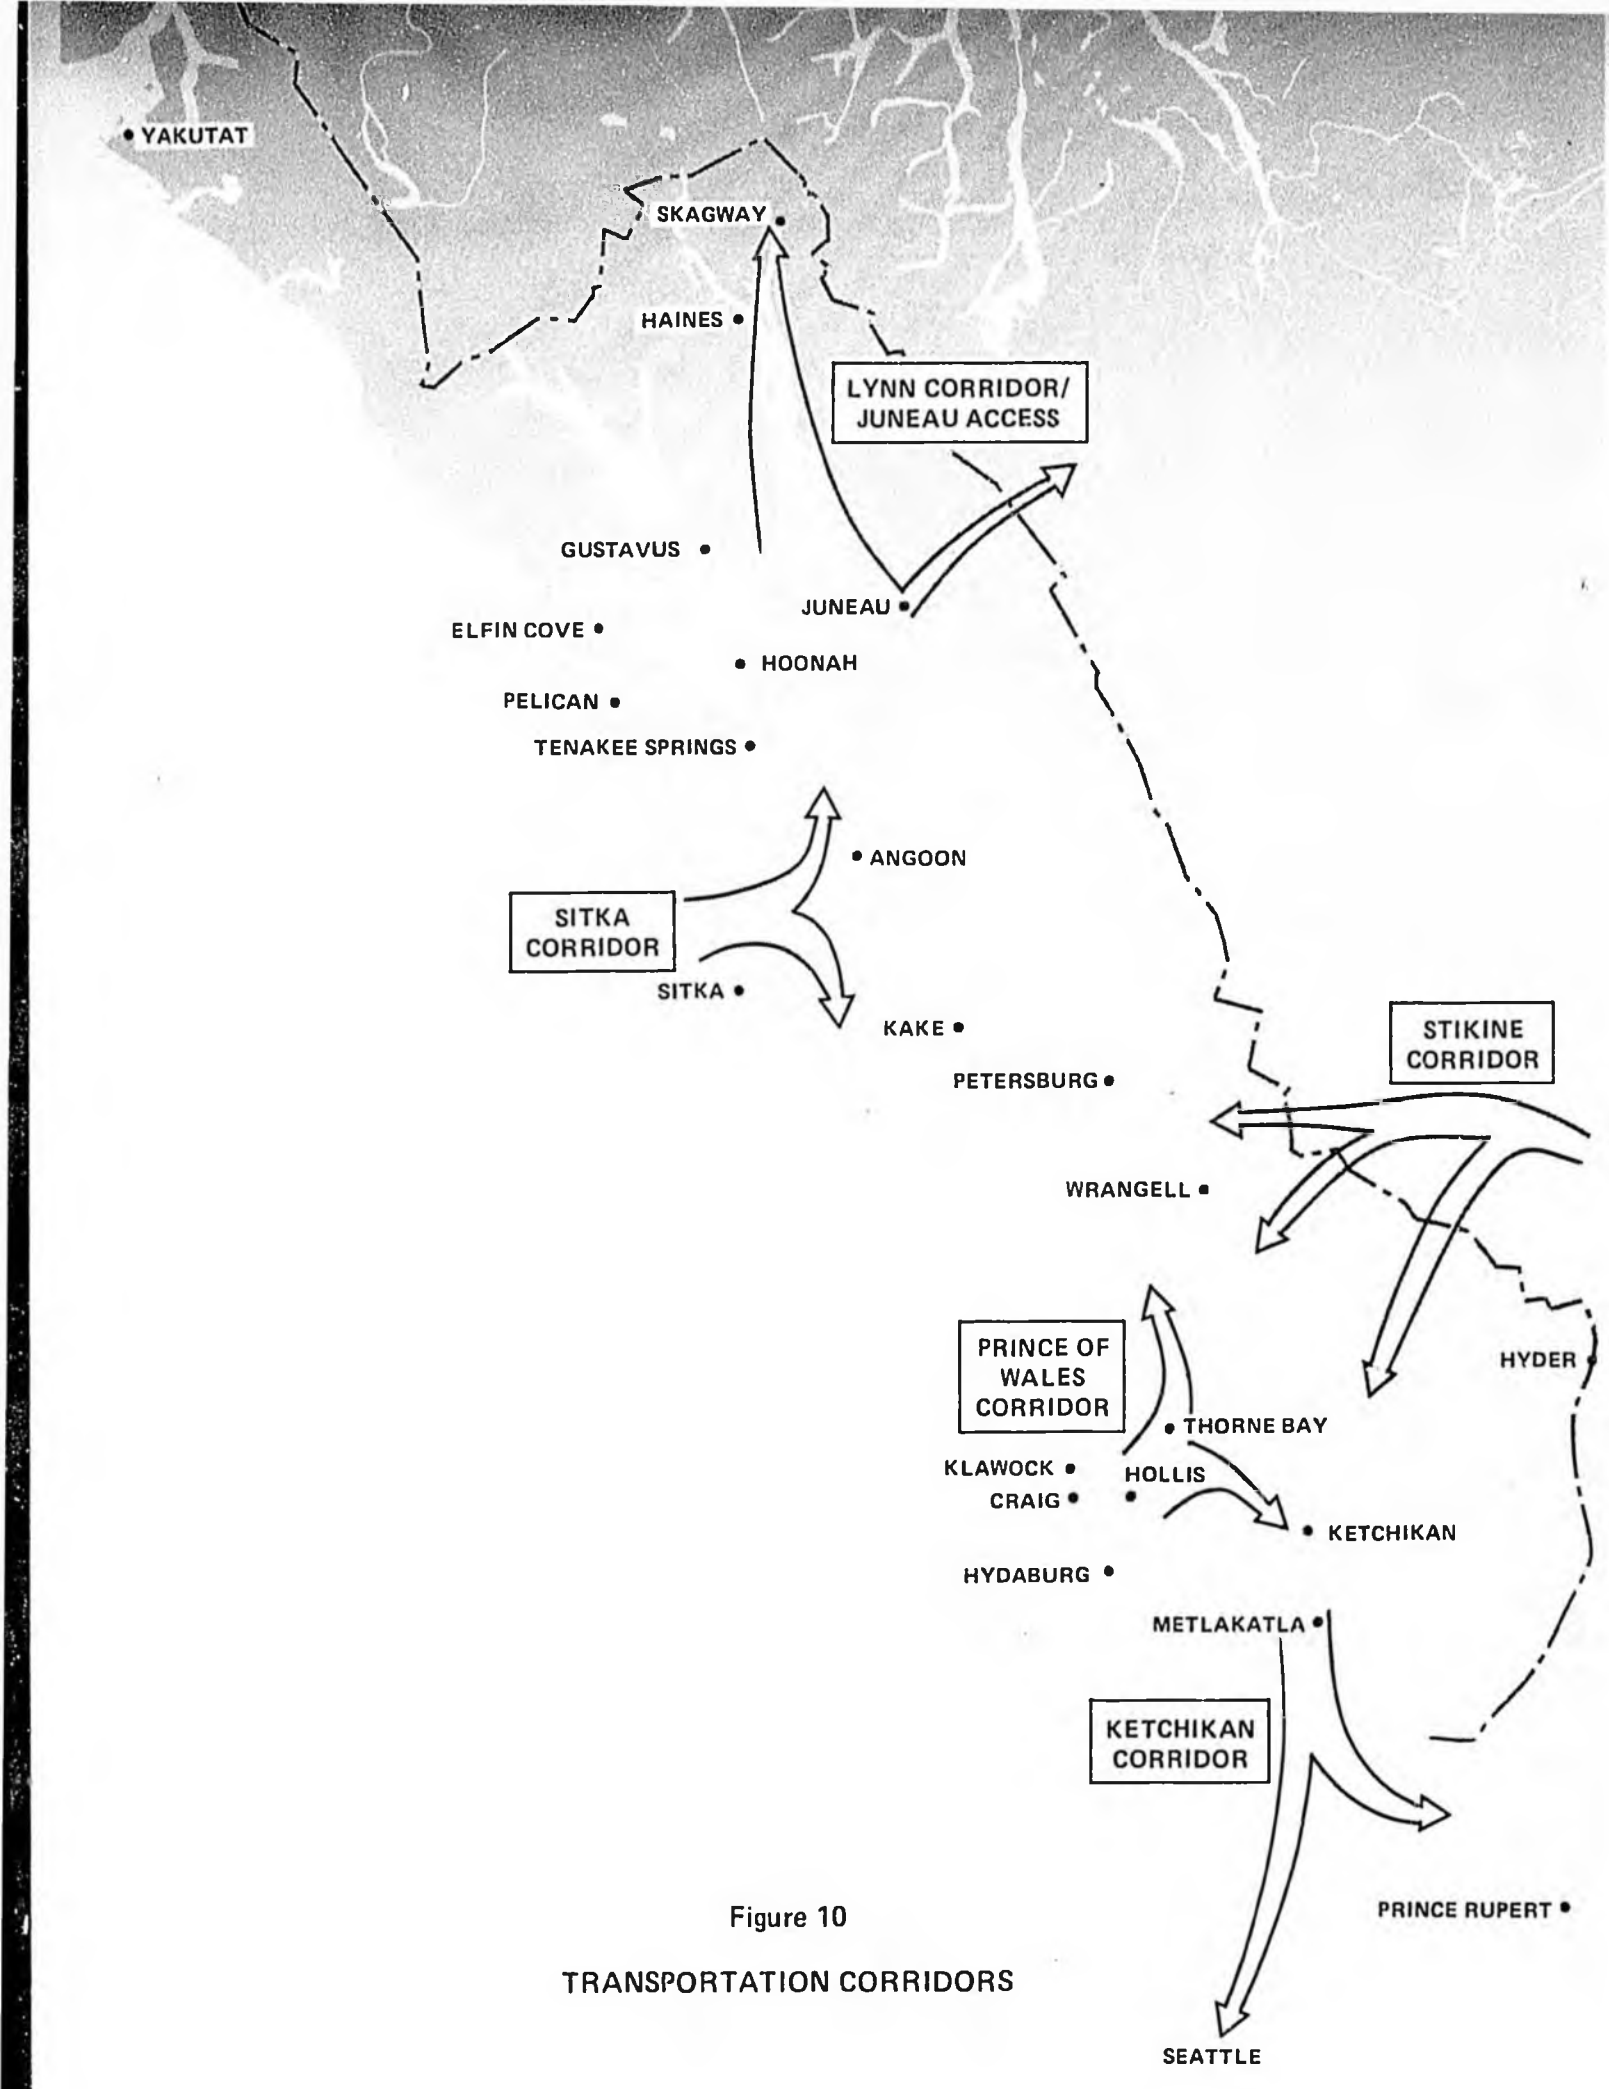

Figure 10

TRANSPORTATION CORRIDORS

Through this pre-evaluation process, a wide range of options was screened down to a somewhat more limited number of preferred alternatives which were then assessed in terms of their desirability within the context of the total regional surface system.

Five key corridors or subregions were identified for separate consideration as part of this prescreening process (see Figure 10, opposite). These were:

- the Juneau Access corridor;
- the Ketchikan-Southern Terminus corridor;
- the Stikine corridor;
- the Sitka Access corridor; and
- the Prince of Wales Island Access system.

A general description of the alternatives evaluated within each of these subregions is outlined in the following sections.

3.3.2 - Juneau Access Corridor Options

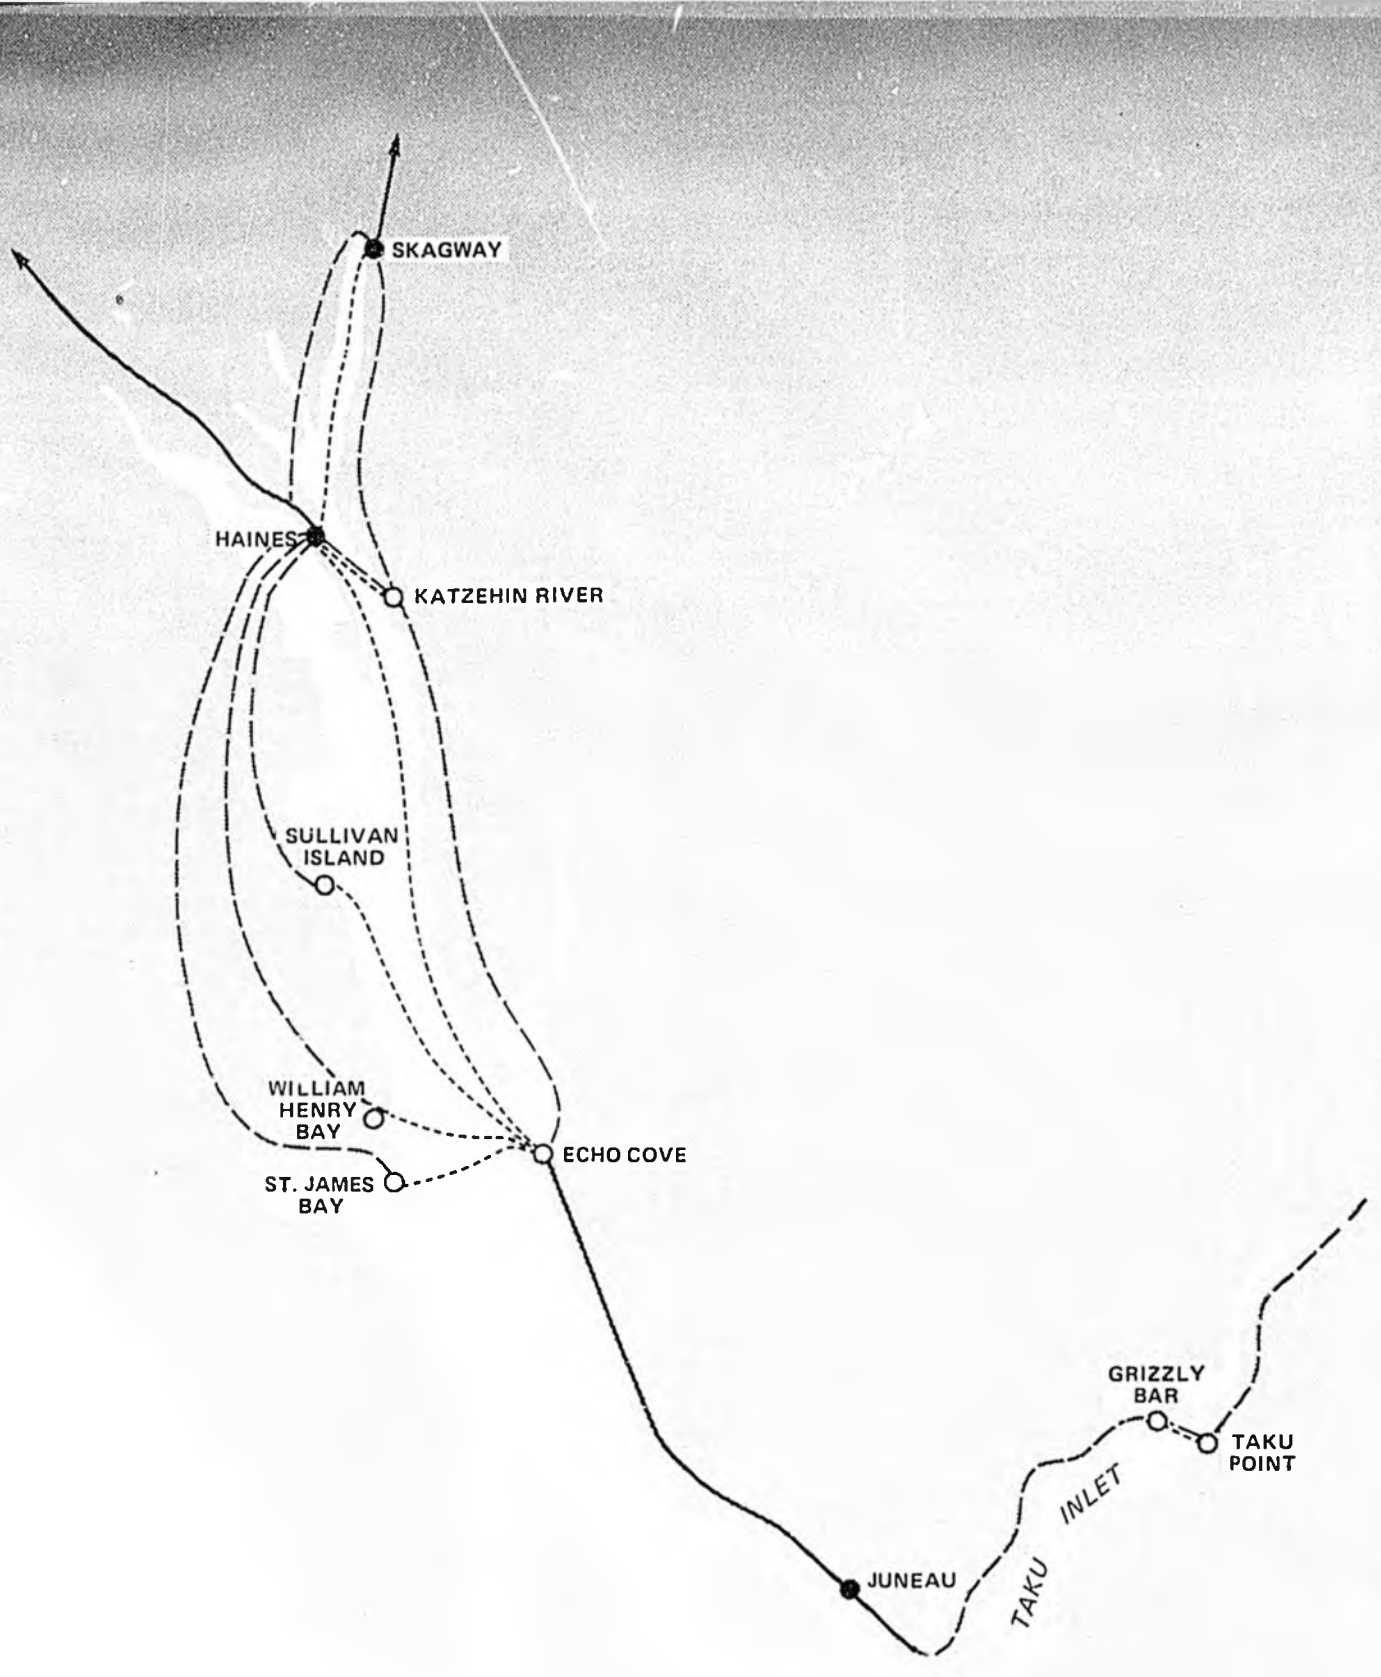
In total, eleven alternatives were evaluated for the provision of surface transportation services between Juneau and the northern roads systems either at Haines and Skagway or through northern BC.

Nine of these alternatives involved providing connections to Juneau via the Lynn Canal through Haines and Skagway (see Figure 11 overleaf). These included:

1. Continue the existing mainline and feeder ferry service.

2. Extend the road up the east side of the canal from Echo Cove to Skagway, connecting with Haines via a bridge across the Chilkoot Inlet. Discontinue ferry service north of Juneau.

3. Extend the east-side road from Echo Cove to Skagway, and construct a road down the west side of the canal between Skagway and Haines. Discontinue ferry service north of Juneau.



LEGEND

NOTE:

Road links as shown do not necessarily represent proposed alignments.

Figure 11

JUNEAU ACCESS CORRIDOR

4. Construct a road up the west side of the Lynn Canal from St. James Bay through Haines to Skagway. Provide a shuttle ferry service between Echo Cove (and the road to Juneau) and St. James Bay (17 miles).

5. Construct a road on the west side of the canal between William Henry Bay and Haines. Provide a shuttle ferry service between Echo Cove and William Henry Bay (14 miles) and between Haines and Skagway (15 miles).

6. Construct a road on the west side of the canal between Sullivan Island and Haines. Provide shuttle ferry service between Echo Cove and Sullivan Island (30 miles) and between Haines and Skagway (15 miles).

7. Extend the east side road from Echo Cove to the Katzehin River. Provide a shuttle ferry service from the Katzehin River to Haines (6 miles) and from Haines to Skagway (15 miles).

8. Extend the east side road from Echo Cove to Skagway. Provide a shuttle ferry service from the Katzehin River to Haines (6 miles).

9. Provide high-speed ferry service from Echo Cove to Haines and Skagway operating three round trips per day during the peak season.

The remaining two Juneau access options would provide Juneau residents with access to the existing road system via a route up the Taku Valley into northern British Columbia. These involved:

10. Extend the Thane Road up the west side of Taku Inlet to Grizzly Bar. Bridge to the east side and continue to the Canadian border.

11. Follow the same routing but connect the west and east banks via a shuttle ferry.

The main capital and annual operating costs associated with these options are given in Table 3.2, overleaf.

TABLE 3.2

JUNEAU ACCESS CORRIDOR OPTIONS - COST CHARACTERISTICS

	New Capital Requirements						Average Annual Operating Costs[3]		
	Roads[1]		Vessels		Terminals	Total	Vessels & Terminals	Roads	Total
	Mi	$M		$M	$M	$M	$M	$M	$M
Existing System	-	-	-	-	-	-	$7.4	-	$7.4
East-Road/Bridge	76	$440.0	-	-	-	$440.0	-	$2.1	2.1
East-Road/Road	109	365.0	-	-	-	365.0	-	2.5	2.5
West-St. James Bay	95	231.5	2	$7.0	$8.5	247.0	4.5	1.9	6.4
West-William Henry Bay	45	119.0	4	14.0	11.0	144.0	8.9	1.1	10.0
West Sullivan	21	61.5	4	14.0	8.5	84.0	8.9	0.9	9.8
			5	17.5		87.5	11.1		12.0

Taku - Shuttle	55[2]	141.0	1	2.0	2.0	145.0	9.0	1.1	10.1

1) Costs are based on construction standards necessary to qualify for Federal-aid to highways funding

2) To Canadian border only.

3) Excludes capital amortization.

Each of these options was evaluated in terms of total financial costs to the State government, Marine Highway and the users; in terms of ability to serve existing traffic and generate new demands; and in terms of user service and travel time. Comparing the benefits generated under the various options with the costs incurred, it was decided that the best options overall were:

- continue existing ferry service (Option 1);
- extend the east-side road to Skagway and provide a shuttle ferry service between Haines and the Katzehin River (Option 8); and
- provide a high-speed ferry service from Echo Cove to Haines and Skagway (Option 9).

These concepts were therefore retained for reassessment within the context of the entire regional transportation system.

3.3.3 - Ketchikan/Southern Terminus Corridor Options

The prescreening process within the Ketchikan/Southern Terminus corridor (see Figure 12 overleaf) focused on a combination of vessel scheduling and vessel acquisition alternatives. The options evaluated were as follows:

1. Continue existing service with existing fleet.
2. Continue existing schedule, adding a new mainline vessel on the Seattle route as soon as possible.
3. Shuttle the Columbia between Seattle and Ketchikan twice weekly during the peak summer season.
4. Operate the Columbia out of Port Hardy during the peak season.
5. Operate all mainline services out of Prince Rupert.

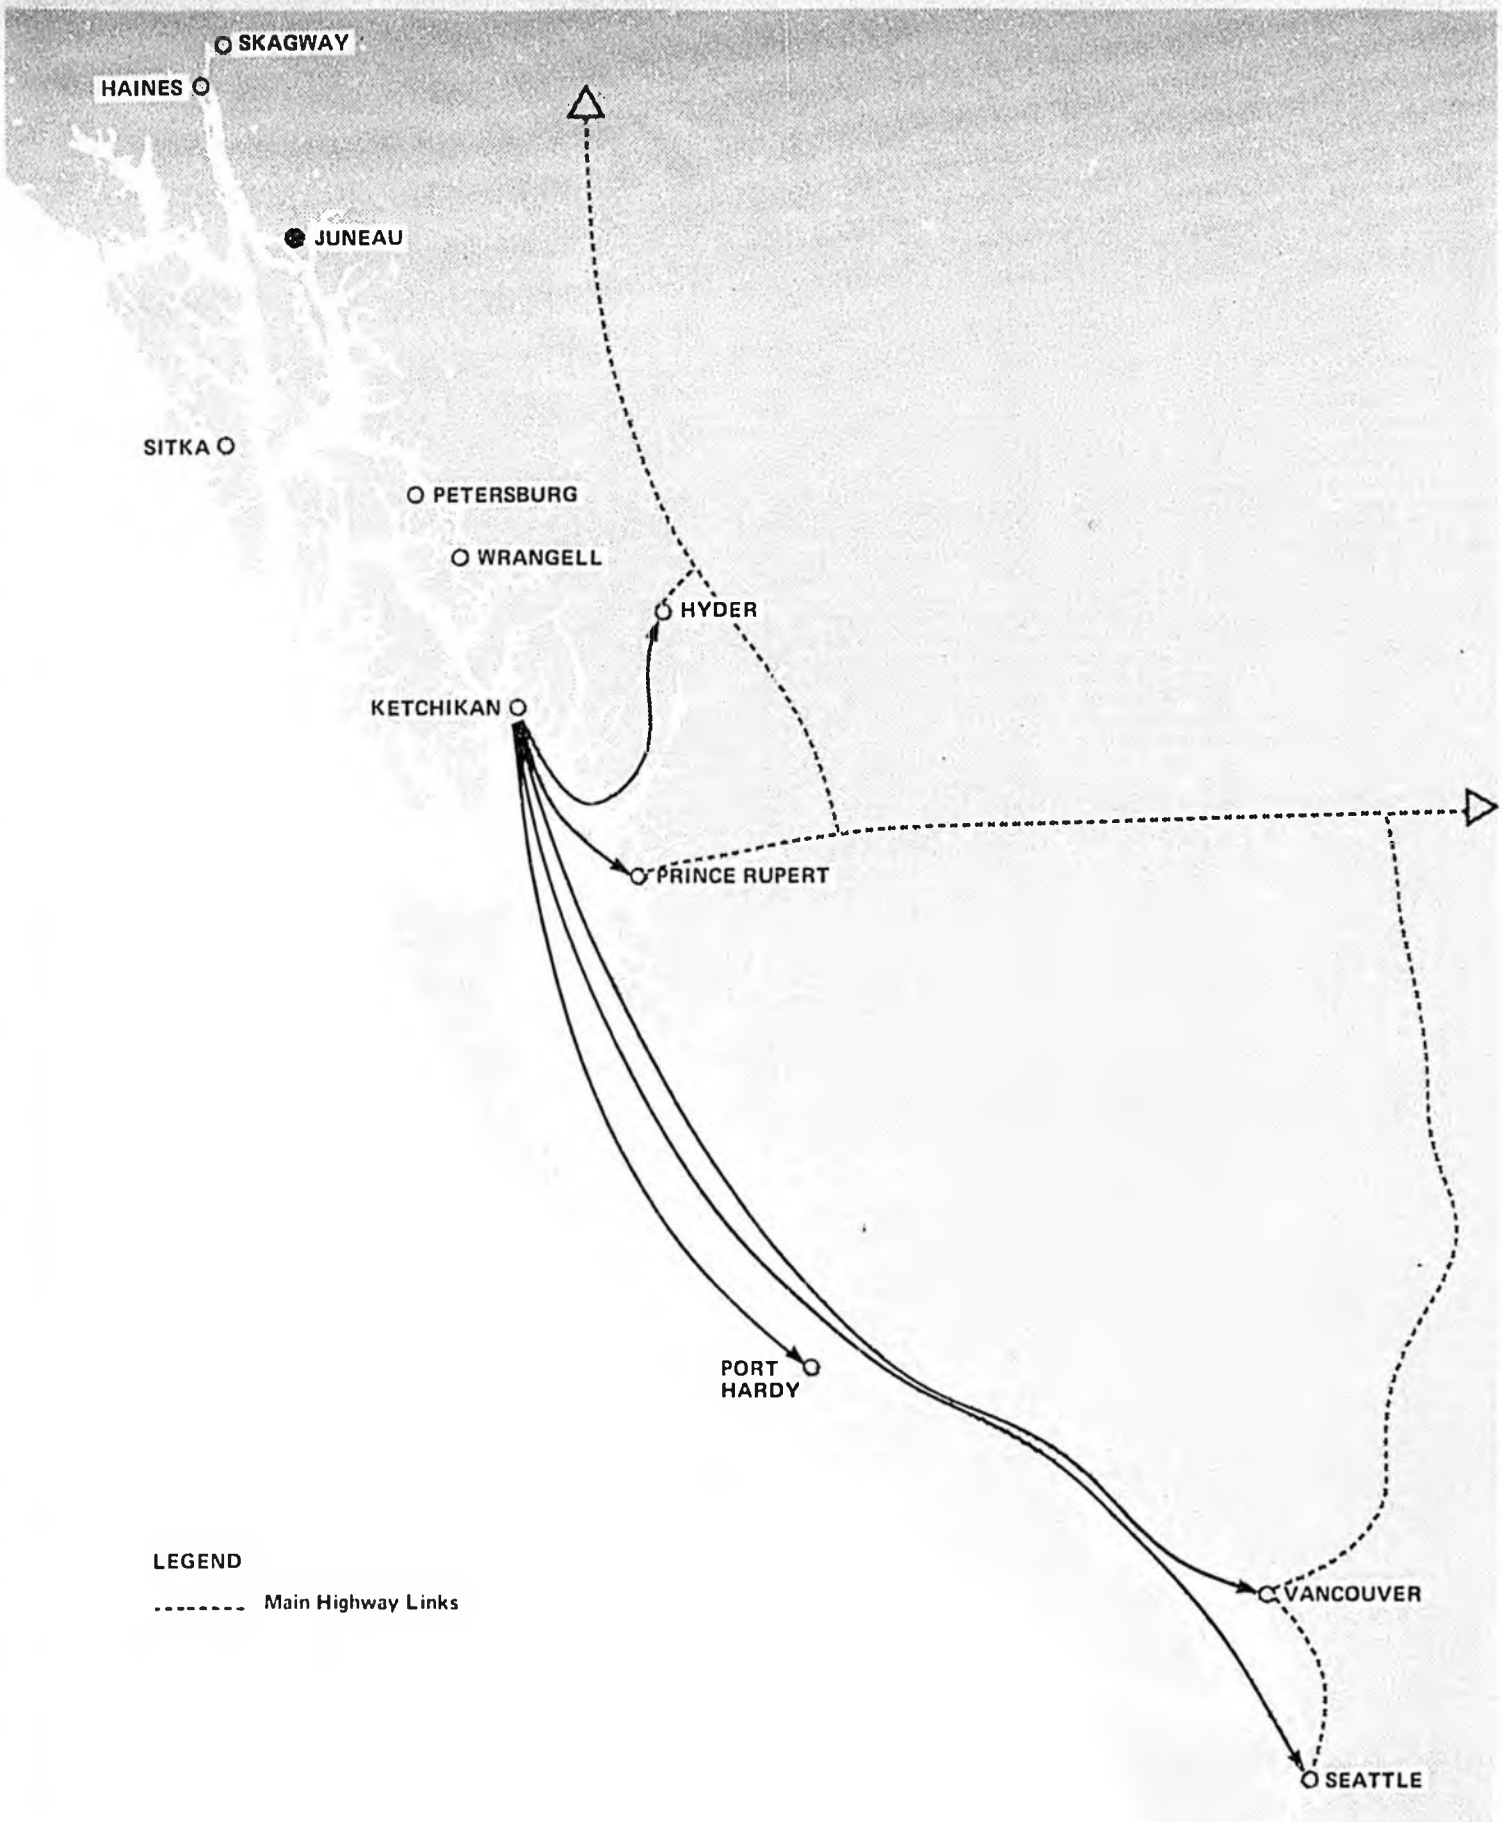

Figure 12

KETCHIKAN CORRIDOR OPTIONS

6. Operate all mainline services out of Hyder.

7. Shuttle the Columbia between Seattle and Ketchikan. Supplement mainline service with the Aurora and LeConte.

8. Acquire a foreign flag vessel to serve traffic between the Lower 48 and Southeast communities. (Note: under existing marine law this vessel could not carry traffic from one US port to another but could free up space on the existing US flag ferries.)

9. Operate all mainline services out of Prince Rupert during the summer peak season only.

Table 3.3 overleaf summarizes these options in terms of annual costs and ability to satisfy projected demand between the Southeast Region and the Seattle and Prince Rupert areas.

Again a detailed analysis was carried out with regard to the financial and service impacts of each of these options and it was decided that four alternatives warranted further evaluation in the context of the regional system. These were:

- add a mainline vessel(s) to serve growing demand (Option 2);

- shuttle the Columbia between Seattle and Ketchikan, supplementing mainline service with the Aurora and LeConte (Option 7);

- acquire a foreign flag vessel to operate out of Vancouver (Option 8);

- operate all peak season mainline services out of Prince Rupert (Option 9).

While these four options represent specific operational alternatives, they may also be regarded as representing a range of philosophies in terms of meeting the growing demand to and from the southern terminus. The first and third options suggest that demand should be met with new vessels (although

TABLE 3.3

KETCHIKAN CORRIDOR OPTIONS

	New Mainline Vessels Added In:	Net AMH Deficit[1] Mainline Service ($ Millions)	Unserved Demand[2] Passengers	Unserved Demand[2] Vehicles
Existing System	-	$291.0	225,000	16,000
Add New Vessels	1990 1993	413.7	31,000	-
Columbia Shuttle	1991 2001	359.2	-	-
Port Hardy Summer Terminus	2000	330.8	350,000	-
Prince Rupert Terminus	2003	352.6	530,000	-
Hyder Terminus	2003	357.7	1,200,000	-
Columbia Shuttle: Aurora, LeConte to Mainline Routes	1993	294.9	-	-
Foreign Flag Vessel	1986 2000	325.3	-	-
Prince Rupert Summer Terminus	2003	313.9	350,000	-

1) Discounted total over 20-year planning period.

2) Total over 20 years.

the foreign flag vessel represents a more economical option in terms of capital), while the second and fourth focus on maximizing use of existing vessels to serve (in the case of the Columbia shuttle) or partially serve (in the case of Prince Rupert turnaround) the Seattle demand. As such they provide an indication of the tradeoffs involved in attempting to balance internal service, tourist service and financial revenues and costs.

3.3.4 - Stikine Corridor Options

The assessment of surface alternatives within the Stikine Corridor (see Figure 13 overleaf) had a twofold focus: first, the provision of surface links between mid-region communities and the continental road system and secondly, the use of these links as either an adjunct to or substitute for Marine Highway links to Prince Rupert and Seattle. Such surface links would provide routing for the movement of passengers and vehicles to and from the Region as well as a means of access to potential resource developments in both Alaska and northern British Columbia.

In terms of intra-regional links, seven alternative concepts were evaluated.

1. Wrangell Road (Pass) Option - Construct a road from Wrangell to the Canadian border with a highway pass to the West Fork of the Katete River.

2. Wrangell Road (Tunnel) Option - Construct a road as in Option 1 but build a tunnel to the West Fork of the Katete River.

3. Wrangell Road/Shuttle Ferry Option - Construct a road as in Option 1. In addition, operate a shuttle ferry between Wrangell and Blind Slough to provide internal Wrangell/Petersburg service and to link Petersburg with the new road system.

4. Petersburg Road Option - Construct a road from Petersburg (end of the Mitkof Highway) to the border along the south bank of the Stikine.

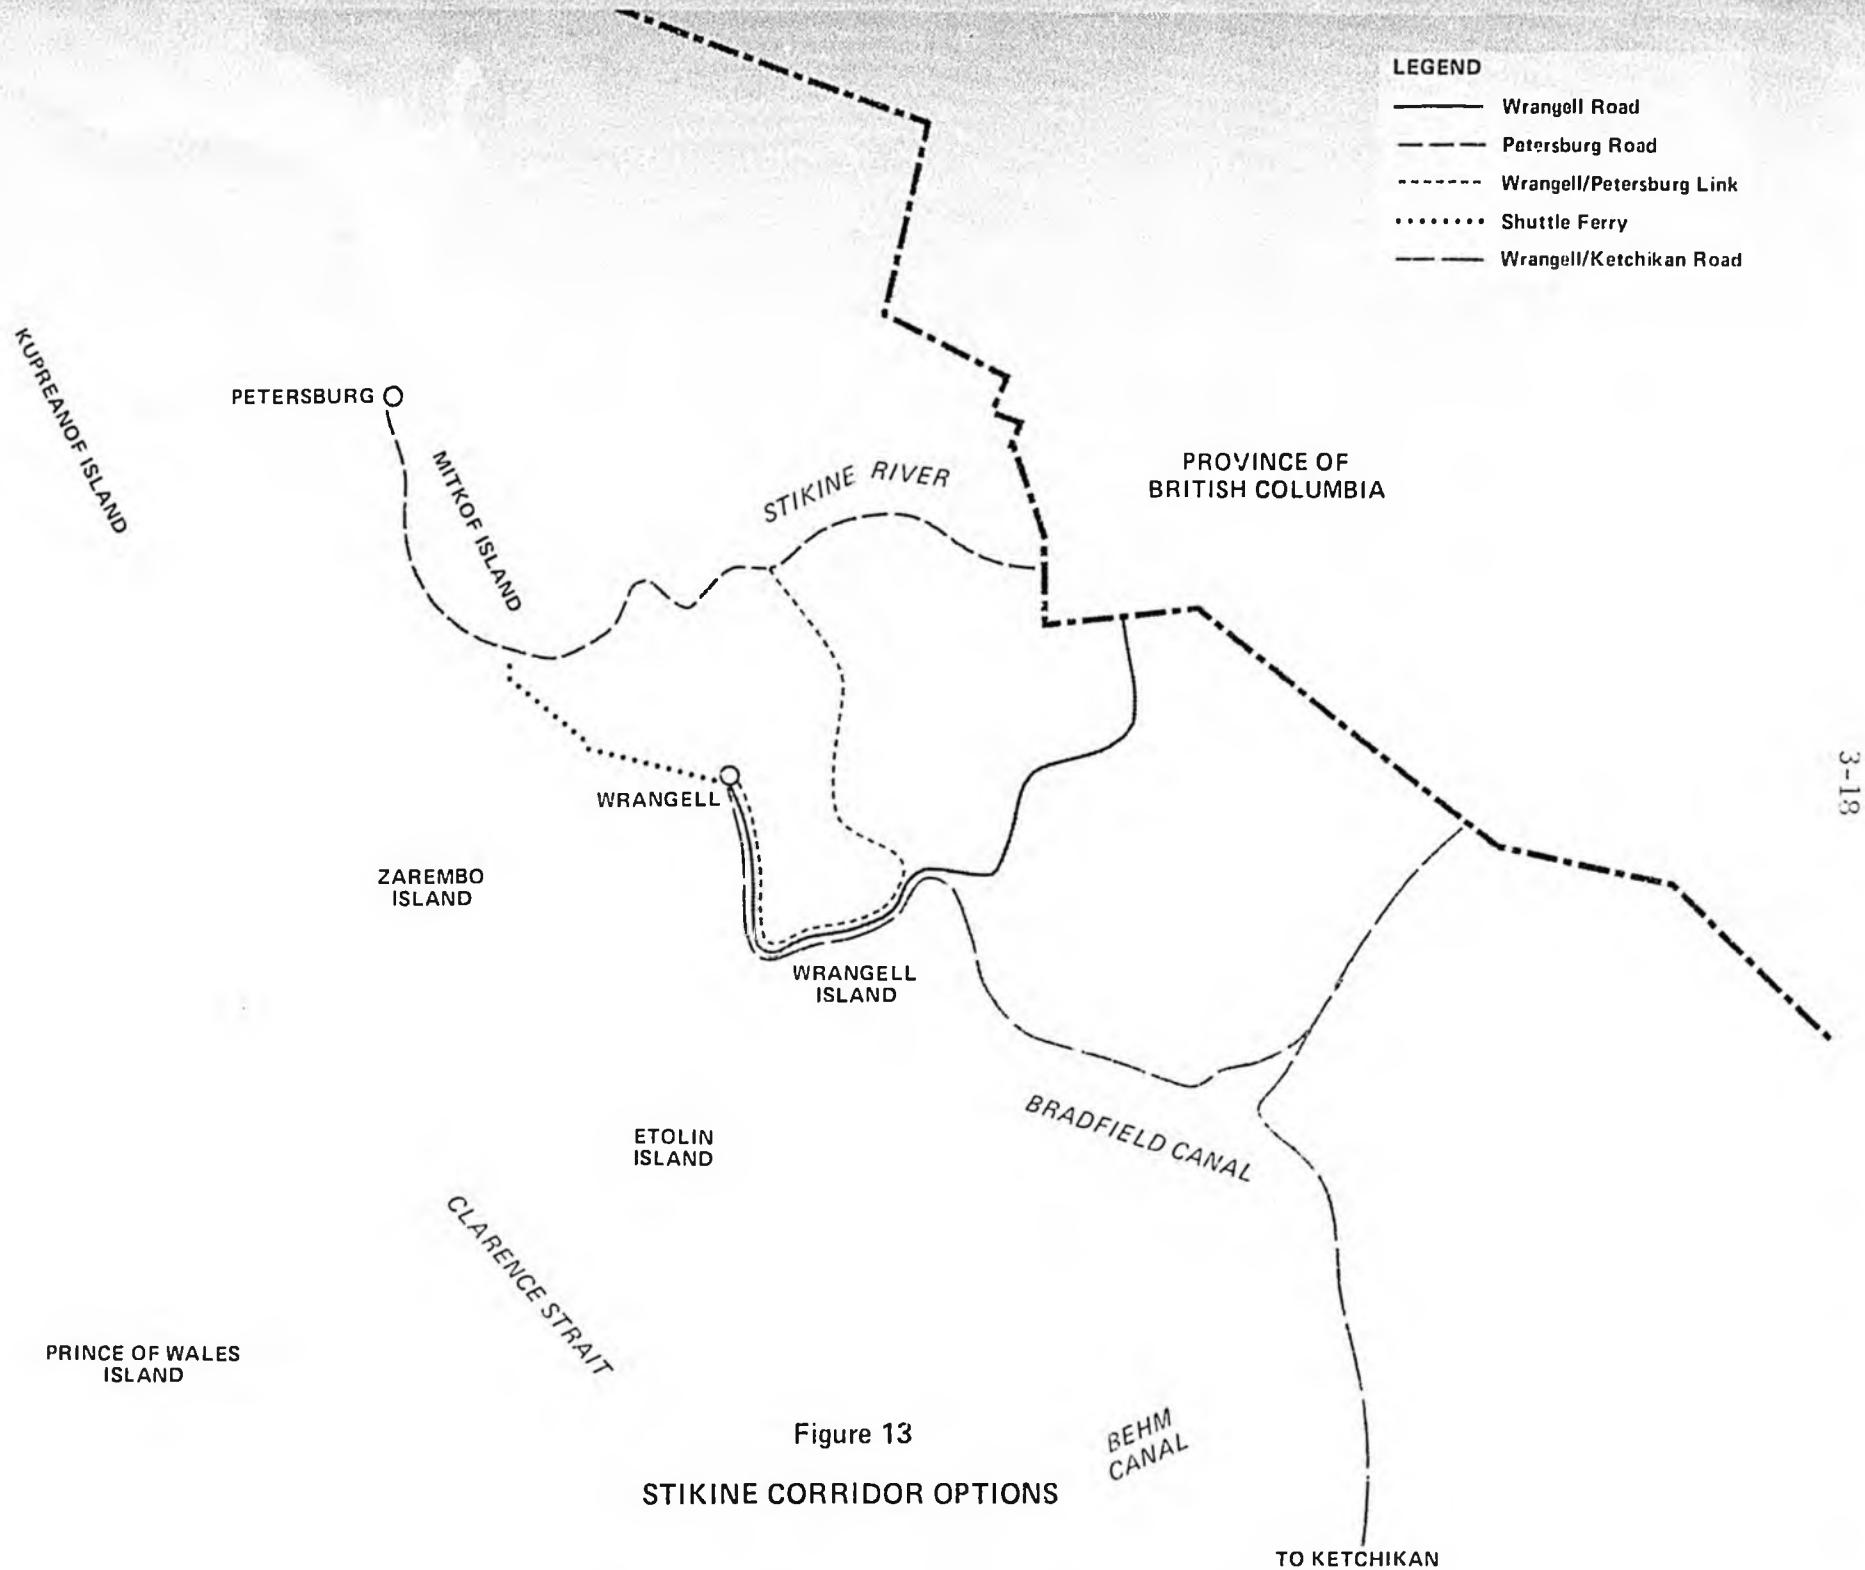

Figure 13

STIKINE CORRIDOR OPTIONS

5. Petersburg Road/Shuttle Ferry Option - Construct a road as in Option 4. Operate a shuttle ferry between Wrangell and Blind Slough to provide internal Wrangell/Petersburg service and to link Wrangell to the new road system.

6. Wrangell/Petersburg Road Option - Construct a road as in Option 4. In addition, construct a road from Wrangell, connecting it to the new Petersburg road at the mouth of Andrew's Creek.

7. Wrangell/Bradfield Road Option - Construct a road from Wrangell to the Canadian border via the Bradfield Canal and the North Fork of the Bradfield River. Provide a connecting link to Ketchikan.

Table 3.4, overleaf, summarizes the capital and operating costs associated with these options.

Each of the above intra-corridor options were evaluated under two alternative scenarios for Marine Highway operations. In the first, or 'mainline' scenario it was assumed that the Marine Highway would maintain its existing schedule of operations to Seattle and Prince Rupert and that the Stikine road would act as a surface alternative for overflow vehicle demand out of these southern ports. In the second, or 'loop' scenario it was assumed that the Marine Highway vessels would operate within the Southeast region only and that the Stikine road would substitute for existing ferry service to Seattle and Prince Rupert.

Again all options were evaluated in terms of financial impacts on users, the State government and the Marine Highway; in terms of ability to meet demand; and in terms of the level of service provided to tourist and resident traffic. The results of this assessment indicated that the preferred corridor options were:

- construct a road from Wrangell to the Canadian border and provide shuttle ferry service from Wrangell to Blind Slough (Option 3); and

TABLE 3.4

STIKINE CORRIDOR OPTIONS

	Additional Capital Costs				Annual Operating Costs[2]		
	Road[1]		Vessels + Terminals	Total	Road	Ferry	Total
	Mi	$M	$M	$M	$M	$M	$M
Wrangell Road/Pass	49	$157.0	-	$157.0	$1.5	-	$1.5
Wrangell Road/Tunnel	48	183.0	-	183.0	2.2	-	2.2
Wrangell Road/Petersburg Shuttle[3]	49	159.0	$4.7	163.7	1.6	$0.6	2.2
Petersburg Road	34	120.0	-	120.0	0.9	-	0.9
Petersburg Road/Wrangell Shuttle	34	120.0	4.7	124.7	0.9	0.6	1.5
Wrangell/Petersburg Road	77	190.0	-	190.0	2.0	-	2.0
Wrangell/Bradfield Road	176	373.0	2.2	375.2	3.2	1.0	4.2

1) Costs are based on construction standards necessary to qualify for Federal-aid to highways funding.

2) Excludes capital amortization.

3) Includes upgrading of Mitkof Highway.

- construct a road from Petersburg to the Canadian border and provide a Wrangell-Blind Slough shuttle ferry connection (Option 5).

Furthermore it was found that, in all instances, continuation of the existing mainline ferry service as an adjunct to the road system was preferable to the 'loop' ferry service scenario in terms of both financial impacts and user service levels.

3.3.5 - Sitka Corridor Options

The fourth subregion which was preassessed at the corridor level was the Sitka area, (see Figure 14 overleaf), with particular reference to the most effective way of incorporating Sitka into the surface transportation system. While a wide range of marine/road schemes were available to serve Sitka traffic, only five were considered to provide a level of service which was either comparable to, or better than the current situation. These options were:

1. Continue existing mainline and feeder ferry service.

2. Construct a road from Sitka to Baranof and operate mainline and feeder vessels out of Warm Springs Bay.

3. Construct a road to Rodman Bay and operate mainline and feeder services out of a terminal there.

4. Provide a direct high-speed catamaran-type service (14 vehicle, 90 passengers capacity) between Sitka-Juneau and/or Sitka-Petersburg. Continue feeder service with the LeConte.

5. Provide high-speed SES-type ferry service (40 vehicles, 180 passengers capacity) between Sitka-Juneau and/or Sitka-Petersburg, calling at intermediate communities along the way.

Annual capital and operating costs associated with each of these options are shown in Table 3.5 overleaf.

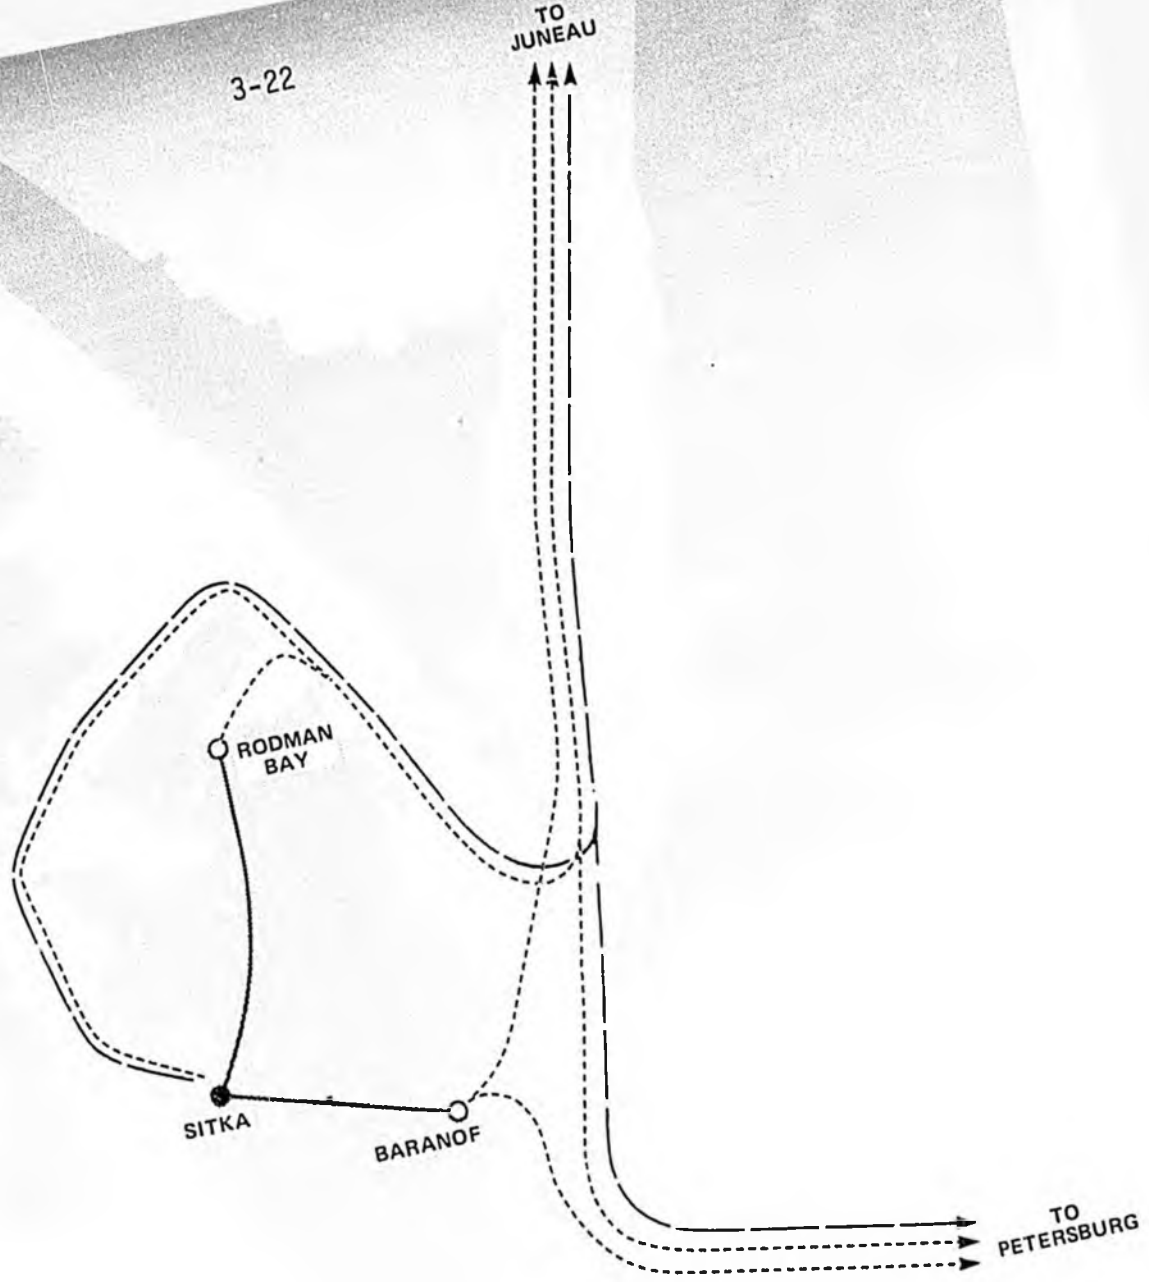

Figure 14

SITKA ACCESS OPTIONS

TABLE 3.5

SITKA CORRIDOR OPTIONS

	Additional Capital Costs					Annual Operating Costs[3]		
	Road [1]		Terminals + Ferries [2]		Total	Road	Ferries	Total
	Mi	$M	No.	$M	$M	$M	$M	$M
Existing Service	-	-	-	-	-	-	$5.2	$5.2
Road to Baranof	26	$176.5	1 (T)	$5.0	$181.5	$1.3	1.7	3.0
Road to Rodman Bay	46	155.0	1 (T)	5.0	160.0	0.6	2.1	2.7
Small High-Speed Ferry	-	-	1 (F)	3.0	3.0	-	2.9	2.9
			2 (F)	6.0	6.0	-	4.8	4.8
Large High-Speed Ferry	-	-	1 (F)	12.0	12.0	-	4.1	4.1
			2 (F)	24.0	24.0	-	8.2	8.2

1) Costs are based on construction standards necessary to qualify for Federal-aid to highways funding.

2) Excludes probable need for new mainline vessels elsewhere in system.

3) Excludes capital amortization.

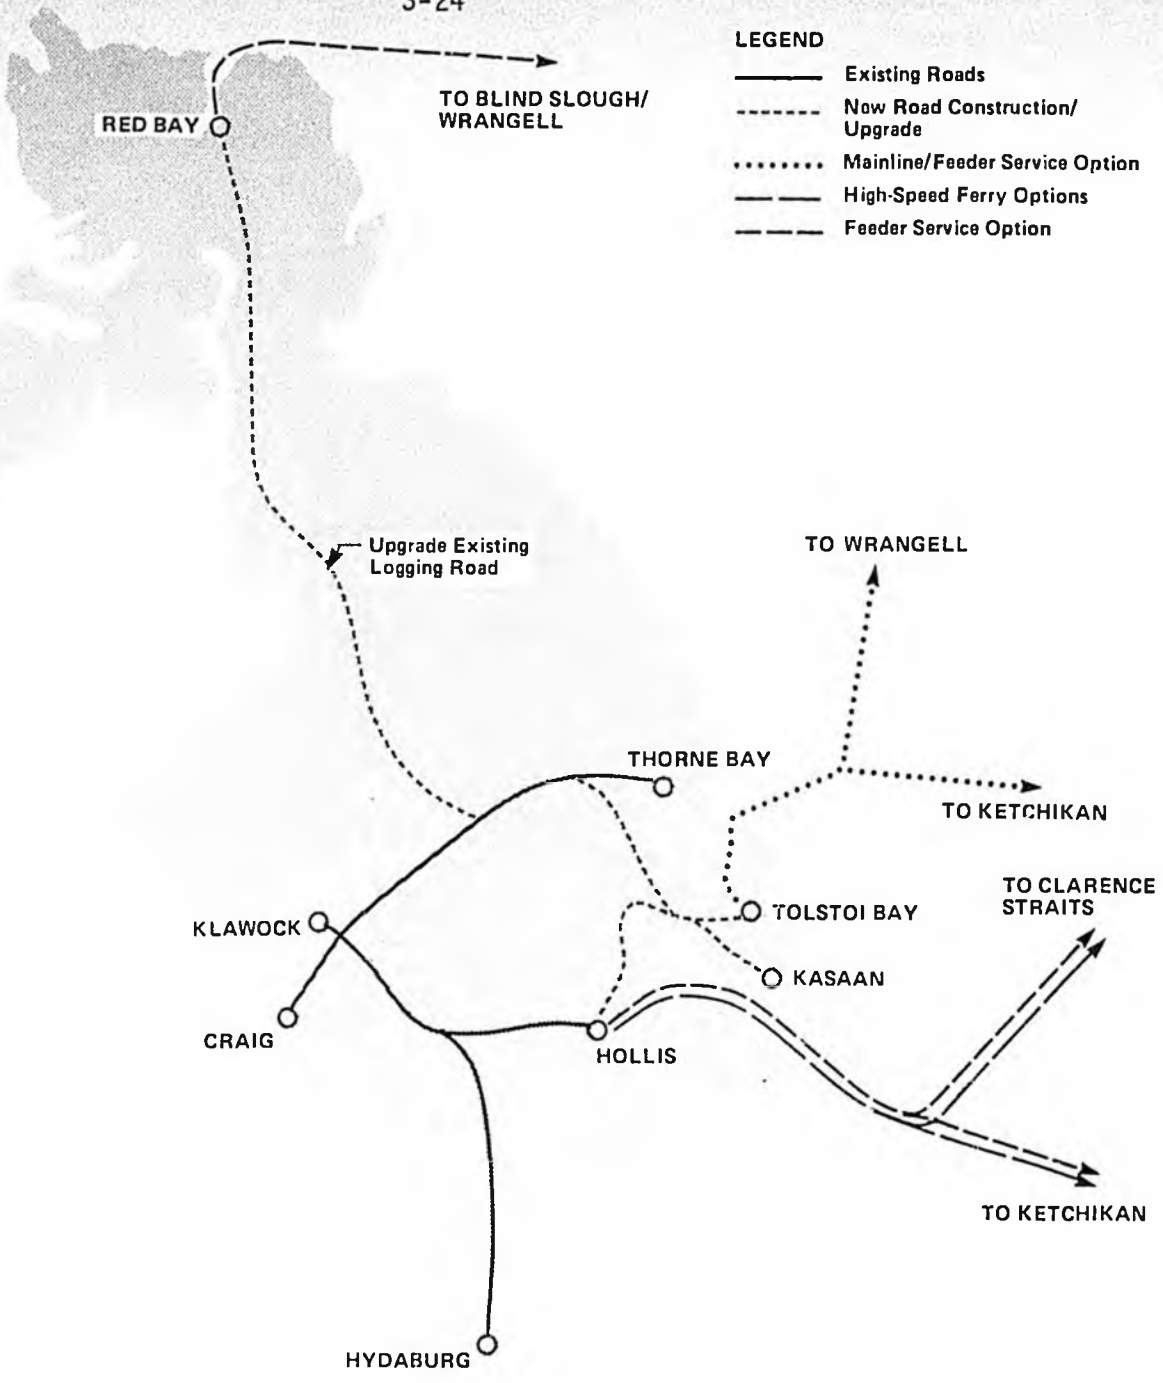

Figure 15

PRINCE OF WALES ACCESS OPTIONS

In terms of evaluation, it was found that the Sitka options could not be meaningfully assessed on a corridor basis alone. The added sailing distance into Sitka combined with the tide delays through Sergius Narrows affect not only Sitka passengers but also the frequency of service and the travel time throughout the mainline and feeder systems. It was therefore decided to carry all Sitka option concepts forward for evaluation in the context of the total system.

3.3.6 - Prince of Wales Access Options

The final subregional assessment study focused on the issue of surface access to and from Prince of Wales Island (see Figure 15 opposite). As with the other corridors, a number of service options were considered. Apart from the option of continuing service in the present manner, these alternatives included the following:

1. Develop a new ferry terminal at Tolstoi Bay. Provide road connections to Thorne Bay and/or Hollis and/or Kasaan. Provide ferry service with the Aurora and/or the mainline vessels.

2. Develop an alternative ferry terminal at the north end of the Island in Red Bay. Upgrade the road connections between Red Bay and the Klawock-Thorne Bay road. Continue limited service with the Aurora from Clark Bay to Ketchikan and provide a new feeder service from Red Bay to Blind Slough and Wrangell.

3. Provide a high-speed catamaran-type ferry shuttle service between Clark Bay and Ketchikan in lieu of the existing feeder service.

4. Provide a high-speed catamaran-type ferry service between Clark Bay, Ketchikan, Metlakatla and other Clarence Straits communities, supplemented by a modified feeder ferry service between Clark Bay and Ketchikan.

The capital and annual operating costs for each of these are shown in Table 3.6, overleaf.

TABLE 3.6

PRINCE OF WALES OPTIONS

	Additional Capital Costs					Additional Annual Operating Costs[2]		
	Roads[1]		Terminals & Ferries		Total	Roads	Terminals & Ferries	Total
	Mi	$M	No.	$M	$M	$M	$M	$M
Tolstoi Bay:								
- Hollis Road	15.9	$21.8	1 (T)	$5.0	$26.8	$0.24	$0.05	$0.29
- Thorne Bay Road[3]	16.9	13.3	1 (T)	5.0	18.3	0.25	0.05	0.30
- Kasaan Connection[4]	6.2	6.1	-	-	6.1	0.09	-	0.09
Red Bay	52.6	63.0	2 (T) 1 (F)	7.0 1.2	71.2	0.80	1.10	1.90
High-Speed Ferries	-	-	1 (F)	3.0	3.0	-	1.75	1.75[5]

1) Costs are based on construction standards necessary to qualify for Federal-aid to highways funding.

2) Does not include cost of existing ferry services. Excludes capital amortization.

3) Includes upgrade of 5.4 miles of existing Kiawock-Thorne Bay Road.

4) Only includes segment from Lindman Lake to Kasaan.

5) Based on year-round operation. Summer operation only would reduce costs to $0.75 - 0.90 million per year.

As with the Sitka corridor, it was felt that the Prince of Wales service options could best be evaluated within the context of the total system. Accordingly all four concepts were carried forward for evaluation as system alternatives. For system purposes, the Tolstoi Bay option was assumed to include both mainline and feeder ferry service and was assumed to be linked to the existing road system via Thorne Bay. With the upgrading of the road from Klawock to Thorne Bay, a connection via Thorne Bay could prove as attractive as one via Hollis to residents of Craig, Klawock and Hydaburg.

3.4 - Surface System Alternatives - Regional

3.4.1 - General

The objective in the corridor or subregional assessment was to narrow down the number of options for providing essentially similar services within a particular area, where the choice of one option over another was unlikely to cause repercussions elsewhere in the region. Where it was felt, however, that different corridor options might create different impacts throughout the regional system, representative examples of these different corridor concepts were retained for further analysis.

Having defined the schemes which best represented solutions to corridor problems, attention was turned to the total regional surface transportation system. At the regional level, the key issue was to develop a balance between the demand for services by Alaska residents in different parts of the region, the need for services to support the Region's tourism, fisheries, mining and timber industries, and the need to allocate State funds in a judicious and beneficial manner. Since these three concerns are not always compatible with one another, the focus of the assessment was to determine the tradeoffs involved as emphasis was directed towards meeting one or more of these concerns at the possible expense of the others.

A wide range of system alternatives were therefore defined in order to allow a detailed analysis of the interactions between competing goals and hence to

deduce those system components which offered the most effective balance in terms of meeting the demands for better transportation service in a cost-effective manner.

To ensure that system alternatives were realistic and to ensure that all impacts were taken into account, regional transportation options were specified in considerable detail. This included:

- specifying peak and off-peak schedules for existing and proposed new vessels;
- developing preliminary specifications for new vessels and obtaining builder estimates for construction and operating costs;
- defining alignments for new roads and developing preliminary engineering-level costs;
- defining and costing new terminal facilities where applicable; and
- projecting passenger and vehicle demand over each link in the system and generating user costs for vehicle operations and/or ferry fares on each route.

In addition, a computer model was developed which calculated for each year of the 20-year planning period:

- the capacity of the system and the portion of demand which could be met;
- the capital and operating costs of the marine/road system;
- the user costs for road and ferry travel; and
- the user travel time between all points in the system including delays related to frequency of service and requirements for transfer.

3.4.2 - Short-Term System Options

The objective of the updated transportation plan was to provide guidelines for the transportation system over a 20-year time period. There is, however, a division between changes that can be accomplished (and are required) in a short time period and changes that can be accomplished (and may be necessary) over a longer time frame. Major capacity additions, for example, in the form of constructing new roads or new mainline vessels may require several years to accomplish, while schedule changes or the introduction of 'off-the-shelf' vessels can be introduced in the near future. For this reason, separate surface system alternatives were defined with one set aimed at the short-term and the other at the long-term planning horizon.

Short-term alternatives were defined to meet several criteria:

- they could be easily implemented (with a 1 to 3-year period);
- they would improve the system's ability to meet demand through the late-1980s or early-1990s; and
- they were sufficiently flexible that they would not preclude any longer-term options.

On the basis of these criteria, seven options were defined for the short-term provision of surface transportation services.

1. No change - continue existing (1985) ferry service.
2. Matanuska to Seattle - operate both the Columbia and Matanuska out of Seattle during the peak.
3. Prince Rupert Terminus - operate all mainline vessels out of Prince Rupert during the peak season.

TABLE 3.7

SHORT-TERM SYSTEM ALTERNATIVES - SUMMARY OF IMPACTS

Option	Net Cost to State ($ Millions)	Passengers not Served (Percent of Peak Demand)			Impacts[1]		
		Seattle	Prince Rupert	Internal	State Cost Savings[1] ($ Millions)	User Cost Savings[2] [3] ($ Millions)	User Time Savings[2] (Million Hrs.)
Existing System	$454.4	37.7%	0.4%	-	-	-	-
Matanuska to Seattle	428.7	10.6	12.7	-	$25.7	$1.4	3.9
Prince Rupert Terminus	503.9	57.1	-	-	(49.5)	(2.0)	0.6
Columbia Shuttle	427.1	6.3	3.3	-	27.3	4.3	(3.3)
Foreign Flag Vessel	482.6	1.5	-	-	(28.2)	5.8	3.5
High-Speed Catamarans	457.1	3.0	9.7	-	(2.7)	3.8	9.2
High-Speed SES Ferries	471.1	3.0	3.1	-	(17.3)	5.0	10.7

1) As compared with continuing existing (1985) service; all figures are discounted 20-year totals.

2) Brackets denote cost or time increases rather than savings.

3) Includes costs for failure to meet demand.

4. Columbia shuttle - operate the Columbia twice weekly between Seattle and Ketchikan during the summer peak.

5. Foreign flag vessel - acquire a foreign flag vessel to operate out of Vancouver during the peak season.

6. High-Speed Catamarans - acquire one or more medium-range, medium-capacity (14 vehicles, 90 passengers) catamaran-type ferries to provide intra-regional service (a fleet of four was evaluated). Focus mainline service on the Seattle routes.

7. High-Speed Surface-Effect Ferries - acquire one or more longer-range, higher-capacity (40 vehicles, 180 passengers) SES-type vessels to provide intra-regional service (a fleet of two vessels was evaluated). Focus mainline vessels on the Seattle route.

These seven scenarios were reviewed in terms of financial impacts on users, the State, and the Marine Highway, in terms of the extent to which they could meet projected passenger and vehicle demand and in terms of the level of service offered to users with respect to service frequency and total travel time. A comparison was carried out between the benefits accruing to the users (from the viewpoint of cost, service and/or travel time) and the net costs incurred by the State and Marine Highway in providing the service. All costs and benefits were measured against the option of continuing the existing schedule. Table 3.7 opposite summarizes the highlights of the findings. All figures represent a system-wide total over 20 years. Financial costs are discounted to reflect their value in terms of current dollars in order to provide a consistent basis for comparing among alternatives.

The analysis raises several interesting points. For example, the two options of operating the Matanuska to Seattle and of shuttling the Columbia to Ketchikan would both generate cost savings to the State as a result of lower Marine Highway deficits. In addition, both would generate user cost savings as a result of reducing the costs associated with unmet demand. The Columbia shuttle, however, would generate high penalties in terms of total

travel time since passengers traveling north of Ketchikan (approximately 75% of Seattle demand) would have to disembark at Ketchikan and wait until they could be accommodated on a vessel out of Prince Rupert.

The other short-term options would all result in higher costs to the State either because they would result in higher Marine Highway operating deficits (Prince Rupert terminus) or because they would require investment in new vessels which could not be fully recovered out of revenues. In the case of high-speed catamaran-type ferry service, these costs would be offset by the user savings associated with the increased ability to meet demand. In the other instances, however, it would have to be presumed that user time savings were sufficiently attractive to offset the net financial losses associated with the service option.

Overall, the most attractive short-term option from the viewpoints of service, travel time and government cost would appear to be routing the Matanuska to Seattle during the summer peak. The chief drawback of this option is that withdrawing the Matanuska from Prince Rupert would quickly lead to capacity problems both at Prince Rupert (where two trips per week are lost) and in the Ketchikan-Petersburg corridor (where service is reduced by one trip per week). Part of this capacity shortfall could be covered by operating the Aurora more frequently out of Prince Rupert but this would create a gap in service to Prince of Wales Island. It was therefore proposed that two high-speed catamaran-type ferries be acquired and put into service in the Ketchikan/Hollis/Petersburg region as a means of freeing the Aurora to operate more frequently out of Prince Rupert, providing improved service to residents of Prince of Wales Island, and providing additional capacity on the Ketchikan-Petersburg corridor.

It was felt that the proposed short-term plan offered an effective balance between the demands of residents, the needs of tourists and other industry sectors, and the requirement to use government funds in a responsible manner. The plan offers tourists and residents a second weekly vessel to and from Seattle and offsets the lost internal services by drawing the Aurora into partial mainline service and enhancing feeder services with high-speed catamarans. While this increases the Marine Highway's capital

and operating costs, part of this increase is offset by the greater earning power of the Matanuska and Aurora on their revised routes and by the revenue-generating potential of the high-speed vessels.

At the same time, the proposed plan offers flexibility in the long term in that it involves a relatively small ($6 million) investment in new equipment which could, if circumstances change, be put to use elsewhere in the system.

3.4.3 - Long-Term System Options

The definition and assessment of long-term surface system alternatives involved a changed perspective in terms of both the demands to be met and the range of options available to provide service. While traffic demand is expected to continue to increase in the future, it is possible, in the long term, to envision major changes in the transportation system through the acquisition of additional mainline vessels, the development of new road links, the purchase of high-capacity, high-speed ferries, and the phased introduction of more substantial schedule changes.

As in the short-term, however, the key concern was to establish a balance between the goals of serving resident demand, accommodating the needs of the tourism and other industry sectors, and allocating government funds in a judicious and beneficial manner. A range of long-term alternatives was therefore specified not only in terms of operating characteristics but in terms of the level of investment in new capacity in order to meet demand.

The issue of investing to meet demand was of particular concern since it was recognized that new investment in mainline vessel capacity would primarily serve peak season tourist demand out of Seattle. During the off-peak season these vessels would not be required. It was therefore decided to investigate a range of investment options in order to determine the savings and impacts associated with providing alternate levels of peak season capacity.

Two investment scenarios were therefore analyzed:

- acquire sufficient vessels to meet peak season demand out of both Seattle and Prince Rupert; and

- acquire new mainline vessels only when combined vehicle demands out of Seattle and Prince Rupert exceed combined vessel capacity. This implies acceptance of the concept that passengers with vehicles will be willing to transfer from Seattle to Prince Rupert if ferry capacity is available.

In addition, for sensitivity testing, selected scenarios were evaluated whereby no new mainline vessels were acquired and demand in excess of capacity was presumed to be lost.

Alternatives for surface system operations were defined in terms of a series of 'Focuses' where each focus involved emphasizing a particular concept in terms of regional service and evaluating its impact throughout the system from the viewpoints of cost and service effectiveness.

Five key 'focus' areas were developed.

1. Mainline Service Focus - This option involved continuing the philosophy of the June 1980 Plan whereby the existing mainline and feeder route structures were maintained and additional capacity was provided by the acquisition of new mainline vessels.

2. Lynn Canal Focus - This option emphasized changes within the Lynn Canal corridor, analyzing their impacts on both Lynn service and on service throughout the region. Two Lynn service options were evaluated:

   - an east-side road from Juneau to Skagway with a shuttle ferry from Haines to the Katzehin River;

   - two high-speed SES-type shuttle ferries from Echo Cove to Haines and Skagway.

In both cases, northbound mainline ferry service was assumed to terminate at Juneau.

3. Sitka Focus - This option focused on changing the way in which the Sitka community was incorporated into the surface system. Three service options were assessed:

   - construct a road from Sitka to Baranof and operate mainline and feeder services out of Warm Springs Bay;

   - construct a road from Sitka to Rodman Bay and provide mainline and feeder ferry services out of a Rodman Bay terminal;

   - provide high-speed SES-type ferry service on the Sitka-Juneau and Sitka-Petersburg links. Terminate mainline service into Sitka.

4. Prince of Wales Island Focus - This option emphasized alternative means of providing service to communities on Prince of Wales Island. Four specific options were evaluated:

   - Relocate the Clark Bay terminal to Tolstoi Bay, and provide mainline and partial feeder service through the new terminal. Connect Tolstoi Bay to the Island communities by extending the road from Thorne Bay to Tolstoi Bay. (Other road connections could be made to Hollis and Kasaan.)

   - Develop a new terminal at Red Bay on the north end of the Island, connected by road to the existing Klawock-Thorne Bay highway. Provide ferry service from Red Bay to Blind Slough and Wrangell, and from Hollis to Ketchikan.

   - Acquire a high-speed catamaran-type ferry to provide twice-daily shuttle service between Hollis and Ketchikan. Transfer the Aurora to other routes.

TABLE 3.8

LONG-TERM SYSTEM OPTIONS - MEET DEMAND SCENARIOS

	Net Cost to State ($ Millions)	Impacts[1] Government Cost Savings[2] ($ Millions)	User Cost Savings[2] ($ Millions)	User Time Savings[2] (Million Hrs.)	Comments
Mainline Service Focus	$583.9	-	-	-	-
Lynn Focus:					
- road	772.9	$(189.0)	$73.6	15.3	Includes benefits to 3 million induced passengers.
- high-speed ferry	619.2	(35.3)	9.1	5.8	Includes benefits to 0.5 million induced passengers.
Sitka Focus:					
- Baranof	642.7	(58.8)	(1.2)	(0.2)	-
- Rodman Bay	626.6	(42.7)	(2.4)	(0.6)	-
- high-speed ferry	600.4	(16.5)	0.1	4.0	Includes benefits to 25,000 induced passengers.
Prince of Wales Focus:					
- Tolstoi Bay	574.0	9.9	(0.2)	0.9	-
- Red Bay	618.2	(34.3)	(0.1)	0.6	-
- high-speed shuttle	570.4	13.5	0.4	2.4	-
- high-speed loop	571.0	12.9	0.4	0.7	-
Stikine Focus:					
- Wrangell Road	640.5	(56.6)	3.5	(1.9)	(Involves an increase in unserved demand; added
- Petersburg Road	607.2	(23.3)	3.1	(1.9)	(capacity provided only when demand cut of
- Wrangell/Ketchikan Road	778.1	(194.2)	[3]	[3]	(YPR/Stikine exceeds capacity.

1) As compared with Mainline Service Focus (June 1980 Plan); all figures are discounted 20-year totals.

2) Brackets denote cost or time increases rather than savings.

3) Major changes in service patterns make comparison based on existing demand invalid.

- Acquire a high-speed catamaran-type ferry to provide service in the Hollis-Ketchikan-Clarence Straits region. Supplement Hollis-Ketchikan service with alternate-day service by the Aurora.

5. Stikine Corridor Focus - This option emphasized development of a mid-region road access to supplement mainline ferry service. The two preferred corridor options were evaluated in the systems context, and a third option--constructing a road from Ketchikan to the Canadian border with a connecting link to Wrangell--was also included.

   The three Stikine options therefore involved:

   - Construct a road from Wrangell to the Canadian border. Provide shuttle ferry service between Wrangell and Petersburg via Blind Slough.

   - Construct a road from Petersburg to the Canadian border. Provide shuttle ferry service between Wrangell and Petersburg via Blind Slough.

   - Construct a road from Ketchikan to the Canadian border with a connecting link to Wrangell. Operate ferry services south of Ketchikan/Hollis and north of Wrangell.

It should be noted at the outset that definition of these focus areas was not meant to suggest that all service improvements should be focused in a single region. Rather the intent was to determine the relative system-wide impacts associated with these various improvements and select those which offered the greatest benefits relative to their costs.

As mentioned earlier, these scenarios were assessed under a range of alternative investment levels in terms of meeting projected Seattle/Prince Rupert demand. Tables 3.8 opposite and 3.9 overleaf summarize the general findings first for scenarios which would meet the full level of demand and secondly, for scenarios which would meet only combined demand out of the southern termini.

TABLE 3.9

LONG-TERM SYSTEM OPTIONS - REDUCED INVESTMENT SCENARIOS

Option	Net Cost to State ($ Millions)	Seattle Peak Passenger Demand		Impacts[1]		
		Not served (%)	Served by Diversion (%)	Government Cost Savings[2] ($ Millions)	User Cost Savings[2] ($ Millions)	User Time Savings[2] (Million hours)
Mainline Service Focus	$583.9	1.8%	2.0%	-	-	-
Lynn Focus:						
- road	702.7	4.5	12.4	$(118.6)	$73.1	10.2
- high-speed ferry	530.9	1.9	11.9	53.0	9.1	(0.2)
Sitka Focus:						
- Baranof	569.7	13.1	4.8	14.2	(3.6)	(0.2)
- Rodman Bay	554.4	13.1	4.8	29.5	(4.8)	(3.5)
- high-speed ferry	511.6	1.9	10.4	72.3	-	0.7
Prince of Wales Focus:						
- Tolstoi Bay	492.0	6.7	6.1	91.9	(1.1)	(2.7)
- Red Bay	536.1	6.7	6.1	47.8	(1.0)	(1.2)
- high-speed shuttle	484.6	3.3	3.4	99.3	(0.2)	(0.4)
- high-speed loop	485.2	3.3	3.4	98.7	(0.2)	(2.0)
Stikine Focus:						
- Wrangell Road	640.5	8.0	10.4	(56.6)	3.5	(1.9)
- Petersberg Road	607.2	8.0	10.4	(23.3)	3.1	(1.9)

[1] As compared with the Mainline Service Focus (June 1980 Plan); all figures are discounted 20-year totals.

[2] Brackets denote increases in cost or time rather than savings.

Examination of the findings indicates first that if demand is to be met throughout the system, the least costly methods from the government perspective involve changes in service to Prince of Wales Island. The Tolstoi Bay and high-speed catamaran options both offer government cost savings as compared with the Mainline Service Focus and cause only minor (and generally beneficial) impacts in user costs and travel time.

The second table, (Table 3.9) which compares the 'reduced investment' scenarios, also highlights some significant findings. For example, it would appear that by viewing combined Seattle/Prince Rupert vehicle demand as a single market and accepting transfer of vehicles from one departure port to the other, substantial cost savings can be realized relative to the Mainline Service Option with very little reduction in either the total passengers served or the quality of service provided. In the Lynn and Sitka high-speed ferry options in particular, mainline schedules can be rearranged such that the system continues to meet virtually all of the Seattle passenger demand, yet no new mainline vessels would be required until the late-1990s. The Prince of Wales Focus options also succeed in meeting a substantial portion of the Seattle demand. In these cases, however, a new mainline vessel would be required by the early-1990s.

Overall, the Sitka shuttle appears to offer the most attractive features in terms of meeting demand at a low level of new investment while generating the same benefits in terms of user cost and travel time as those achieved under the more costly Mainline Service Option. The Sitka Shuttle option is closely followed by high-speed Lynn service which generates lower system savings in terms of government costs but, by operating out of Echo Cove, offers cost savings to existing and induced Lynn traffic.

Also attractive are the Tolstoi Bay terminal and Prince of Wales high-speed ferry options. In the long-term, however, these options by themselves require a fairly early decision on new mainline capacity in order to meet demand and involve some negative impacts in terms of user cost and user travel time.

After detailed consideration of the implications of these findings, it was recommended that a 'combination' scenario should form the long range plan for surface transportation in the region. Specifically it was suggested that:

- the features of the short-term plan be carried over into the long term with the Matanuska operating out of Seattle and two high-speed catamaran-type ferries operating in the Prince of Wales-Ketchikan-Clarence Straits region;

- that two larger high-speed SES-type ferries be purchased for peak season operations. One would provide daily round trip service between Sitka and Juneau with stops at Angoon, Tenakee Springs and Hoonah. The second would provide twice daily round trip service between Juneau/Auke Bay, Haines and Skagway;

- that the Matanuska operate on an 'open jaw' or alternating terminus route, sailing first from Seattle, through the region and terminating at Prince Rupert, then sailing back through the region and terminating in Seattle. On this route the Matanuska would serve Sitka en route from and en route to Seattle (a total of three times in two weeks) but would not serve the Lynn Canal;

- that the Columbia operate on a similar 'open jaw' route, but serving the Lynn Canal rather than Sitka, and that the Malaspina and Taku operate on mainline routes between Prince Rupert and Haines/Skagway;

- that the LeConte continue to provide feeder service for passengers and heavy vehicles in the Sitka-Petersburg and Sitka-Juneau corridors;

- that the Aurora be used in the Prince Rupert - Juneau corridor, also providing heavy freight service to Prince of Wales Island.

- that to offset the failure to provide full service out of Seattle, private operators be encouraged to provide vehicle capacity between Seattle and the Southeast Region.

4 - TRANSPORTATION PLAN

4 - TRANSPORTATION PLAN

The analysis described in the preceding sections was drawn together to generate an updated transportation plan for Southeast Alaska. The goals, objectives, policies and features of this plan are stated in the following sections.

4.1 - Goals

As stated previously, the goal of the transportation plan is to provide a means of serving the transportation demands of Alaskan residents, and to provide the transportation services necessary to support the regional economy, while recognizing that these aims must be accomplished in a fiscally responsible manner.

4.2 - Objectives

Since these goals often involve conflicting pressures, the objective in defining the plan was to find a balance between service levels and cost where service level objectives included:

- providing capacity to meet demand;
- maximizing service frequency;
- minimizing travel time;
- minimizing travel cost;

and cost objectives included:

- minimizing capital expenditures;
- minimizing system operating deficits.

In all cases, an associated objective was to minimize adverse social, economic and environmental impacts within the Region.

4.3 - Policies

As part of meeting the goals and objectives, certain policies were proposed with regard to the provision of transportation services. These were as follows.

- Ensure that all residents of Southeast Alaska have access to at least a minimum transportation service.

- Encourage the provision of transportation in the Region by private operators where they are able to provide an adequate and competitive service.

- Define potential transportation/utility corridors and encourage the US Forest Service and mining interests to construct future resource road development within these corridors where practical.

- Avoid duplication of transportation services by the State except in the interest of public safety or service reliability requirements.

- Avoid duplication of public and private transportation operations.

- Promote the concepts that different modes will offer a natural competitive advantage in different regions and encourage development of modes best suited to the community's specific needs.

- Provide opportunity for effective public participation in transportation decisions.

4.4 - Aviation System Plan

Short-Term (1986-1990)

- Complete runway extensions at the airports in Kake, Hoonah and Klawock.

- Upgrade and/or expand seaplane facilities at Angoon, Pelican, Tenakee Springs, Thorne Bay, Whale Pass, Craig and Metlakatla.

- Introduce improved navigation aids:

  - relocate VHF transmitters where necessary to provide improved line-of-sight reception;

  - introduce microwave landing systems (MLS) at airports served by jet aircraft and also at Klawock airport;

  - provide nondirectional radio beacons (NDB) at all airports which have scheduled air services;

  - as funds permit, introduce runway lighting at regional airports to permit night-time VFR operations and improve safety in poor weather conditions;

- Review and develop a policy on the provision of emergency landing strips.

Long-Term (1991-2005)

- Support development of float plane facilities in regional communities as service and demand require.

- If current community opposition is withdrawn at Angoon, Pelican and Tenakee Springs, support development of new airports in these communities as part of a wheel-based regional airport system.

- Ensure that clearance is available at both existing and new airports to permit ultimate extension of runways to 4000 feet in order to accommodate larger commuter aircraft.

4.5 - Marine Highway System Plan

Short-Term (1986-1990)

- Operate the Matanuska and Columbia out of Seattle in the peak season.
- Increase Aurora service in the Prince Rupert-Petersburg corridor.
- Subject to analysis by the Alaska Marine Highway System as to the most appropriate design/configuration, acquire two medium-capacity, mid-range, high-speed ferries to supplement peak service in the Ketchikan-Hollis-Clarence Straits regions.

Long-Term (1991-2005)

- Subject to Marine Highway analysis as to the most appropriate design/configuration, acquire two larger high-speed ferries to provide peak season service in the Sitka-Juneau and Juneau-Lynn corridors.
- Operate the Matanuska on an 'open jaw' route between Seattle, Sitka, Juneau and Prince Rupert, bypassing the Lynn Canal but calling at the other mainline ports.
- Operate the Columbia on an 'open jaw' route between Seattle, Juneau, the Lynn Canal and Prince Rupert, bypassing Sitka but calling at the other mainline ports.
- Operate the Malaspina and Taku between Prince Rupert and Haines/Skagway calling at Ketchikan, Wrangell, Petersburg and Juneau.

- Operate the Aurora in the Prince Rupert-Juneau corridor providing at least weekly service to Hollis and Hyder.

- Operate the LeConte in the Juneau-Sitka-Petersburg corridors providing service to Pelican, Hoonah, Tenakee Springs, Angoon and Kake.

- Operate the two smaller high-speed ferries in the Ketchikan-Prince of Wales-Metlakatla corridor.

- Provide ferry service to Gustavus when supported by the community.

- Review the continuing role of high-speed ferries in the Southeast Marine Highway System and evaluate the need for additional high-speed vessels and routes.

- As traffic demand develops, review the possible need for a new mainline vessel to operate out of Seattle by the late 1990s.

- In the interim, encourage private operators to provide additional vehicle carrying capacity between Seattle and the Southeast Region to meet the needs of tourist and resident travelers.

4.6 - Road System Plan

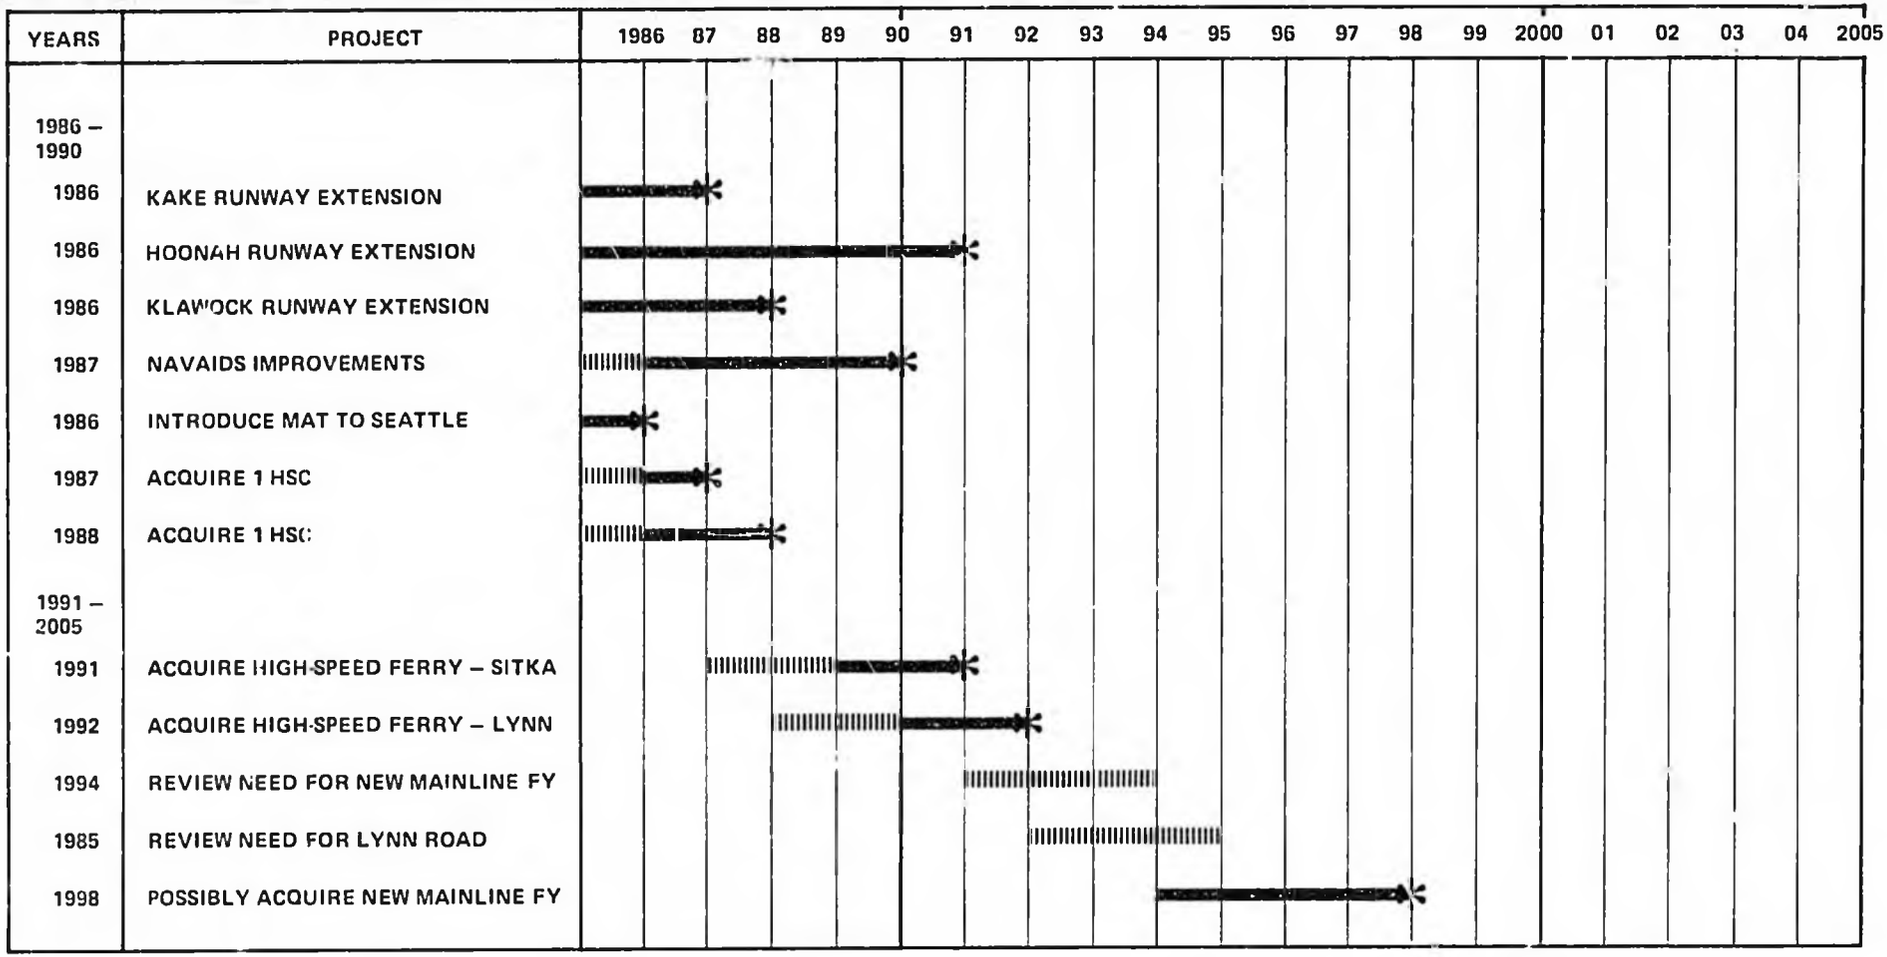
Short-Term (1986-1990)

- Continue upgrading and maintenance of existing road links in the region.

- Ensure that communities are provided with surface access routes to air and marine terminals.

Long-Term (1991-2005)

- Current projections for population growth and economic development suggest that inter-community links will continue to be best served by Marine Highway and air transportation.



LEGEND

Plan

Implement

Initiate Service

Figure 16

TIME FRAME FOR KEY PROJECTS

- Monitor demand on the Lynn Canal route to ascertain when developments warrant reassessment of a Juneau-Haines-Skagway road link.

- Re-evaluate road corridors and transportation technology developments on a periodic basis.

4.7 - Ongoing Planning Process

- Continue an ongoing regional planning process to maintain a data base, to evaluate changes in transportation demands, and to periodically update the Regional Transportation Plan.

- Encourage ongoing development of management information systems to provide reliable, up-to-date data on transportation facilities and modal operations.

- Assign priority to the development of:

  - marine highway traffic data including passenger origin/destination patterns and vehicle characteristics;

  - air traffic data for jet, commuter and air-taxi operations;

  - inventory of aviation facilities;

  - assignable cost data for public transportation services.

- Maintain historical records of changes in transportation patterns in response to the introduction of new services.

1 - INTRODUCTION

EVALUATION OF SURFACE SYSTEM ALTERNATIVES

1 - INTRODUCTION

1.1 - General

As part of developing an updated Transportation Plan for the Southeast Alaska Region, a detailed assessment was carried out with regard to the surface transportation systems which could be implemented in the Region in order to provide improved access to, from and within Southeast Alaska.

The key concept in this assessment was the idea that surface transportation in the Region must be viewed as an integrated 'system.' This 'system' concept implied that the provision of transportation services in specific areas was inextricably linked to a total regional network of services and that changes in one area would frequently impact on services elsewhere. Thus transportation services had to be assessed in a total regional context with a view to maximizing total benefits rather than optimizing services into particular subregions, or communities.

1.2 - Corridor Studies

Notwithstanding the preceding comments, there were certain subregions within Southeast Alaska where a range of surface transportation alternatives were available which were sufficiently similar in terms of regional impact that they could be prescreened in a more limited context, either on the simple basis of capital cost or on the basis of corridor impacts.

As a result, a number of subregional or 'corridor' studies were carried out as a preface to the regional systems evaluations with a view to narrowing down the number of options requiring assessment in the total systems context. Five 'corridors' were reviewed at this level: the Juneau Access (Taku/Lynn) corridor, the Ketchikan-Southern Terminus corridor, the Stikine corridor, the Sitka Access corridor, and the Prince of Wales Island Access

corridor. The surface transportation alternatives evaluated for each of these corridors and the findings and recommendations arising from the evaluations are described in a series of separate documents entitled

. "Evaluation of Corridor Alternatives - Juneau Access (Lynn/Taku Corridors)"

. "Evaluation of Corridor Alternatives - Ketchikan - Southern Terminus - Corridor"

. "Evaluation of Corridor Alternatives - Stikine Corridor"

. "Evaluation of Corridor Alternatives - Sitka Access"

. "Evaluation of Corridor Alternatives - Prince of Wales Island Access."

1.3 - Scope of Analysis

The Southeast Alaska Region was designated to include all Alaska territory south of Icy Bay (see Figure 1). All issues of surface access to, from and within this area were included in the scope of analysis.

Surface transportation was deemed to include both land-based and marine-based modes. Frequently these two modes acted as complements to one another (with roads providing access to ferry terminals) but in some cases a land-based route could serve as an alternative to marine services.

1.4 - Report Format

The remainder of this report is divided into five sections. Section 2 lays out the background to the review of system alternatives, describing the existing surface transportation system and outlining the assumptions with regard to future needs and opportunities, and Section 3 describes the process used to evaluate the alternative system options. Section 4 outlines

the options which were considered as short-term system alternatives and presents the findings of the short-term evaluations, while Section 5 deals with long-term system options in the same manner. Section 6 presents a summary of findings as well as conclusions and recommendations based on the analysis. In addition, two appendixes are provided which describe, in greater detail, some of the evaluation concepts.

2 - REGIONAL PLANNING CONTEXT

2 - REGIONAL PLANNING CONTEXT

2.1 - General

In the years since the previous Transportation Plan was developed, a number of changes have occurred in the Southeast Alaska Region. Some of the changes have been generated internally but many have been generated by outside forces which have impacted on the needs and opportunities within the area.

The intervening years have seen a marked decline, for example, in the resource markets on which a substantial portion of the Alaskan economy is based. Falling oil prices have placed downward pressure on government revenues, while poor markets for forest products and minerals have led to curtailment or deferral of projects which were originally planned for the early 1980s. These factors have led to an increasing reliance on the tourist market, which has remained strong in spite of generally poor economic conditions.

Within the region, shifts in population and income have altered the demand pattern for transportation services. In addition, system changes made as a result of the 1980 Plan have provided new information regarding the interactions between demand and services and have highlighted new areas of service shortfalls.

These factors have combined to create a new context in terms of transportation demand within the Region. At the same time, some significant changes have occurred in the supply side of the equation as new transportation technologies and new types of services have evolved as practical options.

As a result, an initial step in the definition and assessment of system options was to reevaluate the transportation planning framework in terms of

- expected changes in the demand for service,

- the base or existing transportation system, and

- the technological changes which may be available for future integration into the transportation network of the Region.

2.2 - Population and Tourism Growth

The key factors contributing to changing demand for transportation services in Southeast Alaska are the growth in regional population and the growth in tourist traffic into the area. In a survey carried out in 1983, almost 40% of the Marine Highway users were Alaska residents. In addition, on the Marine Highway, almost 50% of the travelers (and over 70% of summer travelers) were tourists. These two markets clearly account for the major portion of surface transportation demand in the Region, and the future growth in these markets will play a key role in defining the need for transportation services.

In the past, population growth in the Southeast Alaska region has generally remained fairly stable and relatively strong. Since the late 1960s, the population of the Region has grown at a fairly consistent rate of 2.5% to 3.0% per year, somewhat lower than the State average of 3.5% but without the marked swings seen in statewide population figures. Similarly, employment opportunity in the Region has shown a fairly stable and strong growth rate, increasing at an average rate of 4.0% per year. (See Table 2.1.)

In the late seventies it was expected that, provided the State capital was not moved from Juneau, the long-term population growth rate could be maintained at around 2.8%, increasing to over 100 000 persons by the year 2000. More recent forecasts, however, have been more pessimistic (see Figure 2). In part because of the Region's dependence on State government employment and the expected need to reduce State spending, forecasts have generally predicted a decline in the long-term annual growth rate. A Delphi forecast prepared in 1983 projected regional population growth of less than 2.5% per year to 1990, declining to below 2% from 1990 to 2000 and less than 1.5% thereafter. The Alaska Institute for Social and Economic Research, using

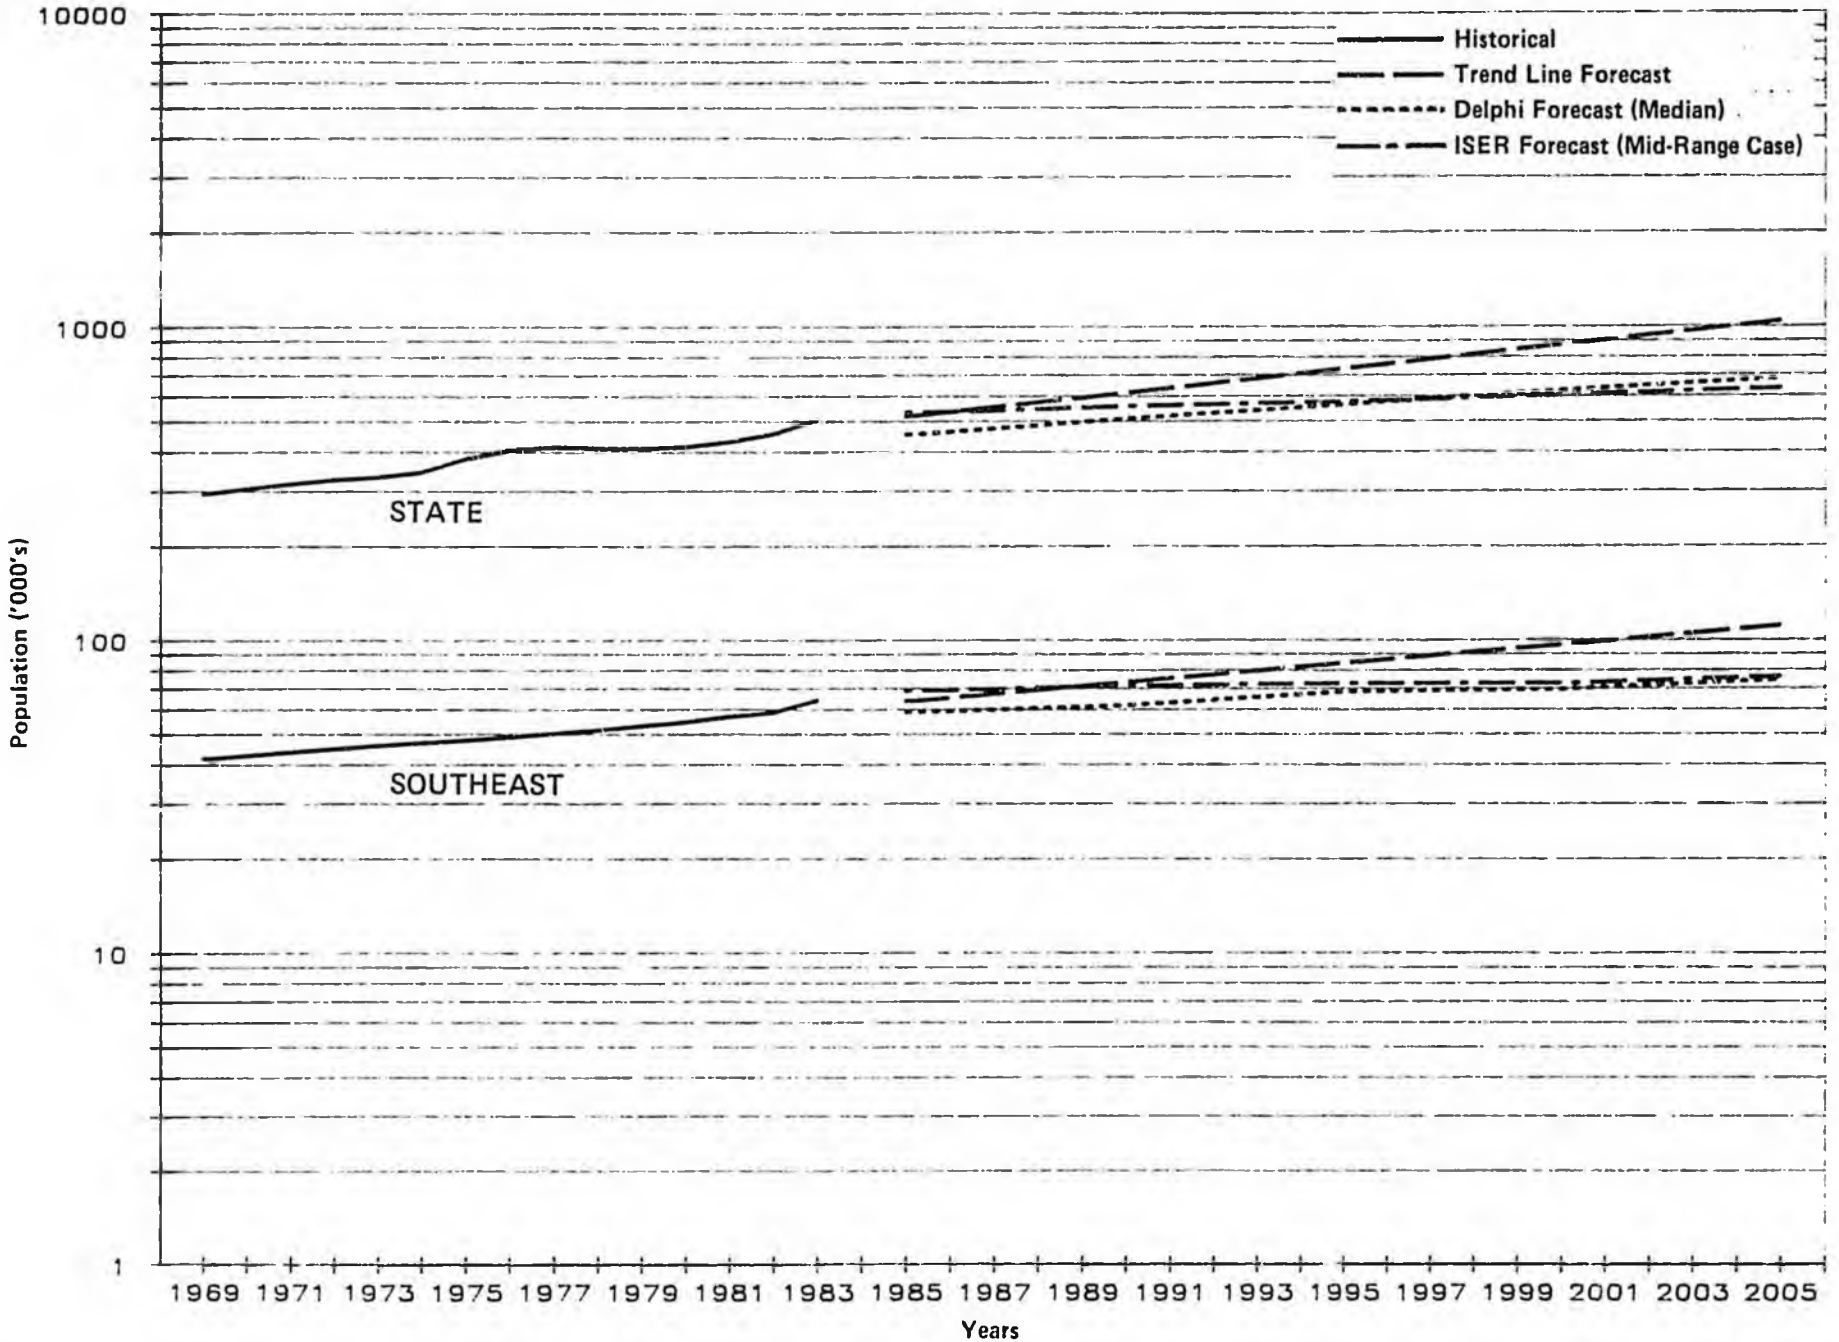
Figure 2
ALASKA POPULATION FORECASTS



the detailed State Economic Model, has projected even lower growth rates for Southeast population ranging from a low of less than 0.5% per year in their pessimistic case, up to an average of less than 1% in their optimistic scenario.

In light of these forecasts and the generally weak long-term prospects for the Region, it was decided, for planning purposes, to project that regional population could maintain its long-term growth rate (2.0%) through to the end of the 1980s but that growth thereafter was likely to decline and stabilize at a rate of 1% per year. Regional population was forecast to increase from 60 800 in 1984 to 73 900 by 1990 and 85 800 by 2005.

The second key market for transportation services is tourist traffic. Relatively little data are available on the growth in this market, but indications are that visitor volumes have grown at an average annual rate of 4.5% in recent years. The long-term prospects for this market are strong as increasing proportions of the population find themselves with the leisure time and financial means to indulge their desire for travel.

It is too early to tell whether Alaska can sustain its share of this growing market, just as it is difficult to predict the portion of these visitors who will make use of State-operated transportation services (airports, roads and the Marine Highway). For planning purposes, however, it was assumed that tourist demand for transportation services into and within the Region would continue to grow at 4.5% per year to 1990 and would taper off to 2.5% per year growth thereafter.

2.3 - Existing Surface Transportation System

The surface transportation system currently in place in Southeast Alaska has also changed somewhat since the introduction of the 1980 Transportation Plan. The system has two key components - the marine service system and the road network.

2.3.1 - Marine System

The main factor in existing the marine transportation system is the Alaska Marine Highway. This operation provides surface links for passengers and vehicles both to, from and within the Southeast Region.

Seven vessels operate in the Southeast area. The four mainline vessels, Columbia, Matanuska, Malaspina and Taku, provide service between the southern road systems at Prince Rupert and Seattle and the northern road connections out of Haines and Skagway. They provide a link for the through movement of traffic as well as for passengers and vehicles moving to and from the Region and internally between a number of ports. All mainline vessels offer overnight accommodation for long-distance passengers.

During the peak season, one of these vessels, the Columbia, operates a weekly service between Seattle and Skagway. The other three vessels offer twice-weekly service out of Prince Rupert, making one three-day trip to Skagway via Clarence Straits and Stephens Passage, and one four-day trip when they travel via Chatham Strait and call at Sitka (see Figure 3). Vehicle capacities range from 90 (for the Taku) to 155 (for the Columbia) while passenger capacities range from 500 to 750.

The three remaining vessels, the Aurora, LeConte and Chilkat, provide mainly internal feeder services carrying passengers and vehicles between the smaller communities and the mainline ports. The smaller of these, the Chilkat, operates between Ketchikan and Metlakatla and occasionally to Prince of Wales Island. The Aurora and LeConte, with 40-vehicle, 250-passenger capacity, provide connections between Prince of Wales Island and the Prince Rupert-Ketchikan-Petersburg corridor, and between communities in the Juneau-Sitka-Petersburg triangle (including Hoonah, Pelican, Tenakee Springs, Angoon and Kake) (see Figure 4).

The Marine Highway also acts as an important link for freight movements, providing substantial capacity for truck movements into and within the Southeast Region. This service supplements the activities of various

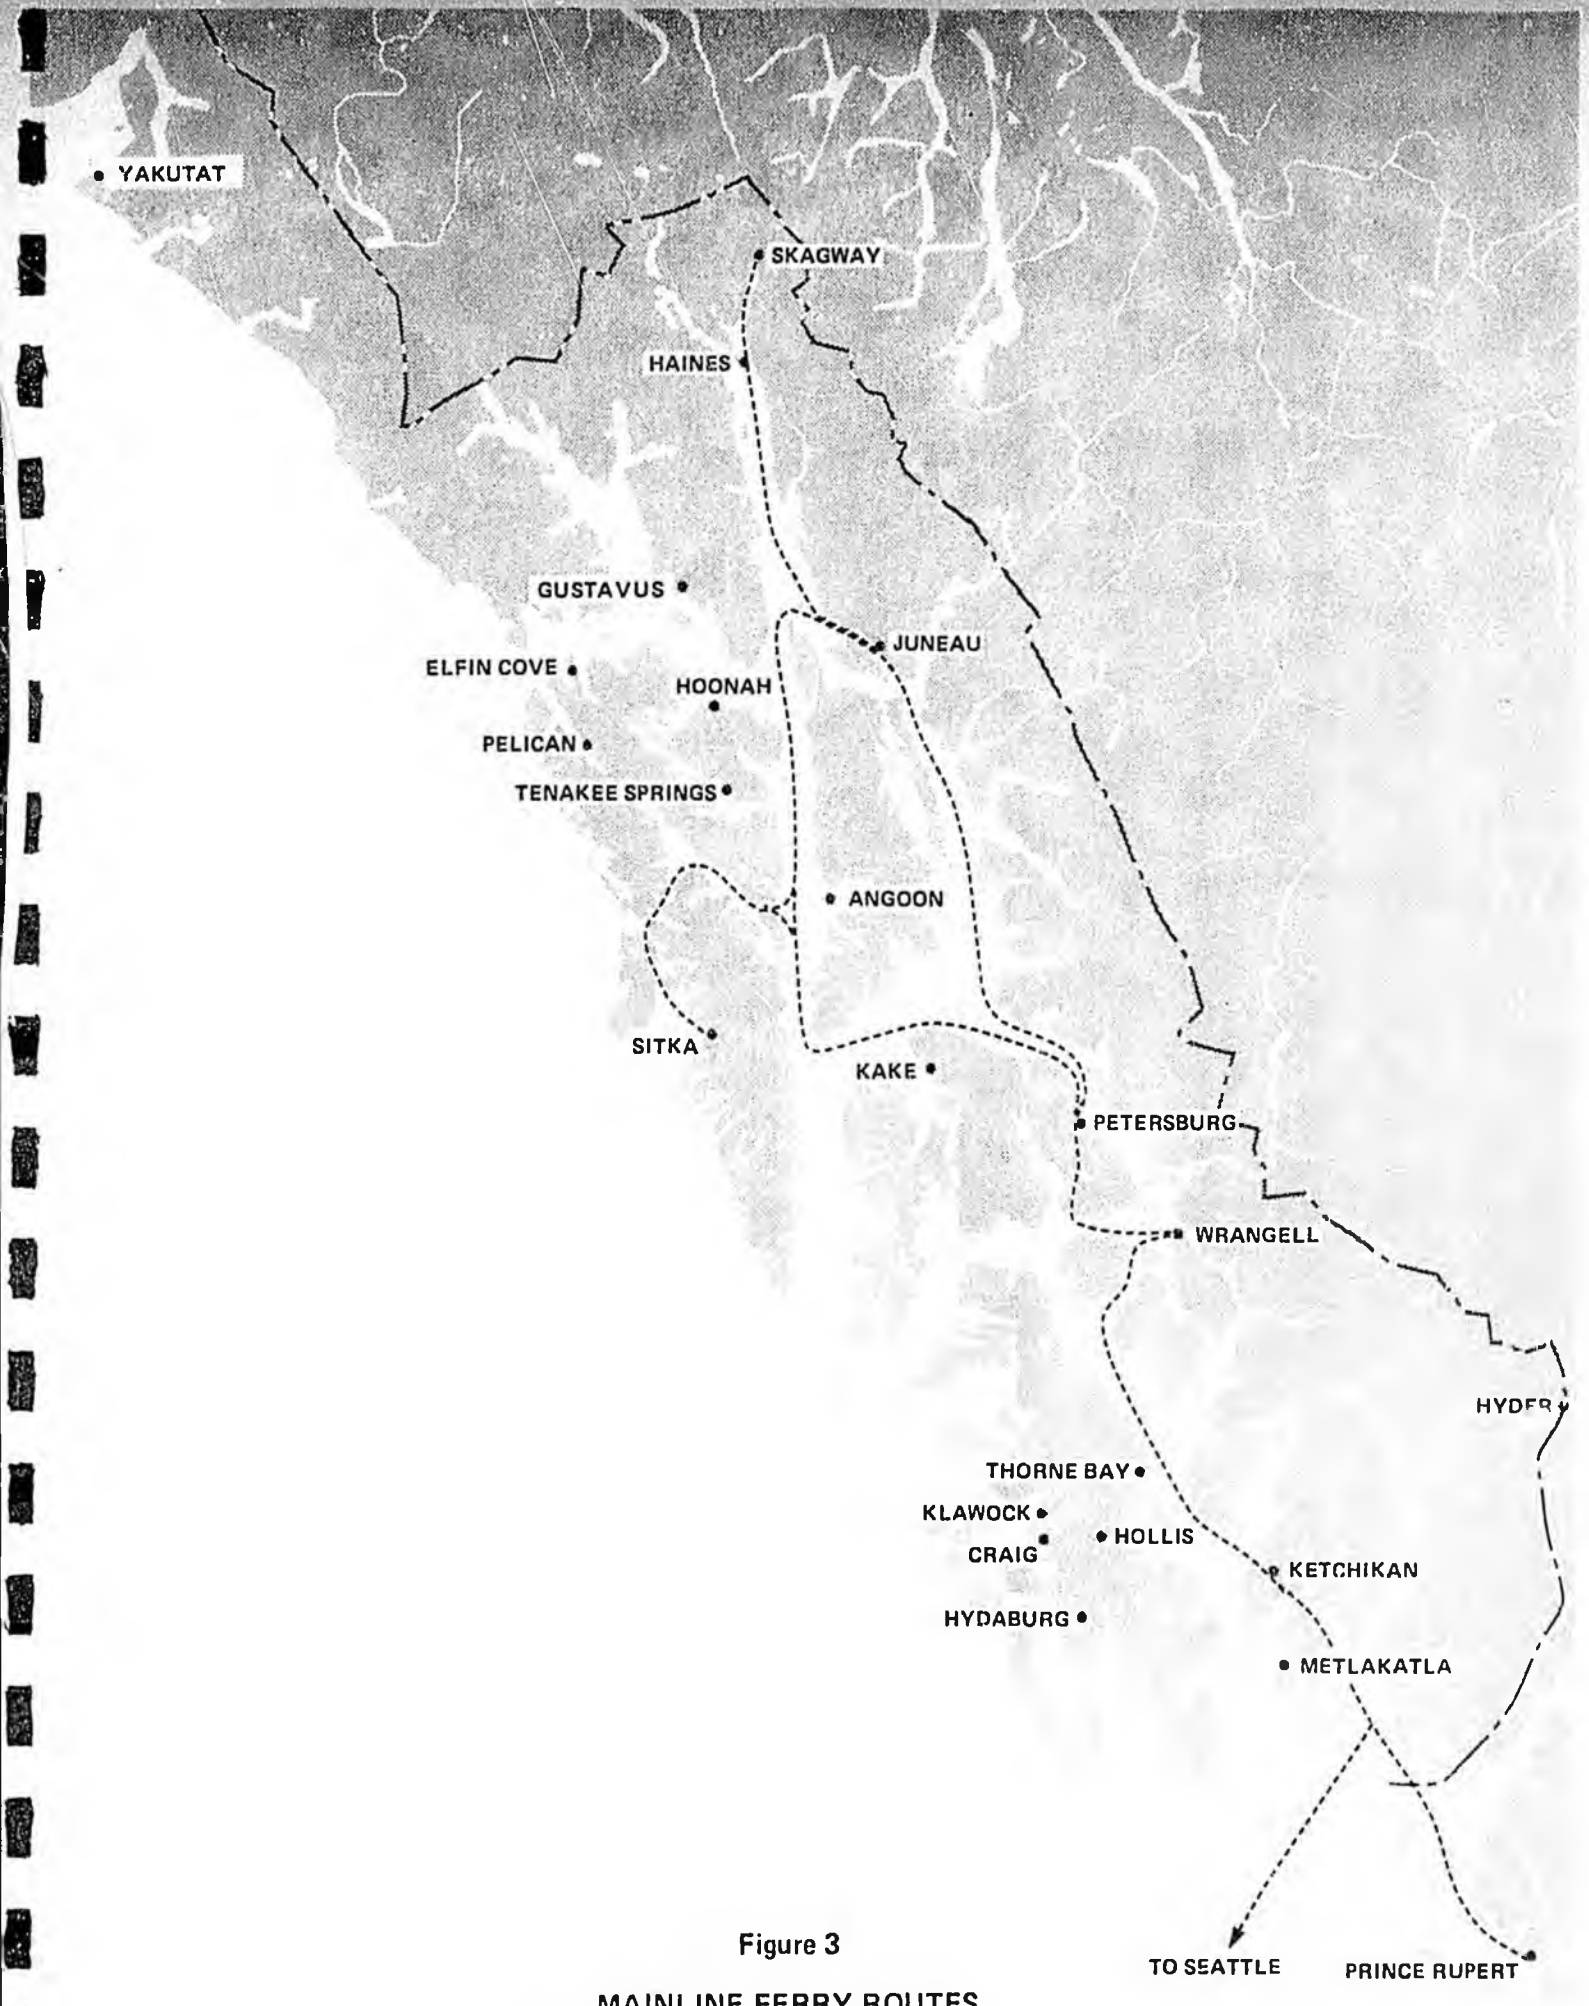


Figure 3

MAINLINE FERRY ROUTES

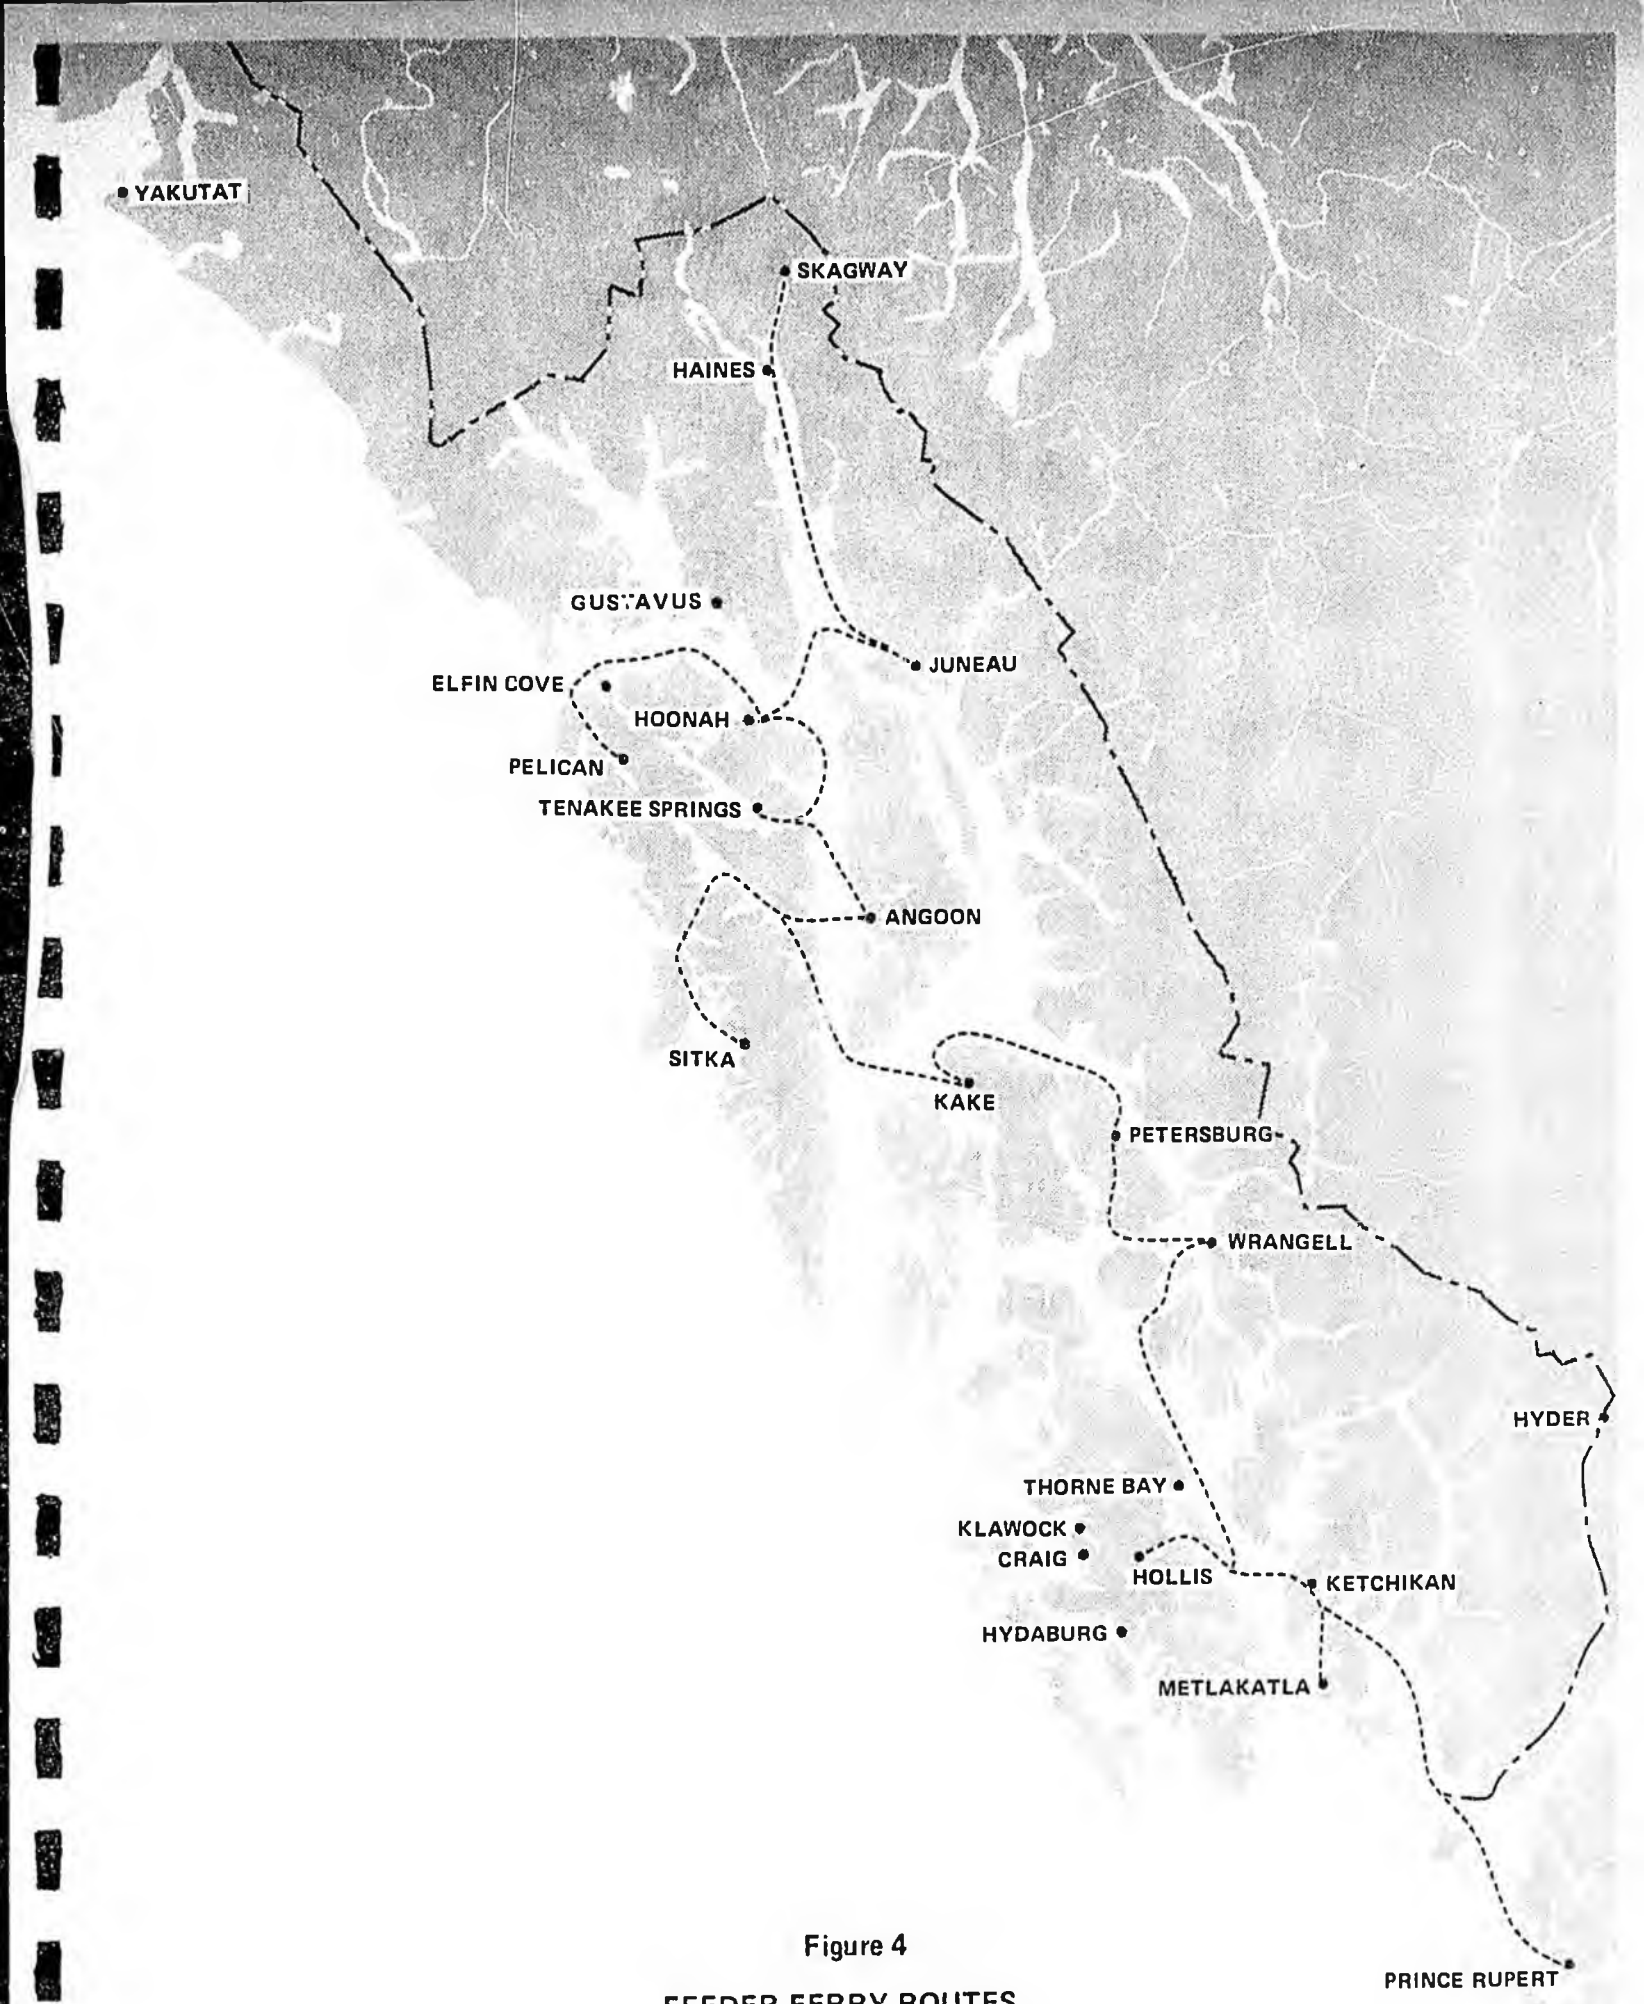

Figure 4

FEEDER FERRY ROUTES

tug-and-barge operators who carry the remaining freight, generally from Seattle, and distribute it to regional communities.

The Region has a range of port facilities to serve the Marine Highway and tug-and-barge operations. Seven communities have ferry terminals capable of handling the mainline vessels (Ketchikan, Wrangell, Petersburg, Sitka, Juneau, Haines and Skagway), while others can accommodate only the Aurora/LeConte class vessels (Hoonah, Tenakee Springs, Angoon, Pelican, Kake, and Hollis/Clark Bay). Two ports are also presently designed to handle the Chilkat (Hollis and Metlakatla) although renovations at Metlakatla will shortly be completed to accommodate the Aurora rather than the Chilkat. In addition, terminal facilities are planned at Hyder and Elfin Cove to allow ferry operations into those communities.

Terminal facilities for tug-and-barge operations vary widely among the communities from sophisticated container-handling terminals at Juneau to break-bulk, manual loading operations at smaller ports.

2.3.2 - Roads System

The roads system in Southeast Alaska is sharply constrained by the geography of the Region. Steep coastlines, multiple fjords and generally mountainous terrain make roads a costly option to construct and maintain. While there are some potential road corridors within the area, only a limited number have been developed (see Figure 5).

Access to the continental road system is provided at three points in the Region: Haines and Skagway in the north and Hyder in the south, but residents in other communities must use the Marine Highway to connect either with these roads or with the road system out of Prince Rupert.

Within the region, a substantial network of roads is operated and maintained to provide access between adjacent communities and links to nearby recreation areas. In addition, the US Forest Service has developed an extensive road network which, while not meeting State standards, provides some travel opportunity as well as a foundation for future road development.

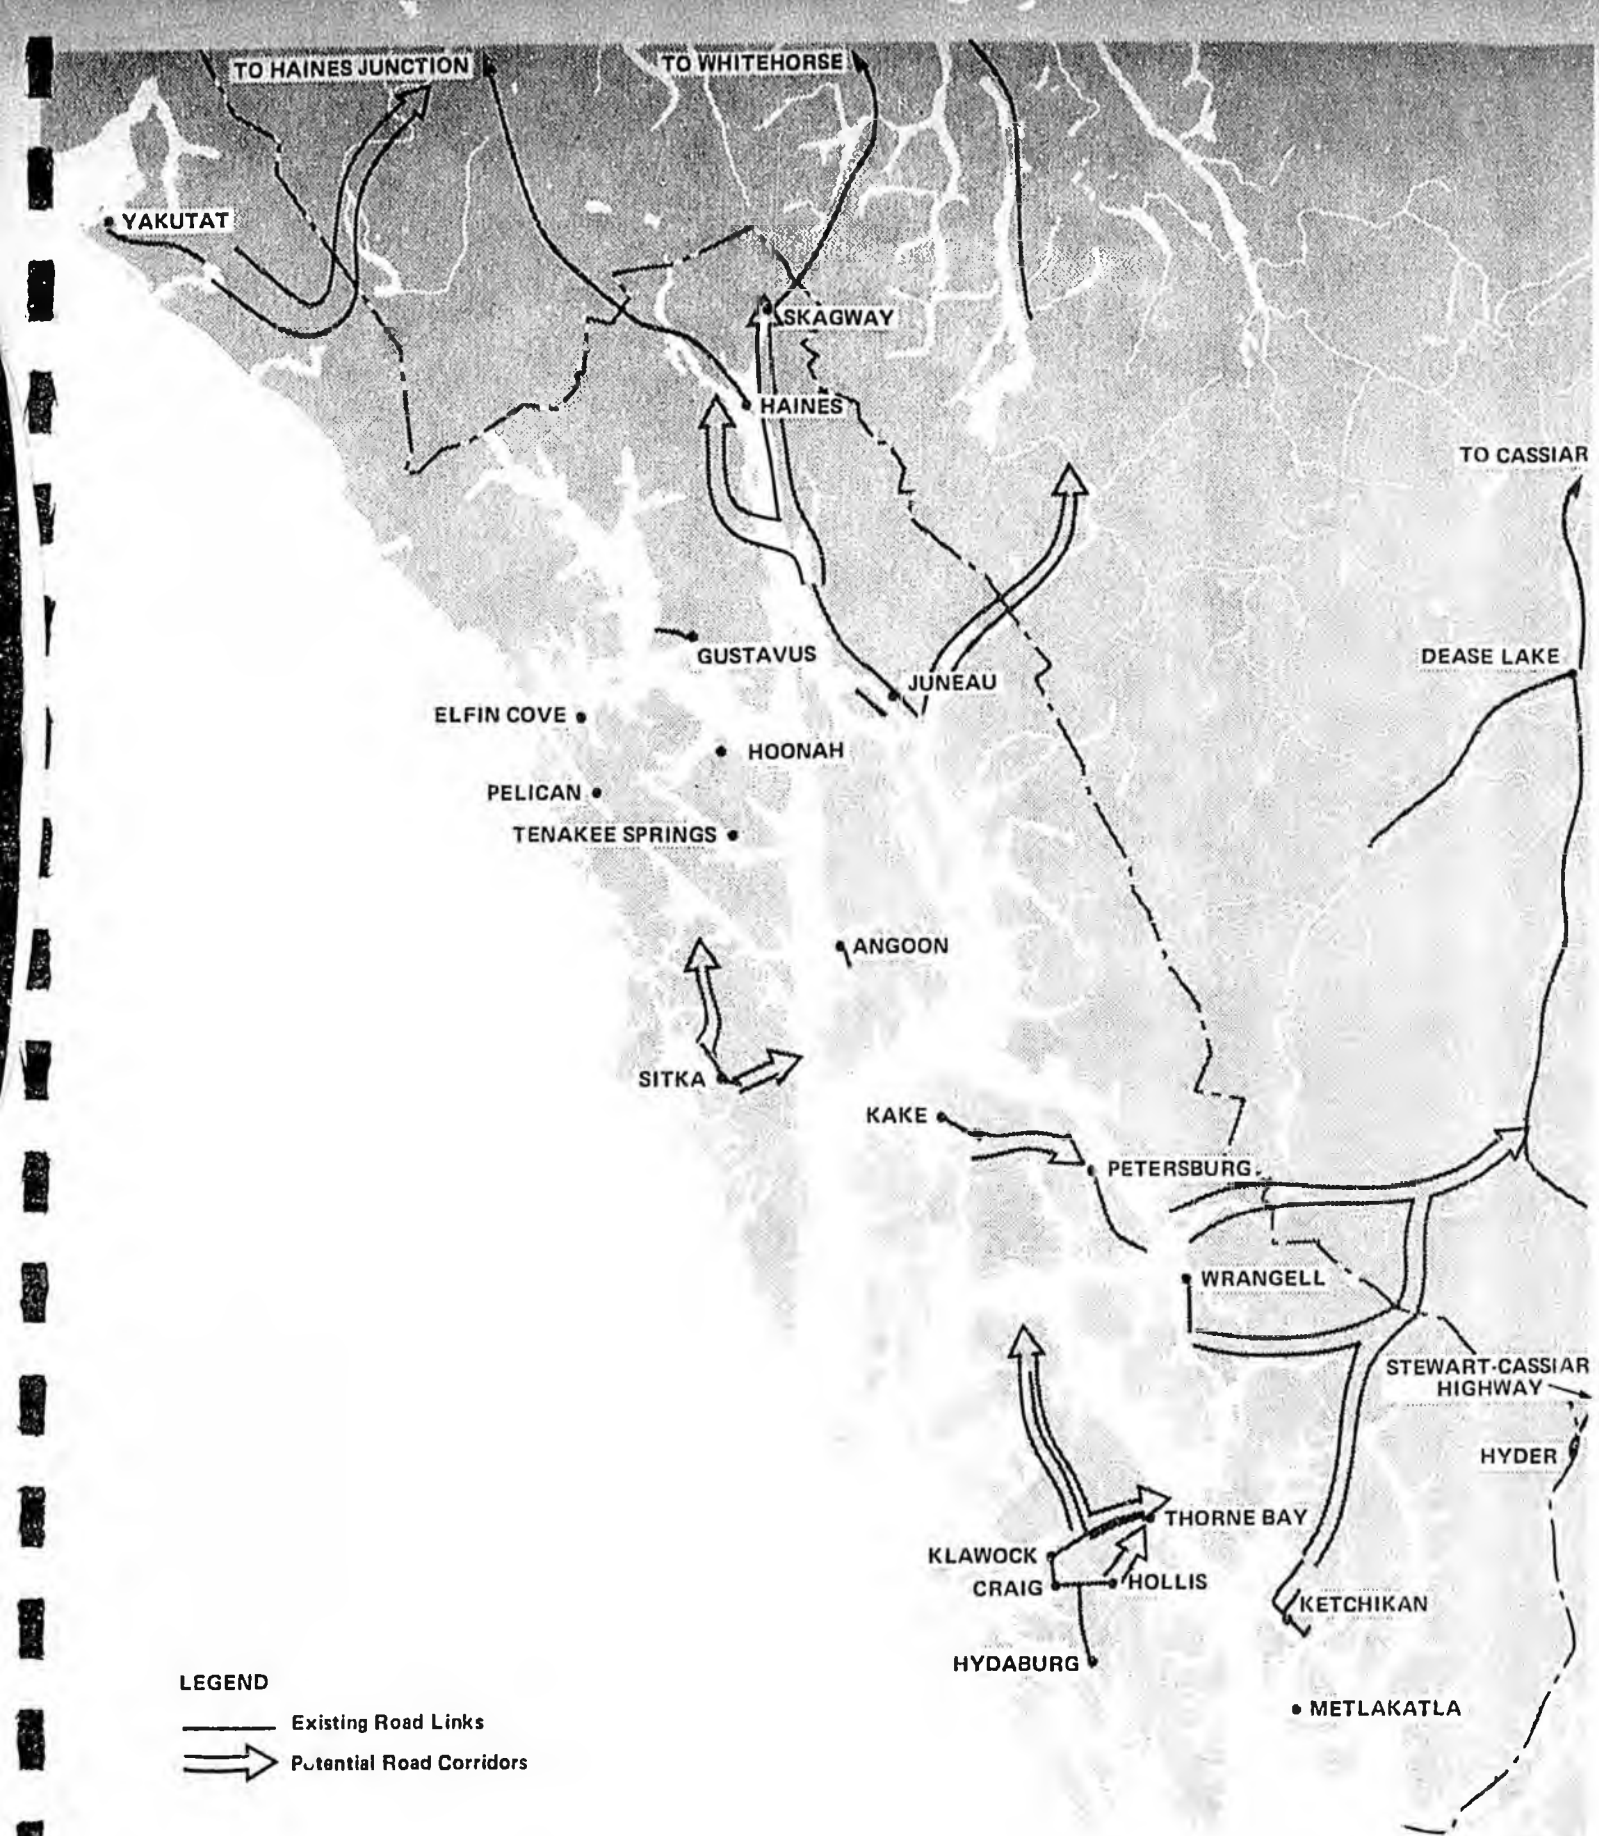

Figure 5

EXISTING ROAD SYSTEM AND ROAD CORRIDORS

In general, however, with the exception of Prince of Wales Island communities, links between major towns within the Region are provided by air and by ferry.

2.4 - Projected Developments in Technology

In terms of new opportunities for the provision of transportation services, the consultants reviewed current and likely future technological developments in marine and road transportation that might impact Southeast Alaska. The detailed review is contained in a separate report ("Technology Evaluation", Sept. 1985) but is summarized below.

2.4.1 - Marine Technology

There were two main areas of technology development in the marine environment that were expected to have impacts on Southeast Alaska transportation. The more immediate was the possible introduction of high-speed craft to provide rapid surface transport between communities.

Air-supported craft, foil-supported craft and conventional displacement planing craft were all reviewed (see Tables 2.2 and 2.3) and two representative types, shown in Figures 6 and 7, were selected as appropriate for use in Southeast Alaska. One type is a conventional catamaran vessel with a capability of moving a small number of vehicles and passengers at speeds up to 30 mi/h. The other is a much larger surface-effect ship (which also has a catamaran hull form) capable of speeds up to 46 mi/h.

Such high-speed craft should not however be looked on as total replacements for existing vessels. While they would enable better utilization of present vessels to be achieved during the summer and, if required, shoulder seasons, the performance of the smaller craft in the winter, except on sheltered routes, is unknown. The larger craft considered appropriate for Southeast Alaska has the capability to operate year-round but, like all high-performance vessels, has limitations relative to payload. For example, automobiles, campers, coaches, and lightly-loaded trucks and vans could be

TABLE 2.2

HIGH SPEED CRAFT
TYPES EVALUATED

Planing and other		no	low-med.	poor-mod.	poor-fair	low-fair	poor	

Types Excluded from Further Analysis - Reasons:

SRN4 Mk2/3 Excluded because of cost - approximately $40 to $50 million built in Britain, lack of licensing for US construction.

Monohull Excluded partly because of cost - $14 to $15 million built in Britain and high power requirements and thus fuel cost for its speed.

SWATH Excluded because of experimental nature and relatively high power requirements. Southeast Alaska waters are not rough enough sufficienty frequently to justify such a vessel.

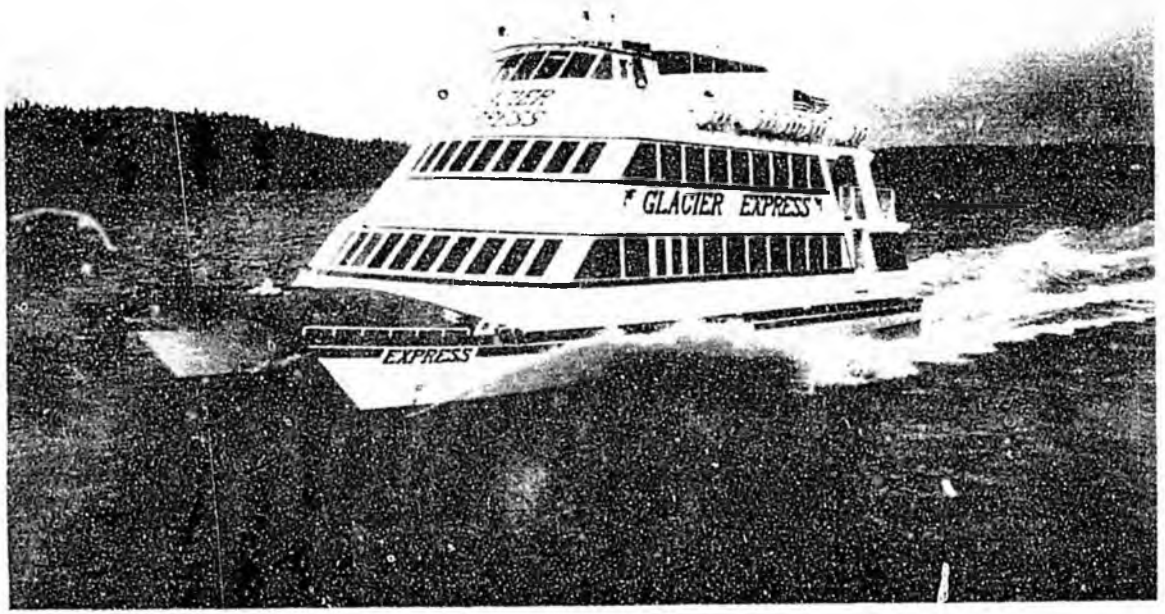

Figure 6

HIGH SPEED CATAMARAN

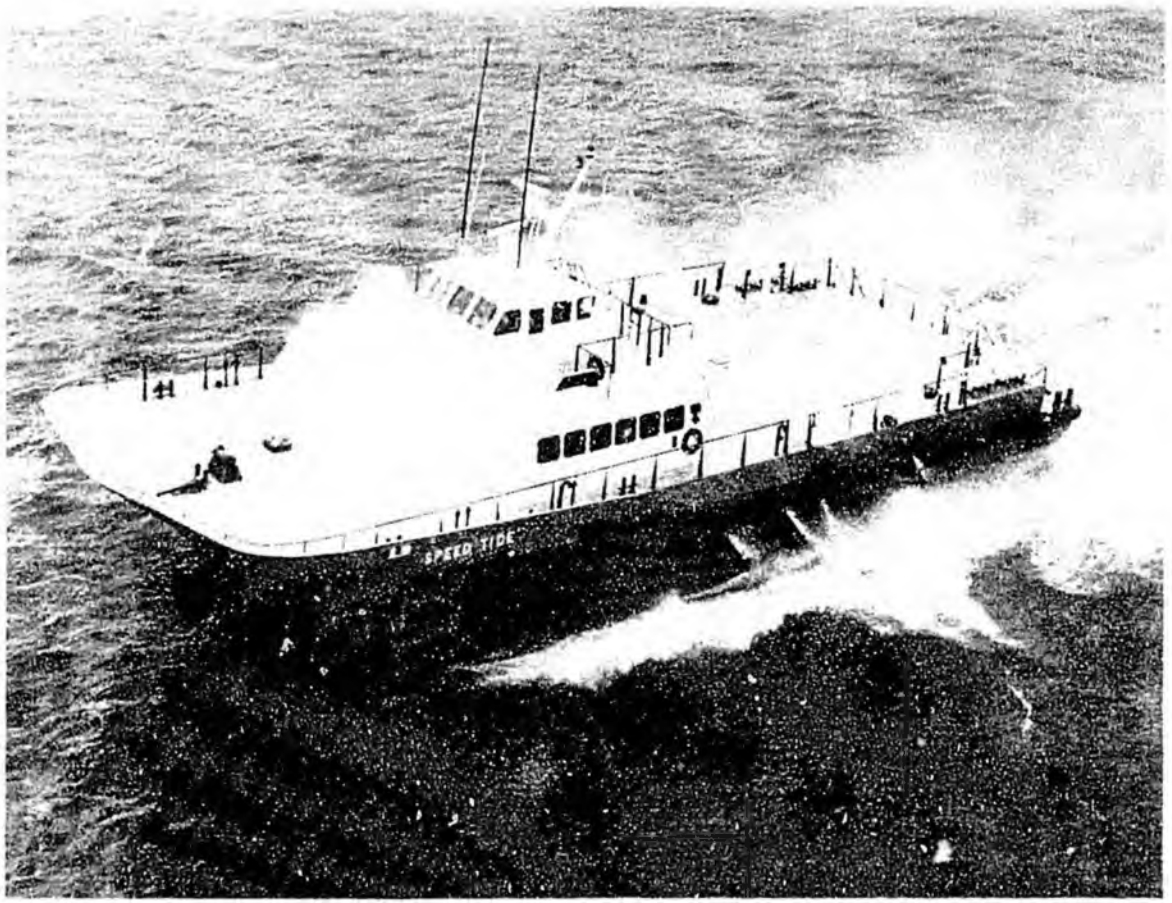

Figure 7

110-ft SES HIGH-SPEED CRAFT

carried on the small high-speed catamaran, but not heavy vans such as refrigerated trailers with a full load of frozen fish. The larger vessel by comparison could carry some heavy trailers, but the number would be limited by payload considerations.

The second area of technology development is related to improvements that could be incorporated in the existing AMH vessels to improve their performance and reduce operating costs. Examples of such developments include

- hull redesign
- improvements in propulsion and machinery
- course-keeping and routing techniques
- advanced machinery automation
- improvement in hull surfaces
- different grades of fuel, and
- adjustments to operating speed.

2.4.2 - Road Technology

No technological developments were foreseen in the road sector that would change the way in which freight was moved or in which tourists and residents would travel. It is expected that freight vehicles moving on the continental road system would increase in length, height, width and weight, making it more difficult for the existing ships to accommodate trucks and vans. In the future, certain road routes may be designated special log haul routes to support the timber industry. Overall, however, the freight business to Southeast Alaska, being a small specialized one, would likely not be impacted to any great extent by such changes for the foreseeable future.

2.5 - Alternative Marine Service Options

2.5.1 - Other Service Suppliers

The foreign flag liner operator has always been a part of the Alaskan cruise market. These operators brought in well over 100 000 tourists at the last count and are expected to continue to bring in a significant number of visitors. A new factor in the market place, however, is the foreign flag ferry operator working in competition with the Marine Highway for point to point travel. It is likely that such operators will increase their activity in the future from either Vancouver or Prince Rupert.

A further new development is that US flag operators are seriously considering building or converting vessels to serve the US cruise market and Alaska is identified by them as a prime destination. The vehicle carrying potential for such vessels is seen as an essential feature, with the result that there is a high probability the Marine Highway will see direct competition in Seattle before the mid-1990s.

Although this competition may skim off tourists from the Marine Highway and possibly reduce revenues, projected tourist departures from Seattle and Prince Rupert indicate that AMH vessels would still be operating close to capacity during the peak season. However, the presence of private operators may serve as an effective complement to Marine Highway services.

2.5.2 - Acquisition of Foreign Flag Vessels

A second new service option for the Region would be for the Marine Highway to acquire and operate a foreign-built ferry. Should a new mainline vessel be necessary, a foreign flag vessel could provide the required increase in capacity at a cost well below that of a new US-built vessel.

The Marine Highway has had past experience of foreign flag vessels with the m/v 'Wickersham'. The experience was not altogether favorable because it was intended to use the vessel in the Seattle/Southeast Alaska trade which

required a waiver from the 'Jones Act'. Such waivers are only given for purposes of national defense, and thus the 'Wickersham' was not acceptable on an ongoing basis.

However, the possibility of the AMH using a foreign flag vessel entirely within the requirements of US maritime legislation is feasible. Such a vessel could operate from Vancouver or Prince Rupert and carry tourists or residents from port of embarkation to port of disembarkation. The only restriction would be that the ship could not carry passengers between ports in Southeast Alaska. Such a vessel operating out of Vancouver or Prince Rupert could materially increase AMH capacity and release existing vessels to operate on those routes that require a US flag ship (i.e., US to US links).

This is essentially the service that Sundance Cruises is providing between Vancouver and Skagway with the m/v 'Stardancer'. The fact that a private operator is willing to provide such a service argues well in its favor although the private operator can usually benefit from lower costs due to greater flexibility in crewing and their ability to use the vessel in other areas during the off-season.

Ideally, therefore, the preference would be to have this service provided by the private sector. However, if private operators fail to provide service for some reason and the AMH is obliged to provide for a higher level of traffic, AMH acquisition of a foreign flag vessel might be a more cost-effective option than acquisition of a new US built ferry.

3 - EVALUATION METHODOLOGY

3 - EVALUATION METHODOLOGY

3.1 - General

The assessment of surface system alternatives was based, in large measure, upon a process whereby a wide range of transportation options were defined for the region and were than evaluated in terms of

- compatibility with goals of the regional transportation system, and
- effectiveness in terms of the service provided relative to the level of costs incurred.

In defining the alternatives, recognition was given to the expressed concerns and desires of the communities and also to the perceived requirements, limitations and opportunities associated with growth, development and new technology. The options developed for evaluation encompassed not only capital improvements (acquisition of new vessels, road and facilities construction) but also changes to the operating systems with a view to improving either the service provided, the system capacity and/or the ongoing operating costs.

The assessment process was aimed at establishing which of the surface options were best able to fulfil the transportation goals of the region in a cost-effective manner, where the goals were defined as

- meet the transportation needs of Alaska residents
- support the regional economy through provision of transportation services, and
- maintain fiscal responsibility through judicious allocation of public funds.

Unfortunately, these goals are not always mutually compatible and, with the present economic environment, may not be collectively achievable.

It was therefore necessary to work towards a compromise which would provide a balance between these diverse goals. In order to assess the implications of various compromises, it was necessary to fully understand the impacts associated with varying degrees of focus on these service-related and cost-related goals.

Accordingly, a wide range of options were specified which covered not only variations in the types of changes made (from a technological and operational perspective) but also variations in terms of the intensity of spending effort in order to meet demand. The analysis of the impacts associated with this range of options provided indications of the trade-offs involved as emphasis was shifted between service-related and cost-related goals.

Each of the proposed system options was evaluated from a number of viewpoints. Insofar as possible, all evaluation measures were quantified in order to provide a basis for comparison among alternatives. Specifically, the options were evaluated in terms of

- financial impacts on the Alaska Marine Highway, the State government and the transportation user

- total user costs including both financial costs and costs associated with the options' success or failure in meeting demand, and

- service/cost effectiveness which compared total user impacts associated with various options (including both cost and service level) with the costs to the government associated with providing the service.

The following sections briefly outline the methodologies used first in defining and then in evaluating the surface system options. A more detailed description of the process and the underlying theories, particularly with regard to the evaluations, is included in the appendixes.

3.2 - Specification of System Alternatives

The specification of the alternatives to be evaluated in the assessment of surface transportation systems was a multi-step process which focused both on developing viable solutions to current and anticipated problems and on developing a sufficiently broad range of solutions to ensure first that no options were overlooked and secondly that a clear picture of the tradeoffs between competing options could be ascertained.

The specifications process involved

1. Definition of the Problem - This entailed a review of community comments and inputs, discussions with operators, and an assessment of projected demand and capacity on various links within the system.

2. Listing of Conceptual Solutions - General concepts aimed at meeting future needs were drawn from a number of sources including community and operator suggestions, previous planning studies (e.g. 1980 Transportation Plan, Governor's Task Force on the Marine Highway) and the consultants' and Technical Committee's ideas with regard to new concepts which might be applied.

3. Prescreening of Corridor Alternatives - As noted in the introductory chapter, in certain subregions a preevaluation process was carried out whereby a number of similar options were prescreened and only the most promising carried forward for further analysis. Five corridors were treated in this manner

   - The Juneau Access corridor in which 11 service options were examined and narrowed down to 2.

   - The Ketchikan-Southern Terminus corridor in which nine options were examined and four retained for further analysis.

   - The Stikine corridor in which a total of ten options were examined and three retained for further analysis.

- The Sitka Access corridor in which four options were examined and three were retained for system evaluation.

- The Prince of Wales Island Access corridor in which four options were evaluated (including variations within some of the service concepts) and all were retained for further system analysis.

For a detailed discussion of these corridor studies, the reader is referred to the series of reports on "Evaluation of Corridor Alternatives."

4. Detailed Definition of System Characteristics - This involved specifying, for each system to be evaluated, the detailed cost, revenue, traffic, and operating characteristics, and included

   - specifying peak and off-peak schedules for existing and proposed new vessels

   - developing preliminary specifications for new vessels and obtaining builder estimates for construction and operating costs

   - defining and costing new terminal facilities where applicable

   - projecting passenger and vehicle demand over each link in the system and generating user costs for vehicle operations and/or ferry fares on each route.

3.3 - Financial Evaluations

Each of the defined system alternatives was first evaluated in terms of financial impacts, including capital and operating costs for the AMH and the State government, revenues received from users, and user costs for both private and public transportation service.

Costs and revenues were calculated for each year of a 20-year planning period (1986-2005), and were then discounted to 1985 dollars to provide an equitable basis for comparison.

In order to deal with the vast number of calculations involved, a computer model was developed which computed, for each year

- the forecast demand on each link in the system
- the capacity of the system to meet the demand and, from this, the number of passengers and vehicles actually carried between various origins and destinations
- the fares and vehicle operating costs of the traffic served (the fares also represented the revenues of the Marine Highway System)
- the capital and operating costs of road links
- the capital and operating costs of terminal facilities
- the capital and operating costs of both new and existing vessels, with operating costs being linked to the vessels' specified schedules.

Total financial costs were then calculated from the viewpoint of

- the Marine Highway, including vessel capital and operating costs, port capital and operating costs, and ferry revenues
- the State government, including road capital and operating costs and Marine Highway deficits
- the passengers and vehicles served, including fares paid and vehicle operating costs.

It should be recognized that, because of the double counting of Marine Highway deficits (as a net cost to the AMH and as a cost to the State), the

financial impacts are not additive. Total system costs are represented by the sum of State and user costs. However, because of concerns regarding the deficit position of the Marine Highway, their financial impacts were calculated separately from total State government impacts.

3.4 - Evaluation of User Impacts

While the financial analysis provided an important measure of comparison among alternative surface systems, it was unable to fully reflect many of the differences among system options and hence, in some respects, provided a distorted picture of the merits of various alternatives.

One major difference among options which distorted the financial picture was the level of traffic served and the manner in which it was served. Many of the options involved meeting less than the full level of service demand. Others involved serving some traffic in a manner other than that demanded by the user (e.g. by requiring users to divert from one port of embarkation to another), while another group involved serving traffic over and above projected basic demand because service under the proposed option was sufficiently more attractive to induce new users into the system. Thus a comparison strictly on the basis of total financial costs did not provide a complete picture of the differences among alternative systems, particularly insofar as user costs were concerned.

A second difference which the financial evaluation failed to account for was the difference in the level of service provided. Level of service encompasses many factors: travel time, frequency of service, transfers, reliability, comfort, convenience, etc. Some of these factors do not lend themselves to quantification and can only be evaluated in a subjective manner. However, factors such as travel time, frequency of service and need for transfers can, at least in part, be quantified and compared among alternatives.

Because of the need to take these differences among options into account in the overall analysis, a supplemental assessment was carried out for each

option with regard to 'user impacts' which quantified the differing effects of the alternatives in terms of demand served and quality of service and which, insofar as possible, assigned values to the differences.

3.4.1 - Differences in Traffic Served

The main effect of differences in the amount of traffic served is the impact in terms of total user cost. The user costs derived from the financial analysis, when presented in 'total' form, do not reflect differences in total traffic. On the other hand, converting these user costs to a 'cost per user' or 'cost per passenger mile' would not account, for example, for the losses of unserved passengers or the inconvenience to diverted users.

Accordingly, to compare options on an equivalent basis, it was necessary to make adjustments to user costs in order to accurately reflect the differences in traffic volumes and in the manner in which these volumes are served.

Differences in the amount and nature of traffic served under the various options arose from three main sources.

1. Unmet Demand - traffic desiring service but unable to be handled by the proposed system.

2. Diverted Traffic - Traffic desiring service to or from one port but presumed to be willing to divert to an alternate port if capacity is available (this primarily relates to excess vehicle demand to and from Seattle which could divert to Prince Rupert).

3. Induced Traffic - Traffic over and above the projected basic level of demand which is drawn to use the system as a result of lower travel costs.

Each of these sources of traffic variation required a somewhat different treatment in order to adjust user costs to a comparable basis.

The user costs associated with those potential users whose demands could not be met by the system was estimated by determining the net losses which they would incur as a result of being unable to make the trip. These losses will vary considerably depending on the purpose of the trip and the actions which the unserved user takes as a result of being unable to make the trip. Losses could range from zero (for a user who decides, for example, to travel elsewhere and derives as much enjoyment for his money there) to much larger sums (for a user who may be forced to take first class accommodation on a cruise ship, but does not derive any benefit from the greater amenities).

In order to estimate an average value for the net losses associated with unmet demand, the concepts of demand and surplus were introduced into the analysis. This is explained in detail in Appendix B. Briefly, the method involved postulating the shape of the demand curve for Marine Highway service and calculating the average difference between the maximum that users would have been willing to pay and the amount they would actually have had to pay for the trip (i.e. their surplus as measured by the difference between the trip's value to them and its cost).

Average lost surplus for passenger and vehicle trips was then multiplied by the number of unserved users under each option and the totals discounted to net present value.

The costs associated with diverted traffic, where users are shifted to an alternate port, would be expected to include increases in travel cost and/or travel time as a result of the diversion. Since users would be expected to minimize their cost (or maximize their benefit), they would logically prefer that routing which offered them the highest advantage. Consequently, the persistently high demand for service out of Seattle would suggest that, to a large number of users, sailing out of Seattle was preferable to driving to Prince Rupert to catch the ferry.

In comparing the actual out-of-pocket costs associated with diversion, however, it was found that in most cases it was considerably less expensive to drive to an alternate port of embarkation rather than to take the ferry for the full distance. Even when the additional travel time for diverted

passengers was taken into account, it was found that users would have to assign an unacceptably high cost to travel time to offset the out-of-pocket savings.

The implication of these findings is that users demanding service out of Seattle rather than Prince Rupert assign some nonmonetary value to the Seattle trip which more than offsets its higher cost. This value could arise from an aversion to driving, from the amenities of the ferry service, or possibly from a preference for door-to-door service.

As a result, the user costs described in the financial analysis, which are based on out-of-pocket expenses for fares and vehicle operation, must understate, in many cases, the full costs associated with diverting passengers, and hence require upward adjustment. Theoretically, this adjustment should more than offset the out-of-pocket savings. However, in the absence of indications as to the amount of extra value assigned to the direct versus the diverted journey, it was decided to assume, conservatively, that diverted users would assign an equal total cost to each and would hence be indifferent among the alternatives. Diversions were therefore presumed to generate zero user impacts in the analysis of user benefits and costs and any out-of-pocket savings accruing to diverted passengers were removed from the analysis by upward adjustment of user costs to the levels incurred by nondiverted traffic.

User costs associated with induced traffic was the third category requiring adjustment. Generally, options which generated induced traffic yielded lower travel costs on a per-user basis (hence the inducement to greater travel). However, many of the induced passengers would not have traveled without the benefit of the lower cost and hence cannot be considered to enjoy the full saving associated with the new system. Accordingly, the travel costs of induced passengers were adjusted upwards by half the difference between the old cost and the new (i.e. cost savings to induced passengers were cut in half for purposes of calculating total savings).

3.4.2 - Differences in Travel Time

An attempt was also made to account for the differing impacts of system alternatives in terms of quality of services provided. While service quality encompasses a number of aspects, it was felt that the aspects which could be measured in a quantitative and an objective manner were those relating to service time, including travel time, waiting time related to service frequency, and waiting time associated with transfers.

In order to calculate the travel time associated with each system option, a computer program was developed which converted the proposed ferry schedule and road network into a matrix of total travel times between all points served in the region. The model calculated in-transit time (based on either vehicle speeds or the speed of the vessel being used), frequency related delays (based on one-quarter of the interval between vessel departures) and transfer times (based on an average 12-hour delay whenever a vessel-to-vessel transfer was required).

Separate travel-time matrices were calculated for each schedule, taking into account peak, shoulder and low-season schedule variations as well as changes over the years within a particular option. These travel time matrices were then multiplied by the number of passengers traveling between the various origins and destinations each year on a seasonal basis.

As with user costs, travel time impacts also required adjustment to reflect the differences among the various options in traffic served. These adjustments are explained in greater detail in the Appendix. Basically the adjustments were as follows:

- where unmet demand occurred, total travel time impacts (increases or savings) were reduced by the amount of impact which would have accrued to the unserved passengers had their demands been met;

- for diverted passengers, travel time impacts were assumed to be zero (i.e., both increases and decreases in travel time were ignored);

- for induced passengers, travel time impacts were reduced by one-half to reflect the marginal nature of this traffic.

3.5 - Service/Cost Effectiveness

The actual selection of preferred choices among the various surface system options was based on a measure which was called 'service/cost effectiveness.' This essentially involved measuring the total user impacts (both positive and negative) associated with changes in the system proposed, and comparing these with the impacts on government costs.

In order to calculate the impacts of changes, it was necessary to specify one option as a base case against which other options could be evaluated. In the short term, the base case was represented by continuation of the existing system and changes in user impacts and government costs arising from new short-term options were measured in comparison with the existing service. In the long-term, the base case was represented by the concepts of the June 1980 Plan which presumed that the existing ferry route structure would be maintained and that new mainline vessels would be added as demand required. Other long-term options were evaluated in terms of the benefits and costs they generated relative to the June 1980 Plan system.

Measurable user impacts fell into two categories

- increases or decreases in user cost as compared with the base case, and

- increases or decreases in user travel time.

For evaluation purposes, the adjusted user costs and travel times (as described in Sections 3.4.1 and 3.4.2) were used to calculate differences in impact.

Government cost impacts included

- increases or decreases in the deficit of the Marine Highway, and

- increases or decreases in the cost of road construction and operation (in actual fact only increases occurred in this category of costs since none of the options envisioned eliminating existing road links).

The evaluation of service/cost effectiveness was carried out in two stages. The first stage involved comparing user cost impacts (increases or savings) with government cost impacts (increases or decreases) to determine whether the monetary benefits to one group exceeded the monetary costs to the other. If both groups enjoyed benefits relative to the base case, the option was preferable to both parties. If both groups suffered higher costs, then the base case would be preferable to both. However, where one group enjoyed benefits and the other suffered cost increases, a comparison was necessary to assess whether the benefits achieved justified the costs incurred.

The second phase of the service/cost effectiveness evaluation involved incorporating travel time impacts into the analysis. These could have been included with user cost impacts simply by assigning an hourly value to travel time and adding the resultant total value of time costs or savings to the value of user cost impacts. The choice of an appropriate value for travel time is, however, a complex issue and any value selected would be open to criticism. Because of the problems associated with developing a defensible measure of time value, an 'imputed value' approach was taken in this analysis.

Under this approach, the total travel time impacts of each option relative to the base case were calculated in terms of hours. Next, the difference was calculated between the monetary impacts accruing to the user and those accruing to the government. This provided a measure of the value which total time impacts would have to have in order for the combined user cost and time impacts to exactly offset the impacts on government costs. The 'required time value' was then divided by the number of hours involved to generate a required hourly value of time (either minimum or maximum depending on whether users incurred travel time savings or travel time increases). These required hourly values of time could then be compared both between options and against subjective measures to determine the

relative rankings of the various alternatives and also the likelihood that total positive impacts (benefits) of a system would exceed total negative impacts (costs).

One caution should be noted in assessing the merits of various system options under the service/cost effectiveness method. Because of the calculation procedure, the method used focuses only on the differences between the options considered. As such it provides a measure of incremental benefits and costs associated with one system as compared with another. It does not presume, however, to measure the total benefits and costs associated with a transportation system per se. Those impacts which are common to all systems are eliminated, by subtraction, from the analysis. Thus, comparison among options should be assessed with caution. An option which generates, for example, a $2 million increase in benefits is not necessarily twice as good as one which generates a $1 million increase since the base benefits accruing to all systems may be $100 million and the more appropriate comparison would be between $102 million and $101 million.

4 - EVALUATION OF SHORT-TERM SURFACE SYSTEM ALTERNATIVES

4 - EVALUATION OF SHORT-TERM SURFACE SYSTEM ALTERNATIVES

4.1 - General

The objective of the analysis of system alternatives was to provide guidelines to changes which could be made in the transportation system over a 20-year period. There is, however, a division between changes that can be accomplished (and are required) in a short time period and changes that can be accomplished (and may be necessary) over a longer time frame. Major capacity additions, for example, in the form of constructing new roads or new mainline vessels may require several years to accomplish, while schedule changes or the introduction of 'off-the-shelf' vessels can be implemented in the near future. For this reason, two separate sets of surface system alternatives were defined with one set aimed at the short-term and the other at the long-term planning horizon. This section describes and evaluates the options considered as short-term solutions. Section 5 deals with the long-term alternatives.

4.2 - Short-Term System Alternatives

In all cases, the system options examined were aimed at meeting the transportation goals in terms of

- meeting the travel needs of Alaska residents
- supporting the regional economy by providing the required transportation services, and
- ensuring a judicious use of government funds.

Apart from this, however, short-term alternatives were defined to meet the following specific criteria

- they could be easily implemented (with a 1- to 3-year period)

- they would improve the system's ability to meet demand through the late-1980s/early-1990s, and

- they were sufficiently flexible that they would not preclude any longer-term options.

The following sections describe the seven options considered as short-term system alternatives.

4.2.1 - Option 1 - Continue Existing Service

This option served as a base case against which all short-term system alternatives were compared. It involved maintaining the existing (1985) routings and schedules for both mainline and feeder ferry service.

During the peak season the Columbia would operate on a weekly schedule out of Seattle while the Matanuska, Malaspina and Taku would operate twice weekly out of Prince Rupert. Each vessel would call at Sitka on a weekly basis. The Aurora and LeConte would continue to serve the feeder communities with Aurora focussing on the Prince Rupert-Ketchikan-Prince of Wales triangle and LeConte focusing on the Sitka-Juneau corridor. The Chilkat would continue to serve Metlakatla.

In terms of meeting demand, this option would result, over a 20-year time frame, in substantial unserved traffic, particularly to and from Seattle. In total, approximately 38% of the peak season passenger demand out of Seattle (260 000 passengers) could not be served and 10% (66 000 passengers) would have to be diverted to Prince Rupert. In addition, some 46 000 vehicle trips would be lost to the ferry system.

4.2.2 - Option 2 - Matanuska to Seattle

This option involved operating a second mainline vessel (probably the Matanuska) out of Seattle during the peak season. All other schedules and routings were unchanged from the base case.

The two-vessels-to-Seattle option provided a somewhat better picture in terms of ability to meet demand out of Seattle. Under this option, a total of 73 000 Seattle passengers (10% of peak demand) and 33 100 Seattle vehicles were unserved over 20 years. However, the loss of two trips per week out of Prince Rupert without any offsetting additional service there, resulted in a loss of 126 000 passengers (12.7% of peak Prince Rupert demand) and 57 400 vehicles out of Prince Rupert over 20 years. In addition, because of these capacity problems at Prince Rupert, no excess Seattle traffic could be diverted.

4.2.3 - Option 3 - Prince Rupert Summer Terminus

Under the third short-term option, all mainline vessels would operate twice weekly out of Prince Rupert during the peak season. Because of the increased capacity out of Prince Rupert, the Aurora was shifted to a Ketchikan base in order to provide additional service to feeder communities. Passengers desiring service to and from Seattle were assumed to transfer to Prince Rupert provided they were traveling with a vehicle. Seattle foot passengers, however, were assumed to be lost to the ferry system.

In total over 20 years this option resulted in the loss of 394 000 passengers out of Seattle (57% of the peak demand) as well as 20 700 vehicle trips. The balance of Seattle demand, a total of 296 400 passengers and 135 000 vehicles, were assumed to transfer to Prince Rupert. All demand to and from Prince Rupert was met by the system since Prince Rupert demand was given priority over Seattle transfers.

4.2.4 - Option 4 - Columbia Shuttle

Option 4 involved shuttling the Columbia between Seattle and Ketchikan during the summer peak, enabling her to make two round trips per week out of Seattle. The other three mainline vessels were presumed to continue their existing routes. However, to compensate for the loss of the Columbia's service north of Ketchikan, the Aurora and LeConte were drawn into quasi-mainline service with Aurora operating weekly out of Prince Rupert and LeConte twice-weekly out of Ketchikan.

Over the 20-year planning period, this option resulted in a loss of 43 200 Seattle passengers (6.3% of peak demand) and 18 500 vehicles. In addition, some 33 200 Prince Rupert passengers and 15 100 vehicles would be lost to the system. Transfers from Seattle to Prince Rupert would be minimal since, by the time capacity became critical at Seattle, it would also be reaching critical levels at Prince Rupert.

4.2.5 - Option 5 - Foreign Flag Vessel

This option required the Marine Highway to acquire and refurbish a foreign-built ferry and operate it out of Vancouver during the peak season. While the vessel could not carry traffic between points within the Southeast region, it could provide relief for capacity problems out of Seattle and thus free up space on the other mainline vessels. All other vessels were assumed to operate on their current schedules.

The addition of a foreign flag vessel enabled the system to meet all demand through to the mid-1990s after which some transfers from Seattle to Prince Rupert would be necessary, and some foot passengers out of Seattle would be lost. In total over 20 years, 10 400 Seattle passengers would be lost (1.5% of peak demand) and a further 22 500 would be transferred to Prince Rupert.

4.2.6 - Option 6 - High-Speed Catamarans

The sixth short-term option focused on using high-speed catamaran-type ferries to provide intra-regional ferry service during the peak season, and concentrating peak mainline service on the Seattle route.

In total, a fleet of four catamaran ferries was presumed, each with capacity to carry 14 vehicles and 90 passengers. These vessels would operate on a variety of both feeder and high-density routes in the region. The Columbia, Malaspina and Matanuska were all presumed to operate once a week out of Seattle while the Taku and LeConte would operate out of Prince Rupert. Aurora was assumed to operate on a combination mainline-feeder route out of Ketchikan providing additional mainline capacity as well as heavy-freight service into feeder communities.

In terms of total traffic served, this option resulted in the loss, over 20 years, of 21 000 peak Seattle passengers (3% of peak demand) and 9 500 Seattle vehicle trips. In addition, there would be a capacity shortfall out of Prince Rupert resulting in a total loss of 96 600 passengers (9.7% of peak demand) and 43 900 vehicle trips to and from the port.

4.2.7 - Option 7 - High-Speed SES Ferries

The final short-term option involved using larger high-speed ferries to provide peak intra-regional service and again concentrating mainline service on Seattle.

Under this scenario, it was presumed that two large (180-passenger, 40-vehicle) SES-type high-speed ferries would be acquired and operated on combined feeder-mainline routes throughout the region. The Columbia, Malaspina and Matanuska would operate out of Seattle while the Taku would continue her existing twice-weekly schedule out of Prince Rupert. In addition, the Aurora would operate on a mainline route out of Prince Rupert

while the LeConte would serve Prince Rupert, Ketchikan and Hollis on a daily round trip basis.

This option had essentially the same impact on Seattle traffic as Option 6; over 20 years a total of 20 800 passengers and 9 400 vehicle trips would be lost. The increased service level out of Prince Rupert, however, resulted in lower losses there. In total, 30 600 Prince Rupert passengers (3.1% of peak demand) and 13 900 vehicles would be lost to the system.

4.3 - Evaluation of Short-Term Options

4.3.1 - Financial Evaluation

As described in the methodology section (Section 3), each option was first evaluated with respect to financial impacts on the Marine Highway, the State government and the user. The results of this analysis (in terms of discounted 20-year total costs and revenues) are shown in Table 4.1.

The table does not provide a separate figure for cost to the State since, under the short-term options, the only changes in costs to the State would arise as a result of changes in the AMHS deficit. Thus net costs to the AMH and total State costs would be the same.

The table indicates that two of the system alternatives, Option 2 (Matanuska to Seattle) and Option 4 (Columbia shuttle), result in a lower financial cost to the State than would arise under continuation of the existing system. In addition, as noted earlier, both options would meet a higher portion of projected demand.

The remaining options all result in higher financial costs than in the base case. However, with the exception of Option 3 (Prince Rupert terminus), all provide service to a greater portion of total demand. As a result, the total costs per effective passenger mile are all (with the exception of Option 3) lower than in the Base Case-Existing System option.

TABLE 4.1

FINANCIAL IMPACTS - SHORT-TERM SYSTEM OPTIONS

(Net Present Value, Total over 20 years discounted at 5% - $ Millions)

System Option	Existing System	Matanuska to Seattle	Prince Rupert Terminus	Columbia Shuttle	Foreign Flag Vessel	High-Speed Catamarans	High-Speed SES Ferries
Cost to AMHS							
Vessel Capital	$241.3	$241.3	$241.3	$241.3	$253.3	$255.7	$270.1
Vessel Operating	671.2	671.2	671.2	673.8	740.5	703.8	711.3
Port Capital	-	-	0.4	3.9	-	-	-
Port Operating	28.2	28.2	28.2	28.2	28.2	28.2	28.2
Less Fare Revenue	(486.3)	(512.0)	(437.2)	(520.1)	(539.4)	(530.6)	(537.9)
Net Cost	454.4	428.7	503.9	427.1	482.6	457.1	471.7
Cost to User							
Ferry	$486.3	$512.0	$437.2	$520.1	$539.4	$530.6	$537.9
Veh. Operating Cost	5.4	-	21.8	0.3	2.0	-	-
Total	491.7	512.0	459.0	520.4	541.4	530.6	537.9
Total Cost	946.1	$940.7	$962.9	$947.5	$1024.0	$987.7	$1009.6
Effective passenger miles (millions)	2063.4	2211.9	1929.1	2268.3	2311.7	2273.4	2298.8
Total cost per effective passenger-mile (dollars)	$0.458	$0.425	$0.499	$0.417	$0.443	$0.434	$0.439

4.3.2 - Service Cost Effectiveness

As noted in the methodology section, however, the financial analysis does not reflect the full range of impacts associated with the various options. In the first place, the financial costs do not reflect the user costs associated either with unmet demand or with the need to divert from one port to another. In the second place, they fail to include the impacts of better service quality (particularly as regards travel time) under certain of the service options.

Accordingly, for each option, the user costs were adjusted to reflect the differences in the number of passengers and vehicles served. In addition, the total travel times under each option were calculated and adjusted to reflect differences in traffic levels.

Each system option was then compared to the base case (Option 1) in terms of total adjusted user costs and total costs to the State, and the differences calculated. The results of this analysis are shown in Table 4.2.

Strictly in terms of user versus government costs, three options appear to have clear cut advantages over the existing system: Option 2 (Matanuska to Seattle), Option 4 (Columbia shuttle) and Option 6 (high-speed catamarans). The first two (Options 2 and 4) offer cost savings to both users and the State and hence are preferable to the current system for both parties. The third option (Option 6) is more costly to the State (by $2.7 million) but offers user cost savings which more than offset the State's cost increase.

Of the other options, Option 5 (foreign flag vessel) and Option 7 (high-speed SES ferries) both offer user cost savings, but the increase in costs to the State more than offsets the users' monetary benefits. The remaining option (Option 3, Prince Rupert terminus), however, is less attractive than the existing system in terms of both user costs and government costs and hence appears to be undesirable to both from the cost perspective.

TABLE 4.2

SHORT- TERM SYSTEM OPTIONS -
IMPACTS ON USER AND GOVERNMENT COSTS

Option	Change[1] in User Cost[2] ($millions)	Change[1] in Government Cost[2] ($millions)	Comments
2 - Matanuska to Seattle	-1.4	-25.7	Both better off.
3 - YPR Summer Terminus	+2.0	+49.5	Both worse off.
4 - Columbia Shuttle	-4.3	-27.3	Both better off.
5 - Foreign Flag Vessel	-5.8	+28.2	User saves 21¢ per dollar of added government cost.
6 - High-Speed Catamarans	-3.8	+2.7	User saves $1.41 per dollar of added government cost.
7 - High-Speed S.E.S.	-5.0	+17.3	User saves 29¢ per dollar of added government cost.

[1] As compared with existing system (Option 1).

[2] NPV of 20-year total costs.

Apart from cost impacts, consideration must also be given to the travel time impacts under the various options. The total adjusted changes in travel time are given in the first column of Table 4.3. The figures indicate that, with the exception of Option 4 (Columbia shuttle) all options lead to net travel time savings as compared with the base case. The highest savings are generated under the two high-speed ferry options (Options 6 and 7) and the lowest under the Prince Rupert terminus case.

In order to assess the value of these time savings, an 'imputed value' approach was used (as described in Section 3). First the total 'required' time value was determined by calculating the algebraic difference between monetary costs and savings (from Table 4.2). This figure represented the total value which would have to be assigned to travel time differences in order for positive impacts (savings) to equal or exceed negative ones (cost increases). The resultant values are shown in column 2 of Table 4.3.

These required total values were then divided by the number of hours saved (or lost) in order to determine the minimum hourly value (or maximum in the case of travel time increases) which would have to be assigned to travel time in order to equalize benefits and costs.

The figures indicate that in two cases (Option 2, Matanuska to Seattle, and Option 6, high-speed catamarans) the value of travel time savings can be as low as zero. Since monetary savings exceed monetary cost increases, the savings in travel time represent an added bonus which serves to enhance the merits of the system.

Three other options can be ranked in order of relative merit based on required time values. These are, in order of preference: Option 7 (high-speed SES ferries) where benefits would exceed costs when the value of travel time exceeds $1.15 per hour; Option 5 (foreign flag vessel), where travel time value must exceed $6.35 per hour; and Option 3 (Prince Rupert terminus) where the hourly value of travel time savings must exceed $83.10 per hour (an unlikely prospect).

TABLE 4.3

SHORT-TERM SYSTEM OPTIONS - USER TRAVEL TIME IMPACTS AND REQUIRED VALUE OF TIME

Option	Change[1] in User Travel Time (million hours)	Required Total Time Value[2] ($millions)	Required Hourly Time Value ($/h)
Matanuska to Seattle	- 3.94	(27.1)	ø
Prince Rupert Terminus	- 0.62	51.5	>83.10
Columbia Shuttle	+ 3.33	(31.6)	< 9.45
Foreign Flag Vessel	- 3.52	22.4	> 6.35
High-Speed Catamaran Ferries	- 9.16	(1.1)	ø
High-Speed SES Ferries	-10.73	12.3	> 1.15

1 As compared with Option 1; existing system.
2 Brackets denote negative required value.

The remaining option, the Columbia shuttle, is more difficult to rank since it generates substantial increases in travel time which offset its monetary advantages. In this case, the hourly value of travel time must be less than $9.45 per hour. Otherwise the cost of travel time increases will offset the monetary savings.

4.3.3 - Summary

The evaluation of the service/cost effectiveness of short-term system options indicates that two alternatives (sending the Matanuska to Seattle and acquiring high-speed catamarans) offer clear advantages over the existing surface system. In both cases, the monetary savings exceed the monetary cost increases. In addition, both options yield significant savings in user travel time.

The remaining options, while potentially better than the existing system (with the exception of the Prince Rupert terminus), are less advantageous than the two preferred alternatives.

The major drawbacks of the two preferred system options would be

- the substantial traffic losses out of Prince Rupert in the case of the 'Matanuska to Seattle' option, and

- the increase in the AMH operating deficit as a result of purchasing four high-speed ferries under the 'high-speed catamaran' option.

These problems are not without solution, however. For example, by combining the two concepts, a compromise situation could be reached whereby two vessels would operate out of Seattle (rather than the three presumed in the high-speed catamaran option) and a smaller number of catamarans could be used to free up one of the feeder ferries (e.g. the Aurora) to operate more frequently out of Prince Rupert.

5 - EVALUATION OF LONG-TERM SYSTEM ALTERNATIVES

5 - EVALUATION OF LONG-TERM SYSTEM ALTERNATIVES

5.1 - General

The definition and assessment of long-term surface system alternatives involved a changed perspective from the short-term in terms of both the demands to be met and the range of options available to provide service. While traffic demand is expected to continue to increase in the future, it is possible, in the long term, to envision major changes in the transportation system through the acquisition of additional mainline vessels, the development of new road links, the purchase of high-capacity, high-speed ferries, and the phased introduction of more substantial schedule changes.

As in the short-term, however, the key concern was to establish a balance between the goals of serving resident demand, supporting the regional economic sectors, and allocating government funds in a judicious and beneficial manner. A range of long-term alternatives was therefore specified not only in terms of operating characteristics but in terms of the level of investment in new capacity in order to meet demand.

The issue of investing to meet demand was of particular concern since it was recognized that new investment in mainline vessel capacity would primarily serve peak season tourist demand out of Seattle. During the off-peak season these vessels would not be required. It was therefore decided to investigate a range of options in terms of investing to meet peak tourist demand in order to determine the savings and impacts associated with providing lower levels of capacity.

Two investment scenarios were therefore analyzed.

- Acquire sufficient vessels to meet peak season demand out of both Seattle and Prince Rupert

- Acquire new mainline vessels only when combined vehicle demand out of Seattle and Prince Rupert exceeds combined vessel capacity. This implies

acceptance of the idea that passengers with vehicles will be willing to transfer from Seattle to Prince Rupert if ferry capacity is available.

In addition, for sensitivity testing, selected scenarios were evaluated whereby no new mainline vessels were acquired and demand in excess of capacity was presumed to be lost.

5.2 - Long-Term System Alternatives

Alternatives for surface system operations were defined as a series of 'Focuses' where each focus involved emphasizing a particular concept in terms of regional service and evaluating its impact throughout the system in terms of cost and service effectiveness.

Five key 'focus' areas were developed and are described in the following sections. It should be noted at the outset that definition of these 'focus' areas was not meant to suggest that all service improvements should be focused in a single region. Rather, the intent was to determine the relative system-wide impacts associated with these various improvements and select those which offered the greatest benefits relative to their costs.

5.2.1 - Option 1 - Mainline Service Focus

This option represented the base case against which all long-term options were evaluated. Essentially it involved continuing the philosophy of the June 1980 Regional Transportation Plan whereby the existing mainline and feeder route structures were proposed and additional system capacity provided, as required, by the acquisition of new mainline vessels.

For costing and capacity purposes, a conceptual new mainline vessel was defined which would be used in all cases where additional mainline ferries were required. The conceptual vessel, termed the 'AMH Special', was envisioned as providing effective capacity for 200 vehicles and 750 passengers, at a cruising speed of 18 miles per hour. Total capital cost was estimated at $45 million, while crewing and fuel costs were based

on the costs incurred by the Colombia. Maintenance costs were based on the average costs for mainline vessels.

Under the mainline service focus option, three of these new vessels would be required over the 20-year planning period. While one is needed immediately on the Seattle route, it was estimated that such a vessel could not be brought into service before 1989. A second 'AMH Special' would be required on the Seattle route by 1993, and a third vessel would be required, this time out of Prince Rupert, by the early 2000s.

Once the first 'AMH Special' was brought into operation in 1989, this option would successfully meet all system demand throughout the planning period. Between 1986 and 1989, a total of 12 500 passengers would be lost due to capacity shortfalls out of Seattle.

5.2.2 - Lynn Canal Focus

These options emphasized changes within the Lynn Canal corridor, analyzing their impacts on both Lynn service and on service throughout the region. Two Lynn service options, representing the preferred Lynn corridor alternatives, were evaluated (see Figure 8).

- An east-side road from Juneau to Skagway with a shuttle ferry from Haines to the Katzehin River.

- Two high-speed SES shuttle ferries from Echo Cove to Haines and Skagway.

In both cases, northbound mainline ferry service was assumed to terminate at Juneau.

Investment

The Lynn road option involved extending the existing road from Echo Cove up the east side of the Lynn Canal to Skagway. A new ferry terminal would be built near the mouth of the Katzehin River and two shuttle ferries would operate between the new terminal and the existing terminal at Haines,

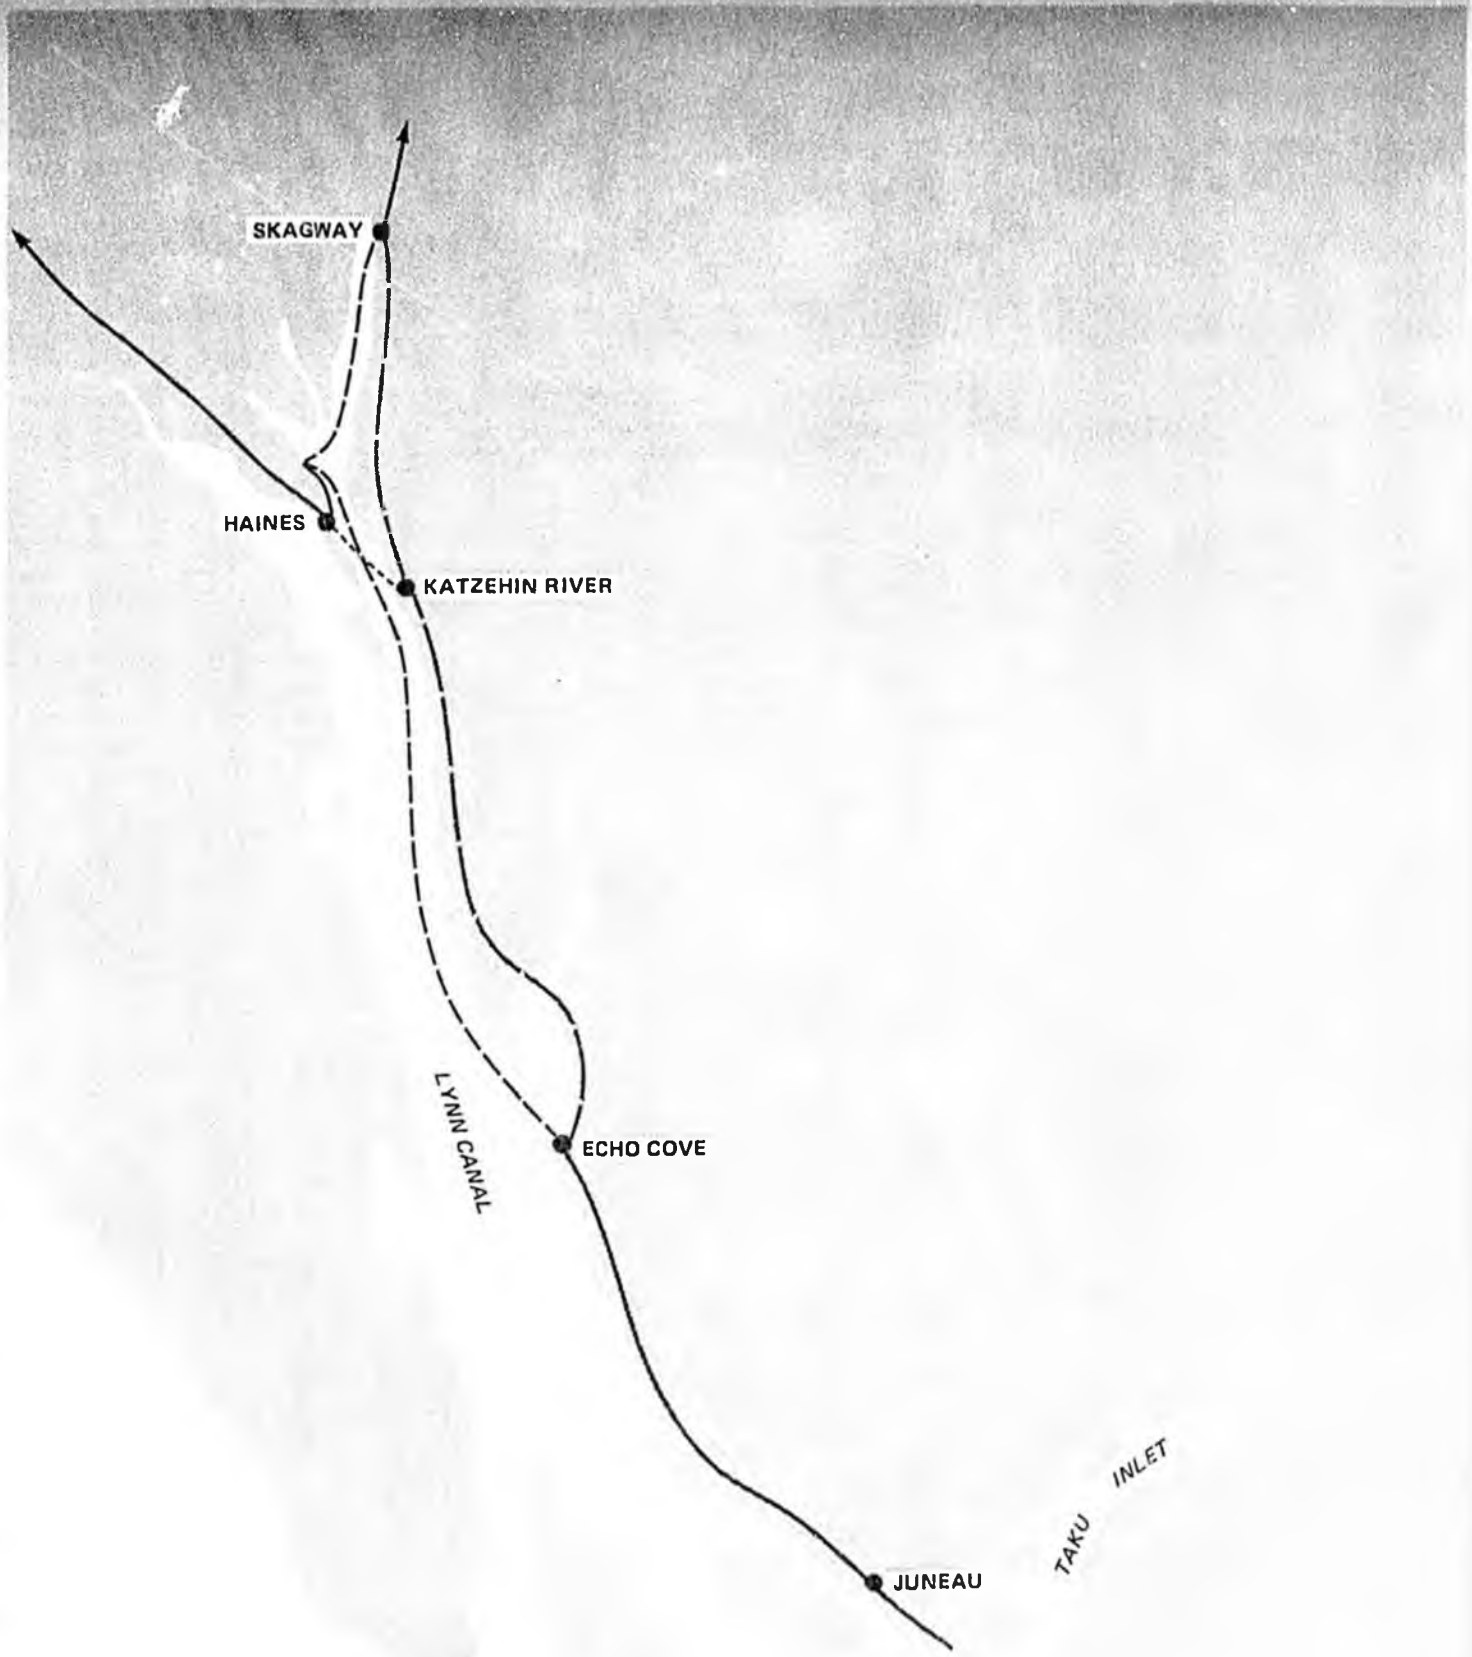

Figure 8

LYNN FOCUS ALTERNATIVES

providing a connection from Haines and the Haines Highway to the new road. Total capital investment for the road, terminal and shuttle ferries would be in the order of $274 million.

Under the high-speed shuttle option, the Marine Highway would acquire two SES-type, high-speed ferries to provide service between Echo Cove, Haines and Skagway. Each vessel was assumed to make three round trips per day during the summer season, calling at Haines on both the northbound and and southbound runs. For purposes of analysis, the high-speed ferries were assumed to operate during the summer season only. However, they could potentially operate on a reduced schedule during the off season if required. Total capital investment, including upgrading parts of the road to Echo Cove, constructing a new terminal there, and acquiring two high-speed ferries, was estimated at $31 million.

From the viewpoint of the system as a whole, two levels of investment were defined for each of these Lynn cases. In the 'meet demand' cases, new mainline vessels would be required in 1989 and in 1998, both operating on the Seattle route. In the 'reduced investment' cases, only one new mainline vessel would be added in 1998.

Ferry Schedules

In order to take advantage of the termination of mainline and feeder ferry service up the Lynn Canal revised schedules were defined for the existing and proposed new ferries. These are outlined in Figures 9 and 10. Under the 'meet demand' scenario, the proposed peak season Seattle service (Figure 9) would have both the Columbia and the second (1998) new ferry operating on an 'open jaw' route, running north from Seattle to Juneau, south to Prince Rupert, then back north to Juneau and south to Seattle. A trip from Seattle to Prince Rupert would require 4.5 days, so each vessel would return to Seattle every nine days. Two other vessels, the Matanuska and the first new mainline ferry would operate on a weekly round trip service from Seattle to Juneau, calling at Sitka in both directions.

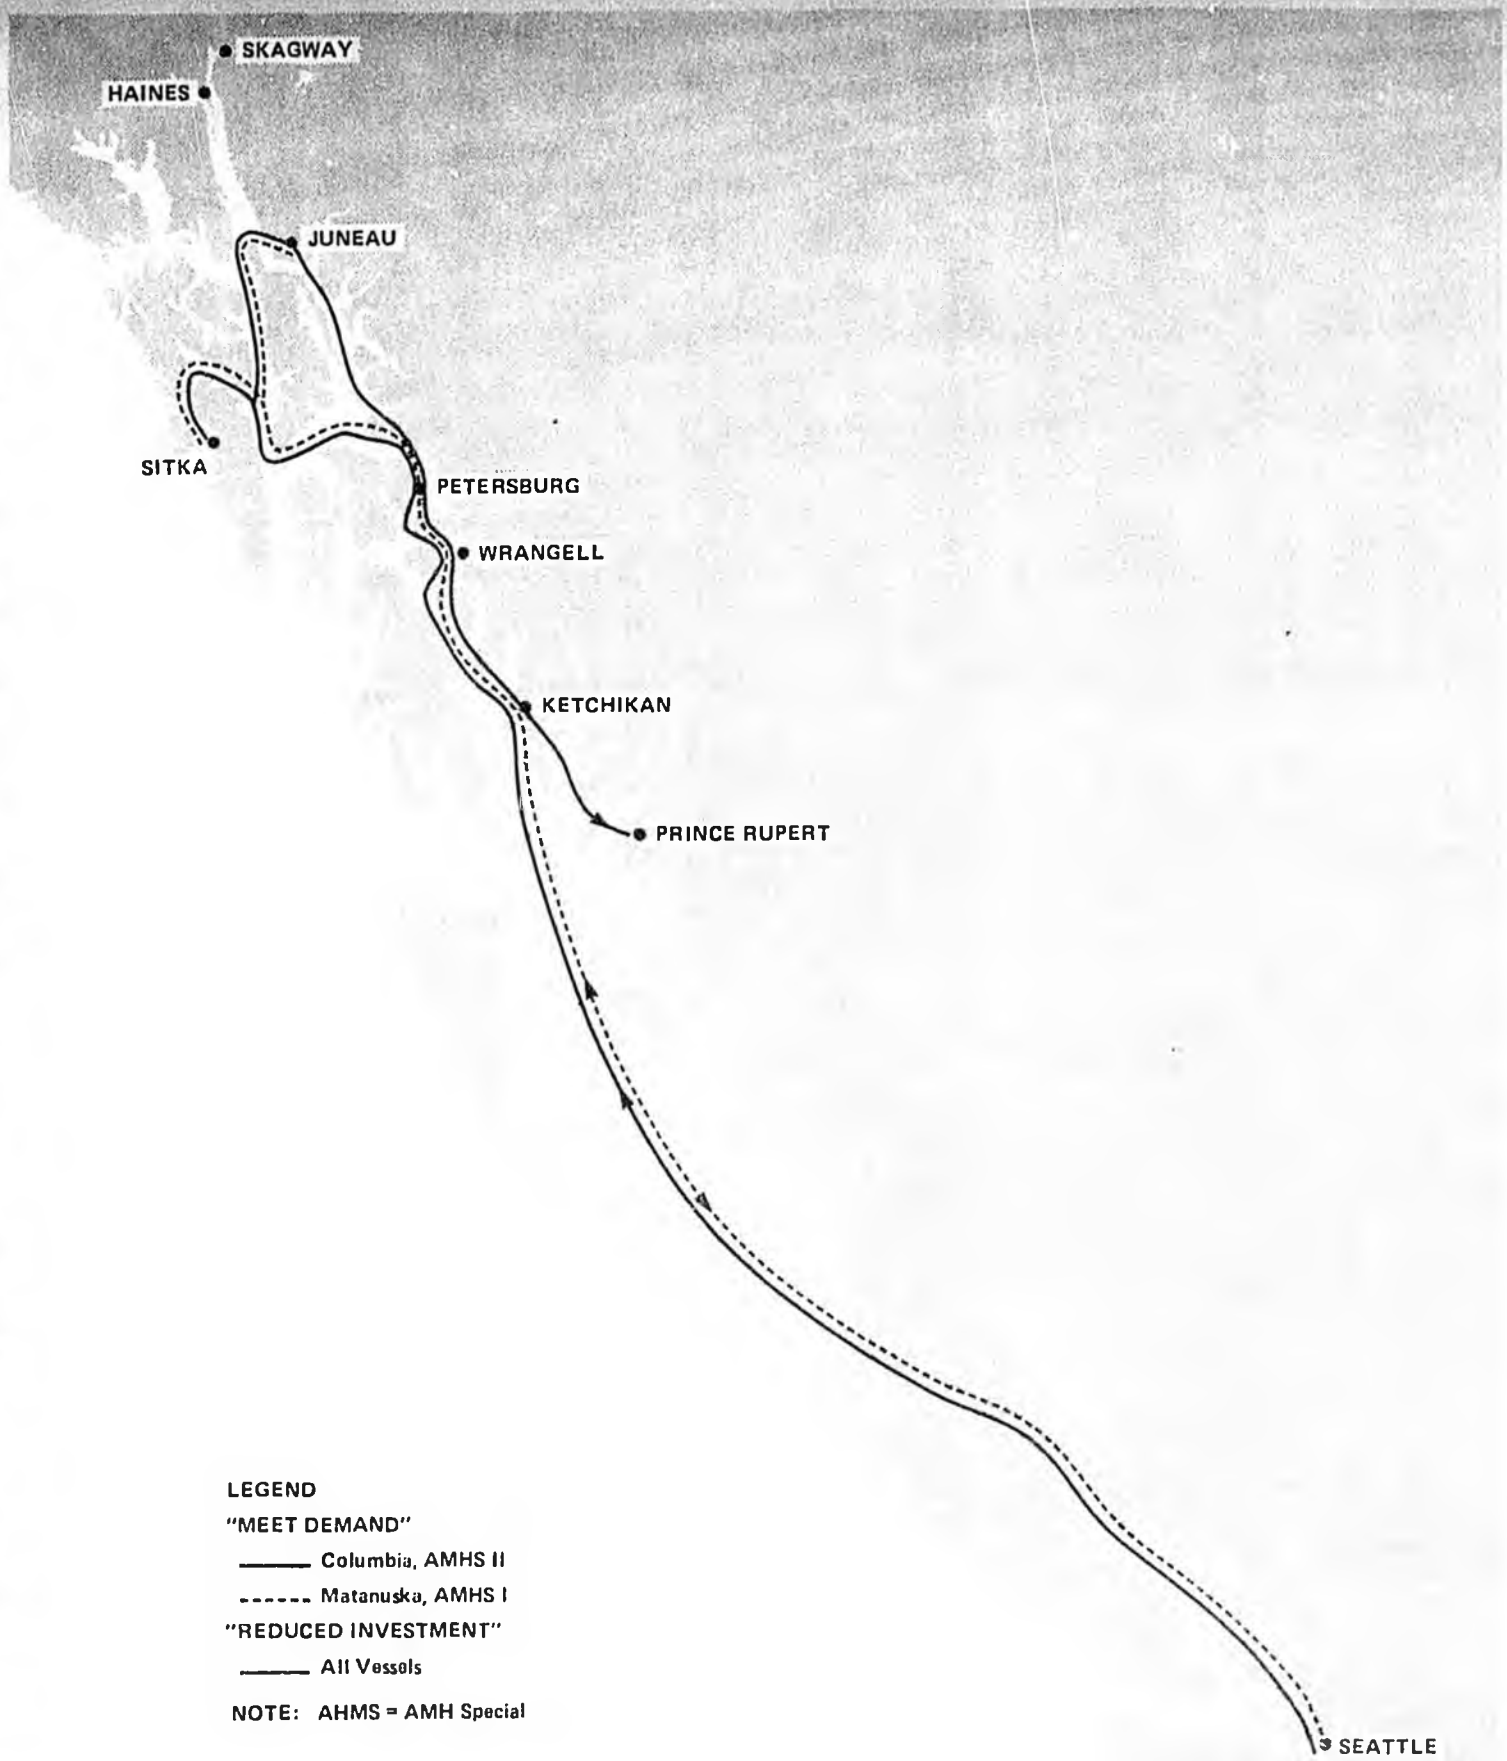

Figure 9

LYNN FOCUS OPTIONS
SEATTLE SERVICE

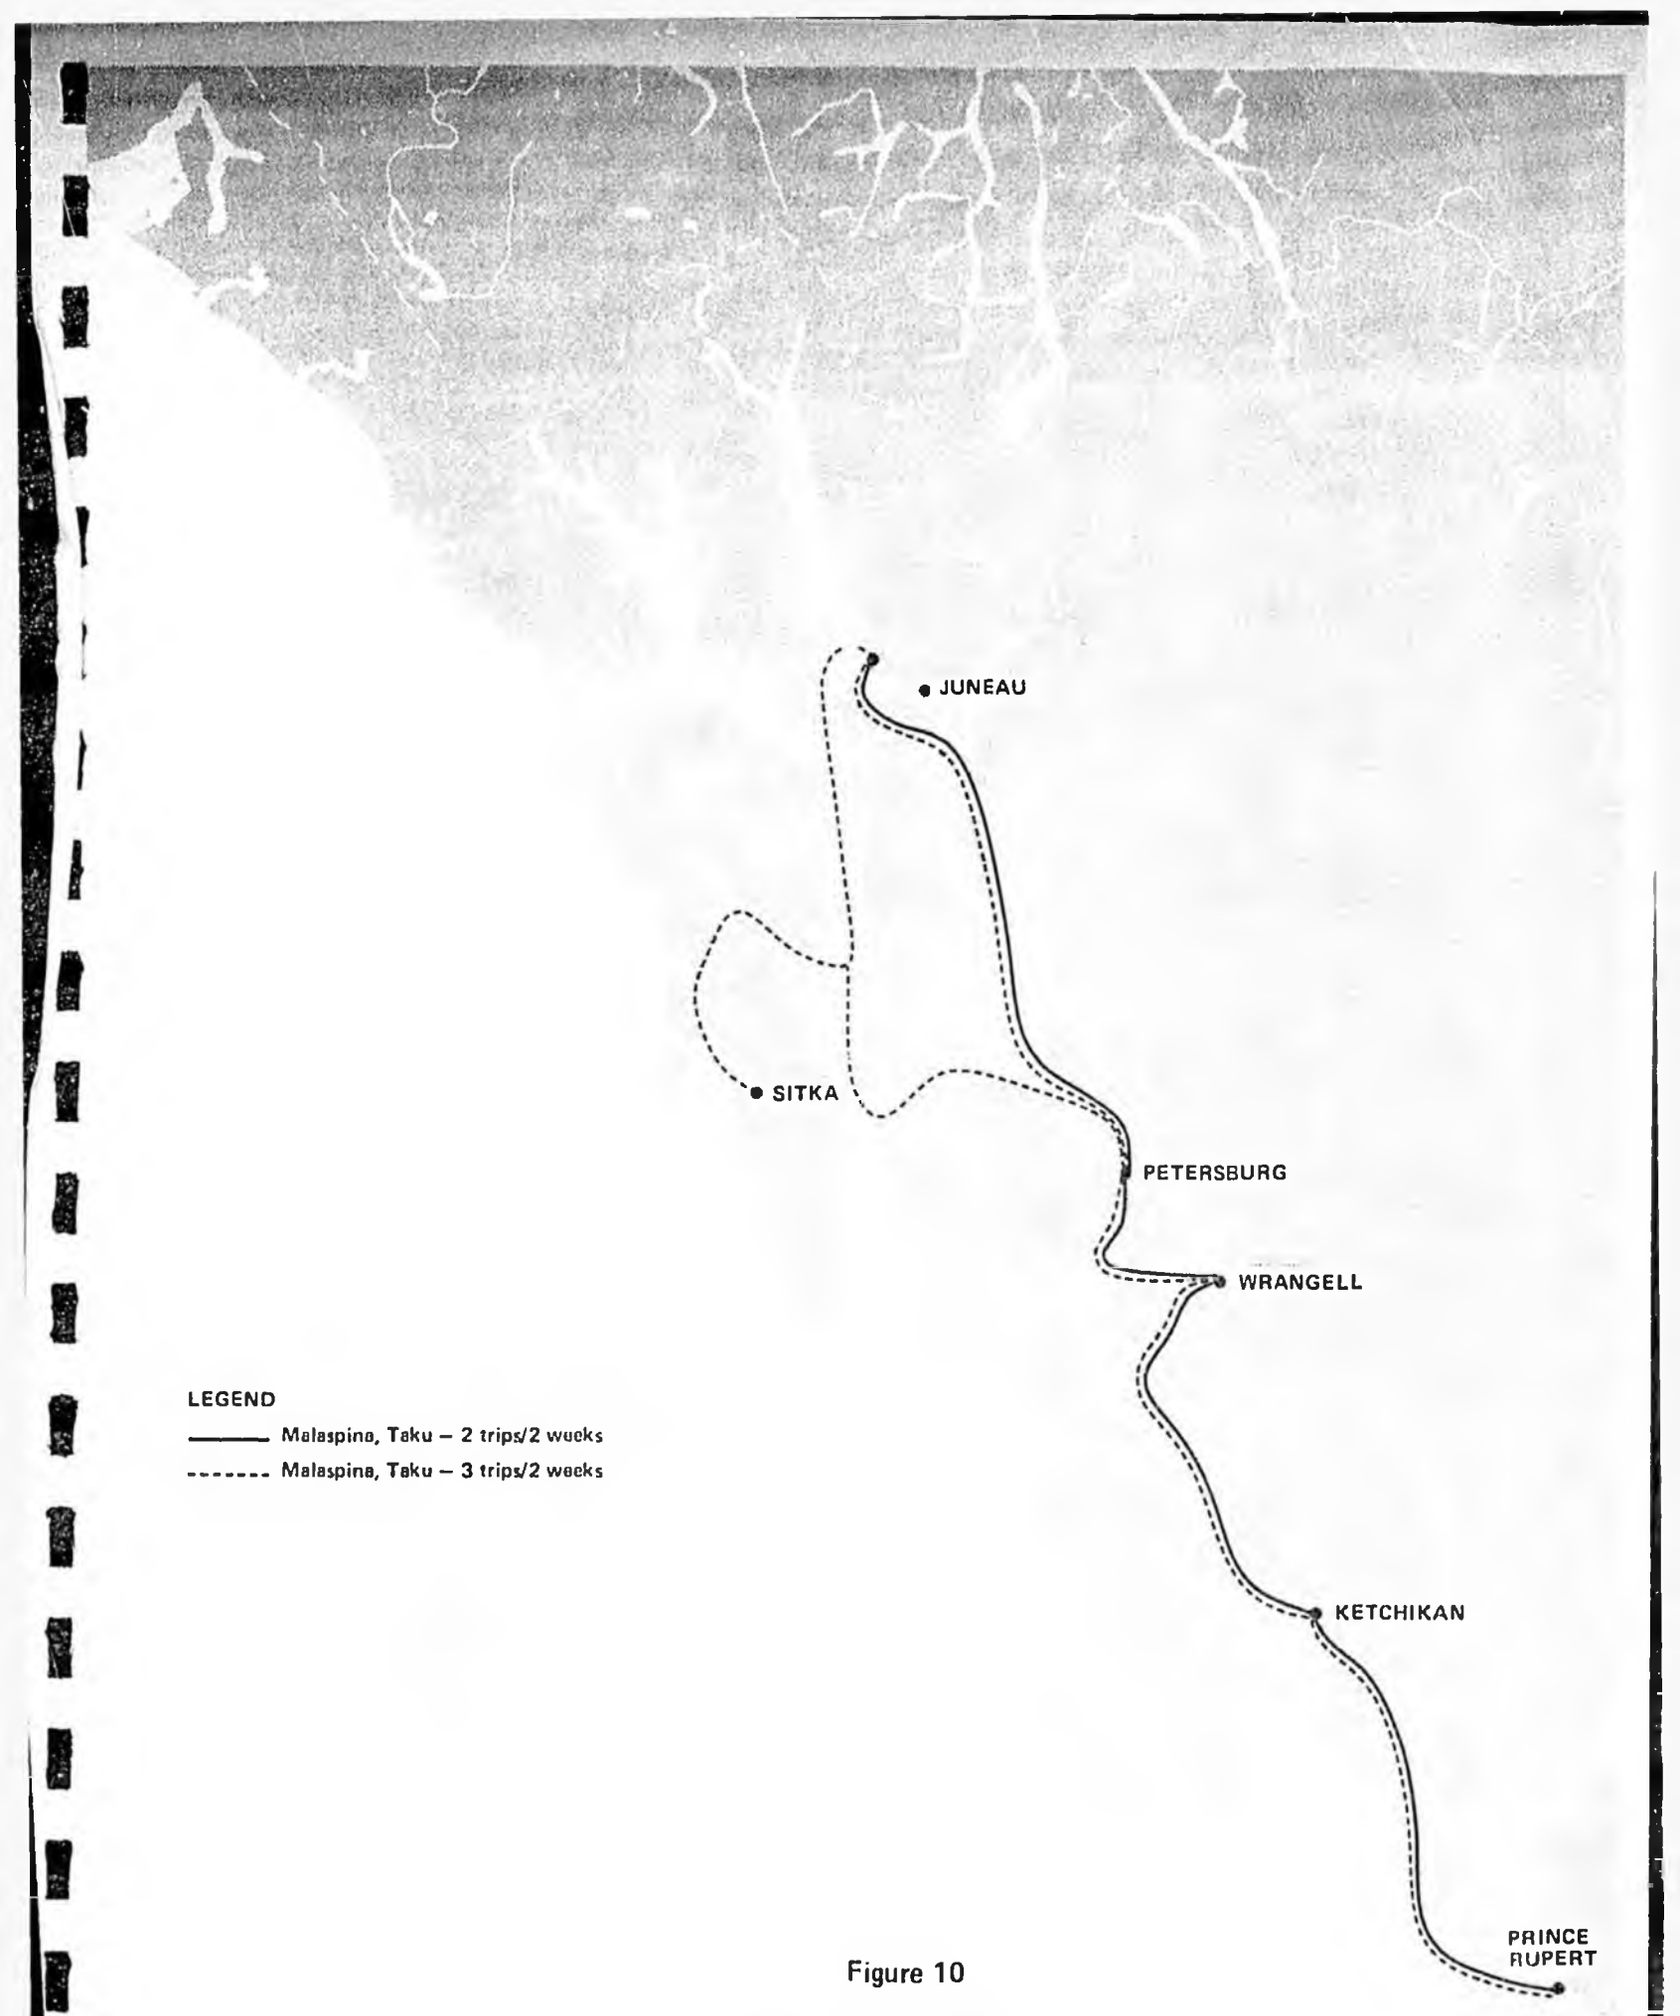

Figure 10

LYNN FOCUS OPTIONS
PRINCE RUPERT FERRY SERVICE

Under the 'reduced investment' scenario, where only one new mainline vessel was acquired, the Columbia, the Matanuska, and the new ferry would all operate on the 'open jaw' schedule.

Revised ferry routings out of Prince Rupert are shown in Figure 10. The Malaspina and Taku would operate on routes very similar to their existing schedules, calling at Sitka on alternate trips, but would not travel up the Lynn Canal. This allows a slight increase in the number of trips from two per week to five in a two-week period. These schedules would apply under both the 'meet demand' and 'reduced investment' scenarios.

In terms of feeder ferry service, a number of alternatives would be possible under the Lynn options. The added mainline service between Prince Rupert and Petersburg could free the Aurora to provide more links for Prince of Wales Island. Similarly, the termination of Lynn Canal service and the added mainline trips would allow the LeConte to focus on linking northern feeder communities to a greater number of destinations.

Traffic Impacts

Under the 'meet demand' scenarios, the Lynn options would provide service to all traffic throughout the system after 1989 (when the first new mainline vessel was acquired). Under the 'reduced investment' scenarios, the Lynn road option would result in total losses of 31 100 passengers and 1 000 vehicles out of Seattle over 20 years, primarily between 1986 and 1989 (4.5% of peak demand) and the diversion of 85 600 passengers (12.4% of peak demand) and 38 900 vehicles from Seattle to Prince Rupert.

The 'reduced investment' Lynn high-speed shuttle option would result in the loss of 13 000 passengers out of Seattle (2% of peak demand) and the diversion of 82 200 passengers (11.9% of peak demand) and 37 400 vehicles from Seattle to Prince Rupert.

Within the Lynn corridor itself, both Lynn options were assumed to generate a measure of induced traffic (i.e. passengers and vehicles which would not have made the trip under the existing system but which were persuaded by

lower costs and/or better service to travel in the corridor). Different inducement factors were used for the road and the shuttle options. Under the road option it was assumed that the lower cost and improved travel time would generate an average of 100 000 additional vehicle movements per year. The shuttle option, with a lower service level and higher cost was assumed to generate on average an additional 25 000 vehicle trips per year. With summer operation only, induced traffic was estimated at one-half the annual figure or an average of 12 500 vehicle trips.

5.2.3 - Sitka Focus

The Sitka options focused on long-term changes in the way in which the Sitka community was incorporated into the surface system. Three service options were assessed.

- Construct a road from Sitka to Baranof and operate mainline and feeder service out of Warm Springs Bay.
- Construct a road from Sitka to Rodman Bay and provide mainline and feeder ferry services out of a Rodman Bay terminal.
- Provide high-speed SES ferry service on the Sitka-Juneau and Sitka-Petersburg links. Terminate mainline service into Sitka.

A map highlighting these options is shown in Figure 11.

Investment

The Baranof road option would involve the construction of a new road from Sitka to Warm Springs Bay. In total, 26 miles of new road, including a tunnel and substantial avalanche protection, would be required and a new mainline/feeder ferry terminal would have to be constructed. Total capital cost to implement this option was estimated at $181.5 million.

The Rodman Bay road option would involve a 46 mile extension of the existing northbound road and construction of a new mainline/feeder ferry terminal on

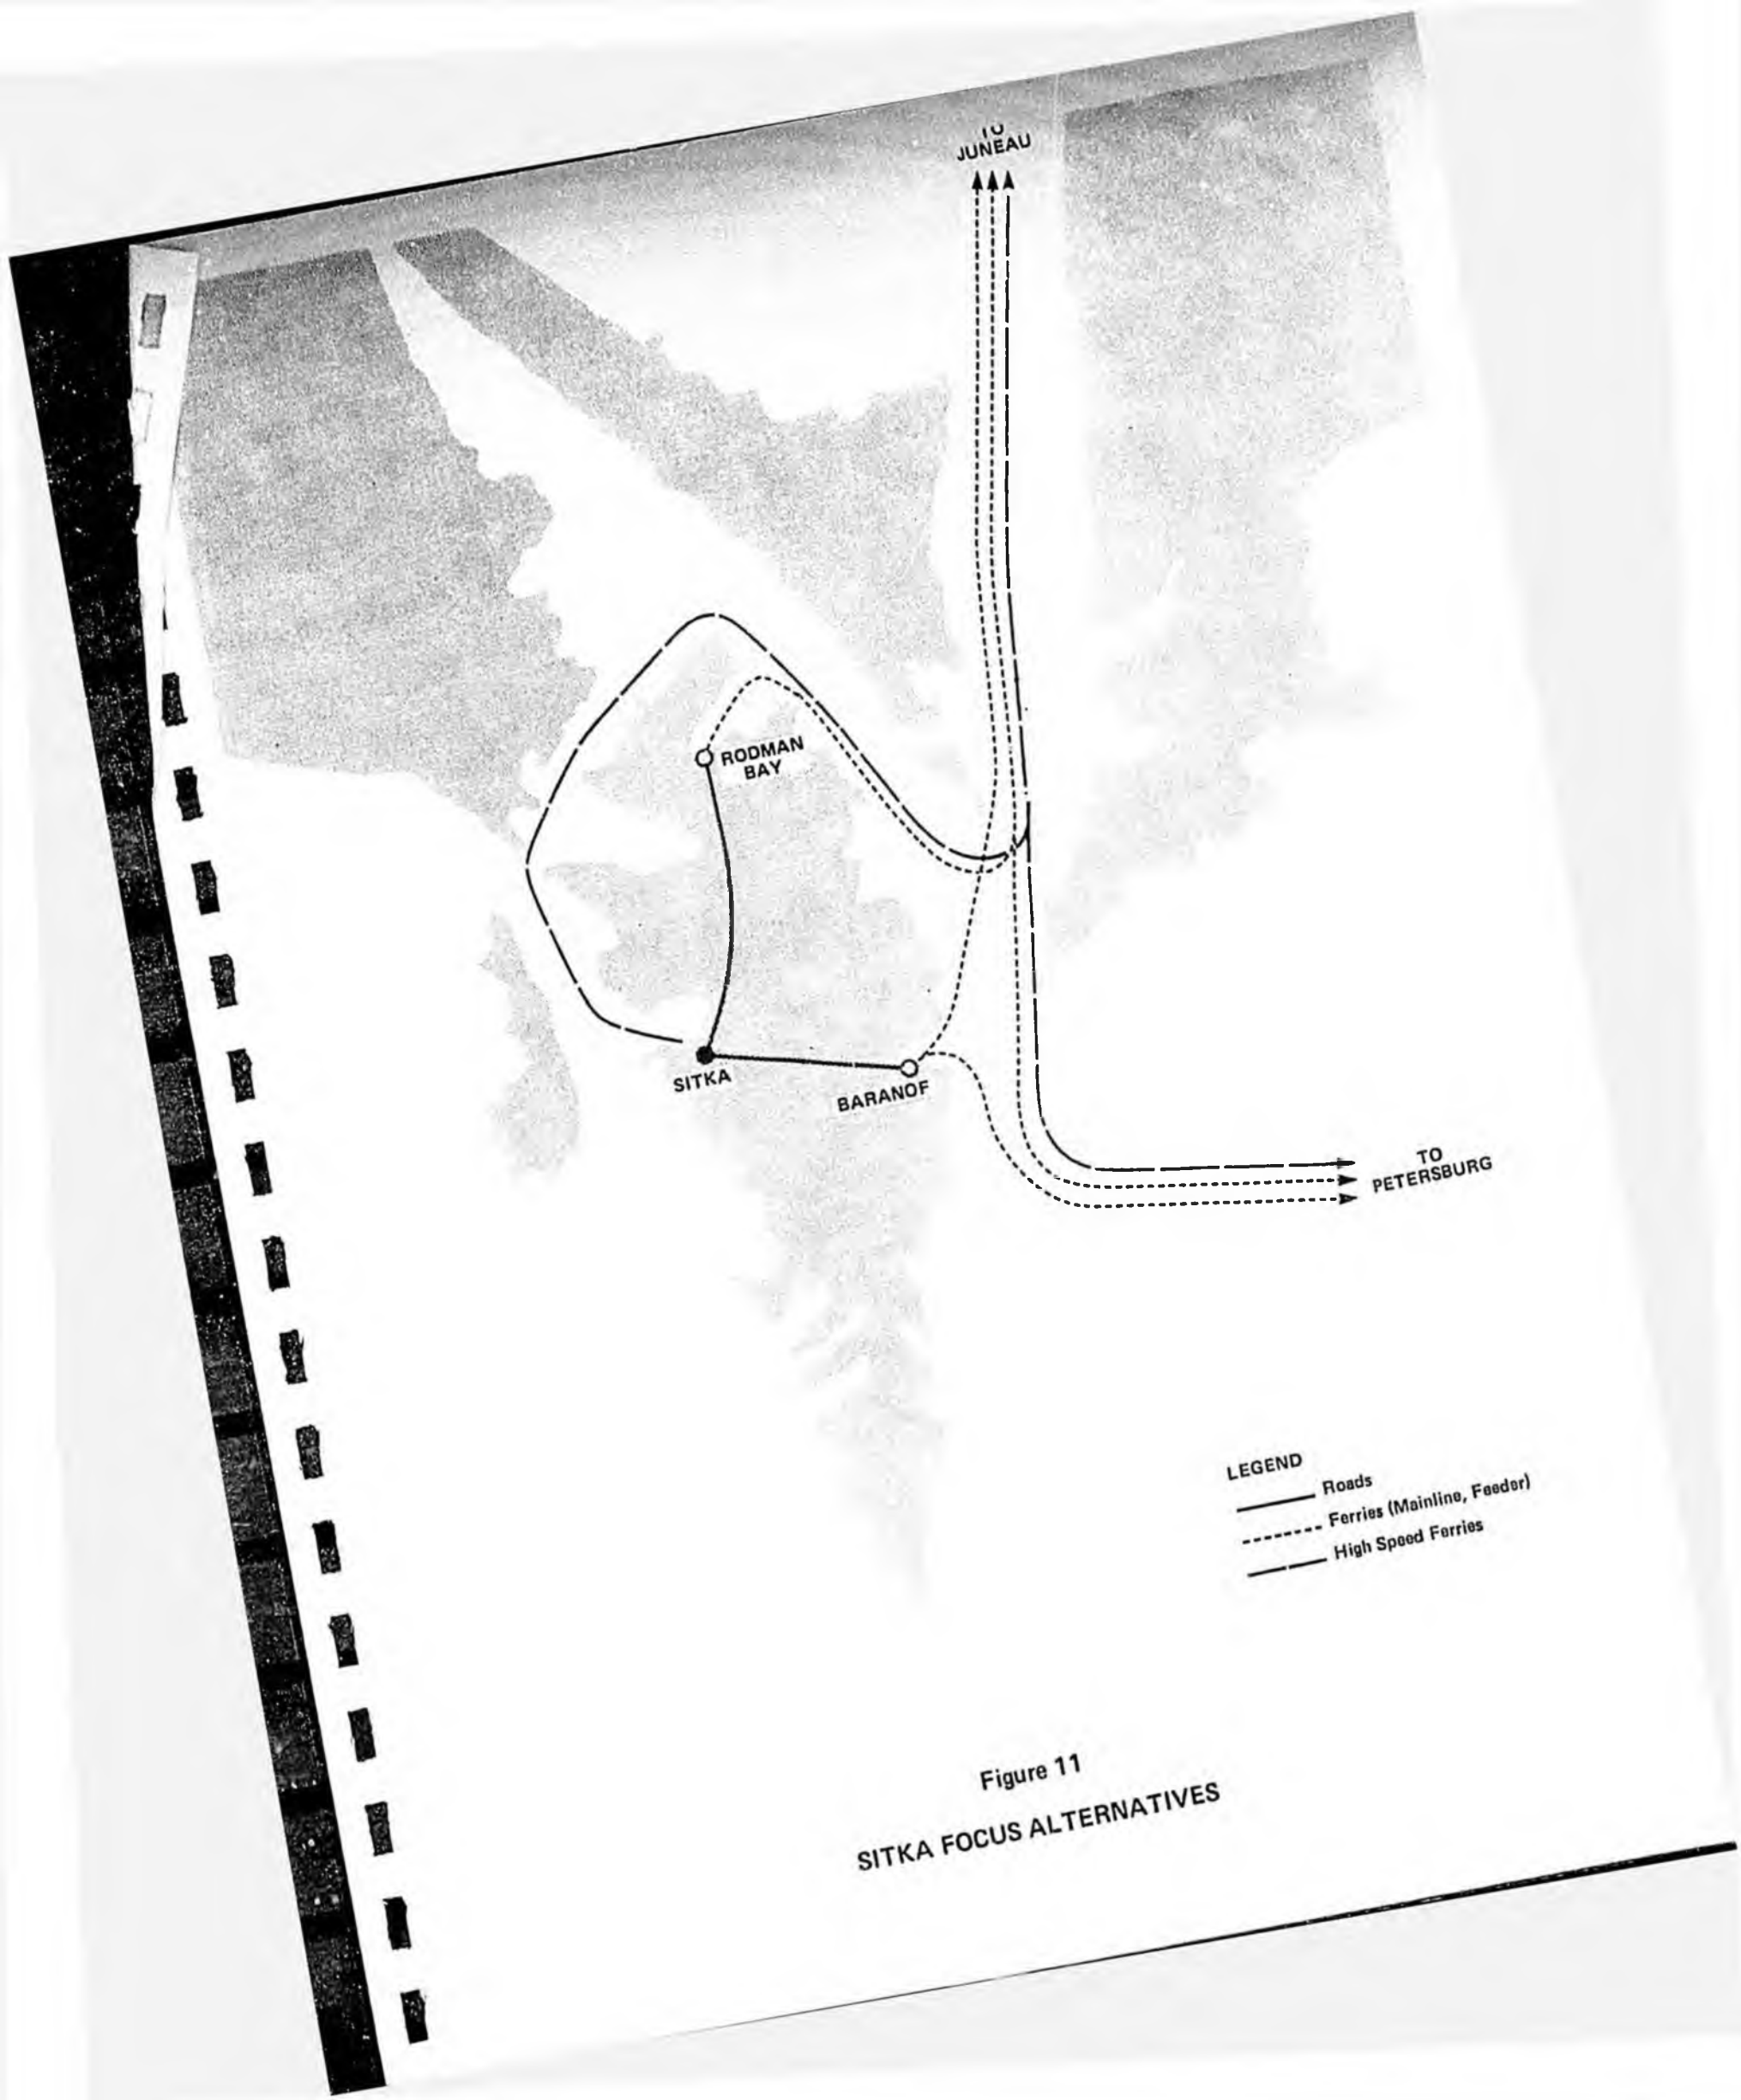

Figure 11

SITKA FOCUS ALTERNATIVES

Rodman Bay. Although the road distance is substantially greater than under the Baranof option (the new terminal would be approximately 54 miles from Sitka), the terrain is less severe and total capital cost for the road and terminal was estimated at $160 million.

The third Sitka option would involve the use of two large SES-type high-speed ferries to link Sitka to Juneau, Petersburg, and the feeder communities in between. One vessel would make a daily round trip from Sitka to Juneau calling at Angoon in both directions and at Tenakee Springs and Hoonah on either the outbound or return leg. The second vessel would make a daily round trip from Sitka to Petersburg, calling at Kake in both directions. For analytical purposes, these vessels were assumed to operate during the peak season only, with normal mainline and feeder services being resumed in the off-peak. However, as with the Lynn high-speed option, these vessels could potentially operate over a longer season on a reduced schedule if required. Total new capital investement in this option would be $24 million - $12 million per vessel.

The required mainline capacity additions under each of these Sitka options were essentially the same. Under the 'meet demand' scenarios, all options were found to require new mainline vessels in 1989 and in 1998. Under the 'reduced investment' scenarios, each option presumed a new mainline vessel in 1998 only.

Ferry Schedules

Ferry schedules under the Baranof and Rodman Bay road options were adjusted to take advantage of the time saving arising from the reduced sailing distance and elimination of the tide delays in Sergius Narrows. The proposed mainline routes are shown in Figures 12 and 13.

Figure 12 shows the Seattle ferry service under the two Sitka road options. Under the 'meet demand' scenarios, two vessels, the Columbia and the second new ferry, would operate on an 'open jaw' route from Seattle north via Baranof/Rodman Bay to Skagway, then south to Prince Rupert. At Prince Rupert they would turn back north to Skagway, then south via Baranof/Rodman

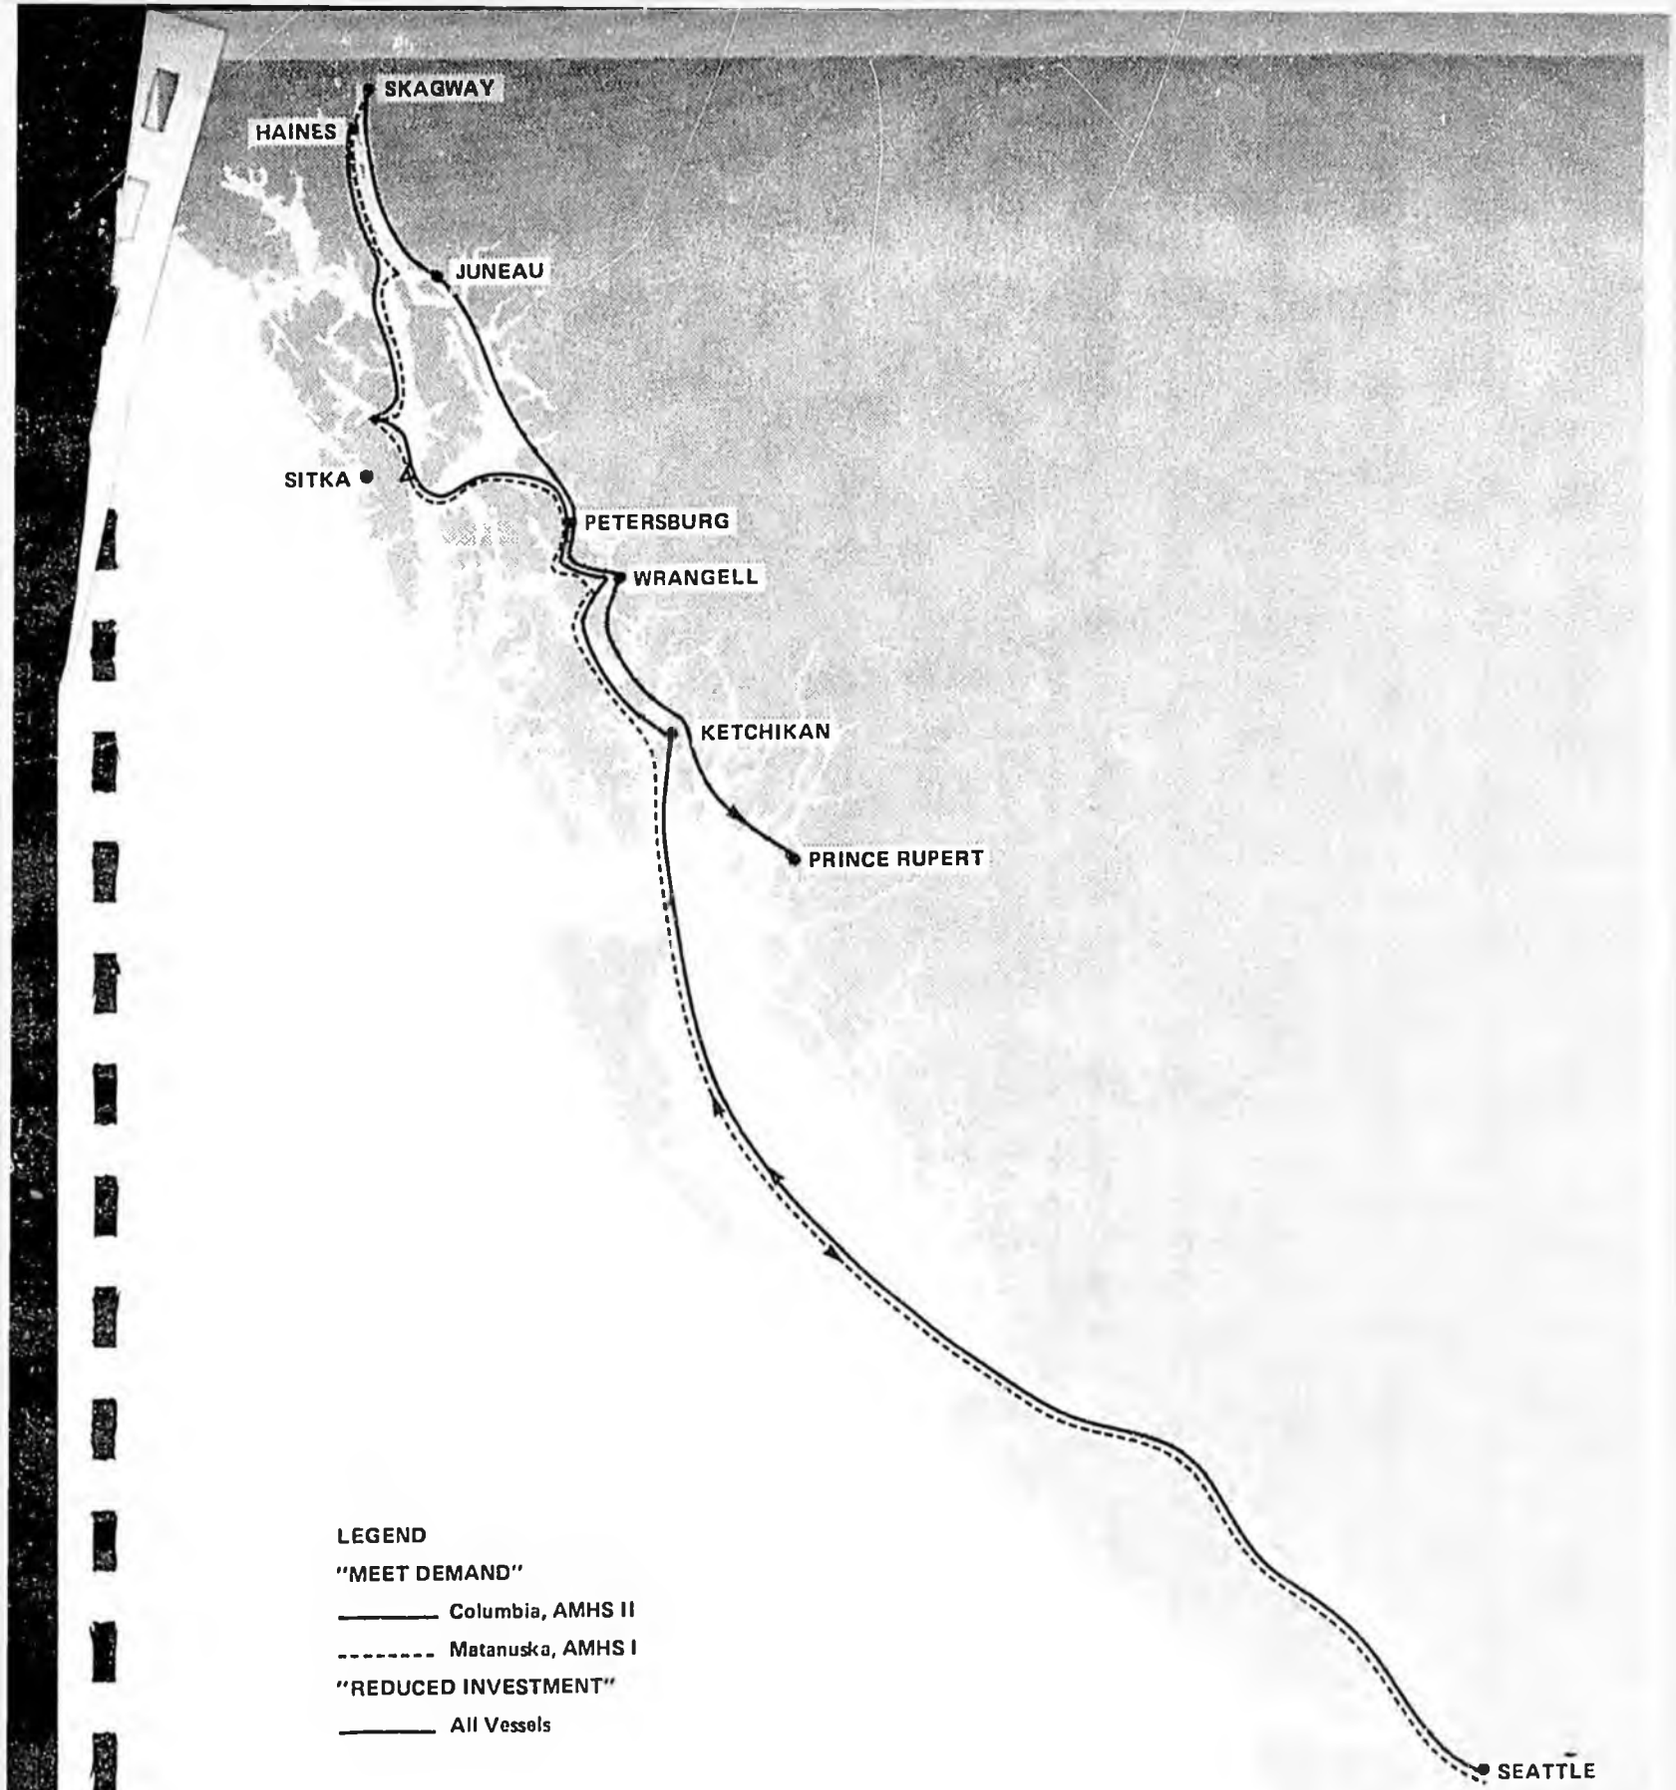

Figure 12

SITKA ROAD OPTIONS
SEATTLE FERRY SERVICE

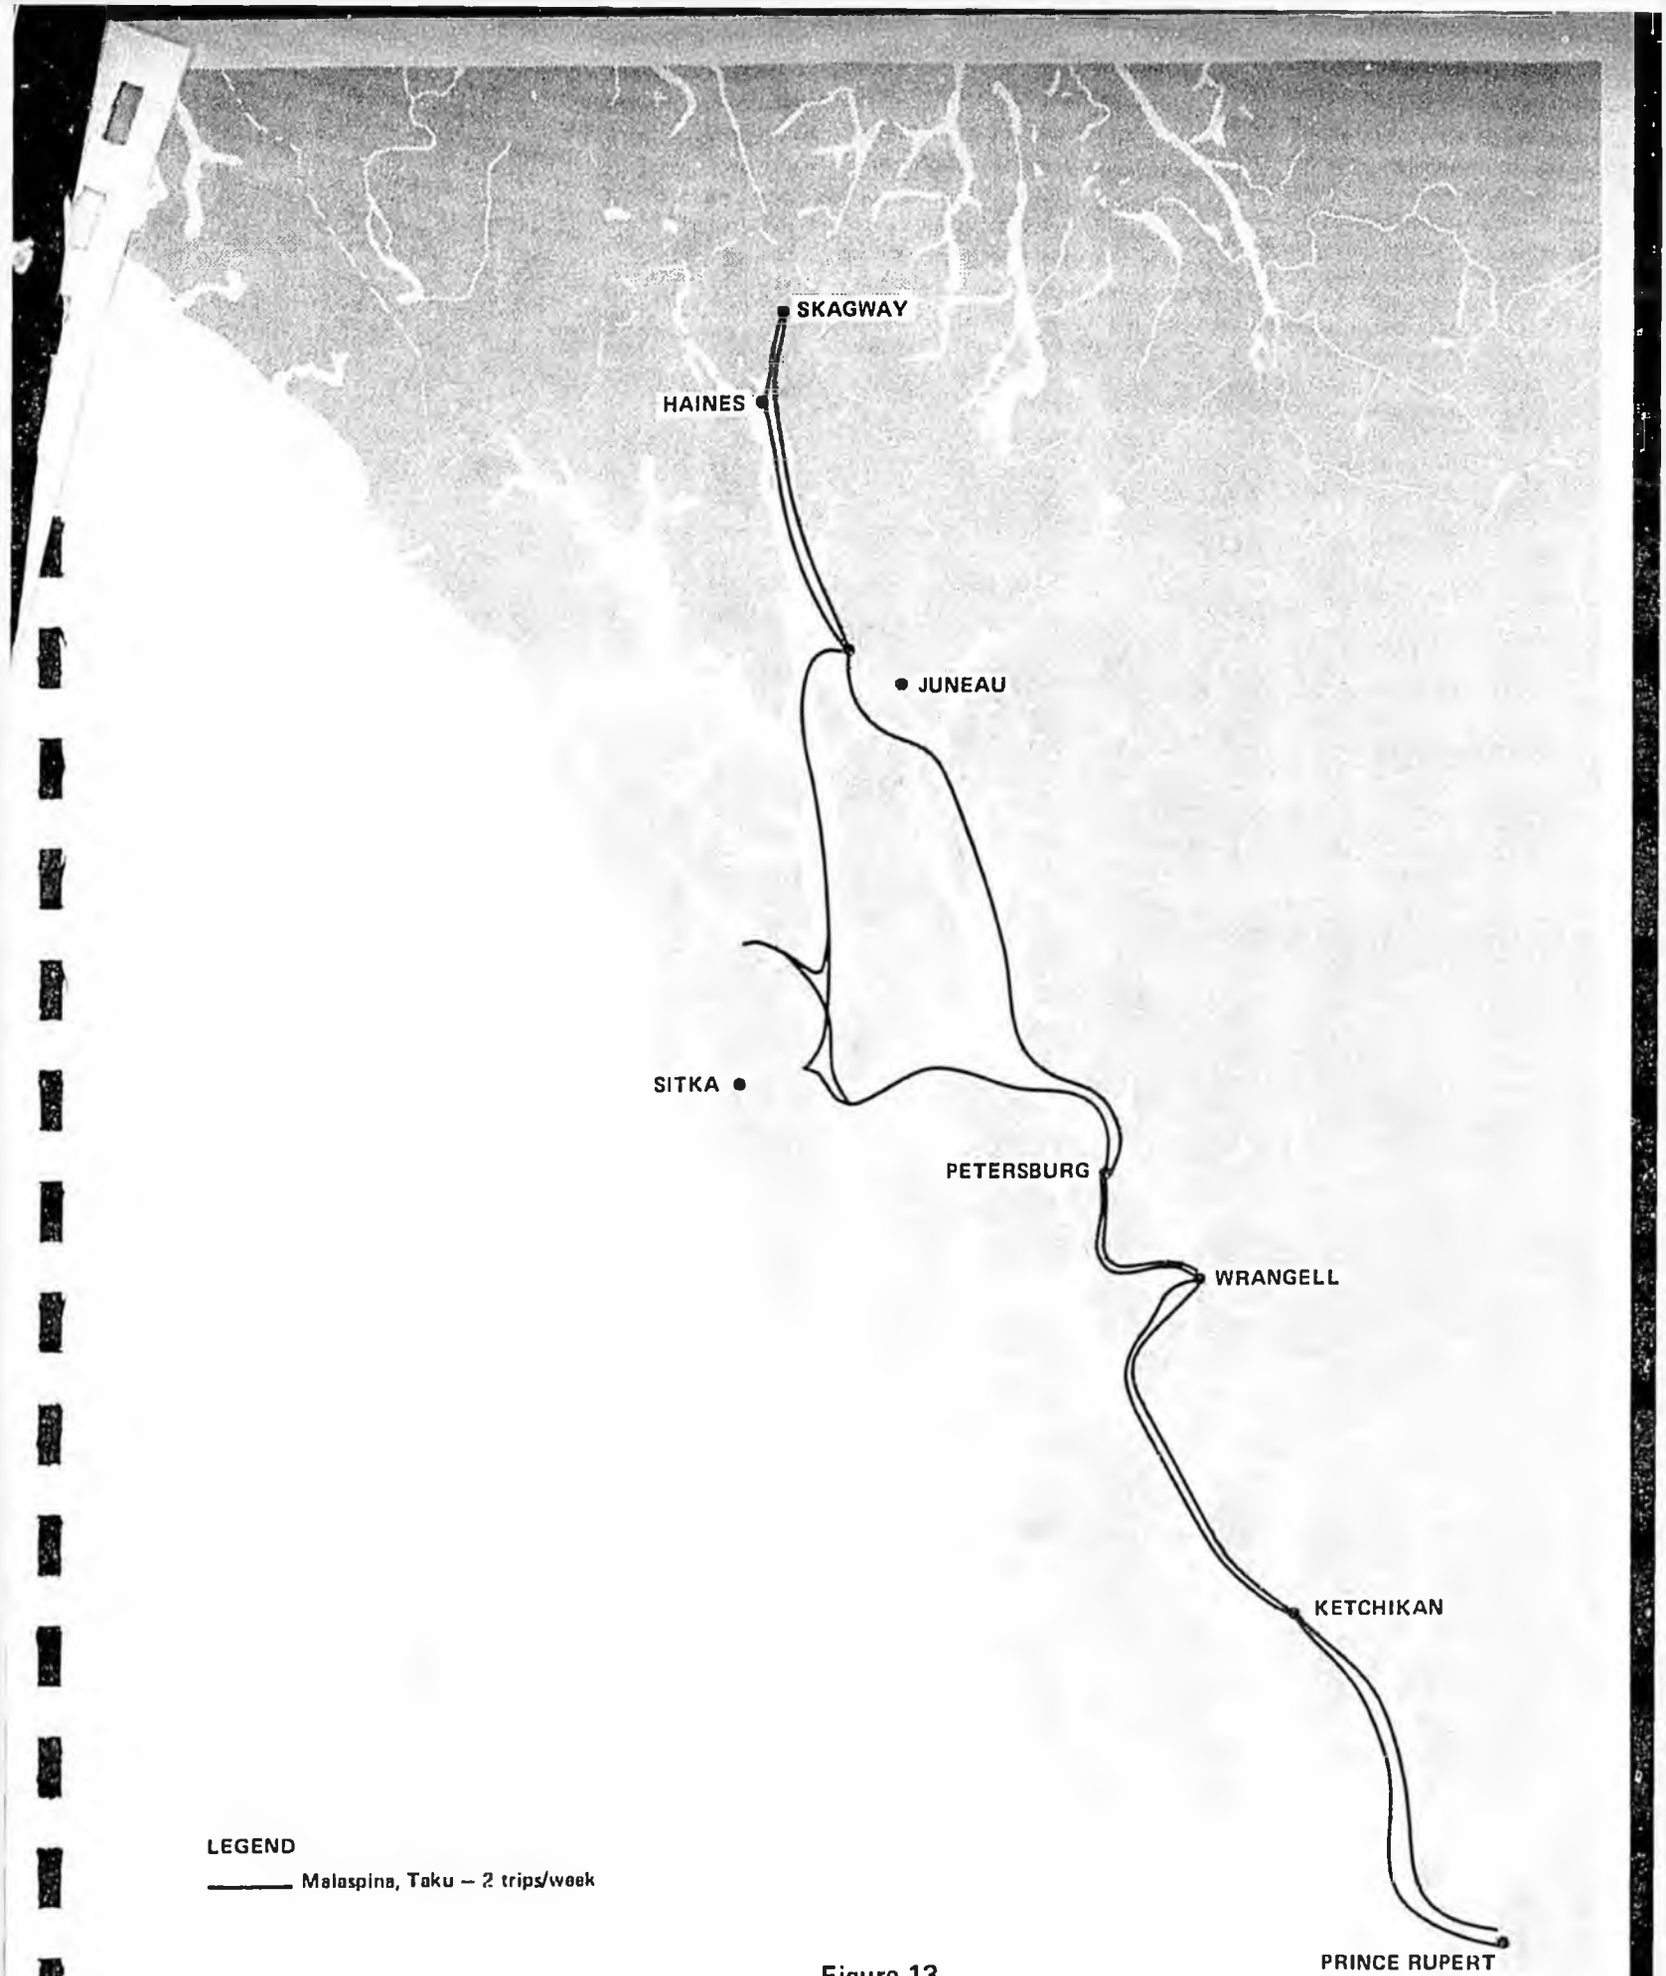

Figure 13

SITKA ROAD OPTIONS
PRINCE RUPERT FERRY SERVICE

Bay to Seattle. Each trip from Seattle to Prince Rupert would take 4.5 days so each vessel would return to Seattle every nine days. Two other vessels, the Matanuska and the first new ferry would operate a weekly round trip service from Seattle to Skagway, calling at Baranof/Rodman Bay in both directions.

Under the 'reduced investment' scenarios, Seattle service would involve three vessels, the Columbia, the Matanusaka, and the new ferry, operating on the 'open jaw' route between Seattle and Prince Rupert.

The proposed Prince Rupert service is shown in Figure 13. Under the road options, the Malaspina and Taku would operate twice weekly on a route basically similar to their current 'Sitka' run. However, instead of making only one trip per week via Sitka, they would call at Baranof/Rodman Bay on both round trips.

The road options would also allow greater utilization of the LeConte. The time saved by eliminating three weekly trips into Sitka harbor could be used to provide additional trips into the feeder communities of Kake, Angoon, Hoonah, Tenakee Springs and Pelican.

The Sitka shuttle option involved somewhat different ferry schedules for the mainline and feeder services. Since Sitka would be served, under this option, by high-speed ferries to Juneau and Petersburg, the mainline ferries were able to sail directly between Juneau and Petersburg without traveling west of Admiralty Island.

The proposed mainline routes out of Seattle and Prince Rupert are shown in Figures 14 and 15 respectively. The Seattle service, under the 'meet demand' scenario, would involve operating the Columbia, the Matanuska and the second new mainline ferry on an 'open jaw' route between Seattle, Skagway and Prince Rupert. The first new ferry would operate a weekly round trip service between Seattle and Skagway.

Under the reduced investment scenario, all three vessels would operate on an 'open jaw' route out of Seattle. These routes and schedules offer essentially the same Seattle service as under the road options.

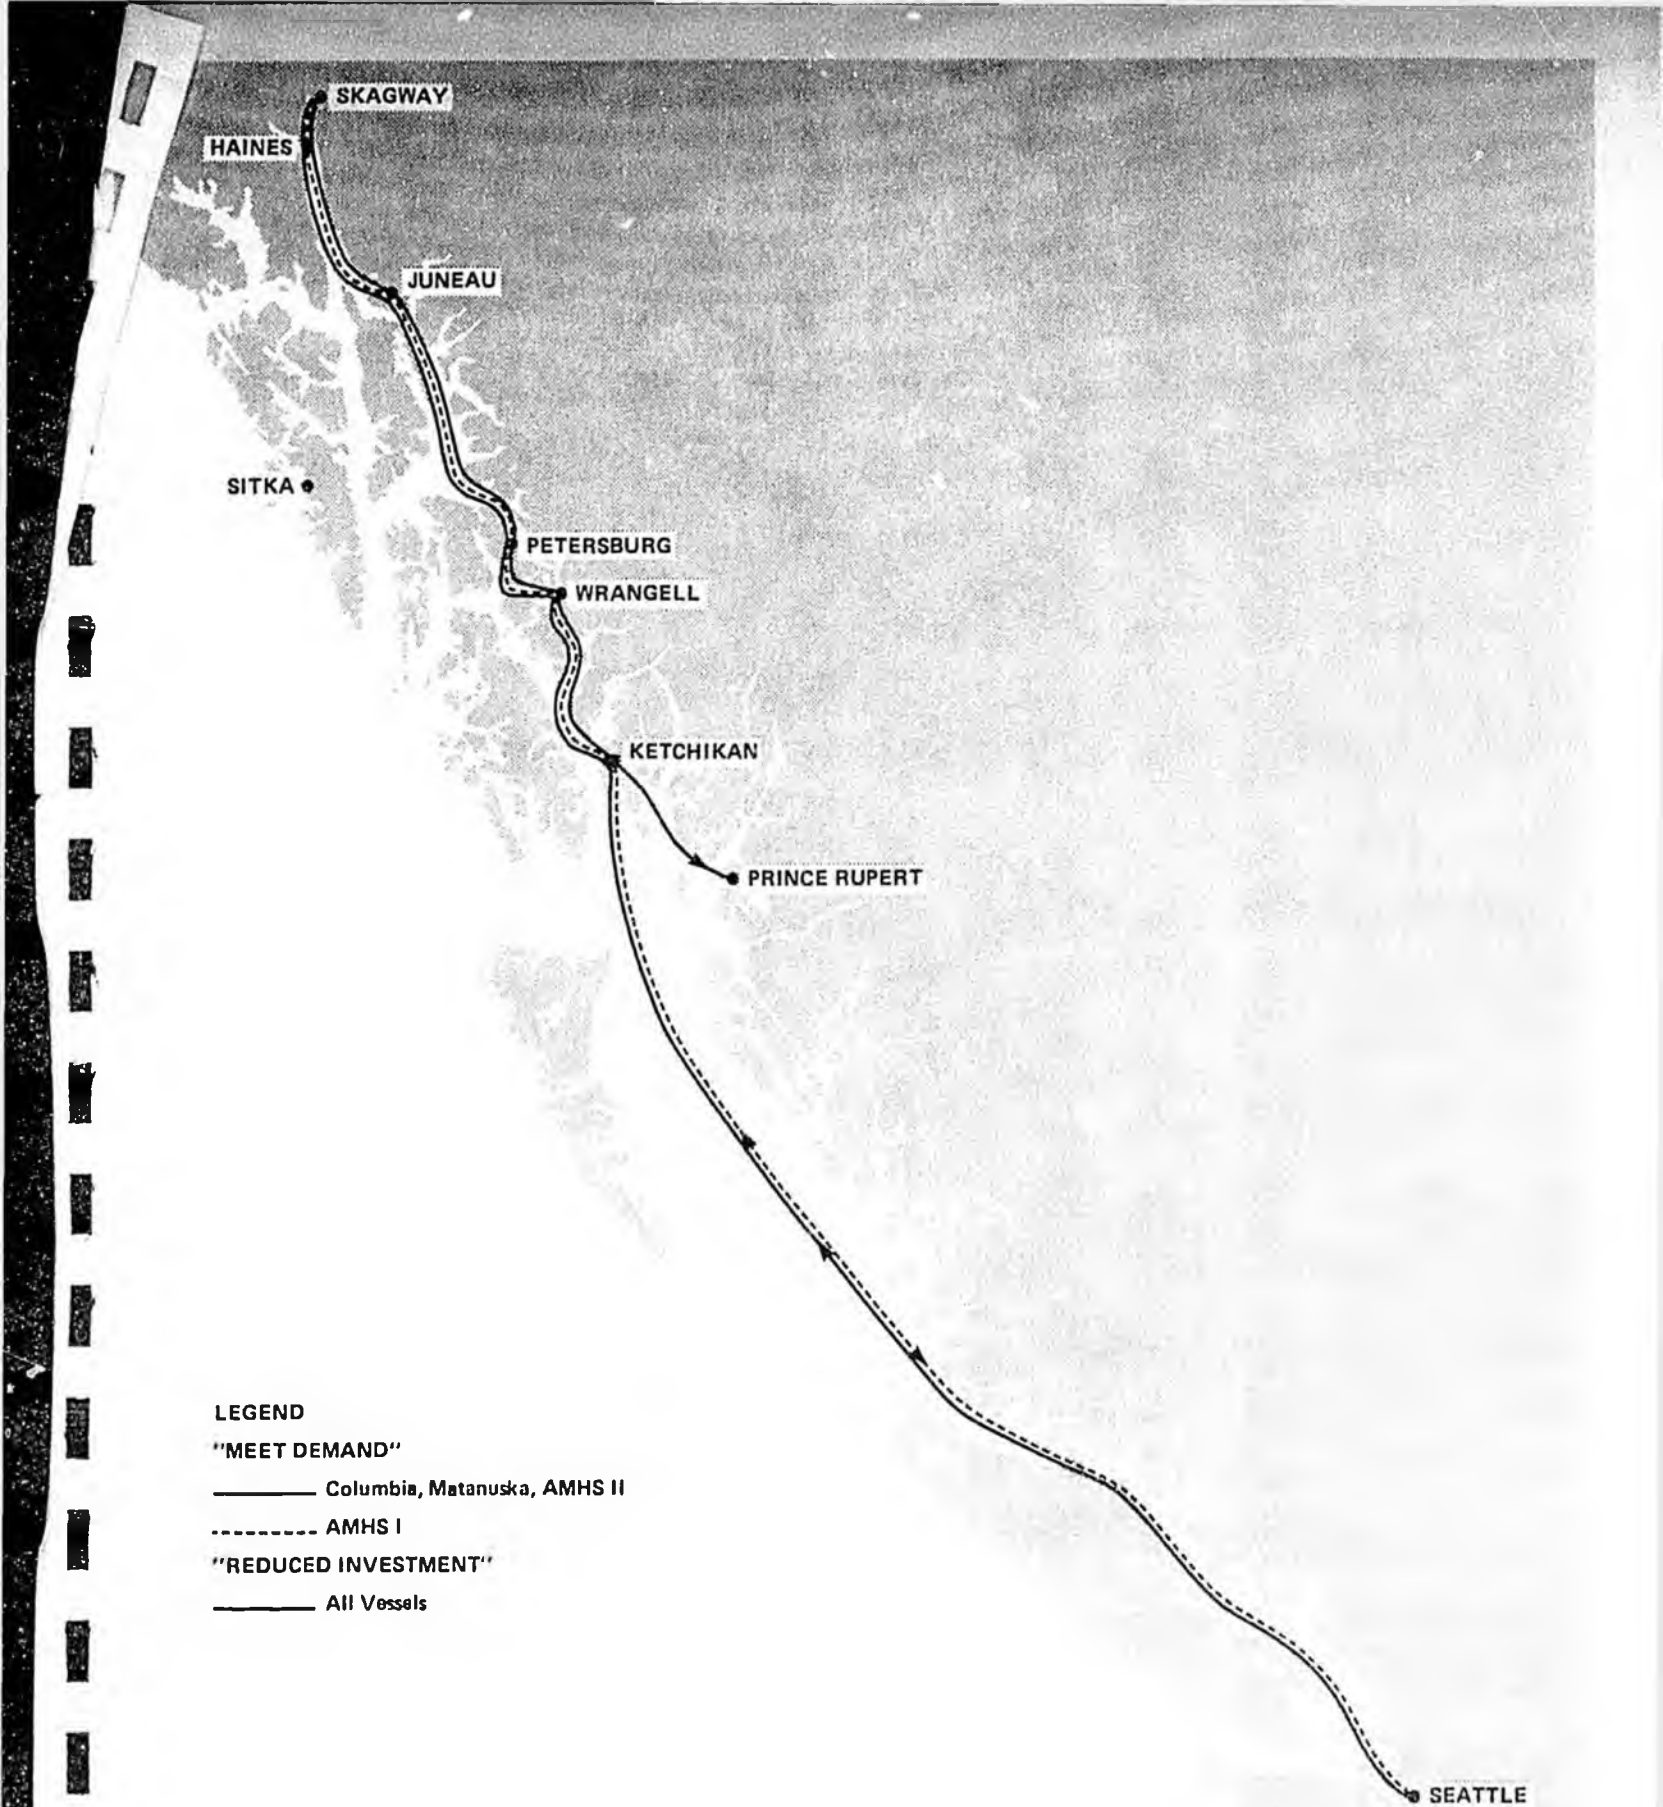

Figure 14

SITKA SHUTTLE OPTION
SEATTLE FERRY SERVICE

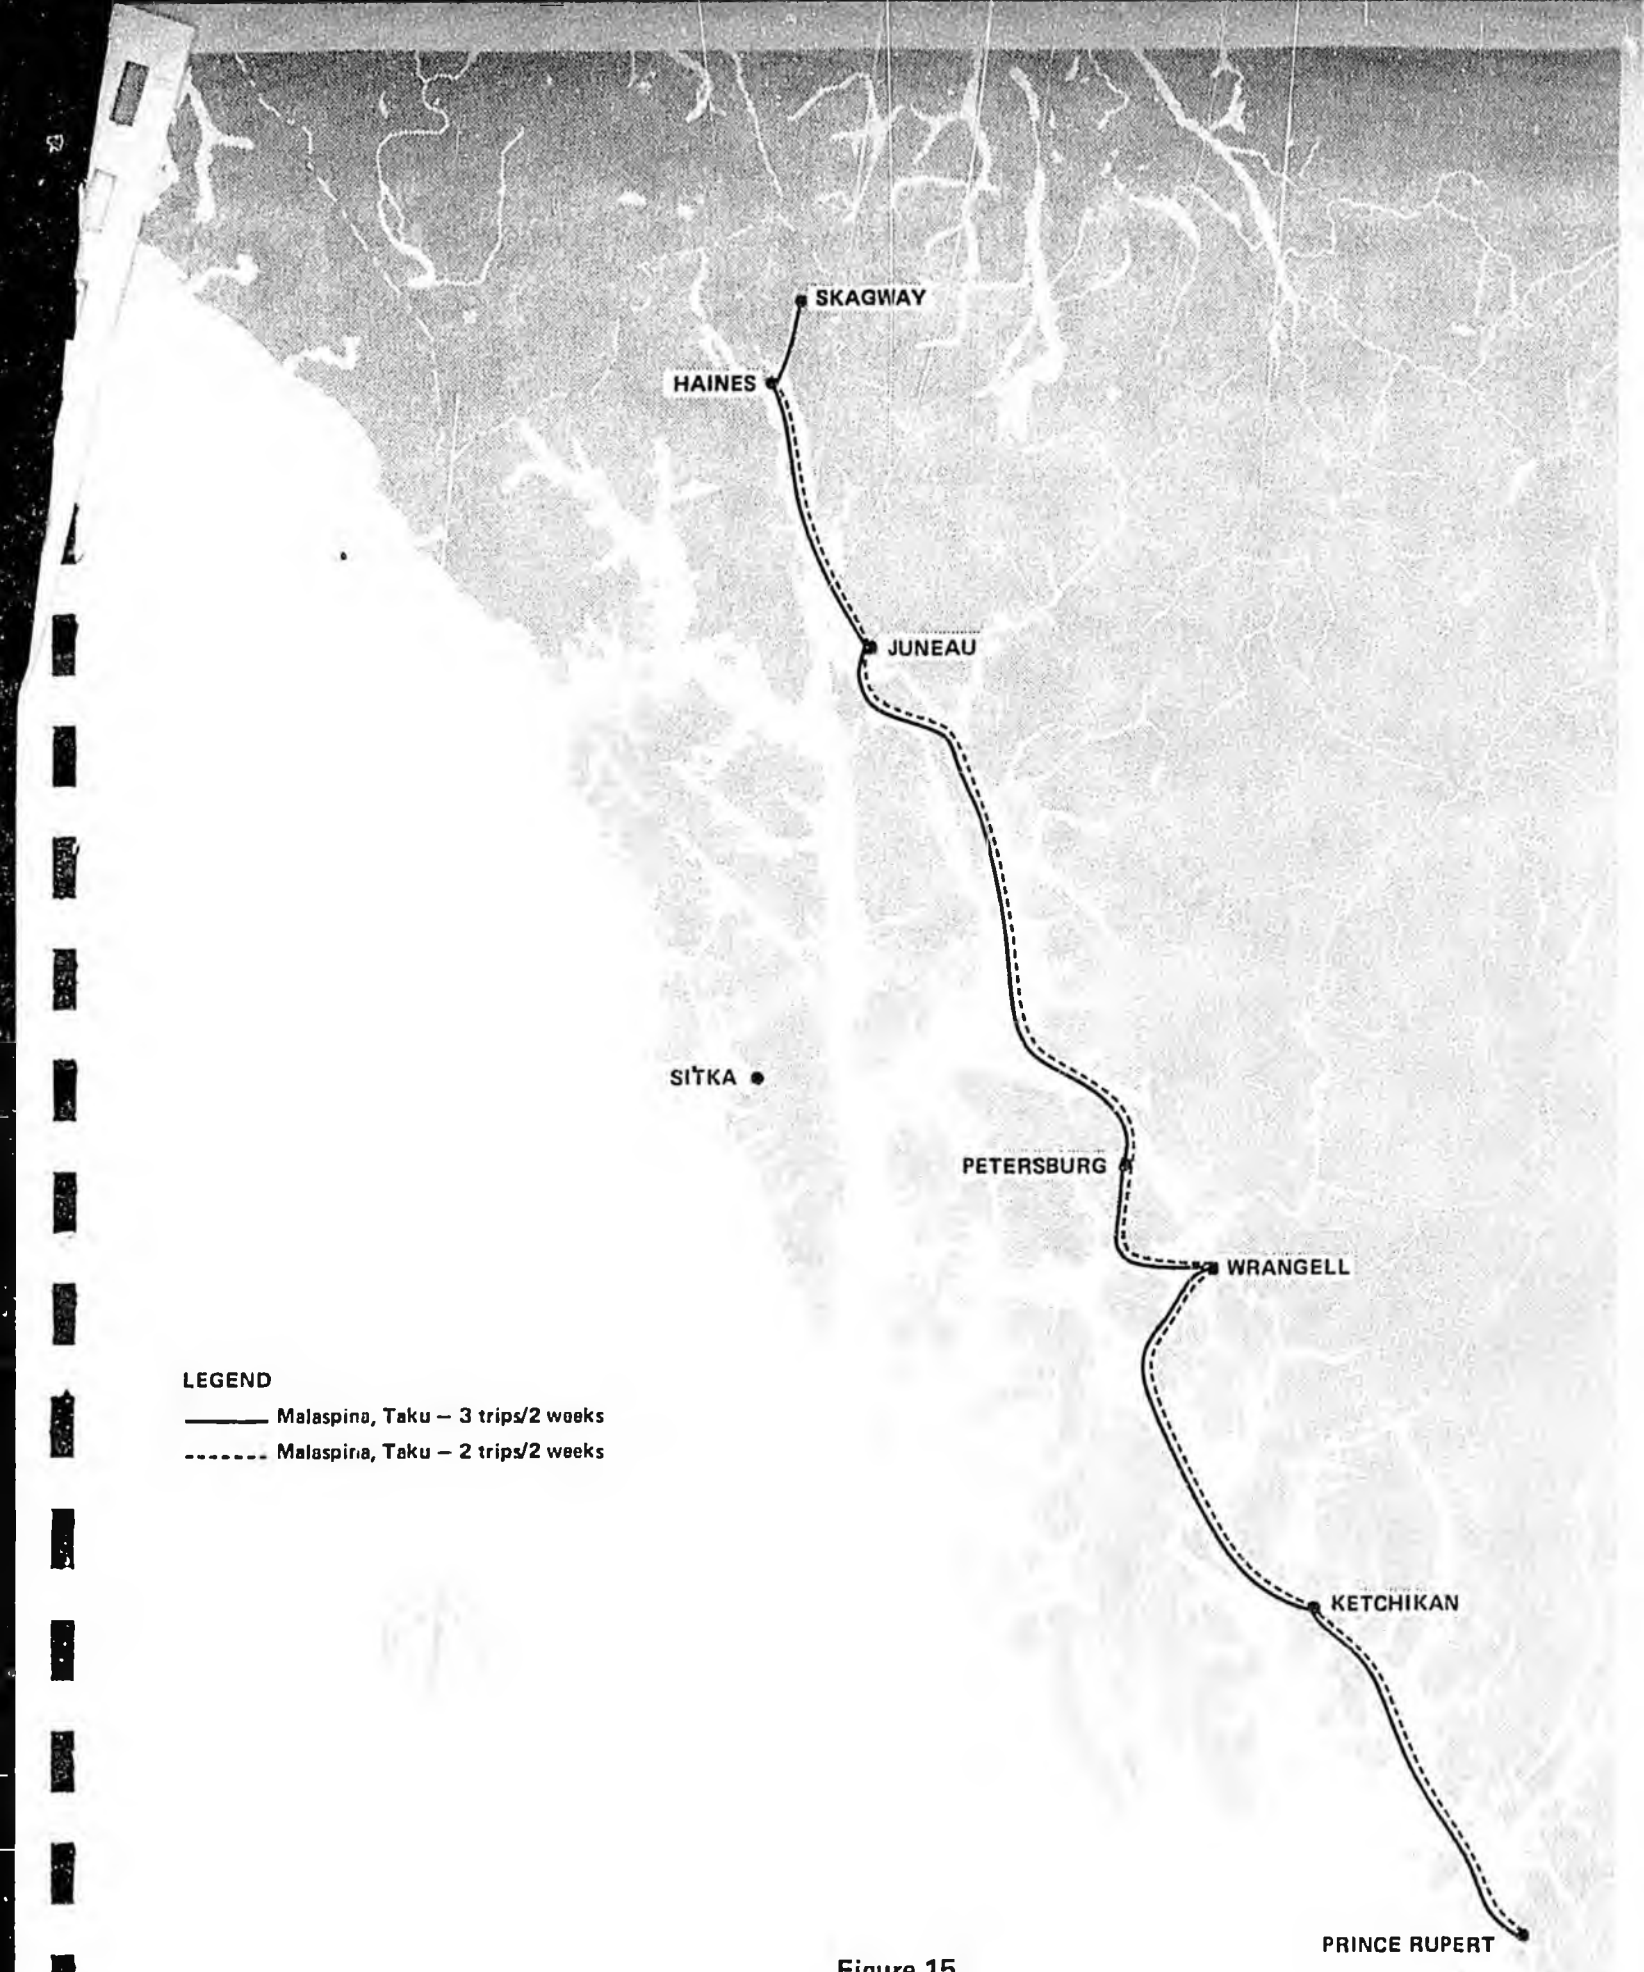

Figure 15

SITKA SHUTTLE OPTION
PRINCE RUPERT FERRY SERVICE

Prince Rupert service under the Sitka shuttle option would be somewhat better than under the road options, however. Rather than two round trips per week out of Prince Rupert, the Malaspina and Taku could each make five round trips over a two-week period. On three of these voyages they would travel as far as Skagway. On the remaining two, however, they would have to turn at Haines. Skagway would, however, be served on all voyages by the Seattle vessels.

Proposed changes in feeder service under the Sitka shuttle option were minor. The LeConte would continue to serve Pelican but on a more frequent basis. In addition, she would continue to provide service in the Juneau-Sitka-Petersburg region for movement of heavy freight and oversized vehicles.

Traffic Impacts

The traffic impacts of the Sitka options were roughly the same under the 'meet demand' scenarios. Apart from some losses during the early years until a new mainline vessel could be brought into service, all options met system demand throughout the planning period. The shuttle option involved somewhat lower losses, however, since it could be implemented earlier than the road options and could therefore provide additional Seattle and Prince Rupert service at an earlier date.

Under the 'reduced investment' scenarios, where no new vessels were added until 1998, the shuttle option resulted in lower losses than did the two road alternatives. The Baranof and Rodman Bay options resulted in losses of 83 800 Seattle passengers (12.1% of peak demand) and 24 900 Seattle vehicles over 20 years, and a small portion of Prince Rupert demand (6 900 passengers and 3 200 vehicles) could also not be served. In addition, 33 000 Seattle passengers and 15 000 vehicles would be diverted to Prince Rupert.

The reduced investment shuttle option resulted in the loss of 13 000 Seattle passengers (1.9% of peak demand) over 20 years. Diversions would be higher than in the road options, however, with 71 700 Seattle passengers obliged to transfer to Prince Rupert.

The Sitka high-speed ferry option was also expected to attract a small amount of induced traffic, largely from the air service. While the high-speed service would be significantly better than the existing ferry service, it would not, however, provide a service comparable to the daily jet flights to and from Juneau and Ketchikan. Accordingly, the high-speed ferry was estimated to attract approximately 5% of the projected peak internal jet passengers or an average of approximately 1 375 passengers per year.

5.2.4 - Prince of Wales Island Focus

The Prince of Wales Island focus concentrated on the local and system-wide impacts of changes in the service to and from Prince of Wales Island. Four separate options were evaluated. (See Figure 16.)

- Relocate the Clark Bay terminal to Tolstoi Bay, and provide mainline and partial feeder service through the new terminal. Connect Tolstoi Bay to the Island communities by extending the road from Thorne Bay or from Hollis.

- Develop a new terminal at Red Bay on the north end of the Island, connected by road to the existing Klawock-Thorne Bay highway. Provide ferry service from Red Bay to Blind Slough and Wrangell, and from Hollis to Ketchikan.

- Acquire a high-speed catamaran-type ferry to provide twice-daily service between Hollis and Ketchikan. Move the Aurora to other routes.

- Acquire a high-speed catamaran-type ferry to provide service in the Hollis-Ketchikan-Clarence Straits region. Supplement Hollis-Ketchikan service with alternate-day service by the Aurora.

Investment

The Tolstoi Bay terminal option would require construction upgrading of approximately 17 miles of road to connect Thorne Bay to the new site. In

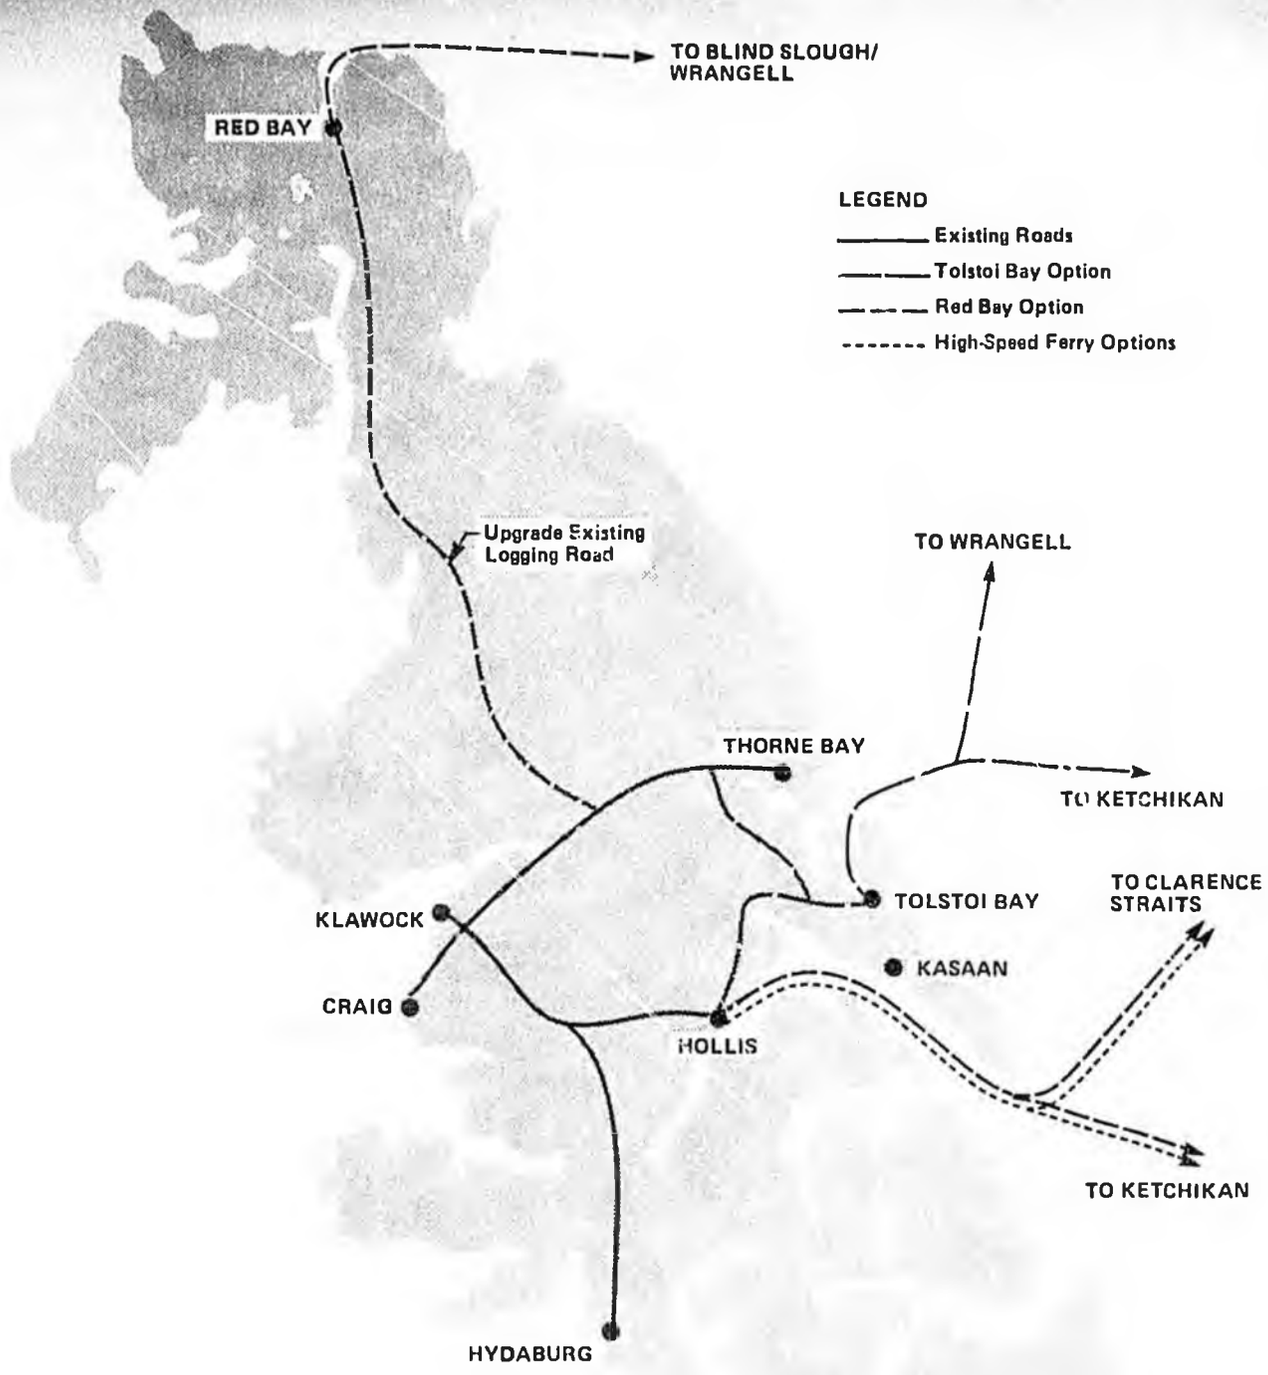

Figure 16

PRINCE OF WALES FOCUS OPTIONS

addition, a new mainline/feeder ferry terminal would have to be constructed. Estimated capital cost for this option was $18.3 million. The alternative of connecting to Tolstoi Bay through Hollis would involve 16 miles of new road construction. Estimated capital cost (including terminal development) would be $26.8 million.

The Red Bay terminal option would require the upgrading and extension of an existing forest service road. The total distance from Red Bay to the junction with the Klawock-Thorne Bay road would be approximately 53 miles. In addition, new shuttle terminals would be required at Blind Slough (on the southern shore of Mitkof Island) and at Red Bay, and a small (15-vehicle) shuttle ferry would have to be acquired. Total estimated capital cost for the road, terminals and ferry was estimated at $71 million.

The two high-speed ferry options would each involve purchase of a single high-speed catamaran-type vessel at a cost of approximately $3 million. Some port modifications might also be necessary, but the extent of these would depend on the locations being served and on the level of sophistication desired.

Investment in the existing ferry system under the 'meet demand' scenarios was the same for all four Prince of Wales options; specifically, new mainline ferries were added to the system in 1989 and 1993. This corresponded closely to the additions required in the 'mainline service' option. However, the Prince of Wales options did eliminate the need for additional capacity out of Prince Rupert at the turn of the century.

Under the 'reduced investment' scenarios, a single new vessel was required by the system in 1993 under all Prince of Wales options.

Ferry Schedules

Modifications to the existing mainline and feeder ferry schedules under the Prince of Wales focus were most significant under the Tolstoi Bay terminal options. For the mainline vessels travelling out of Seattle, (the Columbia and the new mainline ferries), the revised schedule would involve calling at

Tolstoi Bay on both the northbound and southbound legs of their weekly voyages. The mainline vessels sailing out of Prince Rupert (the Matanuska, Taku and Malaspina) would call at Tolstoi Bay on their weekly trip via Sitka. On their direct Prince Rupert-Skagway voyage, however, they would bypass Tolstoi Bay. In order to supplement service out of Prince Rupert and in the Clarence Straits region, the Aurora was assumed to make 2-day round trips from Prince Rupert to Petersburg, calling at Tolstoi Bay in both directions.

The Red Bay option involved no change to existing mainline ferry service. Feeder service was provided by the shuttle ferry which would make a daily round trip between Red Bay, Blind Slough and Wrangell, and by the Aurora which would operate on a 2-day round-trip schedule calling at Prince Rupert, Ketchikan, Hollis, Wrangell and Blind Slough.

The high-speed shuttle and high-speed loop service options also involved no change in the mainline ferry service. Under the high-speed shuttle option, the catamaran could make two round trips per day between Hollis and Ketchikan. Alternatively, on some days (e.g. mid-week or Sundays) it could make one round trip to Hollis (and possibly Kasaan) plus two round trips between Ketchikan and Metlakatla. The Aurora could then be used to serve the Prince Rupert-Clarence Straits corridor as far north as Kake on a 2-day round-trip basis.

The Prince of Wales loop option would be similar to the shuttle option except that there would be more focus on multi-community high speed routes and less focus on direct Hollis-Ketchikan links. The Aurora would then supplement service between Hollis and Ketchikan, operating on a 2-day round trip route to Prince Rupert, Ketchikan, Hollis and Wrangell.

Traffic Impacts

Traffic impacts of the various Prince of Wales options were similar to other 'focus' options under the 'meet demand' scenarios. Once a new mainline vessel was brought into service in 1989, all demand would be met throughout the planning period.

Under the 'reduced investment' scenarios, the Tolstoi Bay and Red Bay options would both result in the loss of 46 100 passenger trips and 5 400 vehicle trips out of Seattle (6.7% of peak passenger demand) over the 20-year planning period. An additional 41 900 passengers (6.1% of peak demand) and 19 000 vehicles would be diverted from Seattle to Prince Rupert.

Under the two high-speed ferry options, losses out of Seattle would amount to 22 700 passengers and 5 600 vehicles over the study period (3.3% of peak passenger demand). In addition, 23 600 passengers and 10 700 vehicles would be diverted from Seattle to Prince Rupert.

5.2.5 - Stikine Focus

The final group of long-term system options emphasized development of a mid-region road access to supplement mainline ferry service. The two preferred options from the corridor studies were evaluated in the systems context, and a third option--constructing a road from Ketchikan to the Canadian border with a connecting link to Wrangell-- was also included.

The three Stikine options therefore involved the following (see Figure 17).

- Construct a road from Wrangell to the Canadian border. Provide shuttle ferry service between Wrangell and Petersburg via Blind Slough.

- Construct a road from Petersburg to the Canadian border. Provide shuttle ferry service between Wrangell and Petersburg via Blind Slough.

- Construct a road from Ketchikan to the Canadian border with a connecting link to Wrangell. Operate ferry services south of Ketchikan/Hollis and north of Wrangell.

Investment

The Wrangell road/shuttle option involved extending the existing road south past Pat's Creek, across Wrangell Island, crossing to the mainland at the

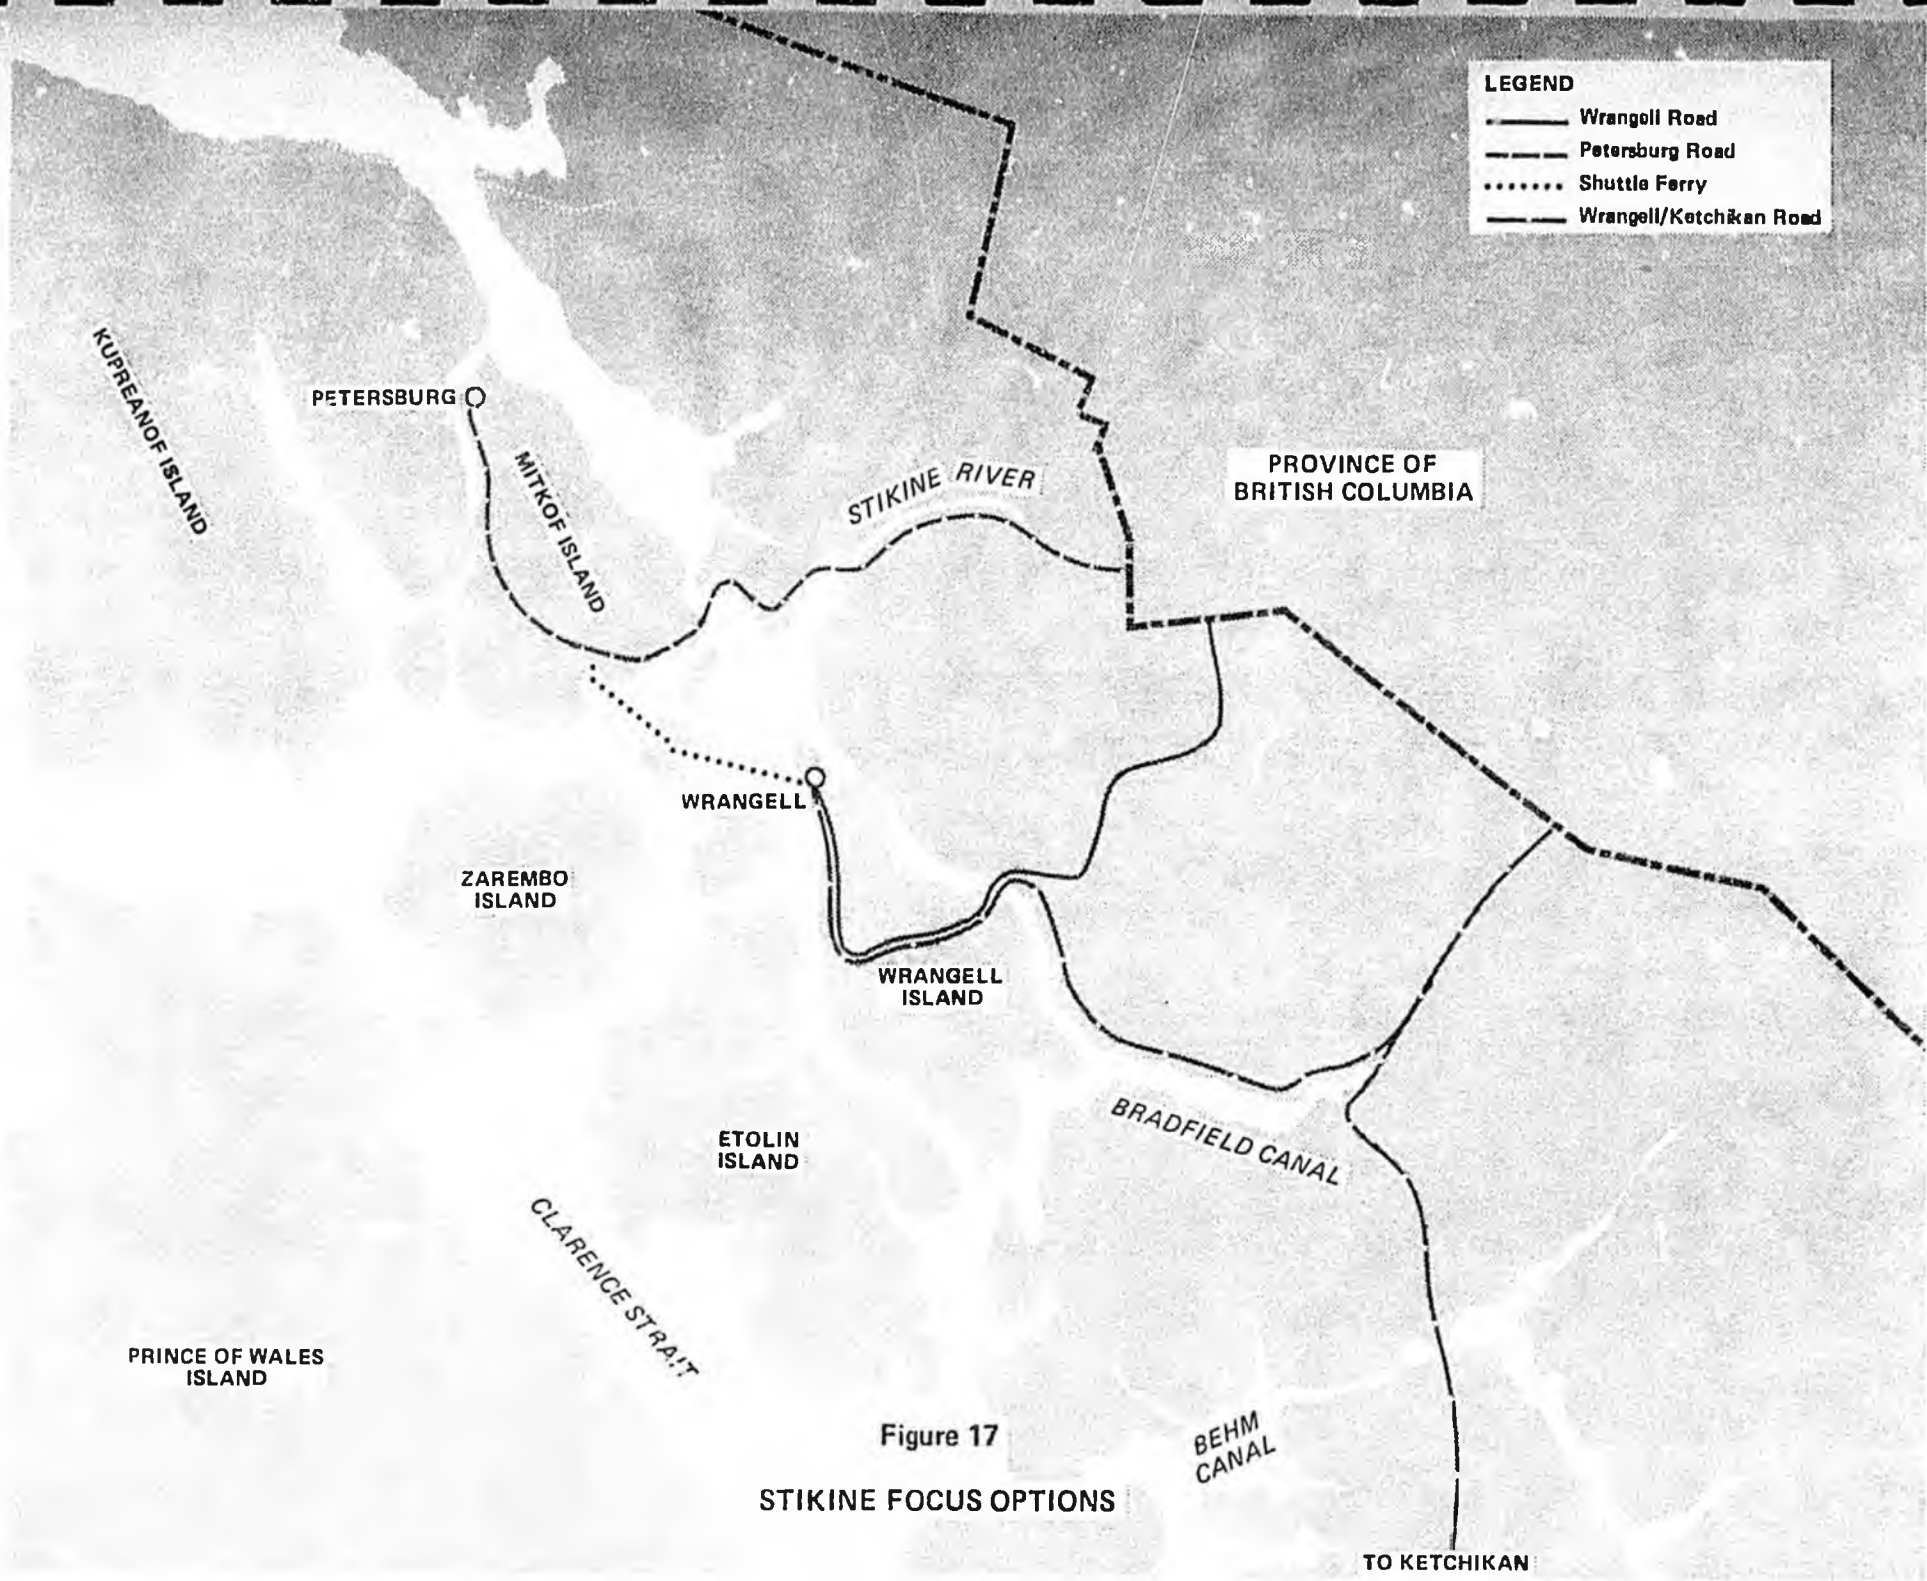

Figure 17

STIKINE FOCUS OPTIONS

Narrows, and following Aaron's Creek and the West Fork to the border. A total of 49 miles of new road would be required at an estimated cost of $157 million. In addition, a new ferry terminal would be built at Blind Slough, and a small shuttle ferry purchased which would be used to link Petersburg to Wrangell and the new highway. Capital cost for these items, together with some upgrading of the Mitkof highway, would add a further $6.5 million to the capital cost.

The Petersburg road option involved extending the existing Mitkof Highway across Dry Strait and along the south bank of the Stikine River (crossing over at Limb Island) to the Canadian border. As with the Wrangell option, a shutt'e ferry service would be provided so that both communities could be linked to the highway. This option would involve construction of 34 miles of new road at an estimated capital cost of $120 million. The shuttle ferry and terminal would add a further 6.5 million to the cost.

The Wrangell-Ketchikan road option would involve a significantly more substantia' road-building effort. The link out of Ketchikan would align northeasterly to Carroll Inlet, then follow the general alignment of Carroll Creek up to the north end of Revillagigedo Island. A shuttle ferry would be used to cross the Behm Canal just east of Bell Island after which the road would follow the Eagle River to Bradfield Canal and the North Fork of the Bradfield River and Craig River to the border. The Wrangell link would follow the alignment of the proposed Wrangell/Stikine road to Aaron's Creek, then turn south to follow the Blake Channel and Bradfield Canal, linking up with the Ketchikan Road at the mouth of the North Fork-Bradfield River.

Total construction would involve 176 miles of new road plus two shuttle-ferry docks at the Behm Canal for a total capital cost of $374 million. The shuttle ferry would add approximately $1 million to this total.

The need for mainline ferry capacity additions under the Stikine alternatives was approached in a somewhat different manner than under the other 'focus' options. While the 'meet demand' scenarios for other options involved providing ferry capacity to meet demand at both Seattle and Prince

Rupert, in the case of the Stikine road options the presumption was that the road would be used as an alternative to additional mainline capacity. Accordingly, under the Stikine options, 'meet demand' implied providing sufficient ferry capacity to carry traffic entering the system at Prince Rupert and/or at Wrangell-Petersburg. Thus, this scenario related more closely to the other options' 'reduced investment' scenarios where passengers with vehicles were obliged to transfer from one port to another in order to obtain ferry service.

Under this criterion, the Wrangell and Petersburg road options required the addition of one vessel operating out of Seattle in 1993 and a second vessel operating out of Prince Rupert in 1997. In this way, they were able to serve all vehicle traffic into the southeast region and at the same time keep the losses of Seattle foot passengers at a reasonable level.

Ferry Schedules

Apart from the added vessels, the existing ferry route structure was maintained throughout the planning period for the Wrangell and Petersburg road options.

The Wrangell-Ketchikan road option involved more drastic modifications to the ferry route structures. Since the policy of the transportation system is not to run ferry service in parallel with regional roads, it was presumed that ferry service would be eliminated between Wrangell and Ketchikan. Thus, through traffic from points south of Ketchikan to points north of Wrangell would have to travel either via road and then ferry or alternatively by ferry-road-ferry if they do not have direct access to the road system.

The proposed ferry service involved operating the Columbia on a twice-weekly shuttle service between Seattle and Ketchikan. The Aurora would provide daily round-trip service between Prince Rupert, Ketchikan and Hollis. All traffic between Seattle and Ketchikan/ Hollis and between Prince Rupert and Ketchikan/Hollis would be accommodated by one of these vessels.

Traffic from the southern termini and Ketchikan/Hollis to Wrangell and points north would use the road system (the Stewart-Cassiar Highway and/or the new Ketchikan road) to get to Wrangell. Ferry service out of Wrangell would be provided by the Malaspina, Taku and Matanuska. The Matanuska would provide twice-weekly service between Wrangell and Skagway calling at Sitka in both directions. The Malaspina and Taku would each provide two day round-trip service from Wrangell to Petersburg, Juneau, Haines and Skagway. The LeConte would continue on her existing routes. These scheduling changes are summarized in Figure 18.

Traffic Impacts

The traffic impacts of the Wrangell and Petersburg road options would involve the loss, over 20 years, of a total of 55 300 Seattle foot passengers (8% of peak season demand) and just under 1 000 vehicles. Total diversion of Seattle traffic to either Prince Rupert or the Stikine would amount to 71 800 passengers and 32 600 vehicles. This includes a total of 16 400 passengers and 7 500 vehicles travelling from Seattle to either Wrangell or Petersburg.

The traffic impacts of the Wrangell/Ketchikan road are more difficult to quantify. Theoretically, this system would fail to meet the needs of foot passengers travelling between the southern termini and points north of Ketchikan since some sort of vehicle would be required to get from Ketchikan to Wrangell. Similarly, foot-passenger traffic between Hollis/ Ketchikan and points north could be lost unless the passengers have a vehicle available to them at either Ketchikan or Wrangell. In addition, existing vehicle traffic from Seattle, Prince Rupert and Ketchikan to Wrangell, while served by the road system, would be lost to the ferry service. In total, as many as 700 000 passengers could be lost to the ferry system over the 20-year period, of which 526 000 would represent unserved demand.

Whether or not this is a fair assessment of impacts is questionable however. To evaluate a system which represents a fundamental departure from the existing type of service on the same basis as options which essentially conform to the existing pattern of demand can lead to misleading results.

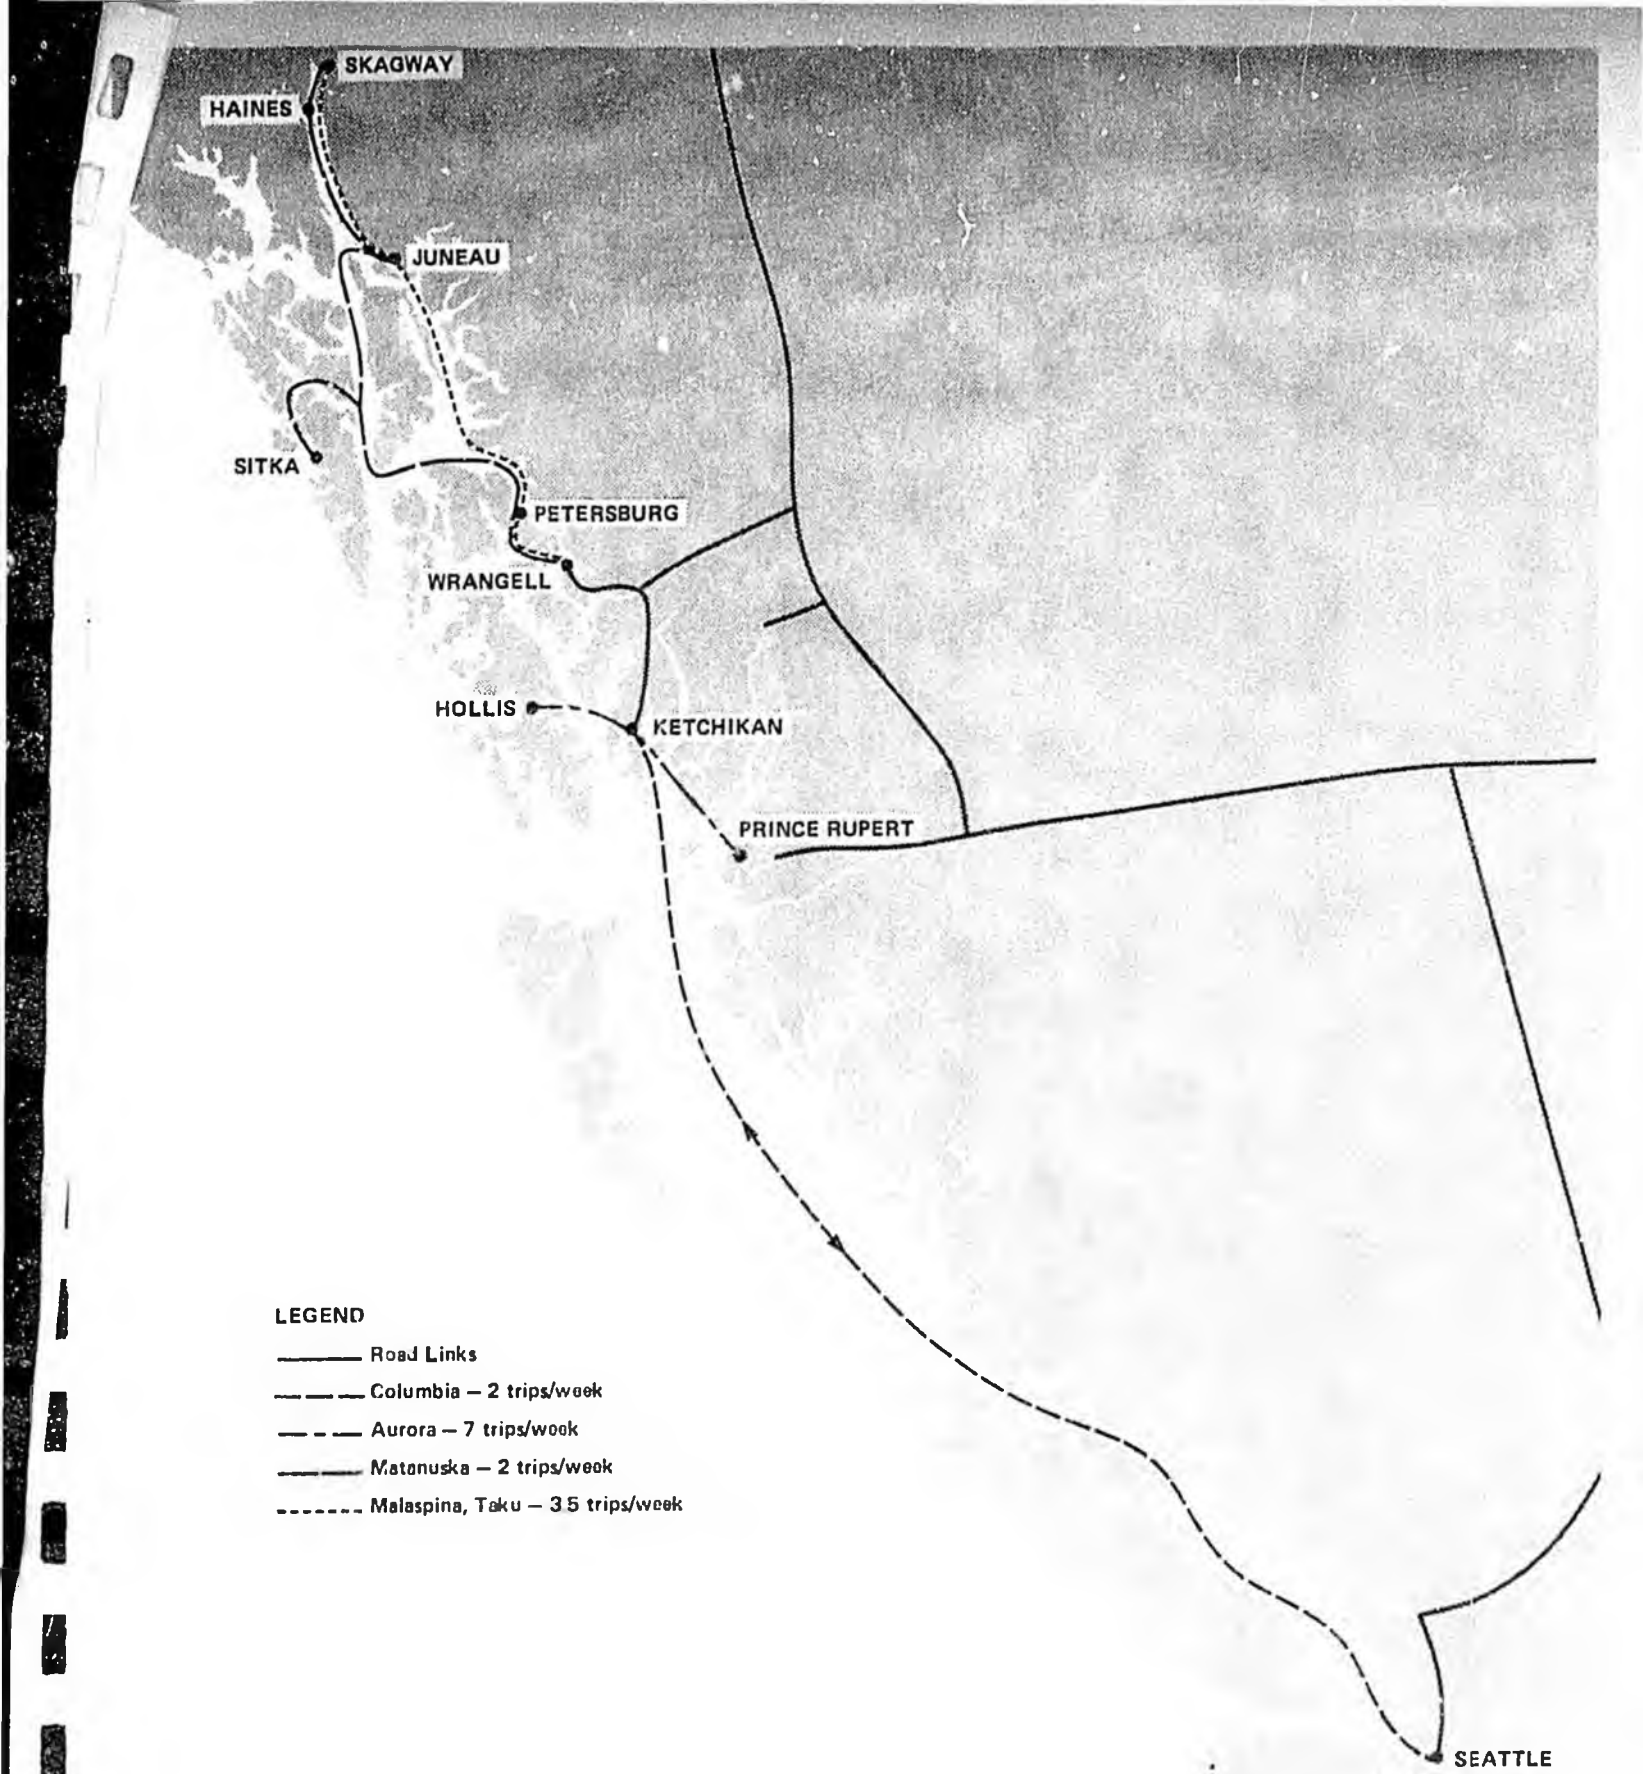

Figure 18

WRANGELL/KETCHIKAN ROAD
FERRY SERVICE

While the Wrangell/Ketchikan road option would seriously disrupt foot-passenger traffic to and from the region it could also, potentially, generate substantial new traffic into the area by drawing in through traffic from the Stewart-Cassiar and Alcan Highways.

5.3 - Evaluation of Long-Term System Options

5.3.1 - Financial Evaluation

Each of the long-term system options was first evaluated with respect to financial impacts on the Marine Highway, the state government, and the transportation user. The results of this analysis are summarized in Table 5.1 for the 'meet demand' scenarios and in Table 5.2 for the 'reduced investment' cases.

Looking first at the 'meet demand' scenarios (Table 5.1), it is apparent that one of the least costly options from the viewpoint of the state is the June 1980 Plan. All Lynn, Sitka and Stikine options and the Prince of Wales-Red Bay alternative represent a higher state cost yet serve essentially the same, or, in the case of the Stikine, a lower level of demand. However, there are three options which involve a lower overall cost to the state, all in the Prince of Wales region: the Tolstoi Bay terminal and the two high-speed ferry options.

Turning to the 'reduced investment' scenario (Table 5.2), however, leads to somewhat different results. If a slippage is allowed in terms of meeting demand as requested out of the southern terminus ports, the state can realize substantial savings over the June 1980 Plan under a number of service options. Once again, three of the Prince of Wales options appear most attractive. However, the Sitka shuttle and Lynn shuttle options also begin to look attractive.

5.3.2 - Service Cost Effectiveness

As noted in the methodology section, however, the financial analysis does not provide an assessment of the full impacts of the different levels of traffic served, nor does it provide a measure of the quality of service being offered under the different system options.

Accordingly, a supplemental analysis was carried out whereby user costs were adjusted to take into account the different degrees of service being provided, and a travel time assessment was developed to provide a measure of service quality.

The adjusted differences between each option and the base case (June 1980 Plan) were then calculated in terms of user costs and user costs plus travel time. The values of these 'impacts' were then compared with the increases or decreases in government cost under each option relative to the base case.

The comparative monetary impacts of the various long-term options are given in Table 5.3 for the 'meet demand' scenarios and in Table 5.4 for the 'reduced investment' scenarios.

The figures in Table 5.3 indicate that, based on quantifiable monetary impacts, three of the Prince of Wales options (Tolstoi Bay terminal and the two high-speed craft options) are more attractive than the June 1980 Plan from both the user and government perspectives. The two Lynn options, the Sitka shuttle and the three Stikine options provide some monetary savings to users, but these savings are less than the corresponding increases in government costs. The remaining three options are less attractive to both users and the state from the monetary viewpoint (although service advantages may serve to offset some of these costs).

Turning to Table 5.4 which presents the analysis of 'reduced investment' scenarios, it is apparent that, by allowing a slackening of the efforts to meet demand at the southern termini, the government can realize substantial savings at very little monetary cost to the user. In the 'reduced

2) Net present value - 20-year total.

investment' scenarios, all options except the Lynn road offer government cost savings which more than exceed increases in user costs. In one instance, the Lynn shuttle, both government and users are better off financially than under the June 1980 Plan, while in a second instance, the Sitka shuttle case, user costs are the same as under the June 1980 Plan, but government costs are substantially lower. It would therefore appear that, in terms of monetary impacts on users and the State, it is possible to achieve substantial savings by meeting combined southern termini demand rather than by attempting to serve all of the demand generated at Seattle.

(It should be reiterated, however, that this hypothesis does not apply in the extreme case where all of the Seattle demand is served out of Prince Rupert. As indicated in the short-term 'Prince Rupert Terminus' option the Marine Highway is better off providing some service to Seattle in view of the higher revenue-earning capability of vessels on the Seattle route.)

The final step in the analysis was to integrate savings or increases in travel time into the comparison of user and government impacts. These changes in user travel time relative to the 'June 1980 Plan' option are shown, for the 'meet demand' scenarios, in the first column of Table 5.5. (Total travel time impacts were not calculated for the Wrangell-Ketchikan Road option since it was felt that the probable future pattern of demand would change in response to the significant service changes and that comparison, based on existing demand patterns, would be misleading.)

The table indicates that, on a system-wide basis, several of the system options generate travel time savings over and above those realized under the 'June 1980 Plan' option. The most significant savings arise under the two Lynn options, and in the Sitka shuttle case. Lesser travel time savings accrue under the four Prince of Wales service options, while the two Sitka road options and the Stikine corridor cases lead to overall increases in total system travel time.

The flow of these travel time impacts, however, is not uniform among the options. An assessment was carried out with regard to the distribution of time savings among the various system users which calculated the portion of

2) Net total of user and government cost increases - brackets denote net cost savings.

total time savings (or increases) accruing to peak season traffic out of the southern termini versus the portion accruing to peak season internal traffic and to shoulder and low-season users.

The findings indicated a wide variance among options in the distribution of travel time impacts. In the Lynn road case, 79% of the travel time savings were 'internal'; i.e. accrued to peak internal traffic and to shoulder and low-season users, while 21% accrued at the southern termini. In the Lynn shuttle case, however, only 21% of the savings were realized internally; the balance accrued to traffic out of Seattle and Prince Rupert.

In the Sitka cases, the Baranof road option led to an increase in total system travel time of 0.2 million hours; however, 'internal users' realized net savings of 0.2 million hours while traffic out of the southern termini incurred losses of 0.4 million hours. In the Rodman Bay case, total system impacts represented an increase of 0.6 million hours in travel time, of which 33% (or a 0.2 million hour increase) accrued to internal users. In the Sitka shuttle case, however, 85% of travel time savings accrued internally.

In the Prince of Wales cases, the two new terminal options (Tolstoi Bay and Red Bay) resulted in relatively small system-wide travel savings. Approximately 90% of these savings accrued internally. In the high-speed shuttle option, approximately one-third of the benefits accrued internally (which, in terms of hours, is roughly equivalent to the internal time savings accruing under the new terminal options). In the high-speed loop option, however, virtually all of the 0.7 million hours saved accrued to traffic to and from the southern termini.

Finally, in the case of the two Stikine options, it was found that although system-wide time impacts represented an increase in total travel time of 1.9 million hours, this consisted of an increase of 2.5 million hours to peak traffic out of the southern termini, and a saving of 0.6 million hours to peak internal and shoulder and low season users.

Table 5.5 also shows the required value which would have to be assigned to travel time impacts (both in total and on an hourly basis) in order to offset the net monetary impacts of the system options. As described earlier, this represents an 'imputed value' approach to determining travel time value and provides a basis for subjective judgement as to whether total marginal benefits are likely to outweigh marginal costs.

The results of the travel time analysis suggest that under the 'meet demand' scenarios, three Prince of Wales options present definite advantages to both system users and the state government as compared with the June 1980 Plan. These are the Tolstoi Bay terminal and the two high-speed ferry options. In addition to providing net monetary savings (as described in Table 5.3), these options also generate savings in total system travel time over the planning period. Hence, no positive value needs to be assigned to the travel time savings in order for marginal benefits to offset marginal costs.

(If one were to assign a negative value to travel time savings, then these scenarios could theoretically appear less attractive. A negative time value would imply, however, that travellers found time savings to be a disadvantage and were deterred from using the system as a result of the improved travel times. While this may be arguable in a general sense, that is with reference, for example, to a tourist's preference for a leisurely trip, it was felt that within the range of time savings being considered for the system it was more likely that users would assign either zero value or some positive value to travel time savirgs.)

On the premise that travel time savings have some positive value, three other options also show potential advantages over the June 1980 Plan: the Sitka shuttle, the Lynn shuttle, and the Lynn road. Under the two shuttle cases, users would have to assign a value in excess of $4.10 and $4.52 per hour respectively to the travel time savings in order to equalize system benefits with costs while under the Lynn road option, users would have to assign a value above $7.54 per hour to travel time.

In the remaining options, it is unlikely that the total benefits relative to the base case would outweigh the total costs. Travel time savings under the Red Bay option would only offset the monetary cost increases when the value of travel time savings exceeded $57.33 per hour. In the other options (the Sitka road cases and the Stikine corridor options), both travel time and monetary cost would increase on a system-wide basis, and time savings would have to have a negative value in order to offset cost increases.

Table 5.6 presents the same type of analysis for the 'reduced investment' scenarios. As expected, in view of the smaller number of mainline vessels and hence lower service frequency, the travel time savings are less than under the 'meet demand' scenarios. Only two options, the Lynn road and the Sitka shuttle, show system-wide travel times which are lower than under the June 1980 Plan 'meet demand' scenario. The remaining options all lead to varying levels of increase in total user travel time.

In most cases, however, these travel time increases are offset by net savings in monetary costs (as described in Table 5.4). Only the Lynn road option leads to higher net monetary costs than in the base case.

Comparison of the travel time impacts and the monetary costs (required total time value) in Table 5.6 indicates that one option, the Sitka shuttle, shows definite advantages over the June 1980 Plan. This option yields a slight (0.7 million hours) decrease in total system travel time and provides a substantial net monetary saving relative to the base case. In addition, the Lynn shuttle and Prince of Wales shuttle also appear likely to be viable. In these cases, substantial cost savings are offset by small increases in travel time. These travel time increases would not outweigh the monetary benefits, however, as long as the value of these time increases is assumed to be less than $310.50 per hour (for the Lynn shuttle), or less than $247.75 per hour for the Prince of Wales shuttle case.

The remaining options, though still potentially viable, are less attractive than the above three cases since all result in either higher travel time increases and/or lower monetary savings. Among these options, the three remaining Prince of Wales cases are most likely to prove beneficial,

2) Net total of user and government cost increases - brackets denote net cost savings.

requiring only that travel time be valued at less than $30 to $50 per hour in order for cost savings to outweigh travel time increases. The Sitka road options are less attractive since they involve both greater increases in travel time and lower savings in monetary costs. Travel time value must be less than $7.06 per hour in the Rodman Bay case and less than $3.42 per hour in the Baranof option.

The remaining option, the Lynn road, is more difficult to rank against the other options because it involves travel time savings (as opposed to increases) offset by monetary costs. In this instance, the road option would prove viable as long as the value of travel time savings exceeded $4.48 per hour.

5.3.3 - Summary

The assessment of long-term surface system options indicates a number of pertinent points. These may be highlighted as follows.

- If the system goal is to meet all projected demand for surface transportation, substantial investment will be required in new facilities, and increased costs will be incurred by the Marine Highway and by the state.

- The least costly methods (in monetary terms) of meeting this demand can be achieved by making changes in service to Prince of Wales Island (either by building a new terminal at Tolstoi Bay at a total Regional System cost of $574 million or by introducing high-speed ferry service out of Hollis at a cost of approximately $571 million). These options are followed (in order of increasing cost) by the base case June 1980 Plan option ($584 million), the Sitka shuttle option ($600 million), the Red Bay terminal ($618 million) and the Lynn shuttle ($619 million). The Petersburg road option, although costing only $607 million, does not really rank with the preceding cases as it does not meet Seattle demand to the same extent.

- If a lower capacity to meet demand can be accepted within the system (specifically by treating combined Seattle and Prince Rupert vehicle demand as a single unit and requiring that both ports be at capacity before new vessels are acquired), the Marine Highway and state can achieve significant cost savings. Total state costs under these 'reduced investment' scenarios range from $485 million for cases involving high-speed ferry service to Hollis to $570 million for the Sitka-Baranof road option. Only the Lynn road, at $703 million, remains more costly than the 'June 1980 Plan - meet demand' scenario.

- In terms of service-cost effectiveness, where each new system option is compared with the June 1980 Plan in terms of user cost, travel time and cost to the government, several 'meet demand' options appear to be potentially more attractive than the June 1980 Plan, primarily as a result of improved service quality which offsets the increased costs (or, in the Prince of Wales cases, enhances the cost savings). In declining order of preference, these would be Prince of Wales high-speed ferries, Tolstoi Bay terminal, Sitka shuttle, Lynn shuttle, and Lynn road.

- Service-cost effectiveness evaluations for the 'reduced investment' scenarios indicate even more significant advantages from several of the options relative to the June 1980 Plan case since the negative impacts of these scenarios (in terms of costs of unmet demand and increases in travel time) are sufficiently small that they are unlikely to outweigh the significant government cost savings. Rankings of the 'reduced investment' options were somewhat different than the 'meet demand' cases, with the Sitka shuttle achieving the highest ranking followed by the Lynn shuttle, the Prince of Wales shuttle, and the other Prince of Wales system options.

6 - CONCLUSIONS

6 - CONCLUSIONS

6.1 - Summary of Findings

One of the main objectives of the definition and assessment of surface system alternatives was to provide a quantitative basis for selecting from among a number of technical and operational alternatives those options which offered the greatest improvement in 'service' relative to cost. A second objective, however, was to provide information with regard to the trade-offs associated with the conflicting pressures to maximize service and to keep costs at a reasonable level.

With these considerations in mind, the more significant findings from the analysis may be summarized as follows.

Short-Term

- Of the options available to improve system capacity and service in the near future, the most attractive overall involve maximizing use of existing vessels. At existing fare levels, the Marine Highway cannot generate sufficient revenues to offset the capital cost of new mainline vessels. Therefore, options involving new vessel acquisition generally result in higher system deficits.

- Increasing service to Seattle improves the financial picture from the viewpoint of the AMHS and, to a point, offers a better matching of capacity and demand. Marine Highway ratios of revenue to operating cost are highest on the Seattle route due to the high load factors, the relatively high fare levels, and the berth revenue.

- Too heavy a focus on Seattle service, however, leads to lower service levels within Southeast Alaska and potentially to capacity problems on some links in the system (in particular Ketchikan-Petersburg and Juneau-Haines).

- The most attractive of the options considered involves operating both the Matanuska and Columbia out of Seattle during the peak season. However, this leads to vehicle capacity problems in the Prince Rupert to Petersburg corridor.

  These problems could be mitigated by operating the Aurora between Prince Rupert and Petersburg where she would run full-time at near-capacity load factors.

- Moving the Aurora creates a gap in terms of service to Hollis and, under current plans, in service to Hyder and Metlakatla. This problem could be alleviated by purchasing one or two small high-speed catamarans to serve the Hollis-Ketchikan-Metlakatla routes.

Long-Term

- In the long-term, a wider variety of options are open in terms of improving capacity and service.

- The most costly long-term options are those which attempt to meet projected demand since all involve substantial investment in roads and/or new mainline ferries.

- Substantial savings can be generated by accepting a reduction in the service of demand out of Seattle, particularly with regard to vehicle traffic which could, presumably, transfer to Prince Rupert.

- If full demand is to be met, the most attractive options involve changes in service to Prince of Wales Island either by building a terminal at Tolstoi Bay or by instituting high-speed ferry service to Hollis. While this option still requires two new mainline vessels over the 20-year planning period, it allows deferral of a third mainline vessel by freeing the Aurora to operate more frequently in the Prince Rupert-Petersburg corridor.

- If a reduced level of service is accepted in terms of meeting Seattle demand, the government can obtain substantial cost savings under certain options without creating undue impacts on users either in terms of unmet demand or service quality. The most attractive option under these 'reduced investment' scenarios is to terminate mainline service to Sitka and provide high-speed ferry service as a substitute. Next in attractiveness is to substitute a high-speed ferry for mainline service up the Lynn Canal. These two options are followed in attractiveness by the 'reduced investment' versions of the Prince of Wales options relating to Tolstoi Bay and to high-speed ferries.

6.2 - Conclusions

The preceeding summary highlights two issues from the viewpoint of establishing a Regional Transportation Plan. First, there are technical and operational options available in both the short and long term which represent more service-cost effective solutions than the existing system and the June 1980 Mainline Service system respectively.

Secondly, in terms of balancing between service-related (meet demand) and cost-related goals, an attempt to meet all future demand (i.e., fully satisfy the service related goals) results in substantial penalties in terms of keeping government expenditures under control. However, a relatively small compromise in terms of meeting demand, particularly out of the southern termini, results in substantial cost savings to the government without causing major penalties in terms of user service levels.

With these factors in mind, the following proposals are put forward as a plan of action for the provision of surface transportation services. It will be noted that the proposed systems represent a hybrid of several systems alternatives, drawing, where possible, on the best aspects of the preferred systems and using aspects of other systems to offset perceived problems.

Short-Term

- Additional service should be provided to Seattle. This improves the Marine Highway's financial position and directs more capacity towards the higher demand routes.

- To make up for the lost services of a mainline vessel within the region, the Aurora should be drawn into a truncated mainline service out of Prince Rupert.

- The Aurora's current routes in the Prince of Wales-Clarence Straits region should be served by two new high-speed catamaran-type vessels. These involve a minimum capital cost (in the range of $3 million each) and could provide a higher service level on these routes.

Long-Term

- The best results in terms of 'focus' options arise under the 'reduced investment' scenarios, in particular those which involve using two high-speed craft to serve either Sitka or the Lynn Canal and those which involve changes in Prince of Wales service.

- The Prince of Wales high-speed service proposed in the short-term therefore appears to have long-term viability and should be maintained.

- Some of the scheduling and service benefits of high-speed service to Sitka and the Lynn could be retained if only a single high-speed ferry were assigned to each in combination with a reduced level of mainline service. This is particularly true in the Sitka case where a Sitka-Petersburg high-speed service would not attract sufficient traffic to be viable on its own merits.

- It is therefore recommended that two large SES-type high-speed ferries be acquired, one to provide daily round trip service between Sitka and Juneau, calling at Angoon, Hoonah and Tenakee Springs, and the second to

provide twice-daily round trip service from Juneau to Haines and Skagway.

- The open jaw routes which were proposed out of Seattle under the Sitka and Lynn Focus options could be split between two mainline vessels with the Matanuska serving Sitka but not the Lynn and the Columbia serving the Lynn but not Sitka.

- The LeConte could provide increased service in the Sitka-Petersburg corridor and into Pelican as well as supplemental and heavy-freight service into the Juneau-Sitka corridor.

- The remaining vessels could provide increased service between Prince Rupert and Skagway to increase the system's total vehicle-carrying capacity as well as service frequency in the mainline corridor.

- Under this option, the decision on acquiring a new mainline ferry could be deferred until the mid to late 1990s. This reduces the Marine Highway's cash flow requirements and also reduces the risks that a new vessel will be underutilized if demand does not materialize or if private operators achieve substantial market penetration.

APPENDIX A

EVALUATION METHODOLOGY

APPENDIX A

EVALUATION METHODOLOGY

A1 - GENERAL

The general method used to assess corridor alternatives consisted of five main steps

- Forecast expected travel demand in the corridor over the next 20 years;
- Define a range of possible methods of meeting this demand, and the equipment and/or infrastructure necessary to serve the traffic under each method;
- Determine the associated capital and operating costs and revenues;
- Calculate the financial impacts of each alternative from the viewpoint of the operator, the government and the user;
- Calculate the service/cost effectiveness of each alternative and select the preferred option(s).

Each of these steps is described in greater detail in the following sections.

A2 - TRAVEL DEMAND

The forecasting of travel demand both within the Southeast Region as a whole and within particular corridors of the Region involved first analyzing the

existing patterns of traffic for both surface (marine, road) and air modes and identifying the factors which would cause this traffic to grow and change in the future.

Since the data regarding existing travel patterns was limited, this analysis was kept at a relatively simple level. Three factors were identified as the key issues impacting future travel demand. These were: regional population growth, growth in tourism, and changes in transportation service. The first two factors were deemed to cause general growth within the existing patterns of travel demand (or growth in 'base traffic') while the third was deemed to either increase or decrease the 'base traffic' demand within particular corridors.

To forecast 'base traffic' demand (i.e., demand in the absence of service changes) existing travel was separated, on the basis of survey data, into tourist and nontourist traffic. This separation was done on a seasonal basis (in order to reflect the higher summer peaking in tourist travel) for both marine highway and air services. Tourist and nontourist components of existing traffic were then forecast, the former on the basis of expected growth in tourism travel to Alaska and the latter on the basis of expected population growth in the Southeast Region.

The growth rates assumed for tourism travel and for regional population were based on historic growth rates, tempered by concerns that with declining revenues and potential declines in government spending, these growth rates could not be maintained over the long-term. Consequently, tourism was assumed to grow at 4.5% annually to 1990 and at 2.5% annually thereafter. Regional population was assumed to grow at 2.8% per year to 1990, tapering off to 1% thereafter.

Over and above these population and tourism based growth rates, there was a special additional growth applied to air traffic, amounting to 1.4% per year. This additional growth reflected the long-term increase in the propensity of travelers to use the air mode--an increase which has generated growth in air traffic above and beyond that which can be explained by population and tourism growth alone.

The origin-destination patterns of this future 'base traffic' demand were assumed to follow the existing pattern of movements to, from and within the region. Therefore a growth in marine highway tourist demand, for example, would cause a corresponding percentage growth in traffic on all marine highway tourist-serving routes.

Once this 'base traffic' load had been calculated for the system and for the various corridors, adjustments were made to corridor demand to reflect the different service levels associated with corridor alternatives. These adjustments included diversion of traffic to a different port, loss of traffic, transfer between modes, and increases in traffic due to improved access depending on the service scenario. The particular adjustments associated with each corridor option are outlined in detail as part of the description of alternatives (Section A3).

A3 - DEFINITION AND DESCRIPTION OF CORRIDOR ALTERNATIVES

Having established the potential traffic demand within a corridor, the existing surface transportation service was reviewed and alternative road and marine options proposed which would increase capacity and or reduce operations costs. These alternative options were drawn from community suggestions, proposals put forward by the Department of Transportation, and new proposals put forward by the consultant.

An effort was made to develop a wide variety of corridor options in order to provide a range of costs and impacts for comparison purposes. Both capital (new roads, new ferries) and operational (new schedules) options were included when appropriate. In all cases the alternatives included a base-case 'no change' option against which new options could be assessed.

Once the corridor options had been defined, a detailed operating and investment schedule was laid out for each alternative specifying the traffic

to be served, the way in which it would be served, the timing of new road and new vessel requirements, and the operating schedules and procedures within the corridor. Traffic and operating procedures were both specified on a seasonal basis.

A4 - DEVELOPMENT OF COST DATA

Capital Costs - Roads

Capital costs for new road links were based on the Department of Transportation's per-mile costs of construction over various types of terr· n. Routes were specified through detailed analysis of relief maps, through discussion with DOT/PF engineers and, where possible, through inspectior of the area. Road links were then broken down into segments based on the severity of terrain and degree of construction difficulty, and the appropriate per-mile costs were applied.

Special structures such as bridges, tunnels, snowsheds, etc, were costed independently and included in total cost where required.

Capital Costs - Marine

Capital costs for marine facilities and equipment included costs of new terminal facilities, capital costs associated with the existing ships, and capital costs associated with new shuttle ferries, mainline ferries and high-speed craft. In the first two cases capital costs were based on Marine Highway data regarding terminal construction costs and expected replacement value of the existing fleet. In the case of new vessels, typical current construction costs for the type of vessel required were developed through discussions with shipyards, brokers, and manufacturers.

Operating Costs - Road

Operating costs for the road links included regular maintenance and winter snow removal. They were based on the actual costs per mile incurred by the DOT/PF.

Operating Costs - Marine

The operating costs for existing vessels and terminal facilities were based on the actual experience of the Marine Highway. Vessel costs were segregated into annual costs (major maintenance, overheads) seasonal costs (crew, stores and supplies) and daily costs (primarily fuel).

Operating costs for new vessels were based on Marine Highway experience in the case of mainline ferries, and on discussions with builders and other operators in the case of shuttle ferries and high-speed craft.

User Costs

Costs to users fall into three main categories: fares on existing ferries, fares on new ferries or new ferry routes, and vehicle operating costs on road links.

Fares on the existing ferry system were based on the current summer and winter rates for the Marine Highway. For new routes on existing vessels, fares were assumed to be the same per-mile as on current routes.

For new types of equipment (shuttle ferries, high-speed craft) it was initially assumed that fares would be set on the same basis as current ferry charges; that is, that fares would have to cover at least half of the total operating costs (excluding capital) of the new vessels. However, later analysis indicated that new vessels serving as a substitute for existing vessels generated sufficient savings elsewhere in the system that their fares could be maintained at existing fare levels and still lead to an overall improvement in the system operating cost recovery.

Accordingly current fare levels were used for traffic on these new vessels.

Vehicle operating costs on road links were based on the variable portion of average per-mile operating costs for mid-size automobiles. This was felt to be a fair representation of the mix of vehicles likely to be using the road. In actual fact, owners of vans and campers would pay more while owners of small cars would pay less.

In cases where corridor options required vehicles to divert from one port to another, vehicle operating costs were increased to include overnight accommodation if the diversion involved more than 12 hours driving time.

A5 - FINANCIAL ANALYSIS

The traffic, operating and cost data bases described above were then drawn together into a year-by-year financial analysis of each corridor alternative. Capital costs for roads, vessels and terminal facilities were assigned to the years in which they would be incurred. Road operating costs were based on miles of road in service, while marine operating costs were derived from the proposed Marine Highway schedules under each option.

User costs for each year were determined by first calculating the number of vehicles using the road links (either as a result of being diverted to another port and/or as a result of a new road link being available), and multiplying this number by the cost per vehicle over the relevant distance. A revised ferry demand matrix was then calculated (taking into account diverted and/or lost ferry traffic) and multiplied by the fares matrix to determine total fares paid to the Marine Highway.

The annual financial flows were then discounted at an interest rate of 5% to determine the net present value of capital, operating and user costs under each scenario.

A6 - EVALUATION OF SERVICE/COST EFFECTIVENESS

The financial evaluations provided an indication of the total costs to operators and users associated with the various corridor alternatives. They did not, however, reflect the differences among alternatives in terms of ability to serve demand and the quality of service provided.

In order to account for these differences, each corridor alternative was compared with the corridor 'base case' (which represented continuation of existing service) with respect to the number of passengers and vehicles served, the cost per user served, and the average travel time (including delays related to frequency of service). Appropriate values were assigned to the 'service' differences between the alternatives and the base case to represent the incremental benefit (cost) to the user. These user benefits (or costs) were then compared with the incremental cost (or cost saving) to the government to form a basis for evaluating service/cost effectiveness.

The approach to assigning values to 'service' differences varied somewhat between corridors due to the different focuses of the corridor alternatives. In the Lynn corridor, for example, the focus was on improving service through new modes and on generating traffic over and above existing demand. Measures were therefore required for the value of time and cost savings to existing and to new traffic. In the Ketchikan corridor, the focus was on the existing ferry system and on trying to adjust schedules so as to meet a higher portion of current demand in a cost-effective manner, and measures were primarily required for the costs of not meeting traffic needs or of meeting needs by diverting traffic to other ports.

In general, the following principles were used in assigning values to service differences.

- Cost savings to existing traffic - include the full dollar value of saving.

- Cost savings to new traffic - include half of the difference between the fare (or travel cost) under the new option and the fare applicable under the base case (this presumes that traffic attracted as a result of less expensive service assigns a lower value to the trip).

- Cost of failing to meeting demand - include the average surplus which the user would have enjoyed if space had been available. Surplus was calculated by postulating the shape of the demand curve for service and calculating the average difference between the maximum which users would have been willing to pay for the trip and the fares which would normally have been charged. (This is discussed in greater detail in Appendix B.)

- Costs to diverted traffic - assume that users diverted to another port attribute a cost to the diversion equivalent to any out-of-pocket savings associated with using the new port. Thus users moved from one port to another were assumed to incur neither benefits nor costs. This assumption was necessary because the total trip cost from Seattle was lower via road to Prince Rupert than via direct ferry, yet demand continues to be strong out of Seattle. There is, therefore, some nonmonetary advantage to the direct ferry trip which offsets cost savings associated with diverting to Prince Rupert. This nonmonetary advantage could best be accounted for by assuming that diverted passengers assigned equal cost to trips out of either port.

- Time savings to existing traffic - include the full number of hours saved in total travel time (sailing time, port time and delays related to schedule frequency).

- Time savings to new traffic - include one half of the difference between total travel time under the new option and total travel time under the base case.

The user cost impacts (whether positive or negative) were calculated for each corridor option relative to the corridor base case. Total savings (or increases in user costs were then compared with the total additional cost (or saving) to the government associated with the new service.

If an option showed both lower user costs and lower government costs than the corridor base case, it was clearly preferable to both parties. If it showed higher costs to both users and the state, it would not be attractive to either party. If one group's costs increased while the other group's cost declined, then the preferred options were deemed to be those which yielded the highest user benefits (or lowest user costs) per dollar of government expenditure (or government cost saving).

Where time savings were a major factor in the benefits, an imputed value of time saved was calculated by comparing the number of hours saved with the net cost of providing the saving. This provided a measure of the value which must be assigned to time savings in order for project benefits to equal costs. The options which required the lowest hourly values to be assigned to time savings were chosen as the preferred options. (Additional discussion of the calculation of time savings is provided in Appendix B.)

APPENDIX B

EVALUATION OF USER IMPACTS – CORRIDOR AND SYSTEM ALTERNATIVES

APPENDIX B

EVALUATION OF USER IMPACTS - CORRIDOR AND SYSTEM ALTERNATIVES

B1 - COSTS OF UNMET DEMAND

In analyzing both short-run and long-run system options we are faced with a situation where the predicted level of demand for ferry service is not being met to the same degree in the various cases.

To assess the impact of system options on users and potential users in terms of the costs and/or benefits they incur under the various alternatives, it was therefore necessary to find some means of assigning a value to these differences in ability to meet demand. The method used was to derive an economic measure of the costs incurred by users (where users are defined as the total numbers requesting ferry service) as a result of changes in the ferry system. To assess these impacts, users were divided into three categories for the purpose of calculating costs: those served as requested, those served by diversion to alternate ports, and those not served under the particular option.

Those passengers who are served under all systems are indifferent between the options. Because the fare structure remains constant, they incur neither costs nor savings as a result of system changes and hence do not figure in the analysis.

Those passengers who are served by diversion to another port (normally from Seattle to Prince Rupert) are in a somewhat different category. If their costs were higher out of Prince Rupert they would be said to incur a cost as a result of the diversion--presumably a disbenefit of the system which forced them to divert. In actual fact, however, it was found that their out-of-pocket costs were lower as a result of the diversion--that in fact

incurs as a result of having to accept alternative transport. A third possibility would be that the user would decide not to make the trip in which case the cost he incurs is the loss of utility which he associated with the ferry trip.

Determining which definition of opportunity cost is most applicable to the unserved marine highway demand is a difficult task, and generalizations must be applied. Our choice for this study was to calculate opportunity cost based on the third concept; i.e. that the trip would not be made and the loss was therefore equivalent to the utility the user would have enjoyed had he been able to get on the ferry. A major factor in selecting this concept, particularly as opposed to the 'cost of alternatives' method, was the absence of a clearly comparable alternative means of transport. The alternatives available (cruise ship, air, road) differ from the marine highway service in so many nonquantifiable aspects that an assessment of cost differences would entail substantial subjective judgments which could be difficult to establish and to defend.

The calculation of opportunity cost based on lost utility required an estimation of the value which potential users would assign to the trip. A base approximation of this utility is the price they would have been willing to pay--in this case the marine highway fare for passenger and vehicle trips. Accordingly, the opportunity cost associated with unserved traffic consists in part of the fares they would have paid had they been able to get on the ferry. Offsetting this opportunity cost, however, is the fact that the potential user can retain the monies he would otherwise have spent. (In our analytical process the loss associated with unpaid fares is borne by the marine highway.)

The fare level, however, represents only a part of the customer's lost utility. Assuming an elastic demand for ferry services (i.e. a sloping demand curve) some of the traffic demand would have been willing to pay more for the trip than the price set by the marine highway. In other words, they would assign a utility to the trip which exceeds the fare they would have to pay. This 'surplus' utility is also lost when a potential user cannot be served.

To calculate this surplus, it is necessary to know the shape of the demand curve, or the relationship between the price of the service and the number of users willing to purchase it. Since no data was available on this subject, we adopted a conservative hypothesis that demand for marine highway services would fall to zero at the point where the price was equal to the cheapest cruise package over the same route. The average surplus per user is, therefore, one half the difference between the cruise price and the marine highway fare.

The lost surplus was calculated by multiplying average surplus by the number of unserved passengers under each system option, to give the net opportunity cost of unsatisified demand. (Annual figures were discounted to net present value so that they could be compared with AMH costs on a consistent basis.)

The above calculations account for the surplus associated with foregone passenger trips, but do not cover the surplus associated with vehicles which cannot be accommodated in the system. In order to estimate this lost vehicle-related surplus, it was assumed that the demand curve for vehicle trips has the same slope as that of passenger trips--in other words, that a proportionate increase in the price of each would lead to a proportionate decrease in demand. This assumption was used to calculate the average surplus associated with vehicle trips and hence the lost surplus as a result of unmet vehicle demand.

In summary, user costs under the various system alternatives were calculated only for those potential users who could not be accommodated by the system. Users who were either served as requested or served via diversion were assumed to incur neither benefits nor disbenefits from a cost viewpoint.

The cost assigned to the unsatisfied demand was calculated on the basis of net foregone utility which was in turn approximated by the total additional surplus utility which would have been enjoyed had demand been met by the system.

To calculate this surplus, it is necessary to know the shape of the demand curve, or the relationship between the price of the service and the number of users willing to purchase it. Since no data was available on this subject, we adopted a conservative hypothesis that demand for marine highway services would fall to zero at the point where the price was equal to the cheapest cruise package over the same route. The average surplus per user is, therefore, one half the difference between the cruise price and the marine highway fare.

The lost surplus was calculated by multiplying average surplus by the number of unserved passengers under each system option, to give the net opportunity cost of unsatisified demand. (Annual figures were discounted to net present value so that they could be compared with AMH costs on a consistent basis.)

The above calculations account for the surplus associated with foregone passenger trips, but do not cover the surplus associated with vehicles which cannot be accommodated in the system. In order to estimate this lost vehicle-related surplus, it was assumed that the demand curve for vehicle trips has the same slope as that of passenger trips--in other words, that a proportionate increase in the price of each would lead to a proportionate decrease in demand. This assumption was used to calculate the average surplus associated with vehicle trips and hence the lost surplus as a result of unmet vehicle demand.

In summary, user costs under the various system alternatives were calculated only for those potential users who could not be accommodated by the system. Users who were either served as requested or served via diversion were assumed to incur neither benefits nor disbenefits from a cost viewpoint.

The cost assigned to the unsatisfied demand was calculated on the basis of net foregone utility which was in turn approximated by the total additional surplus utility which would have been enjoyed had demand been met by the system.

B2 - TRAVEL TIME DIFFERENCES

A second aspect of user impacts which had to be dealt with in the evaluation of alternatives was the level of service provided. The major significant differences among alternatives in terms of service quality related to travel time and frequency of service out of various ports.

In order to measure these differences we developed a travel time model which converted ferry schedules into a travel time matrix for all O/D combinations in the system. The model calculated the sum of sailing time (based on a weighted average speed for ships operating on the route), port time, and waiting times. Waiting times were related to frequency of service over a given link and transfer requirements

The frequency-related delay time was set at one-quarter of the average interval between ship calls, while the delay associated with transferring from one vessel to another was set at 12 hours (with the exception of the Columbia shuttle where passengers transferring at Ketchikan were assumed to be delayed an average of 36 hours due to shortage of capacity on vessels out of Prince Rupert).

Because of differences in traffic levels, it was not possible to merely compute the differences in total travel time among the system options. We therefore segregated travel times for those routes where traffic levels varied and calculated the average time per passenger on those routes and within the balance of the system. Peak, shoulder and low travel times were computed separately.

The average travel times under each alternative were compared with the base case times to determine time saved or lost per passenger served as a result of the new system.

To calculate total travel time impacts of a scenario, transferred passengers were eliminated since they are presumed to be indifferent to the combined time and cost effects of transferring. The remaining passengers carried

over the various routes were multiplied by the appropriate travel time changes to give gross time impacts (provided these passengers constituted part of the base demand for the system and did not represent induced traffic), while the passengers whose demand was not met by the system were multiplied by the change in travel time and the result deducted from gross impacts. This latter adjustment reflected the impact of the changed service level on the overall attractiveness of the voyage which the potential user could not take.

Finally, where new passenger traffic was induced on a particular link because of system changes (e.g. as in the long-run Lynn alternatives), the total time savings accruing to the induced passengers were divided in half on the principle that savings to marginal users represented a lower benefit than those accruing to 'base demand' users.

The annual streams of net time impacts were discounted to present value at a 5% rate in order that they would be comparable with discounted cost figures.

BELLINGHAM AS SOUTHERN TERMINUS

OF

THE ALASKA MARINE HIGHWAY

The city of Bellingham, the Port of Bellingham and the Whatcom County Chamber of Commerce are very enthusiastic in their attempt to establish Bellingham as the southern terminus of the Alaska Marine Highway (AMH). To this end, the Port of Bellingham has allotted $2 million of its calendar year 1988 budget for terminal infrastructure construction. City staff has produced two videos supporting the move which have already been shown publicly in both Alaska and Washington, and civic and community leaders continue to be in contact with Alaskan transportation, business and government leaders.

When the current lease, held by the Port of Seattle, expires in September of 1989, Bellingham intends to submit a bid for the contract. During interim, Rep. Bette Cato and staff visited Bellingham and spoke with interested parties from the city, port and community of Bellingham regarding the feasibility of such a move. As a result of that trip, the following report was prepared.

1. Location of Terminal

Bellingham is proposing that one of two sites near its downtown area be chosen as the future site of the southern terminus of the Alaska Marine Highway. Both sites are located in Whatcom International Shipping Terminal which is adjacent to the present Port of Bellingham administration building. Some of the appropriate infrastructure already exists. Other infrastructure such as a terminal facility built to state of Alaska specifications, would have to be added. There is ample space available at either of these locations for parking, storage, loading and off-loading, and maneuvering of freight and vehicles. The Port of Bellingham is a deep water port that would require no dredging. Port security includes the city of Bellingham police, and Port of Bellingham and Georgia Pacific pulp mill securities.

The Seattle terminus is located near the heart of downtown Seattle which can be a very congested area. The space available for parking, storage, loading and off-loading, and maneuvering of freight and vehicles is quite limited.

2. Terminal Access

Northwest travelers currently access the Alaska ferry terminal in Seattle either by taxi from Sea-Tac International Airport, or they drive their own vehicles to the terminal because they plan to take them north. Cab fare for the trip from the airport to the Seattle ferry ranges between $15.00 and $24.00, and traveling time is 30 - 60 minutes. Travelers planning to bring their own vehicles onto the ferry face limited parking opportunities and a lack of nearby RV (recreational vehicle) facilities.

If the terminus were to be located in Bellingham, travelers flying into Sea-Tac airport would be able to catch any one of 30 twenty-minute flights per day to Bellingham International Airport at a cost of $19 or $44. They would then take a 15 minute cab or bus ride from the Bellingham airport to the Bellingham ferry terminus. Or, travelers flying into Sea-Tac airport could take a commercial bus from the airport to the downtown Seattle bus terminal and then transfer to a another bus headed for Bellingham. Greyhound has three connections to Bellingham daily. One way fare is $12.45.

Travelers planning to take their vehicles with them onto the ferry would drive to Bellingham. Bellingham is located 86 miles north of Seattle and 54 miles south of Vancouver, B.C. It is accessed by Interstate 5, and the proposed terminal is a five minute turn off of the interstate. Because Bellingham has had more of an opportunity to plan for its development, access to the city is much less congested than in the Seattle area. City traffic is minimal, and parking opportunities near the proposed site are abundant. Nearby RV facilities already exist, and on site RV facilities have been included in the development plan.

For travelers concluding their trip at the southern terminus,
the procedure would be reversed.

3. Cost Comparison.

Bellingham is located 80 nautical miles north of Seattle. This translates into a savings of roughly 4-6 hours of traveling time in one direction. As Puget Sound becomes more congested, the time savings may become even greater. Less distance traveled means less fuel consumed, and at an average of 21 gallons of fuel burned per nautical mile, over 3,000 gallons of fuel per trip could be saved if the terminal was located in Bellingham. Less distance traveled would also mean less wear and tear on equipment.

Salary savings would be realized only if the shorter distance to Bellingham resulted in the ship's completing its

overall trip in less time, and only if labor contracts could be negotiated to include a shorter work week. No salary savings would be realized if the overall trip took the same amount of time because the crew is paid the same regardless of whether the ship is in port or on the water. Since Juneau and Ketchikan are the only points at which crew can begin and end their work weeks, they would still be considered to be at work when the ship was docked in Bellingham.

The state of Alaska currently pays the Port of Seattle $6.00 for every passenger up to 40,000 passengers that either gets on or off the ferry per year in Seattle. This agreement results in a maximum amount payable per year to the Port of Seattle of $240,000. In FY'87, 34,374 passengers were billed to the state by the Port of Seattle at a cost to the state of $206,244.

Rather than bid a fixed fee per passenger up to a maximum cap, the Port of Bellingham is planning to propose a sliding fee scale which would be tied into meeting certain goals of passenger and freight. In other words, the more passengers and freight that moved through Bellingham, the higher the fee received by Bellingham, but because there would be no cap on the number of passengers for which Bellingham would be paid, the incentive would be there for Bellingham to draw as many passengers as possible. Since there would be no cap, the incentive for Bellingham to draw additional passengers could ultimately result in additional revenue for the state of Alaska. As it currently stands, there is no incentive for the Port of Seattle to service more than 40,000 passengers.

At this point, it is not clear whether or not there would be a cost savings in freight if the terminus were to be located in Bellingham. Although freight could be transported to and from Seattle in less time on Interstate 5 than it could be transported by ferry, the time savings may be overridden by the increased transportation costs of trucking freight to a central consolidation area which is done in order to consolidate ferry freight with other freight in the area for the purpose of long distance transporting. For instance, Lynden Transport, Incorporated, a major shipper to Alaska via the Alaska Marine Highway System, currently transports its freight from the Seattle ferry terminal to Kent, a suburb of Seattle, where it is then consolidated with other LTI freight. Since the distance from Bellingham to Kent is greater than the distance from Seattle to Kent, it may at first appear there would be no cost savings associated with the move and, in fact, it may appear that the shipping costs would be higher because of the additional trucking costs. However, there are many variables inherent in this issue including but not limited to whatever offer is made to shippers by the Port of Bellingham should Bellingham be successful in its bid for the southern terminus. It is also

not clear if the AMH would lower its shipping rates in response to the fact that the trip to and from Bellingham is shorter. However, Lynden Transport, Inc., in a letter sent to the Commissioner Hickey of the Alaska Dept. of Transportation and Public Facilities, has stated that it would support any move by the ferry that would improve services and reduce costs to its customers in southeastern Alaska.

4. Special Attractions

Seattle and Bellingham both have much to offer the Northwest traveler.

Bellingham is a growing community of 50,000 people located on the Inside Passage. Bellingham Bay is to the west and the beautiful Northern Cascade Mountains are to the east. Major industry in the area includes agriculture, commercial fishing, forestry, manufacturing and recreation. It is home of the famous "From Ski to Sea in 60 Minutes" race, as well as sport fishing, scuba diving, beach combing, sailing, camping and hiking. It is home of Western Washington University. Temperatures range from 30 - 74 degrees Fahrenheit with an average of 49 degrees, and rainfall averages 34 inches. A world trade center and a regional shopping center are currently in the process of being built.

In addition to its many tourist attractions, Whatcom County is host to four foreign trade zones. Because of the special tax exemptions afforded these areas, much new business has been attracted to the area. The trade zones should provide a positive position within the international market place for Whatcom County. Bellingham is an important regional and transportation hub <u>without</u> the congestion of Puget Sound.

Seattle is also an attractive destination for northwest travelers. Its many well-known attributes include Pike Place Market, the Seattle Aquarium, numerous fine restaurants, the theater, the Kingdome, the University of Washington and other respected universities and colleges, excellent sailing opportunities, etc.

The point is, both locations have much to offer the traveler interested in extending his or her vacation beyond the ferry ride. The difference is, the Port of Bellingham plans to market these attractions to potential passengers should it become the southern terminus of the ferry system.

5. Market Development

Whatcom County already hosts more visitors from outside the state than any other county in Washington. Using the theme "The Last Great Marine Adventure" and expanding the services

available to passengers, civic leaders plan to draw even more visitors to their county by actively recruiting passengers to the Alaska Marine Highway. Plans are to target Canada as well as the United States. Ideas for expanding and improving service to AMH passengers via the Port of Bellingham include allowing passengers to book on shore reservations by computer while still on board the ferry, using computers to suggest trips and map routes for passengers to use once they hit the shore, and the convenient, on shore availability of tax exempt cards for residents of the state of Alaska.

6. Summary

Intent language inserted in Alaska's FY'88 operating budget stated: "It is the legislature's intent that the Department [of Transportation and Public Facilities] study the potential cost savings of using Bellingham as the southern terminus of the Alaska Marine Highway System. The study should examine fuel savings, more efficient use of vessels, labor savings, lease savings, and the relative quality of passenger facilities which might be offered in Bellingham as compared to Seattle. The study should be submitted to the legislature no later than December 1, 1987."

The Department of Transportation and Public Facilities is currently in the process of compiling its interim study. While cost saving factors have yet to be determined, locating the southern terminus of the Alaska ferry system in Bellingham will give the Alaska Marine Highway a much more visible profile. Because it would be one of the biggest fishes in a little pond, the city and Port of Bellingham and the Whatcom County Chamber of Commerce are willing to develop the terminus to the fullest marketing extent possible. Their cooperation is impressive. They are eager to work with the state of Alaska in order to further their goals. They are willing to address whatever questions and concerns may arise regarding the relocation and they are determined to make their dream a reality. They want to work with the state of Alaska in order to expand recreational opportunities, especially for the RV traveler. The community of Bellingham would like to develop a partnership with the state of Alaska that extends beyond the Alaska Marine Highway.

Bellingham Assessment Presentation

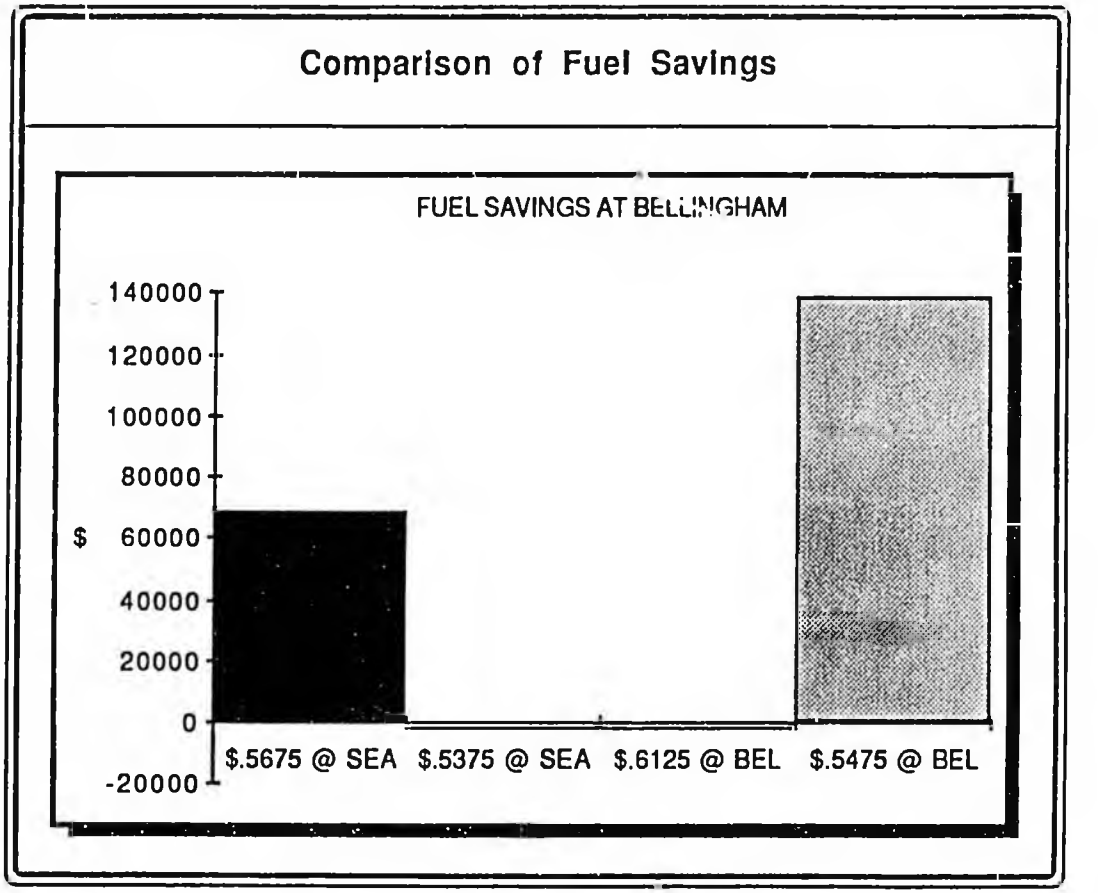
- Assumptions
- Fuel savings at Bellingham
- Labor savings
- Lease savings & relative quality of passenger facilities offered by BEL vs. SEA
- Conclusions

Assumptions

- No change in traffic level
- No change in tariffs
- Present labor agreements
- Quality of facilities at Bellingham and Seattle are equivalent
- Continuing public mandate for Puget Sound Service

Fuel savings at Bellingham

- Historically, fuel price has been higher at Bellingham than Seattle
- Analysis shows that potential fuel savings are approximately $68,000 per year
  - 2.4% of annual system fuel consumption
  - 1.6% of annual system fuel expense
- The most important factor in AMHS fuel expense is price rather than steaming time.
- Comparison of Fuel Savings
- If time savings at Bellingham are used for additional service there is no fuel saving



Comparison of Fuel Savings
FUEL SAVINGS AT BELLINGHAM
140000
120000
100000
80000
$ 60000
40000
20000

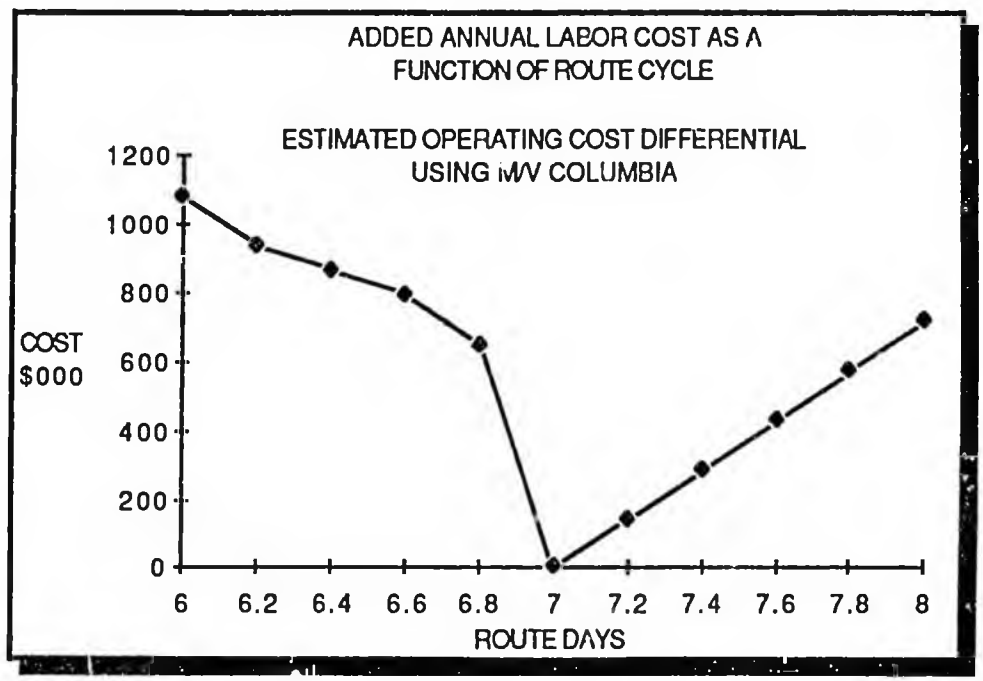
Labor savings

- No significant labor savings available under present AMHS labor agreements
  - Present agreements are based on a 7 day route cycle
  - Variation from the 7 day cycle triggers premium pay provisions of the agreements
    - Minimum guarantee
    - Overtime
    - Late arrival
    - Early Callback
  - Impact on Labor cost of non-7-day route cycles

Impact on Labor cost of non-7-day route cycles



Lease savings & relative quality of passenger facilities offered by BEL vs. SEA

- Advantages to Bellingham
  - Shorter trip distance
    - Potential travel time savings
    - Potential fuel savings
    - Potential additional service capability
    - Minimizes risk of premium pay on existing schedules
    - Permits increased time at Alaskan ports
  - Bellingham has allocated $2,000,000 to terminal site improvements
  - Dockside fueling permissible
  - Aggressive port marketing effort
- Disadvantages to Bellingham
  - Lower stewards revenue
  - No existing terminal at Bellingham
  - Use conflicts at Bellingham
    - Dockface use

Lease savings & relative quality of passenger facilities offered by BEL vs. SEA (cont'd)

- Parking & staging area use
- Warehousing space would have to be acquired
- All operational requirements would have to be established
- Additional travel required to reach Seattle area
- Initial pilotage costs
- Cost of re-establishing goodwill at new location
- Cost and timeliness of supplies delivered to new location
- Relocation expense
- Employee impacts

- Other issues related to Bellingham not yet resolved
  - Fueling time and cost
  - Longshoring cost
  - Bellingham head taxes
  - Bellingham facility lease costs
  - Impacts to commercial users

Lease savings & relative quality of passenger facilities offered by BEL vs. SEA (cont'd)

- Impacts to "walk-on" traffic
- Advantages to Seattle
  - Presently functional facility
  - Immediate access to Seattle area
  - Established location with "good will" developed
- Disadvantages to Seattle
  - Structural deficiencies (some being corrected)
  - Aging facility is becoming less attractive
  - Terminal location is in a congested traffic area
  - Parking & staging area expansion limited
  - No dockside fueling capability
- Other issues related to Seattle not yet resolved
  - Head taxes under a new lease
  - Facility lease costs under a new lease

Conclusions

- Both Seattle and Bellingham appear to be acceptable southern terminus locations
- Methods of resolving outstanding issues:
  - Requests for proposals
  - Direct negotiations
- Public input will be solicited through the AMHS Advisory Board
- Key factors in the port selection decision:
  - The quality and cost of the facilities to be provided
  - Users preferences
  - Reasonable resolution of issues relating to commercial users and "walk-ons"
  - Decision to be made by late summer or early fall 1988

A UNIT IN THE ORIGINAL FILE.

OVERVIEW OF HOUSE BILL 62

The purpose of the Act is to establish an authority for the operation, management, planning and construction of facilities for the Marine Highway System with a legal existence independent of and separate from the state government.

The authority consists of a seven member board appointed by the Governor. The Authority is a public corporation of the state and is an instrumentality of the state D.O.T. BUT has a legal existence independent of and separate from the state.

The directors serve at the pleasure of the Governor for four year terms. The directors receive no compensation but are entitled to travel and per diem expenses authorized by law for state boards and commissions.

The Authority shall employ an executive director who is responsible for selecting and employing additional staff as necessary.

The Authority may adopt and enforce by-laws and regulations for the conduct of its business and for the use of its services and facilities.

It is assumed the Authority would utilize the State Accounting System where possible.

The following assumptions are made:

1. The Alaska Marine Highway Authority's time and attendance, personnel and accounting systems would interface the existing State systems and be compatible.

2. There would be an annual appropriation for full operating costs of the authority each year that would be made up of expected revenue, i.e. program receipts and a general fund subsidy to cover the remainder.

3. The authority would continue to use:

   a. State owned office buildings
   b. The State Mail System
   c. The state equipment fleet
   d. The statewide purchasing contracts
   e. Share communications lines
   f. Insurance, bonding, etc. as now supplied
   g. Legal service from the Attorney General's office

4. The Directors of the Authority would meet an average of three days per month or thirty six days per year.

5. Administrative support would be provided to the Board of Directors from their existing staff

Introduced: 1/22/87
Referred: Transportation
and Finance

IN THE HOUSE BY CATO

HOUSE BILL NO. 62

IN THE LEGISLATURE OF THE STATE OF ALASKA

FIFTEENTH LEGISLATURE - FIRST SESSION

A BILL

For an Act entitled: "An Act relating to ferries and ferry terminals and establishing the Alaska Marine Highway Authority."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

* Section 1. PURPOSE. The purpose of this Act is to establish an authority for the operation, management, planning, and construction of facilities for the marine highway system with a legal existence independent of and separate from the state government. The authority shall be the exclusive state agency directly associated with the operation, management, planning, and construction of facilities for the marine highway system.

* Sec. 2. AS 19 is amended by adding a new chapter to read:

CHAPTER 70. ALASKA MARINE HIGHWAY AUTHORITY.

ARTICLE 1. CREATION AND ORGANIZATION.

Sec. 19.70.010. ALASKA MARINE HIGHWAY AUTHORITY. The Alaska Marine Highway Authority is established. The authority is a public corporation of the state. The corporation is an instrumentality of the state in the Department of Transportation and Public Facilities but has a legal existence independent of and separate from the state and has continuing succession until its existence is terminated by law.

Sec. 19.70.020. DIRECTORS. (a) The authority consists of seven directors appointed by the governor as follows: a representative of commercial carriers, a representative of the maritime industry, a representative of the tourism industry, and four members of the public representing regions served by the marine highway as follows: (1) one

THE ALASKA MARINE HIGHWAY SYSTEM

It is generally acknowledged that changes are required in the Alaska Marine Highway System.

In order to make these changes we need to identify what the areas of concern are:

ARE THEY:

1. Revenue shortfalls - Are revenues generated adequate?
   Does AMHS continue to hold it's share of the market?
   Are management decisions dramatically affecting the revneue picture?
   What can be done to increase revenues OR decrease expenses?

2. Services? a. Proposed cuts in services
   b. lack of adequate services to accommodate in-state transportation needs

3. Scheduling - Is the scheduling of ferries convenient and adequate to meet the needs of the residents of the communities it serves?

4. Marketing - Is the Marine Highway being marketed properly?

5. Personnel - Is the department top heavy/bottom heavy?
   When cuts to AMHS budget are made, are these cuts absorbed in personnel and in services?

6. Management - Are management decisions for AMHS made after extensive consideration of the alternatives?
   Is adequate time spent working toward improving AMHS?
   Does management have representation from the various aspects of the industry to enable well researched decisions to be made?
   What could help improve and expand the decision making process?
   Should decisions for AMHS be made by by DOT management?

SUMMER SCHEDULING - AMHS

Vessels servicing the North and Southbound runs

Malaspina - Monday and Thursday services from Prince Rupert to Skagway via Ketchikan, Wrangell Petersbury, Juneau, Haines

Taku - Sunday and Tuesday services from Prince Rupert to Skagway vai Ketchikan, Wrangell Petersbury, Juneau, Haines

Matanuska - Tuesday service Seattle to Skagway via Ketchikan, Wrangell, Petersbury, Juneau Haines

Columbia - Friday service from Seattle to Skagway via Ketchikan, Wrangell, Petersburg, Juneau Haines

****

Le Conte - Monday service leaves Petersburg to Skagway via Kake, Sitka, Angoon, Tenekee, Hoonah, Juneau, Haines

Thursday service Pelican to Haines via Hoonah and Juneau

Aurora - Monday, Tuesday, Thursday, Saturday and Sunday services from Ketchikan to Hollis

Friday service from Hyder to Hollis via Ketchikan

Tustumena - Provides continual service between Seward, Kodiak, Seldovia, Homer and Port Lions. Provides summer service between Valdez and Cordova

Bartlett - Sails on a daily basis to provide services between the ports of Valdez, Whittier and Cordova in summer.

The new FY 88 budget for AMHS proposes the following cuts:

a. Reduce Malaspina service by four months

b. Reduce Taku service by six months

c. Columbia lay up planned for 6 months

d. Scheduled service lay up of all vessels

This will mean only the Matanuska will operate year round on this north and southbound run. As a result of these reductions in service and layups 164 crew members will be impacted

****

Service to Prince of Wales Island and Southeast communities

a. Reduce the Aurora service by four months resulting in a single feeder vessel service in Southeast for eight months of the year versus the current four month period.
The Le Conte would be the single feeder vessel.
The Chilkat would increase service by four months to supplement service between Ketchikan and Prince of Wales Island.

****

Service to Southwest system

a. Reduce the Bartlett service by six months. The Tustumena will provide service for the entire Southwest system. Services between Cordova and Valdez in winter would not be available for 2 months because the Bartlett would be in lay up and the Tustumena would be in for servincing

****

OVERVIEW OF ALASKA MARINE HIGHWAY SYSTEM

Under the direction and supervision of House Transportation Chairman, Representative Bette Cato, House Transportation Committee staff, Rhonda Cargill and Wendy Chamberlain attended the Alaska Marine Highway Advisory Board Meeting. A meeting was also held with Deputy Commissioner Joe Camp who provided a great deal of information to the Chairman. This is an overview of those meetings. Due to the Chairman's strong interest in the Marine Highway System this report also includes information on areas researched, and answers to questions asked by the Chairman.

On Friday August 12th, 1985 the Alaska Marine Highway Authority Advisory Board had its' first meeting with Alaska Marine Highway. Approximately 2 years ago the Governor appointed members to a Marine Highway Task Force. The Task force work ended after completion of the Task Force Report which included 139 recommendations.

The Southeast Conference Board of Directors, comprised of southeast district representatives, southeast legislators, and southeast community mayors wrote to the Governor and the Department of Transportation requesting the task force be continued as an active board and be expanded to include representation from each marine highway "user" community. This would insure ongoing communication between the State administration and the people of Alaska serviced by the ferry system.

Although the task force was disbanded, Commissioner Knapp felt that the Southeast Conference provided a mechanism for input and recommendations from many of the southeast communities, and hence the Southeast Conference appointed representatives from each of the communities to serve on the Alaska Marine Highway Advisory Board.

The Advisory Board plans to meet with Marine Highway on a quarterly basis. As this was the first meeting an overview of Marine Highway was given by Commissioner Knapp and Deputy Commissioner Camp.

As this overview of Marine Highway is being done in August, 1985 it may be necessary to update this report to reflect any unanticipated changes made by Marine Highway during the next few months. Information gathered from monitoring and oversight of AMHS by the Chairman and staff will also be updated.

ALASKA MARINE HIGHWAY REPORT

Personnel

Commissioner of DOT - Richard Knapp
Deputy Commissioner - Joe Camp

There are 725 persons with Marine Highway who work afloat.
155 persons work ashore
During the past summer there were 850 vessel employees required to fill 331 jobs per week on all vessels. Considering two crews that totals 662 permanent jobs with 188 relief persons to fill in. Despite this there were times when there were not enough personnel to dispatch to cover all positions on vessels. Sick leave and vacation leave taken by employees accounted for a large portion of the personnel shortage.

Most of the personnel for Marine Highway are under union agreement. New contracts were recently agreed upon, these contracts are in effect until 1988.

Over 90% of unlicensed personnel are Alaskan residents
Over 50% of the masters, mates and pilots are Alaskan residents
Under 50% of the engineers are Alaskan residents

64% of the Marine Highway's total operating budget is for personnel services costs and benefits for employees.

During the past several months various "letters to the editor" have appeared in local newspapers drawing attention to the high salaries earned by Marine Highway management. The figures presented by Deputy Commissioner Joe Camp and those outlined in the Alaska Marine Highway budget indicate the following:
21% of ashore Marine Highway personnel earn over $40,000/year
32% of afloat Marine Highway personnel earn over $40,000/year

Alaska Marine Highway has recently reached an acceptable agreement with the Marine Engineers Beneficial Association on the local hire of engineers, therefore the percentage of Alaska hire of engineers should increase.

Vessel Information

The Alaska Marine Highway currently has nine vessels in operation. These include:

M/V Chilkat - the original ship of the Alaska Marine Highway She was acquired in 1959 and services the Southeast Panhandle.

M/V Malaspina - built in 1963, renovated in 1972 she services Northbound and Southbound areas

M/V Matanuska - built in 1963, renovated in 1978 she services Northbound and Southbound areas

M/V Tak - built in 1963, renovated in 1981, services northbound and southbound ports.

M/V Tustumena - built in 1964, renovated in 1969, services Seldovia, Homer, Port Lions and Kodiak.

M/V Bartlett - launched in 1968 she services Cordova, Valdez and Whittier.

M/V Columbia - She is the largest of Alaska's ferries and was launched in 1973.

M/V LeConte - Launched in 1973 servicing the Northern Panhandle.

Plans for the future for vessels

As the M/V Chilkat is the oldest vessel, the Marine Highway plans to retire the M/V Chilkat in the summer of 1986. She will stay in reserve for emergencies.

There is currently a masterplan being developed for the Alaska Marine Highway a draft of which should be available for the next legislative session. This plan will include a report on fast ferries.
Hopefully these fast ferries will provide a comfortable, cost effective and efficient alternative for various southeast communities.
The Marine Highway plans to request funds for the purchase of fast ferries in their FY 87 budget. (Federal and State)
Preliminary estimates show the cost of the fast ferry to be between 2-3 million dollars.
Further information on these ferries will be available when the masterplan is completed.

The Tustamena requires major passenger refurbishing. A recent survey showed a lot of life left in the hull of the Tustamena and therefore the Alaska Marine Highways plans to request refurbishing funds for the Tustamena in the FY 1988 budget. (Fed. & State)

Currently, each vessel is laid up for repairs annually. These routine repairs and maintanence can usually be completed in 30 days. Alaska Marine Highway has received a great deal of publicity over the recent laying up of the Colombia. It is anticipated that the Colombia will be in dead ship lay up in Seattle until at least March 1, 1986. The maintanence work on the Colombia is being done in Seattle, this in itself has created a great deal of controversy, particularly among Marine Highway employees.

The decision to place the Colombia in dead ship lay up was made because of revenue shortfalls. It costs approximately $90,000 more per run to sail the Colombia as compared to the other vessels that complete the same run. The maintenance contract was awarded to a Seattle firm because it was considerably less expensive and because no facilities are currently available in Alaska to allow for ships to be laid up for a long period of time. It is anticipated that next year the Ketchikan facility will be completed and ship lay up will then be done in Ketchikan, however, at the present time the additional cost of laying a ship up in the state of Alaska makes this unfeasible.
The plan for bringing the Colombia out of lay up and the expenses and considerations for the lay up are explained fully in the budget section.

Marine Highway would also like to increase the number of ocean going vessels they have available. Currently only the Tustamena is able to make runs to the Aleutian chain or any other "ocean" areas.

Future plans for terminals and facilities

Alaska Marine Highway recently reached an agreement with Canada on the use of the Prince Rupert facility. In the near future a 5 year lease will be signed for the facility with options to renew every five years for the next 20 years.

In June this year Marine Highway began providing services to the community of Hyder. This community will be serviced once a week by the Marine Highway. There are no plans to move the terminal from Prince Rupert to Hyder at this time, however, monies will be requested in the FY 87 budget to build a facility in Hyder. If approved this terminal may be considered for use in conjuction with the Prince Rupert terminal for north and southbound services. As Federal funds can only be used for capital projects such as purchasing and refurbishing of vessels, rebuilding and reparing facilities etc. it is likely that the much of the funding required to build the facility in Hyder will be requested from the Federal Government.

The $38 million Ketchikan vessel maintainence facility is underway and is scheduled for completion in December, 1986. The maintenance work is currently being done in Seattle, therefore this should be a definite asset to the community of Ketchikan and the State.

Funds have been allocated for construction of shore facilities at Kodiak, Homer, Seldovia and Whittier. Much of this funding is received from the Federal Government. For Example:

Kodiak	(Federal)	$2,790,000
	(State)	210,000

This facility will be an important step towards increasing the quality and efficiency of the service provided by the M/V Tustumena and/or the Tustumena replacement vessel.

Homer	(Federal)	$3,255,000
	(State)	245,000

This project is being coordinated with the City of Homer's revised Port Development/Small Boat Harbor project.

Seldovia Ferry Terminal	(Federal)	$3,255,000
	(State)	245,000

Additional site reconnaissance and preliminary engineering is being done on this project to enable shuttle ferry service for Homer/Seldovia.

Whittier Ferry Terminal (Federal) $2,180,000
(State) 140,000

Funds were allocated for this project in FY 86. Due to the poor condition of the current structure immediate reconstruction will be necessary.

Current Marine Highway Preliminary Engineering Projects.

Valdez Ferry Terminal - $50,000
After the preliminary engineering is done funds for construction of this project will be requested in future years budgets

Seward Ferry Terminal _ $75,000
This facility is in very poor condition. Alaska Marine Highway made an emergency appropriation of $150,000 in August, 1985 to assist with repair of pilings and bumpers at this terminal. After the preliminary engineering and location study is completed Alaska Marine Highway plans to request capital construction funds for this project.

Plans are in progress to build new immigration offices and ticketing offices in the Prince Rupert facility.

A new terminal in Metlakatla should be completed in May of 1986. Metlakatla will then be serviced by the Aurora via Prince of Wales Island, this will allow the Chilkat to retire.

Terminal work is now being done at both the Wrangell and Petersburg facilities

MARINE HIGHWAY FY 86 BUDGET

FY 86 Budget for Marine Highway

The next section reviewed is the budget. Under the direction of the Chairman, this section was monitored and reviewed continually. This information is being presented now because much of the decision making and questions asked regarding such matters as ferry scheduling, areas serviced, fares and overall operations are made based on their overall impact on the budget.

In FY 86 the total budget for Alaska Marine Highway is $68 million This is a $3 million or 4% increase over FY 85.

The total budget breaks down as follows:
$32 million state funds
$36 million project revenue

In FY 86 the Legislature changed slightly the way in which funds are appropriated for Alaska Marine Highway. Previously, all revenues from Marine Highway went into the general funds and an amount was appropriated from the Legislature for operation and maintenance of Alaska Marine Highway.

In FY 86 Alaska Marine Highway requested a $68 million dollar budget. The Legislature approved this amount and appropriated $32 million from the general fund. The remaining $36 million is to come from revenue generated by Alaska Marine Highway. If they do not generate this amount, they will have to make cuts to balance their budget. This allowed Alaska Marine Highway to receive Legislative approval for the budget amount requested, and yet provides management with the challenge of making decisions that will directly affect their revenues and in turn their overall operating budget.

Although it is early in the fiscal year, information provided to the Chairman indicate that the $36 million in projected revenues for the year may have been somewhat optomistic.
The projected revenues were approximately a $3 million increase over FY 85. It is realistic to expect that Marine Highway will increase revenues slightly over FY 85. Taking this into consideration Marine Highway anticipate that the "magic number" for "additional" revenues that they will need to generate to be approximately $1.8 million.

With overall revenue figures available as of September, 1985 it has become apparent that Marine Highway management will have to make operating cuts if they are to balance their budget for FY86. To date preliminary estimates show that cuts up to $1.8 million will have to be made by management. In an attempt to meet this shortfall, Marine Highway has implemented the following cost saving measures:

1. Lay up the M/V Colombia in Seattle until at least March 1, 1986. As stated earlier, each year the vessels go into lay up for approxminately 30 days for rountine maintanence. Because the Colombia is the most expensivr vessel run on the Seattle run, and, the winter operating costs exceed the revenues generated management decided to lay her up.
A contract for the maintanence and repairs to the Colombia was awarded to a Seattle based firm. When consideration was given in an attempt to lay up the Colombia in Ketchikan the additional cost made this unfeasible.
The cost comparison done by Marine Highway was as follows:

Contract work in Seattle	$143,000
Contract work in Ketchikan	$528,000

Several factors account for the higher costs to lay up the vessel in Ketchikan.

a. Cost to steam the ship would be very expensive, as the Ketchikan facility is not completed there is not adequate power available to steam the ship.
600 amps is required
280 amps power available from ship

b. Cost for 122 days of crew salary for 10 crew members. This was estimated to amount to approximately $297,000.

c. Garbage collection would have to be arranged
d. Sewer disposal (estimated to be $13,000)
e. Telephone

It is hoped that the Colombia will be brought out of lay up and crewed March 1st, however, Marine Highway management may find it necessary to leave the Colombia in lay up status until April. This decision will be made late December when the revenue picture becomes clearer.

2. Discussions between Representative Cato and Marine Highway management in early December provided no other definite information on proposed cuts or changes in service to balance the budget. Areas management stated may need to be considered included assessing the toll free lines and evaluating the cost of maintaining this service. Marine Highway management state that the cost of providing these toll free lines is very expensive, particularly the intrastate lines. Therefore careful consideration may need to be given to the actual benefit verses the cost of this service in the upcoming months.

WHY THE SHORTFALL IN REVENUE PROJECTIONS?

Alaska Marine Highway is concerned about the shortfall in revenue projection for FY 86. After many discussions, meetings and evaluation of information available, management feel the following areas contribute to this shortfall:

1. Airline fares

With the recent ultra super saver fare reduction by both Alaska and Western airlines many people are using air as a means of transportation because with the current price structure it is considerably faster and less expensive to fly. A decline in reservations is also being voiced by a number of local hotels who state that reservations are down as much as 30% under previous years. Inexpensive fares to Europe and other overseas countries are considered to be one reason for this as people are taking advantage of these low fares to travel overseas.

2. Cruiseship lines more competitive.

M/V Stardancer, owned by an overseas company loads in Vancouver and sails on a 3 day trip to Haines with a 4 day return trip. The Stardance makes stops in Juneau, Misty Fjords and Tracy Arm. This vessel has the capacity to carry approximately 300 vehicles. The fares for this trip are lower than fares charged by Alaska Marine Highway.

Example:

Standard Automobile shipping cost	
Seattle to Haines on Alaska Marine Highway	$500.00
Vancouver to Haines on M/V Stardancer	$250.00
25 to 26 foot motor home	
Seattle to Haines on Alaska Marine Highway	$1,000.00
Vancouver to Haines on M/V Stardancer	$350.00

Cabins

Cabin prices on the M/V Stardancer vary depending on the luxury of the cabin, however, a person may travel on the Stardancer in an inside cabin, with his/her meals inculded for the same price as a standard cabin on Alaska Marine Highway excluding meals.

2. Passenger load down

Although reservations for this summer were as projected, the actual revenue generated as a result of this travel is down. Alaska Marine Highway management feel that while numbers are up, the actual distance that individual passengers travelled is down and hence revenues are down.
The Seattle run is the most profitable run.
From information available it appears that the number of persons travelling on this run is down AND, the number of large vehicles transported on this run is also down.
In summary, this summer the Alaska Marine Highway system transported a greater number of passengers and vehicles, however, passengers travelled shorter distances. Also, while there was an increase in the number of vehicles transported by Alaska Marine Highway, the number of oversized vehicles travelling was down considerably.

Both long distance travel and large vehicle transportation are two areas that are very profitable for Marine Highway.

Representative Cato was assured the problem of "no shows" would be overcome this year as new regulations (attached), requiring advance payment of tickets and penalties for cancellation went into effect October 1st, 1985. Previously, persons who made reservations could pick up and pay for their ticket on the day of sailing. This, although very convenient for the traveller made the problem of "no shows" very frustrating and expensive.
The threatened strike by the masters, mates and pilots also had an effect as people either cancelled their reservations or used alternative means of travel.

WHAT ARE THE SOLUTIONS?

Proposed solutions to these concerns are currently being discussed. As several of these solutions go hand in hand with proposed changes in ferry scheduling and services this section will be outlined next along with the proposed changes.

Ferry Scheduling

Along with being one of the most difficult tasks for Alaska Marine Highway, scheduling is also one of the areas that many of the complaints arise over.

In order for persons to be able to plan for their vacations, ferry schedules are printed months in advance.
The decisions on next summers schedule were made September 1st 1985. This schedule has already been sent to the printers.
Once schedules are printed the department
is locked in as far as the number of vessels servicing an area, the number of runs being made per week and the pricing structure for fares, therefore long range decisions have to be made as accurately as possible well in advance.

Possible Solutions

In discussions with Representative Cato, Deputy Commissioner Joe Camp outlined the many alternatives that have been explored.

1. Agressively compete with the cruise lines.

2. Increase services on the most heavily booked runs to try and increase revenues.

3. Increase services on the most profitable runs. The revenue and direct expenses graphs included in the appendices provides a clear breakdown on each runs revenue verses direct expenses.

4. Cut services

5. Evaluate all the runs and have fares structured to attempt to make each run, where possible, cover expenses. (See attached graph in appendices)

6. Look at alternatives - fast ferries - as a more cost effective method of travel to areas within the state.

It is the intent of DOT and Alaska Marine Highway to continue all areas currently serviced. Runs made within Alaska to the smaller rural communities are not profitable, and, in many cases these runs only return revenues to cover approximately 20-30% of the expenses. Both Commissioner Knapp and the Chairman feel that services must be continued to these areas, they are remote parts of Alaska that have very few alternatives available. One of the main reasons Alaska Marine Highway was put into service was to provide a means of transportation within Alaska.

Several of the above alternatives are being considered at this time.

1. Increase services.
   The most heavily booked runs are the north and southbound runs from Seattle and Prince Rupert to Haines and Skagway. A great difference is apparent when the profitability of these two runs is compared:

Current service and revenues

Seattle to Skagway - 1 trip per week
1000 passengers (total) 165 vehicles
200 state rooms

Revenue for this run $325,000.00

Prince Rupert to Skagway - 2 trips per week
1400 passengers 330 vehicles
400 state rooms

Revenue from this run $218,000.00

The above breakdown shows that by carrying fewer people and fewer vehicles per week the Seattle run returns $107,000 more than the Prince Rupert run.

Consideration has been given to raising the fares on the Prince Rupert run to make the same profit as the Seattle run, however this would mean a 60% increase in fares. Marine Highway has therefore increased the fares on the Seattle run 4% and increased fares on the Prince Rupert run 8%.

In an attempt to take advantage of the more profitable Seattle run, Marine Highway has decided to make an additional weekly run from Seattle during the summer instead of Prince Rupert. This change is reflected in the new ferry schedules.

The graphs that follow and also those included in the appendices given an actual breakdown of each run and show revenues generated verses expenses incurred.

Other areas discussed or review

The reservations section of the Marine Highway is an area that is very busy. While on tour of the facility with Mr. Camp the telephones were ringing constantly. This is another area that many people complain about, -- not being able to reach the Marine Highway for reservations.

There are currently 9 lines available to Marine Highway:
These calls are answered in priority from Group 1 to 3.
Group 1 - 2 toll free lines for use within Alaska
Group 2 - 3 lines available for local callers
Group 3 - 4 toll free numbers for out of state use.

As you will see from the attached summary, 5163 calls were made to Marine Highway on August 5th, 1985. Of this 1389 calls were answered from the 2 toll free in state lines compared to 2400 from the 4 toll free out of state lines. This possibly explains the difficulty getting through to Marine Highway within Alaska.
The department is considering deleting one of the toll free out of state lines and possibly adding another toll free in state line for use by Alaskans. This addition may not be possible if revenues for the year continue to be down from those projected.
The cost of maintaining a toll free in state line is considerably more expenses because of in state telephone rates.

Although the 4 toll free out of state lines are constantly in use the time taken with each of the out of state calls is much longer than the local and in state calls. This is due to the fact that many people call from other states to make inquiries on everything from scheduling to the weather and are usually unfamiliar with the area and request a description on each port of call, which in turn ties up the staff and the lines for a considerable length of time. Therefore, deletion of one or more of the out of state toll free lines would be both cost saving and time saving.

Other office procedures

One of the biggest obstacles facing the Marine Highway should be overcome in this fiscal year. At the present time much of the hardware needed to make the computer system truly effective is not on line. Therefore in order to compare revenues from ticket sales month to month each ticket has to be individually punched into the

computer before a monthly figure is available. Currently the information available in from sales 2 to 3 months previous. The necessary hardware has been purchased and is currently being installed. This will provide accurate, up to date information on revenues generated for the previous months. This will help with management decisions such as fare structures etc.

All time sheets for all marine highway onshore an offshore personnel are computed by hand. Requests for funds for computers will be in the FY 87 budgets.

In summary, Alaska Marine Highway system has several short time priorities:

a. To make the necessary adjustments or cuts to balance the FY 86 operating budget. It is hoped that any adjustments or necessary cuts will have the least amount of impact on services or personnel.
b. To assess and implement methods to attain projected revenues. To work toward overcoming any obstacles and agressively compete in the transportation business.
c. To automate the offices to provide the most current and accurate information on passengers travelled, revenues generated and expenses incurred and therefore allow management to react more agressively to industry demands and swings, and to implement any changes that may be necessary for them to meet or exceed their projections.

The Long term plans for Marine Highway include looking into the fast ferries as an alternative. Constructing, upgrading and rebuilding facilities and vessels and providing more cost effective, efficient services both onshore and offshore.

JUL 15 1985

NOTICE OF PROPOSED CHANGES IN THE
REGULATIONS OF DEPARTMENT OF TRANSPORTATION AND
PUBLIC FACILITIES

Notice is given that the Department of Transportation and Public Facilities, under authority vested by AS 44.42.030, proposes to adopt regulations in Title 17 of the Alaska Administrative Code, dealing with Alaska Marine Highway tickets, to implement AS 44.42.020 as follows:

(1) 17 AAC 70.220(a) and (b) are proposed to be amended to incorporate the provisions of 17 AAC 70.221, and

(2) 17 AAC 70.221 is proposed to be adopted to establish procedures for refunds on Alaska Marine Highway tickets with the amount refunded, reduced depending upon when in relation to sailing the cancellation of the reservations occurs, the time of the year the space is reserved, and the particular route.

Notice is also given that any person interested may present written statements or arguments relevant to the proposed action by writing to Deputy Commissioner, Alaska Marine Highway System, Pouch R, Juneau, Alaska 99811, so that they are received no later than August 9, 1985.

This action is not expected to require an increased appropriation.

Copies of the proposed regulations may be obtained by writing to:

Merv Griggs
Alaska Marine Highway System
Pouch R
Juneau, Alaska 99811

The Department of Transportation and Public Facilities, upon its own motion or at the instance of any interested person, may, after the deadline stated above, adopt proposals within the scope of this notice without further notice or may decide to take no action on them.

DATE: _____

_____
Joe D. Camp
Deputy Commissioner
Alaska Marine Highway System
Department of Transportation
and Public Facilities

17 AAC 70.220(a) and (b) are amended as follows:

17 AAC 70.220. REFUND OF FARES, RATES OR CHARGES. (a) Passage tickets for passengers or vehicle deck space when presented by the legal owner, within one year of valid date, may be redeemed, subject to the provisions of 17 AAC 70.221, under the following conditions:

(1) unused passage tickets when travel was not performed or when transportation was not provided will be refunded at full value upon application;

(2) changes in destination, number of persons ticketed, size of vehicle or other details that result in the transportation provided being of lesser value than the purchase price of the passage ticket, must be adjusted on the basis of the true published value of the transportation provided; the adjusted difference will be refunded upon application;

(3) lost tickets may be refunded upon application and certification of loss.

(b) Tickets issued for stateroom or berth accommodations, when presented by the legal owner, may be redeemed, subject to the provisions 17 AAC 70.221, under to the following conditions:

(1) if canceled prior to sailing full refund may be made upon application,

(2) when travel distance is shorter than originally ticketed, or when all berths originally ticketed are not used, no adjustment in charges for the berth or stateroom service will be allowed. (Eff. 7/8/72, Reg 42; am / / , Reg.)

17 AAC 70.221. REFUND OF TICKET AMOUNTS. (a) Amounts refunded on tickets shall be reduced from the full ticket price for routes specified in this section as follows:

(1) if cancelled thirty days prior to sailing, 100 percent is refunded;

(2) if cancelled more than twenty days, but less than thirty days before sailing, 80 percent is refunded;

(3) if cancelled more than ten, but less than twenty days before sailing, 60 percent is refunded;

(4) if cancelled less than ten days before sailing 40 percent is refunded; and

(5) if the vessel sails without cancellation of the tickets, nothing is refunded;

(b) The provisions of this section apply to the following routes:

(1) all tickets for sailings using Seattle as a point of origin or as a destination;

(2) all tickets for sailings northbound from Prince Rupert during June and July of each year;

(3) all tickets for sailings southbound to Prince Rupert from July 15 through September 15 of each year;

(4) all tickets for any sailing between Whittier and Valdez; and

(5) all tickets for individual sailings specified in the Alaska Marine Highways' schedule. Schedules are issued for the periods October 1 through April 30 and May 1 through September of 30 each year. Copies of the schedules may be obtained from The Alaska Marine Highway System, Pouch R, Juneau, Alaska 99811. (Eff. / / / , Reg.)

All Employees
Alaska Marine Highway System

I am writing this letter to all employees in response to a letter (copy attached) published on Thursday, October 31 in the Juneau Empire. That letter got my attention for three reasons:

1) It contained persistent false rumors and accusations;

2) it was allegedly signed by a dedicated employee who had recently died; and

3) it mentioned one event that occurred after his death.

On Friday morning, November 1, while pondering how Mr. Clark could have written a letter about something that occurred after his death, I received a call from Mr. Carl Sampson, Managing Editor of the Empire. He had just received a call from Mr. Clark's daughter who had informed him that Mr. Clark could not have written or had anything to do with that letter since Mr. Clark had been gravely ill in a Portland hospital for some time before his death. The Friday Empire carried an editorial (copy attached) that states the Editor's position much better than I can.

Even though some individual or group of individuals has taken advantage of Mr. Clark and his family and possibly the letter to the editor should be ignored, I believe I owe it to all of you to answer with facts the false charges that letter implied. My comments respond paragraph by paragraph to the letter to the editor.

Our labor costs are high. Over 53.5 percent of our total operating budget is in personal services costs and benefits for our vessel employees. Shore employee personal services and benefits are less than 9.5 percent of our total operating budget. No other major vessel operator faces those types of labor costs to my knowledge and experience. Most of the wages are hard earned and well deserved, but management must ensure that we do not pay for services not needed.

Office personnel have not tripled. In fact, there have been a total of only 15 personnel added to the authorized Alaska Marine Highway System (AMHS) personnel count since July 1980 and seven of these were approved this year and are Capital funded positions to manage construction projects for Marine Facilities Engineering. It may seem to the unknowning as if many positions have been added to headquarters staff since AMHS has consolidated under one Deputy Commissioner. With the exception of the 15 new personnel, all other positions have long been employed in Department of Transportation and Public Facilities (DOT&PF), doing AMHS work. Many were simply located elsewhere where they reported to different supervisors but they were performing AMHS tasks. The DOT&PF reorganization in 1983/84 simply located them centrally in the same organization which, incidentally has made us more responsive and efficient. There are 7 persons or 4.7 percent in the shore staff of AMHS earning $60,000 or more. There are 69 or over 8.1% of all vessel personnel earning that much or more. In addition, there are 205 or 24% of all vessel personnel earning between $40,000 and $60,000. Ashore there are 24 or 16.3% earning those wages. Shoreside supervisors and managers are not eligible for overtime even though many extra hours of work are required. The shore staff to vessel employee ratio of AMHS compares very favorably with the Washington State Ferries. Washington State Ferries have one person ashore for every four afloat while AMHS has one person ashore for every 5.8 persons afloat.

In the winter our administrative staff must still order the supplies, account for revenues and expenses, pay the bills, dispatch personnel, handle payroll, prepare budgets, manage capital construction projects and make reservations. There is no slack period ashore as there is on the routes.

We are implementing a limited number of training programs for our shoreside staff just as we are for our vessel personnel. Both programs will increase as our budget will allow. Non-performers, both afloat and ashore are being appropriately dealt with within the bounds of union contracts.

Management philosophy is not intended to be antagonistic toward vessel personnel. When I was at sea I made a vow that if ever I was in a management position ashore, I would ensure that the shore staff always remembered that their only reason for being was to support the ships. We are dedicated to making AMHS a more efficient organization that better serves the needs of all Alaskans. We are antagonistic to any personnel who seem only to think of how they can get more for doing less or those who fail to remember that our sole reason for operating is to serve the public.

M/V COLUMBIA will be in a dead ship lay up status until at least March 1. Todd Shipyard will also complete the industrial overhaul during that period. To lay COLUMBIA up in Ketchikan this year would have cost AMHS a minimum of $528,000 in auditable costs. The Todd Shipyard contract is for $143,000, or a savings of $385,000. That savings equates to two extra weeks sailing for a mainline vessel, providing service to the public.

Shoreside employees travel on passes only when they are on official business, therefore reservations for cabins are in order and meals are included in lieu of per diem. Occasionally, I take my vehicle when I travel on official business on the ferry. It is a cost savings measure as I then do not need to rent a car at destination and I only do this if there is adequate space available. Shoreside personnel do not receive passes for vacation travel. Shoreside employees' family members never receive passes for passage or meals. Mr. Black's daughter was, traveling on a purchased ticket, erroneously not charged for an evening meal on M/V COLUMBIA this summer. Mr. Black brought it to the attention of the Port Steward and thought it was resolved before he left the ship. After debarking, he discovered the meal had not been paid for and he paid the bill the next COLUMBIA trip through Juneau.

I firmly believe that we have the finest system and that we have more dedicated, hard working employees than any organization of comparable size anywhere in the world. We must all work together to improve our system so that it can function to its fullest to provide service to the public. To the majority of you who work so hard for our system, I say thanks, keep up the good work and help us realize the real potential this system has.

Sincerely,

Joe D. Camp
Deputy Commissioner

Enclosures

Mr. Black and I were recruited from outside the state. We both had extensive experience in managing and working with civilian crewed vessels. Many successful businesses recruit ex-military personnel for their proven track record as cost effective managers. We both hope to remain in Alaska for a long time. Incidentally, we have given all vessel employees who collect COLA but who are "P. O. Box Alaska residents" the opportunity to correct past errors without penalty. Those who we now identify as having filed false claims in order to collect COLA will be dealt with to the limits of the law including termination and collection actions to recover COLA paid non-residents. Only the cheaters should be bothered by this. Alaska residents and those honest outsiders who don't collect COLA should be happy to see it happen.

Some marketing surveys have been conducted for specific purposes. Where appropriate and where funding is available the recommendations are implemented.

I made the statement that I thought airline super saver fares were the principle cause of falling revenue this year. There are many other factors involved and we are taking whatever action we can to counter those losses. One will be to sail two vessels out of Seattle next summer. Our service to Hyder was the result of legislation that required it. DOT&PF argued against it in all committee hearings because of the anticipated losses. The $47,000 loss was for the entire summer, not each week. We will again serve Hyder/Stewart next summer, but since we will be carrying vehicles we should not have a loss.

Last summer we had over 850 vessel employees to fill 331 jobs per week on all vessels. Considering two crews that totals 662 permanent jobs with 188 relief personnel to fill in. In spite of that number of extra personnel we sometimes did not have enough personnel to dispatch to cover all positions on all vessels. We did not sail below Coast Guard certificate. AMHS is the only seasonal business I know of that has allowed almost unlimited leave during the peak season. Too liberal a leave policy and a higher than usual "not fit" situation during a portion of this summer left us short. With the funding shortages we have, hiring additional personnel was not the answer, but better managing the personnel we have may be. We are seriously considering limiting all personnel to no more than one work week leave and then only for a limited number on leave each week between May 15 and September 15 next year. I dislike having to limit leave but we are in a seasonal business whether we like it or not.

JUNEAU EMPIRE - October 31, 1985

Letters

Ferries need help from top down

Dear Sirs,

This letter is a response to the growing antipathy being created in the Alaska Marine Highway Systems (A.M.H.S.) between shipboard personnel and the management in the Juneau office. Management seems oblivious to its contribution to waste in state government and prefers to put the blame on "high" labor costs. Examples of mismanagement are rife, but we will explore only a few in this document.

Office personnel and mid-level managers have about tripled in the past five year, with officer's wages averaging $60,000 a year. One might compare ferry management (in terms of the ratio of office to line workers) with private shipping companies or the Washington State Ferries. They operate with a fraction of the personnel and have bigger budgets, more ships, and larger payrolls.

Each winter half the ships are laid up in the shipyard for maintenance, but there is never a reduction in force in office personnel. Actual ships and compliment crews are static, while office workers multiply exponentially.

There is no policy of continuing (or even initial) management training. Poor personnel are never removed, just shifted to a different title – usually a position of more responsibility.

Management philosophy is antagonistic to shipboard workers and is heavily infiltrated by ex-military personnel. Since when is the military a good place to recruit people to be cost effective?

Top management has been imported from outside the State of Alaska, even though Governor Sheffield in a recent press interview still gives lip service to local hire on state financed projects.

There have been approximately 11 marketing surveys done for the state in as many years (at what cost?) that have NEVER been utilized. Evidently no one in Juneau knows how to analyze and implement the data gathered by the firms contracted for the surveys.

A D.O.T. official in a recent public statement blamed loss of ferry revenue on super saver air fares, but said the A.M.H.S. is taking steps to save money at the operational level. So far this has translated into less sailors and stewards to work shipboard during peak summer months, and inaugurating weekly trips to Hyder, Alaska, at $17,000 per trip.

Lay up on "dead ships" (those vessels with no maintenance being done and no workers aboard) are being tied up to sit in ports outside of Alaska. These docking fees could just as easily go to Alaskan cities with docking facilities.

Ethical standards for any operation, be it public service, the private sector or the military, are set by the leadership and filter down to subordinates. At the A.M.H.S. we are given the examples of "do as I say, not as I do." Memorandums are issued denying employees traveling on passes from (1) reserving staterooms or (2) having free meals aboard the ship, yet an official's daughter travels with her father while he is ostensibly on official business, all meals provided to them at state expense. On a recent "special" voyage to Sitka, officials traveling on passes reserved their stateroom accommodations, even after their own memos (dated two weeks previously) state quite clearly there would be no exceptions to the pass-reservation rule.

The old adage "Physician, heal thyself" might be well applied to a bloated, inefficient bureaucracy whose typical response to declining state revenues and calls for a more cost effective program is to blame the workers who set no policy, have little or no control of day-to-day operations and who struggle to interpret variable and often capricious office politics.

Juneau, 99803

JUNEAU EMPIRE - November 1, 1985

An apology for an abuse of a privilege

A newspaper has many jobs: to inform, to entertain and to provide a forum for the expression of opinions. Each of those functions is important, because together they provide a well-rounded view of the world around us. If one of those functions had to be chosen as most important, the free expression of opinion would probably be it. That's because in a democracy, the free expression of opinion is not reserved for the few, it is a privilege enjoyed by all.

Most of the time, people express their opinions in a responsible manner. Once in a great while, however, that privilege is abused. It doesn't happen when an individual speaks deeply held beliefs, and it doesn't happen when an honest error in fact is stated.

It happens when an individual, or group of individuals, purposely seeks to deceive.

By all indications, that's what happened in a letter to the editor published in Thursday's Empire. In it, someone apparently forged another person's signature. While that is bad enough, the person whose name had been forged had passed away nine days after the letter was dated. The family says he had been severely ill in Oregon and there is no way he could have written the letter or had anything to do with it.

Maybe the person who forged that letter has a just cause. Or maybe he thought he was being real smart by taking another man's name. But no matter how you look at it, nothing can justify this sort of flagrant and willful abuse of a privilege. Whoever did it not only destroyed his credibility and perpetrated the most irresponsible of deceptions, he needlessly hurt the man's family, friends and former co-workers.

What can justify that sort of action? Nothing. What can make up for the hurt? Nothing.

We offer our apologies to the members of Larry Clark's family and the many other people who we hurt by publishing that letter, and you can bet we will make every effort to make sure this never happens again.

If the person responsible for this deception had any courage or sense of right, he or she would also apologize to the family and to the public.

DIVISION OF ADMINISTRATIVE SUPPORT
ALASKA MARINE HIGHWAY SYSTEM

Martin J. Nusbaum, Director

- With its staff of 51 the Division of Administrative Support was able to meet its objective of providing the necessary supply, personnel and finance functions for the Alaska Marine Highway System by meeting the following objectives.
- Payroll and dispatching errors decreased by 25%.
- Decrease in crew travel pay due to dispatch errors by 28%.
- Decrease in time on recording crew seniority points by 28%.
- Decreased processing time whereby vendor payments were accomplished under thirty days from time of invoice to payment.
- Further progress is anticipated in FY 86 in that objectives toward improving systems with the help of computers is expected to be made in the following areas:
- Prompt and accurate rating and response to marine employee applicants as to hiring qualifications and compliance with affirmative action.
- Improve warehouse and inventory control procedures. Reduce error rate to 2%.
- Establishment of cost centers including management and accounting requirements to identify profit/loss for services performed.

Sent to Dave
10-31-85 / 15

ALASKA MARINE HIGHWAY SYSTEM
DIVISION OF MARKETING AND SERVICES

Josephine Emery, Director

- A major change took place within the Division of Marketing and Services in FY 85 when reservations' functions were centralized in Juneau. A staff of 65 includes reservations positions which were shifted from both the Seattle and Anchorage offices, which had previously shared the reservations load, to the Juneau office. Toll free lines, two Alaskan and four out-of-state were installed along with appropriate electronic call distribution, monitoring and reporting. This has proven effective with the number of unanswered telephone calls being reducted significantly.

- Most of the objectives of the Division were reached as the response to telephone and letter inquiries improved as planned and the number of vehicles transported increased from 94,000 to 99,000 as projected. However, two objectives were not reached. Passenger traffic did not reach projected levels as ridership actually declined one percent compared to the projected rise of three percent.

- With passenger traffic declining, revenue also fell short of projections by nearly six percent at $32.6 million.

ALASKA MARINE HIGHWAY SYSTEM
DIVISION OF MARINE FACILITIES ENGINEERING

Harold Moeser, Director

- With the FY 85 funding level Marine Facilities Engineering was able to meet its objectives in the development and obligation of $10,700,000 in capital construction. Projects included the rehabilitation of the M/V MATANUSKA and Petersburg Ferry Terminal ($7,500,000), and new or major improvements at Tenakee, Hoonah and Ketchikan ($3,200,000).

- The staff total of 20 includes a Naval Architect and five registered professional engineers. Beginning in FY 85 a full time Shore Maintenance Manager function was established to schedule and contract for shore maintenance as needed.

- The legislature authorized 7 additional positions for FY 86 which will allow this Division to target for an FY 86 capital construction output of $26,000,000. The primary emphasis will be in completing the Ketchikan Ship Repair Yard ($18,000.000), improvements to vessels M/V COLUMBIA (Bow Thruster), M/V BARTLETT and M/V MATANUSKA ($2,600,000), and new or improved terminal facilities at Wrangell, Metlakatla and Seward ($5,200,000). Maintenance of all Alaska Marine Highway Terminals is ongoing and estimated to be $200,000 per year.

ALASKA MARINE HIGHWAY SYSTEM
DIVISION OF MARINE OPERATIONS

Eugene H. Black, Director

Objectives of FY 85

- Full utilization of our capital assets, our ships, and shore facilities.
- Provide additional service the private sector could not offer. This deals with new Alaskan ports and frequency of service.
- Increase ship operating days and passenger boardings.
- Reduce overhaul costs

  a. Increasing productivity per labor hour
  b. Improved scheduling
  c. Shorter layup period

- Improve passenger service by upgrading facilities and expanding passenger food service options.
- Re-engine the M/V MATANUSKA.
- Upgrade safety equipment to state of the art on all Alaska Marine Highway System vessels.

The number of employees under Alaska Marine Highway System supervision

- Nine shoreside management positions to supervise 725 vessel positions.

Accomplishments

- The ships were better utilized with an increase in ships operating days.
- Service to Alaskan communities was expanded by scheduled trips to Hyder, Alaska. Service across the Gulf of Alaska was expanded and studies are being done to analyze this area.
- Overhaul costs were reduced by several changes in management practice.

a. Executed second year of a five (5) year service contract with main engine manufacturer for the maintenance of the main engines on the M/V COLUMBIA with an estimated annual cost savings of 500,000 dollars, which has resulted in improved operational reliability of the M/V COLUMBIA.

b. Better scheduling of layup personnel resulted in more productivity with smaller crew levels.

c. Less days were spent in layup status resulting in more use of Alaska Marine Highway System vessels.

- Extensive upgrading of Alaska Marine Highway System vessels occurred in FY 85. The major ones that affected Passenger Services are:

a. Reinstituted year-round table service for dinner meal on board Seattle run ships.

b. Installed Amtrak style recliners on M/V's LeCONTE, AURORA and COLUMBIA.

c. Installed toddler play area on M/V's TAKU and MALASPINA.

d. Major carpet upgrading on M/V's MALASPINA, LeCONTE and TAKU.

e. Remodel of Cocktail Lounge and Dining Room on the M/V MALASPINA.

f. Installed public showers on the M/V AURORA and M/V LeCONTE.

- The M/V MATANUSKA was re-engined. The life cycle cost savings justified this project. The fuel consumption comparisons are very favorable after the first four months of operations.

- Several safety related changes were made to bring Alaska Marine Highway System up to the state of the art.

a. Upgraded all radar systems in the fleet with state of the art capability.

b. Installed new extended skeg on the M/V COLUMBIA to improve her handling characteristics.

c. Conducted firefighting and CPR training programs for employees in Deck, Engine and Stewards Departments.

d. Continued upgrading the plumbing, electrical and ventilation systems aboard the ships.

e. Increased emphasis on the upgrading of all navigational equipment.

- The change in direction from FY 84 to FY 85 was more a consolidation than a change. More efficient use of Alaska Marine Highway System Facilities, better scheduling of work and personnel, and expanded frequency of service.

- FY 86 is a year where due to budgetary restraints, major cost cutting measures are being put in place. It is our intention to not retreat in regard to increasing our passenger boardings comparison. We are planning to accomplish more but with less. The proposed changes are:

a. By better scheduling, the M/V COLUMBIA will be layed up during the least profitable period. Even with the layup, passenger boardings should show a reasonable increase. The savings from this measure will result in a cost savings of approximately $431,952.16 due to her being in cold ship status void of crew.

b. The average time the ships will remain in maintenance/overhaul status will be cut, allowing additional time on the run to offset the M/V COLUMBIA layup.

c. Size of overhaul crew levels will be cut by 11%. Due to improved procedures and scheduling, the work will be completed in less days.

d. The food service during overhaul period will be replaced with meal per diem, which will result in a cost savings of $241,915.46.

e. There will be a change to two mainline ships calling on Seattle during the summer season, which will result in savings from less expensive supply costs and should increase revenues due to more passenger miles being logged.

BILL SHEFFIELD, GOVERNOR

DEPARTMENT OF TRANSPORTATION AND PUBLIC FACILITIES

POUCH Z
JUNEAU, ALASKA 99811
PHONE: (907) 465-3900

OFFICE OF THE COMMISSIONER

February 28, 1985

Ms. Sally Smith
President
Southeast Conference
P. O. Box 29
Douglas, AK 99824

Dear President Smith:

This is in response to your recent letters to Deputy Commissioner Joe Camp and me regarding reactivation and expansion of the Marine Highway Task Force. The Task Force was appointed by Governor Sheffield, and its work ended with completion of the Task Force Report. I do not believe it would be beneficial to reactivate and expand the Task Force at this time.

I can, however, see some benefits from having an advisory group to work with the Alaska Marine Highway System. I believe such a mechanism currently exists within the Southeast Conference. I would like to suggest that your Transportation Committee or some other group from your organization assume such a role. I can see the need for regular meetings and suggest for your consideration, quarterly meetings to be scheduled by the Advisory Group at their convenience with the concurrence of the Deputy Commissioner of the Alaska Marine Highway.

Sincerely,

R. J. Knapp
Commissioner

cc: Joe Camp, Deputy Commissioner
Alaska Marine Highway System

...laskans"

SOUTHEAST CONFERENCE

P.O. Box 29 • Douglas, Ak. 99824

(907) 586-6846

February 5, 1985

The Honorable Bill Sheffield
Governor
State of Alaska
Pouch A
Juneau, AK 99811

Dear Governor Sheffield:

The Southeast Conference board of directors, comprised of Southeast district representatives, Southeast legislators, and Southeast community mayors, has reviewed the Marine Highway Task Force report to the State and is following the implementation of those recommendations we support.

The Southeast Conference board requests the Marine Highway Task Force be continued as an active board and be expanded to include a representative from each marine highway "user" community. This would ensure ongoing communication between the State administration and the people of Alaska serviced by the ferry system.

We shall appreciate your comments regarding this request which the board believes will achieve a balanced direction for the future of the marine highway system.

Respectfully,

Sally Smith

Sally Smith
President

RE: Ferry Stystems in Washington State and British Columbia
Research Request 87-025

You requested general information regarding the ferry systems in Washington State and British Columbia. Information on fares, traffic, employee unions and financial structure is provided below.

Washington State Ferry System

The Washington State Ferry (WSF) system began operation in 1951. The system was purchased from individuals who had been operating ferries on the Puget Sound since the turn of the century. The state purchased 15 ferries, 20 terminals and miscellaneous supplies for $4.95 million. Today, the Marine Division of the Washington State Department of Transportation controls assets valued at over $308 million and operates 22 vessels which carry seven million vehicles and 17 million passengers each year.

All of the ferries are capable of carrying cars as well as passengers. The largest vessels in the system are two 440-foot "jumbo" ferries, each with a capacity of 206 autos and 2,000 passengers. The smallest ferry (150 feet) is capable of carrying 40 autos and 200 passengers. The total car-carrying capacity of all the ferries is 2,412. The ferries are not equipped with sleeping facilities, although food service is available on the majority of the vessels.

The system operates nine routes serving 20 terminal locations throughout Puget Sound. Routes are devoted to both commuting and recreational travel. The shortest route is 1.5 nautical miles (15 minutes) in the Tacoma urban area, and the longest route is 38 nautical miles (3-1/2 hours) in the San Juan Islands. Recreational travel accounts for 32 percent of all ferry trips. Seventy percent of all passengers are recreational travelers.

The British Columbia Ferry Corporation

The British Columbia Ferry (BCF) Corporation was created in 1960 by the provincial government. The system began after two private ferry companies operating in B.C. went on strike. During 1961, with purchase of the assets of one of the striking companies, the corporation operated two ships over one route and employed approximately 225 people. In 1985, the BCF was consolidated with the coastal fleet of the Provincial Division of the Ministry of Transportation and gained 14 vessels and ten routes. Today BCF operates 39 vessels over 25 routes and employs approximately 2,700 people. The system is a Crown Corporation, which means it is publicaly owned and pays no provincial or federal income taxes.

Of the 39 ships operated by the system, 38 have car carrying capabilities. The largest vessels are five 457-foot "jumbo" ferries that can each carry 360 vehicles and 1,500 passengers. The smallest vessel is a 38-foot passenger-only ferry with a capacity of 40 people. Two vessels have sleeping facilities and approximately half offer food service.

The shortest route in the system is two nautical miles (18 minutes) and the longest is 274 nautical miles (15 hours). The busiest route is between Vancouver and Victoria--the provincial capital. All of the routes are day routes except for one, which becomes an overnight trip during the winter season. The corporation serves urban commuters, recreational travelers, and a great number of business travelers between the mainland and the capital. Summer is the busiest season; during the winter, traffic drops by approximately 50 percent.

Fares. Fares for the most heavily used route between Vancouver and Victoria are $19 for a car and driver and $4 for a passenger. Today's fares represent about a 200 percent increase for vehicles and a 100 percent increase for passengers over fares charged when the corporation began operation in 1960. Reservations are utilized for vehicles and passengers on one route and for vehicles on only two routes. Credit cards are accepted only on the routes which utilize reservations.

Traffic. Until 1982, the BCF had experienced a steady growth in traffic. Since that time, volume has decreased slightly each year. The system expects 1986 to set all time traffic records due the increase in tourism at the World's Exposition in Vancouver. According to the corporation, traffic is handled efficiently by the current vessels and there are no plans for fleet expansion.

Employees. Of the 2,700 employees, all are unionized except for the ship's captains. The British Columbia Ferry and Marine Workers Union represents the workers.

RE: Ferry Stystems in Washington State and British Columbia
Research Request 87-025

You requested general information regarding the ferry systems in Washington State and British Columbia. Information on fares, traffic, employee unions and financial structure is provided below.

Washington State Ferry System

The Washington State Ferry (WSF) system began operation in 1951. The system was purchased from individuals who had been operating ferries on the Puget Sound since the turn of the century. The state purchased 16 ferries, 20 terminals and miscellaneous supplies for $4.95 million. Today, the Marine Division of the Washington State Department of Transportation controls assets valued at over $308 million and operates 22 vessels which carry seven million vehicles and 17 million passengers each year.

All of the ferries are capable of carrying cars as well as passengers. The largest vessels in the system are two 440-foot "jumbo" ferries, each with a capacity of 206 autos and 2,000 passengers. The smallest ferry (150 feet) is capable of carrying 40 autos and 200 passengers. The total car-carrying capacity of all the ferries is 2,412. The ferries are not equipped with sleeping facilities, although food service is available on the majority of the vessels.

The system operates nine routes serving 20 terminal locations throughout Puget Sound. Routes are devoted to both commuting and recreational travel. The shortest route is 1.5 nautical miles (15 minutes) in the Tacoma urban area, and the longest route is 38 nautical miles (3-1/2 hours) in the San Juan Islands. Recreational travel accounts for 32 percent of all ferry trips. Seventy percent of all passengers are recreational travelers.

Fares. Fares range from $0.95 (passenger) and $3.40 (car and driver) for a 15-minute route to $5.50 (passenger) and $23.65 (car and driver) for a 3-1/2-hour route. Table 1 presents a history of cross sound auto and driver fares and passenger fares and the consumer price index during the last sixteen years. The table indicates that fares have increased at a pace comparable to the Seattle area consumer price index. The WSF does not utilize reservations, except for cars on the Anacortes, Washington-Sidney, B.C. route during the summer months only. The WSF does not accept credit cards for payment of fare.

Traffic. Table 2 shows that systemwide traffic grew steadily during the 1970s but declined in the early 1980s, when Washington experienced a severe economic downturn. Since 1982, total traffic volume has been gradually returning to the 1979 peak. Traffic has already exceeded previous highs on many routes. The system makes an average of 323 daily trips, carrying 47,000 passengers and 19,000 vehicles. The smallest route has 534 average daily passengers and 200 vehicles; the largest has 8,554 average daily passengers and 4,325 vehicles. The summer months are the busiest time: traffic drops by 57 percent during the winter.

During the past six years, WSF has acquired six new vessels. Due to reduced traffic and these new vessels, the system has been able to avoid increasing service hours. Total system vehicle traffic is projected to grow at an average annual rate of 0.4 percent during the next six years. Traffic on some routes is expected to decline, while other routes are expected to expand substantially. To accomodate the growth, the system plans to purchase four passenger-only vessels. These ferries will be utilized on runs that currently experience traffic overloads during certain service periods.

Employees. The WSF employs approximately 950 year-round employees, with 250 employees added during the summer months. All employees are unionized. The three unions representing WSF employees are: Captains, Mates, and Pilots Union; Inland Boatmen's Union; and Marine Engineers Beneficiaries Association.

Financial Structure. Fare revenues have covered approximately 70 percent of operating expenditures and 40 percent of operating and capital expenditures during the last three fiscal years. In addition to fares, the WSF system acquires revenue from taxes and a toll bridge. Table 3 is a flow chart depicting how the revenues from fares, car registration fees, gas and vehicle taxes, bond sales, and federal funds are channeled into different accounts to cover operating and maintenance, ferry improvement, construction, and debt service expenses. Table 4 is a history of operating expenses and revenue sources of the WSF since 1967. Table 5 presents anticipated revenues and expenditures in the 1985-1987 biennium.

The British Columbia Ferry Corporation

The British Columbia Ferry (BCF) Corporation was created in 1960 by the provincial government. The system began after two private ferry companies operating in B.C. went on strike. During 1961, with purchase of the assets of one of the striking companies, the corporation operated two ships over one route and employed approximately 225 people. In 1985, the BCF was consolidated with the coastal fleet of the Provincial Division of the Ministry of Transportation and gained 14 vessels and ten routes. Today BCF operates 39 vessels over 25 routes and employs approximately 2,700 people. The system is a Crown Corporation, which means it is publicaly owned and pays no provincial or federal income taxes.

Of the 39 ships operated by the system, 38 have car carrying capabilities. The largest vessels are five 457-foot "jumbo" ferries that can each carry 360 vehicles and 1,500 passengers. The smallest vessel is a 38-foot passenger-only ferry with a capacity of 40 people. Two vessels have sleeping facilities and approximately half offer food service.

The shortest route in the system is two nautical miles (18 minutes) and the longest is 274 nautical miles (15 hours). The busiest route is between Vancouver and Victoria--the provincial capital. All of the routes are day routes except for one, which becomes an overnight trip during the winter season. The corporation serves urban commuters, recreational travelers, and a great number of business travelers between the mainland and the capital. Summer is the busiest season; during the winter, traffic drops by approximately 50 percent.

Fares. Fares for the most heavily used route between Vancouver and Victoria are $19 for a car and driver and $4 for a passenger. Today's fares represent about a 200 percent increase for vehicles and a 100 percent increase for passengers over fares charged when the corporation began operation in 1960. Reservations are utilized for vehicles and passengers on one route and for vehicles on only two routes. Credit cards are accepted only on the routes which utilize reservations.

Traffic. Until 1982, the BCF had experienced a steady growth in traffic. Since that time, volume has decreased slightly each year. The system expects 1986 to set all time traffic records due the increase in tourism at the World's Exposition in Vancouver. According to the corporation, traffic is handled efficiently by the current vessels and there are no plans for fleet expansion.

Employees. Of the 2,700 employees, all are unionized except for the ship's captains. The British Columbia Ferry and Marine Workers Union represents the workers.

Financial Structure. The BCF operates each year on a $40 million (Canadian) subsidy from the provincial government. Due to the large increase in traffic from Expo, the corporation hopes to show a profit this year.

* * * *

I hope you find this information useful. I am expecting detailed traffic and financial reports from the British Columbia Ferry Corporation and will contact you when I receive them. Please contact our office if you have any questions.

The Honourable Alex V. Fraser
Minister of Transportation & Highways:

1984-85 yielded appreciable reductions in the B.C. Ferry Corporation's operating deficit. This was achieved while still meeting the Corporation's mandate of offering the best possible service in the most efficient manner. While 1983-84 was effectively a year of stabilization and overall operational streamlining, this past fiscal year has been one of significant adjustment to the service to high loss areas. At the same time, the modest traffic growth experienced in 1983-84 over that of 1982-83 was once again reversed in 1984-85. The traffic results were well below expectations, with vehicles at 4,460,069 and passengers at 11,912,943. This represents a decline of .5% in vehicles and 3.9% in passengers over 1983-84.

In keeping with the British Columbia Government's instructions to cure costs in all possible areas, a major assessment review of high loss areas was completed. The review, which touched on all aspects of service to the North Coast, Sunshine Coast and Gulf Islands, took a three-pronged approach: 1) to reduce operating costs, particularly during the low revenue off season period by more closely matching schedules to traffic demand and patterns; 2) to provide residents of communities dependent upon the ferries as a transportation link with a service that would meet their day to day requirements; and, 3) to maximize the Corporation's role in the province's vital tourist industry.

I am pleased to report that the success of the Ferry Corporation's ongoing cost reducing program is due in part to the spirit of cooperation that prevailed between the communities concerned and the Corporation in implementing cost reducing measures that have already yielded impressive results. For example, service to the North Coast was reduced between Prince Rupert and Port Hardy during traditionally low traffic months. However, the projected savings allowed the Corporation to carry out ship renovations necessary to implement a day boat operation during the summer tourist season. The summer of 1985 will see the launching of this new day cruise service between Prince Rupert and Port Hardy - a service that will substantially increase the tourist activity to northern communities.

Efficiency measures undertaken on the Sunshine Coast also involved a reduction in the number of sailings. However, a ramp at Langdale terminal was doubledecked with the result that the route can now be fully operated with a doubledecked ship. This has effectively increased the lift-off capacity while at the same time allowing the Corporation to operate the service in a more cost efficient manner.

While the emphasis this past year was directed to cutting costs on specific routes, overall savings were achieved in all facets of the operation. Labour costs, which account for the major part of the operating budget, were substantially reduced by a general streamlining of the establishment in line with the provisions of the collective agreement.

As mentioned, the anticipated turnaround in traffic levels did not materialize during 1984-85. Indeed, while in 1983-84 a slight increase in vehicles and passengers was experienced, this past year has seen a decline of 22,638 vehicles and 484,962 passengers. Nevertheless, despite the general decline in traffic, the month of August set an all-time record for passengers and vehicles. Also, a hopeful indication that recovery has begun is the performance of commercial vehicle traffic. For all routes, commercial traffic was up 3% over 1983-84 and 8% over 1982-83. For the last quarter of 1984-85, commercial traffic on the two Vancouver Island routes was up 6.8%. In the past, commercial traffic has often been a precursor or leading indicator of overall traffic trends.

With this in mind plans are underway to meet the increased demand during Expo '86. The fleet's expansion since 1980 by way of lifting five major vessels, plus the ships presently laid up, has put the Corporation in an excellent position to meet projected vehicle lift-off demands. In addition, bus passenger pick up and drop off zones are being revamped at the major terminals to make it a more attractive and convenient means of travel.

British Columbia's ferry fleet plays an important role in preserving the coastal residents' way of life by offering a vital transportation link. At the same time the fleet itself is seen by millions of tourists as a major attraction. The B.C. Ferry Corporation's employees, management and board of directors take pride in meeting the many and varied needs of their travelling public.

On behalf of the Board,

S. M. Hodgson

Stuart M. Hodgson
Chairman

The Corporation has now experienced three straight recessionary years with little or no growth in most categories of traffic. The notable exception to this pattern is the 3% increase in commercial vehicles – a hopeful sign toward economic recovery in British Columbia.

In spite of soft traffic patterns, the future looks promising. In the face of adversity over the past three years, costs have actually been reduced through careful planning of ship and crew schedules. It is encouraging to note that these and other continuing management efficiencies have resulted in a further 5% reduction of operating expenses while net revenue increased 5% in spite of declines in traffic. The increase in revenue was in part, a reflection of the very modest increase in fares. Vehicle fares increased by aproximately 5% in February of 1985.

The Corporation is now leaner, more efficient and well positioned to take advantage of the anticipated return to healthy traffic growth expected over the next two years.

Good progress was made this year in a continuing effort to improve overall efficiency of the fleet through the application of a more precise match between capacity and traffic. Input from local residents has become a regular feature of the planning process. Community meetings were held on the Sunshine Coast, the North Coast and the Gulf Islands to discuss proposed schedule changes.

Although service was cut back on some routes, the number of sailings for the entire system increased by 3% in 1984/85. There was a total of 70,313 one-way sailings.

Sunshine Coast service and efficiency were improved with the introduction of the converted "Queen of Alberni" into operation on the Langdale-Horseshoe Bay route in conjunction with upgraded terminal facilities at Langdale.

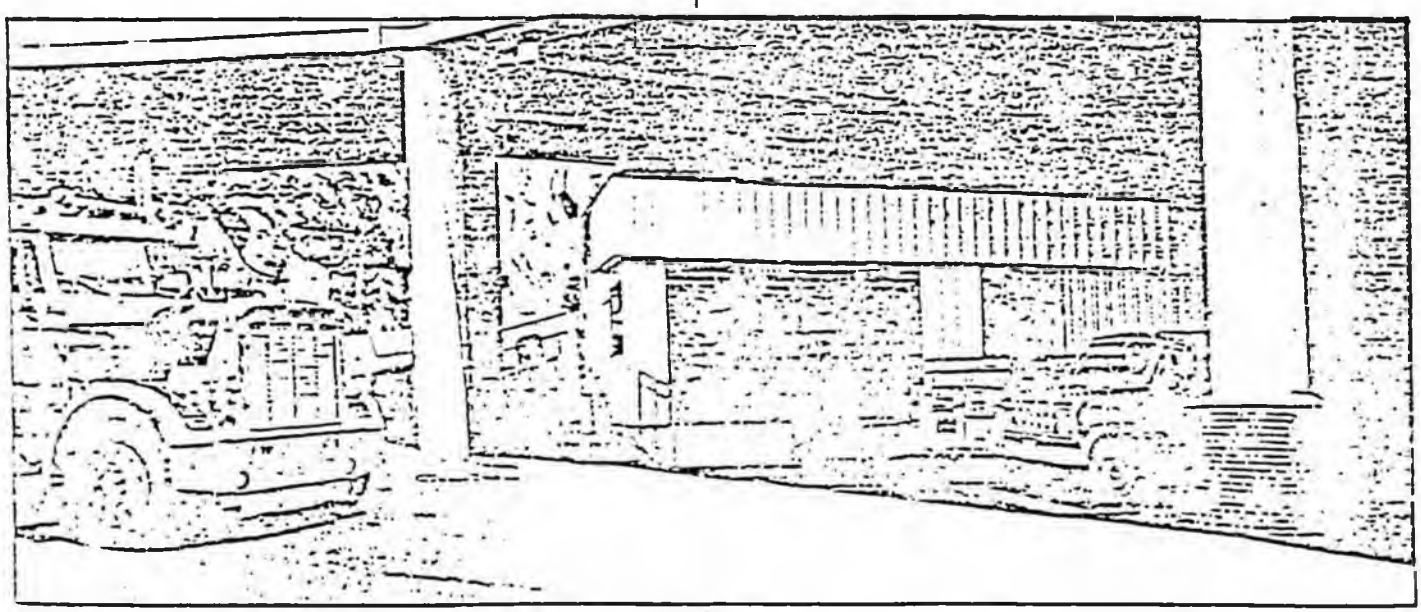
On the North Coast substantial cuts were made in winter service, with the elimination of the Tsawwassen leg of the Prince Rupert-Port Hardy route from the winter operation. A single ship made one trip per week to Port Hardy and two round trips to Skidegate.

In addition, the chartered Prince Rupert-Masset tug and barge service for drop trailers was terminated March 31, 1985. Commercial drop trailers will be carried on the regular ferry route from Prince Rupert to Skidegate. During 1984/85 it was decided that the summer service between Prince Rupert and Port Hardy would be a daylight operation commencing the summer of 1985.

The most significant improvements in efficiency have resulted from better scheduling of crews. Overtime costs have been substantially reduced. A policy of flexible vessel licences has enabled the Corporation to vary the size of crews throughout the day according to the requirements of traffic.

One of the new management tools introduced in 1984/85 was an Executive Network of microcomputers.

The Executive Network provides senior management with traffic statistics, revenue information, spreadsheet applications and forecasting models. Senior managers are using the system to monitor current traffic and demands on schedules. Historical data can be viewed in order to identify trends. By combining



Passenger waiting room, Horseshoe Bay

...se features with a forecasting model, it is possible to ...ly predict capacity utilizations, licence requirements and probable overloads. By using the spreadsheet application, senior managers can analyze various scenarios with regard to tariff and revenue items. The system, therefore, is a powerful tool that can aid senior management in both short term and long term planning.

Engineering

The Corporation's major construction project this year was the lifting of the "Queen of Alberni." The contract was placed February 27, 1984 and 105 days later, on June 11, 1984, the ship was back in service with a new upper car deck doubling its original vehicle capacity.

Coinciding with this project was a major upgrading of facilities at Langdale Terminal. The vehicle loading ramps were double-decked in order to permit simultaneous loading of both vehicle decks. New offices and waiting rooms were constructed and the holding compound layout was redesigned.

Modifications were commenced on the "Queen of the North" to suit the new "Day Cruise" service. Because of the cancellation of contracted tug and barge service to the Queen Charlotte Islands, both the "Queen of the North" and "Queen of Prince Rupert" were outfitted to carry refrigerated trucks by installation of new car deck exhaust systems to enable truck cooling units to operate during the crossing of Hecate Strait. The holding compound at Skidegate Terminal was increased in ... to accommodate drop trailer traffic.

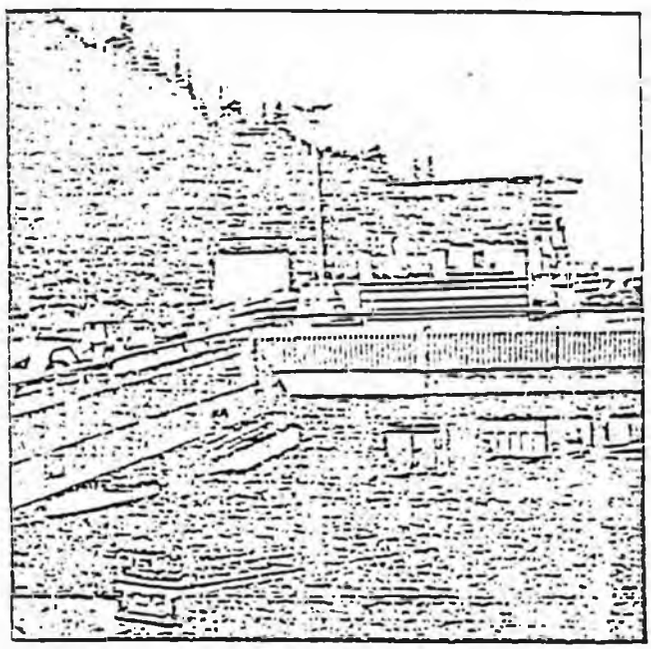
Improvements in facilities at major terminals have continued.

At Swartz Bay a new passenger pick-up facility was completed adjacent to the docks, thus shortening the walking distance for discharging foot passengers and alleviating congestion at the departure ticketing area. New toll booths were built in order to improve the flow of traffic and expand the holding compound. Planning is underway at Swartz Bay for double-laning the upper vehicle ramp at Number 1 Berth; for expansion of the refrigerated and dry stores area; and for construction of a new bus passenger loading facility which will include six bus bays and a new passenger waiting room.

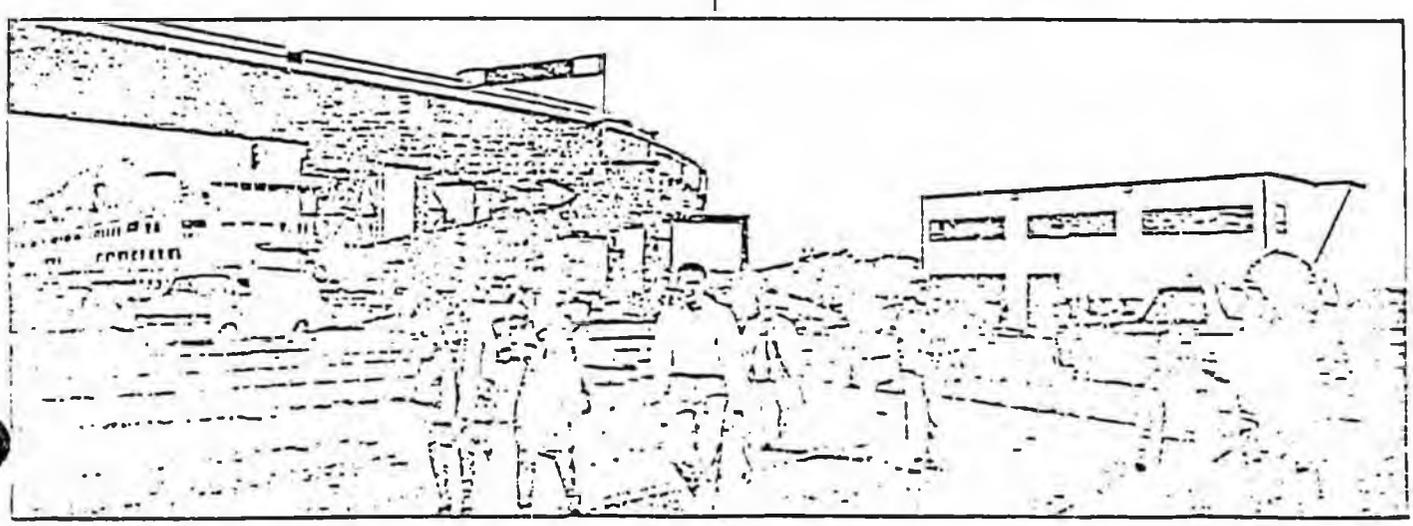
At Tsawwassen the upper vehicle ramp at Number 2 Berth has been widened to two lanes, thus speeding the loading and unloading process, and the cafeteria was expanded to provide additional seating.

At Horseshoe Bay the upper vehicle holding area was extended and a new passenger waiting room and control tower were built.

After a period of extensive testing during 1983-84, fuel metres have been fitted to all major vessels. The fuel metres, together with better ship scheduling, has resulted in total fuel consumption in 1984/85 of 76,258,000 litres, a 3% reduction from the previous year.



Control tower, Horseshoe Bay



Overhead ramp, passenger waiting room, and office, Langdale

New fleet colours are appearing on the vessels as they go into refit for regular maintenance. Approximately half the vessels have now been repainted. The EXPO 86 logo is being painted on funnels in conjunction with the repainting program.

Catering

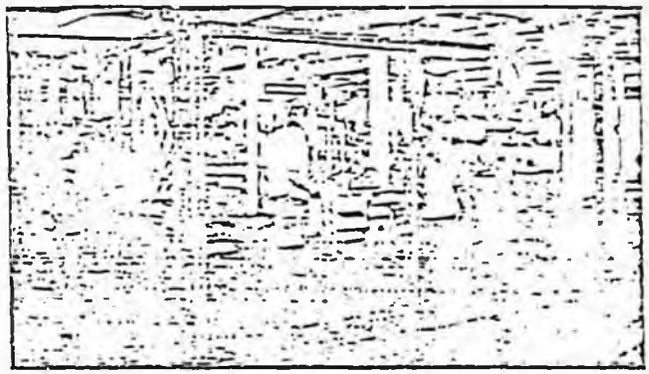
The past fiscal year was a period of consolidation for the Catering and Passenger Services area. Total revenue declined as a result of lower passenger traffic, smaller average expenditure per passenger and the closing of marginal outlets. Although within budget, the Gross Profit percentage was slightly lower than the previous year. Menu price increases were kept at a minimum in response to the public's resistance to high priced menu items.

General operating expenses were reduced substantially with the result that the net operating loss was reduced from previous years in spite of declining revenue.

Reductions in Route #10 (Port Hardy-Prince Rupert) operations have produced substantial drops in both liquor and stateroom revenue; however, the lost revenue was more than offset by reduced expenses. Anticipated sales increases on the new day run concept should more than replace these lost marginal sales with very productive revenue dollars.

Ongoing emphasis on newsstand development has produced an increase in both sales and newsstand gross profit in spite of limited passenger traffic. In support of this trend, the Vancouver Class vessels will be featuring new expanded gift shops with three vessels completed prior to the summer of 1985.

The new Tsawwassen test kitchen and Quality Control Supervisor continue to produce basic improvements in food quality. Although gradual, these improvements have proven to be lasting and consistent throughout the fleet. Revised food purchasing procedures have also been effective in improving quality consistence and value.

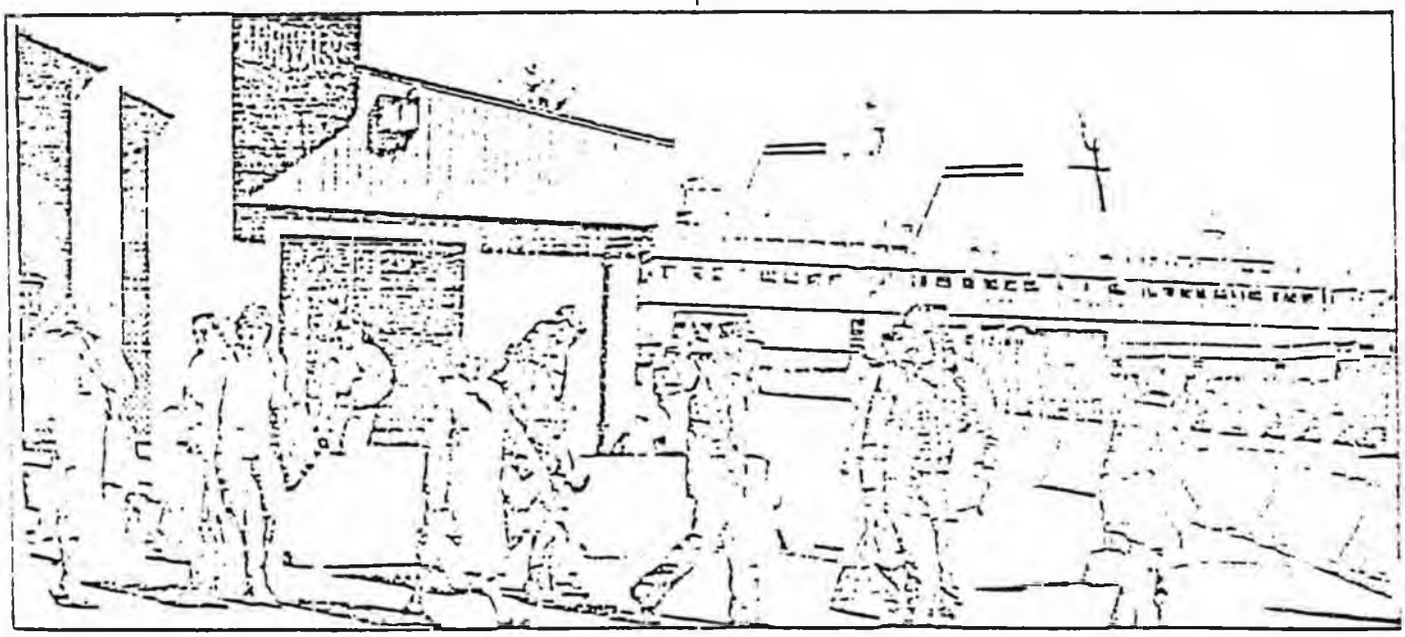


Expanded newsstand/giftshop

Communications

B.C. Ferries has continued to expand its role in the promotion of tourism, in recognition of the significance of this growing industry to British Columbia and the Corporation as a major source of revenue. A major activity this winter has been the promotion of the Day Cruise, which is to be introduced on the Northern route to Prince Rupert in the summer of 1985.

The Corporation has also expanded its activities in major travel shows in key market areas of the U.S. and Canada, working in close cooperation with Tourism B.C. and the tourism regions of the province. The past year also featured more involvement with local tourism communities in areas served by the Corporation.



Foot passenger arrivals, Swartz Bay

mputerized reservations for the Gulf Islands and North ast which were completed in 1983 have been streamlined, now offer an even more efficient service to travel agents and the general public. This process will continue as we prepare well ahead for the anticipated volume of enquiries that will be generated by Expo 86.

Labour Relations

The main Labour Relations activity during 1984 was the administration of the collective agreement that was concluded in 1983. This included developing a layoff and recall procedure with the Union which allowed the Corporation to downsize its work force.

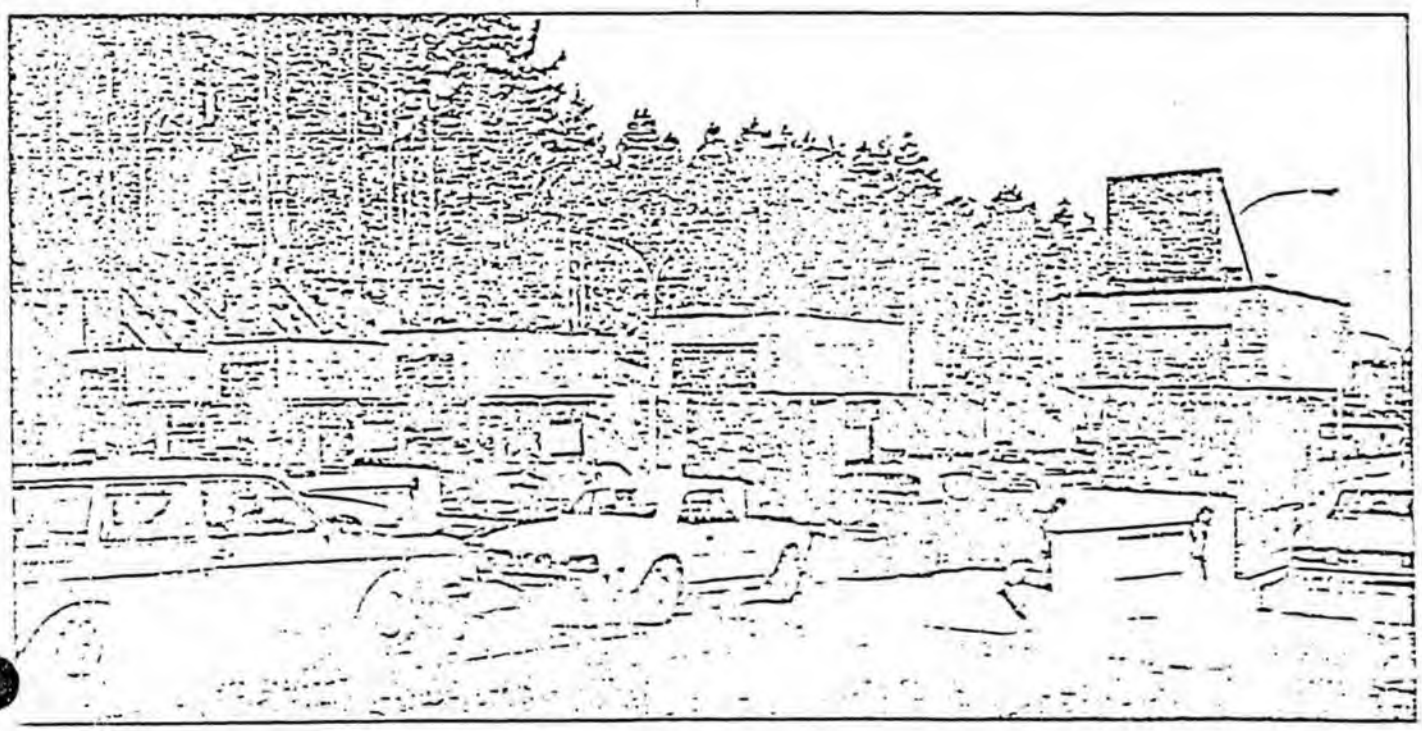
A number of grievances arose as a result of the new contract language; however, the parties were able to resolve these differences of opinion in accordance with procedures established under the collective agreement. This last fiscal year saw no time loss due to picket action of any kind, including third-party picketing.

Personnel

The greater flexibility in manning and improvements in scheduling afforded by the Agreement concluded on October 30, 1983, impacted most significantly on the personnel function in 1984. A new bargaining unit establishment, reflecting the Corporation's ongoing commitment to reduce overall wage costs by means of the rationalization of the Corporation's man resource requirement to a level commensurate with its operational requirements, was accepted and approved. At the same time the Corporation's commitment to reduce its outstanding banked overtime liability continued with positive results; careful manpower planning reduced the total banked overtime by 31%.

The new bargaining unit establishment of 1951 positions resulted in a reduction of 221 positions effective October 10, 1984. Where the reduction impacted on an employee it was effected in consultation with that employee, his Union representative and his Union executive. As a result of the extensive preparatory work completed, and despite the inevitable rippling effect of "bumping," the overall reduction in the number of employees was brought about with a minimum of disruption of personal inconvenience. Of those employees who were laid off and who elected to return to work with the Corporation when work is available, and after allowing for attrition of present regular employees through retirement, death, disabilities, etc. it is considered that the vast majority will return to work as full time regular employees within the next 18 months. In the interim, they will be offered every opportunity to work for the Corporation throughout the busy summer months or any other time that their services can be used.

A.L. Collier
President and
Chief Executive Officer

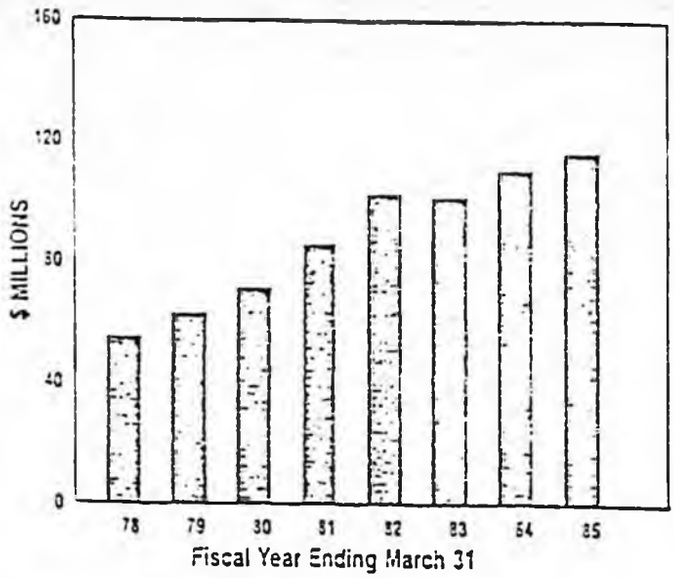


Vehicle toll booths, Swartz Bay

NET OPERATING REVENUE + 5%

Despite the lack of significant traffic growth in recent years, revenues have been growing as a result of regular, modest, annual fare increases.

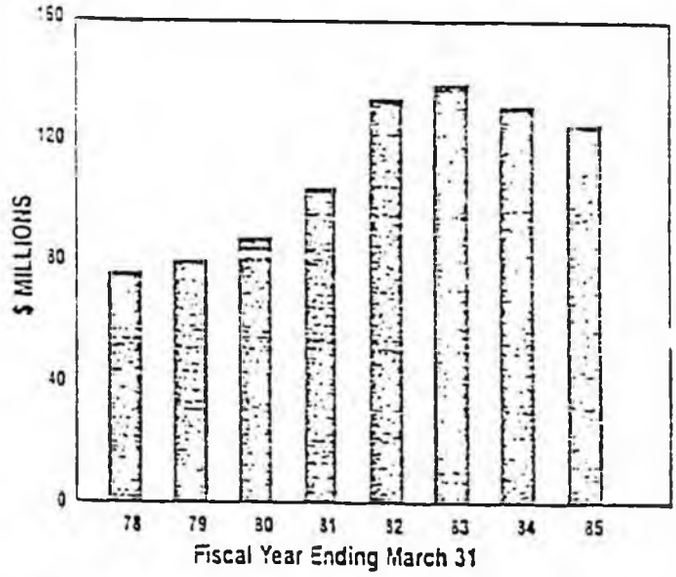
Net operating revenue has grown at an average rate of 7.7% per year over the past five years.



OPERATING EXPENSES – 5%

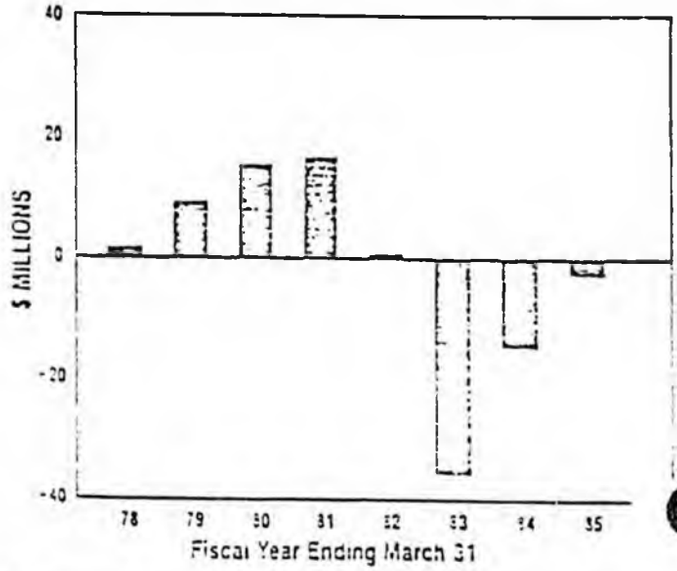
After a period of sharply rising costs in the late 70's and early 80's, operating expenses have been brought under control over the past three years.

This restraint was essential due to lack of traffic growth and a major reduction in the provincial government subsidy.



INCOME/LOSS AFTER SUBSIDY & DEPRECIATION

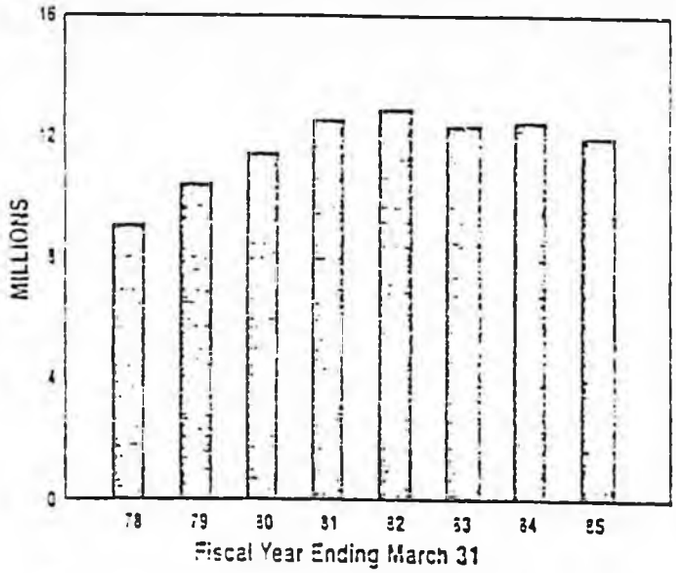
Despite the lack of traffic growth there has been a strong financial recovery over the past three years as a result of operating cost restraint and modest fare increases.



TOTAL PASSENGERS – 4%

After a small increase in 1983/84, passenger traffic has fallen again in 1984/85.

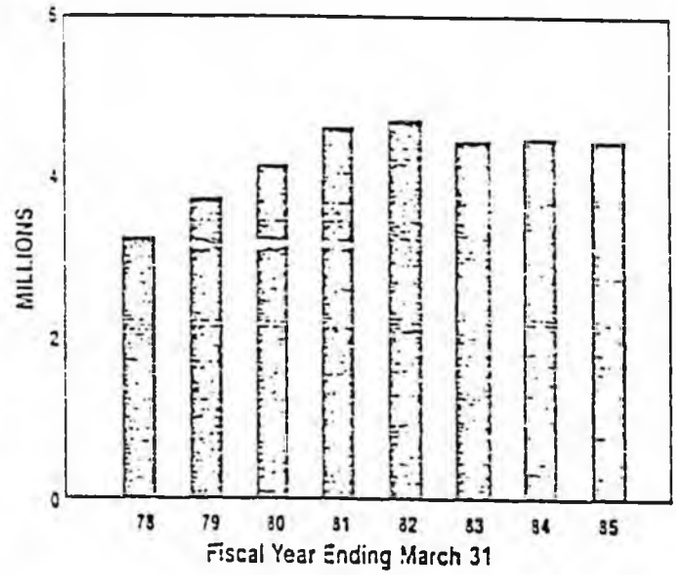
Over the past 24 years, 185 million passengers have been carried. The 200 millionth passenger is expected during the summer of 1986.



TOTAL VEHICLES – 0.5%

Total vehicle traffic has remained virtually unchanged over the past three years.

Over 67 million vehicles have been carried since 1960.



COMMERCIAL VEHICLES + 3%

Commercial vehicles have shown a steady increase over the past two years after suffering a sharp decline in the early 1980's.

In the past, commercial traffic has usually been a precursor or leading indicator of changes in other traffic categories.

AUDITORS' REPORT

To the Lieutenant-Governor in Council
Province of British Columbia

We have examined the balance sheet of British Columbia Ferry Corporation as at March 31, 1985 and the statements of income, deficit and changes in financial position for the year then ended. Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests and other procedures as we considered necessary in the circumstances.

In our opinion, these financial statements present fairly the financial position of the Corporation as at March 31, 1985 and the results of its operations and the changes in its financial position for the year then ended in accordance with generally accepted accounting principles applied on a basis consistent with that of the preceding year.

Summary of Accounting Policies

YEAR ENDED MARCH 31, 1985

In accordance with Section 8(7) of the Ferry Corporation Act the financial statements of the Corporation are prepared in accordance with generally accepted accounting principles. Significant accounting policies followed in the preparation of these financial statements are:

Inventories –

Inventories are valued at the lower of cost and current replacement cost.

Long-Term Disability –

Amounts paid to the Superannuation Branch of the Public Service Commission under the Long-Term Disability Plan are accounted for by the Corporation on the basis of accruing in the financial statements that portion estimated to be payable to employees until retirement for individual disability with the balance of the amounts paid being included in prepaid expenses.

Fixed Assets –

Acquired from the Province of British Columbia effective January 1, 1977:

(a) Ships

Ships, which comprise part of the total assets acquired from the Province effective January 1, 1977 by Order-In-Council dated December 16, 1976 and transferred at an assigned value of $1, have been revalued by the Corporation and are reflected in the accompanying financial statements at their estimated depreciated replacement value as at January 1, 1977 on the basis of construction records for labour and materials valued at 1977 cost exclusive of any federal ship building subsidies which may have been available during the extended period of years during which the individual ships were built and during which such subsidies fluctuated substantially. The estimated depreciated replacement value of the ships at January 1, 1977 is not intended to reflect fair market value of the fleet nor can it be considered to approximate fair market value because of the specialized nature and limited saleability of the ships themselves.

In addition, three ships presently under charter by the Province until 1994 are subchartered to the Corporation for the same period at an annual cost of $1 each, with the Corporation being responsible for all operating, repair, and maintenance costs. Under the terms of the subcharter agreement with the Province, the Corporation may in 1994 request that the Province exercise its option to purchase these ships at its own expense in accordance with the terms of its charter agreement. In the event that such option is exercised, clear title to the ships will be transferred to the Corporation. As a result of these transactions and agreements, these ships are reflected as capital assets of the Corporation in the accompanying financial statements and are similarly stated at their estimated depreciated replacement value as at January 1, 1977.

(b) Berths, buildings and equipment

Berths, buildings and equipment also comprise part of the total assets acquired from the Province effective January 1, 1977 by Order-In-Council dated December 16, 1976 and transferred at an assigned value of $1.

These assets are reflected in the accompanying financial statements at their estimated depreciated replacement value as at January 1, 1977 based upon an appraisal made by Universal Appraisal Company Limited as at that date.

Additions and disposals subsequent to January 1, 1977:

The costs of major replacements, additions, extensions and improvements are capitalized in the fixed asset accounts. The costs of maintenance, repairs, minor renewals or replacements are charged against income. On retirement or disposal of fixed assets, the costs thereof and the related accumulated depreciation are eliminated from the accounts and any gains or losses are reflected in the statement of income.

On October 1, 1983 the remaining buildings and equipment at Deas Dock facility, not acquired from the Province on January 1, 1977 were transferred at an assigned value of $1. These assets are reflected in the accompanying financial statements at their estimated depreciated replacement value as at October 1, 1983 based upon an appraisal made by Universal Appraisal Company Limited as at that date.

Depreciation –

Fixed assets are depreciated on the straight line method based upon the following useful lives:

Ships	25 years
Berths	5 - 10 years
Buildings and equipment	4 - 25 years

Amortization of Promissory Note Discount and Issue Costs –

Promissory note discount is amortized on a compound interest method over the term of the debt. Issue costs are amortized on a straight-line basis over the term of the debt.

Provision for Annual Refit Costs –

The Corporation provides for ship refit expense by charging against income the anticipated costs over the period between refits.

Notes to Financial Statements

YEAR ENDED MARCH 31, 1985

1. CASH AND SHORT-TERM INVESTMENTS

Funds, other than those required for immediate settlement of liabilities, are invested in short-term commercial securities authorized pursuant to the terms and provisions of the Financial Administration Act of British Columbia. The investments are arranged through the Ministry of Finance of the Province.

2. ACCOUNTS RECEIVABLE

Provision has been made for the uncollectibility of a 1980 accounts receivable of $1,950,519 due from the British Columbia Steamship Company (1975) Ltd. for the lease and modifications to the Lessee s specifications of the M.V. "Queen of Prince Rupert".

3. INVENTORIES

	1985	1984
	(expressed in thousands)	
Spare components, parts and supplies	$ 6,987	$ 6,332
Fuel and lubricants	1,153	1,980
Goods for resale and catering supplies	413	440
	$ 8,553	$ 8,252

4. RESERVED FUNDS

The Corporation has segregated assets that are required for specific purposes or as required by long-term debt obligations.

	1985	1984
	(expressed in thousands)	
Sinking funds for long-term debt (note 5)		
Administered by the Province	$ 345	$ —
Administered by the Corporation	3,300	—

6. LONG-TERM DEBT

	1985	1984
	(expressed in thousands)	
Long-term debt issued by the Corporation		
8.95% Promissory notes (effective rate of 15.75%), are repayable in five equal annual instalments of $5.7 million commencing March 5, 1988	$ 28,500	$ 28,500
Less unamortized discount and issue costs	6,473	7,332
	22,027	21,168
12.08% Promissory note (effective rate of 12.44%) due September 9, 2003 is repayable by annual sinking fund payments of $322,492 commencing September 9, 1984	14,758	14,758
Less unamortized issue costs	17	18
	14,741	14,740
	36,768	35,908
Sinking fund payment required within one year	322	322
	$ 36,446	$ 35,586

Principal and sinking fund payments due in each of the next five years:

1986	1987	1988	1989	1990
$322,492	$322,492	$6,022,492	$6,022,492	$6,022,492

The Province of British Columbia unconditionally guarantees the payment of principal and interest on the Promissory notes.

7. ACCRUED SICK LEAVE LIABILITY

On September 1, 1978 the Corporation introduced short-term illness and injury and long-term disability plans and as of that date all employees ceased accruing sick leave credits. Under the collective agreement with the employees, in the event of illness, the accumulated sick time may be withdrawn prior to retirement and on retirement any balance remaining is payable in cash at 50% of accredited time. The liability as at March 31, 1985 based upon a recent actuarial evaluation by Reed Stenhouse Associates Limited established the present lump sum value of cash payouts on retirement to all employees at $4,172,000 which, with interest will accumulate an amount required to meet those obligations. The recorded liability as actuarially evaluated in 1982 with accrued interest net of withdrawals to 1985 exceeded the current evaluation by $1,569,391. One third of the excess is reflected in current operations and the balance will be reflected in operations of the next two fiscal periods. Funds reserved for liquidation of this liability are invested in short-term commercial security (Note 1).

8. CONTRIBUTED SURPLUS

	1985	1984
	(expressed in thousands)	
Excess of estimated depreciated replacement value over assigned value of $1 of assets acquired from the Province of British Columbia		
- Ships, berths, buildings and equipment effective January 1, 1977	$ 249,674	$ 249,674
- Buildings and equipment effective October 1, 1983	727	727
	$ 250,401	$ 250,401

9. OTHER INCOME

	1985	1984
	(expressed in thousands)	
Parking and ancilliary traffic revenue	$ 947	$ 837
Interest earned on funds in bank and short-term investments	1,559	1,112
	$ 2,506	$ 1,949

10. PROVINCIAL SUBSIDY AND BENEFITS

The Corporation receives a subsidy from the Province of British Columbia which is determined annually.

Included in fixed assets as "ships under capital lease" are three ships leased from the Province at an annual cost of $1 each. The annual cost of these charters to the Province is $4,819,800. In addition the Corporation utilizes Crown land for terminals and highway access without rental or property taxes. The value of these benefits is indeterminable. The Corporation, as an agent of the Crown, is not liable to taxation, including taxation on improvements, except insofar as the Crown is liable.

The Corporation utilizes Ministries and Agencies of the Provincial Government for negotiation and purchase of fuel, materials, and communications. The aggregate of these transactions is $39.3 million (1984 - $45.3 million).

11. INTEREST EXPENSE

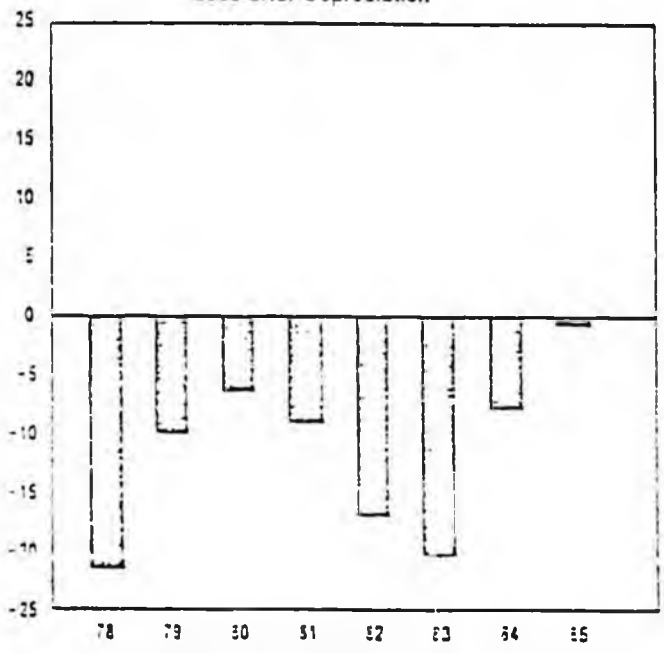
VANCOUVER ISLAND

The two Mainland-Vancouver Island routes are among the busiest ferry routes in the world, carrying 7.8 million passengers and 2.8 million vehicles in 1984/85.

A concentrated effort at improving cost efficiency over the past 3 years has resulted in a tremendous reduction in the loss.

For the first time this year the Vancouver Island routes are very close to a break-even operation.

VANCOUVER ISLAND
Loss after Depreciation

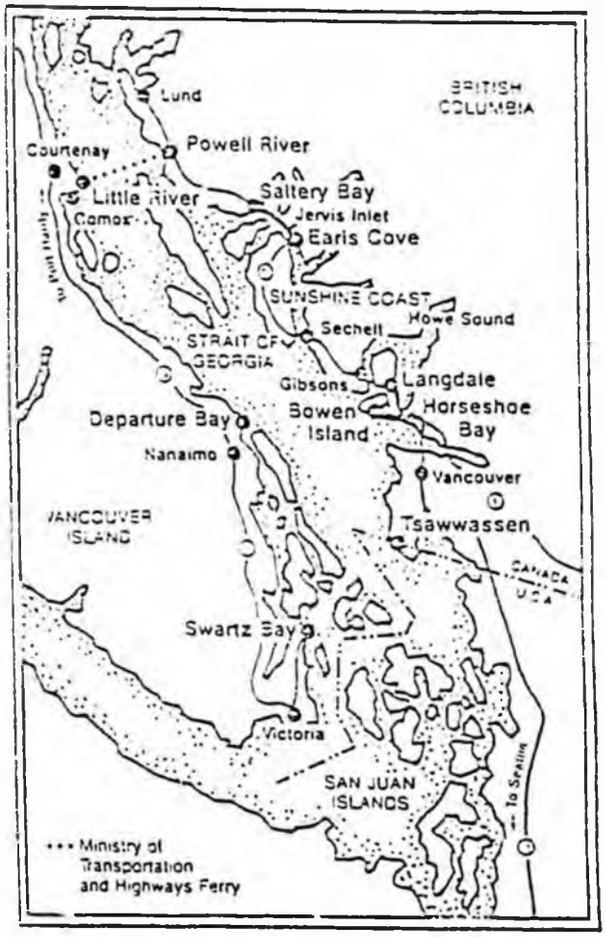


SUNSHINE COAST

The Sunshine Coast includes four routes:
Horseshoe Bay - Langdale
Horseshoe Bay - Bowen Island
Earls Cove - Saltery Bay
and the passenger-only service from Langdale-Gambier Island-Keates Island.

These routes carried 2.5 million passengers and 1 million vehicles in 1984/85. Although traffic has declined in each of the past three years, there has been an improvement in the financial performance.

The loss in 1984/85 was $11 million, virtually unchanged from the previous fiscal year.



SUNSHINE COAST
Loss after Depreciation

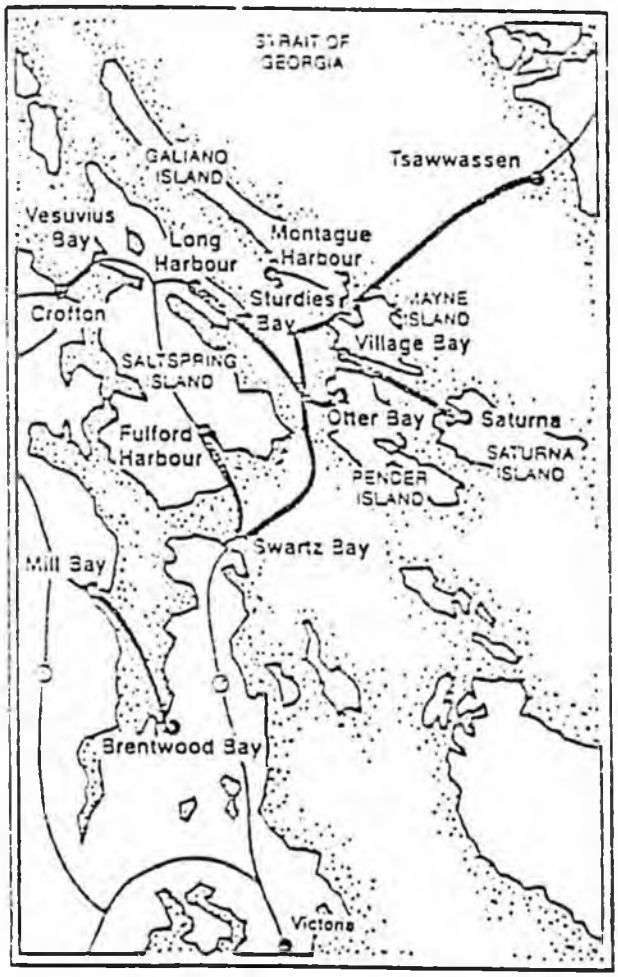
GULF ISLANDS

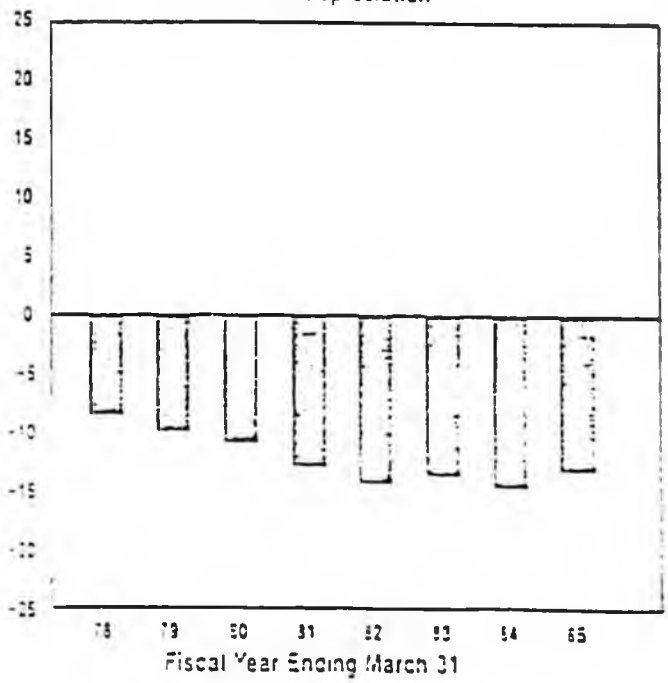
The Gulf Islands vessels service the islands of Salt Spring, Pender, Galiano, Mayne and Saturna. The region also includes the Brentwood-Mill Bay route.

In 1984/85 these routes carried 1.5 million passengers and 623,000 vehicles.

The operating loss in 1984/85 was $13 million, which is a 9% reduction from the previous year.



GULF ISLANDS
Loss after Depreciation



NORTH COAST

The North Coast services include:
Prince Rupert - Port Hardy
Prince Rupert - Skidegate.

In addition the Corporation has contract services for passenger routes from Prince Rupert to Port Simpson and Kincolith.

Until March 31, 1985 there was also a contract tug-and-barge service between Prince Rupert and Masset.

For the three years previous to 1984/85 the loss on these routes averaged about $15 million per year. With the elimination of Tsawwassen-Port Hardy service and other cost efficiencies the operating loss has been reduced by 19% to $11 million.

Langdale	85 "
Swartz Bay	450 "
Tsawwassen	1250 "

Catering

Passengers have the convenience of an enlarged cafeteria system on the converted ferries. These cafeterias have seating for up to 224 people at one time. There is also a snack bar on the four vessels operating between Tsawwassen and Swartz Bay. These ships also provide buffet service during the peak summer schedule. Catering facilities are also on most other vessels servicing the major routes and at major terminals except Horseshoe Bay.

. . . . /3

Employees

There are approximately 2000 employees in the system, compared with 200 when the ferry service began in 1960.

Ships Services

Passenger elevators have been installed in all the major and 'C' Class ships, specifically for those who are unable to manage the stairs. The M.V.s "Queen of Sidney" and "Queen of Tsawwassen" do not have elevators. All major ferries have nursing mothers facilities, non-smoking sections, and restrooms for the disabled.

Machine Repair Shop

A service unique to the ferry business is the combined machine repair shop established at Deas Dock on the Fraser River, which allows for a planned program of continuing preventative maintenance. Another unique service is the most modern and completely equipped life raft servicing centre in Canada, also located at Deas Dock. Refitting and lay-up berths are now in operation on the man-made basin at this location.

Capsule History

The idea of a ferry system germinated when Vancouver Island was isolated during the Seamen's Strike in July 1958. Private ferry companies were approached to provide the solution with the Provincial Government undertaking to build highway and wharf facilities on Vancouver Island and the mainland to provide the quickest possible service. When private industry turned down the plan, the Government decided to go ahead on its own.

In March 1959, the Provincial Government announced plans to enter the ferry business. The first contracts were let to Victoria Machinery depot and Burrard Dry Dock for the M.V. "Sidney" and the M.V. "Tsawwassen".

Landings were built at Swartz Bay to service Victoria and at Tsawwassen to service Vancouver. At the latter site, a two-mile causeway was built which used 2,500,000 cubic yards of boulder, rock, and gravel fill.

Inauguration of the two-hour service started on June 15, 1960.

On September 1, 1961, the Gulf Island Service was purchased by the British Columbia Ferry Authority. In October 1961, Black Ball Ferries Ltd., which operated ferries from Horseshoe Bay to Nanaimo and to the Sunshine Coast, was purchased.

The inaugural run of the M.V. "Queen of Prince Rupert", sailing the Inside Passage to Prince Rupert from Kelsey Bay, was in May 1966.

. . . . /4

In April 1967, British Columbia Ferries purchased the "Pere Nouvel", which was renamed the M.V. "Sunshine Coast Queen", to replace the "Langdale Queen" and the "Sechelt Queen" on the Howe Sound service. This double-ended ferry was the largest in the fleet at that time, having a capacity of over 180 cars. This is no longer the case, as the stretch-lifted ferries now have lift-off capabilities of up to 400 vehicles. The "Sunshine Coast Queen" has since been sold.

In June 1967, the M.V. "Mill Bay" was purchased from Coast Ferries and serves the Saanich Peninsula between Brentwood Bay, on the Peninsula, to Mill Bay, approximately 15 miles from Duncan.

The "Howe Sound Queen", which has a carrying capacity of 70 automobiles, was taken over to replace the "Bowen Queen" to alleviate the increasing traffic on the Horseshoe Bay/Bowen Island route.

The jumbo vessels, Queens of "Cowichan" and "Coquitlam", were added to the fleet in 1976. Both capable of carrying 362 automobiles each, they were joined by the "Queen of Alberni", built specifically to carry overheight, commercial, and recreational vehicles. All have elevators and on board cafeterias.

On January 1, 1977, British Columbia Ferries became British Columbia Ferry Corporation, a Crown Corporation. The Chairman of the Board is Stuart Hodgson, President is Andrew Collier. George Baldwin is the General Manager.

Three minor vessels, the M.V.s "Mayne Queen", "Powell River Queen", and "Bowen Queen", were stretched and repowered in 1979. Each ship is now capable of carrying 70 vehicles.

In May 1979, the "Dogwood Princess II" replaced the "Dogwood Princess" on the Gambier and Keats Islands route. The new passenger-only vessel carries 38 people.

On May 29, 1980, the M.V. "Queen of the North", formerly the "Queen of Surrey", commenced service on the Inside Passage run. Port Hardy became the new terminus on northern Vancouver Island on May 31, 1979, replacing Kelsey Bay. During the summer, this vessel departs from Port Hardy every other day with an en route stop at Bella Bella once a week. In the off-season service between the two ports is on a once-weekly basis.

The "Queen of Prince Rupert" was chartered by B.C. Steamship Company to operate between Seattle, Washington and Victoria during the summer of 1980. She was returned to B.C. Ferries in October of that year and commissioned to the service between Prince Rupert and Skidegate, Queen Charlotte Islands. The "Queen of Prince Rupert" operates on the Skidegate - Prince Rupert route in the summer.

Two more jumbo (360-car) ferries, the Queens of "Surrey" and "Oak Bay", were built at Burrard Yarrows Corporation in Vancouver and Victoria. They entered service in May and June of 1981.

. . . . /5

An innovative new conversion program was begun in 1981 with the "lifting" of two of the "stretched" vessels, the Queens of "Vancouver" and "Victoria". Each ship was cut in half horizontally, just below the passenger (promenade) deck, raised vertically 10 feet on hydraulic jacks, and an upper car deck was added. This same operation has since been effected on the Queens of "Saanich" and "Esquimalt" and these four converted ships are now carrying record loads of vehicles.

On June 15, 1985, the B. C. Ferry Corporation celebrated its 25th Anniversary of operation, a significant milestone in the history of British Columbia.

On October 6, 1985, the 14 saltwater ferries (formerly operated by the Provincial Ministry of Transportation and Highways) were transferred to the B.C. Ferry Corporation making the Crown Corporation one of the largest ferry operations in the world in terms of number of ships (39) and number of routes (24). Over 400 employees joined B.C. Ferries at the same time, increasing the number of workers in the ferry fleet to approximately 2600, rising to over 3000 in summer.

Alterations and Innovations

Over the years since the inception of the ferry service, innovations have continuously been undertaken to improve and increase capacities. When the first two ships were built, they were modelled on the style of Black Ball ferries. The Queens of "Sidney" and "Tsawwassen" are both very similar to Black Ball's "Coho". Then, when the next seven ships were built, the plans differed and, because of this change, each of these ships have been able to undergo alterations that have greatly improved their lift-off potential.

In 1968, ramps were installed on the car decks leading to mezzanine decks affixed to the midships bulkhead. This innovation increased the car carrying space from 110 vehicles to 150. Then, starting in 1969, an amazing (at that time) alteration took place. Each ship was taken to the shipyard, cut in half, and an 84 foot section was built, floated into place, and the ship was welded together again! This further increased the capacity for vehicles to 200. At the same time, the dining rooms were extended and solarium seating was added in the new section aft of the bridge on the sun deck.

As time went on, more and more people were using the popular ferries, and line-ups in the peak travel periods became a problem. More ferries were needed, so three new vessels were commissioned. Two of them were built on the lines of Washington State ferries; the third, with basically the same lines, was constructed to carry primarily overheight, recreational, and commercial traffic. This was in 1976 but in 1979, it became evident that another two 'C' Class (or Super ferries) were required and they were built with yet more improvements, enabling them to carry 350 cars.

. . . . /6

In the spring of 1981, an enormous and exciting conversion program was commenced. Two of the original seven major vessels, those built between 1961 and 1964 and which had already been "stretched", were now to be "lifted". The ship was cut in half again, this time horizontally, the top half raised on hydraulic jacks, and a new deck inserted. The upper sun deck solariums also underwent change, they were covered in and made into more useful and attractive seating areas. The midships lounge on the promenade deck was also renovated with a snack bar added. Since then, two more of this class vessel have been converted, this time adding ramps, bringing the car carrying capability to, believe it or not, 400 cars!

The "Queen of Alberni", B.C. Ferries' "overheight vehicle" ship, was lifted in the spring of 1984 increasing her car-carrying capacity from 150 to 300 vehicles and returned to service on the Horseshoe Bay/Langdale route 3 months later.

At her 1986 refit, the "Queen of Alberni's" passenger lounges and cafeteria were enlarged making this vessel more suitable for service on the Horseshoe Bay/Departure Bay route.

During the Expo season (May - October, 1986), five ferries that had been in lay-up were repainted in the new B.C. Ferry colours (red, marine blue, and white) and came into service to assist with the heavy demand expected during the World's Fair.

Yes, since 1960, there have been many changes, both on and off the ships of B.C. Ferries. Carpeted decks, where there was once linoleum; cafeterias with an extensive menu; elevators (the new ships have two each); restrooms for the disabled; and pay phones. And ashore, special ramps had to be constructed to comply with the converted vessels' modifications; overhead walkways extended, improved, and carpeted for foot pasesengers' comfort; greater parking areas; new and more ticket booths; and extra berths and docking facilites. The list just goes on!

MEMORANDUM

TO: Representative Bette Cato

FROM: Mary Jennings MJ
Legislative Analyst

RE: **Options for the Alaska Marine Highway System to Operate Similarly to Cruise Ships**
Research Request 87.058

You requested a discussion of options for the Alaska Marine Highway System (AMHS) to operate more similarly to cruise ships on the mainline route. The mainline is the route from Seattle to Skagway via Prince Rupert; four ships operate on the mainline at different times of the year.

Background

The number of cruise ships that operate in the waters of Southeast Alaska has grown dramatically during the past few years. According to the State Division of Tourism, over 90 percent of all tourists in Southeast arrive by way of cruise ships. Although specific data are not available from cruise ship companies, one can assume that the expansion that has occurred is an indicator of profitabity. The AMHS vessels that operate on the mainline generate revenue equal to approximately 80 percent of costs. Since ferries and cruise ships operate basically over the same route, the question arises as to why the cruise ships are able to operate at a profit and the ferries are not. The following sections of this memorandum present a discussion of options that would allow the AMHS to operate more similarly to cruise ships.

Reducing Labor Costs

Labor costs of onboard personnel of AMHS ferries account for approximately 60 percent of a vessel's operating costs. According to persons contacted in various cruise ship companies, the labor costs of cruise ships are much lower than ferries. None of the cruise ship companies were willing to give specific data concerning operating costs, but one company official estimated that the labor cost of the AMHS were more than twice as high as the labor costs of a cruise ship. The official added that this was not due to less on-board personnel but because cruise ships utilized nonunion labor at relatively low wages.

Due to union labor on AMHS vessels, labor costs can be reduced only by contract negotiations. Contracts are scheduled for negotiation during 1988. Potential cost savings may be realized if contracts can be negotiated for lower wages, although it is doubtful that the unions would accept wages at the same level as cruise ship workers.

Leasing to Private Industry

According to the Executive Director of the Inland Boatman's Union, the current contract does not allow nonunion workers on vessels leased by the State. The union does not feel that this is a negotiable issue. Therefore, even if mainline operation were leased to the private sector it would still be difficult to lower labor costs to cruise ship levels. The option of selling the vessels to private industry also exists, but because this would remove the vessels from control of the State, this option was not researched.

Year Round Full Capacity

A cruise ship company representative stated that cruise ship lines are able to operate profitably because their vessels operate at full capacity year-round. This is achieved by operating in different locations, such as Europe and the South Pacific, during the winter in North America. According to Joe Camp, Deputy Commissioner of the Alaska Marine Highway System, the level of ferry useage drops by approximately half during the period from October to May. Mr. Camp did not feel it was feasible for AMHS ferries to operate outside Alaska during the winter because this would leave many Alaska communities without ferry transportation. He also doubted that ferry unions would be amenable to operating outside Alaska for half of the year.

Package Tours

Travel agents suggested that AMHS could compete more effectively if trips were offered as a package of complete services. Agents stated that the majority of cruise ship passengers buy package tours that include all aspects of their trip, from meals to airfare. According to travel agents with whom I spoke, the AMHS would have to change several areas of service in order to accommodate the package tour traveler. One travel agent suggested that the AMHS should redesign staterooms into a uniform two-bed size because this is the standard package tour booking size. (Ferries are designed in two, three and four-bed size.) One agent suggested that ferries should dock in communities for longer periods of time and only during the day. The agent stated that because the ferries tend to dock in the middle of the night, it is difficult to coordinate ferry useage with other tourism-related activities. The agent also suggested that the ferries should dock closer to downtown areas because this is more convenient for tourists.

Other travel agents suggested that the ferry should offer higher quality food and onboard entertainment, such as discos and gaming.

The AMHS representatives felt that many of the changes to allow package tours would be costly and would conflict with the system's goal of providing basic transportation services for Alaskans. One official stated that to redesign all staterooms into a two-bed size would require a great deal of lay up time and would be expensive. Additionally, AMHS stated it would be difficult to schedule mainline vessels for strictly daytime docking because this would conflict with the schedules of feeder vessels that also use mainline docks. Another AMHS official stated that many downtown docking facilities that the cruise ships use would not accommodate ferries because of the need for vehicle-loading facilities.

Additional Marketing

One cruise ship company stated that a high level of marketing is an important factor in determining the level of business of a cruise ship company. According to Joe Camp, marketing of the AMHS has suffered in the past two fiscal years due to budget cuts. He stated that the system plans to spend more money on marketing this year and will emphasize mainline operations. For example, Mr. Camp stated that a "weekend getaway" promotional program is being developed to encourage Seattle area residents to ride the ferry during the months of May and September when ferry traffic is moderate. The system plans to offer a package tour that will include a ferry ride to a port in Alaska and a flight back to Seattle. The AMHS is working with the Port of Seattle, Alaska Airlines and Seattle area travel agents.

Raising Ticket Prices.

During the summer of 1987, a roundtrip ticket on the AMHS between Seattle and Skagway will cost $396. A comparable length trip on a cruise ship will cost anywhere from $2,000 to $5,000 dollars. As mentioned earlier, the cruise ship package includes many other services besides travel. If the AMHS were to include additional services with the ticket price, then rates may be increased to be more comparable with cruise ship rates. It is questionable whether it would be feasible for the system to offer different levels of service on the mainline route--one level for package tours and another level to provide basic transportation needs. According to AMHS, the additional administration to provide two levels of service would be costly. Additionally, operations of the ship would have to altered drastically to provide the same services offered on cruise ships.

Independent Travelers

Bob Dindinger, who is a member of the Southeast Tourism Marketing Council, felt that the AMHS could best increase tourist useage by targeting the independent traveler. He stated that the independent traveler is not as convenience-oriented as a tour ship traveler and therefore is more amenable to ferry useage.

A study by the State Division of Tourism indicates that during the 1970s, 68 percent of independent travelers came through Southeast and today only seven percent visit this area. The study indicates that the majority of independent travelers now visit the Southcentral area. Mr Dindinger felt that this is due to promotional campaigns by Anchorage and Fairbanks directed toward the independent traveler. He stated that the council is currently working with the State Division of Tourism and tourism-related businesses in Southeast, including the AMHS, to develop a promotional campaign to attract independent travelers to Southeast.

Mr. Dindinger had other ideas that would allow the ferry system to compete more aggressively in the overall tourism market. He suggested that a travel agent's commission for booking ferry space should be raised from the current seven percent to ten percent. He stated that a ten percent commission is the standard commission awarded to travel agents. Mr. Dindinger felt that the seven percent commission awarded by the AMHS is a disincentive to travel agents who might otherwise promote ferry travel. Mr. Dindinger added that a study has shown that over half of all independent travelers utilize travel agents.

Mr. Dindinger also suggested that the system should pre-sell only 80 percent of its space 90 days before departure instead of the current 90 percent. He felt the remaining 20 percent should be sold full price. He felt that this would increase revenues because less space would discounted by a travel agent's commissions. He also noted that it might leave more space open to Alaskans, who tend to make reservations closer to departure dates.

I hope you find this information useful. If you have any questions please feel free to contact me.

LEGISLATIVE AFFAIRS AGENCY

M E M O R A N D U M December 12, 1986

SUBJECT: Alaska Marine Highway System
(Work Order No. 15-0270)

TO: Representative Bette Cato

FROM: George Utermohle
Legislative Counsel

You have asked whether certain recommendations for improvements to the Alaska Marine Highway System (AMHS) can be implemented through legislation. This memorandum addresses those recommendations.

ONE: ALLOW AHMS TO OPERATE AS A SEPARATE ENTITY FROM THE DEPARTMENT OF TRANSPORTATION AND PUBLIC FACILITIES.

Government agencies may be conferred with a wide range of independence. Most government agencies are established as subordinate entities within a department and are subject to the centralized administration and control of the commissioner of the department. The divisions within the departments fall into this category. Certain other agencies are attached to a department only for administrative purposes and have a legislative mandate distinct from that of the department. These agencies, such as the Alaska State Building Authority, the Alaska Housing Finance Corporation, and the Alaska Railroad Corporation, are usually state corporations and operate independently of any policy control by the commissioner of the department. Even among these independent agencies there is considerable variation in the amount of autonomy conferred on them. The agency with the greatest degree of independence is the Alaska Railroad Corporation (ARRC). ARRC maintains its own administrative and budgeting functions, as well as policy development functions independent of any other state agency, including the legislature. This high degree of independence is granted by the legislature and thus can be reduced or eliminated by the legislature.

Generally, the highest degree of independence occurs at the department level. Any state agency could be raised to the level of department. The former Division of Corrections was moved from the Department of Health and Social Services and was made into a separate department of its own. The major draw backs to this approach are the costs involved and the Alaska Constitution. When a department is created a commissioner and staff must be hired, and independent accounting, budgeting, purchasing, personnel, and other services must be established. The Alaska Constitution limits the executive branch of government to twenty principal departments. (art. III, sec. 22, Ak Const.) There are currently fifteen principal departments in the executive branch.

The Alaska Marine Highway System is currently a line division within DOTPF and is subject to administrative, budgetary, and policy oversight by the commissioner. AMHS would achieve greater independence from DOTPF by making it a an independent corporation within the department. HB 23 (Fourteenth Legislature) did exactly that. HB 23 created the Alaska Marine Highway Authority as a corporation within DOTPF. The department would exercise no control over the Authority, but could handle the administrative functions such as purchasing, payroll, etc.

TWO. ALLOW AMHS TO OPERATE WITHOUT REQUIRING IT TO MAKE A PROFIT LIKE THE ALASKA RAILROAD CORPORATION.

AMHS is not required to make a profit. Neither is ARRC. The only mandate to ARRC is that it should generally operate the railroad on a self-sustaining basis.

AHMS is not required to return a profit or even break even under its current mandate. HB 23 did not change this, even though management of the marine highway system was transferred to an independent state corporation.

THREE: SEPARATE MANAGEMENT, ACCOUNTING, AND OPERATION OF THE MARINE HIGHWAY SYSTEM FROM DOTPF.

AMHS can operate independently of the administrative structure of DOTPF by creating an independent administrative structure within the current division. Administrative independence can also be achieved by conferring the necessary authority on an independent state corporation to manage the marine highway system. Administrative independence comes as a matter of course when an agency is made a department.

The Alaska Marine Highway Authority proposed in HB 23 had considerable control over its own operations. HB 23 did not specifically mention whether the authority was to perform its own administrative work. Whether an independent authority does its own administrative work is mostly a matter of whether the legislature appropriates funds for administrative services. So, it is not necessary for HB 23 to confer administrative independence on the Alaska Marine Highway Authority, but mention of such an intent in the bill would assure that money will be allocated to that function.

FOUR: ENSURE THAT AMHS CONTINUES TO PROVIDE IN-STATE TRANSPORTATION SERVICES.

Establishing priorities for the service by AMHS is a very straight forward process. All that is required is that the legislature establish those priorities. Such priorities can be established through appropriations or through legislation establishing priorities or levels of service for the marine highway system. For example, if you wish to ensure that ferry service is provided to certain towns or no service is provided outside the state, these requirements can be specified in statute.

FIVE: PROVIDE A MECHANISM FOR OVERSIGHT AND INPUT TO THE MARINE HIGHWAY SYSTEM, PARTICULARLY FROM PRIVATE INDUSTRY.

State agencies receive oversight and input on a daily basis from the public which they serve. Oversight and input are also received from commissioners, the governor, and the legislature (especially through the budget process). In a number of instances the legislature has created specific mechanisms for input and oversight of state agencies. These mechanisms vary in formality from the loosely-knit but extensive system of fish and game advisory boards to the boards of independent state corporations which have explicit requirements for public and private industry members.

In HB 23 an independent state corporation was created with responsibility for operating the marine highway system. The board of the corporation included a number of seats restricted to members of various private industry groups and to members of the public from various parts of the state. Such a mechanism as this assures that some oversight and input to the marine highway system takes place.

ALASKA LEGISLATURE COMMITTEE FILES 1987 - 1988 8672
5132 HTRA COMM. MTGS: AK. MARINE HWY. (FILE 2) - OVERVIEW AKRR

If you should decide to introduce legislation on the marine highway system, please contact me with your specific proposals. If I can provide further assistance, please contact me.

August 14, 1986

Mr. Stephan Mason
Acting Chairman
Coalition for the Improvement of
Alaska Marine Highway System
P. O. Box 9625
Ketchikan, AK 99901

Dear Mr. Mason:

I appreciate the opportunity to reply to your letter of August 2. Many of the questions have been asked of me personally on my various ship visits and obviously my answers have not reached all the right ears. The following should provide factual data and I hope it will clear up some popular misconceptions currently in circulation. The deadline you imposed has made it difficult to research all of the technical and detailed data you have requested. That information will be forwarded at a later date. I will restate or paraphrase your question, then provide the answer.

1. Q. Give us background information regarding lost jobs.

   A. For FY 87 Alaska Marine Highway System (AMHS) like other branches of State government, was cut below FY 86 levels. These cuts came in several increments of various amounts during the budget process and included cost avoidances achieved through reduction in fuel prices. It was and continues to be our goal to provide the maximum amount of service to the public with the resources available. During the process it was determined that cutting of approximately $700,000 in vessel personal services would result in less severe cuts in scheduled vessel service than would otherwise be required. This decision was made for two reasons; 1) to continue maximum service to the public and 2) maximum service means maximum employment. The guidelines used to determine which positions would be cut were; 1) not adversely effect safety, 2) not adversely effect passenger services and 3) keep additional overtime to a minimum. The Director of Operations outlined the requirements to the shoreside department heads who then met and agreed on specific positions for cuts. I reviewed and approved the cuts.

2. Q. How much money was estimated would be saved by each department cut and all collectively?

   A.

Engineer Department	$178,000
Deck Department	303,700
Purser	33,300
Steward	208,800
Total	$723,800

3. Q. How much increased overtime has been submitted from each department since the job cuts. How much increased overtime has been submitted collectively?

   A. There has been substantial overtime submitted. It is being compiled and analyzed as limited staff time permits. I will forward the results of this effort when it is completed.

4. Q. When exactly can we expect all these lost jobs to be reinstated?

   A. AMHS is conducting an internal review of shipboard manning comparing required functions and work loads with manning. This study is expected to be completed this fall. Upon completion of this review, the preliminary finding will be reviewed with union and operating personnel prior to making any final determination. Both licensed and unlicensed input will be solicited and discussed. The result of this process should provide us with a valid manning document, based on required functions, workloads and services aboard each vessel.

5. Q. How many jobs have been eliminated from Department of Transportation and Public Facilities beach operations in accordance with recent funding cuts. What job positions and titles were eliminated and were these people terminated or moved to other positions within your operation? What exactly is the revenue savings currently reflecting these job cuts on the beach?

   A. The following matrix should answer the above questions for AMHS.

FY 87 Budget Reductions prior July 1

Position/Title	Who	Action	Where did the incumbent go	Estimated Savings (in Thousands)
Administrative Assistant	vacant	Delete	vacant	34.1
Director of Marketing & Services	Emery	Delete	accepted classified service job	89.9
Secretary I	McCorcle	Delete	transferred to another department	31.8
Reservation Specialist	vacant	Delete	vacant	46.6
Accounting Clerk II	Roberson	PFT to seasonal	reduced pay	15.3
Accounting Clerk II	Harrigan	PFT to seasonal	reduced pay	10.6
Accounting Clerk II	Ketcham	PFT to seasonal	reduced pay	10.6
Clerk III	Salazar	PFT to seasonal	reduced pay	5.2
Clerk III	Seagrave	PFT to seasonal	reduced pay	5.2
Clerk III	Annand	PFT to seasonal	reduced pay	5.2
Clerk III	vacant	PFT to seasonal	reduced pay	5.2
Clerk III	vacant	PFT to seasonal	reduced pay	5.2
Clerk IV	Romzek	PFT to seasonal	reduced pay	5.8
Budgeted overtime for various positions		Delete		48.6
				309.3

Additional Cuts ordered since July 1

Position/Title	Who	Action	Where did the incumbent go	Estimated Savings (in Thousands)
Director of Operations	Black	Terminated	Terminated August 15	82.9
Secretary I	Vaden	Layoff	Lay off 8/29	27.6
Planner	Lindbeck	Layoff	Bumped down Jr. person lay off 8/29	45.2
Payroll Supervisor	O'Connor	retirement	leave vacant	45.7
Ferry Services Manager III	Clark	retirement	leave vacant	43.8
Accounting Technician I	Reddekopp	PFT reduced to 30 hr wk	reduced pay	12.6
Clerk III	Del Fierro	PFT reduced to 30 hr wk upon retirement	reduced pay beginning September 26	10.0
Stockhandler	Currie	Seasonal reduced from 9.6 months to 6 months	reduced pay	11.9
			Total	279.7

The net result is that approximately 15 percent of the total shoreside AMHS staff have had their jobs eliminated, held vacant or experienced some lesser degree of negative effect on their pay.

6. Q. How does that revenue savings correspond to the estimated revenue cuts the shore-side DOT&PF operations are expected to take in response to current funding cuts?

A. The Department of Transportation and Public Facilities was required to take an overall 15% cut in the operating budget. If each element within the Department had been required to absorb that degree of cut the AMHS service and employment would have been severely crippled. By allocating total DOT&PF resources AMHS initially took approximately a 10% cut while the rest of the Department absorbed the rest. Impacts of this funding level would have included laying up the Columbia indefinitely and dropping one main line ship from winter service to southeast. When presented to the Governor this was considered unacceptable and he restored $2 million to take the COLUMBIA out of layup and put on schedule to take advantage of the busy season. This meant that AMHS took approximately a 7% cut while the rest of the Department took an 18% cut.

7. Q. May we have an official statement concerning Mr. Black's dismissal?

A. Mr. Black was relieved of duties as Director of Operations on July 16. He has been assigned some technical projects to work on prior to his final day at work on August 15.

8. Q. What transfer of job functions will this represent?

A. There are no plans to refill the position at this time nor has a decision been made as to whether or not it will be refilled. In the interim, I am taking on the responsibility of the Division and am relying heavily on the Port Captain, Port Engineer and Passenger Services Manager for day-to-day operations.

9. Q. Who has access to our reservations system and to our standby reservations and wait lists? What kind of confidentiality can we expect in regard to protecting our reservations from being raided by private enterprise?

A. All AMHS terminals have access to Reservation Management System (RMS II). Vista Travel in Fairbanks is the only travel agency with access to RMS and they finally became operational in late June 1986. Because of the special equipment requirements and technical difficulties experienced when we were actively attempting to bring

Vista Travel "on-line" I believe it would be almost impossible for an unauthorized party to gain usable access to RMS II. I have heard many rumors that "STARDANCER" has access to RMS II. I don't believe it. I have heard stories that "someone made a reservation on AMHS and was immediately called by STARDANCER and offered a better deal". I would like to talk to someone this actually happened to in order to attempt to reconstruct what happened. The only possible connection of STARDANCER to State of Alaska "lists" I am aware of is the fact that the Division of Tourism compiles a computer list of all people who respond to their Vacation Planner questionnaire and indicate they would consider visiting Alaska by "ferryliner" and this list is available for sale to any firm wishing to purchase it.

10. Q. What were the exact figures on passenger and vehicle reservations made for the special Expo sailing of the M/V MATANUSKA?

A.

	Southbound	Northbound
Passengers	159	147
Vehicles	13	24

At no time was either sailing booked full and there is no reason potential passengers should have been told it was full.

11. Q. Exactly how many reservations were made for Alaska State Government officials and dignitaries?

A. One. A reservation was made for DOT&PF Commissioner Knapp with the hope that he would be available to make the trip and present a letter from Governor Sheffield to the "Counsel General of the Expo". Other State business prevented Commissioner Knapp from making the trip and Captain R. M. Johnson presented the letter from the Governor.

12. Q. Were Governor Sheffield and Lt. Governor McAlpine scheduled to sail on that special Expo trip.

A. No.

13. Q. Exactly how many passengers actually showed for the sailing? How may vehicles?

A.

	Southbound	Northbound
Passengers	75	75
Vehicles	10	17

14. Q. Please give us the exact amount collected on the cancellation fees.

A. None. All passengers who paid in advance made the trip. Since there were numerous staterooms and car deck space available for additional passengers desiring to make reservations the manifests were not purged of those who had not paid.

15. Q. How much revenue was expended on the Expo sailing?

A. The M/V MATANUSKA was operating on the Seattle route, Tuesday sailings. On May 20, the M/V MATANUSKA called in Vancouver, B. C. instead of proceeding on south to Seattle, therefore the only additional costs of the "Expo trip" were those incurred directly as a result of calling in Vancouver. Those costs were as follows:

Agency fee	Canadian	$1,350.00
Pilot	Canadian	2,017.55
Berthage	Canadian	2,700.18
Miscellaneous	Canadian and U.S.	596.62
Total	U. S.	$4,936.56

16. Q. Please give us a complete description of the complete Expo advertising campaign and its cost.

A. No money was budgeted or expended on special advertising for the Expo sailing. Maximum advantage was taken of radio public service announcements, press releases and media interviews, all at no cost to AMHS.

17. Q. A number of questions were asked concerning repairs and upgrade to the Haines and Skagway docks with the implication that these were undertaken by AMHS in order to accommodate STARDANCER.

A. I will deal with Skagway first. The City of Skagway obtained a grant from the State of Alaska to improve the ore dock to accommodate SUNDANCER. AMHS had no part in that grant. The Haines transfer bridge and tower were old and in need of replacement just as the Petersburg and Wrangell facilities were. Replacement of the Haines facilities was budgeted in FY 81. Design specifications were completed and received FHWA approval in January 1981. The project was advertised in November 1983 and construction began March 6, 1984. This dock was designed for AMHS vessels only. The STARDANCER was modified to fit Haines rather than the other way around, and for the record STARDANCER pays approximately $1,000.00 per hour to use the Haines dock on a not to interfere basis with AMHS vessels.

18. Q. Who authorized the solicitation of AMHS traffic in line for boarding AMHS vessels by McDonald Enterprise/Sundance Cruise lines? Who authorized their use of the Haines terminal building for the same?

A. No one. In fact the State Terminal Tariff prohibits their use of our building. When it was brought to my attention that this was happening, I immediately had it stopped.

19. Q. How much of the Haines dock was federally funded? How much was State taxpayer funded?

A. Haines terminal project

State general funds	$ 159,591.91
FHWA funds	2,246,636.09
Total	$2,406,228.00

20. Q. Was the M/V COLUMBIA instructed to priority-load Juneau vehicles out of Haines during the summer of 1985? If so, who authorized it and for what reasons?

A. There were no changes in standby loading procedures ordered for M/V COLUMBIA or any other vessels out of Haines last summer.

21. Q. Was the M/V AURORA instructed to load only Ketchikan/Hollis traffic out of Prince Rupert during the summer of 1985?

A. No. If there was space available after loading all reserved vehicles, standby vehicles would be loading in their order on the standby list.

22. Q. Why have you not initiated an additional flyer inclusion on all tickets indicating a passengers "final destination"?

A. This may be a good idea as the data would be useful. We do have data on passengers disembarking at Haines and Skagway but we do not have final destination. Presently there is no staff time available to compile the data because of other higher priority work and reduced staff.

23. Q. What was price per gallon for fuel in Seattle and Skagway during the time M/V MALASPINA was on the Seattle run in the winter of 1985? (December 1984, January and February 1985). How much fuel did M/V MALASPINA purchase from each facility during that time?

A.

	Price	Amount Purchased
Skagway	.919 gal	208,193 gals
Seattle	.738 gal	202,649 gals

The M/V MALASPINA is required to fuel in Skagway for stability reasons.

24. Q. What is being done to publish and promote the life saving and waterway safety contributions of the Alaska Marine Highway vessels.

A. If the press has not already covered the story a press release is prepared. In addition, articles are carried in the DOT&PF newsletter In Transit as appropriate.

25. Q. May we have a complete list of all rescue operations by AMHS vessels, all records of assistance to vessels in trouble, and all contributions made by AMHS vessels in the area of public waterway safety?

A. No specific record is kept other than the entries in the ship's logs. Complete retrieval would require prohibitive efforts.

26. Q. We would greatly appreciate receiving a full and complete selection of personal and/or community commendations which exist. (In the area mentioned in Q. 25.)

A. No such file exists. As such letters and/or commendations are received, they are sent with a forwarding letter to the vessel Master and/or individuals as appropriate. An example is enclosed.

27. Q. Please give us a description of the Seattle phone reservation system from 1982 to the present.

A. In 1982 and until December 1984, the Seattle office had four telephone reservation clerks. Reservations were centralized in Juneau in December 1984 and toll free lines from both "outside" and within Alaska were established to the Juneau office. The Seattle "reservations" office was closed (the terminal and ticketing remained) and the four reservation clerk positions were transferred to Juneau.

28. Q. How many phone lines existed at which periods of time? When was the toll free 800 number installed? How long was it in existence and how much did it cost? When was it removed, how many non-toll free lines were installed to replace it?

A. When the Centralized Reservation Office was established in Juneau in December 1983 it was set up with two Alaska-only toll free lines, four "outside" toll free lines and three local lines. The "outside" toll free lines were discontinued in April 1986 because of budgetary restrictions. At that time an additional Alaska-only toll free line and three additional non-toll free (907) lines were installed. The actual bills paid for the toll free lines are as follows:

		Outside lines	Alaska only lines
January	1985	$ 4,612.92	
February	1985	3,337.19	$ 7,793.54
March	1985	4,191.61	16,486.63
April	1985	5,510.98	12,507.86
May	1985	8,059.46	15,307.62
June	1985	7,714.86	15,307.62
July	1985	8,456.62	15,307.62
August	1985	5,828.09	17,263.15
September	1985	4,481.02	16,264.00
October	1985	3,201.24	4,898.77
November	1985	2,506.58	6,716.92
December	1985	3,152.71	751.11
January	1986	7,141.40	1,515.70
February	1986	6,391.85	23,741.05
March	1986	4,878.45	21,099.20
April	1986	101.32	25,646.09
May	1986		25,621.65
June	1986		29,342.40
July	1986		28,681.00
		$79,566.30	$284,251.93

29. Q. Josephine Emery was Director of Marketing for what period of time?

A. Mrs. Emery was Director of Marketing and Services from January 1984 until May 1986.

30. Q. Could you please give us a description of her duties as Director of Marketing?

A. Her primary responsibilities included managing a $4.7 million operating budget along with the development, revision and communication of policies, rules and procedures for the promotion and sales of passenger, vehicle and stateroom space on the system which carries approximately 370,000 passengers and 100,000 vehicles.

She participated in the tourism industry to promote travel on the system, monitored community needs and probable effects of changing schedules or capacity; monitored passenger services on vessels; and responded to customer complaints.

She also supervised 65 employees, located in 18 offices and terminals in Seattle, Washington; Prince Rupert, B. C. and Alaska. She was responsible for publication and distribution of seasonal schedules and acted as project manager for the development and maintenance of a second generation computerized Reservation Management System (RMS II).

31. Q. What were her accomplishments as Director of Marketing?

A. She was Project Manager for the development of second generation Computer Reservation Management system; centralized and increased reservation sales office hours. Introduced toll-free numbers and introduced electronic call distribution system in central reservation office to assist planning for proper staffing, monitor efficiency and provide necessary data for future staffing levels; timely publication and distribution of printed schedules; employees in uniforms to improve Alaska Marine Highway system image and assist in public identification; coordinated promotional programs with the State Division of Tourism; and served on the Board of Directors of the Southeast Tourism Council and Juneau Convention and Visitor Bureau.

32. Q. Please give us a brief history of her prior marketing experience.

A. 1978 - 1980 Instructor - Tanana Valley Community College. Instructed three credit course - "Fundamentals of Transportation".

1974 - 1978 Manager, Passenger Services and Sales. Wien Air Alaska, Fairbanks.

1961 - 1974 Supervisor, Marketing and Sales - Western Airlines. Seattle, San Francisco, Ketchikan and Anchorage.

33. Q. How much was the advertising budget for FY 82 through FY 86?

A. The base budget printing and advertising line item for FY 82 through FY 86 was as follows:

FY 82	121.7
FY 83	149.4
FY 84	177.7
FY 85	125.3
FY 86	161.4

34. Q. What was the general breakdown of advertising costs for FY 85 and FY 86?

A. FY 85 breakdown: Summer and Winter schedules printing $90,000; tickets $20,000; miscellaneous printing and print advertising $14,000.

FY 86 breakdown: Summer and Winter schedules printing $100,000; tickets $30,000; miscellaneous printing, photo contest and print advertising $31,000.

35. Q. Who decided to implement the cancellation fees?

A. I did.

36. Q. Do you think the cancellation fees are particularly unfair during the busy summer months when the rooms, in particular, can be resold and bring in their expected revenue?

A. No, I do not. The cancellation penalty is a tool to encourage people who change their mind about traveling to cancel their reservation in order that we may then offer the space to someone on our "wait-list", a new innovation which allows our reservation's center personnel to confirm reservations for people on the wait-list as cancellations occur. This is in contrast to the standby list which only allows people in the terminal to board if there is a no-show. Before the penalty individuals were not cancelling their reservations causing the computer to show the vessel "booked solid". Other potential passengers then could not make reservations and when the person with the original reservation "no showed" we sailed with light loads. Staterooms almost always are filled on board by "cabin standby", passengers, but others may have decided not to travel because of non-availability of confirmed car deck or stateroom space.

37. Q. For exactly how many years was the no-charge stopover option available?

A. Staterooms have always been charged on a trip segment basis. This is the first year trip segment fares have been charged for other classes of fares.

38. Q. Who decided to discontinue this attractive travel incentive?

A. I did to help cover some of our costs during a year when operation of our vessels was directly tied to earned revenue for the first time.

39. Q. Could you please give us the cost increase figures on a fare from Seattle/Skagway with stops in Ketchikan, Wrangell, Petersburg, Juneau and Haines as opposed to a through fare?

A.

Trip Segment Fare		Through Fare	
Sea-Ktn	138	Sea-Sgy	208
Ktn-Wrg	22		
Wrg-Psg	14		
Psg-Jnu	36		
Jnu-Hns	18		
Hns-Sgy	10		
Total	238	Total	208

40. Q. Are you considering reinstating the travel incentive of through fares?

A. Yes, either through elimination of or by lowering the difference in costs.

41. Q. May we have a list of private organizations that the State has contracted with for labor with their physical location and address?

A. AMHS has contracted on occasion for specific jobs when cost analysis has shown contracting out to be less expensive. Specifically, the M/V MATANUSKA staterooms were cleaned by Coast Janitorial Service following the reengining of that vessel in Portland. The contracted

job cost $8,230.00. The Chief Steward has stated he needed 10 stewards to do the job which would have cost $21,918.00 per diem and wages (minimum guarantee included) and $376.70 in travel cost. The cost avoidance was approximately $14,064.70. Additionally, a contract has been signed with a company, Wright Service, to provide assistance in cleaning staterooms on the vessel turn arounds in Skagway. The contract calls for a cost of $6.25 per room. This is measured against the cost of "turn around" stewards from Juneau to Skagway to Juneau and the overtime plus the limited time in port. This program has been accepted by Chief Stewards as necessary, especially when there is limited turn around time in Skagway. Other contracts are entering into only if specific cost avoidance can be shown.

42. Q. How much was spent on contracted labor in 1984, 85 and 86?

A. This information is not readily available. As staff time will allow the answer will be researched and the information provided at a later date.

43. Q. How many "Comprehensive Plans" have been done regarding proposed operating plans for the Alaska Marine Highway System?

A. The Alaska Marine Highway is currently developing a comprehensive System Plan as recommended in the 1984 AMHS Task Force Report. It is scheduled to be completed this fall, and to my knowledge this is the only comprehensive plan developed in recent history.

The Southeast Region of DOT&PF has a Southeast Transportation Plan developed in 1980 that address AMHS as well as other modes of transportation in Southeast Alaska. It was updated earlier this year. It is a plan that addresses transportation from a regional aspect and does not go into detail nor does it address all the aspects that the AMHS System Plan will include.

44. Q. Is the AMHS System Plan Policy Workshop report yet another "proposed comprehensive plan"?

A. No. It is a small portion of the System Plan under development.

Sincerely,

Joe D. Camp
Deputy Commissioner

DEPARTMENT OF TRANSPORTATION & PUBLIC FACILITIES
OPERATING BUDGET COMPARISON
AND NARRATIVE OVERVIEW
FY86 AUTHORIZED - FY88 GOVERNOR'S REQUEST
(in millions)

Source of Funding	FY86 Authorized	FY87 Authorized	FY87 Revised	FY88 Governor's Request*	$ Change FY87 Rev. to FY88
Gen. Fund	$177.8	$161.4	$143.4	$124.1	($19.3)
Other Funds	116.2	118.5	118.8	122.1	3.3
Dept. Totals	$294.0	$279.9	$262.2	$246.2	<$16.0>
% G.F. Change From Previous Year	<0.4>%	<9.2>%	<11.2>%	<13.5>%	

*Excludes $5.2 million switch to user fees for Dalton Highway toll charges.

General fund decrements totalling $21.1 million and one general fund increment for $1.8 million for Marine Highways Risk Management increases have been accepted by the Governor. This is a net reduction of $19.3 million for the Department of Transportation and Public Facilities (DOT&PF). This yields a 13.5% departmental reduction from the FY87 Revised general fund budget. Please note this includes a net reduction of approximately 14% for the Alaska Marine Highway System (AMHS) and a 13.1% cut for all remaining DOT&PF general funds.

In addition, it is proposed that $5.2 million be changed from general funds to user fees to reflect operation of the Dalton Highway as a toll road. This would bring the general fund (GF) reduction to $24.5 million, or 17.1% of the Department's FY87 Revised GF budget. However, since this proposal would require separate legislative action this funding change is being considered as a part of the proposal for new legislation rather than as a part of the Department's budget.

Excluding the AHMS, and the Dalton Toll proposal, a general fund reduction of 13.1% and $11.0 million from the FY87 Revised GF level of $84 million is proposed. This 13.1% reduction in FY88

would mean that units of the department other than AHMS have been reduced by 36.1% since the FY86 authorized GF budget.

A net reduction for the general fund portion must be viewed in light of the overall impact to revenue from cuts to the AMHS. The AMHS has a FY'87 general fund revised budget of approximately $60 million and a subsidy level of about $30 million. We have identified the impacts from reducing the subsidy level by about $6 million, which results in a total reduction to the AMHS general fund budget of about $8.4 million due to revenue cuts.

MAJOR HIGHLIGHTS

The following depicts the major impacts from adoption of these proposals:

(1) Elimination of all state maintenance on nearly 1,600 miles of roads currently on the state maintenance system that are not considered the highest priority routes, or do not require minimal maintenance efforts due to investment of federal funds;

(2) Elimination of all maintenance except for minimal safety repairs and physical highway protection (which adds a hidden cost for increased legal liability) for approximately 800 miles of highways that are not priority routes, but have federal investment requiring continued state efforts to protect this investment;

(3) Reduction of maintenance funding by another 8% on the remaining 2900 miles of roads, which means a total reduction well in excess of 25% for maintenance and operation of these facilities in less than 18 months;

(4) Elimination or reduction of airport maintenance by over 7%, with particular emphasis on daytime operations only and major reduction of winter maintenance at certain airports statewide;

(5) Substantial reductions in Marine Highway service including unmanned layup of 6 vessels for a total of 29 months. This will affect at least 230 crew members. This leaves the Southeast system with no change to summer service, but only one mainline vessel and one feeder vessel for the other 8 months of the year, and the Southwest system with single vessel service for 6 months and no service for 2 months during the winter.

(6) Institution of a toll or user fee charge of approximately $500 per trip, per 18-wheeler for commercial use of the James Dalton Highway north of the Yukon River, which

may lead to eventual closure due to inability to recover adequate fees;

(7) Elimination of maintenance for campgrounds, rest areas, turnouts and waysides, land fills, and litter pickup for state highways to preserve funds for essential M&O functions; and

(8) Reductions in facilities maintenance including janitorial services for state buildings from 5 to 3 days per week, grounds-keeping, and clearing of snow and ice from sidewalks and parking areas.

HIGHWAY MAINTENANCE & OPERATIONS

The impact to highway M&O is particularly troublesome when viewed in a longer term context. Since 1980, DOT&PF's responsibilities have grown over 10%, while available real dollars have decreased by nearly 30% under the FY'87 revised budget.

To gain additional perspective, consider the likely effects of the FY'87 reductions already taken:

(1) Little preventative maintenance anywhere on the system, which means little highway crack sealing, patching or resurfacing.

(2) Traffic services such as snow plowing, striping, and pothole patching can only be performed on a priority basis, and roads to recreational areas and low traffic rural and suburban areas can be plowed only if time permits; and

(3) Routine summer maintenance will have to be eliminated or drastically curtailed if extraordinary winter snow and ice conditions occur.

Following the M&O cuts in August 1986, it is no longer possible to cut further on the basis of a straight percentage decrease across the entire system. Instead, it has been necessary to structure further reductions on a programmatic basis by classifying the highway system as follows:

(1) Category I: Priority routes that provide the intrastate connecting system between the population and economic centers, airports, and major harbors, thereby covering Alaska's fundamental transportation links.

(2) Category II: Routes where the state has invested sufficient federal funds to contractually bind us to provide a minimum level of maintenance to realize anticipated service life of the constructed improvements.

(3) Category III: All other routes that the state currently has on the state maintenance system.

We have further differentiated the importance of state efforts for maintenance into eight groups. These are in increasing order of importance (1) snow and ice control on Category III roads within organized governmental units; (2) all activities on Category III roads within organized governmental units; (3) snow and ice control on Category II routes within organized governmental units; (4) snow and ice control for Category III routes outside governmental units; (5) snow and ice control on Category II roads outside governmental units; (6) all activities on Category III roads outside governmental units; (7) maintenance at 30% of historical levels for Category II roads within governmental units; and (8) maintenance at 30% of historical levels on Category II routes outside governmental units.

The basic assumption is that a currently organized governmental unit would be better able, and probably more likely, to assume maintenance responsibilities for routes within their boundaries than people outside of a governmental unit Please note this may require legislative action to grant road powers in certain cases. This also recognizes that for many routes in rural areas there is not an identifiable user group to assume this responsibility. We have also assumed that while snow and ice control is important, it is less critical in the long run than basic life/safety and structural maintenance efforts, partially because of our agreement with the Federal Highway Administration (FHWA) to prevent highway deterioration.

While we tried to structure the decrements in increasing order of importance, and with as much individual selection as possible to allow decisions other than simply "take it or leave it," it is important to underscore the radical and severe nature of these propos s. First, these cuts have been prepared on top of other [illegible] cuts that we're currently managing, with cost data gaps [illegible]ng current performance. Second, there has been no public involvement to review and legitimize the methodology. Third, there may be administrative code and federal legal constraints hindering or preventing implementation of some of these proposals. Finally, there is probably a hidden cost of increased legal liability from implementing these proposals, which needs to be scrutinized.

AVIATION/BUILDING MAINTENANCE & OPERATIONS

The FY'87 aviation cuts have also severely curtailed preventative maintenance work, such as runway crack sealing and patching. Snow and ice removal may not always occur, depending on available manpower. Certified airports may not be open for all scheduled flights if safe operational conditions cannot be provided, or if overtime is not available to provide required crash/fire/rescue (CFR) services. Additional curtailment of routine summer maintenance efforts may also occur.

The proposed FY'88 decrements reduce these efforts further, and force more service elimination. Elimination of winter maintenance may force operators to perform their own snow control or to switch to a different airport. Reductions or elimination of CFR activities may restrict the types of aircraft now using certain runways. Specific impacts include the winter closure of Nome's North/South runway, and service reductions or eliminations at Barrow, Umiat, Northway, Bettles, Tanana, Unalakleet, Talkeetna, and Kotzebue. If significant cuts are pursued in the aviation M&O area, more work is needed to ensure an equitable level of service reductions statewide.

FY'87 reductions for building M&O have meant that efforts on heating and ventilation components have been limited to emergency repairs. Considerable deferred maintenance continues to accrue. Any FY'88 cuts would further exacerbate these problems.

ALASKA MARINE HIGHWAY SYSTEM

To date the AMHS has not incurred any substantial reductions in available general funds, although there have been service reductions to offset cost increases. Since the AMHS's portion of DOT&PF overall general fund budget is about 40%, it has become necessary to scrutinize all components carefully and to propose ways to achieve significant general fund reductions to accommodate your request.

Since the AMHS is a transportation entity that generates revenue, the true cost to the state is not the total general fund appropriation, but is the net general fund cost or subsidy. Accordingly, we have proposed three sets of decrements to reduce the net subsidy by about $6 million for FY'88. Although we have not structured our proposal in this fashion, we believe serious consideration should be given to changing the current budget method to provide program receipt authority to expend generated revenues, along with the general fund subsidy needed to achieve the selected service level. This separation in funding would make it clearer to all concerned there is a revenue aspect to the AMHS.

The following depicts the specific impacts from reducing the subsidy level by $6 million:

(1) Reduce M/V MALASPINA service by four months. Reduce M/V Taku service by six months. Both vessels would be placed in unmanned layup. In combination with the already scheduled layup of the M/V COLUMBIA for six months and the overhaul periods for every ship, this will leave only one mainline vessel in service from Seattle or Prince Rupert to Skagway for eight months of the year. This will impact approximately 164 crew members during this period.

(2) Reduce M/V AURORA service by four months resulting in single feeder vessel service in Southeast for eight months of the year versus the current four month period. The M/V CHILKAT would increase service by four months to supplement service between Ketchikan and Prince of Wales Island.

(3) Reduce M/V BARTLETT service by six months. The M/V TUSTUMENA will provide service for the entire Southwest system, resulting in general service reductions in the winter, particularly between Valdez and Cordova. There would be no service for two months during the winter.

There are several key assumptions under each scenario. The basic intent is to maximize service for Alaskans, at the expense of tourist business if necessary. Although no service or cost saving assumptions have been included for eliminating Seattle service since current data is inconclusive, we intend to continue reviewing this option as a means to improve service for Alaskans without increasing the subsidy. Another key assumption is that it would be more cost efficient to maintain the same level of summer service for the entire 1987 summer before instituting reductions. This is because of (1) the FY'87 budget authorizes initiation of this level; (2) these are the high revenue months; (3) we have already published our schedule and are accepting reservations; and (4) it would minimize the impact from implementing cuts immediately. If earlier implementation of service cuts is desired, we can analyze this further.

We have not made any assumptions regarding possible savings to minimize service cuts by fare increases. Further work is needed to ascertain what service level savings can be obtained without increasing the subsidy, although we believe there are some possibilities here. Finally, no assumptions have been made about further savings from negotiating wage and benefit concessions or

crew size reductions, or through major streamlining of the administrative side. Please also note there is an increment to fund additional risk management expenses not covered in the current base budget, which if not funded will cause a further reduction in service.

It is important to underscore that the proposed service cuts are not "set in concrete," but merely a general sense of what service levels would be by reducing the subsidy level by $6 million. On the other hand, our current review of available data suggests that changes fairly close to these would be needed to obtain the targeted level of savings. The AMHS is a difficult entity to analyze correctly to achieve the savings we believe can be made, while preserving essential service levels. Any decision to achieve major subsidy reductions will require more work together to ensure we have a rational proposal.

JAMES DALTON HIGHWAY

While the Dalton Highway remains an important transportation facility, we believe it is reasonable to consider covering all or some of the high annual M&O costs through a user fee or toll charge. This is not a new issue, as evidenced by the state's success in including the special provision in Sec. 1113 of the Alaska National Interest Lands Conservation Act, which allows the charging of tolls without facing an obligation to repay federal-aid highway money used to construct the road.

The primary user and beneficiary from continued operation are North Slope oil producers and Aleyska. While it can be argued that we'd be biting the hand that feeds us, and clearly there would be some reduction in tax receipts because of the additional costs, we know of no covenant or agreement requiring continuation of this support at our expense. The Department of Law has advised us that there may be some changes to state statutes needed prior to initiating this proposal.

The per mile M&O cost for the Dalton is higher by at least 70% than for any other major rural transportation route in Interior District. Further, it is worth noting that since state assumption of this responsibility in 1973, we have spent about $50 million in state capital dollars to support this function. While it is conceivable that the net effect over time might be closure of the road because aviation and/or marine modes are selected as the more economical means for support of North Slope oil activities, we believe these are exactly the type of hard choices Alaskans are facing under declining revenues.

Outside of the hue and cry from the oil industry, the other major group negatively impacted would be the trucking industry, particularly owner-operators. We are sympathetic to this concern in light of currently depressed conditions, but ultimately the most cost efficient means of transporting goods must be used to maintain economic stability and growth in Alaska. One answer, which incidentally might also help address the general complaints about "unfair" competition from the Alaska Railroad Corporation (ARRC), would be an interim state assisted training program to relocate trucking industry people into other job opportunities. Another entity that would be negatively impacted if the Dalton closed would be the ARRC since they now haul a fair portion of this business to Fairbanks. It might be necessary to contact them to obtain an assessment of this impact.

A toll to recover the full charge of the department's maintenance and operations costs for the Dalton Highway would mean a charge of about $500 per trip for an 18-wheeler. Our costs are estimated to be $5.2 million annually, approximately $4.3 million in Interior M & O's Highway and Aviation component and $.9 million in the Facilities component. In addition, we have requested an increment for $.4 million in user fees to cover the costs associated with collection of the toll charges (.3 million would be the

annual cost, plus a one time cost of moving and modifying the checkpoint facility). The proposed toll does not include the capital coats for resurfacing or major maintenance of this road.

ADMINISTRATION/PLANNING/DESIGN & CONSTRUCTION

During prior reduction reviews, considerable general funds reductions were obtained in these areas. A total of 30.5% of general funds have been cut in these areas between the FY'86 authorized and FY'87 revised budgets. For example, a considerable portion of the reductions made to achieve the FY'87 revised budget were in these areas, allowing AMHS and M&O cuts to be considerably less than otherwise would have been the case.

Our decrements do include some additional general fund cuts in the planning areas. Otherwise, we are not proposing any further cuts at this time. It appears that sizeable "fat" trimming has already occurred. There is also a potential problem of making reductions to the point that we face problems with the FHWA and Federal Aviation Administration as to whether we are maintaining sufficient state funded management and administration to continue qualifying for federal highway and aviation money. Finally, we do not want to propose any cuts in the administrative or accounting side at least until we have a better handle on the magnitude of those problems, and the level of resources needed to fix them.

One change in the transfer area warrants mention. We are proposing to raise the State Equipment Fleet (SEF) fixed fee rate from 51% of the budgeted FY'87 rate back to 72% of that rate. This rate was dropped as a one-time cost savings measure for FY'87, with an understanding that the rate would be re-instated to keep the Highway Working Capital Fund fiscally sound over the long term. It is our intention to maintain the 72% rate level for at least the next two years, and then reassess what, if any, additional adjustments are needed, particularly in light of possible reduced need for equipment due to other budget reductions. We project this increase will allow us to meet vehicle replacement demand, while maintaining a positive cash flow. This means increased fee costs of about $1.8 million for DOT&PF, which represents about 85% of the SEF's business.

REORGANIZATION SAVINGS

The attached budget submission includes some adjustments for organizational changes that have already been made, including the deletion of a net 5 PX positions based on already taken personnel actions. While further general fund savings are anticipated through additional reorganization and streamlining of current operations, we are not prepared to present any further proposals at this time.

The Commissioner wants to assess the overall operations for a period of time to ensure we don't destroy valuable portions of the organization that are working well. It may be that some of these savings won't materialize until mid to late FY'88 or at the start of FY'89. Accordingly, we respectfully request an understanding that any savings in these areas will be given priority consideration for use to restore reduced or deferred DOT&PF M&O activity.

REVENUE GENERATION

One way to offset some of the impact of both the proposed FY'88 and actual FY'87 reductions is to generate more revenue through our proposal to increase the motor fuel tax from 8¢ to 16¢ per gallon. We estimate this will generate approximately $20 million in additional revenue. We recommend using this increase to help local governments and communities to pay for the increased M&O costs for those roads and highways removed from the state maintenance system. There may be other ways to generate further receipts, such as airport landing and tie-down fees, to offset other reductions. We will continue to review these possibilities.

SUMMARY

DOT&PF provides the state with numerous, essential transportation services. There is no doubt that transportation serves a critical economic role in a state such as ours. We fear pursuing major cuts, particularly in highway and aviation M&O, will only exacerbate our current problems.

Accordingly, until we can develop some of these proposals more fully, including greater acceptance by local communities of many of these responsibilities, it is imperative that we carefully analyze adoption of the large reductions we have identified, and if possible, find other revenues to avoid drastic reductions.

OVERVIEW OF QUESTIONS ASKED BY HOUSE FINANCE COMMITTEE MEMBERS DURING A PRESENTATION BY THE DEPARTMENT OF TRANSPORTATION.

Tuesday, January 26 1987, Commissioner Gutierrez and staff for the Department of Transportation gave a budget presentation and overview to the House Finance Committee.

Attached please find the Department's proposed FY 88 budget from the Governor's office and an overview of the proposed budget changes and cuts.
Much of the information presented at this meeting is in the attached DOT overview report. Rather than be repetitive I felt it may be helpful to update you on some of the questions raised by House Finance Committee members at this meeting.

1. Why have such substantial cuts been made in the areas of M & O and to the Alaska Marine Highway System?

   In 1985, major cuts were made in the areas such as management and design and construction. No cuts have been made in the AMHS and very minimal cuts, have been made in M & O during the previous few years budget cuts. Another point to consider is that when looking at the cuts made to AMHS these cuts reflect cuts from the 1987 "actual" figure and not the revised figures - therefore, the cut to AMHS is actually less than in other areas.

2. How did the department go about categorizing Class 1, 11 and 111 roads - were they categorized on a user basis?

   No. The department felt that if roads were categorized on a user basis, heavily populated areas would have a great deal more Class 1 roads than rural areas. Several factors were taken into consideration including whether the road provides freight transportation needs (Valdez to Fairbanks), whether the road provides the only access to the area, how many people live in the area and numerous other factors where also taken into consideration. The department feels that this area is one that will need further consideration and will ask for community input and advice from local area DOT personnel to help prioritize the roads.

3. With the Capital Projects Cleanup, why can't we just get a computer print out of the total number of projects currently authorized? Then, compile a list of those projects that are physically under construction, complete these projects and start over again with all other projects so that are books and information would be correct and so that the problems with the Federal Government Highway on reimbursement of Federal dollars could be overcome? How long would it take to get this list?

It would be possible to compile a list and have it available in a very short time, 3-5 days. The department feels this would be very inaccurate as the problem is with billings not being made to projects. Therefore, it would take some time to figure out what monies had not been billed to projects and get the paper path moving along. Also, some projects are in the planning and design phase, some are under construction, some have been completed and require outstanding bills to be logged in before the project can be closed out. Because of the methods used for billing to the projects and the way in which project tracking has been done, the department now finds that there are currently thousands of projects that are in question.
Because of the poor accounting system information requested on projects before 1985 is difficult to provide accurately. The older the project, the harder it becomes to provide accurate information.

As of 6/30/85, the capital projects clean up list identified each project and the status of the project. When the department changed over to the new state accounting system this information was not recorded. The department is currently working on correcting the problems that exist.
Mr. Bob Poe has been hired to head up this project and the department is currently working on:

1. Correcting the Federal billing system problem. At the present time all bills submitted for Federal reimbursement receive a manual audit from the Feds before reimbursement is made. This is partly due to previous incorrect billings and also an inefficient system for compiling the bills.
   The department is in the process of requesting proposals for putting in place a system that will adequately perform all FHWA billings. The contract should be awarded within 45 days and the system should be in place in 6 months.

2. The department is also bringing on board two C.P.A.'s to help set up and administer the new accounting system.

4. Is there statutory language changes required to turn the Dalton Highway into a toll road? Is there anything that prevents turning a road that received consideral Federal funds into a toll road?

Based on discussions with the Department of law, DOT believes it advisable to amend As 19.40 to make it clear this arrangement would be legal, therefore yes, an amendment to the AS 19.40 would be required. The State of Alaska has a specific exemption from the requirements under Section 11.13 of the lands bill and relieves the state of any requirement to repay Federal monies used to build this road.

5. On the three tier maintenance program plan, is there some kind of legislation needed to establish a tier reduction program rather than the usual pro-rated reductions usually implemented?

   The Department would like to investigate this further, As Mr. Hickey sees it now the statutes provide the Commissioner with a great deal of latitude to make these decisions. The department has administrative procedures in place as well as regulations which require the department to receive public input and recommendations however, at the present time it does not appear that anything legislative would be required.
   This will need to be looked into further.

6. You refer to an increase in legal liability because of the reduced maintenance, could you explain further?

   The Commissioner stated the department will have to state the level of service it will provide. He feels that if in fact, a road is open, there is a responsibility to provide a minimum level of maintenance on the road. The Commissioner is not sure what this level is and he feels the department will need to consult with the Attorney General's office for legal direction. However, he has raised the question and feels it must be addressed.

7. How will user fees on the Dalton Highway affect the lift axle? If the axle is on the truck would there be a toll for this axle? How is the department addressing the overall lift axle question?

   In terms of the toll charge, if the axle were down and used for weight carrying purposes, it would be charged at the same level - $100/axle.
   As far as the question on regulations, the department has suspended implementation of the regulation to give the department and the legislature a chance to look at some of the issues. There is considerable controversy about some of the issues and, frankly, with the rapid change in economic conditions this issue may require rethinking on how to phase in a proposal. The department still has some basic concerns. There are a lot of concerns about the safety of using the lift axle, the test performed by the department would suggest they are a problem and many drivers have stated to the department in hearings that they are a problem.

Enforcement is a problem because they are used for weight purposes at the scale houses and then in order to avoid wear and tear they are not used.
The department is looking at a new proposal that would allow for lift axles to continue under certain conditions such as Washington has just done.
Steerable as opposed to fixed
Certification from the manufacturer that they are properly guaged to carry the weight they are carrying
Controls on the outside only
The department is still looking into this but feels this type of proposal may be acceptable.

8. Do you envision the $20 million revenue from doubling the motor fuel tax coming back to municipal governments through some sort of statutory shared taxes or how do you envision this? How does the $20 million relate to the actual cost of maintaining roads today?

The administration is going to propose legislation to provide for the pass back of this money. The total M & O cut talked about in Category 1 11 and 111 is about $10 million. With the cuts taken in the past plus this years $10 million total cuts in the past few years in M & O will total about $20 million. This therefore should be sufficient to offset these cuts.

9. Who would have to pay for use of the toll road?

The proposal is a new proposal and has a charge for light vehicles, this charge would be less but there would be a charge for any user of the road on a structured basis.

10. Where do you place schools in the three category system?

It would be catagorized depending on whether the school is on a route. If the school is on a category 111 route we would be looking for the schools to take on the responsibility.
DOT may have to reconsider this categorizing and receive additional input.
Concerns were expressed by Senator Fischer about the roads to schools not being open and yet the constitutional requirement to provide education.
DOT will have to consider this.

11. Why is there an increase in the total dollars for the state equipment fleet, state planning and research and yet dramatic cuts are shown for M & O. What are the philosophical goals of the department?

The administrative sections, planning, research and administration is roughly 12% of the overall general fund dollars of the department budget. In FY 87 revised a large cut was made in these areas and none in AMHS and very little in O & M. The department would be willing to look at the budget more closely as the figures shown are not set. Until the department has a better feel for things such as the Capital Project cleanup they did not want to get rid of any available personnel.

HB 62

FISCAL NOTE ANALYSIS

During FY 84, the Department of Transportation and Public Facilities completed a program of reorganization. Basically, the efforts were toward regionalization of the Department and decentralization of the functions within its operation. As a result, Marine Highway System became a "region" or a stand alone operating unit headed by a Deputy Commissioner.

After almost three years of operating at the new level, the Alaska Marine Highway System has shaken-down internally with planned organization adjustments to ensure all functions previously accomplished outside the System are covered. The current organization with a minimum of additional positions would be required for independent operation as the "Alaska Marine Highway Authority". The new positions required are identified on the attached Request for New Position forms.

No funds for the increased operation of vessels are being requested in this fiscal note. Such an increase would require additional funds whether the System is managed as an Authority or under the present organization within the Department of Transportation and Public Facilities.

It is assumed the Authority would continue to utilize the State Accounting System and other State computer resources, including those needed to support our Reservations Management System. The requirements will remain the same under the current organization or an Authority.

The following assumptions were made:

1. The legislation would take effect July 1, 1987.

2. The "Alaska Marine Highway Authority's" time and attendance, personnel, and leave accounting computer systems will be completed with existing funding and will interface with existing State systems.

3. There would be an annual appropriation for full operating costs of the Authority each year that would include all revenues generated (Program Receipts) and a General Fund subsidy appropriation to cover the balance of costs needed to maintain the currently budgeted level of vessel operating schedules.

4. An inflation factor of five percent has been included for future years beyond FY 88.

5. The position of Deputy Commissioner would be converted to Executive Director and administrative support would be provided to the Board of Directors by the existing staff and the additional positions requested. No transfers of positions would be made from the Department of Transportation and Public Facilities.

6. The Authority would continue to use:

   A. State-owned office buildings.
   B. The State mail system
   C. The State equipment fleet.
   D. The statewide purchasing contracts (i.e. fuel).
   E. "Shared" communications lines.
   F. Insurance, bonding, etc., as now supplied.
   G. Legal services from the Attorney General's Office.

7. The Directors of the Authority would meet an average of three days per month, or thirty-six days per year.

DETAIL OF FY 88 COSTS

MARINE ADMINISTRATION BRU

Personal Services - 1 PFT Position			$ 53.3
Analyst/Programmer IV	$ 53.3

Other		

Justification

Creation of an Authority would require data processing support services which are currently provided by the Department of Transportation and Public Facilities.

This position will be responsible for systems maintenance and enhancement of the reservations system (RMS II) and other information systems specific to the Alaska Marine Highway Authority.

Equipment costs include office equipment and necessary computer equipment (terminal, microcomputer, printer, etc.).

POSITION PAPER
HB 62

House Bill 62 establishes the Alaska Marine Highway Authority as an independent public corporation for the operation, management, planning and construction of the State's marine highway system.

Section 19.70.040 specifies that the authority shall hire an executive director and may employ additional staff as necessary. The proposed language clearly and appropriately places the employees of the Authority in the classified service. However, the status of the executive director and legal counsel are not clearly delineated.

> "The executive director and legal counsel are in the exempt service under AS 39.25.110."

Also add another section to the bill which states:

> "AS 39.25.110 is amended by adding a new paragraph to read:
>
> (23) The executive director and legal counsel of the Alaska Marine Highway Authority."

The Department of Administration/Division of Personnel's position on this bill is neutral.

• OTHER MISCELLANEOUS EXPENSE CUTS	500
TOTAL CASH GENERATED	$ 6,600

ALASKA RAILROAD CORPORATION

SALE/TRANSFER OF RAILROAD

Points to Consider

- If sold within five years of transfer (January 5, 1990), proceeds in excess of State's investment will go to the Federal Government.

- If sold within ten years of transfer (January 5, 1995) and any Railroad property is converted to a use preventing railroad operations, that property and improvements revert back to the Federal Government.

- If use of Railroad right-of-way is discontinued, ownership of land will revert to the Federal Government and then to adjoining land owners.

- Sale of ARRC is a very complex and complicated project which will entail a great deal of planning and major expense for such things as:

  - Sale alternatives
  - Asset valuation
  - Identifying buyers/qualifications
  - Profitability
  - Financing decisions
  - Review of prior line sales
  - Evaluation of labor agreements
  - Row and title issues
  - Risk management issues
  - Develop prospectus

- Consultants and investment bankers must be employed to assist in the above issues to lend credibility.

PASSENGER SERVICES

NORTH

WINTER LOCAL

- Monthly, September 29, 1986 - May 17, 1987
- 1st and 3rd Saturdays - Anchorage to Fairbanks
- 1st & 3rd Sundays - Fairbanks to Anchorage
- 2nd, 4th and 5th Saturday and Sunday
  Round-trip Anchorage to Hurricane
- RDC Equipment to be utilized on all runs

SUMMER EXPRESS - ANCHORAGE VIA DENALI TO FAIRBANKS

- Daily Service, May 23, 1987 - September 13, 1987
- 180 seats available in each direction daily with the steam equipment used during peak season only.
- Tour Alaska will probably attach two railcars and Westours will attach three railcars in each direction or 300 seats.

WHITTIER SHUTTLE

WINTER

- September 19, 1986 - May 13, 1987
- Service on Wednesday, Friday, Saturday and Sunday Weekly
- On Saturday a RDC will run from November 1, 1986 to March 28, 1987
  - This is an additional service on the Whittier Shuttle
- Buses have replaced passenger coaches on the Shuttle

SUMMER

- May 15, 1987 - September 16, 1987 Daily Service
- Exploring the use of buses or leased rail passenger coaches for equipment this summer
  - Daily RDC Service between Anchorage and Whittier is under review to replace bus service between Anchorage and Portage
  - A substantial increase cruise ship traffic movement must also be considered. 33 Dockings 1986, 57 in 1987

SEWARD

WINTER

- Exploring the financial feasibility of a round-trip RDC service to Seward from Anchorage on Saturdays during the Winter of 1986/87

SUMMER

- Round-trip RDC service from Anchorage to Seward
- Service on Fridays, Saturdays and Sundays from June 5, 1987 - August 23, 1987
- Expansion of the successful once a week service in 1986

FOR TODAY'S MEETING YOU HAVE:

A FOLDER THAT INCLUDES:

* a statement from Mr. Barry Morehead, Division Administrator for the Federal Highway Administration Alaska Division

* a list of potential questions for Mr. Morehead

ALASKA - FEDERAL-AID HIGHWAY PROGRAM

I appreciate the opportunity to meet with you.

I wanted to take this opportunity to tell you some of our concerns and problem areas and see if there are some ways you can help resolve them or at least be aware of what we would hope to see in the immediate future. In our office here in Juneau we have 17 people. We work directly with your Department of Transportation and Public Facilities (DOT&PF) personnel in advancing the Federal-Aid Highway Program t.roughout the State - one of the areas that must be addressed is the ever increasing number of projects that may require Federal-aid highway funding. Where I think you and your committee could really help is to explain to your colleagues is, there is a set amount of Federal-Aid Highway funding that is made available to Alaska each year. This has been about $150 million for the last few years. I don't know what future levels will be but I'm sure they will be in the $130-150 million range. The important part is the State will receive a fixed amount and although your overall needs now far exceed our program, based on projects or improvements Alaska DOT&PF has been directed to develop, that fixed amount will not change. So please, at every opportunity you get explain to your colleagues and your constituents there is a fixed amount of Federal-aid highway funding coming to the State and if someone comes up with a high priority project and everyone decides to advance that project, a like dollar amount of projects must be deleted for that year.

Commissioner Hickey can give you a better idea but I understand the various Regions are working on about $1.5 billion worth of projects. What we have asked for is a listing of projects or phases of projects proposed for Federal-aid highway funding. We have asked for this listing to be by fiscal year and to use an anticipated Federal-aid dollar amount in the $150 million range. When we receive this listing we will be able to concentrate our limited resources to the most current year proposals and should eliminate our involvement in projects that will not require Federal-aid highway funding.

Mark and his staff are working on a six-year transportation obligation plan which may meet our needs without any duplication of effort. From our initial discussions there will be an identifier as to which projects are proposed for Federal-aid highway funding.

Another area that really needs to be addressed is how best to handle a project that was estimated to cost say $1.5 million and a year or two later, when design is in a more final state, the cost is estimated at $1.55 million. I guess what I need is to better understand your line item funding and what flexibilities Mark and his people have. What would seem to be a rather insignificant dollar amount causes us some real problems - what normally happens is a request to delete items like lighting or guardrail, to reduce

the length of the project, or something similar. We aren't usually too receptive to those type requests, since the traffic normally dictates the type of facility needed as well as recognized safety features to accommodate that traffic. It would seem to me it should be simple to say, "please add $50,000 to the estimated cost of this project which our most current estimate indicates is needed." The process of doing this must be more cumbersome than I would have thought since this seems to be the last option the State people want to pursue rather than the first. What would be wrong with setting up a project adjustment account of say $2-5 million to handle this type situation - your could get an accounting of how any withdrawals were handled, i.e., what project, what caused, etc., which would stress accountability and at the same time keep projects moving. Like I said, I really don't understand your funding process - possibly you have a method to handle this and the project managers need to be told how it works.

I guess the final area I want to discuss is maintenance. Our very broad criteria for participating in the Federal-Aid Highway Program is that a State must have a highway department with adequate powers and be suitably equipped and organized to carry out the requirements of the program. The other requirement is that State must agree to maintain or cause to be maintained any improvement which utilized Federal-aid highway funding. What I am

going to need to know is which routes, if any, do you propose to no longer maintain. The route that comes to my mind is on Prince of Wales Island. The route called Control Lake to Thorne Bay. There is an active construction contract there now with several other phases planned to get it up to minimum State standards. If the State elects not to maintain these facilities, we should terminate the improvements. I have asked Alaska DOT&PF to respond as soon as possible and their response will depend on what the legislature and Governor decide.

Anyway, that's all I had, any other questions?

Barry F Morehead

Barry F. Morehead
Division Administrator

QUESTIONS FOR MR. BARRY MOOREHEAD - FEDERAL HIGHWAY ADMINISTRATION

1. WHAT IS THE CURRENT STATUS WITH THE FEDERAL HIGHWAY FUNDING?

2. WHICH FEDERAL VERSION, HOUSE OR SENATE IS LIKELY TO PASS?

3. WHAT WILL BE THE OVERALL IMPACT IF THE HOUSE VERSION IS ADOPTED?

4. HOW IS THE RELATIONSHIP BETWEEN THE FEDERAL HIGHWAY ADMINISTRATION AND THE STATE OF ALASKA?

5. HAVE THE PROBLEMS BEEN CORRECTED, ARE THE CORRECTIONS MADE ACCEPTABLE TO FEDERAL HIGHWAY ADMINISTRATION?

6. WHY DID THIS PROBLEM GET TO THE STAGE OF BILLINGS NOT BEING ACCEPTED? WAS THE STATE OF ALASKA GIVEN PLENTY OF NOTICE PRIOR TO THIS ACTION THAT IT'S BILLING METHODS WERE UNACCEPTABLE?

7. SHOULD THE DEPARTMENT AND THE STATE DECIDE TO ADOPT THE PROPOSED MAINTENANCE PROGRAM IN FY 88, THAT IS, CATEGORIZING THE ROADS AS CLASS 1, CLASS 11 AND CLASS 111 ROADS, WOULD THERE BE ANY IMPACT ON FEDERAL FUNDING BECAUSE OF THIS ACTION?

8. WHAT RECOMMENDATIONS OR SUGGESTIONS DO YOU HAVE TO IMPROVE THE CURRENT SYSTEM?

9. WHAT PERCENTAGE OF FEDERAL HIGHWAY FUNDING GOES TOWARD THE SECONDARY ROAD SYSTEM?

10. DURING YOUR PROPOSED TOUR OF ALASKA THIS SUMMER WITH MR. RILEY SNELL, WHAT AREAS DO YOU INTEND TO LOOK AT?

The Honorable Ben Grussendorf
Speaker of the House
Alaska State Legislature
P.O. Box V
Juneau, AK 99811

Dear Representative Grussendorf:

Fermin "Rocky" Gutierrez has resigned his post as Commissioner of the Department of Transportation and Public Facilities. Please remove his name from the confirmation list submitted to you on February 10, 1987.

In accordance with AS 39.05.080 and Article III Section 25 of the Alaska Constitution, I submit the following names for legislative confirmation of appointment to the position noted:

Department of Transportation and Public Facilities
Commissioner Mark S. Hickey

Department of Corrections
Commissioner Susan Humphrey-Barnett

The resumes for these appointments will be submitted to the Fifteenth Alaska State Legislature through the clerks of both houses respectfully.

Sincerely,

Steve Cowper

CAREER OBJECTIVE

To continue public service for the State of Alaska in a position of high level responsibility involving public policy formulation and legislative activity to achieve implementation.

EDUCATION

Bachelor of Science in Foreign Service, Georgetown University, 1976. Major: International Politics - Law, Relations and Organizations. Grade Point Average: 3.64 (Cum Laude).
Junior Year Abroad: Georgetown-at-London/Warsaw.
School of Foreign Service Proficiency in French.

Railroad Profit Strategy Program, Northwestern University, 1979.

WORK EXPERIENCE

Alaska Department of Transportation & Public Facilities
Office of the Commissioner
P.O. Box Z; Juneau, Alaska 99801

Position: Special Assistant for External Affairs
February 1985 to Present

Provide DOT/PF Commissioner with high level staff support for a wide range of external DOT/PF relationships. Major areas of responsibility include the Alaska Railroad Corporation, the Alaska Land Use Council, the Alaska Power Authority, land acquisition and management issues with particular emphasis on Native problems and coordination with the Alaska Department of Natural Resources, transportation corridor and access issues, vehicle weight limits and commerce regulation matters, and special assignments regarding state and federal legislation (e.g., Surface Transportation Assistance Act). Also perform special DOT/PF negotiations as assigned (e.g., Klondike Highway Agreement; North Slope Borough Dalton Highway concerns).

Alaska Department of Transportation & Public Facilities
Office of the Commissioner/Alaska Railroad Transfer Team

Position: Special Assistant II/State Railroad Coordinator
January 1983 to February 1985

Directed and coordinated all state staff work to address and implement the state's decision to acquire the Alaska Railroad from the federal government. Duties included careful scrutiny of valuation work by the United States Railway Association; performance of extensive negotiations with the Federal Railroad Administration; preparation of several detailed reports analyzing transfer issues; legislation drafting and lobbying to obtain passage of the state Alaska Railroad Acquisition & Corporation Acts and necessary appropriations; completion of administrative steps to achieve transfer, including preparation of all transfer documents and employee protection mechanisms; and work to initiate corporate existence and facilitate transition activities. Directed an immediate staff of five members, and an entire work force of about thirty people from seven departments and several law and consultant firms.

Alaska Department of Transportation & Public Facilities
Hdqts./S.E. Divisions of Planning & Programming

Position: Transportation Planner I/Public Facilities Planner I/
Planner IV & III January 1979 to December 1984

Served as Chief Policy Analyst for DOT/PF's Statewide Policy Section. Served as Lead Planner for DOT/PF and the Office of the Governor on the Alaska Railroad Acquisition Project. This included directing and coordinating all work activity of consultant study teams and special outside legal counsel, and major staff support for drafting and other legislative work to obtain passage of the federal Alaska Railroad Transfer Act. Served as DOT/PF's State Rail Plan Manager. Served as DOT/PF's Staff Representative for the Alaska Land Use Council. Performed considerable legislative liaison work on transportation issues for State D-2 Lobbying Team. Served as DOT/PF Project Manager for Governor's 1980 Dalton Highway Policy Analysis. Performed other lead planning duties as assigned.

Alaska Department of Transportation & Public Facilities
Alaska Department of Highways
Headquarters Planning Division

Position: Transportation Planner I/Research Analyst I
November 1976 to June 1978

Served as State Coordinator of the urban and local transportation planning programs, including administrative and technical responsibilities for federal grant programs. Served as Program Manager

for elderly and handicapped transportation grant program under the Urban Mass Transportation Administration. Researched and prepared urban and rural transit studies on Alaskan communities. Served as staff member for the Alaska Transportation Planning Council.

American Council of Education
One Dupont Circle; Washington D.C.

Position: Research Assistant/Shipping Clerk
May 1975 to October 1975

Assisted in the formulation of G.E.D. High School Equivalency Tests and testing procedures. Assisted in the reorganization of office files and revision of office procedures. Performed a wide range of clerical duties as required.

HONORS AND ORGANIZATIONS

Guest Speaker, Anchorage Chamber of Commerce, 1985
Guest Speaker, Fairbanks Chamber of Commerce, 1984
Guest Speaker, International Association of Right-of-Way Agents, Anchorage Chapter, 1984

PURPOSE OF THE REPORT

In accordance with the intent of Titles 24 and 44 of the Alaska Statutes (sunset legislation), we have reviewed the activities of the Board of Marine Pilots to determine if the Board has been operating in an efficient and effective manner.

As required by legislative intent, this report shall be considered during the legislative oversight function in determining whether the Board of Marine Pilots should be reestablished. The law currently specifies that this Board will terminate on June 30, 1987 but will continue until June 30, 1988 for the purpose of concluding its affairs.

The major areas of our examination were the licensing, examination, administration, complaint, and affirmative action functions of the Board. We reviewed and evaluated the following:

1. Applicable statutes and regulations.

2. Tests of files and documents of licensees.

3. Interviews with the Division of Occupational Licensing (OL) employees.

4. Complaints filed with OL, Equal Employment Opportunity Office, Attorney General's Office, and the Ombudsman Office.

5. Discussions with Board members.

6. Minutes of Board meetings and Division correspondence files.

7. Attorney General's Opinions applicable to professional boards.

8. Interviews with personnel from the U.S. Coast Guard.

ORGANIZATION AND FUNCTION

Responsibility for the regulation of marine pilotage is shared by the Federal and State governments. The Federal government, through the U.S. Coast Guard (USCG), regulates pilotage on enrolled vessels, while the individual states are given the right, in the United States Code, to regulate pilotage on registered vessels. Enrolled vessels are vessels registered in the United States and engaged in commerce between American ports; registered vessels are those vessels engaged in foreign trade. The individual states have the right to regulate pilotage on vessels engaged in foreign trade.

The Alaska Board of Marine Pilots was created under AS 08.62 to carry out the State of Alaska's responsibility of regulating pilotage on registered vessels. The Statute became effective in 1970.

The board is made up of seven members - two marine pilots, two agents or managers of vessels, two public members, and the Commissioner of the Department of Commerce and Economic Development. The purpose of the Board of Marine Pilots is to license qualified pilots, to take disciplinary action against negligent or incompetent pilots, and to establish standards for pilotage fees.

Once a marine pilot has received a license from the Board, he is authorized to pilot registered vessels within the established boundaries of compulsory pilotage waters for the State. The compulsory pilotage waters and the exclusions for entering compulsory pilotage waters are defined by regulations. Alaska Statute 08.62.160 requires registered vessels to carry State licensed pilots when inside these boundaries. It is the pilot's job to direct a vessel safely through Alaska's designated inside waters, dock and undock the vessel.

To obtain an unlimited pilot's license an applicant must first obtain both a pilot's license and a master's license issued by the U.S. Coast Guard. In addition, the applicant must perform ten to twenty supervised dockings and undockings and pass written and oral examinations administered by the Board.

The Board also issues limited pilot's licenses and channel pilot's licenses. The holders of limited pilot's licenses may pilot vessels of 2,000 gross tons or less. Channel pilots may pilot vessels in main ship channels only, and can perform dockings and undockings under the direct supervision of pilots holding unlimited pilot's licenses. Proof of dockings and undockings is required to obtain the limited

REPORT CONCLUSION

Policy Issues

This report contains policy issues raised as a result of our evaluation of various Board practices. The final policy decisions affecting these practices are not within the scope of this report but require legislative consideration. In debating these issues, the oversight committees should take into consideration the findings and recommendation presented in this report so the potential impact of policy changes can be evaluated.

Report Conclusion

In our opinion, the Board of Marine Pilots should be reestablished. The regulation and licensing of qualified professionals is necessary to protect the public's health, safety, and welfare. The Board provides this service by establishing minimum experience requirements that provide reasonable assurance that persons licensed are qualified. Also, assurances that those licensed act in a competent manner is provided by investigation of complaints and revocation or suspension of licenses when appropriate.

7. Attorney General's Opinions applicable to professional boards.

8. Interviews with personnel from the U.S. Coast Guard.

(Intentionally left blank)

ORGANIZATION AND FUNCTION

Responsibility for the regulation of marine pilotage is shared by the Federal and State governments. The Federal government, through the U.S. Coast Guard (USCG), regulates pilotage on enrolled vessels, while the individual states are given the right, in the United States Code, to regulate pilotage on registered vessels. Enrolled vessels are vessels registered in the United States and engaged in commerce between American ports; registered vessels are those vessels engaged in foreign trade. The individual states have the right to regulate pilotage on vessels engaged in foreign trade.

The Alaska Board of Marine Pilots was created under AS 08.62 to carry out the State of Alaska's responsibility of regulating pilotage on registered vessels. The Statute became effective in 1970.

The board is made up of seven members - two marine pilots, two agents or managers of vessels, two public members, and the Commissioner of the Department of Commerce and Economic Development. The purpose of the Board of Marine Pilots is to license qualified pilots, to take disciplinary action against negligent or incompetent pilots, and to establish standards for pilotage fees.

Once a marine pilot has received a license from the Board, he is authorized to pilot registered vessels within the established boundaries of compulsory pilotage waters for the State. The compulsory pilotage waters and the exclusions for entering compulsory pilotage waters are defined by regulations. Alaska Statute 08.62.160 requires registered vessels to carry State licensed pilots when inside these boundaries. It is the pilot's job to direct a vessel safely through Alaska's designated inside waters, dock and undock the vessel.

To obtain an unlimited pilot's license an applicant must first obtain both a pilot's license and a master's license issued by the U.S. Coast Guard. In addition, the applicant must perform ten to twenty supervised dockings and undockings and pass written and oral examinations administered by the Board.

The Board also issues limited pilot's licenses and channel pilot's licenses. The holders of limited pilot's licenses may pilot vessels of 2,000 gross tons or less. Channel pilots may pilot vessels in main ship channels only, and can perform dockings and undockings under the direct supervision of pilots holding unlimited pilot's licenses. Proof of dockings and undockings is required to obtain the limited

and unlimited classes of licenses. Applicants for any of the three licenses can obtain temporary licenses by meeting all the licensure requirements and taking a temporary license examination. A second, more extensive, examination is required for permanent licensure which is administered at the subsequent Board meeting.

To obtain license renewal, a pilot must have worked within the area(s) for which he was licensed within the last two biennial periods or petition the Board for determination that he has sufficient knowledge and experience to resume pilotage in the area(s). License renewal is required biennially. It is a pilot's duty to report quarterly the names of all vessels served that were subject to the services of a licensed pilot.

Another function of the Board is to establish standards for setting pilotage fees for services. Any changes of the fees charged by pilots for their services must be approved by the Board.

The Board is assisted in performing its licensing and other administrative functions by staff support from the Division of Occupational Licensing (OL). OL processes applications, maintains files, answers correspondence dealing with the Board, and provides other administrative support as needed by the Board. In addition, OL investigates complaints or accident reports involving marine pilots.

REPORT CONCLUSION

Policy Issues

This report contains policy issues raised as a result of our evaluation of various Board practices. The final policy decisions affecting these practices are not within the scope of this report but require legislative consideration. In debating these issues, the oversight committees should take into consideration the findings and recommendation presented in this report so the potential impact of policy changes can be evaluated.

Report Conclusion

In our opinion, the Board of Marine Pilots should be reestablished. The regulation and licensing of qualified professionals is necessary to protect the public's health, safety, and welfare. The Board provides this service by establishing minimum experience requirements that provide reasonable assurance that persons licensed are qualified. Also, assurances that those licensed act in a competent manner is provided by investigation of complaints and revocation or suspension of licenses when appropriate.

(Intentionally left blank)

FINDINGS AND RECOMMENDATION

Recommendation No. 1

The Division of Occupational Licensing's investigative unit should ensure timely, effective, and efficient investigations of licensing complaints.

The Division of Occupational Licensing (OL) is responsible for monitoring and enforcing ethical and professional licensing standards and requirements for various professional boards. Complaints alleging improper practices on the part of licensees as well as those contesting board licensing decisions are investigated by OL. The effective performance of this function is necessary to promote the welfare of the public and protect the rights of licensees.

During the December 15, 1985 special report on OL, several cases were found where there was up to a year's delay in the appointment of a hearing officer; up to six months between the completion of an investigation and the time an accusation was drawn and served; and up to three months between the time a licensing board made a final decision and notice of the decision was served the disciplined licensee. It was determined that the primary cause of those delays was the absence of an effective case management system. There was no system in place to effectively track investigations from the time of the first complaint through its various stages until final resolution. Also noted was that cases were assigned and prioritized through an informal system with little centralized management control.

The conditions found in 1985 were present for much of our audit period. In addition, the investigative unit had significant delays in processing complaints regarding marine pilots in 1985-1986. Review of the 9 complaints received in Juneau by OL from July 1, 1985 (the cutoff test date of the prior audit) showed 4 complaints received in OL 30 - 70 days prior to processing by the investigative unit. OL has recently initiated a process to log in and update complaint file status utilizing computer resources. Centrally available case information and the newly established investigative procedure manual should provide a basis from which OL can enhance complaint processing by the unit.

(Intentionally left blank)

ANALYSIS OF PUBLIC NEED

Limited Analysis

The following analyses of board activities relate to the public need factors defined in the "sunset" law. These analyses are not intended to be comprehensive, but address those areas we were able to cover within the scope of our review.

I. The extent to which the board, commission, or program has operated in the public interest.

A. The Board of Marine Pilots has operated in the public interest by examining and licensing qualified applicants and proposing changes in regulations that are necessary to enforce State statutes and assure the protection of shipping, human lives, property, and the environment from the dangers posed by vessels in Alaskan waters. To accomplish these functions, the Board has held 6 board meetings, 2 teleconferences, and 6 examination sessions for marine pilots during the past 4 fiscal years.

B. Two applicants were issued temporary upgraded licenses prior to fulfilling the docking and undocking certification as required in regulations 12 AAC 56.030 and 12 AAC 56.040.

II. The extent to which the operation of the board, commission, or agency program has been impeded or enhanced by existing statutes, procedures, and practices which it has adopted, and any other matter, including budgetary, resource, and personnel matters.

A. The Governor, when making appointments to a board or commission, requests that the appointee attend at least 75% of the meetings. From December 1982 through November 1985, one of the seven members had attended only 50% of the meetings. In addition, late appointment caused Board members to fall to 6 (including Commissioner's designee) for two Board meetings.

B. The Board pilot members regularly review the examination content and revise it as needed. The State areas differ slightly from the USCG endorsements available and therefore, the Board needs to ensure that applicant requirements are clear regarding these areas. Also under revision is the accident report form.

C. The Board and OL license examiners are utilizing a procedures manual thereby enhancing effective communication between the administrative function and the Board.

D. The following has hampered or enhanced the Board's effectiveness due to administrative actions by OL:

1. The Board received assistance in drafting legislation and regulatory changes from OL.

2. Alaska Statute 08.01.070(7) requires the Board to forward Board minutes to OL within 20 days of the meetings. This time requirement was not met for the May 1985 Board meeting.

3. OL does not have an allocation plan for indirect costs for each individual board. They do have procedures to recoup costs in total. Available records indicate the Board is not self-supporting.

4. Alaska Statute 08.01.050(9) states licenses will be issued as authorized by the Board. Two licenses were issued in December 1981 with no apparent Board resolution existing in the Board minutes.

5. Board Regulation 12 AAC 56.060(c) requires temporary exams to be administered by two Board members. Two exams were administered with OL Commissioner's designee's authority in Unalaska in 1984 due to the applicant's expression of financial hardship.

III. <u>The extent to which the board, commission, or agency has recommended statutory changes which are generally of benefit to the public interest</u>.

A. The Board changed or deleted definition vagueness in 12 AAC 56.080 and 12 AAC 56.160 concerning experience requirements for biennial license renewal and duties of pilots. This action was in response to a Division of Legislative Audit recommendation in the FY 82 Sunset Review.

B. The Board has revised its regulations effective December 14, 1986 to include a clause (12 AAC 56.075) under which applicants can request a waiver from qualification requirements due to extenuating circumstances. This regulation was needed to lessen the restrictive nature of the Board of Marine Pilots' regulations.

C. The Board redefined the Southwest compulsory pilotage water boundaries in order to eliminate confusion as to area requirements. This action provides more concise information to those individuals in the profession or striving to be, therefore, improving adherence to marine pilot regulations.

D. The Board has proposed legislation affecting AS 08.62.150 which would expand the Board's authority regarding disciplinary action. The enactment of this legislation would allow the Board to reprimand licensees for inattention to duty and negligence.

IV. The extent to which the board, commission, or agency has encouraged interested persons to report to it concerning the effect of its regulations and decisions on the effectiveness of service, economy of service, and availability of service which it has provided.

A. The public is informed of examination dates and regulation changes by notices in 5 newspapers throughout the State.

B. Minutes of Board meetings include "guest" names which consist of industry representatives and/or support staff in attendance.

V. The extent to which the board, commission, or agency has encouraged public participation in the making of its regulations and decisions.

A. As stated in Criteria IV, Letter A, the public is invited to the Board of Marine Pilots' meetings to give input about Board business and proposed regulations.

VI. The efficiency with which public inquiries or complaints regarding the activities of the board, commission, or agency filed with it, with the department to which a board or commission is administratively assigned, or with the Office of the Ombudsman have been processed and resolved.

A. There were no complaints filed with the Office of the Ombudsman, State Office of Equal Employment Opportunity or the Human Rights Commission.

B. A case management system and procedures is currently being established by the Division of Occupational Licensing, Investigative Unit. This implementation should enhance complaint handling. (see Recommendation No. 1).

C. The Division of Occupational Licensing has not always handled complaints and/or accident reports for the Board in a timely manner (see Recommendation No. 1). This could cause unnecessary delays in revoking a negligent pilot's license or in acquiring case facts and therefore affect the due process rights of an individual.

VII. The extent to which a board or commission which regulated entry into an occupation or profession has presented qualified applicants to serve the public.

A. The Board currently regulates 72 pilots and 18 agents. There have been 22 new licenses issued since December 1981. Nine licenses lapsed since 1982; 7 of which were voluntarily not renewed, 2 of which were subsequently renewed after the license expiration date.

B. The Board requires, from pilots, quarterly reports documenting vessels serviced that require State licensed pilots.

VIII. The extent to which state personnel practices, including affirmative action requirements, have been complied with by the board, commission, or agency to its own activities and the area of activity or interest.

A. The Office of Equal Employment Opportunity does not feel the weight, height, or date of birth questions are necessary with the application form and may encourage discrimination. However, neither the Human Rights Commission nor the Equal Employment Opportunity Office have received complaints related to the Board's activities.

IX. The extent to which statutory, regulatory, budgeting, or other changes are necessary to enable the agency, board, or commission to better serve the interests of the public and to comply with the factors enumerated in this subsection.

A. Please refer to the previous section, Findings and Recommendation.

APPENDIX

(Intentionally left blank)

APPENDIX A
BOARD OF MARINE PILOTS
REVENUES COMPARED WITH EXPENDITURES
For the Fiscal Year Ended June 30, 1986
(Unaudited)
(Note 1)

Average Revenue (See Schedule 1 and Note 2)	$11,489
Expenditures (See Note 3)	14,611
Excess of Revenues over Expenditures	$(3,122)

Schedule 1
Types of Revenues

Revenues	Amount Prior to 11/20/86	Amount Effective 11/20/86	Collection Time
Application and Examination Fee	$ 50.00	$120.00	With submittal of application
Temporary License Fee	$ 50.00	$ 20.00	With submittal of application
License Fee	$300.00	$180.00	Biennially
Extension of Route or Upgrade Fee		$ 20.00	With submittal of application

Note 1

This revenue/expenditure comparison was prepared from available records and discussions with Occupational Licensing personnel. The records were not audited by us and, accordingly, we do not express an opinion on the Board's Statement of Revenues Compared with Expenditures.

Note 2

A significant portion of revenues is composed of license renewal fees. Licenses are renewed biennially and the last renewal date was December 31, 1984. Because of the renewals, revenues vary substantially every other year. Therefore, we averaged revenues collected in fiscal year 85 and fiscal year 86 in order to obtain a representative amount of average annual revenues collected.

Note 3

Expenditures consist of direct costs resulting from Board activities, which includes travel, per diem, and miscellaneous contractual expenditures incurred by the Board members and the Board's licensing examiner. This amount does not include indirect administrative expenditures of the Division of Occupational Licensing or expenditures for efforts of other departments assisting the Board.

STATE OF ALASKA

STEVE COWPER, GOVERNOR

FEB 17

Mr. Gerald Wilkerson
Legislative Auditor
Legislative Audit Division
P.O. Box W
Juneau, AK 99801

Dear Mr. Wilkerson:

Thank you for the opportunity to respond to the preliminary performance report on the Board of Marine Pilots. The department concurs that the board should be reestablished and agrees with the recommendation that the Division of Occupational Licensing's investigative unit should ensure timely, effective, and efficient investigations of licensing complaints. As you acknowledged in the report, the division has implemented the following procedures over the past six months which are targeted at increasing the effectiveness of the investigative unit:

1. all current cases in investigation and litigation have been computerized;

2. an in-depth investigation and litigation manual has been prepared and adopted; and

3. all complaints received by licensing examiners are now logged into the investigative unit within three days of receipt.

These procedures have increased the effectiveness of case tracking and processing but will not impact the timely processing of all complaints. There are currently four investigators who have the responsibility for investigating allegations of incompetence and unlicensed activity in 25 occupational areas. Each investigator currently has an average caseload of 50 investigations. This has necessitated the development of a system of prioritizing cases based on the degree of risk to the public. Unfortunately, not all cases can be handled in a timely manner.

Sincerely,

J. Anthony Smith
Commissioner

February 10, 1987

BOARD OF MARINE PILOTS RESPONSE TO PRELIMINARY SUNSET AUDIT DATED NOVEMBER 28, 1987, BY CAPTAIN W.E. MURPHY, MEMBER.

The preliminary audit report is generally a fair and reasonable statement of the Board's performance and problems. Some areas, however, need to be clarified and expanded upon.

PURPOSE OF THE REPORT

The auditors claim that in making their report they "reviewed and evaluated" discussions with Board members. In fact, I know of no Board member who had any dialogue with an auditor relative to their sunset investigation. Contact between Board members and sunset auditors was noticeable by its absence. An auditor did sit in on a Board meeting but did not interview Board members.

ORGANIZATION AND FUNCTION

Under this section the report describes the Board's purpose and duties but does not state its primary duty, established by statute. That is Alaska Statute 08.62.040 which states, in part, "The Board shall (1) provide for the maintenance of an efficient and competent pilot service on all waters covered by this chapter to assure the protection of shipping and the safety of human life and property." This is the most important of the statutes which the Board's performance should be measured against.

The preliminary report, in describing the Board's licensing functions, refers to limited pilot license of under 2000 gross tons. Recently new licensing regulations were put into effect by the Board which creates 4 license categories: channel pilot; step 1 license for vessels of less than 20000 gross tons; step 2 license for vessels of under 40000 gross tons; and unlimited tonnage license.

REPORT CONCLUSION

POLICY ISSUES

The meaning of this paragraph is not clear.Therefore no comment is offered.

REPORT CONCLUSION

The Board concurs with the auditors' conclusion that it should be reestablished. While not without problems, the Board does a good job of protecting the public's interest by regulating pilotage in this state. The demise of the Board would spell the end of any state control over the competence of the navigation of the many foreign vessels and very large tankers which ply Alaska's waters.

FINDINGS AND RECOMMENDATIONS

The Board could not agree more that timely, effective and efficient investigation of licensing complaints should be ensured. Board members have been extremely frustrated with the inordinate amount of time license suspension/revocation proceedings have taken, a process over which the Board exercises no control. The problem goes beyond investigative delay, however. In two recent cases months passed after the investigations were completed before a hearing officer was assigned. The hearing officer,once appointed, granted a series of delays and continuances to both counsel which further slowed the proceedings.

FEB 11 1987

FEB 12 1987

About two years passed before the cases were resolved, during which time the Board suffered much criticism. The perception of the maritime public was that the Board was refusing to act, while in fact the Board could do nothing until the hearing process was finished. This is an example of how bureaucratic inertia can undermine public confidence in a regulatory board. It is a very real problem for this board.
The director of Occupational Licensing is aware of this problem and has instituted reforms which the Board feels will improve the timeliness of both investigations and hearings.

ANALYSIS OF PUBLIC NEED

II D (3)
The audit report points out that the Pilot Board is not self supporting. Board members are aware of this and were mystified when, in 1986, Occupational Licensing lowered the fees for marine pilot licenses. It is the Board's position that it should indeed be self sustaining.

VI C See comments under findings and recommendations.

VIII A The Board has eliminated from its applications questions which might tend to be discriminatory. Weight,height and date of birth information was left on the application at the request of the investigative unit in order to assist it in identifying a licensee it might be required to investrigate.

APPENDIX A
BOARD OF MARINE PILOTS REVENUES COMPARED WITH EXPENDITURES

As stated previously the Board feels it should be self supporting but does not have the authority to set its own fees. This is done by Occupational Licensing. The Board did not recommend and cannot explain why fees were reduced in 1986

THE LEGISLATURE

BUDGET AND AUDIT COMMITTEE

AUDIT DIVISION
POUCH W
JUNEAU, ALASKA 99811-3300

February 19, 1987

Members of the Legislative Budget
and Audit Committee:

We have reviewed the Board of Marine Pilots' response to our preliminary report. Our comments follow:

Purpose of the Report

In his response, Board member Captain W. E. Murphy indicated that no Board member was contacted regarding the sunset review. However, both current and past members were contacted for discussion of current and past Board activity. Members contacted were Judith M. Brady, Marvin Taylor, Captain Donald Oldow, and Kenneth Peavyhouse.

Organization and Function

The new licensing regulations referred to by Captain W. E. Murphy became effective December 14, 1986.

THE ALASKA MARINE HIGHWAY - SOUTHEAST SYSTEM

A HOLISTIC CONCEPT

BY

REPRESENTATIVE BILL HUDSON

December 10, 1987

Executive Summary

INTRODUCTION: The Alaska Marine Highway System (AMHS) is fast approaching 25 years of service in Southeast Alaska and by all accounts has served well. The system consists of seven vessels serving 18 S.E. communities via an inter and intrastate Marine highway over 1000 nautical miles long, connecting this landlocked Alaskan region to Land highways at Prince Rupert and Seattle to the South and Haines and Skagway to the North.

PURPOSE OF THIS PAPER: I have prepared this paper to stimulate discussion and debate on issues surrounding the future of this our essential Marine Highway system.

It is my belief that we must find consensus for and immediately begin the implementation of a Marine Highway plan that will carry this system into the next 20 years of service!

GENERAL CONCEPT: I am proposing a holistic concept that addresses such issues as: Bellingham vs Seattle, Roads vs. Hi-Speed Ferries, System Marketing, Thru-Haul vs. Segmentation Scheduling, and the Need for Compatibility with Regional Economic Development Plans.

TIMELINESS: Given the fact that Marine Union contracts expire March 30, 1988, any operational changes contemplated in the next three years should be established soon.

Vessel age and years of hard use dictate a need for major rehabilitation and/or costly replacement within the next 5 - 10 years.

Southeast Alaska's regional economic development growth will depend on a future system that compliments and supports local independent visitor tourism, emerging seafood production in Southeast Alaska and other businesses relying on marine transportation.

Finally, like any $60 million a year transportation system, we must assure it remains alive and progressive - growing to meet the needs of our state and this region.

CONSIDER OUR PRESENT SYSTEM: Alaska operates this seven vessel fleet at about 67% capacity with far more offline-layup than most private or public shipping companies would.

The system was tailor made to meet peak summer demands and evolved to accommodate many smaller communities over the years.

Ships largely call through Southeast communities and I believe, unknowingly, discourage stopover travel. In fact, I suspect a careful review of traffic figures would show that most of the 45,000 passengers who annually embark at Prince Rupert and Seattle do not spend much time in Southeast communities, to the economic loss of these communities.

Some value added benefits to the system are being realized in every community, especially the larger towns like Juneau, Ketchikan and Sitka, but, every community is losing value because of short docking times, time of arrival and/or the location of our terminals.

Vessel fares are marginally at the point of diminished returns and do not encourage widespread local use.

The system marketing, advertising and promotion is almost non-existent and may be a prime reason why shoulder traffic has not increased appreciably.

RECOMMENDED CHANGES: I believe it is time to implement some of the changes proposed in the 1986 Southeastern Transportation Plan and the Southeast Conference Community Perspective Report. It is time to activly seek demonstration project funds to acquire two properly configured surface effect or conventional high speed vessels to employ in the Lynn Canal corridor between Juneau, Haines and Skagway, and between Ketchikan and Prince Rupert. I intend to approach our Congressional delegation for a realistic determination of this support.

It is time to consider moving our southern terminus from Seattle to Bellingham and to implement a sound marketing and sales program to increase year around passenger, vehicle and freight sales and service.

Traffic should analyze the probable effects of operating a turnaround schedule between Bellingham and Ketchikan interconnecting with an intrastate route between Ketchikan and Juneau with as-needed trips to Sitka. Under this model all mainline traffic would end in downtown Juneau and travellers would proceed north by road and hi-speed ferries.

With this move I recommend we consider the benefits of relocating the Juneau Auke Bay operations to a site in Echo Cove, and to operate directly into downtown Haines or to a terminal site closer to Juneau on the Chilkat Peninsula. Our long-term priority must remain for a road. Realistically we will likely have to wait for significant mining development or exceptional federal funding to justify constructing a $400 million dollar road between Juneau, Skagway and Haines .

I propose that the time saved by stopping mainline traffic in Juneau and relocating to Bellingham be allocated to longer dock time at smaller communities such as Petersburg and Wrangell for sightseeing, local shopping and other such economic benefits as well as to structure more frequent trips.

As a former Director of the AMHS, I understand the many complexities of this unique system and the time honored constraints. I am confident

that vessel employees, shipping and travel agency partners would be willing to consider some changes for the improvement of the system.

I realize the problems associated with changing a system that has operated essentially the same for 25 years; yet I urge change because the present system is becoming increasingly regressive, more costly and is out of sync with the original legislative intent and the economic development needs of the very communities it was created to serve.

I urge creative marketing, such as booking on-board, off-season conventions, university and school field trips, coordinated trip sales with B.C. ferries and perhaps it is time to offer space available travel as a negotiable labor contract provision in lieu of wages. I would consider offering a once a year space available round trip to Alaska residents (at least SE residents) at a minimal charge to garner the passenger service revenue at a time when passenger loads are down. A little revenue is better than no revenue - providing costs are offset to show some profit.

I recommend all changes be coordinated with the Southeast Conference members and Legislators as well as traditional users of the system. Alaskans should be able to use their only highway at less cost.

POTENTIAL BENEFITS OF CHANGE: I believe the changes I have proposed will increase revenue to the system, appreciably increase economic benefits to Southeast communities, increase employment for Southeast crew members, provide affordable, more frequent and dependable transportation

for all Southeast residents and essentially connect the 70,000 Southeast residents with the Yukon, British Columbia, and the rest of our State. Clearly these changes will increase the value added potentials in every community we serve.

I foresee greatly increased tourism activity, less costly travel between cities in Southeast Alaska and expanded travel between Southeast and our neighbors in the Yukon as well as two way travel between Southeast and the rest of our state. Southeast benefits because our highway now supports our ecomomic development plans and the rest of Alaska benefits because Southeast, especially our Capital city, is easier to access and the 70,000 people of SE Alaska can now travel to Anchorage easier and more frequently. Haines and Skagway benefit because they would have direct and frequent, affordable access to other SE markets and legislative activities.

Orienting the ferry system more to a hub in Ketchikan and one in Juneau may encourage many of those Seattle resident employers to relocate back to Alaska.

FINALLY: This paper is meant to be constructive. It should not be construed as a detailed plan, but rather a conceptual plan to build upon. We still need much debate and a whole lot of in-depth study on this vital system.

Whatever we do, we must begin to implement some of the changes to make the system more beneficial to the inevitable growth of our region.

I welcome your comments and input. I seek your support.

Respectfully submitted,

Bill Hudson

THE FLEET

M/V BARTLETT

M/V AURORA

M/V CHILKAT

M/V COLUMBIA

The M/V Aurora—the newest addition to the fleet—was built by Peterson Shipbuilders in Sturgeon Bay, Wisconsin, and began service in 1977. The Aurora is 235 feet long, and can transport 250 passengers and 47 standard vehicles at a service speed of 14 knots. Since the Aurora is used for short runs, staterooms are not available, although food service, a cocktail lounge, and a solarium are provided.

The M/V Bartlett was launched in 1968 at Jeffersonville, Indiana, and went into service from her home port of Cordova the following year. She is 193 feet long, with capacity for 38 standard vehicles, and a passenger capacity of 170. Service speed is 14 knots. Because the Bartlett is only used for short voyages, staterooms are not available. However, food service and a solarium are provided.

The M/V Chilkat, the original ship of the Alaska Marine Highway fleet, was taken over by the State of Alaska following admission to the Union in 1959. Today she serves the Southern Panhandle area between Ketchikan, Metlakatla, and Hollis. The Chilkat measures slightly under 100 feet in length, and cruises at 10 knots. There is room aboard for 15 vehicles and 75 passengers.

The M/V Columbia, Alaska's largest ferry, is the flagship of the Marine Highway fleet. Launched by Lockheed Shipbuilding in Seattle in 1973, the Columbia is 418 feet long, with capacity for 1,000 passengers and 180 standard vehicles. She has a service speed of 19 knots. There are 20 2-berth cabins and 71 4-berth cabins, including 5 deluxe units with sitting rooms. Food service, a cocktail lounge, and a solarium are also available.

The M/V LeConte, launched in late 1973 by Peterson Shipbuilders in Sturgeon Bay, Wisconsin, joined the Alaska Marine Highway fleet in 1974, as the vessel serving the Northern Panhandle area. The LeConte is 235 feet long, with capacity for 250 passengers and 47 standard vehicles, and has a service speed of 14 knots. Since the LeConte is used for short runs, staterooms are not available, although food service, a cocktail lounge, and a solarium are provided.

M/V LE CONTE

M/V TAKU

M/V MALASPINA

M/V TUSTUMENA

M/V MATANUSKA

The M/V Malaspina carries 750 passengers, and provides 56 4-berth and 30 2-berth cabins. She was built in Seattle, Washington in 1963, at the Lockheed Shipbuilding yards; then lengthened and renovated in 1972 at the Willamette Iron and Steel Company shipyard in Portland, Oregon. The Malaspina is now 408 feet long, with capacity for 120 standard vehicles, and has a service speed of 16.5 knots. Food service, a cocktail lounge, and a solarium are available.

The M/V Matanuska was built by Puget Sound Bridge & Dry Dock Company of Seattle, and began service in 1963. In 1978, she was lengthened and renovated; making her 408 feet in length, with capacity for 120 standard vehicles and 750 passengers. She has a service speed of 16.5 knots. There are 84 2-berth, 24 3-berth, and 4 4-berth cabins. Food service, a cocktail lounge, and a solarium are available.

The M/V Taku was built by Puget Sound Bridge & Dry Dock Company of Seattle, and began service in 1963. She is 352 feet long, with capacity for 105 standard vehicles, and a passenger capacity of 500. Her service speed is 16 knots. Renovated in 1981, the Taku has 35 2-berth and 9 4-berth cabins. Food service, a cocktail lounge, and a solarium are available.

The M/V Tustumena was built at Sturgeon Bay, Wisconsin, in 1964, sailed Alaskan waters for five years, then was renovated in San Francisco in the winter of 1969. She is 296 feet long, and has a service speed of 14 knots. The Tustumena has space for 50 standard vehicles, and a passenger capacity of 220—with 25 2-berth and 2 4-berth cabins. Food service, a cocktail lounge, and a solarium are available. The Tustumena provides service to Seldovia, Homer, Port Lions, and Kodiak from her home port of Seward. She also sails from Seward to Valdez and Cordova, on Prince William Sound.

BELLINGHAM AS SOUTHERN TERMINUS

OF

THE ALASKA MARINE HIGHWAY

The city of Bellingham, the Port of Bellingham and the Whatcom County Chamber of Commerce are very enthusiastic in their attempt to establish Bellingham as the southern terminus of the Alaska Marine Highway (AMH). To this end, the Port of Bellingham has allotted $2 million of its calendar year 1988 budget for terminal infrastructure construction. City staff has produced two videos supporting the move which have already been shown publicly in both Alaska and Washington, and civic and community leaders continue to be in contact with Alaskan transportation, business and government leaders.

When the current lease, held by the Port of Seattle, expires in September of 1989, Bellingham intends to submit a bid for the contract. During interim, Rep. Bette Cato and staff visited Bellingham and spoke with interested parties from the city, port and community of Bellingham regarding the feasibility of such a move. As a result of that trip, the following report was prepared.

1. Location of Terminal

Bellingham is proposing that one of two sites near its downtown area be chosen as the future site of the southern terminus of the Alaska Marine Highway. Both sites are located in Whatcom International Shipping Terminal which is adjacent to the present Port of Bellingham administration building. Some of the appropriate infrastructure already exists. Other infrastructure such as a terminal facility built to state of Alaska specifications, would have to be added. There is ample space available at either of these locations for parking, storage, loading and off-loading, and maneuvering of freight and vehicles. The Port of Bellingham is a deep water port that would require no dredging. Port security includes the city of Bellingham police, and Port of Bellingham and Georgia Pacific pulp mill securities.

The Seattle terminus is located near the heart of downtown Seattle which can be a very congested area. The space available for parking, storage, loading and off-loading, and maneuvering of freight and vehicles is quite limited.

2. Terminal Access

Northwest travelers currently access the Alaska ferry terminal in Seattle either by taxi from Sea-Tac International Airport, or they drive their own vehicles to the terminal because they plan to take them north. Cab fare for the trip from the airport to the Seattle ferry ranges between $15.00 and $24.00, and traveling time is 30 - 60 minutes. Travelers planning to bring their own vehicles onto the ferry face limited parking opportunities and a lack of nearby RV (recreational vehicle) facilities.

If the terminus were to be located in Bellingham, travelers flying into Sea-Tac airport would be able to catch any one of 30 twenty-minute flights per day to Bellingham International Airport at a cost of $19 or $44. They would then take a 15 minute cab or bus ride from the Bellingham airport to the Bellingham ferry terminus. Or, travelers flying into Sea-Tac airport could take a commercial bus from the airport to the downtown Seattle bus terminal and then transfer to a another bus headed for Bellingham. Greyhound has three connections to Bellingham daily. One way fare is $12.45.

Travelers planning to take their vehicles with them onto the ferry would drive to Bellingham. Bellingham is located 86 miles north of Seattle and 54 miles south of Vancouver, B.C. It is accessed by Interstate 5, and the proposed terminal is a five minute turn off of the interstate. Because Bellingham has had more of an opportunity to plan for its development, access to the city is much less congested than in the Seattle area. City traffic is minimal, and parking opportunities near the proposed site are abundant. Nearby RV facilities already exist, and on site RV facilities have been included in the development plan.

For travelers concluding their trip at the southern terminus,
the procedure would be reversed.

3. Cost Comparison.

Bellingham is located 80 nautical miles north of Seattle. This translates into a savings of roughly 4-6 hours of traveling time in one direction. As Puget Sound becomes more congested, the time savings may become even greater. Less distance traveled means less fuel consumed, and at an average of 21 gallons of fuel burned per nautical mile, over 3,000 gallons of fuel per trip could be saved if the terminal was located in Bellingham. Less distance traveled would also mean less wear and tear on equipment.

Salary savings would be realized only if the shorter distance to Bellingham resulted in the ship's completing its

overall trip in less time, and only if labor contracts could be negotiated to include a shorter work week. No salary savings would be realized if the overall trip took the same amount of time because the crew is paid the same regardless of whether the ship is in port or on the water. Since Juneau and Ketchikan are the only points at which crew can begin and end their work weeks, they would still be considered to be at work when the ship was docked in Bellingham.

The state of Alaska currently pays the Port of Seattle $6.00 for every passenger up to 40,000 passengers that either gets on or off the ferry per year in Seattle. This agreement results in a maximum amount payable per year to the Port of Seattle of $240,000. In FY'87, 34,374 passengers were billed to the state by the Port of Seattle at a cost to the state of $206,244.

Rather than bid a fixed fee per passenger up to a maximum cap, the Port of Bellingham is planning to propose a sliding fee scale which would be tied into meeting certain goals of passenger and freight. In other words, the more passengers and freight that moved through Bellingham, the higher the fee received by Bellingham, but because there would be no cap on the number of passengers for which Bellingham would be paid, the incentive would be there for Bellingham to draw as many passengers as possible. Since there would be no cap, the incentive for Bellingham to draw additional passengers could ultimately result in additional revenue for the state of Alaska. As it currently stands, there is no incentive for the Port of Seattle to service more than 40,000 passengers.

At this point, it is not clear whether or not there would be a cost savings in freight if the terminus were to be located in Bellingham. Although freight could be transported to and from Seattle in less time on Interstate 5 than it could be transported by ferry, the time savings may be overridden by the increased transportation costs of trucking freight to a central consolidation area which is done in order to consolidate ferry freight with other freight in the area for the purpose of long distance transporting. For instance, Lynden Transport, Incorporated, a major shipper to Alaska via the Alaska Marine Highway System, currently transports its freight from the Seattle ferry terminal to Kent, a suburb of Seattle, where it is then consolidated with other LTI freight. Since the distance from Bellingham to Kent is greater than the distance from Seattle to Kent, it may at first appear there would be no cost savings associated with the move and, in fact, it may appear that the shipping costs would be higher because of the additional trucking costs. However, there are many variables inherent in this issue including but not limited to whatever offer is made to shippers by the Port of Bellingham should Bellingham be successful in its bid for the southern terminus. It is also

not clear if the AMH would lower its shipping rates in response to the fact that the trip to and from Bellingham is shorter. However, Lynden Transport, Inc., in a letter sent to the Commissioner Hickey of the Alaska Dept. of Transportation and Public Facilities, has stated that it would support any move by the ferry that would improve services and reduce costs to its customers in southeastern Alaska.

4. Special Attractions

Seattle and Bellingham both have much to offer the Northwest traveler.

Bellingham is a growing community of 50,000 people located on the Inside Passage. Bellingham Bay is to the west and the beautiful Northern Cascade Mountains are to the east. Major industry in the area includes agriculture, commercial fishing, forestry, manufacturing and recreation. It is home of the famous "From Ski to Sea in 60 Minutes" race, as well as sport fishing, scuba diving, beach combing, sailing, camping and hiking. It is home of Western Washington University. Temperatures range from 30 - 74 degrees Fahrenheit with an average of 49 degrees, and rainfall averages 34 inches. A world trade center and a regional shopping center are currently in the process of being built.

In addition to its many tourist attractions, Whatcom County is host to four foreign trade zones. Because of the special tax exemptions afforded these areas, much new business has been attracted to the area. The trade zones should provide a positive position within the international market place for Whatcom County. Bellingham is an important regional and transportation hub <u>without</u> the congestion of Puget Sound.

Seattle is also an attractive destination for northwest travelers. Its many well-known attributes include Pike Place Market, the Seattle Aquarium, numerous fine restaurants, the theater, the Kingdome, the University of Washington and other respected universities and colleges, excellent sailing opportunities, etc.

The point is, both locations have much to offer the traveler interested in extending his or her vacation beyond the ferry ride. The difference is, the Port of Bellingham plans to market these attractions to potential passengers should it become the southern terminus of the ferry system.

5. Market Development

Whatcom County already hosts more visitors from outside the state than any other county in Washington. Using the theme "The Last Great Marine Adventure" and expanding the services

available to passengers, civic leaders plan to draw even more visitors to their county by actively recruiting passengers to the Alaska Marine Highway. Plans are to target Canada as well as the United States. Ideas for expanding and improving service to AMH passengers via the Port of Bellingham include allowing passengers to book on shore reservations by computer while still on board the ferry, using computers to suggest trips and map routes for passengers to use once they hit the shore, and the convenient, on shore availability of tax exempt cards for residents of the state of Alaska.

6. Summary

Intent language inserted in Alaska's FY'88 operating budget stated: "It is the legislature's intent that the Department [of Transportation and Public Facilities] study the potential cost savings of using Bellingham as the southern terminus of the Alaska Marine Highway System. The study should examine fuel savings, more efficient use of vessels, labor savings, lease savings, and the relative quality of passenger facilities which might be offered in Bellingham as compared to Seattle. The study should be submitted to the legislature no later than December 1, 1987."

The Department of Transportation and Public Facilities is currently in the process of compiling its interim study. While cost saving factors have yet to be determined, locating the southern terminus of the Alaska ferry system in Bellingham will give the Alaska Marine Highway a much more visible profile. Because it would be one of the biggest fishes in a little pond, the city and Port of Bellingham and the Whatcom County Chamber of Commerce are willing to develop the terminus to the fullest marketing extent possible. Their cooperation is impressive. They are eager to work with the state of Alaska in order to further their goals. They are willing to address whatever questions and concerns may arise regarding the relocation and they are determined to make their dream a reality. They want to work with the state of Alaska in order to expand recreational opportunities, especially for the RV traveler. The community of Bellingham would like to develop a partnership with the state of Alaska that extends beyond the Alaska Marine Highway.

UPDATE ON BELLINGHAM AS AN ALTERNATIVE FOR THE SOUTHERN TERMINUS

The current lease between the state of Alaska, Marine Highway System and the Port of Seattle expires September 30, 1989.

Commissioner Hickey and Mr. George Davidson travelled to Bellingham this past summer to look at the Port of Bellingham, the facilities available, the existing infrastructure in place and many other areas the state of Alaska will have to carefully research before consideration can be given to relocating the southern terminus in Bellingham.

The Department of Transportation has prepared a full report on the current alternatives available (Bellingham and Seattle). In discussions with Alaska Marine Highway Management, it seems apparent no real conclusions or decisions will be reached until all parties actually sit down and begin discussions as there are still so many questions that can only be answered or agreed upon during the final stages.

If Bellingham is to be seriously considered these discussions and negotiations would have to begin in the next few months as a final decision would be necessary in June or July of this year to allow Bellingham time to construct and prepare the facilities required.

Port of Seattle

November 16, 1987

The Honorable Mark Hickey
Commissioner
Department of Transportation and Public Utilities
State of Alaska
P. O. Box Z
Juneau, Alaska 99811

Dear Commissioner Hickey:

The Alaska Marine Highway System (AMHS) is a long-time, valued and important tenant of the Port of Seattle. As the governing body of the Port, we want to express both our appreciation and keen interest in continuing to serve as the system's southern terminus. We also want to underscore, following your recent meeting with Port staff, our commitment to serving the needs of the AMHS.

We believe our relationship has been a mutually beneficial one that has served ferry users well over the years. Your terminal at Pier 48 is in the heart of Seattle's central waterfront -- walking distance to the best hotels, restaurants and shops available in the Pacific Northwest. The region's financial, government, retail and hospital districts are centered within a few short blocks of the terminal. Pioneer Square, the Kingdome, the Seattle Center, and the new Convention Center are nearby. And major highway, rail, bus and air connections are just minutes away. Seattle is the region's major distribution center and the origin of freight now using the AMHS.

We want to work with the State of Alaska to make Pier 48 the central focus of the AMHS, including an "Alaska Gateway Center" that would draw public attention to the historic relationship between the residents of Seattle and Alaska. It could serve as a key distribution point for travel information to the thousands of people from all over the world who visit Seattle's central waterfront each year. We want to make Pier 48 a major attraction in itself.

Seattle's central waterfront is undergoing a renaissance -- and Pier 48 is right in the midst of it. The AMHS and the Port have a tremendous opportunity to participate. Planned redevelopment projects, both public and private, along the waterfront now total more than $200 million. The central waterfront will be transformed into a major regional attraction. The projects include removal of the railroad tracks along Alaskan Way, traffic and pedestrian improvements, doubling the size of the Seattle Aquarium, rebuilding the Washington State Ferry Terminal, and a transformation of the properties near our headquarters at Pier 66. We have budgeted $200,000 in 1988 to begin work at Pier 48. Our planning will, of course, look at additional uses that are compatible and supportive of the system.

P.O. Box 1209
Seattle, WA 98111 U.S.A.
(206) 728-3000
Telex 703433

There is a great deal of untapped interest in travel to Alaska. The successful promotion involving the Port, Alaska Airlines and the AMHS last winter demonstrated the potential that exists here. This winter, with the support of the AMHS, the promotion is being expanded. Beginning in January, we will join in hosting a luncheon seminar on board an Alaska ferry at Pier 48 for 70 travel agents each Friday for 12 weeks. In addition, another 24 travel agents will participate in a familiarization trip via the ferry to Juneau, again each week for 12 weeks. While cruising, the travel agents will get a two-day seminar on the history, people and opportunities in Alaska. Working with Alaska Airlines, the travel agents will be flown to Seattle from throughout the airline's system to participate in the program. We think the promotion offers an unparalleled opportunity to sell travel to Alaska, as well as travel on the AMHS.

In summary, we want you to know of our appreciation for past and current programs, and of our interest in expanding on these successes in the future.

Sincerely,

Henry M. Aronson, President
Port of Seattle Commission

Update of Federal Highway Funds for FY 89

Federal fiscal year: October 1 thru September 30 each year

Each year the state is given a dollar amount by the federal government. This amount is called apportionment. Recently, this amount has been around $150 million.

Just before the federal fiscal year begins, the federal government provides the state of Alaska with the authority to spend a given amount. This is called the obligation amount and has been around $129 million.

The dollar difference between the obligation amount and the apportionment amount is carried over by the state.

Periodically throughout the year, the federal D.O.T. contacts each state to assess its ability to spend the obligated amount. If any state finds it is unable to spend the amount it has been obligated, these funds go back to the federal D.O.T. and are available to other states to spend up to their apportionment amount. Alaska has traditionally been able to pick up considerable extra dollars in unspent funds.

In December, 1987 the federal government revised the authorized for Alaska to spend amount. The current amount of federal monies obligated to the State of Alaska for FY 89 is $128.8.

Comparison

FY 87 Obligated amount $145.8 million
Leftover funds made available to Alaska $6.6

Total FY 87 funds funds highway funds to Alaska: $152.4 million

Concern

Because the amount of of obligated funds made available to each state has been reduced significantly, the likelihood of other states being unable to spend their obligated amount is reduced.

At the present time the federal highway dollars available to the state of Alaska have been reduced almost $17 million which is 10%. This reduction, coupled with the concerns over reduced "unspent" funds being available to the state will have a significant impact on the state of Alaskas federal highway program.

DEPARTMENT OF TRANSPORTATION AND PUBLIC FACILITIES (DOT&PF)

CAPITAL PROJECT CLEAN-UP (CPC)

INTERIM STATUS REPORT

PRESENTATION OUTLINE

- Brief review of history leading to current CPC effort
  - ° Factors which led to the problem
  - ° Previous DOT&PF efforts to correct the problems
  - ° Steps taken this time to make CPC successful

- CPC concept
  - ° Not just a clean-up of project history data
  - ° Goal of CPC effort
  - ° Overall approach
  - ° Ownership of solution
  - ° Change in philosophy

- Review of CPC work effort and update of current status
  - ° Captial project report
  - ° Third party billing system
  - ° Development of AKSAS training program
  - ° Establishment of accounting procedures and controls
  - ° Establishment of new AKSAS structures
  - ° Evaluation and correction of project history data
  - ° Review of organizational structure
  - ° Evaluation and improvement of management reporting

- What can you expect next legislative session
  - ° January 1 report Short - Numbers will not be updated - file -
  - ° Possible supplemental appropriation bill
  - ° Significantly increased accountability
  - ° On-going CPC efforts

- What can the legislature do to help prevent this from happening again

- Questions and Comments

DEPARTMENT OF TRANSPORTATION AND PUBLIC FACILITIES
Capital Project Clean-up
Workplan
(Revised October 20, 1987)

Task Number	Task Description	Responsibility	Status *
1.0	PROJECT MANAGEMENT		
1.1	Develop project workplan and Gantt chart - Review plan with staff in Headquarters, Southeastern, Central and Northern regions. - Review plan with legislative staff. - Review plan with legislative committees if they are interested.	RGP	C
1.2	Monitor performance against workplan.	RGP TGK RS RB	A
1.3	Provide monthly status reports to: - Governor - Commissioner - Regional Directors - Interested Legislators - Others as required	RGP RB	A
2.0	CAPITAL PROJECT REPORT		
2.1	Reconcile State Legislative Appropriation (SLA) to AKSAS appropriation data at total control level:		
2.1.1	SLA 1980 to present (Fund 11100) researched and 100% reconciled.	JM	A
2.1.2	Pre 1980 SLA (Fund 11100); establish policy to address unreconcilable balances.	JM	C
2.2	Bond issues current funding mix researched and reconciled.	JM	A
2.3	Identify miscellaneous RSA's and all other unidentified appropriations. Develop procedures and timelines to close appropriations.	JM RB	C
2.4	Develop list of capital projects using AKSAS data for review and completion of costs-to-complete by regions.	RGP JM RL	C
2.5	Input regional data into 4/15 report program and AKSAS where applicable. Analyze data and prepare 4/15 report format.	RGP JM	C

* A = In Progress C = Completed N = Not Started

Task Number	Task Description	Responsibility	Status
2.6	Present corrected list of capital projects.	RGP	C
2.7	Update initial 4/15 Report to include phase appropriations not programmed to the intended projects.	JM	C
2.8	Establish capital project control file to accumulate adjustments identified during financial clean-up in workplan section five.	JM BA	A
2.9	Develop new Capital Project Report file which incorporates financial clean-up activity with current AKSAS balances. This file will provide a data base for producing CIP status reports until AKSAS has been updated for all clean-up activity.	JM RB	A
3.0	ESTABLISH ACCOUNTING PROCEDURES AND CONTROLS		
3.1	Review and respond to the Legislative Audit and DOT&PF Internal Review audit reports (Headquarters and regional administrative functions).	RS RB	C
3.2	Establish procedures to monitor "A" errors.	TH RB	C
3.3	Review the use of PCIS system and assure that appropriate controls are in place between this system and AKSAS.	RB DH	C
3.4	Coordinate with regional project managers to develop management reports from PCIS for use as project status/ management tool.	RS RB TGK	A
3.5	Establish control to assure that programming of funds to project appropriation structure does not exceed SLA appropriation (by source).	TH RB JM	C
3.6	Develop control sheet for cross entity controls to be included in the project appropriation structure.	TH RB	C
3.7	Develop new structure implementation check-list for all CIP projects. (Headquarters structure review).	TH RB	C
3.8	Evaluate current Financial Management Operations Manual (FMOM) for completeness. Identify items requiring update and prepare policies and procedures to support all new activities.	RS RB PR	A
3.8.1	Develop and implement policy and procedures for closing out old CIP projects.	RS TH RB	C

Task Number	Task Description	Responsibility	Status
3.9	Monitor implementation of new accounting systems in Section 4 and 6. Initiate management reports to document controlled and reconciled implementation.	RB TH	A
4.0	ESTABLISH AND IMPLEMENT NEW AKSAS STRUCTURES		
4.1	Enhance and develop project status structures (active, completed, closed).	RS RB	C
4.1.1	Repoint all projects to correct status.	RS JM	A
4.2	Review current appropriation and project AKSAS structures for efficient financial roll-up and reporting.	RB	C
4.3	Establish new standard "DOT&PF project appropriation" structures (80,000 series) for all active and completed projects (prepared in region).	RS RB	A
4.4	Enhance project structure to include breakout of expenditures by classification (i.e., participating, non-participating and deferred).	TH RB	C
4.5	Enhance SLA appropriation structure to include allocation of funding between source (G.F., FHWA, etc.)	TH RB	C
4.6	Input 4/15 report data (election district) into contract structure.	JM RB	A
4.7	Establish Funding Source level total control (TC), AR's for all current SLA TC appropriations.	TH JM	C
4.7.1	Fund old total control AR equal to expenditures and change status to inactive, (i.e., lockdown).	TH JM	A
4.7.2	Program new AR's for net appropriation balance carried forward. Identify funding and provide new appropriation mix factor.	JM	A
4.7.3	Discuss procedures with representatives from D.O.A. and O.M.B..	TH JM RB	C
4.8	Program costs to complete of active projects into DOT&PF project appropriation structures (80,000 series).	TH JM RB	A
4.9	Develop procedures for back charging expenditures against the SLA appropriation structure.	TH RB	A
4.10	Produce procedures manual to document new RSA/PDA accounting process. Coordinate with Regions for training and development.	RB DK	C

Task Number	Task Description	Responsibility	Status
5.0	EVALUATION OF PROJECT DATA HISTORY		
5.1	Evaluate and reconcile 6/30/85 to 7/1/85 conversion of project and appropriation balances (PBA - AKSAS).	JM TH DH	C
5.1.1	Develop automated process to evaluate history conversion - (appropriation and project).	JM RB DH	A
5.1.2	Develop processes and procedures to correct conversion problems identified in 5.1.1.	JM RB BA	A
5.2	Develop processes to evaluate and reconcile all project expenditures from a transaction register 7/1/85 to lock-down date (project managers). Identify actual project expenditures.	JM RB BA	A
5.2.1	Project managers confirm validity of expenditures and sign off.	JM RB	N
5.3	Evaluate and reconcile all federal-aid project expend-itures within the billing system.	TH RB JM	A
5.3.1	Reconcile AKSAS to FMS billing system.	TH RB JM	A
5.4	Evaluate and reconcile revenue received by project with the expected revenue.	TH JM	A
5.4.1	Correct revenue recording errors.	TH JM	A
5.5	Evaluate and determine correct funding mix to be applied to lockdown AR using new appropriation mix factors determined in 4.7.2.	JM RB	A
5.5.1	Incorporate 6/30/85 funding mix into data recorded from 7/1/85 through lockdown.	JM RB	A
5.5.2	Calculate mix in lockdown.	JM RB	A
5.6	Evaluate and correct current SLA appropriatrion series funding problems identified in 5.5.	JM RB	A
6.0	DEVELOP THIRD-PARTY BILLING SYSTEM		
6.1	Develop Request for Proposal (RFP) and Letter of Interest.	RGP TGK	C

Task Number	Task Description	Responsibility	Status
6.2	Review RFP and Letter of Interest with regions, FHWA, Headquarters, DOA and AG's Office.	RGP TGK	C
6.3	Mailout Letter of Interest and distribute RFP's as requested by interested vendors.	TGK	C
6.4	Hold Pre-Bid Conference with vendors.	TGK	C
6.5	Respond to vendors questions prior to proposal due date.	TGK	C
6.6	Evaluate proposals and select three (3) finalists for oral presentation.	TGK Eval. Committee	C
6.7	Select vendor and conclude contract negotiations.	TGK Eval. Committee	C
6.8	Monitor vendor performance, provide appropriate guidance to vendor (e.g., steering committee, review meetings, etc.) and provide State data processing support as required.	RGP TGK	C
6.8.1	Assist vendor in early implementation of Federal "front-end edits."	RS TH TGK	C
6.9	Participate in development of vendor's system conversion plan.	RS TH TGK	C
6.10	Participate in development and performance of user training.	RS RB TGK ES	A
6.11	Participate in development and presentation of user and system documentation.	RS TH RB TGK	C
6.12	Coordinate State resources necessary for system conversion.	RGP TH TGK	A
7.0	EVALUATE AND IMPROVE MANAGEMENT REPORTING		
7.1	Review current management reports received from AKSAS, PCIS, PDS, SRA and Federal Billing.	TGK RB	C
7.2	Determine what management reporting capabilities currently exist with these systems but which are presently unused.	TGK RB	A

Task Number	Task Description	Responsibility	Status
7.3	Assess DOT&PF requirements for additional management reporting and determine how existing capabilities can address these needs.	TGK RS RB	A
7.4	Establish priority list to address management reporting needs and develop workplan for their implementation.	TGK RB	A
7.4.1	Review requested enhancements for the Project Cost Information System (PCIS). Address uniformity within regions and compatibility with AKSAS.	RB DH	A
8.0	REVIEW ORGANIZATIONAL STRUCTURE AND STREAMLINE AS APPROPRIATE		
8.1	Document problems currently experienced by DOT&PF staff as they relate to - project cost accounting - general accounting issues - administrative function	RGP RS RB	
8.1.1	Develop survey to identify problem areas.	RGP RS RB	N
8.1.2	Conduct more detailed interviews with DOT&PF staff, as required, to gain further knowledge of problems identified in 6.1.1.	RGP RS RB	N

MEMORANDUM

State of Alaska
Department of Transportation & Public Facilities

TO: Mark S. Hickey
Commissioner

DATE: October 30, 1987

FILE NO:

TELEPHONE NO: 465-3900

FROM: Robert G. Poe, Jr.
Deputy Commissioner
Budget and Finance

SUBJECT: October Capital Project Clean-up Status Report

The Capital Project Clean-up (CPC) effort continues to require the commitment of a large number of Departmental employees. The majority of these personnel resources are focused on two distinct objectives. One is identify and isolate the significant financial inaccuracies recorded in the Alaska State Accounting System (AKSAS) data base while developing an interim data base to compile, organize, adjust and report the financial status of capital projects. Secondly, the implementation of new accounting subsystems and controls, within AKSAS, to enable the long term maintenance, control and reporting of corrected financial data. Both of these major tasks made significant progress in the past month. The time line for implementation of the new subsystem will be extended beyond the initial estimate (January 1, 1988). The time extension is necessary because several workplan steps required to correct the AKSAS data base are being incorporated into the implementation phase rather than handled as a separate task. The CPC effort extends beyond the efforts of the Department of Transportation and Public Facilities (DOT&PF) and is receiving needed support from the Department of Administration and Office of Management and Budget. This support consists of technical and procedural reviews and accounting system enhancements. Overall the CPC program continues to make progress in all significant workplan sections. Status of the specific tasks is outlined below.

PROJECT MANAGEMENT

The CPC workplan was developed in February and is continually under review. The October 20th revision (attached) incorporates the most recent revisions and details the status of each task.

CAPITAL PROJECT REPORT

DOT&PF Divisions of Management and Finance (DMF) and Information Systems (ISD) have established a complete data base file to compile updated information on the status of capital appropriations and project expenditures. As the correct status and financial standing of capital projects is identified, any variances from the current AKSAS balances will be reconciled and adjustments made. Actions taken during the past month are as follows:

° The Capital Project Report data base contains approximately 3,600 projects (including RSAs). A preliminary control report has been prepared and forwarded to the regions for review. This report classifies 1,300 projects as active and 2,300 as completed or closed. The task of compiling project indicative data (i.e., completion date and cost to complete by fund source) began October 20 and is scheduled for completion November 20. The Project Cost Information System (PCIS) was modified to receive and maintain this project information for monthly management reporting.

° Work continues to update the report data base with financial information from the previous DOT&PF and state accounting system files. This data was evaluated and adjusted during prior CPC efforts and will provide corroborating information for any AKSAS adjustments identified.

DEVELOP ACCOUNTING PROCEDURES AND CONTROLS

Establishing specific accounting procedures and controls within DOT&PF (statewide) is critical to assure accurate and timely information for capital project activity. Successful implementation will require development of new AKSAS structures and supporting accounting controls. Actions taken to achieve these goals are as follows:

° All regions continued work on converting active capital appropriations and projects into the new accounting subsystem. To date twelve percent of the projects have been converted. In addition, the CPC effort has initiated closing procedures on ten percent of closed projects.

° The Policy and Procedure (P&P) section has proposed formation of a management team to address all issues related to setting guidelines for Federal participation in administrative costs. The management team's goal is to review past practices and develop parameters to be followed in development of a new statewide policy on this issue. A field review team will be assigned to gather data and develop recommendations.

EVALUATION OF AKSAS DATA HISTORY

Both DOT&PF Internal Review and Division Directors and Legislative Auditors have raised concerns over the accuracy of historical data transferred into AKSAS when the State converted from the old accounting system (PBA). In an effort to evaluate and substantiate or correct this data the following steps have been taken:

° As addressed in our September report the DMF and ISD have developed an automated screening process to highlight erroneous transactions recorded in the AKSAS data base. Since that report an additional review step has been added

to perform an "accounting" review of detailed transaction reports. This review is necessary to segregate erroneous transactions which could not be sorted in the computer screening. This review is scheduled for completion by November 25. At that time reports detailing adjusted, inception to date, project expenditures will be forwarded to project managers for review.

ENHANCEMENT OF THE FEDERAL BILLING SYSTEM

Due to the loss of Federal certification of the present Federal Billing System, we are currently developing a new Third Party Billing System (TPB). The following is a summary of the steps completed in the past month:

° The technical problems which delayed implementation for four weeks have been resolved. The DMF is reviewing Federal projects for a clean financial cut-off from the current billing system. Final adjustments should be completed and billings produced in the new TPB system for federal reimbursement by November 9th.

EVALUATE AND IMPROVE MANAGEMENT REPORTING

The ISD has indicated the need to compile data and examine in detail the Department's current reporting and systems maintenance workload. The Division's goal is to develop a long term plan to coordinate ISD resources to meet the Department's management reporting needs. Actions taken to achieve these goals are as follows:

° DOT&PF executive management met October 5 on the topic of management reporting requirements within the Department. This group identified a variety of subjects which, if reported on periodically, would aid management both in the operation of the Department, and in responding to outside inquiries about the department's activity. ISD is to analyze the list to determine what percentage of the subject information is currently available and what the costs of providing the balance are. This analysis is expected by December.

° ISD technicians have completed and implemented an automated reconciliation to assure that PCIS and AKSAS remain in balance. This program has identified that all but 71 (two percent) of the projects that are recorded in PCIS are currently in balance. These 71 projects are being reviewed and necessary adjustments will be made to correct the variances. The reconciliation will be run on a regular basis to assure that any variances are researched immediately.

DEVELOP STATEWIDE AKSAS TRAINING PROGRAM

In January, the Department conducted a training needs assessment survey. This survey indicated an overwhelming desire for AKSAS training. In response, a three level DOT&PF Statewide program is being developed. Significant accomplishments are as follows:

- The Level I (introductory) program continues with classes being held statewide. Level I classes have been available for four months and 230 employees have been through training. Level IIA (data input) classes were initiated at Headquartrs during October and 14 employees attended. Classes are expected to begin in the regions during December.

Please call if you have any additional questions or if we can be of further assistance.

MEMORANDUM

State of Alaska
Department of Transportation & Public Facilities

TO: Mark S. Hickey
Commissioner

DATE: September 30, 1987

FILE NO:

TELEPHONE NO: 465-3900

FROM: Robert G. Poe, Jr.
Deputy Commissioner
Budget and Finance

SUBJECT: September Capital Project Clean-up Status Report

During September the Capital Project Clean-up (CPC) program continued work on the implementation of two new accounting subsystems. These current tasks are the key steps necessary to provide the Department of Transportation and Public Facilities (DOT&PF) with corrected financial data and accounting systems which can control and report financial activity. Additionally, significant progress was made in researching the problems created when the Department recorded historical financial data from the old state accounting system into the new Alaska State Accounting System (AKSAS). Conversion to the new Third Party Billing System was delayed one month. This delay was necessary to allow the Division of Management and Finance (DMF) time to correct revenue recording problems and to identify variances from the current billing system. The AKSAS Training Program continued to grow, approximately 180 people have attended Level One, with Level Two classes scheduled for October. The accomplishments in all workplan areas, during the last month, are as follows:

PROJECT MANAGEMENT

The CPC workplan was developed in February and is continually under review. There have been no significant revisions to the workplan since the July 10th revision, which was attached to the July status report. Critical steps necessary to meet the January, 1988 Capital Project Report are being monitored against an updated time chart.

CAPITAL PROJECT REPORT

DOT&PF Divisions of Management and Finance (DMF) and Information Systems (ISD) have established a complete data base file to compile updated information on the status of capital appropriations and project expenditures. As the correct status and financial standing of capital projects is identified, any variances from the current AKSAS balances will be reconciled and adjustments made. Actions taken during the past month are as follows:

- The control report for capital appropriations currently identifies 2156 total control appropriations (including RSA's) for which the DOT&PF is responsible. This preliminary report has been forwarded to the regions for review and verification.

- Initial research has begun to identify the financial status of all prior year Capital Project Funds. These funds were established between 1976 and 1980 and contain unexpended Federal authorization and bond proceeds. The current balances recorded in AKSAS indicate significant financial clean-up is required.

DEVELOP ACCOUNTING PROCEDURES AND CONTROLS

Establishing specific accounting procedures and controls within DOT&PF (statewide) is critical to assure accurate and timely information for capital project activity. Successful implementation will require development of new AKSAS structures and supporting accounting controls. Actions taken to achieve these goals are as follows:

- All regions continued work on converting active capital appropriations into a new subsystem designed to provide accounting control. To date 95 appropriations have been converted. The Department of Administration (DOA) has provided DOT&PF with a unique budget transaction which will simplify the process. This task is scheduled for completion by January, 1988.

- The Policy and Procedure (P&P) section coordinated policy development activity related to Departmental financial and legal responsibility for state and federal projects granted to municipalities, procedures for professional services contracts and audit procedures for Internal Review. Work continued on P&P's for Federal participation in administrative costs and for timesheet processing. These items are expected to be ready for management review in October.

EVALUATION OF AKSAS DATA HISTORY

Both DOT&PF Internal Review, Division Directors and Legislative Auditors have raised concerns over the accuracy of historical data transferred into AKSAS when the State converted from the old accounting system (PBA). In an effort to evaluate and substantiate or correct this data the following steps have been taken:

- The DMF and ISD have developed an automated screening process to highlight erroneous transactions recorded in the AKSAS data base. Reports detailing adjusted inception to date project expenditures will be produced in October. These reports are to be reviewed by project managers to determine the reasonableness of project costs.

- The DMF has initiated a process to update a capital project budget file. This file is necessary to provide a detailed breakout of the various project funding sources. The previous AKSAS structures did not provide adequate data for control of individual fund source balances. Once this file is reestablished the actual project expenditures can be allocated to the appropriate fund source.

ENHANCEMENT OF THE FEDERAL BILLING SYSTEM

Due to the loss of Federal certification of the present Federal Billing System, we are currently developing a new Third Party Billing System (TPB). The following is a summary of the steps completed in the past month:

- The TPB transaction edit system, for both Federal highway and aviation projects, achieved final acceptance sign off. The system has been in operation for seven weeks on a limited basis. The indicative data for all highway projects should be completely input by mid October and edits initiated at that time.

- The new billing module of the TPB system has been successfully tested. The implementation of active projects has been delayed four weeks. Technical problems related to project revenue recorded by the Time and Equipment subsystem are being discussed with the DOA. In addition the DMF is reviewing individual project balances recorded in AKSAS and comparing this to the amounts billed to date in the current billing system. Variances identified will be reconciled and appropriate adjustments recorded.

EVALUATE AND IMPROVE MANAGEMENT REPORTING

The ISD has indicated the need to compile data and examine in detail the Department's current reporting and systems maintenance workload. The Division's goal is to develop a long term plan to coordinate ISD resources to meet the Department's management and financial reporting needs. Actions taken to achieve these goals are as follows:

- ISD technicians have finished modifications to stabilize the Project Cost Information System (PCIS). Current work entails development and implementation of an automated reconciliation to assure that PCIS and AKSAS remain in balance.

- An executive level team to study DOT&PF's management reporting requirements has been formed and their first working meeting is scheduled for October 5th.

DEVELOP STATEWIDE AKSAS TRAINING PROGRAM

In January, the Department conducted a training needs assessment survey. This survey indicated an overwhelming desire for AKSAS training. In response, a three level DOT&PF Statewide program is being developed. Significant accomplishments are as follows:

- The Level One (introductory) program has been available for three months. Approximately 180 employees have been through training. Classes are scheduled to continue through December.

- Level IIA (data entry) training manual and materials are completed and presentations are scheduled for the first and third weeks in October.

- Level IIB (customized management report writing) draft manual is completed and going through preliminary review. The manual will be distributed for the regions to review and provide comments during October.

Please call if you have any additional questions or if we can be of further assistance.

MEMORANDUM

State of Alaska
Department of Transportation & Public Facilities

TO: Mark S. Hickey
Commissioner

DATE: August 31, 1987

FILE NO:

TELEPHONE NO: 465-3900

FROM: Robert G. Poe, Jr.
Deputy Commissioner
Finance and Budget

SUBJECT: August Capital Project Clean-up Status Report

The Capital Project Clean-up (CPC) program continues in full swing. Seven of the nine CPC workplan sections are in the implementation phase while the other two, management reporting and organizational review, are in the research and development stages. Significant August activity included the partial implementation of two newly designed accounting subsystem, Capital Project Funding and Federal Billing, which will be integrated into the Alaska State Accounting System (AKSAS). They are two of the key components of the Third Party Billing System which will allow the Department to meet it's financial accounting and reporting objectives. Implementation of the new Capital Project Funding subsystem includes not only setting up new appropriations and projects in the subsystem, but also the conversion of all current active appropriations and projects into it. The specific progress of each workplan section is detailed below.

PROJECT MANAGEMENT

The CPC workplan was developed in February and is continually under review. There have been no significant changes to the workplan since the July 10th revision, which was attached to the July status report.

CAPITAL PROJECT REPORT

DOT&PF Divisions of Management and Finance (DMF) and Information Systems (ISD) have established a complete data base file to compile updated information on the status of capital appropriations and project expenditures. As the correct status and financial standing of capital projects is identified, any variances from the current AKSAS balances will be reconciled and adjustments made. Actions taken during the past month are as follows:

- One hundred and forty capital appropriations have been identified as inactive. Steps are being taken to identify the financial status and prepare appropriations for close-out.
- There are numerous interdepartmental Reimbursable Service Agreements (RSA's) in AKSAS which are inactive. The State agencies associated with the RSA's are being contacted to confirm their status. Where applicable, financial transactions to officially close agreements will be processed.

DEVELOP ACCOUNTING PROCEDURES AND CONTROLS

Establishing specific accounting procedures and controls within DOT&PF (statewide) is critical to assure accurate and timely information for capital project activity. Successful implementation will require development of new AKSAS structures and supporting accounting controls. Actions taken to achieve these goals are as follows:

- As stated above, implementation has begun for a new process designed to control accounting for capital appropriations (Capital Project Funding). To date, twenty appropriations have been converted into the new subsystem. This task is scheduled for completion by January 1988. To ensure the success of this task, which we feel is crucial to the success of CPC, eight Departmental personnel have been temporarily reassigned to the divisions responsible for the conversion.

- The DMF has recently developed new procedures for closing out completed capital projects. During August, the regional Project Control groups forwarded forty-eight State-funded projects to the DMF and forty-three were formally closed under the new procedures.

- The Policy and Procedure (P&P) Section continued to work on several tasks. These included P&P's relating to Federal participation in administrative costs and procedures for time sheet processing. In addition, the section is working closely with DOT&PF Internal Review and Engineering and Operations Standards divisions on other statewide issues which affect financial operations.

EVALUATION OF AKSAS DATA HISTORY

Both DOT&PF Internal Review, Division Directors and Legislative Auditors have raised concerns over the accuracy of historical data transferred into AKSAS when the State converted from the old accounting system (PBA). In an effort to evaluate and substantiate or correct this data the following steps have been taken:

- The DMF and ISD are developing an automated screening process to highlight erroneous transactions recorded in the AKSAS data base. The initial design is complete and currently being tested.

- In addition to the data base files established for the Capital Project Report section, two additional files are being established to aid in evaluating AKSAS history data. These files consist of the June 1985 data from the PBA and FMS accounting systems which were the previous DOT&PF accounting systems. Prior CPC efforts reconciled the two data bases as of June 30, 1985, and provided information which will corroborate adjustments identifed in history clean-up.

ENHANCEMENT OF THE FEDERAL BILLING SYSTEM

Due to the loss of federal certification of the present Federal Billing System, we are currently developing a new Third Party Billing System (TPB). The following is a summary of the steps completed in the past month:

- Phase one of the new TPB, AKSAS transaction edits for the Federal Highway Administration (FHWA) program, was implemented successfully. AKSAS expenditure transaction edits (for federal billing) are operating for fifty-three capital projects. The majority of FHWA projects will be under edits by the end of September.

- Phase two of the new TPB, production of the FHWA bill, is in the final stages of testing. Implementation of this system is scheduled for early September. This will be a significant step towards the DOT&PF goal of reestablishing a certified billing system. Total conversion to this system is expected to take six months. Capital projects will only be converted to the new system after they have been evaluated by the CPC effort.

- An extensive users manual for TPB is in draft form and has been distributed for review. A training program for selected individuals involved in the federal billing process is being developed.

EVALUATE AND IMPROVE MANAGEMENT REPORTING

The ISD has indicated the need to compile data and examine in detail the Department's current reporting and systems maintenance workload. The Division's goal is to develop a long term plan to coordinate ISD resources to meet the Department's management and financial reporting needs. Actions taken to achieve these goals are as follows:

- ISD personnel have found flawed logic in the Project Cost Information System (PCIS) the system used by project managers to manage capital projects, which has caused erroneous financial reporting in PCIS for some time. Additional resources will be assigned to PCIS in September to make corrections and to begin work on PCIS enhancements identified during earlier research into the Department's management reporting.

- The new Deputy Commissioner of Operations was hired during August. This marks the arrival of the last key player for the effective planning of Management Information Systems (MIS) activity at DOT&PF. He is presently being briefed on current MIS capabilities, and formal MIS planning sessions are expected to commence during September.

DEVELOP STATEWIDE AKSAS TRAINING PROGRAM

In January, the Department conducted a training needs assessment survey. This survey indicated an overwhelming desire for AKSAS training. In response, a three level DOT&PF Statewide program is being developed. Significant accomplishments are as follows:

- The Level One (introductory) program has been available for two months. Approximately one hundred and twenty employees have been trained and feedback has been overwhelmingly supportive of the program. The majority of trainees have been from the accounting, planning and clerk typist sections. Additional emphasis is now focused on increasing attendance from construction and engineering groups.

- The Level Two (section A) program for data input functions has been completed. The pilot training session was held during August and the manual was updated with final enhancements. Initial training sessions will be held in the Headquarters region during September.

Please call if you have any additional questions or if we can be of further assistance.

SUBJECT: July Capital Project Clean-up (CPC) Workplan Status Report

The Department's Capital Project Clean-up (CPC) program has completed six months of work under the new workplan initiated in February. The positive effects of this expanded effort are being reflected in many aspects of the financial operations. Immediate benefits have resulted from the initiation of new accounting procedures and improved communication and flow of financial information between the Statewide and Regional offices. The Department-wide AKSAS Training Program classes for Level One have been very successful. Workplan sections covering enhancements to the State Accounting System (Federal billing and capital project funding) continued in the refinement and integration stage. This time was necessary for review of the new systems, enhancements to the implementation plans and expanding of the knowledge base throughout the Regional offices. Overall the CPC effort continues with all significant workplan sections making progress. Status of the specific tasks are detailed below.

PROJECT MANAGEMENT

The CPC workplan was developed in February and is continually under review. The July 10th revision (attached) incorporates the most recent updates and details the status of each task.

CAPITAL PROJECT REPORT

DOT&PF Division of Management and Finance (DMF) has established several data base files to compile updated information on the status of capital appropriations and project expenditures. These files will initially contain data through June 30, 1987. As the current status and financial standing of appropriations and capital projects are identified the appropriate data bases will be adjusted. This activity will be compared with the prevailing AKSAS data and variances reconciled.

DEVELOP ACCOUNTING PROCEDURES AND CONTROLS

Establishing specific accounting procedures and controls within DOT&PF (statewide) is critical to assure accurate and timely information for capital project activity. Successful implementation will require development of new AKSAS structures and supporting accounting controls. Actions taken to achieve these goals are as follows:

- As addressed in previous status reports the department has developed a new process to control accounting for appropriations and project costs. Procedures for converting the current activity have been developed and discussed with regional office personnel. Each region has selected the first group of appropriations for conversion by August 15th.

- Due to the previous accounting and billing problems it has been approximately one year since any capital projects have been final vouchered and closed-out. The DMF has recently reestablished procedures for closing out completed capital projects. A proposed Policy and Procedure (P & P) has been implemented and appropriate personnel assigned to initiate it. Selective projects are currently going through the new process.

- The DMF's new Policy and Prccedure Section has several tasks in progress. The critical projects include an amended P & P for federal participation in administrative costs and a new P & P to achieve timely submission of time sheets for all project chargeable activity. In addition, the project close-out procedures are being refined to accomodate a variety of capital projects, including planning and research projects.

ENHANCEMENT OF THE FEDERAL BILLING PROCESS

Due to loss of federal certification of the present Federal Billing System, we are currently developing a new Third Party Billing System. The following is a summary of the steps which have been completed in the past month.

- Weyerhaeuser Information Systems (WIS) has completed the initial program coding for the Federal Highway Administration (FHWA) front-end edit transactions and automated billings. WIS is working with the Department of Administration to utilize the AKSAS Test System to check and modify the program execution. Limited live production is scheduled for mid-August.

- The DMF is compiling the project specific indicative data necessary to implement the FHWA transaction edits. Implementation begins in mid-August and will take approximately eight weeks to complete. This step is significant as it will have an immediate positive effect on the current billing system. This will minimize the staff time necessary to assure the integrity of current charges appearing in the monthly federal-aid bill.

EVALUATE AND IMPROVE MANAGEMENT REPORTING

The Information Systems Division (ISD) has indicated the need to compile data and examine in detail the Department's current reporting and systems maintenance workload. The Division's goal is to develop a long term plan to coordinate ISD resources to meet the Department's management and financial reporting needs. Actions taken to achieve these goals are as follows:

- The Division has completed it's analysis of the key financial and management information systems currently in use. This analysis addresses the capacity, stability and compatability of the various systems. This overview resulted in ISD initiating some preventative maintenance programming to enhance the integrity and integration of certain systems.

- Preliminary discussions are being held to identify the management group that will create an information systems plan to comprehensively address the Department's management reporting needs. This effort will incorporate the current capabilities wherever feasible.

DEVELOP STATEWIDE AKSAS TRAINING PROGRAM

In January, the Department conducted a training needs assessment survey. This survey indicated an overwhelming desire for AKSAS training. In response a three level DOT&PF Statewide AKSAS Training Program is being developed. Significant accomplishments-to-date are as follows:

- The Level One (introductory) training program is fully developed and regional training schedules are being set-up. Two regions have completed one month of hands on training. Follow up reinforcement training is being made available for course participants.

- The Level Two training program is currently being developed. The program will contain two major sections. Section A will detail data entry procedures and Section B will cover customizing management reports. The draft training manual for Section A has been completed and the pilot training course scheduled for August 5th.

Please call if you have any additional questions or if we can be of further assistance.

SUBJECT: Capital Project Clean-up Status Report

The Department's Capital Project Cleanup (CPC) effort continues to make progress in all key workplan areas. As detailed in our May 10th revised CPC workplan, there are nine distinct steps with tasks in progress. The past months activity centered around the refinement, coordination and integration of the new accounting procedures and computer enhancements being developed by DOT&PF. The principal components include a new Third Party Billing System, RSA/PDA accounting process and financial history clean-up. The planning and design stage of these components have reached the final phase. In addition, the Department's Level One (introductory) AKSAS Training Program is fully developed and personnel training is set to start in two regions. The accomplishments in all workplan areas, during the last month, are as follows:

PROJECT MANAGEMENT

The CPC workplan was developed in February and is continually under review. There have been no significant changes to the workplan since the May 10th revision attached to the May Status Report. To facilitate the scheduling of workloads and timing of implementation for sections 4, 5 and 6 (new accounting procedures, history clean-up and billing system) additional detailed pert charts are being developed.

CAPITAL PROJECT REPORT

The initial Capital Project Report (also known as the 4/15 Report), which outlined the financial status of the CPC projects, was updated in early June for additional unprogrammed activity. Information from the June updated report was used to recalculate DOT&PF's share of the general fund continuing programs - capital reserve amount. It was estimated that the reserve could be decreased by $86 million.

This workplan section will be expanded at a later date to outline the tasks necessary to produce a revised Capital Project Report once the significant clean-up efforts are completed.

DEVELOP ACCOUNTING PROCEDURES AND CONTROLS

Establishing specific accounting procedures and controls within DOT&PF (statewide) is critical to assure accurate and timely information for capital project activity. Successful implementation will require development of new AKSAS structures and supporting accounting controls. Actions taken to achieve these goals are as follows:

- In recent months a new accounting process was developed to control DOT&PF accounting for appropriations and project costs. A limited number of appropriations and projects are being accounted for under the new process on a test basis. Minor refinements to this process are being documented and expanded use of the process is anticipated by late July.

EVALUATION OF AKSAS HISTORY DATA

Both Internal Review, DOT&PF Division Directors and Legislative Auditors have raised concerns over the accuracy of historical accounting data transferred into AKSAS when the State converted from the old accounting system (PBA). In an effort to evaluate and substantiate or correct this data the following steps have been taken:

- DOT&PF Division of Management and Finance (DMF) and Information System Design (ISD) are researching the transactions which took place during data conversion and the subsequent efforts to record history detail. This research is necessary to identify and correct erroneous or incomplete computer executions. To facilitate this process audit trail computer files, for FY'85, '86, and '87 activity, were provided to ISD. The direct access to this data has greatly enhanced the effort.

ENHANCEMENT OF THE FEDERAL BILLING PROCESS

Due to loss of federal certification of the present Federal Billing System, we are currently developing a new Third Party Billing System. The following is a summary of the steps which have been completed to date.

- Weyerhaeuser Information Systems has completed the overall project general design document. Both the Federal Highway Administration front-end edit section and the comprehensive section (FAA, RSA's, revenue and bill production) are in the detailed design stage. Program coding has begun in both sections.

- DMF and Weyerhaeuser Information Systems have begun detailing the critical path necessary for implementation. A preliminary workplan is being outlined and will be completed by mid July. Test project implementation is scheduled to begin in early August.

EVALUATE AND IMPROVE MANAGEMENT REPORTING

The ISD has indicated the need to compile data and examine in detail the Department's current reporting and systems maintenance workload. The Division's goal is to develop a long term plan to coordinate ISD resources to meet the Department's management and financial reporting needs. Actions taken to achieve these goals are as follows:

- Meetings between ISD and regional staff have been held to identify potential enhancements to the Project Control Information System (PCIS), Project Scheduling (P2) and Resource Allocation System (RAS). These systems are integral management tools for project managers. Enhancements including cleaner interface with AKSAS to insure database integrity are in the design phase.

- A workplan is currently being developed to identify the timeframe and resource commitment necessary by ISD to implement the various computer enhancements and new or expanded management reports identified in regional meetings.

DEVELOP STATEWIDE AKSAS TRAINING PROGRAM

In January the Department conducted a training needs assessment survey. This survey indicated an overwhelming desire for AKSAS training. In response a three level DOT&PF Statewide AKSAS Training Program is being developed. Significant accomplishments-to-date are as follows:

- The Level-One training program is fully developed and regional training schedules are being set up. Two regions will begin classes in late June.

- All regions have now identified personnel to serve as local instructors. An instructors training course will be held in Juneau on July 13th.

- The first draft of the Level-Two (section A) Training manual is complete and has been forwarded to the regions for review. The pilot training course is anticipated by late July.

FROM: Robert G. Poe, Jr.
Deputy Commissioner
Finance and Budget

SUBJECT: Capital Project Clean-up Status Report

The Capital Project Cleanup (CPC) program is in full swing. An updated CPC Work Plan which is attached, indicates that all nine key sections have tasks in progress. Significant accomplishments during the past month include issuance of the Capital Projects Report (4/15 Report), introduction of the Level One AKSAS Training Manual to regional personnel and implementation of the new AKSAS appropriation accounting process. The status of the work plan tasks addressed during the last month are as follows:

PROJECT MANAGEMENT

The CPC work plan was developed in February and is continually under review. The May 10th revision incorporates the most recent modifications. A status column was added to the Work Plan which indicates the progress of each task.

CAPITAL PROJECT REPORT

This report is being developed to identify and communicate to the Commissioner and Governor the financial status of all CIP projects and the cost to complete or cost to cancel each project. The following steps have been performed:

- The Capital Project Report was presented to the Governor and House of Representatives Finance Subcommittee on April 15th. Reports were also provided to the offices of all Legislators.

- Efforts are continuing, to identify the significant inaccuracies in the AKSAS appropriation and project balances. Data base files, which detail updated appropriation balances, are being compiled for comparison to both the current AKSAS balances and the Capital Project Report information.

- The Department is preparing an update to the initial Capital Project Report. This update will detail additional project phase appropriations not yet programmed to the intended project and breakout cost to complete by fund source.

DEVELOP ACCOUNTING PROCEDURES AND CONTROLS

Establishing specific accounting procedures and controls within DOT&PF (statewide) is critical to assure accurate and timely information for capital project activity. Successful implementation will require development of new AKSAS structures and supporting accounting controls. Actions taken to achieve these goals are as follows:

- Draft procedures were prepared to support the new appropriation accounting process. These procedures were presented to the regional Project Control Chiefs for review and approval, on May 1st. As of June 8th it is anticipated that all new projects will be accounted for under the new process.

- The Division of Management and Finance (DMF) is currently outlining the course of action necessary to convert all previous appropriations into the new controlled accounting structure. Conversion is scheduled to begin by June 15th.

- Based on audit findings of both Internal Review and Legislative Audit staffs and at the direction of the Office of Management and Budget (OMB) it has been determined that certain regional appropriation transactions must be dual approved by the DMF. This control procedure will be active by June 1st.

- The DMF is considering a new finance section responsible for development and implementation of policies, procedures and internal control. This will not require the hiring of new staff, but a more efficient use of existing staff. Effective May 1st the DMF assigned one part time position to begin updating the Financial Management Operations Manual (FMOM). We anticipate that this will be a full time position for FY'88. This section's first assignment, to draft project closing procedures, is expected to be implemented by May 20th.

EVALUATION OF AKSAS HISTORY DATA

Both Internal Review, DOT&PF Division Directors and Legislative Auditors have raised concerns over the accuracy of historical accounting data transferred into AKSAS when the State converted from the old accounting system, PBA.

- DOT&PF DMF and Information System Design (ISD) are working with the Department of Administration, Division of Finance to research the transactions which took place during the data conversion. This research is necessary to identify and correct erroneous or incomplete computer executions. This process is expected to take two months.

ENHANCEMENT OF THE FEDERAL BILLING PROCESS

Due to loss of federal certification of the present Federal Billing System, we have begun to develop a new Third Party Billing System. The following is a summary of the steps which have been completed to date.

° As reported in our April memo, Weyerhaeuser Information Systems was selected to design the new federal billing system. They have completed the front-end edit design criteria and program coding is scheduled to begin immediately. Currently the contractors are ahead of their work schedule which calls for full implementation by late September.

EVALUATE AND IMPROVE MANAGEMENT REPORTING

The ISD has indicated the need to compile data and examine in detail the Department's current reporting and systems maintenance workload. The Division's goal is to develop a long term plan to coordinate ISD resources to meet the Department's management and financial reporting needs.

° The Division has completed it's initial review of the Department's information reporting usage and needs. This review has identified in addition to AKSAS, two key peripheral managment reporting systems, Project Costs Information System (PCIS) and Project 2 (P/2). Meetings are now being scheduled to plan and develop the most efficient and effective information flow between all three systems.

° Regional personnel have provided ISD with a proposed list of enhancements for the PCIS system. The list is being evaluated, in conjunction with the Division's long term plans for uniformity within regions and compatibility with AKSAS. A prioritized list of system enhancements will be distributed for review by June 15th.

DEVELOP STATEWIDE AKSAS TRAINING PROGRAM

In January the Department conducted a training needs assessment survey. This survey indicated an overwhelming desire for AKSAS training. In response a three level DOT&PF Statewide AKSAS Training program is being developed. Significant accomplishments to date are as follows:

° A training coordinator has been designated in each region, to assist in program development and implementation.

- The Central and Northern Regions have identified personnel to serve as local trainers. The Level One Manual was introduced to these trainers during pilot training sessions April 29th and 30th.

- The Level Two Training Manual is currently being developed. This manual will contain two major sections. Section one will detail data entry procedures and section two will cover customizing management reports. Completion of both sections is scheduled for the middle of June.

Please call if you have any additional questions or if we can be of further assistance.

Deputy Commissioner
Finance and Budget

SUBJECT: Capital Project Clean-up
Status Report

The Capital Project Clean-up (CPC) effort continues to make progress as measured by the CPC workplan you received with the March 16th status report. Since that report, considerable headway has been made in several key areas including the expansion of field work in DOT&PF regional offices, beginning work on the new Federal billing system and completion of an AKSAS training manual. The status of the workplan tasks addressed during the last month are as follows:

PROJECT MANAGEMENT

The CPC work plan and gantt chart which were developed in February are continually under review. At this time, there have been no significant revisions to the workplan and all major tasks are proceeding as planned.

Tom Haas (former State Accountant, Department of Administration) accepted the position of Assistant Director, DOT&PF Division of Management and Finance (DMF). His knowledge of and experience with AKSAS along with his years of experience in state government have already enhanced the CPC effort.

CAPITAL PROJECT REPORT (APPROPRIATIONS 1982 TO PRESENT)

This report is being developed to identify and communicate to the Commissioner, Governor and Legislature the financial status of all CIP projects and the cost to complete or cost to cancel each project. Several phases related to the development of this report are in process. The following steps have been performed:

- DOT&PF regional offices have reviewed the preliminary report of capital projects. The estimated costs to complete or cost to cancel each project have been forwarded to DOT&PF DMF for input and evaluation.

- Preliminary review has identified certain inaccuracies in AKSAS balances. Specifically, the recorded budgets and inception-to-date expenditures of some CIP projects contain unauthorized transactions. We are designing a reconciliation process to identify and correct the errors.

- Presentation of the Capital Projects Report to the Legislature is scheduled for April 15th.

DEVELOP ACCOUNTING PROCEDURES AND CONTROLS

Establishing specific accounting procedures and controls within DOT&PF (statewide) is critical to assure accurate and timely financial information for capital project activity. Successful implementation will require development of new AKSAS structures and supporting accounting controls. Actions taken to achieve these goals are as follows:

- As reported in our last memo, we have developed a new process to control DOT&PF accounting for appropriations and project costs. This process has been approved by the Office of Management and Budget (OMB) and we are currently working on specific procedures to assure complete and controlled implementation of the new process.

- A review process for the Project Costs Information System (PCIS), which is used for budgeting and cost estimation by project managers in all regions, is currently in the design stage. The Information System Division (ISD) anticipates implementation by June 1st. A regular review process is necessary to assure the integrity of data downloaded from AKSAS to PCIS.

- DOT&PF DMF has initiated a project to establish current accounting policies and procedures. The current Financial Management Operations Manual (FMOM) is incomplete and outdated. Meetings will be held with the regional offices to review current operations and prioritize the areas of need.

- After lengthy discussions with the regions, it was determined that written project closeout procedures needed to be developed immediately. Those procedures are currently in draft form and are being reviewed in the regions.

- The needs assessment survey conducted in January indicated a high demand for AKSAS training. DOT&PF DMF has initiated a training program to be administered statewide. The program will consist of three levels of training ranging from a basic introduction to advanced structure design. The Level One program and manual is complete and training will begin in the Central Region by May 1st.

EVALUATION OF AKSAS HISTORY DATA

Both Internal Review and division directors for DOT&PF as well as legislative auditors have raised concerns over the accuracy of historical accounting data transferred into AKSAS when we converted from the old accounting system.

- DOT&PF DMF and ISD are working with the Department of Administration, Division of Finance to research the transactions which took place during the data conversion. This research is necessary to identify and correct erroneous or incomplete computer executions. This process is expected to take three months.

ENHANCEMENT OF THE FEDERAL BILLING PROCESS

Due to loss of federal certification of the present Federal Billing System, we have begun to develop a new Third Party Billing System. The following is a summary of the steps which have been completed to date.

- An RFP review committee evaluated vendor responses and selected Weyerhaeuser Information Systems to design the new federal billing system. Contract negotiations have been concluded and field work was started on Monday April 13th.

- The DOT&PF DMF in conjunction with the Federal Highway Administration (FHWA) has instituted a regular billing process and new procedures which will allow a timely processing of the federal-aid bill during development of the new billing system. Part of these new procedures include the development of a billing log which outlines and addresses various concerns of both parties regarding the federal-aid monthly billings.

EVALUATE AND IMPROVE MANAGEMENT REPORTING

Tom Kluberton, Director of ISD, produced a listing which catelogues all accounting and finanical reports regularly produced in his division. This listing has been distributed throughout all DOT&PF regions. The regions will compile responses from the various report users and forward this information to Headquarters. Responses will be evaluated and used as a basis to develop a long-term plan to coordinate ISD resources to meet the Department's accounting and financial reporting needs.

SUBJECT: Capital Project Cleanup
Status Report

This is the first in what will be a series of DOT&PF Capital Project Cleanup (CPC) status reports. These memos are intended to keep you informed as to our progress in addressing this critical issue for the Department. As you can see from the attached CPC work plan, we have expanded the scope of our CPC efforts considerably beyond cleaning up capital project historical data. Each month we will report to you on specific progress we have made in addressing each of the areas outlined in the workplan attached to this memo. You may wish to retain the work plan so you can follow our progress. Should you have any questions as we progress through this effort please call me at 465-3900 or Bob Bartholomew or Jim Merrill at 465-3911. The following is a discussion of our progress to date against the CPC workplan.

Status

PROJECT MANAGEMENT

The CPC work plan and gantt chart were developed in February, 1987. The plan has been reviewed with the DOT&PF Headquarters and Legislative Finance Committees staff. We are continuing to refine this workplan.

On March 2, 1987 two new employees, Randy Simmons, CPA, Director of Management and Finance and Bob Bartholomew, CPA, CPC Coordinator were brought on board to assist in CPC efforts.

Randy Simmons will fill the role as Comptroller of DOT&PF and Bob Bartholomew will perform the role of CPC Coordinator.

CAPITAL PROJECT REPORT (APPROPRIATIONS 1982 TO PRESENT)

This report is being developed to identify the financial status of all CIP projects post 1982 and report to the Commissioner, Governor and Legislature the cost to complete or cancel each project. Several phases related to the development of this report are in process. The following steps have been performed:

- Reconciliation of State Legislature Appropriations (1982 to present) to appropriation data recorded in AKSAS is substantially complete and the final report is being developed. Final variances will be detailed and significant items supported by memorandum.

- Prior accounting activity had produced files of unresolved input errors. "E" errors effect the capital project expenditures and require clearing to produce accurate reports. "A" errors are amounts correctly recorded into AKSAS but rejected in the conversion to FMS (Federal Billing System). These items require ongoing research to determine if such costs are federal participation costs. "E" error reconciliation is substantially complete and costs have been correctly recorded into AKSAS. A new system implemented in 1986 has eliminated the occurrence of "E" errors. A detailed listing of current "A" errors is regularly produced and monitored by the Assistant Director. Occurrence of "A" errors will be eliminated during the Federal Billing System Project.

- Double recording errors originated when the old State accounting system was converted to AKSAS. Certain appropriation and expense data were double recorded with a net financial effect of $0. The entries have caused confusion in tying gross balances to source documents. The majority of these items have been identified and where necessary are being corrected in conjunction with the AKSAS appropriation reconciliation referenced above.

- A preliminary report of capital projects (1982 to present) has been produced. This report details project budget and expenditures inception to date. The report will be forwarded to the DOT regional offices on 3/13/87 for review and input of estimated costs to complete or cancel each project.

- Presentation of the Capital Projects Report to the Legislature is scheduled for 4/15/87.

DEVELOP ACCOUNTING PROCEDURES AND CONTROLS

Establishing specific accounting procedures and controls within DOT&PF (Statewide) is critical to assure accurate and timely financial information for capital project activity. Successful implementation will require development of new AKSAS structures and supporting accounting controls. Initial actions taken to achieve these are as follows:

- DOT&PF Internal Review Audit Reports issued in January, 1987 have been reviewed and procedures necessary to implement recommended controls are being developed. Draft procedures are anticipated by April 16, 1987.

- We have developed new AKSAS reporting and control structures to correct the current problem of monitoring project/appropriation status. Specific procedures are being developed for approval by the Office of Management and Budget. Once approval is obtained new appropriations/projects will be accounted for using the new structures.

- Processes to input and control revenue estimates and TANAB controls is scheduled to begin the week of March 16 - March 20.

- The Project Costs Information Systems (PCIS) is used for budgeting and latest costs estimates, by project managers in the Southeast and Northern Regions. Review and evaluation of the PCIS is scheduled to begin the week of March 16 - March 20.

ENHANCEMENT OF THE FEDERAL BILLING PROCESS

Due to loss of federal certification of the present Federal Billing System, we have begun the process to develop a new Third Party Billing System. The following is a summary of the steps in this process which have been completed to date.

- DOT&PF Finance and Information Systems Divisions, developed requirements for a new federal billing system. An RFP was prepared and forwarded to software vendors in February. Proposals were closed 3/6/87 and the review committee is currently evaluating them.

MANAGEMENT REPORTING

Tom Kluberton, Director of Information Services, is currently identifying all accounting and financial reports regularly produced in his department. Headquarters and Regional Finance (accounting) departments will be contacted beginning March 16, 1987 to determine their current report usage and whether all needs are being met. A draft overview of the Department's Accounting and Financial reporting requirements will be developed by April 17, 1987.

OFFICE OF THE PRESIDENT

The Honorable Bette Cato, Chairperson
House Transportation Committee
State of Alaska
Juneau, Alaska

Dear Representative Cato:

The Highway Users Federation is pleased to submit this report of a ten-month review of the Alaska Highway Program. The pages that follow list our major findings and recommendations. The balance of the report is our perspective on the status of the Program, its financing and management.

While we have made a number of recommendations for change to improve program efficiency and effectiveness, we did find much to praise. First and foremost, we found a cadre of dedicated people that have sustained the program over a long period of time throughout leadership and organizational transitions, criticisms by those outside the program that may not have understood the magnitude or complexity of the job to be done and sometimes difficult working conditions.

Also we found much has been accomplished for which Alaskans can be proud. Alaska is in the national forefront in traffic safety and bridge conditions. Notwithstanding the elements that must be dealt with, Alaska's state highway network is "on a par" with other states. Anchorage's arterial street and highway system has come a long way in the 1980's toward being as modern as any in the nation. And the Marine Highway System and most of Alaska's major airports provide reasonable service to its users and the Alaskan economy.

We also pay tribute to the current and previous ADOT&PF management teams that have had to deal with a wider range of responsibilities than any of their counterparts in other state highway or transportation departments of the nation. While most such state officials have highway responsibilities and little more, ADOT&PF officials must administer the state highway program, as well as the operations of the two International Airports, 215 other airports, a nine-ship ferry system, most state-owned buildings and the state equipment fleet.

While Alaska is unique in this most important aspect, the Federation recommends that the current scope of responsibility remain unchanged. However because of this extraordinary scope,

it is recommended that the headquarters staff be augmented to provide more effective policy direction.

Some of the recommendations are far reaching and politically sensitive -- ie. transferring some state highway responsibilities to Alaska's boroughs and cities, and raising highway user taxes and dedicating these to the State Highway Program. However these actions should free up other currently earmarked transportation funds thereby allowing the Department to undertake the other recommendations that require added resources.

Transportation is vitally important to the social and economic well being of Alaskans. The public side of the Alaska transportation System -- that is highways, airports, ferries and harbors -- is a fragile network and the public responsibility to keep the system up and operating safely and efficiently is great. Much progress has been made in building the network. It is important that resources be found to keep what you have and to make those advances that are prudent expenditures within Alaska's overall resources.

The opening page of the report lists the members of the Alaska Highway Program Review Advisory Council. The Council met five times during the course of the review and assisted Highway Users Federation staff in outlining the key issues to pursue and in reviewing factual information and findings.

The pages that follow contain our major findings and recommendations. The rest of the report contains charts and graphs to give interested persons a better understanding of the current status of the Alaska Highway Program. The first chapter outlines how the state and municipalities share road responsibilities, where the money comes from and what agencies spend it. The second chapter discusses road conditions and traffic service. Chapter three indicates the accomplishments of the State Highway Program and how the Program relates to needs. The fourth chapter deals with managing the State Highway Program. Changes over time are shown as well as comparisons with national averages.

The Highway Users Federation is a 55 year old business league made up of the key industries and their associations that have an interest in safe and efficient highway transportation at reasonable costs. On behalf of our members and our affiliate, the Highway Users Federation of Alaska, we appreciate the opportunity to offer our perspectives on the Alaska Highway Program. We are grateful for the cooperation of Commissioner Hickey and the entire staff of the Alaska Department of Transportation and Public Facilities. We stand ready to further assist you in the months and years ahead.

Sincerely,

Lester P. Lamm

MAJOR FINDINGS AND RECOMMENDATIONS

I. Distinguishing Characteristics of Alaska's Highway Program

Alaska's Highway Program has many characteristics that set the Program apart from other states highway programs. The major distinguishing characteristics are as follows:

1. High Road Cost. The annual cost of administering, maintaining and improving Alaska's highway (all roads) and supplementary ferry system -- $48,000 per mile and $1,100 per capita --is above comparable national averages -- $16,000 per mile and $260 per capita. This is due to Alaska's severe weather conditions, unusual foundation characteristics (permafrost), difficult terrain, restricted building and repair seasons, remoteness of many parts of the system and the high cost of materials, supplies, equipment and services.

2. Highway User Taxes Are A Small Portion Of Funds. Unlike most states where highway user taxes and fees are the only state funds used to support the state highway program, Alaska's highway user taxes and fees meet only a small fraction (ten percent) of the Alaska State Highway Program costs.

3. Highway User Taxes Are Low. Alaska truck taxes and fees are the lowest in the nation while Alaska automobile user taxes and fees rank 37th from the top state in the nation.

4. First In Federal $ Received/Federal Taxes Paid. Alaska is first in the nation in the ratio of Federal Aid Highway Program payments received to federal highway user taxes paid. Over the fiscal year 1956 to 1985 period, Alaska has received $2.2 billion in Highway Trust Funds as compared to $256 million in federal highway user taxes paid by Alaskans -- a 9 to 1 ratio.

5. Unique State Highway System. Unlike any other state, Alaska's state highway system serves less than half of Alaska's communities of over 250 persons. Unserved communities are however connected to the rest of the state through a system of state-owned airports and by a state-owned ferry system.

6. Traffic Density Low. Alaska has the second lowest population and the fewest registered motor vehicles of any state in the nation. Only three states have fewer vehicle miles of motor vehicle travel. The average daily traffic on Alaska's roads is one half the national average.

7. Lowest Road Density. Alaska has the largest land area of any state in the nation (2-1/4 times the land area of Texas) and the lowest road density in the nation, only 1 mile of public road per 57 square miles of land area. By way of comparison, Nevada has the next lowest road density with 1 mile of road for every 2.5 square miles of land.

8. Road Miles Are Low. Despite Alaska's vast land area, only Delaware, Hawaii and Rhode Island have fewer miles of public roads.

9. Bridge Leader. Based on a national survey, Alaska is first in the nation in bridge conditions. Alaska has the smallest proportion of deficient bridges among the 50 states.

11. Fewest Traffic Fatalities. Among the 50 states, Alaska and North Dakota had the fewest 1986 traffic fatalities. For 1986, Alaska's mileage death-rate stood at 2.13 deaths per 100 million vehicle-miles of travel or 14 percent below the national average. And when all facts are in, it appears that Alaska's 1987 traffic safety record will improve upon the 1986 record.

12. Most Comprehensive State Department of Transportation. Unlike other state highway and transportation departments, which are mainly responsible for state highway system administration, maintenance, operation and improvement, the Alaska Department Of

Transportation & Public Facilities has major responsibilities for airports, ferries, harbors, public buildings, as well as highways.

13. Most Decentralized Department. The ADOT&PF is more decentralized than any other state transportation agency with major control vested in regional offices as well as the International Airport System and Marine Highway System offices.

II. Major Recommendations

1. Keeping A Good Program Going. First and foremost, Alaska needs to find the money necessary to maintain its record of progress in transportation service. Major strides have been made in developing and improving the state highways, bridges, airports, marine highways and harbors. In all aspects, it is a system in which Alaskans can be proud. Finding the resources to sustain the progress, or at least to sustain the existing system and service levels, in the face of Alaska's social needs, is the most serious challenge.

2a. Setting A State And Municipal Road Responsibility Policy. Currently, the ADOT&PF and Alaska's municipalities share the management of roads within municipalities without a state-municipal, agreed-upon policy that is based on the traffic service (functional) characteristics of the roads. Unlike the state highway networks in other cities of the nation, which serve principally as distributors of statewide traffic to major centers of traffic attraction within urban areas, many of Alaska's urban state highways function as minor arterials or collectors of traffic through or around residential neighborhoods. As a result, the ADOT&PF is looked to for funding the maintenance and improvement of streets and roads that are primarily of concern to citizens in urban neighborhoods. Alaska's rural and urban state highways of statewide traffic significance must compete for scarce funds with streets and roads of only local importance.

2b. Establishing An Urban Arterial Fund. Urban street and highway development has been predicated largely by legislative earmarking of funds for specific improvement projects and by such initiatives as the Anchorage Accelerated Road Program. A statewide approach to meeting urban arterial needs has been lacking. However, once road responsibility policy has been agreed upon and streets and highways transferred to the

appropriate agency (ADOT&PF, cities and boroughs), it is recommended that an Urban Arterial Fund be established to fund the improvement of those arterial streets in Alaska's major municipalities that are not included in the state highway system.

3a. Increasing ADOT&PF Maintenance And Operations Resources. Funds for highway maintenance must be increased to ensure that state highways are preserved and that safe and efficient levels of service are made available to the public.
Responsibility for 292 airports and 5,542 miles of state highway is now spread among a maintenance force of 570 people (as of 6/30/87) as compared to 661 people at the same point in time in 1985. Based on a national survey, Alaska is among the states with the fewest highway maintenance personnel per lane-mile of highway in the nation. Furthermore, the highway and aviation portion of the maintenance and operations expenditures dropped 24 percent from $71.2 million in FY 1986 level to $53.9 million in FY 1987. While the FY 1988 authorization level increased to $61.6 million, this is not adequate to restore effective maintenance operations. Snow and ice removal operations have been reduced to the point where motorists are being inconvenienced, and if a severe winter is experienced, more problems will occur. Signs of physical neglect, while already noticeable, will become more pronounced as water and ice continue to widen unsealed cracks and as shoulder erosion and unrepaired pavement edges continue to break up.

3b. Develop And Publish Maintenance And Operations Options. To arrive at the appropriate highway maintenance funding level, it is suggested that the ADOT&PF develop and publish highway maintenance and operations options. It is suggested that this study define three or more levels of highway maintenance that might be provided With such information specified, along with clear indications of costs and benefits, the Department, the Legislature and the public will have the best possible basis for funding decisions. Service level A would be the optimum with little or no inconvenience to motorists during snow and ice conditions. Potholes and edge raveling would be eliminated. All pavement cracks would be sealed each year. All ditches and culverts would be kept cleaned. Ten percent of the state highway system would be seal-coated each year. Brush would be cut

back annually on all state highways. Shoulders would be leveled each year. Signs, pavement markings, culverts and guardrail would be kept in good repair at all times. The object of the Service Level A evaluation is to determine the cost to 1) gain the maximum service life from each highway and bridge and 2) gain the best possible service for the motorist.

Service level B would be a lower increment of service on all state highways, especially the 1,000 miles of Major Collector Highways. As is the case today, some routes would be closed during winter months. Service level B is most nearly consistent with the 1987 maintenance programs.

Service level C would be a still lower level of maintenance and operations than has heretofore existed.

In each case a full explanation of the options should be developed and published. The short and long range benefits of the optimum service level should be specified, as should the consequences of providing the optional lesser service levels.

4a. Initiating A Comprehensive Needs Analysis. To determine the optimum level of funding for the state highway improvement program, it is recommended that the ADOT&PF make an engineering appraisal of the cost to meet state highway system deficiencies as they are likely to occur over the next ten years. Such an analysis should be carried on concurrently with the maintenance and operations analysis and the revision of state highway responsibilities, because these associated analyses directly affect the needs appraisal. For example, a heavy emphasis on highway preservation reduces the need for surface rehabilitation and visa versa. Also, a smaller urban state highway system will reduce the overall magnitude of state highway system needs.

4b. Building On The Recently Completed Interstate Highway System Needs Estimate. The ADOT&PF has recently completed a mile-by-mile analysis of Interstate Highway System needs. This carefully prepared analysis compared the existing 1,089 miles of Alaska's designated Interstate Highways with "tolerable" highway standards. Deficiencies were noted, estimates of costs to correct deficiencies were calculated and a priority of need assigned to each deficiency. The Interstate Highway Needs Estimate provides an excellent

basis for similar estimates of needs (with different standards of tolerability) for the other four functional systems of state highways, that is Other Principal Arterials, Minor Arterials, Collectors and Local Access Roads.

A summary of the needs estimates, along with the priority established for each need, will provide a sound basis for determining total state highway program needs (capital plus maintenance) with options to fit Alaska's financial capability.

5a. Determining Highway User And Other Tax Resources. Together with an agreed-upon, restructured state highway system and an accurate appraisal of the cost to meet the most needed state highway deficiencies and a determination of highway maintenance and operations costs, it is also recommended that a fiscal analysis be made of highway user taxes and other funds that might be used to meet long range goals for state highway system development, improvement and maintenance. A financial plan should then be set to provide long term stability for a goal-oriented program.

5b. Relating Highway User Taxes To The State Highway Program. Unlike most states, where highway user taxes and fees -- motor fuel taxes, motor vehicle registration fees and other special taxes on motor vehicles, their operation and use -- are the principal resource for funding the state highway program, Alaska's Constitution precludes strict dedication of any tax. However a few other states and the Canadian Provinces have a situation similar to Alaska, and in these cases such taxes are informally dedicated to the state highway program. Officials and the public have recognized that the highway program has such far reaching economic and social implications that a secure funding source is important. It is also recognized that state and provincial highway programs benefit, in terms of effective and efficient use of resources, when transportation officials have reasonable assurance of funds over at least a five year period.

The success of the nation's highway program over the past 70 years is primarily attributable to the fact that it has been supported by user-based funds. Alaska's highway and airport progress has been based on a readily predictable and reasonably stable supply of funds stemming from the Federal Aid Highway and Federal Aviation Programs which are both funded by federal user taxes.

5c. Raising Motor Fuel Taxes and Other Highway User Fees or Dedication of Other Taxes. In order to completely fund the state highway program from state highway user taxes, it will be necessary to raise the existing taxes and fees. New highway user taxes and fees, such as use or sales taxes on motor vehicle transfers, not presently in existence in Alaska is another possibility. Dedication of a portion of mineral severance taxes to the State Highway Program might also be considered. Determining how much of an increase or what new taxes should be employed is beyond the scope of this review, but should be included in the fiscal analysis recommended.

In comparison with their counterparts in the rest of the nation, Alaska's truckers and other motorists currently pay low taxes and fees for truck and automobile use.

For heavy trucks, Alaska ranks lowest in the nation with a tax load of $1,598 per year or 2.0 cents per vehicle-mile of heavy truck travel. This compares to Washington which collects over three times as much ($4,990 per truck, and 6.2 cents per vehicle-mile of heavy truck travel). The highest taxer of heavy trucks is Arizona which collects $11,012 per truck or 13.8 cents per vehicle-mile of heavy truck travel.

For automobiles, Alaska ranks 37th among the states with a $122 tax per average automobile or 1.0 cents per vehicle-mile of travel. The highest in the nation is Rhode Island with an annual tax load of $731 per automobile or 5.9 cents per vehicle-mile of automobile travel (six times the Alaska load). The lowest is New York at $73 per year and 0.6 cents per vehicle-mile of travel. Washington's annual tax on automobiles is $310 per vehicle or 2.5 cents per vehicle-mile of auto travel.

5d. Keeping Trucking And Railroad Industries Competitive. An increase in highway user taxes will increase trucking industry costs, while railroad costs remain unchanged. The existing economic balance between the trucking and railroad industries will have changed. To retain current levels of profitability and service, truck rates may have to increase which may result in loss of business. And there are other consequences that have to be considered in any such tax change. Therefore it is recommended that the change in highway user taxes be preceded by economic analyses of highway/railroad competition and

proposed initiatives that would retain the economic viability of the two competing modes after the tax change.

6. Planning To Upgrade The Existing State Highway System. The recently adopted and implemented process of annually updating the Six Year Capital Improvement Program in close alignment with estimates of federal funds should be maintained as a fundamental tool in managing ADOT&PF capital improvements.
It is also suggested that a state highway surface restoration program be specified with a goal of resurfacing a prescribed number of state highway miles each year - a number that is consistent with the need to upgrade, or at least retain, the current level of rideability, skid resistance and pavement structural integrity. Similar goals as well as schedules of accomplishment should be set to complete the modernization of each of the functional classes of state highways.

7. Planning State Highway System Expansion. Most of Alaska's Interstate Highways, Other Principal Highways, Minor Arterials and Major Collector Highways that link together Alaska's economic centers were built over the past 50 years. It is realistic to forecast that additions will be made to this System over the next 50 years as Alaska expands its economic base. Now is the time to set an overall plan for expansion of the State Highway System and to establish priorities of need for each planned route. With such a plan (or future updated versions of the plan) and link-by-link estimates of cost, Alaska citizens can then decide the time schedule for building each and the means for its financing.
Not only should the plan address Alaska's mineral, forest and recreational resources but also Alaska's strategic military and defense situation. Because of the uncertainty about the amount of traffic that would be generated by many such routes, the use of special low cost design standards should be explored for the initial primitive routes.

8. Setting Statewide Highway Improvement Priorities. At present state highway improvement priorities are based on regional priorities after geographic apportionment of funds. As a result, some funded improvements are of low statewide significance and some

projects of high statewide importance are not being funded. A statewide priority system, developed in concert with the proposed engineering appraisal of highway deficiencies, will aid in setting equitable geographic apportionment of funds and funding the most urgently needed improvements.

9. Recapitalizing the State Equipment Fleet. The ADOT&PF Program includes maintaining a $118 million, 6,500-vehicle equipment fleet for ADOT&PF and 18 other state agencies. A Highway Equipment Working Capital Fund was established by law in 1960 as the accounting mechanism for deposit of lease funds and the appropriation of money for servicing the equipment and replacing worn or obsolete pieces. However, as the result of transfers out of the Fund to meet other State of Alaska needs and a FY 1987 reduction in lease fees to help agencies with budget constraints, the HEWCF was reduced to the point where the 1986 and 1987 schedules of equipment replacement could not be met. As a result state agencies are having to cope with the problem of maintaining equipment that should have been replaced or making do without those pieces that cannot be kept operable.
To meet the problem, the ADOT&PF raised lease rates in FY 1988 and appointed a task group to review the needs of the State Equipment Fleet and to recommend other necessary actions.

10. Establishing A Motor Carrier Advisory Council. There are a number of important issues that face government officials and the trucking industry. Sizes and weights, industrial use highways, safety, taxation and railroad competition are a few of the current issues that need to be discussed in open forums. To gain greater cooperation and better understanding of the issues and positions of the various interests, it is recommended that the ADOT&PF establish a Motor Carrier Advisory Council representing truckers, shippers, and the state agencies involved with truck regulation, and that recommendations be made to the ADOT&PF Commissioner. It is suggested that a trucking industry leader act as chairman of the Council but with ADOT&PF staff support in setting agendas.

11. Retaining A Strong Research Effort Program. By the nature of Alaska's climate and topography, the ADOT&PF has had to maintain a strong research program aimed at finding the most economical and effective methods of building and maintaining highways, as well as airports, harbors, ferries and public buildings. Finding the funds to keep a strong research program is vital to the ADOT&PF Program. Likewise, it is essential that important research results be brought to the attention of design, maintenance and construction staff.

III. Other Recommendations

The following are a list of other suggestions to enhance the efficiency and effectiveness of administering the ADOT&PF program:

1. Strengthening the Headquarters Function. The technical capability of the ADOT&PF headquarters staff should be augmented to strengthen its role of providing policy direction, improve the monitoring of Program expenditures, provide better support for the diverse elements of the ADOT&PF Program, better monitor the condition and performance of the state transportation systems, better plan for transportation systems that will promote safe and efficient travel as well as economic development, establish both maintenance management and pavement management systems and better inform the public of Alaska's transportation progress and problems.
This recommendation is not to be construed as a criticism of decentralized management of Alaska's Transportation Program but as a necessary augmentation that will provide resources to better coordinate the decentralized management team.

2. Improving Accountability. The ADOT&PF public information program should be expanded to better inform the public on:
a) how tax resources are being spent overall as well as according to mode,
b) on progress or lack of progress on meeting goals and,
c) on special problems that need to be addressed.

At the minimum, comprehensive ADOT&PF annual, or biennial, reports should be prepared and published.

In 1987 the Department placed heavy emphasis on accounting for previous and current expenditures on capital projects. A training program aimed at improving staff understanding and use of the Alaska State Accounting System was also implemented. Nevertheless, continued effort is needed to resolve the capital project accounting problem.

3. Enhancing Productivity. With one out of every three ADOT&PF Program dollars devoted to personnel services, the ADOT&PF should continue to give high priority to reviewing and analyzing staff productivity, and a comprehensive plan of manpower needs should be developed. Furthermore, guidelines need to be established on the use of consultants based on comparative analyses of public/private costs.

4. Improving Staff Morale. The ADOT&PF should continue to seek to bring more middle management and other employees into the decision making process. The formation of task committees to make a full evaluation of internal needs and to study specific problems is a good method of gaining greater employee appreciation of the Program, a greater sense of involvement and more pride of accomplishment.

5. Upgrading the ADOT&PF Personnel Function. The ADOT&PF needs to establish a career guidance program aimed at retaining key leaders and preparing others to step up to leadership assignments. The personnel section should become the key resource in meeting the needs of employees while at the same time assisting management to place the best qualified person in each management position.

6. Coordinating Maintenance Management. There is a need for a review of the current methods of managing the maintenance and operations program. Revisions should be made where it is found necessary to improve on the reporting of information needed to set program goals and to monitor progress toward meeting such goals. An Alaska highway and airport maintenance manual should be developed to enhance maintenance efficiency and effectiveness.

INTRODUCTION, BACKGROUND AND ACKNOWLEDGEMENTS

The Review of the Alaska Highway Program was performed under contract with the Alaska Legislature. Most of the investigative work was accomplished from January through September 1987.

This is the seventh in a series of highway program reviews that the Highway Users Federation has accomplished over the 1984 through 1987 period. Prior to the Alaska Review, the highway programs of Tennessee (1984), Idaho (1984-1985), Indiana (1985), Mississippi (1985-1986), Nebraska (1986-1987), and Missouri (1987) were reviewed and reports submitted. Mr. Marshall Reed, PE, the Federation's Manager of State Transportation Studies has directed each of the efforts. Mr. Antony Petty managed the Alaska report production, and Ms. Nancy Calvin assisted with report graphics.

Advisory Council. A Highway Program Review Advisory Council was established to assist in the Review. Its members, all Alaskans, are listed on the second page of this report. All have close ties to the Alaska Highway Program.

The Council met five times during the course of the Review to help establish the most important issues to be pursued and to counsel the Federation on the findings.

The Highway Users Federation is indebted to the Council members for their assistance. It was observed that while each member has an economic stake in the Alaska Highway Program, each displayed an overriding interest in pursueing the best course for Alaskans and the Alaska economy.

ADOT&PF Cooperation. In each of the reviews, the work was carried out cooperatively with the state highway or transportation department. The ADOT&PF found office space for the Project Director within the headquarters' building, and Ms. Ginger Johnson (the ADOT&PF Public Information Officer) was appointed Project Liaison Officer. All of the Alaska data used in the Review came from the ADOT&PF and other Alaska agencies.

Highway Users Federation. The Highway Users Federation is a national business league made up of those corporations and associations that have an interest in safe and efficient highway transportation. The organization was first established in 1932, and it has been instrumental over the years championing the many aspects of our nation's highway programs that increase highway efficiency and safety at reasonable costs.

Highway Users Federation of Alaska. The Highway Users Federation of Alaska is an affiliate of the national organization, and it focuses on Alaska highway and traffic safety issues. All members are Alaska citizens. They represent such groups as the Alaska Trucking Association, the Alaska Chapter of the Associated General Contractors and Alaska's oil industry. It was the HUFA that brought the highway program review process to the attention of the Alaska House Transportation Committee, and that Committee sponsored the legislation required to establish the agreement for the $60,000 Alaska Highway Program Review.

Review Process. The object of the highway program review process is to evaluate the effectiveness of each state's total highway program in meeting its citizens needs for safety, service and cost effective transportation now and in the future.

Strengths of the current program and areas which can be improved are identified. Current assignments of responsibilities and resources between the state and local governments are analyzed as are the processes by which decisions are made in the planning, construction, maintenance and operation of the state highway system.

While much of the Review entailed interviews of key ADOT&PF officials in Juneau, trips were made -- via the State Highway System, the Alaska Marine Highway System and both commercial and chartered aircraft -- to most of Alaska's major cities and many of the smaller communities. Officials in each ADOT&PF Region were contacted as well as the Directors of the Alaska Marine Highway System and the International Airports.

Anchorage officials were interviewed to gain their perspective on municipal street and highway progress and problems. Also many remote communities were visited for first hand impressions on transportation operations and System needs.

The ADOT&PF maintenance foremen in many of the maintenance stations were contacted to determine their impressions of needs versus available resources. Over half of the State Highway System was driven.

Based on data summaries, comparisons with national statistics, visual impressions, interview comments, knowledge of other state highway programs and Advisory Council discussions, the major findings and recommendations were formulated and refined. The ADOT&PF headquarters' staff, as well as the Region and Division staffs, reviewed and commented on both the major findings and recommendations and the facts and figures presented in preliminary drafts of this final report.

In general, ADOT&PF officials and employees displayed an extraordinary amount of interest in the interviews and findings. The Highway Users Federation considered all comments in formulating this final report.

We hope that our perspectives on the Alaska Highway Program wil be useful as you plan for the future.

CHAPTER I

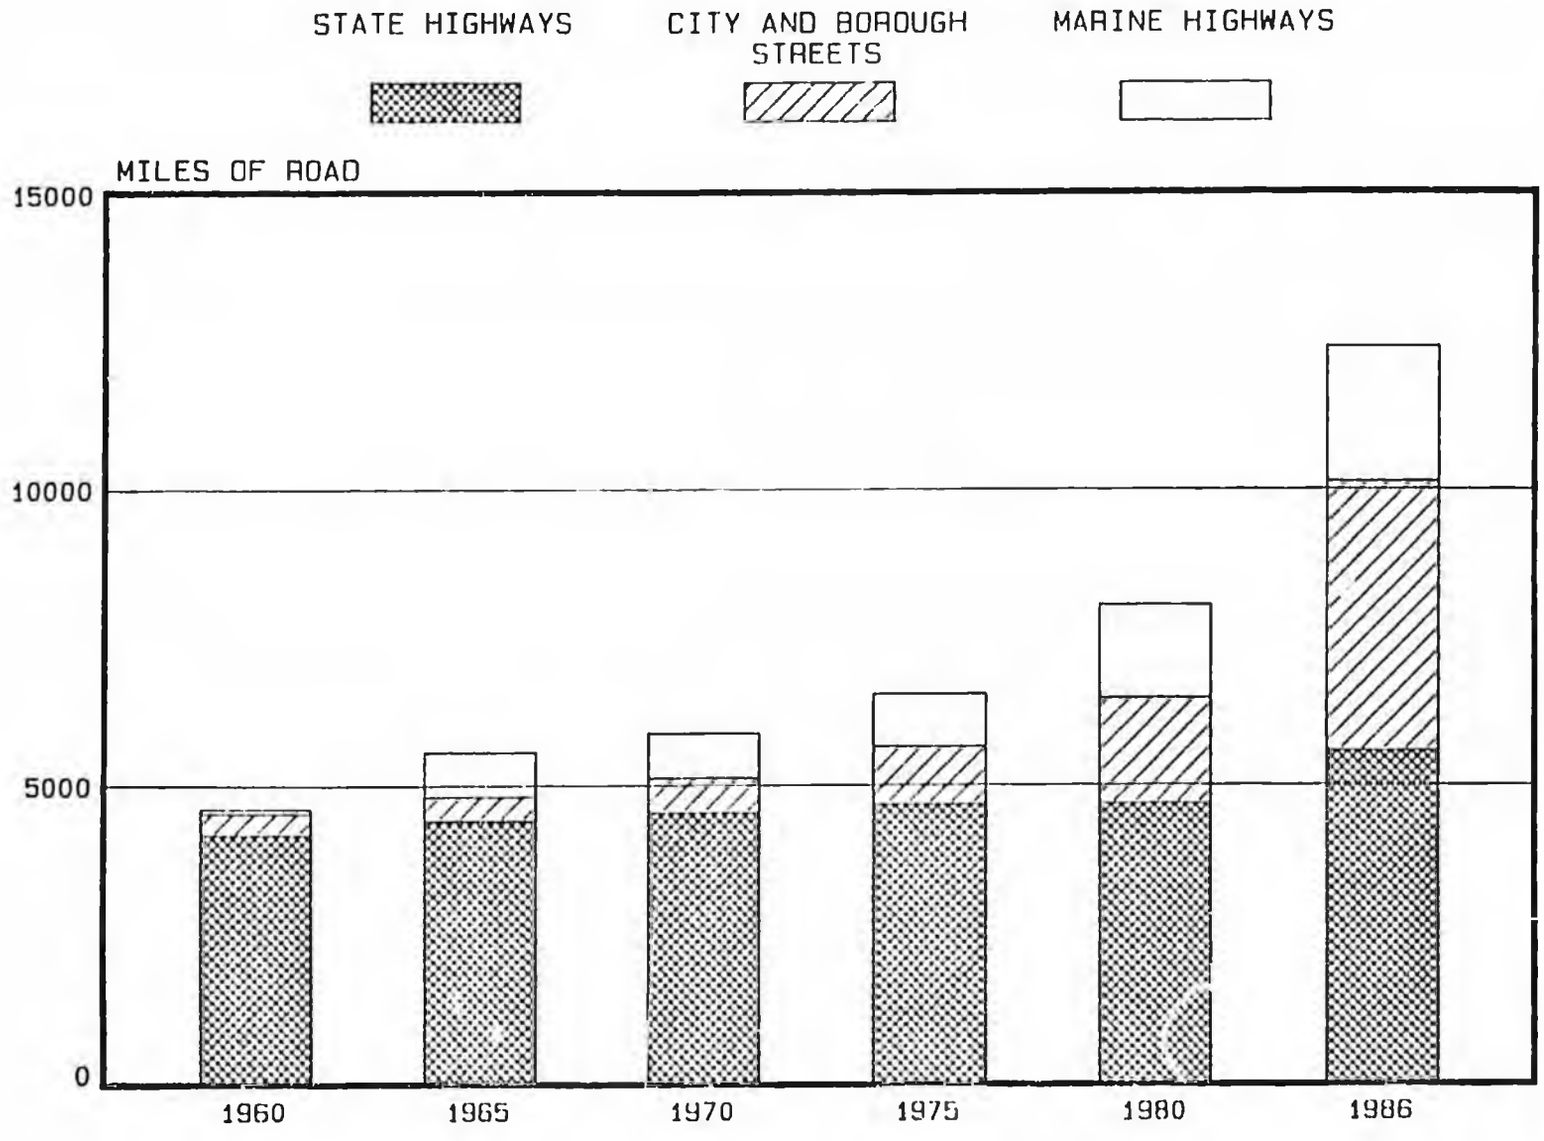
TRANSPORTATION FINANCE & RESPONSIBILITIES

CHAPTER I

TRANSPORTATION FINANCE AND RESPONSIBILITIES

This Chapter includes a Review of the Role of the State, Cities and Boroughs in Sharing Responsibilities for Administering, Maintaining, Operating and Improving Alaska's Transportation System as well as a Review of the Funds Available to Meet These Responsibilities.

MILES OF ROAD



NOTE: EXCLUDING FEDERALLY OWNED ROADS.

Over 10,000 Miles Of Road. Discounting the 224,000 miles of road that are under the direct control of federal agencies, there are 3.6 million miles of land service roads in the United States. Alaska's 12,370 miles is less than three one hundreths of a percent. Yet Alaska's land area is 16 percent of the nations total. Only Delaware, Hawaii and Rhode Island have fewer miles of road.

Marine Highway Routes Are State Highways. Including the ferry routes of the Marine Highway System, there are 7,824 miles of highway that are considered state highways. These routes are administered, operated, maintained and improved by the Alaska Department of Transportation and Public Facilities.

Since 1960 the state highway system (including Marine Highway System routes) has doubled in extent. The most significant change is the expansion of the Marine Highway System, due largely to the shift in the status of service to the Aleutian Chain in 1981 from testing and demonstration to permanently, scheduled service.

However during this 27 year period, the 416 mile Dalton Highway was built by private interests and added to the State Highway System. Also during this time, the 325 mile Parks Highway was completed to provide better highway service between Alaska's two largest centers, Anchorage and Fairbanks. Other shorter links of state highways have also been added.

Alaska Unique. The truly striking transportation distinction between Alaska and the rest of the nation is that the majority of Alaska's communities of over 250 people are not connected by land via the State Highway System. The remoteness of some places, the water barriers and the difficulty of traversing the terrain have made such connections either impossible or inordinately expensive. Alaska has therefore relied on a system of ferry routes with nine ships capable of conveying both passengers and vehicles to some communities and to an extensive system of airports that allows air service to all other communities of over 30 people.

The Alaska Railroad. Alaska also has a 480 mile railroad system that is vitally important to the shipment of general commodities as well as mineral and forest products over the Seward to Fairbanks mainline. A spur to Whittier connects the main line with the Marine Highway System on Prince William Sound and to barges that service the "lower 48 states"..

In 1982, the State of Alaska purchased the railroad line, equipment and property. The Alaska Railroad Corporation operates the freight and passenger service. While the railroad is independent of the ADOT&PF, the ADOT&PF Commissioner is a member of the Alaska Railroad Company's Board of Directors.

Cities And Boroughs Also Have Road Responsibilities. In those parts of Alaska that have a population base and a system of local government (city or borough), the governmental entity can accept responsibility for some roads. While the ADOT&PF is not required to take into the State Highway System those roads that cities and boroughs will not accept, typically the ADOT&PF does take on this responsibility.

Leap In City And Borough Roads. Note that the chart indicates a significant growth in city and borough road and street mileage over the 1960 to 1986 period. Some of the increase is related to subdivision street construction by developers and some is related to state appropriations for specified roads. However some of the increase is due to better accounting by the cities and boroughs for road miles, since 1980 state legislation greatly increased the state revenue sharing funds that are based on miles of road.

NOTE: EXCLUDES MARINE HIGHWAY SYSTEM, MINOR COLLECTORS AND LOCAL ACCESS ROADS.

FUNCTIONAL CLASSES OF RURAL ROADS

Functional Highway Classification - A Basis For Management Decisions. Most state highway agencies classify their state highways based on their traffic service functions. The resulting hierarchy gives managers a tool for decision-making regarding the distribution of scarce resources. Design standards, improvement priorities and maintenance standards are all related to the functional classification of roads. The map shows the functional designation of Alaska's major rural roads and their extensions through urban areas.

Interstate Highways, The Most Important Arteries. Alaska's most important rural roads are those designated to be Interstate Highways (1,089 miles). These connect Alaska's largest centers – Anchorage and Fairbanks – with each other and to the main route of land travel into Alaska. An Interstate Highway Spur also connects Anchorage with the Kenai Peninsula.

As the chart at right shows, the average mile of Interstate Highway is traversed by 1,750 vehicles per day. Alaska's Interstate Highway System's average traffic density is only one seventh the 12,900 vehicles per day average traffic density on all rural Interstate Highways in the nation. Due to this lower traffic density, Alaska's rural Interstate Highways are built to two-lane design standards rather than the four-lane, divided highway standards found in other states.

Other Principal Arterials Next In Importance. In terms of traffic service, Alaska's Other Principal Arterials are next in importance. The Egan Expressway in Juneau and the Klondike and Haines Cut-Off Highways are examples of Other Principal Arterials. They are important because they connect Haines, Skagway and Juneau to the Alcan Highway and to the Alaska Marine Highway System.

Minor Arterials Expand The System. As seen, the Minor Arterials link other important Alaska centers with the Interstate Highway System.

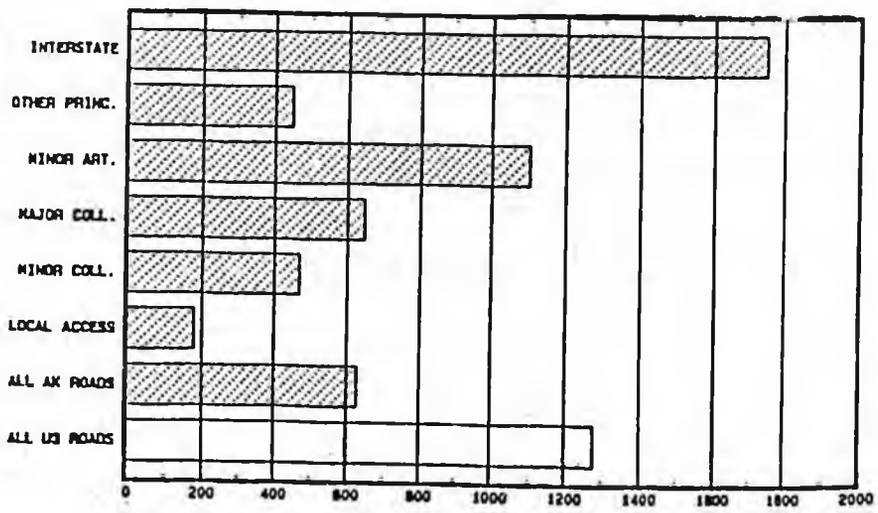
Major and Minor Collectors. the Major and Minor Collector Highways further expand the system. All remaining rural roads that serve long-distance travel are designated as Collector Highways. However not all Collectors are state highways, as some are under the jurisdiction of Alaska's cities and boroughs. The Major Collector classification is given to the more heavily travelled Collectors.

Local Access Roads. The remaining rural roads (not shown on the map) that serve individual or small groups of houses, camps or farms are termed local access. These roads function predominantly as a means of access to land, rather than as a means to convey people, products and raw materials through an area. Most such roads are in the Matinuska-Susitna and Kenai Boroughs.

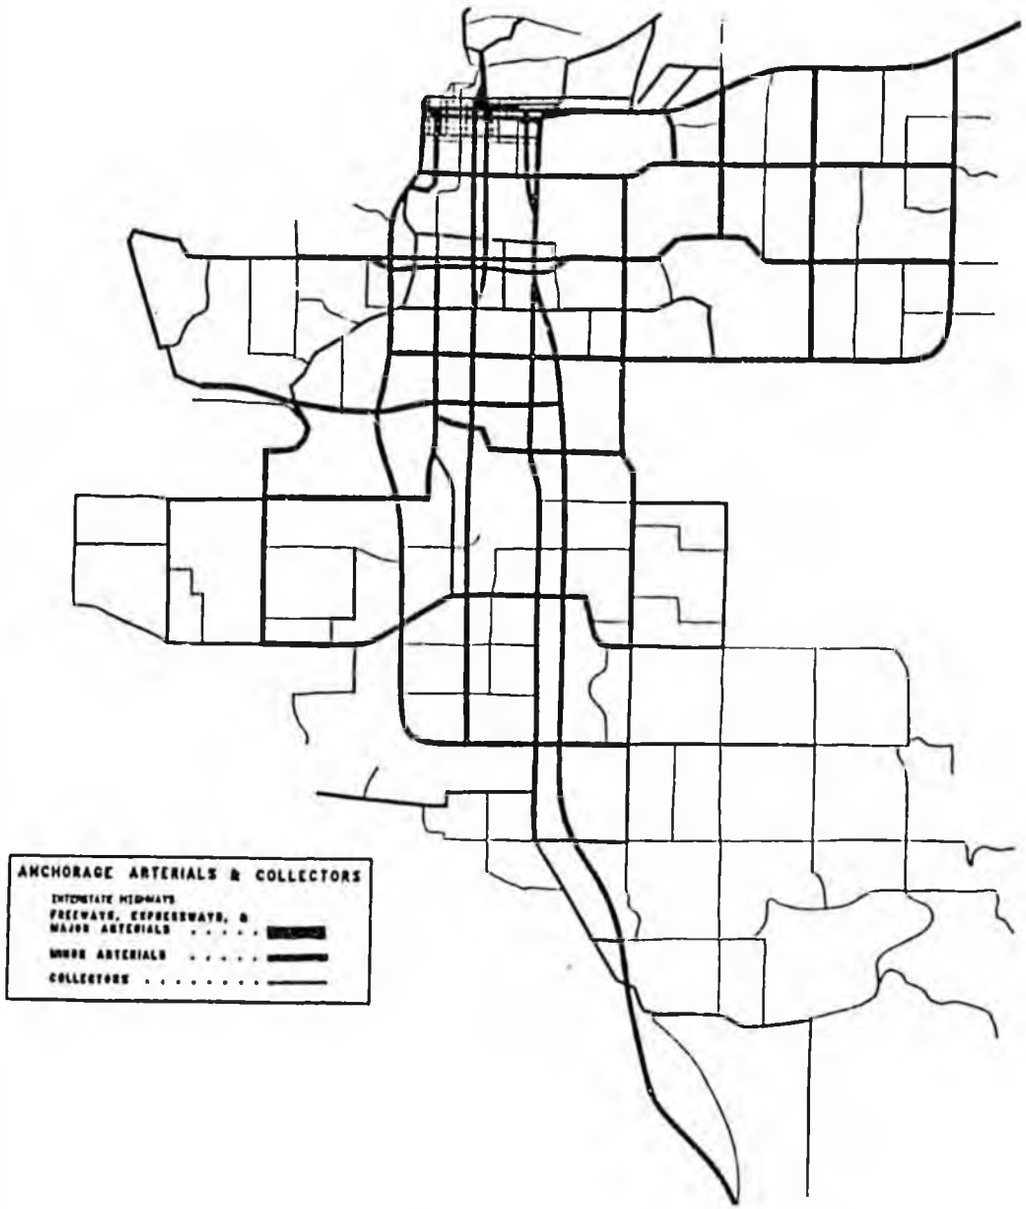
MILES

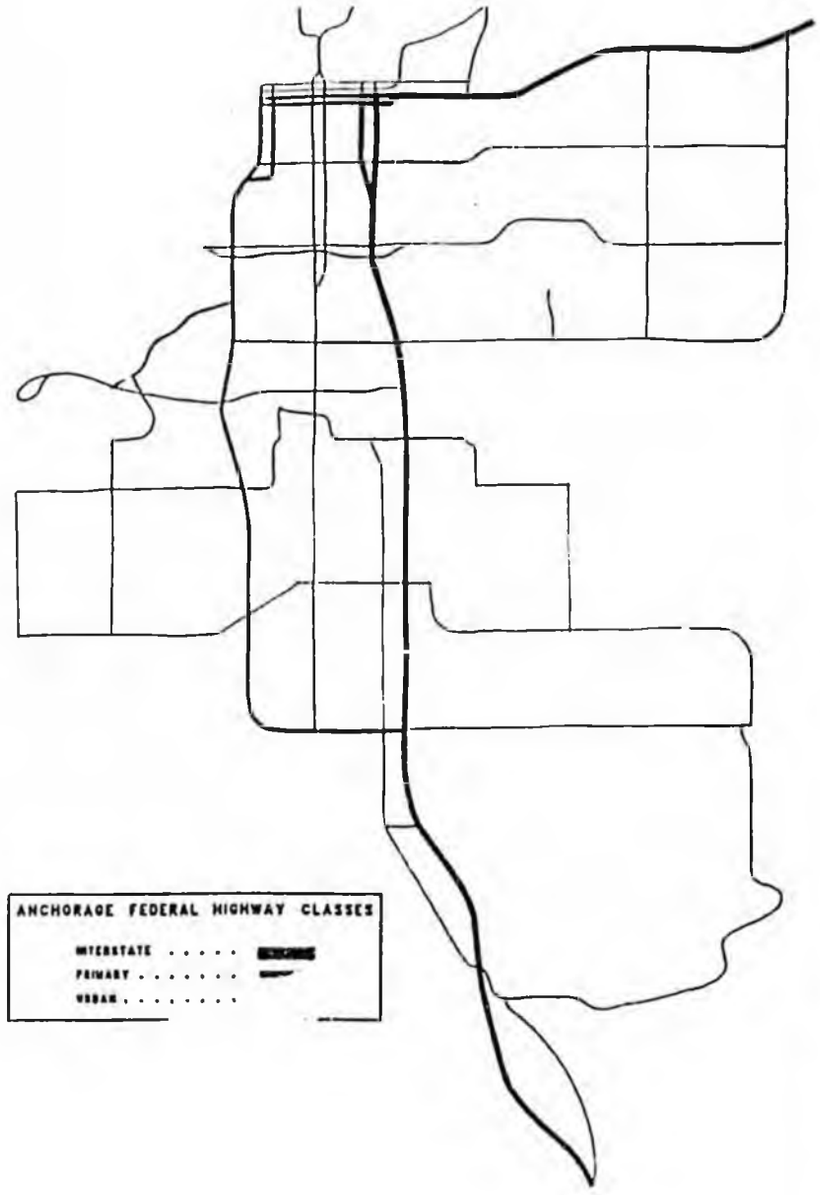
TOTAL: 9,980 MILES

TRAFFIC DENSITY



ANCHORAGE ROAD CLASSIFICATIONS





Functional Highway Classification Also An Urban Management Tool. The maps show three types of Anchorage road classifications. In the upper left are the functional classes agreed upon cooperatively by ADOT&PF and Anchorage officials. The designated Federal Aid Highway Systems are shown in the upper right. And the map on the bottom right shows the designated state highways.

Not shown is the street and highway maintenance scheme agreed upon by ADOT&PF and Anchorage officials in which some state highways are maintained by the Municipality of Anchorage and some municipal streets are maintained by the ADOT&PF. Also not shown are the 780 miles of Local Access Streets in the Anchorage urbanized area.

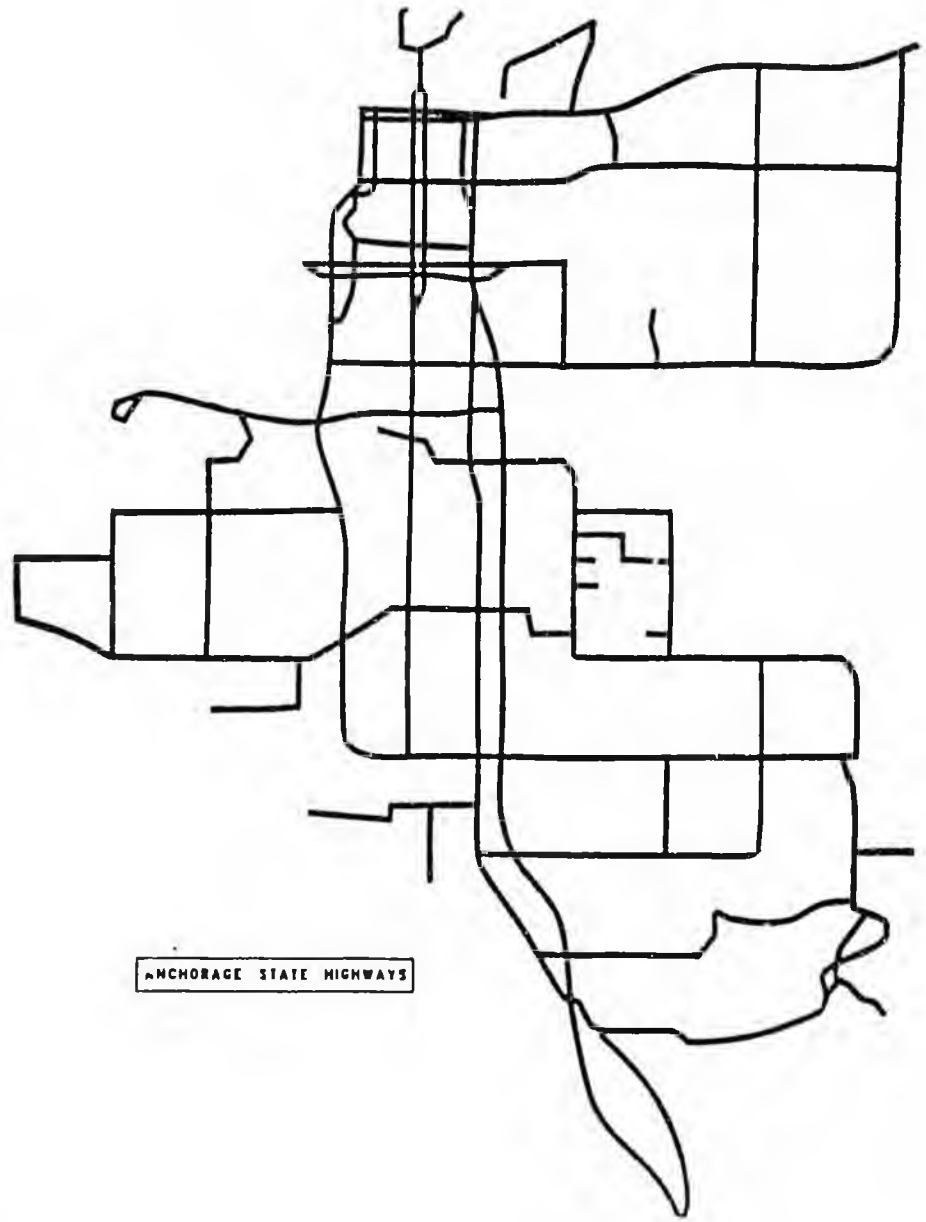
The below table indicates the importance of each functional class of Anchorage streets and highways. Of particular significance is the 88 miles of Interstate Highways, Freeways, Expressways and Major Arterials (9 percent of the miles) which serve almost two thirds (65.4 percent) of Anchorage's daily motor vehicle travel.

Functional Classes	Miles	% Mi.	% Travel	Traffic Density*
Interstate, Freeways, Expressways and Major Arterials	88	9.0	65.4	25,400
Minor Arterials	29	3.0	11.4	13,400
Collectors	80	8.2	10.1	4,300
Local Access	780	79.8	13.1	600
	977	100	100	

* Average daily vehicles per road mile.

The designated Federal Aid Highway System routes – Interstate, Primary and Urban – were adopted based on the traffic service function. These are the routes eligible for improvement with Federal Aid Highway Program funds. I-3

High Proportion of State Highways. There are 176 miles of state highway in the Municipality of Anchorage and 801 miles of either municipal street or streets that are "service area maintained". By agreement with the Municipality, the service areas levy road taxes and maintain all non-state highways within their area.



BLANK

At 16 percent of the road miles, the state highway system serving Anchorage is more extensive than the average urban state highway network (13 percent) in the nation. (And the national statistics are biased on the high side by high proportions of state highways in the cities of several Eastern states.) Furthermore in Alaska's urban areas, many streets and roads that serve a collector or minor arterial function are state highways.

As a result state resources must be used for the operation, maintenance and improvement of routes with only a minor traffic service function. Routes of greater statewide traffic service significance–in terms of their function in either connecting communities or distributing statewide traffic to important economic centers within urban areas–must compete for scarce state resources with the urban collector and minor arterial routes of low statewide significance. Compounding the problem is the fact that ADOT&PF officials must unnecessarily deal with urban issues such as land use and traffic control that are more properly a local responsibility.

Joint Action Needed. While the ADOT&PF has authority to transfer responsibility for state highways to local government, this is a very difficult problem due to the local government cost implications. Therefore, to resolve the issue of urban highways, it is recommended that the ADOT&PF and the Legislature first establish a state highway jurisdiction policy in concert with municipal officials and then make the changes that satisfy the policy.

Use The Functional Classification Plan. The most widely accepted basis for redefinition of state highways is the functional classification hierarchy of streets and highways. This is used to test alternative state/local jurisdictional plans.

Suggested Alternatives. One obvious alternative is to place only urban extensions of state highways on the urban state highway network. A second is to add to the first by including all Freeways and Expressways. The third alternative would be the addition of Major Arterials.

Financial Resources Are An Important Consideration. To ease the burden of a shift in urban road responsibility, there are financial and management arrangements that can be established.

One such arrangement is the Urban Arterial Board in the State of Washington. Only 6.7 percent of the urban road mileage in Washington is designated as state highway. Therefore the Washington Legislature established an Urban Arterial Fund and an Urban Arterial Board in 1968 to assist municipalities on a fund matching basis to make improvements to those designated urban arterials that are not state highways. It is recommended that Washington's success in limiting urban state highway responsibilities to major arterials and the success of the Urban Arterial Board and the Urban Arterial Fund in meeting Washington's urban arterial needs be studied for possible application in Alaska.

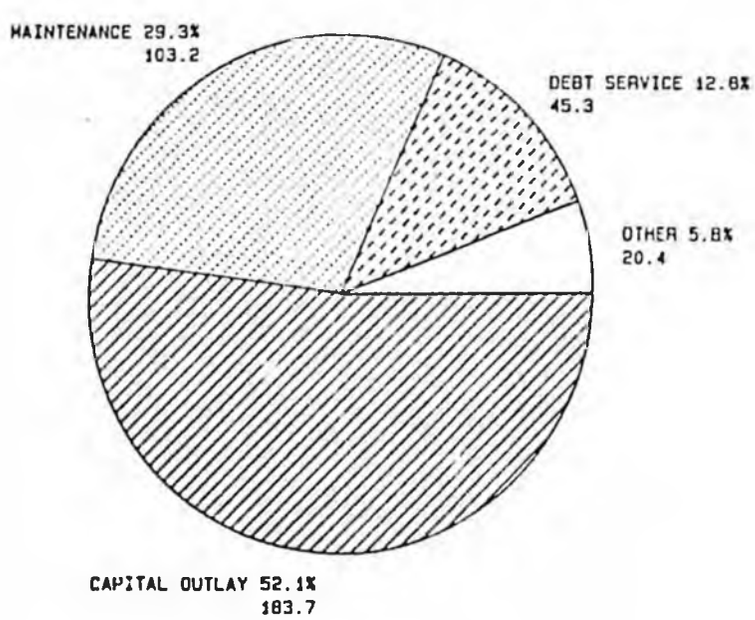
First Steps Taken. The need for a clear policy on road control is recognized by Alaska officials. In 1987 the Alaska Legislature set forth the following directive to begin dealing with the issue:

> "IT IS THE INTENT OF THE LEGISLATURE THAT DOT/PF: 1) ESTABLISH A ROAD RESPONSIBILITY TASK FORCE COMPRISED OF REPRESENTATIVES OF DOT/PF, LOCAL GOVERNMENTS, UNORGANIZED AREAS, AND USER GROUPS. THE TASK FORCE IS TO REVIEW THE FEASIBILITY OF TRANSFERRING THE RESPONSIBILITY OF DIRECT MAINTENANCE ON CERTAIN ROUTES FROM THE STATE TO LOCAL GOVERNMENTS, AND TO EXAMINE REASONABLE AND EQUITABLE FUNDING SOURCES FOR MAINTENANCE ACTIVITIES, INCLUDING A REVIEW OF THE MOTOR FUEL TAX AND OF THE EXISTING ROAD SERVICE ACCOUNT IN THE STATE' REVENUE SHARING PROGRAM. THE TASK FORCE SHALL ALSO STUDY THE ISSUES OF ROAD OWNERSHIP, LIABILITY, AND THE TRANSFER OF EQUIPMENT AND EMPLOYEES..."

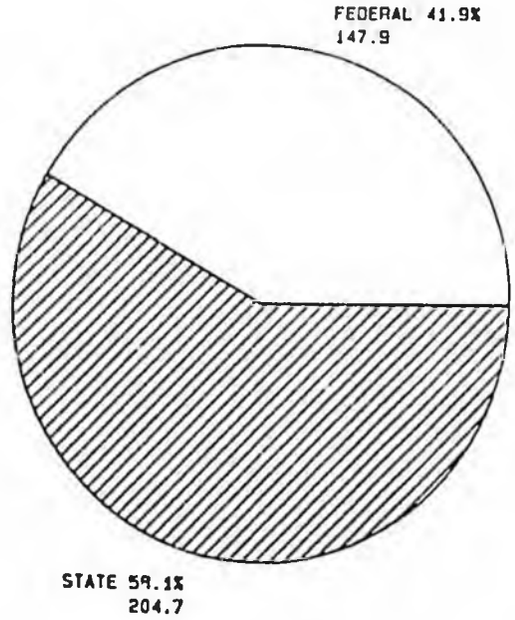
In September 1987, the ADOT&PF selected a facilitator to assist the Commissioner in responding to the mandate. In November, the Task Force was named and a first meeting planned.

1986 STATE HIGHWAY PROGRAM

EXPENDITURES



RECEIPTS



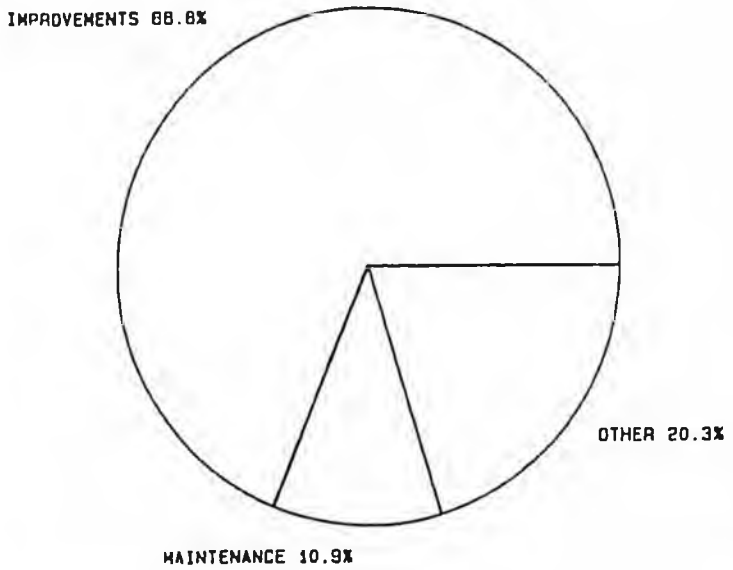
TOTAL: $352.6 MILLION

Highway Expenses Five Times The National Average. For 1986 (calendar year) the ADOT&PF reported to the Federal Highway Administration that it spent $353 million on state highway administration, maintenance, operations and improvement. This is about $700 per capita and compares with a $140 per capita national average of expenditure on state highways.

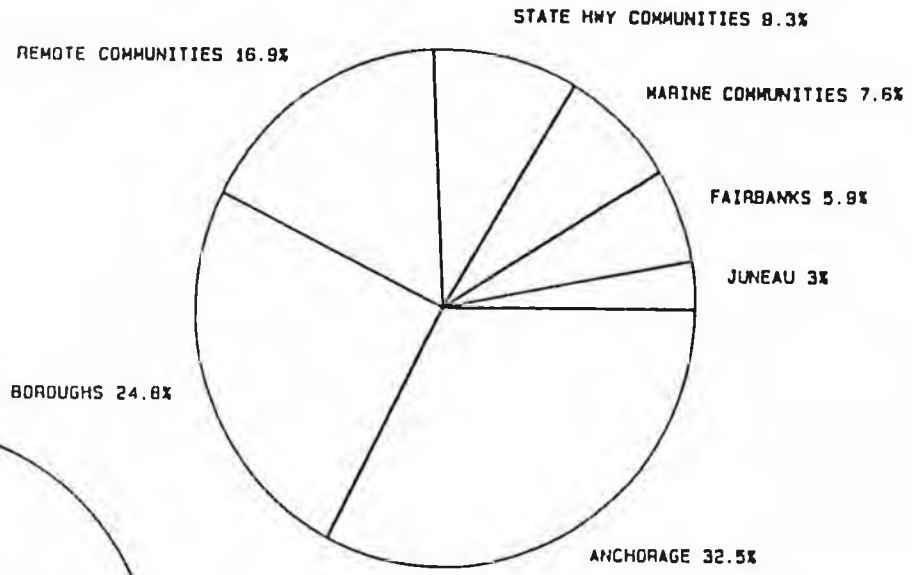
Marine Highway System Costs Included. Included are all 1986 capital as well as maintenance and operations expenditures for both land service state highways and the Marine Highway System. Also included are $45.3 million to service the state debt on borrowing for previous state highway system improvements. Law enforcement and safety expenditures amounting to $11.4 million are included in the "other" category of expenditure as well as $4.7 million for highway program administration and $4.2 million for highway planning and research. Finally in the other category is the 1986 expenditure of $4.3 million for Local Service Roads and Trails, which is a portion of the State Highway Program (administered by the ADOT&PF) but directed toward local road betterments.

1985 LOCAL ROAD & STREET PROGRAMS

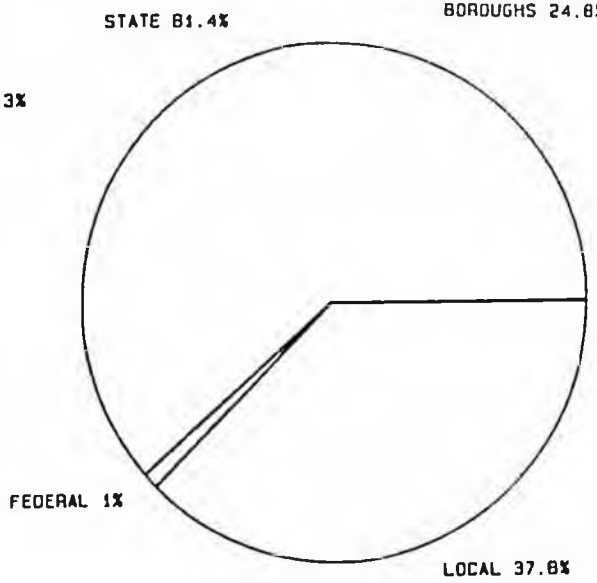
SPENDING CATEGORIES



UNITS OF GOVERNMENT



SOURCE OF FUNDS



TOTAL: $237.8 MILLION

Total Road Spending High. Alaskans raised and spent $237.8 million in 1985 (calendar year) for upkeep and improvement of the 3,992 miles of local streets and roads. For a population base of only 536,000 persons, this is a very significant level of expenditure. When combined with the 1986 state highway program of expenditure, it is estimated that total 1986 highway, street and road spending was about $590 million or $1,090 per capita, about four times the national average ($260 per capita).

Important ADOT&PF Factfinding Function. To assist the Office of the Governor and the Legislature and to comply with federal mandates, the ADOT&PF annually surveys, compiles and reports on local road and street spending. The ADOT&PF also verifies annually the current mileage of local roads and streets and this provides the base for state apportioning of road revenue sharing funds. 1985 information is the latest available on local road finance.

Road Revenue Sharing Funds. When the Legislature fully funds this program, each community receives a base of $2,500 per mile of conventional road and $1,500 for each mile of ice roads. However these amounts are adjusted upwards to accomodate higher costs in many areas of the state.

While communities are required to use only 20 percent of the funds for road purposes, ADOT&PF studies show that a majority of the road revenue sharing funds are actually used for road purposes.. Only that portion of the road revenue sharing funds that were actually devoted to municipal road programs are reported in the annual ADOT&PF surveys of municipal road expenditures.

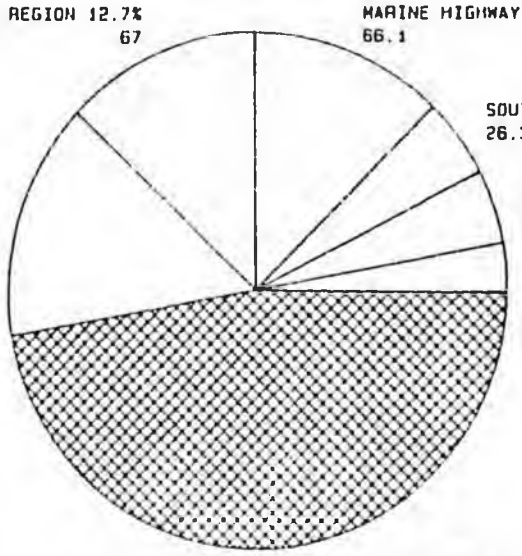
Special Terminology Used. Note the special terminology used in the "Units of Government" chart. "State Highway Communities" refers to all cities (15) directly served by the land service State Highway System, excluding Anchorage and Fairbanks. "Marine Communities" are the 20 cities, excluding Juneau, that are served by the Marine Highway System but not connected to the land service State Highway System. The "Remote Communities" are the remaining incorporated or unincorporated places not served by state highways or ferries.

State Funds Rising. In 1985, state grants for local roads amounted to $145 million, up from $88.4 million in 1984. This includes the portion of road revenue sharing funds that were used in road upkeep and other state funds appropriated for specific local road improvements. On the average the 1985 state contribution toward local road and street upkeep amounted to $270 per capita, but ranged from $120 per capita in the seven boroughs to $740 per capita in the Remote Communities.

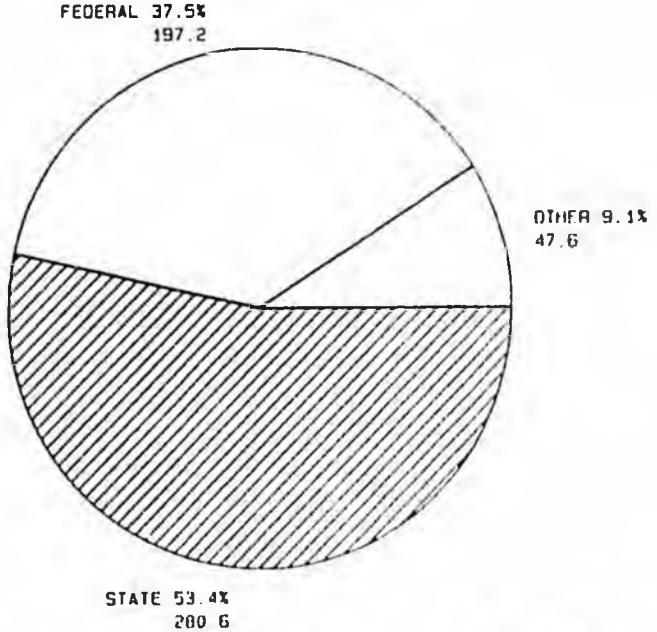
Fairbanks High in 1985 State Road Receipts. Based on miles of local road in each community, Fairbanks led with $132,000 per mile in state road receipts, while at the other extreme, the seven boroughs received an average of $13,000 per mile. Anchorage received $50,500 per mile. However in reviewing municipal road receipts and expenditures, it should be recognized that the year-to-year fluctuations are large and closely related to specific road improvements authorized by the Legislature.

1986 ADOT&PF EXPENDITURES

AREA

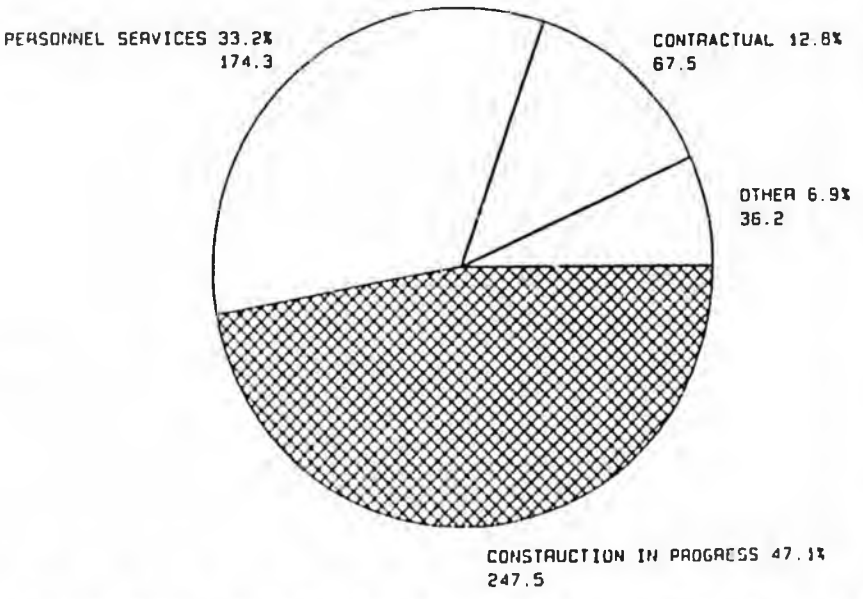


FUND SOURCES



TOTAL: $525.4 MILLION

EXPENDITURE OBJECTS



ADOT&PF Spent $525.4 Million In 1986. The charts above and at right are five perspectives on Alaska Department of Transportation and Public Facilities expenditures in fiscal year 1986. The ADOT&PF is not only responsible for State Highway System administration, operations, maintenance and improvement, but also owns, operates and maintains the nine-ship Marine Highway System, two International Airports, 215 other airports, 45 seaplane floats, harbor facilities, the state equipment fleet and almost 400 state owned buildings.

Highlights:

- o Payments for construction in progress, mostly highway and airport improvements, represented almost half of all expenses, $247.5 million.
- o Spending in the Northern Region, which has the most miles of state highway, led the three ADOT&PF regions.
- o Not included as ADOT&PF income is the $33.8 million in passenger and vehicle fees for Marine Highway System passage, which accrue directly to the Alaska Treasury.
- o About three fourths of the federal funds are reimbursements from the Federal Highway Trust Fund for state highway improvements. The other one fourth is from the Federal Airport Trust Fund for airport improvements.
- o Some of the "other" income is from concessions and fees from Anchorage and Fairbanks International Airport usage. These funds are deposited in the International Airport Enterprise Fund.
- o Two thirds (66.8 percent) of all expenditures were directed to private enterprise for construction in progress, supplies and other costs of business operation. One third (33.2 percent) was for ADOT&PF salaries and benefits.
- o 57.2 percent of all expenditures were for design (consulting or in house), right of way purchase and construction progress payments for improvements to highways, airports, ferries, harbors and other public facilities.

More Information Needed On Finance Trends. The information shown is the result of a special analysis made for this Review by the ADOT&PF. However it has been Highway Users Federation experience in other state highway program reviews that such information is readily available in the annual reports of the state highway and transportation departments. The information is important for the following reasons:

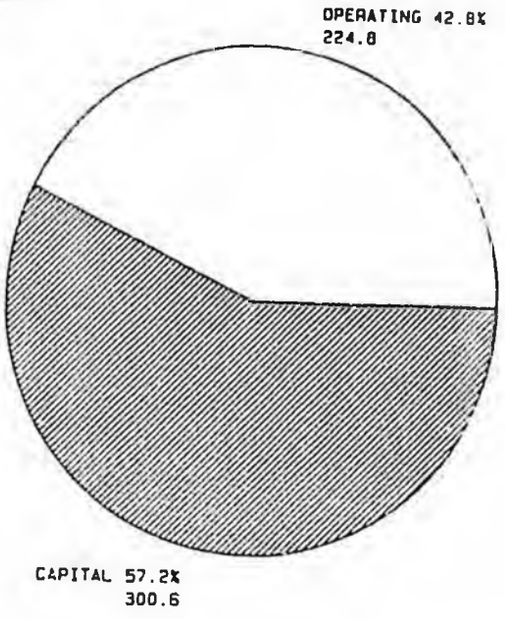
1) to place the Program in perspective with the programs of other state highway and transportation departments in order to detect possible inconsistencies,

2) to place modal components in perspective,

3) to analyze trends, and

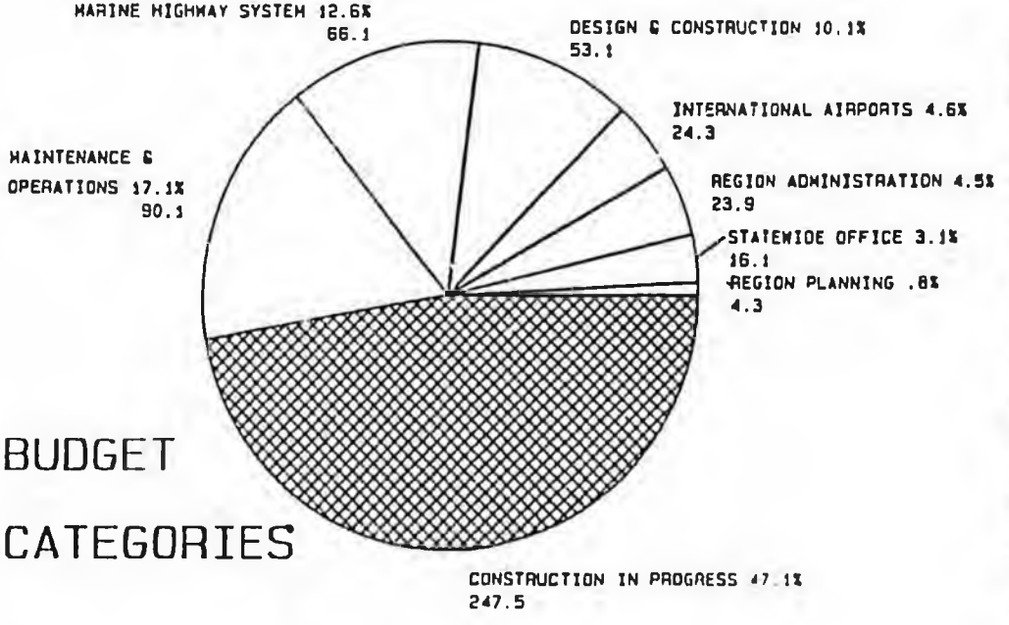
4) to provide legislators, administrators, other officials and constituent organizations with information necessary to make informed decisions regarding Program direction and support.

MAJOR BUDGET ELEMENTS



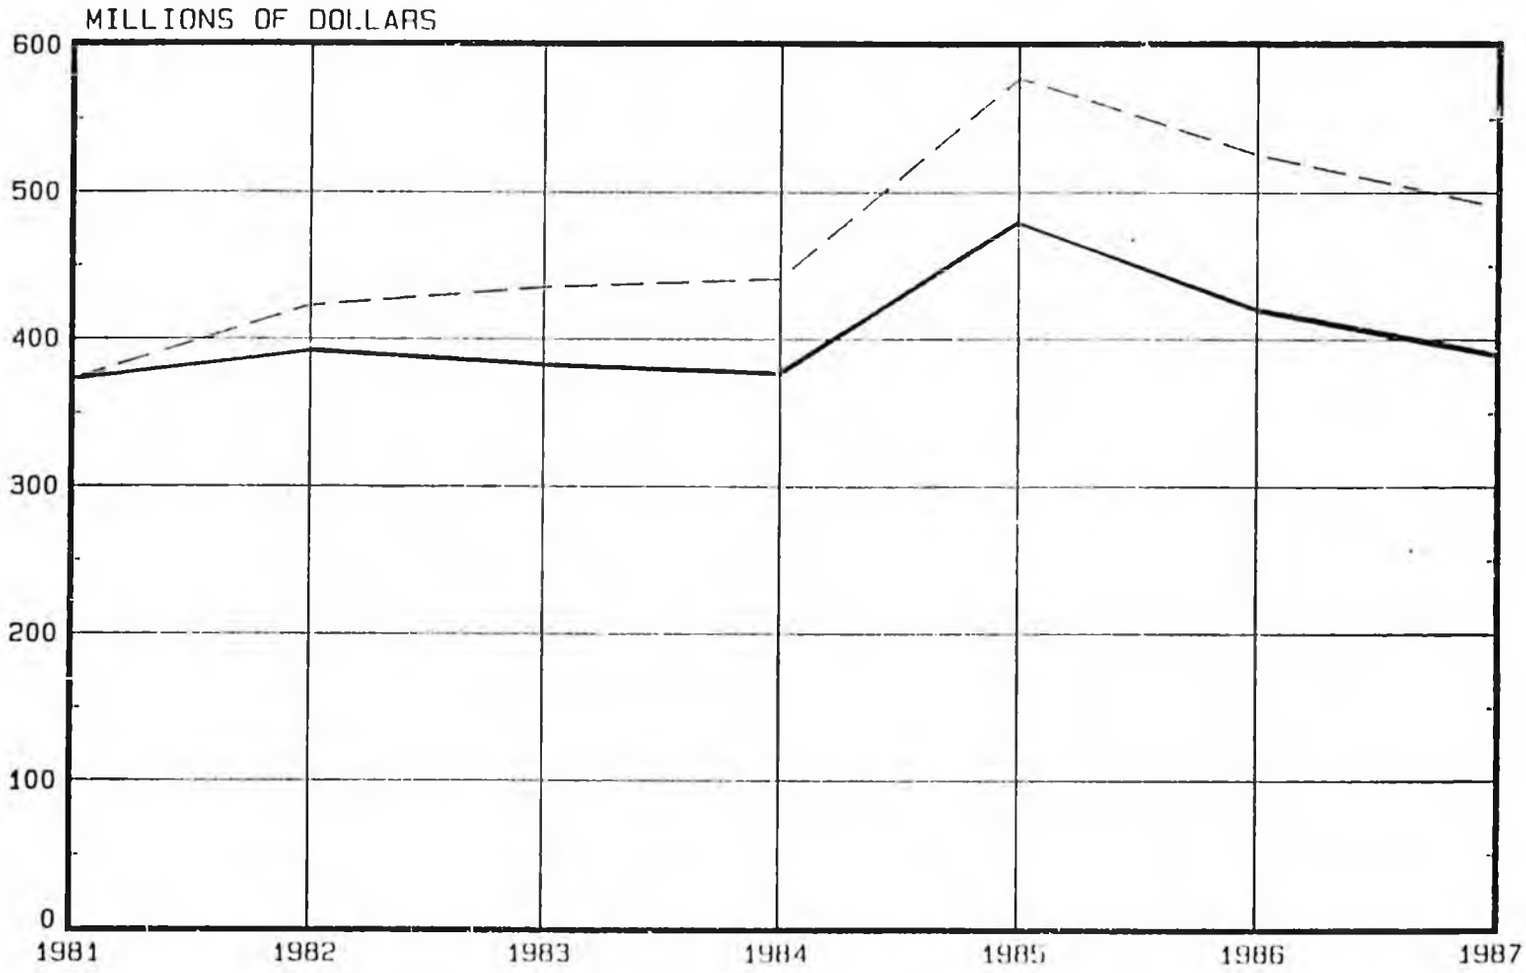
TOTAL: $525.4 MILLION

BUDGET CATEGORIES



ADOT&PF EXPENDITURE TRENDS

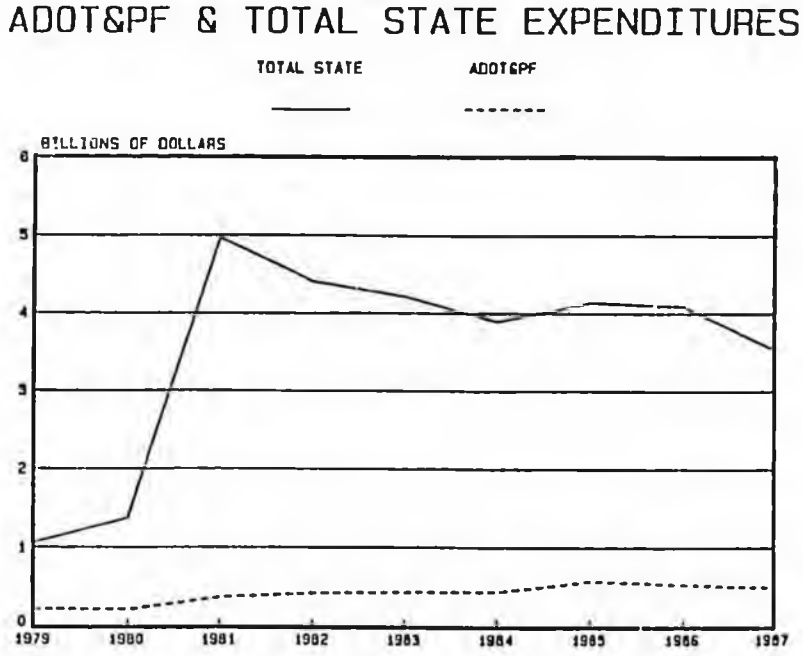
CURRENT $ CONSTANT 1981 $



ADOT&PF Spending Up Modestly Over Last Seven Years. Two views of ADOT&PF spending over the 1981 to 1987 period are shown in the above chart. The dashed line shows the actual spending while the solid line depicts the value of the spending when inflation is considered. (The Anchorage Area Consumer Price Index was used to show the 1981 value of each current year's spending.) As a result of the eroding value of money, ADOT&PF spending of $493 million in FY 1987 was worth only $385 million in terms of what could be purchased with 1981 money. Despite the apparent $120 million increase in ADOT&PF funds, the 1987 spending level was up by only $20 million or five percent over the 1981 level.

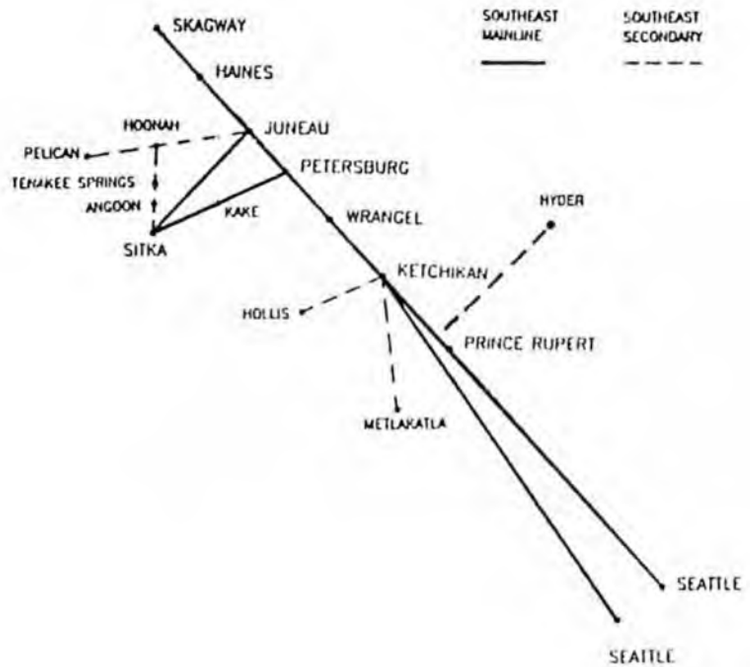
ADOT&PF Expenditure Increases Are Low When Related To Travel Increases. Travel change is one indicator of transportation finance need. During the 1981 to 1987 period motor vehicle travel in Alaska increased 62 percent, airport enplanements increased by 25 percent and Marine Highway System passengers were up by 9 percent. Furthermore, the lane-miles of state highway increased 12 percent, thereby increasing the demand for such maintenance activities as snow and ice control.

ADOT&PF Proportion of Total State Spending Has Diminished. While ADOT&PF spending has risen from $212 million in 1979 to $493 million in 1987, other state spending has risen even faster. This is noted by the fact that 1987 ADOT&PF expenditures represented 13 percent of total State of Alaska expenditures in 1987, down from 20 percent in 1979.

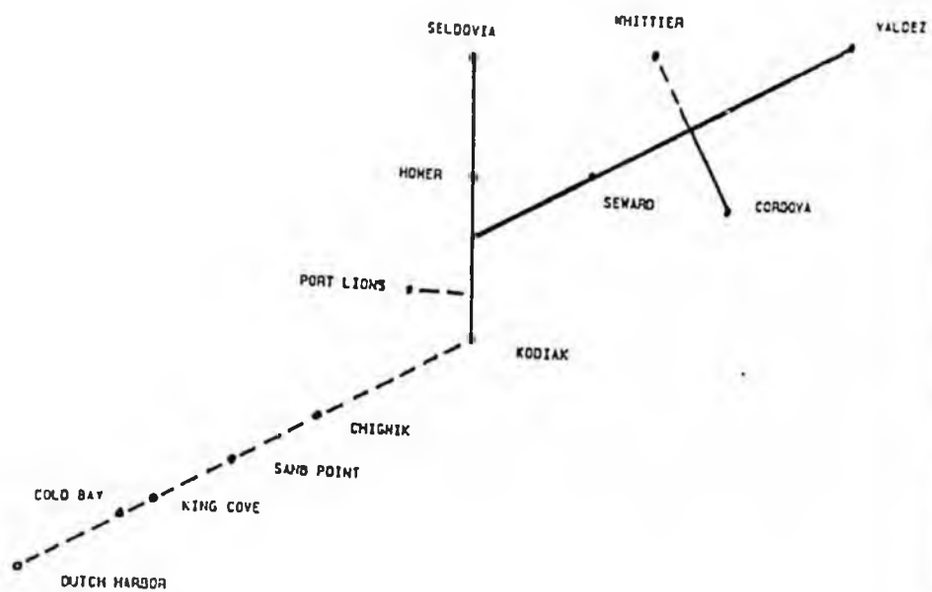


MARINE HIGHWAY SYSTEM

SOUTHEAST



SOUTHWEST



Waterborne Highway System. Alaska has more coastline than the rest of the United States combined. And more than half of its cities are unreachable by conventional highways. These are the reasons that Alaskans in 1960 voted the necessary bonds to establish the state's waterborne highway system. Operating as a division of the Department of Transportation and Public Facilities, the Marine Highway System started with one vessel – the Motor Vessel Chilkat. During its first fully operational year in 1963, four ships served the fleet.

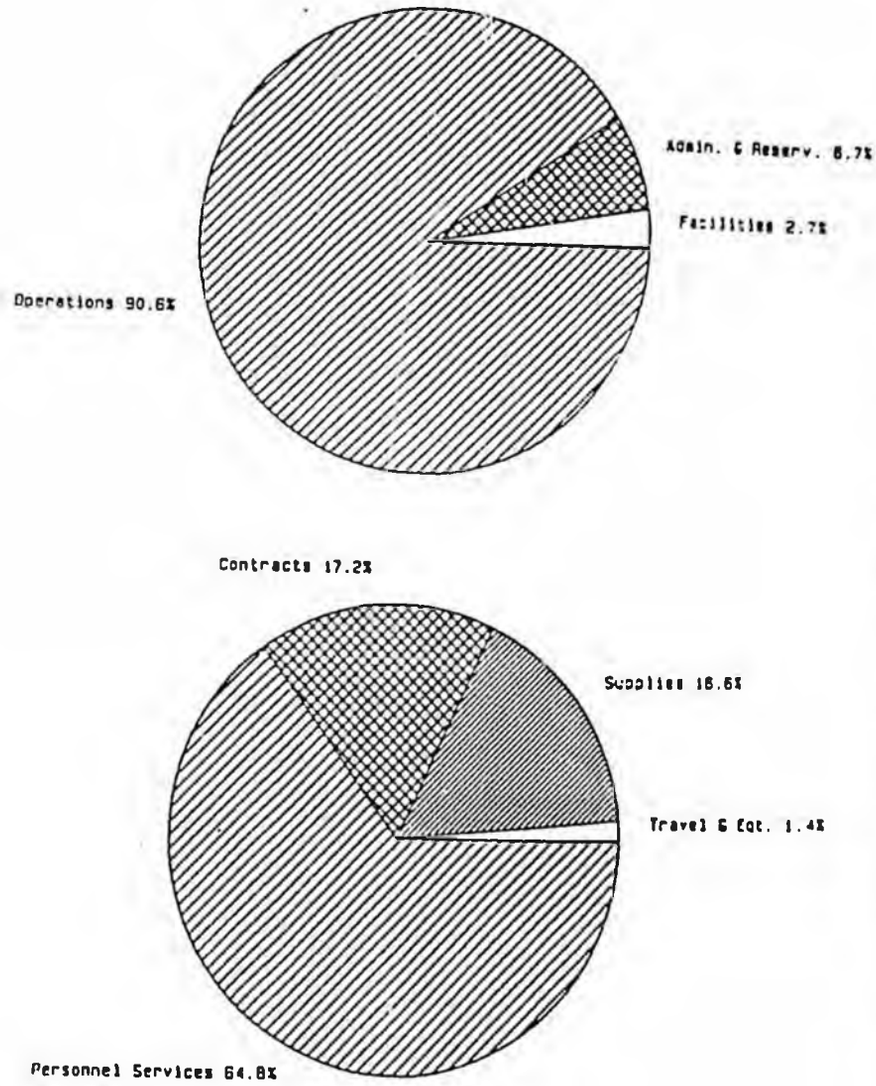
Nine Vessel Fleet. The original system operated from northern terminals at Skagway and Haines, to Prince Rupert in the south. Since then service has been extended to Seattle. And the nine ships, which now comprise the fleet, also provide feeder service in Southeastern Alaska, as well as from the Kenai Peninsula to the island city of Kodiak, to the communities of the Aleutian Chain, and to the communities on Prince William Sound.

The Motor Vessel Columbia is the largest ferry. Built in 1973 the Columbia is 418 feet long, with a capacity for 1,000 passengers and 180 automobiles. She has a service speed of 19 knots. There are 20 2-berth cabins and 71 4-berth cabins.

The other ferries range in size from 100 feet to 408 feet and have passenger carrying capacities ranging from 75 to 750 persons as well as auto and truck carrying capability. Food service, state rooms, cocktail lounges and solariums are available.

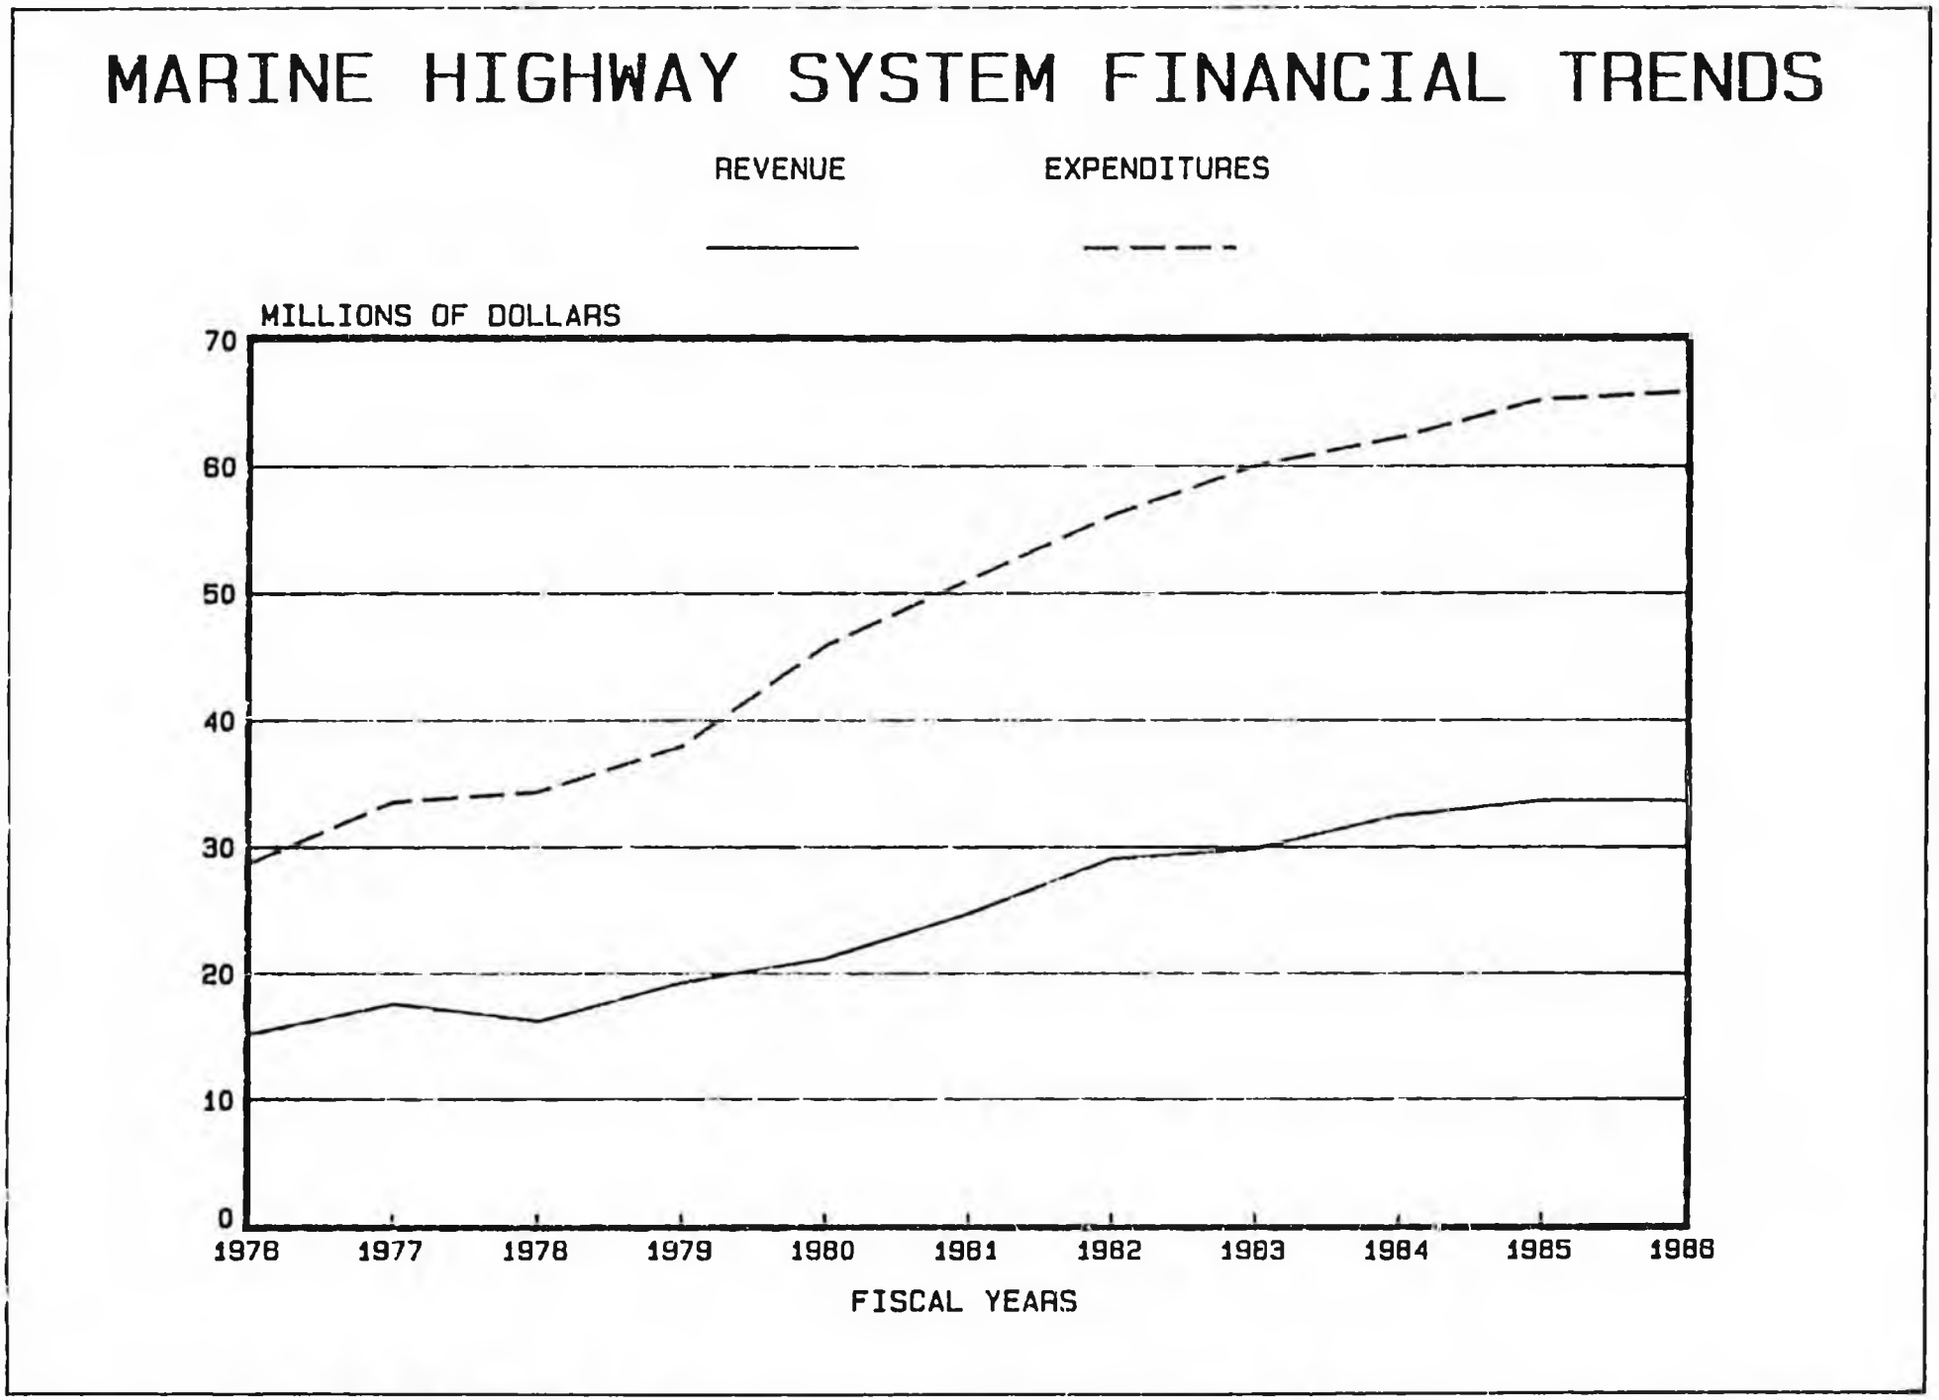
Unique System. No other state department of transportation in the nation operates a ferry fleet that offers such extensive service.

1987 BUDGET



Total: $63.4 Million

MARINE HIGHWAY SYSTEM FINANCIAL TRENDS



Fares Cover Over Half AMHS Costs. As shown above, passenger and vehicle fares and other en route receipts met about 55 percent of all costs in fiscal year 1986. (FY 1987 expenditures were $65 million while revenues were $33.8 million.) And this relationship between revenues and expenditures has remained approximately steady for the past 12 fiscal years.

Operations Are The Major Costs. As shown in the 1987 budget charts on the right, the costs of ship operations including necessary overhauls and improvements are 90.6 percent ($56.4 million) of all costs. The manning of shore facilitiesand overall administration costs, including the operation of the reservation system, is 9.4 percent ($7.0 million) of budgeted costs.

Personnel Costs Are Almost Two Thirds of All Costs. The 1987 budgeted complement included 879 persons, (705 permanent, 174 seasonal or part-time). To operate the ships safely and efficiently, to maintain the equipment and to serve the personal needs of passengers, AMHS personnel costs are almost two thirds (64.8 percent) of total costs.

Morale Good. Despite the extensive travel, crew morale seems to be good. Management in recent years has made progress in attending to member concerns and in giving crew members a greater voice in management decisions. Periodic Director and crew meetings have proved to be successful.

Need To Budget For Ship Replacements. The ferries range in age from 10 to 24 years with the average being 18 years old. With ship replacement costs ranging from $10 million for the smaller ships to $100 million for the larger ships, it would be prudent for Alaskans to begin setting aside funds annually to meet replacement needs. As is the case for Alaska's International Airport capital assets, it is suggested that future needs be accounted for in the annual budget process. Passenger and vehicle revenue is the suggested source of depreciation funds.

Need For Secure Funding Sources. As is the case for highway planning, ADOT&PF officials need the assurance of secure funds over a three to five year period in order to plan the most effective and efficient program of AMHS operations, maintenance and improvements. Passenger and vehicle revenue should form the base of such funds with set annual supplements from the Legislature and the communities served.

There are 998 airports and bush landing strips in Alaska with 215 out of 294 state-owned facilities actually maintained by the ADOT&PF. The Anchorage and Fairbanks airports are included in the Alaska International Airport System in that they serve commercial aircraft of many nationalities. Due to their complexity, the International Airports are managed by a special division of the ADOT&PF.

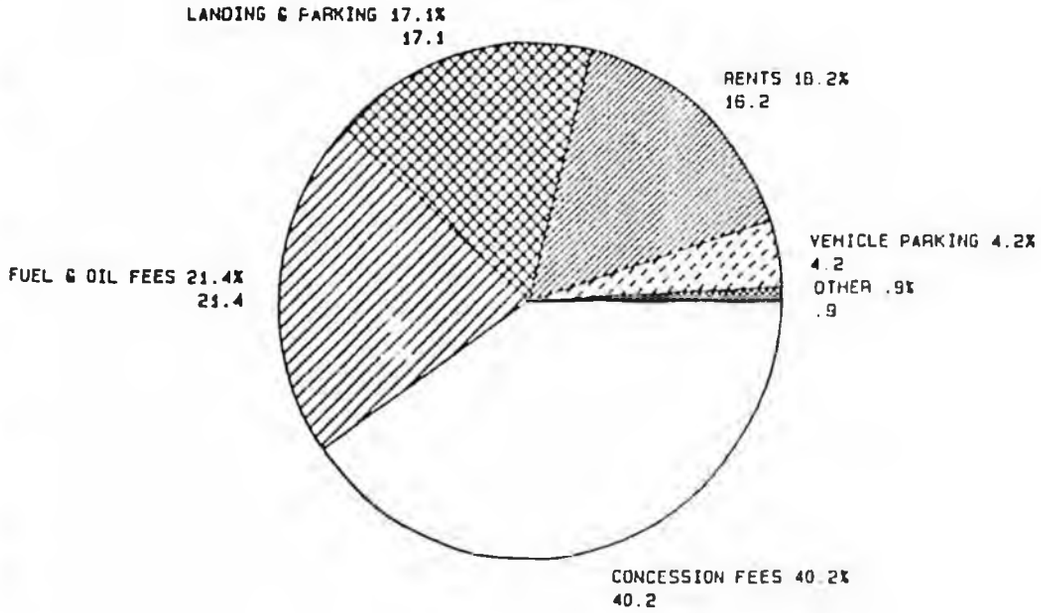
TOTAL:	138	110	46	294

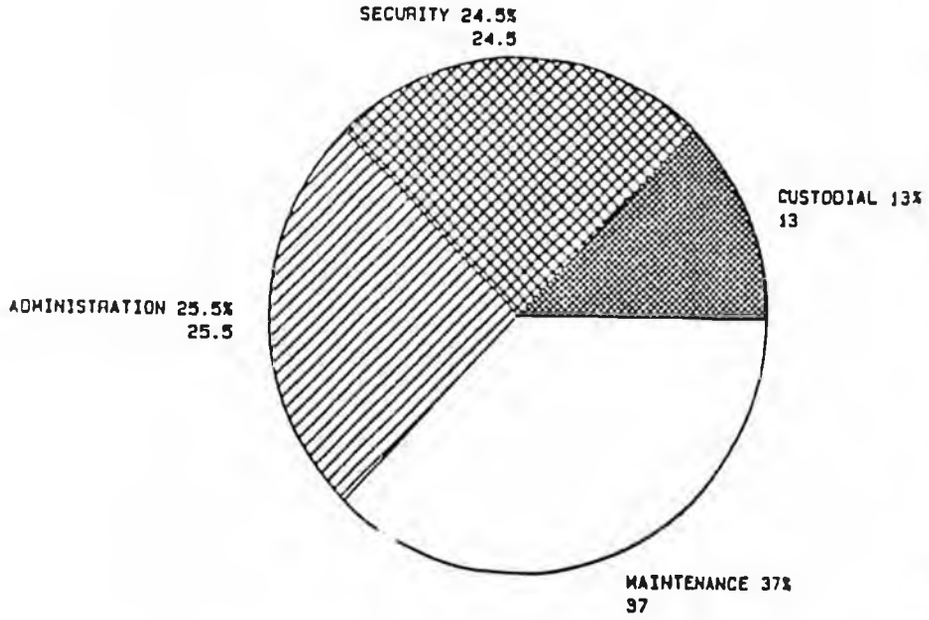
INTERNATIONAL AIRPORTS

1986 REVENUE



TOTAL: $47.9 Million

1986 OPERATING EXPENSES



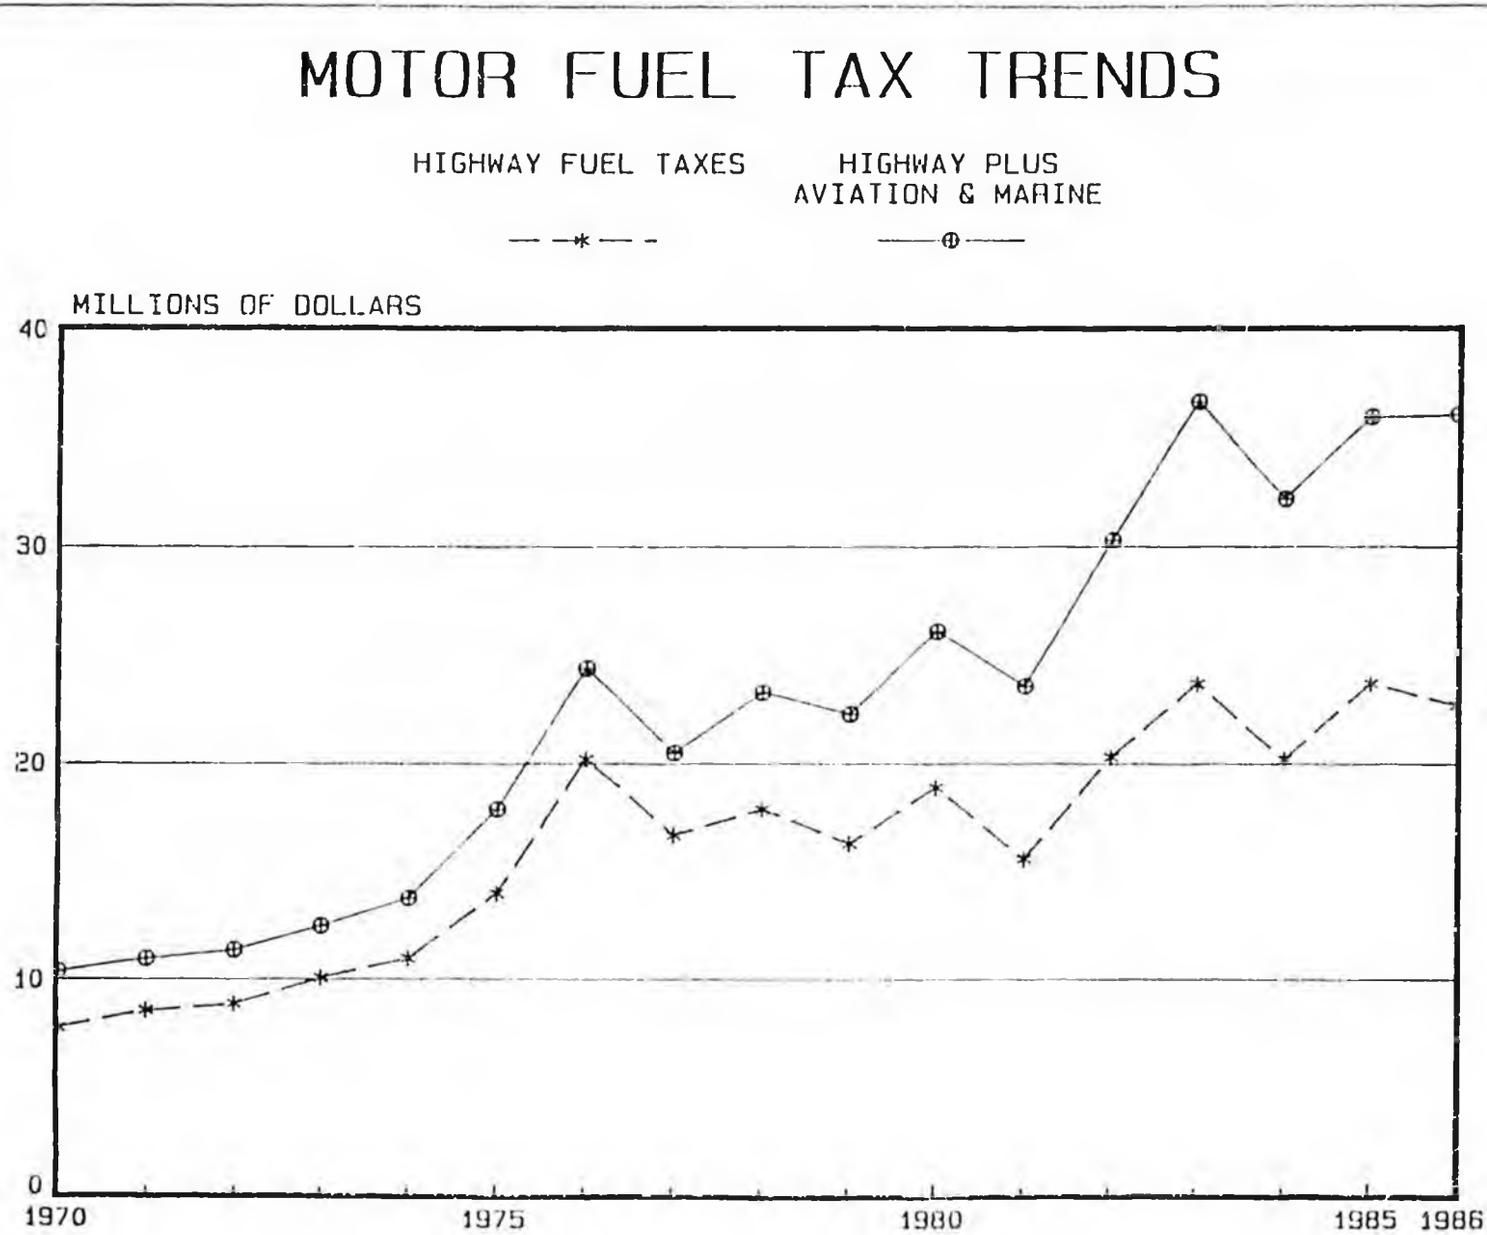
TOTAL: $25.5 Million

Because of its fast growth, extensive capital needs, self-sufficient nature and the need to guarantee the amortization of Alaska International Airport System bonds, all operating revenue generated and all expenditures are accounted for in a special Enterprise Fund. As indicated, revenues in fiscal year 1986 amounted to $47.9 million up from $42.5 million in 1985. And despite Alaska's economic downturn, revenues continued upward in 1987 to $48.9 million. As of June 30, 1986 the combined value of the two airports stood at $293 million up from $251 million a year earlier.

Bond Debt Up. At the close of fiscal year 1986 bonded indebtedness stood at $41.9 million. An additional $38.0 million of revenue bonds were issued in November 1986 for construction of the parking garage at the Anchorage International Airport.

Improvements. In fiscal year 1986 the $22.4 million in operating income together with $2.0 million in federal grants and net interest income of $0.9 million were used to make bond principal payments ($2.0 million), to increase restricted assets ($0.1 million), to increase working capital ($3.8 million) and to upgrade airport property, plant and equipment ($19.3 million).

MOTOR FUEL TAX TRENDS



Secure Funding Source Needed. One of the problems of providing a secure, predictable source of funds for Alaska's State Highway Program is that the highway user tax base does not provide enough revenue to support highway system maintenance and improvement needs. However for most other states of the nation the motor fuel taxes, the auto and truck registration fees and assorted other taxes and fees levied on motor vehicles and their use do provide the necessary funds to support the State Highway Program. The success of the nation's highway programs is largely attributable to the fact that secure and predictable highway user taxes have met the capital, operating and maintenance needs.

Low Highway User Taxes And Fees. The reason that Alaska's highway user taxes and fees do not meet highway program needs is that they are low in comparison with other states.

For heavy trucks, Alaska ranks lowest in the nation with a tax load of $1,598 per year or 2.0 cents per vehicle-mile of heavy truck travel. This compares to Washington which collects over three times as much ($4,990 per truck, and 6.2 cents per vehicle-mile of heavy truck travel). The highest taxer of heavy trucks is Arizona which collects $11,012 per truck or 13.8 cents per vehicle-mile of heavy truck travel.

For automobiles, Alaska ranks 37th among the states with a $122 tax per average automobile or 1.0 cents per vehicle-mile of travel. The highest in the nation is Rhode Island with an annual tax load of $731 per automobile or 5.9 cents per vehicle-mile of automobile travel (six times the Alaska load). The lowest is New York at $73 per year and 0.6 cents per vehicle-mile of travel. Washington's annual tax on automobiles is $310 per vehicle or 2.5 cents per vehicle-mile of auto travel.

The above facts are based on a 1987 U. S. Department of Transportation report, "Road User and Property Taxes". The taxes and fees were those in effect on January 1, 1987. Included are all highway user taxes and, where applicable, state personal property taxes. The study compared annual taxes on a 80,000 lb. gross vehicle weight truck/trailer combination driven 80,000 miles per year and a 4,200 lb. gross vehicle weight automobile driven 12,500 per year.

Raising Motor Fuel Taxes. Alaska's motor fuel tax, which has not changed since 1961, is eight cents per gallon and the revenue trend from the tax is as shown in the chart.

A comparison of the 1988 revenues with 1988 State Highway Program receipts (page I-5) shows a wide disparity. A ninefold increase in the tax on fuel used in highway travel would have been required to raise the $200.5 million per year of state funds, including debt service, motor vehicle law enforcement and highway safety programs.. Over a fivefold increase in total motor fuel tax receipts (highway plus aviation and marine fuel taxes) would have been required to raise the $200.5 million of state funds used to support the 1988 State Highway Program

However as shown on page III- 11, a doubling of the total motor fuel tax would meet the FY 1988 budget for highway and airport maintenance. As has been the experience of state highway program managers in other states, the earmarking of highway user taxes and fees (or other taxes, such as mineral severance taxes) for the state highway program or distinct parts of the program, such as highway maintenance, enables program managers to better plan for efficient and effective use of the funds.

Maintaining Balance Between Competitors. The Alaska Railroad Corporation and private truckers compete for freight movement in some important corridors. And it is important to maintain the existing balance in trucking and railroad costs when enacting highway finance initiatives. Higher highway user taxes would immediately change costs in the trucking industry to the railroads advantage -- unless the railroads costs were raised concurrently.

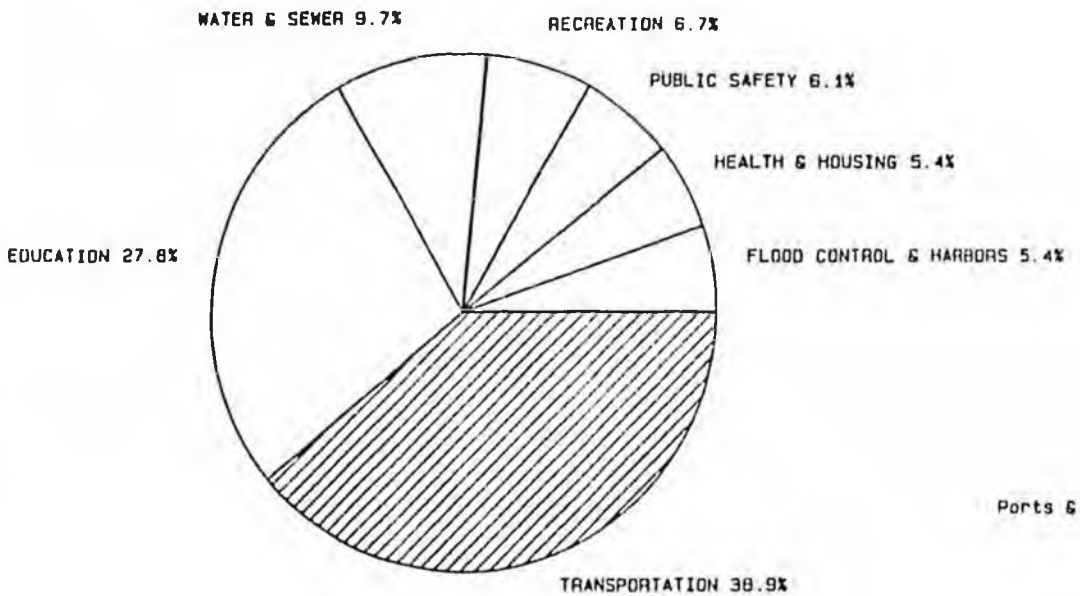
Two Possibilities That Need Further Study. One solution is enactment of legislation requiring the Alaska Railroad Corporation to pay motor fuel taxes. The Railroad is currently exempt from such taxes.

A second solution is to establish a regulation requiring the Alaska Railroad Corporation to pay monthly, quarterly or annual fees to the Alaska Treasurer in lieu of the taxes.

In either case it is suggested that at least half of the added railroad payments be used for railroad/highway grade separations. This would expand the program of constructing grade separations thereby enhancing safety and the efficiency of both rail and truck freight operations.

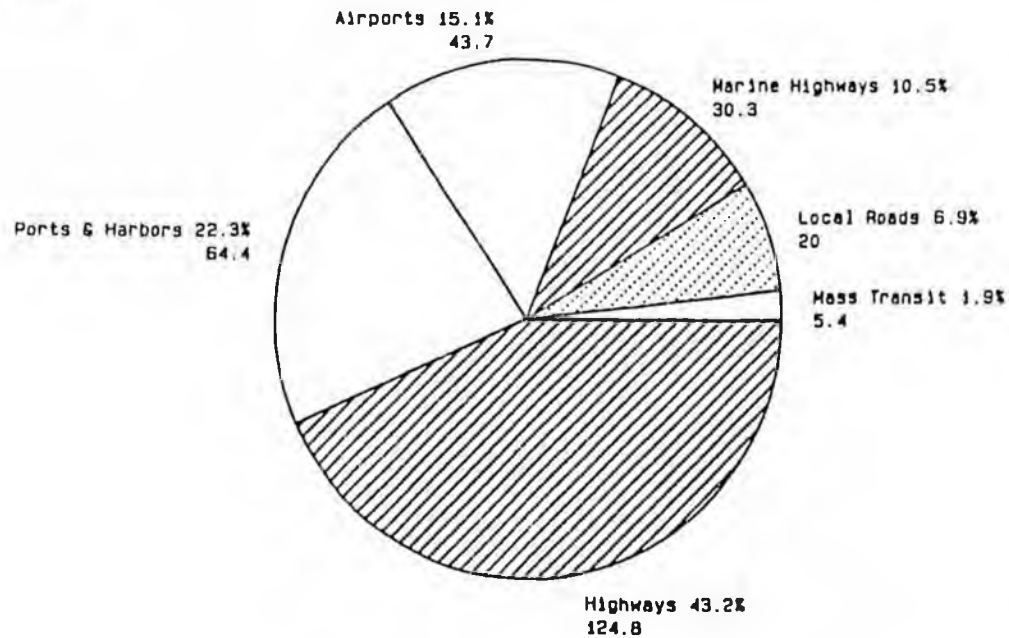
STATE BONDS

TOTAL SINCE STATEHOOD



TOTAL: $1.4 BILLION AS OF 6/30/84

TRANSPORTATION DEBT



TOTAL: $288.6 MILLION AS OF 12/31/86

Transportation Debt Being Rapidly Amortized. As shown in the right hand pie chart, the state transportation debt stood at $288.6 million as of December 31, 1986. This is down by $47.6 million from the close of the previous calendar year and $95.5 million down from two years previous. At that rate of amortization, state transportation bonds will be eliminated in six years.

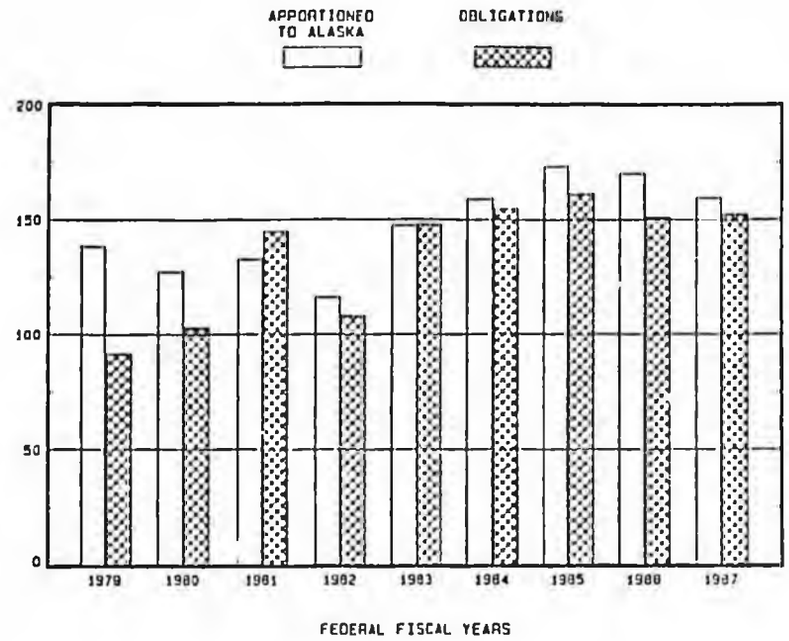
At $155.1 million, the debt for land highways and the Marine Highway System represented 53.7 percent of the December 31, 1985, transportation debt (The revenue bonds sold by the Alaska International airport System are not included in the charts.)

Some states rely extensively on the bond market for their state highway capital improvement programs. As a nation, total state highway debt was $20 billion as of December 31, 1985,the latest year in which debt summary information is available.

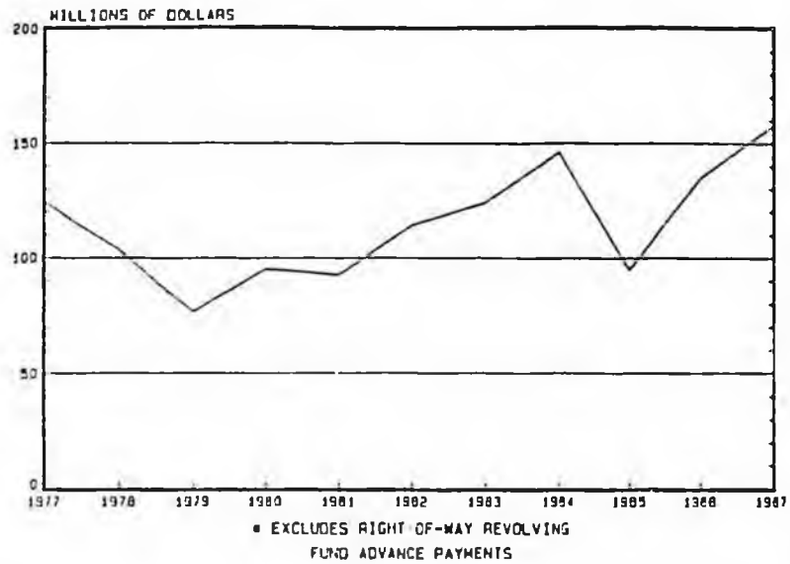
Alaska leads The Way In Public/Private Cooperation. Alaska has three outstanding examples of private funding for highway construction – 1) the 416 mile Dalton Highway built by oil interests; 2) the 50 miles of Red Dog Mine Access Road being financed by the Alaska Industrial Development Authority which will be reimbursed by private mining interests; and 3) the $1.3 million contribution by a trucking firm for the upgrading of the Klondike Highway to allow heavy-laden ore trucks to gain access from Canadian mines to the port at Skagway.

Military Involvement Also Important. The construction of the Alaska Highway in both Canada and Alaska by the U.S. Army during the early part of World War II was also a tremendous contribution to Alaska highway development.

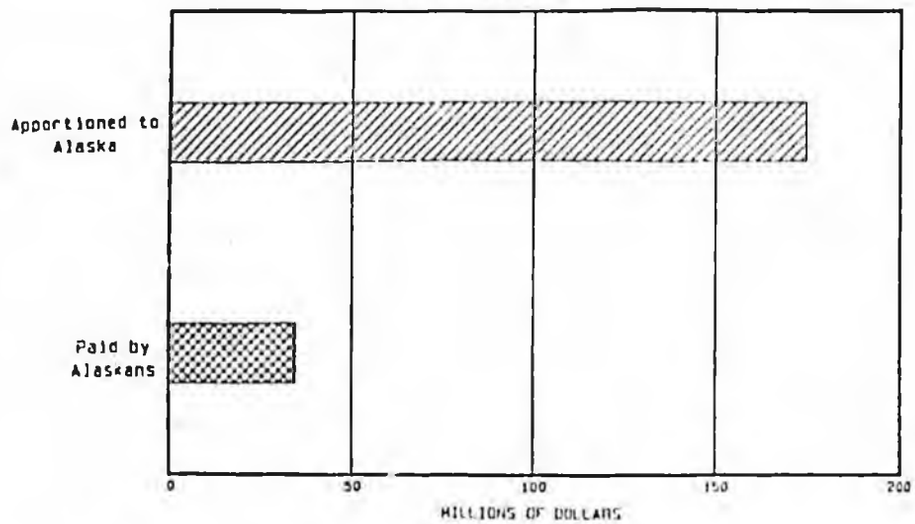
FEDERAL AID HIGHWAY PROGRAM



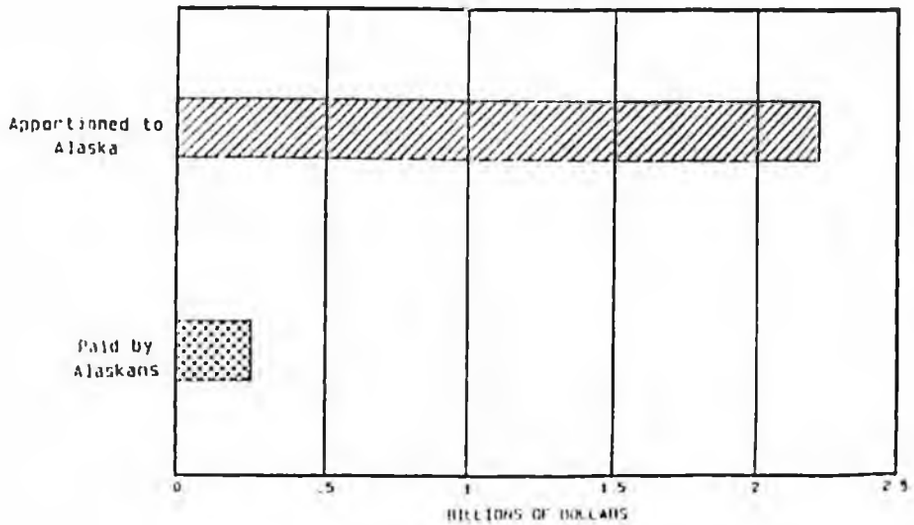
REIMBURSEMENTS



FY 1985



SINCE 1956



Federal Aid Highway Program Critically Important To Alaska. The chart on the upper left indicates the trends in the amounts of federal funds:
1) apportioned to Alaska, and 2) made available after budget limitations were applied by lawmakers and actually used (obligated for subsequent spending on Alaska road and bridge improvements). Federal aid highway funds are restricted by federal mandate for highway, ferry and ferry terminal improvements as well as planning, research and safety activities. Federal funds cannot be directed to highway maintenance activities.

1987 A Record. The upper right chart tracks actual payments to Alaska from 1977 to 1987 (federal fiscal years). Note that 1987 was Alaska's record-high year for Federal Aid Highway Program receipts. The federal funds stem largely from a nine cents per gallon tax on gasoline, a three cents per gallon tax on gasohol, a 16 cents per gallon tax on diesel and other special motor fuels, as well as a 12 percent sales tax on heavy truck and truck trailer purchases, a tax on truck tire sales and an annual use tax on heavy trucks. The federal highway user taxes are accounted for in the U.S. Treasury in a Highway Trust Fund and apportioned to each state for the modernization of major highway systems and bridges.

Federal Budget Controls Limit Spending. For the October 1, 1985 to September 30, 1986 federal fiscal year, Alaska was apportioned $165 million of authorized funds, but due to federal obligational control limitations only $151 million of the apportioned funds were actually available to Alaska. In other words $14 ($9 federal and $1 state) million worth of highway improvement projects could not be started because the obligation ceiling restricted the use of authorized and available Highway Trust Fund money.

Slowdown In Highway Improvements. The situation is far worse for fiscal year 1988 because it is controlled by the authorization levels mandated by the Surface Transportation and Uniform Relocation Assistance Act of 1987. This act reduced annual authorization levels over the 1988 to 1991 period. Furthermore, obligational control further limits fiscal year 1988 funds to about $130 million. Unless obligational controls are lifted, Alaska's highway improvement program will be sharply lower than the 1983 to 1987 experience.

Federal Incentives For Road And Bridge Modernization. The portion of the cost borne by federal highway user taxes, depends on the Federal Aid Highway System – Interstate, Primary, Secondary, Urban classification of the road to be improved. Federal funds will participate in 94.7 percent of the cost of Interstate Highway System original construction or rehabilitation, 91.4 percent of the cost of improving the other Systems and 80 percent of bridge replacement or rehabilitation costs. Overall, every dollar of Alaska funds that are made available for highway and bridge improvements is matched by nine dollars of Federal Highway Program funds – up to the limit of federal obligation authority. This is a great incentive for Alaska highway and bridge modernization.

Alaska Benefits The Most From The Federal Aid Highway Program. The bottom left chart indicates the amount of Federal Aid Highway Program funds apportioned to Alaska in 1985, as well as the amount of federal highway user taxes paid by Alaskans in that year. The bottom right chart summarizes both Alaska's apportionment of Federal Aid Highway Program funds and Alaskans payment of federal highway user taxes over the 1956 to 1985 period. At five and one half to one for FY 1985 and nine to one overall, Alaska leads all other states in the ratio of apportionments to taxes paid. This is due primarily to the fact that state apportionments of federal funds are related to the extent of land area in each state. Alaska, having the largest proportion of land of any state in the nation, receives disproportionally large shares of Federal Aid Highway Program funds.

Non-monetary Benefits. Besides financial assistance, there are other benefits that come with a strong Federal Aid Highway Program. First, it is required that national design standards be used and this promotes national uniformity as well as the safest possible highway environment. Second, federal officials on the scene in Alaska (the Juneau office of the Federal Highway Administration has a 12-person professional staff) provide both an oversight function as well as technical assistance to ADOT&PF officials. Lastly, the long standing spirit of cooperation that has prevailed between federal and ADOT&PF officials has been a stabilizing influence in Alaska's program of highway improvement.

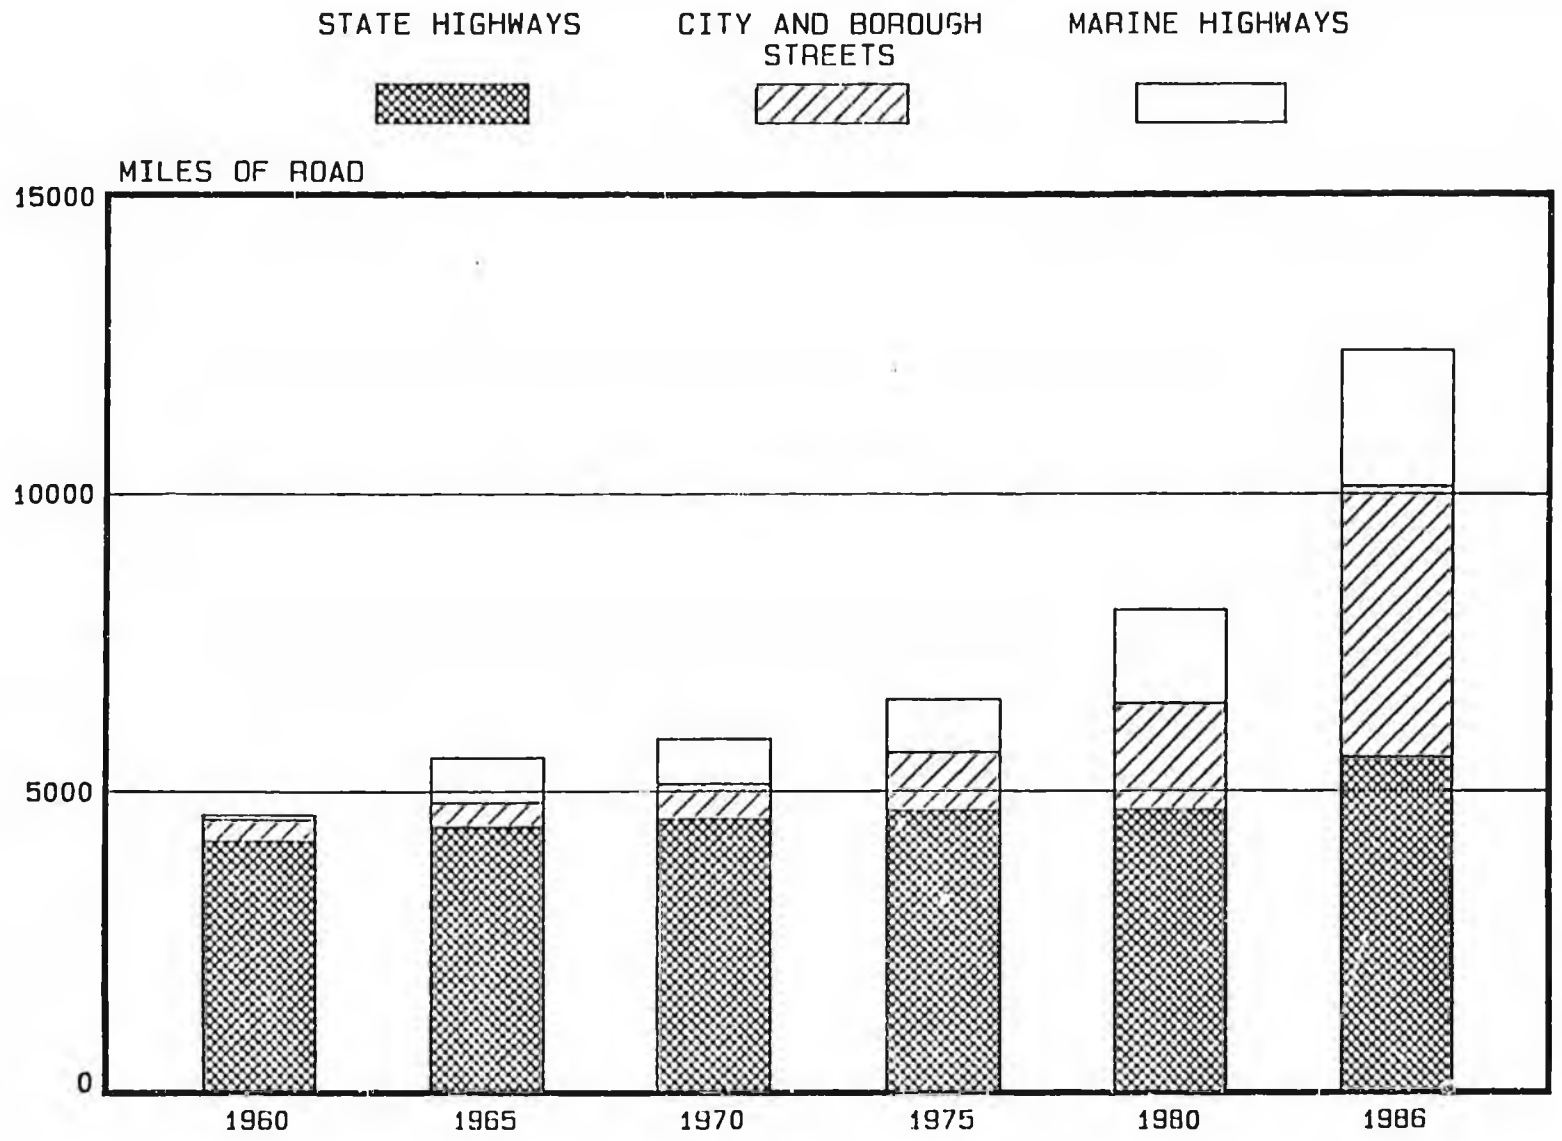
CHAPTER I

TRANSPORTATION FINANCE AND RESPONSIBILITIES

This Chapter includes a Review of the Role of the State, Cities and Boroughs in Sharing Responsibilities for Administering, Maintaining, Operating and Improving Alaska's Transportation System as well as a Review of the Funds Available to Meet These Responsibilities.

MILES OF ROAD



NOTE: EXCLUDING FEDERALLY OWNED ROADS.

Over 10,000 Miles Of Road. Discounting the 224,000 miles of road that are under the direct control of federal agencies, there are 3.6 million miles of land service roads in the United States. Alaska's 12,370 miles is less than three one hundreths of a percent. Yet Alaska's land area is 16 percent of the nations total. Only Delaware, Hawaii and Rhode Island have fewer miles of road.

Marine Highway Routes Are State Highways. Including the ferry routes of the Marine Highway System, there are 7,824 miles of highway that are considered state highways. These routes are administered, operated, maintained and improved by the Alaska Department of Transportation and Public Facilities.

Since 1960 the state highway system (including Marine Highway System routes) has doubled in extent. The most significant change is the expansion of the Marine Highway System, due largely to the shift in the status of service to the Aleutian Chain in 1981 from testing and demonstration to permanently, scheduled service.

However during this 27 year period, the 416 mile Dalton Highway was built by private interests and added to the State Highway System. Also during this time, the 325 mile Parks Highway was completed to provide better highway service between Alaska's two largest centers, Anchorage and Fairbanks. Other shorter links of state highways have also been added.

Alaska Unique. The truly striking transportation distinction between Alaska and the rest of the nation is that the majority of Alaska's communities of over 250 people are not connected by land via the State Highway System. The remoteness of some places, the water barriers and the difficulty of traversing the terrain have made such connections either impossible or inordinately expensive. Alaska has therefore relied on a system of ferry routes with nine ships capable of conveying both passengers and vehicles to some communities and to an extensive system of airports that allows air service to all other communities of over 30 people.

The Alaska Railroad. Alaska also has a 480 mile railroad system that is vitally important to the shipment of general commodities as well as mineral and forest products over the Seward to Fairbanks mainline. A spur to Whittier connects the main line with the Marine Highway System on Prince William Sound and to barges that service the "lower 48 states"..

In 1982, the State of Alaska purchased the railroad line, equipment and property. The Alaska Railroad Corporation operates the freight and passenger service. While the railroad is independent of the ADOT&PF, the ADOT&PF Commissioner is a member of the Alaska Railroad Company's Board of Directors.

Cities And Boroughs Also Have Road Responsibilities. In those parts of Alaska that have a population base and a system of local government (city or borough), the governmental entity can accept responsibility for some roads. While the ADOT&PF is not required to take into the State Highway System those roads that cities and boroughs will not accept, typically the ADOT&PF does take on this responsibility.

Leap In City And Borough Roads. Note that the chart indicates a significant growth in city and borough road and street mileage over the 1960 to 1986 period. Some of the increase is related to subdivision street construction by developers and some is related to state appropriations for specified roads. However some of the increase is due to better accounting by the cities and boroughs for road miles, since 1980 state legislation greatly increased the state revenue sharing funds that are based on miles of road.

STATE HIGHWAY FUNCTIONAL CLASSES
Interstate Highways
Other Principal Arterials
Minor Arterials
Major Collectors
NOTE: EXCLUDES MARINE HIGHWAY SYSTEM, MINOR COLLECTORS AND LOCAL ACCESS ROADS.

FUNCTIONAL CLASSES OF RURAL ROADS

Functional Highway Classification - A Basis For Management Decisions. Most state highway agencies classify their state highways based on their traffic service functions. The resulting hierarchy gives managers a tool for decision-making regarding the distribution of scarce resources. Design standards, improvement priorities and maintenance standards are all related to the functional classification of roads. The map shows the functional designation of Alaska's major rural roads and their extensions through urban areas.

Interstate Highways, The Most Important Arteries. Alaska's most important rural roads are those designated to be Interstate Highways (1,089 miles). These connect Alaska's largest centers -- Anchorage and Fairbanks -- with each other and to the main route of land travel into Alaska. An Interstate Highway Spur also connects Anchorage with the Kenai Peninsula.

As the chart at right shows, the average mile of Interstate Highway is traversed by 1,750 vehicles per day. Alaska's Interstate Highway System's average traffic density is only one seventh the 12,900 vehicles per day average traffic density on all rural Interstate Highways in the nation. Due to this lower traffic density, Alaska's rural Interstate Highways are built to two-lane design standards rather than the four-lane, divided highway standards found in other states.

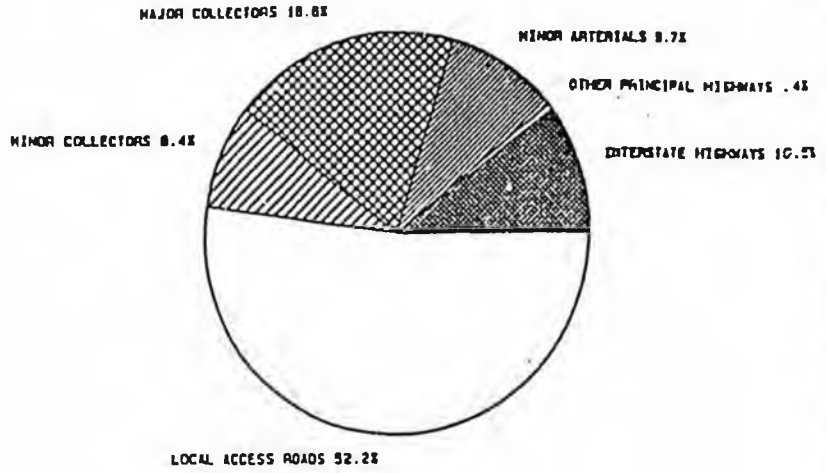
Other Principal Arterials Next In Importance. In terms of traffic service, Alaska's Other Principal Arterials are next in importance. The Egan Expressway in Juneau and the Klondike and Haines Cut-Off Highways are examples of Other Principal Arterials. They are important because they connect Haines, Skagway and Juneau to the Alcan Highway and to the Alaska Marine Highway System.

Minor Arterials Expand The System. As seen, the Minor Arterials link other important Alaska centers with the Interstate Highway System.

Major and Minor Collectors. the Major and Minor Collector Highways further expand the system. All remaining rural roads that serve long-distance travel are designated as Collector Highways. However not all Collectors are state highways, as some are under the jurisdiction of Alaska's cities and boroughs. The Major Collector classification is given to the more heavily travelled Collectors.

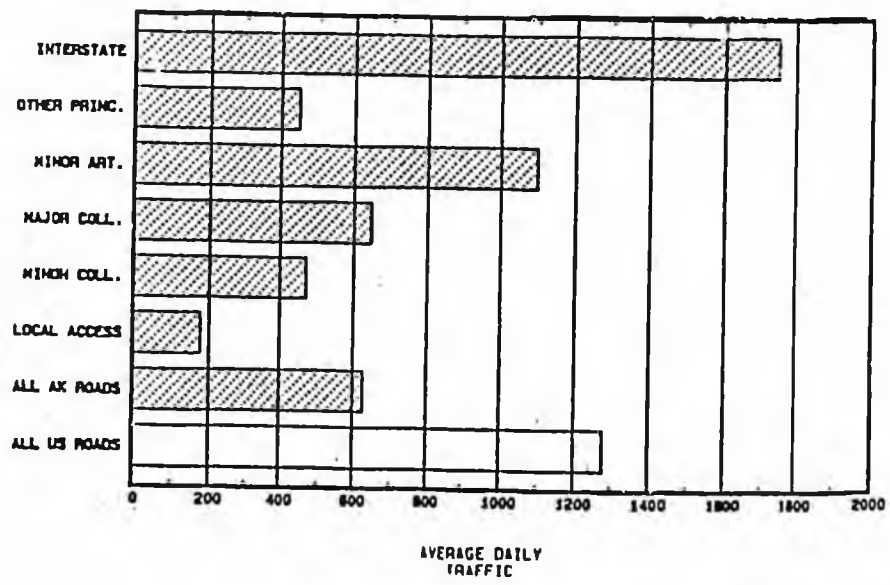
Local Access Roads. The remaining rural roads (not shown on the map) that serve individual or small groups of houses, camps or farms are termed local access. These roads function predominantly as a means of access to land, rather than as a means to convey people, products and raw materials through an area. Most such roads are in the Matinuska-Susitna and Kenai Boroughs.

MILES

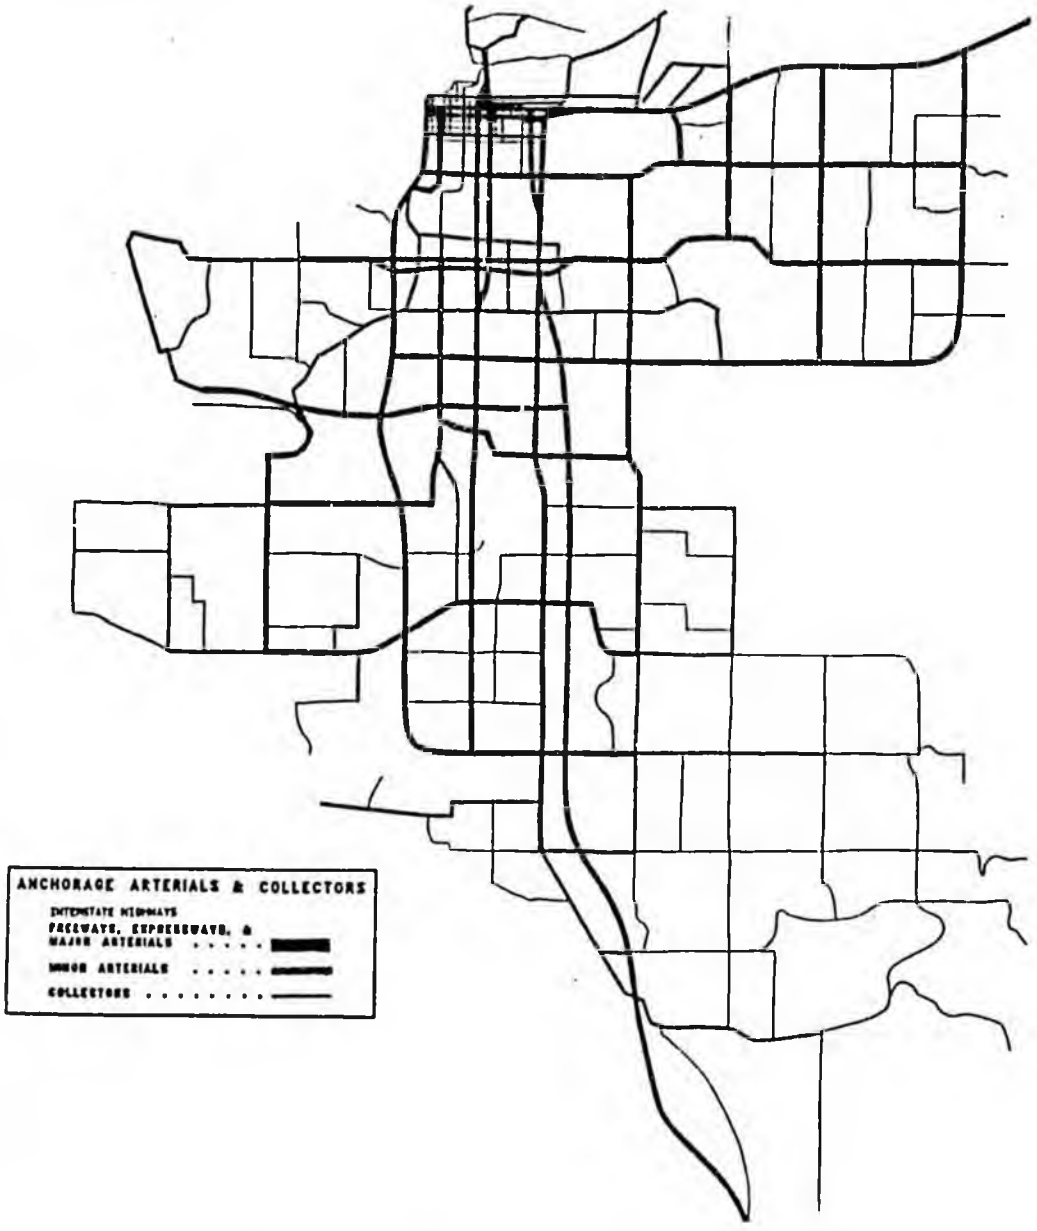


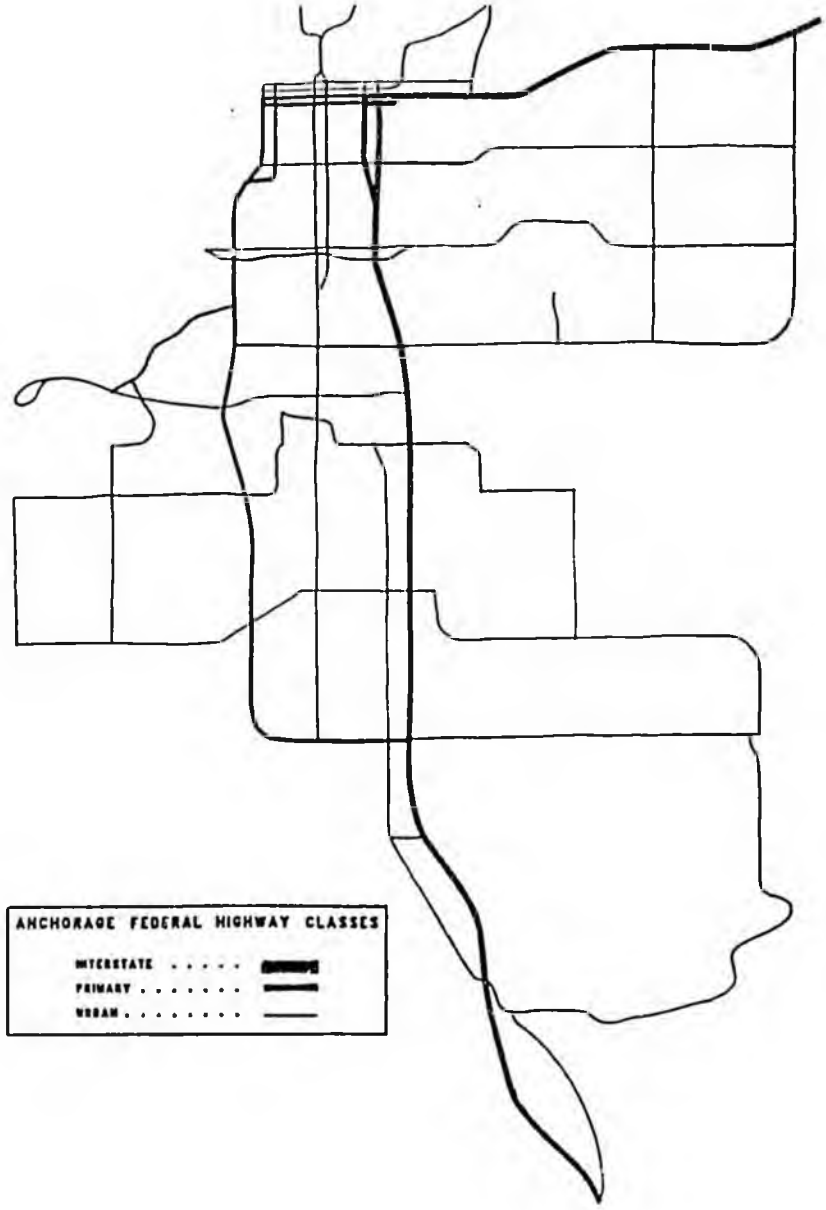
TOTAL: 9,980 MILES

TRAFFIC DENSITY



ANCHORAGE ROAD CLASSIFICATIONS





Functional Highway Classification Also An Urban Management Tool. The maps show three types of Anchorage road classifications. In the upper left are the functional classes agreed upon cooperatively by ADOT&PF and Anchorage officials. The designated Federal Aid Highway Systems are shown in the upper right. And the map on the bottom right shows the designated state highways.

Not shown is the street and highway maintenance scheme agreed upon by ADOT&PF and Anchorage officials in which some state highways are maintained by the Municipality of Anchorage and some municipal streets are maintained by the ADOT&PF. Also not shown are the 780 miles of Local Access Streets in the Anchorage urbanized area.

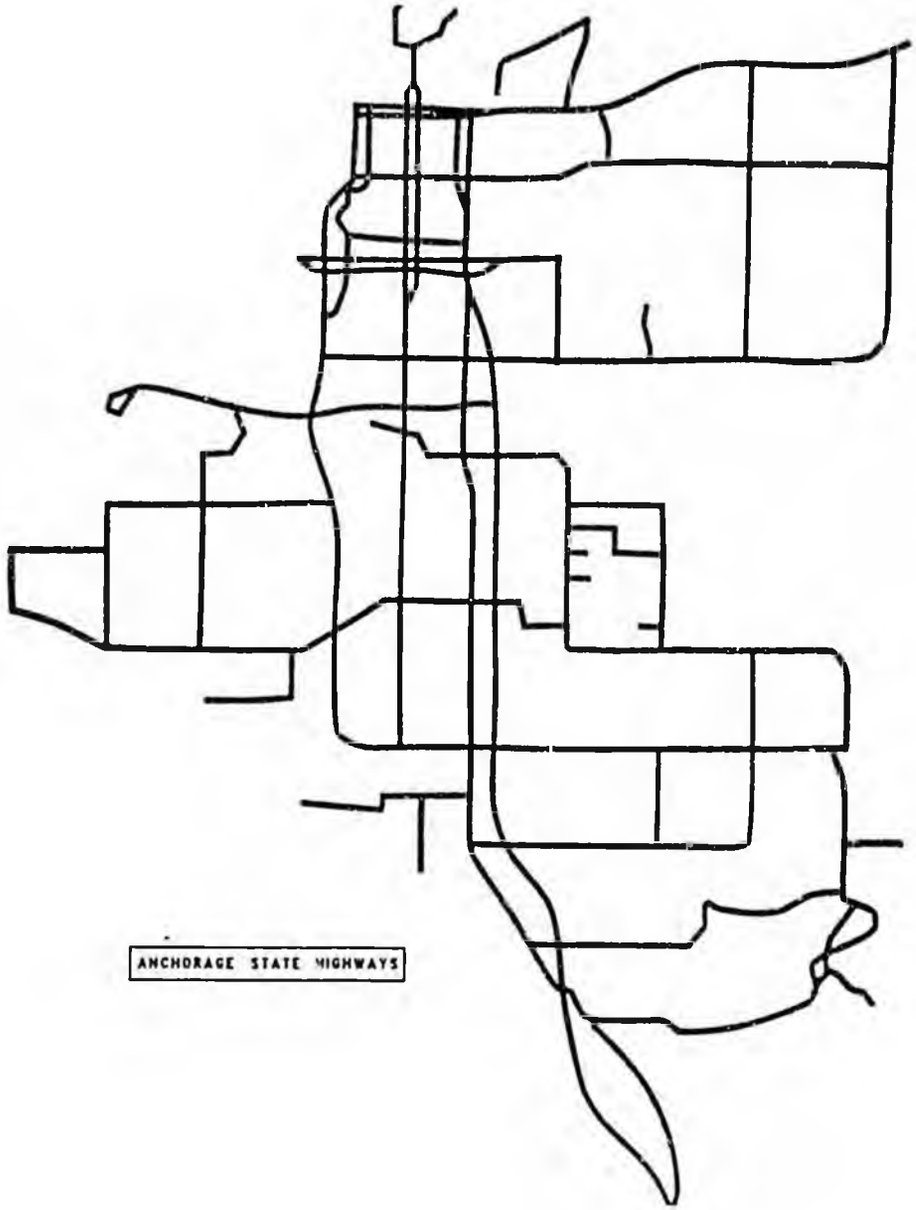
The below table indicates the importance of each functional class of Anchorage streets and highways. Of particular significance is the 88 miles of Interstate Highways, Freeways, Expressways and Major Arterials (9 percent of the miles) which serve almost two thirds (65.4 percent) of Anchorage's daily motor vehicle travel.

Functional Classes	Miles	% Mi.	% Travel	Traffic Density*
Interstate, Freeways, Expressways and Major Arterials	88	9.0	65.4	25,400
Minor Arterials	29	3.0	11.4	13,400
Collectors	80	8.2	10.1	4,300
Local Access	780	79.8	13.1	600
	977	100	100	

* Average daily vehicles per road mile.

The designated Federal Aid Highway System routes -- Interstate, Primary and Urban -- were adopted based on the traffic service function. These are the routes eligible for improvement with Federal Aid Highway Program funds. I-3

High Proportion of State Highways. There are 176 miles of state highway in the Municipality of Anchorage and 801 miles of either municipal street or streets that are "service area maintained". By agreement with the Municipality, the service areas levy road taxes and maintain all non-state highways within their area.



BLANK

At 18 percent of the road miles, the state highway system serving Anchorage is more extensive than the average urban state highway network (13 percent) in the nation. (And the national statistics are biased on the high side by high proportions of state highways in the cities of several Eastern states.) Furthermore in Alaska's urban areas, many streets and roads that serve a collector or minor arterial function are state highways.

As a result state resources must be used for the operation, maintenance and improvement of routes with only a minor traffic service function. Routes of greater statewide traffic service significance–in terms of their function in either connecting communities or distributing statewide traffic to important economic centers within urban areas–must compete for scarce state resources with the urban collector and minor arterial routes of low statewide significance. Compounding the problem is the fact that ADOT&PF officials must unnecessarily deal with urban issues such as land use and traffic control that are more properly a local responsibility.

Joint Action Needed. While the ADOT&PF has authority to transfer responsibility for state highways to local government, this is a very difficult problem due to the local government cost implications. Therefore, to resolve the issue of urban highways, it is recommended that the ADOT&PF and the Legislature first establish a state highway jurisdiction policy in concert with municipal officials and then make the changes that satisfy the policy.

Use The Functional Classification Plan. The most widely accepted basis for redefinition of state highways is the functional classification hierarchy of streets and highways. This is used to test alternative state/local jurisdictional plans.

Suggested Alternatives. One obvious alternative is to place only urban extensions of state highways on the urban state highway network. A second is to add to the first by including all Freeways and Expressways. The third alternative would be the addition of Major Arterials.

Financial Resources Are An Important Consideration. To ease the burden of a shift in urban road responsibility, there are financial and management arrangements that can be established.

One such arrangement is the Urban Arterial Board in the State of Washington. Only 6.7 percent of the urban road mileage in Washington is designated as state highway. Therefore the Washington Legislature established an Urban Arterial Fund and an Urban Arterial Board in 1968 to assist municipalities on a fund matching basis to make improvements to those designated urban arterials that are not state highways. It is recommended that Washington's success in limiting urban state highway responsibilities to major arterials and the success of the Urban Arterial Board and the Urban Arterial Fund in meeting Washington's urban arterial needs be studied for possible application in Alaska.

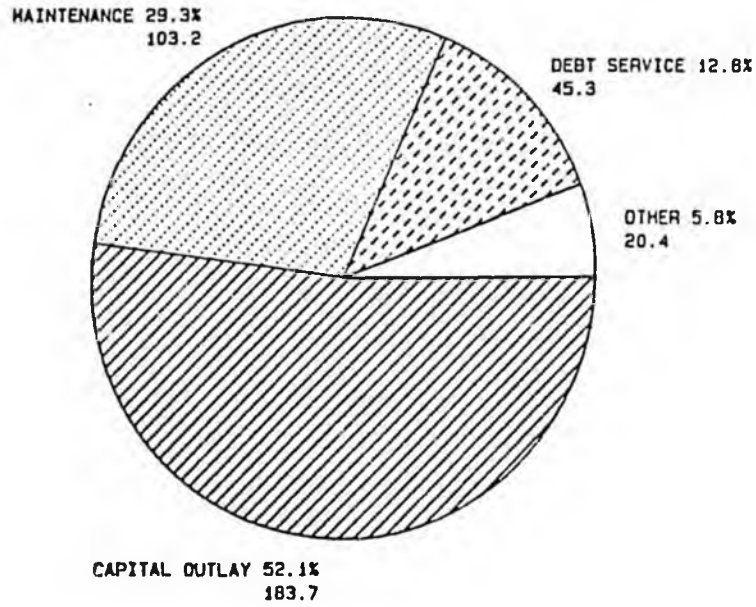
First Steps Taken. The need for a clear policy on road control is recognized by Alaska officials. In 1987 the Alaska Legislature set forth the following directive to begin dealing with the issue:

> "IT IS THE INTENT OF THE LEGISLATURE THAT DOT/PF: 1) ESTABLISH A ROAD RESPONSIBILITY TASK FORCE COMPRISED OF REPRESENTATIVES OF DOT/PF, LOCAL GOVERNMENTS, UNORGANIZED AREAS, AND USER GROUPS. THE TASK FORCE IS TO REVIEW THE FEASIBILITY OF TRANSFERRING THE RESPONSIBILITY OF DIRECT MAINTENANCE ON CERTAIN ROUTES FROM THE STATE TO LOCAL GOVERNMENTS, AND TO EXAMINE REASONABLE AND EQUITABLE FUNDING SOURCES FOR MAINTENANCE ACTIVITIES, INCLUDING A REVIEW OF THE MOTOR FUEL TAX AND OF THE EXISTING ROAD SERVICE ACCOUNT IN THE STATE' REVENUE SHARING PROGRAM.
>
> THE TASK FORCE SHALL ALSO STUDY THE ISSUES OF ROAD OWNERSHIP, LIABILITY, AND THE TRANSFER OF EQUIPMENT AND EMPLOYEES..."

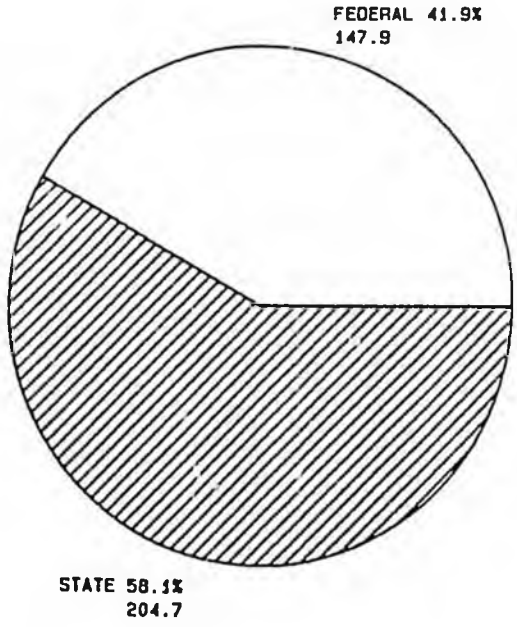
In September 1987, the ADOT&PF selected a facilitator to assist the Commissioner in responding to the mandate. In November, the Task Force was named and a first meeting planned.

1986 STATE HIGHWAY PROGRAM

EXPENDITURES



RECEIPTS



TOTAL: $352.6 MILLION

Highway Expenses Five Times The National Average. For 1986 (calendar year) the ADOT&PF reported to the Federal Highway Administration that it spent $353 million on state highway administration, maintenance, operations and improvement. This is about $700 per capita and compares with a $140 per capita national average of expenditure on state highways.

Marine Highway System Costs Included. Included are all 1986 capital as well as maintenance and operations expenditures for both land service state highways and the Marine Highway System. Also included are $45.3 million to service the state debt on borrowing for previous state highway system improvements. Law enforcement and safety expenditures amounting to $11.4 million are included in the "other" category of expenditure as well as $4.7 million for highway program administration and $4.2 million for highway planning and research. Finally in the other category is the 1986 expenditure of $4.3 million for Local Service Roads and Trails, which is a portion of the State Highway Program (administered by the ADOT&PF) but directed toward local road betterments.

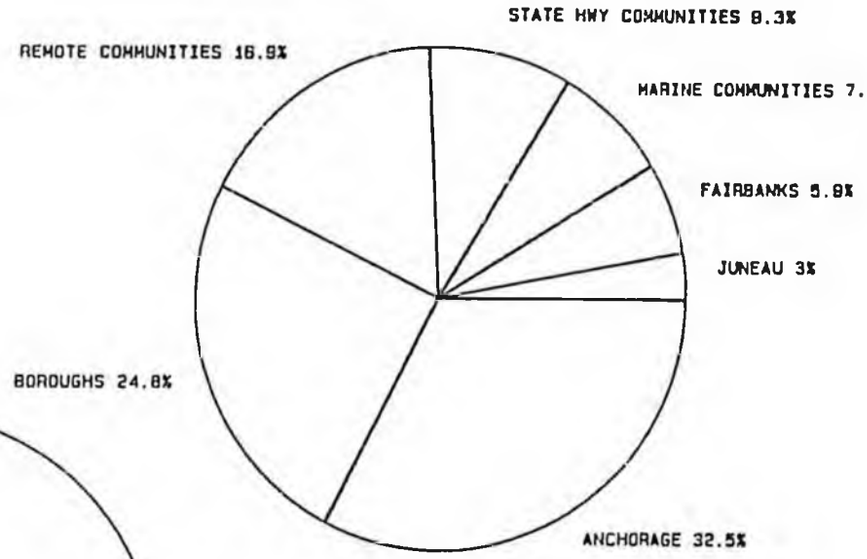
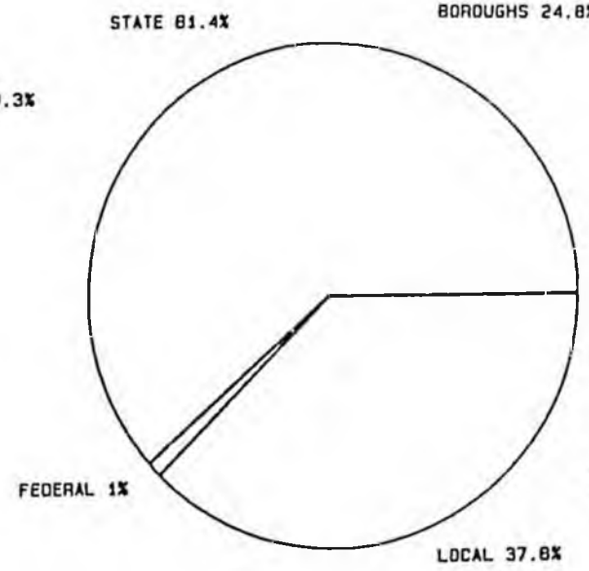
UNITS OF GOVERNMENT



SOURCE OF FUNDS



TOTAL: $237.8 MILLION

Total Road Spending High. Alaskans raised and spent $237.8 million in 1985 (calendar year) for upkeep and improvement of the 3,992 miles of local streets and roads. For a population base of only 536,000 persons, this is a very significant level of expenditure. When combined with the 1986 state highway program of expenditure, it is estimated that total 1986 highway, street and road spending was about $590 million or $1,090 per capita, about four times the national average ($260 per capita).

Important ADOT&PF Factfinding Function. To assist the Office of the Governor and the Legislature and to comply with federal mandates, the ADOT&PF annually surveys, compiles and reports on local road and street spending. The ADOT&PF also verifies annually the current mileage of local roads and streets and this provides the base for state apportioning of road revenue sharing funds. 1985 information is the latest available on local road finance.

Road Revenue Sharing Funds. When the Legislature fully funds this program, each community receives a base of $2,500 per mile of conventional road and $1,500 for each mile of ice roads. However these amounts are adjusted upwards to accomodate higher costs in many areas of the state.

While communities are required to use only 20 percent of the funds for road purposes, ADOT&PF studies show that a majority of the road revenue sharing funds are actually used for road purposes.. Only that portion of the road revenue sharing funds that were actually devoted to municipal road programs are reported in the annual ADOT&PF surveys of municipal road expenditures.

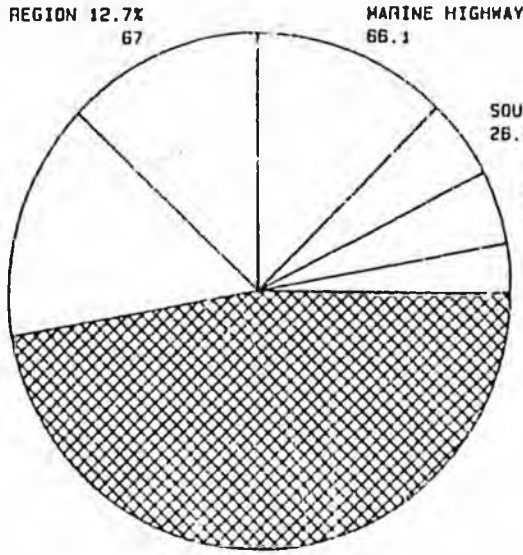
Special Terminology Used. Note the special terminology used in the "Units of Government" chart. "State Highway Communities" refers to all cities (15) directly served by the land service State Highway System, excluding Anchorage and Fairbanks. "Marine Communities" are the 20 cities, excluding Juneau, that are served by the Marine Highway System but not connected to the land service State Highway System. The "Remote Communities" are the remaining incorporated or unincorporated places not served by state highways or ferries.

State Funds Rising. In 1985, state grants for local roads amounted to $145 million, up from $88.4 million in 1984. This includes the portion of road revenue sharing funds that were used in road upkeep and other state funds appropriated for specific local road improvements. On the average the 1985 state contribution toward local road and street upkeep amounted to $270 per capita, but ranged from $120 per capita in the seven boroughs to $740 per capita in the Remote Communities.

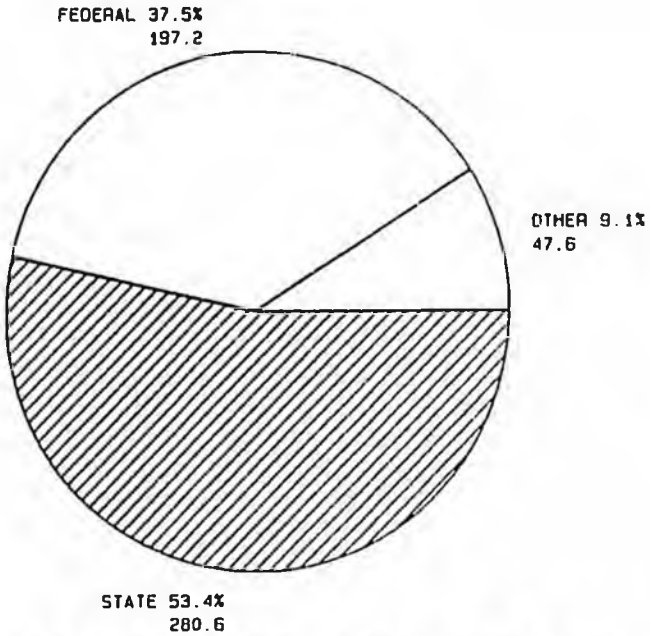
Fairbanks High In 1985 State Road Receipts. Based on miles of local road in each community, Fairbanks led with $132,000 per mile in state road receipts, while at the other extreme, the seven boroughs received an average of $13,000 per mile. Anchorage received $50,500 per mile. However in reviewing municipal road receipts and expenditures, it should be recognized that the year-to-year fluctuations are large and closely related to specific road improvements authorized by the Legislature.

1986 ADOT&PF EXPENDITURES

AREA

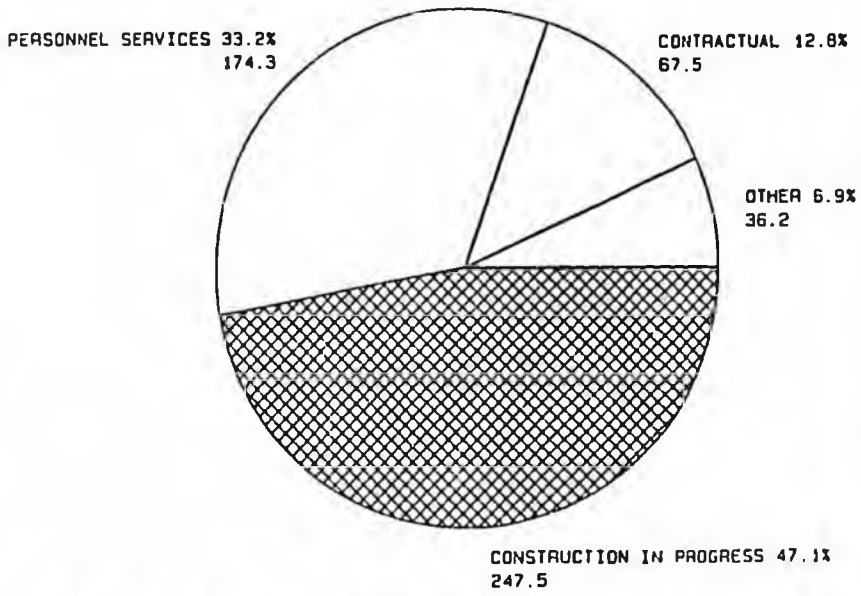


FUND SOURCES



TOTAL: $525.4 MILLION

EXPENDITURE OBJECTS



ADOT&PF Spent $525.4 Million in 1986. The charts above and at right are five perspectives on Alaska Department of Transportation and Public Facilities expenditures in fiscal year 1986. The ADOT&PF is not only responsible for State Highway System administration, operations, maintenance and improvement, but also owns, operates and maintains the nine-ship Marine Highway System, two International Airports, 215 other airports, 45 seaplane floats, harbor facilities, the state equipment fleet and almost 400 state owned buildings.

Highlights:

- o Payments for construction in progress, mostly highway and airport improvements, represented almost half of all expenses, $247.5 million.
- o Spending in the Northern Region, which has the most miles of state highway, led the three ADOT&PF regions.
- o Not included as ADOT&PF income is the $33.8 million in passenger and vehicle fees for Marine Highway System passage, which accrue directly to the Alaska Treasury.
- o About three fourths of the federal funds are reimbursements from the Federal Highway Trust Fund for state highway improvements. The other one fourth is from the Federal Airport Trust Fund for airport improvements.
- o Some of the "other" income is from concessions and fees from Anchorage and Fairbanks International Airport usage. These funds are deposited in the International Airport Enterprise Fund.
- o Two thirds (66.8 percent) of all expenditures were directed to private enterprise for construction in progress, supplies and other costs of business operation. One third (33.2 percent) was for ADOT&PF salaries and benefits.
- o 57.2 percent of all expenditures were for design (consulting or in house), right of way purchase and construction progress payments for improvements to highways, airports, ferries, harbors and other public facilities.

More Information Needed On Finance Trends. The information shown is the result of a special analysis made for this Review by the ADOT&PF. However it has been Highway Users Federation experience in other state highway program reviews that such information is readily available in the annual reports of the state highway and transportation departments. The information is important for the following reasons:

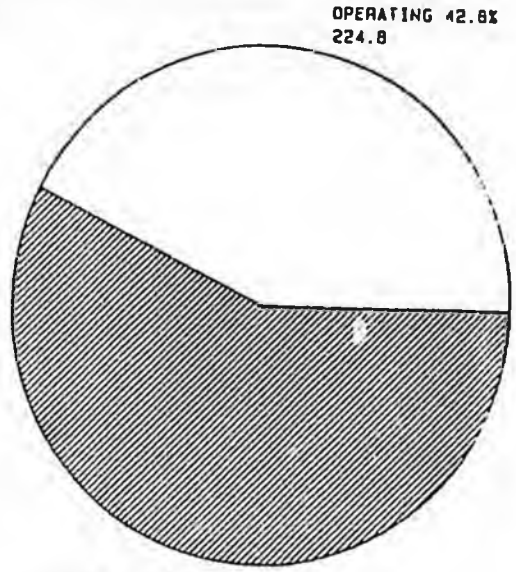
1) to place the Program in perspective with the programs of other state highway and transportation departments in order to detect possible inconsistencies,

2) to place modal components in perspective,

3) to analyze trends, and

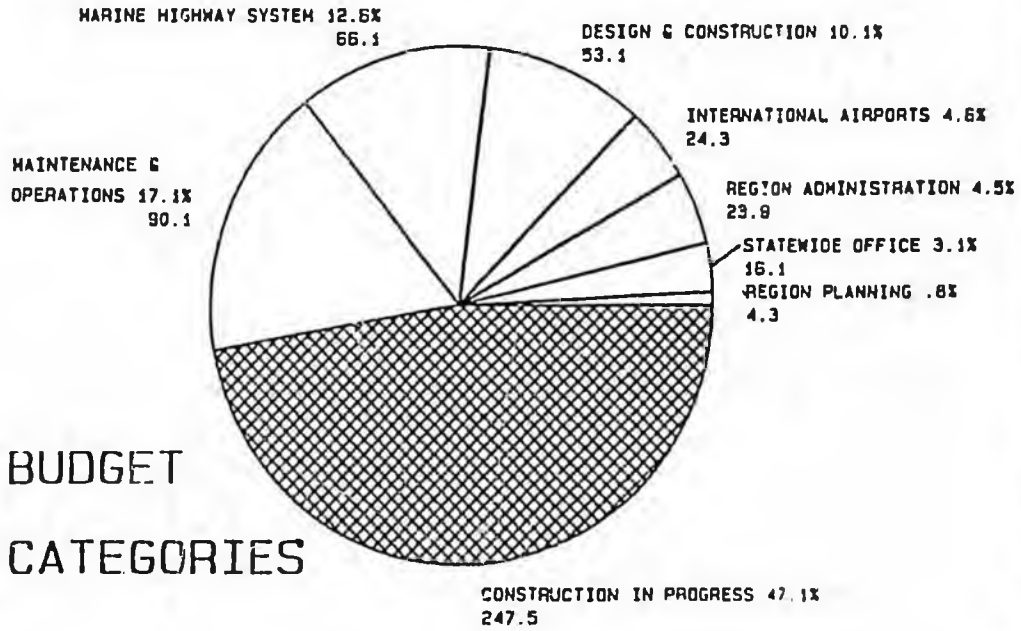
4) to provide legislators, administrators, other officials and constituent organizations with information necessary to make informed decisions regarding Program direction and support.

MAJOR BUDGET ELEMENTS



TOTAL: $525.4 MILLION

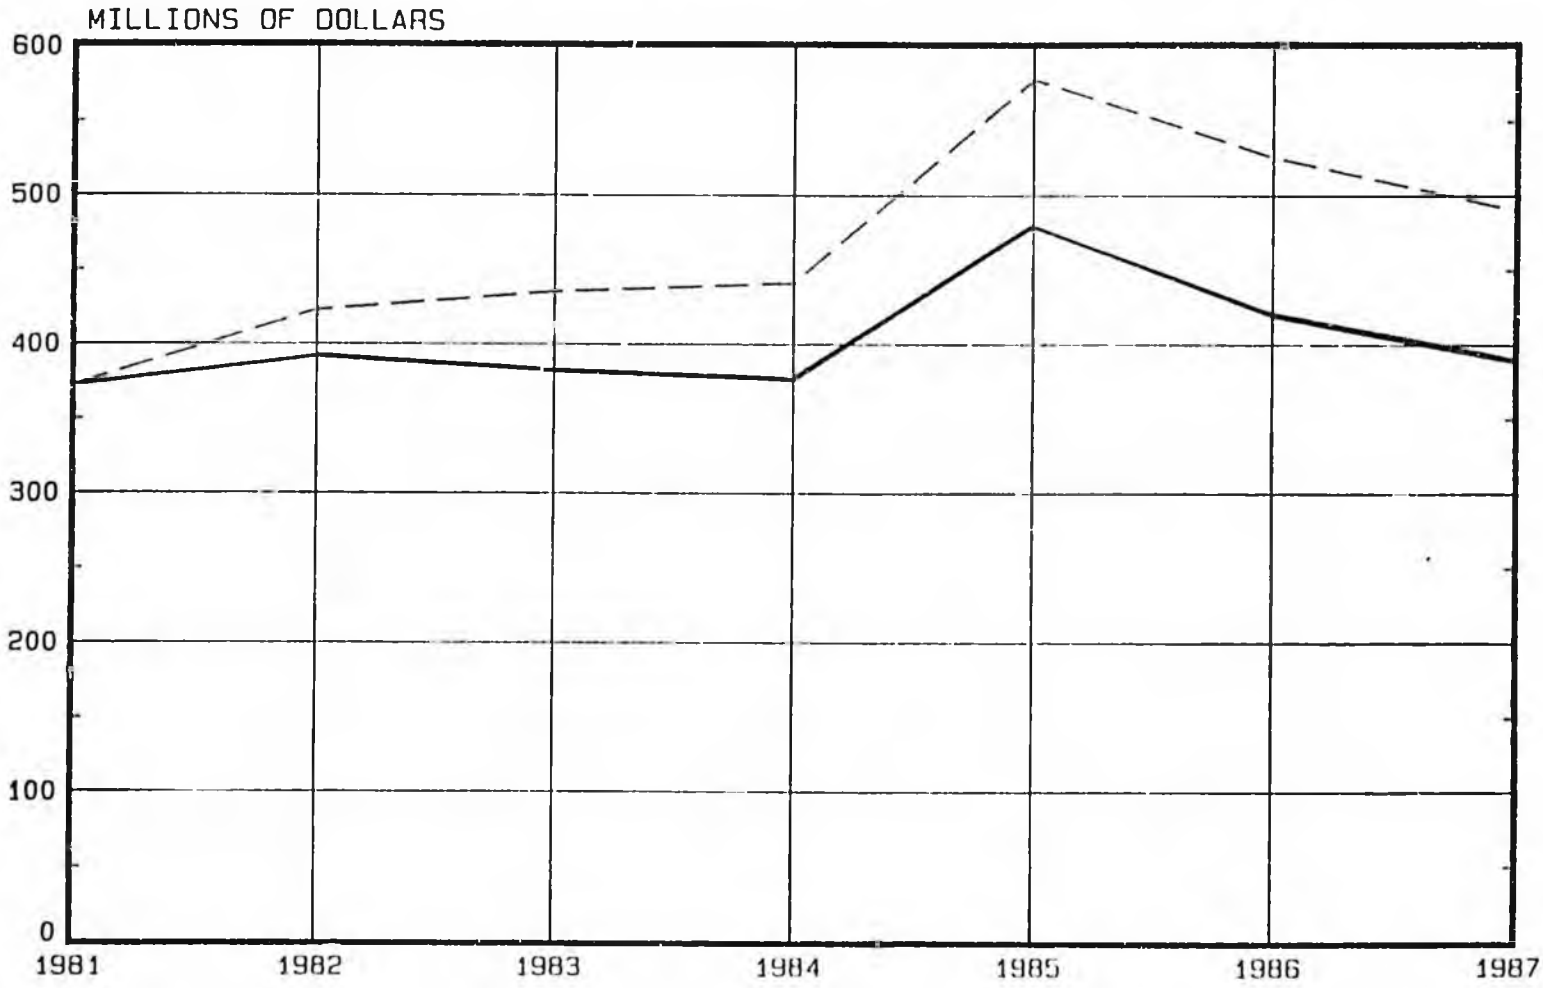
BUDGET CATEGORIES



ADOT&PF EXPENDITURE TRENDS

CURRENT $ — — — —

CONSTANT 1981 $ ——————

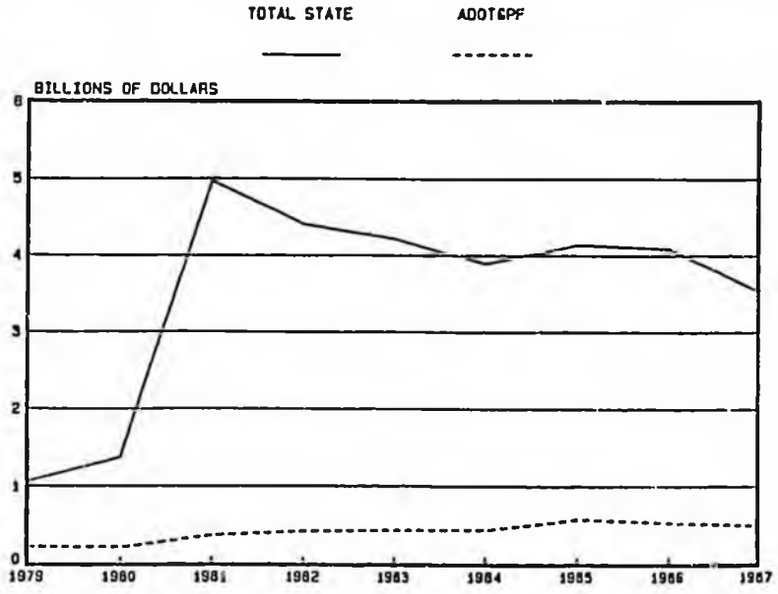


ADOT&PF Spending Up Modestly Over Last Seven Years. Two views of ADOT&PF spending over the 1981 to 1987 period are shown in the above chart. The dashed line shows the actual spending while the solid line depicts the value of the spending when inflation is considered. (The Anchorage Area Consumer Price Index was used to show the 1981 value of each current year's spending.) As a result of the eroding value of money, ADOT&PF spending of $493 million in FY 1987 was worth only $385 million in terms of what could be purchased with 1981 money. Despite the apparent $120 million increase in ADOT&PF funds, the 1987 spending level was up by only $20 million or five percent over the 1981 level.

ADOT&PF Expenditure Increases Are Low When Related To Travel Increases. Travel change is one indicator of transportation finance need. During the 1981 to 1987 period motor vehicle travel in Alaska increased 62 percent, airport enplanements increased by 25 percent and Marine Highway System passengers were up by 9 percent. Furthermore, the lane-miles of state highway increased 12 percent, thereby increasing the demand for such maintenance activities as snow and ice control.

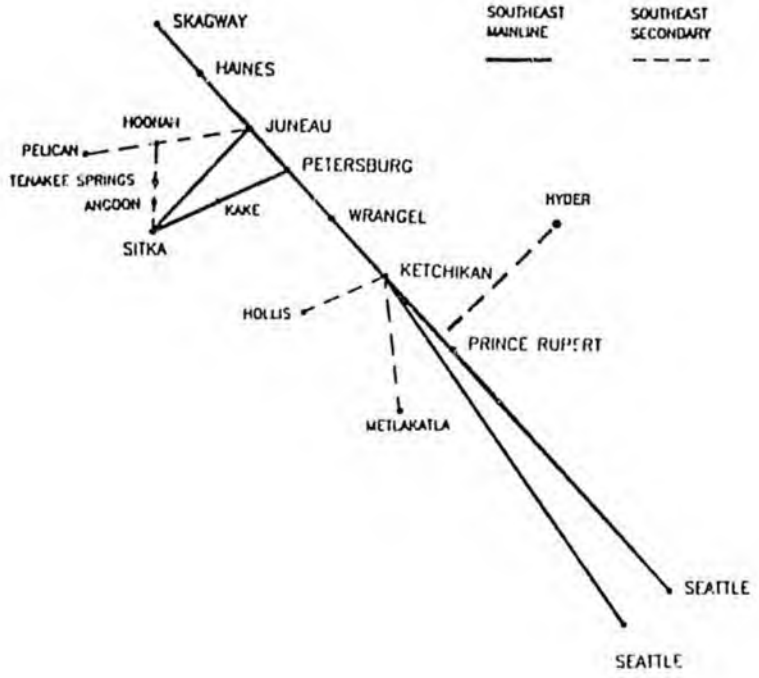
ADOT&PF Proportion of Total State Spending Has Diminished. While ADOT&PF spending has risen from $212 million in 1979 to $493 million in 1987, other state spending has risen even faster. This is noted by the fact that 1987 ADOT&PF expenditures represented 13 percent of total State of Alaska expenditures in 1987, down from 20 percent in 1979.

ADOT&PF & TOTAL STATE EXPENDITURES

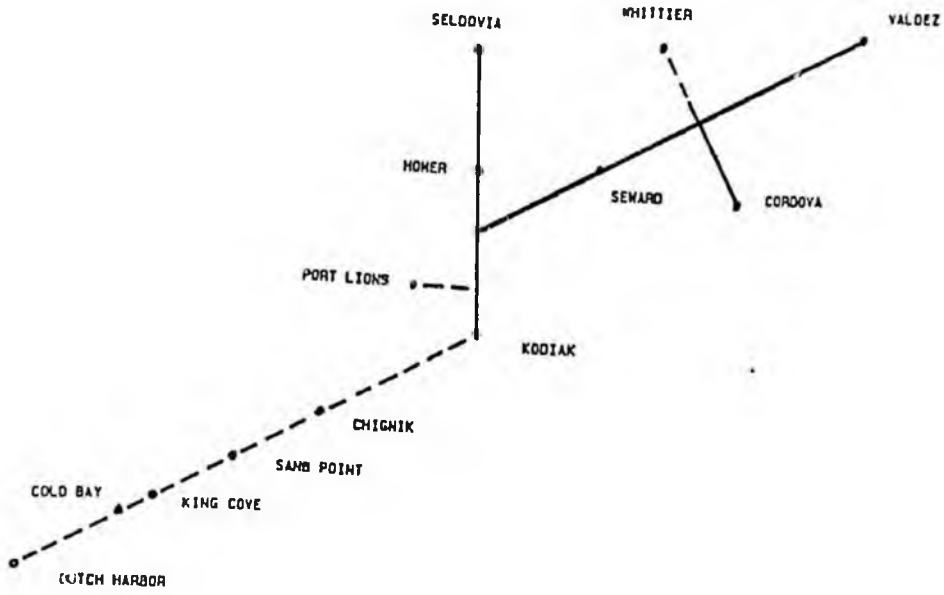


MARINE HIGHWAY SYSTEM

SOUTHEAST



SOUTHWEST



Waterborne Highway System. Alaska has more coastline than the rest of the United States combined. And more than half of its cities are unreachable by conventional highways. These are the reasons that Alaskans in 1960 voted the necessary bonds to establish the state's waterborne highway system. Operating as a division of the Department of Transportation and Public Facilities, the Marine Highway System started with one vessel -- the Motor Vessel Chilkat. During its first fully operational year in 1963, four ships served the fleet.

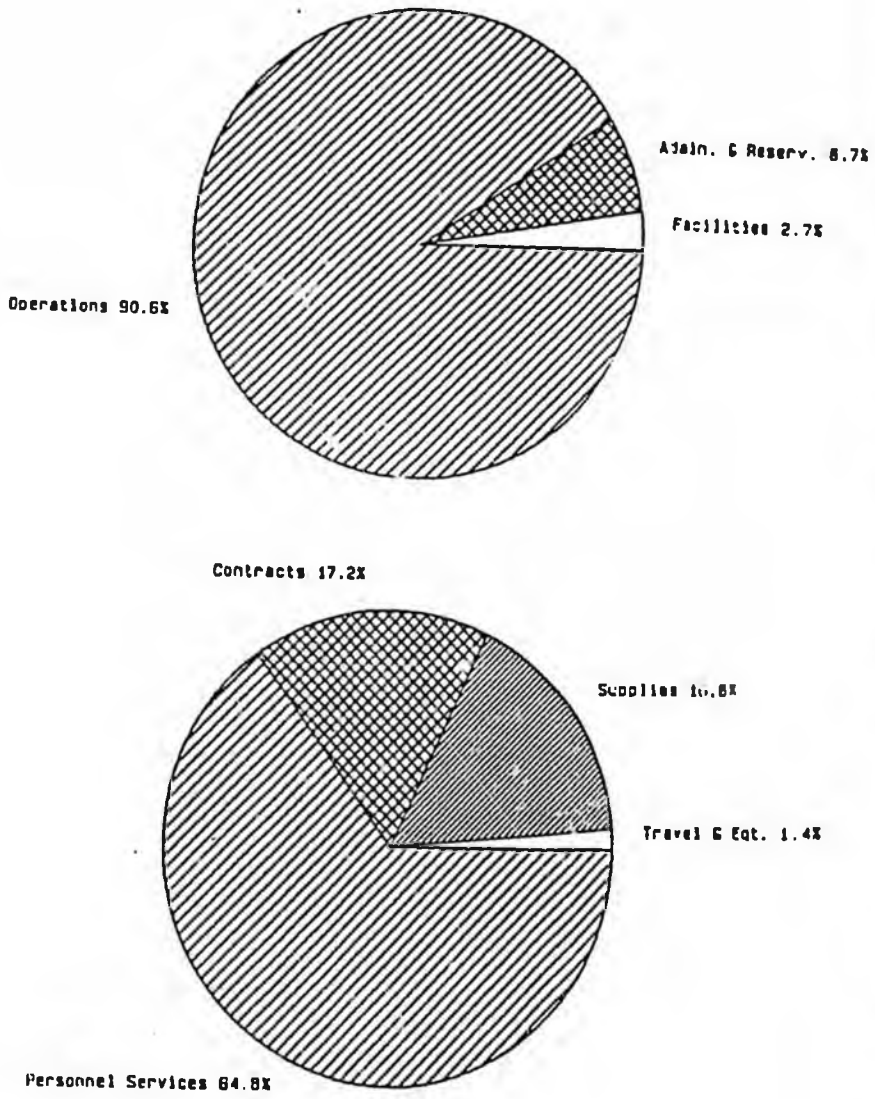
Nine Vessel Fleet. The original system operated from northern terminals at Skagway and Haines, to Prince Rupert in the south. Since then service has been extended to Seattle. And the nine ships, which now comprise the fleet, also provide feeder service in Southeastern Alaska, as well as from the Kenai Peninsula to the island city of Kodiak, to the communities of the Aleutian Chain, and to the communities on Prince William Sound.

The Motor Vessel Columbia is the largest ferry. Built in 1973 the Columbia is 418 feet long, with a capacity for 1,000 passengers and 180 automobiles. She has a service speed of 19 knots. There are 20 2-berth cabins and 71 4-berth cabins.

The other ferries range in size from 100 feet to 408 feet and have passenger carrying capacities ranging from 75 to 750 persons as well as auto and truck carrying capability. Food service, state rooms, cocktail lounges and solariums are available.

Unique System. No other state department of transportation in the nation operates a ferry fleet that offers such extensive service.

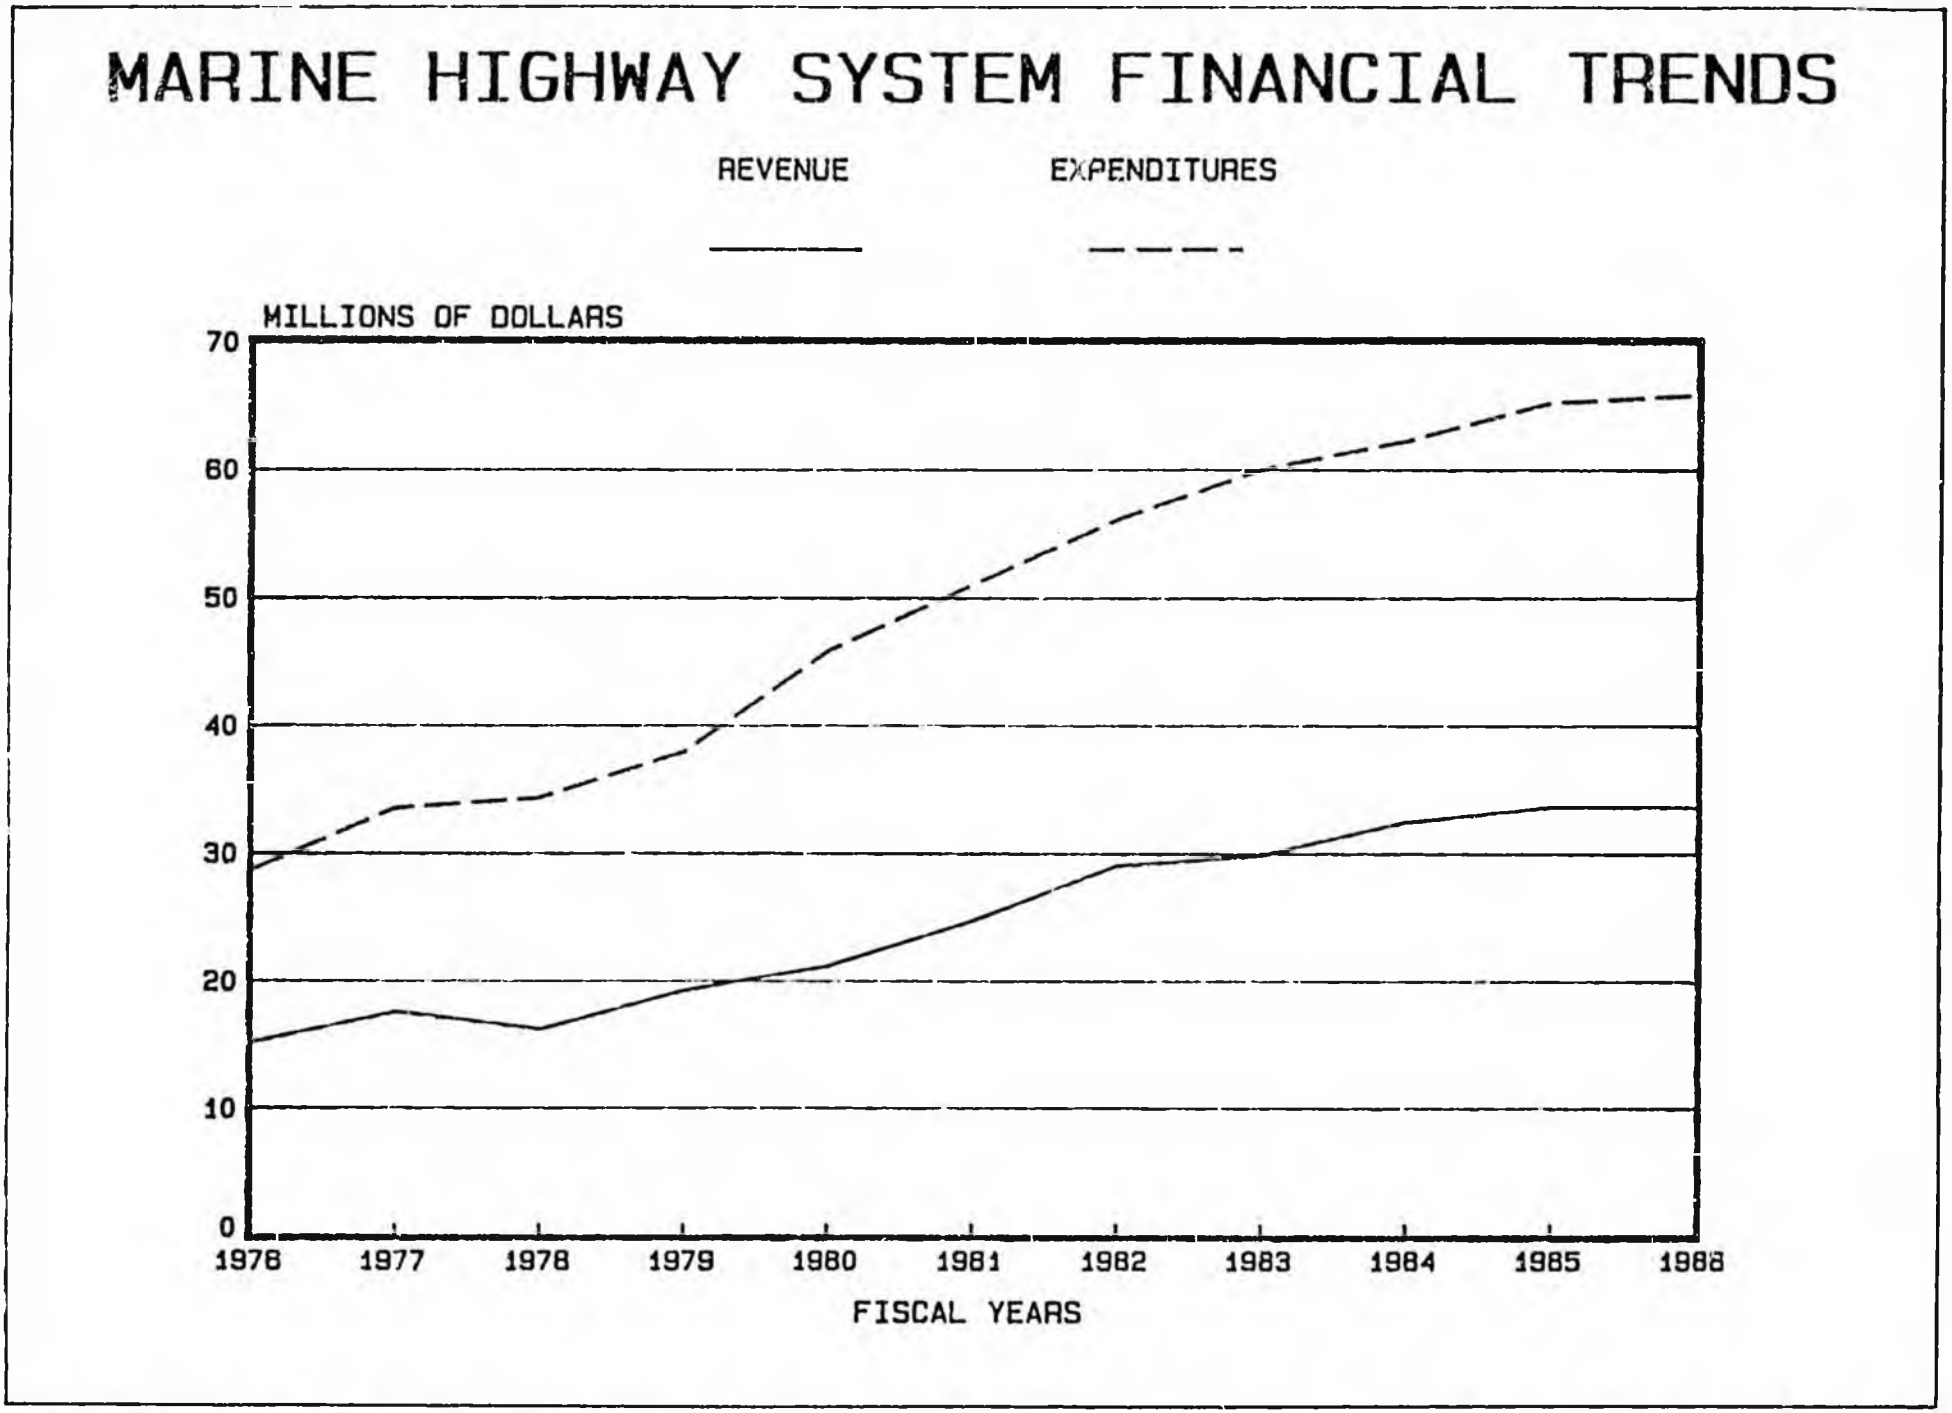
1987 BUDGET



Total: $63.4 Million

ALASKA LEGISLATURE COMMITTEE FILES 1987 - 1988 8672
5136 HTRA COMM. MTGS: CAPITAL PROJECTS CLEANUP

MARINE HIGHWAY SYSTEM FINANCIAL TRENDS



Fares Cover Over Half AMHS Costs. As shown above, passenger and vehicle fares and other en route receipts met about 55 percent of all costs in fiscal year 1986. (FY 1987 expenditures were $65 million while revenues were $33.8 million.) And this relationship between revenues and expenditures has remained approximately steady for the past 12 fiscal years.

Operations Are The Major Costs. As shown in the 1987 budget charts on the right, the costs of ship operations including necessary overhauls and improvements are 90.6 percent ($56.4 million) of all costs. The manning of shore facilitiesand overall administration costs, including the operation of the reservation system, is 9.4 percent ($7.0 million) of budgeted costs.

Personnel Costs Are Almost Two Thirds of All Costs. The 1987 budgeted complement included 879 persons, (705 permanent, 174 seasonal or part-time). To operate the ships safely and efficiently, to maintain the equipment and to serve the personal needs of passengers, AMHS personnel costs are almost two thirds (64.8 percent) of total costs.

Morale Good. Despite the extensive travel, crew morale seems to be good. Management in recent years has made progress in attending to member concerns and in giving crew members a greater voice in management decisions. Periodic Director and crew meetings have proved to be successful.

Need To Budget For Ship Replacements. The ferries range in age from 10 to 24 years with the average being 18 years old. With ship replacement costs ranging from $10 million for the smaller ships to $100 million for the larger ships, it would be prudent for Alaskans to begin setting aside funds annually to meet replacement needs. As is the case for Alaska's International Airport capital assets, it is suggested that future needs be accounted for in the annual budget process. Passenger and vehicle revenue is the suggested source of depreciation funds.

Need For Secure Funding Sources. As is the case for highway planning, ADOT&PF officials need the assurance of secure funds over a three to five year period in order to plan the most effective and efficient program of AMHS operations, maintenance and improvements. Passenger and vehicle revenue should form the base of such funds with set annual supplements from the Legislature and the communities served.

There are 998 airports and bush landing strips in Alaska with 215 out of 294 state-owned facilities actually maintained by the ADOT&PF. The Anchorage and Fairbanks airports are included in the Alaska International Airport System in that they serve commercial aircraft of many nationalities. Due to their complexity, the International Airports are managed by a special division of the ADOT&PF.

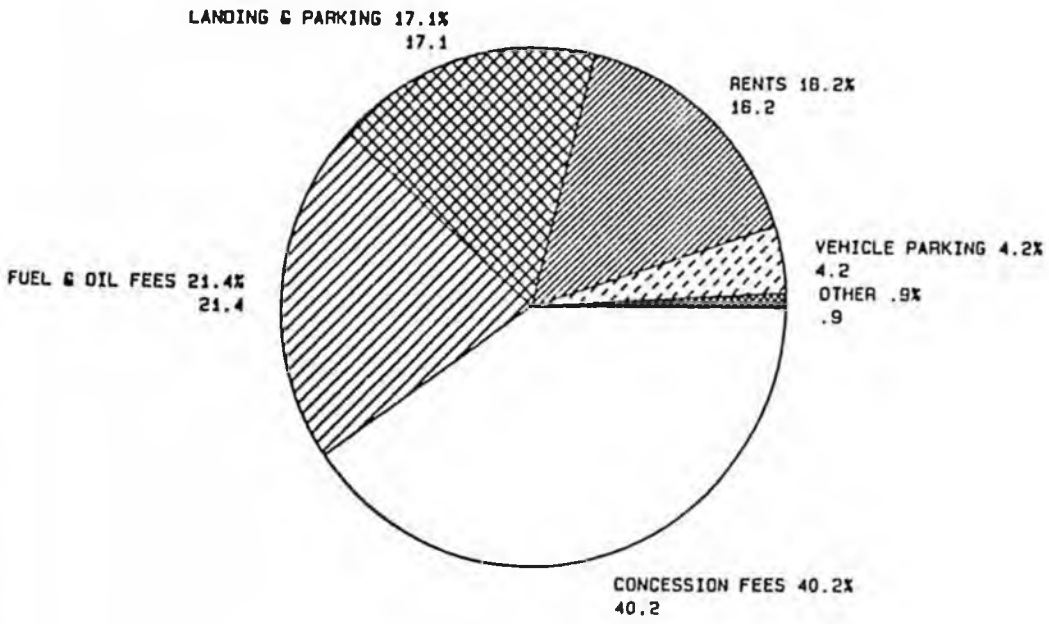
TOTAL:	138	110	46	294

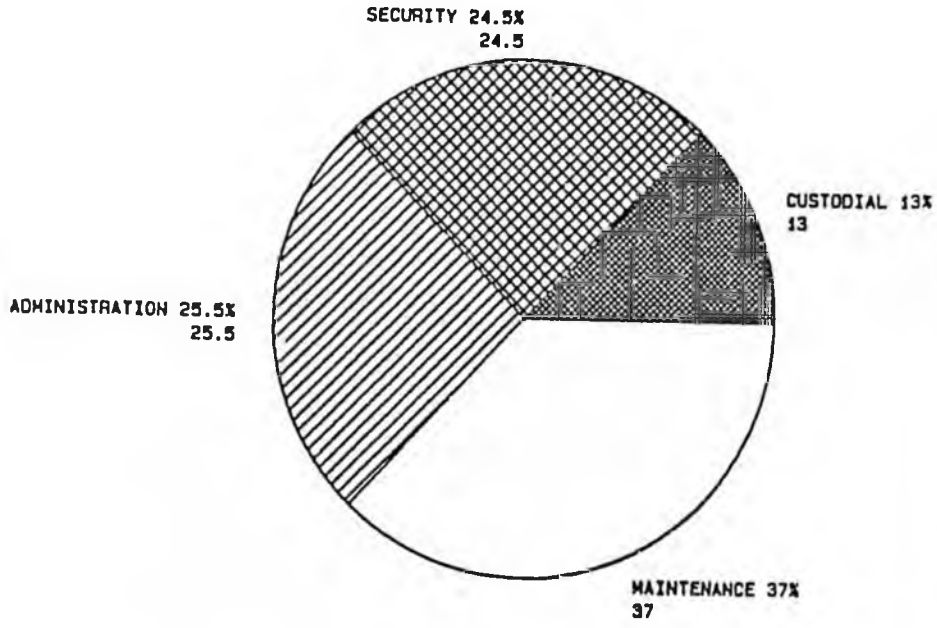
INTERNATIONAL AIRPORTS

1986 REVENUE



TOTAL: $47.9 Million

1986 OPERATING EXPENSES



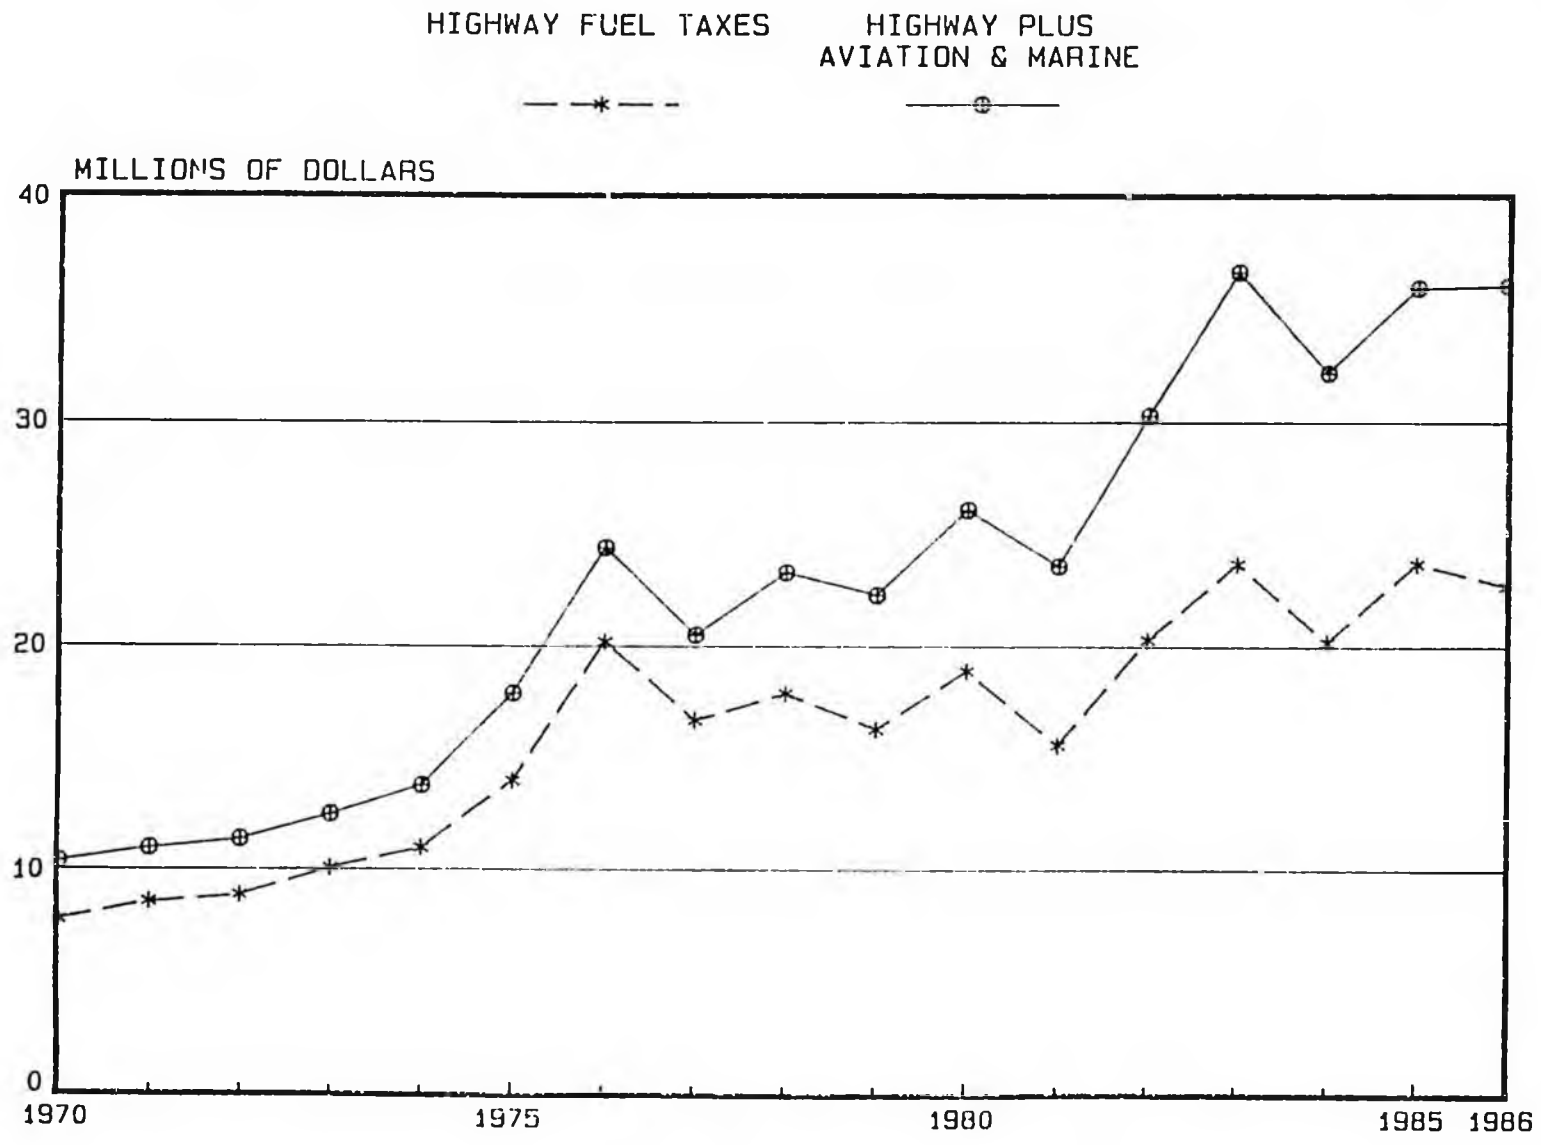
TOTAL: $25.5 Million

Because of its fast growth, extensive capital needs, self-sufficient nature and the need to guarantee the amortization of Alaska International Airport System bonds, all operating revenue generated and all expenditures are accounted for in a special Enterprise Fund. As indicated, revenues in fiscal year 1986 amounted to $47.9 million up from $42.5 million in 1985. And despite Alaska's economic downturn, revenues continued upward in 1987 to $48.9 million. As of June 30, 1986 the combined value of the two airports stood at $293 million up from $251 million a year earlier.

Bond Debt Up. At the close of fiscal year 1988 bonded indebtedness stood at $41.9 million. An additional $38.0 million of revenue bonds were issued in November 1986 for construction of the parking garage at the Anchorage International Airport.

Improvements. In fiscal year 1986 the $22.4 million in operating income together with $2.0 million in federal grants and net interest income of $0.9 million were used to make bond principal payments ($2.0 million), to increase restricted assets ($0.1 million), to increase working capital ($3.8 million) and to upgrade airport property, plant and equipment ($19.3 million).

MOTOR FUEL TAX TRENDS



Secure Funding Source Needed. One of the problems of providing a secure, predictable source of funds for Alaska's State Highway Program is that the highway user tax base does not provide enough revenue to support highway system maintenance and improvement needs. However for most other states of the nation the motor fuel taxes, the auto and truck registration fees and assorted other taxes and fees levied on motor vehicles and their use do provide the necessary funds to support the State Highway Program. The success of the nation's highway programs is largely attributable to the fact that secure and predictable highway user taxes have met the capital, operating and maintenance needs.

Low Highway User Taxes And Fees. The reason that Alaska's highway user taxes and fees do not meet highway program needs is that they are low in comparison with other states.

For heavy trucks, Alaska ranks lowest in the nation with a tax load of $1,598 per year or 2.0 cents per vehicle-mile of heavy truck travel. This compares to Washington which collects over three times as much ($4,990 per truck, and 6.2 cents per vehicle-mile of heavy truck travel). The highest taxer of heavy trucks is Arizona which collects $11,012 per truck or 13.8 cents per vehicle-mile of heavy truck travel.

For automobiles, Alaska ranks 37th among the states with a $122 tax per average automobile or 1.0 cents per vehicle-mile of travel. The highest in the nation is Rhode Island with an annual tax load of $731 per automobile or 5.9 cents per vehicle-mile of automobile travel (six times the Alaska load). The lowest is New York at $73 per year and 0.6 cents per vehicle-mile of travel. Washington's annual tax on automobiles is $310 per vehicle or 2.5 cents per vehicle-mile of auto travel.

The above facts are based on a 1987 U. S. Department of Transportation report, "Road User and Property Taxes". The taxes and fees were those in effect on January 1, 1987. Included are all highway user taxes and, where applicable, state personal property taxes. The study compared annual taxes on a 80,000 lb. gross vehicle weight truck/trailer combination driven 80,000 miles per year and a 4,200 lb. gross vehicle weight automobile driven 12,500 per year.

Raising Motor Fuel Taxes. Alaska's motor fuel tax, which has not changed since 1961, is eight cents per gallon and the revenue trend from the tax is as shown in the chart.

A comparison of the 1986 revenues with 1988 State Highway Program receipts (page I-5) shows a wide disparity. A ninefold increase in the tax on fuel used in highway travel would have been required to raise the $200.5 million per year of state funds, including debt service, motor vehicle law enforcement and highway safety programs.. Over a fivefold increase in total motor fuel tax receipts (highway plus aviation and marine fuel taxes) would have been required to raise the $200.5 million of state funds used to support the 1988 State Highway Program

However as shown on page III- 11, a doubling of the total motor fuel tax would meet the FY 1988 budget for highway and airport maintenance. As has been the experience of state highway program managers in other states, the earmarking of highway user taxes and fees (or other taxes, such as mineral severance taxes) for the state highway program or distinct parts of the program, such as highway maintenance, enables program managers to better plan for efficient and effective use of the funds.

Maintaining Balance Between Competitors. The Alaska Railroad Corporation and private truckers compete for freight movement in some important corridors. And it is important to maintain the existing balance in trucking and railroad costs when enacting highway finance initiatives. Higher highway user taxes would immediately change costs in the trucking industry to the railroads advantage -- unless the railroads costs were raised concurrently.

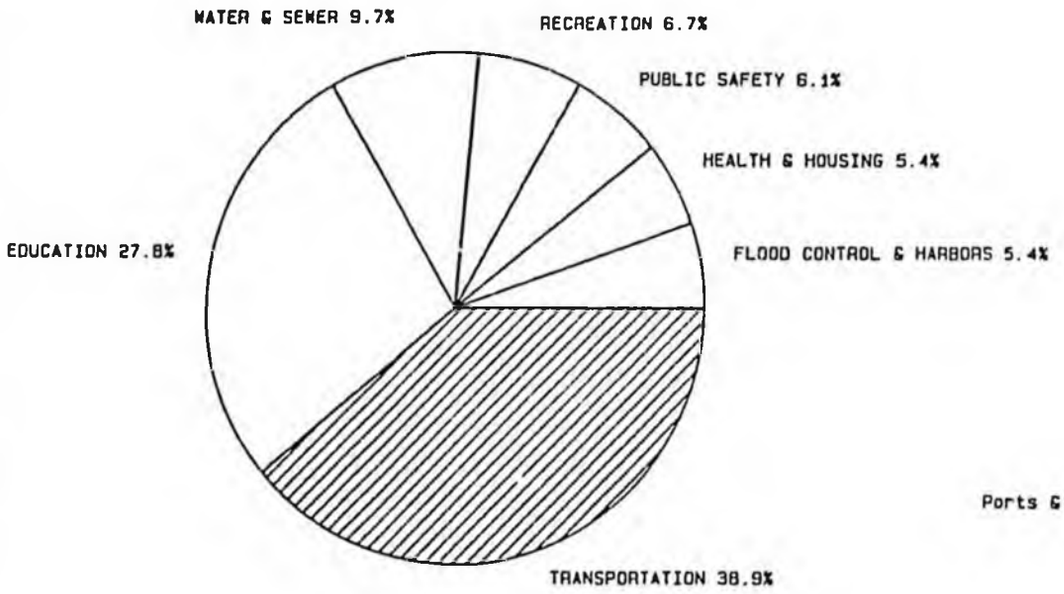
Two Possibilities That Need Further Study. One solution is enactment of legislation requiring the Alaska Railroad Corporation to pay motor fuel taxes. The Railroad is currently exempt from such taxes.

A second solution is to establish a regulation requiring the Alaska Railroad Corporation to pay monthly, quarterly or annual fees to the Alaska Treasurer in lieu of the taxes.

In either case it is suggested that at least half of the added railroad payments be used for railroad/highway grade separations. This would expand the program of constructing grade separations thereby enhancing safety and the efficiency of both rail and truck freight operations.

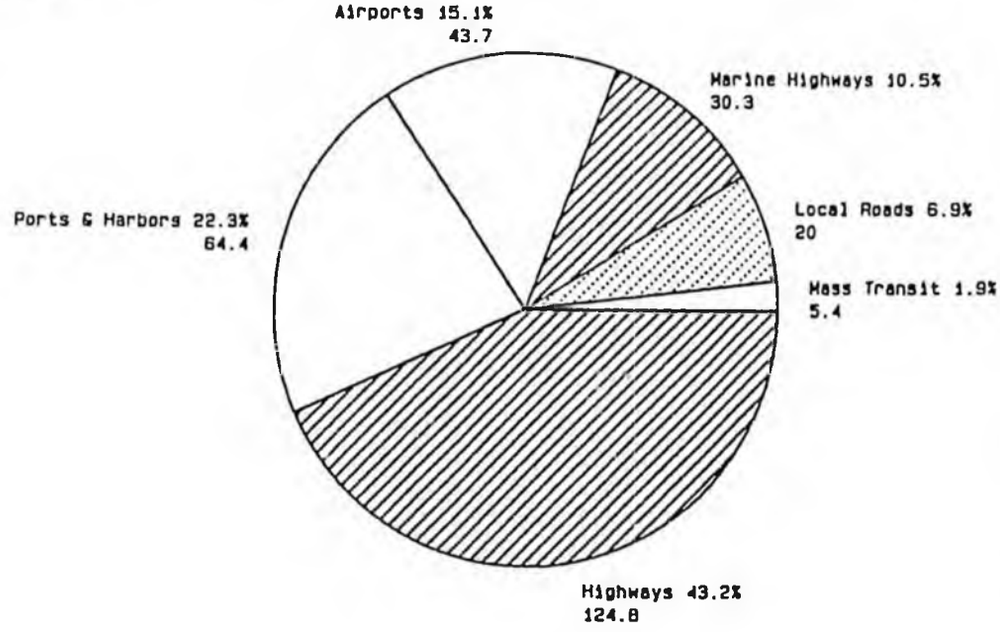
STATE BONDS

TOTAL SINCE STATEHOOD



TOTAL: $1.4 BILLION AS OF 6/30/84

TRANSPORTATION DEBT



TOTAL: $288.6 MILLION AS OF 12/31/86

Transportation Debt Being Rapidly Amortized. As shown in the right hand pie chart, the state transportation debt stood at $288.6 million as of December 31, 1986. This is down by $47.6 million from the close of the previous calendar year and $95.5 million down from two years previous. At that rate of amortization, state transportation bonds will be eliminated in six years.

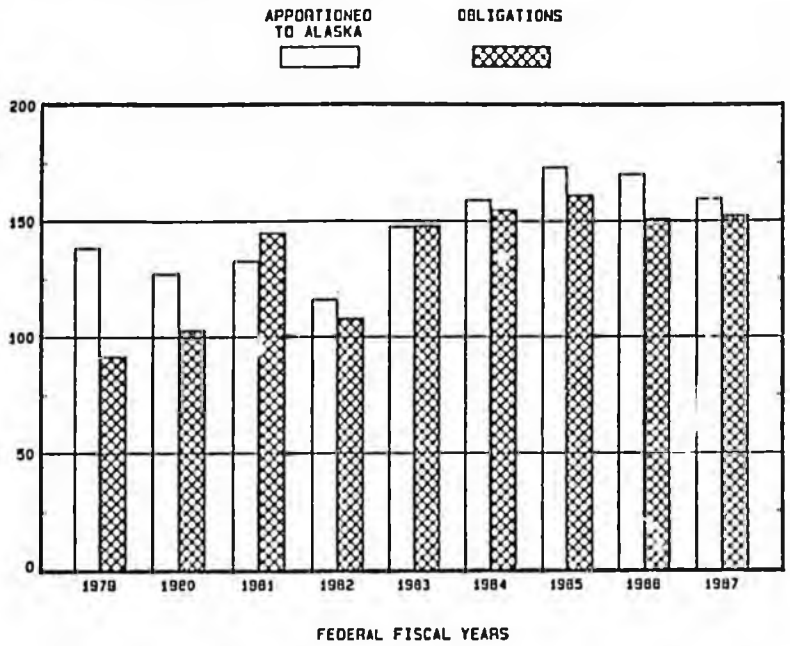
At $155.1 million, the debt for land highways and the Marine Highway System represented 53.7 percent of the December 31, 1985, transportation debt. (The revenue bonds sold by the Alaska International airport System are not included in the charts.)

Some states rely extensively on the bond market for their state highway capital improvement programs. As a nation, total state highway debt was $20 billion as of December 31, 1985,the latest year in which debt summary information is available.

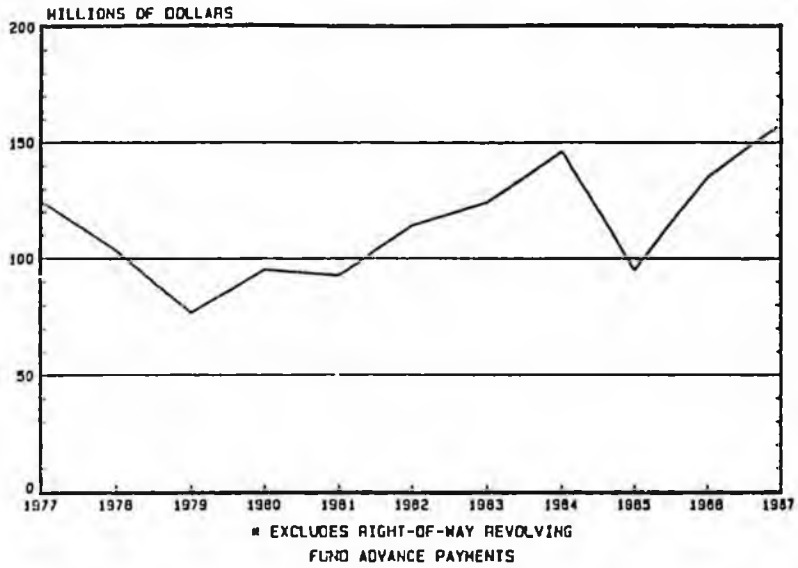
Alaska leads The Way in Public/Private Cooperation. Alaska has three outstanding examples of private funding for highway construction – 1) the 416 mile Dalton Highway built by oil interests; 2) the 50 miles of Red Dog Mine Access Road being financed by the Alaska Industrial Development Authority which will be reimbursed by private mining interests; and 3) the $1.3 million contribution by a trucking firm for the upgrading of the Klondike Highway to allow heavy-laden ore trucks to gain access from Canadian mines to the port at Skagway.

Military Involvement Also Important. The construction of the Alaska Highway in both Canada and Alaska by the U.S. Army during the early part of World War II was also a tremendous contribution to Alaska highway development.

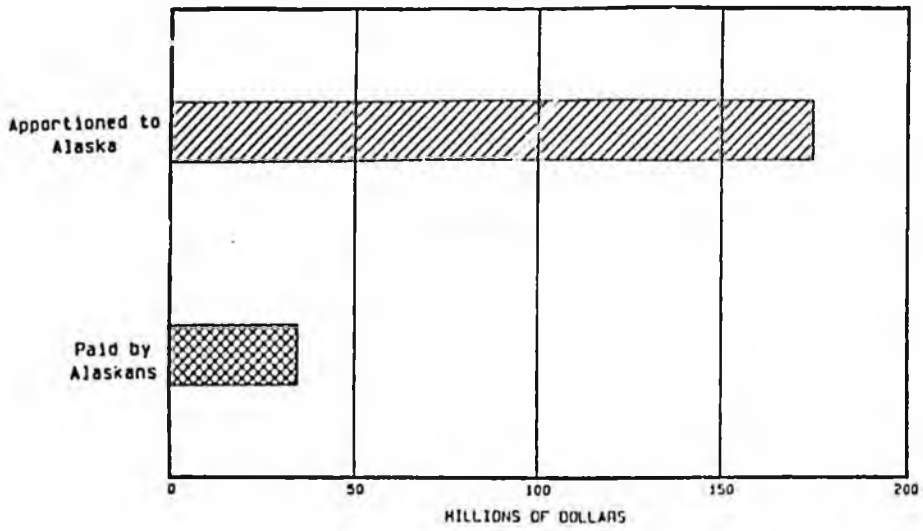
FEDERAL AID HIGHWAY PROGRAM



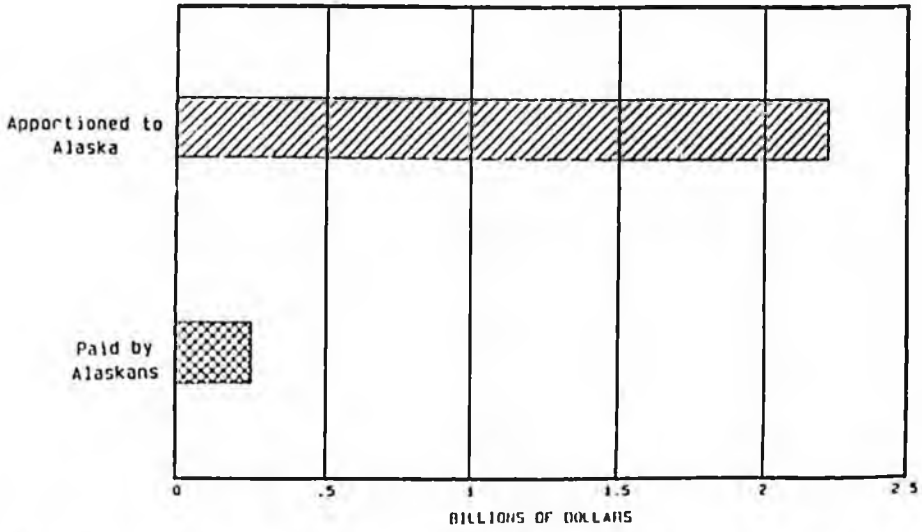
REIMBURSEMENTS



FY 1985



SINCE 1956



Federal Aid Highway Program Critically Important To Alaska. The chart on the upper left indicates the trends in the amounts of federal funds:

1) apportioned to Alaska, and 2) made available after budget limitations were applied by lawmakers and actually used (obligated for subsequent spending on Alaska road and bridge improvements). Federal aid highway funds are restricted by federal mandate for highway, ferry and ferry terminal improvements as well as planning, research and safety activities. Federal funds cannot be directed to highway maintenance activities.

1987 A Record. The upper right chart tracks actual payments to Alaska from 1977 to 1987 (federal fiscal years). Note that 1987 was Alaska's record-high year for Federal Aid Highway Program receipts. The federal funds stem largely from a nine cents per gallon tax on gasoline, a three cents per gallon tax on gasohol, a 16 cents per gallon tax on diesel and other special motor fuels, as well as a 12 percent sales tax on heavy truck and truck trailer purchases, a tax on truck tire sales and an annual use tax on heavy trucks. The federal highway user taxes are accounted for in the U.S. Treasury in a Highway Trust Fund and apportioned to each state for the modernization of major highway systems and bridges.

Federal Budget Controls Limit Spending. For the October 1, 1985 to September 30, 1986 federal fiscal year, Alaska was apportioned $165 million of authorized funds, but due to federal obligational control limitations only $151 million of the apportioned funds were actually available to Alaska. In other words $14 ($9 federal and $1 state) million worth of highway improvement projects could not be started because the obligation ceiling restricted the use of authorized and available Highway Trust Fund money.

Slowdown In Highway Improvements. The situation is far worse for fiscal year 1988 because it is controlled by the authorization levels mandated by the Surface Transportation and Uniform Relocation Assistance Act of 1987. This act reduced annual authorization levels over the 1988 to 1991 period. Furthermore, obligational control further limits fiscal year 1988 funds to about $130 million. Unless obligational controls are lifted, Alaska's highway improvement program will be sharply lower than the 1983 to 1987 experience.

Federal Incentives For Road And Bridge Modernization. The portion of the cost borne by federal highway user taxes, depends on the Federal Aid Highway System -- Interstate, Primary, Secondary, Urban classification of the road to be improved. Federal funds will participate in 94.7 percent of the cost of Interstate Highway System original construction or rehabilitation, 91.4 percent of the cost of improving the other Systems and 80 percent of bridge replacement or rehabilitation costs. Overall, every dollar of Alaska funds that are made available for highway and bridge improvements is matched by nine dollars of Federal Highway Program funds -- up to the limit of federal obligation authority. This is a great incentive for Alaska highway and bridge modernization.

Alaska Benefits The Most From The Federal Aid Highway Program. The bottom left chart indicates the amount of Federal Aid Highway Program funds apportioned to Alaska in 1985, as well as the amount of federal highway user taxes paid by Alaskans in that year. The bottom right chart summarizes both Alaska's apportionment of Federal Aid Highway Program funds and Alaskans payment of federal highway user taxes over the 1956 to 1985 period. At five and one half to one for FY 1985 and nine to one overall, Alaska leads all other states in the ratio of apportionments to taxes paid. This is due primarily to the fact that state apportionments of federal funds are related to the extent of land area in each state. Alaska, having the largest proportion of land of any state in the nation, receives disproportionally large shares of Federal Aid Highway Program funds.

Non-monetary Benefits. Besides financial assistance, there are other benefits that come with a strong Federal Aid Highway Program. First, it is required that national design standards be used and this promotes national uniformity as well as the safest possible highway environment. Second, federal officials on the scene in Alaska (the Juneau office of the Federal Highway Administration has a 12-person professional staff) provide both an oversight function as well as technical assistance to ADOT&PF officials. Lastly, the long standing spirit of cooperation that has prevailed between federal and ADOT&PF officials has been a stabilizing influence in Alaska's program of highway improvement.

CHAPTER II

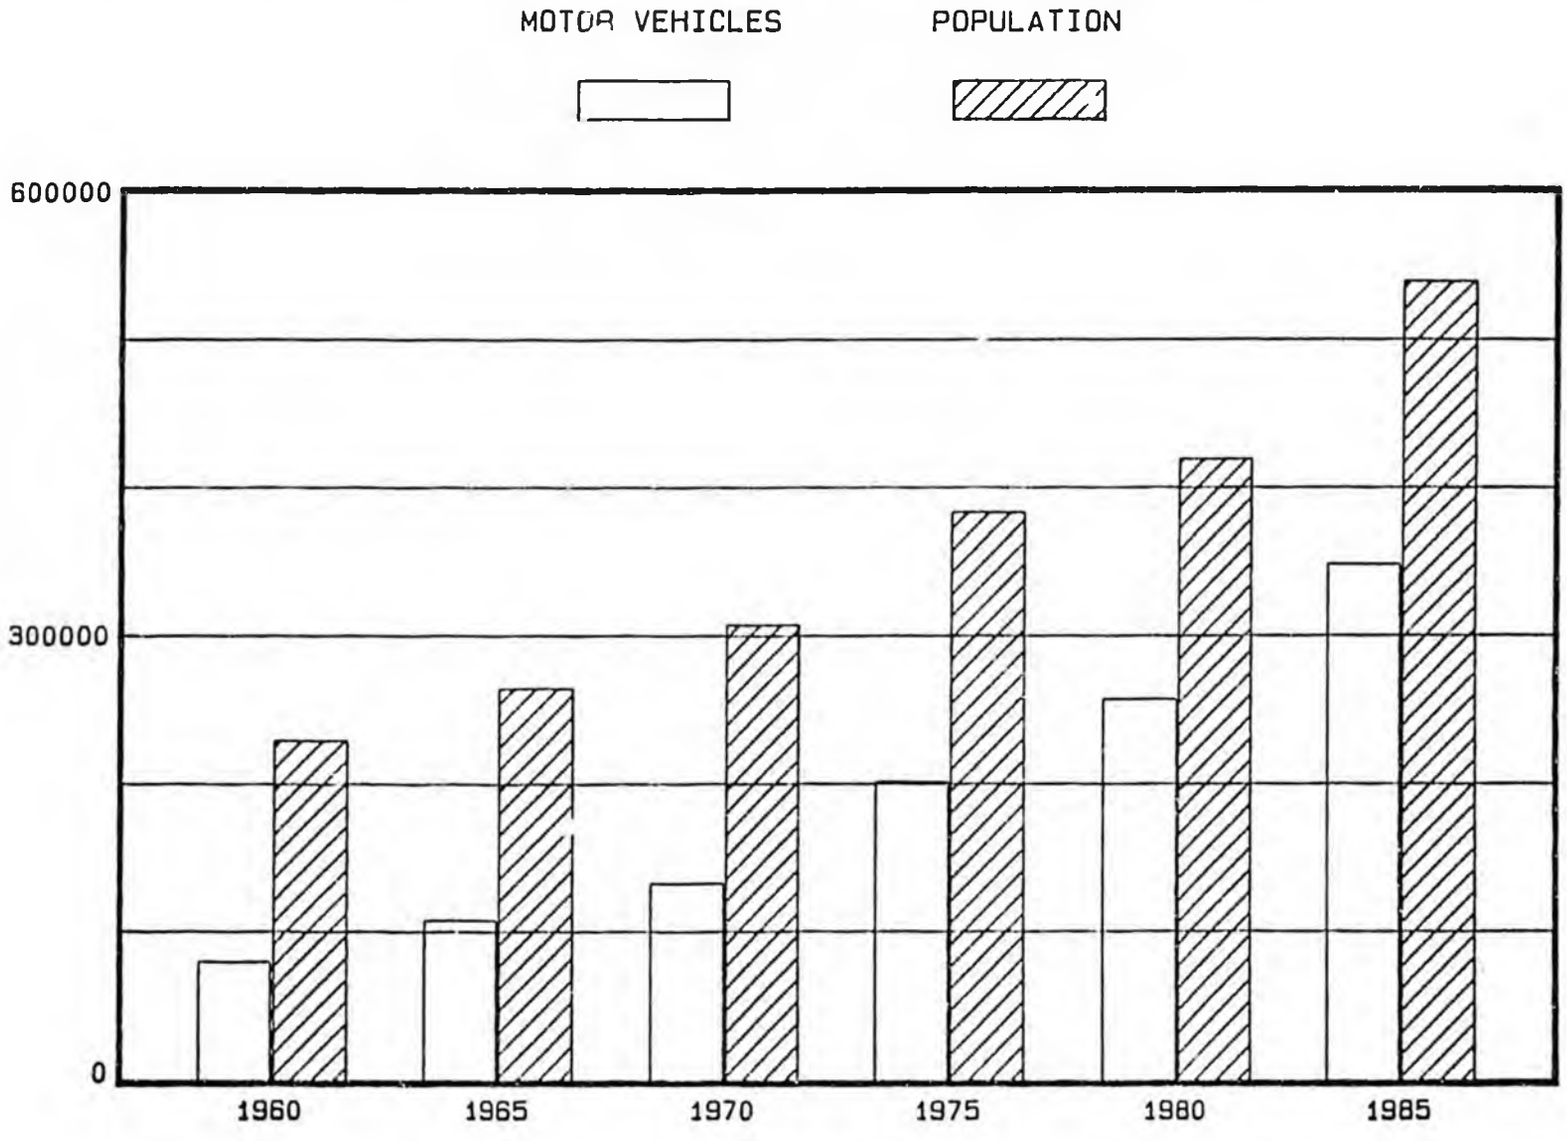
HIGHWAY PERFORMANCE AND CONDITION

CHAPTER II

Highway Performance and Conditions

Population, Registered Motor Vehicles, Motor Vehicle Travel and Traffic Safety Trends are Analyzed. The Status of Alaska's Highways and Bridges as well as the Means for Measuring the Status are Reviewed. The Trends in Passengers and Vehicles Carried by the Marine Highway System are Presented along with the Trend in Airport Use. Where applicable, Comparisons are made with National Averages.

POPULATION AND MOTOR VEHICLE TRENDS



National Comparison. For the last 25 years, the total United States population increased by 30 percent while registered motor vehicles doubled and travel tripled. Significant as these statistics are, Alaska's growth far surpasses the national averages. Between 1960 and 1985 Alaska's population doubled while the number of registered motor vehicles quadrupled and the vehicle miles of motor vehicle travel increased sixfold.

Motor Vehicles Catching Up With People. Like the rest of the nation, the number of registered motor vehicles is approaching unity with population. In 1960 there was one vehicle for every three people in Alaska. Now there are two vehicles for every three Alaska citizens.

Anchorage Important. Just under half (47 percent) of Alaska's citizens live in Anchorage and almost a third (31 percent) of the motor vehicle travel is on Anchorage urbanized area streets and state highways.

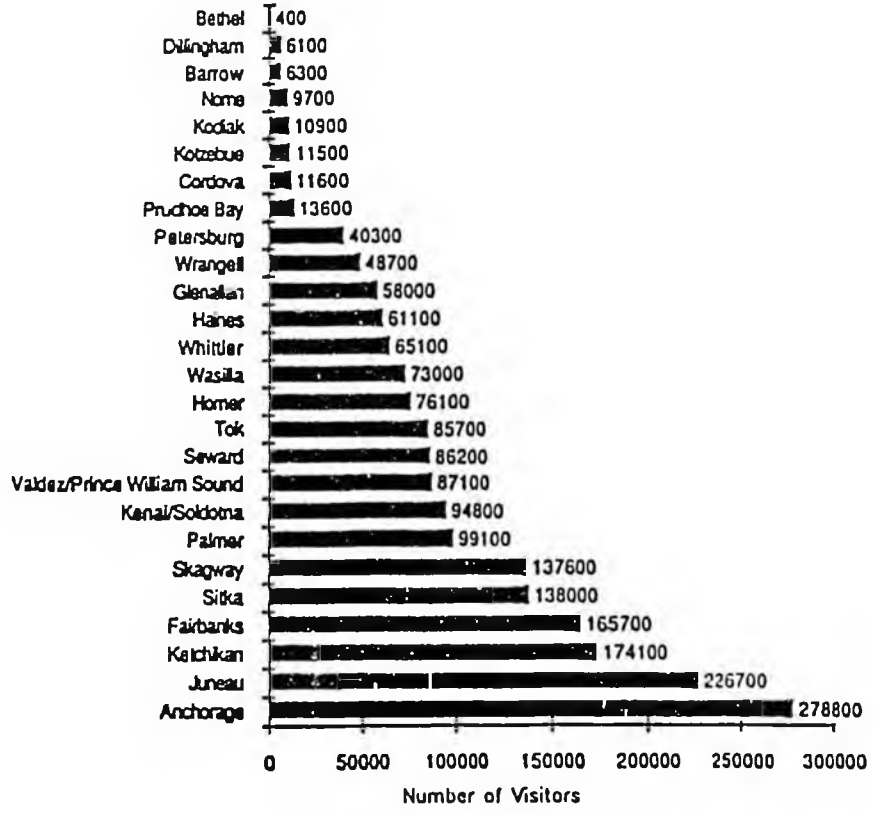
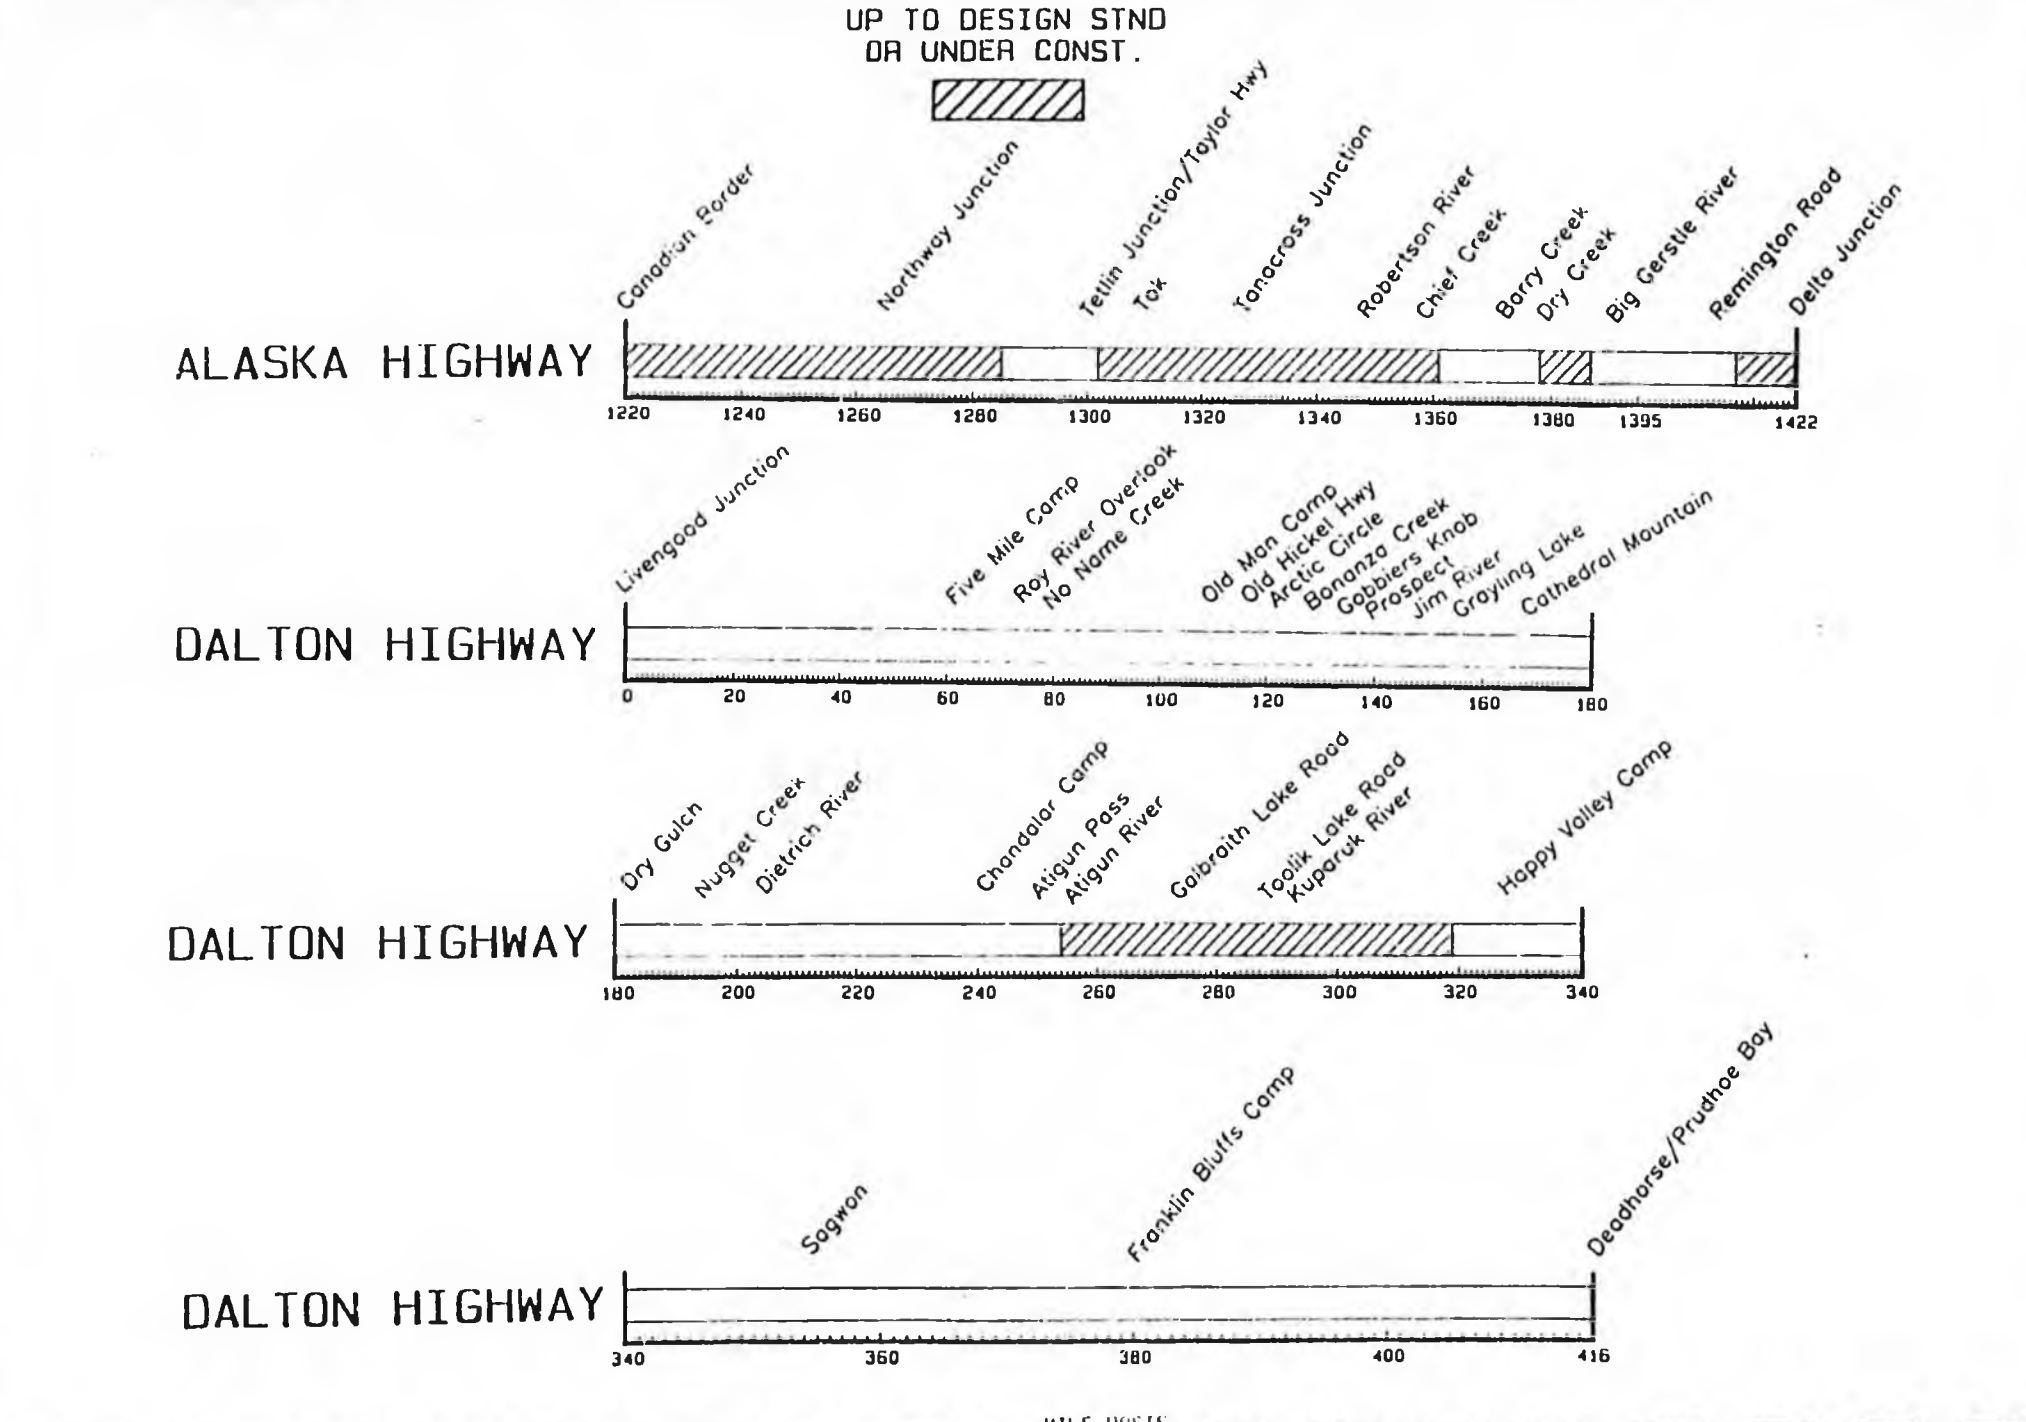
TOTAL VISITS: 904,600
SUMMER 1985

While much of Alaska's future is difficult to predict because of its heavy ties to resource development, Alaska's picturesque scenery and exceptional hunting, fishing and camping opportunities are certain to continue attracting national and international visitors. A 1985 survey of Alaska's visitors shows the significance of the travel modes and the popularity of the various regions and communities.

NUMBER OF VISITORS TO COMMUNITIES



ANALYSIS OF NORTHERN REGION HIGHWAYS



The page above and the following six pages graphically show the status of Alaska's major state highways. The cross-hatched sections were being improved in 1987 or were judged by ADOT&PF planners and engineers to meet tolerable standards of design. The blank sections are judged to be intolerable in terms of surface conditions, pavement width or alignment. A cursory review shows that about half of the road miles have tolerable physical and traffic service characteristics while half have serious deficiencies that need to be corrected.

The charts are arranged by ADOT&PF Region beginning with the Northern Region which has the most extensive miles of state highway.

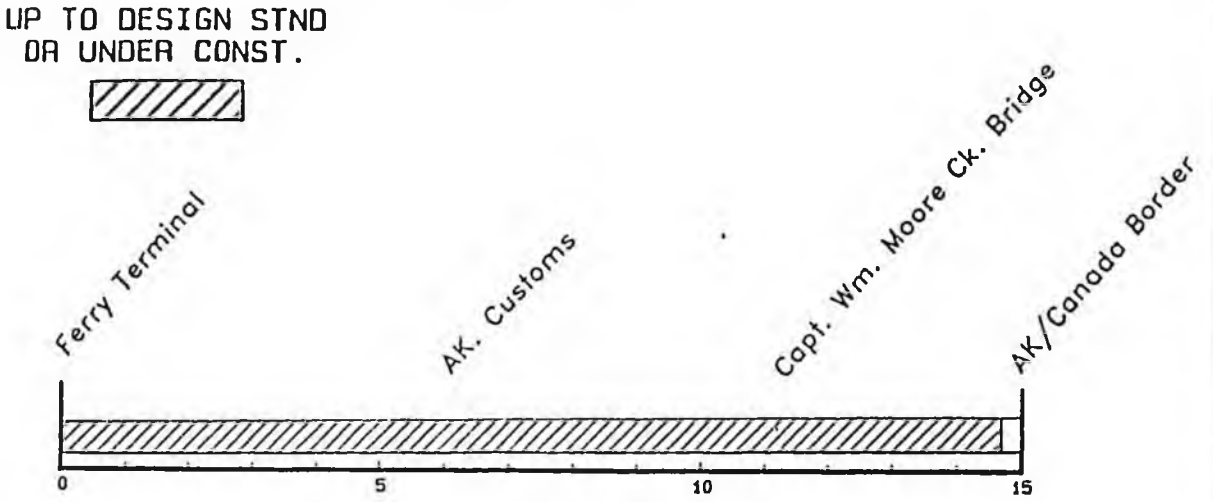
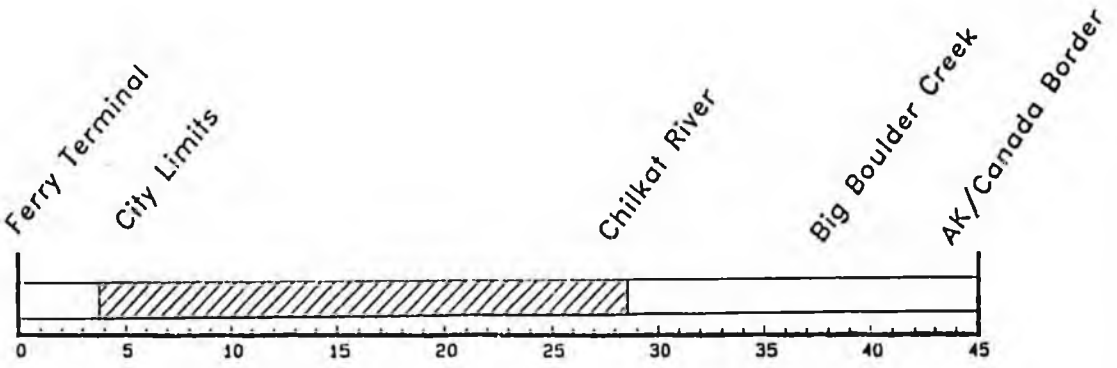
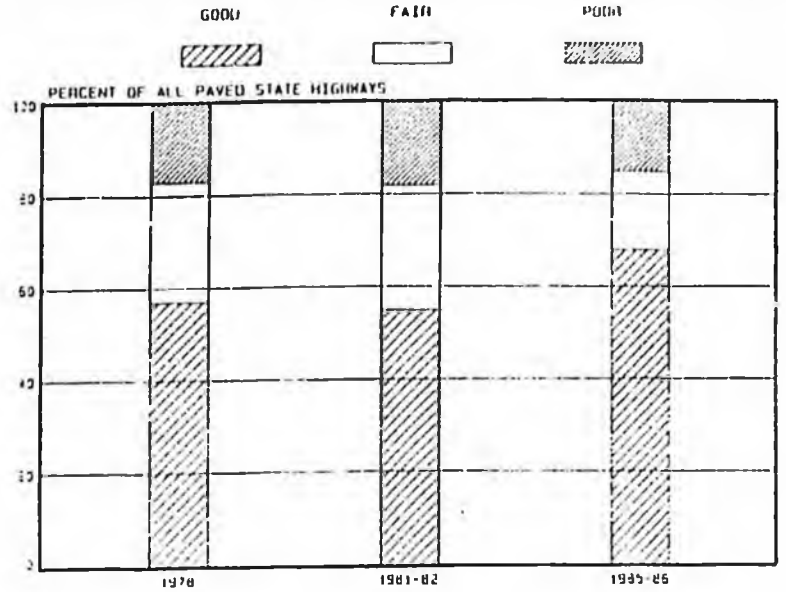
ANALYSIS OF SOUTHEAST REGION HIGHWAYS

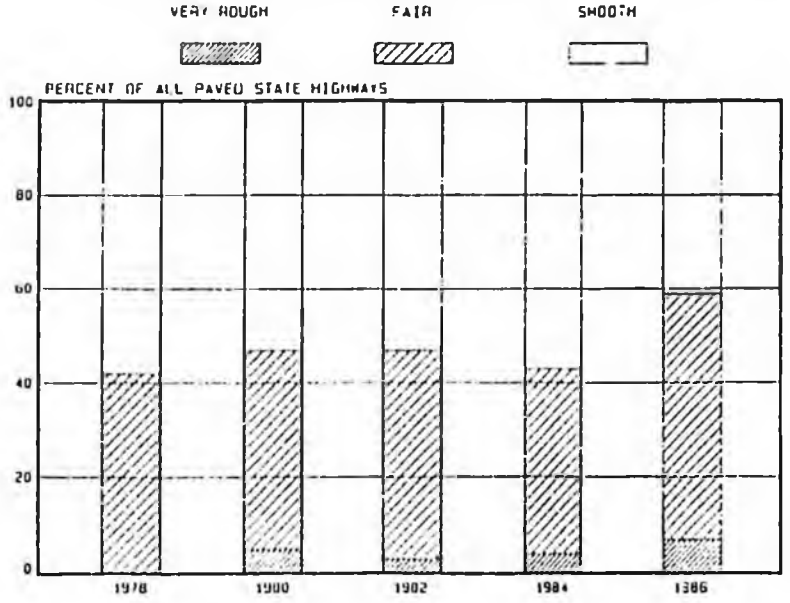




PAVEMENT STRUCTURAL CONDITION TREND



HIGHWAY RIDEABILITY TREND



Starting in 1978 the ADOT&PF's Research Section began surveying the condition of the paved sections of the state highway system. Both the structural integrity and the smoothness, or rideability, of the pavement were judged.

Structural Improvement; Deterioration In Rideability. The uppermost chart indicates the trend in the proportion of highways judged to be "good", "fair" and "poor" in terms of pavement soundness. The proportion of pavement in good structural condition has moved from 58 percent in 1978 surveys to 69 percent in 1985-1986 surveys, while over the same period of time, the proportions of paved state highway with fair and poor structural ratings decreased.

On the other hand, the lower chart shows that the proportion of very rough pavement (in terms of rideability) rose from less than one percent in 1978 to seven percent in 1986. At the same time, the proportion of state highways with smooth pavement dropped from 58 percent in 1978 to 41 percent in 1986.

National Surveys Give Low Ratings To Alaska's Highways. The ADOT&PF participates in periodic national surveys of sample sections of highways in order to provide federal officials and Congress a national overview of pavement conditions and highway performance. This information is used to judge the effectiveness of the Federal Highway Program. However according to the latest compilation of theses nationwide assessments of pavement condition, Alaska does not fair well. For example based on 1985 information, Alaska's rural Interstate Highway System was judged to be 45th among the 50 states in pavement serviceability.

Applauding Condition Rating Efforts. Alaska officials are commended for finding the resources to periodically measure the structural soundness and rideability of all state highway pavements. The information is used to not only accurately determine overall trends in pavement serviceability but also to pinpoint the most critical pavement rehabilitation needs. Not all states have identified the importance of such information to policymakers.

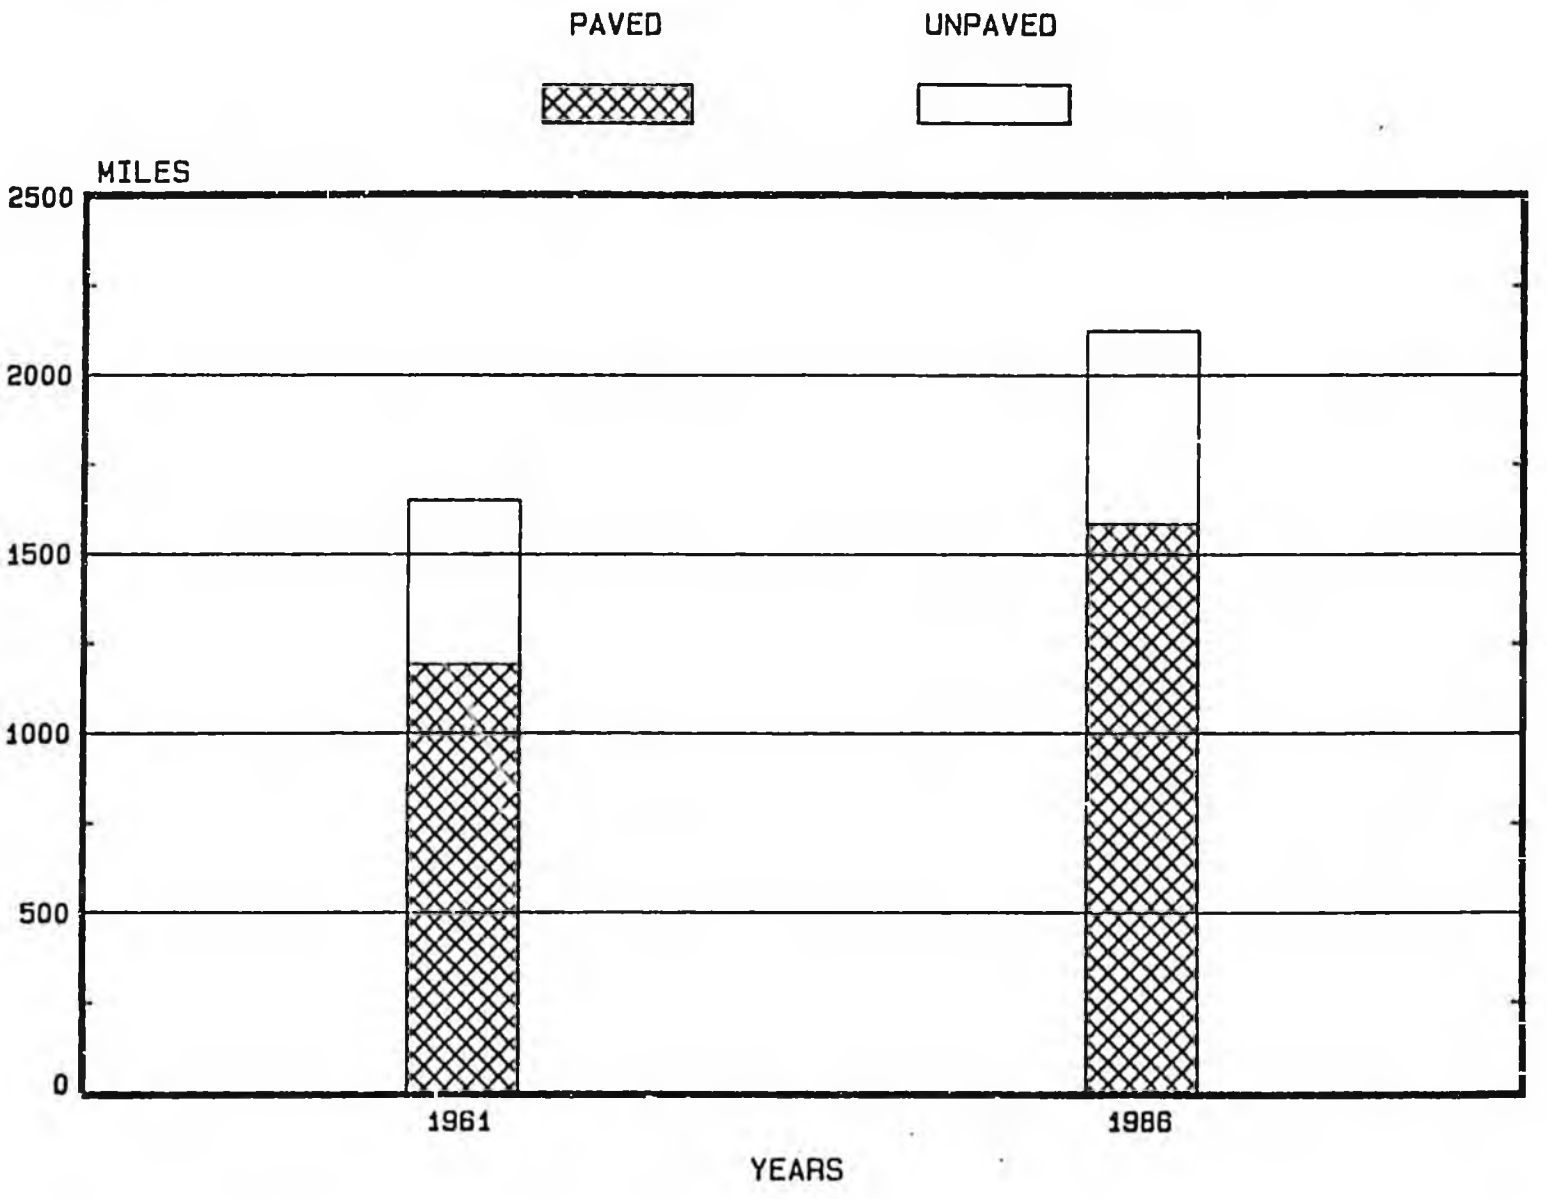
Further Efforts Needed. However other elements of the ADOT&PF physical inventory of the State Highway System need to be improved to provide up-to-date information on current physical characteristics, functions and traffic service and to provide the best possible information on trends. In general, the public and Alaska's policymakers need to be better able to answer the question, "Is the System improving, deteriorating or remaining static?"

Need For Better Information On Municipal Roads. With the exception of road miles, there is currently no central source of information on the physical and traffic service characteristics of the city streets and borough roads that are not a part of the State Highway System. But this is important information in that over $100 million in state funds are directed annually to municipal road programs (see page I-6). It is therefore recommended that the ADOT&PF – in cooperation with municipal officials – develop and keep current the physical and traffic service inventories of municipal roads, as well as state highways, and to report periodically on changes that take place.

Pavement Management System Needed. Many states have coupled their pavement rating processes with techniques for evaluating alternative improvements and estimates of the economic advantages of each. Greater pavement maintenance efforts can be compared with seal coats, various thicknesses of overlays or recycled overlays, and more complete rehabilitation of the pavement and subgrade to determine cost comparisons, both now and over the pavement life. Such information has proven to be an important aid to policymakers in making cost effective improvement program decisions.

While the ADOT&PF is making good progress toward implementing a pavement management system, it is recommenced that the ADOT&PF and the Legislature continue to give high priority to this important new tool.

INTERSTATE, PRINCIPAL & MINOR ARTERIALS



Almost 400 Miles Of Paved Highways Added To State System. The above chart is a comparison of paved and unpaved miles of the more important state highways -- Interstate, Other Principal Arterials and Minor Arterials. While the miles of paved highways has increased by 392, the amount of unpaved routes is still a significant proportion of Alaska's most important state highways.

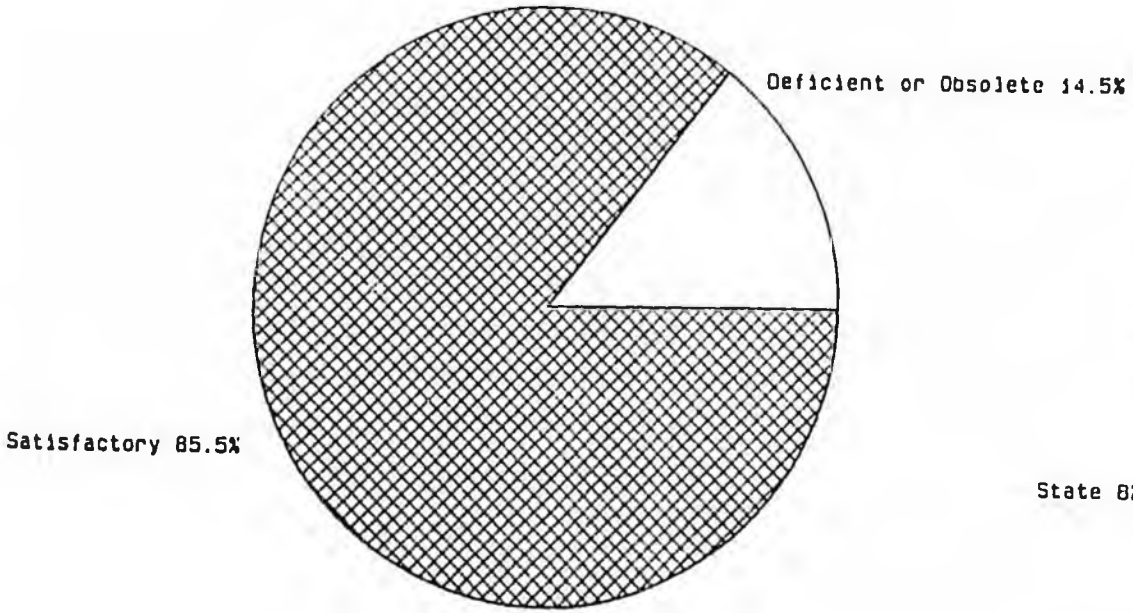
More Trend Information Needed. In order for officials and Alaska's taxpayers to determine whether or not progress is being made, more trend information is needed. As Alaska's highway inventories and highway evaluation techniques are improved, such information will become available to better judge State Highway Program effectiveness.

More Comprehensive Annual Reports Needed. The ADOT&PF, like many transportation agencies in the nation during the 1970's stopped the development and publication of periodic (annual or biennial) comprehensive reports on program progress. But now with greater public concern for the expenditure of tax resources, transportation agencies are returning to the documentation of progress or lack of progress in meeting overall objectives.

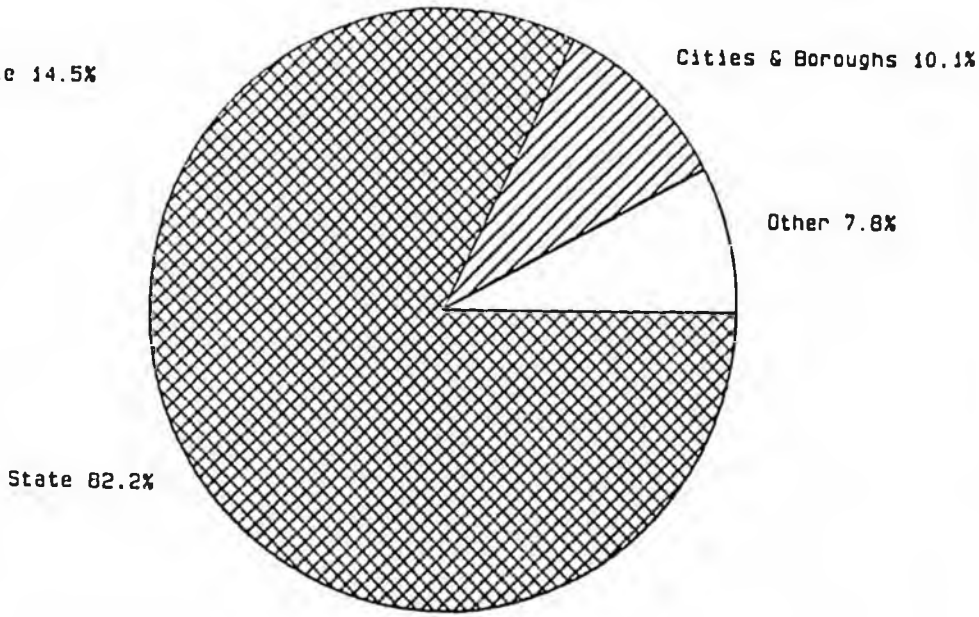
Periodic reports with emphasis on charts and maps are an excellent method of communicating the facts about complex transportation programs. The information is needed by the ADOT&PF management team and by Alaska's lawmakers to help make the best use of scarce resources.

ALASKA BRIDGES

CONDITION



RESPONSIBILITIES



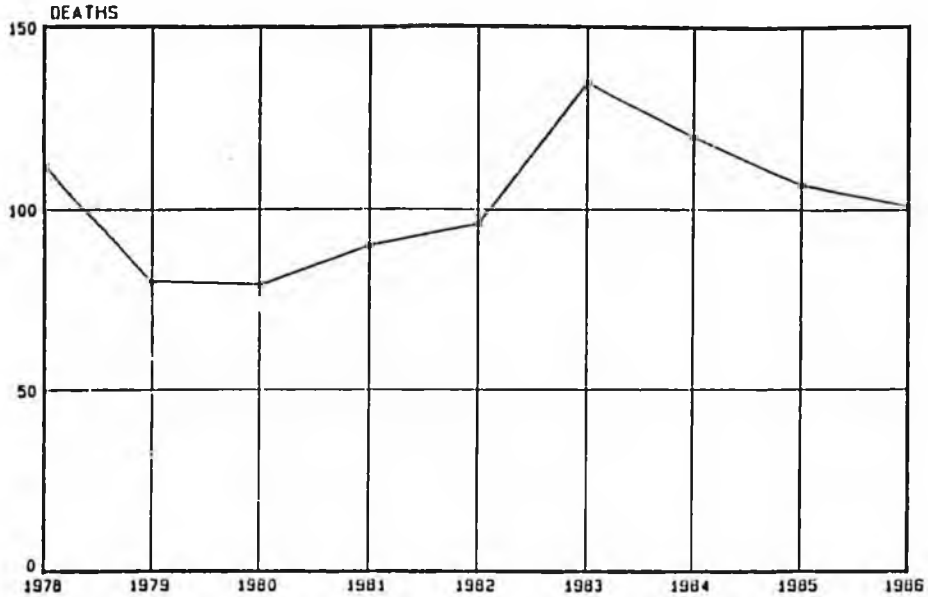
TOTAL: 825

NOTE: INCLUDES ALL BRIDGES OVER 20' SPAN

Alaska Excels In Bridges. If by national standards Alaska's highway pavement is below the average, likewise by national standards Alaska is the leader in bridge conditions. As compared with the nation as a whole where deficiencies have been found in 42 percent of the bridges, 85.5 percent of Alaska's bridges are in satisfactory condition. No other state has as high a percentage of their bridges in satisfactory condition.

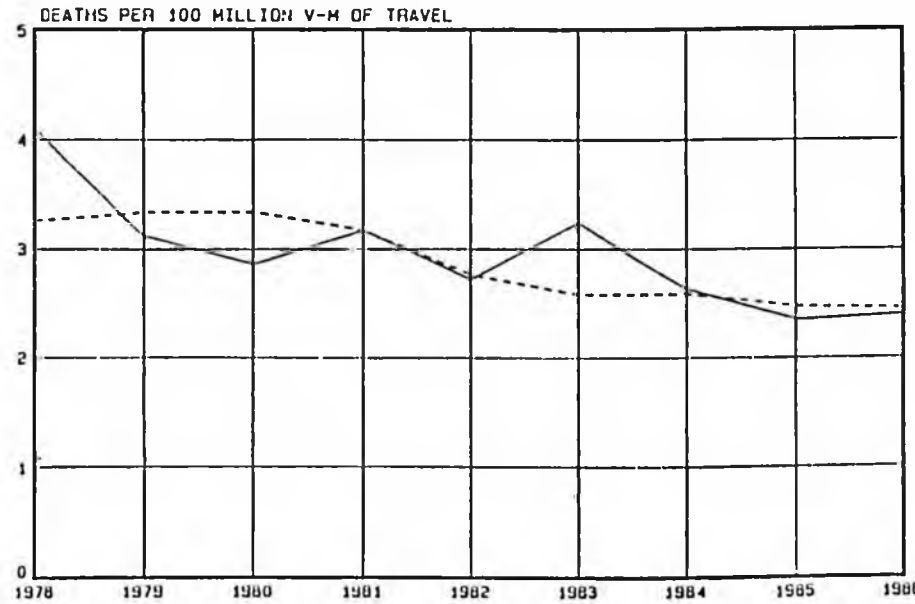
Biennial Bridge Surveys. In 1970 Congress mandated that every state inspect and report on bridge conditions on a biennial basis. The above charts and the cited statistics are as found in these national surveys and the resulting reports.

HIGHWAY SAFETY



TRAFFIC FATALITIES

ALASKA _____ U.S. - - - - - - -



FATALITY RATES

Traffic Safety Statistics Headed In Right Direction. Both the number of annual traffic fatalities and the number of annual traffic fatalities per 100 million vehicle miles of travel have been on a downward trend since 1983 . Alaska's 1986 2.4 fatality rate (traffic deaths per 100 million vehicle-miles of travel) is 41 percent below the rate just ten years ago. Furthermore, Alaska's traffic fatality rate has been below the national average for the last two years.

As shown in the table below, traffic fatalities are not the only positive accident statistics, as both the number of accidents and the number of injuries decreased from 1985 to 1986 and from the three-year, 1983-to-1985 averages to 1986.

	1985	1986	% Change from 1985	% Change from previous 3-year average
Vehicle-miles of Travel (millions)	4.8	4.7	-1.7%	+4.4%
Accidents	7,700	14,858	-19.1%	-23.8%
Fatalities	127	101	-20.5%	-25.7%
Injuries	6,165	5,525	-11.6%	-18.9%

Challenging 1988 Traffic Safety Goal. The traffic safety statistics are as reported in the Alaska Highway Safety Plan For Fiscal Year 1988, published by the Alaska Highway Safety Planning Agency. This Agency, which is responsible for the coordination of Alaska's overall traffic safety program, has established a 1988 goal of a further reduction in Alaska's traffic fatality rate to 2.0 deaths per 100 million vehicle miles driven. Judging by the preliminary estimates of 1987 traffic fatalities, which are down considerably from 1986 levels, the stated goal for 1988 may have been reached in 1987.

Engineered Safety Important. One of the major challenges ahead for the Alaska Highway Program is to continue the reduction of annual traffic fatalities in the face of increasing motor vehicle travel. Much of the progress to date nationally and in Alaska is due to the program of ever-improving the highway environment in terms of wider lanes, wider shoulders, separation of opposing lanes of traffic with medians, better control of intersections, increasing sight distances, improved signing and markings and all the other elements of highway modernizations. Much of the traffic safety progress of the future depends on continuing the modernization of Alaska's highways and bridges.

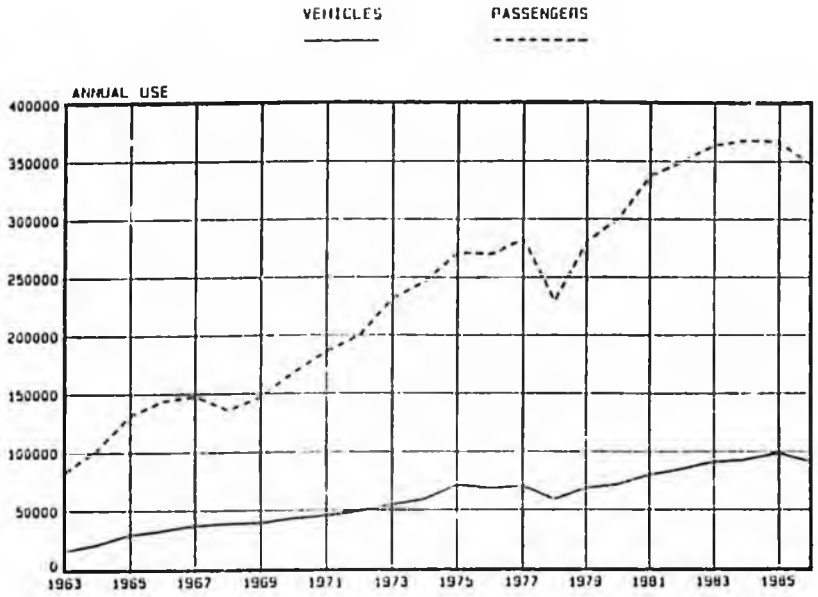
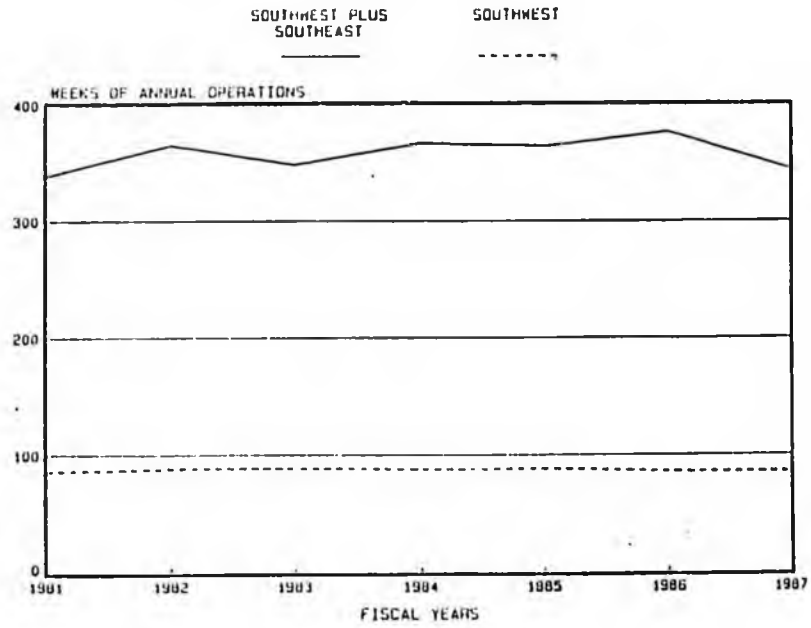
New Integrated Data Retrieval System. The ADOT&PF in 1987 made operational a new automated system for storing and analyzing highway and bridge information. The chart indicates some of the types of data that are being stored, retrieved and analyzed in the System. The Department now has a new powerful tool. However as discussed previously, some of the highway inventory information remains to be obtained and entered into the System. Much progress has been made, but there is a formidable job ahead for the ADOT&PF before this System becomes completely useful.

MARINE HIGHWAY SYSTEM TRENDS





Outside of the strike year, 1978, the Alaska Marine Highway System has enjoyed almost constant growth in passengers and vehicles served. Based on observations and interviews with passengers, the System appears to be a popular and vital part of the economics of both Southeast and Southwest Alaska.

Recent Studies. However to deal with a number of important issues surrounding AMHS service, the ADOT&PF in 1985 commissioned a series of studies. Some of the more important issues dealt with by the consulting team are as follows:

1. The capacity of the System is taxed by the tourist demand to and from Seattle thereby causing reservation problems for Alaska citizens.

2. Likewise the capacity from Juneau northward to Haines and Skagway is sometimes overtaxed.

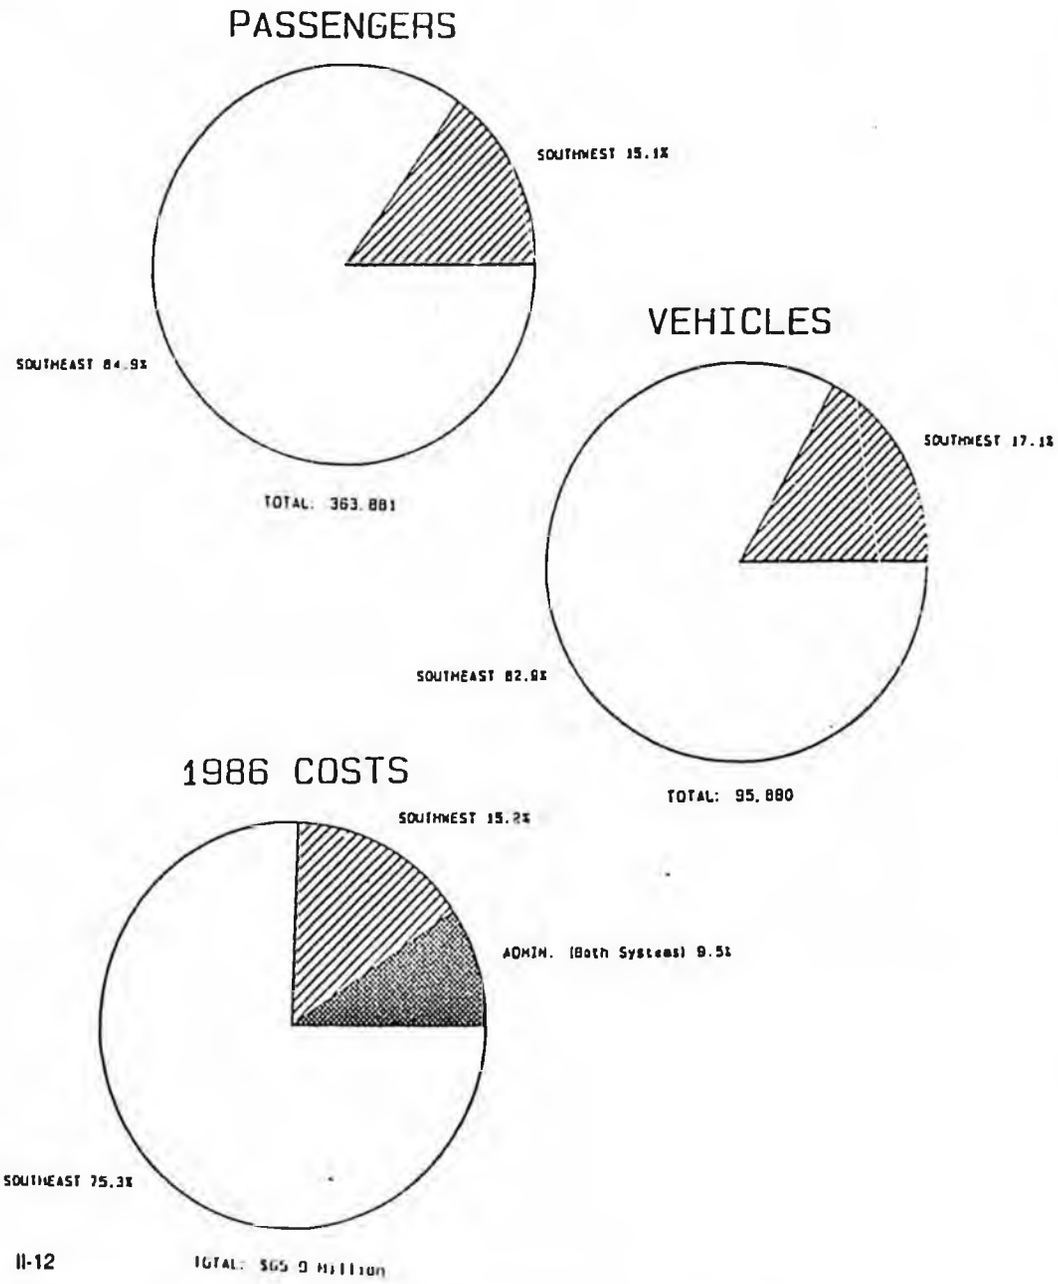
3. Providing mainline service to out-of-the-way communities causes navigational problems and adds a days time to through travellers or travellers between Juneau and all points south.

4. Building highways, new terminals and adding short ferry links to shorten some trips might relieve capacity problems and improve overall accessibility thereby generating induced travel and economic expansion.

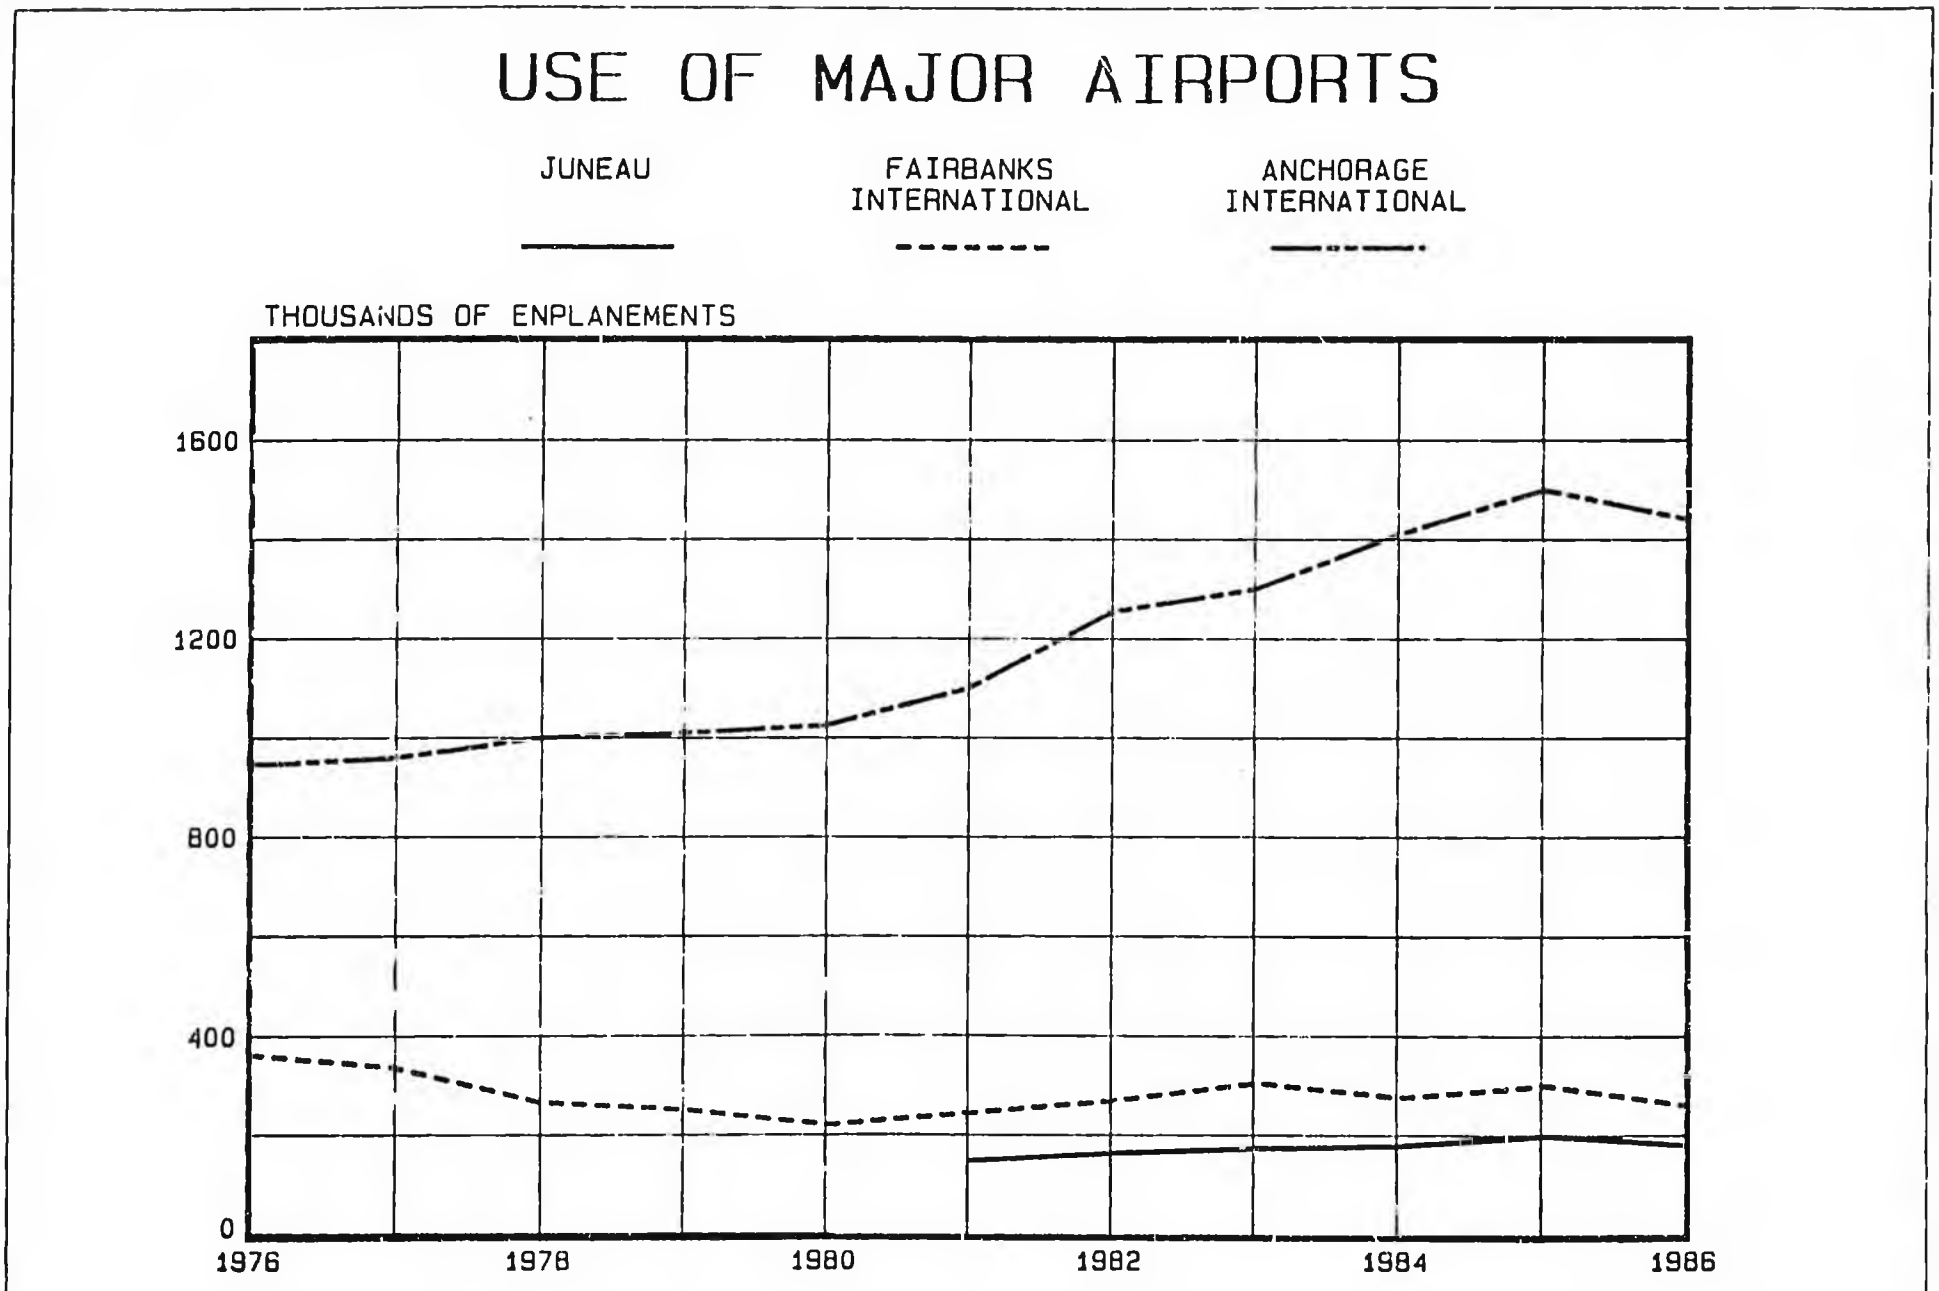
5. The addition of high speed ferries might also relieve capacity problems, allow additional service to some communities and provide basic service to other communities not now served.

While the studies did indicate much could be done, the estimated, initial capital costs for most alternatives studied were prohibitively high. The exceptions were the proposals to add new, high-speed ferries, but even these had a high budget impact.

S.E. & S.W. SYSTEMS COMPARED



USE OF MAJOR AIRPORTS



Commercial Airline Use Of Key Airports. The chart indicates the trends in commercial airline enplanements at Alaska three key airports.

Anchorage Growth Spectacular. Since 1980 the Anchorage International Airport has seen a 50 percent rise in airline deplanements and enplanements. And these figures do not include the Europe-to-Orient refueling, stopover flights that Anchorage International Airport enjoys.

Good Physical Condition. While the evaluation of Alaska's airports was beyond the scope of the Review, it was observed that each of the key airports were in good physical condition with modern terminals and good parking and road access.

Other Airports Being Improved. The other 215 airports, that are operated and maintained by the ADOT&PF, are in various stages of improvement. With the aid of Federal Airport Improvement Program funds, it appears that Alaska has made good progress in ensuring that isolated communities have reasonable airport facilities.

Private Airplanes Important To Alaskans. The Federal Aviation Administration reports that there were 9,604 licensed private aircraft belonging to Alaska citizens in 1986. Thus about five percent of Alaska families have air mobility.

CHAPTER III

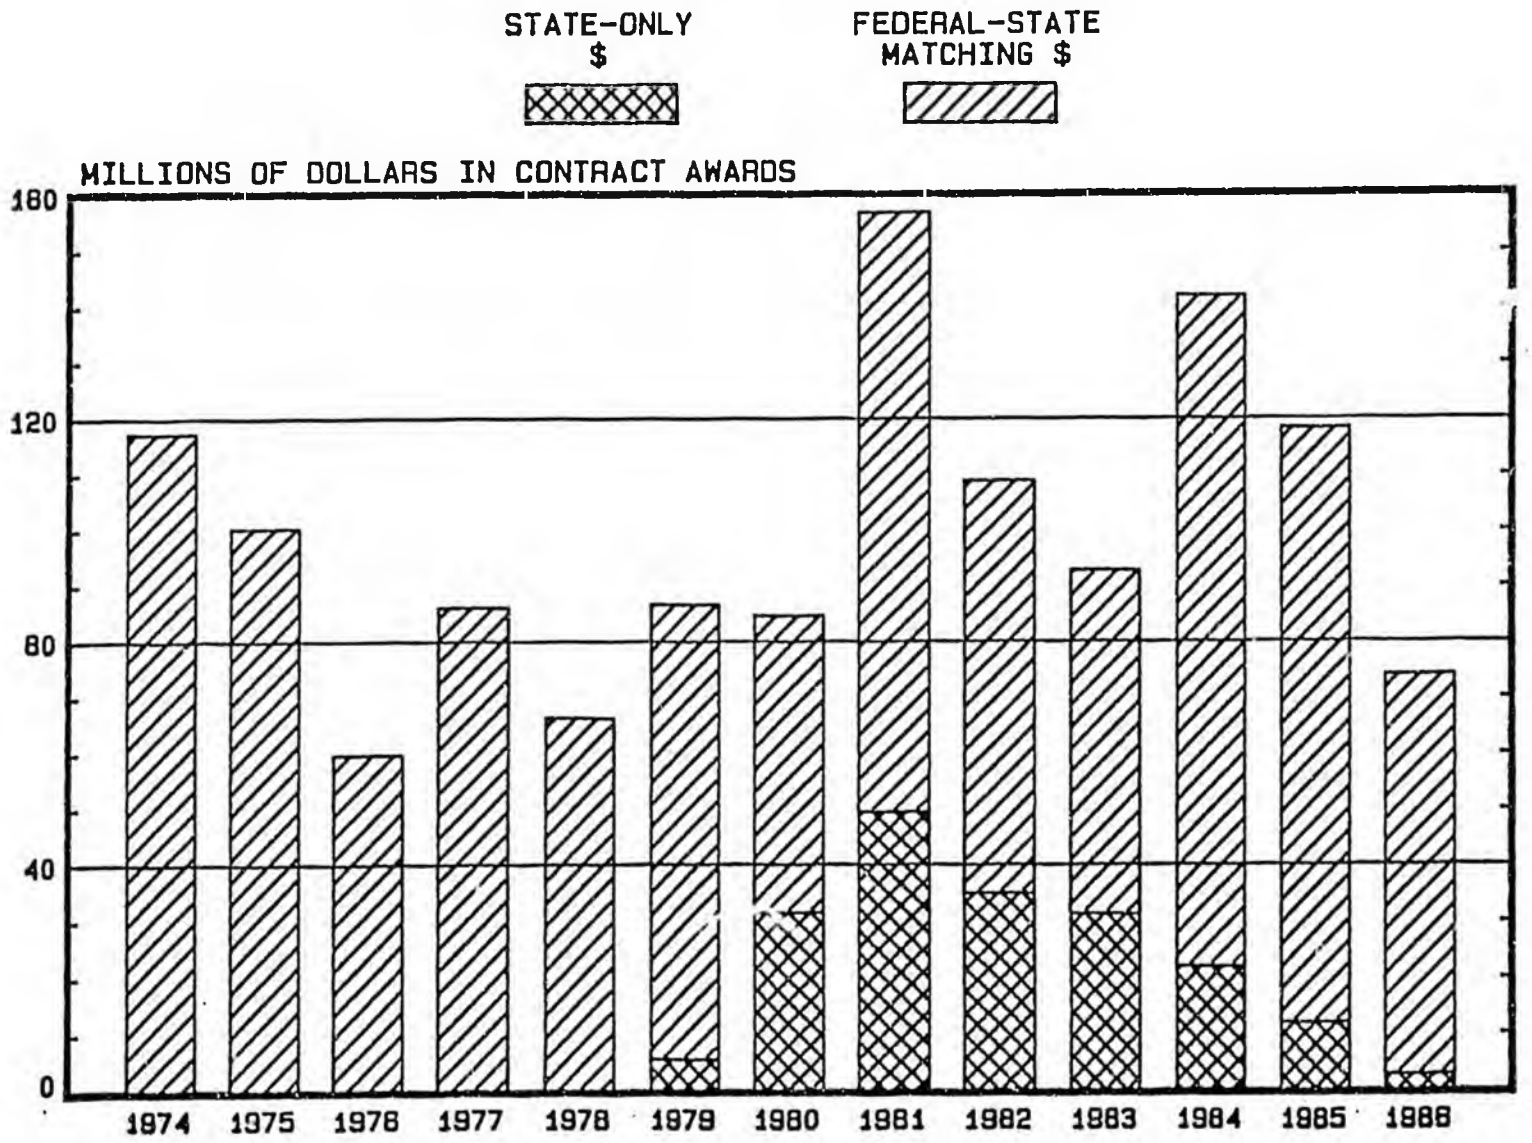
HIGHWAY PROGRAM AND NEEDS

CHAPTER III

HIGHWAY PROGRAM AND NEEDS

A Review of the State Highway and Bridge Improvement (Construction) Program in terms of both Accomplishments to date and Plans for the Future. The Utility of Engineering Analyses of Highway Needs is Discussed, as is the Expansion of the State Highway System. Also reviewed is the Highway and Airport Maintenance and Operations Program as it Relates to the Physical Condition of Alaska's Highways and the Traffic Service Provided. The Accomplishments of the ADOT&PF Research Program are also Analyzed.

HIGHWAY IMPROVEMENT HISTORY



$1.3 Billion, 13 Year Program. The above chart shows that over the 1974-1986 period (calendar years), the ADOT&PF awarded $1.3 billion in contracts to both build new state highways and to reconstruct, rehabilitate or otherwise modernize existing state highways. While the sum of each year's annual contract awards ranged from $60 million in 1976 to $157 million in 1981, the average for the period was $100 million. While not shown on the chart, ADOT&PF officials indicate $108 million in highway construction awards were made in calendar year 1987.

Disappearance Of State-Only Improvements. Two types of funding were used. The first and most prevalent is the combination of Federal Aid Highway Program funds with matching state funds. The other is state-only funds. The downward trend in state-only contracts since 1981 is consistent with Alaska's downtrend in state resources.

Matching Federal Funds Important. Most state highway and transportation officials view matching federal aid funds as the first call on available resources. This is especially true in Alaska where each Alaskan dollar made available for highway construction contract awards, generates nine matched dollars from the Highway Trust Fund (the repository of federal highway user taxes and fees) -- up to the limit of obligational authority set by Congress and the National Administration.

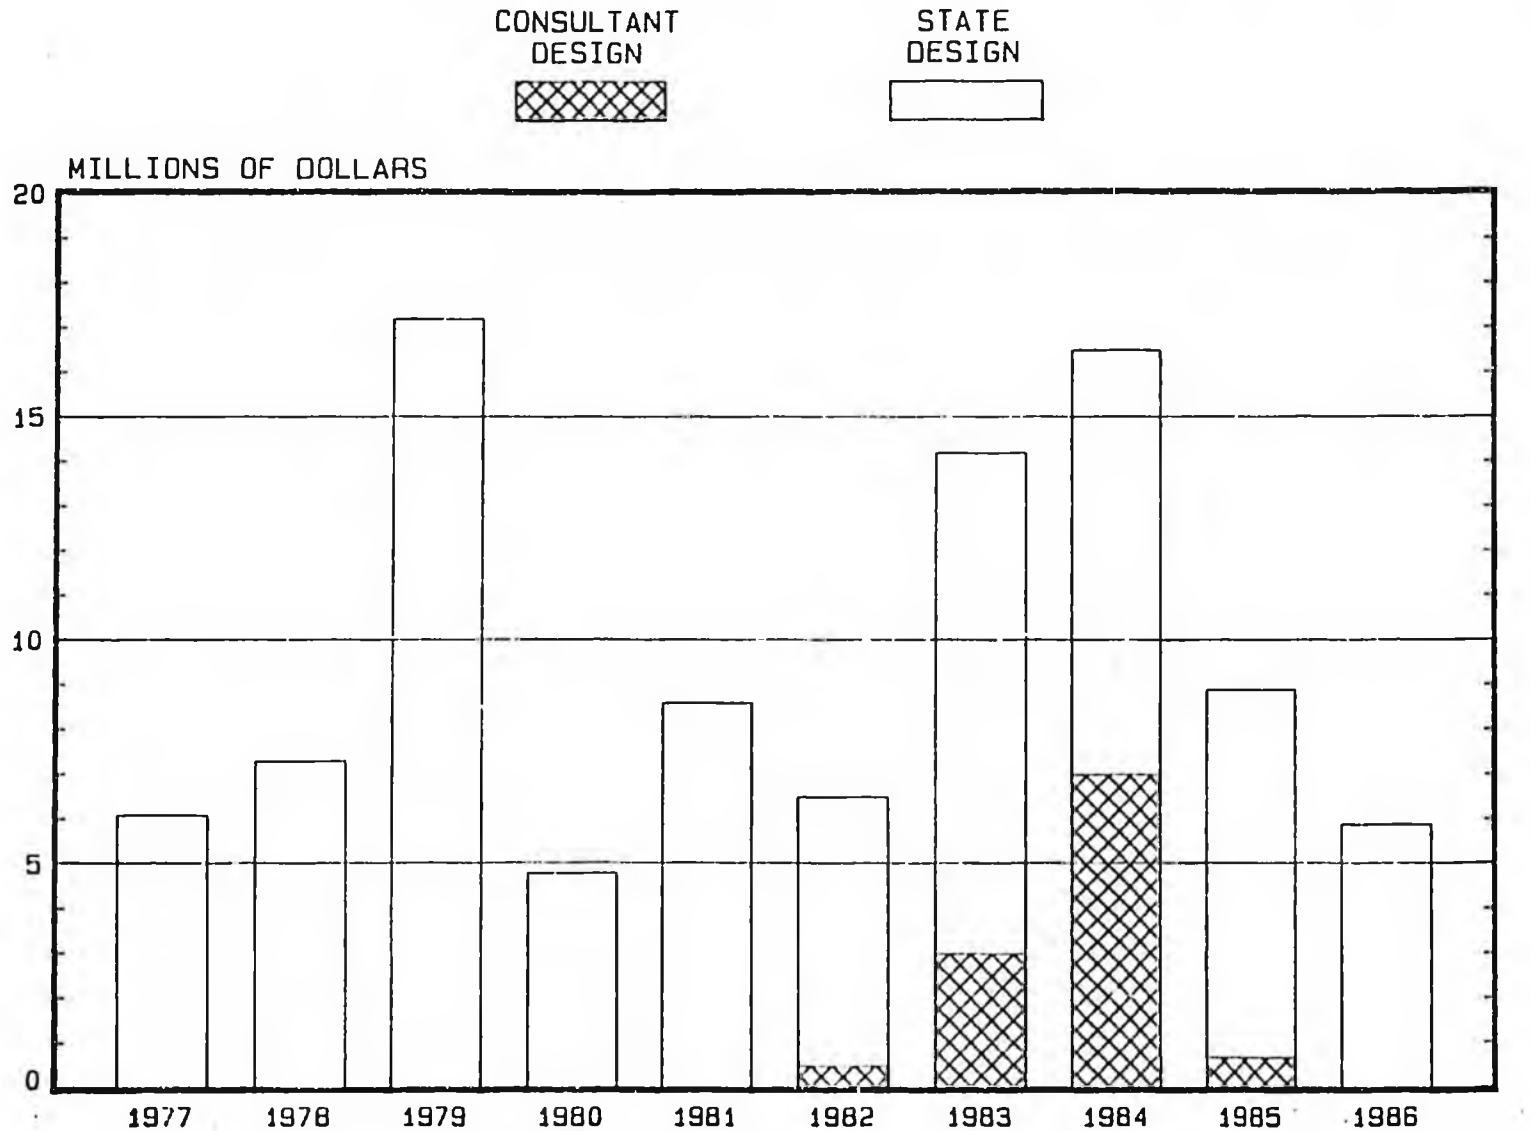
Highway Contract Awards And Federal Obligations. Note that the dollar volume of highway contract awards is consistantly less than the dollar volume of annual obligations of Federal Aid Highway Program funds (see page I-15). The apparent discrepancy is due to the fact that more than just highway improvements are committed to in the process of obligating federal aid highway funds, such as bridge rehabilitation or construction projects, construction engineering and inspection, highway planning and research activities and right of way purchases.

Up And Down Nature Of Annual Construction Awards Tough On Contracting Industry. It is important for Alaska to retain a cadre of experienced highway contracting firms in order to gain the lowest possible bid prices and the best quality improvements. However the wide deviations in annual ADOT&PF contract awards make it difficult for the contracting industry and its employees. The uncertainty about the dollar volume of ADOT&PF improvement Programs impedes the contractors' ability to plan ahead in terms of equipment, materials and manpower. Such uncertainty could force some Alaska contractors out of business (especially the small ones) or could force some contractors to relocate in other states.

Need For State-Only Program. Most states find the resources to maintain at least a small state-only highway improvement program in order to make some essential, usually low cost improvements that cannot wait for the normal federal clearances or that are not eligible for federal financing. Furthermore, some states maintain a large state-only improvement program to both accomplish many low cost improvements and to augument the larger more comprehensive federal aid program.

However when highway and transportation officials face a situation -- such as Alaska faces now -- where it is difficult to raise the funds to match federal aid highway funds, most state-only improvements are deferred. As a result, the state loses the ability to fund some types of low cost improvement, such as highway resurfacing, that do not always need to include other design improvements like alignment changes, pavement widening, guardrail installation -- but are necessary to qualify for federal funds. In other words, there are some improvements that while necessary, do not meet federal criteria for matching funds. ADOT&PF officials need the flexability of at least a $10 million state-only highway improvement program.

BRIDGE IMPROVEMENT HISTORY

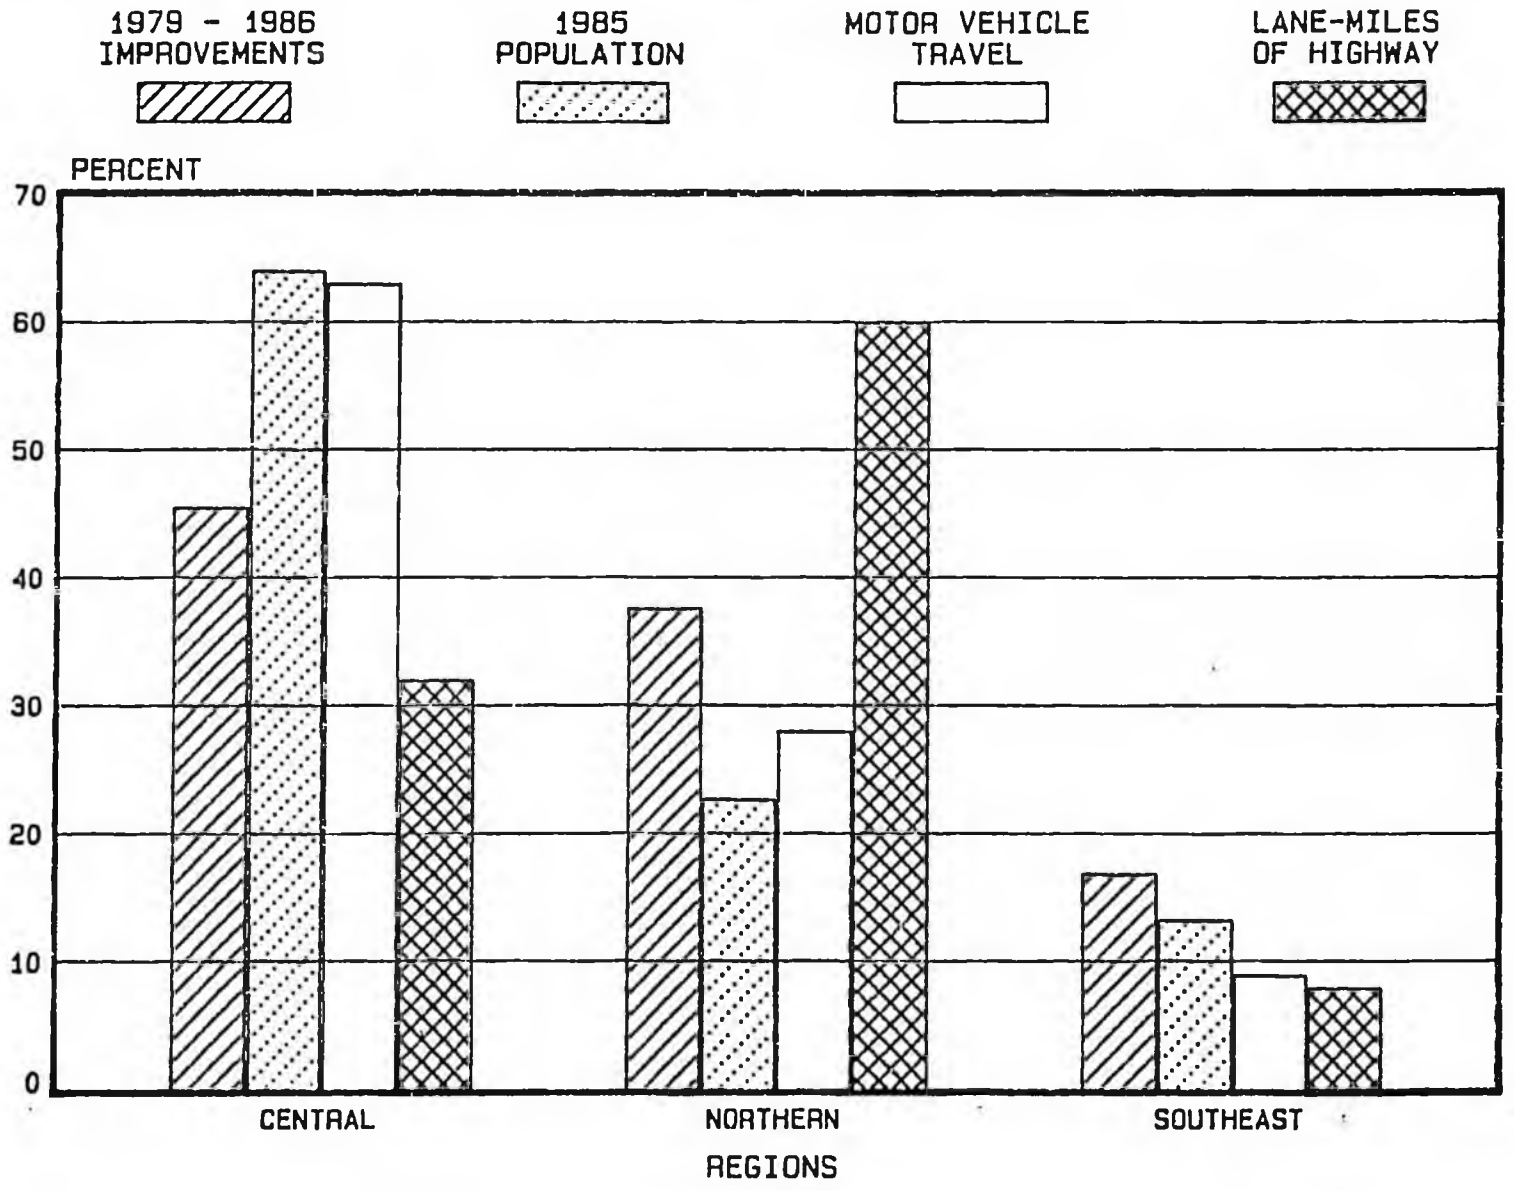


NOTE: 173 BRIDGES REPLACED OR REHABILITATED, 1977 - 1986.

$96 Million, 10 Year Bridge Program. Out of the 676 bridges that are on the State Highway System, 173 have been built, replaced or rehabilitated over the ten year, 1977-1986 period. A total of $96 million in bridge construction projects were awarded to contract -- an average of 17 per year.

Because of the specialized nature of the work, all bridge design and plan preparation, that is accomplished by ADOT&PF staff, is done in the Juneau headquarters office.

DISTRIBUTION OF HIGHWAY IMPROVEMENTS



Highways And Bridges Are Two Thirds Of Total ADOT&PF Capital Improvement Program. For the 1979 to 1986 period, the Central Region awarded the most capital improvement projects, that is for highways, bridges, harbors, ferries, ferry terminals, airports and state buildings. The highway and bridge share of the $1.5 billion in contract awards was $948 million or two thirds of the total.

The charts above show the distribution of the $1.5 billion of contract awards for the years 1979 through 1986, as well as how the distribution relates to population, motor vehicle travel and lane-miles of state highway in each Region.

Distribution of Improvements, A Hot Issue. One of the "hotest" issues in most state highway programs is the distribution of resources for capital improvements. In some states the distribution is based on formulas with factors such as population, miles of highway, lane-miles of highway, engineering appraisals of need or some combination of factors.

In some states either the legislature or the highway (or transportation) commission sets the distribution. And in some states – like Alaska – the chief executive officer of the department sets the distribution.

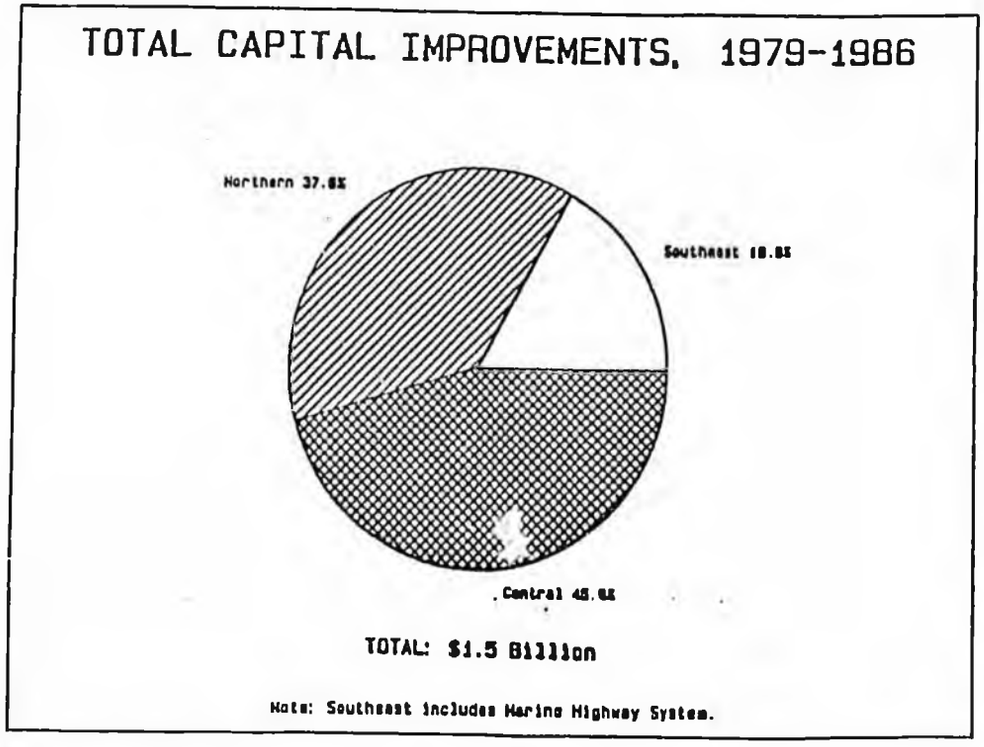
In no state is their complete agreement on who should set the formula or the factors that should be used in the formula for distributing the improvement program funds geographically. The best practice is to consider all possible factors and to make adjustments as new factors, or combinations of factors are agreed upon as more equitable bases for fund distribution.

Distribution Targets. The following are the distribution targets used by the ADOT&PF in recent years for the geographical distribution of highway improvements:

	Percent
Central Region	45.8
Northern Region	38.5
Southeast Region	9.7
Marine Highway System	6.0
	100.0

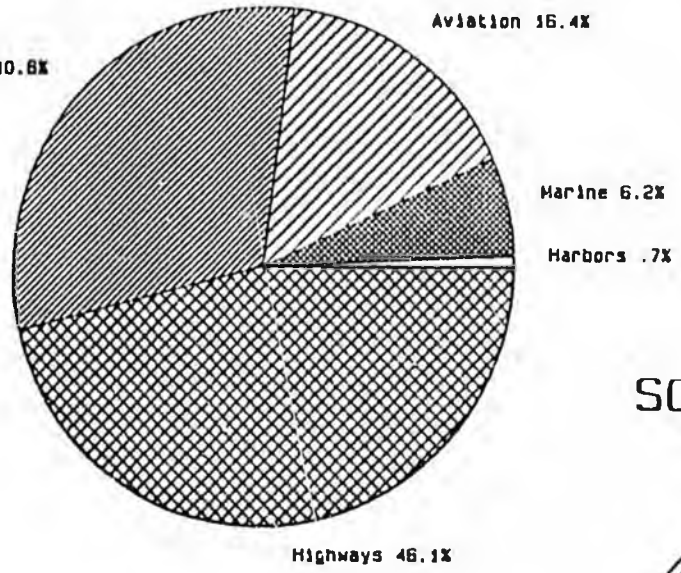
Note from the chart at right how close the total ADOT&PF capital improvement program for the 1979-1986 period has come to the highway distribution targets.

In recent years, the ADOT&PF has based the distribution of highway improvement funds on a formula that includes population, land area, paved lane-miles of highway, total lane-miles of highway and annual vehicle-miles of travel in each Region. However, the distribution process is currently under examination to ensure that it is promoting equity in the modernization or upgrading of the State Highway System.

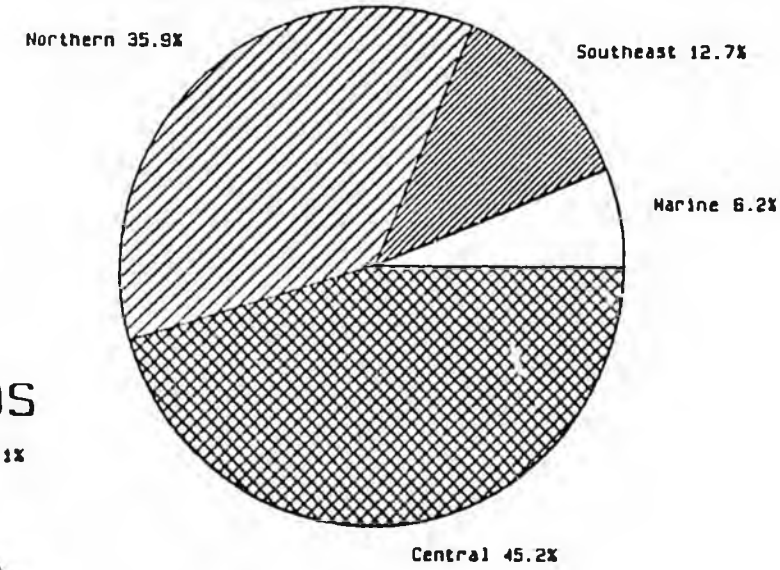


1986 CONTRACT AWARDS

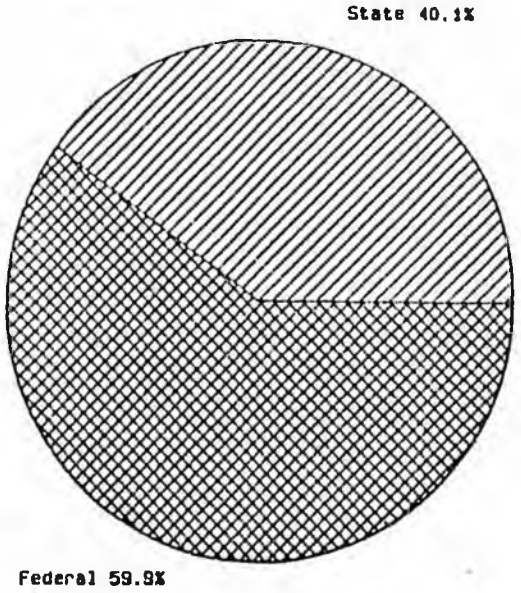
MODE



REGION



SOURCE OF FUNDS



$160.9 MILLION

In calendar year 1986 the ADOT&PF awarded $160.9 million in improvement contracts. Almost half (46.1 percent) were for highway and bridge improvements. The Central Region awarded 45.5 percent of the total projects, very close to the highway target (45.8 percent) for that Region.

Federal Participation. Six out of every ten dollars of the funds necessary to accomplish the improvements were federal dollars. In that the federal government does not ordinarily participate in building and harbor improvements, the federal participation was 87.2 percent of the $110.5 million in highway (and bridge), aviation and Marine Highway System improvements. $50.4 million of state funds were directed to buildings and harbor projects and $14.1 million directed to federal participation projects.

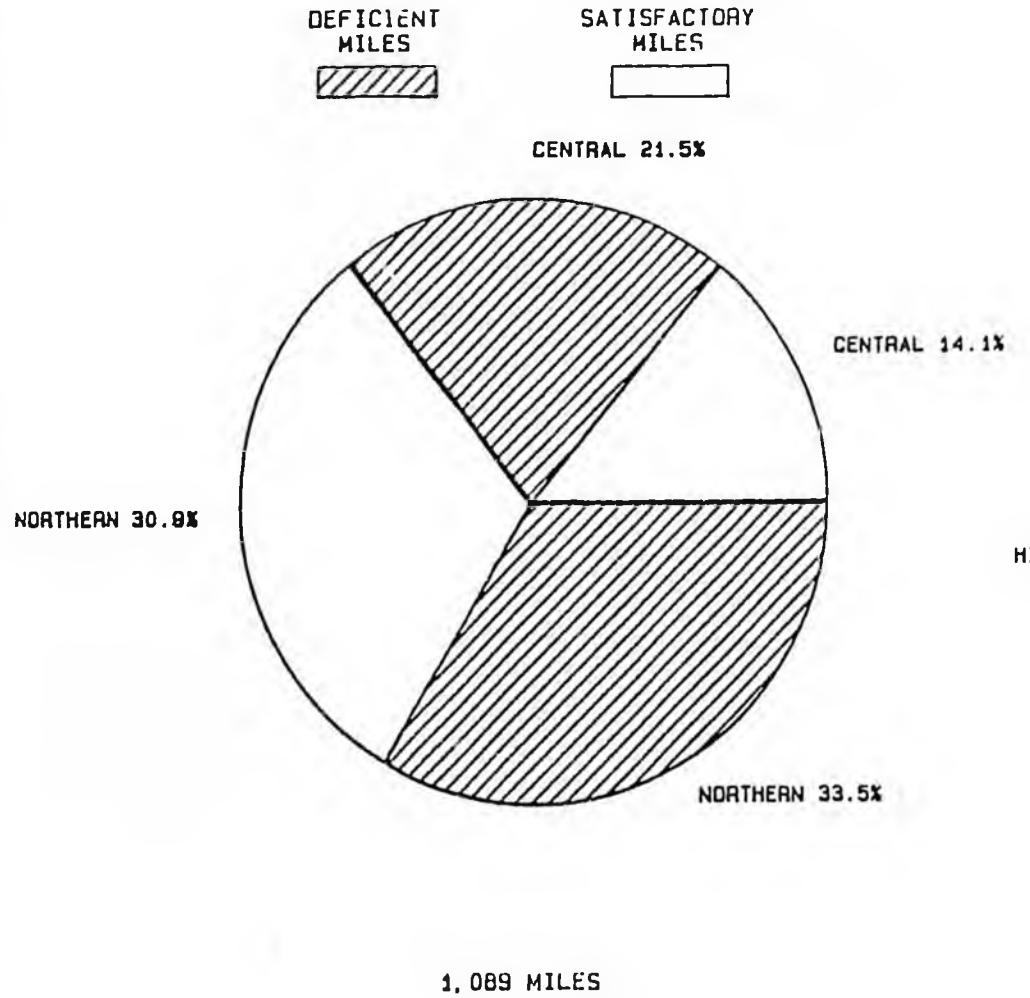
New Analytical Process Being Examined. With over $100 million of improvement projects being awarded to private contractors each year, it is important to closely monitor the contract prices being bid to both guard against possible fraud and collusion and to assist the designers in finding the most cost-effective of alternative designs. To aid the bid analysis process, the ADOT&PF is now examining a new computer-assisted procedure, sanctioned by the American Association of State Highway and Transportation Officials, that will provide faster review of construction project bids. Other states have found that the procedure has been helpful in speeding the bid analysis process and in detecting inconsistencies in the bids.

Decentralized Program Control Part Of The Problem. Alaska's decision to decentralize the management of the ADOT&PF Program in 1982 may be an inhibiting factor in gaining centralized information about many aspects of ADOT&PF Program – such as the construction contract bidding process. Without an ADOT&PF, department-wide model, each Region and Division has developed and employs their own set of processes. Analysis of all the various management techniques used by the decentralized management team is beyond the scope of this Review.

Need To Standardize Management Systems. Decentralized control of the ADOT&PF Program appears to be absolutely essential for a state as large as Alaska and with so much of its Program in remote areas. However, in order to facilitate the aggregation of essential information on how the Program is being carried out, it is recommended that the ADOT&PF's management systems be standardized. The progress being made in improving the accounting for capital expenditures (see Chapter IV) is an example of this suggested approach to improved management of the ADOT&PF Program.

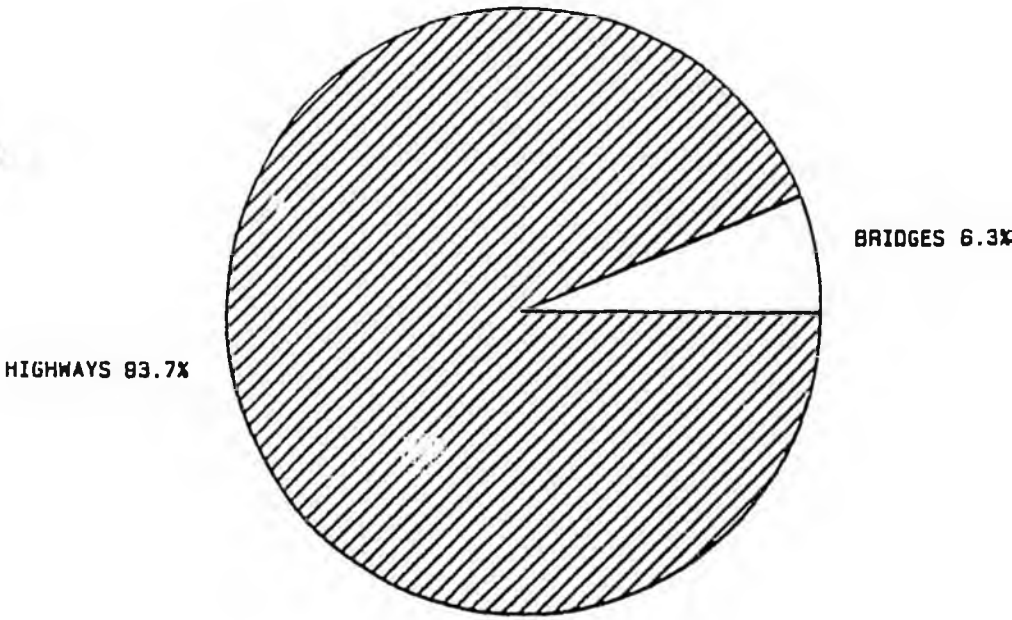
Need To Augment The Headquarters Staff. In order to develop a standard bid review process, as well as highway and airport maintenance management procedures, accounting procedures, construction practices, design standards, preconstruction and construction scheduling procedures, right of way purchase procedures, training procedures, career guidance practices, construction quality control procedures, improvement program goals and all the other systems and policies needed to effectively manage and monitor the ADOT&PF Program, it will be necessary to augment the ADOT&PF headquarters staff. The added staff should be employed to find the appropriate systems from the various techniques in use by the Regions and Divisions – or in other states, to document and test the systems and then to assist in their promulgation and application.

INTERSTATE HIGHWAY SYSTEM NEEDS



1,089 MILES

IMPROVEMENT COSTS



$976 MILLION

In 1987 the Department with the aid of a consulting firm completed a two year, $94,000, planning project to assess the needs of Alaska's 1,089 mile Interstate Highway System. The results show that 490 miles of this System currently meet reasonable standards of tolerability. However the results also show that 599 miles are deficient in one or more ways. Costs to upgrade the deficiencies were estimated to be $976 million.

Exemplary Analysis. The team of engineers that carried out the needs analysis were made up of people with much former experience with the Washington Department of Transportation. The realistic approach to the analysis and the attention to detail prompt the note that this is a model analysis, one of the best of its kind. Great care was taken to relate pavement and bridge widths and curvatures and grades to the latest national standards of tolerability. To this was added assessments of accident experience, pavement condition and speed reductions.

Narrow Roadways A Critical Problem. Narrow roadways closely followed by poor pavement condition were the most critical elements. However 42 miles had curves and grades that were too sharp or too steep for safe, efficient driving. 40 of the 140 bridges on the system were found to be too narrow in terms of safe side clearances or not capable of carrying heavy truck loads (29 were both narrow and restrictive in load carrying capability).

Priorities Also Set. Another exemplary feature of the needs assessment is that it established a priority rating system and listed the improvement priority for each deficient section of Interstate Highway.

Recommendation: Set Goals For Interstate Upgrading. Based on the needs estimate and estimate of future availability of federal funds, it is recommended that a multi-year target be set for Interstate Highway System upgrading. If it is anticipated that Alaska will realize about $130 million each year in Federal Aid Highway Program funds, it is suggested at least half be devoted to Interstate modernization. At that rate and allowing for modest inflation, it would take 15 to 20 years to complete the effort. Other options of placing more or less resources into the Program should be investigated.

Also Recommended: Make Similar Needs Analyses Of Other Principal Arterials And Minor Arterials.

1972 STATE HIGHWAY PLAN
Existing Routes (1987)
Proposed Trunk Routes
Note: One Inch Equals 200 Miles

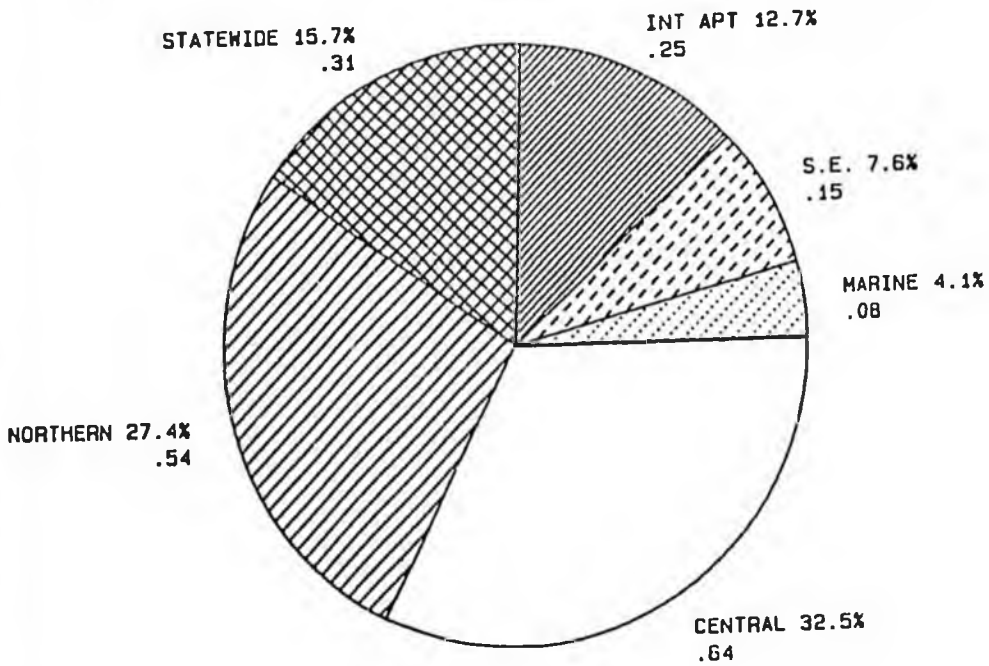
Expanding State Highway Service. The above plan for expansion of the State Highway System has no official status. It was developed in 1972 by the Alaska Department of Highways and is presented here to stimulate thinking about Alaska's future.

Many of the routes may not be feasible to build. The plan in its entirety is beyond the financial capability of Alaska. However, such routes as the Alaska Highway were probably once thought impossible. And a route to Prudhoe Bay was also beyond anyone's imagination. Is it time for Alaskans to again plan to open up more of their state by building first-phase, primitive roads? Should major communities such as Nome and Bethel be connected to the State Highway System? And should a highway be built north of Juneau to provide land access between the state capitol and Alaska's largest city? And what route or routes would be first priority?

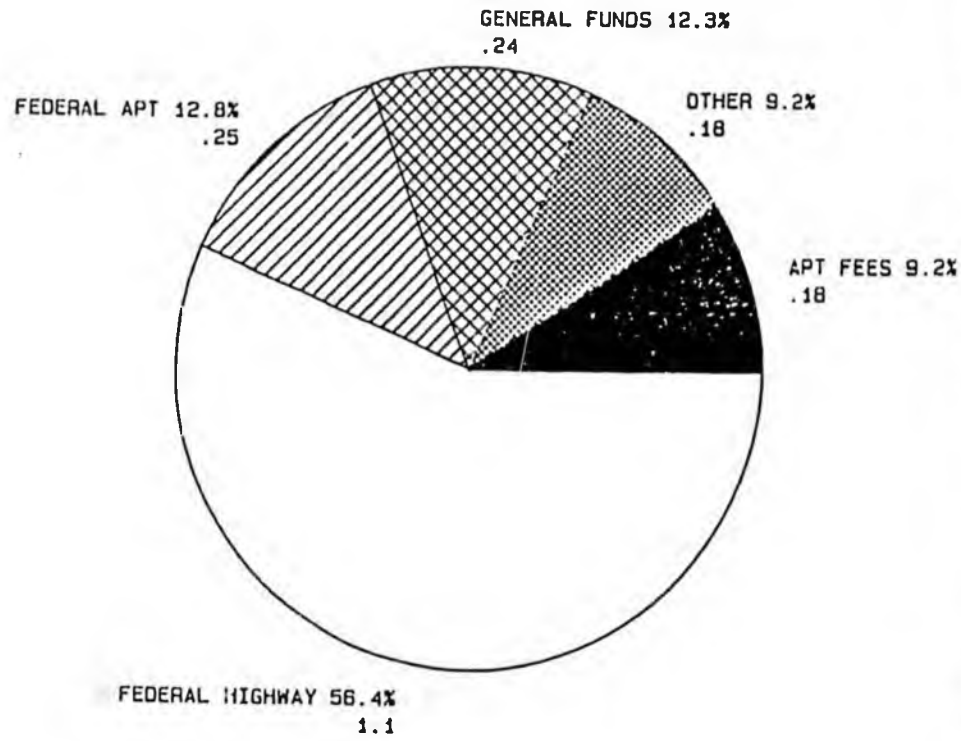
Alaska's Strategic Location. Just as the National Interstate Highway and Defense System was conceived to tie together strategic points in the United States, a basic road network for more of Alaska would also seem militarily important.

CAPITAL IMPROVEMENT PROGRAM, 1988-1993

DISTRIBUTION



$ SOURCE



TOTAL: $2.0 BILLION

Note: "Statewide" includes state matching $ for Federal Aid Highway Program Improvements and $ for state equipment fleet replacements.

Important Control Mechanism. Annually the ADOT&PF updates and publishes a six year capital improvement program. It is the source document for the scheduling of improvement projects' preconstruction engineering activities. Only those projects that are listed in the six year program can be let to contract. And only those listed projects can be advanced to the design stage. Annually the proposed improvement projects are studied and revisions made as project priorities change and year-to-year scheduling shifts are found necessary.

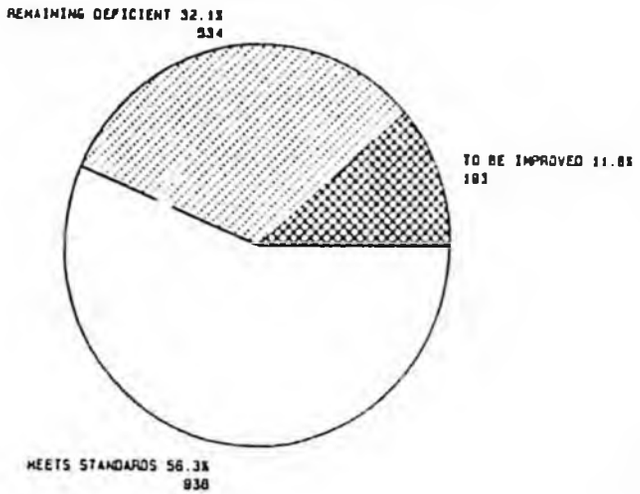
Stabilizing Influence. This master document of long range planning has been important in stabilizing the work activities of the Department. No longer is it justifiable for Region or Division officials to insert unlisted projects into their surveying, preliminary engineering or design work programs, without prior official application for a change in the capital improvement program.

Sources Of $2.0 Billion Program. The total dollar value of the projects listed in the 1988-1993 (including a seventh year, 1987, which was added due to the late date in receiving 1987 Federal Aid Highway Program funds) is $1.96 billion. The Program anticipates that 69 percent of the funds will come from federal sources, 12 percent from the State General Fund, 9 percent from the International Airport Revenue Fund and 10 percent from other sources. The other sources includes equipment lease fees accruing to the Highway Working Capital Fund for State Equipment Fleet replacements. Also in the other category are funds that will be reimbursed to the Department by other other agencies for both plan preparation and construction. Lastly the other source of funds includes International Airport Revenue bonds for Anchorage and Fairbanks airport improvements that are beyond that which can be financed by International Airport revenues.

Planned Distribution Of Funds. It is estimated that $1.2 billion or almost 60 percent of the total program of expenditure is for improvements in the Central and Northern Regions. However it should be noted that the $310 million (15.7 percent) that is listed for statewide expenditures includes all the state matches of federal funds (regarless of improvement project location), as well as planned expenses for State Equipment Fleet replacements, the funds for research and the funds for transportation planning.

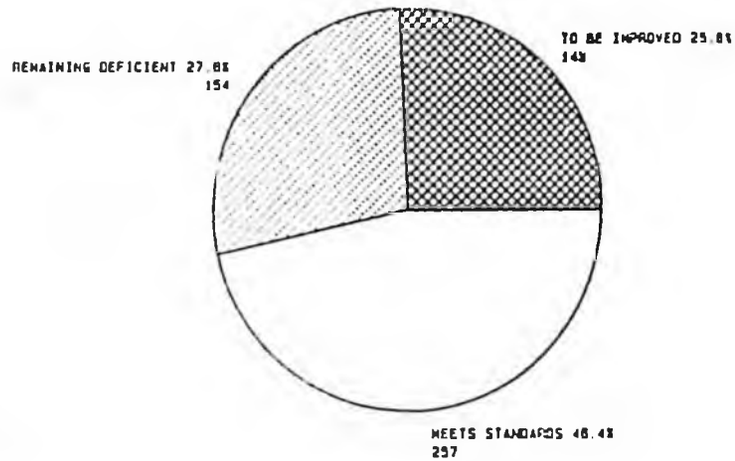
SIX YEAR PROGRAM OF HIGHWAY IMPROVEMENTS

NORTHERN REGION



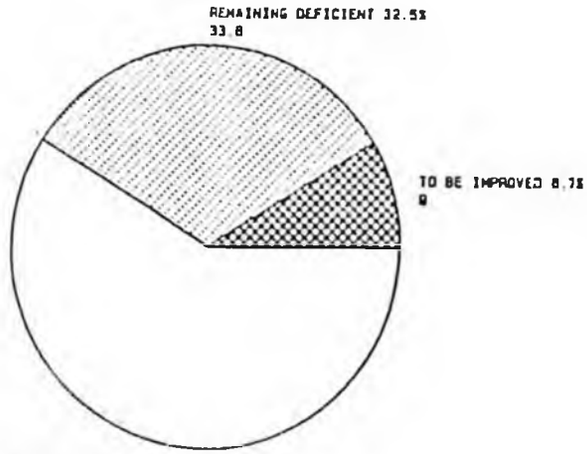
TOTAL: 1665 MILES

CENTRAL REGION



TOTAL: 554 MILES

SOUTHEAST REGION



TOTAL: 103 MILES

NOTE: IMPROVEMENTS INCLUDE UPGRADING & REHAB
FEDERAL AID INTERSTATE AND PRIMARY HIGHWAYS

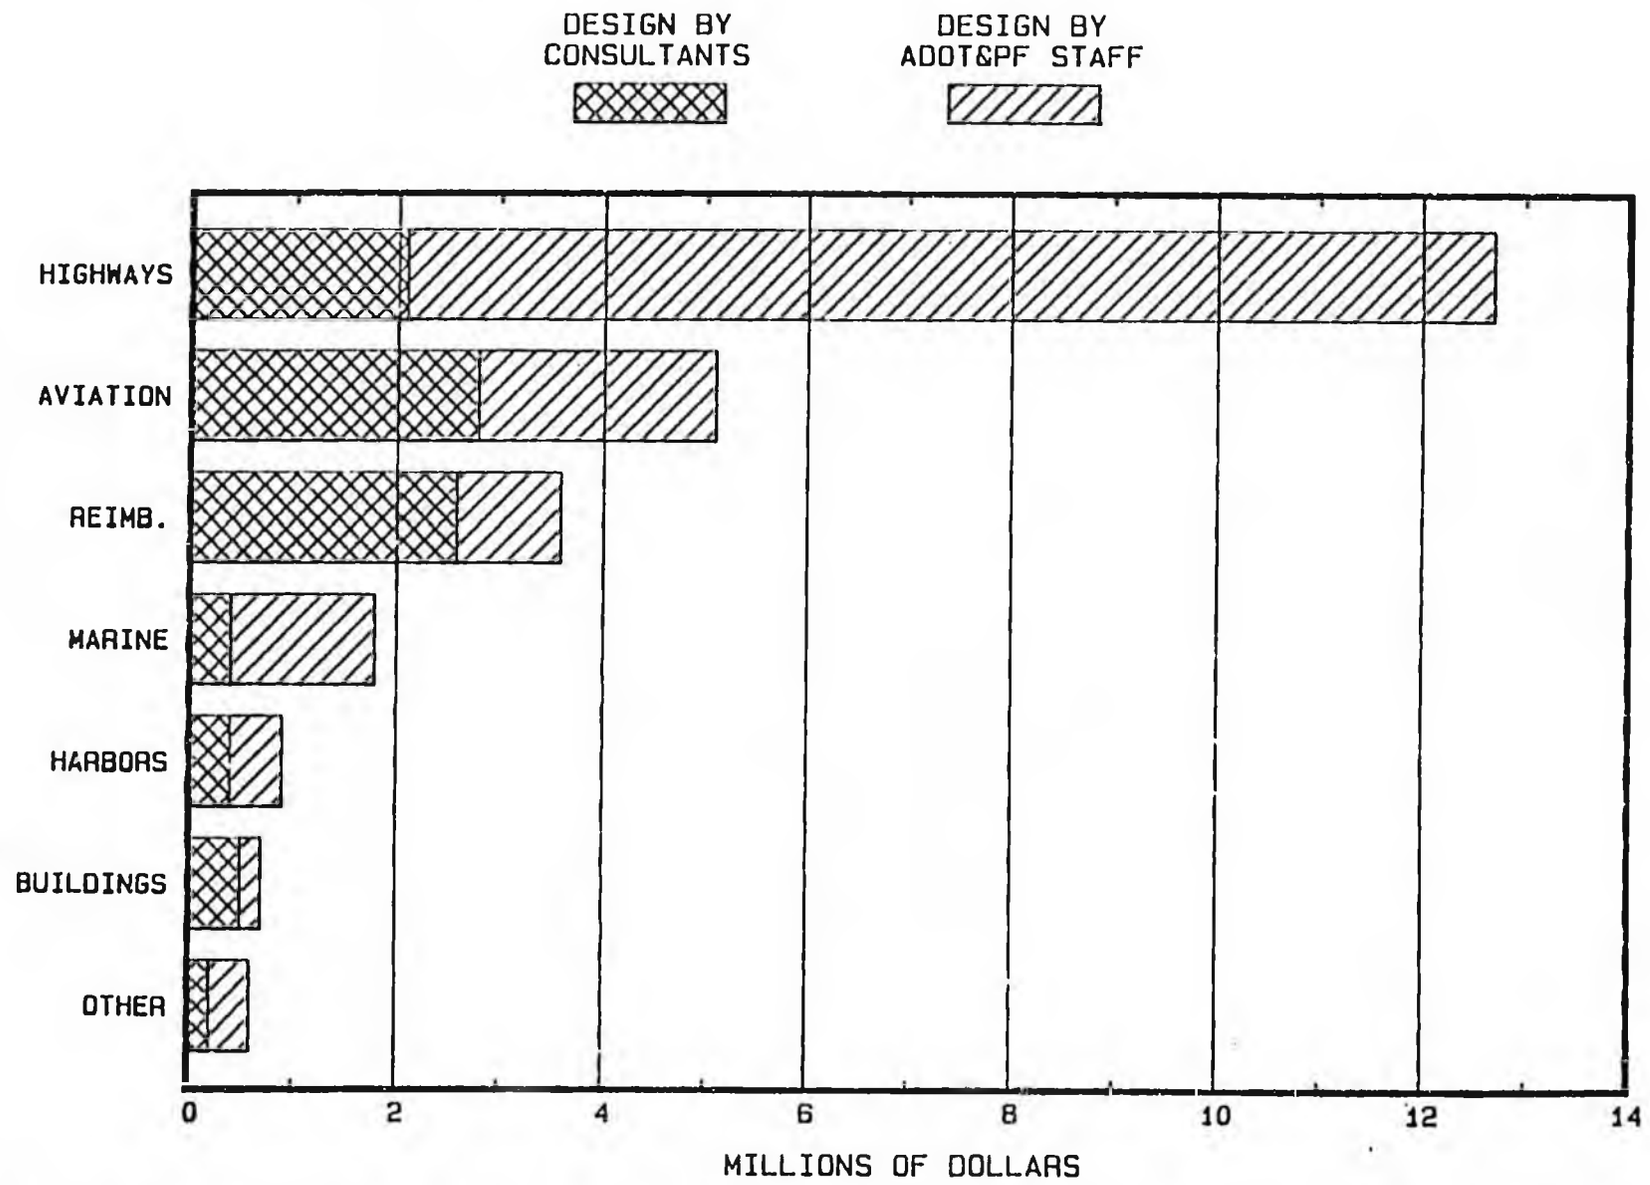
Planned Program Of Accomplishments. The charts indicate, in dark cross-hatched lines, the miles of Interstate, Other Principal and Minor Arterial improvements to be accomplished over the 1988 to 1994 period in each of the ADOT&PF Regions, that is as listed in the 1988-1994 Capital Improvement Program. Also shown are the miles of those most important highways that according to ADOT&PF officials now (1987) meet standards of tolerability as well as those highways that will remain deficient or must wait to be improved until beyond the 1988-1994 planning period.

Mileage Summary. In sum, 1,254 miles are currently performing satisfactorily or are in satisfactory condition, while 365 miles are to be awarded to contract for improvement by the end of fiscal year 1994. 722 miles will remain to be improved in ensuing years.

Impressive Goal. Assuming that these figures are correct and that 50 percent of the deficiencies on Alaska's most important highways can be corrected by 1995, Alaska will be in an enviable situation. It means that by July 1, 1994, 70 percent of Alaska's Interstate Highways, Other Principal Arterials and Minor Arterials and their urban extensions will be in satisfactory condition. Few states in the nation are in a position to indicate that state their highway improvement programs will yield such positive results.

To Be Sure Make Needs Evaluation And Implement The Pavement Management System. More accurate evaluation of the status of Other Principal and Minor Arterials is necessary to confirm the facts and figures. Furthermore since pavement is a never-ending challenge to keep in reasonably good condition, the ADOT&PF pavement management system, that is currently being developed, will be an excellent tool for accurately and continually monitoring progress or lack of progress in pavement status.

1986 DESIGN WORK BY STAFF AND CONSULTANTS

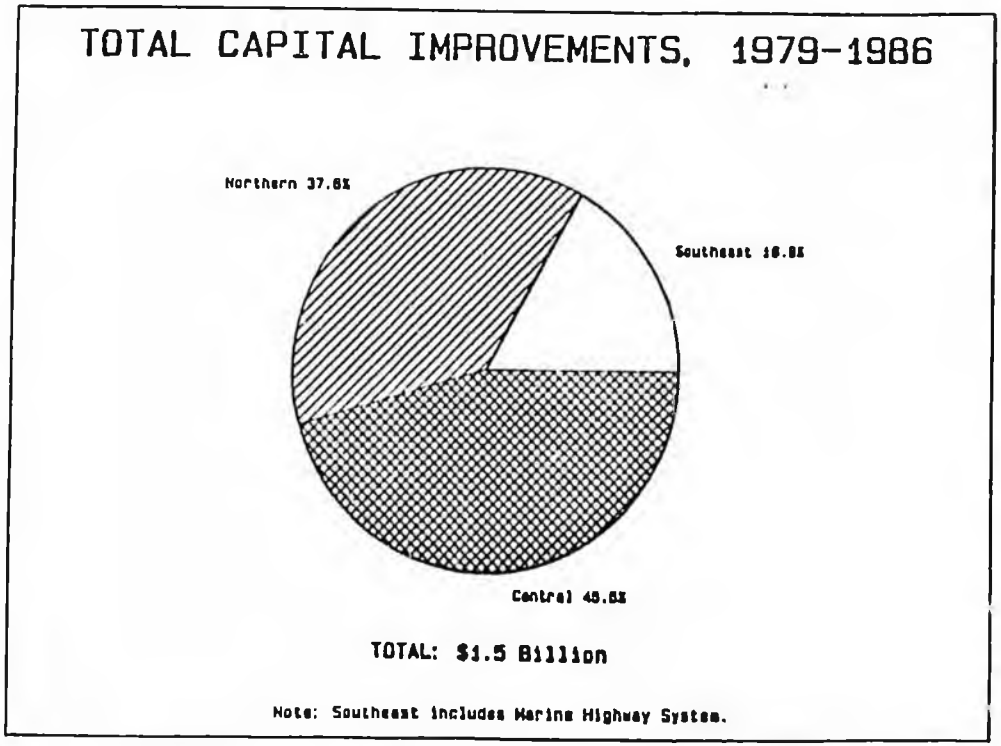


NOTE: 1986 TOTAL DESIGN COSTS WERE $25.4 MILLION; PAYMENTS TO CONSULTANTS WERE $8.9 MILLION OR 34.9%

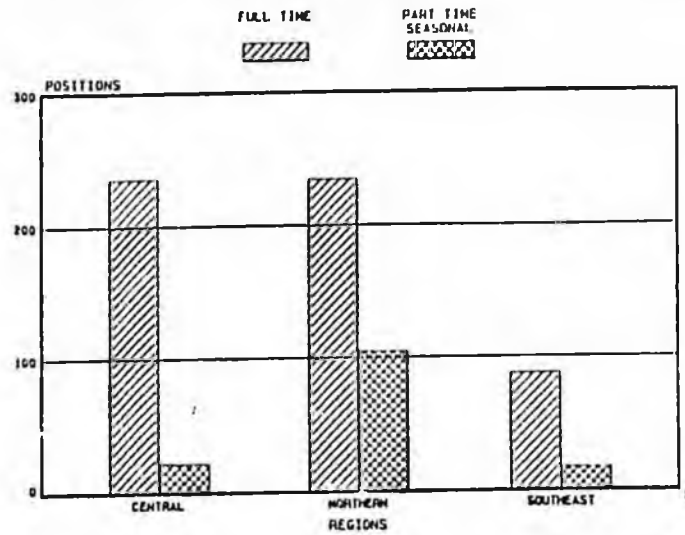
34.9 Percent Of Design Work By Private Firms. Of the $25.4 million spent on design in 1986, 34.9 percent was accomplished by private consulting engineering and architectural firms. Aviation, including the design of airports and ancillary facilities, led the way with over half (54 percent) accomplished by private enterprise. In second place was the $2.6 million in engineering analysis and design of buildings and facilities for other state and local government agencies. Only 16 percent of the combined highway and bridge designs in 1986 were accomplished by private engineering firms.

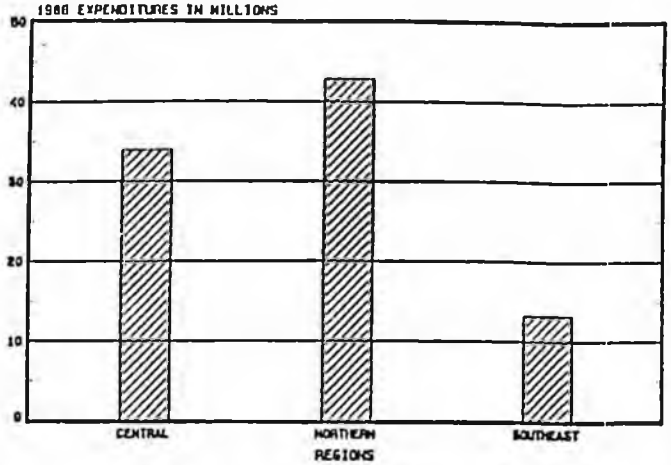
Most States Call On Outside Consultants. While some states, accomplish all design work with state staff, most states reserve some work for consulting engineering firms. In some states consultants help out with the very straight-forward designs where the chance of a communications problem between the state and the engineers is small. However most states reserve for private forces complex bridge or urban highway work, where specialized effort is required. While some states aim for a specified portion of all work to go to consultants, others reserve the "peaks" in design work load for consulting firms.

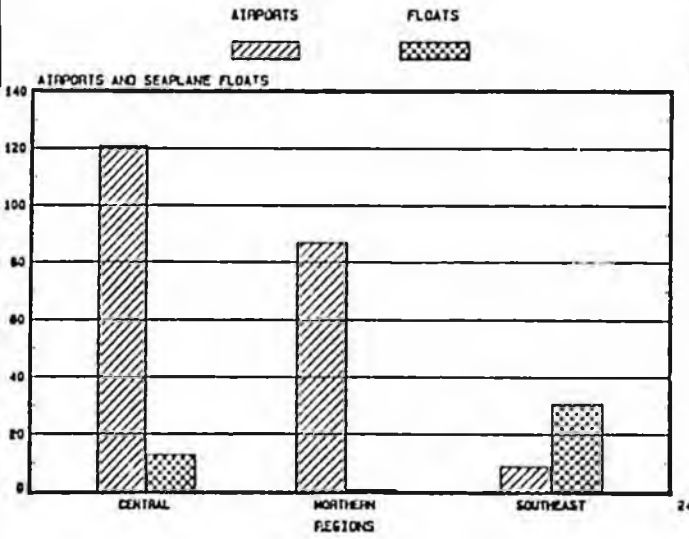
Recommendation: Set Consulting Engineering Policy. There is always the debate about which method, public or private engineering design and plan preparation, is most cost effective. Currently, the ADOT&PF lacks both the facts on public and private costs and a policy on the use of engineering firms based on such facts. It is therefore recommended that a consulting engineering policy be developed based on a cooperative effort by private and ADOT&PF engineers to find comparable, public and private design and plan preparation costs.

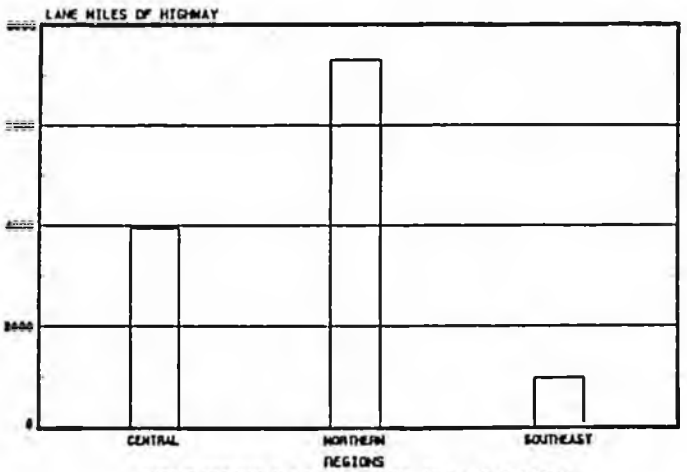


MAINTENANCE AND OPERATIONS

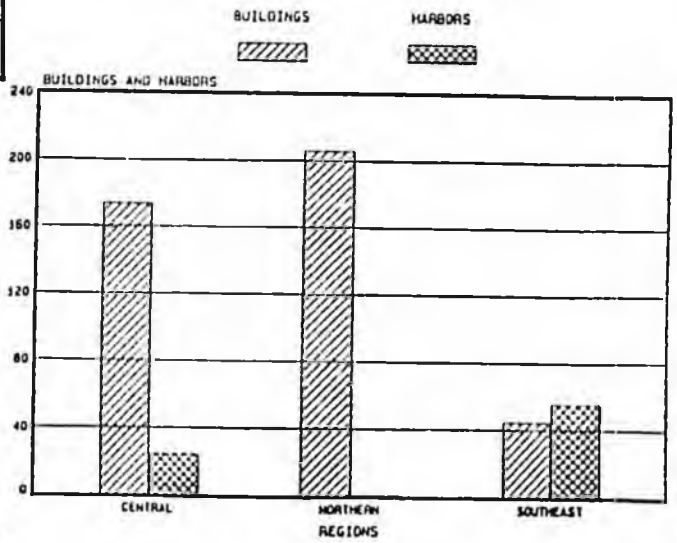








MARINE HIGHWAY AND INTERNATIONAL AIRPORTS EXCLUDED



MARINE HIGHWAY AND INTERNATIONAL AIRPORTS EXCLUDED

Maintenance And Operations. Perhaps the most unrewarding work in the highway industry is that of the people that are responsible for keeping our highways operable, safe and in as near to their as-built condition as resources allow. In fiscal year 1986 the ADOT&PF spent $91.3 million in maintenance and operation of highways, airports (excluding the International Airports and Marine Highway System maintenance and operations), harbors, ferry terminals and most state buildings.

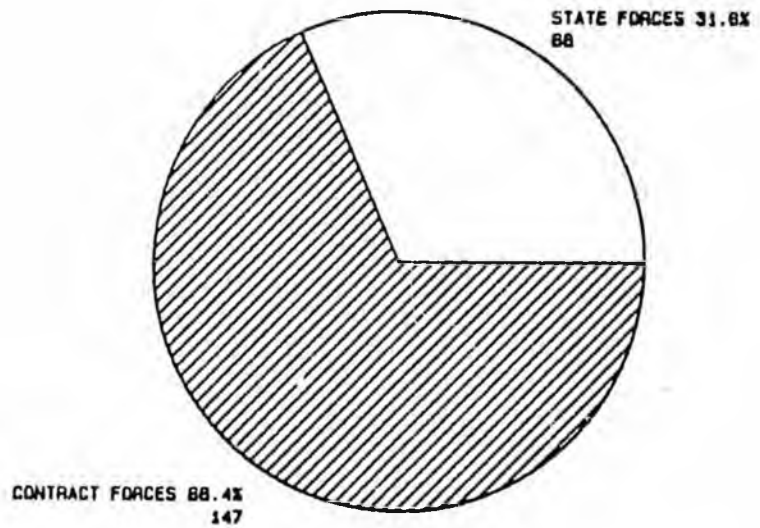
Responsibilities. The above charts indicate the relative maintenance manpower strengths of the three Regions and the split of maintenance and operations expenditures in fiscal year 1986. Also shown are the broad mix of maintenance and operations responsibilities, including lane-miles of highway, airports and seaplane floats, buildings and harbors.

Manpower. As of June 30, 1987, the Department employed 570 maintenance and operations people down from 661 people at the same point in time in 1985. Based on 1986 survey information from all state highway and transportation agencies in the nation, Alaska ranked 49th in the nation in maintenance personnel per lane-mile of state highway. Furthermore Alaska is the only state whose maintenance forces must not only maintain highways but also buildings and airports.

Major Airport Responsibility. With 215 state-owned and maintained, land airports and 45 seaplane floats, the ADOT&PF must not only ensure that the physical components of the airports are safe but also the operational equipment (landing lights, signs and wind indicators) of airports are in safe working condition. This is a major responsibility, especially where heavy snowfall may impede operations. Nevertheless, the ADOT&PF maintenance forces are responsible for advising pilots as to safe or unsafe landing conditions. To further compound the problem, most (68.4 percent) of the airport maintenance and operation function is contracted out to private individuals or corporations in remote areas where the supervision of work effort is difficult and costly.

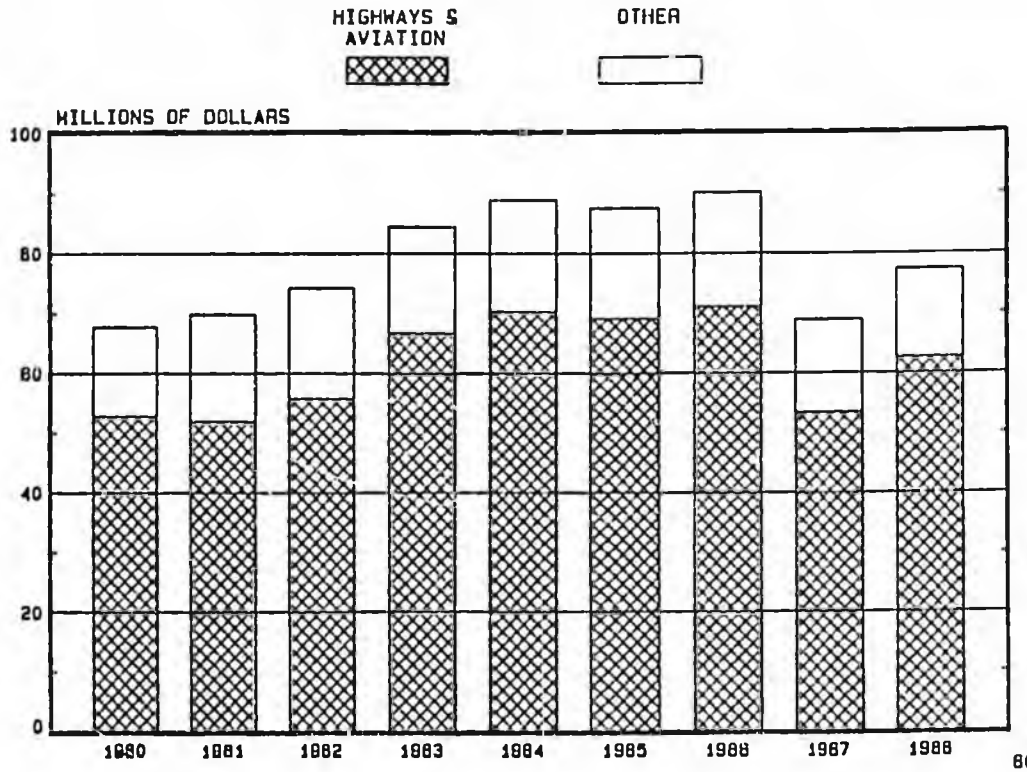
Force Spread Thin. The highway maintenance function is divided into maintenance districts. There are 85 maintenance stations, (one per area) each responsible for between 20 and 150 miles of road as well as the state airport or airports within the area. Manning has dropped to as low as two people at some maintenance stations making it difficult to schedule leave. Sickness or injuries sometimes mean snow removal operations must be stopped. Overtime is common. All leave must be scheduled in the frost-free months. Not only does the lack of flexibility hamper winter operations but summer crack sealing, mowing, brush cutting, seal coating and ditch and culvert clearance operations are affected.

MAINTENANCE OF LAND AIRPORTS



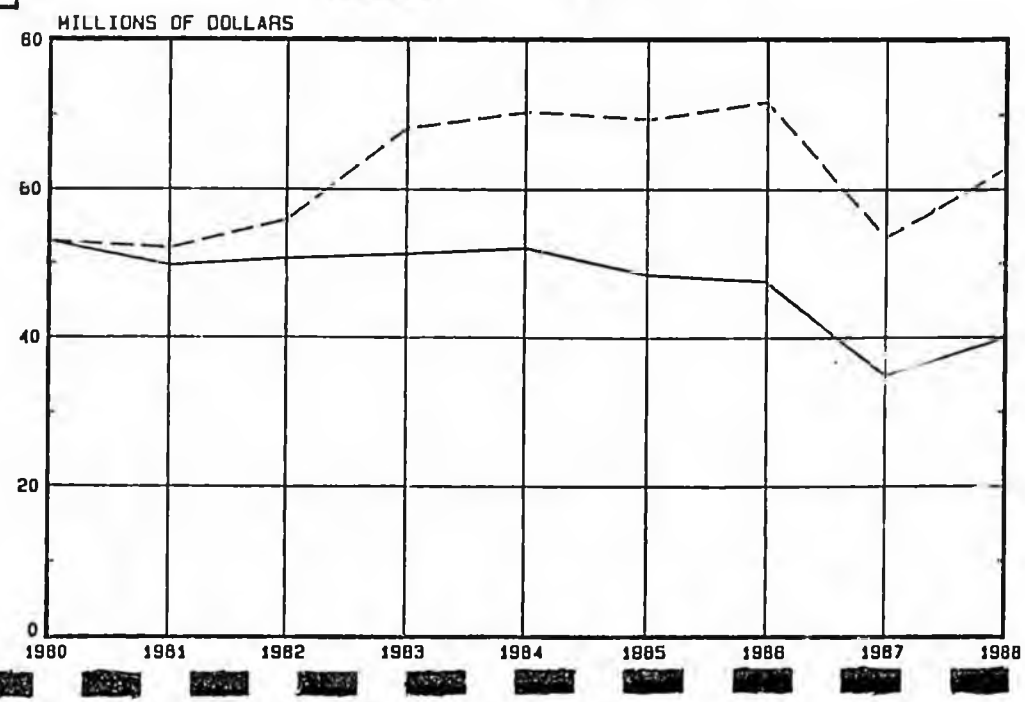
TOTAL: 215 AIRPORTS

MAINTENANCE & OPERATIONS TRENDS



Notes: 1) Actual fiscal year expenditures, 1980-1987.
2) FY 1988 is authorized expenditures.
3) Marine Highways and International Airports not included.

HIGHWAY & AVIATION M&O ONLY



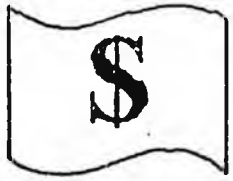
State Budget Constraints have Severely Impacted M&O. During the 1980 to 1988 period, maintenance and operations funds have varied from a low of $66.9 million in fiscal year 1980 to a high of $91.3 million in 1986. The highway and aviation portion (about 80 percent) of M&O expenditures varied from $52.0 million in 1981 to $71.2 million in 1986. Taking into account inflation and added lane-miles of highway responsibilities, fiscal year 1987 highway and aviation expenditures were 33 percent lower than seven years earlier. While fiscal year 1988 highway and aviation funds are up $8.8 million over 1987 expenditures, in terms of 1980 buying power and additional road responsibilities, 1988 budgeted funds are 25 percent less than spent in 1980.

Recommendation: Make A Highway And Aviation M&O Analysis. While Federation staff did witness highway maintenance problems in our cursory field checks, these visits and interviews were not sufficiently comprehensive to indicate the most cost-effective level of highway and aviation funding. However it is suggested that ADOT&PF staff establish a maintenance management procedure (with adequate monitoring of actual use) to henceforth gain accurate information on maintenance resource management. Furthermore it is suggested that optimal, minimum and several intermediate levels of service for all maintenance management activities be established and these service levels be used as a basis for public debate on the ADOT&PF service level to be provided. The analysis should provide estimates of the cost of each service level along with the benefits and consequences.

Maintenance Facilities Excellent. In the field evaluation of Alaska's roads it was noted that ADOT&PF maintenance stations were at least as good and in many cases better than others in the nation.

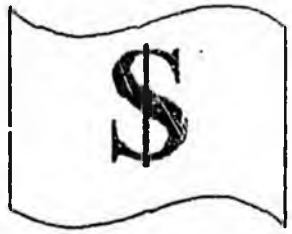
Federal Concern For Highway Maintenance. While federal aid highway funds are not available for highway maintenance, the Federal Aid Highway Act (Title 23) mandates that states adequately maintain all highways that were built or upgraded with federal aid highway funds. In fact the law stipulates a holdback of federal funds if it is found that a state highway or transportation department is not adequately maintaining such highways.

RESEARCH PAYS

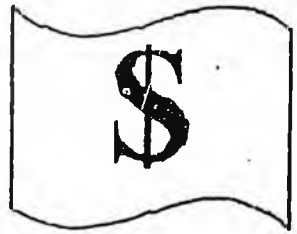


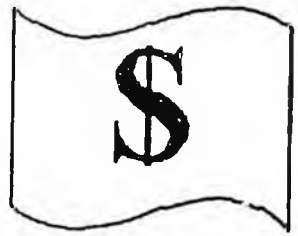
INVESTMENT

COST SAVINGS



INCREASED SAFETY





Highway Research A Must In Alaska. No where else in the nation is it as necessary as in Alaska to use materials on hand in road building. The cost to transport rock to remote places for the construction of highway subgrades is often prohibitive. Curing of bituminous pavement and concrete structures is difficult in the extreme cold of the Arctic as well as the extreme dampness of Southeast Alaska. Obtaining a stable, hard-surface highway over permafrost ice – that is subject to melting due to the heat-absorbing nature of bituminous materials – is a construction challenge. To meet these and many other problems, Alaska's highway designers must rely on research and researchers to find cost-effective solutions.

Research Program Less Than One Third Of One Percent Of 1986 ADOT&PF Program. In 1986 $1.7 million were appropriated for the ADOT&PF Research Program, or about 0.3 percent of the $525 million of ADOT&PF fiscal year 1986 expenditures. By private industry standards, the ADOT&PF research effort is extremely low.

Comparable To National Averages. Nevertheless, the proportion of transportation fund devoted to research is roughly comparable to the nationwide average. Total nationwide highway research spending in 1986 was 0.2 percent of nationwide highway spending.

Forty-four Percent Federal Funds. Two federal programs – Highway and Energy – provided 44 percent of 1986 ADOT&PF Research Program funds. The remaining 56 percent were appropriations of Alaska's General and Capital Funds.

Research Section Located At University of Alaska. The 14-person Research Section of the ADOT&PF is headquartered on the main campus of the University of Alaska in Fairbanks. Both the University's and the ADOT&PF Research Programs benefit from this association. Fourteen other states have similar joint transportation department and University research efforts.

Research Committee Sets Programs. While the Research Program is administered by the ADOT&PF Northern Region, representatives of each regional offices, the headquarters office and the Marine Highway System meet to monitor progress and to consider additional needed research.

Two Important Recent Contributions. After six years of investigation and testing by the Research Section, radioluminescent runway edge lighting has become operational. This is vitally important to Alaska's remote communities where lack of electric power has hampered safe airport operations.

The Falling Weight Deflectometer was tested by the Research Section and made available to designers in 1981. This machine simulates the impact upon pavement of a moving truck. The machine not only enhances the design of pavements and subgrade but is an important tool in assessing possible pavement damage due to heavy truck passage during spring thaw conditions.

Other Ongoing Research. As of January 1, 1988 there were 24 research projects going forward to improve: highway design, operations and maintenance; airport operations and design; building design and energy supply; harbor design; coastal navigation; ferry hull design; communication systems; and air quality measurement.

CHAPTER IV

HIGHWAY MANAGEMENT AND PRODUCTIVITY

CHAPTER IV

MANAGEMENT AND PRODUCTIVITY

A Review of the Alaska Department of Transportation and Public Facilities Organization as it Compares with other State Highway and Transportation Departments. The Size of the Staff as Compared with total State of Alaska Employees. Salary Comparisons with other Western States are shown. The Status of Capital Project Clean-up is reported, as is the Status of the Highway Equipment Working Capital Fund.

Major Milestones of Alaska Highway Program

1956: 1) Federal highway funds made available to Alaska

1959: 2) Statehood - transfer of public works (including highways) from federal to state jurisdiction.

1960: 3) Marine Highway System formed.

1962: 4) Alaska Department of Highways separated from Alaska Department of Public Works.

1964: 5) Extensive earthquake damage to roads.

1967: 6) Alaska Highway (ALCAN) completely paved (Alaska portion).

1970: 7) Federal Highway Act allows highway funds to be used for ferry upgrading.

1971: 8) Local Service Roads and Trails Program implemented.

1971: 9) Parks Highway completed.

1974: 10) Dalton Highway opened by oil companies.

1977: 11) Alaska Department of Transportation and Public Facilities formed.

1979: 12) Oil revenues generate major expansion in transportation capital expenditures.

1981: 13) High point in contract awards, $260.7 million (highways $157.2 million).

1982: 14) Regionalization of ADOT&PF.

1982: 15) Alaska Interstate Highway System designated.

1985: 16) Last appropriation for Local Service Roads and Trails Program.

1986: 17) High point in Highway and Airport Maintenance and Operations authorizations, $71.2 million.

Alaska's road program and its management has seen some dramatic changes over the past 30 years; more so than any state highway or transportation agency in the nation. From the perspective of this Review, the most significant milestones or events are shown above.

Two Important Management Decisions. The formulation of the Alaska Department of Transportation and Public Facilities in 1977 and the regionalization or decentralization of Program control in 1982 were most important changes. Bringing all state transportation agencies into one organization was certainly an important management decision from both the perspective of the Governor and the Legislative. Transferring much of the control to the Regional and Division Directors was a decision that lessened the Commissioner's and headquarters' staff roles and gave great latitude and flexibility to the Region and Division Directors.

Highway Program "Weathers The Storm". Whenever a strong program such as the State Highway Program is combined with other efforts such as Public Facilities, the weaker program is usually strengthened and the strong program loses some of its stature.

While this has been the case in some states, we conclude that the State Highway Program has not suffered in Alaska. The improvement and maintenance of highways remains as one of the most important issues for the Commissioner, the ADOT&PF headquarters' staff and the Regional staff. The responsibility for public facilities, the International Airports, other state airports, harbors and the Marine Highway System has not eclipsed the highway responsibility. The decision to combine these agencies and functions with the Highway Department and the highway functions was a good one and it should stand.

Regionalization Also Sound Decision. The decision to allow the Regions and Divisions greater control over the ADOT&PF Program and particularly the State Highway Program was also logical and beneficial.

However, as discussed in Chapter II and III, the ADOT&PF headquarter staff needs to strengthen both its role of providing policy direction to the Regions and Divisions and its role of monitoring program status and progress. To accomplish this, the ADOT&PF budget should be increased to allow additional staff in the headquarters' offices.

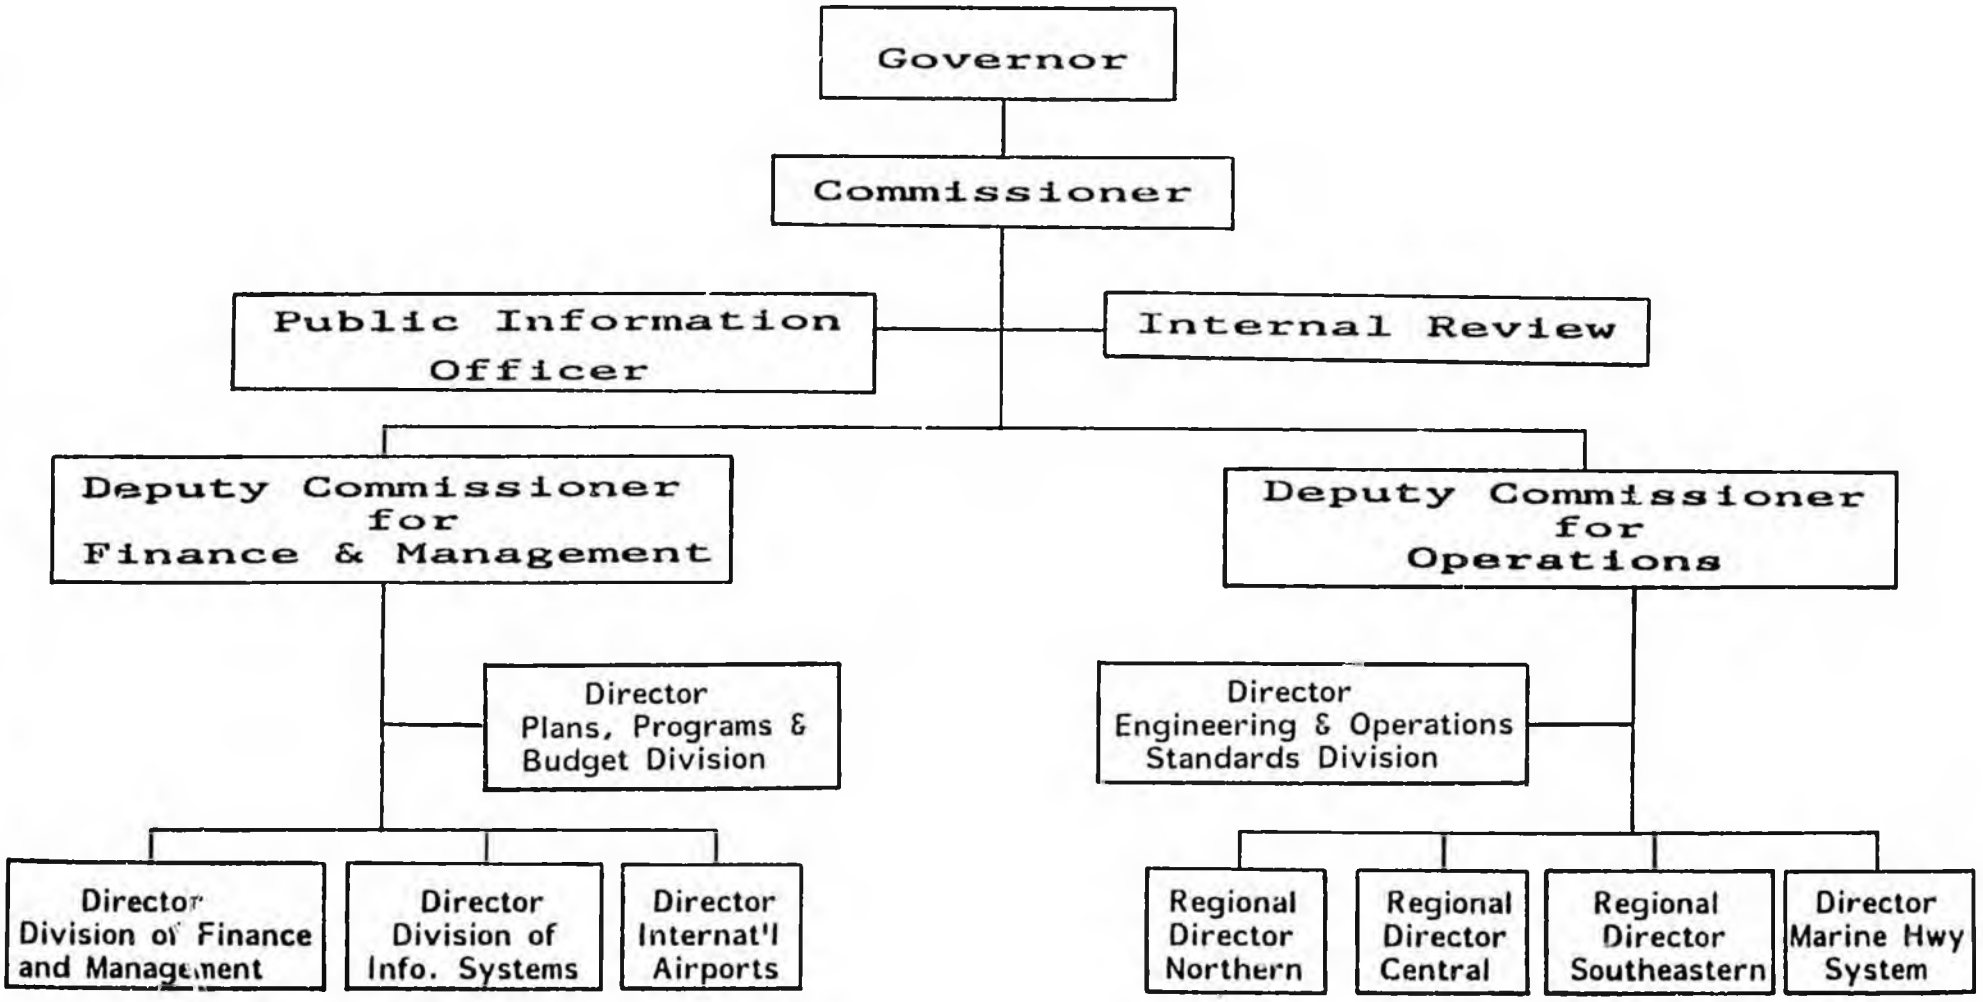
5137 HTRA COMM. MTGS: CAPITAL PROJECTS CLEANUP - HB 31

209

ALASKA
DEPARTMENT OF TRANSPORTATION
AND PUBLIC FACILITIES



Management Instability. One of the problems of the previous Department of Highways and now the Department of Transportation and Public Facilities is the rate of turnover at the top two levels of management. Since 1977, the ADOT&PF has had six chief executive officers. Communications, plans, programs and policies all go through transition as the new team of managers moves into their function and responsibilities over a large organization with a large budget.

Bright Future. For the first time in recent years, the Commissioner was selected in early 1987 from within the ranks of the ADOT&PF and this has tended to provide stability at a time when it was most needed. He has taken over with a minimum of confusion and has brought people with professional and technical experience to key positions.

Organization. The above organization chart depicts the lines of responsibility as they stood in late 1987. However, the Commissioner has a mandate to report to the Legislature in January 1988 on his recommendations for reorganization.

Differences Between ADOT&PF And Other State Highway And Transportation Agencies. The following are a list of notable differences between the ADOT&PF organization and the other state transportation and highway agencies:

1. Most states have appointed boards or commissions to advise and assist the departments' chief executive officers on policy matters.

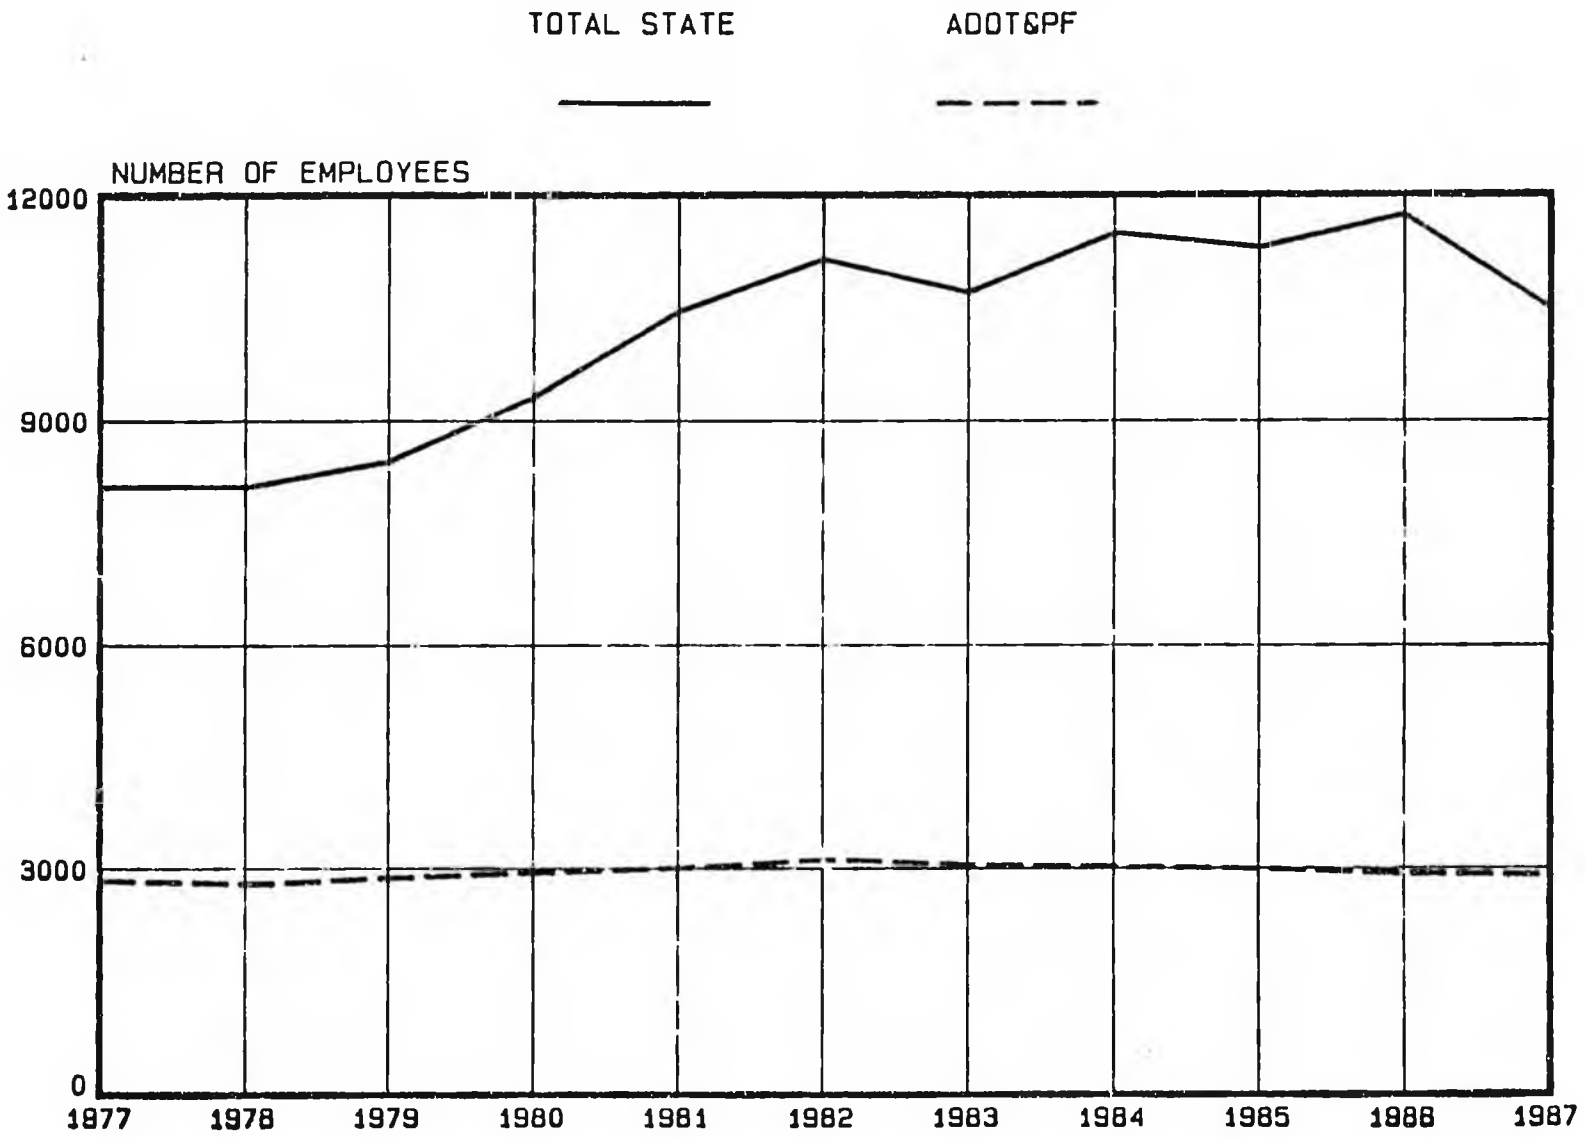
2. The ADOT&PF is the most comprehensive state transportation agency in the nation. Most state agencies are chiefly highway departments with only minor roles in administering federal and state grants for aviation, mass transportation, waterways and railroad improvements, with no construction, operational and maintenance responsibilities for the other-than-highway-transportation modes.

3. Most state agencies have a cadre of senior highway construction, maintenance and design engineers in the headquarters office that set policies and procedures to guide region, division or district staff. These people also monitor field activities and provide technical advice. The ADOT&PF lacks such headquarters' expertise in all areas.

4. The budget finance office is not normally at the deputy level. However, it is obvious with ADOT&PF's accounting problems why this office is positioned as it is.

5. In Alaska, each Region office operates similarly to an independent state highway agency with planning, contract letting, personnel, training functions, as well as the maintenance, construction inspection and design functions normally found in regional, division or district offices.

ADOT&PF STAFF COMPARED TO TOTAL STATE STAFF



NOTE: AS OF 2/87

ADOT&PF Complement Has Remained Level While Other Agencies Are Up By 45 Percent. According to ADOT&PF personnel files and the files of the Alaska Department of Administration, the state had 10,303 employees on the payroll as of the end of January 1987 and the ADOT&PF 2,916, or 28 percent of the total State complement. However, while the total of the other state agencies is 45 percent above 1977 manpower levels, the ADOT&PF overall complement has remained virtually unchanged over the 1977 to 1987 period.

Overall ADOT&PF Productivity Up. Total employees have remained constant. Discounting the effects of inflation, ADOT&PF's 1987 funds were only marginally ahead of 1977 funds (see page I-8). At the same time, travel has greatly increased as has lane-miles of highway, both of which increase the workload, particularly of maintenance force. It is therefore concluded that ADOT&PF staff productivity has increased over the 1977-1987 period.

Engineering And Marine Highway Positions Most Prevelent. The charts at right indicate: 1) the location of the 1987 ADOT&PF authorized permanent complement and 2) the functions of 2,727 employees that were on the payroll as of April 1987, a point in time when very few temporary or seasonal employees were employed.

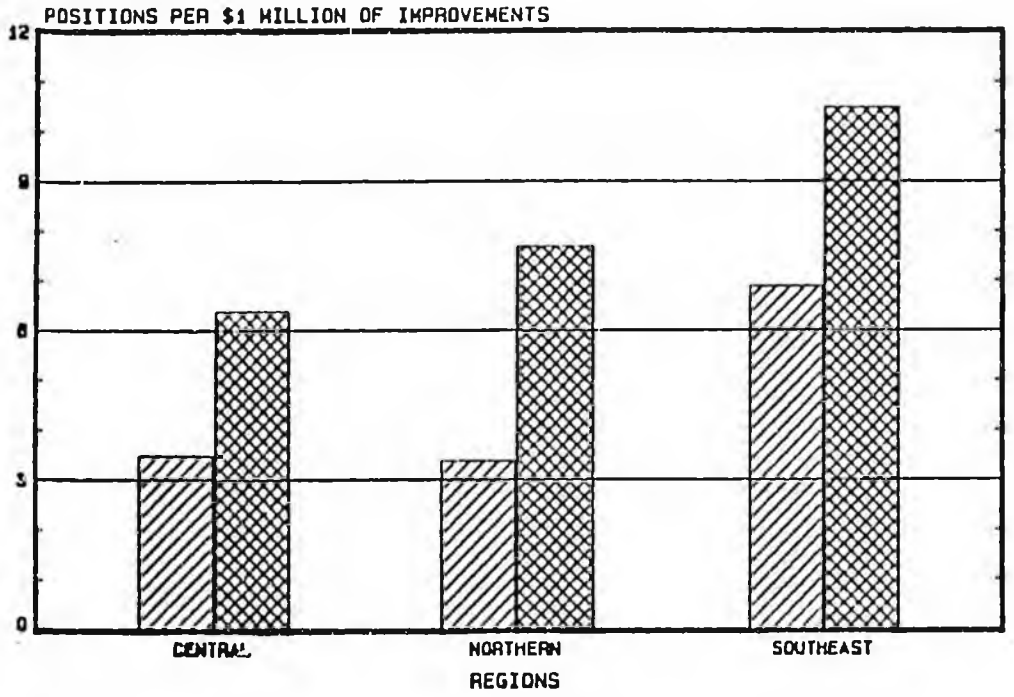
TOTAL: 2,727 (AS OF 4/30/87)

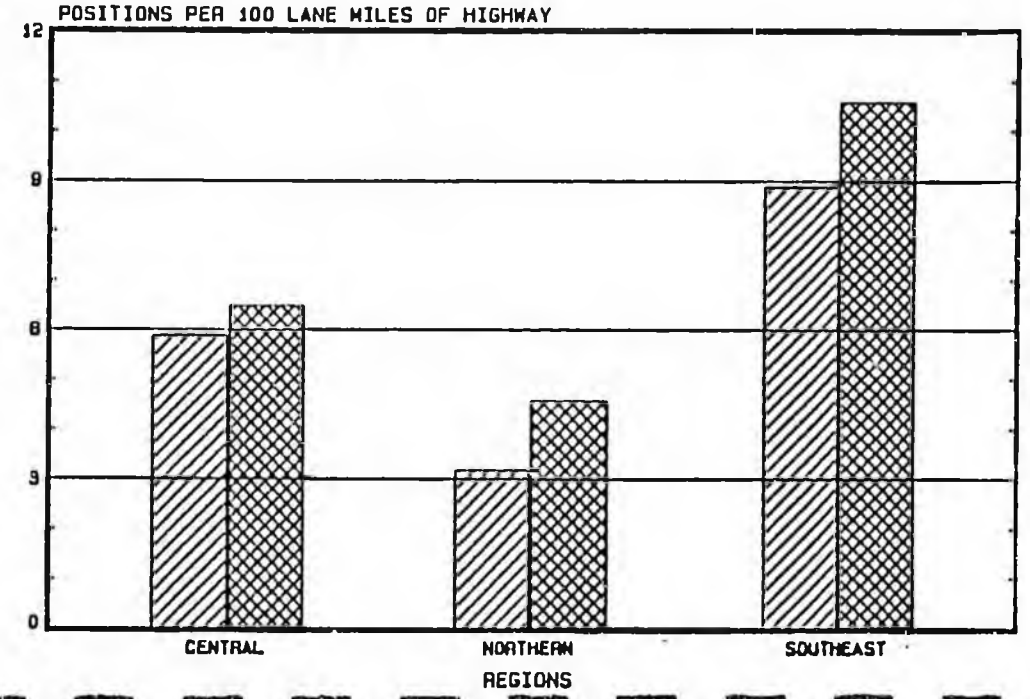
PERSONNEL ANALYSES

FULL TIME POSITIONS

TOTAL POSITIONS



DESIGN & CONSTRUCTION



MAINTENANCE & OPERATIONS

Preliminary Judgment: Productivity Highest in Central & Northern Regions. Preliminary judgments about region-to-region employee productivity can be judged by the two charts. However, other factors must be considered in making final judgments. With the fewest miles of highway to maintain and the lowest share of highway improvement funds, the Southeast Region must maintain, a minimum force that does not necessarily relate to workload.

Impact of Retirement Program. As of January 31, 1987, the ADOT&PF had lost 142 people to the statewide retirement incentive program offered by the Legislature. Two early analyses of the effects of these retirements are shown at the right. Other conclusions are as follows:

1. 54 percent of the retirees' positions were left vacant or abolished.
2. $1.37 million of wages were saved in fiscal year 1987.
3. Costs to the State of Alaska for offering early retirement are spread over a four year period and amount to $4.2 million. This compares to four-year, wage savings of $5.4 million.

By the end of the fiscal year cutoff period, 355 ADOT&PF employees took advantage of the RIP program.

Young ADOT&PF Work Force. In part due to the reduction in personnel program and in part due to the generally youthful nature of Alaska's population, the ADOT&PF is judged to be the most youthful of the nation's state highway and transportation department employees. With a retirement program that allows full retirement after 55 years of age with at least five years of service, it was observed that very few people stay beyond age 55. Furthermore, no other state can boast a commission executive staff all under the age of 45.

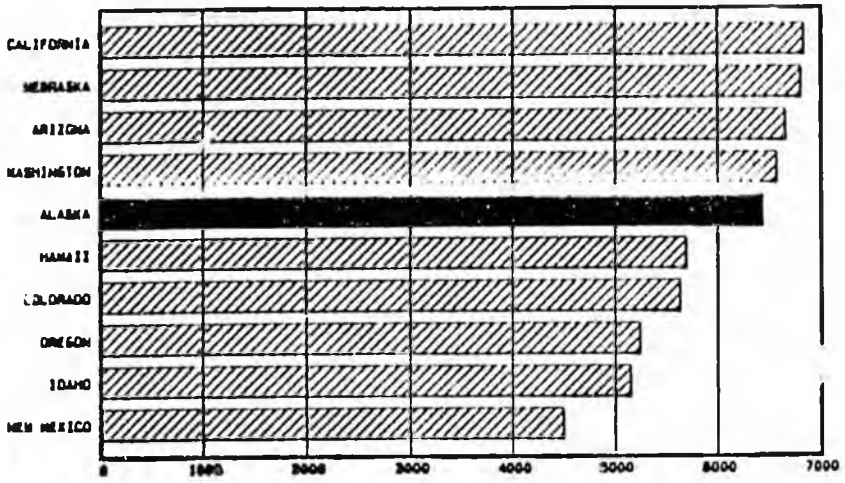
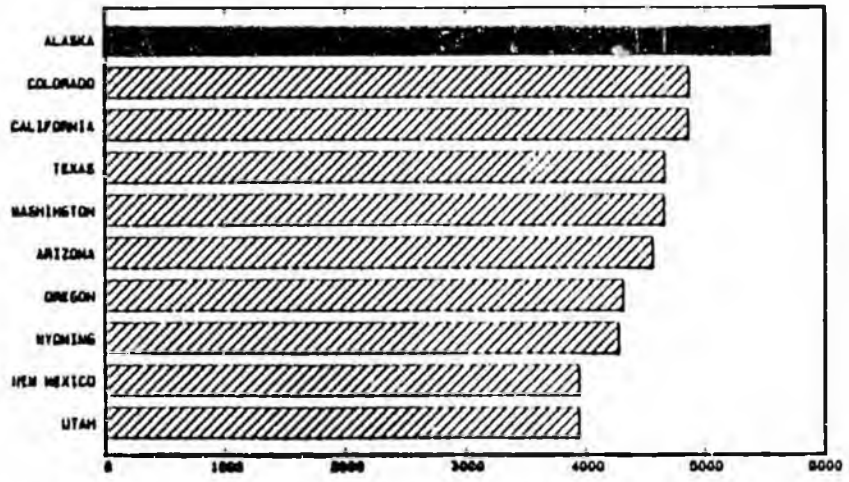
SALARIES COMPARED

COMMISSIONER/SECRETARY/ADMINISTRATOR OF TRANSPORTATION

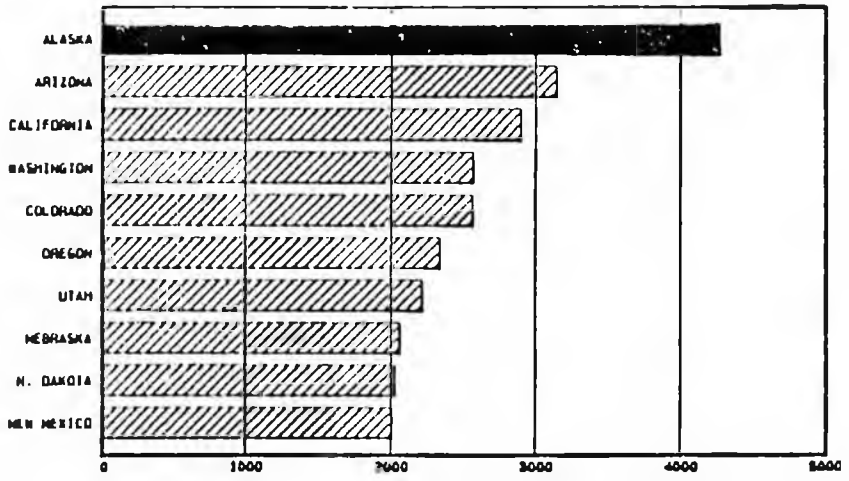


BRIDGE DESIGN ENGINEERS

(DIVISION CHIEF LEVEL)



TRANSPORTATION PLANNER'S



NOTES: 1) AVERAGE MONTHLY SALARIES, 1986.

2) HIGHEST 10 AMONG WESTERN STATES.

Salaries And Benefits Generous. While the incentives for retirement are good, the incentives for making the ADOT&PF a career are high. This page and the next show the 1986 average monthly salaries of seven categories of ADOT&PF staff as they compare to their counterparts in the other Western States. Note for each category of employee that the Alaska earned salary is compared with the 9 highest (only) of the other 17 Western States. The survey results are as reported by the American Association of State Highway and Transportation Officials.

Comparability. Note also that the categories were limited to those categories of ADOT&PF employees that had reasonable comparability with other states. Where it was deemed that ADOT&PF personnel of the same job title as their Western State counterparts had different functions, the category was eliminated.

Alaska Cost of Living Is Between 36 and 43 Percent Higher. Based on the January 1987, "Cost of Living Index" published by the American Chamber of Commerce Research Association, the cost of living in Alaska cities is between 36.4 percent and 43.5 percent higher than the average for all U.S. cities. These facts and Alaska's 1985-1987 economic transition should be considered when assessing the current applicability of ADOT&PF salaries.

Salary Issue Brought Forth Because Of The 1987 Debate. The facts are included in this review largely because of the debates in 1987 between government representatives that are trying to cope with Alaska's sudden drop in revenue resources and the public employee unions that are working hard to maintain current wages.

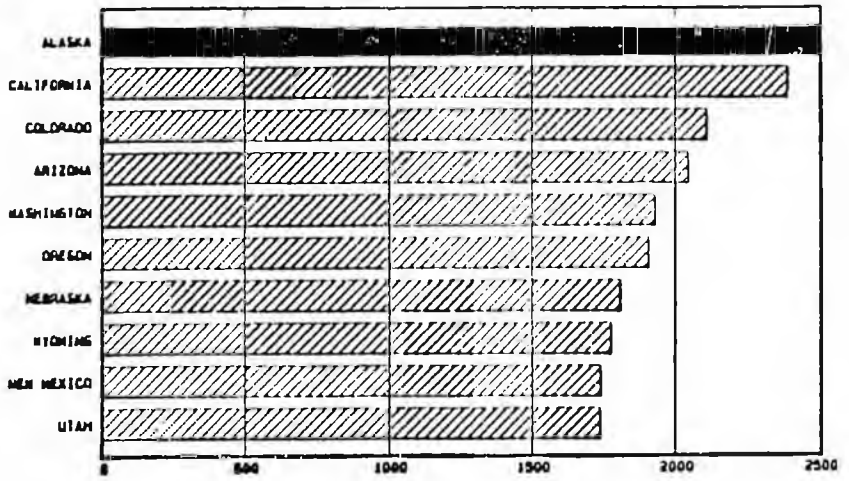
Federation's Position. In most of the other state highway programs reviewed to date, the Highway Users Federation found that salaries were low when compared with the responsibilities involved. In Alaska, however, we find the salaries consistent with the need to attract and retain capable people.

Highway Maintenance Workers. The group of ADOT&PF employees that appear to be most out of line with their counterparts in Western States, are the highway maintenance workers. However, in Alaska's case most highway maintenance employees are expected to be skilled heavy equipment operators, while for the most part the average highway maintenance employee in other states is not expected to have such skills. Furthermore, Alaska's salary differentials for remote locations have a considerable impact on maintenance worker salaries.

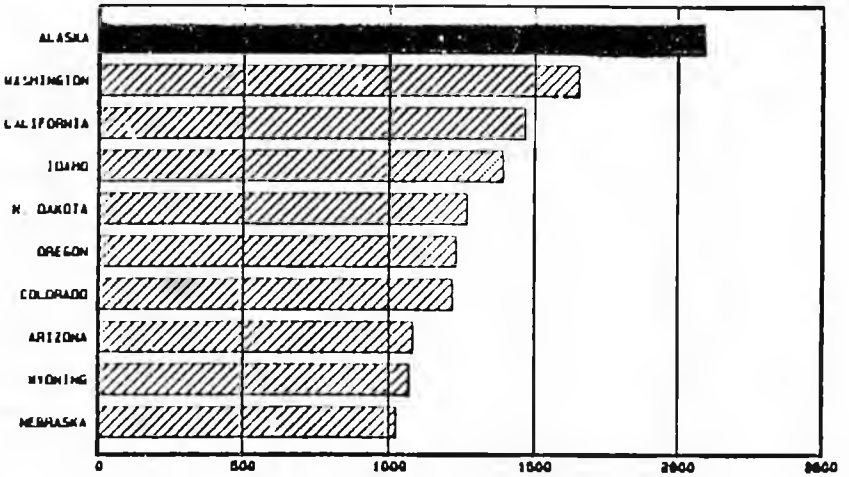
Transportation Planners. ADOT&PF's 12 transportation planners also appear to have abnormally high salaries in comparison with their counterparts in other Western States. However, in the context of Alaska's decentralized program and unlike other state highway and transportation programs, each ADOT&PF Region as well as the headquarters office, has a transportation planning staff that maintains important public liaison functions. As in all States, ADOT&PF transportation planners are the key group for pinpointing highway deficiencies, setting improvement needs and priorities, making environment assessments and accomplishing preliminary engineering functions.

SALARIES COMPARED

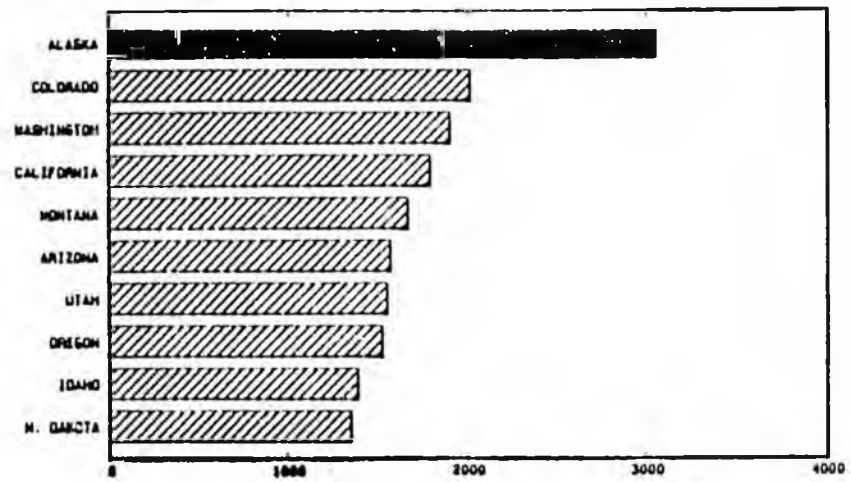
GRADUATE CIVIL ENGINEERS



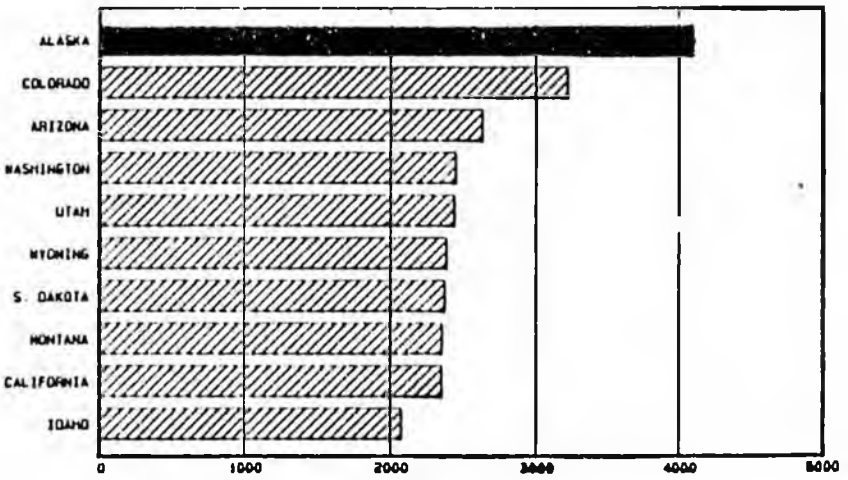
ENGINEERING AIDES



HIGHWAY MAINTENANCE WORKERS



HIGHWAY MAINTENANCE SUPERVISORS



NOTES: 1) AVERAGE MONTHLY SALARIES, 1986.
2) HIGHEST 10 AMONG WESTERN STATES.

Facilities. Not only are the salaries and benefits conducive to maintaining a highly trained and motivated staff, but the working conditions in shops, laboratories and offices appear to be an important asset to the Program, with some exceptions.

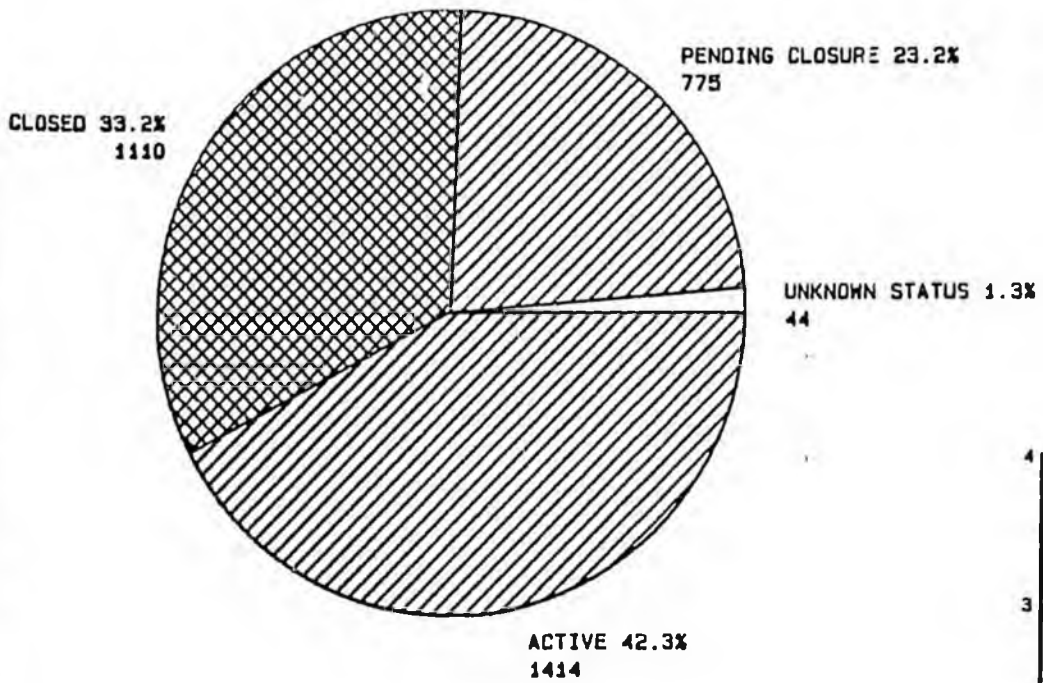
Regional and Headquarters Offices Good. The headquarters office facility as well as the regional offices in Fairbanks and Anchorage are excellent and provide good working conditions. The facilities in Nome and Valdez were viewed as adequate.

Southeast Region Headquarters Functions Need To Be Consolidated. The Southeast Region staff are divided between two offices, eight miles apart. In order to be effectively managed, the Southeast Region headquarters staff needs to be consoidated in a single building.

More Space Needed For Marine Highway System Staff. It was observed that among all the ADOT&PF offices visited, those of the Alaska Marine Highway System were most cramped for space. It is therefore recommended that a space allocation plan be developed for AMHS headquarters staff, and that either the existing AMHS building be expanded or that another suitable building be found to meet AMHS space allocation needs.

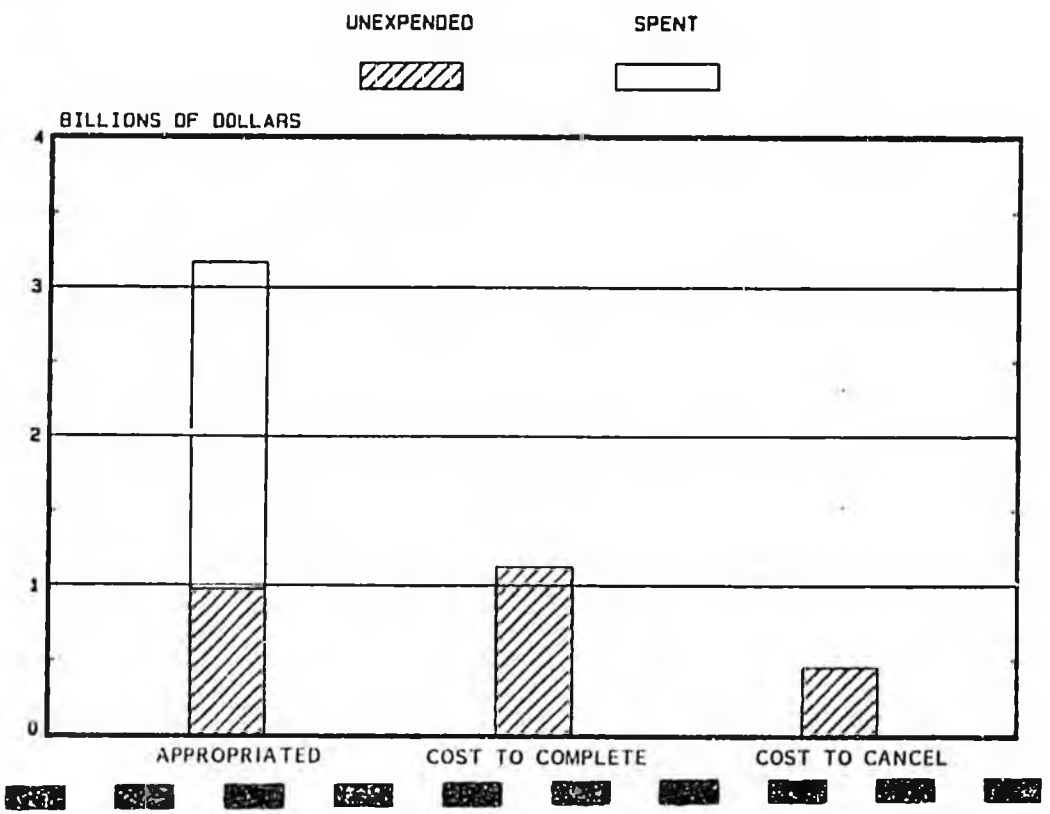
CAPITAL PROJECTS CLEAN-UP

PROJECT STATUS



TOTAL: 3,343 PROJECTS

FINANCIAL STATUS



NOTE: STATUS AS OF 3/10/87.

Capital Project Clean-up. For a number of years the ADOT&PF has found it difficult to accurately account for and report the financial status of its Capital Improvement Program (CIP). The increase in project appropriations during the early 1980's coupled with the then new decentralization policy, frustrated the Department's efforts to gain and retain accounting for the costs of preconstruction engineering activities, right of way costs, construction progress payments and the other elements of the CIP Program.

Objectives. The Capital Project Clean-up effort is designed to accomplish the following objectives:

1. Restore confidence in DOT&PF's ability to effectively manage capital improvement projects.

2. Use the State's accounting system (AKSAS) to control and accurately report the status of improvement projects.

3. Identify appropriation adjustments needed to correct the ADOT&PF's financial data base.

4. Develop a management reporting system for preconstructing engineering and construction projects.

5. Identify and develop needed policies, procedures and training.

Status. The original CPC effort (January 1984 through June 1985) produced an interim report to management based upon project and appropriation data as of June 30, 1985. This report revealed the current status of all ADOT&PF projects. However, the recommendations in the report were never implemented. Additionally, the accounting data base in AKSAS was not adjusted to reflect the proper financial balances as of that date.

In January of 1987, the Department gave its "highest priority" to the current CPC effort. In April the Department produced a preliminary status report of all of its capital improvement projects, as shown graphically above.

1987 Findings. The report identified over 3,343 projects with a authorized dollar value of $3.2 billion. 1,617 are highway projects with a $1.8 billion dollar value.

While the majority of these projects are cited in specific legislation, the remaining projects are authorized by agreements with other agencies and are composite, non-project-specific appropriations such as for highway planning and highway research. The report provides the current status of each project in terms of level of completion, the project budget, the unexpended balance, the cost to complete and the cost to cancel the project.

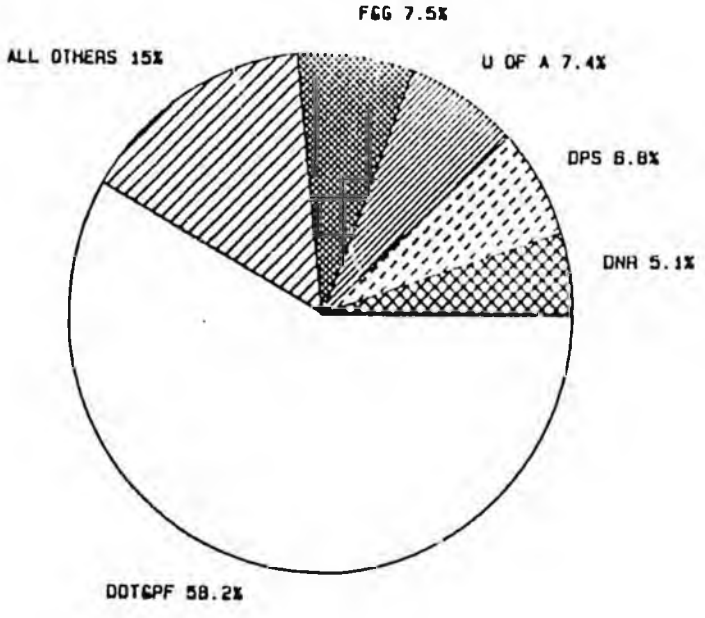
Overspending Found. The reported "cost to complete" (determined by project managers) exceeded the programmed balance by approximately $144 million indicating that an additional $144 million is needed to engineer and build the projects.. ADOT&PE officials anticipate that the final amount will be substantially less, following an accurate assessment of actual financial data.

The "cost to cancel" element includes reimbursement of Federal Aid Highway Program receipts for projects that were stopped before the improvement was awarded to contract.

The ADOT&PF indicates that the CPC effort will be completed in June 1988.

MANAGING STATE VEHICLES

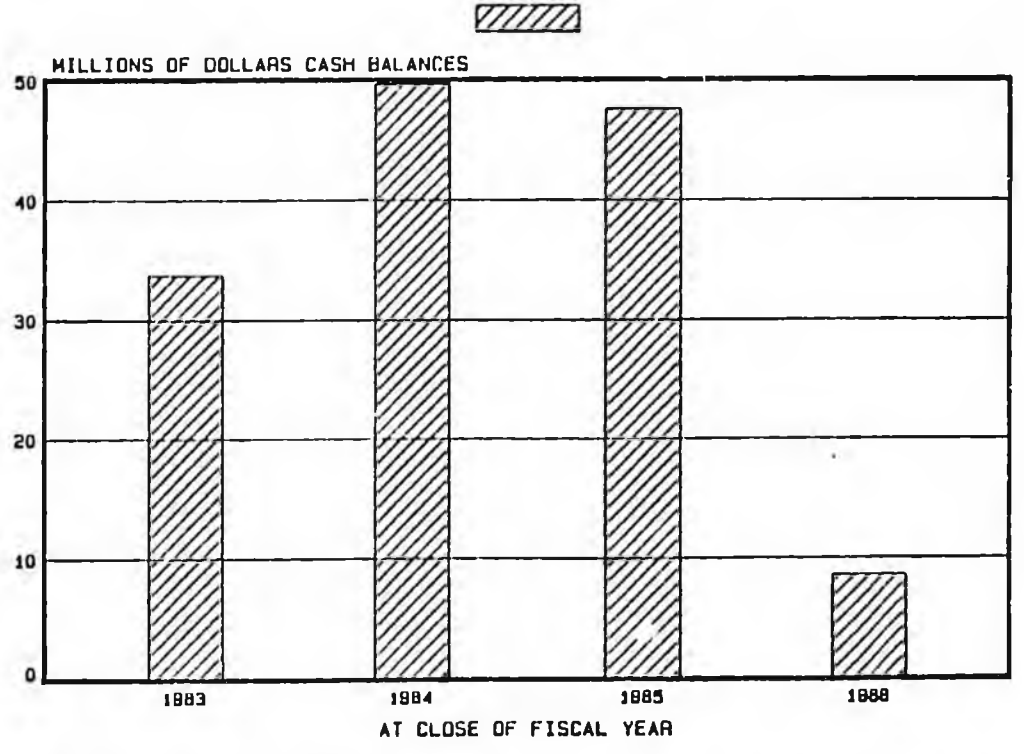
STATE EQUIPMENT FLEET



TOTAL VEHICLES & EQUIPMENT: 6,517

TOTAL REPLACEMENT VALUE: $117.7 MILLION

HIGHWAY EQUIPMENT WORKING CAPITAL FUND



Among the many responsibilities of the ADOT&PF is the management of the 6,517 vehicles and equipment that are leased to ADOT&PF forces and 18 other divisions of state government. Among the vehicles are cars, trucks, road graders, bulldozers, asphalt heating pots, sanders, snow plows and fire trucks. Alaska statutes state that the ADOT&PF shall "supervise and maintain all state automotive and mechanical equipment". A special Highway Equipment Working Capital Fund was established to receive leased funds and to expend appropriations from the Fund for maintaining, repairing and replacing the $117.7 million (1987 value) of vehicles and equipment.

HEWCF Low On Resources. The October 1987 draft of an audit of the state equipment fleet and ADOT&PF management procedures indicates the current HEWCF balance is inadequate to assure that needed vehicles can be replaced in order to sustain a modern and efficient fleet.

Main Problems Cited: Management Decisions To Reduce Lease Rates and Legislative Transfers Of HEWCF Funds To General Fund. Lease rates were set previous to 1986 to establish funds for replacements after careful analysis of expected future service lives of the vehicles and equipment. However, a steep reduction in the rates (49 percent) was made in FY 1987 to reduce state agencies' operating budgets in a time of fiscal crisis. Also because it was perceived that HEWCF fund balances were too high, the Legislature appropriated $62.7 million of HEWCF over the 1983 to 1987, five year period for other than State Equipment Fleet purposes.

Replacements Being Put Off. As of the audit report date, HEWCF balances have allowed only 75 percent of the scheduled fiscal year 1986 replacement to be made and almost none of the vehicles scheduled to be replaced in fiscal year 1987. The result: an aging fleet.

Recent ADOT&PF Steps. Two steps were taken in 1987 to resolve state equipment fleet problems. One, lease rates were again raised. And two the ADOT&PF appointed a task force to review and make recommendations regarding state equipment fleet problems.

ALASKA HIGHWAY PROGRAM REVIEWED

The Alaska Department of Transportation and Public Facilities continues to improve service to Alaskans, despite being the nation's most comprehensive state transportation department, according to a report released today by the Highway Users Federation.

Unlike most state transportation departments, which concern themselves mostly with highways, the report says Alaska's department maintains a system of 5,542 miles of state highways, two international airports, 215 regional airports, and a nine ship ferry system.

These special demands on the department are a major factor in the findings and recommendations included in the report titled "Alaska Highway Program Review."

Although Alaska is the nation's largest state, only three other states - Delaware, Hawaii and Rhode Island - have fewer miles of public road.

Alaska leads the nation in the ratio of Federal-aid Highway Program money received compared to actual highway user fees paid. Between 1956 and 1985, Alaska received $2.2 billion federal dollars while contributing $256 million, a nine to one ratio.

Yet state highway users taxes, such as trucking and state gasoline taxes, have remained extremely low in comparison with other states, the report says. While highway user taxes cover all of highway program costs in most states, Alaska's highway user taxes meet only one percent of its highway program costs.

Because the state maintains a higher proportion of minor roads than most states, roads of major significance must compete with local roads for scarce state highway funds. The analysis recommends that local governments increase their role in maintaining minor roads, so the state can concentrate its funds on more important routes.

Despite its tremendous dependence on transportation facilities, Alaska lags behind most states in the number of maintenance employees per lane-mile of highway.

The 59 page report also cited the need for more centralized planning and system analysis so that Alaskans can better manage their overall transportation priorities.

The department is essentially spit into three regional offices, which determine their priorities after a geographic apportionment of funds. This hinders the department from setting overall transportation policy directions.

The Highway Users Federation, a private sector road transportation organization with affiliated business coalitions in every state, is conducting highway program reviews throughout the county at the request of state transportation authorities and highway user groups.

The report is available from the House Transportation Committee of the Alaska State Legislature.

STATE OF ALASKA
THE LEGISLATURE

LEGISLATIVE AFFAIRS AGENCY

P.O. BOX Y, STATE CAPITOL
JUNEAU, ALASKA 99811
907 465-3800

CONTRACT BETWEEN

STATE OF ALASKA
LEGISLATIVE AFFAIRS AGENCY

AND

HIGHWAY USERS FEDERATION FOR SAFETY
AND MOBILITY
1776 Massachusetts Avenue, N.W.
Washington, D. C.

CONTRACT AMOUNT: $60,000

The parties to this agreement, made and entered into this 30th day of September, 1987, are the Legislative Affairs Agency, on behalf of the House Transportation Committee, (hereinafter referred to as the "Agency") and Highway Users Federation for Safety & Mobility, a nonprofit corporation, (hereinafter referred to as the "Consultant").

THE PURPOSE OF THIS AGREEMENT is to provide the House Transportation Committee with a review of the Alaska highway system.

CLAUSE I - STATEMENT OF WORK

The Consultant shall:

(A) review the Alaska highway system to study the manner in which the highway system of the State and its administration, maintenance and planned improvements meet and may continue to meet the needs of the highway using public in the State;

(B) work with the Alaska Department of Transportation and Public Facilities and a study advisory committee established for the contract by the House Transportation Committee, under the oversight of the House Transportation Committee; and

(C) prepare a detailed report of the Consultant's findings and recommendations for use by the legislative, administrative, and other public leaders of Alaska and a second report for distribution to the general public highlighting the findings and recommendations.

CLAUSE II - PERIOD AND DATES OF PERFORMANCE AND TERMINATION

The work under this contract shall be performed from November 17, 1986 through December 31, 1987.

CLAUSE III - PROJECT DIRECTOR

The Project Director shall be Representative Bette Cato, Chair of the House Transportation Committee.

CLAUSE IV - COMPENSATION AND METHOD OF PAYMENT

(A) For the work specified in this contract the Consultant shall be:

(1) compensated Forty Thousand and No/100 Dollars ($40,000.00) for the Consultant's services; and

(2) reimbursed for:

(a) travel expenses in the amount of Fifteen Thousand and No/100 Dollars ($15,000.00); and

(b) other expenses, including publication expenses, in the amount of Five Thousand and No/100 Dollars ($5,000.00).

(B) If payment is not made within 90 days after the payment becomes due under this contract, the Agency shall pay interest on the unpaid balance of the billing at the rate of 1.5 percent per month from the date payment becomes due to the date the payment is made. A payment is considered made on the date it is personally delivered or mailed to the Consultant.

(C) The payments under this clause are conditioned on the Consultant submitting billings with available receipts and the Project Director approving the payments.

(D) Total payments under this contract, including reimbursement for expenses, may not exceed Sixty Thousand and No/100 Dollars ($60,000.00).

CLAUSE V - RECORDS, DOCUMENTS, AUDITS

The Consultant shall maintain accurate records, including detailed time records, as may be required by the Project Director. The records are subject to inspection by the Agency or the Project Director at all reasonable times. All documents, reports and writings generated as a consequence of work done under this contract shall become the property of the State of Alaska and, upon completion of the work or at the termination of this contract, shall be delivered to the Project Director.

CLAUSE VI - WORKERS' COMPENSATION INSURANCE

During the life of this contract, the Consultant shall provide and maintain for all employees of the Consultant engaged in work under this contract, workers' compensation insurance as required by AS 23.30. The Consultant shall require any subcontractor to provide and maintain workers' compensation insurance for the Consultant's employees doing work under this contract.

CLAUSE VII - CERTIFICATION

Execution of this contract by the Executive Director or his designee hereby constitutes a certification that funds have been appropriated and encumbered for the amount of this contract.

CLAUSE VIII - INDEMNIFICATION

The Consultant shall indemnify, save harmless, and defend the State, its officers, agents and employees from liability of any nature or kind, including costs and expenses, for or on account of any and all legal actions or claims of any character whatsoever resulting from injuries or damages sustained by any person or persons or property as a result of any error, omission or negligence of the Consultant relating to its performance of this contract.

CLAUSE IX - ASSIGNMENT

This contract may not be assigned to another party unless in writing and signed by all the parties to the contract.

CLAUSE X - MODIFICATION AND PREVIOUS AGREEMENTS

This agreement replaces the 11-17-86 agreement between the Consultant and Representative Cato for the House Transportation Committee. This agreement contains all the terms and conditions agreed upon by the parties. No other understandings, oral or otherwise, regarding the subject matter of this agreement shall be deemed to exist or to bind either of the parties to this agreement. This contract may not be modified unless in writing and signed by all parties to the contract.

IN WITNESS WHEREOF, the parties have executed this agreement on the dates indicated below.

ALASKA HIGHWAY PROGRAM REVIEW

MAJOR FINDINGS -- PROGRAM STRENGTHS:

1. ALASKA RANKS AMONG THE BEST NATIONALLY IN BRIDGE CONDITIONS.

2. ALASKA'S TRAFFIC SAFETY RECORD IS ON A PAR WITH THE REST OF THE NATION.

3. ANCHORAGE'S ARTERIAL STREET AND HIGHWAY IMPROVEMENT RECORD IS IMPRESSIVE.

4. COOPERATIVE, PUBLIC/PRIVATE HIGHWAY FINANCE PLANS HAVE BEEN IMPORTANT TO ALASKA'S HIGHWAY DEVELOPMENT.

5. FEDERAL SUPPORT HAS BEEN AND REMAINS A VITAL FACTOR IN ALASKA'S HIGHWAY DEVELOPMENT.

6. A RECENTLY INITIATED 6 YEAR PROGRAM OF TRANSPORTATION MODERNIZATION HAS BROUGHT RELATIVE STABILITY TO STATE HIGHWAY PROGRAM MANAGEMENT.

7. THE MARINE HIGHWAY SYSTEM IS UNIQUE AND THE SERVICE GOOD.

8. ALASKA'S MAJOR AIRPORTS ARE IN EXCELLENT CONDITION, AND GOOD PROGRESS IS BEING MADE IN UPGRADING SMALL AIRPORTS.

9. THE ADOT&PF STAFF IS THE MOST YOUTHFUL IN THE NATION THEREBY PROVIDING AN EXCELLENT BASE FOR DEVELOPING FUTURE LEADERS.

10. THE PAY AND BENEFITS PLAN AS WELL AS THE OFFICES AND MAINTENANCE FACILITIES ARE AMONG THE BEST IN THE NATION, AND THESE FACTORS CONTRIBUTE TO A STABLE AND DEDICATED ADOT&PF WORK FORCE.

item #5

ALASKA HIGHWAY PROGRAM REVIEW

Major Findings -- Concerns:

1. Roadway preservation activities have been cut to the point where Alaska may not now be gaining the maximum service life from highway improvement investments.

2. The ADOT&PF maintenance manpower level has fallen to the point where the resulting reductions in snow and ice removal activities sometimes create hazardous conditions and inconvenience motorists.

3. Because Alaska's State Highway Program lacks a dedicated fund source, it is difficult to set a long range plan for system modernization, pavement upgrading, and system expansion.

4. The state is looked to for the finance of local road needs, thereby diluting the effectiveness of the State Highway Program in meeting maintenance and modernization needs of rural and urban routes of statewide significance.

5. While decentralized control of Alaska's transportation system is necessary, this makes it more difficult than in other states for ADOT&PF officials to develop and apply uniform policies. The paucity of technical staff in the ADOT&PF headquarters office further compounds the problem of both developing such policies as well as the monitoring of policy implementation.

6. There is a need to develop better information on the condition and performance of Alaska's transportation systems and the adequacy of funds to meet the needs.

COMMONWEALTH NORTH

MEMORANDUM

TO: The Honorable Bette Cato, Chairman
House Transportation Committee
FROM: Loren Lounsbury, Chairman
Commonwealth North Railroad Committee
DATE: March 9, 1988
RE: Commonwealth North Railroad Study

Thank you for inviting us to meet with you and your committee regarding the study Commonwealth North is currently undertaking regarding the Alaska Railroad. As you may know, our organization has followed closely the railroad before the transfer, and at the time of the transfer. We are interested now in how it is doing under the state statute and what its future should be.

We have divided our team into three subcommittees:

1. An Operations subcommittee. This group is looking at how the railroad is doing since the transfer. This group is chaired by Frank Danner of Peat Marwick.

2. A Sale Option subcommittee. This group is looking at whether the railroad should be sold to a private entity or whether parts of it or its operations should be leased or put on contract. Chaired by Bob Dickson of the law firm of Atkinson, Conway & Gagnon.

3. An Economic Development subcommittee. This group is examining how the railroad could be more effective in assisting economic development, not just in Southcentral or Interior Alaska, but throughout the state. This group is examining potential extensions, both contiguous and non-contiguous. The group is chaired by Ray Latcham, Vice President of Norgasco.

Founding Co-Chairmen Governor Walter J. Hickel and the late Governor William A. Egan
Max Hodel, President • Joe Hayes, Vice President • Loren Lounsbury, Vice President • Frank Turpin, Vice President
Sue Linford, Secretary • Robert E. Bulmer, Treasurer • Richard F. Barnes • Carl F. Brady, Sr. • David L. Chatfield • Roy M. Huhndorf
Archbishop Francis T. Hurley • Jeff Lowenfels • Dean Nelson • George N. Nelson • Governor Bill Sheffield
Judge James Singleton • William J. Tobin • William Wade • Connie Yoshimura
Malcolm B. Roberts, Executive Director

935 West Third Avenue / Anchorage, Alaska 99501 / 907-276-1414

I am very pleased by the calibre of this committee. The list of the members and their affiliations is attached. Also attached, is our draft outline for the study we are undertaking.

The mandate to us from our Board is to maintain a statewide perspective in terms of what is in the best interest of all Alaskans at this critical time when diversification and strengthening of our economy is so urgently needed.

We welcome this chance to meet with you, receive your advice and answer any questions.

Our hope is to complete our study and bring it back for your review by mid-April.

Thank you very much.

COMMONWEALTH NORTH

OUTLINE

COMMONWEALTH NORTH RAILROAD STUDY

1.0 Assessment of Current Operations

- 1.1 Review profit/loss information
- 1.2 Review major revenue components
  - .1 Freight
  - .2 Passenger
  - .3 Real Estate
  - .4 Other
- 1.3 Review major expense components
  - .1 Labor cost
    - .1 negotiated
    - .2 other
  - .2 Fuel
  - .3 Depreciation
  - .4 Management costs
  - .5 Other
- 1.4 Review Management controls
  - .1 Corporation Act requirements
  - .2 Management by the Board of Directors
    - .1 Established policies
      - .1 operations of the board

Founding Co-Chairmen Governor Walter J. Hickel and the late Governor William A. Egan
Max Hodel, President • Joe Hayes, Vice President • Loren Lounsbury, Vice President • Frank Turpin, Vice President
Sue Linford, Secretary • Robert E. Bulmer, Treasurer • Richard F. Barnes • Carl F. Brady, Sr. • David L. Chatfield • Roy M. Huhndorf
Archbishop Francis T. Hurley • Jeff Lowenfels • Dean Nelson • George N. Nelson • Governor Bill Sheffield
Judge James Singleton • William J. Tobin • William Wade • Connie Yoshimura
Malcolm B. Roberts, Executive Director

935 West Third Avenue / Anchorage, Alaska 99501 / 907-276-1414

.2 ethics and conflict of interest

.3 procurement and property disposal

.4 hiring and personnel

.5 real estate leasing

.6 other

.2 Budget review and approval

.3 External management controls (Audits)

.1 Financial

.2 Management

.4 Internal management controls

.1 Approval authority guide

.2 AFE process

.3 Employee Expense Guide

1.5 How has the ARRC balanced their mandate to be self-supporting with their responsibility as a public entity?

.1 Public input process

.1 Board meetings

.2 Public meetings on public interest issues

.1 procurement policy

.2 real estate lease policy

.3 passenger services

.3 Interface with public officials

.1 Local

.2 State

.3 Federal

.4 Community Briefing Council

.2 Examples of public/private issues

.1 Passenger service

.2 Procurement policy

.3 Donations of Railroad property

.4 Are the tariffs fare?

.3 Political involvement

.1 How should the Legislature be involved in RR issues?

.1 ARCA

.2 Legislative history

.2 Recent examples of how the Legislature has been involved.

.1 Real estate

.2 Purchase of ties

.3 Caboose bill

.4 Free service to seniors

.5 Moose bill

1.6 Is ARRC aggresively marketing RR services?

1.7 What has the ARRC done to maintain/upgrade RR equipment and facilities?

.1 Equipment

.2 Facilities

2.0 Should the RR be sold to a private entity?

2.1 Summarize legislative intent and requirements on privatization

2.2 The pros and cons of privatization

.1 in the short-term

.2 in the long-term

2.3 Estimated cost of offering the RR for sale

2.4 What action should the state take?

3.0 What should the RR be in the long run?

3.1 Summary of the Railroad's historical role in development of Alaska

3.2 ARCA

3.3 What should be done now to maximize RR's use as a development tool?

.1 By RR

.2 By the State

3.4 Examples of development options (extentions)

.1 What known resource provinces could be tapped?

.2 How much would a railroad extention cost per mile?

3.5 What do rural residents and Native corporations think about such extentions?

3.6 What obstacles would such expansion encounter from federal agencies, especially federal land managers?

3.7 Are there environmental/engineering problems?

3.8 What are the potential benefits?

subcommittees: 1. Operations
2. Sale options
3. Economic Development

2/88 COMMONWEALTH NORTH RAILROAD COMMITTEE

	Loren Lounsbury Chairman 277-4334	Former Commissioner of Dept. of Commerce and Economic Development; President, Lounsbury & Assoc.; Vice President, Commonwealth North.

The resumes for these appointments will be submitted to the Fifteenth Alaska State Legislature through the clerks of both houses.

Sincerely,

Steve Cowper
Governor

Elsensohn

April 21, 1987

BOARDS & COMMISSIONS

APR 23 1987

Honorable Steve Cowper
Governor of the State of Alaska
Office of Governor Cowper
P.O. Box A
Juneau, Alaska 99811

Attention: Sheila Gottchrer

This letter is my resume' of sea time and piloting requested by your office.

I began going to sea as Ordinary Seaman in 1943. In 1943 I got my Third Mates License. In the years that followed I raised my qualifications to Master of Vessels of any gross tons, any waters. I have been piloting in Southeastern Alaska since the summer of 1973. On January of 1976 I became a full-time pilot here.

I am extremely interested in piloting here from the standpoint of safety. Shipping is very important to the economy of Alaska, but the potential dangers to lives, property, and ecology are very real. Because of these facts I believe the Board of Marine Pilots has a great responsibility to make piloting in Alaska as accident free as possible. In order to assist in reaching these goals, I would be pleased to be a member of the Board of Marine Pilots.

Respectfully,

Harold K. Elsensohn

Capt. H. K. Elsensohn
License No. 050

MARK A FOSTER
1220 Chena Ridge Road
Fairbanks, Alaska 99709
(907) 479-3688
457-6877 (wo)

Birthplace: Fairbanks, Alaska

EXPERIENCE:

May 06- Current — CITY OF FAIRBANKS.
Engineer, Electric Utility and Special Projects

Special Projects include: Member of City Manager's Ad Hoc Budget Committee, conducted detailed research on operating and capital budgets; Project Engineer for Proposed Electric Utility Sale, responsible for project administration, research and development of technical and policy issues, and preparation of reports for staff, management, Public Utilities Board and City Council; Engineering Department Management Plan, developed departmental goals and objectives to supplement 1987 budget; Engineering Department Review of City/Borough Unification, developed departmental issue paper reviewing unification issues and associated pros and cons; Engineering Department Compensation Review, review City of Fairbanks compensation policy since institution of 1979 personnel ordinance.

Research and preparation of plans, specifications, and contract documents for procurement and construction contracts. Administration of construction contracts. Research, preparation, and administration of professional services contracts with engineers, architects, and consultants. Research electric utility problems, develop alternative solutions, and prepare recommendations based on engineering feasibility and life cycle costing including benefit/cost analyses. Projects include: Coal Handling Facility, Ash Handling System, Chena #6 Battery House, Alaskaland Riverboat Basin Stabilization and Landscaping. Provide assistance to other engineers on: Power Plant Baghouse, Wastewater Treatment Plant Potable Water Pumps, Power Plant Demineralizers.

Aug. '84- May '86 — EBENAL GENERAL, INC. Fairbanks, Alaska
Vice-president, General Contractor specializing in commercial construction.

Develop detailed cost estimates and prepare bid packages for lump-sum, unit-price, and design/build contracts. Plan and develop construction schedules and cost control budgets. Prepare periodic estimates of project schedule and budget as basis for pay estimates. Procure materials, tools, and equipment as necessary. Coordinate and direct construction crews and multiple subcontractors to expedite completion of projects. Contract administration and coordination between company, owner, architect, engineers, and site inspectors. Maintenance of daily records including: submittals, as-builts, change orders, inspection records, and shop drawings. Projects from the 1985 construction season include: Chena Lakes Maintenance Facility, Chena Lakes Nature Trail, Chena Lakes Boat House, Moose Creek Fire Dept. Addition.

Aug.'84-
May '85

UNIVERSITY OF ALASKA, FAIRBANKS.
Chancellor's Office Internship.

Assisted with research of UAF Policy Manual. Coordinated 1984 UAF legislative forum for Interior Delegation. Coordinated and directed student inquiries. Aided UAF student lobbying efforts. Developed budget analysis data. Research projects included: high school graduate market study, faculty productivity, student loan program, tenure issues, capital projects and construction costs.

June '84-
Aug.'84

UNIVERSITY OF ALASKA, STATEWIDE ADMINISTRATION
Program Assistant, Office of Human Resource Development.

Assisted the Director in developing and conducting a compensation survey of classified staff across the state. Acquired knowledge of market surveys, position classifications, and compensation systems.

April'83-
Sept.'83,
May'82-
Sept.'82

CITY OF FAIRBANKS.
Building Inspector.

Inspected building construction to ensure compliance with building codes, plans, specifications, and other applicable requirements. Assist and advise architects, designers, engineers, constractors, and the general public in matters relating to construction and code requirements. Process building permit applications. Examine plans and specifications to ensure compliance with codes and ordinances.

EDUCATION:

Sept.'83-
Current

UNIVERSITY OF ALASKA, FAIRBANKS

Working toward Masters Degree in Arctic Engineering. Have completed over 40 credit hours of graduate curriculum. *Thesis topic: Life Cycle Costs of Public Construction in the State of Alaska.*

Sept.'79-
March'83

STANFORD UNIVERSITY. Stanford, California.

Graduated in March '83 with a B.S. in Civil Engineering. Member Stanford Student Chapter of the American Society of Civil Engineers. *Thesis: Economic Feasibility of Susitna Hydroelectric Project.*

Fall '75-
Spring '79

LATHROP HIGH SCHOOL. Fairbanks, Alaska.

Graduated Salutatorian. Served as Student Body President.

ADDITIONAL INFORMATION

BOARDS AND COMMISSIONS RESUME

INSTRUCTIONS

A separate application is required for each position for which you apply. Complete and specific answers will aid in rapid and accurate processing of your resume. The initial determination of whether you qualify for the position specified will be based on this application.

Please type or print legibly in ink. Forward to the above address. Be sure your answers are correct. A willfully false answer may result in your disqualification or removal from office if you are appointed.

Position for which I am applying: Personnel Board

Please list any other State Board or Commission on which you serve:

REPORT ADDRESS AND TELEPHONE CHANGES PROMPTLY

Name	Previous Name applied under
Marlene JOHNSON	
Mailing Address	**Residence Address**
P.O. Box 218	#1 Hill St.

Hoonah, Alaska 99829	
Home Telephone	**Business or Message Telephone**
907-945-3372	907-586-1512

AS 39.05.100 requires that a person appointed to a board or commission be a registered voter BEFORE the last general election held _____:

Are you a registered voter? ☒ YES ☐ NO

Voter Registration Number (Optional): 8998

Social Security Number (Optional): 574-10-6688

Have you ever been convicted of a misdemeanor within the past five years or a felony within the past ten years? ☐ YES ☒ NO
If "YES", explain the circumstances on a separate sheet of paper and attach it to this application. A conviction is not necessarily grounds for disqualification. The number of convictions, nature, recency, and relationship to the board position applied for will be evaluated and a determination will be made after a review of all relevant facts.

A policy in the Governor's Office pertaining to boards and commissions is that a member attend at least 75% of the meetings. Are there any circumstances in either your professional or personal life which would prevent you from participating at the required meetings? ☐ YES ☒ NO
If "YES", explain on a separate sheet of paper and attach to this application.

This position may require that the member travel to either urban or rural (or both) areas. Are there any circumstances which would prevent you from participating?

NO

CONFLICTS OF INTEREST: Certain Boards and Commissions require full disclosure of personal financial data under AS 39.50.010. If required for the Board or Commission for which you are applying, are you willing to do so?
☒ YES ☐ NO

Could you or any member of your family be affected financially by decisions to be made by the Board or Commission for which you have applied?
☐ YES ☒ NO If "YES", explain.

The Office of the Governor will not discriminate against an applicant for a Board or Commission based on Sex, Age, National Origin, Marital Status, Pregnancy, Handicap, Religion, or Parenthood.

01-012 (Rev. 8/84)

TRAINING & EXPERIENCE: (If resumé attached, it is not necessary to complete it. Fill in A-D)

A. List any professional licenses, certifications, or registrations and dates obtained that may be used as qualifying criteria:

None

B. List both formal and informal education and training experience (use additional paper if necessary):

High School - Juneau High graduate

C. List any community service positions, municipal government positions, state positions held, and list any awards received. These include both compensated and uncompensated positions (for example, president of a service organization or a mayor). Also include length of time served in the positions.

Hoonah School Board - Jan. 1961 Thru Oct. 1985
Rural Cap 1965 - 1974

D. Employment work history: paid, unpaid, or voluntary (use additional paper if necessary):

Southeast Skyways -	1969 - 1982
Wings of Alaska	1982 - 1986
Sealaska, Inc	1971 - 1986
Huna Totem, Inc	1974 - 1980
" " "	1983 - 1986

The Office of the Governor and the State of Alaska have an Affirmative Action Equal Employment Opportunity Program. To assist in the program, you are asked to voluntarily answer the following questions to provide the information necessary for reporting purposes. Under State and Federal law, the information you provide will not be used to illegally discriminate against you.

SEX

STEVE COWPER
GOVERNOR

STATE OF ALASKA
OFFICE OF THE GOVERNOR
JUNEAU

March 4, 1988

The Honorable Bette Cato
Chairperson
House Transportation Committee
P.O. Box V
Juneau, AK 99811

Dear Representative Cato:

Governor Cowper has appointed Mark Foster to a public seat on the Board of Marine Pilots. As a "public" member, Mr. Foster may not:

be engaged in the occupation that the board regulates;

be associated by legal contract with a member of the occupation that the board regulates except as a consumer of the service provided by the occupation; or

have a direct financial interest in the occupation that the board regulates.

Mr. Foster's education, background and experience have aptly prepared him for carrying out the powers and duties of the Marine Pilots Board:

1. involvement and participation in establishing and monitoring public policy;
   ("...assure protection of shipping and the safety of human life and property;")
   AS 08.62.040(a)(1)

2. research activities in work and education;

3. successful completion of undergraduate and graduate degrees from Stanford University and University of Alaska, Fairbanks.
   (ability to establish standards,
   adopt regulations,
   establish qualifications of pilots,
   "...make any other provision for proper and safe pilotage upon the waters..")
   AS 08.62.040

Mr. Foster possesses the attributes and qualifications of an exemplary public member--that is, he is concerned about ensuring good and fair public policy and maintaining high standards in the profession. He is highly intelligent, public-minded and most competent. He is an excellent problem solver and analytical thinker. As a public member he does not need to possess a particular knowledge of marine pilotage. Rather as a public member he should be and is objective, without a special interest or self-interest agenda, thoughtful and fair.

If you have any questions regarding the qualifications for public membership on the board, please contact me.

Sincerely,

Sheila K. Gottehrer

SUBJECT: HB 31, Relating to Registration of Commercial and Noncommercial Motor Vehicles

With increasing frequency, we hear complaints of commercial vehicles with out-of-state license plates operating on our highways. While some operators may pay the required registration fee, others do not. Enforcement of registration laws is difficult as there is no visual means to quickly identify the illegal nonregistered operator.

In addition, many new residents or nonresidents working temporarily instate fail to comply with state registration requirements, choosing instead to maintain their vehicle registration in other states. These residents benefit from our roads and jobs without paying the required fees.

HB 31 would eliminate distinctions between nonresident and resident commercial vehicles for purposes of registration, assessing fees, and display of license plates. Only licensed ICC and FMC carriers and unladen commercial vehicles operating under a one way trip permit would be exempted - although prominent display of permits would be required.

HB 31 would shorten the length of time a nonresident, noncommercial vehicle is exempt from state registration requirements and require proof of any exemption from registration.

We consider this legislation to be an important element of the Alaska residency and local hire issues in its attempt to enforce our vehicle registration laws and to legally, but forcefully, discourage the use of nonresident commercial vehicles.

Last session we introduced a bill with identical provisions, HB 456, which passed all committees of referral but died in the Senate Rules Committee while awaiting a vote by the full Senate in the final hours of the session.

SUMMARY

HB 31

Relating to Registration of Commercial and Noncommercial Motor Vehicles

Background

Current State law or regulations require the registration of all vehicles operating instate. However, many new residents or nonresidents working temporarily instate illegally maintain their vehicle registration in other states. These operators benefit from our roads and jobs without paying the required fees.

Current State law also does not specifically address the handling of nonresident commercial vehicles operating temporarily instate. Regulations now provide for permitting or registration for such vehicles. However, with the exception of licensed ICC and FMC carriers, the regulations do not require the display of a permit or registration for nonresident commercial vehicles. Thus, it is difficult for law enforcement officers and the public to distinguish between a vehicle holding a valid temporary permit and one operating illegally instate.

Additionally, fees for temporary permits for nonresident commercial vehicles are now determined administratively by prorating the resident commercial vehicle fee for the number of days the nonresident vehicle is registered for use instate. This method does not appear to result in fees appropriate for the privilege of operating nonresident commercial vehicles in Alaska.

HB 31 would accomplish the following:

1. Shorten the length of time a nonresident, noncommercial vehicle is exempt from State registration requirements and require proof of any exemption from registration.

2. Eliminate the distinction between resident and nonresident commercial vehicles for purposes of registration, assessing fees, and display of license plates.

3. Limit the authority for issuance of special permits and the exemption from normal registration to only short-term, one-way unladen commercial vehicles and licensed ICC and FMC carriers. Permits would have to be prominently displayed.

SUBJECT: Registration of Motor Vehicles - HB 31

TO: Representative Pat Pourchot

FROM: Michael F. Ford
Legislative Counsel

The following is a sectional analysis of HB 31, as requested:

Section 1

Lowers the nonresident exemption from registration of a non-commercial vehicle from 90 to 60 days, and the requirement that registration take place after employment is lowered from 15 to 10 days after the person becomes employed. Requires commercial vehicles to be registered when use begins, except as provided in AS 28.10.011 and 28.10.131(c).

Section 2

Requires the person claiming nonresident exemption from registration to provide proof of qualification for the exemption.

Section 3

Technical amendment in conjunction with section 4.

Section 4

Allows the owner of a commercial vehicle temporarily operating in-state to register a commercial vehicle, while maintaining title in another jurisdiction.

Section 5

Requires owners of commercial vehicles licensed by the I.C.C. or the F.M.C., and registered in another jurisdiction

who desire to retain registration and title in the other jurisdiction, to register the commercial vehicle, but exempts the owner from title requirements.

Section 6

Adds an additional exemption from registration requirements for an unladen commercial vehicle making a single continuous trip not exceeding 10 days.

Section 7

Requires special permits issued under AS 28.10.151 to be prominently displayed.

Section 8

Technical amendment in conjunction with section 4.

Section 9

Effective date.

BILL NO: HB 31

DATE: January 19, 1987

TITLE: An Act relating to registration of commercial and noncommercial motor vehicles.

CONTACT: Bill Brown
465-4335

DEPARTMENT OF PUBLIC SAFETY

The bill will require full registration of commercial vehicles not used as legitimate interstate carriers, and reduce the time period in which a person is required to register a vehicle.

All commercial vehicles may now obtain a "trip permit" that allows them to operate in Alaska for up to 90 days. This gives summer commercial operators an advantage over Alaska residents who must pay full fees. This bill restricts use of the trip permit to only licensed interstate carriers, and requires temporary operators to pay full fees. This is done to put non-residents on an equal economic basis with Alaska residents while, at the same time, not placing a restrictive burden on legitimate interstate carriers.

The Department of Public Safety supports this bill.

IN THE HOUSE BY THE TRANSPORTATION COMMITTEE

CS FOR HOUSE BILL NO. 31 (Transportation)

IN THE LEGISLATURE OF THE STATE OF ALASKA

FIFTEENTH LEGISLATURE - FIRST SESSION

A BILL

For an Act entitled: "An Act relating to registration of commercial and noncommercial motor vehicles; and providing for an effective date."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

* Section 1. AS 28.10.121(a) is amended to read:

(a) A nonresident owner of a noncommercial vehicle registered outside the state is exempt from the registration provisions of this chapter for 60 [90] days after entry into the state if the vehicle at all times when driven in this state is registered in and has displayed upon it a currently valid registration plate issued for it by another jurisdiction. However, if the person becomes gainfully employed in the state or takes action that [WHICH] indicates an intention to acquire residence in the state, the person shall comply with the licensing and registration provisions of this chapter within 10 [15] days of commencement of employment or of taking action that [WHICH] indicates the person's intention to acquire residence. If the vehicle is a commercial vehicle, the vehicle must be registered when its commercial use begins except as provided in AS 28.10.011 and 28.10.131(c) [IN ACCORDANCE WITH AS 28.10.141 AND OTHER APPLICABLE PROVISIONS OF THIS CHAPTER].

* Sec. 2. AS 28.10.121 is amended by adding a new subsection to read:

(d) It is the responsibility of the person claiming exemption under this section to provide proof of qualification for the exemption.

* Sec. 3. AS 28.10.131(a) is amended to read:

(a) If a vehicle to be registered under this chapter is previously registered outside the state, the jurisdiction of registry shall be stated in the application, and the owner shall surrender to the department all evidence of out-of-state registration in the owner's [HIS] possession or control except as provided in this section or AS 28.10.141, and the department may require verification of the vehicle identification number.

* Sec. 4. AS 28.10.131 is amended by adding a new subsection to read:

(c) If the owner of a commercial vehicle desires to maintain title in another jurisdiction, the department, when satisfied that the applicant is temporarily operating in-state and is the lawfully registered owner of the commercial vehicle, may register the commercial vehicle without issuing a title and shall type or stamp on the face of the State of Alaska certificate of registration "No Title Issued."

* Sec. 5. AS 28.10.141 is amended to read:

Sec. 28.10.141. INTERSTATE USE OF VEHICLES. When, in the course of regular interstate operation in this state [OF] a commercial vehicle licensed by the Interstate Commerce Commission under 49 U.S.C. 1-1240 (Interstate Commerce Act) or regulated by the Federal Maritime Commission under 46 U.S.C. 804 (Interstate Commerce Act) is registered in another jurisdiction, and it is desirable to retain the registration and title of the vehicle in the other jurisdiction, the owner or an agent of the owner shall register the vehicle and pay all required fees and taxes and submit for inspection the certificate of registration issued by that jurisdiction. The department, when satisfied that the applicant is entitled to the exemption from the title requirements of this chapter, shall register the vehicle but may not issue a certificate of title. [NOTICE OF THE FACT THAT THE VEHICLE IS REGISTERED

IN ANOTHER JURISDICTION SHALL APPEAR ON THE CERTIFICATE OF REGISTRATION ISSUED BY THIS STATE AND IN THE RECORDS OF THE DEPARTMENT MAINTAINED UNDER AS 28.10.071.]

* Sec. 6. AS 28.10.151 is amended to read:

Sec. 28.10.151. VEHICLES TRANSPORTED UNDER SPECIAL PERMITS. When moved or driven under a special permit to be designed and issued by the department, the registration required by this chapter is not required of

(1) a vehicle under construction and which is not completed;

(2) a vehicle while being moved from one place to another for the purpose of inspection, weighing, or meeting other requirements of the department; or

(3) a vehicle while being moved or driven from one location to another for the purpose of rebuilding, dismantling, or permanently removing the vehicle from the highways and vehicular ways and areas of the state;

(4) an unladen commercial vehicle making a single continuous trip by a noncircular route for a period of time not exceeding 10 days.

* Sec. 7. AS 28.10.151 is amended by adding a new subsection to read:

(b) A special permit issued under this section shall be prominently displayed.

* Sec. 8. AS 28.10.201(d) is amended to read:

(d) Except for vehicles registered under AS 28.10.131(b) or (c) and 28.10.141, the department may not register a vehicle unless the applicant for registration at the same time applies for and obtains a certificate of title under this chapter, or presents satisfactory evidence that a certificate of title was previously issued to the

applicant. The department may not accept the application for the original certificate of registration or title to a vehicle unless the vehicle is in the state at the time of application. However, the department may accept an application for registration and certificate of title for a vehicle which is not in the state when the application is made by a registered and bonded dealer or by a resident of the state when the application is accompanied by a manufacturer's statement of origin, or in the case of a used vehicle, when the application is accompanied by a certificate of title issued in another jurisdiction [AND A CERTIFICATE OF INSPECTION BY A PEACE OFFICER OF THAT JURISDICTION STATING THAT THE VEHICLE HAS BEEN DETERMINED TO BE THE VEHICLE DESCRIBED IN THE CERTIFICATE OF TITLE AND THAT THE VEHICLE HAS NOT BEEN REPORTED STOLEN].

* Sec. 9. This Act takes effect immediately under AS 01.10.070(c).

Re: HB 31

Dear Representative Cato:

I would like to take this opportunity to advise you and the Transportation Committee that the Division of Motor Vehicles supports this piece of legislation.

Since working with Representative Pourchot prior to his introduction of the bill, the division has decided to recommend another change to Section 8 of the bill. That change would be to delete lines 10, 11, 12 and 13 on page 4, and putting a period at the end of line 9. It is the feelings of the division that this wording is no longer necessary, and it is creating a hardship on Alaska residents who purchase used motor vehicles out of state. It is also causing extra processing time for an action we feel is no longer necessary.

I am sorry I had to leave the hearing yesterday before I was able to testify because of a time conflict with another hearing.

Sincerely,

Bill Brown
Chief of Driver Services

ALASKA RAILROAD CORPORATION

P.O. Box 7-2111 • Anchorage, Alaska 99510-7069

January 28, 1987 MAR 0 2 1987

Representative Dave Donley, Chairman
Labor & Commerce Committee
House of Representatives
P. O. Box V
Juneau, Alaska 99811

Re: HB 47, An Act Relating to the Alaska Railroad Corporation

Dear Representative Donley:

Thank you for allowing the Alaska Railroad Corporation ("ARRC") this opportunity to comment upon HB 47 which proposes significant changes to ARRC's enabling legislation.

We understand that your committee will conduct a work session on this bill and others today. I hope that our comments will be helpful as you review the legislation. Should questions arise which are not adequately addressed in our position paper, please feel to contact me. My phone number is 265-2461.

I do apologize for the length of our response and our delay in getting it to you. However, the bill recommends sweeping changes to a model of a public corporation created, as you know, by the 1984 legislature to operate the State-owned railroad. That model was intended to insure that the railroad would be a rail carrier generating, retaining, and managing its revenues to better serve Alaska's transportation and development needs. Although State leadership gave ARRC enough independence to conduct its activities as a separate and viable economic entity, a recognition of State ownership and essential governmental functions led to public accountability requirements manifested most clearly by open meetings, governor-appointed board members, financial and management audits, annual and oversight reports, legislative approval of land disposals, and long-range capital improvement and program plans. This blend of substantial financial and operational independence subject to State oversight has resulted in a quasi-public, quasi-private railroad armed with the flexibility it needs to react quickly to changing market, operational, and financial needs.

The model was created only after months, perhaps years, of research, study, discussion, and debate. If I had to choose one message to leave with you today, it would simply be that HB 47 proposes sweeping detrimental changes to the legislature's earlier vision of a financially independent, but publicly accountable, railroad only two years following transfer. The work reflected in the Alaska Railroad Corporation Act and ARRC's track record to date perhaps deserve the same commitment of time and careful deliberation before the Act's vision is in large part abandoned.

Our feeling is that in a number of ways HB 47 will restrict and curtail ARRC's ability to react meaningfully to changing freight and real estate markets to the detriment of its self-sufficiency and those many Alaskans who depend upon a viable rail transportation option in Alaska. Those who appear most likely to benefit by such changes are the railroad's water carrier, trucking, and real estate competitors.

Thank you very much.

Sincerely yours,

Larry D. Wood

POSITION PAPER / Alaska Railroad Corporation

House Bill 47: An Act Relating to the Alaska Railroad Corporation

I. Introduction. House Bill 47, introduced by Representatives Brown, Ellis and Boyer, proposes numerous and substantial changes to the Alaska Railroad Corporation Act, AS 42.40.010 et seq. ("ARCA"). The issues raised by the bill fall into four categories, each of which has been the subject of at least some recent media attention. All, we believe, are adequately accommodated or protected by existing laws or Alaska Railroad Corporation ("ARRC") board rules. The proposed changes will also harm the economic viability of the railroad.

These are the first major revisions of ARCA which have been proposed since 1984 when the law was enacted. The following discussions explain the sweeping limitations to ARRC's original State charter suggested by this bill. The legislature has previously directed that ARRC operate as a self-sustaining business and has blended substantial financial and operational independence with public accountability requirements. Many of HB 47's abrupt and significant changes threaten to destroy those dynamic characteristics which give ARRC the flexibility it needs to survive economically in today's declining freight markets.

ARRC strongly opposes HB 47 and respectfully recommends that ARCA remain unchanged.

II. Major Provisions of the Bill.

A. Moose Kills. One area of concern addressed by HB 47 is the effect of railroad operations on wildlife, specifically moose. The bill requires that ARRC salvage meat and consult with the State Department of Fish and Game (ADF&G) to minimize adverse effects. We believe that these proposals only duplicate present laws and ignore ARRC/ADF&G cooperation.

As a consequence of railroad, truck, and automobile operations in Alaska, moose are unfortunately killed We explain below that ARRC has already mitigated these losses by changing some equipment and operational techniques, repeatedly discussing remedial alternatives with State Fish & Game representatives, and insuring that, where possible, meat is salvaged.

B. Confidentiality. The bill restricts those subjects which may be protected as confidential and discussed by ARRC's Board at executive sessions. Freight divisions, contract rate agreements and discussions of land acquisitions

or disposals are targeted. As explained below, public discussion and disclosure of vital railroad market data will actually injure consumers by giving railroad competitors the opportunity to make rail transportation a less competitive option in Alaska.

C. Operations. Several sections of HB 47 require the railroad board to ensure that passenger and freight services are maintained at 1985 levels. Board approval will be required for any expansion or reduction of service. Present law requires involves Board approval only where a change in service levels is "major." Although inadequate financial resources may allow the Board to forego railroad expansions, it may not reduce the 1985 services levels for financial reasons. Presumably, any such reduction may require legislative approval.

Discussion which follows points out that railroad passenger service is a major drain on ARRC revenues: $1.5 million annually. Although State tourism needs, resident access requirements, and tradition may justify ARRC's commitment to passenger service, economics do not. Save for a few excursion lines, Alaska's is the only unsubsidized rail passenger service in America. Present State law requires ARRC to report significant and permanent service reductions to the legislature. However, despite these losses, ARRC has not reduced services. They have been increased. Innovations in equipment, scheduling, and routes have helped mitigate the $2 million annual loss which existed before transfer.

For its economic survival, however, ARRC depends upon the flexibility of its management to immediately respond to changing freight market conditions by expanding, modifying, or in some cases, reducing service levels. To the extent this bill will detract from ARRC's marketplace resiliency it will significantly defeat the State's earlier attempts to preserve rail freight service in Alaska.

D. Land Issues. HB 47's provisions also significantly affect ARRC's leasing, easements and permitting practices. The bill proposes that railroad managers may only enter into such land use agreements for one year or less; Board approval would be required for agreements of greater duration. The Board must hold at least one public hearing not less than 60 days before entering such agreements. In addition, it must make a written finding that these contracts are in the best interest of the people of the State, taking into consideration adjacent land uses, municipal land use plans and ordinances, economic development, revenue-generating potential, and public comment received.

The bill retains the current requirement that disposals be made at fair market value, but clarifies an exception for disposals to the State and municipalities. In addition, it

requires that any disposal of natural resources (e.g., gravel, timber) be made by competitive bid.

Finally, HB 47 would require legislative approval of all leases for over 35 years. ARCA presently allows longer leases so long as a right of termination is retained if the property is needed for railroad purposes after 35 years.

To the extent these significant modifications attempt only to underscore the need for public awareness of ARRC leasing decisions, we can applaud such concern. However, a discussion which follows points out that Board policies and rules already protect the public's need to know of railroad leasing activities. The ARRC, we believe, has already struck a careful balance between public involvement in its leasing decisions and its fundamental reliance upon real estate leasing practices which can adequately and quickly respond to market opportunities. Even a brief review of financial statements emphasizes the railroad's traditional and heavy reliance upon growing real estate revenues. HB 47's modifications promise to undermine railroad financial viability by seriously inhibiting marketing opportunities. The changes work to the advantage only of ARRC's competitors and, ironically, to the probable disadvantage of Alaska's public which, we believe, will increasingly depend upon aggressive development of private and public land resources.

III. HB 47's Impact.

A. Moose Kills. Like other Alaskans, ARRC is already subject to the requirements of AS 16.30 regarding salvage of big game. Moreover, the railroad has a history of cooperation with ADF&G, as attested by the attached article from that department's own in-house magazine. Corporation personnel continue to consult with ADF&G representatives and with fish and wildlife enforcement officers of the Department of Public Safety. Procedures are already in place to help insure killed moose are salvaged.

The unfortunate fact is that moose choose to use the cleared railroad track as well as public roads in years of heavy snowfall. For example, the winter of 1985-86 was extremely mild and only 17 moose were killed by railroad operations. In the 1984-85 snowy winter, more moose were killed on southcentral Alaska highways (319) than on the railroad right-of-way (316).

We believe the legislation is unnecessary. ARRC already abides by the State's salvage laws and it will continue to work with ADF&G personnel to mitigate moose losses.

B. Executive Session/Confidentiality. Sections 4 and 5 of HB 47 propose that confidential railroad marketing and

business data, including freight divisions and contract rate agreements, be disclosable to the public. The railroad's water carrier, trucking, real estate, and port competitors would reap the greatest benefit from this relaxation of the law. Using sensitive information related to railroad freight rates, developing markets, and business opportunities to their advantage, railroad competitors may successfully eliminate ARRC's capability to offer competitive freight rates and real estate in Alaska.

The State purchased the railroad in part to preserve a rail transportation option in Alaska. Therefore, it structured a public corporation which would vigorously pursue a market presence to best serve consumer needs and avoid State financial assistance. In ARCA the Alaska legislature recognized ARRC's need to protect its proprietary information from general public scrutiny to preserve that mandate of railroad self-sufficiency. HB 47 promises to largely undo this protection.

Rate divisions and contract rate agreements explain just how much ARRC charges to haul commodities. Divisions split freight revenues for particular shipments between the railroad and its connecting carriers; contract rate agreements establish freight charges between the railroad and its shippers. Armed with information collected from ARRC's files (or Board minutes since HB 47 would also eliminate freight divisions, contract rate agreements, and proposed land acquisitions and disposals as subjects which may be discussed in the Board's executive sessions), competitors may undercut railroad charges and contracts to their financial advantage in what are already highly competitive freight and real estate markets.

Federal law may also protect the freight rate information which railroad competitors seek through passage of this legislation.[1/] After the transfer of the railroad into

---

1/ Please see 49 U.S.C. § 11910: "A common carrier . . . that knowingly discloses to another person, except the shipper or consignee, . . . (A) information about the nature, kind, quantity, destination, consignee, or routing of property tendered or delivered to that carrier . . . without the consent of the shipper or consignee, and (B) that information may be used to the detriment of the shipper or consignee or may disclose improperly, to a competitor the business transactions of the shipper or consignee, shall be fined not more than $1,000." Because divisions and contract rate agreements will contain such information, legal counsel should opine whether HB 47 will inevitably conflict with this federal mandate. Note that the Interstate Commerce Commission requires only that minimal aspects of contract rate agreements be filed with that agency.

State ownership, the federal Alaska Railroad Transfer Act ("ARTA") specified that the State-owned railroad would be a rail carrier engaged in interstate and foreign commerce subject to the jurisdiction of the ICC and entitled to all of the business opportunities available to comparable railroads, including contract rate agreements. 45 U.S.C. § 1207.

Like federal deregulation in the airline, trucking, and telephone industries, deregulation of certain rail activities in the Staggers Rail Act of 1980 was meant to promote the viability of the rail transportation option in America. The Act was passed as a response to the financial difficulties then plaguing the nation's railroads. Congress felt that much of the problem lay with excessive governmental regulations. Hence, it granted rail carriers the privilege to conduct their operations by contract as other businesses do. Instead of charging uniform tariffs of general applicability, railroads would be able to negotiate individual contracts with their shippers.

For example, no longer bound by difficult and time consuming notice and rate-making regulations in its competition for TOFC ("trailer on flat car") traffic, railroads, including ARRC, may adjust rates quickly to changing market conditions, contract directly with shippers for the movement of their freight, and offer special services and accomodations to customers on a one-to-one basis. Special care is taken to ensure that contract rate agreement information is not disclosed to competitors. The overriding thrust of the Staggers Act is to protect the confidentiality of contract provisions and to ensure to the purchasers of transportation services and to railroads a degree of confidentiality similar to that of other businesses throughout the country.

HB 47 threatens to largely eliminate legislative directions that all business opportunities available to other railroads be afforded to ARRC and that the corporation be operated "according to sound business management practices" on a self-sustaining basis. To be successful, ARRC must continue to offer competitively-priced services in the marketplace. HB 47's demand that the railroad's shipper and carrier agreements be open for inspection by its competitors may also be an indication that ARRC has made its mark as a serious competitor for freight in a diminishing Alaska market.

HB 47 also eliminates confidential Board discussions of the details related to proposed land acquisitions or disposals. The prospect of public discussion of the confidential terms of proposed real estate transactions would have a significant chilling effect on ARRC market opportunities. The bill ignores the reality that most businessmen and women do not announce land acquisitions or

development plans until all options have been quietly researched, examined, and discussed. If ARRC should ever compete with other industrial landowners for this highly competitive trade, it must have the flexibility to honor requests that proposal information be protected. Public involvement at this early stage may even go beyond what is required of State agencies. The public interest is presently and adequately protected by the current law and Board rules that require all sales of land be acted upon and approved by the Board and legislature in public session.

C. Operational Restraints. The legislature's vision that ARRC be self-sustaining will be severely impacted by HB 47's directive that passenger and freight service levels be maintained at 1985 levels. Also, present law already requires a detailed oversight report to be provided to the governor and legislature before ARRC may undertake a significant reduction in services. The report, and public Board action which proceeds it, ensures adequate protection of the public's interest and provides ample opportunity for public involvement as a recent proposed sale of exhausted rail passenger equipment demonstrated.

Although some adjustments are naturally required by changing markets and developing innovations, the corporation's commitment to existing levels of freight and passenger services is evident. In fact, ARRC has dramatically improved passenger services since transfer and is committed to the purchase of new passenger coaches and two newly refurbished self-propelled railcars. Nonetheless, passenger service amounts to a $1.5 million drain on ARRC's financial resources (down from a $2 million annual loss at transfer). However, to be economically viable, ARRC must have the ability to adapt to swings in the economic climate, particularly as freight markets change.

An examination of revenues from passenger service for the first 18 days of January 1987 demonstrates the need for flexibility in managing service levels. Total estimated revenues were $12,504 while the estimated costs were $59,900, for a loss of $47,496. Such seasonal variations in market demand are expected and the corporation has not moved to eliminate these services.

Managerial flexibility to match the overall level of services to market demands is essential. HB 47 would eliminate that flexibility, to the marked disadvantage of ARRC's financial self-sufficiency and to the probable advantage of railroad competitors.

D. Land Issues. The corporation is the owner of a substantial amount of land (over 22,000 acres in addition to right-of-way) suitable for commercial leasing. Long-term

leases of that land are subject to the provisions of a Board policy which was developed only after significant public input. The Board's leasing policy is intended to accommodate the continued viability of competitive railroad leasing and adequate public awareness and involvement.

The additional requirements imposed by this bill would adversely affect the corporation's leasing program in many respects. In ARRC's commercial setting, its ability to act decisively is often necessary to capitalize on real estate market trends. HB 47's 60-day notice requirement would significantly destroy ARRC's marketing efforts in a highly competitive economy and seriously impact any opportunity to obtain the highest possible return on rail land.

The delay and intense public scrutiny suggested by this legislation would also discourage many potential lessees who are both eager to finalize a transaction and reluctant to prematurely reveal their financial affairs in public. The present Board policy requires public Board action to approve leases of more than three years and advance public notice of lease approvals. These public Board meetings allow concerned citizens ample opportunity to submit their comments. Proposed lease development of railroad Government Hill is a recent example of this process in action. It appears to provide an adequate balance between aggressive development of ARRC lease opportunities with public awareness and input. HB 47's attempts to significantly complicate railroad leasing procedures promises to undermine the railroad's self-sufficiency without meaningfully improving ARRC's own recognition and implementation of its public accountability obligations.

The bill's restriction of leases to 35 years in duration without legislative approval would also undermine leasing opportunities. Most long-term ground lease terms start at 55 years to allow high-quality improvements to be amortized over the entire lease term. ARRC's present policy was designed to accommodate commercial lessees who envision substantial improvements to railroad property. Financial institutions will not loan money to these lessees to build significant improvements unless a longer lease term is assured. After considerable discussions involving ARRC representatives, prospective and present lessees, and banks, ARCA's present restriction on long-term leases (they may be terminated if needed for railroad purposes after 35 years) has satisfied lending institutions. Lessees are on their way to improving lease parcels. Parenthetically, those improvements will also substantially add to the State's equity as the owner of rail property.

An additional impact of HB 47 is a logistic one. The corporation is presently lessor or permittor in some 1200

agreements. On the average, roughly two dozen such agreements are processed through the corporation's real estate department a month. Some of these transactions involve minor amendments, but a considerable number are substantial changes. Were the Board of Directors required to hold a public hearing before every agreement is made, it would be forced to devote an inordinate amount of attention to commercial, market-dictated decisions more appropriately left to the corporate officers hired to apply their experience and skill in real estate leasing. ARCA's honorariums may not begin to adequately compensate a largely volunteer Board for such new management responsibilities. On the other hand, long-term leases may require Board scrutiny, and provision has been made to present them, following public notice, to the Board for approval at its public meetings.

HB 47 also requires a detailed inventory of land and natural resources in ARRC's annual report to the legislature. This detailing of "present uses, future development plans, and known resource development potential for the land, interests in land, and natural resources" calls for extraordinary research, development and planning efforts which ARRC is presently not funded or staffed to provide. Of course, specific land use planning for large industrial areas must and is being developed to effectively respond to market needs, but the comprehensive land and natural resources planning called for here can only compel the commitment of dwindling personnel and financial resources to less vital activities.

HB 47 amends AS 42.40.350(d) to expressly permit leases to municipalities at less than fair market value. This change is also unnecessary; ARRC has consistently interpreted an existing exception for State leases to include leases to political subdivisions.

Finally, the bill proposes that any sale of railroad natural resources be made by competitive bid. This is also an unnecessary and undesirable limitation. Similar to the marketing of rail leases, ARRC needs the flexibility to establish the fair market value of any natural resources slated for sale by means in addition to competitive bid. This is particularly true when market conditions are greatly fluctuating and values are best established over time. The proposal also ignores the reality that sales of gravel and rock, for example, may not be conducive to the artificial structuring of a competitive sale format because of time constraints, remote locations, and market conditions.

ARCA already calls for the "prudent operation of the railroad according to sound business management practices" and directs ARRC's Board and management to "manage the corporation on a self-sustaining basis." A limitation on the types of

permitted sales of natural resources is at best a redundancy which also calls for prudent decision-making and, at the worst, a limitation which also threatens the railroad's financial vitality.

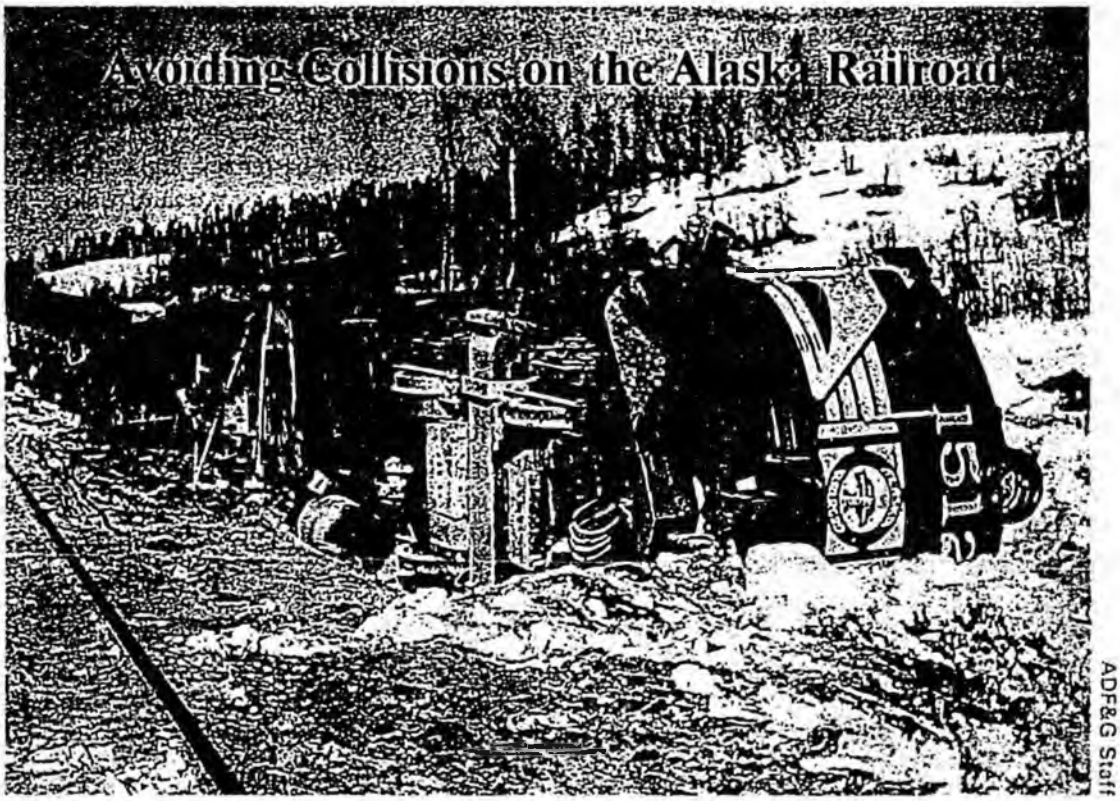
IV. Conclusion.

The Alaska Railroad Corporation opposes HB 47. The sweeping limitations it proposes upon railroad operations may not only undo the legislature's original vision of a quasi-private, quasi-public railroad armed with the flexibility it needs to survive in competitive freight and real estate markets, but seriously threaten its economic survival.

For all these reasons, we respectfully request that the bill's proposed amendments to the Alaska Railroad Corporation Act be rejected.

3654L

When Moose and Train Meet:



ADF&G Staff

by Jack C. Didrickson and Raymond J. Kramer

On the last day of February 1985, Alaska Railroad Locomotive Number 3006N chugged its way out of the Anchorage railroad yards bound for Fairbanks. None of its crew realized that an unwanted record would be set before it arrived at its destination the next morning. Nineteen moose would die that trip, crushed by the locomotive, while the helpless crew watched, unable to save the victims. And, as the winter snows continued, more moose died on almost every run until the annual total for the entire length of the railroad came to 385.

Fortunately, not every year is a duplicate of the winter of 1984-85. This past winter (1985-86), 17 moose were killed along the entire length of the Alaska Railroad.

What causes these mortalities, and what can be done to lessen or prevent them? These are questions of primary importance to not only game biologists and railroad employees, but also to the public, some of whom see this as a shameful situation that could be easily remedied. Although many ideas have been proposed and tried, there is no one good solution.

Initially, both ADF&G and the Alaska Railroad presumed that the high mortality in some years occurred simply because the moose population periodically fluctuated, with most kills occurring when the population was high. We now know this is not the case. By correlating the Alaska Railroad's daily records over the years with weather patterns which coincided with the chronology of high moose losses, we could see a pattern. In years of deep snow depth (three to five feet) for long periods of time, moose losses along the tracks drastically increased. Conversely, in winter periods of little snow, or when spring thaws decreased the snow depths, moose-train incidents significantly declined.

A majority of the 1984-85 mortalities occurred on the tracks between Willow and Talkeetna, in an area known as Game Management Unit (GMU) 14B. This is an area with a large moose population, most of which remains in the high reaches of the Talkeetna Mountains throughout the summer and fall. In winter, as snow and winds increase in these highlands, a large number of the moose move down the mountain slopes to their critical winter food supply of willows along the Susitna River.

Unfortunately, both the railroad and the main highway from Anchorage to Fairbanks bisect their migration path.

When snows exceed three feet, the moose find these man-made "trails" a convenient place to walk or rest, and therein lies the cause of the mortality. Moose are somewhat reluctant to leave these cleared areas and they have not, for the most part, learned to fear trains or autos. As a result, an additional 77 animals were killed by highway vehicles during the 1985 season. Also, many become stressed by deep snow and the lack of nearby browse. In residential areas along the highway, stressed moose belligerently chased dogs, children, and adults, with the result that another 40 were killed in defense of life and property, bringing the total loss of moose in GMU 14B to 502. Hunters, on the other hand, took only 216 animals in the following 20-day September season, before the deep snows set in.

Although a large percentage of mortalities for all years occurs between Willow and Hurricane, with a few other "hot spots," mortalities are otherwise fairly uniformly distrubuted along the entire length of the tracks; therefore, the problem is not merely a local one. A solution must be provided that works along the entire railroad corridor from Seward to Whittier to Fairbanks.

Meetings have been held between the Alaska Railroad personnel and ADF&G game biologists to seek answers and actions, and members of the public have enthusiastically offered innovative ideas, but no single, concrete solution has been found.

There are certain realities which must be faced where "compromise" simply won't work. The trains must run and they must run on or near schedule; too many people and businesses are dependent on the products delivered to interrupt service. Closing down the railroad in winter is no solution. Scheduling the trains to run only in daylight hours won't work, with only four to five hours of daylight present during the critical months. Accurately predicting where and when deep snows will occur is beyond human technology. We must look to the tracks and trains themselves for solutions.

Perhaps the most "far-out" solution offered so far was that of a giant cushioned rubber bumper attached to the front of the locomotive. Here, laws of physics and elasticity come to bear, causing visions of a moose being hit at 40 mph, sinking into this giant cushion, and then being sprung out in front of the train again, only to be picked up and thrust again, endlessly bouncing down the tracks.

Another more realistic attempt was to mount sonic whistles on the locomotive which might alert the animals. The experiment failed, however. When the train moved comparatively slowly, the whistles didn't whistle, and when it was very cold they froze into silence.

Slowing the train from 40 to 20 mph in "hot spot" areas was another idea. Not only did scheduling dif-

In times of heavy snow, moose make use of the cleared areas on the tracks of the Alaska Railroad for walking and resting. Here, a train has stopped for a moose bedded down on the tracks during a snowstorm in the winter of 1985.

M. Penn
Anchorage *Daily News*

ficulties make this impossible, but the trains couldn't climb certain grades on the icy tracks if momentum was lost.

Decking or covering the ties on trestle bridges to permit moose to safely cross was suggested, but this idea was denied because speed sensors on the train wheels reportedly will not work properly in the presence of the coverings.

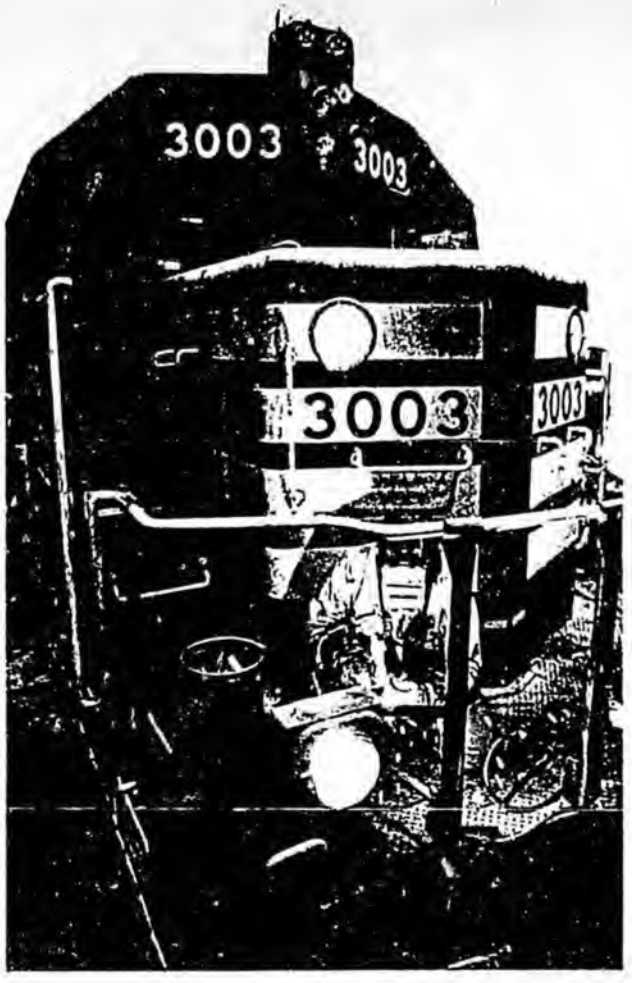
One of the major problems in deep snow is that of the "tunnel" effect which trains create with their own snow plow on the front. In this situation, once a moose is on the track, after struggling in deep snow, it won't leave even with a train bearing down on it. There is little room between the train and the wall of snow and the moose are often sideswiped. "Wing plowing," where special equipment plows 20 feet on either side of the tracks seems to have merit in certain areas where topography permits, but this is not the complete answer. When the railroad bed is significantly higher than surrounding terrain, moose still prefer the track bed to jumping down into deep snow.

The best, but perhaps most complicated, scheme offered so far is to allow permit hunters to harvest moose along the railway corridor, at times when heavy snowfall occurs. Logistically, this would prove difficult. First, permits would have to be fairly allocated and there would be no guarantee in any particular year that a hunt would be held. The hunt would occur only in areas determined to be "hot spots" and then only within a narrow corridor along the tracks. When snows are deep, snowmachines bog down and would prove worthless. Furthermore, hunters riding snowmachines, or even walking down the railroad right-of-way, simply would not be safe; eventually someone would be hit by a train.

The only apparent method of getting hunters afield would be to run a "hunter train" which could stop in designated areas, let hunters off for a period of time, and pick them up later, with their harvested moose. This plan, too, offers tremendous logistical problems and would require a great deal of common sense and wintercraft knowledge on the part of each hunter. If regular train schedules were to continue, each hunter would have to be back at his designated pickup point precisely on time, as the train could not delay its schedule. A hunter who took an animal too far away would perhaps have to leave all or part of his moose behind; this is a violation of wanton waste laws and would defeat the purpose of obtaining the meat.

Based on random permit drawing, there is a chance that some inexperienced hunters might be drawn who would have no idea of the severity of camping out in -40° weather. To leave them out in these conditions overnight could prove disastrous, particularly if a storm occurred. Inevitably, someone would get lost, frostbitten, or hypothermic.

For lack of a workable solution, the problem is far from resolved. We would all like to see a harvest shift from trains to hunters. In Canada, Sweden, Norway, and Russia, game managers are also seeking answers to this problem, but as yet no economically feasible solution has been found. Fencing both sides of the railway would not only be exorbitantly expensive, but would also cut the moose off from their winter habitat. Overpasses or underpasses, with wing fences to funnel the animals onto these routes, have shown promise in Europe, but because of the great mileage involved would require literally millions of dollars to accomplish effectively in Alaska. Just such an underpass has been proposed outside Anchorage under the Glenn Highway; the results of this experiment will tell us much over the next few years.



M. Penn
Anchorage *Daily News*

Frank Box, boilermaker for the Alaska Railroad, welds one of two lights that were attached to the locomotives to chase moose off the tracks.

Can our railbelt moose populations sustain these losses? The answer is a cautious "yes," with the adjustment of seasons and bag limits, but game managers would prefer to see a better use for the tons of meat that are spoiled by a train's crushing impact.

As Alaska moves into the 21st century, answers to this vexing problem may be found. In the meantime, game biologists must continue to obtain basic biological information to justify attempts at possible solutions.

Jack C. Didrickson, who has been with the department since 1959, serves as Area Game Biologist with the Division of Game, ADF&G, Palmer.

Raymond J. Kramer serves as Game Biologist, Division of Game, ADF&G, Anchorage.

MEMORANDUM

TO: Rep. Dave Donley, Chairman
House Labor and Commerce Committee

DATE: January 23, 1987

FROM: Rep. Kay Brown

RE: HB 47

HB 47, An Act relating to the Alaska Railroad Corporation, has been referred to the House Labor and Commerce Committee for consideration.

Thank you for scheduling a work session on the bill at 4:30 p.m., Wednesday, January 28.

The primary purpose of the bill is to ensure that the railroad's publicly-owned lands and resources are managed in the best interest of Alaskans.

HB 47 would limit the railroad's complete discretion to dispose of public lands through long-term leases. While a sale which disposes of the railroad's entire interest in land is subject to legislative approval, the railroad's chief executive officer, acting under delegated authority, can achieve a result similar to absolute title transfer by issuing a long-term lease. From a public interest perspective, issuing a long-term lease should be subject to procedures that ensure an opportunity for public participation before the decision is made.

The attached sectional analysis by George Utermohle, Legislative Counsel, describes the bill in more detail. I have also attached a memo by Utermohle discussing confidentiality standards.

I look forward to discussing HB 47 with your committee.

SUBJECT: Section by section analysis of HB 47, An Act relating to the Alaska Railroad Corporation

TO: Representative Kay Brown

FROM: George Utermohle GU
Legislative Counsel

The following is the section-by-section analysis of HB 47 which you requested.

Section 1 amends AS 42.40.100 by expanding the duties of the board of the Alaska Railroad Corporation to include:

(1) maintenance of passenger and freight operations of the railroad at the same level as when the railroad was transferred from federal to state ownership or, if funding is available, expansion of passenger and freight operations beyond the level of service at the time of transfer;

(2) management of real property interests and natural resources owned by the corporation in the best interest of the people of the state; among the information which the board must consider in making its determination of what is in the best interests of the people of the state are land use ordinances and plans of cities and boroughs affected by railroad land management decisions, adjacent land uses, the development and revenue potential of the land, and public comment on land management decisions proposed by the board.

(3) consultation with the Alaska Department of Fish and Game on ways that the railroad can reduce the effects of railroad operations on wildlife.

Section 2 amends AS 42.40.120(b) to require the board of the Alaska Railroad Corporation to delegate authority to the executive officers of the railroad to grant leases, easements, permits, or other interests in railroad land for periods not exceeding one year. A grant of a lease,

easement, permit, or other interest in land for a period exceeding one year must be approved by the board of the corporation under Section 8 of the bill. Current law allows the executive officers of the railroad, through delegated authority, to enter into long term leases (up to 35 years under any conditions and exceeding 35 years if the lease is subject to termination by the railroad).

Section 3 amends AS 42.40.120(c) to require specific approval by the board of the Alaska Railroad Corporation before railroad services can be expanded or reduced in any way and before the corporation can lease, grant easements or permits, or allow use of railroad land for a period of time that exceeds one year.

Section 4 amends AS 42.40.170(b) to remove the authority of the board of the Alaska Railroad Corporation to discuss land disposal or acquisition issues in executive session. The board's authority to discuss matters related to divisions and contract rate agreements in an executive session is also repealed.

Section 5 amends AS 42.40.220(b) by limiting the items of information which the Alaska Railroad Corporation may withhold from public disclosure to the following items:

(a) personnel records

(b) communications with and work product of legal counsel

(c) information consistent with the standards and practices of the U.S. Interstate Commerce Commission for the protection of proprietary information associated with specific shippers.

The discretion of the corporation to identify additional similar types of information for non-disclosure is removed. Confidentiality is removed from information associated with divisions and contract rate agreements.

Section 6 amends AS 42.40.260 by requiring that the annual report prepared by the Alaska Railroad Corporation and provided to the governor and legislature include information on the land and natural resources held by the corporation. Pending proposals for the lease or disposal of land or natural resources must also be disclosed in the annual report.

Section 7 amends AS 42.40.285 by requiring that any lease of land by the Alaska Railroad Corporation for a period exceeding 35 years be approved by the legislature. The former exemption is repealed.

Section 8 amends AS 42.40.350(c) by permitting the Alaska Railroad Corporation to lease, grant easements in or permits for rail land for a term exceeding one year only if the board of the corporation determines that the transaction is in the best interests of the people of the state. Rail land is that land owned by the corporation that is not included in the railroad utility corridor along the main or branch lines of the railroad. At least 60 days before taking final action on the transaction, the board must prepare a written report on the proposed transaction and a determination that the transaction is in the best interests of the people of the state. The board must hold a public hearing in a city or borough affected by a lease, easement, or permit issued for a term exceeding one year.

Section 9 amends AS 42.40.350(d) by requiring that any lease or other disposal of land by the Alaska Railroad Corporation be at fair market value as determined by appraisal or by competitive bid unless the lease or disposal is to the state, a city or a borough.

Section 10 adds new language to AS 42.40.350 requiring that the disposal of natural resources from the land of the Alaska Railroad Corporation be by competitive bid unless the disposal is to the state or to a city or borough.

Section 11 adds new language to AS 42.40.420 to allow the Alaska Railroad Corporation to issue permits to individuals for temporary, short term, or emergency use of railroad land.

Section 12 adds a new section, AS 42.40.460, requiring the Alaska Railroad Corporation to salvage for human consumption the meat of big game animals killed by operations of the railroad.

LEGISLATIVE AFFAIRS AGENCY

M E M O R A N D U M January 21, 1987

SUBJECT: AS 42.40.170(b)(7) and AS 42.40.220(b); Information of a type treated as confidential under the standards and practices of the United States Interstate Commerce Commission

TO: Representative Kay Brown

FROM: George Utermohle
Legislative Counsel

This memorandum seeks to clarify the impact of certain language in AS 42.40.170(b)(7) and AS 42.40.220(b). Under the authority of these sections the Alaska Railroad Corporation may maintain the confidentiality of "information of a type treated as confidential under the standards and practices of the United States Interstate Commerce Commission." It is difficult to determine what information is kept confidential by this provision, however a review of the federal statutes and regulations pertaining to the Interstate Commerce Commission does explain what information is public.

Under 49 CFR 1001.1 the following records of carriers regulated by the Interstate Commerce Commission are available to the public:

(a) Copies of tariffs, rate schedules, quotations or tenders of a rate for transportation for the federal government, classifications, powers of attorney, concurrences, and contracts filed with the commission; however arrangements between carriers may be withheld from public disclosure if disclosure is not necessary in the public interest.

(b) Annual and other periodic reports containing answers to questions asked by the commission; the annual report must contain an account of the affairs of the carrier, in as much detail as the commission may require.

(c) Annual and other periodic reports, maps, profiles, and other data filed with the commission for the purpose of

valuing the property of the carrier; the commission may close these records to the public but must state its reasons for doing so. (49 U.S.C. 10783(d))

(d) All docket files, including pleadings, depositions, exhibits, transcripts of testimony, recommended and proposed reports, exceptions, briefs, reports and decisions of the commission in any proceeding, and carrier operating authorities granted in those proceedings.

(e) File and index of security interests in railroad property granted by carriers and required to be recorded with the commission.

Freight commodity shipment reports of railroads are also public. However reports involving the traffic of less than three shippers in a single commodity reporting class are not public. Information involving the traffic of less than three shippers must be included in supplemental reports which are confidential unless the commission approves their release. (49 CFR 1248.6)

According to the procedures of the Interstate Commerce Commission listed above, most of the information collected by the commission is public. Aside from the specific exemptions for freight commodity shipment reports involving less than three shippers in a single commodity reporting class and the discretionary exemptions for arrangements between carriers under 49 U.S.C. 10764(a)(2) and for valuation reports under 49 U.S.C. 10783(d), it is not clear what other information collected by the Interstate Commerce Commission may be withheld from public disclosure. Overall, a considerable amount of information about the operations of the Alaska Railroad is public information under the standards and practices of the Interstate Commerce Commission.

The true extent of the Alaska Railroad's power to withhold information under its authority to mirror disclosure decisions of the Interstate Commerce Commission cannot be ascertained in the abstract. Only on an issue by issue and case by case basis can the limits of the Alaska Railroad's power to withhold information be established. The ability to determine in advance what information is public is complicated by the discretionary authority of the Interstate Commerce Commission to make certain information confidential in one instance but to make it public in another instance. However, if the need should arise for information that the Alaska

Railroad lawfully withholds under the authority of AS 42.40.170(b)(7) and AS 42.40.220(b), the legislature always has the authority to force disclosure by repealing these provisions.

Confidentiality of information collected by the Interstate Commerce Commission is maintained to protect the proprietary and financial interests of carriers regulated by the commission and of third parties such as customers of the carriers. The Alaska Railroad Corporation, or the State of Alaska as owner of the corporation, may waive its right to confidentiality in proceedings before the commission and thus allow otherwise sensitive information to be made public. The primary issue that the corporation or state would want to consider once it decides that it no longer wants to keep certain information confidential, is whether the interest of third parties will be adversely affected by disclosure of the information and if so, should the information still be made public.

If I can provide further information on this subject, please contact me.

SUBJECT: Comments on HB 47 by General Counsel to the Alaska Railroad Corporation

TO: Representative Kay Brown

FROM: George Utermohle GU
Legislative Counsel

At the request of Peg Mentele of your staff, I have reviewed the letter and comments by Larry D. Wood to Representative Dave Donley, dated January 28, 1987, regarding HB 47. For the most part, Mr. Wood comments on issues related to the operation, autonomy, and competitive position of the Alaska Railroad Corporation. These issues are policy oriented matters within the purview of the legislature and are not legal issues.

However I did find two legal issues presented by Mr. Wood's letter that I could address. The first issue related to disclosure of confidential information of shippers and consignees by the railroad. 49 U.S.C. 11910(a)(1) authorizes a fine of not more than $1,000 upon an employee of a railroad who discloses "the nature, kind, quantity, destination, consignee or routing of property" delivered to the railroad if the information could be used to injure the shipper or consignee or if the information improperly releases information about the business transactions of the shipper or consignee. This prohibition against disclosure does not apply to situations where (1) the shipper or consignee consents to the disclosure; (2) the information is given to an employee of the state; or (3) the shipment of goods is within a state and not subject to the jurisdiction of the Interstate Commerce Commission. The federal law does not prohibit the release of the rate charged for shipping the goods, however release of just the amount charged for shipping goods is useless information without knowing the kind of goods shipped, the origin, and the destination of the goods. It is the information protected by 49 U.S.C. 11910(a)(1) that

conveys information value to the pure rate data. The release of just the rate data would not provide useful information.

The most significant exception to 49 U.S.C. 11910(a)(1) involves the release of protected information with the consent of the shipper or consignee. The railroad could require that shippers and consignees consent to disclosure of certain information as a condition of doing business. Such an arrangement would avoid the prohibition against disclosure, however there may be competitive and business ramifications if the Alaska Railroad was to require disclosure of otherwise confidential information.

To the extent that HB 47 does require release of information on divisions and contract rates protected under 49 U.S.C. 11910(a)(1) there does appear to be a conflict with federal law. As a general rule, federal law will prevail over contradictory provisions of state law. The disclosure requirements of HB 47 relating to release of division and contract rate information could be tailored to comply with federal law but the value of the information available may well be useless to the public or even to a competitor.

The second issue raised by Mr. Wood's letter relates to the lease of railroad land to municipalities at less than fair market value. In regard to AS 42.40.350(d), Mr. Wood says that "ARRC has consistently interpreted an existing exception for State leases to include political subdivisions." AS 42.40.350(d) states:

> (d) A lease or disposal of land approved by the legislature under AS 42.40.285 by the corporation to a party other than the state shall be made at fair market value as determined by a qualified appraiser or by competitive bid.

Since the term "state" as used in AS 42.40 is not defined, the definition of the term in AS 01.10.060(13) applies. In that section "state" means "the State of Alaska unless applied to the different parts of the United States and in the latter case it includes the District of Columbia and the territories." This definition refers only to the State of Alaska and does not include any reference to municipalities. Though municipalities, as political subdivisions of the state, draw their existence from the state, municipalities and the state are distinct legal, political, and corporate

entities. It could be argued that the term "State of Alaska" implicitly includes political subdivisions of the state, but there is not a strong case for that interpretation in my view.

Thus an ambiguity exists as to the meaning of AS 42.40.350(d). HB 42 resolves this ambiguity by expressly including municipalities within the coverage of the exception to fair market value disposals of railroad lands and resources.

ALASKA RAILROAD CORPORATION 1987 LEGISLATIVE SESSION

FISCAL INFORMATION

House Bill No. 47
Publish date: 1/19/87

Title: An Act relating to the Alaska Railroad Corporation
Sponsors: Brown, Ellis and Boyer

HB 47 proposes numerous and substantial changes to the Alaska Raiload Corporation Act ("ARCA"). The issues fall into four categories, confidentiality of railroad marketing and business data, passenger and freight service operational restraints, leasing procedures, and wildlife losses.

A position paper submitted by the Alaska Railroad Corporation ("ARRC") has explained that the issues and concerns implied by the bill's provisions have been adequately accomodated or protected by existing laws and/or ARRC Board rules and management practices. In addition, many of HB 47's abrupt and significant changes threaten to destroy those dynamic characteristics which give ARRC the flexibility it needs to survive economically in today's declining freight markets. If this occurs, the legislature's earlier vision of a financially and operationally independent railroad will in large part be undone.

We anticipate that, as a result of this legislation, revenues will be lost and expenses will be increased. ARRC will be unable to sustain its operations without State subsidies. Given the fact that ARRC projects a very modest profit in 1987, subsidy requests should be expected to closely mirror the added costs and losses attributed to legislative changes. These figures are listed below.

Although it is extremely difficult to accurately estimate just what figures should be expected, the following summary provides a reasonable projection of anticipated annual expenses/losses.

Should the economy continue its present decline, these figures should be expected to increase, perhaps by as much as 10% per year.

Passenger Service Losses

As a result of innovations in equipment and scheduling, ARRC has been able to significantly reduce its passenger service losses which existed at transfer, some $2.2 million annually. HB 47 would require ARRC to maintain the "level of passenger...service provided at the time of transfer." If this means that ARRC would be required to add back to its passenger service the cost of a full service train to northbound winter service and replace its self-propelled rail diesel cars, an additional $512,000 loss should be anticipated. Should ARRC lose its financial self-sufficiency as a result of this requirement and others, entire State subsidy of passenger service would be required. Without meaningful innovations, the loss could be as high as $1.5 million annually.

Additional Real Estate Administrative Costs and Revenue Losses

The additional procedural requirements related to land leases and renewals are expected to require an additional $50,000 in administrative costs. Estimating a growth rate of 25% in real estate revenues and a 50% reduction in lease revenues due to significant procedural requirements and time delays not common to commericial enterprises, ARRC projects an annual $250,000 loss of real estate business.

Confidentiality of Railroad Marketing and Business Data

HB 47 proposes that, unlike other modes of transportation including truck and water barge, its confidential marketing data and proprietary business information be available for public, and competitor, inspection. Beyond the policy and legal issues raised by this suggestion, ARRC expects to lose a significant portion of its freight revenues should this proposal be implemented. These losses are directly attributed to restrictions in railroad marketing mechanisms and opportunities which would be caused by HB 47. General freight revenue losses are estimated at $4.6 million annually.

Total Annual Fiscal Impact

Passenger Service Losses	$1,500,000
Real Estate	300,000
General Freight Revenues	4,600,000
Total	$6,400,000

ALASKA RAILROAD CORPORATION

P.O. Box 7-2111 • Anchorage, Alaska 99510-7069

February 6, 1987

Representative Dave Donley, Chair
House Labor and Commerce Committee
Pouch V
Juneau, Alaska 99811

Re: HB 47, Labor and Commerce Committee Questions to ARRC

Dear Representative Donley,

Thank you for your January 29, 1987, letter. I do hope that the Alaska Railroad Corporation's position paper has been of some assistance to you and the Labor and Commerce Committee as HB 47 is considered.

We have answered the questions you sent with your letter. The answers and exhibits are attached. In a separate document we also provide some estimates of the bill's fiscal impact on the ARRC and the State of Alaska.

With the time available to us, some answers may not be as complete as we would have preferred. If additional questions arise, please feel free to call me at 265-2461.

Finally, we would simply reiterate that HB 47 is not remedial legislation. We believe that the concerns and issues implied by its provisions have been adequately addressed in the Alaska Railroad Corporation Act, other state or federal laws, Board rules and company policies, and management practices. Ironically, the legislation does threaten to largely undo the legislature's earlier vision of a self-sustaining, but publicly accountable, railroad.

Sincerely yours,

Larry D. Wood
General Counsel

cc: F.G. Turpin, President & CEO

ALASKA RAILROAD CORPORATION 1987 LEGISLATIVE SESSION

FISCAL INFORMATION

House Bill No. 47
Publish date: 1/19/87

Title: An Act relating to the Alaska Railroad Corporation
Sponsors: Brown, Ellis and Boyer

HB 47 proposes numerous and substantial changes to the Alaska Raiload Corporation Act ("ARCA"). The issues fall into four categories, confidentiality of railroad marketing and business data, passenger and freight service operational restraints, leasing procedures, and wildlife losses.

A position paper submitted by the Alaska Railroad Corporation ("ARRC") has explained that the issues and concerns implied by the bill's provisions have been adequately accomodated or protected by existing laws and/or ARRC Board rules and management practices. In addition, many of HB 47's abrupt and significant changes threaten to destroy those dynamic characteristics which give ARRC the flexibility it needs to survive economically in today's declining freight markets. If this occurs, the legislature's earlier vision of a financially and operationally independent railroad will in large part be undone.

We anticipate that, as a result of this legislation, revenues will be lost and expenses will be increased. ARRC will be unable to sustain its operations without State subsidies. Given the fact that ARRC projects a very modest profit in 1987, subsidy requests should be expected to closely mirror the added costs and losses attributed to legislative changes. These figures are listed below.

Although it is extremely difficult to accurately estimate just what figures should be expected, the following summary provides a reasonable projection of anticipated annual expenses/losses.

Should the economy continue its present decline, those figures should be expected to increase, perhaps by as much as 10% per year.

Passenger Service Losses

As a result of innovations in equipment and scheduling, ARRC has been able to significantly reduce its passenger service losses which existed at transfer, some $2.2 million annually. HB 47 would require ARRC to maintain the "level of passenger...service provided at the time of transfer." If this means that ARRC would be required to add back to its passenger service the cost of a full service train to northbound winter service and replace its self-propelled rail diesel cars, an additional $512,000 loss should be anticipated. Should ARRC lose its financial self-sufficiency as a result of this requirement and others, entire State subsidy of passenger service would be required. Without meaningful innovations, the loss could be as high as $1.5 million annually.

Additional Real Estate Administrative Costs and Revenue Losses

The additional procedural requirements related to land leases and renewals are expected to require an additional $50,000 in administrative costs. Estimating a growth rate of 25% in real estate revenues and a 50% reduction in lease revenues due to significant procedural requirements and time delays not common to commericial enterprises, ARRC projects an annual $250,000 loss of real estate business.

Confidentiality of Railroad Marketing and Business Data

HB 47 proposes that, unlike other modes of transportation including truck and water barge, its confidential marketing data and proprietary business information be available for public, and competitor, inspection. Beyond the policy and legal issues raised by this suggestion, ARRC expects to lose a significant portion of its freight revenues should this proposal be implemented. These losses are directly attributed to restrictions in railroad marketing mechanisms and opportunities which would be caused by HB 47. General freight revenue losses are estimated at $4.6 million annually.

Total Annual Fiscal Impact

Passenger Service Losses	$1,500,000
Real Estate	300,000
General Freight Revenues	4,600,000
Total	$6,400,000

1. How much land was transferred to the ARRC from the federal government?

Response: Approximately 40,600 acres were transferred to the state-owned Alaska Railroad Corporation ("ARRC") by the federal government on January 5, 1985. Transfer documents included interim conveyances, quit claim deeds, exclusive use easement deeds, patents and exclusive licenses, each reflecting varying quality of ownership interest. As competing claims to the parcels of land involved are adjudicated by the federal Bureau of Land Management and surveyed, the title documents will be reissued and acreages may change.

2. What percentage or what approximate number of acres is railroad utility corridors?

Response: Railroad utility corridors comprise approximately 34% of the ARRC's total acreage, or 13,800 acres.

3. What percentage or what approximate number of acres is rail land?

Response: Rail land (non-right-of-way) constitutes 66% of the total real property of the corporation, or 26,800 acres.

4. What is the approximate number of acres of rail land which is necessary for the operation of the railroad? For example, for railroad terminals, yards, and offices.

Response: This figure cannot be accurately estimated at this time. As noted below, all rail lands are needed for support of railroad operations. Lease and permit revenues are responsible for a significant portion of ARRC income. Like other American railroads, ARRC depends upon its land resources to sustain its economic viability. See responses to Questions No. 6 and No. 17 below.

5. For each of the following local government entities, state the approximate number of acres of land located within each entity, give a general description of the land and major improvements and give the estimated fair market value of the land:

-- Anchorage
-- Seward
-- Fairbanks
-- Whittier
-- Palmer
-- Wasilla
-- Other municipalities

Response: The following figures are exclusive of the 200-foot right-of-way which runs throughout each governmental entity's jurisdiction. Fair market value figures are derived from the Jackson-Cross appraisal performed prior to transfer.

Anchorage: Approximately 660 acres in the Anchorage Terminal Reserve, of which some 300 acres are used for terminal operations. Approximately 95% of this district is zoned I-2 and intended primarily for heavy manufacturing, storage, major shipping terminals and other related uses. Uses which are generally permitted in commercial districts are also found here. Approximately 50% of the property is leased to third parties, whose improvements include warehouses, tank farms, Quonset huts and storage yards. An additional 900 acres is located at Portage and used in part for the railroad's loading facility and parking associated with the Whittier Shuttle. Fair market value estimated at $39 million.

Seward: Approximately 300 acres, of which 50 acres are used for railroad operations (i.e. TOFC yard, railroad dock). The remainder is unimproved and submerged lands in Resurrection Bay. Fair market value estimated at $1.4 million.

Fairbanks: Approximately 461 acres, of which some 270 acres are utilized for a TOFC yard, shops, and other railroad facilities. Approximately one-half of the remaining land is leased, for uses and with improvements similar to those found in Anchorage, i.e. warehouse, tank farms, Quonset huts, storage yards. Fair market value estimated at $6.1 million.

Whittier: Approximately 272 acres, of which approximately 150 are used for railroad operations. Major improvements include railroad docks, barge slips, ferry terminal, shuttle ramp, small boat harbor, and several commercial buildings leased to third parties. Fair market value estimated at $.9 million.

Palmer: Right-of-way only.

Wasilla: Right-of-way only.

Nenana: Approximately 270 acres, most of which is leased to the City of Nenana for commercial purposes. Fair market value estimated cannot readily be broken out of the "other" category in the Jackson-Cross appraisal.

Valdez: Approximately 60 acres, which includes raw and undeveloped land as well as trackage for rail barges and two lessees. Fair market value estimated at $365,000.

6. State the fair market value of (1) all land as described above and of (2) all rail land which is not necessary to the operation of the railroad.

Response: The fair market of the lands discussed in the responses above was obtained from the Jackson-Cross appraisal that was used as a basis for evaluation prior to transfer. Because of the overall declining economy statewide, ARRC believes that this fair market value (in the neighborhood of $51 million for the total real property now owned by ARRC) has probably decreased.

In light of the fact that revenues derived from non-operational leases and other uses of real estate by third parties represented 9.6% of the ARRC's total revenue in 1986, ARRC believes that all rail land is necessary for the operation of a financially sound railroad.

7. If the ARRC is unable to provide the fair market value as requested in the preceding questions, give the railroad's most accurate estimate of the fair market value, describe the basis of the estimate, and describe what steps have been taken, if any, to determine the actual fair market value.

Response: Since transfer, the ARRC has not commissioned a full fair market value appraisal of its properties. Individual appraisals are being done in accordance with the requirements of some lease agreements. These recent appraisals on individual parcels of leased land show a decline in value over the past two years.

8. Describe each lease affecting rail land, specifically including a general description of the land involved, the term of the lease, and the lease rate.

Response: The ARRC is presently the lessor in approximately 300 leases and permittor or grantor in some 700 other permits, road crossing agreements, easements or other land use agreements. ARRC will be happy to provide the Committee with a computerized listing summarizing the 1000 total agreements if it desires, but for convenience furnishes the following general information.

Revenues in 1986 from ground leases was approximately $5.5 million. Generally speaking the railroad lands are located in industrial zoned districts where the intended use is primarily for heavy manufacturing, storage, major shipping terminals and other related uses. The term of these ground leases ranges anywhere from 10 to 55 years. The average lease rate among the 300 tenants would fall between 8.5 and 9.5% per year. The annual rate being set in new leases is 9.5%, as established in a study performed for ARRC (copy attached).

9. Describe the leasing policy of the railroad for rail lands, including any factors considered and procedures followed

to determine whether the lease is for the benefit of the people of the state, is in conflict with the land use plans of local governments, is compatible with adjacent land uses, or to otherwise communicate with local governments and adjacent land owners.

Response: The attached copy of the ARRC's long-term lease policy indicates that the corporation considers all the factors listed in the Committee's question. The procedures followed are also addressed.

It is the policy of the ARRC Real Estate Department to approve of those leases, subdivisions, plats, and land uses that are consistent with local municipal ordinances and land use regulations. For example, for rail lands within the Municipality of Anchorage, Title 21 of the Municipality's ordinances, "Land Use Regulations", would be strictly adhered to with respect to leasing and approved activities of lessees, just as any other commercial enterprise.

10. What individual(s) is in charge of implementing the policies or procedures described in the preceding question?

Response: The ARRC's Director of Real Estate, Larry J. Houle, is the individual in charge of implementing the policies or procedures described in the preceding question. His actions are subject to the chain of approval expressed in the corporation's Approval Authority Guide (relevant pages are attached).

11. Is the ARRC currently considering any leases in addition to those identified or those to which ARRC is currently a party? If so, describe.

Response: There are presently five requests before the Real Estate Department to lease ARRC property. Three of these requests pertain to land located in the Fairbanks Terminal Reserve, each parcel approximately 5 acres in size. The fourth request to lease has been made by the Municipality of Anchorage for a tract ranging from 61.4 acres to as much as 120 acres in size located south of the mouth of Ship Creek. The fifth relates to acreage at the head of Passage Canal in Whittier.

12. Is the ARRC considering any development, sale or disposal of rail land or of any resources thereon? If so, describe.

Response: Presently, the only such activity being considered is the potential land trade with the Municipality of Anchorage for the Government Hill bluff area. There is a remote possibility that the Municipality of Anchorage may also be interested in the 12 acres of land underlying the Panoramic View Apartments also located on Government Hill.

13. What is the current status of the previously contemplated development of the bluff surrounding Government Hill, referred to by the residents as the Government Hill Greenbelt or West Bluff?

Response: In accordance with the ARRC Board of Directors' wishes expressed at its September 1986 monthly meeting, there is no development presently contemplated as to the bluff lands adjacent to the Government Hill area of Anchorage.

14. Describe any negotiations the ARRC is conducting with the Municipality of Anchorage regarding the above described development and any potential resolutions.

Response: There are no on-going negotiations between the Municipality and ARRC, although both parties have expressed interest in the concept of an exchange of lands which would permit the Municipality to administer the site as a greenbelt or park.

15. Is the ARRC currently negotiating or has the ARRC been requested to negotiate with any local governments regarding lease, transfer of interest, sale or other disposition of rail land? If so, please describe the local governments involved and issues raised in such negotiations or requests.

Response: The ARRC has worked with all of its host local governments in the past regarding uses of railroad land. For example, the City of Whittier requested a lease for a camper park located on railroad land. A lease was offered to the City but was never executed because funding for the project evaporated. A lease was finalized with the City of Seward for property underlying the new U.S. Coast Guard Shore Support Facility. At the request of the Tri-Valley community located in the Healy area, a long-term lease for a cemetery site was granted. The ARRC is presently finalizing a lease with the City of Palmer for expanded use of the old depot and beautification of the right-of-way through town. Negotiations are proceeding with the City of Nenana over the issue of periodic fair market rental value adjustments under its existing lease.

ARRC has also worked with local governments regarding historic sites. The City of Talkeetna and ARRC cooperated in the leasing of the German Bachelor's Cabin, although the lease was executed by ARRC and the Talkeetna Historical Society. The ARRC also worked with the state Department of Natural Resources in leasing property currently occupied by the Potter Section House south of Anchorage.

Finally, the ARRC has worked with the Municipality of Anchorage to achieve the development and construction of a portion of the Coastal Trail along and within the railroad right-of-way adjacent to Knik Arm in Anchorage. Negotiations are still underway regarding some aspects of this use. The Municipality of Anchorage has also initiated discussions with ARRC concerning its desire to assume a lease presently held by Anchorage Dredge and Dock. The Municipality plans a Ship Creek Landing development at the site, and has proposed that ARRC grant it a new lease for the property.

ARRC is involved in negotiations with several Native corporations regarding land entitlements under the Alaska Native Claims Settlement Act and the Alaska Railroad Transfer Act. Settlement of one of these matters was recently reached with Eklutna, Inc.

16. Describe the procedures the ARRC follows when a local government requests communication with the ARRC regarding rail land located within local government boundaries.

Response: When a local government communicates with ARRC for leasing purposes, the corporation responds either in writing or in person, at times by telephone. Responses may come from either the President and CEO or the Director of Real Estate. Communications regarding other activities on rail lands, either existing or proposed, such as road crossings or utility easements, are customarily assessed first by the appropriate technical department (e.g., Engineering, Telecommunications). The final permitting document is executed by the Real Estate Director.

17. Describe all natural resources, including without limitation, sand, gravel, oil, gas, timber and minerals on rail land, and any existing or planned inventory of those natural resources.

Response: No inventory has yet been taken, nor is one presently planned. Railroad lands do contain sand, gravel, timber, and coal reserves.

18. Describe all disposals of interest in, development of, or lease of any of the resources identified in response to the above question.

Response: The only agreement relating to disposal of such resources to date has been an entry permit granted to the Usibelli Coal Mine Company for exploratory analysis upon railroad properties located in the Healy area.

19. Describe all changes in the levels of freight and passenger service which have been implemented since the transfer from the federal government.

Response:

Changes in freight service since the transfer from the federal government:

a) ARRC has added daily scheduled overnight freight service between Anchorage and Fairbanks which is particularly important for shipments of petroleum products, trailers on flat cars, and general commodities.

b) ARRC has added unit trains for export coal service between Healy and Seward.

Changes in level of passenger services since transfer from the federal government:

a) ARRC found that ridership between Anchorage and Fairbanks in the winter was primarily from persons needing access to their homes and cabins between Anchorage and Hurricane. Consequently, ARRC increased the number of trips through the north local area (Anchorage to Hurricane) from eight per month during the 1984/85 winter to fourteen per month during the winter of 1986/87. With this increase in local service, ARRC found that a reduction in number of winter trips each month to Fairbanks from four to two served customers' needs.

b) The northline trains were split into an express and a local train during the summer season. This increased the number of trains on the north line from fourteen to twenty per week from 1984 to 1986.

c) The Budd car, a self-propelled rail diesel passenger coach (RDC), is used on the north local trains instead of full service trains.

d) The number of shuttles between Portage and Whittier increased from twenty-five per week during the summer of 1984 to thirty-four per week during the summer of 1986.

e) During the winter, the number of Portage/Whittier shuttles increased from six to eight per week from 1984/85 to 1986/87 with the addition of the Saturday Budd service.

f) Buses instead of passenger rail cars are used on the Whittier Shuttle and between Anchorage and Portage. This enables ARRC to provide faster service with direct pick-up and drop-off at many Whittier locations. This change was partially due to the retirement of an antiquated passenger train set. At Portage, the buses are driven onto flat cars for the rail trip to Whittier. There, the buses disembark and make various stops in the community.

g) Anchorage to Seward service was provided by Budd car one day a week during the summer of 1986 versus none in 1984.

20. Describe all currently proposed or planned changes in the levels of freight and passenger service which have been implemented since the transfer from the federal government.

Response:

Proposed changes in the level of freight service:

There are no proposed changes in the level of freight service at this time. ARRC plans to change its service level as and when needed to serve its customers and meet market demand.

Proposed changes in passenger services:

a) ARRC plans to purchase a new passenger train to arrive in 1988 which will increase the available seats in the summer season. The retirement of an antiquated train set may result in additional "sold-out" days during the 1987 summer season.

b) Seven more private rail passenger cars will arrive in 1987. This will add four hundred and twenty more available seats per day in the summer of 1987, between Anchorage and Fairbanks.

c) The number of Portage/Whittier shuttles increased from 25 per week during the summer of 1984, to 34 in 1986, and will probably increase to 42 in 1987.

d) If the Whittier citizens and other shuttle customers desire, the ARRC may replace two full train shuttles per week during the 1986/87 winter with four Budd car shuttles per week during the winter of 1987/88.

e) The Seward summer service will increase to three Budd car roundtrips per week in 1987 from one in 1986 and none in 1984.

f) ARRC may add one roundtrip per week to Seward during the 1987/88 winter.

21. Describe the procedures which the ARRC follows and the factors considered when it evaluates the need to change levels of freight or passenger service.

Response: Management reviews ARRC's costs, competitive factors, market demands, and customer and community needs before making a change in level of either freight or passenger

service. In some cases, ARRC management has attempted to elicit community input through public hearings.

22. Describe all changes in the rates charged by the railroad for hauling freight since the transfer from the federal government.

Response: ARRC has used contract rate agreements and exempt rate quotations in an effort to take better advantage of opportunities under deregulation as well as to respond to competitive pressures. As a result, individual rates have varied upward and downward. There have been no across-the-board changes in tariff rates. With regard to specific rate amounts that are not set forth in ARRC's tariff, please see answer to Question No. 29.

23. Describe all currently proposed or planned changes in the rates charged for hauling freight since the transfer from the federal government.

Response: ARRC plans to restructure its exempt rate quotes for intermodal traffic to simplify that segment of ARRC's business. ARRC plans to restructure exempt rate quotes for other segments in the future for the same reasons. Otherwise, ARRC does not have any present plans to change its rates other than to change them when necessary to meet competition and improve profitability.

24. Has the Board invoked an executive session to discuss the policy aspects (as opposed to the financial details) of acquisition or disposal of any interest in land? If so, please state when, describe the land affected, and the action discussed.

Response: No, the Board has not invoked an executive session to discuss the policy aspects of any land acquisition or disposal.

25. Why does the Board believe it is necessary to invoke executive session to discuss the policy aspects of acquisition or disposal of an interest in land?

Response: It would be necessary to invoke an executive session for discussion of land acquisition and disposal when the financial details of proposed transactions would have a significant chilling effect on the marketability or viability of the proposal. Depending upon the financial, operational, or legal aspects of a transaction, early public disclosure may discourage interest by responsible developers, afford real estate competitors an opportunity to frustrate ARRC plans, and/or increase or decrease market values to ARRC's detriment. Please note that no Board action can take place in executive session.

26. Describe each instance since February 1985 in which the Board has invoked an executive session to discuss the subjects described in A.S. 42.40.170(b)(7).

Response: Those instances included the following Board meetings:

February 15, 1985	- Board Mtg.	- Tariff Increase
November 21, 1985	- Board Mtg.	- Corporation Marketing Plan
		- Costing Procedures
December 19, 1985	- Board Mtg.	- Corporation Marketing Plan
February 20, 1986	- Board Mtg.	- Marketing Update
April 17-18, 1986	- Board Mtg.	- Marketing and Financial Projections
May 21, 1986	- Board Mtg.	- Marketing Update

Such information was also discussed in executive session as part and parcel of litigation reports. For example, a state case, City of Valdez v. ARRC, unsuccessfully sought protected pipe rate costing information, and an ICC boxcar exemption proceeding was an unsuccessful effort by watercarriers to deny ARRC the benefit of ICC deregulation of railroad boxcar movements.

27. Describe those specific categories of documents which the ARRC does not make public.

Response: ARRC does not specifically designate by type those documents that are open for public inspection and those that are not. Rather, when a particular request for information is received, ARRC first determines the nature of the request and then provides the information if it is not within the scope of those matters set forth in AS 42.40.210(b) and Board Rule No. 4.

ARRC's Board of Directors has adopted Rule 4, a copy of which is attached as an exhibit, which elaborates upon matters not available for public inspection.

28. Describe those specific categories of documents which the ARRC does make public.

Response: See response to Question No. 27.

29. Describe the specific types of documents which ARRC withholds from the public as being "proprietary information" associated with specific shippers consistent with the standards and practices of the ICC.

Response: The types of documents which fall into the category relating to proprietary information, divisions and

contract rate agreements would include cost studies, cost data, contract rate agreements, exempt rate quotations, divisions sheets, bills of lading, waybills, any documents relating to a shipper's business, and any notes or correspondence relating to any of the above.

30. Describe the specific types of documents which ARRC withholds from the public as being "proprietary information" associated with divisions consistent with the standards and practices of the ICC.

Response: See response to Question No. 29.

31. Describe the specific types of documents which ARRC withholds from the public as being "proprietary information" associated with contract rate agreements consistent with the standards and practices of the ICC.

Response: See response to Question No. 29.

32. Other than the specific types of documents described, describe other specific types of documents which the ARRC withholds from the public as "proprietary information" consistent with the standards and practices of the ICC.

Response: See response to Question No. 29.

33. List each rule pursuant to which the ARRC has designated documents as privileged or proprietary under A.S. 42.40.220 or otherwise, and describe the types of documents and information withheld from the public pursuant to each rule.

Response: See response to Question No. 27.

34. Describe the rationale of the ARRC in refusing to provide the Transportation Committee with documents requested by that committee in 1985 and 1986.

Response: It is our recollection that the information requested was operating costs for movement of freight via trailers on flat cars. Railroads in the United States have not been required by law to divulge costs. Such information has always been considered proprietary, and confidentiality has been protected. Clearly, such rules promote competition by allowing railroads the same business advantages and marketing mechanisms enjoyed by other transportation modes. In those instances where it was necessary for the Interstate Commerce Commission to have the costs in order to arrive at a conclusion, the cost data was submitted to the Commission on a confidential basis, was not divulged to the complainant or to the public, and did not appear in any printed report. Federal and state laws provide ARRC the same rights and benefits to

protect confidential information. This enables the company to price and contract its services on a businesslike basis and to respond quickly to market conditions.

35. Describe the documents and categories of information the ARRC refused to give to the Transportation Committee.

Response: Although we are not certain at this date what documents were refused, they were most probably those which would divulge confidential contract rates or operating costs, and which could be attributed to any freight service segment.

Categories of information which must remain confidential:

- contract rates
- operating costs for specific freight moves
- any information which would identify shipments concerning one shipper or consignee

36. Describe all procedures and practices by which the ARRC attempts to minimize the adverse effect of the operation of the railroad on wildlife.

Response: In cooperation with the Alaska Department of Fish and Game ("ADF&G"), the ARRC has experimented with numerous methods to minimize the adverse effects of its operations on wildlife, specifically big game. Historically, moose are the game population most affected by the railroad, primarily in years of deep snow (3 to 5 feet) for long periods of time. Unfortunately, many of the experiments have failed to demonstrate a reliable way to discourage moose usage of the plowed track (see response to Question No. 39 below). Presently, the effort is concentrated on plowing the right-of-way as wide as possible, and a combination of lights, horns and bells to frighten them away from the track. Where possible, the train engineers slow down to reduce the chance of a strike.

ARRC is again cooperating with ADF&G in its ongoing study of the moose mortality along the tracks. For example, arrangements are being made for game biologists to accompany a locomotive on several trips north this season. The corporation has also engaged a private consultant to develop electronic equipment to frighten the moose and drive them away from the track. Research and equipment design under that contract are scheduled for completion within the current winter season, with construction and installation of equipment to follow depending on the results of research.

37. Describe all actions taken by the ARRC if a train hits a moose, including names of people to whom the information is reported, reports made, and attempts to salvage meat.

Response: The ARRC has, at least since the early 1980's, cooperated with the ADF&G and fish and wildlife enforcement officers of the Department of Public Safety ("DPS") to ensure the retrieval and salvage of moose hit by trains. Since 1983, this process has been refined and carried on under an informal understanding by which railroad crews immediately reported a strike to the train dispatcher, who called the appropriate fish and wildlife number for the game management unit involved. If the moose was salvageable (that is, sufficiently intact after the collision), the railroad section crew was under instructions to transport the carcass to the nearest public road crossing, where DPS had notified the next eligible charity to pick it up. The process was completed within 20 hours after the collision and in most cases (when the section crew could be immediately contacted), within only a few hours. ADF&G game biologists have assured ARRC that game retrieval within this time frame is sufficient, so long as the air temperatures are as cold as is generally the case during the period when moose strikes occur.

The train which strikes a moose is required to stop and make an inspection unless it is clear that the animal is free of the track and presents no danger to train movement. The crew evaluates the condition of the animal (i.e. is it alive and crippled? is it salvageable if already dead?) and immediately notifies the Dispatcher by radio. The local section crew is then notified of the necessity to either dispatch a crippled moose and/or salvage the carcass. The carcass is field dressed, with the ARRC providing necessary equipment for this purpose, and delivered to crossings as discussed below.

This procedure was formalized for the current season with an addition to the ARRC's Timetable No. 120, a set of operating rules utilized by all operations personnel. A copy of the procedure is attached as an exhibit. It generally restates the process which had been previously developed by ARRC and DPS officers and includes the specific telephone numbers used by the Dispatcher to notify DPS. In addition, for the Gold Creek area where DPS has not in the past maintained a charity list (due to the area's isolation from the public road system), the ARRC has worked with DPS to distribute sign up sheets among area residents and return those sheets to DPS to compile a list of eligible recipients. In these areas, the ARRC crew retrieving a moose is authorized by DPS to transport the carcass to a convenient spot along the track for access by the next eligible recipient. The section crew members, residents of the area themselves, are well aware of the best locations for such pick-up.

Such salvage activities cost ARRC money and divert employees from other necessary duties. For example, in

calendar year 1986 (a year of light snowfall), approximately 200 man-hours were expended, for an estimated $5,000 in additional labor costs.

38. How many moose were hit by trains in each calendar year from 1980 through 1986?

Response: Rather than using figures for calendar years, the following statistics encompass the winter season of the indicated year, which is when most moose strikes occur. Figures for the years before 1984 were compiled by the ADF&G.

1979-80 - 54
1980-81 - 24
1981-82 - 50
1982-83 - 144
1983-84 - 63
1984-85 - 384
1985-86 - 37
1986-87 (to 2/6/87) - 91

39. Describe all other procedures of which the ARRC is aware which would additionally minimize the risk of hitting moose and state why the ARRC has not implemented such procedures.

Response: The ARRC is not aware of any other procedures it could employ which would fulfill the criteria addressed in this question. There have been other suggestions but in our experience they have proven unfeasible. Among the failed experiments are sonic whistles, which did not sound when the trains moved at slow speeds and froze when it was very cold; slowing the train, which raised havoc with schedules, made it impossible to climb certain grades on the icy track, and lead to many more crippled animals; and decking between ties on bridges so that moose can safely cross, which caused federally-required speed sensors on the train wheels to work improperly. Other, even less feasible ideas have been considered and rejected, such as installing a "bumper" on the front of locomotives. Operating the train only in daylight hours is equally impractical, since the problem arises in winter when those hours are too short to allow the shipping business of the railroad to survive. In addition, to meet shippers' arrival time requirements, night operations are essential.

Another suggestion, which does not appear feasible and has thus not been implemented by ADF&G and the ARRC, is a special "hunting season" to thin moose in the area when heavy snowfall occurs. This concept would be difficult to administer and has been soundly criticized by ADF&G personnel. See Dickerson, J.C. & Kramer, R.J., "When Moose and Train Meet: Avoiding

Collisions on the Alaska Railroad," Alaska Fish & Game (Sep.-Oct. 1986). A copy of this article is attached as an exhibit.

40. Describe all pesticides used by the ARRC, and the areas in which such pesticides are applied. Describe any complaints the ARRC has received regarding the use of pesticides, and describe the procedures the ARRC has or intends to implement to discuss such complaints in public.

Response: Beginning in the 1950's, the federal Alaska Railroad conducted a herbicide program to control vegetation along the railroad right-of-way. Vegetation maintenance is periodically required to ensure safe railroad operations. The state-owned ARRC has not applied any such chemicals since it took over operation of the railroad in 1985. It applied to the state Department of Environmental Conservation in 1985 for a permit to apply a herbicide known as hexazinone on the right-of-way. After public hearings, a working draft of ARRC's proposed Vegetation Maintenance Management Program study was distributed to interested parties for comment. To allow sufficient time for public and agency input, ARRC withdrew its application for spraying in 1985. No application was filed for the 1986 spraying season and thus the right-of-way has not been treated for some time.

Because of the likelihood of harm to its roadbed (vegetation allows water to seep in among ballast and gravels, weakening support of ties and rails) and the encroachment of brush along the right of way which blocks train crews' view (particularly to see dangers in time to avoid collisions), ARRC expects to file an application for a permit to apply hexazinone in the coming summer. All the comments received on the draft study will be used in the preparation of the permit application.

Hexazinone is low in toxicity to mammals, fish, birds, and invertebrates and has been fully tested to EPA standards. The permitting process will, of course, comply with the public notice and opportunity to comment required by state law and DEC regulations. See AS 42.40.440. ARRC has received complaints regarding the proposed use of any herbicide, including hexazinone, from a group of Talkeetna area residents in the past and expects they, as well as any others, will again have an opportunity to express their concerns on the matter in the public notice process.

41. Describe any action the ARRC has undertaken to determine alternate methods of vegetation control other than pesticides actions undertaken in the past.

Response: The working draft referred to in the response to Question No. 40 was commissioned from the Corps of Engineers and included an assessment of alternative methods of vegetation

control. The study concluded that the available alternatives, which included general expansion of roadbed maintenance, manual labor, and mechanical control, among others, were either cost prohibitive or not feasible to completely eliminate the need for herbicide application. ARRC does mechanically remove vegetation outside the ballast section of the roadbed.

42. Describe the current situation in Moose Pass.

Response: The current situation in Crown Point has remained largely unchanged during the fall and winter of 1986. Exhaustive environmental monitoring in addition to work already performed by ARRC has been ongoing by State of Alaska contractors. Currently Dames & Moore, a contractor working on behalf of the state, is completing work on a study to determine what chemical residues may still remain in the Crown Point impact area. The final report is due on March 2, 1987.

Despite study results which indicate that suspect chemicals are not present in homes or appear at or below ordinary household levels, complaints persist by some residents that the March 2, 1986 tank car release has a continuing detrimental effect on their health. Many other residents have returned to their "pre-release" lifestyles, and appear not to be impacted whatsoever. In an effort to determine the health and property issues, and to assist those who remain displaced, the defendants in a lawsuit brought by some 50 Crown Point residents have brought in experts to assist in the monitoring of ongoing problems. In addition, some claims have settled.

43. How many residents are still not living in their homes as a result of the incident at Moose Pass?

Response: It is difficult to determine precisely the number of residents that are currently out of their homes because of the gas release. Most residents of the area returned to their homes immediately after the incident. In the following months, some individuals moved back in the area on their own volition. Others have reaccommodated themselves in the area in new or renovated living quarters. Approximately 45 people remain out of their homes at the present time, which makes up approximately 18 families.

44. How much money has the State of Alaska paid to attempt to rectify the adverse effects at Moose Pass?

Response: In December 1986, the State of Alaska estimated that expenditures were in the neighborhood of $650,000.00. Estimates of the overall expenditure for the state by the time it ceases making payments exceed $850,000.00.

45. How much money has the ARRC paid to attempt to rectify the adverse effects at Moose Pass?

Response: Approximately $650,000.00 was initially spent in assisting Crown Point residents immediately after the release, and in clean up and environmental monitoring. Ongoing expenses are accruing as claims are settled, and costs are incurred for professional and outside services.

46. Describe the procedures the ARRC has implemented to prevent a recurrence of the type of incident that occurred at Moose Pass?

Response: New steam track heating procedures have been implemented which are intended to greatly reduce any risk of human error in the heating of tank car commodities. It must be noted, however, that the March 1986 release was not simply a case of the overheating of a tank car commodity. Once the error had been realized, railroad personnel properly contacted the consignee and shipper and explained the situation. The shipper's disastrous advice was that the product was probably not harmed and the car could be safely moved to its designation, where its load would cool. After the event, ARRC soon learned that the exothermic chemical reaction which resulted could have been easily avoided by cooling the shipment by running cold water through the car's steam coils. Procedures will also insure that accurate and reliable information concerning heating is received from shippers and/or manufacturers. Finally, UF-85, the commodity in the March tank car, is now heated by the consignee at the delivery point when necessary to offload it into tanker trucks. Rather than heating the entire load at once, the consignee heats the material as it enters the exit hoses. Temperatures are also well within safety ranges.

47. What is the policy of the ARRC with regard to hiring Alaskan residents?

Response: The ARRC was one of the first businesses in Alaska to join the Governor's Council on Alaskan Hire. ARRC recruits almost exclusively with Alaska Job Service offices throughout the state. The only positions which are advertised outside Alaska are those positions for which a highly qualified candidate cannot reasonably be expected to be found in the state or positions in our Seattle office.

Attached is Board Resolution No. 85-5: Relating to the policy of Hiring Alaska Residents.

48. What is the policy of the ARRC with regard to purchasing Alaskan goods and services?

Response: ARRC's Procedure 33-12.01, adopted at the July 18, 1985 ARRC Board Meeting states:

3.5 Female, Minority, and Alaskan Vendors. It is the policy of the ARRC to encourage meaningful participation of female, minority, and Alaskan owned vendor sources to provide useful and acceptable quality services or materials at competitive prices. Procurement personnel are responsible for making practical efforts to locate and solicit minority vendor bids for products or services. The Manager of Procurement is responsible for the effective implementation of this guideline in ARRC procurement activities.

This policy was subject to public review and input prior to adoption by the Board of Directors. A public hearing was conducted June 21, 1985 at ARRC Headquarters which was attended by approximately thirty local vendors. Their input was considered in the procedure subsequently presented to the Board on July 18, 1985, at which time public comment was allowed by the Board and considered prior to adoption. This procedure follows the legislature's mandate in ARCA "that the procurement procedures of the corporation meet accepted railroad industry standards." AS 42.40.100(8).

49. Who is the individual in charge of implementing the policies described above?

Response: The Manager, Procurement or his or her equivalent.

50. What percentage of ARRC employees are Alaskan residents?

Response: As of February 6, 1987, 98% of ARRC employees are Alaskan residents (some employees are located in Seattle).

51. What percentage of the goods and services (other than services rendered by employees) purchased by the ARRC are of Alaskan origin, production or manufacture?

Response: ARRC purchased approximately $8,000,000.00 in goods during 1986. Of this figure $4,000,000.00 represents locomotive and other fuels which are all of Alaska origin, production and manufacture. All office supplies, lumber and other building materials are purchased on the local market. Whether these are of Alaskan origin, production or manufacture is not known, except with respect to wooden railroad ties. During 1985-86, the ARRC purchased approximately 35,000 hardwood ties from Wrangell Forest Products Ltd. in southeast Alaska for its summer maintenance programs. Goods which are peculiar to the ARRC, such as locomotive parts, passenger car parts, and the like, are not obtainable on the local market and

must be purchased from vendors outside Alaska. Additionally, the majority of such parts must be obtained from the original manufacturer to maintain warranties.

Services purchased by ARRC include engineering expertise, legal counsel, risk management services, adjusters, printing and binding services, employee counseling services and medical referral services. To the greatest extent possible and available, these services are obtained through competitive procurement practices. In most cases these services are obtained from the local market.

52. Provide a copy of the 1985 budget of the ARRC.

Response: Attached (1985 Budget Prepared by Federal Railroad).

53. Provide a copy of the 1986 budget of the ARRC.

Response: Attached.

54. Provide a copy of the proposed 1987 budget of the ARRC.

Response: Attached.

55. To the extent it is not clearly reflected in the above budgets, state the percentage of total budget and dollar amount for each year identified above expended on or allocated to:

--administration of the ARRC
--travel expenses for executive level employees
--salary levels for each executive level employee
--fringe benefits for executive level employees

Response:

Percentage

1985	1986	1987	
21.9	20.5	19.2	administration of the ARRC
0.5	0.8	0.5	travel expenses (total management)
--	11.9	11.8	salary of non-represented employees

Thousands of Dollars

1985	1986	1987	
13,209	11,909	10,826	administration of the ARRC
322	450	300	travel expenses (total management)
--	6,919	6,668	salary of non-represented employees

Above percentages are approximate.

Salary Levels*:

Range	Number of Positions	Position
$125,000	1	President/CEO
$70,000-92,000	16	Vice Presidents and Department Managers (3 levels)
$58,000-64,000	40	Mid Level Managers (3 levels)
$22,000-53,000	56	First Level Managers and Professional Staff

* Information only for February 1987; prior years have not yet been compiled. Please advise if this is needed.

56. What was the final net profit or loss of the ARRC in 1985, 1986, and projected for 1987?

Response:

Thousands of Dollars

1985	1986	1987
7,133	(1,500) Estimated Loss	354 Estimated Income

57. What percentage of the ARRC's income for calendar years 1985 and 1986 was derived from passenger and freight operations, and how much from rail lands?

Response:

Percentage

Income 1985	Revenue 1985	Income 1986	Revenue 1986	
42.6	93.6	91.9	(440.0)	- Passenger and Freight
57.4	6.4	9.1	340.0	- Real Estate
100.0	100.0	100.0	100.0	- Total Percent

58. What was the actual dollar effect of the reduction of inventory (as described in the Performance Audit dated July 28, 1986) undertaken by the ARRC in 1985 and in 1986 on the figures identified in response to the above question?

Response:

Balance (Millions of Dollars)		
1-06-85	12-31-85	6-30-86
7.5	4.6	4.6

*Inventory was revalued during 1985 to compensate for obsolete items as well as remove from inventory those items of no value.

59. What dollar amount, including allocable overhead, was spent during each year of operation by the ARRC on

--management of rail lands
--provision of passenger and freight service
--other operations (describe)

Response:

Thousands of Dollars		
1985	1986	
500	650	Management of rail lands (estimated)
59,601	57,242	Passenger and freight service

Appraiser's Qualification

CERTIFICATION

I certify that, to the best of my knowledge and belief,...

1.-- the statements of fact contained in this report are true and correct.

2.-- the reported analyses, opinions, and conclusions are limited only by the reported assumptions and limiting conditions, and are my personal, unbiased professional analyses, opinions, and conclusions.

3.-- I have no present or prospective interest in the property that is the subject of this report, and I have no personal interest or bias with respect to the parties involved.

4.-- my compensation is not contingent on an action or event resulting from the analyses, opinions, or conclusions in, or the use of, this report.

5.-- my analyses, opinions, and conclusions were developed, and this report has been prepared, in conformity with the requirements of the Code of Professional Ethics and the Standards of Professional Practice of the American Institute of Real Estate Appraisers.

6.-- the use of this report is subject to the requirements of the American Institute of Real Estate Appraisers relating to review by its duly authorized representatives.

7.-- I am currently certified under the voluntary continuing education program of the American Institute of Real Estate Appraisers.

Franklin M. King, Jr., MAI

STUDY OBJECTIVE

The objective of this study is to estimate the current "fair market rental rate" applicable to lands leased under the terms and conditions of the Alaska Railroad Corporation's newly-drafted, Long-Term Lease Policy. The estimated rental rate (a/k/a lease rate) is to be applied to the market value of land (fee simple interest) to determine the annual rent payment. A copy of the Long-Term Lease Policy is included in the addenda to this report.

SCOPE OF INVESTIGATION

The appraiser reviewed the ARR Long-Term Lease Policy and, for comparison purposes, secured information on land leases throughout the State. The comparative lease data are divided into private and public sector categories.

Private Sector Leases:

Data was gathered on over 50 land leases between private parties. A breakdown of the leases by locale is: Anchorage - 46%; Juneau - 23%; Fairbanks - 17% and; other areas - 14%. When possible, the appraiser reviewed the lease instrument but, in some cases, it was necessary to rely on interviews of the parties and prior "write-ups" by other appraisers. A tabular summary of the private sector lease data is set forth later in this report. Additional details, leases copies,etc., are on file.

Public Sector Leases:

Various public entities have active land leasing programs and information on same was obtained through interviews and review of lease documents. Data sources included: State of Alaska (Department of Natural Resources); Municipality of Anchorage; City of Cordova; Fairbanks North Star Borough; City & Borough of Juneau; City of Kenai and; City of Seward. A summary of pertinent public sector lease data is contained later in this report.

SUMMARY OF LAND LEASE RATES

Private Sector Land Leases

Lease No.	Rent As % FMV	Eff. Date	Lease No.	Rent As % FMV	Eff. Date	Lease No.	Rent As % FMV	Eff. Date
A-1	10.0%	7-85	A-18	9.0%	7-81	J-2	10.0%	11-85
A-2	7.0%	1-84	A-19	10.0%	9-79	J-3	9.0%	12-84
A-3	9.0%	6-84	A-20	8.0%	8-79	J-4	10.0%	5-84

A-13	9.0%	3-83	F-6	13.0%	10-82	O-2	12.0%	11-84
A-14	10.0%	12-81	F-7	7.0%	1983	O-3	10.0%	4-83
A-15	13.0%	8-81	F-8	5.3%	2-78	O-4	8.0%	3-83
A-16	10.0%	4-81	F-9	7.7%	1978	O-5	10.0%	10-83
A-17	12.0%	4-81	J-1	12.0%	1-86	O-6	10.0%	7-81
						O-7	10.0%	12-81

Range of Lease Rates:	5.3% --- 14.0%
Average:	9.5%
Median:	10.0%
Mode:	10.0%

Public Sector land leases

State of Alaska (DNR)	6.0% --- 15.0%	(Eff. 1981 - 86)
Muni. of Anchorage (Port)	8.0% --- 10.0%	(Since late 1970's)
City of Cordova	9.0%	(Since mid-1970's)
Fairbanks N. Star Borough	10.0%	(7-84)
City & Borough of Juneau	9.0% --- 12.0%	
City of Kenai	6.0%	(Since mid-1960's)
City of Seward	8.0%	(Since mid-1970's)

MARKET DATA ANALYSIS

Lease Rates:

Private sector annual ground rents tend to be set within a range of about 5% to 14% of fair market value (FMV) as depicted on the facing page. The mean of the sample considered in this study was 9.5% and two-thirds of the private sector leases were at 8% to 10% of FMV. Nearly all of the leases involved commercial sites.

Unlike private sector lease rates which are normally determined through open-market negotiations, public sector rates are most often established by appraisal. Not surprisingly, the indicated lease rate range of 6% to 15% closely approximates that of the private sector. This range is demonstrated by State Department of Natural Resources (DNR) leases but, narrows when one considers that the low-end rates are applicable to residential and recreation lands and the high-end rates are for 25-year fixed rent leases.

It should also be noted that: (1) All but one of the Port of Anchorage leases are at 9% to 10% of FMV; (2) The most recent lease rates for City & Borough of Juneau lands are at 10% and; (3) The City of Kenai deliberately maintains a relatively low lease rate of 6%.

From all indications, lease rates are not locationally-sensitive but are fairly uniform in range around the State. There is also an apparent uniformity of rates over the past 10 or so years.

Lease Term:

The standard ARR long-term ground lease will be for 35 years (longer periods may be negotiated). Excluding five short-term leases (1 to 5 years), the private sector leases have an average term of 53.71 years (including optional renewal periods), with a median and mode of 50 years. The public sector lease terms were:

State of Alaska (DNR)	25 -- 55 yrs.
Port of Anchorage	19 -- 61 yrs., typ. 50 yrs.
City of Cordova	20 yrs.
Fairbanks N. Star Bor.	50 yrs.
City & Bor. of Juneau	35 yrs.
City of Kenai	55 -- 99 yrs.
City of Seward	30 yrs. typically

The five private short-term leases demonstrate lease rates of: 7.6% (A-1); 8.4% (A-10); 10.5% (A-11); 10% (A-14) and; 7% (F-6). These rates are in the central data range and there is no evidence that the term of lease has a measurable impact on the selection of a lease rate.

Rent Adjustment Method:

The standard ARR lease will provide for rent adjustments at 5-year intervals based on appraisal of fair market rental value. Rent revisions are to be regulated by a rent "floor" determined by changes in the CPI (All Urban Consumers - U.S. Cities Average) and a rent "ceiling" or "cap" established through negotiation.

Nearly one-half of the private sector long-term leases (confirmed cases) call for rent adjustments at 5-year intervals. The others varied with the frequency of rent adjustments ranging from annually to as seldom as 10-year intervals. Rent floors were typically set at prior rent amounts, although there were a few leases specifying minimum annual increases of 5%. Several of the leases have rent caps whereby maximum rent is determined by an annual percentage increase in the previous rent. The maximum rates of increase ranged from 4% to 15%/year with the average being 8.74%.

Most of the private sector, 5-year adjustable leases provide for rent revisions in line with CPI variations and a lesser number call for adjustments based on reappraisals. Since land value appreciation has usually exceeded inflation in most Alaskan cities, it would seem reasonable for reappraisal leases to carry lower rental rates than those of indexed leases. This is supported by a matched pair of leases (A-2 and A-5) which are similar except that the former is a reappraisal lease with a going in lease rate of 7% and the latter is an indexed lease with a rate of 10%. As can be expected of an imperfect market, paired leases O-2 (reappraisal with 12% rate) and O-3 (indexed with 10% rate) are contradictory.

The data are also inconsistent with respect to rent caps (see A-1 vs. A-2, A-6 vs. O-2 & A-5 vs. A-18) but, all other things being equal, a lease with reasonable limits on potential rent increases should reflect a higher going in rate than one without limitations.

All of the public sector leases surveyed call for periodic rent adjustments based on reappraisals and this is predominantly done at 5-year intervals. The newer State DNR leases do not provide for rent adjustments during the first 25 years and, predictably, their lease rates (9.5% to 15%) are normally higher than rates for leases that are updated to market rent levels on a more frequent basis. Relatively few of the public sector leases include rent floors or caps.

Lessee Expenses:

Long-term land leases are usually structured so that lessees pay all property expenses, i.e., land rent is net to the lessor. This is true of all the public sector leases surveyed and also of over 80% of the private sector leases (confirmed cases).

The standard ARR lease will require lessees to pay all property expenses and, as such, fits the market norm.

Subordination, A signment & Subleasing:

The standard ARR lease will not permit subordination of the lessor' interest (leased fee estate) but will allow assignment and subleasing with lessor approval. These are typical features as over 80% of confirmed private sector leases do not provide for subordination and 97% allow assignment and subleasing. Those leases allowing subordination to lessee financing exhibit lease rates ranging from 8% to 10% with an average rate of 8.6%. These rates seem low considering the added risk normally associated with subordination. However, it is recognized that there are factors blended into the rates.

Public sector leases do not allow subordination of the leased fee but usually permit assignment and subleasing with lessor consent.

Option to Purchase:

The ARR standard lease will not provide the lessee with an option to purchase the premises and, as would be expected, this is normally true of public sector leases. In those confirmed instances, 75% of private sector leases do not include an option to purchase either.

Although the sample data are inconclusive on this point, it would seem that an option to purchase should not affect lease rates if the price is at current market value. Other prices and unusual purchase terms could justifiably influence rental value.

Reversion of Lessee Improvements:

About 86% of the confirmed reversion clauses in the long-term private sector leases provide that either the improvements revert to the lessor upon expiration of the lease or the lessor may opt to remove same at lessee's expense. Notably, in these instances, the lease term (including renewal periods) approximates or exceeds the economic life expectancy of the improvements. This is also true in those few instances where the lessee has the option of removing the improvements.

Public sector reversion clauses vary, but most frequently call for tenant removal of improvements. Here again, lease periods are generally scheduled to approximate anticipated improvement economic life.

The ARR's standard reversion clause parallels that of the typical private lease in that,"....Lessor may, at its option, become the owner of all improvements located on the demised premises, or may require lessee, at the expense of lessee, to remove, demolish, or otherwise dispose of such improvements....".

Assuming that: (1) ARR lease periods will be negotiated to coincide with the normal useful life of lessee improvements and; (2) Salvage value will tend to be offset by the cost of removing improvements; then neither lessor nor lessee would benefit or lose from retention of the improvements upon expiration of the lease. Accordingly, lease rates would not be measurably affected by the reversion clause.

Condemnation Clause:

Private and public sector leases typically provide for awards based on the respective interests of the parties and, at a minimum, entitle lessees to awards for their improvements. The eminent domain provisions of the ARR lease are not unusual in that they specify lessee compensation to be governed by State law.

Arbitration:

The ARR lease provides for binding arbitration of disputes involving rent revisions, condemnation aspects and assignments of lessee's interest. Only 37% of the private sector leases (confirmed instances) allow for some form of arbitration and public sector leases do not normally include arbitration clauses.

Arbitration is normally a less expensive method of settling disputes than litigation and, as such, can benefit both landlord and tenant. Unfortunately, the sample data are mixed as to the effects of arbitration provisions (see A-2 & A-3 vs. A-6 and also A-18 vs. O-3). Even though there is no quantifiable market support, it seems reasonable that a small lease rate premium would accrue to an arbitration clause like that of the ARR lease.

LEASE RATE RECOMMENDATIONS

Although land leases constitute a large part of the market in some areas of the country, their limited use in Alaska makes it difficult to quantify differences in specific conditions and provisions. However, in spite of market irregularity, there is a relatively uniform range of lease rates around the State.

Private sector leases that are most comparable to the standard ARR lease are as follows:

Lease No.	Rate	Comparability
A-6	8.0%	Most similar
A-2	7.0%	Very similar but no arbitration
A-3	9.0%	Very similar but no arbitration
O-2	12.0%	Very similar but no rent cap
O-5	10.0%	Very similar but no rent cap
O-6	10.0%	Very similar but no rent cap
A-1	10.0%	Very similar but no rent cap or arbitration
Average=	9.4%	

These leases epitomize market imperfection and, interestingly, their average rental rate is nearly the same as the average of the total private sector sample.

Based on analysis of private and public sector leases, a fair rental rate for ARR long-term leases would be at 9% to 10% or, say, 9.5% of market value. This lease rate is considered appropriate for all railbelt locales from Seward to Fairbanks (locational variations in land rents would, of course, be a function of land value).

This rate is based on the assumption that: (1) Lease periods will be negotiated to coincide with economic lives of lessee improvements; (2) The cost of removing such improvements at the end of a lease will be offset by their salvage value and; (3) Rent caps will be negotiated to limit rent increases to 5% to 10% per year.

It is recognized that methods of leasehold taxation vary within the State and those jurisdictions utilizing valuation of "possessory interests" tend to be more costly to lessees of tax-exempt lands than those that rely on appraisal of "rent savings". Nevertheless, the recommended lease rate of 9.5% is considered appropriate regardless of taxation method since it is consistent with the market norm, i.e., land rents are typically net to the lessor with the tenant being responsible for all property operating expenses.

YIELD ANALYSIS

Ongoing inflation and land value increases over the term of most leases result in internal rates of return (IRR) or yield rates in excess of actual lease rates. Three possible scenarios involving an ARR lease with a fair market rental rate of 9.5% are as follows:

Assumptions: (1) Initial Land Value = $100,000
(2) Lease Term = 35 Years
(3) Reversion Value of Lessee Improvements = 0

	EXAMPLE A Inflation & Land Apprec. @ 3%/Yr. (compounded)	EXAMPLE B Rent Cap @ +25% Over Prior Amt. & Land Apprec. @ 5%/Yr. (comp.)	EXAMPLE C Rent Cap @ +50% Over Prior Amt. & Land Apprec. @ 10%/Yr. (comp.)
	Annual Rent	Annual Rent	Annual Rent
1st 5 Yrs.	$ 9,500	$ 9,500	$ 9,500
2nd " "	11,013	11,875	14,250
3rd " "	12,767	14,844	21,375
4th " "	14,800	18,555	32,063
5th " "	17,157	23,193	48,094
6th " "	19,890	28,992	72,141
7th " "	23,058	36,240	108,211
Land Rever. End 35th Yr	281,386	551,602	2,810,244
YIELD =	12.01%	13.42%	17.05%

Example A is believed to be on the conservative side as annual inflation has been closer to 4% since 1982 and is forecast at 3.7% for 1986 (see chart on facing page). Example C could be more representative of yield on urban lands such as those in Anchorage where the average compound rate of appreciation for commercial and industrial sites was 10.0% and 8.7%, respectively, over the past ten years (per survey data published annually by our firm).

Pre-tax yields in the range of 12% to 17% for ARR leases would certainly be in line with returns on competitive investments:

	4th Qtr.'85	3rd Qtr.'85	2nd Qtr.'85	4th Qtr.'84
Real Estate Yield	12.75-15%	12.75-15%	12.75-15%	13-15.5%
	December	September	June	December
Bond Yields				
Corp.(Aaa)	10.16%	11.07%	10.94%	12.13%
Corp.(A)	11.19%	11.99%	11.98%	12.92%
Corp.(Baa)	11.58%	12.48%	12.40%	13.40%

The real estate yields are on a pre-tax basis and are published by Real Estate Research Corporation. They primarily reflect IRR on unleveraged investments in prime properties such as major office buildings, industrial and R&D facilities, and large apartment complexes.

The bond yields are those of major corporations as reported by Moody's Bond Survey. Real estate capital requires greater yields than corporate bonds due to relative risk factors.

* Per appraisal. Actual rent administratively set at much lower rate.

** Reduced rate for remote location.

STATE OF ALASKA LAND LEASES

Various State agencies are involved in ground leasing but, in some cases, rents are not at market levels. For example, current land rents at the Anchorage International Airport were administratively-established some 15 years ago. State officials are aware that these rents are less than could be obtained in an open market atmosphere and a rent study was commissioned some time ago. Indications are that there will be an increase in the near future. However, airport officials believe it unlikely that rents will be brought to market levels as such would hamper efforts to promote the aviation industry.

Considered more pertinent are ground leases granted by the Department of Natural Resources (DNR). A tabular summary of data from several DNR leases is on the facing page.

The first four examples are old leases executed in the 1960's wherein annual land rents are adjusted at 5-year intervals based on reappraisals. Recent reappraisals of these and other similar leased properties have established rents at 6% to 9% of market value with residential and recreation land rents typically falling in the lower end of the lease rate range. Most updated rents for commercial and industrial ground are based on rates of 8% and 9%.

The last twelve examples are newer State leases wherein land rents are level for the first 25 years (10 years in one case). Annual rent for each 10-year period thereafter is set at market rent but cannot be greater than a 50% increase in the preceding rent. As would be expected, the rate range of 9.5% to 15% set for these leases is higher than typical rates for the 5-year adjustable DNR leases.

Some other characteristics of the typical DNR lease are briefly noted as follows:

Lease Period:

25 to 55 years.

Rent Adjustments:

Typically based on reappraisal wherein appraiser estimates both current market value of land and the applicable annual rate of return or lease rate.

Rent Floor/Ceiling:

Typically no floor. Ceiling identified in those leases adjustable after 25 years.

Lessee Expenses:

All expenses paid by lessees (rents are net to the State).

Subordination/Assignment/Subleasing:

Subordination of leased fee to lessee financing not permitted. Assignment and subleasing permissable with lessor appproval.

Option to Purchase:

None.

Reversion of Lessee Improvements:

Lessee to remove within 60 days or lessor may dispose of.

Condemnation:

Lessee entitled to award for lessee-owned improvements.

Arbitration:

Not typically provided for in lease.

PORT OF ANCHORAGE INDUSTRIAL LOTS

(1) Based on original unfilled condition.
(2) Includes contribution of paving.
(3) Average amount based on $.425/s.f. of filled land (9.1 acres) and $.150/s.f. of unfilled and easement encumbered land (2.06 acres)

01-051P

MUNICIPALITY OF ANCHORAGE LAND LEASES

Two major areas of municipal land leasing activity are the Merrill Field Airport and the Port of Anchorage. Merrill Field rents are administratively set to fund the operation of the airport and the data from those leases are not of much use in this study.

The Port of Anchorage subdivision is 100% leased and a tabular summary of lease data is presented on the facing page. The leases date back to the early 1960's and, for the most part, are similar in content. Some key characteristics are as follows:

Rental Rate:

Annual land rents are set at 8% to 10% of fair market value by agreement of the parties or by appraisal.

Lease Period:

Typically 50 years including renewal options.

Rent Adjustments:

Annual land rents are typically adjusted at 5-year intervals to fair rental value by mutual agreement or independent reappraisal.

Rent Floor/Ceiling:

Leases do not provide for rent minimums or caps.

Lessee Expenses:

All expenses paid by lessee (ground rents are net to the lessor).

Subordination/Assignment/Subleasing/Purchase Option:

No subordination of leased fee to lessee financing is allowed. Assignment and subleasing is permitted with lessor approval. Option to purchase is not granted.

Reversion of Lessee Improvements:

Newer leases provide that lessor may consent to retain improvements or may require their removal at lessee expense.

Condemnation:

Lessee entitled to award for value of lease and lessee improvements.

Arbitration:

Not provided for in leases but, lessees may appeal rent increases to the Port Commission.

CITY OF CORDOVA LAND LEASES

The City of Cordova has about 15 acres of industrial land under lease. This ground is subdivided into 15,000 to 80,000 s.f.+- lots and leased to various parties. Another 17 acres is expected to be available for lease in 1986. A summary of lease data is as follows:

Rental Rate:

Annual land rents are set at 9% of assessed value as determined by contract assessor. This rate is stated in the leases and has been in effect for many years.

Lease Period:

Typically 20 years with negotiable renewal options.

Rent Adjustments:

Annual land rents are adjusted at 3-year intervals based on "9% of the valuation as determined by a qualified appraiser". In practice, the stated rate is applied to the assessed land value which is normally updated annually.

Rent Floor/Ceiling:

Typically none.

Lessee Expenses:

All expenses paid by lessees (rent is net to the lessor).

Subordination/Assignment/Subleasing:

No subordination of leased fee to lessee financing allowed. Assignment and subleasing permitted with lessor's consent.

Option to Purchase:

Typically none.

Reversion of Lessee Improvements:

Typically the lessee must remove within 90 days or lessor may retain or remove at lessee's expense.

Condemnation & Arbitration Clauses:

Normally not in leases.

FAIRBANKS NORTH STAR BOROUGH LAND LEASE

The FNSB land leasing program is in it's infancy although the land base exceeds 100,000 acres. Most of the acreage is in remote locations but there are 200 acres +- near Fairbanks which will be concentrated on for disposition by leasing. At present, there are two land leases with another two or three expected to be consummated this year. One of the existing leases is 50% below market by assembly approval. The other lease is summarized as follows:

Lessor/Lessee:

FNSB/McKee Meats, Inc.

Rental Rate:

Annual land rent was set at 10% of the appraised value and this rate is stated in the lease.

Lease Period:

30 years beginning 7/23/84 plus two options to renew at 10 years each.

Rent Adjustments:

Annual land rent is adjusted at 5-year intervals based on 10% of appraised value. Land to be valued at time of reappraisal as if it were in the same state as at the beginning of the lease term excluding any improvements by the tenant.

Rent Floor/Ceiling:

None.

Lessee Expenses:

Rent is reportedly net to lessor (lease is silent on this point).

Subordination/Assignment/Subleasing:

Lease is silent on these items.

Option to Purchase:

None.

Reversion of Lessee Improvements:

Fixtures and structures shall be removed by lessee at end of lease.

Condemnation/Arbitration:

Not addressed in lease instrument.

CITY & BOROUGH OF JUNEAU LAND LEASES

The City & Borough of Juneau leases out some 50 parcels of land to various entities. The leasing program began many years ago and lease provisions have changed over time. A summary of lease data is as follows:

Rental Rate:

In recent years, new and revised leases reflect annual land rents based on 9% to 12% of fair market value. Most current rates are about 10%.

Lease Period:

Varies. Newer leases have maximum terms of 35 years.

Rent Adjustments:

Annual land rents are adjusted annually in some instances and at 3-year intervals in others. In the case of newer leases, adjusted rents are based on the City Assessor's recommendations as to both the market value of the land and the applicable rate of return.

Rent Floor/Ceiling:

Not typically provided in leases.

Lessee Expenses:

All expenses usually paid by lessee (rent is net to lessor).

Subordination/Assignment/Subleasing:

Subordination of leased fee to lessee financing is not permitted. Assignment and subleasing is usually permitted with lessor's approval.

Option to Purchase:

None.

Reversion of Lessee Improvements:

Typically lessee may remove or title reverts to lessor.

Condemnation:

Varies but lessee is normally entitled to award for improvements.

Arbitration:

Not typically provided for in leases.

CITY OF KENAI LAND LEASES

The City of Kenai leases out some 110 parcels of land (mostly city lots) to various private parties. The leasing program began in the mid-1960's and at present there are only 4 or 5 lots and some undeveloped acreage that are not leased. A summary of lease data is as follows:

Rental Rate:

Annual land rents are set at 6% of fair market value and this rate, which is stated in the leases, has been in effect since the inception of the leasing program. City officials acknowledge this is below rates utilized in other areas, but do not anticipate any changes in the foreseeable future. The most recent leases incorporating the 6% rate were executed in 1985.

Lease Period:

Typically 55 to 99 years.

Rent Adjustments:

Annual land rents are adjusted at 5-year intervals based on 6% of fair market value which is estimated by a "qualified independent appraiser". Fair market value is based on the condition of the lands on the date of lease plus the value of improvements made by the City subsequent to the date of lease.

Rent Floor/Ceiling:

City code provides that redetermined annual rent shall be limited to a 50% increase over the prior rent until the 30th anniversary, after which the cap provision shall no longer apply. This rent ceiling provision acknowledges that investors and developers need a reasonable assurance of stability in future rents.

Lessee Expenses:

All expenses paid by lessees (rent is net to the lessor).

Subordination/Assignment/Subleasing:

No subordination of leased fee to lessee financing allowed. Assignment and subleasing permitted with consent of lessor.

Option to Purchase:

None.

Reversion of Lessee Improvements:

Varies. Early leases provide for removal of improvements by lessee within 60 days or sale to succeeding lessee with lessor

appproval. Recent leases provide that title to improvements automatically vests in City upon termination.

Condemnation:

Rent abatement and award allocated by agreement or determined by arbitration if disputed.

Arbitration:

Not provided for in leases except in connection with condemnation clause.

CITY OF SEWARD LAND LEASES

The City of Seward leases out some 27 land parcels to private parties. These parcels are in or close to town. Lands still available for lease include 80 acres +- within the Seward Marine Industrial Center and 80 acres +- at the Fourth of July Creek industrial area. A summary of lease data is as follows:

Rental Rate:

Annual land rents are established at 8% of fair market value by appraisal. Although not stated in the leases, this rate has been in effect for the past 10-years and the City's appraiser does not expect any change in the near future. Most recent rents based on this rate were set in 1985. A summary of lease data is as follows:

Lease Period:

Typically 30 years. There are some shorter-term leases and a few in excess of 30 years, e.g. Suneel Alaska Corporation @ 55 years.

Rent Adjustments:

Annual land rents are adjusted at 5-year intervals based on MAI appraisal of fair market rental value exclusive of lessee's improvements.

Rent Floor/Ceiling:

Typically none.

Lessee Expenses:

All expenses paid by lessee (rent is net to lessor).

Subordination/Assignment/Subleasing:

No subordination of leased fee to lessee financing allowed. Appproval of lessor required for assignment and subleasing.

Option to Purchase:

None.

Reversion of Lessee Improvements:

Lessee to remove prior to expiration of lease or title to improvements vests in City.

Condemnation/Arbitration:

Award to be allocated as provided by law/Controversies or claims relating to leases to be settled in accordance with Uniform Arbitration Act of Alaska.

ALASKA RAILROAD CORPORATION

P.O. Box 7-2111 • Anchorage, Alaska 99510-7069

ALASKA RAILROAD CORPORATION

LONG TERM LEASE POLICY

The Alaska Railroad Corporation (referred to below as "Lessor" and "ARRC") will adhere to the following policies and guidelines when leasing real property for terms of five or more years. The policies and guidelines contained in this statement may be changed from time to time when the Alaska Railroad Corporation determines a change is appropriate.

1. PURPOSE

The purpose of this policy statement is to set forth guidelines and principles upon which the Alaska Railroad Corporation's standard long-term lease will generally be based. This statement is intended to give prospective Lessees and other interested persons information about the ARRC's policy with respect to its land lease program. However, this statement is not intended to provide the precise language that will appear in a lease or to substitute for or override any terms of a lease. It is important for prospective Lessees and other persons interested in a particular lease to carefully review the terms of the particular lease itself, because the lease (and not this policy statement) creates the legal relationship between Lessor and Lessee and defines the rights of each of the parties.

This policy governs new leases entered by the Alaska Railroad Corporation. Section 4 of the policy identifies circumstances under which an existing lease will be replaced by a new lease conforming to this policy statement.

2. PRE-LEASE MATTERS

2.01 COMMITMENTS. Long-term lease agreements require formal approval by ARRC Management. Neither letter proposals nor lease drafts will constitute a formal offer from Lessor. Such documents constitute nonfinal negotiating proposals by Lessor's representative and indicate the terms and conditions the representative is willing to recommend to Management. Lessor becomes bound only upon the execution of the typewritten lease by ARRC.

2.02 PUBLIC NOTICE AND RECORDATION OF LEASE. This provision relates to required public notice and public recording with respect to individual leases. It does not govern publication or relate to Lessor's marketing or leasing policies.

(a) Published Notice. Notice will be published in a newspaper of general circulation, serving the community where the property is located, for three (3) consecutive days, ending fifteen (15) days prior to the effective date of the proposed

EXHIBIT B

long-term lease. The notice will only describe the parcel to be leased, the proposed Lessee, date of proposed action, and the name, address, and telephone number of the Alaska Railroad Corporation representative.

(b) Memorandum of Lease. Upon the execution of this Agreement, both parties agree to execute a Memorandum Short Form Lease suitable for recording purposes.

2.03 ADMINISTRATIVE FEE. With Lessee's formal application to lease, Lessee will include payment of an administrative fee of Two Hundred Dollars ($200.00). The fee will apply to the first month's rental if a lease is executed. If the application is denied, the fee will be retained to defray administrative costs. Lessor may increase the administrative fee from time to time when an increase becomes necessary to cover costs.

2.04 PERFORMANCE OR CONSTRUCTION BONDS. At Lessor's option, Lessee will, before commencing construction of any improvement, including but not limited to subsurface improvements on the premises, deposit with the Lessor a bond or certificate thereof, in a sum not less than the cost of such construction and in form and with surety satisfactory to the Lessors, guaranteeing the completion of such construction free and clear of all mechanics' and materialmen's liens, together with such information and evidence as Lessors may reasonably require to assure that the Lessee is able to and will make all payments required by contract to be made as and when the Lessee is required to do so. The performance assurance, if required, may be in the form of surety, cash, assigned deposit, or irrevocable letter of credit.

2.05 PERMITS. All permits required by municipal, state or federal law are to be secured by and at the expense of Lessee.

2.06 PARCEL MAPS. The Lessor does not require the recording of parcel or subdivision maps. However, if a parcel or subdivision map is required by municipal ordinance, it must be approved by the proper governmental body and recorded by Lessee prior to execution of the lease or option to lease. Preparation of parcel or subdivision maps will be the responsibility of the Lessor; however, a nonrefundable deposit may be required of the Lessee to cover the cost of preparation.

2.07 CONDITION OF PROPERTY. Lessor will lease property "as is, with all faults", and without any representations or warranties by Lessor as to the characteristics or suitability of the Premises. Prior to execution of the Lease, Lessee will be given an opportunity to independently investigate the Premises, and to assess:

(i) the feasibility of developing the Premises for the purposes intended by Lessee;

(ii) the size and dimensions of the Premises;

(iii) the availability and adequacy of water, sewage and any utilities serving Premises;

(iv) the presence and adequacy of infrastructure or other improvements on, near, or affecting the Premises;

(v) the extent and condition of any grading or other site work already performed or hereafter required for Lessee's possible development of the Premises;

(vi) any surface, soil, subsoil or other physical conditions of or affecting the Premises, such as climate, geological, drainage, air, water or mineral conditions;

(vii) easements and reservations of record affecting the title;

(viii) the existence of governmental laws, regulations, ordinances, restrictions or requirements concerning the use density, location or suitability of the Premises for any existing or proposed development including such matters as zoning, building, subdivision, environmental and other regulations;

(ix) the necessity or availability of any rezoning, zoning variances, conditional use permits, building permits, environmental impact reports, parcel or subdivision maps, public reports and any other governmental approval;

(x) the necessity or existence of any dedications, taxes, fees, charges, costs or assessments that may be imposed in connection with any regulation or authorization or the obtaining of any required Permits; and

(xi) all matters concerning the condition, use and development of the Premises.

2.08 RELOCATION OF FACILITIES. Any necessary or desired relocation of Lessor's facilities will be made at the sole expense of Lessee. Lessee must communicate any request for relocation of Lessor's facilities before the lease is entered.

2.09 STORAGE OF HAZARDOUS MATERIALS. No leases will be granted for storage of hazardous materials (including gasoline and diesel fuel) unless Lessee first exhibits full compliance with municipal, state, and federal environmental laws and regulations, produces proof of satisfactory liability insurance naming Lessor as co-insured, and agrees to indemnify and save Lessor harmless from claims related to storage of such materials. Lessee is required to advise Lessor of intended storage of such materials before a lease is entered or extended. Lessee will schedule a pre-lease conference with Lessor to discuss the proposed storage, safety questions and compatibility of the proposed storage with adjoining land use; Lessee must furnish to Lessor copies of all permit applications, permits issued, denials of permits, and other actions on permit applications. Lessee whose use or storage of small quantities of hazardous materials is only incidental to business operations will be required to indemnify and save Lessor harmless from claims related to storage of such materials.

3. TERMS OF LEASES

3.01 PRINCIPLES GOVERNING RENT DETERMINATION. The following general principles govern rent determination by Lessor.

(a) Rent at Fair Market Value. Rent will be established at fair market value as agreed to by Lessor/Lessee and determined by a qualified appraiser or by competitive bid.

(b) Protection Against Inflation. Lessor will be protected against inflation by periodic revision of rent. Lessee will be protected against unforseeable inflation by maximum rent revision limits.

(c) Predictability of Rent. Rent revision should be accomplished in a manner that permits Lessee to engage in reasonable business planning and provides sufficient predictability to facilitate financing of Lessee's activities.

(d) Recognition of Value Contributed by Lessee. Permanent value contributed by Lessee to Lessor's ownership interest (such as nondepreciable improvements) should be recognized through appropriate amortization methods, including but not limited to credits against rent. Depreciable structures ordinarily will not represent such value, as the Lessee will be expected to amortize the full value of such structures over the Lease Term.

3.02 DETERMINATION OF RENT.

(a) Establishment of Initial Rent. Initial rent will be established at fair market value as agreed to by Lessor/Lessee and determined by a qualified appraiser, or by competitive bid, at Lessor's option. The initial rent will be adjusted during the term of the lease in the manner specified and prenegotiated in the lease. The standard long-term ground lease is for a period of thirty-five (35) years. However, lease terms that extend beyond the thirty-five (35) year period may be negotiated.

(b) Rent Revision Parameters. The long-term master lease will incorporate the following parameters establishing upper and lower limits for revision of rent.

(i) Minimum Revised Rent ("Rent Floor"). The new rent established by the rent revision procedure for a particular period will not be less than the prior period rent period.

(ii) Maximum Revision Rate ("Rent Cap"). A percentage rate establishing a maximum rate of rent revision (rent cap) to apply at the time of each revision will be predetermined and incorporated in the long-term lease.

(iii) Rental Rate and Rent Caps. ARRC's Board of Directors will periodically review the rental rate and rent caps. The rental rate will remain constant throughout the original Lease Term and will be stated in the lease.

(c) Rent Revision Process.

(i) Appraisal. The rent will be revised at a minimum every five (5) years or as otherwise negotiated in the lease. Lessor shall obtain a fair market value appraisal from an independent qualified appraiser. Appraisal instructions for each reopen period will be defined in the master lease document. At the end of the original Lease Term, the property is to be appraised at the highest and best use compared with similar properties within the community.

(ii) Arbitration. An arbitration clause will be incorporated into the lease to provide an equitable means of resolving disputes concerning the appraised value of the premises. The arbitrator's decision with respect to a rent revision shall be final.

(iii) Determination of Fair Market Value Rent By Use of Fixed Rental Rate. The rental rate used for rent revision under a lease will remain fixed during the term of the lease and the same rate will be employed in connection with all revisions. The rental rate will be based on an independent study of relevant Alaska markets to be periodically commissioned by ARRC and reviewed by the ARRC Board of Directors. The revised rent will be determined by applying to the appraised value a percentage representing the general return or rental rate in effect for ARRC properties on the date the lease is executed.

3.03 RENT CREDITS. Rent credits or rental offsets may be negotiated PRIOR to the installation of certain nondepreciable improvements. Upon installation, theses improvements immediately become the property of the Lessor and are to be considered in any future rent modification. Examples of nondepreciable improvements include, but are not limited to, excavation, backfill and gravel.

3.04 EFFECTIVE DATE OF RENT ADJUSTMENTS. Until any increase in the original rent rate (called the "Base Rent") is determined, Lessee shall pay the same Base Rent as was applicable the previous year. When an adjustment of Base Rent has been determined and Lessee notified, such adjusted Base Rent as so determined shall be due and payable to Lessor, retroactive to the commencement of the lease year for which such rental adjustment is made, and any deficiency resulting from such rent adjustment shall be payable within thirty (30) days after the giving of such notice to Lessee. Lessee will be responsible for NO MORE THAN NINETY (90) days of unbilled retroactive rent at the increased level.

3.05 PUBLIC ENTITIES. As a public corporation, the Alaska Railroad Corporation is exempt from taxation by local governments. In recognition of the Alaska Railroad Corporation's position as a participating member within each host community, the Alaska Railroad Corporation may lease its lands to the State and its political subdivisions at less than fair market value. Specific requests will be negotiated on a case-by-case basis. (The Alaska Railroad Corporation will also institute a fee-use permit system for municipalities for various kinds of land use that do not require leases. This program is not covered by this policy.)

3.06 TAXES AND ASSESSMENTS. Lessee will (a) pay all taxes on Lessee's improvements directly to the taxing authority, and (b) all assessments agreed to in the lease benefits of assessments not agreed to in the lease for public improvements levied against the property shall be paid for by Lessor.

3.07 INDEMNIFICATION AND LIABILITY INSURANCE.

(a) Indemnification. Lessee will be required to defend, and hold Lessor harmless against all liability, damages, costs, losses, and expenses arising out of Lessee's use or occupancy of the Premises.

(b) Liability Insurance. Lessee will, at his own expense, obtain and maintain in effect, during the whole of the Lease Term, comprehensive general liability insurance in respect to the leased premises, under policies naming Lessor as additional assureds, issued by an insurance company authorized to do business in Alaska with minimum limits of not less than the amounts specified by Lessor.

Satisfactory evidence of insurance will be furnished to the Lessor prior to the execution of the lease. This evidence will provide for thirty (30) days prior notice to Lessor of any written cancellation, nonrenewal, or material change in the policy.

3.08 TRACKAGE.

(a) Use of Lessee-Owned Trackage. A separate, standard form of track agreement will cover the installation, maintenance, and operation of trackage.

(b) Use of Lessor-Owned Trackage. Where Lessee desires use of Lessor-owned trackage, the lease form will provide such rights. Use of Lessor-owned trackage may be restricted to the extent Lessor deems necessary. The rental rate will be a standard, system-wide charge which may be revised by Lessor, from time to time. The current charge is $6.00 per track foot, per annum.

3.09 ENVIRONMENTAL AND OTHER LAWS AND REGULATIONS. Lessee, at its own expense, will comply with all laws, regulations, rules and orders applicable to its property and operations, regardless of when they become or became effective, including, without limitation, those relating to health, safety, noise, environmental protection, waste disposal, and water and air quality.

Should any discharge, leakage, spillage, emission, and pollution of any type occur upon or from the premises due to Lessee's own use and occupancy including subleasing and uses by others, Lessee, at its expense, will be obligated to clean the premises to the satisfaction of Lessor and any governmental body having jurisdiction thereover.

(Note: Lessor's ENVIRONMENTAL POLICY prohibits new leases for gasoline service stations or assignment of existing service station leases from the present Lessee to a third party having a substantially lesser net worth. Use of underground storage tanks for any purpose requires Lessor's specific approval. Oil and gasoline bulk plant leases will be written with Lessor's commercial lease indemnity and insurance provisions.)

3.10 USE OF PREMISES. Lessee's failure to commence use of the premises for the purposes specified in the Lease, or discontinuance of such use for a period to be specified in the lease, will constitute an event of default.

3.11 SUBORDINATION. Lessor will not agree to subordinate its legal title to land; however, Lessee may assign the lease to an institutional lender as security for a loan to finance development, subject to the provisions of Paragraph 3.14.

3.12 ASSIGNMENT. Assignment of the Leased Premises for any reason will require Lessor's prior written consent. Lessor will consent to an assignment only when Lessor is satisfied that Lessor's interests will not be adversely affected. Requests for consent to assignment of the Lease are to include the proposed assignee's current and complete financial statement as prepared by a certified public accountant in accordance with generally accepted accounting principles or the prior two (2) years' tax returns. An administrative fee will be charged by the ARRC to cover the cost of processing a request for assignment. The financial considerations of the assignment need not be disclosed to the ARRC. Approval of assignment will not be unreasonably withheld by the ARRC.

3.13 SUBLEASING. Lessor's written consent to a sublease is required before the Lessee enters the sublease. Copies of any sublease approved must be filed with Lessor and will be subject to the terms of the Master Lease relating to the terms and subleases. Any financial considerations can be "blocked out" by the Lessee and is not required to be disclosed to the ARRC.

3.14 OWNERSHIP OF SUBSURFACE IMPROVEMENTS. Tenant improvements to the subsurface estate, including excavation and backfill, become the property of Lessor upon installation and will be considered in all future rental modifications. Rental credits or offsets may be negotiated for certain nondepreciable improvements in accordance with Paragraph 3.03, above. Means and methods of construction must be of mutual benefit to Lessee and Lessor; for example, the economics of excavation and fill may be weighed against the economics of alternative piling construction methods. The type of improvement and method of installation must be approved by Lessor in advance.

3.15 REMOVAL AND OWNERSHIP OF ABOVE-SURFACE IMPROVEMENTS. Ownership of such above-surface improvements at the end of the Lease Term will be governed by the terms of the lease. The appropriate disposition of above-surface improvements as specified in the lease at the end of the Lease Term will depend on the circumstances surrounding a particular lease, including the length of the lease, the nature and value of the improvement contributed by the Lessee, the likelihood that the Lease will be renewed, and Lessor's assessment of the best use of the property following the expiration of the Lease.

3.16 LESSEE'S OBLIGATIONS WITH RESPECT TO IMPROVEMENTS. The Lessee will agree not to remove, destroy, waste or substantially modify improvements on the Premises without Lessor's prior written authorization. This policy is intended to protect the Lessor's security interest in the improvements on the Premises and to enhance land-use planning. Approval of improvements will not be unreasonably withheld by ARRC.

4. REPLACEMENT OF CERTAIN EXISTING LEASES

The Alaska Railroad Corporation will honor the binding terms of existing leases it acquired from the Federal Government. However, it is the policy of the Alaska Railroad Corporation, to the extent feasible, to bring existing leaseholds under the new standard long-term lease reflecting the principles set forth in this statement. This policy is adopted to implement the legislature's determination that fair market value should be obtained for leases, to make the administration of the leasing program more efficient and equitable as a whole, to promote uniformity, and to eliminate unnecessary controversy and uncertainty concerning the terms of leases issued by the Federal Government before the sale of The Alaska Railroad to the State of Alaska. To implement this policy, the following actions, among others, will be taken:

(a) If a Lessee desires extension of a Lease Term, and Lessor is agreeable to such extension, the existing lease will be terminated and a new lease consistent with this policy statement will be issued.

(b) If Lessee desires to change the area under lease by increasing or decreasing acreage, and Lessor is agreeable to such change, the existing lease will be terminated and a new lease consistent with this policy statement will be issued.

(c) All existing leases containing a provision allowing Lessor to terminate a lease upon ninety (90) days notice will be terminated after providing the required notice to the Lessee, and, at the time notice of termination is given, Lessor will offer Lessee an opportunity to enter a new lease consistent with this policy statement.

(d) Existing Lessees, at their option, will be given the opportunity to terminate their current leases and enter into the new Alaska Railroad Corporation long-term lease contract.

In appropriate cases, as determined by Lessor, an existing lease may be amended and restated, rather than replaced, by substitution of terms consistent with this policy statement. For example, Lessor will offer Lessee an amended lease in lieu of a new lease in cases where termination of the existing lease would cause the Lessee's note to become due and payable at the time of termination.

5. RENEWAL OF LEASES

It is the policy of the Alaska Railroad Corporation to approve a Lessee's request for renewal of a lease made no less than six (6) months prior to the end of the Lease Term when:

(a) The Lessee has faithfully complied with the requirements of the existing Lease;

(b) The Lessee's continuing use of the property is consistent with surrounding land use, any relevant land-use or development plans of Lessor, and the highest and best use of the property; and

(c) Lessor does not require the property for Railroad purposes.

The rental terms and renewed leases will be adjusted to incorporate the then-prevailing fair market rental value and will include rent revision requirements, in accordance with the lease policy and relevant provisions of law in effect at the time of renewal. To the extent terms of the existing lease are inconsistent with policy or law in effect at the end of the Lease Term, or are otherwise obsolete, the renewed lease will be modified to eliminate such inconsistent obsolete provisions.

6. REGULATORY AUTHORITY OF ALASKA RAILROAD CORPORATION

Under Section 390 of the Alaska Railroad Corporation Act (AS 42.40-390), the Board of Directors of the Alaska Railroad Corporation is given governmental authority to adopt exclusive rules governing use of Railroad lands by Lessees and others having interest in such lands. The terms of leases issued by the Alaska Railroad Corporation do not limit the Board's authority to adopt land-use rules governing activities on the leaseholds. Lessees will be given reasonable advance notice of any rule proposed to or under consideration by the Board that might affect activities on leasehold property or impose an obligation on Lessees.

The foregoing terms and conditions constitute, in part, guidelines and standards on which Lessor's long-term industrial lease is based. Many terms are not negotiable, and applicants are urged to study them very carefully. Please address all questions to Lessor's representative at the outset of negotiations:

RULE NO. 4 - PUBLIC DISCLOSURE OF INFORMATION

(Adopted 12-17-84
Amended 7-18-85)

A. Public Information:

As provided in AS 42.40.220, information in the possession of the Corporation is public and available to public inspection at reasonable times.

B. Restrictions on Disclosure:

As further provided under such provision and as required by the Alaska Railroad Transfer Act of 1982 (ARTA) (45 U.S.C. 1204), the following information is hereby designated to be of a privileged or proprietary nature and shall be withheld from public inspection:

1.) As required under Sec. 605(b) (ARTA), certain information of the Federal Alaska Railroad available to the Corporation, including, "proprietary business data, personnel records, and other information, the public disclosure of which is prohibited by law;"

2.) personnel records of the Corporation including but not limited to each employee's original application for employment and employment memorandum, resume, any and all salary information, reports of other employment investigations, tests, any letters of recommendation, reports of work performance, reports of the employee's progress, disciplinary actions, and such other records as may be created in the employee's initial employment and continued service to the Alaska Railroad Corporation. Personnel records may be released upon receipt of written authorization from the employee, former employee, or applicant whose records are requested. Such authorization shall specifically identify the information authorized for release.

For employees who transferred to the Corporation pursuant to P.L. 97-468, personnel records shall include the employee's Official Personnel Folder, Emergency Medical Folder, and any copies thereof. Disclosure of information contained in the Official Personnel Folder and Emergency Medical Folder shall be governed by applicable Federal law and regulation;

3.) communications with and work product of counsel;

4.) all other records, documents, data or information of a privileged or proprietary nature, including but not limited to proprietary information associated with specific shippers, divisions and contract rate agreements, and specifically including all information that may be withheld or protected from discovery in proceedings before the Interstate Commerce Commission consistent with the Commission's standards and practices;

5.) other information the subject of which could be discussed in executive session under AS 42.40.170;

6.) any other information or records required to be kept confidential by Federal or State law or regulations.

OPERATING CIRCULAR NO. 37
ENGINEERING BULLETIN NO. 87-01

To: All Concerned

From: Supt. of Transportation
Chief Engineer

Subject: Policy for Moose That Have Been Struck by Trains

In addition to Special Instruction No. 6 of Timetable No. 120, the following will apply.

Crews of trains that strike moose will evaluate the condition of the moose and report to the train dispatcher, i.e. is it dead, crippled, or has it run away?

When the train crew reports the moose dead, the train dispatcher will notify the appropriate on duty section foreman. If after section work hours, the train dispatcher will arrange to have the foreman notified at morning lineup.

If the moose was reported as crippled, the train dispatcher will notify the appropriate section foreman so that the wounded animal may be humanely dispatched. Overtime is authorized for this purpose. If unable to reach the appropriate section foreman, the train dispatcher will try to contact an adjacent section foreman, Engineering Department supervisor, or call a District Roadmaster as applicable.

The section foreman will evaluate the carcass. If salvageable, the carcass will be field dressed. The foreman will advise the train dispatcher the road crossing the carcass will be delivered or that the carcass is not salvageable.

The train dispatcher will call the appropriate number below to advise that a moose was struck by a train and that a carcass is available for a charity to pick up at a particular crossing or that the carcass was not salvageable.

The disposal of salvageable moose meat is directed by the Division of Fish and Wildlife Protection of the State of Alaska Department of Public Safety (FWP). They will arrange for the carcass to be picked up at the applicable road crossing.

ARRC LOCATION	ALASKA STATE TROOPER DISPATCHER	
Seward to Portage	262-4453	Soldotna
Whittier Branch	269-5711	Anchorage
Portage to Matanuska	269-5711	Anchorage
Matanuska to Cantwell	745-4247	Palmer
(7:30 a.m. - 4:30 p.m. Monday through Friday; after hours call Anchorage)		
Cantwell to Eielson	452-2114	Fairbanks

EXHIBIT E

Neither FWP nor any employee of the ARRC may authorize any non-employee to enter upon Railroad property except at road crossings.

No employee may utilize any portion of a train killed moose nor give any part to any person except as designated by FWP.

When the salvaged carcass is taken into Whittier, the train dispatcher will contact Whittier Chief of Police who will arrange for the disposal of the carcass. FWP will be advised of the kill and disposition of the moose. The number for the Chief of Police is 474-2340.

If the initial report from the train crew was that the moose ran off, only a report to the designated telephone number is required.

4. HANDLING OF CARS CONTAINING HAZARDOUS MATERIALS:

For train placement, switching restrictions, emergency actions by train crews, shipping paper information and inspection requirements, refer to the Hazardous Materials chart in the back of this timetable.

Switching restrictions for cars placarded with Flammable Gas placard and Poison Gas placard apply to empty as well as loaded cars. Switching restrictions for TOFC/COFC also apply to flat cars with any placarded lading.

It will be the yard conductor's responsibility to know if any placarded cars are on a track before releasing any other cars into that track.

Conductors will review train consist for proper placement of all placarded cars. Cars improperly placed will be switched out to obtain proper placement prior to train movement.

The Emergency Response Identification number located in the center of each placard or on each waybill, switch ticket, or other document used to move hazardous materials, provides information and actions to be taken in the event of an accident or unintentional release of hazardous materials.

Should an accident occur, locate the waybills for cars involved or refer to the number on the placard. This four digit number is referenced in DOT Publication P.5800.3 or subsequent issues, Emergency Response Guidebook. The book, utilizing the four digit number, will provide vital information, the most significant potential hazards and gives guidance for initial actions to be taken by personnel involved or engaged in the initial response to an accident. Yardmasters, Chief Dispatcher and Trainmasters can provide the necessary response information from the guide book.

Emergency Response Personnel, police, fire, and/or medical, will be assisted and allowed access to accidents and/or incidents involving hazardous materials.

5. BLOCKING WYES/SIDINGS:

No siding or wye will be blocked with cars, engines, or on-track equipment unless authorized by the Train Dispatcher.

6. GAME ANIMALS/LIVESTOCK:

When trains hit any large animals, train will come to a complete stop and train inspection will be made except when it is known animal is clear of track and will cause no danger to movement of trains.

Whenever any animals are struck or killed by trains, a report must be made to the Train Dispatcher immediately.

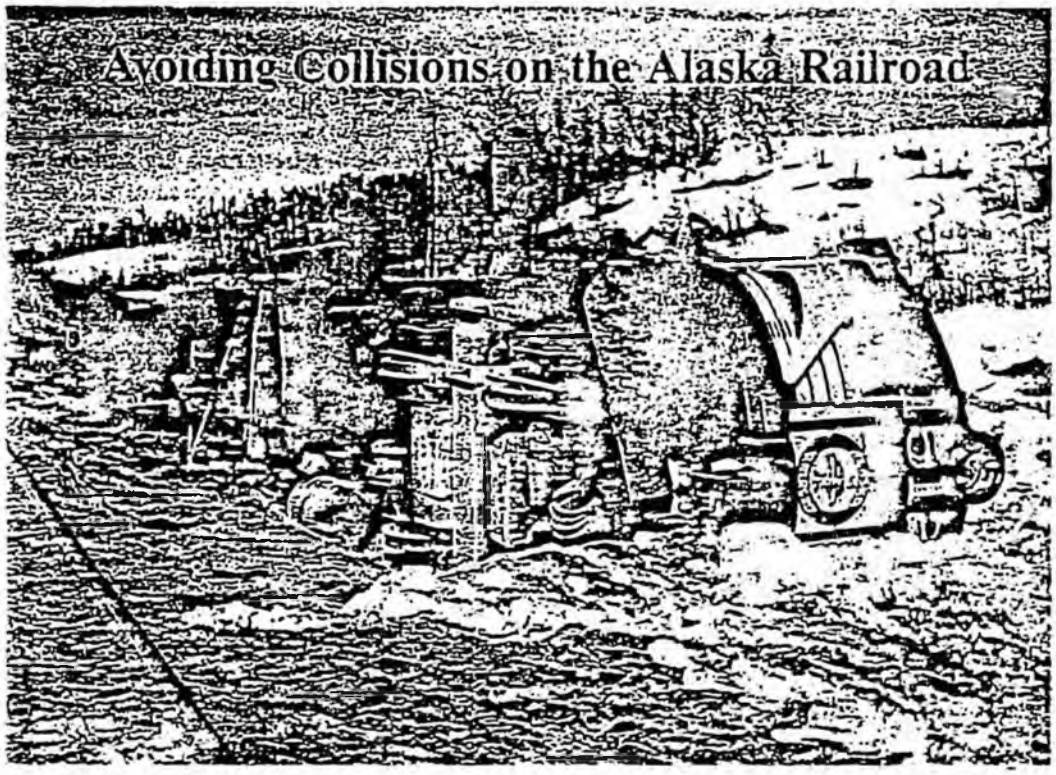
7. LOADING AND HANDLING HEAVY EQUIPMENT:

Trains handling cranes, draglines, shovels, and similar equipment set up with or without boom attached, must be handled under special arrangement.

Yardmasters or agents will insure proper placement of steel underframe flat cars of not less than 100,000 pounds capacity for loading of equipment specified above. It will be the responsibility of the Mechanical Department to inspect and accept such loads, advising the Yardmaster or Agent of acceptance, giving car number and maximum speed at which car may be moved. It will be the responsibility of the Yardmaster or Agent to see that no loads such as specified above will be placed in trains for movement until they have been accepted by the Mechanical Department and the Dispatcher has been notified of speed restrictions. Dispatcher will issue instructions covering restrictions. Equipment with boom attached must be loaded with boom trailing unless approval from Dispatcher is obtained for movement in forward position. Conductors handling loads with boom in forward position, except on work trains, will be authorized to do so by message from Dispatcher.

When Moose and Train Meet:

Avoiding Collisions on the Alaska Railroad



ADF&G Still

by Jack C. Didrickson and Raymond J. Kramer

EXHIBIT F

On the last day of February 1985, Alaska Railroad Locomotive Number 3006N chugged its way out of the Anchorage railroad yards bound for Fairbanks. None of its crew realized that an unwanted record would be set before it arrived at its destination the next morning. Nineteen moose would die that trip, crushed by the locomotive, while the helpless crew watched, unable to save the victims. And, as the winter snows continued, more moose died on almost every run until the annual total for the entire length of the railroad came to 385.

Fortunately, not every year is a duplicate of the winter of 1984-85. This past winter (1985-86), 17 moose were killed along the entire length of the Alaska Railroad.

What causes these mortalities, and what can be done to lessen or prevent them? These are questions of primary importance to not only game biologists and railroad employees, but also to the public, some of whom see this as a shameful situation that could be easily remedied. Although many ideas have been proposed and tried, there is no one good solution.

Initially, both ADF&G and the Alaska Railroad presumed that the high mortality in some years occurred simply because the moose population periodically fluctuated, with most kills occurring when the population was high. We now know this is not the case. By correlating the Alaska Railroad's daily records over the years with weather patterns which coincided with the chronology of high moose losses, we could see a pattern. In years of deep snow depth (three to five feet) for long periods of time, moose losses along the tracks drastically increased. Conversely, in winter periods of little snow, or when spring thaws decreased the snow depths, moose-train incidents significantly declined.

A majority of the 1984-85 mortalities occurred on the tracks between Willow and Talkeetna, in an area known as Game Management Unit (GMU) 14B. This is an area with a large moose population, most of which remains in the high reaches of the Talkeetna Mountains throughout the summer and fall. In winter, as snow and winds increase in these highlands, a large number of the moose move down the mountain slopes to their critical winter food supply of willows along the Susitna River.

Unfortunately, both the railroad and the main highway from Anchorage to Fairbanks bisect their migration path.

When snows exceed three feet, the moose find these man-made "trails" a convenient place to walk or rest, and therein lies the cause of the mortality. Moose are somewhat reluctant to leave these cleared areas and they have not, for the most part, learned to fear trains or autos. As a result, an additional 77 animals were killed by highway vehicles during the 1985 season. Also, many become stressed by deep snow and the lack of nearby browse. In residential areas along the highway, stressed moose belligerently chased dogs, children, and adults, with the result that another 40 were killed in defense of life and property, bringing the total loss of moose in GMU 14B to 502. Hunters, on the other hand, took only 216 animals in the following 20-day September season, before the deep snows set in.

Although a large percentage of mortalities for all years occurs between Willow and Hurricane, with a few other "hot spots," mortalities are otherwise fairly uniformly distrubuted along the entire length of the tracks; therefore, the problem is not merely a local one. A solution must be provided that works along the entire railroad corridor from Seward to Whittier to Fairbanks.

Meetings have been held between the Alaska Railroad personnel and ADF&G game biologists to seek answers and actions, and members of the public have enthusiastically offered innovative ideas, but no single, concrete solution has been found.

There are certain realities which must be faced where "compromise" simply won't work. The trains must run and they must run on or near schedule; too many people and businesses are dependent on the products delivered to interrupt service. Closing down the railroad in winter is no solution. Scheduling the trains to run only in daylight hours won't work, with only four to five hours of daylight present during the critical months. Accurately predicting where and when deep snows will occur is beyond human technology. We must look to the tracks and trains themselves for solutions.

Perhaps the most "far-out" solution offered so far was that of a giant cushioned rubber bumper attached to the front of the locomotive. Here, laws of physics and elasticity come to bear, causing visions of a moose being hit at 40 mph, sinking into this giant cushion, and then being sprung out in front of the train again, only to be picked up and thrust again, endlessly bouncing down the tracks.

Another more realistic attempt was to mount sonic whistles on the locomotive which might alert the animals. The experiment failed, however. When the train moved comparatively slowly, the whistles didn't whistle, and when it was very cold they froze into silence.

Slowing the train from 40 to 20 mph in "hot spot" areas was another idea. Not only did scheduling dif-

In times of heavy snow, moose make use of the cleared areas on the tracks of the Alaska Railroad for walking and resting. Here, a train has stopped for a moose bedded down on the tracks during a snowstorm in the winter of 1985.

M. Penn
Anchorage *Daily News*

ficulties make this impossible, but the trains couldn't climb certain grades on the icy tracks if momentum was lost.

Decking or covering the ties on trestle bridges to permit moose to safely cross was suggested, but this idea was denied because speed sensors on the train wheels reportedly will not work properly in the presence of the coverings.

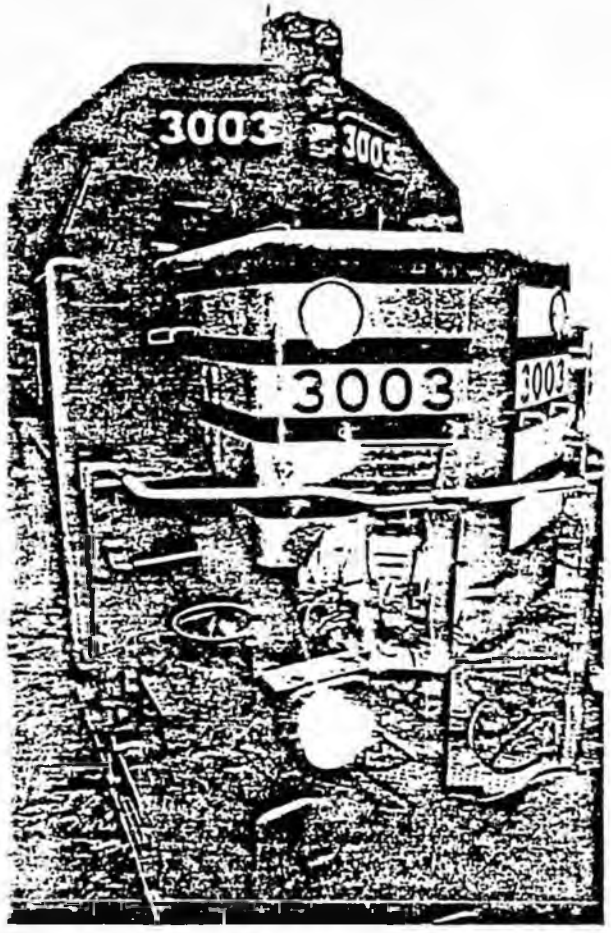
One of the major problems in deep snow is that of the "tunnel" effect which trains create with their own snow plow on the front. In this situation, once a moose is on the track, after struggling in deep snow, it won't leave even with a train bearing down on it. There is little room between the train and the wall of snow and the moose are often sideswiped. "Wing plowing," where special equipment plows 20 feet on either side of the tracks seems to have merit in certain areas where topography permits, but this is not the complete answer. When the railroad bed is significantly higher than surrounding terrain, moose still prefer the track bed to jumping down into deep snow.

The best, but perhaps most complicated, scheme offered so far is to allow permit hunters to harvest moose along the railway corridor, at times when heavy snowfall occurs. Logistically, this would prove difficult. First, permits would have to be fairly allocated and there would be no guarantee in any particular year that a hunt would be held. The hunt would occur only in areas determined to be "hot spots" and then only within a narrow corridor along the tracks. When snows are deep, snowmachines bog down and would prove worthless. Furthermore, hunters riding snowmachines, or even walking down the railroad right-of-way, simply would not be safe; eventually someone would be hit by a train.

The only apparent method of getting hunters afield would be to run a "hunter train" which could stop in designated areas, let hunters off for a period of time, and pick them up later, with their harvested moose. This plan, too, offers tremendous logistical problems and would require a great deal of common sense and wintercraft knowledge on the part of each hunter. If regular train schedules were to continue, each hunter would have to be back at his designated pickup point precisely on time, as the train could not delay its schedule. A hunter who took an animal too far away would perhaps have to leave all or part of his moose behind; this is a violation of wanton waste laws and would defeat the purpose of obtaining the meat.

Based on random permit drawing, there is a chance that some inexperienced hunters might be drawn who would have no idea of the severity of camping out in -40° weather. To leave them out in these conditions overnight could prove disastrous, particularly if a storm occurred. Inevitably, someone would get lost, frostbitten, or hypothermic.

For lack of a workable solution, the problem is far from resolved. We would all like to see a harvest shift from trains to hunters. In Canada, Sweden, Norway, and Russia, game managers are also seeking answers to this problem, but as yet no economically feasible solution has been found. Fencing both sides of the railway would not only be exorbitantly expensive, but would also cut the moose off from their winter habitat. Overpasses or underpasses, with wing fences to funnel the animals onto these routes, have shown promise in Europe, but because of the great mileage involved would require literally millions of dollars to accomplish effectively in Alaska. Just such an underpass has been proposed outside Anchorage under the Glenn Highway; the results of this experiment will tell us much over the next few years.



M. Penn
Anchorage Daily News

Frank Box, boilermaker for the Alaska Railroad, welds one of two lights that were attached to the locomotives to chase moose off the tracks.

Can our railbelt moose populations sustain these losses? The answer is a cautious "yes," with the adjustment of seasons and bag limits, but game managers would prefer to see a better use for the tons of meat that are spoiled by a train's crushing impact.

As Alaska moves into the 21st century, answers to this vexing problem may be found. In the meantime, game biologists must continue to obtain basic biological information to justify attempts at possible solutions.

Jack C. Didrickson, who has been with the department since 1959, serves as Area Game Biologist with the Division of Game, ADF&G, Palmer.

Raymond J. Kramer serves as Game Biologist, Division of Game, ADF&G, Anchorage.

Adopted July 18, 1985

Resolution No. 85-5:
Relating to the policy of
Hiring Alaska Residents

WHEREAS the Board of Directors of the Alaska Railroad Corporation has examined corporate statistics to determine the ratio of Alaska residents hired to non-residents; and

WHEREAS this examination reveals that nearly all new employees were Alaskans at the time of employment; and

WHEREAS sound justification existed for the employment of those non-residents;

NOW, THEREFORE, BE IT RESOLVED that management of the Corporation continue this performance in hiring Alaska residents to develop and to maintain a viable and stable workforce for both the Corporation and the State of Alaska.

ALASKA RAILROAD CORPORATION

Pouch 7-2111
Anchorage, Alaska 99510 - 7069

November 27, 1984

The Honorable Bill Sheffield
Governor
State of Alaska
Pouch A
Juneau, AK 99811

Dear Governor Sheffield:

Enclosed for your information and consideration is the budget submittal for the Alaska Railroad Corporation. This document was approved at our November 21 Board meeting and includes our funding requests for the upcoming Legislative session.

In accordance with the authority granted in the Alaska Railroad Corporation Act, we established the calendar year as the Railroad's fiscal year for both its operating and capital budget cycles. This approach avoids placing a burden on the Railroad to perform end-of-year reporting during its busy summer activity, and provides greater ease for capital planning consistent with the Railroad's annual cycle of activity.

The first part of the enclosure contains the Railroad's CY-85 (calendar year) and CY-86 capital budget. The two-year program is for approximately $44.1 million. Projected revenues and available appropriations will be used to fund about $24.4 million. The remaining $19.7 million is being requested as part of the State's FY-86 capital budget.

The second part of this enclosure addresses the question of anticipated operating loss from continued passenger service. It is estimated that approximately $1.7 million in additional revenue in CY-85 and $1.9 million in CY-86 will be needed to cover operating costs for the Railroad's passenger operations. Consistent with the Alaska Railroad Corporation Act, we are submitting a report detailing the costs associated with the continued provision of these services. However, we have decided against requesting any subsidy at this time, but will cover these losses with other available revenues. In addition, it should be noted that about $7.5 million of the CY-86 capital budget includes capital assistance related to the continued provision of passenger service.

Due to our recent decision to switch to a calendar year fiscal year, the necessary material explaining the complete CY-85 and CY-86 operating budgets has not been completed. Another package with the detailed information on the operating budgets for these two years will be forwarded shortly.

Due to time constraints, the Board has not had an ample opportunity to become familiar with all components of the enclosed submittal. We anticipate the need to make some adjustments during the weeks ahead as we become better acquainted with this information and receive greater specificity on transfer-related costs and liabilities. By transmittal of this letter, the Board of Directors of the Alaska Railroad Corporation respectfully requests your concurrence with the capital funding request contained in this material.

If we can be of any further assistance in helping you review this matter, or if you would like us to be available in Juneau to discuss this further, please let us know.

Thank you for your consideration of this matter.

Sincerely,

James O. Campbell
Chairman of the Board

THE ALASKA RAILROAD

CALENDAR YEAR 1985 PRIORITY CAPITAL PROGRAM

BUILDINGS

1. Energy Conservation - Phase IV $1,250,000

Funds requested are part of a larger project approved in 1980. To date, $5.45 million has been obligated for this project. This $1.25 million will complete construction of Anchorage Railroad heating plants and eliminate dependence on the high-cost outmoded Knik Arm Power Plant for heat supply. Chugach Electric Association has stopped electricity generation at this plant and scheduled the shut down of steam production in 1985. This phase will install modern, efficient, and properly sized heating plants that will realize significant energy savings, and improve working conditions. Large sections of the 30-year-old steam distribution system with high heat losses and maintenance cost will be eliminated. The installed system will permit utilization of waste oil burners for shop heat and the processing of steam. The return on investment based on a $3.2 million investment is 27 percent.

2. Anchorage Warehouses $110,000

Provide for the fencing and paving of the Materials Yard in Anchorage. Relocation of the Material Yard will provide critically-needed space in the Anchorage train yard as well as co-locating this activity with the rest of the warehousing operation. Paving and fencing will allow material handling with forklifts instead of rail cranes and provide required security. The return on investment for this project will be 29 percent.

3. Computer Air Conditioning $65,000

Replace computer room air conditioner and upgrade Wang Room air conditioning capacity. The computer room air conditioner is in poor condition and not expected to operate reliably during the 1985 summer season. The Wang computer equipment operation has grown beyond the capacity of the existing air conditioning unit. Adequate air conditioning is essential for the computers to remain operational and to protect the Railroad's contracts and lease agreements with equipment suppliers.

ROADBED, TRACK AND OTHER FACILITIES

4. Ballast Placing $1,250,000

Annual restoration of track surface and alignment with ballast is required to maintain proper track structure in accordance with FRA Track Safety Standards, maintain safe train speeds, and to prevent accelerating maintenance costs due to deteriorating track structure. Distortions of track surface which occur due to frost action, permafrost melt, normal compaction and degradation of ballast require raising and realigning, and placing of new ballast. Additional select crushed ballast is used to improve drainage in order to decrease further distortions as well as prevent lateral displacement of the track structure due to increased train speeds, increased traffic, and thermal stresses.

5. Bank Widening $450,000

Provide 120,000 cubic yards of aggregate which is considered the minimum essential in an annual program to increase the stability of the Railroad's mainline embankment, reduce permafrost melt, and prevent waste of crushed ballast. Bank widening along the main line has been minimal since the earthquake repairs of 1964 and 1965. Approximately 250 miles of main-line subgrade requires widening of shoulders to standard width to maintain the track to line and grade, provide walkways for trainmen and permit maintenance of the track structure to FRA standards. Permafrost melt in past years has created a situation that is self-destructive. Crushed rock in many areas now runs directly to the bottom of the embankment slope. A critical area is the section from Dunbar to Happy (a permafrost region) where restoration of shoulders is a must.

6. Rail Lubricators $60,000

Install five rail lubricators to reduce rail wear and improve locomotive fuel consumption. Tests conducted by AAR, FRA FAST, and some Class I railroads indicate as much as a 40-percent reduction in locomotive fuel consumption as well as reduced wheel hunting and rail wear from selective rail/flange lubrication. The lubricators will extend the life of five miles of rail on curves an estimated two years, from seven to nine years. The return on investment is 59 percent. Payback is 1.8 years.

7. Palmer Branch Rehabilitation $400,000

This critical section of the Railroad requires rehabilitation in 1985 in order to maintain the existing and forecast levels of rail service. During the past year, over 6-1/2 million tons of gravel (79% of the total tonnage) moved over the Palmer Branch. The weight of rail on the Palmer Branch between milepost 3.6 and 4.5 is 70# compared to 115# rail on the main line. The 70# rail is inadequate for the loaded gravel cars. The rail has become surface bent and kinked. Angle bar failure is high and cross level is extremely difficult to maintain. Because the cross ties are in poor condition, 500 per mile must be replaced over the entire branch. Work will include replacing 2400 feet of curve worn 115# rail, shoulder cutting where mud now blocks drainage, and the introduction of standard ballast sections.

8. Elastomeric Rail/Tie Fastners $500,000

To increase rail stability, reduce longitudinal rail movement, and increase rail life on curves. This takes advantage of the "state of the art" fastners, commonly referred to as Pandrol plates and clips to provide a cost effective way of ensuring greater rail safety. Rail rotation on curves in recent years has increased lateral loading of gauge face which results in increased rail wear, rail corrugation, gauge widening, and rail rollover. Wood ties, cut spikes, and standard tie plates are no longer adequate under today's wheel loadings. The Pandrol plates and clips provide a wider base (15-1/2" vs 13") which increases stability, and provides a clamping force of +- 5000 psi per clip between plate and rail base. This clamping force also eliminates the need for rail anchors and, when used out-of-face on hardwood ties, will prevent rail rollover. Derailments caused by rail rollover in recent years probably could have been avoided if Pandrol plates and clips had been installed. Funds will purchase Elastomeric plates, clips, shoulder inserts, "E" clips, anchors, and screws.

9. Microwave Radio $425,000

Provides microwave radio telecommunications between Portage and Moose Pass and Hurricane and Gold Creek. Last year the Railroad completed a microwave system over the entire main line except for those two segments and from Portage to Whittier. This work will complete the replacement of open wire telephone pole lines with microwave except for the 12 miles from Portage to Whittier. The telephone pole line between Portage and Moose Pass is in need of major rebuilding at an estimated cost of $200,000. This line is also subject to outages from adverse winter conditions as well as man-made causes. With the increased traffic to Seward (coal export and TOFC), the pole line will be unable to carry the required data and communication traffic. Improved and reliable train communications will be provided in both areas. The return on investment based on rebuild cost avoidance is 139 percent.

10. Bridge Program $800,000

Funds are required for the cyclic replacement/renewal of bridges and culverts along the railroad trackage. The 1985 program includes major maintenance or renewal of 22 bridges, 23 culverts, and 2 tunnels. Repairs and maintenance are necessary to maintain bridges, culverts, and tunnels in a safe condition for rail traffic. Replacement of bridge timbers, culverts, and timber supports is necessary on a 30-year cycle, depending upon the quality of original materials, local environmental conditions and special circumstances, such as fires and accidents. These expenditures will minimize the requirements for placing slow orders which cause increased running time and operating cost.

11. Tunnel Program $1,500,000

Funds will be used to reconstruct the roadbed and track, replace tunnel timber supports and increase tunnel clearances in the five tunnels south of Portage between milepost 51 and 53. The result will be reduced maintenance costs, increased operating efficiency, and the minimizing of operational hazards. Winter icing problems require constant maintenance and the ever present threat of accidents. Tunnel supports need replacement and extension to prevent rock falls. Overhanging rock slopes which are unstable must be removed and stabilized. Avalanche hazard areas also require structural protective measures. Tunnel clearance will be increased to allow standard clearance in the tunnels. These tunnels are subject to continuous water problems that have deteriorated the track structure, necessitating reconstruction of the roadbed and track. The tonnage increases brought about by TOFC movements and the export of coal require the upgrading of these tunnels to an acceptable level for safe and efficient operating conditions. An engineering design contract was funded in the FY '84 budget.

12. Utility Systems $650,000

This is part of a multi-year program of replacement of 30-plus year old electrical, water, sewer, and heat distribution systems. The $650,000 in 1985 will concentrate on meeting EPA requirements which the Railroad considers as high priority. Utility systems in Anchorage, Fairbanks, and Whittier Yard areas have exceeded expected lives. Corrosion to pipes and valves, breakdown of electrical insulation and related aging problems are causing frequent maintenance efforts, energy waste and dangerous working conditions. Asbestos

pipe insulation, PCB oil in electrical gear, and non-code construction also requires replacement of these systems. This modernization will reduce costs, reduce losses due to outages, and remove health and life safety hazards. Return on investments on projects using these funds ranges from 34 to 68 percent, with an average ROI of 51 percent.

13. Anchorage Fuel Station Additions $250,000

Provides for effective and efficient operational upgrade of Anchorage locomotive fuel station. Includes the installation of lube oil and waterlines, relocation of fuel stanchions, and replacement of eight fuel meters. The lube and water lines are needed to enable full locomotive servicing at the fuel station. The current temporary arrangement is expensive to maintain (as it must be removed in the fall and reinstated in the spring) and serves only one track. Relocated fuel stanchions will eliminate the need for long hoses which are expensive to renew, difficult to handle, present a tripping hazard, and increase damage done to fueling valves from striking the pavement. New fuel meters will be remote readout temperature compensated. The current meters are inadequate due to restricted flow rate and lack of temperature compensation. They do not have the capability of measuring fuel added to the tanks. Return on investment is 36 percent with a payback of 4.3 years based on an estimated 20-year life.

14. Whittier Ramp and TOFC Facilities $475,000

To complete development of Whittier TOFC Yard. Includes construction of a loading ramp, installation of storm drains, lighting, fire protection, and grading. The full development of the TOFC Yard will permit efficient handling of van freight service. Drainage is required to allow a second TOFC track to be installed. With both TOFC tracks, 50 trailer flat cars can be loaded without switching the cars, thus allowing the handling of rail and trailer freight with one train crew. Loading ramp is required to permit handling of heavy equipment and TOFC which cannot be toplifted in Whittier without conflicting with the shuttle operation. Yard maintenance will be reduced by 1/2 of a man year because of better drainage.

15. Eielson Branch Rehabilitation Phase I $2,100,000

Current traffic projections over the portion of the Eielson Branch from Fairbanks to the North Pole Refinery are 575,000 revenue tons in 1985 and 850,000 revenue tons in 1986. This is an increase from 375,000 revenue tons in 1983 and 450,000 revenue tons in 1984. Between MP 6 to MP 18 there are 9.6 track miles of 75# rail with 16" joint bars. 75# non-control cooled rail is inadequate for present loads. Increased traffic and speed requires a heavier section for safety. The subgrade for the entire length is substandard. Certain locations would require additional shoulder material. The spacing is 20 ties per 39' rail. Fixed elevations would require a combination of undercutting and plowing. To be able to maintain this portion of track with the increase tonnage, it is necessary to rehabilitate this line. The work includes relaying 9.6 track miles of 75# rail with 115# rail, insulating subgrade, adding additional material to bring the subgrade up to standard width, sledding (plowing out old pitrun ballast), adding/replacing ties, placing ballast and surfacing track. At North Pole, the only auxiliary track the Railroad has for switching cars is the 1,500-foot North Pole siding. For the projected volume of traffic, an additional 4,000-foot siding is needed between North Pole and the refinery. The projected

traffic will require the Railroad to handle one loaded and one empty 50-70 car train at a time near the refinery. The proposed track will reduce the switching time at the refinery.

This work is a two-phased project; the first phase includes the rail relay and the siding at North Pole.

16. Whittier Barge Slip #2 $300,000

To improve the reliability and function of the Railroad's only operational barge slip in Whittier. The slip winches and hoists are 13 years old. The motors, gears, bearings, and electrical gear require major overhaul or replacement. The winches are frequently breaking down and the new double-deck barges introduced in 1984 put increased strain on this equipment beyond its original design. The shifting winches require relocation, new fairleads, and the addition of a consistent-tension feature to enable them to be used again with the current and projected barges.

EQUIPMENT

17. Purchase 5 New 2800HP Locomotives $1,500,000

Acquisition is essential to provide motive power for export coal trains operating between Healy and Seward in 1985 and subsequent years. The Railroad's current fleet of locomotives is not sufficient to provide power for the new export coal service. During the past summer (1984), an average of 90% (approximately 51 units) were dedicated to use in performing the existing business. Of the remaining 10% (6 units), 4% (2 units) were undergoing major repairs, and 6% (4 units) were receiving minor repairs and necessary periodic maintenance and service. During the summer's peak periods, gravel trains were frequently delayed as there were no units available to replace gravel train locomotives that required refueling or servicing. The purchase of 5 new locomotives will provide the minimum proposed consist of 5 units in this export coal service. The alternative of acquiring used locomotives was considered but ruled out in favor of the GP-49 2800 HP locomotives, four of which were purchased in October 1982. The GP-49, first built in 1982, incorporates the latest "state of the art" improvements providing dramatically increased pulling power making them ideal to meet the hill grades the coal train will encounter. The return of investment for these locomotives is 25 percent.

18. Purchase 65 100-ton Hopper Cars $1,150,000

Acquisition is essential to support export coal train service between Healy and Seward. The export coal train will require 65 cars per train. With this one set of cars, the train will operate three times a week. The type of car is compatible to the hopper cars used in North-end coal and Palmer-Anchorage gravel service, thus allowing interchange with present equipment. The existing hopper-car fleet is used to full capacity during the spring-summer-fall seasons. Failure to acquire these additional cars will necessitate allocation of the present fleet between coal and gravel service during the spring-summer-fall season and will endanger the Railroad's largest revenue commodity due to the inability to furnish rolling stock. Nonacquisition of these cars will also result in use of older high-maintenance cars for winter service. Maintenance cost of new cars is estimated as 3.4 cents per mile compared to approximately 8.0 cents for older cars. The return of investment for these hopper cars is 26 percent.

19. Acquire 30 Intermodal Platform Cars $920,000

Acquisition necessary to support increased TOFC service on all major segments of the Railroad's main line. This purchase involves 30 intermodal platform cars, each capable of moving three trailers of 27 to 50 feet and weighing up to 100,000 gross weight pounds per trailer. This will enable the Railroad to market trailers with heavy loads and thus take advantage of the 48' x 102" equipment presently entering the market. Several other benefits will accrue upon acquisition of these cars. The Railroad would return to the owner 13 cars now on daily rental, saving $118,625 annually. An additional 10 cars leased by Alaska Hydro-Train would be released saving $72,885 in annual mileage payments. Acquisition of these new cars would permit the reduction of one train weekly to Whittier and one to Seward saving $699,190 annually. Total annual savings is approximately $900,000. The return on investment for these cars is 24 percent.

20. Acquire 5 Covered Hopper Cars $125,000

Cars are needed to meet current and projected cement traffic. For the past four seasons, the demand for cement movement has consistently been in excess of the Railroad's ability to supply covered hopper cars. The Railroad's need is for 10 cars and this requests the acquisition of 5 used, covered hopper cars in 1985 with a follow up of 5 in 1986. In 1984, the Railroad had to lease 7 additional cars at $20 per day. Kaiser Cement Company also leased 5 cars. These temporary arrangements are more expensive for both parties and there is no assurance they can be leased in future seasons. The revenue loss is at least $285,000 annually due to equipment nonavailability based on 5 cars per week at $3,000 a car over a 19-week season. The return of investment based on a 10-year life is 200% with payback in less than one year.

21. Upgrade 17 Passenger Cars $300,000

To provide reliable air conditioning and essential passenger amenities to passenger cars used between Anchorage and Whittier to service cruise ships. This upgrade proposal will install 3 transformers and a train line in each car to service air conditioning, repair floors, repaint, repair upholstery and other deficiencies as necessary. The Railroad faces the real possibility that rail service provided the past two years to cruise ships docking at Whittier will be canceled with resultant loss of revenue unless the relatively poor passenger comfort from using these cars can be improved. This has created a serious public relations image for the Railroad. The cars rely on generators driven by the car wheels that also charge the batteries. The capacity of the batteries is such that the air conditioning can operate only about 30 minutes when the car is standing. The nature of the service provided necessitates the cars standing at Anchorage for approximately 6 hours between trips to Whittier. Because the cars are exposed to the sun during this period, the interior heat causes extreme discomfort to passengers on the return trip to Whittier. Based on loss of revenue if cruise ship service is cancelled, the return on investment is 167 percent.

22. Engineer Construction Equipment $950,000

Replace and modernize construction equipment used by the Engineering Department. The existing Engineering Department equipment fleet is inadequate to conduct maintenance and construction programs. Much of the equipment has been in service so long that frequent breakdowns occur which,

along with the unavailability of parts, results in high maintenance costs. Safety is a paramount concern and would be substantially enhanced with the replacement of older equipment. The $950,000 requested will replace 32 items which constitutes the highest priority needs and represents only 2 percent of the construction equipment inventory. Included are generators, compressors, rail saws, bull dozers, spike drivers, push cars, a tamper, a regulator, and other items--most of which are over 20 years old and some over 35. Return on investment varies with the piece of equipment ranging between 12 and 165 percent with an average ROI of 46 percent and payback in 2.3 year.

23. Snow Removal Equipment $900,000

Increased rail traffic and the expansion of van yards at Seward and Whittier and the new coal transload facility at Seward necessitates the acquisition of snow removal equipment to ensure prompt clearance and avoid any disruption in terminal service. The Railroad is confronted with a serious support problem in this area. Three snow blowers recently had to be retired, and the remaining fleet is old, unreliable and subject to frequent failures. Of the 18 graders, loaders, and snow blowers available, 5 were built in the 60's, 12 in the 70's, and 1 in 1981. The existing snow blowers are single-use machines which are idle most of the year. This proposes two major items--loaders, incorporating quick disconnects, snow blowers and buckets to provide versatility in order that they can be utilized throughout the year in a planned maintenance system. Return on investment is 40 percent.

24. Purchase One Locomotive Crane $800,000

To replace one of three 1950-era locomotive cranes. All three cranes (LC-103, 104, and 105) are over 30 years old and in very poor condition and are past due for heavy overhaul. Virtually all mechanical parts are worn beyond reclamation and wiring insulation is seriously deteriorated. Parts are no longer available for these cranes. Due to the advanced state of deterioration of these units, it is becoming impractical to continue them in a safe, serviceable condition much longer. The ditcher cranes are required to maintain track drainage ditches, remove slides, and improve unstable hillsides. The geological nature of the area through which the Railroad passes is very unstable, requiring constant clearing of drainage ditches, removal of rocks and mud from tracks and removing ice glaciers. The Railroad is vulnerable in three widely separate areas (Healy Canyon, Chase Bluffs, and the Spencer-Grandview). At times slides occur at all three locations. Serious subgrade and ballast saturation occurred during 1984 when two ditchers were clearing slides and one was in the shop for repairs. This condition necessitates the purchase of one replacement crane in 1985. Return on investment is 40 percent.

25. Material Handling Equipment $85,000

Purchase two truck-yard hostlers to replace two yard hostlers on lease at $16,800 per annum. The Railroad has expanded TOFC/COFC traffic, most notably SeaWay Express service into Seward and Alaska Hydro-Train roll on/roll off service into Whittier in 1984. In order to handle this traffic with cost-effective and reliable yard hostlers, replacement of the two leased vehicles, which are nearly 12 years old and in poor condition, with two new yard hostlers is advisable. Under terms of the lease agreement, the Railroad is responsible for cost of repairs and maintenance of the leased yard hostlers. Due

to age of these vehicles, downtime for repairs was as high as 20 percent. Parts are becoming obsolete, necessitating substitute parts to keep them operating. Return on investment is 19 percent.

26. Telecommunications Test Equipment $125,000

Purchase of telecommunications test equipment is required to be able to maintain the Railroad's communication systems within FCC and industry standards. Radio lab test equipment will provide a second radio lab position to service and maintain base, mobile, and portable radios as well as pagers. This will eliminate the summer backlog of radio repairs which has necessitated an extra man on train crews because of unrepaired radios. The Railroad has a very limited amount of microwave test equipment. As the microwave systems age, outages and reduced performance will result unless an adequate check program is enforced. Data systems test equipment is needed to isolate problems with software, hardware, and transmission systems. Estimated annual savings resulting from crew costs, microwave, and data system savings is $30,000.The average rate of return on investment for this equipment is 26 percent.

27. Upgrade Radio System $200,000

To improve dispatcher radio communications and install a communication capability within the Whittier tunnels. The current radio system is severely congested. This condition can be corrected by adding multi-channel capacity to the dispatcher radio system. Trains can then operate on alternate radio channels. The addition of communications in the Whittier tunnels will enable train crews to talk to the dispatcher while inside the tunnels. No communication from within the tunnel (3-1/2 miles) is possible now.

OTHER PROJECTS

28. Passenger Service-Glazing, Platforms, Repair $380,000

To provide improved passenger amenities by upgrading deficiencies that are principal causes of frequent tourist passenger complaints received by the Railroad and the State. Specifically these funds will be used to replace window glazing in six Amtrak dome cars ($240,000), improve by constructing or lengthening passenger platforms at Whittier nd Anchorage to accomodate cruise ship passengers, and selected repair of seating and carpeting.

TOTAL	$26,110,000

THE ALASKA RAILROAD

CALENDAR YEAR 1986 CAPITAL PROGRAM

BUILDINGS

1. Warehouses $100,000

This represents a much needed but fractional part of the start of a multi-year program to replace or upgrade warehouses. To adequately plan and budget for the Railroad's warehouse needs, a $90,000 study will be initiated in 1985. This study, which will include a facilities plan and preliminary design for replacing warehouses, will form a basis of future capital budget items. Two of the existing Anchorage warehouses have exceeded their expected service lives and have serious deficiencies. This $100,000 will be used to fund the highest priority and most pressing immediate needs commensurate with traffic projection support in 1986.

ROADBED, TRACK AND OTHER FACILITIES

2. Ballast Placing $1,500,000

Annual restoration of track surface and alignment with ballast is required to maintain proper track structure in accordance with FRA Track Safety Standards, maintain safe train speeds, and to prevent accelerating maintenance costs due to deteriorating track structure. Distortions of track surface which occur due to frost action, permafrost melt, normal compaction and degradation of ballast require raising and realigning, and placing of new ballast. Additional select crushed ballast is used to improve drainage in order to decrease further distortions as well as prevent lateral displacement of the track structure due to increased train speeds, increased traffic, and thermal stresses.

3. Bank Widening $800,000

Provide 250,000 cubic yards of aggregate to increase the stability of the Railroad's mainline embankment, reduce permafrost melt, and prevent waste of crushed ballast. Bank widening along the main line has been minimal since the earthquake repairs of 1964 and 1965. Approximately 250 miles of main-line subgrade requires widening of shoulders to standard width to maintain the track to line and grade, provide walkways for trainmen and permit maintenance of the track structure to FRA standards. Permafrost melt in past years has created a situation that is self-destructive. Crushed rock in many areas now runs directly to the bottom of the embankment slope. A critical area is the section from Dunbar to Happy (a permafrost region) where restoration of shoulders is a must.

4. Rail Lubricators $60,000

Install five rail lubricators to reduce rail wear and improve locomotive fuel consumption. Tests conducted by AAR, FRA FAST, and some Class I railroads indicate as much as a 40-percent reduction in locomotive fuel consumption as well as reduced wheel hunting and rail wear from selective rail/flange lubrication. The lubricators will extend the life of five miles of rail on curves an estimated two years, from seven to nine years. The return on investment is 59 percent.

5. Elastomeric Rail/Tie Fastners $750,000

To increase rail stability, reduce longitudinal rail movement, and increase rail life on curves. This takes advantage of the "state of the art" fastners, commonly referred to as Pandrol plates and clips to provide a cost effective way of ensuring greater rail safety. Rail rotation on curves in recent years has increased lateral loading of gauge face which results in increased rail wear, rail corrugation, gauge widening, and rail rollover. Wood ties, cut spikes, and standard tie plates are no longer adequate under today's wheel loadings. The Pandrol plates and clips provide a wider base (15-1/2" vs 13") which increases stability, and provides a clamping force of +- 5000 psi per clip between plate and rail base. This clamping force also eliminates the need for rail anchors and, when used out-of-face on hardwood ties, will prevent rail rollover. Derailments caused by rail rollover in recent years probably could have been avoided if Pandrol plates and clips had been installed. Funds will purchase Elastomeric plates, clips, shoulder inserts, "E" clips, anchors, and screws.

6. Microwave Radio $250,000

Provides microwave radio telecommunications between Portage and Whittier. This will complete the replacement of open wire telephone pole lines with microwave over the entire main line. Besides removing the need for a pole line from Portage to the tunnels, it eliminates the marine cable in the tunnels and beyond to Whlittier which were placed in the 40's and about reached the end of their useful life. This microwave will avoid replacement of the pole line and marine cable at a cost of $200,000. The microwave will provide a higher capacity, more reliable and secure system. The return on investment is 140 percent with a payback in 1.25 years.

7. Bridge Program $1,000,000

Funds are required for the cyclic replacement/renewal of bridges and culverts along the railroad trackage. The 1986 program includes major maintenance or renewal of 16 bridges and 30 culverts. Included is major pier work on Bridge 264.1 (Susitna River at Gold Creek) and Bridge 86.6 (Bird Creek). Repairs and maintenance are necessary to maintain bridges, culverts, and tunnels in a safe condition for rail traffic. Replacement of bridge timbers, culverts, and timber supports is necessary on a 30-year cycle, depending upon the quality of original materials, local environmental conditions and special circumstances, such as fires and accidents. These expenditures will minimize the requirements for placing slow orders which cause increased running time and operating cost.

8. Tunnel Program $1,000,000

This is phase three of a multi-year program to rehabilitate the tunnels south of Portage between milepost 51 and 53. The completed project will result in reduced maintenance costs, increased operating efficiency, and the minimizing of operational hazards. Winter icing problems require constant maintenance and the ever present threat of accidents. Tunnel supports need replacement and extension to prevent rock falls. Overhanging rock slopes which are unstable must be removed and stabilized. Avalanche hazard areas also require structural protective measures. Tunnel clearance will be increased to allow standard clearance in the tunnels. These tunnels are subject to continuous water problems that have deteriorated the track structure, necessitating reconstruction of the roadbed and track. The tonnage increases brought about by TOFC movements

and the export of coal require the upgrading of these tunnels to an acceptable level for safe and efficient operating conditions. An engineering design contract was funded in the FY '84 budget, and phase two was funded in CY '85 budget.

9. Utility Systems $400,000

This is part of a multi-year program of replacement of 30-plus year old electrical, water, sewer, and heat distribution systems. The $400,000 in 1986 will concentrate on meeting EPA and OSHA requirements which the Railroad considers as high priority. Utility systems in Anchorage, Fairbanks, and Whittier Yard areas have exceeded expected lives. Corrosion to pipes and valves, breakdown of electrical insulation and related aging problems are causing frequent maintenance efforts, energy waste and dangerous working conditions. Asbestos pipe insulation, PCB oil in electrical gear, and non-code construction also requires replacement of these systems. This modernization will reduce costs, reduce losses due to outages, and remove health and life safety hazards. The return on investment is 34 percent.

10. Eielson Branch Renabilitation Phase II $1,900,000

Current traffic projections over the portion of the Eielson Branch from Fairbanks to the North Pole Refinery are 575,000 revenue tons in 1985 and 850,000 revenue tons in 1986. This is an increase from 375,000 revenue tons in 1983 and 450,000 revenue tons in 1984. Between MP 6 to MP 18 there are 9.6 track miles of 75# rail with 16" joint bars. 75# non-control cooled rail is inadequate for present loads. Increased traffic and speed requires a heavier section for safety. The subgrade for the entire length is substandard. Certain locations would require additional shoulder material. The spacing is 20 ties per 39' rail. Fixed elevations would require a combination of undercutting and plowing. To be able to maintain this portion of track with the increase tonnage, it is necessary to rehabilitate this line. The work includes relaying 9.6 track miles of 75# rail with 115# rail, insulating subgrade, adding additional material to bring the subgrade up to standard width, sledding (plowing out old pitrun ballast), adding/replacing ties, placing ballast and surfacing track. At North Pole, the only auxillary track the Railroad has for switching cars is the 1,500-foot North Pole siding. For the projected volume of traffic, an additional 4,000-foot siding is needed between North Pole and the refinery. The projected traffic will require the Railroad to handle one loaded and one empty 50-70 car train at a time near the refinery. The proposed track will reduce the switching time at the refinery.

This work is a two-phased project; the first phase included the rail relay and the siding at North Pole, this second phase includes placing shoulder material, sledding, tie renewal, placing ballast and surfacing the track.

11. Hot Box and Drag Detectors $500,000

This funds 5 of 12 hot-box and drag detectors the Railroad proposes to install in 1986, 1987 and 1988. The State sponsored SVERDRUP ARR engineering evaluation conducted in 1984 also recommended 12 be installed. The purpose of these detectors is to warn of wheel and bearing overheating and of equipment dragging on a moving train. By pinpointing the source of the defect in the train consist, the problem car can be set out before it causes a derailment. On the basis of preventing only one major derailment over a two-year period

costing $750,000 and equating to the total capital cost of 12 detectors, the return on investment is 85 percent.

12. TOFC Terminal Upgrade $1,500,000

The substantial increase in roll-on roll-off trailer traffic through Seward and Whittier in 1984 and anticipated greater level of this traffic in 1985 and in the future dictates an upgrading of TOFC terminal facilities, especially at Seward and Whittier. These finds will be used for paving, van packer storage facilites, and upgrading of the Railroads terminal facilities at Whittier, Seward, Fairbanks and Anchorage, with priority to Seward and Whittier. It is essential that the Railroad upgrade these terminals in order to retain this important traffic, increase safety, and improve the level of effectiveness and efficiency. Specifically the paving and upgrading will:

1) Increase productivity and efficiency in the operation of the van terminal;

2) Reduce damage to trailers and ladding resulting from soft surface causing loads to tip over;

3) Reduce damage to landing gear because of sinking into the ground;

4) Increase life of equipment (van packer, jockey trucks, forklifts) because dust will be minimal;

5) Provide a smooth operating surface thus minimizing vibration and resistant force in travel thereby increasing the life of equipment;

6) Increase handling capacity of van packer because of hard surface;

7) Increase safety in operation on hard surface as opposed to uneven gravel surface;

8) Reduce possibility of dropping trailers or containers attributed to uneven surface;

9) Reduce surface maintenance cost of grading.

EQUIPMENT

13. Purchase 5 New 2800HP Locomotives $700,000

Acquisition is essential to provide motive power for export coal trains operating between Healy and Seward in 1985 and subsequent years. The Railroad's current fleet of locomotives is not sufficient to provide power for the new export coal service. During the past summer (1984), an average of 90% (approximately 51 units) were dedicated to use in performing the existing business. Of the remaining 10% (6 units), 4% (2 units) were undergoing major repairs, and 6% (4 units) were receiving minor repairs and necessary periodic maintenance and service. During the summer's peak periods, gravel trains were frequently delayed as there were no units available to replace gravel train locomotives that required refueling or servicing. The purchase of 5 new locomotives will provide the minimum proposed consist of 5 units in this export

coal service. The alternative of acquiring used locomotives was considered but ruled out in favor of the GP-49 2800 HP locomotives, four of which were purchased in October 1982. The GP-49, first built in 1982, incorporates the latest "state of the art" improvements providing dramatically increased pulling power making them ideal to meet the hill grades the coal train will encounter. Return on investment is 25 percent. Locomotives will be purchased in 1985; this constitutes the annual payment of principal plus interest.

14. Purchase 65 100-ton Hopper Cars $490,000

Acquisition is essential to support export coal train service between Healy and Seward. The export coal train will require 65 cars per train. With this one set of cars, the train will operate three times a week. The type of car is compatible to the hopper cars used in North-end coal and Palmer-Anchorage gravel service, thus allowing interchange with present equipment. The existing hopper-car fleet is used to full capacity during the spring-summer-fall seasons. Failure to acquire these additional cars will necessitate allocation of the present fleet between coal and gravel service during the spring-summer-fall season and will endanger the Railroad's largest revenue commodity due to the inability to furnish rolling stock. Nonacquisition of these cars will also result in use of older high-maintenance cars for winter service. Maintenance cost of new cars is estimated as 3.4 cents per mile compared to approximately 8.0 cents for older cars. Return on investment is 26 percent. Hopper cars will be acquired in 1985; this constitutes the annual payment including principal and interest.

15. Acquire 30 Intermodal Platform Cars $385,000

Acquisition necessary to support increased TOFC service on all major segments of the Railroad's main line. This purchase involves 30 intermodal platform cars, each capable of moving three trailers of 27 to 50 feet and weighing up to 100,000 gross weight pounds per trailer. This will enable the Railroad to market trailers with heavy loads and thus take advantage of the 48' x 102" equipment presently entering the market. Several other benefits will accrue upon acquisition of these cars. The Railroad would return to the owner 13 cars now on daily rental, saving $118,625 annually. An additional 10 cars leased by Alaska Hydro-Train would be released saving $72,885 in annual mileage payments. Acquisition of these new cars would permit the reduction of one train weekly to Whittier and one to Seward saving $699,190 annually. Total annual savings is approximately $900,000. Return on investment is 24 percent. Cars will be acquired in 1985; this constitutes annual payment including principal and interest.

16. Acquire 5 Covered Hopper Cars $125,000

Cars are needed to meet current and projected cement traffic. For the past four seasons, the demand for cement movement has consistently been in excess of the Railroad's ability to supply covered hopper cars. The Railroad's need is for 10 cars of which 5 will be acquired in 1985 and this requests 5 in 1986. In 1984, the Railroad had to lease 7 additional cars at $20 per day. Kaiser Cement Company also leased 5 cars. These temporary arrangements are more expensive for both parties and there is no assurance they can be leased in future seasons. The revenue loss is at least $285,000 annually due to equipment nonavailability based on 5 cars per week at $3,000 a car over a 19-week season. Return on investment is 200 percent.

17. Engineer Construction Equipment $2,000,000

Replace and modernize construction equipment used by the Engineering Department. The existing Engineering Department equipment fleet is inadequate to conduct maintenance and construction programs. Much of the equipment has been in service so long that frequent breakdowns occur which, along with the unavailability of parts, results in high maintenance costs. Safety is a paramount concern and would be substantially enhanced with the replacement of older equipment. The $2,000,000 requested will replace 37 items which constitutes the highest priority needs and represents about 2 percent of the construction equipment inventory. Included are generators, compressors, rail saws, bull dozers, spike drivers, push cars, a tamper, a regulator, tie machines and other items--most of which are over 20 years old and some over 35. The average return on investment is 46 percent.

18. Snow Removal Equipment $1,100,000

Increased rail traffic and the expansion of van yards at Seward and Whittier and the new coal transload facility at Seward necessitates the acquisition of snow removal equipment to ensure prompt clearance and avoid any disruption in terminal service. The Railroad is confronted with a serious support problem in this area. Three snow blowers recently had to be retired, and the remaining fleet is old, unreliable and subject to frequent failures. Of the 18 graders, loaders, and snow blowers available, 5 were built in the 60's, 12 in the 70's, and 1 in 1981. The existing snow blowers are single-use machines which are idle most of the year. This purchase includes two graders, two all terrain haulers with 27 cubic yard capacity and one self-contained quick disconnect snow blower to be attached to an existing loader. Return on investment is 40 percent.

19. Purchase One Locomotive Crane $800,000

To replace one of three 1950-era locomotive cranes. All three cranes (LC-103, 104, and 105) are over 30 years old and in very poor condition and are past due for heavy overhaul. Virtually all mechanical parts are worn beyond reclamation and wiring insulation is seriously deteriorated. Parts are no longer available for these cranes. Due to the advanced state of deterioration of these units, it is becoming impractical to continue them in a safe, serviceable condition much longer. The ditcher cranes are required to maintain track drainage ditches, remove slides, and improve unstable hillsides. The geological nature of the area through which the Railroad passes is very unstable, requiring constant clearing of drainage ditches, removal of rocks and mud from tracks and removing ice glaciers. The Railroad is vulnerable in three widely separate areas (Healy Canyon, Chase Bluffs, and the Spencer-Grandview). At times slides occur at all three locations. Serious subgrade and ballast saturation occurred during 1984 when two ditchers were clearing slides and one was in the shop for repairs. This condition necessitates the purchase of one replacement crane in 1985, and one in 1986. Return on investment is 40 percent.

20. Telecommunications Test Equipment $100,000

Purchase of telecommunications test equipment is required to be able to maintain the Railroad's communication systems within FCC and industry standards. Radio lab test equipment will provide portable field equipment to service and maintain base, mobile, and portable radios as well as pagers. The Railroad has a very limited amount of microwave test equipment. As the

microwave systems age, outages and reduced performance will result unless an adequate check program is enforced. Data systems test equipment is needed to isolate problems with software, hardware, and transmission systems. Estimated annual savings resulting from crew costs, microwave, and data system savings is $18,100. Return on investment is 26 percent.

21. Rebuild Four Locomotives $1,600,000

Rebuild and upgrade four obsolescent locomotives to modern standards. The current locomotive fleet is capable of supporting planned service only if all units are serviceable at least 90% of the time. The oldest "second generation" power is the five GP-40's purchased from Conrail. These units will be 19 years old in 1986. One has already been virtually destroyed by fire and the wiring on the other four is in such bad condition that electrical fires are a constant probability. These units must either be replaced or rebuilt and upgraded. Our choices are:

1) Rebuild and upgrade all four units now at $400,000 each and then replace them in 10 years or,

2) Replace these four units as they self destruct, estimated to be one per year for the next four years.

Based on the present value (as of 1986) of the ten-year costs of the two options, option once costs #3.21 million and option two is $3.87 million, therefore, the best option is one which realizes a savings of $666,000 by rebuilding four units in 1986.

22. Purchase 25 Tank Cars $550,000

Acquisition is necessary to support steadily increasing petroleum traffic from the refinery at North Pole to Nenana, Anchorage and Seward. Volume is expected to double in 1986 and increase by 50% in 1987. Also, in addition, expansion of the refinery at North Pole, the Railroad needs to replace 10,000 gallon equipment which has exceeded the economic age limit for tank cars. Failure to acquire this equipment will result in loss of revenue due to the inability to handle additional traffic and the increased cost of handling the additional traffic because of movement in smaller 10,000 gallon units. Additional revenue expected from acquisition from this equipment will be $1,600,000 annually. This funding covers down payment and first year's payment plus financing charges and freight.

23. Purchase 20 Chain Tie-Down Cars $400,000

Cars are required to support additional roll-on roll-off business which is a result of the initiation of this type service by SeaWay Express and Alaska Hydro-Train. Need for cars has been further increased by markets developed since 1983 using present chain tie-down equipment. These cars eliminate approximately 80% of labor used to place machinery or vehicles on these railcars as compared to existing equipment and this results in savings for both the Railroad and the customer. Heavy duty features on these cars will also make the Railroad more competetive in the oilfield products market. Additional revenue expected from acquisition of this equipment is $720,000 annually. This finding covers down payment and first year's payment plus financing charges.

24. Axle Lathe $100,000

To increase axle machining capacity. Due to increased car and locomotive mileage, the Railroad is unable to keep up with the demand for new axles using the existing machine. The only practical alternate to buying an additional machine is to ship in completed wheel/axle sets. Mounted axles take up a lot of space and only 24 can be shipped on a 50 foot car at $66/foot on the barge. Axles can be shipped 140 to a car for the same price. Thus the shipping savings are enough to pay for the machine within three years. Return on investment based on a 25 year life of the machine is 62 percent.

25. Wheel Lathe $200,000

To maintain compliance with Association of American Railroad's regulations, an adequate wheel lathe is necessary. The existing Niles wheel lathe is worn to the point that the Railroad will not be able to continue to produce acceptable wheels (per AAR standards). The Railroad can buy a new lathe, rebuild the old, or send the work out. Sending out is not practical because barge costs alone would be $300 per wheel set. A new lathe will cost about one million dollars and require a new foundation. Rebuilding the present machine (and updating it with numerical control) will cost from $200,000 to $600,000. The rebuild can be done on a unit exchange basis keeping down time to an absolute minimum. The rebuilt machine will use the same foundation as the old machine - an additional advantage. Return on investment is 54 percent.

26. Repair One Dock Crane $300,000

The Railroad has two 45-ton Gantry cranes on the Railroad dock at Seward. One was built in 1941 (Colby) and one in 1942 (Washington). The Colby crane was recently moved to the west side while the Washington crane serves the east side. While not used extensively, both must be operable, since they are not mutually supporting each other. The options, on the older crane (Colby) are to replace it or rebuild it. However, to retain these options for future consideration, action is required in 1986 by repairing the crane housing in order to protect the machinery and perform a careful inspection. A complete rebuilding is estimated to cost about 40 percent of replacement cost. These funds are to protect the crane, perform a thorough inspection, and repair or rebuild to the extent funding will permit.

OTHER PROJECTS

PASSENGER SERVICE PROJECTS:

27. Denali National Park Station $100,000

To improve efficiency and safety of handling passengers and baggage at Denali National Park Station, to reduce train stopover time for loading, and to improve employee productivity. The station at Denali Park has been in operation for several decades without major improvement or upgrading. As many as 750 persons may utilize the station and its plaforms within a 30-minute period. In addition the movement of their baggage is a major commitment. This program will allow for design and construction of improvements to:

a) facilitate baggage handling in shorter time in a more efficient manner,

b) provide safety barriers and "cue-up" lines for patrons to utilize while waiting for train arrivals,

c) pave and otherwise improve the loading ramps and platforms used by the public.

Completion of these tasks will greatly reduce or eliminate a major safety hazard.

28. Remanufacture Ten Passenger Cars $5,000,000

Upgrade and improve service by remanufacturing ten passenger cars used in the provision of public transportation, thus reducing public discomfort, deminishing equipment failures, lowering operating costs, and extending the fleet life by 10-15 years of additional service. The Corportation will remanufacture ten passenger cars to modern specifications and standards intended to assure a service life into the 21st Century. A contract will be sought with a major Outside manufacturer for this service. Present equipment averages 35 years of age and is worn-out. Unless remanufactured or replaced public convenience and safety will require its retirement by 1987. The seasonal nature of Alaska rail service demands, and the reduced cost (by 60%) as compared to purchasing new passenger cars make this approach feasible. The remanufactured cars will be compatible with ten other cars similarly overhauled in 1981. In future years, the remaining cars in the fleet will be remanufactured.

29. Shuttle Improvements $2,400,000

Improve stationary and equipment facilities on Whittier-Portage Shuttle to acommodate public demand and improve basic acommodations to a level of minimal comfort. The project will provide paved assembly and parking areas, security fencing to eliminate theft and vandalism to vehicles, improvement of loading ramps, installation and improvement of area lighting, provision of small covered shelters for foot passengers waiting on trains, installation of "cue lines" for vehicles awaiting trainsportation to/from Marine Highway System, purchase of one modern shuttle coach, rebuilding of two shuttle baggage and power generator cars, and addition of updated safety lighting and power hookups to 14 flatcars used for movement of vehicles on Shuttle trains.

The very basic facilities in use in Portage reflect an era when only 20% of the present public business was carried. Whittier ground facilities are non-existent. During the next 5-10 years this service is expected to grow by about 100% and provides the only public land access to Whittier and the Marine Highway. These requested improvements, long overdue by most evaluations, are the result of user requests and analysis of the needs in order to provide the minimum level of decent public service by the Shuttle trains.

THE ALASKA RAILROAD CORPORATION

Operating Loss from provision of Passenger Train Service
Calendar Years 1985 and 1986

State Oversight Report information
as required by the
Alaska Railroad Corporation Act

November 27, 1984

Under the terms of AS 42.40.280 a State Oversight Report must be provided before undertaking an application for an appropriation to be used for providing any service that is not self-sustaining.

The Corporation has determined that the provision of the present level of passenger train services to the general public is not self-sustaining and that approximately $1.7 million in CY-85 and $1.9 million in CY-86 will be needed to cover the total operating costs for this service.

To comply with the Alaska Railroad Corporation Act, this report addresses the requirements of AS 42.40.280. The Corporation, however, is deferring any actual request for a subsidy for later action. A separate explanatory statement is being submitted detailing the capital budget request for $7.5 million in the CY-86 Corporation budget related to the continued provision of passenger service.

Sec. 42.40.280 (b)

"The report....shall be in writing, describe the proposed undertaking in detail, and specify"

THE ALASKA RAILROAD CORPORATION
PASSENGER SERVICES

General Description of Passenger Program

****

Two classes of service are presently provided:

1. Scheduled passenger service and charter trains.

2. The Anchorage-Portage-Whittier "Shuttle".

THE WHITTIER SHUTTLE

Since 1967, the Shuttle has been supported in part by a contract with the State of Alaska which provides for payment of operating losses, and--to a very minor degree--equipment costs. This became a full service contract about 1978.

Since about 1980, the state has limited payments to $150,000 annually by requesting that amount of appropriation or limiting the budget item to that amount. The program is under contract with the Department of Transportation and Public Facilities (DOT&PF). The present contract will expire April 30, 1985. Because the Corporation is a state entity, this contract will be combined into the overall passenger service program of the Railroad after January 5, 1985.

Due to increased service frequency requested by the State in recent years, and increased internal costs to the Railroad, the operating subsidy amount is substantially inadequate. Our estimate is that the present $150,000 will be exhausted by February 1985.

This service earns a considerable surplus during the period from mid-May to early September, when tourism and recreational uses of Prince William Sound are at their peak. At other times it is very lightly patronized, primarily by those having business in Whittier or who reside there.

The 1984 Legislature was requested by the DOT&PF to provide $1 million for use in improving the worn out equipment on the Shuttle. $600,000 was appropriated. This money is now available and the department and the Railroad are jointly working to seek appropriate equipment improvements which can be accomplished for this amount. These funds will be expended on shuttle improvements, and their expenditure has been considered in conjunction with the Corporation's capital request for passenger improvments in CY-86.

The estimated amount of subsidy funds for operating assistance to the Shuttle in CY-85, based on FY84 service levels and no expansion of them, is $225,000.

SCHEDULED PASSENGER SERVICE AND CHARTER TRAINS

Passenger trains operate year-round from Anchorage to Fairbanks. From mid September until early May (about seven months) these trains are operated on a round trip basis once a week. During the remaining five months the trains operate daily between these cities.

One out of every five visitors to Denali National Park arrives or departs by an Alaska Railroad train. The demand for train seats outstrips our capacity on many days each summer. Listings in major tour publications and an active role in the State's tourist industry groups is maintained.

While summer tourist service does operate at a loss and returns no capital reserve funds, the amount of losses are small compared with those of other world railways. Well over 70% of the operating costs of this service are returned in fares, while the U.S. standards for Amtrak are presently 52% revenue generated and in Canada about 40% fare incomes.

Excluding capital and equipment replacement costs, the trains suffer operating losses of varying intensity:

------ During 1984, the loss by the Railroad for each passenger in summer months was about $4.79.

------ During 1984, the loss by the Railroad for each passenger carried in the other months, when once-weekly service is operated, approximated $294.85.

WHO RIDES ALASKA RAILROAD ANCHORAGE-FAIRBANKS TRAINS?

The summer daily trains cater almost exclusively (over 90%+ of the ridership) to visitors to Alaska, part of the second largest cash industry of the State. They also serve, as an adjunct, rural and remote area citizens of Alaska who have no other means of access to their homes. This service is under extreme pressure for increased capacity, and improved comfort levels. The Railroad presently has only a limited ability to meet that demand. Despite this limited capability to expand and absolutely no promotion by the ARR, the ridership

increased 16.8% in 1984 (nearly 23% if the privately owned Tour Alaska Inc. luxury cars are included).

Winter service, conversely, serves almost totally (98%) the rural and remote area residents of Alaska who live near the tracks. These residents travel only an average of 20-30 miles by rail from the closest road. Yet they are dependent on the railroad.

As few as 269 passengers rode these trains in an entire month during the winter of 1983-84 for a total of about 35 passengers on each one way train, which travels a route of 356 miles! It is no surprise that the per passenger out-of-pocket loss in operating this service is $294.85. In seven months of FY84 a grand total of 2772 passengers rode the trains north of Anchorage!

CRUISE SHIP SERVICE FOR THE TOURIST INDUSTRY

In 1982 a few test dockings at the Railroad's Port of Whittier proved the popularity of cruise ships bringing their passengers to Interior Alaska. This was the first breakthrough from the tradition of operating cruise ships only as far north as Skagway or Juneau.

In 1983, about 10,000 new passengers--all cruise ship patrons--rode chartered trains to Anchorage from Whittier. An equal group departed from Whittier, providing nearly double the tourism impact of round-trip tourists.

In 1984, this business improved again, with several dozen cruise ships representing two major tour operators using Whittier. Over 20,000 visitors shared the spectacular trip to or from Whittier by train to access their ship.

For 1985, a third company has scheduled arrivals in Whittier and an additional 10-12 thousand passengers are expected from this service. A spinoff of the popular business is a number of arrivals by Cunard Lines' "Sagafjord" at the Port of Anchorage in 1985. Approximately 40% of these passengers are expected to book passage on the Alaska Railroad trains to Denali Park and Fairbanks.

This service returns most of the railroad's out-of-pocket costs, and is serving as a major catalyst for the tourist industry in the heart of southcentral and interior Alaska.

A major problem is that the equipment used for special and charter service is old and must either be replaced soon or subjected to a major rebuilding by a shop outside Alaska.

The Railroad is at the point where a "GO" or "NO GO" decision must be made to either withdraw from this service soon or to invest substantial capital in equipment improvements.

OTHER SPECIAL TRAINS

A number of other special trains, mainly patronized by Alaskans, are operated in charter for groups or individuals, or operated as a "railroad" special train.

These include several trains a year to the Seward area--Salmon Derby, 4th of July; the State Fair of Alaska (2-3 trains); Nordic Ski Club, to the Kenai Mountains (4 trains with 700 passengers each); Railroad Week to the Palmer Transportation Museum; corporate charters for employees or VIP's; special party trains by groups to Whittier, Seward, and to the north; etc.

These trains are priced and marketed at a profit to the Railroad in operating costs, but not to return capital costs.

Occasional official trains are operated, such as for the 60th Anniversary of the Railroad, an anticipated special program for the State on January 5-6, 1985, or for promotion of Alaska or the railroad as a transportation carrier.

SPECIFIC REQUIREMENTS OF A STATE OVERSIGHT REPORT

Sec. 42.40.280 (b) (1)

The financial impact on the corporation is detailed in the attached statement of estimated income and expenses from our passenger service program in Calendar Years 1985 and 1986.

Losses of $1.7 million and $1.9 million are projected by operation of the same level of service as that which was offered in 1984.

Sec. 42.40.280 (b) (2)

The nature and level of the services provided passenger patrons of the corporation will not be affected if the corporation undertakes commitment of funds in the amounts stated above.

Sec. 42.40.280 (b) (3)

The action of providing an operating subsidy for passenger services is necessary and desirable because:

a. Services have been publicized and announced throughout the World for 1985 in conformance with the needs and practices of the tourism industry.

b. Elimination and/or reduction of passenger services below their present level would be a major blow to the total Alaska tourist industry.

c. Elimination and/or reduction of passenger services to Alaska citizens residing in remote or "bush" locations served only by the corporation would result in extreme hardship for these persons, in some cases of a life-threatening nature.

d. The provision of land access to Whittier would be severely restricted and reduced, and fares would rise substantially, during seven months each year when most of the traffic on the Shuttle trains is by Whittier residents.

Sec. 42.40.280 (b) (4)

The passenger services provided by the corporation are not expected to become self-sustaining financially during the next five years. Passenger service worldwide is operated basically as a public and/or social service. The present level of corporation service requires a much lower ratio of subsidy funding versus income from the service than elsewhere in North American and the World generally. The corporation's goal in continuing this service is to provide quality services at a realistic public cost to support essential access for Alaska citizens, and as a catalyst to the fast-growing statewide tourist industry.

Sec. 42.40.280 (b) (5)

While the corporation is presently not requesting an appropriation for the purpose of providing passenger service that is not financially self-sustaining, the likelihood of future application is strong.

The Act requires that the amount of any appropriation be calculated in accordance with United States Interstate Commerce Commission (ICC) standards for determining rail service subsidies.

Such standards do not presently exist. At one time, prior to the Staggers Rail Reform Act of 1980, the ICC did have certain regulations in effect which dealt with passenger subdidy computation. These were, however, designed for metropolitan area commuter rail service which is not directly comparable to Alaska services. These standards were repealed in their entirety in 1980.

In addition, the ICC standards provided for full cost recovery by rail carriers, plus management fees and profits. The corporation's computation of its passenger costs do not claim recovery of general overhead costs, costs for use of capital, or management/profit fees. Therefore, the corporation's level of subsidy is significantly below any which would result from using the old ICC standards.

Because no standards do exist, the corporation believes that this provision of the Act does not apply to the passenger services which it provides within Alaska.

THE ALASKA RAILROAD CORPORATION

Capital Budget Request CY-85 & CY-86
Passenger Services

November 27, 1984

The Corporation is requesting an appropriation for capital improvements during Calendar Years 1985 and 1986 which includes $7.5 million for projects within the passenger services functions of the Railroad.

Summarized, these funds will be expended as follows:

a. $100,000 for improvements to the station facilities at Denali National Park.

b. $2.4 million for station and terminal improvements, and rolling stock improvements, to the Whittier to Portage "Shuttle" service.

c. $5 million for remanufacture of ten (10) passenger cars from 1950-era equipment which is essentially worn out.

These improvements are the first phase of a general upgrading of the passenger service facilities and equipment on the Alaska Railroad. Except for a $4 million investment by the Congress in 1981, the railroad has never invested in a major upgrading of their passenger facilities. The 1950-era car fleet was acquired used in 1971 and is essentially intact, as-built, in service.

Unless investment is made in the above projects, public safety and comfort will be jeopardized and the corporation's ability to provide service at its present level will be significantly reduced.

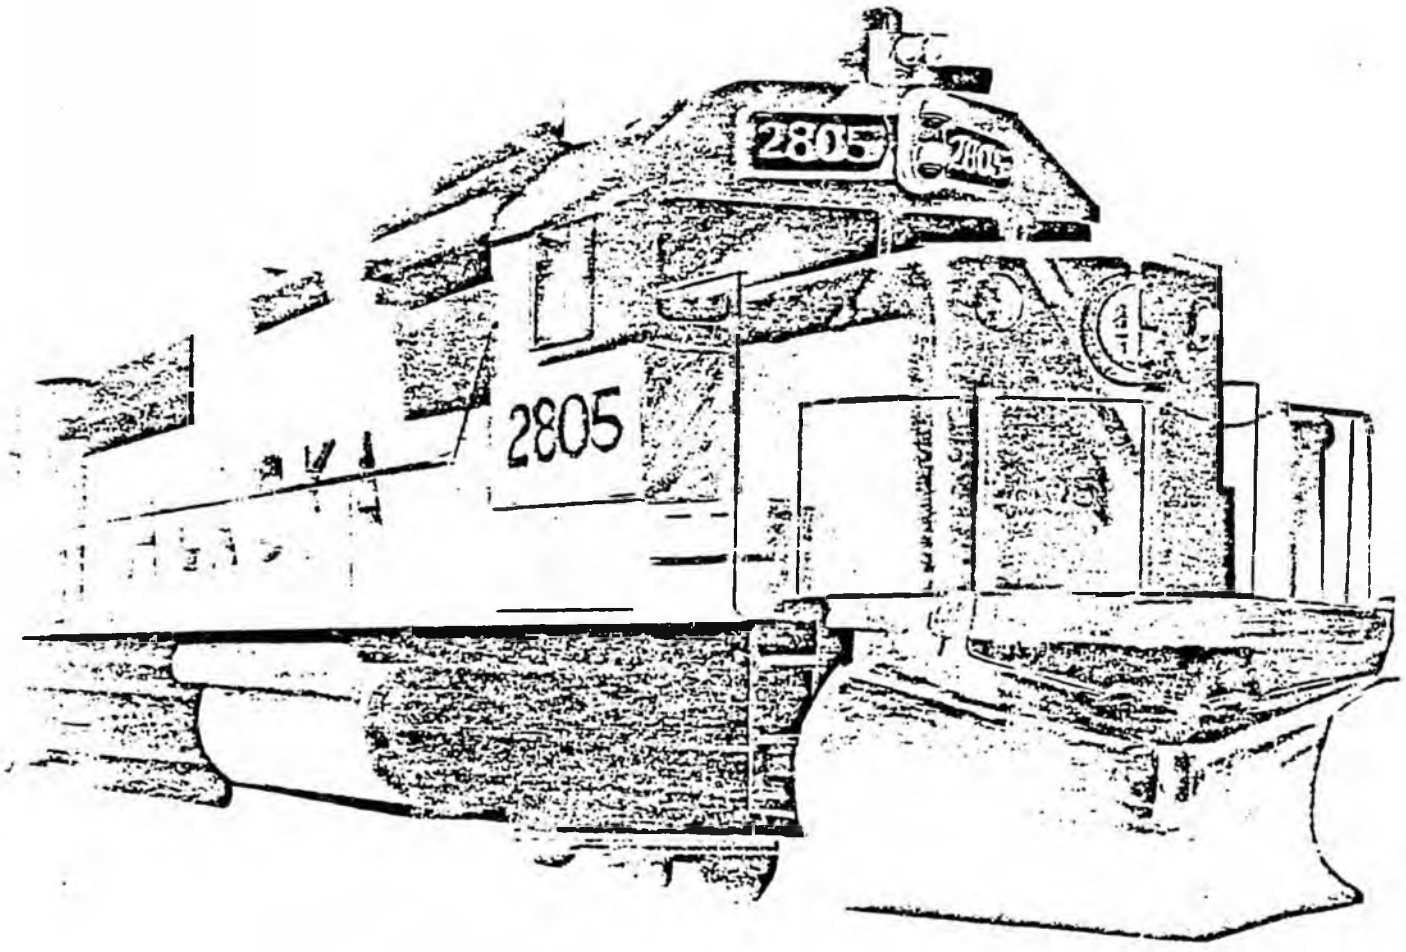
ANNUAL REPORT



PRESIDENT'S LETTER

Unlike New Year's resolutions, business goals and objectives are made with the thought in mind that they will be met or broken. I am happy to report that after one year of operation as a state-owned corporation, the Alaska Railroad has an impressive scorecard based on the goals we set and achieved. And this is a trend we expect to continue in the coming years.

Of course, none of this would be possible without the hard work of the corporation employees. Their dedication to the Alaska Railroad makes it possible for the corporation to achieve its objectives.

The overall goal of the Alaska Railroad Corporation is to foster and promote long-term economic growth and development in Alaska by providing transportation services on a self-sustaining basis at competitive rates and at the same time generate sufficient funds to upgrade and maintain the physical integrity of the railroad.

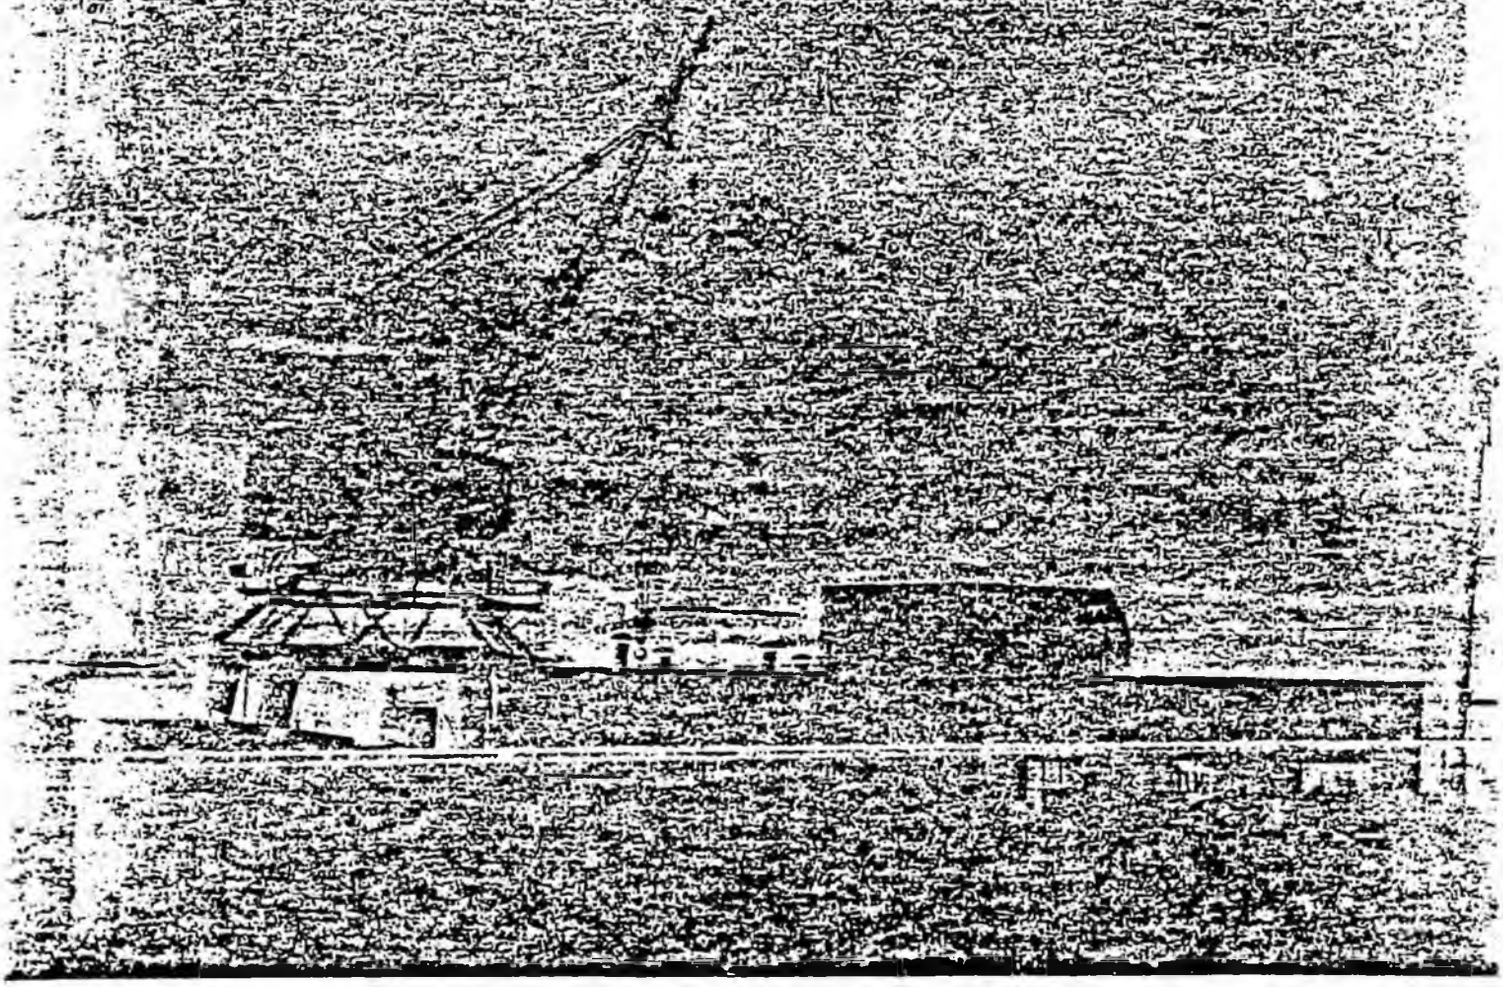
To achieve that overall goal, a three-year plan was developed that includes an extensive marketing program to increase our revenue, coupled with an intense effort to streamline our operations to reduce our costs. The

[illegible] modernizing the railroad, including purchasing new equipment, upgrading the track and roadbed and improving our physical plants.

The marketing objectives of our plan include increasing our revenue from petroleum products and our piggyback trailer service. In 1985 we added two new trains that give priority service to these customers, increasing petroleum revenues by 15 percent and piggyback revenues by 20 percent.

In addition, we plan over the next three years to reduce our losses from passenger service. No railroad makes money on passenger service, and the Alaska Railroad is no exception, recording losses of $18 million in 1985. With the purchase of two new rail diesel cars in late 1985, we expect to cut those losses by $500,000 in 1986 alone.

While we were attempting to boost revenues, we made major plans to reduce expenses by streamlining and implementing new computerized accounting, personnel, procurement, supply, [illegible] and distribution and preventive maintenance programs. Most of the projected savings are completed by year-end 1987. The remainder of the efforts should be completed in 1988.



Two significant cutbacks outlined in our three-year plan are reduction of our vehicle fleet by 25 percent and reduction of our operating employees by 20 percent. By the close of the first year we had cut our vehicle fleet by 22 percent and had better than expected inventory reductions, including track material, by 18 percent. Most of these items were sold at public auction, adding over $5 million to our cash revenues.

Our most ambitious objectives in the three-year plan are capital expenditures needed to modernize our equipment, improve efficiency and maintain the physical integrity of the railroad.

Equipment purchases planned for 1986 were 6 new locomotives and 115 new rail cars. In 1985 we bought five locomotives and 245 new rail cars for a total of $9 million. We also plan to replace our old, inefficient construction equipment. In 1985 we spent $600,000 and will purchase another $3 million worth in 1986.

All of these efforts would be fruitless if we did not pledge to protect gains and income. We maintain our outreach and marketing programs. We spent more on them in 1985 than at any time in the railroad's recent history. In this area, as well as all [illegible]

this year than following the Valdez oil spill, which caused $30 million in damage to the railroad.

Without impressive cost reductions and [illegible] there achieved by the Alaska Railroad Corporation [illegible] on its way to fulfilling the dream that has guided so many Alaskans to push for this railroad from the federal government. There were [illegible] trials and failures in 1985 and 1986 promises to hold its share of challenges. But I am confident that we can all be me

Frank C. Turpin
President and
Chief Executive Officer

For the Alaska Railroad Corporation, 1985 was a year of changes.

Change is inevitable in any business. It is a natural part of growth. However, for the Alaska Railroad Corporation, 1985 was a year of changes unlike any the Alaska Railroad had ever experienced.

The first and most dramatic change came within the first week of 1985, when on January 5 ownership of the Alaska Railroad was officially transferred from the federal government to the state of Alaska.

That transfer of ownership set the stage for many, many more changes, from management and personnel to policies and procedures. And with those changes a foundation was laid for the prosperous development of the newly formed Alaska Railroad Corporation.

Alaska paid the federal government $22.3 million for the Alaska Railroad. That purchase price included 655 miles of track, 38,000 acres of land including all rights-of-way, 1,545 units of rolling stock including locomotives, freight cars and passenger coaches, and four terminal facilities, one each in Seward, Whittier, Anchorage and Fairbanks.

A NEW CORPORATION

Transfer of railroad ownership to Alaska was made possible by the Alaska Railroad Transfer Act (ARTA), enacted by Congress in 1982. In 1984 the Alaska legislature adopted the Alaska Railroad Corporation Act (ARCA), establishing it as a public corporation of the state that would act as a separate, profit-making entity.

On January 5, 1985, as a result of the transfer, the federal railroad's financial books were closed. On January 6 the new state corporation technically began business with no operating funds. To meet the railroad's immediate money needs, the state legislature allocated, in addition to the sale price, a one-time startup fund of $10.9 million. The money was used to meet the corporation's first month's payroll and to continue several capital improvement projects that had been initiated under the federal system.

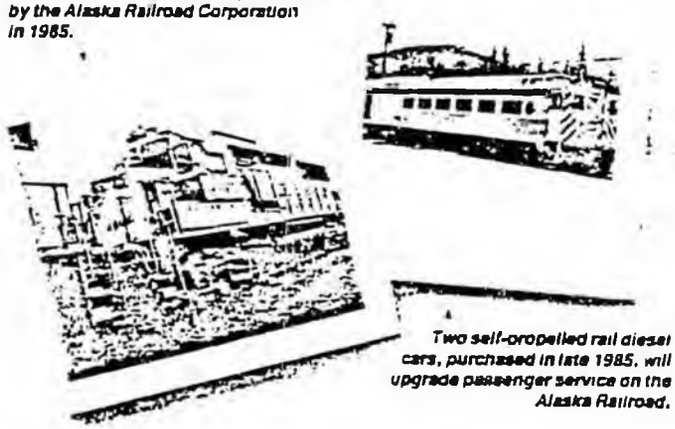
Within its first month of operation the new Alaska Railroad Corporation showed a profit, and continued to do so through the end of the year. In its first year of operation under state ownership, the Alaska Railroad Corporation netted $7.1 million, among the largest gains recorded by the railroad in its 62-year history.

John Riley, Federal Railroad Administrator, and Bill Sheffield, Governor of Alaska, signed an agreement January 5, 1985 to transfer the Alaska Railroad from federal to state ownership.

ARCA provided for the stewardship of the new corporation by a seven-member board of directors appointed by the Governor of Alaska.

The board is responsible for management of the corporation but has delegated certain powers and duties to Frank G. Turpin whom the board selected to serve as the railroad's president to guide the day-to-day operations of the corporation. He joined the railroad immediately upon transfer.

Five new locomotives were purchased by the Alaska Railroad Corporation in 1985.



Two self-propelled rail diesel cars, purchased in late 1985, will upgrade passenger service on the Alaska Railroad.

GOALS FOR 1985

As chief executive officer, Turpin set three goals for the new corporation: earn a profit without seeking state subsidies, broaden management emphasis from a concentration on operations to include marketing and finance, and modernize the railroad's rolling stock, equipment and physical plant.

Giant steps forward were accomplished in 1985 in all three areas. Each step meant changes as the railroad moved away from federal procedures and began operating more like a private business.

The first goal of earning a profit without state subsidies was accomplished in the first year. To control future spending and to get the best value from its revenue, the corporation developed a three-year capital spending program. The plan includes replacement or addition of several units of rolling stock and heavy equipment. The net result will be lower maintenance costs and improved service to customers.

MODERNIZING THE RAILROAD

The three-year plan also tied in with the corporation's goal to modernize the railroad. To improve freight hauling capabilities, 45 new intermodal flatcars called "articulated" cars were purchased for $4.5 million. The first step toward upgrading the aging locomotive fleet was the purchase of five new state-of-the-art diesel locomotives valued at $1 million each. The cars and locomotives arrived in the spring of 1985 and were placed in service immediately. At the close of the year the first of two 48-seat, self-propelled rail diesel cars (RDCs) arrived. The rebuilt cars were purchased to improve and reduce the cost of the winter passenger service and to augment summer and charter services.

The new cars and engines were obtained through a lease/purchase program that allowed the corporation to avoid seeking state subsidies. While the railroad had not been able to take advantage of the lease/purchase option under federal ownership, the corporation's unique position as a quasi-public enterprise enabled the railroad to make the best use of its revenue by leveraging its cash and buying on credit.

Doug Engebretson is a carman for the Alaska Railroad in Fairbanks. An average of 600 employees worked at the railroad in 1985.

NEW MANAGEMENT EMPHASIS

Other changes occurred within the railroad's Finance Department as steps were taken to equalize the emphasis on the three key departments in the railroad: operations, marketing and finance. A computerized accounting system was implemented to improve what had previously been manual procedures. Generally Accepted Accounting Principles (GAAP) were adopted as the railroad's accounting standards, which more closely matched revenue to expenses.

The Marketing Department took a more aggressive stance in seeking business for the railroad. The freight sales division was expanded by the addition of a freight sales manager with responsibility for the sales force in Anchorage and Seattle. Marketing developed and promoted two new unit trains, one for overnight trailer traffic and one for bulk petroleum products, to better meet the needs of Alaska shippers.

The Operations Department, responsible for all train movements and the upkeep on all rolling stock, equipment and track, in 1985 conducted the largest overall roadbed maintenance program in recent years. There were 81,000 linear feet of rail replaced, 26,000 new ties laid and about 200 miles of main line track resurfaced.

OUR EMPLOYEES

With all the changes that occurred at the Alaska Railroad Corporation, it is natural that employees would feel the impact. Steps were taken to streamline some departments while others added personnel. An average of 600 employees worked throughout the year, with peak employment topping the 900 mark during the busy summer construction season.

A significant change occurred in the personnel office when it was tied to the labor relations and the compensation and benefits divisions under the corporate umbrella title of Human Resources Department.

All but about 120 of the corporation's employees are represented by unions. There are seven bargaining units representing five unions: American Federation of Government Employees (blue collar and white collar units), American Train Dispatchers Association, Agents/Operators Unit; American Train Dispatchers Association, Train Dispatchers Unit; Brotherhood of Railway Carmen of the U.S. and Canada, International Association of Machinists and Aerospace Workers, and the United Transportation Union.

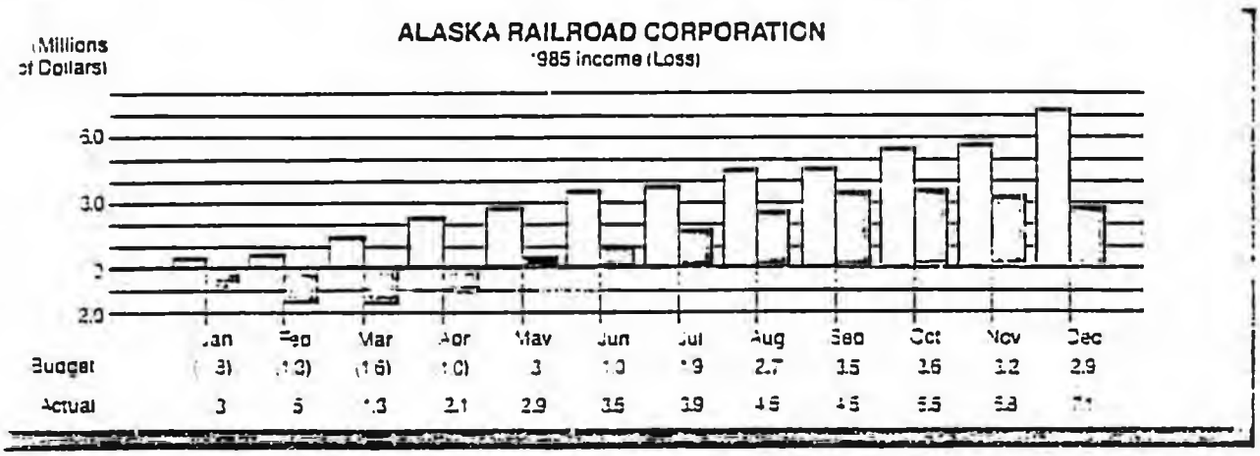
Under federal and state law the union contracts in existence at the time of transfer are to be renegotiated by the corporation within the first two years of operation under state ownership. Beginning in August 1985, for the first time in the history of the Alaska Railroad, all seven bargaining units and management met at the bargaining table to begin hammering out new contracts. Negotiations will continue in 1986.

THE FUTURE

Despite all the changes and reorganization it experienced in 1985, the Alaska Railroad Corporation is looking to 1986 as another year of challenges. An ambitious program is planned to continue to upgrade and improve the railroad's track and roadbed, its rolling stock and its physical plant. A $66 million operating budget was approved by the Board of Directors for 1986 plus $13.3 million in capital improvements.

The Marketing Department will continue its aggressive stance in seeking business for the railroad while providing new, more improved services to meet the customers' needs.

While 1985 was a year of transition for the Alaska Railroad, 1986 is expected to be a year of fine-tuning that will bring the corporation into the forefront of the transportation industry in Alaska.



The Operations Department is the part of the railroad most people are familiar with because it is most visible. Operations has three major divisions: Transportation, Motive Power and Equipment, and Engineering. Together these three divisions are responsible for all train movements, for the upkeep of all rolling stock and equipment, and for construction and maintenance of the track and roadbed and all railroad buildings.

Other divisions in Operations are less known, such as Security and Claims, Operating Rules and Hazardous Materials. Security and Claims is responsible for the security of the line including preventing trespassing and for investigating train and train-related accidents. This department also processes all claims for lost or damaged freight and equipment.

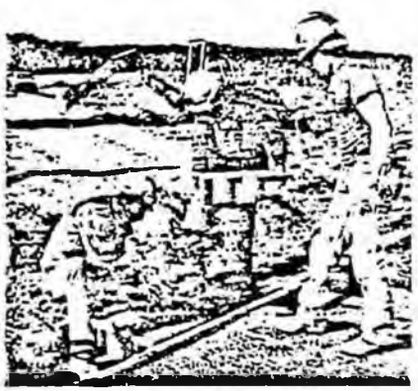
The Operating Rules Department administers the railroad's rules program for operating trains and equipment. To ensure understanding and compliance of the operating rules and special instructions, periodic training and testing is provided for operating personnel by this department.

The Hazardous Materials Office is responsible for inspecting equipment, rolling stock and buildings for compliance with corporate rules and regulations regarding the use and transportation of hazardous materials.

ENGINEERING

5 crews replaced about 26,00 crossties, relaid 81,000 linear feet of mainline rail using premium alloy rail, and turned another 40,500 feet of rail on curves. More than one-third of the rail system, or about 200 miles, was surfaced.

Bridge crews repaired and upgraded 23 steel and timber bridges, including the repair or installation of timber stringers, bulkheads, pilings, guard rails and bridge ties.



Maintenance workers installed a new, high technology material at railroad crossings that will provide a better crossing surface for the traveling public.

The single largest maintenance expenditure totalled about $2 million for rehabilitation of five tunnels between mile 51 and 53 of the main line. The two-year, $4 million project, about 50 miles north of Seward, will decrease maintenance of the tunnels and improve operations through that section of track. Work completed by the project contractor in 1985 included rock bolting of all the tunnels, ditching to improve drainage, and pouring four of 10 new reinforced concrete tunnel portals.

The Engineering Department coordinated with the state Department of Transportation and the Municipality of Anchorage in construction of two grade-separated crossings in the Anchorage area. The work included three new railroad bridges at Dimond Boulevard, 76th Avenue, and Campbell Creek, plus 1.6 miles of new mainline track. Work was begun also on the Municipality's West Northern Lights Boulevard project in Anchorage. When completed in 1986 it will be similar to the grade-separated crossing at Dimond Boulevard.

Engineering also coordinated with the Department of Transportation in Fairbanks in making track changes to the Fairbanks Yard to provide space for construction of a highway nearby and an overpass across the Fairbanks Yard. The work included construction of a balloon track to replace the wye and will eliminate a crossing in the middle of the yard.

Most of the work completed by the Engineering Department was designed to improve or enhance other areas of the Operations Department. For instance, electrical service was installed at the Anchorage and Fairbanks van terminals to provide "keep from freezing" (KFF) trailer service. KFF provides shippers with electrical power for heating and preserving goods shipped during the winter in trailers on flat cars.

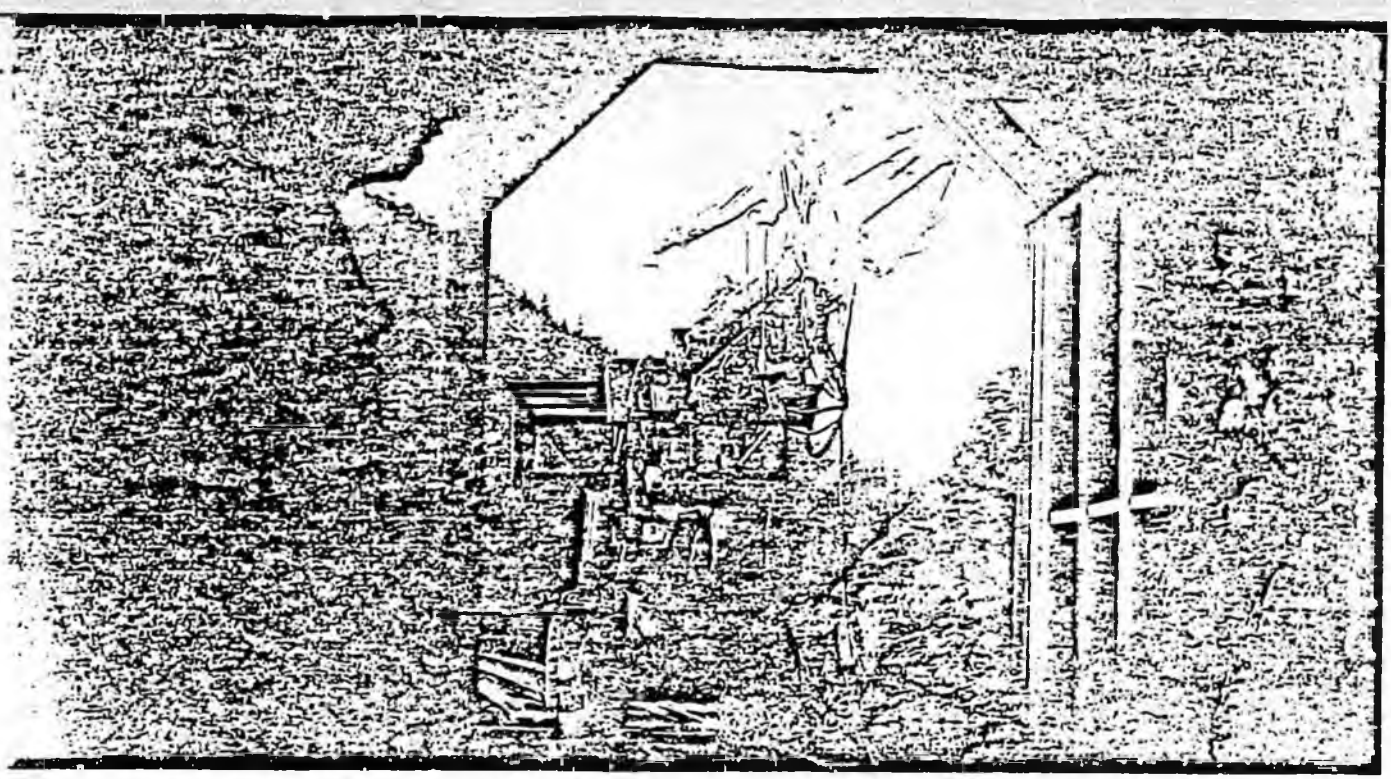
Increased truck-trailer traffic on the Alaska Railroad led to the construction of a 4,000-foot van track in Whittier to improve trailer-on-flatcar (TOFC) service. Other van terminal improvements were made both at Whittier and Seward including new trackage, lighting and drainage.

Upgrade of 12 miles of the Eielson Branch was begun with the replacement of 4.6 miles of 75-lb. rail with secondhand 115-lb. rail that was replaced on the main line. The branch line serves Ft. Wainwright, North Pole and Eielson Air Force Base. It is used for delivery of coal to fuel the military's power plants. A 4,100-foot siding was constructed on the branch line at North Pole to accommodate increased traffic expected to result from the expansion of the nearby oil refinery.

Throughout the year Engineering employees worked to upgrade and improve the railroad's physical plant. Facilities at Fairbanks, Denali Park, Anchorage and Seward were painted or remodeled; water, heating and sewage systems were improved; and roofs were replaced or insulated to reduce maintenance, repair defects, reduce heat loss and improve appearance and operation.

The single largest physical improvement was construction of boiler plants in several Anchorage facilities as part of the final phase of a three-step utility modernization program that eliminates the railroad's dependence on a nearby high-cost, outmoded, commercial heating plant. The results are significant energy savings and improved working conditions.

The project included installation of five boilers, including three 400-horsepower steam boilers in the old blacksmith shop, which when constructed in the early 1920s was the original railroad boiler plant, and two 125-horsepower hot water boilers in a new building constructed near the Anchorage warehouse area. Three smaller plants were installed to heat the general office building, which houses the Anchorage Passenger



Rehabilitation of five tunnels between Seward and Portage was the single largest track maintenance expenditure in 1985. The $4 million, two-year project will be completed in 1986.

Depot; the annex, which includes the accounting and computer personnel; and the Anchorage freight house, which includes the procurement offices.

This project will be completed in 1986 with installation of an energy management and control system, some minor renovations to buildings, and relocation of the car cleaning facility.

MOTIVE POWER AND EQUIPMENT

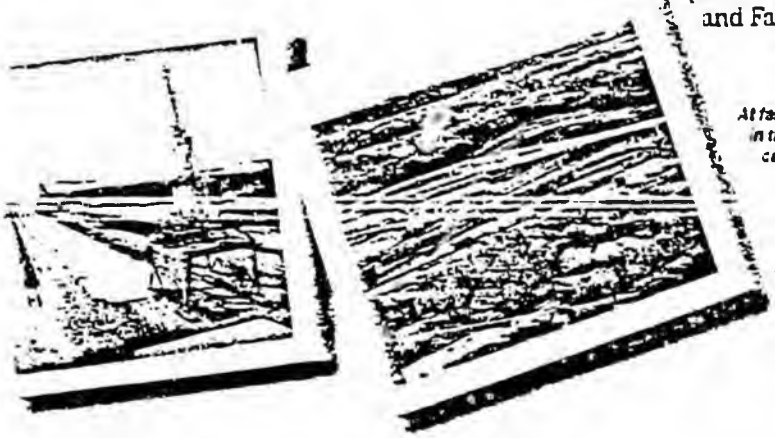
While the Engineering Department was working in 1985 to improve the condition of the railroad tracks, roadbed and physical plant, the Motive Power and Equipment (MP&E) Department acquired new rolling stock and equipment or overhauled much of what was already on hand.

Major purchases included five new state-of-the-art GP49 diesel locomotives manufactured by the Electro Motive Division of General Motors. The 2,300-horsepower locomotives have an anti-wheel-slip system that improves train performance and fuel consumption.

In an effort to improve the reliability of the existing locomotive fleet and to reduce maintenance costs, MP&E completed a major overhaul of the electrical components and trucks on two locomotives and completed the rewire and electrical upgrade to control circuits on a third. A fourth locomotive was repowered with new pistons, cylinder liners and heads.

Several locomotives were judged beyond economical repair and were retired, including No. 1500. An F-7 engine that had a glamorous history with the Alaska Railroad, No. 1500 provided the power for many ceremonial trains including two trains used during transfer ceremonies in January. No. 1500 also was featured in a motion picture filmed on the Alaska Railroad in 1985 called "Runaway Train." It was the grand old lady's last official duty before being retired and donated to a local transportation museum.

To improve freight-hauling capabilities, 45 articulated intermodal cars were purchased for TOFC service. Each car is hinged, or articulated, in three sections to allow for easier train movement. There is space on each car for three trailers. The cars are used primarily for hauling trailers between Anchorage and Fairbanks.



At far left, the railroad yard in Fairbanks includes about 440 acres in the heart of the city. A row of articulated flat cars shown at center awaits trailers for shipment to Anchorage.

Left, the Alaska Railroad owns about 660 acres near downtown Anchorage, most of which is at the mouth of Ship Creek. In the background is the roundhouse where all equipment maintenance and repairs are done.

MP&E began construction of two power cars and wired 15 of the new articulated cars to provide electricity for trailers carrying perishable goods and other commodities that might freeze.

Two self-propelled passenger cars were purchased in 1985 also. The cars, known as rail diesel cars or RDCs, were rebuilt with the installation of twin 347-horsepower Cummins engines and twin-disc transmissions. The first of the two cars was received in December 1985 and was placed in winter passenger service at the start of the new year.

For the first time MP&E placed an employee in the railroad's Seattle office to work exclusively with shippers in solving technical problems related to equipment use and loading requirements. A program establishing new rules for open-top loads was initiated to reduce the cost to shippers for improperly secured or heavy loads.

TRANSPORTATION

Train movements increased dramatically in 1985 and the Transportation Department worked to ensure those movements were made safely and efficiently. Gross trailing ton miles, a measurement for the movement of one ton over one mile, were up 25 percent in 1985 over 1984. Freight traffic accounted for the major portion of this increase, but passenger traffic also rose. Ridership surpassed the quarter-million mark for the first time in the railroad's history.

The first full year of export coal service by the railroad was completed in 1985. A steady source of revenue was derived from the three-unit-trains-a-week movement of coal from the Usibelli mine at Healy to Seward for export to Korea. The contract for hauling export coal began in December 1984 and since its inception 132 coal trains have hauled 671,000 tons of export coal.

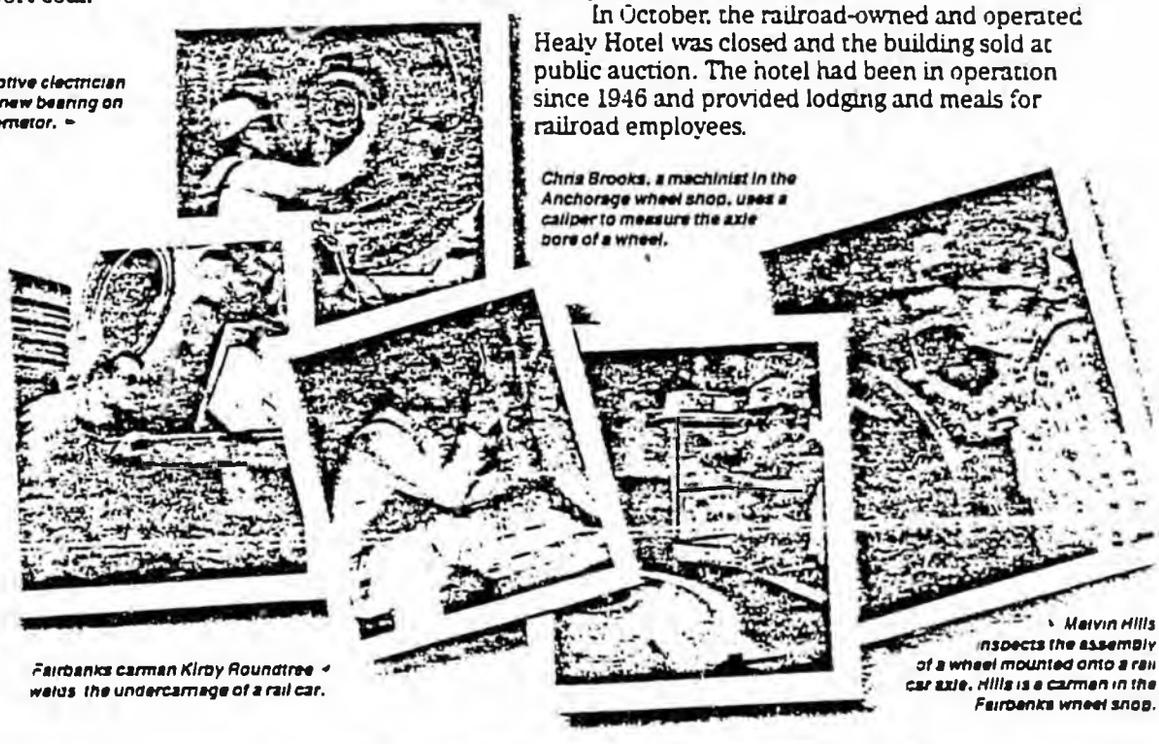
In addition, 562,000 tons of coal were moved from Healy to the Fairbanks area to provide fuel for five power plants in Interior Alaska and the military bases at Wainwright, Clear and Eielson.

In May 1985, a new intermodal freight service was inaugurated called the Arctic FOX, or Freight Overnight Express. This service is a unit trailer train that provides six-days-a-week overnight delivery of trailers and containers between Anchorage and Fairbanks. The Arctic FOX operates with an average of 10 articulated flat cars that provide space for about 30 trailers or containers. The FOX hauled 5,832 trailers in its seven months of operation in 1985.

The FOX is the first cabooseless train service operated on the Alaska Railroad and the first service operated with a two-member crew. This was made possible by the addition of train rear-end devices. These end-of-train monitors provide vital information to locomotive engineers operating cabooseless trains. Each device consists of two units, a receiver in the locomotive cab and a transmitter on the rear car of the train. Together these units allow crews to monitor air brake pressure, detect motion in the last car of the train and measure train distances traveled. The units also provide the rear-end car with an FRA-required amber light that automatically turns on at dark.

During the same time the Arctic FOX service was initiated, the Anchorage freight house operations were discontinued. All services for loading and unloading railcars, consolidation of freight, and rubber-tire delivery were contracted to local businesses in an effort to divest from some less profitable, labor-intensive operations. Because of the railroad's rapid growth in the intermodal business, all Anchorage freight house employees were transferred to Intermodal Services, which was established as a separate division within the Transportation Department.

In October, the railroad-owned and operated Healy Hotel was closed and the building sold at public auction. The hotel had been in operation since 1946 and provided lodging and meals for railroad employees.



Jim Trueblood, a locomotive electrician in Anchorage, installs a new bearing on a locomotive engine alternator.

Chris Brooks, a machinist in the Anchorage wheel shop, uses a caliper to measure the axle bore of a wheel.

Larry Newsham, technical services manager, inspects loaded rail cars before shipment from Seattle to Anchorage.

Fairbanks carman Kirby Roundtree welds the undercarriage of a rail car.

Melvin Hills inspects the assembly of a wheel mounted onto a rail car axle. Hills is a carman in the Fairbanks wheel shop.

Because of its high operating and maintenance costs, the hotel was closed in favor of a more economical means of providing these services by contracting with a local motel and cafe at Healy.

In December the second new freight service for 1985 began operating. A daily unit tank train service between Fairbanks and Anchorage, called the Oil Worker Limited or OWL, transports petroleum products from the local oil refinery southbound to Anchorage and gasoline northbound to Fairbanks from storage yards in Anchorage. This daily service greatly improved freight delivery service for these commodities and turnaround time on empty tank cars.

OPERATING RULES

In late 1985, after extensive review and consultation with railroads operating in the Lower 48, the Operating Rules Department began training operating personnel on an innovative new system known as Track Warrant Control. This system is used on many other U.S. railroads and is designed to expedite the movement of trains while providing a safe and efficient operation. It will replace the complicated and time-consuming train order method in use at the Alaska Railroad for decades. Target date for railroad-wide implementation of the Track Warrant Control system is set for February 1986.

SECURITY AND RISK MANAGEMENT

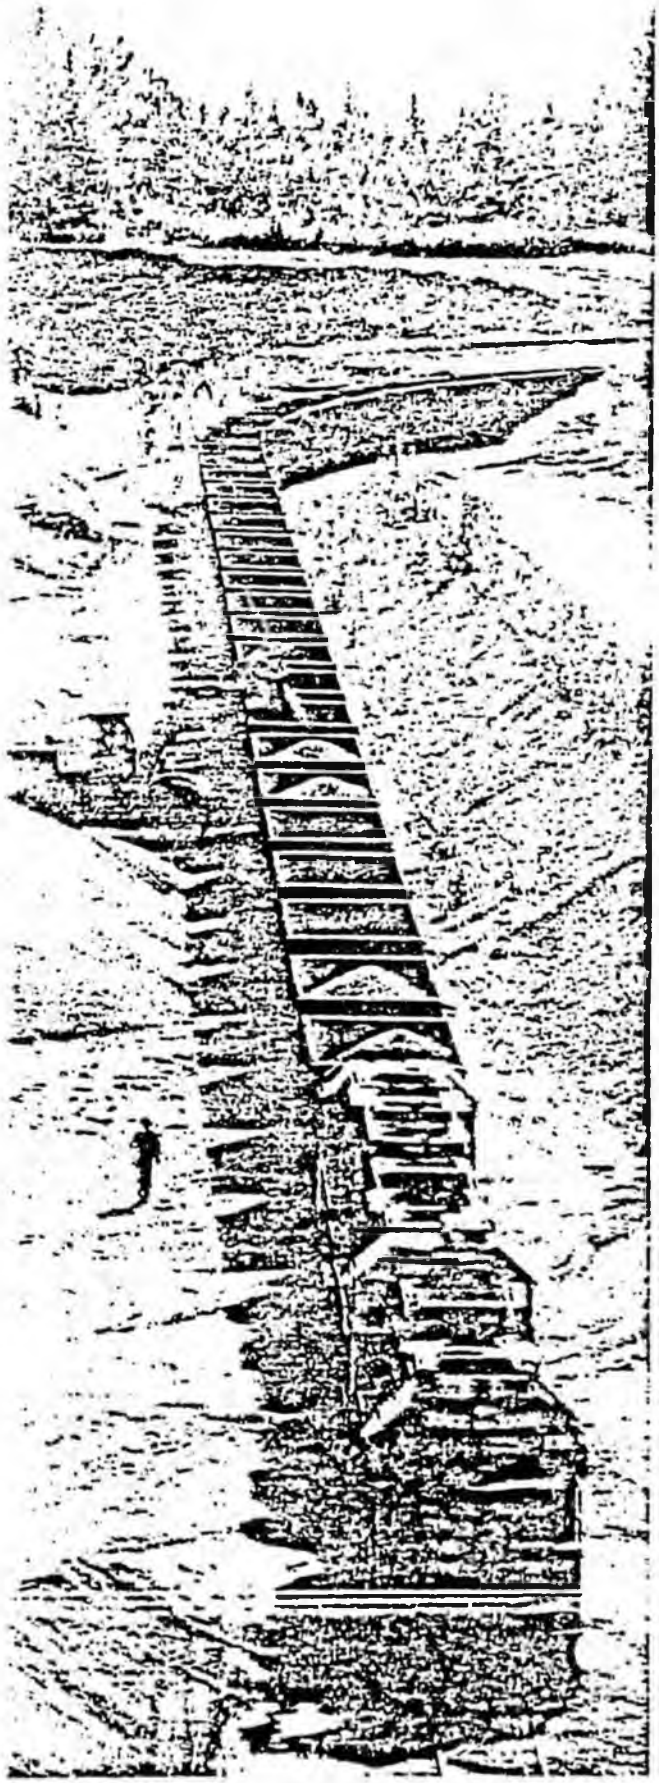
With the transfer of the Alaska Railroad to state ownership, the new corporation was required to organize a risk management program to provide insurance for property damage or loss, theft, fire, vandalism and other potential liabilities. For the first six months of 1985 the railroad operated on an interim program with coverage provided under the state of Alaska's risk management program.

During this interim period a review of the railroad's insurance needs was conducted and a risk management program developed that was marketed to domestic and foreign underwriters.

With the first year of experience as a reference, the risk management program is being assessed and modifications being made as the insurance markets dictate and as the corporation also continues to define and refine its specialized insurance needs.

HAZARDOUS MATERIALS

As part of its continuing safety program, the Alaska Railroad provided training and information regarding the loading and movement of hazardous materials to shippers as well as local fire fighting and emergency services personnel along the railbelt. The Hazardous Materials Specialist provides assistance to customers to ensure that materials shipped on the Alaska Railroad are loaded and placarded in compliance with federal regulations. Examples of materials shipped in 1985 include petroleum products such as gasoline and jet fuel, and chemicals for use in manufacturing.

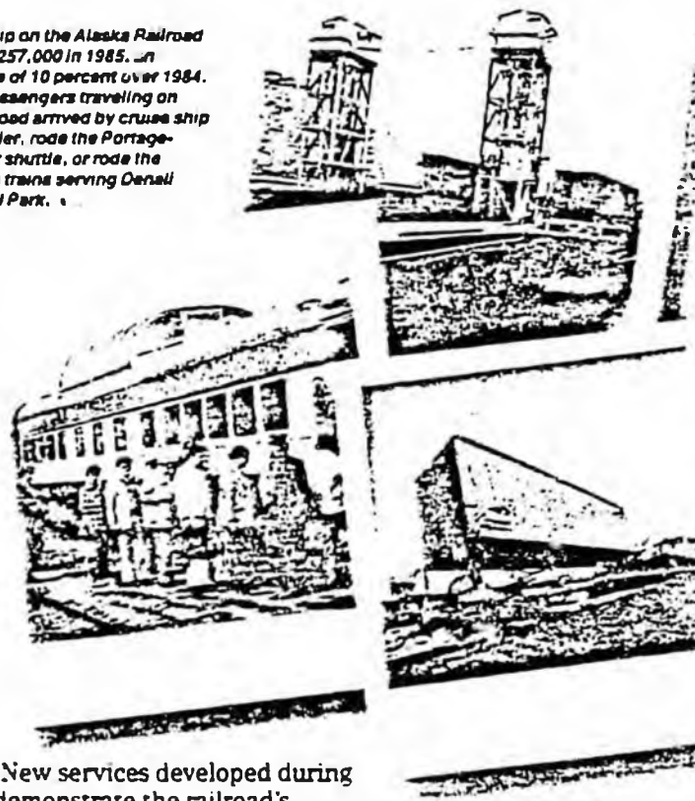


Gravel unit trains are loaded near Palmer, in the Matanuska Valley, 40 miles north of Anchorage.

To achieve the business goals of the new railroad, the Marketing Department expanded the activities of the department, placing greater emphasis on developing new markets for the railroad's services.

Marketing's role within the corporation includes selling, pricing, rate and service contracting, cost of service analysis, market planning, market research, market development, customer service, advertising and promotion of both freight and passenger service. It also includes management and development of the real estate holdings of the corporation.

Ridership on the Alaska Railroad totaled 257,000 in 1985, an increase of 10 percent over 1984. Most passengers traveling on the railroad arrived by cruise ship in Whittier, rode the Portage-Whittier shuttle, or rode the express trains serving Denali National Park.



Whittier is one of Alaska's major ports and is also an important freight terminal for the Alaska Railroad. Rail cars, truck trailers and containers bring goods to Alaska through Whittier.

Seward is another major port served by the railroad. Coal exports, rail cars, trailers and imported pipe shipments are moved by the railroad from this small seaport community.

A trailer is shipped on an articulated flat car, one of 45 specially designed cars bought by the railroad in 1985. Each flat car can carry three trailers.

New services developed during 1985 demonstrate the railroad's dedication to customer service. The first of these specialized services was initiated only four months after the railroad transfer. Named the Arctic FOX (Freight Overnight Express), the service provides overnight delivery of high priority, highway trailers between Anchorage and Fairbanks using specially designed articulated flat cars, the first equipment purchased by the railroad in 1985. The efficiency of the FOX operation permits the railroad to compete with motor carriers in this market and pass the cost saving along to the Alaska consumer. Since its inception in May, the popularity of the FOX has steadily increased. By the end of the year it was operating regularly at over 90 percent capacity.

Another priority service begun in 1985 was the OWL (Oil Worker Limited). This daily train transports jet fuel from the petroleum refinery at North Pole to Anchorage, returning to the Fairbanks area with gasoline and other petroleum products. The efficiency of this service has made it possible for the customer to double the shipping volume without increasing the number of tank cars it leases.

FREIGHT SERVICE

Freight service is the most important source of income for the railroad. In 1985 it resulted in three-quarters of the corporation's $67 million in revenue. Passenger service and real estate revenues accounted for another 13 percent of the total.

Over 90 percent of freight revenue is derived from five areas: rail cars from the Lower 48, coal, petroleum, gravel, and TOFC/COFC (trailer on flat car/container on flat car.) The remaining percentage of freight is split between pipe shipments and local freight. Rail cars, coal and TOFC/COFC are handled predominately at two of Alaska's major ports, Seward and Whittier.

One-fifth of the freight revenue is derived from coal shipments, either export or local delivery. Alaska coal is exported to Korea through a major coal transloading facility built at the Port of Seward in 1984. The coal export contract with the Koreans runs through 1992. During the first year of the contract (actually 13 months, including December 1984) 871,000 tons of coal were moved to Seward. That is about 20 percent below the volume projected because of lower consumption by the customer, Korea Electric Power Company.

Coal shipments within Alaska were also lower than expected. Warmer than usual temperatures in

ALASKA LEGISLATURE COMMITTEE FILES 1987-1988 8672
5140 HTRA HB 47 (FILE 1)

712

Interior Alaska resulted in reduced consumption by the five power plants in the Fairbanks area and the nearby military bases that use coal for fuel. About 562,000 tons were shipped locally in 1985.

Gravel and sand shipments, which move in unit trains between the Matanuska Valley and Anchorage, were the fifth largest revenue producers among all commodities shipped by rail. These shipments are tied to the cyclical rise and fall of the Anchorage area construction industry, which began to decline in 1985. Although lower activity in highway and building construction is anticipated again in 1986, a high volume of gravel is expected to move via the Alaska Railroad.

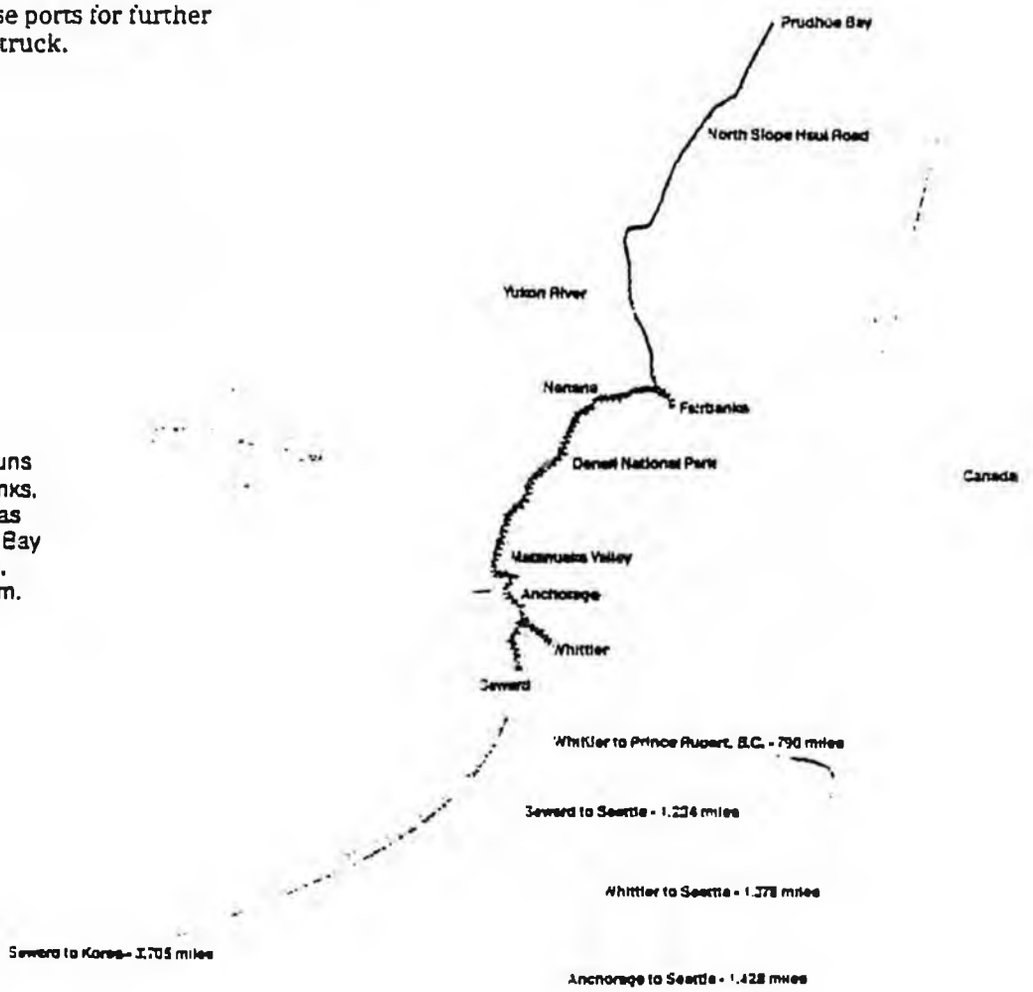
The Alaska Railroad connects with a number of water carriers providing a variety of excellent services from the Lower 48 to Alaska ports of Whittier, Seward, and Anchorage. Major rail carriers and truck lines connect with these water carriers at Seattle, Tacoma, and Prince Rupert, British Columbia. The water carriers provide frequent rail car barge, trailer, and container service.

Among the extensive railroad properties are the modern facilities at the ice-free ports of Whittier and Seward. Bulk and container cargos are unloaded at these ports for further transportation via rail and truck.

Interior Alaska covers thousands of square miles, much of it primitive wilderness; and, its towns and settlements are often isolated by distance and terrain. But, although the Alaska Railroad goes no farther than Fairbanks, it uses a combination of transportation modes, including motor carriers, river boats, and aircraft, to carry freight to the remote corners of the state.

Freight is transferred at Nenana to river barges which provide through routes and rates in connection with the railroad. This river freight service extends along the Tanana and Yukon rivers to Fort Yukon, and even to Marshall, just 150 miles from the Bering Sea. The railroad has for decades provided this essential service to the Bush, and is continuing to upgrade transportation facilities and services.

The railroad competes actively for the transportation of imported steel pipe products, which move into Alaska principally through the ports of Seward, Anchorage, and Valdez. The railroad moved 74,000 tons of pipe in 1985.



The "railbelt" region of Alaska runs 470 miles from Seward to Fairbanks, connecting southcentral Alaska as well as the interior and Prudhoe Bay with water carriers from Canada, the Lower 48, and the Pacific Rim.

An aggressive marketing effort and improved service by rail led to a strong recovery in this business in December. Ship traffic through Seward resumed late in the year, discharging pipe for movement to the North Slope oil fields through the railroad's terminal in Fairbanks.

The Alaska Railroad Corporation is a major supplier of transportation services for the petroleum industry. Steel pipe, drilling compounds, machinery, and supplies routinely move over the railroad to Fairbanks for further movement by motor carrier to the North Slope. Massive drilling rigs are fabricated by an Anchorage firm then disassembled for transportation to the oil fields.

PASSENGER SERVICE

The majority of the 257,000 passengers who chose the Alaska Railroad for travel in 1985 arrived on cruise ships through the railroad's port of Whittier, rode the Portage-Whittier shuttle, or rode the express trains serving Denali National Park. Ridership rose by almost 10 percent over 1984, making the year a record for the railroad's passenger train service.

The purchase of two specially rebuilt rail diesel cars (RDCs) received in late 1985 is expected to reduce significantly the cost of wintertime rail service to rural areas, where the greater part of passenger service losses are incurred. These self-propelled passenger cars are available for charter and excursion trains and to supplement other passenger services where necessary.

The Alaska Railroad offers several types of passenger services, depending on season and destination. These services include the Denali express, the rural local service, Whittier shuttle, Seward excursion, and winter service.

The Denali express is the summer service on the Anchorage - Denali Park - Fairbanks route. Trains leave Anchorage and Fairbanks daily from late May to mid-September and serve Denali National Park each way. The Denali express is the last traditional intercity passenger train in the United States and provides spectacular views of Mt. McKinley, the tallest mountain in North America.

The rural, or Bush, service which moves people and their belongings (such as animals, supplies, and food) to remote areas not served by highway or air, is a major public service of the railroad. Bush passengers flag the train at almost any point for personalized service. Wintertime essential Bush and shuttle services during the eight-month season result in about 7 percent of the railroad's annual passenger business. The railroad also provides weekly small freight shipment service to these remote homesites.

The 12-mile trip from Portage to the community of Whittier is traveled by what is familiarly known as the Whittier shuttle. The shuttle provides the only land access to this small but major seaport town. Passengers may ride the train or in their vehicles that are loaded onto flat cars at Portage. Much of the trip is through tunnels because of the many rugged mountains encountered between Portage and Whittier. The train makes several round trips daily between the two stops in the summer. Connections and reservations are available with the Alaska Marine Highway ferry service from Whittier to Valdez.

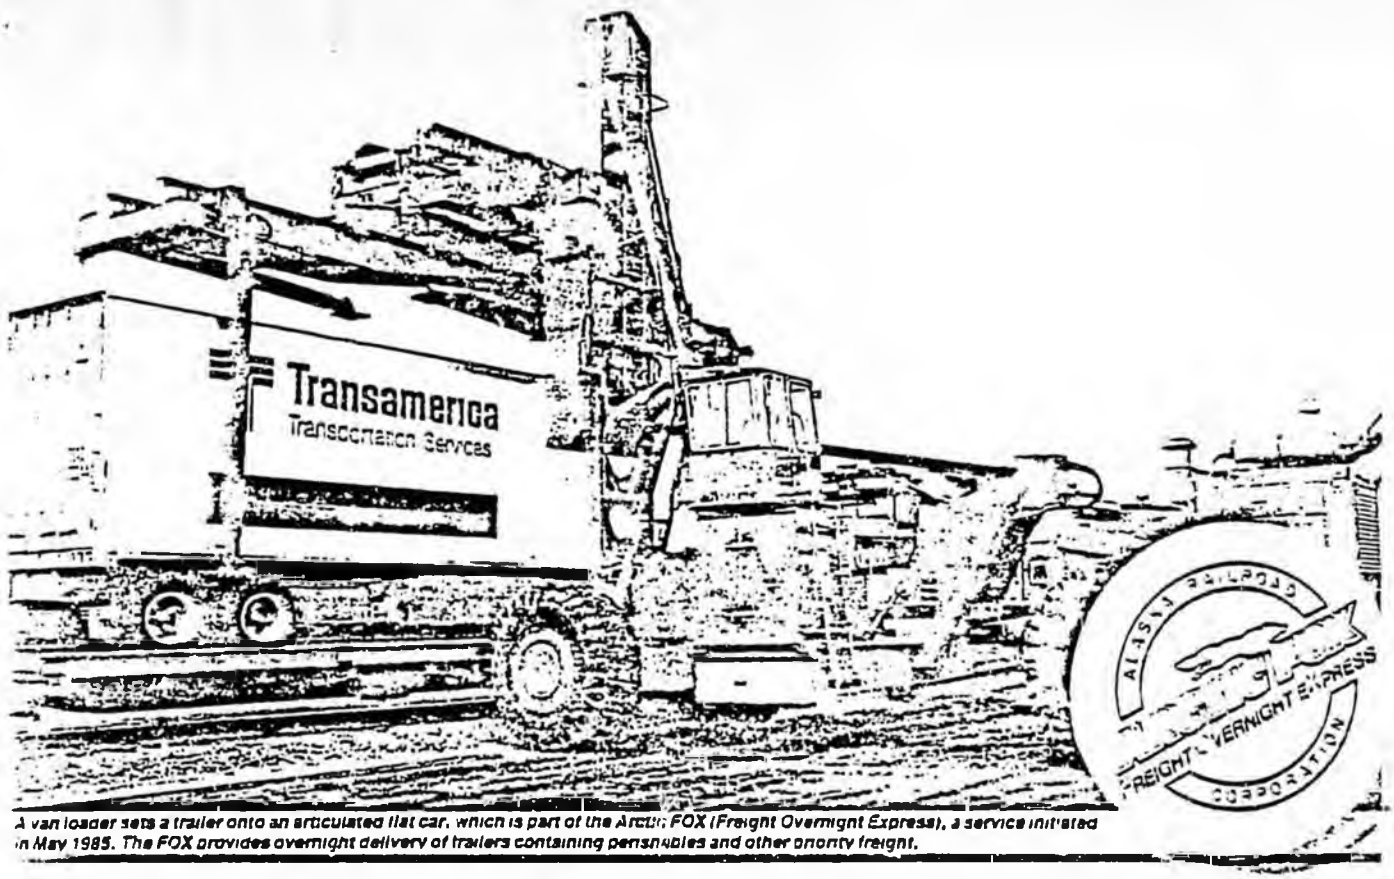
Cruise ship service to Whittier and significant increases in recreational use of the Prince William Sound region, coupled with a banner tourist year on the Valdez to Whittier state ferry route, boosted the number of passengers on the Whittier shuttle by over 20 percent. Ridership in 1986 promises to exceed 1985.

This 20,000-gallon tank car is part of the OWL (Oil Worker Limited), a new, daily unit train that brings jet fuel from North Pole to Anchorage, and returns to Fairbanks with gasoline and other petroleum products.

Coal is loaded at the Usibelli coal mine near Healy for shipment to Seward and then Korea. Twenty percent of freight revenue comes from local and export coal.

Phil Hibdon, left, and Dennis Smith, railroad marketing representatives, provide pricing information for freight service.

Bob Smith is a freight salesman in the railroad's Seattle office. His duties include selling freight services, making customer contacts and servicing existing contracts between the Lower 48 and Alaska.



A van loader sets a trailer onto an articulated flat car, which is part of the Arctic FOX (Freight Overnight Express), a service initiated in May 1985. The FOX provides overnight delivery of trailers containing perishables and other priority freight.

Passenger trains to Seward will begin regular service in 1986 after a 30-year absence. The Railroad was the original link between Anchorage and Seward but service was discontinued when highway travel became more popular. During the summer the railroad will offer a weekly day-long excursion from Anchorage to Seward. Passengers will see glistening glaciers, experience the view from high rocky ledges and wind along canyon streams on this 230-mile round trip through some of Alaska's most beautiful mountain territory.

Winter passenger service is provided on a reduced scale during the shoulder season of September to May. Passenger trains travel between Anchorage and Fairbanks twice each month and to Hurricane twice each weekend.

REAL ESTATE

The Alaska Railroad Corporation controls approximately 38,000 acres of land from the ports of Seward, Whittier and Anchorage to the interior city of Fairbanks. Approximately 40 percent of the land is a transportation corridor or railroad rights-of-way. The remaining real estate includes operational and nonoperational parcels within railbelt communities.

Since transfer of the railroad to state ownership, the scope and duties of the Real Estate Department have expanded to include a greater involvement in land-use planning. Coordinated efforts between Operations and Real Estate departments have been initiated to identify surplus lands available for long term lease. This would result in a more efficient use of undeveloped railroad properties. Leasing policies and practices have been written and implemented to create a more equitable and consistent approach to land management. Innovative ground lease techniques such as rent credits for certain non-depreciable lessee improvements and rent caps that create predictable and financially attractive lease documents will be made available under this new policy. Real estate revenues for 1985 were approximately $4.3 million.

During 1985, a study was initiated to analyze and recommend for the department an office automation system to catalog and create a database to store some 1,200 real estate lease and permit contracts. The recommendation will be implemented in 1986.

Positive steps are being taken to develop a closer working relationship within railbelt communities. The Real Estate Department recognizes the need for a more cooperative approach between the Alaska Railroad Corporation and its host municipalities and boroughs.

THE FUTURE

To implement the Marketing Department's diverse role within the railroad, a formal marketing plan was developed by the department and in late 1985 was approved by the Alaska Railroad Corporation Board of Directors. A key element of the plan calls for new, aggressive marketing programs to establish the identity of the Alaska Railroad throughout the Northwest as well as in the Alaska shipping community.

CHIEF COUNSEL'S OFFICE

The Chief Counsel and his staff were kept very busy in 1985 with the myriad legal issues facing the new railroad corporation.

Topics reviewed during the year by the legal staff included real estate, regulatory review of the rail industry and the railroad's rate structure, personnel and labor relations, commercial financing, and risk management.

The State Transfer Team, which was created prior to transfer of ownership of the railroad to coordinate that process, passed responsibility for many legal tasks to the Chief Counsel in the first quarter of 1985. Foremost among these assignments was continuing oversight of the conveyancing of 38,000 acres of railroad parcels and right-of-way from the federal government to the corporation. Survey, description, and procedural issues continue to be overshadowed by Native corporation claims to valuable railroad parcels. The railroad was involved in negotiations with Ahtna, Eklutna and Toghetthele native corporations. An agreement was reached with Ahtna Inc. in 19[illegible]. Negotiations will continue in 1986 to resolve the remaining claims.

The interpretation and application of both old and new railroad leases required considerable legal support. Corporate attorneys assisted in development of a new leasing policy and new master lease. The legal office also participated in the development of corporate relations with many state, federal, and military agencies regarding mutual land ownership and management concerns.

The legal staff was instrumental in the financing of millions of dollars in new equipment purchases in 1985 by preparing and negotiating necessary commercial documents. Procurement of equipment and materials also required legal review of solicitation packages and legal assistance in the resolution of bid disputes.

Competitor challenges to the corporation's pricing of piggyback traffic (truck trailers on flat cars) led the Chief Counsel to retain transportation and accounting experts to review the corporation's rate costing practice. The studies confirmed that the corporation's pricing was appropriate.

Competing water carriers fought unsuccessfully to deny the corporation any participation in the Interstate Commerce Commission's exemption of boxcar traffic from regulation. The exemption will permit more freedom in the marketing of transportation services.

Through the first year of state ownership, the corporation received relatively few claims for personal injury and property damage related to railroad operations. Corporate counsel participated in resolution of several of the claims and in review of the corporation's risk management procedures.

Given the breadth of 1985 corporate legal affairs, the Office of the Chief Counsel will be challenged by these and new assignments in 1986.

Chris Muniz, a truck driver for the railroad, assists in loading and unloading trailers on flat cars in the Anchorage yard.

An administrative assistant, Shirley Tobin is employed in the railroad's Seattle office.

Betty Elge is the dock agent, and Beverly Clauson, foreground, a clerk-typist, in Seward.

As a federal agency, the Alaska Railroad had adhered to federal hiring practices and personnel procedures. With transfer of ownership to the state, the railroad began to develop and implement policies and procedures that more closely responded to the needs of the new Alaska Railroad Corporation.

In the process, several personnel and employee relations functions were consolidated into one department. The Human Resources Department was created from the old Personnel Office. Added to it were Organization, Compensation and Benefits, Labor Relations, and Health, Safety and Environment. This reorganized department provides a full range of employee relations services for both management and employees. Affirmative action and the streamlining of recruiting and hiring practices are a top priority in better utilization of the work force.

Among the major Human Resources projects in 1985 was conversion of all personnel and payroll records to a fully automated, computerized system. Complete conversion to the new records system was expected by February 1986. This change will allow ready access to employee data and will insure an accurate employee record system.

Human Resources played a significant role in labor negotiations in 1985. According to both the federal transfer and state corporation acts, union contracts in existence at the time of transfer to state ownership are to be renegotiated by the corporation within the first two years of state operation. Beginning in August 1985, for the first time in the history of the Alaska Railroad, representatives from all seven bargaining units and management met at the bargaining table. This unique process called for bargaining with all the unions at once on items common to all the units. By year's end significant steps had been made toward reaching a mutually agreeable master contract.

Negotiations will continue in 1986 to finalize the master agreement after which each bargaining unit will have an opportunity to negotiate an addendum specifically for each union.

UNIONS REPRESENTING RAILROAD EMPLOYEES

(As of December 31, 1985)

Union	Employees
United Transportation Union	128
Brotherhood of Railway Carmen	40
International Association of Machinists and Aerospace Workers	89
American Federation of Government Employees	288
American Train Dispatchers Association	13
American Train Dispatchers Association, Train Dispatchers Unit	5
Blue collar and white collar units*	

Administration of all benefits programs for railroad employees is managed by the Organization, Compensation and Benefits Department in Human Resources. This department administers the new life insurance and medical care programs for employees, including vision, hearing and dental care. This new program is designed to cover new employees and transferred employees and was implemented in February 1985.

This department also implemented a pension plan and a tax-deferred savings plan for non-represented employees. These plans allow employees to contribute a portion of their pre-tax earnings to a retirement and investment program. The deferred savings plan allows employees to build funds for their retirement while reducing their current taxes. Employees who participated in the Civil Service Retirement program prior to transfer remain in that system.

A safe workplace and working conditions have always been a priority at the Alaska Railroad. Corporation-wide training programs in first aid and cardiopulmonary resuscitation were provided several times throughout the year by the Safety Office. Safety meetings were held throughout the railroad on a regular basis to keep safety in the forefront of employees' minds while at work and at home.

The result was a reduction in accidents and serious on-the-job injuries. At the close of the year the Alaska Railroad Corporation was in contention with other railroads of similar size for a second place Harriman Award. The Harriman is a national safety award presented by the Federal Railroad Administration. The railroad received a fourth place Harriman in 1984 and a third place in 1983.

BENEFIT PROGRAMS
(As of December 31, 1985)

PENSION PLAN	Federal Retirement System*	Corporation Program	Total

When the Alaska Railroad changed hands from federal to state government, the Finance Department was a primary recipient for dramatic alterations. The changes were part of a corporate three-year plan generated in early 1985. The Finance Department as well as the corporation met or exceeded its goals for the first year.

The financial reorganization began with a management-oriented focus on the department. Accordingly, the position of Vice President of Finance was created, with all finance, information systems, procurement and supply departments reporting to this position. Formerly, under federal administration, those departments reported to the Department of Administration.

An important objective outlined in the three-year plan was the purchase of new equipment. Under federal administration all major purchases were paid by cash appropriated by Congress as part of the federal Department of Transportation budget. The new Finance Department was able to prepare a financial package that emphasized lease-purchase agreements for equipment and also established a credit line for the new corporation. The package resulted in the purchase of approximately $12 million in new equipment such as flat cars, locomotives, rail diesel cars and computers. The corporation spent an additional $10 million for improvements to the mainline track, tunnels and other areas.

Installation of an on-line accounting and financial system was another giant step taken by Finance. A new IBM 4361 computer was added which handles accounts payable-receivable, general ledger, inventory, purchasing, payroll and personnel management. The new system uses modern on-line capabilities as the standard for its operations, which prior to transfer had depended on a manual accounting system. In addition to updating the railroad's finance and record keeping capabilities, the Finance Department was responsible for expanding the use of personal computers in several work areas. The new PCs generate a huge time and cost savings in every department in which they are used.

A major activity of the new corporation in 1985 was wrapping up all accounts receivables and payables left behind by the federal government. The Federal Railroad Administration (FRA) contracted with the Alaska Railroad Corporation to collect outstanding accounts receivable and make payments for outstanding federal debts. Over $12 million of federal accounts receivable was collected by the corporation, much of which was more than six months past due. The corporation received a collection fee based on its contract with the FRA.

Another major activity specifically involved the corporation's surplus inventories. The Finance Department streamlined the warehouse and supply operations by eliminating excess inventories through public auctions held throughout 1985, generating approximately $1 million in revenue. A more efficient supply operation has resulted from the reductions.

New computers help Dave Brazell, computer operator, to streamline the financial and record keeping process for the railroad.

The accounting department in Anchorage was substantially updated with the addition of a new computer which handles accounts payable and receivable, general ledger, inventory, purchasing, payroll and personnel management.

The corporation began divesting itself of the gift shop business in 1985. Though not finalized at the close of the year, sale of the Passenger Depot gift shops to the private sector is in progress.

When reflecting on 1985 I consider the major accomplishment of the Alaska Railroad Board of Directors was effectively setting the stage under state ownership for the future successful management of the Alaska Railroad.

As directors we fully realize that our first responsibility is to the citizens of Alaska. We also see a need to establish an arena of cooperation and accountability with the Governor and the state legislature. Thanks to the positive response of Governor Bill Sheffield and the oversight committees of the legislature, we were able to establish this bond of trust and were given the latitude to function in a free enterprise environment. This certainly contributed to our success in 1985 and provided a platform on which those who follow in our footsteps may build.

At our regular board meetings, in order to be more responsive to the needs of the communities we serve, as well as our customers, an opportunity is provided at each forum for public comment. It is this exchange that has given the board of directors an opportunity to receive input on such issues as leasing policies, bidding procedures, needs of our employees, and the public response to our services.

This ability to communicate on a local level with management, as well as the board of directors, has provided a vehicle for public communication that was practically nonexistent under federal ownership. I am sure this was the intent of Senator Ted Stevens and the many others who worked so long and hard for state ownership of the Alaska Railroad.

In 1985 we were able to benefit from the momentum of the prior year's economy, a stable work force and some creative management innovations by the railroad management. The result was increased earnings and a profit at the bottom line. However, 1986 will present new concerns. The Alaska Railroad, like any other business in Alaska, is not exempt from the predicted slowdown in the economy. It will take a concerted effort on the part of each of us to continue our first year's success.

The board of directors would be remiss if each member did not thank you for your patience and support during this first year. We are making history with this railroad and it is exciting.

James O. Campbell
Chairman of the Board of Directors

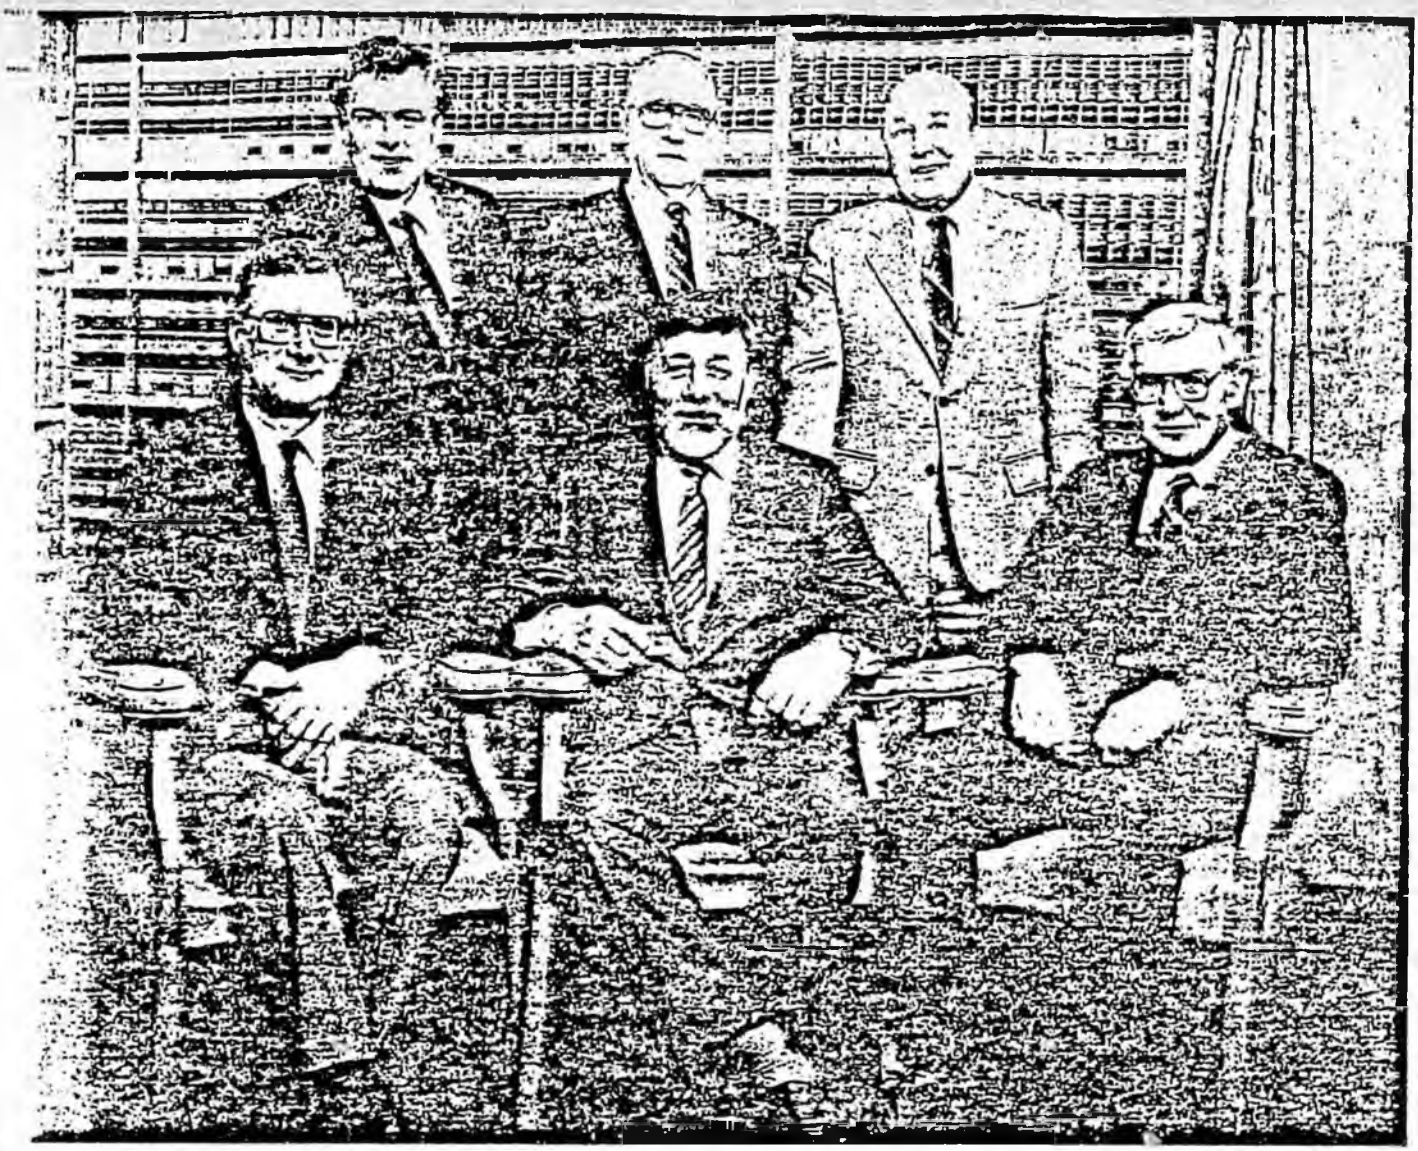
Prior to the transfer of the Alaska Railroad to state ownership in January 1985, a seven-member board of directors for the Alaska Railroad Corporation was appointed by Governor Bill Sheffield. Appointment of the board fulfilled a requirement outlined in the 1983 Alaska Railroad Corporation Act, which established the corporation.

The Alaska Railroad Corporation board is responsible for the management of the corporation but has delegated certain powers and duties to the Chief Executive Officer, Railroad President Frank Turpin.

James O. Campbell is chairman of the board of directors. He was president and general manager of Spenard Builders Supply when his retirement was announced in late 1985. Campbell has worked and served on numerous special committees and community service projects. A resident of Alaska since 1959 he has been an Anchorage assemblyman and president of the Anchorage Chamber of Commerce.

Board vice chairman is **Frank X. Chapados** of Fairbanks. He has been an Alaska resident since his birth in Juneau in 1914, and has worked most of his life in southeastern and interior Alaska. Currently, he is president and general manager of H & S Forwarders, Inc., in Fairbanks. Chapados was elected to the state House of Representatives in 1958, re-elected in 1961, and served as chairman of the Joint House & Senate Finance Committee. He has been active in many civic and community programs including being past president of the Fairbanks Chamber of Commerce. He has worked as an enforcement agent for the U.S. Fish and Wildlife Service and was also a U.S. Marshal in Fairbanks.

Myron M. Christy is the railroad board member from out of state. He resides in San Francisco and fulfills the directive of the legislature that one board member have at least 10 years of management experience in the railroad industry outside Alaska. Christy worked with the Western Pacific Railroad Company from 1950 to 1973 in many positions including president and CEO. Currently he is consultant and director for U.S. Leasing International, Inc.



The Board of Directors, seated from left: Commissioner Loren H. Lounsbury; Board Chairman James O. Campbell; and Lewis E. Dickinson. Standing from left are Gerald D. Valinske; Board Vice Chairman Frances X. Chapados; and Commissioner Richard J. Knapp. Shown separately below left is Myron M. Christy.

Lewis E. Dickinson is a founding partner of DOWL Engineers, a professional engineer and a registered land surveyor. As a railroad board member, he brings with him over 30 years of engineering experience and almost 25 years of business management experience. Prior to founding DOWL Engineers, he worked for the City of Anchorage in the city engineer's office.

Richard J. Knapp is one of the two state commissioners who serve on the railroad board. As commissioner for the Department of Transportation and Public Facilities, Knapp represents the transportation interests of the state. Knapp is a retired rear admiral of the U.S. Coast Guard, one of six appointed by President Carter in 1978. A graduate of the U.S. Coast Guard Academy, he served as district commander of the Coast Guard in Alaska from 1980 to 1984, and has a master's degree in business administration from George Washington University in Washington, D.C.

The second commissioner representing the state of Alaska is **Loren H. Lounsbury**, Commissioner of Commerce and Economic Development. Lounsbury is a 40-year Alaska resident, and graduated from Anchorage High School in 1952. He is a professional engineer and a registered land surveyor. Until his appointment as commissioner in January 1985, he was president of Lounsbury and Associates, Inc. Lounsbury has served on numerous community service boards and is the former Honorary Consul of the Republic of Korea for Anchorage.

Gerald D. Valinske serves on the railroad board as a member of the United Transportation Union, Local 1626. He has been a conductor with the Alaska Railroad since 1975. A 12-year Alaska resident, Valinske worked with the Milwaukee Railroad as a brakeman prior to moving to Alaska. In 1984, he was a lobbyist for the United Transportation Union, American Federation of Government Employees, and the Brotherhood of Railway Carmen.

EXPLANATION OF VARIANCES - YEAR-TO-DATE

- Revenues are lower due primarily to reduced coal shipments, gravel, TOFC/COFC, and miscellaneous shipments; Increased revenues have been obtained in petroleum products, real estate, and reimbursable work for State road crossing projects, etc.

- Expenses are down primarily due to early reduction in summer work force, reduced car hire costs, better fleet utilization, and accounting adjustments for inventories/depreciation due to Purchase Accounting Allocation Method, and reclassification of Summer Track Improvement Program from expense to capital in accordance with unit of property definition.

* Minor difference due to rounding

** The month of December, 1985, reflects adjustments to accruals/estimates for both revenue and expense.

ALASKA RAILROAD CORPORATION
EXPENSE PERFORMANCE ANALYSIS
Through the Period Ending December 31, 1985

Department	Month			Year To Date		
	Actual*	Budget	Variance	Actual	Budget	Variance
Transportation[1]	1,471	1,666	(195)	20,556	25,566	(5,010)
Motive Power & Equipment	1,703	925	778	12,571	11,958	613
Ways & Structures[2]	1,114	861	253	12,310	12,810	(500)
Marketing	90	182	(92)	1,229	1,921	(692)
Overheads[3]	(2,255)	1,206	(3,461)	11,980	13,224	(1,244)
Depreciation[4]	267	400	(133)	1,455	4,800	(3,345)
Total	2,390	5,240	(2,850)	60,101	70,279	(10,178)

Explanation of Variances - Year-to-Date

(1) Decrease due to freight movements, primarily IOFC/COFC, gravel, and reduced coal traffic.

(2) Reduction results from accounting adjustment for Summer Track Improvement Program from expense to capital in accordance with ICC unit of property definitions offset by higher than budgeted personnel costs.

(3) Underrun due to inventory re-evaluation partially offset by increased insurance costs, reorganization costs and other miscellaneous costs.

(4) Depreciation lower due to restatement of assets according to purchase accounting allocation method.

* December, 1985, reflects accrual adjustments to conform with audited year end financial statements.

OPERATIONS DEPARTMENT CAPITAL PROPOSAL

PROPOSED 1987 BASELINE CAPITAL BUDGET
SUPPLEMENTAL PROJECT INFORMATION SHEET
($000)

A.	PROJECT TITLE:	LIGHT VEHICLE REPLACEMENT PROGRAM
B.	LOCATION:	OPERATIONS DIVISION
C.	ESTIMATED COST:	$278
D.	ACCURACY OF COST ESTIMATE:	CLASS 111 (+ OR - 15%)
E.	STATUS OF ENGINEERING DESIGN & COST ESTIMATE:	N/A
F.	PROJECT DESCRIPTION:	PURCHASE 16 LIGHT VEHICLES

G. PROJECT JUSTIFICATION:

The present vehicles scheduled for replacement have body and rust damage, high mileage, and experience high maintenance costs. The vehicles' average age is eight years and mileage over 80,000. These vehicles have met or exceeded their forecasted economic life of five years or 70,000 miles.

Older vehicles with high mileage are difficult to maintain to ensure reliable operating status. An annual replacement program will result in lower vehicle maintenace cost, increase availability resulting in increased productivity, and a higher quality vehicle fleet.

PROPOSED 1987 BASELINE CAPITAL BUDGET
SUPPLEMENTAL PROJECT INFORMATION SHEET
($000)

A. PROJECT TITLE: UPGRADE ANCHORAGE TOFC YARD

B. LOCATION: SHIP CREEK

C. ESTIMATED COST: $65

D. ACCURACY OF COST ESTIMATE: CLASS 111 (+ OR - 15%)

E. STATUS OF ENGINEERING DESIGN & COST ESTIMATE: N/A

F. PROJECT DESCRIPTION:

Resurface the existing TOFC Yard. The project will consist of fill, grading, compaction, and surfacing with D-1 or equivalent.

G. PROJECT JUSTIFICATION:

The current TOFC Yard has not received any major improvements since 1984. Over the last three years of constant use and exposure to weather conditions, the yard has deteriorated to an uneven, wash-board surface resulting in slower operations and potential safety hazards. In August, two employees claimed on-the-job back injuries from operating yard hostlers over this rough terrain for extended periods of time.

PROPOSED 1987 BASELINE CAPITAL BUDGET
SUPPLEMENTAL PROJECT INFORMATION SHEET
($000)

A. PROJECT TITLE: HEAD END POWER PLANT

B. LOCATION: ANCHORAGE

C. ESTIMATED COST: $75

D. ACCURACY OF COST ESTIMATE: CLASS 11 (+ OR - 10%)

E. STATUS OF ENGINEERING DESIGN & COST ESTIMATE: COMPLETE

F. PROJECT DESCRIPTION:

Purchase and install a 315 KW head end power plant in locomotive 3010. This project was initiated in fourth quarter 1986 with $28 forecasted as a work in process carryover. The estimated 1987 expenditures is $75.

G. PROJECT JUSTIFICATION:

The modification of locomotive 3010 with a head end power unit provides the most utility to railroad operations. This modified locomotive will be used in passenger service and winter freight service. The winter utilization will consist of keep from freezing freight service.

PROPOSED 1987 BASELINE CAPITAL BUDGET
SUPPLEMENTAL PROJECT INFORMATION SHEET
($000)

A. PROJECT TITLE: MATERIAL HANDLING EQUIPMENT

B. LOCATION: ANCHORAGE

C. ESTIMATED COST: $20

D. ACCURACY OF COST ESTIMATE: CLASS III (+ OR - 15%)

E. STATUS OF ENGINEERING DESIGN & COST ESTIMATE: N/A

F. PROJECT DESCRIPTION:

Purchase and install miscellaneous shop equipment

G. PROJECT JUSTIFICATION:

This investment pool represents an equipment replacement program established to update our shop equipment. The shop equipment will be replaced with new more efficient equipment when the old equipment breaks down beyond economic repair.

PROPOSED 1987 BASL .NE CAPITAL BUDGET
SUPPLEMENTAL PROJECT INFORMATION SHEET
($000)

A. PROJECT TITLE: OVERHEAD CRANE IMPROVEMENTS

B. LOCATION: ANCHORAGE

C. ESTIMATED COST: $50

D. ACCURACY OF COST ESTIMATE: CLASS 11 (+ OR - 10%)

E. STATUS OF ENGINEERING DESIGN & COST ESTIMATE: N/A

F. PROJECT DESCRIPTION:

Purchase and install new power supply for the General Repair Shop DC cranes.

G. PROJECT JUSTIFICATION:

The proposed new power supply will enable the crane to be operated from floor level controls versus from a cab on the crane. The new floor level controls will reduce labor requirements and improve shop safety. Additionally, noise levels will be reduced and improving the working conditions.

PROPOSED 1987 BASELINE CAPITAL BUDGET
SUPPLEMENTAL PROJECT INFORMATION SHEET
($000)

A. PROJECT TITLE: RAIL PROGRAM

B. LOCATION: SYSTEM WIDE

C. ESTIMATED COST: $319

D. ACCURACY OF COST ESTIMATE: CLASS III (+ OR - 15%)

E. STATUS OF ENGINEERING DESIGN & COST ESTIMATE: COMPLETE

F. PROJECT DESCRIPTION:

Install 14,400 feet of alloy rail.

G. PROJECT JUSTIFICATION:

This is an annual major maintenance program designed to replace rail that has exceeded its useful life for mainline operations. The used rail will be cascaded to sidings and or yard tracks where re-required. The replacement rail will come from existing inventories and will not require a capital outlay.

PROPOSED 1987 BASELINE CAPITAL BUDGET
SUPPLEMENTAL PROJECT INFORMATION SHEET
($000)

A. PROJECT TITLE:	BALLAST PROGRAM
B. LOCATION:	SYSTEM WIDE
C. ESTIMATED COST:	$658
D. ACCURACY OF COST ESTIMATE:	CLASS III (+ OR - 15%)
E. STATUS OF ENGINEERING DESIGN & COST ESTIMATE	COMPLETE

F. PROJECT DESCRIPTION:

Replace 60,000 cubic yards of ballast and resurface 300 miles of track.

G. PROJECT JUSTIFICATION:

This is an annual major maintenace program designed to replace ballast that has exceeded its useful life. The replacement ballast will come from existing inventories and will not require a capital outlay.

PROPOSED 1987 BASELINE CAPITAL BUDGET
SUPPLEMENTAL PROJECT INFORMATION SHEET
($000)

A PROJECT TITLE: BRIDGE PROGRAM

B. LOCATION: SYSTEM WIDE

C. ESTIMATED COST: $575

D. ACCURACY OF COST ESTIMATE: CLASS III (+ OR - 15%)

E. STATUS OF ENGINEERING DESIGN & COST ESTIMATE: COMPLETE

F. PROJECT DESCRIPTION:

This is an annual program of major maintenance on steel bridges, timber trestles, and culverts. Deteriorated ties, piling, bridge timbers, and culverts are replaced on a programmed basis.

G. PROJECT JUSTIFICATION:

Timber bridge components have an average service life of 30 years. Major rehabilitation work in the 1952 - 1956 period resulted in a significant amount of 30+ year old timber in service. This program is required to replace these bridge members to reduce the risk of failure. Culvert replacements are required to maintain drainage and keep roadbed maintenance costs from increasing. Renewed bridges also reduces the cost of track maintenace at the bridge ends. The replacement and/or upgrade of the substructure of the bridges is required to ensure the load carrying capabilities of the bridge and maintain a safe operating railroad.

The material cost is estimated at $200 with the majority of the materials coming from existing inventory.

PROPOSED 1987 BASELINE CAPITAL BUDGET
SUPPLEMENTAL PROJECT INFORMATION SHEET
($000)

A PROJECT TITLE: RAIL TIE FASTNERS

B. LOCATION: SYSTEM WIDE

C. ESTIMATED COST: $100

D. ACCURACY OF COST ESTIMATE: CLASS III (+ OR - 15%)

E. STATUS OF ENGINEERING DESIGN & COST ESTIMATE: COMPLETE

F. PROJECT DESCRIPTION:

Install 150 gage plates and 300 Pandrol tie plates on curves of 6 degrees or greater. This is a carryover project approved in the 1986 Capital Budget.

G. PROJECT JUSTIFICATION:

These devices prevent spreading track gage. Spreading of gage on sharp curves as well as rail rotation under severe lateral loading is a very serious concern for the Railroad. Constant regaging on wooden ties reduces tie service life by an estimated 15%.

The gage plates and Pandrol tie plates are in our current inventory minimizing any capital outlay for materials.

PROPOSED 1987 BASE. .NE CAPITAL BUDGET
SUPPLEMENTAL PROJECT INFORMATION SHEET
($000)

A PROJECT TITLE: FIBER OPTIC CABLE TERMINALS

B. LOCATION: ANCHORAGE, PORTAGE, & WHITTIER

C. ESTIMATED COST: $112

D. ACCURACY OF COST ESTIMATE: CLASS III (+ OR - 15%)

E. STATUS OF ENGINEERING DESIGN & COST ESTIMATE: COMPLETE

F. PROJECT DESCRIPTION:

Install digital fiber optical terminals to replace open wire pole line and marine cable system between Portage and Whittier. This is a carryover project approved in the 1986 Capital Budget.

G. PROJECT JUSTIFICATION:

The pole line cable system to Whittier was built in 1940 and is in need of major overhaul and replacement. The system received major damage during the 1964 earthquate and four sections have been replaced with temporary cable. In the last six years most of the lead splices have badly corroded and are close to failure. A replacement system will cost $325,000, but an agreement between Anchorage Telephone Utility and the Railroad has enabled us to utilize the fiber optic system between Anchorage and Whittier. This agreement will eliminate the need for replacement of the pole line. Purchasing the fiber optic terminals and connecting them to ATU's fiber optic system will give us full data and telephone service to the Whittier Terminal.

PROPOSED 1987 BASELINE CAPITAL BUDGET
SUPPLEMENTAL PROJECT INFORMATION SHEET
($000)

A. PROJECT TITLE: WHITTIER ELECTRIC

B. LOCATION: WHITTIER TERMINAL

C. ESTIMATED COST: $200

D. ACCURACY OF COST ESTIMATE: CLASS III (+ OR - 15%)

E. STATUS OF ENGINEERING DESIGN & COST ESTIMATE: REVIEW STATUS

F. PROJECT DESCRIPTION:

Replacement of existing high voltage distribution system in the Whittier Yard.

G. PROJECT JUSTIFICATION:

The railroad has incurred a PCB contamination problem in the Whittier electrical distribution system. The current system is a non-standard distribution network which is contaminated with PCB's. A replacement system is necessary to eliminate future PCB problems and to minimize clean up costs of the current contaminated system.

PASSENGER SERVICES CAPITAL PROPOSAL

PROPOSED 1987 BASELINE CAPITAL BUDGET
SUPPLEMENTAL PROJECT INFORMATION SHEET
($000)

A. PROJECT TITLE — Containerized Baggage

B. LOCATION — Anchorage

C. ESTIMATED COST

40 Containers @ $800 each	$32,000
Fairbanks Forklifts	Already Owned
Anchorage Forklift	20,000
Denali Forklift	20,008
Total Cost	$72,000

D. ACCURACY OF COST ESTIMATE — Class 3

E. PROJECT DESCRIPTION
Purchase containers and forklifts to handle the baggage on the Anchorage via Denali to Fairbanks Express. The containerization will reduce the manual handling of the baggage.

F. PROJECT JUSTIFICATION
The ARRC needs to come into the modern ages with baggage handling. The containerized system will reduce staffing at Fairbanks and Anchorage and save layover time at Denali Park.

Cash Flow	Year 0	Year 1	Year 2	Year 3	Year 4	Year 5
Equipment	(72)					
Anc/Fbx Labor Savings		24	24	24	24	24
Forklift Maintenance		(2)	(4)	(6)	(8)	(10)
Less 12 Hour Dead Head Trains		2	2	2	2	2
	(72)	24	22	20	18	16

Life Expectancy probably 7 years, use 5 to be conservative.

INTERNAL RATE OF RETURN 13.03%

PROPOSED 1987 BASELINE CAPITAL BUDGET
SUPPLEMENTAL PROJECT INFORMATION SHEET
($000)

A. PROJECT TITLE — Whittier Shuttle Flat Cars

B. LOCATION — Anchorage

C. ESTIMATED COST — 5 @ $20,000 each = $100,000
This project will be funded with State of Alaska Shuttle Funds.

D. ACCURACY OF COST ESTIMATE — Class 3

E. PROJECT DESCRIPTION
The cost of maintaining the current rail passenger cars used on the Whittier Shuttle was excessive so this equipment has been disposed of. In reviewing the alternatives, it appears that buses on flat cars may be the most cost effective. This requires the purchase of flatcars to place the buses on. The current flatcars are filled to capacity on numerous occasions so putting the buses on these would reduce vehicle capacity too much.

F. PROJECT ALTERNATIVES FOR WHITTIER PASSENGER EQUIPMENT
1. Rental Buses on Flatcars.
2. Purchased Buses on Flatcars.
3. Lease of Rail Passenger Equipment.

The cost of these three alternatives will be analyzed extensively prior to the actual purchase decision.

House Labor and Commerce Committee

Re: Proposed Committee Substitute - HB 47

On the prime sponsor's request, I have instructed my staff to prepare a committee substitute for HB 47, an act relating to the Alaska Railroad Corporation, for your review on Wednesday, January 28, at our 4:30 p.m. meeting.

The CS makes minor technical changes to language on Page 2, line 29, Page 3, line 22, Page 4, line 7, and on Page 6, line 4, to make the language consistent throughout the bill and with existing statute.

Further, the CS changes Page 3, line 22 to reinsert the phrase "in a major way", so that the language is consistent with current law.

Finally, there are two substantive changes in the CS. The first is Page 2, line 9 where the placement of a comma has been changed, thus changing the meaning of the sentence. The second is on Page 6, line 8, where language has been added to require that a public hearing be held at least 30 days before taking final action.

The bill's prime sponsor, Representative Kay Brown, will be present at the Wednesday meeting to explain both the intent of HB 47, and the changes presented in the CS.

Analysis of fiscal impact of CSHB 47 (L&C)

New administrative requirements for public notice, hearing and written findings prior to significant land use actions could increase the railroad's costs of operation. The bill's requirement to salvage the meat of big game animals for human consumption also could require additional expenditures by the railroad. However, there would be no increase in costs borne by the state or the General Fund. Based on information provided by the railroad, I estimate that the increased costs to the railroad resulting from CSHB47 (L&C) should be no more than about $50,000 a year.

Re: Committee Substitute for HB 47, An Act Relating to the Alaska Railroad Corporation

Dear Dave,

Thank you again for the opportunity to express our comments on House Bill 47 and a committee substitute at the Juneau hearing last week.

We've carefully reviewed the substitute and enclose our position paper and amended fiscal information. I understand that the bill has been passed to Bette's committee and will send her a courtesy copy of all of our written comments.

Despite the changes in the committee substitute which mitigate the impact of earlier proposals, we do remain adamantly opposed to the legislation. CSHB 47 recommends significant detrimental changes to the legislature's earlier vision of a financially independent, but publicly accountable, Alaska Railroad Corporation. We are especially hopeful that House leaders will not support the bill.

If you have questions about our additional statements, please feel free to contact me or our general counsel, Larry Wood.

Sincerely,

F.G. Turpin
President & CEO

cc: Honorable Bette Cato, Chairman
House Transportation Committee

James O. Campbell
Chairman, ARRC

POSITION PAPER / Alaska Railroad Corporation

COMMITTEE SUBSTITUTE FOR
HOUSE BILL 47

An Act Relating to the
Alaska Railroad Corporation

I. Introduction. As the Committee is aware, the Alaska Railroad Corporation ("ARRC") voiced strong objections to the provisions of House Bill 47 as originally introduced. The revisions contained in the Labor and Commerce Committee Substitute for House Bill 47 have alleviated several of the concerns previously expressed by ARRC. The Corporation applauds the committee's response to its concerns but remains opposed to enactment of the bill for the reasons set forth in the following discussion and in its previous position paper.

II. Provisions of Bill/Impact on ARRC.

A. Operations. The original provisions of HB 47 imposed unrealistic requirements on the ARRC Board to maintain passenger and freight service at 1985 levels. The Committee Substitute acknowledges economic reality and directs the Board to maintain (as well as expand) those service levels only when practicable in light of financial resources. In addition, unlike original HB 47, the Committee Substitute retains the present language of the Alaska Railroad Corporation Act ("ARCA") requiring Board approval only when management reduces or expands service "in a major way." ARRC agrees with the thrust of these changes in the bill. However, we continue to believe that there is no magic in the level of service provided by the federal government at the time of transfer and that this provision is superfluous. Board responsibility for adequate service to the people of Alaska is already sufficiently assured by the mandate in AS 42.40.100(5) that it "provide for safe, efficient, and economical transportation to meet the overall needs of the state". As previously noted, a legislative oversight report is presently required before a significant reduction or increase in service occurs. AS 42.40.280(a).

B. Moose Kills. The Committee Substitute retains the previous bill's language regarding salvage of big game meat and compulsory consultation with the Alaska Department of Fish & Game to minimize adverse effects of railroad operations on wildlife. As pointed out in ARRC's previous position paper and in other information and testimony furnished to the Labor and Commerce Committee, the Corporation already works closely with Game representatives and salvages moose meat. This portion of the bill continues to be duplicative and unnecessary.

C. Confidentiality. ARRC appreciates the Committee's efforts to accomodate the confidentiality requirements of federal law in this area. The original bill proposed to allow public disclosure of ARRC's contract rate agreements and freight divisions; the Committee Substitute restores these two items to the list of matters which may be considered at ARRC's executive Board sessions and designated as confidential by Board rule.

However, the Committee Substitute continues to limit the items which may be made confidential by Board rule to only those listed in the legislation. This unreasonably restricts the Board's ability to preserve confidentiality as to other matters, including those which it may consider at executive session. Creating such an inconsistency between the two statutes is unwarranted and unwise. The present law lists examples of confidential items in recognition of the fact that the Legislature cannot reasonably anticipate all those instances where privacy is warranted. The ARRC Board needs the flexibility to identify and protect proprietary and competition sensitive information furnished to it or generated within the Corporation.

Finally, the Committee injected a new requirement into the revised bill requiring ARRC to furnish to the Attorney General upon request any information withheld under the Board confidentiality rule. ARRC believes that this requirement would destroy the confidentiality of the material, inasmuch as Department of Law records are public documents unless some privilege attaches to them. The Department of Law does not represent ARRC. The Corporation retains independent legal counsel. No attorney-client privilege would protect the information furnished which could include commercial information protected by federal law. The State already has access to the targeted information through two State commissioner/ARRC Board members and through a legislative audit process where confidentiality requirements are preserved.

The Committee Substitute continues to require public Board discussions of proposed land acquisitions or disposals. ARRC strongly believes that such an approach will have a chilling effect on market opportunities. The public interest is sufficiently protected by current law which requires all disposals of land to be acted upon and approved by the Board and Legislature in public session.

D. Land Issues. In apparent response to the administrative burdens implicit in HB 47, the Committee Substitute now requires Board hearings and written findings only with regard to agreements involving "resource development, resource exploration, capital improvements, or other significant change in the use of rail land." Although this provision eases the financial and logistic burden presented by

the original language, such limitations do remain inappropriate if ARRC is to meaningfully compete in a commercial setting. The opportunity for public review of significant changes in land use is guaranteed by the legislative oversight and approval provisions which already exist in ARCA.

In addition, the new provision is vague and ambiguous. Rail land, to the extent it is the subject of third-party agreements, is commercially leased land. ARRC is ground lessor or permittor. It is unclear whether the hearing and written finding provision would apply to a lease which contemplates substantial capital improvements to the property--not an uncommon feature of a long-term ground lease. It is also unclear whether the provision would apply when property is to be leased or assigned to a new lessee who would use rail land for a different purpose than predecessor lessees. Would this amount to a "significant change in the use of rail land?" To the extent that the 60-day notice/written "best interest" determination and 30-day hearing process is triggered by ordinary commercial leasing practices, it will significantly inhibit the Corporation's ability to effectively compete in the real estate market environment. ARRC must have the flexibility to quickly, but responsibly, adjust to market needs.

In addition, to require the Board's written "best interest" determination to be made at least 60 days before taking action, yet requiring a public hearing at least 30 days in advance, appears illogical. Information of use to the Board's finding will likely be presented at the public hearing.

The Committee Substitute still requires the ARRC Board to determine that the people's best interest is served by any lease, permit or other land use authorization. While this determination is no longer expected to be made in writing or 60 days prior to action, it still injects inappropriate delays to commercial transactions. CSHB 47 lists various matters which must be considered by the Board as it formulates its "best interest" finding. However, the economic best interests of a self-sustaining railroad are not always identical with standards which are pertinent to the "best interest" determinations applied to State-owned land. The primary focus of State land decisions may not be projected financial benefits. Since ARRC depends heavily upon sensible and profitable development of its land resources to honor the Legislature's mandate for railroad economic viability, its focus fixes on careful, but decisive and aggressive, marketing of its leased lands. The ARCA requirement that leases be made at fair market value is a sufficient assurance that transactions will promote the State's ownership interest and achieve a fair return to ARRC. Substitution of a best interests standard is not consistent with ARRC's mission of economic independence.

The revised bill also requires Board approval of leases of more than one year's duration and legislative approval of leases with terms of greater than 35 years. As noted above, CSHB 47 also rejects confidential Board discussions of land acquisitions or disposals and requires an extensive and expensive inventory of natural resources and land uses on an annual basis. ARRC reiterates its objections to these provisons for the reasons expressed in its earlier submissions to this Committee.

III. Conclusion. Despite some improvements to the bill, the Committee Substitute for House Bill 47 threatens to seriously hamper the Corporation's ability to survive in present freight and real estate markets. For these reasons, we oppose CSHB 47 and request that the proposed amendments to ARCA be rejected.

ALASKA RAILROAD CORPORATION 1987 LEGISLATIVE SESSION SUPPLEMENTAL FISCAL INFORMATION

Committee Substitute for House
Bill 47 (Labor & Commerce): An Act Relating
to the Alaska Railroad Corporation
Publish date: 2/17/87

Like its predecessor, the Committee Substitute for House Bill 47 proposes substantial changes to the Alaska Railroad Corporation Act ("ARCA"). As a result of its revisions, however, several of the adverse financial impacts of the original version of HB 47 have been reduced. The differences are outlined below; otherwise, the position expressed in the Alaska Railroad Corporation's previous fiscal information (attached) is still valid and applicable to this proposed legislation.

Passenger Services Losses. The changes in CSHB 47 allow ARRC to maintain levels of passenger service within those financial resources available. Hence, the $1.5 million loss earlier projected would not be required by law.

Real Estate Costs and Losses. The additional costs arising from real estate transactions have been lessened but not eliminated by the changes in CSHB 47. ARRC now estimates that an additional $30,000.00 will be expended to satisfy procedural requirements relating to land use agreements. While less commercial leasing will be affected, ARRC continues to project a $150,000.00 annual loss in real estate business. In addition, the detailed inventory of land, resources, actual and projected uses and plans, and development potential is estimated to cost $150,000.00 the first year and $35,000.00 to update annually thereafter.

Confidentiality of Marketing and Business Data. Inasmuch as the requirement to furnish confidential/proprietary business information to the Attorney General upon request opens that vital data to potential public scrutiny, ARRC continues to estimate freight losses as a result of CSHB 47 of $4.6 million annually.

Total Annual Fiscal Impact

Real Estate	$ 365,000 (first year)
General Freight Revenues	4,600,000
Total	$4,965,000

Office of General Counsel
February 25, 1987

CS HB 47
Changes from HB 47

I. Operations.

1. Makes the phrase "to the extent practicable within financial resources" apply to both expansion and maintaining 1985 levels of service. Formerly, because of placement of a comma, it applied only to the expansion of service.

2. Restores the phrase "in a major way" to the level of service change requiring Board approval. This provision now reads as originally enacted in ARTA.

3. Effect is still to specifically impose on the Board the responsibility to maintain or expand service at transfer levels to the extent financially practicable.

II. Wildlife.

1. No change from original HB 47.

III. Land Issues.

1. Still requires Board approval of leases over 1 year in length and Legislative approval of those over 35 years. Adds any options to renew into the computation of years involved.

2. Also still requires annual inventory of land and resources and for any natural resource disposal to be at competitive bid; still authorizes disposals to municipalities at less than fair market.

3. Changes the requirement that all leases, permits, etc. be preceded by Board written "best interest" finding and public hearing. Present proposal still requires Board to make such a finding for all leases, etc. but not in writing and not at any particular time. Best interest is still defined elsewhere in the bill to require consideration of adjacent land uses, municipal land use plans and ordinances, etc.

4. Adds a new section requiring written "best interest" finding by Board and public notice 60 days before final action on any "agreement that involves resource development, resource exploration, capital improvements, or other significant change in the use of rail land." Board must hold public hearing in affected municipality at least 30 days before taking final action.

IV. Confidentiality.

1. Restores "divisions and contract rate agreements" as items which may be considered by the Board in executive session. Continues to remove "land acquisition or disposal" from such status.

2. Restores "divisions and contract rate agreements" to the listing of items which can be made confidential by Board rule but still makes the list all inclusive and thus more limited than present Board rule categories.

3. Adds requirement that any information kept confidential under Board rule must be provided to the Attorney General upon request. Applies to personnel records, attorney communications and work product, and ICC-protected information such as divisions and contract rate agreements.

Call Up ____

Dear Legislator:

I was distressed to read in the February 19, 1987, Anchorage Times article of Representative Kay Brown's House Bill 47.

The provision requiring board approval for any leasehold conveyances would severely hinder the Alaska Railroad's ability to operate and bargain in the real estate marketplace. The Alaska Railroad has a fiduciary responsibility to all Alaskans to maximize income from it's lands, and enhance it's profitability.

I had the opportunity to serve on an ad-hoc citizen/industry committee last year which advised the Alaska Railroad on revisions to it's leasing policy. This policy review aided the new management in bringing it's real estate management practices into the twentieth century.

The proposed legislation is a step backwards, and is typical of governmental over regulation.

Sincerely,

H. Norman Rokeberg
Jack White Company

Brown's bill steps backward

Dear Editor:

I was distressed to read in the Feb. 19 Anchorage Times article of Rep. Kay Brown's House Bill 47.

The provision requiring board approval for any leasehold conveyances would severely hinder the Alaska Railroad's ability to operate and bargain in the real estate marketplace. The Alaska Railroad has a fiduciary responsibility to all Alaskans to maximize income from its lands, and enhance its profitability.

I had the opportunity to serve on an ad hoc citizen/industry committee last year which advised the Alaska Railroad on revisions to its leasing policy. This policy review aided the new management in bringing it's real estate management practices into the twentieth century.

The proposed legislation is a step backwards, and is typical of government over regulation.

I. ARRC'S ESTIMATED FISCAL IMPACT

ARRC estimated that HB 47 would have a fiscal impact of $6,400,000 annually. ARRC did not submit any factual data or meaningful analysis to support this estimate. The estimate appears to be based on a misunderstanding of the requirements of HB 47 or on concerns which are largely eliminated by the proposed CSHB 47.

For example, ARRC claims that since CSHB 47 requires maintenance of services to the level existing at the time of transfer, ARRC will be required to provide the precise service which existed at the time of transfer, including using certain types of RR equipment (which are no longer available) at a cost of 1.5 million annually. It is clear that such unreasonable, technical compliance would not be required. ARRC would only be required to provide the LEVEL OF SERVICE (not the precise same service) which existed at the time of transfer. Additionally, as the proposed CSHB 47 makes clear, such service would only required "to the extent PRACTICABLE WITHIN FINANCIAL RESOURCES AVAILABLE".

Next, ARRC simply asserts, without identifying a factual basis, that requiring public notice and competitive bidding in leasing railroad land and natural resources will result in all lease payments being REDUCED BY 50%.

Finally, ARRC states, again without benefit of any factual data, that if it cannot keep its rate documents confidential it will not be able to compete with truckers and shippers and it will lose 4.6 million dollars annually. While the soundness of this claim may be disputed, CSHB 47 allows ARRC to keep its rate documents confidential.

Thus, the fiscal on the ARRC should be greatly reduced under the CSHB 47 (L & C).

1. Explain the basis for ARRC's estimated fiscal impact.

II. THE VALUE OF RAILROAD LAND, INCLUDING RESOURCES (Reference: questions 5-7, 17, 18))

ARRC stated that it had a total of 40,600 acres, of which 13,800 were utility corridors and 26,800 were non-right-of-way. ARRC identified 1,923 of these acres as being in the heart of Alaska's cities (Anchorage, Seward, Valdez, Fairbanks, Whittier, and Nenana).

1. Where are the other 24,877 acres of rail lands?

2. Describe the location and existing improvements.

3. Estimate the value of these lands outside the municipalities.

4 . Regarding the estimates of fair market value for rail land in Alaskan cities, do ARRC's estimates include improvements? Is ARRC taking the position that the estimates are high? Does ARRC use these values as a basis for its leasing?

5. Describe known or suspected natural resources on rail land.

6. Describe the agreement with Usibelli. What rights were given? How much was paid? What are the terms, particularly regarding future developments?

III. LEASING PRACTICES (Reference: Questions 1-10)

ARRC acknowledges that there should be public involvement in leasing rail lands. See ARRC's letter to Rep. Donley, dated January 28, 2987, pp. 3 and 7. ARRC states that its long-term leasing policy is sufficient to ensure such public input occurs. However, the ARRC leasing policy requires only newspaper publication by legal description after a lease has been executed and is about to go into effect.

1. Under this policy, how is public input on long-term leasing decisions solicited or obtained?

2. ARRC appears to have dramatically increased its revenue from real estate (40% increase from 1985 to 1986) and has stated that it plans to place increasing emphasis on development of real estate. If this is true, it would appear that the clash between the public and the railroad has just begun and will dramatically increase as development continues. Does ARRC intend to pursue further development of rail lands?

3. Regarding question no. 57, what is the difference between "income" and "revenue" (real estate accounts for 57.4% of "income" but only 6.4% of "revenue").

IV. WILDLIFE PROTECTION/MEAT SALVAGE (Reference: questions 36-39)

Testimony from the moose federation will be presented. They have first-hand information on this issue.

Committee members may wish to question the ARRC regarding various devices which could lessen the moose kill, including:

-reducing speed on the Anchorage-Fairbanks freight run to

30 m.p.h. during periods of high snow and between the hours of twilight and 8:00 p.m.;

-installing a third headlight aimed higher than the existing two headlights;

-installing plywood between the rails on bridge areas so that moose are not tripped, trapped and run over.

V. CROWNPOINT (Reference: questions 42-46)

1. ARRC was not clear whether it or the state paid $650,000 for the Crown Point accident or who will pay the additional necessary monies. Who paid? Who's going to pay the rest? If the state, does ARRC intend to repay the state? Isn't this money a state subsidy?

2. How much did Borden Chemical, Alaska Oilfield Services or Unocal pay for Crown Point damages? Will those companies attempt to recover money from ARRC?

3. ARRC stated damage was the result of the shipper's bad advice. Is this generally agreed upon? Is ARRC seeking to recover money from the shipper?

4. Since Crown Point, ARRC has again improperly heated urea-formaldehyde. When did the subsequent accident(s) take place? What procedures has ARRC implemented since LAST accident?

5. What is status of the lawsuit brought by Crown Point residents? How many of the 18 families are plaintiffs in that lawsuit?

VI. SALARIES (Reference: question 55)

1. Do the salary figures include the value of benefits? If not, describe the benefits, additional compensation and allowances for each salary range, including travel and entertainment allowances.

2. In 1986 the ARRC spent $450,000 on travel. Who went where and what was the purpose?

3. What is the standard percentage of budget paid by other railroads for administrative expenses, executive salaries and benefits, and overhead?

VII. PROFITS AND LOSS; ACCOUNTING (Reference: questions 52-59)

1. ARRC estimates a $1,500,000 loss for 1986. What is the reason for this loss? Does this amount include any money paid or reserved for Crown Point damages?

2. What is represented by the $484,000 item for contractual services to the legal department? Does ARRC have a legal staff? Why is so much spent on outside counsel?

VII. FREIGHT AND PASSENGER SERVICE

1. Does the ARRC plan to haul tour buses to McKinley this summer? What will be the effect on the local economies if the tour buses no longer stop in the smaller communities?

2. May ARRC legally subsidize freight rates by using income earned from real estate to pay railroad expenses or overhead? What percentage of ARRC's overhead is allocated to real estate operations?

IX. MISCELLANEOUS

3. Section 3 cf Ch 153 SLA 84 requires a special report on the long term operations of ARRC and alternatives be submitted to the legislature by February 1, 1987. What is the status of that report?

LEGISLATIVE AFFAIRS AGENCY

M E M O R A N D U M February 18, 1987

SUBJECT: Section by section analysis of draft CSHB 47(L&C), An Act relating to the Alaska Railroad Corporation

TO: Representative Kay Brown

FROM: George Utermohle
Legislative Counsel

The following is the section-by-section analysis of the draft CSHB 47(L&C) which you requested.

Section 1 amends AS 42.40.100 by expanding the duties of the board of the Alaska Railroad Corporation to include:

(1) maintenance or expansion of passenger and freight operations at or above the level that existed when the railroad was transferred from federal to state ownership, if the funding is available;

(2) management of real property interests and natural resources owned by the corporation in the best interest of the people of the state; among the information which the board must consider in making its determination of what is in the best interests of the people of the state are land use ordinances and plans of cities and boroughs affected by railroad land management decisions, adjacent land uses, the development and revenue potential of the land, and public comment on land management decisions proposed by the board;

(3) consultation with the Alaska Department of Fish and Game on ways that the railroad can reduce the adverse effects of railroad operations on wildlife.

Section 2 amends AS 42.40.120(b) to require the board of the Alaska Railroad Corporation to delegate authority to the executive officers of the railroad to grant leases, easements, permits, or other interests in railroad land for a total term of less than one year. The term of a lease,

easement, permit, or other interest in railroad land subject to this section includes the initial term plus any options to renew. A grant of a lease, easement, permit, or other interest in land for a total term of a year or more must be approved by the board of the corporation under Section 8 of the bill. Current law allows the executive officers of the railroad, through delegated authority, to enter into long term leases (up to 35 years under any conditions and exceeding 35 years if the lease is subject to termination by the railroad).

Section 3 amends AS 42.40.120(c) to require specific approval by the board of the Alaska Railroad Corporation before the corporation can lease, grant easements or permits, or allow use of railroad land for a term, including any options to renew the agreement, of one year or more.

Section 4 amends AS 42.40.170(b) to remove the authority of the board of the Alaska Railroad Corporation to discuss land disposal or acquisition issues in executive session.

Section 5 amends AS 42.40.220(b) by limiting the kinds of information which the Alaska Railroad Corporation may withhold from public disclosure to the following items:

(a) personnel records

(b) communications with and work product of legal counsel

(c) information consistent with the standards and practices of the U.S. Interstate Commerce Commission for the protection of proprietary information associated with specific shippers, divisions, and contract rate agreements.

The Alaska Railroad Corporation shall provide any information kept confidential under these provisions to the Department of Law if the Attorney General requests to see the information.

Section 6 amends AS 42.40.260 by requiring that the annual report prepared by the Alaska Railroad Corporation and provided to the governor and legislature include information on the land and natural resources held by the corporation. Pending proposals for the lease or disposal of land or natural resources must also be disclosed in the annual report.

Section 7 amends AS 42.40.285 by requiring that any lease of land by the Alaska Railroad Corporation for a total period, including any options to renew, exceeding 35 years be approved by the legislature. The former exemption is repealed.

Section 8 amends AS 42.40.350(c) by permitting the Alaska Railroad Corporation to lease, grant easements in or permits for rail land for a total term, including options to renew, of one year or more only if the board of the corporation determines that the transaction is in the best interests of the people of the state. Rail land is that land owned by the corporation that is not included in the railroad utility corridor along the main or branch lines of the railroad. If the board does not make a determination that the lease, easement, permit, or other authorization to use rail land is in the best interests of the people of the state, then the transaction is void.

Section 9 amends AS 42.40.350(d) by requiring that any lease or other disposal of land by the Alaska Railroad Corporation be at fair market value as determined by appraisal or by competitive bid unless the lease or disposal is to the state, a city, or a borough.

Section 10 adds new language to AS 42.40.350. The disposal of natural resources from the land of the Alaska Railroad Corporation must be by competitive bid unless the disposal is to the state, a city, or borough.

At least 60 days before taking final action on any agreement that involves resource exploration or development, capital improvements, or other significant change in the use of rail land the board shall prepare a written finding of fact and a determination that the agreement is in the best interest of the people of the state. The board must publish a notice that it has prepared the finding of fact and the determination. At least 30 days before taking final action on the agreement the board must hold a public hearing in a city or borough affected by the agreement. Any agreement that is subject to these requirements is void if the requirements are not satisfied.

Section 11 adds new language to AS 42.40.420 to allow the Alaska Railroad Corporation to issue permits to individuals for temporary, short term, or emergency use of railroad land.

Section 12 adds a new section, AS 42.40.460, requiring the Alaska Railroad Corporation to salvage for human consumption the meat of big game animals killed by operations of the railroad.

RE: CSHB 147; Request for Transportation Comm. Assistance in Obtaining Documents

CSHB 47 has passed from the Labor and Commerce Committee to the Transportation Committee. While CSHB 47 was before the Labor and Commerce Committee, the Railroad stated that it would provide the legislature with a computerized summary of 300 leases if this information would be helpful. (See: Document submitted to L&C Committee, entitled Alaska Railroad Corporation 1987 Legislative Session, Fiscal Information, dated February 6, 1987, p. 3.) In that same document, the Railroad stated it had completed appraisals for some parcels of Railroad land and indicated that the Railroad had begun or completed a "fee-use permit system" for leasing to political subdivisions. (See: Response to 7, p. 3 and Exhibit B, section 3.05.)

Because the primary focus of CSHB 47 involves legislative and public oversight of Railroad management of state lands, I believe this information may be helpful to the Transportation Committee in evaluating CSHB 47. Therefore, I respectfully request that the Transportation Committee request this information from the Railroad.

For your convenience, I have attached a letter which may be used to request this information.

Thank you very much for your consideration. I look forward to working with you on this issue.

Dear Mr. Turpin

Re: CSHB 47, an act relating to the Alaska Railroad Corporation

On behalf of the House Transportation Committee, I would like to thank you for the information the Alaska Railroad Corporation submitted to this Committee and to the Labor and Commerce Committee.

In the document submitted to the Labor and Commerce Committee on February 6, 1987, entitled Alaska Railroad Corporation 1987 Legislative Session, Fiscal Information, the Alaska Railroad Corporation indicated that it could submit a computerized summary of 300 leases, certain completed appraisals and information regarding a "fee-use permit system." The Transportation Committee has received a request for this information and would appreciate your providing this information at the earliest convenience.

Thank you for your help and cooperation.

Sincerely,

Representative Bette Cato, Chair
House Transportation Committee

RE: Response to ARRC's Opposition to CS HB 47

I. Introduction

The Alaska Railroad Corporation (ARRC) acknowledges that the Labor and Commerce Committee Substitute for HB 47 addresses many of ARRC's concerns. However, ARRC still opposes CS HB 47 and submits a fiscal note of $4,965,000.

For your convenience, this response to ARRC's opposition to CS HB 47 follows the format used in the opposition statement.

II. Provisions of CS HB 47

A. Operations: HB 47 required ARRC to maintain or expand services at the level existing at the time of transfer; CS HB 47 limits this to the extent financially practicable. ARRC acknowledges that the CS eliminates the fiscal impact in this area. ARRC still objects, arguing that current law requiring ARRC to meet the needs of the people provides adequate safeguards in this area.

The new language is justified and needed to strengthen the presumption that the ARRC will meet the needs of the state by maintaining or expanding service levels.

B. Moose Kills: ARRC restates its objection; it feels these provisions are unnecessary because ARRC already complies with the provisions of the bill through administrative practice.

It is well established that the legislature may turn voluntary administrative practice into statutory obligations. Furthermore, there is disagreement as to whether the railroad is currently doing all that it can in this area. (See statement of the Alaska Outdoor Council, attached).

(907) 465-4998

C. Confidentiality: The response of ARRC to this issue does not appear to be based on a good faith analysis of CS HB 47. HB 47 required ARRC to make certain rate-making documents public. ARRC responded that this would destroy ARRC's ability to be competitive, at a cost of 4.6 million dollars annually. ARRC did not provide any back-up for this assertion. Nonetheless, CS HB 47 deleted this provision. However, CS HB 47 would allow the attorney general to have access to the confidential documents, and thereby allow to conduct an in-state investigation of rate-making. ARRC responded by speculating that this would destroy confidentiality as thoroughly as making the records public. Thus, ARRC maintains that the annual fiscal impact will be $4.6 million. ARRC did not provide any analysis to support this estimated fiscal impact.

Legal Services states it is clear that the Attorney General will be required to keep this information confidential. Thus, there will not be a $4.6 million impact.

ARRC additionally states this provision is unnecessary because ARRC provides certain financial information to its auditor.

D. Land Issues: HB 47 required public hearings and written findings before ARRC could enter into any land agreements for terms exceeding one year. CS HB 47 requires hearings and findings only for agreements exceeding one year which involve natural resources, capital improvements, or substantial changes in the use of rail land. Both versions require ARRC to manage rail lands in the best interests of the people and to determine fair market value based on competitive bidding or appraisals.

While ARRC agrees that public involvement in the management of public land is necessary, ARRC says CS HB 47 is inappropriate. Land management is the crux of the bill and needs to be addressed. Over 40,000 acres of state land have been transferred to the railroad, and it appears there is nearly a total lack of oversight and public influence or knowledge about management of that land. The Transportation Committee estimated rail assets were worth $500 million to $1 billion. The Municipality of Anchorage estimated that the 1,500 acres of land in Anchorage and Portage alone had a value in excess of $250 million. Yet, under current law, a single person has the authority to lease such assets for up to 99 years without any competitive bidding, public notice, or public input. ARRC continually asserts that current law provides for fair market value transactions, public notice and legislative oversight. These assertions are not correct.

The railroad itself acknowledges the need for public input but states that its the recently implemented procedures of publishing a notice of intent to lease in the classified ads and placing a sign on the property are sufficient. Neither of

these procedures actually creates any appreciable level of public awareness (for example, placing a sign in an undeveloped area to advertise a natural resources agreement would not lead to significant public awareness). Worse, these procedures are followed only when the railroad has decided that it will try to complete a particular transaction. CS HB 47 attempts to include the public at the inception--when the decision is being made to plan an industrial park, develop condominiums, or develop natural resources. Involving the public at this stage will not complicate commercial negotiations. Subject to fair market value considerations, the railroad would be free to negotiate the details of land leases after the public had the opportunity to influence the basic decision of whether to develop public lands. The bill requires competitive bidding to lease or sell natural resources such as oil, gas, coal and gravel.

The provisions of CS HB 47 are not vague. They would apply to all new leases and to extensions, assignments, subleasing, or grants of permission to lessees under existing leases which contemplate natural resource development, capital improvements, or changes in land use patterns. There is nothing illogical about requiring the Board to make written findings regarding development of a particular piece of property available to the public before a public meeting so that the public can investigate the findings and policy premise on which the decision was based.

Thank you for considering my views.

ALASKA OUTDOOR COUNCIL, INC.
3780 McGINNIS DR. JUNEAU, AK 99801
(907) 789-3450

March 7, 1987

Representative Kay Brown
Pouch V
Juneau, AK. 99811

Dear Representative Brown:

I would like to submit this letter as the official position of the Alaska Outdoor Council regarding House Bill 47.

For the record, the Alaska Outdoor Council is a federation of 45 Alaskan sportsmen and outdoor organizations with a membership of over 10,000. We would request that this testimony be entered on behalf of our statewide membership.

We have reviewed HB 47 and wish to support a portion of this legislation which is extremely important to our membership. Although the Alaska Outdoor Council would not take a position on much of this legislation, we do support that portion which would require the Alaska Railroad Corporation to salvage wild animals killed by the railroad which are utilized for human consumption. We would also support legislative requirements which would minimize railroad kills through greater safety precautions.

The past record of the Alaska Railroad has been less than satisfactory in dealing with railroad kills of wildlife, especially moose. Lack of salvage means a loss of hundreds of thousands of dollars annually in salvageable meat which could be utilized by many Alaskans.

The Alaska Outdoor Council appreciates the support of the legislature on this issue and we pledge our assistance and support.

Sincerely,

Ron Somerville

SUBJECT: Confidentiality of proprietary information associated with specific shippers, divisions and contract rate agreements under CSHB 47(L&C)

TO: Representative Kay Brown

FROM: George Utermohle GU
Legislative Counsel

Peg Mentele of your staff has asked whether the release of proprietary information associated with specific shippers, divisions, and contract rate agreements to the Department of Law under AS 42.40.220(b), as amended by sec. 5 of CSHB 47(L&C), would cause this information to be a public record available for public inspection.

The right to inspect public records is contained in AS 09.25.120. A person has the right to inspect records held by state agencies and instrumentalities of the state, including the Department of Law and the Alaska Railroad Corporation, unless the records are required to be kept confidential by a federal law or regulation or by state law. (AS 09.25.120(4)). Since the confidentiality of proprietary information associated with specific shippers, divisions, and contract rate agreements is maintained by the Alaska Railroad in order to conform with the standards and practices of the Interstate Commerce Commission on these matters, this information is exempt from public disclosure under AS 09.25.120. The release of this information to the Department of Law will not cause this information to become public because those provisions of federal law and regulation and state law that allowed the information to be confidential while in the possession of the Alaska Railroad Corporation also apply to the Department of Law.

Thus proprietary information associated with specific shippers, divisions, and contract rate agreements that is confidential under AS 09.25.120 and AS 42.40.220(b) retains its confidential status even when the information is in the possession of the Department of Law.

PHONE: (907) 465-4100

February 2, 1987

The Honorable Kay Brown
Alaska State Legislature
P. O. Box V
Juneau, AK 99811

Dear Representative Brown:

You recently requested information about moose mortality on the Alaska Railroad (ARR) and the guiding industry. In your discussion with Regional Game Supervisor Dan Timm he said that the department would provide more information on these subjects. This letter responds to your letter to Dan Timm of January 19 regarding the issue of moose mortality. I will follow-up with a letter on the guiding industry shortly.

With respect to moose mortality on the ARR, I have enclosed several documents which summarize the problem, actions we have suggested that the railroad take to help reduce mortality, and the railroad's response. I have also included information about road kills in the Matanuska/Susitna Valley.

Prior to state ownership of the ARR, moose mortality was notably under reported. As you can see from the enclosures, July 1, 1984 - June 30, 1985, was the worst year on record with 382 moose killed. The great majority of animals were killed between Houston and Chase between late-January and late-March. When the packed snow depth is 30 to 35 inches, the mortality rate increases markedly. At that point, moose are primarily looking for areas of minimal snow depth to conserve energy; because they are plowed, railroad and highway rights-of-way are highly attractive.

Many moose-railroad collisions result in unsalvageable meat. However, moose meat fit for human consumption is taken by ARR personnel to the nearest crossing and the location is reported to Fish and Wildlife Protection (FWP) officers. A list of needy families in the Matanuska/Susitna Valley is maintained by FWP, and when salvageable moose meat becomes available, a family is called. Other animals probably are picked up and used by residents living near the track. When

animals are unfit for salvage, the ARR removes the carcasses from the immediate right-of-way and puts them in heavy brush, ravines, or similar locations. Although we do not have records on the proportion of moose salvaged in prior years, as of January 3, 44 moose had been killed by train this winter and 10 were reported for salvage to FWP.

It is possible that some of the 34 unreported animals were utilized by local residents, but most were unfit for salvage. As of January 3, 60 moose have been killed by cars in the same area, and nearly all of these animals were salvaged.

Our interpretation of current regulations is that the ARR is not required to notify FWP when an animal is killed. You asked whether legislation should be introduced to require salvage. In our view the ARR, under state ownership, is being sufficiently cooperative in the salvage of most moose fit for human consumption, particularly considering the remoteness of the area, winter weather conditions, the relatively few workers on the line during winter months, and the relatively high cost of salvaging meat. With continuing public interest and concern for train-caused moose mortality, the ARR should remain very cooperative.

You also asked if the ARR has been cooperative in trying to reduce moose collisions. As you will see from the enclosed letters, the department has made a number of suggestions to reduce collisions, and we will make additional suggestions to the ARR after we have analyzed currently available data. Unlike the situation which existed when the railroad was federally owned, ARR officials have been very cooperative in letting us see their daily records and in openly discussing the problem.

Some of our suggestions have been adopted and likely reduced moose mortality in the latter part of the 1984-85 winter. Others have not been adopted because of federal regulations governing railroad operations, high monetary cost, or other reasons.

Nothing short of complete fencing on both sides of at least 65 miles of track with over- or underpasses to facilitate moose movements will reduce moose mortality to a bare minimum. However, fencing and maintenance of moose passage structures would cost several million dollars and even then would not eliminate mortality. Sweden, British Columbia, and other areas have problems such as ours, but they too have not found an adequate solution.

Following the high moose mortality in the winter of 1984-85 on the railroad and highways, the Board of Game acted to reduce hunter harvest in the affected area. The moose population has responded well. It is preferable that

hunters take moose during severe winters than for trains to kill them. However, hunting along the ARR right-of-way can also create problems because the ARR has concerns with people being on or near the right-of-way, or using the railroad right-of-way for access.

Thank you for the opportunity to provide you with background information and suggestions regarding moose mortality. If you have any questions on this material, please do not hesitate to contact us. Best wishes for success in your new role as state representative.

Sincerely,

Don W. Collinsworth
Commissioner

Re: Sale or Lease of the Assets of the Alaska Railroad Corporation

Dear Jim:

You have asked that I point out and discuss the parameters of a sale or lease of the assets of the Alaska Railroad Corporation ("ARRC"). I am pleased to do so.

I.

EXECUTIVE SUMMARY

Sale of the Alaska Railroad

When the State of Alaska purchased the Alaska Railroad in January, 1985, it agreed to many sale terms. These terms include a provision in the federal Alaska Railroad Transfer Act ("ARTA") that requires the State to turn over any profits of a subsequent sale or transfer of the railroad to the United States, if the sale occurs within the first five years of State ownership.

In the face of this restriction the Alaska Railroad Corporation Act ("ARCA") requires the Alaska Railroad Corporation ("ARRC") to include in its annual report an analysis of potential arrangements to sell the railroad every five years, including documentation of at least three offers to sell the railroad. These must be bona fide attempts by the State-owned railroad to sell all or part of its assets and operations.

The combination of ARTA's requirement that the State turn over any sale profits to the federal government if the railroad is sold before January 5, 1990, and the huge cost of researching, preparing, soliciting, and negotiating meaningful sale or transfer alternatives justify repeal of ARCA's direction that sale offers be solicited by ARRC. This is very simply accomodated by repealing the second sentence of AS 42.40.260(b):

> The analysis shall include documentation of at least three offers to sell the corporation initiated by the corporation during the last five years.

Of course, the requirement that ARRC offer to sell the railroad three times every five years could be simply modified to begin in 1990. However, complete repeal of this sentence does not eliminate the legislature's original desire that ARRC pursue a disposal of its assets. The first sentence of AS 42.40.260(b) would remain:

> Every five years the annual report shall include an analysis of potential sale arrangements whereby the corporation may be transferred into private ownership.

Total repeal of the "three offers" requirement seems preferable to continuing an artificial stimulus to sales efforts even after 1990. Instead, "potential sale arrangements" would be initiated by market opportunities and railroad and State needs.

Some may suggest that offers to sell the railroad could stipulate that the sale will not be consummated until after 1990, thus avoiding ARTA's requirement that profits from an earlier sale be surrendered to the United States. The private operator could be granted a lease of railroad lands and operations until then. However, there are legal pitfalls to this approach if the lessee does not have a clear option to back out of a sale slated for 1990 and beyond. Otherwise, the "lease" may be determined to be a pre-1990 "sale" and subject to the ARTA restriction. Also, even a well-drafted lease will not be a "sale" which will satisfy ARCA's "three offers to sell" mandate.

For these reasons, we continue to recommend that AS 42.40.260(b) be repealed in part.

Efforts to sell the railroad seem premature until the State has decided whether sale of the railroad lies in the public's best interest. On one hand, profits of a sale after 1990 may help to bolster declining State revenues. However, an early or untimely sale to a private owner operator may endanger continued vitality of the line in a recessing economy.

Finally, at least that portion of the special governor s report required by ARCA to review operational alternatives and the transfer of all or part of the railroad operations to the private sector should be funded and completed. Its conclusions will greatly assist State leaders as they consider sale issues.

At a minimum, ARRC should be allowed to delay its solicitation of responsible offers until it receives a clear direction from Juneau that a sale should be pursued before 1990.

II.

DISCUSSION

Legal Constraints: ARTA's Strings

At the beginning of this century, railroading was a financial failure in Alaska. Convinced of a legitimate need for year-around access to Fairbanks and other Interior communities, the federal government wisely purchased the remnants of the Alaska Northern and Tanana Valley railroads to establish The Alaska Railroad. With considerable governmental support, the line ultimately stretched from Seward to Fairbanks' satellite communities. Serving Alaska's transportation and development needs for 70 years, the Alaska Railroad was an established government institution by 1982 when the guidelines for its sale to the State of Alaska were set forth in ARTA. Yet, Congress recognized that continuation of the railroad's services was vitally important to many Alaska communities which substantially or completely depend upon the carrier's operations. Congressional concerns about continued railroad operations, belief that the State was enjoying a bargain, and skepticism about the prospects of an entirely private railroad led to the attachment of some important strings to the sales agreement.

First, if within five years after transfer to the State (January 5, 1990) Alaska sells or transfers all or substantially all of the railroad, the sale or transfer proceeds which exceed the State's costs of Railroad improvements and liabilities must be paid to the United States. In other words, the State's profits from a sale before 1990 automatically inure to the federal government.[1/]

Second, if within ten years after transfer to the State (January 5, 1995) all or part of the Railroad's property is converted to a use which would prevent railroad operations,

---

1/ There is no express setoff for the State's original purchase price and start up costs. Presumably, these sums are "net liabilities" incurred by the State for the railroad. Caution dictates that this interpretation be agreed to by the U.S. Attorney General before the line is sold or transferred. The Attorney General is required to enforce this section of the Act.

that property and its improvements will revert to the United States. To prevent this reversion, the State may tender the property's fair market value. While this limitation will not prevent sale or transfer to a private owner or operator, it is intended to encourage continued rail service until 1995. It could also impact the line's sale value.

Finally, if use of Railroad right of way is discontinued, ownership in the land will revert to the U.S. The federal government will then convey the land to adjoining landowners.

Although these few limitations do not restrict further railroad transfers, they do represent economic liabilities, especially until 1990. The timing of the State's disposal plan is therefore particularly critical.

ARCA's Marching Orders: Too Little Too Soon?

The State of Alaska agreed to abide by ARTA's sales terms. For instance, it has ensured that the railroad is a rail carrier operating, retaining, and managing its own revenues to better serve Alaska's transportation and development needs. In framing the public corporation's operating characteristics in ARCA to conform to this expectation, State leadership gave ARRC enough independence to conduct its activities as a separate and viable economic entity.

Exemptions from laws which apply to State agencies mean generally that ARRC receives and manages its own revenues, supplies, equipment, facilities and real estate, establishes its own personnel policies, compensation systems, and employment agreements, promulgates its own rules to govern all internal and external affairs, and controls its own purchasing, financing, and budgeting needs. On the other hand, a recognition of ARRC's State ownership and essential governmental functions led to public accountability requirements manifested by open meetings, Governor-appointed board members, procurement and ethical codes substantially equivalent to State models, financial and management audits, annual and oversight reports, legislative approval of land disposals, and long-range capital improvement and program plans. This blend of substantial financial and operations independence subject to State oversight results in a quasi-public, quasi-private railroad armed with the flexibility it needs to quickly react to changing markets and operational and financial needs. However, the ARRC model was not designed to last forever. It was formed only to "operate and manage the Alaska Railroad pending eventual transfer of the Railroad to the private sector."

Budget slashes by the federal government raised a very real State concern that the railroad's drain on a dwindling treasury would be ended by surplusing the line and its assets with no guarantee of continued rail operations in Alaska. The State's purchase of the railroad was intended to preserve an important link in Alaska's transportation network without creating another Marine Highway System to bleed the State's own treasury. But legislators never intended that the State would long own and operate a railroad. They gave ARRC directions to find a private buyer, if it could, within a reasonably short time frame. However, these disposal directions are sketchy, probably untimely in light of ARTA restrictions, and poorly drafted in contrast to the scholarship generally reflected in ARCA.

ARCA requires ARRC's annual report to contain "an analysis of potential sale arrangements every five years whereby the corporation may be transferred into private ownership." This analysis must include "documentation of at least three offers to sell the corporation initiated by the corporation during the last five years."[2/]

Unfortunately, the ground rules for these offers are not provided. The spectrum of the meaning of "sale" is broad, extending to such alternatives as public offerings of stock by a business corporation, direct purchase by individuals, partners, or parent corporations, management and/or employee buyouts, leases with options to buy, and separate sales of real property, operating facilities, and equipment. To render some meaning to ARRC sales efforts we must imply an intent that mere technical compliance with the sale offers provision is insufficient. The offers must be good faith overtures to bona fide potential purchasers who have the interest and ability to consummate an acceptable disposal arrangement.

Although the corporation is required to initiate offers to sell its assets, the governor may sell or lease the railroad and dissolve the corporation. The sale must be approved by the

---

2/ The reference to "corporation" is an error: the public corporation is not a business corporation with transferable stock. The clear intent, however, is that ARRC attempt to sell all or substantially all of its assets. Despite the use of "transferred," offers to sell, not offers to lease or transfer, are probably expected.

legislature.[3/]

ARCA requires that sale or lease terms guarantee continued railroad operations and, at a minimum, reimburse the State for money it has spent in connection with the Alaska Railroad. Therefore, to insure continued rail operations, any offer to sell must include a reversion of the railroad's property to the State should the line cease to operate. Unlike the federal government's ten year cap on a reversion affecting non-right of way lands, an open-ended reversion will virtually guarantee some degree of railroad operations by a private operator. But an open-ended reversion will also have a substantial impact on the railroad's market value. Without it, the private firm will have considerable flexibility in retaining or disposing of railroad assets.

The ARCA sale and lease sections create ambiguities, apparent inconsistencies, and lack definity. However, those problems are substantially overcome by reasonable interpretations of the statute to ascertain the State's probable intentions. ARRC may then consider a very broad spectrum of sale and lease alternatives.

The Next Step: What Are the Available Options?

A. Option One - Request Repeal of AS 42.40.260 and/or Completion of Special Governor's Report

AS 42.40.260(b) provides simply:

> Every five years the annual report shall include an analysis of potential sale arrangements whereby the corporation may be transferred into private ownership. The analysis shall include documentation of at least three offers to sell the corporation initiated by the corporation during the last five years.

Repeal of only the emphasized portion of the statute will eliminate a premature sale without eradicating the legislature's original desire that ARRC pursue a disposal of

---

3/ In searching for consistency between these separate sections, the corporation's offer should be consummated by the governor (he can also initiate his own offers) and then presented to the legislature for approval. Although the corporation's power to consummate its own transaction may be necessarily implied, legislative approval is also either an express or implied requirement and exposes the agreement to the governor's veto in any event. The best course suggests that the governor should become involved early in the sales effort.

its assets. However, this amendment will require legislative action. Another alternative which will require State funding but avoids any reopening of ARCA for changes this year is discussed below.

A special governor's report is required by a temporary law enacted with ARCA. A private consultant must research, consider, and comment upon what long term railroad operations will best serve Alaska's needs. The report must contain specific recommendations on operational alternatives and transfer of all or part of the railroad operation to the private sector. Unfortunately, funding for the study was not provided to meet a February 1, 1987, deadline. This information seems critical to a meaningful legislative review of disposal alternatives. The report may also measurably assist any legislative reconsideration of its direction that ARRC attempt to sell the railroad before 1990. The report should also discuss another ingredient to a complete transfer: clear land title. ARRC is not expected to receive patent to all of its lands until 1989 or later.

The report may consider the importance of continued rail operations in Alaska and recommend those specific reversion terms which will require operations by a private buyer for a specified period without greatly depressing the line's sales value.

Some consideration must also be given to the loss of important exemptions from federal and State laws now enjoyed by the State-owned railroad. For example, a private owner will not be shielded from tax and railroad worker's compensation, retirement, and unemployment laws. Tax-exempt financing will not be available to meet operational needs. Clearly, the economic impact to these changes can and should be measured since they will influence the railroad's sales price and, perhaps, its vitability as a totally private operation.

A report which also identifies operational alternatives should also significantly defray ARRC's expenses by narrowing its search for viable sale or lease options should ARCA not be amended.

If the legislature funds the Governor's report this year it may later reconsider, if necessary, ARCA's directive that the railroad's assets be sold in the face of a troubling ARTA deterrent.

At a minimum ARRC's sales efforts should be delayed until the State has reaffirmed its instruction that the line be sold, if possible, by 1990. Otherwise, ARRC's time and resources may be wasted if offers are prepared, tentatively accepted, and then rejected by the legislature.

B. Option Two - Proceed With Sale Or Lease Offers

The breakdown of large railroads into much smaller short lines has recently lead to the pooling of a great deal of expertise and experience in these disposals. The success of short lines will depend upon managerial experience in proposing lower operations and labor costs and aggressively pursuing new and expanded markets. The options seem endless and without consultants' assistance ARRC may soon become muddled in an explosion of information. Market opportunities are also difficult to identify and seize without capable assistance from those experienced in a number of marketing, financial, and operations disciplines.

Nonetheless, offers to sell the railroad can be prepared. If they are properly drafted, they may even avoid the requirement that profits of an early sale must be turned over to the United States. For instance, a private operator may lease all or part of the railroad's operations until 1990 when a sale will be consummated. As noted above, however, a lease must grant a prospective lessee the clear right to reject a purchase in 1990 and beyond. Otherwise, it will be declared a "sale" which may be subject to the ARTA restriction upon early sales of the railroad. In addition, a "lease" will not satisfy ARCA's "three offers to sell" requirement.

Within the relm of opportunities for transfer of the railroad, either by sale, lease or lease with a purchase option, there are infinite possibilities. Here is a listing of just some of the sale, lease, or transfer alternatives:

1. Sale of all of ARRC's assets, both real estate and personalty, to an existing corporation such as the Burlington Northern or CSX.

2. Sale of only the right of way, other railroad operating properties, and railroad equipment to an existing corporation.

3. No. 2 with an agreement that the purchaser manage the non-operating properties.

4. Nos. 1, 2 or 3 except that the transfer is by lease or lease with a purchase option instead of by sale.

5. Transfer of only portions of the railroad, such as the Anchorage-Fairbanks, Fairbanks-North Pole, and Whittier-Anchorage portions to those shippers who most use those portions.

ALASKA LEGISLATURE COMMITTEE FILES 1987-1988 8672
5142 HTRA HB 47 (FILE 2) - HB 62

714

6. Creation of a business corporation to own the entire railroad:

6.1 Capitalized by a public stock offering..

6.2 Employee purchase with substantial financing through debt securities or state financing terms.

6.3 Management purchase with substantial financing through debt securities or state financing terms.

6.4 Purchase by Alaskans through permanent fund dividend "check-off".

III.

CONCLUSION

The Board and management of ARRC should request direction from Juneau regarding ARCA's mandate to attempt an early sale of the railroad. Should State leaders renew their desire that the railroad be sold before 1990 and profits be turned over to the United States, ARRC can proceed to develop a disposal plan which includes alternatives for consideration. On the other hand, the State may wish to delay or repeal directions that offers be solicited while it considers what long-term railroad operations are in the public's best interest. Funding of the special governor's report seems to be a crucial first step to meaningful discussion of the principal issue involved: private or continued public ownership of the Alaska Railroad? If transfer of the line and its assets to the private sector is truly desired, the timing and general direction of disposal plans should also be considered.

Finally, ARRC may simply proceed to execute ARCA's direction that offers to sell the railroad be put together and implemented. A preliminary first step appears to be to retain consultants well-versed in railroad sales processes. Sound, practical advice seems vital before choices are made amongst a host of sales and transfer alternatives.

Very truly yours,

Larry D. Wood
General Counsel

cc: Members of the Board of Directors
F. G. Turpin, President and Chief Executive Officer

3576L

STATE OF ALASKA

BILL SHEFFIELD, GOVERNOR

DEPARTMENT OF FISH AND GAME

DIVISION OF GAME

333 RASPBERRY ROAD
ANCHORAGE, ALASKA 99502

344-0541

March 7, 1985

Mr. Frank G. Turpin
President & Chief Executive Officer
Alaska Railroad Corporation
Pouch 7-2111
Anchorage, AK 99510-7069

Dear Mr. Turpin:

The recent high rate of moose/train collisions prompted us to investigate the problem and to recommend possible solutions. We appreciate your cooperation in this matter and your concern for the animals has been apparent.

The following discussion and recommendations would result in fewer moose mortalities on the railroad. Some of these actions have already been taken by the railroad and some may not be feasible. Obviously, our expertise is not in running a railroad! The recommendations are based on a graduate student's study of moose on the railroad in the late 1950s, our area biologist's (Jack Didrickson) past experience with this chronic problem, and two recent trips by Jack between Wasilla and Fairbanks in a lead engine's cab. Mr. Didrickson has been the area game biologist at Palmer for nearly 20 years, and his area of responsibility includes the Willow to Talkeetna track which has been the area of greatest moose mortality for many years.

IMMEDIATE ACTIONS

1. Accurate reporting of milepost locations on moose/train encounters should be required daily.

   We have had difficulty acquiring accurate information in the past concerning specific collision sites and annual total moose mortality on the railroad. We request that you develop a system to provide us with daily records of moose collisions by milepost location. This will provide a firm basis on which to implement other recommended actions, and it will help us in

management of the moose population. In some winters, such as this one, mortality is significant and accurate mortality reporting will assist in setting annual hunting regulations and evaluating overall population mortality. Expedient reporting by milepost will also aid in the efficient salvage of moose meat. We would appreciate receiving any records you may have regarding moose/train collisions in previous years. It would also be helpful to us if you could supply a "track chart" from Wasilla to Chase. Finally, we should exchange information about moose concentrations this winter and in subsequent winters.

2. Train speed should be reduced in problem areas.

Your orders to reduce train speed to 20 to 30 mph from Willow to Talkeetna were well placed and have already resulted in fewer collisions. Without the benefit of precise locations of collisions, we recommend an expansion of the slow order to include the area between Wasilla and Chase. As information is compiled for the rest of this winter and in subsequent winters, slow orders can undoubtedly be modified to allow increased train speeds between moose concentration areas. There will be some winters (and portions of others) when slow orders are not necessary. As you know, the slower a train is going the more time a moose has to get out of the way (if it is so inclined), and the more time the engineer has to further slow the train. We realize that it may take a mile or more for a train to stop, depending on speed, train weight and track grade. It may not be feasible to stop when moose are encountered, but any extra slowing by the train should help. Moose will quickly disperse from the tracks when temperatures warm and snow settling and thawing occurs. Slow orders should remain in effect until snow depths decrease and moose disperse.

3. Maximum distance of snow removal should be continued in problem areas.

The removal of snow with a spreader or wing blade from up to 20' from the tracks was a positive action on your part. A narrow tunnel or sidewalls of snow leaves the animals no escape route. As specific chronic locations are identified, the wing blade can be used only in those areas. For the remainder of this winter, we recommend continued use of the wing blade where terrain permits between Willow and Talkeetna and expand this to include the area between Wasilla and Chase. New snow should be removed as soon as possible because moose increase their movements from place to place immediately after a snow.

4. Adjust timing of train runs.

During winters of heavy snow when moose are concentrated near the right-of-way, we believe that running trains during daylight hours would substantially reduce collisions. Moose and other wildlife are more easily approached and less wary during the night and increase their activity during early morning and late evening hours. Based on limited observations, it appears that one train closely following another by an hour or less difference would be desirable. Moose are oftentimes scared from the tracks by a train and they may not move back on the tracks until a second train has passed. This behavior was observed the night that Mr. Didrickson was on a train immediately behind another one. Future observations by railroad personnel and our biologists would test the validity of this recommendation.

5. Adjust engine headlight.

An upward adjustment of at least one of the two or four headlights on each engine would allow the crew to see moose at a greater distance. The train could thus be slowed more, giving an animal increased time to clear the tracks. We endorse the engineers' "tactics" of turning off the lights once a moose is seen, and then flashing the lights and using the whistle. Constant bright lights at night disorient and "mesmerize" wildlife, so the animals should not be fixed with a steady beam.

6. Continue experiment with ultrasonic scare device.

The initial test of the effectiveness of an ultrasonic scare device was inconclusive. The devices were attached to the lead engine on one run to Fairbanks and moose behavior was observed. One moose was killed on that run. The devices were removed on the return run, but moose behavior was similar and no moose were killed. We put the devices back on engine #3008 and have asked your personnel to keep track of moose collisions by #3008 versus other lead engines. Even if ultrasonic sound can reach animals over the train noise, placement of such devices on the engine is a problem. The devices are easily plugged with snow, rain or other matter, and the manufacturer says they are not wind-activated until speeds reach 30 mph. In this regard, we were pleased to hear of your efforts to develop an electronically activated ultrasonic scare device. Hopefully, it will prove effective in conjunction with other preventative measures.

LONG-TERM SOLUTIONS

Moose/train collisions are a chronic problem which become acute in winters of deep snow accumulation such as this year. The moose population using the Wasi a to Talkeetna right-of-way has been increasing since the severe winters of the early 1970s and this increase undoubtedly has contributed to the present high collision rate. There are, however, actions which can be taken to reduce moose mortality in future years; complete elimination of the problem is not, unfortunately, a realistic goal. In addition to the proposed actions discussed above, the following recommendations may assist in developing long-term solutions to this problem.

1. Replace walkways on bridges.

We understand that metal walkways between rails on bridges were removed sometime ago when electronic sensors on the underside of trains were installed. The metal walkways caused the sensors to be inoperative. If waterproof plywood were placed between rails, the animals would once again have a safe travel lane across bridges. This becomes especially important when a moose is running ahead of a train at night and the animal tries to cross a bridge. Furthermore, without this modification, an animal that drops between the ties and is hit by a train is reportedly more apt to damage the traction motors located on the underside of the engines.

2. Create "artificial" rights-of-way.

Moose frequent the railroad right-of-way for two main reasons: the area is comparatively snow free and it provides a good source of food. Large numbers of moose are driven from the high country by deep snow and they encounter the railroad during their migration to lowlands. Some moose continue westward and winter near the Parks Highway and along the Susitna River. Other moose come from west of the Susitna River and also winter in the river bottom and east to the railroad. In total, moose in the river-highway-railroad corridor from Willow to Talkeetna probably now number at least 3,000.

The growth of moose food or browse (small trees and brush) has been stimulated in the right-of-way from, as we understand, two main factors: tree-clearing by dozers, particularly near crossings to enhance visibility; and the termination of brush control by spraying for environmental reasons.

After a system of accurate moose/train collision reporting has been established and the more serious problem sections of track identified, mechanical means of brush control in the right-of-way should be implemented. Depending on terrain, permafrost conditions, and land ownership, dozers or other suitable machinery could create and maintain an "artificial" right-of-way some distance from the track during winters of deep snow accumulation. This would provide areas of lesser snow depth for the animals and would stimulate regrowth of browse.

Another habitat-oriented recommendation is to create large areas of browse at least ½ mile from the tracks. Excellent quality and abundant food sources would attract moose away from the tracks. Large scale habitat enhancement can be accomplished by "chaining" with dozers, fire, or mechanical "tree crushers" depending upon site specific conditions. The department has used all three techniques in Alaska and we own three 40-ton tree crushers for such work on the Kenai Peninsula. We would be pleased to explore the possibilities of large scale habitat enhancement with the railroad, should you feel this is a feasible alternative. We have advanced the possibility and desirability of moose habitat enhancement within the Susitna River Valley north to Talkeetna, but other priorities and funding limitations probably preclude such work in the immediate future.

Your cooperation and sensitivity to the moose/train collision problem are appreciated and the positive actions to date have resulted in reduced moose mortality. Thank you for the opportunity to allow our biologist to make first-hand observations from a locomotive. Should deep snows continue, we would again like to observe from your locomotives. We will continue working with you to reduce the severity of the problem and I am sure that after an accurate collision reporting system is implemented we can make more definitive recommendations.

Sincerely,

W. Lewis Pamplin, Jr.
Director

ALASKA RAILROAD CORPORATION

Pouch 7-2111 • Anchorage, Alaska 99510-7069

March 21, 1985

Mr. W. Lewis Pamplin, Jr.
Director
Division of Game
Department of Fish and Game
State of Alaska
333 Raspberry Road
Anchorage, AK 99502

Dear Mr. Pamplin:

This is in response to your letter of March 7, 1985, pertaining to recommendations and possible solutions to reducing moose/train incidents.

Mr. Jack Didrickson recently met with some of our staff and is aware of our most current efforts to implement the suggestions proposed by Fish and Game.

In adhering to the format of your letter, the following is the current status of the items in the order presented in your letter.

IMMEDIATE ACTIONS

1. Daily reporting of moose/train encounters.

   The Chief Train Dispatcher is maintaining mileposts locations on moose/train encounters daily. Our security department verifies the accuracy of the information before distribution to Fish and Game.

2. Reducing train speed in problem areas.

   The reduced train speeds may have been partly responsible for reducing collisions; however, it was observed that incidents of moose maiming increased dramatically. Even at reduced train speeds, trains could not stop in time to avoid collisions when the moose displayed their inconsistent behavior patterns that included not getting off the tracks for approaching trains. Some moose weakened by hunger remained bedded down between the rails and either refused or were too weak to remove themselves from the track.

   Mr. Didrickson informed us of the maiming problem and inquired about the feasibility of further reducing train speed or resuming normal speeds to prevent maiming. To reduce speeds further would have put the trains in the speed range where harmonics develop within the train that increase the probability of derailments, due to the "rock and roll" of the cars. The alternative was to resume speeds to normal safe track speeds.

3. Maximum distance of snow removal.

The snow fleet will continue to operate as needed and the wing blade will be used to the maximum, as permitted by the terrain.

Additionally, a private individual was given permission to clear the snow by grading a path on the Railroad right-of-way. The areas this was done include Mileposts 210 and 211. Cuts were also made 90 degrees to the cleared area to encourage moose exists. Results of these efforts have not been ascertained.

4. Adjust timing of train runs.

The volume of traffic that the Alaska Railroad is presently committed to prohibits running trains only in daylight hours. Commitment to our customers demands reliable and timely service. To reduce operations to daylight hours would have a serious economic impact on commerce within the State of Alaska.

5. Adjust engine headlights.

The focusing of locomotive headlights is regulated by the Federal Railroad Administration. The headlights on our locomotives are adjusted consistent with these regulations.

At Mr. Didrickson's suggestion, we have installed "ditch" lights on one locomotive to illuminate the right-of-way on either side of the tracks. The rationale was that by turning the headlight off when approaching a moose, these ditch lights would illuminate to the side of the tracks, thus encouraging the moose to migrate off the track. The results of this trial application have proven to be ineffective. There were five moose collisions on the first trip using this procedure.

6. Ultrasonic devices.

It is our hope that future developments in this field may offer feasibility towards application of ultrasonic techniques in deterring moose from the Railroad. We have been advised that technological development in this field will be an extended process.

LONG TERM SOLUTIONS

1. Replace walkways on bridges.

   The metal was removed from between the rails on bridges, because it provided an uninterrupted smooth surface, which "fooled" the radar sensing units on our most sophisticated locomotives. In doing so, the locomotive control responded as if it has experienced a control failure, which in turn resulted in erratic pulling power and caused train handling problems. Plywood covering would recreate the smooth surface and the problems associated with it.

   We are researching what can be applied to a bridge covering that would allow the radar frequency to respond as required, while allowing moose to cross the bridges without risking injury by falling between the rails.

2. Create artificial rights-of-way.

   Our engineering department is in the process of formulating the Alaska Railroad Corporation Vegetation Control Program for the upcoming season. It is anticipated that mechanical brush cutting will be a significant part of this program. The probability of the Railroad participating in habitat enhancement programs outside our own right-of-way would be very low, because available resources will have to be committed to in-house priorities. Large scale programs of moose habitat enhancement areas developed by your Department in the future may prove beneficial.

We will continue to work closely with your Department concerning future recommendations as they develop. Hopefully through our joint efforts, solutions can be found to reduce moose mortality on the Railroad in future winters of deep snow accumulation.

Sincerely,

F. G. Turpin
President and Chief Executive Officer

D I V I S I O N O F G A M E

344-0541

November 13, 1985

Mr. Frank Turpin, President
Alaska Railroad Corporation
Pouch 7-2111
Anchorage, AK 99510-7069

Dear Mr. Turpin:

We in the Department of Fish and Game (ADF&G) thank you and your staff for meeting with us on October 15, 1985 and thoroughly discussing the moose/train collision problem. I believe that both our organizations sincerely want to cooperate in a mutual effort to explore, test, and implement those things which will reduce moose mortality during winter along your right-of-way. Actions should obviously be practical and of real benefit. I am particularly please that you have made available to us your daily train records so that we can extract specific information which will provide an objective basis for our future recommendations and response on your part.

As a summary of possible solutions, in this letter I will summarize those things which we've suggested to you and/or have been suggested to us that may reduce mortality. Then I will ask that a few specific things be done this winter. The broad spectrum of possible solutions is:

Trains or Their Scheduling

-- reduce speed to 20-30 mph in moose concentration areas (you responded that prolonged slow speed generates undesirable track harmonics)

-- daylight operation (you responded that efficient freight moving requires night hauling so people receive freight during the day)

-- time spacing between trains (we recommend minimum spacing)

-- number of trains during winter (we recommend the fewer the better)

-- modifications to engines

- sound scare devices (you are working with the U. of A., EE Dept.)

- headlight adjustment (we recommended upward adjustment so that animals can be seen sooner)

- angled light to illuminate the animal's escape path (the first night used, a moose hit the light)

— track car precede each train to scare moose off tracks

Modifications in or Near the Right-of-Way

— keep the right-of-way browse free (we have supported use of an environmentally safe herbicide)

— remove snow a maximum distance from tracks with spreader plow in problem areas (you mostly plow with engine blades)

— fill in open spaces between rails on trestles (apparently your sensors that electronically control power to drive wheels don't work when those spaces are covered)

— use of scents/odors or recorded wolf howls to discourage moose from using the area

— fixed lighting in problem areas

— maintain snow free areas adjacent to the tracks

— creation of browse/wintering areas some distance from tracks

— moose-proof fencing in problem areas (used in Sweden)

Other and Miscellaneous

— special hunt in problem areas to convert train mortality to hunter mortality (a short term "solution" that could create liability problems for you, and time/manpower problems for us if hunters had to be accompanied — you and we were going to further explore this possibility)

— public perception (in future contacts with the press, we will put railroad moose kills in numerical and biological context with other mortality sources such as hunter harvest and road kills).

— use of "stun guns" by people on engines to scare moose off tracks when a strike is imminent (would necessitate a very slow train).

— humane dispatch of crippled animals (we've recommended train crews carry rifles, but this is apparently illegal, and sometimes impractical for trains to stop; engineers notify dispatcher of strikes and he notifies Fish and Wildlife Protection).

-- disposition and utilization of dead moose (we would appreciate knowing of your efforts in this regard beyond notification of FWP).

Winter 1985-86

Based on our observations last winter, engine-only plowing in deep snow creates a tunnel which holds moose on the tracks. In our view scare devices, slower trains and other actions probably would have some, but minimum effect in deep tunneled snow. Even when a wing plow was used, where the grade was steep and the plow didn't follow the downward grade contour moose would sometimes leave the tracks ahead of a train, flounder in deep snow and return to the tracks to be hit.

We request that this winter the railroad wing plow a section of track in an experimental way to quantify the effectiveness of wing plowing. Part of the plowed area could be quickly done and part more carefully done to follow grade contours. Another technique which we would like to see experimentally tried is the removal of snow in diagonal lanes away from the track, the theory being that moose running ahead of a train would leave the track at snow-free areas. This experiment could be done in areas with or without wing plowing and if successful, would offer an alternative technique to reduce kills. Based on the compilation of moose kill and snow depth information from last winter which Jack Didrickson analyzed and distributed at our meeting, we'd suggest not wing plowing and/or angular "lane plowing" until the snow reached and settled to a depth of 25" or more in the Willow-Talkeetna area.

Would the railroad also agree to a small experiment of covering a trestle or part of a trestle with plywood or if we can obtain it, military style landing mat? The trestles were formerly covered with metal sheeting and plywood or the porous mat may not affect your electronic seneors like metal did.

Our concept of a permit hunt is to implement it only when moose collisions became an acute problem and no other solution is at hand. It would in part convert one form of mortality to another, but it would also put large numbers of people in the immediate right-of-way area which would frighten animals to some distance from the tracks. We understand and appreciate your very real concerns for public safety and railroad liability, so we likely will not propose such a hunt to the Board of Game in 1986. Should we devise a permit hunt that meets our mutual requirements, opportunities to create such a hunt will occur in January and late May or early June.

We will soon be contacting Marcy Trump about extracting information from the daily train records. We would also again appreciate the opportunity to ride trains this winter and we will be contacting Marcy or Mr. Blackwell about this.

Thank you again for your past cooperation and we are anxious to help design an experiment for this winter.

Sincerely,

Dan Timm

Mr. Dan Timm
Acting Regional Supervisor
Department of Fish and Game
State of Alaska
333 Raspberry Road
Anchorage, AK 99518-1599

Dear Mr. Timm:

As mentioned on your December 17 letter, newspapers have a tendency not to report the total story and oftentimes leave the reader wondering just what the complete facts of the issue may be.

For the upcoming winter season, we plan to experiment with a sound device that we expect to arrive shortly. These devices apparently have been successful on motor vehicles, and hopefully they will work on our trains this winter.

The plowing along the railroad right-of-way will be accomplished by additional wing plowing by our spreaders when they are removing snow. The wing on a spreader has an effective extension of about 20 feet per side so where optimum terrain allows, there will be a trough of approximately 40 feet for the moose to traverse. We are not sure if the increased winging will be successful; because as you know, the snow area from the slope of the subgrade, where the wing plows, will be softer than the track structure itself.

Thank you for the opportunity to provide you with the complete facts; and I appreciate your interest and share your concerns.

Sincerely,

F. G. Turpin
President and Chief Executive Officer

Table 1. Numbers of moose killed by collisions with trains in the Alaska Railroad right-of-way between Seward and Fairbanks during winter (October through April) and summer (May through September) periods, 1963-86.

Year[a]	Period		Total
	Summer	Winter	
1963-64	-	45	45

Moose

(Continued from Front Page)

completely enthusiastic about the program.

Dave Walker, Mile 87 Parks Highway, said he believes the program needs to be organized better.

"They have no coordination at all," he said.

Walker said he had to travel about 35 miles to the other side of Trapper Creek to get his moose charity this year while Trapper Creek residents have had to travel to his area to get their moose.

Five moose have been killed at his "front door" in the last two weeks, but now he's no longer eligible, Walker said.

Walker runs a Salvation Army food bank from his video store, Video 87, and shares his moose charities with other families. He said he has participated in the program for a number of years, but has not

Moose on the move are highway hazard

By ERIC TROYER
Frontiersman staff

Heavy snows have driven moose out of the hills and onto Valley highways where motorists are having to skid and swerve to avoid collisions.

But the drivers don't always succeed; large numbers of moose are being killed in collisions here lately, with about 50 kills reported on the Parks Highway north of Big Lake. Five more have been killed on the Glenn Highway, seven in the Wasilla area and three in the Palmer area, Alaska State Troopers said.

Moose typically become a road hazard in the winter when heavy snows make cleared roadways more attractive to travel in.

When a moose gets caught high and dry on a road staring down two thousand pounds of hurtling steel, its chances of survival are slim. Vehicles don't usually fare much better.

The famed Aluska Railroad "Moose Gooser" also takes a number of moose lives over the course of a winter when deep snow makes a plowed rail line an attractive trail.

But when these denizens of the north lose their lives on Alaska's transportation lines someone often benefits.

The troopers have a program that allows selected people to salvage the meat from moose killed on the roads and railroads. Attempting such a salvage without permission from the troopers is illegal.

Anyone can apply to be eligible for a "moose charity," but there are usually only about 40 moose charities a year for about 1,000 applications.

Need is not a prerequisite to apply, but it is used to determine who goes first on the list.

When a moose charity is reported police dispatchers call the next person on the list for the area. That person may then butcher the moose.

Linda Gange on the Parks Highway said the program has worked well for her and her husband, who is disabled.

"I think it's great!" she said.

In each of the past three years the Ganges have gotten a moose from the program. Their neighbors help them to butcher and haul the meat, she said.

"We're in a good area," Gange said, adding "I guess it's not a good area for the poor old moose."

The applications are divided into four areas: Palmer, Wasilla, the Parks Highway and the Glenn Highway. The Parks Highway usually has the highest number of moose charities in a winter.

Lloyd Haessler, Mile 63.5 Parks Highway, said he has been participating in the program for 30 years and that the moose meat really helps out during the winter.

However, not everyone is

THE ALASKA RAILROAD LEASEHOLDERS ASSOCIATION
P. O. BOX 4-2479
ANCHORAGE, ALASKA 99509

MAR 1 2 1987

March 10, 1987

House Transportation Committee
Honorable Bette Cato, Chair
P. O. Box V
Juneau, Alaska 99811

Re: House Bill 47

Dear Representative Cato,

The letterhead name of the group fairly describes the organization from which this letter comes. Our association was organized in 1967 in response to the bureaucratic predations of the Alaska Railroad under federal ownership. Membership is limited to current lessees of the Alaska Railroad and is mostly composed of small, local businesses. Our members directly create well over a thousand local jobs.

I and representatives of our association have been working closely with the staff of the railroad for more than a year to help develop a new leasing policy. The results of this effort have just been approved by the Directors of the railroad and steps are being taken to put it into practice.

Our association believes the new policy to be responsible, flexible, and fair to both lessee and railroad and therefore to ALL Alaskans. It contains both a workable public hearing and appeal process.

As long term tenants, some of whom have been cast in reinforced concrete for 30 or more years on railroad leases, we are vitally concerned with any change in the practices or procedures of the railroad which would affect our abilities to improve, sublease, transfer leases, or finance our operations on these leases. We are all locked into long term commitments so our very livelihoods are at stake along with those of our employees.

The past few years clearly show how imperative it is for business to be able to react quickly and flexibly to changing business conditions. This agility must include the Alaska Railroad which is also a business and which is woven deeply into the economic fabric of most of Alaska.

THE ALASKA RAILROAD LEASEHOLDERS ASSOCIATION

What happens to the Alaska Railroad has its effect on every Alaskan.

We have been reviewing H. B. 47. This bill appears to us to add a layer of regulation with its inevitable attendant bureaucracy to the administration of railroad land. In the light of the new leasing policy our association does not believe this additional regulation to be necessary or desirable. We urge you to eliminate the provisions of H. B. 47 which would require further additional time and effort in the administration of railroad lands beyond what is presently required.

Very truly yours,

James R. Clinton

James R. Clinton,

Re: Committee Substitute to House Bill 47:
An act relating to the Alaska Railroad Corporation

Dear Representative Ellis,

The Government Hill Community Council has been actively following the progress of House Bill 47, especially in regards to land use of the Government Hill Greenbelt. At our March 16th meeting, the Government Hill Community Council passed a resolution endorsing the House bill to the extent that it affects land use management and leasing of railroad properties. The resolution passed unanimously.

We are aware that House Bill 47 has not yet been scheduled for hearing. We request that you schedule this bill for hearing at your earliest convenience.

Very truly yours,

GOVERNMENT HILL COMMUNITY COUNCIL

James E. Hill, President

Representative Bette Cato
Alaska State Legislature
P.O. Box V (MS3100)
Juneau, AK 99811

Dear Representative Cato:

The Anchorage Chamber of Commerce has been and is a strong supporter of the Alaska Railroad. We are appreciative of earlier legislation passed to provide railroad management with the opportunity to operate in the most business like environment. We are concerned with recent legislative efforts this session to direct unnecessary oversight and layers of bureaucracy at the railroad.

Our Chamber applauds your efforts to study these individual bills. We hope your efforts, and efforts of others in the House and Senate, will prevent unnecessary management interference. The Anchorage Chamber believes, "...if it isn't broken, don't fix it".

Sincerely,

Wayne K. Beckwith
Executive Vice President

Pouch V
Juneau, AK 99811

Gentlemen:

This letter is to support the passage of House Bill #47, particularly the section that required the Alaska Railroad to open its financial records to the public.

Much more needs to be done to prevent the State from being in direct competition with private enterprize, but this bill is a step in the right direction.

The financial disclosure should be in sufficient detail to allow the reader to determine how the railroad's losses are financed, what kind of taxes are paid and to what extent the State subsidizes its operations.

The State's ownership of the railroad has been a severe economic hardship on the trucking industry, and to businesses supported by the truckers such as parts, fuel and tire dealers.

We urge you to give this bill your support.

Sincerely,

Birdie Matz

Birdie Matz,
Store Manager,
B&C Auto Supply-Eagle River.
