Subsection 10(a) (page 16 lines 10 – 23) authorizes the conveyances and clarifies that the Alaska Energy Authority may take other actions before actual conveyances. The Alaska Energy Authority may contract to allow the corporation to operate and maintain the project. Such a contract would provide the corporation with some level of control over the assets prior to actual conveyance. The Alaska Energy Authority may also contract and agree to convey the projects in the future after bonds or debt are paid, refinanced, or defeased, or after approvals are obtained. This provision provides the same flexibility the corporation will require in planning for acquiring assets under the transition and finance plan to be developed in section 8 of the bill. The corporation will need to review and address

all contractual, regulatory, or other restrictions on the transfer of assets into the corporation. With respect to the Bradley Lake hydroelectric project, this will include review of covenants related to outstanding bonds, and transfer of the FERC license. The flexibility provided in subsection 10(a) and the transition and finance plan under section 8 may enable the corporation to integrate facilities and assets into corporation's operations without first obtaining ownership.

The conveyances of the Bradley Lake hydroelectric project and the Alaska Intertie will be subject to, and will not eliminate, existing contractual rights of various Greater Railbelt electric utilities. For example, the power generated by the Bradley Lake hydroelectric project is already sold to the utilities under a power sales agreement. The right to use the Alaska Intertie is subject to provisions of the Alaska Intertie Agreement. However, the Alaska Intertie Agreement is scheduled to terminate in October 2010, and has been subject of renegotiations between the Alaska Energy Authority and Greater Railbelt electric utilities that participate in the project. The Alaska Energy Authority anticipates that the parties will address as part of the transition and finance plan, whether negotiations with the utilities regarding the agreement should be completed by the corporation rather than the Alaska Energy Authority.

Subsection 10(b) (page 16 line 24 – page 17 line 10) defines certain terms used in section 10 of the bill.

Sections 11 and 12. (Page 17 line 11 – page 18 line 14) Sections 11 and 12 provide for the contingent repeal of section 10 of the bill which authorizes the Alaska Energy Authority to convey the Bradley Lake Hydroelectric Project and the Alaska Intertie to the corporation. That repeal will take effect if none of the Greater Railbelt electric utilities choose to participate in the corporation by delivering to the Alaska Energy Authority an acceptable letter of intent by July 31, 2010..

Section 11 (page 17 lines 11 – 12) repeals section 10 of the bill.

Subsection 12(b) (page 17 lines 29 – 30) makes section 11 take effect if none of the Greater Railbelt electric utilities deliver to the Alaska Energy Authority by July 31, 2010, an acceptable letter of intent under which the utility commits to enter a phased commitment agreement among the Alaska Energy Authority, the corporation, and the utility.

Subsection 12 (c) (page 17 in 31 – page 18 line 2) requires the executive director of the Alaska Energy Authority to notify the lieutenant governor and revisor of statutes if the conditions of subsection 12(b) are met.

Subsection 12(d) (page 18 lines 3 – 14) defines certain terms used in section 12 of the bill.

Section 13. (Page 18 line 15) Section 13 gives the bill an immediate effective date.

Greater Railbelt Energy and Transmission Corporation - GRETC

A New Not-for-profit Energy and Transmission Company

Senate Resources Committee

March 17th, 2010

How we got here

- REGA Study
- Business Case for a new Railbelt G&T Company

→

- GRETC Legislation: 2009
- Senate Bill 143
- House Bill 182

- Joint Electric Utility Board Meeting
- First of it's kind
- Letter to Governor
- Formation of Task Force

→

- GRETC Legislation: 2010
- Committee Substitute requested

Railbelt Integrated Resource Plan

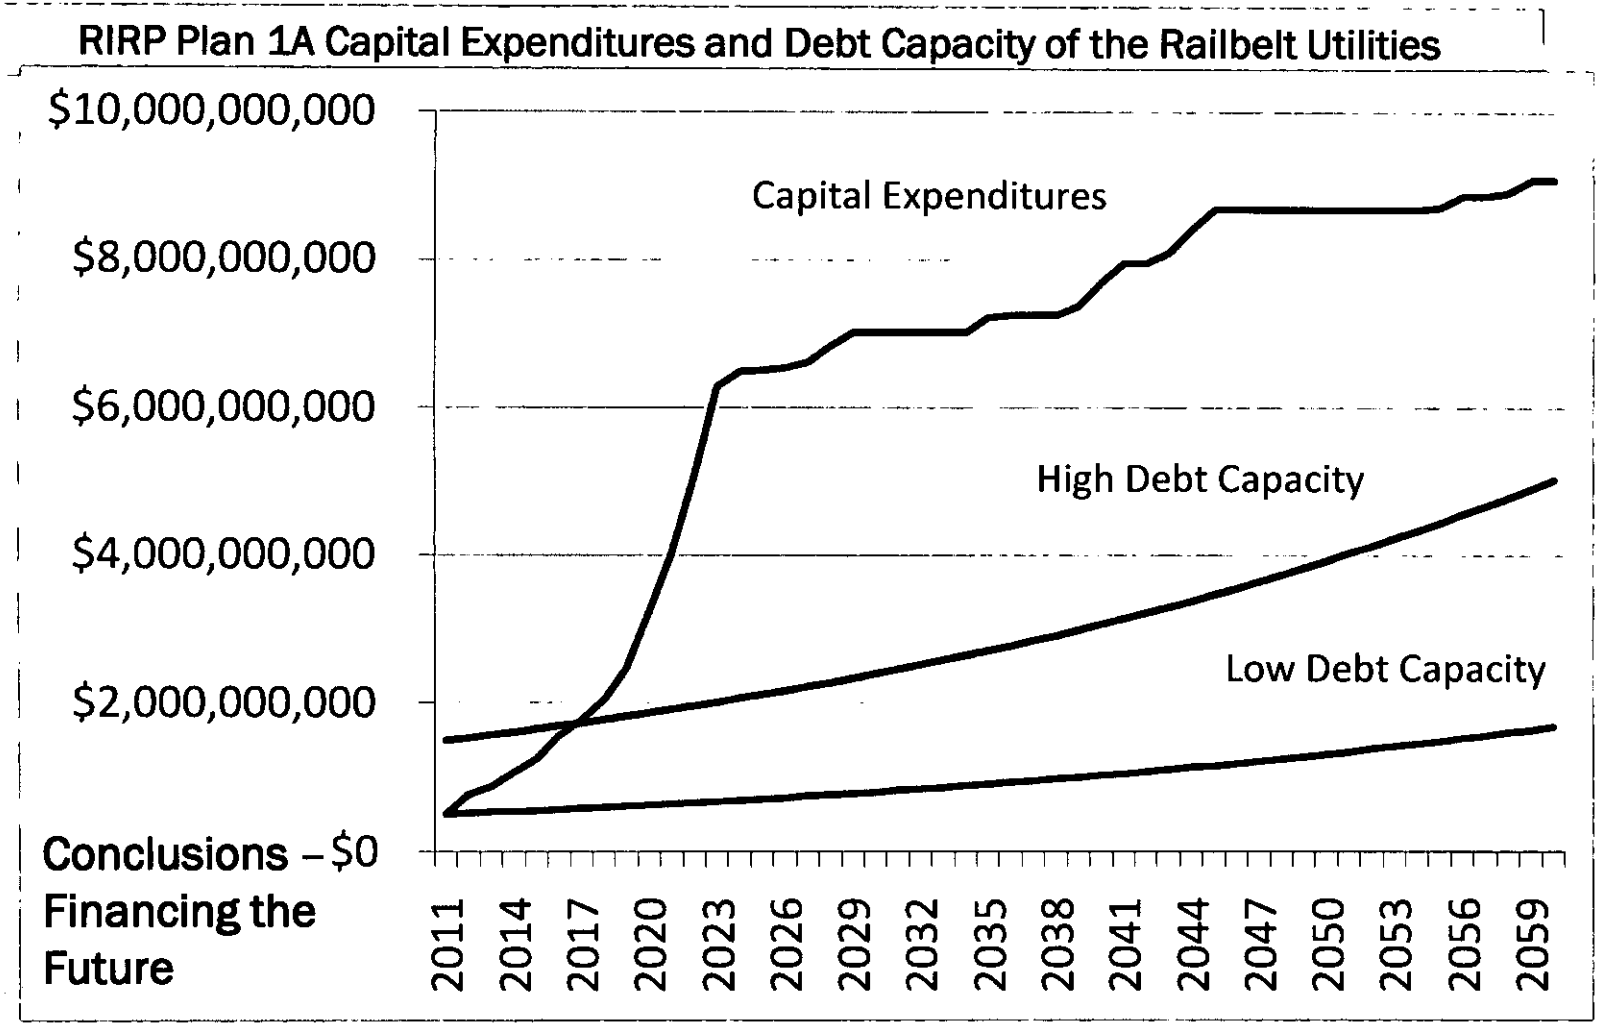
- Economically schedules what, when, and where to build G&T, based on available fuel and energy supplies
- 50-year time horizon

Goal for GRETC

Robust transmission
Diversified fuel supply
Least cost power rates
Spread risk
Financial assistance
Regional planning
Wise resource use
Respond to large load growth

GRETC = Greater Railbelt Energy and Transmission Company

A Comprehensive Plan for the Alaska Railbelt



Source: B&V RIRP report, Seattle Northwest Securities

A BRIEFING TO DESCRIBE THE CORPORATION

- *How is this new GRETC different from what was proposed in the 2009 legislature?*
- Topics for discussion to gain this understanding
  - 1. *Governance*
  - 2. *Powers of Corporation*
  - 3. *External Controls for Corporation Activities*
  - 4. *Initial Tasks for GRETC*

1. GOVERNANCE

- Private, not for profit statutory corporation, with board of directors
  - 2 board members from each Railbelt public Utility member
  - 1 public board member
- Each board member has equal vote
- Board required to designate a chief executive officer
- Employees of GRETC not State Employees
- All board processes public
- GRETC required to develop bylaws

1. GOVERNANCE – MEMBERSHIP IN GRETC

- Public Utility Members – Those Railbelt Utilities with Service Areas and retail customers, who are interconnected with the Railbelt Electrical Grid.
- Members – Other entities that purchase services from the corporation
- Membership requires 2/3 vote of board

2. POWERS OF CORPORATION

- Provide wholesale electric power to public utility members at lowest reasonable long-term cost
- Business purpose – acquisition, construction or development of generation and transmission assets, and ancillary services. Examples are
  - Procure fuel supplies
  - Develop operating standards for service territory of the corporation
  - Develop generation and transmission projects

2.POWERS OF CORPORATION – *DIFFERENCES FROM 2009 LEGISLATION*

- The new GRETC – in contrast to last year's bill
  - *Now a voluntary organization*
  - *Subgroups of utilities can develop G&T projects outside of GRETC, and still serve on the board and purchase services from GRETC.*
  - *Be the primary recipient of state financial aid*
  - *GRETC is not directed to become an all-requirements provider of wholesale power for the Railbelt –flexibility in approach to develop future Railbelt G&T infrastructure.*
  - *AEA Integrated Resource Plan provided as a resource to GRETC – requirement to follow removed.*
  - *Requires at least 4 Railbelt Utilities to join for formation.*

3. EXTERNAL CONTROLS

- Areas of Oversight
  - Consumer Protection
  - Financial Oversight
  - Effectiveness of Corporation
- Protections
  - RCA economic regulation for a 5 year sunset
  - Management audits at 3 year intervals for 10 years

4. INITIAL TASKS FOR GRETC – FORM THE COMPANY

- Form the Board of Directors
- Develop, consider and approve Corporate Bylaws
- Establish staffing plan
- Establish relationship with Alaska Energy Authority – support agreements
- Develop time line for critical actions – for GRETC to begin its business functions

4. INITIAL TASKS FOR GRETC – START THE WORK

- Identify task list for GRETC
  - Develop Integrated Resource Plan
    - State Sponsored Railbelt Integrated Resource Plan will be available for use by GRETC
  - Priority list of projects, business functions, and contractual agreements
  - Develop Capital Improvements Plan
- *Begin Critical Infrastructure capital projects*

- Questions?

The Alaska Intertie Electric Transmission Line

Description: The Alaska Intertie is a 170 mile long electrical transmission line that stretches from Willow to Healy River. The Intertie project includes several high voltage transformers, switching and access points at each end. This transmission link includes 3 facilities placed strategically in the Railbelt Grid, to provide system electrical stability. The project cost $124 million.

Also a part of the intertie operation, are ongoing agreements with Matanuska Electric Association to use MEA owned transmission lines to connect the intertie into the Chugach Electric Transmission System at the Teeland Substation, some 25 miles to the southern end of the intertie at Willow. An Alaska Intertie extension project is being pursued by the Alaska Energy Authority and Municipal Light and Power in an interagency agreement, to construct a section of transmission line that will extend AEA owned assets to the Chugach Electric Association transmission system. This extension will become a part of the project.

Background: The project was designed for high voltage operation at 345 kilovolts to handle expected Susitna power transmission needs. When the Susitna project was shelved, the need for movement of large amounts of power from the Talkeetna area both north and south because a potential future requirement, so the project was placed into operation at 138 kilovolts, and was configured to transmit up to 75 megawatts of power.

Because the project ran short of funds, arrangements were made with MEA to rent 20 miles of their 115 Kilovolt transmission system, and to build a 5 mile section from Teeland Substation on the Knik Road to a connection location within the MEA service area at Hollywood Road. The Railbelt Utilities in cooperation with the Alaska Energy Authority sought appropriations out of the Railbelt Energy Fund to complete the intertie in 2003. This extension project is presently being pursued by the AEA, in conjunction with two other intertie renovation projects, the Static VAR compensator upgrade and Tower 195 renovation. AEA is also reviewing with its contractor ML&P and with Chugach Electric Association where the southern terminus of the intertie should connect into the Chugach Electric Association system. This consideration is included in the regional integrated resource plan AEA is pursuing for the Railbelt.

Purpose: The Alaska Intertie connects the southern Railbelt Utilities electrically with Golden Valley Electric Association that serves communities to the north of the Alaska Range. Designed to move power in both directions, the intertie has been used chiefly to convey inexpensive electrical energy produced by Chugach Electric and Municipal Light and Power northward to become a part of the GVEA energy portfolio. Recently, power flows have flowed from GVEA south to the Chugach system, when Chugach lacked access to sufficient natural gas to carry the Chugach system load.

Sources of Funds: The intertie is owned outright by the Alaska Energy Authority, and has no debt associated with it. The Railbelt Utilities gain access to the project through an Intertie Agreement. As with Bradley, while AEA is the owner, the Railbelt Utilities through contract maintain and control the intertie. The agreement can only be changed with unanimous agreement from the Railbelt Utilities, but there is a termination clause that AEA has used to start a 4 year termination process, with the intent of negotiating a new agreement. This termination date is October 2010.

Operation of Facility: AEA contracts with ML&P and with GVEA to monitor and control the Intertie. Each operates a control center, and staff work cooperatively in the operation of the project. AEA contracts with Chugach, MEA and GVEA for maintenance of northern and southern legs of the project, and for maintenance of the three electrical stability (SVC) facilities.

The AEA project manager sits on the Intertie Operating Committee, which handles all technical and financial matters for the intertie project. The agreement specifies that the transmission rate be determined each year based on proposed schedules for use and annual budgets. At the end of the year, actual costs and power transmitted are used to true up costs. AEA receives no revenue from the project, and recovers only its program management costs from the annual budget.

Bradley Lake Hydroelectric Project

Description: Bradley is a storage hydro electric power project located near Homer, Alaska. With a peak capacity of 126 MW, and significant water storage held behind a rock fill dam, Bradley is an important part of the Railbelt operating power portfolio. Due to its remote location, the project has its own airstrip, boat dock, residential quarters, and utility system. The project is interconnected to the Homer Electric Association transmission system through 21 miles of dual 138KV transmission lines.

Background: The power generation potential of Bradley Lake was first studied by the U.S. Corps of Engineers and presented in a report dated March 1955. The project was authorized by Congress in 1962, but, despite its feasibility, federal funds were not available for its construction. The Alaska Energy Authority (then Alaska Power Authority) assumed responsibility for the project in 1982. Preliminary plans and field investigations started in 1982. In April 1984, the Authority submitted an application for license to the Federal Energy Regulatory Commission (FERC). The license to construct the project was issued on December 31, 1985. In December 1987, the Authority and the Railbelt utilities entered into a Power Sales Agreement to delineate responsibilities. Project was declared in commercial operation September 1, 1991. Bradley has been producing power for 16 years. In 2007, Bradley produced 392,000 MWh of power at a cost of approximately $.039 per kWh.

Purpose: The Bradley project provides 5-10% of the annual Railbelt electric power needs at the lowest Railbelt wide generation cost. Bradley is most important to the Railbelt electric system during the cold winter months, when demand for both electric power and gas for heat is at its highest. Utilities limited by available gas use Bradley power to meet the high electric demand.

Source of Funds: The project is owned by the Alaska Energy Authority, who has issued tax exempt bonds to finance a portion of cost of the project. The original cost was $328 million. The State of Alaska appropriated a portion of the construction funds to AEA's predecessor Alaska Power Authority, and the original principal on tax exempt revenue bonds was $165M. Since going into operation this initial principal has been paid down to a present amount of $113.69M. The bonds will be paid off in 2021. When bonds are paid off, payments are to continue to AEA for deposit into the Railbelt Energy Fund to refund the initial appropriations made to build the project.

Operation of Facility: All costs of operation that include payments to the bond holders and operations and maintenance costs are borne by the Railbelt Utilities and their Rate payers, who are signatories to the Bradley Lake Power Sales Agreement. Governance is through management committees populated by the Railbelt Utilities, with the AEA project manager also a member. Each year a new rate is calculated to offset actual costs of operation of the project. The Alaska Energy Authority has a small administrative fee associated with owning the asset and receiving rate payments and paying for the cost of operation. AEA provides a project manager to oversee the AEA involvement in the project.

- The agreement specifies an allocation of the Bradley Lake Power to Railbelt utilities, and through subsidiary agreements the utilities dispatch this power through the Railbelt grid to each utility.

- Under the power sales agreement, 100 percent of the project's capacity and energy has been sold to purchasers who are a part of the agreement:

    1. Chugach Electric Association, Inc. 30.4%
    2. Municipality of Anchorage 25.9%
    3. Alaska Electric and Energy Cooperative, Inc. [1] 25.8%

4.	Golden Valley Electric Association	16.9%
5.	City of Seward	1.0%

Note 1: AEG&T power flows as follows:
Homer Electric Association at (12.0%)
Matanuska Electric Association at (13.8%)

- AEA cannot unilaterally terminate the Bradley Power Sales agreement. The agreement could be changed, but only if all the Railbelt Utilities agreed. The term of the agreement is 50 years, or the date the revenue bond principal obligations are paid. Purchasers will have the ability to renegotiate the power sales agreement after bond obligations are retired.

CHUGACH

RESOLUTION

01 01 10

WHEREAS, Chugach Electric Association, Inc. (Chugach) participated in the Alaska Energy Authority's Railbelt Electrical Grid Authority (REGA) study, published September 12, 2008, which identified significant economic benefits to Railbelt electric utilities from joint utility operations; and

WHEREAS, the formation of the Greater Railbelt Energy and Transmission Corporation (GRETC) is a way to unify Railbelt utilities; and

WHEREAS, the GRETC can provide regional generation and transmission (G&T) planning on behalf of Railbelt utilities; and

WHEREAS, the GRETC can secure adequate fuel supplies for existing and planned generation resources while concurrently developing and promoting renewable and alternative energy projects to diversify the generation portfolio; and

WHEREAS, the GRETC, with State financial assistance, can best meet the extensive capital investment needs for the expansion and modernization of the Railbelt's G&T infrastructure; and

WHEREAS, the stated purpose of GRETC is to provide all Railbelt utilities with access to reliable and affordable long-term wholesale power supplies.

NOW THEREFORE, BE IT RESOLVED, Chugach shall support House Bill No. 182, attached, enacting the establishment of the Greater Railbelt Energy and Transmission Corporation.

CERTIFICATION

I, Alex Gimarc, do hereby certify that I am the Secretary of Chugach Electric Association, Inc., an electric non-profit cooperative membership corporation organized and existing under the laws of the State of Alaska: that the foregoing is a complete and correct copy of a resolution adopted at a meeting of the Board of Directors of this corporation, duly and properly called and held on the 27th day of January, 2010; that a quorum was present at the meeting; that the resolution is set forth in the minutes of the meeting and has not been rescinded or modified.

IN WITNESS WHEREOF, I have hereunto subscribed my name and affixed the seal of this corporation the 27th day of January, 2010.

(Seal)

Alex Gimarc

RESOLUTION 10-11
SUPPORTING DRAFT HOUSE BILL 182

WHEREAS, the Railbelt Utilities, working cooperatively with the Alaska Energy Authority have authored legislation in the form of draft House Bill 182 (January 21, 2010), for the purpose of establishing the Greater Railbelt Energy and Transmission Company (GRETC); and

WHEREAS, the GRETC is intended to ensure adequate, reliable, safe and stable wholesale electric power to public utility members on a non-discriminatory basis, at the lowest reasonable long-term cost; and to be the primary recipient of state financial assistance provided to support the acquisition, construction or development of generation and transmission assets, and ancillary services and assets, for the electric utility members of the corporation; and

WHEREAS, representatives of staff and Board of Directors of the Cooperative have participated in developing the legislation; and

WHEREAS, the Board of Directors is committed to continuing to work in good faith toward the development of an organization created to advance the above purposes;

NOW, THEREFORE;

BE IT RESOLVED that the Board of Directors of Homer Electric Association, Inc. hereby supports the passage of House Bill 182 in the form presented to the Board and commits the Cooperative to work in good faith to secure the benefits resulting from cooperative efforts with other Railbelt Utilities.

CERTIFICATION

I, David B. Thomas, do hereby certify that I am Secretary of Homer Electric Association, Inc., and that the foregoing resolution was adopted at a meeting of the Directors of Homer Electric Association, Inc., held on January 27, 2010, at which meeting a quorum was present.

ANCHORAGE, ALASKA
Resolution No. 2010- 01

A RESOLUTION OF THE ANCHORAGE MUNICIPAL LIGHT AND POWER UTILITY BOARD OF DIRECTORS REGARDING THE JOINT UTILITY TASK FORCE OMNIBUS REVISION TO HB 182 NOW SET TO BE FILED WITH THE ALASKA STATE LEGISLATURE

WHEREAS, the Anchorage Assembly and Mayor of Anchorage have by ordinance delegated to the ML&P Board the independent operation, management and oversight of the utility; and

WHEREAS, two representatives of the ML&P Board of Directors and senior members of management have participated with the Joint Utility Task Force in an effort to propose and acquire support of modifications to the original version of HB 182 introduced by the Alaska Energy Authority during the 2009 legislative session to create the Greater Railbelt Energy and Transmission Corporation (GRETC) necessary to address concerns ML&P and the Board had with the original proposed legislation, and

WHEREAS, changes have been made to the original version of HB 182 such that the Board of Directors and management are reasonably confident that the interests and rights of ML&P and its ratepayers are adequately provided for and protected by the JOINT UTILITY TASK FORCE OMNIBUS REVISION TO HB 182 (attached);

NOW THEREFORE, THE ML&P BOARD OF DIRECTORS RESOLVES THAT:

- The Board and management will continue to positively participate in discussions with the Joint Utility Task Force and in the legislative refinement of the JOINT UTILITY TASK FORCE OMNIBUS REVISION TO HB 182 and will respond to any proposed modification or amendments to this bill in a manner that tries to harmonize the interests of ML&P, its rate payers, and the Municipality of Anchorage with those of other Railbelt utilities.

- ML&P's position on this bill at this time should in no manner be construed as a decision or recommendation for ML&P to join, or not to join GRETC. That decision will be made once a bill is finalized and the form and content of a Letter of Intent with the Alaska Energy Authority has been established.

PASSED AND APPROVED by the ML&P Board of Directors this 27th day of January, 2010.

Memorandum

To: City of Seward, City Council

CC: Phillip Oates, City Manager

From: John Foutz, Electric Utility Manager

Date: 1/28/2010

Re: Update on the GRETC Legislation

For the past four weeks the joint utility task force has been meeting in Anchorage to finalize the GRETC legislative bill. In the legislature this bill is known as HB182. All six railbelt utilities as well as members from various state agencies attended the four meetings.

The primary reason for the meetings was to finalize the language in HB182 that can be agreeable to all six utilities as well as some added language from the state. One of the primary concerns expressed by some of the utilities was a need for voluntary participation, while a concern of the states was some protection for financial obligations. At this time both criteria seem to be addressed adequately.

Some other concerns articulated by the utilities were:

1. Control of the new enterprise by the utilities.
2. No Regulation by the RCA.
3. The decision to include further utilities in the future should be left to the discretion of the utilities and not the state.
4. And assurances this course of action is following the same guidelines as the Bradley Lake Project model.

The state insisted that three items be included into this bill.

1. The new entity will be the primary recipient for state funds.
2. The organization have the ability to collect funds to help pay for depreciation of future projects.
3. The business will be charged with being the moderator for a standard of reliability and interconnectivity.

The essence of the document has support by the six utilities and the state; all that is required is the correct language. The task force is currently working on final language to present to the states legislative body, with a meeting on Thursday, January 21st and quite possibly another meeting during the week of January 25th – 30th.

3111

Agenda Statement

Meeting Date: November 24, 2009

To: Phillip Oates, City Manager

From: John Foutz, Electric Utility Manager

Agenda Item: Support Of The Greater Railbelt Energy And Transmission Corporation

---

BACKGROUND & JUSTIFICATION: Leaders of Chugach Electric Association, Matanuska Electric Association and the City of Seward held a joint meeting on November 20, 2009 and moved forward in support of legislation to create the Greater Railbelt Energy and Transmission Corporation, or GRETC. The organizations outlined their vision in a resolution that noted many of the benefits the new organization would bring. These include joint planning, state-assisted financing, and utility technical expertise to operate and maintain projects.

The organizations note that the successful Bradley Lake hydroelectric project provides a model for GRETC activities. Bradley Lake is a state-owned, utility-operated project whose low-cost power is shared through power sales contracts with each of the six Railbelt electric utilities. The state provided the financing for Bradley Lake through a combination of grants and bonds, with the utilities covering the debt service in exchange for power from the project.

Legislation to create GRETC was introduced in both the House and Senate earlier this year, but the legislature adjourned with the bills still in the energy committees of the two bodies. Legislators and utilities have devoted a great deal of time to energy issues during the interim, and the GRETC bills will continue to receive attention when the legislature reconvenes in 2010.

The GRETC concept of a single Railbelt organization to provide generation and transmission services emerged from a study of how the region's grid works today and how it could best meet the needs of Alaskans in the future. The Railbelt Electrical Grid Authority study, completed in September 2008, was led by the Alaska Energy Authority with funding from the legislature. The REGA study identified an average annual present worth net savings of between $10.5 and $30.9 million which equates to between a 3.6% to 10.1% net savings for Railbelt consumers. In a related effort, the AEA is currently doing an integrated resource plan to determine how to meet the generation needs of the Railbelt for the next 50 years.

The Parnell administration, like the Palin administration before it, continues to support the GRETC legislation. The governor's senior energy advisors and AEA leadership have met repeatedly with Railbelt electric utilities to discuss the legislation and seek consensus on the issues.

A task force of the boards of all Railbelt electric utilities will continue their work on GRETC and related issues.

INTENT: The City of Seward will confirm their support for the GRETC concept.

CONSISTENCY CHECKLIST: Where applicable, this agenda statement is consistent with the Seward City Code, Charter, Comprehensive Plans, Land Use Plans, Strategic Plan and City Council Rules of Procedures or Other Plans or Policies:

FISCAL NOTE:
No known fiscal impact at this time.
Approved by Finance Department: Kristen Erchinger

ATTORNEY REVIEW: Yes_____ No____X___

RECOMMENDATION: The City Council pass resolution 2009-133, showing support for GRETC and encouraging additional Railbelt utilities to support the GRETC legislation.

Sponsored by: Oates

CITY OF SEWARD, ALASKA
RESOLUTION 2009-133

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF SEWARD, ALASKA, IN SUPPORT OF THE GREATER RAILBELT ENERGY AND TRANSMISSION CORPORATION

WHEREAS, Chugach Electric Association (CEA), Matanuska Electric Association (MEA) and the City of Seward (COS) jointly support the establishment of the Greater Railbelt Energy and Transmission Corporation (GRETC) and will collectively work with the Alaska Energy Authority (AEA) to incorporate proven business concepts into the current Legislation (HB182 and SB143) establishing GRETC; and

WHEREAS, the stated purpose of GRETC is to provide all Railbelt electric utilities with access to reliable, long-term, wholesale power supplies at stable prices; and

WHEREAS, to fulfill this purpose GRETC must acquire adequate fuel supplies for existing and planned generation resources while concurrently developing and promoting renewable and alternative generation and regional transmission projects that can diversify power supply resources; and

WHEREAS, GRETC will best succeed based upon a private/public partnership with a unified business structure that incorporates rational economic decision making, lowest financing costs and provides business continuity through technical competence, and corporate leadership; and

WHEREAS, the Railbelt electric grid has significant capital investment needs, and GRETC in cooperation with the Alaska Energy Authority (AEA) and state-assisted financing can provide the lowest cost financing and reduce the risk to individual utilities; and

WHEREAS, GRETC can provide regional generation and transmission planning for the benefit of all Railbelt utility customers through an Integrated Resource Plan (IRP) process and this process will support rational funding decisions for future generation and transmission projects; and

WHEREAS, through the GRETC planning process, all Railbelt utilities will benefit from increased reliability and over time GRETC will endeavor to provide equal reliability for all service territories within its jurisdiction; and

WHEREAS, the Bradley Lake hydroelectric project is one example of a project that has been successful based upon state-assisted financing through AEA and the combined strengths of the Railbelt electric utilities to manage and operate highly technical generation and transmission facilities; and

CITY OF SEWARD, ALASKA
RESOLUTION 2009-133

WHEREAS, AEA has completed the Alaska Railbelt Electrical Grid Authority (REGA) study (September 2008) the identified economic benefits of joint utility operations, but acknowledged the need for a transition period due to complexities of existing utility ownership and contractual arrangements; and therefore the following guidelines are suggested to allow for a successful transition to GRETC:

- Existing utility generation, transmission, and fuel assets may be cooperatively integrated into GRETC operation based upon a range of options (sale, lease, or other beneficial operating agreements) at the option of the utilities owning such assets,
- Utilities may participate through sales agreements with GRETC for desired services,
- Existing power sales agreements will not change except under terms mutually acceptable to all parties,
- During transition to GRETC, operation of the interconnected system may be governed by a single set of interconnection guidelines that will be jointly established by GRETC and the utilities,
- Power sales arrangements and ancillary services can be made available to participating utilities that need services which cannot be provided by GRETC initially and these services can be available through bilateral contract arrangements; and

WHEREAS, The Railbelt utilities have energy service needs that have not historically been undertaken by all utilities and GRETC can provide these services on a bundled or unbundled basis for the benefit of all. These services can include:

- Planning reserves
- Operating reserves
- Base load power
- Power dispatch
- Wind integration
- Acquisition of Independent Power Producer (IPP) Renewable resource projects (reduces coordination from six utilities to one)
- G&T project management
- Fuel supply aggregation, acquisition, storage and scheduling
- Grant application processing and management
- Other services as deemed appropriate by the GRETC board of directors; and

WHEREAS, GRETC will offer services based on uniform rates for like services and utilities will pay for services they receive under standard tariffs or contract arrangements; and

WHEREAS, GRETC will be regulated through the GRETC board of directors and under a state regulatory regime that will allow the best value for Railbelt customers; and

CITY OF SEWARD, ALASKA
RESOLUTION 2009-133

NOW, THEREFORE, BE IT RESOLVED BY THE CITY COUNCIL OF THE CITY OF SEWARD, ALASKA that:

Section 1. The City of Seward, along with CEA and MEA, encourage Homer Electric Association (HEA), Municipal Light and Power (ML&P) and Golden Valley Electric Association (GVEA) to support and join GRETC; and

Section 2. The City of Seward, CEA and MEA jointly support the creation of GRETC using proven business concepts that will provide reliable, stable and affordable G&T services to our customers.

PASSED AND APPROVED by the City Council of the City of Seward, Alaska, this 24th day of November, 2009.

THE CITY OF SEWARD, ALASKA

Willard E. Dunham, Mayor

Subject: GRETC Resolutions

Can you please forward a copy of the resolution passed by your utility in regard to the GRETC Legislation today?

I understand ML&P doesn't meet until noon and our board meeting is tonight.

As soon as I get all of them, I will make sure that all of the utilities get copies. Thank you.

CITY OF SEWARD ALASKA

April 9, 2009

Governor Sarah Palin
State Capitol, Third Floor
Juneau, Alaska 99801

Dear Governor Palin:

On behalf of our respective Railbelt electric utilities, we are writing to thank you for your efforts to bring us together for a serious consideration of the best way to meet the future generation and transmission needs of our organizations. We very much appreciate the resources you have committed to this process, beginning with the Railbelt Electrical Grid Authority (REGA) study and progressing through the development of the Greater Railbelt Energy and Transmission Corporation legislation. Your administration has done an outstanding job in leading this effort. We particularly appreciate the efforts of Mr. Joe Balash and Mr. Jim Strandberg for their individual commitments.

Your efforts led to a notable meeting. On April 7th, 2009, a joint meeting was held of the governing bodies of the six Railbelt electric utilities. We came together to discuss the legislation and how the joint G&T could benefit our individual utilities. What we discovered is that utilities generally agree on the G&T concept but have concerns on specific transition issues. The governing members were also concerned about the state's role and what commitment the state would have in providing financial assistance for development of generation and transmission infrastructure. It was this premise that drove the REGA study recommendations for a state authority. While we understand that a finance plan was part of the transition plan, its existence is paramount to choosing this G&T structure over other alternatives.

The utility governing bodies want to move this process forward and have agreed to form a governing body task force to learn more about the specific transition issues. We look forward to

working with the administration and are committed to dedicating the required resources to make this a success.

The task force should meet no later than May 8th, 2009 to begin the process. We invite the administration to meet with us to develop a work plan to address the various transition issues of concern. To fund these transition issues, we recommend the legislature appropriate approximately $1.5 million from the Railbelt Energy Fund to the Alaska Energy Authority.

Once again, thank you Governor Palin for your leadership on this issue. We very much appreciate your support as we investigate the best way to provide reliable, affordable electricity for Railbelt Alaskans.

Sincerely,

Wilfred Abbott, Chair
Anchorage Municipal Light & Power

Rebecca Logan, Chair

Senate Bill 144 – Musk Oxen Permits & Tags

Version 26-LS0666/R, March 9, 2009
STAFF: Tim Benintendi, 465-4989

SPONSOR STATEMENT and SECTIONAL ANALYSIS

SPONSOR STATEMENT:

There are four Game Management Units in which musk oxen are found in Alaska; Unit 18 (Nunivak and Nelson Islands), Units 22 and 23 (Seward Peninsula and Northwest), and Unit 26 (Northeast). The musk oxen population in Alaska is currently estimated to be 4,400 animals, and annually, between 325 and 350 animals are available for harvest.

The primary objective of SB 144 is to allow issuance of a second permit for a musk ox hunt in a second Game Management Unit or hunt area within a unit, for resident hunters and subsistence hunters only; no out-of-state hunters qualify. If a harvester does not take an animal under the first permit, this would double the chance a hunter has to harvest the bag limit of one animal, either a bull or a cow. It would not allow for the taking of two animals.

Current statute provides for a limit of one musk ox permit for each hunter per calendar year. Musk oxen are the only game animals in the Arctic to which the one-permit restriction still applies. Under SB 144, the department could issue subsistence permits beyond a calendar year basis, to accommodate a season which straddles two calendar years (Example: a season which runs from August 1st to March 15th), because a "year" under this bill, is changed from a calendar year to a regulatory year, which is July 1st to June 30th.

Wildlife biologists and regulators within the Department of Fish and Game have determined that the health and size of the state's herd is well past the threshold for expanding opportunities for Alaskan hunters. State biologists

estimate that a nominal number of additional permits would be issued under the provisions of this bill, and perhaps 25 more animals would be harvested. If passed this legislative session, these new provisions would be in place for seasons beginning in August of this year.

In summary under SB 144, a qualified hunter would be allowed to obtain a second permit for another hunt area or Game Management Unit, if he or she did not successfully harvest a musk ox under conditions of their first permit.

SB 144 carries a ZERO fiscal note, and has the support of the department. Support from the hunting community in Northwest Alaska includes the Northern and Southern Norton Sound Advisory Committees, and the Seward Peninsula Musk Ox Cooperators' Group. We have discovered no opposition to this bill.

SECTIONAL ANALYSIS:

SECTION 1: Amends AS 16.05.340(a)(16) to allow the Board of Game to reduce or eliminate the fee, as well as the tag requirements, for a musk oxen hunt, and makes it applicable to all or a portion of a game management unit. Applying this to an open season has been eliminated. The objective is to have the statute for musk oxen read the same as for other game.

SECTION 2: Amends AS 16.05.346(a) by providing that the department shall issue permits to take musk oxen once the Board of Game has reduced or eliminated requirements for a resident tag and fee. This statute is further amended by providing that a resident may not be charged a fee for an application for a musk oxen permit under these circumstances.

03/20/09

Donny,

Thank you very much for your help this winter in convincing the ADF&G to continue issuing permits for the RX 104 registration musk ox permits to interested Alaskan hunters who traveled to Shishmaref to hunt ox.

There are three types of musk ox hunts in game unit 22E.

1) Federal permits available to local residents of unit 22E only, valid for hunting on federal lands only.

2) DX 097 (drawing permit) is available through the general permit drawing to all Alaska resident and non-resident hunters for 4 year old, or older (trophy) bull ox on state or private lands in game unit 22E only. There are currently 20 permits available for the draw each regulatory year (July 1st through June 30th).

Once issued (in July of each regulatory year), the hunter can hunt 4 year old, or older bull musk ox throughout the entire hunting season of August 1st through March 15th of the current regulatory year. If the hunter hunts the fall season (August 1st through December 31st) portion of that calendar year, he must have a valid hunting license and $500 resident/$1,100 non resident bull ox tag for that calendar year, and if unsuccesful, must purchase a new hunting license and bull ox tag for that portion (January 1st through March 15th) of the subsequent calendar year that the permit remains valid for.

The DX 097 permit is valid for one bull ox.

3) RX 104 (registration permit) is available to any Alaska resident statewide and is issued in Nome, Wales and Shishmaref. The hunter must obtain the permit in person at ADF&G office in Nome or the IRA office in Shishmaref upon presenting a valid hunting license. There is no cost for the permit or the tag. The season is open from August 1st through March 15th for bulls and January 1st through March 15th for cows unless the season is closed by emergency order if 31 cows or 50 oxen total are harvested before March 15th.

The horn tips (trophy destruction) must be cut on all oxen harvested with this permit before the horns can be removed from game unit 22.

The season has never been closed because of the ADF&G harvest goal of 50 oxen were taken to my knowledge in the history of this hunt. There are several key factors to the low level of harvest:

A) The local hunters are not very enthusiastic about ox hunting.
B) The area is very remote and expensive to travel to for non-local Alaska residents.
C) The trophy value is destroyed which further restricts interest in non-local hunters.

D) Winter weather and storms makes access from Nome by snow machine marginal and dangerous for most people not familiar with the country.

The ADF&G is trying to increase the harvest of oxen in sub-unit 22E for the health of the herds and providing greater hunting opportunity for the public. I have several ideas to propose to the Federal RAC and State BOG concerning regulatory proposals to address this issue, but they do not require legislative state statute changes to implement, if accepted.

The issue we ran into this winter commenced when the state BOG opened all game unit 22 to drawing and registration hunts, replacing Tier II hunting. Sub unit 22E has always been treated differently as the ox population vs. hunting interest dynamics are different than the remainder of game unit 22.

At some point in this process AS 16.05.346 was reviewed and the verbiage within the statute "a person is not eligible for more than one musk ox permit a year" was interpreted to mean that a person must obtain the RX 104 permit by December 31st to hunt the portion of the calendar year January 1st through March 15th.

This administrative regulation change was implemented with very poor public notification. It is in the hunting regulation booklet, although poorly indicated and no public notices were evident in Shishmaref as the community most affected by the change. The accepted procedure for all the years the hunt has been in place was for the hunter to go to the IRA office in Shishmaref and obtain the permit up until the close of the season.

I am not sure the best solution to this problem as I am not versed in law or administrative regulation.

I would like to see the following solution: AS 16.05.346 amended to define a year as "a person is not eligible for more than one musk ox permit per regulatory year July 1st through June 30th" and not a calendar year and that the ADF&G SHALL issue RX 104 permits until either the regulatory season closes or the harvest goal is met for that regulatory year, and not cease issuing permits December 31st.

I realize the ADF&G could take an administrative position to not issue permits after December 31st regardless of law changes and in that case I would like to see the ADF&G have to make the permits available online, other wise hunters will have to travel to Nome and Shishmaref twice to hunt the same animal.

I am enclosing the information for a state attorney who is knowledgeable in ADF&G issues and could be consulted to clarify the issue and interpretation of the law:

Current Status of Muskoxen in Alaska 1970-2009

Letty Hughes[1], Patricia Reynolds[2], Kimberlee Beckmen[1], Phillip Perry[1], Geoff Carroll[1], Steve Arthur[1]
[1]Alaska Dept. of Fish & Game, [2]US Fish & Wildlife Service, Arctic National Wildlife Refuge

Introduction

Muskoxen (*Ovibos moschatus*) were reintroduced to Alaska after disappearing in the late 1800s. The first establishment of muskoxen from Greenland to rural Alaska was Nunivak Island in 1936. The Nunivak population acted as a source of animals for future relocations on historic range between 1967-1981. The relocation of 300 animals created five populations throughout Alaska: Nunivak, Nelson Island, Northeastern, Northwestern, and Seward Peninsula (Figure 1). The successful establishment of muskoxen populations and current cooperative management efforts have resulted in range expansion, population growth, and stability, along with hunting and viewing opportunities.

Recent Range Expansion

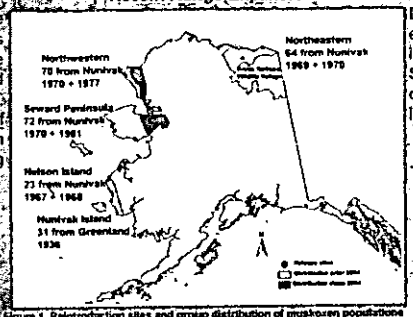

Figure 1. Reintroduction sites and group distribution of muskoxen populations

Harvest

Hunting of reintroduced muskoxen first occurred on Nunivak Island in 1975. Four of the five populations are open to harvest on an annual quota and permit basis (Table 1). In 2008, the Board of Game adopted regulations that allow Alaskans to harvest muskoxen on the Seward Peninsula with a registration permit (Gorn 2009). The new hunts were created from recommendations from local advisory committees and Seward Peninsula Muskox Cooperators, a stakeholder group established in 1994.

Table 1. Harvest of Muskoxen in Alaska

Population	Hunting Began	Average Annual Harvest Pre-1998	Average Annual Harvest 1998-2008	Available Harvest 2009	Hunt Structure 2009	Sex of Harvest	Available Harvest as % of population 2009
Nunivak Island	1975	58	81	85	•Drawing •Registration	•Bulls 1975-1976 •Cows & Bulls 1979-present	15
Nelson Island	1981	23	23	42	•Registration	•Cows & Bulls	8
Northeastern	1990	5	8	0	No Open Season	•Closed to harvest in 2006	0
Northwestern	1998	No Hunt	<3	6	•Tier II drawing	•Bulls 1999-present	1
Seward Peninsula	1995	13	78	187	•Tier I Registration •Drawing •Federal Permit	•Bulls 1995-2000 •Cows & Bulls 2000-present	7* *will be < 7% in 2010-2011 pending survey results

Population Growth

During the 74 years since 31 muskoxen were first established on Nunivak Island, populations have increased to over 4400 animals in Alaska (Table 2). The Seward Peninsula population is the state's largest, and continues to expand eastward (Figure 1) as the population increases (Figure 2).

Table 2. Current size of Alaska muskoxen populations

Population	Population Size	Date of Estimate	Status
Nunivak Island	667	Oct. 2009	•16% from 1947-1969 •Stable since 1970
Nelson Island	557	Jun. 2009	•22% from 1968-1981 •6% from 2004
Northeast	200-250*	Apr. 2008	•650 muskoxen by 1995 •Declined 60% 1998-2006 •Stable from 2006-2008
Northwest	324-424*	Jan. 2008	•6% from 1978-1998 •Stable from 1999-2008
Seward Peninsula	2688*	Mar. 2007	•14% from 1970-2000 •6% from 2000-2007
Total minimum Alaska population estimate	4486		* Incomplete 2009 survey; ** Dec. 2009; *** Minimum known animals confirmed

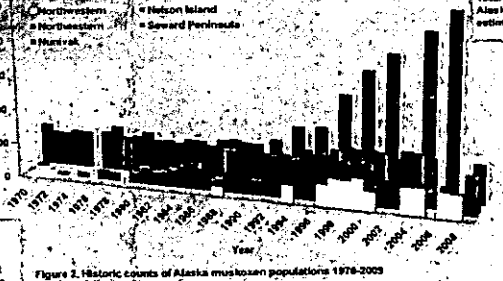

Figure 2. Historic counts of Alaska muskoxen populations 1970-2009

Table 3. Mortality type in Northeastern population 2007-2009

Mortality Type	Adults	Calves	Total
Bear Predation	16	36	52
Disease	2	2	4
Vehicle collision	3	0	3
Other non-predation	4	10	14
Total	25	48	73

Mortality and Disease Surveillance

Seward Peninsula
- Predation relatively low compared to Northeastern
- Chlamydia present (Gorn 2009)
- Low in copper
- Negative for iron, zinc, selenium (Gorn 2009)
- Composition surveys show 30 yearlings:100 cows since 2002 (Gorn 2009)

Northeastern
- Predation a significant mortality factor (Table 3)
- Mortalities from drowning and stranding on sea ice
- Chlamydia present (Lenart 2009)
- Copper deficient (Lenart 2009)
- Low calf recruitment and low calf:cow ratios (Lenart 2007)

Future Management

The reintroduction of muskoxen to Alaska continues to be successful. Population growth and range expansion provides opportunities for consumptive and non-consumptive uses of muskoxen. Continued investigation of population parameters and health assessments along with public input will enhance future management of Alaska muskoxen.

ANALYSIS: *(Attach a separate page if necessary)*

The UA Alaska Center for Energy and Power (ACEP) will administer grant funds appropriated in to the "emerging energy technology fund." ACEP would provide services for an administrative fee similar to that used by the Denali Commission, 5%. Thus there would be no additional fiscal impact beyond what is appropriate into the fund. This would be a service fee charged on the amount of funding used on a project by project basis. At this time there is not an established amount to be appropriated for the fund. If there were $5 million in projects funded in a given year the service fee would total $250,000.

(Revised 9/10/2008 OMB)

ANALYSIS CONTINUATION

The UA Alaska Center for Energy and Power will administer grant funds appropriated in to the "emerging energy technology fund." This will entail:

Selecting and calling an advisory group to;
- establish priorities and criteria which are consistent with the statute.
- evaluating and prioritizing grant proposals
- awarding grants
- evaluating results of projects completed.

Fiscal administration, accounting, and reporting on project status and overall accomplishment of the funds invested;
- distribute funds to successful grant proposals
- provide regular report to various constituents on project status
- account for and report on funds balance
- provide annual report on results achieved.

ACEP would provide these services for an administrative fee similar to that used by the Denali Commission, 5%. Thus there would be no additional fiscal impact beyond what is appropriate into the fund. This would be a service fee charged on the amount of funding used on project by project basis. At this time there is not an established amount to be appropriated for the fund. If there were $5 million in projects funded in a given year the service fee would total $250,000.

ACEP

The Case for Funding Applied Energy Research

There is no doubt that energy is (and should be) foremost in the minds of Alaskans. Most of the money flowing through the Alaska economy is from the oil resources on the North Slope, and our lives are connected in both positive and negative ways with the price of energy.

Alaska's rural communities have reached a crisis level in the escalating cost of energy. Along the Railbelt, traditional fossil fuel based resources used for power generation, such as Cook Inlet natural gas, are in decline. Production of oil from the North Slope is also in decline. This has led state policymakers at both the legislative and executive level to begin the process of developing a comprehensive energy plan for the state. Alaska has the financial means, available resources, and political willpower to become a leader in developing renewables, stranded energy resources, and difficult to extract fossil fuel resources, including the vast proven heavy oil resources on the North Slope. Alaska has already made significant strides in this direction. The Alaska renewable energy fund created under HB152 and administered by AEA is by far the largest and most aggressive fund of its type in the country. In addition, Governor Palin's stated target to achieve 50% renewable power generation by 2025 is also the most ambitious goal among the 50 states.

In order to fulfill the vision of Governor Palin and many others of truly becoming a leader in the energy field, Alaska must invest in three areas: energy projects, energy policy, and energy research. It is essential to develop a plan which incorporates a balanced approach between these key elements, and elements of which are being worked on at the legislative and executive levels of state government. In addition, the Alaska Energy Authority has already been tasked with managing the project component; however projects funded under the Alaska Renewable Energy Fund are explicitly limited to proven, existing technologies. AEA currently has no mandate or capability to engage in energy research, and the current legislation does not allow for funding of any emerging technologies. While this is appropriate under the goals for this funding, the lack of identified funding for applied energy R&D greatly limits Alaska's ability to successfully achieve a leadership role in the energy field. This is particularly crippling in a state with very different conditions than are found elsewhere in the U.S. in terms of environment, population density, and the isolated nature of the electrical generation and transmission system.

While basic research addresses mostly scientific questions (what are the basic rules of the universe), applied research is aimed at developing technologies for immediate use. This requires understanding of the basic underlying science, but centers on producing cost effective, reliable, and locally appropriate technologies. An important part of this research is independent third party testing and verification of technologies before these are deployed in remote sites. A funded applied energy research program through the

3132

State of Alaska could ensure a much greater success rate for projects in the field, including the 77 projects recently funded under the Alaska Renewable Energy Fund.

For example, the Alaska Center for Energy and Power is currently involved in programs to test and evaluate new battery systems, waste heat recovery devices and hydrokinetic turbines. The goal is to ensure manufacturer performance claims are accurate and that the devices perform as expected under harsh Alaskan conditions. In one case, a waste heat recovery device had received numerous international rewards and looked like a very viable candidate for improving efficiency from diesel engines. However, when researchers from ACEP travelled to a location where the unit was purportedly in operation, it was quickly apparent that the manufacturer performance claims were not being realized in the field and that this was not a technology that should be invested in at this time. ACEP was able to alert the Alaska Energy Authority to this fact and prevented unnecessary expenditure of state funds on what undoubtedly would have been a failed and frustrating project. A relatively small investment (a few days of research and phone calls, a few thousand dollars spent on travel) allowed a good decision about the investment of hundreds of thousands of dollars that would have been spent purchasing equipment from out of state suppliers.

Dollars spent on energy research can also be leveraged to bring additional federal dollars to Alaska. The Alaska Center for Energy and Power frequently submits proposals for federal funds under the U.S. Department of Energy, which generally required 20% cost share for projects. The lack of state funding to date for ACEP has greatly hampered the ability to bring in this federal funding. At this time, given the $13 Billion the Obama administration intends to commit to renewable energy research, tremendous opportunities exist for tapping federal funding, but much of this funding will still require some demonstration of program support at the state level. Every $1 of state funding can generate an additional $4 of investment from federal sources.

According to the National Science Foundation, Alaska currently ranks 46th among states in terms of funding spent on R&D, and has no significant mechanism for funding energy research at the state, regional, or local level. Despite tremendous expenditures proposed for developing natural gas resources, renewable energy, and immediate short-term relief for the high cost of energy, the state has been slow to see the need for investment in research. If Alaska is truly to become a leader in energy, it will be necessary to invest in energy research in addition to project development.

By funding research as a part of the state's overall investment in energy projects, Alaska has the opportunity to truly become a leader on the world stage in energy development in a manner which can provide stable, affordable energy throughout the state while simultaneously developing economic opportunities for its residents and its industries. It is only by taking a balanced approach between forward-thinking policy, investment in cost-effective projects, and investment in research to 'peer over the horizon' at emerging technologies which will provide future energy solutions that this goal can be realized.

Alaska Emerging Energy Technology Development Fund

Background Narrative

The United States is entering a new era. The Obama administration is now promising an economic stimulus package that will likely top $700 billion. Many of those dollars will replace and repair crumbling infrastructure. A significant portion of the money will fund energy infrastructure, including renewable energy projects, new transmission lines, and research and development of emerging energy technologies.

Renewable energy has become mainstream, and is no longer considered "alternative." Large-scale wind, geothermal and hydroelectric technologies are mature and cost competitive. Other technologies such as biomass, solar, and ocean power (tidal and wave) are in various states of commercialization. One of the goals of the upcoming federal spending will be to bring those technologies to maturity to help lessen our dependence on foreign oil. But since very little oil is used to generate electricity in the United States, America will need to find new ways to apply renewable-sourced electricity to both heating and transportation.

Today there are several companies around the world working to capture "first mover" advantage in the electric car industry. The Israeli company *Better Place* has recently been grabbing headlines with its plan to create a charging station infrastructure where a customer simply pulls into the station and swaps a depleted battery for a freshly charged one. Others see renewable-sourced hydrogen and fuel cells as part of our transportation future.

Alaska is already seeing consumers in communities like Sitka and Juneau switch from oil based heating to relatively inexpensive hydro-based electric heat. Residents of those communities are also exploring ways to use electricity for transportation. If a new large hydro facility is built to serve the Railbelt, Southcentral Alaskans will do the same. Wave and tidal based electricity presents enormous potential for Alaskan communities to generate excess electricity to be used for heating and transportation. Alaska is also seeing a growing use of wood biomass for central heating facilities that are decreasing the use of heating oil. Some of those same communities are also interested in the technology that gasifies wood to generate electricity.

Necessary innovations in battery storage, tidal and wave power technology, biomass gasification, and hydrogen generation, transportation and storage all require continued research and development. Breakthroughs in ways to capture and store carbon also need more R & D. Private industry is already engaged in such R & D, and is being supported by a number of state-based funds and small federal programs. However, with the federal government now on the verge of much larger investment in such technologies, it's a good bet that the states with existing emerging energy technology development programs will be first in line for federal grant money.

3134

Alaska's creation of the Renewable Energy Grant Fund in 2008 was a fundamental first step in the long process of decreasing Alaskans' dependence on volatile priced fossil fuels. Getting viable renewable energy projects in the ground is an essential long-term investment for many communities. But the Renewable Energy Grant Fund is only one component of an overall state renewable energy program.

Because of Alaska's unique remote communities and abundant renewable energy resources, our state has an excellent opportunity to become a world leader in renewable energy development. Unlike any other place in the nation, Alaska can demonstrate new technology *and save consumers money at the same time* because energy prices in rural communities are already so high. Demonstrating emerging technologies in rural Alaska could also lead to the state becoming a leading marketer of that expertise to the two billion people on the planet who do not yet have any electricity at all. However, the Renewable Energy Grant Fund was not designed or written to fund demonstration projects. In order for Alaska to be part of what many are calling the next industrial revolution in energy innovation, Alaska needs to create its own "Emerging Energy Technology Development Fund."

Such a Fund should encourage collaboration between Alaska institutions of higher learning and private industry, with a modest contribution of state money to capitalize and catalyze its creation. Because no state agency currently exists with the expertise to do so, the Fund should be administered by a newly created Alaska Energy Trust. The Trust should be a non-profit, non-governmental entity overseen by the Regulatory Commission of Alaska. This arrangement is similar to the one that established the very successful Energy Trust of Oregon. The Fund should provide both grants and loans to university researchers, non-profits, private industry and local governments to fund research and development, demonstration projects and market transformation of renewable and alternative energy technologies that have a high likelihood of becoming economically and technologically viable in the short term in a carbon constrained world. Equally important, the Fund should provide coordination and funding for targeted work force development and education programs that will train Alaska's next generation of construction workers, technicians, engineers and scientists that will guide us through the next century of energy innovation.

The Trust should be administered by a professional staff with oversight from an Advisory Committee that consists of nine representatives from state and federal agencies and private institutions that have expertise in emerging technologies. The methodology for funding projects should give the most weight to projects that create partnerships with Alaska entities, have matching funds and will lead to real benefits for the people of Alaska.

With the Governor's recent announcement that the goal of the State of Alaska shall be to obtain 50% of its electricity from renewable energy sources by the year 2025, the state has set an important target. Establishing an emerging energy technology development fund is a necessary and timely component of reaching that goal, stabilizing energy costs and diversifying Alaska's economy.

Establish an Emerging Energy Technology Fund

One of Three Priorities for Enhancing Alaska's Quality of Life and Protecting a Healthy Environment

The Need

The creation of the Renewable Energy Grant Fund in 2008 was a critical first step in the process of promoting a secure, clean energy future for Alaska. However, the Renewable Energy Fund is only one component of a renewable energy program and was not designed to fund developing technologies that are not yet fully commercialized like tidal, geothermal or battery storage. Because of Alaska's unique remote communities and abundant renewable energy resources, our state has an excellent opportunity to become a world leader in emerging renewable energy development. Unlike any other place in the nation, Alaska can demonstrate new technology *and save consumers money at the same time* because energy prices in rural communities are already so high. In order for Alaska to be part of what many are calling the next industrial revolution in energy innovation, Alaska needs to create its own "Emerging Energy Technology Development Fund." Establishing an Emerging Technology Fund is also necessary to help grow our cutting edge University programs and create a highly valued workforce.

With the Governor's recent announcement that the goal of the State of Alaska shall be to obtain 50% of its electricity from renewable energy sources by the year 2025, the state has set an important target. Establishing an emerging energy technology development fund is a necessary and timely component of reaching that goal, stabilizing energy costs and diversifying Alaska's economy. It could also favorably position Alaska to receive a larger portion of the upcoming $700 billion economic stimulus package. A significant portion of the federal money will fund energy infrastructure, including renewable energy projects, new transmission lines, and research and development of emerging energy technologies and those states with existing emerging technology development programs will be first in line for federal grant money.

The Proposal

The Alaska Conservation Alliance supports the creation of the Emerging Energy Technology Development Fund proposed by the Renewable Energy Alaska Project (REAP), a coalition of urban and rural Alaska utilities, businesses, conservation and consumer groups, and Alaska Natives. The Emerging Energy Technology Development Fund should help Alaska become a leader in research and implementation of technologies for battery storage, tidal and wave power, biomass gasification, and hydrogen generation, as well as transportation and storage of energy. The Fund should provide both grants and loans to university researchers, non-profits, private industry and local governments to fund research and development, demonstration projects and market transformation of renewable and alternative energy technologies that have a high likelihood of becoming economically and technologically viable in the short term. Equally important, the Fund should provide coordination and funding for targeted work force development and education programs that will train Alaska's next generation of construction workers, technicians, engineers and scientists that will guide us through the next century of energy innovation. After all, the $55 billion/year "clean energy" business is expected to at least quadruple worldwide by 2015.

The Benefits

- Develop commercially promising emerging energy technologies for use both in Alaska and in the world-wide market.
- Puts Alaska in prime position to tap into $700 billion Federal stimulus program.
- Alaska can demonstrate new technology and save rural energy consumers money.

26th Alaska legislature

RE: SUPPORT SB 177
SENATE RESOURCES COMMITTEE

Dear Senator Meyer,

The Petersburg Charter Boat Association (PCBA) represents 17 individual charter and lodge businesses operating 22 active vessels in the sportfishing industry. We have been an active association since 1991.

The original legislation authorizing the guide license and logbook program has been an extremely valuable tool in aiding the Alaska Department of Fish and Game and the State of Alaska , in the collection of data necessary to identify not only who the charter industry is but how they interact with other user groups. This information is important for the management of Alaska's resources and resource users, both sport and commercial.

PCBA supported the original bill and we fully support SB 177 complete with the associated fees necessary to fund this ongoing program.

Sincerely,

Stan Malcom
President
Petersburg Charter Boat Association

SENATOR KEVIN MEYER
SENATE DISTRICT O

SPONSOR STATEMENT FOR SB 177

"An Act repealing the termination of licensing and regulation of sport fishing operators and sport fishing guides and licensing and registration of sport fishing vessels; and providing for an effective date."

SB 177 will ensure the continuation of Alaska's sport fish guide licensing and reporting program, which has proven beneficial to both the sport fishing industry and resource managers.

Legislation authorizing the program was passed in 2004 for a number of purposes. The Department of Fish & Game (ADF&G) sought more comprehensive and credible information on guide numbers and guiding activities. ADF&G also wanted to create basic standards for sport fish business operators and guides, including minimum liability insurance coverage, first aid certification, and in some cases U.S. Coast Guard vessel licensing.

Many stakeholders who were initially skeptical of these measures now acknowledge their role in advancing the guiding profession. This increased level of professionalism has helped raise the standing of the sport fish industry across the state.

Many also agree that data collected through the program is an important tool in ADF&G's mission to develop and sustain healthy sport fisheries. The data is of great value not only to the ADF&G's fisheries biologists but also to the Alaska Board of Fisheries, the International Pacific Halibut Commission, and the North Pacific Fishery Management Council.

Sport fish data collection also contributes to Alaska's exemption from the recently instituted National Saltwater Angler Registry. NOAA exempts states from this federal registry and data collection system if they have programs in place to provide angler information. Sport fishers would otherwise be required by 2011 to purchase a certificate of registration for $15 to $25.

Passing SB 177 will permit the ADF&G to continue to foster high standards in Alaska's sport fishing industry. It will also enable the ADF&G to continue collecting important data for management decisions benefitting both the state's fisheries resources and their stakeholders.

Re: SB 177

Dear Senator Kevin Meyer:

Kenai River Sportfishing Association (KRSA) is a 501(c) 3 charitable non-profit dedicated to fishery conservation on the Kenai River and in Alaska. Our programs focus on habitat conservation, fisheries management, research and education.

KRSA is in full support of SB 177, which would repeal the sunset of the sport fish guide licensing program through ADFG. We feel that the sport fish guide licensing program is an essential component of fisheries management that should continue without sunset. The program provides sport fish guides with minimum professional standards and gathers valuable information on the numbers of guides, clients, and harvest levels and patterns, which can be used in sound management of our recreational fisheries.

We support timely reporting requirements of log book information from guides, and the efforts of ADFG process such information into real-time data that then can be used in a timely manner by fisheries managers.

We would like to see implementation of an electronic based log book reporting system, which would remove the current bottleneck of having to enter the paper-based log book information into an electronic database management system. Access to and the ability to use data from the log books should mirror the timeframe of the weekly guide reporting requirements. Unfortunately at this time with the paper-based system that is not possible. This leaves fisheries managers in the position of having to use forecast or past trend data instead of real time data in their in-season decision making.

We support a fee structure that covers the full costs of the program, with the understanding that the goal of being able to provide real-time data from the

log books to fisheries managers is a priority for the department and gets implemented in a timely fashion.

In summary, KRSA supports the continuation of the sport fish guide licensing program as an essential component of responsible fisheries management. Thank you for the opportunity to provide comment on this issue.

Respectfully,

Dick Erkeneff, Board Chair
Kenai River Sportfishing Association

SEAGO
SouthEast Alaska Guides Organization

April 3, 2009

Senator Kevin Meyer
Capitol Building Room 101
Juneau, AK 99801

Re: Support for SB-177

Dear Senator Meyer:

The Southeast Alaska Guides Organization (SEAGO) represents 26 sport fishing guides and lodges throughout Southeast Alaska with more than 100 active vessels. Information provided to ADF&G for reporting and analysis under this legislation is of great value and continuation of this program is beneficial to multiple user groups.

This program is one of the best tools that ADF&G has to identify who is involved in the charter/lodge industry and provides important data used to establish levels of harvest, effort, identification of clients, as well as species targeted. The money collected is used for issuing licenses and for sport fishing logbook data collection and reporting expenses.

Our members support extension of the current law with the fees at their levels as originally passed in 2004.

Sincerely,

John Blair, Executive Director

ALASKA STATE LEGISLATURE

SENATOR JOE THOMAS

Senate Bill 195 – An Act relating to the repeal of the establishment of the Goldstream Public Use Area

Sponsor Statement

The Goldstream Public Use Area (GPUA) was created in 1990 by Senator Bettye Fahrenkamp and Representative Mike Davis in order to preserve the recreational opportunities, traditional uses and atmosphere of the local neighborhoods. The GPUA is set to sunset on July 1st, 2010 unless Senate Bill 195 is passed this session.

The GPUA encompasses a patchwork of nearly 2000 acres of state land bordered by Sheep Creek Road to the east, Goldstream Road to the north and the Steese Highway to the east. The GPUA is home to an ever-growing network of trials that connect users to the Chatanika River Valley, the White Mountains and the Fairbanks area, all from a central location close to Fairbanks' population base. The GPUA is passively managed by the state and the trails are maintained by volunteers at no cost to the taxpayers.

All uses are allowed in the area and the GPUA is utilized year round by a variety of outdoor enthusiasts and families.

The repeal of the GPUA's sunset clause is actively supported by the Alaska Outdoor Council, Alaska Dog Mushing Association, Alaska Miners Association, Nordic Ski Club of Fairbanks, Alaska Trapper's Association, Skijoring and Polk Association, Fairbanks Snow Travelers, Northern Area State Parks Advisory Board, Fairbanks North Star Borough Trails Advisory Board, Alaska Trails, Interior Trails Preservation Coalition, Interior Alaska Land Trust, Arctic Audubon Society, and the *Fairbanks Daily News-Miner.*

Additionally, nearly 100 individuals have written letters of support.

Senate Bill 195 receives broad support from the community and I urge you to support this important effort.

"This all makes for an ideal center for outdoor recreation, a sort of Central Park for the Goldstream neighborhoods. It deserves permanent designation."

-Fairbanks Daily News-Miner Editorial, December 25th, 2009

January – May: State Capitol – Juneau, Alaska 99801 – (907) 465-2327 – 1 (800) 336-7383 – Fax (907) 465-5241

Senator.Joe.Thomas@legis.state.ak.us

Brief facts on Senate Bill 195

The Goldstream Public Use Area was created in 1990 by Sen. Bettye Fahrenkamp and Rep. Mike Davis and is set to sunset on July 1st, 2010:

The GPA is a patchwork of nearly 2000 acres of state land between the Steese Hwy to the east, Sheep Creek Rd to the west and south of Goldstream Rd to the north.

There is an expanding network of trails that can connect you from the Steese Hwy to Minto Flats and the Richardson Hwy to the White Mountains.

The Tanana Railroad Trail is the main trail within the GPUS and is a future section of the 100 Mile Loop Trail. Also, a proposed connector to the Skyline trail system is also in the works. A substantial maze of smaller trails is also maintained by volunteers.

All uses are statutorily allowed in the area:

Sec. 41.23.150 (c) ...the commissioner shall allow uses within the Goldstream Public Use Area, including but not limited to horseback riding, hiking, mining, all terrain vehicle driving, bicycling, dog sledding, cross-country skiing, skijoring, snowmachining, camping, and other traditional public uses of fish and wildlife populations such as fishing, hunting, trapping, viewing, and photographing of moose, trumpeter swan and other waterfowl, otter, beaver, mink, muskrat, and fox.

Impact on the state:

The state passively manages the GPUA and there are no financial costs incurred by this area. Its trails are maintained by volunteers throughout the year.

SB 195 is supported by:

Alaska Outdoor Council, Alaska Trapper's Association, Alaska Dog Musher's Association, Alaska Mining Association, Nordic Ski Club of Fairbanks, Skijoring and Polk Association, Northern Area State Parks Advisory Board, Fairbanks North Star Borough Trails Advisory Board, Alaska Trails, Interior Trails Preservation Coalition, Fairbanks Snow Travelers, Interior Alaska Land Trust, Arctic Audubon Society, and the Fairbanks Daily News-Miner

% Senator Joe Thomas
1292 Sadler Way, Suite 308
Fairbanks Alaska, 99701

Re: Goldstream Public Use Area

Dear Members of the Alaska State Legislature:

The Goldstream Public Use Area, Alaska Statues 41.23.140-170, is an important asset to the Fairbanks North Star Borough community. Senator Joe Thomas is proposing a bill that would remove the "sunset" clause of July 1, 2010 from the Goldstream Public Use Area, AS 41.23.140, and preserving it in perpetuity. As recommended to me by the Borough Trails Advisory Commission and the Parks and Recreation Advisory Commission, I support this legislation.

For many years this area of approximately 2,000 acres has been used for a variety of summer and winter outdoor recreational activities. These activities range from motorized to non-motorized uses and include snow-machining, sled dog-mushing, skiing, skijoring, snowshoeing, hunting, hiking, trapping, berry picking, walking, and canoeing to name a few. With its proximity near a major urban area the Goldstream Public Use Area not only provides for these uses but also serves as a vital link to an ever expanding network of recreational trails, extending beyond the boundaries of the borough, and enjoyed by local and state-wide residents alike.

The outdoor recreational opportunities within the Goldstream Public Use Area provide significant economic and social value to the Borough, its residents, and visitors to our community. To lose this public use area would be a tremendous loss to our community. I urge your support of this important piece of legislation.

Sincerely,

Luke Hopkins, Mayor
Fairbanks North Star Borough

Subject: Goldstream valley

To whom it may concern,

I live in the Goldstream valley and routinely use the trails on both the East and West side of Ballaine road. I support making the Goldstream Public Use Area into a permanent public use area.
The loss of these trails would mean needing to relocate, with a kennel of sled dogs it is imperative to be able to run from home.

Sincerely,
Melissa Rouge

Subject: Support for Goldstream Public Use Area

Please add my name as a supporter of making the Goldstream Public Use area protections permanent.

I'm the volunteer trails coordinator for the Alaska Dog Mushers Association in Fairbanks and help with issues concerning the 28 mile trail system located in and around Creamers Refuge between College Road and Farmers Loop Road.

These two trails systems, along with several others in the Fairbanks area, help make Fairbanks the mushing capital of the world and contribute significantly to the winter economy by supporting local businesses and bringing in out-of-town visitors.

As Fairbanks has grown, access to many trails has been lost due to new construction blocking unofficial trails. It's critical that key existing trails be protected from future encroachment. Fortunately, the Goldstream Public Use area is so wet that there are few alternative uses that are practical and continued multi-use recreational use is clearly the highest and best use.

Thanks.

Dear Alaska State Legislature,

Our names are Susan Slifer and Cliff Moore. We live in the Goldstream Valley and support the Goldstream Public Use Area.

We believe the access and opportunities to outdoor recreation of all types that are available because of the Goldstream Public Use Area are essential to maintaining a strong quality of life for us and our entire community. This Public Use Area is home to a wide variety of uses, including hunting, dog mushing, motorized and non-motorized access, skiing and skijoring, boating, berry picking, trapping and many others. This array of allowable uses gives every Fairbanks resident and family a place, close to town, where they can enjoy the Alaskan great outdoors.

The Goldstream Public Use Area encompasses an ever growing number of established trails that are utilized year round by user groups of all kinds. The loss of this open space, access to trails and beautiful scenery would be a major loss to every resident of Fairbanks, no matter their lifestyle.

Thank you and we urge you to join us in supporting the continued existence of this important piece of legislation.

Sincerely,

Cliff Moore

Dear Alaska State Legislature

My name is Eleanor Viereck and I support the Goldstream Public Use Area. The large area is an incredibly valuable asset to dog mushers who need long trail systems for training and recreation. I have used this area for fifty years for berry picking, skiing, biking, bird watching, and field trips when I teach ethnobotany and ecology courses or take young people on nature quests. I drive over to Goldstream valley from my home in Pearl Creek Valley to get a good look at a sky without light pollution in the winter dark. The land values in Pearl Creek valley (adjacent to Goldstream Valley) are enhanced by the existence of our ski trails. And as an ecologist I feel strongly about the importance of this undisturbed area as a resource for our long-term well-being, and even for our survival.

Thank you,

Eleanor G. Viereck, Ph.D.

Subject: Goldstream Trails

Senator Thomas,

I strongly support the effort to convert the Goldstream Public Use Area to permanent status.

I live in Goldstream Valley, on Pine Wood Road (top of Pandora), several miles from these trails, and I regularly use them in the winter for dog mushing and skiing. I personally contribute to maintenance of the trails by grooming some of them in winter (for dog mushing) using snowmachine and iron drag. I also occasionally enter the area in late summer for berry-picking.

The Goldstream Public Use Area is very important to the character of the area. My experience is that yes, people are able to share these trails for all types of recreational activities, because of the generally cooperative attitude of the users. This type of non-regulated, cooperative use is the type of thing Alaskans often say they want. I strongly support making the public-use status of the area permanent.

Thank you for your efforts.

Fairbanks, AK 99708

12/22/09

Dear Senator Thomas:

Please allow the Alaska Trappers Association to add their voice to those in support of the Goldstream Public Use Area (GPUA) and your proposed legislation which would preclude the "sunsetting" of the current law.

ATA is a statewide organization with several hundred members in the Fairbanks area. At the time of the original legislation establishing the GPUA, our group, along with many other outdoor users, supported Senator Fahrenkamp and Representative Davis in their efforts to protect this area. Our support for keeping the area insulated from development and open to a wide variety of outdoor activities has not diminished.

We feel that the multiple uses of this area, particularly when it comes to wildlife, is a model of cooperation. The trails system is important to untold local recreationists, including trappers. The area is heavily used for moose hunting (currently by bowhunting only) and has been the site of habitat improvement and enhancement projects by ADFG and ADNR.

We are grateful that trapping was one of the designated uses when the area was established. This use remains important. Having areas such as the GPUA in proximity to town is very helpful to new and younger trappers who cannot travel great distances.

We appreciate and support your efforts to rid the statute of the "sunset" clause.

Sincerely,

Randy Zarnke, President

Dear Senator Thomas,

Thank you for having Grier attend the Legislative Briefing presented by the Citizen Advisory Board of the Northern Area State Parks on December 9th, 2009. The members of the Board appreciated the opportunity to share our pride in, and our hopes for, Alaska State Parks.

The goal of Alaska State Parks is to assure quality management of our park units. We have implemented a wide range of ways to provide quality service with the least cost to the state. Tools include privatization, partnerships, grants, volunteers, and user fees.

Unfortunately these tools haven't proven successful for the three popular sites in the Northern Area as well as the 66.5 million dollar Deferred Maintenance Back-log. We ask for your support in strengthening the park system for the use, enjoyment, and welfare of the people.

Thanks again for attending the briefing and supporting Alaska State Parks! We look forward to working with you on issues and opportunities facing our State Parks. Please feel free to contact us with any comments or questions. Thank you for your support of Alaska State Parks!

December 17, 2009

Senator Joe Thomas,

RE: SUPPORT OF THE Goldstream Public Use Area

Sen. Thomas,

Alaska Trails greatly appreciates your efforts in helping to preserve the Goldstream Public Use Area. We hope the Legislature sees the wisdom in saving this very valuable resource in interior Alaska by keeping the public use area and eliminating the sunset clause.

The Goldstream Public Use Area has many points in its favor:

- It is used for a large variety of winter activities including snowmachining, mushing, Nordic skiing, ski-joring, running, walking, biking, and snowshoeing.
- Despite much of the public use area being boggy, it is still popular in summer and fall for berry picking, bird watching, and hunting.
- The main trail that traverses the public use area is integral to the 100-Mile Loop Trail, an important trail project of the Fairbanks North Star Borough.
- The area borders a parcel of land that the borough plans to turn into Skyline Ridge Park, a lightly managed park with an emphasis on trails. Trails already existing there connect to trails in the Goldstream Public Use Area.
- Winter tourism is growing in interior Alaska. A large component of that business is the easy availability of trails and the recreational opportunities they offer. Goldstream Valley offers one of the best wilderness trail experiences that can be had a few minutes from Fairbanks.
- Land in the public use area is mostly boggy. It is far more valuable as a public use area than it would ever be if it were developed.

Alaska Trails urges the Alaska State Legislature to support the Goldstream Public Use Area by continuing its existence without a sunset clause. This valuable resource needs to be protected.

Sincerely,

Max Gruner
Executive Director
Alaska Trails

INTERIOR TRAILS PRESERVATION

ITPC

Tuesday, December 15, 2009

Senator Joe Thomas,
1292 Sadler Way Ste 314
Fairbanks, AK 99701

Re: The Goldstream Public Use Area

Dear Sen. Thomas,

Thank you for taking up this very important issue. We strongly urge the state legislature to pass a law that would continue the Goldstream Public Use Area. This area is a highly popular and important part of winter recreation to interior Alaska for both residents and visitors. We were unaware of the sunset provision in the original law that created the public use area and were very concerned when we learned of it.

The nearly 2,000-acre PUA is heavily used by area residents and others. Goldstream Valley, of which this PUA is a critical part, is especially popular in the winter. The area has a network of trails used by mushers, snowmachiners, skijorers, winter bikers, skiers, runners, walkers, and snowshoers. The trails connect to other trails that lead to Fox, lower Goldstream Valley, El Dorado Creek Valley, O'Connor Creek Valley, and Skyline Ridge. The trails in the PUA can be accessed at several points including parking pullouts on Ballaine and Goldstream roads, Skyline Ridge trails, and subdivisions off Ballaine and Goldstream roads. This access and popularity make the PUA a very valuable resource.

Additionally, the main trails in the PUA make up a portion of the borough's 100-Mile Loop Trail, a trail concept that will connect existing trails to make a large circle around Fairbanks. The 100-Mile Loop Trail will greatly enhance the trail experience in Fairbanks. The trails through the Goldstream PUA are a critical part of that project. Trail connectivity is critical. Without it, trails can be unusable or even unsafe if trails must cross numerous roads. This is especially true for mushers, a significant portion of winter trail users here.

Yet another important aspect of the PUA, is its proximity to a planned borough park. The Fairbanks North Star Borough is working with the state Department of Natural Resources to assume ownership of a 400-acre parcel of land on Skyline Ridge that abuts the PUA. The borough intends to turn that parcel of land into a lightly managed park. The park and PUA would complement each other.

Much of the PUA is boggy during summer, yet it is still used by berry pickers, canoers,

ITPC
P.O. Box 74263, Fairbanks, AK 99707 Phone: (907) 458-7968

bird watchers, and hunters. The boggy land is ill-suited for development. However, experience has shown that with enough gravel people will build in all sorts of boggy land. That is why it is imperative that the PUA be protected. It is worth far more to the community as a public use area than if it were eventually sold and developed as sub-prime lots.

We ask that the PUA be continued without a sunset clause. We are confident that if given proper protections the Goldstream Public Use Area will be a valuable asset to the community for many years to come.

Sincerely,

Eric Troyer

BOARD RESOLUTION

RE: Removing sunset clause on the Goldstream Public Use Area designation

WHEREAS the legislation for the Goldstream Public Use Area (AS 41.23.140 - 41.23.170), a nearly two thousand acre patchwork of designated Alaska State land in the Goldstream Valley north of Fairbanks, is set to sunset on July 1, 2010, and

WHEREAS the Goldstream Public Use Area is used by dog mushers, runners, snow machiners, skiers, hunters, berry pickers, bird watchers, trappers and others for recreation, subsistence and other activities; and

WHEREAS the proximity of the Goldstream Public Use Area to the population of Fairbanks makes it especially valuable to families and outdoor enthusiasts of all levels; and

WHEREAS the Goldstream Public Use Area provides many other ecosystem services in its natural condition, including water filtering and storage capacity, wildlife habitat, and natural viewsheds; and

WHEREAS the Interior Alaska Land Trust owns 110 acres of conservation land adjacent to three parcels included in the Goldstream Public Use Area and has an interest in preserving the conservation values of the adjacent lands for its members and residents of the Fairbanks area; therefore

BE IT RESOLVED, that the Interior Alaska Land Trust supports legislation to remove the sunset clause from the legislation designating the Goldstream Public Use Area, and have that legislation stand until modified by vote of the legislature. The Interior Alaska Land Trust supports Senator Joe Thomas (D-Fairbanks) and any other legislators in their efforts to remove this sunset clause.

The Board of the Interior Alaska Land Trust unanimously voted to approve this resolution during a regularly scheduled monthly board meeting on 8 December 2009.

Signed _____
Roselynn Ressa, Board President

A central park: Goldstream public use area needs permanent designation

12.25.09 - 11:31 pm

A letter to the editor dated Nov. 23, 1959, from Jim Todd offered a hopeful vision for the Goldstream Valley, which lies just beyond the hills that form the northern horizon in Fairbanks.

Todd appealed to the territory's Bureau of Public Roads, or, rather, the "Bureau of Parallel Ruts," to divert some of its "superhighway"-building enthusiasm into a real road for Goldstream, where dozens of farmers were struggling in the mud.

"We beg your assistance, dear editor. Next year when these spendthrifts start blowing their measly millions, help them 'blow' a few thousand into roads into Goldstream Valley. Alaska's returns will be a thousandfold," Todd wrote.

The roads came to be, but Todd's vision did not. As a result, much of the valley bottom remains undeveloped. For the past 20 years, the state-owned portions of the lowlands have been held in that undeveloped condition by the Goldstream Public Use Area, a popular, legislatively designated withdrawal. The withdrawal is about to expire, so the Legislature needs to reaffirm it — permanently this time.

It was an accident both of Fairbanks' economic history and the swampy nature of the Goldstream Valley bottom that the area remained undisturbed. By the mid-1960s, the roads that Todd wanted were built. Sheep Creek Road was a modern, if still-unpaved, thoroughfare. Goldstream and Ballaine roads weren't far behind. The farmers didn't follow, though. Instead, the roads mostly brought homeowning commuters. Today, the evening view from the valley divide — whether at Happy Gap on Sheep Creek Road or the top of the big hill on Ballaine — reveals a constellation of house lights on the slopes to the north.

The valley bottom itself, where some of the farmers of Todd's day worked, remains empty in many places. Some of the land was never homesteaded because it was too wet or frozen. But the farmers also were undercut by the increasingly efficient road, rail, air and ocean connections to the Lower 48, which allowed importation of cheaper fresh food. So, aside from some large mining pits, Goldstream is more wooded today than it was in the 1950s and early 1960s.

The residential homeowners who replaced the farmers, however, have put the lowlands to use. The acreage has become a favorite year-round recreation area. The old Tanana Valley Railroad bed, along which ties and spikes sometimes still can be seen, provides a backbone trail through the area. The railroad intersects with a few roads and other trails from the homesteading era. Here and there, the old roads are sinking into lakes that began decades ago as drainage ditches, but they still work as winter routes. Ponds, swamps and creeks of various sizes are scattered throughout the area, containing the relatively rich variety of wildlife and vegetation that such areas support.

This all makes for an ideal center for outdoor recreation, a sort of Central Park for the Goldstream neighborhoods. It deserves a permanent designation.

12.21.09 - 02:17 am

FAIRBANKS — For the past 10 years, Bonnie Borba has been able to run her sled dogs right out of her home on Snowhook Drive in the Goldstream Valley.

Her property, like many of her mushing neighbors, bumps right up next to the Goldstream Public Use Area, an almost-2,000-acre swamp along Goldstream Creek that transforms into a popular winter playground each winter for mushers, skiers, skijorers and snowmachiners in the Goldstream Valley.

"That's why we moved there," said Borba, a sprint musher. "Everybody on Snowhook Drive moved there for dog mushing purposes. We have access to the trails right from our house."

What Borba and others didn't know until recently is that there is a 20-year sunset clause on the Goldstream Public Use Area, which was created in 1990 by the Alaska Legislature as a result of a bill sponsored by Rep. Mike Davis and Sen. Bettye Fahrenkamp, both of Fairbanks. The area is set to lose its protected status this coming year.

"That'd be a real bummer if we lost it," Borba said. "I can't see anyone developing it. It's a swamp. Its best use is the uses it serves now."

Borba and her neighbors, along with several outdoor recreation groups, have sent letters to Sen. Joe Thomas, D-Fairbanks, asking him to keep the Goldstream Public Use Area the way it is in perpetuity. Thomas' district includes the Goldstream Valley.

Sen. Thomas agrees, which is why the second-year senator plans to introduce a bill this legislative session to drop the sunset clause and make the Goldstream Public Use Area permanent.

"The legislation will remove the sunset clause and the conversation will ensue from there," Thomas said. If somebody says, 'Well, that means in perpetuity' and we'll say, 'Yeah, that's what we want.' If people object, we work at it from there."

The public use area is a patchwork of land east and west of Ballaine Road along Goldstream Creek. The biggest chunk, and the one that gets the most use, extends east up Goldstream Valley from Ballaine Road. Over the years, an intricate trail network has been developed in the biggest portion of the area.

"Mushers, bicyclists, snowmachiners, skijorers, walkers, trappers, I've passed them all," Borba said.

The area is famous for its abundance of blueberries and attracts hordes of berry pickers in the summer.

Goldstream Valley resident Dick Bishop proposed the idea of a public use area to Rep. Mike Davis, his neighbor at the time, in the late 1980s as a way to preserve trail access on state land that was rapidly disappearing to residential development.

"My thought was that already for decades that area had been used by people for outdoor activities," Bishop said. "It seemed like it was important to the extent possible to get the remaining state lands which hadn't been put up for disposal in a category where those uses could continue."

The public use area concept has worked out fabulously, Bishop said. It's been a low-profile, high-use area with no bureaucracy involved. The area is maintained by users and the state hasn't been involved in any way except for its creation.

"There's been very few conflicts and very few problems," Bishop said. "It seems to me it's worked out real well."

It was Davis who reminded Bishop of the sunset clause last spring. Bishop in turn contacted Thomas' office.

Thomas in turn sent out a letter to multiple user groups soliciting support for the public use area, and his aide, Grier Hopkins, attended meetings with mushing, skijoring and snowmachine clubs, as well as outdoor and mining groups. So far, all Hopkins and Thomas have heard is support.

"We have not run into any opposition at all," Hopkins said, noting that even the Alaska Miners Association wrote a letter in support.

Peg Bowers, who lives a mile or so from the area, skis on the trails about twice a week during the winter.

"For me it's a place I can take my dog and let it run and I can ski at the same time," Bowers said shortly after a ski with her golden retriever, Andra, on Thursday.

Like many, Bowers knew about the Goldstream Public Use Area but she didn't know about the sunset clause. Hearing about it has spurred her to action. Bowers intends to write a letter to Thomas voicing her support for the public use area.

"I thought since it was a public use area it was going to be there forever," she said. "I'd be really sad to lose it. It's part of the joy of where we live."

With lots of support and no opposition, Thomas is hopeful his bill will make it

through the Legislature this session.

Senator Joe Thomas
Alaska State Legislature
1292 Sadler Way, Suite 308
Fairbanks, AK 99701

by fax - 2 pp. total

Dear Senator Thomas:

Thank you for proposing legislation to give the Goldstream Public Use Area permanent legal status by eliminating the sunset provision from state law. I strongly support this action.

I was very involved in the original Goldstream Public Use Area (GPUA) proposal in the late 1980's. As a Goldstream Valley resident, I was well aware of the area's many values. My family and I were regular users of the trails and wild areas for dog mushing, snow machining, hunting, bird watching camping, berry picking, and just enjoying the varied landscapes and water bodies. Several of our friends have trapped there in the past.

I knew that the Valley trails had been used by mushers, hunters, trappers, miners and others going back to the early 1900's. The old Tanana Valley Railroad grade, dating from the early 1900's, was and is the central east-west Valley trail. Well known sprint dog mushers Rosie Losonsky, Pete Machione, and others trained in the Valley, and it's a popular area for today's sprint, distance and recreational mushers, i.e. "Sunday Tail Waggers".

The trails run through the valley, with numerous connecting trails leading out of the area in all directions, so that in winter one can start in Goldstream Valley and go to most all of the outlying areas around Fairbanks and even to distant parts of Alaska.

In the late 1980's there was increased interest in sales of private and public lands for residential developments even on very poor lands for such use, including the Goldstream Valley lowlands, which are extensively underlain with permafrost. Important main and connector trails as well as numerous ponds, swamps, parts of creeks and good wildlife habitat occurred on the several large parcels of State lands in the Valley lowlands. If those lands were disposed of, much of the trail access could be blocked and other outdoor recreation such as hunting, trapping, wildlife viewing, etc., could be denied by private land owners. Some restriction had already occurred as former homesteads were broken up and pieces sold. People built cabins and larger homes on poor lands, often with complications following due to the extensive permafrost.

If the State lands followed the same pattern of use, important outdoor uses could be lost or restricted, and a lot of people could be disadvantaged by having unknowingly bought and built on unstable, wet, thaw-prone ground.

The situation prompted me and others to propose that all the State lands be kept in public ownership, and open to all the uses which had occurred there for decades.

Representative Mike Davis agreed to introduce legislation to establish the Goldstream Public Use Area. Senator Betty Fahrenkamp took an interest in it. Senator Arlys Sturgelewski, Chairman of the Rules Committee, was convinced of its merits by a brief field-road trip near Session end. Support developed and opposition faded as legislators learned that the most valuable assets of the State lands were the trails and wildlife habitat and the continued opportunities for public use.

Since its establishment, the GPUA has remained pretty much as it was at the beginning as far as the lands, waters, habitats and trails, although some trails have been blocked by nearby private ownership. My impression is that outdoor uses have generally increased as more Fairbanks area residents have found the trails and other opportunities are really convenient and enjoyable. But public uses do not seem to have become congested, perhaps due to the many miles of trails and large undeveloped areas. To the best of my knowledge there have been no serious conflicts among the various uses, even though, mercifully, there are no formal rules or management dictates in place specific to the GPUA. There has been very little impact on ground cover, trail condition, or habitat from public uses. Users of the GPUA seem to take pretty good care of it.

In my opinion, the Goldstream Public Use Area has proven to be a great public outdoor asset and it has not been an impediment to various human uses and developments in Goldstream Valley.

Thank you again for preparing legislation to maintain the Goldstream Public Use Area. I will strongly encourage the Interior delegation to support it, the Legislature to pass it, and the Governor to sign it.

Sincerely,

Dick Bishop

P.S. Merry Christmas
Happy New Year!

Dear Alaska State Legislature,

My name is ORVILLE HELMS and I support the Goldstream Public Use Area.

I believe the access and opportunities to outdoor recreation of all types that are available because of the Goldstream Public Use Area are essential to maintaining a strong quality of life for me and our entire community. This Public Use Area is home to a wide variety of uses, including hunting, dog mushing, motorized and non-motorized access, skiing and skijoring, boating, berry picking, trapping and many others. This array of allowable uses gives every Fairbanks resident and family a place, close to town, where they can enjoy the Alaskan great outdoors.

The Goldstream Public Use Area encompasses an ever growing number of established trails that are utilized year round by user groups of all kinds. The loss of this open space, access to trails and beautiful scenery would be a major loss to every resident of Fairbanks, no matter their lifestyle.

Thank you and I urge you to join me in supporting the continued existence of this important piece of legislation.

Sincerely, Orville Helms

Dear Alaska State Legislature,

My name is Victoria Foote and I support the Goldstream Public Use Area.

I believe the access and opportunities to outdoor recreation of all types that are available because of the Goldstream Public Use Area are essential to maintaining a strong quality of life for me and our entire community. This Public Use Area is home to a wide variety of uses, including hunting, dog mushing, motorized and non-motorized access, skiing and skijoring, boating, berry picking, trapping and many others. This array of allowable uses gives every Fairbanks resident and family a place, close to town, where they can enjoy the Alaskan great outdoors.

I believe the access and opportunities to outdoor recreation of all types that are available because of the Goldstream Public Use Area are essential to maintaining a strong quality of life for me and our entire community. This Public Use Area is home to a wide variety of uses, including hunting, dog mushing, motorized and non-motorized access, skiing and skijoring, boating, berry picking, trapping and many others. This array of allowable uses gives every Fairbanks resident and family a place, close to town, where they can enjoy the Alaskan great outdoors.

The Goldstream Public Use Area encompasses an ever growing number of established trails that are utilized year round by user groups of all kinds. The loss of this open space, access to trails and beautiful scenery would be a major loss to every resident of Fairbanks, no matter their lifestyle. The Goldstream Public Use Area section in statute, 41.23, protects the subsurface resource interests in the area, guaranteeing potential development of our riches in the future.

Thank you and I urge you to join me in supporting the continued existence of this important piece of legislation.

Sincerely,

Kathryn Grace Arlen B.A., M.A.

Hello. I'm writing about the sunsetting of the provision to protect the Goldstream Public Use Area. As a frequent recreational user of the area, I really appreciate the tremendous opportunity we have to ski in the woods right outside our back door. Recreational opportunities like this are what make Fairbanks such a great place to live. I would like to encourage Sen. Thomas to work to extend the provision.

thanks,
elizabeth green markley

Hi Mr. Hopkins,

I'm emailing you to let you know I received word of the sunset on the provision that protects the Goldstream Valley Recreation area in 2010. My husband and I were recently able to purchase land in Goldstream area in the neighborhood where we have rented for a long time. The primary reason that we wanted to remain permanently in this neighborhood off of Line Drive was because we can skijor from our front door into Goldstream Valley and beyond. We can also commute to work on our bikes or skis. These things are precious to us--not having to drive our old car around in the winter in order to get out with our dogs. We spent much of last winter building a house on our property and have thoroughly enjoyed to be able to transition into a more permanent status here, next to all these great trails!

Please pass this on to Senator Thomas, in hopes that he will consider extending or making this protected area a permanent feature here in Goldstream Valley!

Laura Grage

Dear Alaska State Legislature,

My name is _____ and I support the Goldstream Public Use Area.

I believe the access and opportunities to outdoor recreation of all types that are available because of the Goldstream Public Use Area are essential to maintaining a strong quality of life for me and our entire community. Cc: Grier Hopkins; chenaflats@gmail.com
Subject: Goldstream Public Use Area

Follow Up Flag: Follow up
Flag Status: Completed

Dear Senator Thomas:

We are writing to express our support for the continued protection of the Goldstream Public Use Area and to urge you to pursue legislation to extend and enhance the conservation status of these properties. We frequently use Goldstream Valley for recreation, skiing, running and biking on the many trails that lace the valley, picking berries in the wetlands, and occasionally even canoeing the creek. These trails, the uncluttered landscape, and the wildlife that lives in the valley add immensely to our quality of life, and to that of our neighbors! Unfortunately, changing land ownership has resulted in the closure of a number of important trails over the past several years, and residential construction is encroaching on the valley wetlands.

At a minimum, we'd like to see existing Goldstream Valley Recreation Area parcels protected indefinitely. We would also like to see the area enlarged and made more continuous, as opportunity permits. On the west side of Ballaine Road the recreation area parcels are scattered along the valley with much private land interspersed, although most of this boggy area remains undeveloped and would serve the public better in the future as a recreational sanctuary than as a rag tag assemblage of subdivisions and rental cabins.

It is my understanding that DNR has been reluctant to acquire additional land to add to the Recreation area, even to the extent that they turned down land offered to them by the Interior Alaska Land Trust. Furthermore, when we spoke to DNR staff at the in Fairbanks office, they were barely aware of the existence of the Goldstream Public Use Area...let alone that it was their department's job to manage it! We feel that adding to the Recreation Area is golden opportunity that won't last long.

The Goldstream Valley Public Use Area is a much loved and well used public resource that adds character and a lovely backdrop to the area, even for residents who do not actively recreate here. As a recreation area, it offers a huge benefit to a wide range of outdoor enthusiasts who access the trail system from their own neighborhoods. Again, the western portion is less protected than would be optimal. We urge you to look into ways to protect and enlarge this excellent playground for the future.

Thank you,

Jon Miller and Lou (Linda) Brown

Dear Mr. Hopkins,

I recently found out that the public use area in the Goldstream Valley may lose its protected status. We cannot let this happen! This area is an integral part of who we are as a community, providing recreational opportunities to those who may not otherwise have such opportunities. It has been a blessing for the past several years to be able to walk out my back door and skijor for miles through this area whenever I wanted to. I know there are hundreds of other mushers, skiiers, and other recreational users of these trails that feel as strongly as I do that we must keep this area protected.

Sincerely,
Jessica Guritz

Hello Grier,

Please forward my support for maintaining the Goldstream Recreaction Area to Senator Joe Thomas.

Having lived in this area for 30 years I have seen a lot of irresponsible and inappropriate development. This area is mostly a wetlands, drainage, and mining tailings subject to instability and permafrost. Traditional recreation is the best use of this area (multiple use trails, non-motorized access in the summer).

Senator Thomas is very reasonable and I trust he will work towards the highest level of permanent protection.

Thank you for your hard work on our behalf,

Barb O'Donnell

Subject: Goldstream Valley Public Use Area

Dear Senator Thomas,
I have lived next to and used the Goldstream Public Use Area for 30 years and learn that it's protection may end in 2010. I also understand you may be submitting legislation which would make this area protected permanently. I support this idea 100%. I wish it would have happened 20 years ago. The area is not suited for development, however for multi-use all-year recreation, it's perfect. It's a resource that needs protection in a permanent way, so I can't encourage you strongly enough to do this. Thank you very much. I know I speak for all my neighbors who have used this area for years as well. Best regards, John and Susanne Lyle

Dear Alaska State Legislature,

My name is Jon Underwood and I support the Goldstream Public Use Area.

I believe the access and opportunities to outdoor recreation of all types that are available because of the Goldstream Public Use Area are essential to maintaining a strong quality of life for me and our entire community. This Public Use Area is home to a wide variety of uses, including hunting, dog mushing, motorized and non-motorized access, skiing and skijoring, boating, berry picking, trapping and many others. This array of allowable uses gives every Fairbanks resident and family a place, close to town, where they can enjoy the Alaskan great outdoors.

The Goldstream Public Use Area encompasses an ever growing number of established trails that are utilized year round by user groups of all kinds. The loss of this open space, access to trails and beautiful scenery would be a major loss to every resident of Fairbanks, no matter their lifestyle.

Thank you and I urge you to join me in supporting the continued existence of this important piece of legislation.

Sincerely,
Jon Underwood

Hello Grier,

I just got notice about the Goldstream Public Use Area being in danger of losing protected status in 2010. PLEASE help us protect this unique ecosystem that is already in danger due to global warming issues. The land IS NOT suitable for development of any kind. The protected status it holds today is the most beneficial for all peoples who may visit the area, and all animals that inhabit the land. I may be wrong, but I do believe this piece is part of the 100 mile trail system that is suppose to be dedicated to public use.

I was involved with a huge rezone project in the borough that occurred this fall. My farm borders state land that was rezoned into public usage. I rezoned my farm from general usage to Rural Ag 10 to
protect it from over building and loss of fragile habitat. I am sure
that the group that worked so hard on this rezone will be contacting you to urge that the land remain protected.

PS Congratulations to your dad and you for a successful campaign. My son and I went twice to the polls to make sure the right candidate was elected. This was the first time my son got to vote (as he just turned 18 this summer). At first he did not think the election was important enough to vote, then he listened to the candidates and knew he had to go vote...we voted together in the same booth and we celebrated together once the race was won!

pss I still remember you in class at Ryan Middle School...smile.
Seems you are doing very well in life.

Sincerely,
Sarah Drew

Hi, Grier-

Recently, someone forwarded a little article about the impending sunset of the Public Use Area designation for the Goldstream Valley's trail system. As a frequent, year-round user of these trails, both for bird watching and skijoring, I'm concerned that these trails might loose protection in 2010. I support any efforts that Sen. Thomas and his staff make to permanently designate these trails as a Public Use Area. Please let me know how I can help.

Sincerely,

Lauren Attanas

Hi Grier,

I am contacting you regarding the Goldstream Public use area. I use the area both East and West of Ballaine for hunting, berry picking, and skiing and ski jouring. It is Accessable to me via the new Sky Ridge Park on top of Ski Boot hill road. I live off of Grenac Road. One Idea that comes to mind is to sell the permant status as an adjoining plot of Rec. land to this new borough park.

Let me know what I can do to help preserve this area for recreation use.

Thanks,

Jose Rueter

Follow Up Flag: Follow up
Flag Status: Completed

Hi I just wanted to write that I strongly support the Goldstream Trails public area that is potentially losing its protection in 2010. Trails are one of the biggest community assets Fairbanks has. They distinguish this city from any other 100,000 person sprawl anywhere else. Trails increase property value of the houses around them, improve community health by facilitating exercise and improving air quality by allowing non-motorized travel.

Please protect this area!

Thank you,

Ben Abbott

Sen. Thomas:
I have used the Goldstream Public Use Area, as defined below, for running and snowshoeing for several years, and I would like it to continue to be available for such uses. Maybe someday I'll get out there skiing and/or berry-picking also. Please consider me a supporter of your bill to keep the area available for public recreation.

Thank you,
Jane Lanford

The Goldstream Public Use Area, a nearly two thousand acre patchwork of designated recreation land in the Goldstream Valley north of Fairbanks, is set to sunset on July 1, 2010. This means the recreation area which encompasses a number of heavily used trails, hunting areas and berry picking opportunities extending from Cash Creek to the Steese Highway will dissolve and be removed from state statute.
The Goldstream Public Use Area is used avidly by dog mushers, runners, snow machiners, skiiers, hunters of all types, berry pickers, bird watchers and trappers to name a few. Its close proximity to the population of Fairbanks allows our families and outdoor enthusiasts of all levels an easy opportunity to enjoy our great outdoors.
Senator Joe Thomas (D-Fairbanks) will be introducing a bill to remove this sunset date and have the Public Use Area remain in perpetuity during the upcoming legislative session starting January 19, 2010. Because of the quickly approaching sunset date, time is of the essence and Senator Thomas must move this bill through the entire legislature in just 90 days. The most effective way to show legislators from across the state the importance of keeping this public use area intact is to show its wide spread support by those that use it.
If you recreate in this area, know somebody who does, or you just enjoy all that the Goldstream Valley's open space has to offer, please contact Senator Thomas' office and ask how you can help. He will have form letters for you to sign on to, a list of supporters and groups to lend your name to and will work with you to make it as easy as possible. Contact his staff, Grier Hopkins at grier.hopkins@legis.state.ak.us or (907)456-8161 to find out how you can help protect this integral part of our Fairbanks lifestyle.

Please let me know what I can do to help extend the protection of this part of Goldstream Valley. My boyfriend and I own 90 acres adjacent to this part of Goldstream and we ski, skijor, winter bike, and berry pick all over the area. These trails are well used and very loved. On my way home today (a rare +30 December day in Fairbanks) there were all sorts of people parked at the main Ballaine road trailhead loading and unloading.

Tell me who to write to or call, and I'd be happy to do so.

Sincerely,

Sen Joe Thomas,

I support the effort to extend or make permanent the current status of the Goldstream Public Use area. I live at 1039 Pika Road, uphill to the south of the area. I am a frequent winter user of the trail system in this area of Goldstream valley, east of Ballaine road. I would like to see the area maintain it's current status as a multi-use recreation area. It's too cold and the ground is mostly permafrost, so it's not good for any kind of housing or industrial development.

If any changes are made, I'd like to see restrictions on summertime use of 4 wheelers, which tear up the main trail in wet or boggy areas.

Sincerely,

Alexander Kaufman

Dear Alaska State Legislature,

My name is Timothy D. Mortensen and I support the Goldstream Public Use Area.

I believe the access and opportunities to outdoor recreation of all types that are available because of the Goldstream Public Use Area are essential to maintaining a strong quality of life for me and our entire community. This Public Use Area is home to a wide variety of uses, including hunting, dog mushing, motorized and non-motorized access, boating, berry picking, trapping and many others. This array of allowable uses gives every Fairbanks resident and family a place, close to town, where they can enjoy the Alaskan great outdoors.

The Goldstream Public Use Area encompasses an ever growing number of established trails that are utilized year round by user groups of all kinds. The loss of this open space, access to trails and beautiful scenery would be a major loss to every resident of Fairbanks, no matter their lifestyle.

Thank you and I urge you to join me in supporting the continued existence of this important piece of legislation.

Sincerely,

Timothy D. Mortensen

Dear Alaska State Legislature,

My name is Carol Kaynor and I support the Goldstream Public Use Area. Please help us to protect this valuable resource.

The Goldstream Public Use Area is used for a host of summer and winter activities, including hunting, wildlife photography, motorized and non-motorized access, boating, berry picking, trapping, dog mushing, skijoring, snowmachining, and hiking. The area also provides important wildlife habitat. As most local Fairbanksans know, a pair of trumpeter swans often visits the pond next to Ballaine Road in the spring, and waterfowl are common all over the area. Moose browse on the willows, foxes hunt the ptarmigans. Blueberries grow rampant in the boggy fields north of the creek.

There is major community support for the public use area. A good example is the support shown to the Interior Alaska Land Trust several years ago when they endeavored to acquire the "Blueberry Preserves," a piece of property that lay in between two large blocks of state-owned land in the public use area. The land trust received a huge outpouring of community donations and in-kind support, enabling them to make that purchase.

As a dog musher and skijorer, access to protected trails is extremely important to me. When I moved to Snowhook Trail in 1996, I thought I had died and gone to heaven. Several friends and I bought property there specifically because the parcels bordered the Goldstream Public Use Area. My neighbors and I could run our sled dogs right from our yards, and we could access the extensive network of trails that wind through the public use area. I relocated to Snowhook from another area that had once had a beautiful but unprotected trail system, a trail system now crisscrossed with driveways.

My neighbor and running partner, Bonnie Borba, and I have spent many years maintaining about 10 miles of these trails in the public use area. We spend hours and hours brushing for safety and line of sight, removing stumps, and filling holes, as well as grooming after each snowfall. While grooming or running dogs, we've encountered dog mushers, skijorers, hikers, bicycle riders, four-wheelers, and snowmachiners. From personal experience, I can say that the portion of the public use area that we groom gets heavy and constant use in the winter. We know of many winter users who access the public use area not just from the pullout at Ballaine, but from the El Dorado Creek trail, Willow Run, and several other trails.

The Goldstream Public Use Area is an important and valuable asset to our community. Please support its continued existence.

Sincerely,

Carol Kaynor

Senator Joe Thomas
Alaska State Senate
Fairbanks, Alaska

Hi Joe,

We just want to weigh in on the Goldstream Recreation Area issue. As you know, we've been in this area since 1961 and have seen it evolve over the years. Although my wife and I were teaching in the Bush when Mike Travis was able to set the area aside as recreational, we were thankful that he was foresighted enough to do this. Now that it's coming up for renewal, Jennifer and I are heartily in support of your taking this issue seriously and pushing for a permanent recreational designation.

I couldn't count on all my fingers and toes ten times how much we and our friends from all over Fairbanks have used this area for recreation, whether for skiing or walking in winter or bird watching and walking in summer. I also included it on the Audubon birding and hiking map when I designed the map two years ago.

So, yes, we support your attempts to make this recreational area a permanent one for the Fairbanks North Star Borough. Go for it. Make it so, as Capt. Jacques Piccard said.

Sincerely,

Frank and Jennifer Keim

Subject: Goldstream Public Use Area

Dear Senator Thomas,
After reading the December 21, 2009 article in the Fairbanks Daily News-Miner, "Groups work to preserve public use area in Goldstream Valley," I decided to write you.
I live in Goldstream and use the trails in this public use area frequently. One thing that never ceases to amaze me about this trail network is that, despite the high traffic volume it sustains, it never seems to show the wear and tear of crowds. If someone is inconsiderate enough to litter, someone else who is a little more civic-minded seems to come along right behind them and clean it up. I've never had problems with vandalism, theft, or any other issue that tends to plague so many public-use areas in other places.
As a matter of fact, early this winter, a car had been abandoned at the pullout. After a few weeks, I became sick of looking at it. I contacted the Troopers who referred me to the Borough. The Borough referred me to Alaska DOT. I called a gentleman at DOT and left a voicemail describing the problem. That evening, as I went home, I saw that the car was gone. I was ecstatic that a response had come so quickly. I sent a grateful email to the gentleman at DOT.
A few days later, he called me to say that he was glad that the car was gone, but DOT hadn't done it.
I think that someone else who calls Goldstream home, who takes pride in our little piece of paradise, coincidentally got sick of looking at it the same day I did, towed it away, and ponied up the $60 to dump it legally.
This is only an anecdote, but it certainly lends credence to my idea that something as precious as this kind of a playground in our own back yards is worth taking care of, and it's obvious that the area is well-loved and well-stewarded by those who use it.
Goldstream is a wonderful community nestled into a great town, and much of the flavor of our community comes from the trail networks and the people who use them. Every morning, as I come into town and hit the crest of Ballaine and the flats stretch out in front of me, I think to myself how lucky I am to live in such a beautiful area. Every evening, as I come down the hill and pass the pullout for the Public Use Area, I think the same thing.
Your work to preserve this area for the use and enjoyment of everyone, in perpetuity, will be noted and appreciated by all who use this area. Even those who have never used the Public Use Area would surely miss it, once it's gone.
Thank you for reading this.
Sincerely,
Laurie Smith

Subject: Goldstream Public Use Area

Mr Hopkins:
I support Senator Thomas filing a bill to eliminate the "sunset clause" on the Goldstream Public Use Area. I am a 36-year resident of Goldstream Valley, and supported the initial legislation that was introduced by Representative Mike Davis. I have used the trails in the area since I moved here in 1974, and hunted and picked berries there. In fact, access to the trails and the rest of that area was one reason for my moving to Goldstream Valley. When I still had a dog team I probably used the trails at least 3 times a week for 17 years during the mushing season, and even now I'm out there at least once a week skiing, skijoring or just walking. I've watched as new houses have extended down into the valley from both the north and south sides, and have seen what happened to the trail system west of Ballaine Road where it used to be possible to access trails on both sides of Goldstream Creek. Although the mine has disrupted the original trails on the upper end, the miners have provided alternative access through their claims. However, this is voluntary on their part and I am sure that without the official designation for recreational use, we'd have lost a lot of the trail system to poorly planned development in the valley. This area supports a lot of recreational activity now, with virtually no infrastructure improvements. The only real change from 30 years ago is the Ballaine Road pullout, which has enhanced access to the area. So it seems to me that this has been a real benefit for the public at very little cost. I hope we can keep it that way.
Sincerely,

Richard Shideler

Subject: support of Goldstream Public Use Area-

Hello Grier,
This email is in support of a permanent status designation of the Goldstream Public Use Area: I have lived in the Goldstream Valley for over 21 years and know that the networks of trails have been extensively used over this period by myself along with many skiers, mushers, snow shoers, snowmachiners, bikers, runners, walkers, berry pickers, canoers, bird watchers, and more. I was just on the trails last week for an hour in the late afternoon, and at minus 20 I saw 4 pairs of walkers, 3 dog mushers, 3 snowmachiners, 1 skier with her dog and 2 runners- the area is very much a favorite public winter playground for people and their families. The Goldstream Public use area is a unique part of Fairbanks that many residents enjoy and want to keep a free access designation. Please use this email in any way you can to voice my support of this. This letter is also supported by Alaska's most legendary sprint sled dog racing Champion George Attla, who is living in the Goldstream Valley this winter while coaching a young person training a sprint team to race throughout the state. He also told me to mention that he feels Fairbanks is an exceptional community in its support of traditional winter sports, and why change a good thing. He told me to add his name with mine below.

Please contact me if you have any questions about this email.

Thank you for your time.

Kathy

Subject: Continue Goldstream Public Use Area

Dear Alaska State Legislature,

I strongly support continuing the Goldstream Public Use Area.

The Goldstream Valley Public Use Area is a key to this northern portion of Fairbanks. The rural character of the area is dependent upon open space and the multi-use trails that have long been used within it. Like Creamer's Refuge on the edge of the city, the Goldstream Public Use Area helps preserve the traditionals of the community.

Please vote to extend this legislation that makes Fairbanks a wonderful place to live.

Sincerely,

John M and Kathleen K Wright

3262

Dear Alaska State Legislature,

My name is Davya Flaharty and I support the Goldstream Public Use Area.

I believe the access and opportunities to outdoor recreation of all types that are available because of the Goldstream Public Use Area are essential to maintaining a strong quality of life for me and our entire community. This Public Use Area is home to a wide variety of uses, including hunting, dog mushing, motorized and non-motorized access, skiing and skijoring, boating, berry picking (mmm blueberries!), trapping and many others. This array of allowable uses gives every Fairbanks resident and family a place, close to town, where they can enjoy the Alaskan great outdoors.

The Goldstream Public Use Area encompasses an ever growing number of established trails that are utilized year round by user groups of all kinds. The loss of this open space, access to trails and beautiful scenery would be a major loss to every resident of Fairbanks, no matter their lifestyle.

Thank you and I urge you to join me in supporting the continued existence of this important piece of legislation.

Sincerely,

Davya Flaharty

Dear Senator Thomas,

I am writing you to support the preservation of public lands in the Goldstream Valley as open space. As an avid trail user in this area and the author of "Outside in the Interior", I have extensive knowledge of the trails here. These trails are all multi-use trails, that is, they are utilized by snowmachiners, cross-country skiers, skate skiers, skijourers, people walking and talking their dogs for walks, berry pickers, wildlife enthusiasts and bicyclers. There are 4 main subregions of the Goldstream Valley - Cache Creek, Ace Lake, West Goldstream and East Goldstream. The latter two are divided by Ballaine Road. Numerous trails are contained within each subregion and many other trails and trail systems are adjacent to these areas. The West Goldstream area has already undergone significant development which has lead to the outright loss of some trails and the reduction of others. Currently, the trail systems are intact enough that they are somewhat still linked. Please do what you can to protect these well used and loved trails and open areas. Further, improvements, such as a tunnel connecting the East and West areas under Ballaine, should be investigated. Protection of these areas will be a great gift to future Fairbanksians. Please feel free to contact me if you have any questions or if I can be of assistance in this endevour. Thank you.

Subject: Support for Goldstream Public Use Area

Dear Alaska State Legislature,

We are Bob and Joann Henszey, and we support the Goldstream Public Use Area.

In addition to the form letter below, we support the Goldstream Public Use Area as a valuable green space asset already in place for the public's enjoyment. As one of the founding supporters for the Chena Flats Greenbelt Project at the base of Chena Rigde in Fairbanks (www.chenaflats.org), we know how difficult it is to purchase green space from private ownership so a traditional common use area can continue to be enjoyed by the public in the midst of a rapidly developing community. Chena Flats would have been much easier if our local government had the foresight to set this area of wetland bogs aside in the first place like the Goldstream Public Use Area.

We believe the access and opportunities to outdoor recreation of all types that are available because of the Goldstream Public Use Area are essential to maintaining a strong quality of life for our family and our entire community. This Public Use Area is home to a wide variety of uses, including hunting, dog mushing, motorized and non-motorized access, skiing and skijoring, boating, berry picking, trapping and many others. This array of allowable uses gives every Fairbanks resident and family a place, close to town, where they can enjoy the Alaskan great outdoors.

The Goldstream Public Use Area encompasses an ever growing number of established trails that are utilized year round by user groups of all kinds. The loss of this open space, access to trails and beautiful scenery would be a major loss to every resident of Fairbanks, no matter their lifestyle.

Thank you, and we urge you to join us in supporting the continued existence of this important piece of legislation.

Sincerely,
Bob and Joann Henszey

Subject: Goldstream Public Use Area

Dear Alaska State Legislature,

My name is Karen Brewster and I am writing to express my support for the Goldstream Public Use Area in Fairbanks. I am a regular user of the trails in this area and believe it is critical that they remain open and available to full public access. Having this wide open undeveloped space and vast trail network in the heart of Fairbanks is a key part of what makes life in Fairbanks so wonderful. Studies have shown that living close to greenspace and having access to outdoor recreation opportunities create a better quality of life and make people happier and healthier.

I believe the access and opportunities to outdoor recreation of all types that are available because of the Goldstream Public Use Area are essential to maintaining a strong quality of life for me and our entire community. This Public Use Area is home to a wide variety of uses, including hunting, dog mushing, motorized and non-motorized access, skiing and skijoring, boating, berry picking, trapping and many others. This array of allowable uses gives every Fairbanks resident and family a place, close to town, where they can enjoy the Alaskan great outdoors.

The Goldstream Public Use Area encompasses an ever growing number of established trails that are utilized year round by user groups of all kinds. The loss of this open space, access to trails and beautiful scenery would be a major loss to every resident of Fairbanks, no matter their lifestyle. With the continued protection of this public use area, I would also like to see some minimal management to deal with conflicting uses and trail maintenance issues.

Thank you and I urge you to join me in supporting the continued existence of this important piece of legislation.

Sincerely,
Karen Brewster

Dear Alaska State Legislature,

My name is Doug Braddock and I support removing the sunset date for the Goldstream Public Use Area (GPUA). I live near the GPUA and am a regular user of the trails in the area.

The Fairbanks North Star Borough is in the process of taking over ownership and management of Bender Mountain Park, located to the south of the GPUA. The trail systems within Bender Mountain Park and the GPUA are complementary and allow for many great multiple-use recreational opportunities.

For the above reason, I would like to see the Goldstream Public Use Area remain in existence without the need to periodically remove a sunset date.

Thank you and I urge you to join me in supporting the continued existence of this important piece of legislation.

Sincerely,

Doug Braddock

There are enough subdivisions in the Fairbanks area with room for more buildings. This is Fairbanks, and we value the remoteness of our home. If we build on all the available land, it will no longer be Fairbanks. The corner of New Steese and the Mitchell Expressway already looks much like parts of Anchorage or towns in the lower 48. While I like the convenience, I liked the raw land better. Some good bike trails are under that asphalt.

Thank you and I urge you to join me in supporting the continued existence of this important piece of legislation.

Sincerely,

Don Logan

To Senator Joe Thomas, care of Grier Hopkins,

Dear Alaska State Legislature,

Our names are Aren and Jen Gunderson and we support the Goldstream Public Use Area.

We believe the access and opportunities to outdoor recreation of all types that are available because of the Goldstream Public Use Area are essential to maintaining a strong quality of life for us and our entire community. This Public Use Area is home to a wide variety of uses, including hunting, dog mushing, motorized and non-motorized access, skiing and skijoring, boating, berry picking, trapping and many others. This array of allowable uses gives every Fairbanks resident and family a place, close to town, where they can enjoy the Alaskan great outdoors.

The Goldstream Public Use Area encompasses an ever growing number of established trails that are utilized year round by user groups of all kinds. The loss of this open space, access to trails and beautiful scenery would be a major loss to every resident of Fairbanks, no matter their lifestyle. We use this trail system for skijoring and mushing our 5 dogs. We have introduced numerous individuals to skijoring and mushing on these trails and others in the Goldstream Valley. This trail system is unique in that it is so close to town and heavily used, yet maintained and regulated entirely by local residents through their mutual respect for the land and its users at no cost (that we am aware of) to the state or borough.

Thank you and we urge you to join us in supporting the continued existence of this important piece of legislation.

Sincerely,

Aren and Jen Gunderson

590 Mammoth Drive, Fairbanks, AK

Dear Alaska State Legislature,

My name is Jen Gunderson and I support the Goldstream Public Use Area.

I believe the access and opportunities to outdoor recreation of all types that are available because of the Goldstream Public Use Area are essential to maintaining a strong quality of life for me and our entire community. This Public Use Area is home to a wide variety of uses, including hunting, dog mushing, motorized and non-motorized access, skiing and skijoring, boating, berry picking, trapping and many others. This array of allowable uses gives every Fairbanks resident and family a place, close to town, where they can enjoy the Alaskan great outdoors.

The Goldstream Public Use Area encompasses an ever growing number of established trails that are utilized year round by user groups of all kinds. The loss of this open space, access to trails and beautiful scenery would be a major loss to every resident of Fairbanks, no matter their lifestyle.

Thank you and I urge you to join me in supporting the continued existence of this important piece of legislation.

Sincerely,

Jen and Aren Gunderson

Dear Alaska State Legislature,

My name is Carolyn Parker and I support the Goldstream Public Use Area. I have lived in the Goldstream Valley area for almost 40 years and have used the area north of Ballaine Road (as well as a lot of the area downstream of Ballaine Road, following Goldstream Creek all the way to S of Murphy Dome, for skiing, ski-joring, snowmaching, bird watching and berry picking. Most of us realize that most of this area is totally unfit for subdivision efforts due to the saturated and permafrost rich soils, but its use for berry picking, wildlife habitat, and all forms of winter recreation is invaluable for those of us who live in the area. It is a 'green belt' we would certainly hate of see lost.

The Goldstream Public Use Area encompasses an ever growing number of established trails that are utilized year round by user groups of all kinds. The loss of this open space, access to trails and beautiful scenery would be a major loss to every resident of Fairbanks, no matter their lifestyle.

Thank you and I urge you to join me in supporting the continued existence of this important piece of legislation.

Dear Alaska State Legislature,

My name is Jane Lanford, and I support the Goldstream Public Use Area. I have personally used the area off and on since 1994 for running and snowshoeing, both for training and in races. I keep meaning to get out there berry-picking and cross-country skiing, and I hope it stays available until I do. I also enjoy looking for, and often spotting, moose and other critters every time I drive through on Ballaine or other roads.

I believe the access and opportunities to outdoor recreation of all types that are available because of the Goldstream Public Use Area are essential to maintaining a strong quality of life for me and our entire community. This Public Use Area is home to a wide variety of uses, including hunting, dog mushing, motorized and non-motorized access, skiing and skijoring, boating, berry picking, trapping and many others. This array of allowable uses gives every Fairbanks resident and family a place, close to town, where they can enjoy the Alaskan great outdoors.

The Goldstream Public Use Area encompasses an ever growing number of established trails that are utilized year round by user groups of all kinds. The loss of this open space, access to trails and beautiful scenery would be a major loss to every resident of Fairbanks, no matter their lifestyle.

CS FOR SENATE BILL NO. 203( )

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-SIXTH LEGISLATURE - SECOND SESSION

BY

Offered:
Referred:

Sponsor(s): SENATORS FRENCH AND WIELECHOWSKI, Ellis

A BILL

FOR AN ACT ENTITLED

"An Act relating to the regulation of a gas storage facility by the Regulatory Commission of Alaska; relating to a tax credit for a facility to store Cook Inlet gas for sale and delivery in the state; relating to an exemption from the oil and gas exploration, production, and pipeline transportation property tax for a facility that stores Cook Inlet gas for sale and delivery in the state; and providing for an effective date."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

*** Section 1.** AS 42.05.990(4) is amended to read:

(4) "public utility" or "utility" includes every corporation whether public, cooperative, or otherwise, company, individual, or association of individuals, their lessees, trustees, or receivers appointed by a court, that owns, operates, manages, or controls any plant, pipeline, or system for

(A) furnishing, by generation, transmission, or distribution, electrical service to the public for compensation;

(B) furnishing telecommunications service to the public for compensation;

(C) furnishing water, steam, or sewer service to the public for compensation;

(D) furnishing by transmission or distribution of natural or manufactured gas to the public for compensation;

(E) furnishing for distribution or by distribution petroleum or petroleum products to the public for compensation when the consumer has no alternative in the choice of supplier of a comparable product and service at an equal or lesser price;

(F) furnishing collection and disposal service of garbage, refuse, trash, or other waste material to the public for compensation;

(G) furnishing a tank, depleted reservoir, injection well for gas storage permitted under AS 31.05, or other structure in the state for the storage of gas that is designated to be sold and delivered in the state by a public utility providing the service described in (D) of this paragraph;

*** Sec. 2.** AS 43.20 is amended by adding a new section to article 1 to read:

Sec. 43.20.046. Cook Inlet gas storage facility tax credit. (a) A taxpayer that is an owner of a Cook Inlet gas storage facility may apply as a credit against the state tax liability that may be imposed on the taxpayer under this chapter, for a tax year beginning after December 31, 2009, 20 percent of the taxpayer's qualified capital investment in a Cook Inlet gas storage facility. The credit is subject to the terms and conditions of this section and is in addition to any other credit authorized to the taxpayer by this chapter.

(b) A qualified capital investment for the investment credit under (a) of this section is

(1) a cash expenditure or a payment due under a binding payment agreement entered into after December 31, 2009, and before January 1, 2013, made for the direct cost of purchasing, constructing, or otherwise acquiring an ownership interest in the real property or tangible personal property used in this state for a Cook Inlet gas storage facility; in this paragraph, "property" includes

(A) property that is placed in use under a capitalized lease or an operating lease; and

(B) machinery, appliances, supplies, and equipment directly related to the storage of gas produced from the Cook Inlet sedimentary basin and designated for sale and delivery in the state; and

(2) the cost of cushion gas acquired after December 31, 2009, and before January 1, 2013, that is required for a Cook Inlet gas storage facility to function.

(c) The credit for each tax year allowed under (a) of this section may not exceed 50 percent of the taxpayer's total tax liability under this chapter. An unused portion of the credit for the tax year

(1) may be carried forward into one or more of the following tax years, except that the unused credit from one tax year may not be carried forward for more than five following tax years;

(2) shall be applied to the taxpayer's tax liability under this chapter during the following tax year before allowance of a credit allowed under (a) of this section for that following tax year.

(d) To obtain the credit allowed by this section, the taxpayer has the burden of demonstrating compliance with the requirements of this section to entitle the taxpayer to the claim of and the amount of the credit. A credit may not be claimed before the gas storage facility is ready to receive gas for storage. To claim the credit, a person shall submit, on a form prescribed by the department, information that demonstrates that the taxpayer is eligible for the credit and evidence of the expenses that are the basis of the claim of the credit. A person

(1) required to file a return under this chapter shall submit the form claiming the credit with the taxpayer's return;

(2) not required to file a return under this chapter shall submit the form claiming the credit before May 1 of the year following the year in which the expenditure qualifying for the credit under this section is made.

(e) A taxpayer entitled to a credit under this section

(1) with prior written approval by the department, may convey, assign,

or transfer the credit to another taxpayer or business entity;

(2) forfeits the credit to which the taxpayer is entitled during the tax year and any carryover of it under (c) of this section, but does not forfeit the portion of the credit that accrued in a previous taxable year that may be carried over under (c) of this section, if the taxpayer

(A) disposes of the qualified capital investment;

(B) takes the qualified investment out of service; or

(C) fails to use the Cook Inlet gas storage facility primarily for the storage of gas for sale and delivery in the state.

(f) In this section,

(1) "Cook Inlet gas storage facility" means a tank, depleted reservoir, injection well for gas storage permitted under AS 31.05, or other structure in the state for the storage of gas that is produced from the Cook Inlet sedimentary basin and designated for sale and delivery in the state, and includes machinery, supplies, and equipment directly related to and necessary for filling and withdrawing gas from the structures holding the gas for storage in the facility;

(2) "Cook Inlet sedimentary basin" has the meaning given in AS 43.55.900;

(3) "cushion gas" means gas that is needed to pressurize the storage facility and that allows the storage facility to function.

* **Sec. 3.** AS 43.56.210(5) is amended to read:

(5) "taxable property"

(A) means real and tangible personal property used or committed by contract or other agreement for use within this state primarily in the exploration for, production of, or pipeline transportation of gas or unrefined oil (except for property used solely for the retail distribution or liquefaction of natural gas), or in the operation or maintenance of facilities used in the exploration for, production of, or pipeline transportation of gas or unrefined oil; "taxable property" includes

(i) machinery, appliances, supplies, and equipment;

(ii) drilling rigs, wells (whether producing or not),

gathering lines and transmission lines, pumping stations, compressor stations, power plants, topping plants, and processing units;

(iii) roads, tank farms, tanker terminals, docks and other port facilities, and air strips;

(iv) aircraft and motor vehicles owned by a person whose principal business in the state is the exploration for, production of, or pipeline transportation of gas or unrefined oil and whose operation of the aircraft or motor vehicle directly relates to the conduct of that business;

(v) maintenance equipment and facilities, and maintenance camps and other related facilities; and

(vi) communications facilities owned by a person whose principal business in the state is the exploration for, production of, or pipeline transportation of gas or unrefined oil and whose operation of the communications facilities directly relates to the conduct of that business;

(B) does not include

(i) permanent residences;

(ii) office buildings requiring substantial local government services;

(iii) oil and gas pipeline systems owned and operated by a public utility that is certificated under AS 42.05.221 and is regulated by the Regulatory Commission of Alaska;

(iv) aircraft and motor vehicles, except aircraft and motor vehicles taxable under (A)(iv) of this paragraph; [AND]

(v) communications facilities, except communications facilities taxable under (A)(vi) of this paragraph; **and**

(vi) notwithstanding (A) of this paragraph, a Cook Inlet gas storage facility, as that term is defined in AS 43.20.046;

*** Sec. 4.** This Act takes effect immediately under AS 01.10.070(c).

ANALYSIS: *(Attach a separate page if necessary)*

SB 203 amends AS 43.20 and adds a new section called the Cook Inlet gas storage facility tax credit. The bill would provide 20% of qualified capital investment of a Cook Inlet gas storage facility to receive a tax credit that does not exceed 50% within a tax credit year. This tax credit would: (1) be in addiiton to any other available credits authorized by this Chapter (2) may be conveyed, assigned or transferred to another taxpayer or business entity (3) appears to provide tax credit for any fees associated with the acquisition and maintenance of a gas storage lease or agreement (4) and includes the cost and royalties associated with "cushion gas".

There is no anticipated fiscal impact to the Division of Oil and Gas. The application of tax credits will have an indeterminant impact on the revenues acquired by the Division.

FISCAL NOTE

STATE OF ALASKA
2010 LEGISLATIVE SESSION

BILL NO. SB 203

ANALYSIS CONTINUATION

Bill Language:

This bill provides a tax credit for the purchase, construction, or other acquisition of an ownership interest in a Cook Inlet (CI) gas storage facility. Capital expenditures qualifying for the credit include the acquisition of real and tangible personal property as well as cushion gas required for the facility to properly function. Only expenses incurred after December 31, 2009 and before January 1, 2013 would qualify for the credit. A taxpayer would be able to take a credit of 20% of its qualified capital investment against its Alaska corporate income tax (CIT). The taxpayer could offset no more than 50% of its total CIT liability in any given tax year. Any unused portion of the credit could be carried forward for five years. A taxpayer entitled to the credit could transfer the credit to another taxpayer.

This bill also would exempt a Cook Inlet gas storage facility from the oil and gas property tax.

Revenues:

Although it is difficult to determine the number of taxpayers who would take advantage of this tax credit, we do expect corporate income tax and oil and gas property tax revenues to decline. There are three existing gas storage facilities in the Cook Inlet region that would potentially qualify for the corporate income tax credit and oil and gas property tax exemption provided by this bill. Since this bill does not require the construction of new facilities, the sale of an existing facility would qualify for the credit. Taxpayers would most likely take steps to qualify these facilities for the associated tax credits.

Due to the complexity of the oil and gas property tax, it is difficult to determine what portion of existing property taxes would be exempt under this bill. However, we expect some portion of these existing facilities will qualify for the exemption and, therefore, state property taxes would decline. Because 43.56 allows a local municipality to receive property tax revenue on oil and gas property assessed by the state, the Kenai Peninsula Borough would also see a decline in their property tax as it relates to existing facilities and foregone revenues in the future for potential new facilities.

Reduction in corporate income tax and oil and gas property tax revenues are indeterminate at this time.

Expenditures:

The provisions of this bill would most likely require the hiring of additional state staff. It is not known at this time the number of position(s) that would be needed. Additional administrative work required of the Department would be dictated by the number of taxpayers who take advantage of the credit and the associated work required to validate those credits.

Alaska State Legislature

Senator Hollis French

SB 203 – Cook Inlet Gas Storage Facilities

Sponsor Statement

Senate Bill 203 creates economic incentives for companies in Cook Inlet to develop storage facilities for natural gas.

While natural gas supply in Cook Inlet is sufficient to supply southcentral Alaska with the energy it needs for the near future, the need to produce gas at a constant rate results in more gas than the system needs in the summer months and near-shortages when demand is far higher in the winter.

Recently, the Regulatory Commission of Alaska (RCA), the Municipality of Anchorage and local utility companies have all discussed the possibility of natural gas shortages for homes and businesses during peak winter use. Both Enstar and Chugach Electric Association indicated in a recent RCA hearing that gas shortages could occur as early as winter 2011-2012.

While incentives exist to encourage producers to explore for new supplies, there are no similar incentives for storage. According to studies and industry sources, development of an adequate storage system could cost companies $100 -- $200 million dollars.

Under SB 203 development costs for the creation of gas storage facilities or reservoirs will be eligible for a tax credit like those offered for development of new wells. Cushion gas, which would remain in storage wells to maintain pressure for efficient removal, would not be subject to taxation. The legislation would also exempt storage facilities and equipment from state property taxes.

Senator Hollis French

SB 203 SECTIONAL ANALYSIS

Section 1

Section 1 provides for a 20% tax credit on qualified gas storage facilities. Qualifying expenditures include; a payment for a lease, machinery, supplies, equipment, or the cost of cushion gas which pressurizes the well for efficient extraction. The gas must be designated for sale and delivery in Alaska. A qualifying purchase must be made between December 31, 2009 and January 1, 2013, and cannot exceed 50% of the total tax liability.

The section also outlines the process for applying for the tax credit, and defines "Cook Inlet gas storage facility," and "cushion gas."

Section 2

Section 2 exempts Cook Inlet gas storage facilities from state property taxes.

Senator Hollis French

CSSB 203\P Explanation of Changes

P. 2, line 13: Adds gas storage facilities to the definition of a "public utility" under the Alaska Public Utilities Regulatory Act.

P. 2, line 21: Inserted "direct cost" to definition of "a qualified capital investment." This narrows the costs to which a company would be allowed to apply the credit.

P. 3, line 9-10: Deleted "but shall be calculated before the application of any other credits allowed under this chapter." This was in conflict with other language in statute.

P. 3, line 20-21: Inserted "A credit may not be claimed before the gas storage facility is ready to receive gas for storage."

What price CI gas?

RCA gleans views on breaking utility supply contract approval logjam

Alan Bailey

Petroleum News

While concerns rise about whether natural gas supplies from Alaska's Cook Inlet basin will be able to keep up with local utility demand, especially during the depths of the winter, a debate continues regarding whether Cook Inlet gas prices are too low to entice sufficient new gas exploration and development, or whether the Cook Inlet gas producers are crying wolf over the gas supply situation, to increase their profits by pushing gas prices up.

Since 2004 the Regulatory Commission of Alaska, in its role of regulating the utilities and protecting energy consumers from unnecessarily high energy prices, has rejected as too expensive every gas supply contract that Enstar Natural Gas Co., the main Southcentral Alaska gas utility, has negotiated with Cook Inlet gas producers. A recent supply agreement between power utility Chugach Electric Association and gas producer ConocoPhillips is the only utility gas supply contract that the commission has approved in that time.

But what is a reasonable price for Cook Inlet natural gas?

On Sept. 16 RCA convened a technical conference to seek views on how to provide regulatory oversight of gas pricing, to help change the regulatory process for gas supply contract approval from what has all too often become an expensive and time consuming minefield, possibly delaying new gas development, into more of a well-marked pathway.

Producer view

The major Cook Inlet gas producers declined to participate in the conference, citing anti-trust issues that might be raised by their involvement in discussions about how gas prices might be set. But a written statement by Marathon, one of those producers, reiterated an often expressed oil company view that supply contracts, including gas pricing arrangements, should be "freely and fairly" negotiated between the producers and the utilities, rather than be specified in some way by regulators.

"The regulators should regulate the regulated, not the gas market," Marathon said. And negotiations between the producers and the utilities need to recognize that producers are driven by the balance between risk and reward, in a situation where gas projects in Alaska compete for finite funding with other projects on a global basis, the company said.

But the isolated nature of the tiny Cook Inlet utility gas market and the lack of a spot market for Cook Inlet gas have made it impossible to determine a market-driven local gas price and have led gas contract negotiations into some creative ways of establishing contract prices.

A few decades ago, prior to the formation of dynamic national and global natural gas markets, negotiations between Southcentral utilities and the Cook Inlet gas producers led to long-term contract gas prices indexed to the price of oil. And, with a large glut of Cook Inlet gas, those prices were low relative to other part of the United States.

Changing market

Then in the early 2000s, as tightening Cook Inlet gas supplies started to draw people's attention to the need for more Cook Inlet gas exploration, and as a burgeoning North American and global trade in natural gas drove the establishment of many gas trading hubs, Cook

Inlet gas contract negotiations moved toward the indexing of Cook Inlet gas prices to gas markets elsewhere, in particular to the Henry Hub market in the Lower 48.

Indexing Cook Inlet gas prices to Lower 48 prices would enable Cook Inlet gas exploration to compete for capital with gas exploration projects elsewhere, the gas producers argued.

In 2001 RCA approved a Unocal gas supply contract with Enstar that used a Henry Hub index, and in 2004 the commission approved a similar contract between Enstar and the NorthStar Energy Group. However, the commission subsequently dropped its support for Henry Hub indexing, and for other proposed indices involving North American trading points at the demand or downstream end of gas transmission networks, saying that these markets did not model the market situation in the Cook Inlet and resulted in over-priced Cook Inlet gas.

The commission proposed instead a price index based on a basket of producer basin markets, an approach that the producers rejected for contracts with Enstar but which forms the basis of the pricing in the recently approved Chugach contract.

Market index?

Is the use of this form of market index appropriate as a benchmark for gas prices in Cook Inlet, the commissioners asked at the Sept. 16 conference? And should the commission specify a "safe harbor" range of prices that would be acceptable to the commission and guarantee contract approval?

Some conference participants cautioned about the difficulty of restraining prices within a narrow range, an approach that seems akin to price controls. And Dan Dieckgraeff, Enstar's manager of rates and regulatory affairs, argued the case for price mechanism flexibility, given the inevitable differences between different contract situations and the evolving nature of gas markets.

Trying to pick a pricing mechanism that works perfectly today is not useful for determining gas prices in the future, given that gas markets around the world are changing continuously, he said.

And Commissioner Janis Wilson commented that experience of linking Cook Inlet gas prices to Lower 48 market indices has in practice demonstrated how little connection there is between the market dynamics in the Lower 48 and the gas supply and demand situation in the Cook Inlet.

"Here we are with a (gas) surplus in the Lower 48, prices going way down, and we're facing gas shortages (in the Inlet)," Wilson said.

Another possible Cook Inlet gas price model discussed at the conference is a price cap indexed to the estimated price of imported LNG, imports that would form an obvious alternative to the Cook Inlet basin as a gas source.

And Aurora Gas, the one producer to participate in the conference, would like to see some percentage of the total gas demand set aside for bidding in an open spot market that would give small producers like Aurora market access, while also establishing a market gas price. However, utilities have expressed concern about this concept, because of utility needs for assured supplies from medium- to long-term contracts.

No cost data

One problem that the commission faces when it comes to assessing a reasonable gas-price level is the absence of information regarding the cost of Cook Inlet gas production, information that the gas producers are unwilling to divulge, said Commissioner Anthony Price.

"One emphasis in prior gas contracts is that there's more cost in the Cook Inlet, and yet there's no evidence put on the record of the cost in the Cook Inlet," Price said. "... There's nothing we can land on."

Dieckgraeff said that, although costs factor into gas producer decision making, in his experience it is gas prices that determine gas producer investment commitments. On the other hand, the cost of servicing the extreme swings in Alaska utility gas demand between summer and winter must be taken into account when comparing Alaska gas prices with those in the Lower 48, he said.

In fact, the commission is seeking views on whether it should allow seasonal price variation, or possibly gas producer cost add-ons for the

storage of gas for winter use, in approved gas supply contracts. The conference participants seemed to share a view that new gas storage in the Cook Inlet basin will prove to be a key factor in managing gas supplies for winter use, and that the necessary storage facilities will come at a cost. Storage facilities could also provide a gas market for small producers such as Aurora Gas, said Alan Dennis, royalty manager in Alaska's Division of Oil and Gas.

Price flexibility

However, as in models for the base pricing of gas, there needs to be flexibility from one contract to another in the way in which storage costs can be recovered, whether cost recovery comes from tiering the gas prices to different levels of delivery, or from a single, year-round "bundled" price. Dieckgraeff argued.

"One size fits all isn't the way we want to go here," he said.

RCA is also considering whether there may be value in legislative changes to state statutes, to specify how the commission should review utility gas supply contracts, perhaps with a specified pricing mechanism for the gas. These possibilities did not provoke any response from the conference participants, other than one comment that a statutory standard of the review for the contracts might be helpful in improving the review process.

Other topics discussed during the conference included the fact that the utilities in general support RCA pre-approval of their gas supply contracts, prior to tariff approval, as an essential means of eliminating the significant financial risk that would otherwise result from the possibility of the commission rejecting a contract after a tariff has gone into effect. Some conference participants also expressed concern that a too broad participation in utility tariff hearings, including the involvement of entities with unclear or inappropriate agendas, had in some cases unduly increased the length and cost of the hearings.

Tax incentives proposed for gas storage

Alaska Sen. French unveils bill offering tax credits, property tax relief to encourage Cook Inlet facilities for holding natural gas

Wesley Loy

For Petroleum News

Alaska state Sen. Hollis French plans to introduce legislation to provide tax incentives for development of Cook Inlet natural gas storage capacity.

French, an Anchorage Democrat who sits on the Senate Resources Committee, said he's concerned about potential winter gas supply shortages for homes and businesses in Southcentral Alaska.

"Storage makes sense. It's like cutting an extra cord of wood in the summer to burn in the winter," French said in a Nov. 2 press release.

A problem with storage, however, is the considerable expense.

"According to studies and industry sources, development of an adequate storage system could cost companies $100-$200 million," the press release said.

French's five-page draft bill defines a Cook Inlet gas storage facility as a tank, a depleted reservoir, an injection well for gas storage, "or other structure in the state for the storage of gas that is produced from the Cook Inlet sedimentary basin and designated for sale and delivery in the state."

The bill has two major elements.

First, it offers a state corporate income tax credit. A company may apply as a credit against its tax liability "20 percent of the taxpayer's qualified capital investment in a Cook Inlet gas storage facility," the bill says.

It defines a qualified capital investment as a cash expenditure or contract struck between Dec. 31 of this year and Jan. 1, 2013, for development of a storage facility.

Another qualified capital investment is the cost of "cushion gas" necessary to pressurize the storage facility. This permanent inventory of cushion gas is a major initial cost factor for storage developers.

The credit could not exceed 50 percent of a company's total tax liability each year, the bill says.

The bill's second major element would exempt gas storage facilities and equipment from the state oil and gas property tax.

Storage already happening

While Cook Inlet gas fields are approaching depletion, the most pressing issue right now is deliverability — getting enough gas into the distribution grid during the coldest winter days to meet peak demand. Regulators, energy companies and elected officials have talked increasingly of the possible need for consumer conservation measures or even rolling power blackouts as early as this winter.

French, a former oil industry worker and Senate bipartisan majority member who's running against Republican Gov. Sean Parnell, has touted storage as a way to squirrel away summer gas production for use during winter.

The storage incentives are akin to state perks now in place to encourage exploratory drilling, French said.

But some storage efforts already are progressing without the benefit of the tax incentives he is proposing.

Chevron and Marathon have established three storage facilities in depleted reservoirs at the Swanson River, Pretty Creek and Kenai fields.

Enstar Natural Gas Co., the major gas utility for Southcentral Alaska, is working with Houston-based ANR Pipeline Co., a TransCanada Corp. subsidiary, on development of a new storage facility.

Aurora Gas also wants to develop a gas storage facility at its Nicolai Creek gas field.

French's bill will be considered once the Legislature opens its new session on Jan. 19.

Two types of tax incentives

The bill has two major elements.

First, it offers a state corporate income tax credit. A company may apply as a credit against its tax liability "20 percent of the taxpayer's qualified capital investment in a Cook Inlet gas storage facility," the bill says.

It defines a qualified capital investment as a cash expenditure or contract struck between Dec. 31 of this year and Jan. 1, 2013, for development of a storage facility.

Another qualified capital investment is the cost of "cushion gas" necessary to pressurize the storage facility. This permanent inventory of cushion gas is a major initial cost factor for storage developers.

The credit could not exceed 50 percent of a company's total tax liability each year, the bill says.

The bill's second major element would exempt gas storage facilities and equipment from the state oil and gas property tax.

Storage already happening

While Cook Inlet gas fields are approaching depletion, the most

pressing issue right now is deliverability — getting enough gas into the distribution grid during the coldest winter days to meet peak demand. Regulators, energy companies and elected officials have talked increasingly of the possible need for consumer conservation measures or even rolling power blackouts as early as this winter.

French, a former oil industry worker and Senate bipartisan majority member who's running against Republican Gov. Sean Parnell, has touted storage as a way to squirrel away summer gas production for use during winter.

The storage incentives are akin to state perks now in place to encourage exploratory drilling, French said.

But some storage efforts already are progressing without the benefit of the tax incentives he is proposing.

Providing coverage of Alaska and northern Canada's oil and gas industry

Seeking CI gas storage

Enstar working with TransCanada subsidiary on Cook Inlet gas storage facility

By Alan Bailey

Petroleum News

Faced with a slowly increasing natural gas demand accompanied by steadily declining Cook Inlet gas deliverability, Enstar Natural Gas Co, the main gas utility in Southcentral Alaska, is working with Houston-based ANR Pipeline Co, a subsidiary of TransCanada, to establish a new Cook Inlet underground gas storage facility with an eventual capacity of up to 15 billion cubic feet, to alleviate a pending gas deliverability shortfall, John Lau, Enstar's director of transmission operations, told Petroleum News Aug. 17. The two companies plan to make a final decision by the end of this year on whether to proceed with construction of the facility, he said.

ANR would fund, build and operate the facility as a third-party operator, with Enstar and other utilities paying for storage space.

With Southcentral Alaska utility gas predominantly used for heating homes and business, gas demand in the cold of winter typically peaks at levels 10 times greater than the troughs in demand during the summer. And in the past this huge seasonal demand swing has been accommodated by full-service supply contracts, in which Cook Inlet gas producers take responsibility for upping the supply rates during the winter.

Years ago increasing gas delivery was simply a matter of opening up valves on gas wells, but now there isn't that excess deliverability, Lau said. Instead, the producers now need expensive infrastructure to accommodate the demand swings, he said.

No new contracts

- Fire Alarm & Detection
- Fire Brigade Training
- Facility Survey
- Special Hazard Suppression
- Electrical Security Systems
- Certification Inspections
- Marine Systems
- Fire Sprinkler Systems
- Portable Fire Extinguishers

ENGINEERED
Anchorage, Alaska
800 478-7973

In addition, with 25 percent of its required gas supplies in 2011 not under contract, and no significant new gas supply contracts in the offing, Enstar is facing a supply crunch in about 16 months. And, since the Regulatory Commission of Alaska has rejected as too expensive all new gas supply contracts that Enstar has negotiated since 2001, Enstar anticipates that any new contracts that might fill the pending gas supply gap would involve constant rates of delivery year-round at constant pricing, an arrangement known in gas utility parlance as "flat gas."

"There's noone coming to us with contracts for us to take before the RCA anymore," Lau said. "So what we're looking at for contracts that we ... most likely will get in the future is that we're going to have to buy flat gas, or near flat gas."

The expected future introduction of these near constant delivery rate contracts will require Enstar to have access to a storage facility, to warehouse gas purchased in the summer for bolstering winter delivery. That storage need is the more pressing because of the possibility of the LNG export terminal on the Kenai Peninsula closing in 2011, when the current U.S. Department of Energy LNG export license expires — the LNG plant currently provides an invaluable service during severe cold weather by curtailing LNG production, to divert gas for utility use.

And even if gas from the North Slope starts flowing into Southcentral Alaska through a direct "bullet" pipeline from the slope, or through a spur line off a main North Slope gas line, Cook Inlet gas storage will be needed to enable a relatively constant flow of gas through the line year-round, to ensure viable pipeline operations, and to provide backup capacity for periods when the pipeline is shut-in.

Investigating options

Enstar has been investigating gas storage options for about three years and had proposed establishing its own storage facilities as part of the terms of two gas supply contracts that RCA rejected in 2008, Lau said. Subsequently, the utility has been considering options for storage that it now believes will be vital to the future of Southcentral utility gas supplies.

"Now we're looking at what we need in four years, six years, eight years," Lau said. "... The storage that's implemented here in the next couple of years, it'll be used in the Cook Inlet for decades to come."

And the gas producers will likely need to continue to operate their own storage facilities, to enable them to accommodate utility demand swings under the terms of some gas supply contracts, he said.

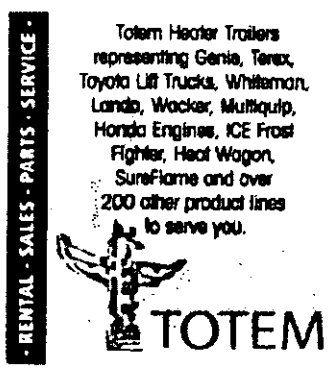
Although it would typically take about 36 months to permit, construct and fill a new underground storage facility, Enstar has asked ANR to work out how to make a new facility available to Enstar for the winter of 2011-2012, Lau said.

In fact, the coming winter of 2009-2010 could see a gas deliverability shortfall, if the weather becomes especially cold. But by 2011, under current supply arrangements, a shortfall will become certain, regardless of the weather, Lau said.

"We've identified dire consequences that will happen if we do not have gas

Alaska Telecom, Inc.
OIL SANDS TRADE SHOW
AND CONFERENCE

NORTHLANDS
EDMONTON, ALBERTA



available out of storage in the winter of 2011-2012," he said.

Four issues

ANR has extensive experience of operating gas storage in the Lower 48 and believes that the 2011 deadline for bringing the new Cook Inlet storage into operation is feasible, Lau said. But the aggressive project timeline will involve spending the next six months resolving four crucially important issues.

First of all, the companies need certainty about whether the Regulatory Commission of Alaska would approve Enstar's tariff changes for factoring in the fees that Enstar will need to pay to ANR for storage usage — Enstar must be sure that it will be able to recover the storage costs from the gas supply rates that it charges its customers, Lau said.

"No private entity will spend any capital on putting together any process or storage, unless they're sure they can recover their costs," he said.

Secondly the companies need to make sure that it will be possible to obtain the use of a suitable storage reservoir, given that all Cook Inlet field reservoirs are currently controlled by gas producers. Four possible reservoirs are under consideration and discussions are in progress with the relevant producers about gas storage possibilities, Lau said.

All of the reservoirs being considered are currently producing gas, a situation preferable to converting a completely depleted reservoir for storage, given that the remaining field gas, occupying perhaps 20 to 30 percent of the field reservoir, can be purchased as "pad gas," gas that simply supports the underground gas pressure and which would otherwise have to be injected into the reservoir, Lau explained.

The purchase of this in-place pad gas from the field owners would form a significant part of the capital cost of the gas storage project, he said.

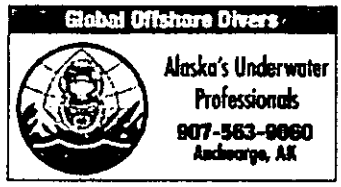
A third issue is ensuring that all of the permits required to build and operate the storage facility can be obtained, including environmental permits and state approval of a gas storage lease in the chosen field reservoir.

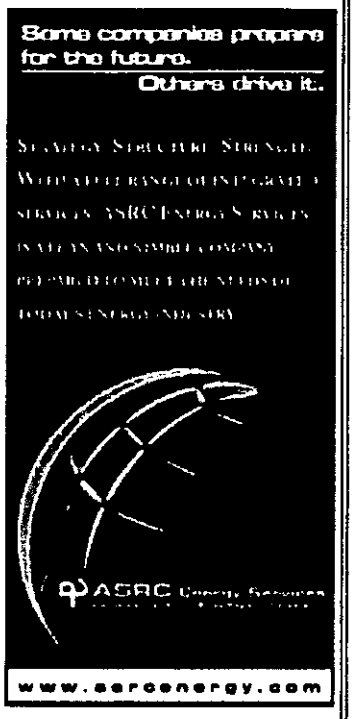
The fourth challenge being addressed in the coming six months is the development of a viable business plan that would work effectively for all of the companies involved in some way with the gas storage project, Lau said.

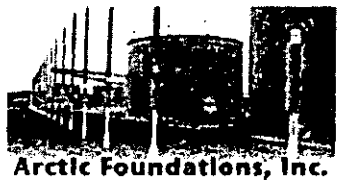
Supply uncertainty

In addition to these primary challenges, significant uncertainty about the sources of future Southcentral Alaska add complications to Enstar and ANR's gas storage plans — future gas supplies could come from new gas discoveries in the Cook Inlet basin, through some form of gas line connecting to the North Slope or from the import of LNG. In particular the import of LNG though the existing LNG export facility on the Kenai Peninsula — a scenario that, based on current trends, Enstar thinks could come into play around 2014, 2015 — would impact the optimum way in which to design the new storage facility.

In fact, Enstar has started evaluating what additions will be made to Cook Inlet gas reserves in the coming years, to try to pin down the time when will begin to be necessary to boost Cook Inlet gas supplies by importing gas from elsewhere.







In particular, the company wants to know how much of the reserve additions that the state has projected are certain rather than just being possible.

"When it comes to keeping customers warm we need 100 percent (certainty)," Lau said.

Enstar is also discussing with ConocoPhillips and Marathon, the owners of the LNG facility, the possibility of re-gasifying LNG, to support peak utility gas deliverability during severe winter cold. However, uncertainty regarding the renewal of the LNG export license in 2011 complicates that option — Enstar is seeking an opinion from the federal regulators on what the renewal decision is likely to be.

But the core question of establishing a new underground storage facility comes back to ensuring that utility gas continues to flow to consumers during the cold Alaska winter.

"It's not going to be cheap, but it's certain supply," Lau said.

Providing coverage of Alaska and northern Canada's oil and gas industry

More gas storage needed

Zager says a variety of storage options required; scope for conservation

Alan Bailey

Petroleum News

With winter cold in Southcentral Alaska perhaps three months away, the season is fast approaching when a severe cold snap could push the required delivery rate of utility natural gas for heating and power generation up to and perhaps beyond the limits of feasible production from gas wells in the Cook Inlet basin. One possible solution to this gas deliverability crunch is the use of gas storage facilities, to store excess gas produced during the summer and then release that gas into the utility system during the winter when demand is high.

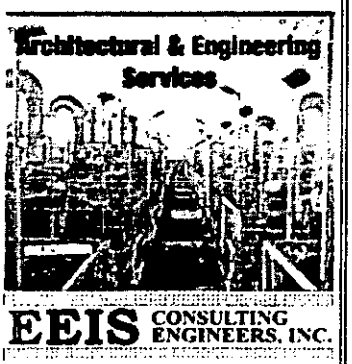
Three facilities

There are already three storage facilities successfully operating in depleted gas fields around Cook Inlet. Marathon operates one of these facilities in its Kenai gas field; Chevron operates two facilities, one in the Swanson River field on the Kenai Peninsula and one in the Pretty Creek field on the west side of the Cook Inlet. And Aurora Gas is proposing to establish an additional storage facility in its Nicolai Creek field south of Tyonek.

"At peak, when our storage is full, we can do in excess of 60 million cubic feet per day out of the combined (Chevron) systems," John Zager, Chevron's Alaska manager, told Petroleum News Aug. 4.

Both facilities can help support either the on-going high gas load of a typical winter or the peak load during particularly severe cold. However, Chevron tends to use Pretty Creek primarily to bolster the on-going winter load.

"We tend to turn that on and leave it on throughout the winter, whereas we tend to use Swanson more as a peaking field," Zager said.



Zager said that gas storage is critical to addressing the short to intermediate issues relating to the deliverability of utility gas. And a variety of different types of storage could address different delivery needs, such as continuous or needle peaking supply. In addition to the type of below-ground storage that has been implemented already, the above-ground storage of LNG would be especially suitable for needle peaking delivery of gas.

Not cheap

But none of the gas storage options is cheap.

"People want to talk about affordable gas, which is a great desire, but you need to look at security of supply too," Zager said.

Both Chevron and Marathon operate their storage facilities in support of their own operations, to ensure that they can meet their contracted gas supply obligations during the winter. But the storage supports long-term, full-service supply contracts, with constant gas pricing regardless of season variations in demand. This type of contract is disappearing, in part because it does not recognize the full cost of meeting winter demand, Zager said.

Instead, pricing will likely become more flexible, perhaps tiered to the gas demand level, thus opening possible gas storage roles for gas utilities, power utilities or perhaps third-partY gas storage operators.

"The market will find an answer, given the opportunity," Zager said. "Tiered pricing may work. There may also be a mechanism whereby a utility and the customers would pay a capacity charge, whether they use the gas or not."

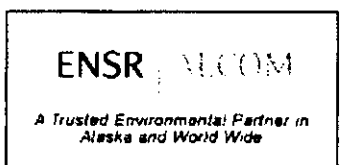
The concept of a capacity charge arises from the need to protect a gas storage operator from the risk of establishing and filling a storage facility, and then encountering a mild winter in which the storage is not needed — essentially the capacity charge would operate like an insurance premium, to ensure the availability of sufficient gas during exceptionally cold weather.

And then there is the risk associated with uncertainty in the future of the Cook Inlet gas market — in June Ethan Schutt, vice president for land and legal affairs for Cook Inlet Region Inc., a Native regional corporation with major land holdings around the Cook Inlet, told the Senate Resources Committee that CIRI had determined that the development of gas storage for third-party use in the Cook Inlet basin is very unattractive for private industry because of high development costs and high market uncertainty.

"Although the concept seems attractive and to serve a public purpose, the economics aren't worth the risk right now," Schutt said.

Technical challenges

However, aside from the commercial challenges of establishing a viable gas storage facility, anyone setting up an underground storage facility in the Cook Inlet basin faces some significant technical challenges. Whereas in the Lower 48 a company might construct an underground storage facility by using fossilized reef structures with large cavities, or by leaching salt from an underground salt dome to create a cavern that can be filled with gas, operators in the Cook Inlet basin have to use relatively poor reservoirs in muddy sandstones, Zager said.



"We in the Cook Inlet do not have what are considered good storage reservoirs," he said.

Producing gas too fast from a Cook Inlet sandstone reservoir runs the risk of sand production through the gas wells, while issues such as water encroachment in the reservoir need to be considered. There's also the risk of losing gas that's pumped into a less-than-optimum reservoir for storage.

"The first time you're filling that reservoir with gas, you're just hoping it comes back out again," Zager said.

And the need to use a depleted gas field for storage limits the number of underground storage facilities that can be brought into use, as well as determining the locations of gas storage sites and possibly introducing issues relating to joint ownership of field leases. The need to locate a storage facility at a place on the Cook Inlet pipeline system where stored gas can be delivered at sufficient rate through the pipelines further limits the availability of gas storage locations — many Chevron properties are offshore, where storage operation does not seem to make much sense, Zager said.

And no one is going to take the risk of trying to establish an underground facility in a location other than a depleted field.

"My theory would be if nature hasn't been able hold gas for a long period of time, I'm not going to bet on it," Zager said.

New gas

Zager also cautioned that, although gas storage can help with short-term gas deliverability issues, the storage does not actually create any new gas to bolster supplies. In the longer term gas from new Cook Inlet discoveries, from the North Slope or from LNG imports will have to come on line, he said.

And, in the short term, gas conservation, through measures such as turning down thermostats, using wood stoves and deferring activities with high power or gas consumption, could go a long way to overcoming the peak gas deliverability hurdle.

"If on a cold day you could shave demand by 10 percent, that would equate to a nice-sized gas field or an entire storage facility," Zager said.

And building a new storage facility, including permitting, and perhaps drilling a new well and installing compression, would likely take a couple of years.

"It's not like if we decided now, we can have anything ready for this winter, or probably even next winter," Zager said.

Alberta's leader in a deep hole

Alberta Premier Ed Stelmach is in a struggle for his political life.

Consider this:

- His Progressive Conservative party got relegated to third place in a recent election to fill a vacancy in the provincial legislature.
- Support for his governing party has tumbled to 30 percent from 54 percent three years ago, when he was chosen to succeed Ralph Klein, and his own performance as leader has close to a 60 percent disapproval rating.
- Klein, in what was widely seen as a poison dart, suggested Stelmach would need 70 percent support at the party's mandatory leadership review on Nov. 7 if Stelmach was to remain at the helm.
- Alberta's Auditor-General Fred Dunn warned the province could lose C$100 million in royalties this year because it allowed oil sands giants Suncor Energy and Syncrude Canada

OK for Shell plan

MMS approves Beaufort Sea 2010 drilling if permitting requirements met

By ALAN BAILEY
Petroleum News

On Oct. 19 Shell passed another major milestone in its multiyear quest to start exploration drilling on Alaska's Arctic outer continental shelf, when the U.S. Minerals Management Service approved the company's new Beaufort Sea exploration plan, a plan involving the drilling of two exploration wells during the 2010 open water season using a single drillship, the Frontier Discoverer.

"The Minerals Management Service is committed to developing offshore energy resources responsibly," said MMS Director Liz Birnbaum. "Now that we have approved Shell's plan and reached this important milestone, we will continue to work with Shell to ensure that all activities are conducted in a safe and environmentally responsible manner."

And time is of the essence for completion of the permitting for both the Beaufort and Chukchi Seas: The company has said that it needs it to be in a position to make a go-or-no-go decision on the 2010 drilling at the start of that year, given the expense and effort involved in ramping up for any Arctic outer continental shelf drilling activity.

Plan approval is subject to Shell obtaining all required permits and authorizations, including

Pioneer plans more appraisal work at offshore Cook Inlet prospect this year

By KAY CASHMAN
Petroleum News

Work on the Cosmopolitan oil prospect in Southcentral Alaska's Cook Inlet basin has ramped back up, operator Pioneer Natural Resources told Petroleum News Oct. 20.

In January, Pioneer put plans to drill an appraisal well on hold until 2010 because of low oil prices, although Tadd Owens said the company would continue to investigate the feasibility of commercial oil production from Cosmopolitan, which was discovered in 1967 by Pennzoil.

Owens, Pioneer's director of government and public affairs, also said Pioneer was "well positioned to ramp back up when prices recover."

"Pioneer will conduct additional appraisal work at Cosmopolitan during the fourth quarter of this year and first quarter of 2010. The company plans to work over and flow test the Hansen 1A L1 well — originally drilled in 2007 — in order to gain additional reservoir information."
—Tadd Owens, Pioneer Natural Resources Alaska spokesman

In August, Pioneer said it would continue with just one drilling rig in Alaska in 2009 and 2010 — at its offshore North Slope Oooguruk oil field —

ALAN BAILEY
KEN SALAZAR

A key scientific agency is advising the Obama administration against oil and gas leasing in large portions of the nation's Outer Continental Shelf.

The National Oceanic and Atmospheric Administration recommends that Alaska's North Aleutian basin, which takes in rich Bristol Bay commercial fishing and subsistence gathering grounds, be crossed off the government's proposed 2010-15 leasing schedule.

And NOAA also says no leasing should occur in Alaska's remote Chukchi Sea pending further research into oil spill risk and Arctic cleanup capabilities.

NOAA's position was amid an extraordinary outpouring of public feedback the U.S. Minerals Management Service received by the Sept. 21 extended deadline to comment on the new offshore leasing plan, which would revise the current 2007-12 plan.

MMS, an Interior Department agency that regulates offshore oil and gas activity, said it received more than 450,000 comments on the plan, which the Bush administration released in its final days in office.

• NATURAL GAS

Mackenzie Gas Project mood on upswing on all sides

By GARY PARK
For Petroleum News

The key Canadian government and Imperial Oil leaders in the Mackenzie Gas Project are not even close to giving up on the scheme.

Environment Minister Jim Prentice said Oct. 14 the chances of a natural gas pipeline from Canada's Arctic have "never been closer" to success — a view strongly endorsed the next day by Imperial Chief Executive Officer Bruce March.

JIM PRENTICE

Prentice told the Calgary Herald's editorial board he is counting on the regulatory groundwork for the MGP to wrap up next spring.

March shares that view, saying the process is closer than ever to completion, although there is much work still to be done.

Despite an uncertain outlook for gas "those are the risks that all the developers and producers in the energy business know how to manage much easier than the risks" of the Joint Review Panel and other regulatory aspects of the MGP, he said.

"When we get to the point it is in our hands we will be thrilled," he said.

Prentice said he is confident the JRP, which is examining the socioeconomic and environmental aspects of the pipeline, will deliver its final report close to the December target date.

Assuming that happens, the National Energy Board should hear its final arguments in April, allowing the regulators to deliver their conclusions and recommendations to the federal cabinet.

Several years late

"As you know, (the JRP is) several years late," Prentice conceded. "But my understanding is that they should be able to get this done by the end of December.

"It's easy to be dismissive, but the truth is this has been a lot of work for many years and we've never been closer (in 40 years) to having the regulatory and environmental part finished."

Meanwhile, Imperial and its co-venturers (Shell Canada, ConocoPhillips Canada, ExxonMobil Canada and the Aboriginal Pipeline Group) have been working on a fiscal framework with the Canadian government.

Prentice said those talks are upbeat, despite the slump in gas prices.

"I get the sense the proponents continue to be committed to the project," he said.

Inuvik Mayor Derek Lindsay told the Calgary Herald that he was living in Inuvik when the first serious attempt to develop Arctic gas fell through in 1977.

"I don't want to see that happen again," he said. "It crippled this town for 10 years."

If and when a pipeline gets a green light, there will be more activity in Inuvik and in the Beaufort Sea. ●

• SAFETY & ENVIRONMENT

Uncertainty over Copenhagen talks

Prentice suggests financial crisis trumping environmental concerns; Obama administration looking at bilateral pacts with India, China a to break developed-developing country deadlock

By GARY PARK
For Petroleum News

Hopes for a global climate-change agreement are wilting in the buildup to December's United Nations-sponsored talks in Copenhagen, with the Canadian government suggesting that the financial crisis is trumping environmental concerns.

Environment Minister Jim Prentice said Oct. 14 he is far from sure an agreement will be reached in Denmark, not least because of the differences emerging between the United States and the European Union.

The Obama administration is also turning its energies to alternative bilateral pacts with India and China, with the intention of breathing fresh life into the deadlock between developing and economically advanced countries.

In a candid assessment, Prentice said "increasingly people are being realistic" about the chances for a full and complete agreement.

"There's probably too much work to be done in that time that is left," he said.

Prentice said it is likely that Copenhagen will achieve nothing more than "some agreed principles."

Whatever happens on the global stage, Prentice said Canada intends to roll out its own plans for reducing greenhouse gas emissions by 20 percent from 2006 levels by 2020.

If that happens, each Canadian province will have to carry its share of the load, which could involve more ambitious federal targets than Alberta is currently willing to introduce on its own, he suggested.

But Prentice said the road to Copenhagen has encountered the compelling argument that reducing poverty is a greater priority for less-wealthy countries than reducing GHGs.

Some expect greater certainty

Despite Prentice's less than optimistic forecast for Copenhagen, there are petroleum industry leaders who expect greater certainty on issues such as cap-and-trade systems and carbon capture and storage.

Peter Voser, the chief executive officer of Royal Dutch Shell, told a Calgary conference that society "needs real progress on climate policy frameworks that put a price on emissions and promote CCS and other clean energy technologies."

A spokesman for Environment Canada said the Canadian government remains committed to tabling a "full suite of specific policies (prior to the Denmark summit) covering all major sources of Canadian greenhouse gas emissions."

He conceded that federal plan will involve major revisions to the Canadian strategy released 18 months ago to cut GHGs by 20 percent by 2020 and 60 percent by 2050.

"The economic downturn and the renewed engagement by the new U.S. administration has required that we fine tune our approach to tackling climate change," he said.

The spokesman said there has been progress in talks between U.S. and Canadian officials seeking to harmonize climate

A graph of daily temperatures in Anchorage between June 2008 and May 2009 demonstrates the extreme fluctuations in temperature that typify a Southcentral Alaska winter. In this particular winter two cold snaps in October and November followed by an extreme cold spell in January nearly brought the Cook Inlet natural gas delivery system to its knees, especially when coupled with two gas compressor failures.

• NATURAL GAS

Are Cook Inlet gas supplies in crisis?

As winter approaches, Chevron manager presents facts, figures about natural gas supply and demand in Southcentral Alaska

By ALAN BAILEY
Petroleum News

Natural gas has flowed out of the Cook Inlet basin with apparent ease for around 40 years, in some ways the life blood of Southcentral Alaska, firing heater furnaces, fueling power stations and supporting significant industrial activity. But does recent talk about gas shortages in the basin signal the beginning of the end for Cook Inlet gas? Or is the region merely transitioning through a period when gas supplies come more into balance with demand, following years of excess gas resources?

At the Oct. 15 meeting of the Alaska Geological Society, Steve Wright, Chevron's Alaska development manager, presented his perspectives on the Cook Inlet gas situation. Wright, an experienced oil industry geologist, now oversees Chevron's Cook Inlet oil and gas development program.

Most of the Cook Inlet gas comes from oil and gas fields discovered during the heyday of oil exploration in the 1960s and 1970s. And, after many years of production, gas reserves — the volumes of gas confidently thought to exist in proven gas reservoirs — have declined by about 80 percent, from about 8 trillion cubic feet to about 1.5 tcf, Wright said.

"The Cook Inlet gas reserve base is now believed to be at its lowest point for 40 years," he said.

At the same time the gas deliverability — the rate at which gas can be produced and delivered to market — is also dropping.

"Total Cook Inlet gas deliverability has declined about 40 percent in the last three to four years," Wright said.

High investment

The declines in reserves and deliverability have come despite a high level of expenditure in Cook Inlet gas development in recent years, with something in excess of $500 million being invested in just the last two years, Wright said.

"Over the past two years alone there have been 29 gas development wells drilled in 11 different gas fields around the basin," he said.

Development activities have included six wells in the Grayling Gas Sands; three wells in the Beluga River field; two winter-drilled wells on the west side of Cook Inlet; two development wells and a compression project in the Ninilchik field; three development wells in the North Cook Inlet field; eight development and storage wells in the Kenai field; and two development wells in the Happy Valley field.

That development activity probably slowed the annual rate of the gas deliverability decline to between 10 and 15 percent; the natural decline rate would likely be 15 to 20 percent, were there to be no development intervention, Wright said.

Production data from the Alaska Oil and Gas Conservation Commission indi-

cates that the deliverability decline has become especially pronounced in the last three years, mainly as a consequence of production declines from the four big legacy gas fields: Beluga River, North Cook Inlet, Grayling Gas Sands and Kenai. In fact, the Ninilchik field, a good-sized field that came on line in 2003 as a result of modern exploration, has actually been increasing its production, Wright said.

Faced with declining deliverability, Cook Inlet gas producers have developed three underground gas storage facilities, to warehouse summer-produced gas to help meet peak demand levels in the winter.

Grim picture

A chart of historic and forecast annual gas production, published by the Alaska Department of Natural Resources in December 2006 and sometimes referred to as the "gas cliff," paints a grim picture of future gas production expectations. According to this chart, after a huge ramp-up in Cook Inlet gas production in 1965 to 1970, production continued to climb for another 10 years before leveling off and remaining fairly constant until around 2006-07. Using future production estimates based on known gas reserves, DNR predicted that production would plunge precipitously in subsequent years.

But current estimates of gas production for 2009 indicate an overall production level considerably lower than the projected value on the 2006 DNR graph, Wright said.

"You might conclude that the DNR forecast was somewhat optimistic overall," he said.

And an Alaska Natural Gas Development Authority projection of gas supplies versus gas demand shows annual supply volumes dropping below total gas demand around 2012-13, Wright said.

"After that point, total supply will not meet utility demand in the basin," he said.

Data presented to the Regulatory Commission of Alaska by Enstar Natural Gas Co., the main Southcentral Alaska gas utility, and by Chugach Electric Association, a major Southcentral electric utility, suggest shortfalls in utility gas supplies at around that same 2011-13 timeframe, Wright said.

Production figures from the LNG plant at Nikiski on the Kenai Peninsula also make sobering reading — the LNG plant was originally built to establish an export market for excess natural gas from the Cook Inlet basin.

According to data from ANGDA, in 2008 the LNG plant used on average about 180 million cubic feet per day of Cook Inlet gas, a gas volume that repre-

GAS SUPPLIES

sented about 42 percent of the total amount of gas produced from the basin.

"Exports from the LNG plant have ramped down significantly this year, and the 2009 numbers may actually show those LNG volumes to be half of what they were in 2008," Wright said.

Urgent

Plots of projected daily gas deliverability versus daily gas demand show an even more urgent problem: Daily gas deliverability will likely fall below peak demand requirements during the cold of the winter, well before total annual gas production drops below annual gas needs.

With much of the utility gas being burned to heat buildings, daily temperatures in Southcentral Alaska form the key drivers behind gas consumption, Wright explained. And there is an obvious annual cycle of temperature changes between warm summers and cold winters, he said. But superimposed onto that broad cycle are chaotic day-to-day temperature fluctuations, fluctuations that become much more extreme during the winter than during the summer.

"That's obvious to all of us who live here and know that winter temperatures can vary by 30 or even 50 degrees over a couple of days," Wright said.

Those extreme temperature fluctuations, on top of an already heightened winter demand, place a huge stress on the gas deliverability system. And at no time has that stress become more apparent than in January 2009, when a series of events brought utility gas delivery to the brink of failure.

The problem started with two early winter cold snaps in October and November of 2008.

"The gas storage project operators at the three gas storage projects around the inlet had to start depleting the volumes that they had in the reservoirs very early, to meet the demand during these cold snaps," Wright said.

Levels halved

As a consequence, gas levels in the storage facilities had dropped to half of their start-of-winter levels by the end of 2008.

Then came an exceptional, extreme cold period in January, with day temperatures averaging around minus 8 F to minus 10 F, and night temperature bumping 20 below zero for 10 days to two weeks: The semidepleted storage facilities struggled to keep up with the extreme gas demand.

> *"Exports from the LNG plant have ramped down significantly this year, and the 2009 numbers may actually show those LNG volumes to be half of what they were in 2008."*
> **—Steve Wright, Chevron's Alaska development manager**

"The reservoir pressures in the storage reservoirs were about half of what they had been," Wright said. "They could only deliver, because of the dynamics of gas flow, about a quarter of what their total deliverability would have been at the start of the winter."

The failure of two gas compressors, the machines used to drive gas through the gas pipeline system, then completed what Wright characterized as a perfect storm for gas supplies.

Then, as gas pressures in the gas transportation system started to fall rapidly, oil company and utility personnel swung into action.

"The producers and utilities went into emergency response mode and worked together very effectively and we were able to head off a potential catastrophic situation by supporting one another, moving gas around the system ... and working together to deal with this problem," Wright said.

The various stakeholders in the gas supply system have since been reviewing what happened in this emergency, refining contingency plans to deal with any similar situations in the future.

"What we do know is that these types of temperature scenarios can't be avoided," Wright said. "This is reality. What we've got to do is put plans in place to deal with those kinds of scenario when they develop."

Solutions?

But what's to be done about the bigger picture of dwindling Cook Inlet gas supplies?

Natural gas exploration in the Cook Inlet basin is especially challenging, thanks to a high-cost environment, a dwindling support industry, long development lead times and difficult operational logistics.

And the results of exploration over the past 10 years don't look too encouraging.

According to AOGCC data, eight different operators drilled 15 exploration wells and eight coalbed methane appraisal wells during that time period, Wright said.

"So we obviously had a lot of companies looking for gas," Wright said. "A lot of different ideas, concepts being generated, plays developed and wells drilled to test those concepts."

Five of the 15 exploration wells were classified as discoveries, with just two of the discoveries — the Ninilchik and Happy Valley fields — being deemed commercial.

"That translates to a commercial success rate of somewhere between 10 and 15 percent," Wright said. "Success rates for exploration in the Lower 48 are typically 50 percent or higher these days."

Moreover, in addition to land access being limited by the closure to oil and gas development of regions such as the Kenai National Wildlife Refuge, all of the moderate- to large-sized geologic structures that typify the reservoir settings of the established gas fields have now been drilled and tested, Wright said. Seasonal access restrictions on the western Cook Inlet coast result in a need to stage equipment over the winter. And, offshore, the listing of the Cook Inlet beluga whale and the increasing difficulty in renewing water discharge permits are raising new challenges for oil and gas development.

Wright also cautioned that, although there are explorers who want to drill offshore using a jack-up rig, a realistic time frame to bring a new offshore gas field on line, taking into account exploration, field appraisal, engineering, platform construction and development drilling, would likely be 10 years.

And, although there may well be potential to find new Cook Inlet natural gas resources in stratigraphic traps, subtle traps formed by the juxtaposition of rock strata, rather than the big structural traps of the established gas fields, discovering those subtle traps would be a major challenge, given the limitations of Cook Inlet seismic data. Essentially, the ancient river channels that would have generated these traps are quite narrow and cannot be resolved in the existing seismic, Wright said.

Other options

Other options being considered to bring new natural gas resources into Southcentral Alaska include a direct "bullet line" from the North Slope, or a spur line from a future main North Slope gas line. But first gas from a bullet line would be unlikely to appear before 2018, and first gas from a spur line might not flow until 2023.

Another possibility would be to import foreign LNG through the LNG plant on the Kenai Peninsula, although negotiating an acceptable LNG supply contract for the small quantities of utility gas required in Alaska could prove challenging, Wright said. And then there are possible alternative energy sources such as hydropower, geothermal power and CIRI's recently announced underground coal gasification plant.

But with so much uncertainty about the future, finding solutions will take a concerted effort by everyone, Wright said.

"We firmly believe that the best way to solve problems is through public and industry awareness, and working jointly," Wright said. "... There's no single entity, not a single producer, not a utility, not the regulatory agencies, not the State of Alaska, that can solve this problem on its own." ●

Village corporations seek pipeline help

Coalition controls 100 miles of gas line route along Alaska Highway, wants partner to help pursue jobs, training for megaproject

By WESLEY LOY
For Petroleum News

A coalition of Alaska Native village corporations is seeking help in pursuing employment and other opportunities should a natural gas pipeline be constructed through their region.

The four corporations are arrayed along the Alaska Highway between Delta Junction and the border with Canada.

The coalition includes the Dot Lake, Northway, Tetlin and Tanacross village corporations. They are united as Din e'h LLC. State records show the limited liability company was organized on June 16 of this year.

Din e'h translates to "the people" in the Athabascan language of the Upper Tanana River valley.

Din e'h published an advertisement in the Oct. 11 edition of the Anchorage Daily News saying the group was "seeking a partner experienced in large project construction to provide capability, capacity, and proven performance for a joint venture in gas pipeline bidding processes.

"The goal is to create jobs, train workers, and encourage long-term economic opportunities for the Alaska Native people of the Upper Tanana."

The group planned to talk with qualified firms at an Oct. 24 meeting in Anchorage.

Belinda Thomas, general manager for Din e'h, told Petroleum News in an Oct. 20 e-mail the group had attracted several midsized and large contenders for the work.

Din e'h is looking for "teaming partners" who have "a strong commitment to local capacity building," Thomas said.

According to the group's newspaper ad, the four villages together own the surface estate of about 100 miles of the gas pipeline route between Delta Junction and the Canadian border.

Competing gas line projects

The four Native village corporations are among many localities likely to seek jobs or other benefits should major energy companies succeed in building a multibillion-dollar pipeline to carry the North Slope's prodigious natural gas reserves to market.

The project has been a dream of Alaska economic development boosters for decades, but the extreme cost and complexity of the project coupled with weak gas prices have kept the project from happening.

Currently, two competing projects are in the planning stages, with both aiming to hold open seasons next year to test interest among producers for signing long-term contracts to ship gas through a pipeline.

Both projects would follow the Alaska Highway into Canada, passing through the Din e'h region.

One project, called Denali, involves partners ConocoPhillips and BP. Pipeline operator TransCanada and ExxonMobil are teaming on the other project. ●

UNCERTAINTY

change policies to advance "our respective environmental and energy objectives."

Voser said Shell endorses a cap and trade system that is at the core of the American Clean Energy and Security Act passed narrowly in June by the U.S. House of Representatives, viewing that as the lowest-cost means of reducing carbon dioxide emissions.

If that bill is adopted by the Senate, now seen as unlikely before 2010, the U.S. would be committed to lowering GHG emissions by 17 percent from the 2005 level by 2020 and 83 percent by 2050.

Alberta government hasn't wavered

The Alberta government has never wavered from its position that it will not support any national approach that erodes investment in the province's energy projects, notably the oil sands — something Prime Minister Stephen Harper put high on his list when he agreed to work with President Barack Obama on a joint climate change pact.

Harper reinforced that line after a meeting with Obama in mid-September when he reminded "all our American friends that Canada is by far the largest supplier of energy to the United States."

"And we are determined to be a continental partner in dealing with the very linked problems of climate change and energy security."

However, the two leaders made no specific reference to the oil sands.

In a symbolic gesture, David Jacobson, the new U.S. ambassador to Canada, visited the oil sands on Oct. 14 in what was billed as an effort to help the Obama administration draft a policy on major sources of energy supply for the U.S.

He said officials in both countries recognize there must be a balance between the need for energy security and protecting the environment.

"I've learned a lot about the tremendous strides that have been taken over the last several years with respect to improving the environmental record in treating the oil sands," Jacobson told reporters in Calgary.

He echoed the suggestion by Prentice that a deal in Copenhagen is a long shot, noting that the U.S. health care debate has eclipsed work on energy legislation in Congress, meaning the chances of major energy policy decisions before the international conference are slim. ●

Canadian trusts face 'brave new world'

NAL sets standard with 4 deals in recent months as it bulks up prior to joining corporate world once trusts lose tax-free shelters

By GARY PARK
For Petroleum News

NAL Oil & Gas Trust is rapidly becoming a leader among Canada's trusts as it settles on a future strategy with barely one year left before losing its tax-free status.

It struck an agreement Oct. 13 to take over Breaker Energy for C$403 million (including the assumption of C$93 million in net debt) — its fourth deal in recent months.

Launched six years ago by former executives of Alberta Energy Co. (a founding company of EnCana), NAL is moving into the midrange of Canadian oil and gas producers.

Assuming the Breaker transaction is concluded in early December, NAL expects to enter 2010 with production of 31,000 barrels of oil equivalent per day from properties in Alberta, British Columbia and Saskatchewan.

NAL's objective is to add "quality assets with upside opportunity through internal investment and acquisitions."
—NAL Oil & Gas Trust CEO Andrew Wiswell

It will have a proved-plus-probable reserve life index of 8.7 years from reserves of 96 million boe, undeveloped land of 550 acres and tax pools (or credits) of C$1.2 billion (including Breaker's contribution of C$270 million).

Breaker will contribute production of 6,700 boe per day (45 percent oil and gas liquids and the rest natural gas), 23 million boe of proved-plus-probable reserves and 140,000 net undeveloped acres.

Deal follows earlier buys

The deal follows NAL's acquisitions of Alberta Clipper for C$115 million and Spearpoint Energy for C$16 million, plus a joint venture to exploit central Alberta's Cardium oil play.

The trust will issue about 25 million trust units at C$12.54 each to finance the acquisition, which works out to C$5.96 a Breaker share, a 12 percent premium to the junior company's preceding 20-day average trading price.

On a production basis, NAL is paying about C$58,000 per flowing barrel and C$16.91 per barrel for reserves, compared with ATB Financial's estimated average of C$46,195 and C$12.93.

Kim Page, an analyst with Wellington West Capital Markets, said that given the valuation metrics there is unlikely to be a counterbid.

Breaker President Dan O'Neil said blending his company's assets with NAL's strong financial position "will allow the combined entity to high-grade its opportunities and fully develop and expand Breaker's potential."

Breaker has pinpointed about 400 (350 net) low-risk development prospects, including 190 horizontal resource-style locations on its land, with the prospect of adding 2,900 boe per day in central Alberta and long-term gas opportunities in northeastern British Columbia of 50-100 billion cubic feet of recoverable gas.

NAL Chief Executive Officer Andrew Wiswell said the inclusion of Breaker will be another significant step in repositioning to convert NAL from a trust to a corporation in 2011, when the Canadian government will put both sectors on the same tax footing.

He said NAL's objective is to add "quality assets with upside opportunity through internal investment and acquisitions."

Action on the M&A front has been quietly gathering speed this year as trusts have decided what route they will take in the post-2010 world.

No single solution

The decision making comes three years after Canada's Finance Minister Jim Flaherty dropped a bombshell on the sector to avert a stampede by corporations in all sectors to join trust ranks and take advantage of a tax loophole.

Now that the initial anger has faded, the bulk oil and gas trusts seem resigned to joining the corporate world, though some will delay their transition while they use tax pools to reduce their taxable income beyond Jan. 1, 2011.

Some apparently believe that it will make no difference if they continue as trusts and some have trimmed their monthly cash payouts in favor of increasing capital spending to strengthen their reserves and production.

The conclusion is that there is no single solution for trusts plotting their future direction. Sayer Energy Advisors has reported that trusts completed C$1.4 billion in unit issues in the first half of 2009, compared with a paltry C$218 million in the same period of 2008, raising the total from unit issues and debentures to C$2.1 billion.

Sayer said these moves could underscore M&A activity by trusts that want to expand their core operations before joining the corporate world in 2011.

In addition to NAL, the busiest acquisitors have been Penn West Energy Trust and Zargon Energy Trust.

Blackmont Capital said that comparing the "real-world valuation parameters" of the NAL-Breaker deal with current market valuations of some intermediate producers, "a couple of them appear to be overvalued."

More capital appreciation

One thought taking hold is that the next generation of trusts will lean more toward capital appreciation from their transition income-generating priority, which could benefit the struggling service sector if it results in increased exploration and development, with an emphasis on horizontal wells and multifracturing work.

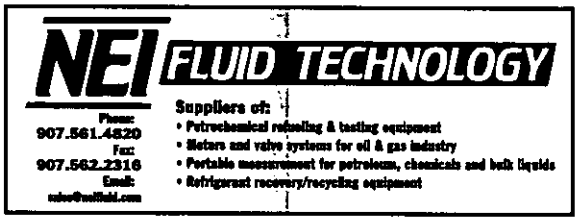
Meanwhile, Calgary-based investment dealer Peters & Co. has listed Pengrowth, Paramount Energy Trust and Peyto Energy Trust as relatively cheap takeover targets based on their expected 2010 cash flows per barrel of oil equivalent against their boe enterprise values.

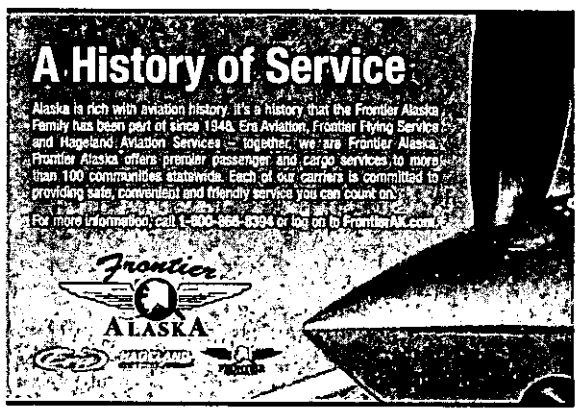
"From an acquirer's viewpoint, desirable entities possess above average cash-flow generating capabilities and below average current valuation levels," the firm said.

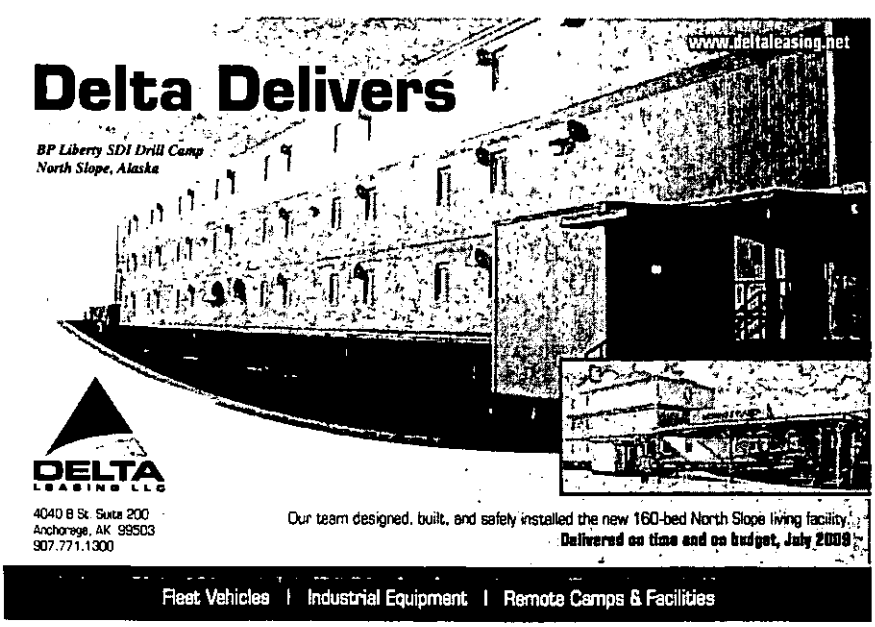
Blackmont Capital said that comparing the "real-world valuation parameters" of the NAL-Breaker deal with current market valuations of some intermediate producers, "a couple of them appear to be overvalued."

In particular, the firm identified Birchcliff Energy and Progress Energy Resources as "expensive on a flowing barrel basis," while Celtic Exploration and Progress "look expensive on a reserve basis."

However, Blackmont said it was "dangerous to draw conclusions based only on this one transaction" adding it would "not expect market valuations to vary too widely from what real-world purchasers are prepared to pay for assets." ●







ALTERNATIVE ENERGY

RCA to adopt net metering regulations

New regulations provide incentive for investment in renewable electric generation, allowing consumers to put power into utilities

By KRISTEN NELSON
Petroleum News

Renewable power generation may be coming to your neighborhood. And it may be built by your neighbor, thanks to proposed regulations that would require Alaska's largest utilities to allow hookups by such privately built generation to their power grids.

The Regulatory Commission of Alaska voted 4 to 1 on Oct. 14 to adopt regulations establishing net metering requirements for the state's largest electric utilities.

The vote ends a tussle between Alaska's electric utilities and proponents of net metering, who believe net metering will increase renewable energy development in the state, while utilities believe net metering will be a burden on other consumers.

Net metering allows a customer of an economically regulated utility to interconnect eligible onsite generation facilities with the electric utility's distribution system, the commission said in an Oct. 16 press release.

In 2008 RCA rejected net metering standards proposed by the Bush administration and began work on regulations targeted to Alaska, including workshops with participation by utilities and proponents of net metering.

The regulations commissioners approved are the result of work done since the Environmental Policy Act of 2005 created guidelines for net metering which state regulators were required to consider, but not to accept.

Alaska regulations

The new Alaska regulations apply to economically regulated electric utilities with total retail sales of 5 million kilowatt hours or more, which limits the RCA regulations to the state's largest electric utilities: Bethel Utilities Corp., TDX North Slope Generating, Alaska Power Co., Alaska Electric Light & Power, Homer Electric Association, Matanuska Electric Association, Municipal Light & Power, Chugach Electric Association and Golden Valley Electric Association, which sell from 39.1 million kilowatt hours (Bethel), to 1.349 billion kilowatt hours (Golden Valley Electric).

The affected utilities would be required to interconnect with eligible customer generation systems up to a systemwide total capacity of 1.5 percent of average retail demand. Eligible customer generation systems are limited to a total onsite capacity of 25 kilowatts.

Net metering customers would be billed for net consumption and receive bill credits when the customer's generation exceeds usage.

Technologies eligible for net metering generation are limited to solar photovoltaic, solar thermal, wind, biomass, hydroelectric, geothermal, hydrokinetic, ocean thermal, landfill gas and biogas energy. The commission may approve other sources that generally have similar environmental impact.

For and against

Summaries of comments on the proposed regulations by RCA staff highlighted some of the disputed issues between net metering proponents and the state's electric utilities.

Municipal Light & Power — one of two electric utilities serving the Anchorage area — told the commission it believed net metering would cause more harm than good while the Alaska Power Association, which represents major consumer-owned power utilities in the state, including ML&P, said that although the proposed regulations did not reflect its preferred position, they were a reasonable compromise between two extremes.

The Alaska Center for the Environment said net metering would reduce utility bills for participating consumers, while the APA said public benefits of net metering would be privately subsidized by non-net metering consumers rather than through typical public means such as grants, tax incentives or similar methods.

ML&P said net metering would cause generation to be built that is not cost effective, burdening ratepayers as a group with higher costs, and requiring ratepayers who do not own net metered generation to subsidize the small minority of ratepayers who will install net metered generation.

Golden Valley Electric Association concurred, telling the commission that net metering is in conflict with the cost-causer cost-payer principle, requiring nongenerating members to subsidize members installing small renewable generation and forcing the utility electrical system to act as a battery for renewable generating facilities.

What about smaller utilities?

In response to comments that the 5 million-kilowatt-hour limit would prevent smaller utilities from utilizing net metering, RCA staff said if a utility is too small to be covered by the RCA regulations it can enact its own net metering regulations.

"The regulations require certain larger utilities to enact net metering rules. Smaller utilities, or utilities that are outside of our authority to economically regulate, are exempted from the requirement and instead allowed to choose independently whether net metering makes sense for their system."

RCA staff said the limitations on net metering were imposed to protect the integrity of the systems:

"The Railbelt electric system, the largest interconnected 'grid' in Alaska is very small in comparison to the nationwide grid in the Lower 48 states and lacks a robust transmission and distribution network."

TDX Sand Point Generating is a case in point, the staff said, with retail sales for their last fiscal year 4.254 million kilowatt-hours, an average retail demand of 485 kilowatts per day.

With the proposed 1.5 percent of average retail demand limit, TDX Sand Point could have up to 7.3 kilowatts of installed on-site consumer renewable generation, less than half of the proposed 25 kilowatt per installation limit proposed in the regulations.

GOVERNMENT

Senate passes bill with icebreaker funding

The full U.S. Senate has passed the 2010 Homeland Security Appropriations conference report that includes $32.5 million in funding for enhancements to U.S. icebreaker capability, Sen. Lisa Murkowski, R-Alaska, said Oct. 20. The bill, which also appropriates U.S. Coast Guard funding for fiscal year 2010, now goes to President Obama for his signature.

The United States currently has just two working icebreakers, the Healy and the Polar Sea, with a third icebreaker, the Polar Star, currently in caretaker status.

The United States currently has just two working icebreakers, the Healy and the Polar Sea, with a third ice breaker, the Polar Star, currently in caretaker status.

Funding from the conference report that the Senate has just passed would pay to finish refurbishment of the Polar Star, to reactivate this icebreaker and extend its service life. The conference report would also require the Coast Guard to investigate whether a new heavy polar icebreaker class vessel should be built, or whether money should be spent on extending the service lives of the existing icebreakers — the Polar Sea has a remaining service life of five years, Murkowski said.

"While reactivation of our second heavy icebreaker helps, the U.S. must begin to plan for the long term replacement or extension of our ice breaker fleet," Murkowski said. "These vessels are becoming increasingly important as access to the Arctic, and its resources, increases due to climate change and a reduction in summer sea ice. Activities such as energy development, tourism, marine transportation and shipping will increase and the Coast Guard must have the resources to respond. This funding is a good start."

—ALAN BAILEY

continued from page 9

NET METERING

Smaller utilities also have different operating parameters, staff said, and interconnecting small non-firm generation may create operational problems, with scenarios varying from utility to utility.

But, RCA staff said, nothing in the regulations prevents a rural community from implementing net metering.

Limit at 1.5 percent

There were a number of objections to a limitation in the regulations of 1.5 percent — that is, a utility may refuse to interconnect for new net metering if that connection would cause net metering to exceed 1.5 percent of the utility's average demand.

APA, Chugach Electric Association and ML&P all pointed out that 1.5 percent was the agreement reached at the commission's technical conference.

RCA staff said the proposed regulations allow a utility to approach the commission regarding increasing the cap to allow additional net metering beyond the 1.5 percent of average retail demand.

"Staff believes it is the intent of the commission to allow a controlled trial of net metering that will limit the potential rate increase for consumers who do not choose to net meter. This cap is an essential part of limiting that financial risk."

Utilities are required to publish annually the result of the 1.5 percent of average retail demand calculation and the total nameplate capacity of interconnected net metering consumers, which will allow the commission to monitor how quickly interconnection is occurring and revisit net metering regulations as required, RCA staff said.

Commercial generation not included

There were objections to the limit of 25 kilowatts on consumer generation and the staff said that limit was chosen so that smaller consumer generators would have the opportunity to participate.

"With a larger generator capacity and a limited system capacity for net metering, the smaller systems could be squeezed out," RCA staff said.

Larger corporate consumers did not participate in the process, staff said, indicating a lack of serious interest at this time.

There were a large number of comments arguing that excess generation should be valued at the full retail rate rather than the discounted avoided-cost rate.

RCA staff said the language was based on "the compromise reached by the net metering advocates and the utilities at the technical conference. To alter this section at this juncture would undermine the fragile agreement that was reached by the participants. The net metering rules contained herein are designed to limit the potential negative financial effects of net metering" on those consumers who do not participate in net metering.

"Staff concurs that this mutes the benefits of net metering for those who participate in the program. Both sides on this issue have strongly argued their positions but neither side has any real experience with net metering in Alaska. Staff believes that going forward with the substance of the proposed regulation is the best way to build experience in net metering. The rules can be revisited in the future as needed and with actual data."

There were a number of objections to language in the proposed regulations allowing utilities to petition the commission for special rates for net-metered consumers "if the utility can demonstrate an adverse material rate impact on utility consumers that do not participate in the net metering program."

RCA staff said utilities always have the right to petition the commission for changes in the rates they charge, and it "believes the proposed language offers a protection to net metering consumers by requiring the utility to demonstrate that the effect of net metering is both 'adverse' and 'material' to consumers that do not participate in net metering."

The commission will release an order adopting net metering regulations, which become official once reviewed by the attorney general and the lieutenant governor. ●

Canada backs carbon capture

Governments commit C$1.65B to 2 projects, claim they lead world in developing technology; others say industry should do cleanup

By GARY PARK
For Petroleum News

Canadian and Alberta taxpayers are starting to feel a rather large hand in their pockets as the two governments roll out plans for carbon capture and storage projects — their key technological initiative to remove greenhouse gas emissions from the atmosphere.

In early October, C$865 million in public money was pumped into Royal Dutch Shell's planned C$1.35 billion Quest project, with Chevron Canada and Marathon Canada as partners, to inject 1.1 million metric tons a year of carbon dioxide from the company's Edmonton-area heavy oil upgrader into underground storage, some of it for possible use in enhanced oil recovery.

STEPHEN HARPER

Less than a week later, the governments announced they would contribute C$781 million for a $1.4 billion CCS project. TransAlta plans to capture about 1 million metric tons a year from its coal-fired electricity plant in central Alberta.

These handouts are taking place amid mounting questions about whether largely untested CCS technology will achieve its hoped-for goals without causing a financial boondoggle.

Of the public share, Alberta will account for almost C$1.2 billion, drawn over 15 years from the C$2 billion it has earmarked to develop and test CCS technology.

'Clean energy superpower'

Prime Minister Stephen Harper said the TransAlta venture, with Capital Power and Paris-based Alstom as partners, meets the federal government's objectives of helping economic recovery and improving the environment.

"To keep Canada on the cutting edge, we are investing massively in scientific research and development. A major focus of these investments is our energy sector."

Harper said that in order for Canada to meet its goal of becoming an "energy superpower" it must be a "clean energy superpower."

Alberta Premier Ed Stelmach said the benefits of Project Pioneer will extend far beyond the TransAlta plant by offering "lessons on how other plants might be retrofitted here in Alberta and around the world."

The project was not on the original short list of three projects that Alberta tagged for its CCS money.

A spokesman for Greenpeace said governments should play no role in subsidizing CCS efforts by giant companies.

"Industry created this toxic mess and they should be fully and financially responsible for cleaning it up," said Mike Hudema.

He also described CCS as a "risky, expensive smokescreen," urging governments to invest more in renewable energy technology, such as wind and solar power, which he said will create more jobs over time.

Alberta Energy Minister Mel Knight defended the approach, arguing government must be a partner in developing CCS technology.

Federal Natural Resources Minister Lisa Raitt, who joined Knight at the Quest announcement, said: "We have to start somewhere. We start today. There are some hurdles to CCS, but the good news is the technology has already been technologically proven."

Reduction in emissions pledged

The Canadian government has pledged to reduce greenhouse gas emissions by 20 percent below 2006 levels by 2020.

Graham Boje, vice president of health safety and sustainable development with Shell's Canadian division, cautioned that, despite the financial backing, Quest has yet to receive corporate sanctioning.

He said the project has a "long way to go before it becomes a fully operational CCS project. We're still in the project development phase and the final investment decision depends on a range of factors."

Boje said it will take about two years to complete engineering, undergo public consultation and obtain regulatory approvals.

The Alberta government is still working on the two other projects that made its initial short list: the Alberta Carbon Trunk Line, a joint proposal by Enhance Energy and North West Upgrading to incorporate gasification, carbon dioxide capture transportation, enhanced oil recovery and storage, drawing on carbon dioxide from the Agrium fertilizer plant and the planned North West heavy oil upgrader; and an integrated gasification combined-cycle power generation plant proposed by Epcor Utilities and Enbridge at the Genesee site in central Alberta.

Coalbed methane recovery honored

The Alberta government derived some hope when an enhanced coalbed methane recovery project, led by the Alberta Research Council, landed an international award in London, England, earlier in October.

The recognition from the Carbon Sequestration Leadership Forum was for work completed last year involving the injection of carbon dioxide into deep, unmineable coal bed, displacing the underground methane with CO_2, reducing greenhouse gas emissions and improving the recovery of coalbed methane in the process.

Knight said the award established that the government-funded research council is a "global leader when it comes to contributing real solutions to address climate change."

The forum also endorsed a second Alberta project, co-led by ARC Resources and the research council, aiming to store carbon emissions from Alberta's industrial heartland region, north of Edmonton, in an underground reef formation, which is estimated to have the potential to handle 1 million metric tons a year of CO_2 by 2015 for more than 20 years. ●

CH2MHILL

Building a better Alaska

CH2M HILL has long been recognized as a most-admired company and leading employer, including being named by FORTUNE magazine as one of the 100 Best Companies to Work For and one of America's Most Admired Companies (2008).

At CH2M HILL, we are committed to providing our interns with an enriching, educational, and fun experience that offers them "real world" industry experience and complements their chosen academic field. As part of our commitment, we train and mentor each student—giving them the opportunity to experience all phases of the Alaska oil and gas industry, from production through pipelines to refinery operations. Our goal is to help build a procession of talented individuals with the potential to develop into future leaders and key technologists in our employee-owned company.

Each intern—hired by and assigned to a specific business group—is given the opportunity to work alongside professional engineers and technical experts on real projects. And when summer comes to an end, several interns are offered jobs in positions throughout the company. We welcome you to join us as we move toward building a better Alaska.

F&W proposes polar bear critical habitat

200,541 square-mile area includes much of the outer continental shelf, the barrier islands and land along the Beaufort Sea coast

By ALAN BAILEY
Petroleum News

On Oct. 22 the U.S. Fish and Wildlife Service announced its proposed designation of critical habitat for the polar bear, following the May 2008 listing of the bears as threatened under the Endangered Species Act. The proposed habitat region encompasses a total area of 200,541 square miles of U.S. territory covering those areas of the Arctic Alaska offshore continental shelf where water depths are 300 meters (980 feet) or less in depth; barrier islands and spits along Alaska's northern coast; and polar bear, on-land denning habitat along the Beaufort Sea coast.

The onshore denning habitat consists of lands within about 20 miles of the northern coast of Alaska between the Canadian border and the Kavik River, and within about eight miles of the coast between the Kavik River and the city of Barrow.

The announcement of the proposed critical habitat designation triggers a 60-day public comment period.

But Strickland emphasized that federal agencies had already been conducting Endangered Species Act section 7 consultations for the polar bear, prior to the critical habitat designation, and that the recent U.S. Minerals Management Service approval of Shell's Beaufort Sea exploration plan had successfully gone through this consultation process.

"This administration is fully committed to the protection and recovery of the polar bear," said Interior Assistant Secretary for Fish, Wildlife and Parks, Tom Strickland. "Proposing critical habitat for this iconic species is one step in the right direction to help this species stave off extinction, recognizing that the greatest threat to the polar bear is the melting of Arctic sea ice caused by climate change. As we move forward with a comprehensive energy and climate strategy, we will continue to work to protect the polar bear and its fragile environment."

Fish and Wildlife has also proposed the prohibition of international trade in polar bears and their parts, Strickland said.

Thorough evaluation

Although the Endangered Species Act requires the Department of the Interior to, if possible, designate critical habitat at the time a species is listed under the act, Fish and Wildlife has not proposed the critical habitat designation until now because of the time that it has taken to conduct a thorough evaluation and peer review of its proposal, Fish and Wildlife said.

Under the terms of the Endangered Species Act, geographic areas designated as critical habitat contain features that the Department of the Interior considers essential for the conservation of a listed species and that may require special management or protection. And under section 7 of the act, federal agencies must ensure that any federally authorized activities are unlikely to jeopardize the continued existence of the species or to destroy or adversely modify the critical habitat.

Oil industry

The designated critical habitat area for the polar bear includes places where the oil industry is active: Fish and Wildlife will evaluate the economic impacts of the habitat designation, Strickland said.

But Strickland emphasized that federal agencies had already been conducting Endangered Species Act section 7 consultations for the polar bear, prior to the critical habitat designation, and that the recent U.S. Minerals Management Service approval of Shell's Beaufort Sea exploration plan had successfully gone through this consultation process. Onshore and offshore oil and gas activities have also already been subject to significant review and regulation under the Marine Mammals Protection Act.

"We believe that it will not be a significant additional burden on the industry ... but it does further heighten the importance of trying to minimize any kinds of activity in these critical areas that might adversely affect the bear," Strickland said of the proposed critical habitat designation.

Critical habitat receives an additional level of legal protection under section 7 of the Endangered Species Act, he said.

Fish and Wildlife has stepped up its funding efforts and is expanding its consultation capabilities, including the deployment of staff to the North Slope to support the development and implementation of community-based, polar bear-human interaction plans for the North Slope villages, said Sam Hamilton, director of the U.S. Fish and Wildlife Service.

Sea ice

About 93 percent of the designated habitat area is occupied by winter sea ice, Strickland said.

"Through eons of time polar bears have evolved and adapted to life on the sea ice, and they depend on this area for resting, breeding, hunting and feeding," Hamilton said. "Polar bears require sea ice as a platform for hunting and feeding on seals; seasonal long-distance movements; travel to terrestrial maternal denning areas; resting and mating."

The majority of the U.S. polar bears remain on sea ice year round and prefer the shallow areas of the continental shelf, he said. And, according to Fish and Wildlife, most polar bear populations use onshore

● LAND & LEASING

B.C. lifts lid on new gas play

Government discloses 'sleeping dog' in Liard basin, west of Horn River, Montney plays; operators tight-lipped about plans, results

By GARY PARK
For Petroleum News

It's in a hush-hush mode right now, but E&P companies in British Columbia could be quietly extending the province's gas hot spot beyond the Montney and Horn River formations.

One of the first public hints came at a Northeast British Columbia Natural Gas Symposium in Calgary at the end of September, when a senior government official said the little-explored Liard basin — west of the Horn River shale gas basin and 65 miles northwest of Fort Nelson — is generating strong interest at monthly land auctions.

Vic Levson, executive director of the Resource Development and Geoscience Branch of the B.C. Energy Ministry, said the region is a "sleeping dog that has been lying quiet."

But bidders committed C$48.3 million in the first seven months of 2009 to secure exploration rights in the basin, compared with C$18.5 million for all of 2008, doubling the average price to C$1,500 per hectare.

However, he said the companies are "keeping a pretty low profile," although some of the operators are shifting their exploration efforts to unconventional from conventional prospects.

The players include two majors — Apache and EOG Resources — while three juniors (a partnership of Questerre Energy and Transeuro Energy and Stone Mountain Resources) have embarked on evaluation programs.

Levson said the government is hopeful that the early exploration is the start of a new trend.

He said the province believes the basin is a "good target ... we'd like to see more companies" take an interest in the area.

The lightly explored Beaver River area (incorporating the Liard basin and Fold Belt region) 100 miles northwest of Fort Nelson, has stirred interest among producers interested in evaluating and testing the potential of Mississippian-aged shales.

B.C. tops land sales

Otherwise, British Columbia, having topped Canada's provincial land sales for the first time in 2008, remains the frontrunner.

For the first nine months of the year, it generated C$330 million in successful bids, compared with C$247 million in Alberta and C$51 million in Saskatchewan.

That total was a starting C$3.5 billion behind the total for the same period last year, with British Columbia down about C$2 billion, Alberta off by C$715 million and Saskatchewan taking a C$797 million tumble, all paying the price for the industry-wide downturn.

British Columbia's per-hectare average price plunged to C$1,281 from C$3,820 in the first nine months of 2008; Alberta has edged up each quarter from C$119 to C$166 and C$257, but lags far behind the 2008 average of C$377; and Saskatchewan nosedived to C$297 from C$1,781.

There was no more hope for Alberta at its first October auction, which drew a mere C$21.9 million in successful bids and an average C$204 per hectare, compared with the C$38.7 million and C$329 per hectare at the comparable 2008 sale.

B.C. sees move to drilling

Otherwise, British Columbia is seeing the first signs that blockbuster land sales in 2007 and 2008 are being translated into drilling plans, although what is in store for the upcoming peak winter season has yet to be disclosed.

For the first nine months of 2009, the regulator has approved 532 new well licenses. Although that is down more than 30 percent from the same period of 2008, the September permits totaled 68, the most in any month since March and only 11 behind September 2008.

Alex Ferguson, commissioner of the B.C. Oil and Gas Commission, said the mood among operators is more positive than it was a few months ago, but until companies complete their budget plans the government is in a "blind spot."

Over the past seven years, the commission has approved 32 experimental schemes for shale gas formations, allowing ongoing research in drilling, completion and/or production technology.

For Horn River those in the experimental phase include majors such as Imperial Oil, EOG Resources Canada and Hunt Oil Company of Canada and smaller players such as Stone Mountain, Kodiak Bear Energy, Quicksilver Resources Canada and Storm Gas Resource.

EnCana has led the way in Horn River since 2001, listed as operator of 90 wells, 79 categorized as nonexperimental and five wells licensed as experimental, but not yet drilled, a commission report said.

It said that after completing its 2008 drilling program, EnCana reported average per well production rates of 5 million cubic feet per day, while the first wells of 2009 have posted flow rates of 9.5 million to 11 million cubic feet per day after 15 days.

The lightly explored Beaver River area (incorporating the Liard basin and Fold Belt region) 100 miles northwest of Fort Nelson, has stirred interest among producers interested in evaluating and testing the potential of Mississippian-aged shales. The commission said some promising results have already emerged from tests. ●

OUR ARCTIC NEIGHBORS

Rosneft wants tax breaks for Arctic development

Russia needs to realistically assess the risks and costs of Arctic oil and gas development, Sergey Bogdanchikov, the president of state-owned oil company Rosneft, told the Murmansk International Economic Forum Oct. 15. Exploration drilling in the offshore Arctic can be done with far less certainty than drilling in traditional exploration areas in western Siberia, Bogdanchikov said. The cost of working in Arctic regions is also extremely high, he noted.

"Here we can already talk in quite concrete, specific terms, based on our development of the shelf off Sakhalin, and if you compare the figures from western Siberia, $30 to $50 to produce a ton of hydrocarbons, on the Far Eastern shelf we have about $300 and it will be at least $600 to $700 to produce a ton of hydrocarbons here on the Arctic shelf," Bogdanchikov said. "Companies have to be prepared for this and our government, of course, also has to be prepared for it. When it determines a tax policy for the offshore regions it can't be identical for the Caspian, the Sea of Azov, the Black Sea and the Arctic Shelf. We hope for mutual understanding with the government here.

"We have to be honest above all with ourselves going into such a complex task as developing the Arctic shelf," Bogdanchikov said. "We are technologically backward here in the Russian Federation in virtually all the technology that is necessary."

At this point in Bogdanchikov's speech Alexei Miller, the CEO of Gazprom, Russia's other state-owned energy giant, interrupted to indicate that he agreed with the sentiment.

"We have to synchronize the following processes, the process of licensing on the shelf, the process of conducting geological exploration work and the process of preparing Russian industry, companies that are on both the regional and the national scale, in order to support these projects and to achieve the required production on time," Bogdanchikov said.

"When we're talking about investment of $250 to $300 billion, the question is whether this investment will go into Russian companies located in Russia or

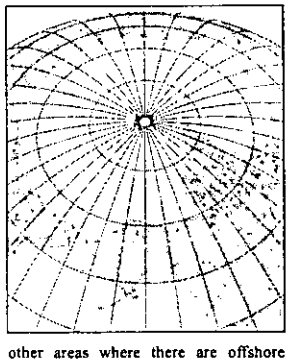
StatoilHydro ready for Shtokman collaboration

Norwegian company will use experience from Ormen Lange, Snohvit to develop subsea installations for Russian Barents Sea project

By SARAH HURST
For Petroleum News



Norway's StatoilHydro is gearing up for the "mother of all projects" — developing the Shtokman gas field in the Russian part of the Barents Sea — Bengt Lie Hansen, the company's president in Russia, said in a speech at the Murmansk International Economic Forum Oct. 15. StatoilHydro is a partner in phase one of Shtokman, with a 24 percent interest in the Shtokman Development company. Russia's Gazprom has a 51 percent interest and France's Total has the remaining 25 percent.

StatoilHydro was trying for 20 years to get involved in Shtokman before signing the phase-one agreement in February 2008, Hansen said.

"(Shtokman) I think will be the locomotive for developments in the Arctic," he said. "And I think that will not only have implications for the investing companies, it will have lots of implications for the Murmansk region, as we have seen in other areas where there are offshore developments, you see a lot of spinoff effects that you hardly are able to assess before you start out."

Shtokman will provide gas to Europe via the planned Nord Stream pipeline under the Baltic Sea, and to Atlantic mar-

No quick carbon fixes

Oil sands leader argues 'absolute' limits on oil sands' GHG would burden sector; Imperial boss says answers could take 100 years

By GARY PARK
For Petroleum News

Two leading players in the Alberta oil sands — the flashpoint of Canada's climate-change wrangling — have answered criticism that the sector is not doing enough to explain itself.

In the process, they got to grips with the range of challenges facing those seeking answers to greenhouse gas emissions.

Marcel Coutu, chief executive officer of Canadian Oil Sands Trust, which owns 36.7 percent of the giant Syncrude Canada operation, said oil sands producers should be allowed to raise GHGs, even if that means forcing other industrial sectors to shoulder a heavier share of meeting national climate change goals. Bruce March, chief executive officer of Imperial Oil, said it has taken 100 years to create the GHG problem and it will probably take another 100 years to meet growing global energy demand while dealing with climate change concerns.

Their comments came a month after Peter Voser, the new chief executive officer of Royal Dutch Shell, told a Calgary business summit that industry and governments have failed to promote the oil sands as a key answer to the energy needs of Asia and the wider world.

Arguing that oil sands opponents have done an effective job of trashing the resource, he called on industry and governments to play a more active role in promoting the oil sands and making a case for the future importance of unconventional oil.

New Alberta publicity campaign

The Alberta government has recently launched a three-year, C$25 million publicity campaign to counter some of the negative publicity from environmental groups who have labeled the oil sands as "dirty oil."

The Canadian Association of Petroleum Producers, whose member companies account for more than 90 percent of Canada's oil and natural gas production, has also admitted it is lagging in the battle for hearts and minds and has pledged to answer public concerns about the industry's environmental impact.

But Voser insists the oil sands could be taking a larger international role in energy markets by building pipelines to the British Columbia coast, opening up tanker routes to Asia-Pacific markets.

Speaking at the same Calgary conference, federal Environment Minister Jim Prentice agreed Canada needs to be more active in promoting its technological gains in energy production.

"Canada's role must be perceived as the most environmentally cautious producer of energy of all kinds, from green energy to hydrocarbons, in the world," he said.

Intensity-based limits proposed

But Coutu warned that if the oil sands face an absolute limit on their GHGs, regardless of increasing output, that would "put a very, very heavy burden on a business that is in a growth mode" and a key driver of the Canadian economy.

Rather that stifle oil sands output, the Canadian government should impose intensity-based limits, reducing per-barrel GHGs, leaving other industries to pick up the slack, he said.

Marcel Coutu, chief executive officer of Canadian Oil Sands Trust, which owns 36.7 percent of the giant Syncrude Canada operation, said oil sands producers should be allowed to raise GHGs, even if that means forcing other industrial sectors to shoulder a heavier share of meeting national climate change goals.

"What we have to do is prioritize what is most important to the economy and our quality of life," Coutu said. "At the end of the day I don't think there is a single element of our economy that is more important than energy."

He told the editorial board of The Globe and Mail that the vast majority of GHGs result from the consumption of energy by motor vehicles, airplanes and heating homes and commercial buildings — rather than the production phase.

He said the oil sands account for only 5 percent of Canada's total emissions, suggesting that figure should be measured from a global perspective.

Coutu said Canada's net export energy role should also be taken into account, because Canada could end up being saddled with the environmental costs of products that are used in other countries.

March, speaking to the Calgary Chamber of Commerce on Oct. 15, said the industry and governments must work on policies that allow energy to be developed from all available sources — such as wind, solar, nuclear, hydroelectric and geothermal power — not just oil and gas.

"We also require new transformative technologies such as second generation biofuels, which require long-term research investments, but will have the potential to effect change on a global scale," he said.

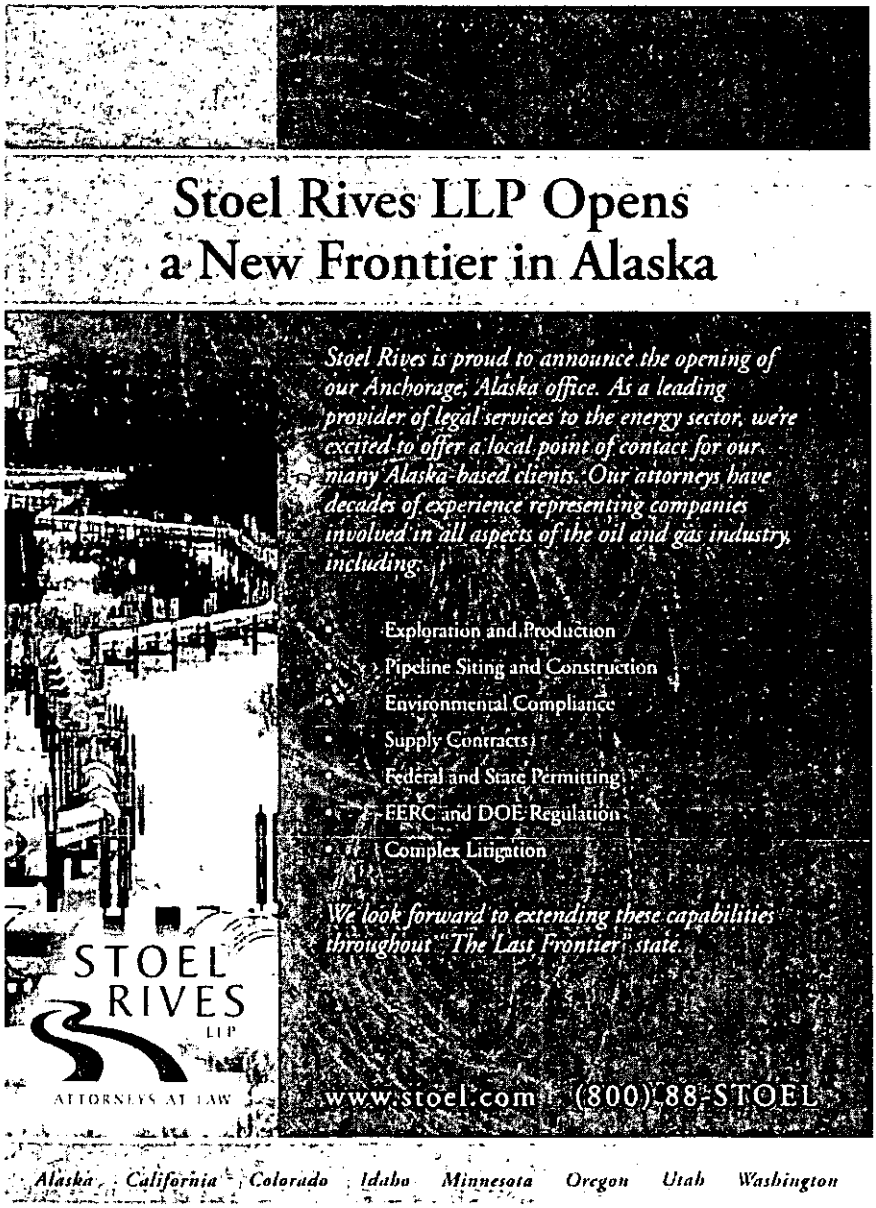
Exxon investing in algae

ExxonMobil, which owns 69.6 percent of Imperial, is planning to invest more than C$600 million in a venture to develop biofuels from algae in a research and development venture with Synthetic Genomics, a privately held company that is concentrating on gene-based research.

March said this effort, which could bolster the world's transportation fuel supply and eventually reduce GHGs, needs long-term planning horizons to deal with climate change.

GHGs have been "created for 100 years and I believe it will take at least

see CARBON FIXES page 16



kets in the form of LNG, according to Hansen. StatoilHydro's experience developing the Ormen Lange gas field in the Norwegian Sea just south of the Arctic Circle and the Snohvit gas field in the Barents Sea will enable it to develop the subsea installations for Shtokman, he said.

"Tie these installations after they've been pre-drilled by floating units to the large floating unit, which will be the floating production ship, which will be disconnectable due to the harsh environment and the ice," Hansen said. "Bring the gas and the condensate onshore to Teriberka, a journey of about 600 kilometers (373 miles), for processing and ready for transportation as pipeline gas as well as LNG.

"StatoilHydro feels prepared for venturing north together and we think that we can bring three main elements to that table, called TPC," Hansen said. TPC stands for "technology enabler," "performing challenging development tasks" and "cooperation across borders." The company has been an architect in developing technology on the Norwegian continental shelf and its skills in that regard are highly relevant in Russia, Hansen explained.

"We have been able to carry out megaprojects within cost and schedule — complex projects," Hansen said. "We know that these ... have a tendency to experience cost overruns and schedule slippages, which of course has a detrimental effect on the viability of the project. So no one can guarantee, but I think we have to use the best experience and the best expertise we can get hold of.

"And my last comment is cooperation," Hansen said. "I think that is very important: We have been able to drive the cooperation between the authorities, the suppliers, the research facilities and the oil companies to obtain maximum value for everyone involved, and I think that is also some luggage that we would like to bring to Russia, which I think can create even better results in the future. So we are looking forward to be one of the partners in developing these fantastic possibilities that we can see in the Arctic." ●

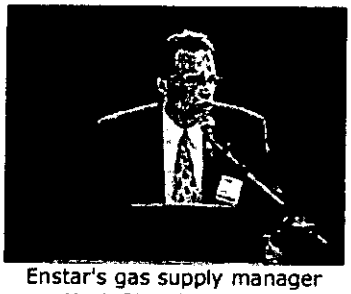
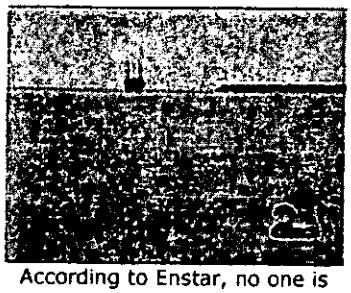
Enstar: Cook Inlet natural gas is rapidly diminishing



Enstar's gas supply manager Mark Slaughter (Mike Nederbrock/KTUU-DT)



According to Enstar, no one is sure exactly what is causing the depletion of reserves. (Mike Nederbrock/KTUU-DT)

by Lori Tipton
Wednesday, September 16, 2009

ANCHORAGE, Alaska -- The utility that uses Cook Inlet gas to help heat Southcentral Alaska says there is a steady depletion of gas reserves.

That was the topic of discussion Wednesday at the fifth annual Oil and Gas Congress meeting in Anchorage.

Enstar's gas supply manager, Mark Slaughter, says despite five new wells being drilled in the last year, research shows a considerable drop in the amount of gas in Cook Inlet.

In 2006, producers reported a rate of close to 150 million barrels per day, but as of last year they only reported about 50 million barrels per day.

According to Enstar, no one is sure exactly what is causing the depletion of reserves.

"There's a potential problem that's coming and we need to prepare for it, there's investments that need to be made, decisions that need to be made, and that date is coming," Slaughter said.

The U.S. Department of Energy has predicted local demand will outpace supply as early as 2014 -- producers are predicting it could happen by 2013.

SAIC has made no independent investigations concerning the accuracy or completeness of the information relied upon.

3356

Executive Summary

The seasonal variation in South-central Alaska natural gas demand is large, about 1.75 times the yearly average demand on the peak demand day in the winter for total gas demand (utility natural gas for residential and commercial heating and electric utility use for power generation) and about 2.5 for utility gas only. Historically the swing in gas demand has been met by spare production capacity from the Cook Inlet gas fields. As Cook Inlet production capacity has declined, the capability of the existing gas fields has decreased to the point that gas storage has been developed by the operators to provide contracted quantities and to provide the peak capacity needed on the coldest days. On January 9, 2007 a record was set by ENSTAR that required that natural gas be diverted from the liquefied natural gas (LNG) plant to meet the peak requirement (ENSTAR 2007). In the future, unless additional natural gas resources are developed in the Cook Inlet basin, natural gas from other sources will have to be developed to meet the demand for natural gas. Options include a spur pipeline to bring North Slope natural gas to South-central Alaska or gas from interior basins (e.g., the Nenana Basin) or imported LNG. Other options to reduce the demand such as coal plants, wind farms, hydropower, geothermal, and tidal power opportunities in the Railbelt region may reduce the demand for natural gas for power generation but will not offset the need for natural gas for home and business heating unless customers convert home heating to electric heating.

The objective of this study is to identify potential locations for underground natural gas storage in the Cook Inlet region. Storage is anticipated to be essential to achieve the capacity and deliverability required to meet the regional need for load balancing, operational balancing, and efficient management of the spur line system supply.

The reservoir characteristics and the production infrastructure for the existing and potential gas storage reservoirs in the Cook Inlet provide the basis for the evaluation and determination of the most likely candidates for possible future underground storage. It is assumed that a spur pipeline connecting an Alaska Gas Pipeline transporting North Slope natural gas to markets outside Alaska with offtake points in Alaska will be operational in 2020. The storage volume and deliverability rate required to meet the anticipated natural gas demand for utility gas and electric power generation are estimated from historical production and demand data. The characteristics of an ideal underground natural gas storage facility (base-load and peaking-load gas storage facilities) are described as are the three existing underground Cook Inlet storage facilities and the characteristics of potential underground storage facilities in the Cook Inlet. Finally, the potential Cook Inlet storage fields and pools are compared to the ideal storage characteristics to arrive at a ranking of the potential gas storage reservoirs. A general description and estimate of the costs related to conversion of a gas production reservoir to a gas storage facility are presented.

Overview of Cook Inlet Reservoirs

The Cook Inlet area has been the subject of oil and gas exploration since the early 20th Century, and the initial commercial discovery was made in 1957 at the Swanson River oil field on the Kenai Peninsula. Over the next decade additional oil accumulations were discovered and developed. During the oil exploration and subsequently, 30 gas fields were discovered ranging in size from less than 1.0 billion cubic feet (Bcf) of gas to more than 2.3 trillion cubic feet (Tcf) of gas. There are currently 30 gas fields and 57 individual pools recognized by the Alaska Oil and Gas Conservation Commission.

3357

Storage Volume, Rate of Delivery Requirements and Estimates

A Railbelt natural gas demand forecast developed by ANGDA based on historical and projected demands for the use sectors is used for this assessment (ANGDA 2006). This demand forecast is for the entire Railbelt and includes regions of the state that will be served by an Alaska Natural Gas Pipeline from the North Slope and a spur pipeline to South-central Alaska. However, some of these regions will not be directly served by the spur pipeline; i.e., Fairbanks, North Pole, Delta Junction, Healy, Tok, Valdez).

The future of industrial use of natural gas in the Cook Inlet area will be determined by availability and price of natural gas for industrial purposes in the South-central Alaska. Agrium closed its nitrogen fertilizer operations due to a shortage of natural gas supply in Alaska's Cook Inlet basin. The balance of the historical industrial natural gas usage is for the ConocoPhillips/ Marathon LNG plant at Nikiski. The export license expires March 31, 2009. The plant owners have applied to the U.S. Department of Energy for a 2-year extension of this export license but the outcome of that assessment is not known at this time.

Continued industrial use of natural gas to provide an industrial base in South-central Alaska such as continued LNG operations and petrochemical industry will be determined by the availability and price of gas in the Cook Inlet from gas produced in the Cook Inlet or delivered through a spur pipeline from the North Slope (Thomas et al. 2004, Thomas et al. 2006, ANGDA 2006).

The minimum gas storage based on future estimated demand ranges from 11.1 Bcf in 2020 to 15.7 Bcf in 2040. Depending on the minimum gas storage required to meet demand in South-central Alaska is considered **too risky** because of the serious consequences of any shortfall that would cause a disruption in service in winter. There are currently **no alternative sources** of natural gas for heating and other essential services so a shortage causing a disruption of service to large portions of service area would be very costly and highly disruptive. Therefore, a safety factor of 1.5 was applied to arrive at the amount of gas storage required to meet seasonal swings in demand and possible longer-term disruptions that could result from equipment failures or pipeline breaks requiring several days to weeks to repair. Use of the 1.5 safety factor results in estimated gas storage capacity requirements of 16.7 Bcf in 2020 increasing to 23.5 Bcf in 2040. The selected gas storage reservoirs must be capable of providing the daily delivery rates during peak-demand season or multiple gas storage reservoirs or peaking reservoirs must be developed. Gas storage must also be able to deliver the incremental rates needed on the coldest highest demand days.

Although it is not possible to accurately predict the supply and demand situation that will exist in 2020, the estimated demand implies that a 300 MMcf/d spur pipeline will be needed in 2020. This assumes no new additional sources of gas from the Cook Inlet and no offsetting reduction in demand that could result from power generation from sources other than natural gas. This spur pipeline capacity will need to be expanded to 350 MMcf/d in 2030, 400 MMcf/d in 2035 and 450 MMcf/d in 2040 to meet the anticipated demand growth. Future industrial demand is not included in these capacity volumes.

The design withdrawal rates for base storage requirements range from 120 MMcf/d in 2020 to 169 MMcf/d in 2040. Unless the base storage reservoirs are capable of providing adequate deliverability through additional wells to meet the anticipated peak-day demands, peaking storage facilities may need to come on line between 2020 and 2025 and increase to a minimum deliverability rate of about 80 MMcf/d.

3358

Ranked Candidates for Base Load Storage

The ranking of potential future base load storage sites will be determined by the following considerations.

- Reservoir size near the ideal volume–excessive capacity may require large volumes of cushion gas in order to achieve optimum operating rates. Capacity significantly below the ideal would require high existing reservoir pressures to minimize cushion gas and maximize working gas. Excessive storage concerns may be offset by using a greater number of wells to keep withdrawal rates at required levels. Reservoir size less than the ideal volume will require multiple facilities, which may be an advantage, when taking disruptions into consideration.
- Deliverability of a reservoir is a function of the number of wells, reservoir pressure, and communication. In the scenario analyzed, the number of wells in each potential storage site is taken to be two times the number of wells utilized during that pools historically high production stage (Appendix A, Table A.2). It may be possible to achieve greater deliverability by drilling more infill wells and adding compression.
- Gas volume can be a very costly component of the storage economics. The amount of working gas is taken as a constant (20 Bcf) and the variable is the volume of cushion gas required, which is based largely on the reservoir pressure. Large low pressure reservoirs may require several 100 Bcf of gas to achieve the necessary pressure.
- Depletion prior to 2015 is preferred and prior to 2020 is a virtual necessity. This provides adequate time to plan and prepare the site for gas storage. Those that are depleted after 2020 would need to be deferred or some agreement with the lease holders/operators would need to be negotiated to use part or all the field/pool for storage.

The large Kenai Field pools and the Beluga River Undefined pool were excluded from the final list because they have very large reservoir size (capacity) and require excessive volumes of cushion gas, 146 to 179 Bcf (Appendix A, Table A.1) to achieve pressures equivalent to the ambient pipeline pressure.

The Beluga River Undefined pool is somewhat unique. It includes numerous pay sandstones (more than 40) in the Sterling and Beluga formations. These pays are cut by an unknown number of the wells, probably ranging from 2 or 3 per pay to perhaps as many as 10 per pay interval. Individual wells may penetrate and produce from as many as 50 pays. The volume of cushion gas required is nearly 650 Bcf (Appendix A, Table A.2). The issues regarding well integrity, communication between pay zones, and depletion status of individual sandstones indicate that using any of these horizons for storage is not feasible based on current knowledge. The operators continue to delineate and refine their understanding of the interrelations among pays, wells, and production. Hence, there may come a time when specific, depleted horizons are viable candidates for storage.

The rankings for the potential base load storage site candidates are shown in Table 1 and the locations are shown on Figure1. They are compared to the "Ideal Storage Pool" criteria.

The Swanson River Sterling pool is ranked as number one primarily because it has good-to-high deliverability, is expected to be depleted by 2020, and requires moderate amounts of cushion gas. The reservoir size is adequate but falls in the mid-range of the preferred size class, and expansion of storage capacity is limited to about 10 Bcf over the estimated requirement.

3359

Table 1. Ranked Candidates for Cook Inlet Base Load Storage

Rank	Pool	Reservoir Size (Bcf)	Deliverability[1] (MMcf/d)	Cushion Gas Required (Bcf)	Depletion Date (Year)
	IDEAL POOL	**25-50**	**120-169**	**0.0**	**2010-2015**
1	Swanson River/Sterling	39	60 (160)	9.0	2019
2	Beaver Creek/Beluga	92	61 (106)	16.0	2028
3	Ivan River	97	34 (65)	8.0	2019
4	Kenai/Sterling # 5.2	66	30 (36)	0.0	1981
5	Swanson River/Tyonek	28	29 (89)	6.0	2006
6	Beaver Creek/Sterling	140	33 (51)	24.0	1994

1. The number in the column is the 'adjusted" low deliverability, which is the value used to rank the candidate sites; the number in parenthesis is the "adjusted" high deliverability and can be achieved but is not sustainable for the entire demand season (Appendix A, Table A.2).

The Beaver Creek Beluga site has excellent reservoir size, the highest deliverability, but requires more cushion gas and is not expected to be depleted until 2028. These latter two factors prevent it from being ranked No. 1 and could drop it below the Ivan River pool.

The Ivan River pool is rated as the third choice due to the capacity and moderate volume of cushion gas required. The expected depletion date of 2019 is an additional plus. The primary negative factor is the relatively low deliverability of only 34 MMcf/d under the assumed development scenario.

The Kenai Sterling # 5.2 has been depleted since 1981 and has good-to-excellent reservoir size. The capacity is in excess of the requirements and no cushion gas is required to achieve ambient pipeline pressures. The chief problem is deliverability of only 30 MMcf/d using the one-to-one producing well scenario. There are suggestions that water encroachment has been detected, which may have the potential to reduce deliverability.

The Swanson River Tyonek pool is the smallest of the top six candidates at 28 Bcf, which is at the low end of the preferred size range. It requires a moderate amount of cushion gas, but has a projected deliverability in the one-to-one infill well case of only 29 MMcf/d.

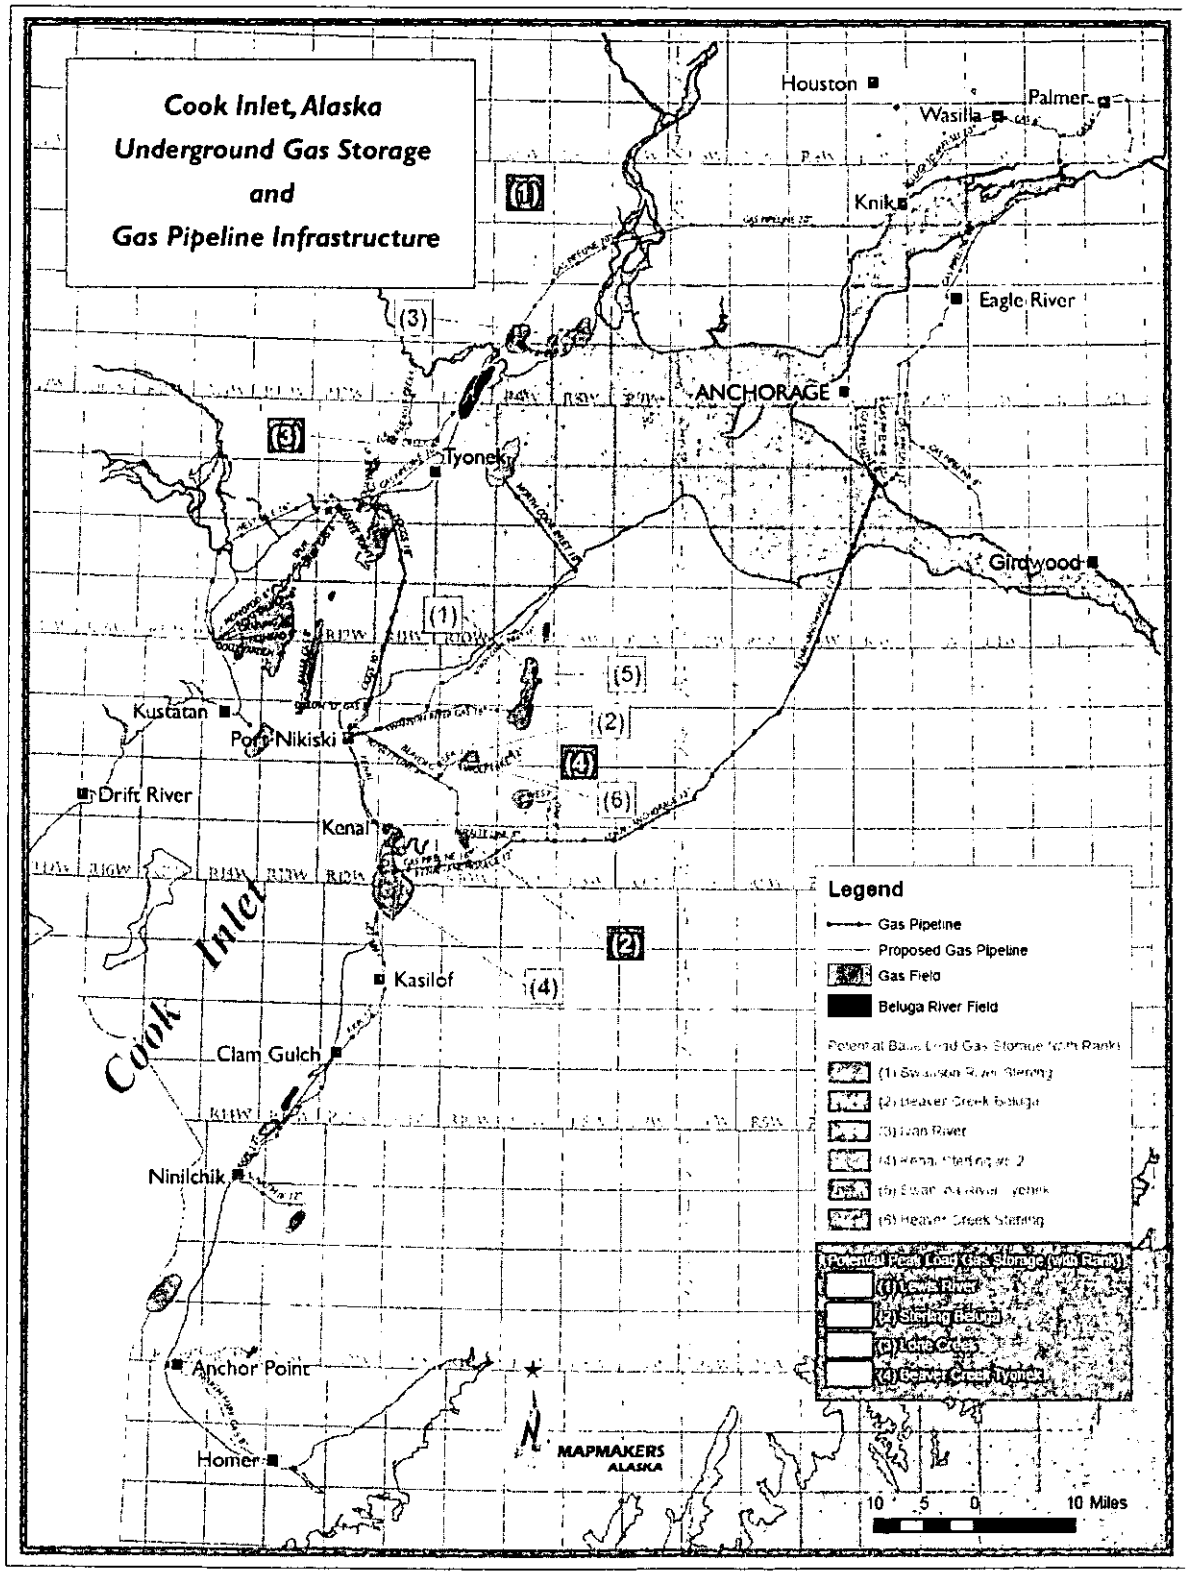
The Beaver Creek Sterling pool is ranked No. 6 because of the problems with water encroachment, which requires a large volume of cushion gas and also reduces the deliverability. There is a large capacity for gas storage, and an early depletion date, but unfortunately that is due largely to the fact the pool watered out. The anticipated deliverability is about 33 MMcf/d.

The results of these evaluations indicate that there are viable potential future underground natural gas storage sites in the Cook Inlet gas fields that will meet the anticipated need for base load gas storage. However, among the leading candidates there are no true stand-alone reservoirs with regard to sustainable deliverability. Each of the candidate pools meets the capacity needs but under the proposed development none of them are capable of achieving the 120 to 169 MMcf/d design withdrawal rates (see Table 2.6 and Section 3.1).

Unless future detailed studies indicate otherwise, these pools in some combination should provide adequate storage for any reasonably forecast seasonal storage needs and achieve the deliverability needs for peak season demand. Under certain conditions, multiple base load storage facilities may negate the need for separate peak load storage, at least for the initial years of the pipelines existence.

3360

Figure 1. Cook Inlet Potential Underground Gas Storage Locations and Gas Pipeline Infrastructure



3361

Ranked Candidates for Potential Peak Load Storage Sites

The need for a separate peak load facility or facilities depends on the ultimate nature of the base load storage facilities. At this time the working scenario requires peak load storage for the short, very high demand periods resulting from conditions of extreme cold weather. Five pools were identified that would be candidates for potential peak load storage as shown in Table 2. The total storage capacity of these pools ranges from 6.2 Bcf to 15.1 Bcf (Appendix A, Table A.3). These pools are all on the pipeline system and are within 50 to 100 miles of the major consumers. Three key factors were utilized to rank or eliminate the pools: reservoir size, deliverability, and cushion gas requirements.

Table 2. Cook Inlet Ranked Peaking Load Storage Candidates

Rank	Pool	Reservoir Size (Bcf)	Cushion Gas Required (Bcf)	Deliverability[1] (MMcf/d)
1	Lewis River Undefined	14.3	1.6	130
2	Sterling Beluga Undefined	15.1	2.0	125+
3	Lone Creek Undefined	6.2	0	62
4	Beaver Creek Tyonek Undefined	6.3	0.5	58

1. 1% of the working gas volume (reservoir size minus cushion gas).

The existing Cook Inlet gas storage facilities have gas volumes of this size or smaller and average deliverability rates are about one percent of the total working gas. Based on these averages, maximum deliverability rates may range from a low of 58 MMcf/d for the Beaver Creek Tyonek undefined pool to a high of 131 MMcf/d for the Sterling Beluga Undefined pool. This assumes the reservoirs are filled to capacity and the cushion gas has been discounted.

Using the one percent of working gas volume (reservoir size minus cushion gas) as average daily deliverability, only two of the remaining pools are capable of achieving the 80 MMcf/d maximum anticipated peak gas requirements in 2040. The Lone Creek Undefined and the Beaver Creek Undefined pools are fall below the margin of 70 MMcf/d in 2025 for the assumed spur pipeline rates. Both the Lewis River and Sterling Beluga undefined pools have capability to achieve the desired deliverability in 2040 with potentials of approximately 125 to 130 MMcf/d each.

The Lone Creek and Lewis River sites are located on the west side of the Cook Inlet and could easily supply the electrical generation plant, while the Beaver Creek and Sterling Beluga sites are located on the east side and could be dedicated to the gas utilities.

The location and ranking of the potential peak load gas storage reservoirs/pools are shown in Figure 1.

Summary of Potential Cook Inlet Storage Sites

Six potential base load storage and four peak load storage sites are identified in the study. All the base load storage candidates are of sufficient size that, even with the anticipated cushion gas requirements of the various pools, they retain the capacity for the requisite volume of about 20 Bcf of working gas. At the calculated low sustainable deliverability rates none of them are gauged to have rates that are sufficient to serve as the sole storage facility and multiple storage pools are required. At the calculated high deliverability rates the Beaver Creek Beluga (120 MMcf/d) and the Swanson River Sterling (160 MMcf/d) can meet the demand, but not for sustained periods or for the duration of the high demand winter season.

3362

The four potential peak storage sites are equally distributed between the west and east sides of Cook Inlet and the Lewis River and Sterling Beluga undefined pools have the potential to meet any anticipated peak demand needs. The Lone Creek and Beaver Creek Tyonek, as a pair could also meet that demand.

Cost of Potential Storage Facilities

The total capital costs for a 20 Bcf working gas storage facility, requiring the purchase of 20 Bcf of cushion gas, drilling of four new wells at $7 million each, and capable of delivering a maximum rate of 100 MMcf/d are estimated to be $8.1 million/Bcf. This compares to values given in a study by the Federal Energy Regulatory Commission (FERC 2004) of $5 to $6 million/Bcf for a typical depleted natural gas reservoir storage field in the Lower 48. The costs will vary depending on the specific sites chosen. The average cost-of-service for 20 storage operator tariffs collected by FERC (2004) indicated a median cost-of-service of $0.64/Mcf. A determination of the regulatory framework that the spur pipeline and gas storage facilities in the Cook Inlet will need to be determined as well as site-specific requirements to provide an accurate estimate of the tariff. A cost-of service estimate is not included in this study.

Storage Measures

Total capacity is the maximum volume of gas that can be stored in an underground storage facility and is determined by the physical characteristics of the reservoir.

Base gas (or cushion gas) is the volume of gas intended as permanent inventory in a storage reservoir to maintain adequate pressure and deliverability rates throughout the withdrawal season.

Working gas capacity is, by definition, total capacity minus base gas.

Working gas is the volume of gas in the reservoir above the designed level of the base gas. Working gas is that which is available to the marketplace.

Deliverability is a measure of the amount of gas that can be delivered (withdrawn) from a storage facility on a daily basis. Also referred to as the deliverability rate, withdrawal rate, or withdrawal capacity, deliverability is most often measured in terms of million cubic feet or dekatherms per day. The deliverability of a given storage facility is variable, and depends on factors such as the amount of gas in the reservoir at any particular time, the pressure within the reservoir, compression capability available to the reservoir, the configuration and capabilities of surface facilities associated with the reservoir, and other factors. In general, a facility's deliverability rate varies directly with the amount of base and working gas in the reservoir; it is at its highest when the reservoir is most full and declines as working gas is withdrawn.

3366

1 Introduction

The seasonal variation in South-central Alaska natural gas demand is large, about 1.75 times the yearly average demand on the peak demand day in the winter for total gas demand (utility natural gas for residential and commercial heating and electric utility use for power generation) and about 2.5 for utility gas only. Historically the swing in gas demand has been met by spare production capacity from the Cook Inlet gas fields. As Cook Inlet production capacity has declined, the capability of the existing gas fields and pools has decreased to the point that gas storage has been developed by the operators to provide contracted quantities and to provide the peak capacity needed on the coldest days. On January 9, 2007 a record was set by ENSTAR that required that natural gas be diverted from the liquefied natural gas (LNG) plant to meet the peak requirement (ENSTAR 2007). In the future, unless additional natural gas resources are developed in the Cook Inlet basin natural gas from other sources will have to be developed to meet the demand. Options include a spur pipeline to bring North Slope natural gas to South-central Alaska or gas from interior basins (e.g., the Nenana Basin) or imported LNG.

ANGDA is a major driving force to construct a pipeline to deliver North Slope gas into the Cook Inlet area to meet the energy needs of South-central Alaska. The need for a pipeline to bring natural gas to South-central Alaska is based on the declining natural gas reserves in the Cook Inlet from the currently developed fields. The critical nature of this need has been described in several recent reports and studies (Thomas et al. 2004, Thomas, et al. 2006, ANGDA 2006). The issues facing South-central Alaska future natural gas needs and sources were discussed in great detail by numerous presenters at the Alaska Oil and Gas Conservation Commission's (AOGCC) South Central Alaska Energy Forum held in Anchorage, Alaska, September 20-21, 2006.[1]

When a spur pipeline is used to deliver natural gas to South-central Alaska, it will be essential that the pipeline operate at a constant rate matching the nominated and contracted rate. This can be achieved by developing one or more of the depleted or nearly-depleted Cook Inlet gas reservoirs as gas storage facilities.

1.1 Objective

The objective of the project is to identify potential locations for underground natural gas storage in the Cook Inlet region. Storage is anticipated to be essential to meet storage capacity and deliverability required to meet the regional need for load balancing, operational balancing, and efficient management of the spur line system supply. The reservoir characteristics and the production infrastructure for the existing and potential gas storage reservoirs in the Cook Inlet provide the basis for the evaluation and determination of the most likely candidates for possible future underground storage.

1.2 Scope and approach

Section 2 of the report contains an analysis of the storage volume and deliverability rate required to meet the anticipated natural gas demand for utility gas for residential/commercial heating, and electric power generation. Section 3 contains a description of the characteristics of an ideal underground natural gas storage facility including base-load and peaking-load gas

[1] http://www.aogcc.alaska.gov/homeogc.shtml

3367

storage facilities. Section 4 contains a description of the three existing underground Cook Inlet storage facilities. Section 5 describes the characteristics of potential underground storage facilities in the Cook Inlet. In Section 6 the potential storage facilities are compared to the ideal storage characteristics to arrive at a ranking of the potential gas storage reservoirs. Section 7 includes a general description and estimate of the costs related to conversion of a gas production reservoir to a gas storage facility to provide a general guideline for the costs on a unit volume basis.

The data used to analyze Cook Inlet oil and gas reservoirs were obtained from the publicly available sources including the AOGCC, Alaska Department of Natural Resources (ADNR), and the Regulatory Commission of Alaska (RCA). Chevron and Marathon currently operate gas storage facilities in the Cook Inlet at Swanson River, Pretty Creek and Kenai River Sterling Pool #6. These operators were contacted and they all provided general overviews of their operations and experiences in operating gas storage reservoirs in the Cook Inlet.

1.3 Overview of Cook Inlet Petroleum Geology and Reservoirs

The effort to identify and evaluate potential Cook Inlet natural gas storage facilities is focused on the nearly depleted or depleted oil and gas reservoirs of the Cook Inlet Tertiary Basin. Prior to the discussion of the character and criteria required for Cook Inlet natural gas storage, it is informative to provide a very rudimentary over-view of the geological setting and petroleum geology of the Cook Inlet basin.

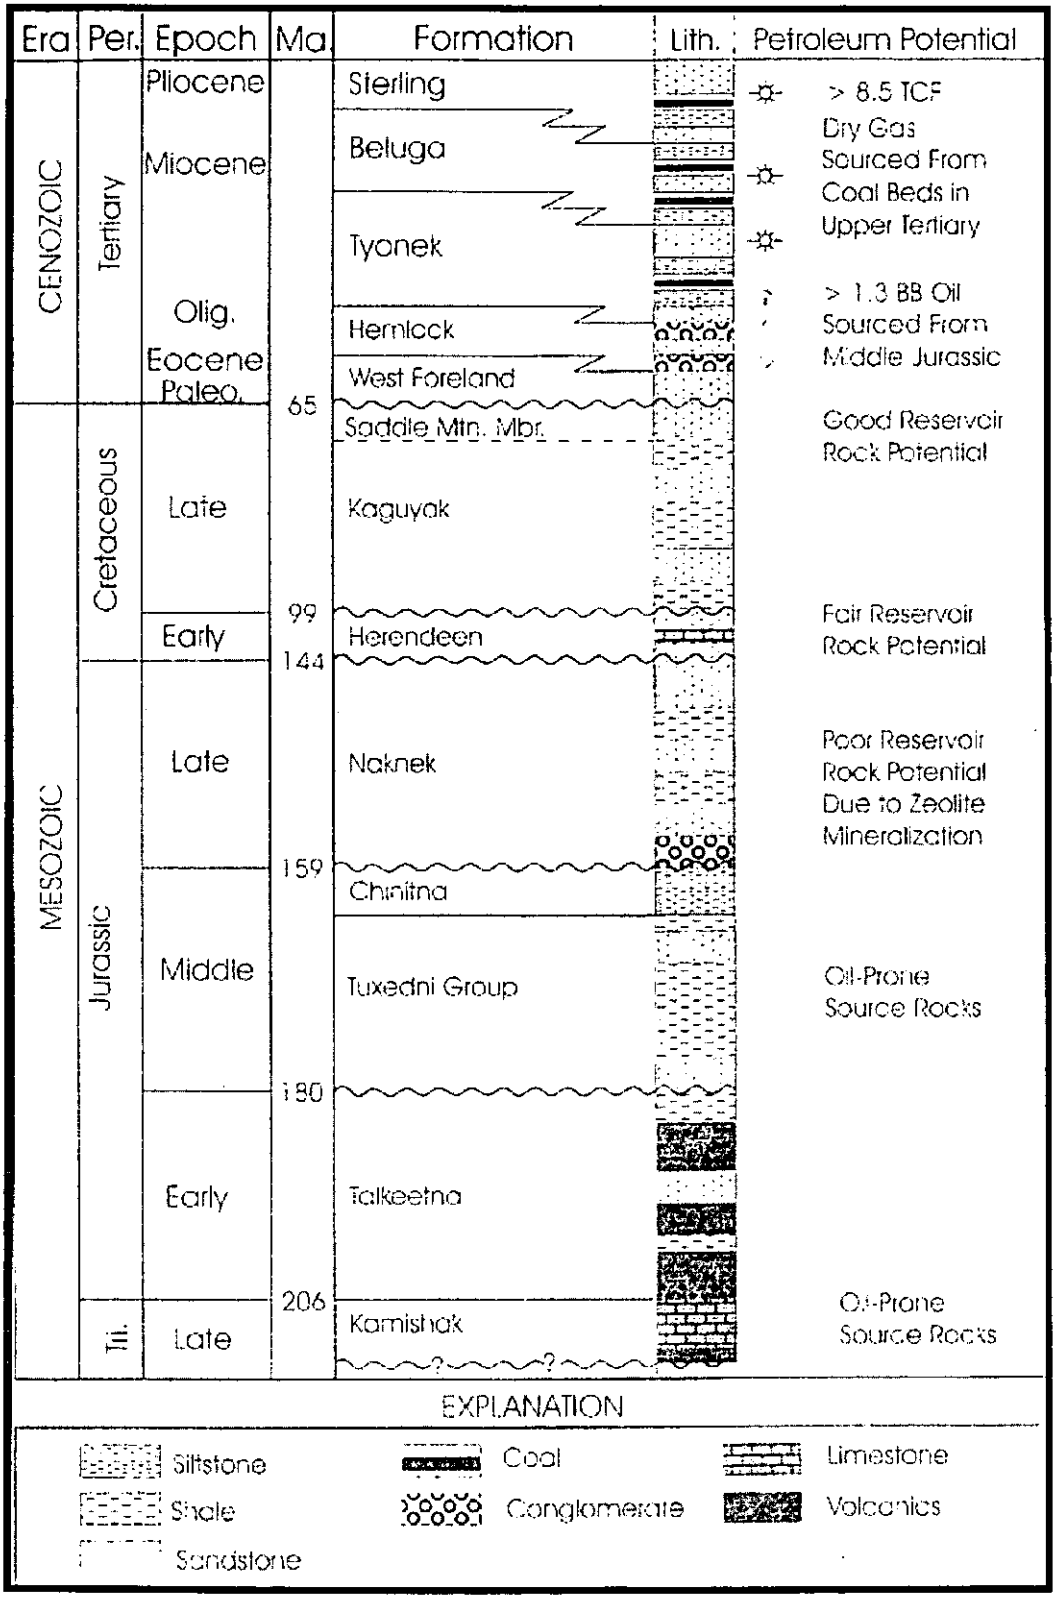
The Cook Inlet area has been the subject of oil and gas exploration since the early 20th Century, and the initial commercial discovery was made in 1957 at the Swanson River oil field on the Kenai Peninsula. Over the next decade additional oil accumulations were discovered and developed. During the oil exploration and subsequently, 30 gas fields were discovered ranging in size from less than 1.0 billion cubic feet (Bcf) of gas to more than 2.3 trillion cubic feet (Tcf) of gas (Thomas, et al. 2004, Table 2.5). The basin geological framework, character of the petroleum systems, the age, depositional framework, and distribution of hydrocarbons are discussed in considerable detail in Thomas, et al. (2004) and only a brief overview is provided here.

The entire Cook Inlet Tertiary section was deposited under non-marine conditions. The sub-aerial fans and a variety of fluvial channel systems constitute the reservoirs for the known, commercial oil and gas accumulations of the basin. The alluvial fan complexes provide thick, relatively continuous reservoirs and are best developed along the margins of the basin. The fluvial reservoirs have varying geometries and degrees of heterogeneity, depending upon the type of steam (braided, meandering, etc.) responsible for their formation. Consequently, these reservoirs have varying degrees of potential to serve as storage reservoirs depending on the nature of fluvial system and the degree to which they inter-finger with and migrate across the various overbank and flood plain facies (coals, mudstones, etc).

The Cook Inlet stratigraphic section (Figure 1.1) depicts both the Mesozoic and Cenozoic rocks of the Cook Inlet Basin and indicates the source intervals for oil and gas. The bulk of the gas is non-associated gas and is in no way related to the rocks or processes that generated the oil and associated gas. As can be seen from Figure 1.1 the oil is sourced thermogenically, from older Mesozoic rocks, and has accumulated in the lower portion of the Tertiary interval–in the West Foreland, Hemlock and lower Tyonek formations. Many of these oil-bearing reservoirs of the lower portion of the Tertiary section are of fan origin and hence thick and widespread in nature. This is especially true of the most important oil-bearing unit, the Hemlock Conglomerate.

3368

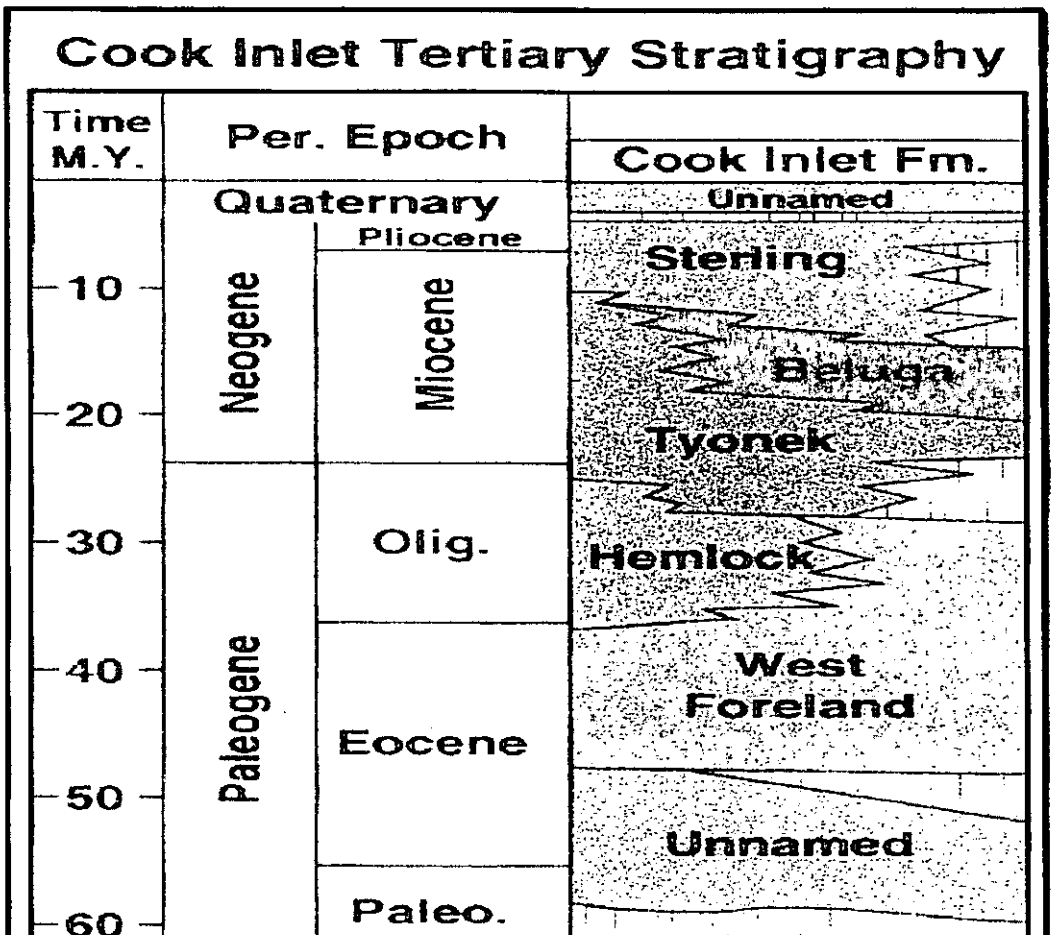
Figure 1.1. Cook Inlet Basin Alaska–Stratigraphic Column & Oil and Gas Reservoirs



3369

The non-associated gas was sourced biogenically, from the coals and coaly mudstones of the upper Tyonek, Beluga, and Sterling Formations. This gas has accumulated in reservoirs of the same age and system. These reservoirs are predominantly of fluvial origin, are more limited in distribution, and possess greater lateral heterogeneity. Figure 1.2 shows the stratigraphic and temporal relationships of the various formations of the Kenai Group (Swenson, R. F., 1997).

Figure 1.2 Cook Inlet Tertiary Section



There are currently 30 gas fields and 57 individual pools recognized by the Alaska Oil and Gas Conservation Commission (AOGCC 2006a). These Cook Inlet gas fields and pools, the cumulative production through 8/31/2007, and the remaining reserves estimates using a 10 MMcf/mon production cutoff for each pool are shown in Table 1.1. The reserves estimates were made using standard reservoir engineering material balance methodology (Slider 1983). The material balance data and the production rate versus pressure data for the field/pool are also used to estimate to estimate the amount of cushion gas required to return the pools to a pressure condition required to provide the required production rates. These estimated reserves total 1,102.4 Bcf in this analysis and do not include Probable/Under-development reserves. The ADNR Division of Oil and Gas (ADOG) 2007 Annual Report Table III.2 (ADNR 2007) lists gas reserves as 1,269.0 Bcf, without Probable/Under-development reserves, and 1,684.6 Bcf with

3370

Probable/Under-development reserves. These reserves and production forecasts are close enough to the same that the ADOG production forecast (Table III.9. ADNR 2007) is used as a basis for estimating the gas storage capacity and deliverability rate required for gas storage in the Cook Inlet and the individual pool assessments performed in this study were used for individual pool estimates for the year when production is expected to stop and to determine the volumes of cushion gas required and associated pressures and deliverability rates.

The bulk of the Cook Inlet pools are in sandstone deposited by the fluvial channel systems of the upper Tyonek, Beluga, and Sterling formations. The sandstones of the lower part of the Sterling Formation constitute the best gas reservoirs in the basin and reflect the development of a thick succession of superposed fluvial channel systems. Consequently, it can be predicted, that all other factors being equal, the Sterling fields and pools should rank high in the ultimate listing of potential natural gas storage facilities.

The gas pools of the area are typically defined in one of two ways; 1) named after a specific sandstone within a formation as the Kenai #5.1 or #6 pools in the Kenai gas field, or 2) termed undefined, meaning there are multiple productive zones through the section and are named after the field or formation in which they occur, as Beluga River Undefined (produces from interval throughout the Beluga and Sterling formations) and Beaver Creek Tyonek Undefined (produces from intervals throughout the Tyonek).

Thomas et al. (2004) present a table derived from AOGCC data (2003) that provides porosity and permeability data for the three primary gas-bearing formations. While the number of samples is small, these data indicate the relative quality of the units as storage targets. In the most attractive unit, Sterling Formation, this sampling yields a porosity range of 10 to 33 percent with an average of 28 percent, and the permeability ranges from 125 to 2000 md with an average of 579 md. The upper Tyonek Formation has a porosity range of 12 to 29 percent with an average of 20.7 percent, and the permeability range is 0.25 to 1600 md with an average of 312 md. The Beluga Formation is the least prospective interval having a porosity range of 10 to 28 percent, with an average of 21.7 percent, but the permeabilities are much lower, ranging from 0.1 to 300 md, with an average of only 75 md. As stated earlier, the Sterling Formation gas pools should provide the most attractive options for future natural gas storage facilities.

3371

Table 1.1. Cook Inlet Gas Fields and Pools (as of 08/31/2007)

Field	Pool	Cumulative (8/31/2007) (MMcf)	Remaining Reserves (10 MMcf/mon production cutoff)

1. Current Gas Storage Fields/Pools
2. McArthur River Production Cutoff rate = 50 MMcf/mon
3. North Cook Inlet Production Cutoff rate = 100 MMcf/mon

2 Storage Volume and Rate of Delivery Requirements

The seasonal variation in South-central Alaska natural gas demand is large, about 1.75 times the yearly average demand on the peak demand day in the winter for total gas demand (utility natural gas for residential/commercial heating and electric utility gas for power generation) and about 2.5 for residential/commercial utility gas only. Historically the swing in gas demand has been met by spare production capacity from the Cook Inlet gas fields. When a spur pipeline is used to deliver natural gas to South-central Alaska, it will be essential that the pipeline operate at a constant rate matching the nominated and contracted rate. This can be achieved in the Cook Inlet by developing one or more of the depleted or nearly-depleted gas reservoirs as gas storage facilities. The basis for estimating the natural gas volumes and delivery rates from gas storage reservoirs needed to meet the seasonal fluctuations in natural gas demand throughout the year are described in this section.

2.1 South-central Alaska Demand Forecast

A Railbelt natural gas demand forecast developed by ANGDA based on historical and projected demands for the use sectors is used for this assessment (ANGDA 2006). This demand forecast is for the entire Railbelt and includes regions of the state that will be served by an Alaska Natural Gas Pipeline from the North Slope and a spur pipeline to South-central Alaska. However, some of these regions will not be directly served by the spur pipeline; i.e., Fairbanks, North Pole, Delta Junction, Healy, Tok, Valdez). The utilities and service areas are defined as shown in Table 2.1.

Table 2.1. Railbelt Gas and Electric Utilities and Service Areas (ANGDA 2006)

Electric Utility	Service Area
Anchorage Municipal Light & Power (AML&P)	**Central Anchorage**
Chugach Electric Association (Chugach)	Anchorage, Kenai Peninsula, Whittier, Tyonek
Homer Electric Association (HEA)	Homer, Soldotna, Seldovia, Kenai
Matanuska Electric Association (MEA)	Chugiak, Eagle River, Palmer, Wasilla, Talkeetna
Golden Valley Electric Association (GVEA)	Fairbanks, North Pole, Delta Junction, Healy
Seward Electric System (SES)	Seward
Copper Valley Electric Association (CVEA)	Copper River Basin, Valdez
Alaska Power Company (APC)	Tok, Dot Lake
Gas Distribution Utility	**Service Area**
ENSTAR	South-central Alaska/Anchorage Area
Fairbanks natural Gas (FNG)	Portion of Fairbanks
Independents and Direct	Anchorage area in addition to ENSTAR

The forecast is described in the ANGDA (2006) report in Section 4.2 Gas Demand and is shown in Table 2.2 and Figure 2.1. The natural gas used for electrical power generation by Railbelt power utilities are shown in columns B through G and the gas utilities are shown in columns H thought J. The 5-year industrial average represents the historical use by the LNG plant and the Agrium fertilizer plant. The estimate for the gas used for operation of the natural gas production and delivery system is shown in column L. Column M shows the total natural gas demand in trillions of BTUs (tBtu). Some of these demand components, APC-Tok, CVEA, and FNG, will not be connected to the anticipated spur pipeline but their impact is minor relative to other uncertainties in long-term demand forecasting and these demand components are not removed from this assessment.

3373

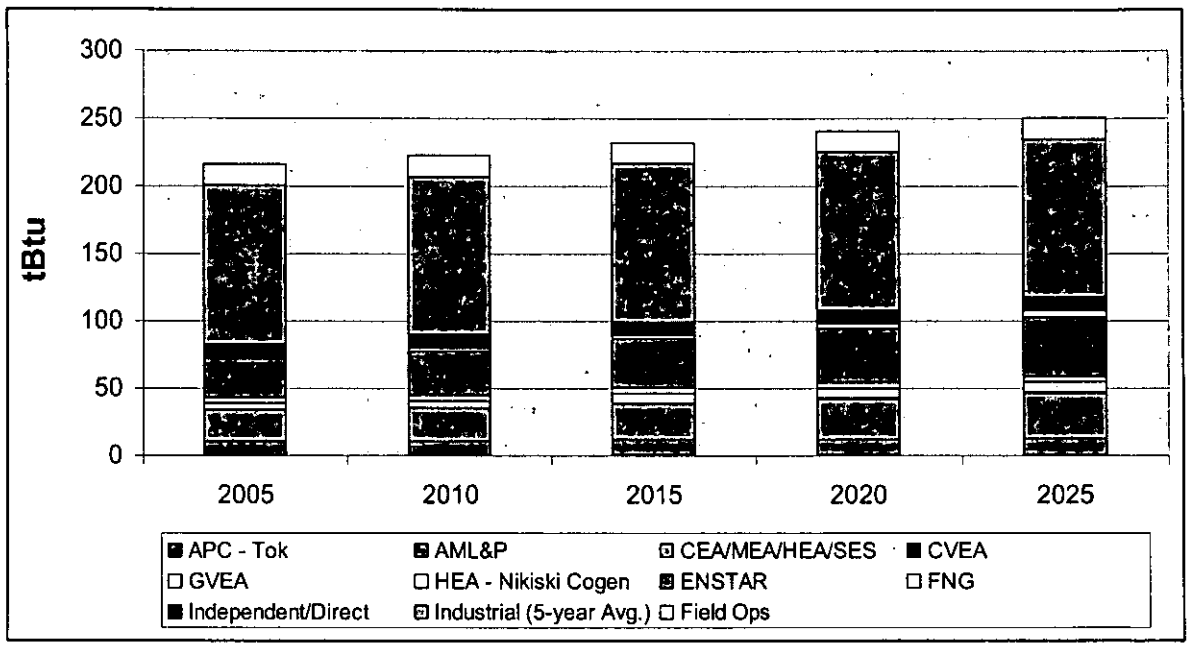
Figure 2.1. Railbelt Natural Gas Demand (Source: ANGDA)



2.1.1 Industrial Demand

The future of industrial use of natural gas in the Cook Inlet will be determined by availability and price of natural gas for industrial purposes in the South-central Alaska. Agrium announced in a September 25, 2007 statement that it was closing its nitrogen fertilizer operations at the end of September due to a shortage of natural gas supply in Alaska's Cook Inlet basin (PN 2007). The balance of the historical industrial natural gas usage is for the ConocoPhillips/Marathon LNG plant at Nikiski. The export license to continue operation of this facility expires March 31, 2009. The plant owners have applied to the U.S. Department of Energy for a 2-year extension of this export license but the outcome of that assessment is not known at this time.

Continued industrial use of natural gas to provide an industrial base in South-central Alaska such as continued LNG operations and petrochemical industry will be determined by the availability and price of gas in the Cook Inlet from gas produced in the Cook Inlet or delivered through a spur pipeline from the North Slope (Thomas et al. 2004, Thomas et al. 2006, ANGDA 2006).

3374

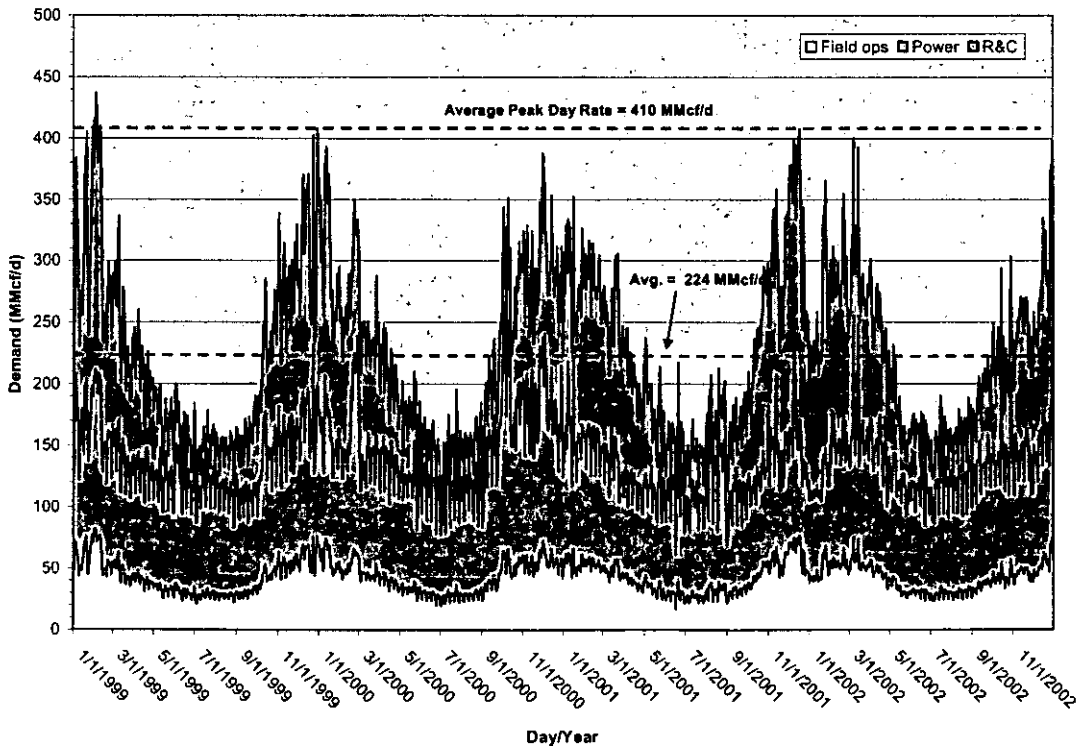
2.1.2 Seasonal Variations in Gas Demand

The seasonal fluctuation in gas demand is a function of ambient conditions and the balancing of available gas production, transmission, and end-user requirements of the South-central and Railbelt demand. Any industrial customers for natural gas from the spur pipeline will require a steady supply of natural gas and would be expected contract for constant delivery rates of gas and would not contribute to the seasonal fluctuations.

Historically, Cook Inlet gas fields have had adequate excess production capacity to meet seasonal demands. Ideally, the industrial users would not be called on to curtail industrial operations to meet peak-day demands from the gas utility and electric generation sectors. However, on January 6, 2007 natural gas was diverted from the LNG plant to meet a surge in demand due to cold weather (ENSTAR 2007). A properly designed spur pipeline and gas storage operation would alleviate the need for curtailing any future industrial operations.

The seasonal changes in demand that cause the need for gas storage are illustrated in Figure 2.2. Swings in utility gas demand (residential and commercial) are much larger than the power generation sector These data, which show daily demand for the 1999 to 2002 time period, are provided to illustrate the daily and seasonal demand swings and **should not be relied upon for decision purposes** because some of the data were generated by scaling to yearly average data from ADNR (2007). The natural gas from a spur pipeline that is not required to meet demand in the summer is available for injection into gas storage facilities for withdrawal to meet the shortfall in winter. This would allow a spur pipeline to be operated at a constant flow rate, which is highly desirable.

Figure 2.2. Illustrative South-central Alaska Daily Demand-1999-2002



Data sources: ENSTAR, AML&P and scaled to match yearly data by segment are reported by ADNR 2007, Table III.10, Division of Oil and Gas 2007 Report.

3375

2.1.3 Gas Demand Forecasts to 2040

Forecasts for the time period from 2020 to 2040 were developed by extending the forecast shown in Table 2.2 for electricity generation (Columns B to G), residential/commercial (columns H to J), and field operations Column L). Gas storage to make up for any short fall in spur pipeline delivery in these demand components is essential. Fro simplicity, utility gas is assumed to be 1000 Btu/Mcf, the results are shown in Table 2.3.

Table 2.3. Railbelt Natural Gas Demand to 2040 (1000 Btu/Mcf)

A	B	C	D	E	F	G	H

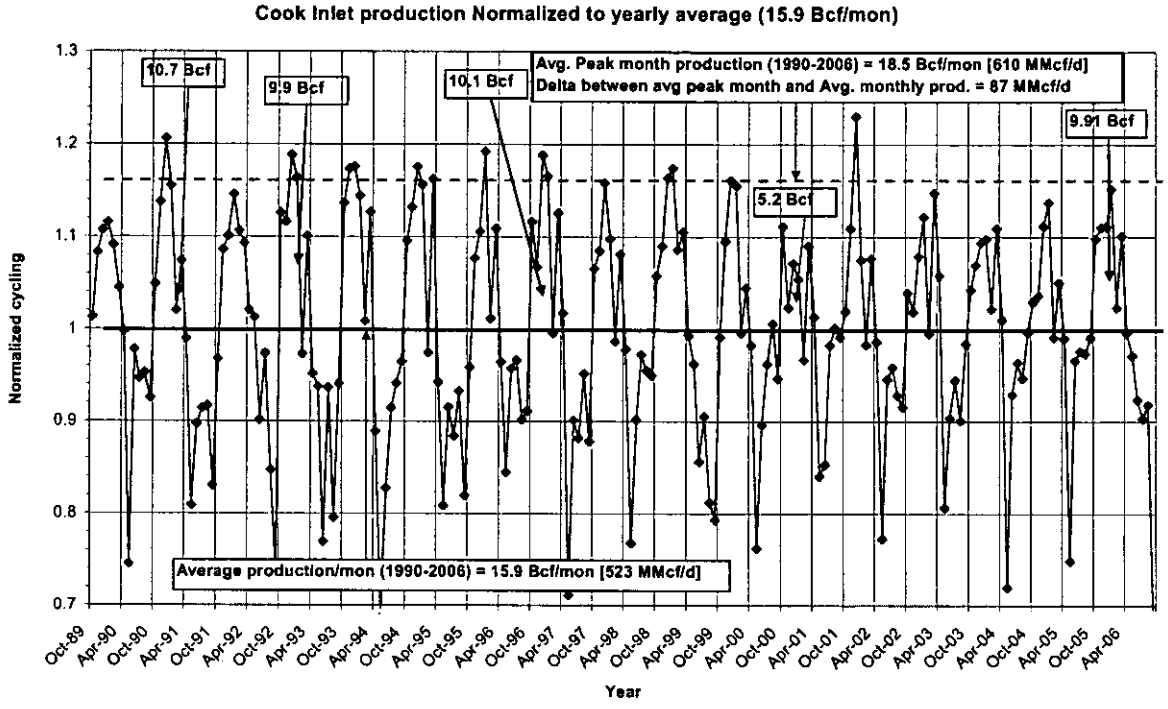
2.2 Storage Volumes and Rate of Delivery to Meet Seasonal Fluctuations

An analysis of Cook Inlet production history from 1990 to 2006 provides a long-term view of the year-to-year variation in production to meet total demand (industrial, residential/commercial, electricity production, and field operations and other) over a longer history. These data were normalized to the average monthly production rate of 15.9 Bcf/mon over this period and are shown in Figure 2.3. The volume of gas above the monthly average ranges from a high of 10.7 Bcf in the 1990-1991 winter season to a low of 5.2 Bcf in the 2000-2001 winter season. The average of the peak monthly production during this time period is 18.5 Bcf/mon. The difference between the average peak month and monthly average is 87 MMcf/d.

3376

Figure 2.3. Normalized Cook Inlet Production (1990 to 2006)



2.2.1 Storage Volumes Based on Total Cook Inlet Production from 1990 to 2006

The average of gas for the peak-season months above the monthly average from 1990 to 2006 is 8.2 Bcf. In 2006 the volume was 9.6 Bcf. Using these volumes and the projected percentage increases in Table 2.2, Column H, the volume required for storage would range from 10.3 Bcf in 2020 to 14.0 Bcf in 2040 as shown in Table 2.4.

Table 2.4. Base Gas Storage Capacity Estimate from Historical Production

Year	Gas Storage Estimate (Bcf/yr)
2005	8.2
2010	8.8
2015	9.6
2020	10.3
2025	11.1
2030	12.0
2035	13.0
2040	14.0

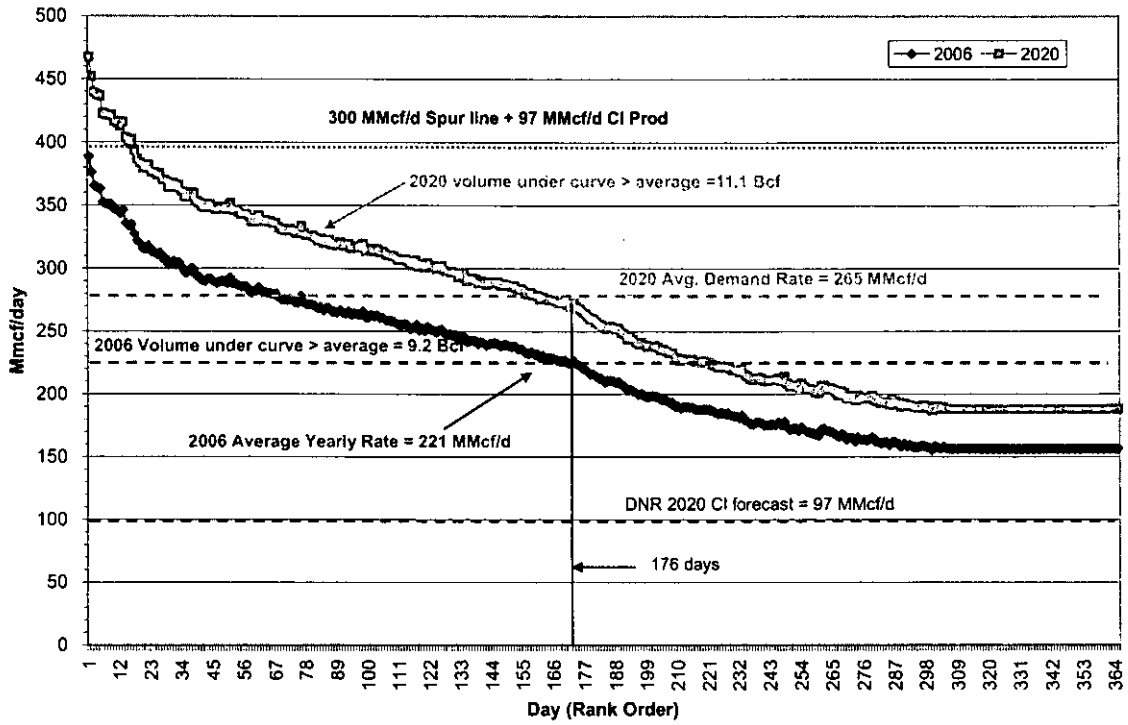
2.2.2 Storage Volumes Based on Daily Gas Utility and Electric Utility Demand

Cook Inlet daily demand data are available from various sources for the Residential/Commercial and Electric Generation segments and have been complied for 2006 and forecasts developed through 2020 (Dunmire 2007). These data are shown in Figure 2.4. These demand volumes do not include the Fields Ops segment included in the Railbelt Demand included in Table 2.2.

3377

The volume of gas above the average demand to meet Residential/Commercial and Electricity Generation demand for 2006 is 9.2 Bcf and 11.1 Bcf for 2020.

Figure 2.4. South-central Alaska Natural Gas Demand (Gas Utility and Power Generation)



The data used to develop Figure 2.4 also provide the peak-day demand for these demand segments (Dunmire 2007). The gas storage estimates, the average daily demand rate, and peak daily demand rate to 2040 are estimated based on the 2020 estimates using the percentage increases from Table 2.3 Column C for Electric Utilities (power generation) and Column E for Gas Utility (residential/commercial). These estimates are shown in Table 2.5. These estimates are about 10% larger than the volumes shown in Table 2.4 that were based on total Cook Inlet production. Gas storage reservoirs must be capable of supplying the volumes and deliverability rates to meet demand above the average daily rate throughout the high-demand season of the year. The daily demand analysis indicates this is about 176 days per year.

Table 2.5. Base Storage Estimate from Daily Demand

Year	Gas Storage Estimate (Bcf/yr)	Avg. Daily Demand (MMcf/d)	Peak daily Demand (MMcf/d)
2006	9.2	221	389
2020	11.1	265	467
2025	12.1	290	511
2030	13.2	316	559
2035	14.4	344	611
2040	15.7	376	668

3378

The consequences to South-central Alaska utility gas customers of deliverability falling below demand for even one day in the winter makes it imperative that a safety factor be included in the planning for gas storage requirements. A longer disruption of several days or weeks resulting from events such as equipment failure or pipeline breaks is always a possibility. Hence, the base storage capacity is increased by 1.5 times the base gas storage estimate to provide a safety factor for evaluating potential gas storage reservoirs as shown in column C in Table 2.6. The gas storage volumes increase from 16.7 Bcf/yr in 2020 to 23.5 Bcf/yr in 2040. Table 2.6 also includes the average withdrawal rate for the base storage and the proposed design withdrawal rates of 1.9 times the average withdrawal rates, columns D and E, respectively.

Table 2.6. Base Gas Storage and Average Withdrawal Rates for Gas and Electric Utilities

A	B	C	D	E
Year	Gas Storage Estimate (Bcf/yr)	1.5 times Required Gas Storage (Bcf/yr)	Avg. Withdrawal Rate[1] (MMcf/d)	Design Withdrawal Rate[2] MMcf/d)
2006	9.2	--	--	--
2020	11.1	16.7	63.1	120
2025	12.1	18.2	68.9	131
2030	13.2	19.8	75.0	142
2035	14.4	21.6	81.8	155
2040	15.7	23.5	89.0	169

1. Average withdrawal rate = Required gas storage/176 days
2. The design withdrawal rates are 1.9 times the daily average withdrawal rates

It is essential that the spur pipeline and Cook Inlet production provide the **average daily demand** throughout the year and that gas storage or some other alternative source of gas be available to meet the daily demand above the average. The average daily demand must also include the volumes required for Field Ops to operate the natural gas supply system. Any Industrial demand would be in addition to the volumes presented in these tables. The minimum required throughput rate for a spur pipeline to meet this average requirement is shown in Table 2.7. However, a higher spur pipeline rate will be required in the first few years to provide gas to build cushion gas and working gas volumes required to meet the capacity and deliverability required.

Table 2.7. Minimum Spur Pipeline Rate to Meet Average Demand

Year	Average Daily Gas and Elec. Utility Demand (MMcf/d)	Average Daily Field Ops Demand (MMcf/d)[1]	Average Daily Demand (Gas and Elec. Utility & Field Ops) (MMcf/d)	Cook Inlet Production Forecast[2] (MMcf/d)	Spur Pipeline Rate Required for Average Daily Demand[3] (MMcf/d)
2006	221	42	263	--	--
2020	265	42	307	97	210
2025	290	42	332	52	280
2030	316	42	358	30	328
2035	344	42	386	17	369
2040	376	42	418	10	408

1. From Table 2.2.
2. ADNR 2007 Annual Report (Forecast extended to 2040 from 2036)
3. Spur pipeline rate = Average Daily Demand – Cook Inlet Production

Before a spur pipeline will be operational in 2020, South-central Alaska must have additional natural gas for power generation and residential/commercial use to meet the short fall from existing Cook Inlet reserves. This shortfall can be offset by successful Cook Inlet natural gas exploration; switching a portion of the power generation from natural gas to alternatives such as

3379

coal, wind, hydropower, or tidal power; import of LNG; or some combination of all of these options including energy efficiency and conservation measures. When a spur pipeline is available those options that have been put in place for the interim need will still be available. For example, if LNG import is part of the solution, it may need to be continued until gas storage has been built to a level to meet the winter season demand.

In addition, gas storage deliverability must be available to meet the peak-day demands. Gas storage reservoir characteristics, operational design, and costs will determine whether this can be accomplished by spare capacity from the base storage facility or if a peaking-load storage facility will be required to meet the demand.

Due to the necessity to nominate spur pipeline rates on a long-term basis and to build gas storage (cushion gas and working gas), it is assumed that the spur pipeline rate will initially be 300 MMcf/d. Because of the uncertainty of the alternatives, described above, that will have been put in place this assumption is only one possible scenario out of numerous possible scenarios. In addition, if there are industrial users for spur pipeline gas, the rate will need to be higher by that amount unless industrial users would be willing to be curtailed on high demand days.

The assumed initial rate of 300 MMcf/d would need to be increased in increments to meet growing demand and it is anticipated that the spur pipeline will be designed such that additional compression can be added to increase the throughput rate as needed. This also means that there must be opportunities to nominate higher off-take rates from the Alaska Gas Pipeline in the future as currently anticipated. The gas storage withdrawal rates needed for peak-day deliveries for the assumed spur pipeline rates of 300 MMcf/d in 2020 increasing to 450 MMcf/d by 2035 are shown in Table 2.8. These volumes would allow for a significant build up of gas storage of a full year's supply for Cook Inlet consumers or industrial use.

The peak-day demand shown in Table 2.6 has been increased by the average daily demand for the Field Ops demand segment (42 MMcf/d) for these calculations. The Field Ops demand will also vary on a daily basis throughout the year but volumes for that variation are not available.

Table 2.8. Gas Storage Deliverability Required for Peak-Day Rate

Year	Avg. Daily Demand (MMcf/d)	Estimated Peak day rate[1] (MMcf/d)	Cook Inlet Production Forecast[2] (MMcf/d)	Spur Pipeline Rates[3] (MMcf/d)	Gas Storage Withdrawal Rate Req'd for Peak Day[4] (MMcf/d)	Design Withdrawal Rate[5] (1.9 times Avg. Rate) (MMcf/d)	Max. rate reg'd from peaking storage[6] (MMcf/d)	Yrly Volume Available for Cushion and Working Gas[7] (Bcf/yr)
2006	263	–	–	–	–	–	–	–
2020	307	509	97	300	112	120	-8	33
2025	329	553	52	300	201	131	70	8
2030	352	601	30	350	221	142	79	10

2040	404	710	10	450	250	169	81	20

1. Peak day rates from Table 2.5 are increased by 42 MMcf/d to include the Field Ops volumes.
2. ADNR 2007 Annual Report (Forecast extended to 2040)
3. Assumed Nominated Spur Pipeline rates
4. Gas Storage Withdrawal Rate reqd. for Peak Day = Est. Peak Day rate – Cook Inlet Production – Spur Pipeline Rate
5. From Table 2.6.
6. Max. Rate for Peaking Storage = Gas Storage Withdrawal Rate Reg'd on peak Day – Design Withdrawal Rate
7. Gas Volume available for Building Cushion & Working Gas Volumes = (Cook Inlet Prod. + Spur Pipeline Rate – Avg. Daily Demand)*365 days

2.3 Summary of Storage Volume and Rate of Delivery Estimates

Historical Cook Inlet production and seasonal demand data were both analyzed and indicate a similar gas storage requirement. The minimum gas storage based on future estimated demand

ranges from 11.1 Bcf in 2020 to 15.7 Bcf in 2040. Depending on the minimum gas storage required to meet demand in South-central Alaska is considered too risky because of the serious consequences of any shortfall because there are **no alternative sources** of gas for heating and other essential services totally dependent on natural gas at this point in time. Therefore, a safety factor of 1.5 was applied resulting in an estimated gas storage capacity of 16.7 Bcf in 2020 increasing to 23.5 Bcf in 2040. The spur pipeline must have a delivery rate high enough to build up the cushion gas and working gas required for the selected reservoir to meet the base storage requirement plus the 50% safety factor in volume and provide the daily delivery rates during peak-demand season.

Gas storage must also be able to deliver the incremental rates needed on the coldest days. Based on an assumed 300 MMcf/d spur pipeline in 2020, with expansion to 350 MMcf/d in 2030, 400 MMcf/d in 2035 and 450 MMcf/d in 2040, the incremental delivery from gas storage required to meet the peak-day demand estimates ranges from 112 MMcf/d in 2020 to 250 MMcf/d in 2040. The design withdrawal rates for base storage requirements range from 120 MMcf/d in 2020 to 169 MMcf/d in 2040. Unless the base storage reservoirs are capable of providing adequate deliverability through additional wells to meet the anticipated peak demands, peaking storage facilities may need to come on line between 2020 and 2025 and increase to a minimum deliverability rate of about 80 MMcf/d.

The potential gas storage reservoirs are described in the Section 3.

3381

3 Characteristics of Ideal Natural Gas Storage Facility

An ideal natural gas storage system is described that will meet the optimum base load and peaking load conditions for the Cook Inlet area. The characteristics of this storage system are based on gas volumes that are largely determined by an anticipated constant spur line capacity and seasonally variable usage volumes (residential, commercial, and industrial) in the Cook Inlet area. With these assumptions is place, both the ideal base load and peak load storage facilities are described within the constraints of the known geologic and engineering characteristics of the reservoir intervals of the Cook Inlet Tertiary section (Figure 1.1 and 1.2).

Ideal storage facilities are the products of a complementary interaction of geological, engineering, and logistical elements that are present within the Cook Inlet area. Essential parameters include proximity and connection to existing pipeline system(s), existing gas producing infrastructure, potential storage volume, reservoir geometry and heterogeneity, porosity, permeability, water saturation, water influx characteristics, access to potential storage site, and reservoir pressure/depth. The criteria necessary for the "ideal' storage facility or facilities are described below. The concept of a dual storage system requires that the base load and peak load storage sites/systems possess somewhat different characteristics.

3.1 Base Load Storage Facility Criteria

The base-load storage facility must be of sufficient size to accommodate the excess gas delivered during the low-demand summer months and have the characteristics that will facilitate the withdrawal of the gas during the winter season in quantities and at rates sufficient to meet the average expected demand. This storage facility is not intended or designed to meet the extreme volumes required for short periods during very high use days. The following criteria describe the ideal base-load storage reservoir for Cook Inlet.

- To meet the anticipated storage needs required to offset annual seasonal fluctuations in residential/commercial and power generation demand, at a proposed start-up date of 2020, the storage facility has a working gas capacity of 16.7 BCF (Table 2.8). The facility needs to be capable of expansion to 23.5 BCF or more by 2040, to satisfy the demands of a growing population. The storage system must be capable of delivering an average of 120 MMcf/d in 2020 and 169 MMcf/d in 2040.

  The storage volume discussed above represents only the working gas with a 150% safety factor and does not include the volume of cushion gas required. The cushion gas volume, depending on the reservoir conditions, may be zero to one, or more, times the working gas volume. Consequently, the target storage sites should be viewed as having a total storage capacity (cushion plus base load) of 25 to 50 Bcf gas-in-place.
- Trapped and capped with tank-like characteristics, distinct structure, and evidence of pressure depletion without support.
- Low to moderate water encroachment is preferred. Gas storage in a water-saturated sandstone may cause production problems if water is produced thereby decreasing gas flow rate and increasing water handling problems at the surface. Formation water may potentially trap gas when injection displaces it and then resaturates it during production operations (AOGCC 2005a).
- Gas field/pool near depletion but with enough residual gas to act as cushion gas and provide base-line pressure (≈ 1000 psi) at or near existing pipeline pressures, thus requiring little, if any, compression to get gas into distribution network.

3382

- All wells in good condition, including injectors, producers, and any plugged wells within the area of storage; the production infrastructure is in place.
- Storage site located on and with access to an existing pipeline, with sufficient capacity to deliver required volumes on demand. The pipeline must not have bottlenecks that can compromise its ability to meet demand.
- Storage reservoir porosity of 15 percent or more and permeability in the range of 400 to 1,000 md. These parameters provide sufficient volumes for storage and guarantee high production rates
- Good lateral reservoir continuity, adequate net pay thickness (50 ft or more), and high net to gross ratios in the storage formation (0.75 to 1.0), to facilitate injection, communication, and withdrawal.
- Access to storage site must be unencumbered, no operator or environmental/refuge issues.
- Proximal to market(s) – generation plants, distribution systems, etc.

These criteria describe a storage reservoir that is capable of holding enough natural gas to satisfy long term seasonal demand requirements, provide a buffer should a disruption in delivery from the spur pipeline occur, and guarantee a prolonged steady supply of natural gas for months without the need to cycle additional gas into the storage facility.

3.2 Peak Load Storage Criteria

If a peak load storage facility is required, it may be met two ways. It may be provided by a separate storage site that is designed to produce high volumes of gas for short intervals, a few days at a time. After this short period of high production the facility may be exhausted and require recharging in preparation for the next interval of high demand. Many of the characteristics of an ideal peak load storage facility are similar to that of base load storage but some important differences exist and are highlighted in the following listing.

- Storage capacity of **6 to 8 Bcf** and capability of producing 60 **MMcf/d** in 2020 with ability to increase to **80 MMcf/d** by 2040 (Table 2.8).
- Trapped and capped with tank-like characteristics, distinct structure, and evidence of pressure depletion without support.
- No water encroachment.
- Gas field/pool at or near depletion, but with pressures equal to or above those of the pipeline system – preferably a deep reservoir to assist with high pressure requirement.
- All wells in good condition as with the base-load case and production infrastructure is in place.
- Storage site with **access to high volume pipeline.**
- Porosities and permeabilities of 15 percent and 400 to 1000 md respectively
- Good lateral continuity and reservoir homogeneity and high net-to-gross ratio and adequate pay thickness (50 ft) as in the base load case.
- Access to storage site must be unencumbered.
- Proximal to markets/customers.

These criteria describe a relatively small, well-defined reservoir, which has an existing infrastructure capable of both compressing and injecting significant volumes of gas at high pressure over a period of one to two weeks and producing similar volumes over the same period of time.

3383

4 Characteristics of Existing Cook Inlet Underground Storage Facilities

There are currently three natural gas storage facilities in Cook Inlet. Two are operated by Chevron, Pretty Creek on the west side of Cook Inlet and Swanson River on the east side of the inlet as show in Figure 4.1. The third is operated by Marathon at the Kenai gas field on the east side of Cook Inlet. The operators of these facilities produce the gas and store it for times of high demand. This is unlike the situation that would exist if these facilities or other fields/pools operated by the Cook Inlet gas producers were to be utilized by the owners of North Slope natural gas delivered to the Cook Inlet area by a spur line. These third-party issues are beyond the scope of this study and will need to be evaluated by others at a later date.

4.1 Swanson River Natural Gas Storage Facility

The oldest natural gas storage facility in Cook Inlet is operated by Chevron at the Swanson River field (Figure 4.1). This storage facility was approved and the Storage Injection Order No. 2 was issued in 2001 (AOGCC 2001). The facility was later expanded to include a second reservoir (AOGCC 2005b). The facility stores dry gas from the Swanson River field and other Cook Inlet fields. The storage intervals are the 64-5 and 77-3 sandstones of the Tyonek Formation (AOGCC 2001, AOGCC 2005b, and Havelock 2006). The facility is situated on a major gas pipeline network, near the intended market. The facility has met all state requirements regarding integrity of wells, infrastructure, and stratigraphic isolation of the storage horizons and is located on a 16-inch gas pipeline (Figure 4.1)

The original storage interval was the Tyonek 64-5 sandstone, defined as the sandstone between measured depths of 6,375 ft and 6,443 ft in the SRU #43-28 well. The SRU #43-28 well has a gas/water contact at a measured depth of 6,390 ft, providing for a net pay of approximately 12 ft (AOGCC 2006). The calculated porosity ranges from 10 to 36 percent, water saturation from 51 to 55 percent, and the permeability ranges to several hundred millidarcies. The reported average values for porosity and permeability in the AOGCC 2004 Annual Report on pool statistics are 29 percent and 200 md respectively (AOGCC 2006a). While the injection orders do not provide a depositional environment for the Tyonek 64-5 sandstone, the description of the encasing sediments strongly suggest that the unit is the product of deposition by meandering streams.

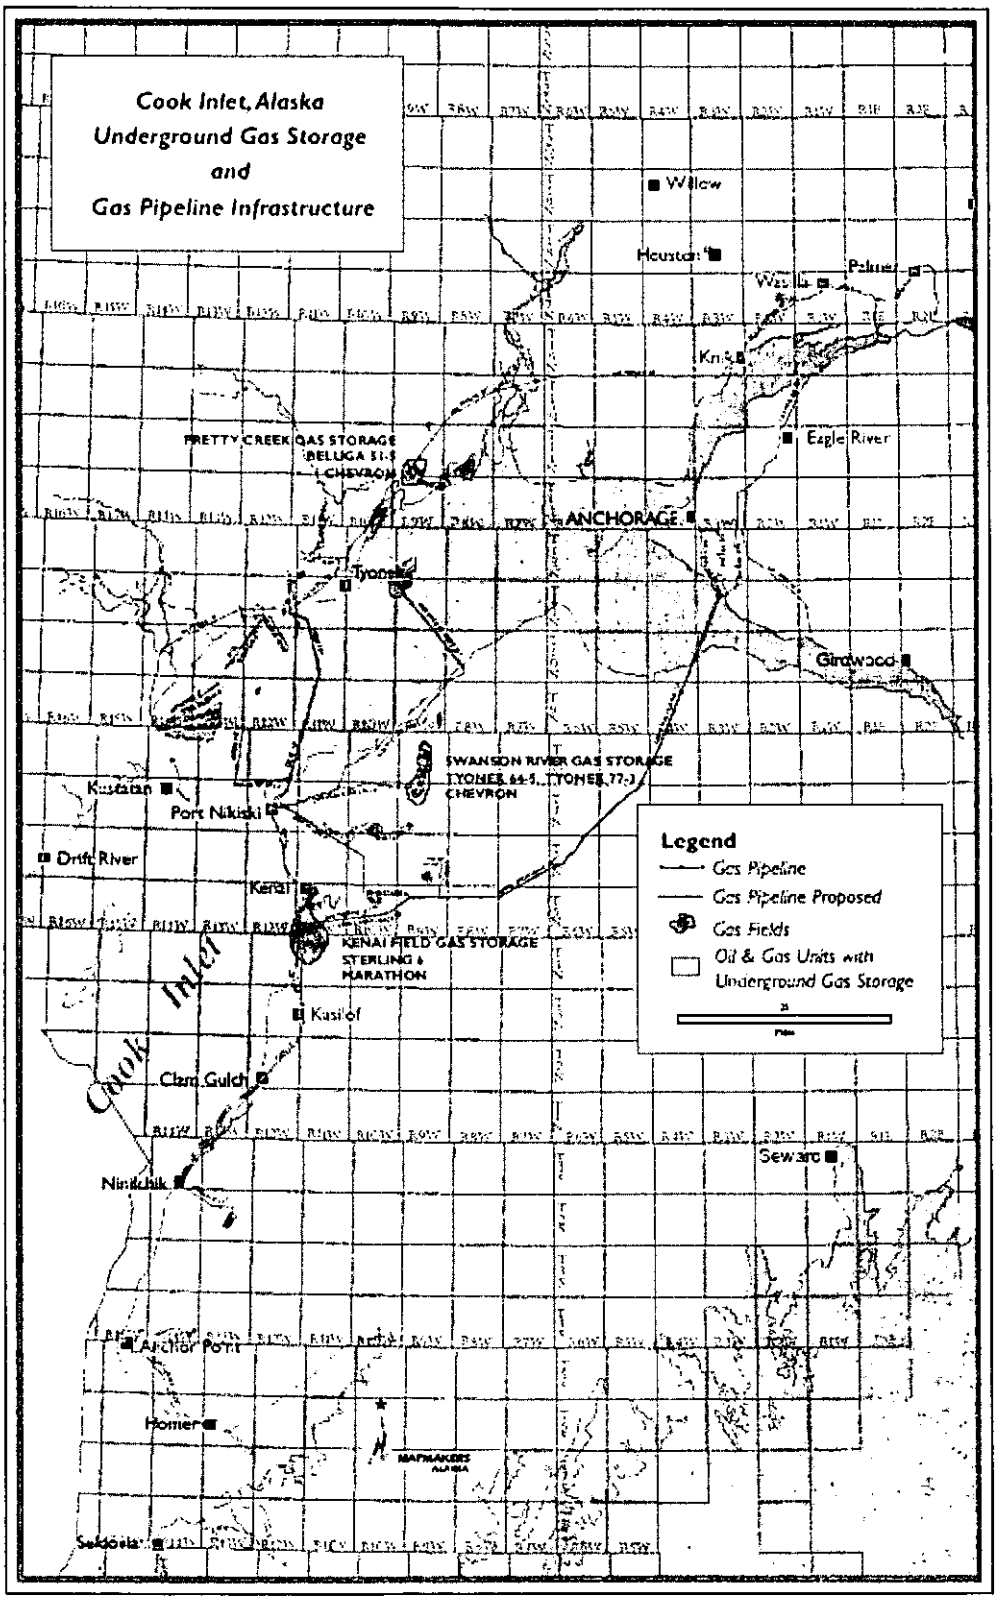
The reservoir pressure as of December 4, 2004 was 2,850 psi. The estimated maximum daily injection volume is 10 MMcf/d and peak production is also 10 MMcf/d.

The second storage reservoir at Swanson River is the Tyonek 77-3 sandstone, which is defined as the sandstone found in the SCU #42A-05 well between 7,972 and 8,001 ft measured depth (MD). The Tyonek 77-3 interval was approved in 2005 (AOGCC 2005b). Based on core data this sandstone has an average net reservoir porosity of 28 percent (AOGCC 2005b), permeability ranges to several hundred millidarcies, and average water saturation is 50 percent. Gross sandstone thicknesses range from 25 to 40 ft based on well control. The reservoir sandstone is interpreted as a meandering stream deposit, which is laterally equivalent to flood plain mudstones and coals.

The original reservoir pressure within the 77-3 sandstone was 4,774 psi and the average injection pressure is 3,500 psi (AOGCC 2005b). The estimated maximum injection rate is expected to be 42 MMcf/d (AOGCC 2005b) and peak production rate is about 10 MMcf/d (Havelock 2006).

3384

Figure 4.1. Cook Inlet Map of Existing Storage Locations



3385

The working gas capacity and deliverability of the two Tyonek storage reservoirs at Swanson River are provided by Havelock (2006) in his presentation to the South Central Alaska Energy Forum. The working gas capacity is 2.2 Bcf/yr. The total daily average deliverability is 7.4 MMcf/d, and total daily peak deliverability is 20.8 MMcf/d, from two wells, one producing from the 64-5 and the other from the 77-3 sandstone.

The operator, Chevron,[2] has provided an update on the Swanson River storage facility, which revises the deliverability of the facility. There are now four production wells in the storage facility, two in the Tyonek 64-5 reservoir and two in the Tyonek 77-3 reservoir. These wells are expected to be capable of peak deliverability rates of 60 to 70 MMcf/d from a total storage volume of ~ 30 Bcf.

4.2 Pretty Creek Natural Gas Storage Facility

Chevron has developed a second gas storage facility at Pretty Creek (Figure 4.1), designed as a periodic peak demand producer (AOGCC 2005a). The storage gas is predominantly from the Middle Kenai Gas Pool in the McArthur River field, but may also include some gas from other fields on the west side of the inlet. The Pretty Creek storage facility is connected to a major 20-inch gas pipeline (Figure 4.1) and is in close proximity to the electrical generation facility at Beluga. The facility has met all the state requirements regarding well integrity, infrastructure, and isolated nature of storage reservoir. The isolated nature of the reservoir was established by material balance analysis.

The storage interval is the Beluga 51-5 sandstone, which is defined as lying between 5,144 ft MD (-3,585 ft TVDss) and 5,173 ft MD (-3,605 TVDss) in the PCU #4 well. Data regarding the nature of the 51-5 sandstone is not included in Injection Order No. 4 (AOGCC 2005a) but Chevron (2007) supplied the following information. The net pay is 16 ft and the net-to-gross ratio is 0.80. Porosity ranges from 18 to 30 percent with an average of 28 percent and permeability is 132 md based on a pressure buildup in the storage sandstone. The water saturation is poorly known but estimated to be about 45 percent. The general depositional environment is described as stream sediments deposited in a low energy environment (AOGCC 2005a). The injection order further states that these Beluga sandstones "are commonly lenticular and often discontinuous over interwell distances."

The estimated original pressure was 1,674 psi at a true vertical depth (TVD) of 3,686 ft. The average wellhead injection pressure is 1,550 psi. The estimated maximum injection rate is 20 MMcf/d (AOGCC 2005a).

The facility is small with limited storage capacity and deliverability. Havelock (2006) places the working gas volume at only 0.70 Bcf/yr and the total daily peak delivery at 7.3 MMcf/d. Chevron[2] has provided revised numbers for the Pretty Creek Beluga 31-5 storage facility. The storage volume is given as ~ 2.0 Bcf and a peak delivery rate of 10 MMcf/d when the reservoir is full.

4.3 Kenai Natural Gas Storage Facility

The third natural gas storage facility in the Cook Inlet area is the most recently developed and the largest established to date. It is operated by Marathon at the Kenai gas field. The storage interval is the Sterling #6 pool (Figure 4.1). This facility has a much greater storage potential than the Pretty Creek and Swanson River facilities combined. Gas from the Kenai and Cannery

[2] Chevron – personally communication, December 2007.

3386

Loop fields are stored during the summer for withdrawal during the high demand months of the winter.

The facility is connected to a 12-inch gas pipeline that supplies Anchorage (Figure 4.1). It has met all state requirements regarding infrastructure, reservoir isolation, and performance. However, there is a necessary qualifier; the storage facility meets the requirements for well integrity at the limited operating pressures and volumes, mandated by the Alaska Oil and Gas Conservation Commission. Caution was dictated by the lack of cement bond logs, for some wells, that are typically used to determine isolation of the injection zone in all wells penetrating the confining layer (AOGCC 2006).

The gas is stored in two thick fluvial sandstones, the C-1 and C-2 sandstones of the Sterling #6 gas pool. The sandstones are comprised of friable to unconsolidated sandstone to clayey sandstone, with minor inter-bedded siltstone and coal (AOGCC 1969). These sandstones are defined in the KU 31-07X well. The C-1 sandstone occurs between 4,366 ft and 4,500 ft TVDss and the C-2 interval is between 4,530 ft and 4,569 ft TVDss. The two sandstones have a total of 110 ft of net pay (AOGCC 2006a) and a net-to-gross ratio of 0.64. The two sandstones are in pressure communication, have porosities that range from 4 to 16 percent, permeabilities that range from 400 to 1000 md, and original water saturations of about 32 percent.

The original reservoir pressure was 2,138 psi at a datum of 4,565 ft TVDss (AOGCC 1969) and the maximum pressure at which the Sterling #6 gas storage will operate is 300 psi (AOGCC 2006b). The storage unit is currently operating at less than 200 psi. A typical injection cycle will consist of 6 Bcf stored during the summer and produced during the winter.

Peak delivery rates vary widely at the Sterling Pool #6. Pool #6 working gas capacity is currently 6 Bcf/yr, but may be expanded to 11 Bcf/yr or more. The total gas-in-place is limited to 50 Bcf under the current lease (Havelock 2006). Prior to being designated a storage interval, the Sterling #6 pool had produced more than 523 Bcf and OGIP is modeled to have been at least 563 Bcf (AOGCC 2006b). Thus, the true potential of this pool as a storage facility has not been realized and at some time in the future it could potentially be expanded to provide storage for 100 Bcf or more.

4.4 Summary of Existing Natural Gas Storage

The three existing natural gas storage facilities in the Cook Inlet area provide seasonal storage for their operators, who store surplus production during the low-demand summer season to meet their obligations and the increased demand of the utilities during the winter. The gas stored is exclusively from the fields that they (Chevron and Marathon) own and operate. This will not be the situation, when and if, storage from a spur line is initiated. However, the characteristics of these facilities are probably very like those that will be developed for storage of spur line natural gas. Havelock (2006) provided a table that summarized the existing facilities and it is reproduced (*with modifications*) here to provide an overview of the current situation and to serve as an example of what the future gas storage pools may resemble.

3387

Table 4.1. Cook Inlet Gas Storage Deliverability (MMcf/d) (Havelock 2006) (*modified to include revisions for Swanson River and Pretty Creek as provided by Chevron;[3] numbers in parenthesis are from Chevron)*

Facility	Number of Wells	Peak Delivery/Well (Average) (MMcf/d)	February 2006 Rate (MMcf/d)	Historical Average Produced Volume (MMcf)	Total Daily Peak Delivery (MMcf)	Total Daily Average Delivery (MMcf)	Working Gas (Bcf/yr)
Swanson River (Tyonek 54-5 and 77-3)	2 *(4)*	10.4 *(~15 to 16)*	9.2	3.7	20.8 *(60 to 70)*	7.4	2.2
Kenai (Sterling Pool #6)	9	6.7	3.7	–	60.3	33.3	6.0
Pretty Creek (Beluga 31-5)	1	7.3 *(10)*	–	2.4	7.3 *(10)*	2.4	0.7
TOTAL	**12 (14)**				**88.4 (~135)**	**43.1**	**8.9**

3388

5 Characteristics of Potential Underground Storage Facilities in Cook Inlet

The objective is to identify and describe in detail the characteristics of depleted or soon to be depleted reservoirs that may be suitable for conversion to and use as future potential underground gas storage facilities in Cook Inlet

This task involves the identification, review, and evaluation of all gas fields or participating areas that may be depleted or otherwise abandoned by the time the spur line is built (10 years ±), to determine their suitability as base-load and/or peak-load gas storage facilities. Oil fields have been **excluded** and the effort is focused on the more conventional gas fields as potential storage facilities. The use of any of these gas fields/participating areas by a third party will likely depend on them no longer being economically viable as commercial gas fields.

In addition to the evaluation and characterization of the parameters listed under Tasks 2.1 and 2.2, the issue of ownership of the abandoned pore space and the ultimate responsibility for remediation and restoration of these fields may be factors that have to be considered in determining the viability of any site as a storage facility. These latter two components may have some bearing on the costs of operating some potential storage facilities.

5.1 Geological and Reservoir Engineering Characteristics of Potential Storage Facilities

The first step in evaluating Cook Inlet reservoirs as potential gas storage facilities was to eliminate the oil fields to avoid the issues related to duplication of facilities and the added costs of oil and water handling in these fields. As shown in Table 1.1, 30 gas fields and 57 gas pools have been discovered in the Cook Inlet Basin. The objective is to reduce this number to those that best meet the requirements and characteristics to function as a potential gas storage facility.

The elimination process began with the offshore gas fields (6 fields/6 pools), including the two large gas fields, McArthur River and North Cook Inlet fields. These were excluded because of the remoteness of the fields, difficult access, and limited space available to develop the gas handling and associated facilities. Next, those gas fields south of the Kenai gas field (4 fields and 8 pools) are considered to be too far removed from the major market/users and therefore are not included in the listing of fields that would be considered as potential future natural gas storage facilities. As a consequence of these two steps, the number of candidates was reduced to 20 fields and 43 pools. The bulk of the effort from this point onward was devoted to identification of primary candidates for base load storage.

The question of underground peak-load storage has two possible answers; either simply create larger base load facilities and add extra wells and increase the operating pressure or identify and develop smaller, high pressure high volume storage sites.

5.1.1 Potential Base Load Storage Facilities

After eliminating the oil fields, offshore gas fields and southern Kenai Peninsula gas fields, a high percentage of the remaining fields/pools are simply too small to provide adequate base load storage capacity for the winter heating and electrical generation needs of the area. Included in this category are fields like Albert Kaloa, Birch Hill, Lone Creek, and Lewis River, which have estimated ultimate recoveries (EUR) in the range of less than 1.0 Bcf to about 12.0 Bcf. To this point most of the culling of potential storage sites has not been based on geological

3389

and reservoir engineering criteria, but rather on location, type of native hydrocarbon, and size. There are a number of fields or pools that may have the requisite geological, engineering, and infrastructure characteristics to serve as future base load storage facilities for natural gas. These fields and pools will be the focus of this section of the report.

A total of six fields with 16 pools meet the initial set of requirements and are summarized in Table 5.1. This table provides information regarding the capacity to store cushion and working gas, reservoir parameters, and estimates of remaining reserves in 2020, the year reserves are expected to be depleted to the point of non-commerciality, and probability of reserves growth.

Table 5.1. Cook Inlet Gas Fields/Pools Geological and Engineering Characteristics

Field/pool (6/30 & 16/57)	Reservoir Volume[1] (Bcf)	Porosity[2] (%)	Perm.[3] (md)	Pay(n/g)[4] (Feet)	Pressure[5] (Psi)	Estimated reserves at 2020 (Bcf)[6]	Reserves[7] (Est. Yr. Depleted)	Reserves Growth[8] (high/mod/low/none)

1. Reservoir Volume – Estimated Original Gas in Place Volume (OGIP).
2. Porosity – value either calculated or from cores; (?) indicates values estimated from equivalent producing intervals.
3. Permeability – value either calculated or from cores: (?) indicates values estimated from equivalent producing intervals.
4. Pay (n/g) – net pay in feet and (portion of sandstone-bearing interval that is net pay).
5. Pressure – current reservoir pressure.
6. Estimated reserves 2020 – reserves remaining to be recovered at assumed pipeline startup date.
7. Reserves (Estimated Year. Depleted) – year of last production from pool, now available for storage use.
8. Reserves Growth – probability that additional reserves will be attributed to the pool before 2020 and not included in estimated reserves 2020 column.
9. 10 MMcf/mon Production cutoff.

3390

The criteria (1) through (8) in Table 5.1 will be applied to the candidate pools to determine their suitability for conversion to storage facilities. Each pool was examined in respect to the criteria listed above and will ultimately be ranked in terms of how closely it approaches the ideal characteristics described in Section 3. These comparisons are summarized below.

Reservoir Storage Volume: Adequate reservoir volume is the first and foremost criterion in choosing a storage facility. Based on the demand assumptions of Section 2.0, fields with adequate pressures to minimize the quantity of cushion gas may qualify if their capacity exceeds the 16.7 Bcf required for working gas volume, including a 50 percent safety margin. Under those standards all 16 pools would have adequate capacity to meet the base load storage needs of the region in 2020, but two, the Swanson River Tyonek and the Cannery Loop Sterling (Table 5.1), may be marginal to store the 23.5 Bcf needed in 2040.

Given that cushion gas will be required and perhaps in volumes equal to or greater than the working gas volume, then any pool with less than 25 Bcf of total gas storage capacity would probably be inadequate to meet the demand level expected in 2040. If the maximum expected volume of cushion gas required were equal to or slightly greater than the working gas, a total gas capacity of at least 50 Bcf would be needed. Two pools fail to satisfy this demand, Swanson River Tyonek and Cannery Loop Sterling and would not be adequate as stand-alone storage facilities. Thus under the foreseen demand scenario, 14 of the pools of Table 5.1 would have the necessary total gas storage capacity, if large volumes of cushion gas are required. Several of these have very large capacity and may be very costly to adequately charge if selected.

Porosity: Five of the pools lack data regarding porosity of the producing interval. Ten of the other eleven pools (Table 5.1) have porosities that are 15 percent or greater. The sole exception is the Beaver Creek Beluga pool, which averages 10 percent. There are no reliable porosity data for the reservoirs in the other five pools; which include the Cannery Loop pools and the Kenai upper Tyonek/Beluga and Beluga pools Table 5.1. By comparison with pools developed within the same interval and in relative proximity the Cannery Loop Sterling pool can be assumed to have porosity of 15 percent or more, and the Cannery Loop Beluga pool probably has porosities in the 10 percent range. Using Tyonek porosities from the Swanson River Tyonek pool it is reasonable to anticipate that the Kenai upper Tyonek/Beluga, Kenai Tyonek, and Cannery Loop upper Tyonek pools have porosities that exceed 15 percent and may range as high as 25 percent. Therefore, at least 14 of the pools have porosity of 15 percent or greater.

Permeability: The ability to produce at high rates requires the reservoir/pool have high permeability. Twelve of the pools have permeability data (Table 5.1) and four lack this information. For these four pools, the probable permeability range can be approximated by comparison with pools developed in similar units in nearby pools. Of the twelve pools with permeability data, at least ten equal or exceed 250 md (Table 5.1) and should be capable of high production rates. An additional three pools, the Kenai Tyonek Kenai upper Tyonek/Beluga, and Cannery Loop Sterling should also have permeabilities in this range. Based on the reported permeabilities or by analog with reported permeability ranges in the Beaver Creek Beluga and Kenai Beluga can be expected to have permeabilities of less than 100 md.

Pay: Net pay thickness is available for all the pools and ranges from a low of 10 ft in the Swanson River Sterling pool to more than 200 ft in the Beluga River Undefined. The net-to-gross ratio ranges from1.0 (Beaver Creek Beluga pool) to 0.39 (Ivan River Undefined), but the gross intervals are unknown for ten of the pools (Table 5.1). A high net-to-gross ratio combined with a pay thickness of 40 ft more provides for an excellent injection/withdrawal scenario. Ten of the pools have net pay in excess of 40 ft and three of those (Beaver Creek Sterling, Beaver Creek Beluga, and Kenai Sterling #6) have net-to-gross ratios in excess of 0.5. However, since

3391

there is little direct data on the nature of the interbedding of non-reservoir facies and the general lack of gross interval thicknesses, this parameter was not directly considered in the ranking of sites.

Pressure: Current pressure in the sixteen pools ranges from a high of 2,462 psi in the Swanson River Tyonek pool to a low of 100 to psi in four of the five Kenai Sterling pools (Table 5.1). Reservoir pressures near or above pipeline pressures are preferred to avoid the need for compression to get the gas into the pipeline system during periods of rapid withdrawal. Ten to twelve of the pools have pressures approaching or exceeding that goal. Pressures of this magnitude also reduce or eliminate the need for large volumes of cushion gas.

Estimated Reserves at 2020 and Estimated Year Depleted: The volume of recoverable native gas expected to remain in the reservoir at start up of the spur line potentially has a direct bearing on the availability or suitability of that pool as a potential storage facility. The estimated deletion rates suggest that only two pools, the Beluga River Undefined and the Kenai upper Tyonek/Beluga will still have significant remaining reserves in 2020; thus, essentially all of the remaining fourteen pools are storage candidates on this basis. The estimated year depleted refers to the date at which the field or pool would be no longer capable of economic production and a major impediment to development as a storage site would have been removed.

Reserves Growth: The life of these fields or pools depends not only on the existing known recoverable reserves but also on the as-yet-undiscovered or undeveloped/delineated resources within the known limits of the producing "structure." Single or two sandstone pools, such as the Kenai Sterling #6 pool are defined so that it is very difficult to "discover" additional reserves, unless a local fault block is indicated. On the other hand, fields like the Beluga River do not have defined single sandstone pools and in the fluvially dominated environment under which the sandstones were deposited, a multitude of additional channel sandstones are without question awaiting the properly placed extension or "exploration" well. The same is true of the Kenai field as a whole. While the probability of finding additional reserves in the Kenai Sterling #5.1 or #5.2 pools is essentially zero, the probability of finding gas within as yet untapped sandstones, present within the mapped outlines of the Kenai gas field is moderate to high. As an example of this Table 5.1 shows no anticipated reserves growth for the Kenai Sterling pools but indicates a moderate probability of reserve additions in the upper Tyonek/Beluga and Tyonek pools.

The effect of reserve additions would be to delay or make more difficult the transformation of a producing gas field into a storage facility. Table 5.1 indicates that six pools are considered to have no future reserve additions and should still be strong candidates for conversion to storage, six have a low probability of reserves growth and thus are good candidates for future natural gas storage; two pools have a moderate probability for reserves growth and combined with their anticipated depletion dates (Table 5.1) would be more risky choices, and one field, the Beluga River field has a high probability of significant reserves growth and on this basis presents one of the greatest challenges for conversion to storage.

These factors plus the infrastructure characteristics, location, pipeline access and other non-reservoir factors are examined and compared to the ideal facility for the purposes of ranking storage candidates in Section 6.

5.1.2 Potential Peak Storage Facilities

The need for a peaking storage facility is uncertain at this time. It is possible that a base load storage facility could be developed with the required working gas capacity, pressure regime, and spare wells for increased production during periods of high demand and thus eliminate the requirement for a smaller high rate, short term storage facility (see Table 2.7). However, it is necessary and prudent to identify possible peak load storage sites, even if they are not required

3392

at the start up of the spur pipeline. The evaluation of peak storage sites is focused on smaller pools with high pressures and the reservoir parameters necessary for high production rates.

Table 1.1 identifies five pools with storage volumes of 6.2 to 15.1 Bcf, which is sufficient to meet the anticipated peak load requirements if large volumes of cushion gas are not required. These pools are presented in Table 5.2.

Table 5.2. Cook Inlet, Potential Peak Load Gas Storage Sites

Field/Pool	Reservoir Volume (Bcf)	Porosity (%)	Permeability (md)	Pay (n/g)	Current Pressure (psi)
Beaver Crk/Tyonek undefined	6.3	(25 ?) estimated	(5-500 ?) estimated	45 ft (??)	1,124
Lewis River/Undefined	14.3	22	45	85 (0.45)	1,687
Lone Creek/Undefined	6.2	19	100	??	475
Pretty Creek/Undefined	11.0	22	~120 estimated	60 (.67)	910
Sterling/Beluga Undefined	15.1	10	0.1	100 ft (??)	3,154

Table 5.2 includes most of the same data as Table 5.1 with the exception of the various reserve categories. The criteria for a peak load facility are presented in Section 3.0 and differ from those for the base load facility in three significant ways: 1) require smaller volumes, a capacity of 5 to 10 Bcf or so; 2) require high reservoir pressures (2.0 to 2.5 times ambient pipeline pressures) to assure high production rates, and 3) access to high volume pipeline.

Reservoir Storage Volume: The reservoir storage volume presented in Table 5.2 is the total gas capacity, which must be adequate to include any required cushion gas as well as working gas. As a consequence, the Beaver Creek Tyonek Undefined and the Lone Creek Undefined pools, at 6.3 and 6.2 Bcf, may have inadequate storage, if a significant volume of cushion gas is required to achieve the necessary pressure to assure high production rates. This is especially true of the Lone Creek Undefined pool, which has a current pressure of only 475 psi. On the sole basis of capacity, the Pretty Creek Undefined, Lewis River Undefined, and the Sterling Beluga Undefined pools appear to be capable of providing the storage volumes necessary for a stand-alone peak load facility.

Porosity and Permeability: Porosity values for three of the pools (Table 5.2) is approximately 20 percent, which is good to excellent. There are no published data for the Beaver Creek Tyonek Undefined pool, but by analogy with the Swanson River Tyonek Pool an average porosity of 25-29 percent can be expected. The porosity of the Sterling Beluga Undefined is low at 10 percent and further downgrades this candidate.

Permeability is low by most Cook Inlet standards in all five pools, but exceptionally low (0.1 md) in the Sterling Beluga Undefined pool. The Lone Creek and Pretty Creek pools (Table 5.2) have permeability in the 100 to 120 md range, which suggests that high reservoir pressures may be required to boost production rates for peak load conditions. The Lewis River Undefined pool has a permeability of 45 md, which would require even higher pressures than the Lone Creek and pretty Creek pools.

Pay: Good to excellent pay thickness is known to be present in four of the pools (Table 5.2). There is no reported pay thickness for the Lone Creek Undefined pool. The pay parameter does not eliminate any of the pools from consideration.

Pressure: Since the peak load storage facilities need to be able to produce large volumes for short periods, it is advantageous for the facilities to operate at relatively high pressures,

3393

definitely above the ambient pipeline pressure. The current reservoir pressure in these five pools spans a low of 475 psi in the Lone Creek Undefined pool to a maximum of 3,154 psi in the Sterling Beluga Undefined pool. Most of these pools will probably require a volume of cushion gas to attain an operating pressure sufficient to meet peak demand flow rates. The sole exception is the Sterling Beluga Undefined pool, which has high pressure at 3,154 psi; however, the reservoir has a permeability of only 0.1 md and on this basis is suspect as a viable storage candidate.

5.1.3 Summary of Future Natural Gas Storage Options

The options for potential future natural gas storage facilities have been addressed from both the base load and peak load perspectives and the preliminary listing consists of 16 base load candidates and five peak load possibilities. Based on geological and reservoir engineering criteria these choices have been evaluated in terms of suitability and are ranked in Section 6 with respect to their approximation to the ideal facility as described in Section 3. While several of these sites may not have the capacity, as stand alone facilities, to fulfill the storage requirements, it might be advantageous to have two smaller storage sites as opposed to one large facility.

5.2 Gas Storage Reservoir Conversion Design Criteria

The potential gas storage fields in the Cook Inlet as described above are partially depleted gas production reservoirs. The conversion of the gas production reservoirs to gas storage reservoirs should are expected to consist of the following steps:

- Gathering of geological and engineering information.
- Assessing the mechanical condition of wells.
- Determining additional surveys needed.
- Determining the working storage content of the reservoir.
- Determining the number of wells needed.

In order to find the working storage content of a reservoir, the range of pressures used must be selected. The upper pressure is set based upon the information available, particularly the mechanical condition of the wells. The pressure range also has much to do with the flow capacity of the wells.

5.2.1 Mechanical Condition

The mechanical condition of the wells and facilities will impact the technical and economic viability. First, it is necessary to gather information on the field, such as:

- Initial reservoir pressure
- Gas production versus reservoir pressure
- Reservoir temperature
- Gas composition, gravity
- Wells drilled, locations, depths
- Reservoir structure
- Degree of water drive
- Well flow capacity
- Mechanical condition of wells.

All wells drilled to the producing horizon must be located, checked by cement bond log, caliper logs, casing inspection logs, and made mechanically sound. Where poor bond exists, squeeze

3394

cementing is required. When the casing is corroded, a liner may be cemented in place or other recompletion techniques with a non-corrosive completion fluid in the annulus. Even wells classed as dry holes should be reopened, re-cemented, or cased as observation wells.

5.2.2 Storage Capacity

Gas production and bottomhole pressure data were examined for each pool in the Cook Inlet area. Plots of P/Z versus cumulative production volumes were constructed for each pool resulting in estimates of original-gas-in-place (OGIP). Example data are shown in Appendix A, Figure A. and A.2. It was assumed that most pools would recover about 90% of OGIP at shut-in conditions. The two OGIP values were compared to insure a reasonable volume was estimated. The only pool for which the two values were not close was the Beaver Creek Sterling; the depletion performance indicates significant water influx occurred. The Kenai Sterling 5.2 also shows this characteristic behavior to a lesser degree but no water production was reported.

5.2.3 Field Deliverability

For most of the gas producing history of the Cook Inlet, supply exceeded demand; therefore, few, if any, wells were produced at capacity. Production history does not reflect the true deliverability of a pool. State of Alaska production records were used to determine the average production performance of each pool on a volume per day per well during the life of the pool. These data were combined on a plot of the P/Z versus cumulative recovery discussed in Section 5.2.2 (Appendix A). A best fit line was drawn to smooth the data over time and reservoir pressure. As noted above, these resulting flow rates are believed to be restricted volumetric rates. The flow rates used in this evaluation were increased by 50% to account for restricted flow rates, possible rate increases resulting from stimulation treatments, and current drilling and completion technology that will be used for any new wells. Marathon reports in a recent report (PN 2007a) that the use of their new Excape completion technology allows completion and fracture stimulation of several zones simultaneously, which will decrease costs and increase well productivity. A more complete well by well examination would be required to determine the amount of rate increase possible.

5.2.4 Design of Well Capacity

When the storage capacity has been set and the character of the market is known, a maximum flow rate for the field at a given content of gas can be estimated. From the estimated production schedule for the reservoir and peak day requirements, the amount of gas in the reservoir and hence the reservoir pressure can be determined. From the field performance curve and the reservoir pressure, the flowing well pressure can be determined for the stated flow rate. These calculations will give the suction pressure to the compressor required to send the gas to market.

5.2.5 Number and location of wells

The addition of the deliverabilities of the wells in the depleted field is likely to give a field deliverability curve that falls short of maximum flow rate. The remedy is to drill more wells or increase the deliverability of the old wells. A structure map of the field with the deliverability of the wells marked on it will provide a good tool to find locations in the reservoir that will give the higher deliverability needed. When drilling takes place, flow tests should be performed to determine the cumulative deliverability so that enough wells can be completed to match the predicted deliverability curve. When there is a high deliverability in part of the field and low in another the tendency may be to drill all new wells in the high permeability area. Care should be taken of creating a pressure sink if a common header gathering system is used. Wells from the

high pressure, low permeability area will transfer the gas to low pressure area. Also to limit the surface piping gathering system, directional and horizontal wells should be considered.

5.2.6 Dehydration, Compression and Metering

Wellhead gas may pass directly to the gathering system without treatment, be heated, have alcohol injected into it or processed by a wellhead dehydration unit. Where central treating is performed, either solid absorbent or glycol absorption processes may be used. The solid adsorbents are more expensive to install, but easier to operate under overloaded, intermittent or short cycling conditions.

The compression requirement depends on the field operating pressure levels and market delivery pressure. Compression horsepower should be selected by an economic study of the number of wells, the field operating pressure level and the schedule of gas withdrawal in winter and need for injection in the summer.

Gas will be metered into and out of storage in American Gas Association standard meters to keep and accurate account of gas in the reservoir. Plant usage, gas losses while blowing of wells and even unaccounted for losses should be recorded.

5.2.7 Planned Observations

When converting a gas field to storage a long-term life is contemplated with a life cycle of over 30 years. The possibility that gas might find a way to leave the reservoir especially through mechanical imperfections should considered.

Gas analyses should be made of all natural gases in the vicinity of the depleted gas field to be converted to a storage field. These analyses may identify any gas found in water wells. A good guide or principle is that the water-filled confining zone above the caprock and in the gas zone on the edges of the field should be observed for both the absence of gas and the degree of pressure change.

3396

6 Comparison of Ideal Storage Facility to Available Options

The criteria and characteristics identified in Section 3.0 are used to compare the variously identified potential storage facilities to the ideal Cook Inlet underground gas storage facility and rank them based on the results of this comparison. The ranking reflects how these options meet the optimum conditions required to satisfy base load and peak load needs associated with gas supply and usage in the Cook Inlet region. Table 6.1 was developed to facilitate the ranking process for the base load storage options but not all the criteria presented in Table 5.1 were used to construct Table 6.1. Some criteria will require additional study at the time of final selection, such as well integrity, water encroachment issues, and legal obstacles to use of the site for gas storage. Issues like access to a pipeline, relative proximity to customers, and tank-like characteristics are generally equivalent in all the remaining candidates and are excluded from the ranking criteria. The parameters of porosity, permeability, net pay, and net-to-gross have been replaced by a deliverability factor (Appendix A), which is the average well production rate derived from P/Z calculations times the anticipated number of producing wells. Finally, the total gas volume required to bring the reservoir to ambient pipeline pressure was added to the ranking process. Appendices A and B provide the basis for this table. Appendix A summarizes the process and values used to establish per well rates and volume of gas required to achieve ambient pipeline pressures. Appendix B shows the scaling used for the ranking criteria, where a ranking of 1 is best.

The limited number of peak load options did not require that a comparable table be constructed for that ranking.

6.1 Ranking Potential Base Load Storage Candidate Sites

The ranking of the base load storage candidate sites is shown in Table 6.1. It is an intermediate step in the final recommendation and reflects the comparison of the quantifiable criteria of the candidate sites to the ideal storage site, which is presented as standard for comparison. Pools with less than the ideal volume of 25 to 50 Bcf are included for consideration, as there may be justification for two or more storage facilities, as insurance against a disruption at the storage site or to reduce the potential need for large volumes of cushion gas at one of the larger sites.

The component values considered to constitute the Ideal Storage Facility are shown in Table 6.1. Pools 11 through 16 of Table 6.1 have very large reservoir size (capacity) and, with the sole exception of the Kenai Tyonek pool, require excessive volumes of cushion gas, 146 to 179 Bcf (Appendix A, Table A.1) to achieve pressures equivalent to the ambient pipeline pressure. As a consequence, these large Kenai Field pools and the Beluga River Undefined pool have been excluded from further consideration.

The Beluga River Undefined pool is somewhat unique. It includes numerous pay sandstones (more than 40) in the Sterling and Beluga formations. These pays are cut by an unknown number of the wells, probably ranging from 2 or 3 per pay to perhaps as many as 10 per pay interval. Individual wells may penetrate and produce from as many as 50 pays. The volume of cushion gas required is nearly 650 Bcf (Appendix A, Table A.2). The issues regarding well integrity, communication between pay zones, and depletion status of individual sandstones indicate that using any of these horizons for storage is not feasible based on current knowledge. Given that the operators continue to delineate and refine their understanding of the interrelations among pays, wells, and production, there may come a time when specific, depleted horizons are viable candidates for storage.

3397

Table 6.1. Preliminary Comparison of Base Load Storage Options to the Ideal Storage Facility

Pool	Reservoir Size (Bcf)	Deliverability (MMcf/d)	Cushion Gas Volume (Bcf)	Depletion Date (Year)	Rank
IDEAL	**25-50**	**120-169**	**0.0**	**<2015**	
Swanson River/Sterling	1	2	1	2	**1**
Beaver Creek/Beluga	2	1	1	4	**2**
Swanson River/Tyonek	1	5	1	1	**3**
Beaver Creek/Sterling	3	4	1	1	**4**
Kenai/Sterling #5.2	2	5	1	1	**5**
Ivan River	2	4	2	2	**6**
Cannery Loop/Sterling	1	5	1	3	**7**
Cannery Loop/Upper Tyonek	2	5	1	3	**8**
Kenai/Sterling #5.1	5	1	5	1	**9**
Cannery Loop/Beluga	3	2	3	5	**10**
Kenai/Sterling #6	5	1	5	2	**11**
Kenai/Sterling #4	5	1	5	2	**12**
Kenai/Sterling #3	5	1	5	3	**13**
Kenai/Tyonek	5	3	3	4	**14**
Kenai/Upper Tyonek-Beluga	5	1	5	5	**15**
Beluga River/Undefined	5	1	5	5	**16**

Reservoir Size: All of the top ten pools have reservoir size that is equal to or greater than the ideal storage facility and meet the anticipated storage needs well into the middle of the 21st century. These are presented in Table 6.1. The two pools, the Cannery Loop Sterling and Swanson River Tyonek pools (Table 5.1 and Appendix B, Table B.1) have reservoir sizes that are at the lower end of the acceptable range and under some conditions may be too small to be stand-alone storage facilities but may provide secondary sites; however, they have the additional constraint in that they have limited deliverability (Appendix A, Table A.2). The other eight pools have sufficient reservoir size to qualify as stand-alone storage sites. Of these, the Kenai Sterling #5.1 pool has a reservoir size of nearly 500 Bcf (Table 5.1) and would require 178 Bcf of cushion gas to reach adequate reservoir pressure; thus, it is eliminated from further consideration on this basis. The results are that seven pools clearly meet the requirements for reservoir size and two additional pools may, but are definitely adequate as secondary pools.

Deliverability: The seven stand-alone and two smaller pools were examined from the aspect of deliverability. Deliverability is defined here as the calculated "adjusted" low average well rate times the number of wells expected to be producing from the storage facility (Appendix A, Table A.1). Table A.1 also shows the "adjusted" average high rate. The low rate was chosen, since it is the rate that must be sustainable as the storage facility is drawn down by production. For example, the Kenai Tyonek pool has been assigned a deliverability of 48 MMcf/d, but at high rates may deliver as much as 72 MMcf/d.

The Beaver Creek Beluga and Swanson River Sterling pools are expected to have deliverability rates of about 60 MMcf/d, and the Cannery Loop Beluga pool has the potential for over 50 MMcf/d. The Ivan River and Beaver Creek Sterling pools are expected to be capable of 30 to 40 MMcf/d, and the Kenai Sterling #5.2, and the Cannery Loop upper Tyonek are rated at 20 to

3398

30 MMcf/d. This reflects the order in which they would be ranked on deliverability. From the deliverability perspective, none of these pools appears to have adequate rates to be stand-alone facilities.

The smaller Cannery Loop Sterling and Swanson River Tyonek pools are rated at 20 to 30 MMcf/d; further diminishing their attractiveness as prospective storage sites.

Cushion Gas Volume Required: The volume of cushion gas required to achieve ambient pipeline pressures is an important consideration. In this evaluation the remaining seven stand-alone and two secondary candidates have cushion gas requirements ranging from zero, in the case of the Kenai Sterling #5.2 pool, to 43 Bcf in the Cannery Loop Beluga pool (Appendix A, Table A.1). This provides an additional measure of the relative value of the potential site, in terms of monetary savings related to gas purchases.

Depletion Date: The remaining candidate pools were next evaluated based on the anticipated depletion date, which is an important factor in this analysis. It is necessary that the potential site be available for storage by the time the spur pipeline is operational. In this scenario, that date has been assumed to be 2020. Many advocates hope to have the pipeline in operation at an earlier date – such as 2017. The assumption was made that a pool would need to be at or near the end of its commercial life before it was converted to storage. Based on this assumption, pools like the Cannery Loop Beluga and the Beaver Creek Beluga, which are not expected to be depleted until 2031 and 2028, respectively, would drop considerably in the ranking. Four of the seven larger pools (Table 6.1) are expected to be depleted by 2020 and would be potentially available for conversion to storage. The Cannery Loop Upper Tyonek pool depletion date is estimated to be about 2022.

Among the smaller pools the Swanson River Tyonek pool is also expected to be depleted by 2020 and would be a possible storage site, while the Cannery Loop Sterling is expected to be depleted about 2023.

The summation and discussion above constitutes the basis for the final list of recommended sites to be considered as potential future base load storage facilities. This listing will deviate in some details from that of Table 6.1 due to a more objective integration of timing, deliverability, and total gas volumes required to attain pipeline pressures. The foregoing discussions of Section 6.1 establish the rational for this approach.

6.1.1 Final Ranking

The ranking of potential future base load storage sites is strongly determined by the following considerations. The other criteria of Tables 5.1 and 6.1 do not vary significantly among the principal potential storage sites and were largely discounted in this final selection process.

- Reservoir size near the ideal volume–excessive capacity may require large volumes of cushion gas in order to achieve optimum operating rates, and capacity significantly below the ideal would require high existing reservoir pressures to minimize cushion gas and maximize working gas. Excessive storage concerns may be offset by using a greater number of wells to keep withdrawal rates at required levels. Reservoir size less than the ideal volume will require multiple facilities, which may be an advantage, when taking disruptions into consideration.
- The deliverability of a reservoir is a function of the number of wells and reservoir pressure and communication. In the scenario presented in the following discussions, the number of wells in each potential storage site is taken to be two times the number of wells utilized during that pools historically high production (Appendix A, Table A.2). It may be possible to achieve greater deliverability by drilling more infill wells.

3399

- Gas volume can be a very costly component of the storage issue. The amount of working gas is taken as a constant (20 Bcf) and the variable is the volume of cushion gas required, which is based largely on the reservoir pressure. Large low pressure reservoirs may require ten's to hundred's of Bcf's of gas to achieve the necessary pressure.
- Depletion prior to 2015 is preferred and prior to 2020 is a virtual necessity. This provides adequate time to plan and prepare the site for gas storage. Those that are depleted after 2020 would need to be deferred or some agreement with the lease holders/operators would need to be negotiated to use part of all the field/pool for storage.

Table 6.2 summarizes the rankings for the potential base load storage site candidates and compares them to the "Ideal Pool". The four criteria are listed with values extracted from Table 5.1 and Appendix A (Tables A.1 and A.2). Despite all efforts to base the decision on quantifiable, objective data, there remains an element of subjectivity in the selection process. Until detailed studies of the candidate pools are completed, the true strengths and weaknesses of these sites will be largely unknown. These ranked potential future base load storage sites are located on Figure 6.1.

Table 6.2. Ranked Candidates for Base Load Storage

Rank	Pool	Reservoir Size (Bcf)	Deliverability[1] (MMcf/d)	Cushion Gas Required (Bcf)	Depletion Date (Year)
	IDEAL POOL	**25-50**	**120-169**	**0.0**	**2010-2015**
1	Swanson River/Sterling	39	60 (160)	9.0	2019
2	Beaver Creek/Beluga	92	61 (106)	16.0	2028
3	Ivan River	97	34 (65)	8.0	2019
4	Kenai/Sterling # 5.2	66	30 (36)	0.0	1981
5	Swanson River/Tyonek	28	29 (89)	6.0	2006
6	Beaver Creek/Sterling	140	33 (51)	24.0	1994

1. The number in the column is the 'adjusted" low deliverability, which is the value used to rank the candidate sites, the number in parenthesis is the "adjusted" high deliverability and can be achieved but is not sustainable for the entire demand season (Table A.2).

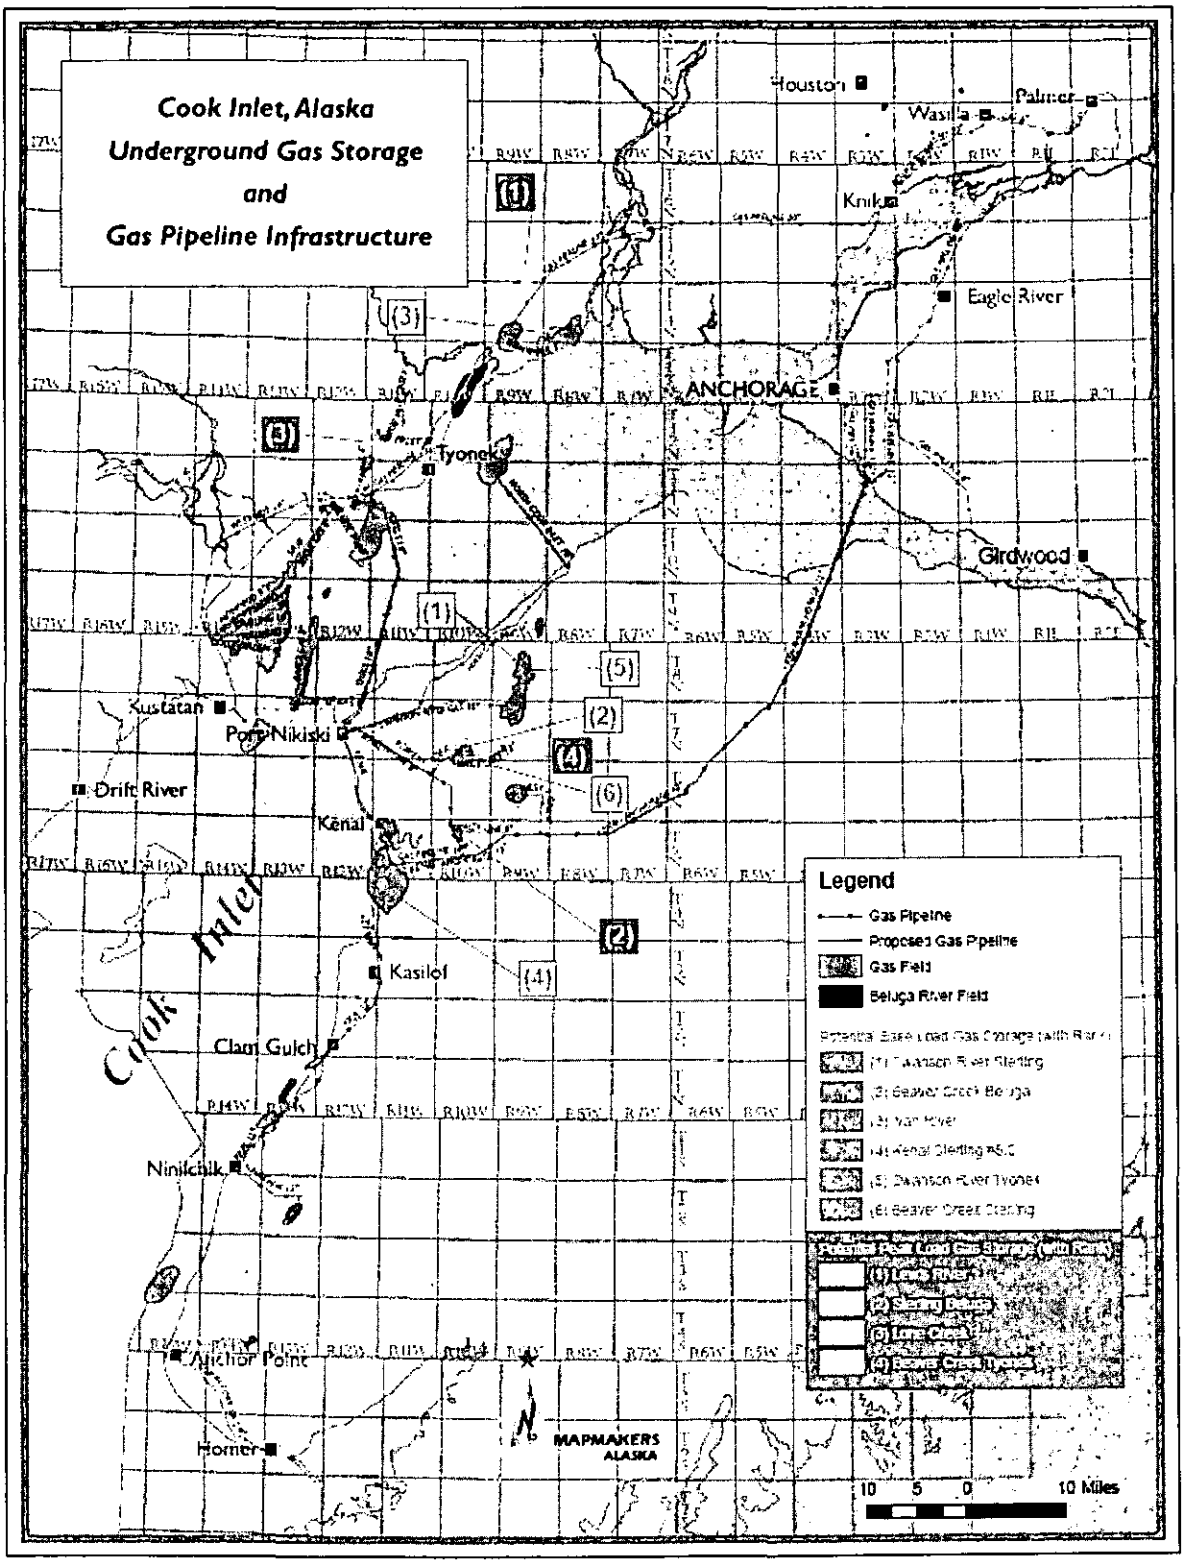
The Swanson River Sterling pool is ranked as number one primarily because it has good-to-high deliverability, is expected to be depleted by 2020 and requires moderate amounts of cushion gas. The reservoir size is adequate but falls in the mid-range of the preferred size class, and expansion of storage capacity is limited to about 10 Bcf.

The Beaver Creek Beluga site has excellent reservoir size, the highest deliverability, but requires more cushion gas and is not expected to be depleted until 2028. These latter two factors prevent it from being ranked No. 1 and could drop it below the Ivan River pool.

The Ivan River pool is rated as the third choice due to the capacity and moderate volume of cushion gas required. The expected depletion date of 2019 is an additional plus. The primary negative factor is the relatively low deliverability of only 34 MMcf/d.

The Kenai Sterling # 5.2 has been depleted since 1981 and has good-to-excellent reservoir size. The capacity is in excess of the requirements and no cushion gas is required to achieve ambient pipeline pressures. The chief problem is deliverability of only 30 MMcf/d using the one-to-one producing well scenario. There are suggestions that water encroachment has been detected, which may have the potential to reduce deliverability.

Figure 6.1. Cook Inlet Map of Storage Locations



3401

The Swanson River Tyonek pool is the smallest of the top six candidates at 28 Bcf, which is at the low end of the preferred size range. It requires a moderate amount of cushion gas, but has a projected deliverability in the one-to-one infill well case of only 29 MMcf/d.

The Beaver Creek Sterling pool is ranked No. 6 because of the problems with water encroachment, which requires a large volume of cushion gas and also reduces the deliverability. There is a large capacity for gas storage, and an early depletion date, but unfortunately that is due largely to the fact the pool watered out. The anticipated deliverability is about 33 MMcf/d.

The results of these evaluations indicate that there are viable potential future underground natural gas storage sites in the Cook Inlet gas fields. However, among the leading candidates there are no true stand-alone reservoirs with regard to sustainable deliverability. Each of the candidate pools meets the capacity needs but under the proposed development none of them are capable of achieving the 120 to 169 MMcf/d design withdrawal rates of Table 2.6 and Section 3.1.

The large pools, Kenai field pools and the Beluga River field, that were eliminated early in the evaluation process would have the deliverability required, if cushion gas volumes well in excess of 100 Bcf were injected (Appendix A, Table A.1). In fact, to establish ambient pipeline pressure, 648 Bcf of cushion gas would need to be injected into the Beluga River field (Appendix A, Table A.2) unless a zone or zones could be successfully isolated while maintaining active production operations. But, why shelve expensive cushion gas when the same volumes could be used as working gas in two or three smaller facilities, such as the Swanson River Sterling and others of Table 6.2? The use of two or more storage facilities also provides a safety measure in the case of a disruption at the storage facility. It would also be advantageous to have a facility located in both sides of the Cook Inlet for similar reasons.

Unless future detailed studies indicate otherwise, these pools in some combination should provide adequate storage for any reasonably forecast seasonal storage needs and achieve the deliverability needs for peak season demand. Under certain conditions, multiple base load storage facilities may negate the need for separate peak load storage, at least for the initial years of the pipelines existence.

6.2 Final Ranking Potential Peak Load Storage Candidate Sites

The need for a separate peak load facility or facilities depends on the ultimate nature of the base load storage facilities. At this time the working scenario requires peak load storage for the short, very high demand periods resulting from conditions of extreme cold weather. As identified in Section 5, there are five pools that would be candidates for potential peak load storage (Table 5.2) and the total storage capacity of these pools ranges from 6.2 Bcf to 15.1 Bcf (Appendix A, Table A.3). These pools are all on the pipeline system and are within 50 to 100 miles of the major consumers. Three key factors were utilized to rank or eliminate the pools. These are same factors used to develop the final rankings for the base load storage: reservoir size, deliverability, and cushion gas requirements.

The five identified pools/fields are of such a size that they meet the requirements of the peak load demand anticipated in 2020. In increasing order of total storage capacity they are (Appendix A, Table A.3):

- Lone Creek Undefined – 6.2 Bcf (requires zero cushion gas),
- Beaver Creek Tyonek Undefined – 6.3 Bcf (0.5 Bcf cushion gas),
- Pretty Creek Undefined – 11.0 Bcf (6.0 Bcf cushion gas),
- Lewis River Undefined – 14.3 Bcf (1.6 Bcf cushion gas),

- and Sterling Beluga Undefined – 15.1 Bcf (2.0 Bcf cushion gas).

The existing Cook Inlet gas storage facilities have gas volumes of this size or smaller and average deliverability rates are about one percent of the total working gas. Based on these averages, maximum deliverability rates may range from a low of 58 MMcf/d for the Beaver Creek Tyonek undefined pool to a high of 131 MMcf/d for the Sterling Beluga Undefined pool (Appendix A, Table A.3). This assumes the reservoirs are filled to capacity and the cushion gas has been discounted.

Based on minimization of cushion gas volume (Appendix A, Table A.3) the Pretty Creek Undefined pool would be eliminated, since nearly half the volume of gas in the pool would be unavailable for withdrawal.

Using the one percent of working gas volume (original gas in place minus cushion gas equals working gas) as average daily deliverability, the only two of the remaining pools are capable of achieving the 80 MMcf/d maximum anticipated peak gas requirements in 2040. The Lone Creek Undefined and the Beaver Creek Undefined pools are fall below the margin of 70 MMcf/d in 2025 for the assumed spur pipeline rates. Both the Lewis River and Sterling Beluga undefined pools have capability to achieve the desired deliverability in 2040 with potentials of approximately 125 to 130 MMcf/d each.

The ranking for peak load storage and reasons are given below, and their location and ranking are given in Figure 6.1.

1.) Lewis River Undefined: low cushion gas requirements, near power generation facility, and maximum potential deliverability of approximately 130 MMcf/d.

2.) Sterling Beluga Undefined: low cushion gas requirements, ready access to Anchorage area gas users, and maximum potential deliverability of 125+ MMcf/d.

3.) Lone Creek Undefined: falls short of the deliverability rate with a maximum rate of about 62 MMcf/d but requires no cushion gas and could provide a secondary peak storage facility.

4.) Beaver Creek Tyonek Undefined: falls short on deliverability rate at 58 MMcf/d but requires only 0.5 Bcf cushion gas and could provide a secondary peak storage facility.

The Lone Creek and Lewis River sites are located on the west side of the Cook Inlet and could easily supply the electrical generation plant, while the Beaver Creek and Sterling Beluga sites are located on the east side and could be dedicated to the gas utilities (Figure 6.1).

6.3 Summary of Potential Underground Natural Gas Storage Candidates

The evaluation has established the existence of six potential base load storage and four peak load storage sites. All the base load storage candidates are of sufficient size, that even with the anticipated cushion gas requirements of the various pools, they retain the capacity for the requisite volume of working gas. At the calculated low, sustainable deliverabilities none of them are gauged to have rates that are sufficient to serve as the sole storage facility and multiple storage units are required. At the calculated high deliverability rates the Beaver Creek Beluga (120 MMcf/d) and the Swanson River Sterling (160 MMcf/d) can meet the demand, but not for sustained periods or for the duration of the high demand winter season.

The four peak storage sites are equally distributed between the west and east sides of Cook Inlet and the Lewis River and Sterling Beluga undefined pools have the potential to meet any anticipated peak demand needs. The Lone Creek and Beaver Creek Tyonek, as a pair could also meet that demand.

3403

7 Costs of Potential Storage Facilities

The Federal Energy Regulatory Commission (FERC) published a report in 2004 describing the "Current State of and Issues Concerning Underground Natural Gas Storage" (FERC 2004) that describes the status and economics of underground storage in the U.S. Storage economics, storage development costs, and the value of storage as described. Storage development costs for a typical 2-cycle/yr depleted reservoir field can cost between $5 million and $6 million/Bcf of working gas capacity (FERC 2004). The costs are site-specific based on:

- the quality and variability of the geologic structure of the proposed site;
- the amount of compressive horsepower required;
- the type of surface facilities needed;
- the proximity to pipeline infrastructure; and
- permitting and environmental issues.

The FERC report (2004) reports that cost-of-service is frequently used to value services offered by regulated storage providers such as interstate pipeline companies. It allows for recovery of costs and a return on capital. The FERC review (2004) of 20 storage operator tariffs indicated a median cost-of-service of $0.64/Mcf. The economic evaluation of Cook Inlet gas storage is expected to be different, most likely higher cost, than Lower 48 gas storage because of the inability to purchase gas at low prices in the summer for storage and sell it at higher prices in the winter season and the more remote and higher cost environment in the Cook Inlet. A cost-of-service estimate is not included in the report.

Estimates for capital and operating costs associated with developing and operating potential Cook Inlet storage facilities are described below. These costs are generic and general at this stage of gas storage design and are intended as a basic guideline to identify the components and provide a reasonable estimate of the magnitude. The regulatory framework and the allowable rates of return have not been established for any regulated storage facilities in Alaska.

The factors influencing the cost of operating the storage facility includes such items as:

- Conditioning the reservoir to serve as a storage facility.
- Designing and developing the gas injection and withdrawal infrastructure including reconditioning of old wells and drilling and completing any new wells required to meet deliverability requirements.
- Construction or upgrades of a pipeline to connect the gas storage facility to the gas distribution system.
- Rentals or other fees to owner of pre-existing infrastructure.
- Costs (price/unit volume) associated with acquiring a gas storage lease and any fees associated with the injection of stored gas, docking (length of time stored), and withdrawal.
- Purchase cost of cushion gas and working gas.
- Operating and maintenance costs.

It is noted in the FERC report (2004) that the cost of purchasing cushion gas is one of the most expensive elements of a storage project. In addition, if there are remaining reserves in the field

3404

at the time of conversion, the value of those stranded reserves may need to be added to the costs or accounted for in the yearly production cycle.

The estimated cost data in Table 7.1 are for a 20 Bcf working gas storage facility requiring 20 Bcf of cushion gas, four new infill wells, and 100 MMcf/d of maximum deliverability to provide a general guideline for expected costs to construct a storage facility in the Cook Inlet. The total capital costs include the purchase of cushion gas. The costs will vary depending on the specific sites chosen. The operating costs needed for a cost-of-service calculation can be estimated as shown based on percentages of the capital cost on an annualized basis. These calculations are not included in this study.

Table 7.1. Estimated Cost of Construction of a 20 Bcf Gas Storage Facility

Expenditure item includes installation	Cost
Compressor 4000 hp	$8,000,000
Dehydration	$2,200,000
Piping and valves	$50,000
Instrumentation and controls including metering	$1,000,000
Civil, concrete etc	$1,750,000
Insulation and paint	$25,000
Electrical bulk material	$500,000
Engineering	$750,000
Make up wells @ $7MM	$28,000,000
20 Bcf cushion gas @ $6.00 Mcf	$120,000,000
Total Capital Costs	**$162,275,000**
Total Capital Costs ($millions/Bcf)	**$8.1 million/Bcf**

Operating cost
Fixed costs: Depreciation, interest taxes, insurance, etc. –41% of annualized capital costs
Direct costs: 3% of annualized capital costs

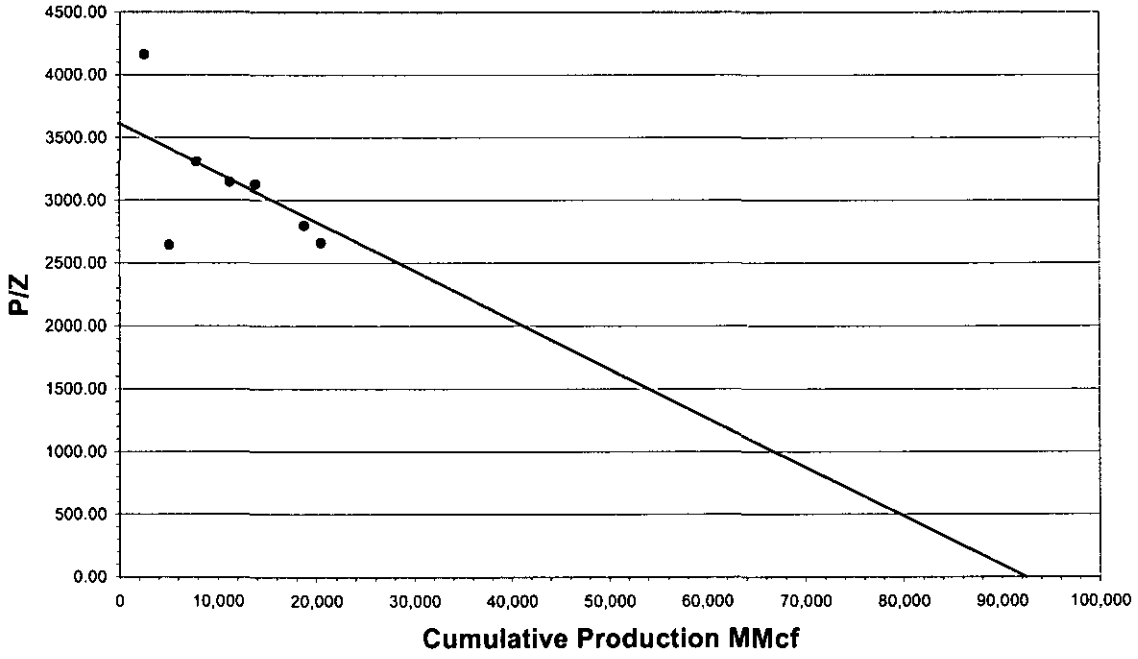
Appendix A: Gas production and bottomhole pressure data were examined for each pool in the Cook Inlet area. Plots of P/Z versus cumulative production volumes were constructed for each pool resulting in estimates of original-gas-in-place (OGIP) as shown in Figure A.1 for the Beaver Creek Beluga Pool. It was assumed that most pools would recover about 90% of OGIP at shut-in conditions. The two OGIP values were compared to insure a reasonable volume was estimated. The only pool for which the two values were not close was the Beaver Creek Sterling and the depletion performance indicates significant water influx occurred. The Kenai Sterling 5.2 also shows this characteristic behavior to a lesser degree but no water production was reported.

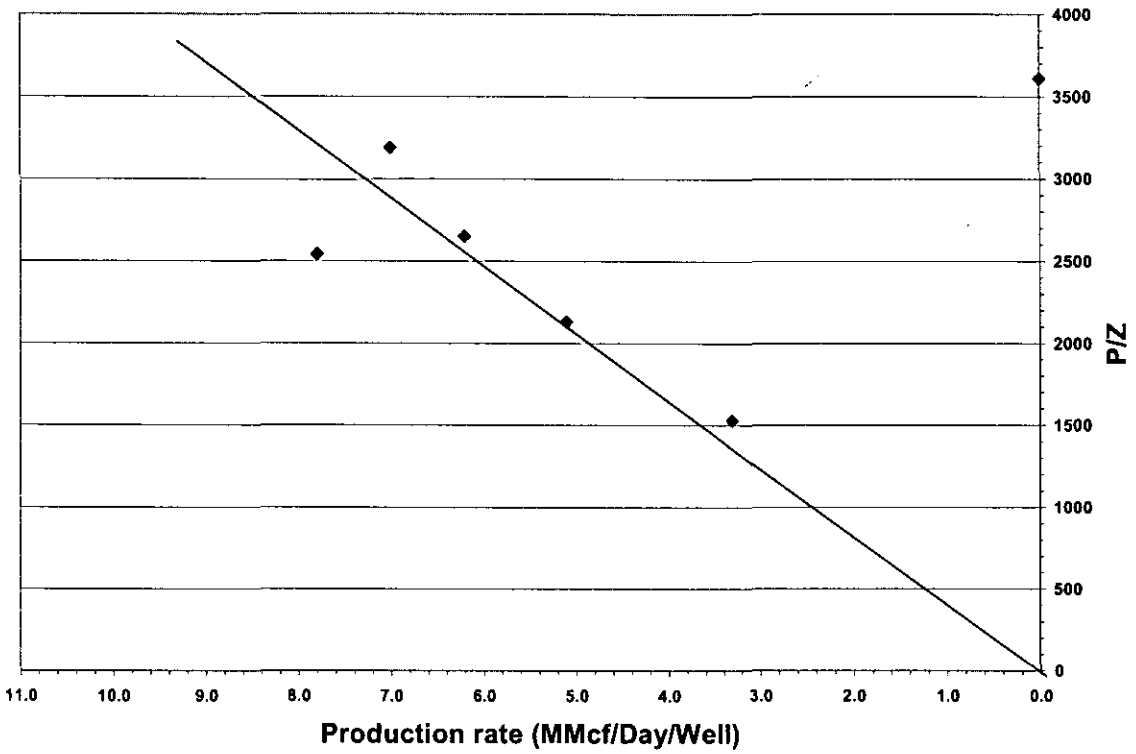
Figure A.1. Beaver Creek Beluga Pool, P/Z versus Cumulative Production



For most of the gas producing history of the Cook Inlet, supply exceeded demand; therefore, few if any wells were produced at capacity. Therefore, production history does not reflect the true deliverability of a pool in the Cook Inlet. State of Alaska production records were used to determine the average production performance of each pool on a volume per day per well during the life of the pool. These data were combined on a plot of the P/Z versus production rate as shown in Figure A.2. A best fit line was drawn to smooth the data over time and reservoir pressure. The flow rates on a per well basis were estimated from these curves for the as a function of pressure. The low rate is determined at a P/Z of 1000 and the high rate at the P/Z with 20 Bcf of Working Gas added to the remaining reserves at 2020. The pressures and rates are shown for each pool in Table A.1.

3408

Figure A.2. Beaver Creek Beluga Pool P/Z versus Production Rate



The historical Cook Inlet flow rates are thought to be restricted in many cases; therefore the flow rates used in this evaluation were increased by 50% to account for restricted flow rates. Possible rate increases resulting from stimulation treatments and current drilling and completion technology used on any new wells as shown in Table A.1 (adjusted average well rates in the last two columns in the table). Marathon recently reported on the use of their Excape completion technology that allows completion and fracture stimulation of several zones simultaneously, which decrease costs and increases well productivity. A more complete well by well examination would be required to determine the amount of rate increase possible in any pool.

Table A.2 shows the Cook Inlet Pools as ranked in Section 6. The table includes the Total Gas Required to have 20 Bcf of working gas above a P/Z of 1000, the number of existing wells, and the number of wells and deliverability with 1-to-1 infill, ½-to-1 infill, and no infill.

Table A.3 contains evaluation data developed by the same methodology used for data in Table A.1 and A.2 for the potential peaking storage pools. None of these reservoirs are expected to have any remaining reserves in 2020. The maximum deliverability is taken to be 1% of the working gas volume.

CS FOR SENATE BILL NO. 208(RES)

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-SIXTH LEGISLATURE - SECOND SESSION

BY THE SENATE RESOURCES COMMITTEE

Offered:
Referred:

Sponsor(s): SENATOR WIELECHOWSKI

A BILL

FOR AN ACT ENTITLED

"An Act requiring the Department of Natural Resources and the Department of Revenue to evaluate current incentives and recommend additional ways to increase gas exploration, development, and production in the Cook Inlet sedimentary basin; and providing for an effective date."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

*** Section 1.** The uncodified law of the State of Alaska is amended by adding a new section to read:

SHORT TITLE. This Act may be known as the Cook Inlet Energy Incentive Act.

*** Sec. 2.** The uncodified law of the State of Alaska is amended by adding a new section to read:

LEGISLATIVE FINDINGS. The legislature finds that

(1) natural gas produced in the Cook Inlet area is used to generate nearly 90 percent of the electricity used in Southcentral Alaska and to heat approximately 130,000 homes and businesses; gas from the Cook Inlet area is vital to the economic well-being of

New Text Underlined [DELETED TEXT BRACKETED]

L
3415

Southcentral Alaska and has been the least expensive energy source available to more than half of the state's population for over three decades;

(2) for many years, there was far more gas in the Cook Inlet area than could be consumed by Alaskans, providing plentiful low-priced gas; however, in recent years, prices have risen dramatically as reserves in the Cook Inlet area are being depleted;

(3) as of January 2010, more than 7.75 trillion cubic feet of natural gas have been produced from the Cook Inlet area; original reserves of more than eight trillion cubic feet have been reduced by production to approximately one trillion cubic feet, with relatively few new proved reserves to replace the natural gas that has been produced in the past;

(4) new field exploration is required to augment remaining reserves and replace historic production; without successful discoveries of new natural gas reserves, natural gas reserves in the Cook Inlet area may be depleted within two decades, and yearly in-state demand may exceed supply within one decade;

(5) geologists estimate that there are trillions of cubic feet of undiscovered and technically recoverable gas in the Cook Inlet area;

(6) additional investment in developing natural gas reserves in existing fields in combination with exploration for new natural gas reserves will be necessary to ensure an adequate future supply of natural gas for Southcentral Alaska;

(7) aggressive investment in exploration and development is constrained by the small size of the in-state market, which prevents natural gas producers in the Cook Inlet area from selling the natural gas they discover within a reasonable period of time.

*** Sec. 3.** The uncodified law of the State of Alaska is amended by adding a new section to read:

STUDY AND REPORT RELATING TO INCENTIVES FOR INCREASING GAS PRODUCTION AND THE EXPLORATION FOR AND MARKETING OF GAS IN THE COOK INLET SEDIMENTARY BASIN BY THE DEPARTMENT OF NATURAL RESOURCES AND THE DEPARTMENT OF REVENUE. (a) The Department of Natural Resources, in consultation with the Department of Revenue, shall

(1) evaluate the effectiveness of incentives the state currently offers to increase exploration for, development of, and production of gas in the Cook Inlet sedimentary basin;

(2) identify, evaluate, and recommend additional incentives that may be enacted by the legislature to increase the exploration for, development of, and production of gas in the Cook Inlet sedimentary basin;

(3) determine the cost, feasibility, and a proposed organizational structure for a new state entity that would take a more active role in the exploration, development, and marketing of gas in the Cook Inlet sedimentary basin and other areas in the state that the commissioner of natural resources finds to have the greatest priority for development.

(b) The Department of Natural Resources and the Department of Revenue shall report the findings, conclusions, and recommendations on the subjects described in (a) of this section to the legislature before November 1, 2010.

(c) In this section,

(1) "Cook Inlet sedimentary basin" has the meaning given in regulations adopted to implement AS 38.05.180(f)(4);

(2) "proved gas reserves" means gas reserves within the definition of "proved oil and gas reserves" in 17 C.F.R. 210.4-10(a)(22) as that paragraph read on January 1, 2010.

*** Sec. 4.** This Act takes effect immediately under AS 01.10.070(c).

ANALYSIS: *(Attach a separate page if necessary)*

SB 208 requires the Department of Natural resources to complete a report by November 1, 2010 for the legislature dealing with potential measures to encourage the investment needed to bring on undeveloped and unproven gas resources in the Cook Inlet.

It is estimated that $200,000 will be required for an outside consultant and legal advice. If the study must be completed by November 1, 2010, DNR will evaluate whether an existing contract with an outside consultant can be modified to include this work. It will be a challenge to complete a thoughtful and comprehensive study in such a short period of time.

Sponsor Statement

CS for SB 208: Cook Inlet Energy Incentives Act

SB 208 tasks the Departments of Natural Resources and Revenue with evaluating existing incentives designed to promote more natural gas exploration and production in the Cook Inlet Basin and recommending additional strategies that might encourage greater levels of production. The departments would be required to complete this analysis and provide recommendations to the legislature by November 1, 2010, in time for legislative action in 2011.

For over three decades, Cook Inlet gas has been vital to the economic wellbeing of Southcentral Alaska. It is has been an affordable source of fuel for more than half of the state's population, heating more than 130,000 homes and businesses. In addition, it is has been used to generate approximately 90% of the electricity used in the region.

For many years, there was far more gas in Cook Inlet than could be consumed by Alaskans. Existing "proven" reserves of gas, however, have declined from more than 8 trillion cubic feet to just over 1 trillion, with relatively little replacement of what has been consumed or exported. Substantial exploration will be required to augment remaining reserves and maintain production levels necessary to meet the needs of the Railbelt. Without this, known reserves of gas within Cook Inlet may be depleted within two decades, and yearly instate demand may exceed supply within one decade. Investment both within existing fields and in prospective new areas will be required.

Fortunately geologists estimate there are trillions of cubic feet of undiscovered and technically recoverable gas in the Inlet. The challenge will be to encourage companies to invest in the Inlet and "prove up" these vast reserves, so that Alaskans will have access to this local, affordable supply of gas.

This bill tasks the Departments of Natural Resources and Revenue with the responsibility of identifying and evaluating new strategies to ensure that Alaskans have access to this gas. It sets an ambitious timeline for this analysis, mandating submission of recommendations to the legislature by November 2010.

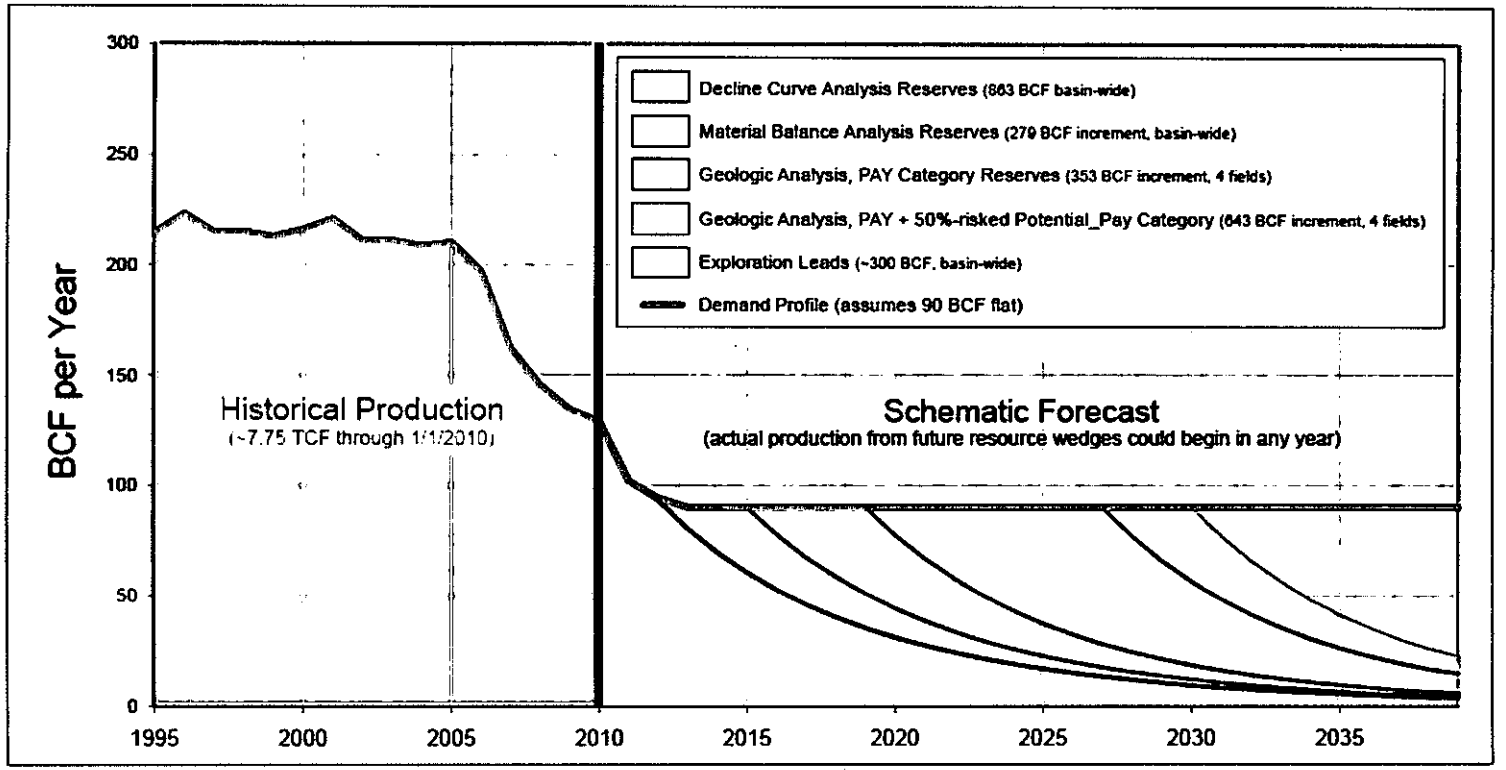

Figure 14. Hypothetical production forecast for the Cook Inlet basin showing increments of reserves and resources identified by engineering and geological analyses discussed in text. This schematic diagram assumes that near-term production will come from gas volumes documented by the most conservative estimation techniques. Successive wedges are introduced with progressively lower certainty regarding commerciality, volume, and timing of first production. Production from future resource wedges could begin in any year, resulting in a more complex forecast, and extending the production lifespan of previous wedges. On the other hand, we are unable to predict the commercial thresholds at which volumes from future wedges become economic to recover. Wedges show gas volume increments from basin-wide decline curve analyses (red), basin-wide material balance analyses (orange), deterministic geologic mapping of PAY (green), and 50 percent-risked Potential_Pay (yellow) in four large gas fields (Beluga River, North Cook Inlet, Ninilchik, and McArthur River Grayling gas sands). The last wedge (gray) is a more speculative estimate of aggregated gas volumes that may be recoverable from the exploration leads discussed in text.

EXECUTIVE SUMMARY

Over the past year, there has been widespread concern over whether the existing system of natural gas production and delivery in the Cook Inlet basin can continue to meet the energy demands of south-central Alaska. Of most immediate concern is whether there may soon be shortfalls during brief spikes in peak gas demand brought about by severe winter weather. A thorough understanding of the problem requires consideration of at least two major sets of issues. The first set includes geologic and engineering details regarding how much gas remains to be recovered from Cook Inlet fields, and what steps are required to access it. The other is a complex set of commercial and infrastructure factors that determine the ability to provide gas to the end user. This report addresses geologic and engineering issues regarding gas reserves and resources. Issues regarding the economics of drilling additional wells, recompleting existing wells, optimizing infrastructure, and the ability to sell the gas into the Cook Inlet market are beyond the scope of this paper. Nevertheless, as is the case with most maturing gas provinces, the costs and financial risk associated with accessing and producing the additional reserves and potential reserves identified by this study will increase with time, likely contributing to increases in the price of gas.

Reservoir engineering and geological analyses were undertaken independently of one another to evaluate the volumes of gas remaining in existing fields. These analyses are preliminary, based on data currently available to the Division of Oil and Gas. All 28 of the currently producing Cook Inlet gas fields were evaluated by applying decline curve analysis and material balance engineering methods to publicly available production data obtained from the Alaska Oil and Gas Conservation Commission (AOGCC). Based on extrapolations of production trends, these engineering techniques were used to derive estimates of remaining proved and probable reserves.

Four of the gas fields judged from engineering analyses to have the greatest remaining potential were selected for further study via detailed geologic analyses: Beluga River, North Cook Inlet, Ninilchik, and the McArthur River Grayling gas sands. Development geology techniques yielded volumetric estimates of original gas-in-place and initial recoverable gas (estimated ultimate recovery) for these four large fields, drawing and preserving important distinctions between gas volumes in known pay intervals versus gas in potential pay intervals. Comparison of geologically based recoverable gas with cumulative production yielded estimates of the remaining recoverable gas in the four fields.

The independent engineering and geologic approaches pursued in this study allow the reporting of remaining gas volumes at varying levels of production certainty and readiness. The total proved, developed, producing (PDP) reserves remaining to be produced from all existing fields in the Cook Inlet is estimated at 863 BCF. This volume was identified by decline curve analyses and assumes sufficient investment to maintain existing wells. Additional probable reserves that would be recoverable by increasing investment in existing fields are estimated at 279 BCF. This volume is identified as the basin-wide difference in the results of material balance methods and decline curve analyses. Geologic evaluations of the Beluga River, North Cook Inlet, Ninilchik, and the McArthur River Grayling gas sands reservoirs indicate the potential for an additional increment of 353 BCF in high-confidence pay intervals, and another

3427

possible increment of 643 BCF (in the 50 percent-risked case) from lower-confidence pay intervals, both of which are arguably not in communication with existing wellbores, and thus cannot be estimated from the engineering methods. These incremental volumes are the difference, for these four gas fields, between the remaining recoverable gas estimated in geologically identified high-confidence pay and potential pay minus that estimated by material balance analyses.

These geologically identified volumes of known and potential nonproducing gas represent a significant energy resource, which if developed, have the potential to supply local demand well into the next decade. This forecast assumes that exports of gas from the basin will be curtailed during demand shortfalls, and cease altogether at the closure date of the current export license (March 31, 2011). It also assumes that no new significant demand will be developed until additional resources are discovered in new fields.

We also discuss higher-risk contingent resources that await confirmation and delineation in exploration prospects outside of producing areas where previous well penetrations suggest follow-up drilling may be warranted. Finally, we recognize, but have not attempted to quantify, potential undiscovered gas resources in unexplored areas or underexplored plays within the Cook Inlet basin. Significant work is underway by government and industry stakeholders to analyze this exploration potential, which could be an integral part of the region's energy portfolio well into the future. The findings of this study suggest there are a variety of short-, medium-, and long-term opportunities that have the potential to meet the energy demands of south-central Alaska over the next decade or more.

3428

INTRODUCTION

Purpose of This Study

South-central Alaska has relied on production from Cook Inlet gas fields to meet demand for electrical power generation, heating, and industrial use since commercial production began in the 1950s. Exports of liquefied natural gas (LNG) have been another significant sector of the region's gas market since 1969. A salient characteristic of south-central Alaska's natural gas demand profile is the pronounced seasonal fluctuation in fuel consumption for heating and power generation. In addition to the highly predictable difference between average summer usage and average winter usage, there are large, less predictable demand spikes during winter cold spells. Up to this point, producers have been able to meet spikes in consumer demand by incrementally adjusting production at the field and wellhead level. Curtailing industrial consumption, for example, closure of the Agrium US, Inc. fertilizer plant in Nikiski, has also played an important role in utility load management. More recently however, as an increasing number of Cook Inlet's fields show significant decline, concern has arisen over the producers' ability to provide sufficient gas to consumers during winter demand spikes, with some predicting shortfalls beginning in 2011-2013 (Petroleum News, 2009). This report summarizes the results of engineering and geologic analyses conducted within the Alaska Division of Oil and Gas (DOG) to better quantify remaining accessible reserves in the Cook Inlet's major gas fields, and to categorize these volumes relative to readiness and certainty of production. Many closely related economic and infrastructure considerations are outside the scope of these analyses.

As Cook Inlet gas (and oil) fields mature, it is prudent to re-evaluate the original gas-in-place (OGIP) and compare that against cumulative production in order to assess remaining reserves. Most oil and gas fields in Alaska have outperformed their initial estimates for original in-place hydrocarbons (for example, Blasko, 1974), so it is critical for resource managers to continually re-evaluate the reserves picture as new data and new technology is acquired. The purpose of this study is to examine and analyze the currently available engineering and geologic data to determine if enough gas is available to meet the anticipated demand for south-central Alaska for the next decade. The analysis assumes sufficient market opportunities will exist to drive appropriate investment in more complete field development operations, infrastructure debottle-necking and upgrades, and commercial alignment between unit partners. Both engineering and geologic methods were employed in the analysis of existing fields, and a complete description of the methodologies can be found in the body of this report. The results of this work will help determine how much gas remains in the Cook Inlet fields so that realistic development scenarios can be formulated. The economics of drilling additional wells, recompleting existing wells and the ability to economically transport and sell the gas into the Cook Inlet market are important commercial issues that were not addressed by this work.

Although new gas found through exploration activity outside of existing field areas will be an important part of the long term reserves outlook for the Cook Inlet, those resources can take years to identify and bring on line, so they may not affect the short-term development issues addressed in this study. Nevertheless, a brief discussion on exploration potential in the basin is included in this report, and the reader is encouraged to keep up-to-date on subsequent state and federal publications that will further address exploration potential.

Regional Geology

The Cook Inlet basin is part of a northeast-trending collisional forearc setting that extends approximately from Shelikof Straight in the southwest to the Wrangell Mountains in the northeast. The basin is bounded on the west and north by granitic batholiths and volcanoes of the Aleutian volcanic arc and Alaska Range, respectively, and on the east and south by the Chugach and Kenai Mountains, which represent the emergent portion of an enormous accretionary prism (Haeussler and others, 2000; Nokleberg and others, 1994). High-angle faults, including the Bruin Bay, Castle Mountain, and Capps Glacier faults, modified the west and north sides of the forearc basin (for example, Barnes and Cobb, 1966; Magoon and others, 1976). The Border Ranges fault lies near the eastern edge of the forearc basin (fig. 1; for example, Magoon and others, 1976; Bradley and others, 1999), but is locally overlapped by Cenozoic basin-filling strata.

Mesozoic strata, having a regional composite thickness of nearly 40,000 feet, represent the foundation upon which the Cenozoic forearc basin developed (Kirschner and Lyon, 1973; fig. 2). Mesozoic strata extend continuously at depth under Tertiary nonmarine deposits and are exposed along the up-turned western and eastern margins of the forearc basin (Fisher and Magoon, 1978; Magoon and Egbert, 1986). Tertiary nonmarine strata, which are up to 25,000 feet thick in the axial region of the basin (Boss and others, 1976), consist of a complex assemblage of alluvial fan, axial fluvial, and alluvial floodbasin depositional systems (Swenson, 2002). These Tertiary nonmarine strata are the primary oil and gas reservoirs in the basin.

The Tertiary stratigraphy of the basin is complex (fig. 2) and includes a basal unnamed unit of Paleocene to early Eocene age that is correlative to parts of the Wishbone, Chickaloon, and Arkose Ridge Formations in the Matanuska Valley segment of the basin (an older uplifted segment of the forearc basin according to Trop and Ridgway, 2007). The overlying stratigraphic units were assigned to the Kenai Group by Calderwood and Fackler (1972) and originally included, in ascending order, the West Foreland Formation, the Hemlock Conglomerate, the Tyonek Formation, the Beluga Formation, and the Sterling Formation. Boss and others (1976) subsequently restricted the Kenai Group to the Tyonek, Beluga, and Sterling Formations on the basis of interpreted unconformities between the West Foreland and Tyonek. They considered the Hemlock Conglomerate a member of the Tyonek Formation. The overlapping ages of these formations shown in figure 2 demonstrates the time-transgressive nature of the Tertiary stratigraphy (McGowen and others from Swenson, 2002). Limited outcrops around the perimeter of the basin demonstrate dramatic facies changes from basin axis to basin margin locations.

Large hydrocarbon traps were formed in the Tertiary nonmarine strata of the upper Cook Inlet when the thick succession of reservoir facies were deformed into a series of north-northeast-trending, discontinuous folds arranged in an en echelon pattern. Most fold structures formed by right lateral transpressional deformation on oblique-slip faults (Haeussler and others, 2000). Many of these faults extend into underlying Mesozoic age marine rocks. These structures are attributed to the ongoing collision between the Yakutat block in southeastern Alaska and inboard terranes across much of southern and central Alaska (Trop and Ridgway, 2007). This collision is resulting in the progressive collapse of the forearc basin from the northeast toward the southwest (analogous to a closing zipper; Trop and Ridgway, 2007). All producing oil and gas fields in upper Cook Inlet are asso-

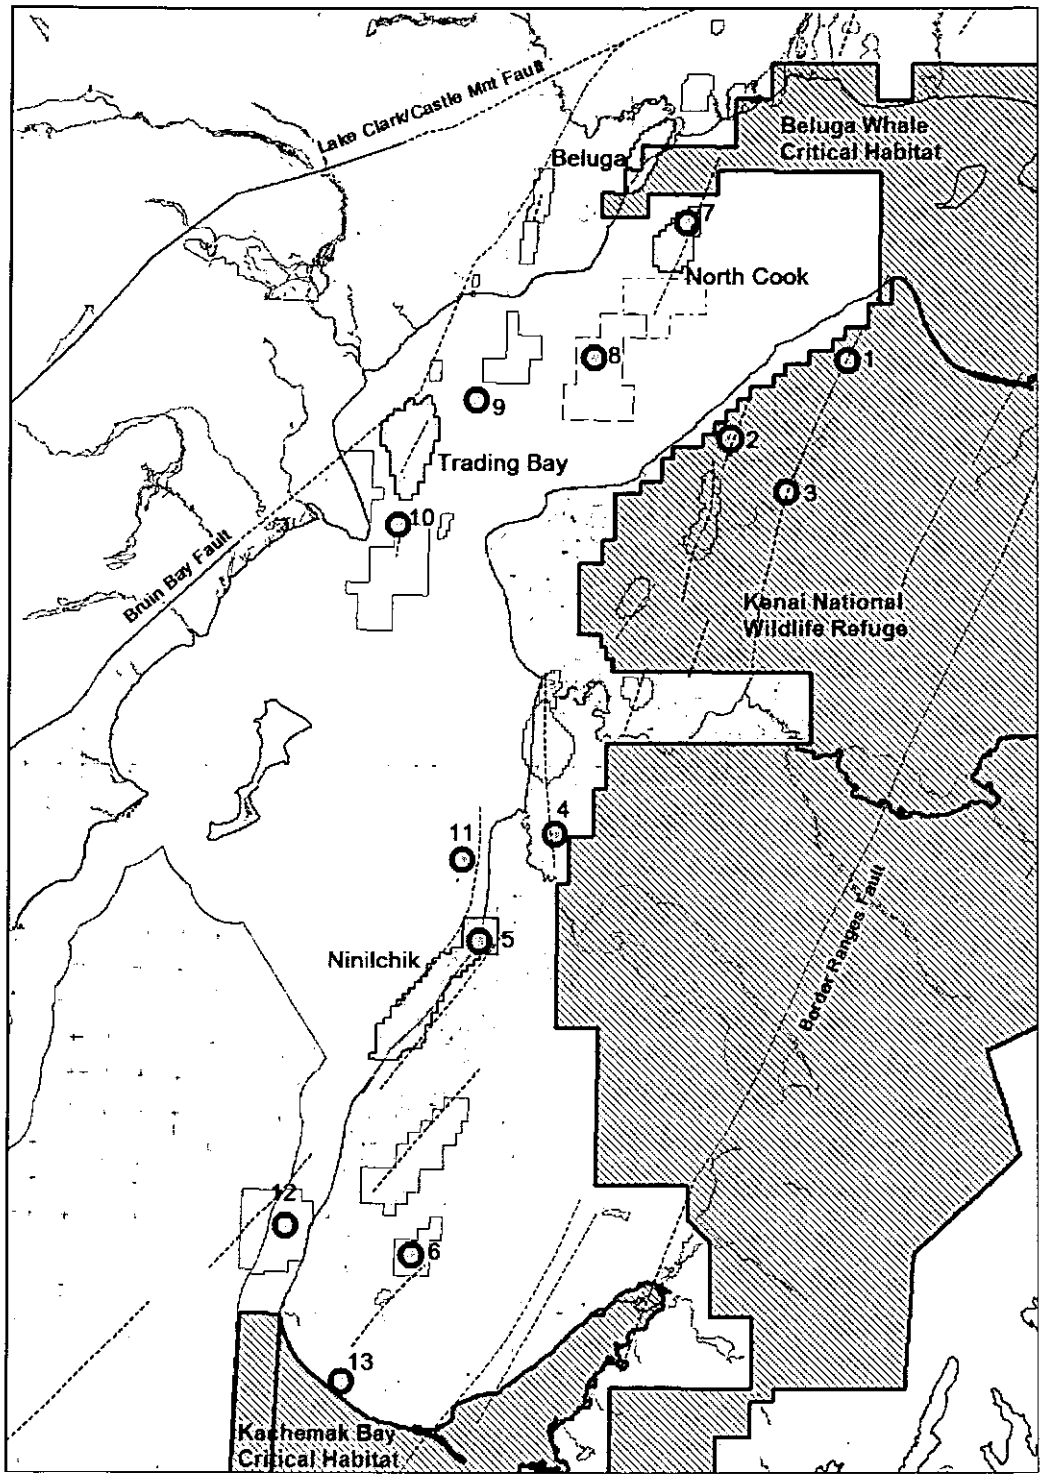

Figure 1. Location map of the central part of the Cook Inlet basin showing oil and gas producing units (the four major gas fields with geologic reserve estimates are highlighted with pink fill); major faults and fold axes; undeveloped exploration leads (numbered green dots); and areas with exploration access restrictions (green hachure).

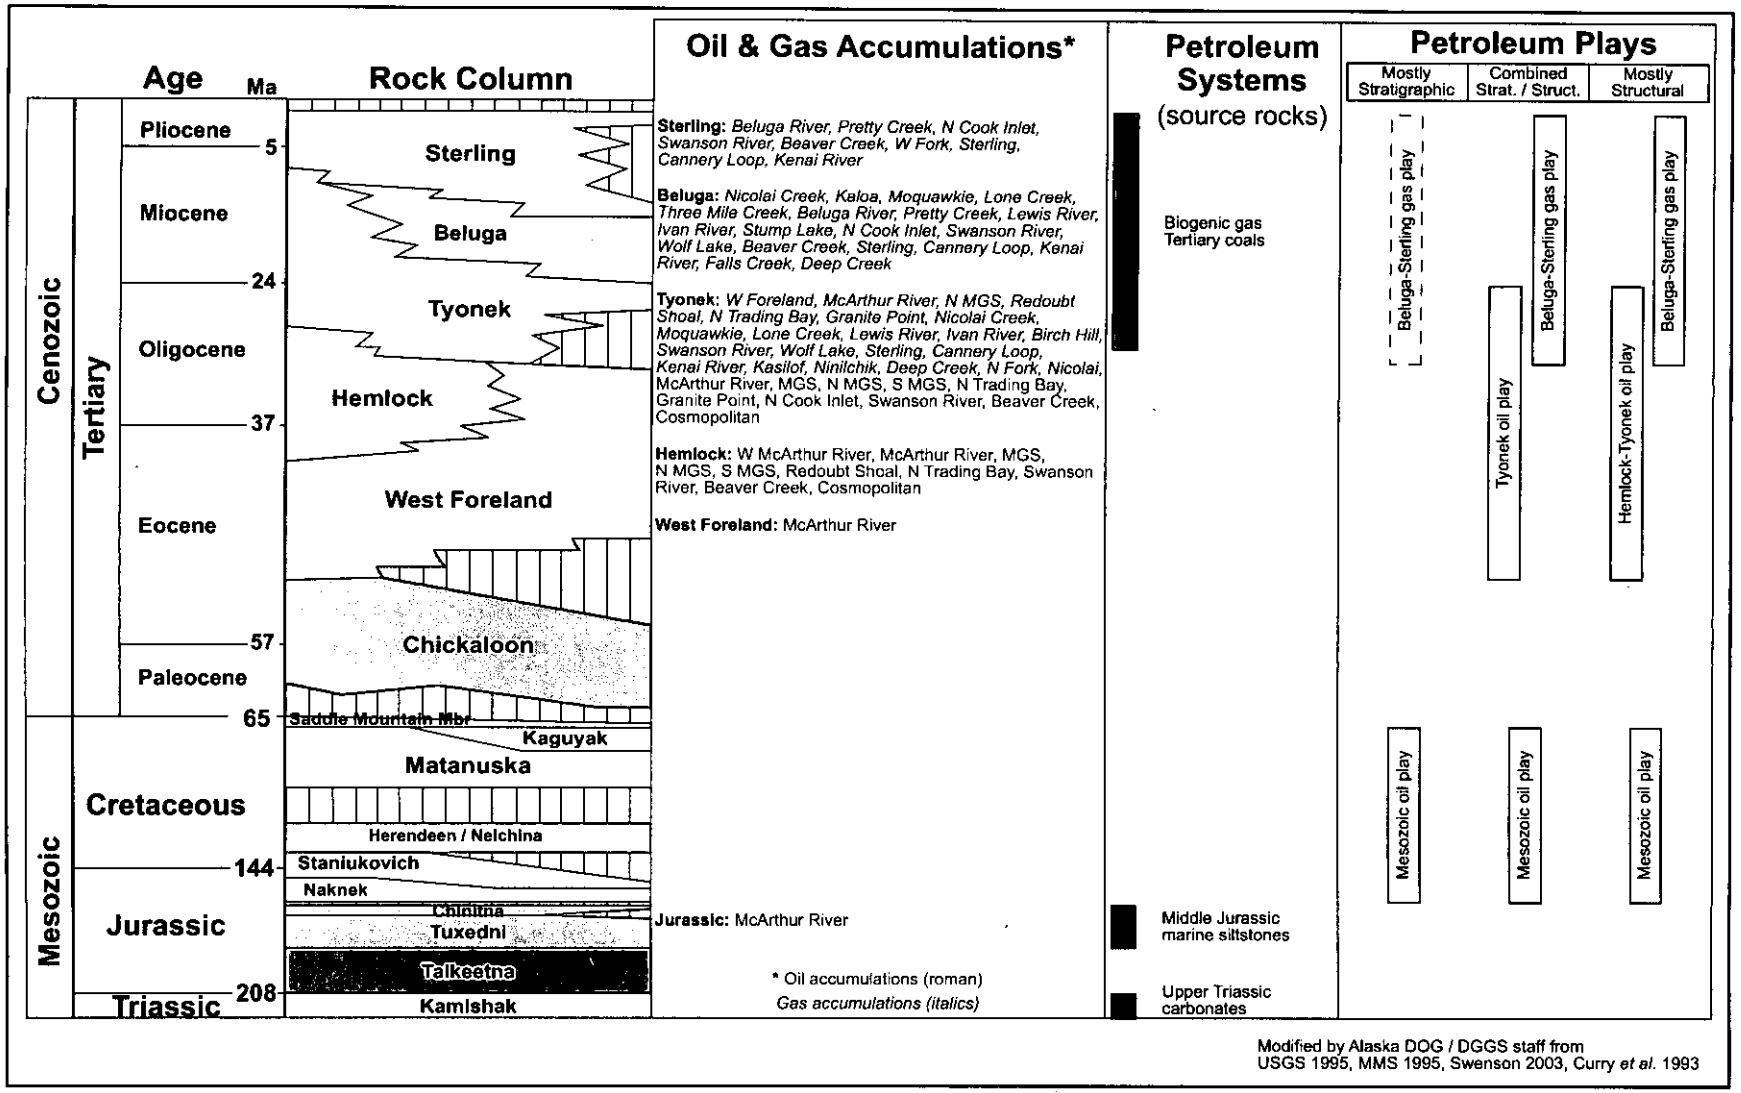

Figure 2. Chronostratigraphic and petroleum systems summary chart for the Cook Inlet basin

ciated with structural closures. Gas in most fields resulted from release of biogenic methane as thick coal-bearing successions were uplifted along fold structures.

Cook Inlet Petroleum Systems

In order to understand how a natural resource can be optimally developed, it is important to understand its origin and history. The oil and gas produced from the Cook Inlet fields (fig. 1) come from two separate and distinct hydrocarbon systems. The oil, along with minor amounts of associated gas, was generated in deeply buried Mesozoic source rocks by thermogenic (temperature-driven) processes. Expelled from the source rock under high pressure, these buoyant hydrocarbons migrated upward along faults and permeable strata into trapping geometries in Hemlock and lower Tyonek sandstones of Tertiary age (fig. 2). More than 1.3 billion barrels of oil have been discovered and produced from these reservoirs since 1958.

The petroleum system that is the focus of this paper, and has become the recent focus of many south-central Alaskans, is a biogenic system that produced dry natural gas (methane). The generation, migration, and trapping of this resource are significantly different than that of the oil. The biogenic methane, which accounts for more than 90 percent (Claypool and others, 1980) of the nearly 7.75 trillion cubic feet (TCF) of historic gas production in Cook Inlet, was sourced from the widespread coals in the shallower part of the Tertiary section. Unlike thermogenic hydrocarbon generation, biogenic gas generation relies on bacteria that thrive only at relatively shallow burial depths where temperatures are less than about 80°C. Biogenic methane begins to form by decay of organic matter in the near surface environment. As deposition proceeds and bacterial methane continues to form, large quantities dissolve in the surrounding pore waters and remain adsorbed in coal beds. In the Cook Inlet basin, late-stage uplift lowered the pore fluid pressure and liberated the gas from solution in the coals, allowing it to migrate relatively short distances into fluvial sandstone reservoirs in the Tyonek, Beluga, and Sterling Formations. The complex geometries of these Tertiary reservoir sandstones, as well as the coal-to-sand migration pathways, provide both challenge and opportunity for field development. The same geologic complexity that makes it difficult to identify all potential reserves in a field also provides ubiquitous isolated reservoirs containing a significant amount of untapped gas potential.

PROCESS, DATA, AND COMPARISON OF ANALYTICAL TECHNIQUES

This report presents preliminary findings regarding forecast production, original gas-in-place, and estimated remaining reserves for Cook Inlet natural gas fields. We estimate remaining reserves at varying levels of production certainty using reservoir engineering and development geology methods (Table 1). The two approaches are very different, both conceptually and in analytical scope, and are discussed separately. It is important that multiple analytical methods are employed in analyzing complex fluvial systems like the Cook Inlet gas reservoirs because each method evaluates a slightly different portion of the reserves picture. Because they are based on extrapolations of historical production data, the engineering approaches are limited by the extent of field development that has occurred to date, and yield the more conservative estimates. The geologic analyses calculate larger reserve estimates because they assess the entire field, including upside potential from nonproducing intervals that may be capable of produc-

	Engineering Analyses		Geologic Analyses	
	Decline Curve Analysis	Material Balance	Geologic, PAY category only	Geologic, PAY + 50%-risked Potential_Pay
Sum 4 Fields	697	860	1,213	1,856
Sum Other Fields	166	282	not analyzed	not analyzed
Total	863	1,142	--	--

Notes: All values in BCF. Other fields are 24 remaining Cook Inlet producing gas fields (see Table 2).

Table 1. Comparison showing a range of estimated remaining gas reserves based on separate engineering and geologic analyses of four fields: Beluga River, North Cook Inlet, Ninilchik, and McArthur River (Grayling gas sands). These results suggest that geologic analyses identify gas reserves in pay and potential pay intervals that have not been fully developed, and therefore, cannot be represented in the engineering-based estimates.

ing. Throughout this report, we consistently present estimated gas volumes rounded to the single BCF to facilitate comparisons with values in the tables and appendices that represent calculated results. In reality, most of these estimates carry considerable uncertainty, and many could be rounded at lower levels of apparent precision for purposes of discussion outside of this text.

The engineering approaches are introduced first, followed by a discussion of the deterministic geologic approach. Two primary reservoir engineering methods, decline curve analysis and material balance analysis, were applied to 28 producing gas reservoirs to determine proved developed producing (PDP or 1P) reserves and probable (2P) reserves (Society of Petroleum Engineers and others, 2007).

Decline curve analysis (DCA) reflects only that gas that has been in communication with producing wellbores and has been produced relatively continuously over the life of the field. It cannot account for gas shut in early in field life, gas behind pipe and never perforated, nor gas between wells with large spacing. Additionally, estimates of original gas in place (OGIP) derived from material balance techniques (MB) represent only gas that has produced into a wellbore at some point during field life. The geological analysis calculates an OGIP for the entire structure and attempts to include potential untapped gas sands that were logged in the wellbore but never produced, marginal quality reservoirs that were not perforated at initial field development, or isolated reservoirs that lie between existing wellbores because well spacing is not sufficient to encounter them.

The engineering analyses relied on pub-

lic domain production and pressure data that producers report to the Alaska Oil and Gas Conservation Commission (AOGCC) on a monthly basis. Thus, in order to estimate deliverability, a daily rate must be calculated from the reported monthly values in order to predict short term demands. Decline curve analysis (DCA) was primarily used to forecast production and estimate remaining recoverable gas (RRG). Material balance methods were used to validate DCA estimates and determine OGIP and RRG. The future production rates and volumes have been compared to anticipated demand to predict gas availability in the Cook Inlet basin over the next decade.

The geologic analysis was limited to four of the five largest existing fields that are still being actively developed and that the engineering analyses indicate have the greatest share of future gas production potential. A deterministic geologic approach was used to identify pay and potential pay in the North Cook Inlet, Beluga River, Ninilchik, and the McArthur River (Grayling gas sands) fields. The geologic analysis utilized well log curves, drilling and completion history, pressure history, and production data to identify and map pay at the field scale as a basis for new calculations of original gas-in-place, initial recoverable reserves, and remaining reserves.

The Kenai gas field was not included in the geologic analyses because it is a federal unit and the State has limited well data and no seismic data over the field. We did conduct engineering analyses of the Kenai field because the production data are publicly available from the AOGCC. Of all the fields in the basin, the Kenai gas field has been subjected to the most aggressive second- and third-cycle development efforts to maximize recovery and access gas in tight reservoirs. As discussed later, the Kenai field is an excellent example of the late-life reserves growth that can be achieved with continuing development investment.

Table 1 organizes the gas reserve estimates of this study relative to readiness and certainty of production. In standardized reserves and resources nomenclature (for example, Society of Petroleum Engineers and others, 2007), our estimates derived from decline curve analysis can be considered proved reserves, whereas estimates identified from material balance represent probable reserves. The geologically derived estimates represent a mix of proved, probable, and possible reserves as well as some contingent resources. These analyses do not include economic filters, so it is not possible to draw a line between commercial reserves and subcommercial resources. Prospective resources, those remaining to be discovered, are discussed in less specific terms in the exploration potential section of this report. Estimates of exploration resources reflect a combination of in-house exploration experience, interpretation of publicly available geological and geophysical data, and resource assessments and other reports published by the U.S. Geological Survey and the U.S. Department of Energy.

RESERVOIR ENGINEERING ESTIMATES

Decline Curve Analysis

Decline curve analysis (DCA) is a standard petroleum engineering technique whereby current production trends are extrapolated into the future to estimate rates, and by integration, the remaining recoverable gas (RRG). As outlined above, DCA is based only on historically and currently producing gas that is in communication with the producing wellbores. By definition, DCA cannot measure gas reserves that exist in hydraulically isolated reservoir volumes (zones, sandbodies, or structural compartments) until that part of the reservoir is perforated for production

into the well. RRG in this context is only the developed gas left in the container. A reservoir DCA will change significantly during the period it is being developed. Early estimates will under-predict RRG if the reservoir is not fully developed (fig. 3).

The decline curve analysis is a relatively conservative look at future gas production because it represents a snapshot influenced by past events, and does not fully account for future events. Therefore, the forecast is a prediction of future performance assuming past trends will remain the same and all investment to support it will remain constant. Decline curves were based on monthly AOGCC production volumes or rates plotted on a logarithmic scale versus a linear time scale in months. The semi-log plot dampens minor data fluctuation and lends itself to a linear extrapolation referred to as exponential decline. The DCA portion of this work is based on the assumption that the reservoirs exhibit volumetric (tank-like) behavior. The linear decline extrapolation yields RRG by integration of the area under the line (fig. 3).

DCA recoveries were calculated on a well basis for the larger units where wells produce nearly continuously and on a pool, reservoir, or unit basis for every field that is active. There were several cases where decline appeared hyperbolic, which, on semi-log charts, plots as a curve in early to mid-life and becomes linear in late field life. Hyperbolic decline is often characteristic of low permeability reservoir rock, but it may be masked by water production, production at rates below capacity, and other well events. Another factor affecting decline is water influx from an underlying aquifer. If the aquifer is large compared to the gas reservoir, water influx will act to partially replace the gas produced from the pore space and sustain the reservoir pressure in the early to mid-life of the reservoir. A derivative effect is that as water influx into the wellbore increases, the pressure gradient increases, resulting in a steepening of the decline rate. Water influx in the Cook Inlet basin reservoirs is complicated by fluvial depositional systems that contain stratigraphically discontinuous layers of separate productive sands. Individual layers may not be in pressure communication and most likely have different gas-water contacts, especially in the Beluga and Tyonek sands. Production performance changes as water invades some intervals, effectively shutting off production and trapping gas, resulting in decreased overall recovery.

The DCA forecast of remaining proved, developed, producing gas in the 28 Cook Inlet fields amounted to a total of 863 BCF, with 697 BCF in just four fields (Beluga River, North Cook Inlet, Ninilchik, and the McArthur River Grayling gas sands). The DCA forecast rate represents an "annual average rate forecast" as depicted in figure 4. This estimate should be viewed as fairly conservative because of certain assumptions inherent in the technique. The forecast rate is usually conservative where wells and reservoirs do not produce at maximum capacity on an annual basis. This limitation applies to the Cook Inlet gas market, which is notable for its large demand swings between summer and winter. Thus, the daily or monthly production from the reservoir or individual well does not always represent its productive capacity. Daily production rates for gas wells are dictated by daily or monthly demand, volumes specified in production contracts, and LNG export volumes. In addition, the reservoir and wells often produce at surface pressure considerably higher than pipeline conditions (choked back). Under those conditions, DCA cannot accurately predict future production capability. Another difficulty is accurate representation of future investments and projects to sustain rates such as drilling wells, remedial activity, new perforations, well workovers, and

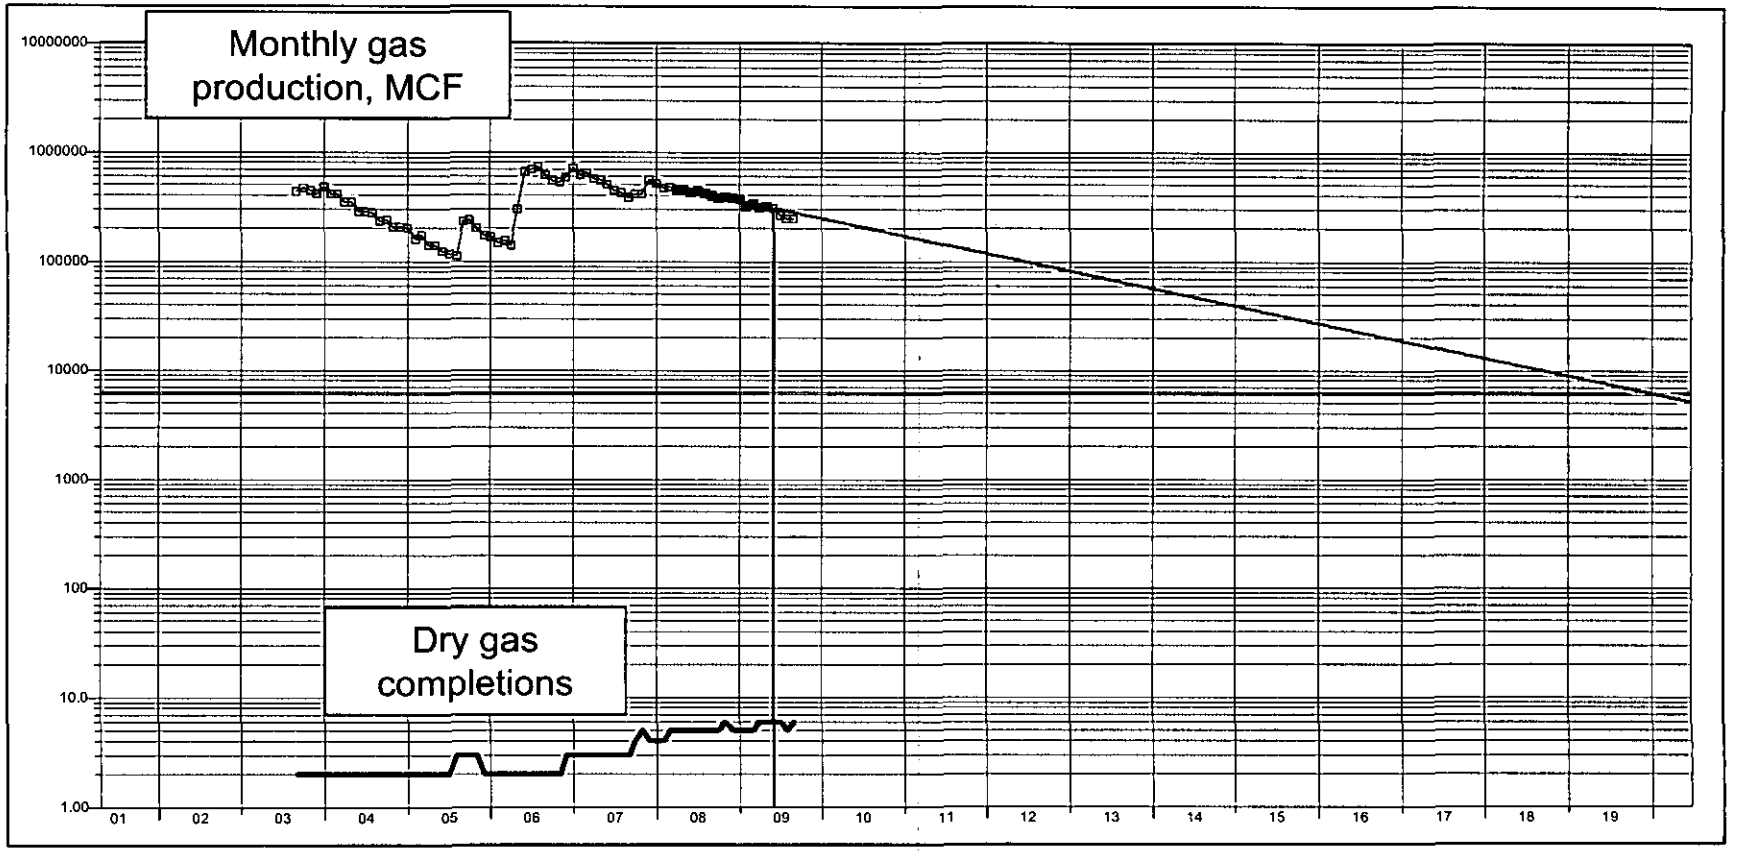

Figure 3. Typical decline plot; the Ninilchik GO Tyonek reservoir decline plot is illustrated. Horizontal axis is time (2001-2019); vertical axis is monthly production volume in thousands of cubic feet (MCF/month). Note the steep decrease from 2002 until mid 2004. As new wells are added (the lower red line on the chart) between 2004 and 2006, the production rate increased in a step fashion, then begins to decline again in 2007 to present. Some of the rate increase may be a result of perforation of new sands or stimulation of perforated sands. This chart is a good example of impacts of development activity early in the reservoir's life. When the reservoir is fully developed, it will follow the trend until depleted. Decline curve analyses are used to estimate remaining proved, developed, producing gas reserves.

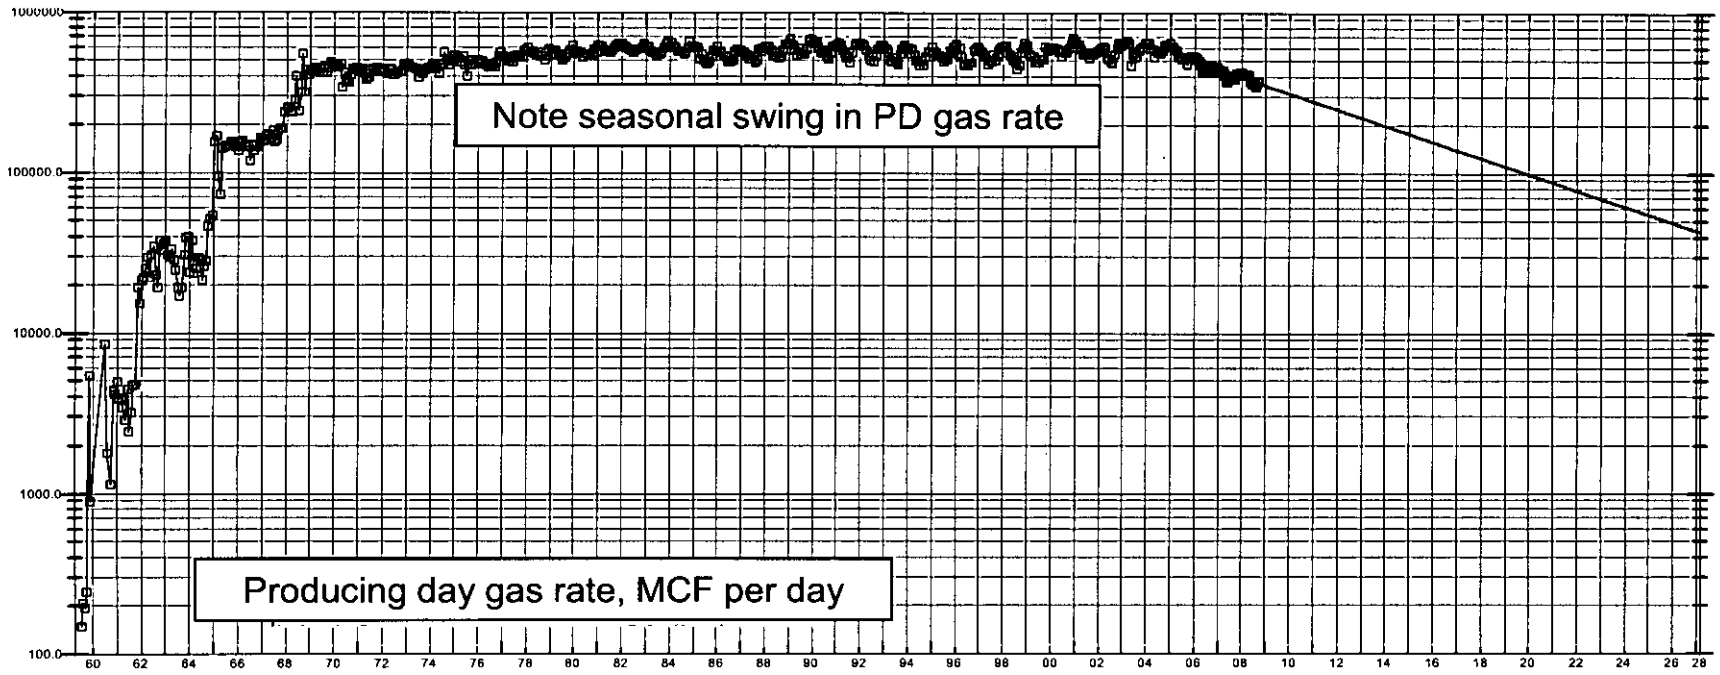

Figure 4. Decline curve projection based on data trend for production from all 28 Cook Inlet gas fields. Horizontal axis is time (1960-2028); vertical axis is producing day gas rate (MCF/day). Extrapolation line represents an annual average rate forecast, and does not illustrate seasonal fluctuation in demand.

additional compression. Figure 5 illustrates how DCA reserve estimates change after new wells are put on production. The initial rate forecast is considerably lower because it does not account for incremental production from the new completions.

If development investment does not continue in later field life, the decline trend will steepen because gas rate is dependent on regular maintenance or remediation. Changes in future economic conditions will influence gas availability affected by contract obligations, cost of maintenance, investment capital availability, and return on investment. Previous Cook Inlet rate forecasts have been subject to the same limitations.

Material Balance Analysis

Material Balance (MB) is a technique that uses the volumetric relationship between pressure, gas properties, and production to define OGIP and project remaining recoverable gas (RRG). A plot of reservoir pressure, P, divided by Z, the gas compressibility factor, yields a straight line that defines the volume of gas in the reservoir. Our MB analysis relies on reservoir pressure, reservoir characteristics, and gas production data from AOGCC databases. In most cases the linear trend can be extrapolated to zero pressure to determine the initial amount of gas in pressure communication throughout the reservoir, or OGIP. Note that material balance estimates account only for gas in pressure communication with producing wells, and cannot predict gas in isolated parts of the reservoir.

P/Z extrapolated to abandonment pressure will yield RRG for the reservoir sands that are in hydraulic (pressure) communication. A public domain spreadsheet program from Ryder Scott Company, L.P. was used to account for reservoir properties such as temperature, gas gravity, water saturation, gas composition, rock compressibility, and the Z factor for calculating P/Z based on periodic pressure measurements.

Figure 6 is an example of a typical P/Z MB plot. In this example, extrapolation to P/Z = 0 psia yields OGIP of 4.5 BCF and RRG, assuming abandonment P/Z=194 (~200 psia), is 4.2 BCF. The RRG is dependent on accurate knowledge of the abandonment pressure. Although we assumed an abandonment pressure of ~200 psia, the ultimate pressure for a given reservoir will be a function of operation costs, price of gas, and cost of compression. The surface production pressure is a function of reservoir pressure depletion and pipeline conditions. Wells in the Kenai gas field produce at surfaces pressure between 20 and 200 + psia, depending on pad location and the compressor configuration. Therefore, assuming a 200 psia abandonment pressure can underestimate RRG. In other fields in the basin the current surface producing pressure exceeds 800 to 1000 psia.

North Cook Inlet Unit (NCIU) and Beluga River Unit (BRU), had pressure data for each well going back 20-30 years. Most other pools had average pool pressures provided to AOGCC on a periodic basis. Even though the Sterling and Beluga Formations in the BRU are metered separately, the gas production is reported to AOGCC as a single commingled volume. Because gas production data for each formation are not available for the Beluga River Unit, the MB calculation is less reliable due to the uncertainty introduced by arbitrarily dividing the reported combined Beluga and Sterling Formations gas production back into two separate formations.

None of the reservoir P/Z plots showed evidence of active pressure support or water drive; however there is distinct evidence of water influx (fig. 7). Water influx steepens the

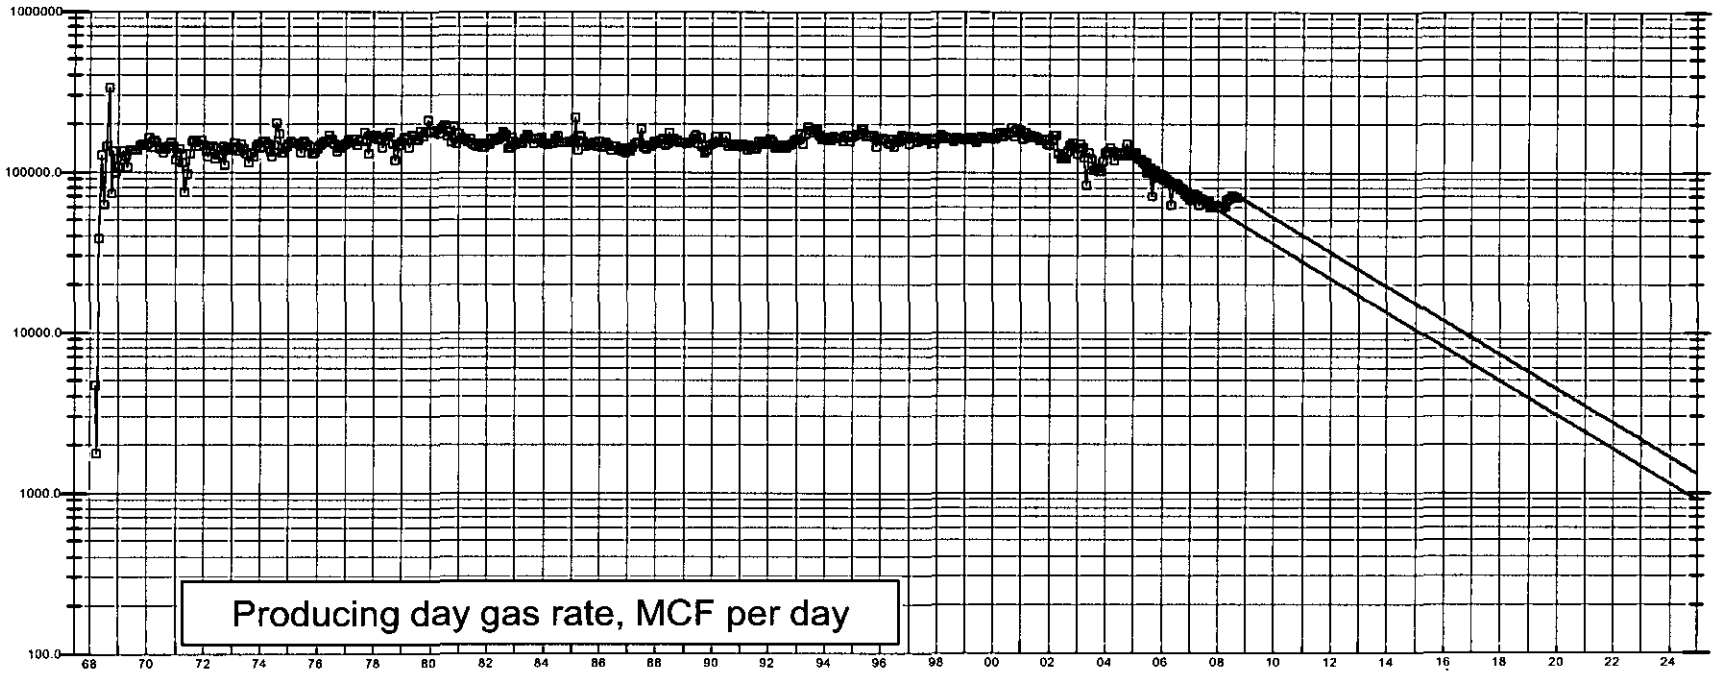

Figure 5. Example of decline curve analysis before and after new wells, North Cook Inlet Unit. Horizontal axis is time (1968-2025), vertical axis is monthly production volume in thousands of cubic feet (MCF). The well-established decline trend from 2004 to 2008 changes as new wells are added (green line versus red line trends). The remaining recoverable gas estimated from each trend will differ.

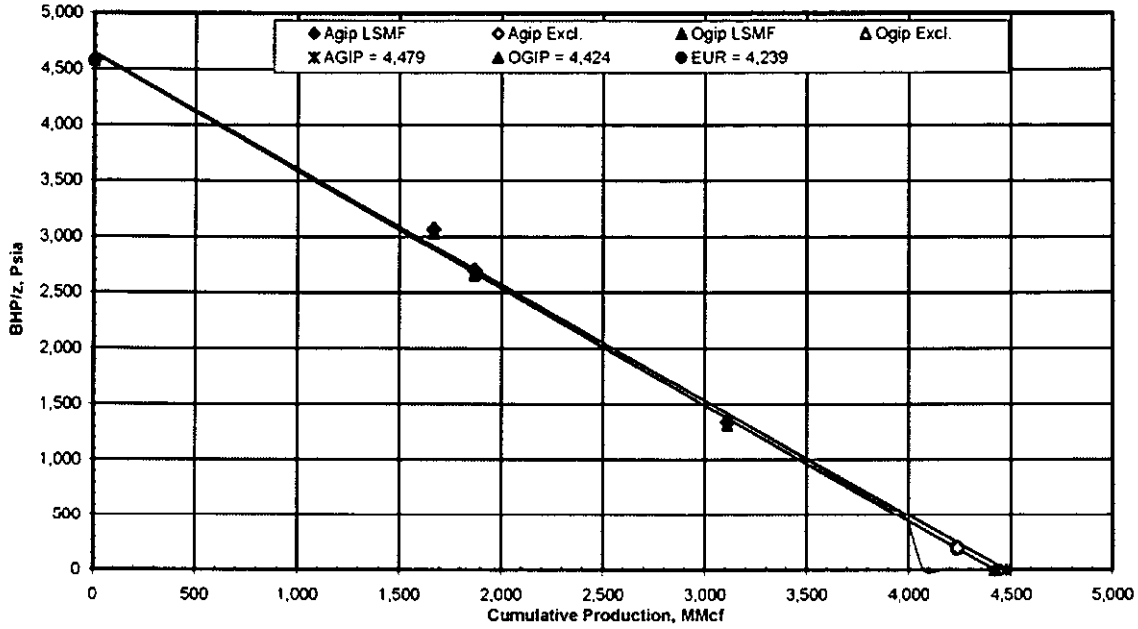

Figure 6. Typical P/Z plot. Vertical axis represents bottom hole pressure divided by Z, a dimensionless factor related to gas density, pressure, and temperature. The horizontal axis is cumulative gas volume produced at the time pressure is measured. Extrapolation of the trend will determine remaining recoverable gas and original gas in place at abandonment and 0 pressure respectively.

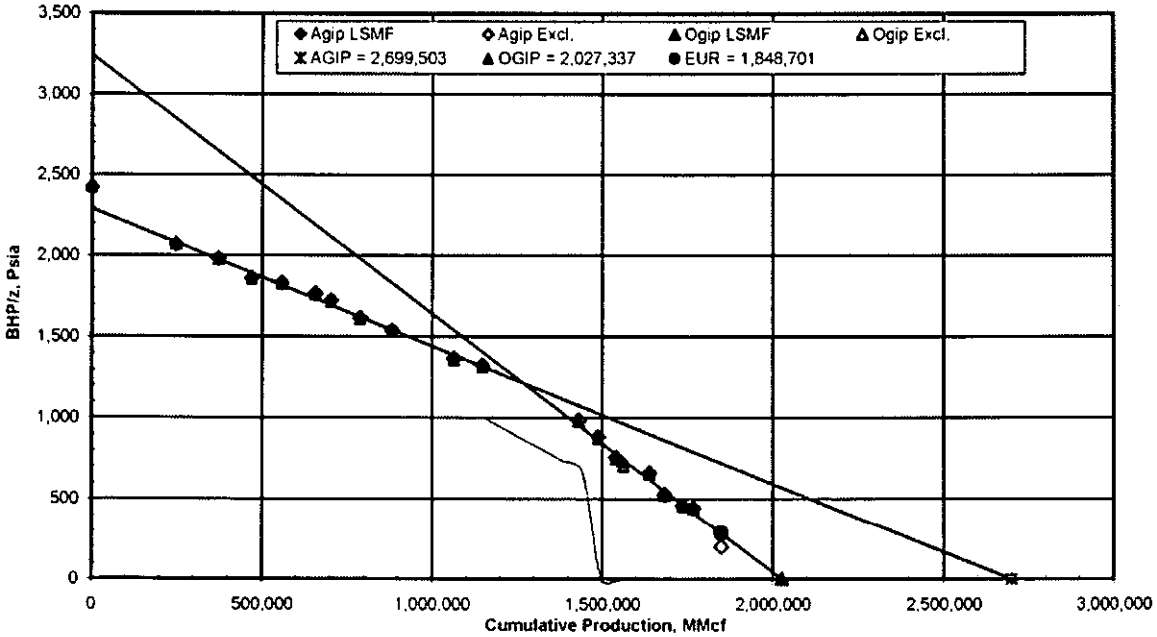

Figure 7. P/Z plot showing water influx and reservoir shrinkage. The initial trend (red line) shows a much higher in-place volume through production to about 1,300 BCF cumulative production. The later trend (green line) shows how water production has caused reservoir hydrocarbon volume to shrink by isolation of water dominated sand intervals or displacement of gas by water. Either way, the effect is reduction of hydrocarbon volume in communication within the reservoir.

slope of the linear P/Z trend. Water influx may trap gas or invade the reservoir space and replace gas, and in many cases, requires the invaded interval to be cemented off, isolating a portion of the reservoir and effectively shrinking the productive pore volume if not accessed by another well up-dip. In the example shown in figure 7, water influx has reduced the volume of gas producible at an assumed abandonment P/Z value of 200 psia by more than 600 BCF. Cases of this type were reviewed to ensure data accuracy and account for water impacts. Generally, the MB trend was either very clear, or it was unusable.

Another issue affecting the MB calculations is the validity and quality of the pressure data reported to AOGCC. The quality of pressure data depends on the type of reservoir and the method used to estimate or measure reservoir pressure. A good understanding of the common geological and engineering attributes of Cook Inlet fields, such as multi-formation pools, complex layering, discontinuous stratigraphic layers, and communication throughout the reservoirs is necessary to properly interpret the pressure data.

Some reservoirs had few points for P/Z analysis or the data were scattered, inconsistent, and subject to unstable measurement caused by insufficient shut-in time. In several cases, the P/Z results had to be disregarded because there was insufficient pressure data, no reasonable trend or the resulting RRG differed significantly from the decline analysis. There are several pools where P/Z showed less original gas-in-place than what had already been produced. Such discrepencies highlight the need for rigorous review and reiteration of MB calculations and further investigation of possible causes for questionable results. Comparison with other methods and inclusion of periphery data is also critical in order to come up with reasonable estimations.

The material balance and decline curve results were compared to look for significant inconsistencies. Analyses were reviewed and material balances or decline analyses for a given unit were repeated to account for obvious discrepancies. In some cases, the process of turning wells on and off over time creates the illusion that a pool's production is declining much slower (that is, the pool has more gas remaining) than shown by analyses of the individual wells in the pool. Although the seasonal swing is evident in a field-level production chart, it is often obscure when looking at charts for individual wells. This can be problematic for wells that do not have a long history trend and the winter to summer swing has a large influence on the decline in relation to the MB. In those cases, all available data were reviewed in order to determine which result should be used. In most instances it was possible to find trends that better suited the data or it was possible to see what caused the problem and come to a reasonable conclusion.

In many cases MB calculated significantly more gas than the DCA; we view this excess as potentially recoverable gas. Judgment and reservoir performance were required in reconciling differences between MB- and DCA-based estimates. In general, where production behavior is predictable and water influx is not an issue, the trends made sense and were used to estimate both remaining recoverable gas and additional potential.

Table 2 provides the results of the DCA forecast and the results of the MB calculations for 28 Cook Inlet gas fields. The difference between MB and DCA remaining recoverable reserves totals 279 BCF at 200 psia abandonment pressure. The difference increases by 120 BCF if estimated at 50 psia abandonment. Although abandonment pressure of 50 psia may be attainable in general, each reservoir must be evaluated for its cost-benefit at abandonment.

Table 2. Decline forecast, additional potential remaining recoverable gas identified from material balance analysis, and estimated ultimate recovery for 28 Cook Inlet gas fields. Geologic volumetric analyses were prepared for the four large fields (shaded) at top of list.

The MB-DCA difference represents gas that is in communication with the current completions in a reservoir. Conceptually, MB estimates greater than DCA estimates suggest that the reservoir is not producing at its maximum capacity. Investment may be required to access the potential gas reserve additions in the form of well stimulations, installation of compression, re-drills, or other activities to improve reservoir performance.

Large Field Reserves Growth

We calculated a time series of estimated ultimate recovery (EUR) for the 28 gas fields by adding cumulative production to RRG at each interval. Tracking EUR over time is useful for observing the effect of development as a reservoir matures. Early EUR estimates are typically conservative and often increase as development progresses and more of the in-place gas resource moves to the producible reserves category. Progressive reservoir development is the rule in markets such as the Cook Inlet that can only absorb a fixed amount of gas per year. The four largest reservoirs (Kenai, Beluga River, North Cook Inlet, and the McArthur River Grayling gas sands) demonstrate this reserves growth in the EUR progression.

A review of past DCA forecasts and MB estimates (sources: DOG Annual Reports–1994, 1999, 2003, 2007, and 2009 internal estimates) showed significant growth in the last 10 years. Figure 8 is a chart showing the EUR at various stages of development since 1993. Comparison of EUR at various dates indicated reserves in three of the largest fields (Kenai, Beluga River and McArthur River Grayling gas sands reservoir) grew by more than 770 BCF; however the North Cook Inlet field appeared to decrease by about 360 BCF. It will be critical to further assess the reason for this decline. The reserves growth in all the other fields can be attributed to 42 new and redrilled wells during the period, and additional perforation and stimulation activity. The apparent decrease at North Cook Inlet may be caused by water influx and cementing off a number of intervals, effectively reducing the reservoir volume, but it is unclear with the currently available data. The EUR calculations demonstrate that even in mature fields such as Kenai, significant reserve growth is still possible after 30-40 years of production with diligent and systematic well work.

Deliverability at the Well and Reservoir Scale

In the following discussion, "deliverability" is used in the strict engineering sense of the term, which refers to the gas production capabilities of a well, or in some cases, production capabilities at the reservoir scale (for example, Lee, 2007, p. 840). This discussion does not address the much broader set of commercial and infrastructure factors that determine the ability of the entire Cook Inlet gas production and distribution network to provide gas to the end user. Determining deliverability at the well and reservoir scale is, nonetheless, a key part of predicting the overall system's ability to satisfy peak demand.

Past and present well or reservoir deliverability. One analysis method used to mitigate decline forecast shortcomings is accurate measurement and forecasting of daily well rates on a periodic basis. This can be done with real time data, or by converting monthly data to daily figures in order to calculate producing day (PD) well rate. The most accurate PD data are production rate measurements taken on a daily basis along with producing pressure and temperature. Unfortunately, the Division of Oil and Gas does not have daily data and can

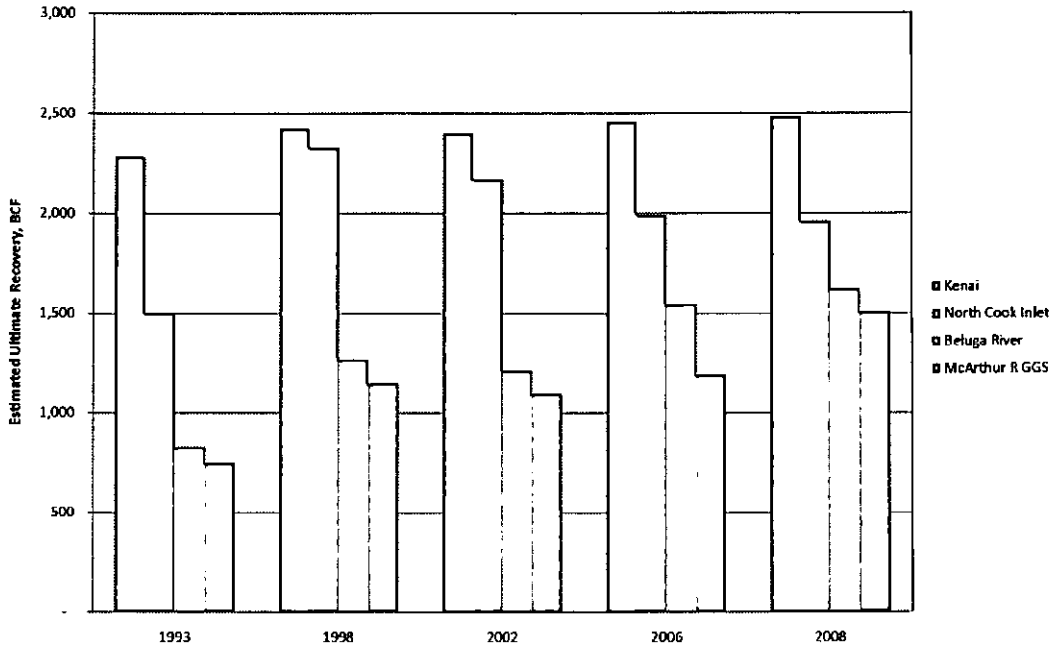

Figure 8. Reserves growth in Cook Inlet's largest gas fields, 1993-2008.

only estimate an average maximum daily rate on a monthly basis. The result is a smoothed rate profile that does not reflect the daily to weekly peaks and lows corresponding to short term demand swings.

Evaluating past well or reservoir deliverability estimates gives a hint of the relationship between average annual gas rate from DCA and peak PD gas rate from monthly volumes and producing day data. Calculations were based on a summation of producing day rates for each gas well by month (initially excluding storage production rate). A producing day rate derived from monthly data is still useful in estimating deliverability, but it smoothes through the extremes that would be evident in real time data. As an example, a well that produced 20, 10, and 5 MMCF/day for three days would average 11.7 MMCF/day over that period, which is some 40 percent below the actual peak. Given that limitation, there is still a significant swing between winter and summer PD rates when compared to annual average production rate. The peak PD rate has two components, the normal gas PD rate and the storage PD rate. Figure 9 compares the average annual rate to PD rates with and without storage from 1995 to present.

The ability to meet peak demand with real-time production has significantly diminished in the last decade because reservoir pressure has declined, water influx has increased, and not enough wells were drilled to replace reserves and maintain redundancy for peak rate capacity. Nevertheless, well workovers, additional wells, and compression have been slowly added in an attempt to meet the high-swing local demand. However, drilling high-cost wells and installing expensive new equipment to meet momentary demand spikes is economically challenging. As a result, gas storage in depleted reservoirs will become an important part of the deliverability portfolio that provides for peak capacity. In the past,

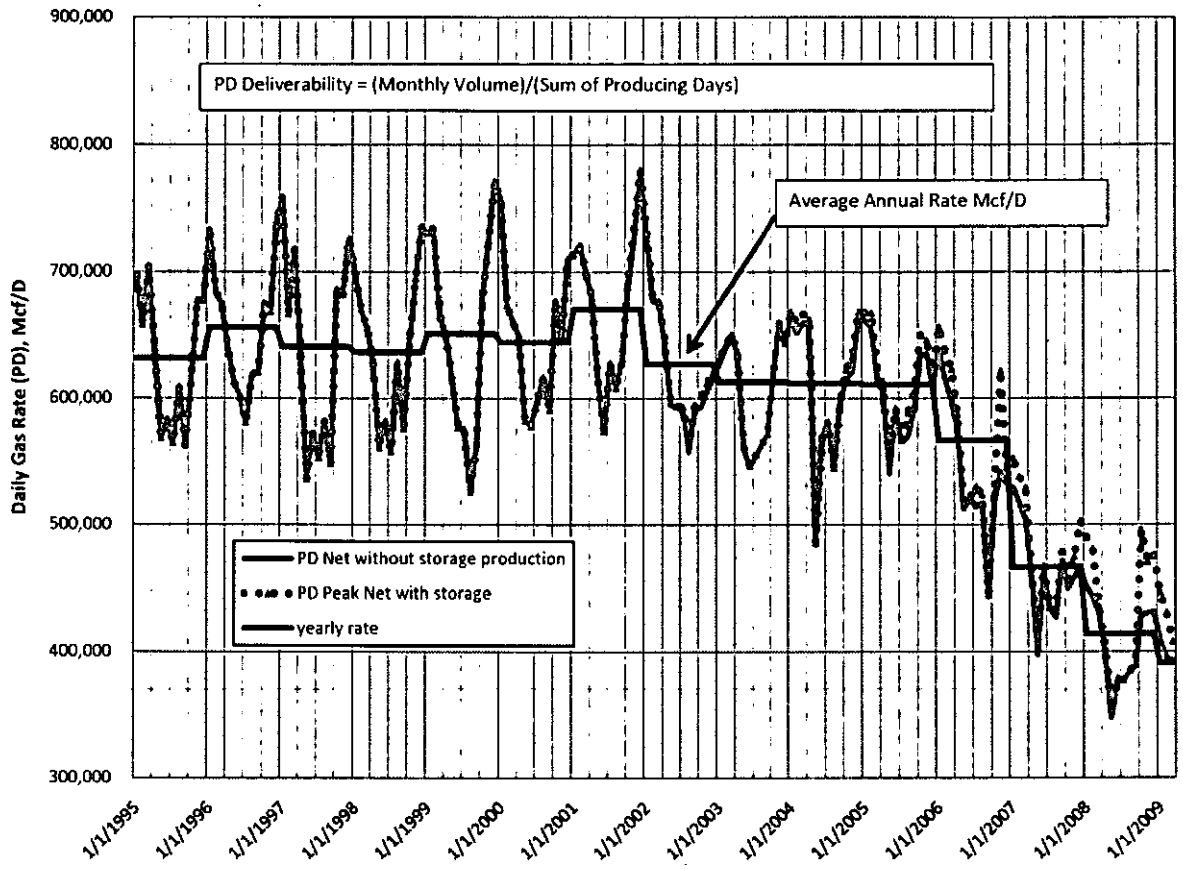

Figure 9. Producing day (PD) deliverability with and without storage, based on monthly volumes.

there was significant production capacity that lay idle during the summer months even with the fertilizer and LNG plants online. A strong seasonal swing is evident in the production histories of major fields such as BRU and NCIU, but it has diminished noticeably in recent years even though the fertilizer plant has been shut down and the LNG plant is not operating at maximum capacity. Field operators are now much closer to producing at or near apparent capacity year round. Like many other gas distribution systems, storage will emerge as a key feature necessary to meet peak demands during extreme weather periods.

As the annual production rate decreases, and producers store more gas during low demand periods, the ability to forecast excess capacity will become more complicated because storage rates are highly dependent on instantaneous demand and on the amount of gas in storage. Steps that could be taken toward meeting peak demand include adding new wells, investing in rate-sustaining work, stimulating productivity, adding compression to maintain production at lower reservoir pressures, and developing more storage capacity. All these options increase production costs and ultimately, the price needed for the commodity.

Predicting future well or reservoir deliverability. Extrapolation of maximum PD (producing day) rate data assumes that a well or reservoir can meet that maximum, at least on a periodic basis. The importance of a maximum

deliverability forecast is to estimate the ability to meet peak demand on those days when temperatures are very low and gas demand is very high. Figure 10 shows the method of estimating maximum PD rate for a pool by selecting peaks and forecasting into the future. This was done for each pool in the Cook Inlet basin then summed to provide a forecast.

Figure 11 shows the PD deliverability forecast results compared to average annual rate from DCA. The forecast peak PD deliverability is higher than average annual rate; however, peak deliverability can only be sustained for a relatively short period. The PD deliverability analysis can be done well-by-well or collectively on a reservoir basis. Regardless of method, the maximum PD rate forecast is only an estimate and may be influenced by the same events that affect decline curve analysis. This method yields a more representative estimate of future peak production rate (PD deliverability) than an annual average rate derived from decline curve analysis.

An additional challenge to predicting future deliverability is the complex geology. Cook Inlet's reservoirs are challenging to evaluate because of the discontinuous fluvial sand bodies, especially in the Beluga and Tyonek Formations. The Sterling Formation contains thicker sand packages that tend to be in pressure communication. In the Beluga and Tyonek reservoir section, new drilling has added deliverability and captured previously stranded gas reserves by a combination of in-fill drilling and adding perforations in existing wells. Clearly, more drilling and well work will be required to develop enough deliverability to meet peak demand swings in the coming years.

As a rule, the Cook Inlet reserves and annual production forecast have not really changed much from forecast to forecast. The major uncertainty lies within deliverability to meet daily and peak demand. To fully understand maiximum PD rate to meet daily and peak demand, more detailed and up-to-date production data is critical. The ability to analyze daily production numbers from all producing zones would indicate which wells and reservoirs are able to respond during demand spikes caused by extreme low temperatures.

GEOLOGICAL ESTIMATES

The geologic portion of this reserves study focused on four producing gas fields in Cook Inlet: Beluga River, North Cook Inlet, Ninilchik, and McArthur River (Grayling gas sands). A deterministic log- and grid-based approach was used to analyze and map pay and potential pay thickness for numerous producing horizons and to calculate original gas-in-place (OGIP) volumes within these fields. Publicly available production data from the AOGCC were used to determine recovery factors for these four fields. The recovery factor fraction was then multiplied by the mapped OGIP to calculate the geologic estimates of original reserves for each of the four fields. Subtracting the cumulative production from each field yielded our geologic estimates of remaining reserves. The following discussion details the process used in the geologic analyses conducted for this project.

Data Sources

Much of the data used in this evaluation is publicly available from the AOGCC. Confidential data the Division of Oil and Gas receives for Unit Plans of Development were also used to augment the AOGCC data set. Information from the geological literature regarding fluvial depositional systems in Cook Inlet and elsewhere helped inform sound well log correlations and was useful in petrophysi-

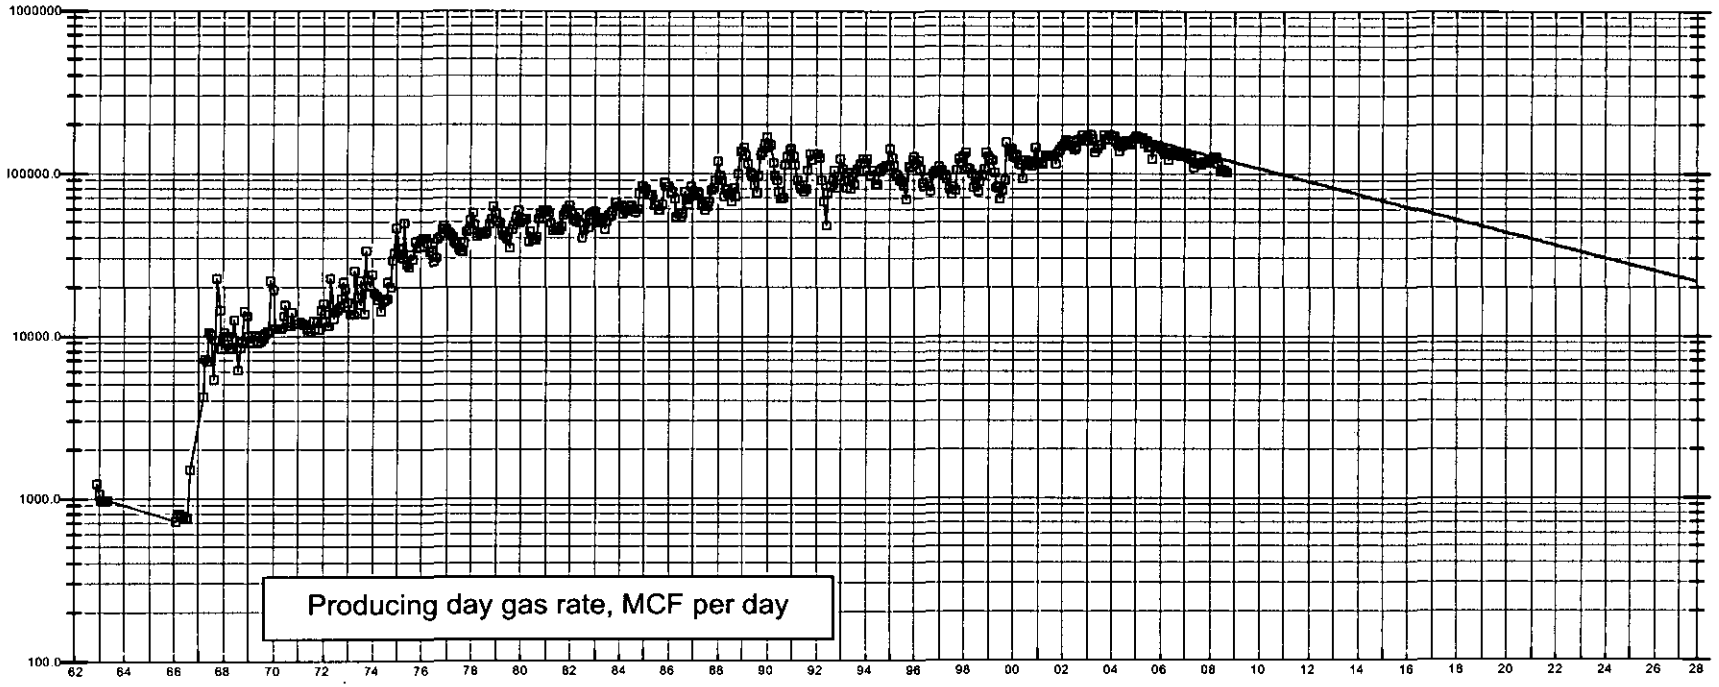

Figure 10. Example of peak deliverability forecast for a pool. Horizontal axis is time (1962-2028); vertical axis is producing day gas rate (MCF/day). Extrapolation is based on maximum PD rate only.

cal interpretation (e.g., Bridge and Tye, 2000; Flores and Stricker, 1991; LePain and others, 2008).

The dataset collected and analyzed for this geologic evaluation consists of digital petrophysical well logs and directional well surveys; geologic formation tops; confidential and non-confidential structural surfaces (grids) and faults; details of well drill stem tests, perforations, reservoir and flowing pressures; gas compositional analyses; fluid contact depths; and core-based porosity, permeability, grain density, and saturation data.

Data Rendering

The data rendering process began with loading all the above data into databases used with our interpretation and mapping software

(Landmark GeoGraphix). Digital petrophysical well log data, directional well surveys, perforations, completion intervals, and drill stem test data were critical data sets that were interpreted together from the beginning stages. Most petrophysical well log suites in Cook Inlet wells contain data for spontaneous potential (SP), gamma ray, deep-, medium-, and shallow-measurement resistivity, and some combination of porosity logs such as density, neutron, and/or sonic transit time data.

After loading and interpreting the data mentioned above, criteria were established for identifying and flagging basic lithofacies (rock types). We flagged non-pay lithofacies (coal and shale) and focused attention on lithofacies that contain pay and potential pay (sandstone, argillaceous sandstone, and sandy siltstones). Coals were flagged as having a bulk density log response less than or equal to 1.9 g/cm^3 and a neutron porosity log response greater than 45 percent. Rare, very pure claystone intervals were selected to define a shale baseline on the SP log.

Pay Evaluation and Identification

We based our pay criteria on log character, mud log data, drill stem test data, and/or completion reports that identify sandstone intervals as having flowed gas with a rate that resulted in the sandstone being completed as a gas-producing interval. Two different categories were created in GeoGraphix using interval picks: PAY and Potential_Pay. These two interval picks were interpreted for each production zone (major subdivision of the reservoir formation, for example Sterling A) in all wells with a petrophysical well log suite (Figure 12). The breakout of zones varies from field to field, based on the variable characteristics of the Tyonek, Beluga, and Sterling reservoirs in different parts of the basin.

Intervals identified as PAY have the following characteristics:

a) Sandstone intervals that were completed after drilling and logging that either produced or are currently producing gas. These sandstones exhibit elevated deep resistivity relative to down-dip wet sandstones of the same producing horizon, as well as an SP shift off the shale baseline, plus sonic-neutron or neutron-density cross-over, or a decrease in sonic travel time (slower than the travel time in shales or wet sandstones).

b) Some unperforated sandstone intervals were identified as PAY if they could be reasonably correlated to sandstones perforated and producing in recent wells, or perforated as 'by-passed pay' in older wells that have been worked over.

c) Some unperforated sandstone intervals were identified as PAY if the log response was very similar to a perforated gas interval in the same well.

Potential_Pay was picked in intervals that have the following characteristics:

a) Sandstones that were perforated and flowed only minor gas; flowed minor gas with water during testing; thin sandstones comingled during a drill-stem-test; or stacked perforated intervals where gas was present and produced, but it was unclear which sandstones were productive. In most of these cases, gas production was accompanied by water that may have been coming from one or more of the producing horizons.

b) Sandstones in which indications of free gas (shows) on well logs are not as robust as in the PAY sandstones, but generally have elevated resistivity along with a lesser degree of gas response (cross-

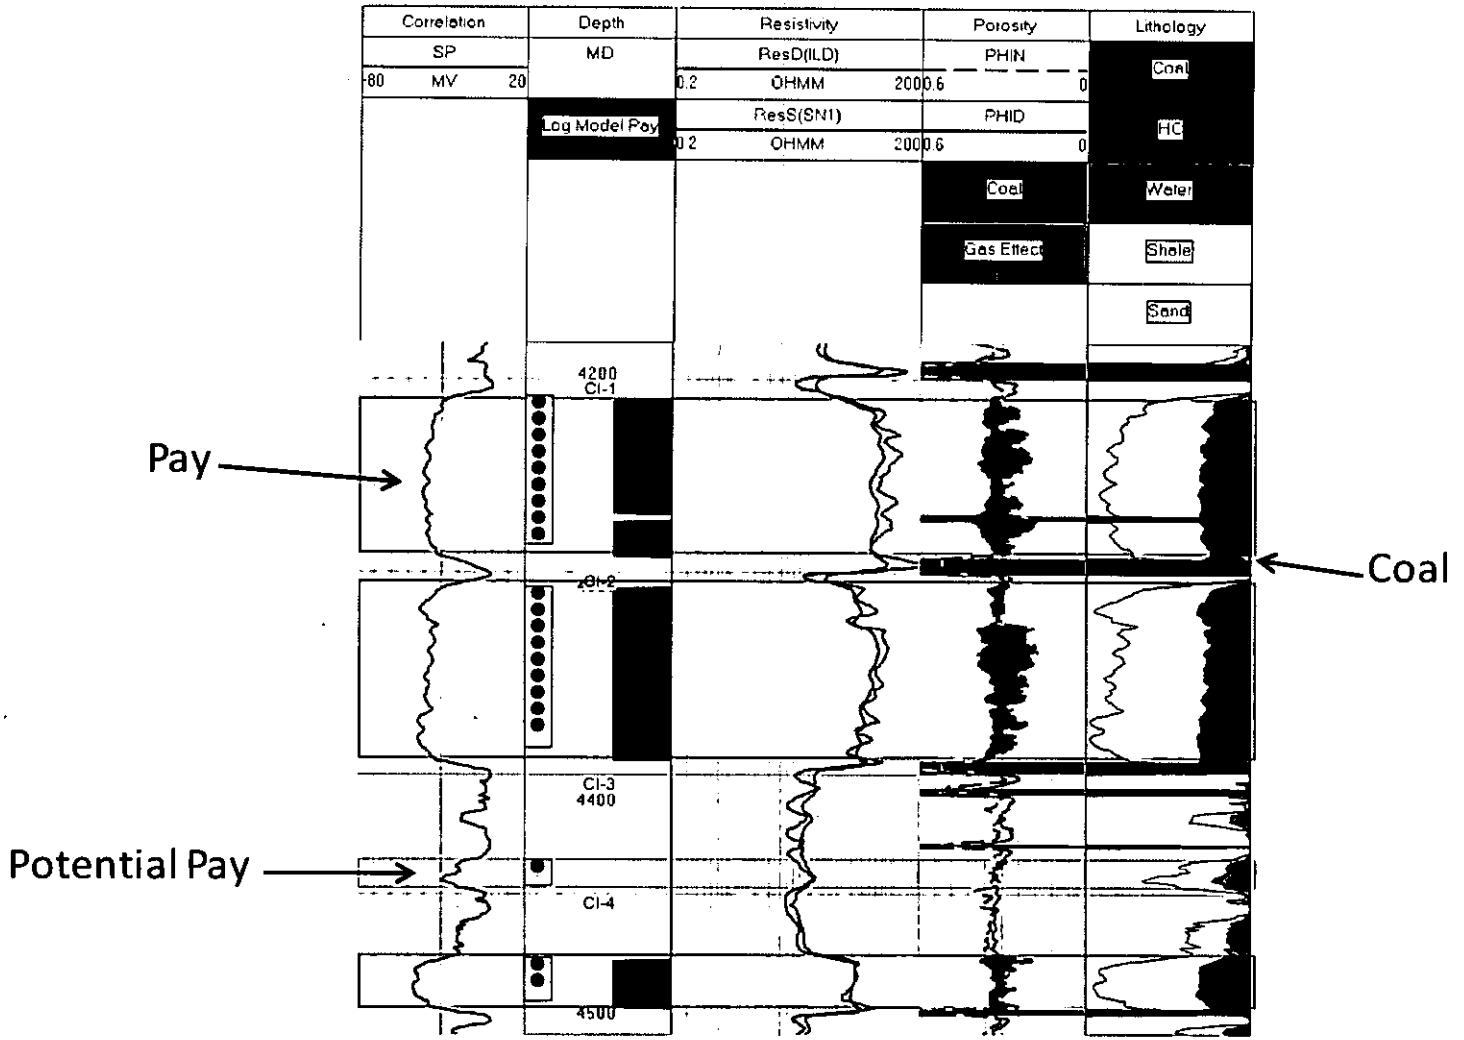

Figure 12. Well log example illustrating PAY (green) and Potential_Pay (yellow). Coal (black) is flagged as non-pay at right. Perforated intervals are shown in the depth track as black vertical dots. CI-1, CI-2, CI-3 and CI-4 are examples of zone picks in which Pay and Potential Pay were summed for each well. Petrophysical logs are noted in the log header. Depth is measured depth feet.

over or convergence) on sonic-neutron or neutron-density porosity log suites.

In addition to the PAY and Potential_Pay criteria described above, we gained information through preliminary petrophysical analysis of well log suites to calculate shale volume (Vsh), porosity, water and hydrocarbon saturations in the Beluga River, North Cook Inlet, Ninilchik, and McArthur River (Grayling gas sands) fields. Saturation analysis is highly dependent on the resistivity of the connate water (Rw) found in a sandstone interval. Given that Rw varies significantly across short distances in Cook Inlet sandstones, we did not rely on petrophysical analysis for this study. Rather, the log-based analyses helped to validate our PAY and Potential_Pay intervals identified using the criteria described above.

PAY category sandstones were color-coded green and Potential_Pay intervals were color-coded yellow on all log displays and well cross-sections. Figure 12 illustrates a typical example of the difference between the pay categories (compare the log responses in the thin, Potential_Pay sandstone at 4,430 feet measured depth relative to that in the PAY sandstone at 4,250 feet measured depth). Interbedded coals are flagged and colored black. All sandstones were evaluated and categorized as PAY, Potential_Pay, or non-pay (ignored). PAY in each well was summed in true vertical depth feet (TVD) for each zone. This cumulative sum, gross TVD feet of PAY, was stored by zone for each well as an attribute labeled PAY using the Zone Manager application in GeoGraphix. The same process was followed for summing gross TVD feet of Potential _Pay for each zone in each well.

Mapping Procedure

The digital mapping process was executed in GeoGraphix using gridding, contouring, and database tools of the GeoAtlas and Zone Manager applications. Thickness (isopach) grids of reservoir zones were made from well control by subtracting the depth of the tops of successive zones from each other and contouring them using a standard gridding algorithm (minimum curvature) to obtain gross zone thickness.

Subsea depth structure grids were prepared next, representing the top surface of each zone. This was accomplished by starting at the top of the reservoir interval and progressively subtracting the underlying isopach grid to generate the next deeper structure map. This process was continued downward throughout the zones of interest in each field. Each structure map generated this way was checked for accuracy by plotting it with zonal tops to assess surface accuracy.

Isopach grids of PAY and Potential_Pay were generated for each zone from the gross values stored in the system as described above, taking steps to limit these grids to the productive area of each zone. An example of the zonal data is shown in Table 3, representing the Beluga D zone at the Beluga River Unit. In order to limit the aerial distribution of PAY and Potential_Pay thickness grids, well logs and well history files were examined for evidence of gas-water contacts. Because numerous producing horizons do not have known gas-water contacts, the completion reports, drill stem test reports and gas mudlog readings were consulted to pick the lowest known gas (LKG) and highest known water (HKW) depths in TVD subsea for each zone. The differences between HKW and LKG depths are highly variable, sometimes differing by hundreds of feet. In most cases, we assumed an approximate gas-water contact at the midpoint depth between HKW and LKG, and clipped the Gross Pay and Gross Potential_Pay mapping grids for each zone at the intersection of the midpoint depth with the zone's top struc-

BLUGD

Table 3. An example of zonal data for the Beluga D zone at Beluga River Unit. Zone picks were made by DNR staff. PAY and Potential_Pay were picked for each zone in each well according to criteria discussed in the text. If the well had a density porosity curve, the average density porosity was calculated within PAY and Potential_Pay intervals for that zone. Blanks appear in the table where necessary well logs were not available over the Beluga D zone.

ture surface. In reality, PAY and Potential_Pay are distributed throughout each zone, whereas in our model, they are assumed to be stacked at the top of the zone, just below the structural surface that was clipped with the approximate fluid contact. Figure 13 is an example of one zonal gross PAY map. Because there are hundreds of individual Sterling, Beluga and Tyonek Formation sandstones, it was not possible to structurally clip each individual pay interval with a LKG or HKW contact in the time frame allotted for this project.

Original Gas-in-Place and Initial Reserves

We used the following equations to calculate original gas-in-place in standard cubic feet:

$$OGIP = 43{,}560\ (\text{gross pay volume})\ (N{:}G)\ (1\text{-}Sw)\ (\emptyset) / Bgi,$$

and

$$Bgi = 0.02829\ (Z)\ (T) / (P)$$

where gross pay volume refers to the volume of gross Pay or Potential_Pay sandstone in acre-feet, N:G is the net-to-gross ratio within the gross Pay or Potential_Pay intervals, Sw is fractional water saturation, Ø is decimal porosity, Bgi is initial gas formation volume factor, Z is a gas compressibility factor, T is temperature in degrees Rankine, and P is pressure in psia. The density log was used to determine porosity. Porosity was averaged for the pay intervals by using the PAY interval as a discriminator curve and calculating the average density porosity in PAY for each zone. This value was then gridded using the same minimum curvature algorithm and grid increment as the PAY isopach. The average porosity and

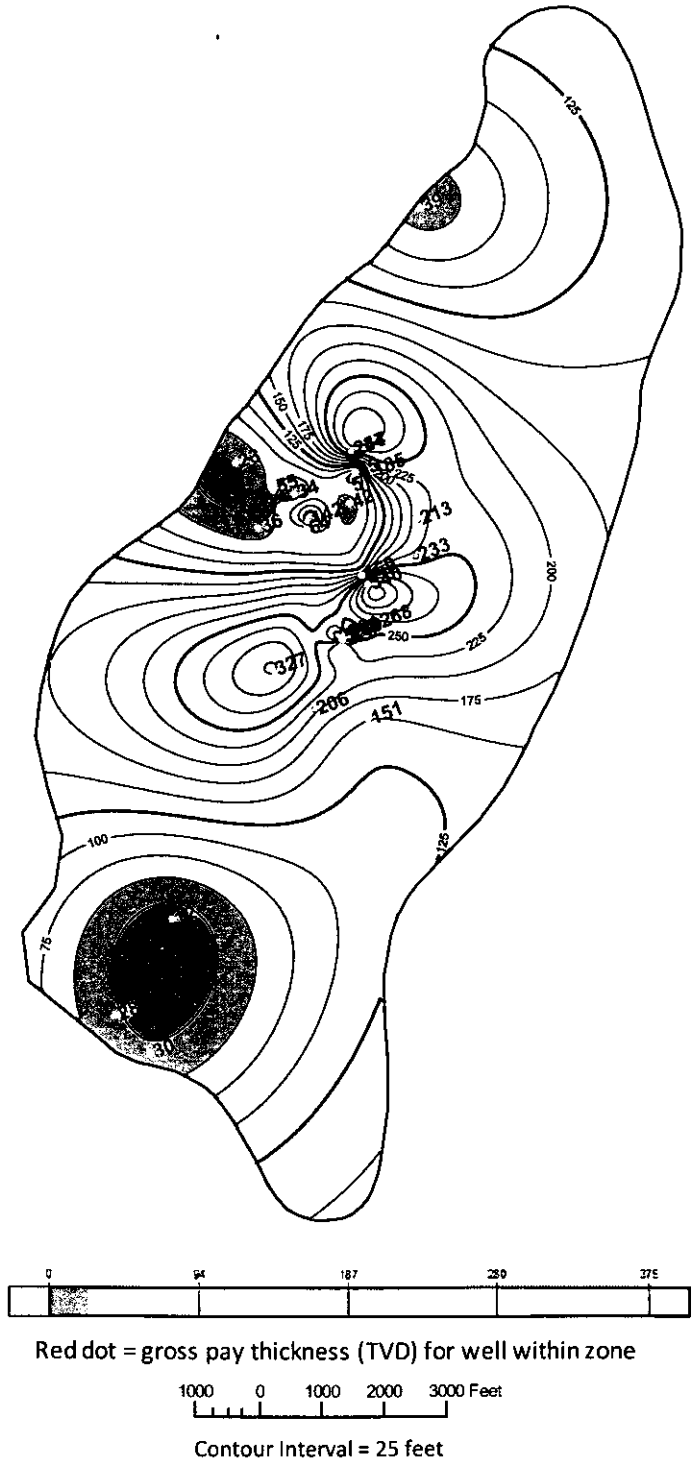

Figure 13. Example of zonal gross pay isopach map, McArthur River field Grayling gas sands.

pay isopach grids were multiplied together to create a grid of bulk pore volume contained in intervals considered as PAY. Further multiplication times the net-to-gross ratio yielded net pore volume. The same process was used to determine net pore volume in intervals counted as Potential_Pay.

Because of the inherent problems with determining water saturation in the Cook Inlet basin discussed above, we used water saturation values provided in the AOGCC annual pool reports. Reservoir pressure and the gas compressibility factor were all calculated on a zonal basis depending on temperature and subsea depth at the midpoint of the zone. There were no AOGCC pool reports for the Ninilchik Unit. For that field, we assumed 40 percent water saturation; this figure is likely pessimistic, which will lead to conservative gas reserve estimates.

Overall recovery factors were calculated for each of the four fields studied, based on production and test data. Because most individual sandstones within the Sterling and Beluga Formations have different recovery factors, a range of recovery factors is presented in Appendices 1-4. Recovery factors were decreased for zones with lower permeability based on downhole permeability measurements or calculated from porosity-permeability transforms. The recovery factors were then applied to the mapped original gas-in-place (OGIP) volumes to calculate initial recoverable gas in place (RGIP).

Table 4 presents one deterministic case of the geologically estimated reserves calculated for the four fields studied: Beluga River, Ninilchik, North Cook Inlet, and McArthur River Grayling gas sands. Values are reported in billions of cubic feet (BCF) of gas. Calculations are presented for the PAY, Potential_Pay (risked at 50 percent), and the sum of PAY + 50 percent-risked Potential_Pay in the first three columns. The next three columns present initial recoverable gas-in-place (RGIP) for those three categories. The next column lists the projected cumulative production through 12/31/2009 for each field, based on AOGCC data. The last two columns represent the calculated remaining reserves for the PAY and PAY + 50 percent-risked Potential_Pay categories, calculated by subtracting the cumulative production from the RGIP. Each column contains a total for the sum of the four fields. The sum of the reserves in the PAY category for the four fields is 1,213 BCF of gas. The sum of the reserves in the PAY + 50 percent-risked Potential_Pay is 1,856 BCF of gas. The chart demonstrates that a high percentage of remaining reserves calculated from geologicall techniques reside in the more certain PAY category and less in the Potential_Pay category. However, risking the Potential_Pay resources at 50 percent yields additional upside potential of 643 BCF.

Multiple deterministic cases could be considered. Appendices 1 through 4 present Potential_Pay calculations risked at 10 and 90 percent confidence levels.

EXPLORATION POTENTIAL OF COOK INLET BASIN

Leads – Discovered Undeveloped and Undiscovered Resources

Within the Cook Inlet region, there are several areas where publicly available geologic data, geophysical data, or reports indicate potential for discovered but undeveloped gas accumulations. A number of other areas are identified to have elevated prospectivity for undiscovered accumulations. This discussion briefly describes a list of exploration candidates or leads that have been actively pursued by industry in the past. The list discussed below is by no means comprehensive, nor all en-

Field	OGIP (BCF)			** RGIP = OGIP x RF (BCF)			Cumulative Production (BCF, projected through 12-31-09)	Remaining Reserves (BCF)	
	PAY only	50%-risked Potential_Pay only	Total, PAY + 50%-risked Potential_PAY	PAY only	50%-risked Potential_Pay only	Total, PAY + 50%-risked Potential_PAY		PAY only	Total, PAY + 50%-risked Potential_Pay
Beluga River	2,137	592	2,729	1,856	342	2,198	1,150	706	1,049
Ninilchik	182	167	349	164	117	280	104	60	177
North Cook Inlet	2,300	211	2,511	2,060	151	2,211	1,818	242	393
McArthur River	1,757	41	1,798	1,581	33	1,614	1,376	205	237
Totals	**6,376**	**1,011**	**7,386**	**5,661**	**643**	**6,304**	**4,448**	**1,213**	**1,856**

*** RGIP = initial recoverable gas-in-place = OGIP x Recovery Factor. Production and test data suggest a range in recovery factor within the Sterling and Beluga Formations*

Table 4. Geologic estimates of original gas-in-place, original recoverable gas, and year-end 2009 reserves remaining in four Cook Inlet gas fields.

compassing for the basin. These opportunities are grouped into onshore and offshore areas. It is important to note that there is a significant amount of ongoing work, in both the industry and government sectors, to identify exploration opportunities for future activity and reserves additions. The Division of Oil and Gas is currently collaborating with the Division of Geological & Geophysical Surveys in this effort in order to facilitate exploration for oil and gas in the next decade.

Onshore areas. It is estimated that identified potential candidates located onshore might yield between 40 and 120 BCF of recoverable gas (in aggregate). They are associated with identified anticlinal trends and most have at least one well that penetrates the lead, is adjacent to it, or can be projected along structural trend. The candidates described below are all located on the east side of Cook Inlet, and are listed from north to south (fig. 1).

1) Point Possession lead – lightly explored anticline trend within the within the Kenai National Wildlife Refuge, roughly along the same general trend as Sunrise lead.

2) Birch Hill structure - faulted anticline closure on-trend with Swanson River field. The reservoir is in the Tyonek Formation. Chevron is currently moving toward development.

3) Sunrise lead - lightly explored anticline trend. Marathon has acquired 2D seismic data, and has plans to drill in the winter of 2009-2010 on CIRI land within the Kenai National Wildlife Refuge.

4) Cohoe Unit – potential faulted trend down plunge from Kenai Field anticline. Potential reservoirs in the Beluga and Tyonek Formations.

5) North Ninilchik structure - faulted anticline closure down plunge from Ninilchik Unit. Potential reservoirs in the Beluga and Tyonek Formations.

6) Nikolaevsk unit - faulted anticline closure on-trend with North Fork field. Potential in the Tyonek Formation.

Offshore areas. The candidates identified below lie in state waters and it is estimated that they might yield between 100 and 400 BCF of gas (in aggregate). The majority of these candidates are associated with identified anticlinal trends and, as with the onshore plays, they have at least one well that penetrates the lead, is adjacent to it, or can be projected along structural trend. They are described generally from north to south (fig. 1).

7) North Cook Inlet Field – faulted struc-

tural nose north of the existing field. Potential reservoirs in the Beluga and Tyonek Formations.

8) Corsair (SRS) structure - faulted anticline closure. Potential reservoirs in the Sterling, Beluga and Tyonek Formations.

9) North of Middle Ground Shoal - faulted anticline trend. Potential reservoirs in the Beluga and Tyonek Formations.

10) North Redoubt - faulted structural nose up-dip from the Redoubt field. Potential reservoirs in the Sterling, Beluga and Tyonek Formations.

11) Kasilof structure – faulted anticline closure north of Ninilchik field. Potential reservoirs in the Beluga and Tyonek Formations.

12) Cosmopolitan structure - faulted anticline closure. Potential in shallow reservoirs in the Tyonek Formation.

13) South Diamond Gulch structure - faulted anticline trend within Kachemak Bay. Potential reservoirs in the Tyonek Formation.

Quantitative Assessments of Undiscovered Technically Recoverable Resources

Federal agencies are tasked with the lead responsibility for publishing estimates of undiscovered technically recoverable resources for all parts of the United States, including the Cook Inlet basin. The U.S. Geological Survey assesses the potential onshore and in state-managed waters, whereas the Minerals Management Service analyzes potential in federally-managed waters of the Outer Continental Shelf (OCS). In all cases, these agencies address the inherent uncertainty of such assessments by creating probability distributions that describe a wide range of possible values. A probabilistic estimate is best described by its mean value (expected case) accompanied by specific fractiles of its distribution, such as the F95 value (lowside case, with a 95% probability that the actual volume is greater) and the F5 value (upside case, with only a 5% chance that the actual volume is greater). The results of the most recent assessment encompassing the upper Cook Inlet producing region are presented in Table 5 (compiled from Gautier and others, 1996). These estimates will be updated in an ongoing USGS resource assessment specific to the Cook Inlet region, prepared in cooperation with the Alaska Division of Geological & Geophysical Surveys

Assessed Play and Undiscovered Resource	**Oil, MMSTB** (million stock tank barrels)			**Gas, BCF** (billion cubic feet)		
	F95	*Mean*	*F5*	*F95*	*Mean*	*F5*
Hemlock-Tyonek play Oil & Associated gas	43	647	1,337	43	647	1,337
Beluga-Sterling play NGL & Non-associated gas	0	0	0	42	738	1,923
Late Mesozoic oil play	Play was assigned a 9% chance of hosting at least one accumulation; resource volumes not quantitatively assessed.					

Table 5. Federal estimates of undiscovered technically recoverable conventional oil and gas resources of the upper Cook Inlet region (after Gautier and others, 1996).

and Alaska Division of Oil and Gas, with expected publication in late 2010.

A more recent study conducted on contract to the U.S. Department of Energy considered potential undiscovered resources using a different statistical approach as part of a larger study of natural gas supply and demand in the Cook Inlet region (Thomas and others, 2004). Noting that the distribution of field sizes within the basin does not conform to the expected lognormal state, this study estimated that there may be 13 to 17 trillion cubic feet of conventionally recoverable gas remaining to be discovered, largely in stratigraphic or combination structural traps.

Impediments to Future Exploration

There are several issues that may hamper future exploration, both in terms of further developing some of the areas with known potential described above, as well as making new discoveries in lightly explored areas. Some of the concerns are of a commercial nature, and others involve restrictions on surface access to prospective areas. Comprehensive exploration efforts in the Cook Inlet, like any area in the US, will require patience and diligence from all stakeholders in order to reduce exploration and operating costs, provide access to critical data, and provide access to surface acreage in areas of high resource potential, but sensitive wildlife habitat. All these issues must be addressed in a collaborative stakeholder effort if the Cook Inlet region is to maintain an economically and environmentally sound industry.

COMBINED ENGINEERING AND GEOLOGIC ANALYSES

The various engineering and geologic analyses of this study yield a wide range of estimated remaining reserves. Table 1 compares four different reserve estimates derived for the four fields emphasized in this study, based on 1) decline curve analysis, 2) material balance analysis, 3) the geologic estimate that includes only reserves in the PAY category, and 4) the geologic estimate that includes reserves of the PAY category plus 50 percent of the volume in the Potential_Pay category. Note that these analyses are not intended to represent any particular fractiles of a statistical distribution; for example, we do not consider them to represent F95-F50-F5 reserve values. The following discussion describes Table 1 in detail.

The most conservative estimate of reserves is based on decline curve analysis alone, which estimates a total of 697 BCF proved, developed, producing reserves remaining in the Beluga River, North Cook Inlet, Ninilchik, and McArthur River (Grayling gas sands) fields. Decline curve analysis also identifies 166 BCF of proved, developed, producing reserves remaining in the other 24 fields, for a basin-wide total of 863 BCF. Material balance analysis identifies an additional 163 BCF of probable reserves in just the four large fields, yielding a total of 860 BCF proved and probable reserves remaining there. In the other 24 fields, material balance estimates 116 BCF more than decline curve analysis, yielding 282 BCF of proved and probable reserves in those fields, and a basin-wide total of 1,142 BCF remaining proved and probable reserves.

The geologic volumetric evaluations, completely independent of the engineering techniques, yield larger reserve estimates for the four large fields. This is consistent with the probability that there is considerable gas remaining in these reservoirs that has not contributed to production, and therefore, cannot be captured by the engineering estimates. The geologic evaluation of existing well data in

the four fields indicates 1,213 BCF of gas reserves remaining to be produced from just the high-confidence PAY category. Subtracting the 860 BCF that material balance indicates is already in communication with producing wells yields an estimated 353 BCF of currently non-producing gas—the "redevelopment prize"—in those four reservoirs. When recoverable gas in the Potential_Pay category are risked at 50 percent and added to those in the PAY category, the estimated reserves remaining in the four fields increase to 1,856 BCF, adding an increment of 643 BCF in those fields.

Engineering and Geological Discussion

This study addresses the fundamental question: given the currently available engineering and geologic datasets, how much additional gas resource is available for second and third cycle redevelopment efforts in producing field areas? Combining these results with forecasted demand scenarios provides a timeline that suggests how long known reserves can supply local needs. It is important to note that this study does not address which development activities will be economically feasible in future market scenarios. Nevertheless, if one assumes appropriate market conditions will exist, then investment in more complete field development operations, infrastructure de-bottlenecking and upgrades, and appropriate commercial alignment between unit partners will occur and a significant portion of the remaining reserves identified in this study will be developed to meet local demand for at least the next decade.

Figure 14 presents a schematic production forecast for the basin that includes wedges of incremental reserves identified by the various methods discussed in this report. Construction and interpretation of this diagram is complicated by the fact that the engineering estimates reflect all 28 gas fields, whereas the additional reserves estimated by geologic analyses come only from the Beluga River, North Cook Inlet, Ninilchik, and McArthur River (Grayling gas sands) fields. This forecast assumes that production will not exceed demand, which is projected flat at 90 BCF/year. It should be stressed that the point of this schematic diagram is to illustrate the additional gas volumes estimated in various reserve and resource categories identified using multiple analytical methods, and to estimate how long those volumes may be able to meet demand. The actual timing of when gas from any one of those wedges will go on production is unknown, and certain to be more complicated than can be shown here.

The most conservative wedge in red represents future production of proved, developed, producing reserves (863 BCF) identified basin-wide by decline curve analysis alone. The orange wedge represents production of additional probable reserves (279 BCF) identified as the basin-wide difference between material balance and decline curve analyses. The green wedge corresponds to the incremental production that could be achieved in just the four large fields through aggressive development of technically recoverable gas in the PAY category that we argue is not reflected in the engineering analyses because it is not currently in communication with producing wellbores (353 BCF). The yellow wedge represents the additional untapped gas from the Potential_Pay category in those four fields, risked at 50 percent (643 BCF). Finally, the gray wedge illustrates speculative future production from contingent gas resources that await confirmation, delineation, and development (an aggregated volume estimated at 300 BCF from the exploration leads identified in this report). This illustrates the likelihood that investment in more complete development of the producing Cook Inlet gas fields could yield sufficient gas to meet projected demand for years to come.

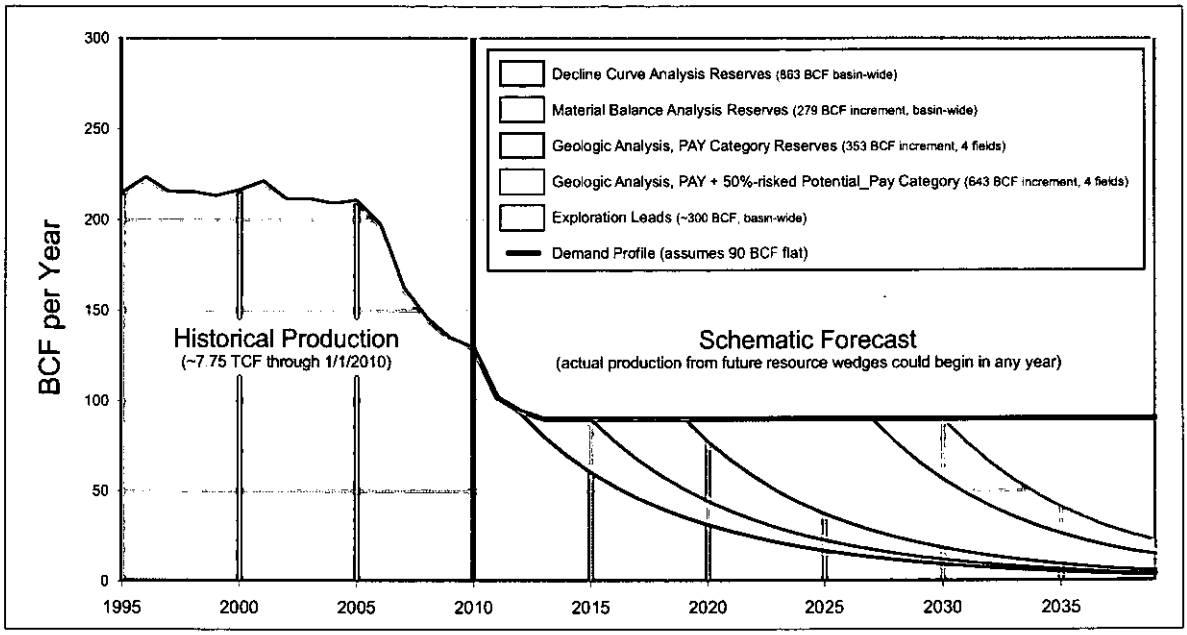

Figure 14. Hypothetical production forecast for the Cook Inlet basin showing increments of reserves and resources identified by engineering and geological analyses discussed in text. This schematic diagram assumes that near-term production will come from gas volumes documented by the most conservative estimation techniques. Successive wedges are introduced with progressively lower certainty regarding commerciality, volume, and timing of first production. Production from future resource wedges could begin in any year, resulting in a more complex forecast, and extending the production lifespan of previous wedges. On the other hand, we are unable to predict the commercial thresholds at which volumes from future wedges become economic to recover. Wedges show gas volume increments from basin-wide decline curve analyses (red), basin-wide material balance analyses (orange), deterministic geologic mapping of PAY (green), and 50 percent-risked Potential_Pay (yellow) in four large gas fields (Beluga River, North Cook Inlet, Ninilchik, and McArthur River Grayling gas sands). The last wedge (gray) is a more speculative estimate of aggregated gas volumes that may be recoverable from the exploration leads discussed in text. See text for additional discussion.

CONCLUSIONS

This report summarizes a multi-disciplinary effort to quantify remaining gas reserves in the Cook Inlet basin. Reserves have been categorized relative to readiness for and certainty of production to predict whether existing reserves are capable of meeting demand over the next decade. The following list describes important points regarding the analytical techniques employed and the findings derived from this effort.

1) Decline curve forecasts in demand-limited production situations do not always predict future rate. The rate derived from decline curve analysis represents an approximation of average annual rate.

2) Decline curve analysis (DCA) is a fair predictor of the remaining recoverable

gas (RRG) of currently producing reserves, but is limited by the underlying assumption that past performance will continue and well-related activity to sustain production will continue. Daily PD (producing day) rate deliverability based on monthly data gives a more accurate picture of peak rates from wells.

3) The best data for determining peak rates are real time data measured at the well level on a daily basis at actual demand conditions. These data are not publicly available for the fields assessed in this study.

4) Material balance (MB) methods are a good tool for predicting RRG and original gas-in-place, but only for pay intervals that are in communication with actively producing wellbores.

5) The quality of MB analyses is directly related to quality of pressure data, frequency of measurement, and accurate knowledge of the reservoirs.

6) Estimating gas maximum PD rates from proved, developed, producing (PDP) reserves is best accomplished using multiple analyses; DCA, MB, analysis of daily pressure, temperature, and production data, and maximum PD rate forecasting each play an important role. These methods could be combined in a systems model which includes pipeline parameters, field infrastructure, reservoir parameters, and economic parameters to help predict ability to meet demand under various conditions.

7) Geologic evaluation of the Beluga River, North Cook Inlet, Ninilchik, and McArthur River (Grayling gas sands) fields using interpretive pay identification and mapping techniques strongly suggests that these reservoirs contain significant additional technically recoverable gas reserves that have yet to be brought into communication with producing wellbores.

8) Geologic reserve estimates for the four fields may be conservative in some zones where, in the absence of other data, we assumed 40 percent water saturation. Reserves calculated in other zones may be either conservative or optimistic where we lacked definitive constraints on gas-water contacts with which to clip the aerial extent of the mapped PAY and Potential_Pay volumes. Improved reserve estimates would be possible by using effective porosity and calculated water saturations obtained through additional log analysis.

9) The highly productive Sterling Formation in the known fields is in decline. The remaining reserves base is primarily in the Beluga and Tyonek Formations, which in general do not have the high productivity rates of the Sterling Formation. The long term performance of wells targeting these gas sands is unknown.

Economic Considerations

The Cook Inlet gas market is isolated and relatively small when compared to other national and global markets. Gas deliverability is challenged during spikes in demand, which implies that it is difficult to make the investment necessary to meet short-duration, high-deliverability requirements. In order to engage in drilling and development projects in the Cook Inlet, local producers must internally justify doing so as an alternative to pursuing other projects worldwide. Therefore, economic viability of investment in reserves development to meet demand spikes must be

evaluated in the context of an isolated market in order to fully appreciate the supply and demand relationships. Development investment is clearly being made, but investment viability in short term deliverability projects may be challenged in some cases.

The results of this study suggest enough proved and probable gas reserves exist in Cook Inlet reservoirs to satisfy local demand well into, and possibly beyond the next decade. This forecast assumes that either a significant amount of gas is found by explorers to meet industrial use, or that the export of gas out of the basin will stop at the end of the current license period. It also assumes that no new significant market demand will arise until reserves can be developed to satisfy the entire market. The higher-risk contingent and prospective resources that await confirmation and delineation in exploration prospects have the potential to play a large role in the supply-demand scenarios of the future, but will require the availability of sufficient risk-capital.

Although infill drilling, perforating undeveloped sands, and targeting marginal reservoirs are effective ways to add reserves to replace production, these activities come at a relatively high price that will need to be absorbed into a small-volume market. These cost increases will likely put upward pressure on ultimate consumer pricing. It will be critical for all stakeholders to recognize the significant impediments that will hinder development of the remaining gas resource in the Cook Inlet basin, and work together to overcome them.

ACKNOWLEDGMENTS

The authors thank Kevin Banks, Director of the Division of Oil and Gas, for realistically defining the expectations, scope, and deadlines associated with this project. Michael Heumann made significant contributions to the decline curve and material balance analyses of this study during an internship with the Division of Oil and Gas. We thank Robert Swenson, Director of the Division of Geological & Geophysical Surveys, for critical reviews and revisions of numerous drafts of this report. We relied heavily on the expertise of Mike Pritchard for help in drafting the figures and tables. Christina Holmgren and Heather Ann Heusser were instrumental in the final editing and formatting of the document in its present form.

CS FOR SENATE BILL NO. 220(RES)

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-SIXTH LEGISLATURE - SECOND SESSION

BY THE SENATE RESOURCES COMMITTEE

Offered:
Referred:

Sponsor(s): SENATE RESOURCES COMMITTEE

A BILL

FOR AN ACT ENTITLED

"An Act declaring a state energy policy; relating to energy efficiency, energy conservation, and alternative energy; relating to an emerging energy technology fund and a renewable energy refundable tax credit; relating to a fuel purchasing cooperative, to the Alaska heating assistance program, to energy codes and efficiency standards, to a state agency energy use reduction program and to state energy use data, to the Southeast energy fund, to the alternative energy revolving loan fund, to nuclear energy production and facilities, to the definition of 'power project' or 'project' as it relates to rural and statewide energy programs and the Alaska Energy Authority, to the definition of 'alternative energy system,' and to the renewable energy grant fund; establishing an Alaska energy efficiency revolving loan fund; directing the Department of Transportation and Public Facilities to prepare a report on the feasibility of using compressed natural gas to power vehicles in the state, including vehicles owned or

operated by the state, and including in that study, if warranted, a pilot program proposal for powering some vehicles owned or operated by the state with compressed natural gas; authorizing and relating to the issuance of bonds by the Alaska Housing Finance Corporation; and relating to an energy report by the Office of the Governor."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

*** Section 1.** The uncodified law of the State of Alaska is amended by adding a new section to read:

SHORT TITLE. This Act may be known as the Alaska Sustainable Energy Act.

*** Sec. 2.** The uncodified law of the State of Alaska is amended by adding a new section to read:

LEGISLATIVE POLICY. The legislature recognizes that the state's economic prosperity is dependent on available, reliable, and affordable residential, commercial, and industrial energy to supply the state's electric, heating, and transportation needs. The legislature further recognizes that energy efficiency, renewable energy, fossil fuels, and conservation will each play an important role in meeting the state's energy needs, which vary widely across the state's diverse geographic regions. In establishing a state energy policy, the legislature intends for the state to achieve a 10 percent increase in energy efficiency from 2010 levels by 2015 and a 15 percent increase in energy efficiency by 2020, after accounting for growth in population and economy. Therefore, it is the policy of the state to

(1) institute a comprehensive and coordinated approach to supporting energy efficiency and conservation by

(A) establishing statewide energy efficiency codes for new and renovated public buildings and by assisting local communities interested in adopting energy efficiency codes for new and renovated residential and commercial buildings;

(B) decreasing public building energy consumption through conservation measures and energy-efficient technologies; and

(C) educating state residents on the benefits of energy efficiency and conservation, including dissemination of information on state and federal programs that reward energy efficiency;

(2) encourage economic development by

(A) promoting the development of renewable energy resources, including geothermal, wind, solar, hydroelectric, hydrokinetic, tidal, and biomass energy with a goal of generating 50 percent of the state's electricity using renewable energy resources by 2020;

(B) promoting the development, transport, and efficient use of nonrenewable energy resources, including natural gas, coal, oil, nuclear energy, gas hydrates, and heavy oil, for use by Alaskans, for export, and as feedstock for value-added enterprises;

(C) working to identify and assist with development of the most cost-effective, long-term sources of energy for each community statewide;

(D) creating and maintaining a state fiscal regime that encourages private sector development of the state's energy resources;

(E) ensuring a reliable in-state gas supply for residents of the state;

(3) support energy research, education, and workforce development by investing in

(A) training and education programs that address energy conservation, efficiency, extraction, processing, and transportation, including programs that address workforce development and workforce transition; and

(B) applied energy research and development of emerging technologies, including university programs, to achieve reductions in state energy costs and stimulate industry investment in the state;

(4) coordinate governmental functions by

(A) actively collaborating with the private sector and local and federal agencies to achieve the state's energy goals and to meet emissions, renewable energy, and energy production targets; and

(B) reviewing and streamlining regulatory processes and balancing the economic costs of review with the level of review necessary to protect the public interest.

* **Sec. 3.** The uncodified law of the State of Alaska is amended by adding a new section to read:

PURPOSE. The purpose of AS 44.42.067, enacted by sec. 23 of this Act, is to reduce the amount of energy consumed by public facilities in use in 2010 by 15 percent by 2020, thereby reducing costs to the state and increasing jobs in energy efficiency industries.

*** Sec. 4.** AS 14.08.101 is amended to read:

Sec. 14.08.101. Powers. A regional school board may

(1) sue and be sued;

(2) contract with the department, the Bureau of Indian Affairs, or any other school district, agency, or regional board for the provision of services, facilities, supplies, or utilities;

(3) determine its own fiscal procedures, including but not limited to policies and procedures for the purchase of supplies and equipment; the regional school boards are exempt from AS 37.05 (Fiscal Procedures Act) and AS 36.30 (State Procurement Code);

(4) appoint, compensate, and otherwise control all school employees in accordance with this title; these employees are not subject to AS 39.25 (State Personnel Act);

(5) adopt regulations governing organization, policies, and procedures for the operation of the schools;

(6) establish, maintain, operate, discontinue, and combine schools subject to the approval of the commissioner;

(7) recommend to the department projects for construction, rehabilitation, and improvement of schools and education-related facilities as specified in AS 14.11.011(b), and plan, design, and construct the project when the responsibility for it is assumed under AS 14.11.020;

(8) by resolution adopted by a majority of all the members of the board and provided to the commissioner of the department, assume ownership of all land and buildings used in relation to the schools in the regional educational attendance area, as provided for in AS 14.08.151(b);

(9) provide housing for rental to teachers, by leasing existing housing from a local agency or individual, by entering into contractual arrangements with a local agency or individual to lease housing that will be constructed by the local agency

or individual for that purpose, or, without using for the purpose that portion of public school funding that consists of state aid provided under AS 14.17, by constructing or otherwise acquiring housing that is owned and managed by the regional educational attendance area for rental to teachers;

(10) employ a chief school administrator;

(11) **apply for and use the proceeds of a loan from the Alaska energy efficiency revolving loan fund (AS 18.56.855);**

(12) exercise those other functions that may be necessary for the proper performance of its responsibilities.

*** Sec. 5.** AS 18.45.020 is amended to read:

Sec. 18.45.020. United States licenses or permits required. A person may not manufacture, construct, produce, transfer, acquire, or possess a special nuclear material, by-product material, **special nuclear material facility, by-product material facility,** production facility, or utilization facility, or act as an operator of a production **facility** or utilization facility, wholly within the state without first obtaining a license or permit for the activity in which the person proposes to engage from the Nuclear Regulatory Commission if the commission requires a license or permit to be obtained by persons proposing to engage in the activities.

*** Sec. 6.** AS 18.45.025(a) is amended to read:

(a) A person may not construct a nuclear fuel production facility, **nuclear utilization facility,** utilization facility, reprocessing facility, or nuclear waste disposal facility in the state without first obtaining a permit from the Department of Environmental Conservation to construct the facility on land designated by the legislature under (b) of this section.

*** Sec. 7.** AS 18.45.025(b) is amended to read:

(b) The legislature shall designate by law the land in the state on which a nuclear fuel production **facility**, nuclear utilization **facility, utilization facility**, nuclear reprocessing **facility**, or nuclear waste disposal facility may be located. In designating the land in the state on which

(1) a nuclear utilization facility or utilization facility may be located, the legislature shall act in the interest of regulating the economics of

nuclear energy;

(2) a nuclear fuel production **facility**, [NUCLEAR UTILIZATION,] nuclear reprocessing **facility**, or nuclear waste disposal facility may be located, the legislature shall act to protect the public health and safety.

*** Sec. 8.** AS 18.45.025(c) is repealed and reenacted to read:

(c) The Department of Environmental Conservation shall adopt regulations governing the issuance of permits required by (a) of this section. However, a permit may not be issued until the municipality with jurisdiction over the proposed facility site has approved the permit.

*** Sec. 9.** AS 18.56.090 is amended by adding a new subsection to read:

(f) In furtherance of its corporate purpose, the corporation may, in cooperation with the Alaska Energy Authority, provide technical assistance to municipalities related to residential and commercial building energy codes and energy efficiency standards.

*** Sec. 10.** AS 18.56 is amended by adding a new section to read:

Sec. 18.56.855. Alaska energy efficiency revolving loan fund. (a) The Alaska energy efficiency revolving loan fund is established in the corporation to carry out the purposes of this section. The revolving loan fund consists of money or assets appropriated or transferred to the corporation for the revolving loan fund, including money and assets deposited in the revolving loan fund by the corporation and earnings on investments of money held in the revolving loan fund. The corporation may establish separate accounts in the fund. The corporation shall establish the interest rates, security provisions, and other terms of a loan made under this section taking into consideration the corporation's cost of funds and other factors the corporation considers appropriate.

(b) Money and other assets of the Alaska energy efficiency revolving loan fund may be used to

(1) make loans to regional educational attendance areas or to municipal governments, including subdivisions of municipal governments, or to the state for the purpose of financing energy efficiency improvements to buildings owned by regional educational attendance areas, by the state, or by municipalities in the state;

(2) secure bonds issued by the corporation to finance the loans described in (1) of this subsection;

(3) pay costs of administering the revolving loan fund; and

(4) pay the costs of administering and enforcing the terms of loans made by the corporation from the revolving loan fund.

(c) Before a regional educational attendance area, a municipal government, or a subdivision of a municipal government, may borrow money from the corporation under this section, the regional educational attendance area or the municipal government shall waive any sovereign immunity defense it may have available to it with respect to enforcement of the terms of the loan. A regional educational attendance area or a municipal government may waive sovereign immunity to comply with the requirement of this subsection. The state waives any sovereign immunity defense against enforcement of the terms of a loan made to the state under this section. A person or corporation having a claim under this section shall bring an action in a state court in Alaska that has jurisdiction over the claim.

(d) All regional educational attendance areas and municipal governments in the state are authorized to borrow from the corporation under this section. The corporation shall set out the terms of a loan to a regional educational attendance area in a loan agreement or similar document. At the discretion of the corporation, a borrowing by a regional educational attendance area or a municipal government under this section may be effected by use of a loan agreement or similar document evidencing and setting out the terms of the loan or by issuance of a bond by the municipal government to the corporation. Notwithstanding a charter provision requiring public sale by a regional educational attendance area or a municipality of its municipal bonds or other indebtedness, a regional educational attendance area or municipality may sell its bonds under this section to the corporation at a negotiated, private sale. At the discretion of the corporation, the bonds or other indebtedness of the municipality may be general obligations of the municipality or may be secured by an identified revenue source or by a combination of the full faith and credit of the municipality and an identified revenue source.

(e) Notwithstanding any other provision of law, to the extent that a department

or agency of the state is the custodian of money payable to a regional educational attendance area or to a municipality, at any time after written notice to the department or agency head from the corporation that the regional educational attendance area or municipality is in default on the payment of principal of or interest on municipal bonds or other indebtedness then held or owned by the corporation, or amounts due under an agreement between the corporation and a regional educational attendance area or a municipality, the department or agency shall withhold the payment of that money from that regional educational attendance area or municipality and pay over the money to the corporation for the purpose of paying the principal of and interest on the bonds or indebtedness. The notice must be given in each instance of default. If a notice is given under this subsection and under AS 44.85.170 and the default is continuing under this subsection and under AS 44.85.170, the department or agency shall make payment to the corporation and to the Alaska Municipal Bond Bank Authority on a pro rata basis, taking into consideration the principal amount of the respective default amounts.

(f) An authorized state officer may borrow from the corporation under this section for buildings owned by the state. The superintendent of a regional educational attendance area, at the direction of the regional educational attendance area school board, may borrow from the corporation under this section for buildings owned by the regional educational attendance area.

(g) In addition to other security that may be given with respect to a loan made under this section, the corporation may require a deed of trust on the building that is the subject of the energy efficiency loan and the real estate on which the building is located. A regional educational attendance area or a municipality may grant a deed of trust to the corporation as needed for this purpose. An authorized state officer may grant a deed of trust to the corporation as needed for this purpose.

(h) The corporation shall administer the Alaska energy efficiency revolving loan fund in accordance with regulations adopted by the corporation. The corporation may adopt regulations under AS 18.56.088 to carry out the purposes of this section.

(i) This section applies to home rule municipalities.

(j) In this section, "authorized state officer" means

(1) the commissioner of the department of the state for a building owned by the state;

(2) the executive director of a public corporation for a building owned by the public corporation;

(3) the legislative council for a building owned by the legislature;

(4) the administrative director of courts for a building owned by the judicial system;

(5) any other person designated in writing by a person listed in (1) - (4) of this subsection.

* **Sec. 11.** AS 35.10 is amended by adding a new section to article 1 to read:

Sec. 35.10.012. Alternative energy for public works. (a) For each public work subject to AS 35.10.010 - 35.10.080, the construction of which begins on or after January 1, 2011, the department shall consider using a nonfossil fuel fired alternative energy system for heat or electrical power if the department reasonably believes that an alternative energy system to supply heat or power is available that

(1) is comparably reliable to a fossil fuel fired system; and

(2) if used over the course of the life of the facility,

(A) will not cost more than a fossil fuel fired system to purchase, install, maintain, and operate; and

(B) will have less measurable adverse effect on the environment than a fossil fuel fired system.

(b) If the department determines that an alternative energy system described in (a) of this section is available and can be used as a primary or secondary source of heat or electrical power, as to a public work the construction of which under this chapter begins on or after January 1, 2011, the department shall construct the public work to accommodate or be compatible with the alternative energy system.

(c) In this section, "construction" does not include reconstruction, alteration, improvement, or major repair.

* **Sec. 12.** AS 36.30 is amended by adding a new section to read:

Sec. 36.30.323. Consideration of energy efficient equipment. When the Department of Administration enters into contracts to purchase equipment that uses

energy, it shall give consideration to the energy efficiency of the equipment where credible and objective information on efficiency levels is readily available.

* **Sec. 13.** AS 37.07.040 is amended to read:

Sec. 37.07.040. Office of management and budget. The Alaska office of management and budget shall

(1) assist the governor in meeting the requirements of AS 37.07.020, including the coordination and analysis of state agency goals and objectives, plans, and budget requests;

(2) prepare for submission to the governor an annually updated six-year capital improvements program and the proposed capital improvements budget for the coming fiscal year, the latter to include individual project justification with documentation of estimated project cost;

(3) develop procedures to produce the information needed for effective policy decision making, including procedures to provide for the dissemination of information about plans, programs, and budget requests to be included in the annual budget and opportunity for public review and comment during the period of budget preparation;

(4) assist state agencies in their statement of goals and objectives to achieve, among other things, the legislature's mission and desired results, preparation of plans, assessments of the extent to which missions and desired results have been achieved, budget requests, and reporting of program performance; all documents forwarded by the office to a state agency containing instructions for the preparation of program plans and budget requests and the reporting of program performance are public information after the date they are forwarded;

(5) administer its responsibilities under the program execution provisions of this chapter so that the policy decisions and budget determinations of the governor and the legislature are implemented;

(6) provide the legislative finance division with the budget information it may request;

(7) provide the legislative finance division with an advance copy of the governor's budget workbooks at least seven days before the legislature convenes in a

regular session;

(8) prepare the proposed capital improvements budget for the coming fiscal year evaluating both state and local requests from the standpoint of need, equity, and priorities of the jurisdiction; other factors such as project amounts, population, local financial match, federal funds being used for local match, municipality or unincorporated community acceptance of the facility, and all associated costs of the facility may be considered;

(9) for each department in the executive branch, report to the legislature by the 45th day of each regular session the amount of money appropriated to the department that is expected to lapse into the general fund at the end of the current fiscal year;

(10) establish and administer a state agency program performance management system involving planning, performance budgeting, performance measurement, and program evaluation; the office shall ensure that information generated under this system is useful for managing and improving the efficiency and effectiveness of agency operations;

(11) by January 15, list each lease-purchase agreement entered into by an agency during the immediately preceding fiscal year for the acquisition of equipment or other personal property, together with a description of the property acquired and financial details, including the purchase price, the term for payments, the amount of each payment, and the amount of interest or financing charges paid;

(12) work with state agencies to develop a standardized methodology to collect and store energy consumption and expense data.

*** Sec. 14.** AS 42.45.040 is repealed and reenacted to read:

Sec. 42.45.040. Southeast energy fund. (a) The Southeast energy fund is established as a separate fund. The fund consists of money appropriated to the fund by the legislature, including

(1) money transferred to it under former AS 42.45.050;

(2) gifts, bequests, contributions from other sources, and federal money; and

(3) interest earned on the fund balance.

(b) The fund is not a dedicated fund.

(c) The authority may make grants from the Southeast energy fund for power projects, repayment of loans, and payments on bonds

(1) for hydroelectric projects serving Southeast Alaska; or

(2) for other projects or programs designated by the legislature, to assist in meeting the energy needs of Southeast Alaska.

(d) An appropriation from the fund for a project described in (c) of this section lapses back into the fund if substantial, ongoing work on the project has not begun within five years after the effective date of the appropriation.

*** Sec. 15.** AS 42.45.045(d) is amended to read:

(d) The authority shall, in consultation with the advisory committee established under (i) of this section and the Department of Natural Resources,

(1) develop a methodology for determining the order of projects that may receive assistance, including separate requirements for grant eligibility, and adopt regulations identifying criteria to evaluate the benefit and feasibility of projects for which an applicant applies for support from the legislature, with the most weight being given to projects that serve any area in which the average cost of energy to each resident of the area exceeds the average cost to each resident of other areas of the state, and significant weight being given to a statewide balance of grant funds, [AND] to the amount of matching funds an applicant is able to make available **for a project, and to projects that are likely to have a financial benefit that exceeds the amount of grant funds received**;

(2) make recommendations to the legislature for renewable power production reimbursement grants; [AND]

(3) not later than 10 days after the first day of each regular legislative session, submit to the legislature a report summarizing and reviewing each grant application submitted under this section and a recommended priority for awarding grants**; and**

(4) require activity reports for each project funded at intervals determined by the authority.

*** Sec. 16.** AS 42.45.045 is amended by adding a new subsection to read:

(m) The authority shall enter into contracts or agreements with experts to assist in conducting an independent economic or financial analysis for each recommended application. The information shall be included in the report to the legislature required by (d) of this section.

*** Sec. 17.** AS 42.45 is amended by adding a new section to article 5 to read:

Sec. 42.45.260. Fuel purchasing cooperative. The authority shall facilitate the organization of a statewide fuel purchasing cooperative by contacting and providing technical assistance to potential participants in the cooperative, including local governments, utilities, school districts, state agencies, tribal governments, housing authorities, and other interested nonprofit entities.

*** Sec. 18.** AS 42.45 is amended by adding a new section to read:

Article 7A. Emerging Energy Technology Fund.

Sec. 42.45.375. Emerging energy technology fund. (a) The emerging energy technology fund is established. The fund consists of

(1) money appropriated to the fund by the legislature to provide grants for energy projects; and

(2) gifts, bequests, contributions from other sources, and federal money appropriated to the fund.

(b) The fund is not a dedicated fund.

(c) The fund shall be administered by the authority, but the authority may contract for the investment of money appropriated to the fund but not disbursed for a grant. The authority, in consultation with the advisory committee established under (f) of this section, may make grants from the fund to eligible applicants for

(1) research, development, or demonstration projects designed to

(A) test new energy technologies or methods of conserving energy; or

(B) improve an existing energy technology; and

(2) applied research projects that employ energy technology with a reasonable expectation that the technology will be commercially viable in not more than five years.

(d) In making grants under this section, the authority, in consultation with the

advisory committee established under (f) of this section, shall give priority to

(1) Alaska residents, associations, organizations, or institutions;

(2) projects that demonstrate partnership with the University of Alaska or another Alaska postsecondary institution; and

(3) projects supported by matching funds or in-kind partnerships.

(e) In administering the fund, the authority may enter into a contract or agreement with the University of Alaska to provide technical and economic analysis for the advisory committee established under (f) of this section and a review of the projects awarded grants.

(f) An advisory committee is established and consists of seven members. Each member of the committee shall have a degree in science or engineering, or equivalent professional experience, and at least two years of experience working in the state. Members of the committee shall be appointed by the governor to staggered three-year terms. The committee consists of one representative of each of the following groups:

(1) a business or organization engaged in the renewable energy sector;

(2) a business or organization engaged in the fossil fuel energy sector;

(3) the Alaska Power Association or an Alaska electric utility;

(4) the Denali Commission established under P.L. 105-277 and mentioned in a note at 42 U.S.C. 3121;

(5) the National Renewable Energy Laboratory;

(6) the Arctic Energy Office of the National Energy Technology Laboratory;

(7) the Alaska Industrial Development and Export Authority.

(g) A member of the advisory committee appointed under (f) of this section serves without compensation but is entitled to per diem and travel expenses as provided in AS 39.20.180.

(h) If a member of the advisory committee appointed under (f)(4), (f)(5), or (f)(6) is not available to serve as a member of the committee, the governor shall appoint a representative from a federal agency or department with a comparable mission or purpose to the agency listed in (f)(4), (f)(5), or (f)(6) to fill the position on the committee. If a representative from a federal agency or department is not available

to fill the position, the governor may appoint a member from a state agency or department.

(i) In this section,

(1) "eligible applicant" means

(A) an electric utility holding a certificate of public convenience and necessity under AS 42.05;

(B) an independent power producer;

(C) a local government, quasi-governmental entity, or other governmental entity, including a tribal council or housing authority;

(D) a business holding an Alaska business license; or

(E) a nonprofit organization.

(2) "energy technology" means technology that promotes, enhances, or expands the diversity of available energy supply sources or means of transmission, increases energy efficiency, or reduces negative energy-related environmental effects; "energy technology" includes technology related to renewable sources of energy, conservation of energy, enabling technologies, efficient and effective use of hydrocarbons, and integrated energy systems;

(3) "fund" means the emerging energy technology fund.

* **Sec. 19.** AS 42.45.990(4) is amended to read:

(4) "power project" or "project" means a plant, works, system, or facility, together with related or necessary facilities and appurtenances, including a divided or undivided interest in or a right to the capacity of a power project or project, that is used or is useful for the purpose of

(A) electrical or thermal energy production [OTHER THAN NUCLEAR ENERGY PRODUCTION];

(B) waste energy utilization and energy conservation; or

(C) transmission, purchase, sale, exchange, and interchange of electrical or thermal energy, including district heating or interties;

* **Sec. 20.** AS 43.20 is amended by adding a new section to read:

Sec. 43.20.046. Renewable energy credit. For purposes of calculating the tax payable under this chapter, a taxpayer shall apply as a credit against tax liability any

renewable energy refundable tax credits earned under AS 43.98.040.

*** Sec. 21.** AS 43.98 is amended by adding a new section to read:

Sec. 43.98.040. Renewable energy refundable tax credit. (a) A person that produces renewable energy may claim a renewable energy refundable tax credit in the amount of 15 percent of the retail rate charged by the person, as determined by the Regulatory Commission of Alaska for each kilowatt-hour of electricity produced from renewable energy.

(b) A person may claim a credit under this section in the first year the capital investment used to produce electricity from renewable energy is placed into service and for the four years following that year.

(c) A person may claim a credit under this section only for a capital investment

(1) to produce electricity from renewable energy that is placed into service on or after the effective date of this Act; or

(2) to expand production of electricity from renewable energy if the investment for production expansion is made on or after the effective date of this Act.

(d) A person

(1) shall use a credit under this section to offset taxes imposed under AS 43.20 (Alaska Net Income Tax Act); and

(2) may not calculate and apply the credit against the alternative minimum tax levied under the authority of AS 43.20.021(f).

(e) The department shall prescribe a form or format and adopt procedures to allow a person to claim a refundable credit under this section. The commissioner shall pay the amount of a tax credit under this section to a person who submits a form and follows procedures adopted under this subsection. A credit under this section shall be paid in the manner provided in AS 43.20.030(e) for the payment of refunds. Payments may not be made under the authority of this subsection without an appropriation for that purpose.

(f) A credit claimed under this section may not exceed 10 percent of the person's capital investment for the production of electricity from renewable energy or $30,000,000, whichever is less. In calculating a person's capital investment, a person

may not include any state or federal grant the person received for the capital investment.

(g) In this section,

(1) "capital investment" means an expenditure made

(A) for real property or tangible personal property used in this state in the production of electricity from renewable energy; and

(B) for an asset first placed in service for the production of electricity from renewable energy in the state during or before the tax year in which the credit is claimed; in this subparagraph, "placed in service for the production of electricity from renewable energy in the state" means that the first use of the capital investment is in this state; if the property on which the claim of the credit is based has been used outside the state in the tax year of acquisition and is brought to this state during that year or a subsequent year, the property does not qualify as a capital investment;

(2) "credit" means the renewable energy refundable tax credit authorized by this section;

(3) "renewable energy" means geothermal, solar, hydroelectric, wind, biomass, hydrokinetic or tidal, and wave energy.

* **Sec. 22.** AS 44.42.020(a) is amended to read:

(a) The department shall

(1) plan, design, construct, and maintain all state modes of transportation and transportation facilities and all docks, floats, breakwaters, buildings, and similar facilities;

(2) study existing transportation modes and facilities in the state to determine how they might be improved or whether they should continue to be maintained;

(3) study alternative means of improving transportation in the state with regard to the economic costs of each alternative and its environmental and social effects;

(4) develop a comprehensive, long-range, intermodal transportation plan for the state;

(5) study alternatives to existing modes of transportation in urban areas and develop plans to improve urban transportation;

(6) cooperate and coordinate with and enter into agreements with federal, state, and local government agencies and private organizations and persons in exercising its powers and duties;

(7) manage, operate, and maintain state transportation facilities and all docks, floats, breakwaters, and buildings, including all state highways, vessels, railroads, pipelines, airports, and aviation facilities;

(8) study alternative means of transportation in the state, considering the economic, social, and environmental effects of each alternative;

(9) coordinate and develop state and regional transportation systems, considering deletions, additions, and the absence of alterations;

(10) develop facility program plans for transportation and state buildings, docks, and breakwaters required to implement the duties set out in this section, including but not limited to functional performance criteria and schedules for completion;

(11) supervise and maintain all state automotive and mechanical equipment, aircraft, and vessels, except vessels and aircraft used by the Department of Fish and Game or the Department of Public Safety; for state vehicles maintained by the department, the department shall every five years evaluate the cost, efficiency, and commercial availability of alternative fuels for automotive purposes, and the purpose for which the vehicles are intended to be used, and convert **vehicles to use alternative fuels** or purchase **energy efficient** vehicles [TO USE ALTERNATIVE FUELS] whenever practicable; the department may participate in joint ventures with public or private partners that will foster the availability of alternative fuels for all automotive fuel consumers;

(12) supervise aeronautics inside the state, under AS 02.10;

(13) implement the safety and financial responsibility requirements for air carriers under AS 02.40;

(14) inspect weights and measures;

(15) at least every four years study alternatives available to finance

transportation systems in order to provide an adequate level of funding to sustain and improve the state's transportation system.

*** Sec. 23.** AS 44.42 is amended by adding a new section to read:

Sec. 44.42.067. Retrofits and new construction for energy efficiency; energy efficiency report. (a) Not later than January 1, 2020, the department shall work with other state agencies to retrofit at least 25 percent of all public facilities, starting with those it determines are the least energy efficient, if the department determines that retrofitting the public facilities will result in a net savings in energy costs to the state within 15 years after completion of the retrofits for a public facility and if funding for the retrofits is available.

(b) A retrofit or deferred maintenance of a public facility performed under this section, to the extent feasible, shall meet or exceed the most recently published edition of the ASHRAE/IESNA Standard 90.1, Energy Standard for Buildings Except for Low-Rise Residential Buildings, as published by the American Society of Heating, Refrigerating and Air-Conditioning Engineers.

(c) New construction of a public facility under this section shall meet or exceed the most recently published edition of the ASHRAE/IESNA Standard 90.1, Energy Standard for Buildings Except for Low-Rise Residential Buildings, as published by the American Society of Heating, Refrigerating and Air-Conditioning Engineers.

(d) Not later than January 1 of each year, the department, in consultation with the Department of Administration, shall submit a report to the legislature detailing the department's progress in meeting the requirements of this section to reduce state energy consumption and costs and carrying out the duties listed in AS 44.42.020 related to energy use. The department shall include in the report an analysis of the consumption and expense data recorded by the office of management and budget under AS 37.07.040, comparing energy consumption levels in each year with past years to determine if reductions are being achieved.

(e) In this section, "public facility" means a facility owned and controlled by the state for government or public use that is 10,000 square feet or more and is not a legislative building or court building.

* **Sec. 24.** AS 44.83.080 is amended by adding a new subsection to read:

(b) In furtherance of its corporate purpose, the authority shall annually plan and conduct, in cooperation with the Alaska Housing Finance Corporation, a public education campaign to promote energy efficiency and conservation.

* **Sec. 25.** AS 44.83.990(6) is amended to read:

(6) "power project" or "project" means a plant, works, system, or facility, together with related or necessary facilities and appurtenances, including a divided or undivided interest in or a right to the capacity of a power project or project, that is used or is useful for the purpose of

(A) electrical or thermal energy production [OTHER THAN NUCLEAR ENERGY PRODUCTION];

(B) waste energy utilization and energy conservation; or

(C) transmission, purchase, sale, exchange, and interchange of electrical or thermal energy, including district heating or interties;

* **Sec. 26.** AS 45.88.010(a) is amended to read:

(a) There is established in the Department of Commerce, Community, and Economic Development the alternative energy **conservation** revolving loan fund to carry out the purposes of AS 45.88.010 - 45.88.090. Loans made under AS 45.88.010 - 45.88.090 are to be used

(1) to develop means of energy production utilizing **one or more alternative energy systems; and**

(2) to purchase, construct, and install energy conservation improvements in commercial buildings [ENERGY SOURCES OTHER THAN FOSSIL OR NUCLEAR FUEL, INCLUDING, BUT NOT LIMITED TO, WINDMILLS, WATER AND SOLAR ENERGY DEVICES].

* **Sec. 27.** AS 45.88.010 is amended by adding a new subsection to read:

(e) The Alaska energy conservation revolving loan fund consists of

(1) money appropriated to the fund by the legislature;

(2) gifts, bequests, or contributions from other sources;

(3) principal and interest payments or other income earned on loans or investments in the fund; and

(4) money chargeable to principal or interest that is collected through liquidation by foreclosure or other processes on loans made under AS 45.88.010 - 45.88.090.

*** Sec. 28.** AS 45.88.020(a) is amended to read:

(a) The department may

(1) make loans for the purchase, construction, and installation**, in commercial buildings that are located in the state,** of

(A) alternative energy systems**; and**

(B) energy conservation improvements;

(2) adopt regulations necessary to carry out the provisions of AS 45.88.010 - 45.88.090, including regulations to establish reasonable fees for services provided and charges for collecting the fees;

(3) collect the fees and collection charges established under this subsection.

*** Sec. 29.** AS 45.88.025 is amended by adding a new section to read:

Sec. 45.88.025. Eligibility. To be eligible for a loan under AS 45.88.010 - 45.88.090, an applicant must

(1) physically reside in the state and maintain a domicile in the state during 12 consecutive months before the date of application for a loan and may not have

(A) declared or established residency in another state; or

(B) received residency or a benefit based on residency from another state;

(2) be at least 51 percent owned by individuals described in (1) of this section if the applicant is a corporation, joint venture, or partnership; or

(3) be a nonprofit organization under AS 10.20.

*** Sec. 30.** AS 45.88.030(a) is repealed and reenacted to read:

(a) A loan made under AS 45.88.010 - 45.88.090 may not exceed $50,000. If the requested loan amount exceeds $30,000, the applicant must deliver to the department a document from a financial institution stating that

(1) the applicant has been denied a loan for the same purpose; or

(2) the loan from the financial institution is contingent on the applicant also receiving a loan from the fund.

* **Sec. 31.** AS 45.88.030(e) is amended to read:

(e) The rate of interest for a loan **under AS 45.88.010 - 45.88.090 is the prime rate, as defined by AS 44.88.599, plus one percentage point, but may not be less than five percent a year** [FOR AN ALTERNATIVE ENERGY SYSTEM IS FIVE PERCENT FOR THE FIRST $15,000 OF THE LOAN AND 15 PERCENT FOR THE AMOUNT OF THE LOAN THAT EXCEEDS $15,000].

* **Sec. 32.** AS 45.88.030 is amended by adding a new subsection to read:

(f) A loan under AS 45.88.010 - 45.88.090 must be secured by a mortgage or other security instrument in the real property to be improved and a lien on the improvements financed with the loan.

* **Sec. 33.** AS 45.88.090(a) is amended to read:

(a) In AS 45.88.010 - 45.88.090,

(1) "alternative energy system"

(A) [(1)] means a source of thermal, mechanical or electrical energy **that** [WHICH] is not dependent on oil or gas or a nuclear fuel for the supply of energy for space heating and cooling, refrigeration and cold storage, electrical power, mechanical power, or the heating of water;

(B) [(2)] includes

(i) [(A)] an alternative energy property as defined by 26 U.S.C. 48(a)(3)(A) (Sec. 301, P.L. 95-618, Internal Revenue Code);

(ii) [(B)] a method of architectural design and construction which provides for the collection, storage, and use of direct radiation from the sun;

(iii) [(C)] a woodstove with a catalytic converter or a catalytic converter for a wood stove; [AND]

(iv) [(D)] a steam, hot water, or ducted hot air central heating system that uses wood or coal for fuel; **and**

(v) a high efficiency wood pellet stove;

(C) [(3)] does not include

(i) [(A)] a stove that uses only wood, coal, or oil for fuel; or

(ii) [(B)] a fireplace or fireplace insert;

(2) "commercial building"

(A) means a building that is intended to be used for commercial purposes;

(B) does not include

(i) a residential structure or mobile home that contains one to four family housing units; or

(ii) individual units of condominiums or cooperatives;

(3) "energy conservation improvement" means

(A) structural insulation;

(B) thermal windows and doors;

(C) a furnace replacement burner designed to achieve a reduction in the amount of fuel consumed as a result of increased combustion efficiency;

(D) a device for modifying flue openings designed to increase the efficiency of operation of the heating system;

(E) an electrical or mechanical furnace ignition system that replaces a gas pilot light;

(F) an automatic energy-saving setback thermostat;

(G) a meter that displays the cost of energy usage;

(H) caulking and weather stripping of doors and windows;

(I) insulating shades and shutters;

(J) air and water recuperators.

*** Sec. 34.** AS 46.11.900(1) is amended to read:

(1) "alternative energy system"

(A) means a source of thermal, mechanical, or electrical energy that is not dependent on oil or gas [OR A NUCLEAR FUEL] for the supply of energy for space heating and cooling, refrigeration and cold storage, electrical

power, mechanical power, or the heating of water;

(B) includes

(i) an alternative energy property as defined by 26 U.S.C. 48(a)(3)(A); and

(ii) a method of architectural design and construction that provides for the collection, storage, and use of direct radiation from the sun;

* **Sec. 35.** AS 47.25.621 is amended to read:

Sec. 47.25.621. Alaska <u>affordable</u> heating [ASSISTANCE] program. (a) The Alaska **<u>affordable</u>** heating [ASSISTANCE] program is established in the Department of Health and Social Services to provide expanded eligibility for Alaska residents for home heating assistance, to the extent funds are **<u>available in the Alaska affordable heating fund</u>** [APPROPRIATED BY THE LEGISLATURE FOR THAT PURPOSE].

(b) The **<u>Alaska affordable</u>** heating [ASSISTANCE] program established under this section is in addition to the federal low-income heating and energy assistance provided under 42 U.S.C. 8621 - 8629 (Low-Income Home Energy Assistance Act of 1981), as amended, and implementing regulations.

* **Sec. 36.** AS 47.25.621 is amended by adding a new subsection to read:

(c) The Alaska affordable heating fund is established as a separate fund to be managed by the Department of Revenue. The fund consists of appropriations made to it. Interest earned by the fund may be appropriated to it. The Department of Health and Social Services shall use money in the fund for Alaska affordable heating payments.

* **Sec. 37.** AS 47.25.622 is amended to read:

Sec. 47.25.622. Duties. The **<u>Department of Health and Social Services</u>** [DEPARTMENT] shall

(1) administer the Alaska **<u>affordable</u>** heating [ASSISTANCE] program provided under AS 47.25.621;

(2) adopt regulations under AS 44.62 (Administrative Procedure Act) to carry out the purpose of the program;

(3) coordinate payments among other heating assistance programs to

avoid duplication of payments.

* **Sec. 38.** AS 47.25.623 is amended to read:

Sec. 47.25.623. Eligibility; payment amount. An individual is eligible for home heating assistance payments under the Alaska **affordable** heating [ASSISTANCE] program if the individual

(1) is a resident of the state;

(2) is physically present and resides in a home in the state when the home heating costs are incurred;

(3) **for assistance calculated under (b) and (c) of this section, has gross household income not to exceed, as a percentage of the federal poverty guideline for Alaska set by the United States Department of Health and Human Services and revised under 42 U.S.C. 9902(2),**

(A) 225 percent for a determination to be made under (c)(1) - (3) of this section; and

(B) 250 percent for a determination to be made under (c)(4) of this section; and [HAS GROSS HOUSEHOLD INCOME ABOVE 150 PERCENT BUT THAT DOES NOT EXCEED 225 PERCENT OF THE FEDERAL POVERTY GUIDELINE FOR ALASKA SET BY THE UNITED STATES DEPARTMENT OF HEALTH AND HUMAN SERVICES AND REVISED UNDER 42 U.S.C. 9902(2);]

(4) meets other eligibility requirements specified in regulations adopted under AS 47.25.622.

* **Sec. 39.** AS 47.25.623 is amended by adding new subsections to read:

(b) The Department of Health and Social Services shall determine the number of points for each eligible individual based on the point formula used under 42 U.S.C. 8621 - 8629 (Low-Income Home Energy Assistance Act of 1981), as amended, and implementing regulations. Except as provided in (d) of this section, the amount of the Alaska affordable heating payment for an individual equals the base amount calculated under (c) of this section minus the amount the individual is eligible to receive under the federal low-income home energy assistance program under 42 U.S.C. 8621 - 8629, as amended, and implementing regulations.

(c) The Department of Health and Social Services shall calculate the base amount of the Alaska affordable heating payment for the individual based on points determined under (b) of this section and on the average price a barrel of Alaska North Slope crude oil for sale on the United States West Coast during September through February of the preceding fiscal year as follows:

(1) $130 a point when the average price is not more than $75 a barrel;

(2) $140 a point when the average price is more than $75 and not more than $100 a barrel;

(3) $150 a point when the average price is more than $100 and not more than $150 a barrel;

(4) $165 a point when the average price is more than $150 a barrel.

(d) Under the program authorized by AS 47.25.621 - 47.25.626, taking into consideration the gross household income rates established in (a) of this section and the base amounts to be calculated under (b) and (c) of this section,

(1) if insufficient money is appropriated to fully fund the Alaska affordable heating payments during the fiscal year, the department

(A) shall, for the duration of that fiscal year, suspend calculation and payment under (a)(3)(B) of this section and calculate and pay all eligible individuals under (a)(3)(A) of this section; and

(B) may, to the extent there is or may be an appropriation balance surplus to the amount required to make all payments under (A) of this paragraph, by regulation, establish at any time during the fiscal year a prospective pro rata reduction of the payment rates that the department will pay to eligible individuals under the program during that fiscal year qualifying under (a)(3)(B) of this section and, thereafter, may provide for prorated payments; and

(2) if the commissioner reasonably determines that the total of appropriations from all sources during the fiscal year may exceed the amount required to fully fund all applications for assistance for Alaska affordable heating payments, the commissioner may expend the amount of excess money, not to exceed the total amount of the appropriations, to carry out the purpose of AS 47.25.621 - 47.25.626;

under the authority of this paragraph, the commissioner shall distribute the estimated excess money pro rata among individuals receiving assistance under this section without regard to the limitations set out in the dollar value of the point formula expressed in (c)(1) - (4) of this section.

*** Sec. 40.** AS 47.25.626(a) is amended to read:

(a) The **Department of Health and Social Services** [DEPARTMENT] may develop a regional Alaska heating [ASSISTANCE] program for the administration of AS 47.25.621 - 47.25.626 to provide home heating assistance in a uniform and cost-effective manner in a region of this state if an Alaska Native organization is authorized to implement a federally approved tribal family assistance plan that includes that region and has been awarded a tribal energy assistance grant for a program that includes that region under 42 U.S.C. 8623(d).

*** Sec. 41.** AS 47.25.626(b) is amended to read:

(b) The department may award contracts to implement a program developed under (a) of this section. A contract authorized for delivery of home heating assistance under a regional Alaska heating [ASSISTANCE] program under this section is exempt from the competitive bid requirements of AS 36.30 (State Procurement Code). Subject to appropriation, a contract under this section must be in an amount that represents a fair and equitable share of the money appropriated for the Alaska **affordable** heating [ASSISTANCE] program under AS 47.25.621 - 47.25.626 to serve the state residents specified in (a) of this section. The authority provided under this section to contract is in addition to the authority to contract in AS 47.05.015 or other law.

*** Sec. 42.** AS 47.25.626(f) is amended to read:

(f) If the department establishes a regional Alaska heating [ASSISTANCE] program and awards a contract to provide home heating assistance under this section, a person applying for home heating assistance under AS 47.25.621 - 47.25.626 in the region of the state covered by the regional Alaska heating [ASSISTANCE] program may obtain home heating assistance from the department only through the organization designated by the department to serve the region.

*** Sec. 43.** AS 43.20.046, enacted by sec. 20 of this Act and AS 43.98.040, enacted by sec. 21 of this Act, are repealed January 1, 2018.

*** Sec. 44.** AS 44.42.067(c), enacted by sec. 23 of this Act, is repealed January 1, 2021.

*** Sec. 45.** AS 45.88.010(c), 45.88.030(c), 45.88.030(d), and 45.88.040(a) are repealed.

*** Sec. 46.** The uncodified law of the State of Alaska is amended by adding a new section to read:

OFFICE OF MANAGEMENT AND BUDGET. Not later than November 1, 2010, the Office of Management and Budget shall develop a standardized methodology to collect and store energy consumption and expense data as described in AS 37.07.040(12), as enacted by sec. 13 of this Act.

*** Sec. 47.** The uncodified law of the State of Alaska is amended by adding a new section to read:

DEPARTMENT OF TRANSPORTATION AND PUBLIC FACILITIES. Not later than one year after the effective date of this Act, the Department of Transportation and Public Facilities, in consultation with the Alaska Energy Authority, shall adopt and implement a systematic process for prioritizing the retrofitting of state facilities for a long-term increase in energy efficiency and reduction of energy costs.

*** Sec. 48.** The uncodified law of the State of Alaska is amended by adding a new section to read:

OFFICE OF THE GOVERNOR ENERGY REPORT. Not later than November 1, 2010, the governor shall submit a report to the legislature providing recommendations for how best to structure state energy programs and offices to increase the coordination and efficiency of the state's efforts.

*** Sec. 49.** The uncodified law of the State of Alaska is amended by adding a new section to read:

USE OF COMPRESSED NATURAL GAS TO POWER VEHICLES; PILOT PROGRAM; STUDY; PROPOSAL; REPORT. (a) The Department of Transportation and Public Facilities shall, under the authority of AS 44.42.020(a)(3), study the feasibility of using compressed natural gas to power vehicles in the state. The study must

(1) review existing government programs and incentives offered in Utah and other North American jurisdictions that promote the use of compressed natural gas to power vehicles;

(2) review and summarize relevant studies and investigations on existing

public policy incentives that encourage the use of compressed natural gas to power vehicles;

(3) evaluate the environmental benefits and technical merits of using compressed natural gas to power vehicles;

(4) consider the economic, environmental, and technological advantages and disadvantages of using and promoting the use of compressed natural gas to power vehicles in the state; and

(5) if warranted by the findings of the study, set out a proposal for a pilot program in the state to test the use of compressed natural gas to power vehicles owned or operated by the state; the proposal must

(A) recommend the most cost-effective and appropriate departments and geographic locations for a pilot program;

(B) detail how the pilot program, if successful, could be expanded to provide for increased use of compressed natural gas to power vehicles owned or operated by the state, as well as privately owned or operated vehicles;

(C) estimate the costs to the state of a pilot program in which the state would purchase vehicles powered by compressed natural gas or convert existing vehicles to be powered by compressed natural gas, including

(i) the costs of maintaining vehicles powered by compressed natural gas and training maintenance personnel;

(ii) the costs of adapting, or encouraging the adapting of, state vehicle fueling locations to provide compressed natural gas;

(iii) the costs of using compressed natural gas instead of diesel fuel or gasoline;

(iv) the costs of expanding the pilot program or developing additional pilot programs under (B) of this paragraph;

(v) other costs or savings that can be reasonably expected to accompany the pilot program.

(b) The Department of Transportation and Public Facilities shall prepare a report containing the results of the study under (a) of this section not later than December 1, 2010. The department shall notify the legislature when the report is available.

* **Sec. 50.** The uncodified law of the State of Alaska is amended by adding a new section to

read:

BOND AUTHORIZATION AND PROVISIONS. (a) In addition to the powers in AS 18.56.090, the Alaska Housing Finance Corporation may issue bonds in an amount not to exceed $250,000,000 to make loans from the energy efficiency revolving loan fund established by AS 18.56.855, enacted by sec. 10 of this Act, and to finance the purposes permitted by AS 18.56.855, enacted by sec. 10 of this Act. AS 18.56.110 - 18.56.190 and 18.56.855, enacted by sec. 10 of this Act, apply to bonds issued under this section, except that bonds issued under this section are not subject to, and may not be counted against, the bond issuance limitation set out in AS 18.56.110(g).

(b) The Alaska Housing Finance Corporation shall deposit the proceeds of bonds issued under (a) of this section in the Alaska energy efficiency revolving loan fund in accordance with AS 18.56.855, enacted by sec. 10 of this Act.

* **Sec. 51.** The uncodified law of the State of Alaska is amended by adding a new section to read:

REVISOR'S INSTRUCTIONS. (a) The revisor of statutes is instructed to change the heading of art. 6 of AS 18.56 from "Article 6. Energy Conservation" to "Article 6. Energy Efficiency and Conservation Programs.

(b) The revisor of statutes is instructed to change the heading of art. 1 of AS 45.88 from "Alternative Energy Revolving Loan Fund" to "Alternative Energy Conservation Revolving Loan Fund."

ANALYSIS CONTINUATION

Bill Language:

This fiscal note examines the changes in tax credit programs in the Department of Revenue and does not address the effects on other departments or public corporations.

This bill would create a refundable tax credit for electricity production from new or expanded renewable energy projects in the state. The amount of the credit is 15 percent of the retail rate of each kilowatt hour of electricity charged by the energy producer. The retail rate is determined by the Regulatory Commission of Alaska. The refundable credit is available in the year the date the capital investment used to produce renewable energy is placed into service, and the following four years. The tax credit would be applicable only to the Alaska Corporate Net Income Tax liabilities, but may not be taken against the alternative minimum tax. The credit cannot exceed 10% of the capital investment or $30,000,000, whichever is less. A person may not include state or federal grants as part of the capital investment.

For purposes of this bill, "renewable energy" means geothermal, solar, hydroelectric, wind, biomass, hydrokinetic or tidal, and wave energy.

The tax credit would apply to projects placed into service on or after the effective date of this Act. The tax credit provisions of the bill include a sunset date of January 1, 2018.

Revenues:

Revenues from this bill are indeterminate because we do not know the size or number of projects that would qualify for the credit. Also we do not know whether projects that qualify would choose to take the credit.

As an example, a 54-megawatt wind farm such as the Fire Island project near Anchorage could potentially be eligible for a $3 million annual credit refund. Over five years, the credit could amount to $15 million, but the 10% of capital costs limit would likely reduce the value of the credit. Any state or federal aid for the capital costs of the project would reduce the amount of the investment eligible for the credit refund.

Expenditures:

The provisions of this bill could be implemented with existing state resources. No additional personnel or resources would be needed, since the DOR is already performing these duties.

ANALYSIS: *(Attach a separate page if necessary)*

SB 220, titled the "Alaska Sustainable Energy Act," impacts the Alaska Energy Authority by

Section 14 - repealing and reenacting the purpose of the existing Southeast Energy Fund managed by the Alaska Energy Authority. From this fund AEA could award grants for hydroelectric projects serving Southeast Alaska or "for other projects or programs designated by the legislature, to assist in meeting the energy needs of Southeast Alaska." Currently the fund balance is zero. Depending on the capitalization, AEA would need to draft regulations and develop a process to administer grants including an allocation method for the various types of eligible projects which would bring additional expenses.

(Revised 11/6/2009 OMB)

STATE OF ALASKA
2010 LEGISLATIVE SESSION

BILL NO. CSSB 220(RES)

ANALYSIS CONTINUATION

Sections 15 and 16 - amending the Renewable Energy Fund grant recommendation program by a) requiring match to be verified by the applicant b) explicitly requiring significant weight be given to projects that are likely to have a financial benefit that exceeds the amount of the grant funds received c) requiring activity reports for each project d) requiring AEA to contract with an economist to prepare a written evaluation for each project recommended for funding. AEA does not anticipate increased costs with these changes.

Section 17 - requiring AEA to facilitate the organization of a statewide fuel purchasing cooperative. AEA would develop literature to assist organizations who are interested in forming a cooperative. We will hold meetings throughout Alaska to provide the necessary technical assistance. AEA will need to contract with an entity or person with fuel pricing and purchasing expertise and cooperative formation expertise. Approximate costs are **$50,000** (travel); **$200,000** (contractual - including 1 Range 12 AIDEA admin support - LT temp)

Section 18 - establishing the "Emerging Energy Technology Fund" and requiring the authority to administer the fund by making grants to eligible applicants. Cost Assumptions:
Approximately **$82,000** in one-time start up costs to develop program ciriteria, RFA process, review process, grant agreements, etc. (Contractual)
Approximately **$20,160** per year to cover Advisory Committee expenses (travel - assume $660 airfare x 120 perdiem x 7 members x quarterly meetings)
Approximately **$276,518** per year to cover contract for personal services with AIDEA
Positions required: 1 Range 22 for program/project management; 1 Range 15 for finance/grant administration; 1Range 12 for administrative support.(Contractual)
Approximately **$10,000** (Equipment) for new staff

Section 19 - changing the definition of a power project relative to the power project fund to include nuclear production. AEA's costs are zero because there are currently no projects of this type. However, in the event viable nuclear projects are identified, annual operating costs would increase by $365,000 for each nuclear power project that has to be managed; $165,000 for a project manager with technical nuclear knowledge and $200,000 for contractual advisory service in the field.

Section 24 - requiring AEA, in cooperation with AHFC, to plan and conduct an annual public education campaign to promote energy efficiency and conservation. The Alaska Energy Efficiency Program and Policy Recommendations published on June 12, 2008 recommended $1 million annual budget for education and outreach. The recommendation included approximately $800,000 per year for workshops for both commercial and residential, public speakers, media campaigns, labeling buildings with energy information, and approximately $200,000 for outreach. Currently, AEA is working on an outreach plan and has budgeted $150,000 of existing funds for the initial effort. **$150,000** of additional funds will enhance this effort.

DOT&PF will hire an Engineer/Architect II, and an Engineer/Architect I to oversee the retrofits of all public buildings and to manage the performance contracts under the revolving loan program. DOT&PF estimates that 4 public facilities, as defined in the bill, need to be retrofit annually to meet the goal of having 25% completed by 2020. Additionally these positions will conduct the alternate energy analysis required under section 11. The department will hire a consultant ($75.0 budgeted) to develop the systematic process for prioritizing the retrofitting of state facilities required to be adopted under section 47. A second and separate consultant ($90.0 budgeted) will study the feasibility of using compressed natural gas to power state vehicles and develop a pilot project with estimated costs by the required due date of December 2010. Supply costs in FY2011 include the cost of outfitting two positions with desks, computers, phones, fax, printers and general office supplies. The contractual costs include $33.7 for additional office space (component 2892) for the new positions. On going contractual costs include costs for copier, fax, phone, maintenance costs, core services costs and training and professional development.

ANALYSIS: *(Attach a separate page if necessary)*

CSSB220 changes the name of the Alaska heating assistance program (AKHAP) to the Alaska affordable heating program (AAHP) and allows for an income eligibility limit of up to 250% of the federal poverty guidelines (FPG) when the average price of a barrel of North Slope Crude (NSC) between February and September of the preceding year exceeds $150 per barrel. The bill also fixes the dollar value of a Community Heating Point (CHP). CHP is the key factor in determining the amount of heating assistance payments and, under this bill, the dollar value assigned to the CHP is linked to the average price of a barrel of NSC. This legislation allows payments for households receiving federal assistance from LIHEAP to be supplemented by AAHP funds to ensure payments to lowest income households is based on the same dollar per CHP value used to determine payments for the Alaska affordable heating program. It also establishes the Alaska affordable heating fund (AAHF) in the Department of Revenue (DOR) to be used by the Department of Health and Social Services (DHSS) to provide heating assistance payments to eligible households.

DHSS Finance & Management Services
Date: 3/5/2010

ANALYSIS CONTINUATION

Assumptions

The $5,000.0 in the governor's FY11 proposed budget for the Alaska heating assistance program is adequate to cover the initial benefit and administrative costs for the new Alaska affordable heating program. This would require an average price of a barrel of North Slope Crude oil (NSC) in the preceding year (Feb. - Sept. 2010) below $75, which triggers a CHP value of $130.

In general, AAHP will be administered and operated in the same manner as AKHAP.

A fair and equitable share of the appropriation for the Alaska affordable heating fund will be distributed to tribal organizations operating a regional affordable heating program.

Eligible households with incomes at or below 150% FPG may have their LIHEAP payment augmented with funds from the Alaska affordable heating fund.

For FY10, the state's share of the federal LIHEAP block grant only allows the state to provide awards based on a Community Heating Point (CHP) value of $115 per point to eligible households. It is assumed federal funding for FY11 and the per-point value assigned to a CHP will remain the same.

In FY11, it is estimated that the state and tribal affordable heating programs will serve 21,600 households. Approximately 19,000 will be recipient households of the LIHEAP program and 2,600 will only be beneficiaries of the affordable heating program. It is assumed that the average number of points for which a household below 150% FPG is eligible is 10. The average number of points for a household between 151% and 225% FPG is 5.

Benefit costs will increase in FY12 due to a projected caseload growth of 3%, with costs remaining relatively stable in out years if the average price of a barrel of NSC remains below $75. However, assessing program impacts is complicated by the uncertainty in estimating program participation. The cost of heating fuel for consumers increases as the value of NSC increases. Increased consumer costs are likely to increase demand for the program's services and benefits. This is expected to be most pronounced when the value of NSC exceeds $150 per barrel and the higher income limit is triggered. It is estimated that as many as 5,000 more households may be eligible when the income limit reaches 250% FPG.

Projections of Total Benefit Costs: The $5,000.0 currently in the governor's FY11 approved budget for the Alaska Heating Assistance Program will be used to cover benefit and administrative costs of the initial year of the Alaska Affordable Heating Program.
The total costs for benefits in FY11 are estimated to be $4,540.0 in state general funds as shown below.

LIHEAP (State and Tribal) households: $130-$115 = $15 x 10 CHP x 19,000 households =	$2,850.0
For AAHP (State and Tribal) households: $130 x 5 CHP x 2,600 households =	$1,690.0
	$4,540.0

Changing only the NSC sale price, the annual costs for benefits would be:
$6,570.0 when a barrel of NSC sells for $75 to $100 per barrel ($140 per CHP); and
$8,600.0 when a barrel of NSC sells for $100 to $150 per barrel ($150 per CHP).

When NSC exceeds $150 per barrel, the 250% income limit and the highest $/CHP value is triggered and as many as 5,000 additional households may become eligible for a total cost of $15,770.0 ($165 per CHP).

BILL NO. CSSB 220(FIN)

ANALYSIS CONTINUATION

Currently the fund balance is zero. Depending on the capitalization, AEA would need to draft regulations and develop a process to administer grants including an allocation method for the various types of eligible projects which would bring additional expenses. Costs are unknown at this time.

Section 12 - establishing the "Emerging Energy Technology Fund" and requiring the authority to administer the fund by making grants to eligible applicants. Cost Assumptions:

Approximately **$82,000** in one-time start up costs to develop program ciriteria, RFA process, review process, grant agreements, etc. (Contractual)

Approximately **$21,840** per year to cover Advisory Committee expenses (travel - assume $660 airfare + 120 per diem x 7 members x 4 quarterly meetings)

Approximately **$276,518** per year to cover contract for personal services with AIDEA
Positions required: 1 Range 22 for program/project management; 1 Range 15 for finance/grant administration; 1Range 12 for administrative support.(Contractual)

Approximately **$10,000** (Equipment) for new staff

Section 13 - changing the definition of a power project relative to the power project fund to include nuclear production. AEA's costs are zero because there are currently no projects of this type. However, in the event viable nuclear projects are identified, annual operating costs would increase by $365,000 for each nuclear power project that has to be managed; $165,000 for a project manager with technical nuclear knowledge and $200,000 for contractual advisory service in the field.

CS for Senate Bill 220(FIN) includes language that will set up an energy efficiency revolving loan fund and authorize the Alaska Housing Finance Corporation to sell up to $250 million in bonds to fund the program.

Costs associated with the issuance of these bonds are anticipated to be covered with annual operating budget authorizations. Operational costs for issuing and monitoring these bonds will be done with existing personnel and within the authorized operating budget for FY11 and beyond.

DOT&PF will hire an Engineer/Architect II to oversee the retrofits of public buildings done through the revolving loan program. This position will be the state's expert on energy audits, retrofits and performance contracting and will work closely with the Alaska Housing Finance Corporation on the Alaska Energy Efficiency Revolving Loan Program providing assistance with the development and management of performance contracts, reviewing loan applications and setting standards. The position will standardize the collection of energy consumption data and expenses for those state facilities owned and operated by DOT&PF.

A consultant ($90.0 budgeted) will study the feasibility of using compressed natural gas to power state vehicles and develop a pilot project with estimated costs by the required due date of January 2011. Supply costs in FY2011 include the cost of outfitting the new position with desk, computer, phone, and general office supplies. On going contractual costs include costs for copier, fax, phone, maintenance costs, core services costs and training and professional development.

MEMORANDUM March 5, 2010

SUBJECT: Sectional summary of CSSB 220(RES) (Work Order No. 26-LS1197\D)

TO: Senator Lesil McGuire
Co-Chair of the Senate Resources Committee
Attn: Mike Pawlowski

FROM: Brian J. Kane BJK
Legislative Counsel

You have requested a sectional summary of Work Order No. 26-LS1197\D, a bill draft known as the Alaska Sustainable Energy Act.

Please note that a sectional summary of a bill is not an authoritative interpretation of a bill. The bill itself is the best statement of its contents.

Section 1 of the bill provides for the short title of the bill.

Sections 2 and 3 of the bill offer the legislative policy and purpose for certain sections of the bill.

Section 4 of the bill allows a regional school board to apply for and use the proceeds of a loan from the Alaska energy efficiency revolving loan fund.

Section 5 of the bill amends AS 18.45.020 to include the phrases "special nuclear material facility" and "by-product material facility" in order to cover more projects or activities in this section for which a license or permit may be needed from the Nuclear Regulatory Commission.

Section 6 of the bill adds the phrase "nuclear utilization facility" to AS 18.45.025(a) in order to conform with definitions listed in AS 18.45.900.

Section 7 of the bill amends AS 18.45.025(b) to state that when the legislature designates by law the land in the state on which a nuclear utilization facility or utilization facility may be located, it must act only in the interest of regulating the economics of nuclear energy.

Section 8 of the bill deletes a line of AS 18.45.025(c) that states that a permit may not be issued unless approved by the governor, leaving only a requirement for approval by the Department of Environmental Conservation and a municipality.

Section 9 of the bill provides the Alaska Housing Finance Corporation with the power to provide technical assistance to municipalities regarding energy codes and efficiency standards.

Section 10 of the bill creates an energy efficiency revolving loan fund in the Alaska Housing Finance Corporation for providing loans to regional attendance areas, municipalities, or the state for the purpose of financing energy efficiency improvements to buildings.

Section 11 of the bill tasks the Department of Transportation and Public Facilities with reviewing the option of using alternative energy when adopting plans and specifications for public works.

Section 12 of the bill provides that the state shall give consideration in procurements to purchasing energy efficient equipment.

Section 13 of the bill requires the Office of Management and Budget to work with state agencies to develop a standardized methodology to collect and store energy consumption and expense data.

Section 14 of the bill repeals and reenacts the Southeast Energy Fund to expand the options for money going into the fund and expands the projects for which the fund may be used.

Section 15 of the bill amends a provision of the renewable energy grant fund regarding the methodology for determining the order of projects to receive funding and requiring activity reports to be filed by grant recipients.

Section 16 of the bill amends the renewable energy fund statute by requiring the Alaska Energy Authority to hire an expert to conduct financial and economic analysis for each recommended grant application.

Section 17 of the bill tasks the Alaska Energy Authority with facilitating the organization of a statewide fuel purchasing cooperative.

Section 18 of the bill creates the emerging energy technology fund.

Section 19 of the bill amends the definition of "power project" or "project" in AS 42.45.990(4) to delete the exclusion of nuclear energy from the definition in relation to statewide and rural energy programs.

Section 20 of the bill adds the renewable energy production tax credit as an exception to a tax credit limitation set for corporations.

Section 21 of the bill establishes a renewable energy production tax credit.

Section 22 of the bill requires the Department of Transportation and Public Facilities to purchase energy efficient cars whenever practicable.

Section 23 of the bill tasks the Department of Transportation and Public Facilities with retrofitting 25 percent of all public facilities by 2020, making sure that deferred maintenance and new construction meet national standards for energy efficiency, and reporting to the legislature on the department's progress.

Section 24 of the bill requires the Alaska Energy Authority to annually plan and conduct, in cooperation with the Alaska Housing Finance Corporation, a public education campaign to promote energy efficiency and conservation.

Section 25 of the bill amends the definition of "power project" or "project" in AS 44.83.990(6) to delete the exclusion of nuclear energy from the definition in relation to the Alaska Energy Authority.

Sections 26 - 33 of the bill amend the alternative energy revolving loan fund by amending the funding sources and having the fund used only for commercial buildings.

Section 34 of the amendment amends the definition of "alternative energy system" in AS 46.11.900(1) to remove the exclusion of nuclear fuel as it relates to financing of energy efficient homes and buildings.

Sections 35 - 42 converts the Alaska heating assistance program into the Alaska affordable heating program and makes substantive and conforming changes to that program.

Section 43 of the bill repeals AS 43.20.046 and 43.98.040, which are the renewable energy production tax credit sections of the bill, on January 1, 2018.

Section 44 of the bill repeals AS 44.42.067(c) (retrofit and new construction for energy efficiency, added by bill section 23) on January 1, 2021.

Section 45 of the bill repeals AS 45.88.010(c), 45.88.030(c), 45.88.030(d), and 45.88.040(a).

Section 46 of the bill requires the Office of Management and Budget to work with state agencies to develop a standardized methodology to collect and store energy consumption and expense data no later than November 1, 2010.

Section 47 of the bill requires the Department of Transportation and Public Facilities, in consultation with the Alaska Energy Authority, to adopt and implement a systematic process for prioritizing the retrofitting of state facilities for a long-term increase in energy efficiency and reduction of energy costs.

Section 48 of the bill requires the Department of Transportation and Public Facilities to study the feasibility of using compressed natural gas to power vehicles in the state and develop a proposal for a pilot program if warranted by the study.

Section 50 of the bill authorizes the Alaska Housing Finance Corporation to issue bonds to support making loans from the energy efficiency revolving loan fund established by AS 18.56.855.

Section 51 of the bill directs the revisor of statutes to make two changes to article headings to conform with statutory changes.

Fiscal Notes for SB 220: 26-LS1197\D

Department/RDU	Total	FTE	Part-Time	Notes
Health & Social Services	0	0	0	Currently funded in Gov budget. Potential increases in future when oil prices are high.
DOT/PF	493.2	2	0	Can be reduced $15.0 by changing effective date of CNG study.
Department of Administration	0	0	0	
DEC	0	0	0	
Department of Revenue	0	0	0	SB 220 establishes a refundable tax credit that could impact future revenues.[1]
DCCED: Alaska Energy Authority	788.7	0	0	
DCCED: AIDEA	*	3	0	326.5 (included in the AEA fiscal note)
Total:	1281.9	5		

[1] The refundable tax credit created by SB 220 is set to sunset by 2018. In order to qualify for the credit, an investment must produce energy before 2018. Documents from the Alaska Energy Authority state that a total of $970.9 million has been requested in the three rounds. With $125 million appropriated (and assuming no federal grants) the total obligation for these projects would be $84.59 million based on the 10% cap.

SB 220, version D: Overview

The *Alaska Sustainable Energy Act* includes a broad range of policy tools designed to attract investment in Alaska's energy sector and stimulate the economy. The programs in SB 220 fall into three basic categories: near-term, mid-term and long-term solutions. Following is a brief list of some of the programs in the *Alaska Sustainable Energy Act.*

Near Term Solutions: Plan and Assist

- **Refine the Alaska Heating Assistance Program**: SB 220 links this program to the price of oil to provide additional heating assistance to low-income Alaskans when the price of oil is high and the state enjoys significant surpluses. This program is a supplement to the federal Low-Income Heating Assistance Program (LIHEAP).

- **Prioritize Energy Efficiency Retrofits:** Just like a person's home, state buildings can be made more energy efficient. Currently, the State of Alaska alone (not counting schools) spends roughly $55 million per year on heating and lighting its buildings. Energy efficiency improvements can save 20% in energy costs which could translate to more than $10 million in savings per year. SB 220 requires the Department of Transportation and Public Facilities to prioritize which buildings to fix first.

- **Establish an Energy Efficiency Revolving Loan Fund**: Senate Bill 220 creates a revolving loan program to fund energy efficiency improvements in public buildings. School districts, municipalities and state government will have access to the funds needed to upgrade their facilities. Based on what we have seen from the State's *Weatherization* and *Home Energy Rebate* programs, this fund will foster 1,500 to 2,000 jobs in the construction industry in Alaska.

- **Coordinate and Consolidate State Energy Programs:** SB 220 asks the Governor to evaluate how best to coordinate the State's energy departments and programs in order to avoid duplication of efforts. The Governor is directed to provide a plan to the legislature by November of 2010.

- **Organize a Statewide Fuel Cooperative**: Many rural communities struggle with crippling fuel costs. SB 220 directs the Alaska Energy Authority to work with interested communities to establish a fuel coop that will facilitate bulk purchases, lowering costs especially for small communities.

Medium Term Solutions: Incentivize Investment

- **Renewable Energy Tax Credit:** Several states have passed renewable energy tax credits to encourage investment in renewable energy resources. SB 220 contains a renewable energy tax credit that would provide a refundable tax credit to investors in order to encourage private sector investment in Alaska's renewable energy sector.

- **Loans to Businesses for Energy Conservation Improvements**: Alaska already provides loan programs to households for energy improvements. SB 220 includes loans of up to $50,000 for businesses to enable investments in energy efficiency. This program will help primarily small businesses get access to the capital they need to make investments that will save money and encourage economic development.

Long Term Solutions: Innovate

- **Emerging Energy Technology Fund (EETF)**: With the high cost of energy in many of our communities, Alaska provides a unique opportunity for innovation. The *Alaska Sustainable Energy Act* would create a fund that would provide grants for testing energy technologies in Alaska. The EETF would foster innovation and enable Alaskans to develop solutions to our energy challenges in Alaska; creating high-tech jobs and spurring investment in our economy.

Co-Chair Senate Finance Committee
State Capitol Room 516
Juneau AK, 99801

Senator Lyman Hoffman
Co-Chair Senate Finance Committee
State Capitol Room 518
Juneau AK, 99801

Dear Senator Stedman and Senator Hoffman,

When oil hit $147 a barrel in 2008, the State's coffers overflowed but individual Alaskans suffered the highest energy costs in the nation. These staggering costs did not drop along with the price of oil in 2009. Alaskans still pay 50% more for electricity than the average American and at least double the average price for heating fuel. As recently as this summer, the mean price for gasoline in 99 Alaska communities was $5.37 per gallon, with some communities paying up to $10/gallon. To make matters worse, these costs are growing relative to Alaskans' paychecks. In 2000, low-income households in remote, rural communities spent 16% of their income on energy. By 2008, this had grown to 47%. With all of our tremendous resources, Alaskans face natural gas shortages in Southcentral Alaska; businesses are closing their doors and laying off workers because of the price of energy; and some rural Alaskans are leaving their communities because they can't afford to heat their homes and keep their lights on.

Members of the Senate Resources and Energy Committees spent the interim hearing this story firsthand. In communities across the State, we listened to the urgent requests of Alaskans for help, and worked with them to identify solutions to the energy challenges that have plagued Alaska for years. The input we received was incorporated into a broad *Draft State Energy Policy and Program Recommendations*, document which was first released to the public in October of 2009. The public then weighed in again and offered additional comments on the draft proposal. After reviewing these comments we drafted SB 220, the Alaska Sustainable Energy Act, that offers long-term solutions to some of the energy challenges Alaskan face.

But legislation alone will not solve all of the pressing energy problems Alaskans face. Progress requires a commitment of funds to help Alaskan households, businesses and communities cut costs, use energy more efficiently, and develop new, renewable sources of energy. The legislature has committed substantial resources to energy issues over the past few years and we heard from Alaskans directly about the impact these expenditures have had on their lives. Below are a series of budget recommendations that builds on the legislature's previous work and which we believe will help provide Alaskans with more affordable and reliable energy over the long term. We ask that you give these recommendations serious consideration as the process of developing a budget for fiscal year 2011 proceeds.

- **$25 million for weatherization to reduce home energy costs**

  Weatherization is a proven way to reduce energy costs over the long-term. Annual household savings from weatherization average $526/year or $7,565 over the life of improvements. Nationally, the Department of Energy reports that weatherization saves the equivalent of 3 barrels of oil per dwelling per year or 60 barrels over 20 years. DOE reports that $1.83 is saved for every dollar spent on weatherization. The $200 million the state appropriated in 2008 for weatherization is likely to be fully encumbered by the end of FY'10. According to an AHFC report, more than 27,000 houses in Alaska still need to be weatherized; 1 in 5 rural homes and nearly 8,000 homes in Anchorage cannot maintain a comfortable room temperature; and more than 115,000 homes are "drafty."

- **$175,000 to help Alaskans learn how to lower their energy costs through a statewide public education campaign on energy efficiency**

  Alaskans stand to save millions by making their homes and businesses more energy efficient. An educational campaign can teach Alaskans simple ways to save energy and money, boosting family, community and state budgets. Local utilities can forecast anticipated energy savings and downsize infrastructure accordingly, and the state can minimize its investments in new and upgraded infrastructure. Energy efficiency and conservation is typically 50-75% cheaper than building new power plants or buying energy on the open market.

- **$100,000 to provide technical assistance to businesses to help them reduce their energy-related expenditures and improve profitability**

  This funding will enable the Alaska Energy Authority to help businesses reduce their energy consumption and improve their bottom lines. AEA plans to use federal stimulus funds to initiate a technical assistance program this fiscal year. This appropriation would enable their efforts to continue, assisting more businesses around the state.

- **$250,000 for energy-related job training**

  Using grant funds, the Alaska Vocational Technical Center currently trains power plant managers and bulk fuel operators to maintain reliable and efficient power plants, reducing operating costs in many communities across Alaska. AVTEC has purchased high efficiency generators and switchgear on which plant operators can be trained. However, with weakening federal support for the Denali Commission, funding is dwindling and these programs will need state support to continue.

- **$2 million to help Alaskans save money with energy efficient appliances**

  Several states provide rebates to homeowners who replace older energy-inefficient appliances (e.g., furnaces, refrigerators, and water heaters) with appliances that are substantially more efficient than federal standards. The Department of Energy reports that last year savings from Energy Star appliances were enough to power 10 million homes and avoid greenhouse gas emissions from 12 million cars. Consumers also saved an estimated $6 billion.

- **$25 million for the Renewable Energy Fund (above the Governor's proposed $25 million)**

  In 2008, the Legislature pledged $300 million in funding over a 5-year period to in-state renewable energy projects. The Renewable Energy Fund provides grants of up to $4 million dollars to eligible renewable energy projects for feasibility and reconnaissance studies, energy resource monitoring, and construction. Continuing to support the Renewable Energy Fund through FY2012 will allow the Legislature to fulfill its five-year pledge to help communities develop their renewable energy resources and transition off of traditional fossil fuels sources.

- **$8 million for rural power system upgrades (above the Governor's proposed $2 million) to reduce electrical costs in rural Alaska**

  In the last decade, the Alaska Energy Authority has upgraded about 35 rural power systems, resulting in an average increase in efficiency of 26%. These upgrades have saved these communities more than $1 million a year in fuel costs. About 25-30 community power systems still need to be upgraded. Since 2000, funding for these upgrades has come predominantly from the Denali Commission. However, the Commission's budget is in sharp decline and the state will have to step in if it wishes to assist the 25-30 communities still in severe need of upgrades.

- **$200,000 to provide technical assistance to operators of rural power systems to lower costs through improved system reliability and efficiency**

  The Alaska Energy Authority currently provides assistance to power system operators in more than 120 villages. The goal of this program is to enable local operators to become self-sufficient in running remote systems in an efficient and cost-effective manner.

- **$4 million to upgrade bulk fuel storage facilities (above the Governor's proposed $1 million) to lower fuel costs for families and businesses in rural Alaska and meet federal environmental codes**

  In the early 1990s, many rural communities faced the threat that they would no longer be allowed to take delivery of fuel in bulk quantities because of the condition of their bulk fuel storage tank farms. The Bulk Fuel Upgrade Program, which has been largely supported by the Denali Commission, provides funding for repairs to enable affected communities to continue to receive fuel. Sixty-four projects have been completed so far, 7 are underway, and 33 remain. Unfortunately funding from the Denali Commission is declining dramatically and the state will have to step in if this effort is to be completed.

- **$3 million in state matching funds to enable communities to qualify for roughly $9 million in federal public transportation funds**

  Community transportation systems help many Alaskans get to work, school, medical facilities, and other critical destinations. Alaska currently has 11 road-based community transit systems, and is 1 of only 3 states that do not invest any general funds in public transit operations. Local governments (e.g., the Mat-Su Borough and Kenai Peninsula Borough) are struggling to raise sufficient matching funds to secure federal funds and have had to leave federal funds on the table, undermining this energy-efficient form of transportation.

- **$3 million to replenish the Power Project Loan Fund (above the Governor's proposed $7 million)**

  The Power Project Fund provides loans to utilities, local governments and independent power producers for the development or upgrade of electric power facilities, including conservation, bulk fuel storage, and waste energy conservation. The loan term is related to the productive life of the project, but cannot exceed 50 years. Interest rates vary between tax-exempt rates at the high end and zero on the low end. Forty-seven loans for a total of $26 million are currently out, with only one past due. The Fund balance is running low and more funding is necessary to support legitimate, cost-saving requests from applicants.

- **$200 million for Long-Term Railbelt Energy Projects**

  A Regional Integrated Resource Plan was recently completed for the Railbelt to guide development of the region's power systems over the next 50 years. This report assesses the cost and feasibility of numerous power production alternatives and identifies huge expenditures that will be needed to maintain reliable and affordable energy for the region. Re-building the Railbelt Energy Fund incrementally will help prepare communities and the state for needed investments and enable near-term projects to proceed.

- **$10 million for Susitna, Chakachamna and Glacier Fork Hydro Projects**

  The Railbelt Integrated Resource Plan identified large hydro projects as a preferred energy source for the region. These funds would enable the AEA to carry out 1) needed geotechnical work, permitting, and initial conceptual design for the Susitna Hydro Project ($6 million), 2) feasibility and field studies related to the proposed Lake Chakachamna Hydro Project ($3 million) and 3) conceptual design and preliminary permitting for other hydroelectric projects ($1 million). This work will help the Administration and Legislature determine whether additional investment in and ultimate construction of each of these projects is advisable.

- **$3 million for the Emerging Energy Technology Fund**

  Currently there is little or no state funding available for research and development of new energy technologies. Although the state supports renewable energy development through the REF, projects are limited to proven "off the shelf" technologies. The proposed Emerging Energy Technology Fund would encourage innovation and exploration of new sources of renewable energy and match funds provided by the Denali Commission.

- **$10 million for the Southeast Energy Fund**

  An expanded and capitalized Southeast Energy Fund can assist in the construction of power generation projects in Southeast and completion of a regional electrical grid. Most communities in the region are not on hydro power and the majority still burn oil to generate electricity and heat. In addition, many of the hydroelectric facilities in Southeast are at or near capacity, severely limiting regional economic growth opportunities.

- **Support for Southeast Energy Planning** (in Governor's budget)

  A Regional Integrated Resource Plan (RIRP) for Southeast Alaska will help comprehensively assess regional needs, power production alternatives and their costs. The RIRP will build on the current Southeast Alaska Electrical Intertie system plan and create a rational approach to prioritizing state and local investment.

- **Fully fund the Power Cost Equalization Program**

  The Power Cost Equalization program is a critical foundation of Alaska's energy policy. Fully funding the PCE program will continue to provide desperately needed relief in communities suffering under the highest energy costs in the nation.

We fully appreciate the challenges you face on the Senate Finance Committee and diverse funding needs facing our State. We ask you to consider these items as you craft the operating, capital and supplemental budgets for fiscal year 2011 and plan ahead for fiscal year 2012.

Sincerely,

Senator Bill Wielechowski

Senator Lesil McGuire

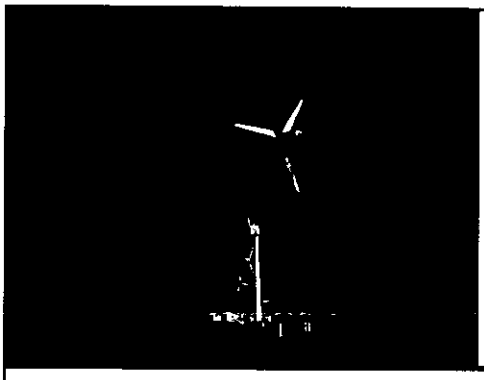
CC: Senator Dennis Egan
Senator Johnny Ellis
Senator Charlie Huggins
Senator Donny Olson
Senator Joe Thomas
Senator Gary Stevens
Governor Sean Parnell

Fact Sheet for the Renewable Energy Refundable Tax Credit

Senate Bill 220: 26-LS1197\D Sections 20 & 21

Prepared By: Michael Pawlowski, Aide Senator Lesil McGuire

Production tax credits have been used by the federal government and other states to encourage the development of electricity from renewable energy sources. Unlike grants or other incentives offered during the design and construction phases, production credits only accrue to a project when it begins generating electricity. This attribute makes production tax credits an attractive incentive mechanism. The *Alaska Sustainable Energy Act* (Senate Bill 220) offers a renewable energy refundable tax credit as policy alternative to encourage investment in renewable energy in Alaska. This fact sheet is intended to provide an explanation of how the refundable credit is calculated. The projects selected are for illustrative purposes only and do not represent actual projects. Data for the calculations were taken from potential projects identified in the *Alaska Energy Report* prepared by the Alaska Energy Authority and available online.



Example 1: A 5 MW Wind/Diesel Hybrid System

Capital Cost:	$23.5 million
Installed Capacity:	10%
Kilowatt-Hours/yr:	4,380,000
Cost KwH:	.63 cents
Grants:	$3.5 million Renewable Energy Fund $2 million Federal

Step 1: ***Calculate the base credit***: 15% of the electricity sold.

.63 cents x 4,380,000 kilowatt-hours/year = $2,759,400 in gross sales of electricity.

$2,759,400 per year x 15% credit rate = $413,910 annual refundable credit

Step 2: ***Calculate the total allowable credit***: 10% of CAPEX (excluding grants)

CAPEX: $23.5 million - $3.5 million REF - $2 million in federal = $18 million

Allowable CAPEX of $18 million x 10% = allowable cap of $1.8 million.

Step 3: ***In Practice:*** the credits are available for 5 years subject to the cap for CAPEX:

Base Credit: $413,910 over 5 years = $2,069,550 but maximum = $1.8 million

Year 1: $413,910 : Year 2: $413,910 : Year 3: $413,910 Year 4: $413,910

Year 5: **$144,360** ($1.8 million - $1,655,640 [$413,910 x 4])

Total Renewable Energy Refundable Tax Credit: **$1,800,000**

CS FOR SENATE BILL NO. 287(RES)

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-SIXTH LEGISLATURE - SECOND SESSION

BY THE SENATE RESOURCES COMMITTEE

Offered:
Referred:

Sponsor(s): SENATORS MCGUIRE, Davis

A BILL

FOR AN ACT ENTITLED

"An Act amending the powers and duties of the Alaska Railroad Corporation related to the exercise of authority to purchase, transport, and sell natural gas produced on the North Slope for in-state use, and transferring exclusive and primary responsibility for the initiation and development of that project to that corporation; and providing for an effective date."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

*** Section 1.** The uncodified law of the State of Alaska is amended by adding a new section to read:

LEGISLATIVE FINDINGS AND PURPOSE. (a) The legislature finds that

(1) by 2018, declining oil flow through the Trans Alaska Pipeline System will seriously diminish state revenue;

(2) Cook Inlet natural gas reserves are depleting at a rate that could cause significant short-term shortages for residential and commercial gas users in Southcentral

Alaska by 2013;

(3) a proposed natural gas pipeline to deliver North Slope gas reserves to the North American domestic gas pipeline grid at a connection in central Alberta will not produce revenue for the benefit of the state before 2020;

(4) the state's significant reserves of natural gas should be made available on a priority basis in the state to enhance employment opportunities, expand the state's economy, and supply a significant portion of community energy needs;

(5) the Alaska Natural Gas Development Authority is studying a pipeline spur, aggregating in-state demand for natural gas, and facilitating delivery of natural gas and natural gas liquids to Alaskans; and

(6) in light of competing demands for future uses of the state's North Slope natural gas reserves, an aggressive effort involving planning, permitting, and coordination of information sharing, of necessary agreements and commitments, and commercial negotiations among interested parties is necessary for completion of construction of an in-state natural gas pipeline that will provide significant direct benefit to the people of the state at the earliest possible date.

(b) It is the purpose of this Act

(1) to give general direction to the Alaska Railroad Corporation, an agency that enjoys express authority to acquire, construct, improve, maintain, equip, and operate a natural gas pipeline and related facilities for the transportation of natural gas recovered from the North Slope without regard to whether the facilities are or will be owned in whole or in part by the corporation or located on land owned by the corporation, to plan and develop construction of a high pressure in-state natural gas pipeline of appropriate diameter between Alaska's North Slope and Cook Inlet sufficient to provide for the distribution of natural gas for residential and commercial purposes at locations along the pipeline route; and

(2) to advance to the point of project sanction an in-state natural gas pipeline that will provide significant direct benefit to the people of the state at the earliest possible date.

*** Sec. 2.** AS 42.40.460 is amended by adding a new subsection to read:

(l) The provisions of AS 42.40.560(d) prevail over the provisions of this section for the purpose of development of the North Slope natural gas pipeline project

described in that section.

* **Sec. 3.** AS 42.40.560 is amended to read:

Sec. 42.40.560. North Slope natural gas pipeline. The corporation may provide [FINANCING] for the acquisition, construction, improvement, maintenance, equipping, and operation of a natural gas pipeline and related facilities**, and for the financing of the pipeline project and related facilities,** for the transportation of natural gas recovered from the North Slope of this state without regard to whether the facilities are or will be owned in whole or in part by the corporation or located on land owned by the corporation. **The authority provided by this section is limited to the project popularly identified as the Stand-Alone Pipeline Project, or Stand-Alone Project, that**

(1) proposes to develop a gas pipeline system to transport natural gas, and possibly additional natural gas liquids to markets in the Anchorage bowl area, and the Kenai Peninsula, and to additional customers along the transportation route;

(2) contemplates the commercial development of two primary sources of natural gas, the Prudhoe Bay Central Gas Facility and the Gubik gas field located in the northern foothills of the Brooks Range, and allows for use of gas from either or both of those gas sources or from any other source of natural gas;

(3) projects a pipeline system routing generally along the state's existing transportation corridors between the North Slope and Southcentral Alaska, starting from each potential gas source location, making its way to the Trans Alaska Pipeline System and Dalton Highway corridor, generally paralleling that corridor from the North Slope to the vicinity of Livengood, north of Fairbanks, and continuing to the Cook Inlet area, using one of two routes that are the existing transportation corridors between Fairbanks and Cook Inlet: the Parks Highway and the Richardson and Glenn Highways; and

(4) is compatible but not competitive with the project described in and authorized by AS 41.41 or the project described in and authorized by AS 43.90.

* **Sec. 4.** AS 42.40.560 is amended by adding new subsections to read:

(b) In the exercise of its authority under (a) of this section for a North Slope natural gas pipeline project, the corporation shall

(1) establish, maintain, and operate a subsidiary of the corporation to perform the work described in this section;

(2) aggressively pursue the acquisition of all necessary federal permits and authorizations essential for the development and operation of the project;

(3) provide monthly reports to the presiding officers of each house of the legislature and to the governor on the corporation's activities relating to the project;

(4) initiate a cost study for construction of a gas-to-liquids facility; in the exercise of its authority under this paragraph, the corporation may arrange for essential engineering and design work; and

(5) initiate efforts to identify and develop in-state markets for the natural gas to be delivered by the project and, to the extent necessary to ensure the long-term feasibility of the project, work to identify and develop overseas markets for the gas.

(c) Subject to AS 36.30.015(e), the board may provide that all or any portion of the project described in this section shall be subject to competitive sealed bid or competitive sealed proposal procedures.

(d) To fulfill its obligations under this section, the corporation shall identify all or a portion of a proposed natural gas pipeline transportation corridor:

(1) to the maximum extent possible consistent with ensuring the long-term feasibility of the project, the corporation shall make reasonable efforts to locate the proposed corridor between Fairbanks and the Kenai Peninsula on its land;

(2) notwithstanding any contrary provision of law, the Department of Natural Resources shall grant the corporation a right-of-way lease under AS 38.35 for the transportation corridor identified under (1) of this subsection if

(A) the corporation submits a complete right-of-way lease application under AS 38.35.050;

(B) the lease application is made the subject of notice and other

reasonable and appropriate publication requirements under AS 38.35.070; and

(C) the corporation agrees to be bound by the right-of-way lease covenants set out in AS 38.35.120;

(3) notwithstanding any contrary provision of law, a right-of-way lease granted under (2) of this subsection is subject to AS 38.05, except that the best interest findings requirements of AS 38.05 do not apply to a lease made under this subsection.

*** Sec. 5.** The uncodified law of the State of Alaska is amended by adding a new section to read:

ALASKA RAILROAD CORPORATION: TRANSITIONAL PROVISIONS AFFECTING OBLIGATIONS UNDER AS 42.40.560. (a) Subject to (c) of this section, in discharging its obligations under AS 42.40.560(b)(2), enacted by sec. 4 of this Act, the Alaska Railroad Corporation shall

(1) initiate permit and acquisition applications in accordance with the federal permit schedule that was provided to the legislature by the Office of the Governor on or about December 15, 2009;

(2) seek letters of intent from buyers and sellers of natural gas to ship gas using the facilities of the project and, from information obtained, by February 15, 2011, define the project parameters that would allow the project to be commercially viable;

(3) seek letters of interest from private pipeline construction and operating companies to develop the project; the work under this paragraph should be initiated between November 15, 2010, and shall be completed by March 15, 2011;

(4) prepare and submit to the governor and the presiding officer of each house of the legislature, by December 15, 2010, any initial legislation necessary to advance the project;

(5) identify or define and submit to the legislature, not later than January 15, 2011, the corporation's estimates of any long-lead time cost items or work tasks to achieve an early start-up for the project;

(6) prepare a final bankable feasibility document; the work under this paragraph should be initiated by July 1, 2011, and shall be completed by June 30, 2012; and

(7) unless otherwise provided in the monthly report required by AS 42.40.560(b)(3), enacted by sec. 4 of this Act, prepare and submit a report at each of the

dates set out in (1) - (6) of this subsection to the governor, the speaker of the house of representatives, and the president of the senate.

(b) The parties having responsibility for contracts, permit and acquisition applications, and studies in progress on the effective date of this Act entered into by the Office of the Governor or a state agency shall transfer those obligations and initiatives to the Alaska Railroad Corporation. Transfer of those obligations and initiatives may not be unreasonably delayed.

(c) The corporation shall cease its activities under this section and AS 42.40.560, as amended by secs. 3 and 4 of this Act, if the corporation receives a communication that

(1) the governor, after setting out with particularity the reasons that support the decision, has entered a finding that

(A) an agreement has been entered into that will result in construction of the project described in AS 43.90;

(B) construction of the project described in this section would prevent initiation and completion of the project described in AS 43.90; or

(C) other circumstances warrant cessation of activities under this section and AS 42.40.560;

(2) the legislature expresses its approval of the finding of the governor made under (1) of this subsection by concurrent resolution.

*** Sec. 6.** This Act takes effect July 1, 2010.

CS FOR SENATE BILL NO. 228( )

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-SIXTH LEGISLATURE - SECOND SESSION

BY

Offered:
Referred:

Sponsor(s): SENATORS MCGUIRE, Wielechowski, Ellis

A BILL

FOR AN ACT ENTITLED

"An Act providing for a tax credit for investment in a facility that produces liquids from gas, coal, or biomass; and providing for a production tax limit on gas used in the state as a raw material for producing liquids or petrochemicals from gas."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

*** Section 1.** AS 43.20 is amended by adding a new section to article 1 to read:

Sec. 43.20.046. Special investment tax credit to produce liquids from gas, coal, or biomass. (a) Subject to (b) of this section, for purposes of calculating eligible taxes, the taxpayer may apply as a credit against eligible taxes the following percentage on only the first $1,000,000,000 of investment in the state for each taxable year after December 31, 2010, for a facility that produces liquids from gas, coal, or biomass: (1) 100 percent on the first $50,000,000 of investment; (2) 80 percent on investment over $50,000,000 but not exceeding $100,000,000; (3) 70 percent on investment over $100,000,000 but not exceeding $150,000,000; (4) 60 percent on investment over $150,000,000 but not exceeding $200,000,000; and (5) 40 percent on

investment over $200,000,000 but not exceeding $1,000,000,000. A credit may not be allowed under this subsection for leased property. The credit under this subsection may not exceed $475,000,000 for a single facility.

(b) A taxpayer may not claim an investment tax credit under (a) of this section unless the facility that produces liquids from gas, coal, or biomass or the mining project began operation and production after December 31, 2010. A facility for producing liquids from gas, coal, or biomass or a mining project is considered to have begun operation and production when the first liquids from gas, coal, or biomass or the first minerals are produced that are ultimately either sold or transferred for further processing or ultimate use.

(c) The investment tax credit for a taxable year allowed by (a) of this section may not exceed 60 percent of the eligible tax liability. Any unused portion of the investment tax credit may be carried forward.

(d) A tax credit under this section may not be claimed for investments made after December 31, 2020.

(e) In this section,

(1) "biomass" has the meaning given in 26 U.S.C. 45K(c)(3) (Internal Revenue Code);

(2) "facility for producing liquids" means the integrated plant, facilities, and equipment used for producing liquids from natural gas, coal, or biomass;

(3) "liquids" means a product stream of commercial quality that is a mixture of hydrocarbon molecules, each of which has between five and 20 carbon atoms with attached hydrogen atoms, none of which contain oxygen or other elements.

*** Sec. 2.** AS 43.55.900(24) is amended to read:

(24) "used in the state" means delivered for consumption as fuel in the state, including as fuel consumed to generate electricity **or used as fuel or feedstock in a manufacturing process creating an end product in the state, regardless of the final disposition of the manufactured end product**.

*** Sec. 3.** AS 43.55.900 is amended by adding a new paragraph to read:

(25) "manufacturing process" means the process of forming a valuable compound by chemically converting gas or components of gas or chemically

combining gas or components of gas with other substances; "manufacturing process" does not include gas processing, gas treatment, dehydration, fractionation, compression, or liquefaction.

SENATOR LESIL MCGUIRE

Summary of Changes to SB 228 in CSSB 228, Version 26-LS1324\S

The following changes were made to SB 228 (26-LS1324\R) *Tax Incentives for Gas to Liquids* in order to include coal-to-liquids or biomass-to-liquids in the list of eligible facilities for the proposed investment tax credit as originally intended by the sponsor, and to correct an error in the original version related to provisions in the federal income tax code.

Changes to Section 1:

From: (26-LS1324\R) Section 1: Page 1, line 11-12: "for a gas-to-liquids facility:"

To: (26-LS1324\S) Section 1: Page 1, line 10-11: "for a **facility that produces liquids from gas, coal or biomass**:"

In the version of SB 228 that was introduced (26-LS1324\R), a facility had to be a "gas-to-liquids" facility in order to qualify for the proposed credits. While either coal (CTL) or biomass (BTL) must first be converted to a synthetic gas before they can be converted to a liquid, Legislative Legal Services recommended expanded language to ensure that a CTL/BTL facility qualified as the sponsor originally intended.

Changes to Section 1-6

Sections 1-6 have been consolidated into a single section in the S version and established as a separate "Special industrial incentive tax credit" under a new section in AS 43.20; the Alaska Net Income Tax Act. The change was made because of the linkage to 26 U.S.C 38 (Internal Revenue Code) in section 1 of the R version. 26 U.S.C. 38 was changed and the proposed facilities would not qualify under the current federal code.

Since the State adopts by reference the federal code in Alaska's Net Income Tax Act, the creation of a separate section was necessary in order to provide the desired incentive. It is important to note that as currently drafted, the S version provides a substantially greater credit than originally proposed in the R version. Separate provisions of Article 20 limit deductions to 18% of any federal credit. As drafted, the S version does not contain this limit.

Sponsor Statement for Senate Bill 228: Tax Incentives for Gas-to-Liquids

Fischer-Tropsch is a chemical process through which synthesized gas is converted into a liquid hydrocarbon. The liquid hydrocarbons created through a Fischer-Tropsch process are a synthetic crude oil or synthetic diesel fuel that are both significantly cleaner burning than traditional oil or even ultra-low sulfur diesel, and command a premium in the market. The synthesized gas required by the process can be created from a wide variety of resources, ranging from wood and biomass to coal or natural gas. The technology is therefore often described as either a: BTL (biomass-to-liquids), CTL (coal-to-liquids), GTL (gas-to-liquids) or XTL ("X" resource-to-liquids) process.

Alaska has prolific coal, biomass and natural gas reserves that could provide the resources necessary for a robust XTL industry. When coupled with the growth in worldwide demand for the cleaner synthetic crude oils and clean diesels created through the Fischer-Tropsch processes, XTL technology presents an important opportunity for Alaska. XTL is a value-added, labor intensive process that can provide thousands of high-paying jobs in the State.

However, XTL facilities are capital intensive investments that often require billions of dollars and hundreds of thousands of man hours to construct. This is why Senate Bill 228 provides a corporate income tax credit for the construction of an XTL facility in Alaska. SB 228 allows a company to claim a credit against their future corporate income taxes based on a declining percentage of the first billion dollars of investment they make in Alaska. The amount of tax credits they may claim in any given year is limited to 60% of their tax liability, which ensures Alaska will have the revenue to provide this incentive.

SB 228 also clarifies that gas used in Alaska for value added industries like GTLs or petrochemicals receives the same tax treatment as gas used to generate electricity or heat Alaskans homes.

South Africa has been producing diesel from coal and natural gas for generations. Through XTL technology they have created an extensive value-added industry that is a foundation for their economy. The purpose of SB 228 is to open Alaska to these promising technologies and attract the investment necessary to establish a vibrant, value-added economy in Alaska.

MEMORANDUM January 28, 2010

SUBJECT: Sectional Summary for SB 228 (Work Order No. 26-LS1324\R)

TO: Senator Lesil McGuire
Attn: Mike Pawlowski

FROM: Donald M. Bullock Jr.
Legislative Counsel

You have requested a sectional summary of the above-described bill.

As a preliminary matter, note that a sectional summary of a bill should not be considered an authoritative interpretation of the bill and the bill itself is the best statement of its contents. If you would like an interpretation of the bill as it may apply to a particular set of circumstances, please advise.

Section 1. Amends AS 43.20.042(a) to authorize a tax credit on the first $1,000,000 of qualified investment during a taxable year for a gas-to-liquids facility. The credit is applicable to investments made after December 31, 2010.

Section 2. Amends AS 43.20.042(b) to increase the amount of qualified investment for exploration, drilling of wells, development, or mining of certain minerals and other natural deposits that is eligible for a tax credit, to $1,000,000 for each taxable year. The credit is applicable to investments made after December 31, 2010.

Section 3. Amends AS 4320.042(c) to make the credits in secs. 1 and 2 only applicable to a gas-to-liquids facility or mining project that began operation and production after December 31, 2010. Describes when a gas-to-liquids or mining project is considered to have begun operation and production.

Section 4. Amends AS 43.20.042(f) by updating the reference to an Internal Revenue Code provision for carrying forward the investment tax credit. Provides that the credit may not be carried forward to a tax year beginning after December 31, 2025.

Section 5. Amends AS 43.20.042(g) by stating that investments made after December 31, 2020 are not eligible for the credit under AS 43.20.042, except as provided in AS 43.20.042(f).

Section 6. Repeals and reenacts AS 43.20.042(h) and includes definitions for term used in AS 43.20.042.

Section 7. Amends the definition of "used in the state" in AS 43.55.900(24). The definition is relevant to particular tax limits in AS 43.55 (Oil and Gas Production Tax and Oil Surcharge).

STATE OF ALASKA
2010 LEGISLATIVE SESSION

BILL NO. CSSB 228(RES)

ANALYSIS CONTINUATION

Bill Language:

This bill will allow an incentive tax credit for investment in a facility constructed to produce liquids from gas, coal, or biomass against a taxpayer's corporate income tax (CIT) liability. The credit would be 100 percent on the first $50 million of investment; 80 percent on the second $50 million of investment; 70 percent on the third $50 million of investment; 60 percent on the fourth $50 million of investment; and 40 percent of investment over $200 million but not more than $1 billion.

A taxpayer could only claim the credit on a project which begins operation and production after December 31, 2010 and on investments made after December 31, 2010 and before January 1, 2021 . The maximum credit that a taxpayer could claim for its investment in such a facility would be $475 million. However, the credit could not offset more than 60 percent of a taxpayer's CIT liability in any given tax year and any unused credit could be carried forward through tax years prior to January 1, 2026 (15 years). The first tax credits that could be claimed under the provisions of this bill would be in fiscal year 2012.

For Example: The State currently receives about $600 million a year in corporate income tax from our oil and gas taxpayers. If 10 taxpayers pay, an average of $60 million a year each, and two of those taxpayers build a GTL plant, the maximum credit they can claim is $475 million. That credit is limited to 60% of their current tax liability. So, if their tax liability increased to say $70 million due to sales from the facility, they could tax a maximum credit of $42 million each year for up to 15 years or until the full $475 million credit has been taken. Based on two taxpayers doing this, the effect would be $84 million in reduced corporate income tax for approximately 11.5 tax years.

Additionally, Section 7 of this bill would amend the definition of gas used in state to include gas used as raw material for producing liquids or petrochemicals.

Revenues:

Corporate income tax revenue would decline as a result of this bill by as much as $475 million per facility. However, since a taxpayer could not offset more than 60 percent of its current CIT liability in any given year, the decline in revenue would be limited each year as recoupment of the investment would be spread over several tax years. It is difficult to determine how many taxpayers would take advantage of this tax credit and invest in constructing a facility of this type in Alaska. Therefore, total affect on corporate income tax revenue as a result of this bill is indeterminate.

The provision in Section 7 of this bill would broaden the production tax treatment provided in AS 43.55.011(o) to include gas manufactured or otherwise converted to liquids or petrochemicals. The tax impact of this provision is also indeterminate for several reasons, including the uncertainty as to whether companies will take advantage of the provision, and if so, the magnitude of the project to be undertaken, the amount of gas to be committed, the price of the gas, and other factors.

Expenditures:

The provisions of this bill would most likely require the hiring of additional audit staff. It is not known at this time the number of position(s) that would be needed. Additional administrative work required of the Department would be dictated by the number of taxpayers who take advantage of the credit and the associated work required to validate those credits.

sasol
reaching new frontiers

reaching new energy frontiers

through competitive GTL technology

3551

Sasol's integrated gas-to-liquids (GTL) solution offers significant economic, strategic and environmental benefits for many of the world's gas-rich countries. This proven technology – based on many years of focused research and development in Fischer-Tropsch synthesis technology in South Africa – presents an opportunity for gas-rich countries to diversify and expand their national energy sectors, while also substantially reducing the undesirable emissions produced by burning conventional diesel fuels.

sasol
reaching new frontiers

sasol at a glance

Leading the way through Fischer-Tropsch technology

Sasol is an integrated oil and gas company with substantial chemical interests. Based in South Africa and operating worldwide, the company is listed on the New York Stock Exchange and the JSE stock exchange in Johannesburg, South Africa. Sasol is the leading provider of liquid fuels in South Africa and a major international producer of chemicals. It uses proprietary Fischer-Tropsch technologies to commercially produce synthetic fuels and chemicals from low-grade coal and natural gas.

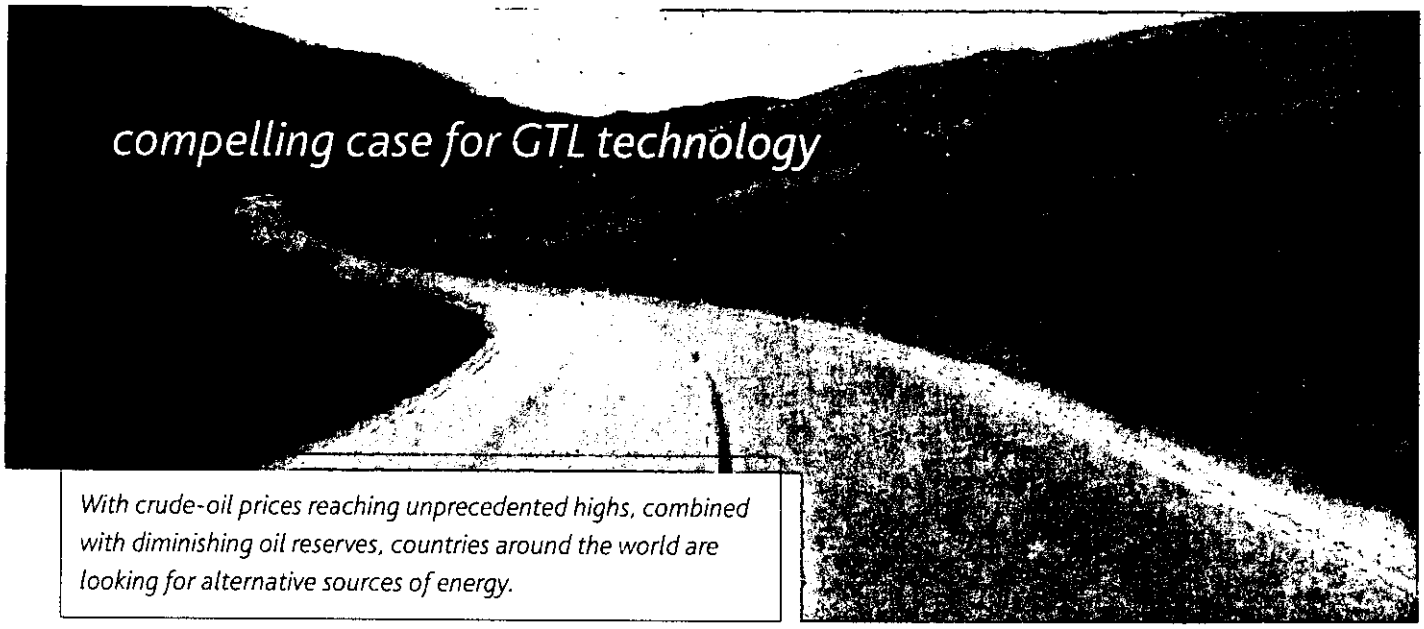
Sasol has more than 50 years of proven commercial experience in producing synthetic fuels. Gas-to-liquids (GTL) technology is a step within the proven coal-to-liquids (CTL) technology that Sasol has perfected in South Africa. In fact, today, Sasol is world-renowned for operating the only world-scale coal-based synthetic fuel manufacturing facility in Secunda, south-east of Johannesburg. The Secunda plant produces 160 000 barrels a day (b/d) of fuel from coal.

Sasol manufactures more than 200 fuel and chemical products that are sold worldwide. In South Africa, Sasol also operates coal mines to provide feedstock for its synthetic fuels plants.

Sasol produces crude oil off the coast of Gabon, refines imported crude oil into liquid fuels in South Africa and retails liquid fuels and lubricants through a growing network of Sasol convenience centres and Exel service stations. Its liquid fuels interests also include wholesaling in South Africa and overland exports to several sub-Saharan African countries.

Sasol produces natural gas in Mozambique for supply to customers and as feedstock for some of its fuel and chemical production in South Africa. The company commissioned its first international joint-venture GTL plant in Qatar in 2006 and a second GTL plant is under construction in Nigeria for planned commissioning in 2009. These GTL ventures incorporate the proprietary Sasol Slurry Phase Distillate™ process.

3553



compelling case for GTL technology

With crude-oil prices reaching unprecedented highs, combined with diminishing oil reserves, countries around the world are looking for alternative sources of energy.

Rising to global energy challenges

The case for investing in gas-to-liquids (GTL) fuel-production technology has become increasingly compelling. GTL technology offers an exciting opportunity for stakeholders to:

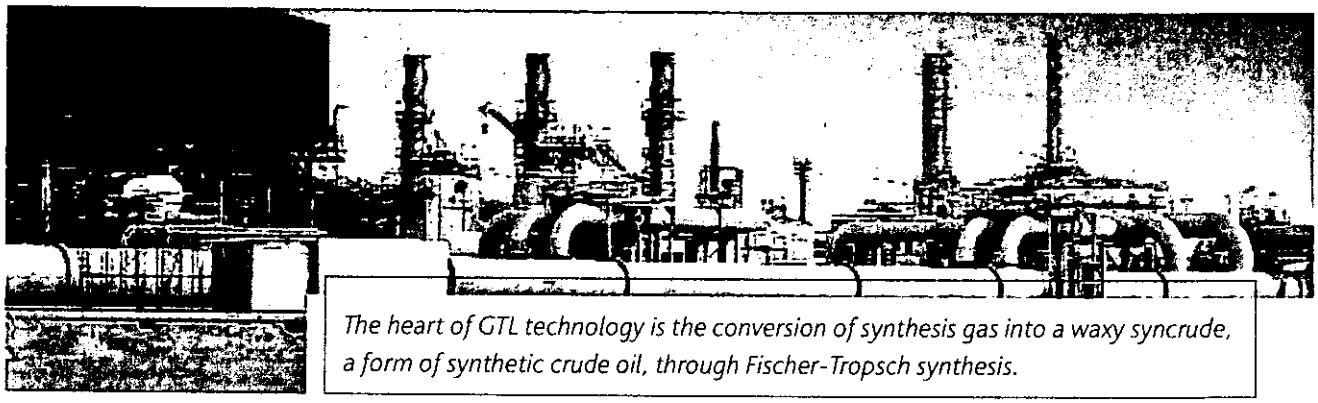
- *monetise underutilised natural gas resources;*
- *diversify economies and create new employment opportunities;*
- *reduce dependence on crude oil;*
- *counter geopolitical risks;*
- *use cleaner fuels and reduce emissions to the atmosphere; and*
- *manage dieselisation - the rapid growth in diesel-powered vehicles compared with their petrol-powered (gasoline) counterparts.*

With crude-oil prices reaching unprecedented highs (exceeding US$70,00 a barrel during May 2006), combined with diminishing oil reserves, countries around the world are looking for alternative sources of energy. Many are turning to gas. The world has abundant gas reserves, with an estimated 50% substantially underutilised.

Today, Sasol is providing its proven GTL technology to gas-producing countries like Qatar and Nigeria, allowing them to convert some of their gas reserves into a low-sulphur, low-aromatics form of synthetic diesel, GTL diesel. Backed by five decades of operational experience, as well as comprehensive research and development in Fischer-Tropsch process technology, Sasol has developed, and is marketing worldwide, its unique GTL technology, the Sasol Slurry Phase Distillate™ process.

3554

understanding GTL technology



The heart of GTL technology is the conversion of synthesis gas into a waxy syncrude, a form of synthetic crude oil, through Fischer-Tropsch synthesis.

Turning gas into cleaner diesel

GTL technology comprises proven chemical processing technologies to convert natural gas into liquid fuels and related petrochemicals.

The heart of GTL technology is the conversion of synthesis gas into a waxy syncrude, a form of synthetic crude oil, through Fischer-Tropsch synthesis. Synthesis gas – or syngas – is a blend of hydrogen and carbon monoxide that can be used as the building block for producing more-complex molecules, such as those needed to make high-quality GTL diesel.

In the case of the Sasol Slurry Phase Distillate™ (Sasol SPD™) process, Sasol uses its proprietary low-temperature Slurry Phase Fischer-Tropsch technology to convert natural gas into GTL diesel, GTL naphtha and some liquefied petroleum gas (LPG). *(See page eight).*

Naphtha – a mixture of light hydrocarbons – is used as a feedstock for producing certain chemicals. GTL naphtha is ideal as a feedstock for producing ethylene. It is also ideal for fuel-cell applications.

LPG comprises gaseous hydrocarbons or petroleum gases such as propane, butane and pentane that are pressurised in liquefied form and used for heating.

The Fischer-Tropsch process – incorporated into both GTL technology and coal-to-liquids (CTL) technology – was first developed during the 1920s and has been advanced by Sasol in South Africa since the 1950s. Sasol's original Fischer-Tropsch research and development was focused on improving CTL technology.

During the 1980s, Sasol's focus began to include GTL technology. From this commitment, the group's unique GTL technology was born: the Sasol SPD™ process.

3555

abundant gas reserves

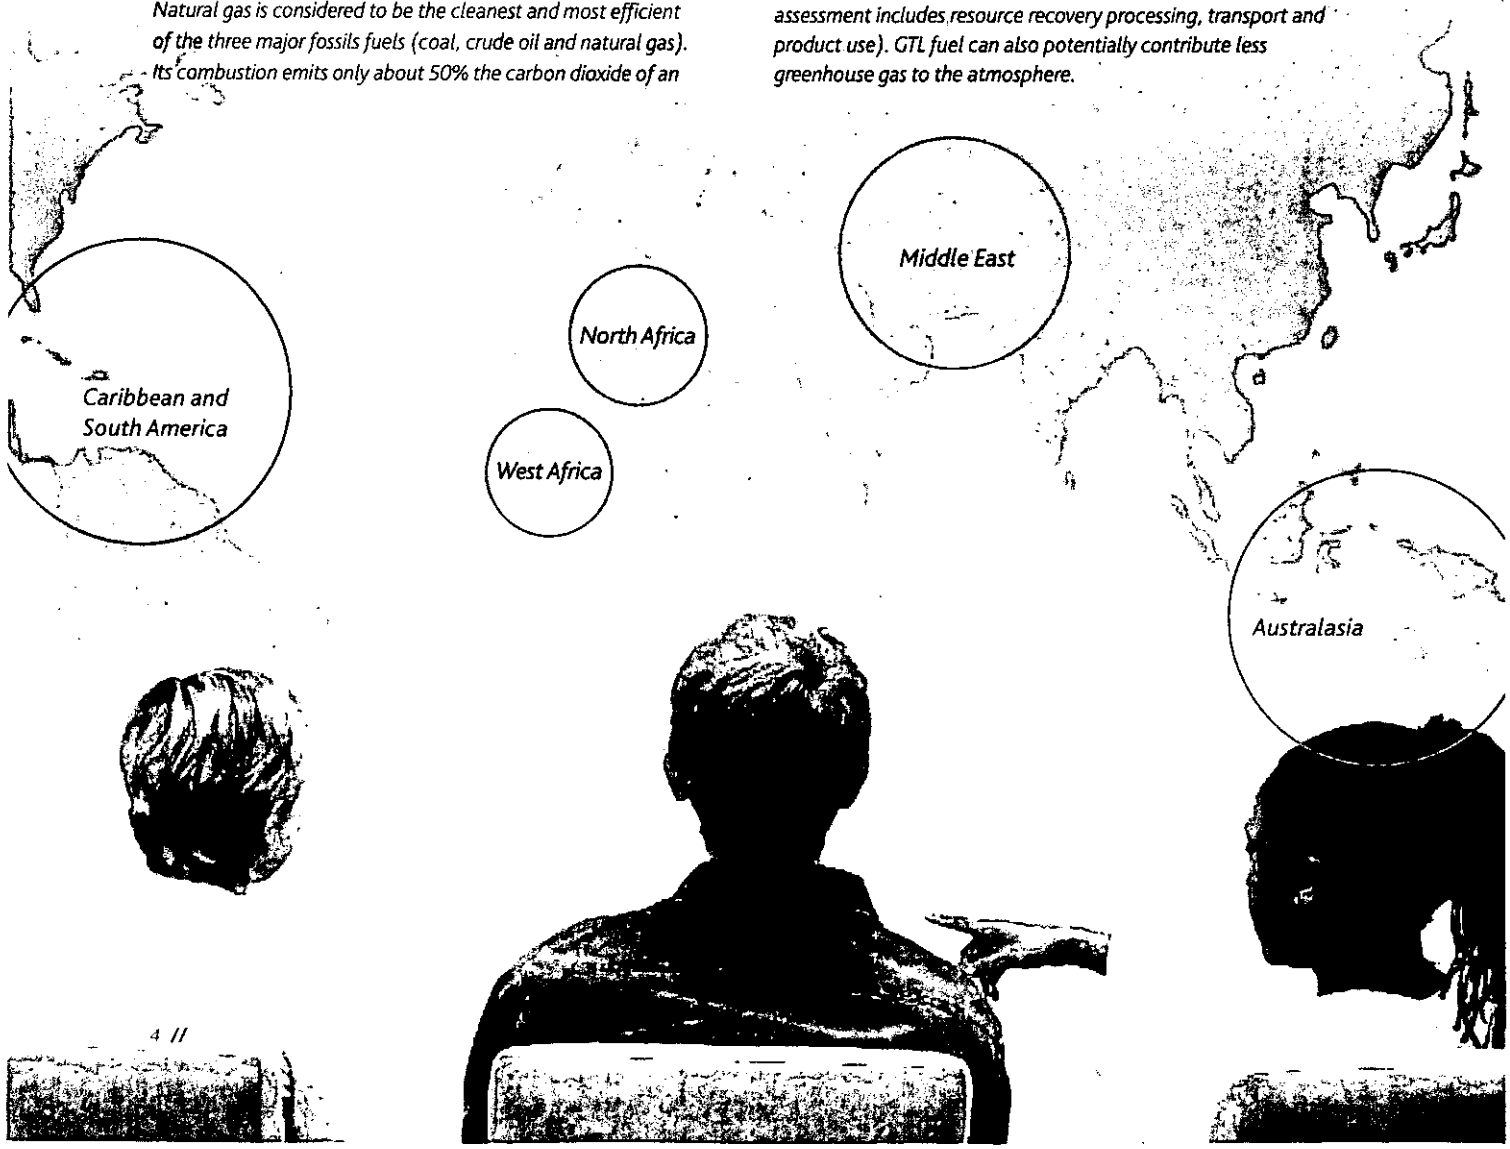
Providing an important new gas-monetisation solution

GTL plants are ideally suited for gas-rich countries, especially where the reserves are underutilised or where large amounts of associated gas are flared during commercial oil production.

The world has abundant reserves of natural gas: about 175-trillion cubic metres – an oil equivalent of at least 1 000-billion barrels. Major underutilised reserves are found in Russia, Iran, Qatar, other parts of the Middle East, parts of North America and Australia. Countries looking to eliminate the flaring of associated natural gas, like Nigeria, also present ideal opportunities for GTL.

Natural gas is considered to be the cleanest and most efficient of the three major fossils fuels (coal, crude oil and natural gas). Its combustion emits only about 50% the carbon dioxide of an equivalent amount of combusted coal. On the strength of this, along with its abundance, natural gas has in recent years become increasingly attractive as a hydrocarbon energy source for developed and emerging economies around the world.

Independent comparative studies recently conducted between traditional crude-oil refining and GTL technologies came to the same conclusion: volatile organic compounds, which contribute to smog, acidifying emissions like sulphur oxides and nitrogen oxides, as well as particulate emissions and waste are all drastically reduced in favour of the GTL product life cycle. (A full-product life-cycle assessment includes resource recovery processing, transport and product use). GTL fuel can also potentially contribute less greenhouse gas to the atmosphere.



3556

sasol
reaching new frontiers

dieselisation and the changing energy paradigm

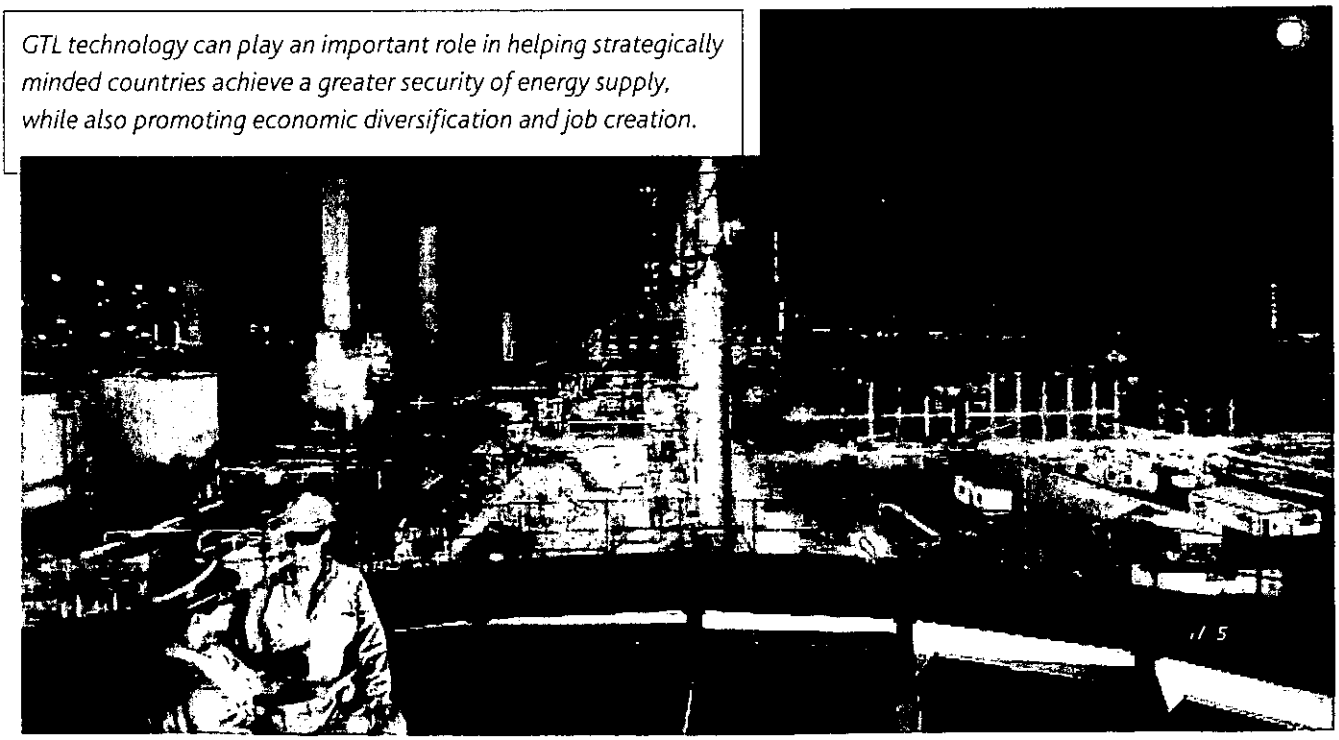
Bringing a smart solution to rapid dieselisation

GTL diesel offers a potentially far-reaching solution for the world's changing energy paradigm, most notably because of the dramatic rise in diesel consumption in both developed and emerging economies.

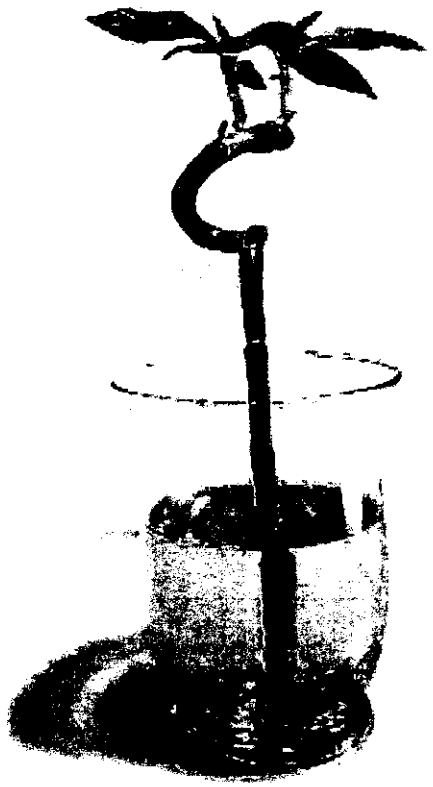
With crude-oil prices escalating, GTL technology plays an important role in helping strategically minded countries achieve a greater security of energy supply, while also promoting economic diversification and job creation.

The case for GTL technology is further strengthened by the growing demand from consumers, environmentalists, governments and automotive producers for cleaner, higher-performing fuels. Diesel is far more energy efficient than petrol and contributes to the drive to reduce carbon dioxide emissions in the transportation sector.

GTL technology can play an important role in helping strategically minded countries achieve a greater security of energy supply, while also promoting economic diversification and job creation.



benefits of GTL products



GTL diesel is positioned as a clean, premium product or as a blend stock to enhance the quality of conventional diesels.

Offering a cleaner, better-performing diesel

GTL diesel is of significant higher quality than diesel derived from crude oil. GTL diesel has a high cetane number (at least 70 compared with a 45 to 55 rating of most diesels), low sulphur (less than five parts per million), low aromatics (less than 1%), and good cold flow characteristics, which can be optimised to suit specific applications.

GTL diesel is positioned as a clean, premium product or as a blend stock to enhance the quality of conventional diesels.

Best of all, GTL diesel can be used in all modern diesel engines. Its high-quality properties result in reduced noise and other performance benefits. The high cetane number and very low levels of sulphur and aromatics ensure a more efficient and cleaner-burning combustion environment. This leads to a substantial reduction in engine wear and exhaust emissions.

Significantly, too, GTL diesel is compatible with established fuel distribution infrastructures. It can therefore be distributed by ship, road tanker or rail tanker without transport operators having to undertake new investments to modify their equipment. It can also be used with both current and envisaged future engine and exhaust technologies. Compression-ignition vehicles using GTL diesel do not need to undergo any engine or exhaust system modifications.

GTL ventures offer other benefits. A high-quality GTL naphtha is also produced in the Fischer-Tropsch process. With a high content of paraffins and very low contents of sulphur, naphthenes and aromatics, it is ideal as cracker feedstock to produce ethylene for the plastics industries (mostly for producing polyethylene and polyvinyl chloride).

3558

sasol's role in promoting GTL

Promoting optimum competitiveness

Since the mid-1990s, Sasol has focused on developing GTL ventures internationally with world-renowned partners.

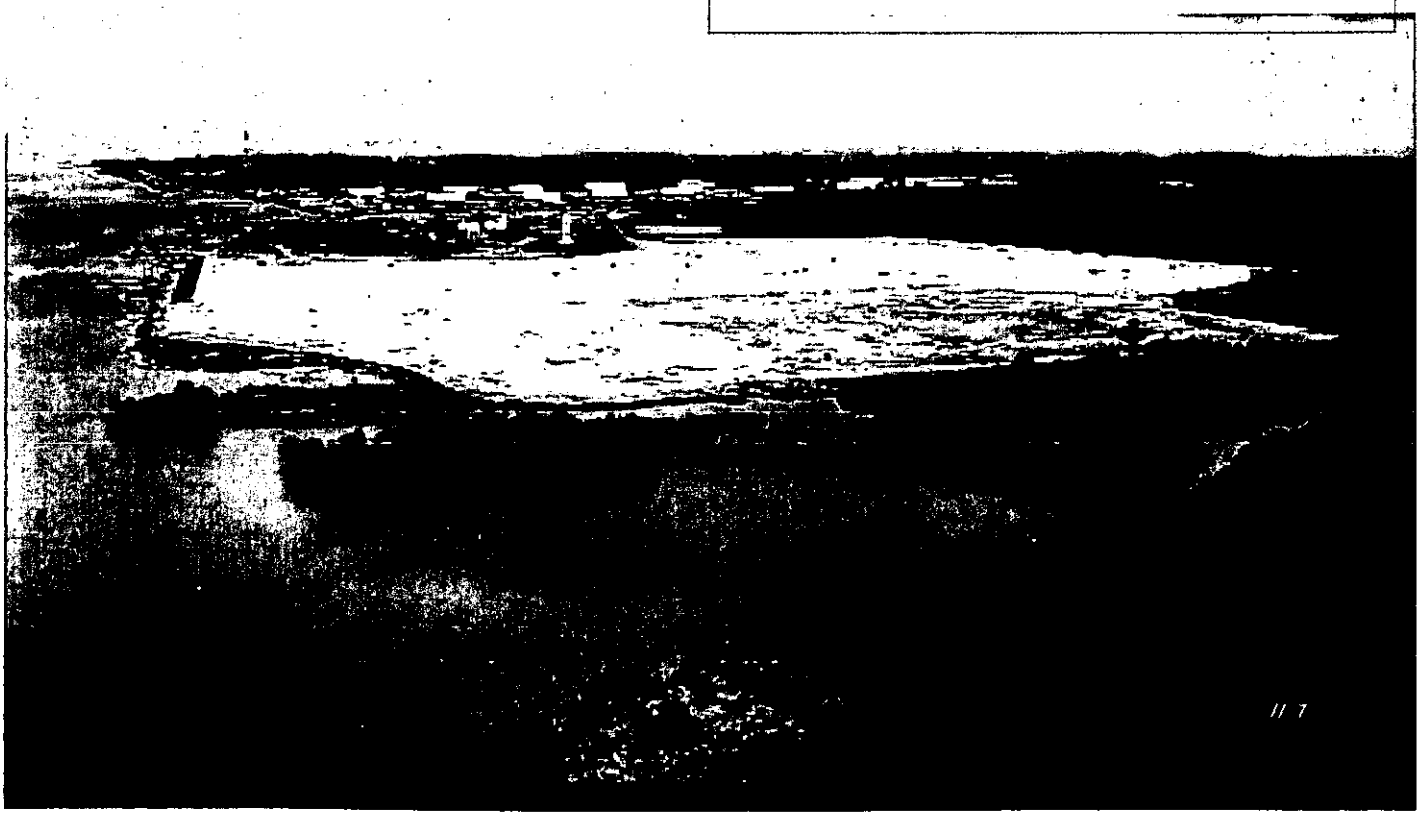
Sasol formed a joint venture with Chevron of the USA, Sasol Chevron, to develop sustainable GTL projects, as well as market and distribute GTL products worldwide.

Such partnerships make good business sense. Besides creating greater synergy in areas such as technology, plant design and plant operations, GTL partnerships also enable large capital investments. GTL ventures, such as the ORYX plant in Qatar, require at least US$1-billion to develop.

In Qatar, Sasol has partnered with the state oil company, Qatar Petroleum, while in Nigeria it has, through Sasol Chevron, entered into a venture with the National Nigerian Petroleum Company and Chevron Nigeria Limited.

Sasol offers gas-rich countries a proven gas-beneficiation technology that can be used to monetise underutilised gas reserves. Sasol also offers extensive operating experience, having brought on stream its first Fischer-Tropsch-based CTL venture in 1955. Since then, Sasol has undertaken extensive research and development in Fischer-Tropsch synthesis technology and patented several processes and specialised catalysts.

Sasol offers countries such as Nigeria extensive operating experience.



3559

sasol Slurry Phase Distillate ™ process

Converting natural gas into high-quality diesel

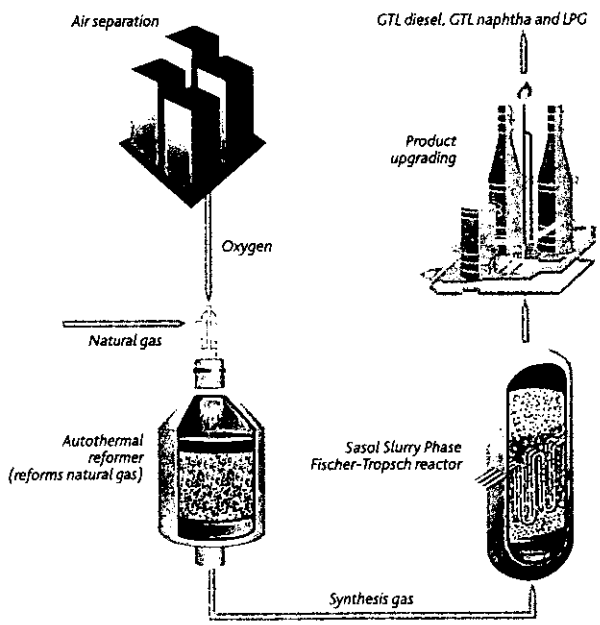
The fully integrated, three-step Sasol Slurry Phase Distillate ™ (Sasol SPD ™) process dates back to the 1980s when Sasol developed its low-temperature Slurry Phase Fischer-Tropsch reactor at Sasolburg. Combined with a proprietary iron- or cobalt-based catalyst, this technology allows for the creation of chemicals and liquid fuels from either coal or gas.

The first Sasol SPD™ process step is gas reforming. Here, natural gas reacts with oxygen and steam over a catalyst to produce synthesis gas (syngas). To achieve this, Sasol and its global GTL partners use Haldor Topsøe's proven autothermal reforming technology.

The second process step entails Fischer-Tropsch synthesis through which syngas is converted into longer-chain or waxy hydrocarbons in the reactor. Syngas is fed to the bottom of the reactor where it is distributed into a slurry consisting of liquid wax and particles of Sasol's proprietary advanced cobalt catalyst. As the gas bubbles up through the slurry, it diffuses into the catalyst and is converted into waxy syncrude.

The long-chain wax product is then separated from the slurry containing the catalyst particles in a proprietary Sasol process. The lighter, more volatile fractions leave in a gas stream from the top of the reactor. The gas stream is cooled to recover the hydrocarbons that have a lower molecule weight (the lighter cuts), as well as some quantities of water.

The hydrocarbon streams are then sent to the product-upgrading unit for the third step, which uses Chevron Isocracking™ technology. This step produces the final GTL diesel, GTL naphtha and LPG.



Sasol Slurry Phase Distillate ™ process

3560

leading the way in Qatar and Nigeria

sasol
reaching new frontiers

Sasol's first two GTL projects

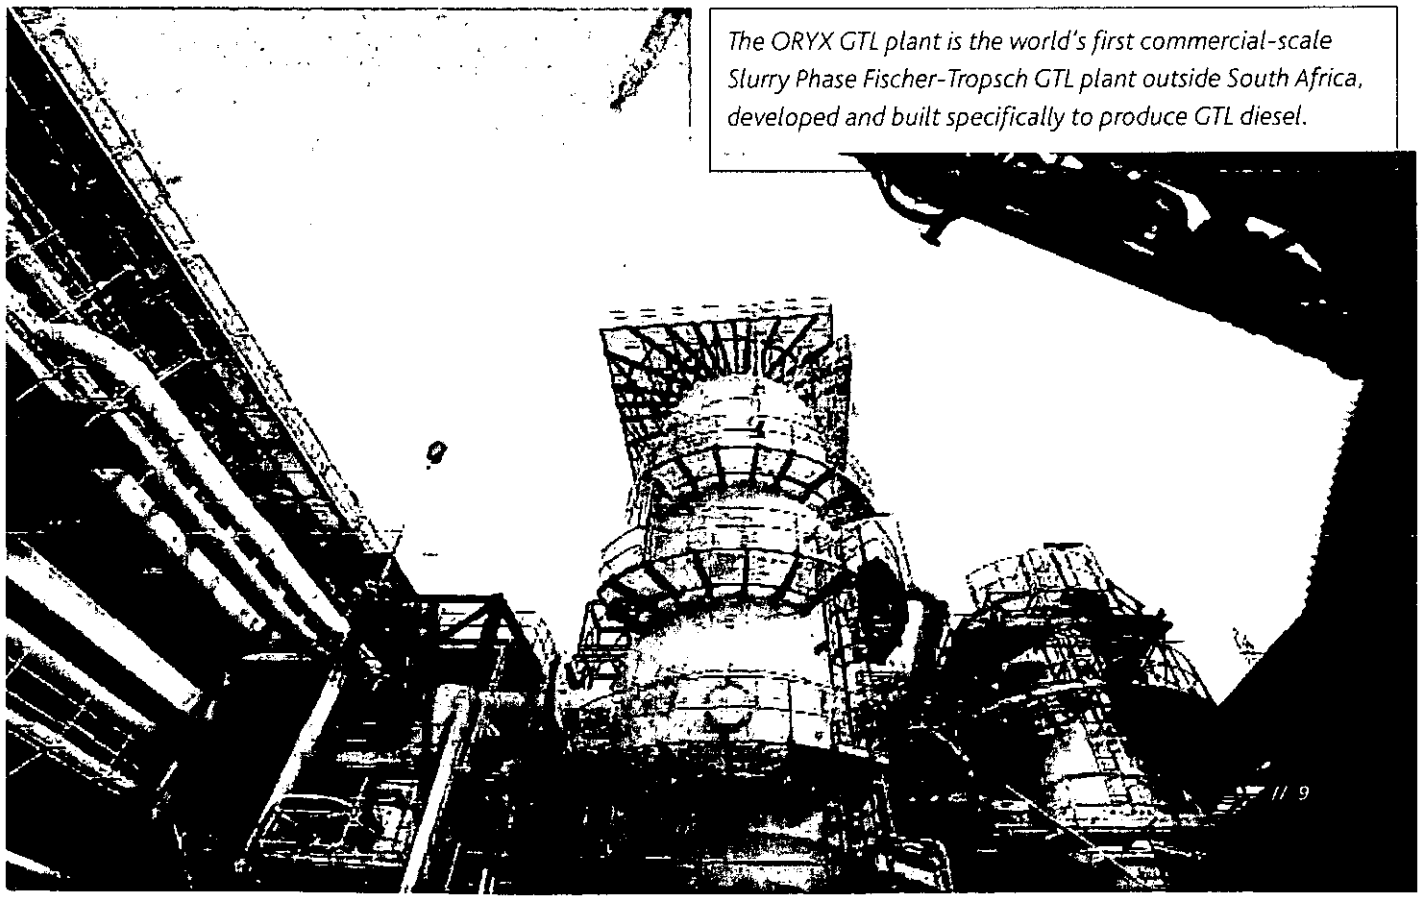
Sasol inaugurated its first GTL project, the ORYX GTL venture, at Ras Laffan on the north-eastern seaboard of Qatar, in partnership with Qatar Petroleum, in June 2006.

The engineering, procurement and construction contract for this project commenced in early 2003. Developed at a cost of about US$1-billion, the 34 000 b/d ORYX GTL plant uses the Sasol SPD™ process.

The ORYX GTL plant is the world's first commercial-scale Slurry Phase Fischer-Tropsch GTL plant outside South Africa, developed and built specifically to produce GTL diesel and, to a lesser extent, GTL naphtha and LPG. It will produce about eight-million barrels a year of GTL diesel as a fuel to be used either neat or as blend stock.

To complement the ORYX project, Sasol and Sasol Chevron are working with the National Nigerian Petroleum Corporation and Chevron Nigeria Limited to develop another 34 000 b/d GTL project, the EGTL plant at Escravos in the Niger Delta. Construction work commenced in 2006 and the plant is expected to go into production in 2009. It will also use the Sasol SPD™ process to produce GTL diesel, GTL naphtha and some LPG.

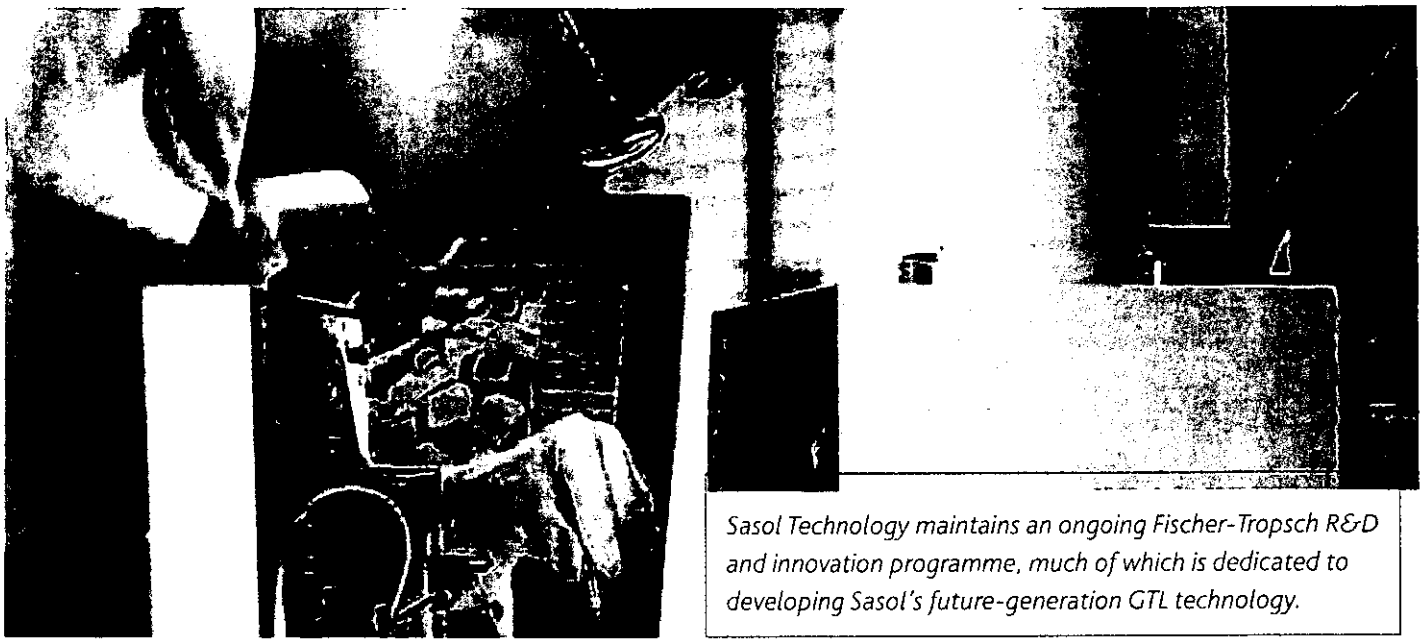
Sasol is engaged in exploratory discussions with other gas-rich countries with a view to developing additional GTL plants.



The ORYX GTL plant is the world's first commercial-scale Slurry Phase Fischer-Tropsch GTL plant outside South Africa, developed and built specifically to produce GTL diesel.

3561

technological development and support



Sasol Technology maintains an ongoing Fischer-Tropsch R&D and innovation programme, much of which is dedicated to developing Sasol's future-generation GTL technology.

Partnering to sustain a culture of innovation

Sasol has long been an enthusiastic champion of its Fischer-Tropsch technology, having invested substantial funds and intellectual capital to advance this technology.

Sasol Technology maintains an ongoing Fischer-Tropsch R&D and innovation programme, much of which is dedicated to developing Sasol's future-generation GTL technology. Its research – covering specifics such as iron- and cobalt-based catalysis and Fischer-Tropsch reactor design – is focused on opportunities to enhance the performance of Sasol's GTL process, while also lowering capital costs, increasing process flexibility and improving eco-efficiency.

To strengthen its Fischer-Tropsch R&D, Sasol operates two complementary research groups at St Andrews University in Scotland and Twente University in the Netherlands. The group also maintains technology partnerships with other major technology players, including Chevron for Isocracking™ and Haldor Topsøe for reforming.

At De Meern, near Utrecht in the Netherlands, Sasol has partnered with the US-based catalyst producer, Engelhard, to commercialise and operate a unique chemical plant devoted to producing Sasol's advanced cobalt catalyst now being used in the ORYX GTL plant.

Sasol Technology maintains other beneficial partnerships, some of which are focused on Sasol's GTL fuel technology. Sasol has been working with original equipment manufacturers, including Caterpillar, Citroën, DaimlerChrysler, Peugeot and Volkswagen. It is also collaborating with Engelhard, Johnson Matthey and other catalyst producers to evaluate the effects of new-generation Sasol diesel and petrol on automotive catalysts.

Sasol also maintains close links with reputable research and testing organisations in Europe and the USA, including the Southwest Research Institute at San Antonio, Texas. These collaborators have been closely involved in testing the technical and environmental characteristics of the GTL diesel produced through the Sasol SPD™ process.

In addition, Sasol has an alliance with the Ishikawajima-Harima Heavy Industries (IHI) engineering consortium in Japan for the fabrication of the specialised Slurry Phase Fischer-Tropsch reactors used in the Sasol SPD™ process. IHI fabricated the two reactors for the ORYX GTL plant and is fabricating another two for the EGTL project.

3562

GTL glossary

sasol
reaching new frontiers

associated gas: *natural gas found with crude oil in an underground geological formation.*

autothermal reformer: *a type of catalytic partial-oxidation reactor in which the endothermic heat needed for chemical reforming is provided by combustion reactions of oxygen in the feed.*

beneficiation: *a process used to increase the value of a material or chemical.*

blend stock: *an ultra-low-sulphur diesel that is blended with a conventional diesel to reduce the latter's sulphur content on a parts-per-million basis.*

catalyst: *usually a metal or metallic compound that enables a reaction to occur between two or more chemicals that would not otherwise react – or to promote the speed and efficiency of a reaction between these chemicals.*

cetane (hexadecane, $C_{16}H_{34}$): *a colourless, liquid, straight-chain paraffin (alkane) used to standardise the knock rating of diesel.*

chain: *chemically, pertaining to a line of atoms of the same type in a molecule. A chain can be open (straight-chained or branch-chained) or closed (ringed).*

cold-start ignition: *the ability to start a vehicle's engine in cold conditions, usually at temperatures of below freezing.*

distillation: *boiling or re-evaporating a liquid and then recondensing it and collecting the vapour.*

hydrocarbons: *a general term for organic compounds containing only, or primarily, carbon and hydrogen molecules.*

Isocracking™: *proprietary Chevron technology used to selectively crack long-chain waxy molecules to produce the mildly isomerised middle-distillate products of GTL diesel, kerosene and GTL naphtha.*

life-cycle assessment: *a process of formally identifying and understanding the flow of energy and materials through a manufacturing system, commencing from a raw material in the ground, through processing and product manufacture, and ending with post-consumer product disposal.*

linear: *pertaining to organic chemicals with a straight-chain molecular structure, rather than branched chains.*

liquefied petroleum gas (LPG): *gaseous hydrocarbons such as propane, butane and pentane pressurised in liquefied form and used for heating.*

methane (CH_4): *a colourless, odourless gas that combusts easily and produces a pale, slightly luminous flame; it is the main constituent of natural gas and can undergo chemical reforming to produce syngas.*

naphtha: *a generic term for a flammable, light distillate or hydrocarbons feedstock, or a mixture of light hydrocarbons, used for gas or petrochemicals manufacture.*

paraffins (alkanes): *saturated aliphatic hydrocarbons of the generic formula CnH_{2n+2} found in natural gas and crude oil. They are indifferent to oxidising agents, hence the Latin-derived name of paraffin meaning "little allied". The names of specific paraffins end with an -ane suffix and include methane, ethane, propane, butane, pentane, heptane and octane. The first four, methane to butane, are gases, the higher numbers are liquids and those above $C_{16}H_{34}$ are waxy solids.*

particulates: *microscopic air-borne material, such as sand, ash or dust, from either natural occurrences, such as volcanoes and dust storms, or industrial activities, such as coal burning.*

reactor: *an enclosed vessel inside which a predetermined and controlled chemical reaction occurs as part of a chemical manufacturing process.*

reforming: *the conversion of straight-chain paraffins into branch-chained ones through cracking or catalytic reaction.*

slurry: *a liquid containing an appreciable amount of suspended solids.*

synthesis: *the formation of more-complex chemical compounds or molecules from simpler compounds or molecules.*

synthesis gas (syngas): *a carbon monoxide-hydrogen mixture used as a petrochemicals feedstock for synthesis and normally derived from the partial oxidation, or catalytic reaction with steam, of methane, which can be derived through natural gas reforming or coal gasification.*

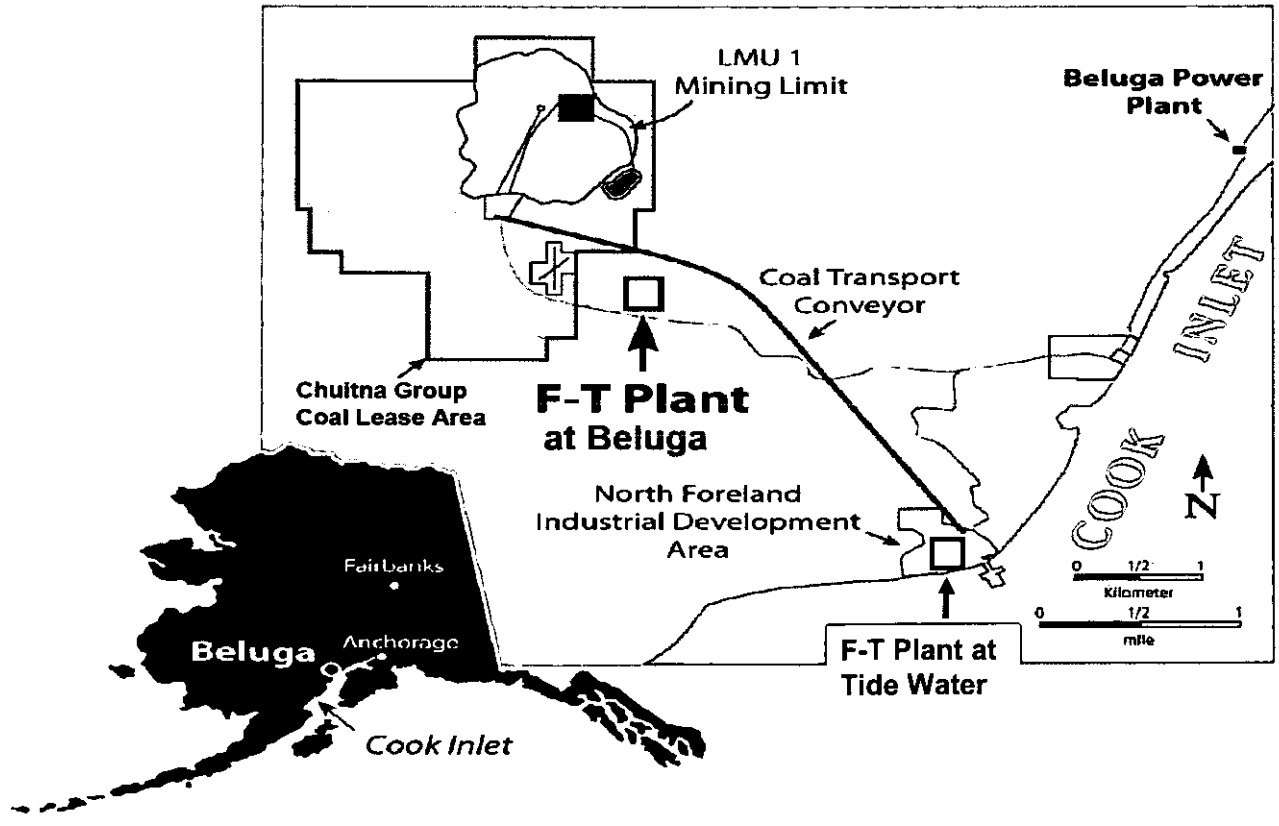
ALASKA WEST COOK INLET
Coal To Liquids Project

80,000 bbl/d Coal To Liquids "Beluga CTL Plant"
(Mine Mouth or Tide Water)



ALASKA BELUGA CTL PROJECT – THE RIGHT CHOICE...✓

- ☑ REASONABLE RATE OF RETURN FOR EQUITY OWNERS;
- ☑ Beluga CTL plant and coal reserves next to the tide water;
- ☑ The Beluga coal field has 50+ years of supply;
- ☑ CO_2 sequestering available through local depleted gas fields;
- ☑ CO_2 enhanced oil recovery in local reservoirs – 150 to 300 million barrels;
- ☑ Local electric market needs 350 to 450 MW of new power;
- ☑ 12 miles from electric grid serving 85% of Alaska's electric load;
- ☑ 10 miles from natural gas transmission system delivering 500 mmcf/d;
- ☑ Almost half of Alaska's population lives within 65 miles of CTL site;
- ☑ 80% of the engineering, design, fabrication, construction and operating companies serving Alaska's North Slope and Cook Inlet oil and gas industry are located within 45 miles of the proposed CTL site;

ADDITIONAL POINTS THAT WILL FAVOR AN ALASKA CTL PLANT

- ☑ 30 miles from Drift River oil export terminal - 500,000 bbl tankers;
- ☑ 20 miles from an existing
  - ☑ 70,000 bbl/d crude oil refinery - Tesoro
  - ☑ A 1.5 million ton/yr fertilizer plant – Agrium
  - ☑ A 1 million barrel tank farm with import/export dock and a products pipeline to the Anchorage fuels market;
- ☑ The Port of Anchorage 45 miles from CTL plant site;
- ☑ The State of Alaska has received a Federal Grant to build a bridge across the inlet from Anchorage to the west side of the Cook Inlet;
- ☑ The State of Alaska has obtained right of way & is looking at building a road and extending the Alaska Rail Road down the west side of the Cook Inlet to aid in commercial development;
- ☑ Alaska Rail Road could potentially provide tax free revenue bonds to aid in financing;
- ☑ Weather conditions similar to Chicago – not the arctic;
- ☑ The Alaska CTL site is a short tanker trip to one of the highest price fuel markets

WHAT DOES A BELUGA CTL PROJECT REPRESENT FOR ALASKANS?

- A $5 Billion World Class CTL Plant
- 1,300 Permanent Jobs
  - Over 5,000 during construction
- 2 Billion Barrels of Transport Fuels
  - Equivalent to a 6 billion bbl oil field
- 6 TCF of Natural Gas
  - Energy Equivalent in waste heat recovery
- 350 + Million Barrels of EOR Crude Oil
  - $1.75 billion in State Royalty money
- 380 MW of Low Cost Waste Heat Electricity
  - $900 million in rate payer savings over 15 years
  - Near Zero CO_2 Emission Electricity
- State and Local Tax Revenue
  - $1 billion in local tax revenue over 20 years
- Western Cook Inlet Land Development

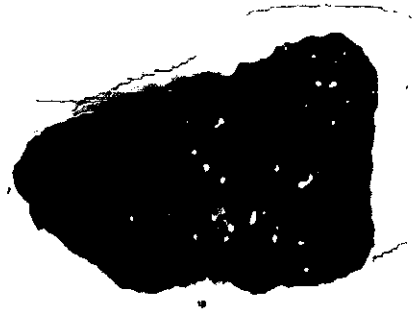
COAL TO LIQUIDS

F-T DIESEL

BILLIONS OF TONS OF COAL

EQUALS

BILLIONS OF BARRELS



WHAT DOES 1.3 BILLION TONS OF WEST COOK INLET COAL REPRESENT

- 2 BILLION BARRELS OF FUELS
  - The SASOL F-T process will turn 1 ton of West Cook Inlet coal into 1.5 barrels of product
  - 1.5 barrels x 1.3 billion = 2 billion barrels of fuels
- 2 Billion of "RECOVERABLE" barrels
  - 2 Billion barrels of recoverable crude is the equivalent of a 6 Billion barrel oil find

Note: the F-T conversion process depends upon the quality of the coal, (ie. the carbon content)
Assume that 3 to 4 tons of Alaska coal will produce 1 ton of F-T fuels. 1 ton of F-T fuels is approximately 326 gallons.
326 gallons is equal to 7.76 barrels thus 1 ton of Alaska coal could produce 2 to 2.6 barrels of finished fuels.

A CTL/BTL PLANT PRODUCES FISCHER-TROPSCH (F-T) TRANSPORT FUELS AND PETROCHEMICAL FEEDSTOCKS SOME OF THE CLEANEST FUELS IN THE WORLD

BUT WHAT IS THE F-T PROCESS?

The Fischer-Tropsch Synthesis

$$2\,CO(g) + H_2(g) \rightarrow (-CH_2-)_n(l) + CO_2(g) + H_2O$$

Okay, don't let the chemistry scare you!

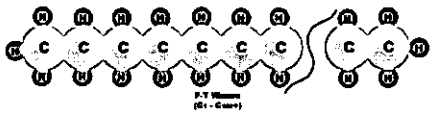
Let's take a look.....

Three Steps in GTL/CTL/BTL Refining to make F-T Fuels

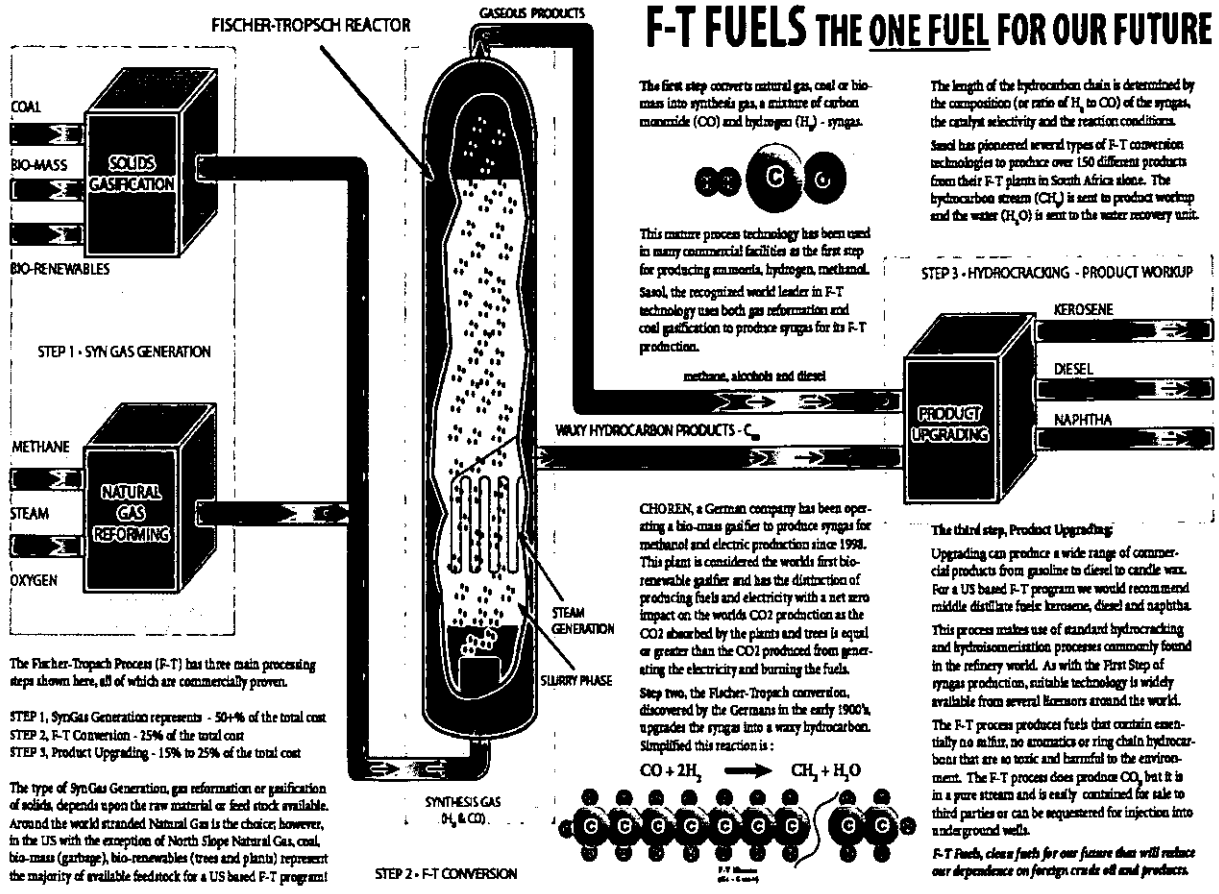
GTL/CTL/BTL Processes use 3 distinct steps to convert a gas or solid into synthetic transport fuels:

- Step 1 - Syn-Gas generation (H_2 & CO)

- Step 2 - The F-T reaction (paraffin wax)



- Step 3 - Product upgrading
  - Kerosene – Diesel – Gasoline - Jet Fuel - Naphtha



F-T FUELS THE ONE FUEL FOR OUR FUTURE

The first step converts natural gas, coal or bio-mass into synthesis gas, a mixture of carbon monoxide (CO) and hydrogen (H_2) - syngas.

This mature process technology has been used in many commercial facilities as the first step for producing ammonia, hydrogen, methanol.

Sasol, the recognized world leader in F-T technology uses both gas reformation and coal gasification to produce syngas for its F-T production.

CHOREN, a German company has been operating a bio-mass gasifier to produce syngas for methanol and electric production since 1998. This plant is considered the worlds first bio-renewable gasifier and has the distinction of producing fuels and electricity with a net zero impact on the worlds CO2 production as the CO2 absorbed by the plants and trees is equal or greater than the CO2 produced from generating the electricity and burning the fuels.

Step two, the Fischer-Tropach conversion, discovered by the Germans in the early 1900's, upgrades the syngas into a waxy hydrocarbon. Simplified this reaction is :

The length of the hydrocarbon chain is determined by the composition (or ratio of H_2 to CO) of the syngas, the catalyst selectivity and the reaction conditions.

Sasol has pioneered several types of F-T conversion technologies to produce over 150 different products from their F-T plants in South Africa alone. The hydrocarbon stream (CH_2) is sent to product workup and the water (H_2O) is sent to the water recovery unit.

The third step, Product Upgrading:

Upgrading can produce a wide range of commercial products from gasoline to diesel to candle wax. For a US based F-T program we would recommend middle distillate fuels: kerosene, diesel and naphtha.

This process makes use of standard hydrocracking and hydroisomerization processes commonly found in the refinery world. As with the First Step of syngas production, suitable technology is widely available from several licensors around the world.

The F-T process produces fuels that contain essentially no sulfur, no aromatics or ring chain hydrocarbons that are so toxic and harmful to the environment. The F-T process does produce CO_2 but it is in a pure stream and is easily contained for sale to third parties or can be sequestered for injection into underground wells.

F-T Fuels, clean fuels for our future that will reduce our dependence on foreign crude oil and products.

The Fischer-Tropach Process (F-T) has three main processing steps shown here, all of which are commercially proven.

STEP 1, SynGas Generation represents - 50+% of the total cost
STEP 2, F-T Conversion - 25% of the total cost
STEP 3, Product Upgrading - 15% to 25% of the total cost

The type of SynGas Generation, gas reformation or gasification of solids, depends upon the raw material or feed stock available. Around the world stranded Natural Gas is the choice; however, in the US with the exception of North Slope Natural Gas, coal, bio-mass (garbage), bio-renewables (trees and plants) represent the majority of available feedstock for a US based F-T program!

WHAT DOES A BELUGA CTL PROJECT NEED TO BE SUCCESSFUL?

- **ATTRACT ONE OF THE WORLDS F-T TECHNOLOGIES TO ALASKA**
  - THERE ARE AT LEAST TWO F-T TECHNOLOGY OWNERS IN THE WORLD CAPABLE OF DESIGNING AND BUILDING A COMMERCIAL SCALE CTL PLANT!
    - **BOTH SASOL AND SHELL ARE BUILDING GTL PLANTS IN QATAR, 3 CTL PLANTS IN CHINA AND 1 IN AUSTRALIA**
    - **BOTH MAY BE PEOPLE CONSTRAINED TO PARTICIPATE IN MORE THAN 1 OR 2 ADDITIONAL CTL PROJECTS**
- ALASKA MUST BE COMPETITIVE WITH OTHER CTL/GTL PROJECTS ACROSS THE WORLD – (NEED *AS GOOD OR BETTER RETURN's*)
  - **(China, Australia, Indonesia, Iran, Qatar, South America)**
- ALASKA MUST BE BETTER THAN OTHER POTENTIAL CTL PROJECTS IN COAL RICH STATES IN THE LOWER 48
  - **Montana, Wyoming, Ohio, North Dakota, Illinois, Indiana, New Mexico, Arizona, Texas, Utah**
- IF ALASKA DOESN'T BUILD THE FIRST CTL PLANT IN THE US, IT MAY HAVE TO WAIT 10 TO 20 YEARS FOR THE NEXT OPPORTUNITY

WHAT DOES THE ALASKA BELUGA CTL PROJECT NEED?

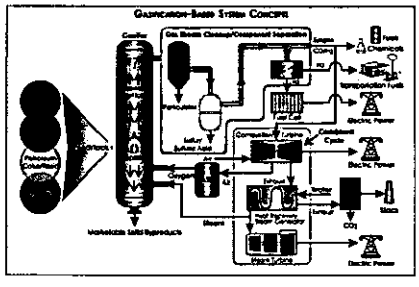
- THERE IS NO QUESTION THAT AT TODAY'S CRUDE OIL PRICES CTL IS ECONOMIC - HOWEVER
- BANKS DON'T LEND MONEY ON $50 CRUDE OIL PRICES
- S&P REQUIRES 1.5 TIMES DEBT COVERAGE AT $28 CRUDE OIL
- THE CURRENT 50¢/GALLON ENERGY CREDIT IN THE TRANSPORTATION BILL - HR-3 IS AN ANSWER - BUT
  - REQUIRES RENEWAL EVERY 5 YEARS
- EXTENDING (GUARANTEEING) THE TERM OF THE F-T ENERGY CREDIT IS ONE SOLUTION
  - Senate Bill 3325 (Coal to Liquids Fuel Promotion Act of 2006)

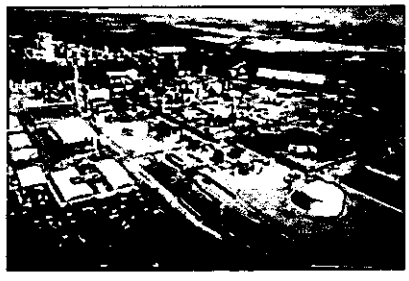
MORE THAN JUST A CTL PROJECT

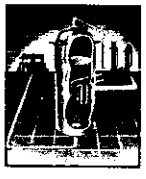
HUNDREDS OF VALUE ADDED BUSINESSES ARE POSSIBLE

VALUE ADDED INDUSTRIES

- The Sasol CTL plants in South Africa produce over 150 different value added products from effluent streams.
- The North Dakota Gasification plant uses the Lurgi process to convert 6 million tons per year of lignite coal to syngas and liquids. The average daily production at Great Plains is about 160 million cubic feet of high quality pipe line natural gas.
- Many by-products are also produced at the plant, including: ammonium sulfate, anhydrous ammonia, carbon dioxide, dephenolized cresylic acid, krypton and xenon gases, liquid nitrogen, naphtha, phenol, and methanol.







SYN-GAS ECONOMICS

THE MARKET FOR SYN-GAS PRODUCTS IN ALASKA IS VERY LIMITED

IT CAN NOT SUPPORT A LARGE SCALE COMMERCIAL GASIFICATION COMPLEX!

Export is the only option

F-T Diesel - world market unlimited

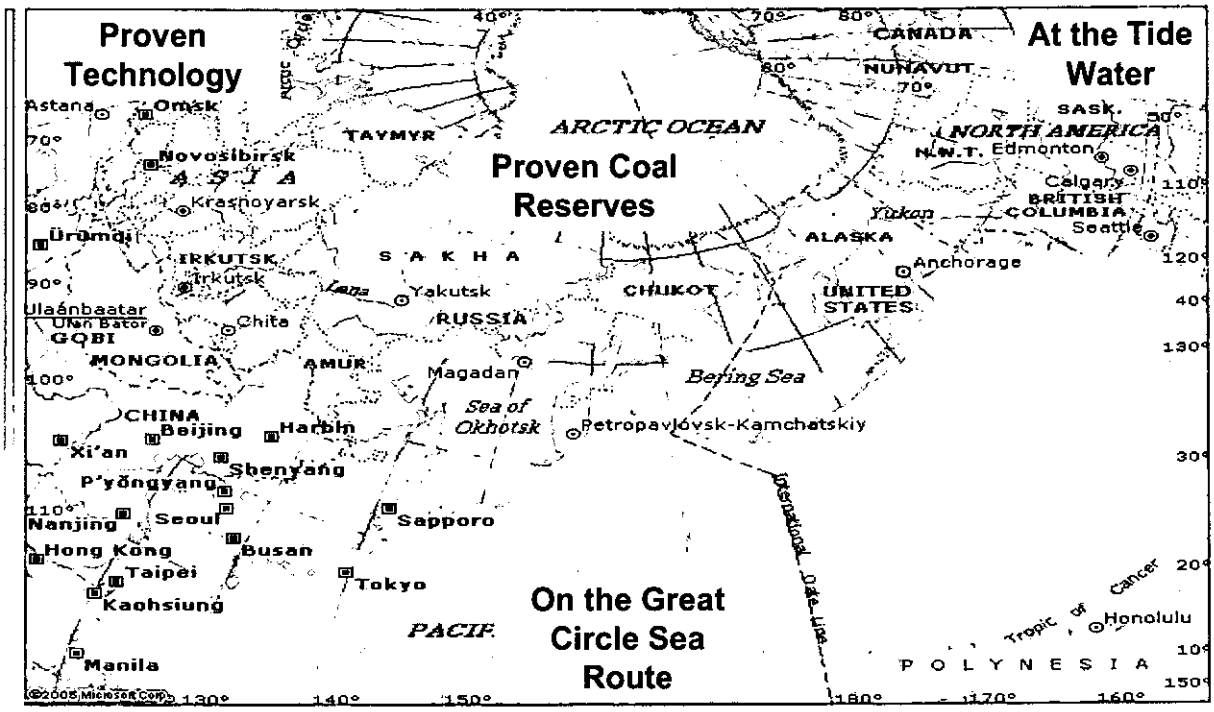
- 16 million barrels per day and growing (245 billion gallons per year)

California Diesel Market

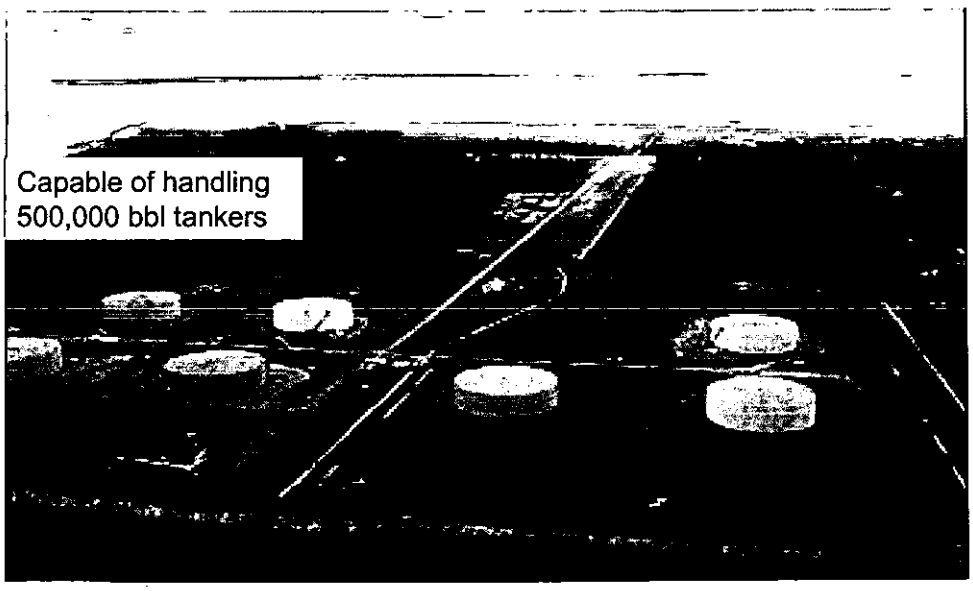
- 420,000 barrels per day and growing (17 million gallons per day)

US WEST COAST THE PRIMARY MARKET FOR ALASKA CTL PRODUCTS

BELUGA CTL PROJECT
NEAR AN EXISTING DEEP WATER EXPORT TERMINAL



DRIFT RIVER EXPORT TERMINAL
COOK INLET, ALASKA



F-T FUEL TECHNOLOGY IS PROVEN BUT IS IT ECONOMIC ?

- Over 40 billion gallons of F-T fuels sold to date from BTL CTL and GTL plants around the world – It is proven !
- Over 500,000 bbl/d of new GTL plants under construction or planed for Middle East alone – it is commercial !
- At today's price of crude oil – they are economic !
- Commercial Banks don't lend money on today's crude oil price for projects

Bringing Alaska North Slope Natural Gas to Market

At least three alternatives have been proposed over the years for bringing sizable volumes of natural gas from Alaska's remote North Slope to market in the lower 48 States: a pipeline interconnecting with the existing pipeline system in central Alberta, Canada; a gas-to-liquids (GTL) plant on the North Slope; and a large liquefied natural gas (LNG) export facility at Valdez, Alaska. NEMS explicitly models the pipeline and GTL options [66]. The "what if" LNG option is not modeled in NEMS.

This comparison analyzes the economics of the three project options, based on the oil and natural gas price projections in the *AEO2009* reference, high oil price, and low oil price cases. The most important factors in the comparison include expected construction lead times, capital costs, and operating costs. Others include lower 48 natural gas prices, world crude oil and petroleum product prices, interest rates, and Federal and State regulation of leasing, royalty, and production tax rates. Each option also presents unique technological challenges.

Natural Gas Resources and Production Costs

Natural gas exists either in oil reservoirs as associated-dissolved (AD) natural gas or in gas-only reservoirs as nonassociated (NA) natural gas. Of the 35.4 trillion cubic feet of AD gas reserves discovered on the Central North Slope in conjunction with existing oil fields, 93 percent is located in four fields: Prudhoe Bay (23 trillion cubic feet), Point Thomson (8 trillion cubic feet), Lisburne (1 trillion cubic feet), and Kuparak (1 trillion cubic feet) [67]. Together, those resources (a total of 35.4 trillion cubic feet of AD natural gas reserves) are sufficient to provide 4 billion cubic feet of natural gas per day for a period of 24 years, at an expected average cost of $1.21 per thousand cubic feet (2007 dollars) [68]. The cost estimate is relatively low, because an extensive North Slope infrastructure has been built and paid for with revenues from oil production, and because there is considerably less exploration, development, and production risk associated with known deposits of AD natural gas.

Although additional AD natural gas might be discovered offshore or in the Arctic National Wildlife Refuge (ANWR), most of the "second tier" discoveries in areas to the west and south of the Central North Slope are expected to consist of NA natural gas in gas-only reservoirs. Production costs for gas-only reservoirs are expected to be considerably higher than those for AD natural gas, because they are in remote locations. In addition, the full costs of their development will have to be paid for with revenues from the natural gas generated at the wellhead.

For the first tier of North Slope NA natural gas (29.2 trillion cubic feet) production costs are expected to average $7.91 per thousand cubic feet (2007 dollars). For the second tier, production costs are expected to average $11.03 per thousand cubic feet. Because the cost of producing NA natural gas is substantially greater than the cost of producing AD natural gas, this analysis uses the lower production costs for AD natural gas to evaluate the economic merits of the three facility options examined.

Facility Cost Assumptions

Of the three facility options, the costs associated with an Alaska gas pipeline are reasonably well defined, because they are based on the November 2007 pipeline proposals submitted to the State of Alaska by ConocoPhillips and TransCanada Pipelines, in compliance with the requirements of the Alaska Gasline Inducement Act (AGIA). Costs associated with GTL and LNG facilities are more speculative, based on the costs of similar facilities elsewhere in the world, adjusted for the remote Alaska location and for recent worldwide increases in construction costs (Table 11).

Other key assumptions for all the options analyzed include natural gas feedstock requirements, natural gas heating values, characteristics of the operations, State and Federal income tax rates, and the time required for planning, obtaining required permits, and constructing the facilities. Key assumptions that are unique to each option include the following: for the Alaska pipeline option, the tariff rate for the existing pipeline from Alberta to Chicago and the spot price for natural gas in Chicago; for the LNG facility option, capital and operating costs, including the cost of building a pipeline from the North Slope to

Table 11. Assumptions for comparison of three Alaska North Slope natural gas facility options

Assumption	Pipeline option	LNG option	GTL option
Natural gas conversion efficiency (percent)	*94*	*80*	*60*
Capital costs (billion 2007 dollars)	*27.6*	*33.9*	*57.5*
Operating costs (million 2007dollars per year)	*263.0*	*392.9*	*894.3*

3582

liquefaction and storage facilities in Valdez, and the value of LNG delivered in Asia and Valdez; and for the GTL facility option, the time required to conduct tests to determine whether the Trans Alaska Pipeline System (TAPS) should be operated in batch or commingled mode with GTL, the production level and mix of product, the oil pipeline tariff and tanker rates to U.S. West Coast refiners, and the price of GTL products relative crude oil prices. The costs of testing and possibly converting TAPS into a batching crude/product pipeline are not included for the GTL option.

Discussion

To compare the economics of the three options, an internal rate of return (IRR) was calculated for each alternative, based on the projected average price of light, low-sulfur crude oil and the projected average price of natural gas on the Henry Hub spot market in the *AEO2009* reference, high oil price, and low oil price cases for the 2011-2020 and 2021-2030 periods (Table 12). The IRR calculations (Figures 20 and 21) assume that the average prices for the period in which a facility begins operation will persist throughout the 20-year economic life of the facility. Projected crude oil prices show considerably more variation across the cases and time periods than do Henry Hub natural gas prices, affecting the relative economics of the three options. In 2030, in the low and high oil price cases, crude oil prices are $50 and $200 per barrel, respectively, and natural gas prices are $8.70 and $9.62 per million Btu, respectively (all prices in 2007 dollars).

The *AEO2009* projections show wide variations in oil prices, which are set outside the NEMS framework to reflect a range of potential future price paths. For natural gas prices, variations across the cases are smaller, reflecting the feedbacks in NEMS that equilibrate supply, demand, and prices in the natural gas market model. Natural gas price increases are held in check by declines in demand (especially in the electric power sector) and increases in natural gas drilling, reserves, and production capacity. Similarly, natural gas price declines are held in check by increases in demand and decreases in drilling, reserves, and production capacity. Natural gas prices are also restrained because only a small portion of the natural gas resource base is projected to be consumed through 2030, and the marginal cost of natural gas supply increases slowly.

Table 12. Average crude oil and natural gas prices in three cases, 2011-2020 and 2021-2030

	2011-2020	2021-2030
Oil price (2007 dollars per barrel)		
Reference	*107.32*	*123.26*
High oil price	*154.24*	*193.25*
Low oil price	*51.61*	*50.31*
Natural gas price (2007 dollars per million Btu)		
Reference	*7.04*	*8.21*
High oil price	*7.52*	*8.50*
Low oil price	*6.24*	*7.88*

As indicated in Figures 20 and 21, IRRs for the pipeline option are sensitive to natural gas price levels, whereas IRRs for the GTL and LNG options are more sensitive to crude oil prices. Consequently, from 2021 through 2030, IRRs for the pipeline option vary by 15 to 17 percent across the three price cases, whereas those for the GTL and LNG options vary by 4 to 24 percent and 7 to 27 percent, respectively. On that basis, the pipeline option would be considerably less

Figure 20. Average internal rates of return for three Alaska North Slope natural gas facility options in three cases, 2011-2020 (percent)

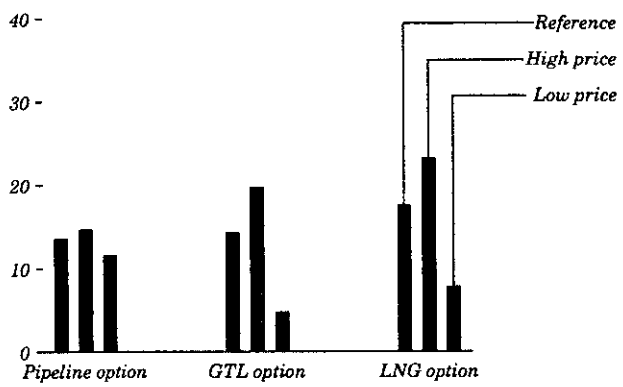

Figure 21. Average internal rates of return for three Alaska North Slope natural gas facility options in three cases, 2021-2030 (percent)

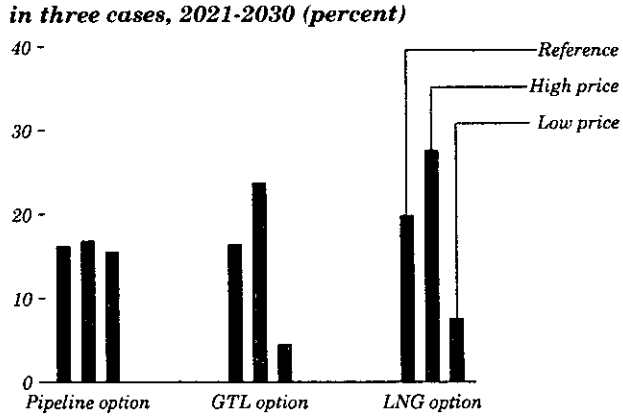

3583

risky than either the GTL or LNG option. Also, the pipeline would involve significantly less engineering, construction, and operation risk than either of the other options.

The potential viability of an Alaska natural gas pipeline is bolstered by the fact that British Petroleum (BP), ConocoPhillips (CP), and TransCanada Pipelines already have committed to building a pipeline. All three have extensive experience in building and financing large-scale energy projects, and both BP and CP have access to substantial portions of the less expensive North Slope AD natural gas reserves. Given that institutional support, along with the prospect for adequate rates of return, the natural gas pipeline option appears to have the greatest likelihood of being built.

Because the GTL option does not include the cost of testing and adapting the existing TAPS oil pipeline to GTL products—which would require third-party cooperation and likely cost reimbursement—the GTL rates of return are overstated. In addition, the GTL results include considerable uncertainty with regard to capital and operating costs and future environmental constraints on GTL plants. Prospects for Alaska GTL facilities are further clouded by the current absence of project sponsors.

Of the three options, an LNG export facility shows the highest rates of return in the reference and high price cases; however, it shows low rates of return in the low price case. The project risk associated with the LNG option is considerably less than that for the GTL option but greater than for the pipeline option. The LNG option is further undermined by the fact that there are large reserves of stranded natural gas elsewhere in the world that have a significant competitive advantage both because of their proximity to large consumer markets and because they would not require construction of an 800-mile supply pipeline. Although there is definite interest in the LNG export option in Alaska, current advocates of the project have not yet secured letters of intent from potential buyers to purchase the LNG, nor do they have ownership of low-cost AD reserves, extensive experience in the management of large-scale projects, or strong financial backing. Finally, if oil shale deposits in the rest of the world turn out to be as rich in natural gas as those in the United States, worldwide demand for LNG could be reduced considerably from the levels that were expected just a few years ago.

Other Issues

The analysis described here focused primarily on the relative economics and risks associated with each of three options for a facility to bring natural gas from Alaska's North Slope to market. There are, in addition, a number of other issues that could be important in determining which facility option could proceed to construction and operation, three of which are described briefly below.

Resolving ownership issues for the Point Thomson natural gas condensate field lease. The State of Alaska has revoked the Point Thomson lease from the original leaseholders. Point Thomson holds approximately 8 trillion cubic feet of recoverable natural gas reserves, and without that supply, the existing North Slope AD reserves would be insufficient to supply a natural gas pipeline over a 20-year lifetime. The 35.4 trillion cubic feet of existing AD natural gas reserves on the Central North Slope includes Point Thomson's 8 trillion cubic feet, and without those reserves only 27.4 trillion cubic feet of North Slope gas reserves would be available, providing just 18.8 years of supply for a 4 billion cubic feet per day facility. As long as the ownership issue of the Point Thomson lease remains unresolved, the possibility of pursuing construction of any of the three options is diminished.

Obtaining permits for an Alaska natural gas pipeline in Canada. The pipeline option could encounter significant permitting issues in Canada, similar to those that have already been encountered by the Mackenzie Delta gas pipeline, whose construction has been significantly delayed as the result of a failure to secure necessary permits. Because there have been no filings for Canadian permits by any Alaska gas pipeline sponsor, the severity of this potential problem cannot be determined.

Exporting Alaska LNG to foreign consumers. Some parties in the United States have called for a halt to current exports of LNG from Alaska to overseas markets. If Alaska were prohibited from exporting LNG to overseas consumers, the financial risk associated with any new Alaska LNG facility would increase significantly, because the financial viability of an LNG facility would be tied solely to lower 48 natural gas prices, which are projected to be considerably lower than overseas natural gas prices.

Shipping GTL products through TAPS. The joint ownership structure of TAPS could prevent a

3584

minority owner from using the pipeline to ship GTL from the North Slope south to Valdez and on to market.

Conclusion

The *AEO2009* price cases project greater variance in oil prices than in natural gas prices. If those cases provide a reasonable reflection of potential future outcomes, then the pipeline option in this analysis would be exposed to less financial risk than the GTL and LNG options. Additionally, it is the only option that already has the commitment of energy companies capable of financing and constructing such a large, capital-intensive energy facility. The balance of the factors evaluated here points to an Alaska natural gas pipeline as being the most likely choice for bringing North Slope natural gas to market.

Endnotes

66. The GTL option is represented in NEMS in the form of facilities with capacities of 34,000 barrel per day that can be added incrementally when oil and petroleum product prices are sufficiently high to make their operation profitable.

68. K.W. Sherwood and J.D. Craig, *Prospects for Development of Alaska Natural Gas: A Review as of January 2001* (Anchorage, AK: U.S. Department of Interior, Minerals Management Service, Resource Evaluation Office), Chapters 4 and 5, web site www.mms.gov/alaska/re/natgas/akngas2.pdf. Resource recovery costs were updated for this analysis, to reflect the escalation of drilling costs over time.

3585

Bringing Alaska North Slope Natural Gas to Market

Introduction

At least three alternatives have been proposed over the years for bringing sizeable volumes of remote Alaska North Slope natural gas to market. This discussion analyzes those alternatives, namely (1) a gas pipeline interconnecting with the existing pipeline system in central Alberta Canada, (2) a gas-to-liquids (GTL) plant on the North Slope, and (3) a large liquefied natural gas (LNG) export facility at Valdez, Alaska.

The National Energy Modeling System (NEMS), which produces the energy projections published in the *Annual Energy Outlook*, explicitly models the pipeline and GTL options.[1] This article presents an additional 'what if' option and analyzes potential economic value of each of the three alternatives under the oil and natural gas price projections in the reference, high, and low oil price cases of the *Annual Energy Outlook*.

This comparison analyzes the economics of the three project options looking at their expected construction lead times, and capital and operating costs of each option. Considerable uncertainties exists, however, regarding these costs and lead times and with respect to future lower 48 natural gas prices, world crude oil and petroleum product prices, interest rates, and Federal and State regulation of leasing, royalty, and production tax rates. Each facility also presents unique technological challenges, further adding to the uncertainty.

To ensure consistent treatment across the alternatives, one common assumption is that each facility would be based on a North Slope natural gas production level of 4 billion cubic feet (Bcf) per day and that each facility type has a minimum economic lifetime of 20 years. A 20-year facility life, relying on 4 Bcf per day, requires a total dedication of 29.2 trillion cubic feet (Tcf) of North Slope natural gas reserves.

Alaska North Slope Natural Gas Resources and Production Costs

Natural gas exists either in oil reservoirs as associated-dissolved (AD) natural gas or in gas-only reservoirs as non-associated (NA) natural gas. Of the 35.4 Tcf of AD gas reserves discovered on the Central North Slope in conjunction with existing oil fields, 93 percent is located in 4 fields: Prudhoe Bay (23 Tcf), Point Thomson (8 Tcf), Lisburne (1 Tcf), and Kuparak (1 Tcf).[2] These 35.4 Tcf of AD gas reserves are sufficient to serve a 4 Bcf facility for 24 years.

Producing the existing 35.4 Tcf of AD gas reserves is expected to cost an average of $1.21 per thousand cubic feet (Mcf) (2007 dollars).[3] This relatively low AD production

[1] NEMS represents the GTL option in the form of 34,000 barrel per day facilities that can be added incrementally when oil and petroleum product prices are sufficiently high to make these facilities profitable relative to the technological and market risks facing GTL.

[2] Source for ANS associated-dissolved gas reserves: Alaska Department of Natural Resource, *Alaska Oil and Gas Report*, July 2007, Table III.1, page 3-2.

[3] U.S. Department of Interior, Minerals Management Service, "Prospects for Development of Alaska Natural Gas: A Review as of January 2001," Resource Evaluation Office, Anchorage, Alaska, Chapters 4 and 5. NA gas costs reflect exploration and development drilling, completion, and production costs at a

3586

cost is because an extensive North Slope infrastructure has been built and paid for by oil production, and because there is considerably less exploration, development, and production risk associated with these known AD gas deposits.

Although additional AD natural gas might be discovered offshore or in the Arctic National Wildlife Refuge (ANWR), most of the North Slope natural gas expected to be discovered west and south of the Central North Slope is NA gas in gas-only reservoirs. The cost of producing these gas-only reservoirs is expected to be considerably higher than AD gas because of their remote location and because the full cost of development must be paid for by the natural gas revenues generated at the wellhead. The first tier of North Slope NA gas (29.2 Tcf) is expected to cost $7.91 per Mcf (2007 dollars) to produce, while the second tier of NA gas is expected to cost $11.03 per Mcf.[4] Because the NA natural gas production cost is substantially greater than the estimated AD gas production cost, this analysis will focus on the relative economic merits of the three facility options only in the context of the less expensive AD gas.

Facility Cost Assumptions

Of the three facility options, the costs associated with an Alaska gas pipeline are well defined, based on the November 2007 pipeline proposals submitted in compliance with the Alaska Gasline Inducement Act (AGIA) requirements by ConocoPhillips and TransCanada Pipelines to the State of Alaska. Costs associated with gas-to-liquids and liquefaction facilities are more speculative, and are based on similar facilities found elsewhere in the world, adjusted for the remote Alaska location and for recent world-wide construction cost increases (Table 1).

Table 1
Alaska North Slope Facility Costs and Operating Parameter Assumptions
(Costs are in 2007 dollars)

	Gas Pipeline to Alberta	LNG Export Facility	GTL Facility
Gas Conversion Efficiency 1/	94%	80%	60%
Capital Costs (Billion dollars) 2/	$27.6	$33.9	$57.5
Operating Costs (Million $ per year) 3/	$263.0	$392.9	$894.3

1/ LNG facility efficiency does not include any LNG tanker losses while in transit; pipeline efficiency based on AGIA averages; LNG and GTL losses based on levels cited in technical literature Source: Bipin Patel, Foster Wheeler Energy Limited, "Gas Monetisation: A Techno-Economic Comparison of Gas-To-Liquid and LNG," 2005.

2/ Each option's capital cost includes $6.5 billion in capital costs to pay for gas gathering and treatment facilities. Gathering and treatment costs based on ConnocoPhilips AGIA proposal costs. LNG capital costs based on liquefaction plant estimates provided by Robert Baron, a DOE/Fossil Energy consultant, and

---

reasonable rate of return, but do not include gas gathering and processing costs, which are included in the capital and operating costs of each of the three facilities. The AD gas costs represent the cost of pumping the natural gas out of the reservoir to the surface, periodically reworking the wells, and drilling some infill wells, plus a reasonable rate of return for these activities, but do not include gathering and processing costs.

[4] Ibid. Each tier of 29.2 Tcf is based on the gas requirements of a 4 Bcf per day facility operating over a 20-year economic life.

3587

prorated AGIA gas pipeline costs based on the mileage from the North Slope to Valdez, and escalated by 20% to reflect the cost of building over the Alaska Range mountains in a seismically active zone. GTL North Slope capital cost based on $110,000 per daily stream barrel as per the Petroleum News article, "Legislators told GTL a no-go for ANS gas," March 11, 2007.
3/ Operating costs include labor, maintenance, administrative overhead, etc. but do not include natural gas feedstock costs. Pipeline operating costs are based on EIA's NGTDM model values. LNG operating costs are based on study by Robert Baron, consultant for DOE/FE Study of LNG and GTL costs, 2006. GTL operating costs are based on EIA's INGM model.

Other key assumptions for each facility type include:

- All Facility Types:
  - The natural gas feedstock requirement is 4 Bcf per day,
  - The natural gas heating value is 1,099 Btus per cubic foot[5],
  - In the first year of operation, a project produces at 50 percent of capacity at 60 percent of annual operating cost, and
  - The State and Federal income tax rates collectively are 38 percent.

- Alaska Gas Pipeline:
  - The Alberta to Chicago gas pipeline tariff rate is $0.70/MMBtu (2007 dollars)[6],
  - Chicago spot natural gas prices are approximately $0.10/MMBtu less than Henry Hub spot prices[7], and
  - The pipeline takes 9 years to plan, permit, and construct, with most of the construction costs incurred during the last 4 years.

- LNG Facility:
  - Capital and operating costs include the cost of building a gas pipeline from the North Slope to the liquefaction and storage facilities in Valdez, but do not include the cost of tankers to ship LNG to customers,
  - LNG delivered in Asia is valued at 85 percent of the low-sulfur, light crude oil price,[8]
  - The LNG at Valdez is valued at 85 percent of the delivered LNG price to account for LNG shipping costs, and
  - The LNG facility, including the gas pipeline from the North Slope to Valdez, takes 5 years to plan, permit, and construct.

- GTL Facility:
  - GTL facility costs do not include any costs to test and possibly convert the Trans Alaska Pipeline System (TAPS) into a batching crude/product pipeline[9],

3588

- Prior to construction of a GTL facility, 3 years would be required to conduct tests to determine whether TAPS should be operated in batch or commingled mode with GTLs[10],
- Produces about 460,000 barrels per day of petroleum products of which 30 percent is naphtha and 70 percent is distillate (diesel)[11],
- A $4.87/bbl oil pipeline tariff rate[12] and a $3.50/bbl tanker rate[13] to U.S. West Coast refiners are assumed for GTL petroleum products,
- GTL products are collectively priced at 120 percent of the West Texas Intermediate crude oil price[14], and
- The GTL facility takes 5 years to plan, permit, and construct due to a harsh site environment and difficult logistics.

Discussion

To compare the economic attractiveness of each of the three options, internal rates of return (IRR) were calculated for each alternative, based on the average projected prices of light, low-sulfur crude oil and Henry Hub spot natural gas (Table 2) for the *AEO 2009* reference, high oil price, and low oil price cases during two periods spanning 2011 through 2020 and 2021 through 2030 (Figure 1). These IRR calculations assumed that the average price over each time period persists during the entire 20-year economic life of the facility. Projected crude oil prices show considerably more variation across the cases and time periods than do Henry Hub gas prices and can flow through to project outcomes. In 2030, crude oil prices range from $50 dollars per barrel (2007 dollars) in the low oil price case to $200 per barrel in the high oil price case, while gas prices range from $8.70 per million Btu to $9.62 per million Btu across the same oil price cases.

Table 2
Average Projected Crude Oil and Natural Gas Prices
For Periods Spanning 2011-2020 and 2021-2030
By *Annual Energy Outlook 2009* Oil Price Case

		2011-2020	2021-2030
Light, Low-Sulfur Crude Oil Price	Reference Case	$107.32	$123.26
(Dollars Per Barrel)	High Oil Price Case	$154.24	$193.25
	Low Oil Price Case	$51.61	$50.31
Henry Hub Spot Natural Gas Price	Reference Case	$7.04	$8.21
(Dollars per Million Btu)	High Oil Price Case	$7.52	$8.50
	Low Oil Price Case	$6.24	$7.88

The AEO2009 oil price projections show a large variation in oil prices, which are set outside of the NEMS framework to reflect the full range of potential future oil prices. In contrast to oil, a smaller variation in natural gas prices is projected across all the NEMS

[14] Based on historical averages.

3589

cases, including the oil price cases. The smaller variation in natural gas prices results from the NEMS natural gas market feedbacks that equilibrate supply, demand, and price.

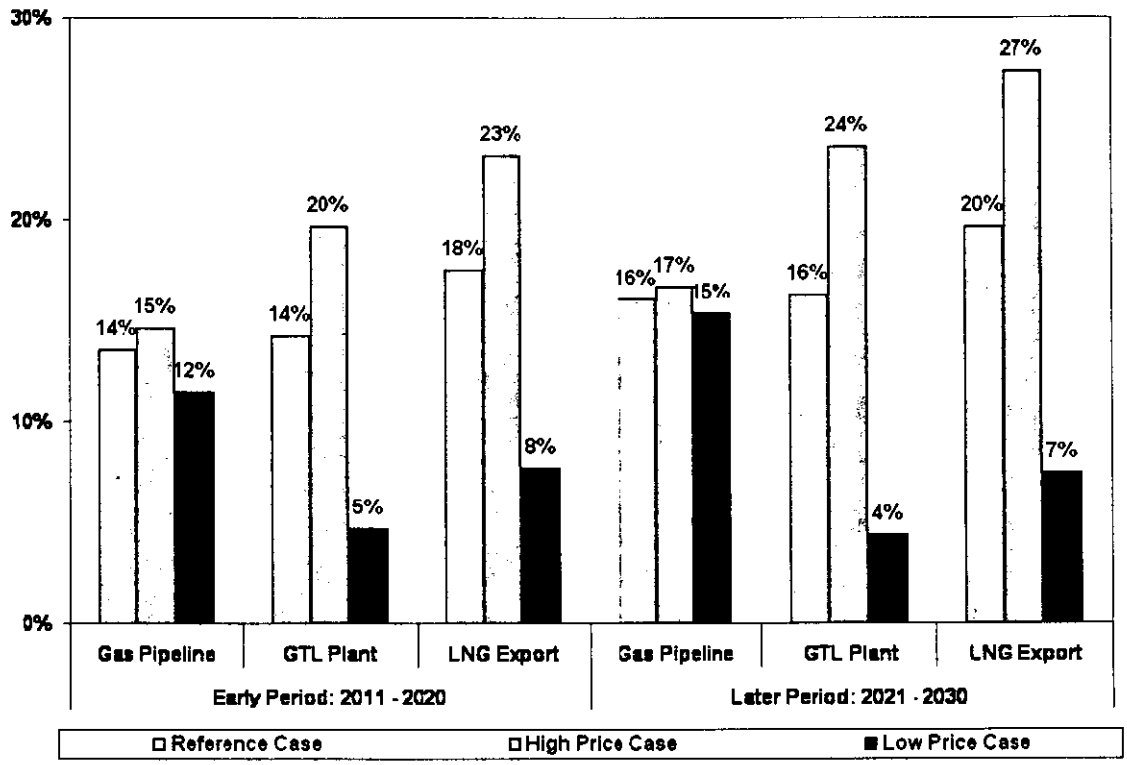
Within NEMS, natural gas price increases are held in check by declining natural gas demand (especially within the electric power sector) and by increasing natural gas drilling, reserves, and productive capacity. Similarly, natural gas price declines are held in check by an increasing gas demand and by decreasing gas drilling, reserves, and productivity capacity. Natural gas prices are also restrained by the fact that only a the small proportion of the gas resource base is consumed through 2030 and that the marginal cost of gas supply increases slowly in the initial portion of the gas supply curve.

Gas pipeline IRR results are sensitive to gas prices while GTL and LNG IRR results are sensitive to crude oil prices (Figure 1). During the 2021 through 2030 period, the small variability in projected gas prices results in pipeline rates of return ranging between 15 and 17 percent, while the large variability in projected oil prices results in GTL and LNG rates of return ranging between 4 to 24 percent and 7 to 27 percent, respectively. If the projected range in oil and gas prices is a reasonable expectation of potential future outcomes, then the gas pipeline option is considerably less risky than either the GTL or the LNG option. The gas pipeline also has significantly less engineering, construction, and operation risk than either of the other options.

The viability of an Alaska gas pipeline is bolstered by the fact that British Petroleum (BP), ConocoPhillips (CP), and TransCanada Pipelines have each committed to building a gas pipeline. These parties have extensive experience in building and financing large scale energy projects, while BP and CP have access to a substantial portion of the less expensive North Slope AD gas reserves. Given the institutional support and the prospect for adequate rates of return, a gas pipeline presently has the greatest likelihood of being built.

Because the GTL option does not include the cost of testing and adapting the existing TAPS oil pipeline to GTL products which would require third-party cooperation and likely cost reimbursement, the GTL rates of return are overstated. GTL results are also burdened by considerable uncertainty regarding capital and operating costs and any future environmental constraints that might be imposed on such plants. Prospects for Alaska GTL facilities are further hindered by the absence of project sponsors at the present time.

Figure 1
2011 – 2020 and 2021 - 230 Average Internal Rates of Return
For the Three North Slope Alaska Facility Options
Using North Slope Associated-Dissolved Wellhead Natural Gas Feedstock
For the *Annual Energy Outlook 2009* Oil Price Cases



Of the three facility options, an LNG export facility presents the best rates of return in the reference and high oil price cases. However, this option earns low rates of return in the low oil price case. The project risk associated with the LNG export option is considerably less than for GTL but greater than for the pipeline.

The financial viability of an Alaska North Slope LNG export option is further undermined by the fact that there are large stranded gas reserves elsewhere in the world that enjoy a significant competitive advantage both by their proximity to large consumer markets and by not being burdened with having to build an 800-mile Arctic supply pipeline. These stranded foreign gas reserves would be developed for LNG export at a significantly lower cost than those located in the Alaska North Slope, thereby making the potential future demand for Alaska North Slope LNG much more speculative and uncertain.

Even though there is a definite interest in the LNG export option in Alaska, the current project advocates have neither secured letters of intent from potential buyers to purchase LNG nor do they have (1) ownership of the low-cost AD gas reserves, (2) extensive large-scale project management experience, or (3) strong financial backing.

Other Issues

This analysis focused primarily on the relative economics and risks associated with each North Slope facility option. However, there are a number of non-economic issues that could hinder or preclude the construction of these facilities. The most significant of these issues include:

- Revocation of the Point Thomson gas-condensate field lease. The State of Alaska has revoked the Point Thomson lease from the original leaseholders. Point Thomson holds approximately 8 trillion cubic feet of recoverable gas reserves. Absent the availability of the Pt. Thomas gas, the existing North Slope AD gas reserves are insufficient to supply a gas pipeline over a 20-year lifetime.[15] As long as the ownership issue of the Point Thomson lease remains unresolved, the possibility of pursuing construction of any of the three options is unlikely.
- Obtaining permits for an Alaska gas pipeline in Canada. The gas pipeline option could encounter significant permitting issues in Canada, similar to those that have already been encountered by the Mackenzie Delta gas pipeline, whose construction has been significantly delayed as a result of being unable to secure all necessary permits. Because there have been no filings for Canadian permits by any Alaska gas pipeline sponsor, the severity of this potential problem is indeterminate at this time.
- Exporting Alaska LNG to foreign consumers. Some parties within the United States have called for a halt to the current LNG exports from Alaska to overseas markets. If Alaska were prohibited from exporting LNG to overseas consumers, then the financial risk associated with any new Alaska LNG facility would increase significantly because the financial viability of an LNG facility would be tied to lower 48 natural gas prices, which are projected to be considerably lower than overseas natural gas prices.
- Shipping GTL products through the TransAlaska oil pipeline system (TAPS). The joint ownership structure of TAPS could prevent a minority owner from utilizing TAPS for shipping petroleum liquids from their GTL plant on the North Slope southward to Valdez for movement to PADD 5 or elsewhere.

Conclusions

The AEO2009 oil price cases project greater variation in oil prices than in natural gas prices. If these scenarios are a reasonable reflection of potential future outcomes, then the natural gas pipeline would be exposed to less financial risk than the GTL and LNG facilities. The gas pipeline also has significantly lower engineering, construction, and operation risk than the GTL and LNG facilities. Finally, only the gas pipeline has the commitment of energy companies that are capable of financing and constructing such a large, capital-intensive energy facility. So the balance of the factors evaluated among the

[15] The 35.4 Tcf of existing natural gas reserves includes Pt. Thomson's 8 Tcf. Without the Pt. Thomson gas reserves, only 27.4 Tcf of North Slope gas reserves would be available for only 18.8 years for a 4 Bcf per day facility.

Agrium Kenai Nitrogen Operations Plant
Nikiski, Alaska

The Agrium fertilizer plant has been experiencing shortages of natural gas for feedstock and winter shutdowns have occurred. This study focused on evaluating the feasibility of the gasification of Beluga coal, shipped from the Chuitna Mine located across the Cook Inlet, to produce synthetic gas to be used by Agrium. The coal gasification facility would be located at the Agrium site.

BELUGA COAL GASIFICATION FEASIBILITY STUDY

Executive Summary

The objective of the Beluga Coal Gasification Feasibility Study was to determine the economic feasibility of developing and siting a coal-based integrated gasification combined-cycle (IGCC) plant in the Cook Inlet region of Alaska for the co-production of electric power and marketable by-products. The by-products, which may include synthesis gas, Fischer-Tropsch (F-T) liquids, fertilizers such as ammonia and urea, alcohols, hydrogen, nitrogen and carbon dioxide, would be manufactured for local use or for sale in domestic and foreign markets.

This report for Phase 1 summarizes the investigation of an IGCC system for a specific industrial setting on the Cook Inlet, the Agrium U.S. Inc. ("Agrium") fertilizer plant in Nikiski, Alaska. Faced with an increase in natural gas price and a decrease in supply, the Agrium is investigating alternatives to gas as feed stock for their plant. This study considered all aspects of the installation and infrastructure, including: coal supply and cost, coal transport costs, delivery routes, feedstock production for fertilizer manufacture, plant steam and power, carbon dioxide (CO_2) uses, markets for possible additional products, and environmental permit requirements.

Phase 2 of the project was initially planned to entail a generalized assessment of locating an IGCC plant at an alternative location in the Cook Inlet region, with plant size and design based on local and export markets for the suite of potential products. The Cook Inlet-specific Phase 1 results, reported here, provided insight and information that led to the conclusion that the second study should be for an F-T plant sited at the Usibelli Coal Mine near Healy, Alaska.

This Phase 1 case study is for a very specific IGCC system tailored to fit the chemical and energy needs of the fertilizer manufacturing plant. It demonstrates the flexibility of IGCC for a variety of fuel feedstocks depending on plant location and fuel availability, as well as the available variety of gas separation, gas cleanup, and power and steam generation technologies to fit specific site needs.

Background

Natural gas production from the major Cook Inlet fields is declining and known reserves are not sufficient to meet current demand beyond 2012. South Central Alaska natural gas prices have already risen and even in the best scenario, this upward trend will continue. The critical question is where South Central Alaska's future energy supplies will come from and at what price. Because of the declining natural gas supplies, the Agrium plant is scheduled to shut down in the fall of 2006.

The Cook Inlet/Susitna Basin coal fields contain 1.4 billion short tons of measured reserves (10.5 billion short tons of identified reserves). The measured reserves are equivalent to 21.4 trillion cubic feet of natural gas or 3.7 billion barrels of North Slope crude oil on a Btu content basis. This resource is the last undeveloped coal field in the United States that is on tidewater open to year-round shipping. It could be used for electric power production, export, converted to high value products, or a combination of these.

3597

There is renewed interest in the Beluga coal field, part of the Cook Inlet/Susitna Basin, to meet industrial and power requirements in the region. The increasing population in the area will require additional electric power generation. New developments, such as the Pebble Project, a proposed gold-copper mine, will also require additional power. Beluga coal, however, will potentially compete with other energy sources. For example, a spur line to transport North Slope gas is currently being investigated. There is a need, therefore, to technically and economically evaluate the Beluga coal option on a similar timeline. Having a completed study available will provide a base case for making project selections.

Faced with the increasing cost and reduced availability of natural gas, Agrium, which owns and operates a fertilizer plant at Nikiski on the Cook Inlet, is investigating the use of coal feedstock as a replacement for natural gas. The Agrium "Blue Sky Project" will assess the value of coal gasification in this specific industrial setting. Their concept includes gasification and a separate power plant, but is not an IGCC design.

The sections below summarize the study's assumptions, project scope and results, key findings, conclusions/recommendations, and plans for Phase 2.

Project Scope and Results

In this investigation, two plant configurations were considered for comparison. Case 1 is a system designed entirely as an IGCC. The IGCC plant would satisfy the Agrium facility's entire feedstock and electric power needs. Because of the size of available components, the final design will have the capacity to produce excess electrical power that can be sold to the local grid.

The Case 2 design retains the gasification trains from Case 1 to produce the fertilizer feedstocks, but replaces the combined-cycle equipment with a conventional fluidized bed combustion system to produce steam for the plant and for power production.

The results of the investigation are summarized below under major topic areas.

Coal & Limestone – Beluga coal from an undeveloped mine approximately 30 miles across the Cook Inlet from Agrium's plant is likely the most economic source of coal for the Cook Inlet region. The proven reserves are more than sufficient to supply the plant for the life of the project. Developers are actively pursuing permitting for the Chuitna Mine and plan to begin exporting to Pacific Rim countries by 2010. A second option is to transport coal from the currently operating Usibelli Coal Mine near Healy, AK. Both mines would produce sub-bituminous coal with nearly identical properties. Usibelli coal must be shipped by rail to either Anchorage or Seward. The final leg of the delivery chain for Chuitna or Usibelli coal is a barge trip across the Cook Inlet. The provisions of the Jones Act require that all shipping between U.S. ports must be on U.S. made, owned, and manned vessels. The Chuitna coal could be delivered to the Agrium plant at $1.84 to $1.99/MMBtu ($31.00.98 to $33.51/tonne); Usibelli coal could be delivered at $1.96 to $2.11/MMBtu ($33.10 to $35.63/tonne).

Limestone will be required in the design Case 2. The Alaska Lime Company mine near Cantwell could supply limestone to Agrium for an estimated $115/tonne, in sufficient quantity to meet plant demands.

Value Added Products – The demand for the coal gasification by-products of the Beluga Coal Gasification Project have been investigated as part of this evaluation. The areas considered include international, domestic, regional and local markets. Typical gasification products and by-products assessed in Phase 1 include elemental sulfur, sulfuric acid, slag (as an aggregate or

3598

replacement), carbon dioxide (CO_2), and Fischer-Tropsch diesel. The Phase 1 plant design does not include provisions for products other than fertilizer; however, the Phase 2 plant will be designed to produce Fischer-Tropsch fuels and other products. In Phase 2 the F-T analysis will be expanded. Phase 2 by-products may include nitrogen, carbon dioxide (for other than enhanced oil recovery), argon, and secondary value added by-products (naphtha, kerosene, etc.).

Carbon Dioxide – A coal gasification plant at the Agrium site would produce a significant quantity of CO_2. The carbon to hydrogen ratio for coal is much higher than for natural gas. Therefore, a coal gasification plant sized to meet the hydrogen requirements of fertilizer production produces more CO_2 than a plant fed with natural gas. The current natural gas fed plant emits about 114 MMscfd of CO_2 in both concentrated AGR (acid gas removal) and dilute flue gas streams. A gasification plant, of a size to produce an equivalent amount of hydrogen (the current study's Case 1 design) will emit about 280 MMscfd of CO_2. Of that 280 MMscfd, 91 MMscfd will be in a concentrated CO_2 gas stream from the acid gas processing section and 189 MMscfd will be in the form of dilute flue gas from the gas turbine stack. The desirability of developing a plant of this nature may hinge in part on the disposal or beneficial use of this CO_2. For that reason, this study assessed the potential of CO_2 for use in enhanced oil recovery (EOR) and for sequestration in underground reservoirs. There are more than a dozen reservoirs in the five major fields of Cook Inlet, within a 20-mile radius of the Agrium plant, that pass the screening criteria for miscible CO_2 floods.

- Using the average range of incremental increase in production (8 to 11%) via CO_2 flooding, the five major Cook Inlet oil fields have the potential to produce an incremental 290 to 400 million barrels of oil (MMbo). Using only the five major reservoirs and a 25% of cumulative production estimate, the incremental production would be approximately 300 MMbo.
- Screening level economics performed for the McArthur River field, the largest field in the Cook Inlet, suggest that an economic CO_2 flooding program in Cook Inlet's oil fields might be possible at oil prices greater than $35 to $40 per barrel, with the cost of CO_2 ranging from $0.50/Mcf to $1.20/Mcf. After the EOR assessment was completed, a preliminary economic analysis showed that the capital equipment cost for capturing and handling the CO2 was not economically feasible, thus the CO2 capture segment of the Case 1 and 2 designs was drooped and it was assumes that the gas would be vented. Refined analyses may show ways of using the CO2 for EOR that are feasible.
- The results of a successful flooding program could extend the life of the oil fields for 20 or more years and yield as much incremental oil as has been produced from these fields in the last quarter century.

Natural Gas Market – Agrium currently relies on scarce Cook Inlet natural gas as the chief feedstock for manufacturing fertilizer. Switching to synthesis gas from coal will increase the amount of natural gas available for other uses such as home heating and electric power generation in the Cook Inlet area. The impact on natural gas demand by eliminating Agrium as a natural gas customer was evaluated in another DOE/RDS study ("*Gas Needs and Market Assessment - Alaskan Spur Pipeline Project*" Contract No. DE-AM26-04NT41817, Task 211.01.06, completed in June, 2006). In that assessment, it was assumed that unless low cost natural gas is obtained the fertilizer plant will suspend operations in the fall of 2006. If the Agrium plant converts to coal as feedstock, effectively removing it from the regional gas market,

3599

no effect on that assessment was found, because conversion to coal will have the same effect as a plant shut-down.

Electric Power Market – The impact of Agrium switching from natural gas to coal would have a small impact on the local power market. The most effective design of the gasification system includes electrical generation capacity sufficient to completely power the Agrium facility and provide 70 MW of power for sale to the grid. Under the current grid configuration and markets, the impact of this increment on local power generation and transmission needs would be minimal. The grid infrastructure could handle the power without significant upgrades and the market would be able to absorb it. Incremental revenue from the 70 MW of power capacity would be about $45.94/MWh in 2010.

Gasification Plant Design – The coal gasification plant investigated in this study is designed to provide Agrium's Kenai Nitrogen Operations (KNO) plant with the following suite of required products:

- 282 million standard cubic feet per day (MMSCFD) of hydrogen at 400 psig and of suitable quality for ammonia production.
- Stoichiometric quantity of nitrogen (approximately 100 MMSCFD) at 400 psig and 99.99% purity.
- 1,500,000 lb/hr steam at 1500 psig and a minimum temperature of 825°F.
- 300,000 lb/hr steam at 600 psig and 625°F.
- 5,000 TPD CO_2 suitable for urea production (25 psig)
- Electric power to satisfy the auxiliary power requirements for the gasification plant and the KNO facility, to make the entire facility electric power independent.

In addition to the products provided from the IGCC plant to the fertilizer plant, the fertilizer plant will return 1,200,000 lb/hr of high-pressure condensate at 1200 psig and 450°F to the IGCC facility.

Phase 1 assessed two alternative design configurations for meeting the KNO requirements:

Case 1: Process the syngas from the gasification plant to supply required hydrogen and nitrogen to the KNO ammonia synthesis loop compressor and produce sufficient steam and power for internal KNO consumption. This case employs a gas turbine for power production.

Case 2: Process the syngas from the gasification plant to supply required hydrogen and nitrogen to the KNO ammonia synthesis loop compressor, but do not produce power from a gas turbine. Rather, it would employ a fluidized bed coal combustion power plant to independently produce the required power and steam for the KNO facility.

Six gasification technologies were considered for this study, and the ConocoPhillips E-Gas technology was ultimately selected. The criteria considered included commercial status, ability to gasify the proposed feedstock, type of solid waste produced, oxygen/coal ratio, modular capacity of the gasifier, syngas composition, operating pressure and other byproduct potential.

Preliminary results from Case 1 indicated that the syngas availability from the gasification plant could be improved by replacing the 7FA gas turbine combined cycle with a CFB coal-fired boiler. Initial analysis also indicated that capital cost savings could be realized through this

3600

change in plant configuration. However, to produce sufficient steam and power to satisfy KNO operations, the CFB boiler and associated steam turbine would have to be larger and less efficient, resulting in a higher capital cost per unit of output. Table ES.1 summarizes the performance characteristics and capital costs for Case 1 and Case 2.

3601

Table ES.1 Case-by-Case Comparison of Performance and Capital Costs

	Case 1	Case 2
Power Production		
Gas Turbine	197 MW GE 7FA	N/A
Steam Turbine	36 MW	156 MW
Syngas Expander	N/A	16 MW
Net Plant Power	70 MW[1]	12 MW
Coal Feed		
To Gasifiers	11,700 TPD	10,680 TPD
To CFB Boiler	N/A	1,800 TPD
Overall Plant Efficiency, HHV[2]	54.8%	48.4%
Condenser Duty	270 MMBtu/hr	729 MMBtu/hr
Capital Cost Area ($1,000's)		
Gasification Island	$569,500	$567,900
Gas Cleanup	$261,600	$263,900
Gas Turbine and HRSG	$153,000	N/A
CFB Boiler	N/A	$254,700
Syngas Expander-Generator	N/A	$8,100
Steam Turbine-Generator	$12,600	$47,200
Cooling Water System	$9,400	$19,800
Feedwater System	$8,000	$26,100
Balance of Plant	$625,900	$682,300
Total Plant Cost	$1,640,000	$1,870,000

Financial Analysis

Financial analyses for both cases were performed using the Power Systems Financial Model Version 5.0 (developed by Nexant for DOE) and the case-specific design and project cost estimates. The Power Systems Financial Model has been used in numerous gasification studies, and is now the NETL standard for IGCC systems analysis. The key results desired from the analysis were the project return on equity investment, discounted cash flow, and identification of

[1] The Case 1 design will provide a Net Plant Power of 81 MW. However, due to the potential sale price for power at various levels, the economic analyses assumed 70 MW of power available for sale to the grid.

[2] In this case, Overall Plant Efficiency equals the power generated plus chemical value of the hydrogen generated divided by the thermal input to the plant. It does not take into account the efficiency of the down-stream process in which the hydrogen is used.

3602

key model sensitivities. The amounts of hydrogen, nitrogen, CO_2, power, and steam exported to the Agrium facility were held constant. Table ES.2 shows the key model input differences and financial results for each case.

Table ES.2 Financial Cost Summary

	Case 1	Case 2
Plant EPC[3] Cost ($MM)[4]	1312	1498
Power Export to Grid (MW)	70	12
ROI (%)	11.1	6.0
Payback Year (2011 Start)	12 yrs.	20 yrs.

Case 1 clearly possesses superior financial potential relative to Case 2. While both cases produce enough raw materials necessary for ammonia and urea production at the Agrium facility, Case 2 is more expensive, produces less export power, and requires slightly more coal feed. Removal of the gas turbine from Case 1 and replacement in Case 2 with a CFB and a larger steam turbine to supply the necessary feedstocks to the Agrium plant does not appear to be economically justified.

Sensitivity analyses were performed on all model inputs in both cases. The items found to have the greatest impact on the financial results are the plant system availability, EPC cost, ammonia/urea prices, and delivered coal cost. None of the other model inputs impacted the ROI by more than 3 percentage points for the range of variables tested. Events that increase product prices and/or reduce capital or delivered coal costs will have a large positive influence on the project economics. The equity ROI remained positive after examining a wide range of potential conditions for EPC cost, availability, and coal price. For these inputs, the model results should be considered robust for this stage of the project analysis.

Because of the very wide range of potential values, the model input with the largest potential impact on project economics is the ammonia/urea price. In the last eight years, ammonia prices have ranged between $100 and $275/metric ton, with considerable volatility. Since this project has an estimated 30-year project life, the sensitivity analysis examined this entire price range. At ammonia prices at or below ~$150/metric ton, the project will have difficulty producing positive equity returns. None of the other financial model inputs impacted the results as strongly over the range of possible inputs considered. While this is not an issue that is unique to the development of a gasification facility at the Agrium site, it should have the greatest focus when making future capital investment decisions at the site.

The CO_2 produced from the proposed gasification plant has potential economic value for enhanced oil recovery operations in the region. An initial value of $0.50/MSCF of carbon dioxide was used after discussions with local oil and gas producers. Designing the plant to

---

[3] Engineering, Procurement, and Construction

[4] This value is the same as the "Total Plant Cost" from Table ES.1 less the 25% contingency

3603

capture and sell the CO_2 under those conditions yielded an IRR that was ~1 percentage point lower than the final Case 1 design. A sensitivity analysis on carbon dioxide showed that a value of nearly $1.00/MSCF would be necessary to make the increased capital expenditure a break-even proposition with Case 1. Since it was estimated that this value is higher than what could be obtained in the Alaskan market, equipment for carbon dioxide capture and storage was removed from the base case designs.

Environmental Issues – Construction and operation of an IGCC facility at the existing Agrium Kenai Plant would require a number of federal, state and borough environmental permits. Environmental issues pertaining to air emissions, water supply, wastewater discharges, management of solid and hazardous wastes, and marine ecological impacts would need to be addressed in the project planning and design process to ensure compliance with existing regulatory requirements. In addition, one or more of the federal agencies with permitting jurisdiction could require an Environmental Assessment or an Environmental Impact Statement in accordance with the National Environmental Policy Act (42 U.S.C. § 4321 et seq.).

Phase 1 Conclusions:

The analyses showed that:

- The conversion of the Agrium plant is technically and economically feasible under the assumptions made. In the most financially attractive feasible case, Case 1 had an internal rate of return of 11.1%; Case 2 had an IRR of only 6.0%. Developers and investors use economic hurdles to judge investments and risk. Each case is different, so whether this yield is sufficiently high to secure financial commitments is a decision that can only be made by developers.
- There are sufficient coal resources to supply the plant at an economic delivered price.
- CO_2 will be produced in sufficient quantity and at a cost that may permit enhanced oil recovery in the Cook Inlet. The potential exists to recover as much as 300 MMbo – equaling the last 25 years of production. However, the CO_2 sales price will have to be greater than currently projected for this to be economically feasible.
- Large domestic and export markets exist for many by-products.
    - The developing Fischer-Tropsch diesel market has potentially the best return, but is also the one that is the least understood at this time.
    - Elemental sulfur and sulfuric acid have good and well understood world-wide markets.
    - Slag will need to be marketed locally as low-density aggregate, road building material, or sand blasting grit.
- Natural Gas - No change to the predictions described in *"Gas Needs and Market Assessment - Alaskan Spur Pipeline Project"*[5] was found.

---

[5] Thomas, C.P. and C. Ellsworth, et al, (RDS), "Gas *Needs and Market Assessment - Alaskan Spur Pipeline Project*" Contract No. DE-AM26-04NT41817, Task 211.01.06, completed in June, 2006.

3604

- Electric power - The 70 MW of export power will bring a sales price of about $45.95/MWh in 2010. This excess power will not result in major impacts on the generation or transmission systems in the region over the time period evaluated.
- An analysis of the current design basis indicates that a proposed IGCC facility at the Agrium Kenai Plant is feasible in terms of current environmental permitting and compliance requirements imposed by federal, state and local regulations. Detailed environmental compliance strategies and mitigation measures would need to be developed in concert with design details and operational plans.

Phase 2 Project Plan:

The Phase 1 plant was designed for a very specific size, optimized for the level of production at the Agrium plant. In Phase 2, a plant based on the Phase 1 design will be considered for location at the Usibelli Coal Mine, near Healy. An NETL project[6] has determined that Healy would be the third most likely coal-to-liquids plant site in Alaska, after Nikiski and Beluga. Alaska Natural Resources to Liquids Company is pursuing a private sector initiative to develop the Alaska Beluga Coal-to-Liquids Project (AK Beluga CTL) on the west side of Cook Inlet. Since the Nikiski site was used in Phase 1 and AK Beluga CTL is underway, the Healy site was selected for Phase 2. The Healy plant will be optimized for commodity production levels consistent with expected local and export market demand and for electric power output levels consistent with growth projections and infrastructure capabilities. The conceptual design of this plant will be based on the design of the Phase 1.

Alaska Natural Resources to Liquids Company is pursuing a private sector initiative to develop the Alaska Beluga Coal-to-Liquids Project (AK Beluga CTL) on the west side of Cook Inlet. The AK Beluga CTL plant is also a gasification based facility and is on much scale larger (80,000 barrels per day) than that considered in Phase 1 of this study. As part of Phase 2, an investigation of the feasibility of piping synthesis gas from the proposed CTL plant to the Agrium plant will be undertaken.

Contributors and Acknowledgements

This work was funded by the U.S. Department of Energy's National Energy Technology Laboratory (U.S. DOE-NETL). Brent Sheets and James Hemsath of the NETL Arctic Energy Office (AEO) were the contract monitors and the authors would like to acknowledge the significant role played by U.S. DOE/NETL/AEO in providing programmatic guidance and review of this report.

The analytical portion of this study was conducted over a five month period beginning in October 2005. Assistance and support was received from many agencies and industry. Specifically, the authors thank members of the Advisory Committee for input and guidance, and for providing assistance in obtaining publicly available data in a timely and efficient manner.

Advisory Committee

An Advisory Committee was formed to review the scope of work, monitor progress, and make suggestions for further work. The primary function of the committee was to make sure the most critical issues were addressed and to assist in obtaining critical data. The Advisory Committee met on December 1, 2005 and February 17, 2006. The committee members are listed below.

- **Agrium U.S. Inc**: Lisa Parker, Corporate Relations; Tim Johnson, Technical Services
- **Alaska Department of Natural Resources**: Rick Fredericksen, Mining Section Chief, Division of Mining, Land, and Water
- **Alaska Governors Office**: Linda Hay, Special Staff Asst. - Resources
- **Alaska Industrial Development and Export Authority**: Ron Miller, Executive Director
- **Alaska Power Association**: Brad Janorschke, General Manager Homer Electric Association
- **DRven**: Robert Stiles, President, Mine Owner Representative
- **Usibelli Coal Mine**: Steve Denton, V.P. Business Development
- **At-Large:** Eric Yould
- In addition to their participation in the Advisory Committee, several members were interviewed by phone and in person, in some cases multiple times, regarding select opportunities. They graciously shared materials and estimates, and directed us to visit web sites and interview other agencies and developers involved in the industrial opportunities.

Memorandum
TO: Senator Lesil McGuire
FROM: Chuck Burnham, Legislative Analyst
RE: Advanced Coal Technology: Wyoming Coal to Liquids Facility and State Incentives
LRS Report 10.108

You asked for an overview of the state regulatory and taxation regimes applicable to the Medicine Bow coal to liquids (CTL) facility currently under development in southeastern Wyoming.[1] You were also interested in state incentives to encourage development of CTL or other advanced coal technologies.

Briefly, our research located no Wyoming regulatory or taxation measures that are specific to CTL or to the Medicine Bow facility under development.

Taxation

We asked Craig Grenvik, administrator of Wyoming's Mineral Taxes Division, if any taxation framework was being developed specific to CTL. Mr. Grenvik stated that no such framework had been detailed and that, whatever the design of the final regime, his experience suggests that new tax regulations will be litigated.[2]

If the Medicine Bow facility were to be subject to the Wyoming state fiscal regime for coal production that is in place today, the following would apply:

- **Severance Tax:** 7 percent for surface mines (3.5 percent for underground mines);
- **Ad Valorem – Production**: Levied by counties on value of production at the mine mouth. Average Rate: 60 mills (6 percent).
- **Ad Valorem – Property**: Levied by counties on assessed valuation of physical property, such as mining facilities and equipment. Average Rate: 60 mills (6 percent).
- **Sales and Use Taxes**: Levied by the state and local government on purchases of goods and services. Rate: 4 to 6 percent depending on county.
- **State Royalties and Rents**: 12.5% (surface) and rents, $1 to $4 per acre.[3]

[1] As you know, the proposed $2.7 billion Medicine Bow facility is projected to begin producing 20,000-22,000 barrels of transportation fuels per day in 2014 using low-sulfur coal from a collocated mine. More information on the project is available on the website of its parent company, DKRW Advanced Fuels, at *http://www.dkrwenergy.com/fw/main/Medicine-Bow-111.html*.

[2] Mr. Grenvik can be reached at (307) 777-5237, or by email at *cgrenv@state.wy.us*.

[3] In addition to state taxes, royalties, and rents, facilities located on federal land are subject to federal royalties of 12.5 percent (which are ultimately shared with the state), and fees for the Abandoned Mine Lands fund. Wyoming fiscal information is from "A Concise Guide to Wyoming Coal," Wyoming Mine Association; available through *http://www.wma-minelife.com/*.

Regulation

Regulatory processes for the Medicine Bow project will presumably be largely the same as those for traditional coal mines and petroleum refiners, although additional regulations may be developed relating to the planned liquefaction and transportation of carbon dioxide (CO_2), which will be sold to oil producers for reinjection in order to pressurize wells and increase production. At this point in the facility's development, the primary applicable regulations are those related to industrial siting and environmental permitting, which apply to all industrial facilities and potential large-scale emitters of pollution. We provide links to regulatory reports and permitting documents below:

- "Medicine Bow Fuel & Power, LLC, Coal-to-Liquids Project Industrial Siting Permit Application," prepared by CH2M Hill, September 2007, *http://deq.state.wy.us/out/downloads/MBFP_ISA_Permit_Application_09-17-07_Final.pdf*. This document provides project, construction, and operation descriptions and analysis of socioeconomic impacts of the facility. Appendices to the report are available at *http://deq.state.wy.us/isd/isdnews.htm* [see the bottom of the page].

- "Final Opinion of Water Supply and Water Yield Analysis for Medicine Bow Fuel and Power's Proposed Coal-to-Liquid Plant and Saddleback Hills Coal Mine in Carbon Basin, Carbon County, WY," Wyoming State Engineer's Office, Ground Water Division, October 2007, *http://deq.state.wy.us/isd/downloads/MBFP%20SEO%20Final%20Opinion.pdf*.

- Archive of documents related to the challenge of the approval of Medicine Bow's air quality permit, available on the website of the Wyoming Environmental Quality Council (*http://deq.state.wy.us/eqc/m*) through the link to "In the Matter of Medicine Bow Fuel and Power, LLC Air Permit CT-5873, EQC Docket No. 09-2801" The permit itself is available through the link "Exhibit F." That document lists the specific emissions standards applicable to the facility.

- Although not solely related to the Medicine Bow facility, the Wyoming Legislature formed a Carbon Sequestration Working Group, which published its report in September 2009. To the extent the findings and recommendations of the group are adopted and implemented, the report may impact the development of the project. The report is available at *http://deq.state.wy.us/carbonsequestration.htm*.

State Incentives

Attached are two documents that provide details on state incentives for advanced coal technologies. They are as follows:

- "State Incentives for Advanced Coal Projects," Coal Utilization Research Council, 2006; and
- Julia Verdi, "Incentives for Coal Gasification Plants," National Conference of State Legislatures, January 12, 2010.

I hope this information is useful. Please do not hesitate to contact us if you have questions or require further information.

State Incentives for Advanced Coal Projects

Several states have adopted incentives for advanced coal projects. This report examines the state incentives currently available for advanced coal projects as well as proposals for incentives and provides resources for obtaining additional information.

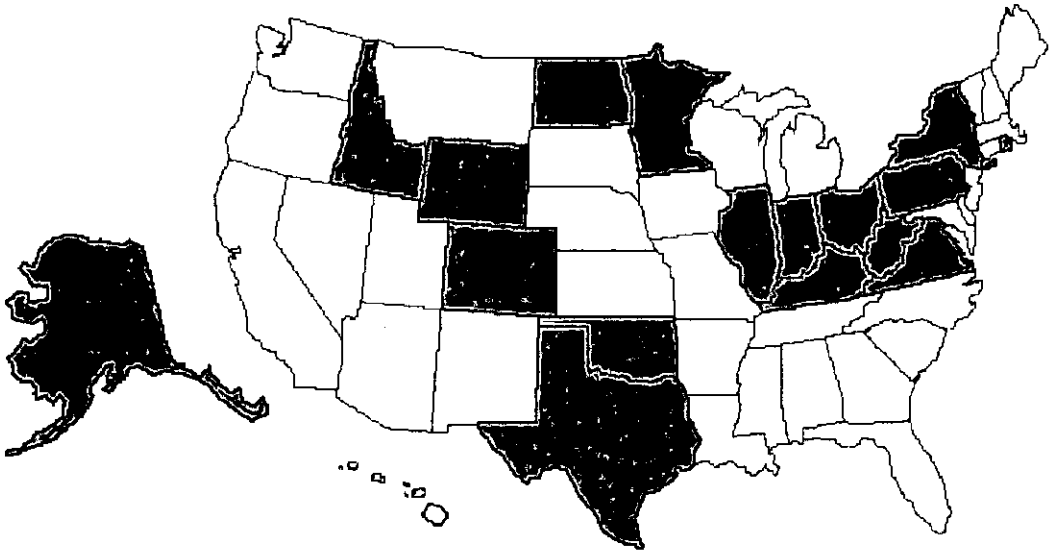

Fig. 1 – States with current incentives for advanced coal projects (Alaska, Colorado, Idaho, Illinois, Indiana, Kentucky, Minnesota, New York, North Dakota, Ohio, Oklahoma, Pennsylvania, Rhode Island, Texas, Virginia, West Virginia, and Wyoming) are shaded.

Prepared by the Coal Utilization Research Council, 2006

ALASKA

The state of Alaska has provided assistance to a clean coal project through its Alaska Industrial Development and Export Authority (AIDEA). The AIDEA Development Finance Program can provide bond financing to a "plant or facility demonstrating technological advances of new methods and procedures and prototype, commercial applications for the exploration, development, production, transportation, conversion, and use of energy resources."[1] This program provided $85 million in bond funding for the 50 MW Healy Clean Coal Project in the 1990's. Projects must be able to demonstrate that they will be able to produce adequate revenues to repay the bonds. Projects seeking financing over $10 million must be approved by the state legislature.

COLORADO

In 2006, Colorado adopted legislation to encourage the construction of a clean coal technology demonstration project.[2] The legislation provides incentives for an IGCC project, which is defined as a facility in Colorado that uses Colorado or other western coal to generate electricity and demonstrates the capture and sequestration of a portion of the project's carbon dioxide emissions. Additionally, the plant may not exceed 350 MW nameplate capacity without a finding from the Colorado Public Utilities Commission (CPUC) that the larger size is necessary to obtain the benefits of federal cost-sharing, financial grants or tax benefits, or other financial opportunities.

The legislation provides a variety of incentives for IGCC projects, including:

- Waivers of the CPUC's certificate of public convenience and necessity requirement
- Full cost recovery from customers, including full life-cycle capital and operating costs associated with the IGCC project
- Recovery of additional costs for electricity purchased due to planned and unplanned outages of an IGCC project.
- Waiver of CPUC rules requiring competitive resource acquisition
- With CPUC approval utilities may enter into a power purchase agreement with the owner of the IGCC facility that provides compensation to the facility owner for its costs and provides a reasonable return on investment. Such payments by a utility are recoverable through a rate adjustment clause on a timely basis.

Finally, IGCC projects are eligible for financial assistance from the Governor's Office of Energy Management and Conservation through the Clean Energy Development Fund. Currently, $2 million per year is appropriated for the fund through fiscal year 2008.[3]

3611

IDAHO

Idaho has adopted a moratorium on the construction of new coal fired power plants effective until April 2008.[4] The moratorium, however, does not apply to IGCC facilities.

ILLINOIS

Coal Revival Program[5]

Direct financial assistance is available for capital costs including buildings, structures, durable equipment and land at new facilities.[6] To qualify, a facility must:

(1) create 400 MW of new generating capacity, use coal or gases derived from coal as its primary fuel source, and support the creation of at least 150 new Illinois coal-mining jobs, OR

(2) Use coal gasification or IGCC to generate chemical feedstocks, transportation fuels or electricity.

The amount of the grant will depend on the state occupation and use taxes to be paid on Illinois-mined coal used at the new facility.[7] The maximum grant to any one facility is $100 million.

High Impact Business Program[8]

New or expanded electric generating facilities using coal are now eligible to apply for High Impact Business designation. This program offers a sales tax exemption on building materials and equipment, a utility tax exemption, and an investment tax credit.

Property Tax Abatement[9]

Facilities may be eligible to receive property tax abatement from local taxing districts. Facilities receiving a new High Impact Business designation are eligible for up to $4 million in property tax abatements over a 10 year period. Other facilities meeting

---

[4] IDAHO CODE ANN. § 39-125.

[5] To view grant application information view this document fromthe Illinois Department of Commerce and Economic Opportunity (DCEO) website.

[6] To be considered a "new facility" construction must have commenced on or after July 1, 2001. 20 ILL. COMP. STAT. 605/605-332(a).

[7] Funding is roughly equal to the present value of future sales taxes paid on Illinois-mined coal over a 25-year period. 20 ILL. COMP. STAT. 605/605-332(b)(3).

[8] For more details on the High Impact Business program view pages 2-3 of this document from the Illinois DCEO website. *See also* 20 ILL. COMP. STAT. 655/5.5.

3612

the definition of "new electric generating facility"[10] are eligible for property tax abatement on a sliding scale based on the valuation of the facility.[11]

A brochure produced by the Illinois Department of Commerce and Economic Opportunity (DCEO) Office of Coal Development regarding direct financial assistance via the Revival program, the High Impact Business program, and tax abatement program is available from the DCEO website.

Long-Term Contracting[12]

In 2005, Illinois amended the Public Utilities Act to allow any gas utility to enter into a 20-year supply contract with any company for synthetic natural gas produced from coal through the gasification process. To qualify, the coal gasification facility must commence construction by July 1, 2008. Further, the amended Act provides that costs paid for synthetic natural gas are reasonable and prudent and recoverable for the first 10 years of the contract if certain conditions are met (most notably that the contract was entered into by June 21, 2006).

Illinois DCEO Coal Grant Programs

- Coal Competitiveness Program
  - Purpose: For projects that improve coal extraction, preparation and transportation systems in Illinois
  - Amount: $50,000 to $1.5 million, up to 20 percent of project cost

- Coal Research Program
  - Purpose: To fund universities and other research institutions focusing on clean coal technology development, coal chemistry, mining productivity and coal combustion byproduct utilization
  - Amount: $60,000 to $250,000

- Coal Development Program
  - Purpose: To advance promising clean coal technologies beyond the research stage towards commercialization by providing a 50/50 match with private industry dollars, typically to universities and technology developers
  - Amount: $250,000 to $600,000

[10] To qualify as a "new electric generating facility" the facility must create 400 MW of new generating capacity, use coal or gases derived from coal as its primary fuel source, and support the creation of at least 150 new Illinois coal-mining jobs. 20 ILL. COMP. STAT. 605/605-332(a).
[11] 35 ILL. COMP. STAT. 200/18-165.
[12] 220 ILL. COMP. STAT. 5/9-220(h).

3613

- Coal Demonstration Program
  - Purpose: To provide partial funding for selected large-scale demonstration of advanced coal systems for utility and industrial use that will produce significant economic benefits for Illinois
  - Amount: $1 million to $30 million (A project-specific appropriation and approval by the governor are required

For more information on Illinois' grant programs, including applications, visit the DCEO's website at http://www.illinoisbiz.biz/dceo/Bureaus/Coal/Grants.

INDIANA

Tax Credits for IGCC Facilities[13]

Indiana has tax credits available to newly constructed[14] IGCC power plants located in Indiana. The facility must convert coal into synthesis gas and use that gas to generate electric energy. To qualify facilities must also be dedicated primarily to serving Indiana retail electric utility consumers.

The tax credit is equal to the sum of 10 percent of the first $500 million of investment in the facility plus 5 percent of any investment over $500 million. The credit is spread out over 10 years. In each year the credit is multiplied by the percentage of Indiana coal used at the facility.[15]

Financial Incentives for Clean Coal and Energy Projects[16]

Several types of projects qualify for financial incentives under this program, including:

- New energy generating facilities that use clean coal technology and are fueled primarily by Illinois Basin coal or coal gases
- Projects that reduce regulated air emissions from existing energy generating plants that are fueled primarily by Illinois Basin coal or coal gases
- Projects to provide transmission service to a new energy facility
- Projects to develop alternative energy sources, including renewable energy
- The purchase of fuels produced by a coal gasification facility
- Projects meeting any of the above criteria that use coal bed methane[17]

---

[13] IND. CODE § 6-3.1-29

[14] The Indiana Code defines "new energy generating facility" at IND. CODE § 8-1-8.8-8. Notably, the repowering, construction or expansion must have begun after July 1, 2002.

[15] Indiana coal is defined as coal from a mine whose coal deposits are located in the ground wholly or partially in Indiana regardless of the location of the mine's tipple. IND. CODE § 4-4-30-4.

[16] IND. CODE § 8-1-8.8.

[17] The incentives legis lation was initially enacted in 2002. In 2005 the statute was amended to include projects that use coal bed methane in the definition of "clean coal and energy projects." However, the section of the statute regarding incentives was not amended and does not explicitly provide for financial incentives for coal bed methane projects. It is possible that the Indiana Utility Regulatory Commission could view this as a clerical oversight rather than a legislative policy choice and exercise its discretion

Incentives for these projects include timely recovery of costs and an additional three percentage points on the return on shareholder equity that would otherwise be allowed. The timely recovery of costs incentive allows for rate adjustment via a "tracker" instead of a full blown rate case to recover costs for incurred in the construction, repowering, expansion, operation or maintenance of a qualifying facility. The financial incentives program is administered by the Indiana Utility Regulatory Commission.

KENTUCKY

Kentucky currently provides tax credits for clean coal facilities.[18] The amount of the credit is $2 per ton of Kentucky coal purchased used at a certified clean coal facility. To qualify a facility must:

- Have begun operations after January 1, 2005
- Have a cost greater than $150 million
- Be located in Kentucky
- Be certified by the Kentucky Environmental and Public Protection Cabinet as reducing emissions of pollutants released during generation of electricity through the use of clean coal equipment and technologies
- Not have claimed the incentive ton tax credit with the same coal[19]

After the enactment this tax credit in 2005, the Kentucky Public Service Commission (KPSC) issued a report that called for adoption of incentives for IGCC, possibly including grants, low interest loans, and tax credits.[20] The KPSC stated that it was uncertain whether an IGCC facility would qualify for a certificate of public convenience and necessity under current Kentucky law and that it was unclear how the environmental benefits of an IGCC facility could be accounted for in an environmental surcharge proceeding. The KPSC recommended extending the incentives currently offered for renewables to IGCC and called for discussion of financing IGCC facilities via securitization.

In June 2006, Kentucky adopted legislation that provides incentives for a potential FutureGen site.[21] A FutureGen site approved by DOE would be exempt from Kentucky taxes on the sale, rental, storage, use or other consumption of tangible personal property used to construct , repair, renovate, or upgrade the facility, including repair and replacement parts purchased for the plants.

---

under IND. CODE § 8-1-8.8-11(a)(5) to award "other financial incentives the commission considers appropriate" to coal bed methane projects.

[18] KY. REV. STAT. ANN. § 141.428.

[19] KY. REV. STAT. ANN. § 141.0405. This section provides a $2 per ton tax credit for coal-fired electric generation for tons of coal purchased above the baseline year (1999) level.

[21] HB 1, 2006 Extraordinary Session of the Kentucky Legislature, signed into law on June 28, 2006. Available at http://www.lrc.ky.gov/record/06SS/HB1/bill.doc.

3615

MINNESOTA

Unlike other states that have adopted generally applicable legislation to encourage the adoption and development of clean coal technology, Minnesota has taken a more specific approach. The Minnesota statute provides incentives to the Mesaba Energy IGCC plant.[22] The legislation provides for an annual grant of $2 million for five years, exempts the Mesaba plant from the requirement of a certificate of need, and entitles the developer to enter into a 450 MW long-term power purchase agreement with Xcel Energy.

NEW YORK

New York's Governor George Pataki has launched the Advanced Clean Coal Power Plant Initiative (ACCPPI) with the goal of building one or more advanced coal power plants in the state. The ACCPPI Shovel Ready Team[23] is conducting feasibility studies and initial environmental reviews of potential sites. The Team is scheduled to issue its final report and requests for proposals on September 1, 2006. Applications are due by October 31, 2006 and the winning proposals are expected to be announced in December 2006.

ACCPPI is offering a variety of financial incentives to winning proposals, including:

- New York Power Authority (NYPA) will agree to enter into a power purchase agreement with the developer
- If requested, NYPA may become a minority share partner in the project
- NYPA will establish a Clean Coal Initiative Fund ($50 million) to implement carbon sequestration technology when it becomes available
- Tax exempt bonding authority of up to $200 million per year, capped at $1 billion
- Qualification for Empire Zone tax treatment regardless of location
- Brownfield Cleanup Program benefits in qualifying locations

NORTH DAKOTA

The North Dakota Constitution provides that up to 20 percent of funds in the coal development impact trust fund may be appropriated for clean coal demonstration projects.[24] Projects must be submitted to the North Dakota Industrial Commission for approval.

Additionally, all new coal plants in North Dakota are eligible for a tax deduction equal to one percent of total wages and salaries paid in the state for the first three years

---

[22] MINN. STAT. § 216B.1694.

[23] The Shovel Ready Team is made up of the Governor's Office of Regulatory Reform, New York Power Authority, New York State Energy Research and Development Authority, Department of Environmental Conservation, Empire State Development, and the Public Service Commission.

[24] N.D. CONST. art X, section 21.

3616

and one-half of one percent for the fourth and fifth years.[25] Investments in new power plant construction, repowering, or environmental upgrades may also be eligible for an exemption from the state's 5 percent sales and use tax.[26] North Dakota also provides for an exemption from 85 percent of the state's installed capacity tax (with the possibility of the local government waiving its 15 percent) and a full exemption from the state's production tax.[27]

OHIO

Ohio administers its clean coal incentives through the Ohio Coal Development Office (OCDO).[28] The OCDO makes awards funds to coal research and development projects with a goal of assisting in the deployment of cost-effective technologies that can enable the use of high-sulfur Ohio coal in compliance with current and future environmental limits. The OCDO offers grants, loans, and loan guarantees.

The OCDO periodically seeks projects through public solicitations and requests-for-proposals (RFPs), most recently in the spring of 2005. Once an RFP is submitted, it is reviewed by independent technical reviewers and submitted to the Technical Advisory Committee (TAC). Projects favorably recommended by the TAC are subject to final approval by the Ohio Air Quality Development Authority (OAQDA). The specific amount of funds available for individual projects is set by each RFP.[29]

In 2006, Ohio expanded its definition of "air quality facility" to include (1) any coal research and development project[30], (2) property used in connection with the by-products of a coal research and development project[31], and (3) property that is a part of the FutureGen project.[32] Being designated an "air quality facility" allows a project to seek state-funded mortgage insurance from the Development Financing Advisory Council[33] and financing from OAQDA issued revenue bonds.[34]

Ohio also created the FutureGen Initiative Fund and appropriated $1.25 million towards the drilling of test wells to assist the state's efforts to secure the FutureGen project.[35]

---

[25] N.D. CENT. CODE § 57-38-30.1.
[26] N.D. CENT. CODE § 57-40.2-04.2.
[27] N.D. CENT. CODE § 57-60-02.
[28] OHIO REV. CODE ANN. § 1551.32.
[29] In the most recent RFP, funds for an individual project were capped at the lesser of $5 million or one-third of the total project cost for full-scale projects and lower amounts for smaller projects.
[30] As used in the definition of "air quality facility" a "coal research and development project" is defined by § 1555.01(C) of the Ohio Code as a project that is financed, in whole or in part, with a grant or loan from the OCDO.

3617

OKLAHOMA

Oklahoma offers coal-fired electric generation facilities a tax credit of $5 per ton of Oklahoma-mined coal.[36]

PENNSYLVANIA

Pennsylvania's Alternative Energy Portfolio Standards Act[37] requires electric distribution companies and electric generation suppliers to provide a percentage of their electricity from alternative energy sources. Following the enactment of the Act in 2004, companies must provide the following percentages of their electricity from Tier II alternative energy sources, including IGCC[38]:

Years 1-4	4.2 percent
Years 5-9	6.2 percent
Years 10-14	8.2 percent
Years 15+	10 percent

Pennsylvania's Governor has also proposed the Energy Deployment for a Growing Economy (EDGE) initiative, which would offer incentives for IGCC technology. These incentives would include[39]:

- Priority funding from the Pennsylvania Economic Development Financing Authority (PEDFA) and the Pennsylvania Energy Development Authority (PEDA) through low-interest loans
- Allowing long term contracts for gas and electricity products
- Permitting synthetic gas producers to operate without the burden of utility regulation when they serve and sell to limited purchasers such as chemical, manufacturing or industrial facilities
- Ensuring that electricity produced by these plants will be subject to the pricing and cost-recovery provisions of the state's Alternative Energy Portfolio Standards Act

The State of Pennsylvania is also in negotiations with EPA to allow utilities a one-time option of allowing older facilities to continue using coal without updated air pollution controls if the utility agrees to replace the plant with an IGCC facility by 2013.[40]

---

[36] OKLA. STAT. tit. 68, § 2357.11.
[37] 73 PA. CONS. STAT. § 1647.2.
[38] Waste coal is also a Tier II alternative energy source. Coal mine methane is considered a Tier I alternative energy source. Under the Act, the Tier I sources must account for eight percent of electric energy sold in 2020.
[39] Press Release, Pennsylvania Department of Environmental Protection, Federal Appeals Court Sides with Pa., 13 Other States in Suit Against EPA (March 20, 2006) (available online at http://www.depweb.state.pa.us/news/cwp/view.asp?Q=495309&A=3).
[40] *Id.*

RHODE ISLAND

Rhode Island law directs the state's energy facilities siting board to give priority to projects based on eight criteria, one of which is the use of coal processed by clean coal technology.[41] Rhode Island defines clean coal technology as a technology developed in the DOE clean coal technology program and shown to produce emissions levels substantially equal to those of natural gas fired power plants.[42]

TEXAS

In 2005, the Texas legislature provided $22 million in grant funds for clean-coal and gasification projects.[43] Texas also funded the site screening process for possible FutureGen plants and allows expedited permitting for projects that are related to the construction of a FutureGen component.[44]

In 2006, Texas adopted legislation that instructs the Railroad Commission of Texas to acquire ownership of carbon dioxide captured by a FutureGen project located in the state.[45] This would relieve the entity operating a FutureGen project of potential liability for the carbon dioxide captured and sequestered.

VIRGINIA

Virginia allows "clean coal projects"[46] priority in the processing of permit applications with the State Air Pollution Control Board.[47]

WEST VIRGINIA

The West Virginia public service commission has the authority to authorize rate-making allowances for electric utility investment in clean coal technologies.[48]

WYOMING

[44] TEX. HEALTH & SAFETY CODE ANN. § 382.0565 & TEX. WATER CODE ANN. § 5.001(6).
[45] HB 149, signed May 31, 2006 79th Texas Legislature, 3rd called session. Available at http://www.capitol.state.tx.us/cgi-bin/tlo/textframe.cmd?LEG=79&SESS=3&CHAMBER=H&BILLTYPE=B&BILLSUFFIX=00149&VERSION=5&TYPE=B.
[46] Virginia defines "clean coal project" as "any project that uses any technology, including technologies applied at the precombustion, combustion, or postcombustion stage, at a new or existing facility that will achieve significant reductions in air emissions of sulfur dioxide or oxides of nitrogen associated with the utilization of coal in the generation of electricity, process steam, or industrial products, which is not in widespread use, or is otherwise defined as clean coal technology pursuant to 42 U.S.C. § 7651n." VA. CODE ANN. § 67-400.
[47] VA. CODE ANN. § 67-401.
[48] W. VA. CODE § 24-2-1g.

3619

In 2006, Wyoming passed legislation creating a sales and use tax exemption for new coal gasification or coal liquefaction facilities and the equipment used to construct a new facility or make it operational.[49] The exemption does not apply to tools and other equipment used in construction of a new facility, contracted services required for construction and routine maintenance, or equipment utilized or acquired after the facility is operational.

STATES CONSIDERING ADVANCED COAL INCENTIVES

The following states have taken undertaken studies of potential incentives for advanced coal technologies and/or expressed a strong interest in developing such technologies in their state.

Arizona

- In 2006 Arizona created the Clean Coal Technology Task Force comprised of government and industry participants.[50] The task force is charged to "determine whether new state policies or incentives are needed to promote the development of new clean coal fired power plants in this state."

Montana

- Montana's Governor has expressed a strong interest in using coal to produce synthetic fuels, but no incentives have been enacted. One proposed bill for the Montana legislature's upcoming 2007 session would offer tax breaks on equipment used for carbon sequestration.[51]

Wisconsin

- In 2005, Wisconsin Governor Jim Doyle asked the state Public Service Commission and the Department of Natural Resources to investigate the potential of IGCC technology in Wisconsin. A June 2006 Draft Report from the study group outlined 22 potential steps for the state to consider that would advance IGCC technology in Wisconsin.

WESTERN GOVERNORS' ASSOCIATION PROPOSAL

The Western Governor's Association's Advanced Coal Task Force recently recommended that the Western Governors and the Western states provide direct financial assistance, recovery of costs, expedited permitting and other incentives for the development of advanced coal technologies.[52]

Incentives for Coal Gasification Plants
January 12, 2010
Julia Verdi

Alabama

CODE OF ALABAMA TITLE 40. REVENUE AND TAXATION. CHAPTER 9B. TAX INCENTIVE REFORM ACT OF 1992. s 40-9B-4. Authorization of abatement.

(f)(1) For a qualifying industrial or research enterprise described in Section 40-9B-3(a)(10)e., which is owned by a utility described in Section 37-4-1(7)a., and which is a coal gasification or liquefaction project or an advanced fossil-based generation project, as such terms are defined in Section 40-18-1, or which utilizes hydropower production, an abatement under this section shall be in an amount equal to 100 percent of the state noneducational ad valorem taxes owed for plant, property, and facilities for the maximum exemption period, and in an amount equal to 50 percent of the state construction related transaction taxes. The abatement shall not be subject to the procedures in Section 40-9B-5 or 40-9B-6.

Indiana

TITLE 4. STATE OFFICES AND ADMINISTRATION ARTICLE 4. LIEUTENANT GOVERNOR; DEPARTMENT OF COMMERCE CHAPTER 11.6. ADDITIONAL AUTHORITY; SUBSTITUTE NATURAL GAS CONTRACTS 4-4-11.6-12 Legislative findings

Sec. 12. The general assembly makes the following findings:

(1) The furnishing of reliable supplies of reasonably priced natural gas for sales to retail customers is essential for the well being of the people of Indiana. Natural gas prices are volatile, and energy utilities have been unable to mitigate completely the effects of the volatility.

(2) Long term contracts for the purchase of SNG between the authority and SNG producers will enhance the receipt of federal incentives for the development, construction, and financing of new coal gasification facilities in Indiana.

(3) The authority's participation in and oversight of the purchase, sale, and delivery of SNG to retail end use customers is critical to obtain low cost financing for the construction of new coal gasification facilities.

(4) Obtaining low cost financing for the construction of new coal gasification facilities is necessary to allow retail end use customers to enjoy the benefits of a reliable, reasonably priced, and long term energy supply.

TITLE 6. TAXATION ARTICLE 3.1. STATE TAX LIABILITY CREDITS CHAPTER 29. COAL GASIFICATION TECHNOLOGY INVESTMENT TAX CREDIT 6-3.1-29-19 Credit agreement; description; requirements

Sec. 19. (a) The corporation shall enter into an agreement with an applicant that is awarded a credit under this chapter. The agreement must include all the following:

(1) A detailed description of the project that is the subject of the agreement.

(2) The first taxable year for which the credit may be claimed.

(3) The maximum tax credit amount that will be allowed for each taxable year.

(4) A requirement that the taxpayer shall maintain operations at the project location for at least ten (10) years during the term that the tax credit is available.

(5) If the facility is an integrated coal gasification powerplant, a requirement that the taxpayer shall pay an average wage to its employees at the integrated coal gasification powerplant, other than highly compensated employees, in each taxable year that a tax credit is available, that equals at least one hundred twenty-five percent (125%) of the average county wage in the county in which the integrated coal gasification powerplant is located.

(6) For a project involving a qualified investment in an integrated coal gasification powerplant, a requirement that the taxpayer will maintain at the location where the qualified investment is made, during the term of the tax credit, a total payroll that is at least equal to the payroll that existed on the date that the taxpayer placed the integrated coal gasification powerplant into service.

(7) A requirement that:

(A) one hundred percent (100%) of the coal used:

(i) at the integrated coal gasification powerplant, for a project involving a qualified investment in an integrated coal gasification powerplant; or

(ii) as fuel in a fluidized bed combustion unit, in a project involving a qualified investment in a fluidized bed combustion technology, if the unit is dedicated primarily to serving Indiana retail electric utility consumers;

must be Indiana coal, unless the applicant wishes to assign the tax credit as allowed under section 20.5(c) of this chapter or elects to receive a refundable tax credit under section 20.7 of this chapter and the applicant certifies to the corporation that partial use of other coal is necessary to result in lower rates for Indiana retail utility customers; or

(B) seventy-five percent (75%) of the coal used as fuel in a fluidized bed combustion unit must be Indiana coal, in a project involving a qualified investment in a fluidized bed combustion technology, if the unit is not dedicated primarily to serving Indiana retail electric utility consumers.

(8) A requirement that the taxpayer obtain from the commission a determination under IC 8-1-8.5-2 that public convenience and necessity require, or will require:

(A) the construction of the taxpayer's integrated coal gasification powerplant, in the case of a project involving a qualified investment in an integrated coal gasification powerplant; or

(B) the installation of the taxpayer's fluidized bed combustion unit, in the case of a project involving a qualified investment in a fluidized bed combustion technology.

(b) A taxpayer must comply with the terms of the agreement described in subsection (a) to receive an annual installment of the tax credit awarded under this chapter. The corporation shall annually determine whether the taxpayer is in compliance with the agreement. If the corporation determines that the taxpayer is in compliance, the corporation shall issue a certificate of compliance to the taxpayer.

TITLE 6. TAXATION ARTICLE 3.1. STATE TAX LIABILITY CREDITS CHAPTER 29. COAL GASIFICATION TECHNOLOGY INVESTMENT TAX CREDIT 6-3.1-29-1 Tax credit applicants; women and minority business enterprises

Sec. 1. The general assembly declares that the opportunity for the participation of underutilized small businesses, especially women and minority business enterprises, in the coal gasification industry is essential if social and economic parity is to be obtained

by women and minority business persons and if the economy of Indiana is to be stimulated as contemplated by this chapter. A recipient of a credit under this chapter is encouraged to purchase goods and services from underutilized small businesses, especially women and minority business enterprises.

Kansas

CHAPTER 79. TAXATION - ARTICLE 2. PROPERTY EXEMPT FROM TAXATION 79-225. Property exempt from taxation; certain integrated coal gasification power plant property

(a) The following described property, to the extent herein specified, shall be exempt from all property taxes levied under the laws of the state of Kansas:

(1) Any new integrated coal gasification power plant property or any expanded integrated coal gasification power plant property.

(2) All property purchased for or constructed or installed at an integrated coal gasification power plant to comply with air emission standards imposed by state or federal law.

(b) The provisions of subsection (a) shall apply from and after purchase or commencement of construction or installation of such property and for the 12 taxable years immediately following the taxable year in which construction or installation of such property is completed.

(c) The provisions of this section shall apply to all taxable years commencing after December 31, 2005.

(d) As used in this section:

(1) "Expanded integrated coal gasification power plant property" means any real or tangible personal property purchased, constructed or installed for incorporation in and use as part of an expansion of an existing integrated coal gasification power plant, construction of which expansion begins after December 31, 2005.

(2) "Expansion of an existing integrated coal gasification power plant" means expansion of the capacity of an existing integrated coal gasification power plant by at least 10% of such capacity.

(3) "Integrated coal gasification power plant" has the meaning provided by K.S.A. 79-32,238, and amendments thereto.

(4) "New integrated coal gasification power plant property" means any real or tangible personal property purchased, constructed or installed for incorporation in and use as part

of an integrated coal gasification power plant, construction of which begins after December 31, 2005.

Key to Energy Security: Converting Coal to Gas to Synthetic Fuels to More Petroleum Production

By
Paul Metz, Director
Mineral Industry Research Laboratory
University of Alaska Fairbanks

Arctic Mining Symposium
03/12/10

Outline of Presentation

- Alaska's Energy Challenges
- Developing an Energy Plan
- Coal to Synthetic Gas and Liquid Fuels
- Carbon Dioxide and Enhanced Oil Recovery
- Financing the CTL Project
- Rails to Resources to Markets
- Summary of the Synergistic Effects of the Proposed Projects
- Conclusions

Arctic Mining Symposium
03/12/10

3626

- Decreasing oil production and revenues from the North Slope.
- Decreasing natural gas production from the Cook Inlet Basin.
- Increasing federal and state regulations that decrease incentives to find and develop more oil, natural gas & coal.
- Increasing federal and state regulations the increase the cost of petroleum refining.
- Alternate and lower cost sources of supply of natural gas to the contiguous states.
- Highly fluctuating energy costs as a function of worldwide demand and production of petroleum.
- Combined negative effects of costs and limited fuel supplies on the air cargo industry in Anchorage in particular and the transportation and tourism industries in Alaska in general.

- The KEY to developing cost effective and stable energy supplies and energy security for Alaska and the Nation is an Energy Plan that includes a Public Private Partnership between the state, the federal government, and the various industries that facilitates the FULL utilization of our coal, natural gas and petroleum resources.

- Natural Gas
  - Reserves in Prudhoe Bay and Kuparuk Fields – 26 Tcf.; Reserves in Pt. Thomson – 9 Tcf.
  - Total 35 Tcf

Gross Value ($ Billions)	at ($/mcf)
$210	$6
$280	$8
$350	$10
$420	$12
$490	$14

Arctic Mining Symposium
03/12/10

- Petroleum
  - Original Oil in Place (OOIP) 67 Billion Barrels
  - Expected Total Recovery Without Enhancement – 22 Billion Barrels
  - Gross Value of 8 Billion Barrels of Enhanced Oil

Arctic Mining Symposium
03/12/10

- Coal
  - Resources widely disbursed in Alaska but majority of high rank on the western end of the North Slope.
  - U.S.G.S. recent resource assessment – 5.5 trillion tons with majority of resources high rank coals @ 15,000 Btu/lb.
  - Magnitude of resource: 50% of U.S. electrical energy generated with coal; at 100% coal generation, Alaska could sustain the U.S. for at least 2,500 years!

Arctic Mining Symposium
03/12/10

Gross Value of Alaska Coal

Resources at Various Price Levels

Price ($/ton)	Gross Value of 5.5 trillion tons ($ trillions)
40	220
60	330
80	440
100	550
120	660
140	770
160	880
180	990

Arctic Mining Symposium
03/12/10

[illegible]

- Coal
  - Estimated coal resources of Alaska is at least 5.5 trillion tons with majority high rank coal @ 15,000 Btu/lb.

  Total energy in proven gas reserves – 3.5×10^{16} Btu.
  - Total energy in remaining oil in place – 3.9×10^{17} Btu.
  - Total energy in estimated coal resources 1.7×10^{20} Btu. (10,000 x that in the natural gas).

Arctic Mining Symposium
03/12/10

Synergism of Three Major Energy Projects

- Alaska In-State Natural Gas Pipeline (ENSTAR "Bullet Pipeline")
- Coal to Liquids Plant (Synthetic Fuels Plant as under investigation by Fairbanks Economic Development Corporation)
- Carbon Dioxide Enhanced Oil Recovery of Stranded Heavy Oil in Prudhoe Bay and Kuparuk Oil Fields.

Arctic Mining Symposium
03/12/10

[illegible]

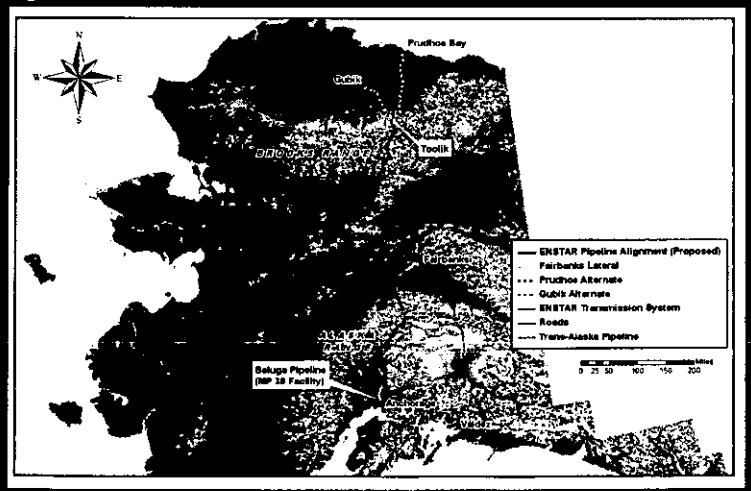
- Cook Inlet Basin has supplied gas for electric power generation, space heating in the Anchorage area, industrial uses in the Kenai area, and for export markets.
- Current supplies will be depleted by 2015 with current shortages during peak demand periods.
- Expected cost to discover and develop new gas reserves in the Basin: $5-6 billion if the price of gas is deregulated.
- Current and potential market in the Fairbanks area - less than 10% of the needs in south-central Alaska.

Arctic Mining Symposium
03/12/10

About the ENSTAR Pipeline

Arctic Mining Symposium
03/12/10

About the ENSTAR Pipeline



03/12/10

- Estimated capital cost of 24 inch (0.5 Bcf/d) natural gas pipeline from Gubik 'Gas Field' (Expected dry pipeline quality gas) to Fairbanks and Anchorage – $3.8 billion.
- Estimated cost to discover and develop 30 year supply of gas from Gubik - $1.0 billion (Anadarko Petroleum).
- ENSTAR target date for gas to Anchorage is 2015.
- Total of Anchorage, Kenai, and Fairbanks markets significantly less than 0.5 Bcf/d.
- Project needs large commercial user to be economically feasible – Hence FEDC Coal to Liquids Project.

Arctic Mining Symposium
03/12/10

Coal to Liquids Project

- Estimated capital cost of 40,000 barrel per day plant: $4.6 billion.
- Products: Jet-A and diesel fuel.
- Estimated return on capital at an average price for these synthetic fuels of $2.57/gal.:12%.
- During 2008 diesel peaked at approximately $5.00/gal. and over the next decade it is expected that the price will return to this level.
- Major benefit in the long term coal conversion is the long term price stability of coal, large domestic resources of coal, and thus no adverse impact on trade balance and the value of the dollar.

Arctic Mining Symposium
03/12/10

Major Environmental Concern with Respect to Coal Combustion

- Carbon Dioxide emissions – 3.6 tons for every ton of coal combusted.
- Potential technologies for CO_2 sequestration – most expected to result in significant 25% or more increased cost of energy produced.
- Carbon Dioxide enhanced oil recovery (see Schlumberger web site for new CO_2 sequestration projects office in Calgary, Alberta.
- North Slope producers have utilized water flooding and CO_2 injection to enhance oil recovery on the Alaska North Slope since 1980s.

U.S. Department of Energy Investigations of CO_2 Enhanced Oil Recovery

- See Advanced Resources International Report, 2005.
- Major constraint to CO_2 enhanced oil recovery on the North Slope is the availability of large volumes (1 Tcf/yr) of CO_2 at costs not exceeding 5% of the well price of oil.
- Coal to Liquids Plant operating at 200,000 barrels per day could produce this volume of CO_2 .

Rates of Return for 200,000 b/d Plant at

Oil Price	Sale of CO_2 (@5% Oil Price)
$40	7.3%
$60	12.4%
$80	17.1%
$100	21.6%
$120	26.0%
$140	30.4%

Rates of Return for 200,000 b/d Plant at

1/8 royalty on 12 billion barrels of oil

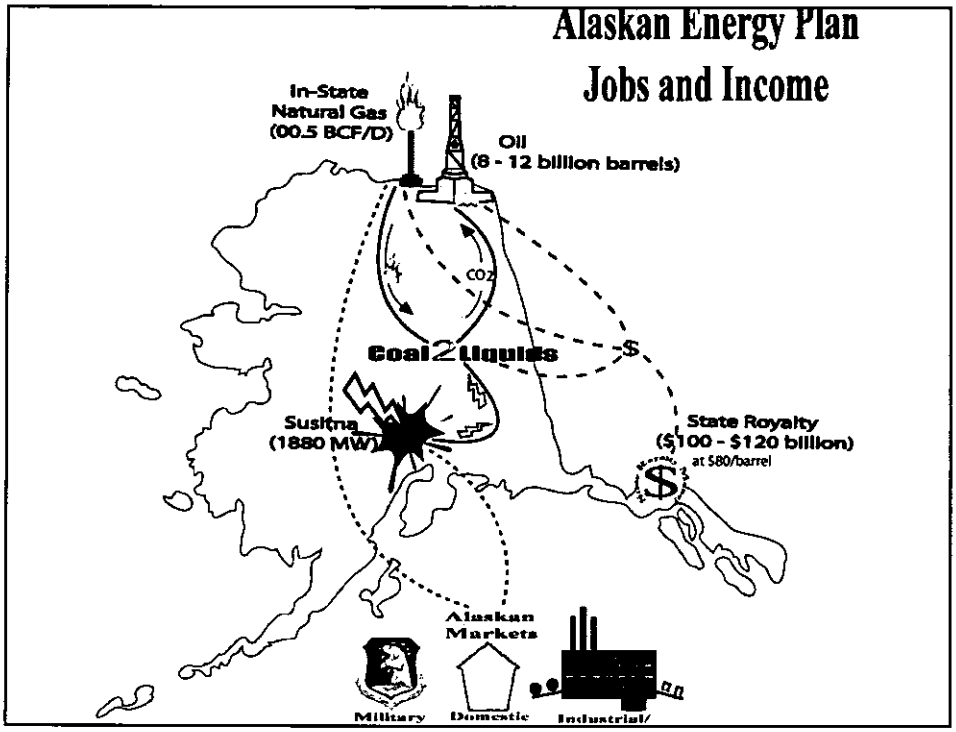
Oil Price	Sale of CO_2 (@5% Oil Price)
$40	18.6%
$60	28.2%
$80	37.7%
$100	47.1%
$120	56.5%
$140	65.9%
$160	75.4%
$180	84.5%

Arctic Mining Symposium
03/12/10

Financing the Coal-to-Liquids Plant

- ARRC Tax Exempt Non-Recourse Bonds
- Requirement – long term contract with North Slope Producers for the sale of carbon dioxide at the CTL Plant Site.
- 12 inch line to NS estimated to cost $2.4-$2.8 billion.
- Advanced Resources International used hurdle ROR of 15% and 25% based on an oil price of $25/barrel and tax incentives of $10/barrel thus an effective well-head price of $35/barrel.
- This analysis assumes a minimum oil price of $40/b and that the tariff on the CO_2 line will not exceed $5/barrel of oil recovered which is very conservative.

Arctic Mining Symposium
03/12/10



Summary of Synergistic Effects of the Proposed Projects

- Maintenance of higher levels of oil production and revenues from the North Slope for another 30 years.
- Replacement of Cook Inlet natural gas production with North Slope gas for both Anchorage and Fairbanks.
- Supplement or replacement of North Pole refinery production with low sulfur synthetic fuels @ 200,000 barrels per day.
- Availability of in-state gas without constraints of markets in the contiguous states.
- Stable fuel supplies and prices as a function of the large in-state supply of coal.
- Long term stable fuel supplies and prices for the air cargo and other transportation systems in Alaska.

Arctic Mining Symposium
03/12/10

CONCLUSION

- NOT TAPS FOR TAPS FOR AT LEAST ANOTHER 30 YEARS

Concentration of Carbon Dioxide in the Atmosphere During the Phanerozoic

- Complex life forms developed during the Phanerozoic time.
- This time interval includes the last 600 million years of Earth history.
- For 85% of the time during this interval of Earth history, carbon dioxide concentrations in the atmosphere were two or more times greater than present levels.
- Extreme levels of carbon dioxide in the atmosphere during this time probably exceeded current levels by 2000%.
- These extreme levels did not result in irreversible global warming or mass extinctions.
- Carbon dioxide in the atmosphere has increased from approximately 250 to 330 ppm over the past 50 years (30%).
- Even the most extreme predictions of anthropogenic carbon emissions over the next 100 years do not exceed two times current levels.

CS FOR SENATE BILL NO. 242(RES)

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-SIXTH LEGISLATURE - SECOND SESSION

BY THE SENATE RESOURCES COMMITTEE

Offered:
Referred:

Sponsor(s): SENATOR MCGUIRE

A BILL

FOR AN ACT ENTITLED

"An Act providing income tax credits for geothermal resource exploration and development."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

*** Section 1.** AS 43.20 is amended by adding a new section to article 1 to read:

Sec. 43.20.046. Geothermal resource tax credits. (a) In addition to any other credit authorized to the person by this chapter, a person may take a credit against the tax due under this chapter for geothermal resource exploration and development as provided by this section.

(b) A person is eligible for a geothermal resource exploration credit for qualified exploration expenditures incurred after the effective date of this section and before July 1, 2018, in the amount of 30 percent of the qualified exploration expenditures incurred for exploration for a geothermal resource. An unused geothermal resource exploration credit may not be carried forward for more than 20 years immediately following the year in which the geothermal resource first generates

gross income.

(c) A person is eligible for a geothermal resource development credit in the amount of 30 percent of the qualified development expenditures incurred to develop a geothermal resource. An unused geothermal resource credit may not be carried forward for more than 20 years immediately following the year in which the geothermal resource is first used to generate gross income.

(d) A credit under (b) or (c) of this section may be transferred to a person who is a successor in interest in the geothermal resource project that resulted from the exploration qualifying for an exploration credit under (b) of this section or qualifying for a development credit under (c) of this section. Subject to appropriation, an unused credit for

(1) an exploration expenditure under (b) of this section is refundable on an annual basis;

(2) a development expenditure under (c) of this section is refundable after the geothermal resource first generates gross income.

(e) In this section,

(1) "geothermal resource" has the meaning given to "geothermal resources" in AS 38.05.965;

(2) "qualified development expenditure" means an expenditure

(A) incurred after two wells capable of commercial production have been drilled, completed, and flow tested;

(B) to develop a known geothermal resource; and

(C) that is reasonable and necessary

(i) to acquire, lease, or rent real property, including an expenditure for engineering services, surveying, title insurance, recording fees, legal services, site improvements, site restoration, access roads, and fencing;

(ii) for the construction of the facility to develop and use the geothermal resource, including an expenditure for drilling development wells; materials; labor; travel and transportation related to facility design; and the costs of startup, commissioning, and testing;

(iii) for equipment used in the operation of the facility;

(iv) for safety measures and environmental protection;

(v) for financial and legal services related to obtaining licenses and permits and preparing an environmental impact statement;

(vi) for capitalized interest during the construction period;

(3) "qualified exploration expenditure" means an expenditure

(A) to explore a previously unknown geothermal resource; and

(B) that is reasonable and necessary for goods, services, or rental of personal property required for the surface preparation, drilling, and assessment of the commercial potential of a geothermal resource.

ALASKA STATE LEGISLATURE

SENATOR LESIL McGUIRE
SENATOR BILL WIELECHOWSKI
Co-Chairs, Senate Resources Committee

MEMORANDUM

Memorandum

To: Leg. Legal

From: Shalon Szymanski, Committee Aide
Senate Resources Committee

Date: March 19, 2010

Re: Final CS Request

Please create a FINAL Senate Resources CS for SB 242 mirroring work order number 26-LS1347\E but also incorporate the two attached amendments.

If you have any questions or need further information, please feel free to contact me on my direct line, 465-4522

Thank you!

PASSED

Amendment #1

Offered in the Senate By Senator McGuire

To: CS SB 242 (RES), Draft Version "E"

Page 1, line 14 – page 2 line 1: Delete "the geothermal resource first generates gross income."

Insert: "the exploration expenditure was incurred."

Page 3, line 8: Delete "previously unknown"

PASSED

26-LS1347\R.1
Bullock
3/16/10

AMENDMENT

OFFERED IN THE SENATE BY SENATOR WIELECHOWSKI

TO: SB 242

Page 2, following line 19:

Insert a new subsection to read:

"(e) A person that receives a credit under (b) or (c) of this section,

(1) shall reduce a cost related to the geothermal resource that would otherwise be included in a proceeding for determining a just and reasonable rate under AS 42.05.381 by the amount of the credit; and

(2) may not elect to be exempt from the provisions of AS 42.05."

Reletter the following subsection accordingly.

Changes to SB 242 (26-LS1347\R) in CS SB 242 (26-LS1347\E)

Section 1: The CS SB 242 makes the following changes to the geothermal exploration and development tax credits.

1. The tax credits may only be taken for expenditures made after the effective date of the act.
2. The differentiation between credits for exploration on state land (50%) and non-state land (25%) has been removed.
    a. Exploration credits are fixed at a flat 30% of qualified expenditures.
    b. Exploration credits are made refundable annually.
    c. Unused[1] exploration credits may be carried forward for 20 years rather than the original five to seven.
3. Development credits are increased to 30% from 10% in the original bill.
    a. Development credits are refundable after the project produces gross revenues.
    b. Unused development credits may be carried forward for 20 years.
4. A definition of when exploration becomes development has been added to the bill on page 2, lines 20-21.

[1] Refundable credits are subject to appropriation. The carry forward language has been included in case an appropriation is not made.

SPONSOR STATEMENT – SB 242

"An Act providing income tax credits for geothermal resource exploration and development."

Electric power generated from geothermal sources is a clean, sustainable and environmentally friendly alternative to fossil fuels. It can play a major part in meeting the future energy needs of the railbelt and other regions.

Unlike many other types of renewable energy, geothermal power requires a capital intensive exploration program that carries risks similar to the oil and gas development Alaskans are more familiar with. Senate Bill 242 provides an incentive for the exploration and development of geothermal resources that is similar to those currently in statute for oil and gas projects. SB 242 allows a company exploring for a geothermal resource to receive a credit against their future corporate income taxes for expenses incurred in exploring for, and developing a geothermal resource. Therefore, SB 242 contains two distinct credits; one for exploration and one for development.

Under SB 242 a company would receive a credit in the amount of 50% of their exploration expenditures for work conducted on State land, and 25% for work conducted on other lands within the State of Alaska. The total exploration credits a company would be eligible for would be capped at $20 million. When a company began developing a geothermal resource, SB 242 would then provide a credit of 10% of the expenditures made to develop the resource.

However, the combined credits envisioned by SB 242 could not be used to reduce a taxpayer's annual tax bill by more than 50%. This provision ensures that while the State is incentivizing geothermal development, it would still receive revenue from geothermal development.

The clean, reliable power provided by geothermal resources has formed the foundation of the economy of Iceland for years. SB 242 will provide the incentives necessary to attract world-class geothermal development to Alaska; and potentially help establish a new, sustainable economy in Alaska.

MEMORANDUM January 28, 2010

SUBJECT: Sectional summary for SB 242 (Work Order No. 26-LS1347\R)

TO: Senator Lesil McGuire
Attn: Mike Pawlowski

FROM: Donald M. Bullock Jr.
Legislative Counsel

You have requested a sectional summary of the above-described bill.

As a preliminary matter, note that a sectional summary of a bill should not be considered an authoritative interpretation of the bill and the bill itself is the best statement of its contents. If you would like an interpretation of the bill as it may apply to a particular set of circumstances, please advise.

Section 1. Adds a new section to AS 43.20 -- AS 43.20.046 -- that provides an income tax credit for geothermal resource exploration and development. States the amount of the credit and the period in which expenditures may be made to qualify for the credit. Provides limitations on the carry-forward of unused credit and limitations on the amount of credit that may be applied. Includes definitions for terms used in the section, including definitions for the expenditures that qualify for the credit.

BRIEFING PAPER

THE CASE IN SUPPORT OF SB242 FOR PROVIDING INCOME TAX CREDITS FOR GEOTHERMAL RESOURCE EXPLORATION AND DEVELOPMENT

EXECUTIVE SUMMARY

Geothermal power offers reliable baseload power that delivers consistent megawatt-hours 24 hours per day, 365 days per year, which is something that most other forms of renewable resources cannot provide. In fact, for a utility or regional transmission organization, a geothermal power plant shows up in a resource plan much like a conventional power plant. Geothermal power is also unique in its lack of emissions, minimal land use, low visual impact and other environmental merits.

Geothermal energy is extremely cost competitive when compared to other forms of renewable energy and fossil-fuel based processes (e.g. natural-gas based plants, as indicated by studies performed by the California Energy Commission[1] [2]).

Geothermal development is also an effective means to create long term and diversified jobs. A report by the Geothermal Energy Association concludes that a typical 50 MW geothermal plant provides opportunities for 212 direct, indirect, and induced full-time jobs[3].

Although believed to be rich in geothermal resources in various regions around the state, Alaska has yet to develop a single utility-size geothermal power plant. One major hurdle for geothermal development is the relatively high capital cost associated with exploration, drilling and development. This hurdle is even bigger in Alaska compared to other states, due to the remoteness of the resources and the harsh terrain and climate. While capital costs for development and construction of geothermal power plants in other states is typically around $4,000/kW[4], in Alaska estimates typically increase 25%-50%.

Similar to oil & gas exploration, exploring for geothermal resource involves both non-intrusive exploration but primarily high-cost exploration drilling, in order to identify, confirm and delineate the geothermal resource. This endeavor is not only capital-intensive, but also of high risk. While in several western states substantial exploration drilling for geothermal resources took place primarily in the 1970's and 1980's, the geothermal resources in Alaska are mostly "Greenfields", thereby increasing the cost required to confirm these resources and the associated risk.

[3] http://www.geo-energy.org/publications/reports/Socioeconomics%20Guide.pdf

[4] Climate Change Business Journal, April/May 2009

Even after a geothermal resource is explored and successfully confirmed, the additional costs associated with developing a power plant utilizing that resource are still great, and include developing the well-field by drilling of additional production and re-injection wells as well as by putting in place the required pumping and piping infrastructure, building a power plant, and the supporting infrastructure.

The state of Alaska has recognized the similar financial challenges associated with oil & gas exploration and development, and has therefore put in place tax credits in attempt to reduce some of the risk and cost.

The suggested amendments to AS.43.20 come to recognize that: (a) geothermal exploration and development are similar in their cost and risk nature to those of oil & gas; and (b) promoting the development of geothermal resources is no less important to Alaska's economy than developing oil & gas resources, as it helps achieving Alaska's goals of increasing its renewable energy portfolio in order to diversify its energy resources, stabilize long-term power prices, fight climate change as well as providing long term jobs, primarily in rural areas.

The proposed amendments will serve to incentivize exploration of geothermal resources, and are therefore expected to boost exploration and confirmation of previously unconfirmed resources, thereby generating more opportunities for geothermal development.

The suggested amendments will also serve to incentivize development of new geothermal power plants by reducnig the total capital investment required for such development.

Financial analysis indicates that the combined credits, if made refundable, will lower the total cost of geothermal development by more than 10%, and are therefore expected to lower the total cost of power to the ratepayer by 5-10%

Therefore, by introducing these incentives, the state will recognize both the merits and the financial challenges associated with geothermal power, will promote new development and will help reduce the total cost to the ratepayer.

ANNEX: ORMAT COMMETS TO THE SUGGESTED LANGUAGE IN SB242

While greatly in support of this bill we would like to raise some concerns related to its potential impact on boosting geothermal exploration and development.

Page	Line	Note
1	6	**Point of Consideration:** "person" **Note:** The term "person" is used on this line as well as throughout the document to describe the eligible recipients. The term "person" is a term of art and is defined under Alaska Code Title 43.20.340(8) as "an individual, a trust or estate, a partnership, or a corporation." The term "taxpayer" is likewise defined at Title 43.20.340(10) to mean a "person subject to a tax imposed by this chapter." The rest of Title 43 generally uses the term "taxpayer" when describing the entity eligible for claiming a credit. We are concerned that use of "person" rather than "taxpayer" creates ambiguity as to who can claim a credit and who it is applicable to. **We suggest substituting the term "taxpayer" for "person" as it is less open to potential conflicting interpretations.**
2	1	**Point of Consideration:** Clarification of "$20,000,000" limitation per project **Note:** There is no time period stated to which the limitation applies, just the "project." This might preclude additional credit opportunities in the future if significant investment is needed to expand a certain project, though such expansion may be similarly capital-intensive a the original exploration and development . **We suggest considering a "per year" time period or a stronger definition of the term project.**
2	3 - 11	**Point of Consideration:** "years" **Note:** The term "years" is generally interpreted as "tax years." If the statute is interpreted as such, unintended consequences could adversely affect the carry-forward period. If, perhaps, for a variety of reasons a developer is required to file a "short-year" return for any of these years, that could dramatically reduce the carry-forward period. Potentially, then, the credit carry-forward period could expire before the plant is either placed in service or generates "gross income." **We suggest to instead state "60 months" for example, instead of "five years".**
2	3-7	**Major Point of Consideration:** Carry-forward time **Note:** Geothermal exploration and development greatly defers from oil&gas in the duration of the process. It may very well take more than 5 years from start of exploration until a geothermal plant is placed in service (due to permitting, weather and other delays). Furthermore, it typically takes more than 7 years from the date when a plant is placed in service until it accumulates substantial taxable income against which the credits can be claimed. Under the current language it is likely that the carry-forward period expires before all credits can be used. **We suggest extending the carry-forward periods in item (1) to 8 years and in item (2) to 20 years upon facility being "placed in service".**

2	16-19	**Major Point of Consideration:** "Successor in interest" language will greatly limit our ability to enjoy the credit **Note:** As currently stated the credit is only able to be transferred to a successor in interest. This is a term of art which, generally, would mean the purchaser of the facility (the successor in ownership to a business that is carried on substantially as it was before). As written, the bill will not help a developer to monetize the credit in a timely manner. Geothermal projects typically only start generating taxable income 5-7 years after commercial operation at the earliest. Therefore, the carry-forward period will probably elapse before the developer has a chance to utilize the credits. Furthermore, the current language will probably not allow the developer to recover any portion of their loss in case the exploration work does not lead to a revenue generating plant (in case a commercial-size resource is not confirmed). **We suggest changing this item (2) to read: "may be sold, assigned, exchanged, conveyed, or otherwise transferred, or refunded in whole or in part").**
3	7	**Point of Consideration:** "capitalized interest" **Note:** The current phrasing "capitalized interest" could potentially limit the types of costs that qualify. **We suggest using "capitalized costs", which may cover a substantially broader scope.**
3	10	**Major Point of Consideration:** "unknown" **Note:** The current phrasing "unknown" could potentially leave room for interpretation or argument as to whether a certain location being explored in "unknown" or not. As an example, a certain location may be known to have hot spring, but may still require substantial geothermal exploration in order to confirm the existence of a commercial-size resource.. **We suggest using the term "unconfirmed" as used by the Geothermal Energy Association and others.**

Message from Mr. Lucien Bronicki, Chairman and Chief Technology Officer

Developing clean, reliable, and sustainable energy systems has been our mission and core business for more than four decades.

From the first product Ormat created - a solar pump in Mali, Africa - to the 48 MW Olkaria geothermal power plant we now operate in Kenya - Ormat's focus on creating value-added sustainable energy products is unchanged. Our proprietary technology – the Ormat Energy Converter, which effectively converts low and medium temperature heat into electrical energy – has been successfully applied to geothermal power plants and to recovered energy generation systems using waste heat from process industries and gas pipeline compressors.

Despite an economic environment characterized by volatility and uncertainty in the second half of 2008, Ormat continued to demonstrate solid, steady growth. Our revenues increased 16.5% for the year to approximately $345.0 million, Ormat-owned generating capacity increased by 109 megawatts (MW) and demand for our geothermal and recovered energy products continued to grow, resulting in a record product backlog of $194.0 million as of February 2009

These results speak to the growing awareness, acceptance and demand for sustainable energy sources that are able to produce electricity with no or significantly less emissions of CO_2 and other pollutants such as nitrogen oxides, than fossil fuel generated electricity. We believe geothermal and recovered energy sources are poised to play a significant role in the cleaner energy mix of the future – and our company is committed to advancing new opportunities and the technologies that will be necessary to enhance their availability and effectiveness on a larger scale.

In the US, Ormat is a lead participant in research and development work on Enhanced Geothermal Systems, in concert with several academic institutions and the US Department of Energy (DOE). These initiatives, while still in the early stages, are focused on innovative technologies that could more than double geothermal megawatt potential in the US.

We are also committed to continuing to support the future growth of our company. In 2008, Ormat added 150,000 acres of new leases to our exploration development inventory. This includes securing the geothermal rights to 35,000 acres of land in an area close to Anchorage, Alaska, an active volcanic region with high potential for discovery of a large geothermal field, compared with the more mature geological formations in Nevada and California, where our current base of operations is concentrated.

Ormat Technologies, Inc.
2008 Sustainability Report

Regardless of where we operate, in more developed jurisdictions or in countries that are just beginning to build their energy infrastructure, Ormat recognizes the importance of effective community and stakeholder engagement, of providing opportunities for local employment and training, as well as investing in initiatives that make a lasting difference at the local community level. In this sustainability report you'll be introduced to our company, our technologies and our business practices as they relate to each of these areas. You'll also learn more about geothermal and recovered energy production.

Thank you for your interest in Ormat Technologies, Inc. We welcome your questions, comments and feedback about this report and look forward to continued dialogue.

Sincerely,

Lucien Bronicki
Chairman and Chief Technology Officer

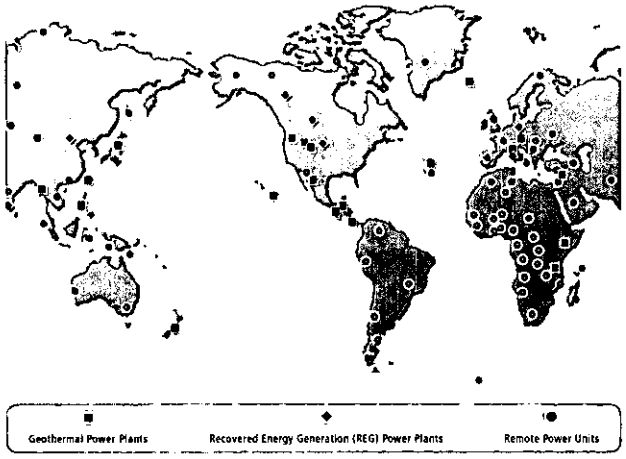
Organizational Profile

Ormat Technologies, Inc. (Ormat) is the world's leading vertically integrated company primarily engaged in the geothermal and recovered energy power businesses. Ormat explores, develops, designs, manufactures and sells equipment for geothermal and recovered energy-based electricity generation (REG), as well as remote power unit. In addition, our company provides services relating to the engineering, procurement, construction, operation and maintenance of geothermal and recovered energy power plants.

Collectively, our products and services are covered by 75 United States (US) patents.

Ormat Technologies, Inc. is a public company traded on the New York Stock Exchange, under the symbol ORA and is headquartered in Reno, Nevada. Our current generating portfolio includes the following geothermal and recovered energy-based power plants: in the United States - Brady Complex, Heber Complex, Mammoth, Ormesa Complex, Puna, Steamboat Complex, OREG 1, OREG 2; in Guatemala - Zunil and Amatitlan; in Kenya - Olkaria Complex; in Nicaragua - Momotombo and in New Zealand - GDL.

Global Presence - Geothermal and REG power plants and Remote Power Units installed by Ormat worldwide



Ormat Project Financing Recognized as "Best Sustainability Deal"

The project financing transaction supporting Ormat's new 48 MW Olkaria III Geothermal Power Plant in Kenya was recognized by EMEA (Europe Middle East Africa) Magazine as the "Best EMEA Sustainability Deal for 2008". The 10-year project finance loan for US $105 million was arranged by global agent Deutsche Investitions und Entwicklungsgesellschaft mbH (DEG), in association with a group of European Development Finance Institutions. The magazine annually highlights financial transactions in the EMEA region that represent innovation and excellence.

Our company is the second-largest geothermal power plant owner in the US. Ormat currently owns and operates nine geothermal and recovered-energy power plants complexes that generated, in 2008, approximately 2.5 million megawatt hours (MWh) of electricity produced without nitrogen oxide emissions and with significantly lower emissions of carbon dioxide (CO_2) compared with fossil fuel generated electricity. Virtually all of the electricity generated by our geothermal and recovered-energy power plants is currently sold pursuant to long-term power purchase agreements, providing generally predictable cash flows. In the United States, the purchasers of power from our projects are typically investor-owned electric utility companies. Outside of the United States, the purchaser is typically a state-owned utility or a privately-owned entity and we typically operate our power plants pursuant to rights granted to us by a governmental agency pursuant to a concession agreement.

In 2008, Ormat generated revenues of $345 million, earned net income of approximately $50 million and at December 31st, employed 1,069 people worldwide.

Ormat's Growth Plants

Ormat is one of the fastest growing geothermal and recovered power generation companies in the United States, as measured by growth in generating capacity.

Ormat Revenues ($ millions)

2006	2007	2008
$269.0	$296.0	$345.0

Growth in Ormat-Owned Generating Capacity (MW)

2006	2007	2008
400	410[1]	505[2]

At the end of 2008, Ormat owned a total of 505 MW of geothermal and recovered energy generating capacity worldwide. 377 MW is generated by our power plants in the US and the remaining 128 MW is generated by our international power plants. Between 82 MW and 94 MW of geothermal and recovered energy generation projects will be added to Ormat's generation portfolio through new construction targeted for completion by the end of 2010. In addition, Ormat has between 150 MW and 170 MW currently under development.

Our company plans to continue building a geographically balanced portfolio of geothermal and recovered energy assets, as well as to continue our record of leadership as a manufacturer and provider of products and services related to sustainable energy.

[1] On September 25, 2007, Leyte transferred its power plants in the Philippines to the off taker pursuant to a Build, Operate, and Transfer agreement. This transfer reduced our owned foreign generation capacity by 39 MW
[2] Including 50 MW of the North Brawley power plant in California which is in the start up phase.

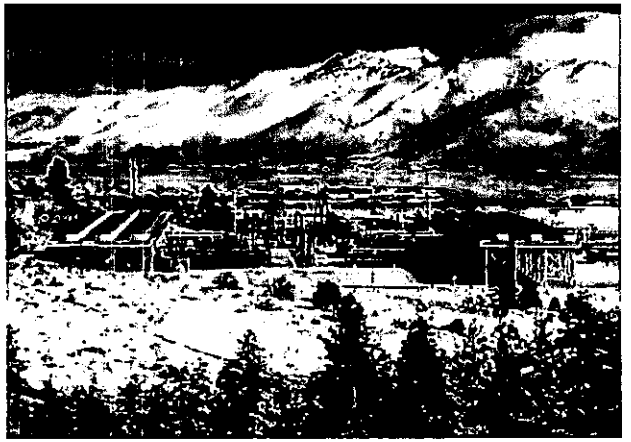
About This Report

This is the first sustainability report published by Ormat Technologies, Inc. and is for the calendar year 2008. On a go-forward basis, Ormat plans to publish sustainability reports annually. Questions concerning any of the information contained about Ormat's sustainability performance may be directed to sustainability@ormat.com.

This report was prepared referencing the Global Reporting Initiative's G3 Guidelines, however we have not self-declared a level of disclosure at this time. As our first sustainability reporting effort, Ormat is working to develop internal frameworks and processes to facilitate more comprehensive reporting in the future. While the financial and operational data presented in this report has been verified for corporate financial disclosure purposes, a formal external verification of the information presented herein has not been conducted.

Ormat Technologies, Inc. or Ormat refers to the entire company and its subsidiaries. Dollar figures are US unless otherwise noted.



Ormat's 84 MW geothermal complex at Steamboat, Nevada supplies all of Reno's households with electricity

Corporate Governance

Ormat's Code of Business Conduct & Ethics is intended to:

- Promote honest and ethical conduct, including fair dealing and the ethical handling of conflicts of interest and corporate opportunities;
- Promote the protection and proper use of Corporation assets;
- Maintain the confidentiality of information acquired in the course of business;
- Promote compliance with applicable laws and governmental rules and regulations;
- Encourage the prompt reporting of any illegal or unethical behavior;

The full Code of Business Conduct and Ethics document can be found at the Ormat website under the investor realation tab.

Ormat stands behind the principles of honesty, openness, fairness and trust as pillars of our approach to corporate governance. These principles are reflected in the exacting standards that are set out in our Corporate Governance Guidelines, and our Code of Business Conduct and Ethics, both of which were adopted in 2004 and took effect as our company was formally registered for trading on the New York Stock Exchange. Each provides a framework that is aligned with regulatory requirements and reflects 'best practices' principles.

Ormat established and maintains adequate internal control over financial reporting and is in compliance with Sarbanes-Oxley Act (SOX). The effectiveness of Ormat's internal control has been audited by Price Waterhouse Coopers (PWC, one of the "Big Four" global accounting firms).

Ormat is a publicly traded company managed by a seven-member Board of Directors. Mr. Lucien Bronicki is Chairman and Chief Technology Officer, Mrs. Yehudit "Dita" Bronicki is a Director and Chief Executive Officer and Mr. Yoram Bronicki is President and Director and Chief Operating Officer of the company. The other four directors serving on Ormat's board are non-executive and classified as independent. They are: Robert F. Clark, Roger W. Gale, Jacob J. Worenklein, Dan Falk.

In 2008, Ormat's Board of Directors met 13 times to review the business affairs of the company and provide oversight. Key committees of the Board of Directors include: Audit, Compensation, and Nominations & Corporate Governance.

The Audit Committee's purpose is to assist the Board in its oversight responsibilities as they relate to Ormat's accounting policies and internal controls, financial reporting process and legal and regulatory compliance, as well as to maintain ongoing open lines of communication between the Board and Ormat's financial management, internal auditors and independent auditors. Among the key responsibilities the Audit Committee performs is the review and discussion of Ormat's annual audited financial statements and disclosures under "Management's Discussion and Analysis of Financial Condition and Results of Operations".

Ormat's Compensation Committee's primary purpose is to review and approve corporate goals and objectives relevant to compensation of our CEO, evaluate the performance of the CEO against those goals and objectives and determine and approve CEO compensation, as well as compensation of any of the five other most highly compensated executive officers. Recommendations to the Board for non-CEO compensation, incentive compensation plans and equity based plans are also under the committee's responsibilities.

3659

The Nominating and Corporate Governance Committee is responsible for identifying and recommending individuals to serve as members of Ormat's Board of directors, to oversee the evaluation of the Board's performance and CEO and to take a leadership role in shaping the corporate governance of the company.

Corporate Charters for each committee of the Board are contained in full on Ormat's website under "Corporate Governance".

All directors, officers and employees of Ormat are expected to read and be familiar with our company's Code of Business Conduct and Ethics and Corporate Governance Guidelines, as appropriate, and are also expected to affirm their agreement to adhere to these standards by signing a compliance certificate.

Ormat's Secretary of the Board of Directors fulfills the role of Code of Ethics contact person for our company. Shareholders of the company as well as employees are invited to participate in the Annual General Meetings Ormat hosts, where dialogue concerning the company's plans, progress and operations is encouraged. Our company also regularly hosts meetings for employees, where they are encouraged to learn more about company operations and share their questions and/or concerns. Employees also are informed of several tools they can use should they wish to report unethical behavior or file an anonymous complaint: a letter box, a telephone line and the website www.ethicspoint.com, on which Ormat has a section.

Ormat's Environmental Management System has been regularly audited and certified as complying with the International Standard ISO 14001.

Ormat's Puna geothermal power plant, located in Hawaii, which delivers 30 MW of clean electricity

Ormat selected for SB20 List

Ormat is now a member of the SB20 (Sustainable Business 20) a ranking of the world's 20 most innovative companies that are playing a leading role in creating the sustainable economy of the future. Compiled by the Progressive Investor newsletter, the judging panel for the SB20 is comprised of leading green stock analysts who use both sustainability and financial criteria to identify the most compelling green companies.

The 20 companies selected are noted for their advancement of sustainability, must have made significant progress toward achieving their stated goals, demonstrate strong management and be leading influencers in their particular sector.

Corporate Memberships

Ormat Technology, Inc. is a member of the following organizations:

- Centre for Energy Efficiency and Renewable Technologies (CEERT)
- Geothermal Energy Association (GEA)
- Geothermal Resources Council (GRC)
- Reno-Sparks Chamber of Commerce
- Economic Development Authority of Western Nevada (EDAWN)
- Nature Conservancy of Nevada
- National Renewable Energy Laboratory (NREL)
- American Council On Renewable Energy (ACORE)
- International Energy Agency (IEA)
- The International Solar Energy Society (ISES)

Sustainability Index Participation

Ormat's expertise and innovation in developing geothermal energy has been recognized by a growing number of sustainability indexes worldwide:

- The Cleantech Index™ – www.cleantechindex.com
- The SB20 List – www.SustainableBusiness.com
- NEX WilderHill New Energy Global Innovation Index – www.nexindex.com
- The Domini 400 SocialSM Index (DS400) – www.kld.com/indexes/ds400index/index.html

- RENIXX® - Renewable Energy Industrial Index – www.renewable-energy-industry.com/stocks/

3660

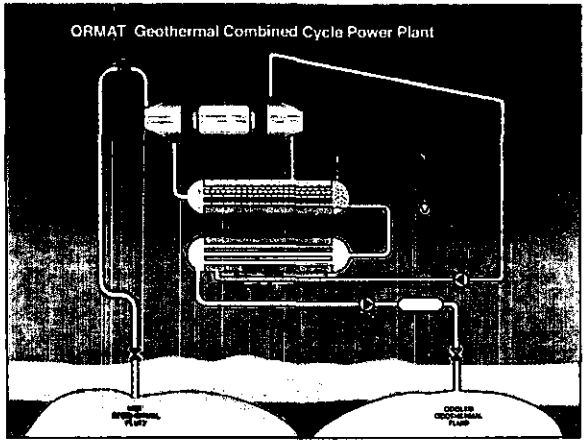
Environmental Leadership

The Environmental Benefits of Geothermal and Recovered Energy

Geothermal energy is heat energy that comes from the earth's molten interior deep in the earth's crust. This valuable heat is brought near to the surface due to movements in the earth's crustal plates by intrusion of molten magma and by deep circulation of groundwater. Reservoirs of hot water under pressure are formed. By drilling wells into these reservoirs, steam and high-pressure hot water can be captured and directed to drive turbines in power plants, completing the conversion of this earth-bound energy from heat to electrical energy.

Cooled geothermal fluid is injected back to the reservoir where it is reheated and preserves the resource mass balance and sustainability. The advantages of geothermal energy are enormous; it harnesses a natural locally available energy source, it offers base load electricity 24/7 year-round supply with high reliability and provides an environmentally friendly energy alternative which produces no NOx emissions and negligible CO_2 emissions.

Geothermal energy is used as a source of direct heat and electrical power generation in over 29 countries today, providing approximately 10,000 MW of electricity[3] which is enough to power between 10 and 12 million average homes.



[3] Source: GEA and Earth Policy Institute

Ormat also develops products that produce electricity from recovered energy or so-called "waste heat". Recovered energy represents residual heat that is generated as a by-product of a variety of industrial processes, such as cement manufacturing and gas compression stations. This residual heat, which would otherwise be wasted, may be captured in the recovery process and used by recovered energy power plants to generate electricity without burning additional fuel and/or generating emissions.

Ormat (and its parent company Ormat Industries Ltd.) has developed and manufactured over 1,200 MW of geothermal and recovered energy generation power plants with zero fossil fuel consumption and negligible emissions.

We are committing considerable effort towards exploring the vastly untapped geothermal and recovered energy resources available, and are working to develop and to innovate our geothermal power plants and technology.

We believe the importance of renewable energy as an alterative to fossil fuel will continue to grow and be aided by state, federal and international regulatory frameworks that are intended to reduce carbon emissions, promote renewable energy use, introduce market-based emissions trading systems and provide economic stimulus in a sustainable context. In the US, actions in these frameworks have been introduced through the implementation of the Renewable Portfolio Standards and, most recently the provision under the American Recovery and Reinvestment Act of 2009 (Stimulus Act).

Ormat Power Projects Eligible for Greenhouse Gas Emissions Trading

In December 2008, the Executive Board of the United Nations Framework Convention on Climate Change (UNFCCC) officially registered Ormat's Amatitlan Geothermal Project in Guatemala as a Clean Development Mechanism (CDM). The project is expected to offset emissions of approximately 83,000 tons of CO_2 per year. With Amatitlan registered under the CDM, the project will be eligible to receive certified emission reduction credits, each equivalent to one ton of carbon dioxide, which can be traded or sold. The project has a long-term contract to sell all of its emission reduction credits to a European buyer.

Ormat's GDL power plant in New Zealand is also working towards participation in the JI mechanism and the Olkaria III power plant is working towards participation in the CDM mechanism.

3661

Ormat's Energy Consumption

In 2008, the amount of electricity consumed by all of our manufacturing facilities was 3,514 MWh, all of which is derived from the grid and whose souce are fossil fuel based power plants. Still, this amount is negligible, as these 3,514 MWh are equivalent to less than 11 hours of operation of clean, low-carbon energy produced by Ormat's fleet of geothermal and REG power plants.

Ormat's 2008 Geothermal and REG Power Production

Ormat's geothermal and recovered energy power plants produce green, fossil fuel free electricity. To accurately calculate the emissions our renewable generation sources mitigate, we have calculated mitigation factors for several other potential energy sources which could have been used to provide electricity.

As Ormat's power plants provide baseload (constant, year-round) electricity, we compared them with other baseload energy sources: coal, oil, and natural gas. The comparison is based on a 2002 EIA study[4].

In 2008, power plants owned by Ormat have produced more than 3 million MWh of electricity. According to the calculation, this means our power plants mitigated 2.6 million tons of CO_2 compared with coal, 2.4 million of CO_2 compared with oil and 1.5 million tons of CO_2 compared with natural gas-fired electricity.

The power plants which Ormat sold to third parties produced in 2008 approximately the same amount of electricity, thus mitigating a similar amount of CO_2. We are unable to provide exact figures as we do not operate these power plants. However, in aggregate, in 2008 all power plants using Ormat's technology have mitigated approximately 5.2 million tons of CO_2 compared with coal, 4.8 million tons of CO_2 compared with oil, and 3 million tons of CO_2 compared with natural gas.

Improving Environmental Performance

Ormat's generating portfolio as of the end of 2008 includes a total of 14 geothermal and recovered energy power plant in the United States, Guatemala, Kenya, Nicaragua and New Zealand. While each power plants in our portfolio provides a positive alternative to carbon-intensive electricity generation, our company remains committed to ongoing action to minimize the environmental impact of our operations through reducing, reusing, recycling and applying leading edge technology. In fact, this approach is encapsulated in the Ormat Quality, Environmental, Health and Safety Policy, which guides these initiatives.

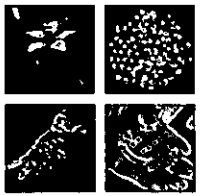
[4] Bloomfield, K., Moore, J.N., and R.M. Neilson Jr. (2003), Geothermal Energy Reduces Greenhouse Gases. Geothermal Research Council, GRC Bulletin, April 2003. www.geothermal.org/articles.html

Ormat Technologies, Inc.
2008 Sustainability Report
ORMAT

Wildlife Studies Enhance Conservation

Thymeleaf buckwheat is an endangered plant species and as such, is one of the plants that Ormat's operations take precise measures to protect. From our Steamboat power plant in Nevada, Ormat has donated to the Nevada Department of Wildlife, the state agency responsible for the restoration and management of fish and wildlife resources, to further study sagebrush in the region. Other species we work to develop and maintain include the Flat Tailed Horned Lizard, Sage Grouse, Desert Tortoises and Burrowing Owls.

We recognize the value of cultural resources on the sites that we develop and provide cultural resource surveys at a number of power plants to promote awareness of the archeological and biological significance of the land.



Ormat's Quality, Environmental, Health and Safety Policy

Ormat's QEHS policy is an integral part of our corporate policy and includes the following elements:

- Active communications between Ormat and its customers and suppliers in order to achieve understanding of customers' requirements, expectations, customer satisfaction and to provide effective product support.
- Compliance with applicable environmental, health and safety regulations where Ormat operates.
- continuous efforts to achieve:
  - High standards of safety in the production, construction and operational phases of our products in order to minimize risks to personnel and the public, improved product performance and reliability
  - Reduced costs and time to market
  - Prevent of pollution
  - Savings in energy and materials
- Implementation and certification of an integrated management system in accordance with ISO 9001 and 14001 international standards.
- Top management committed to dedicate resources and attention in order to comply with the requirements and continually improve the effectiveness of the integrated management system.

In Ormat's offices , efforts are in place to reduce the unnecessary use of paper products and preserve forests. Due to our widespread corporate geography, our company relies extensively on the Internet to enhance communication between head office and operating locations. We also reduce travel time and conduct training using "webinars", rather than through meetings. Car pooling is also encouraged for employees engaged in any travel on behalf of the company, as well as for regular commuting.

Most of our power plants are air cooled consuming no water. In addition a number of initiatives are underway throughout our facilities to reduce the amount of water and energy our operations consume. For example, we are investigating different ways to use recycled water in the power plants we operate in California and Nevada, and through the use of recuperators, we are reducing the water consumption of each new power plant we construct.

3662

Compliance with Environmental Laws

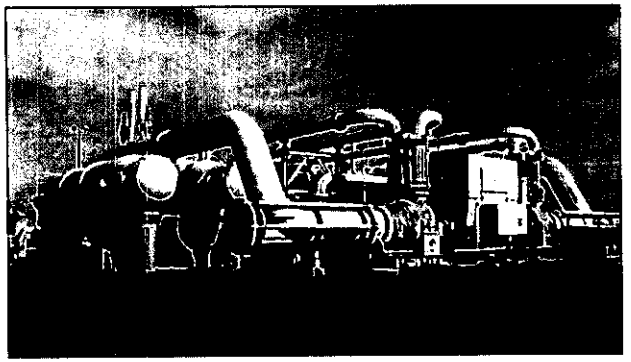
Ormat's US operations operate in compliance with the National Environmental Policy Act (NEPA) on public lands and the California Environmental Quality Act (CEQA) on private lands. This compliance includes performing environmental studies and implementing a variety of measures to mitigate any identified significant impact.

Scrap metal, used oil, and plastics & glass from used computers are the major categories of recyclables currently collected at Ormat facilities. All facilities benefit from our efforts to maximize the efficiency of our operations. We've introduced more efficient turbine units at our Steamboat 2/3 plants, which have resulted in lower oil consumption. The use of variable speed drives on key well pump motors has increased their output and productivity, while decreasing oil consumption. In addition, rigorous technical evaluation of geophysical data helps us reduce drilling risk and the number of holes that are required to maximize the output of geothermal reservoirs.

Drilling with a Difference

Ormat's operating procedures require all employees, as well as drilling contractor personnel, to be educated about and adhere to our company's policy regarding the standards for environmental protection we apply to our drilling activities and ongoing operations. Drilling geothermal wells is, in many respects, similar to the drilling procedures used for conventional oil and gas drilling. Our overarching goal is to minimize disturbance to the site from the outset, to protect wildlife, land and ground water throughout the well's operating life and to restore the site to its natural state when the well is no longer productive. Our environmental protocols for drilling geothermal wells include prevention of soil erosion, surface and ground water quality protection, by using steel casing cemented to below these zones, the use of only non-toxic, non-hazardous drilling mud constituents, the containment of all waste drilling mud, cuttings and runoffs, air quality protection and noise prevention. These measures may be implemented either prior to construction, during construction or during operations of the plant, depending on the specific measure.

Throughout 2008, Ormat did not incur any fines for environmental incidents or infractions.

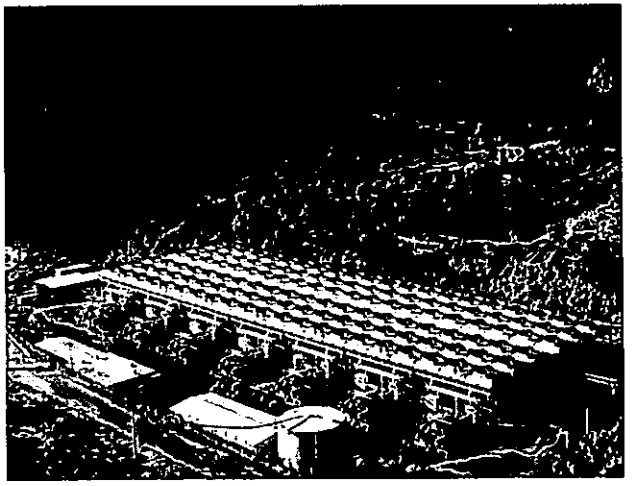


Ormat's Ormesa geothermal complex, located in California, which delivers 57 MW of clean electricity

Community and Stakeholder Involvement

Connecting with the Community

As a responsible and responsive corporate citizen, Ormat believes it is important to cultivate positive relationships with a wide variety of stakeholders who have an interest in our geothermal and recovered energy power plants. To do so, we employ a variety of activities and communications tools which include websites about our power plants and ongoing projects that affect the local community; a community relations program that encourages employee volunteerism and purchasing from local vendors; participation in local boards such as the Mammoth Lakes Alternative Energy Task Force; the maintenance of an extensive list of stakeholders with whom we stay in touch with via email, phone calls, meetings, and tours of the power plant; and by providing local support to community organizations. These combined efforts ensure that stakeholders are provided with timely and accurate information about our operations and development plans and that they are able to learn more about geothermal energy and how it contributes to the local economy and a cleaner environment.



Ormat's Zunil geothermal power plant, located in Guatemala, which delivers 24 MW of clean electricity

Support for Education

Ormat is a strong supporter of education as the foundation for positive, life-long learning and the path to fulfilling and brighter economic futures. Wherever we operate, we look for innovative ways to help improve the educational opportunities available within the local community, to advance research and development in the geothermal industry, to strengthen the array of tools and resources available and to further the academic careers of students by funding student scholarships and internships.

Advancing Higher Learning

Ormat has developed several close relationships with the institutes of higher learning in Nevada, where our corporate headquarters are located. We work with the Nevada System of Higher Education, which includes three institutions – the University of Nevada, Reno (UNR) which includes the Great Basin Center for Geothermal Energy, the University of Nevada Las Vegas and the Desert Research Institute.

In addition to providing direct funding support, Ormat also supports these institutions in different ways: senior Ormat employees regularly deliver lectures on geology and engineering projects; we support research and development initiatives that will further the understanding of geothermal energy; and we utilize and hire interns who work in our operations, gaining first-hand experience in geothermal energy production.

Ormat is an associate member of the Massachusetts Institute of Technology Energy Initiative (MITEI). Our company's contribution to this leading institution in 2008 provides funding for Energy Fellowship support for students. Ormat supports UNR with a grant as well as offering internship for students. Oramt is also a supporting member in the leadership council of the University of Colorado-Boulder Renewable and Sustainable Energy Institute (RASEI).

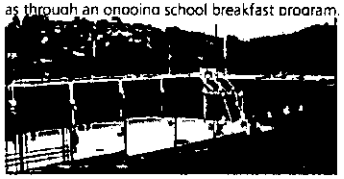
Opening Educational Doors

Ormat operates geothermal power plants in Guatemala, Nicaragua and Kenya – countries where local residents are challenged by limited access to education. In these countries, Ormat helps meet more basic needs.

For example, in 2008 in Kenya, our company provided funding to seven local primary schools to sponsor the salary costs for 21 teachers. While providing resources for instruction is important, helping to supplement the nutritional needs of the students is also a priority. In 2008, Ormat sponsored a feeding program at the Narasha Primary School throughout the academic year. Providing construction funding for a new classroom, and channeling support for secondary school fees are other practical ways our funds opened doors to the future for Kenyan students.

In Guatemala, Ormat provides similar types of support to ensure local resident who reside in the communities close to Ormat's Amatitlan plant – El Cedro, Bejucal, San Francisco las Sales, San Jose Calderas and Pepinal – benefit from our presence. In 2008, Ormat created a trust fund to manage all community affairs programming and provided seed funding of $150,000 to launch the fund. The trust is concentrating on education, health and eco-tourism initiatives to help develop economic opportunities at the local community level and is managed by three individuals – a representative from the local community, a representative from Ormat's Amatitlan plant and an independent advisor.

Our support for education is expressed through scholarships to students who excel in their studies, funding for computers, books, maintenance and other classroom resources, as well as through an ongoing school breakfast program.



Enhancing local educational opportunities in the South American and African countries where we operate is an investment in the future of local communities.

Providing a Hand-Up

While supporting educational initiatives is the primary focus of Ormat's community investment outreach, there are many other ways in which our company reaches out to the local people who live close to our power plants.

In Nicaragua in 2008, our company contributed to a wide variety of social, recreational, community infrastructure and building projects, which included providing medicine, buying Christmas gifts for disadvantaged children, supplementing the local fire fighting facilities and contributing to the construction of the Momotombo Church.

In Kenya, support provided by Ormat in 2008 for the local Narasha community helped them repair a leading water tank. Other gifts helped channel monthly support to the Kenya Wildlife Service's education assistant, the Kenya NEMA annual environmental conference, the Aberdare National Park Rhino Ark, the Lake Naivasha Riparian Association (LNRA) world conservation day and LNRA membership. At this year's inauguration ceremony, Ormat contributed to the National Famine Relief Fund.

In Guatemala, Ormat's connection with the local community close to the Zunil power plant resulted in medical visits for students and the local school and the distribution of vitamins throughout the community.

Many of Ormat's community investments help supplement existing infrastructure and contribute in an important way to the local quality of life.

Human Resources Policies

Ormat recognizes that engaged, motivated and energized employees are the key to our success as a leading geothermal and renewable energy innovator. Wherever we operate around the globe, it is Ormat policy to hire locally and to ensure that our employees are trained and ready to realize their potential. In all of our power plants, all employees, from the plant manager down, are locals.

Wherever our company operates, Ormat respects and adheres to the laws of each country. We are an equal opportunity employer and comply with all state and federal laws prohibiting discrimination based upon race, color, national origin, marital status, religion, sex, age, sexual orientation, mental condition, medical disability, veteran or other protected status. Ormat did not record any legal action or complaints with respect to our human resources activities in 2008.

In addition to competitive salaries, Ormat provides employees with an attractive series of employee benefits, which include an employer-sponsored retirement plan, an employee assistance program, voluntary benefits for four types of insurance, emergency travel assistance, and leave time for illness, bereavement and jury duty time.

Ormat is an equal opportunity employer. Wherever we operate, we hire locally and empower our employees to realize their potential.

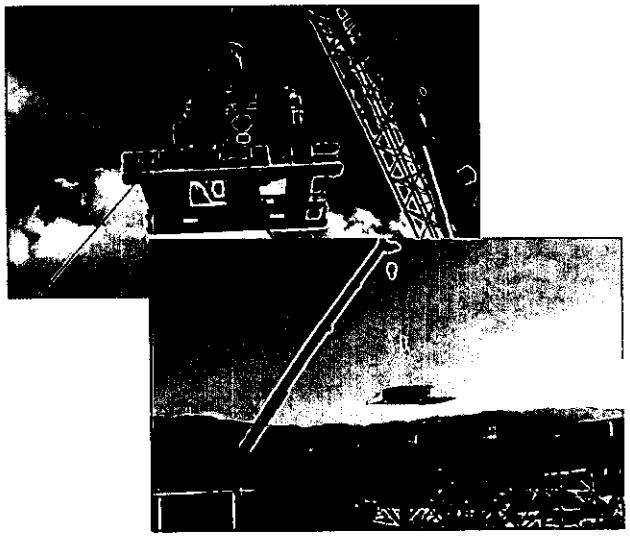
Safety & Health Performance

Safety is a significant priority at Ormat. We believe training – in face-to-face and on-line forums – continually reinforces the importance of applying the right procedures and helps keep safety awareness, values and attitudes at the top of our employees and contractors minds during their day-to-day activities inside our power plants and other operating facilities.

In 2008, Ormat recorded a Total Case Incident Rate (TCIR) of 2.4 across all of our operations in North America and worldwide. TCIR is calculated based on the number of recordable incidents a company experiences in a year, multiplied by 200,000 and divided by the total hours worked by employees during that year. The 2.4 TCIR Ormat achieved compares favorably with the industry average TCIR of 4.7 in 2008.

Also in 2008, Ormat recorded a Days Away and Restricted Time (DART) performance of 1.6, compared with the industry average of 2.9.

No fatal incidents were recorded in any of Ormat's operations in 2008.



Construction of an Ormat Power Plant

Safety Training Priorities

Ormat employees with operational responsibilities are required to complete annual coursework which is aligned with Ormat's safety procedures and for which completion is mandatory. Employees are tested to verify their knowledge at the end of each course, which include the following:

- Blood Borne Pathogen Guidelines.
- Breeching and Hot Tapping – This involves procedures for developing a work plan for breeching working fluid piping components as well as hot brine piping and components.
- Cold Weather Awareness – Guidelines for safe operations in cold weather, including personal protection.
- Confined Space Entry Program – This program outlines requirements for determining and mitigating confided space hazards and controlling entry into confined space areas.
- Contractor Safety.
- Cranes/Rigging/Lifting Devices.
- Electrical Safety Procedure – This program includes guidelines for NFPA 70e clothing and process.
- Emergency Action Plan requirements, which are site specific.
- Ergonomics.
- Excavation and Trenching.
- Fall Protection.
- Fire Prevention – Employees receive annual training on plant fire systems and fire extinguisher usage.
- First Aid/CPR.
- HAZCOM – includes Material Safety Data Sheets (MSDS) and chemical awareness.
- Heat Illness Awareness – Required in California and covered at all other plant sites.
- Hearing Conservation – Employees exposed to noise levels above 85dba receive training and hearing screening annually.
- Hot Work/Cutting and Welding.
- Injury and Illness Prevention Plan, Written Workplace Safety Plan.
- Lockout/Tagout – This involves control of energy for safe work.
- Personal Protective Equipment (PPE).
- Process Safety Management – Three-year rotating classes on elements of PSM that are not covered under general safety training.
- Respiratory Protection – Those employees who are required to wear respiratory PPE receive annual pulmonary and respiratory screening.
- Safety Policy/Safety Responsibilities.

Ormat's Safety Resource Structure

Ormat operates 14 different geothermal and recovered energy generation plants in several different countries. To ensure that a consistent approach is applied to safety throughout our company we have created an overarching Strategy Safety Committee. This committee includes Ormat's Vice-President of Operations, Manager of Business Processes, Operations Planning Coordinator, Human Resources and Plant Manager, and outlines the expectations and safety plan for the company.

An Operations Safety Improvement Team regularly meets and consists of representatives from each Ormat power plant. Together, they share their experiences, review incidents and ways to prevent them from reoccurring, identify best practices, evaluate new equipment, programs and services and provide an important conduit to Ormat's corporate management about plant issues and opportunities from a safety context. This team also conducts regular safety audits at each power plant.

Safety Improvement Teams are plant site specific and feature cross-functional plant representation. These teams work with plant management to develop and implement safety plans, review incidents and provide support in resolving issues and develop projects designed to enhance the safety performance of the power plant.

Ormat has an Industrial Hygiene function currently managed by contract with an outside vendor who is charged with developing and maintaining sampling plans for noise, heat, dust, chemicals, welding emissions and asbestos-free verification.

Ormat achieves a consistent company-wide approach to safety through an overarching Strategy Safety Committee.

Safe Harbor Statement

Information provided in this sustainability report may contain statements relating to current expectations, estimates, forecasts and projections about future events that are "forward-looking statements" as defined in the Private Securities Litigation Reform Act of 1995. These forward-looking statements generally relate to Ormat's plans, objectives and expectations for future operations and are based upon its management's current estimates and projections of future results or trends. Actual future results may differ materially from those projected as a result of certain risks and uncertainties. For a discussion of such risks and uncertainties, see "Risk Factors" as described in Ormat Technologies, Inc.'s Annual Report on Form 10-K filed with the Securities and Exchange Commission on March 5, 2008 and on Quarterly Report on Form 10-Q filed with the Securities and Exchange Commission on November 6, 2008.

These forward-looking statements are made only as of the date hereof, and we undertake no obligation to update or revise the forward-looking statements, whether as a result of new information, future events or otherwise.

ANALYSIS: *(Attach a separate page if necessary)*

SB 243 eliminates royalties from any state geothermal lease entered into for geothermal resources after the effective date. Under AS 38.05.140(d) the commissioner, for the purpose of encouraging the greatest ultimate resource recovery, already has the authority to reduce royalties on an entire leasehold for geothermal resources in order to promote development. Implementing this bill during the immature state of the geothermal industry may only result in the transfer of state resource revenue to private developers.

CS FOR SENATE BILL NO. 243(RES)

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-SIXTH LEGISLATURE - SECOND SESSION

BY THE SENATE RESOURCES COMMITTEE

Offered:
Referred:

Sponsor(s): SENATOR MCGUIRE

A BILL

FOR AN ACT ENTITLED

"An Act relating to the royalty obligation for geothermal resources."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

*** Section 1.** AS 38.05.181(g) is amended to read:

(g) Each geothermal lease shall be conditioned upon payment by the lessee of a royalty of **1.75 percent** [NOT LESS THAN 10 PERCENT BUT NOT MORE THAN 15 PERCENT] of the gross revenues derived from the production, sale, or use of geothermal resources under the lease **during the first 10 years immediately following the date the geothermal resource first generates gross income and 3.5 percent of the gross revenues derived from the production, sale, or use of geothermal resources under the lease after that first 10-year period**. Royalties may be taken in kind rather than in value if the commissioner determines that taking in kind would be in the best interest of the state.

*** Sec. 2.** The uncodified law of the State of Alaska is amended by adding a new section to read:

APPLICABILITY; AMENDMENT OF EXISTING LEASES. (a) Section 1 of this

Act applies to a lease for a geothermal resource or the renewal of a lease for a geothermal resource entered into on or after the effective date of this Act.

(b) The commissioner of natural resources shall offer the royalty rates in AS 38.05.181(g), as amended by sec. 1 of this Act, as an amendment to a lease or renewal of lease entered into before the effective date of this Act.

SPONSOR STATEMENT – SB 243

"An Act removing the royalty obligation for geothermal resources."

Electric power generated from geothermal sources is a clean, sustainable and environmentally friendly alternative to fossil fuels. It can play a major part in meeting the future energy needs of the railbelt and other regions.

The problem for any company seeking to build a commercial grade geothermal plant in Alaska is high capital costs that run 25-50 percent higher than the Lower-48. Operational costs could run 100 percent higher than the rest of the country.

Senate Bill 243 assists companies in developing geothermal resources discovered in commercial quantities on state land by lifting the 10 to 15 percent royalty payment obligation currently in state statute.

SB 243 is a common sense effort to make geothermal power projects economically viable and produce more affordable and reliable electric power for homes and businesses.

Geothermal electrical generation has been used for decades all over the world and creates "green" jobs. Alaska can now join other states and nations using geothermal sources to create a safe and secure source of electricity.

I urge all my colleagues to support SB 243 and move our state towards a secure energy future.

MEMORANDUM January 28, 2010

SUBJECT: Sectional summary for SB 243; removing the royalty obligation for geothermal resources (Work Order No. 26-LS1346\A)

TO: Senator Lesil McGuire
Attn: Mike Pawlowski

FROM: Donald M. Bullock Jr.
Legislative Counsel

You have requested a sectional summary of the above-described bill.

As a preliminary matter, note that a sectional summary of a bill should not be considered an authoritative interpretation of the bill and the bill itself is the best statement of its contents. If you would like an interpretation of the bill as it may apply to a particular set of circumstances, please advise.

Section 1. Amends AS 38.05.181(c) by deleting language that requires a royalty obligation in conjunction with a noncompetitive geothermal lease.

Section 2. Amends AS 38.05.181(d) by deleting royalty share as an alternative term in a competitive geothermal lease sale.

Section 3. Amends AS 38.05.181(e) by deleting language that states that the rent paid on a geothermal lease is a credit against the royalty accruing on the lease.

Section 4. Amends AS 38.05.0181(f) by deleting a reference to royalties as a term to be considered in the renegotiation of a geothermal lease.

Section 5. Amends AS 38.05.182(a) to delete the statutory section providing for a geothermal resource royalty in a spanned citation for statutes that provide for royalties that may be taken in kind rather than in money.

Section 6. Deletes AS 38.05.181(g), which requires a royalty to be paid for the sale or use of a geothermal resource.

Section 7. Adds a section to uncodified law to state that secs. 1 - 5 of the Act apply to a lease or renewal of a lease for a geothermal lease entered into on, or after, the effective date of the Act.

ANALYSIS: *(Attach a separate page if necessary)*

SB 243 would eliminate state royalties on geothermal production. Royalty volumes are not taxable. Therefore, by eliminating state royalty on geothermal production, the taxable volume of geothermal production would be increased.

There are currently no commercial geothermal projects in Alaska. However there are projects that may begin exploration or development at a number of locations around the state including Naknek, Akutan, Chena and Mt. Spurr.

The increase in state taxes would vary based on the volume and value of geothermal production but is estimated to range from approximately $100,000 for a 5MW facility to $1.8 million for a 50MW facility. Due to uncertainty about future development the fiscal impact of this legislation can not be accurately determined at this time.

BRIEFING PAPER

THE CASE IN SUPPORT OF SB243 FOR REMOVING ROYALTY OBLIGATIONS FOR GEOTHERMAL RESOURCES

EXECUTIVE SUMMARY

Geothermal power offers reliable baseload power that delivers consistent megawatt-hours 24 hours per day, 365 days per year, which is something that most other forms of renewable resources cannot provide. In fact, for a utility or regional transmission organization, a geothermal power plant shows up in a resource plan much like a conventional power plant. Geothermal power is also unique in its lack of emissions, minimal land use, low visual impact and other environmental merits.

Geothermal energy is extremely cost competitive when compared to other forms of renewable energy and fossil-fuel based processes (e.g. natural-gas based plants, as indicated by studies performed by the California Energy Commission[1] [2]).

Multiple western states (e.g. California, Nevada, Hawaii, Utah and Oregon) recognize the merits of geothermal power and have generated geothermal power for decades. These states, among many others, also have multiple new geothermal projects under development.

Although believed to be rich in geothermal resources in various regions around the state, Alaska has yet to develop a single utility-size geothermal power plant. One major hurdle for geothermal development is the relatively high capital cost associated with exploration, drilling and development, as well as high operation and maintenance costs due to the remoteness of resources and the harsh terrain and climate. While capital costs for development and construction of geothermal power plants in other states is typically around $4,000/kW[3], in Alaska estimates typically increase 25%-50%. Operation and maintenance costs of geothermal plants in Alaska are expected to be as much as 100% higher than the respective lower 48 states, again due to the typical remoteness of the plants.

In other western states, geothermal power projects rarely are required to pay State royalties. A report by the Geothermal Energy Association explains geothermal royalties vary depending on land ownership type (Federal, state, private) yet tend to range from 0.5% to 5.5% of revenues[4]. The majority of the geothermal projects currently under development in the US are on Federal lands, where BLM regulations call for revenue royalties of 1.75% during the first 10 years and 3.5% thereafter.

[3] Climate Change Business Journal, April/May 2009

[4] http://www.geo-energy.org/publications/reports/Socioeconomics%20Guide.pdf

In Alaska, despite the fact that geothermal development faces greater financial challenges compared to other states, the current statutes call for royalty rates of 10%-15%, similar to oil, gas and mineral regulations. Ormat believes this rate is cost-prohibitive and is one of the reasons no utility-size geothermal plant has ever been built in the state.

Financial analysis shows that removing the 10-15% royalty obligation will lower the operations and maintenance cost by 10-15%, therefore lowering the kWh cost by 10-15%. Removing royalty obligations from geothermal power plants in Alaska will serve to acknowledge the unusually high costs of geothermal development, operation and maintenance while incentivizing geothermal development in the state. This will ultimately lower the cost of clean, reliable power to the ratepayers.

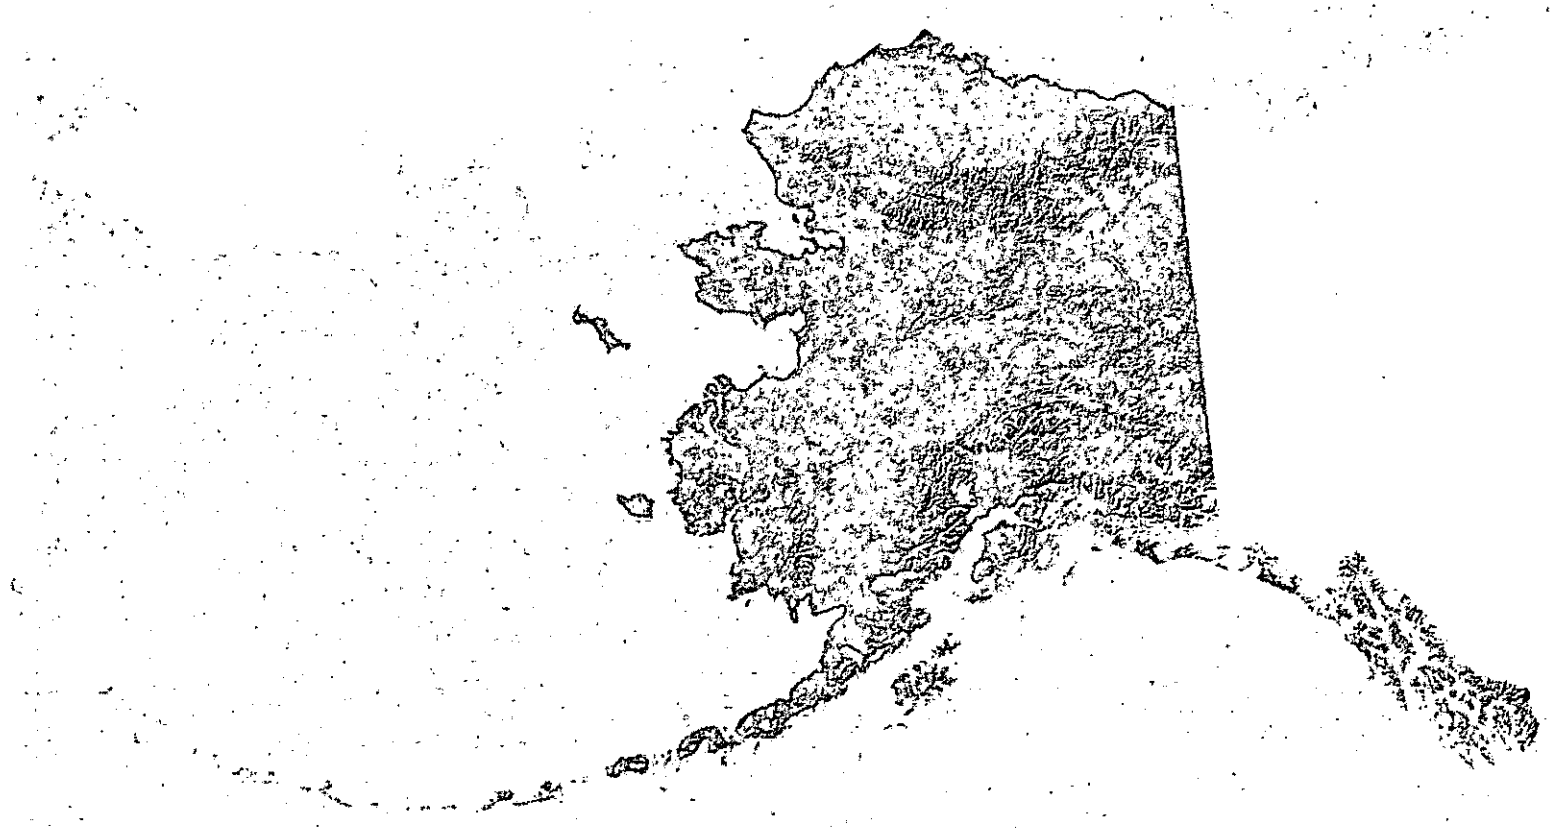
RENEWABLE ENERGY

ATLAS

OF ALASKA



A Guide to Alaska's Clean, Local, and Inexhaustible Energy Resources

July 2007

Why Renewable Energy is Important

As concerns about rising fossil fuel prices, energy security, and climate change increase, renewable energy can play a key role in producing local, clean, and inexhaustible energy to supply Alaska's growing demand for electricity, heat, and transportation fuel. Because there are little or no fuel costs associated with generating electricity from renewable sources, more Alaskans are looking to resources like wind, geothermal, hydroelectric, ocean, and biomass to hedge against the increasing cost of natural gas and diesel.

Renewable energy resources provide low-risk energy that, over the long term, can lower costs. With some of the best renewable energy resources in the country, Alaska has an opportunity to be a leader in their development and bring new revenue streams into the state's economy.

The Renewable Energy Atlas of Alaska is designed as a resource for policy makers, advocates, landowners, developers, utility companies and others interested in furthering the production of electricity and fuels from wind, solar, biomass, geothermal, hydro and ocean power resources. Produced with the use of GIS technology, this Atlas brings together the best renewable resource maps and data into a single comprehensive publicly available document. While the maps contained in this atlas do not eliminate the need for on-site resource assessment, they do provide an estimate of the available resources.

This atlas is posted on the Alaska Energy Authority website, www.akenergyauthority.org. Map data will be available in interactive format at the State of Alaska's new energy inventory web site at www.energyinventory.alaska.gov.

Alaska's Energy Infrastructure

With 20% of the country's landmass and less than 1% of its population Alaska's unique geography has driven development of its energy supply infrastructure—power plants, power lines, natural gas pipelines, bulk fuel "tank farms" and related facilities. Alaska has over 200 remote, stand-alone electrical grids serving villages as well as larger transmission grids in Southeast Alaska and the Railbelt. The Railbelt electrical grid follows the Alaska Railroad from Fairbanks through Anchorage to the Kenai Peninsula and provides 80% of the state's electrical energy.

Powered by wood until 1927, Fairbanks switched to coal after the Railroad provided access to Nenana and Healy coalfields. The Anchorage area has enjoyed relatively low-cost heating and power since expansion of the Eklutna hydro plant in 1955 and the development of major Cook Inlet oil and gas discoveries in the 1960s.

Completed in 1986, the state-owned Willow - Healy Intertie now provides a diversity of energy sources to the six Railbelt electrical utilities.

Approximately 70% of the Railbelt's electricity comes from natural gas generators. Major power generation facilities in the Railbelt include Chugach Electric Association's 430 MW natural gas-fired plant west of Anchorage at Beluga, Anchorage Municipal Light and Power's 266 MW natural gas-fired plant in Anchorage, Golden Valley Electric Association's 129 MW facility near Fairbanks fueled by oil from the Trans-Alaska Pipeline, and the 126 MW state-owned Bradley Lake hydroelectric plant near Homer. In total, 1,340 MW of installed power generation capacity exists along the Railbelt to serve an average load of approximately 500 MW and a peak load of over 800 MW.

During the early 1980s the state completed four hydropower projects to serve Ketchikan, Kodiak, Petersburg, Valdez, and Wrangell. With a total generating capacity of 76 MW, the "Four Dam Pool" projects displace the equivalent of approximately 20 million gallons of diesel fuel per year for power production. Other major hydro facilities supply the communities of Juneau and Sitka.

With a few notable exceptions, most of the rest of Alaska's power and heating needs are fueled by diesel that is barged from Lower 48 suppliers or transported from petroleum refineries in Nikiski, North Pole, and Valdez. After freeze-up, many remote communities must rely on the fuel that is stored in tank farms, or pay a premium for fuel flown in by air tankers. Currently state and federal authorities are supporting a large program to fix leaky tanks, improve power generation and end use efficiency, and exploit local energy sources such as wind and hydro.

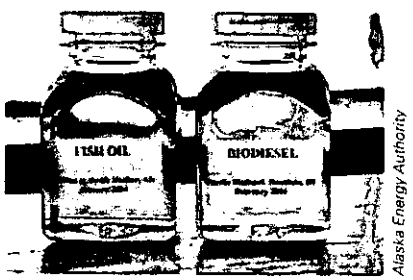
Biomass

Alaska's primary biomass fuels are wood, sawmill wastes, fish byproducts, and municipal waste.

Wood remains an important renewable energy source for Alaskans, with over 100,000 cords per year used for space heating statewide. Closure of the major pulp mills in Sitka and Ketchikan in the 1990s brought an end to large-scale wood-fired power generation in Alaska. However, recent increases in oil prices have raised interest in using sawdust and wood wastes as fuel for lumber drying, space heating, and small-scale power production. Alaska has also seen renewed interest in converting low-value wood and wood wastes to liquid fuels such as ethanol.

Groundfish processors in Unalaska, Kodiak and other locations produce approximately 8 million gallons of pollock oil every year as a byproduct of fish meal plants. Much of the oil is used as boiler fuel for drying the fish meal or exported to Pacific Rim markets for livestock and aquaculture feed supplements and other uses. In 2001, with assistance from the State of Alaska, processor UniSea Inc. conducted successful tests of raw fish oil/diesel blends in a 2.2 MW engine generator.



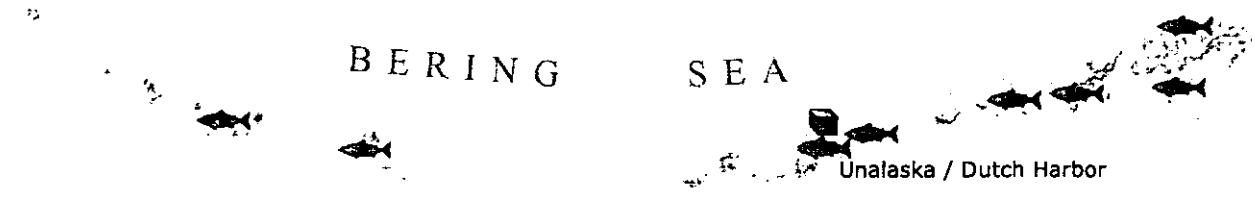
Raw fish oil and fish oil biodiesel from the Unisea plant in Dutch Harbor.

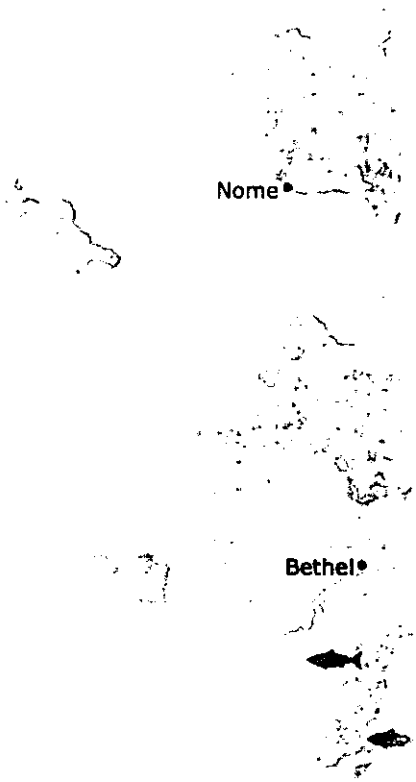
Since then, the company has expanded the operation and now uses approximately one million gallons of up to 70% fish oil for power production each year. Currently state, federal, university, and industry groups are testing fish oil biodiesel storage, handling and performance in diesel generators and developing a portable demonstration module for recovering a portion of the estimated 13 million gallons of fish oil returned to the ocean each year as processing waste. Local groups in Anchorage, Fairbanks, and other communities are converting waste fry oil into fuels for heating and transportation.

Alaskans generate approximately 650,000 tons of garbage per year. Eielson Air Force Base, near Fairbanks, densifies paper separated from the local waste stream and then co-fires the 4 cm square "cubes" at the base's coal-fired power plant. Beginning in 1997, the facility has produced 600-3000 tons per year of "refuse-derived fuel" providing up to 1.5% of the base's heat and power. Conventional recycling of paper, approximately half of Fairbanks' waste stream, is economically marginal given the distance to Lower 48 markets.

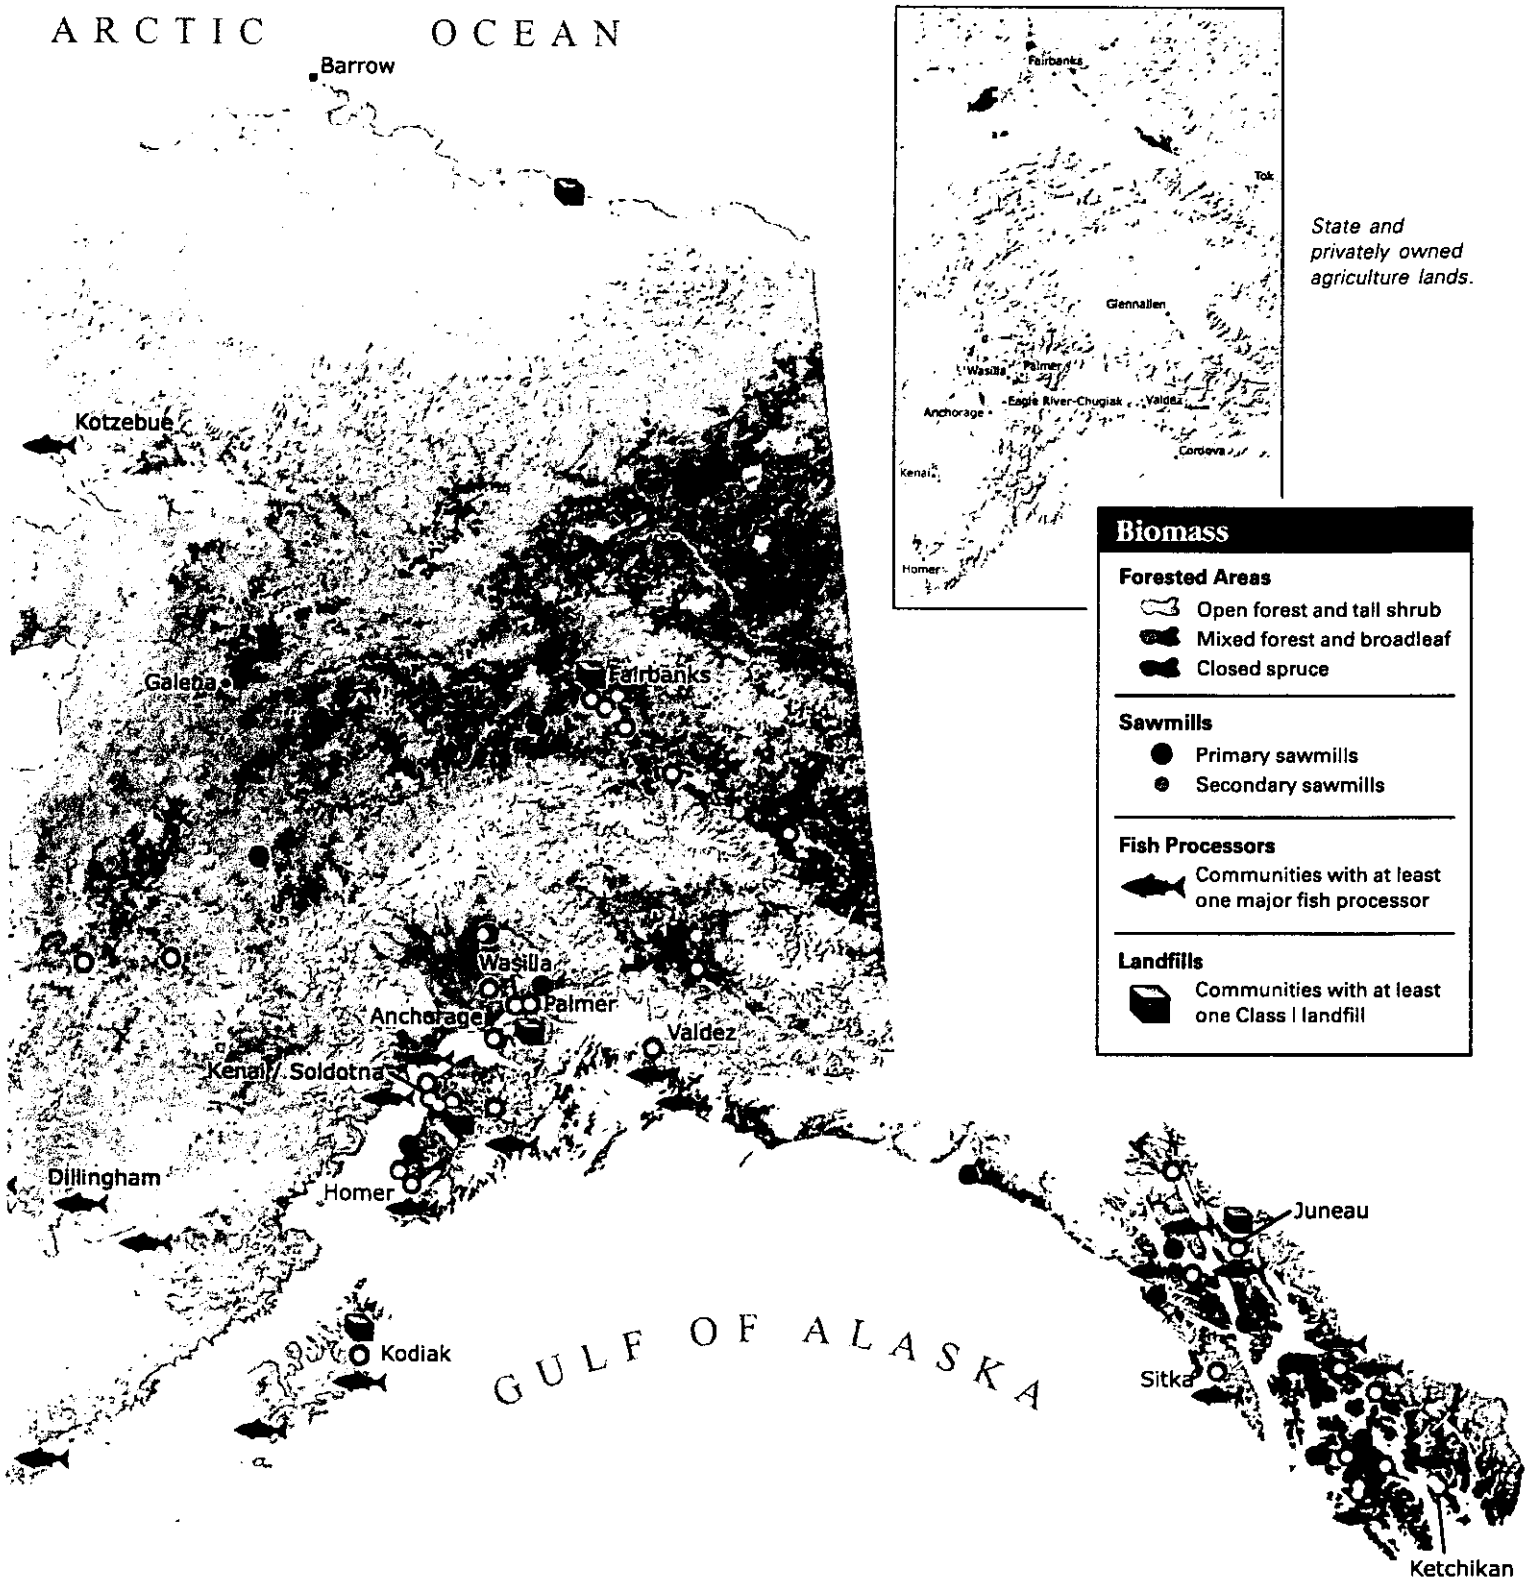
Energy recovery from Anchorage landfill gas is viable, according to a report prepared in 2005 for the Municipality of Anchorage. The landfill will produce methane with an energy equivalent of approximately 1.9 million gallons of diesel fuel per year over the next ten years. The gas could be used to heat nearby military or school facilities, or be converted to 2.5 MW of electrical power, enough to supply 2,500 homes in the Railbelt.

It is also possible that Alaska's agricultural lands may be used to produce energy crops, such as rapeseed, to produce biodiesel.





Alaska's Renewable Energy Resources



3690

Geothermal

Alaska has four distinct geothermal resource regions: 1) The Interior Hot Springs, which include the band of hot springs that runs east-west from the Yukon Territory of Canada to the Seward Peninsula, 2) The Southeast Hot Springs 3) The Wrangell Mountains, and 4) The Ring of Fire Volcanoes, which includes the Aleutians, the Alaska Peninsula, and Baranof Island.

The Interior Hot Springs and the Southeast Hot Springs are low to moderate temperature geothermal systems with surface expression as hot springs. The Wrangell Mountains are composed of several active volcanoes that may have geothermal energy development potential. The Ring of Fire is an active volcanic arc that circles the Pacific and hosts high-temperature hydrothermal systems. These systems are seen on the surface as hot springs, geysers, and fumarole fields.

The use of geothermal resources falls into two categories: direct use and electricity production. Direct use of geothermal energy includes all non-electricity-producing applications. Potential applications for direct use of geothermal energy in Alaska include district heating, greenhouses, absorption chilling, mariculture, process heating in the seafood industry, swimming pool heating, and hydrogen production.

Three large-scale geothermal electric power generation projects have been proposed in Alaska: the Mt. Makushin project to provide power to the City of Unalaska, the Akutan project to provide power to the City of Akutan, and the Mt. Spurr project to provide power to the Railbelt grid. If developed, the Makushin and Akutan projects would also provide district heat and process heat to local, municipal, and fish processing customers. Each of these proposed geothermal power projects has the potential to produce tens and possibly hundreds of megawatts of electric power.

In the Interior, Chena Hot Springs Resort serves as an example of diverse use of geothermal energy. The resort has installed the first geothermal power plant in Alaska with assistance from state and federal agencies. The project includes two 200 kW organic rankine cycle generators, and displaces 150,000 gallons of diesel per year. Based on $2.50/gallon fuel prices, the $2.1 million project saves over $375,000 per year. In addition to the electric power plant, the Chena Resort uses its geothermal resources for outdoor baths, district heating, swimming pool heating, and to provide heat and carbon dioxide to its greenhouses. The site also demonstrates the use of geothermal energy for refrigeration. The resort installed a 16 ton absorption chiller in 2005 to provide chilling to an outdoor ice museum, which is kept frozen year-round. The chiller uses water from a 165°F geothermal well as a heat source, and a 40°F creek as a heat sink. This technology has potential applications in other Alaska communities that could use waste or geothermal heat to provide cooling for fish processing, ice production and community cold storage.

Naknek Electric Association is actively investigating geothermal potential and development of a regional electrical transmission system.

Hydroelectric

Hydroelectric power, Alaska's largest source of renewable energy, supplies 24 percent of the state's electrical energy. In 2007, 27 hydro projects provide power to Alaska utility customers, ranging in size from the 105 kW Akutan hydro project in the Aleutians to the 126 MW state-owned Bradley Lake project near Homer, which supplies 8% of the Railbelt's electrical energy. An additional 20 privately-owned hydro projects are catalogued in the Alaska Energy Authority's database.

Most of the state's developed hydro resources are located near communities in Southcentral, the Alaska Peninsula, and Southeast—mountainous regions with moderate to high precipitation. Outside the Railbelt, major communities supplied with hydropower are Juneau, Ketchikan, Sitka, Wrangell, Petersburg, Kodiak, Valdez, Cordova, and Glenallen.

Like Bradley Lake, the 8 MW Blue Lake project near Sitka is an example of a project that stores energy by impounding water in a reservoir behind a dam. The dam is approximately 145 feet high with a spillway 342 feet above sea level. Water travels from the lake through a 1.3 mile tunnel to the main powerhouse, which discharges water near sea level. The project can store over 100,000 acre-feet of water— enough buffer between inflow and outflow to power Sitka for over a month—and supplies 60 percent of Sitka's average annual power requirements.

Other projects provide hydro storage without dam construction through the natural impoundment of an existing lake. The 31 MW Crater Lake project, part of the state-owned Snettisham project near Juneau, includes a "lake tap" 200 feet below the normal level of the lake that supplies water to a powerhouse at sea level through a 1.5 mile tunnel.

In contrast to projects providing storage, smaller "run-of-river" projects use more modest structures to divert a portion of the natural river flow through turbines to make power. An example is the 824 kW Tazimina project near Iliamna. Here water is diverted through an intake 250 feet upstream from a 100 foot waterfall through a steel pipe to an underground powerhouse. Water is released back into the river near the base of the falls.

Many rural communities located on the Yukon and other large rivers are interested in using river current for generating power. In 2002 Alaska Power and Telephone proposed testing UEK Corporation's 90 kW twin propeller system in the Yukon's 5.5 mph flow near Eagle. The propellers resemble underwater wind turbines anchored under the river's surface. Although funding for this demonstration is not yet available, current efforts directed toward developing tidal energy resources may advance this concept.

Ocean

Alaska has 34,000 miles of coastline, more than all other states combined. For centuries the sea has provided rich marine resources that attracted people to the Alaska coast. Now another potential marine resource is being considered: harvesting energy from the ocean.

Ocean energy falls into three general categories: ocean thermal energy conversion (OTEC), tidal energy, and wave energy. OTEC applications are limited to tropical areas such as Hawaii and the southern Atlantic Coast, and are not suited for development in Alaska. That leaves tidal and wave energy, with each having the potential to meet some of Alaska's energy needs, although the technology for exploiting those potentials are not yet commercially available. Some tidal energy technology may also be used in river applications (*see Hydroelectric, page 10*).

Tidal energy is a concentrated form of the gravitational energy exerted by the moon and, to a lesser extent, the sun. This energy can be converted into electricity in two ways: by dams that force water through turbines at high and low tidal stages, and by underwater turbines that are turned by tidal flow. One of the significant benefits of tidal energy is that the tides are predictable for centuries in advance.

This map gives estimates of average tidal flow electrical generation potential for 35 sites based on the assumption that 15% of the available energy in each tidal stream is captured. Cook Inlet, with North America's second largest tidal range, has attracted interest as an energy source for the Railbelt for many years. In 2006, the Electric Power Research Institute, in partnership with the Alaska Energy Authority, Chugach Electric and ML&P, completed a tidal energy study at Cairn Point on Knik Arm. The study results showed that an estimated 17 MW of power could be generated using tidal energy, enough to power 17,000 homes. Since the report was published, the Federal Energy Regulatory Commission has issued eight preliminary tidal energy permits to energy developers for Alaska projects.

Wave energy is the result of wind acting on the ocean surface. Alaska has one of the best wave resources in the world, with parts of the Aleutian Islands coast averaging more than 50 kW per meter of wave front. The total wave power flux on southern Alaska's coast alone is estimated at 1,250 TWh per year, or almost 300 times the amount of electricity Alaskans use every year. Similar to other renewable energy sources in Alaska, a challenge to using wave energy is the lack of energy demand near the resource.

Much of Alaska's wave energy is dissipated on remote, undeveloped shorelines. The greatest wave energy resources are at the western end of the Aleutian Chain, while substantial resources are found on the southern side of the Alaska Peninsula and the outer coastline of Kodiak and southeast Alaska. There are currently no wave energy projects in Alaska; however several communities such as Yakutat may provide viable sites.

Solar

Although Alaska's northern location presents the challenge of minimal solar energy during the long winter when energy demand is greatest, solar energy fulfills an important role in space heating and off-grid power generation.

Most Alaskans know that careful house design and construction can minimize the use of heating fuel. "Passive solar" design includes proper southern orientation and the use of south facing windows that transfer the sun's energy into the house through natural processes of conduction, convection, and radiation. Passive solar design employs windows, thermal mass, and proper insulation to enable the building itself to function as a solar collector.

"Active solar" heating systems use pumps or fans to move energy to a point of use, such as a domestic hot water tank. A typical home demands a large amount of fuel year-round for domestic hot water, so using the sun to heat water for even seven or eight months a year saves significant amounts of energy. A larger role for active solar hot water systems may emerge as advances in heating systems allow solar heated fluid to supply in-floor systems currently heated by conventional fuel boilers.

The state's largest utility-connected photovoltaic power system is in the remote community of Lime Village. Placed on line in 2001, the 106-panel hybrid photovoltaic-diesel-battery system can generate up to 12 kW.

Although large utility-scale solar electric projects such as a 64 MW solar thermal plant in Nevada are being built in the Lower 48, significant utility-scale solar generation is unlikely in Alaska due to high capital costs and low yearly solar power output. For off-grid cabin owners, remote government installations, and other places where a relatively small amount of electricity is needed and proven generation options are limited, solar photovoltaics remain an excellent choice. As the price of solar panels continue to drop, more people are likely to consider solar electricity economical, especially if the cost of fossil-fueled electricity continues to rise.

Wind

Alaska has abundant wind resources suitable for power development. Costs associated with fossil fuels and improvements in wind power technology make harnessing this clean, renewable energy source a growing opportunity for many Alaskans.

The wind map on these pages provides an initial indication of the potential for wind energy development. Wind power density, represented as watts per square meter, is divided into seven power classes. Wind energy feasibility depends on size of electrical load, price of displaced fuel such as diesel or natural gas, foundation cost, and other site-specific variables.

Much of the best winds are located in the western and coastal portions of the state. The winds in these regions tend to be associated with strong high and low pressure systems and related storm tracks. In parts of southwest Alaska, turbines may actually need to be sited away from some of the best winds to avoid extreme gusts and turbulence. In the interior, average wind speeds tend to be much lower, although localized wind resources can be found near elevated terrain or channeled passes like those near Healy and Delta. Katabatic winds, created by variation in air mass temperatures, are found in places like the upper Matanuska Valley and near Seward and Juneau. In parts of Southeast Alaska, offshore locations are promising, but steep terrain and large forested areas limit onshore potential. Site-specific wind resource data has been collected through the Alaska Energy Authority's anemometer loan program.

Wind power technologies being used or planned in Alaska range from small wind chargers at off-grid homes or remote camps, to medium-sized machines displacing diesel fuel in isolated village wind-diesel hybrid power systems, to large industrial turbines greater than 1 MW. On the Railbelt, several of the major utilities are examining wind power as a way to diversify future sources of energy and hedge against rising natural gas prices. Initial studies by Chugach Electric Association and land owner Cook Inlet Region, Inc. at Fire Island west of Anchorage indicate a wind power class 4 to 5. Golden Valley Electric Association has made substantial progress in developing the Eva Creek Wind project located near existing transmission lines north of Healy. 50 MW projects at Fire Island and Eva Creek would each be capable of supplying approximately 3% of the Railbelt's electrical energy.

Alaska's first wind farm, located in Kotzebue in a Class 4 to 5 wind resource, has been displacing a significant portion of the utility's diesel fuel with wind power since 1997. On St. Paul Island in the Bering Sea, the Tanadgusix Corporation (TDX) takes advantage of a Class 7 wind resource to provide electricity, as well as heat produced from excess wind energy, to a large industrial facility. Alaska Village Electrical Cooperative recently installed 300 kW wind projects in Toksook Bay and Kasigluk. An intertie from Toksook Bay also provides electricity to Nightmute and Tununak. Other projects are underway or planned in Kodiak, Sand Point, Nikolski, Hooper Bay, Chevak, Gambell, and Savoonga.

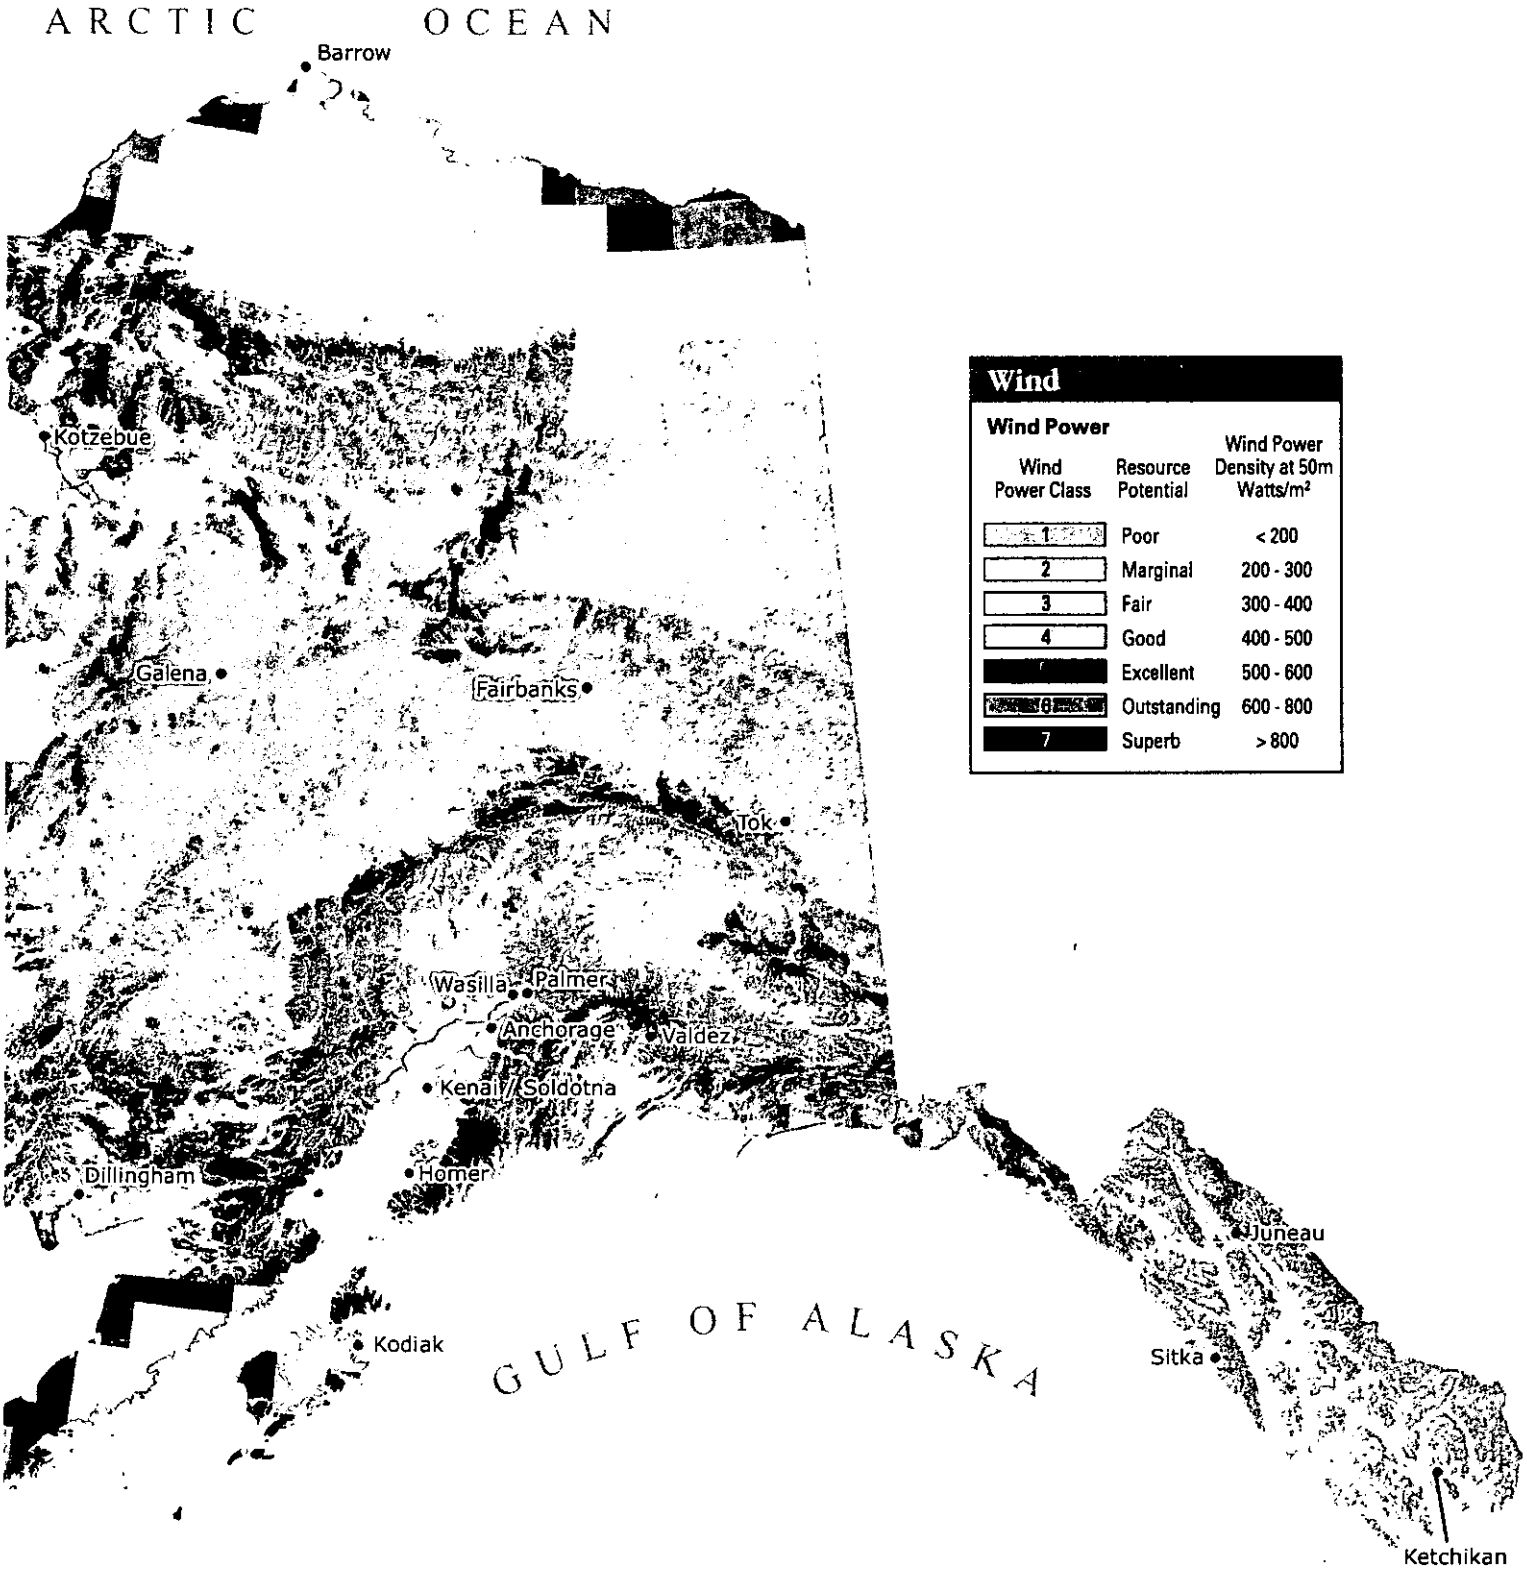
Alaska's Renewable Energy Resources



Renewable Energy Policies

State and federal policies that encourage renewable energy projects play an important role in their development.

At the federal level the production tax credit (PTC) is the primary incentive tool. The PTC was passed by Congress to even the playing field between the renewable energy industry and the heavily subsidized fossil fuel and nuclear industries. The PTC currently allows the owners of qualifying renewable energy projects to take 1.9 cents off their tax bill for every kilowatt-hour of renewable energy generated during the first ten years of the project. Though the tax credit is an important part of renewable energy project financing, one criticism of the PTC has been its short term duration. Congress has reauthorized the tax credit a year or two at time, making it difficult for investors to plan development of renewable energy resources far into the future.

Because there are few other federal policies that support renewable energy development besides the PTC, individual state policies have been the primary drivers of renewable energy development in the United States. The three primary policies used across the country are net metering, renewable portfolio standards, and renewable energy funds. A fourth policy area focuses on state set electrical tariffs being used in countries like Canada, Germany, and Spain.

Net Metering

State net metering rules provide an incentive for individuals and businesses to invest in their own small renewable energy systems by allowing them to sell back into the grid any excess power they produce. Forty states now offer some form of net metering. Different rules in each state determine the maximum amount of power an individual can sell back to the utility, the price at which the utility must purchase the power, and the length of time an individual producer can "bank" the power they produce before a "net" bill must be calculated.

Rich Seifert

Home near Fairbanks that uses a combination of photovoltaic cells for power, an active solar water heater, and passive solar design.

Although it is possible for individuals to sell power back in some Alaska utility districts, Alaska does not have a statewide net metering law that would make it much easier to do so.

Alaska Energy Authority

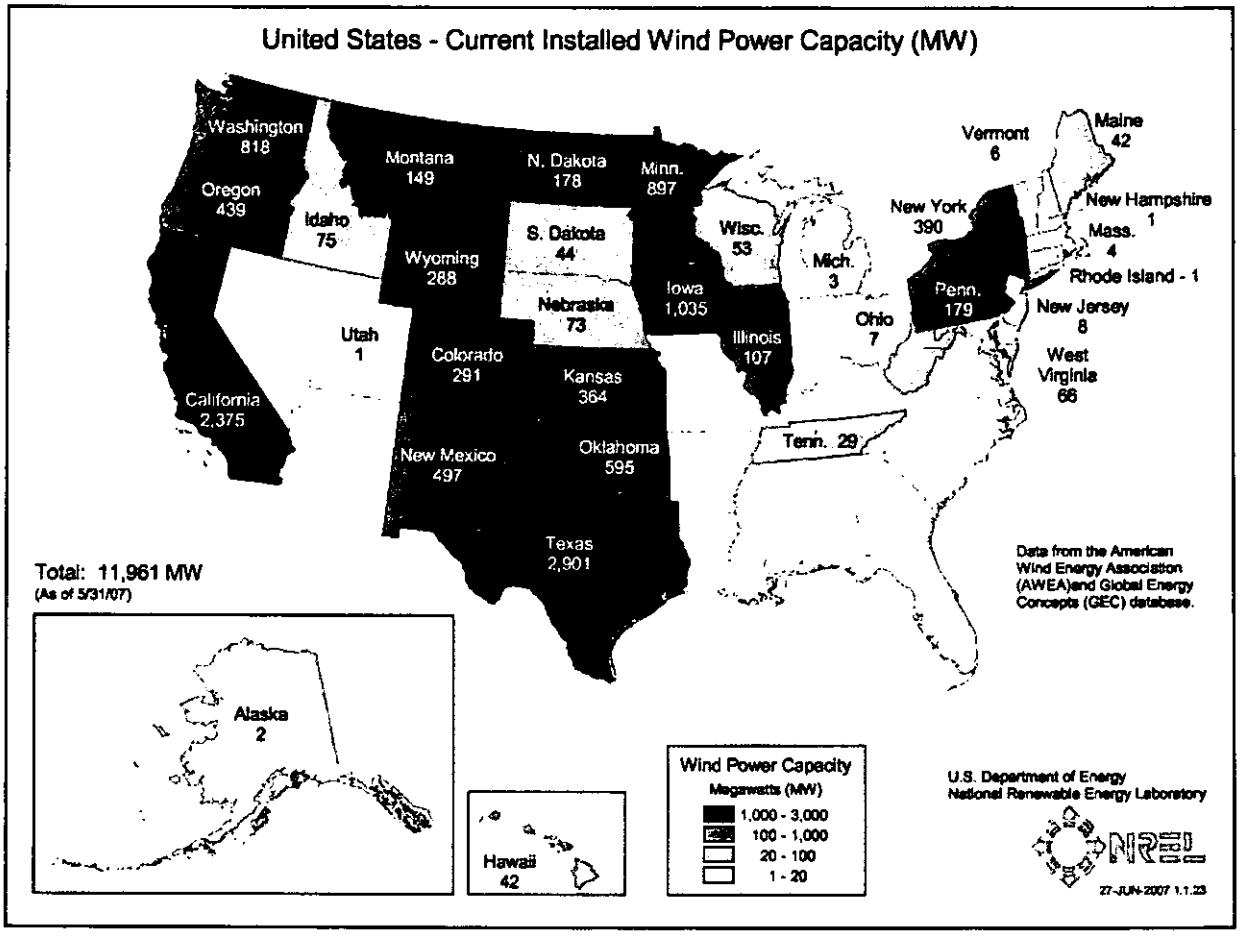
Renewable energy creates jobs for Alaskans

In the Fairbanks area Golden Valley Electric Association (GVEA) has developed the Sustainable Natural Alternative Power (SNAP) program. SNAP allows GVEA customers who wish to support renewable energy development to do so by contributing to a fund that is held in escrow by the utility company. Individuals in the GVEA service area who want to produce up to 25 kW of renewable electricity for the grid are paid from the escrow fund in proportion to the amount of power they produce.

Renewable Portfolio Standards

Twenty-two states and the District of Columbia now have a policy known as a renewable portfolio standard (RPS). An RPS is a state law that requires utility companies to generate a specified percentage of their electricity from renewable resources by a certain date. For example, Nevada law mandates that investor owned utilities in that state produce 20% of their electricity from renewables by the year 2015. The percentage and the end date range widely across the various states that have an RPS. Utilities are typically given interim milestones, and must pay a fine if they do not reach those milestones. Most states allow utilities to purchase renewable energy credits (RECs) to meet the RPS standard and avoid paying fines. The RPS approach makes different entities and renewable energy resources compete to meet the standard.

3701



Wind is the fastest growing energy sector in the world. The U.S now ranks second in total installed wind generation capacity behind Germany, although the U.S. still generates less than 1% of its electricity from wind. Denmark already generates over 20% of its electricity from wind, followed by Spain at 8% and Germany at 6%.

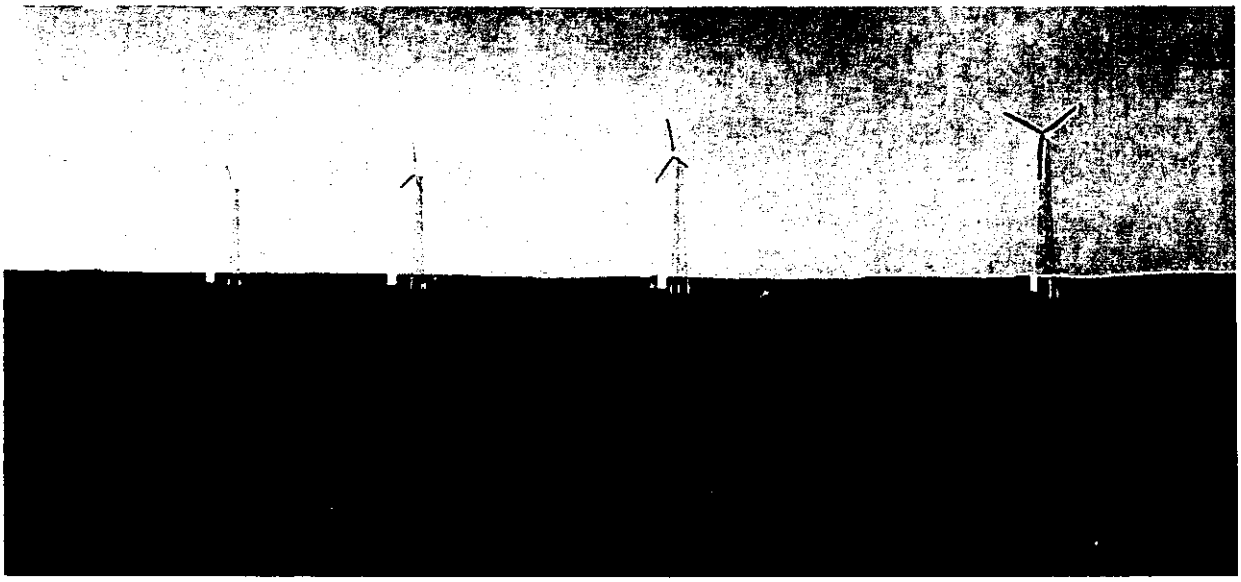
Renewable Energy Funds / System Benefit Charges

Fifteen states have renewable energy funds (sometimes called clean energy funds), most of which are supported by small, mill-rated surcharges on energy sold to consumers. These surcharges are sometimes referred to as system benefit charges. Renewable energy funds provide support for the development of renewable energy by helping to remove market barriers, lowering financing costs, developing infrastructure, and educating the public. For example, the system benefit charges in Oregon are deposited into an independent trust that funds eligible wind, solar electric, biomass, small scale hydro, tidal, geothermal, and fuel cell projects. These projects are supported by grants, loans, rebates, equity investments, and other financing mechanisms used by the fund.

Terms of the various funds vary from state to state. Some states have scheduled funds to last only five years. Other states have open-ended funds. Longer-term funds provide greater stability for renewable energy developers. It's estimated that over the next 20 years the combined renewable energy funds of the 15 states will invest about $4.5 billion in renewable energy generation.

In the states that have both an RPS and a renewable energy fund, the two policies complement each other in stimulating the renewable energy market. RPS standards "pull" renewable energy technologies into a state by providing a long-term market that reduces investment risk and provides a level playing field for developers. On the other hand, renewable energy funds "push" clean energy technologies by lowering market barriers through direct investment incentives

Renewable Energy Policies



Kotzebue Electric Association

Four 66 kW Integrity wind turbines that make up part of Kotzebue Electric Association's 957 kW wind farm. By the end of 2006 Kotzebue will have 1155 kW of installed wind capacity. In a typical year the wind farm displaces over 100,000 gallons of diesel fuel.

and supporting the infrastructure needed to develop renewable energy. For example, in California, the fund is used to buy down the above-market costs of renewable energy. And of course, the development that takes place as a result of renewable energy funds helps states meet their RPS requirements.

Renewable Energy Credits (RECs)

Utilities recognized years ago that there was a market demand for clean renewable energy when customers agreed to pay more for resources like wind. Today, rather than charging a premium for renewable source power, most utilities sell the social and environmental attributes of renewable energy separately from the actual electrons in the form of certificates. Also known as "green tags," renewable energy certificates (RECs) are essentially the bragging rights that are created when renewable energy is produced. Each REC represents the production of one megawatt hour of renewable energy and the displacement of approximately 1,400 pounds of CO_2 emissions. Buyers of RECs include utilities trying to meet state RPS requirements, as well as a growing number of federal agencies and corporations committed to supporting increased renewable energy production. For example, Fortune 500 company Whole Foods is buying RECs from wind farms to offset 100% of the electricity used in all of its facilities in the United States and Canada.

Renewable Energy Alaska Project (REAP) and the Bonneville Environmental Foundation (BEF) recently joined forces to create the first REC containing renewable energy from Alaska. *Denali Green Tags* are available through the BEF website, and contain the social and environmental attributes from small village wind projects in rural Alaska.

Alaska Volcano Observatory

Steam vent on Kiska Volcano in the Aleutian Islands. Several communities in the Aleutians are considering developing their geothermal resources.

3703

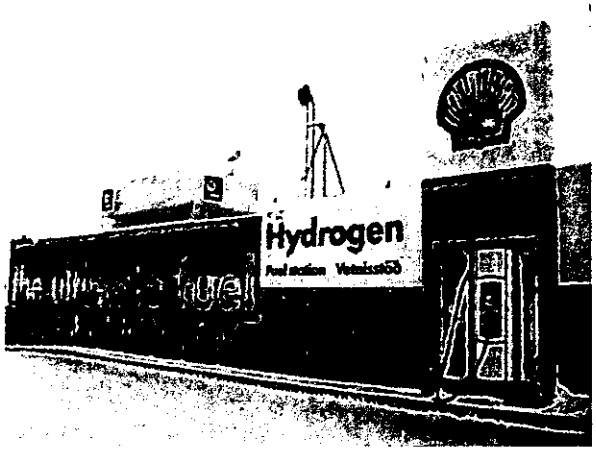
Electricity Feed Laws and Advanced Renewable Tariffs

Electricity feed laws and advanced renewable tariffs (ARTs) are used in a number of European countries and are considered by many to be the world's most successful policy mechanism for stimulating rapid renewable energy development. They give renewable energy producers guaranteed access to the electric grid at a price set by the regulatory authority, giving producers the contractual certainty needed to finance renewable energy projects. They also enable homeowners, farmers, cooperatives and others to participate on an equal footing with large commercial developers of renewable energy. Currently 16 countries in the European Union use some form of feed law.

ARTs are the modern version of Feed Laws. They differ from the simpler feed laws in several important ways. Tariffs are differentiated by technology. (There is one price for wind energy, another price for solar, etc.). Tariffs within each technology can also be differentiated by project size or, in the case of wind energy, by the productivity of the resource. Tariffs for new projects are also subject to periodic review to determine if the program is sufficiently robust. For example, programs are reviewed every two years in France, and every three years in Germany.

The Canadian province of Ontario recently enacted a type of Advanced Renewable Tariff called a Standard Offer Contract. The program offers 11 cents/kWh (Canadian) to producers of wind, biomass and small hydro energy and 42 cents/kWh for solar photovoltaic energy. The contracts are for 20 years, and will be adjusted for inflation as time goes on. (This price compares to the 2006 residential retail price for electricity in Ontario of just under $0.06/kWh). There is no limit to the number of projects that may apply for a contract, but the size of each project is capped at 10 MW. The contracts are available to anyone, including homeowners, businesses and commercial energy producers.

Many commentators are looking to Ontario's new policy to become a model that other North America jurisdictions will follow. Recently the State of Washington passed a modest version of a feed law for small solar projects. It gives businesses and homes with solar photovoltaics a credit of 15 cents/kWh for electricity generated by the PV system. The credit is capped at $2,000 annually and runs until 2015. The law also combines economic multipliers to increase the system owner's credit up to 54 cents/kWh if the project's components are manufactured in Washington.



Chris Rose, REAP

Hydrogen filling station in Reykjavik, Iceland. Iceland gets 99% of its electricity and over 90% of heat for buildings from its geothermal and hydroelectric resources. Ninety-three percent of Icelanders support the government's goal to be the first nation in the world to replace its use of fossil fuels in autos and boats with hydrogen fuel.

Alaska

Two state documents have recently made policy recommendations calling for the increased development of renewable energy in Alaska. In 2003 the Alaska State Legislature commissioned the Alaska Energy Policy Task Force to develop a long-term energy policy for Alaska. In its written report to the Legislature the Task Force established goals to "promote research, development, and demonstration of clean and renewable energy" and to "promote conservation and energy efficiency across all of Alaska." It also recommended that Alaska "increase the proportion of renewables in long-term fuel sources," including hydroelectric generation.

The 2004 Alaska Rural Energy Plan, which was supported by state and federal agencies, concluded that wind energy development was feasible in a substantial number of rural communities, and recommended an aggressive program of resource assessment and turbine deployment in rural Alaska. The Alaska Energy Authority has begun to implement the plan through its anemometer loan and rural power system upgrade programs.

3704

Glossary

Absorption Chiller - A device that uses heat energy rather than mechanical energy to cool an interior space through the evaporation of a volatile fluid.

Active Solar - A solar water or space-heating system that uses pumps or fans to circulate the fluid (water or heat-transfer fluid like diluted antifreeze) from the solar collectors to a storage tank subsystem.

Alternative Fuels - A term for "non-conventional" transportation fuels derived from natural gas (propane, compressed natural gas, methanol, etc.) or biomass materials (ethanol, methanol, or biodiesel).

Anemometer - An instrument for measuring the velocity of wind; a wind gauge.

ASTM - Abbreviation for the American Society for Testing and Materials, which is responsible for the issue of many standard methods used in the energy industry.

Availability - Describes the reliability of power plants. It refers to the number of hours that a power plant is available to produce power divided by the total hours in a set time period, usually a year.

Avoided Cost - The incremental cost to an electric power producer to generate or purchase a unit of electricity or capacity or both.

Biodiesel - A domestic, renewable fuel for diesel engines derived from natural oils like fish and vegetable oil; produced by a chemical process which removes the glycerin from the oil and meets a national specification (ASTM D 6751).

Biomass - Organic matter that is available on a renewable basis, including agricultural crops and agricultural wastes and residues, wood and wood wastes and residues, animal wastes, municipal wastes, and aquatic plants.

Bioenergy – Electrical, mechanical, or thermal energy or fuels derived from biomass.

Capacity Factor - The ratio of the average power output of a generating unit to the capacity rating of the unit over a specified period of time, usually a year.

Co-firing - Using more than one fuel source to produce electricity in a power plant. Common combinations include biomass and coal, biomass and natural gas, or natural gas and coal.

Cogeneration - The generation of electricity and the concurrent use of rejected thermal energy from the conversion system as an auxiliary energy source.

Conduction - The transfer of heat through a material by the transfer of kinetic energy from particle to particle; the flow of heat between two materials of different temperatures that are in direct physical contact.

Convection - The transfer of heat by means of air currents.

Dam - A structure for impeding and controlling the flow of water in a water course that increases the water elevation to create hydraulic head. The reservoir creates, in effect, stored energy.

District Heating System - Local system that provides thermal energy through steam or hot water piped to buildings within a specific geographic area. Used for space heating, water heating, cooling, and industrial processes. A common application of geothermal resources.

Distributed Generation - Localized or on-site power generation, which can be used to reduce the burden on a transmission system by generating electricity close to areas of customer need.

Distribution Line - One or more circuits of an electrical distribution system on the same line or poles or supporting structures, usually operating at a lower voltage relative to a transmission line.

Domestic Hot Water - Water heated for residential washing, bathing, etc.

Electrical Energy - The amount of work accomplished by electrical power, usually measured in kilowatt-hours (kWh). One kWh is 1,000 Watts generated for one hour and is equal to 3,4138tu.

Energy - The capability of doing work; different forms of energy can be converted to other forms, but the total amount of energy remains the same.

Energy Crop - A plant grown with the express purpose to be used in biomass electricity or thermal generation.

Energy Storage - The process of storing, or converting energy from one form to another, for later use. Storage devices and systems include batteries, conventional and pumped storage hydroelectric, flywheels, compressed gas, hydrogen, and thermal mass.

Ethanol - A colorless liquid that is the product of fermentation used in alcoholic beverages, in industrial processes, and as a fuel.

Feedstock - A raw material that can be converted to one or more products.

Fossil Fuels - Fuels formed in the ground from the remains of dead plants and animals, including oil, natural gas, and coal. It takes millions of years to form fossil fuels.

Fuel - Any material that can be burned to make energy.

Fuel Oil - Any liquid petroleum product burned for the generation of heat in a furnace or firebox, or for the generation of power in an engine. Domestic (residential) heating fuels are classed as Nos. 1, 2, 3; Industrial fuels as Nos. 4, 5, and 6.

Generator - A device for converting mechanical energy to electrical energy.

Geothermal Energy - Energy produced by the internal heat of the earth; geothermal heat sources include: hydrothermal convective systems; pressurized water reservoirs; hot dry rocks; manual gradients; and magma. Geothermal energy can be used directly for heating and cooling or to produce electric power.

Head – A measure of fluid pressure, commonly used in water pumping and hydro power to express height that a pump must lift water, or the distance water falls. Total head accounts for friction and other head losses.

Heat Pump - An electricity powered device that extracts available heat from one area (the heat source) and transfers it to another (the heat sink) to either heat or cool an interior space or to extract heat energy from a fluid.

Hybrid System - An energy system that includes two different types of technologies that produce the same type of energy; for example, a wind turbine and a solar photovoltaic array combined to meet electric power demand.

Hydroelectric Power Plant - A power plant that produces electricity by the force of water falling through a hydro turbine that spins a generator.

Hydrogen - A chemical element (H_2) that can be used as a fuel since it has a very high energy content.

Landfill Gas - Naturally occurring methane produced in landfills that can be burned in a boiler to produce heat or in a gas turbine or engine-generator to produce electricity.

Large-scale or Utility-scale - A power generating facility designed to output enough electricity for purchase by a utility.

Load - Amount of electricity required to meet customer demand at any given time.

Meteorological (Met) Tower - A structure instrumented with anemometers, wind vanes, and other sensors to measure the wind resource at a site.

Ocean Energy Systems - Energy conversion technologies that harness the energy in tides, waves, and thermal gradients in the oceans.

Ocean Thermal Energy Conversion (OTEC) - The process or technologies for producing energy by harnessing the temperature differences between ocean surface waters and that of ocean depths.

Organic Rankine cycle – A system that uses a hydrocarbon instead of water as a working fluid to spin a turbine, and therefore can operate at lower temperatures and pressures than a conventional steam process.

Panel (Solar) - A term generally applied to individual solar collectors, and typically to solar photovoltaic collectors or modules.

Passive Solar Design - Construction of a building to maximize solar heat gain in the winter and minimize it in the summer, thereby reducing the use of mechanical heating and cooling systems.

Peak load – The amount of electricity required to meet customer demand at its highest.

Penstock - A component of a hydropower plant; a pipe that delivers water to the turbine.

Photovoltaics (PV) - Devices that convert sunlight directly into electricity using semiconductor materials. Most commonly found on a fixed or movable panel; also called solar panels.

Power - Energy that is capable of doing work; the time rate at which work is performed, measured in horsepower, Watts, or Btu per hour.

Production Tax Credit (PTC) – An incentive that allows the owner of a qualifying energy project to reduce their taxes by a specified amount. The federal PTC for wind, geothermal, and closed-loop biomass is 1.9 cents per kWh.

Radiation - The transfer of heat through matter or space by means of electromagnetic waves.

Railbelt - The portion of Alaska that is near the Alaska Railroad, generally including Fairbanks, Anchorage, and the Kenai Peninsula.

Renewable Resource - Energy sources which are continuously replenished by natural processes, such as wind, solar, biomass, hydroelectric, wave, tidal, and geothermal.

Run-of-River Hydroelectric - A type of hydroelectric facility that uses the river flow with very little alteration and little or no impoundment of the water.

Small-scale or Residential-scale - A generating facility designed to output enough electricity to offset the needs of a residence, farm or small group of farms, generally 250 kW or smaller.

Solar Energy - Electromagnetic energy transmitted from the sun (solar radiation).

Solar Radiation - A general term for the visible and near visible (ultraviolet and near-infrared) electromagnetic radiation that is emitted by the sun. It has a spectral, or wavelength, distribution that corresponds to different energy levels; short wavelength radiation has a higher energy than long-wavelength radiation.

Tidal Power - The power available from either the rise and fall or flow associated with ocean tides.

Transmission Grid - The network of power lines and associated equipment required to deliver electricity from generating facilities to consumers through electric lines.

Turbine - A device for converting the flow of a fluid (air, steam, water, or hot gases) into mechanical motion.

Wave Energy - Energy derived from the motion of ocean waves.

Wind Energy - Energy derived from the movement of the wind across a landscape. Wind is caused by the sun heating the atmosphere, earth, and oceans.

Wind Turbine - A device that converts energy in the wind to electrical energy, typically having two or three blades.

Windmill - A device that converts energy in the wind to mechanical energy that is used to grind grain or pump water.

Wind Power Class - A class based on wind power density ranging from 1 (worst) to 7 (best).

Wind Power Density - The amount of power per unit area of a free windstream.

Wind Resource Assessment - The process of characterizing the wind resource, and its energy potential, for a specific site or geographical area.

UNITS

Ampere - A unit of measure for an electrical current; the amount of current that flows in a circuit at an electromotive force of one Volt and at a resistance of one Ohm. Abbreviated as amp.

Amp-Hours - A measure of the flow of current (in amperes) over one hour.

Barrel (Petroleum) - Equivalent to 42 U.S. gallons (306 pounds of oil, or 5.78 million Btu).

British Thermal Unit (Btu) - The amount of heat required to raise the temperature of one pound of water one degree Fahrenheit; equal to 252 calories.

Cord (of Wood) - A stack of wood 4 feet by 4 feet by 8 feet.

Gigawatt (GW) - A unit of power equal to 1 billion Watts; 1 million kilowatts, or 1,000 megawatts.

Hertz - A measure of the number of cycles or wavelengths of electrical energy per second; U.S. electricity supply has a standard frequency of 60 hertz.

Horsepower (hp) - A measure of time rate of mechanical energy output; usually applied to electric motors as the maximum output; 1 electrical hp is equal to 0.746 kilowatts or 2,545 Btu per hour.

Kilowatt (kW) - A standard unit of electrical power equal to one thousand watts, or to the energy consumption at a rate of 1000 Joules per second.

Kilowatt-hour (kWh) - A common measurement of electricity equivalent to one kilowatt of power generated or consumed over the period of one hour; equivalent to 3,413 Btu.

Megawatt (MW) - One thousand kilowatts, or 1 million watts; standard measure of electric power plant generating capacity.

Megawatt-hour (MWh) - One thousand kilowatt-hours or 1 million watt-hours.

Mill - A common monetary measure equal to one-thousandth of a dollar or a tenth of a cent.

Quad - One quadrillion Btu. (1,000,000,000,000,000 Btu)

Therm - A unit of heat containing 100,000 British thermal units (Btu).

Terawatt (TW) - A unit of electrical power equal to one trillion watts or one million megawatts.

Tonne - A unit of mass equal to 1,000 kilograms or 2,204.6 pounds, also known as a metric ton.

Volt (V) - A unit of electrical force equal to that amount of electromotive force that will cause a steady current of one ampere to flow through a resistance of one ohm.

Voltage - The amount of electromotive force, measured in volts, that exists between two points.

Watt (W) - Instantaneous measure of power, equivalent to one ampere under an electrical pressure of one volt. One watt equals 1/746 horsepower, or one joule per second. It is the product of Voltage and Current (amperage).

Watt-hour - A unit of electricity consumption of one Watt over the period of one hour.

Watts per Square Meter (W/m^2) - Unit used to measure wind power density, measured in Watts per square meter of blade swept area.

October 2006

Summary

Geothermal energy is defined as heat from the Earth. It is one among only a few energy sources that is renewable, sustainable, and reliable over the long term. The United States, with a capacity of 2828.25 MW, continues to be the world leader in online capacity of geothermal power.

A. Externalities

Geothermal energy development, like any development, produces a series of effects. These effects, both positive and negative, include not only standard components such as the cost of building a power plant and generating power, but also effects that are sometimes difficult to quantify. Effects that are typically not taken into account in establishing the market price of goods or materials are known in economic circles as "externalities." In assessing the viability of an electricity source, externalities that should be considered include:

- average number of hours a facility can produce power in a 24 hour day
- ability of a facility to generate power during peak hours
- ability of a facility to increase/decrease generation, or be brought on line or shut down at the request of a utility's system operator
- the expected capacity factor of a facility (roughly defined as the reliability of a system)
- air emissions, other potential environmental effects, and related public health issues
- visibility and other aesthetic concerns
- water and waste disposal
- offsite fuel and transportation
- land usage, including the extent and impact of land use and zoning
- water usage
- employment

Geothermal power plants, like most types of power plants, promote economic growth. One of the unique external benefits of geothermal power, unlike many traditional types of power, is sustainable development. Geothermal development is sustainable because it is environmentally friendly and lasts for generations. Geothermal plants provide long-term, stable, well-paying jobs (typically in rural areas), produce nearly zero air emissions and associated health impacts, and supply billions of dollars to local, state, and federal economies through decades of reliable, secure, domestic, renewable energy production. In addition, geothermal plants can help states meet renewable portfolio standards (RPSs), ensuring that renewable power is available on a consistent, rather than intermittent, basis.

3711

B. Employment

A geothermal power plant provides significantly more jobs than a comparative natural gas-fired power plant, according to the Department of Energy (DOE).[1] Geothermal jobs are quality, long term, and diverse. According to the Environmental Impact Statement/Environmental Impact Report (EIS/EIR) for the proposed Telephone Flat geothermal development project located in the Glass Mountain Known Geothermal Resource Area (KGRA) in California, the average wage at the facility will be more than double the average wage in the surrounding counties. GEA's employment survey found that the overwhelming majority of geothermal jobs (95%) are permanent, and most are also full-time.

In 2004 the geothermal industry supplied about 4,583 direct power plant related jobs. The total direct, indirect, and induced[2] employment impact of the industry in 2004 was 11,460 full-time jobs.[3] Looking to the future, geothermal employment should expand significantly. In 2005 alone, GEA has verified over 2000 MW of geothermal projects under development, which would increase geothermal capacity, and subsequently geothermal employment, by over 70%. Within the next ten years, the Western Governors' Association (WGA) estimates that over 5600 MW could be produced in eleven U.S. states, the economic effect of which is detailed in the table on page v.

Geothermal Development and Rural America

Rural areas that suffer from particularly high rates of unemployment can benefit from geothermal development. Because geothermal resources (hot water and steam) cannot be transported long distances and electricity is generated on-site, development facilities are located at the site of the resource. As a result, geothermal development and associated economic benefits occur in remote, rural areas. At the Mammoth Pacific Power Plant in Mammoth Lakes, California, the contested geothermal facility now produces substantial revenue, employment, and energy security for the small town in which it is located, while avoiding virtually all of the hydrologic and aesthetic concerns raised during the planning process. The plant is now considered a geothermal success story by industry and community members.

C. Economic Impacts

Geothermal's upfront costs, comprising mainly of exploration and development, make up the majority of costs accrued over the life of the plant. The operation and maintenance (O&M) phase accounts for a very small percentage of total costs, but can vary depending upon the location of the facility. O&M costs are low because geothermal relies on a

[2] See glossary for definitions
[3] Geothermal Energy Association (GEA) (September 7, 2005). *Expanding Geothermal Power Could Create 100,000 New Jobs*. Press Release. Retrieved June 16 2006 from www.geo-energy.org.

sustainable, environmentally friendly, low-maintenance fuel that is basically free once it is developed.

Most geothermal developers agree that the levelized cost[4] of power for new geothermal projects ranges from about 5.5 to 7.5 cents per kilowatthour (kWh). The following table displays the average cost figures for several phases of geothermal development.[5]

Selected Cost Parameters of a Geothermal Power Plant

PHASE	SUBPHASE (if applicable)	2004 Cost per kW	Cost for 50 MW Plant
Exploration		$150	$7.5 million
Site Development	Permitting	$20	$1 million
	Drilling	$750	$37.5 million
	Steam Gathering	$250	$12.5 million
	Power Plant equipment & construction	$1500	$75 million
	Transmission	$100	$5 million
Total		$2770	$138.5 million

It is important to note, when considering the figures in the table above, that actual cost figures vary considerably from site to site based upon a number of factors. These factors include:

- Type of project: expansion of an existing project will entail less exploration cost than a "greenfield" project (one that hasn't been previously drilled), where specific resource locations are unknown
- Plant size: the larger the plant, the less the cost per megawatt (economies of scale)
- Well characteristics: depth, diameter, productivity, subsurface geology, rock formation properties
- Site accessibility and location
- Time delays
- Ease with which the resource can be retrieved, influenced by permeability, depth of the reservoir, and pressure
- Characteristics of the geothermal fluid/steam, including chemistry and temperature

[4] See glossary for definitions

3712

- Fluctuations in the costs of certain materials or services, such as drilling, cementing, or steel for well casing
- Lease and permitting costs/issues
- Transmission costs
- Tax incentives, such as the production tax credit (PTC) included in the 2005 Energy Policy Act (EPAct)
- Financing: types of investors, interest rates, debt periods, rate of return
- Resource availability and quality
- Seasonal and weather variability

Geothermal facilities provide substantial contributions to the United States economy. The chart on page v indicates the economic output that would result if WGA's geothermal potential estimates are achieved.

The table below summarizes some of the economic benefits produced by an average, 50 MW facility over 30 years of operation on federal lands. While 30 years is the standard economic timeframe used to calculate costs at most energy facilities, geothermal plants typically last more than 30 years. Other socioeconomic benefits, including tax contributions, are not captured in this table.

Sample Economic Benefits at a 50 MW Geothermal Power Plant

Employment (direct, indirect, and induced)		212 fulltime jobs/800 person-years (p-*y)[6]
Economic Output (over 30 years, nominal)		$749 million
Royalties	Contribution to the Federal Government	$5.46 million
	Contribution to the State	$10.9 million
	Contribution to the County	$5.46 million

Besides the costs expended through the development and construction of a power plant, geothermal developers often make significant contributions to the communities in which they are located, as well as the local, state, and federal governments under whose jurisdiction they operate. Some contributions come as royalties or taxes, which are mandated by the government, while some come voluntarily from the geothermal company. In addition, wages paid to geothermal employees often circulate back through the community.

[6] Person year corresponds to the employment of one person during one year.

Summary of Western States' Near-Term Geothermal Potential and Resulting Employment and Economic Contribution

	New Power Capacity (MWs)	Direct and Indirect and Induced Employment (Power Plant Jobs/Construction & Manufacturing Employment)**	30 Year Economic Output (nominal)+
California	2,400	10,200 ft jobs/38,400 person*yrs	$36 billion
Nevada	1,500	6,375 ft jobs/24,000 person*yrs	$22.5 billion
Oregon	380	1,615 ft jobs/6,080 person*yrs	$5.7 billion
Washington	50	212 ft jobs/800 person*yrs	$749 million
Alaska	25	106 ft jobs/400 person*yrs	$375 million
Arizona	20	85 ft jobs/320 person*yrs	$300 million
Colorado	20	85 ft jobs/320 person*yrs	$300 million
Hawaii	70	298 ft jobs/1,120 person*yrs	$1 billion
Idaho	860	3,655 ft jobs/13,760 person*yrs	$12.9 billion
New Mexico	80	340 ft jobs/1,280 person*yrs	$1.2 billion
Utah	230	978 ft jobs/3,680 person*yrs	$3.4 billion
Wyoming, Montana, Texas, Kansas, Nebraska, South Dakota, North Dakota	Potential Exists; Resource not studied in WGA Report	Not Studied	Not Studied
Total Western States (additional to current)	**5,635 MW**	**23,949 fulltime jobs/90,160 person*years of construction and manufacturing employment**	**84,410,046,000.00** **Almost 85 billion dollars to the U.S. economy over 30 years**

** Power plant jobs are the direct, indirect and induced full-time jobs (ft jobs) created by reaching the full power production capacity indicated. Construction and manufacturing jobs are the direct, indirect and induced jobs necessary to build and supply the power plants at the full power capacity indicated. Construction and manufacturing jobs are expressed as full-time positions for one year (person*years), however these jobs will be spread out over several years depending upon the development time frame for new projects. Direct employment results in 1.7 full time positions and 6.4 person*years per megawatt. Induced and indirect impacts were calculated assuming a 2.5% multiplier; for a total direct, indirect, and induced employment impact of 4.25 full time positions and 16 person*years per megawatt.

+Economic Output measures gross power sales over 30 years, assuming power sells at $.06/kWh and produces at a 95% capacity factor. Economic output is represented in nominal dollars, is not adjusted for inflation, and is rounded to the nearest million. Total economic output is not rounded.

I. INTRODUCTION

A. Background

In 2004, the Geothermal Energy Association (GEA), in support of the U.S. Department of Energy (DOE) Geothermal Technologies Program, surveyed the existing U.S. based geothermal literature related to socioeconomics. Much of this information turned out to be old, incomplete, or inconsistent. In an effort to update and improve the available information, GEA produced two publications on the socioeconomics of geothermal energy: *Factors Affecting Cost of Geothermal Power Development* and *Geothermal Industry Employment Survey Results and Analysis*. However, even after these publications were released, GEA routinely received questions about the basic economic, social, and employment impacts related to geothermal energy. Drawing upon the existing GEA documents and additional sources, GEA has produced this *Handbook on the Externalities, Employment, and Economics of Geothermal Energy* to address these key questions. "Externalities," including social and environmental effects, are costs or benefits attributable to activities that are not reflected in the price of the goods or services produced.

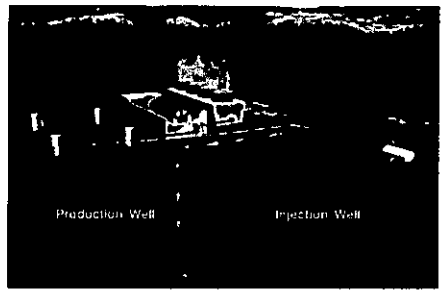
This handbook is divided into five sections. Some of the most common questions related to geothermal costs and benefits will be answered in each, including:

- *I. Introduction*: What is geothermal energy? How much geothermal energy is produced? What is geothermal potential?
- *II. Externalities*: What are the environmental implications of geothermal development? Is geothermal development sustainable?
- *III. Employment*: What types of jobs are created by the geothermal sector, and how long will they last? How many people currently work in the U.S. geothermal industry?
- *IV. Economic Impacts*: What is the cost of geothermal power or of a geothermal facility? Does the price of geothermal power fluctuate? What is the total estimated geothermal contribution to the U.S. economy?
- *V. Case Study Analysis (Mammoth Pacific Power Plants)*: Did the construction of the geothermal power plants at Mammoth impact tourism? After several decades, how have the power facilities affected the community?

B. Geothermal Basics

Geothermal energy is defined as heat from the Earth. It is considered a renewable resource because the heat emanating from the interior of the Earth, estimated to be equivalent to 42 million MW of power, is essentially limitless and continuously regenerates through natural geologic processes. The four main types of geothermal power plants are flash, binary, dry steam, and flash/binary combined cycle.

Figure 1: Basic Structure of a Geothermal Power Plant



Source: Geothermal Education Office (GEO)

To develop electricity from geothermal resources, wells are drilled into deep subsurface permeable regions containing natural hot water or steam, far below the shallow groundwater depth. The wells bring the hot fluids to the surface for use in generating electricity. Because hot geothermal fluids will cool if transported more than a few miles from the wellheads, geothermal power plants must be built at the site of the reservoir. If the deep resource contains hot compressed liquid water, it may be expanded to create steam or used to heat a secondary fluid that is converted to steam. The expanding steam is separated in a surface vessel (steam separator) and delivered to the spinning turbine, and the turbine powers a generator.[8] Flash, the most popular type, starts with hot water to produce electricity, while dry steam starts with hot steam to produce electricity. In the binary process, the geothermal water heats another liquid that boils at a lower temperature than water. The two liquids are kept completely separate through the use of a heat exchanger, so geothermal's already low emissions are reduced to zero. A combination of flash and binary technology, known as the flash/binary combined cycle, has been used effectively to take advantage of the benefits of both technologies.

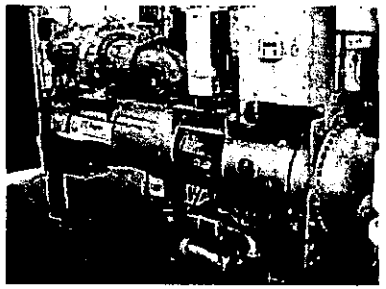
Two cooling options are available: water or air cooling. The most popular type, water cooling, requires a continuous supply of cooling water and creates vapor plumes. Air cooled systems, in contrast to the relative stability and continuous efficiency of water cooled systems, can be extremely efficient in the winter months, but are less efficient in hotter seasons when the contrast between air and water temperature is reduced, so that air does not effectively cool the organic fluid. Air cooled systems are preferred in areas where the viewshed is particularly sensitive to the effects of vapor plumes, as vapor plumes are only emitted into the air by water cooling towers and not air cooling towers. Most geothermal air cooling is used in binary facilities.

While geothermal resources capable of power generation are only economically viable in the geologically active western states at this time, geothermal fluids and the heat they contain are currently used in 26 states for "direct uses" in spas, for space and district heating, and in industry, agriculture and aquaculture. Besides electricity production and

[8] Kagel, Alyssa et al. (2005). *Geothermal Energy and the Environment*. Geothermal Energy Association (GEA). Retrieved August 2, 2006, from www.geo-energy.org.

direct use, the third type of geothermal use, often called "geothermal heat pump" or "ground source heat pump" technology, does not require a geothermal reservoir. Rather, heat pumps make use of stable temperatures of approximately 65°F just a few feet underground, and can be used anywhere in the world. While this paper focuses on geothermal power production that takes place in the western U.S., widespread applications and uses of geothermal energy, such as through direct use or heat pump applications, span the entire country.

Figure 2: New Technology Using Low Temperature Resources at Chena Hot Springs in Alaska



Source: Chena Hot Springs, Alaska

Experts are exploring ways to produce geothermal energy in a variety of new ways: using oil and gas wells, hot dry rock (HDR) technology (an application that does not require liquid or steam), and low temperature resources, for example. Further advancements could make geothermal energy for direct use and power production economically viable throughout the U.S.

C. Current Generation

The United States continues to be the world leader in online capacity of geothermal energy. According to the Energy Information Administration (EIA), geothermal energy in 2005 generated approximately 16,010 Gigawatt hours (GWh) of electric generation or about 0.36% of U.S. annual electricity generation. U.S. capacity is rated at 2828.25 MW.

1. Developing Projects

Up to 1,500 MW of new geothermal power plant capacity are currently under development in the United States. 223 MWs are currently under construction in eight projects across the western United States. Unconfirmed projects (some of which are likely to be developed within the next few years) raise these numbers to over 2,000 MW of potential capacity currently under consideration.

D. Potential

Estimates for geothermal potential vary depending upon the study cited and the assumptions behind each study. A study considering only near-term potential, for example, will present vastly different numbers than a study considering long-term potential. Whether the timeframe considered is short or long, the potential for geothermal development is significantly greater than current geothermal output. With future technologies in geothermal engineering, geothermal output could exceed all the worldwide oil, gas and coal resources.

1. Short-Term Potential

In late 2005, the Western Governors' Association (WGA) estimated that nearly 6,000 MW of potential exist in eleven U.S. states at known, readily developable sites.[9] This resource base could produce electricity within 10 years without any technological advances. It is considered a short-term, limited potential estimate.

2. Long-Term Potential

The U.S. Geological Survey (USGS), in its Circular 790,[10] estimates a hydrothermal (liquid) resource base in each of two categories: an Identified Resources Base, which locates each of the sites included by latitude and longitude and presents specific information on each in the appendix, and an Undiscovered Resource Base, which is limited by depth, heat and location-related parameters. The potential, as assessed by USGS Circular 790, is as follows:

- Identified Resources Base (excluding National Parks): 23,000MW +/- 3,400 MW
- Undiscovered Resource Bases: 72,000-127,000MW
- Total Identified and Undiscovered Resource Base: 95,000-150,000MW

The USGS is currently working to revise these estimates using modern techniques that were not available during the study noted above and published in 1978.

II. EXTERNALITIES

Geothermal energy development, like any development, produces a series of effects. These effects, both positive and negative, include not only standard components such as the cost of building a power plant and generating power, but also effects that are sometimes difficult to quantify. Effects that are typically not taken into account in establishing the market price of goods or materials[11] are known in economic circles as "externalities." Notes one researcher, "the externality cost of fossil fuels...is not taken into account in the conventional analysis of electricity production cost per unit of energy produced."[12] Despite the fact that negative externalities such as pollution or land degradation, and positive externalities such as increased employment and reduced health risks, are rarely figured into conventional cost analysis, they should still be considered in assessing the viability of a resource. Numerous studies show that externalities significantly change costs – some studies even indicate that the externality costs of burning coal for electricity can be greater than the generation costs.[13]

Geothermal energy provides secure, low cost, reliable, environmentally friendly heat and electricity; supplies thousands of quality jobs; boosts rural economies; increases tax bases; stabilizes energy prices; provides baseload power; and diversifies the fuel supply. Each of these externalities benefits the U.S. economy in direct and indirect ways. Geothermal plants, for example, unlike coal and natural gas, incur no "hidden costs" such as offsite degradation of land and waterways, high air emissions, and health impacts to humans. Some of the factors to consider when choosing an energy source for a particular region are illustrated in table 1 on the following page.

Hydropower	24	Y	Y	30-35
Biomass	24	Y	Y	83

*The wind figure refers to full operation only; this figure increases if partial wind generation is considered.

Other externalities, besides those listed in the above table, include but are not limited to aesthetic concerns, resource availability and cost, environmental concerns, waste and water disposal, resource quality, transportation, land degradation, extent and impact of land use, zoning, water usage, and seasonal variability. The California Energy Commission (CEC) confirmed the importance of considering outside factors: "a more comprehensive analysis, which evaluates economic and environmental impacts, would be preferable to resource evaluation based on rate impacts alone."[16]

These outside factors influence all electricity sources. Nuclear plants, for example, use extensive land and water resources and have near and long-term spent fuel disposal concerns. Natural gas plants, in contrast to nuclear, suffer from considerable problems with fuel availability, a concern that has driven up the price of natural gas in recent years. Coal plants, while generally more economical than nuclear or natural gas facilities, use extensive land and water resources, suffer from significant environmental concerns such as air emissions and health impacts, and have mine tailings disposal problems. Solar and wind plants, with few water use issues, have land use, aesthetics, and resource availability problems. Geothermal is consistently available, but geothermal reservoirs must be managed properly in order to ensure sustainability, and thus, geothermal plants have potential resource availability concerns. Production from hydropower fluctuates with snow and rain fall and seasonal variability, and can be destructive if not managed carefully. Biomass plants also suffered fuel availability problems.

[14] A plant that is *Dispatchable* can increase or decrease generation, or be brought on line or shut down at the request of a utility's system operator.
[15] A plant that is capable of *Peaking* can be used to meet daily increases in electricity demand. Power demand tends to peak in late afternoon or early evening before gradually declining to its lowest point at night.
[16] Miller, Santord A (Sept/Oct 1996). Incorporating Economic and Environmental Externalities of Geothermal and Natural Gas Generating Technologies. GRC Transactions; Vol 20. 187 – 193.

A. Meeting State RPS Requirements

Twenty states and the District of Columbia have Renewable Portfolio Standards (RPSs) which requires that a percentage of the electricity supplied by generators be derived from renewable sources. For many states, geothermal may be the preferred option to meet RPSs: geothermal is one of the only renewable energy sources that delivers reliable, baseload power. When geothermal is used in conjunction with other renewables such as wind and solar to meet RPSs, geothermal helps ensure that renewable power is available on a consistent, rather than intermittent, basis.

B. Promoting Sustainable Development

Sustainability is defined by the USGS as "economic development that takes full account of the environmental consequences of economic activity and is based on the use of resources that can be replaced or renewed and therefore are not depleted." A resource that is naturally renewable, such as geothermal energy, must still be properly managed to ensure sustainability. Geothermal energy is managed through the use of a geothermal reservoir: wells are drilled into the reservoir, and the hot liquid or steam is brought up to the surface and used to produce power. If the fluid in the reservoir is extracted at a faster rate than the rate at which it naturally regenerates, the reservoir will not be sustainable. Geothermal engineers must determine the rate at which geothermal energy (heat) can be extracted from the reservoir so that maximum electricity can be produced and the longevity of the reservoir can be preserved. Obtaining sustainability also depends upon the rate of injection of the resource (see *Steam Gathering System*, page 27, for more information about injection). While *sustainability* describes how a resource is used, *renewability* describes a property of a resource.[17] Geothermal is one among only a few energy sources that is both renewable and, if properly managed, sustainable over the long term.

Development fuels economies and grows communities. But development can sometimes produce negative externalities, including pollution from industrial activity, or short-term economic booms followed by long-term busts. *Sustainable development* is a type of development that is successful only when social, economic, and environmental consequences are considered over a longer timeframe. According to the International Institute for Sustainable Development (IISD), sustainable development must integrate environmental stewardship, economic development and the well-being of all people—not just for today but for countless generations to come.[18]

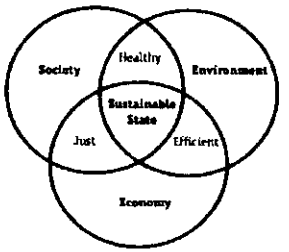
Figure 3: Three Spheres of Sustainable Development



Source: The Official Website of the state of New Jersey

Geothermal plants facilitate sustainable development. They provide long-term, stable, well-paying jobs (see *Employment* for more information), produce nearly zero air emissions and associated health impacts, and supply hundreds of thousands of dollars to local, state, and federal economies through decades of reliable, renewable, consistent energy production. The three spheres necessary for sustainable development are illustrated in the figure to the left, and discussed in more detail in the following sections.

1. Economy

Geothermal projects generate revenue for small, rural communities. Taxes and royalties paid by developers help support and grow underserved areas. The economic benefits of geothermal extend beyond just the community or sector in which they are located: for every dollar invested in geothermal energy, at least 2.5 dollars are invested back into the economy.[19] Over time, geothermal's economic benefits are even greater. Geothermal use throughout the U.S. helps stabilize volatile energy markets, and brings diversity and security to the economy (see *Direct Payments* for more information).

2. Environment

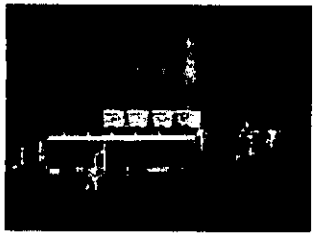
Development of any kind may cause environmental impacts. Any energy source, renewable or not, will require land and manmade materials, but renewable energy sources create far fewer environmental impacts than traditional fossil fuel sources. Geothermal, in particular, is unique in its ability to produce few environmental impacts, while also ensuring a high level of dependability.

[19] Hance, Nathanael (2005). *Factors Affecting Cost of Geothermal Power Development*. Geothermal Energy Association (GEA) and represent 2004$. Geothermal Energy Association (2004). *Geothermal Energy Potential*. Retrieved November 10, 2004, from http://www.geo-energy.org/USGeoProv.pdf.

a) Air Emissions

Geothermal produces significantly less air pollution per unit of energy produced than traditional fossil fuel sources, resulting in fewer respiratory health problems for the U.S. population. The American Lung Association estimates that power plant emissions, primarily from coal plants, result in over 30,000 yearly deaths.[20] Greater use of geothermal power can decrease air emissions as compared to a greater use of fossil-fuel generation. This is certainly the case for Lake County, California, downwind of the world's largest geothermal field known as "The Geysers." Lake County is the only air district in California that has been in compliance with all state and federal air quality standards for over 17 years.

Figure 4: West Ford Flat Power Plant at The Geysers



Source: Calpine Corporation

Because fossil fuel health impacts are difficult to monetize, it is difficult to approximate the cost savings produced by renewable electricity options. One way to approximate positive geothermal externalities is to examine the economic values received for air emissions in existing emissions trading systems.

An article published in the *Electricity Journal* by GEA attempts to monetize the cost savings of geothermal power. GEA calculated geothermal's emissions savings compared with coal if examined within emissions trading markets. The study found that the positive externality benefits of geothermal from avoided air emissions—considering only carbon dioxide, sulfur dioxides, nitrogen oxides, and particulate matter—is $255.4 million per year.[21] In contrast, a 1995 study estimates that costs of power generation would increase 17% for natural gas and 25% for coal if environmental costs were included.[22] These additional costs include land degradation, potentially hazardous air emissions, forced extinction and destruction of animals and plants, and health impacts to humans.

[22] Haberle and Flynn (1995). *Comparative Economics and Benefits of Electricity Produced from Geothermal Resources in the State of Nevada*. Univ. of Nevada, Las Vegas.

Recent studies show that both air quality and renewable technologies would benefit from stricter emissions control. An analysis of emissions legislation including "four pollutants,"—mercury, carbon dioxide, sulfur dioxides, and nitrogen oxides—as opposed to only "three pollutants"—mercury, sulfur dioxides, and nitrogen oxides— show that renewables energy sources such as geothermal increase most significantly under a four pollutant plan that includes regulations to reduce CO_2 emissions.[23]

Today's U.S. Geothermal output offsets harmful pollutants and greenhouse gases that would otherwise be generated by coal facilities each year, including 16 million tons of carbon dioxide (CO_2), 78 thousand tons of sulfur dioxides (SO_2), 32 thousand tons of nitrogen oxides(NO_x) and 17 thousand tons of particulate matter (PM).[24]

b) Public Health

Health impacts deliver an unfair burden to people living in the areas where fossil fuel plants are developed, as well as areas downwind of polluting plants where emissions travel. When a community's health is affected, its pocketbook is affected as well. According to one study, "health care is the single largest and fastest growing segment in numerous state and city budgets."[25]

A 2004 study by Abt Associates, a consulting firm regularly employed by the Environmental Protection Agency (EPA), attempted to quantify costs associated with fossil fuel pollution.[26] The study found that health impacts associated with particulate matter emissions[27] from coal power plants alone subtracts billions of dollars each year in the form of healthcare costs from the U.S. economy. According to the report, the health care costs resulting from emissions at coal facilities, in 1999 $ by 2010, would be:

- $150 billion: mortality
- $5.5 billion: chronic bronchitis
- $3.3 billion: heart attacks
- $187 million: respiratory hospital admissions
- $206 million: cardiovascular hospital admissions

Prepared for Clean Air Task Force*. Retrieved April 10, 2006, from http://www.clearthenir.org/dirtypower/docs/abt_powerplant_whitepaper.pdf.
[27] Particulate matter (PM) is a broad term for a range of substances that exist as discrete particles. Particulate matter includes liquid droplets or particles from smoke, dust, or fly ash.

3720

- $7 million: emergency room visits for asthma
- $13 million: acute bronchitis
- $16 million: upper and lower respiratory symptoms
- $367 million: work loss days
- $956 million: minor restricted days

These costs total almost $160 billion, and place a substantial burden on hospitals, health care professionals, health insurers, taxpayers, company productivity, not to mention the individuals inflicted with these ailments.

If other emissions besides particulate matter were considered—including NOx, SO_2, CO_2, or mercury—or if fossil fuel sources other than coal were considered, the health care cost estimates would increase. The figure below compares particulate matter emissions from coal, natural gas, and geothermal power plants.

Figure 5: Particulate Matter Comparison

	Coal	Natural Gas	Geothermal
Lbs/MWh	2.23	0.14	0

Comparing pulverized coal boiler, natural gas combined cycle, and average existing power plant, geothermal.

Source: Antares Group, Inc.

c) Environmental Implications of Baseload Power

Geothermal energy is a baseload resource: it is available 24 hours a day, 365 days a year. Not only does baseload power contribute to power stability, it also contributes to environmental stability. An intermittent peaking plant—one that is available only part of the day, or only during peaking hours—usually works in conjunction with a more reliable energy source. This means that an intermittent plant—even if it is renewable and emissions free—supplies consistent power only if paired with a baseload plant—usually a polluting fossil fuel plant such as a coal facility. When two plants are necessary, more land is required, and greater environmental impacts, such as air emissions, are produced. Geothermal is one of only a few resources that is clean, renewable—and also baseload.

3. Society

Geothermal provides a much needed source of employment to rural communities. Geothermal jobs are typically stable, long term, diverse, and high quality (see *Employment* for more information). Property taxes and royalty revenues are typically allocated to schools and roads. In counties with geothermal power projects on federal leases, a provision of the 2005 Energy Policy Act (EPAct) requires that 25% of the federally imposed royalty is returned to the county of origin, 25% to the federal government, and 50% to the state (previously royalties were equally shared by the state and federal government). Most developers hire locally and donate additional funds to local schools, museums and community centers.

a) Increasing National Security

Of the renewable options usually considered, geothermal is one of the few that provides baseload power while at the same time lowering homeland security risks. Geothermal plants do not rely upon unstable international energy sources. Also, geothermal facilities are local, and smaller than large fossil or nuclear plants. Geothermal plants are therefore important regional energy sources that are less likely to be used as terrorist targets. Finally, geothermal plants are not significantly impacted by scheduled outages.

b) Producing Power at Home

By producing power at home, jobs and revenue are generated in the U.S., rather than transported overseas. In addition, transportation over long distances in not required. Geothermal energy can displace natural gas in the electric power sector, which is increasingly imported from overseas sources.

III. EMPLOYMENT

A. Current Employment

Geothermal provides more jobs per MW than natural gas, according to the DOE, as shown in Table 2 below.[28] While the figures in table 2 are not consistent with GEA's most recent employment data, the information is included for comparison purposes only.

Table 2: Comparative Job Creation

Power Source	Construction Employment (jobs/MW)	O&M Employment (jobs/MW)	Total Employment for 500 MW Capacity (person-years)
Geothermal	4.0	1.7	27,050
Natural Gas	1.0	0.1	2,460

Source: U.S. DOE[29]

In 2004 alone, the geothermal industry supplied about 4,583 direct power plant related jobs. The total direct, indirect, and induced impact[30] of the industry in 2004 was 11,460 full-time jobs.[31] Employment is expected to increase in coming years as geothermal plant development and research expands.

B. Job Quality

Not only does geothermal provide more jobs than a traditional power plant, it also provides quality, long-term jobs. According to the proposed Telephone Flat geothermal development project EIS/EIR located in the Glass Mountain Known Geothermal Resource Area, the average wage at the facility will be more than double the average wage in surrounding counties. According to the California census bureau, the average

[28] U.S. DOE (Jan 2006). *Employment Benefits of Using Geothermal Energy*, Geothermal Technologies Program. Retrieved March 17, 2006 from http://www1.eere.energy.gov/geothermal/employ_benefits.html.
[29] This table is included for comparative purposes only. While these geothermal employment numbers are not consistent with GEA's updated employment information, GEA chose to include this table, endorsed by US DOE, in order to show how geothermal's employment figures compare with natural gas'. GEA has chosen to include these slightly outdated figures because they allow an even comparison between natural gas and geothermal. As we do not have updated natural gas figures, we cannot update only the geothermal figures for the purpose of comparison.
[30] See glossary for definitions
[31] GEA Press Release (2005). *Expanding Geothermal Power Could Create 100,000 New Jobs*. Retrieved May 17, 2006, from http://www.geo-energy.org/publications/pressReleases/Expanding%20Geothermal%20Power%20Could%20Create%20100,000%20New%20Jobs%20September%207%202005.pdf.

per capita income in 1998 in the closest counties was around $20,000, with the average California per capita income nearly $8,000 higher.[32] The average projected wage related to operation at the Telephone Flat facility would be higher than both the county and state averages, totaling between $40,000 and $50,000 (1998 $).[33]

GEA's employment survey found that the overwhelming majority of geothermal jobs are permanent (95%), and most are also full-time. At The Geysers in California, 425 full-time and 225 part-time residents of the community are employed.[34]

1. Geothermal Employment and Rural America

Geothermal resources tend to be located in rural areas with few employment opportunities. Because geothermal energy must be developed where the resource is located, geothermal power plants tend to benefit these economically depressed areas by providing jobs, stability, and revenue. Geothermal developers, who typically negotiate 10 to 30 year agreements with purchasers (see *Financing* for more information), provide jobs that can be guaranteed for decades, presuming plants are not sold or do not suffer from financial problems.

Rural communities face many unique challenges. Lack of stable, secure, long-term jobs in rural communities leads many young adults with "the most education and the greatest earning potential" to emigrate, leaving a poorer, older, and smaller population.[35] Many rural communities, including those in which geothermal facilities tend to be located, suffer from significantly higher unemployment rates than the general population. In 2004, California's unemployment rate was 6.2%, while Siskiyou County, one of the areas closest to the proposed Telephone Flat proposed geothermal power plant, had an unemployment rate more than one-third higher than the California average, at 9.3%.[36] The Center for Mental Health Services (CMHS), found that "many rural Americans are at or below the national poverty level," which can result in physical and psychological harm.[37] Unemployment in rural communities makes residents particularly susceptible to high levels of social and health related problems—more so than their urban counterparts.[38]

[38] Jackson, Glenn & Charles Cook, Substance Abuse and Mental Health Services Administration

Rural communities tend to focus on a single source of revenue, such as manufacturing or agriculture, and this can contribute to unemployment and economic instability. Geothermal offers an important means of diversifying the economic base and simultaneously adopting an "innovative income-generating [strategy] to build on...assets, diversify...economies, attract new businesses, and sustain... successes."[39] Such diversification, according to the Sonoran Institute, is a direct indicator of economic stability.[40] The jobs within at a geothermal facility cover a broad spectrum of skills, and draw from a diverse selection of applicants.

2. Types of Jobs Created

Geothermal provides long-term income for people with a diversity of job skills. People employed by the sector include welders; mechanics; pipe fitters; plumbers; machinists; electricians; carpenters; construction and drilling equipment operators and excavators; surveyors; architects and designers; geologists; hydrologists; electrical, mechanical, and structural engineers; HVAC technicians; food processing specialists; aquaculture and horticulture specialists; managers; attorneys; regulatory and environmental consultants; accountants; computer techs; resort managers; spa developers; researchers; and government employees.

C. Projected Employment

Looking to the future, geothermal employment should expand significantly. In 2005 alone, GEA has verified over 2000 MWs of geothermal projects under development. If only half of this development comes online within the next few years (a conservative estimate), these new facilities will support 6400 person-year (p-*y) manufacturing and construction jobs and 740 power plant O&M jobs. If these 1000 MW last 30 years – another conservative estimate – new production will create 28,600 p*-y jobs. This employment estimate increases if the additional jobs brought on by research, direct use applications, and other geothermal activities are considered. The number also excludes indirect employment impacts.

Figure 6: Power Plant Workers

Source: EERE Geothermal Technologies Program

Take just one example of a developing project in Imperial County, California, at the Salton Sea Unit 6, where all permits have been secured for a 215 MW plant. Once this power plant produces electricity, it will be one of the largest renewable energy projects in the United States. According to congressional testimony, the plant will employ 550 construction workers, eventually leading to more than 60 "high paid, fulltime positions." Testimony concludes that the plant will represent "the single largest capital investment in Imperial County, which is the most economically disadvantaged area in the state."[41]

1. California Potential

Geothermal provides 5% of California's electricity, only a small percentage of the known, developable potential. This potential could contribute much-needed electricity to areas where the population is on the rise and blackouts have already occurred. In California, geothermal is expected to contribute more jobs to the state than any other renewable sector. The table on the following page shows the number of both construction and operational person-years that will likely be generated over the lifetimes of the plants built in California, producing electricity for California, from 2003-2017:[42]

2. Direct and Indirect Potential, Western States

Most industries measure employment through both direct and indirect employment impacts. While indirect impacts are somewhat difficult to quantify, they help capture an industry's overall employment. According to a report by the Western Governors' Association (WGA),[43] development of the near-term geothermal potential of 5,600 MW of geothermal energy would result in the creation of almost 100,000 new power plant, manufacturing and construction jobs. If the USGS estimate of 125,000 MW of geothermal potential is developed, millions of quality jobs will be created. The table on the following page shows employment and resulting economic output estimates based on WGA's near-term estimates.

[43] Western Governors' Association (WGA) (2005). *CDEAC - Geothermal Task Force*. Retrieved March 14, 2006, from http://www.westgov.org/wga/initiatives/cdeac/geothermal.htm.

Table 4: Summary of Western States' Near-Term Geothermal Potential and Resulting Employment and Economic Contribution

	New Power Capacity (MWs)	Direct and Indirect and Induced Employment (Power Plant Jobs/Construction & Manufacturing Employment)**	30 Year Economic Output (nominal)+
California	2,400	10,200 ft jobs/38,400 person*yrs	$36 billion
Nevada	1,500	6,375 ft jobs/24,000 person*yrs	$22.5 billion
Oregon	380	1,615 ft jobs/6,080 person*yrs	$5.7 billion
Washington	50	212 ft jobs/800 person*yrs	$749 million
Alaska	25	106 ft jobs/400 person*yrs	$375 million
Arizona	20	85 ft jobs/320 person*yrs	$300 million
Colorado	20	85 ft jobs/320 person*yrs	$300 million
Hawaii	70	298 ft jobs/1,120 person*yrs	$1 billion
Idaho	860	3,655 ft jobs/13,760 person*yrs	$12.9 billion
New Mexico	80	340 ft jobs/1,280 person*yrs	$1.2 billion
Utah	230	978 ft jobs/3,680 person*yrs	$3.4 billion
Wyoming, Montana, Texas, Kansas, Nebraska, South Dakota, North Dakota	Potential Exists; Resource not studied in WGA Report	Not Studied	Not Studied
Total Western States (additional to current)	**5,635 MW**	**23,949 fulltime jobs/90,160 person*years of construction and manufacturing employment**	**84,410,046,000.00** **Almost 85 billion dollars to the U.S. economy over 30 years!**

** Power plant jobs are the direct, indirect and induced full-time jobs (ft jobs) created by reaching the full power production capacity indicated. Construction and manufacturing jobs are the direct, indirect and induced jobs necessary to build and supply the power plants at the full power capacity indicated. Construction and manufacturing jobs are expressed as full-time positions for one year (person*years), however these jobs will be spread out over several years depending upon the development time frame for new projects. Direct employment results in 1.7 full time positions and 6.4 person*years per megawatt. Induced and indirect impacts were calculated assuming a 2.5% multiplier; for a total direct, indirect, and induced employment impact of 4.25 full time positions and 16 person*years per megawatt.

+Economic Output measures gross power sales over 30 years, assuming power sells at $.06/kWh and produces at a 95% capacity factor. Economic output is represented in nominal dollars, is not adjusted for inflation, and is rounded to the nearest million. Total economic output is not rounded.

II. COSTS AND PAYMENTS

Geothermal's upfront costs, made up of exploration, resource confirmation and characterization (drilling and well testing), and site development (facility construction), comprise the majority of costs accrued over the life of the plant. In 2001, the Electric Power Research Institute (EPRI) estimated that capital reimbursement and associated interest account for 65% of the total cost of geothermal power, while the cost of fuel and operation account for only 35%. In contrast, fossil fuel facilities typically spend 65% on fuel, and only 35% on upfront costs.[44] Geothermal's high upfront costs and low O&M costs, while challenging to developers and investors, help stabilize the power market. Since the cost of fuel at a geothermal plant is so low compared to the initial cost of planning for and building the plant, the operational cost is less likely to fluctuate.

The following sections highlight cost information for each phase of development: exploration, confirmation, site development, financing, and O&M costs. Each phase also includes a set of sub-phases, and where appropriate or applicable, cost figures are sited for each sub-phase. These figures are unique and not cumulative unless otherwise noted. All cost figures are derived from GEA's 2005 Employment Study and represent 2004 $.[45]

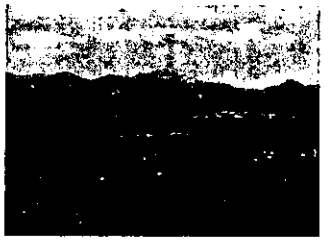
A. Exploration

The first phase, exploration, during which resources are defined, can be divided into three sub-phases: regional reconnaissance, district exploration, and prospect valuation. Exploration for commercially viable projects costs between $100/kW - $200/kW.[46] At a typical, 50 MW plant, exploration costs will total an average of $7.5 million, including all sub-phases (regional reconnaissance, district exploration, and prospect evaluation).

1. Regional Reconnaissance identifies resource areas at the least specific level, at around 1000 km.^{2} The price for regional reconnaissance has been estimated at roughly $7.70 per kW[47] installed. For the typical geothermal plant, a 50 MW facility, this amounts to $385,000 in total regional reconnaissance costs.[48]

[44] Capital cost of a combined cycle natural gas power plant only represents about 22 percent of the levelized cost of electricity produced from the plant whereas the fossil fuel cost accounts for 67 percent. (Source: Source: "An Assessment of the Economics of Future Electric Power Generation Options and the Implications for Fusion", Oak Ridge National Laboratory, 1999)., Oak Ridge National Laboratory, 1999).
[45] Hance, Nathanael (2005). *Factors Affecting Cost of Geothermal Power Development.* Geothermal Energy Association (GEA) and represent 2004$. Geothermal Energy Association (2004). *Geothermal Energy Potential.* Retrieved November 10, 2004, from http://www.geo-energy.org/USGeoProv.pdf.
[46] The average confirmation costs of projects considered as "cost competitive" by GeothermEx (2004) *(i.e. capital investment ≤ 2400$/kW)* is 153$/kW. Inflated confirmation cost estimates published in EPRI 1997 correspond to 140.35 $/kW.
[47] Nielson D (1989), *Competitive economics of Geothermal Energy: The Exploration and Development Perspective,* University of Utah, estimated this exploration phase to cost $500,000 for a 100 MW

Figure 7: Geothermal Surface Manifestation, Indicating Possible Underground Resources: Steam Vent in Central Nevada



Source: Daniel Fleischmann, GEA

Regional reconnaissance costs are influenced by the amount of resource information already available and by the accessibility of prospective areas. Government agencies, international development institutions, or multilateral aid programs typically subsidize or even fully finance such activities (through national geologic mapping or satellite imagery, for example).

The USGS completed a geothermal resource survey in 1978, Circular 790. However, when the assessment was conducted, relatively few geothermal power plants existed. That 1978 survey, which considered mostly resources with visible surface manifestations, identified 125,000 MW of geothermal potential throughout the U.S. Currently only 2825 MW of that potential is utilized—a mere fraction of the known potential. EPAct requires the USGS to update its 1978 survey by 2008. That update will incorporate data developed by federal agencies, states, and private entities; will consider the additional knowledge brought by increased geothermal power generation; and will take into account the technological advances that have emerged since 1978.

2. District Exploration identifies resources within more precise regions of around 100 km^2 with the intent of securing reservoirs for further exploration. Geophysical and geochemical surveys are completed and, if encouraging, exploration wells are drilled. Usually, in a greenfield prospect, temperature gradient holes will be drilled or cored. If those are encouraging (they indicate high enough temperature gradients), then a larger well, capable of testing a reservoir, may be drilled. Two types of geothermal exploration wells are generally used: either production-size (or full-size) exploration wells, or smaller and less expensive slim holes. A slim hole typically cannot be used during actual geothermal production, and so developers often opt to drill a production-sized well. However, if drilling a production well does not locate a usable resource, the money lost will be twice as great as if a slim well had been used. A slim well costs an average of $22.50 per kW. District exploration cost varies depending upon geology and resource depth. Wells drilled during this phase are called "wildcats" and have an average success rate of 20-25%. Oil and gas exploration, which relies on wildcat drilling, has a similar

geothermal power project. The $500,000 value has been inflated according to the U.S. BLS inflation calculator in order to represent 2004 dollar values. The inflation index for the 1989-2004 period is 1.54.
[48] All cost figures for "typical 50 MW plants" are drawn from: Hance, Nathanael (2005) [See footnote #5].

one in five success rate.[49] Drilling costs are escalating rapidly as the cost of steel and cement increases, so the cost figures cited above may be lower than the current average.

3. Prospect Evaluation is the most costly and specific phase of exploration. This phase costs about $77.00 per kW. For an average, 50 MW geothermal power plant, the total cost for prospect evaluation amounts to $3.85 million. This phase (which overlaps with the district exploration phase) seeks to locate the best sites to drill production wells with fluid temperatures and flow rates at levels that can produce electricity.

4. Geothermal and Oil and Gas Exploration: A Comparison

Because of technological constraints, geothermal resources below depths of 4 km are typically not considered economically viable. By improving technology and increasing the depth at which resources can be considered economical by only 2 km, to a total depth of 6 km, the potential for developable geothermal resources expands significantly. Increasing the geothermal drilling depth by only one kilometer—to 5 km depths, as is the current practice in Iceland—could dramatically expand the number of developable geothermal resources. Though the drilling techniques and procedures for geothermal wells are similar to those used in the oil and gas industry, the latter is remarkably farther along in its exploration capabilities when compared to geothermal. The depth record for a gas well is in the Gulf of Mexico. It was drilled in January 2004 by Shell Oil Company to a depth of 33,200 feet, or over 10 km.[50] Because many gas wells have elevated temperatures, work is being conducted to determine if these existing wells can be utilized for geothermal power generation.

5. Factors Affecting Exploration Costs

Financing costs can significantly increase the cost of exploration. Because the risk factor for geothermal is so high (only 25% of wells drilled during exploration find a usable resource), companies seek equity investors to share in the risk by financing the project. Equity invested in geothermal yields an average annual rate of 17%.[51] This increases the total exploration costs considerably (see *Financing* for more information). In recent years, the increased cost of steel and cement materials required for drilling and well completion has significantly increased drilling costs—in some cases, nearly doubling the drilling cost.

[49] EIA. *Supply*. Retrieved September 6, 2006, from http://www.eia.doe.gov/pub/oil_gas/petroleum/analysis_publications/oil_market_basics/supply_text.htm.
[50] Geothermal Energy Association (2004). *Geothermal Energy Potential*. Retrieved November 10, 2004, from http://www.geo-energy.org/USGeoProv.pdf.
[51] Owens, Brandon, Platts Consulting and Research (September 2002). *An Economic Valuation of a Geothermal Production Tax Credit*. Geothermal Resources Council Transactions, Vol. 26.

A number of other factors affect exploration costs:

- Expansion of an existing project will require lower exploration costs than greenfield projects, where a reservoir has not been previously drilled
- The larger the plant, the less the cost per MW (economies of scale)
- When costs of drilling materials, such as steel, fluctuate, so will the cost of drilling; also if the lithologies (properties of the rock formation) are more difficult to drill through, the cost of drilling will increase
- Lease costs and lag time in obtaining leases and permits increase the costs associated with exploration
- Site location and accessibility both influence exploration costs; costs tend to increase if the resource is located in a remote area
- Competition for drill rigs, as has occurred in Nevada over the past year as both gold and geothermal exploration have expanded
- Exploration techniques, including geophysics, chemistry, and number of slim holes needed
- Time delays (see following section)

Considering all of these factors, exploration is estimated to cost $100 – 200 / kWh. Exploration for the typical 50 MW geothermal power plant will thus cost between $5 and $10 million, with costs rising as the cost of steel increases.

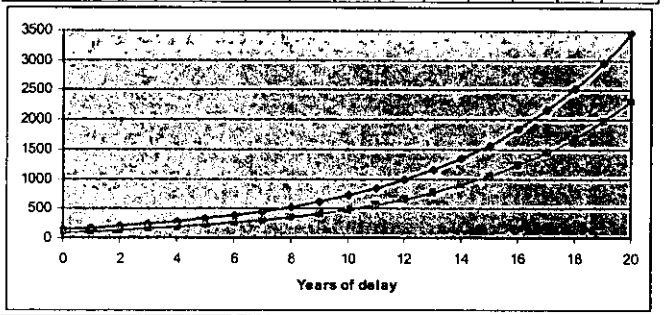
a) Project Delays: Increasing the Total Cost

Project delays due to permitting, leasing, or other issues can significantly increase the exploration cost of a project. The table and chart on the following page show the cost increase of the expected value of a $100 (pink lower line) and $150 (blue upper line) capital investment when a 17% rate of return is considered. The vertical column represents the increase in exploration costs (in 2004 $) due to delays. As shown in the figure below, an initial investment of $100 translates into an investment of $2311 after twenty years; likewise, an initial investment of $150 will cost $3466 after twenty years.

3726

Figure 8: Typical Exploration Cost Increase Caused by Delays

Delay (years)	0	1	2	3	4	5	6	7	8	9	10
Exploration Costs	100	117	137	160	187	219	257	300	351	411	481
	150	176	205	240	281	329	385	450	527	616	721



Delay (years)	11	12	13	14	15	16	17	18	19	20

Source: Hance, GEA

B. Confirmation

The confirmation phase seeks to confirm the energy potential of a resource by drilling production wells and testing their flow rates until around 25% of the resource capacity needed by the project is confirmed. Confirmation cost estimates for commercially viable projects average $150/kW.[52] At a typical, 50 MW plant, confirmation costs will total $7.5 million. The drilling success rate at the confirmation phase is 60%.[53]

A number of factors influence confirmation costs:

- The depth and diameter of the well
- The properties of the rock formation
- The number of wells drilled (determined by well productivity)
- Site accessibility
- Time delays

[52] The average confirmation costs of projects considered as "cost competitive" by GeothermEx (2004) *(i.e. capital investment ≤ 2400$/kW)* is 153$/kW. Inflated confirmation cost estimates published in EPRI 1997 correspond to 140.35 $/kW.

[53] GeothermEx (2004) estimates that a 60 percent success rate for production wells during the confirmation phase is reasonable, because confirmation drilling is based on very limited data about the deep resource, and the reservoir information gathered during confirmation later leads to the higher overall success rate."

- Rate of return on money invested

1. Confirmation Success Rate

GEA is often asked why the confirmation success rate is so low, especially considering that geothermal power plants have been operating for decades. Although the operating procedures for geothermal plants are mature and developed, the exploration and confirmation procedures are not nearly as advanced as operation. Often, geothermal resource areas have been found inadvertently in locations without any surface manifestation whatsoever. Even areas with surface manifestation do not always produce resources when drilled. If exploration shows the existence of a resource, confirmation is still needed to prove whether or not the resource is suitable for electricity production. All of these uncertainties accounts for the 60% confirmation success rate. As time goes on, it is expected that research activities will improve the confirmation success rate.

C. Site Development

The site development phase covers all the remaining activities that bring a power plant on line: drilling, project permitting, liquid and steam gathering system, and power plant design and construction. Site development costs at a 50 MW geothermal facility will average $131 million,[54] with site development costs varying considerably from project to project.

1. Drilling

The success rate for drilling production wells during site development averages 70 to 80%. The size of the well and the depth to the geothermal reservoir are the most important factors in determining the drilling cost. Inexpensive wells could cost as little as $1 million while expensive wells could cost $8-9 million. An average well will probably cost between $2 and 5 million.[55] Inexpensive wells tend to be found in areas of shallow resources located in sedimentary rocks, while expensive wells tend to be found in deep reservoirs located in hard rock formations.

[54] EIA's geothermal capital costs are low compared to those referenced in GEA's recent report, *Factors Affecting Cost of Geothermal Power Development* (see footnote #5). GEA lists geothermal development costs at $2620 per kWh, while EIA information represented in Table 1 of this paper lists geothermal capital costs at $2100 per kWh. The increase in the cost of the former can be explained because of the inclusion of additional cost parameters: financing, developer's soft costs, transmission costs, and others. Few of these parameters are included in the EIA figures of Table 1. However, if the figure of $2620 per kWh had been used for geothermal in Table 1, while using EIA figures for the other technologies, the cost figure for geothermal would include a larger set of parameters than those included in the other technologies, and thus would not provide a fair comparison.

[55] A 2M$ cost figure is most likely applicable to low average cost figure (e.g. a shallow resource) while a 5M$ well would rather correspond to the high end of the "average" cost figure.

3727

The average drilling expenses for a known geothermal site with existing production wells is $648/kW,[56] excluding confirmation drilling costs. Interviews with geothermal developers revealed that total drilling costs—including confirmation and site development drilling—range from $600/kW to over $1200/kW with an average drilling cost of close to $1000/kW. A typical, 50 MW plant would accrue an average of $37.5 million in drilling costs. However, just as the cost of drilling during exploration has significantly increased due to rising steel prices, so too has the cost of drilling during site development. In some cases, drilling costs have doubled.

A number of factors influence drilling costs:

- Permeability of the rock (ability of fluid to flow through the rock)
- Depth of the reservoir
- Chemistry of the geothermal fluid
- Resource temperature and pressure
- Competition with the oil & gas industry for drilling equipment (escalating rig and equipment costs, particularly steel and cement)
- "Known" versus "unknown" fields: drilling costs are expected to average 37% less on "known" geothermal fields compared with "unknown" fields[57]
- Reservoir engineering

a) A Note about Drilling Costs

GEA has often been asked why drilling costs are so high relative to the total price of a constructing a geothermal power plant. Indeed, after power plant design and construction, drilling costs account for the second largest cost associated with geothermal power development, at almost 30% of total cost. There are a number of reasons for this comparatively high drilling cost. Drilling requires a considerable amount of costly materials, such as steel. The cost of steel has been increasing in recent years, which creates competition between the geothermal and oil and gas industries, because oil and gas producers can generally afford to buy more of these costly materials. Additionally, competition for drill rigs drives up the costs. Geothermal drilling technology continues to require refinement if costs are to be reduced and accuracy is to be improved. Compared to geothermal's low operation and fuel costs, the cost of drilling looks particularly high; however, the levelized cost of geothermal power looks much more reasonable, and often, even cost-competitive with other available technologies.

2. Project Leasing and Permitting

Like all power projects, geothermal power projects must comply with a series of legislated requirements related to environmental concerns and construction criteria. Laws

[56] Hance, Nathanael (2005). *Factors Affecting Cost of Geothermal Power Development*. Geothermal Energy Association (GEA) and represent 2004$. Geothermal Energy Association (2004). *Geothermal Energy Potential*. Retrieved November 10, 2004, from http://www.geo-energy.org/USGeoProv.pdf.
[57] Stefansson V (2002). *Investment cost for geothermal power plants*, Geothermics 31, pp 263-272.

and regulations vary significantly from state to state and, to some extent, depend on the land ownership. While procedures for approving construction of coal and natural gas facilities are generally standardized and transparent, those for permitting and leasing geothermal lands – before construction can even begin – can be arduous and unclear. Respondents to a recent survey about the barriers of new developing geothermal projects listed up to two decades of delay, with an average of 2 years, due primarily to difficulties in obtaining leases and permits for their projects.

During project development, leases are issued, site exploration for which permits are required takes place, and construction permits are issued. Overlapping jurisdiction, lack of funds, and lack of personnel has lead to leasing backlogs in many states, where applicants have been forced to wait decades for lease approval. EPAct's recent amendments to leasing laws seek to streamline the leasing process and facilitate the issuance of more leases. Because the new law has not yet been implemented, at this time its impact is unclear.

Most phases of project development must comply with a series of land use requirements. National Environmental Policy Act (NEPA) review costs are a subset of permitting costs, i.e., there are other permitting costs to consider besides NEPA compliance. Both permitting and leasing will require some sort of environmental documentation, whether it be the detailed Environmental Impact Statement (EIS), or the Environmental Assessment (EA).

One estimate places an EIS related to NEPA requirements at an average cost of $600,000, with an average time of up to two years. [58] Total permitting costs vary significantly for each project, often falling well above or below the average. While permitting a small project may only cost about $200,000 and take less than one year (best case scenario), permitting a large project may cost over a million dollars and take more than three years.

Even though geothermal plants are some of the most environmentally benign that exist today, the permitting requirements associated with geothermal development can be overwhelming. At the Mammoth Pacific plant, located in California, a five-year struggle for expansion permits resulted in approval with a 22-page "conditional use permit," with over 100 conditions that had to be met in order for the expansion to move forward (see *Mammoth Pacific Case Study* for more information).

3. Steam Gathering System

The liquid and steam gathering systems are the network of pipes connecting the power plant with production and injection wells. Production wells bring the geothermal fluid to the surface to be used for power generation, while injection wells return most of the used fluid back into the geothermal system to be used again. Injection helps ensure that geothermal systems are sustainable and that the resource is not depleted.

[58] National Geothermal Collaborative (November 2004). Geothermal Leasing Panel. Accessed March 23, 2006, at http://www.geocollaborative.org/publications/default.htm.

A number of factors influence the cost of the steam gathering system:

- Site topography
- Slope stability
- Average well productivity and thus, pipeline sizes
- Size and spread of the steam field
- Characteristics of the geothermal fluid (temperature, pressure)
- Site accessibility (road construction needs and difficulties)
- Chemical characteristics of the geothermal fluid

Recent cost estimates provided by geothermal power developers average 250$/kW and, in some cases, exceeded $400/kW. At a typical 50 MW plant, the steam gathering system costs approximately $12.5 million.

a) Benefits of Injection

Benefits of injection include enhanced recovery of geothermal fluids, reduced subsidence, safe disposal of geothermal fluids, and an increased operational lifetime of the reservoir.[59] Geothermal plants can last for decades if managed properly. Because geothermal facilities rely on a constant source of fuel that can be recycled through the system, the cost of maintaining the geothermal facility is minimal once the drilling and exploration takes place, while the benefits of using a clean, stable energy source—including reduced air emissions, increased national security, energy stability, reduced dependence upon foreign oil—are substantial.

One geothermal complex, The Geysers in California, has realized unique benefits from its injection activities. At The Geysers, injection serves the dual purpose of environmentally responsible disposal of reclaimed water, which would otherwise be discharged onto fields or into local waterways, and rejuvenating geothermal reservoirs with additional water sources. Reclaimed water from Lake County is being injected deep into The Geysers reservoir at the rate of approximately 2.8 billion gallons annually. Additionally, about 4 billion gallons annually (11 million gallons of treated wastewater per day) is being pumped to The Geysers for injection from cities in Sonoma County. These projects have proven to be a great success.

4. Power Plant Design and Construction

In designing a power plant, developers must balance size and technology of plant materials with efficiency and cost effectiveness. The power plant design and construction depends upon the type of plant (flash, binary, dry steam, or flash/binary

[59] California Division of Oil, Gas, and Geothermal Resources (2004). *Geothermal Injection Wells*. Retrieved November 4, 2004, from http://www.consrv.ca.gov/DOG/geothermal/general_info/injection_wells.htm.

combined cycle), as well as the type of cooling cycle used (water or air cooling). See *Geothermal Basics* for more information about cooling systems and power plant types. Labor costs are estimated to account for 41% of total project construction costs while materials and "other" costs respectively represented the remaining 40% and 19%. Labor costs can increase by 10% if camps are needed to provide housing and meals to workers when a resource is remotely located.[60]

Figure 9: Soda Lake Binary Power Plant, Fallon, Nevada.

Source: Daniel Fleischmann, GEA

Besides the costs related to physically building a power plant, other power plant related costs include soft costs and land costs. *Soft costs* relate to project development and financial issues, including expenses such as engineering, legal, regulatory, documentation and reporting activities. Soft costs represent approximately 6 -10% of total costs.

Land costs can vary depending upon the type and ownership of land in question—desert vs. agricultural land; rural land vs. land close to cities, purchased vs. leased parcels. For steam geothermal systems,[61] land costs include subsurface mineral rights that correspond to roughly 10% of the value of steam.

a) Land Cost and Use Comparison

Although any development will impact land, fossil fuel site development and land use tends to be more destructive than geothermal development. Fossil fuel power plants impact both the site of the plant and the site of drilling (for natural gas), or mining (for coal). Transportation impacts for pipelines and coal shipments, usually via rail, can also be environmentally destructive. Coal mining can damage large swaths of land and degrade streams. Coal power use impacts and associated costs would be much higher if

[60] Bloomquist, Gordon (2002). "Economics and Financing," In *Geothermal Energy* (UNESCO), Chapter 9, M.H. Dickson and M. Fanelli.

[61] At a *dry steam geothermal power plant*, steam directly from the geothermal reservoir runs the turbines that power the generator, and no separation is necessary because wells only produce steam.

mining, processing, transport, construction, and reclamation were included. Nuclear costs increase due to the required safe maintenance of huge amounts of radioactive waste, and the cost of keeping waste safe is imposed on future generations. Nuclear also uses and discharges extensive water resources. Natural gas wells are drilled hundreds of miles from the plant site, and this means that the gas is transported by pipeline across considerable distances to be used at the power plant. In the future, much of our natural gas will likely be imported from other countries as liquefied natural gas.

With geothermal development, land use impacts are located at the power plant and transmission line site. There is no potential for disasters such as the 1989 Exxon Valdez oil spill in Prince William Sound, Alaska, where 15 million gallons of oil in transport were accidentally released into a pristine natural area. Over 30 years, the period of time commonly used to compare life cycle impacts of different power sources, geothermal uses less land than most other sources.[62] Geothermal plants can also be built upon multiple use land, where aquaculture operations, agricultural activities, and hunting can regularly take place on the same site as the power plant. Cascaded uses, where a power facility provides power and thermal heating needs for collocated businesses, are also common at geothermal power plants.

Geothermal facilities use less freshwater than other electricity sources. An analysis of a geothermal and a natural gas facility shows that a typical geothermal facility uses significantly less freshwater than a natural gas facility.[63] A binary geothermal plant with an air-cooling system uses virtually no freshwater at all.

b) Transmission Issues

Because geothermal resources cannot be transported distances over a few miles, geothermal power plants must be built at the site of the reservoir and must rely upon transmission systems to bring their power to the regional power grid. Sometimes transmission infrastructure does not exist where a geothermal resource is located, and additional power lines must be built, adding to project costs. Geothermal developers pay the direct costs to connect their plant to the grid, and in some cases incur additional transmission related costs. These additional costs could include the construction of new lines, upgrades to existing lines, or new transformers and substations.

[62] Brophy, Paul (1997). Environmental Advantages to the Utilization of Geothermal Energy. *Renewable Energy*, Vol 10:2/3, Table 3, pp. 374.

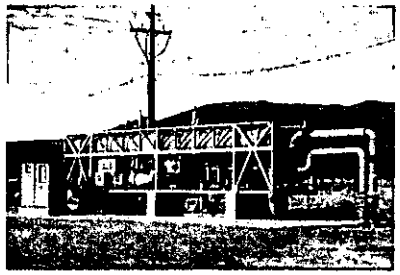
[63] Telephone Flat Environmental Impact Statement 3.2-32, 3.2-34, 3.2-35; natural gas: Calpine Corporation Sutter Power Plant Project, Application for Certification (AFC) (Dec 1997). Table 2.2-1, *Estimated Average Daily Water Requirements.*
NOTE ON CALCULATIONS: Telephone Flat (geothermal)was proposed to produce 48 MW and use an average of 6.5 acre feet/year, Sutter (natural gas) was proposed to produce 500 MW and use an average 4,336,000 gals/day. Numbers based on the assumptions that one acre-foot = approximately 325,851 gallons, as reported by USGS (http://water.usgs.gov/pubs/circ/2004/circ1268/htdocs/text-conversion.html) and that the water usages are averaged over a 24 hour a day, 365 day a year time period.

Projects considered economically viable have transmission related costs ranging from $13 to $236 per kW with an average of $104/kW.[64]

A number of factors influence the transmission costs:

- existing lines
- topography of the area
- size of the plant – Considering a 10 MW and a 100 MW project with similar transmission requirements, transmissions costs for the larger project will be 10 times smaller than the cost for the smaller project, since the cost will be shared out over a much larger power output.

Figure 10: A Small Power Plant in Nevada, the Wabuska



Source: Ormat

c) Other Factors that Influence Design and Construction

A number of other factors besides transmission influence the cost of designing and constructing a power plant:

- The temperature of the resource: as the temperature increases, the efficiency of the power system increases and the specific cost of equipment decreases
- The depth to the reservoir
- The chemistry of the geothermal fluid
- Water availability, which will help determine the type of cooling system that will be used[65]
- Location, topography and geologic factors
- Power plant technology choices
- Larger projects will cost less per MW than smaller projects (economies of scale)
- Greenfield projects tend to cost 10 to 15% more than power plant expansions

[64] Sanyal S (2004). *Cost of Geothermal Power and Factors that affect it.* GeothermEx.

[65] Two different kinds of cooling systems exist: air-cooled or water-cooled. Water-cooled systems are generally considered to be less expensive to build and operate as long as water is inexpensive and readily available.

d) Geothermal Power Plants and Tourism

Most geothermal power plants will either not affect tourism or cause it to increase. Take the example of the power plant at Mammoth Lakes, California, a sight of heavy outdoor recreation and active fisheries. Although people initially opposed the project due to worries over tourism impacts, the project is now highly regarded among community members and visitors alike. Many people in the city do not even know the power plant exists because it was so expertly engineered to blend into the surrounding environment (See *Mammoth Pacific Case Study* for details). Tourism might increase when students, scientists, or interested individuals visit the site of the power plant, thereby bringing business to the local community, but rarely does geothermal development negatively impact tourism. Tourism has certainly increased near the Blue Lagoon in Iceland, a turquoise body of mineral rich water, which was actually created by geothermal water discharged from a power plant.[66]

5. The Production Tax Credit (PTC)

EPAct 2005 provides a production tax credit (PTC) for renewable technologies, including geothermal, through the end of 2007. This PTC provides a 1.9 cent tax credit for each KWh of power produced by an eligible facility (or $19 per MWh) as adjusted annually for inflation. The PTC was available only to wind and closed loop biomass in 1992, and resulted in the "increased installed capacity of wind turbines in the United States," according to the EIA, with "large amounts of capacity built in the year prior to the expiration of the PTC, and virtually no capacity built when the PTC [was] not available."[67] As of 2005, the PTC was expanded to include not only geothermal facilities, but also open-loop biomass, solar energy, small irrigation power, and municipal solid waste (MSW) power facilities. The value of the PTC is halved for open-loop biomass, MSW, landfill gas, small hydro and incremental hydro from efficiency improvements or capacity additions at existing hydro projects. Coal owned by or held in trust on behalf of an Indian tribe and refined coal are eligible as well, with the credit set at $4.375 per ton for refined coal and $1.50 for Indian coal.

a) Impact on Geothermal Cost

One analysis found that a PTC would decrease the levelized cost of geothermal power by 25 – 30% compared with the current policy environment.[68] For many developers, a PTC

[66] Geotimes, Dec. 2003. http://www.geotimes.org/dec03/Travels1203.html. Retrieved November 9, 2004.
[67] EIA, DOE. Policies to Promote Non-hydro Renewable Energy in the United States and Selected Countries (February 2005). Retrieved April 5, 2006, from http://www.eia.doe.gov/cneaf/solar.renewables/page/non_hydro/nonhydrorenewablespaper_final.pdf#2.
[68] Owens, Brandon, Platts Consulting and Research (September 2002). *An Economic Valuation of a Geothermal Production Tax Credit*. Geothermal Resources Council Transactions, Vol. 26, pgs 467 – 471.

can dictate whether or not a power purchase agreement (PPA) will be secured (see *Financing* for more information). Without a PTC, geothermal power will not likely be brought to the grid. Besides increasing geothermal and other renewable development, the PTC lowers the price customers must pay for renewable energy.[69]

Figure 111: Raft River Groundbreaking

Source: Dan Fleishmann, GEA

b) Impact on Geothermal Development

As of October 2005, one newly operating geothermal power plant, the Richard Burdette power plant located near Reno, Nevada, benefited from the production tax credit (see figure 12 below). About a half dozen other plants—of the three dozen or so under development—are set to come online in time to benefit from the credit. One of the plants that will likely benefit from the PTC is the Raft River geothermal power plant, which will be the first geothermal plant to produce power in the northwest (figure 11).

Other plants included in the 35 new projects under development as of 2006 may benefit from the credit, but timeframe issues make this uncertain. Many industry experts, including Ormat, the owner of the Richard Burdette plant, admit that "it is too early to assess the impact of provisions in EPAct, including the PTC, on the geothermal industry." Ormat stresses, however, on behalf of the geothermal industry, that the PTC will likely "enhance the ability of geothermal projects to compete with other fossil fuel technologies." Only in the next few years will the geothermal industry know for sure what the impact of the PTC will be. It is anticipated, however, that the PTC, especially if extended, will result in new geothermal development. In fact, industry leaders and the GEA, the industry trade group representing U.S. companies, identify the PTC is one of the most effective policy tools to expand geothermal development.

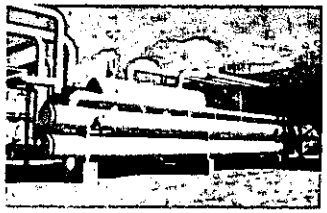
37731

Figure 122: Richard Burdett Plant



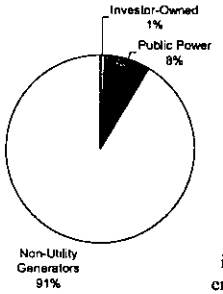
Source: Ormat

c) Geothermal Market Price

Even though the levelized cost of certain distributed renewable energy sources might be higher than the levelized cost of geothermal energy, geothermal still needs the PTC to remain competitive. The reason for this price difference can be explained, in part, by the power prices in the wholesale vs. the retail market. In general, for an energy source to compete in the wholesale market, it must cost less than the competitive cost in the retail power market. Geothermal is an energy source sold in the wholesale power market, while a source such as solar is typically sold in the retail power market.

It is true that geothermal prices are decreasing, and in fact are close to market price. While geothermal is one of the most cost-effective options of the renewable energy sources available, in many cases geothermal technology still struggles to compete with polluting fossil fuel sources. Geothermal developers hope that, with time, they will be able to compete in the wholesale power market without the PTC. But today's studies show that in order for geothermal to compete against highly subsidized fossil fuel energy sources, the PTC is necessary.

Figure 13: Public and Private Ownership of Geothermal



Source: American Public Power Association (APPA)

Power Plants, 2003d) Alternative for Independent Power Producers: CREBs

Clean Renewable Energy Bonds (CREBs) provide an incentive for electric co-ops and public power projects that cannot qualify for the PTC. A CREB is a special type of bond, known as a "tax credit bond," that offers cooperatives the equivalent of an interest-free loan for financing qualified energy projects for a limited term.[70] While the

[70] National Rural Electric Cooperative Association (NRCA). *Clean Renewable Energy Bonds (CREBs).* Retrieved August 11, 2006 from http://www.nreca.org/Documents/PublicPolicy/CleanRenewableEnergyBonds.pdf.

majority of geothermal power plants, designated as either private or utility-generators, benefit from the PTC, some geothermal power plants, such as the Northern California Power Agency (NCPA) facilities, are publicly owned. The breakdown of private/public ownership is shown in figure 13 on the preceding page.[71] Two NCPA units generate 220 MW of geothermal power at The Geysers. New publicly owned projects are in the works, including several on Indian land.

e) PTC Timeframe Challenges for the Geothermal Industry

EPAct specifies that a facility eligible for the PTC must be built by the end of 2007. This stipulation poses a challenge for many geothermal developers, because most new geothermal facilities cannot be constructed by that time. Most geothermal projects take 3 to 5 years to come online, without even considering permitting and leasing issues that can delay operation further. In one instance, a geothermal power company is only developing 25 of its contracted-for 215 MW, because only 25 MW can be developed within the timeframe set forth in the PTC. According to the largest geothermal power producer in the U.S., Calpine Corporation, without a facility qualifying for a PTC, even though "buyers have shown considerable interest in purchasing geothermal power because it is both renewable and extremely reliable...the utilities are likely to award power purchase contracts to plants that can be constructed in a shorter time frame and can offer more price certainty."[72]

Table 5 on the following page shows average leadtimes for selected alternative energy technologies.[73] As the table shows, several other technologies suffer from long leadtimes: geothermal, conventional hydropower, and biomass share the longest leadtimes. Many geothermal developers in California—the state with the most developed geothermal resources—complain of even longer leadtimes. Note that nuclear, with an EIA-projected six-year leadtime, benefits from long-term loan agreements, substantial R&D funding, and numerous other benefits.

6. Mitigation Measures

Despite the minimal impact of geothermal facilities compared to fossil fuel sources, geothermal development is accompanied by significant mitigation measures.

At most geothermal facilities, detailed site planning, facility design, materials selection, revegetation programs, and adjustment to transmission line routing are routine components of geothermal operations. One large geothermal company reduced the visual impacts of their power plant by painting all piping forest green to blend into the surrounding landscape. Another installed the first air-cooled geothermal power plant in order to eliminate the view of steam plumes that accompany the more standard water-cooled geothermal plant (for details, see *Mammoth Pacific Case Study*). Some companies utilize non-specular conductors, which reduce reflection and glare on transmission lines. Transplanting trees is also a common mitigation technique.

Several noise muffling techniques and equipment are available for geothermal facilities. During drilling, temporary noise shields can be constructed around portions of drilling rigs. Noise controls can be used on standard construction equipment, impact tools can be shielded, and exhaust muffling equipment can be installed where appropriate. Because turbine-generator buildings are usually designed to accommodate cold temperatures, they are typically well-insulated acoustically and thermally, and equipped with noise absorptive interior walls.

Mitigation also consists of monitoring activities. Ongoing monitoring activities could include but are not limited to well pressure, water chemistry, archeological, species, ecosystem, surface site, and deep temperature monitoring. Most mitigation measures are set forth in permitting conditions and in environmental documents that are available for public review.

[74] Municipal Solid Waste

D. Financing

Two types of investors typically provide money for geothermal development: equity investors and debt investors. Early *equity investors* may recover the money they invest only if geothermal exploration proves the existence of a resource that results in an operating project or a sale. Because high risk is involved for equity investors, equity investors expect a high rate of return if a project is successful—16-20 percent or more.[75]

Debt investors are usually risk-averse lenders or commercial banks. Debt investors are among the first financial stakeholders to recover their money in case of project failure. Because comparatively lower risk is involved for debt investors, debt investors receive lower interest rates (about 6-8%). Debt investors usually will not lend money unless a certain percentage has already been invested by an equity investor. Today's geothermal projects are generally composed of 70% debt and 30% equity. As an added constraint, debt lenders (commercial banks) will require 25% of the resource capacity to be proven before lending any money. This means that all early phases of the project have to be financed by equity. So, while geothermal developers would prefer their projects were funded entirely by debt due to lower interest rates, at least part of the project, especially the upfront costs, must be funded by equity.

1. Interest Rates for Geothermal Developers

Different types of developers will be required to pay different rates of interest over various timeframes for their loans. For example, Independent Power Producers (IPPs),[76] which account for all but one geothermal power producer in the U.S., will pay an average interest rate of 10.7% over 15 years, while a municipal utility[77] will pay an average interest rate of 5.5% over 30 years.[78] This means that the cost of financing for an IPP could increase the levelized cost of power[79] by as much as 44% compared with the cost at a municipal utility.

2. Length of Debt

In order to secure the revenue flow of the project, commercial banks will require the developer to have a Power Purchase Agreement (PPA) that covers at least the length of the debt period. A PPA, negotiated with a utility, guarantees that a power plant will be able to deliver its power to the grid at a fixed or market-dependent price for a certain

[75] Return on equity figures provided above are nominal. To obtain real interest rates, inflation has to be subtracted from nominal interest rates.
[76] An "IPP" is a private non-utility or utility-affiliated entity that generates electricity and sells it to other businesses including utilities.
[77] A "municipal utility" is one owned and operated by a town or city with an organized local government.
[78] U.S. DOE, EPRI (1997). Renewable Energy Technology Characterizations.
[79] "Levelized cost" is defined as the total capital, fuel, and operating and maintenance costs associated with the plant over its lifetime divided by the estimated output in kWh over its lifetime (expressed here in current dollars).

period of time.[80] Geothermal power plants have a planned lifetime of at least 30 years and usually operate much longer, while power purchase agreements typically last 10 to 20 years. This means that the debt payback period of the project has to fit into the PPA timeframe. After a geothermal project pays back the debt incurred by a PPA, over ten years or more, costs may then fall by about 50% to cover just O&M costs for the remaining time during which a facility operates.

3. Long-term PPAs and Stability

Although obtaining a long-term PPA may be challenging for a developer, the agreement helps stabilize the electricity market. A geothermal PPA transfers any risk related to fuel from the market and/or consumer to the developer and/or operator. A PPA ensures a stable, long-term electricity price for decades. This price security means that geothermal energy can offset the U.S.'s dependence upon the highly volatile fossil fuel power market. Once a power project is built, most of its power production costs are known and predictable and, in many cases, few market parameters can modify them.

4. The True Capital Cost of Power: Considering Capacity Factor

At first glance, geothermal power plants seem to require higher upfront costs than most other renewable and fossil fuel technologies. A closer look, however, proves that this is not the case. Table 6 on the following page shows the weighted overnight costs[81] once capacity factor (CF) is considered.[82] CF measures the amount of power that a facility produces related to its rated capacity over time. Geothermal plants have the highest projected rated CF of any renewable facility, according to EIA. The overnight or capital costs increase dramatically for most technologies when capacity factor is considered, but stay relatively stable for geothermal. This means that geothermal's overnight costs based on generation—the number of MWs actually producing electricity—is competitive with other fuel sources.

[80] Power Purchase Agreements are long-term contracts that specify power prices and output for the period considered. They are usually the result of political commitment that aims to diversify the energy mix and promote alternative sources of energy (renewable energy) to stabilize long-term price projections but are not always available neither easy to obtain.

[81] Overnight costs for each technology are calculated as a function of regional construction parameters, project contingency, and technological optimism and learning factors, according to EIA.

[82] From EIA (2006). *Assumptions to the Annual Energy Outlook 2006.* Retrieved April 17, 2006, from http://www.eia.doe.gov/oiaf/aeo/assumption/index.html.

Table 6: Overnight or Capital Cost Comparison

Technology	Base Overnight Costs (2005, per MW)	2010 Capacity Factor (percent)	Weighted Overnight Costs[83]
MSW / Landfill Gas	1,443	90	1,603
Biomass	1,659	83	1,999
Wind	1,091	37	2,949
Geothermal	2,100	95	2,211
Conventional Hydro	1,320	64	2,063
Solar Thermal	2,589	31	8,352
Photovoltaic (PV)	3,981	21	18,957

E. O&M Costs

Operation and Maintenance (O&M) costs consist of all costs incurred during the operational phase of the power plant. Operation costs include labor, spending for consumable goods, taxes, royalties, and other miscellaneous charges such as internal electricity uses. Maintenance costs include all expenses related to the upkeep and maintenance of the equipment and the continued sustainability of the resource through injection and other activities such as reservoir and environmental monitoring and reporting. Geothermal is one of few technologies with near zero fuel costs. This, combined with a high capacity factor, means that geothermal is one of the most reliable fuel sources available today.

1. Direct Payments (Government Taxes, Royalties and other Revenues)

Geothermal facilities make significant contributions to the U.S. economy. Some contributions come as royalties or taxes, which are mandated by the government, while some come voluntarily from the geothermal company. In many areas where geothermal resources are developed, the developer is considered a "good neighbor" because of substantial local contributions.

[83] In order to calculate the weighted overnight costs, we divided 100 by the projected 2010 capacity factor (CF) percent, and then multiplied the resulting number by the EIA listed base overnight cost. For example, to find geothermal weighted overnight cost, we divided 100 by 95, and then multiplied the resulting number (1.053) by 2,100. We chose to represent capacity factors projected for 2010 because the average new geothermal power plant will come online at or near 2010 if development begins today. Also, this is the earliest year capacity factor is rated in EIA's Assumptions to the Annual Energy Outlook 2006.

a) Royalties

Royalties are payments that power producers are required to make to the owners of the geothermal resource. Exact royalty values are difficult to provide since terms and conditions of geothermal leases vary according to the resource owner (private vs. government). Royalty values range from 0.5 to 5.5% of the price of power and typically account for 10 to 15% of O&M costs. Globally, the "average effective royalty rate" paid by geothermal power producers in 2004 for leases concerning resources located on federal land was 3.94%.[84]

Between 1970 and 1997, geothermal power plant operators had paid a total of nearly $500 million to the Federal Government in royalties.[85] In 2000, California alone supplied $14,373,308 in federal royalties from geothermal leases.[86]

Recent changes to royalty fees proposed by the Mineral Management Service (MMS) Royalty Advisory Committee would provide $4 million a year to local counties, according to the proposed rule. Assuming the newly proposed royalty schedule,[87] over 30 years, an average, 50 MW plant will supply a total of over $16 million to the federal government and the state and county where the resource is developed. The new rules require geothermal producers to pay a royalty of 1.75% of total annual income for the first 10 years, and 3.5% for every year thereafter. Of this amount, 25% goes directly to the county, 50% to the state, and 25% to the federal government. This means that for the first ten years of production, assuming an average price of 6 cents/kWh and 95% capacity factor, without adjusting for inflation, every year a 50 MW geothermal plant will contribute $218,453 to the state, $109,226 to the federal government, and $109,226 to the county government. From the eleventh year on, without adjusting for inflation, every year the plant will contribute $436,905 to the state, $218,452 to the county, and $218,452 to the federal government. Over 30 years, the power plant would contribute a nominal total of over $16 million to federal, state, and local governments.

b) Taxes

Geothermal power producers contribute to government budgets through different kinds of taxes:
- *Property taxes* are based on the estimated value of the company assets. Tax rules may be different from one jurisdiction to another.

[84] The royalty ranges provided above were provided by BLM and MMS to the Royalty Policy Committee for the "Geothermal Valuation Subcommittee Report" that was published in May 2005.
[85] National Geothermal Collaborative. *Geothermal Energy and Economic Development*. Retrieved March 13, 2006, from http://www.geocollaborative.org/publications/Geothermal_Energy_and_Economic_Development.pdf.
[86] Bureau of Land Management (December 2004). *Geothermal Leasing in California*. Retrieved July 12, 2006, from http://www.blm.gov/ca/pa/minerals/geothermal.html.
[87] Proposed rules were issued in August 2006. At publication, these rules had not been finalized.

- *Federal and State income taxes* are calculated upon the net revenue of the company. Rules may vary from one state to another and the amount will vary according to the company structure and annual profits.
- *Sales taxes* paid on consumables and services will depend on the amount and value of goods needed for O&M (which varies with the technologies used) and will also vary from one state to another.

Besides companies' tax contributions, local employees will pay income, property, municipal, county, and sales taxes.

In many counties where geothermal power plants exist, the plant is one of the largest taxpayers. In 2003, The Geysers paid property taxes to two counties totaling more than $11 million. CalEnergy, the largest geothermal company in the region, is the single largest taxpayer in Imperial County, supplying 25% of the tax base.[88] At the geothermal power plants located in Inyo County, California, plant owners pay approximately $6 million annually, of which roughly two-thirds is used to fund schools.

c) Voluntary Payments

Besides royalty and tax payments, geothermal companies often provide voluntary funds to the communities in which they are located. The Mammoth Pacific power plant, for example, has been designated a "good neighbor" by many locals for making donations to local groups in the area and building a new community center from the proceeds of the power plant (see *Mammoth Pacific Case Study* for details).

d) Projected Payments

Achieving the 2001 goals of the DOE Geothermal Energy Strategic Plan could result in payment of over $7 billion in royalties to the Federal Government by 2050, and income tax revenues of over $52 billion (1998 $).[89] From just the state share in these royalties, alone, that would mean an additional investment of $3.5 billion in schools and local government facilities in the western states (1998 $).[90]

Renewable Northwest Project reports that a 100 MW project in Eastern Oregon could create over a $1 million (1990 $) of additional local income each year, and would pay $4 million-$6 million (1990 $) in local and state fees, royalties and taxes, according to the Oregon Department of Energy. In contrast, a similarly-sized natural gas project sends

[90] Ibid

$11-24 million (1990 $) out of the region every year for fuel costs alone.[91]

The construction of two new geothermal plants by Calpine Corporation in Siskiyou County, California would result in a total economic benefit of almost $114 million over 30 years (2002 $), with a yearly average increase of almost $4 million. Property taxes and royalty revenues for the two projects totals $956,286, and the 30-year total is $28,688,581 (2002 $).[92] The new royalty laws would provide even more money to the local community in which the plants are located. This money will generate jobs, improve community living, and boost educational standards throughout the region.

Two plants in the planning stages, the Fourmile Hill and Salton Sea Unit 6 Geothermal Power Plant projects, would together have a total economic benefit of $866 million, or $29 million per year.[93]

2. Indirect and Induced Payments

For every dollar invested in geothermal energy, the resulting growth of output to the economy is $2.50 or more. This means that the investment required to bring 1000 MWs of new geothermal power online within the next three years as projected, the associated $2.8 billion investment[94] will bring an economic output of at least $7 billion nationwide, and even more over several years.

F. The Levelized Cost of Geothermal Power

The California Energy Commission (CEC) estimates the levelized generation costs from new geothermal plants at 4.5 to 7.3 cents per kWh, which over the lifetime of the plant can be competitive with a variety of technologies. Recent EIA analysis places geothermal energy at a lower levelized cost than natural gas combined-cycle, wind, open-loop biomass, nuclear, solar thermal, and photovoltaic (with costs increasing in the order in which they are listed).[95] However, two points should be considered regarding these estimates. First, it is important to keep in mind the different prices associated with

competitiveness in different markets (wholesale vs. retail). Second, the lower-end price figures cited for geothermal likely rely on lower than average upfront financing agreements (see *Financing*), or consider only new projects that are built as expansions of existing projects. Expansion projects typically forgo many of the construction, resource risk, and transmission costs associated with new plants.

In fact, most geothermal developers contend that the cost for new projects is more accurately reflected in a range of 5.5 to 7.5 cents per kWh. Even so, the current price for geothermal expansion projects can be competitive with coal-fired plants, and greenfield projects can be competitive with natural gas.[96] At current fossil fuel market prices, natural gas costs the equivalent of 8 to 9 cents per kWh (2005 $).[97]

Figure 14 on the following page shows that developing and defining the geothermal resource costs almost as much as building the power plant. For geothermal, a full one quarter of total costs are attributed to drilling alone, and almost half of all levelized costs are spent before the plant goes online.

1. Geothermal and Fossil Fuels: Comparing True Levelized Costs

While it is important to compare the costs of various components of power production across technologies, it is perhaps more important to consider other factors, not necessarily apparent at first, that directly impact the levelized cost of power over the long and short term.

a) Subsidies

According to the nonpartisan *Taxpayers for Common Sense*, the fossil fuel industry receives billions of dollars in subsidies from the U.S. government[98]—almost 80% of the subsidies supplied to the energy industry.[99] *Taxpayers* estimates that removing subsidies could reduce U.S. carbon emissions by 65-70 million metric tons. These U.S. subsidies amount to as high as $18.3 billion a year ($ 2000).[100] The removal of fossil fuel subsidies has been advocated by World Bank as the first order of priority in instituting economic policies to protect local and global environments that could also help spur new renewable development.[101] Further, a report by the New Economics Foundation says that

worldwide fossil fuel subsidies amount conservatively to about $235 billion a year ($ 2004),[102] while other sources put the figure closer to $250-300 billion (mid-1990s $), plus an estimated $100 or more per barrel necessary to secure the supply of oil imports.[103]

b) Trend in Cost of Power over Time

Geothermal costs have decreased considerably – by nearly 50 % over the past two decades. According to the National Renewable Energy Laboratory (NREL), costs neared 15 cents per kWh in 1980, with current prices decreasing to 7 cents per kWh. And while geothermal prices are expected to continue to decline, both coal and natural gas prices will likely increase, according to the EIA. Natural gas prices have increased recently, often experiencing boom and bust type cycles. Most industry experts agree that geothermal is one of only a few alternative technologies that could compete economically with polluting technologies in the near term—even without considering the ancillary benefits of geothermal production. Authors noted in one recent EIA publication, "In some regions and years, new geothermal...plants may be competitive with new coal-fired plants, but their development is limited by the availability of geothermal resources."[104]

c) Electricity Needs and Cost Savings

In the long run, renewable energy resources can help decrease costs by providing domestic, low-cost, low-pollution options to meet U.S. energy needs. An EPA study concludes that if all states were to implement "cost-effective energy efficiency and clean energy policies, the expected growth in demand for electricity could be cut in half by 2025, providing billions of dollars in customer savings, contributing to lower prices for natural gas, and substantially reducing greenhouse gas emissions."[105] Another study cites that increasing renewable energy generation to 20% could "reduce natural gas use by 6%, while saving consumers nearly $27 billion."[106] Geothermal, as a renewable technology, offers all of these benefits. In addition, geothermal's long-term, legally binding PPAs offset some of the volatility of other energy markets.

3737

d) Investors' Perspective

Unfortunately, many investors tend to consider only the near term. They favor the electricity source—such as coal—that will require the lowest cost and risk upfront, without considering the higher costs associated with the fuel itself over the long term. With fossil fuel development, utility commissions usually permit the recovery of increased fuel costs through fuel-price adjustment clauses in power contracts, passing the increase in cost onto the consumer. Geothermal developers, on the other hand, bear all of the risks associated with fuel cost changes. This means that if costs increase, the developer loses money; if costs decrease, the developer makes money.

Investments in geothermal projects may take longer to recover because of exploration and drilling costs and risks, among other factors. The longer recovery time leads many lenders to invest in fossil fuel projects with smaller associated risks. While petroleum prospectors can usually get a full return on their investment in less than a year, geothermal prospectors can wait ten years or more for a full return on their investment.[107]

e) Addressing Shortages and Concerns Over Increasing Fossil Fuel Prices

Natural gas prices have soared recently, and our oil reserves are continually being depleted. In the mean time, our energy needs are increasing. The development of renewables, in conjunction with improved efficiency, provides one of the only solutions to our increasing energy needs that is both readily available and environmentally friendly. Drilling in Alaskan National Wildlife Refuge (ANWR), nuclear development, and new advanced coal facilities are examples of projects that will likely require 10 years or longer. Research into other energy sources such as fusion or hydrogen is not expected to provide any new energy in the near term. The good news is that many megawatts of geothermal potential, along with potential from other renewable sources, exist throughout the United States that are developable today.

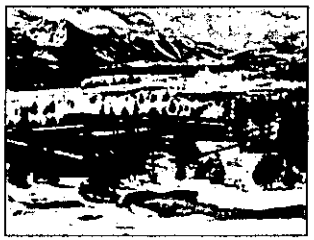
IV. CASE STUDY: MAMMOTH PACIFIC POWER PLANT

Figure 15: View of Mammoth Pacific II



Source: Ormat

The following section offers a firsthand account of the development process for a geothermal power plant. It reveals what took place behind the scenes to bring a power plant online near a small, California community, as indicated by the people who were involved in that process—both within and outside the developing company. This case study documents one plant's transformation from one of the most hotly contested to one of the most locally and internationally appreciated power plants in the United States.

A. Setting

Travel guides advertise Mono County, California, as "a land of fire and ice" with "extraordinary features [that] attest to the region's active geologic past."[108] The largest city within Mono County, the Town of Mammoth Lakes, is a recreation area, where regular activities include skiing, mountain climbing, hiking, fishing, and is a land that one local described as Los Angeles' playground. At the time the Mammoth Pacific power plants were developed near the Town of Mammoth Lakes, the type of geothermal technology used[109] was relatively new and unexplored. The effects of such a plant, especially upon such a prime recreation area prized for its natural beauty, were uncertain.

[108] Official Website for Mammoth Lakes (2004). Retrieved October 7, 2005 from http://www.visitmammoth.com/arcainfo/geology.html.

[109] At a *binary geothermal power plant*, the type developed at Mammoth, electricity is produced using lower temperature geothermal resources, at 100° C (212° F) to 165° C (330° F). In the binary process, the geothermal water heats another liquid that boils at a lower temperature than the geothermal water. The two liquids are kept completely separate through the use of heat exchangers used to transfer the heat energy from the geothermal water to the "working-fluid." The secondary fluid vaporizes into gaseous vapor and (like steam) the force of the expanding vapor turns the turbines that power the generators. The vapor is then condensed back to a liquid and reused over and over.

B. Plans for Development

The first unit at the Mammoth Pacific Complex, the 10-MW MP-I power plant that came online in 1984, was relatively unknown by constituents of Mono County. But the 1990 expansion, which added two 15 MW units to the Mammoth Pacific Complex, bringing the total capacity at the complex to 40 MW, met substantial public scrutiny. These two new facilities, one on private land, known as MP-II, and one on federal land (Inyo National Forest), known as PLES I, were proposed by Mammoth Pacific, L.P. (MPLP) as expansion projects.

C. Public Reaction and Company Response

Once plans for the expansion began, a full five years before permits were issued in 1989, people began voicing concerns related primarily to tourism and environmental impact. With guidance from Mono County Economic Development Director Dan Lyster, the county established the Long Valley Hydrologic Advisory Committee (LVHAC) in 1986 in response to those concerns. Members of LVHAC included regulatory agencies such as Mono County; the Bureau of Land Management (BLM) the U.S. Forest Service (USFS); California Dept. of Fish and Game; California Division of Oil, Gas, and Geothermal Resources; and Mammoth Community Water District; as well as the developer. The meetings were open to the public and were regularly attended by technical groups, representatives from USGS, and local organizations such as the Sierra Club.

At the same time that the LVHAC was formed, MPLP (through it managing partner, initially Pacific Energy and currently Ormat) responded to the concerns voiced by constituents. According to Claude Harvey, Pacific Energy's Senior Vice President in charge of geothermal at the time, without a timely and comprehensive response to peoples' concerns, the expansion would never have been permitted.

"When a project is going to be controversial, you've got to get in there and talk to the people directly," notes Harvey. "You've got to knock on doors, show up at town meetings, respond to letters in the local paper. Explain the benefits of a geothermal power plant and the benign nature of the plant. That's what we [Pacific Energy] did, and, if we hadn't done so, the plant simply would not have come online, because we wouldn't have had the necessary public support."

Dwight Carey, an environmental consultant who worked with MPLP during the expansion, notes that MPLP's efforts to integrate itself into the community have been ongoing, and continue to this day under the efforts of Bob Sullivan, plant manager: "MPLP has made it a point to be a true member of the community - making presentations, inviting tours, sponsoring community events - and generally making sure that people in the community at all levels (both in the economic and environmental community) know what is going on. As a result, the community trusts MPLP, and is not willing to immediately believe the worst if issues or concerns are brought up."

D. Permitting

Though the permitting process began in 1986, only after a five-year struggle to obtain permits was permission finally granted for construction. The MP-II expansion project, located on private land, was approved by Mono County with a "conditional use permit," a 22-page document that contained over 100 conditions that had to be met in order for the project to move forward. The PLES I project, located on public land managed by the Inyo National Forest, was approved with a similar extensive list of conditions. Each project was required to pay for its own detailed study (an Environmental Impact Report [EIR] for the MP-II project and an EIS for the PLES I project) that assessed all potential environmental impacts of each project and the potential cumulative impacts of all of the projects.

According to Lyster, these two projects were the most highly conditioned power plant projects in California, with a laundry list of water monitoring activities developed by LVHAC and required by the respective permits. Water monitoring activities, including quality, flow, and temperature monitoring of geothermal resource wells, hot and cold water springs, groundwater wells, and surface waters, were initially conducted by USGS, but subsequently some of those have been transferred to the power company. Additional permit conditions required transplanting pine trees, extensive revegetation of disturbed areas, archeological surveys and monitoring, and painting structures with specific colors approved by the agencies.

E. Construction

The expansion construction followed a breathtaking pace—the shortest amount of time Harvey had ever seen—so that the plants could reap the benefit of an investment tax credit. The company that designed the power plant, started by Harvey and Ben Holt, provided much of the financial backing for the project. Efficient, state-of-the art facilities were operating in December 1990, just a year after construction began. Today, 15 years later, the plants continue to produce power with few hydrologic impacts, and minimal emissions or aesthetic impacts.

Notes Harvey, "you'd never find a hotel that blended so well into this pristine environment." A hotel wouldn't contribute as much money to the economy, and it certainly wouldn't provide electricity to the grid, he adds.

MPLP took steps that showed their willingness to integrate into the community. For example, they paid special attention to preserving and adding to the bicycle paths, they utilized costly and efficient technology to minimize noise, and they ensured that roads were accessible in the wintertime.

Harvey, who, before his tenure with Pacific Energy had built many power plants—including coal, natural gas, and nuclear facilities—says that the Mammoth Plants "involved the longest, biggest, and most arduous permitting process" he's ever gone

through. "I never got into [a project] as hot and controversial as Mammoth during my 40 years of experience, and that's ironic because the Mammoth plant was the most environmentally benign I've ever worked on."

Richard Campbell, one of the primary engineers for the units at Mammoth, helped design a power plant that is not only environmentally benign, but also unobtrusive. He and the company he worked for, Ben Holt Company, designed low-lying, camouflaged facilities that are difficult to spot even from a major highway overlooking the plant. The company also put silencers in place to limit noise.

Based on Campbell's design, the MP-I plant became the first of its kind to utilize air-cooled technology, rather than the water-cooled technology used by geothermal power plants before it. While water-cooled units emit generally harmless but noticeable steam plumes, air-cooled units have no visible emissions and minimal operating losses of geothermal fluid or gases. Besides reducing the aesthetic impact, air-cooled binary cycle technology requires no cooling water—a particularly important consideration in the Mammoth area where water availability is limited.

F. Results of Monitoring Activity

After years of monitoring, with the Mammoth power plants continually pumping at 12,500 gallons of hot water per minute, there have been few adverse impacts attributed to plant development. Even so, all monitoring efforts continue on a regular basis, and are made available once a quarter to any interested parties. With continued efficient management practices, the plant will likely stay online many years into the future.

Carey measures the success of the plant based on the minimal impact over the last 15 years of operations: "none of the dire predictions about the worst case impacts of the expansion projects came true. The projects aren't that visible; no adverse impacts to the hot springs in Hot Creek or the hatchery or the Owens tui chub have been documented; deer are grazing amongst the wells; no spills have adversely affected the creeks; and tourism is doing well." People slowly but surely began to realize that not only did the Mammoth Plants produce no negative impacts, it actually produced community benefits.

G. Economic Benefits

One such benefit is employment. Construction of the plant required a few hundred workers; current operation requires 21 full-time employees, with additional seasonal employees. The plants provide some of the best jobs in the Town of Mammoth Lakes, with a population of around 7,000. Both the original managing partner, Pacific Energy, and the current managing partner, Ormat Nevada, Inc., have made a commitment to hiring locally, with most full-time employees entering the geothermal field from a variety of backgrounds. Jobs histories of current Mammoth employees include positions as ski patrolmen, ex-miners, bartenders, and volunteer firemen. Ormat provides the

considerable training needed for these highly skilled positions, and workers are encouraged to stay with the company long term. Indeed, most of them do.

"A number of our employees have been with us for 20 years," says Sullivan. "I myself have been with the company for over almost 15 years."

Another benefit of the Mammoth Pacific geothermal plant is its low environmental impact. This type of plant produces minimal air emissions. A study showed that the pine trees surrounding the geothermal plants emit more greenhouse gases than the fugitive emissions from the power plants themselves. The effect on the deer population, which was one of the concerns of the California Department of Fish and Game when it sued Mono County to prevent the approval of the MP-II project, was found to be one half of one deer over the entire lifetime of the plant. Hawks have flocked to the area near the plants, and can be seen using the thermal currents to assist in soaring. In 1991, the California State Assembly passed a resolution commending the MPLP on the start-up of two of its geothermal power facilities in Mono County, recognizing its use of clean energy without "environmentally damaging emissions." In addition, for four consecutive years (2000-2004), MPLP received from the California Department of Conservation an award for its outstanding environmental record at its Mono County geothermal facilities.[110]

Another significant benefit has been the financial contributions of the power plant. MPLP has been designated a "good neighbor," by many locals, including Lyster, for making donations to local groups in the area. MPLP built a new community center from the proceeds of the power plants. According to Sullivan, MPLP is one of the largest taxpayers in the county, supplying over half a million dollars last year alone.

H. MP: A Success Story

The Mammoth Pacific Complex, which supplies power enough for approximately 40,000 homes, has provided many socioeconomic benefits. MPLP's involvement at all levels—including monitoring, individual responses to citizens' concerns, sponsorship of community events, funding of community centers, and construction of aesthetically pleasing facilities—demonstrates its commitment to Mono County. Despite initial challenges, MPLP has emerged as a true success story for the geothermal community.

[110] DOE EERE Geothermal Technologies Program (Update Jan 2005). *The Award-Winning Environmental Performance of Geothermal Power in California.* Retrieved October 14, 2005, from http://www.eere.energy.gov/geothermal/geopower_calif_awards.html.

Glossary[111]

Aquaculture:[112] farming of organisms that live in water, such as fish, shellfish, and algae.

Baseload Capacity: The generating equipment normally operated to serve loads on an around-the-clock basis.

Baseload Plant: A plant, usually housing high-efficiency steam-electric units, which is normally operated to take all or part of the minimum load of a system, and which consequently produces electricity at an essentially constant rate and runs continuously. These units are operated to maximize system mechanical and thermal efficiency and minimize system operating costs.

Baseload: The minimum amount of electric power delivered or required over a given period of time at a steady rate.

Binary-Cycle Plant: A geothermal electricity generating plant employing a closed-loop heat exchange system in which the heat of the geothermal fluid (the "primary fluid") is transferred to a lower-boiling-point fluid (the "secondary" or "working" fluid), which is thereby vaporized and used to drive a turbine/generator set.

Biomass: Energy resources derived from organic matter. These include wood, agricultural waste and other living-cell material that can be burned to produce heat energy. They also include algae, sewage and other organic substances that may be used to make energy through chemical processes.

Capability: The maximum load that a generating unit, generating station, or other electrical apparatus can carry under specified conditions for a given period of time without exceeding approved limits of temperature and stress.

Capacity Factor: a measure of the amount of real time during which a facility is used

Capacity: The amount of electric power delivered or required for which a generator, turbine, transformer, transmission circuit, station, or system is rated by the manufacturer.

Carbon Dioxide: A colorless, odorless, non-poisonous gas that is a normal part of the air. Carbon dioxide, also called CO_2, is exhaled by humans and animals and is absorbed by green growing things and by the sea.

Coal: A readily combustible black or brownish-black rock whose composition, including inherent moisture, consists of more than 50 percent by weight and more than 70 percent by volume of carbonaceous material. It is formed from plant remains that have been compacted, hardened, chemically altered, and metamorphosed by heat and pressure over geologic time.

Combined Cycle: An electric generating technology in which electricity is produced from otherwise lost waste heat exiting from one or more gas (combustion) turbines. The exiting heat is routed to a conventional boiler or to a heat recovery steam generator for utilization by a steam turbine in the production of electricity. This process increases the efficiency of the electric generating unit.

Condensate: Water formed by condensation of steam.

Consumption (Fuel): The amount of fuel used for gross generation, providing standby service, start-up and/or flame stabilization.

Cooling tower: A cooling tower is the structure associated with water-cooled heat extraction systems. Hot water is spayed from the top of the structure and cascades against an upwards airflow that cools the water (mainly through evaporation).

Cost: The amount paid to acquire resources, such as plant and equipment, fuel, or labor services.

Crust: Earth's outer layer of rock. Also called the lithosphere.

Debt: An amount owed to a person or organization for funds borrowed. Debt can be represented by a loan note, bond, mortgage or other form stating repayment terms and, if applicable, interest requirements. These different forms all imply intent to pay back an amount owed by a specific date, which is set forth in the repayment terms.

Demand (Electric): The rate at which electric energy is delivered to or by a system, part of a system, or piece of equipment, at a given instant or averaged over any designated period of time.

Demand (Utility): The level at which electricity or natural gas is delivered to users at a given point in time. Electric demand is expressed in kilowatts.

Direct impacts: All expenditures associated with construction and maintenance of geothermal power plants. During the construction phase, it corresponds to the total investment associated with the power plant construction. During the operation and maintenance phase, it relates to all expenditures in goods and services associated with power plant operation and maintenance.

Direct Use: Use of geothermal heat without first converting it to electricity, such as for space heating and cooling, food preparation, industrial processes, etc.

Dispatch: The operating control of an integrated electric system to: Assign generation to specific generating plants and other sources of supply to effect the most reliable and economical supply as the total of the significant area loads rises or falls. Control operations and maintenance of high-voltage lines, substations and equipment, including administration of safety procedures. Operate the interconnection. Schedule energy transactions with other interconnected electric utilities.

Distribution: The delivery of electricity to retail customers (including homes, businesses, etc.).

[111] All terms from Energy Information Administration [EIA] (2002) *Glossary of Electricity Terms*, Retrieved August 1, 2006, from http://www.eia.doe.gov/cneaf/electricity/epav1/glossary.html; California Energy Commission [CEC] (2004), *Glossary of Energy Terms*, Retrieved August 1, 2006, from http://www.energy.ca.gov/glossary/; U.S. DOE Energy Efficiency and Renewable Energy Geothermal Technologies Program. *Geothermal Glossary*. [112] Source: USGS

Drilling: Boring into the Earth to access geothermal resources, usually with oil and gas drilling equipment that has been modified to meet geothermal requirements.

Dry Steam: Very hot steam that doesn't occur with liquid.

Economics: The study of how the forces of supply and demand allocate scarce resources. Subdivided into microeconomics, which examines the behavior of firms, consumers and the role of government; and macroeconomics, which looks at inflation, unemployment, industrial production, and the role of government.

Economy of scale: Reduction in cost per unit resulting from increased production, realized through operational efficiencies. Economies of scale can be accomplished because as production increases, the cost of producing each additional unit falls.

Electric Plant (Physical): A facility containing prime movers, electric generators, and auxiliary equipment for converting mechanical, chemical, and/or fission energy into electric energy.

Electric Utility: A corporation, person, agency, authority, or other legal entity or instrumentality that owns and/or operates facilities within the United States, its territories, or Puerto Rico for the generation, transmission, distribution, or sale of electric energy primarily for use by the public and files forms listed in the Code of Federal Regulations, Title 18, Part 141. Facilities that qualify as cogenerators or small power producers under the Public Utility Regulatory Policies Act (PURPA) are not considered electric utilities.

Emissions Standard: The maximum amount of a pollutant legally permitted to be discharged from a single source.

Energy Policy Act 2005 (EPAct): (Public Law 109-58) is a statute which was passed by the United States Congress on July 29, 2005 and signed into law on August 8, 2005 at Sandia National Laboratories in Albuquerque, New Mexico. The Act, described by proponents as an attempt to combat growing energy problems, provides tax incentives and loan guarantees for energy production of various types.

Energy Source: The primary source that provides the power that is converted to electricity through chemical, mechanical, or other means. Energy sources include coal, petroleum and petroleum products, gas, water, uranium, wind, sunlight, geothermal, and other sources.

Energy: The capacity for doing work as measured by the capability of doing work (potential energy) or the conversion of this capability to motion (kinetic energy). Energy has several forms, some of which are easily convertible and can be changed to another form useful for work. Most of the world's convertible energy comes from fossil fuels that are burned to produce heat that is then used as a transfer medium to mechanical or other means in order to accomplish tasks. Electrical energy is usually measured in kilowatthours, while heat energy is usually measured in British thermal units.

Environmental Impact Study: A document required by federal and state laws to accompany proposals for projects and programs that may have an impact on the surrounding area.
equity: Ownership interest in a corporation in the form of common stock or preferred stock. It is the risk-bearing part of the company's capital and contrasts with debt capital which is usually

secured and has priority over shareholders if the company becomes insolvent and its assets are distributed.

Facility: An existing or planned location or site at which prime movers, electric generators, and/or equipment for converting mechanical, chemical, and/or nuclear energy into electric energy are situated, or will be situated. A facility may contain more than one generator of either the same or different prime mover type. For a cogenerator, the facility includes the industrial or commercial process.

Flash Steam: Steam produced when the pressure on a geothermal liquid is reduced. Also called flashing.

Fossil Fuel: Any naturally occurring organic fuel, such as petroleum, coal, and natural gas.

Fossil-Fuel Plant: A plant using coal, petroleum, or gas as its source of energy.

Fuel: Any substance that can be burned to produce heat; also, materials that can be fissioned in a chain reaction to produce heat.

Generating Unit: Any combination of physically connected generator(s), reactor(s), boiler(s), combustion turbine(s), or other prime mover(s) operated together to produce electric power.

Generation (Electricity): The process of producing electric energy by transforming other forms of energy; also, the amount of electric energy produced, expressed in watthours (Wh).

Geology: Study of the planet Earth, its composition, structure, natural processes, and history.

Geophysical survey: Geophysical methodologies used during the exploration and drilling phases to locate the resource and identify the best suited sites to drill production wells. These may include gravity surveys, ground magnetic surveys, magnetotelluric surveys, electrical resistivity surveys, and seismic surveys.

Geothermal: Of or relating to the Earth's interior heat.

Geothermal Energy: Natural heat from within the Earth, captured for production of electric power, space heating or industrial steam.

Geothermal Heat Pumps: Devices that take advantage of the relatively constant temperature of the Earth's interior, using it as a source and sink of heat for both heating and cooling. When cooling, heat is extracted from the space and dissipated into the Earth; when heating, heat is extracted from the Earth and pumped into the space.

Geothermal Plant: A plant in which the prime mover is a steam turbine. The turbine is driven either by steam produced from hot water or by natural steam that derives its energy from heat found in rocks or fluids at various depths beneath the surface of the Earth. The energy is extracted by drilling and/or pumping.

Geothermal Steam: Steam drawn from deep within the Earth.

Geyser: A spring that shoots jets of hot water and steam into the air.

Geysers, The (note: "The" of "The Geysers" is always capitalized): A large geothermal steam field located north of San Francisco.

Greenfield project: A greenfield project (as opposed to a project expansion) is a project that is developed on a resource (area) that is not used by an existing power plant.

Greenhouse Effect: The increasing mean global surface temperature of the Earth caused by gases in the atmosphere (including carbon dioxide, methane, nitrous oxide, ozone, and chlorofluorocarbon). The greenhouse effect allows solar radiation to penetrate but absorbs the infrared radiation returning to space.

Grid: The layout of an electrical distribution system.

Gross Generation: The total amount of electric energy produced by the generating units at a generating station or stations, measured at the generator terminals.

Heat Exchanger: A device for transferring thermal energy from one fluid to another.

Heat Pumps: *See Geothermal Heat Pumps*

Hot Dry Rock: A geothermal resource created when impermeable, subsurface rock structures, typically granite rock 15,000 feet or more below the Earth's surface, are heated by geothermal energy. The resource is being investigated as a source of energy production.

Hydroelectric Plant: A plant in which the turbine generators are driven by falling water.

Independent Power Producers: Entities that are considered nonutility power producers in the United States. These facilities are wholesale electricity producers that operate within the franchised service territories of host utilities and are usually authorized to sell at market-based rates. Unlike traditional electric utilities, Independent Power Producers do not possess transmission

Indirect impacts: This correspond to the economic impact that affects all industries that provides goods and services to the industries directly involved in power plant construction or operation and maintenance. Indirect impacts thus quantify the impact of changes in power plant construction or O&M activities on the industries that supplies it.

Induced impacts: Industries that experience both direct and indirect impacts will often change their employment levels to meet the new level of demand. These employment changes induce changes in income that are spent in the region to purchase goods and services. This income effect is the source of induced impacts. Induced impacts leads to further rounds of indirect and induced impacts as the increased demand for goods and services purchased by workers leads to further increases in output in other industries.

Injection well: Injection wells inject the brine back into the reservoir after using it in the power production process.

Injection: The process of returning spent geothermal fluids to the subsurface. Sometimes referred to as reinjection.

Kilowatt (kW): One thousand watts.

Kilowatthour (kWh): One thousand watthours.

Known Geothermal Resource Area (KGRA): A region identified by the U.S. Geological Survey as containing geothermal resources.

Lead-time: The amount of time between the placing of an order and the receipt of the goods ordered.

Lease: A contract between a lessor and a lessee for the use of a vehicle or other property, subject to stated terms and limitations, for a specified period and at a specified payment.[113]

Levelized cost: The present value of the total cost of building and operating a generating plant over its economic life, converted to equal annual payments. Costs are levelized in real dollars (i.e., adjusted to remove the impact of inflation).

Lithologies: properties of a rock formation

Load (Electric): The amount of electric power delivered or required at any specific point or points on a system. The requirement originates at the energy-consuming equipment of the consumers.

Magma: The molten rock and elements that lie below the Earth's crust. The heat energy can approach 1,000 degrees Fahrenheit and is generated directly from a shallow molten magma resource and stored in adjacent rock structures. To extract energy from magma resources requires drilling near or directly into a magma chamber and circulating water down the well in a convection- type system. California has two areas that may be magma resource sites: the Mono-Long Valley Caldera and Coso Hot Springs Known Geothermal Resource Areas.

Mantle: The Earth's inner layer of molten rock, lying beneath the Earth's crust and above the Earth's core of liquid iron and nickel.

Megawatt (MW): One million watts.

megawatt hour (MWh): One million watthours.

Mitigation: Structural and non-structural measures undertaken to limit the adverse impact of natural hazards, environmental degradation and technological hazards

Municipal utility: Water or electric company over which the State Department of Public Utility Control does not have jurisdiction to regulate.

---

[113] Federal Reserve. *Glossary of Terms*. Retrieved August 1, 2006, from www.federalreserve.gov/pubs/leasing/glossary.htm.

Natural Gas Combined-Cycle: plants that generate electricity using two methods, the steam cycle and the gas cycle. In the steam cycle, fuel is burned to boil water and create steam which turns a steam turbine driving a generator to create electricity. In the gas cycle, gas is burned in a gas turbine which directly turns a generator to create electricity. Combined cycle power plants operate by combining the gas cycle and the steam cycle for higher efficiency.

Natural Gas: A naturally occurring mixture of hydrocarbon and nonhydrocarbon gases found in porous geological formations beneath the earth's surface, often in association with petroleum. The principal constituent is methane.

Net Capability: The maximum load-carrying ability of the equipment, exclusive of station use, under specified conditions for a given time interval, independent of the characteristics of the load. (Capability is determined by design characteristics, physical conditions, adequacy of prime mover, energy supply, and operating limitations such as cooling and circulating water supply and temperature, headwater and tailwater elevations, and electrical use.)

Net Generation: Gross generation less the electric energy consumed at the generating station for station use.

Nitrogen oxides (NOx): Oxides of nitrogen that are a chief component of air pollution that can be produced by the burning of fossil fuels. Also called nitrogen oxides.

Non-specular conductors: conductors treated to reduce the amount of light reflected, usually by dipping the conductor in an acid bath that takes the shine off thereby reducing visibility.

Nuclear Energy: Power obtained by splitting heavy atoms (fission) or joining light atoms (fusion). A nuclear energy plant uses a controlled atomic chain reaction to produce heat. The heat is used to make steam run conventional turbine generators.

Nuclear Power Plant: A facility in which heat produced in a reactor by the fissioning of nuclear fuel is used to drive a steam turbine.

Open-Loop Biomass: [114] any agricultural livestock waste nutrients; or, any solid, nonhazardous, cellulosic or lignin waste material or by product of wood
or paper mill operations, including lignin in pulping liquors, which is derived from

Outage: The period during which a generating unit, transmission line, or other facility is out of service.

Particulate Matter (PM): Unburned fuel particles that form smoke or soot and stick to lung tissue when inhaled. A chief component of exhaust emissions from heavy-duty diesel engines

Peak Demand: The maximum load during a specified period of time.

[114] American Forest & Paper Association (August 2005). *Senate Corrections Comments*. Retrieved August 1, 2006, from http://www.senate.gov/~finance/Technical%20Correction%2005/Comments%20on%20Tax%20Technical%20Corrections-%20Finance.pdf.

Peaking Capacity: Capacity of generating equipment normally reserved for operation during the hours of highest daily, weekly, or seasonal loads. Some generating equipment may be operated at certain times as peaking capacity and at other times to serve loads on an around-the-clock basis.

Permeability: The relative ease with which a porous medium can transmit a liquid under a hydraulic gradient. In hydrology, the capacity of rock, soil, or sediment to allow the passage of water.

Plant: A facility at which are located prime movers, electric generators, and auxiliary equipment for converting mechanical, chemical, and/or nuclear energy into electric energy. A plant may contain more than one type of prime mover. Electric utility plants exclude facilities that satisfy the definition of a qualifying facility under the Public Utility Regulatory Policies Act of 1978.

Pollution: Unwanted particles, mist or gases put into the atmosphere as a result of motor vehicle exhaust, the operation of industrial facilities or other human activity.
power purchase agreement: The off-take contract from a large customer to buy the electricity generated by a power plant.

Power: The rate at which energy is transferred. Electrical energy is usually measured in watts. Also used for a measurement of capacity.

Price: The amount of money or consideration-in-kind for which a service is bought, sold, or offered for sale.

Production well: A production well is a well drilled through a geothermal resource that produces geothermal brine.

Profit: The income remaining after all business expenses are paid.

Qualifying Facility (QF): A cogeneration or small power production facility that meets certain ownership, operating, and efficiency criteria established by the Federal Energy Regulatory Commission (FERC) pursuant to the Public Utility Regulatory Policies Act (PURPA).

Rate of return: The annual rate of return on an investment, expressed as a percentage of the total amount invested. also called return

Reconnaissance:[115] A method of gathering data, often associated with surface surveys, in which archaeological remains are systematically identified and plotted on a map.

Regulation: The governmental function of controlling or directing economic entities through the process of rulemaking and adjudication.

Reliability: Electric system reliability has two components--adequacy and security. Adequacy is the ability of the electric system to supply to aggregate electrical demand and energy requirements of the customers at all times, taking into account scheduled and unscheduled outages of system facilities. Security is the ability of the electric system to withstand sudden disturbances, such as electric short circuits or unanticipated loss of system facilities. The degree

[115] Archeological Institute of America (2006). *Glossary*. Retrieved August 1, 2006, from http://www.archaeological.org/webinfo.php?page=10299.

of reliability may be measured by the frequency, duration, and magnitude of adverse effects on consumer services.

Renewable energy: Resources that constantly renew themselves or that are regarded as practically inexhaustible. These include solar, wind, geothermal, hydro and wood. Although particular geothermal formations can be depleted, the natural heat in the earth is a virtually inexhaustible reserve of potential energy. Renewable resources also include some experimental or less-developed sources such as tidal power, sea currents and ocean thermal gradients.

Renewable Resources: Naturally, but flow-limited resources that can be replenished. They are virtually inexhaustible in duration but limited in the amount of energy that is available per unit of time. Some (such as geothermal and biomass) may be stock-limited in that stocks are depleted by use, but on a time scale of decades, or perhaps centuries, they can probably be replenished. Renewable energy resources include: biomass, hydro, geothermal, solar and wind. In the future, they could also include the use of ocean thermal, wave, and tidal action technologies. Utility renewable resource applications include bulk electricity generation, on-site electricity generation, distributed electricity generation, non-grid-connected generation, and demand-reduction (energy efficiency) technologies.

Reservoir: A natural underground container of liquids, such as water or steam (or, in the petroleum context, oil or gas).

Revegetation:[116] Regrowing native plants, mainly trees and shrubs, by active restoration, natural process restoration, or both.

Revenue: The total amount of money received by a firm from sales of its products and/or services, gains from the sales or exchange of assets, interest and dividends earned on investments, and other increases in the owner's equity except those arising from capital adjustments.

Royalty: A payment made for the use of property, especially a patent, copyrighted work, franchise, or natural resource. The amount is usually a percentage of revenues obtained through its use.

Sales: The amount of kilowatthours sold in a given period of time; usually grouped by classes of service, such as residential, commercial, industrial, and other. Other sales include public street and highway lighting, other sales to public authorities and railways, and interdepartmental sales.

Slim-hole: Slim-holes are small diameter wells drilled during the exploration phase in order to verify the existence of a productive geothermal resource and provide information about the geologic structure of the site. Such holes are sometimes preferred to "full-diameter production wells" since they are significantly less expensive.

Socioeconomics:[117] Research into the effects of both social and economic factors on individuals and communities. Socioeconomics begins with the assumption that economics is not a self-contained system, but is embedded in society, polity, and culture.

[116] The Nature Conservancy. Retrieved August 1, 2006, from www.tncvalifornia.org/glossary/.
[117] Harvard University (http://www.researchmatters.harvard.edu/topic.php?topic_id=260) and Society for the Advancement of Socio-Economics (SASE)

Solar Energy: Heat and light radiated from the sun.

Stability: The property of a system or element by virtue of which its output will ultimately attain a steady state. The amount of power that can be transferred from one machine to another following a disturbance. The stability of a power system is its ability to develop restoring forces equal to or greater than the disturbing forces so as to maintain a state of equilibrium.

Standby Service: Support service that is available, as needed, to supplement a consumer, a utility system, or to another utility if a schedule or an agreement authorizes the transaction. The service is not regularly used.

Subsidence: A sinking of an area of the Earth's crust due to fluid withdrawal and pressure decline

Sulfur oxides: Compounds containing sulfur and oxygen, such as sulfur dioxide (SO2) and sulfur trioxide (SO3).

Sustainablility:[118] Economic development that takes full account of the environmental consequences of economic activity and is based on the use of resources that can be replaced or renewed and therefore are not depleted.

System (Electric): Physically connected generation, transmission, and distribution facilities operated as an integrated unit under one central management, or operating supervision.

Temperature gradient hole: A temperature gradient hole is a relatively slim and shallow hole (50-600 feet deep) that aims to estimate the rate of increase of ground temperature with depth.

Transmission System (Electric): An interconnected group of electric transmission lines and associated equipment for moving or transferring electric energy in bulk between points of supply and points at which it is transformed for delivery over the distribution system lines to consumers, or is delivered to other electric systems.

Transmission: The movement or transfer of electric energy over an interconnected group of lines and associated equipment between points of supply and points at which it is transformed for delivery to consumers, or is delivered to other electric systems. Transmission is considered to end when the energy is transformed for distribution to the consumer.

Turbine: A machine for generating rotary mechanical power from the energy of a stream of fluid (such as water, steam, or hot gas). Turbines convert the kinetic energy of fluids to mechanical energy through the principles of impulse and reaction, or a mixture of the two.

Utility: A regulated entity which exhibits the characteristics of a natural monopoly. For the purposes of electric industry restructuring, "utility" refers to the regulated, vertically-integrated electric company. "Transmission utility" refers to the regulated owner/operator of the transmission system only. "Distribution utility" refers to the regulated owner/operator of the distribution system which serves retail customers.

(http://www.sase.org/index.php?option=com_content&task=blogsection&id=5&Itemid=43). Retrieved August 1, 2006, 2006.

3745

Watt: The electrical unit of power. The rate of energy transfer equivalent to 1 ampere flowing under a pressure of 1 volt at unity power factor.

Watthour (Wh): An electrical energy unit of measure equal to 1 watt of power supplied to, or taken from, an electric circuit steadily for 1 hour.

Global Geothermal Industry Balances Short-Term Development With Long-Term Investment in EGS

If the Low-Carbon & Renewable Power segment of the Climate Change Industry were a baseball team, geothermal energy would be the underrated veteran shortstop who doesn't hit many homers but fields consistently, rarely strikes out and scores runs on a regular basis. Let the stars like wind turbines and solar photovoltaic (PV) panels get the headlines; let the sports writers pump up the egos of rookies like thin-film PV, cellulosic biofuels and solar thermal power. Geothermal will be there to rack up solid stats and deliver for the team and the fans year after year.

Geothermal power's workmanlike quality stems from the fact that it offers something that wind and solar cannot provide: reliable baseload power that can be counted on to deliver megawatt-hours 24 hours a day, 365 days a year. In fact, for a utility or regional transmission organization, a geothermal power plant shows up on a resource plan grid like a conventional power plant.

In a broad context there are really three ways to look at geothermal energy:

1) Traditional steam-generated electricity generation, or hydrothermal, as it is often known, is site-dependent and has rather limited potential of perhaps 30,000 MW in the United States;

2) Enhanced geothermal systems (EGS) allow electricity generation from hot dry rock, thus opening up the map and the potential for geothermal power. But it is still early stages for EGS; and

3) Direct use geothermal encompasses space heating, hot water, process heat, pools, greenhouses and aquaculture. Direct use is exploited in more countries than electricity generation (see box on page 5), but CCBJ classifies it as an energy efficiency application in that it replaces conventional sources of energy. The main growth in direct use during the last decade has been geothermal or ground-source heat pumps for space heating.

The Geothermal Energy Industry

Geothermal energy was a $6.8 billion global industry in 2008, generating 66,000 GWh of electricity worth close to $4.8 billion, $1.1 billion in equipment sales and $900 million in service revenues. The United States market is the world's largest at $2.3 billion, and forecasts are for high growth as a strong pipeline of projects are developed in the next few years when carbon regulations are expected to drive a subsequent wave of growth.

Hence the focus of this review on electricity generation and its tie in with the power sector. Geothermal electricity "bridges both the conventional feedstock and renewable energy options for electric power generation rather uniquely," wrote **Deloitte** in a February 2008 report for the U.S. **Department of Energy (DOE)**. Geothermal's baseload characteristics allow "it to compete with other baseload feedstocks such as coal, natural gas and nuclear. At the same time, geothermal energy is a clean, renewable resource that competes with other renewable energy options such as wind and solar [making] it an attractive option for reliable and scalable generation while satisfying renewable energy voluntary or mandatory portfolio standards."

Yet, geothermal both in the United States and the rest of the world is not being deployed at a particularly brisk pace. At the end of 2008, cumulative worldwide installed capacity was between 9,900 and 10,500 MW, including 2,200 MW in operating capacity in the United States, according to estimates from **New Energy Finance** (NEF) and **Emerging Energy Research**. (Some 400-500 MW of capacity at the 1,400-MW Geysers project in California is on standby.)

Globally the pipeline of hydrothermal electricity projects currently in development exceeds the installed capacity by about 500 MW (see chart on page 2). The United States, Indonesia, the Philippines, Iceland and New Zealand account for 77% of the 10.7-MW pipeline, according to NEF estimates as of April 2009.

How Geothermal Stacks Up Against Other Renewables

Not only is geothermal's 10,000 MW in current global capacity easily less than 10% of the comparable capacity figure for wind power (121 GW worldwide) and less than two thirds of solar PV's installed capacity (15 GW), but geothermal electricity generation represents a comparatively anemic growth rate. At the end of 2003, global geothermal capacity was at 8,400 MW, meaning average annual growth from 2003-2008 was about 3.4%. Not bad if you're in the soup business, but in the clean energy business that kind of growth doesn't generate much excitement. By contrast, PV's 5.95-GW jump in 2008 as tallied by **SolarBuzz** represented one year growth of 110%. Wind power's leap forward in 2008 as tallied by the **Global Wind Energy Council** was 29%.

Even with the recent growth in wind and solar, renewable sources remain fairly insignificant in the 19 million GWh global electricity picture. In terms of electricity production, however, geothermal's superior capacity factor makes its contribution to global electricity generation more substantial than solar and close to half that of wind—at least in 2006, the most recent year for which the International Energy Agency publishes data. According to the IEA, geothermal electricity accounted for 59,200 GWh or 0.31% of global electricity generated, with wind at 0.7% and solar 0.2% in the same year. Coal (41%), gas (20%), hydro (16%), nuclear (15%) and oil (6%) made up 98% in 2006, according to IEA. Of course, lumping geothermal with the other renewables does de-emphasize its higher capacity factor (see table at right) and predictable baseload contribution valued by utilities.

As a business segment, CCBJ estimates the U.S. geothermal industry accounted for $2.3 billion in revenues in 2008, or 34% of the $6.8 billion global total. The $7 billion figure for the global geothermal industry compares to $56 billion for wind and $28 billion for solar (See dedicated CCBJ editions from 2008).

CCBJ defines the geothermal industry in three subsegments: electricity generation; equipment sales; and services. The latter includes exploration & resource assessment, well field drilling & development and plant design & construction. Electricity represents about 70% of the global total, but the ramping up of growth until the 2008 financial meltdown had corresponding investments in site evaluation, drilling, etc. that tilted the share of revenues more to services in growing mar-

Typical Market Drivers for Renewable Energy

Driver	Developed markets	Emerging markets
Power prices	+	++
Demand growth	++	+++
Reliance on energy imports	+++	++++
Environment	++++	+

Note: Each + indicates relative importance of market driver; Drivers are the same worldwide, but priorities vary.

Source: Pathway to Accelerated Commercialization by Raser Technologies. Original Source: B.C. Hydro - Challenges & Choices (2006); Jacob & Company Securities estimates. Levelized cost is the present value of the total cost of building and operating a generating plant over its economic life, converted to equal annual payments.

kets, the U.S. included. CCBJ forecasts indicate that following a delay resulting from the freezing of credit and financing, the geothermal market will resume a growth trajectory and reach $5 billion in the U.S. and $16 billion globally by 2014.

Revenues available to specialist consulting & engineering firms could arguably be the total service amounts of roughly $1 billion globally the past few years, with a jump to $2-3 billion provided nothing further curtails the current pipeline or forecasted growth trajectory. A significant portion of these revenues, however, would be drilling or construction, meaning pure C&E project revenue would likely be closer to half these figures.

According to a variety of analysts and CCBJ interviews with industry leaders and experts, the growth of geothermal has historically been hampered by several constraints and challenges. In the first place, without a technological revolution like that promised by enhanced geothermal systems (EGS, also known as hot dry rock technology; see EGS/HDR feature on pages 29-31), geothermal power can only be developed in countries with suitable underground geothermal resources. Most geothermal resources are located along the seismically active Ring of Fire that roughly follows the coasts of the Pacific Ocean. Other resource areas include Eastern China and the Himalayan Belt, the Caribbean, Iceland, The Azores, Canary Islands, Italy, parts of Northern and Eastern Europe, the Eastern and Southern Mediterranean and Kenya, Tanzania and other countries is the East Africa Rift zone.

Investors prefer to buy geothermal companies or their operating power plants rather than invest in new projects.

In the second place, geothermal development is to a certain degree a speculative enterprise. Like wildcatters in the oil industry, geothermal developers must spend millions of dollars drilling for underground resources that they're not sure are present—or present in the quantities that will lead to their expected return on investment. "Geothermal projects have distinctly different challenges than other, more traditional, renewable technologies such as wind, solar, and biomass," notes the DOE's office of **Energy Efficiency and Renewable Energy (EERE)** in its *Geothermal Tomorrow* report. "Geothermal projects require subsurface exploration and well field development and have greater upfront risk because the geothermal resource is not confirmed without drilling."

Geothermal developers at **Greenpower Conferences'** March 2009 Geothermal Innovation and Investment conference in San Francisco said that typically 20% to 30% of the wells they drill—wells costing from $1.5 million to $10 million—end up hitting "dryholes." While not always physically dry, these dryholes are of sub-commercial enthalpy (heat energy). Compounding this dryhole risk is the fact that in the United States and some other regions, many of the best and most easily accessible geothermal resources—those with surface expressions like hot springs and fumaroles—have already been developed. To tap undeveloped resources for new power plants, developers must take on more risk in their drilling and development efforts.

As described in the developers roundtable article that follows this overview on page 9, as recently as the summer of 2008 developers could obtain debt financing to finance some of this resource and wellfield development work. Today the pendulum has swung the other way. Those lenders willing to finance geothermal projects require that developers sink wells and have proven resources—"steam behind the pipe" as they call it—before they will finance power plant construction. Separately with the depressed market caps of publicly held geothermal developers, private equity funders would rather buy companies or their assets than invest in new projects. Financial institutions in the market for tax credits are few and far between. And except for companies with a technology play in the emerging EGS segment, venture capitalists aren't interested in geothermal companies because of the lack of upside potential.

In this difficult environment, geothermal developers are urging the U.S.

Geothermal Energy: Opportunity and Challenge

Advantages from Utility Perspective

- Firm 24x7, not an intermittent resource
- Competitive cost
- Small physical footprint with minimal environmental impact
- 20-40 MW size does not require EHV transmission
- Credibility from years of success
- Recognized as a well-established industry

Some Development Challenges

- Financing uncertainty & heightened risk aversion
- Resource uncertainty
- Consolidating site control
- Prospecting/drilling cost on front-end
- Permitting
- Long lead-time
- Supply curve: progression to lower quality prospects

Challenges for Utilities

- Increasing RPS requirements puts pressure on utilities to turn to big projects
- Greenfield project failure an issue
- Uncertainties regarding amount, timing, and cost at odds with competitive resource procurement
- Operating plant/resource performance predictability an issue
- Few players in geothermal industry have the financial strength to go the distance

Direct Use Geothermal and Impacts on Climate Change

Electricity is produced from geothermal sources in 24 countries. Direct application of geothermal energy has been reported by 72 countries. In 2005, the worldwide use of geothermal energy was 57 TWh/yr of electricity and direct use was 76 TWh/yr, as reported by the **Intergovernmental Panel on Climate Change** (IPCC), a scientific intergovernmental body set up by the World Meteorological Organization and by the United Nations Environment Programme. Six developing countries are in the top 15 countries in direct use, with China at the top of the list. Direct use utilizes low-enthalphy geothermal fields that don't produce hot water at temperatures sufficient to generate power. While many firms engaged in geothermal electricity also work on direct-use projects, the segment is more driven by utilities, governments or companies using the heat directly. (Note: IPCC has released forecasts for geothermal electricity with global capacity reaching 24 GW in 2020, 46 GW in 2030, 90 GW in 2040 and 140 GW in 2050)

Direct Use Applications: Direct applications of geothermal energy are for space heating 52%, hot water (bathing and swimming) 30%, horticulture (greenhouses and soil heating) 8%, industry 4%, and aquaculture (mainly fish farming) 4%, according to John Lund in his paper *World-Wide Direct Uses of Geothermal Energy 2005.* Ground-source heat pumps are growing due to their ability to utilise groundwater or ground-coupled temperatures. According to IPCC, scenarios for future development show only a moderate increase in traditional direct use applications, but an exponential increase in heat pumps, as geothermal heat pumps can be used for heating and/or cooling in most parts of the world. In addition, geothermal heat pumps driven by fossil-fuel electricity reduce CO2 emissions by at least 50% compared with fossil-fuel fired boilers. If the electricity that drives the geothermal heat pump is produced from a renewable energy source like hydropower or geothermal energy the CO2 emission savings are up to 100%. The total CO2 emission reduction potential of geothermal heat pumps has been estimated to be 1.2 billion tonnes per year or about 6% of global CO2 emissions. Geothermal heat pumps will be covered in CCBJ's upcoming edition on energy efficiency and demand response.

Geographic and Application Breakdown of Direct Use Geothermal

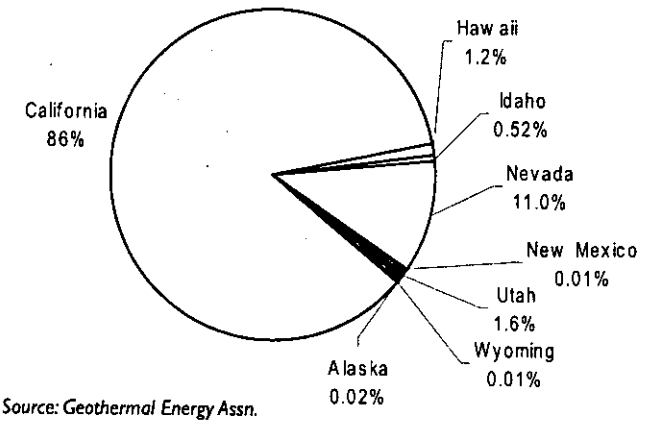
2009 U.S. Geothermal Power Capacity On-Line



Source: Geothermal Energy Assn.

Department of Energy to use some of its ARRA funding—$400 million for geothermal and $6 billion for innovative technology loan guarantees—to subsidize drilling. As of May 2009, DOE had not issued guidance on this question. In international developments, the recession's impact on Icelandic geothermal firms has been amplified by the collapse of Iceland's currency. With the krona almost worthless on the international market, Icelandic geothermal developers that had set their sights on developing projects in foreign markets have scaled back to focus on the significant potential in their homeland.

Western States' Near-Term New Geothermal Power Capacity

	Capacity MW	Number of Sites
Alaska	20	3
Arizona	20	2
Colorado	20	9
California	2,400	25
Hawaii	70	3
Idaho	860	6
Nevada	1,500	63
New Mexico	80	6
Oregon	380	11
Utah	230	5
Washington	50	5
Total	**5,630**	**138**

Source: Western Governors' Association, Geothermal Task Force of the Clean and Diversified Energy Initiative. The task force concluded that Western States have a capacity of 13,000 MW that can be developed on specific sites within a reasonable timeframe, of these, 5,600 MW are considered viable for commercial development by 2015.

Long-Term Market Drivers Look Solid

The phrase "when the economy recovers" is becoming a cliché of analysts and commentators looking at virtually all industries, but there's really no other way to say: When the economy recovers, and when the prices of oil and gas resume their inevitable rise into the $100-plus territory, the geothermal power industry's prospects will improve. The CCBJ global market forecast, not that dissimilar from the base-case capacity-growth scenario of Emerging Energy Research (EER), has 2011-2014 annual growth in the high teens, with double-digit growth persisting to 2020.

Market drivers for geothermal power are fundamentally sound: In the developed world, renewable energy standards and greenhouse gas caps are pushing utilities toward low-carbon generation, and geothermal's baseload qualities give it advantages over solar and wind. As outlined in the chart on page 3, energy supply and security are also drivers, as is power price in regions such as the Caribbean and parts of South Asia that are highly dependent on imported diesel oil for power supply. Some developing country markets are using feed-in tariffs popularized mostly for other renewables in Germany and other developed nations.

With renewed growth, however, the geothermal power segment will have to contend with a couple of looming challenges. One is lack of access to drilling rigs. When oil prices were in the stratosphere and demand was outstripping supply, geothermal developers had a difficult time contracting for rigs and crews. With the drop in prices and demand, that has gotten easier; but rising prices and demand will inevitably cause drilling demand to rise. Another challenge will be recruiting and training staff. "The professional staff available in geothermal is minute," said Doug Glaspey, CEO of U.S. Geothermal, at the March conference. "In order to grow, you have to have skilled professionals, and that's a very difficult thing to accomplish in this business today." Investment capital is also required, and although the flow of venture money into cleantech businesses was tallied at over $8 billion in 2008, geothermal is not the sexiest category.

EER states that geothermal power plant investment could reach $13-20 billion by 2020, representing cumulative investment in geothermal exploration, drilling, and power plant construction. In comparison with EER's broader power generation forecasts, geothermal is the fourth-largest market for cumulative renewable power generation investment between 2009 and 2020, behind onshore wind, solar PV, and biomass, but ahead of offshore wind, CSP, and small hydro globally by 2020.

EER's base-case growth scenario forecasts 20 GW of geothermal installed during the 2010s, with their high-growth scenario at about 1.5 times that or about 30 GW. The vast majority of growth in both scenarios is North America and Southeast Asia, although the rest of the world accounts for as much as 25-30% of growth in some years of EER's forecast. A few new markets are expected to see sustained growth, led by Chile, Turkey, Russia, East Africa, and Central America. Established markets in Iceland, Mexico, and New Zealand are also expected to

Regions Where Geothermal Companies Expect to Increase Their Work in 2009-2011

United States	69%
Europe	31%
Indonesia	31%
Central America	23%
Australia	15%
Africa	12%
China	12%
New Zealand	12%
Philippines	12%
Rest of Asia	12%
Canada	12%
Italy	8%
Japan	8%
Mexico	8%
India	8%
Chile	8%
Iceland	4%

continue to tap their potential. Australia is what EER calls the largest region of uncertainty, as its substantial goal of bringing online over 2 GW of geothermal by 2020 remains contingent on successful deployment of unproven EGS.

As mentioned, the United States leads the world in online capacity of geothermal energy and continues to be one of the principal countries to increase its geothermal growth. Geothermal electric power generation is centered in eight U.S. states: Alaska, California, Hawaii, Idaho, Nevada, New Mexico, Utah and Wyoming with Oregon and Colorado coming on line. Total U.S. installed capacity was 3,040 MW as of March 2009, according to GEA's *U.S. Geothermal Power Production and Development Update* that includes some units on standby. With a pipeline of now more than 4.4 GW of confirmed projects, the U.S. geothermal market is poised to more than double existing capacity over the next five years, says EER, with U.S. carbon legislation and national

Geothermal Industry Gameboard Not Too Crowded

The geothermal power industry consists of project developers that identify, finance and build geothermal power plants; consulting engineering and technical firms that identify and quantify geothermal resources, conduct environmental analyses, design, operate and maintain projects; drilling firms that drill wells for exploration and production; engineering, procurement and construction (EPC) firms that build geothermal power plants; manufacturers of turbine generator sets, heat exchangers and other equipment; and other specialty firms. Some firms perform multiple roles, for example, manufacturers sometimes develop their own projects and EPC firms often provide multiple technical services with in-house staff. Exploring for and developing geothermal power resources requires specialized expertise that is concentrated in a few countries including Japan, Iceland, the United States, Canada, New Zealand, Australia and the Philippines.

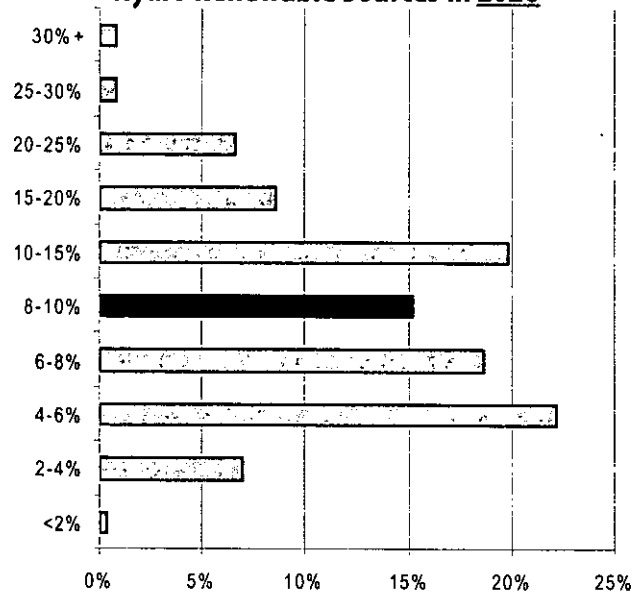
The number of firms in the industry is very small compared to other energy sectors. There are 11 manufacturers of geothermal turbine generator sets and related power plant components. They include: Alstom (France), Ansaldo (Italy), Fuji Electric (Japan), GE Energy (United States), Mitsubishi Heavy Industries (Japan), OAO Kalugo Energo (Russia), Ormat Technologies (United States), Siemens (Germany), Turboden (Italy), Toshiba (Japan) and UTC/Pratt & Whitney (United States). At the most recent international trade show of the **Geothermal Energy Association** in the United States, there were fewer than 100 exhibitors.

Geothermal project developers and power plant owners can be divided into two categories: 1) major independent power producers (IPPs) and utilities and 2) pure-play geothermal developers. The former category includes (U.S. companies unless stated): ArcLight Capital Partners/Terra-Gen Power, Calpine, Chevron, ENEL (Italy), EnBW (Germany), Geysir Green Energy (Iceland), LaGeo (El Salvador), Mid-American/CalEnergy, Ormat Technologies and PNOC EDC (The Philippines). Unocal and Chevron had historically been active developers of geothermal power in Southeast Asia. In 2005, Chevron acquired Unocal, and Chevron today is the world's largest private owner of geothermal power plants with combined capacity of 1,273 MW in the Philippines and Indonesia. Pure-play developers include: Magma Energy (Canada), Nevada Geothermal Power (Canada), Polaris Geothermal (Canada), Ram Power, Raser Technologies, Sierra Geothermal (Canada), U.S. Geothermal, Vulcan Power and Western GeoPower (Canada).

Enhanced geothermal systems (EGS) firms include AltaRock, Green Rock Energy (Australia), Panax Geothermal (Australia), Petratherm (Australia) and Potter Drilling. Leading technical and engineering consultancies and EPC contractors include AMEC, Enex (Iceland), GeothermEx, Geothermal Development Associates, Geothermal Resource Group, Horizon Well Logging, Hot Dry Rocks (Australia), Mannvit Engineering (Iceland), Ormat Technologies, Power Engineers, SAIC, SKM Consulting (Australia), West Japan Engineering Co. and Wood Group (United Kingdom)

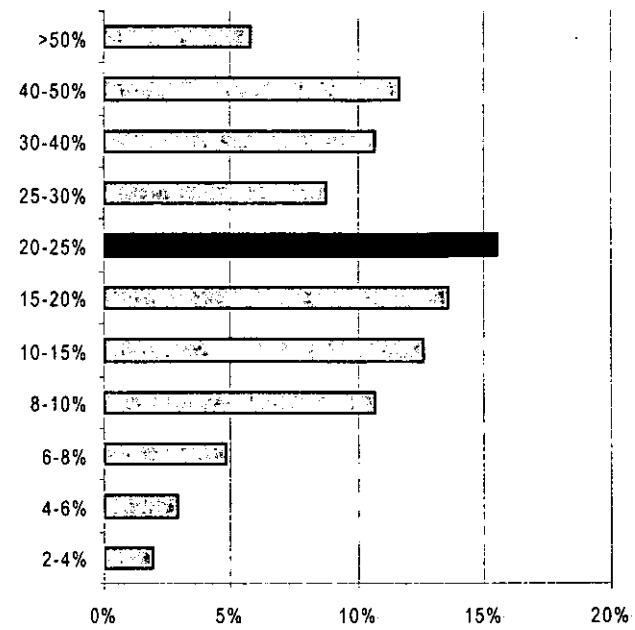
Leading drilling and drilling services companies include Baker Hughes, (United States), B.J. Services (United States), Boart Longyear (United States), Halliburton (United States), Iceland Drilling (Wales), Schlumberger (France, United States and The Netherlands), Thermasource (United States) and Weatherford (United States).

Percentage of U.S. Electricity Generation From Non-Hydro Renewable Sources in 2020



Source: Multiple CCBJ surveys with the same question conducted in 2008 and 2009 on the following topics: wind energy, CCS, snapshot and geothermal. Black bar indicates median range. Question was: U.S. DOE's Energy Information Administration says non-hydro renewable sources were responsible for 2.4% of U.S. electricity generation in 2006. What percentage of U.S. electricity generation do you believe non-hydro renewable sources will represent in 2020? (includes wood, municipal solid waste, landfill gas, sludge, biomass, geothermal, solar and wind).

Percentage of U.S. Electricity Generation From Non-Hydro Renewable Sources in 2050



Source: Multiple CCBJ surveys with the same question conducted in 2008 and 2009 on the following topics: wind energy, CCS and geothermal. The black bar indicates median range.

RPS expected to drive sustained growth from 2015-2020.

The global geothermal pipeline now exceeds 10 MW of projects under development, which if completed would almost double the installed global geothermal capacity of 10.5 GW built up over the past 30 years.

Currently, there are over 215 commercial geothermal electricity projects operating in 24 countries. The largest dry steam field in the world is The Geysers, 116 km north of San Francisco. The Geysers began in 1960 and has 1360 MW of installed capacity. **Calpine Corp.** now owns 19 of the 21 plants in The Geysers and is currently the United States' largest producer of geothermal energy. The other two plants are owned jointly by the Northern California Power Agency and the City of Santa Clara's municipal Electric Utility (now called Silicon Valley Power). Since the activities of one geothermal plant affects those nearby, the consolidation plant ownership at The Geysers has been beneficial because the plants operate cooperatively instead of in their own short-term interest. The Geysers is now recharged by injecting treated sewage effluent from the City of Santa Rosa and the Lake County sewage treatment plant. This sewage effluent used to be dumped into rivers and streams and is now piped to the geothermal field where it replenishes the steam produced for power generation.

Another major geothermal area is located in south central California, on the southeast side of the Salton Sea, near the cities of Niland and Calipatria, Calif. There were 15 geothermal plants producing electricity in the area. CalEnergy owns about half of them and the rest are owned by various companies. Combined the plants have a capacity of about 570 MW. The Basin and Range geologic province in Nevada, southeastern Oregon, southwestern Idaho, Arizona and western Utah is an area of rapid geothermal development. Several small power plants were built during the late 1980s during times of high power prices. Plants in Nevada at Steamboat near Reno, Brady/Desert Peak, now produce about 240 MW. As indicated on the chart on page 24, Nevada and Utah account for 86% of the new leases granted by the U.S. government in 2007-2008.

While geothermal electricity using existing technology indeed has good short-term prospects, the best sites are already snapped up. If geothermal is to make a big dent in renewables' inevitable penetration of the U.S. electricity business, EGS will have to play a role. Regardless, the manufacturers, consulting engineers, investors and policymakers in the CCBJ community believe that non-hydro renewables will account for roughly 8-10% of electricity by 2020 and 20-25% by 2050, according to compiled results of CCBJ surveys that incorporated the identical question (see charts above). How America reaches these thresholds remains to be seen, but it seems certain that there will be an ample supply of scientists, engineers, entrepreneurs, businessmen and corporations to chase the goal. ☼

Geothermal Developers Grapple With Financial Realities of 2009

For many geothermal power plant developers in North America, the worldwide economic free-fall that began in September 2008 has turned 2009 into a year of holding on, hunkering down and trying to survive. Despite holding leases to tens of thousands of acres of geothermal-rich land in the western United States, most developers lack risk capital to invest in the upfront geo-scientific work and exploratory drilling that is needed to verify the extent and quality of geothermal resources under the ground. (An exception to some degree is **Ormat Technologies**, which generated $252 million in revenues last year from its 505-MW portfolio of existing geothermal power plants; for more on Ormat see story on page 20.)

As recently as a year ago, developers could obtain debt financing before they had validated and drilled the production wells to tap geothermal resources—had "steam behind the pipe" in industry parlance. Not so today. "We've come out of a period in which there has been hyper-liquidity, a buyer's market for capital if you will. In the period we're in now, the pendulum has swung the other way," Ric Abel, Managing Director, Electric Finance Group, **Prudential Capital Group**, told CCBJ in April. "While in the past developers could get debt sooner in the life of a project and finance their drilling with a larger percentage of debt, today drilling and proving up the resource is seen as an equity risk."

Abel spoke at the March 2009 San Francisco Geothermal Innovation and Investment Forum sponsored by **Greenpower Conferences**. He was one of several representatives of lending institutions who discussed just how much financial conditions have tightened up for geothermal developers since the fall of 2008.

Investors had similarly bad news. Venture capitalists from **Google.org** and **KPCB** said they're only investing in technology firms with a strong upside potential, like those aiming to gain a position in the emerging enhanced geothermal systems (EGS) industry (also known as hot dry rock or HDR; for more, see feature on pages 29-31).

Private equity investors told the audience that because of the depressed market caps of publicly held geothermal developers, investors would prefer to buy geothermal companies or their operating power plants rather than invest in new geothermal projects. "Right now because of the large number of [geothermal] companies looking for financing as well as the significantly shrunken pool of available capital we expect that [development] deals will be few and far between going forward. The return hurdles and pre-requisites for successful private equity investment will be a lot higher," Paul Ho, managing director of **Hudson Clean Energy Partners**, told the audience.

New Wave of Developers

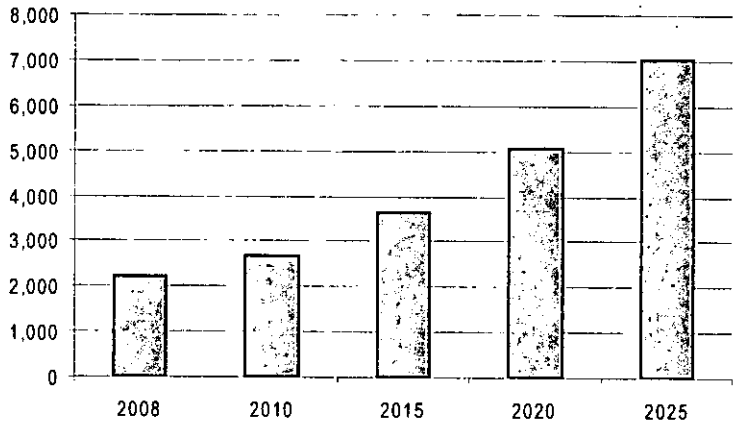
This was not news to the North American geothermal project developers who were in the audience, five of whom would later sit on a panel together representing their firms: **Magma Energy, US Geothermal, Ram Power, Nevada Geothermal Power** and **Sierra Geothermal Power**. These companies are part of a relatively new wave of pure-play geothermal project developers that emerged in this century, driven by the California energy crisis, the adoption of renewable energy standards in western states and the emergence of climate change and energy security concerns. Unlike Ormat and a handful of larger independent power producers and energy companies playing in U.S. geothermal project development—such as **CE Generation** and **Enel North America**—these firms are in the early stages of building their portfolios of geothermal projects. Tim Stephure, a geothermal expert at **Emerging Energy Research**, calls them "junior developers." Some have purchased existing plants with an eye toward expanding or repowering those facilities, but all are focused on new developments.

Hezy Ram, a longtime executive with Ormat who founded Ram Power last year, told an anecdote that while not literally true was nonetheless emblematic of the state of play for him and his counterparts. After leaving a meeting with an investor, he checked the visitor register at the front desk. Competing developer Doug Glaspey of U.S. Geothermal had been in just before him, while Brian Fairbank, CEO of developer **Nevada Geothermal Power** had just arrived for his appointment. (Both Glaspey and Fairbank were on the conference panel.) "We all go to the same private equity funds and financial institutions and talk to the same people," he said. "We need development capital. And as you know capital is very scarce today."

Development capital—lots of it—is needed for the upfront work that developers must do not only to verify that adequate geothermal resources lie under the ground they've leased or purchased, but also to sink wells accurately enough to tap those resources. In this economic environment, until they've got "steam behind the pipe," they can't access private equity funding, tax-credit equity or project-finance debt. And even when they can meet the risk requirements of such funders, funding is harder and more expensive to obtain than any time in recent memory.

As Abel pointed out, prior to the recession, developers could often obtain debt financing for some of this risky resource development activity. Not only is that no longer the case, but prospective equity investors are requiring more resource development work—more steam behind the pipe—before they'll invest in projects. And lenders are requiring higher levels of equity investment before they'll lend money for a project. One geothermal

Forecast of US Capacity for Conventional Hydrothermal Power



Source: CCBJ 2009 Geothermal Survey conducted in April 2009. Question was: Geothermal generating capacity in the United States was approximately 2,200 MW at the end of 2008. Given an economic revival by 2010 and adequate incentives, please estimate the US capacity for conventional hydrothermal power for 2010, 2015, 2020 and 2025. Result displayed is an average of the responses written in.

veteran who spoke to a CCBJ editor at the conference said: "The big economic problem affecting us now is the amount of debt you can get as part of your total project cost. This amount used to be 70-80%, and you'd only have to come up with 20-30% equity. First of all, nobody is really doing any deals right now. Banks don't have money they're willing to loan on such projects. But the numbers we're hearing tossed around [by lenders willing to lend] are more like 40-50% equity."

Panelists agreed that the last significant geothermal financing deal in the United States was Nevada Geothermal Power's $180 million line of credit to build a 50-MW project near Winnemucca, Nevada. But as CEO Brian Fairbank told CCBJ in an interview, the financing was much less favorable than what the company had anticipated. And in the current climate, the developer's success in getting steam behind the pipe for 50 MW has not led to any breakthroughs in financing an additional 50 MW at the same site. "Just at the time when we should have the light of success shining on us, we've run into the collapse in the credit market and a situation where the equity markets aren't working very well either." (For more on Nevada Geothermal Power, see page 28.)

Geothermal Land Rush

Before a developer worries about financing, however, it must have land leased for development, either from private owners, states or the federal Department of Interior, which controls through **the Bureau of Land Management** (BLM) millions of acres in the West. After May 2007, when the BLM finalized its rules for auctioning leases under the Energy Policy Act of 2005, there was a "land rush" as firms bid for favorable parcels. Auctions in 2007 brought in bids ranging from an historic high of $14,000 per acre for a 470-acre parcel adjacent to The Geysers in California to bids in the neighborhood of $300 to $500 per acre in Nevada, according to a BLM news release. Data compiled by Emerging Energy Research shows that since 2007 the three top lessees are Ormat, with about 150,000 acres; **Raser Power Systems** with some 75,000 acres; and Magma Energy with about 45,000 acres. These three are followed by some 20 developers with anywhere from a few hundred acres to 20,000-plus acres under lease. (See chart on page 24.)

The BLM has been paid more than $63 million for geothermal leases since 2007, according to Kermit Witherbee, national geothermal program manager for the agency. According to Witherbee, the perceived value of auctioned leases have dropped significantly. In the agency's last auction in December 2008, the average price was between $30 and $50 per acre.

For developers without existing leases or rights to private or federal lands, the prospects of gaining a toehold in geothermal development are increasingly slim. Most of the favorable geothermal sites—outside of off-limits areas like Yellowstone National Park—have already been developed or acquired. "Those of us who have been around for a few years kind of got the first pick on some of these prospects that that [already] had drilling [done] and had discoveries," said Doug Glaspey, CEO of **U.S. Geothermal.** "Those are the sites we went to first, and those are rapidly being consumed not only by ourselves but by new entrants in the market. So the quality of [geothermal site] prospects is going down. That means the risk to define and develop new resources is going higher and higher."

Drill, Baby, Drill (With DOE Money?)

While the output of wind, solar PV, biomass, hydropower and other renewable power plants can be predicted with a fair amount of certainty, geothermal developers face much more uncertainty as they search for steam supplies anywhere from 2,000 to 10,000 feet underground.

To find geothermal resources of sufficient enthalpy (heat energy) for power generation, they start with geological mapping that points to likely areas. They also consider distance to grid connections. Then they hire staff or consultants to perform geochemical analyses of hot springs and geophysical analyses such as seismic studies to refine models of likely resources. On many prospective geothermal properties, developers have the benefit of earlier explorations done by oil and gas companies that were investigating geothermal in a big way in the 1970s and 1980s.

Many of those prospective sites were not developed because the market drivers of that era diminished with the decline in oil prices. Additionally, the binary technology that can utilize lower-temperature geothermal resources was not available on a commercial scale at that time.

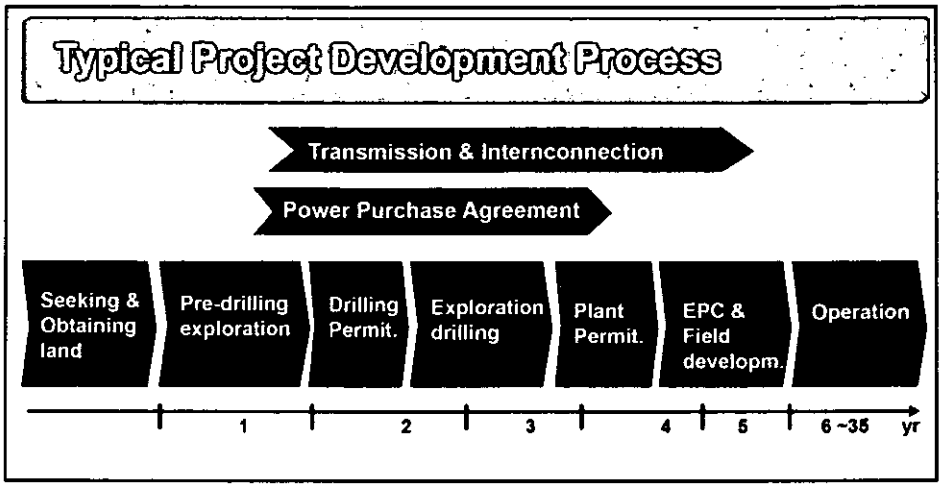
The costs for the geologic mapping, geochemical and geophysical work is generally in the hundreds of thousands of dollars for a 40 to 50 MW geothermal power project—add in permitting for the well drilling phase and you're looking at $2 million to $3 million, according to Brian Fairbank of Nevada Geothermal Power (see page 27).

Then the cash really starts to flow. Developers hire drilling contractors who come with rigs, equipment and personnel and charge $25,000 a day or more. Sometimes a drilling program start with slimhole test wells that can cost $2 million to $3 million each; in other cases developers and their contrators go straight to the production wells that can cost anywhere from $3 million to $10 million or more.

Like wildcat oil drillers, the geothermal prospectors are usually looking in areas without a history of geothermal production. They don't always hit paydirt, yet the drilling contractors must be paid. In fact, drilling "dry holes" is quite common. Developers estimated the risk at 20% to 30% on greenfield projects that haven't already been subjected to some exploratory drilling. "That scares a lot of people," said Glaspey.

"The drilling is really the wild card in geothermal," said Gary Thompson, CEO of Sierra Geothermal Power in response to a questions about average costs for developing a geothermal wellfield. "You have to have a fairly large contingency when you're talking about drilling because [the costs] are all over the map It could be $2 million, it could be $15 million to drill one of these wells. And your output varies [on the the same scale]. It could be two megawatts per well or 10 or 15 megawatts per well."

Typical Geothermal Project Develoment Process



Source: Geothermal Development in Emerging Markets by Rahm Orenstein, Ormat Technologies, Inc. Geothermal Innovation & Investment Conference, March 24th, 2009.

Given the risks of hitting dryholes and creating wells that produce less power than anticipated, the typical upfront capital required for a geothermal project of 40-50 MW with a typical life cycle of 30-35 years could be from $30 million to $50 million, according to developers. With the high risk profile of their endeavor and the difficulty of financing such activities, developers and other speakers at the conference pleaded with one particular person in attendance: Ed Wall, manager of the **U.S. Department of Energy's Geothermal Technologies Program**. What they asked for repeatedly is for Wall to use some of the $400 million for geothermal contained in the American Recovery and Reinvestment Act (ARRA) stimulus package to help developers mitigate this daunting dry-hole risk (see list on page 17).

"It's great to spend money on EGS. That's the future," said Glaspey. "But if you want megawatts on the ground today, you have to capitalize exploration. The way you do that is put it into drilling programs. Cost share [from the DOE] would be very nice for folks like us."

"There's a tremendous amount of conventional geothermal projects out there that desperately need assistance in order to do the drilling," said Abel from Prudential. "I think from a stimulus bill perspective, getting projects built, producing electricity and creating those jobs is where there's more bang for your buck."

Another option for DOE funding, according to Glaspey, is the loan guarantee program for renewable energy technology funded to the tune of $6 billion by the ARRA. "It may be possible for DOE to offer us loans at 3.5-4% interest," he said. "That's very encouraging, although we can't wait two years to get that kind of financing package," he added, referring to DOE's past difficulties with the loan guarantee program.

Long-Term Drivers

Despite the current difficulties, geothermal developers are operating in a marketplace with some very strong long-term drivers. Regardless of what happens with federal renewable energy standards and climate change legislation, utilities in western states are already under state laws requiring sharp increases in renewable generation. Because of its reliable baseload properties—in contrast to the intermittency of wind and solar—utilities and grid operators can more easily incorporate geothermal generators.

Those "junior developers" who can hang on through this difficult period will likely enjoy a more robust market envi-

ronment within one to two years. Prudential Capital Group's Ric Abel pointed out at the March conference and in a separate interview with CCBJ that institutional lenders like insurance companies still have a large appetite to finance long-term projects like geothermal power plants built with fixed-price EPC contracts and 20-year power purchase agreements. "There is money available, although it's a lot more expensive than it was a year ago," said Abel. "While drilling and proving up the resources is an equity risk, building the power plant and producing electricity for a PPA is more of a debt risk."

Abel said geothermal projects are financed in similar fashion to combined cycle gas turbine plants and other fossil fuel-fired power plants, with a waterfall structure designed to ensure that asset maintenance—including reservoir maintenance in the case of geothermal—is adequately funded and creditors are paid before plant equity owners. "This structure was developed and perfected primarily with gas-fired projects.... Most of the major law firms that focus on project finance are very familiar with this structure and the documents associated with it. At various times, including in the recent period of hyper-liquidity, people have deviated from that structure, but now the pendulum has swung back and lenders are approaching power projects in this more standard format."

For geothermal projects, a "disciplined operating budget" to maintain reservoir viability is critical to giving long-term lenders assurance. "You've got to have continued funding to maintain the geothermal resource, which is your fuel supply, on an ongoing basis," he said.

Emerging Energy Research's Stephure points to some recent investment highlights that show the underlying strength of the geothermal segment, but also point toward consolidation trends. He noted that Canadian energy company Alta-Gas recently purchased a 25% stake in

Magma Energy and Raser Technologies has recently executed a funding agreement with **Copper Canyon Mining**. Australian EGS geothermal developers **Geodynamix** and **Petratherm** have formed alliances and joint ventures with very large companies: Geothermix with Indian conglomerate **Tata** and Petratherm with Australian utility **TruEnergy** and oil & gas producer **Beach Petroleum**. "Companies with bigger balance sheets will be better positioned moving forward," said Stephure.

"There are definitely some opportunities for these players to take advantage of the economic situation. They can fund a lot of activity in house and pick up projects from developers who are struggling. M&A activities are likely to occur. We may also see utilities move into this space, either developing or owning their own projects or partnering to help develop projects." In chaos lies opportunity is how some observers are characterizing 2009 and the geothermal industry has both. ☼

Geothermal Power in Developing Countries

With the best geothermal resources located along the Pacific Ring of Fire, there are enormous opportunities for developing geothermal power in Asian and Latin American countries that currently have little or none. The eastern and southern Mediterranean and the East Africa Rift zone (Kenya, Ethiopia, etc.) also present large geothermal development opportunities.

But developing geothermal power plants in many emerging markets is an enterprise fraught with high risks—risks that are layered on top of the ordinary risks of hitting dryholes and drilling under-producing wells that confront geothermal project developers in the United States and other developed countries. To build geothermal wellfields and power plants, most developing countries (the exceptions being the Philippines, Mexico, El Salvador and Indonesia) need foreign experts, suppliers and development capital because they lack the internal capacity—yet foreign firms often find it difficult to work in many developing countries because of the lack of frameworks to manage risks, delays in administrative processing, frequent requests for local patronage, contracts being violated and projects being shut down for murky political reasons.

"In some of these markets you have to add political risk to the drilling risks and credit risks that exist in developed countries," said Rahm Orenstein, director of business development for internationally active **Ormat Technologies** in a talk at the March 2009 Geothermal Innovation and Investment Forum sponsored by **Green-Power Conferences** in San Francisco. "Then you have off-take risk. In some countries, there's a high risk that your electricity customer won't pay you."

Poor market conditions are also a barrier to geothermal development in many developing countries. These include: Electricity markets that have not been fully restructured to encourage competition by independent power producers (IPPs), low rates for electricity that price geothermal out of the market, and lack of incentives to subsidize the up-front investment costs of geothermal power projects. "In many countries, geothermal has to compete with fossil fuels that still get subsidies and incentives," explained Orenstein. Additionally, many developing countries that have restructured their state power monopolies to facilitate more competition still retain monopolistic elements. "Any place we go and compete as an IPP is a market that has been deregulated to allow merchant power suppliers like us to compete, which is good.... But in some cases we discover that market is still to some extent monopolistic. Utilities may have been broken into a generation company and a transmission and distribution company, so now they have two monopolies."

For developing countries desperate for more domestic power sources—and for the worldwide effort to mitigate carbon emissions—the consequences that these risks and barriers will forestall geothermal power development in emerging markets are immense. **West Japan Engineering Co.** (West JEC), which has extensive experience in Central America, estimates that 3,000 MW to 4,000 MW—about 10 times current installed geothermal capacity—of new geothermal could be developed in that region given proper market structures, incentives and policies.

Geothermal-rich Indonesia has set a goal of building more than 4 GW of geothermal power capacity by 2014 (It currently has less than 1 GW online), but many international companies are reluctant to work there because of its unfavorable power market, bureaucratic inertia and reputation for corruption. In Kenya, some 4 GW of geothermal capacity—triple the nation's current electrical generation capacity—could be developed in the Rift Valley given proper market conditions and incentives, according to a study by UN agencies and the national power generation utility.

Foreign firms have successfully developed geothermal power projects in all of these regions and other developing nations. But it hasn't been easy.

Case In Point: Kenya

Ormat began developing a geothermal project in Kenya in the late 1990s, soon after the former state-owned power monopoly was unbundled into generation and transmission-distribution units. "Kenya was still heavily reliant on several hydropower projects for its electricity generation, and in the late 1990s the country suffered a major drought that caused generation to drop by some 30 percent," said Orenstein. The reliable baseload characteristics of geothermal made it an ideal resource for the country's power needs, according to Orenstein.

A **World Bank** supervised international competitive bid was issued by the utility, which was won by Ormat. Nine months after signing of a 30-year 50 MW power purchase agreement (PPA), the first 8 MW plant came online, and was soon expanded to 12 MW. By May 2002, Ormat had completed and demonstrated a total of 48 MW of steam capacity from the wells, but then it had to wait an agonizing six years to wade through what Orenstein called "administrative and political issues" before it could complete its power plant to reach that capacity. Ormat invested $150 million of its own funds for the wells and the plant; only recently was it partially refinanced by a loan from the German DEG lead consortium.

Kenya has relatively high electricity tariffs—between $80 and $120 per MWh compared to $60 to $80 for the rest of sub-Saharan Africa, according to a report by Julie Rowlett of the **Columbia University School of International and Public Affairs**. So Ormat's wholly owned Kenyan

subsidiary **OrPower** is likely doing well. But according to Ormat's 2008 annual report, the firm, along with the handful of other IPPs operating in Kenya, is under pressure to reduce tariffs to allow the government to make good on campaign promises of cheaper electricity. Furthermore, its customer **Kenya Power and Light Company** is being re-organized. And the country is in a state of ongoing political turmoil between President Mwai Kibaki and Prime Minister Raila Odinga.

To manage the risks of operating in countries like Kenya, Ormat buys political risk insurance from the **Multilateral Investment Guarantee Agency (MIGA)** of the **World Bank Group** or from **Zurich Re**, for most of its foreign projects, according to the company's annual report.

Ranking Developing Country Markets

Research outfit **New Energy Finance** has ranked the favorability of geothermal markets in both developed and developing countries. NEF's four criteria are:

Stability – political, economic and social, including a reliable electricity grid.

Availability of **local partners** to handle licensing, permitting and obtaining power purchase agreements.

A positive **policy framework** with high energy demand and limited supply

Incentives or subsidies such as feed-in tariffs, renewable energy certificate trading schemes and tax exemptions.

West JEC would probably add to that list a wholesale power market that is amenable to power purchase agreements (PPAs). Without PPAs, geothermal plants compete as merchant power producers, being dispatched only when their power is needed and their price is competitive. "Not all countries are like the United States where you can get PPAs," said Enrique Lima, general manager for overseas business. "In Central America, for example, it is difficult to get PPAs. You have to compete in the market where the price varies 24 hours a day. It can go from as low as 1 to 2 cents and as high as 10 to 13 cents at peak. But the duration of the peak is very short, so the average price you'll get is 3 or 4 cents. This makes it very difficult for geothermal to compete."

It's no suprise that Kenya is near the bottom of NEF's rankings with a 2.0 ranking out of 4.0 possible points. (See chart on left for all of NEF's rankings.) Many developing countries rank more highly, in NEF's view, including Chile, Hungary, Nicaragua, Guatemala, Indonesia, the Philippines and Turkey.

Indonesian Puzzle

But according to New Energy Finance Associate Mark Taylor—and research by CCBJ's parent company **Environmental Business International (EBI)** on behalf of the Organization for Economic Cooperation and Development—the level of risks and difficulties presented by certain countries can be as much a matter of perception or opinion as fact. Indonesia, for example, is widely perceived as a very difficult market to develop geothermal projects due to broken contracts, turgid bureaucracies, an unfriendly power market and corruption. According to an executive with an international engineering firm active in geothermal worldwide, wholesale power prices in Indonesia are tied to the price of coal power, essentially pricing geothermal out of the market. This individual (who was interviewed confidentially for EBI's OECD study) doesn't believe

A + symbol signifies that country fully meets the criteria and 1 point. A +/- symbol indicates that a country only partially meets the criteria and is awarded a 0.5 point.

that the government's plan to offer higher rates for geothermal and other renewables will succeed because of resistance within the electricity bureaucracy.

WJEC's Lima offered a more balanced perspective on Indonesia, telling CCBJ: "The Indonesian government is now thinking what kind of support is needed for geothermal and other renewables but they have not yet reached a conclusion." And Taylor says he has "talked to people who have developed projects there, and they say that if you know the people and the culture, it's not that bad." Indeed, **Chevron**, which calls itself the largest producer of geothermal energy in the world, has a 30-year history of geothermal work in Indonesia (through **Unocal** which Chevron acquired in 2004). According to Taylor, government officials in charge of boosting geothermal production to 4.4 GW by 2014 are aware of its reputation and working to ease some of the barriers and challenges.

A key insight that emerged from EBI's research is that some firms succeed handsomely in doing business in foreign markets where others fear to tread. One wind power developer told EBI that his firm avoided mature wind-power markets in OECD countries to focus on the opening markets in what he called "dodgy" countries with higher levels of political risk and corruption. While some firms reported avoiding China because of intellectual property risk and poor contract enforcement, several European wind power firms work quite successfully in China. It appears that a market which scares off some firms can offer opportunities to other firms that adapt to the country's business norms and market conditions.

For geothermal power developers, however, the higher levels of risk and difficulty imposed by operating in a "dodgy" country are much more formidable than for wind power because of the cost of quantifying and developing resources. While assessing the expected annual yield of a wind farm site is not a trivial matter, doing the drilling needed to prove and develop the geothermal resource for a 50-MW power project can run as high as $50 million or more.

Governments, Funding Institutions Step Up

Because of these high costs and the attendant risks of finding dryholes or hitting reservoirs with lower than expected power capacity, geothermal power development in emerging markets is often too risky for the private sector to do on its own. To offset these costs and risks, developed country governments, multilateral lending agencies like the World Bank and in some cases host country governments subsidize the exploration and resource development phase of creating a new geothermal power plant.

The impact of such subsidies can be seen in the contrast between the geothermal power development trajectories of the Philippines and Indonesia. The two countries are both rich in geothermal resources and both began developing them in the 1970s, yet the Philippines today has about 1900 MW of capacity online, meeting about 17% of total demand, while Indonesia has less than 1 GW meeting 5% of demand. According to multiple informants for EBI's OECD research, the Philippines' success story was based on a policy in which publicly owned **PNOC Energy Development Corporation (EDC)** took the exploration and drilling risk, selling steam to power plant developers.

By contrast Indonesia required foreign developers to fund exploration and drilling. "In the 1990s, you could do a geothermal power project in the Philippines for 4.5 cents to 5 cents U.S. per kilowatt-hour, but contracts in Indonesia were at 7.5 to 8 cents because developers were putting a big margin on for the risks being assigned to the projects," said EBI's source with the international engineering firm. (PNOC EDC has since been privatized and EBI's sources say the industry is watching closely to see how its development policies evolve.)

Looking forward, Taylor says that funding to underwrite the costs of resource exploration and wellfield development will be vitally important to building geothermal projects in most developing countries. "Right now, developing geothermal in these countries is so high-risk that there needs to be some sort of multilateral bank or government intervention to help out," he said.

He spoke recently with the head of the World Bank's $25 million GeoFund which subsidizes drilling and exploration and technology development. The official reported that the fund had lent $5 mil-

Developing Markets with Most Promise in Geothermal

- Brazil
- Canada (2 responses): political stability, history of resource development
- Chile (2 responses): resource and government support, great resource, new developers in area
- China (2): Universal carbon tax
- Iceland: size of resource
- India: universal carbon tax
- Indonesia (4) : lots of resources
- Japan
- Kenya
- Mexico
- Nevis Island (Antilles): great start, high electricity pricing
- Nicaragua: good resource
- Philippines (5): replace dependance on diesel powered generation; size of resource
- Turkey

Source: CCBJ 2009 Geothermal Survey conducted in April 2009. Question was: Many regions of the developing world such as Central America and parts of Africa have tremendous potential to develop more geothermal power, yet little internal capacity to develop their resources. In many cases, such countries present high risks for foreign geothermal developers and service providers. Please note the three developing countries that you think will grow their geothermal power capacity the most over the next 10 years and what factors will make those markets favorable for geothermal development.

lion and still had another $20 million to lend, which would likely go to subsidize three resource exploration efforts and five technology development programs. "**The European Investment Bank** and **the European Bank for Reconstruction and Development** have also offered funding, but the existing financing resources are absolutely not enough. To significantly ramp up geothermal power capacity in developing countries, it will be necessary for multilateral banks to step up their financing."

Enrique Lima of West JEC told CCBJ about a series of geothermal projects in countries such as the Philippines, Indonesia, Guatemala, Jordan, Panama, Colombia and other countries for which the initial stage of development were or are being financed by country-to-country development assistance programs. "This kind of financing through donations or soft loans may provide means to offset risk," said Lima.

Chile, Turkey, Hungary Entice Developers

According to Taylor, a country that has been particulary successful in turning around a negative reputation for geothermal development is Chile. Developers were plagued by long delays in receiving permits until the government streamlined the permitting by setting deadlines for administrative departments.

"Chile is one of the best markets now for two reasons," said Taylor. "It doesn't have a feed-in-tariff but it has an average wholesale electricity price of $115 per megwatt-hour, which is very high. The other reason is that it has an immense geothermal resource and developers who have looked at it are fairly confident that they can make projects work economically." The Chilean government is also offering a $5 million subsidy per geothermal project and is doing organized leasing and tendering of known geothermal resource areas.

"Many mining companies up in Northern Chile need a lot of electricity, and they're paying high rates for it," said Taylor. "There is a lot of geothermal [in the mining areas], with geysers and other surface expressions." Combining small distributed projects for mines and other remote industries with utility-scale projects, Chile can develop 2350 MW of geothermal power capacity according to an estimate provided by NEF from **Bob Lawrence & Associates**, a consulting firm.

Other developing-country markets have implemented feed-in-tariffs for geothermal, according to Taylor. These include Hungary with a $90 per MWh rate; Turkey with $70 per MWh; and **the Central American Electrical Interconnection System (SIEPAC)** linking Panama, Costa Rica, Honduras, Nicaragua, El Salvador, and Guatemala has set an $80 per MWh FIT (SIEPAC is still under construction as of April 2009). ☼

Trouble In Central America: One Company's Experience

CCBJ's parent company Environmental Business International (EBI) recently conducted a series of confidential interviews with geothermal market participants on behalf of the Organization for Economic Cooperation and Development to assess the market barriers in different countries. EBI's informants (interviewed confidentially) told stories of extra costs, obstacles and delays due to government procedures and local business culture. One of the most daunting experiences was related by an international developer doing its first project in Central America. As a result of these experiences, the company will raise its revenue requirements for future projects in the country by 10% to 20%. (The country is not identified to protect the company's confidentiality.) Among the challenges:

* A government anti-corruption law made customs clearance cumbersome and expensive. A mistake like classifying a pipe fitting as a pipe could result in fines and special treatment of all the company's imports for a year.

* Conflicts between labor unions in Mexico and Central America resulted in a *de facto* ban on Mexican trucks crossing the border. In spite of a regional free trade agreement, shipments are re-loaded at the border—a requirement that could not be safely met for a 50-ton heat exchanger the company was importing. A logistics contractor had to negotiate a special arrangement with the unions.

* The company had difficulty importing the isopentane needed for the binary steam cycle because customs officials didn't know how to classify it.

* Banking regulations prevented the company from opening an account unless it established a domestic company. This meant that the company could not establish credit at local vendors and had to get quotes, write purchase orders and process invoices through its home office for all purchases.

* The project tender document gave the client—a quasi-public utility—the right to travel at the developer's expense to inspect the production of components. While traveling to inspect heat exchanger or turbines was justifiable, client staff insisted on traveling to visit the makers of commodity items like transformers and pumps.

* For some site preparation work, the company was forced to employ laborers instead of heavy equipment.

* After a site engineer was murdered, the company hired an armed security service to accompany all foreign staff 24 hours a day.

ARRA Update: Federal Procurement Picks Up at GSA, DOD and DOI

Federal government agencies are flush with cash to spend quickly thanks to the American Recovery and Reinvestment Act (ARRA), also known as the Stimulus Package. And a great deal of that cash will go to services and products related to energy efficiency and renewable energy projects. While **the U.S. Department of Energy (DOE)** is the largest recipient and disburser of ARRA funds for energy efficiency and renewable energy, other federal, state and local agencies also have a great deal of new money to spend on these segments by September 30, 2010.

As noted in our first edition of 2009 (January/February/March 2009), given the size and the phased implementation of the ARRA, CCBJ will cover aspects relevant to our readers over several editions in 2009. In this edition, we focus on federal procurement for services and products associated with energy efficiency and renewable energy by three federal agencies: **General Services Administration** (GSA), **Department of Defense** (DOD) and **Department of Interior** (DOI).

According to CCBJ's estimates, these three agencies will directly spend about $5.5 billion on contracts for renewable energy and energy efficiency projects by September 30, 2010. (Note: this does not include funds being channel to states, local governments, housing authorities, tribes and school districts by the **Department of Education, Environmental Protection Agency, Housing and Urban Development** and DOE.)

Five and a half billion dollars is a rough estimate based on an educated guess about the amount of capital project funds that GSA, DOD and DOI agencies will spend on energy-related projects. Congress gave the agencies wide latitude, telling the Army, for example, to spend $1.47 billion to "improve, repair and modernize... facilities, restore and modernize real property to include barracks, and invest in the energy efficiency of ... facilities." All other DOD departments, including reserves, received similar marching orders. Similarly, the **Bureau of Land Management, Fish and Wildlife Service** and other DOI agencies have been given money for "repair of roads, bridges, property, and facilities and for energy efficient retrofits of existing facilities."

With that kind of discretion, the full scope of GSA, DOD and DOI spending on energy efficiency projects like upgraded lighting and replacement of inefficient HVAC equipment and renewable energy projects such as solar water heating systems and wind turbines won't be known for some time. But early indications are that spending from DOD at least will be very robust.

In a March 2009 report to Congress, DOD highlighted hundreds of energy efficiency and renewable energy projects that will be funded with ARRA money. Just a few examples: $4.7 million for wind turbines at the **Air Force's** Cape Newenham Long Range Radar site in Arkansas; $10.7 million for a PV system at Camp Pendleton Marine Corps Base in California; and $3 million to upgrade the HVAC system at Fort Leavenworth in Kansas.

Obviously, there's a lot of work on tap for equipment installers and integrators and engineering and construction firms. But DOD is also looking for consultants to do conceptual planning and analysis work. A whole section of ARRA DOD funding is devoted to research, development test and evaluation (RDT&E) projects, and DOD aims to spend much of that funding on energy related projects.

There are initiatives around designing more fuel-efficient military vehicles and developing renewable energy generation and energy devices for combat usage; contracts for those types of projects will prob-

Recommendations for DOE for Utilization of the $400 million in ARRA or Stimulus Funds for Geothermal Energy

Reduce drilling risk
Fund Exploration and Drilling
Incentives for exploration
Invest in exploration research
Create new test wells for deeper operations
Help finance geothermal development first cost
Construction loan capital for shovel-ready developments
Continue and Increase Loan Guarantees
Staff Up to Process Loan Guarantee Applications
Reduce development red-tape
Facilitate and ease permitting process
Concentrate on Hot Dry Rock Geothermal Energy
Invest in proving EGS technology
Fund EGS developments
Fund traditional deployment instead of EGS
Don't squander it on EGS
Invest in geothermal R&D
Advance hard-rock drill-bit development
Invest in cycle engineering and simulation
Advance hybrid solar/binary power plants
Fund new research for power conversion technology

Source: CCBJ 2009 Geothermal Survey conducted in April 2009. Question was: What three top recommendations would you give to US DOE for the $400 million it received in the American Recovery and Reinvestment Act (ARRA) specifically for geothermal.

ably go to firms' with prior experience in combat and weapons systems. But there are also RDT&E projects suitable for consulting engineering firms with expertise and capabilities in designing building energy systems. For example, the Army is looking to spend $3 million for planning of an ultra-low energy campus that can be a model for other facilities. The Navy and Marine Corps expect to spend $2.5 million on developing methods to integrate cogeneration into tactical systems. And the Air Force is in the market for ideas to maximize renewable energy development on its vast test ranges.

According to Chris Lippert, corporate initiative leader for energy efficiency at $2-billion consulting engineering firm **Tetra Tech**, federal agencies have pent-up demands for energy efficiency and renewable energy projects—demands that are finally being satisfied with ARRA funding. "DOD and all federal agencies have been under some form of federal mandate to reduce energy use for some time," said Lippert, citing the Energy Policy Act of 2005 and the Executive Order 13423 signed by former President George Bush in 2007. "But these mandates have not traditionally come with funding. Now that the stimulus package has made funds available, federal agencies are well positioned to implement a large wish list of projects to cut energy use and save on energy costs. There's a great opportunity for the private sector to provide those services."

While many businesses can become federal contractors, given the rigid timelines for spending in the ARRA, Lippert and others think that the vast majority of spending will go to existing contractors. "Existing contract vehicles are incredibly important," he said. "The contracting staff on the federal side is already overtaxed and now they're being asked to take on this significant chunk of work."

That doesn't mean that only those already in the federal doorway need apply because there is great scope for subcontracting work. In demand will be installers and integrators of renewable energy and energy efficiency equipment and projects, but also consulting firms with relevant expertise.

According to Lippert and other executives familiar with federal contracting, becoming a subcontract supplier to a federal contractor is not all that difficult. "As long as you can prove you have your relevant licensing, such as a plumber's license for installing solar water heating, you can start on day one," said Scott Sklar of the **Stella Group**, a firm that integrates solar, wind, geothermal and other renewable energy sources for public and private sector clients. "You may have to get some additional bonding and insurance."

Where to Find Opportunities

Sklar, Lippert and others agree that the best places to start looking for federal subcontracting opportunities are the federal websites, particularly GSA.gov and FedBizOpps.gov. "You have to take the time to troll through and look at all the opportunities," said Sklar. "The U.S. government is the biggest user of energy in the world and the biggest owner of buildings. I suggest focusing on the niches where you are most capable.... You may have done a lot of medium-sized business renovations and now you want to install solar systems for medium-sized buildings. Well, that's different from doing a giant base dormitory that is six square blocks. Focus on what your experience level is and look at the government through that lens."

Sklar takes note that energy efficiency and renewable energy contractors may be able to find significant opportunities with some of the 16 energy service companies (ESCOs) designated as primary energy service performance contractors by DOE in December (see list above). CCBJ's conversations with a couple of these entities indicate that they anticipate being in the market subcontracting vendors, but their needs are probably more skewed to implementation rather than planning and analysis. (Funding for many of these projects is not tied to ARRA but rather to cost savings achieved by energy conservation measures; CCBJ will cover ESCOs and energy service performance contracting in our upcoming edition on energy efficiency and demand response.)

DOE's Primary Energy Service Performance Contractors

Ameresco
Chevron Energy Solutions
Clark Realty Builders
Consolidated Edison Solutions

TAC Energy Solutions
The Benham Companies
Trane U.S.

The GSA handles purchasing and procurement for multiple federal agencies, and many federal contractors hold what are known as multiple award schedule contracts that GSA administers. "A multiple award contract schedule allows any federal government agency and some state agencies and some contractors to the federal government to access the products and services through the GSA," said Al Tattersall, a senior vice president of federal contractor **GP Physics**. "The advantage to agencies in doing it this way is that it reduces the amount of time for contracting." GSA schedules have already been analyzed and vetted for fair pricing of products and services, and individual agencies can essentially shop among GSA schedule holders for vendors, then work through GSA to execute the contract quickly.

According to Lippert, federal agencies have different preferences regarding whether to procure services through

a GSA schedule or handle their own procurement. "It really gets down to a specific branch of DOD, a region or even a specific base within that region," he said. "The preference may come down to a certain individual procurement officer's experiences."

The eLibrary on GSA.gov can be used to locate firms that hold multiple award schedule contracts. With stimulus money flowing, many of these firms will be already looking at how to ramp up their capabilities through subcontractors. "We have been approached by government agencies with which we have contracts, and we've been told that they are expecting stimulus funding that would expand the scope of work that we would provide through our existing contracts," said Tattersall.

There's also the option to look for specific contract opportunities being offered directly by federal agencies. GSA's FedBizOpps.gov website lists any contract greater than $25,000, according to Tattersall. "In this case, you're not looking for the contract vehicle but the types of procurement that are being opened for solicitation," he said. He suggests prioritizing solicitations based on NAICS codes and geography for regional firms, then contacting the relevant agencies directly.

For businesses that meet federal small business criteria (see SBA.gov/faqs), most federal agencies have liaison staff who can assist in locating prime contractors who may be bidding on specific projects. "You tell them the type of work you do and they will assist you, including telling you companies who are bidding on contracts where you could be a good subcontractor," said Tattersall. "Almost every military facility, including NASA, has someone responsible for getting small businesses involved in acquisition primarily because Congress sets targets for small business contracting."

Tetra Tech's Lippert says that such requirements will lead his firm to subcontract even when it possesses all the needed capabilities for a contract in-house. "We're a large firm and proud of our broad expertise, but since a number of federal clients have small business requirements in their contracting, we'll plan to exceed those," said Lippert. "There could also be niche technologies where we need to bring in a technical specialist."

(Tattersall and Lippert also noted that for small firms willing and able to become qualified as federal contractors, contracting requirements can put their firm in the prime contractor spot with larger firms acting as subcontractors. "Some of the small-business set-asides can be for quite sizeable contracts, so there's often a real need for the expertise and experience that a large business can provide. We are in mentor-protégé and joint-venture relationships with some small businesses that qualify for set-asides," said Lippert.)

As far as making contact with and cultivating a subcontractor relationship with a federal contractor, Tattersall recommends the additional step of registering as an interested party for solicitations of interest on FedBizOpps.gov. "They'll post your name as a company looking to subcontract."

Lippert underscores Tattersall's advice about using the small business liaisons at DOD facilities, but he says old-fashioned networking and marketing can be valuable as well. "Getting involved with groups, where they want to do business, that will give them insight and referrals is a good start." he said. "The Society of American Military Engineers, for example, has monthly meetings and is a great place to do business networking."

"We certainly get cold calls and have people sending us information, but even in this modern world where we're all tied together through technology, my preference would be to meet someone face to face at a SAME meeting or have an introduction facilitated by a small business liaison from one of the DOD branches." If such introductions lead to a potential relationship, it is always preceded by thorough vetting, said Lippert. "Just because we have this glut of funding, we'll still continue to do thorough vetting of subcontractors. The taxpayers don't want to see projects funded that aren't high quality." ☼

Reasons for Regional Variations in U.S. Geothermal Power Prices

- 1) Transmission Access; 2) Utility Attitude towards renewables; 3) RPS requirements; 4) Supply and Demand; and 5) Competition from other sources
- Regulatory structure, energy efficiency mandates, market manipulation of pricing
- RPS states, proximity to fuel, natural resource availablity, transmission constraints, labor costs
- RPS and transmission infrastructure
- States pushing RPS have higher prices; regions with marginal pricing based on natural gas-fired generation currently have lower pricing
- Transmission access, level of Renewable Portfolio Standards, utility attitude towards geothermal
- Transmission capacity/ installed power conversion technology
- Free market pricing is subject to the law of supply and demand, and stimulus/incentive. We are seeing voluntary standards causing some important rises in price paid for renewables, with incentives coming from contribution to portfolio in a utilities footprint, and what that utilty thinks it can safely pass to their rate base. A Federal Renewable Porfolio Standard will change the game significantly (at a cost to all rate payers). Time will tell, but in the meantime, there is sufficient demand and pricing to make hydrothermal projects work financially, and that is what it's all about.

Source: CCBJ 2009 Geothermal Survey conducted in April 2009. Question was: Please comment on variations in power prices in U.S. states and regions and what causes these variations.

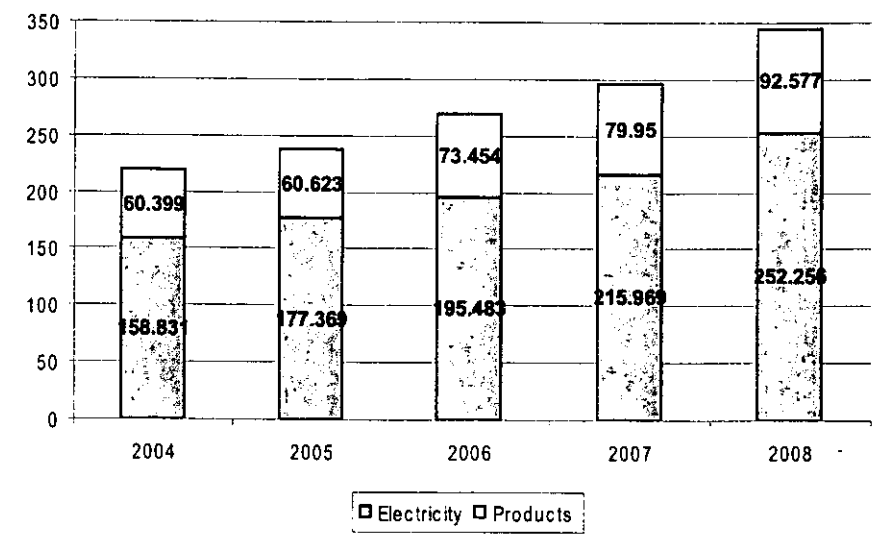
Ormat Leads Market With Technology and Vertical Integration

Ormat is the clear leader with $350 million in sales, but more competition is seen for low-temperature geothermal projects using binary technology

The geothermal power industry is made up of project developers and independent power producers (IPPs); scientific and technical consultants; drilling outfits and drilling technology firms; manufacturers of power plant equipment; and consulting engineers who explore for resources and design and build power plants. Many firms perform multiple roles in this value chain, but there is only one truly vertically integrated corporation whose activities and revenue streams stretch from resource exploration through equipment manufacturing to engineering, procurement and construction (EPC) contracting and power sales: **Ormat Technologies**.

According to its 2008 annual report, Ormat generated $344.8 million in revenues in 2008, 16.5% growth over 2007. Ormat's power sales revenues from its geothermal plants (both Ormat-built and acquired) and recovered energy generation (REG) plants (see below for more on REG) accounted for $252 million or 73.2% of revenues with product sales accounting for $92.6 million or 26.8% of 2008 revenues. Ormat built 109 MW of company-owned geothermal and REG capacity in 2008 and increased its portfolio to 505 MW. Ormat is on track to build between 82 MW to 94 MW by the end of 2010 for its own portfolio, according to a company spokesperson.

This cash flow from electricity sales puts Ormat in an enviable position relative to smaller developers that are struggling for needed upfront development capital in the current economic climate. "The cash flow generated by our portfolio of operating geothermal and REG power plants provides us with a robust and predictable base for our exploration, development and construction activities, to a certain level without the need to tap into external liquidity sources," notes the annual report. "We believe that this gives us a competitive advantage over certain competitors whose activities are dependent on external credit and financing sources, particularly in light of the current global credit and financial crisis."



Source: Ormat 10-K for fiscal year 2008 ended December 31, 2008. Products includes revenues from four groups: Power Units for Geothermal Power Plants; Power Units for Recovered Energy-Based Power Generation; Remote Power Units and other Generators; and Engineering, Procurement and Construction (EPC) of Power Plants. Electricity includes three groups: Energy and capacity; Lease portion of energy and capacity; and Lease income.

The company's reported highlights for the last year alone show just how broad and diverse its geothermal operations and revenues are. Among its accomplishments: Signing a $65 million contract to supply and oversee construction and startup of a geothermal power plant in Costa Rica; Starting commercial operation of 35 MW of new plant capacity in Kenya; Securing rights to some 150,000 acres of land in Alaska, California, Hawaii, Nevada, Oregon and Utah; Acquiring 51% ownership of a New Zealand geothermal plant; Signing a joint venture to develop a new geothermal project in Nevada; joining a power development consortium in Indonesia; Signing EPC contracts with developers in New Zealand and Nevada worth $42 million and $76 million; Signing a $16 million supply contract for a geothermal project in Turkey; And closing a $63 million tax credit financing deal for an existing plant.

Israeli Roots, But U.S. Was 72% of Ormat's Revenues in 2008

A U.S. company with Israeli roots, Ormat was founded to develop and market heat exchangers and turbines using the organic rankine cycle (ORC) which Ormat founder Lucien Bronicki and his collaborator Harry Zvi Tabor, both Israeli, developed in the early 1960s. ORC uses working fluids with boiling points lower than water to recover energy and generate steam and power from heat sources that would otherwise be insufficient to power steam generators. The original technology was developed at **the National Physical Laboratory** in Jerusalem in the frame-

work of solar energy research. Lucien Bronicki formed Ormat in 1965 in Israel.

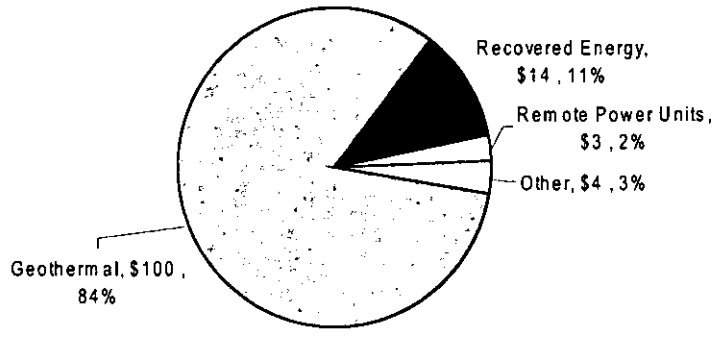
Bronicki originally targeted solar thermal applications in remote off-grid villages, but with that technology facing poor commercial prospects, what emerged from his work was the small Ormat Energy Converter (OEC), a power unit for remote telecom stations, offshore oil and gas rigs and other off-grid facilities that need small amounts of electrical power.

In 1972, Ormat was established in the United States where it supplied OEC units to the Trans Alaska Pipeline. According to material published on Ormat's website, for remote power applications the OEC uses natural gas, kerosene, diesel and other combustion fuels to heat the working fluids, which the hermetically sealed unit condenses and re-uses, allowing continuing operations for many years with periodic refueling and maintenance. More than 3,500 OECs of up to 7 kW capacity have been have been installed in 63 countries, according to Ormat's website.

Ormat turned its attention to geothermal, solar and biomass in the 1970s, with geothermal eventually becoming its major focus. Its business model has steadily evolved from that of a supplier of power systems and components to a vertically integrated firm that builds, owns and operates its own geothermal power plants as an IPP, as well as an EPC contractor that builds power plants for other geothermal project developers.

The company continues to market small OECs and REG systems. For its REG segment, Ormat foresees major growth by selling to North American natural gas pipeline operators who produce waste heat at compression stations driven by gas turbines. Ormat reports that the **Federal Energy Regulatory Commission** (FERC) is asking proponents of new or expanded pipelines to improve their energy efficiency.

Ormat Product Revenues: Expected Sales in 2009 ($mil)



Source: Ormat 10-K for 2008. Products include revenues from four groups: Power Units for Geothermal Power Plants; Power Units for Recovered Energy-Based Power Generation; Remote Power Units and other Generators; and Engineering, Procurement and Construction (EPC) of Power Plants.

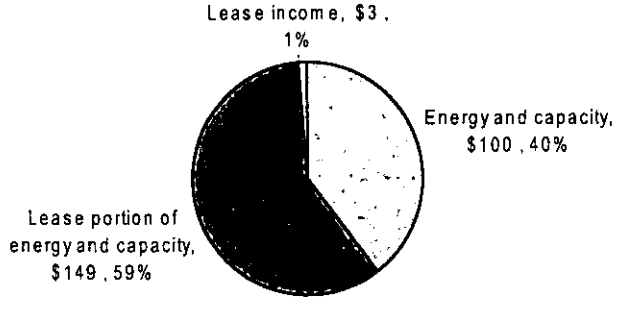
Ormat has begun building 5 to 6 MW REG systems along interstate natural gas pipelines and midstream gas processing facilities. The company also see opportunities for REG in the power sector in Colorado, Massachusetts, Ohio, Pennsylvania, Washington and other states where utilities can install REG systems on power plants and count the capacity toward their renewable energy standards. Additionally, North and South Dakota and the U.S. **Department of Agriculture** have qualified REG systems for low-interest loans. In North America, Ormat estimates the market potential for REG at 1,000 MW. After building out this domestic market, the company plans to target Europe which has "similar potential," according to the report.

By contrast, the potential for adding geothermal power in the United States is much larger. Ormat's Director for Policy and Business Development Paul Thomsen says the company sees the potential for geothermal power capacity to grow to 30,000 MW to 40,000 MW by 2050, or an order of magnitude larger than the less than 3,000 MW in 2009. As has been widely reported, a 2007 **Massachusetts Institute of Technology** study projected a potential of 100,000 MW of geothermal generating capacity if enhanced geothermal systems (EGS) can be deployed successfully. (For more on EGS, see page 29.)

More Competition for the Binary Technology Segment

Ormat built its geothermal power business by leveraging its ORC expertise to create what became known as binary geothermal power plant technology. When Ormat first entered the geothermal market in the early 1980s, its technology was an upstart contender.

Ormat Electricity Revenues: 2008 ($mil)



Source: Ormat 10-K for 2008

Most of the action was focused on using conventional flash steam generation with high-temperature geothermal resources of 350 degrees fahrenheit and above. But when Ormat's technology came on the scene, those high-temperature resources were starting to become more scarce because they were the most favorable for geothermal power and therefore developed first. By the mid-1980s, geothermal project developers increasingly needed energy conversion technology that could make use of lower-temperature resources. "Until then people had only been looking for resources that had high temperature steam," said Thomsen.

While Ormat grew its business over the next two decades, it also facilitated the growth of the geothermal industry. Its niche technology position grew into a commanding lead in the fast-growing binary power plant segment, leaving the steam segment to other players, mostly large turbine manufacturers. "Ormat has never tried to compete with Mitsubishi or GE or other manufacturers on huge steam turbines," said Thomsen.

One industry veteran estimated that binary technology accounts for about 10% of the existing stock of geothermal capacity worldwide, and that Ormat has built 95% of those plants. Despite its lower penetration in commissioned power plants, binary technology represents the greatest growth potential because of the prevalence of undeveloped geothermal resources under 350° F, according to many industry experts. (Other factors go into the choice between flash steam technology and binary technology; see Nevada Geothermal profile on page 27 for more information.)

"In the United States, the low-temperature resources are huge," said Enrique Lima, general manager for overseas business of **West Japan Engineering Co.** (West JEC), a prominent and globally active geothermal consulting engineering firm. "The amount of hot water available is very large and the temperatures are well suited to the application of binary power generation. This is why many companies are trying to tap these resources."

Lima points to other countries where binary geothermal development could be the pivotal enabling technology for geothermal because of the abundance of underground reservoirs of 350° F or lower. "Exploration and development of low-temperature resources is happening in countries as diverse as Australia and Greece, and in countries like Hungary, Romania, and Jordan, where oil and gas exploration has led to discoveries of hot water and interest in geothermal energy."

According to Tim Stephure, clean and renewable power generation analyst at **Emerging Energy Research**, binary technology is slightly more expensive than conventional flash steam generation technology, but Stephure says this disadvantage is mitigated by the fact that the exploration and drilling risks are reduced because developers have a better chance of tapping resources of sufficient enthalpy

(heat energy) for the binary process. "In cost comparisons to wind or varying solar technologies, binary geothermal technology is very economically favorable," said Stephure. "The low-temperature market will probably have the highest growth rate going forward as there are so many more areas that can be explored.... Nevada has tremendous opportunities in this regard as well as some other states like Utah."

Ormat's Thomsen underscored Stephure's viewpoint about the lower risk levels and costs of drilling for low-temperature geothermal reservoirs. "Probably 90 percent of the geothermal projects in existence today were built on top of reservoirs that had some kind of surface expression such as hot springs or rapidly melting snow," he said. "Now that most of these have been developed, the industry is looking for what we call blind resources."

"Geothermal is where the oil & gas industry was in the 20s and 30s when they thought they were running out of oil because most of the reservoirs with surface manifestations had been utilized," said Thomsen. "We're now looking at deeper more moderate temperature resources that aren't inherently obvious or haven't been developed previously. In this phase, the advantage of Ormat's technology being able to user lower temperature heat is critical."

Stephure noted that European countries are banking on using binary technology as well as emerging EGS technology to tap the lower temperature geothermal resources under their soil as well as hot dry rock (HDR) resources. "A lot of European countries don't have those high-temperature resources you see along the Pacific Ring of Fire," said Stephure. "Germany has implemented a feed-in tariff for geothermal of up to €0.27. The base is €0.20 with enhancements of €0.04 if you do combined heat and power and €0.03 if you do EGS. This is the first direct incentive of this kind." ☼

Technology Providers and Developers Vie to Compete With Ormat in Emerging Geothermal Niches

United Technologies, Raser, Turbine Air Systems, Exorka and others develop in manufacturing, the lab and in the field.

Although Ormat dominates the low-temperature binary segment of the geothermal power market today, competitors have emerged in the last several years. **United Technologies Corp.** is its most high-profile competitor on the power systems technology front. Since 2006, UTC has marketed its PureCycle binary technology systems for geothermal power. PureCycle is a 280-kW modular unit that can be deployed in arrays to create commercial-scale plants. According to Michael Ronzello, North American sales and business development manager for **PureCycle** (marketed by UTC's **Pratt & Whitney Power Systems** division), PureCycle promises faster construction cycles. "Our modular approach to power plant deployment drastically reduces construction time," said Ronzello, indicating that plants can be constructed in 6-12 months (after hot water supply is established). "We have the capability to leverage Pratt & Whitney Power Systems 20 plus years of expertise and experience in the power business to provide full turnkey geothermal power plants using PureCycle".

While UTC doesn't publicly disclose prices for its equipment, Ronzello said the company expects to compete with Ormat's cost per MW of capacity by sourcing components from a UTC-owned affiliate. "We use off-the-shelf components and technology from our sister division, Carrier, the leader in commercial HVAC equipment," he said. According to Ronzello, Carrier produces components for PureCycle "in a pre-engineered, pre-manufactured fashion that drives down costs, increases quality and allows customers to take advantage of the lead time that is common in Carrier."

Raser Gains Efficiency With Networking

UTC's largest customer and best advocate is **Raser Technologies** (Provo, Utah). Raser has leveraged its expertise in electric motor technology to develop methods of networking the modular UTC units for optimal performance and efficiency. "Just like there are people who make computers and people who network computers together to function better, we've figured out how to network [the UTC PureCycle units] together so they can work in harmony and produce electricity more efficiently," said Richard Putnam, Raser's director of investor relations.

It's not clear yet how UTC's PureCycle systems will compare with Ormat's in terms of performance, costs and reliability. The geothermal developer community, while not unhappy with Ormat's equipment and EPC work, would certainly welcome additional competition in binary technology. But with over 20 years of experience and a proven ability to execute the guaranteed EPC contracts that lenders need to see before financing projects, Ormat will not be an easy competitor to take market share from. "We have been able to simplify our processes over time," said Thomsen. "We have fewer moving parts. We have a low speed turbine that doesn't require a gear box. Our power plants have become much more efficient over time [and EPC] projects much more streamlined and more efficient [resulting in] longer run times, greater longevity, less wear and tear on turbines, less opportunity for pump failure, less piping."

The industry is watching closely to see how the first Raser-UTC plants perform and what their construction costs are. Raser brought its first project online in 2008, the 11-MW Thermo No. 1 plant in Beaver County, Utah. According to Putnam, production wells drilled for the

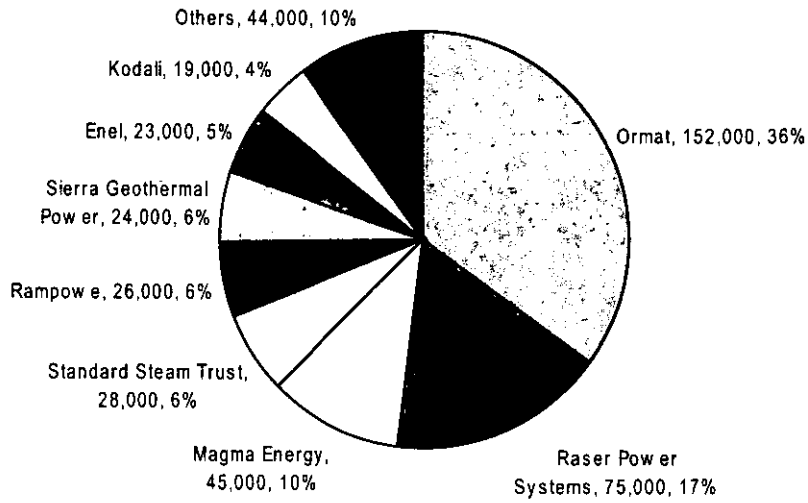
plant revealed a larger-than-expected geothermal reservoir capable of supplying steam for more than 200 MW of power plant capacity. "We had thought there were maybe 20 to 30 megawatts, but after doing some nice drill-out, GeothermEx, an independent geothermal consulting company, was able to verify and independently report that this is now a 230 megawatt resource," he said.

Raser's annual report for 2008 reported a capital cost for Thermo No. 1 of $88.1 million, with at least another $9.5 million needed to get the plant up to full operating capacity. That would seem to indicate a capital cost of about $7,000 per kilowatt of gross capacity. (After supplying its own pump loads Thermo No. 1 will produce 10 to 11 MW net from gross power capacity of 14 MW). That amount is far higher than the typical $4,000 per kW of gross capacity cited by developers at the recent Geothermal Innovation and Investment Conference or the $3,500 to $4,500 per kW range cited for Ormat plants by Ormat's Thomsen. (Those cost ranges include the highly variable cost of resource exploration and wellfield development. "We know the price of plants we build down to the penny. What we don't know is the cost of developing the resource," said Thomsen.)

But according to Putnam and Raser CEO Brent Cook, the nearly $100 million price tag for Thermo No. 1 included the production wells that revealed the reservoir's very large potential plus the cost of a larger transmission line to ship more electrons than anticipated to the company's electricity customers (currently the City of Anaheim, Calif.). "We are comfortable that the $57 to $59 million range is accurate for non–recurring development costs," wrote Cook in an email. "We expect our costs to be $3,800 to $4,200 per MW installed cost."

Raser's Beaver County development is just the opening salvo in a four-state development program that the company expects to yield hundreds of megawatts. Indeed, Raser aims to become a major developer and IPP operator of geothermal projects in the United States, Indonesia and elsewhere.

BLM Geothermal Competitive Leases by Acres, 2007–present



Source: Compiled by Emerging Energy Research; By state the 2007-2008 leases are 52% in Nevada, 34% in Utah and 9% in Oregon, 4% in Idaho. Others include Agua Caliente, Oski Energy, Geothermal Technical Partners, Silver State Geothermal, Vulcan Power, Geothermal Rail Ind. Dev., Miller Dusty, S4 Consultants, Montera Energy Ventures, US Geothermal, Calpine, First Covenant Construction, US Renewables Group, Kelsey South, High Valley. Figures in acres rounded to the nearest thousand acres. BLM is Bureau of Land Management.

After Ormat, Raser is the second largest acquirer of geothermal leases on federal land since 2007. According to figures compiled by **Emerging Energy Research**, Ormat purchased leases to about 150,000 acres (the company owns leases on a total of 220,000 acres according to its annual report), followed by Raser with approximately 75,000 acres and **Magma Energy** with about 45,000 acres (see chart above). "We have accumulated domestic geothermal interests in Nevada, New Mexico, Oregon and Utah," notes Raser's report. "With the help of internal and external geologists, we intend to continue to identify, evaluate and acquire additional interests in properties." And last year, Raser and **Indonesia Power** were the successful bidders on a geothermal concession in Indonesia that covers approximately 100,000 acres with potential resources. At CCBJ's deadline, Raser and Indonesia Power will still finalizing their joint venture agreement.

Turbine Air Systems Exploits Rankine Cycle

Another emerging potential Ormat competitor that some in the geothermal industry are excited about is **Turbine Air Systems** (TAS; Houston), an industrial cooling and heating systems manufacturer that has begun developing technology for geothermal applications. TAS already has a foothold in the power industry with its modular inlet chilling units that can increase the efficiency of gas-fired power plants in hot climates. "TAS has translated this modular construction to geothermal power and advanced waste heat recovery organic Rankine cycle systems," states a company brochure. The company aims to leverage its experience in the power sector to offer design and engineering services for geothermal developers rather than just off-the-shelf sales.

Halley Dickey, director of geothermal business development for TAS, told CCBJ that the company has developed a renewable energy division aiming to provide power plants to solar thermal power projects as well as geothermal and industrial heat recovery. "We've been working on the development of our organic Rankine cycle program for seven years," he said.

"We own some unique patents related to geothermal binary technology." The first plant to deploy a TAS system may be on the horizon, as Dickey said the company is negotiating with an undisclosed potential U.S. client to supply a 15-MW plant in 2010.

Kalina Has Backers & Detractors, Needs Manufacturer

A third competitor in the binary geothermal power systems segment is **Exorka** (Munich, Germany), which markets binary technology based on the Kalina system using an ammonia-water mixture as a working fluid. One speaker at the March 2009 geothermal industry conference disparaged the Kalina system from the lectern, saying that after promising to revolutionize the industry and unseat Ormat, the technology had gotten nowhere. The speaker claimed that there are only two Kalina plants worldwide and neither are operating. One conference participant speculated to CCBJ that the difficulties facing the Kalina process stemmed from its use of a mixture of ammonia and water; because the two fluids boiled at different temperatures, Kalina systems had to cope with constantly changing compositions.

But Exorka's CTO Gestur Bardarson reported that four of five Kalina cycle plants built since the late 1990s "have mostly shown high reliability, although some equipment problems have been present [but] no more ... than can be expected for new technology employed in the first commercial plants." A 2-MW plant in Husavik, Iceland, achieved a capacity factor of between 89% and 96% from 2005 to 2007, according to Bardarson. A 3.3 MW waste heat plant at a **Sumitomo Metal Industries** steel plant in Japan has been running smoothly since 1999 with an annual capacity factor as high as 99%, he said.

Raser's Richard Putnam told CCBJ that company staff has evaluated Kalina technology and visited some of the pilot plants. "We believe the technology has a positive operating history that should be discussed. It is unclear who will take the manufacturing lead on the technology, but we believe the technology is sound and proven."

There is also a prospective nano-technology entrant, Power Chips being developed by Gibraltar-based **Borealis Exploration**. The technology was announced in 2003 with a promise of superior power conversion for geothermal applications, waste heat recovery and other applications. A news release described Power Chips as "solid state thermotunnelling devices which use a combination of thermionic emission and quantum mechanical electron tunnelling to increase the rate of electron emission in solid-state converters." But Power Chips appears to either be in deep stealth mode or inactive since the last news relase posted on its website is more than two years old. (An email inquiry to Borealis was not returned by CCBJ deadline.)

Ormat, of course, is not standing still technologically. Thomsen says that the company's more than 25 years of experience designing, managing and operating geothermal plants gives it a technical edge over prospective competitors. "Converting heat to electricity is very expensive and hard to do," said Thomsen. "Some of our competitors have tried to do cookie-cutter type plants that they can produce rapidly. We started with small units and gradually built larger and larger units, refining our knowledge and expertise continually."

Ormat also has an operational edge that enables it to get the most MWh out of its plants for the lowest operating costs, according to Thomsen and Ormat's annual report. "Our intimate knowledge of the equipment that we use in our operations allows us to operate and maintain our projects efficiently and to respond to operational issues in a timely and cost-efficient manner," states the report. "Moreover, given the efficient communications among our subsidiary that designs and manufactures the products we use in our operations and our subsidiaries that own and operate our projects, we are able to quickly and cost effectively identify and repair mechanical issues and to have technical assistance and replacement parts available to us as and when needed."

Ormat Takes a Crack at EGS

Ormat is pushing the frontiers of geothermal technology in two key initiatives with the U.S. **Department of Energy**, one to explore the potential to exploit hot water that is co-produced with oil and gas and another to advance enhanced geothermal systems (EGS).

At the **Rocky Mountain Oilfield Testing Center** (RMOTC) in Wyoming, a 250-kW Ormat binary power unit started generating electricity in September 2008 using heat from 190° F water that is co-produced with oil. The potential to generate on-site power from such a set-up is enormous. RMOTC estimates that U.S. oil and gas wells that produce hot water along with hydrocarbons could generate "upwards of 5,000 MW of power," according to an RMOTC news release.

Ormat's Thomsen told CCBJ that the project is "over-producing what we had expected it to do." But moving ahead with co-production at oil and gas drilling sites will be a challenging endeavor. For one thing, there's the fact that according to RMOTC, the water recovered with oil or gas is usually only heated to a maximum of 220° F, far lower than what geothermal developers prefer to produce power economically. Furthermore the costs of operating such a system will depend on how the hot water is disposed of, i.e., through reinjection or surface dumping.

Probably much more significant to the future of geothermal power is Ormat's DOE-funded work on EGS with collaborators **GeothermEx**, **University of Utah**, **U.S. Geological Survey** and others on two

EGS demonstration projects.

As discussed in in the following feature on enhanced geothermal systems, EGS has the potential to vastly expand geothermal if it allows power to be produced successfully from hot dry rocks—as opposed to the conventional hydrothermal resources relied on for all geothermal power today, both flash and binary. The demonstration projects aim to hydraulically stimulate fractures that can enhance the production of hot water of sufficient enthalpy to generate additional power. "It's still very early stage R&D, but we're excited about not only developing technology to create standalone resources for EGS but also to create new life or viability for existing resources."

"We still need to prove the technical viability, and then get to the point of proving commercial viability," said Thomsen. "Ormat's experience has shown us that you can have complete technical success and zero commercial viability and vice versa." He also averred that it will be important to focus not just on the potential of EGS to greatly expand the pool of resources available for geothermal power but to look for ways to use the emerging technology to enhance existing geothermal power sites.

"If you can go back to wells that are less productive and, for lack of a more scientific term, tinker with them and produce more heat, we might determine that our potential hydrothermal resources may be much larger than we thought. For example, if you drill a well in a standard hydrothermal resource and don't get adequate permeability or heat, you might be able to use EGS technology to fragment back into the reservoir and stimulate adequate permeability and heat."

Growing Organically

With its healthy balance sheet and dominant vertically integrated position, Ormat might be expected to be on the hunt for project developers long on leases but short on capital. But according to Thomsen, the firm is reticent to diminish its third-party customer base through acquisition even though that might provide competitive advantages. "The only time we compete directly against another developer is when we're bidding on a resource at the federal land auctions," said Thomsen. "Once another developer is successful in achieving its resource position, we look to provide them with third-party power plant equipment."

Thomsen says that last year Ormat executives were asked by some in the geothermal industry whether they were considering making a bid for **Nevada Geothermal Power** when the developer was trying desperately to finance its Blue Mountain Project during the 2008 economic collapse. "People asked us 'Are you looking at this as potential acquisition?' We said no. We don't want potential third-party clients living in fear that we would acquire them when they run into financial difficulties."

Some financial analysts or deal-makers might argue Ormat is undervaluing the benefits of consolidation. But it's hard to argue with a business model in which Ormat's development arm pushes ahead with its own projects while earning revenues from equipment sales and EPC contracts—including $76 million from Nevada Geothermal for designing and building the Blue Mountain project.

Ormat's future is clearly tied to supplying and servicing a vigorous and growing geothermal industry, and to that end the company is a cheerleader for its counterparts as well as a competitor. Thomsen echoes a theme heard commonly in geothermal circles: The industry deserves more respect and recognition, and when elected officials, utility commissioners and activists talk about the importance of renewable energy, geothermal should be mentioned in the same breath as wind and solar.

"On one hand it can be frustrating that people don't recognize geothermal and its reliable baseload attributes as compared to wind and solar," said Thomsen. "But on the other hand, the investor-owned utilities we sell power to all know who we are and what we do. Geothermal might not be on the front page of the Wall Street Journal or the New York Times, but there are not many utilities who aren't familiar with geothermal. Serendipitously, after CCBJ interviewed Thomsen in April, Morgan Stanley put geothermal power on the cover of the *Wall Street Journal* on May 20, 2009, with a full-color ad touting geothermal as a sound investment, while promoting its expertise on the industry. "Unlike wind or solar energy, geothermal utilizes a constantly present energy source —the Earth. Just below our feet lies an industry that could reach $122 billion by 2030." While Morgan Stanley's 20-year valuation of the industry may be little more than an educated guess, the firm's promotion of its expertise harkens to what Thomsen says utilities have known for years: "To quote Michael Yackira, CEO of **NV Energy**, 'Geothermal projects don't look any different to an IOU than any other fossil fuel project,' While that's not sexy, it's a badge of honor for the industry. We're seen in their integrated resource plans as being just as reliable as coal or natural gas plants." ☼

Typical Geothermal Plant Development Costs ($/kw)

Development Stage	Cost ($/kW)
Exploration and resource assessment	400
Well field drilling and development	1,000
Poewr plant, surface facilities, transmission	2,000
Other dev't costs (fees, working cap, contingency)	600
Total development cost	4,000

Source: Geothermal Tomorrow, U.S.Department of Energy's Office of Energy Efficiency and Renewable Energy; Costs for a typical 20 MW plant or a total of $80 million; Does not include financing charges of interest rates 5-6% for some utilities or as high as 15% for IPPs."

Nevada Geothermal Power, Last in Before the Credit Freeze, Looks to Heat Up the Geothermal Market

Like several other pure-play geothermal developers, **Nevada Geothermal Power** (NGP) is a Canadian company with a U.S. subsidiary targeting development prospects in the lower 48. NGP became something of a celebrity in the small U.S. geothermal world last year because it secured project financing for its 49.5 MW Blue Mountain power plant near Winnemucca, Nevada, just before credit markets locked up in the third quarter of 2008. But the company's experience also illustrated just how difficult it is to finance a geothermal power project in this economic environment.

The credit facility NGP received from **Trust Company of the West** on August 29, 2008 enabled it to give **Ormat Technologies** a full notice to proceed on a previously negotiated $76 million engineering, procurement and construction (EPC) contract and to conclude a $4.5 million deal with **Wilson Utility Construction** for a transmission line to the regional grid. As of spring 2009, the project was on schedule and NGP expected Blue Mountain to be in commercial operation by the end of the year. The power buyer is investor-owned utility **NV Energy**.

"Our timing was perfect," said CEO Brian Fairbank in recounting his firm's dash for cash last summer. "We had been working with **Morgan Stanley** on a 30-month construction loan that would have then been replaced with production tax credits for permanent financing." With a proven resource of 50 MW (40 MWe) and the guaranteed turnkey EPC bid from Ormat, the project looked solid, until the credit markets started to unravel in mid-2008. "All summer we'd been sitting down with Morgan Stanley and the syndicating banks trying to close the deal, but it was apparent even then that the credit markets were not working. Around the end of July we were basically running out of time and needed to move forward." That's when NGP got its financing deal done with TCW—at 14 percent.

Cost of Developing a Geothermal Project

High front end costs

- High upfront confirmation costs, compared to other renewables
- Drilling, money, leasing, time

Phasing exploration mitigates risk

- Geochemistry, geology, geophysics and permitting: $2.5 million
- Temperature gradient drilling, slim-holes: $2.5 million
- Production test wells: $3.0 -$6.0 Million X 2
- $15 million plus to feasibility! Requires high risk upfront equity!

Source: Nevada Geothermal Power, presentation by CEO Brian Fairbank at Greenpower Conferences' March 2009 Geothermal Innovation and Investment conference

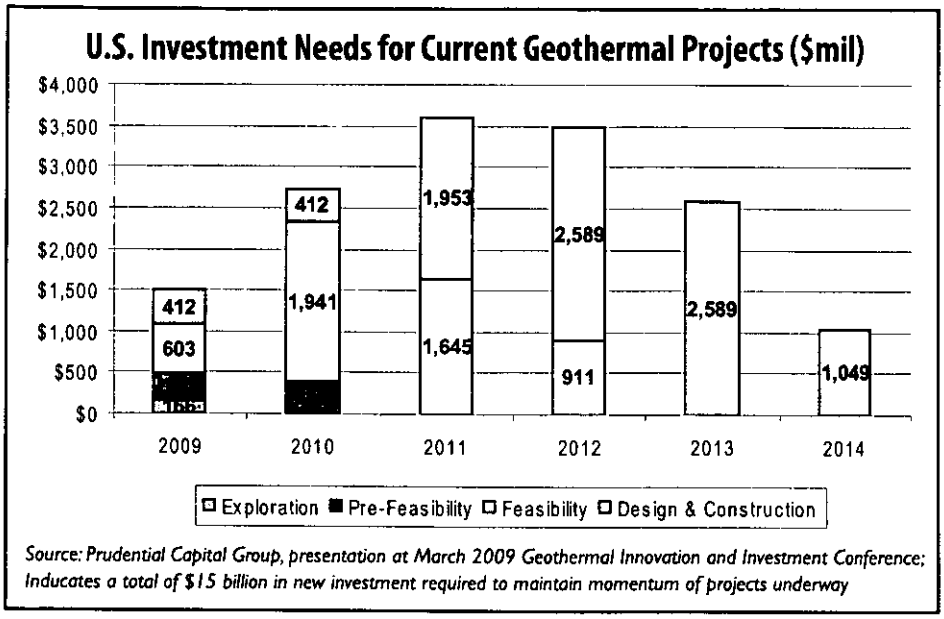
"In today's economic environment, this financing looks good," said Fairbank. "It's a facility up to $180 million that we draw as we need it." Fairbank says NGP is currently packaging a production tax credit (PTC) based financing, a task that is by no means easy since the tax credit capacity of U.S. financial institutions has shrunk dramatically with their declining profits. The American Recovery and Investment Act (ARRA) stimulus bill extended the "placed in service" date for tax credit qualification for geothermal projects to December 31, 2013, so Fairbank is confident that buyers will be found. The plant's commercial operation date (COD) looming—it could arrive by October 2009—and the impetus to take out the 14% debt is rather compelling.

Selling the PTCs is NGP's most preferable option; as noted in CCBJ's Q1 2009 edition, the House-Senate Joint Committee on Taxation estimates that PTCs taken over the 10-year qualification period are worth roughly 50 percent more than the investment tax credit that Blue Mountain and other renewable generators can also qualify thanks to ARRA. "The PTCs are worth $21 a megawatt-hour to start with, indexed to inflation. So if we're selling power at $75 to $80 per megawatt-hour, that's pretty significant," said Fairbank. Accelerated depreciation is also on offer, and combined with PTC value, Fairbank figures that NGP can offer a buyer about $100 million worth of tax benefits.

However, in today's climate, Fairbank acknowledges that he may have to go with the new tax credit option provided by the ARRA: a grant in lieu of a 30% investment tax credit (ITC). But like other geothermal developers eyeing the grant-in-lieu-of ITC, Fairbank is concerned about how much of the upfront exploration and drilling costs will be considered tangible costs by the U.S. Treasury for the purpose of calculating the ITC. At CCBJ's deadline, guidance on that issue had not come forth.

As is the case for many geothermal projects, in the process of drilling wells to tap the underground hot water resources at Blue Mountain, NGP ended up hitting one dry-hole—not literally dry but of sub-commercial enthalpy (heat energy)—and some "false starts" in Fairbank's words on injection wells (used to stimulate continuing flow of hot water). "We drilled a well to the north that didn't turn out."

At $3 million to $6 million per well, the ability to include unproductive wells in the investment cost basis that qualifies



Source: Prudential Capital Group, presentation at March 2009 Geothermal Innovation and Investment Conference; Inducates a total of $15 billion in new investment required to maintain momentum of projects underway

for the ITC is not trivial. According to Fairbank and other geothermal developers, typically 20% to 30% of the wells drilled on such a project end up not functioning as expected—but such dry-holes are an inevitable part of development, and they help the developer and its technical consultants understand more about their reservoir and target future drilling more accurately.

In fact, with the production drilling already completed, this gives Fairbank and his team reason to think that there is another 50 MW of geothermal power capacity to be tapped from the geothermal reservoir under their ground. "In oil and gas terms, there's an inferred or possible resource toward the mountain to the east," said Fairbank. Geoscientific and geochemical indications give strong hints of this. "The water we're producing now is 375 degrees Fahrenheit, but the chemistry of the water indicates that ultimate source temperatures greater than 400 Fahrenheit. In the long run we may not have found the hottest part of the resource." But more drilling is needed to prove it.

And speaking of temperatures, NGP's 375 degree Fahrenheit geothermal resource was hot enough to allow use of conventional flash steam technology—which would have resulted in a somewhat less costly power plant. But early on NGP chose the binary technology offered by Ormat, which uses working fluids and heat exchangers to capture the heat energy in lower temperature geothermal resources. According to Fairbank, the decision was based in part on the fact that while initial drilling turned up 375 degree Fahrenheit hot water, NGP couldn't be sure subsequent wells wouldn't be too cool for flash technology.

Plus, the closed-loop binary systems offered benefits for reservoir longevity and air quality permitting. "With binary you reinject 100% of the water and that helps maintain the overall resource's longevity because you're pressuring the reservoir," said Fairbank. "With flash, you're losing the vapor, about 30 percent of the water."

"Flash plants also have some slight air emissions in the vapor," said Fairbank. The most common is hydrogen disulfide—the rotten egg smell. "[To meet air quality regulations] you have to scrub that out. You can deal with it, but binary is absolutely emission free."

NGP is pursuing development of three other projects: Pumpernickel Valley and Black Warrior in Nevada and Crump Geyser in Oregon. With TCW funding for Blue Mountain only, NGP expects to be in the market for more financing soon. Because the expensive drilling programs must be funded by scarce equity—in the "hyperliquidity" era that ended last year, some debt funding might have been available—NGP is hoping that **the U.S. Department of Energy (DOE)** decides to use some of its **$400** million in ARRA funding for geothermal to subsidize drilling programs. Either that or a piece of the **$6** billion in new loan guarantee funds in the ARRA, hopefully made available in a process more streamlined that past DOE loan guarantees. "The existing established loan guarantee program is for technology [but for applicants] it has been more trouble than it was worth," said Fairbank. "My understanding is that the new program may be for other things, including geothermal drilling. The geothermal industry needs that." ☼

EGS Could Vastly Expand Geothermal Power But Funding of RD&D Projects Needed

Conventional geothermal industry competes with EGS for scarce funding.

In our page one overview for this edition, CCBJ characterized the geothermal power industry as the veteran journeyman shortstop on the baseball team of the Low-Carbon and Renewable Power Segment. Well, if one thinks of the geothermal power industry as a professional baseball team, **enhanced geothermal systems (EGS)** would be the 15-year-old phenom impressing the pro scouts. Only that metaphor is not grand enough. Imagine that the scouts have discovered a whole high school full of future all-stars who are destined to break every baseball record without using steroids and triple the size of Major League Baseball's fan base and revenues. That's just the kind of game-changing status that EGS is gaining in geothermal research and investment circles.

While the U.S. resources for conventional geothermal power—also known as "hydrothermal" because underground hot water provides the steam supply for power plants—are limited to the West and capable of growing to between 30,000 and 40,000 MW, geothermal plants using EGS could be built almost anywhere. A **Massachusetts Institute of Technology (MIT)** study projects that EGS technology could enable geothermal power to supply 100,000 MW of capacity in the United States, nearly 10% of current installed electrical generating capacity.

But as of 2009, EGS (which also stands for engineered geothermal systems and is alternately known as HDR, for hot dry rock) is more like a kid trying out for little league. After three decades of research and field testing, there are no EGS power plants pumping electrons to a utility grid. "So far there have only been test power plants run on true EGS experiments where they've actually fractured the rock and circulated the water," said EGS expert David Blackwell, co-author of the MIT report and a professor of geophysics at **Southern Methodist University** at the March 2009 Geothermal Innovation and Investment conference in San Francisco.

Blackwell acknowledged that European EGS projects in France and Germany are generating grid power, albeit in amounts of 3 MW or smaller. But he told the audience that those projects are not what he considers true EGS because their developers drilled into subterranean rock with existing fractures. "They didn't actually make the fractures," said Blackwell. In Blackwell's and many others view, the first company to accomplish a true EGS project will likely be **Geodynamics** of Australia, which looks ready to culminate six years of R&D with a 1-MW geothermal plant in South Australia's Cooper Basin. The pilot project will power the remote town of Innamincka as early as the summer of 2009, displacing a diesel generator that costs $15,000 a month to fuel. "That will be the first real long-term, large-scale test of EGS," said Blackwell.

EGS Basics

So what is EGS? In a nutshell, it is using hydraulic fracturing techniques—commonly deployed in the oil & gas industry—to open up sealed fractures in hot rocks far underground, then using injection wells to push cold water through the newly opened fractures where it is heated and returned to the surface to supply heat for power generation. EGS "emulates naturally occurring hydrothermal circulation systems—those now producing electricity and heat," wrote Jefferson Tester and co-authors of MIT's 2006 report, *The Future of Geothermal Energy*.

MIT's report has generated buzz in the media and in investment circles. Before the recession, EGS drew some venture capital, which had been rare to non-existing in the mature geothermal industry. **AltaRock Energy**, which aims to develop a pilot EGS project by drilling into granite below the hydrothermal reservoir that fuels The Geysers power plant in California, received $26.25 million from **KPCB, Khosla Ventures, Google.org** and **Vulcan Capital**; **Potter Drilling** has received $4 million from Google.org.

Not exactly big numbers in the clean energy field where solar took in 40%, biofuels 11% and wind 6% of $8.3 billion in global cleantech investing in 2008. Indeed, most money going into EGS has come from governments, including the United States, Germany and Australia. MIT's report authors warn that governments will have to keep putting up money for some time to come. "It is likely that government will have to fully support EGS fieldwork and supporting R&D. Later, as field sites are established and proven, the private sector will assume a greater role in co-funding projects—especially with government incentives accelerating the transition to independently financed EGS projects in the private sector."

Australia, which has little in the way of conventional hydrothermal resources, is one of the most aggressive EGS funders. The government has pledged about $45 million for pilot projects, and several hundred million dollars in shareholder investments have flowed into about 10 public companies. Along with Geodynamics, the leading firms include **Panax Geothermal** and **Petratherm**. Yet, in the United States, many in the geothermal industry would prefer that government keep the fledgling EGS phenom on a diet and feed them instead, or as the case may be, keep them alive through this current period of capital scarcity. "It's great to spend money on EGS. That's the future," said Doug Glaspey, CEO of **U.S. Geothermal**. "But if you want megawatts on the ground today, you have to capitalize exploration. The way you do that is put it into drilling programs."

Hot Dry Rock vs. Hot Wet Rock

To one pioneering EGS/HDR researcher, starving RD&D to support the existing geothermal industry would be a case of history repeating itself. Donald Brown was one of the three scientists from the U.S. DOE's **Los Alamos National Laboratory** who pioneered HDR and created a test project—one of the few "true EGS experiments" in Blackwell's rankings—at Fenton Hill, New Mexico. "HDR was actually Bob Potter's invention," Brown told CCBJ. "Mort Smith and I modified it, and I wrote the patent."

The Fenton Hill team developed two confined HDR reservoirs, the first from 1975 to 1977 and the second from 1983 to 1985. The first phase was centered at a depth of about 9,200 feet with a mean temperature of 385° F and the second phase was 11,500 feet underground with a mean temperature of 455° F. Contractors **Dowell Oil Well Services** and **Halliburton** fractured the rock with hydraulic pressure until fissures and cracks that had been long sealed by precipitation were forced open—a common technique in the oil & gas industry. This part of the process included a feat that still impresses Brown today: a massive hydraulic fracturing in which Dowell injected 5.7 millions over two and half days at a surface pressure of 7,000 PSI. "No EGS stimulation has ever approached those numbers."

Hoop stress created by the pressurization made the reservoirs tight at their margins. Injection wells pumped cool water down and through the fractures, where it was heated, then up to the surface—so the system operated in a closed loop, comparable to an automobile cooling system. "The stimulated joints were held open by reservoir pressure, a pressure greater than the joint closure stress so that the HDR reservoir was highly dilated," said Brown. "We were not at all worried about the joints plugging up again with dissolved minerals, since all the dissolved mineral species reached equilibrium in the pressurized close-loop circulating fluid within about two weeks. No precipitation occurred thereafter anywhere in the earth loop."

Years of testing concluded in 1995 showed the potential to generate about 1-MW of electric power, so the team began soliciting a partner from the geothermal industry. "It would have involved bringing in a company like Ormat to build a binary power plant," said Brown. "We got bids, the bids were evaluated and a winning contractor had been selected." The project would have provided invaluable information on "how to best produce heat in an engineered HDR reservoir," according to Brown.

"Our modeling suggested that the one-third cubic kilometer reservoir would last 10 to 20 years. It could be extended laterally or in depth, and I've got other tricks up my sleeve to increase the productivity and lifetime, but we would need to run a reservoir to demonstrate those." But Brown says DOE declined to fund the project at the last minute, instead directing money to building a 29-mile pipeline to carry recharge water to The Geysers, then owned by **Unocal, Calpine** and **Northern California Power Authority**. According to a report by some consulting engineers for the project, the $48 million project was 40% funded by DOE and other public agencies.

"It was frustrating," recalls Brown. With a change in leadership at DOE's geothermal program, he says the agency "didn't understand HDR. They didn't understand what we had done. They just wanted to get us as a thorn out from under their saddle. We kept saying how good HDR was and they kept saying 'but the industry doesn't like it so we're not going to fund it.'"

Echoing Blackwell's viewpoint, Brown contends that most existing EGS test programs are not true HDR, but rather HWR, or hot wet rock. Other industry sources and the MIT report confirm this, but note that the aim of these projects is to engineer those currently unproductive hot rocks to increase their permeability and make them productive for geothermal power. Brown contends HWR technology misses the true home run potential for geothermal, however. "Less than 1% of the geothermal resource is naturally occurring fluids in place, either along faults or in a steam dome like at The Geysers," he said. "The other 99% is HDR. When you can utilize HDR, you go from a few little fly specks on the world map to the rest of the map."

Regardless of disagreements over HDR vs. HWR, Brown agrees with the rest of the EGS crowd in saying that better drilling technology is needed to enable EGS to go forward on a large scale. While conventional hydrothermal drilling doesn't go much below 10,000 feet, candidate resources for EGS power plants start at 10,000 feet deep and can be as much as 30,000 feet below the surface.

The MIT report says both "evolutionary" and "revolutionary" techniques will be needed; in the former category, the report authors look for "more robust drill bits, innovative casing methods, better cementing techniques for high temperatures, improved sensors, and electronics capable of operating at higher temperature in downhole tools"; and in the second category, "new methods of rock penetration [with] lower production costs."

Brown, who has come back from retirement to work on HDR as a guest scientist at Los Alamos, likes the hard-rock polycrystalline diamond compact (PDC) drag bit now being developed by a company called **Novatek International**. "It can improve the drilling rate by a factor of three and will cut our front end costs down considerably so the economics of HDR become more attractive." Brown is also working with some undisclosed venture capital investors who are considering a demonstration project at Fenton Hill.

"The reservoir is still there, and one of the wells is still in decent shape," he said. "If we started today we would probably have power coming off the lines in three years." He says the investors would look to patent some of the technology coming out of the project and build on their first-in-class reputation and expertise to roll out more and larger EGS/HDR projects... They're willing to lose money on the first power generation demonstration. They know that we have to produce power to go to the bankers in order to get funding to step out into other areas and do this HDR."

This theme was echoed by speakers at the March geothermal conference in San Francisco. "We need to cross that first hurdle of getting some demonstration projects going," said Susan Petty, CEO of **AltaRock Energy**. Government funding will be key, according to Petty and others.

"Hydrothermal projects have high upfront capital costs, but EGS has an even higher upfront capital cost with the added difficulty that it's an emerging technology," she said. "We've going to have to rely on funds from the government to help us continue our R&D and to guarantee loans or to provide low-cost capital so we can get our wells through, set up demo sites and run these systems for a while so we can show they work."

Yet, North American conventional geothermal developers—with more 3,000 MW of capacity in the pipeline largely stalled by the recession—say they need DOE money to go forward. "It's very important that these hydrothermal development programs not get stalled," said Brian Fairbank, CEO of **Nevada Geothermal Power**.

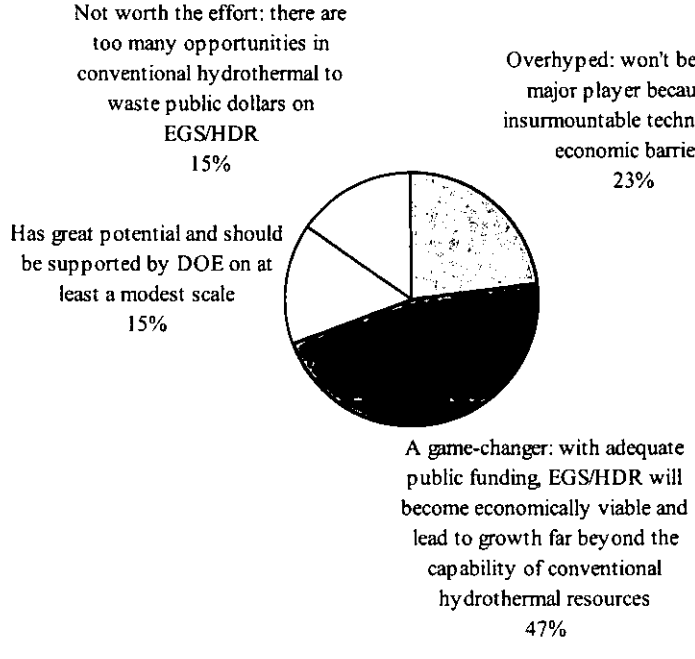
In other words, DOE's $400 million for geothermal is already overcommitted before the agency has had time to come up with disbursement guidelines.

Geothermal industry veterans, lenders and investors expressed a range of opinions to CCBJ about EGS's ultimate viability. "Do I think it can work, sure. But is it economic? I don't know enough to really comment one way or anther," said Ric Abel, managing director for electric finance at **Prudential Capital Group**. "When you start drilling holes 20,000 or 25,000 feet down, and you have to get a fluid down there and back up, you're talking about an enormous parasitic load. I just don't have a good feeling for how the economics will come together."

A veteran geothermal engineer who now consults for investors told CCBJ: "EGS is the holy grail, and like the holy grail it may be just a myth." But many who follow geothermal and other renewable energy technologies contend that with adequate public support, EGS/HDR will fundamentally change the geothermal game. "Work that we are doing in Canada suggests that with adequate investment we can utilize EGS successfully even when temperatures are between 125 and 150 celsius (257 and 302 Fahrenheit)," said Michal Moore, who is a senior fellow at the Institute for Sustainable Energy, Environment and Economy at the **University of Calgary** in Alberta, and a former member of the California Energy Commission. "With the impending changes to coal emission requirements and the retirement of a significant amount of nuclear baseload electric power, the potential of EGS geothermal is critically important."

Brown, who helped invent the concept of HDR geothermal energy, is now finishing a book covering the HDR Project at Fenton Hill and working with his project backers in Washington to get needed support from natural-resource agencies for restarting Fenton Hill (it's located in a national recreation area). At 77, his enthusiasm for EGS is as strong as that of a rookie slugger at the plate. "I want to see HDR out there commercialized and I'm working very hard to do that. Our plant can be online within three years, and from there, the future of HDR is almost unlimited." ☼

Opinions on Enhanced Geothermal Systems (EGS)



Source: CCBJ 2009 Geothermal Survey conducted in April 2009. Question was: Enhanced geothermal systems (EGS), also known as hot dry rock (HDR) technology, can vastly expand the use of geothermal power in the United States and elsewhere. Yet after more than 30 years of research, EGS has only been the subject of small-scale demonstration plants (and many observers say those projects are not using true HDR resources). Please check the category that best describes your general view of the future of EGS/HDR:

STATE OF ALASKA
2010 LEGISLATIVE SESSION

BILL NO. SB 245

ANALYSIS CONTINUATION

Bill Language:

This bill extends the existing salmon product development tax credit, for investment in processing equipment used to produce value-added salmon products, by four years through 2015. The salmon product development tax credit allows taxpayers to take a credit against their fisheries business tax liability for 50% of qualified investment in new value-added salmon processing equipment. Credits may be applied against 50% of the fisheries business tax liability on salmon processed in Alaska in the year generated and the three subsequent years .

Revenues:

Although it is difficult to determine the number of taxpayers who would take advantage of this tax credit, the DOR would expect reduced fisheries business tax collections in the years added. The department would expect the fisheries business tax to decrease by $2.4 million for each additional year the credit is extended.

Expenditures:

The provisions of this bill could be implemented with existing state resources. No additional personnel or resources would be needed.

SPONSOR STATEMENT
SB 245

An Act Relating to the Salmon Product Development Tax Credit

SB 245 extends the deadline for salmon processors in Alaska to receive a salmon product development tax credit. The program allows applicants to claim a credit on their annual fisheries business tax for the purchase of eligible equipment. Credits received may not exceed 50% of a taxpayer's liability. Under current law, processors can claim the credit for property first placed into service by December 31, 2011. This bill would extend the program's sunset date to December 31, 2015, allowing the processors ample time to continue their long-range investment planning.

The salmon product development tax credit was a key recommendation of the Joint Legislative Salmon Industry Task Force. First enacted in 2003, the credit was part of an effort by Alaska's elected leaders and the fishing industry to develop innovative value-added salmon products. Since then it has stimulated some important changes in Alaska's commercial fishing industry. New processing equipment eligible for the tax credit enables businesses to offer a more diverse complement of Alaska salmon products which helps increase overall customer acceptance. Modern equipment also helps increase efficiency of processing operations and improves throughput, meaning that quality has improved. This tax credit also encourages in-state processing of our salmon which is critical to job creation and retention in fishing communities.

Although Alaska's salmon industry is beginning to recover from years of low values caused by factors such as competition from fish farming, the industry continues to be challenged by the recent economic depression, changes in the marketplace, and increasing labor and energy costs. Extending the tax credit beyond its current sunset date of December 31, 2011 will allow the industry to continue the progress that is being made in developing and producing salmon products that will keep Alaska's fisheries competitive in world markets. The state should continue to support one of our most important basic industries by extending the salmon product development tax credit through passage of SB 245.

PSPA

PACIFIC SEAFOOD PROCESSORS ASSOCIATION
Est. 1914

RECEIVED
FEB - 8 2010

February 8, 2009

Senator Lesil McGuire, Co-Chair
Senator Bill Wielechowski, Co-Chair
Senate Resources Committee
State Capitol
Juneau, AK 99801-1182

RE: Request for scheduling and passage of SB 245 –
Extension of the Salmon Product Development Tax Credit

Dear Senators McGuire and Wielechowski:

On behalf of the Pacific Seafood Processors Association, a trade association of seafood processing companies with operations in many communities throughout Alaska, I am writing in strong support of SB 245 and to request that this important legislation be scheduled for a hearing and action in the Senate Resources Committee as soon as possible.

The legislature constructed the existing Salmon Product Development Tax Credit program tightly to accomplish very specific goals. It is proving to be very successful in accomplishing its intended purpose of encouraging and enabling Alaska salmon processors to develop and produce value-added salmon products in Alaska. This, in turn, is helping Alaska's salmon industry keep pace with evolving consumer demands and keep Alaska salmon competitive on world markets. It is a program that essentially pays for itself by increasing the value and marketability of Alaska salmon.

The attached 1-page document briefly describes some of the improvements that have been made with the help of this program. Many of the new product forms developed and improvements and expansions made in recent years would not have happened, or would have been significantly delayed, without the incentive and assistance provided by the tax credit program. The attached page also describes ways our member companies anticipate utilizing the tax credit program in upcoming years if it is extended.

Alaska's seafood industry, operating in remote areas of Alaska, is dealing with extremely high energy costs, the worldwide economic downturn, and other enormous challenges. Yet, the industry's future, and the future economic benefits Alaska's fisheries provide to fishermen, communities, and the state, depend on continued progress in developing and expanding value-added product forms and capacity. Extension of the Salmon Product Development Tax Credit Program will play an important role in maintaining the continued development and competitiveness of the Alaska salmon industry.

Extending this very effective program makes good sense for Alaska. We urge quick scheduling and passage of SB245.

Thank you very much for your consideration.

Sincerely,

Mary McDowell

Mary McDowell, Vice President

Past use of the Salmon Product Development Tax Credit

The Salmon Product Development Tax Credit Program has been very effective in advancing the goal of increasing in-state value-added processing. The credit has enabled and encouraged seafood companies to make investments in equipment that they would otherwise have had to delay or forego. In many cases, the credit has enabled companies to begin producing value-added product forms they had not previously produced.

Since enactment of the program, PSPA member companies have purchased and put into production a wide variety of value-adding equipment, such as:

- skinless/boneless fillet equipment
- roe separating equipment
- smoking equipment
- equipment to produce boneless/skinless salmon in pop-top ("easy-open") cans
- equipment to produce sockeye ikura
- equipment for packaging ikura in vacuumed sealed packages

The credit has enabled companies to increase capacity of pounds purchased from fisherman and improve quality by adding fillet lines and investing in coolers, blast freezers, and upgrading and increasing freezer capacity.

Anticipated future use of the tax credit

Continuation of the Salmon Product Development Tax Credit would be extremely helpful in maintaining the momentum of the expansion of in-state, value-added processing, and allow companies to plan for future capital investment in their salmon operations around the state and keep Alaska salmon competitive in evolving world markets.

Customers continually want more user-friendly products. The salmon fillet market, for example, has grown tremendously in the last few years and the market has not shown any signs of over supply. It takes some risk and a few years for companies to assess how their investments in value-added processing are paying off and then additional time to gear up and gather financial resources to make additional investments. A tax credit that makes such investments feasible in a shorter timeframe benefits Alaska harvesters, processors, communities, and the state.

If this tax credit program remains available, our member companies anticipate utilizing it in upcoming years for such things as additional filleting equipment; salmon sausage equipment; salmon oil refining equipment; equipment for producing skinless/boneless products; freezing capacity upgrades and increases, portioning equipment, vacuum packing equipment, and salmon roe processing equipment.

OPERATION FAX 206.441.9090
SALES FAX 206.728.1855

Senator Lesil McGuire, Co-Chairman
Senator Bill Wielechowski, Co-Chairman
Senate Resources Committee
State Capitol
Juneau, Alaska 99801-1182

Dear Senator McGuire and Senator Wielechowski:

It is my pleasure to introduce Peter Pan Seafoods, Inc. We were incorporated in 1950 as the successor to P.E. Harris Co., which began canning salmon in Alaska in 1912. Peter Pan Seafoods processes and sells various types of Alaskan seafood products. All of our raw seafood is purchased from independent fishermen participating in fisheries throughout Alaska. Our production facilities include: King Cove, Port Moller, Dillingham, and Valdez. Salmon products account for the largest portion of our sales; other major product lines include crab, halibut, cod, Pollock and black cod. Our products are sold primarily to wholesalers and distributors throughout the world.

Peter Pan Seafoods would like to ask you and the Senate Resources Committee to schedule and pass **Bill HB245, the Salmon Tax Credit Bill**. This bill simply extends for 3 more years an existing program that is proving very successful for the Alaskan salmon industry. We hope to continue the momentum and progress this program has afforded us in keeping our Alaskan salmon products competitive in the domestic and world markets.

We have been able to utilize the salmon tax credit at each of our Alaska production facilities. Both King Cove and Dillingham have added value added salmon fillet and ikura roe lines. In Port Moller, we expanded our value added salmon fillet operation; and in Valdez we added value added salmon fillet production, skinless boneless canned salmon and ikura roe. The progress we have achieved by adding and developing the value added salmon products in such a relatively short time is due to the Salmon Tax Credit.

The ever increasing costs of energy, labor, packaging and insurance are diverting the funds that could otherwise be invested into these sorts of improvements. It is imperative to our industry and Peter Pan Seafoods in particular that the salmon tax credit continue for another 3 years. There is more to be achieved in the development of the salmon value added program to ensure Alaska salmon products keep pace with evolving world markets. We urge the committee to take quick action in support of **HB245, the Salmon Tax Credit**.

Thank you and the Committee for your timely consideration of this issue.

Respectfully,

Barry D. Collier
President and CEO
Peter Pan Seafoods, Inc.

ANALYSIS CONTINUATION

Bill Language:

This bill authorizes the department to withhold issuing a fisheries business license to applicants that fail to pay industry fees levied by NMFS under a fishing capacity reduction program.

Revenues:

The provisions of this bill will have no impact on tax collections.

Expenditures:

The provisions of this bill could be implemented with existing state resources. No additional personnel or resources would be needed.

SECTIONAL ANALYSIS

Senate Bill 255 – Fish Processors Fees, Licenses, and Records

Version 26-LS1413/A, February 3, 2010
STAFF: Tim Benintendi, 465-4989

SECTION 1: Amends AS 16.05.815(a) by adding to the list of information items which may be released by the Department of Fish & Game and by the Alaska Commercial Fisheries Entry Commission. It adds fish ticket information, records, and reports of the total value purchased by each fisherman, buyer, or processor, and makes it available to the National Marine Fisheries Service. This strengthens the NMFS position as loan guarantor of the fleet reduction loan program.

SECTION 2: Amends AS 43.75.020(a) by adding a subsection which provides that an applicant for a fishery business license agrees to pay the 3% fee levied under the fleet reduction program.

SECTION 3: Amends AS 43.75.020(b) by adding final administrative determinations of the National Marine Fisheries Service to the list of judgments or determinations which, if not received by the Department, will not prevent the issuance of a fishery business license to an applicant.

SECTION 4: Provides for an immediate effective date.

STAFF: Tim Benintendi, 465-4989

SPONSOR STATEMENT

SB 255 will enable fisheries that have elected to pursue a capacity reduction (permit buyback) program to have the legal mechanism in place to ensure proper accounting of the transactions involved. The steps taken by this bill are procedural in nature.

Policy regarding capacity reduction through self- imposed fee collections have already been made in both state and federal statute. While allowing the National Oceanic & Atmospheric Administration (NOAA) and the National Marine Fishery Service (NMFS) access to fish ticket data held by the state to monitor loan repayments, this bill puts the final pieces together so that fishermen can decide on their participation based on a complete program.

Fleet capacity reduction programs are mechanisms that allow for stabilization of effort within a fishery. They are intended to ensure the long-term economic sustainability of the fishery by addressing the problem of over-capitalization. Based on the pilot program, 80% of permits bought back were non-resident. Alaska's legal framework for these programs ensures that they are:

FISHERY SPECIFIC - by requiring an affirmative vote of the registered and licensed permit-holding fishermen in the fishery in question. This process is spelled out in AS 43.76.230-270, statutes that were generated by the Joint Legislative Salmon Industry Task Force in 2002. The concept behind that legislation was that each fishery in Alaska has its own specific set of economic

factors, and therefore the participants should have the right of group self-determination in legally meeting the challenges of their fishery. This legislation will not affect any fishery that does not meet the previously established guidelines for capacity reduction.

SELF-FUNDED - In the case of the Southeast Alaska Purse Seine fishery, for example, the fishermen will have to agree to a self-assessment of 3% on each sale of fish they catch to cover the costs of the program.

VOLUNTARY - only fishermen who choose to sell their permits may do so. There is no effort to force any fishermen out of the fishery.

SB 255 does not affect any of the previously enacted pieces of the program. It simply enables the federal NMFS and the state Commercial Fisheries Entry Commission (CFEC) to share required information from the fish tickets (receipts for fish delivery transactions) in order to monitor loan repayments. It also requires processors to remit the fees to NMFS, using the same method as is already in practice for remission of the Alaska Salmon Enhancement Tax.

This legislation takes care of the final procedural hurdles to enable permit capacity reduction programs to go forward in any fishery that chooses to pursue that option and passes the other strict statutory requirements.

Senate Bill 255 is supported by the Southeast Seiners' Association, the United Fishermen of Alaska, and the Alaska Commercial Fishery Entry Commission.

Letter of Intent
Senate Bill 255

The Alaska Legislature recognizes that passage of SB 255 is a necessary step to enable a planned permit buyback program in the Southeast Alaska Salmon Seine fishery to move forward. Further, while the Legislature recognizes the value of reducing the number of permits in the Southeast Salmon Seine fishery, it is also concerned that the permit buyback program will not remove more permits than necessary for the health and viability of the fishery, nor result in negative economic impacts to the region or state, including diminishment of the economic benefits of the investments that have been made in Alaska communities.

Specifically, the Legislature is passing this legislation with the understanding, and the assurance of the Southeast Revitalization Association, that the permit reduction program the association seeks to undertake for the Southeast Alaska Salmon Seine fishery and to implement through the provisions of this bill will not reduce the number of permits in that fishery to less than 260.

Legislative Letter of Intent for HB365/ SB255

The Alaska Legislature recognizes that passage of HB365/ SB255 is a necessary step to enable a planned permit buyback program in the Southeast Alaska Salmon Seine fishery to move forward. Further, while the Legislature recognizes the value of reducing the number of permits in the Southeast Salmon Seine fishery, it is also concerned that the permit buyback program not remove more permits than necessary for the health and viability of the fishery, nor result in negative economic impacts to the region or state, including diminishment of the economic benefits of the investments that have been made in Alaska communities.

Specifically, the Legislature is passing this legislation with the understanding, and the assurance of the Southeast Revitalization Association, that the permit reduction program the association seeks to undertake for the Southeast Alaska Salmon Seine fishery and to implement through the provisions of this bill will not reduce the number of permits in that fishery to less than 260.

The Long Road to Implementing a Consolidation Program for the Southeast Purse Seine Salmon Fishery

2002: Alaska State Legislature enacts AS 16.40.250 to allow permit holders to form non-profit associations for purpose of promoting consolidation of permits

2004: Creation of Southeast Revitalization Association (SRA) by permit holders

2005: Congress amends Magnuson-Stevens, SRA eligibility under Commerce Department & National Marine Fisheries Service

2006: Congressional appropriation;

Alaska State Legislature modifies AS 16.40.250

2008: Alaska State Legislature appropriates $3 million in federal grant monies, resulting in purchase and relinquishment of 35 permits (8.5% of total permits)

2009: NMFS advises it will proceed, but will require access to fish tickets and other records.

How the Program Will Work

1. SRA will establish proper reverse auction procedures
2. Permit holder volunteers to relinquish permit to CFEC
3. Independent audit
4. SRA incorporates bids for submission to NMFS
5. NMFS conducts referendum amongst all permit holders
6. If approved, remaining permit holders pay 3% assessment on ex-vessel of salmon harvested; assessment collected by first buyer and sent to NMFS
7. Minimum of 260 permits remaining in S01A fishery

WHY 260 PERMITS SATISFIES ANY LEGITIMATE OBJECTION VOICED BY SEAFOOD PROCESSING COMPANIES

WHAT THE BILL DOES

1. Amending AS 16.05.815(a) allowing NMFS access to confidential fish ticket and annual records to ensure that first buyers of the salmon are collecting the assessment.

There are already 12 other exceptions in this statute allowing release of this information.

2. Amending AS 43.75.020(a) to provide that when buyers of salmon apply for a fisheries business license – necessary to buy salmon – they must agree to collect and remit the assessment.

There are already five similar conditions in this statute requiring the applicant to pay state or municipal taxes to obtain or maintain a business license.

MEMORANDUM OF UNDERSTANDING

The Southeast Revitalization Association ("SRA") has entered into the following understanding with the undersigned seafood companies:

1. AS 16.40.250 allows permit holders in a salmon fishery to form non-profit associations for the purpose of promoting consolidation or reductions in the number of limited entry permits in a fishery for which the Commercial Fisheries Entry Commission ("CFEC") has issued limited entry permits.

2. The SRA is a duly qualified salmon fishery association under AS 16.40.250 and was organized for the express purpose of developing and implementing a consolidation plan for the Southeast purse seine salmon fishery.

3. Congress under Public Law 108-447, section 209 of the Consolidated Appropriations Act of 2005 amended the Magnuson-Stevens Act ("MSA") making the SRA eligible under a federal buyback loan program established under the U.S. Department of Commerce and administered through the National Marine Fisheries Service ("NMFS").

4. The SRA has developed a draft consolidation or fishing capacity reduction plan ("plan") for the fishery and has submitted that draft plan for approval by the Secretary of Commerce and then NMFS publication of rules to implement the plan.

5. The undersigned seafood companies have expressed concerns that the plan may unnecessarily result in the purchase and relinquishment of too many permits. This occurrence could result in too few fishermen and vessels operating and the potential to reduce the amount of salmon that could be purchased from fishermen by these companies.

6. To address these concerns, the SRA will revise the plan now under NMFS review to provide the following:

   The SRA will amend the plan to provide that under no circumstances will the SRA accept a bid that upon final implementation of the plan could result in fewer than 260 permits remaining in the fishery.

7. The NMFS has indicated it will consent to the proposed plan amendment to limit the number of permits that can be purchased and ultimately relinquished. However, it voiced a cautionary note that the plan is subject

to further review by legal counsel, the Office of Financial Management and Budget and others, which could cause further changes to the plan, including deletion of the proposed limit on the minimum number of permits that would remain in the fishery.

8. The SRA will maintain the position that limiting the number of permits to be purchased and relinquished under the amended plan to 260 is wholly consistent with the MSA, Section 312(b)(2) requirement to achieve the maximum sustained reduction in fishing capacity at the least cost.

9. The undersigned seafood companies agree to support passage of SB 255 and HB 365, as introduced, under the condition that the attached Letter of Intent, or a mutually acceptable revised version of it, is adopted and passed with the legislation by the Alaska Legislature

RE: SUPPORT SB 255, FINALIZE SOUTHEAST ALASKA SEINE BUYBACK

Dear Senators McGuire and Wielechowski,

The Petersburg Vessel Owners Association (PVOA) is a diverse group of 100 commercial fishermen and businesses operating primarily in Southeast Alaska. Our members provide millions of meals to the public annually by participating in a variety of fisheries statewide. Most PVOA members are salmon harvesters, and are also active sport, personal use, and subsistence fishermen who depend on sustainable and conservative management of Alaska's fishing resources to ensure healthy fisheries for the future.

PVOA supports the work of Southeast Alaska Seiners (SEAS) and both HB 365 and SB 255 which will provide the necessary vehicle to specify the route and parameters of the National Marine Fisheries Service (NMFS) loan that fishermen will repay with a 3% assessment. Passage of HB 365 will allow a vote to support that commitment to the assessment as well as support of the program.

Petersburg is one of the top ports in Alaska and the Nation for both pounds landed (#6 in Alaska, #26 in the Nation) and dollar value of landings (#7 in Alaska, #26 in the Nation) due in large part to salmon landings. The Southeast Alaska Seine fleet is a vital component of Petersburg's socio-economic well being.

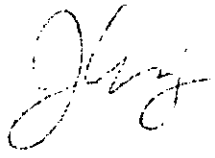
In 2009, there were approximately 70 southeast seine permits actively fished out of Petersburg (Petersburg listed as the mailing address). Each permit and vessel employs four crewmembers who contribute to the local economy and rely on income provided by salmon fishing. Fishing vessels, support businesses, and fishing families are sustained by salmon revenues that are essential to coastal economies. While Petersburg is the most

3809

active commercial fishing port in Southeast Alaska, not one of active permits will be extinguished in a mandatory manner as a result of SB 255.

Thank you for your time and attention to this important matter. If we can provide further information or answer any questions as you finalize the Southeast Alaska seine buyback, please feel free to contact us.

Sincerely,



Julianne Curry
Director

Re: Support for SB255

Dear Senators,

The United Fishermen of Alaska (UFA) supports passage of SB255/HB365.

The bill, while extremely timely and important to certain of our members, is nothing but a "housekeeping" bill that is needed as the last piece of work to finish off the SE fleet consolidation program for SEAS but will also set up a precedence and framework for any similar effort in the state of Alaska conducted at a later date. This legislation allows NMFS to confirm fish ticket/processor data to confirm that the assessment collected to pay back the federal government for the loan is correctly determined and allow for enforcement of those that don't pay the assessment. NMFS only has access to data for a specific fishery that has a federal loan program and not access to all salmon harvest data.

When UFA embraced the Legislative Salmon Task Force in 2001, we recognized that different regions require different solutions. Some groups wanted status quo. Other groups wanted market-oriented solutions. Others wanted to restructure their fishery, or basically re-limit limited entry. We want to acknowledge that many, probably most, of our state waters groups do not support a fleet consolidation program for their own region.

But when the Legislature embarked upon the Legislative Salmon Task Force, this was one of the major solutions that came out for each region to choose from. HB286, authored in 2002 by Drew Scalzi, was one of the resulting pieces of legislation. One of our groups, the Southeast Alaska Seiners Association (SEAS) chose to follow up on this and has already "permanently retired" around 20% of their consolidation target in 2008 with $3 million in NMFS grants that were authorized by the Alaska State Legislature.

Another piece of the pie here is HB484, passed in 2006 by the Alaska State Legislature that mandates a solution in the event of an "optimum number determination" in a court of law that causes retired permits to become reissued. HB484 allows that the Legislature "may" send the resulting funds back to the fleet consolidators, hence relieving fishermen of the uncertainty resulting from the "optimum number" issue.

In the case of SE seine fishery, the active fleet size has not exceeded the buydown goal of the buyback program since 2002. So this fleet consolidation is very unlikely to cost a single job or boat. The 3% assessment that these guys are paying is just an insurance policy for the fishermen (and processors) that there won't be a new "group" or company that will bring in some of the currently unused and dormant 140 permits. In fact there will be at least several dozen permits remaining on poor years and likely a dozen or so remaining even on good years.

UFA supports swift passage of this legislation, which is the wrap-up of the Legislative task force bill HB286 from 2002. It is now 2010 and it seems fitting that the Alaska State Legislature would be willing and able to support a "housekeeping" bill that brings to fruition a bill (nearly unanimous in passage in both the House and Senate) that was brought forth as a result of the Alaska State Legislative Task Force.

Thank you for your consideration of this legislation for one of our group members.

Sincerely

Mark Vinsel
Executive Director

Juneau, AK 99801-1182

RE: SUPPORT SB 255, FINALIZE SOUTHEAST ALASKA SEINE BUYBACK

Dear Representatives McGuire and Wielechowski,

I am writing on behalf of Cordova District Fishermen United (CDFU), a member organization representing over 300 commercial fishermen in Prince William Sound, including 60 seine fishermen, to request your support of SB255.

CDFU is in alliance with the Southeast Alaska Seiners (SEAS) on this bill, and believes the passage of both HB 365 and SB 255 will provide a relatively simple solution in specifying the route and parameters of the National Marine Fisheries Service (NMFS) loan that fishermen will repay with a 3% assessment.

While not directly related to present seine activity in Prince William Sound, the adoption of SB255 will provide a solid framework for any group within the State looking into practical solutions to stabilize their fishery.

We trust that you will see the merits in supporting this bill.

Sincerely,

Rochelle van den Broek
Executive Director

2 March 2010

The Honorable Lesil McGuire and Bill Wielechowski
Co-Chairs, Senate Resources Committee
Butrovich 205
Alaska State Capitol
Juneau, AK 99801-1182

Dear Senators McGuire and Wielechowski:

The Southeast Alaska Seiners Association (SEAS) fully supports SB 255 and would appreciate the opportunity to express such support before your Committee.

SEAS is a trade association of 127 member skippers (of 5 crew), who purse seine for salmon in Southeast Alaska, predominantly with 58 foot vessels. SEAS also has nearly 60 business members who support the fleet, consisting primarily of processors, fuel docks, grocery stores and marine suppliers, contractors, electronic suppliers, mechanics, shipyards and outfitters.

SB 255 Background

SEAS worked with the Congressional delegation to secure a $3 million grant that was spent in 2008, after being authorized to do so by the Alaska State Legislature, to retire 35 permits, or approximately 22% of our target permit reduction. The first part of our fleet consolidation was done under the supervision of the Commercial Fisheries Entry Commission (CFEC), the program was run by Elgee, Rehfeld, CPAs and we advertised throughout Southeast Alaska for a reverse auction. **These are the first ever Alaska state limited entry salmon permits retired under such a program.**

After the further repurchase of around 120-125 permits we expect to get to the 255-260 range of permits remaining available to fish. This time the fishermen are paying and the financing source is a National Marine Fisheries Service (NMFS) loan that fishermen will repay with a 3% assessment. A couple weeks into the 2010 legislative session the main NMFS Financial Services Division personnel came to Juneau to meet with the CFEC leadership as well as the state of Alaska in

☼ PO Box 23081, Juneau, AK 99802 ☼ 907-463-5030 ☼ Fax: 907-463-5083 ☼

order to prepare a bill that would work as the basic "closing document" on our loan.

SB 255 is exactly phrased and intently written with at least a dozen basic drafts prior to introduction. There is no fiscal note and should there be any concern to processors about extra paperwork, the processor can apply for compensation from the assessment. We do not believe at this time that the financial burden of adding a box to the fish ticket will cause any undue financial concern as this is already done in many Boroughs (such as Bristol Bay) and by enhancement taxation as well in the same section of the fish ticket.

This bill is the vehicle that specifies the route and parameters of this assessment and is necessary because this is not only Alaska's first, but it is likely that this is the first state water's fishery that has ever received a NMFS restructuring loan for fleet consolidation. According to NMFS, this bill cannot be changed in any fashion whatsoever - or our $20 million loan for Alaskan fishermen will fail.

When Southeast Alaska was rolled into the state's limited entry program in 1974, there was a **larger than average number of non-resident licenses due to the close proximity to Puget Sound and the Boldt Decision**, while not made until that very year, as well as the first shot at limited entry in 1969, made for a larger fleet than existed in the decade(s) prior to limited entry.

One other compelling reason seiners have sought out fleet consolidation is due to the amount of historical and traditional fishing area currently not available to access by the seine fleet. The Icy Strait corridor of about 100 miles of fishing shoreline was closed nearly simultaneously to the initiation of limited entry. Then in 1985, the 75 mile shoreline of Noyes Island and Dall Island outside of Prince of Wales Island was closed for most of the July fishery and has remained mostly closed by Treaty since then during the month of July. The fleet was bottled up in long line-ups (*boats idling their engines while waiting for hours for the opportunity to set the net and catch fish*) for much of the season save for the peak of some of our better runs. Certainly fuel savings and energy implications were there, but this was not our impetus.

Consequent to the major price crash in 1991 (12 cents per pound for pinks) after the introduction of Russian pink salmon into the Western world, another major price crash in 1996 (7-8 cents) and then again in 2002 (7-8 cents), SEAS decided to get rolling on a major fleet consolidation program. By 2003 and 2004 the fleet had been cut to around 225 boats from 360-375 during the prior decade. Most of these boats and crews no longer fishing were non-residents. **The fleet is a stable 225 average now with as little as 205 permits operated on poorer seasons while 240 is our high in recent years.**

With over 80% of the permits bought back in the first round having been owned by non-residents, the fleet has become even more 'Alaskan'. This trend is expected to continue in the next round, thereby resulting in strong and financially viable fishing families within Alaska.

SB 255 is an important bill because it is the final hurdle to clear in order to facilitate the NMFS Federal loan program so that it will work with Alaskan limited entry fisheries. While it is not a big bill, it is a huge bill for our members and is a necessary step towards stabilizing, modernizing, and maintaining our fishery here in Southeast Alaska.

Sincerely

Dan Castle
SEAS President

Juneau, AK 99801

Senator McGuire, Chair and Committee Members

RE: Support SB 255

Southeast Alaska Fishermen's Alliance (SEAFA) supports HB 365/SB 255. This is legislation that simply allows NMFS to confirm that all the assessment collected from the fishermen by the Processors for a buyback program using federal loan programs has been collected and paid to the federal government and allows for enforcement against those who have not paid.

This legislation would not allow NMFS to collect information for programs that don't have a federal buy-back assessment. This legislation would allow this tool to be used in the future if another buyback with federal funds occurs. The other thing we would point out is that any buyback program has been created occurred by a vote of the fleet.

We support the legislation as a housekeeping measure to correct an oversight to the legislation previously passed to set up associations to conduct buy-back programs.

Southeast Alaska Fishermen's Alliance is a multi-gear/multi-species non-profit membership organization representing our members involved in the salmon, crab, shrimp and longline fisheries of Southeast Alaska. We represent salmon gillnet, seine and troll fishermen.

Sincerely,

Kathy Hansen, Executive Director

Senator Donald Olson
Alaska State Senate
State Capitol, Room 508
Juneau, AK 99801-1182

Re: SB 255, Fish Processor Fees, Licenses, and Records

Dear Senator Olson:

Thank you for the opportunity to respond to your inquiry regarding SB 255, Fish Processor Fees, Licenses, and Records.

SB 255 is a continuation of a program established by the Alaska State Legislature in 2002 allowing Salmon Fishery Associations (AS 16.40.250) formed by fishermen for the purpose of promoting fleet consolidation and capacity reduction. That legislation (HB 286-2002) encourages the Commissioner of the Alaska Department of Fish and Game to assist fishermen in the formation of these associations among the various Alaska salmon fisheries. In 2006, the Alaska State Legislature modified AS 16.43.330 through HB 484 to allow reimbursement to Salmon Fishery Associations in the unlikely event the State of Alaska, through the Commercial Fisheries Entry Commission, issued more limited entry permits into a salmon fishery that has an outstanding loan for fleet consolidation and capacity reduction.

SB 255 is simply an accounting procedure modification to make the program operate more efficiently and allow the lender to monitor the capacity reduction loan repayment. It does not change the program established in 2002 in any way.

The Southeast Revitalization Association (SRA), the fishermen's association formed by the SE Alaska Salmon Purse Seine fleet under the 2002 legislation, is close to receiving federal funding in the form of a loan through the National Marine Fisheries Service (NMFS) to carry out the purposes of the Salmon Fishery Association legislation. NMFS will provide a long term loan to SRA to be paid back by Southeast salmon seine fishermen from future salmon harvests. NMFS requires a mechanism to be able to monitor the loan payback. SB 255 provides that mechanism.

SB 255 will allow NMFS access to confidential state records and reports through an exception to AS 16. 05. 815 (a) (Confidential nature of certain reports and records). This is not an unusual request since a dozen other exceptions have been granted in statute, including NMFS but for purposes of fishery management and enforcement. This legislation is necessary since it is the State of Alaska that maintains the fish ticket harvest data and fish processor annual reports. This exception will provide

assurance to NMFS that they are receiving the proper repayment of their loan. Similarly a requirement is added to AS 43.75.020(a), the Alaska Fisheries Business License, that the applicant in addition to other conditions, agrees to pay the fee assessment collected from the Southeast seine fleet to NMFS.

The original legislation in 2002 was supported by the Alaska fishing community and had overwhelming legislative support in both the House and Senate, as did the 2006 modification. This support stemmed from the fact that the program was initiated by fishermen for fishermen, it is a voluntary program (no one will be forced to sell their limited entry permit), the program requires a majority vote of all the fishermen to implement the loan agreement, the fishery association will have access to federal funds through the Magnuson-Stevens Fishery Conservation and Management Act, there is little State expense or administration, the State maintains all its responsibility to manage its fisheries in the future should conservation or economic conditions change, and the program has had a history of legislative support.

We have been pleased to work with the SRA on the establishment of their association and the success of their pilot program in 2008 which resulted in the buyback of 35 limited entry permits in the SE Alaska salmon purse seine fishery.

With the passage of SB 255 we look forward to a continuous working relationship with SRA and the Alaska fishing community.

Thank you for the opportunity to provide these comments.

Sincerely,

Frank Homan, Chairman
Peter Froehlich, Commissioner
Bruce Twomley, Commissioner

2/2010

CAPACITY REDUCTION PROGRAM FOR THE SOUTHEAST ALASKA PURSE SEINE SALMON FISHERY

By Southeast Revitalization Association

SUMMARY: State and federal legislation authorized this fishing capacity reduction program for the Southeast Alaska purse seine salmon fishery. The program will reduce fishing capacity by permanently relinquishing permits, promote economic efficiency, improve flexibility in the conservation and management of the fishery and obtain the maximum reduction in permits at the least cost.

The program is voluntary and only permit holders of the fishery are eligible to participate. Participating permit holders must abide by the terms and conditions of the program set forth in the Bid Agreement and, if their bid is accepted, a Relinquishment Contract ("Contract") with the Southeast Revitalization Association (SRA) and the Alaska Commercial Fisheries Entry Commission (CFEC). The aggregate of all Bid Agreements and Contracts signed by permit holders whose bids are accepted, will together with supporting rationale, constitute the Reduction Plan ("Plan") to be submitted to the Secretary of Commerce ("Secretary") for approval. Permit holders participating in the program will receive up to $23.5 million in exchange for relinquishing permits.

To obtain the maximum capacity reduction at the least cost, SRA will use reverse auction procedures to rank and determine which bids to accept. If bids are accepted, the SRA will accept the bid with the lowest dollar amount and successively accept each additional bid with the next lowest dollar amount until it either elects not to accept a bid, there are no more bids to accept, or acceptance of the last bid with the next lowest dollar amount would cause the total cost to exceed $23.5 million. The SRA may conduct one or more separate auctions before determining whether the number of bids it elects to accept is sufficient to submit a Plan.

Following SRA submission of the Plan and approval by the Secretary, National Marine Fisheries Service ("NMFS") will conduct a referendum to determine the willingness of the permit holders to repay a fishing capacity reduction loan ("loan") to finance the Plan. A majority vote of all permit holders in favor would bind all permit holders. NMFS will issue a $23.5 million, 40-year loan to be repaid by those permit holders who continue operations in the fishery after implementation of the Plan.

In the event the aggregate amount of all accepted bids is less than $23.5 million, the remaining loan funds would be available for reduction payments as part of a later SRA submitted Plan, subject to approval by the Secretary, and after a successful referendum by the permit holders.

1. **Statutory Background**: The authority for the SRA to conduct the program is Alaska Statute 16.40.250. The program was established under the Consolidated Appropriations Act of 2005 (Act) authorizing the (NMFS) to establish up to a $50 million loan to finance the program and appropriated $500,000 for the cost of the loan. That law was subsequently amended by Section 121 of the Magnuson-Stevens (MSA) Reauthorization Act of 2006 (Public Law 109-447) reducing the loan amount to no more than $25 million and clarifying the respective roles of NMFS and SRA relative to development and implementation of the program. The sum of $235,000 was later appropriated for the cost of guaranteeing the loan amount. The authority for making the loan is sections 1111 and 1112 of the Merchant Marine Act, 1936. NMFS will implement the industry fee system to repay the loan under section 312(d)(2) of the MSA.

2. ***Purpose***. The program will reduce fishing capacity by permanently relinquishing permits, promote economic efficiencies, improve flexibility in the conservation and management off the fishery and obtain the maximum reduction in permits at the least cost by establishing reverse auction bidding procedures under the Plan.

3. ***Definitions.*** Unless otherwise defined, the following terms have the following meanings for the purpose of this program.

Acceptance means SRA acceptance of a bid.

Act means section 209 of Title II of Division B of Public Law 108-447 as amended by section 121 of Public Law 109-447.

Bid means a bidder's irrevocable offer under the Bid Agreement to relinquish a permit.

Bid Agreement means the form identifying the eligible bidder, procedures for the completion and submission of a bid; requirements upon acceptance of a bid and resulting relinquishment of the permit, and any other necessary implementation.

Bid Amount means the dollar amount of each bid by which SRA determines in what order to rank and potentially accept bids.

Final Plan means the aggregate of all Bid Agreements, Commercial Fisheries Entry Commission ("CFEC") documents, Relinquishment Contracts, and supporting documents and rationale; submitted to the Secretary for approval.

Conditional Notice means the CFEC form that any permit holder must sign and agree to abide upon submission of a Bid Agreement.

Conditional Relinquishment means the CFEC form that any permit holder agreeing to relinquish a permit must sign and agree to abide by upon SRA acceptance of the bid.

Fishery means the commercial taking of salmon with purse gear within the Southeast Alaska administrative area as defined under Title 5 Alaska Administrative Code Section 33.100.

Permit means a valid entry permit issued by CFEC to operate in the fishery.

Permit Holder means an individual at the time of bidding is the holder of record of a permit.

Relinquishment Contract means the contract that any permit holder agreeing to relinquish a permit pursuant to Alaska Statute (A.S. 16.43.150(i) must sign and agree to abide by upon acceptance of the bid, and before payment of the bid amount.

Secretary means the Secretary of Commerce or a designee.

Southeast Revitalization Association (SRA) is a qualified fishery association authorized to develop and implement this capacity reduction program under Alaska Statute 16.40.250 and federal law.

4. Eligibility and Application of permit holders

(a) Notification. A copy of the Bid Agreement, CFEC Conditional Notice and Conditional Relinquishment forms, and the Contract shall be mailed to each permit holder.

(b) Application. Any permit holder may apply to participate in the program, by submitting a fully completed and executed, Bid Agreement, including the necessary CFEC forms and the Contract.

5. **Withdrawal:** By submitting a completed and executed Bid Agreement, the person makes an irrevocable offer to relinquish a permit. No person, once having submitted the Bid Agreement, is entitled to withdraw or in any way amend the Bid Agreement.

6. Bid—(i) Binding agreement. A submitted Bid Agreement shall be an irrevocable offer to relinquish the permit for the bid amount, contingent on such offer being accepted by SRA. A bid that is submitted by the permit holder, but is not accepted by SRA, shall be deemed terminated and both the permit holder and SRA shall have no further obligation with respect to Bid Agreement.

> ***(ii)*** **Bid Content**. The submitted Bid Agreement shall include the following information: name, address, telephone number and (if available) electronic mail address of the submitting permit holder; permit number and whether any authorized party holds a security interest in the permit.

(iii) ***Bid submission.*** Any permit holder may submit a Bid Agreement. If a permit holder holds a second permit, such permit holder may, but is not required to submit a Bid Agreement for such second permit. Each application must be submitted to the SRA, c/o Elgee, Rehfeld, Mertz, LLC, Professional Plaza Building B, 9309 Glacier Highway, Suite B-200, Juneau, AK 99801.

(iv) **Validity of Bid.** SRA in consultation with CFEC shall examine each Bid Agreement for consistency and the necessary elements. SRA shall notify the permit holder if the Bid Agreement is non-conforming. In such cases, the permit holder may submit a revised, conforming Bid Agreement if within the prescribed period.

7. Warranty. By submitting a Bid Agreement, the permit holder warrants and represents that the permit holder has read and understands the terms of the Bid Agreement, Contract, CFEC forms, and has had the opportunity to seek independent legal counsel regarding such documents and the consequences of submitting the Bid Agreement.

8. Bids—(i) Ranking. *The* SRA shall rank bids by using a reverse auction in which the SRA ranks the bid with the lowest dollar amount and successively ranks each additional bid with the next lowest dollar amount until there are no more bids or the ranking of the next lowest bid would cause the total program cost to exceed $23.5 million.

(ii) Acceptance and Post-acceptance transfers. Upon expiration of the bid closing date the SRA will determine whether the number of ranked bids it is willing to accept is sufficient to achieve a substantive reduction in harvest capacity and increased economic efficiencies for those permit holders remaining in the fishery. If the SRA makes such a determination and thereafter accepts bids, SRA will send *CFEC* the Conditional Notice form restricting transfer of the permit to any person whose bid was accepted.

9. Submission of Plan, including repayment. The aggregate of all Bid Agreements, the CFEC forms and Contracts will, together with supporting documents and rationale, constitute the Plan to be submitted to NMFS for final approval on behalf of the Secretary. The Plan shall identify as the proposed capacity reduction, the permits identified in the Bid Agreements.

10. **Selection of fishing capacity to be removed by Plan.** The fishing capacity removed under the Plan will be the permits voluntarily offered by permit holders and accepted by SRA up to an aggregate amount of $23.5 million.

11. Approval of the Plan. The criteria for NMFS, on behalf of the Secretary, to approve any Plan must include a finding by the Administrator of NMFS that the Plan is consistent with the Act and MSA, and that it will result in the maximum reduction in permits and fishing capacity at the least cost and in the minimum amount of time.

12. Referendum. NMFS will conduct a referendum to determine the permit holder's willingness to repay a fishing capacity reduction loan to purchase the permits identified in the Plan. A successful referendum by a majority of the permit holders will bind all parties and complete the reduction process.

13. Reduction Payments. Within 60 days of a successful referendum and CFEC receipt of the Contract, SRA through the Secretary will tender the accepted bid amount.

14. Later Pan The SRA may accept a total number of bids in an aggregate amount less than $23.5 million. If this occurs, any remaining funds would be available for reduction payments as part of a later Plan.

15. Reduction Loan —(i) Term. As authorized by the Act, the capacity Reduction Loan ("Loan") shall be amortized over a forty (40) year term. The Loan's original principal amount may not exceed $23.5 million, but may be less if the ultimate reduction cost is less. NMFS has promulgated framework regulations generally applicable to all fishing capacity reduction programs and the Loan shall be subject to the provisions of these regulations.

16. Loan Repayment Permit holders operating in the fishery shall be obligated to pay the fee in accordance with the regulations. Permit holders acknowledge that in the event payments made under the Plan are insufficient to pay the actual Loan, the term of the repayment shall be extended by NMFS until the Loan is paid in full.

> **(i) Interest.** The Loan's interest rate will be the U.S. Treasury's cost of borrowing equivalent maturity funds plus 2 percent. NMFS will determine the Loan's initial interest rate when NMFS borrows from the U.S. Treasury the funds with which to disburse the reduction payments. The initial interest rate will change to a final interest rate at the end of the Federal fiscal year in which NMFS borrows the money from the U.S. Treasury. The final interest rate will be 2 percent plus a weighted average, throughout the fiscal year, of the U.S. Treasury's cost of borrowing equivalent maturity funds. The final interest rate will be fixed, and will not vary over the remainder of the reduction loan's 40-year term. The Loan will be subject to a level debt amortization. There is no prepayment penalty.

(ii) Fees. The Loan shall be repaid by fees collected from the remaining permit holders operating in the fishery.

(A) The fee will be expressed as a percentage of the ex-vessel price of all salmon harvested and landed in the fishery. For example, if the fee is 3% and the ex-vessel weighted average round price is $0.50, then the fee per pound of salmon will equal to $0.015 per pound.

(B) Fees must be assessed and collected on all salmon harvested in the fishery. Although the fee could be up to 3 percent of the ex-vessel price of all post-reduction landings, the fee will be less than 3 percent if NMFS projects that a lesser rate can amortize the Loan over the 40-year term.

(C) It is possible that the fishery may not open during some years. Consequently, the fishery will not produce fee revenue with which to service the Loan during these years. However, interest will continue to accrue on the principal balance. When this happens, if the fee is not already at the maximum 3 percent, NMFS will increase the fee to the maximum 3 percent, apply all subsequent fee revenue first to the payment of accrued interest, and continue the maximum fee rates until the principal and interest payments become current. Once all principal and interest payments are current, NMFS will make a determination about adjusting the fee rate.

(D) Collection. The permit holder or the person who purchases and processes the salmon landed in the fishery shall be responsible for collecting and submitting the fees to NMFS.

(E) Record keeping and Reporting. The permit holder or the person who purchases and processes the salmon landed in the fishery shall be responsible for compliance with the applicable record keeping and reporting requirements.

17. Enforcement/Specific Performance. The parties to the Contract have agreed that the opportunity to develop and submit a capacity reduction program for the fishery under the terms of the Act is both unique and finite. The failure of a permit holder whose bid was accepted to perform the obligations under the Contract will result in irreparable damage to the SRA and the permit holders upon submittal of the Plan to the Secretary for approval. Accordingly, the parties to the Contract expressly acknowledge that money damages are an inadequate means of redress and agree that upon failure of the permit holder to fulfill his obligations under the Contract that specific performance of those obligations may be obtained by suit in equity brought by the SRA in any court of competent jurisdiction without obligation to arbitrate such action.

8/2008

RESULTS OF PILOT PROJECT

SOUTHEAST REVITALIZATION ASSOCIATION

FLEET CONSOLIDATION PROGRAM FOR THE SOUTHEAST ALASKA PURSE SEINE SALMON FISHERY

SUMMARY:

The Southeast Revitalization Association ("SRA") a qualified fishery association under Alaska state law, established and implemented a fleet consolidation program for the Southeast Alaska purse seine salmon fishery.[1] The program utilized a reverse auction system to achieve the greatest consolidation or permit reduction with the available $2,872,746 in federal grant funding[2]. The program allowed for the purchase and relinquishment of 35 permits or 8.4% of all permits at an average cost of $82,020.

STATUTORY AND REGULATORY AUTHORITY:

The statutory authority for SRA to conduct the program is Alaska Statute ("AS") 16.40.250. The program was financed through Pacific Coast Salmon Recovery Fund (PCSRF) dollars designated to SRA under the Consolidated Appropriations Act of 2006 (P.L. 109-108) and related Commerce, Justice, State Conference Report. The authority for relinquishing limited entry fishing permits is AS 16.43.150(1).

RATIONALE:

The Alaska Legislature enacted legislation in 1973 establishing a system for limiting the number of individuals participating in commercial salmon fisheries. The Commercial Fisheries Entry Commission ("CFEC") was also created to implement and administer the "limited entry" system. CFEC determined that 415 was the optimal number of permits (and vessels) for the fishery. For the period 1992-2001 an average of 364 or almost 90% of the permits were fished each

---

[1] A potential second and separate consolidation program has also been enacted for the fishery. Under this program permit holders would receive up to a $23.5 million in exchange for relinquishing permits. Following submission of a consolidation plan by SRA and approval by the Secretary of Commerce, the National Marine Fisheries Service (NMFS) would conduct a referendum to determine the willingness of permit holders remaining in the fishery to repay the loan to effect the second program. A majority vote of all permit holders in favor would bind all remaining permit holders to repay the loan. NMFS would issue a 40-year loan and establish a fee system for repayment of the loan not to exceed three percent (3.0%) of the ex-vessel of all salmon harvested in the fishery.

[2] Initially the SRA was scheduled to receive an additional $1 million in PCSRF grant funding. Unfortunately the State of Alaska and ADF&G reallocated the dollars to Southeast salmon processors to promote canned pink salmon sales.

year. By 2003 participation had fallen to only 210 and in 2007 active participation was no greater than 230.

The dramatic decline was not attributable to resource depletion or excessive vessel capacity, but rather to the dramatic reduction in ex-vessel salmon prices caused by competition from imported farm salmon[3]. Historically, 83% of the Southeast seine harvest is pink salmon. In 1988 the ex-vessel price of pink salmon reached $.88 per pound and then dropped precipitously. For the period 1992-2001 the average price fell to only $.19 per pound. The 2002 price plummeted to $.10 and in 2003 to a mere $.08. Ex-vessel prices rebounded slightly in 2007, but are still far below levels necessary to ensure an economically viable fishery.

The fall in salmon prices, higher operating costs and related consolidation in the processing sector, triggered a call for commensurate consolidation in the Southeast seine fleet. This was a difficult decision. However, it was almost universally recognized that if everyone stays in the fishery, no one will be profitable and the fishery will continue to teeter on economic collapse. Responding to this need, the Legislature under AS 16.40.250 authorized the formation of qualified salmon fishery associations for the purpose of reducing or consolidating a salmon fishery for which CFEC has issued limited entry permits.

GOALS:

The program sought to 1) reduce fishing capacity by permanently revoking a substantial number of permits, 2) promote economic efficiency, 3) improve flexibility in the conservation and management of the fishery and 4) obtain the maximum reduction in permits at the least cost.

DESIGN:

The program was voluntary and all permit holders of the fishery were eligible to participate. To maximize consolidation, the SRA designed a consolidation plan utilizing reverse auction bidding procedures. The SRA then consulted with CFEC to establish program requirements relating to notification, bidding procedures, method of payment and administration. The SRA mailed the consolidation plan to all permit holders on April 7, 2008 and published notice of the plan in various Southeast newspapers.

[3] In 1992 imports of farmed salmon began to seriously impact the U.S. market and ex-vessel prices paid Alaska salmon fishermen. Encouraged by U.S. free trade policy, these imports ultimately flooded the U.S. and then Japanese markets. Today farmed salmon accounts for over 70% of the worldwide market while Alaska salmon accounts for less than 15% of the market.

ADMINISTRATION:

The program was administered by the SRA Manager and Board of Directors. The SRA also utilized the services of the Southeast Alaska Seiners Association ("SEAS") and the Purse Seine Vessel Owners Association ("PSVOA"). Program administration was conducted consistent with the Statement of Work filed with the Alaska Department of Fish & Game ("ADF&G") as part of the PCSRF grant process. The SRA retained the CPA firm of Elgee, Rehfeld, Mertz, LLC, in Juneau, Alaska to receive and log bid applications. The SRA Manager processed the accepted bids and handled the logistics of permit purchasers and ultimate relinquishment of permits by CFEC. Decisions regarding the maximum purchase price and acceptance of a bid were made by the SRA Board. Legal consultation was provided by PSVOA and CFEC.

ADMINISTRATIVE COSTS:

The ADF&G Statement of Work proposed that the SRA receive $42,500 to administer the program. [4] However, upon the withdrawal of bids and subsequent acceptance of higher bids the SRA elected to forego all administrative fees and expenses to maximize the number of permits purchased.

IMPLEMENTATION:

Licenses Available:

The number of permits eligible for 2008 renewal was 415.

Number of Bids Submitted and Accepted:

82 bids were submitted for the cumulative amount of $9,642,994. Individual bid amounts ranged from $44,000 to $700,000. The SRA Board initially accepted 35 bids for a cumulative amount of $2,798,115. Certain accepted bidders later withdrew their bid and upon withdrawal the SRA Board selected the next highest bid amount. The SRA ultimately purchased 35 permits, but for the increased cumulative amount of $2,870,355[5]. The accepted bid amounts ranged from $55,000 to $94,950.

Number of Permits Relinquished:

The program purchased a total of 35 permits or 8.4 % of all permits. These permits were then relinquished and revoked by CFEC pursuant to the terms and conditions of a "Relinquishment Contract" executed by the accepted bidders.

---

[4] ADF&G received $86,183 to administer its portion of the program.

[5] The PCSRF is a reimbursement only grant program. That is, SRA was first required to expend funds before seeking reimbursement. To initiate the program, the SRA borrowed $1 4 million from the Seine Vessels' Reserve, a for profit affiliate of PSVOA. This loan was made without interest and was subsequently repaid.

Identification of Accepted Bidders:
An alphabetical list of the 35 bidders, including the permit number and state of residency follows:

[6] Eighty percent (80%) of the accepted bidders (and permits relinquished) were held by non-Alaskan residents.

REVENUE & EXPENDITURES

The following is a summary of SRA program revenue and expenditures as of August 1, 2008:

SRA BALANCE SHEET

REVENUE		
PCSRF GRANT FUNDS	$	2,872,746
PSVOS/SEAS LOAN[7]		11,714
TOTAL		**2,884,460**
EXPENDITURES		
PERMIT PURCHASES	$	2,870,355
ELGEE REHFELD MERTZ		3,447
PUBLICATIONS[8]		1,789
SMS, INC[9]		3,423
EXPRESS MAIL		630
TRAVEL		3,966
PHONE		485
BANK FEES		365
TOTAL		**2,884,460**

[7] PSVOA and SEAS jointly loaned the SRA this amount to allow the entire grant to be applied toward the purchase of permits.

[8] The SRA published notice of the program in the Juneau Empire, Sitka Sentinel, Petersburg Pilot, Wrangell Sentinel and Ketchikan Daily.

[9] SRA contracted with SMS, Inc, a for profit affiliate of PSVOA, to coordinate mailings to permit holders and payments to accepted bidders.

(3) rearing and sale of ornamental finfish for aquariums or ornamental ponds provided that the fish are not reared in or released into water of the state.

(c) In this section "ornamental finfish" means fish commonly known as "tropical fish," "aquarium fish," or "goldfish," that are imported, cultured, or sold in the state customarily for viewing in aquaria or for raising in artificial systems, and not customarily used for sport fishing or human consumption purposes. (§ 2 ch 91 SLA 1990)

Cross references. — For legislative findings in connection with the enactment of this section, see § 1, ch. 91, SLA 1990 in the Temporary and Special Acts.

Article 4. Fishery Associations.

Section
240. Regional dive fishery development associations
250. Salmon fishery associations

Sec. 16.40.240. Regional dive fishery development associations. (a) The commissioner shall assist in and encourage the formation of qualified regional dive fishery development associations for the purpose of developing dive fisheries in administrative areas of the state in which dive fisheries exist. A regional dive fishery development association is qualified if the commissioner determines that the regional association

(1) is incorporated as a nonprofit corporation under AS 10.20;

(2) represents commercial fishermen who participate in each dive fishery in the region; and

(3) possesses a board of directors that

(A) is representative of commercial dive fishermen who fish in each of the significant commercial dive fishing areas in the administrative area;

(B) has a member who is representative of fish processors who process dive fishery resources in the administrative area; and

(C) has a member who is representative of municipalities in the administrative area.

(b) In this section, "administrative area" has the meaning given in AS 43.76.210. (§ 1 ch 90 SLA 1997)

Sec. 16.40.250. Salmon fishery associations. The commissioner may assist in and encourage the formation of qualified salmon fishery associations for the purpose of promoting the consolidation of the fishing fleet in a salmon fishery for which the Alaska Commercial Fisheries Entry Commission has issued commercial fishing entry permits under AS 16.43. A salmon fishery association is qualified if the commissioner determines that the regional association

(1) is incorporated as a nonprofit corporation under AS 10.20;

(2) is comprised of interim-use permit and entry permit holders in the salmon fishery for which the association is established; and

(3) has a board of directors that is comprised of interim-use permit and entry permit holders in the salmon fishery. (§ 1 ch 134 SLA 2002)

Cross references. — For reimbursement of expenses of fleet reduction programs, see AS 16.43.330(c).

Notes:

A "*" following the year field indicates data are preliminary.
Selected data fields are represented by "." when fewer than four people participated in a fishery.
Selected data fields are represented by "0" when no activity has occurred in a fishery (i.e.,closure).
Gross earnings are estimated using an average annual ex-vessel price per area, species, and gear type.
These data are aggregated by type of permit fished, and thus contain both targeted and incidentally landed species.
Data includes only commercial catch landed on valid permits.
Data associated with test fishing, illegal landings, derbies, educational permits, or unmatchable permits are excluded.

Average Permit Price Notes:
--- indicates that there were no monetary transfers for this fishery.
... indicates confidential information because fewer than four surveys exist.

SB 267

ALASKA STATE LEGISLATURE

SENATOR LESIL McGUIRE
SENATOR BILL WIELECHOWSKI
Co-Chairs, Senate Resources Committee

MEMORANDUM

Date: February 17, 2010

To: Kirsten Waid, Senate Secretary

From: Senator Lesil McGuire, Co-Chair
Senator Bill Wielechowski, Co-Chair
Senate Resources Committee

Re: Senate Resources Committee Schedule

Committee Schedule
Senate Resources
For the week of February 15-19

Unless otherwise noted, all meetings will be held in the Butrovich, Rm 205 @ 3:30 p.m.

Wednesday, February 17th

+ * SB 267 – Oil and Gas Production Tax
+ = *Bills Previously Heard/Scheduled*

Thursday, February 18th

+ * SB 220: Energy Efficiency/Alternative Energy
+ = *Bills Previously Heard/Scheduled*

* First Hearing in First Committee of Referral
\+ Teleconferenced
= Bill was previously Heard/Scheduled

Technical Aspects of SB 267 (Version A)

Dan E. Dickinson, CPA

Senate Resources Committee
Feb 17, 2010

DAN E. DICKINSON CPA

6 Changes in SB 267

1. Change progressivity from .4% to .2% per dollar
2. 30% credit for well work
3. Tax rate tied to Resident Hire
4. Interest not due on retroactive reg changes prior to implementation
5. Interest rate is lower of fed funds +2 or 11%
6. Restore 3 year statute of limitations

2.17.2010

Structure of SB 267

3. Tax rate tied to Resident Hire
4. Interest not due on retroactive reg changes prior to implementation
5. Interest rate is lower of fed funds +2 or 11%
6. Restore 3 year statute of limitations

2.17.2010

DAN E. DICKINSON CPA

What is Progressivity?

- Base Production Tax rate is 25% (AS 43.55.011(e)(1)) of net value or "PTV"
- Combined Progressivity Tax (on same PTV base) can range from 0 to 50%
- Sum= Total tax rate can range from 25% to 75%
- Progressivity rate is calculated as net value of all the (oil and gas produced less royalty)/taxable barrels (boe)= PTV/per barrel
- No progressivity charge when PTV/bbl<$30,
- Current Law:
- For each dollar above $30, .4% added to tax rate
- At PTV/bbl of $92.5, rate drops to .1% for each dollar

SB 267 (Section 11): drop rate to .2%, increase bend-over point to $155

2.17.2010

Progressivity Effect (FY 2008)

- FY 2008 Estimate (year of high prices)
- 25% Base tax – $4.2 billion
- Progressivity – $3.2 billion
- (less credits of $.5 billion)

- Compare to FY 2008
- Royalties (2.4 to GF, .8 to PF) $3.2 billion
- Oil and Gas Income Taxes $.6 billion
- Oil and Gas Property Taxes (State and Local) $.4 billion

Source: State of Alaska DOR Revenue Sources Book (Fall 2008)

2.17.2010

Progressivity in AS 43.55.011(g) vs. Personal Income Tax

- Under AS 43.55.011(g) the progressivity rate generated at high net values (PTVs)/bbl is applied to all the net value.
- ((PTV/bbl-30)* .004)+ 25%* PTV= Tax
- Under federal personal income tax rules:

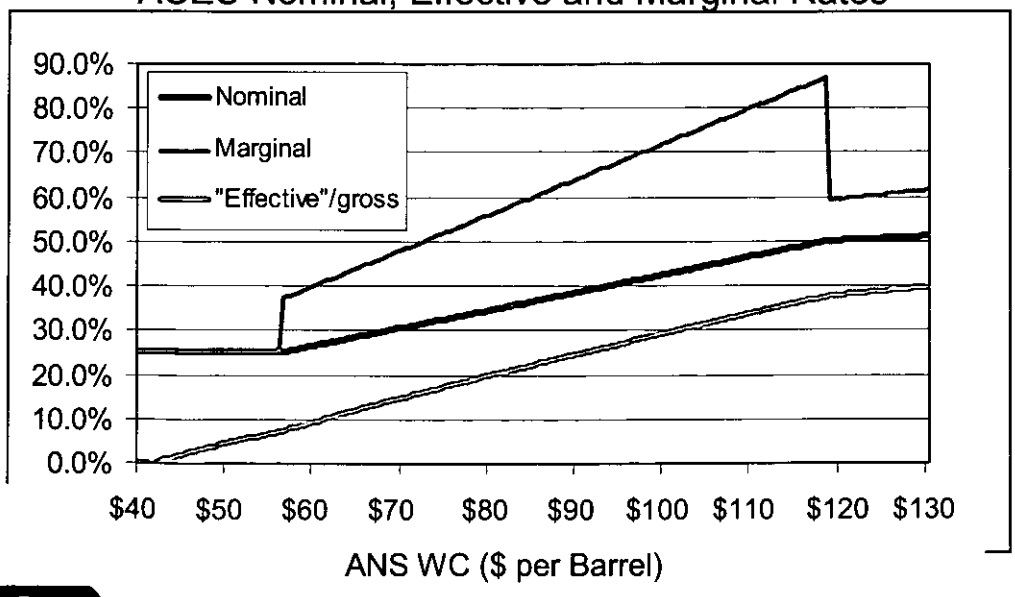
Schedule X—If your filing status is Single

If your taxable income is:		The tax is:	
Over—	But not over—		of the amount over—
$0	$8,350	..... 10%	$0
8,350	33,950	$835.00 + 15%	8,350
33,950	82,250	4,675.00 + 25%	33,950
82,250	171,550	16,750.00 + 28%	82,250
171,550	372,950	41,754.00 + 33%	171,550
372,950	.....	108,216.00 + 35%	372,950

2.17.2010

Production Tax: Progressivity + 25%

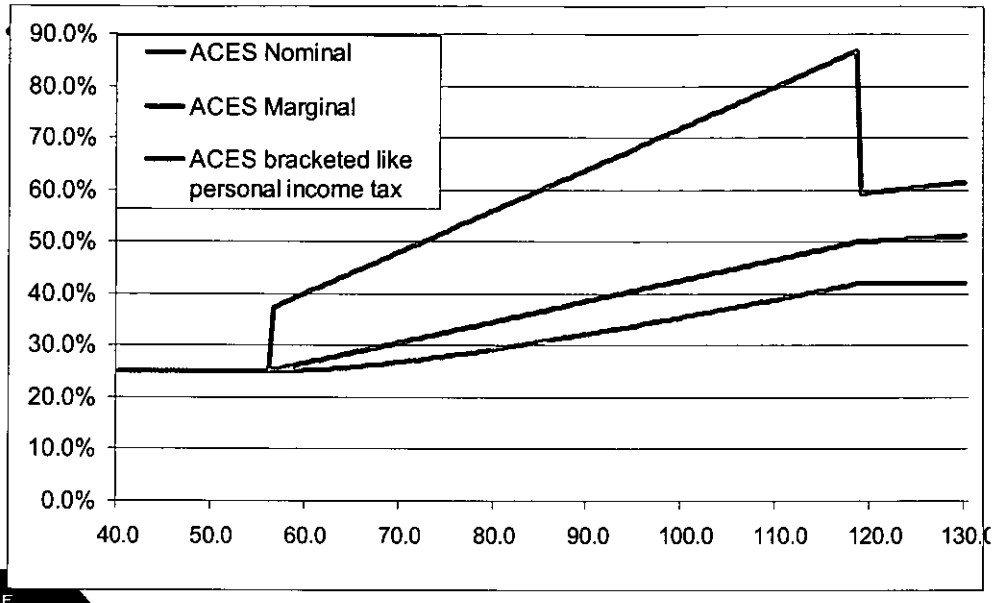
- Reproduction of Figure G from DOR January 14 Report
- "ACES Nominal, Effective and Marginal Rates"



2.17.2010

Production Tax: Progressivity + 25%

- What if the progressivity bracket was like personal federal income tax brackets.



2.17.2010

Crossing the Progressivity/Bracket Threshold

25.4% bigher bracket starts when net value (PTV) passes $30 a barrel

	30	31	Difference
Personal federal income tax progressivity			
PTV	$ 30.00	$30.00 + $ 1.00 = $31.00	$ 1.00
Tax Rate	25.0%	25.0% 25.4% 25.4%	
Tax	$ 7.500	$7.500 + $ 0.254 = $7.754	$ 0.254
Marginal Tax Rate:			25.4%
AS 43.55.011(g) Progressivity			
PTV	$ 30.00	$30.00 + $ 1.00 = $31.00	$ 1.00
Tax Rate	25.0%	25.4% 25.4% 25.4%	
Tax	$ 7.500	$7.620 + $ 0.254 = $7.874	$ 0.374
Marginal Tax Rate:			37%
Difference	$ -	$ 0.12 $ 0.12	$ 0.12

2.17.2010

Production Tax: Progressivity + 25%

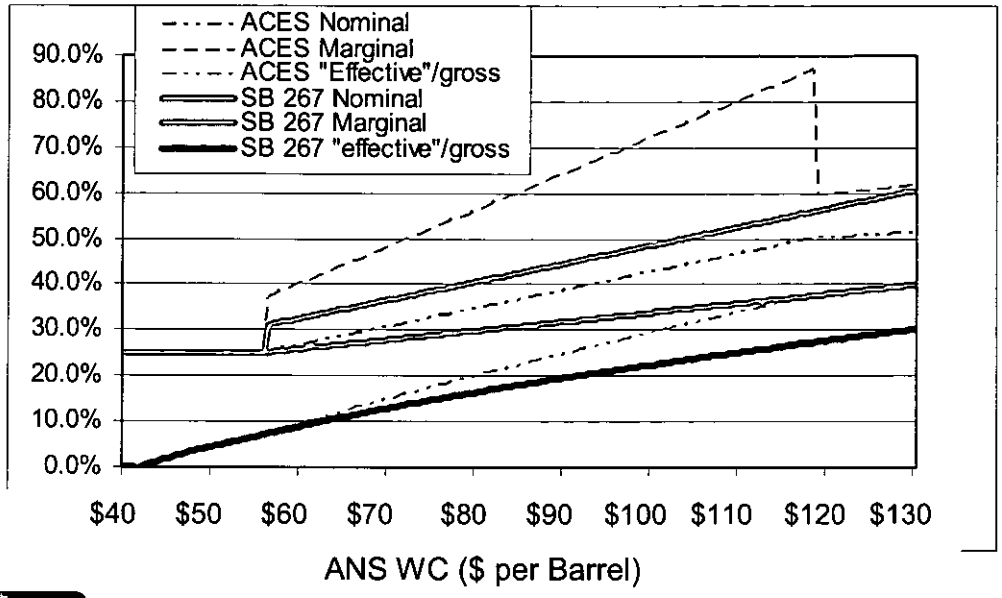
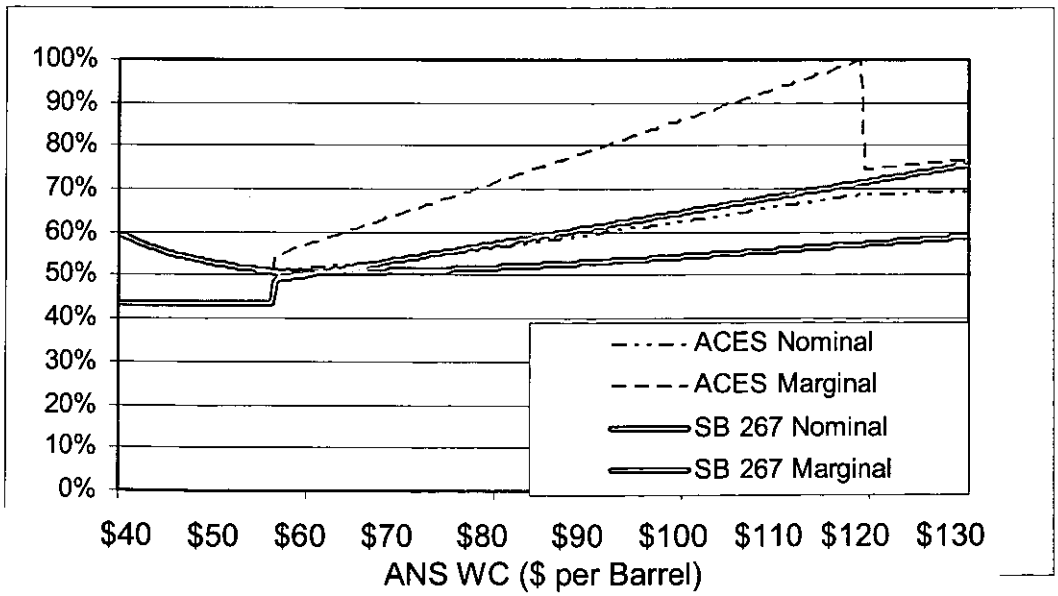
Production Tax: Progressivity + 25%

- Add SB 267 Nominal, Marginal and "effective"/gross"



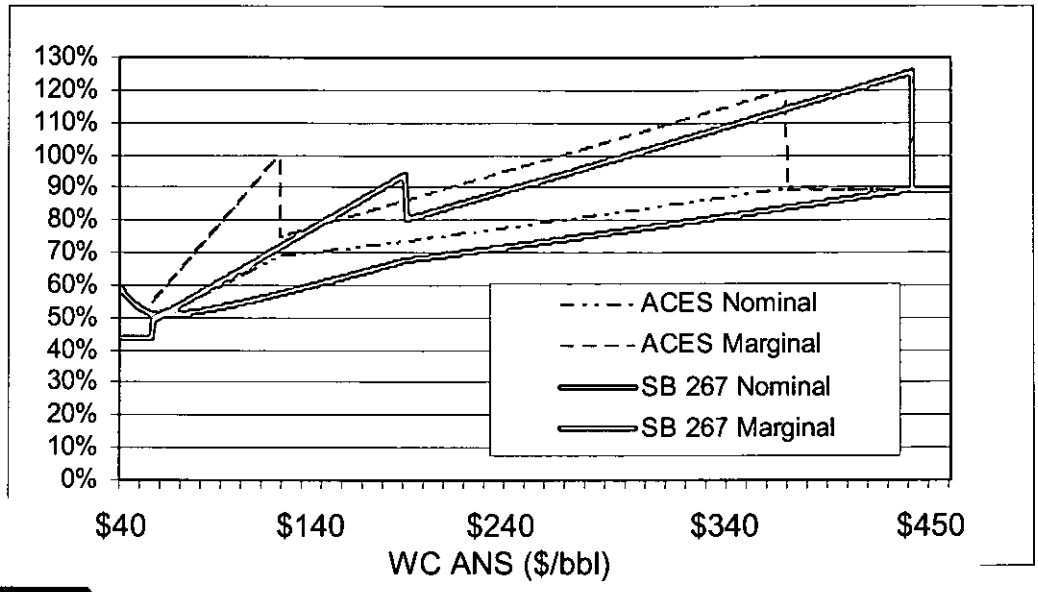
2.17.2010

Total State of Alaska Take (Prod/Prop/Inc Tax + Royalty)



2.17.2010

Total State of Alaska Take (Prod/Prop/Inc Tax + Royalty)



2.17.2010

6 Changes in SB 267

1. Change progressivity from .4% to .2% per dollar
2. 30% credit for well work
3. Tax rate tied to Resident Hire
4. Interest not due on retroactive reg changes prior to implementation
5. Interest rate is lower of fed funds +2 or 11%
6. Restore 3 year statute of limitations

2.17.2010

Investment Credits

- Section 17 adds 30% well work credit to investment credits
- Under Current Law –
- 30% Credit for exploration wells (AS 43.55.025)
- 40% Credit for seismic work outside of existing unit,
  - or exploration wells 25 miles from existing unit, and
  - 3 miles from any prior well (or with certification from DNR that it is for a new target in the Cook Inlet) (AS 43.55.025)
- 20% Credit for any capital investment (AS 43.55.023(a))
- No change to Exploration Credits AS 43.55.025 under this bill

2.17.2010

Compare with Other Well Work Proposals

- How does this compare with Governor's "Well Credits" proposal

-Both create a 30% credit for well work

-Both include pertinent capex and opex

-CS should be effective on the first day of a month (Gov's bill is July 1, 2010) year.

- Differences:
- CS for HB 308 places the credit among the .023 "Tax Credits for certain losses and expenditures" Governor's bill changes name of .025 from "Exploration" to "Exploration and Development" and places it there.
- Different definition of well related expense.
- (Other changes to AS 43.55.025 in Gov's bill)

2.17.2010

Differences between AS .023 and .025

AS 43.55.023 – Tax credits for certain loses and expenditures	AS 43.55.025 – Alternative tax credit for oil and gas exploration
AS 43.55.023 deals with capital costs in (a), lease expenditures in (b), and both in sections (c), (d), (e), (g), (h) and (j). (note – (f) repealed and (i) and (k) deal only with capital).	AS 43.55.025 deals only with exploration costs –by explorers. Administration suggests totally re-writing and re-titling to cover this work by explorers and producers.
21 specific exclusions from lease expenditures listed in AS 43.55.165 (e) (1) – (21) including exclusion of 30 cents a barrel from any capital cost, and certain transactions with affiliates or related parties.	Prohibitions summed up in one paragraph (AS 43.55.025(b)(3)
Restrictions in AS 43.55.011(m) ("credits clawback") do not apply.	AS 43.55.011(m) ("credits clawback") does apply.

Question: Are we certain that the restructuring of AS 43.55.025 will not result in inadvertent changes to the rules?

2.17.2010

Definitions of well work compared

SB 267 proposed AS 43.55.023(m)(3)	Governor's Language proposed AS 43.55.025(b) (3) and (4)
"Well-related expenditures" means	Development well expenditures are for
A lease expenditure	Goods, services and rentals of personal property reasonable required for
related to a well	
and includes a lease expenditure for the purposes of sidetracking, well deepening, well recompletion, well workover,	Re-drilling, casing , cementing or logging, Completing, workover operations or other operations intended to increase or enhance well production
	From a known productive pool;
an injection well and well related seismic work and	And the well is not a service well [injector] or stratigraphic test well.
an intangible drilling and development cost authorized under 26 USC (IRC) as amended, and 26 CFR 1.612-4, regardless of the elections make under 26 USC 263(C0 as amended	
up to the flange connecting the well head to the well line.	

2.17.2010

6 Changes in SB 267

1. Change progressivity from .4% to .2% per dollar
2. 30% credit for well work
3. Tax rate tied to Resident Hire
4. Interest not due on retroactive reg changes prior to implementation
5. Interest rate is lower of fed funds +2 or 11%
6. Restore 3 year statute of limitations

2.17.2010

Rate tied to Resident Hire

- General Approach – (section 15)
- Base Tax rate (in AS 43.55.011(e)) is 25%, and Taxpayers makes monthly payments at that rate
- Any direct labor that is a lease expenditure is accounted for as Resident or non-Resident.
- At the end of the year total hours of labor are used to calculate a ratio for the year: or resident hire %
- New effective rate is calculated:
  - 20% for a 100% Resident Hire ratio up to
  - 25% (current law) for an 80% Resident Hire ratio.
- Taxpayer can then apply for a rebate of the difference for the prior year.
- Note: effective date should be beginning of a year.

2.17.2010

Rates in CS HB 308 proposed 43.055.022 (b)

For Resident Hire Ratios		Rebate of amount under AS 43.55.011(e)(1)	Tax Rate in AS 43.55.011(e)(1)	Rebate as % of PTV	Effective Tax Rate

2.17.2010

Resident Hire -- What will it cost per job?

- "In an extreme example, [according to DOR] hiring just one Alaskan could mean $30 million in tax savings" (Anchorage Daily News 2/11/2010, backpage (A-14))

All figures in Millions of Dollars:	
FY2008 Estimated PTV ($millions)	$ 16,837.7
FY2009 Estimated PTV ($millions)	9,313.1
Average for CY 2009	13,075.4
Assumption: One company is responsible for half	6,537.7
AS 43.55.011(e)(1) taxes at 25%	1,634.4
If one incremental employee (hour) moves taxpayer by one bracket in between 80 - 97.5% then effect is (.5%)	**32.7**

Function of "brackets rate applied to base"
Opposite effect also occurs.

2.17.2010

Resident Hire – What will it cost per job?

Opposite effect also occurs.
Assumption: Company has 6,500 employees and contractors at the statewide average of 70% Residents
1. When Below 70%

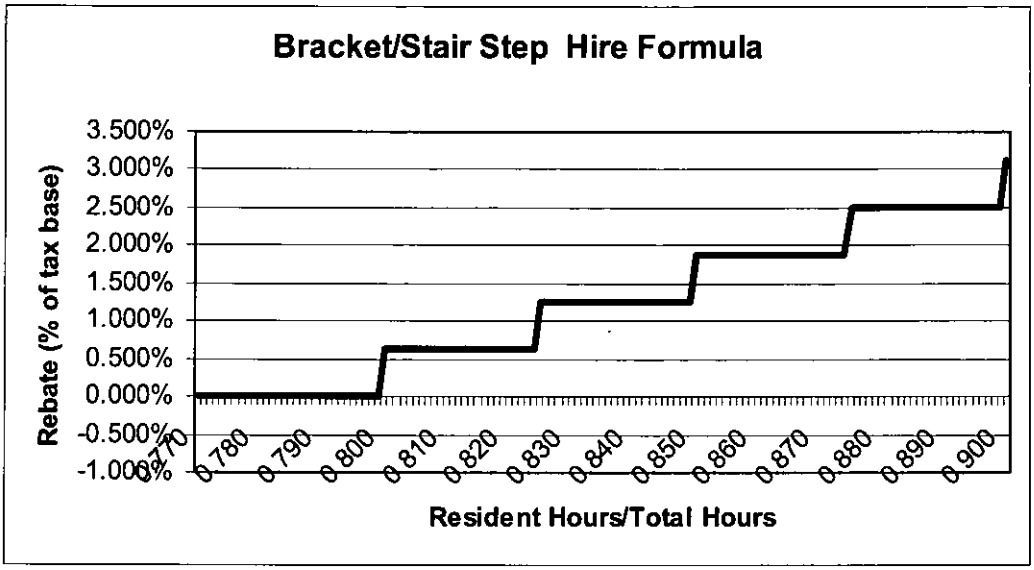
	Total Workers	Resident Workers	Ratio	Tax rate
year one	6,500	4,550	70.00%	25.0%
add		649		
year two	6,500	5,199	79.98%	25.0%

	Total Worker Hours	Resident Worker Hours	Ratio	Tax rate
year one	13,000,000	9,100,000	70.00%	25.0%
add		1,298,000		
year two	13,000,000	10,398,000	79.98%	25.0%

"need to be at 80% to start the conversation"

2.17.2010

Resident Hire – What will it cost per job?



2.17.2010

Resident Hire – What will it cost per job?

Opposite effect also occurs.
Assumption: Company has 6,500 employees and contractors at the statewide average of 70% Residents
(2) When between brackets

	Total Workers	Resident Workers	Ratio	Tax rate
year one	6,500	5,200	80.00%	24.5%
add		162		
year two	6,500	5,362	82.49%	24.5%

	Total Worker Hours	Resident Worker Hours	Ratio	Tax rate
year one	13,000,000	10,400,000	80.00%	24.5%
add		324,000		
year two	13,000,000	10,724,000	82.49%	24.5%

2.17.2010

Stair Step versus Continuous Function

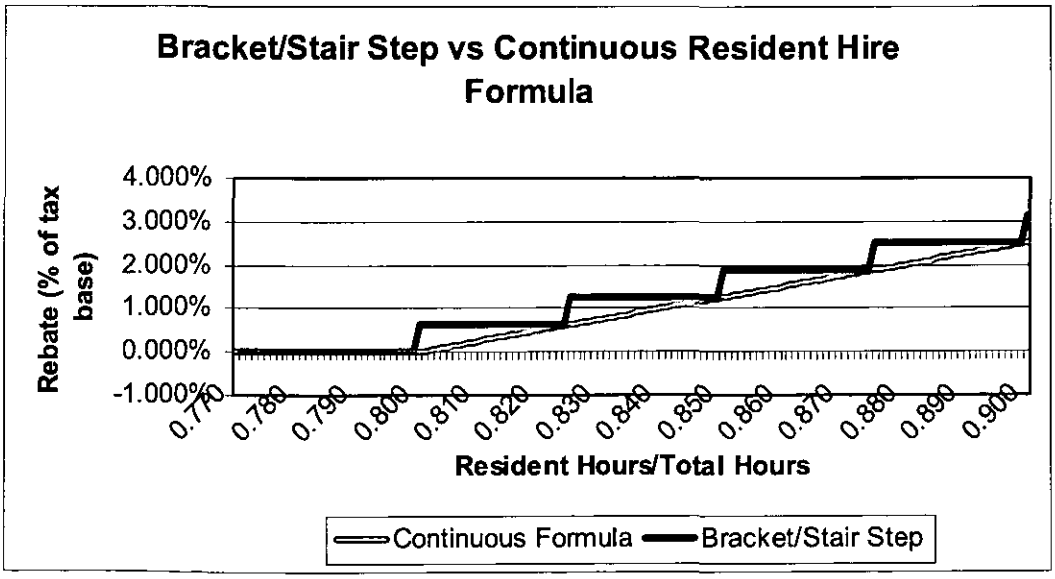
Solution – Continuous function (with rounding)

- Rebate equal to tax base (PTV) times
- Higher of ((Resident Hours/Total hours) or .8)
- Less .8

- That transforms Resident Hire rates between 80% and 100% into a series from 0% to 20%

2.17.2010

2. Stair Step versus Continuous Function



2.17.2010

Problem of "no reporting of nonresident wages"

		Actual	Rounded
FY2008 Estimated PTV ($millions)	$	16,837.7	
FY2009 Estimated PTV ($millions)		9,313.1	
Average for CY 2009		13,075.4	10,000
AS 43.55.011(e)(1) taxes at 25%		3,268.8	2,500
Maximum Rebate (20% of taxes, 5% of base)		653.8	500
Non Resident Workers in industry in 2008		5043	5,000
Average Wages (2008) per worker ($million)		0.083601	0.100000
Total Non- Resident Wages		422	500
Effect of not claiming Non resident wages as lease expense (25%) ($millions)		105.4	125
So by simply not reporting or deducting the 5043 non residents Decrease in taxes: ($millions)		548.4	375

Sources: State of Alaska, Dept. of Labor and Workforce Development, Nonresidents Working in Alaska, 2008 (Jan 2010), derivations from figures in Dept of Revenue, Revenue Sources Book (Fall 2009)

2.17.2010

Some solutions to "no reporting of nonresident wages"

1. Shift the scale so maximum tax savings are not $500 million by $100 million and tax rate could range from 24% to 25%.
2. Require that for any labor to be allowed as a lease expense, all the labor from that company must be calculated in Resident Hire calculation – (with additional rules for pass through).
3. Focus on new hires only, and specific dollar rebate for every new resident hire.
4. Given structure of industry, have the DOR determine a tax rate every year based on the Resident Hire Ratios of 10 (20?) largest employers in the industry or largest generators of lease expenditures.

2.17.2010

Structure of Industry in Alaska

- Producers (taxpayers) have employees & hire
  - Operator who has employees & hires
    - Contractors, and buys "stuff"
- According to the Dept of Labor & Workforce Development (2008) employment in
- Oil and gas (direct) 4,055
- Oilfield Services 12,875
- Total 16,930

2.17.2010

Sources: State of Alaska, Dept. of Labor and Workforce Development, 100 Largest Private Employers, 2008 (Alaska Economic Trends, July 2009),Nonresidents Working in Alaska, 2008 (Jan 2010)

To be addressed by Statute (or Regulations)

- Is the "overhead labor" that is replaced by a formula in 15 AAC 55.270 part of the resident labor calculation?
- If a contractor has a fixed price contract, or charges a fee that includes labor (such as for transportation, turnkey modules, any manufactured good) who determines, or how is it determined whether and how to analyze the labor in that transaction for resident labor?
- Are billed professional services (say by an engineer) "labor" for the resident hire calculation.

2.17.2010

To be addressed by Statute

- If tax was not paid due to limitations in AS 43.55.011(j), (k) and (o) – CI or instate gas, can it be rebated?
- If tax was not paid due to applications of .023 Capitol and Loss Carry Forward Credits, .024 "Low Production" Credits and/or .025 Exploration Credits, can it be rebated?
- If times are tough and taxpayers have to pay the "alternative minimum tax" under AS 43.55.011(f), can that be rebated? It is a tax based on gross – but will still require the calculation of labor costs.
- If there is lots of investment activity and so that generates a loss – No resident hire issues if no tax base? Or should the rebate effect the loss carryforward. (Perverse incentive)

2.17.2010

6 Changes in SB 267

1. Change progressivity from .4% to .2% per dollar
2. 30% credit for well work
3. Tax rate tied to Resident Hire
4. Interest not due on retroactive reg changes prior to implementation
5. Interest rate is lower of fed funds +2 or 11%
6. Restore 3 year statute of limitations

2.17.2010

How is interest calculated?

Current Law

- Production Tax is due on last day of the month following the month of production (AS 43.55.020 (a)).
- Amount of tax due changes because of audit, revised reporting by taxpayer, retroactive revision of tariff due to a regulatory order in a rate case, retroactive change in regulations.
- Interest is charged back to when original tax is due.
- In a settlement Department can compromise amount of tax and amount of Penalty. (AS 43.55.070) – No mention of interest.

SB 267 (section 7) For all taxes, when retroactive regulation is passed, interest only goes back to effective date of regulation.

2.17.2010

Regulations required retroactive to July 2007*

- In 2007 reforms ("ACES") Department charged with a number of specific responsibilities for regulations, as well as general implementation.
  - AS 43.55.150 "the department shall determine the reasonable cost of transportation, using the fair market value of like transportation, the fair market value of equally efficient and available modes of transportation or other reasonable methods.
  - AS 43.55.165(a) "...a producer's lease expenditures for a calendar year are ... costs ...allowed by the department by regulation..."
  - Production tax is a yearly tax – however, effective dates of most of 2007 reform was July 1, 2007, so ways of combining two half years had to be implemented.
  - New reporting requirements (AS 43.55.030 & .040)
  - *New rules for exploration credits (AS 43.55.025)

2.17.2010

Status of Regulations Affecting Returns after July 2007

	Discussion Draft				Public Comment Draft		Adopted
	1	2	3	4	1	2

2.17.2010

Interest on Retroactive Regulatory Changes

- Governor Parnell's suggested approach:
  - More thorough – explicitly recognizes that the absence of regulations is not the absence of any rules
  - Explicitly retroactive – deals with the 2007 -2010 regulatory delay
  - Does not require restructuring AS 43.05.225 (thus eliminates half the provisions in the SB 267) – however only applies to production tax.
  - (although in current version A, section 6, page 3 line 5 requires in the insertion of an "a" in any case.)

2.17.2010

Interest on Retroactive Regulatory Changes

- Possible upgrades to Governor's Language:
- Instead of requiring a departmental determination of good faith by the producer in each case. Assume it, and allow the department to prove otherwise if it finds egregious behavior.
- Possible upgrades to either approach
- AS 43.55.020 (a)(1)-(3) are monthly "installment payments of estimated tax" using 1/12th of estimated credits and 1/12th estimated lease expenditures - so
  - No true up caused by retroactive regs except for annual true up already required under AS 43.55.020 (a) (4) and
  - First first day of month more than 90 days after effective date of regs.

2.17.2010

6 Changes in SB 267

1. Change progressivity from .4% to .2% per dollar
2. 30% credit for well work
3. Tax rate tied to Resident Hire
4. Interest not due on retroactive reg changes prior to implementation
5. Interest rate is lower of fed funds +2 or 11%
6. Restore 3 year statute of limitations

2.17.2010

Interest rate in AS 43.05.225

- Lower tax rate for all tax types (section 6)
- The interest rate applies to all 20 Alaska Tax Types*
- Current law – higher of fed funds + 5 or 11%
- Also applies to late royalty payments.
- **Compounded** Quarterly
- Implemented in 1991 amidst settlement of major production tax and royalty litigation going back to 1977 and era of simple interest.
- Effective date should be end of year, or at the very least, quarter.

2.17.2010

1. Change progressivity from .4% to .2% per dollar
2. 30% credit for well work
3. Tax rate tied to Resident Hire
4. Interest not due on retroactive reg changes prior to implementation
5. Interest rate is lower of fed funds +2 or 11%
6. Restore 3 year statute of limitations

2.17.2010

Restore 3 year State of Limitations

- Section 20 Restores statute of limitations to three years for production tax - time for the state to complete a production tax audit (or, agree to an extension with taxpayer or issue a blue sky assessment)
- Three year rule would begin with 2011 tax year
- Note: in the case of False or Fraudulent returns, or failure to file a return, may proceed "at any time"

- Prior to 2007, SOL was three years for all tax types under AS 43.05.260 –
- In 2007 production tax pulled out and extended to 6 years in AS 43.55.075

SENATOR LESIL MCGUIRE

Sponsor Statement for Senate Bill 267

Anchorage economist Scott Goldsmith characterizes Alaska's economy prior to the discovery of the immense oil deposits on the North Slope as "small, thin and seasonal." With the federal government providing roughly half of Alaska's ninety thousand jobs at the time, the economy was dominated by outside residents and the State's revenue base was small. In 1960 for example, the State of Alaska collected roughly $154 million (2009 dollars) in taxes. This year, the State of Alaska will collect more than $5 billion. In 2009, 89% of the State of Alaska's general fund revenues will come from oil.

Alaska taxes oil based on the value of each barrel of oil produced. Although high oil prices certainly affect the State's treasury, oil must be produced in order for it to be taxed. Currently, Alaska's oil production is declining at between four and five percent per year. Simply maintaining this steady decline rate will require billions of dollars of investment in Alaska's oil patch. Reducing it will require billions more. While this challenge may sound daunting, it is actually an opportunity. For dollars invested in Alaska's oil patch aren't simply large numbers or entries in an accounting ledger; ultimately, dollars invested in Alaska are jobs.

Senate Bill 267 offers a simple exchange to the companies that operate, explore and invest in Alaska: If you invest in the type of activities that lead to increased oil production in Alaska, you will receive the capital investment credits already available to other investments. If you are willing to risk your capital in Alaska, you will be able to reap a reasonable reward for your investment. And most importantly, if you employ Alaskans, you will receive an additional credit against your taxes.

Through the resident worker rebate in Senate Bill 267, a company maintaining an Alaska resident workforce of at least 80% will see immediate reductions in their tax bill. The rebate increases as the level of the resident workforce increases. Estimates show that this provision could generate roughly 5,000 high-paying jobs for Alaskans and $1.2 billion in economic impact for $500 million in foregone State revenues. To put these numbers in perspective, if the credit was just 50% effective (2,500) new jobs it would be like adding the third largest private sector employer in Alaska. More plainly put, 2,500 jobs is roughly the equivalent of the total jobs available in Wasilla according to the last census or another military base. That is millions in new paychecks for Alaskans, who then spend their money in the local economy and generate work for other Alaskans. This multiplier effect will help shore up the economic foundation of our communities and subsequently, strengthen the social fabric of our State.

The battle for Statehood was largely fought over outside control and non-resident employment in Alaska's fishing industry. SB 267 builds on the promise of Statehood by aligning the interest of the oil industry with Alaskans so that together, we can develop our resources as required by our Constitution: for the maximum benefit of Alaskans.

January 14, 2010

Honorable Governor Parnell,

Recently you requested a review of Alaska's oil and gas production tax, and recommendations for how the production tax could be improved. Enclosed for your review is analysis of Alaska's oil and gas production tax (otherwise referred to as "ACES"), which was compiled at my request by the Department of Revenue's technical staff. The ACES Status Report evaluates whether ACES is meeting its intended goals of providing a fair share of revenue to the state while encouraging investment in new oil and gas exploration and development activities.

Based on the report, I am recommending a collection of potential amendments to ACES and its associated Exploration Incentive Credit (EIC) program. The amendments are primarily intended to accomplish two things: 1. Further incentivize drilling and other production enhancing activities; and 2. Address a number of provisions of ACES that may keep explorers from enjoying the full intended value of the capital credit program.

The status report shows that ACES successfully allowed the state to share in the benefits of high oil prices while accommodating fluctuations in production costs and oil prices. ACES adjusted when oil prices tumbled and kept oil operations in Alaska highly profitable relative to other oil provinces. With respect to the impact that the new production tax has had on investment activity, the report is positive, but ultimately inconclusive. While the overall level of taxation increased with ACES, it distributed the impact of that tax burden in a way designed to incentivize investment in new exploration and development. Since ACES passed the legislature, overall spending on oil and gas activities on the North Slope has increased. However, given only two and a half years of experience, during which time oil prices climbed to $140 per barrel then plunged to under $30 per barrel, it would be premature to attribute the increased level of oil company investment to the success of ACES.

3873

Oil taxes are clearly an important factor in industry investment decisions. However, it is misleading to isolate their influence from other key factors, such as world oil prices, geologic potential, access to land, resources and markets, costs of infrastructure and support services, and the legal and regulatory framework. As noted in the report, the true merit of Alaska's current fiscal system can only be determined when it is evaluated in conjunction with these other variables. The scope of the status report, and the limited timeframe since ACES passed, do not allow for such a comprehensive analysis and definitive conclusions.

In addition to documenting several promising trends in industry spending activity, the report notes a number of discrete policy issues associated with the production tax where improvement can be made. These warrant your consideration as potential amendments to the ACES framework.

1. **Increase Credits for All Well-Related Activity to 30%:** The Capital Credit and Exploration Incentive Credit (EIC) programs have been identified as influential in spurring exploration activities. However, the EIC program's 30% credits are only available to wells located more than 3 miles from all existing wells. The state has a significant interest in also incentivizing infill drilling and other well work that will increase oil production, particularly for heavy oil. I therefore recommend expanding the EIC program so that all expenditures related to drilling and well work that add new production or increase the efficiency of existing production will qualify for the 30% EIC credit under AS 43.55.025 regardless of a well's location relative to existing wells.

2. **Increase Access to Capital Credits for New Explorers:** Small producers are currently required to invest in new activities during subsequent years in order to obtain direct payment from the state for previously earned tax credits. This is not an issue for existing producers because they simply deduct credits from their current tax bill and do not need to seek direct payment from the state. Deleting this provision would make the tax credits more accessible to smaller explorers, level the playing field between new and existing operators, and eliminate an unfair double standard.

3. **Accelerate Capital Credit Usage**: Companies currently can only use half of their capital credits in the year they are earned, and the other half the following year. This is true whether the credits are applied against a tax liability or purchased by the state. Taxpayers would see increased value in the credits if they could apply the entire credit in the first year. In addition, this would ease the cost of administering these credits.

4. **Waive Interest on Late Tax Payments Due to Drafting of Regulations**: The ACES regulations, including those defining 'allowable lease expenditures' are being finalized this month. Under the statutes, these regulations are to be applied retroactively to various dates in 2007. To the extent additional taxes are due as a result of the application of the new regulations, such payments would be subject to interest and possibly penalties. While the department can waive penalties, it cannot waive interest charges. A statutory change is required in order to permit the waiver of interest.

I am confident you will find the ACES Status Report informative and interesting. Please consider my recommendations to improve the effectiveness and fair administration of ACES and the EIC program. I look forward to continuing to work with you to encourage additional oil and gas development while preserving Alaska's equitable share of oil and gas profits.

Sincerely,

Patrick S. Galvin
Commissioner

Alaska's Clear and Equitable Share (ACES)
Status Report
Alaska Department of Revenue
January 14, 2010

Introduction

In November 2007, the Alaska Legislature passed House Bill 2001, known as Alaska's Clear and Equitable Share (ACES). ACES made modifications to the prior production tax called the Petroleum Profits Tax (PPT), enacted in 2006. The changes made first with PPT and later with ACES represented substantial production tax reform in that the basis of the tax shifted from the *gross value* to the *net value* of oil and gas production. The gross tax which had been in place prior to the PPT is generally referred to as the Economic Limit Factor (ELF).

This report was prepared at the request of the Commissioner of Revenue in order to evaluate whether ACES is meeting its intended goals of providing a fair share of oil and gas revenue to the state, and encouraging investment in the exploration and development of new oil and gas resources in Alaska.

Following are the key findings of this report:

1) State revenues under ACES in FY 2009 exceeded amounts which would have been generated under either the PPT or ELF systems. The crossover point at which ACES is projected to provide more revenue than ELF is $51 per barrel west coast price in FY 2010.

2) Activation of the progressive surcharge is estimated to occur when west coast sales prices reach $56 per barrel.

3) Capital spending on the North Slope totaled over $2.2 billion in FY 2009 an increase over FY 2008. This is nearly the highest level of capital spending in nominal dollars since oil production began in the state.

4) The impact of the production tax modifications on industry investment cannot be clearly determined due to the influence of other factors and given the limited timeframe during which ACES has been in place.

5) Operating costs have risen since the enactment of PPT and ACES, but the impact of these cost increases to state tax revenues was moderated by the "standard deduction" provision of ACES, which expired December 31, 2009.

6) Increased reporting requirements, particularly of forward looking expenditure information, has greatly enhanced the accuracy of the Department's revenue forecasting efforts.

7) The Department has made significant progress in implementing ACES regulations, but there will be challenges to both the department and taxpayers as the regulations are implemented. Preliminary audits of taxpayers under the new profits-based system (formerly PPT) have begun, consistent with the normal audit timeframe.

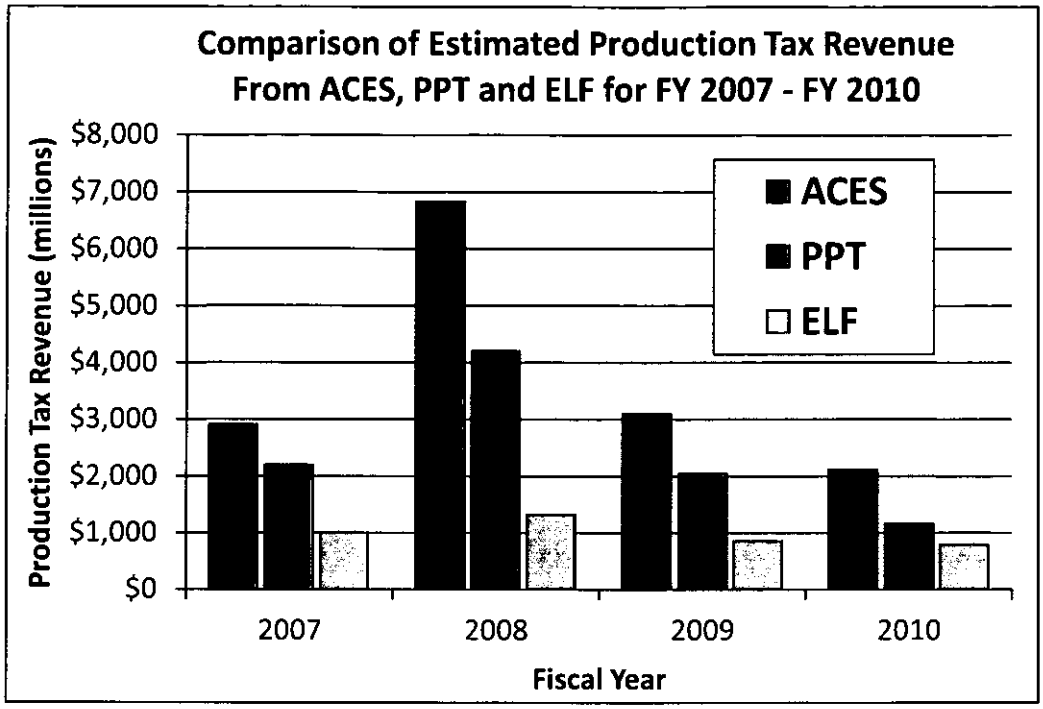
Comparison of Revenues under ACES, PPT and ELF

The net tax structure – first enacted under PPT (2006) and later with ACES (2007) – represents a significant change from the oil and gas tax structure used for much of Alaska's history. Under the earlier tax, known as the Economic Limit Factor (ELF), production tax was levied on oil and gas producing properties, regardless of whether operations were profitable. The current production tax structure requires companies to pay tax only when they are making profits from oil and gas production in the state. In addition, tax credits are provided for capital expenditures, with higher credits available for certain oil and gas exploration investments.

Since its enactment in 2007, ACES has generated more state revenue than would have been generated under either PPT or ELF. In FY 2008, a period of very high oil prices and profits, ACES generated $6.8 billion in production tax revenue, compared with $4.2 billion which would have been received under PPT and $1.3 billion which would have been received under ELF. In fiscal year 2009, during which west coast oil prices average $68.34, ACES generated just over $3.1 billion. This compares with roughly $2 billion that would have been generated under PPT and $858 million under the earlier ELF system.

Figure A compares revenue from ACES, PPT and ELF for FY 2007-2010. The FY 2009 revenues are preliminary. Estimates for FY 2010 are based on the Department's fall 2009 forecast of an average west coast oil price of $66.93 per barrel.

Figure A[1]



The progressive feature in ACES means that the state receives more production tax revenue when oil prices are high relative to underlying costs. Similarly, it significantly lessens the state's share of revenues when per-barrel margins decline. This effect was illustrated in 2008, when oil prices reached a high of $140 per barrel in July, bringing in $900 million in production tax for the month, and later plunged to below $30 per barrel in December, producing a total of $50 million in production tax for the month. Over the course of the full year, ANS crude oil averaged over $92 per barrel, resulting in five times more revenue than would have been realized under the ELF system.

Figure B shows estimated revenues that would be received under ACES, ELF and PPT at various oil prices.[2] The oil price crossover point at which the state receives more revenue under ACES than the ELF system is roughly $51 per barrel. The crossover point has increased over prior

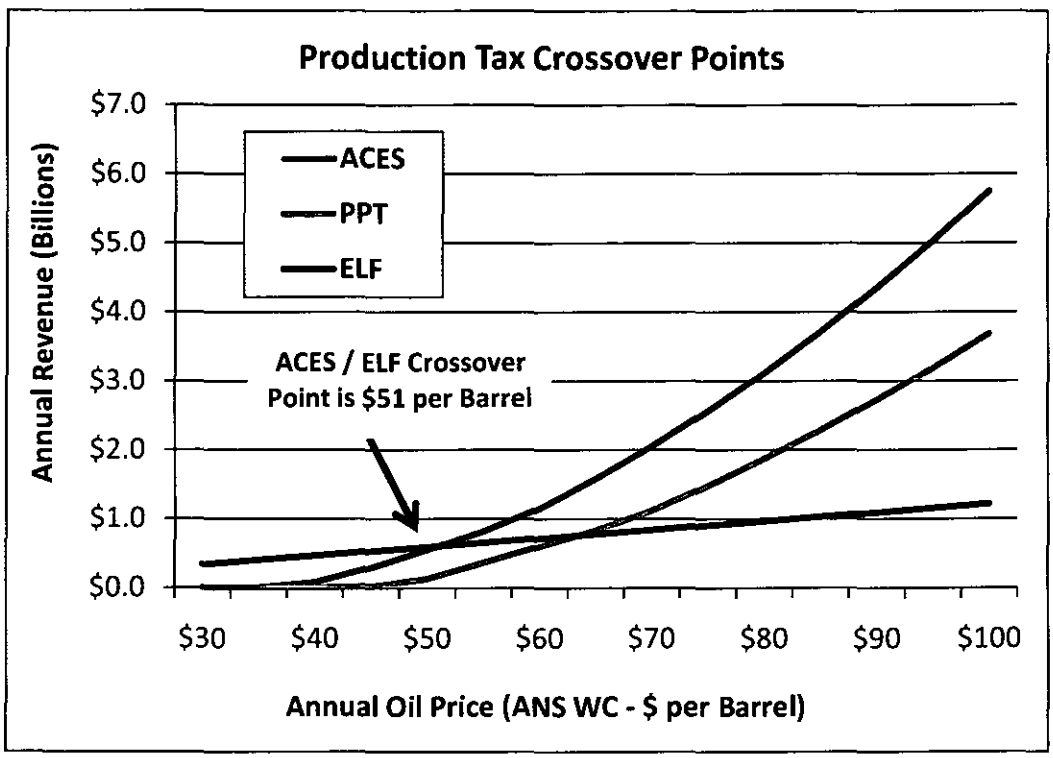
[1] Production tax revenue includes surcharges but does not include any settlements which go to the Constitutional Budget Reserve Fund. FY 2007 PPT revenue includes true-up payments for the period of April 2006 through December 2006. FY 2007 ACES revenue assumes similar true-up payments for comparison purposes. For FY 2007 - FY 2009, assumes actual data for oil price, production, costs and other variables. For FY 2010, assumes oil price, production, costs and other variables as of the fall 2009 forecast. Costs under PPT for FY 2010 for Prudhoe Bay and Kuparuk are based on aggregated company forecasts. For ACES only, assumes that standard deduction would apply for all of FY 2007-FY 2009 and first half of FY 2010. Actual tax revenue, as opposed to modeled revenue, is used for PPT in FY 2007 and ACES in FY 2008-FY 2009.

[2] This analysis assumes a constant oil price for the entire year, production of 655,000 barrels per day, deductible lease expenditures of $20 per barrel and transit costs of $6 per barrel.

3878

years because lease expenditures, which are deductible under ACES, have increased since ACES was passed. It is expected that lease expenditures will decrease as costs decline in delayed response to the decline in oil prices from their 2008 levels.

Figure B[3]



Lease Expenditures

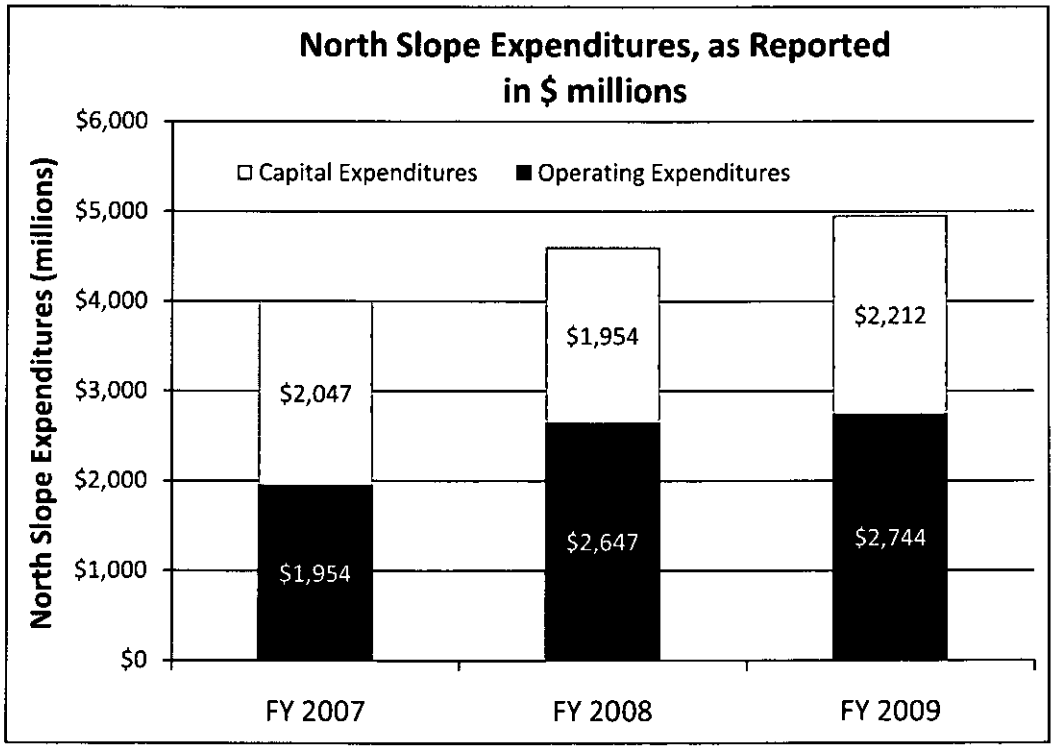
With the introduction of the net tax, it became necessary for the state to identify and forecast allowable lease expenditures for purposes of the tax calculation. Prior to the passage of PPT, the department had not been required to track or audit oil and gas production costs in Alaska. Some early cost data had been acquired directly from producing companies and through preliminary examination of federal tax returns. However, even during the debate over PPT, the state did not have access to comprehensive, Alaska-specific data that would enable policymakers to analyze the effects of the proposed tax over the life of a project. With much more information now being provided under the new tax structure, the department is developing a better understanding of oil and gas costs in Alaska, which will significantly benefit future policy deliberations.

[3] Assumes fixed operating and capital cost of $20 per barrel.

Lease expenditures fall into two general categories that constitute the major deductions under the ACES tax system. Operating expenditures are the costs to operate an oil or gas production facility on a day-to-day basis. These include labor, heat and light for the facilities, and some well work and minor equipment repairs. Capital expenditures are costs incurred to enhance or improve the reserve base, level of production, or facilities. Drilling is one of the most common forms of capital costs, as is facility construction or expansion.

Figure C shows the operating and capital expenditures, as reported on company tax returns and monthly reports, for their North Slope operations, from FY 2007 through FY 2009. Note that the graph represents all reported expenditures for all North Slope properties, regardless of whether or not they are subject to the "standard deduction" provisions of AS 43.55.165(j).

Figure C[4]



Operating Expenditures

Operating costs have risen significantly in recent years for the oil and gas industry worldwide. This has often been linked to the corresponding rise in oil prices beginning around 2002. Projects around the world that were once marginally economic have become viable, increasing the demand for limited supplies of engineering, procurement and construction services, as well

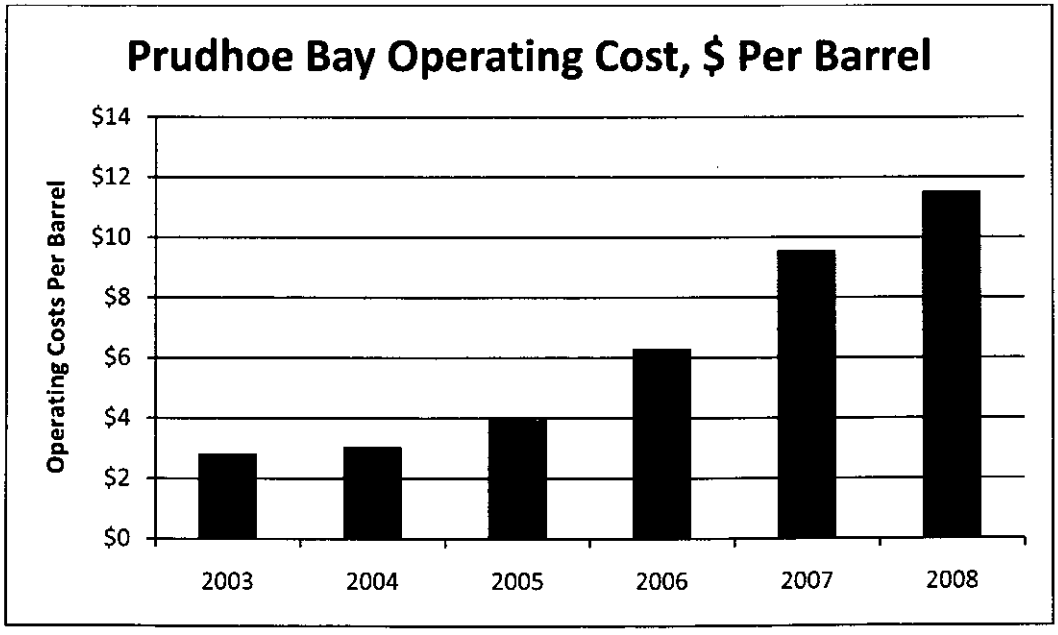
[4] Operating expenditures includes total reported costs, not standard deduction; FY 2007 estimated based on incomplete reporting

as raw materials. Cambridge Energy Research Associates (CERA) reports the upstream operating cost index rose for oil and gas field operations roughly 67% between 2002 and the end of 2008.[5] Meanwhile, the global capital cost index rose over 100% during the same period.[6]

Alaska-specific information obtained through public sources and shared in confidence during the Stranded Gas Development Act negotiations and through ACES reporting shows similar trends on the North Slope. Estimates of operating costs prior to PPT ranged from $3 to $5 per barrel. More recent information indicates that operating costs on the North Slope have doubled, and in some cases nearly tripled. Following the Prudhoe Bay corrosion incidents in 2006, operating expenditures on major repairs increased. However, since that time, the proportion of total operating expenditures directed to major repairs does not appear to have been a key driver in the growth of total operating expenditures.

Figure D shows the upward trend in per-barrel operating costs at Prudhoe Bay from 2003 to 2008. The chart shows a dramatic increase over the six-year period, consistent with cost increases seen in the oil and gas sector worldwide.

Figure D



The recent downturn of the global economy has started to push operating costs back down again. In June of 2009, CERA reported that worldwide, operating costs had declined 8 percent

[5] IHS CERA Upstream Operating Cost Index (UOCI), http://www.ihsindexes.com (Accessed December 11, 2009)
[6] IHS CERA Upstream Capital Cost Index (UOCI), http://www.ihsindexes.com (Accessed December 11, 2009)

over the previous 6 months.[7] The most recent information reported to the department under the new ACES requirements shows this trend to also be developing on the North Slope.

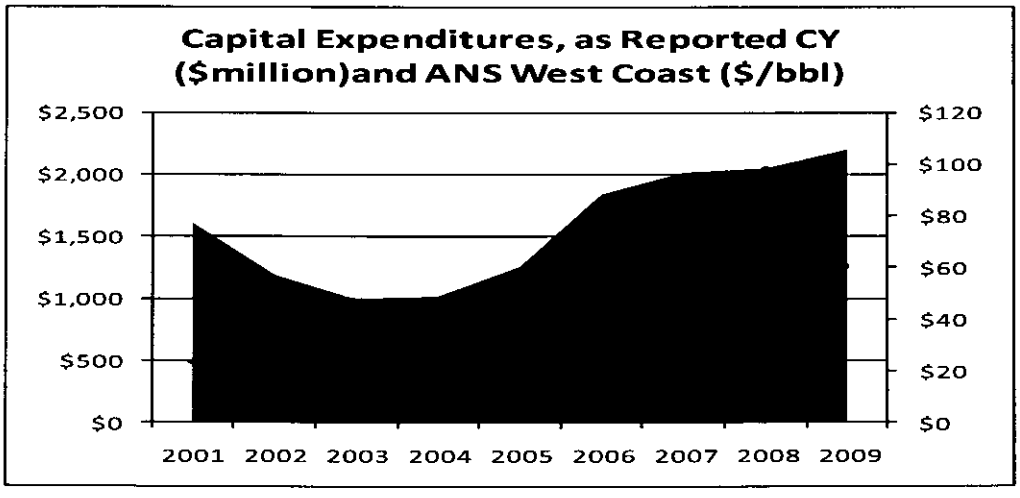
Much of this change can once again be linked to recent trends in oil prices. Lower oil prices led to a slackening of worldwide project activity, driving down the costs of transportation and various consumables. Despite this correlation, however, operating costs have not fallen at the same rate as oil prices. While the department anticipates that per-barrel operating costs will continue to decline under the lower oil price forecast for FY 2009 and FY 2010, they are expected to remain relatively high compared with those from five or more years ago.

Capital Expenditures

Capital expenditures have also increased since PPT and ACES were enacted. While capital expenditures on pipeline repairs at Prudhoe Bay increased after the Prudhoe Bay corrosion incidents in 2006, the majority of growth in capital expenditures is attributable to drilling, seismic and other projects. As shown below, capital spending on the North Slope in CY 2009 was roughly twice the level in either 2003 or 2004. At least some of this increase is due to new development activities. Two major developments – Oooguruk and Nikaitchuq – have gone forward despite recent oil price setbacks. Development of the Point Thomson field is also underway.

Figure E shows historical capital expenditures from CY 2001 to 2009 as reported by oil and gas producing companies operating on the North Slope.

Figure E



[7] IHS CERA: *"Period of Sustained Cost Escalation for Upstream Oil and Gas Facilities Comes to an End,"* June 5, 2009. http://www.cera.com/aspx/cda/public1/news/pressReleases/pressReleaseDetails.aspx?CID=10388 (Accessed December 11, 2009)

In order to forecast North Slope lease expenditures, the department receives forward looking spending projections from taxpayers, and also consults a variety of information sources, including unit forecasts, plans of development, and federal partnership returns. These data give the department significantly better insight into future development plans, as well as trends in operating and capital expenditures.

This information shows a variety of changes on the North Slope in the years ahead. There is continuing development of newer fields like Oooguruk, Nikaitchuq, and Point Thomson. Growth in capital expenditures at many major North Slope units (i.e. Prudhoe Bay, Kuparuk, Colville River and others) appear to slow slightly or decline in the next year or two and re-surge thereafter to the level of the recent past or higher. This trend is consistent with indicators of worldwide industry activity which show a dramatic drop in capital expenditures from the high levels experienced in 2008. This suggests that recent economic contraction may have caused some North Slope development projects to be delayed as producers hope to form a better idea of where the economy and oil prices may be headed.

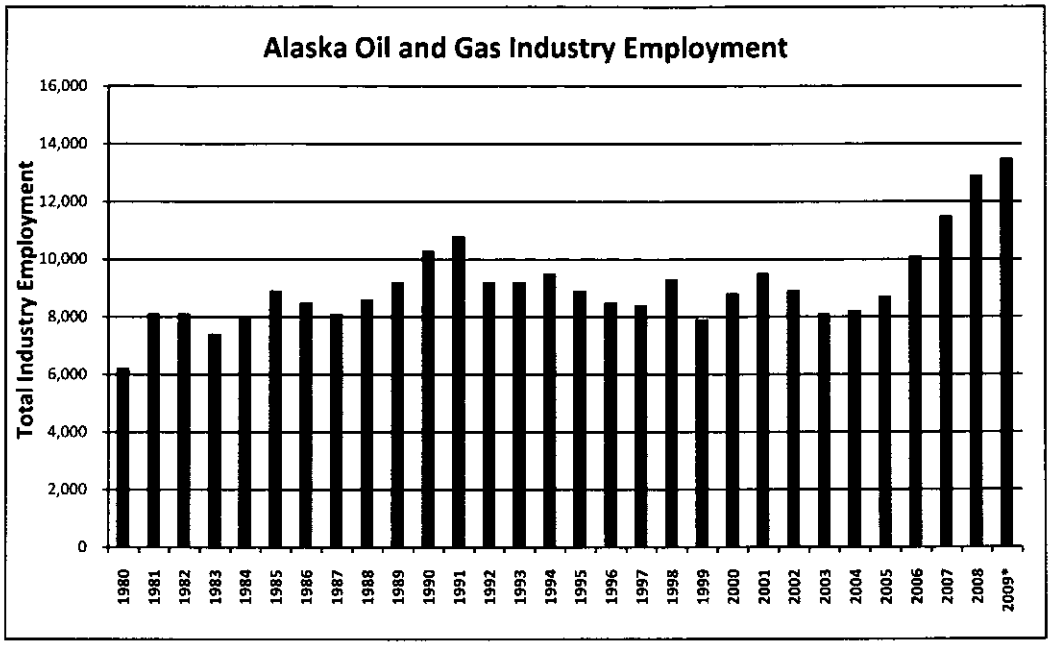
It would be presumptuous to solely attribute the rise in expenditures to the success of the investment incentives found in ACES. Many factors beyond tax policy drive oil and gas investment decisions. However, one of Alaska's new explorers, Savant Alaska, stated in a recent Petroleum News article that ACES had assisted in their development efforts at Badami. "ACES was an important component for Savant in considering investment in Alaska. It definitely had its intended consequence with us." [8]

Industry Employment

Employment in the industry has also increased steadily since the implementation of PPT and ACES, with 2009 forecast to be the highest in state history. It is important to note that this occurred concurrent with a steady rise in the oil prices, which has generally shown a strong correlation with industry activity.

[8] Kay Cashman quoting Savant's Chief Operating Officer Greg Vigil, "Savant Accelerates Badami Drilling Plan," *Petroleum News*, Volume 14, No. 3, January 18, 2009.

Figure F[9]



Flexibility of Tax Burden Evidenced

The increased revenues generated under ACES represent an increased tax burden on Alaska's oil and gas industry. However, there is evidence that ACES effectively adjusts that burden when oil prices drop and profit margins are squeezed. In 2009, a period of relatively low oil prices in comparison to recent years, 35 percent of ConocoPhillips total reported exploration and production profit in the first quarter of the year (Q1), 55 percent in Q2, and 36 percent in Q3, came from its Alaska operations, which only account for 12 percent of the company's worldwide production.[10]

ACES Structure and Tax Rate

The ACES tax consists of a base rate of 25% plus a progressive surcharge, which is triggered when a company's net profits — also known as "production tax value"— exceed $30 per barrel. Beyond this point, the base tax rate is increased by 0.4% for each additional $1 increase in per-barrel production tax value. Using current estimated transportation and production costs of roughly $26 per barrel, the surcharge would begin to be applied when west coast oil prices reach $56 per barrel. When the combined base rate and progressive surcharge reach 50%

[9] Data from Alaska Department of Labor and Workforce Development, Research and Analysis Section (January 11, 2010). Includes nonagricultural wage and salary data and excludes the self-employed. *Estimates for 2009 are preliminary.

[10] ConocoPhillips, Form 10-Q Quarterly Reports Pursuant to Section 13 or 15(d) of the Securities Exchange Act of 1934, March 31, 2009, June 30, 2009 and September 30, 2009.

(approximately $92.50 per-barrel profit or $118.50 West Coast price) the progressive surcharge is lessened to 0.1% for each additional $1 increase in per-barrel production tax value. The maximum nominal tax rate is 75%, which would apply at a profit rate of $342.50 per barrel or $368.50 West Coast price.

As with any tax, ACES may be evaluated using a variety of different metrics, including "effective," "nominal" and "marginal" tax rate comparisons. While each of these can be helpful under the appropriate circumstances, each is also subject to certain limitations. It is important when using these metrics to understand their relative value and how they reflect upon the objectives of the tax system.

The "effective tax rate" is the share of the total gross taxable value at the point of production that is paid in production taxes after credits are applied. It is a good universal measure of the sharing of total petroleum value that can be compared to gross value-based tax systems.

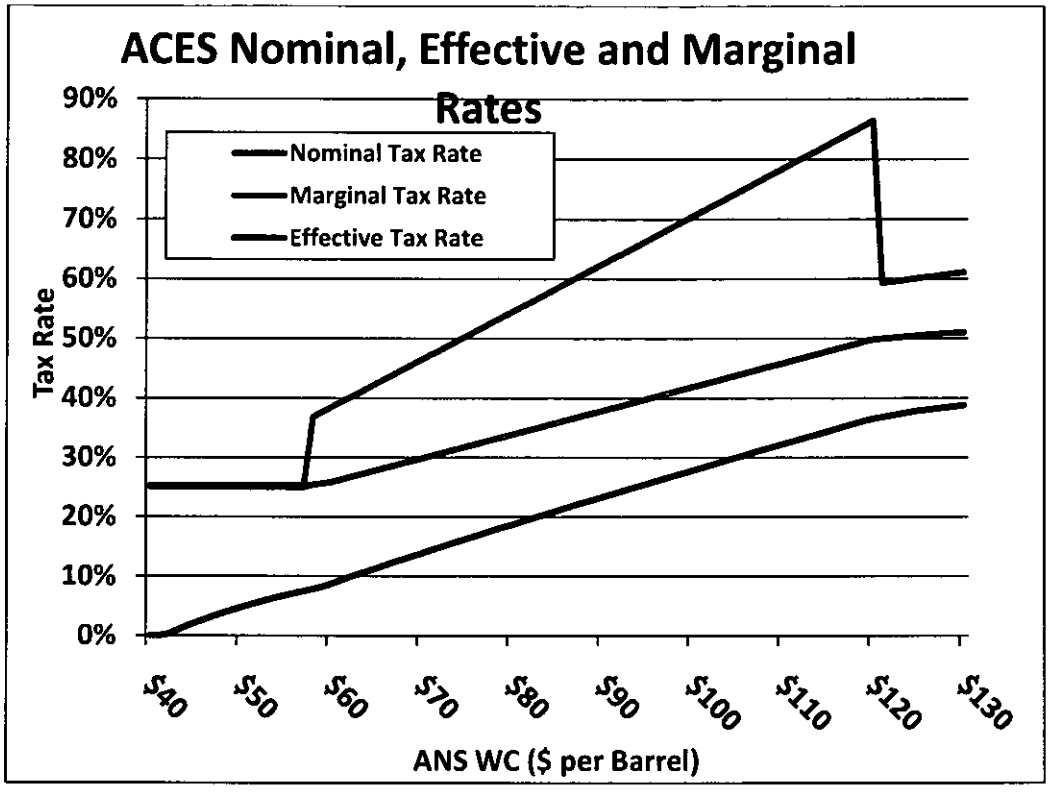
The "nominal tax rate" is the statutory tax rate as applied to the net value of oil and gas production. It does not account for credits or other tax benefits which ultimately impact a company's bottom line. Under ACES, the nominal tax rate varies with the per-barrel profitability. In addition to a base tax rate of 25%, ACES levies a progressive surcharge that can raise the combined nominal tax rate to 75% at extreme price levels.

The "marginal tax rate" is the rate theoretically applied to each dollar increase in oil price. In the case of ACES, the marginal tax rate is 25% until per barrel profit reaches $30 per barrel (about $56 per barrel in west coast spot price under the current cost structure), at which point it increases for every additional dollar up to a marginal tax rate of 87% when the profit reaches $92.50 per barrel (about $118.50 per barrel on the west coast). Following this peak, the marginal tax rate drops off significantly as the profit level continue to rise. With a net based tax system, this metric shows a company the impact of making additional investment, because each dollar they invest is "subsidized" by the government based on the amount of marginal tax they have avoided paying on that dollar.

Each of these metrics has their limitations when considered in isolation from other metrics, or when only one data point on the curve is presented. For example, a marginal tax rate of up to 87% initially sounds excessive. However, at that same price level, the effective tax rate (the tax burden) is less than 40%. The marginal rate of 87% actually represents the state's "portion" of any new investment made at such high prices.

Figure G shows the nominal, effective and marginal tax rates under ACES using a wide range of west coast spot prices.

Figure G



Production Tax Administration and Implementation

The passage of ACES presented significant challenges for tax administration and implementation because it involved comprehensive structural changes to the tax on the heels of the prior year's legislative changes through PPT. These challenges are experienced both on the taxpayer and on the state side.

Tax Credit Successes and Difficulties

The increased spending levels reported earlier in this document, may be due in part to the expansion of capital and exploration credits provided under ACES for reinvestment in the state. Credits can be applied against tax liabilities, sold to other companies or, for companies producing less than 50,000 boe/day, can be purchased by the state. Nearly $550 million in credits were claimed in FY 2009. Approximately $193 million was paid to oil and gas companies

3886

to purchase oil and gas tax credits, while an additional $350 million in tax credits were used to offset tax liabilities.

Some administrative difficulties have arisen due to the requirement that the 20% capital credit be spread out over two years. It has taken a substantial amount of time and resources to develop a database with which the division can track the issuance and staged application of these credits for each taxpayer. This detailed tracking was made necessary by the transferability and use of the credits, and some confusion by taxpayers and their transferees regarding how the credits could be applied. In addition, the two-year spread in the application of the capital credits diminishes their value to taxpayers who look for quick return of their investment dollars. Finally, one of the reasons for the two-year spread in credits was to assist the department in forecasting future revenues. However, the department has found that the information provisions in ACES have been extremely valuable and successful in improving the volume and quality of spending projection data provided to the department by operators. This forward looking spending information has been much more valuable to the revenue forecasting process than the two-year spread in credits.

The Department has also received feedback regarding the reinvestment requirements for new explorers. Under current law, companies generally receive a financial benefit of over 45 percent of exploration expenditures incurred in the state. However, a new entrant to Alaska (with no production to immediately apply the credit against) can only get full value for their expenditures by applying to the state for cash payment for their credits earned. In order to receive such a payment, the company must continue to make expenditures in future years. Although this provision was originally created to support new explorers, it appears to be a limiting factor for companies that have fewer financial resources and are only considering a single exploration investment. In application, this requirement creates a "double standard" where new entrants to Alaska are provided less value for their credits compared to incumbent companies.

"Standard Deduction" provision at AS 43.55.165(j)

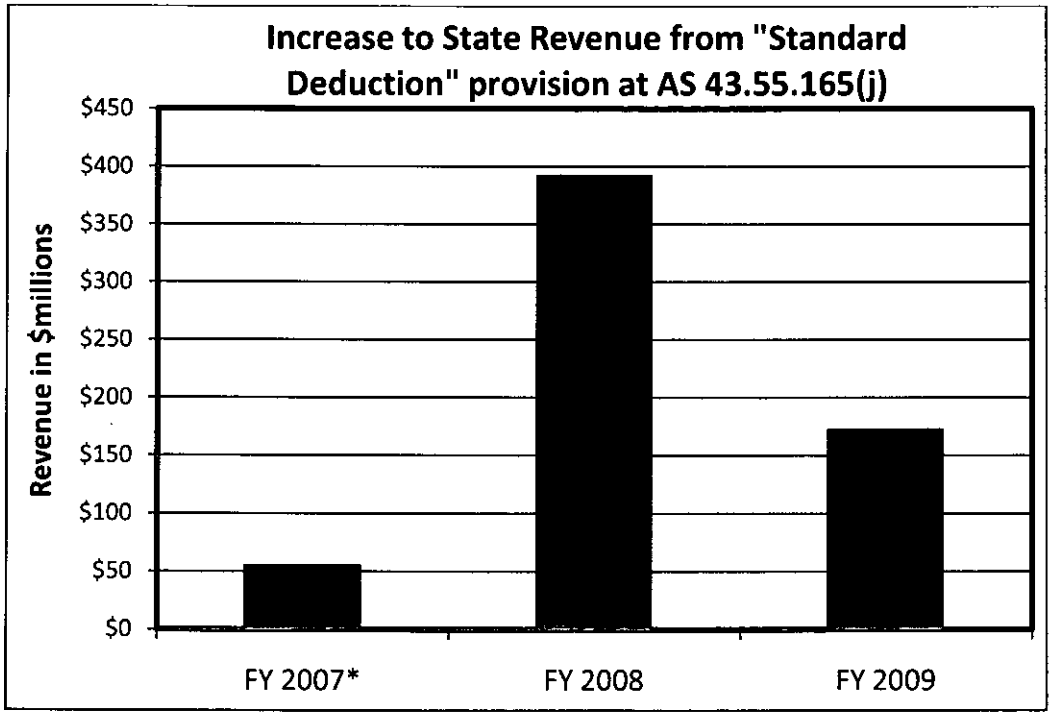
The ACES tax reform made modifications to the deductibility of operating expenditures for certain fields on the North Slope. Alaska Statute 43.55.165(j) limited the deduction of operating expenditures at leases or properties that have produced a cumulative 1 billion barrels of oil and NGLs since the lease or property began oil production. The Prudhoe Bay Unit and the Kuparuk River Unit are subject to these provisions based on their cumulative production. The provision, coined the "standard deduction," limits the deduction of operating expenditures to the amount deducted on the first PPT returns, filed April 1, 2007, for calendar year 2006 expenditures, adjusted annually. This provision, which was effective through December 31,

2009, was intended to moderate the risk associated with adopting a profits based tax without substantial historical data on which to rely for future cost estimates.

Based on company-reported expenditure data, the provision has resulted in a substantially greater tax liability to the state during the time it has been in place. The total liability in FY 2008 was substantially larger than the liability for FY 2009 due to the higher tax rate in FY2008 because of higher net profits realized due to high oil prices.

Figure H shows the increased revenue to the state from the standard deduction from FY 2007 through FY 2009.

Figure H[11]



Regulations

The ACES tax included new restrictions and guidance on allowable lease expenditures, requiring complex regulations. The department has actively sought industry input on the structure of the regulations to ensure they continue to achieve their intended purposes, while avoiding undue burdens for either side. The process has included numerous public workshops pertaining to credit regulation, conforming regulatory changes required by ACES, lease expenditures, facility sharing costs and transportation costs. As a result, the regulation drafting process has been

[11] *Standard Deduction was only in place for half of FY 2007.

3888

lengthy and complex. However, the regulations to define allowable lease expenditures are expected to be finalized this month.

Under the statute the regulations are retroactive to various 2007 dates. To the extent additional taxes are due, taxpayers would be required to pay interest on what would now be late tax payments. The department has discretion to waive any penalties for late payments. However, a statutory change would be needed in order for the department to provide a waiver from interest payments.

Reporting and Revenue Forecasting

ACES requires that companies exploring for or producing oil and gas in the state submit a monthly information report to the department. This report includes estimated data on production volumes, the value of the production, and the operating and capital expenditures related to production. The monthly report is used primarily by state economists to monitor company production and spending. Included with the monthly report is an estimate of taxes owed and credits earned. Twice annually, companies are asked to provide the department with forward-looking expenditure information, along with future production plans to aid the department in providing the legislature with state revenue forecasts.

These reports, in combination with the monthly information reports and the annual tax returns, have significantly enhanced the quality of the department's revenue forecasts.

Audit Compliance

The ACES legislation extended from three to six years, the period in which the department is required to assess production taxes owed. The extension was seen as necessary to assure proper tax assessments, particularly given the complexity of overlapping ELF, PPT and ACES tax laws. The new tax law also included funding for four new "Audit Masters" within the department. The department is still experiencing significant difficulties recruiting and filling audit positions. The department has successfully recruited three Audit Masters, and these individuals have been placed within sections of the Tax Division to assist with implementation and administration of the tax. The recruitment of the fourth Audit Master, and Oil and Gas Revenue Auditors is ongoing.

During 2008, the department's auditors began auditing tax returns that were submitted for calendar year 2006 under the PPT program.

Conclusion

The ACES production tax has been effective in allowing the state to share in the benefits of high oil profitability. It has also responded well to lower oil prices by reducing state tax burden on Alaska's oil and gas producers. Over $2 billion in new capital investment was reported in fiscal year 2009 reaching near-record levels. While these and other indicators suggest that the profits-based tax system has supported North Slope exploration and development, it would be misleading to suggest that ACES alone influences the level of investment. While tax is recognized as being an important factor in investment decisions, it is not the primary determinant. Long-term price forecasts, as well as the resources themselves, have proven to be much more significant drivers of industry activity.

The department is continuing to analyze ACES to identify opportunities to improve the tax framework in order to support additional exploration and development in the state, while not harming the state's revenue base.

The new reporting requirements under ACES are helping the department develop a better understanding of industry expenditures and activity, and have assisted in the state's revenue forecasting efforts. Development of new tax regulations is progressing, though several challenges remain for both the state and taxpayers. Numerous workshops have been held to solicit industry input and these will continue as the department continues to work through outstanding issues. In 2008, the production tax audit group began auditing taxpayers who submitted annual returns for CY 2006 under PPT.

Overall, the information reviewed by the department indicates that ACES is performing as expected when it was passed by the Legislature in 2007. The economic provisions are resulting in the revenue levels anticipated, and the investment incentives appear to distribute the increased tax burden in a fashion that continues to encourage reinvestment, though the experience with the credit program could be improved for new explorers. Challenges remain in the implementation by the department, but they are manageable and the department is positioned to meet those challenges.

Acknowledgements

First and foremost, we wish to thank the many managers and senior officers of petroleum exploration companies and associated firms who submitted survey responses, thereby providing the data for the analyses in this report. We also appreciate the assistance of numerous Canadian trade commissioners overseas who identified petroleum industry contacts in their host countries.

Thanks also are due to the Australian Petroleum Producers and Explorers Association for identifying key companies and providing contact information to ensure ample representation from "down under." We are very grateful to the following groups, among others, for bringing the survey to the attention of their members: the South Australian Chamber of Mines and Energy; the Instituto Argentina del Petroleo y del Gas; the Canadian Association of Petroleum Producers; the Colorado Oil and Gas Association; the Independent Petroleum Association of America; and the Small Explorers and Producers Association of Canada.

Special thanks are due to Diane Katz, the Fraser Institute's Director of Risk, Environment, and Energy Policy, for her insightful editing of this report; to Kristin McCahon for managing its publication; and to Bill Ray for developing the world and regional maps.

Any errors or omissions are the sole responsibility of the authors. As they worked independently, opinions expressed by the authors are their own and do not necessarily reflect the opinions of supporters, trustees, or other staff of the Fraser Institute.

Survey Information

The 2009 Fraser Institute Global Petroleum Survey was distributed to managers and executives of petroleum exploration and production companies around the world and to firms that provide support services to such companies.

The analyses contained in this report are based on information obtained from 577 respondents representing 276 companies. The exploration and development budgets of these participating companies totaled about $200 billion in 2008. That represents more than 50 percent of global upstream expenditures last year, according to the *World Energy Outlook* 2008 (International Energy Agency, 2008).

3893

Executive Summary

This report presents the results of the Fraser Institute's 3rd annual survey of petroleum industry executives and managers regarding barriers to investment in oil and gas exploration and production in various jurisdictions around the world. The survey responses have been tallied to rank provinces, states, and countries by the severity of investment barriers such as high tax rates, costly regulatory schemes, and security threats, among other factors.

A total of 577 respondents completed the survey questionnaire this year, providing sufficient data to evaluate 143 jurisdictions. This is a substantial increase from the 2008 survey, in which 81 jurisdictions were rated, and the 2007 survey, in which 54 jurisdictions were rated.

The jurisdictions have been assigned scores for each of 16 factors that affect investment decisions. The scores are based on the proportion of negative responses a jurisdiction received; the greater the proportion of negative responses, the greater the perceived investment barriers and, therefore, the lower the jurisdiction's ranking.

This year for the first time, the six Australian states, Australia's Northern Territory, and the Timor Gap were each evaluated as individual jurisdictions.

An All-Inclusive Composite Index derived from the scores of all 16 factors provides an overall assessment of each jurisdiction. On this basis, the 10 least attractive jurisdictions for investment are Bolivia, Niger, Venezuela, Ecuador, Sudan, Russia, Bangladesh, Nigeria, Kazakhstan, and Ethiopia.

Jurisdictions within North America, Europe, Australia, and New Zealand generally received the best rankings overall. The 10 most attractive jurisdictions for investment, based on the All-Inclusive Composite Index, are Arkansas, Alabama, Kansas, Austria, Mississippi, Nebraska, South Dakota, Texas, Oklahoma, and Indiana.

Nine of the top 10 jurisdictions on this year's All Inclusive Composite Index are US states. Of these, top-ranked Arkansas and second-ranked Alabama were also among the top three jurisdictions in 2008. Saskatchewan, the only Canadian jurisdiction among the top 10 last year, fell to 38th (of 143) this year.

Among jurisdictions experiencing the greatest drops on the All Inclusive Composite Index are Bangladesh, Cote d'Ivoire, Myanmar, and Libya. In Europe, both Spain and Italy lost considerable ground in the rankings, as did the Ukraine, which continues to be regarded as among the least attractive jurisdictions for investment. Canada's Yukon and Northwest Territories also slipped in the rankings and, along with the third territory, Nunavut, which was rated for the first time this year, stand out as the least attractive regions in North America for investment in exploration and development.

Comments received from respondents highlight why some jurisdictions are considered attractive for investment and others not. Investors say they turn to different jurisdictions when confronted with high royalty fees and tax rates, inadequate infrastructure, price controls, and labor shortages. Similarly, investors prefer to avoid jurisdictions with costly and time-consuming regulations. Other factors being equal, competitive tax and regulatory regimes can attract investment and thus generate substantial economic benefits.

Survey Methodology

Sample design

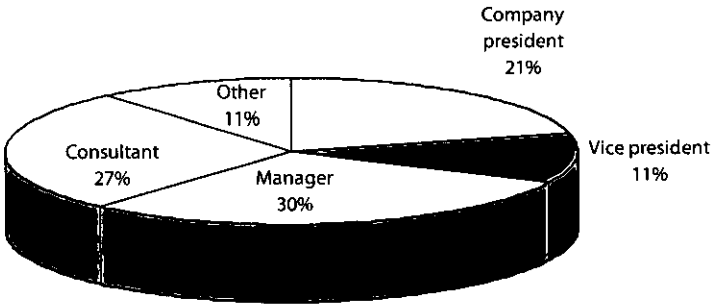
This survey was designed to identify the provinces, states, and countries with the highest barriers to investment in oil and gas exploration and production. This allows jurisdictions ranked poorly by investors to consider reforms that would improve the investment environment. Petroleum companies use the information to corroborate their own assessments and to identify jurisdictions where new investment may be attractive.

The survey was distributed to managers and executives in the "upstream" petroleum industry. This includes exploration for oil and gas reserves, and the production of crude oil, bitumen, and both conventional and non-conventional forms of natural gas. It does not include the refining and processing of crude oil and raw natural gas, or the transportation and marketing of petroleum products.

The names of potential respondents were chosen from publicly available membership lists of trade associations. Canadian trade commissioners abroad also provided the names of some companies and individuals in their host countries. In addition, some industry associations provided contact information for individuals with member companies.

The survey was administered from February 2, 2009 to April 17, 2009. A total of 577 responses were received from individuals representing 276 companies. About two-thirds of the respondents identified themselves as either a manager or holding a higher-level position. The companies represented in the survey account for more than 50% of the industry's annual spending on petroleum exploration and production (International Energy Agency, 2008).

Figure 1: The Position Survey Respondents Hold in Their Company, 2009



3894

Survey questionnaire

The survey was designed to capture the opinions of managers and executives regarding the level of investment barriers in jurisdictions with which their companies were familiar. Respondents were asked to rate how the 16 factors listed below influence company decisions to invest in various jurisdictions.

1. Fiscal Terms—government requirements pertaining to royalty payments, production shares, and licensing fees.
2. Taxation Regime—the tax burden (other than for oil production, which is reflected under Fiscal Terms), including personal, corporate, payroll, and capital taxes.
3. Local Natural Gas Prices—whether regulated rates for natural gas are set too low to recoup exploration and production costs.
4. Cost of Regulatory Compliance—the costs of processing permit applications, participating in hearings, etc.
5. Regulatory Uncertainty—the extent to which the regulatory environment is unstable, i.e., whether there are frequent, unexpected, or unjustified changes in rules and requirements.
6. Environmental Regulations—the costs of complying with regulatory requirements on exploration and production processes and facilities.
7. Local Processing Requirements—the extent to which a jurisdiction requires oil and gas that is extracted locally also to be processed locally.
8. Trade Regulations—the ability of producers to gain access to markets through the export of crude oil, natural gas, and refined petroleum products.
9. Labour Regulations and Employment Agreements—the degree of flexibility employers may exercise in hiring and firing, compensation, and work rules.
10. Local Public Infrastructure—the availability and quality of schools and colleges, hospitals, and recreation facilities.
11. Business Infrastructure—the adequacy of roads, railways, and airports.
12. Geological Database—the availability of credible and complete data on area geology.
13. Labor Availability—the supply and quality of labor, and the willingness of foreign workers to relocate to the region.
14. Aboriginal Land Claims—the uncertainty of unresolved claims by native groups, which can interfere with land access and transportation rights-of-way.
15. Political Stability—the frequency of changes in policies, regulations, and elected officials.
16. Security—the safety of assets and personnel, and the risk of expropriation.

For each of the 16 factors, respondents were asked to select one of the following five responses that best described each jurisdiction they were familiar with:

1. Encourages investment
2. Is not a deterrent to investment
3. Is a mild deterrent to investment
4. Is a strong deterrent to investment
5. Would not invest due to this criterion

The survey included a list of 162 jurisdictions that respondents could evaluate, including most Canadian provinces and territories, many US states (and the Atlantic, Pacific, Alaska, and Gulf Coast offshore regions), all 6 Australian states and 1 territory, the Timor Gap, and countries with current or potential petroleum production capacity. Mexico and other countries where investment in upstream petroleum exploration and development is mostly confined to government-owned facilities were excluded.

Scoring the survey responses

For each jurisdiction, we calculated the percentage of negative scores for each of the 16 factors.[1] We then developed an index for each factor by assigning the jurisdiction with the highest percentage of negative responses a score of 100, and correspondingly lower scores to the other jurisdictions according to their ratings. The jurisdictions with the lowest scores are considered the most attractive by the upstream investors and thus rank better than jurisdictions with higher, more negative scores.

Only jurisdictions evaluated on all 16 factors by an average of five respondents are included in the rankings, and no jurisdictions are included for which fewer than three responses were received for any of the 16 factors. This resulted in the ranking of 143 jurisdictions with a median of 19 responses each.

In addition to rankings for each of the 16 factors, jurisdictions are ranked on four composite indices, as follows.

All-Inclusive Composite Index

The All-Inclusive Composite Index is derived equally from the scores earned by jurisdictions on all 16 factors. This index is the most comprehensive measure of the investment barriers within each jurisdiction. A large index value indicates that investors consider a jurisdiction relatively unattractive for investment.

1 The negative scores were determined by the number of times respondents graded a factor as "a mild deterrent to investment" or as a "strong deterrent to investment," or indicated that they "would not invest" in the jurisdiction because of issues summarized under that factor heading. This year, the scoring methodology was changed to include the "mild deterrent to investment" response in order to differentiate among jurisdictions for which the number of stronger negative responses was negligible or constituted only a small portion of the total number of responses received.

3895

Commercial Environment Index

The Commercial Environment Index ranks jurisdictions on five factors affecting the costs of conducting business and the net revenue potential:

- Fiscal terms
- Taxation regime
- Local price of natural gas
- Local business infrastructure
- Labor availability

The index ranking was calculated by averaging the negative scores for each of these five factors. A large index value indicates that industry managers and executives consider that commercial conditions constitute significant barriers to investment.

Regulatory Climate Index

The Regulatory Climate Index reflects the scores assigned to jurisdictions for the following six factors:

- The cost of regulatory compliance
- Regulatory uncertainty
- Environmental regulations
- Local processing requirements
- Trade regulations
- Labor regulations and employment agreements

A relatively high Regulatory Climate Index value indicates that regulations, requirements, and agreements in a jurisdiction constitute a considerable barrier to investment, resulting in a relatively poor ranking.

Geopolitical Risk Index

The Geopolitical Risk Index represents the scores earned by jurisdictions for political stability and security. These two factors are considered to be more difficult to overcome than either regulatory or commercial barriers because political change typically is necessary before significant progress can be made. A high score on the Geopolitical Risk Index indicates that investment is relatively unattractive in that jurisdiction because of political instability and/or security problems such as crime, confiscation and use of company equipment and vehicles, and the threat of expropriation.

Global Results

All-Inclusive Composite Index

Table 1 compares the 2009 and 2008 scores and rankings of the All-Inclusive Composite Index. The first and second columns present the 2009 and 2008 rankings respectively. The third and fourth columns present the absolute scores for each jurisdiction in 2009 and 2008, based on the percentage of negative responses for each of the 16 factors in the survey. Those at the top of the list are regarded as having relatively few investment barriers and, therefore, as being attractive for investment.

The marked increase in the number of jurisdictions ranked this year represents greater survey participation by upstream investors with knowledge about overseas jurisdictions, especially in the Pacific Rim, Africa, and Europe, as well as a number of US states, and federally administered offshore regions.

The 10 jurisdictions with the largest percentage of negative responses, indicating the greatest barriers to investment, are:

1. Bolivia
2. Niger
3. Venezuela
4. Ecuador
5. Sudan
6. Russia
7. Bangladesh
8. Nigeria
9. Kazakhstan
10. Ethiopia

Apart from Ethiopia and Niger, which were not ranked in 2008, and Bangladesh, which fell from 45th (of 81) in 2008 to 137th (of 143) this year, the jurisdictions in this group were also among the 10 worst in last year's survey.

Bangladesh appears to have fallen from investors' favor largely as a result of fiscal terms, taxation, and the local price of natural gas. The security of production facilities and equipment has also become more problematic there.

In 2008, we noted some deterioration in the relative attractiveness for investment of Colorado, Alaska, and Alberta compared with 2007. The unfavorable ratings for Alberta and Alaska stemmed from increasingly costly fiscal terms and tax rates. Colorado's ranking suffered because of the stringency of its proposed environmental regulations for oil and gas explorers. As table 1 indicates, these factors have continued to affect the jurisdictional rankings.

FINAL

Thank you,

This is my first opportunity to speak at the Meet Alaska, it's a real honor. I'm going to talk about things close to home, to build on the global views we've heard today.

Continuous improvement is very important to BP. It's not a catch phrase or a slogan, but an attitude about how we do our business. It means that we want to be better today than we were yesterday. And better tomorrow than we are today.

In town hall meetings with our Alaska employees, I talk about **BP's 50-year Alaska strategy as a dream – not a promise.**

We've go a lot to do, but there is a lot to play for. The BP resource base in Alaska is greater than 5 billion BOE– but it is challenged.

The barrels are challenged: challenged by markets, challenged by technology and challenged by the cost of doing business.

Our strategy is focused on:

- Safe, Reliable and Efficient Operations
- Building a stable and viable base business at $50/bbl oil price
- And growing the business through unlocking the vast heavy oil and natural gas resources in our portfolio.

Nothing has changed in our strategy – but the business environment has changed, so our tactics have changed.

Factors like our medium term and long term outlook on oil price, costs and productivity, technology, technical risk, and the federal and state fiscal and policy regimes.

To achieve our 50-year dream we need to:

- continuously improve our performance in safety,
- protect the environment,
- deliver a business that is viable today, fit for tomorrow.

And delivers competitive investment options that sustain the business well into the future.

And when I say we, I don't simply mean BP. "We" includes: the industry, our contractors, the state and all Alaskans.

Together, we are facing more challenges than we did a few years ago. I want to touch on safety first. We have made progress – but we are not finished.

BP can't do it without you – safety starts with the people in this room. Our contractors, employees, and everyone who does business in the Alaska oil patch.

Of the 20 million man-hours worked last year, 80 percent were contractor man-hours. I need your help to ensure all the work on the Slope is conducted safely.

We all need to learn from companies like Little Red Services that had zero recordable incidents last year.

Or, facilities like Endicott that earned a three-year re-certification of its VPP Star status under the US OSHA Voluntary Protection Program. It was the first facility in Alaska to be certified by the OSHA program.

We need to learn from the people who made these success stories happen. That's what continuous improvement is all about.

For the contractors in the room, I think it's clear that the way to earn business with BP is to demonstrate you can work safely and efficiently.

The foundation of our strategy rests on a healthy light oil business. And a healthy light oil business is critical to a sustainable oil business in Alaska.

The light oil business has suffered the last few years due to declining production and rising costs.

Costs have risen through significant inflation and increased government take. Our cash break-even point is significantly higher today than it was 5 years ago – and is a threat to our future.

This is hard for people to understand, we remember when the price of oil was very low – $10, so what's changed?

Over the last 5 years, oil and gas industry costs have increased at a rate of four times the price of oil. [1] Meanwhile, North Slope oil production has declined about 29 percent.

Rising cost, reduced outputs and a lower commodity price; this is not a model for a sustainable business.

Economics and policies will continue to drive our business choices, because investment capital is limited.

The best opportunities attract the investment dollars.

BP is in action to improve the quality of the business and the risk-reward balance. We're focusing on three things.

1. Prioritizing the activity set or scope of work
2. Tackling inflation through competition to drive down costs
3. Improving the efficiency and productivity of every $ invested

[1] CERA Capital Cost Index Increased 200% since 2004, 3Q 2009 202%

Regarding the activity set – we are being selective and we are choosing what - and how much - we do.

- risk reduction activities focusing on infrastructure have the first priority
- Growth projects in execution like Liberty are next
- And finally, the base business

Activities that we've slowed or stopped for sustainability are:

- Western Region Development Expansion (WRDX) project as it is not competitive
- Heavy oil project continues, but has slowed by 50%
- Reduced our rig count from 10 to 7 from January last year.[1]

In terms of tackling inflation, many of you are aware of the steps we have taken in our "fit for the future" program.

The industry suffered significant inflation with the increased oil prices … and when the oil prices collapsed, the inflation remained.

[1] 1Q 2009 10 rigs, 1Q 2010 7 rigs, verified by Robinson

As I've said to contractors and to my team, we need to do what's right and fair with the contractor community. We live here too, and I want to ensure that the way we interact with you as contractors has been fair and reasonable.

We want to do business with Alaska contractors -- we just need you to be competitive.

The problem is that a dollar of cost to us is a dollar of revenue to you. No one likes to give up a dollar of revenue. It really hits close to home when you realize 80 percent of BP's spend is with Alaskan companies.

But to be sustainable, we need to ensure we pay market prices for goods and services. Competition is good and we have taken steps to award work to the most competitive suppliers.

For some activities, we've reduced costs by more than 50 percent from a few years ago.

Finally, we are looking to do things more efficiently. We are driving our business to continuously improve – so the next

well we drill will be better than the last ... so that tomorrow's activity is completed more efficiently than today.

We have some stunning examples of great teams making a real difference - teams that are changing the game in terms of safety, productivity and efficiency.

Accuren under the leadership of Dennis Lee, has more than doubled the number of corrosion inspections, improved efficiency and reduced injuries by 90%.

The CH2M Hill Weld Shop under the supervision of Chuck Shaumann and Jay Fillingham increased efficiency by 65%, with less than 1% rejection rate in more than 11,000 welds.

And, the BP Drilling & Wells Workover team and Nabors Rig 4ES, under the leadership of Dave Hebert, improved efficiencies in the installation of electric submersible pumps (ESP) by 33% in less than a year, saving more than $1MM.

These are just a few examples. What we find is that the most efficient teams are also becoming the safest teams. Our

focus is to have this kind of performance everywhere we work.

I have touched on how we are improving the performance and economics of our business – and now I would like to touch on government policy.

Last week's announcement by Governor Parnell on oil tax credits was a positive signal to the industry that he and his administration recognize that the ACES tax needs change to stimulate activity.

The opportunity for dialog is encouraging and we will participate openly. We believe the proposal is a good start, but it's not enough for sustainability of Alaska's oil and gas industry.

In Alaska, policy decisions around taxes made over the past few years have slowed the pace and scale of some of our North Slope developments.

We put projects on the shelf that didn't make sense in this environment and I mentioned three examples earlier.

It wouldn't be fair for me to assert that our investment decisions are solely based on the tax structure – in reality, there are a host of market factors. However, the tax structure plays a significant part in the decision process.

For a tax and royalty regime, Alaska has the least competitive tax structure of anywhere BP works in the world.

In the USA, the tax and royalty structures in the L48 and GOM are more competitive. The tax and royalty regimes in Australia, the North Sea, and Trinidad are also more competitive.

That means Alaska projects have to be more efficient to compete. This means our projects need to produce more barrels per dollar of investment and lower unit costs.

It's a tough challenge against the backdrop of decline and the Arctic environment where construction costs are significantly higher than the L48.

The two biggest issues with the Alaska tax structure are the overall tax rate, and the progressivity portion of ACES.

Here is a simple example:
In a Gulf of Mexico investment, the government take (taxes & royalties) from an incremental $1 at a $90 oil price is about 40 cents. That means the company has the upside potential of nearly 60 cents out of every incremental dollar.

So what is the government take on state lands in Alaska at $90 oil price? Because of the progressivity of the ACES severance tax, the government keeps between 70-80 cents of that one dollar, and the industry's share ranges from 20-30 cents.

If you had opportunities for new growth – where would you put your money? In a place where you can earn 60 cents on an incremental dollar, or 20-30 cents?

It should come as no surprise that we will need to reduce our capital spending about 15% this year. This year's actual capital spending will be about $850 million, compared to over $1 billion in 2009.

However, this 15% top line reduction actually masks the real impact that ACES has had on our base business.

Our 2010 investment consists of roughly one-third infrastructure renewal, one-third for growth and one-third drilling.

The infrastructure investment is not adding production, and the growth projects for BP are primarily our investment in Denali and Liberty.

The investment in our base business is focused on offsetting decline and delivering increased production from in field drilling. This is the activity that delivers more production in the short term.

That activity has been reduced since ACES passed at the end of 2007.

Here is some data that supports that statement:

Our total drilled footage will be more than 50% lower in 2010 vs. 2007. It was nearly 1 million feet in 2007.

Also, our capital investment in the base business has been reduced by 30% when comparing 2007 and 2010 investment.

It was encouraging that the Governor's announcement recognizes that this is an issue. That's a step in the right direction.

The bottom line is it's more difficult to attract capital to Alaska because the risk/reward balance is disadvantaged against investment opportunities in other parts of the world. Alaska has become more of a margin play as there is very little reward for price upside. Alaska needs to do better if it wants to attract investment.

So why then are we investing in Liberty?

Liberty will be the first full federal offshore development in Alaska, and the competitiveness of the project is helped because the high technical risk is balanced with higher

reward under the **federal tax structure – the project is not subject to ACES severance tax**. This is a good example of how policy drives investment.

This year, the first of up to six Liberty ultra-extended reach wells will reach 6-8 miles to a new 100-million barrel field.

First oil production is expected in 2011, peak of 40,000 barrels/day and a capital investment more than $1 billion.

That said, the state still benefits from Liberty:

- In state income and property taxes;
- a share of the federal royalty;
- 40,000 barrels/day down TAPS;
- and a lot of jobs -- about 40 Alaska companies worked on Liberty's construction.

There are other growth opportunities too. But like everything else, economics and policy will drive investment decisions.

The remaining resources in Alaska are significant – there is a lot to play for … but they are technically and commercially challenged – and they are harder to reach.

Being more technically challenged means it's harder for projects to be profitable – it takes more investment for less barrels compared with the past.

But the size of the resource base gives us great hope. There are significant opportunities in heavy oil and Alaska gas. But there are equally significant challenges.

You all know the heavy oil story. In a nutshell, it's an exciting opportunity that requires a technological solution. We have a strong belief we will find that solution.

However, our current estimates indicate that even with technological success, heavy oil is not economic under the current tax structure at today's oil prices.

Gas development is also an important part of our Alaska strategy, and it's certainly on the mind of every person in Alaska.

We all read the papers. Producers in the lower 48 have been aggressively looking at ways to access abundant shale gas resources. And they are succeeding. There has been a significant change in the Lower 48 gas market due to a technological breakthrough.

A recent study estimates that by 2020, unconventional gas, such as shale, is forecast to account for over 50% of total US production … with estimated shale gas supplies that will meet today's US market for 50 to 100 years.[3]

At the same time, Natural gas demand is forecast to remain relatively flat for the next 30 years.[2]

The market in the lower 48 is working … supply is up, demand is flat and Henry Hub prices have reacted.

I believe that demand will have to increase to make Alaska gas commercially viable in the Lower 48.

---

[3] Source: EIA Annual Energy Outlook 2009 & Brian Frank Presentation 1/09

[2] DOE 09 Forecast flat demand 23TCF/yr through 2020.

So gas is challenged. More challenged than it was just a few short years ago. But my team and I are absolutely focused on finding a way to bring Alaska North Slope gas to market. I don't know exactly how the future will play out, but I can promise that we are looking at all options for Alaska gas development.

That takes me back to where I began – our future is about continuous improvement of our business and playing the ball where it lies.

BP's employees are passionate about building a sustainable business in Alaska.

Over 81 percent of our two thousand person workforce call Alaska home. Together BP and our employees support more than 700 education, community organizations and youth teams in 49 different towns and villages across Alaska. Our employees are also the largest contributors to United Way.

Their commitment to Alaska is personal, and so is mine.

For decades BP has been the responsible steward of Alaska resources, delivering revenues to our state.

Our commitment has *not changed*, but our business reality has.

I believe the future will require all the "We" to work together differently – and better, than we have in the past.

I believe by working together with Alaskans, we can make our 50 year dream a promise … and that's what get's me excited about working in Alaska.

Thank you

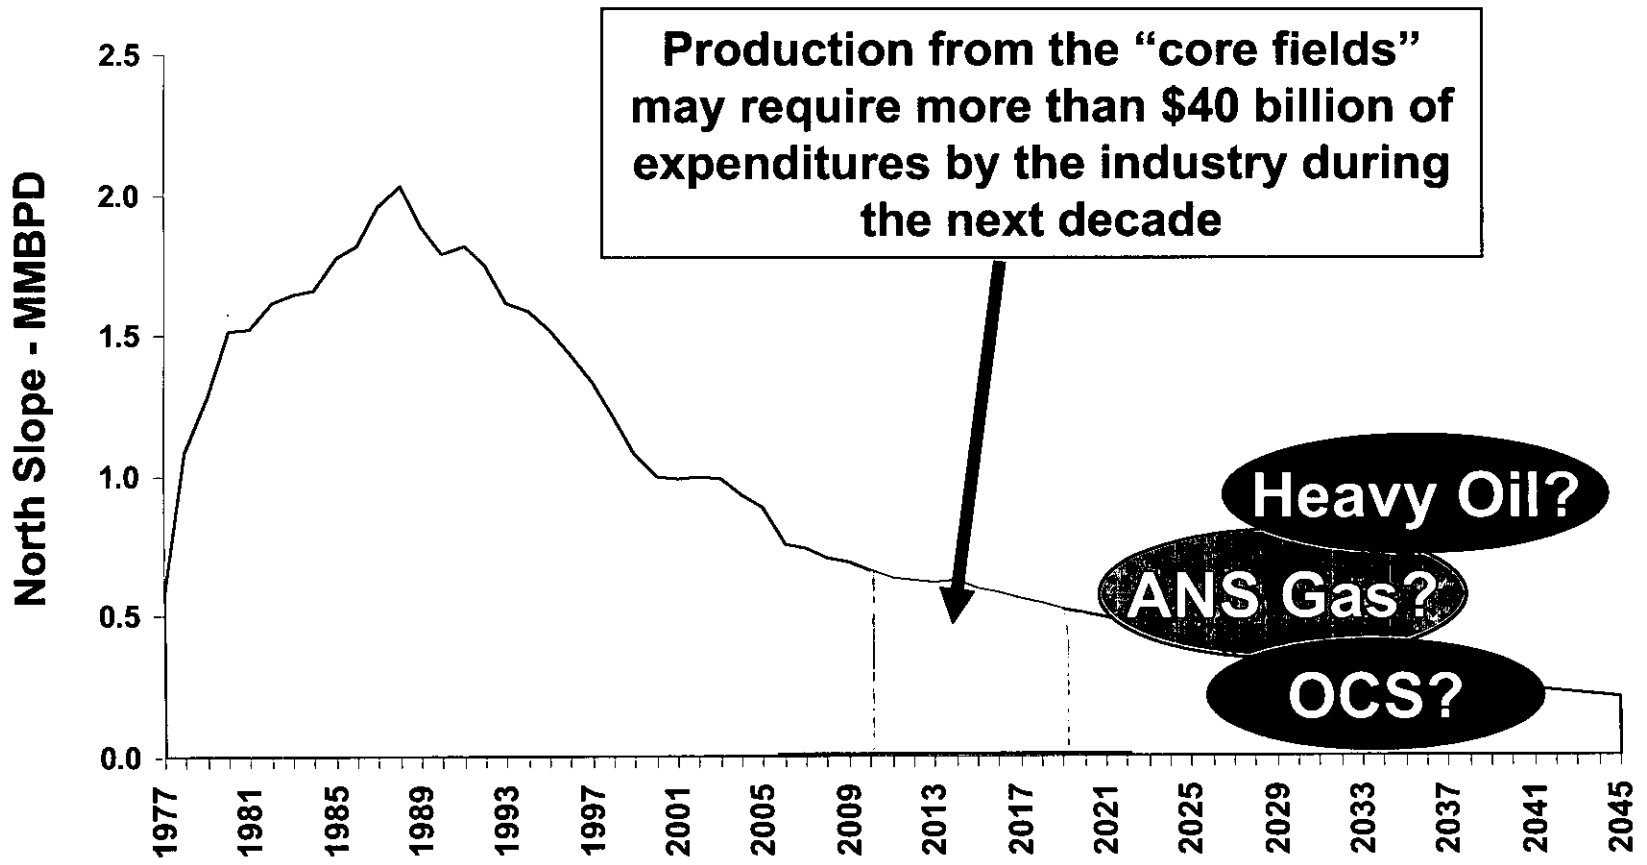
CAUTIONARY STATEMENT FOR THE PURPOSES OF THE "SAFE HARBOR" PROVISIONS OF THE PRIVATE SECURITIES LITIGATION REFORM ACT OF 1995

The following presentation includes forward-looking statements within the meaning of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended, which are intended to be covered by the safe harbors created thereby. You can identify our forward-looking statements by words such as "anticipates," "expects," "intends," "plans," "projects," "believes," "estimates," and similar expressions. Forward-looking statements relating to ConocoPhillips' operations are based on management's expectations, estimates and projections about ConocoPhillips and the petroleum industry in general on the date these presentations were given. These statements are not guarantees of future performance and involve certain risks, uncertainties and assumptions that are difficult to predict. Further, certain forward-looking statements are based upon assumptions as to future events that may not prove to be accurate. Therefore, actual outcomes and results may differ materially from what is expressed or forecast in such forward-looking statements.

Factors that could cause actual results or events to differ materially include, but are not limited to, crude oil and natural gas prices; refining and marketing margins; potential failure to achieve, and potential delays in achieving, expected reserves or production levels from existing and future oil and gas development projects due to operating hazards, drilling risks, and the inherent uncertainties in interpreting engineering data relating to underground accumulations of oil and gas; unsuccessful exploratory drilling activities; lack of exploration success; potential disruption or unexpected technical difficulties in developing new products and manufacturing processes; potential failure of new products to achieve acceptance in the market; unexpected cost increases or technical difficulties in constructing or modifying company manufacturing or refining facilities; unexpected difficulties in manufacturing, transporting or refining synthetic crude oil; international monetary conditions and exchange controls; potential liability for remedial actions under existing or future environmental regulations; potential liability resulting from pending or future litigation; general domestic and international economic and political conditions, as well as changes in tax and other laws applicable to ConocoPhillips' business; and limited access to capital or significantly higher cost of capital related to illiquidity or uncertainty in the domestic or international financial markets. Other factors that could cause actual results to differ materially from those described in the forward-looking statements include other economic, business, competitive and/or regulatory factors affecting ConocoPhillips' business generally as set forth in ConocoPhillips' filings with the Securities and Exchange Commission (SEC), including our Form 10-K for the year ending December 31, 2008, as updated by our quarterly and current reports on Forms 10-Q and 8-K, respectively. ConocoPhillips is under no obligation (and expressly disclaims any such obligation) to update or alter its forward-looking statements, whether as a result of new information, future events or otherwise.

Investment in Core Fields

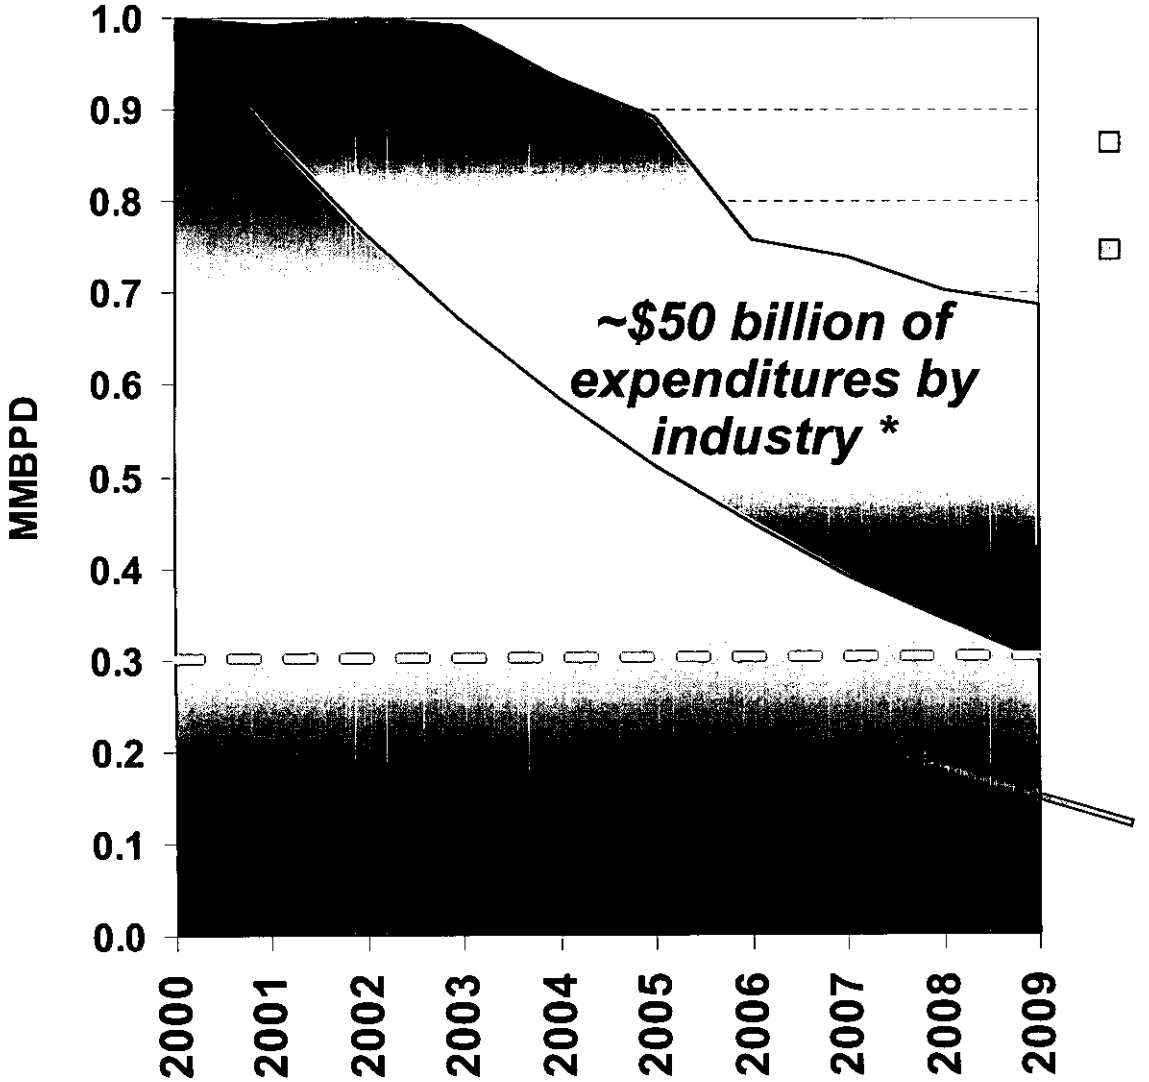


Core fields are the bridge to the future

Sources: DNR production forecast and extrapolation of DOR expenditures forecast

ConocoPhillips

2000-2009 North Slope Production
with and without $50 Billion Invested by Industry



- Peak production in 1988
- $50 billion of expenditures by industry from 2000 - 09
  - Mitigated decline of nearly 400,000 bbl/day

Assumes 12.5% decline
<u>without investment:</u>
Production could have fallen to ~300,000 bbl per day

ConocoPhillips

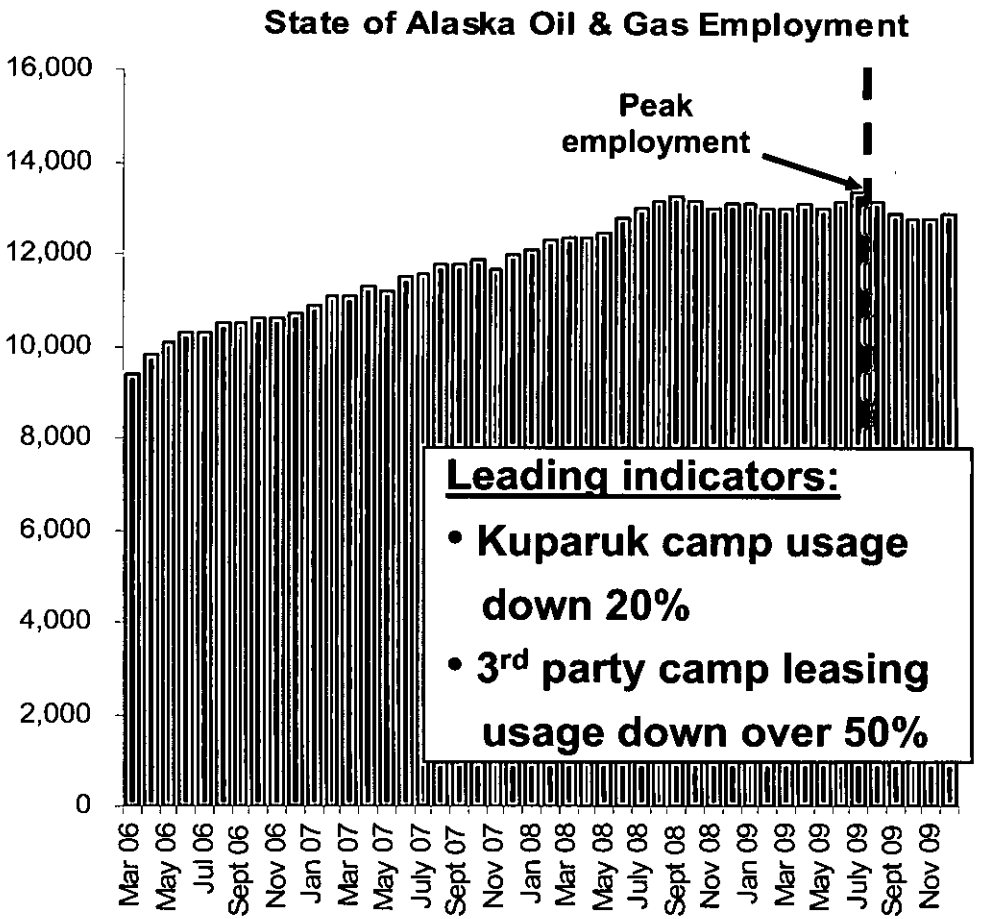
Oil & Gas Employment

Department of Revenue:

- ***"Employment in the industry has also increased steadily since the implementation of PPT and ACES, with 2009 forecast to be the highest in state history"***

Response:

- **Data since July-09 indicate downward trend in Oil & Gas jobs**
- **Prior to July-09 - employment levels driven primarily by maintenance and inspection activity, rather than PPT and ACES**
- **Alaska state unemployment rising**



Source: Alaska Dept of Labor

ConocoPhillips

Investments

Department of Revenue:

- **Investments are up since 2007**
- ***"majority of growth in capital expenditures is attributable to drilling, seismic and other projects"***

Response:

- **Cost levels impacted by hyper-inflation**
- **Maintenance spending is primary driver of recent activity increases on the slope**
- **Investment in new oil production has declined**
  - **Industry drilling / well count down**
  - **$2 billion in projects deferred**

ConocoPhillips

ACES Impacting Projects

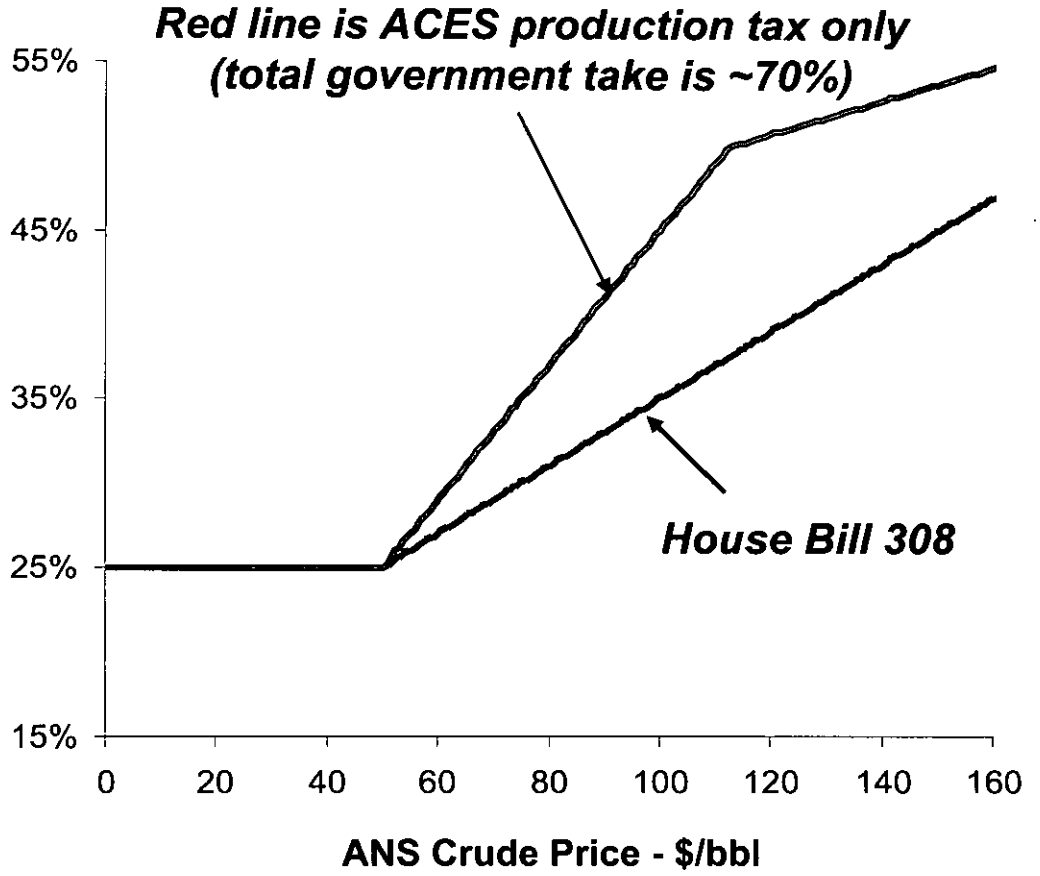
- Project activity since ACES passed
  - Oooguruk – pre-ACES, royalty relief
  - Nikaitchuq – royalty relief
  - Liberty – not subject to ACES
- Over $2 Billion in projects deferred since ACES
  - Approx. 40,000 barrels per day, plus impact on jobs
    - Prudhoe I-Pad and Gas Partial Processing (GPP)
    - West Sak slower pace
    - ULSD topping plant *(opportunity foregone)*

Larger, long-term projects impacted by progressivity

ACES – Progressively Increasing Tax

- **Rapidly increasing tax**
  - Net cash flow tax
  - Higher base tax rate
  - Retroactive
  - Restricted cost deductions
- **Incentives**
  - 20% tax credit for capital
  - 30-40% credit for exploration
- **Uncertainty increased**
  - Dept of Revenue discretion
  - Additional reporting / admin.
  - 6-year audit period
  - Punitive interest rates

ACES Production Tax *(does not incl. royalty, federal, other taxes)*



Significant increase in tax burden and administrative costs

Oil Tax Legislation

	Current Law	Governor Bill (SB271/HB337)	House Bill 308CS / Senate Bill 267	House Bill 321
Base Tax Rate	25%	*No change*	*No change*	**20%**
Progressivity	0.4% per $1 price	*No change*	**Reduced from 0.4 to 0.2%**	*No change*
Tax credits	20% for capital; 30%, 40% for exploration	**Extended to all wellwork activities a 30% credit**	**Extended to all wellwork activities a 30% credit**	*No change*
Audit period	6 years	*No change*	**Return to 3 years**	*No change*
Interest due to delayed regulations	Charge punitive interest with regulations not fully defined	**Grants DOR authority to waive interest**	**Grants DOR authority to waive interest**	*No change*
Capital tax credit utilization	Credits spread over two years	**Full use of credits in the year incurred vs. one half currently**	*No change*	*No change*

Other areas of concern not addressed:

DOR discretion, incomplete regulations, facility sharing treatment, administrative burden, other hidden costs

Summary

- **Industry has over $40 billion in opportunities over the next decade**
  - **Existing fields have upside potential**
- **Future investments are challenged**
  - **Deferred over $2 billion in projects**
  - **Drilling activity has declined**
  - **Increased maintenance activity**
- **Expected legislative focus**
  - **30% well-related activity is a step in the right direction**
  - **Reduced progressivity required for more balanced risk / reward**

Improvements to ACES needed to increase investment and jobs

SB 271

SB 271 OVERVIEW

April 5, 2010

Alaska State Department of Revenue

SB 271 Overview

Purpose

- Increase tax incentives for activities that will result in more jobs and more production of oil and gas
- Provide all taxpayers with the full value of the incentives currently offered
- Provide fairness in the administration of the production tax

SB 271 Overview

Four Main Components

- 30% Credit for Well-Related Expenditures [.025]
- Eliminates requirement that credits be spread over 2 years[.023(a) & (d)]
- Eliminates reinvestment requirement for state purchase of credit certificates [.028(e)(2)-(3)]
- Waiver of interest on retroactive regulations [.020]

4 30% Credit for Infill Drilling – Well-Related Expenditures

30% Credit for Infill Drilling

- Targeting an area of concern – The documented drop, beginning in 2005, in the number of wells drilled in Alaska;
- Provides a credit boost from 20% to 30% for well-related capital expenditures;
- Provides a credit where none is currently available for well-related operating costs (i.e. well work-overs).

Review - SB 271 Overview

Four Main Components

- 30% Credit for Well-Related Expenditures [.025]
- Eliminates requirement that credits be spread over 2 years[.023(a) & (d)]
- Eliminates reinvestment requirement for state purchase of credit certificates [.028(e)(2)-(3)]
- Waiver of interest on retroactive regulations [.020]

Governor Sean Parnell
STATE OF ALASKA

February 9, 2010

The Honorable Gary Stevens
President of the Senate
Alaska State Legislature
State Capitol, Room 111
Juneau, AK 99801-1182

Dear President Stevens,

Under the authority of Art. III, Sec. 18 of the Alaska Constitution, I am transmitting a bill that proposes four discrete changes to Alaska's oil and gas production tax. The bill will provide incentives for explorers and producers to continue to invest in Alaska. The proposed changes will encourage investment and employment within the state, and ultimately, increase production of the state's oil and gas resources.

I remain committed to considering all proposals and ideas that will result in increased exploration and drilling that produce more oil and jobs for Alaskans.

First, the bill will encourage investment by creating a new 30 percent alternative tax credit for qualified costs closely related to well drilling and work over operations designed to enhance current well operations. The taxpayer will have to claim the 30 percent credit within six months of completing the qualifying activity, and will have to submit enough information for the Department of Revenue to determine that the expenditures qualify for the credit.

Second, the bill will allow qualified applicants, regardless of their future spending levels, to receive cash refunds for tax credits that the applicants received for qualified capital expenditures. Under current law, an applicant cannot qualify for a cash refund unless, within 24 months of receiving the tax credit certificate, the applicant incurred a qualified capital expenditure or successfully bid on a lease on State land. If the applicant is unable to meet either requirement, the applicant cannot receive payment for the qualified capital expenditures the applicant invested in the state. To solve this problem, the bill will eliminate the requirement that the applicant make additional capital expenditures or be the successful bidder for a lease on State land.

Third, the bill will allow producers and explorers who qualify for the 20 percent tax credit under AS 43.55.023 for capital expenditures to use the credit in the year that the credit is earned. Currently, producers and explorers are required to spread the benefit over two years. Allowing producers and explorers the full value of their credits in one year would increase the amount available for further exploration activities and for work on currently producing wells.

Finally, the bill will allow the Department of Revenue to waive interest for certain underpayments of taxes due before the effective date of certain regulations implementing the production tax. This provision will apply only if regulations to implement the production tax are not yet in effect at the time the annual tax payments are due, and only if the underpayment results from the producer's good faith estimation of the tax due. Should it be determined that the taxpayer overpaid the amount of tax due under the regulations in effect at the time of payment and that a refund is due, no interest will be due on a refund made within the time period specified in the bill.

With these changes, we will continue to responsibly maximize and invest in Alaska's oil and gas resources. I urge your prompt and favorable action on this measure.

Sincerely,

Sean Parnell
Governor

Phone: (907) 465-2300
Fax: (907) 465-2394

Sponsor Statement
HB 337 / SB 271
Oil Production Tax Credits

Governor Parnell's legislation to modify Alaska's oil taxes (HB 337 and SB 271) is intended to create Alaska jobs, increase production and TAPS throughput quickly, and encourage new companies to explore in Alaska. This is accomplished by providing incentives for explorers and producers only if they do on the ground work in Alaska, by expanding investment credits for that work, allowing companies to enjoy the entire benefit of credits earned, and waiving interest accrued due to retroactive regulations.

These changes will encourage investment in jobs and increased production of the state's oil and gas resources.

- **Encourages Investment by Expanding Investment Credits.**

  The bill increases to 30 percent a tax credit for costs related to drilling wells, including "work over" wells in existing fields that are now excluded from the credit.

  Primary Benefit: Most valuable for infill drilling programs within existing units, like Prudhoe Bay and Kuparuk. Current credits focus on exploration and other remote operations far removed from existing operations. This credit is focused on existing fields where infill drilling and work over wells can be done quickly resulting in new jobs immediately and new production within months.

- **Eliminates the payment delay for explorers by allowing the state to buy capital credits earned by explorers regardless of future spending levels.**

  The bill will allow those who receive credit certificates to receive cash refunds regardless of their future spending levels. Currently, an explorer cannot qualify for a cash payment from the state for its credit certificate unless, within 24 months of receiving the tax credit certificate, the explorer makes additional expenditures or successfully bids on a state oil lease. The bill eliminates this reinvestment requirement.

  Primary Benefit: Explorers can invest with complete confidence that they can monetize their earned tax credits, improving the economics of their project.

3942

- **Allows all companies to enjoy the entire benefit of their capital credits in the year they are earned, eliminating the requirement to spread the credit over two years.**

  The bill allows companies to use their entire tax credits in the year that the credit is earned. Currently, producers and explorers are required to spread the benefit over two years.

  Primary Benefit: Increases the value of the tax credits by allowing them to be monetized quickly.

- **Provides a waiver of interest charges on late payments caused by the retroactive application of new regulations.**

  The bill waives interest calculations for underpayments of taxes due to the retroactive effective date of regulations implementing the production tax. This provision will apply if the underpayment is the result of the producer's good faith estimation of the tax due.

  Primary Benefit: Is simply fairer. This provides for a more just outcome when a producer makes a tax payment based on a good faith understanding of the tax laws, and then regulations are made retroactive to before the time that the payment was due.

FISCAL NOTE

STATE OF ALASKA **BILL NO.** SB 271
2010 LEGISLATIVE SESSION

ANALYSIS CONTINUATION

Bill Language:

This bill makes four refinements to Alaska's oil and gas production tax. The refinements and the revenue impact of each are discussed below:

1. Increased credits for well related expenditures: This bill would modify AS 43.55.025 to allow a 30 percent credit against production tax for exploratory well expenditures and most development well expenditures. For wells more that 25 miles outside of existing units (or more than 10 miles outside of Cook Inlet units) the credit is 40 percent of exploratory well expenditures. These credits would also be an increase in credits for well related expenditures. Currently, companies are allowed a 20 percent credit for well related qualified capital expenditures under the provisions of AS 43.55.023. There are no current provisions for credits against operating expenditures and this bill would extend the 30% credit to well related operating expenditures as well as capital expenditures. This provision would take effect July 1, 2010.

Under current projected spending and production levels, revenues would be estimated to be reduced by $325 million in FY 2011, $335 million in FY 2012, and $350 million in FY 2013-2016. However, the Department of Revenue provides an indeterminant fiscal impact to revenues because the new incentives will likely spur higher spending levels on development activity, which would result in more credits being earned, but would also be expected to increase production, thus providing an offsetting increase in revenue.

2. Removing reinvestment requirement for state purchase of capital credits: For companies applying for state purchase of capital credits, this bill would remove the requirement that the companies reinvest an amount equal to the amount of the credit purchased within 24 months after applying for a credit certificate. This provision would take effect July 1, 2010.

This provision is expected to be revenue neutral as the credits will reduce revenue whether the state purchases the credits or other companies purchase and subsequently apply the credits against a tax liability.

3. Capital credits no longer required to be spread over two years: Producers and explorers receive a capital expenditure credit in the amount of 20 percent of the qualified capital expenditure. This bill would remove the provision that no more than half of the tax credit may be applied for in a single calendar year. As a result, the entire 20 percent credit could be applied in the year it is earned. This is retroactive to January 1, 2010.

There is a revenue reduction for FY 2010 of $120 million because of the immediate effective date of the changes to spreading of capital credits. For FY 2011-FY 2013, the revenue reduction from changes to the spreading of capital credits will be about $50 million per year. For FY 2014 and beyond, the revenue impacts will be negligible.

4. Interest waived for changes in tax liability as a result of to retroactive regulations changes: Following adoption of retroactive regulations to the oil and gas production tax under AS 43.55, the Department of Revenue is required to determine whether the retroactive application of the regulation caused an overpayment or underpayment of the amount due in tax. For an underpayment, interest is waived as long as the underpayment was due to the regulation and the producer made a good faith estimation and payment of its tax obligation under regulations in place when the payment was due. For an overpayment, interest does not accrue until either the first day of the second month following the regulation taking effect, or 90 days after the Department receives an amended annual production tax return with request for refund. The interest provisions are retroactive to February 2007. At this time it is uncertain whether there would be any revenue impact from this change, since it is unclear whether there was any underpayment or overpayment due to the retroactive regulations. The Department of Revenue does not include interest payments in our revenue projections, therefore this change would not affect our revenue forecast.

*** We cannot currently make a determination of the revenue impacts of the bill. For this reason, asterisks are include in our revenue estimates for this fiscal note.

Expenditures:
The Department will be able to implement the provisions of this bill using existing resources.

ANALYSIS: *(Attach a separate page if necessary)*

The bill will, first, change the current provision under AS 43.55.023(b) that only half the various tax credits could be taken in any one year. This limitation spreads the benefits of the credit out over a couple of years, thereby diluting the incentive that the credit provides to the extent that a producer/investor must wait before receiving the full benefit of the credit. This bill would also accelerate most investor's receipt of the full value of the credit. Second, the bill would extend the current 30% credit provided under 43.55.025 to include development drilling (this credit is available now only for exploration wells drilled beyond three-miles of another well. This credit will reduce the taxpayer's tax liability and, other things being equal, contribute to improved economics for development drilling. Finally, the bill allows a small producer to monetize the credit more easily by eliminating the requirement that the producer spend additional money before receiving the credit monies.

The effect on royalty revenue is an indeterminant positive.

BILL NO. SB 271

ANALYSIS CONTINUATION

In these three ways, the bill will encourage additional investment in oil and gas development in Alaska, leading to an expected increase in the amount of oil and gas produced from State lands. This should increase the amount of royalty revenue collected, the exact amount of this increase is indeterminate. This bill also requires that the producer submit to the DNR withing 30 days of the request for a credit under AS 43.55.025 data on development well activity under Section 9. While the DNR currently reviews seismic and exploration well information, the requirement to look at development wells as well may take additional staff time. However, we think we will be able to undertake this review with current staff.

SPONSOR STATEMENT

SB 274 – William Jack Hernandez Sport Fish Hatchery

The purpose of this bill is to name the new state fish hatchery on Elmendorf Air Force Base, the William Jack Hernandez Sport Fish Hatchery. Hernandez pioneered the fish rearing and fish hatchery program at Ft. Richardson.

William Jack "Bill" Hernandez served his country valiantly during WWII, serving as a civilian contractor on Wake Island in the South Pacific, building fortifications for USMC personnel. Wake Island was attacked by the Japanese on Dec. 7, 1941, the same day as the Pearl Harbor attack, and a violent 16 day struggle ensued between the Marine regiment and an overwhelming enemy force. On December 23, 1941, Wake Island was captured and Mr. Hernandez was taken as a prisoner of war. He was a POW for three years before being released following surrender of the Japanese forces in 1945.

In 1947 Mr. Hernandez enlisted in the US Army, and in 1956 his unit was transferred to Fort Richardson where he became a Fish and Wildlife Conservation NCO. His orders were to rehabilitate the lakes and streams on post. As a result of Mr. Hernandez efforts, in 1957 the Secretary of the Army approved a cooperative agreement between the Army, the Alaska Territorial Department of Fish and Game, and the Fort Richardson power plant, allowing the plant's cooling pond to be used for rearing fish. Mr. Hernandez ran the fish rearing project, and annual production reached 12,000 rainbow trout, 100,000 Chinook salmon smolt, and 200,000 Coho salmon smolt.

In 1968 Mr. Hernandez retired from the US Army and received an Army Commendation Medal for his efforts. Shortly after retirement, Hernandez was hired by the Alaska Department of Fish and Game as a Fish Culturist at the Fire Lake Hatchery. In a few years he returned to Fort Richardson to manage the large scale fish hatchery constructed at the cooling pond. He also worked at the nearby Elmendorf fish hatchery. In 1983, after 26 years of dedicated service raising salmon and trout, Hernandez retired.

Sadly, Hernandez died of cancer in 2003. The Veterans of Foreign Wars Post 7665 honored him with a 21-gun salute. He was the epitome of Tom Brokaw's "Greatest Generation." Without his drive and dedication, the fish rearing project at Fort Richardson would have never gotten off the ground. His life's work made an enormous contribution to the sport and commercial fishing industry of the Cook Inlet region. Please honor William Jack "Bill" Hernandez by supporting this legislation.

William Jack Hernandez

William Jack (Bill) Hernandez was born in Los Angeles, California on April 30, 1920 and died Aug. 31, 2003 in Wasilla. At the age of 21, Bill was employed by Morrison-Knudson Construction Co. building fortifications on Wake Island. After the attack on Pearl Harbor, he and other civilian contractor personnel were assigned to assist the Marine detachment defending the Wake Island. On Dec. 23, 1941, Wake Island was captured, and Bill was imprisoned in various POW camps in China. He survived an escape attempt, breaking his ankle while jumping from a train. He was subsequently recaptured, and this is described in several books on the battle of Wake Island, perhaps most notably "Jim's Journey: A Wake Island Civilian POW's Story" as well as a History Channel documentary: "Wake Island: Alamo of the Pacific."

After the war, Bill returned to California enlisting in the Army in 1947. He initially served as a foreign language interpreter, and his early military career took him to Korea and Europe. Bill honed his chess skills and became a Chess Master. At one point, Bill defeated Japan's top chess player. In 1956, his unit was transferred to Fort Richardson, where he became a Fish and Wildlife Conservation NCO. His orders were to rehabilitate the lakes and streams on post. In 1957, after several months of negotiating with the military and others, Bill received a letter from the Secretary of the Army approving a cooperative agreement between the Army, the Alaska Territorial Department of Fish and Game and the Fort Richardson power plant which allowed the plant's cooling pond to be utilized for rearing fish. Bill ran the fish rearing project, and annual production reached as high as 12,000 catchable-size rainbow trout, 100,000 Chinook smolt and 200,000 coho smolt. Bill retired from the Army in 1968 and received an Army Commendation Medal for his efforts: *"Through his perseverance, ingenuity, and scholarly research, he conceived and pioneered a process of rearing rainbow trout, silver salmon and king salmon from the fingerling stage to the migratory smolt, and in addition, accelerated the restocking of post and community lakes and streams.* ***By virtue of Sergeant Hernandez' diligent efforts coupled with his high sense of responsibility, the military conservation program in Alaska received successive official and recorded recognition by the State Legislature of Alaska and by the United States Senate.*** *His invaluable service to the military and civilian communities of Alaska earned him the worthy respect and admiration of all with whom he came in contact."*

Shortly after his Army retirement, Bill was hired by the Alaska Department of Fish and Game as a Fish Culturist at the Fire Lake Hatchery. He returned to Ft Richardson a few years later to manage the large scale hatchery constructed at the cooling pond. Bill also worked at the Elmendorf hatchery. In 1983, after 26 years of dedicated service raising salmon and trout, Bill retired again.

Bill then purchased a boat and fished commercially for seven seasons in Bristol Bay. When not fishing, Bill spent his time at his cabin on Lake Susitna and groomed snowmobile trails in the area. He was a member of the Wake Island Civilian Survivors Association, a Mason, and a Cooperative Weather Observer for NOAA. Though Bill never married, his many friends and dog Peggy were his Alaskan family. He was loved and respected by everyone who knew him.

Bill was buried in his native California, close to his twin sister Jewel with whom he shared a special bond. The Veterans of Foreign Wars Post 7665 honored him with a 21-gun salute. **Bill Hernandez was the epitome of Tom Brokaw's "Greatest Generation".**

5640 Portage Drive
Wasilla, AK 99654
aktn@gci.net
December 24, 2009

Representative Wes Keller
600 E. Railroad Avenue
Wasilla AK, 99654

Dear Representative Keller:

I am a retired ADF&G fisheries biologist, commercial fisherman and one of your constituents. I and various active and retired ADF&G biologists are requesting your assistance with legislation to name the new Elmendorf fish hatchery after the man who pioneered the fish rearing and hatchery program at the Ft Richardson: William Jack (Bill) Hernandez (biography, photos, news clippings and draft bill attached). The Elmendorf hatchery is under construction and is scheduled to be completed in May of 2011. I have written Representative Dahlstrom and Senator Dyson, who represent Elmendorf AFB, to sponsor legislation to name the hatchery after Mr. Hernandez.

Mr. Hernandez was a remarkable man who was a Wake Island civilian POW during WWII, enlisted in the U.S. Army after liberation, and, in 1957, while a sergeant in the Army, started the fish rearing program at Ft. Richardson. He ran the fish rearing facility for 11 years, with annual production reaching 12,000 catchable-size rainbow trout, 100,000 Chinook smolt and 200,000 coho smolt. Bill retired from the Army in 1968, and I was appointed to be his successor at Ft Richardson. Bill left huge "shoes" to fill. There was no hatchery at the site then but rather the pond was segregated into three areas for rearing fish. Two old Quonset huts served as living quarters, warehouse, office and lab. Trout were stocked in lakes on military land as well as Anchorage area lakes. Salmon smolt were released into Ship Creek, and returning adult salmon contributed to the commercial and sport fishery. Bill often worked seven days a week, with limited assistance from ADF&G or Army personnel. Bill was not immune from other duties regularly assigned to NCOs, and he spent one night a week as duty NCO at HQ Co. Bill was a busy guy! After Army retirement, Bill worked another 15 years as a fish culturist for ADF&G at the Fire Lake Hatchery and the new hatcheries on Ft. Richardson and Elmendorf AFB.

Sadly, Bill died of cancer in 2003. Without his drive and dedication, the fish rearing project at Ft. Richardson would have never gotten off the ground and the hatchery there probably would have never been constructed. He made an enormous contribution to Anchorage sport fishermen and Cook Inlet commercial fishermen. Please honor William Jack (Bill) Hernandez by helping with this legislation.

Respectfully,

Tom Namtvedt

Harvest days at the hatchery

Story by Andrew Perala / photos by Paul Brown

Bill Hernandez walks down the narrow steel pathway as he has for years, sideways and backwards, methodically pushing and pulling on the 10-foot aluminum pipe that is the business end of a powerful industrial vacuum cleaner.

The walkway is mounted on top of a six-inch-thick wall that separates two long, narrow fish ponds called raceways — two of the 20 raceways at the Elmendorf State Fish Hatchery, site of one of the greatest concentrations of rainbow trout in the world. Each walkway is 80 feet long by 10 feet wide and holds a single species of fish at a certain stage of growth: 6,000 fat adult rainbow trout in each tank at the east end, hundreds of thousands of finger-length silver salmon in the pond below Hernandez' feet.

Hernandez tugs at the 100 feet of hose now trailing behind him and guides the head of the vacuum cleaner back and forth along the concrete bottom. The four-inch hole at the end sweeps through a brown mix of fish food and fish excreta. The chore is performed weekly.

"It's not natural for the rainbows to jump from one pond to the other," says Hernandez. "But if a rainbow were to jump into a fingerling pond, well, we wouldn't have to feed him anymore."

There are more than a million fish in the Elmendorf hatchery, part of a carefully orchestrated plan to manipulate nature, to get maximum yield.

The six-year-old facility in Fish Heaven on Earth, a placental sind farm where baby rainbows eat, sleep and generate their lives away.

This year the hatchery, located just off the Elmendorf Access Road near Ship Creek, will produce 520,000 king salmon, 800,000 silver salmon and 3 million rainbow trout eggs.

From 3 million eggs come 2½ million fingerling survivors released in 140 lakes from Fairbanks to Kodiak.

All the Elmendorf fish are part of a plan to sate, at least temporarily, the appetites of Alaska sport fishermen.

More than 130,000 rainbow trout are released within the boundaries of the municipality of Anchorage each year. Few, if any, rainbows caught within city limits come from fish that are not hatchery-raised. Although there are no firm figures on how many hatchery-bred salmon are caught statewide, officials say they probably make up the majority.

Delivering the small fish is not a job for the Postal Service. Where there are roads, flatbed trucks with 400-gallon tanks drive up to the edge of the water and pour out the fingerlings. In more remote areas, fish are air-delivered. Converted army-surplus pickups and helicopters with modified pontoons haul the tanks that finally jostle the fish

this wild idea that the warm water from the power plant could be used to raise fish. Nobody believed him, so he went and did it himself. It took a couple of years for it to work, but then he got the hatchery he wanted."

Hernandez ran the hatchery from the early 1960s until last June. When his 20-year military hitch ended in 1969, he took a month off, then started working for the state at the same location.

"When Bill was the manager at Fort Rich," says Dewyl Klafter, the Elmendorf hatchery manager, "you couldn't keep him out of the ponds. Unlike some managers who sit in their offices all the time, Bill had to be hands-on with the fish."

Hernandez admits he probably views fish differently from most people, probably with more recognition and regard.

For the next few weeks he has been waist-deep in rainbow trout, right in the thick of the annual

Fish are scooped up in long-handled nets.

rainbow egg harvest in the hatchery raceways.

His half-dozen hatchery workers dress in heavily insulated waders and wool clothing, standard attire for fish farmers.

Hernandez wears a baseball cap, a bright yellow rain slicker, insulated waders and gloves. An unlit cigar juts from his mouth as he heads for the raceway.

He attacks his work with vigor. When not scooping fish, Hernandez keeps track of the [illegible] by jabbing the pond with the flat end of a [illegible] scraper.

hatchery

Continued from page 9

scooping up a few fish at a time in long-handled nets.

The nets are emptied into the tubs with a wild splashing that is stilled as the tranquilizer, called MC-222, takes effect. The drug tranquilizes voluntary muscle action without affecting the involuntary muscles, so a fish can breathe through its gills but cannot lift a fin to save its life.

Each fish is picked up by two hands. A gentle squeeze to the middle of the gut confirms the fish's status. Eggs will protrude from the underside of a ripe female. Males will squirt clear liquid or white milt.

Females with eggs are passed into a tub next to the doorway of a tent covering a length of the raceway. Males are transferred to a penned-off area at the far end of the raceway. Inside the Quonset-shaped tent two handlers work steadily.

One holds the fish upside down while the other picks up a metallic device shaped like a common garden hose nozzle. A brown hose trails off into the water and is attached to a large green cylinder of the same oxygen hospitals use. There is a trigger on the nozzle device and, at the end, a short, thick needle that looks as though it could fill a basketball. The needle is sharp, though, and a quick jab into the fish's body cavity just behind the dorsal fin produces no blood.

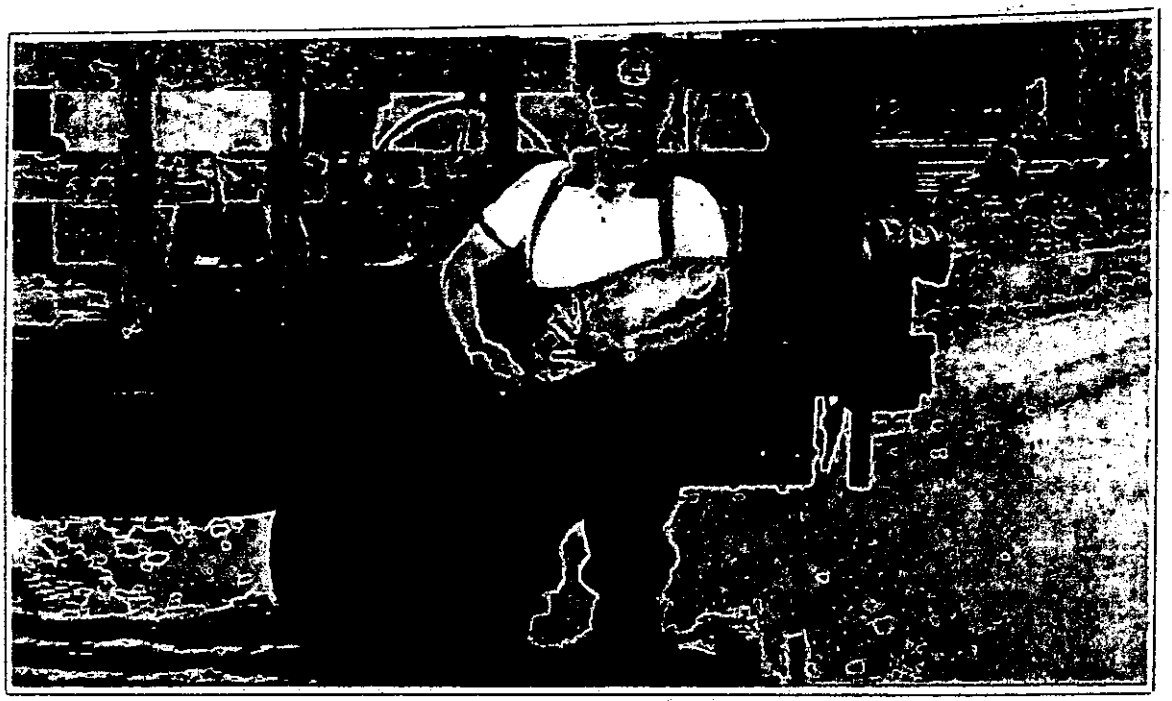
With a pull of the trigger, oxygen at low pressure flows into the fish, gently forcing out the bright orange eggs in a steady stream that spills into a round plastic tray. The eggs are checked to see if the color is normal and if there are any genetic mutations. Occasionally, bad eggs will be dark or green.

At one time eggs were harvested by squeezing the sides of the fish, a process that damaged the eggs and hurt the fish.

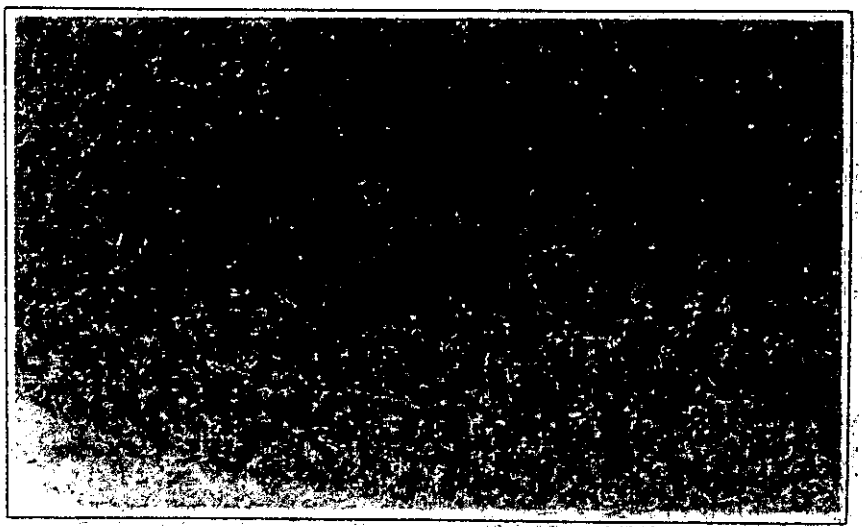
While one worker pours the eggs into a larger bucket, another tosses the rainbow into a penned-off section of the raceway inside the tent. The fish slips into the water like a limp torpedo and lies still for a minute or two, gills working in gulps. The constantly flowing water soon washes away the paralyzing drug. With little flicks of the tail and a few turns of the head, the fish rights itself and surges off into the distance.

Forty fish contribute 1,200 to 2,000 eggs apiece. The eggs are disinfected to kill germs from human contact and given to another worker for fertilization.

The process is quick. With the male fish held firmly in one hand, the handler squeezes a white stream of milt into the bucket. Unlike females, most males die after contributing to the genetic pool. It is the same in the wild. There is no natural reason for male fish to live another winter. Although winter water temperatures dip to as low as 34 degrees, virtually stopping all feeding and movement, the low oxygen content in the lakes would not support larger fish populations.



Bill Hernandez cradles the last fish he will handle at Fort Richardson. Now he plans to catch fish for himself.



This year the Elmendorf hatchery will produce 5 million rainbow trout eggs.

Elmendorf is able to function year-round as a hatchery because it receives from an Air Force generating plant a constant supply of 83-degree waste water that is piped half a mile to the hatchery. There it is mixed with Ship Creek water and brought to a stable temperature.

The temperatures are constantly monitored and alarms sound if there is a variance of more than a few degrees. Rainbows cannot live in water above 62 degrees without suffering from a killing form of stress. For salmon, the disaster brink is several degrees lower. Rainbows live in 42-degree water in the winter and 46-degree water in the spring when spawning.

Of the 19 fish hatcheries and rearing facilities in Alaska, Elmendorf is the only one that handles brood stock rainbow, the fish from which we get more fish. Other hatcheries trap wild salmon in streams and collect the eggs for rearing.

There are approximately 18,000 of the dark, fat trout in three raceways at Elmendorf, ranging in age from 1 to 4 years.

Watching thousands of them rolling in the water can arouse even the most casual fisherman, but catching these hand-fed beauties would be quite a trick.

An eight-foot-high chain link fence surrounds the property. Inside, eight large white plastic dishes create invisible barriers just inside the fence. Cross their line of fire and a shrieking alarm goes off outside the office and inside the newly constructed manager's house just a hundred yards away.

Casting a long line over the fence wouldn't work, either. A 20-foot moat of land separates the fence from the tanks. Reaching the ponds would be simple enough, but dragging a fighting trout overland and flipping it over the fence would be all but impossible.

There is more science than meets the eye inside the hatchery. Besides the electronically controlled warm water system, there is food that would captivate the most jaded readers of junk food wrappers.

Back in the 1940s, the early days of fisheries science, fish at hatcheries Outside were fed chopped cattle guts. Seemed like a good idea at the time. It was a waste product, the fish ate it voraciously, and it appealed to people who thought all that came from cattle was good.

But the diet soon caused epidemic disease and many early hatcheries were closed.

Today, fish food is a science itself. Bagged in 50-pound sacks like dog food, the Oregon mash used at Elmendorf contains 22 ingredients ranging from fish meal to vitamins. An abundance of herring oil makes the pellets soft. Mature fish are fed at least once a day and consume, Hernandez says, about 1 percent of their total body weight daily. Young fish are fed more often, up to seven times a day. The Elmendorf hatchery uses 700 pounds of fish food daily in the peak spring season.

Although he had the opportunity to advance in the Department of Fish and Game hierarchy and the later bureaucracies that came to control the hatcheries in Alaska, Hernandez never pursued those career avenues. This summer, after working more than 25 years for others in the handling of fish, Hernandez will harvest fish on his own. With his 32-foot boat, the Hernando II, he will head out into Bristol Bay in search of king salmon.

A home computer will help him keep track of catch rates, fish locations and feeding patterns. But out on the rolling bay, Hernandez will use his own instinct, gleaned from years of experience, to catch fish.

Andrew Pevela is a reporter for The Daily News.

SB 274 Notes

1. Director Charlie Swanton, ADF&G, Division of Sport Fish, states that he takes no official position with respect to naming a public facility. Swanton also states he has no objection to the proposed name (William Jack Hernandez) for the fish hatchery.

2. Director Swanton states the Division of Sport Fish has not received any additional recommendations for naming the fish hatchery, other than recommendations for naming it after William Jack Hernandez, and several former staff members have also recommended naming the new hatchery after Hernandez.

3. The new state fish hatchery will be completed May 2011.

4. Citizens (including current and former ADF&G employees) who strongly support this legislation and wish to testify via teleconference:

Sponsor Statement
Senate Bill 275

Senate Bill 275 addresses longstanding attempts to determine compensation to the State of Alaska for harvests of common property geoduck clams that may remain on aquatic farm sites. Farmers need to clear their sites of wild geoducks in preparation for planting geoduck seed and lack of resolution on this issue has been a substantial impediment to the development of Alaska's geoduck farming industry.

The Alaska Supreme Court decided on April 16, 2004, that aquatic farm sites should contain only insignificant populations of wild geoduck clams. The Legislature expedited a bill that defined "insignificant" populations of geoducks as less than 2,000 pounds per acre. Since it appeared some sites already leased to farmers might exceed that amount, the legislation allowed ADF&G to determine "reasonable compensation" to the state for the harvest of "significant" wild geoduck stocks.

The last-minute timing of the decision did not leave the legislature enough time to debate different rates of compensation. Consequently, this measure provides the legislature with the opportunity to regain its taxing authority by allowing the legislature to set rates of compensation for the taking of state resources.

The first section of SB275 directs the Alaska Department of Fish and Game to consider the economic health of aquatic farming as it develops regulations. This section was developed in recognition of Article 8, Section 15 of the Alaska Constitution which allows the state to "promote the efficient development of aquaculture in the State."

When the actual costs are included, the Department rate represents an approximate 75% tax rate on the ***net*** profits of harvesting these geoducks, far higher than any other tax rate on resources in Alaska. Therefore, SB275 sets the tax rate for live geoducks at 10% of the gross value. This figure was determined by using ADF&G's formula of providing the state with 50 percent of the net profits of the sales. ADF&G's figure was lower because the agency did not consider all the verifiable costs of the farmers in particular the 3.5% Fisheries Business Tax. In addition, farmers also are required to replace each wild geoduck harvested by planting five juvenile geoducks on the farm site.

The bill also sets a tax rate of 3% on processed geoducks. The 3% rate was suggested by geoduck farmers during the public comment period on the proposed regulations as a good faith offer to provide some compensation to the state, even though they would lose money if they had to sell processed geoducks.

SECTIONAL ANALYSIS
SENATE BILL 275

Section 1 adds that the Commissioner of the Alaska Department of Fish & Game should consider the economic health and sustainability of the aquatic farming industry when it develops regulations for the aquatic farming industry.

Section 2 amends the statute stating that the commissioner may authorize the permittee to remove and sell the excess amount of the wild stock if the permittee pays the department compensation in the amount of 10 % of the ex-vessel value for live products and 3% of the ex-vessel value for a processed product on top of the 3.5% fisheries business tax.

Section 3 provides an effective date for this Act.

Information provided by Alaska Shellfish Growers Association
Rodger Painter 957-0704
Paul Fuhs 351-0407

Senate Bill 275

Reasonable compensation for significant wild geoducks on geoduck farms. Previous legislation required "reasonable compensation" but did not set a compensation rate.

The Association is proposing compensation to the state in the amount of 50% of the net profits from harvesting surplus wild geoducks from farm sites.

$3.50/lb average exvessel price provided by Fish and Game = gross revenue

Farmer costs for harvesting and replacing wild geoducks:

$2.00/lb payment to commercial divers for harvesting geoducks
$0.57/lb reseeding cost
$0.12/lb PSP testing
$0.11/lb State raw fish tax
$2.80/lb Total farmer harvesting cost

$3.50 minus $2.80 = $0.70/lb X 50% tax = $0.35

$3.50/lb ex vessel price divided by $0.35 = 10% of exvessel value

When this 10% is added to the raw fish tax, it would be a total of 13.5% in taxes paid to the state. **Return to State: $0.47/lb. Return to farmer: $0.35/lb.**

Is this reasonable?

This is four times the amount paid by the commercial geoduck divers. In addition, the farmers must replace and leave the same number of geoducks on the farm site at the end of their lease as were there when they started.

Comparison of Impacts of Different Geoduck Tax Rates

The following is a comparison of ADF&G's two attempts to set a tax rate for "reasonable compensation" for the taking of significant stocks of wild geoducks on aquatic farm sites with a 10% gross value tax. This would apply only to 7 farms leased by the state prior to changes in state law forced by a state supreme court ruling. Current pre-leasing surveys by ADF&G (paid by the applicant) will ensure no new sites with "significant" wild stocks are leased and permitted by the state.

	ADF&G	Farmers	
Harvest Cost (vessel, fuel, deckhand)	$ 1.62	$ 2.00	Veriified by farmers with receipts.
Testing Fees (PSP, water)	$ 0.27	$ 0.27	
Reseeding (hatchery seed)	$ -	$ 0.57	Used then eliminated by ADF&G. 5-1 replacement.
Fisheries Business Tax	$ 0.11	$ 0.11	
Totals	**$ 2.00**	**$ 2.95**	
2006-2007 Average Ex-vessel Value	$ 3.50	$ 3.50	
"Net" Profit per Lb.	$ 1.50	$ 0.55	
50% Gross Value Tax	**$ 1.75**	**$ 1.75**	
Farmer profit/loss	**$ (0.25)**	**$ (1.20)**	
21% Gross Value Tax	**$ 0.74**	**$ 0.74**	
Farmer Profit/Loss	**$ 0.77**	**$ (0.19)**	
10% Gross Value Tax	**$ 0.35**	**$ 0.35**	
Farmer Profit/Loss	**$ 1.15**	**$ 0.20**	

What the Public Gets Out of the 10% Tax

Gross Value Tax	10%
Fisheries Business Tax	3.50%
Effective Tax rate	13.50%
Tax Revenue per pound	**$ 0.47**

Plus five juvenile geoduck clams per wild adult harvested.

What the Farmer Gets/Lb. $ 0.20

ANALYSIS: *(Attach a separate page if necessary)*

SB 277 would exempt the owners of renewable energy generation facilities from regulation by the Regulatory Commission of Alaska (RCA). The exempted entity would not be subject to RCA certification requirements or RCA regulation of rates and standards of service.

Since the RCA will not be required to certificate or regulate the owners of renewable energy generation facilities, the agency will not experience any increase in workload due to the passage of SB 277.

SENATOR LESIL MCGUIRE

Sponsor Statement for Senate Bill 277

"An Act exempting from regulation by the Regulatory Commission of Alaska and by municipalities generators of electricity from renewable energy resources that sell electricity to regulated utilities."

The electric demand of the relatively small and dispersed population in Alaska has traditionally been served by regulated utilities. The Regulatory Commission of Alaska (RCA) is charged with certifying utilities, regulating their rates, resolving disputes and protecting consumers. Throughout most of the State, electric utilities are not-for-profit and/or member owned cooperatives that serve a defined geographic area and customer base. Regulation of these utilities, given their monopoly status may certainly be appropriate.

However, regulation can pose obstacles to investment. In many states, the generation of electricity has been deregulated in order to provide an avenue for private sector investment in the sector. In a traditionally regulated model, the investment risk is born by ratepayers where in a deregulated environment the risk is born by investors. In markets that have been deregulated, investment in renewable energy is significantly higher than in strictly regulated markets. A study by the U.S. Energy Information Administration shows that the annual growth of renewable penetration in restructured electricity markets is 11.3% while it is a mere .6% in highly regulated markets. Recognizing the regulatory impediment to the development of renewables, the Federal government has provided avenues for renewable generators to escape state regulation through an application to the Federal Energy Regulatory Commission.

Senate Bill 277 attempts to find a middle ground between a thoroughly deregulated market and the highly regulated environment in Alaska. SB 277 exempts renewable generation from RCA regulation only if the power is sold to a regulated utility. This compromise maintains RCA oversight over the power sales agreements and thereby provides a layer of protection to ratepayers. SB 277 opens Alaska's electricity market to private sector investment in renewables and will encourage investment in a cleaner energy future for Alaska.

MEMORANDUM February 12, 2010

SUBJECT: Definition of "public" in AS 42.05
(Work Order No. 26-LS1353\E)

TO: Senator Lesil McGuire
Attn: Mike Pawlowski

FROM: Brian J. Kane BJK
Legislative Counsel

You have asked the following: For the definition of "public" or "general public"[1] found at AS 42.05.990(3), does that definition include all three subparagraphs, (A), (B), and (C), so that all three must be satisfied to mean "public"? Or, are (A), (B), and (C) three different options for the meaning of "public," as in (A) or (B) or (C)?

Generally speaking, "and" should be used as a conjunctive and "or" as a disjunctive. Under ordinary circumstances, the literal meaning of the words "and" and "or" should be applied unless the literal meaning makes the statute inoperable or it becomes questionable. *Sutherland Statutory Construction*, sec. 21:14 (7th ed.). In the case at hand, though, it seems that using the word "and" as a conjunctive brings the subparagraphs in the definition into conflict. Assuming that all three things are required for the definition of "public," then you have a scenario where there is (1) a group of 10 or more customers, (2) one or more customers, and (3) a utility purchasing the product. If all three of these are a part of "public," then it is quite difficult to think of a situation where this definition would actually apply. On the one hand you are dealing with customers purchasing from a utility, and on the other hand you have a utility purchasing

---

[1] In full, AS 42.05.990(3) reads: (3) "public" or "general public" means

> (A) a group of 10 or more customers that purchase the service or commodity furnished by a public utility;
>
> (B) one or more customers that purchase electrical service for use within an area that is certificated to and presently or formerly served by an electric utility if the total annual compensation that the electrical utility receives for sales of electricity exceeds $50,000; and
>
> (C) a utility purchasing the product or service or paying for the transmission of electric energy, natural or manufactured gas, or petroleum products that are re-sold to a person or group included in (A) or (B) of this paragraph or that are used to produce the service or commodity sold to the public by the utility.

electricity to sell to a customer. These cannot both occur at once in order to fulfill the definition. Using the term "and" as a conjunctive appears to make this definition inoperable, as best I can surmise. Therefore, it appears that the second option for the definition that is offered is the correct interpretation for the definition of "public."Hence, the term "public" means (A), or it means (B), or it means (C).

In relation to the definition for "public utility" -- which has the line "furnishing, by generation, transmission, or distribution, electrical service *to the public* for compensation" -- you can, assuming that "and" is disjunctive, read "public" to mean any one of the three options available in (A), (B), or (C), which offers a more expansive inclusion into this section than a reading requiring all three paragraphs to be met.

The definition in question was amended in 1990.[2] Prior to 1990, the definition read as follows

> (3) "public" or "general public" means
>
> (A) any group of 10 or more customers that purchase the service or commodity furnished by a public utility as defined in (4) of this section; and
>
> (B) any utility purchasing the product or service or paying for the transmission of electric energy, natural or manufactured gas, or petroleum products which are re-sold to a group included in (A) of this paragraph or which are used to produce the service or commodity sold to the public by the utility.

With only two parts to the definition, it seems clearer that "public" either means what is described in (A) or it means what is described in (B). To fall under the definition of public, there does not have to be a scenario where there is a group of 10 or more customers *and* any utility purchasing the product. If that was the proper reading, then finding an entity that met that criteria would be very difficult. The change in the definition that occurred in 1990 added one more subparagraph to the definition (now (B)). Adding this third subparagraph did not change the definition to mean that the term "public" had to include all three paragraphs to be considered "public."

In conclusion, it appears that the term "public" can have the meaning listed in AS 42.05.990(3)(A) or (3)(B) or (3)(C) -- it does not have to meet all three at once. However, amending the definition to change the "and" to an "or" would relieve the definition of controversy.

If I may be of further assistance, please advise.

MEMORANDUM February 16, 2010

SUBJECT: Independent power producer (Work Order No. 26-LS1353\E)

TO: Senator Lesil McGuire
Attn: Mike Pawlowski

FROM: Brian J. Kane BJK
Legislative Counsel

As a follow-up to the memorandum I sent to your office on February 12, 2010, you have asked: If an independent power producer sells to less than 10 customers, would it be a utility and therefore subject to regulation under AS 42.05?

Assuming that the definition of "public" or "general public" in AS 42.05.990(3) is being read as (A) or (B) or (C), then the answer to your question is that it is possible the independent power producer described could be subject to regulation. AS 42.05.990(3) has an option for the definition of "public" that reads:

> (B) one or more customers that purchase electrical service for use within an area that is certificated to and presently or formerly served by an electric utility if the total annual compensation that the electrical utility receives for sales of electricity exceeds $50,000;

If an independent power producer has one or more customers but fewer than 10 *and* meets the other requirements of the definition in (B) -- namely receiving sales of electricity that exceed $50,000 -- then the independent power producer would be regulated under AS 42.05 since it sells to the "public." However, if the producer sells to fewer than 10 customers and does not exceed the $50,000 sales mark, then that producer is not subject to regulation under AS 42.05, as the producer would not be selling to the public, which is a requirement of AS 42.05.990(4)(A) to be a public utility.

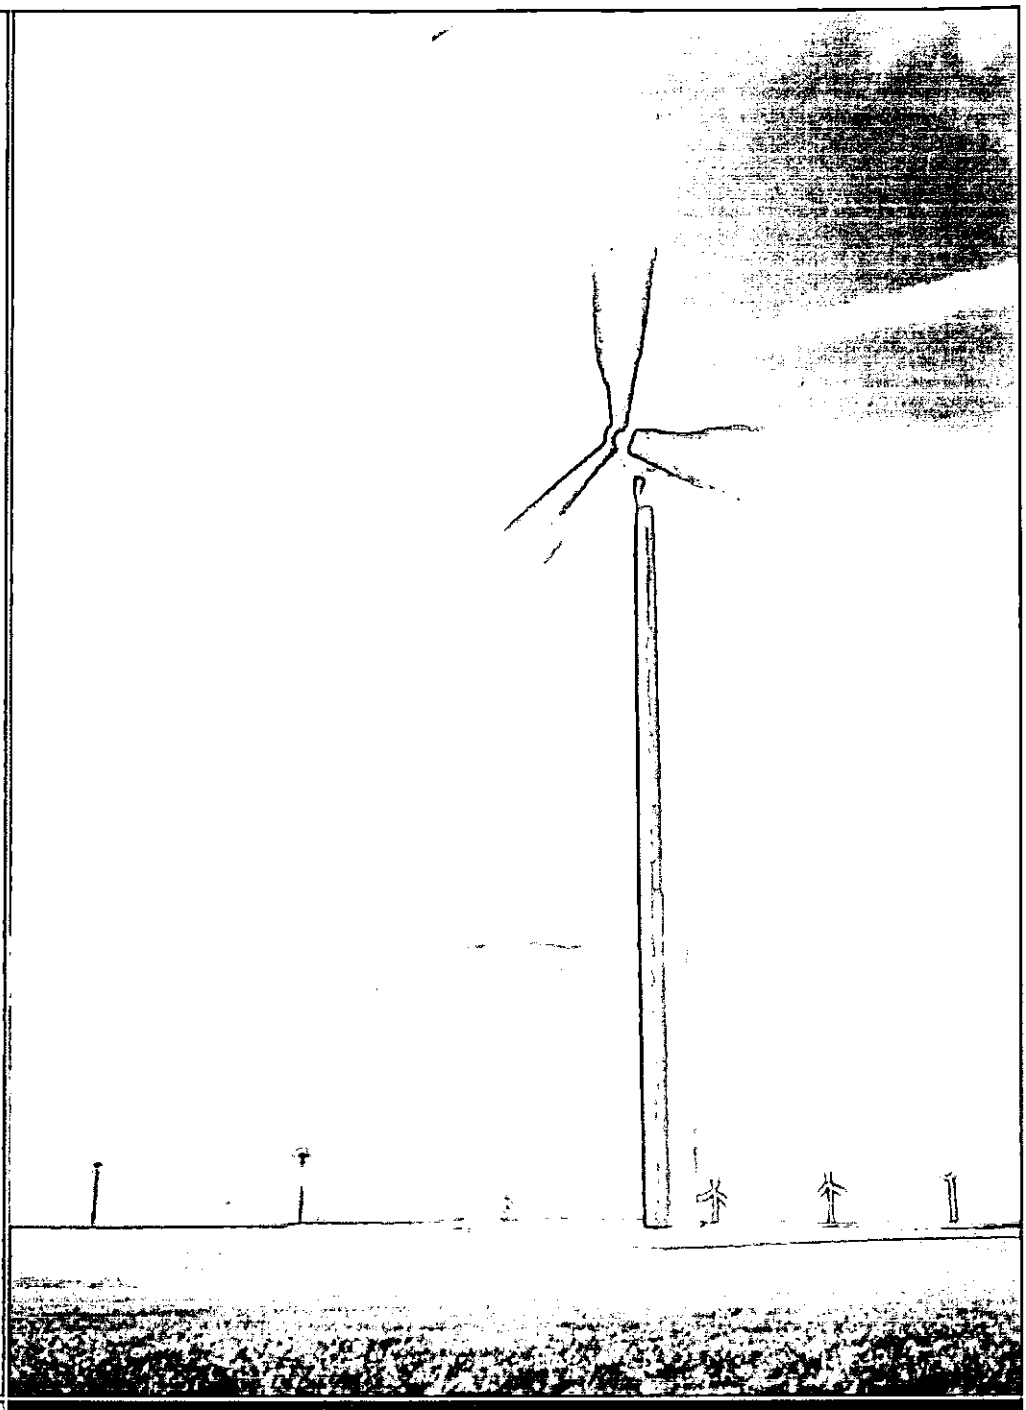
U.S. Department of Energy

Energy Efficiency and Renewable Energy

Bringing you a prosperous future where energy is clean, abundant, reliable, and affordable



20% Wind Energy by 2030

Increasing Wind Energy's Contribution to U.S. Electricity Supply

Prepublication Version

May 2008

6.2.1 Electric Utilities

Approximately 200 investor-owned utilities (IOUs), 70 large municipal and federal or state systems, and 50 rural generation and transmission cooperatives supply power for 3,000 local distribution companies across the country. The largest of these utilities typically own power plants and generate much of the power they supply. They purchase the rest of the electricity needed to serve their customers from other utilities or from nonutility generators through power purchase agreements (PPAs).

Utilities serve a variety of customers with differing needs and priorities, both retail and wholesale. Retail customers are divided into three categories: residential, commercial, and industrial. Residential customers use energy in a single dwelling for personal service. Commercial customers often have multiple dwellings, offices, or business enterprises located in a multifunction building. Industrial customers are typically large manufacturing or assembly plants that have hundreds of workers and multiple electricity applications. Special forms of commercial and industrial customers include the federal, state, and local public sectors.

Retail electricity service to end-use customers is regulated by state commissions in many states and jurisdictions. Some states have implemented restructuring or deregulation of their electricity markets, resulting in increased competition among electricity providers and retailers. In states where competitive entities are vying to supply electric generation and to serve retail customers, wind developers have the opportunity to build wind projects and deliver wind energy. In states that have not restructured, wind developers can sell into wholesale markets or sell to the incumbent utilities under a PPA. Some utilities are pursuing options for owning and operating their own wind projects.

At the national level, FERC policies have been implemented to foster competitive wholesale electricity markets and spur innovation and efficiency improvements. FERC continues to review and modify, as appropriate, its policies concerning competition in wholesale power markets. FERC policies cover some of the nation's electricity grid system, which is made up of transmission lines. FERC treats transmission as a common carrier, meaning that it requires transmission providers to allow nondiscriminatory access to their wires. The large wholesale markets enable a more effective exchange of services and compensation for all electricity generators, including wind power generators, helping them compete for larger shares of generation markets.

To regulate their utilities, roughly half of the states in the country have integrated resource planning (IRP) policies in place. An IRP policy requires utilities to evaluate opportunities to serve loads through energy efficiency and demand reduction programs on the same basis they use to plan new generation. In addition, utilities must compare supply alternatives—including fossil and nonfossil resources—on a risk-adjusted basis. In some decisions made under the IRP process, local customer preference is considered and can influence decisions made by commissions in selecting generation options. As a result, the IRP process has been an important factor in establishing wind power markets.

6.2.2 Federal Agencies

In aggregate, the federal government is the largest single consumer of electricity in the world. Federal agency electricity consumption in 2005 was more than 55,000 gigawatt-hours (GWh), which would equate to approximately 18 gigawatts (GW) of

Cornell University
Special Consultant, NERA

Students and serious practitioners of public utility regulation have long recognized what an imperfect institution it is. Grounded in the conception that these industries are naturally monopolistic—that is, that full achievement of their inherent economies of scale requires that they be organized as franchised monopolies—it followed that they had to be regulated in order to protect consumers from exploitation, while at the same time assuring investors recovery of their prudently (more precisely, in practice, their not-demonstrably-imprudently) incurred costs.

This essentially cost-plus system appeared to work well in electric power during the quarter century following the end of World War II, when technological progress and the progressive realization of economies of scale in generation and transmission, and the adoption of nuclear generation, converged to produce declining rates in real terms. In the decades following 1973, in contrast, two bouts of double-digit inflation in the economy at large, two quadruplings of the price of oil, sharp increases in the cost of capital—especially painful in so capital-intensive a business—and massive cost overruns in nuclear facilities all compelled dramatic rate increases throughout the 1980s, just when a slump in the real prices of oil and natural gas and the advent of combined-cycle gas generation made deregulation and competition look far more attractive to consumers than continued compliance with the historic regulatory bargain.

As this brief historical account demonstrates, the movement for deregulation in the last decades of the 20th century was clearly opportunistic—putting pressures on regulatory agencies to renege on their implicit promise to set rates sufficient to provide fair returns on invested capital—a "temptation of the kleptocrats," as I put it at the time.[1] Significantly, the pressures for deregulation were most insistent in states whose electric companies had invested heavily in nuclear plants and, at the other extreme, virtually nonexistent in states still relying heavily on coal, and particularly coal-fired generating plants that had long since been totally depreciated on the companies' books.

But, clearly, there were fundamental, not merely transient issues at stake as well. As I observed some seventeen years ago, in the context of reforming regulatory practice rather than deregulation:

> [A] consistent use of current competitive market valuations, for successful and unsuccessful investments alike, would be not only unobjectionable but desirable, because it would transfer the cost of failures, symmetrically with the profits of success, from ratepayers to investors.[2]

Manifestly, genuine deregulation would produce the same beneficent result.

Deregulation alone, however, would not take into account the especial importance, in this industry—in which only limited storage of its product is possible—of reliability of supply in the face of demand that fluctuates widely. Under regulation, this reliability was secured by requiring generators to maintain some stipulated margin of excess capacity sufficient to hold loss-of-load probabilities down to some acceptable minimum—the cost of which had to be distributed among all customer groups, since all benefited from it.

It was rarely recognized, however, that such a system was itself highly inefficient, because it failed to recognize that *individual customers* have widely differing needs for such assurances, because they differ correspondingly in the ability to adapt their consumption habits to the widely varying marginal costs. Only a system that provides customers with the choice of contracting with suppliers for such assurances as each of them requires—and its corollary, able instead to alter their consumption habits in response to changes in system marginal costs—can accomplish the purpose, on the one hand, of determining what margin of excess capacity is required in the aggregate and, second, how its costs will be distributed among customers. I commend to readers the authors' exposition of how restructured markets would, by confronting customers with prices varying hourly with contemporaneous marginal costs, give them the opportunity to react in real time, thereby giving each the opportunity to choose the level of reliability he or she wants and is willing to pay for.

Just as the move to restructuring was opportunistic, so too is the current sentiment to return to regulation a reaction to transient developments—in particular, the sharp increase in oil and gas prices—driving marginal costs above historic costs. But the choice of system should not be based, opportunistically, on transient events: the real defect of regulation is that rates set under it are based necessarily on averages—over time and among groups of customers. Ideally, the system would confront each customer with the proper price signals. And production efficiency is best realized when investors bear responsibility for investment decisions.

Policy makers confronting pressures to undo the restructuring of the electricity industry would be well advised to base their decisions on the longer-term benefits that will flow from properly implementing competitive markets, rather than on adventitious circumstances driving market prices temporarily above or below regulated rates.

I. EXECUTIVE SUMMARY[1]

State policy makers are reviewing past decisions to promote competition in electricity markets and, in some cases, are debating whether to reverse course. Competitive electricity markets, also known as "restructured electricity markets," refer to the organization of the electric industry in states where utilities no longer have the obligation to plan and build generating capacity, and have often divested generation ownership. The purpose of this paper is to present an objective review of both traditional regulation and competitive electricity markets in order to assist policy makers as they critically assess their policy options.

The end of transition periods featuring rate caps and the onset of market-based retail rates has resulted in price increases for some states. While many have attributed these price increases to a failure of competition, the timing of the price increases is a coincidence and does not equate to causality. Electricity prices, driven by fuel costs, have risen in all states, not just those that restructured their electricity markets. As a result of these price increases, some states are examining their experiences with electric industry restructuring.

Prices derived by competitive markets and rates derived by traditional regulation[2] are fundamentally different, and will produce different outcomes. Over time, competitive markets are widely held to produce the most efficient results in our economy, providing the lowest costs to customers. Markets reward innovation—the search for and discovery, development, adoption, and commercialization of new products, services, organizational structures, processes, and procedures—that meets market demand. In a competitive environment, customers have more control over what they consume and what they pay, price levels will encourage more efficient use of energy, and market prices will encourage more demand response. Economists and experienced regulators, as well as national electricity policy, favor reliance on competitive markets when workable competition is feasible. It is important to evaluate the attributes of the competitive and cost-based regulatory models, and to critically analyze the strengths and weaknesses of each.

We thank Joshua Rogers for his research and editorial help. The opinions expressed herein are solely attributable to the authors and do not necessarily present a view of the firm or of other NERA professionals.

[2] Traditionally regulated utilities have an obligation to serve under traditional cost-of-service regulation, and to make and implement long-term generation plans in order to provide efficient, safe, adequate, and reliable service over time. It is important to note that even in restructured states, where such a model has been abandoned, there are many residual elements of traditional regulation. Transmission and distribution delivery service prices are regulated, and while customers receive a market-based generation price, the market procurement method is regulated.

Competition facilitates the most efficient means of production. Competitive market pricing provides significant benefits not found under traditional regulatory pricing. Among these benefits are the following:

- Market-based price signals are transparent and can stimulate appropriate infrastructure investment, energy conservation, and demand response.
- Competition provides customers with choices—i.e., customer sovereignty. Customers can exercise their own choices with respect to long-term risks, environmental concerns, and even reliability levels.
- Competitive market pricing allows sellers to tailor products and services to their customers' needs, and use demand-side solutions to avoid supply-side investment where appropriate.
- By pricing at market, prices will be similar for proximate utilities.
- Competition shifts risks from customers to investors.
- Competition produces more efficient results because the investor, not the ratepayer, assumes the generation investment risk.
- In competitive markets, poor producers fail and are acquired or replaced by those with more skill, foresight, and industry.

The electric utility industry pursued competition not for academic reasons, but because regulation was producing unacceptable outcomes, including large price differences between proximate utilities, large plant cost overruns, rate shocks and phase-ins, and customer dissatisfaction with lack of control over their electricity costs. Some innovative pricing concepts were studied, but they were rarely implemented on a large scale, and offerings were limited to a few standard tariffs. New generation built under regulation was considered too risky by both customers and investors, and power plants, particularly nuclear generators, demonstrated poor operating performance.

The differences between cost-of-service regulated rates and prices derived from competition are predictable and certain, and include the following:

- Regulated rates are founded on utilities' and regulators' judgment about the attributes of the product (e.g., reliability, environmental impacts) rather than the discipline of market forces.
- Regulated rates result in utilities and regulators imposing their choices on customers.
- Cost-based regulation makes it difficult for customers to make choices based on their own preferences and responses to market price signals.

- Cost-based regulated prices distort price signals necessary for efficient consumption, and undermine incentives for conservation and demand response. This creates a need to develop complicated and expensive conservation programs that "correct" the price signals through administrative means, when efficient results are obtained with simpler programs and market-derived prices.

Before undoing competitive markets, either intentionally or inadvertently, policy makers should consider the following facts:

- Regulated-monopoly generation imposed huge cost burdens on customers. These burdens, to which customers were exposed under the last significant non-gas capacity expansion, are what led many "high cost" states to restructure. In many states, cost-based regulation failed to produce reasonably priced electricity in the 1980s.

- States continuing with the regulated monopoly model are providing, and must continue to provide, iron-clad cost recovery guarantees for new generation investment.

- Transparent market prices derived in competitive markets are encouraging penetration of energy efficiency (conservation) and facilitating responsive consumer demand, lowering investment needs and providing environmental benefits.

- Innovations in end-use efficiency can potentially be created when customers control their own choices based on available information, and the market provides creative solutions. This can happen to the full extent only in a competitive market.

- Competitive electricity markets have led the way in developing renewable generation.

- Recent price increases are largely driven by fuel price increases, and have occurred in both competitive and traditionally regulated states.

While the promotion of competitive markets may not have been implemented perfectly, the points above suggest that customers would be better served by regulatory efforts directed at refining and improving the competitive model, rather than returning to cost-of-service regulation.

II. INTRODUCTION

Over $400 billion of electric industry infrastructure investment in generating plants will be required between 2006 and 2030.[3] Investments will be needed not only to accommodate the growth in population and the economy, but to replace aging facilities,[4] reduce emissions, fund research and development of innovative technologies, and lessen dependence on the use of liquid fuels from politically unstable foreign sources. In addition, all of these factors must be viewed in the context of heightened interest in renewable energy.[5] With such a large investment at stake, efficiency must be maximized and customers' interests must be protected. A failure to make this investment in the most efficient manner will: (1) make it difficult to ensure affordable and reliable electricity supply; (2) threaten the global competitiveness of the United States; and (3) risk having the country fall short of achieving environmental objectives.

To induce the needed investment, two economic models—that are markedly different both in terms of how they work and the incentives that they provide—can be used. The first is competition. In competitive markets, investors evaluate alternatives, make investment decisions, and place their capital at risk to market forces. Poor investment decisions lead to investor losses, even if such decisions were reasonable at the time they were made. The second model is cost-of-service regulation. In traditionally regulated markets, decisions about the type and timing of generating plant additions are generally determined by utilities, which are overseen by utility regulators. A utility builds, owns, and operates its system subject to oversight by the regulator through an open process that allows for significant input by stakeholders. While utility investors assume a limited set of investment risks, customers assume more, as they ultimately fund and support the investments through the rates they pay. Customers typically bear the risk when the selected investment incurs relatively higher costs, leading to rates that exceed market levels—so long as the utility's actions were prudent, meaning the actions were reasonable given available information.

At the national level, electricity policy is clear. Federal law provides for competition in wholesale generation markets and open access to transmission facilities. While this policy accommodates wholesale competition, it does not mandate or promote competition at the retail level. States have the choice to rely on vertically integrated utilities to plan, build, and own generating plants; to require utilities to use their monopoly position to underwrite long-term contracts that provide cost recovery without regard to how costs compare to the market in the future;[6] or, to transfer the responsibility for investment decisions and the risk of investment

---

[3] "[T]otal of 258 gigawatts of new [generating] capacity is expected between 2006 and 2030, representing a total investment of approximately $412 billion (2005 dollars)," *Annual Energy Outlook* 2007, Energy Information Agency, DOE/EIA-0383, 2007.

[4] In the Northeastern US, about 41,000 megawatts of generation capacity are due to be retired, which is about one-quarter of generating plant in the region. *See*: Hugh Wynne, *U.S. Utilities: Capacity Retirements, Generation Investment and Technology Choice*, Bernstein Research, August 2006.

[5] Over the next five years, renewables comprise about 16 percent of the new generation that has been proposed; wind comprises 88 percent of proposed renewables. *See*: Dan Ford, *Just the Beginning*, Lehman Brothers (Power & Utilities), August 21, 2006, p. 8.

[6] The key phrase here is "in the future." Regulated monopolies have to reasonably plan in this day and age, but the standard by which they are judged is whether their decisions were reasonable based on what a prudent utility

decisions away from customers and on to investors by adopting a competitive model. These state decisions on whether to use cost-of-service regulation, competition, or some mix of the two are critical to achieving efficient investment, promoting environmental goals, and protecting customer interests.

Choosing between competition and cost-of-service regulation is not easy. It can be difficult to fully appreciate the consequences of these two options. Given the long-lived nature of utility assets, the choice will have long-term financial and environmental consequences for energy customers. The United States, with its federal system of government, is unique among nations in reserving this major economic choice for the individual states. Policy makers undoubtedly face difficult challenges in the current environment, with price increases largely driven by input price increases, which have little to do with whether or not there are competitive power markets in the state.

---

management could have known at the time. If, in the future, the regulated utility's costs become uneconomic relative to the market price, the utility would still be able to recover its actual, prudently-incurred costs in rates.

III. THE CHOICE BETWEEN TRADITIONALLY REGULATED AND COMPETITIVE MARKETS IS CLEAR

Under competition, prices reflect the supply and demand conditions at the time, and customers have the ability to choose products and services that allow them to manage their individual electricity usage. Under cost-of-service regulation, customers enter into an ongoing long-term contract to support new generating investment through their local utilities, and have very little product choice. Prices reflect historical costs and historical investment decisions, not prevailing market prices.

Competitive market pricing provides many benefits not found under traditional regulatory pricing. First, because investors are compensated based on the market and not cost, they bear the risks and rewards of generation investment. Second, price signals are more accurate within competitive markets, and can stimulate appropriate infrastructure investment, energy conservation, and demand response. Markets use these price signals to evaluate solutions to current and future energy challenges. Third, competitive market pricing allows sellers to tailor products and services to their customers' needs, and use their ability to respond to prices in a way to avoid new investments where appropriate. Lastly, by pricing at market, prices will be similar for proximate utilities. Consequently, industries located in different utility territories will not be subject to arbitrary cost disadvantages relative to competitors, a balance that represents a change from cost-of-service regulation. Under the latter, if one utility decided to build a nuclear plant that resulted in a large but prudent cost overrun, while the neighboring utility decided on a coal plant that was built within budget, rates for the two utilities could differ sharply. This is not typical of functioning markets, and it is difficult for customers, particularly industrial competitors, to accept such arbitrary pricing.

Regulated prices are based on cost of service, and to the extent that different utilities make different investment decisions, prices for proximate utilities may be very different. Throughout the 1980s and 1990s, regulated prices were far above market. Once gas prices declined and technology developments in combined cycle generation lowered cost and heat rates, the cost of nuclear investments and Public Utility Regulatory Policies Act of 1978 (PURPA) qualifying facility (QF) contracts exceeded the cost of constructing and operating new combined cycle plants, or taking advantage of surplus capacity. Prices charged by proximate utilities differed based on the timing of their plant additions and construction cost outcomes.

Luck played a large factor in determining the rates that particular electricity customers paid. But one thing is certain: the major driver for the move to competitive electricity markets in the 1990s was the series of poor outcomes that occurred during the 1970s and 1980s, when the inclusion of "lumpy" investments in nuclear generating plants led to concerns about "rate shock," rate increase, phase-in plans, and automatic pass-through of fuel costs. Ratepayers and investors shared in the financial burden resulting from these investment decisions.[7]

---

[7] The economic losses resulting from the mistakes of the 1970s and 1980s may have cost as much as $100 billion. *See*: Wald, "Nuclear Plant Drain Put at $100 Billion for U.S.," *New York Times*, February 1, 1988, p. D1. This article was cited in Richard Goldsmith, "Utility Rates and 'Takings,'" *Energy Law Journal*, Vol. 10, No. 2, 1989, p. 241.

There is little reason to believe that a return to traditional regulation would lead to prices that would be continually below or at market levels. The only assured outcome is that cost-of-service regulated prices will reflect historical costs, not the market. Regulated prices could be administratively set to be relatively stable, but this may come at the cost of consistently failing to reflect the actual costs incurred. It makes little sense to attempt to choose between a traditionally regulated and a competitive model based on expectations of future price level differences, as such a choice would be speculative.

In competitive markets, where larger customers face hourly market prices (and smaller customers may elect to do so), electricity providers in many instances offer creative packages to satisfy customers. These are tangible differences between the traditionally regulated and competitive models that are predictable and certain. It is also certain that under competition, customers will have more control over what they consume and what they pay, that price levels will become known and encourage more efficient use of energy, and market prices will encourage the development of more responsive demand. Moreover, the same benefits apply to supply as well as to demand alternatives. For example, in a traditionally regulated model, wind resources will be viable only to the extent that a utility chooses to build or buy wind. In a competitive market, wind developers will have access to regional transmission organization (RTO) transmission and integration service, and will see market incentives to develop projects that provide maximum market benefits. Correspondingly, consumers may elect to buy more energy from wind and other renewable resources.

In competitive markets, generation investment decisions are made by investors in response to customer needs. Investors bear the risk of those decisions. This is a fundamental and important difference between competitive markets and cost-of-service regulation. It is important to consider that bearing risk does not equate to simply absorbing losses. There is an upside and a downside to risk. In return for bearing losses on unsuccessful investment decisions, investors realize gains on successful investments. That is the competitive model that prevails throughout the US economy.

There are other differences between cost-of-service regulation and competition that are predictable and certain. For instance, regulation requires utilities and, in turn, regulators, to substitute their judgment about the attributes of the product (e.g., reliability, environmental impacts) for that of the market, and this makes it difficult for customers to make choices based on their own preferences. Competition gives customers greater choice and control through market-based innovation. Customers can exercise their own choices with respect to environmental attributes, long-term risks, and even reliability levels. Regulated prices also typically distort price signals that are necessary for efficient consumption, and undermine incentives for conservation and demand response. Since the mid-1970s, traditionally regulated utilities have investigated innovative pricing and demand control. Progress has been limited, as regulated tariffs are standard and creative pricing schemes reflecting individual circumstances are hard to implement.

IV. ELECTRICITY COMPETITION WAS PURSUED AS A SOLUTION TO LONG-TERM PROBLEMS

Policy makers should consider that electricity markets were restructured because regulation was producing high prices and generally unacceptable outcomes for both customers and shareholders. This section will explain the cost-of-service regulation problems that began in the mid-1970s, which include price differences between proximate utilities, plant cost overruns, rate shocks and phase-ins, PURPA excess costs, and customer dissatisfaction with the lack of control over their electricity costs. Power plants, particularly nuclear plants, demonstrated poor operating performance.[8] Demand side measures and innovative pricing were frequently discussed but rarely implemented successfully in the traditionally regulated environment. By the mid- to late-1980s, there was substantial dissatisfaction with the outcomes of the regulatory process, which led policy makers to pursue competition in the 1990s.

These well-known regulatory problems, which began in the mid-1970s, created a strong impetus for the industry to restructure. A significant component to the problems was price, which, as Professor Paul Joskow of MIT notes, "reflected the high capital costs and poor operating performance of nuclear power plants commissioned during the 1970s and 1980s, the high prices reflected in PURPA/QF contracts, and the costs of excess capacity which got rolled into regulated prices."[9] It is reasonable to assume that the same or similar problems could arise in states that revert to a system akin to traditional regulation. Problems with traditional, cost-of-service regulation of generation are still relevant in many parts of the United States.

US power systems were, for the most part, developed by vertically integrated utilities. These utilities built, owned, and operated distribution, transmission, and generation facilities. Traditionally, these utilities had exclusive service territories and the right to exclude other entities from the use of their distribution and, to a lesser extent, transmission facilities. The generation investment by these utilities was made pursuant to an obligation to serve all loads in the service territory. The legal framework provided for the right to charge rates that allowed the utility a reasonable opportunity to recover all prudent investments and costs incurred to meet that obligation, and further protected that investment with an exclusive service territory and the right to exclude others from the use of distribution facilities.

Major nuclear plant cost overruns received a large amount of press in the 1970s and 1980s. Regulators no longer wanted to deal with overseeing ratemaking issues years after an investment had been made in a plant. To cite some examples:

- In Ohio, construction of the Zimmer nuclear power plant began in 1969, with an estimated in operation date of 1975. Cincinnati Gas & Electric, Dayton Power & Light,

---

[8] Statistics show that there has been substantial improvement in nuclear operating performance in recent years. This is most easily represented by the increase in average capacity factor across the US nuclear power industry. The Nuclear Energy Institute provides public access to these statistics on its website. Please *see*: http://www.nei.org/resourcesandstats/nuclear_statistics/usnuclearpowerplants/ (Accessed 11/28/07).

[9] Paul L. Joskow, *U.S Energy Policy During the 1990s*, prepared for the conference "American Economic Policy During the 1990s," sponsored by the John F. Kennedy School of Government, Harvard University, June 27 to June 30, 2001.

and Columbus and Southern Ohio Electric made up the ownership group, which predicted that the total cost of construction would be $240 million. There were massive cost overruns after construction began, and the estimated total cost rose to $3.5 billion, while the operating date became uncertain. Following allegations of mismanagement and intervention by the Nuclear Regulatory Commission, the owners announced that the plant would be converted to a coal-fired unit with an estimated completion date of 1991 at an additional cost of $1.7 billion.[10]

- In Michigan, construction of the Midland nuclear power plant was expected to be completed by 1975 at a cost of $276 million. Instead, construction of the plant was halted in 1984, after total costs had risen to $4.2 billion. In 1986, the Michigan Public Service Commission decided that the plant should be converted to a gas-fired unit, with a conversion cost of $600 million.[11]

- In New York, construction of the Nine Mile 2 plant began in 1970. The total cost for this project was initially estimated to be under $400 million, and the facility was projected to be operating by 1977. These estimates changed dramatically after construction began, with total costs reaching $3.7 billion and a completion date of 1986. The total cost of the plant after completion in 1986 was $5.4 billion, of which $4.45 billion was deemed recoverable by the New York Public Service Commission.[12]

There are many other examples of cost overruns, which led to a great deal of regulatory frustration over how to better deal with the construction and financing of generation. These frustrations stemmed from problems with nuclear power plants that experienced huge cost overruns, the aftermath of the energy crises of the 1970s, sharply reduced electricity demand growth rates, and the basic fact, that under the traditional regulatory compact, customers bore the vast majority of the risk.

In response to the regulatory issues, state regulators began to emphasize long-term "integrated resource planning" (IRP), which sought to improve on traditional *ex post* regulation by adding an *ex ante* component.[13] IRP began with the best of intentions—to do utility regulation "right," before the fact. Some regulators decided to use a forward-looking regulatory planning process in an attempt to acquire the least costly resources. At the same time, there was a redoubled emphasis on *ex post* scrutiny of the prudence of generation construction programs before new plants were allowed into the rate base.

[11] *Id.*

[12] Leonard S, Goodman, *The Process of Ratemaking* (Vienna, VA: Public Utilities Reports, Inc., 1998), pp. 866-867.

[13] Paul Joskow points out that PURPA was "accompanied by the creation of public 'integrated resource planning' (IRP) or 'least cost planning' (LCP) processes to determine 'appropriate' electric utility investment and contracting strategies which were eventually implemented with competitive bidding programs .... The rationale for and economic consequences of these programs were controversial." Joskow, *supra* note 9.

By the late 1980s, many utilities that needed new generation supply were required to procure this supply through competitive bid processes and IRPs. By 1990, 27 states had mandated or allowed the use of utility competitive bidding processes for generation resource procurement.[14] Utility participation in these bidding processes depended on state policy. In some cases, they were required to bid through an affiliate, submitting either a fixed-price bid or a proposal to build a rate-base generating facility, where the costs were not fixed. In either case, they would need to justify the selection of the winning bid to the regulator, and they were competing against non-utility providers.

Under traditional regulation, whether generation was built by the utility or by a new entrant, long-term commitments at ratepayer expense were provided to support the construction of long-term generating assets. If built by the utility, the assumption was that the asset would stay in the utility rate base until it was no longer used and useful, which could be 30-50 years. If built by an independent power producer under PURPA, with pricing based on avoided cost (the cost that the utility avoided by building the generation resource itself), the utility was frequently required to sign a long-term contract—sometimes as long as 15 to 30 years—to support the resource. Moreover, counter-party risk was not always adequately recognized, so the decisions that regulators made as part of the IRP process had major ramifications for utilities, new entrants, and electricity users over very long periods of time.

In addition to nuclear cost overruns, PURPA contracts were also burdening customers. As an example, Regulatory Research Associates notes that "[o]n March 10, 1997, NMK and 19 IPPs announced that a Master Restructuring Agreement was reached 'in principle' to restructure or terminate 44 purchased power contracts" and that "under the MRA, NMK would restructure or terminate the 44 power contracts in exchange for approximately $3.6 billion in cash and/or debt securities and 46 million common shares, representing about 25% of NMK's outstanding common shares."[15]

The experiences of the past are especially relevant today. Plant construction costs have escalated sharply as more utilities are adding generation, making it more important than ever that existing resources be used efficiently, and that demand response and energy efficiency programs be pursued when it is economical to do so. The expected cost of building a new nuclear plant, for example, is escalating as a result of "massive inflation in copper and nickel and stainless steel and concrete."[16] Part of the reason for the 25%-30% increase in the estimated cost of a coal-fired plant is the "huge price increases for the raw materials that plants are made from, including copper and nickel," as well as the cost of finishing those commodities into components.[17] Electricity prices are increasing and, just as in a competitive market, regulation does not shield

[17] *Id.*

customers from rising input costs. Though costs may be deferred for a period of time due to the regulatory process, they will be recovered so long as they were prudently incurred.

V. COMPETITION HAS CLEAR ADVANTAGES OVER TRADITIONAL REGULATION AND HAS ALREADY BEGUN TO PROVIDE EFFICIENCY AND ENVIRONMENTAL BENEFITS

Competitive electricity markets allow consumers to choose among providers and service options. This combination of open entry for suppliers and choice for customers provides the benefits of competitive markets (e.g., efficient resource allocation, accurate price signals, and incentives for innovation) and limits competitors' ability to exercise market power. Customers are protected from open-ended commitments to pay above-market costs that would not be passed through in a competitive market. This does not mean that entry into markets will be costless or easy, but rather that all actual competitors, incumbents and new entrants alike, will have made (and potential competitors could make) the investments and commitments necessary for them to compete in the market. Under this system, customers are free to manage long-term risk, which, for example, could include entering into long-term contracts with electricity suppliers.

Under traditional regulation, vertically integrated utilities build new generating plants in order to serve customer demand. Through the regulatory least-cost planning process, utilities are given permission to pursue resource procurement strategies, which effectively commit the regulator to pass the resulting costs through to customers so long as the utility has acted prudently in incurring those costs. This type of utility regulation includes both: (1) an *ex ante* component, requiring the utility to use least-cost integrated resource planning, and to get permission from the regulator before it commits to build or purchase new generating resources; and (2) an *ex post* component, requiring the utility to ask for a rate increase that puts the new plant into the rate base, and allows it the opportunity to earn its opportunity cost of capital on that rate base. Given the utility's obligation to serve, there is a corresponding regulatory obligation to pass through prudently incurred costs to customers, regardless of what those costs would have been in a competitive market.

Table 1 includes a listing of significant differences between firms that operate in competitive and traditionally regulated models that policy makers should consider when deciding how to move forward.

Table 1: Competitive Versus Traditionally Regulated Markets

	Competition	Traditional Regulation
Funding	Company funds investments with the expectation that it will be able to charge customers prices that justify those costs.	Ratepayers fund prudently incurred investments in rate base with a virtual certainty of recovering the costs.
Price Determination	Prices set in a market by supply and demand with open-ended possibilities for pricing structures, which means choice for consumers.	Prices set based on cost with limited menu of regulated tariffs.
Market Concentration	Multiple firms compete with one another, with potential competitors providing competitive pressure as well.	Generally one firm, once with a franchise.
What Is Built	Companies, in response to customer demand, will be more likely to invest in less traditional and more energy-efficient forms of generation, including renewables.	Regulators approve what utilities build. This may or may not be the lowest cost investment, and may or may not be technologically innovative.
Capital Structure	Less use of leverage perhaps, reflecting greater investment risk, but more potential for innovative financing arrangements.	Traditional utility regulation accommodates the use of more debt, but limits innovation.
Who Bears Risk of Bad Investments?	Investors.	Consumers.
Market Activity	The competitive environment is dynamic and subject to entry and exit. This creates a powerful incentive for firms to increase operating efficiency.	Static. Subject to bureaucratic process.
Cost Allocation	Value branding. Independent power companies have a greater opportunity to market different services to different customers.	Cost averaging. Through the regulatory process, costs incurred are averaged out when determining rates, and the ratepayers that incur specific costs may not necessarily pay for them.
Keys To Success	Ability to compete on price, terms, and non-price attributes such as billing arrangements and product innovation (such as green power).	Prudence and accountability in decision making; competence working with regulatory and political policy. Ability to overcome market failures.
Vertical Integration	Greater vertical separation of regulated and competitive activities.	Typically vertically integrated, subject to an internal system of command.
Ownership And Investment	Risk and return expectations will be relatively higher. This will affect what types of entities hold ownership stakes.	Risk and return expectations will be relatively lower. This will affect what types of entities hold ownership stakes.
Marketing	Increased need for marketing, and development of innovative products. Focused on meeting individual customer needs through innovation.	Reduced need for marketing and business development. Largely focused on providing one-size-fits-all solutions for customers.
Price Stability	If price stability is desired by customers, competitive retailers will make such a product available.	The regulatory process eventually allows recovery of all prudent costs. Rates can be slow to respond to changing conditions due to regulatory lag.
Price Signals	Prices tend to reflect marginal costs, the most accurate representation of opportunity cost.	Retail prices can become distorted from marginal costs through the ratemaking process.

This table demonstrates the disparate characteristics of competitive and traditionally regulated markets. The fundamentals of a competitive market, such as having more than one supplier, feasible entry and exit, and enhanced price transparency, create these differences. These factors allow competition to spur reductions in operating expenses and increases in innovation.

Traditional regulation, although based on prudently incurred costs, can yield inefficient results, primarily due to the requirement that utility ratepayers bear the majority of risks, rather than investors.

A. Competition Shifts the Risk to Investors

One of the benefits of restructured markets is that the investment risk for generation plants is shifting from consumers to investors. For instance, after restructuring, there was a huge initial burst of merchant construction in most areas of the country which, despite leading to excess capacity, did not cost customers a dime. This was an especially pertinent topic at the time of restructuring, as there were various notable examples of major cost over-runs in plant construction, especially with nuclear facilities.

Now, with many parts of the country expressing concerns about the adequacy of generation supply, certain states are pursuing policies aimed at providing incentives to build new generation. In competitive markets, wholesale prices provide the incentives to build new infrastructure, with customers free from the obligation to fund those investments. Many traditionally regulated states have recently passed laws providing for prior review of plant—cost recovery guarantees not available to merchant generators—and construction work in progress (CWIP) in rate base.[18] For example:

- **Florida:** In June 2006, legislation that affects several aspects of the state's energy policy was enacted. Senate Bill (S.B.) 888 exempts nuclear power plants from the requirement of a competitive bid and provides for recovery of pre-construction costs and a cash return on CWIP during the construction period of a nuclear power plant. A similar bill, House Bill (H.B.) 549, was enacted on June 12, 2007. This legislation authorizes deferred accounting for the pre-construction costs of integrated gasification combined-cycle (IGCC) plants, and these costs are to accrue a carrying charge equal to the utility's AFUDC rate. All prudently incurred pre-construction costs are recoverable through the utility's capacity cost recovery clause, as is a current return on CWIP.

- **North Carolina:** Senate Bill (S.B.) 3, which was enacted on August 20, 2007, facilitates the NCUC's ability to allow a cash return on CWIP by removing statutory language that had permitted utilities to earn a cash return on CWIP only "to the extent [...] such inclusion is in the public interest and necessary to the financial stability of the utility in question." As an example, the NCUC recently approved the recovery of pre-construction development costs for the proposed Duke Energy Lee Nuclear Station, stating that "to the extent the Commission finds, in a future general rate case proceeding, the specific activities involved in, and the costs of pursuing such Development Work to be prudent and reasonable (whether or not the Lee Nuclear Station is constructed), Duke may

[18] CWIP in rate base, which provides cash before a plant operates, does not occur in competitive markets. For regulated utilities, there have been instances where commissions have allowed CWIP to be recovered when a regulated utility needs cash flow assistance or when Allowance for Funds Used During Construction (AFUDC) balances, which are "paper" earnings not "cash" earnings, grow large and become burdensome financially. Normally, however, CWIP in rate base is not allowed as the plant is not yet benefiting customers, but in order to induce utilities to build more states are formalizing CWIP allowances.

recover" the Development Work costs in rates.[19] These development costs are expected to total $125 million.

- **Nevada:** In 2004, the PUC adopted revised integrated resource planning rules that permit the Commission to approve an incentive mechanism for generation facilities designated as "critical." Under the rules, the PUC has the option to designate a project as critical if it protects reliability, promotes supply diversity, or utilizes renewable resources. For such a project, the utility may be awarded a financial incentive including: (1) an enhanced ROE on the designated critical facility over the life of the facility; (2) a cash return on CWIP associated with the facility; or (3) the deferral of costs incurred to construct the facility.

- **Wisconsin:** Through an ROE adder, the PSC generally allows a current return on 50 percent of a utility's electric and gas CWIP, except for major generation projects where the PSC generally allows a current return on 100 percent of the CWIP associated with that project.[20]

The trend is clear: the US needs to build new generating capacity, greatly increase energy efficiency, or initiate a combination of both in order to meet demand for electricity and diversify the supply mix away from old technology. Cost-of-service regulation could accomplish this, but going down that path will necessitate iron-clad cost recovery assurances for increasingly expensive generation assets.[21] Regulated entities may be volunteering to build new generation, but not without cost recovery guarantees and payments before plants are in service. While the prior building cycle proved that recovery assurances need to be provided to investors, the amount of price risk faced by consumers does not seem to have sunk in. Customers may not yet be aware of the long-term commitments that are being made on their behalf by utilities and their regulators.[22]

B. Economic Efficiency Gains

Reliance on competitive markets is based on the principle that firms with the most efficient production and the most value for consumers should and will prevail. Efficient competition leads to production at the lowest achievable costs in the long-term, which is a socially desirable outcome that results in an efficient use of society's resources. Currently, with

---

[19] Regulatory Research Associates, Inc., Focus Notes, March 30, 2007. A similar approval was granted by the Ohio Public Utilities Commission to American Electric Power (AEP) in 2006, which allowed for the recovery of $24 million in pre-construction costs related to an IGCC facility. *See*: Regulatory Research Associates, Inc., Focus Notes, April 27, 2007.

[20] Regulatory Research Associates, Inc., State Commission Overviews, various dates.

[21] From May 2005 to October 2006, Duke Energy's estimate of construction costs for two new coal-fired plants at its Cliffside site went from $2 billion to $3 billion. The North Carolina Utility Commission ultimately approved a single plant for $1.8 billion, an 80 percent increase from the initial estimate—and that number is still just an estimate. Similarly, Entergy's cost to re-power its Little Gypsy site was estimated in April, 2007, to cost $1 billion; by July, 2007 this figure had increased by over 50 percent to $1.55 billion.

[22] We are not saying that such guarantees and cash flow allowances are unjustified or unnecessary. To the contrary they may be required in regulated situations. The point is that this is a major difference between the regulated and competitive solutions.

transition to competition periods beginning to end, it is too early to determine the ultimate success or failure of electricity competition—but it is possible to see some encouraging trends.

With competition, generation operators' incentives changed dramatically, leading to changes in microeconomic behaviour. Though they may not be immediately evident in prices, benefits are clear in non-price advantages such as greater service variety and the presence of a functioning market for capacity (which promotes efficient investment decisions).

Research papers that focus on measures of efficiency other than price, such as generator efficiency or operating cost reductions, offer a more complete indication of the impacts of competition in the current environment. Research has found that:

- Operating costs of generating plants in states that chose to restructure have been reduced relative to costs of generating plants in states that decided against implementing competition.[23] Plant operators affected by competition reduced labor and non-fuel expenses by about 3%-5% relative to other IOUs and 6%-12% relative to cooperatives or government-owned generation.[24] Similarly, divested generating plants and those subject to incentive regulation mechanisms improved their fuel efficiencies compared to their peers without high-powered incentives.[25]

- One of the benefits introduced by competition in generation was to improve the performance of previously existing generating assets in the face of competition. Availability, non-fuel operating costs, and heat rates improved significantly. Availability of generating capacity has increased over time in both New England and New York. Equivalent availability factors increased significantly in PJM from 1994 to 1998 and have been roughly constant since then with some year-to-year variability.[26] Relatively small efficiency gains—such as a two percent improvement in heat rates—can provide hundreds of millions of dollars of annual fuel savings.

Markets reward innovation—the search for and discovery, development, adoption, and commercialization of new products, services, organizational structures, processes, and procedures—that meets market demand. The role of competitors in the marketplace is to compete on the basis of price and value. While competing on the basis of price is obviously very important, successful competitors can also innovate and offer the customer something better than that offered by standard service. Some value-added services may be related to price, such as information services that improve a customer's ability to manage its energy usage. Value could also be provided in the form of green power, risk management (fixed prices for seasons or a year), bundling of services, or could take a form that is not currently anticipated.

C. Energy Efficiency and Renewables

Energy efficiency, distributed energy resources (DER) programs, and renewables (e.g., wind) all benefit from transparent markets and the competitive incentives that restructured markets provide. In a competitive situation (with an RTO or ISO), it is more likely that price signals for generation services (energy, capacity, and ancillary services) will be market based, and it is also more likely that service providers or retailers will be involved.

1. Market Transparency and Demand Response

Innovative RTO/ISO programs are providing incentives for a wide variety of needed generation and transmission-related resources. The ISO-RTO Council, made up of ISOs and RTOs serving two-thirds of the US market and half of the Canadian market, recently issued three reports documenting the success they have had in terms of managing demand response programs and encouraging renewable investment.[27] The reports note various ways in which RTOs can facilitate renewable development including clear, expeditious, and nondiscriminatory interconnection processes and market-based ancillary services.

Demand response programs that respond to real-time prices can also serve to moderate spot price spikes. Demand response programs work best in transparent markets, which eliminate the need to use an administered-type price, such as avoided cost pricing, which may give very misleading price signals. With a transparent market providing price signals, it becomes possible to fairly evaluate energy efficiency, demand response programs, and renewable resources. Furthermore, ISOs, by definition, have no stake in market outcomes. Because they own no generation, they are neutral with respect to the ownership and types of generating units that operate within their system. The same is not always true for utilities.

2. Availability of Information and Price Signals

It is imperative for potential investors in renewable sources of energy to have access to detailed pricing information so that they can judge the feasibility of their projects. In regard to this, and in support of competition, the ISO/RTO Council reported: "ISO and RTO wholesale markets provide price transparency to inform all market participants, including renewable

[27] For more information, please *see*: ISO/RTO Council, Increasing Renewable Resources, October 16, 2007; ISO/RTO Council, Progress of Organized Wholesale Electricity Markets in North America, October 16, 2007; Markets Committee of the ISO/RTO Council, Harnessing the Power of Demand, October 16, 2007.

generation owners, about the price and the value of their power."[28] In addition, the report notes: "[i]n wholesale electricity markets, developers have access to both historical data and forward price curves to estimate the future value of their generation."[29] This lies in stark contrast to projects not in ISO/RTO regions, where it is likely that the developer will negotiate price bilaterally with the utility, and will not have access to public price information.

The availability of time-based market prices and demand response capability can change the energy cost structure faced by certain utility customers during peak periods, resulting in increased consumer price responsiveness (i.e., elasticity). Thus, customers participating in demand response programs benefit from transparent market prices. Through the market process of numerous buyers and sellers making individual decisions, competitive markets allow consumer demands to be sorted out and aggregated by producers at the lowest possible cost. The price information provided by the market gives buyers and sellers the information they need to make their individual production and purchasing decisions. The Markets Committee of the ISO/RTO Council issued a positive review of ISO/RTO management of the demand response programs in the US and Canada, stating that:

> The markets these ISOs and RTOs administer, which represent approximately two-thirds of electricity demand across the United States and just over 40 percent in Canada, are playing an important and growing role in enabling demand response to reach its full potential. They provide visible price signals that will help consumers make rational decisions about expenditures on electricity in the same way they use market prices for deciding how to purchase other goods and services.[30]

Given the price signals provided by a transparent real-time spot market, demand response programs can be more effective in restructured jurisdictions. Efficiency investments are also spurred when customers see true market prices and can make decisions to use energy more efficiently based on those prices.

States with competitive markets can avoid relying heavily on administratively set credits that may not always adjust readily to reflect changes in costs. Administratively set credits have an important defect: they are *static* in nature, while wholesale power markets are inherently dynamic over time. In dynamic power markets, administratively set credits rapidly become stale and can trigger incorrect and outdated responses. One lesson from the implementation of PURPA in the 1980s is that, in the absence of market prices, setting avoided cost rates is a very difficult task to complete correctly. When wholesale market price information is readily available, these challenges are reduced.

3. Renewable Generation Growth

The records on prices that are maintained by ISOs and RTOs can serve as valuable information to companies deciding whether or not to invest in renewable generation assets. But what has actually happened in recent times, in terms of the *growth* in generation from renewable resources in restructured vs. traditionally regulated states?

Table 2: Growth of Renewable Generation in Restructured and Traditional States 2000-2005

	Growth Rate
Restructured States	11.3%
Traditional States	0.6%

Source: EIA.

Total renewable generation increased in both markets during the period of time between 2000 and 2005. However, renewable net generation in restructured states increased by approximately 11.3 percent, while there has been an increase of less than one percent in traditionally regulated states. This is not to say that restructuring was completely responsible for the relatively larger increase in renewable net generation in restructured states. To prove this, a multitude of other variables would have to be considered, including overall trends in electricity demand, and separate state policies regarding renewables. These statistics are important, however, given the expectation that independent power providers compete based on short term marginal cost, and that renewables would therefore not be viable competitors. In addition, utilities in restructured markets are not mandated to purchase power from PURPA qualifying facilities.[31] At the very least, the growth in renewable net generation in restructured states shows that the transparent market prices, customer choice, and renewable standards that are available in restructured markets help to provide a favorable environment for renewables.

There have been many recent examples of renewables gaining a stronger foothold in restructured markets. For instance, in Maine, a proposed mountain ridge wind farm has already sold its first 10 years of renewable energy.[32] This project is expected to power 44,000 households and reduce daily air emissions in the region by 430 tons a day. Harley Lee, President of Endless Energy in Yarmouth, issued a statement that highlighted Constellation's role as a power marketer, noting that "[o]ur region has lagged behind other parts of the country in the use of

[31] As part of the Energy Policy Act of 2005, Congress substantially narrowed the applicability and scope of QF must-buy requirements. Thus, utilities in much of the US will be relieved from the Section 210 requirements applicable to new QF facilities, with a showing that a new QF has nondiscriminatory access to competitive wholesale markets that meet the applicable standard. For utilities that cannot show that the new QF has access to competitive wholesale markets that meet the Section 1253 standard, the PURPA "must buy" requirements will continue.

[32] Donna M. Perry, "Redington Wind Farm has Deal to Sell Power," *Sun Journal*, April 6, 2006.

wind energy. A major reason has been the lack of a power marketer willing to sign long-term contracts."[33]

Other positive examples of renewable energy in restructured states include an agreement between Constellation and Horizon Wind Energy for an 18-year renewable energy power purchase agreement,[34] a contract between Epuron LLC (Conergy) and Exelon Generation for a 20-year power purchase agreement for the energy produced at a proposed 3 megawatt (MW) solar energy power station in Morrisville, Pennsylvania,[35] and the success of PECO Wind in Pennsylvania.

VI. CONCLUSION

State policy makers face a difficult situation. Restructuring transition periods have ended or are ending as prices are rising across the country. Prices have generally been rising over the past several years, regardless of market structure, primarily because of rising input fuel prices. At the same time, investment needs are growing and environmentally beneficial renewables are being mandated by legislation. Carbon emissions, which are not limited at all now, could be limited moving forward, which will further increase prices. Upward pressure on natural gas and oil prices show no signs of relenting. Even generation equipment costs are rising as the metals needed for their manufacture increase in price, and as demand drives up engineering and construction labor costs. Price increases are unpopular, and in the search for a villain, it is easy to blame competition. The facts, however, do not support the hypothesis that competition is the cause of price increases. The rise in oil and gas prices, equipment costs, impending carbon control costs, and the mandate to replace older and dirtier generation with alternative units are the primary factors behind these price increases. Both competitive and traditionally regulated states are seeing the impact of input price increases.

It is true that restructuring was misunderstood and, in many cases, unrealistic expectations may have been set. The implication that restructuring would always lead to lower prices was not accompanied by the obvious "all else being equal" or "over the long term" provisions. Abstracting from oil and gas prices, renewable mandates, equipment cost increases, and carbon reduction costs, it is likely that prices in restructured states would have declined as transition periods ended. But that did not happen, and industry structure cannot compensate for sharp increases in input prices.

In theory and in practice, restructured markets are superior in providing production efficiency incentives, in encouraging efficient demand side activity, and in encouraging investment in alternative forms of generation. We also know that in competitive markets customers bear much less risk. These factors all point to a policy that favors competition over

cost-of-service regulation. Electricity generation is a capital intensive industry with long lead times, and the benefits of competition cannot be expected to be seen overnight.

We also know that cost-of-service regulation performed poorly during the last major generation building cycle. However, these lessons, while very relevant, may not stand out to current policy makers who were not involved in the industry in the 1970s and 1980s. Competition, with all its imperfections and transitional problems, is too often compared to an idealized version of regulation that may exist in theory but not in practice.

Before rushing to judgment on restructuring and undoing competitive markets, policy makers should consider the following facts:

- Competition and cost-of-service regulation are fundamentally different and competition will shift risk from customers to investors.

- The risks borne by customers and the outcomes they were exposed to under the last significant non-gas capacity expansion are what led states to restructure. In many states, cost-of-service regulation failed in the 1980s.

- States continuing in the cost-of-service regulated model are providing iron-clad cost recovery guarantees for new generation investment and prudence pre-approval.

- The market prices seen in competitive markets will encourage efficient penetration of energy efficiency (conservation) and facilitate demand response, lowering investment needs, and providing environmental benefits.

- Competitive markets have led the way in renewable energy development.

- Recent price increases are largely driven by input price increases, and have occurred in both competitive and traditionally regulated states.

While restructuring may not have been perfectly implemented and there will always be room for improvement, the facts above suggest that regulatory efforts would be better directed at refining and improving the competition model rather than returning to the cost-of-service regulated model.

Changes to Senate Bill 287: 26-LS 1467\R in CS SB 287: 26-LS1467\E

Please note that this analysis is not an authoritative interpretation of changes to the bill. The bill itself is the best statement of its contents.

The following references are to the R version of SB 287

Section 1 The following changes were made to the *Findings and Purposes* section:

1. Page 2, line 1: following "significant" inserted "short term"
2. Page 2, line 8: deleted "developing" and inserted "studying"
3. Page 2, line 14: deleted "will result in" and inserted "is necessary for"
4. Page 2, lines 26-29: deleted all material and renumbered accordingly.
5. Page 2, line 30: deleted "achieve construction of" and inserted "to advance to the point of project sanction"

Section 2 The following changes were made to AS 42.40.560

1. Page 3, line 22: following "either or both of these sources" inserted "or from any other source of natural gas."
2. Page 4, line 1: inserted a reference to AS 43.90 (AGIA)

Section 4 The following changes were made to AS 42.40.560

1. Page 4, inserted a new subsection (d)(1) directing the Alaska Railroad Corporation to establish a subsidiary of the corporation to perform the work described in this subsection.
2. Page 4, line 6: deleted "acquisitions" and inserted "authorizations"
3. Page 4, lines 20-31 through page 5, lines 1-13: inserted new language recommended by Department of Law regarding right-of-way issues.

Section 5 The following changes were made to the provisions in the uncodified law

1. Page 5, line 29: following "2010" inserted "any initial" and following "the project" inserted "to the Governor and the presiding officers of each house of the legislature."
2. Page 6, line 14-22: deleted all material.
3. Page 6, line 30: changed "and" to "or" and inserted new subsection (c)(1)(C) allowing the project to be cancelled due to "other circumstances."
4. Page 6, line 31: inserted a new subsection clarifying that the Legislature expresses its approval by a concurrent resolution.

CS FOR SENATE BILL NO. 287(RES)

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-SIXTH LEGISLATURE - SECOND SESSION

BY THE SENATE RESOURCES COMMITTEE

Offered:
Referred:

Sponsor(s): SENATORS MCGUIRE, Davis

A BILL

FOR AN ACT ENTITLED

"An Act amending the powers and duties of the Alaska Railroad Corporation related to the exercise of authority to purchase, transport, and sell natural gas produced on the North Slope for in-state use, and transferring exclusive and primary responsibility for the initiation and development of that project to that corporation; and providing for an effective date."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

*** Section 1.** The uncodified law of the State of Alaska is amended by adding a new section to read:

LEGISLATIVE FINDINGS AND PURPOSE. (a) The legislature finds that

(1) by 2018, declining oil flow through the Trans Alaska Pipeline System will seriously diminish state revenue;

(2) Cook Inlet natural gas reserves are depleting at a rate that could cause significant short-term shortages for residential and commercial gas users in Southcentral

Alaska by 2013;

(3) a proposed natural gas pipeline to deliver North Slope gas reserves to the North American domestic gas pipeline grid at a connection in central Alberta will not produce revenue for the benefit of the state before 2020;

(4) the state's significant reserves of natural gas should be made available on a priority basis in the state to enhance employment opportunities, expand the state's economy, and supply a significant portion of community energy needs;

(5) the Alaska Natural Gas Development Authority is studying a pipeline spur, aggregating in-state demand for natural gas, and facilitating delivery of natural gas and natural gas liquids to Alaskans; and

(6) in light of competing demands for future uses of the state's North Slope natural gas reserves, an aggressive effort involving planning, permitting, and coordination of information sharing, of necessary agreements and commitments, and commercial negotiations among interested parties is necessary for completion of construction of an in-state natural gas pipeline that will provide significant direct benefit to the people of the state at the earliest possible date.

(b) It is the purpose of this Act

(1) to give general direction to the Alaska Railroad Corporation, an agency that enjoys express authority to acquire, construct, improve, maintain, equip, and operate a natural gas pipeline and related facilities for the transportation of natural gas recovered from the North Slope without regard to whether the facilities are or will be owned in whole or in part by the corporation or located on land owned by the corporation, to plan and develop construction of a high pressure in-state natural gas pipeline of appropriate diameter between Alaska's North Slope and Cook Inlet sufficient to provide for the distribution of natural gas for residential and commercial purposes at locations along the pipeline route; and

(2) to advance to the point of project sanction an in-state natural gas pipeline that will provide significant direct benefit to the people of the state at the earliest possible date.

*** Sec. 2.** AS 42.40.460 is amended by adding a new subsection to read:

(l) The provisions of AS 42.40.560(d) prevail over the provisions of this section for the purpose of development of the North Slope natural gas pipeline project

described in that section.

* **Sec. 3.** AS 42.40.560 is amended to read:

Sec. 42.40.560. North Slope natural gas pipeline. The corporation may provide [FINANCING] for the acquisition, construction, improvement, maintenance, equipping, and operation of a natural gas pipeline and related facilities**, and for the financing of the pipeline project and related facilities,** for the transportation of natural gas recovered from the North Slope of this state without regard to whether the facilities are or will be owned in whole or in part by the corporation or located on land owned by the corporation. **The authority provided by this section is limited to the project popularly identified as the Stand-Alone Pipeline Project, or Stand-Alone Project, that**

(1) proposes to develop a gas pipeline system to transport natural gas, and possibly additional natural gas liquids to markets in the Anchorage bowl area, and the Kenai Peninsula, and to additional customers along the transportation route;

(2) contemplates the commercial development of two primary sources of natural gas, the Prudhoe Bay Central Gas Facility and the Gubik gas field located in the northern foothills of the Brooks Range, and allows for use of gas from either or both of those gas sources or from any other source of natural gas;

(3) projects a pipeline system routing generally along the state's existing transportation corridors between the North Slope and Southcentral Alaska, starting from each potential gas source location, making its way to the Trans Alaska Pipeline System and Dalton Highway corridor, generally paralleling that corridor from the North Slope to the vicinity of Livengood, north of Fairbanks, and continuing to the Cook Inlet area, using one of two routes that are the existing transportation corridors between Fairbanks and Cook Inlet: the Parks Highway and the Richardson and Glenn Highways; and

(4) is compatible but not competitive with the project described in and authorized by AS 41.41 or the project described in and authorized by AS 43.90.

* **Sec. 4.** AS 42.40.560 is amended by adding new subsections to read:

(b) In the exercise of its authority under (a) of this section for a North Slope natural gas pipeline project, the corporation shall

(1) establish, maintain, and operate a subsidiary of the corporation to perform the work described in this section;

(2) aggressively pursue the acquisition of all necessary federal permits and authorizations essential for the development and operation of the project;

(3) provide monthly reports to the presiding officers of each house of the legislature and to the governor on the corporation's activities relating to the project;

(4) initiate a cost study for construction of a gas-to-liquids facility; in the exercise of its authority under this paragraph, the corporation may arrange for essential engineering and design work; and

(5) initiate efforts to identify and develop in-state markets for the natural gas to be delivered by the project and, to the extent necessary to ensure the long-term feasibility of the project, work to identify and develop overseas markets for the gas.

(c) Subject to AS 36.30.015(e), the board may provide that all or any portion of the project described in this section shall be subject to competitive sealed bid or competitive sealed proposal procedures.

(d) To fulfill its obligations under this section, the corporation shall identify all or a portion of a proposed natural gas pipeline transportation corridor:

(1) to the maximum extent possible consistent with ensuring the long-term feasibility of the project, the corporation shall make reasonable efforts to locate the proposed corridor between Fairbanks and the Kenai Peninsula on its land;

(2) notwithstanding any contrary provision of law, the Department of Natural Resources shall grant the corporation a right-of-way lease under AS 38.35 for the transportation corridor identified under (1) of this subsection if

(A) the corporation submits a complete right-of-way lease application under AS 38.35.050;

(B) the lease application is made the subject of notice and other

reasonable and appropriate publication requirements under AS 38.35.070; and

(C) the corporation agrees to be bound by the right-of-way lease covenants set out in AS 38.35.120;

(3) notwithstanding any contrary provision of law, a right-of-way lease granted under (2) of this subsection is subject to AS 38.05, except that the best interest findings requirements of AS 38.05 do not apply to a lease made under this subsection.

*** Sec. 5.** The uncodified law of the State of Alaska is amended by adding a new section to read:

ALASKA RAILROAD CORPORATION: TRANSITIONAL PROVISIONS AFFECTING OBLIGATIONS UNDER AS 42.40.560. (a) Subject to (c) of this section, in discharging its obligations under AS 42.40.560(b)(2), enacted by sec. 4 of this Act, the Alaska Railroad Corporation shall

(1) initiate permit and acquisition applications in accordance with the federal permit schedule that was provided to the legislature by the Office of the Governor on or about December 15, 2009;

(2) seek letters of intent from buyers and sellers of natural gas to ship gas using the facilities of the project and, from information obtained, by February 15, 2011, define the project parameters that would allow the project to be commercially viable;

(3) seek letters of interest from private pipeline construction and operating companies to develop the project; the work under this paragraph should be initiated between November 15, 2010, and shall be completed by March 15, 2011;

(4) prepare and submit to the governor and the presiding officer of each house of the legislature, by December 15, 2010, any initial legislation necessary to advance the project;

(5) identify or define and submit to the legislature, not later than January 15, 2011, the corporation's estimates of any long-lead time cost items or work tasks to achieve an early start-up for the project;

(6) prepare a final bankable feasibility document; the work under this paragraph should be initiated by July 1, 2011, and shall be completed by June 30, 2012; and

(7) unless otherwise provided in the monthly report required by AS 42.40.560(b)(3), enacted by sec. 4 of this Act, prepare and submit a report at each of the

dates set out in (1) - (6) of this subsection to the governor, the speaker of the house of representatives, and the president of the senate.

(b) The parties having responsibility for contracts, permit and acquisition applications, and studies in progress on the effective date of this Act entered into by the Office of the Governor or a state agency shall transfer those obligations and initiatives to the Alaska Railroad Corporation. Transfer of those obligations and initiatives may not be unreasonably delayed.

(c) The corporation shall cease its activities under this section and AS 42.40.560, as amended by secs. 3 and 4 of this Act, if the corporation receives a communication that

(1) the governor, after setting out with particularity the reasons that support the decision, has entered a finding that

(A) an agreement has been entered into that will result in construction of the project described in AS 43.90;

(B) construction of the project described in this section would prevent initiation and completion of the project described in AS 43.90; or

(C) other circumstances warrant cessation of activities under this section and AS 42.40.560;

(2) the legislature expresses its approval of the finding of the governor made under (1) of this subsection by concurrent resolution.

*** Sec. 6.** This Act takes effect immediately under July 1, 2010.

Sectional Analysis of Senate Bill 287: 26-LS 1467\A

Please note that a sectional analysis is not an authoritative interpretation of a bill. The bill itself is the best statement of its contents.

Section 1 of the bill establishes legislative findings and provides the general purpose of the act.

Section 2 of the bill amends AS 18.56.086 to authorize the Alaska Housing Finance Corporation to create subsidiary corporations to finance or facilitate the financing of the project described in section 5.

Section 3 of the bill provides a broad authority to the Alaska Housing Finance Corporation, or a subsidiary thereof, working with the Alaska Railroad, to finance or facilitate the financing of the project described in section 5.

Section 4 of the bill clarifies that the provisions in subsection (d) of section 5 supersede other land transfer processes set out in current law.

Section 5 of the bill expands the authority of the Alaska Railroad under AS 42.40.560 in relationship to financing a natural gas pipeline project, provides direction for the management of a project and directs the Railroad to identify a right-of-way for the project. Section 5 also directs the Department of Natural Resources to convey the selected land and waives the best interest findings of AS 38.05.

Section 6 of the bill amends uncodified law by providing further direction for the transfer of responsibility for the Alaska Stand Alone Pipeline project to the Alaska Railroad.

Section 7 of the bill provides an immediate effective date.

A BILL

FOR AN ACT ENTITLED

"An Act amending the powers and duties of the Alaska Railroad Corporation related to the exercise of authority to purchase, transport, and sell natural gas produced on the North Slope for in-state use, and transferring exclusive and primary responsibility for the initiation and development of that project from the Office of the Governor and the Department of Natural Resources to that corporation; and providing for an effective date."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

*** Section 1.** The uncodified law of the State of Alaska is amended by adding a new section to read:

LEGISLATIVE FINDINGS AND PURPOSE. (a) The legislature finds that

(1) by 2018, declining oil flow through the Trans Alaska Pipeline System will seriously diminish state revenue;

(2) Cook Inlet natural gas reserves are depleting at a rate that could cause

significant shortages for residential and commercial gas users in Southcentral Alaska by 2013;

(3) a proposed natural gas pipeline to deliver North Slope gas reserves to the North American domestic gas pipeline grid at a connection in central Alberta will not produce revenue for the benefit of the state before 2020;

(4) the state's significant reserves of natural gas should be made available on a priority basis in the state to enhance employment opportunities, expand the state's economy, and supply a significant portion of community energy needs;

(5) the Alaska Natural Gas Development Authority is developing a pipeline spur, aggregating in-state demand for natural gas, and facilitating delivery of natural gas and natural gas liquids to Alaskans; and

(6) in light of competing demands for future uses of the state's North Slope natural gas reserves, an aggressive effort involving planning, permitting, and coordination of information sharing, of necessary agreements and commitments, and commercial negotiations among interested parties will result in completion of construction of an in-state natural gas pipeline that will provide significant direct benefit to the people of the state at the earliest possible date.

(b) It is the purpose of this Act

(1) to give general direction to the Alaska Railroad Corporation, an agency that enjoys express authority to acquire, construct, improve, maintain, equip, and operate a natural gas pipeline and related facilities for the transportation of natural gas recovered from the North Slope without regard to whether the facilities are or will be owned in whole or in part by the corporation or located on land owned by the corporation, to plan and develop construction of a high pressure in-state natural gas pipeline of appropriate diameter between Alaska's North Slope and Cook Inlet sufficient to provide for the distribution of natural gas for residential and commercial purposes at locations along the pipeline route;

(2) to transfer the exclusive and primary responsibility for the development of the project described in (1) of this subsection, for which money was appropriated by sec. 19, ch. 14, SLA 2009, from the Office of the Governor and the Department of Natural Resources to the parties identified in this Act; and

(3) to achieve construction of an in-state natural gas pipeline that will provide significant direct benefit to the people of the state at the earliest possible date.

* **Sec. 2.** AS 42.40.460 is amended by adding a new subsection to read:

(*l*) The provisions of AS 42.40.560(d) prevail over the provisions of this section for the purpose of development of the North Slope natural gas pipeline project described in that section.

* **Sec. 3.** AS 42.40.560 is amended to read:

Sec. 42.40.560. North Slope natural gas pipeline. The corporation may provide [FINANCING] for the acquisition, construction, improvement, maintenance, equipping, and operation of a natural gas pipeline and related facilities**, and for the financing of the pipeline project and related facilities,** for the transportation of natural gas recovered from the North Slope of this state without regard to whether the facilities are or will be owned in whole or in part by the corporation or located on land owned by the corporation. **The authority provided by this section is limited to the project popularly identified as the Stand-Alone Pipeline Project, or Stand-Alone Project, that**

(1) proposes to develop a gas pipeline system to transport natural gas, and possibly additional natural gas liquids to markets in the Anchorage bowl area, and the Kenai Peninsula, and to additional customers along the transportation route;

(2) contemplates the commercial development of two primary sources of natural gas, the Prudhoe Bay Central Gas Facility and the Gubik gas field located in the northern foothills of the Brooks Range, and allows for use of gas from either or both of those gas sources;

(3) projects a pipeline system routing generally along the state's existing transportation corridors between the North Slope and Southcentral Alaska, starting from each potential gas source location, making its way to the Trans Alaska Pipeline System and Dalton Highway corridor, generally paralleling that corridor from the North Slope to the vicinity of Livengood, north of Fairbanks, and continuing to the Cook Inlet area, using one of two routes that are the existing transportation corridors between Fairbanks and Cook Inlet: the Parks Highway and the Richardson and Glenn Highways; and

(4) is compatible but not competitive with the project described in

AUTHORIZES CONSTRUCTION

and authorized by AS 41.41.

*** Sec. 4.** AS 42.40.560 is amended by adding new subsections to read:

(b) In the exercise of its authority under (a) of this section for a North Slope natural gas pipeline project, the corporation shall

(1) aggressively pursue the acquisition of all necessary federal permits and acquisitions essential for the development and operation of the project;

(2) provide monthly reports to the presiding officers of each house of the legislature and to the governor on the corporation's activities relating to the project;

(3) initiate a cost study for construction of a gas-to-liquids facility; in the exercise of its authority under this paragraph, the corporation may arrange for essential engineering and design work; and

(4) initiate efforts to identify and develop in-state markets for the natural gas to be delivered by the project and, to the extent necessary to ensure the long-term feasibility of the project, work to identify and develop overseas markets for the gas.

(c) Subject to AS 36.30.015(e), the board may provide that all or any portion of the project described in this section shall be subject to competitive sealed bid or competitive sealed proposal procedures.

(d) To fulfill its obligations under this section, the corporation shall identify all or a portion of a proposed natural gas pipeline transportation corridor. To the maximum extent possible consistent with ensuring the long-term feasibility of the project, the corporation shall make reasonable efforts to locate the proposed corridor between Fairbanks and the Kenai Peninsula, on its land. For land identified by the corporation under this subsection that is not then subject to the corporation's ownership,

(1) the Department of Natural Resources shall promptly reserve the entirety of the corridor across state land identified by the corporation, subject to valid existing rights and provisions of this section;

(2) on an interim basis, the Department of Natural Resources shall condition authorizations for activities on the reserved land to protect the right of the

corporation to initiate and undertake construction of the project or other uses identified for the land; and

(3) the Department of Natural Resources shall convey to the corporation the state's entire interest in the land within the pipeline corridor, subject to valid existing rights; in making the conveyance under this paragraph, the department may reserve to the state (A) the interests required by AS 38.05.125; (B) the right of the department to identify and reserve rights-of-way for potential future crossings under AS 42.40.460(g); and (C) the authority of the department to identify, reserve, authorize, and manage land within the pipeline corridor for future right-of-way leases and uses under AS 38.35; the conveyance of land under this paragraph shall be without cost to the corporation except for the direct administrative costs of the department; the best interest findings requirements of AS 38.05 do not apply to reservations and conveyances made under this subsection.

*** Sec. 5.** The uncodified law of the State of Alaska is amended by adding a new section to read:

ALASKA RAILROAD CORPORATION: TRANSITIONAL PROVISIONS AFFECTING OBLIGATIONS UNDER AS 42.40.560. (a) Subject to (d) of this section, in discharging its obligations under AS 42.40.560(b)(1), enacted by sec. 4 of this Act, the Alaska Railroad Corporation shall

(1) initiate permit and acquisition applications in accordance with the federal permit schedule that was provided to the legislature by the Office of the Governor on or about December 15, 2009;

(2) seek letters of intent from buyers and sellers of natural gas to ship gas using the facilities of the project and, from information obtained, by February 15, 2011, define the project parameters that would allow the project to be commercially viable;

(3) seek letters of interest from private pipeline construction and operating companies to develop the project; the work under this paragraph should be initiated between November 15, 2010, and shall be completed by March 15, 2011;

(4) prepare and submit, by December 15, 2010, legislation necessary to advance the project;

(5) identify or define and submit to the legislature, not later than January 15,

TIMELINE

2011, the corporation's estimates of any long-lead time cost items or work tasks to achieve an early start-up for the project;

(6) prepare a final bankable feasibility document; the work under this paragraph should be initiated by July 1, 2011, and shall be completed by June 30, 2012; and

(7) unless otherwise provided in the monthly report required by AS 42.40.560(b)(2), enacted by sec. 4 of this Act, prepare and submit a report at each of the dates set out in (1) - (6) of this subsection to the governor, the speaker of the house of representatives, and the president of the senate.

(b) The parties having responsibility for contracts, permit and acquisition applications, and studies in progress on the effective date of this Act entered into by the Office of the Governor or a state agency shall transfer those obligations and initiatives to the Alaska Railroad Corporation. Transfer of those obligations and initiatives may not be unreasonably delayed.

(c) Unless provision is made in legislation enacted in 2010 making and transferring appropriations to reappropriate unexpended appropriations made in 2009 to the Office of the Governor and executive branch agencies to support an in-state North Slope natural gas pipeline project, the Alaska Railroad Corporation may apply to the governor to transfer those unexpended balances of appropriations for uses described in AS 42.40.560(b), as enacted by sec. 4 of this Act. The governor may not unreasonably withhold approval of the request. AS 37.07.080(g) does not apply to an application made under this subsection. This subsection constitutes legislative approval to implement the transfer of responsibilities between the named entities as contemplated by AS 37.07.080(h).

(d) The corporation shall cease its activities under this section and AS 42.40.560, as amended by secs. 3 and 4 of this Act, if the corporation receives a communication that

(1) the governor, after setting out with particularity the reasons that support the decision, has entered a finding that

(A) an agreement has been entered into that will result in construction of the project described in AS 43.90; and

(B) construction of the project described in this section would prevent initiation and completion of the project described in AS 43.90; and

(2) the legislature expresses its approval of the finding of the governor made

- ESTABLISHES & DESCRIBES THE AUTHORITY OF THE EXECUTIVE BRANCH

under (1) of this subsection.

*** Sec. 6.** This Act takes effect immediately under AS 01.10.070(c).

2011, the corporation's estimates of any long-lead time cost items or work tasks to achieve an early start-up for the project;

(6) prepare a final bankable feasibility document; the work under this paragraph should be initiated by July 1, 2011, and shall be completed by June 30, 2012; and

(7) unless otherwise provided in the monthly report required by AS 42.40.560(b)(2), enacted by sec. 4 of this Act, prepare and submit a report at each of the dates set out in (1) - (6) of this subsection to the governor, the speaker of the house of representatives, and the president of the senate.

(b) The parties having responsibility for contracts, permit and acquisition applications, and studies in progress on the effective date of this Act entered into by the Office of the Governor or a state agency shall transfer those obligations and initiatives to the Alaska Railroad Corporation. Transfer of those obligations and initiatives may not be unreasonably delayed.

(c) Unless provision is made in legislation enacted in 2010 making and transferring appropriations to reappropriate unexpended appropriations made in 2009 to the Office of the Governor and executive branch agencies to support an in-state North Slope natural gas pipeline project, the Alaska Railroad Corporation may apply to the governor to transfer those unexpended balances of appropriations for uses described in AS 42.40.560(b), as enacted by sec. 4 of this Act. The governor may not unreasonably withhold approval of the request. AS 37.07.080(g) does not apply to an application made under this subsection. This subsection constitutes legislative approval to implement the transfer of responsibilities between the named entities as contemplated by AS 37.07.080(h).

(d) The corporation shall cease its activities under this section and AS 42.40.560, as amended by secs. 3 and 4 of this Act, if the corporation receives a communication that

(1) the governor, after setting out with particularity the reasons that support the decision, has entered a finding that

(A) an agreement has been entered into that will result in construction of the project described in AS 43.90; and

(B) construction of the project described in this section would prevent initiation and completion of the project described in AS 43.90; and

(2) the legislature expresses its approval of the finding of the governor made

under (1) of this subsection.

*** Sec. 6.** This Act takes effect immediately under AS 01.10.070(c).

ANALYSIS: *(Attach a separate page if necessary)*

SB 287 amends the Alaska Railroad Corporation's (ARRC or the corporation) enabling statute to require ARRC to initiate planning and development of construction of an in-state natural gas pipeline. The project is well outside ARRC's norms, both in type and size. Similar to the approach currently underway, this fiscal note addresses funding necessary for ARRC to bring the project through permitting and preliminary engineering phases. Construction costs are not included at this juncture. Also excluded from this analysis are estimated costs to be incurred by a pipeline company or other entity that would presumably complete design and build the project.

FISCAL NOTE

STATE OF ALASKA **BILL NO.** SB 287
2010 LEGISLATIVE SESSION

ANALYSIS CONTINUATION

This fiscal note assumes the corporation will establish a project office, staffed mainly by newly hired ARRC employees. The office will function autonomously from other railroad operations and be funded by the State of Alaska, presumably out of the General Fund. Contractors will be used for all major project functions including engineering, permitting, right of way acquisition, cost estimation, and marketing activities.

ARRC's preliminary evaluation is that substantial progress has been made to date along the critical path to project completion. First, an Environmental Impact Statement (EIS) is well underway. The EIS is almost certainly the most important effort to meet an aggressive project schedule. Second, a well-founded cost estimate for construction is due in June, 2010. This is critical to determining the project financial feasibility and for development of both supplier and customer contracts.

The fiscal analysis summary below is predicated upon ARRC hiring seven new employees to support this effort. By statute, ARRC employees are not state employees; the corporation has a distinct employment system separate from the State of Alaska. The initial basis for the cost estimates shown below are derived from analysis performed by the Office of the Governor, Alaska In-State Gas Pipeline Project office.

SPONSOR STATEMENT FOR SENATE BILL 287

"Act amending the powers and duties of the Alaska Railroad Corporation and the Alaska Housing Finance Corporation related to the exercise of authority to purchase, transport, and sell natural gas produced on the North Slope for in-state use, and transferring exclusive and primary responsibility for the initiation and development of that project from the Office of the Governor and the Department of Natural Resources to those corporations; and providing for an effective date."

Since the discovery of natural gas in Cook Inlet by Unocal in 1958, the residents of Southcentral Alaska have enjoyed relatively cheap and abundant energy. While the development of Cook Inlet natural gas reserves over the succeeding decades was eclipsed by the discovery of the mammoth reserves at Prudhoe Bay; the Inlet has provided gas to generations of Alaskans and fueled the growth of Southcentral since statehood. From the LNG export terminal to the value-added manufacturing facility producing fertilizer at Nikiski, natural gas created an industrial hub on the Kenai. Cheap gas also fueled electric generation throughout the Railbelt, heated homes and facilitated economic growth throughout the region.

Today however, gas supplies in Cook Inlet are declining; threatening the energy security of major segments of Alaska's population. The challenge facing Southcentral is certainly not new; the residents of interior and rural Alaska have faced similar circumstances for generations. That is why the solution lies not in meeting the needs of Southcentral through imported LNG or stop-gap measures, but in a broader strategy to deliver gas to Alaskans. The vast supplies of gas on the North Slope provide an opportunity to meet not only the existing needs in Cook Inlet, but to distribute gas more widely across the state. In communities as diverse as Bethel and Fairbanks, community leaders are working to develop ways to get gas to their community and their efforts ultimately depend on access to a stable supply of gas.

Senate Bill 287 takes an important step towards that goal by tasking the Alaska Railroad, a public corporation of the State of Alaska with developing the Alaska Stand Alone Pipeline (ASAP) project. Work on the ASAP project was started in the latter days of the 2009 legislative session, when language was attached to the Supplemental Appropriations bill (Ch. 14 SLA 09) authorizing work on an in-state natural gas pipeline. As the project has progressed, the need to accelerate its development has become more apparent as the discovery of large deposits of previously inaccessible natural gas reserves in the lower 48 have clouded the future of the American natural gas market. SB 287 moves the ASAP pipeline project beyond legislative intent language into a more enduring statutory framework that will enable the project to progress.

Bringing Alaskans' natural gas to Alaskans will invigorate the economy and should enable the development of value-added industries; providing jobs in-state and a strong economic legacy to Alaskans. While the future demand for gas in the Lower 48 is questionable, the need for gas in Alaska is self-evident. SB 287 focuses the attention on that need and takes a first step toward bringing the energy security Cook Inlet has enjoyed statewide.

Changes to Senate Bill 287 in CS SB 287 (RES) 26-LS 1467\R

Please note that the following is not an authoritative list of changes to the bill. The current version of the bill itself is the best statement of its contents.

General: The Alaska Housing Finance Committee has been removed from the bill.

Section 1: Legislative Findings and Purpose

1. Inserted new language on P. 2, lines 8-10 that recognizes the work the Alaska Natural Gas Development Authority has conducted on a spur-pipeline and in-state demand and deliverability of natural gas.
2. Deleted "only" from subsection (6) on P. 2, line 12.
3. On P. 2, lines 27-28 language was inserted to clarify the "project" described in the bill is the Alaska Stand Alone Pipeline for which an appropriation was made in section 19, ch. 14, SLA 2009.
4. On P. 2, lines 30-31 a new subsection (3) is inserted clarifying the purpose of the act.

Section 3: AS 42.40.560

1. Substantial new language has been inserted expanding the authority of the Alaska Railroad beyond the financing of a natural gas pipeline and allowing for the Railroad to be involved in the permitting and/or construction of a pipeline.
2. The authorization is narrowed to the scope of the specific Alaska Stand Alone Pipeline project.
3. Language has been inserted on P.3, line 31 clarifying that the project is compatible with the authorities granted to the Alaska Natural Gas Development Authority.

Section 5: Uncodified Law

1. New language has been added on P. 5, lines 20-31 through P.6 line 8 establishing firm timelines for the project.
2. New language has been added on P. 6, lines 23 through P. 7 line 1 establishing and describing the authority of the executive branch to terminate the project in the event that an agreement has been entered into to construct the project described in AS 43.90 (AGIA).

Sectional Analysis of Senate Bill 287: 26-LS 1467\R

Please note that a sectional analysis is not an authoritative interpretation of a bill. The bill itself is the best statement of its contents.

Section 1 of the bill establishes legislative findings and provides the general purpose of the act.

Section 2 of the bill clarifies that the provisions in subsection (d) of section 5 supersede other land transfer processes set out in current law.

Section 3 of the bill clarifies that the authority granted in AS 42.40.560 includes the permitting and construction of the Alaska Stand Alone Pipeline project.

Section 4 of the bill expands on the authority of the Alaska Railroad under AS 42.40.560 in relationship to financing a natural gas pipeline project, provides direction for the management of a project and directs the Railroad to identify a right-of-way for the project. Section 5 also directs the Department of Natural Resources to convey the selected land and waives the best interest findings of AS 38.05.

Section 5 of the bill amends uncodified law by providing further direction for the transfer of responsibility for the Alaska Stand Alone Pipeline project to the Alaska Railroad, establishes milestones for the project and allows for the cessation of the project.

Section 6 of the bill provides an immediate effective date.

Prepared By: Michael Pawlowski, Aide to Senator McGuire

An entity managing the construction of a pipeline utilizing state funds may not require a contractor, subcontractor, or material supplier or carrier engaged in the construction of the pipeline construction project to execute or otherwise become a party to any project labor agreement, collective bargaining agreement, prehire agreement, or any other agreement with employees, their representatives, or any labor organization as a condition of bidding, negotiating, being awarded, or performing work on the pipeline project. This provision shall not prohibit a contractor after a contract award from voluntarily utilizing a collective bargaining agreement.

To the maximum extent permitted by law, a person managing a pipeline construction project utilizing state funds must commit to:

(A) hire qualified residents from throughout the state for management, engineering, construction, operations, maintenance, and other positions

(B) contract with businesses located in the state;

(C) establish hiring facilities or use existing hiring facilities in the state;

(D) use, as far as is practicable, the job centers and associated services operated by the Department of Labor and Workforce Development
and an Internet-based labor exchange system operated by the state;

Sectional Analysis of Senate Bill 287: 26-LS 1467\R

Please note that a sectional analysis is not an authoritative interpretation of a bill. The bill itself is the best statement of its contents.

Section 1 of the bill establishes legislative findings and provides the general purpose of the act.

Section 2 of the bill clarifies that the provisions in subsection (d) of section 5 supersede other land transfer processes set out in current law.

Section 3 of the bill clarifies that the authority granted in AS 42.40.560 includes the permitting and construction of the Alaska Stand Alone Pipeline project.

Section 4 of the bill expands on the authority of the Alaska Railroad under AS 42.40.560 in relationship to financing a natural gas pipeline project, provides direction for the management of a project and directs the Railroad to identify a right-of-way for the project. Section 5 also directs the Department of Natural Resources to convey the selected land and waives the best interest findings of AS 38.05.

Section 5 of the bill amends uncodified law by providing further direction for the transfer of responsibility for the Alaska Stand Alone Pipeline project to the Alaska Railroad, establishes milestones for the project and allows for the cessation of the project.

Section 6 of the bill provides an immediate effective date.

Prepared By: Michael Pawlowski, Aide to Senator McGuire

Re: Senate Bill 287

To Whom It May Concern:

My name is John McGrath and am a thirty year member of Ironworkers Local 751 of Alaska. I am writing this letter out of concern that I have seen no language pertaining to a Project Labor Agreement (PLA) on the Bullet Line from the North Slope to Southcentral Alaska.

I urge you to think about all the people a project of this magnitude would employ. One could only hope that a job of this importance being built for ***Alaskans*** would be built by ***Alaskans.***

Respectfully,

John P. McGrath

Re:
Senate Bill 287

To Whom It My Concern:

I am contacting you to support the PLA langrage in SB 287 that is before your committee.

My father, brother and I worked on the Trans-Alaska Pipeline, it had a PLA. Passage of this bill will have a huge positive impact on the people and the State of Alaska. It is without question, the right thing for Alaska!

Thank you for your attention in this matter.

Lifelong Alaskan,

Marc Zimmerman

Wasilla, AK 99654

March 22, 2010

To the Senators of the Resource Committee,

I am asking for your support for the passing of Bill 287. This is the only way to ensure that Alaskans get fair treatment in regards to hiring. We cannot rely on the big oil companies to do the fair thing. When constructed, the Trans-Alaska Pipeline did have a PLA in place. We must do our part to ensure that Alaskans have the same, if not preferred rights to jobs, as we live here, raise our families here. We do not take the money provided and run to the lower 48. Alaskans must stand together, not on the sidelines to help preserve work for us. Please support Bill 287.

Thank you for your support.

Best regards,

Danny O'Leary

North Pole, AK

March 22, 2010

To the Senate Recourses Committee:

I am a resident of the State of Alaska since 1973. Over thirty years ago Alaska and our nation needed oil to support and maintain our infrastructure. Our state was on the forefront against other nations with the chokehold on oil supply.

A pipeline was needed and a pipeline was built with project labor agreement. Today this line still in operation because it was built with people that meet the requirements to do the work.

I respectfully request the passage of Bill 287.

Respectfully,

Israel Figueroa Arce

March 22, 2010

To the Senators of the Resource Committee,

I am asking for your support for the passing of Bill 287. This is the only way to ensure that Alaskans get fair treatment in regards to hiring. Otherwise, it will lead to more big companies hiring lower 48 workers, leaving Alaskans out in the cold. You must remember that the Trans-Alaskan pipeline did have a PLA in place. We cannot stand on the sidelines and let these jobs not be given away. We are isolated from the lower 48, meaning we must rely more on each other and the companies that come to Alaska to hire Alaskans.

Thank you for your support.

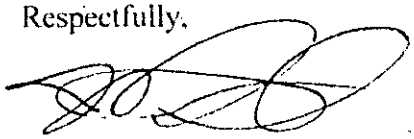
Best regards,

Amy O'Leary
North Pole, AK

To the Senate Resources Committee

I am Jake Rider I was born in Alaska and have lived in both Anchorage and Kenai. I have a worked for Spenard Builders, Sourdough Mining, and VECO's shop in Nikiski before I became an Ironworker. I just finished my Apprenticeship, passed my test to become a Journeyman. Now I need to go to work. This gas pipeline talk has since I was a kid. I am writing you because of the concern I have for Alaskan jobs and for that reason I would ask your committee to support an Amendment to insure that Project Labor Agreement language is part of Senate Bill 287 before it passes from you committee. PLA's are the best way to insure that Alaskans do the work on any Gas Pipeline big or bullet line. I have only been an IW for four years, but now have benefits Health & Welfare and a Pension and I here all the time how these funds need more contributions. Gas pipeline means contributions. Support the PLA please.

Respectfully,



Jake Rider

To Whom It May Concern:

My name is Vernon Zimmerman; this letter is in regard to a project labor agreement in Senate Bill 287. I am a 30-year member of Ironworkers Local Union 751. My father worked in Drift River, ran work on all but one of the platforms in Cook Inlet. I worked on the pipeline and many other projects from Prudhoe Bay to Valdez, Shemya, and parts in between.
If it weren't for trade labor these projects wouldn't be there. In fact, if you're reading this in Anchorage there is a real good chance I stood where you're sitting right now when the building was built. In my view a PLA is a MUST on any large project of this sort, not just for the skilled labor, but trade unions are one of the best ways to insure a large percentage of the work force involved are residents of the state.

Thank you for your time,

Sincerely,

Vernon Zimmerman

Vernon Zimmerman

Dear Senate Resources Committee:

My name is Robert J. Rodeheaver. I am a member of Ironworkers L.U. 751. I am writing you in the hope that you will support Alaskan families first. By supporting P.L.A. for the gas line project referenced in senate bill 287, you are making Alaskans your top priority.

This project would bring a lot of revenue to our pension and trust funds. I want the committee to realize the importance of a P.L.A. on a project of this magnitude for the workers of Alaska. We need to keep Alaskans working on Alaska's projects.

Thank you for your consideration.
Sincerely,

Robert J. Rodeheaver

Senate Resources Committee:

I am Anthony Ladd ironworker also work as an instructor for the Alaska Ironworkers local. I am writing you to urge you to support for my amendment of Senate bill 287 that includes P.L.A language the addition of project labor A will ensure that Alaskan build the Alaska Gas Pipeline. Whether it will be full scale or bullet line. Support the P.L.A amendment.

Respectfully yours,

Anthony Ladd

To the Senate Resources Committee:

My name is Brooks McCumby and I am a journeyman Ironworker in the local 751 I am writing you to ask you to support any amendment of senate bill 287 that includes P.L.A. Language I believe that a project labor agreement is the only way to Insure that Alaskans build the Alaska gas pipeline whether it be full scale or a bullet line please support the PLA amendment.

Truly yours,

Brooks McCumby

Dear Senator,

I would like to take a moment of your time to address my thoughts about SB 287 and how it will affect Alaskans. I think a recent event, which took place here in Anchorage, demonstrates the need for specific language that ensures jobs for Alaskans on any pipeline work.

The United States Air Force expanded their inventory of the F-22 fighter and recently built two hangars on Elmendorf Air Force Base. Great news for the local economy most thought at first. However, things did not look so promising for the locals after the contract to erect these multi-million dollar hangars was awarded to an out of state contractor. Disappointing to say the least, but not illegal. One only has to venture to the Anchorage Airport on a Sunday to watch hundreds of out of state workers as they commute to or from their place of employment.

In September, it was brought to the attention of the Alaska Workers Compensation Fraud Division that the California contractor erecting these hangars, had imported over 25 men to work on this project and was doing so without the required workers compensation coverage to work in Alaska. For a contractor to be in business and not carry workers compensation insurance is not only illegal, but also provides an enormous cost savings to that contractor and by virtue, allows them to significantly underbid any honest contractor.

U.S. Immigration and Customs Enforcement (I.C.E.) were notified that Steel System Erectors of California was employing undocumented aliens recently. Agents from the Anchorage office of ICE investigated and verified this company was employing men who were not supposed to be in the country, let alone working on a United States Air Force base constructing hangars for one of our most sophisticated fighter jets. ICE agents arrested a number of the employees and began deportation procedures.

Even as a disabled veteran, I find it a cumbersome process to be allowed access to Elmendorf, A.F.B. How is it a contractor is able to sneak workers onto our military base for months? ICE reported one of the apprehended workers had a criminal background in California. This criminal was allowed to steal employment for months from an American citizen. Through the illegal actions of this contractor they were able to "win" these jobs away from Alaskans who could surely have used the employment, while apparently receiving a pass for violations of state and federal law.

In the present contracting processes available, only one method of procuring a contract would guarantee local hire first and compliance with state and federal laws pertaining to workers comp insurance and prevailing wage requirements: utilization of a project labor agreement (PLA).

Unfortunately, those who typically argue against the virtues of PLAs are precisely the same ones whose "merit shop" philosophy is often defined by those who perpetuate illegal acts such as those committed in our back yard on Elmendorf AFB.

Ironically, because a Project Labor Agreement was not implemented, a select group of non-residents were able to secure this project through unlawful business practices and successfully implemented a "No Resident Hire" policy.

Senators, I respectfully request you support hiring Alaskans by supporting an amendment to SB 287, which would require a project labor agreement on a natural gas bullet line.

Sincerely,

John Lewis

Weekly Gasline Briefing #10 - Apr. 13th, 2007

Printer Friendly

Governor Sarah Palin Weekly Gasline Briefing #10 April 12, 2007

Thanks for joining us. I'm Tom Irwin, Commissioner of DNR, and a member of the state's gasline team. I am so proud to be a part of this team. And I want you to know that the Governor is on the right track and doing what's best for Alaska.

The gasline team, including myself, and the Governor have traveled the state listening to Alaskans at town hall meetings and during appearances at various public forums, including radio call-in shows. Alaskans recognize that passage of AGIA and forward movement of a gasline project is obviously the top concern of the state. One of the most talked about provisions of AGIA is its Alaska hire provision and I'd like to take a moment to talk about that during this week's gasline briefing.

We have long recognized that AGIA must not only induce a gasline, but also must provide Alaskans real opportunities for gasline-related employment. This means offering vocational programs to train Alaskans for pipeline jobs, as well as assuring that Alaskans will fill those jobs. AGIA fulfills these goals in six ways.

First, AGIA requires that applicants commit to hire Alaskans for management, engineering, construction, operations, maintenance, and other gasline-related positions, and to contract with Alaska businesses, to the extent permitted by law. We want Alaskans trained and experienced in all facets of this project, including its maintenance and management for the 40 or 50 years it is producing.

Second, AGIA requires that applicants commit to establishing local headquarters in Alaska. This is an important requirement, since project management will be coordinated in Alaska.

Third, applicants must commit to negotiate a project labor agreement. A project labor agreement is basically a pre-construction bargaining agreement between management and labor. Under a PLA, costs are established for labor, including wages, benefits, and working conditions. PLAs provide a host of assurances for both management and workers. Stability in labor cost estimates lessen cost overrun risks. And no-strike and lock-out agreements assure there are no management-labor disputes for the duration of the project. This promotes on-time delivery of project milestones. PLA language would allow bidding for any pipeline related work to be open to any qualified firm, union or non-union.

Fourth, AGIA requires the Commissioner of Labor and Workforce Development to develop a job training program for pipeline-related positions. A program like that serves as an inducement to the licensee, which would prefer the state handle this responsibility. We are pleased to do so.

Fifth, do not overlook the importance of the expansion provisions. If explorers get financial terms that enable them to economically explore for, discover, and transport new gas to and through the line, it opens the North Slope basin to not just marketing the known 35 trillion cubic feet of gas there, but to the additional hundreds of trillions of cubic feet of gas waiting to be discovered. A gasline that will transmit hundreds of trillions of cubic feet of gas for 40 or 50 years is a critical means to provide long-term careers to Alaska workers.

Last, AGIA requires that the applicant commit to provide for a minimum of five delivery points of gas in Alaska. Off-take points from the main line provide opportunities for spur lines to fuel Alaska homes and businesses with Alaska gas. In-state delivery also requires additional infrastructure, which in turn requires additional personnel to build and maintain the infrastructure.

The Governor and the gasline team strongly believe in offering Alaskans the best and most meaningful opportunities to capitalize on work generated by AGIA and the gasline it will facilitate. AGIA does that – it offers Alaskans not just jobs, but careers.

Thank you.

Rep. Mark Neuman, Co-Chair
State Capitol, Room 432
Juneau AK, 99801

Dear Members of the Alaska State Legislature, In-State Gas Caucus,

Over three decades ago we built the Trans-Alaska Pipeline; one of the greatest achievements in Alaska's history. Unfortunately, since that time, Alaskans have seen few large-scale projects that would generate the economic activity needed to shape and guarantee the economic prosperity of our state for succeeding generations.

Today, our State finds itself in the unique position to unite around a project that will do just that. So on this historic occasion, I pledge my full support for your efforts in developing Alaska's natural gas for the in-state needs of Alaskans.

As deliverability shortfalls in Anchorage become imminent, and an explosion of natural gas reserves in the Lower 48 are already a reality, it is my view that the best way to bring Alaska's great natural gas potential to fruition is through the construction of an in-state line. An in-state gas line from the North Slope to Kenai or Valdez that also meets the local domestic and industrial needs of Fairbanks and Anchorage is the best option for developing Alaska's natural gas resources and shoring up Alaska's economy for decades to come.

An in-state gas line will fuel electric generation throughout the Railbelt, heating homes and facilitating economic growth throughout the region. Proposals such as Alaska Senate Bill 287, which tasks the Alaska Railroad with developing an in-state pipeline project, and Alaska House Bill 369, which creates an in-state gas development team, are positive steps towards this goal.

In Congress, I will help assist in these endeavors in any way possible beginning with a letter to the Secretary of Energy requesting a long-term extension for the export license of Liquefied Natural Gas. Now is the time to seize upon this opportunity to put Alaskans to work with a project that will carry our economy into the future.

Sincerely,

Don Young

STATE OF ALASKA
OFFICE OF THE GOVERNOR

January 28, 2010

The Honorable Jon Wellinghoff
Chairman
Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

Dear Chairman Wellinghoff,

On November 19, 2009, Harry Noah, the former project manager for Alaska's in-state natural gas pipeline project, sent a letter requesting FERC's assistance in answering jurisdictional questions surrounding Alaska's investigation for in-state delivery of North Slope natural gas. Since then, however, there have been several new developments in the deliverability of Cook Inlet gas. Please accept this letter as an amended version of Mr. Noah's original letter to reflect these changes. As you know, Alaska is committed to the exploration of natural gas delivery, and we look forward to your response concerning the jurisdictional questions outlined below.

Alaska's desire for this study stems from the possibility of deliverability shortfalls in the Anchorage area that might arise in the future under certain scenarios. Historically, the demands for energy in the Anchorage area have been supplied by Cook Inlet production, but due to the natural decline of the reserves base, lack of significant drilling activity, and subsequent loss or potential loss of industrial base-load has resulted in a strain on the economics of maintaining deliverability capacity. In the future, meeting mid-winter demand spikes in the high-swing domestic market will require significant investment in wells and storage projects which will put upward pressure on consumer gas prices. A recently released study by the Alaska Department of Natural Resources outlines this current understanding of Cook Inlet gas resources[1]. The Federal Energy Regulatory Commission's (FERC) most recent report to Congress on the interstate Alaska gas pipeline project also references the State's investigation of in-state options[2].

A top priority of Governor Parnell and his administration is to see an interstate gas pipeline through to completion. An interstate gas pipeline is vital not only to Alaska's future, but also the energy future of our nation. My request for guidance from FERC on in-state pipeline issues in no way should be understood as detracting from that commitment. We want to make sure that Alaskans do not fall short in meeting their needs for natural gas.

---

[1] "Preliminary Engineering and Geological Evaluation of Remaining Cook Inlet Gas Reserves," report submitted to the Alaska Department of Natural Resources by the Alaska Division of Oil and Gas, December, 2009, 37p., available at http://www.dog.dnr.state.ak.us/oil/.

[2] "Eighth Report to Congress on Progress Made in Licensing and Constructing the Alaska Natural Gas Pipeline," report submitted to the United States Congress by the Federal Energy Regulatory Commission, August 26, 2009, pp 5-6.

Our overall question is to confirm and clarify under what circumstances FERC, as opposed to the Regulatory Commission of Alaska (RCA), would have jurisdiction. It is important for the State in evaluating the alternatives to understand what approval processes apply and which regulatory agencies will exercise jurisdiction over a completed in-state pipeline. I am writing, therefore, to ask if you can confirm our understanding regarding possible FERC jurisdiction with respect to the resource use scenarios that would result from delivering North Slope gas to the Cook Inlet basin on either of two possible pipeline routes.

The State of Alaska is currently investigating the cost components of a pipeline that parallels the route of the Dalton Highway from the North Slope and then follows the Parks Highway to the area of Cook Inlet. A second option is a pipeline that will parallel the route of the Dalton Highway from the North Slope and then follow the Richardson and Glenn Highways to the Cook Inlet area. In either case, the pipeline would commence at the outlet of a conditioning plant and end at or near tidewater in Cook Inlet where it would interconnect with an existing RCA-regulated intrastate pipeline in the Anchorage area.

In each case, the in-state pipeline would be a high-pressure pipeline (2500 psi) and would not receive gas from any interstate pipeline or foreign source of gas. The capacity of the line would be between ¼ and 1.0 bcf per day. Thus, physically the pipeline would begin and end in the state of Alaska and would never leave the state during the course of its journey from the North Slope to the Cook Inlet area. Nor would it directly connect to the existing FERC-regulated Kenai Liquefied Natural Gas (LNG) facility; although, given the nature of the Cook Inlet pipeline and distribution system, it might connect to existing pipelines that in turn connect to the Kenai LNG facility. During its journey on the in-state pipeline, North Slope gas might be withdrawn from the pipeline for consumption at intermediate destinations entirely within the state of Alaska as well as for the ultimate distribution in the Cook Inlet area and for export as LNG.

It should be noted that for more than four decades, and with the required federal approvals, Cook Inlet gas has been liquefied and shipped to Japan. Last January, your Commission clarified the scope of its jurisdiction under Section 3 of the Natural Gas Act over the Kenai LNG facility, confirming that FERC exercises jurisdiction over the siting, construction, operation, and maintenance of that LNG facility. The January order did not discuss, let alone assert, jurisdiction over the separate State-regulated pipelines that connect to the LNG terminal. The Kenai LNG facility factors into several of the scenarios where we seek your assistance. For the purpose of the questions being posed in this letter, none of the scenarios currently under investigation involve a new LNG terminal.

We appreciate that any export of gas would be subject to the U.S. Department of Energy (DOE) approval (under Section 3 of the Natural Gas Act), but our concerns are with the jurisdictional questions that may arise over a new in-state pipeline that transports gas – some, or much of which, depending on the time frame, may be exported through the Kenai LNG facility. Under these circumstances, we believe existing FERC precedent would recognize State, not federal, regulation of an intrastate pipeline that would connect to other pipelines that serve local distribution needs as well as LNG exports. We emphasize that, in each of the cases that follow, the primary objective of the in-state line is to serve local domestic and industrial needs in Alaska as those needs arise over time.

The first scenario with regard to the above pipelines would be the case where all of the gas flowing down the pipeline from the North Slope is sold to end-users who consume the gas entirely within the state of Alaska. We believe that, under this circumstance, there would be no question that the

proposed pipeline would be an intrastate pipeline not subject to regulation by FERC. Please confirm that this is correct.

A second scenario would be that, depending on local needs, some of the gas transported from the North Slope to the Cook Inlet area would be sold to and consumed by end-users within the state of Alaska. However, some, and potentially a majority, of that gas might be sold or re-sold to parties that would export it to foreign markets through the Kenai LNG facility. This resembles the current practice for the Cook Inlet natural gas market today. In *Yukon-Pacific*, 39 FERC ¶ 61,216 (1987), the Commission notes that a proposed in-state pipeline that would feed a proposed LNG terminal at Valdez for foreign exports would not be subject to the Commission's jurisdiction. That ruling was earlier than the 2005 amendments to the Natural Gas Act but its logic would still appear to apply to the scenarios we describe here that would not involve construction of a new LNG terminal and would involve an in-state pipeline that would not itself directly connect to the existing LNG terminal.

We ask that you confirm that the addition of a supply of North Slope gas into the Cook Inlet natural gas and foreign export markets would have no effect on the current jurisdictional framework. Again, since any such gas being exported to foreign markets through the Kenai LNG facility would be delivered to the Kenai LNG facility by way of RCA-regulated intrastate pipelines that already deliver gas to the Kenai LNG facility for export, we ask that you confirm that the new in-state pipeline that would in turn deliver the export gas to the intervening intrastate pipeline would not be classified as FERC jurisdictional.

A third scenario with regard to the potential new pipeline from the North Slope would be that some of the gas transported from the North Slope to the Cook Inlet area would be sold to and consumed by end-users within the state of Alaska, but the balance of the gas might be sold to parties that would export it to foreign or Lower 48 markets through the Kenai LNG facility. The third alternative assumes the availability of an operational LNG terminal on the west coast of the United States at some point during the operation of the in-state pipeline. In those circumstances, the ultimate destination of LNG exports from the Kenai terminal would likely depend on the comparative attractiveness at a future date of Lower 48 and overseas markets. The path of gas to those markers would first pass through the in-state pipeline, continue through existing gas pipelines that are regulated by the RCA and then through the existing Kenai LNG facility. Portions of the gas stream from the in-state line would flow respectively to intrastate, interstate, and foreign destinations as needs and markets dictate and accordingly the destination ratios would vary over time. In the totality of the circumstances, we believe a strong case may be made that the in-state line should not be jurisdictional, but we seek the Commission's guidance on this question as well.

On behalf of the State of Alaska, thank you for the support of the Commission's staff in moving the interstate Alaska gas pipeline project forward. The visit of the Commission's staff in August 2009 to meet with State and local agencies, and their tour of the prospective pipeline routes, was helpful in spurring progress in TransCanada Alaska's pre-filing process with your Commission. It is also our understanding that the FERC staff is taking the steps necessary to produce an Environmental Impact Study for the TransCanada Alaska and Denali projects on the timeline defined by the Alaska Natural Gas Pipeline Act. TransCanada Alaska and Denali are also busy preparing for open seasons during 2010.

We greatly appreciate your assistance, and look forward to your response. Please do not hesitate to contact me at (907) 257-1352 if I can further clarify.

Sincerely,

Robert Swenson
Project Manager
Alaska In-State Natural Gasline

OFFICE OF THE CHAIRMAN

Robert Swenson
Project Manager
Alaska In-State Gas Resources
411 Fourth Street
Anchorage, AK 99501

Dear Mr. Swenson:

I am writing in response to your January 28, 2010 letter sent in your capacity as the project manager for the in-state natural gas pipeline project being studied by the State of Alaska. Your letter amended a November 19, 2009 letter from your predecessor as Project Manager, Mr. Harry Noah, describing options being considered for an in-state pipeline to bring natural gas from Alaska's North Slope to meet gas demand in southern Alaska, and seeking guidance regarding under what circumstances the Federal Energy Regulatory Commission, as opposed to the Regulatory Commission of Alaska, would have jurisdiction over the proposed facilities. I appreciate the opportunity to consult with Alaska authorities on the issue of an in-state natural gas pipeline, because I am well aware that the need to make economic energy supplies available to Alaska's residents is a matter of great concern within the state.

I have enclosed with this letter an analysis by my staff of the issues raised in your and Mr. Noah's letters. The analysis represents staff's best judgment, based on the scenarios presented in the letters. Of course, if and when the Commission itself is asked to rule formally on these or similar issues, the Commissioners will have to reach their own decisions on the matters presented to them. Please feel free to contact me and my staff at any time about matters of concern to Alaska. Should you have further questions regarding this response or staff's analysis, please contact Mr. John Katz, Deputy Associate General Counsel for Energy Projects, at (202) 502-8082.

Sincerely,

Jon Wellinghoff
Chairman

Enclosure

COMMISSION STAFF REVIEW OF JURISDICTIONAL ISSUES RELATING TO ALASKA IN-STATE NATURAL GASLINE

This document responds to the January 28, 2009 letter from Mr. Robert Swenson, Project Manager for the State of Alaska's study of a potential Alaska in-state natural gas pipeline (in-state pipeline), amending a November 19, 2009 letter from Mr. Swenson's predecessor, Mr. Harry Noah.

As explained in the letters, the primary purpose of the in-state pipeline would be to transport natural gas from Alaska's North Slope to serve local domestic and industrial needs in Alaska as those needs arise over time. Mr. Swenson seeks to confirm under what circumstances the Federal Energy Regulatory Commission (FERC), as opposed to the Regulatory Commission of Alaska (RCA), would have jurisdiction over the proposed facilities.

Mr. Swenson's letter provides the following information: Alaska is investigating the cost of a pipeline that would parallel the route of the Dalton Highway from the North Slope and then follow the Parks Highway to the area of Cook Inlet. A second option is a route that would parallel the Dalton Highway from the North Slope and then follow the Richardson and Glenn Highways to the Cook Inlet area. In either case, the pipeline would be a high-pressure facility (2500 pounds per square inch), with a capacity of between 0.25 and 1.0 billion cubic feet per day. The pipeline would commence at the outlet of a conditioning plant and terminate at or near tidewater in Cook Inlet, where it would interconnect with an RCA-regulated intrastate pipeline in the Anchorage area. The pipeline would not directly interconnect with the existing, FERC-regulated Kenai Liquefied Natural Gas (LNG) facility, although it might connect to existing pipelines that themselves connect to the Kenai facility.

Mr. Swenson's letter presents three scenarios with respect to the ultimate use of the natural gas transported on the in-state pipeline, and asks for confirmation of the jurisdictional implications of each hypothetical case. Commission staff describes and analyzes each scenario below in light of two sections of the Natural Gas Act (NGA) – NGA section 7, which establishes the Commission's jurisdiction over the construction and operation of interstate natural gas pipelines, and NGA section 3, which establishes the Commission's jurisdiction over facilities used for the import or export of natural gas in foreign commerce.

Scenario 1

In the first scenario, all of the North Slope gas transported by the in-state pipeline would be sold to end-users who would consume the gas entirely within Alaska.

Under these circumstances, Commission staff agrees with Mr. Swenson's conclusion that no authorization would be needed from the Commission for construction and operation of the in-state pipeline.

Scenario 2

Under the second scenario, while some of the North Slope gas transported by the in-state pipeline would be sold to, and consumed by, end-users in Alaska, depending on local needs, some, and potentially a majority of, the gas would be sold to parties who would have it delivered, via connections with the existing intrastate grid, to the Kenai LNG facility for export to foreign markets. As support for the conclusion that the in-state pipeline would not be subject to Commission jurisdiction under this scenario, Mr. Swenson's letter references the Commission's order addressing a somewhat, but not entirely, similar situation in *Yukon Pacific Corporation*.[1]

In that case, Yukon Pacific Corporation was developing a proposal to construct a project, to be known as the Trans-Alaska Gas System (TAGS), to transport gas from the North Slope of Alaska through an 800-mile-long pipeline to a liquefaction plant at Valdez, for export to Asian markets. All of the natural gas flowing through the TAGS pipeline would have been exported exclusively into foreign commerce.[2] In its declaratory order addressing its jurisdiction over the contemplated project, the Commission recognized that the court in *Distrigas Corp. v. F.P.C.*[3] had held "that to prevent gaps in jurisdiction the Commission has the discretion under section 3 'to impose on imports of natural gas the equivalent of Section 7 certification requirements'" but "decline[d] to exercise any discretionary authority it may have under section 3 of the NGA to regulate the siting, construction and operation of the [800-mile] TAGS pipeline,"[4] reasoning that the project would have no economic consequences to U.S. ratepayers (as the costs of the project would be borne by the project sponsors, its lenders and investors, and its foreign purchasers of the gas) and that the environmental review process associated with the Commission's authorization of the liquefaction plant would provide the Commission ample opportunity to consider the environmental and safety aspects of the pipeline.

[4] *Id.* at p. 61,759.

Subsequent to the Commission's consideration of the jurisdictional implications of the Yukon Pacific project in 1987, Congress enacted the Energy Policy Act of 2005 (EPAct 2005),[5] which added a new section 3(e) to the NGA, providing, in part, that "[t]he Commission shall have the exclusive authority to approve or deny an application for the siting, construction, expansion, or operation of an LNG terminal." As defined in section 2(11) of the NGA, as added by EPAct 2005:

> "LNG terminal" includes all natural gas facilities located onshore or in State waters that are used to receive, unload, load, store, transport, gasify, liquefy, or process natural gas that is imported to the United States from a foreign country, exported to a foreign country from the United States, or transported in interstate commerce by waterborne vessel, but does not include –
>
> (A) waterborne vessels used to deliver natural gas to or from any such facility; or
> (B) any pipeline or storage facility subject to the jurisdiction of the Commission under section 7.

Were the Commission to be faced with a proposal like the Yukon Pacific project today, it would have to address whether the 800-mile-long pipeline would be considered a "natural gas facilit[y] . . . used to . . . transport . . . natural gas . . . exported from the United States."

That same question is raised by the circumstances presented in Scenario 2. On the one hand, an argument can be made that the in-state pipeline in Scenario 2 would "transport" natural gas "exported to a foreign country." However, unlike the project in *Yukon Pacific*, Scenario 2 does not involve the construction of a clearly jurisdictional new (or expanded) liquefaction terminal, nor would the hypothesized in-state pipeline interconnect directly with the existing Kenai terminal. Rather, the pipeline would interconnect with existing intrastate pipelines that would in turn connect to the terminal. In addition, notwithstanding that much of the gas transported by the in-state pipeline might be exported in foreign commerce, the impetus for construction of the in-state line in Scenario 2 nevertheless would be to ensure adequate supplies to meet in-state Alaska demand. Also, similar to the situation in *Yukon Pacific*, it appears such a project would have no economic consequences for any U.S. ratepayers outside of the State of Alaska. In the absence of Commission regulation, it would appear that the RCA would have authority to regulate the in-state pipeline as an intrastate pipeline. The Commission

[5]Pub. L. 109-58, 42 U.S.C. §15801 (2005).

would need to consider all of the foregoing in deciding whether it would be required to assert jurisdiction over the proposed pipeline.

Scenario 3

Under the third scenario described in Mr. Swenson's letter, some of the gas transported on the in-state pipeline would be sold to and consumed by Alaska end-users, but some be would sold to parties who would have it transported through existing intrastate pipelines to the Kenai facility, from whence it would be transported, as LNG, to foreign or lower 48 state markets (if an LNG receiving terminal were constructed on the U.S. west coast).

The distinction between Scenarios 2 and 3 is that in the former case, gas not used in Alaska is shipped to foreign markets, while in the latter some gas may be transported in domestic markets. The fact that some of the gas in Scenario 3 might be transported in interstate commerce (from Alaska to one or more of the lower 48 states) could result in the proposed in-state pipeline becoming fully subject to the Commission's NGA jurisdiction. The potential that the commingling of gas for intrastate use with gas that will flow out of the state of production could cause the entire gas stream (and facilities used to transport it) to become subject to section 7 of the NGA and the Commission's jurisdiction was first recognized in 1965 in *California v. LoVaca*.[6] At that time, the U. S. Supreme Court had already articulated in *Interstate Natural Gas Company Inc. v. FPC*[7] the principle that where the Commission has jurisdiction has over the interstate transmission of natural gas, that jurisdiction does not begin at the point at which gas first crosses a state line; rather, it begins at upstream points wherever NGA gathering ends.[8]

It is also possible that the Commission would exercise limited jurisdiction over the interstate service posited by Scenario 3, but not the facility itself, under section 311 of the Natural Gas Policy Act of 1978. Section 311(a)(2) of the NGPA provides that an intrastate pipeline can transport gas in interstate commerce without its facilities and intrastate services becoming subject to the Commission's NGA jurisdiction. That is because section 601(a)(2)(A) of the NGPA provides that for purposes of section 1(b) of the NGA, which sets forth the Commission's jurisdiction over the transportation of gas in interstate commerce:

---

[6]379 U.S. 366 (1965).

[7]331 U.S. 682 (1947).

> the provisions of such Act and the jurisdiction of the Commission under such Act shall not apply to any transportation in interstate commerce of natural gas if such transportation is . . . (ii) authorized by the Commission under [NGPA] section 311(a).

However, the Commission has held that the NGPA's definition of "intrastate pipeline" excludes newly constructed pipelines, since prior to operation they could not qualify as "engaged in" transportation.[9] Thus, the Commission has never found that a company can qualify as an intrastate pipeline without having first established the intrastate character of existing operations in the state where the pipeline is located.[10] But the Commission has also never ruled on how long an intrastate pipeline must have been in operation as such in order to shield its status as an intrastate pipeline while also offering interstate services under section 311 of the NGPA. Nor has the Commission to date ruled that once an intrastate pipeline begins offering interstate services under section 311 of the NGPA, its continued intrastate pipeline status depends on its continuing to provide some specified level or percentage of intrastate service. Nevertheless, the Commission might have reason to question the jurisdictional nature of a new pipeline company that purportedly commenced service as an intrastate pipeline, only to undertake the provision of a substantial amount of service in interstate commerce shortly thereafter under section 311 of the NGPA.
